Printed in U.S.A.
INTRODUCTION

1. GENERAL INFORMATION

SCOPE

1.01 This document describes the Tandem Tie Trunk Service feature in a No. 1 or No. 1A Electronic Switching System (ESS). Tandem tie trunks are nonsenderized (or "cut-through") in their outpulsing operation. For information concerning senderized outpulsing operation of tie and foreign exchange (FX) trunks, see reference A(21) in Part 18. Only nonsenderized outpulsing operation of tie and FX trunks is documented herein. (The terms tie trunk and tie line as used in this feature document are to be considered synonymous.)

REASON FOR REISSUE

1.02 When this document is reissued, the reason for reissue will be stated in this paragraph.

FEATURE AVAILABILITY

1.03 Ordinary tandem tie line service, commonly called 1XX, is available in the generic program base in all active No. 1/1A ESS generic programs. Improved tandem tie line service (11XX) is available beginning with the 1E6 No. 1 ESS generic program and the 1AE6 No. 1A ESS generic program, but requires optional feature groups and special dial repeating trunk circuits. Private network access line service (PNAL) is also available.
with the 1E6/1AE6 and later generic programs. PNAL requires optional feature groups and a special dial repeating trunk circuit. Any mixture of 1XX, 11XX, and/or PNAL can be provided in a No. 1/1A ESS office equipped with the 1E6/1AE6 and later generic programs.

2. DEFINITION/BACKGROUND

DEFINITION

2.01 The Tandem Tie Trunk Service feature provides nonsenderized private line service for large business customers.

BACKGROUND

A. Nonsenderized Private Line Service

2.02 Nonsenderized private line service allows a large business customer to directly determine call routing at each switching point within its network. Customer-dialed access codes are used to connect to an outgoing trunk group of a network. Digits dialed after an access code go out over the outgoing trunk as though the outgoing office were not interposed. Digits dialed after an access code go out as soon as possible after each is dialed. These digits are not translated. Neither are any digits deleted or prefixed. A Centrex/ESSX-1 customer telephone set is effectively (sometimes literally) cut through directly to each of a series of offices, determined by previously dialed digits, until a terminating station number is dialed. (See Fig. 1.)

2.03 The uses of the Tandem Tie Trunk Service feature in a No. 1/1A ESS are of two types, on-network calling and off-network calling. On-network calls remain within a private line network in which the call was first originated. Off-network calls eventually reach the message telecommunication service network or a separate senderized private line network, such as an enhanced private switched communications service (EPSCS) network. For this reason, the off-network type of the Tandem Tie Trunk Service feature is often called access line service at the final switch of the original (nonsenderized) network.

B. Feature Perspective

2.04 Large business customers with multiple geographical locations often prefer to have their locations linked by an economical private telephone network. The Tandem Tie Trunk Service feature often provides the most economical private line service to accommodate Centrex/ESSX-1 customers, but at the cost of a certain amount of inconvenience for the users on those calls which require a complicated tandem route. (A complicated tandem route is one which a user must determine by consulting a network map and then translating a route into a sequence of access codes to be dialed.)

2.05 The Tandem Tie Trunk Service feature offers an economical private line service. It also offers access line service as an accessory to the tie trunk network or independently. The Tandem Tie Trunk Service feature is also used to provide faster call completion for calls to dial pulse trunk groups from Centrex/ESSX-1 customer lines than a senderized group would provide.

2.06 In No. 1/1A ESS offices with generic programs prior to the 1E6/1AE6, the Tandem Tie Trunk Service feature is implemented by use of a simulated cut-through mechanism. No true cut-through service exists. A service circuit is used to collect digits and retransmit them—hence the term dial repeating. A consequence of simulated cut-through operation is that a loud click occurs when simulated cut-through dialing is terminated at end-of-dialing time-out (n seconds after the last received digit is outpulsed, where n is derived from the route index translation for that particular route—4 ≤ n ≤ 12). This click is caused by the removal of the service circuit from the call path when the network path is reconfigured. With the advent of the 1E6/1AE6 generic program, special dial repeating trunks can be used to eliminate the loud click. These special dial repeating trunks also provide private network access line service which features calling number outpulsing prior to cut-through. The Centrex/ESSX-1 customer incurs higher termination charges for these special dial repeating trunks than for trunks which do not have dial repeating capability built in.

C. Feature Purpose

2.07 The purpose of the Tandem Tie Trunk Service feature is to provide nonsenderized outgoing dial pulse service to large business (i.e., Centrex/ESSX-1) customers who are served by No. 1/1A ESS offices. The same trunks used for this nonsenderized dial pulse outgoing service can also be used for incoming
service. Any trunk circuit allowed for the Tandem Tie Trunk Service feature has 2-way capability and can be used for such or can, if desired, be restricted to 1-way outgoing service.

2.08 The Tandem Tie Trunk Service feature is not available to calls which originate outside a Centrex/ESSX-1 customer group.

2.09 For purposes of documentation, three versions of the Tandem Tie Trunk Service feature are distinguished:

(1) Ordinary tandem tie line service (1XX)
(2) Improved tandem tie line service (IIXX)
(3) Private network access line service (PNAL).

1XX and IIXX may be used for nonsenderized on-network and/or off-network calling. PNAL pertains only to access line service where the calling number is multifrequency (MF) outpulsed before the nonsenderized operation begins. 1XX and IIXX may be used for access line service, but only PNAL provides calling number outpulsing. PNAL was designed specifically for access line service to an EPSCS network. IIXX and PNAL are tariffed as an advanced private line termination (APLT), and 1XX is tariffed as tandem tie trunk service.

D. Tandem Tie Trunk Networks

2.10 The tandem tie trunk network (TTTN) is the most commonly switched private line arrangement in the Bell System today. TTTNs are networks of trunks and switching machines that
interconnect the different locations of the large business customers they serve. TTTNs are capable of furnishing both voice and data service to intrastate and interstate traffic. (See Fig. 2.)

2.11 TTTNs range in size from those serving as few as three customer locations to networks interconnecting more than a hundred locations throughout the United States and Canada. Individual locations may be served by key telephone systems, private branch exchanges, or Centrex/ESSX-1. This document addresses the use of the No. 1/1A ESS Centrex/ESSX-1 in a TTTN as a large business customer service location or tandem switch.

2.12 Tie trunks are voice-grade private “lines” used to connect or tie two business customer service locations. Tandem switching—connecting two trunks in order to switch calls through a business customer location—is done by switching systems that also serve the individual large business customer service locations. Each tandem switch can serve several large business customer service locations, as well as being connected to other tandem switches. (See Fig. 3.)

