Default: 10
Valid Entries: 5 - 100

2.4 RTO MIN

Description: The RTO MIN field specifies the minimum value of retransmission timer (each stored unit is 100 milliseconds).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 7
Valid Entries: 5 - 30

2.5 RTO MAX

Description: The RTO MAX field specifies the maximum value in seconds, of retransmission timer (each stored unit is one second).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 10
Valid Entries: 3 - 60

Copyright © 2003 Lucent Technologies

2.6 RTO ALPHA

Description: The RTO ALPHA field specifies the retransmission constant alpha (each stored unit is one millisecond).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 125
Valid Entries: 80 - 500

2.7 RTO BETA

Description: The RTO BETA field specifies the retransmission constant beta (each stored unit is one millisecond).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 250
Valid Entries: 80 - 500

2.8 VALD COOKIE LIFE

Description: The VALD COOKIE LIFE field specifies the life time of a cookie (each stored unit is one millisecond).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 500
Valid Entries: 200 - 1000

2.9 HB INTRVL

Description: The HB INTRVL field specifies the heartbeat interval (each stored unit is one millisecond).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 10
Valid Entries: 8 - 120

2.10 MAX INIT RETRANS

Description: The MAX INIT RETRANS field specifies the maximum number of retransmissions of INIT (Initialized) datagrams.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 7
Valid Entries: 1 - 20

2.11 BURST SIZE

Description: The BURST SIZE field specifies the maximum number of bytes that the sender is allowed to transmit.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 4

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 20

2.12 DELAY ACK TMR

Description: The DELAY ACK TMR (Delay of acknowledgement timer) field specifies how long SCTP will wait before generating an SCTP packet specifically for a SACK (Selective Acknowledge) chunk (each stored unit is one millisecond).

Software Release: 5E16(2) FR3 and later
Required field.
Default: 200
Valid Entries: 100 - 500

2.13 FAST RETRANS CNT

Description: The FAST RETRANS CNT (Fast Retransmit Count) field specifies the number of successive SACKs received indicating a gap before retransmitting a packet.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 8
Valid Entries: 4 - 20

SEC. 3AH: 5886 RECORD
SCTP NEAR ENDPOINT DEFINITION - SCTPNEPD

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to provide information about the SCTP (Stream Control Transport Protocol) near endpoint.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.19.

2. FORM ENTRIES - 5886 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NEAR ENDPOINT NAME

Description: This field specifies the near SCTP endpoint.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

Data Rules:

When NEAR ENDPOINT NAME is entered, MTU ENABLE must be "Y" and PROCESSOR TYPE must be "PH" on the IPPROC form (5987 Record).

2.3 # GSM

Description: The GSM (Global Switching Module) specifies which GSM data is read.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

Data Rules:

GSM must be defined on the SIPGSM form (5880 Record).

2.4 # PCR GRP

Description: This field specifies the processor group number.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 24

Data Rules:

PCR GRP must be defined on the PCRGRP form (5883 Record).

2.5 SCTP PORT

Copyright © 2003 Lucent Technologies

Description: This field specifies the SCTP PORT number (identifier) for the SCTP near endpoint.number of associated SCTP ports to the near endpoint.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 5060
Valid Entries: 0 - 65535

2.6 ENDPOINT PARM SET NAME

Description: This field specifies the SCTP endpoint parameter set.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

Data Rules:

When ENDPOINT PARM SET NAME is entered, it must be defined on the SCTPPARM form (5885 Record).

SEC. 3AI: 5887 RECORD
SCTP ASSOCIATION PARAMETER SET - ASSCPARM

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form provides information about a set of parameters that will be used for SCTP (Stream Control Transmission Protocol) associations.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.20.

2. FORM ENTRIES - 5887 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PARM SET NAME

Description: This field specifies the SCTP association parameter set name.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

2.3 # STREAM NEGO

Description: This field specifies whether or not an association may be established if the desired number of outbound streams are not available.

Software Release: 5E16(2) FR3 and later
Required field.
Default: Y
Valid Entries: Y, N

2.4 # PERMANENT

Description: This field specifies whether or not an association will be maintained as a permanent connection.

Software Release: 5E16(2) FR3 and later
Required field.
Default: Y
Valid Entries: Y, N

2.5 INBOUND STREAMS

Description: This field specifies the number of offered inbound streams.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 32
Valid Entries: 0 - 128

Copyright © 2003 Lucent Technologies

2.6 OUTBOUND STREAMS

Description: This field specifies the number of offered outbound streams.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 32
Valid Entries: 0 - 128

2.7 MAX ASSOC RETRANS

Description: This field specifies the maximum number of retransmissions for an association before the association is declared out-of-service.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 4
Valid Entries: 0 - 32

Data Rules:

MAX ASSOC RETRANS must be between MAX PATH RETRANSS and 2 * MAX PATH RETRANS.

2.8 MAX PATH RETRANS

Description: This field specifies the maximum number of retransmissions of datagrams for an SCTP path before the path is declared out-of-service.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 4
Valid Entries: 0 - 20

SEC. 3AJ: 5888 RECORD
SCTP FAR ENDPOINT DEFINITION - SCTPFEPD

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684.This form is used to provide information about the SCTP (Stream Control Transport Protocol) far endpoint.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.21.

2. FORM ENTRIES - 5888 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FAR ENDPOINT NAME

Description: This field specifies the SCTP far endpoint.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

Data Rules:

When FAR ENDPOINT NAME is entered, DEST SCTP PORT cannot have identical DEST IP ADDR 1 and/or DEST IP ADDR 2.

2.3 # DEST SCTP PORT

Description: This field specifies the associated SCTP port to this far endpoint.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 5060
Valid Entries: 0 - 65535

2.4 # DEST IP ADDR 1

Description: This field specifies the primary IP address associated with this far endpoint.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 000 000 000 000
Valid Entries: 0 - 255 (for each set)

Data Rules:

DEST IP ADDR 1 must have a different value from DEST IP ADDR 2.

DEST IP ADDR1 must be 001.000.000.001- 126.255.255.254, 128.001.000.001 - 191.254.255.254, or 192.000.001.001 - 223.255.254.254.

Copyright © 2003 Lucent Technologies

2.5 DEST IP ADDR 2

Description: This field specifies the primary IP address associated with this far endpoint.

Software Release: 5E16(2) FR3 and later
Valid Entries: 0 - 255 (for each set)

Data Rules:

DEST IP ADDR2 must be 001.000.000.001- 126.255.255.254, 128.001.000.001 - 191.254.255.254, or 192.000.001.001 - 223.255.254.254.

SEC. 3AK: 5889 RECORD
SCTP ASSOCIATION - SCTPASSC

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to provide information about the SCTP (Stream Control Transport Protocol) association.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.22.

2. FORM ENTRIES - 5889 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ASSOC NUMBER

Description: This field specifies the SCTP association identification number.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 1023

Data Rules:

When ASSOC NUMBER is entered with a single IP address far endpoint and SCTP ASSOC PARM SET NAME on this form is equals PARM SET NAME on the ASSCPARM form (5887 Record), MAX ASSOC RETRANS must equal MATH PATH RETRANS on the ASSCPARM form.

When ASSOC NUMBER is entered with multiple IP address far endpoint and SCTP ASSOC PARM SET NAME on this form equals PARM SET NAME on the ASSCPARM form (5887 Record), MAX ASSOC RETRANS must be greater than MATH PATH RETRANS and MAX ASSOC RETRANS must be equal to or less than double MAX PATH RETRANS on the ASSCPARM form.

When ASSOC NUMBER is entered with multiple IP address far endpoint defined on the SCTPFEPD form (5888 Record), SCTP ASSOC PARM SET NAME cannot be set to "DEFAULT".

2.3 # GSM

Description: This field specifies the GSM (Global Switching Module) where data is read.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

Data Rules:

GSM must be defined on the SIPGSM form (5880 Record).

2.4 # NEAR ENDPOINT NAME

Description: This field specifies the near SCTP endpoint.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

Data Rules:

NEAR ENDPOINT NAME and FAR ENDPOINT NAME must be unique.

When NEAR ENDPOINT NAME is entered, it must be defined on the SCTPNEPD form (5886 Record).

2.5 # FAR ENDPOINT NAME

Description: This field specifies the far SCTP endpoint.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

Data Rules:

When FAR ENDPOINT NAME is entered, it must be defined on the SCTPFEPD form (5888 Record).

2.6 SCTP ASSOC PARM SET NAME

Description: This field specifies the set of parameters that are used for association.

Software Release: 5E16(2) FR3 and later
Valid Entries: Up to 20 characters

Data Rules:

When SCTP ASSOC PARM SET NAME is entered it must be defined on the ASSCPARM form (5887 Record).

2.7 ASSOCIATION SET NAME

Description: This field specifies the corresponding association set index which identifies association sets that this association is a member of. This is a no_change field.

Software Release: 5E16(2) FR3 and later
Valid Entries: Up to 20 characters.

SEC. 3AL: 5890 RECORD
ASSOCIATION SET - ASSOCSET

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684.This form is used to provide information about a SCTP (Stream Control Transport Protocol) association set.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.23.

2. FORM ENTRIES - 5890 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ASSOCIATION SET NAME

Description: This field specifies the name of the set of SCTP associations.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: Up to 20 characters

2.3 # GSM

Description: This field specifies the GSM (Global Switching Module).

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

Data Rules:

When GSM is entered on this form, it must be defined on the SIPGSM form (5880 Record).

ASSCID (ASSOCIATION IDENTIFICATION NUMBER)

2.4 NBR

Description: This field specifies the identification number of the association.

Software Release: 5E16(2) FR3 and later
Valid Entries: 1 - 1023

Data Rules:

At least one NBR in the ASSOCIATION IDENTIFICATION NUMBER list must be entered.

NBR in ASSOCIATION IDENTIFICATION NUMBER list must be unique.

When NBR is entered, it must be defined on the SCPTPASSC form (5889 Record).

SCTP association must not appear in more than one association set (ASSOCIATION IDENTIFICATION

SEC. 3AM: 5935 RECORD
BEARER NETWORK DEFINITION - BEARERNET

1. GENERAL

The 5935 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete bearer networks. This form supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. For more information on this feature, see Division 2, Section 7BX.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.15.

2. FORM ENTRIES - 5935 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * BNID

Description: This field is used to specify a bearer network.

Software Release: 5E16 (2) and later
Required field.
Valid Entries: 1 - 512

2.3 SERVICE TYPE

Description: This field is used to define the type of traffic that will be carried.

Software Release: 5E16(2) and later
Required field.
Default: IPV4
Valid Entries: Enter IPV4

RTP

This section contains information about RTP (Real-Time Transport Protocol).

2.4 RTP PKT INT

Description: This field is used to specify the size, in milliseconds, of a RTP packet.

Software Release: 5E16(2) and later
Required field.
Default: 20
Valid Entries: 10, 20 or 30

2.5 JITTER BUF SZ

Description: This field is used to specify the size of the jitter buffer in milliseconds.

Software Release: 5E16(2)and later
Required field.
Default: 100

Copyright © 2003 Lucent Technologies

Valid Entries: Enter a multiple of 5 from 10 - 300

2.6 SILENCE SUP

Description: This field is used to specify whether or not silence suppression is enabled.

Software Release: 5E16(2)and later
Required field.
Default: N
Valid Entries: Y, N

When SILENCE SUPP IS "Y", COMFORT NOISE must be "SPEC".

UDP

This section contains information about UDP (User Datagram Protocol).

2.7 ENA UDP CHKSM

Description: This field is used to specify whether or not checksums are enabled.

Software Release: 5E16(2)and later
Required field.
Default: Y
Valid Entries: Y, N

IP

This section contains information about IP (Internet Protocol).

2.8 TIME TO LIVE

Description: This field is used to specify the time to live field in IP datagrams for this bearer network.

Software Release: 5E16(2)and later
Required field.
Default: 64
Valid Entries: 1 - 255

2.9 TYPE OF SERVICE

Description: This field is used to specify the service type used in IP datagrams for this bearer network.

Software Release: 5E16(2) and later
Required field.
Default: 00
Valid Entries: Enter a hexadecimal number from 0 to 7F.

Data Rules:

For 5E16(2) and later, when TYPE OF SERVICE is not "0", ENA DIFF SERV must be "N".

2.10 ENA DIFF SERV

Description: This field is used to specify whether or not diffserv is enabled.

Software Release: 5E16(2)and later
Required field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

ICMP

This section contains information about ICMP (Internet Control Message Protocol.

2.11 ENA ICMP ERR

Description: This field is used to specify whether or not ICMP error message generation is enabled.

Software Release: 5E16(2)and later
Required field.
Default: Y
Valid Entries: Y, N

2.12 COMFORT NOISE

Description: This field is used to specify the type of comfort noise generated.

Software Release: 5E16(2) and later
Required field.
Default: IDLE
Valid Entries:

Valid TYPE Entries	
Entry	**Definition**
HOTH	Hoth Noise
IDLE	Idle Code
SPEC	Spectral Noise

2.13 GROUP CNT

Description: This field is used to indicate the number of packet groups utilizing this bearer network. This is a no change field.

Software Release: 5E16(2) and later
Required field.
Valid Entries: 0 - 65535

2.14 DIFF SERV CNT

Description: This field is used to indicate the number of trunk groups utilizing differentiated services on this bearer network. This is a no change field.

Software Release: 5E16(2) and later
Valid Entries: 0 - 65535

SEC. 4: MEDIA GATEWAY PROXY FORMS

Copyright © 2003 Lucent Technologies

SEC. 4A: 6920 RECORD
MGP GROWTH - MGPGROWTH

1. GENERAL

The 6920 Record is available with the 5E16 and later Software Releases. It is used to define a MGP (Media Gateway Proxy). The MGP is associated with an SM2000 to create a packet SM (Switching Module).

1.1 Recent Change View

The corresponding Recent Change View for this form is 50.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MGP NAME

Description: This field is used to specify the MGP (Media Gateway Proxy) name.

Required Field.

Software Release: 5E16 and later
Valid Entries: 1 - 16 alphanumeric characters

2.3 * SM NUMBER

Description: This field is used to indicate the SM (Switching Module) number associated with the MGP.

Required Field.

Software Release: 5E16 and later
Valid Entries: 1 - 192

Data Rules:

SM NUMBER must be defined on the EQIM form (5700 Record).

Only one MGPGROWTH form can exist per SM NUMBER.

2.4 WELL KNOWN IP ADDR

Description: This field is used to specify the well known IP (Internal Protocol) address of the MGP. This is a Display Only field.

Software Release: 5E16 and later
Valid Entries: 0 - 255

2.5 PRIMARY IP ADDR

Description: This field is used to specify the primary IP address of the MGP. This is a Display Only field.

Software Release: 5E16 and later
Valid Entries: 0 - 255

Copyright © 2003 Lucent Technologies

2.6 SECONDARY IP ADDR

Description: This field is used to specify the secondary IP address of the IWU (Inter-Working Unit). This is a Display Only field.

Software Release: 5E16 and later
Valid Entries: 0 - 255

SEC. 4B: 6921 RECORD
MGP COMPONENT ASSOCIATION - MGPCOMP

1. GENERAL

The 6921 Record is available with the 5E16 and later Software Releases. It is used to define a MGP (Media Gateway Proxy) component association.

1.1 Recent Change View

The corresponding Recent Change View for this form is 50.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * COMPONENT IP ADDR

Description: This field is used to specify the component IP (Internal Protocol) address of the end unit component.

Required Field.

Software Release: 5E16 and later
Valid Entries: 0 - 255

Data Rules:

COMPONENT IP ADDR must be unique.

2.3 * SM NUMBER

Description: This field is used to indicate the SM (Switching Module) number associated with the MGP.

Required Field.

Software Release: 5E16 and later
Valid Entries: 1 - 192

2.4 # MGP NAME

Description: This field is used to specify the MGP name.

Required Field.

Software Release: 5E16 and later
Valid Entries: 1 - 16 alphanumeric characters

Data Rules:

The combination of MGP NAME and SM NUMBER must be defined on the MGPGROWTH form (6920 Record).

2.5 # COMPONENT TYPE

Description: This field is used to specify the type of component.

Copyright © 2003 Lucent Technologies

Required Field.

Software Release: 5E16 and later
Valid Entries:

Valid COMPONENT TYPE Entries

Entry	Description
IWU	Interworking Unit
LAG	Line Access Gateway
PAG	Packet Access Gateway
TAG	Trunk Access Gateway

Data Rules:

When COMPONENT TYPE is "IWU", COMPONENT ID must be 1 - 5.

When COMPONENT TYPE is "LAG":

- COMPONENT ID must be 1 - 105.
- AESA row 2 must not be entered.

When COMPONENT TYPE is "PAG":

- COMPONENT ID must be 1 - 2.
- EQSTAT must be "O".
- AESA row 1 and 2 must be entered as pairs.
- AESA row 3 and 4 must be entered as pairs.
- AESA row 5 and 6 must be entered as pairs.
- AESA row 7 and row 8 must not be entered.
- AESA row 3 and 4 must be entered before AESA rows 5 and 6.

When COMPONENT TYPE is "TAG", COMPONENT ID must be 1 - 9.

AESA row 1 must be entered for all COMPONENT TYPEs.

When COMPONENT TYPE is "IWU", "LAG", or "TAG":

- AESA row 3 through row 8 must not be entered.

COMPONENT TYPE and COMPONENT ID must be unique per MGP NAME.

- ***NOTE:*** Although checks have been added there that supports LAG, it is for future development. LAG is not support in PS4.0.

2.6 # COMPONENT ID

Description: This field identifies the number of the MGP.

Required.

Software Release: 5E16 and later

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid COMPONENT ID Entries	
COMPONENT TYPE	**Value**
IWU	1 - 5
LAG	1 - 105
PAG	1 - 2
TAG	1 - 9

2.7 # NETWORK PROTOCOL

Description: This field is used to specify the type of network protocol used by the end unit component.

Required.

Software Release: 5E16 and later
Valid Entries:

Valid NETWORK PROTOCOL	
Entry	**Description**
IPDC	Internet Protocol Device Control
SAPP	Sapphire messaging

Data Rules:

When NETWORK PROTOCOL is "SAPP", COMPONENT TYPE must be "IWU", "PAG", or "TAG".

When NETWORK PROTOCOL is "IPDC", COMPONENT TYPE must be "LAG".

2.8 # EQSTAT

Description: This field is used to specify the equipment status of the end unit component.

Required Field.

Software Release: 5E16 and later
Valid Entries:

Valid NETWORK PROTOCOL	
Entry	**Definition**
G	Growth
O	Operational

END SYSTEM ADDRESS

2.9 AESA

Description: The ATM (Asynchronous Transfer Mode) End System Address field is an ATM and system address. For PAG, TAG, and IWU the address is defined per OC3 1+1 pair on the component. For TAG and IWU, the address only applies to the network side, while PAG also deals with the fabric side.

Software Release: 5E16 and later
Valid Entries: blank, or 00 - ff (hexadecimal)

SEC. 4C: 6922 RECORD
MGP PACKET LINE - MGPLINE

1. GENERAL

The 6922 Record is available with the 5E16 and later Software Releases. It is used to add the MGP (Media Gateway Proxy) routing data for packet lines. These packet lines exist on a LAG (Line Access Gateway).

1.1 Recent Change View

The corresponding Recent Change View for this form is 50.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OE

Description: This field identifies the equipment number type.

Software Release: 5E16 and later
Required Field.
Valid Entries:

Valid OE Entries

Entry	Description	Value
X	ISDN (Intergrated Services Digital Network) virtual equipment number type.	(1 - 192) (00001 - 03840) where: (1 -192) = SM (00001 - 03840) = LINE (line)
Y	Analog line virtual equipment number type.	(1 - 192) (00001 - 28800) where: (1 -192) = SM (00001 - 28800) = LINE (line)

WARNING: When the SM portion of the OE is less than 3 digits and the overall length of the OE is less than 8 digits, leading zeros will be added to the left side of the OE to create an OE that is 8 digits in length.

Data Rules:

OE must be defined on the LINE form (5109 Record), MLHLN (5111 Record), DSL (5907 Record), or DSLUSR (5908 Record). When the OE type is "Y", this OE must be defined on either the LINE or MLHLN form. When the OE type is "X", this OE must be defined on either the DSL or DSLUSR form.

2.3 # COMPONENT ID

Description: This field identifies the number of MGPs.

Software Release: 5E16 and later
Required Field.
Valid Entries: 1 - 105

Data Rules:

COMPONENT ID must be defined on the MGPCOMP form with COMPONENT ID set to "LAG".

Copyright © 2003 Lucent Technologies

2.4 ESP

Description: This field identifies whether the packet line has ESP (Essential Service Protection) enabled.

Software Release: 5E16 and later
Required Field.
Default: N
Valid Entries: Y, N

PHYSICAL PORT

2.5 MODULE

Description: This field identifies the physical slot of the packet line.

Software Release: 5E16 and later
Valid Entries: 1 - 16

Data Rules:

MODULE and LINE must both be entered when either one is entered.

2.6 LINE

Description: This field identifies the physical port number of the packet line.

