Overview

Using the Hexago TSP™ Client is a simple and rapid way to get IPv6 connectivity from anywhere. The client needs to be installed and configured on your PC before connecting to the nearest Migration Broker®. The TSP Client is available for the following operating systems: Windows 2000, XP and Server 2003, Linux, FreeBSD, OpenBSD, NetBSD, VxWorks, QNX, Solaris and Mac OS X. This document is the user guide for the Windows version.

Prerequisites

- IPv6-enabled Windows workstation (use “ipv6 install” or see http://www.hexago.com/freenet6/requirements.html)
- TSP Client installer
- IPv4 connectivity from your PC to a Migration Broker (Freenet6, for example)

Installation steps

Remove any previous TSP Client installation
If the TSP Client has previously been installed, uninstall it. It is usually placed in the C:\Program Files\tsp-client folder. This folder contains a Uninstall.exe utility. Start the utility and follow the instructions. When asked if you would like to keep the configuration, click “Yes”.

Run the installer
Find the provided TSP Client installer file and start it. Then follow the instructions.
License Agreement

The TSP Client has both GPL and commercial licenses. After reading the license, click “I Agree” to proceed.
Components
Usually, installing both the TSP binaries and the tunnel drivers is required.

Hover is a bit weird here. On the CD you use “Move”?
Installation directory
Install in the default directory or another of your choice. The default directory is C:\Program Files\tsp-client.

![TSP Client Version 2.0 Setup](image)

Choose Install Location
Choose the folder in which to install TSP Client Version 2.0.

Setup will install TSP Client Version 2.0 in the following folder. To install in a different folder, click Browse and select another folder. Click Install to start the installation.

Destination Folder

![C:\Program Files\tsp-client](image)

Space required: 225.0KB
Space available: 4.2GB

Nullsoft Install System v2.0
Windows compatibility testing

Click “Continue Anyway” when prompted with the Windows compatibility testing dialog.

Verify the install

Verify the install was completed successfully and close the installer.
**TSP Client configuration**

If you would like to use the service in authentication mode (with a registered account), you must edit the TSP Client configuration file. Using the authenticated mode allows you to always keep the same IPv6 address and prefix, even if your IPv4 address changes. An account may be created using the Freenet6 account creation page [http://www.freenet6.net/register.shtml](http://www.freenet6.net/register.shtml).

In the TSP Client directory (C:\Program Files\tsp-client\) double-click on the configuration file tspc.conf.

If the extension is not recognized by Windows, choose the “Select the program from a list option”.

![Windows error message](tspc.conf)

Then choose the WordPad program and make sure the “Always use the selected program to open this kind of file” is selected, then click “OK”.

---

Page 6 of 10
Choose the program you want to use to open this file:

File: tspc.conf

Recommended Programs:
- WordPad

Other Programs:
- Adobe Photoshop
- Creative MediaSource Player
- Internet Explorer
- Microsoft Office Excel
- Microsoft Office OneNote
- Microsoft Office Picture Manager

Type a description that you want to use for this kind of file:

Always use the selected program to open this kind of file

If the program you want is not in the list or on your computer, you can look
for the appropriate program on the Web.
In the file, scroll down to the userid section. Then enter your username and your password.

If you wish to use a Migration Broker other than Freenet6, scroll down the configuration file and find the “server” item. Write the IPv4 address or the name of the Migration Broker as provided by your Internet Service Provider.

Save the configuration file and close it.
Running the TSP Client

To run the TSP Client, double-click on the executable file. A Windows command shell window appears. The window will stay visible if your PC is located behind a NAT device, since the client needs to keep the tunnel up actively in that case.

Testing your IPv6 connection

Now that the tunnel has been created, let’s verify if it works properly. In a normal environment, for example at home, it is possible to verify the tunnel works by connecting to an IPv6 service on the Internet. For example, when going to www.hexago.com, your IPv6 address will appear in the top bar. Also, the KAME logo, a turtle, on www.kame.net, would be dancing if IPv6 connectivity is available.

Another way to test your IPv6 connectivity is to ping the IPv6 endpoint of the tunnel.

Start a Windows command shell by going to the Start menu, than click on Run…, type cmd in the Run window and click “OK”.

In the command window, type cd c:\Program Files\tsp-client

Page 9 of 10
Type “netsh interface ipv6 show route” to display the IPv6 routes. The default route points on the broker endpoint of the tunnel, in this example 3ffe:bc0:8000::8.

```
C:\Program Files\tsp-client>netsh interface ipv6 show route
Querying active state...

Publish  Type       Met  Prefix                    Idx  Gateway/Interface Name
-------  --------  ----  ------------------------  ---  ---------------------
yes      Manual       0  ::/0                       11  3ffe:bc0:8000::8
no       Manual       0  3ffe:bc0:8000::8/128       11  Local Area Connection 15
```

Ping the tunnel endpoint. Use the “ping” command with the IPv6 address the broker endpoint. Note: the ping6 command may be used, but its use might be deprecated in the future. Using “ping” is suggested.

```
C:\Program Files\tsp-client>ping 3ffe:bc0:8000::8
Pinging 3ffe:bc0:8000::8 with 32 bytes of data:

Reply from 3ffe:bc0:8000::8: time=102ms
Reply from 3ffe:bc0:8000::8: time=102ms
Reply from 3ffe:bc0:8000::8: time=102ms
Reply from 3ffe:bc0:8000::8: time=102ms

Ping statistics for 3ffe:bc0:8000::8:
   Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
   Minimum = 102ms, Maximum = 102ms, Average = 102ms
```

In this case, your IPv6 connectivity is working correctly.