2.13 The main purpose of a TTTN is to carry voice traffic among large business customer locations. Some TTTNs also carry low- or medium-speed data, and some are connected to the toll network for users to make calls to telephones which are not part of the TTTN (off-network service). Off-network traffic is carried between locations using the TTTN trunk groups and can also be connected to the message telecommunication service network using PBX central office trunks, foreign exchange trunks, “dial 9”, and/or wide area telecommunications service (WATS) lines.

DESCRIPTION

3. USER OPERATION

CUSTOMER

3.01 The Tandem Tie Trunk Service feature users are Centrex/ESSX-1 stations, including attendants. Stations may be equipped for either dial pulse or TOUCH-TONE® dialing, but TOUCH-TONE stations for 1IXX must have 12-button dials.

3.02 To place a call using 1XX or 1IXX, the user first dials an access code. This code does not have to be of the form 1XX and does not have to be a 3-digit code; in fact, it may be any unused access code in the customer group dialing pattern. The term “1XX” is a carry-over from the older systems which used that form of access code. After the access code, another dial tone is returned. The user then dials the next (perhaps the only) leg of the call. If the office reached with the original access code allows through switching, another access code may be dialed, etc., or a station number may be dialed and the call terminated without through switching to another office. Another possibility is that the access code for message telecommunication service (usually 9) may be dialed, and after another dial tone, any allowable 7- or 10-digit telephone number may be dialed. (See Fig. 4.)

3.03 With PNAL, an access code is dialed (usually one digit, but no more than two digits). Another dial tone is returned, and the user dials the private network called number. If an authorization code is required by the private network, a special dial tone is returned to prompt for the authorization code (usually a 3- to 6-digit code). The PNAL call can be a direct access from a subtending business customer location or the terminating leg of a 1XX or 1IXX call. (See Fig. 5.)

3.04 For 1E6/1AE6 and later generic programs, the customer has the option of 1IXX service rather than 1XX. 1IXX is available only on a network-wide basis so that all No. 1/1A switches in the network must have at least a 1E6/1AE6 generic program. Using 1IXX, the troublesome click which can occur after answer with 1XX is eliminated in most cases. The user of TOUCH-TONE station equipment on an 1IXX call is expected to dial the # digit immediately following the last dialed digit of the call. Otherwise, the troublesome click can occur even with 1IXX. Dial pulse stations using 1IXX simply dial the normal digits and do not get the click. TOUCH-TONE 1IXX users must dial the # digit because the TOUCH-TONE signals are converted to dial pulses by using a service circuit. The click occurs when this service circuit is released. Dialing the # digit releases the service circuit immediately, rather than after an end-of-dialing time-out. Consequently, the click occurs well before answer and is not troublesome.

3.05 Centrex/ESSX-1 stations with call transfer can transfer calls to tandem tie lines and to private network access lines. Similarly, the related threeway conference and consultation hold
Fig. 2—Typical Tandem Tie Trunk Network
calls can be made. The user must not flash to connect the original party or hang up to allow the remaining two parties to finish the call until ringing of the new party is confirmed. Otherwise, a disconnect may result. Call transfer, three-way conference, and consultation hold calls are made in the normal manner when the new party is reached via a 1XX or 11XX tandem tie line or private network access line. See reference A(19) in Part 18.

TELEPHONE COMPANY

3.06 Not applicable.
SECTION 231-090-254

START

USER DETERMINES CALLED NUMBER, DESTINATION, ROUTE(S), AND ACCESS CODE(S)

USER GOES OFF-HOOK

1ST DIAL TONE

USER DIALS APPLICABLE ACCESS CODE, SEE NOTE 1

2ND/SUBSEQUENT DIAL TONE

WILL THAT CUSTOMER LOCATION BE USED FOR TAMDEM TIE TRUNK SERVICE

YES

NO

USER DIALS CALLED NUMBER AT THAT LOCATION, OR "9" (DIAL TONE) PLUS CALLED NUMBER. SEE NOTE 2

CALL PROCESSED USING CENTREX/ESSX-1 SERVICE AND/OR MESSAGE TELECOMMUNICATION SERVICE

SEE NOTE 3 AND CAUTION

UPON CALL COMPLETION USER GOES ON-HOOK

END

NOTES:
1. DIGIT TIMING SCHEME:
   A. FIRST DIGIT AFTER ACCESS CODE MUST BE DIALED WITHIN TEN SECONDS AFTER SECOND/SUBSEQUENT DIAL TONE STARTS.
   B. SUBSEQUENT DIGITS MUST BE DIALED WITHIN N SECONDS AFTER ALL DIGITS COLLECTED SO FAR HAVE BEEN OUTPUTED.
      N IS EQUAL TO THE DROP BACK TIMING VALUE PROVIDED BY THE ROUTE INDEX EXPANSION TABLE. 4≤N≤12

2. WHEN THE CALL IS TOUCH-TONE INTO THE ESS, I1XX USES THE STANDARD 1XX METHOD WHICH EMPLOYS A CONNECTION THROUGH WHAT IS ESSENTIALLY A TOUCH-TONE-TO-DIAL-PULSE CONVERTER. AT THE END OF DIALING, THIS CONNECTION IS REPLACED BY A DIRECT CONNECTION TO THE OUTGOING TRUNK. END OF DIALING IS RECOGNIZED EITHER BY THE RECEIPT OF A # DIGIT OR BY A TIME-OUT. FOR I1XX, ALL TOUCH-TONE PHONES SHOULD BE 12 BUTTON, WITH THE DIALER BEING INSTRUCTED TO DIAL A # DIGIT AS THE VERY LAST DIGIT DIALED. THIS WILL FORCE THE SWITCHING TO OCCUR BEFORE ANSWER. ANY OTHER ESS OFFICES IN THE CALL WILL RECEIVE DIAL PULSES AND WILL NOT DO ANY SWITCHING AT THE END OF DIALING.

3. A "CLICK" IS PROBABLY HEARD 4-12 SECONDS AFTER END OF DIALING UNLESS I1XX (WITH I1XX SOFTWARE, SERVICE CIRCUITS, AND TRUNKS) IS UTILIZED.

CAUTION

IF THIS CALL IS FOR DATA TRANSMISSION PURPOSES AND I1XX IS NOT USED, USER MUST WAIT TIME-OUT, RECOGNIZED BY CLICK, BEFORE BEGINNING DATA TRANSMISSION

Fig. 4—User Operation—1XX or I1XX
Fig. 5—User Operation—PNAL

4. SYSTEM OPERATION

HARDWARE

4.01 Hardware associated with the Tandem Tie Trunk Service feature is shown in Table A and Table B.

OFFICE DATA STRUCTURES

A. Translations

Introduction

4.02 Translation data for the Tandem Tie Trunk Service feature is discussed below. For detailed information on these translation words, as well as common translation data used to process a call, refer to references C(1), C(2), and/or C(3) in Part 18.