Software Release: 5E16 and later
Valid Entries: 1 - 16

```
mgpline                    5ESS Switch          _

SEC. 4D: 6923 RECORD
MGP PACKET TRUNK - MGPTRUNK

1. GENERAL

The 6923 Record is available with the 5E16 and later Software Releases. It is used to add the MGP (Media Gateway Proxy) routing data for packet trunks. These packet trunks exist on a TAG (Trunk Access Gateway).

1.1 Recent Change View

The corresponding Recent Change View for this form is 50.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OE

Description: This field identifies the equipment number type.

Required Field.

Software Release: 5E16 and later
Valid Entries:

Valid OE Entries

Entry	Description	Definition
V	Trunk virtual equipment number type	(1 - 192) (0001 - 1008) (01 - 24) where: (1 -192) = SM (0001 - 1008) = FAC (Virtual Facility) (01 - 24) = CHAN (channel)

WARNING: When the SM portion of the OE is less than 3 digits and the overall length of the OE is less than 8 digits, leading zeros are added to the left side of the OE to create an OE that is 8 digits in length.

2.3 * COMPONENT ID

Description: This field identifies the component ID assigned to the packet trunk. These packet trunks exist on a TAG (Trunk Access Gateway).

Required.

Software Release: 5E16 and later
Valid Entries: 1 - 9

Data Rules:

COMPONENT ID must be defined on the MGPCOMP form (6921 Record) with a COMPONENT TYPE of "TAG".

2.4 * TRUNK TYPE

Description: This field identifies the trunk type assigned to the packet trunk.

Copyright © 2003 Lucent Technologies

Required Field.

Software Release: 5E16 and later
Valid Entries:

Valid TRUNK TYPE Entries

Entry	Description
ISUP	ISDN (Intergrated Services Digital Network) User Part
PRIB	Primary Rate Interface B Channel
PRID	Primary Rate Interface D Channel

Data Rules:

When TRUNK TYPE is "PRIB" or "PRID", INTERNAL PROTOCOL must be "PRI".

When TRUNK TYPE is "ISUP", INTERNAL PROTOCOL must be "ISUP".

When TRUNK TYPE is "ISUP", the OE must be defined on a TRUNK from (5204 Record), where the TKGRP form (5202 Record) has INPULSING or OUTPULSING equal to "ISUP7".

When TRUNK TYPE is "PRID", the OE must be defined on the TRUNK form (5204 Record) with DCHN DESG equal to an unknown value, and the TKGRP form (5202 Record) must have a TRKCLS equal to "EDSL".

When TRUNK TYPE is "PRIB", the OE must be defined on the TRUNK form (5204 Record). The TKGRP form (5202 Record) must have a TRKCLS equal to "EDSL" or "EDSLHM". If the TRKCLS is "EDSL", the DCHN DESG on the TRUNK form must be blank.

2.5 # INTERNAL PROTOCOL

Description: This field identifies the internal protocol assigned to the packet line.

Required Field.

Software Release: 5E16 and later
Valid Entries: ISUP or PRI

PHYSICAL PORT

2.6 # MODULE

Description: This field identifies the physical port module (or slot) number of the packet trunk.

Software Release: 5E16 and later
Valid Entries: 1 - 17

2.7 # LINE

Description: This field identifies the physical port line (or span) number of the packet trunk.

Software Release: 5E16 and later
Valid Entries: 1 - 28

2.8 # CHANNEL

Description: This field identifies the physical port channel number of the packet trunk.

Software Release: 5E16 and later
Valid Entries: 1 - 24

SEC. 5: ISDN MISCELLANEOUS FORMS

Copyright © 2003 Lucent Technologies

SEC. 5A: 5940 RECORD
REMOTE PERIPHERAL ALARMS
- RISITE

1. GENERAL

The 5940 Record is available with 5E5 and later Software Releases. It is used to define remote line units. Prior to 5E12, this form was used to define RISLUs (Remote Integrated Services Line Units). Effective with the 5E12 Software Release, this form is also used to remote AIUs (Access Interface Units). For 5E12 and later, the name of this form was changed from Remote Integrated Services Line Unit Site to Remote Peripheral Alarms. Also, a RP NO (Remote Peripheral Number) field was added to distinguish the two units, the ALARM SM field was changed to SM, and the ALARM RISLU field was removed.

A remote unit defined on a RISITE form where RAS EQUIPPED? is "Y" and RAS DUPLEX ACC? is "N" requires that one OSPSDSL form (5411 Record) be submitted where the DSL NAME ID on the OSPSDSL form matches the SITE ID on the RISITE form and the SM portion (first three digits) of the LCEN on the OSPSDSL form matches the SM on the RISITE form.

An RISITE form where RAS EQUIPPED? is "Y" and RAS DUPLEX ACC? is "Y" requires that two OSPSDSL forms be submitted where the DSL NAME ID on the OSPSDSL form matches the SITE ID on the RISITE form and the SM portion (first three digits) of the LCEN on the OSPSDSL form matches the SM on the RISITE form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 22.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SITE ID

Description: Enter the remote peripheral unit Site ID. (This range of Site ID values was chosen to avoid confusion with the RSM Site ID range.)

Required Field.
Valid Entries: 500 - 999

Data Rules:

No more than 8 remote peripherals can be assigned from the EQAIU form (with an AIU TYPE of "EAIU" for remote AIU) or the EQRISLU form.

SITE IDs defined on this form for an AIU remote peripheral unit must also have the same SITE ID defined on the EQAIU form.

2.3 SITE TITLE

Description: Enter the remote peripheral unit Site Title (e.g., name of town).
Valid Entries: 1 - 15 alphanumeric characters

BUILDING/POWER ALARMS

The following fields (Section 2.5 - Section 2.9) define the building and power alarms. Every Remote

Copyright © 2003 Lucent Technologies

Integrated Services Line Unit scans its own fan and fuse alarms, but one RISLU per site must be selected to scan power and battery alarms for the RISLU site. The same RISLU will also scan building and miscellaneous (office defined) alarms if the RISLU site is equipped with the optional LAU (Link Adapter Unit) RAS (Remote Alarm Section).

2.4 ALARM SM

Description: The name of this field was changed to SM in 5E12. This field name applies to 5E11 and earlier. See SM for usage information.

2.5 SM

Description: Enter the number of the SM that hosts the RISLU responsible for the building and power alarms at the RISLU site. This field was changed from ALARM SM to SM in 5E12.
Valid Entries: 1 - 192

Data Rules:

The SM entered in this field must be defined on an EQRISLU form (5732 Record).

2.6 ALARM RISLU

Description: Enter the number of the RISLU responsible for building and power alarms at the RISLU site. For 5E12 and later, this field was removed.

Software Release: 5E9(2) - 5E11
Valid Entries: 0 - 7

Data Rules:

The RISLU entered in this field must be defined on an EQRISLU form.

2.7 RP NO

Description: Enter the unit number of the RP (Remote Peripheral) which provides the alarms.

Software Release: 5E12 and later
Valid Entries:

Blank or enter 0 - 7 for RISLU.

Data Rules:

The RP NO must be unique for each SM.

2.8 RAS EQUIPPED?

Description: Is this RISLU site equipped with Remote Alarm Section?
Default: N
Valid Entries: Y, N

2.9 RAS DUPLEX ACC?

Description: Is this RISLU site equipped with RAS (Remote Alarm Section) containing duplex ACC (Alarm Conversion Circuits)?
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

Enter "N" if the RISLU site is not equipped with RAS or if the site has simplex ACC.

ON-SITE PERIPHERALS

The following fields (Section 2.10 - Section 2.12) are Recent Change only fields added with the Remote AIU feature.

2.10 SM

Description: This field provides the SM number.

2.11 RP NO

Description: This field provides the remote peripheral number.

2.12 RP TYPE

Description: It provides the type of remote peripheral ("ISLU" or "AIU") responsible for building and power alarms at the remote site.

Figure 2 SAMPLE RISITE FORM 5E12 AND LATER SOFTWARE RELEASES

SEC. 5B: 5941 RECORD
ISDN OFFICE OPTIONS FORM - ISDNOPT

1. GENERAL

For 5E3 and later, the 5941 Record defines a set of office parameters that must be entered when the office is an ISDN (Integrated Services Digital Network) switch. The office can provide ISDN service if:

- an EQPSU form (5741 Record) is entered, with an EQISLU form (5731 Record) and/or EQRISLU form (5732 Record), and/or an EQIDCU form (5846 Record).
- the office contains an ISDN Switching Module, an SM defined on the EQIM form with the CONFIGURATION field set to "LOADED".

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * KEY

Description: This field is required by the software; its value should always be 0.
Default: 0

DSL DFLT SRV

The following field defines the DSL default service group. Available for 5E10 and later, this field supports the Default Service feature. For more information on this feature and other NI-3 features, see the National ISDN section Division 2, Section 1AM.

2.3 DFLT SRV

Description: Enter the name of the default service group that will be assigned to a custom or standard DSL if the DFLT SRV field on the DSL form (5907 Record) is not entered.

The DFLT SRV field supports the Default Service feature, which is a secured feature (SFID 225). For more information on this feature, see Division 2, Section 1AM on National ISDN features. Also see the secured feature Automatic Association of Default Services, Division 2, Section 4A238.

Software Release: 5E10 and later.
Valid Entries: 1 - 7 characters

Data Rules:

DFLT SRV cannot have "/" as the first character.

DFLT SRV must not be one of the following:
- "ABORT"
- "ACTBFG"
- "CLEANUP"
- "NONE"

Copyright © 2003 Lucent Technologies

- "NONTGID"
- "SETUP"
- "TEMP"

If the DFLT SRV field is entered on the ISDNOPT form, it must be defined on a DFLTSRV form.

PACKET SWITCHING

The following fields (Section 2.4 - Section 2.11) define a set of parameters for packet switching.

2.4 PSN

Description: This field specifies the packet switch number of this 5ESS Switch in a Packet Switching network. A packet switching network consists of 5ESS Switches connected via IP (Internal Protocol) trunks. This is called the IP subnetwork. In order for calls to be routed across the network, each switch connected in the subnetwork must have a unique PSN.
Valid Entries: 1 - 255

Data Rules:

If PSN is entered, it supports packet switched trunks, therefore, PSN trunks must have a TRKCLASS of "X75", "X75P"or "PACKET" on the TKGRP form, and the CONFIGURATION on the EQIM form must support packet switching. For the CONFIGURATION that supports the packet switching trunk TRKCLS values,see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E9(1) and later, if a trunk group is defined with TRKCLS "PACKET" on the TKGRP form, and a trunk in the group is assigned to a loaded SM (SM in the equipment number on the TRUNK form is defined on an EQIM form where CONFIG is "LOADED"), then a value must be entered in this PSN field; the PSN may not be the same as the NEXT PSN on the TKGRP form.

2.5 IMPLIED NPA

Description: This field specifies the Implied NPA (Numbering Plan Area) of the office for ISDN packet switching. This NPA allows a switch owner to assign an implied NPA for packet switching which may be different from that for circuit switching (e.g., voice call). The area code chosen should be the NPA most often implied by 7-digit packet switching calls originating from or incoming to this office.
Valid Entries: 200 - 999

2.6 FRAMES RETRANSMITTED

Description: This field specifies the percentage of the threshold value for the ratio of information frames retransmitted to total information frames transmitted.
Valid Entries: 0 - 5

2.7 SEGMENT SIZE

Description: This field specifies the office packet segment size for Intranetwork ISDN Packet Switching.

NOTE: The SEGMENT SIZE field on the TKGRP form (5202 Record) that is applicable for X.75 trunk groups only, will be used for Internetwork ISDN Packet Switching. (See Division 2, Section 5C for more information on Packet Trunk Interface Standardization.)

Required Field.
Default: 16
Valid Entries: 16, 64, 128, or 256 (bytes)

Copyright © 2003 Lucent Technologies

2.8 ILC

Description: Is intraLATA call screening permitted on ISDN SMs (CONFIGURATION set to "LOADED" on associated EQIM form)?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.9 PP IDLE

Description: Enter the Packet Pipe IDLE timer, which is the time (in seconds) without flags before Packet Pipe trunk members go to the idle-channel state. When the PH being used by a packet pipe trunk member detects that a previously active packet pipe has gone idle at layer 1 (i.e. no 0/1 transitions), an "idle" timer of duration PP IDLE is started. If the "idle" timer expires before any activity is detected on the packet pipe, the "idle" condition of the packet pipe is reported to TM (Terminal Maintenance). TM reports the status of the packet pipe as "OOS BLKD IDLE".

This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature see Division 2, Section 8B.

Software Release: 5E10 and 5E11.
Required Field.
Default: 4
Valid Entries: 1 - 30 (seconds)

2.10 PER RATE

Description: Enter the PER (Protocol Error Record) leak rate for the speech handler channel trunks. The field applies to all trunks on a switch. The leak rate represents the number of PERs to be leaked in a period of time.

Example: If the value of this global parameter is set to 5 and the time interval is 3 minutes, then every 3 minutes 5 PERs will be leaked.

This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature see Division 2, Section 8B.

Software Release: 5E10 and 5E11.
Required Field.
Default: 5
Valid Entries: 0 - 255

2.11 PER THRESH

Description: Enter the PER (Protocol Error Record) threshold for speech handler channel trunks. The parameter applies to all the trunks on a switch. A report is generated when the defined PER threshold value is met.

Example:If this global parameter is set to 15, a report is generated when the PER count for a trunk reaches 15. An internal counter is reset so that the next report is only generated when a new PER count of 15 is reached.

This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature see Division 2, Section 8B.

Copyright © 2003 Lucent Technologies

Software Release: 5E10 and 5E11.
Required Field.
Default: 15
Valid Entries: 0 - 255

X75P ONLY

The following fields (Section 2.12 - Section 2.13) define Subnetwork Parameters used for Internetwork ISDN Packet Switching. (For more information see Division 2, Section 5C, Packet Trunk Interface Standardization.)

2.12 SUBNET ID

Description: Enter the clearing Subnetwork Identifier (PVC ID (Permanent Virtual Circuit ID)). When a subnetwork clears a virtual call that is active or in progress, this value is inserted in the Clearing Subnetwork Identification Utility to identify the subnetwork. This ID helps in localizing and detecting problems at the subnetwork level.

Software Release: 5E8 and later.
Required Field.
Valid Entries: 0 - 9999

Data Rules:

For 5E9(2) and later, if the SUBNET ID field is entered, the CONFIGURATION on the corresponding EQIM form must support ISDN. For the CONFIGURATION that supports ISDN see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

2.13 SUBNET CNT

Description: Enter the Transit Subnetwork Count. This threshold value is used to detect invalid looping in the subnetwork within the LATA. It is the service provider's responsibility to ensure that the same value is provisioned for this parameter across the subnetwork.

Software Release: 5E8 and later.
Required Field.
Valid Entries: 0 - 14

Data Rules:

For 5E9(2) and later, if the SUBNET CNT field is entered, the CONFIGURATION on the corresponding EQIM form must support ISDN. For the CONFIGURATION that supports ISDN see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

2.14 #ODB AMA

Description: Are AMA billing entries desired while a B-Channel is being set up for On Demand packet switching via Q.931 signaling? This field applies to a DSL that has the ODB (On Demand B-Channel) feature.

Software Release: 5E5 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.15 PBG AMA MODULE

Copyright © 2003 Lucent Technologies

Description: Should the Billing TNs and PBGs (Packet Business Groups) specified on PBGRP forms (5931 Record) be included in packet business group AMA (Automatic Message Accounting) records?

Software Release: 5E8 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If this field is "Y", a BILLING TN must be entered on each PBGRP form.

NETWORK ID CODES

Fields Section 2.16 - Section 2.18 indicate the type of network in which the switch resides.

2.16 INIC

Description: This field indicates the INIC (ISDN Network Identification Code) of the ISDN network where this switch resides. Also, this field is used for the CNIC (Clearing Network Identification Code) in the PH (Protocol Handler).

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 9999

2.17 TNIC

Description: This field indicates the TNIC (Transit Network Identification Code) value to be used on X.75 trunks when the 5ESS Switch acts as a transit network.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 9999

2.18 PPSN DNIC

Description: This field indicates the DNIC (Data Network Identification Code) of the local telephone company PPSN (Public Packet Switch Network). This parameter will be used in the Protocol Handler to determine whether or not a packet call has crossed an X.75 trunk gateway.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 9999

SWITCH SENSOR ID

The next fields (Section 2.19 - Section 2.20) indicate the Switch Sensor ID used in the AMA billing of packet calls.

2.19 SENSOR ID 1

Description: This field indicates the 1-digit portion of the Switch Sensor ID used in the AMA billing of packet calls.

Software Release: 5E6 and later
Default: 0

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 9

Data Rules:

For ISDN SMs, SENSOR ID 1 or SENSOR ID 2 must be entered and must have a value greater than 0. An ISDN SM is any SM where CONFIGURATION on the EQIM form has a value which supports ISDN.

2.20 #SENSOR ID 2

Description: This field indicates the 5-digit portion of the Switch Sensor ID used in the AMA billing of packet calls.

Software Release: 5E6 and later
Required Field.
Valid Entries: 0 - 32767

2.21 MAX MON

Description: This field indicates the maximum number of MLHG (Multi-Line Hunt Group) queue monitor consoles allowed in the office. A queue monitor console is an ISDN terminal which can display MLHG queue status data.

Software Release: 5E6 and later
Default: 20
Valid Entries: 0 - 255

ISDN BRI Q.931 TIMERS

For 5E7 and later, the ISDN basic call procedures are enhanced to include excessive call delay procedures. Timers associated with this feature are defined in this field group (fields Section 2.22 - Section 2.28).

2.22 T303

Description: This field sets the Q.931 setup response timer value for BRIs (Basic Rate Interfaces). The timer is initiated when a Q.931 setup message is sent to the CPE (Customer Premise Equipment) on a BRI. The timer is canceled when further call progress messages are received, e.g. alerting, connect, disconnect. If the timer expires, then excessive call delay procedures apply; a second setup is sent and if no call proceeding message is received, the T303 timer is restarted. If no response is received before the second T303 expires, then the terminating BRI is cleared.

The time is specified in seconds.

Software Release: 5E7 and later
Default: 2.5
Valid Entries: 1 - 4 in steps of 0.5 (seconds)

Data Rules:

The T303 timer value must be less than the T310 timer value.

2.23 T310

Description: This field sets the Q.931 call proceeding timer value for BRI. This timer is started when a Q.931 call proceeding message is received in response to a Q.931 setup message sent on a BRI. This timer is canceled when additional call progress messages are received, e.g. alerting, progress, connect, disconnect. If T310 expires before any response is received, then the terminating BRI is cleared.

Copyright © 2003 Lucent Technologies

The time is specified in seconds.

Software Release: 5E7 and later
Default: 5
Valid Entries: 3 - 10 (seconds)

Data Rules:

The T310 timer value must be greater than the T303 timer value.

2.24 T301

Description: This field sets the Q.931 ringing timer value for BRIs. The timer is initiated when a Q.931 alerting message, indicating that the CPE is "ringing," is received on a BRI. If T301 expires before receiving any messages, e.g. Q.931 connect or disconnect, then the terminating BRI is cleared.

The time is specified in minutes.

Software Release: 5E7 and later
Default: 5
Valid Entries: 3 - 7 (minutes)

2.25 T320

Description: The T320 timer is used by a packet switching On Demand B-channel with Conditional Notification. For information about the Conditional Notification feature, see Division 2, Section 5I.

T320 is an office timer defined by Bellcore TR 268. It is used for B-channel access to the PH. It is started when the switch sends or receives a CONNect message or after the clearing of the last virtual circuit on the B-channel. It is canceled when a new virtual call is established or when the user initiates B-channel disconnection procedures for the B-channel. The T320 timer is applicable only when the user has subscribed to Conditional Notification.

Software Release: 5E8 and later
Required Field.
Default: 30
Valid Entries: 20 - 60 (seconds) in increments of 5

2.26 TI T1

Description: This field sets the TI T1 timer. The timer determines the maximum time (in seconds) a Standard BRI will wait for an initializing terminal to send an initialization request to the switch.

Software Release: 5E8 and later
Required Field.
Default: 20
Valid Entries: 1 - 30 (seconds)

2.27 FC T1

Description: This field sets the FC T1 timer. The timer determines the maximum time (in seconds) the switch will wait for a Standard CPE to send a HOLD ACKNOWLEDGE message after the switch has sent a HOLD message.

Software Release: 5E8 and later
Required Field.
Default: 4
Valid Entries: 1 - 10 (seconds)

Copyright © 2003 Lucent Technologies

2.28 DISP T2

Description: This field determines the length of time certain displays will appear on a BRI (Basic Rate Interface) CPE. It represents the TD-2 timer specified for ISDN displays in Bellcore TR-NWT-000865 for call control and selected services.

Software Release: 5E9(1) and later
Required Field.
Default: 30
Valid Entries: 10 - 60 (seconds)

ISDN PRI Q.931 TIMERS

2.29 T316

Description: This field determines the time to wait for a Q.931 REST ACK (Restart Acknowledgement) message after sending a Q.931 REST (Restart) message.

Software Release: 5E9(1) and later
Required Field.
Default: 30
Valid Entries: 10 - 20 (seconds, in 10 second intervals)

ISDN TONE/ANNOUNCEMENT

The following field defines ISDN tone and announcement parameters.

2.30 T306

Description: This field sets the ISDN Tone and Announcement timer value. The timer is initiated when a tone or announcement is applied to the calling party on a BRI voice call. If the timer expires prior to the user disconnecting, then the BRI is cleared.

The time is specified in seconds.

Software Release: 5E7 and later
Default: 60
Valid Entries: 30 - 150 in steps of 30 (seconds)

PASC TIMER

The following timer is used to support the PCS/ISDN Interworking feature. The term "PASC" (Personal Communications Access Service - C Interface) is used to refer to this feature on the DSLUSR form.

2.31 ALT REQUEST

Description: Enter the ALT (Automatic Link Transfer) Request Timer in increments of 0.5 seconds. It is used to specify the time allowed for the ALT bridging to complete. When the switch recognizes an ALT request, the old RPCU (Radio Control Port Unit) is sent a facility message requesting permission to perform ALT bridging and a timer is started. The switch expects a facility message indicating that ALT bridging has been completed before the timer expires. If the timer expires, the ALT has failed and the call at the new RPCU is cleared. This field supports the the ISDN PCS Interworking feature. For more information on this feature, see Division 2, Section 1AM.

Software Release: 5E10 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: 1.0
Valid Entries: 0.5 - 5.0 (in 0.5 second increments)

ISDN INSPECT TIMER

The following field Section 2.32 defines the parameters for the ISDN Inspect feature. For more information on ISDN Inspect, see Division 2, Section 1BH.

2.32 ISDN INSPECT

Description: Enter the length of time (in seconds) that a user has, after initial depression of the Inspect feature button, to select another button or call appearance for inspection. The timer starts when the user presses the Inspect button and stops either when the timer expires or the user presses another feature button or call appearance.

Software Release: 5E11 and later.
Required Field.
Default: 3 (seconds)
Valid Entries: 1 - 10 (seconds)

PRI B CHL AVAIL SIG

2.33 RETRY SERV

Description: Enter the number of Service Message Retries. This field was added to support the PRI B Channel Availability Signaling Procedures feature (99-5E-3621) which provides the capability, on a National ISDN Primary Rate Interface, to send SERVICE and SERVice ACKnowledgement messages, from either end of the PRI, reporting the service status of a B-channel. This field is used to set the number of times a SERV message is resent seeking a SERV ACK message. See Division 2, Section 6I.

Software Release: 5E12 and later
Default: 2
Valid Entries: 1 - 4

2.34 PREX ON BRI

Description: Should REX (Routine Exercise) be prohibited for DSLs in the office? This field supports the Prohibit Routine Exercise on Basis Rate Interface Lines Per Office secured feature (SFID 266). Note that this field interacts with the PREX field on the DSL form which supports the Prohibit REX Per DSL Line feature (SFID 267).

See Division 2, Sections 4A266/267.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is entered, SFID 266 ACT on the SFSYS form (5713 Record) must be "Y".

CRITICAL INDICATORS

The following fields (Section 2.35 - Section 2.42) support the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY.

Copyright © 2003 Lucent Technologies

2.35 CRIT PSN

Description: The CRIT PSN field is used to indicate whether the PSN field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.36 CRIT IMPLIED NPA

Description: The CRIT IMPLD NPA field is used to indicate whether the IMPLIED NPA field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.37 CRIT INIC

Description: The CRIT INIC field is used to indicate whether the INIC field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.38 CRIT PPSN DNIC

Description: The CRIT PPSN DNIC field is used to indicate whether the PPSN DNIC field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.39 CRIT TNIC

Description: The CRIT TNIC field is used to indicate whether the TNIC field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.40 CRIT SENSOR ID 1

Description: The CRIT SENSOR ID 1 field is used to indicate whether the SENSOR ID 1 field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.41 CRIT SENSOR ID 2

Description: The CRIT SENSOR ID 2 field is used to indicate whether the SENSOR ID 2 field is critical.

Copyright © 2003 Lucent Technologies

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.42 CRIT ILC

Description: The CRIT ILC field is used to indicate whether the ILC field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 5C: 5942 RECORD
(REMOTE) INTEGRATED SERVICES LINE UNIT
LINE CARD FORM - ISLULC

1. GENERAL

The 5942 (Remote) Integrated Services Line Unit Line Card Record is available with the 5E4(2) and later Software Releases. It is used to define the Line Cards equipped on Remote or local Integrated Services Line Unit Line Group Controllers in a 5ESS Switch.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.7.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.3 * (R)ISLU

Description: Enter the ISLU (Integrated Services Line Unit) or RISLU (Remote Integrated Services Line Unit) number.

Required Field.
Valid Entries: 0 - 7

2.4 * LGC

Description: Enter the Line Group Controller pack number on which the Line Cards are equipped.

Required Field.
Valid Entries: 0 - 15

Data Rules:

The LGC must be defined on an EQLGC form corresponding to the specified SM and (R)ISLU.

LINE CARDS

Up to thirty-two Line Cards can be equipped on each Line Group Controller. For each POS (Position) in which a Line Card is equipped, enter the following fields (Section 2.5 - Section 2.8).

2.5 TYPE

Description: Enter the Line Card type.

Valid TYPE Entries

Entry	Definition
TLC	ISLU T-Card

Copyright © 2003 Lucent Technologies

ZLC	ISLU Analog Line Card (Z-CARD)
SZLC	ISLU Spare Z-Card
ULC	ISLU Phase 2 U-Card
ULCS	ISLU Phase 2 Spare U-Card
APC	ISLU Auxiliary Power Converter
AULC	Software Releases: 5E6 and later. ISLU ANSI U-Card
SAULC	Software Releases: 5E6 and later. ISLU Spare ANSI U-Card

Data Rules:

Spare Z-Cards can only be populated in positions 15 or 31. Spare Phase 2 U-Cards can only be in Position 15. Each spare Line Card that is equipped reduces the total number of lines available for customers by 1. Only two spare Line Cards (secondary and primary pair are counted as 1) may be operational per (R)ISLU at any given time.

Whenever a line group controller is equipped with the LGP KCD2 power circuit pack and with one or more Z-cards (ZLC, SZLC), or Phase 2 U-cards (ULC, ULCS), an APC (Auxiliary Power Converter) can only be defined in Position 8 of every line group controller. A maximum of 16 APCs are allowed per (R)ISLU.

If a line group controller is equipped with the LGP 553A or the LGP 553B power circuit pack, an APC should not be equipped for that LGC.

If the line group controller is equipped with only T-cards, an APC does not need to be equipped for that LGC, but equip Position 8 last; in case Z/U-cards are added later to that LGC, there will be no growth of T-cards required.

Dial Tone First service for analog lines (defined on the LINE form with COIN set to "DTF") requires an ISLU Z-card (defined on this form with a CLI value of 0) with EXPANDED INBAND SGNLING? set to "Y" on the OFCOPT form.

If an ISLULC form is submitted with any of Z or U-Cards, the EQISAP input form must be submitted with circuit pack type of "ISMAN".

For 5E6 and later, an ANSI U-Card occupies one position in the LGC; it can be used with only LGP 553B model power circuit pack, defined on the EQLGC form (5733 Record) with a CLI value of 02.

The spare ANSI U-Card can only be equipped in slot 15 of the LGC (enter "SAULC" in position 15, only).

2.6 EQST

Description: Enter the Equipment Status of the Line Card.

Valid EQST Entries

Entry	Definition
G	Growth Status.
O	Operational Status.
U	Unequipped Status.

Data Rules:

New 5ESS Switch offices and equipment additions require the Operational status.

During off-line ODA data base retrofits, values other than 'O' may exist, but if they do, the EQST value here must be lower than, or equal to, the EQST on the EQLGC form entry for the LGC. The hierarchy of equipment status, from lowest to highest, are Unequipped, Growth and Operational.

2.7 CLI

Description: Enter the Change Level Indicator of the Line Card. For a complete listing of valid CLI values,

Copyright © 2003 Lucent Technologies

J-Drawing and list combinations, see Division 8, Section 1.
Valid Entries: 0 - 7fffffff (hexadecimal)

2.8 PM GRP

Description: Enter the name of the Performance Monitoring group.

If PM GRP is not entered when TYPE is "AULC", "SAULC", "ULC", "ULCS", "PULC", or "SPULC", the threshold value from the PMDEF group defined on the PMTHRESH form (5948 Record) will be used.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

If this field is entered, TYPE must be "AULC", "SAULC", "ULC", or "ULCS".

For 5E8 and later, when PM GRP is entered, the corresponding PMTHRESH form (5948 Record) must be entered with PM TYPE of "DSL".

SEC. 5E: 5944 RECORD
RISLU REMOTE ALARM SECTION BUILDING/MISCELLANEOUS ALARM SCAN POINT FORM - RIBMSC

1. GENERAL

The 5944 Record is available with the 5E4(2) and later Software Releases. It provides information about RISLU RAS (Remote Alarm Section) Building/Miscellaneous scan points. One RISLU at each RISLU site may be optionally equipped with a RAS that provides building/miscellaneous alarm scanning.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.15.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SITE

Description: Enter the Remote Integrated Services Line Unit Site ID. The Site ID range of values is not to be confused with the RSM Site ID range.

Required Field.
Valid Entries: 500 - 999

2.3 * POINT NBR

Description: Enter the RAS alarm scan point number.

Scan points 0 and 1 are always required when a RISLU site has a RAS. These records are initialized for initial offices only from the RISITE form (5940 Record) when RAS EQUIPPED? is set to "Y".

Required Field.
Valid Entries: 2 - 31

2.4 IN USE

Description: Is the alarm operational? "Y" means that the alarm is operational; "N" means that no alarms will be reported.
Default: Y
Valid Entries: Y, N

2.5 MCC NAME

Description: Enter the name of the alarm as it should appear on the MCC (Master Control Center).
Valid Entries: 1 - 9 characters

2.6 TTY NAME

Description: Enter the name of the alarm as it should appear on the tty. This is an office-assignable label to be included in craft output messages concerning the alarm scan point.
Valid Entries: 1 - 20 characters

Copyright © 2003 Lucent Technologies

2.7 ALARM LEVEL

Description: Enter the alarm level to be sounded when the scan point goes off-normal. This is office-assigned, based on the relative importance of the device being monitored.
Default: MIN
Valid Entries:

Valid ALARM LEVEL Entries

Entry	Definition
CRIT	Critical
MAJ	Major
MIN	Minor
ACT	Action
INFO	Information

2.8 PROTECT FROM RC

Description: This field is generated by the ODA system; it is not on the input form. It protects the record from Recent Change activity.

When set to 1, the record cannot be deleted or updated. This field is set to 1 for records where POINT NBR is 0 or 1 and is set to 0 for records where POINT NBR is 2 to 31.

SEC. 5F: 5945 RECORD
LASS OFFICE PARAMETERS FORM - LASSOP

1. GENERAL

The 5945 Record is available with 5E5 and later Software Releases. The LASSOP form is an ODA (Office Data Administration) input form that is used to supply global office options and parameters for the LASS features.

The LASS features, AC (Automatic Callback), AR (Automatic Recall), COT (Customer Originated Trace) and ICLID (Individual Calling Line Identification), are available with 5E5 and later Software Releases.

The LSFs (LASS Selective Feature), SCA (Selective Call Acceptance), CAR (Computer Access Restriction), SCF (Selective Call Forwarding), SCR (Selective Call Rejection), and SDA (Selective Distinctive Alert), are available with 5E6 and later Software Releases.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and office name on each record.

2.2 * KEY

Description: The only valid entry is defaulted to 0.

CUST ORIG TRACE

The following fields (Section 2.3 - Section 2.12) furnish information regarding the COT (Customer Originated Trace) feature.

2.3 AGENCY

Description: Enter the TN of the agency to be contacted to find information regarding a trace. The TN will be displayed upon successful invocation of the COT feature.
Valid Entries: 10 digit TN (0 - 9) or blank

2.4 COT GA FEAT

Description: This field contains the COT Feature Name when the feature is generally available (defined on RC/V View 8.18).

Required Field.
Default: /COTGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

The feature names must be defined on the LSCOTFD form (5972 Record).

2.5 ACTIVATE RTI

Copyright © 2003 Lucent Technologies

Description: This field contains the route index used to access the successful activation announcement after a COT request.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form (5303 Record).

2.6 TRC NA RTI

Description: This field contains the route index used to access the trace not available announcement after a COT request.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form (5303 Record).

2.7 NO RESRC RTI

Description: This field contains the route index used to access the buffer full announcement after attempting a COT activation.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form (5303 Record).

2.8 COT ACT LVL

Description: Enter the level of COT activation that is supplied by the office.

Software Release: 5E7 and later
Required Field.
Default: 1
Valid Entries:

Valid COT ACT LVL Entries

Entry	Definition
1	Standard COT activation introduced with the 5E5 Software Release.
2	Software Release: 5E7 and later. Announcements and displays for COT activation.

Data Rules:

If a 2 is entered in this field, the following fields must be assigned:

Copyright © 2003 Lucent Technologies

- The FIXRT (5301-1 Record) form must have a FIXED ROUTE TYPE of "2LEVEL".
- The ANNAPL (5529 Record) form must have an APPLICATION of "2LEVEL" and at least 1 SM entered.
- On the EQRAP form (5822 Record), the DSU2-RAF must have the MICROCODE 5D142A20, L22 pack equipped, and APPLICATION must be "BRCS-2LV".

TWO LEVEL ONLY

The following fields (Section 2.9 - Section 2.12) are available with 5E7 and later and will be used only when 2-Level COT is provided by the office.

2.9 COT WAIT TIME

Description: Enter the amount of time (seconds) the switch will wait for the customer's response during a 2-Level COT activation request.

Software Release: 5E7 and later
Required Field.
Default: 7
Valid Entries: 1 - 15 seconds

2.10 COT MAX TIMEOUT

Description: This field is used to indicate how many times a customer is allowed to timeout during the interactive recorded announcements for 2-Level COT activation.

Software Release: 5E7 and later
Required Field.
Default: 3
Valid Entries: 1 - 5

2.11 COT MAX ERRS

Description: This field is used to indicate how many times a customer will be allowed to enter incorrect digits during the interactive recorded announcements for 2-Level COT activation.

Software Release: 5E7 and later
Required Field.
Default: 3
Valid Entries: 1 - 5

2.12 COT COST

Description: This field is used to indicate whether the cost amount of the 2-Level COT activation will be included in the announcement.

If a value is not entered, a general announcement will be played indicating that the customer will be charged for the trace. If a value is supplied, the recorded announcement will include the value entered in this field.

Software Release: 5E7 and later
Valid Entries: 00.00 - 99.99 dollars

INDIV CLG LINE ID

Copyright © 2003 Lucent Technologies

The following fields (Section 2.13 - Section 2.14) furnish information regarding the ICLID feature.

2.13 PRI PRVT

Description: Will the originating users private TN be delivered to a Primary Rate Interface?

If "Y" is entered, the user's private TN will be delivered over the Primary Rate Interface along with a Common Channel Signaling presentation indicator set to "restricted". PRI PRVT is only used when STA ID on a TKGRP form (5202 Record) is "TRAN". When STA ID on a TKGRP form is set to "TRAN", and if PRI PRVT is set to "Y", private TNs will be delivered to the terminating trunk. If PRI PRVT is set to "N", private TNs will not be delivered to the terminating trunk. If STA ID is blank, PRI PRVT is not used.

NOTE: PRI PRVT is not used in conjunction with CPN BN OPT, only with STA ID. If PRI PRVT is set to "Y", CPN BN OPT must be set to "NONE".

Software Release: 5E5 and later
Default: 5E9(2) and earlier, Y

5E10 and later, N
Valid Entries: Y, N

2.14 PCP GA FEAT

Description: This field contains the PCP Feature Name when the feature is generally available (defined on RC/V View 8.18).

Required Field.
Default: /DIGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

The feature names must be defined on the DISPFD form (5965 Record).

BULK CLG LINE ID

Field Section 2.15 refers to the BCLID (Bulk Calling Line Identification) feature. For further information on BCLID, see Division 2, Section 1Y.

2.15 BILLING CYCLE

Description: Enter the Billing Cycle in hours. This entry specifies the interval for collection of BCLID AMA records. This parameter applies only for BCLID customers with usage-sensitive billing. Any change in the Billing Cycle will not take effect until the following midnight.

Software Release: 5E8 and later
Default: 24
Valid Entries: 1, 2, 3, 4, 6, 8, 12, or 24 (hours)

AUTOMATIC CALLBACK AND AUTOMATIC RECALL

The following fields (Section 2.16 - Section 2.47) furnish information regarding the AC and AR features.

The AC feature enables a user to automatically place a call to the LICDN (Last Incoming Calling Directory Number) of the terminal. The LICDN is defined as the address of the last party that called. Automatic Callback feature activation enables an end-user to automatically call back the last incoming calling directory number currently associated with the end-user's terminal.

Copyright © 2003 Lucent Technologies

The AR feature enables a calling terminal to automatically place a call to the LOCDN (Last Outgoing Directory Number) currently associated with the terminal and/or to camp on the LOCDN upon receiving busy treatment. The LOCDN is defined as the address of the last party called by a user of the calling terminal.

2.16 B/I SCAN

Description: This field indicates the busy/idle status scan rate for AC and AR.
Default: 60
Valid Entries:
- 5E6 and earlier: 45, 60, 75, 90, 105 and
- 120 seconds
- 5E7 and later: 30, 45, 60, 75, 90, 105 and
- 120 seconds

2.17 TIMEOUT

Description: This field indicates how long scanning will be performed during AC and AR.
Default: 30
Valid Entries: 15 - 45 minutes, in 1 minute intervals.

2.18 SCAN MODE

Description: This field indicates the type of scanning to be used during AC and AR.
Default: TERM
Valid Entries:

Valid SCAN MODE Entries

Entry	Definition
ORIG	Originating Scanning consists of the originating switch sending queries to the terminating switch at regular intervals (defined in the B/I SCAN field), until the idle status of the called TN is returned from the terminating switch.
TERM	Terminating Scanning consists of the originating switch asking the terminating switch to monitor the busy/idle status of the called TN, and to inform the originating switch when the called TN is found idle.

2.19 REINIT SCAN

Description: This field is used to specify the threshold which is used to determine whether or not the T1 timer should be reinitialized during reactivation of AC or AR.

The T1 timer is initialized during activation of AC and AR via the TIMEOUT field.

The T13 timer is initialized by the MAX CAMP field.

During reactivation of AC or AR, if the T13 timer is less than the value specified in this field, the T1 timer will not be reinitialized.

Software Release: 5E7 and later
Required Field.
Default: 300
Valid Entries:
- 0 - 300 in 15 second increments;
- (e.g., 0, 15, ..., 270, 300)

2.20 TCAP

Copyright © 2003 Lucent Technologies

Description: This field indicates the time period the originating switch will wait for a response, after an AC/AR CCS (Common Channel Signaling) TCAP query has been sent to the terminating switch.
Default: 3
Valid Entries: 1 - 10 seconds

2.21 RNGBK TYPE

Description: This field indicates the type of distinctive ringing used for ringback. This field only applies to the Generally Available case, when the AC and AR feature is not assigned to the line.
Default: C
Valid Entries:

Valid RNGBK TYPE Entries

Entry	Definition
A	repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern).
B	repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on followed by 4 seconds off.
C	repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4 seconds off.
D	repeated pattern 1.0 second on, 1.0 second off, 1.0 second on and 3.0 seconds off (also known as code 2 ringing).

2.22 RNG CYCLE

Description: This field indicates the number of AC or AR ringback ring cycles of a distinctive ringing pattern for one ringback attempt. Each ring cycle is 6 seconds.
Default: 4
Valid Entries: 2 - 7 ring cycles

2.23 MAX RNGBK

Description: This field is used by AC and AR to indicate the maximum number of ringback attempts per activation of the feature.

For Standard BRI users (DSL CLS is "STD" on the DSL form), Call Processing software will ignore this field and make only one ringback attempt.
Default: 1
Valid Entries: 1 - 12 ringbacks

2.24 RNGBK WAIT

Description: This field is used by AC and AR to indicate the wait period between ringbacks after the initial unanswered ringback in minutes and seconds. For example, if 3 :15 is entered, ringbacks will occur every 3 minutes and 15 seconds.

This field does not apply to Standard BRI users (DSL CLS is "STD" on the DSL form) since only one ringback attempt will be made. For these users, Call Processing software will ignore any entry in MAX RNGBK and RNGBK WAIT.

Default Value 0 :0
Valid Entries: 0 :0, 3 - 12:SS min:sec; where SS is
0 - 45 in 15 second increments.

Data Rules:

This field must not be greater than 0 if MAX RNGBK is equal to 1.

2.25 AC TO COIN

Description: Will the customer be allowed to invoke the LASS AC feature towards coin phones?

Copyright © 2003 Lucent Technologies

Default: Y
Valid Entries: Y, N

2.26 AC TN UNIQ IGN

Description: Will the checking of the uniqueness of the LASS incoming calling TN (MLHG, PBX, shared TNs, and multiparty lines with the exception of two-party ANI lines are considered non-unique) be ignored upon AC invocation?
Default: N
Valid Entries: Y, N

2.27 AC GA FEAT

Description: This field contains the AC Feature Name when the feature is generally available (defined on RC/V View 8.18).

Required Field.
Default: /LACGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

The feature names must be defined on the LSACFD form (5970-1 Record).

2.28 AR GA FEAT

Description: This field contains the AR Feature Name when the feature is generally available (defined on RC/V View 8.18).

Required Field.
Default: /LARGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

The feature names must be defined on the LSARFD form (5971-1 Record).

2.29 AC CNFRM RTI

Description: This field contains the route index used to access the AC confirmation announcement after an AC request.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form.

2.30 AR CNFRM RTI

Description: This field contains the route index used to access the AR confirmation announcement after an AR request.
Valid Entries:

Copyright © 2003 Lucent Technologies

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form.

2.31 CF ACTIVE DNY RTI

Description: This field indicates the route index used to access the Call Forwarding Active Denial announcement. This announcement is provided when AC/AR activation is attempted on a line that has one of the following active: Call Forwarding Variable, LASS Selective Call Forwarding, Call Forwarding Night Service, LASS Selective Call Acceptance with forwarding, or LASS Computer Access Restriction with forwarding.

If this field is left blank, reorder tone will be provided.

Software Release: 5E7 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index specified in this field must be defined on the RTIDX form.

2.32 LNG TRM DNY RTI

Description: This field contains the route index used to access the AC/AR timed-out without completion announcement after an AC or AR request.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form.

2.33 AC CNCL RTI

Description: This field contains the route index used to access the AC cancellation announcement after the AC cancellation has been requested.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form.

Copyright © 2003 Lucent Technologies

2.34 AR CNCL RTI

Description: This field contains the route index used to access the AR cancellation announcement after the AR cancellation has been requested.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form.

2.35 PTY BUSY RTI

Description: This field contains the route index used to access the AC/AR party is busy announcement after AC or AR has been requested.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form.

2.36 INTER LATA AC/AR

Description: Are AC/AR CCS7 TCAP (Transactions Capabilities Application Part) queries permitted across LATA boundaries?

Software Release: 5E6 and later
Default: N
Valid Entries: Y, N

2.37 AC ORIG CAMP LIM

Description: This field is used to indicate the maximum number of AC camp-ons that can be originated by a line. Short term denial (reorder tone) will be provided to the customer when the limit is exceeded.

Software Release: 5E7 and later
Required Field.
Default: 10
Valid Entries: 1 - 30

2.38 AR ORIG CAMP LIM

Description: This field is used to indicate the maximum number of AR camp-ons that can be originated by a line. Short term denial (reorder tone) will be provided to the customer when the limit is exceeded.

Software Release: 5E7 and later
Required Field.
Default: 10
Valid Entries: 1 - 30

2.39 TERM CAMP LIM

Copyright © 2003 Lucent Technologies

Description: This field is used to indicate how many AC/AR activations may camp-on to a single line. Short term denial (reorder tone) will be provided to the customer when the limit is exceeded.

Software Release: 5E7 and later
Required Field.
Default: 10
Valid Entries: 1 - 20

2.40 MAX CAMP TIME

Description: This field is used to indicate how long an AC or AR camp-on may remain active when the feature has been reactivated.

During an initial activation of AC and AR, the T13 timer is initialized to the value specified in this field.

An initial activation of AC or AR may be active for as long as the value specified in the TIMEOUT field. Reactivations of AC or AR to the same line may continue as long as the T13 timer has not expired.

Software Release: 5E7 and later
Required Field.
Default: 180
Valid Entries:
- 120 - 240 in 15 minute increments;
- (e.g., 120, 135, ..., 225, 240)

2.41 AC ACT LVL

Description: Enter the level of AC (Automatic Callback) activation that is supplied by the office.

Software Release: 5E7 and later
Required Field.
Default: 1
Valid Entries:

Valid AC ACT LVL Entries

Entry	Definition
1	Standard AC activation introduced with the 5E5 Software Release.
2	Software Release: 5E7 and later. Announcements and displays for AC activation.

Data Rules:

If a 2 is entered in this field, the following fields must be assigned:

- The FIXRT (5301-1 Record) form must have a FIXED ROUTE TYPE of "2LEVEL".
- The ANNAPL (5529 Record) form must have an APPLICATION of "2LEVEL" and at least 1 SM entered.
- On the EQRAP form (5822 Record), the DSU2-RAF must have the MICROCODE 5D142A20, L22 pack equipped, and APPLICATION must be "BRCS-2LV".

2.42 AC BLOCK TO PRIV N

Description: Is Automatic Callback blocked to private DNs? This field is used to activate the Automatic Callback Block to Private Number special feature. For more information on this feature, see Division 2,

Copyright © 2003 Lucent Technologies

Section 4A111.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

2.43 AC BLOCK RTI

Description: Enter the blocked Automatic Callback announcement route index. This field specifies the route index of the announcement to be played when Automatic Callback Blocked to Private Number occurs.

Software Release: 5E8 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

For 5E 8 only, if AC BLOCK RTI is assigned on the LASSOP form, then the AC BLOCK RTI must be defined on a RTIDX form.

TWO LEVEL ONLY

The following fields (Section 2.44 - Section 2.47) are available with 5E7 and later and will be used only when 2-Level AC is provided by the office.

2.44 AC WAIT TIME

Description: Enter the amount of time (in seconds) the switch will wait for the customer's response during an AC request.

Software Release: 5E7 and later
Required Field.
Default: 7
Valid Entries: 1 - 15 seconds

2.45 AC MAX TIMEOUT

Description: This field is used to indicate how many times a customer is allowed to timeout during the interactive recorded announcements for 2-Level AC.

Software Release: 5E7 and later
Required Field.
Default: 3
Valid Entries: 1 - 5

2.46 AC MAX ERRS

Description: This field is used to indicate how many times a customer will be allowed to enter incorrect digits during the interactive recorded announcements for 2-Level AC.

Software Release: 5E7 and later
Required Field.
Default: 3

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 5

2.47 AC VOICE BACK

Description: Is the date and time of the last call returned to the customer for a 2-Level AC activation?

Software Release: 5E7 and later
Required Field.
Default: Y
Valid Entries: Y, N

SCREEN LIST EDITING

The following fields (Section 2.48 - Section 2.52) are available with 5E6 and later Software Releases. They are used to define the global parameters for the LASS Selective Features.

2.48 INTER LATA SCREEN

Description: Will the CPN (Calling Party Number) be screened across LATA boundaries?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.49 MAX ERROR RETRY

Description: This field indicates how many user errors will be allowed before the Screen List Editing session will be terminated.

Software Release: 5E6 and later
Default: 4
Valid Entries: 1 - 10

2.50 RESP WAIT TIME

Description: This field indicates how long the switch will wait for a response from a CCS7 (Common Channel Signaling 7) TCAP (Transactions Capabilities Application Part) query during TN validation.

Software Release: 5E6 and later
Default: 10
Valid Entries: 1 - 10 seconds

2.51 VALIDATE LIST ENTRY

Description: Will interswitch Screen List entries be validated via CCS7 TCAP queries during a Screen List Editing session?

- ***NOTE:*** If this field is set to "Y", the switch will attempt to validate the screen list entry via a CCS7 TCAP query. Consequently, interoffice PRI calls will not pass validation even though its CPN (Calling Party Number) can be screened during LSF screening.

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.52 USE BELLCORE SLE

Description: Should the new Bellcore standard SLE interface be used? If "N", the AT&T Standard SLE Interface will be used.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

SELECTIVE CALL ACCEPT

The following fields (Section 2.53 - Section 2.56) are available with 5E6 and later Software Releases. They are used to define the global parameters for the LASS SCA (Selective Call Acceptance) feature.

2.53 SCA MAX SZE

Description: This field indicates how many TNs may be entered into the SCA Screen List.

Software Release: 5E6 and later
Required Field.
Default: 6
Valid Entries: 3 - 31

2.54 SCA REJ RTI

Description: This field indicates the route index used to access the SCA call rejection announcement. The announcement is provided after the CPN (Calling Party number) has failed LASS SCA screening.

Software Release: 5E6 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

This route index must be defined on the RTIDX form (5303 Record).

2.55 SCA REJ BILL

Description: Will the calling party be billed for the SCA call rejection announcement, which is given when a TN has failed SCA screening?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.56 SCA GA FEAT

Description: This field contains the Generally Available SCA Feature.

Software Release: 5E6 and later
Required Field.
Default: /SCAGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names

Copyright © 2003 Lucent Technologies

starting with a slash (/) are reserved for preconstructed features.

Data Rules:

If a preconstructed feature is not used the constructed feature must be defined on the LSCAFD form (5975 Record).

COMPUTER ACCESS RESTRICT

The following fields (Section 2.57 -Section 2.59) are available with 5E6 and later Software Releases. They are use to define the global parameters that pertain to the LASS CAR (Computer Access Restriction) feature.

2.57 CAR MAX SZE

Description: This field indicates how many LASS CAR Screening List entries are permitted.

Software Release: 5E6 and later
Required Field.
Default: 6
Valid Entries: 3 - 31

2.58 CAR REJ RTI

Description: This field indicates the route index used to the CAR announcement. The announcement is provided after the CPN (Calling Party number) has failed LASS CAR screening.

Software Release: 5E6 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The route index must be defined on the RTIDX form (5303 Record).

2.59 CAR REJ BILL

Description: Will the calling party be billed for the LASS CAR announcement given after a CAR screening failure?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

SELECTIVE CALL REJECTION

The following fields (Section 2.60 -Section 2.65) are available with 5E6 and later Software Releases. They are used to define the global parameters that pertain to the LASS SCR (Selective Call Rejection) feature.

2.60 SCR MAX SZE

Description: This field indicates how many LASS SCR Screening List entries will be permitted.

Software Release: 5E6 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: 6
Valid Entries: 3 - 31

2.61 HARSH RTI

Description: This field indicates the route index used to access the SCR harsh announcement. The announcement is provided after the CPN (Calling Party Number) has failed LASS SCR screening.

Software Release: 5E6 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

This route index must be defined on the RTIDX form (5303 Record).

2.62 HARSH BILL

Description: Will the calling party be billed for the LASS SCR harsh announcement given after a SCR screening failure?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.63 GENTLE RTI

