## CORRECTION!

The Red Box circuit of Issue 36 is incorrectly drawn, The two emitters of the transistors should be tied together and connected to pin 1 of the XR-2240 timer. They are incorrectly tied to ground in Issue 36. Please correct the schematic in your issue, even if you don't plan to make the Red Box immediately. It will save you time later on.

## REPORT FROM END OF THE EARTH

Dear TAP and Freaks,
I am a lone freak living in a small town in northern Canada. I am familiar with electronics but not with phones. This town is a long way from anywhere and does not have a real telephone company. I get my phowe from the Canadian National Railroad. This has possibilities but standard techniques don't work. CN's system is tied into AGT in Alberta. and also into the military phone system.

Did you know that the military makes their own Blue Boxes? I often talk to the military guy in charge of their system. He tests their system every Tuesday. Some of the buttons on his Blue Box control priorities. One of these buttons will even take priority over the President of the U, S. Perhaps even a call for a pizza should take priority over Ford, but that's irrelevant.

Anyway, one of the phones where I work has a habit of automatically connecting you to the military system due to some small defect in the exchange (possibly deliberate?) What I have in mind is the development of a facility which would enable freaks to call into here (a Black Box could make that toll free) and then they could dial out of here into the military system. If they had a Blue Box with five additional buttons for the extra tones that the military uses, then they could use any priority they meeded to interrupt any military or government call in any NATO country. What is needed here is some people who know about such things.

A few people here have experimented successfully with communicating direct to the Anik satellite. They used 4 foot dishes made of wire mesh and assorted old microwave gear, but they left town. I think they were liquidated.

The phone company here has changed their equipment around so that it is not possible to call a toll-free number from anywhere in the western half of the NorthWest Territories. So even though they have in-band signalling, Blue Boxes no longer work. However, I am trying to devise a. new type box which I think might work anywhere. Ttre logic is as follows:

1. Dial O for operator. This sets things up so that you are connected to a common wire which passes thru several operator's boards and causes all of them to ring. When one of the operators is not busy and has finished inspecting her fingernails, she answers. This usually happens after 180 rings. When she answers, her board puts an audible tone on the line which causes the other operators' stations to stop ringing since one of the operators has answered. She then asks who you are and writes a little note to remind the organization to bill you. Then she dials your long distance call for you using a touch tone board.
2. So, before any operator answers, put this tone onto the line the same as if one of the operators answered and is telling all the other operators' boards to stop ringing.
3. Dial the number yourself using Blue Box without using the 2600 cycle "on hook" tone.

INFORMATION WANTED
If anybody there knows the frequency of the "operator has answered" or "receiving attention" (or whatever they call it) tone, I would like to know.

I have discovered that the phone company cum railroad company uses a very old signalling system on their order wire. If you dial some number and talk to the guy at the test board, you can ask him to dial for you to certain other test boards in other cities. He uses a system of beeps of a single tone. For example, 55 is just 5 beeps followed by a space and then 5 more beeps. I am going to try sending the beeps myself because, if I can hear them going out, the equipment can probably hear any beeps that I make.

## JULY•AUG 1976

N 0.37

Has anyone ever tried this? How do you find out the number of the test board so you can do it before the guy answers? I think if you reach the test board in a distant city you can dial 9 and get back into the regular phone system. Do southern, Bell style phone systéms have test boards like that? Can the phone company find out whodunnit?
Another thing, kind of scary, the Mounties have two cables from their shop to the exchange with maybe 50 pairs each. Rumor has it that their latest toy is a big box with a dial on it, a handset with a snooper button and a speaker, a bunch of jacks for tape recorders, and a pen recorder for dial clicks. The story goes that they can dial any number with this thing and listen in. It looks like it is a standard gadget made by Western Electric (?) and it wurks only in towns with a type of exchange called an SP - 3. Part of this town has SP - 3 and the rest has something made by a guy named Watison. Does anybody know about this cop equipment? How do you fuck it up?