Centrex Translator

4.03 For the Tandem Tie Trunk Service feature, if the Message Detail Recording on Tie Trunks (TAMA) feature is provided, if the route index increment is greater than 63, or if special dial repeating trunks (SD-IA473, SD-IA474, SD-IA475, and SD-IA476) are specified, a digit interpreter auxiliary block is required for the data type 5, subtype 17 access code final data (Fig. 6). Specifying dial repeating trunks is required to provide 11XX treatment for the call, but has no effect if the 11XX feature is not loaded.

Route Index Expansion Table Translator

4.04 Access to a trunk group can be gained only through a route index. For the Tandem Tie Trunk Service feature, route indexes are required for outgoing tie trunk groups and for tandem tie line cut-through service circuits. All route index expansions require two words. For 1XX and 11XX, outgoing trunk groups require a word 0 and word 1 type 4. Cut-through service circuits require a word 0 and word 1 type 0. PNAL outgoing trunk groups require a word 0 and word 1 type 3. Refer to Fig. 7 for the layouts of the route index expansion table words required for the Tandem Tie Trunk Service feature. The transmitter type in word 1 type 3 must be marked for multifrequency for private network access line service. The ordinary wink bit must not be marked, and the second wink bit must be marked for PNAL.

Trunk Network Number to Peripheral Equipment Number (TNN-to-PEN) Translator

4.05 The Tandem Tie Trunk Service feature requires TNN-to-PEN auxiliary blocks. A 4-word auxiliary block, shown in Fig. 8, is used for tandem tie trunks. Two 7-word auxiliary blocks
are used for each tandem tie line cut-through service circuit. (See Fig. 9.) One 7-word auxiliary block is used for the receiver port (port 0), and another is used for the transmitter port.

**Trunk Class Code Expansion Table Translator**

4.06 The trunk class code expansion table translation words shown in Fig. 10 are required for the Tandem Tie Trunk Service feature.

**Master Scanner Translator**

4.07 The Tandem Tie Trunk Service feature requires the use of the master scanner translator to provide applicable trunk program indexes. The master scanner uses a primary translation word type 2. (See Fig. 11.)

**B. Parameters/Call Store**

4.08 Tandem tie line cut-through service circuits require 18-word (19-word for 1E6/1E6 and later generic programs) outpulsing registers. They also require 9-word transmitter outpulsing annexes, 32-word digit receiver junior registers, 7-word trunk dial pulse transmitter junior registers, etc. These registers/annexes are engineered on a per office basis concerning all applicable features within a given No. 1/1A ESS office. The parameter set cards involved are listed in paragraph 9.02.

4.09 Another type of junior register, called an IXXX junior register, is needed for IXXX calls that involve local second dial tone and/or the TAMA feature. If the TAMA feature is not applicable within a given No. 1/1A ESS office and that office does not supply second dial tone, no IXXX junior registers are required. Parameter set card IXXJR defines the quantity of IXXX junior registers in a No. 1/1A ESS office. (See Fig. 12 and 13.)

4.10 Also, for IXXX calls, one hopper entry is provided for each IXXX junior register (excluding dummy registers). The quantity automatically provided is set equal to the IXXJR set card quantity supplied. (See Fig. 14.)

4.11 For IXXX calls originating locally from dial pulse stations, IXXX senior registers are required. When a locally originated IXXX call is initiated, an IXXX senior register is seized and held throughout dialing. This register is held until answer, abandon, or end-of-dial time-out. If the TAMA feature is applicable within the originating No. 1/1A ESS office, the IXXX senior register is timed out 12 seconds after the last dialed digit. Senior registers, which were formerly used only for step-by-step and foreign exchange trunk calls, now include IXXX senior registers as well. Set card IXXOR is used to indicate the additional number of senior call registers required for IXXX. (See Fig. 15.) Set card IXXOR affects only the SOR call store table.

4.12 IXXX can be loaded without any parameter set cards (except, of course, feature defining set cards). If IXXX is to be used before the next update of office parameters, IXXOR should be specified. If the TAMA feature and/or second dial tone is to be provided with IXXX, IXXOR should also be specified.

4.13 For more detailed information concerning parameter set cards, refer to references C(4) through C(7) in Part 18.

**Call Store**

4.14 The Tandem Tie Trunk Service feature requires the use of dial pulse outpulsing registers. Word 17 is modified for use by this feature. (See Fig. 16.)

**FEATURE OPERATION**

**A. Station Call—Local Office Origination**

4.15 A Centrex/ESS-1 station tandem tie trunk call begins like any other customer originating call up to the time the initial IXX or IXXX access code is dialed. The line seizure is detected, normal dialing connection is established to the proper type customer digit receiver on the trunk link network, and dial tone is returned to the originating station. Digit collection is then initiated. (See Fig. 17A.)

4.16 Upon receipt of a valid access code, identified by a centrex data type 5 subtype 17 translation, the existing receiver connection is abandoned. The calling station is then connected to the receiver port of an idle tandem tie line cut-through service circuit for local origination. Fixed route index 148 is used for connection to the receiver port. An idle outgoing tandem tie trunk is seized and connected to the transmitter port (using TNN-to-PEN translator). In addition, a switching path is reserved to directly

1A178 — Trunk dial pulse receiver
1A179 — Trunk dial pulse transmitter
1A300 — Cut-through circuit

connect the station to the tandem tie trunk. (See Fig. 17B.)

4.17 Second dial tone is received either from the next office (if available) or from the originating office, but not from both. This is specified as an access code option and establishes the restriction that route advances are only allowed between trunk groups arranged for similar second dial tone operation. For IXX and TOUCH-TONE IIXX, local second dial tone is provided before hunting the outgoing trunk. The outgoing trunk is hunted after this dial tone is removed in response to a dialed digit. If no idle trunk is available, overflow signal is returned at this point.

4.18 The calling party continues dialing the remaining access codes and/or called party number. Every dialed digit is repeated over the outgoing tandem tie trunk by the tandem tie line cut-through service circuit for IXX and TOUCH-TONE IIXX. For dial pulse IIXX, the trunk repeats the dialed digits. Except for dial pulse IIXX, the service circuit is abandoned, and the final talking path is established after a 4- to 12-second time-out from the last dialed digit or, if available and used, upon receipt of a # digit from a TOUCH-TONE station. For dial pulse IIXX, the service circuit is removed as soon as a start-dial signal is received, or if the outgoing trunk must be yielded due to glare. See Fig. 17C.