Description: This field indicates the route index used to access the SCR gentle announcement. The announcement is provided after the CPN (Calling Party Number) has failed LASS SCR screening.

Software Release: 5E6 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

This route index must be defined on the RTIDX form (5303 Record).

2.64 GENTLE BILL

Description: Will the calling party be billed for the LASS SCR gentle announcement given after a SCR screening failure?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.65 SCR GA FEAT

Copyright © 2003 Lucent Technologies

Description: This field contains the Generally Available SCR Feature Name.

Software Release: 5E6 and later
Required Field.
Default: /SCRGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

If a preconstructed feature is not used, the constructed feature must be defined on the LSCRFD form (5977 Record).

SELECTIVE DISTINCTIVE ALERT

The following fields (Section 2.66 - Section 2.67) are available with 5E6 and later Software Releases. They are used to define the global parameters that pertain to the LASS SDA (Selective Distinctive Alert) feature.

2.66 SDA MAX SZE

Description: This field indicates how many TNs may be entered into the SDA Screen List.

Software Release: 5E6 and later
Required Field.
Default: 6
Valid Entries: 3 - 31

2.67 SDA GA FEAT

Description: This field contains the Generally Available SDA Feature Name.

Software Release: 5E6 and later
Default: /SDAGA

Required Field.
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

If a preconstructed feature is not used the constructed feature must be defined on the LSDAFD form (5978 Record).

SELECTIVE CALL FORWARD

The following fields (Section 2.68 - Section 2.69) are available with 5E6 and later Software Releases. They are used to define the global parameters that pertain to the LASS SCF (Selective Call Forwarding) feature.

2.68 SCF MAX SZE

Description: This field indicates how many TNs may be entered into the SCF Screen List.

Software Release: 5E6 and later
Required Field.
Default: 6
Valid Entries: 3 - 31

Copyright © 2003 Lucent Technologies

2.69 SCF GA FEAT

Description: This field contains the Generally Available SCF Feature Name.

Software Release: 5E6 and later
Required Field.
Default: /SCFGA
Valid Entries: 1 to 8 characters long, with no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.

Data Rules:

If a preconstructed feature is not used the constructed feature must be defined on the LSCFFD form (5976 Record).

FORWARDING TREATMENT

The following fields (Section 2.70 - Section 2.72) are available with 5E6 and later Software Releases. They are used to define the global parameters that pertain to the LASS SCF and SCA/CAR features.

2.70 FORWARDING MAX

Description: This field indicates how many times a single call may forwarded sequentially.

Software Release: 5E6 and later
Required Field.
Default: 5
Valid Entries: 1 - 32

2.71 SIM INTER OFC FWD

Description: This field indicates how many simultaneous interoffice calls may be forwarded before busy tone is provided to the calling party.

Software Release: 5E6 and later
Default: 1
Valid Entries: 1 - 99

2.72 SIM INTRA OFC FWD

Description: This field indicates how many simultaneous intraoffice calls may be forwarded before busy tone is provided to the calling party.

Software Release: 5E6 and later
Default: 99
Valid Entries: 1 - 99

DISPLAY

The following field(s) (Section 2.73 -Section 2.74) applies to information displayed on CPEs (Customer Premises Equipment).

2.73 CNAM TCAP

Description: Enter the CNAM CCS TCAP query wait period (in seconds). When the CNAM TCAP timer is 3 seconds or less, there is no customer perceived delay to power ringing. If the CNAM TCAP timer value is set to greater than 3 seconds, the customer can experience a delay of as much as 3 seconds before the

Copyright © 2003 Lucent Technologies

start of power ringing. The delay can be as large as the difference between the CNAM TCAP timer value and 3. For example, a CNAM TCAP timer value of 5 could result in a delay of as much as 2 seconds. This delay is caused by waiting for the TCAP response before power ringing.

Software Release: 5E7 and later
Required Field.
Default: 3
Valid Entries: 1 - 6 (seconds)

2.74 CNAM SRC

Description: This field is used by the Originating Switch Calling Name feature to indicate whether the source for obtaining the calling name is from the SCP (Service Control Point) or from ODD (Office Dependent Data) stored locally on the switch. If CNAM SRC field is set to the default value of "Blank" then the Originating Switch Calling Name feature will be inactive.

Software Release: 5E13 and later
Default: Blank (feature inactive)
Valid Entries: Blank, ODD, or SCP

Data Rules:

The Originating Switch Calling Name feature is a secured feature. The ACT field for SFID 318 must be set to "Y" on the SFSYS form (Record 5713-1) before "ODD" or "SCP" can be entered in the CNAM SRC field.

GENERAL

The following field is available for 5E9(1) and later Software Releases. This field applies to information for LASS error treatment.

2.75 ERROR TREAT RTI

Description: Enter the route index for LASS error treatment. The LASS error announcement is provided by a 13A announcement channel via the RTI specified in this field. If the field is blank, reorder tone is provided. This field applies only to analog lines.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

CALL WAITING DELUXE

The following field defines the office parameter for Call Waiting Deluxe. This field supports the Call Waiting Deluxe Phase II Feature. This is a secured feature with SFID 145. For more information on this feature, see Division 2, Section 4A145.

2.76 AMA AGGR TIME

Description: Call Waiting Deluxe AMA Aggregation Time. A certain time of day is selected in which usage of the Call Waiting Deluxe conferencing is calculated for the purpose of billing.

Software Release: 5E10 and later
Default: 0
Valid Entries: 0 to 23 (selectable on the hour).

Copyright © 2003 Lucent Technologies

*AUDIBLE CALLING NAME ON *69 (AUTOMATIC CALLBACK)*

The following fields (Section 2.77 - Section 2.81) are available with 5E14 and later Software Releases. They are used to define the global parameters that pertain to the Audible Calling Name on *69 (Automatic Callback) feature.

2.77 IP DN

Description: Intelligent Peripheral's Dialing Number. This field is used to make a call to the Intelligent Peripheral for audible calling name treatment.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 15

Data Rules:

When IP DN is entered:

- IP DAS must be entered.
- IP SCR must be entered.

For 5E14 and later, Audible Calling Name on *69 (Automatic Callback) is a secured feature and must be purchased by the office before this field can be entered. Consequently, the ACT field for SFID 549 must be set to "Y" on the SFSYS form (5713-1 Record) before IP DN can be entered.

2.78 IP DAS

Description: Intelligent Peripheral's Directory Number Digit Analysis Selector. This field defines a digit analysis selector. It indicates which digit interpreter tables to use for analyzing intelligent peripheral's directory number.

Software Release: 5E14 and later
Valid Entries:

For 5E14 and earlier: Blank, or 1 - 99
For 5E15 and later: Blank, or 1 - 254

Data Rules:

When IP DAS or IP SCR is known, IP DN must be entered.

For 5E14 and later,

- if IP DAS entered on this form is defined on the DAS form (5300-1 Record), then LOCAL DIT (under LINE DAS) on the DAS form must be entered on the LDIT form (5300 Record) where CODE INDEX or CDI is entered, and all combinations of IP SCR entered on this form and CODE INDEX or CDI entered on the LDIT form must be entered on the RAR form (5301 Record) in the SCR and CDI fields respectively.
- the IP DAS assigned on this form must be defined on the DAS form.

2.79 IP SCR

Description: Intelligent Peripheral's Directory Number Screening Index. This field defines a screening index

Copyright © 2003 Lucent Technologies

used for digit analysis of the intelligent peripheral's directory number.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 4095

Data Rules:

When IP DN is entered:

- IP DAS must be entered.
- IP SCR must be entered.

2.80 IP ANS TIMER

Description: Intelligent Peripheral Audible Calling Answer Timer. This field defines a length of time after the switch initiates a call to the Intelligent Peripheral that the switch will wait for an answer before beginning error treatment.

Software Release: 5E14 and later
Required Field.
Default: 2.0
Valid Entries: 0.1 - 10.0 (in increments of 0.1 seconds)

2.81 IP DISC TIMER

Description: Intelligent Peripheral's Audible Calling Disconnect Timer. This field defines a length of time after the switch receives answer from the Intelligent Peripheral that the switch will wait for a disconnect from the Intelligent Peripheral before the switch itself initiates a disconnect to the intelligent Peripheral.

Software Release: 5E14 and later
Required Field.
Default: 3.0
Valid Entries: 0.1 - 10.0 (in increments of 0.1 seconds)

SEC. 5G: 5946 RECORD
LASS CHOKE LIST FORM - LASSCK

1. GENERAL

The 5946 Record is available with 5E5 and later Software Releases. This form allows an office to construct a list of TNs that cannot be camped-on during an AC (Automatic Callback) or AR (Automatic Recall) invocation because they are reserved for special applications like mass calling triggered by radio stations.

This form allows TNs to be entered uniquely on an NPA basis, a NOC basis, or an individual line basis.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.19.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * KEY

Description: Enter the key value which is always 0.

Required Field.
Valid Entries: 0

2.3 CHOKE NUMBERS

Description: The choke number list allows a maximum of 16 entries. This list of numbers will not be allowed to be camped-on to during an AC or AR invocation. The digits must be entered uniquely by a 3-digit NPA, a 6-digit NPA-NXX and/or a 10-digit NPA-NXX-XXXX.
Valid Entries: 3, 6, or 10 digits

- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

SEC. 5H: 5947 RECORD
LASS PREFIX EXCEPTION LIST - LASSPFX

1. GENERAL

The 5947 Record is available with 5E5 and later Software Releases. A prefix of 1 may be required by offices when dialing an NPA or an NPA-NXX. If an office selects to use a prefix, there may be some exceptions where a prefix cannot be used. If an office chooses not to use a prefix, there may be some exceptions where a prefix is needed. This form allows an office to create a list of TNs which are exceptions to the office standard.

This form allows the user to set aside a maximum of ten entries in the list which are an exception to the office prefix dialing standard. Each of the entries may be 3 (NPA) or 6 (NPA-NXX) digits in length.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * KEY

Description: The key value is always 0.

Required Field.
Valid Entries: 0

2.3 1+ PFX USED

Description: Is the office standard to accept DNs dialed with a 1 prefixed to a particular NPA or NPA-NXX?

If PFX USED is set equal to "Y", then 1+ NPA and/or 1+NPA-NXX is defined in the office dialing plan and will route to the DN.

If PFX USED is set equal to "N", then NPA and/or NPA-NXX is defined in the office dialing plan and will route to the DN.

Required Field.
Default: Y
Valid Entries: Y, N

2.4 EXCEPTIONS

Description: This is a list of up to ten dialable codes within an office that are exceptions to what the office prefix standard is for AC invocations. The Exception digits in each entry specify either a 3-digit NPA or a 6-digit NPA-NXX.

Any entries with only an NPA value will supersede the same NPA entered with an NXX value, thus wasting one exception entry (NPA-NXX).
Valid Entries: 3 or 6 digits

- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

Copyright © 2003 Lucent Technologies

Data Rules:

The Exception List entries must be unique.

SEC. 5I: 5948-1/2/3 RECORD PERFORMANCE MONITORING - THRESHOLD GROUP FORM - PMTHRESH

1. GENERAL

The PMTHRESH form (5948 Record) is available with 5E6 and later Software Releases. It is used to define a set of performance monitoring thresholds to be used by an individual BRI (Basic Rate Interface) or group of BRIs with ISLU (Integrated Services Line Unit) terminal facilities (DSL OE type "I"). (Any reference to ISLU also applies to RISLU (Remote Integrated Services Line Unit) terminal facilities.) For more information on ISLU assignments, see the DSL form (5907 Record).

For 5E8 and later, the PMTHRESH form was modified to include performance monitoring for IDCU (Integrated Digital Carrier Unit) facilities (DSL OE types "G" and "M") and DFI-2 (Digital Facility Interface-2) terminal facilities. To accommodate these additional facilities, the 5948 Record was expanded to 5948-1/2/3. For information on IDCU and DFI-2, see the EQIDCU form (5846 Record) and the EQDUP form (5730 Record), respectively.

Performance monitoring is the ability to collect and report performance data for terminal facilities. The operating company has the ability to inhibit and allow the setting and reporting of performance monitoring thresholds.

Performance monitoring applies to all U-cards (5E4(2) and later Software Releases), however, not all of the performance monitoring threshold values apply to each individual U-card. If a certain threshold does not apply, no alert or report data will be generated for that particular U-card.

For 5E6 and later, two types of thresholds are defined on this form: Alert Thresholds and Report Thresholds. Alert thresholds are provided for autonomous alerting when the corresponding current hour or current daily threshold values are reached. The two types of current hour and current daily thresholds are ES (Errored Seconds) and SES (Severely Errored Seconds). These values apply to both directions of BRI transmission, and can be set per performance monitoring group or per U-BRI. Both threshold types should be updated periodically via special port conditioning to ensure their correctness.

The two types of ALE (Automated Line Evaluation) Report thresholds are current interval thresholds and current daily thresholds. The current interval threshold can be set in increments of one hour up to twenty-four hours; if the interval is twenty-four hours, the daily interval report will be generated in place of the current interval report. When one of these report threshold values is exceeded for a particular U-BRI, report data will be sent to the MCC (Maintenance Control Console), SCCS (Switching Control Center System), or ALIT (Automatic Line Insulation Test) channel. Both the current interval and current daily reports contain the following data:

- Line equipment identification
- Current interval or current daily ES or SES counts for both directions of transmission (upstream and downstream)
- Interval or daily threshold for this particular U-BRI
- Indication if counts have been corrupted by either clearing or corrupting Cyclic Redundancy Code tests.

For DSL, the DSL INH GRP field allows you to inhibit performance monitoring for a particular PM GRP name. If activated, all other "inhibit" values for that same DSL PM GRP set on this form will be overridden. (This capability is not available for IFAC and DFI-2 PM groups.)Manual on-demand performance monitoring reports are also available, but require no specific data entered via the 5948 Record. However, if an interval report is being generated at the time of an on-demand request for a

Copyright © 2003 Lucent Technologies

manually generated report, the craft will be informed to retry their request at another time.

Only one report threshold applies to the ANSI U-card; this threshold is the Daily Report Threshold.

For 5E8 and later, additional performance monitoring thresholds were added for IDCU/IFAC and DFI-2 facilities, as follows:

For IDCU/IFAC:

- FLS (Frame Loss Second) - A loss of frame alignment occurs when there are 2 or more framing bit errors out of 4 consecutive framing bits.
- SS (Slip Second) - A slip second is counted whenever one or more slip events occur during a given 10-second interval. A slip event is the insertion or deletion of data bits into or from the data stream and is the direct result of equipment buffer overflow or underflow resulting from improperly timed network equipment.
- UAS (Unavailable Second) - A second with a failed signal condition.

For DFI-2 facilities:

- BPV (Bipolar Violation) - A BPV is a violation of bipolar line coding in which two logically level consecutive pulses occur with the same polarity, excluding B8Zs coding.
- BES (Bursty Errored Second) - A second with at least one, but less than 320, CRC-6 errors.
- COFA (Change of Frame Alignment) - One COFA count is pegged for one or more COFA events in a 10 second interval. A COFA event is declared after a LOFA (Loss of Frame Alignment) (2 or more framing bit errors out of 4 consecutive framing bits) if the current frame alignment is incorrect.
- FS (Failed Second) - A second with a Failed Signal condition: Local "red alarm", AIS (Alarm Indication Signal) "blue alarm", or framing bit error (FER). During a failed second, ES, SES, BES, and SS are not accumulated.
- CRC (Cyclic Redundancy Check) - A cyclic redundancy check error occurs when the computed CRC-6 code for the incoming signal does not match the received code. This event applies only to DS1 Extended Superframe Format (ESF).

For 5E6 and later, the following preconstructed and office default PM groups were available for DSL: /PMGDEF, PMDEF. For 5E8 and later, the DFI-2 PM group was enhanced to include data support. In addition, the following preconstructed groups and office default PM groups were added for IFAC (IDCU Facilities) and DFI-2 facilities, respectively: /FACGDEF; FACDEF and /DF2GDEF; DF2DEF. These are shown in Figures 1 and 2. The maximum number of PM GRPs per PM TYPE is 256 including the switch-owner default group. (Note that the switch-owner default group cannot be deleted via Recent Change.)

Each DSL, IFAC, or DFI-2 PM GRP name must also have associated threshold values defined on this form. If a value is not entered for a particular threshold, a threshold value will be set with the default values from the switch-owner default group record. If switch-owner default thresholds are also not entered, the ODA preconstructed thresholds will be used.

Values from the ODA preconstructed PM GRP records can be used as "templates" to enter and change thresholds for a DSL, IFAC, or DFI-2 group. These values cannot be directly assigned for a PM GRP on the respective ISLULC form (5942 Record), DSL form (5907 Record), EQIFAC form (5847 Record), or the EQDUP form (5730 Record).

Copyright © 2003 Lucent Technologies

1.1 Recent Change View

This record is equivalent to Recent Change view 22.15.

2. FORM ENTRIES - 5948-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *PM GRP

Description: Define the performance monitoring group.

This field is used to define a name for a PM group. The name defined must be different from the ODA preconstructed default groups and the switch-owner default groups shown in Figures 1 and 2. The maximum number of PM GRPs allowed per PM type is 256 including the switch owner default group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Performance Monitoring groups entered on the ISLULC form (5942 Record) with PM TYPE of "DSL" must be defined on this form.

Performance Monitoring groups entered on the EQIFAC form (5847 Record) with PM TYPE of "IFAC" must be defined on this form.

Performance Monitoring groups entered on the EQDUP form (5730 Record) with PM TYPE of "DFI2" must be defined on this form.

For 5E6 and later, if an ISDNOPT form (5941 Record) is entered indicating ISDN SMs in a switch office, PM GRP must have "PMDEF" entered.

For 5E7 and later, the total number of PM forms, which is the sum of the number of PMTHRESH forms and (for 5E9(2) and later) the number of DNUPM forms (5951 Record), must not exceed the MAX NO THR GRPSon the OFCOPT form (5509 Record).

For 5E8 and later, if an ISDNOPT form (5941 Record) is entered indicating ISDN SMs in a switch office, PM GRPs must have "PMDEF", "FACDEF", or "DF2DEF" entered.

2.3 #PM TYPE

Description: Enter the Performance Monitoring Type.

Required Field.

Valid PM TYPE Entries	
DSL	Digital Subscriber Line.
IFAC	Software Release: 5E8 and later IDCU Facility.
DFI2	Software Release: 5E8 and later DFI-2 Facility.

Data Rules:

When PM TYPE is "DSL", only the fields under PERFORMANCE MONITORING (DSL) can be entered.

Copyright © 2003 Lucent Technologies

When PM TYPE is "IFAC", only the fields under PERFORMANCE MONITORING (IFAC) can be entered.

When PM TYPE is "DFI2", only the fields under PERFORMANCE MONITORING (DFI2) can be entered.

2.4 INH PM

The name of this field was changed to DSL INH GRP in 5E8. This field name applies to 5E6 - 5E7. See DSL INH GRP for usage information.

2.5 DSL INH GRP

Description: Is Performance Monitoring inhibited for the DSL group? (This field was called INH PM for 5E6 - 5E7.) If "Y" is entered, all other inhibited entries for DSL on this form will be overridden.

Software Release: 5E8 and later
Valid Entries: Y, N

2.6 REMARKS

Description: Enter any desired remarks up to thirty-two characters in length.
Valid Entries: 1 - 32 characters.

PERFORMANCE MONITORING THRESHOLDS (DSL)

DSL PATH ALERT

The following fields (Section 2.7 - Section 2.12) are used to set DSL Alert threshold values. If values are not entered, switch-owner default or ODA preconstructed values will be defaulted, respectively.

2.7 CUR HR ES

Description: Enter the Alert Threshold for Current Hour Errored Seconds.

This threshold entry represents the number of errored seconds allowed before the current hour alert count is considered to have too many errors.
Valid Entries: 1 - 255

2.8 CUR HR SES

Description: Enter the Alert Threshold for Current Hour Severely Errored Seconds.

This threshold entry represents the number of severely errored seconds allowed before the current hour alert count is considered to have too many errors.
Valid Entries: 1 - 127

2.9 INH CUR HR

Description: Are performance monitoring current hour reports inhibited for all ANSI U-interface cards associated with this PM group?
Valid Entries: Y, N

2.10 CUR DAY ES

Description: Enter the Alert Threshold for Current Day Errored Seconds.

This threshold entry represents the number of errored seconds allowed before the current day alert count is considered to have too many errors.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 4095

2.11 CUR DAY SES

Description: Enter the Alert Threshold for Current Day Severely Errored Seconds.

This threshold entry represents the number of severely errored seconds allowed before the current day alert count is considered to have too many errors.
Valid Entries: 1 - 2047

2.12 INH CUR DAY

Description: Are performance monitoring current day reports inhibited for all ANSI U-interface cards associated with this PM group?
Valid Entries: Y, N

DSL REPORTS

The following fields (Section 2.13 - Section 2.18) are used to set Report threshold values for DSL reports.

2.13 CUR INT ES

Description: Enter the Alert Threshold for Current Interval Errored Seconds.

This threshold entry represents the number of errored seconds allowed before the current interval alert count is considered to have too many errors.
Valid Entries: 1 - 255

2.14 CUR INT SES

Description: Enter the Alert Threshold for Current Hour Severely Errored Seconds.

This threshold entry represents the number of severely errored seconds allowed before the current interval alert count is considered to have too many errors.
Valid Entries: 1 - 127

2.15 INH CUR INT

Description: Are performance monitoring reports for current interval reports inhibited for all ANSI U-interface cards associated with this PM group?
Valid Entries: Y, N

2.16 CUR DAY ES

Description: Enter the Report Threshold for Current Daily Errored Seconds.

This threshold entry represents the number of errored seconds allowed before the current day alert count is considered to have too many errors.
Valid Entries: 1 - 4095

2.17 CUR DAY SES

Description: Enter the Report Threshold for Current Day Severely Errored Seconds.

This threshold entry represents the number of severely errored seconds allowed before the current day alert count is considered to have too many errors.
Valid Entries: 1 - 2047

Copyright © 2003 Lucent Technologies

2.18 INH CUR DAY

Description: Are performance monitoring current day reports inhibited for all ANSI U-interface cards associated with this PM group?
Valid Entries: Y, N

3. FORM ENTRIES - 5948-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 *PM GRP

Description: Define the performance monitoring group.

PERFORMANCE MONITORING THRESHOLDS (IFAC)

IDCU FACILITY LINE ALERTS

The following fields (Section 3.3 - Section 3.8) are used to set IDCU performance monitoring threshold values for line alerts. If values are not entered, switch-owner default or ODA preconstructed values will be defaulted, respectively.

3.3 CUR INT ES

Description: Enter the alert threshold for the IDCU line Current Interval Errored Seconds.

Software Release: 5E8 and later.
Valid Entries: 1 - 4095

3.4 CUR INT SES

Description: Enter the alert threshold for the IDCU line Current Interval Severely Errored Seconds.

Software Release: 5E8 and later.
Valid Entries: 1 - 4095

3.5 INH CUR INT

Description: Is the IDCU line Current Interval alerts Inhibited?

Software Release: 5E8 and later.
Valid Entries: Y, N

Data Rules:

When IDCU line INH CUR INT is entered, IDCU path INH CUR INT must be entered and must be identical.

When IDCU line INH CUR INT is not entered, IDCU path INH CUR INT must not be entered.

3.6 CUR DAY ES

Description: Enter the alert threshold for the IDCU line Current Daily Errored Seconds.

Software Release: 5E8 and later.

SEC. 5K: 5950 RECORD
REMOTE BUSY VERIFY ROUTING FORM - RBVRTI

1. GENERAL

The 5950 Record is available with 5E8 and later Software Releases, and is used to specify routing parameters for RBV (Remote Busy Verify). RBV provides the ISAT (ISDN Attendant) on a 5ESS Switch the ability to busy verify any analog or ISDN line on a remote 5ESS Switch using a dedicated network of ISAT BVTs (Busy Verify Trunks). Lines on the remote 5ESS Switch are busy verifiable only if associated with an incoming ISAT BVT. For how various types of TNs are associated, see Division 2, Section 1T.

1.1 Expanded Definition

ISAT RBV is similar to ISAT Busy Verification of DNs introduced in the 5E4(2) Software Release, with the added capability allowing busy verification of DNs on a remote 5ESS Switch. The following scenario occurs:

1. When the ISAT verifies a DN on a remote 5ESS Switch, the originating 5ESS Switch routes the call to an ISAT BVT. The translated digits of the DN to be busy verified are outpulsed over the outgoing ISAT BVT to the remote 5ESS Switch.

2. The terminating 5ESS Switch checks that the DN is valid and is remote busy verifiable.

3. If the DN is busy and verifiable, the incoming call from the ISAT across the ISAT BVT is bridged onto the active call. The bridging capability is possible only if the busy verifiable DN has a busy verify terminating feature assigned. (where verification barge-in cannot occur, tones are returned from the far 5ESS Switch: high tone for OOS, reorder tone for all else.)

4. If the DN is idle and verifiable, the call alerts as a normal incoming call and the ISAT hears audible alerting.

5. If the called party answers, the ISAT and the called party can converse.

In both the barge-in and idle case, all parties hear a 300 msec, 440 Hz tone from the ISAT's 5ESS Switch every 6 seconds while the ISAT is connected. After 30 seconds, the ISAT is automatically disconnected by the ISAT's 5ESS Switch. During the busy verification call, the ISAT display indicates Remote Busy Verify. This limited display capability is due to the remote 5ESS Switch's inability to provide information over an ISAT BVT to fully populate the DN status display.

DNs may be associated with an ISAT BVT group (via an RBV TGN) or an Attendant Multi-Line Hunt Group (via an ATT MLHG), but not both. Also, ISAT BVTs cannot be of the CCS6 (Common Channel Signaling System 6) or SS7 (Signaling System 7) type.

1.2 Differences Between Remote and Local Busy Verify

Note that operation of the Local Busy Verify feature is not changing. All aspects, except the administration of the types of tones, of the Local Busy Verify feature mentioned in this section describe the existing operation of the feature. Local Busy Verify, in order to be compatible with Remote Busy Verify, changes in terms of what kind of tone is administered for certain failure cases. Upon implementation of RBV, reorder tone is applied for all failure cases when barge-in is not allowed due to the state of the line (Note: An OOS line still is administered high tone.). Reorder tone is applied for the Local Busy Verify case where the DN is not associated with an ISAT group.