The CN exchange includes a computer which dials everybody's number once a day and does a whole series of checks on it automatically. If you have an illegal extension and were dumb enough to leave the bell connected, the computer dials your number and does a "condenser check" by putting a pulse of DC down the line. The extra condenser will lengthen out the time for the pulse to decay and the computer prints out your name and number and what your crime is. The phone men and the RCMP then come in like the Marines and arrest you. I would like to know what else the computer is sensitive to. So far I have discovered "condenser trouble" (illegal extension) and "foreign battery on line" (this means that you called somebody who has "called party priority" and they left it off the hook so you couldn't get disconnected and they tried to get the phone company to trace the call. When this happens, you apply a shot of DC to your phone line (experiment to get the right polarity and use about 40 v ) and you get the dial tone back. However, the exchange prints out "foreign battery on line" with your phone \#. You don't want to be the only fbol that day, so you zap 40 v DC onto all the phone terminations in 3 or 4 apartment buildings. That way nobody knows whodunnit.

We used to talk over the Telex until CN got wise and changed the teletype machine for a modern one. The old one had a switch marked VOICE and TYPE and a jack to plug a handset into. Very economicall I think the voice facility is for their own staff when testing the equipment. They go home at 5 pm and if you dial 8 on the Telex after dialing the number for the city you want, then you get connected to the regular phone system in that city and just dial the number. No bill

Enjoy your Black \& Blue Boxes while you can because in the next few years (and even sooner if you live in certain areas () they're all going to be obsolete! On May 15, 1976 Pa Bell put its new C. C.I.S. system into operation between Chicago, Ill. and Madison, Wisc. This Common Channel Interoffice Signaling system uses high speed data pulses instead of the unual audio MF tones and since the audio talking circuits are wot connected until the called phone has answered, you cannot Black Box the call! Previously, all information such as MF tones, $2,600 \mathrm{~Hz}$, ring back, busy signal, etc. was done over the audio Ring \& Tip phone lines. With C. C.I.S. all of this information is converted into high speed data pulses and is multiplexed onto one common data channel leaving the audio lines free to be used for other calls. Long distance calls will now be processed in 2 seconds as compared to the 10 seconds it now takes.

This new system will take 10 years to complete nationwide and will cost US $\$ 250$ million. Cities that will have C. C.I.S. systems this year besides Chicago and Madison are Kansas City, Dallas, Jacksonville, and Waukesha, Wisc. By the end of 1977 , there will be 37 other cities with C. C.I. S. Pa Bell is using its new ESS \#4 and a modified version of its \#4-A Crossbar in their C. C.I.S. Central Offices. By the end of 1977, about 30 of the nation's 181 4-A Crossbar exchanges. will be C. C. I. S. and by the end of 1978, about 21 ESS \#4 exchanges will be in operation.

But before you all reach for the crying towel, just remember that a phone is simply an electronic device and like ary other electronic device IT CAN BE DEFEATEDI!| The needed technology may get very sophisticated but it's a challenge that the united fone freakswill meet and eventually beat! The Box of the future will no doubt be a cross between a small computer and a data switching center. Remember, old Boxers never die, they just build another color Boxl And the Red Box will still be around tool

## STEAL THIS BOOK IS SOLD OUT

We don 't know when we'll get more copies so please don't order itI

It should come as no surprise that some of our readers are in the pen. Here's part of one letter:
"Finished reading Big Brother Game and am disturbed by the diagrams. He left out connections and parts. I would be glad to help anyone trying to construct these for instance, I have a page of instructions for the construction of a drop-in transmitter. Many of his circuits came from Sams publications and Popular Electronics. The infinity transmitter will not work as shown. He left out 5 (count them) connections to the Signetics Phase Locked loop in the IC infinity and also on the AF Amp IC. I really would get off on writing to some phreaks - if you know of anyone that shares my interest. Hip them to the fact that I'm in here - but they can say virtually any thing they want. "

Don Harbolt<br>Box 1000 (30682)<br>Leavenworth, KS 66048

As you can see, Don's very knowledgeable (No cracks from you smartasses about "then what's he doing there?") He's a veteran of the Mexican air freight industry, importing our favorite flower. If you need any tech info, we'd appreciate it if you'd write to him, instead of, or in addition to, us. He has a lot more spare time than we do. Write legibly! But don't include a self addressed stamped envelope (stamps are contraband) and anyway, the Dept. of Justice (sic) pays his postage.

## MA BELL GETS JOLIIES

(ZNS) A telephone operator has testified that many phone company employees are commonly entertained by having the intimate sex conversations of telephone customers broadiast by loudspeakers throughout the offices.
Christina Huggins, a phone operator in Mill Valley, California, told the Public Utilities Commission in California that "plant men would go through the circuitry" looking for private phone conversations dealing with sex. Huggins said that the more interesting personal calls were then played aloud, purely for amusement.
The phone company, in response, says that such practices "are against company policy."