4.19 If no idle tandem tie line cut-through service circuit for local origination and/or if no idle outgoing tandem tie trunk is available, the originating call is routed to a reorder signal. A reorder signal may also be returned from other offices in the tandem tie trunk network for lack of an idle tandem tie line cut-through service circuit for distant office origination and/or outgoing tandem tie trunk.

B. Attendant Call—Local Office Origination

4.20 If the attendant loop appears on the line link network (50A CPS interface), the originating tandem tie trunk call is processed as described in paragraphs 4.15 through 4.19. The following discussion addresses attendants with loops appearing on the trunk link network (51A CPS interface).

4.21 An attendant originating a tandem tie trunk call originates the call as any attendant call. Normal dialing connection is established to the proper type customer digit receiver on the trunk link network, and dial tone is returned. Digit
collection is then initiated. (See Fig. 18A.) Attendant access is through a screening LEN.

4.22 From this point, an attendant call is processed essentially in the same manner as a station originated call (paragraphs 4.16 through 4.19). See Fig. 18.

C. Incoming Call—Distant Office Origination

4.23 An incoming call on a tandem tie trunk is recognized by the supervisory scans. Via the appropriate fixed route index, a connection is established between the incoming tandem tie trunk and a trunk dial pulse receiver (with TOUCH-TONE applique). See Fig. 19A. (Refer to paragraph 4.17 for second dial tone operation.)

4.24 Upon receipt of a valid access code, identified through centrex data type 5 subtype 17 translations, the trunk digit receiver circuit is released. The incoming tandem tie trunk is then connected to the trunk receiver port of an idle tandem tie line cut-through service circuit for
4.25 The calling party continues dialing the remaining access codes and/or called party number. Every digit dialed on the incoming tandem tie trunk is repeated over the outgoing tandem tie trunk by either the tandem tie line cut-through service circuit for distant origins for 1XX and TOUCH-TONE IlXX, or by the trunk itself for dial pulse IlXX. Except for dial pulse IlXX, the service circuit is abandoned, and the final talking path established after a 4- to 12-second time-out from the last dialed digit, or if available and used, upon receipt of a # digit from a TOUCH-TONE caller. For dial pulse IlXX, the service circuit is removed as soon as a start-dial signal is received, or if the outgoing trunk must be yielded due to glare. (See Fig. 19C.)

4.26 If no idle tandem tie line cut-through service circuit for distant origins and/or no idle outgoing tandem tie trunk is available, reorder signal is returned over the incoming tandem tie trunk.

D. Station Access to a Private Network

4.27 When the Automatic Calling Station Identification (ACSI) feature is applicable, private network access line service must be used to access a private network such as EPSCS. (Otherwise, 1XX or IlXX can be used as described above.) For EPSCS access, an SD-1A473 trunk circuit must be used for a Centrex/ESS-1 station with the ACSI feature applicable at the EPSCS. If the ACSI is not applicable, SD-1A473 trunk circuits are not required, though they still may be used.

4.28 When the ACSI feature applies, the following sequence of actions occur for an originating call. The calling party goes off-hook and is connected to an idle customer digit receiver (Fig. 20A). The calling party dials the EPSCS network code. An SD-1A473 outgoing trunk circuit is seized, wink

**E. Dial Pulse Station Extending an Incoming Call to EPSCS Network With Automatic Calling Station Identification Feature**

4.29 Subsequent user dialing in response to second dial tone (from EPSCS network) proceeds directly over the tie trunk. Second dial tone is delayed approximately 1 second due to MF signaling. The user then dials the private network number of the called party. If an authorization code is required, the EPSCS network prompts with recall dial tone after the called number has been received. The authorization code consists of three to six digits.

4.30 Figure 21 shows the various network connections that occur for the case of a dial pulse station extending an incoming call to an EPSCS network with the Automatic Calling Station Identification feature. A 3-port conference circuit is used as an intermediary circuit between an incoming trunk and an SD-1A473 outgoing tie trunk. Since dial pulses cannot be repeated through a 3-port conference circuit, a tandem tie line cut-through service circuit for local origination is used during the dialing period.

4.31 The incoming trunk is initially connected to a called (dial pulse) station (Fig. 21A). The called station flashes to begin the processes of extending the incoming trunk call onto the EPSCS network. This action results in the connection of
the incoming trunk call to an idle 3-port conference circuit and also of the called station to an idle line receiver. A path between the called station and the 3-port conference circuit is also reserved (Fig. 21B). Upon dial tone, the called station dials the EPSCS network access code. An SD-1A473 outgoing tie trunk circuit is seized, a wink is returned, and automatic number identification is sent forward via MF signaling. After MF outpulsing, the MF transmitter and line receiver are released. The called station is then connected to the receiver port of an idle tandem tie line cut-through service circuit for local origination, and the transmitter port is connected to the SD-1A473 outgoing tie

### B. For Tie & Foreign Exchange Trunk

**Fig. 10—Trunk Class Code Expansion Table Translator—Trunk Class Code Expansion Tables**
trunk. The called station now dials into the EPSCS network via the tandem tie line cut-through service circuit and the SD-1A473 outgoing tie trunk. Connection of the called station to the 3-port conference circuit occurs upon time-out from the last dialed digit or flash, whichever occurs first. The flash should not occur before ringing is heard in order to avoid the possibility of a disconnect. At that time, the tandem tie line cut-through service circuit connections are released, and the SD-1A473 outgoing tie trunk is connected to the 3-port conference circuit (Fig. 21C).

4.32 TOUCH-TONE called stations can dial through a 3-port conference circuit. Therefore, no tandem tie line cut-through service circuit is used for extending an incoming trunk call to an EPSCS network with the Automatic Calling Station Identification feature by a TOUCH-TONE equipped calling station. The operation is similar to that described above. (See Fig. 22.)

4.33 A line-to-line call may similarly be extended to an EPSCS network with the Automatic Calling Station Identification feature.

F. Access to EPSCS Network Without Automatic Calling Station Identification Feature

4.34 SD-1A473 outgoing tie trunks accessed as manual outgoing trunks can be used for EPSCS access when the Automatic Calling Station Identification feature is not used. However, a call cannot be extended to EPSCS by a dial pulse station in this arrangement. In order to allow extended calls from dial pulse stations in this arrangement, the access code must be translated as 1XX or 11XX, using the SD-1A237 or SD-1A473 trunks, respectively.

CHARACTERISTICS

5. FEATURE ASSIGNMENT

5.01 The Tandem Tie Trunk Service feature is assigned on a per access code basis in each large business customer (Centrex/ESSX-1) group.
6. LIMITATIONS

OPERATIONAL

6.01 Trunk dial transfer to a tandem tie line or private network access line is not available. That is, a tie trunk is not allowed to flash and initiate a transfer, threeway conference, or consultation hold call to 1XX, I1XX or PNAL routes. Only attendants and stations can do this. Also, for these calls, flashing to recall the held party or hanging up after initiating a transfer must not be done before ringing is heard.