The purpose of this section is to identify the differences between operation of the Busy Verify feature whether it is applied to a DN on the attendant's switch, or on a remote switch. The differences are listed below:

Copyright © 2003 Lucent Technologies

- For an ISDN attendant to do busy verification on a remote switch, the DN on the remote switch must be associated with an ISAT BVT. For the Local Busy Verify case, the DN to be busy verified must be associated with the ISAT.
- When busy verifying a DN on a remote switch, the ISAT's display indicates Remote Busy Verify. For a DN on the attendant's switch, the display shows a special Busy Verify display which indicates the status of the DN.
- In the case where the DN being busy verified is idle, the attendant may converse with the party as long as desired with no tones being given if the DN is local to the attendant's switch. However, if the DN is remote, the attendant may only be connected for 30 seconds, and barge-in tones are given to all parties every 6 seconds while they are conversing.
- Using FORCED RELEASE during the busy verification of a local DN forcibly disconnects all parties during a barge-in. For a remote DN, FORCED RELEASE simply drops the attendant from the call.

1.3 Recent Change View

The corresponding Recent Change View for this form is 4.63.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ISAT MLHG

Description: Enter the ISAT Attendant MLHG on this switch that can busy verify TNs in a remote switch.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

The ISAT MLHG entered must equal MLHG on an MLHG form (5110 Record), and MLHG FEATURE on that MLHG form must equal FEATURE NAME on a corresponding MLHGFD form (5604 Record), with that MLHGFD form having a HUNT TYPE of "ISAT".

2.3 * RTI

Description: Enter the route index which normally routes a call to the switch for non-data calls.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E13 and earlier: 1 - 4095
- For 5E14 and later: 1 - 16382

Data Rules:

The values entered for RTI and REMOTE RTI cannot be the same.

The RTI entered must equal ROUTE INDEX on the RTIDX form (5303 Record), and TRUNK GROUP NUMBER on that RTIDX form must equal TGN on the TKGRP form (5202 Record).

Copyright © 2003 Lucent Technologies

2.4 # REMOTE RTI

Description: Enter the route index used to route across an ISAT BVT to busy verify a TN on a remote switch.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

The values entered for RTI and REMOTE RTI cannot be the same.

The REMOTE RTI entered must equal ROUTE INDEX on the RTIDX form, and TRUNK GROUP NUMBER on the RTIDX form must equal TGN on the TKGRP form. Also, on the TKGRP form, TRK DIR must be "OUT", TRKCLS must be "ATNDVFY", and ISAT MLHG must equal the ISAT MLHG on the RBVRTI form.

2.5 RTI TGN

Description: This is a Recent Change field only.

2.6 REMOTE RTI TGN

Description: This is a Recent Change field only.

SEC. 5L: 5951-1/2 RECORD
DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM-2000) - DNUPM

1. GENERAL

The 5951 Record is available with 5E9(2) and later Software Releases. It is used to define the performance monitoring thresholds on a DS1 (Digital Signal Level 1), VT (Virtual Tributary), and STSX-1 (Synchronous Transport Signal DNU-S interface) for the DNU-S (Digital Networking Unit - SONET). For more information on DNU-S, see Division 2, Section 9C.

The SONET digital switch interface terminates the STSX-1 interface for the intraoffice environment. It is a 51.84 Mb/s electrical interface and it is limited to a maximum of 900 feet. DNU-S only supports digital trunks.

The STSX-1 interface is made up of the following layers:

- STE (SONET Termination Equipment)
  - Section
  - Line
- STS-1 Path
- VT1.5 Path (Virtual Tributary)
- DS1 Path

The Section and Line layers have been combined and are referred to as the STE (SONET Termination Equipment). The STE, as well as the STS-1, VT1.5, and DS1 can each be considered a separate "facility". The STE, VT, and DS1 facilities can have failures (and thus alarms) associated with them, each can have performance monitoring, and each can be removed from service. Therefore, the STSX-1 interface is operated, administered, provisioned, and maintained based on these subtending facilities. Each of these facilities are defined as follows:

- **STE**

  The STE represents the termination of the Section and Line on the DNU-S. The STSX-1 interface carries a single STS-1.

- **STS-1**

  The STS-1 represents the termination of the STS-1 path on the DNU-S. The STS-1 carries up to 28 VT1.5 tributaries.

- **VT1.5**

  The VT1.5, a 1.728 Mb/s facility, carries one DS1. The VT1.5 tributaries consist of asynchronous mapped DS1s in a floating mode of operation.

- **DS1**

  The DS1 facility is similar to existing DS1 (Digital Signal Level 1) facilities. It is a 1.544 Mb/s facility which carries up to 24 DS0s (64 kb/s).

1.1 Performance Monitoring Threshold Group

Copyright © 2003 Lucent Technologies

The DS1S (Digital Signal Level 1 SONET), VT1, and STE facilities may be monitored. The DNU-S Performance Monitoring Threshold Group allows a user to review, insert, update, and delete performance monitoring groups on a DNU-S for these facilities.

Two types of default PM (Performance Monitoring) groups contain the default data for the PM Group. The Generic default PM group contains the default data for the switch, and it cannot be changed. It is for review only. The PM Group name begins with a "/" for Generic default data. The Office default PM Group can be updated or reviewed, but it cannot be deleted. (See PM GROUP field for an explanation of the Office default PM group versus the Generic default PM group.)

In addition to the default PM Group data, data can be defined for customized PM Groups. In defining a customized PM Group, the fields that are not entered are automatically populated from the Office Default PM Group data. If the field is not defined in the Office Default PM Group (e.g. were nulled out) then the corresponding value from the Generic PM Group will be used.

1.2 Recent Change View

The corresponding Recent Change View for this form is 20.25.

2. FORM ENTRIES - 5951-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PM GROUP

Description: The Performance Monitoring Group name defines the group for the error thresholds that will be inherited by every facility assigned to this group. Users may set their own performance monitoring office defaults by customizing the office default PM (Performance Monitoring) groups: DS1SDEF, STEDEF, and VT1DEF.

There are two pre-defined performance monitoring groups each for DS1, VT1, and STE. PM GROUPs beginning with a "/" are Generic default groups. The Generic default groups may not be assigned to a facility, nor may they be updated or deleted. PM GROUPs that do not begin with a "/" are Office default groups. These may be assigned and/or updated, but may not be deleted. In addition, customized PM GROUPs can be created.

The following Generic default PM GROUPs designated as
- /STEGDEF - STE Generic Default
- /VT1GDEF - VT Generic Default
- /DS1SGDF - DS1S Generic Default

are for review only and cannot be updated or deleted.

The fields in the following Office default PM GROUPs designated as
- STEDEF - STE Office Default
- VT1DEF - VT Office Default
- DS1SDEF - DS1S PM Office Default

are for review and can be updated. The form/record cannot be deleted. (See Figure 1 and Figure 2 for the default data for PM groups.)

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 8 characters

Data Rules:

For every office, DNUPM forms must be defined with a PM GROUP of "/DS1SGDF", "DS1SDEF", "/STEGDEF", "STEDEF", "/VT1GDEF" and "VT1DEF".

PM GROUP entries on the DNUPM form must not be duplicated with PM GRP entries on the PMTHRESH form.

No more than 50 unique PM GROUP names are allowed per SM from the combination of PM GROUP(S) defined on EQSTE form(s) (5857 Record) as STE PM GROUP, and defined on EQVT form(s) (5858 Record) as VT PM GROUP and DS1S PM GROUP.

The "Total Number of PM forms" (the sum of the number of PMTHRESH forms and the number of DNUPM forms) must NOT exceed the entry in the MAX NO THR GRPS field on the OFCOPT form (5509 Record).

2.3 # PM TYPE

Description: The Performance Monitoring Group Type indicates the type of equipment to monitor.

Required Field.

Valid PM TYPE Entries

Entry	Definition
DS1S	Digital Signal Level 1 SONET facility
VT1	Virtual Tributary 1.5 facility
STE	SONET Termination Equipment facility (Section and Line)

Data Rules:

DS1S
If "DS1S" is entered, then only the fields on this form for DS1S can be entered.

The DS1S PM GROUP defined on an EQVT form must have a corresponding DNUPM form with a PM TYPE of "DS1S". The forms correspond if the DS1S PM GROUP entry on the EQVT form is the same as the PM GROUP entry on this form.

STE
If "STE" is entered, then only the fields on this form for the STE can be entered.

The STE PM GROUP defined on an EQSTE form must have a corresponding DNUPM form with a PM TYPE of "STE". The forms correspond if the STE PM GROUP entry on the EQSTE form is the same as the PM GROUP entry on this form.

VT1
If "VT1" is entered, then only the fields on this form for the VT can be entered.

The VT PM GROUP defined on an EQVT form msut have a corresponding DNUPM form with PM TYPE of "VT1". The forms correspond if the VT PM GROUP entry on the EQVT form is the same as the PM GROUP entry on this form.

2.4 REMARKS

Description: Enter any remark for the Performance Monitoring group. This remark is associated with the data used for defining performance monitoring groups.
Valid Entries: 1 - 32 characters.

STE SECTION ALERTS (SSA)

The following fields (Section 2.5 - Section 2.6) define the thresholds for STE Section.

2.5 CUR INT SEFS

Description: Enter the threshold for DNU-S STE section alerts for severely-errored frame seconds in the current 15 minute interval.
Valid Entries: 1 - 225 (seconds)

2.6 CUR DAY SEFS

Description: Enter the threshold for DNU-S STE section alerts for severely-errored frame seconds for the current day.
Valid Entries: 1 - 21600 (seconds)

STE LINE ALERTS (SLA)

The following fields (Section 2.7 - Section 2.10) define the thresholds for STE Line.

2.7 CUR INT ES

Description: Enter the STE Line alert threshold for errored seconds in the current 15 minute interval.
Valid Entries: 1 - 225 (seconds)

2.8 CUR INT SES

Description: Enter the threshold for DNU-S STE line alerts for severely-errored seconds in the current 15 minute interval.
Valid Entries: 1 - 225 (seconds)

2.9 CUR DAY ES

Description: Enter STE Line alert threshold for errored seconds in the current day.
Valid Entries: 1 - 21600 (seconds)

2.10 CUR DAY SES

Description: Enter the threshold for DNU STE line alerts for severely-errored seconds in the current day.
Valid Entries: 1 - 21600 (seconds)

2.11 STE INH CUR DAY

Description: Should the performance monitoring alerts for the DNU-S STE Line and Section for the current day be inhibited?
Valid Entries: Y, N

2.12 STE INH CUR INT

Description: Should the performance monitoring alerts for DNU-S STE Line and Section for the current 15 minute interval be inhibited?
Valid Entries: Y, N

SEC. 5M: 5952 RECORD
ISLU2 LINE BOARD FORM - ISLULB

1. GENERAL

The 5952 Integrated Services Line Unit 2 Line Board Record is available with the 5E10 and later Software Releases. It is used to define the Line Boards equipped in an ISLU-2.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.3 *ISLU

Description: Enter the Integrated Services Line Unit Number.

Required Field.
Valid Entries: Enter 0 - 7 for an ISLU2 on an SM or 0 - 42 for an ISLU2 on an SM2000.

Data Rules:

An ISLU unit number entered on the ISLULB form must be defined on an EQISLU form with a UNIT TYPE of "ISLU2".

2.4 * LG

Description: Enter the ISLU2 Line Group.

Required Field.
Valid Entries: 0 - 15

LINE BOARDS

Up to eight Line Boards can be equipped on each Line Group. Each Line Board has eight circuits. For each Line Board entered, the TYPE, EQST, CLI and SPARE CKT fields must be entered. At least one Line Board must be specified.

When an ISLU2 is mounted at EQUIPMENT VERTICAL "41" or when two ISLU2s are mounted in the same SWITCHING MODULE and EQUIPMENT BAY, a secondary LIBD cannot be assigned to the unit(s). Therefore ISLU2 LINE Boards 4-7 cannot be assigned on any of the ISLULB forms associated with the unit(s).

For each POS (Position) in which a line card is equipped, enter the following fields.

Copyright © 2003 Lucent Technologies

2.5 TYPE

Description: Enter the Line Card type.

Valid TYPE Entries

Entry	Definition	J-Drawing/List
ULBD	5E10 MPU1B ISLU-2 U line board	J5D004AL-1, L60-A CLI: 20000
	5E10 MPU2 ISLU-2 U line board	J5D004AL-1, L61 CLI: 40000
TLBD	5E10 MPT1 ISLU-2 T line board	J5D004AL-1, L80 CLI: 80000
WLBD	ISLU-2 W line board	Not determined. CLI: 0

Data Rules:

When TYPE is "TLBD" or "WLBD", SPARE CKT must be "N".

For RDTAPORT forms that are defined with RDTA OE TYPE set to "K", the RDTA OE NUMBER must be defined on a ISLULB form as SM or ISLU or LG or LB with TYPE set to "TLBD" or "ULBD" and EQST set to "O". (Note: RDTA OE is aaabbccd□, where aaa is SM, bb is ISLU, cc is LG and d is LB POS)

An OE defined on the DSLAP form with OE type of "K" and/or DSL OE defined on the DSL form with a DSL OE type of "K" must be defined as an equipped and operational U or T Board on the ISLULB input form.

When the ISLULB form has an SM/ISLU/LG/LBD combination value that matches a DSL form DSL OE field, where OE TYPE is set to "K", and the DSL CLS field is set to "STD", the ISLULB form, TYPE field indicated by the POS field matched, must be "ULBD" or "TLBD".

2.6 EQST

Description: Enter the Equipment Status of the Line Board.

Valid EQST Entries

Entry	Definition
G	Growth Status.
O	Operational Status.
U	Unequipped Status.

Data Rules:

Only "O", status is allowed in new offices and equipment additions.

For Preliminary Retrofit or Retrofit Processing, equipment can not be marked as "G".

ISLULB forms that have at least one LINE BOARD list element entry with an EQST of "O" or "G", the corresponding EQISLU form must have COMMON DATA EQST equal to "O".

2.7 CLI

Description: Enter the Change Level Indicator of the Line Board. For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.
Valid Entries: 0 - 7fffffff (hexadecimal)

2.8 SPARE CKT

Description: Is a spare line circuit available on this line board. Enter "Y" or "N". "Y" can only be used in POS 0 on LG 0, 8 or in POS 3 on LG 7, 15.
Valid Entries: Y - N

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E10 and later, when SPARE CKT equals "Y" on a line board on the ISLULB forms, circuit 0 associated with the board cannot be used for DSL assignments.

SEC. 5N: 5957 RECORD
REMOTE PERIPHERAL SITE MISCELLANEOUS ALARMS - RPMA

1. GENERAL

The 5957 Record is available with 5E12 and later Software Releases. It is used to define information about RPMA (Remote Peripheral Miscellaneous Alarm) scan points. This form was implemented with the Remote AIU (Access Interface Unit) feature (99-5E-3506). See Division 2, Section 9O.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.24.

2. FORM AND RECORD ENTRIES

3. BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

3.1 *SM

Description: Enter the Switch Module identification number.

3.2 *RP NO

Description: Enter the Remote Peripheral Number.

Required Field.
Valid Entries: 1 - 127

3.3 *RP TYPE

Description: Enter the Remote Peripheral Number.

Required Field.

Valid RP TYPE Entries

Entry	Description
EAIU	Remote AIU.
RISLU	Remote ISLU (ISDN Line Unit).

Data Rules:

When "EAIU" is entered, the corresponding SM/AIU/AIU TYPE must exist on the EQAIU form.

3.4 *POINT NBR

Description: Enter the Point Number.

Required Field.
Valid Entries: 1 - 5

3.5 IN USE

Description: Is the Scan Point operational?

Required Field.

Copyright © 2003 Lucent Technologies

Default: Y
Valid Entries: Y, N

3.6 #NORMAL STATE

Description: Enter the state of the alarm point.

Required Field.

Valid NORMAL STATE Entries

Entry	Description
OPEN	Activated.
CLOSED	Not Activated.

3.7 MCC NAME

Description: Enter the alarm name to be displayed on the MCC (Master Control Center).
Valid Entries:

Blank, or up to 8 characters (backslash and quotes not allowed)

3.8 TTY NAME

Description: Enter the alarm name to be displayed on the TTY (Teletypewriter).
Valid Entries:

Blank, or up to 20 characters (quotes not allowed)

3.9 ALARM LEVEL

Description: Enter the Alarm Level.

Required Field.

Default: MIN

Valid ALARM LEVEL Entries

Entry	Description
CRIT	Critical.
MAJ	Major.
MIN	Minimum.

SEC. 5O: 5990 RECORD
PSU PIPE - PSUPIPE

1. GENERAL

The PSU (Packet Switching Unit) Pipe form (5990 Record) is available with the 5E16(2) FR 1 and later Software Releases. It is used to define a PSU Pipe consisting of a T1 or E1 facility terminating on a PH (Protocol Handler). This form supports the SAAL (Signaling ATM (Asynchronous Transfer Mode) Adaptation Layer) SS7 (Signaling System 7) High Speed Signaling Links feature (99-5E-7451). For more information on this feature, see Division 2, Section 4A670.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.25.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: The SM (Switching Module) field is used to specify a SM number associated with the PSU (Packet Switching Unit).

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

For each PSUPIPE form, there must exist a matching PSUGP form (5949 Record) with the PH TYPE for the CHANNEL GROUPS set to "PH31".

2.3 * PSU PIPE

Description: This field is used to identify which PSU PIPE is used for the SAAL.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: Enter up to 8 alphanumeric characters.

2.4 PSU

Description: This field is used to identify the PSU number.

Software Release: 5E16(2) and later
Valid Entries: 0

2.5 # SHELF

Description: This field is used to indicate the PSU shelf that the PH (Protocol Handler) is equipped with.

Software Release: 5E16(2) and later
Valid Entries: 0 - 4

Copyright © 2003 Lucent Technologies

2.6 # CHAN GROUP

Description: This field is used to specify the logical shelf position of the PH.

Software Release: 5E16(2) and later
Valid Entries: 0 - 15

2.7 CH GRP MEMBER

Description: This field is used to specify the channel group member.

Software Release: 5E16(2) and later
Valid Entries: 0

2.8 # OE

Description: This field is used to specify the equipment type.

Software Release: 5E16(2) and later
Valid Entries:

Valid OE Entries

Entry	Definition
D	NEN (Networking Equipment Number)
N	DEN (Digital Equipment Numbers)

OE TYPE D

Entry	Definition
SM	[001-192]
DLTU	[000-011]
DFI	[01-10]
DBCHAN	[01-48]

OE TYPE N

Entry	Definition
SM	[001-192]
DNUS	[0-7]
DG	[0-1]
STE	[1-6]
STS	[1]
VTG	[1-7]
VTM	[1-4]
DS0	[01-24]

Data Rules:

When OE is "D":

- the DBCHAN part of the OEN must be "01" or "25".
- there must be a matching EQDUP form (5730 Record). If the EQDUP form exists, then DFI USAGE must be "TRUNK", "APPL" must be unknown, and DFI MODE must be "FE8Z" on this EQDUP form.

  - ***NOTE:*** An associated EQDUP form is found by matching the first 8 digits of the DEN on the PSUPIPE form with the concatenated value of SM, DLTU and DFI PACK NBR on the EQDUP form. Also, use FAC 0 on the EQDUP form if the last 2 digits of DEN on the PSUPIPE form is "01"', else use FAC 1 if the last 2 digits of DEN on the PSUPIPE form is "25".

When OE is "N":

- the ds0 part of the OEN must be "01".

Copyright © 2003 Lucent Technologies

- there must be a matching EQVT form (5858 Record). If the EQVT form exists, then APPLICATION TYPE must be "TRUNK", FRAME must be "ESF", and ZCS must be "N" on the EQVT form.

The NENs (Networking Equipment Numbers) must be uniquely assigned on the EQVT form.

The DENs (Digital Equipment Numbers) must be uniquely assigned on the EQVT form.

2.9 MAC LAYER

Description: This field is the Media Access Control Layer of a PSU PIPE.

Software Release: 5E16(2) and later
Valid Entries: ATM

Data Rules:

MAC LAYER must be "ATM".

2.10 APPL LAYER

Description: This field indicates the application type residing on the PSU PIPE. This is a display only field.

Software Release: 5E16(2) and later

ATM LAYER

The following fields (Section 2.11 - Section 2.21) are display only fields used as virtual path indicators.

2.11 MAC VPCS

Description: This field is used to display the maximum number of Virtual Path connections.

Software Release: 5E16(2) and later

2.12 MAX VCCS

Description: This field is used to display the maximum number of Virtual Channel connections.

Software Release: 5E16(2) and later

2.13 VPI BITS

Description: This field is used to display the number of VPI (Virtual Path Indicator) bits allocated for storing the Virtual Path Indicator.

Software Release: 5E16(2) and later

2.14 VCI BITS

Description: This field is used to indicate the number of VCI (Virtual Circuit Indicator) bits allocated for storing the Virtual Path Indicator.

Software Release: 5E16(2) and later

2.15 VPI

Description: This field is used to display the ATM (Asynchronous Transfer Mode) VPI.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later

2.16 VCI

Description: This field is used to display the ATM VCI.

Software Release: 5E16(2) and later

2.17 PCPS

Description: This field is used to display the bandwidth of a point-to-point connection divided by 53 bytes per ATM cell for a T1 ATM PSU PIPE supporting SAAL (Signaling Link ATM Adaptation Layer) High Speed Links.

Software Release: 5E16(2) and later

2.18 SCPS

Description: This field is used to indicate the bandwidth of a point-to-point connection divided by 53 bytes per ATM cell for a T1 ATM PSU PIPE supporting SAAL High Speed Links.

Software Release: 5E16(2) and later

2.19 BT

Description: This field is used to indicate the maximum number of consecutive calls permitted onto the ATM interface.

Software Release: 5E16(2) and later

2.20 CDVT

Description: This field is used to indicate the Cell Delay Variation Tolerance for a point-to-point T1 ATM PSU Pipe supporting SAAL High Speed Links.

Software Release: 5E16(2) and later

2.21 QOSC

Description: This field indicates the Quality of Service Class for an ATM PSU Pipe supporting SAAL High Speed Links.

Software Release: 5E16(2) and later

SEC. 5P: 5592 RECORD
ATM LINK ASSIGNMENT - ATMLNK

1. GENERAL

The The ATM (Asynchronous Transfer Mode) Link Assignment form is available with the 5E17(1) FR 1 and later Software Releases. It allows a user to define and specify parameters for an ATM link. For duplex operations, two channels (CHAN 1 and CHAN 0) are provisioned, each terminating on a PHA2 (Protocol Handler for Asynchronous Transfer Mode). For simplex operations, a single channel (CHAN 1) is provisioned. This form supports the PHA2 (Protocol Handler for ATM PSU to PSU Connectivity feature. For more information on this feature, see Division 2, Section 7BY.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: The SM (Switching Module) field is used to specify a SM number associated with the PSU.

Software Release: 5E17(1) FR1 and later
Valid Entries: 1 - 192

2.3 * PSU

Description: This field is used to identify the PSU number.

Software Release: 5E17(1) FR1 and later
Valid Entries: 0 - 1

2.4 * LINK

Description: This field is used to identify the PSU link number.

Software Release: 5E17(1) FR1 and later
Valid Entries: 1 - 10

2.5 APS TYPE

Description: The APS TYPE field is used to indicate the type of automatic protection switch used on the link.

Software Release: 5E17(1) FR1 and later
Default: UNIDIRECT
Valid Entries:

Valid ASP TYPE Entries

Entry	Definition
BIDIRECT	Bidirectional
NONE	No automatic protection switch type
UNIDIRECT	Unidirectional

Copyright © 2003 Lucent Technologies

2.6 ATM INTF

Description: The ATM INTERFACE field is used to specify whether or not the ATM (Assynchronous Transfer Mode) interface is a User to Network interface, or a Network to Network interface.

Software Release: 5E17(1) FR1 and later
Default: UNI
Valid Entries:

Valid ATM INTF Entries

Entry	Definition
NNI	Network-Network Interface
UNI	User-Network Interface

CHANNELS

These fields (Section 2.7 - Section 2.10) are used to define both channels of the PSU (Packet Switch Unit) link. The channels are defined by assigning physical PHA2s (Protocol Handler for ATM (Asynchronous Transfer Mode) 2s) and channel groups.

2.7 SHELF

Description: The SHELF field is used to define the PSU shelf where the protocol handler for ATM type PHA2 (Protocol Handler for ATM level 2) is located.

Software Release: 5E17(1) FR1 and later
Valid Entries: 0 - 4

Data Rules:

For each channel, when one field is entered, then all fields must be entered.

For each channel, when SHELF or POSITION is entered, then SHELF, POSITION, and CON TYPE must be entered.

The combination of SHELF and POSITION must be unique for both channels.

When SHELF for CHAN 0 equals SHELF for CHAN 1, CHL GRP for CHAN 0 must not equal CHL GRP for CHAN 1.

2.8 POSITION

Description: The POSITION field is used to define the position number where the protocol handler for ATM type 2 (PHA2) is located.

Software Release: 5E17(1) FR1 and later
Valid Entries: 0 - 15

2.9 CHL GRP

Description: The CHL GRP field is used to designate a channel group on the SHELF for the current ATM link channel.

Software Release: 5E17(1) FR1 and later
Valid Entries: 0 - 15

2.10 CON TYPE

Description: The CON TYPE field specifies the connection type of each channel.

Copyright © 2003 Lucent Technologies

Software Release: 5E17(1) FR1 and later
Valid Entries:

Valid CON TYPE Entries	
Entry	**Definition**
ATMNET	PSU connectivity is via ATM Networks.

Data Rules:

When CHANNELS CON TYPE on the ATMLNK form and/or PSULNK form (5057 Record) is "ATMNET", the NEAR PSU on the PSULNK form, and/or PSU on the ATMLNK form must be unique between the ATMLNK and PSULNK forms.

- ***NOTE:*** If NEAR PSU on the PSULNK form is blank, its value is derived from PSU on the EQPSU form (5741 Record) where the PSULNK form's key, NEAR COM ADDR, is matched to the COM ADDR field on the EQPSU form.

CON TYPE for CHAN 0 must be the same as CON TYPE for CHAN 1.

When CON TYPE is "ATMNET", ATM INTF must be "NNI".

AAL2 PARAMETERS

These fields (Section 2.11 - Section 2.15) are used to define both channels of the PSU (Packet Switch Unit) link. The channels are defined by assigning physical PHA2s (Protocol Handler for ATM (Asynchronous Transfer Mode) 2s) and channel groups.

2.11 MAX VCCS

Description: The CHL GRP field is used to designate a channel group on the SHELF for the current ATM link channel. This is a no change field.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Valid Entries: 1024

2.12 START VPI

Description: The START VPI (Virtual Path Identifiers) field is used to specify the starting value of the VPI.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Default: 0
Valid Entries: 0 - 255

Data Rules:

The sum of START VPI and NUM VPI must not be greater than 256.

2.13 NUM VPI

Description: The NUM VPI (Number of the Virtual Path Identifiers) field is used to specify how many VPIs are needed.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Default: 32
Valid Entries: 0, 1, 2, 4, 8, 16, 32, 64, 128, or 256

Data Rules:

NUM VPI multiplied by NUM VCI must be equal to MAX VCCS.

Copyright © 2003 Lucent Technologies

2.14 START VCI

Description: The START VCI (Virtual Channel Identifier) field is used to specify the starting value of the VCI.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Default: 32
Valid Entries: 0 or 32 - 65532

Data Rules:

The sum of START VCI and NUM VCI must not be greater than 65536.

2.15 NUM VCI

Description: The NUM VCI (Number of Virtual Channel Identifiers) field is used to specify how many VCIs are needed.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Default: 32
Valid Entries: 0, 4, 8, 16, 32, 64, 128, 256, 512, or 1024

AAL5 PARAMETERS

2.16 VPC SUPPORT

Description: The Virtual Path Connection Support field is used to specify whether or not the VPC is supported.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Default: Y
Valid Entries: Y, N

CELL DISCARDED THRESHOLDS

These fields (Section 2.17 - Section 2.21) are used to define various cell discarded thresholds needed to support the PHA2 PSU to PSU Connectivity feature. For more information, see Division 2, Section 7BY.

2.17 HEC VIOLATIONS