ASSIGNMENT

6.02 PNAL access codes are limited to one or two digits.

6.03 The Tandem Tie Trunk Service feature requires precise dial tone at all locations which send dial tone back to the caller. Otherwise, callers may receive wrong numbers when the TOUCH-TONE receiver in the tandem tie line cut-through service circuit receives spurious digits from imprecise dial tone frequencies which appear to be valid TOUCH-TONE digits.

6.04 Route advance is seldom done for 1XX and I1XX routes. If route advance is done, the alternate route(s) should have the same second dial tone arrangement as the primary route.

6.05 All TOUCH-TONE stations which can reach I1XX routes should be equipped with 12-button TOUCH-TONE dials so that the caller can dial the # (end-of-dial) digit as the very last digit to avoid the click problem.

6.06 I1XX must be provided on a total network basis if the customer is to have “click-free” tandem tie trunk service. This means that all No. 1/1A ESS switches in the network must have a 1E6/1AE6 or later generic program, the necessary feature package groups, special dial repeating trunk circuits, and the improved tandem tie line cut-through service circuits. All No. 2 ESS switches in the network must be arranged for E&M supervision on those trunks which are part of an I1XX network. Crossbar, step-by-step, and panel offices should need no changes to provide I1XX rather than 1XX.

6.07 The Tandem Tie Trunk Service feature cannot be provided to telephones which are not part of a Centrex/ESSX-1 customer group.

6.08 Prefixing and/or deleting of digits is not permissible, regardless of any information stored in translation data. A 1- or 2-digit speed calling list cannot be used for any dialing of Tandem Tie Trunk Service feature calls.

7. INTERACTIONS

7.01 Not applicable.

8. RESTRICTION CAPABILITY

8.01 The Attendant Control of Trunk Group Access feature, also referred to as the Attendant Control of Facilities (ACOF) feature, allows the attendant to restrict dial access of all stations to certain centrex trunk groups, simulated facilities, and special services by operating specific keys. When ACOF is activated, calls to these facilities may be routed to the attendant for subsequent completion, to a record announcement, or to an intercept tone trunk. See reference A(18) in Part 18.

INCORPORATION INTO SYSTEM

9. INSTALLATION/ADDITION/DELETION

9.01 Applicable hardware such as trunk circuits, service circuits, plug-ins, and network cross-connections are normally installed by an installation force per telephone company order. In conjunction with hardware installation, telephone company personnel input software data supplied by Western Electric on Growth Recent Change forms. Refer to reference C(8) in Part 18, and applicable recent change BSP documentation Section 231-048-XXX, Section 231-118-XXX, and Section 231-318-XXX referenced in Part 18A. (See Fig. 23.)

9.02 The following parameter set cards are applicable to the Tandem Tie Trunk Service feature:

- 9FCX1X Centrex Tandem Tie Line Service
- 9F11XX Same as above

11. SOFTWARE REQUIREMENTS

Note: This part contains cost factors and determination of quantities. Central Office Equipment Engineering System (COEES) Planning and Mechanized Ordering Modules are the recommended procedures for developing these requirements. However, for planning purposes or if COEES is not available, the following guidelines may be used.

10. HARDWARE REQUIREMENTS

Note: This part contains cost factors and determination of quantities. Central Office Equipment Engineering System (COEES) Planning and Mechanized Ordering Modules are the recommended procedures for developing these requirements. However, for planning purposes or if COEES is not available, the following guidelines may be used.

HARDWARE USAGE COSTS

10.01 Hardware usage costs for the Tandem Tie Trunk Service feature are shown in Table C.

HARDWARE CONFIGURATIONS

10.02 Table D shows the hardware configurations used for the Tandem Tie Trunk Service feature. Notice that all trunk order codes ending in "1", except 16201, are designed for I1XX.

HARDWARE QUANTITIES

A. Trunk Circuits

10.03 Total quantities and types of trunk circuits used for the Tandem Tie Trunk Service feature are based upon the nonsenderized special service requirements of Centrex/ESSX-1 customers within a No. 1/1A ESS office. General requirements are addressed in paragraphs 2.02 through 2.13. Trunk circuit engineering is to be done in conjunction with network administration practices detailed in references A(7), A(10), A(11), and A(16) in Part 18.

B. Service Circuits

10.04 Refer to reference A(6) in Part 18.

MEMORY

A. No. 1 ESS

Fixed

11.01 The following memory is required whether or not the Tandem Tie Trunk Service feature is used:

- Generic (program store): See Table E.

- Translations (program store): 16 words per No. 1 ESS office for trunk class code expansion tables for tandem tie line cut-through service circuits.

Conditional

11.02 The following memory is required when the Tandem Tie Trunk Service feature is activated but not yet applied:

- Generic (program store): See Table E.

- Call Store:
  
  (a) In a signal processor office, 200 call store words are required for I1XX.

  (b) I1XX requires I1XX junior registers if the TAMA feature and/or local second dial tone is provided in a No. 1 ESS office. In a central control only office, one I1XX junior register consists of four call store words. Each I1XX dummy register consists of five call store words. In a signal processor office, one I1XX junior register consists of eight call store words. No dummy registers are used. Parameter set card IXXJR defines the quantity of I1XX junior registers.

Page 35
(c) If applicable, one I1XX digit hopper word is provided for each I1XX junior register (excluding dummy registers).

(d) I1XX requires I1XX senior originating registers only for dial pulse originating calls. Parameter set card IXXOR is used to indicate the additional number of senior originating registers and affects only the SOR call store table. A senior originating register consists of 19 call store words.

(e) Parameter set card TLD, requiring one call store word, sets the quantity of tandem tie line cut-through service circuits for distant originations in a No. 1 ESS office.

(f) Parameter set card TLL, requiring one call store word, sets the quantity of tandem tie line cut-through service circuits for local originations in a No. 1 ESS office.

(g) Refer to Part 9 for a list of other set cards affected by this feature. Set cards are engineered per reference C(6) in Part 18 on a per office basis.

Variable

11.03 The following memory is required when the Tandem Tie Trunk Service feature is applied:

- **Translations (program store):**

  (a) 4 words per access code for centrex digit interpreter auxiliary block, if required.

  (b) 2 words per outgoing trunk group for each route index expansion.

  (c) 4 words per outgoing trunk for each TNN-to-PEN auxiliary block.

  (d) 14 words per tandem tie line cut-through service circuit for TNN-to-PEN auxiliary block.

  (e) 4 words for the route index expansion for route indexes 148 and 149. Route index 148 points to the trunk group for tandem tie line cut-through service circuits for local originations. Route index 149 points to the trunk group for tandem tie line cut-through service circuits for distant originations.

(f) 4 words per tandem tie trunk service trunk group for the trunk class code expansion table.

(g) 3 words per tie trunk for the master scanner words.

B. No. 1A ESS

Fixed

11.04 The following memory is required whether or not the Tandem Tie Trunk Service feature is used:

- **Generic (program store, file store):**
  See Table F.

- **Translations (unduplicated call store, file store):** 16 words per No. 1A ESS office for trunk class code expansion tables for tandem tie line cut-through service circuits.

Conditional

11.05 The following memory is required when the Tandem Tie Trunk Service feature is activated but not yet applied:

- **Generic (program store, file store):**
  See Table F.

- **Duplicated Call Store:**

  (a) I1XX requires I1XX junior registers if the TAMA feature and/or local second dial tone is provided in a No. 1A ESS office. One I1XX junior register consists of four call store words. Each I1XX dummy register consists of five call store words. Parameter set card IXXJR defines the quantity of I1XX junior registers.

  (b) If applicable, one I1XX digit hopper word is provided for each I1XX junior register (excluding dummy registers).

<td>1850</td>
<td>—</td>
</tr>
<tr>
<td>Effective with 1E6 Generic Program</td>
<td>1850</td>
<td>768</td>
</tr>
</tbody>
</table>

Note:

For IXX, use feature package CXIX.
For I1XX, use optional feature packages I1XX, DPREP, and DPRPX.
For PNAL only, use optional feature package I1XX and DPRPX.
Any mixture of IXX, I1XX, and/or PNAL can be provided in a No. 1 ESS office equipped with a 1E6 or later generic program.

TABLE F

NO. 1A ESS GENERIC PROGRAM WORDS

<table>
<thead>
<tr>
<th>GENERIC PROGRAM STORE</th>
<th>FIXED</th>
<th>CONDITIONAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature Package Designation (No.)</td>
<td>CX1X (15)</td>
<td>I1XX (115)</td>
</tr>
<tr>
<td>Prior to 1AE6 Generic Program</td>
<td>2410</td>
<td>—</td>
</tr>
<tr>
<td>Effective with 1AE6 Generic Program</td>
<td>2410</td>
<td>736*</td>
</tr>
</tbody>
</table>

Note: For IXX, use feature package CXIX.
For I1XX, use optional feature packages I1XX, DPREP, and DPRPX.
For PNAL only, use optional feature package DPREP.
Any mixture of IXX, I1XX, and/or PNAL can be provided in a No. 1A ESS office equipped with a 1AE6 or later generic program.

* This quantity is less than the comparable No. 1 ESS quantity due to the deletion of EPSCS programming.

(c) I1XX requires I1XX senior originating registers only for dial pulse originating calls. Parameter set card IXXOR is used to indicate the additional number of senior originating registers and affects only the SOR call store table. A senior originating register consists of 19 call store words.

(d) Parameter set card TLD, requiring one call store word, sets the quantity of tandem tie line cut-through service circuits for distant originations in a No. 1A ESS office.

(e) Parameter set card TLL, requiring one call store word, sets the quantity of tandem tie line cut-through service circuits for local originations in a No. 1A ESS office.

(f) Refer to Part 9 for a list of other set cards affected by this feature. Set cards are engineered per reference C(7) in Part 18 on a per office basis.
11.06 The following memory is required when the Tandem Tie Trunk Service feature is applied:

- **Translations (unduplicated call store, file store):**

  (a) 4 words per access code for centrex digit interpreter auxiliary block, if required.

  (b) 2 words per outgoing trunk group for each route index expansion.

  (c) 4 words per outgoing trunk for each TNN-to-PEN auxiliary block.

  (d) 14 words per tandem tie line cut-through service circuit for TNN-to-PEN auxiliary block.

  (e) 4 words for the route index expansion for route indexes 148 and 149. Route index 148 points to the trunk group for tandem tie line cut-through service circuits for local originations. Route index 149 points to the trunk group for tandem tie line cut-through service circuits for distant originations.

  (f) 4 words per tandem tie trunk service trunk group for the trunk class code expansion table.

  (g) 3 words per tie trunk for the master scanner words.

**REAL TIME IMPACT**

11.07 Real time requirements for the Tandem Tie Trunk Service feature are shown in Table G for No. 1 ESS and Table H for No. 1A ESS. Cycle time for No. 1 ESS is 5.5 microseconds, and for No. 1A ESS it is 0.7 microsecond.

**TRANSLATION FORMS**

12.01 ESS translation forms, found in reference C(1) in Part 18, requiring completion are as follows:

(a) ESS 1101—Directory Number Record: This form is used to record directory number assignments and other related information.

(b) ESS 1109A/B—Centrex Group Record: These forms contain centrex class information plus access code data for a centrex group.

(c) ESS 1201A/B—Miscellaneous Trunk Frame Record: These forms relate the equipment location on a frame basis with the trunk network number, trunk group, trunk number, trunk class code, signal distributor points, and supervisory scan points.

(d) ESS 1202—Trunk Group Record: This form provides trunk group number to trunk network number and trunk member number translations.

(e) ESS 1203—Trunk Network Number Record: This form relates the trunk network number to the trunk group and trunk frame location.

(f) ESS 1204—Trunk Class Code Record: This form specifies data for the trunk class code expansion tables.

(g) ESS 1208A/B—Trunk Screening Group Record: These forms associate trunk groups with pseudo line equipment numbers.

(h) ESS 1303A/B/C—Trunk and Service Circuit Route Index Record: These forms specify data for the route index expansion table entries.

(i) ESS 1306—Line Class Code Record: This form provides major originating and terminating class information, as well as rate and route chart column information.

(j) ESS 1400—Traffic Register Assignment Record: This form provides type measurement counts for peg, usage, and overflow counts.
### TABLE G

**NO. 1 ESS PROCESSOR TIME**

</tr>
</tbody>
</table>

* Subtract 171 cycles if call uses both second dial tone and TAMA feature.
† NA - Not applicable.

### RECENT CHANGES

**12.02** There are no new or unique recent change (RC) messages used for the Tandem Tie Trunk Service feature. However, the Tandem Tie Trunk Service feature uses unique keywords with the Centrex/ESSX-1 recent change message and RC:CTXDI for data type 5 entries. Keyword unit STYP 17 is used to provide tandem tie line access. Keyword unit RI ′ffe′ is used to specify the appropriate route index. If the TAMA feature applies, keyword unit AMAT is used to allow automatic message accounting detailed telephone number recording for tie trunks and foreign exchange trunks. Keyword unit DRPT is to specify dial repeating. Refer to reference A(4), A(27), and A(37) in Part 18.