Description: The HEC (Header Error Control) Violation field identifies the threshold for HEC violations.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.18 ATM LYR HDR ERR

Description: The ATM Layer Header Error field identifies the threshold for ATM layer header errors.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

Copyright © 2003 Lucent Technologies

2.19 CRC 10 ERR

Description: The Cyclic Redundancy Check Error field identifies the threshold for CRC 10 errors.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.20 OAM CELL TYP ERR

Description: The Operations Administration and Maintenance Cell Type Error field identifies the threshold for OAM Cell Type errors.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.21 NOT SUPP REQ

Description: The Not Supported Request field identifies the threshold for unsuported requests.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

MISC THRESHOLDS

These fields (Section 2.22 - Section 2.24) are used to define various miscelanous thresholds needed to support the PHA2 PSU to PSU Connectivity feature. For more information, see Division 2, Section.

2.22 OCD ANOMALIES

Description: The Out of Cell Delineation Anomalies field uses the ATM Cell HEC to locate the received cells in a payload. When 7 cell in a row are discarded because of HEC violations, and OCD anomaly occurs, the OCD counter is incremented. The counter is not incremented again until the next OCD anomaly which only occurs after cell delineation is re-established and then lost again. The threshold is a threshold value for the OCD counter.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.23 SD THRESH

Description: The Signal Degrade field indicates the SD bit-errorr threshold that is used for each channel of the ATM link. When this threshold is reached for a channel, the channel has a degraded signal.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 9
Valid Entries:

Valid SD THRESH Entries	
Entry	**Definition**

Copyright © 2003 Lucent Technologies

5	10E - 5 or .00001
6	10E - 6 or .000001
7	10E - 7 or .0000001
8	10E - 8 or .00000001
9	10E - 9 or .000000001

2.24 SF THRESH

Description: The Signal Fail field indicates the SF bit-errorr threshold that is used for each channel of the ATM link. When this threshold is reached for a channel, the channel goes into a signal fail condition.

Software Release: 5E17(1) FR1 and later (Not currently supported)
Required field.
Default: 3
Valid Entries:

Valid SF THRESH Entries

Entry	Definition
3	10E - 3 or .001
4	10E - 4 or .0001
5	10E - 5 or .00001

AAL5 PROTOCOL THRESHOLDS

These fields (Section 2.25 - Section 2.29) are used to define various AAL5 (ATM Adaptation Layer 5) Protocol thresholds needed to support the PHA2 PSU to PSU Connectivity feature. For more information, see Division 2, Section.

2.25 CRC32 VIOLATION

Description: The Cyclic Redundancy Check 32 Violation field identifies the threshold for CRC 32 violations.

Software Release: 5E17(1) FR1 and later
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.26 OVERSIZED SDU

Description: The Oversized Software Data Unit field identifies the threshold for the SDU.

Software Release: 5E17(1) FR1 and later
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.27 LENGTH VIOLATION

Description: This field identifies the threshold for AAL 5 length.

Software Release: 5E17(1) FR1 and later
Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.28 INVALID CPI

Description: The Invalid Channel Path Identifier field identifies the threshold for an invalid CPI.

Software Release: 5E17(1) FR1 and later

Copyright © 2003 Lucent Technologies

Required field.
Default: 0
Valid Entries: 0 - ffffffff hex

2.29 LEVEL 2 QUALITY

Description: This field indicates the AAL5 level 2 quality thresholds.

Software Release: 5E17(1) FR1 and later
Required field.
Default: 100
Valid Entries: 0 - 100

SEC. 2: AUTOMATIC CUSTOMER STATION REARRANGEMENT FORMS

Copyright © 2003 Lucent Technologies

SEC. 2A: 5959-1 RECORD
ISDN ACSR FEATURE DEFINITION FORM - ACSRFD

1. GENERAL

The 5959-1 Record is available with 5E5 and later Software Releases. The ACSRFD form is used to define the various combination of options associated with the ISDN ACSR (Automatic Customer Station Rearrangement) feature.

The ISDN ACSR feature provides a user the ability to change their physical location and retain their current TN (telephone Number), features and group memberships and restrictions without using a service order.

Each terminal (line) which is to use the ACSR feature must be assigned an ACSR feature name, defined on the ACSRFD form, on the appropriate feature assignment form, LINEFA form, BFG form, or an associated CLUSTR form. Only one ACSR feature can be assigned per line. ACSR features can only be assigned to ISDN lines (other than ISDN Attendants and Multi-Line Hunt).

The line (TN) which is assigned an ISDN ACSR feature must be defined on a DSLUSR form (5908 Record) as CKT TN. Both PPB1 USR and PPB2 USR must be set to "N" or blank on the DSLUSR form. ACSR GRP entered on the ACSRFD or ACSRLPA form must match the ACSR GRP entered on an associated DSL form (5907 Record) for this TN.

Certain ISDN ACSR features are predefined and automatically provided in the ODA database at the time of office origination. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than the preconstructed feature. A list of the preconstructed features is contained in Figure 1 .

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.50.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the ISDN Automatic Customer Station Rearrangement Feature name. There are no restrictions on the valid characters except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.5) define the feature options.

2.4 AMA REC

Copyright © 2003 Lucent Technologies

Description: Will an AMA billing record be generated for lines assigned the ACSR feature after an ACSR move?

Required Field.
Default: N
Valid Entries: Y, N

2.5 GRP CNTRL

Description: Is the line assigned this ACSR feature allowed to modify the ACSR group status via a dialed code? The group status is assigned on the ACSRGP form (5959-2 Record) in field GRP ACTIVE.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If GRP CNTRL is "Y", and this feature is assigned to a line, then the line should be assigned a dialing code (on an associated PDIT and/or IDPDCA form) with ACTION equal to "ACSRON" and "ACSROFF".

DEFAULT PARAMETERS

The following fields (Section 2.6 - Section 2.7) define the default parameters assigned with the feature to terminals (lines). These parameters will be assigned to the terminal unless they are overriden by entries on the ACSRLPA forms.

2.6 ACSR GRP

Description: Enter the name of the ACSR Group. There are no restrictions on valid characters.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ACSR Group defined on an ACSRGP form and assigned on the DSL form.

If the ACSR GRP is not assigned on this form, it must be individually assigned to each member via the ACSRLPA form (5959-3 Record).

2.7 PIN REQ

Description: Is a PIN (Personal Identification Number) required by the user before invocation of the ACSR feature?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PIN REQ is set to "Y", then a PIN must be defined on the PIDEF form (5117 Record) for the line associated with this ACSR feature.

Copyright © 2003 Lucent Technologies

SEC. 2B: 5959-2 RECORD
ISDN ACSR GROUP PARAMETERS FORM - ACSRGP

1. GENERAL

The 5959-2 Record is available with 5E5 and later Software Releases. The ACSRGP form is used to define the group level of information required for the ISDN ACSR (Automatic Customer Station Rearrangement) capability.

Each terminal (line) which is to use the ISDN ACSR capability must be assigned an ISDN ACSR feature name, defined on the ACSRFD form (5959-1 Record), on the appropriate feature assignment form, LINEFA, BFG or an associated CLUSTR form. In addition, each terminal must be assigned to an ISDN ACSR Group which may be defined as a default parameter of the ACSRFD form, or on an individual terminal basis with the ACSRLPA forms. The ACSR Group must also be assigned on the DSL form (5907 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.47.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ACSR GRP

Description: Enter the name of the ISDN ACSR Group. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

2.3 RNGBK TYPE

Description: Enter the ISDN ACSR Ringback Type. This field indicates the type of ringing to be applied for the ISDN ACSR ringback call. After the completion of an ACSR move, whether successful or unsuccessful, the user will be rung back.

Required Field.
Default: A
Valid Entries:

Valid RNGBK TYPE Entries

Entry	Definition
A	A repeated pattern of 2 seconds on followed by 4 seconds off.
B	A repeated pattern of 0.8 seconds on, 0.4 seconds off,
C	A repeated pattern of 0.4 seconds on, 0.2 seconds off,
D	A repeated pattern of 1 second on, 1 second off, 1 second on,
E	4-wire ringing pattern 2 seconds on followed by 4 seconds off.
F	4-wire ringing pattern of 1.65 seconds on, 0.35 seconds off.
P	A ringing pattern of 1.64 seconds on, 0.36 seconds off.

2.4 RNG MAX

Description: Enter the ISDN ACSR ringback interval. This field indicates the number of seconds to allow ringing to occur during an ISDN ACSR ringback call.

Required Field.

Copyright © 2003 Lucent Technologies

Default: 24
Valid Entries: 24, 30, 36, 42, or 48 (seconds)

2.5 GRP ACTIVE

Description: Is the ISDN ACSR Group active?

A user with GRP CNTRL set to "Y" on an associated ACSRFD form can modify this group status via dialed codes.

Required Field.
Default: Y
Valid Entries: Y, N

2.6 BCID

Description: Enter the Business Customer Identifier. Messages sent to an external processor (i.e., AP) concerning ACSR moves will include this number for identifying the user on the external processor.
Valid Entries: 1 - 65535

Data Rules:

BCID and AP SITE ID must both be entered or both be blank.

2.7 AP SITE ID

Description: Enter the Application Processor ID. The AP SITE ID specifies the destination AP (or external processor) that messages are sent to regarding ACSR moves from users associated with this ISDN ACSR group.
Valid Entries: 1 - 255

Data Rules:

Both BCID and AP SITE ID must be entered or left blank. The AP SITE ID entered here must be defined on a DSLAP form (5963 Record).

SEC. 2C: 5959-3 RECORD
ISDN ACSR LINE PARAMETERS FORM - ACSRLPA

1. GENERAL

The 5959-3 Record is available with 5E5 and later Software Releases. The ACSRLPA form is used when assigning ISDN ACSR (Automatic Customer Station Rearrangement) features to ISDN lines (other than ISDN Attendants and Multi-Line Hunt). The ACSRLPA form is used to assign ISDN ACSR feature parameters to lines if the default parameters on the ACSRFD form (5959-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.49.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the line.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For 5E12 and later, TN/FEATURE combinations on different ACSRLPA forms can not be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ACSRLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the ISDN ACSR Feature name. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ISDN ACSR Feature defined on the ACSRFD form.

2.4 ACSR GRP

Description: Enter the name of the ISDN ACSR Group. There are no restrictions on the valid characters.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

The name entered here must be that of an ISDN ACSR Group defined on an ACSRGP form (5959-2 Record).

When an ISDN ACSR feature is assigned to a line, then the ACSR GRP must be defined, either on the ACSRFD form or the ACSRLPA form. The ACSR GRP must also be assigned on the DSL form (5907 Record).

If the ACSR GRP is not assigned on the associated ACSRFD form, it must be entered on this form.

2.5 PIN REQ

Description: Is a PIN (Personal Identification Number) required by the user before invocation of the ACSR feature?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PIN REQ is set to "Y", then a PIN must be defined on the PIDEF form (5117 Record) for the line associated with this ACSR feature.

SEC. 3: ISDN INTERCOM FORMS

Copyright © 2003 Lucent Technologies

SEC. 3A: 5960-1 RECORD
ISDN INTERCOM FEATURE DEFINITION FORM - ICMFD

1. GENERAL

The 5ESS Switch 5960-1 Record is available with 5E4(2) and later Software Releases. ISDN Intercom is a form of ISDN station to station calling. It is a dedicated feature button approach using general call appearances. ISDN Intercom calling requires a feature button.

1.1 CA-ICOM Features

The ICMFD form is used to define FB-ICOM (Feature Button Intercom) features. These are distinct from the CA-ICOM (Call Appearance Intercom) feature that is available for 5E9(1) and later. The CA-ICOM feature, which meets the Bellcore requirements for National ISDN, is available for Standard DSL users with CACH terminals. It is not a BRCS feature and is not defined on this ICMFD form or its related forms; rather, it is assigned on the CAICOM form (5984 Record).

To accommodate the transition from FB-ICOM to CA-ICOM features, both types of ICOM features will be available for Standard DSL users in the 5E9(1) Software Release. For 5E9(2) and later, FB-ICOM features will not be assignable to Standard DSL users.

For 5E9(1) only, when an FB-ICOM feature is assigned to a Standard DSL user, a warning will indicate that the assignment will not be supported after 5E9(1) and will suggest that a CAICOM feature be assigned. For 5E9(2) and later, this FB-ICOM assignment will not be allowed.

FB-ICOM and CA-ICOM may not both be assigned to the same line.

1.2 FB-ICOM Features

A Feature Button Intercom user can originate a call to the Intercom group member by pushing the Intercom feature button, then going off-hook (or vice versa) and optionally dialing one or two digits.

Certain Feature Button Intercom features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/) and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed Intercom features is contained in Figure 1 .

Each terminal (line) which is to use a Feature Button Intercom feature must be assigned the feature (defined on this ICMFD form) on the appropriate LINEFA form (5112 Record) or associated CLUSTR form (5600 Record) or BFG form (5625 Record). The corresponding AC field, on the appropriate LINEFA form or associated CLUSTR or BFG form, must be set to "N".

Feature Button Intercom features may not be assigned to Multi-Line Hunt Group lines and therefore cannot be assigned on an MLHLNFA form.

A maximum of ten ICMFD forms may be defined for the office.

1.3 ICM Feature Assignment Rules

A line may be assigned no more than one Feature Button Intercom feature.

When a TN is assigned an ISDN Feature Button Intercom feature on a LINEFA (5112 Record), BFG (5625 Record), or associated CLUSTR form (5600 Record), it must also be assigned a TGSR feature, defined on the TGSRFD form (5607-1/2 Record). The GROUP ID associated with the TGSR feature on the TGSRFD, BFG, or TGSRLPA form (5607-3 Record) must match the TG ID defined on the ISDN Intercom feature's ICMGP form (5960-2 Record).

Copyright © 2003 Lucent Technologies

For 5E8 and later, when a TN is assigned an ISDN Feature Button Intercom feature, the TN must be defined as a CKT TN on a DSLUSR form (5908 Record) that meets one of the following conditions:

- if DSL CLS on the associated DSL form (where the OE on the DSLUSR form matches the DSL OE on the DSL form) is not "STD", then either CA or CA QTY on the DSLUSR form must have an entry;
- if DSL CLS on the associated DSL form is "STD", EKTS on the DSLUSR form must have an entry.

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.45.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter an ISDN Intercom feature name. The FEATURE entry must be unique. It may not start with a slash (/).

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter an optional remark.
Valid Entries: 1 - 32 characters

2.4 AMA CHRG

Description: AMA charging. This field is automatically set to "FLAT" and may not be changed.
Default: FLAT
Valid Entries: FLAT

DEFAULT PARAMETERS

The following fields (Section 2.5 - Section 2.8) define the DEFAULT PARAMETERS assigned with the feature to lines. These parameters will be assigned to the line unless they are overridden by entries on the ICMLPA form (5960-3 Record).

GROUP LIST

The four members of the GROUP LIST (Section 2.5 - Section 2.8) correspond to four buttons on ISDN Customer Premises Equipment terminal(s). The buttons are dedicated to ISDN Intercom by entering "I1ICOM", "I2ICOM", "I3ICOM" and "I4ICOM", respectively, in the ACTION field of the BUTTON LIST on a CFGGRP form (5964 Record). The four buttons are the maximum allowed for an entire Configuration Group.

For 5E5 and later, for each member in the GROUP LIST, an entry must be made in the ICM GRP, the ICM TYPE, and the SOURCE fields.

2.5 ICM GRP

Copyright © 2003 Lucent Technologies

Description: Enter an ISDN Intercom Group Name.
Valid Entries: 1 - 8 characters

Data Rules:

An ICM GRP entry may only be used once in a GROUP LIST. The entry for ICM GRP must be defined in the ICM GRP field on the ICMGP form.

When several Intercom Groups are associated with the same FEATURE, the TG IDs on the corresponding ICMGP forms must be identical.

2.6 ICM TYPE

Description: This field determines whether or not the ISDN Intercom Group will have a maximum of 10 or 100 members.

Software Release: 5E5 and later
Valid Entries:

Valid ICM TYPE Entries

Entry	Definition
ONE	The ISDN Intercom Group allows a maximum of tenmembers.
TWO	The ISDN Intercom Group allows a maximum of 100 members.

2.7 SOURCE

Description: Source of digits for an ISDN Intercom Call.

Valid SOURCE Entries

Entry	Definition
DIAL	A digit or digits are to be dialed after the ISDN Intercom button is pressed.
AUTO	Stored digits.

Data Rules:

If SOURCE is "DIAL", then an entry for AUTO DIAL POSITION must not be made. If SOURCE is "AUTO", then an entry for AUTO DIAL POSITION must be made.

2.8 AUTO DIAL POSITION

Description: The value entered in this field corresponds to the relative position of the called party within an ISDN Intercom Group. The position is defined on an ICMGP form (5960-2 Record).

A group may have up to 100 members; thus, two digits are entered in this field. The first digit points to the key field ICM BLOCK on an ICMGP form. The ICM BLOCK indicates the "tens" group of the position number.

The second digit points to a POSITION on the ICMGP form. The POSITION indicates the "ones" place of the position number. For example, if "89" is entered in this field, the ICM BLOCK field on the ICMGP form would be set to "80" and the POSITION field would be "9". The associated PRIMARY TN on the ICMGP form is the number of the called party. The ICM GRP key field, on the ICMGP form, will have the same entry as the ICM GRP field on this ICMFD form.
Valid Entries: 00-99

Data Rules:

If SOURCE is "DIAL", this field must not be entered. If SOURCE is "AUTO", this field must have an entry.

For 5E5 and later Software Releases, if the SOURCE field is "AUTO" and the ICM TYPE field is "ONE", then the AUTO DIAL POSITION must be "00" to "09". If the SOURCE field is "AUTO" and the ICM TYPE

Copyright © 2003 Lucent Technologies

is "TWO", the AUTO DIAL POSITION must be "00" to "99". If an entry is made for AUTO DIALED POSITION, entries must also be made for ICM GRP and SOURCE.

SEC. 3B: 5960-2 RECORD
ISDN INTERCOM GROUP DIALING PLAN FORM - ICMGP

1. GENERAL

The 5ESS Switch 5960-2 Record is available with 5E4(2) and later Software Releases. The ISDN Intercom Group Dialing Plan form contains information needed to describe the ISDN Intercom group parameters. Information will be entered which will identify the Intercom group name and the Terminal Group identification number.

Up to ten (10) PRIMARY TNs may be entered for this Intercom group. The ten are within the same ICM BLOCK. The ICM BLOCK is the ten's group for the POSITIONs. For example, if the ICM BLOCK is set to 80 and all ten PRIMARY TNs are entered, then the positions 80 through 89 are defined for this Intercom group. An ISDN Intercom group may have a maximum of 100 (10 * 10) members.

For 5E4(2) and later Software Releases, each PRIMARY TN entry in the TN LIST must be unique.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ICM GRP

Description: Enter an ISDN Intercom Group Name. The entry for ICM GRP must be unique.

For 5E8 and earlier, a maximum of 1023 groups can be defined; for 5E9(1) and later, 4095 groups can be defined.

Required Field.
Valid Entries: 1 - 8 characters

2.3 * ICM BLOCK

Description: This field identifies the ten's group that contains the PRIMARY TNs assigned on this form. For example, if 70 were entered in this field, then the PRIMARY TNs would be in POSITIONs 70 through 79 in the ISDN Intercom Group. To enter the maximum of 100 PRIMARY TNs in an ISDN Intercom Group, ten ICMGP forms would have to be submitted.

Required Field.

Software Release: 5E5 and later
Valid Entries: 0, 00, 10, 20, 30, 40, 50, 60, 70, 80, and 90.

2.4 # ICM TYPE

Description: This field is used to indicate if one or two digits will be dialed to access a member of the group.

Software Release: 5E5 and later
Required Field.
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid ICM TYPE Entries	
Entry	**Definition**
ONE	one digit is to be dialed.
TWO	two digits are to be dialed.

Data Rules:

If the ICM BLOCK is 0, this field must be set to "ONE". If the ICM BLOCK is not 0, then this field must be set to "TWO".

2.5 TG ID

Description: Enter a Terminal Group Identification number.

Required Field for 5E8 and earlier.
Valid Entries: 1 - 65535

Data Rules:

For 5E9(1) and later, a TG ID must be entered when the ICM GRP is assigned on an ICMFD (5960-1 Record) or ICMLPA (5960-3 Record) form.

2.6 PRIMARY TN

Description: Enter a Primary Telephone Number that can be called in the intercom group.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: YXXXXXX or NXXYXXXXXX where N is 2 - 9, Y is 1 - 9 and X is 0 - 9.

Data Rules:

The Primary TN must be unique per form entry and per ICM GRP.

For 5E8 and earlier the entry must be defined in the CKT TN field on a DSLUSR form; for 5E9(1) and later, it must be defined in either the CKT TN, or (for CA-ICOM only) in the CKT MLHG TN field.

For 5E7 and earlier, the FIRST CA and NUM CA fields on the DSLUSR form must have values entered.

For 5E8 and later, the DSLUSR form must meet one of the following conditions:

- if DSL CLS on the associated DSL form (where the OE on the DSLUSR form matches the DSL OE on the DSL form) is not "STD", then either CA or CA QTY on the DSLUSR form must have an entry;

- if DSL CLS on the associated DSL form is "STD", EKTS on the DSLUSR form must have an entry. If the PRIMARY TN is defined in the CKT MLHG TN field, it is assigned a Call Appearance Intercom feature available only for Standard DSL CACH terminals; therefore, on the DSLUSR form, EKTS must be "CACH".

For 5E9(1) and later, the PRIMARY TN is assigned either an ISDN Feature Button Intercom feature or an ISDN Call Appearance Intercom feature.

If a Feature Button Intercom feature is assigned to the TN (on a LINEFA, BFG, or associated CLUSTR form), it must be defined on an ICMFD form (5960-1 Record). The ICM GRP from this ICMGP form must appear on the associated ICMFD or ICMLPA form (5960-3 Record).

For a Call Appearance Intercom feature, the TN and the ICM GRP must be entered on the CAICOM form (5984 Record).

Copyright © 2003 Lucent Technologies

For 5E12 and later, the PRIMARY TN's in the TN LIST on the ICMGP form must be unique.

SEC. 3C: 5960-3 RECORD
ISDN INTERCOM (LINE PARAMETERS) FORM - ICMLPA

1. GENERAL

The 5ESS Switch 5960-3 Record is available with 5E4(2) and later Software Releases. It is used when assigning Intercom features to non-Multi-Line Hunt lines. ISDN Intercom feature parameters are assigned to the lines if the default parameters of the ICMFD form (5960-1 Record) are inappropriate or unspecified.

For 5E9(1) and later, an ISDN Call Appearance Intercom feature is available for Standard DSL terminals. Parameters for that feature, which apply only to EKTS CACH terminals, are defined on the CAICOM form (5984 Record).

This ICMLPA form defines parameters only for ISDN Feature Button Intercom features.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.45.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * TN

Description: Enter a valid Telephone Number.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The combination entered for TN and FEATURE must be unique.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ICMLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the TN must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter a feature name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The feature must be an ISDN Feature Button Intercom feature, that is, defined in the FEATURE field on an ICMFD form (5960-1 Record). The TN on this form must be assigned the same FEATURE on a LINEFA form, associated CLUSTR form (5600 Record), or BFG form (5625 Record).

For 5E12 and later, TN/FEATURE combinations on different ICMLPA forms cannot be duplicated.

Copyright © 2003 Lucent Technologies

GROUP LIST

For the 5E4(2) Software Release, the GROUP LIST (Section 2.4 - Section 2.8) consists of up to four unique ISDN Intercom Group Names, Digit Source and Dialed Position. The 5E5 and later, it also contains a field to indicate the ISDN Intercom Type.

The four members of the GROUP LIST correspond to four buttons on an ISDN CPE (Customer Premise Equipment) terminal(s). The buttons are dedicated to ISDN Intercom by entering "I1ICOM", "I2ICOM", "I3ICOM", and "I4ICOM", respectively, in the ACTION field of the BUTTON LIST on a CFGGRP form (5964 Record). The four buttons are the maximum allowed for an entire Configuration Group.

2.4 ICM GRP

Description: Enter an ISDN Intercom Group Name.
Valid Entries: 1 - 8 characters

Data Rules:

The entry must be defined in the ICM GRP field on an ICMGP form (5960-2 Record). When several Intercom Groups are associated with the same FEATURE, the TG IDs on the corresponding ICMGP forms must be identical.

An ICM GRP entry may be used only once in a GROUP LIST. For 5E4(2), an entry in ICM GRP requires an entry in the SOURCE field and the DIALED POSITION field. For 5E5 and later, an entry in ICM GRP requires an entry in the ICM TYPE, the SOURCE and the AUTO DIALED POSITION fields.

2.5 ICM TYPE

Description: This field indicates the number of digits that must be dialed to access a group member.

Software Release: 5E5 and later
Valid Entries: ONE or TWO

Data Rules:

ICM TYPE must be entered for each Intercom group assigned.

2.6 SOURCE

Description: Source of digits for an ISDN Intercom Call.

Valid SOURCE Entries

Entry	Definition
DIAL	Dialed digits.
AUTO	Stored digits.

Data Rules:

If SOURCE is "DIAL", then an entry for AUTO DIALED POSITION must not be made. If SOURCE is "AUTO", then an entry for AUTO DIALED POSITION must be made.

2.7 AUTO DIAL POSITION

Description: The value entered in this field corresponds to the relative position of the called party within an ISDN Intercom Group. The position is defined on an ICMGP form (5960-2 Record).

For 5E4(2), a group may have up to 10 members, each corresponding to a single digit 0 through 9 entered in this field. This single digit points to a POSITION and its associated PRIMARY TN on the ICMGP form

Copyright © 2003 Lucent Technologies

whose single key field, ICM GRP, has the same entry as the ICM GRP field on this ICMFD form.

For 5E5 and later, a group may have up to 100 members; thus, two digits are entered in this field. The first digit points to the key field ICM BLOCK on an ICMGP form; the ICM BLOCK indicates the "tens" group of the position number. The second digit points to a POSITION on the ICMGP form; the POSITION indicates the "ones" place of the position number. For example, if 89 is entered in this field, the ICM BLOCK field on the ICMGP form would be set to 80 and the POSITION field would be 9. The associated PRIMARY TN on the ICMGP form is the number of the called party. The ICM GRP key field, on the ICMGP form, will have the same entry as the ICM GRP field on this ICMFD form.
Valid Entries: 00 - 99

Data Rules:

If SOURCE is "DIAL", then this field must not be entered. If SOURCE is "AUTO", then this field must have an entry.

2.8 TN POSITION

Description: This is a Recent Change verify-only field. This field represents the location of the TN in the corresponding ICM GRP's TN LIST on the ICMGP form (5960-2 Record). The TN is the originating party in the ISDN Intercom call.

SEC. 3D: 5984 RECORD
ISDN CALL APPEARANCE INTERCOM FORM - CAICOM

1. GENERAL