### 13. TESTING

**13.01** Verification that the Tandem Tie Trunk Service feature has been properly installed and assigned can be accomplished by the following input/output messages (abbreviated from the appropriate input/output message manual referenced in Part 18B). System responses should be checked against the applicable ESS translation form data.

- For No. 1 ESS, TAG-TNN and T-READ input messages are used to verify trunk class code expansion table entries. System response should be the TR21 and TW02 output messages. For No. 1A ESS use DUMP:CSS,ADR- to verify the call indicator words. The system response is DUMP:CSS output message.
### TABLE H

**NO. 1A ESS PROCESSOR TIME**  
**NUMBER OF PROCESSOR CYCLES**

<table>
<thead>
<tr>
<th></th>
<th>1XX</th>
<th>2XX</th>
<th>PNAL</th>
</tr>
</thead>
<tbody>

<td>1,508</td>
</tr>
<tr>
<td>Extra Cycles Per Digit Dialed After Access Code If TAMA Feature Applies</td>
<td>80</td>
<td>102</td>
<td>168</td>
</tr>
</tbody>
</table>

* Subtract 342 cycles if call uses both second dial tone and TAMA feature.  
† NA - Not applicable.

- **VFY-EXP** input message is used to verify route index entries. System response should be a TR05 output message.
- **VFY-MSN** input message is used to verify master scan translations. System response should be a TR12 output message.
- **VFY-TKGN** input message is used to verify one or all trunk group numbers. System response should be a TR10 output message.
- **VFY-TNN** input message is used to verify a trunk network number translation. System response should be a TR14 output message.
- **VFY-XDGNT** input message is used to verify access codes. System response should be a TR18 output message.

**13.02** Tandem Tie Trunk Service feature calls should be made over the applicable trunk groups to verify proper operation of the feature when a No. 1/1A ESS is used to originate calls. These calls should be made both from Centrex/ESSX-1 stations and from attendant positions. Tandem Tie Trunk Service feature calls over applicable incoming trunk groups should also be executed to verify proper operation of the feature when a No. 1/1A ESS is used to tandem an incoming call through the office.

**13.03** The tandem tie line cut-through service circuits are diagnosed routinely and on demand by a No. 1/1A ESS. Routine testing is done through automatic progression testing. Demand testing is accomplished from an ESS test position or teletypewriter.
13.04 Testing of trunks used with the Tandem Tie Trunk Service feature is done manually, via test positions, on a periodic and/or trouble report basis. The special dial repeating trunk circuits SD-1A473, SD-1A474, SD-1A475, and SD-1A476 can be diagnosed by a No. 1/1A ESS as a matter of routine (unless 2-way), and on demand request resulting from a call failure if 9SDPRP = 1.

14. OTHER PLANNING TOPICS

14.01 Refer to Table A and Table B for mounting space requirements and to Table C for current drain data.

14.02 Signaling compatibility among different noncentrex business customer locations and centrex business customer locations is a major problem area in tandem tie trunk networks (TTTNs). Certain combinations of noncentrex business customer locations have compatibility problems which can impair service during call setup, even though all equipment individually functions properly. Impairments range from inconveniences to misdirected and high-and-dry calls. Reference C(9) in Part 18 provides basic technical information on signaling compatibility among all types of business customer locations used in TTTNs.

ADMINISTRATION

15. MEASUREMENTS

15.01 Certain traffic measurements are available for I1XX. See Table I. These counts are available on the H, C, DA15, S1, S2, and S3 schedules.

<table>
<thead>
<tr>
<th>TABLE I</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRAFFIC MEASUREMENTS AVAILABLE WITH I1XX</td>
</tr>
<tr>
<td>TMC</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>

</tr>
<tr>
<td>I1XX Junior Register Overflow</td>
</tr>
<tr>
<td>I1XX Senior Register Peg Count</td>
</tr>
<tr>
<td>I1XX Senior Register Overflow</td>
</tr>
</tbody>
</table>

Legend:

EGO — Equipment group or office count number

TMC — Type measurement code

15.02 The I1XX junior register usage measures the usage of these registers by I1XX. This is accomplished by an automatic fast-scan register (10 second). It is not necessary to assign this register to the first 128 registers of the H schedule.

15.03 The I1XX senior register peg count is incremented by one by each attempt to seize an I1XX senior register. The I1XX senior register overflow is incremented by one each time a senior register is not available for an I1XX call.

16. CHARGING

AUTOMATIC MESSAGE ACCOUNTING

16.01 Charging does not apply to the Tandem Tie Trunk Service feature. However, the Message Detail Recording on Tie Trunks (TAMA) feature provides an automatic message accounting record of tie trunk or foreign exchange trunk call originations on a per access code basis. Refer to reference A(23) in Part 18.

UNIFORM SERVICE ORDER CODES

16.02 Due to the varieties and diverse applications of the Tandem Tie Trunk Service feature, refer to the Uniform Service Order Code (USOC) Manual and/or the telephone company USOC coordinator.

SUPPLEMENTARY INFORMATION

17. GLOSSARY

Advanced private line termination (APLT)—A tariff term which includes improved tandem tie line service (I1XX) and private network access line service (PNAL).

Cut-through—As used in this feature document, a synonym for nonsenderized switching mode. (True “cut-through” is a signaling scheme in which the T and R leads are metallically connected through a trunk circuit.)

Improved tandem tie line service (I1XX)—A version of the Tandem Tie Trunk Service feature which provides improved noise and transmission characteristics.

Nonsenderized—A switching method whereby a business customer user directly controls, in stages, the routing of an outgoing call over tie or foreign
exchange trunk facilities through the originating, as well as any intermediate switches. A user is said to “cut through” these offices.

**Ordinary tandem tie line service (1XX)**—A version of the Tandem Tie Trunk Service feature which has inherent operating noise and sometimes, poor transmission quality.

**Private network access line service (PNAL)**—A version of the Tandem Tie Trunk Service feature which allows access line service where the calling number is multifrequency outpulsed before nonsenderized operation begins.

**Tandem tie trunk network**—A private network of tie trunks and switching locations that interconnect the locations of a large business customer. On the network, the switching mode is nonsenderized.

**Tandem Tie Trunk Service feature**—A No. 1/1A ESS feature that provides nonsenderized private line service for Centrex/ESSX-1 customers.

**Tie trunk (also called tie line)**—A voice grade channel used to connect or tie two business customer service locations.

(18) Section 231-090-058—Feature Document—
   Attendant Control of Trunk Group Access
   Feature—2-Wire No. 1 and No. 1A Electronic Switching Systems

(19) Section 231-090-079—Feature Document—Call
   Transfer—2-Wire No. 1 and No. 1A Electronic Switching Systems

(20) Section 231-090-145—Feature Document—Full
   ESSX-1 Feature—2-Wire No. 1 and No. 1A Electronic Switching Systems

(21) Section 231-090-256—Feature Document—Tie
   Trunk and Foreign Exchange Trunk
   Service—2-Wire No. 1 and No. 1A Electronic Switching Systems

(22) Section 231-090-359—Feature Document—
   Semirestricted Centrex Station Class—2-Wire
   No. 1 and No. 1A Electronic Switching Systems

(23) Section 231-090-417—Feature Document—
   Message Detail Recording on Tie Trunks
   Feature—2-Wire No. 1 and No. 1A Electronic Switching Systems

(24) Section 231-118-323—Trunk Translation
   Recent Change Procedures for TG, TGBVT,
   TRK, CFTRK, and TGMEM (CTX-6 through
   1E5 Generic Programs), 2-Wire No. 1 Electronic Switching System

(25) Section 231-118-324—Rate and Route
   Translation Recent Change Procedures for
   NOCNOG, DNHT, NOGRAC, RATPAT, DIGTRN,
   TOLDIG, CCOL, RI, CHRGX, DITABS, TNDM,
   IDDD, and TDXD (CTX-6 through 1E5 Generic
   Programs), 2-Wire No. 1 Electronic Switching System

(26) Section 231-118-325—RC Procedures for
   PSWD, GENT, PSBLK, SUBTRAN (CTX-6
   through 1E5 Generic Programs), 2-Wire No. 1
   Electronic Switching System

(27) Section 231-118-331—Centrex-CO RC
   Procedures for CTXCB, CTXDI, CTXEXR,
   CXDICH, DITABS, DLG, FLXDG, FLXRD, and
   FLXRS (CTX-6 through 1E5 Generic Programs),
   2-Wire No. 1 Electronic Switching System

(28) Section 231-118-333—Overall procedures
   for Adding or Removing a Centrex-CO or
   PBX-CO Customer (All Generic Programs),
   2-Wire No. 1 Electronic Switching System

(29) Section 231-118-335—Line Recent Change
   Procedures—for Line, TWOPTY, MPTY,
   SCLIST, MLHG, ACT, and CFV (CTX-7, CTX-8,
   1E4, and 1E5 Generic Programs), 2-Wire No. 1
   Electronic Switching System

(30) Section 231-118-337—RC Procedures for
   ANIDL, CAMA, CFG, CPD, MSN, NMTGC,
   PLM, ROTL, SIMFAC, and TMBCGA (CTX-6
   through 1E5 Generic Programs), 2-Wire No. 1
   Electronic Switching System

(31) Section 231-128-541—Foreign Exchange
   Trunk Circuit—SD-1A241-01—Operational
   Test

(32) Section 231-130-101—Trunk Test Capabilities
   Description, 2-Wire No. 1 Electronic Switching
   System

(33) Section 231-190-127—Feature Document—
   Enhanced Private Switched Communications
   Service (EPSCS) Description, 2-Wire No. 1
   Electronic Switching System

(34) Section 231-318-303—Trunk Translation
   Recent Change Procedures for TG, TGBVT,
   TRK, CFTRK, TGMEM, CCIS, and TKCONV
   (Through 1AE5 Generic Programs), 2-Wire No. 1
   Electronic Switching System

(35) Section 231-318-304—Rate and Route
   Translation Recent Change Procedures for
   NOCNOG, DNHT, NOGRAC, RATPAT, DIGTRN,
   TOLDIG, CCOL, RI, CHRGX, DITABS, TNDM,
   IDDD, and TDXD (Through 1AE5 Generic
   Program), 2-Wire No. 1 Electronic Switching System

(36) Section 231-318-305—RC Procedures for
   PSWD, PSBLK, SUBTRAN, and GENT
   (Through 1AE5 Generic Program), 2-Wire No.
   1A Electronic Switching System
(37) Section 231-318-309—Centrex-CO ESSX-1 Recent Change Procedures for CTXCB, CTXDI, CTXEXR, CXDICH, DITABS, DLG, FLXDG, FLXRD, and FLXRS (Through 1AE5 Generic Program), 2-Wire No. 1A Electronic Switching System

(38) Section 231-318-310—RC Procedures for ANIDL, CAMA, CFG, CPD, JUNCT, MSN, NMTGC, PLM, ROTL, SIMFAC and TMBCGA, and CLAM (Through 1AE5 Generic Program)—2-Wire No. 1A Electronic Switching System

(39) Section 660-440-010—Codes—Test Line Circuits and Communications Trunks Nationwide Distance Dialing Plan

(40) Section 759-100-000—Index of Central Office Equipment Estimation System (COEES) Practices

(41) Section 851-300-100—Transmission Design Considerations and Objectives—Switched Special Services and Private Branch Exchange (PBX)/Automatic Call Distribution (ACD)/Centrex Station Services

(42) Section 851-300-170—Standard Design of Switched Special Services Circuits—Signaling Range Information

(43) Section 981-010-100—Private Branch Exchange Tie Trunk Circuits—General Description Information

(44) Section 996-102-100—2-Wire No. 1 and No. 1A Electronic Switching System—Business Customer Service—General Description.

B. TTY Input and Output Manuals

(1) Input Message Manual IM-1A001, No. 1 Electronic Switching System

(2) Input Message Manual IM-6A001, No. 1A Electronic Switching System

(3) Output Message Manual OM-1A001, No. 1 Electronic Switching System

(4) Output Message Manual OM-6A001, No. 1A Electronic Switching System.

C. Other Documentation

(1) Translation Guide TG-1A, No. 1—Electronic Switching System—2-Wire

(2) Translation Output Configuration PA-591003, No. 1 Electronic Switching System

(3) Translation Output Configurations PA-6A002, No. 1A Electronic Switching System

(4) Office Parameter Specification PA-591001, No. 1 Electronic Switching System

(5) Office Parameter Specification PA-6A001, No. 1A Electronic Switching System

(6) Parameter Guide PG-1, No. 1 Electronic Switching System, 2-Wire

(7) Parameter Guide PG-1A, No. 1A Electronic Switching System, 2-Wire

(8) Growth Recent Change (GRC) Form Manual, 2-Wire No. 1 and 1A Electronic Switching System, PA-591099

(9) American Telephone and Telegraph Company General Letter 74-11-030, Dated November 8, 1974; Subject: Tandem Tie Trunk Network PBX Compatibility