The CAICOM form (5984 Record) is available with 5E9(1) and later Software Releases. It is used to assign the CA-ICOM (Call Appearance Intercom) feature and associate an intercom group on a Standard ISDN EKTS (Electronic Key Telephone Service) CACH (Call Appearance Call Handling) terminal. Unlike the FB-ICOM (Feature Button Intercom) feature, CA-ICOM is not a BRCS feature and is not assigned to a line on the LINEFA or other BRCS feature assignment forms.

The CA-ICOM feature requires dedicated call appearances which are identified on this CAICOM form and which may not appear on another form for the TN.

The CAICOM form is keyed by TN and ICM GRP. The TN must be the ISDN primary TN of a Standard EKTS CACH terminal defined on a DSLUSR form as CKT TN or CKT MLHG TN. The ICM GRP must be defined on the ICMGP form.

This form supports the CA-ICOM feature of the National ISDN 2 EKTS feature for service uniformity compliance. For more information, see Division 2, Section 1AM.

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter a ISDN EKTS CACH telephone number.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The TN must be defined as either a CKT TN or CKT MLHG TN on a DSLUSR form (5908 Record) where EKTS is "CACH".

For 5E9(1), a TN may be assigned either a Feature Button Intercom feature or a Call Appearance Intercom feature, but not both.

The TN can be entered on no more than four CAICOM forms.

For 5E12 and later, the key pairs, TN and ICM GRP, can not be duplicated on the CAICOM form.

For 5E12 and later, if the first 3-digits of the 7- digit TNs on the CAICOM form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE or the NOC form does not exist, the 7-digit TN(s) must be entered as a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

Copyright © 2003 Lucent Technologies

2.3 * ICM GRP

Description: Enter an ISDN Intercom Group Name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The ICM GRP must be defined on an ICMGP form (5960-2 Record). If SOURCE is "AUTO", and ICM TYPE on the ICMGP form is "ONE", then AUTO DIAL POSITION on this form must be in the range 0 - 9, inclusive.

2.4 ICM TYPE

Description: This is a Recent Change only field. It represents the number of digits that must be dialed to access a member of the intercom group.

The ICM TYPE is defined on the ICMGP form and indicates whether the group is a one- or two-digit group. One-digit intercom groups can have up to ten members, assigned to positions 0 through 9 in the intercom group dialing plan. Two-digit intercom groups can have up to one hundred members, assigned to positions 0 through 99 in the intercom group dialing plan.

2.5 # SOURCE

Description: Enter the source of digits for an ISDN Intercom call.

Required Field.

Valid SOURCE Entries

Entry	Definition
DIAL	Intercom calls originated from call appearances require dialing the digit or digits in the intercom group associated with the TN being called. In a one-digit intercom group (ICM TYPE "ONE"), only one digit must be dialed since there can only be ten members in the intercom group. In a two-digit intercom group, (ICM TYPE "TWO"), two digits may be needed since there can be up to one hundred members in the intercom group.
AUTO	Intercom calls originated from call appearances do not require dialing of digits since the call appearance has a direct connection to one member of the intercom group.

2.6 AUTO DIAL POSITION

Description: Enter the position in the intercom group dialing plan to which intercom calls can be placed automatically from the intercom call appearance(s). The auto dialing capability allows the TN on this form to have a direct connection to the TN associated with the position in the intercom group dialing plan specified in AUTO DIAL POSITION. An auto dial position number may be specified even though no TN has been associated with that position in the intercom group dialing plan on the ICMGP form.

The value entered in this field corresponds to the relative position of the called party within an ISDN Intercom Group. A group may have up to 100 members. Thus, two digits are entered in this field. The first digit points to the ICM BLOCK on the ICMGP form. The ICM BLOCK indicates the "tens" group of the position number. The second digit points to a POSITION on the ICMGP form. The POSITION indicates the "ones" place of the position number. For example, if 89 is entered in this field, the ICM BLOCK field on the associated ICMGP form would be set to 80 and the POSITION field would be 9. The CAICOM TN would match the ICMGP form PRIMARY TN for POSITION 9 where the ICM BLOCK is 80 and the ICM GRP fields on the CAICOM and ICMGP forms match.
Valid Entries: 00 - 99

Data Rules:

Copyright © 2003 Lucent Technologies

If SOURCE is "DIAL", AUTO DIAL POSITION must not be entered; if SOURCE is "AUTO", AUTO DIAL POSITION must be entered.

2.7 TN POSITION

Description: This is a Recent Change only field. It represents the location of the TN in the corresponding TN LIST on the ICM GRP form. The TN is the called party in the ISDN Intercom call.

2.8 # CA

Description: Enter the button number associated with the first call appearance for the Intercom Group. The CA and CA QTY fields are used to specify the number of consecutive call appearances dedicated to the Intercom Group. See Division 2, Section 1AM for information on calculating the range of call appearances.

Required Field.
Valid Entries: 1 - 254

Data Rules:

Because a CPE terminal has a maximum of 254 buttons, the sum of the values entered in the CA and CA QTY fields cannot exceed 255.

Call appearances dedicated to CA-ICOM may not be used for other purposes and therefore may not appear for the same TN on another form. When the TN appears on more than one form, the CA from one form may not be in the range of call appearances, which is CA and (CA + (CA QTY -1)), inclusive, on another form, and may not overlap with the range of K56, K64, DPKT, and ODB DNAs from the DSLUSR form.

2.9 # CA QTY

Description: Enter the call appearance quantity, the number of consecutive call appearances dedicated to the intercom group on the terminal for the TN. The call appearances start at the button specified in the CA field. For example, if CA is 12 and CA QTY is 2, buttons 12 and 13 are dedicated to the Intercom Group.

Required Field.
Valid Entries: 1 - 16

Data Rules:

Because a CPE terminal has a maximum of 254 buttons, the sum of the values entered in the CA and CA QTY fields cannot exceed 255.

SEC. 4: ELECTRONIC DIRECTORY SERVICE FORMS

Copyright © 2003 Lucent Technologies

SEC. 4A: 5961-1 RECORD
EDS (ELECTRONIC DIRECTORY SERVICE)
FEATURE DEFINITION FORM - EDSFD

1. GENERAL

The 5961-1 Record is available in 5E4(2) and later Software Releases. It is used to define Electronic Directory Service features with various combinations of options.

Each terminal (line) which is to use the EDS service must be assigned an EDS feature on the appropriate LINEFA form (5112 Record) or MLHLNFA form (5113 Record) or associated CLUSTR form (5600 Record). Only one EDS FEATURE is allowed on a given LINEFA form and a given MLHLNFA form or associated CLUSTR form(s).

Certain Electronic Directory Service features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed Electronic Directory Service features is contained in Figure 1 .

The maximum number of EDS features that may be defined is 10.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.38.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * FEATURE

Description: Enter the EDS (Electronic Directory Service) Feature Name. Feature Names have no restrictions on valid characters, except that Feature Names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed, or inserted.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E9(1) and later, when an EDS feature with DIR QRY DISP or AUTO CALL set to "Y" is assigned to a Multi-Line Hunt Group terminal on an MLHLNFA, BFG, or CLUSTR form, the MLHG/TERM must be defined on the DSLUSR form as CKT MLHG / CKT TERM.When an EDS feature with DIR QRY DISP or AUTO CALL set to "Y" is assigned to a TN on a LINEFA, BFG or CLUSTR form, the TN must be defined on the DSLUSR form as CKT TN.

For 5E10 and later, if a CKT TN(s) or CKT MLHG/CKT TERM(s) on the DSLUSR form has DSL CLS set to "STD" on the DSL form (OE from DSLUSR form matches DSL OE on the DSL form) and is assigned an EDS feature on the LINEFA, BFG, or CLUSTR form, then it is a secured feature that must be purchased by the office. In order to make this assignment to a "STD" DSL, SFID 225 ACT field must be "Y" on the SFSYS form (5713-1 Record), and the EDS feature must have the following:

- DIR QRY DISP set to "N"
- AUTO CALL set to "N"
- DISP PRIM CLG NAME set to "N"

Copyright © 2003 Lucent Technologies

- DISP SHRD CLG NAME set to "Y"

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.7) define the feature options assigned to terminals (lines): DIR QRY DISP, AUTO CALL, DISP PRIM CLG NAME, and DISP SHRD CLG NAME.

2.4 DIR QRY DISP

Description: Is the Directory Query Display feature option allowed?

The DIR QRY DISP feature requires an ISDN station set or attendant console with a minimum 40-character display and feature buttons. Data capability is not required. The user inputs the name to be queried through a 12-button keypad, receives instructions and responses from the 40 character display and then steps through possible matches. When the option is allowed, a station user with the EDS feature assigned to the primary DN is able to invoke DIR QRY DISP.
Default: N
Valid Entries: Y, N

2.5 AUTO CALL

Description: Is the Auto Call feature option allowed?

When AUTO CALL is "Y", an ISDN user with the EDS feature may place a call, without dialing the destination telephone, to the party associated with a message displayed during message query. The user can set up a call by depressing a CALL button or dialing a code.
Default: N
Valid Entries: Y, N

Data Rules:

Lines that are assigned EDS features with the AUTO CALL option require access to an activation code defined in the Office Dialing Plan on the PDIT form (5300-2 Record) or in the Individualized Dialing Plan on the IDPDCA form (5601-1/2 Record) or access to a Feature Button defined on the CFGGRP form (5964 Record). The activation code must have an ACTION code of "AUCUSE".

When an EDS feature with AUTO CALL set to "Y" is assigned to a member of a Multi-Line Hunt Group on an MLHLNFA form (5113 Record), BFG form (5625 Record), or CLUSTR form (5600 Record), the MLHG/TERM must be defined on a DSLUSR form (5908 Record). If the CKT TN is not entered on the MLHG/TERM definition form, either the TERM must be 1 or the EDS feature must be defined with the DIR QRY DISP field set to "Y".

2.6 DISP PRIM CLG NAME

Description: Is the Calling Name Display Primary Dialing Number feature option allowed?

If this option is "Y" for a TN (Telephone Number), then only the primary TN will receive Calling Name Display.

Calling Name Display Primary Dialing Number provides a calling party's name and TN for display at the called party's ISDN station set when the incoming call begins alerting. Both the calling party and the

Copyright © 2003 Lucent Technologies

called party must be in the same BCID (Business Customer Identification) group to receive the calling party's name.
Default: N
Valid Entries: Y, N

Data Rules:

If the DISP PRIM CLG NAME is set to "Y", then the DISP SHRD CLG NAME must be "N".

2.7 DISP SHRD CLG NAME

Description: Is the Calling Name Display Shared Dialing Number feature option allowed?

If this option is "Y" for a TN, then Calling Name Display is available for all ISDN terminals which share this TN.
Default: N
Valid Entries: Y, N

DEFAULT PARAMETERS

The following field (Section 2.8) defines the default parameters assigned with the feature to terminals (lines). These parameters will be assigned to the terminal unless they are overridden by entries on the EDSLPA or EDSMPA forms.

2.8 EDS GRP

Description: Enter the name of the EDS Group, with no restrictions on the valid characters.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an EDS Group defined on the EDSGP form (5961-2 Record).

SEC. 4B: 5961-2 RECORD
EDS (ELECTRONIC DIRECTORY SERVICE)
GROUP PARAMETERS FORM - EDSGP

1. GENERAL

The 5961-2 Record is available with 5E4(2) and later Software Releases. It is used to define the group information associated with the EDS (Electronic Directory Service) feature.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.38.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * EDS GRP

Description: Enter the name of the EDS group. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

2.3 # BCID

Description: Enter a valid Business Customer Identification.

Required Field.
Valid Entries: 1 - 65535

2.4 # AP SITE ID

Description: Enter the Application Processor Site Identification Number associated with this EDS group.

Required Field.
Valid Entries: 1 - 255

Data Rules:

The AP SITE ID must also be assigned on the DSLAP form.

2.5 PASSWORD

Description: Is the Password option assigned? If the Password option is "Y", a password is required to initiate a query.
Default: N
Valid Entries: Y, N

SEC. 4C: 5961-3 RECORD
EDS (ELECTRONIC DIRECTORY SERVICE)
TN PARAMETERS FORM - EDSLPA

1. GENERAL

The 5961-3 Record is available in 5E4(2) and later Software Releases. The EDSLPA form associates a Telephone Number with an EDS (Electronic Directory Service) feature and group. It is used when assigning EDS features to non-Multi-Line Hunt lines if the default parameters of the EDSFD form (5961-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.38.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the EDS group.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

For 5E12 and later, TN/FEATURE combinations on different EDSLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the EDSLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the EDS feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the EDSFD form.

2.4 # EDS GRP

Description: Enter the name of an EDS group of which this line is a member.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be defined on the EDSGP form.

SEC. 4D: 5961-4 RECORD
EDS (ELECTRONIC DIRECTORY SERVICE)
MLHG PARAMETERS FORM - EDSMPA

1. GENERAL

The 5961-4 Record is available in 5E4(2) and later Software Releases. The EDSMPA form associates a Multi-Line Hunt line with an EDS (Electronic Directory Service) feature and group. It is used when assigning EDS features to Multi-Line Hunt lines to assign EDS feature parameters to the lines if the default parameters of the EDSFD form are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.38.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM NBR

Description: Enter the Multi-Line Hunt Group Member Number.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

2.4 * FEATURE

Description: Enter the name of the EDS feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the EDSFD form.

2.5 # EDS GRP

Description: Enter the name of an EDS group of which this line is a member.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

The name entered must be defined on the EDSGP form.

SEC. 4E: 5961-5 RECORD ELECTRONIC DIRECTORY SERVICE MEASUREMENTS FORM - EDSCNT

1. GENERAL

The 5961-5 Record is available in 5E4(2) and later Software Releases. It is used to identify up to twenty-five Electronic Directory Service Groups that are to receive measurement counts.

1.1 Recent Change View

The corresponding Recent Change View for this form is 24.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * KEY

Description: Enter the KEY value which is always 0.

Required Field.
Default: 0
Valid Entries: 0

2.3 EDS GRP LIST

Description: The EDS GRP LIST is a list of up to twenty-five Electronic Directory Service groups that are to receive measurement counts. Enter the names of the EDS groups.
Valid Entries: 1 - 8 characters

Data Rules:

Each EDS GRP entered must be unique and defined on the EDSGP form.

Copyright © 2003 Lucent Technologies

SEC. 5: MESSAGE SERVICE SYSTEM FORMS

Copyright © 2003 Lucent Technologies

SEC. 5A: 5962-1 RECORD
MESSAGE SERVICE SYSTEM FEATURE DEFINITION FORM - MSFD

1. GENERAL

The 5962-1 Record is available in 5E4(2) and later Software Releases. It is used to define the various combinations of options associated with the MSS (Message Service System).

Each terminal (line) which is to use the MSS feature must be assigned only one MSS feature (defined on the MSFD form (5962-1 Record)) on the appropriate feature assignment form: LINEFA form (5112 Record), CLUSTR form (5600 Record), BFG form (5625 Record), or MLHLNFA form (5113 Record).

For 5E6 and later, up to four Message Service features may be assigned to a line or hunt group member.

When a TN or MLHG member is assigned an MSS feature that has MSG RTRVL DISP, PRINT ON DEMAND, or AUTO CALL set to "Y", or LW CALLING set to "OUT" or "INOUT", then the associated MSS GRP from this or the MSSLPA form must be defined on the MSGP form with a MSG SRV CNTR that is an MLHG. The MLHG must be defined on an MLHG form with a value entered in the AP SITE ID field.

When a TN is assigned more than one MSS feature with an MLHG in the MSG SRV CNTR field of the associated MSGP form, then for those MLHGs with the same AP SITE ID, the SRV ID on the associated MSGP forms must be unique for the TN and AP SITE combination.

1.1 Preconstructed Features

Certain Message Service features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a (/) and the slash may not be used as the first character of any feature other than preconstructed features. A list of preconstructed features is contained in Figure 2.

1.2 Recent Change View

The corresponding Recent Change View for this form is 12.37.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the Message Service Feature Name.

There are no restrictions on the valid characters, except that Feature Names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment as locally necessary.
Valid Entries: up to 32 characters

FEATURE OPTIONS

Section 2.4 - Section 2.12 refer to the feature options. An analog terminal (line) must have AUTO CALL

Copyright © 2003 Lucent Technologies

and MSG RTRVL DISP set to "N".

2.4 ATT COVERAGE

Description: Is Attendant Call Coverage allowed?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If ATT COVERAGE is "Y" and the FEATURE is assigned to a Multi-Line Hunt line, then the TERM field on the MLHLNFA form (5113 Record) must be 1.

If ATT COVERAGE is "Y", either a Call Forwarding feature must be assigned to the line or MLHG member, or, for 5E8 and later, a LASS feature may be assigned. For 5E6 and later, the Call Forwarding feature must be defined on a CFWFD form (5614-1/2 Record) where the FWD CONDITION is "BUSY", "IDLE", "BOTH", "PRCB", "PBSY", or "PIDL"; if assigned to a line, it may also be "PRCI" or "PRCV". The LASS feature must be defined on an LSCAFD (5975 Record) or LSCFFD form (5976 Record).

2.5 LW CALLING

Description: Enter the type of LWC (Leave Word Calling) allowed.

Required Field.
Default: NONE
Valid Entries:

Valid LW CALLING Entries

Entry	Definition
INOUT	LWC Incoming/Outgoing. Enables messages to be sent and received to/from users within the same business group.
OUT	LWC Outgoing. Enables messages to only be sent within the same business group.
NONE	No LWC.

Data Rules:

If LW CALLING is "INOUT", then AUD MSG WAIT IND or VIS MSG WAIT IND field must be "Y".

If LW CALLING is "OUT" or "INOUT", and this feature is assigned to a line, then the line must be assigned at least one dialed code (on the PDIT (5300-2 Record) and/or IDPDCA form (5601-1/2 Record)) or a Button Feature (on the CFGGRP form (5964 Record)) with ACTION equal to "LWCUSE" and an ACTION equal to "CLWCUSE" and a FEATURE associated with the dialed code on the PDIT/IDPDCA/CFGGRP form equal to this MSS feature or the MSS wild-card feature (/MS*).

For 5E6 and later, if a line or hunt group has more than one Message Service feature assigned, only one of the features may have this field set to "OUT" or "INOUT". The other Message Service features must have "NONE" entered.

If LW CALLING is "INOUT" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

2.6 MSG RTRVL DISP

Description: Is MRD (Message Retrieval Display) allowed?

MRD allows the text to be displayed when messages are retrieved.

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If MSG RTRVL DISP is "Y", then ATT COVERAGE must be "Y" or LW CALLING must be "INOUT".

If MSG RTRVL DISP is "Y" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

If an MLHG/TERM is assigned a Message Service System feature (on an MLHLNFA, BFG, or associated CLUSTR form) with MSG RTRVL DISP set to "Y", then the MLHG/TERM must be defined as CKT MLHG / CKT TERM on a DSLUSR form where DISPLAY is "Y".

If TNs are assigned a Message Service System feature (on a LINEFA form, the BFG form, or an associated CLUSTR form) with MSG RTRVL DISP set to "Y", then:

- for 5E9(1) and later, the TN must be defined on the DSLUSR form as CKT TN and DISPLAY must be "Y".

For 5E6 and later, if "Y" is entered and the associated lines or hunt groups have more than one Message Service feature, each Message Service group must have a unique AP SITE ID. The MLHG assigned to the MSS GRP on the MSGP form is associated with the AP SITE ID on the MLHG form.

2.7 PRNT ON DEMAND

Description: Is POD (Printout on Demand) allowed?

POD allows a printout to be requested of all undelivered messages.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PRNT ON DEMAND is "Y", and this feature is assigned to a line, then the line must be assigned at least one dialed code (on the PDIT and/or IDPDCA form) or a Button Feature (on the CFGGRP form) with ACTION equal to "PODUSE" and a FEATURE associated with the dialed code on the PDIT/IDPDCA/CFGGRP form equal to this MSS Feature or the MSS wild-card feature (/MS*).

If PRNT ON DEMAND is "Y" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

For 5E6 and later, if "Y" is entered and the associated lines or hunt groups have more than one Message Service feature, each Message Service group must have a unique AP SITE ID. The MLHG assigned to the MSS GRP on the MSGP form is associated with the AP SITE ID on the MLHG form.

2.8 AUD MSG WAIT IND

Description: Is the Audible MWI (Message Waiting Indicator) activated when messages are left?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If AUD MSG WAIT IND is "Y", then ATT COVERAGE must be "Y" or LW CALLING must be "INOUT".

If AUD MSG WAIT IND is "Y" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

2.9 VIS MSG WAIT IND

Description: Is the Visual MWI (Message Waiting Indicator) activated when messages are left?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If VIS MSG WAIT IND is "Y", then ATT COVERAGE must be "Y" or LW CALLING must be "INOUT".

If VIS MSG WAIT IND is "Y" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

If the VIS MSG WAIT IND is set to "Y" and this feature is assigned to an analog line or MLHG/TERM, then

- an EQDS2P input form(s) must be defined where the sum of the CIRCUITS EQUIPPED is greater than or equal to five for circuit TYPE equal to "LDSU2TX" for a given SM,
- or, for 5E9(2) and later, an EQDSC3 form (5852 Record) must be defined where the sum of the TONE XCVRS is greater than or equal to five for the given SM.

2.10 DEACT MSG WAIT IND

Description: Is the user allowed to deactivate the MWI (Message Waiting Indicator) from their own station set?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DEACT MSG WAIT IND is "Y", then AUD MSG WAIT IND or VIS MSG WAIT IND must be "Y".

If DEACT MSG WAIT IND is "Y", and this feature is assigned to a line, then the line must be assigned at least one dialed code (on the PDIT and/or IDPDCA form) or a Button Feature (on the CFGGRP form) with ACTION equal to "DCTMWI" and a FEATURE associated with the dialed code on the PDIT/IDPDCA/CFGGRP form equal to this MSS Feature or the MSS wild-card feature (/MS*).

If DEACT MSG WAIT IND is "Y" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

2.11 AUTO CALL

Description: Is Auto Call Set-up allowed?

This feature allows the user to place a call to the caller associated with a message being displayed during message retrieval without dialing the destination telephone number.

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

If AUTO CALL is "Y" and the FEATURE is assigned to a Multi-Line Hunt Line, then TERM on the MLHLNFA form must be 1.

If an MLHG/TERM is assigned a Message Service System feature (on an MLHLNFA, BFG, or associated CLUSTR form) with AUTO CALL set to "Y", then the MLHG/TERM must be defined as CKT MLHG/CKT TERM on a DSLUSR form.

If a TN is assigned a Message Service System feature (on a BFG form, LINEFA form, or associated CLUSTR form) with AUTO CALL set to "Y", then the TN must be defined as CKT MLHG/CKT TN on a DSLUSR form.

2.12 MSG WAIT IND SCTY

Description: Is MWI (Message Waiting Indicator) security activated? This field was added as part of the ISVM (Inter-Switch Voice Messaging) feature described in Division 2, Section 1BG. If MSG WAIT IND SCTY is "Y", the MWI request is processed only if the BCID of the VM system matches the BCID of the destination DN of the user requiring the MWI indication. If "N" is entered, no security check is made.

Software Release: 5E7 and later.
Valid Entries: Y, N

Data Rules:

When AUD MSG WAIT IND or VIS MSG WAIT IND is "Y", MSG WAIT IND SCTY must be entered.

When AUD MSG WAIT IND and VIS MSG WAIT IND are "N", MSG WAIT IND SCTY must not be entered.

DEFAULT PARAMETERS

The following field defines the default parameters assigned with the feature to terminals (lines). These parameters will be assigned to the terminal (line) unless they are overridden by entries on MSLPA (5962-3 Record) or MSMPA forms (5962-4 Record).

2.13 MSS GRP

Description: Enter the name of the MSS Group.

The name entered here must be an MSS Group defined on the MSGP form.
Valid Entries: 1 - 8 characters

2.14 EAVM ALW

Description: This field indicates whether Easy Access to Voice Mail is allowed or denied for the particular MSS/ISVM (Message Service System/Interswitch Voice Messaging) feature.

Software Release: 5E15 and later
Default: Y
Valid Entries: Y, N

SEC. 5B: 5962-2 RECORD
MESSAGE SERVICE SYSTEM GROUP PARAMETERS FORM - MSGP

1. GENERAL

The 5962-2 Record is applicable to 5E4(2) and later Software Releases. It is used to define the group information associated with the MSS (Message Service System) feature.

Each terminal (line) which is to use the MSS feature must be assigned an MSS feature name (defined on the MSFD form) on the appropriate feature assignment form, LINEFA or MLHLNFA. In addition, each terminal should be assigned to an MSS Group which may be defined as a default parameter of the MSFD form, or on an individual terminal basis with the MSLPA or MSMPA forms.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.37.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * MSS GRP

Description: Enter the name of the MSS Group. There are no restrictions on valid characters entered. For 5E8 and later, a maximum of 1000 groups can be assigned.
Valid Entries: 1 - 8 characters

2.3 #GRP TYPE

Description: Enter the Message Service Group Type. MSS (Message Service System) defines the group as an intra-switch MSC serving users on the same switch. ISVM (Inter-Switch Voice Messaging) defines the group as in inter-switch MSC serving users on other switches.

Software Release: 5E7 and later.
Required Field.
Default: MSS
Valid Entries:

Valid GRP TYPE Entries

Entry	Definition
MSS	Message Service System
ISVM	Inter-Switch Voice Messaging

Data Rules:

If GRP TYPE is "MSS", then BCID, DELUXE, MSG SRV CNTR, PASSWORD, and SRV ID must all be entered.

If GRP TYPE is "ISVM", then BCID, MSG SRV CNTR, and SRV ID must all be blank and DELUXE and PASSWORD must be "N".

If GRP TYPE is "ISVM", LW CALLING must be "NONE", and MSG RTRVL DISP, PRNT ON DEMAND, and AUTO CALL must all be "N" on the MSFD form for TNs and MLHG/TERM(s) assigned a Message Service System Feature (on the LINE, MLHLNFA, CLUSTR or BFG forms).

2.4 BCID

Copyright © 2003 Lucent Technologies

Description: Enter a valid Business Customer Identification.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

The BCID defined here must match one of the BCIDs 1 - 6 defined on the MLHG form (5110 Record) and the MSG SRV CNTR field matches the MLHG field on the MLHG form.

2.5 DELUXE

Description: Is Deluxe MSS activated?

Required Field.
Valid Entries: Y, N

Data Rules:

If DELUXE is "Y", then the MSG SRV CNTR field must be an MLHG defined on the MLHG form with an AP SITE ID entered.

For 5E4(2) and later, if the MSG SRV CNTR field on this form is defined as a hunt group on the MLHG form (5110 Record) with an AP SITE ID entered, this field must have a value of "Y". Otherwise, DELUXE must be "N".

2.6 MSG SRV CNTR

Description: Enter a Message Service Center Multi-Line Hunt Group Number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

The MSG SRV CNTR defined here must be an MLHG defined on the MLHG form where BCID matches one of the BCID 1 - 6 fields entered on the MLHG form.

2.7 PASSWORD

Description: Is the Password option assigned? If the Password option is Yes, a password is required to retrieve messages.

Required Field.
Default: N
Valid Entries: Y, N

2.8 SRV ID

Description: Enter the Message Service System that is providing message service for this group when the AP is providing more than one message service. When the AP is providing only one message service, SRV ID is optional.

Software Releases, 5E6 and later
Valid Entries: 1 - 255

Copyright © 2003 Lucent Technologies

Data Rules:

When multiple message service systems are being assigned to a terminal and the AP SITE IDs are identical, the SRV IDs entered in this field must not be the same.

SEC. 5C: 5962-3 RECORD
MESSAGE SERVICE PARAMETER FORM - MSLPA

1. GENERAL

The 5962-3 Record is available with 5E4(2) and later Software Releases. It is used when assigning MSS (Message Service System) features to non-Multi-Line Hunt lines to assign MSS feature parameters to the lines if the default parameters of the MSFD form are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.37.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the MSS group.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
ISDN	Digital Subscriber Line associated ISDN (Integrated Service Digital Network) service.
ISATND	ISDN (Integrated Service Digital Network) attendant terminal.

For 5E12 and later, TN/FEATURE combinations on different MSLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the MSLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the MSS feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the MSFD form.

2.4 # MSS GRP

Copyright © 2003 Lucent Technologies

Description: Enter the name of an MSS group of which this line is a member.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be defined on the MSGP form.

For 5E6 and later, if the associated line has more than one Message Service feature assigned and the AP is providing more than one Message Service, the associated MSGP forms (5962-2 Record) must have unique SRV IDs.

2.5 EAVM ALW

Description: This field indicates whether Easy Access to Voice Mail is allowed or denied for a specific line.

Software Release: 5E15 and later
Default: Y
Valid Entries: Y, N

SEC. 5D: 5962-4 RECORD
MESSAGE SERVICE SYSTEM LINE (MLHG/TERM NBR)
PARAMETER FORM - MSMPA

1. GENERAL

The 5962-4 Record is available with 5E4(2) and later Software Releases. It is used when assigning MSS (Message Service System) features to Multi-Line Hunt lines to assign MSS feature parameters to the lines if the default parameters of the MSFD form are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.37.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM NBR

Description: Enter the Multi-Line Hunt Group Member Number.
Valid Entries: 1 - 2015 and 3001 - 3999 (outdial terminals)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
ISDN	Digital Subscriber Line associated ISDN Service.
ISATND	ISDN (Integrated Service Digital Network) attendant.

2.4 * FEATURE

Description: Enter the name of the MSS feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the MSFD form.

2.5 # MSS GRP

Copyright © 2003 Lucent Technologies

Description: Enter the name of an MSS group of which this line is a member.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be defined on the MSGP form.

For 5E6 and later, if the associated hunt group has more than one Message Service feature assigned and the AP provides more than one service, the associated MSGP forms (5962-2 Record) must have unique SRV IDs.

2.6 EAVM ALW

Description: This field indicates whether Easy Access to Voice Mail is allowed or denied for a specific Multiline Hunt Group.

SEC. 5E: 5962-5 RECORD
MESSAGE SERVICE MEASUREMENTS FORM - MSCNT

1. GENERAL

The 5962-5 Record is available with 5E4(2) and later Software Releases. It is used to identify up to twenty-five Message Service System Groups that are to receive measurement counts.

1.1 Recent Change View

The corresponding Recent Change View for this form is 24.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * KEY

Description: Enter the KEY value 0 which is the default and only value.

Required Field.
Default: 0
Valid Entries: 0

MSS GRP LIST

The MSS GRP LIST is a list of up to twenty-five Message Service groups which are to receive measurement counts.

2.3 MSS GRP

Description: Enter the name of the MSS group.
Valid Entries: 1 - 8 characters

Data Rules:

Each MSS GRP entered must be unique and defined on the MSGP form.

SEC. 5F: 5962-6 RECORD
MESSAGE SERVICE CENTERS MEASUREMENTS FORM - MSCCNT

1. GENERAL

The 5962-6 Record is available with 5E4(2) and later Software Releases. It is used to identify up to twenty-five Message Service Center Multi-Line Hunt Groups that are to receive measurement counts.

1.1 Recent Change View

The corresponding Recent Change View for this form is 24.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * KEY

Description: Enter the KEY value 0 which is the default and only value.

Required Field.
Default: 0
Valid Entries: 0

MS MLHG LIST

The MS MLHG LIST is a list of up to twenty-five Message Service Center Multi-Line Hunt Groups which are to receive measurement counts.

2.3 MS MLHG

Description: Enter a Message Service Center Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

Each MS MLHG entered must be unique and defined on the MSGP form.

SEC. 6: DSLAP COMMUNICATIONS DATA FORMS

Copyright © 2003 Lucent Technologies

SEC. 6A: 5963 RECORD
DSL AP COMMUNICATIONS DATA FORM - DSLAP

1. GENERAL

The 5963 Record is available with 5E4(2) and later Software Releases. It is used to define the data links connecting an AP (Application Processor) and the 5ESS Switch. Each AP is connected to one ISDN SM with DSL data links. If the Application Processor Link Diversification Secured Feature (SFID 103) is purchased, the AP links may terminate to two different ISDN SMs. See Division 2, Section 4A103.

If a DSLAP form is submitted, then the APPLICATION PROCESSOR field on the OFCOPT form (5509 Record) must be "SM" or "AMSM". IDCU does not support AP.

1.1 Recent Change View

The corresponding Recent Change view for this form is 24.7.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * AP SITE ID

Description: Enter an Application Processor Site ID.

This ID uniquely identifies the AP to the switch and is used internally for message routing.
Valid Entries: 1 - 255

Data Rules:

5E8 and later:

If AP SITE ID is defined on a DSLAP form with SEC E911 SITE set to "Y", there must be a second DSLAP form with PRIM E911 SITE set to "Y".

A maximum of 10 AP SITE IDs may be defined for a single SM.

5E10 and later:

No more than 10 DSLAP form entries may be submitted for an SM that is not an SM-2000 (i.e. UNIT TYPE on the EQIM form is not "SM2000".

If UNIT TYPE is "SM2000", no more than 30 DSLAP form entries may be submitted.

5E11 and later:

If UNIT TYPE designates an SM-2000 class processor (i.e., "SM2000", "SM2005", etc.), no more than 30 DSLAP form entries may be submitted.

2.3 # SM

Description: Enter the number of the ISDN Switching Module connected to the Application Processor.

Required Field.
Valid Entries: 1 - 192

Copyright © 2003 Lucent Technologies

Data Rules:

A maximum of 16 DSL LINKs can be assigned per SM; a maximum of 30 DSL LINKs can be assigned per SM if UNIT TYPE on the EQIM form designates an SM-2000 class processor.

2.4 SEC AP SITE ID

Description: Enter the secondary application processor site ID.

The secondary application processor site ID is used to define backup links to a separate ISDN SM.

Software Release: 5E8 and later
Valid Entries: 1 - 255

Data Rules:

The AP Link Diversification feature is a Secured Feature that must be purchased by the office, and an SFSYS form (5713-1 Record) must have the ACT field for SFID 103 set to "Y" before the SEC AP SITE field is set to "Y". For more information on the AP Link Diversification secured feature, see Division 2, Section 4A103.

SEC AP SITE ID cannot be the same as AP SITE ID.

If SEC AP SITE ID is entered on a DSLAP form, then:

- Neither the AP SITE ID or the SEC AP SITE ID can be entered as a SEC AP SITE ID on any other DSLAP form,
- For 5E8 - 5E9(2), this SEC AP SITE ID must be defined on its own DSLAP form with a different SM value, the same ISVM value, SEC AP SITE ID blank, SEC E911 SITE set to "N", and PRIM E911 SITE set to "N".

  For 5E10 and later, this SEC AP SITE ID must be defined on a second DSLAP form, where this SEC AP SITE ID entry matches the AP SITE ID field on the second DSLAP form. The second form must have a different SM value, SEC AP SITE ID must not be entered, PRIM E911 SITE must be "N", SEC E911 SITE must be "N", and the entries in the ISVM field and the IDDD15 ALW field must match the values on this form.

2.5 # ALARM

Description: Should alarms be activated when the DSL data links between the AP and ISDN SM are out of service?

Required Field.
Default: Y
Valid Entries: Y, N

2.6 PRIM E911 SITE

Description: Is this AP SITE ID for the primary ESA (E911 Service Adjunct)? This field is used to designate a set of links for the primary emergency services adjunct.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If PRIM E911 SITE is "Y", the AP SITE ID cannot be used for other applications.

When E911 OPTION on the OFCOPT form is "ESA", a DSLAP form must be specified with PRIM E911 SITE set to "Y".

PRIM E911 SITE may be "Y" on only one DSLAP form.

If PRIM E911 SITE is "Y", ALARM should be "Y" and ISVM must be "N".

If PRIM E911 SITE is "Y", then SEC AP SITE ID must not be entered.

If PRIM E911 SITE is "Y", then SEC E911 SITE must be "N".

If PRIM E911 SITE is "Y" on a DSLAP form, then AP SITE ID may not be entered as a SEC AP SITE ID on any other DSLAP form.

2.7 SEC E911 SITE

Description: Is this AP SITE ID a link to the secondary E911 Service Adjunct?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If SEC E911 SITE is "Y", then SEC AP SITE ID must not be entered.

If SEC E911 SITE is "Y", ISVM must be "N".

If SEC E911 SITE is "Y", ALARM should be "Y".

SEC E911 SITE may be "Y" on only one DSLAP form.

If SEC E911 SITE is "Y" on a DSLAP form, then AP SITE ID may not be entered as a SEC AP SITE ID on any other DSLAP form.

If SEC E911 SITE is "Y", a second DSLAP form must exist with PRIM E911 SITE set to "Y".

When SEC E911 SITE is "Y", the AP SITE ID cannot be used for other applications.

The Dual ESA (Emergency Services Adjunct) feature is a Secured Feature that must be purchased by the office, and an SFSYS form (5713-1 Record) must have the ACT field for SFID 108 set to "Y" before the SEC E911 SITE field is set to "Y".

2.8 ISVM

Description: Is this AP associated with ISVM (Inter-Switch Voice Messaging)? (See Div. 2, Sec. 1BG for ISVM Feature Description).

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If PRIM E911 SITE is "Y", ISVM must be "N".

2.9 RMK

Description: This field may be used for any

descriptive comment.
Valid Entries: 1 - 8 characters

2.10 AP IDX

Description: This field is used by Recent Change as a verify only field.

2.11 IDDD15 ALW

Description: Is 15 Digit International Direct Distance Dialing allowed ? This field is used to indicate which format message (existing or expanded) is used for the MDR (Message Detail Recording) feature. "Y" should be entered if the expanded format should be used. This field supports the 15 Digit IDDD secured feature. For more information on this feature, see Division 2, Section 4A223.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "N" if PRIM E911 SITE or SEC E911 SITE is "Y".

For 5E10 and later, this field cannot be "Y" unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record) before "Y" can be entered in this field.

2.12 ALW DUP NXX

Description: This field is used to indicate if the client process on the Switch can accept 7-digit DNs with non-unique NXXs transmitted over the AP link. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

When this field is set to "N", the client process will accept 7-digit DNs that will map to the base NPA for that NXX. When this field is set to "Y", DNs with non-unique NXXs will be transmitted over the AP link. In this case, 7-digit DNs are no longer allowed since the client process is unable to determine the correct NXX.

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

LINK DATA

Use the following fields (Section 2.13 - Section 2.19) to describe up to 16 digital data links that connect the AP to the 5ESS Switch. At least one link must be assigned for each AP, but two are recommended for reliability. When a link is assigned to an AP, it cannot be assigned to any other AP; it must not appear on another DSLAP form.

Data Rules:
A maximum of 16 DSL LINKs can be assigned per SM. For 5E10 and later, 30 AP links are allowed on an SM-2000.

Copyright © 2003 Lucent Technologies

2.13 LCEN

Description: Enter the ISLU LCEN (Line Card Equipment Number) of the DSL.
Valid Entries: 8 digits. See the following table for the LCEN format.

LCEN (LINE CARD EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Integrated Services Line Unit	ISLU	X	0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

Data Rules:

The SM entered here must match the SM field on this form.

For 5E9(2) and earlier, the value assigned in TERMLIM defines the maximum number of ISDN Terminals that are allowed to be simultaneously active per SM. TERMLIM is a no display field on the EQIM form with a default of 2047. In most cases TERMLIM should be set to this value. The ISDN Terminals are defined as follows:

ISDN Terminal Assignments

Form	SM	Number of Assignments
DSL	OE[1,3]	MTERM defines the quantity of ISDN Terminals per DSL form.
DSLAP	LCEN[1,3]	number of ISDN Terminals is incremented by 1 for each LCEN list element defined.
MISLINK	OE[1,3]	1
OSPSDSL	LCEN[1,3]	1 where SERVICE CLASS is not "XDB"

LCEN values entered on DSLAP forms must be unique.

The LCEN must be assigned to an operational Line Card specified on the ISLULC form (5942 Record) with an EQST (equipment status) of "O" and a LINE CARD TYPE of "PULC", "ULC", or "TLC".

If LCEN is entered, the corresponding ISCN value must be entered.

All of the DSLs (Digital Subscriber Lines) on an SM, where the first four numbers of the OE values (first four digits of the LCEN) match for ISLU and IDCU, (i.e., SM/ISLU for ISLUs or SM/IDCU for IDCU) and have the same D REL PIDB and D TIMESLOT, they must also have the same the fifth and sixth digits of the LCEN (LGC for ISLU and RT for IDCU) SHELF and CHL GRP number (the 1 - 3 digits of the D ISCN).

For 5E9(1) and later, an SLG (Sub Line Group) is a group of no more than 4 LC (Line Cards) per LGC (Line Group Controller).As growth occurs, every (R)ISLU, SLGs must be installed in the order shown in the following table. LGC is the fifth and sixth digit of the LCEN. LINE CARDS are the last two digits of the LCEN

Installation Order for SLG

SLG	LGC	LINE CARDS
0-15	0-15	16, 18, 20, 22
16-31	0-15	08, 10, 12, 14
32-47	0-15	24, 26, 28, 30
48-63	0-15	00, 02, 04, 06

2.14 OE

Description: Equipment type and number.
Valid Entries: This is a two segment field comprised of an equipment type and number.

Valid DSL OE Type Entries

Entry	Definition
E	Software Release: 5E12 and later. The DSL-OE is associated with an Access Interface Unit-ISDN equipment number (AIUEN).
I	Software Release: 5E10 and later.

Copyright © 2003 Lucent Technologies

	The DSL OE is associated with an 8-digit ISLU or RISLU (LCEN).
K	Software Release: 5E10 and later. The DSL OE is associated with an ISDN ISLU2 line card equipment number (LCKEN).

If OE is "E", Equipment Number consists of:

ACCESS INTERFACE UNIT, TYPE E

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Access Interface Unit	AIU	XXX	000-127
Pack	PACK	XX	00-19
Circuit	CKT	XX	00-15

Data Rules:

When OE is "E":

- the REL PIDB must be 1 - 5.
- each SM/AIU DPIDB time slot may be assigned only once (i.e., D and/or B Channels cannot be assigned to conflicting DPIDB time slots or quarter time slots due to manual (vs ODA) time slot assignments). Note that D channels are allocated to quarter time slots, therefore, up to four unique assignments can be made before a time slot is considered full. (Time slot conflicts are generated by system message "ISDN288a/b/c" which will assist in resolving conflicts.)

If DSL OE Type is set to "I", the 8-digit OE number consists of the following components:

LINE CARD EQUIPMENT NUMBER, TYPE I

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
(Remote) Integrated Services Line Unit	(R)ISLU	X	0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

If DSL OE Type is set to "K", the ISLU2 Equipment Number consists of:

ISLU2 REMOTE TERMINAL NUMBER, TYPE K

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	LU	XX	00 - 42
Line Group	LG	XX	00 - 15
Line Board	LBD	X	0 - 7
Line Circuit	LCKT	XX	00 - 07

For 5E11 and later, when OE is entered, a corresponding ISCN value must be entered. (This check only applies to the existing form tuples in Large Terminal Growth whether the AILA (Automatic ISDN Line Assignment) feature is active or not). For more information on this feature, see Division 2, Section 1BO.

The LCEN's assigned on the AMLBDSL, DSLAP or OSPSDSL forms, or DSL OE's on the DSL form or OE's on the MISLINK form can not have their D and/or B Channels assigned to conflicting DPIDB time slots or quarter time slots due to manual (vs ODA) time slot assignments. Each SM/ISLU or SM/IDCU DPIDB time slot may be assigned only once. (Note, D channels are allocated to quarter time slots; therefore up to four unique assignments can be made before a time slot is considered full.

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs. (Logical Link Control Blocks) The following applications define the possible LLCB assignments.

LLCB Assignments

Entry	Definition
AMLBDSL	SM is the first three digits of LCEN, SHELF/CHL GRP is the first three digits of ISCN. The count is incremented by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	SM is the first three digits of OE Number, SHELF/CHL GRP is the first three digits of PPB1 ISCN.

Copyright © 2003 Lucent Technologies

	The count is incremented by 1 for each PPB1 ISCN defined.
DSL	SM is the first three digits of OE, SHELF/CHL GRP is the first three digits of PPB2 ISCN. The count is incremented by 1 for each PPB2 ISCN defined.
DSL	SM is the first three digits of OE, SHELF/CHL GRP is the first three digits of D ISCN. If a matching DSLUSR form is not found the count is incremented by 1.
DSLAP	Software Release 5E10 and later. SM is the first three digits of OE, SHELF/CHL GRP is the first three digits of ISCN. The count is incremented by 1 for each unique OE/ISCN combination.
DSLUSR	SM is the first three digits of OE, SHELF/CHL GRP is the first three digits of D ISCN on the corresponding DSL form. The count is incremented by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered. The count is incremented by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
DSLUSR	SM is the first three digits of OE, SHELF/CHL GRP is the first three digits of ODB ISCN1 and/or ODB ISCN2. The count is incremented by 1 if only ODB ISCN1 is entered. The count is incremented by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
MISLINK	Software Release 5E9(1) and later. SM is the first three digits of OE; SHELF and CHL GRP are the SHELF and CHL GRP fields, respectively. The count is incremented by 1 for each MISLINK form.
OSPSDSL	SM is the first three digits of LCEN, SHELF/CHL GRP is the first three digits of ISCN. The count is incremented by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined. Else the count is incremented by 1 for each unique OSPSDSL form.
RTERM	Where RT INTERFACE is "TR303", SM is SM, SHELF/CHL GRP is the first three digits of TMC PRI ISCN, TMC NPRI ISCN, EOC PRI ISCN or EOC NPRI ISCN. The count is incremented by 2 for each TMC PRI ISCN and for each TMC NPRI ISCN entry. The count is incremented by 3 for each EOC PRI ISCN and for each EOC NPRI ISCN entry.
TRUNK	Where TRKCLS equals to "IFOPER", "IFTERM" or "EDSL" on the TKGRP form. SM is the first three digits of DEN or NEN, SHELF/CHL GRP is the first three digits of ISCN. The count is incremented by 1 for each unique TRUNK form.
XAT	SM is the first three digits of OE, SHELF/CHL GRP is the first three digits of ISCN. The count is incremented by 1 for each unique XAT form.

OE Type "I" or "K":
For 5E10 and later, time slots for the DPIDBs, assigned and reserved on an ISLU(2), cannot exceed the maximum number of 32 time slots available for the DPIDB. Timeslots are allocated for DSL D and/or B channels on the OSPSDSL and on the following forms where DSL OE Type is "I" or "K"

- AMLBDSL
- DSL
- DSLAP
- MISLINK

These can also be allocated by the ODA automatic time slotassignment algorithm. Timeslots may also be reserved for On Demand B channel usage on the ODBTS form.

OE Type "I":
When OE Type is "I", the assigned TS may not be equal to the LGC part of the OE or the LGC plus 16.

For 5E10 and later, this data rule applies to an "I" Equipment Type. The ODA automatic time slot assignment algorithm allocates 4 TS to each SM, ISLU (Integrated Services Line Unit), or LGC (Line Group Controller) configuration for each PIDB from the ISLU to the PSU (Packet Switch Unit) as follows:

- for LGCs (digits 5 & 6 of the Equipment Number) numbered between 0 - 7 the time slots are assigned to odd numbered PSU PIDBs and
- for LGCs numbered between 8 - 15 the time slots are assigned to even numbered PSU PIDBs (PIDBs are assigned on the EQISLU form).

For 5E10 and later, an OE with OE Type of "I" must be defined as an equipped and operational U or T card on the ISLULC input form

Copyright © 2003 Lucent Technologies

OE TYPE "K":
When OE Type is "K", the assigned TS may not be equal to the LG part of the OE or the LG plus 16.

For 5E10 and later an OE with OE Type of "K" must be defined as an equipped and operational U or T Board on the ISLULB input form.

For forms with a "K" OE Type, the ODA automatic time slot assignment algorithm allocates four TS to each SM, ISLU2, or LG configuration for each PIDB from the ISLU2 to the PSU as follows:

- for LGs (digits 6 & 7 of the Equipment Number) numbered between 0 - 7 the time slots are assigned to odd numbered PSU PIDBs and
- for LGs numbered between 8 - 15 the time slots are assigned to even numbered PSU PIDBs (PIDBs are assigned on the EQISLU form).

If the DSL, DSLAP, and MISLINK forms have unassigned D TIMESLOTs and/or B TIMESLOTS, ODA is required to assign these values. The ODA assignment requires that a "K" Type OE Number is assignedto LGs 0 - 7 (Note: the sixth and seventh digit of the Equipment Number is the LG) get time slots on odd numbered EQISLU PIDBs and that LCKENs assigned to LGs 8 - 15 get time slots on even numbered EQISLU PIDBs, each with a PIDB TYPE of "PSU".

2.15 ISCN

Description: Enter the D-channel Integrated Services Channel Number.

Each SM can have up to 5 PSU Shelves. Each Shelf can have up to 16 protocol handlers. Shelves and protocol handlers are defined by the first 3 digits of the ISCN field. Each protocol handler can be assigned up to 32 time slots.
Valid Entries: 6 digits. See the following table for the ISCN format.

ISCN (INTEGRATED SERVICES CHANNEL NUMBER)

Equipment		Format	Valid Entries
Shelf	-	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127

Data Rules:

ISCN values entered on DSLAP forms must be unique. (ISCNs can be defined on the following forms but may not be duplicated:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT

If an SM/ISCNs combination has been assigned, then the corresponding combination of SM, PSU, PSU SHELF and GRP must be entered on the PSUGP form.

Copyright © 2003 Lucent Technologies

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

The Shelf in the ISCN field represents the number of the cabinet shelf on which the PSU protocol handler is located. It must correspond to the PSU SHELF on an EQPSU form (5741 Record) that has a SHLF SIDE 0/1 EQST of "O".

The Channel Group is the number of the PSU protocol handler on the shelf. It corresponds to a PROTOCOL HANDLER assigned on an EQPSUPH form (5942 Record) for the corresponding SM and PSU SHELF.

The Channel is the PSU protocol handler member number within the protocol handler.

AMLBDSL, DSL, DSLAP, DSLUSR, ODBRES, OSPSDSL, RTERM, and XAT forms along with all TRUNK forms which have a TRKCLS of "EDSL", "IFTERM", or "IFOPER" defined on the TKGRP form can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM, but they cannot be mixed with an ISCN SHELF and CHL GRP on a PSISM form or a TRUNK form that has a TRKCLS of "PACKET" or "X75" or "X75P" defined on the TKGRP form.

Each Switching Module can have up to 5 PSU SHELFs. On the EQIM form, when UNIT TYPE is not "SM2000", each PSU SHELF can be assigned up to (32 times X) time slots for the following table ofapplications. (Note: X represents the number of PIDBs, 0 to 4, provisioned per shelf.)

Timeslots Reserved for Applications

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

For 5E10 and later, for the above applications (except the RPA application), each DI (Data Interface) in a SM can have a maximum of 256 nailed-up time slots reserved for the application in the preceding table. These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the following applications. Note that a D channel only takes a quarter of a time slot. This data rule is not executed on an SM-2000, because provisioning of nailed-up time slots is not required on an SM2000.

For 5E11 and later, when the ACT field for FID 695 is set to "Y" on the FOSYS form (5713-2 Record) (i.e., the AILA (Automatic ISDN Line Assignment) feature is active), this field on the corresponding DSLAP form must not be entered. For more information on this feature, see Division 2, Section 1BO.

Copyright © 2003 Lucent Technologies

When the ACT field for FID 695 is set to "N" (i.e., the AILA (Automatic ISDN Line Assignment) feature is not active), this field on the corresponding DSLAP form must be entered for LINK numbers where LINK OE is entered.

2.16 TS

Description: Enter the D-channel time slot number.
Valid Entries: 0 - 31

Data Rules:

If any of the TS, QTR TS, or REL PIDB fields are entered, all three must be entered.

The TS must not equal the LGC part of the LCEN/LCKEN or the LGC + 16.

When making manual assignments, care must be taken to use assignments as shown in Figure 1, TS Assignments vs LGC Entry and D PIDB Entry. For example, if manual assignments were being made and the REL PIDB selected is 11 and LGC from the OE is 0, then the TS assignment must be 1, 9, 17, or 25. B and/or D channel assignments made manually cannot conflict with the ODA assignment algorithm. The ODA algorithm is allocated 4 time slots per DPIDB per SM/ISLU/LGC. The LGCs 00 thru 07 are allocated time slots on the odd numbered DPIDBs while LGCs 08 thru 15 are allocated time slots on the even numbered DPIDBs. Manual time slot assignments do not have to follow this algorithm. However, if manual assignments are made, they will use one or more time slots. These manual assignments diminish and may conflict with the time slots available for the ODA assignment algorithm. For example, TS 1, 9, 17 and 25 are the 4 time slots that are allocated to ODA for LGC 0 in any ISLU which has a DPIDB 11 assigned. If a manual assignment is made to TS 9 on DPIDB 11 from any LGC in this ISLU there will only be 3 TS left on PIDB 11 for ODA assignments. Of course other odd numbered DPIDBs will have 4 TS for ODA assignments to LGC 0.

2.17 QTR TS

Description: Enter the D-channel quarter time slot number.
Valid Entries: 0 - 3

Data Rules:

If any of the TS, QTR TS, or REL PIDB fields are entered, all three must be entered.

In order to conserve resources, the assignment of QTR TSs must be "packed". That is, all quarter time slots in a time slot must be assigned (if possible) to a TS (Timeslot) before another TS is used. To pack the TS all D-channels on an LGC are candidates for assignments to the same TS. No D-channels can be assigned to a TS to which a D-channel from another LGC has been assigned. The D-channels which are assigned to a TS must all be in the same DSL GROUP. Furthermore, if the PROTOCOL HANDLER TYPE on the EQPSU form (5742 Record) is "PH16", the DSL MEMBERs of this DSL GROUP, when divided by six, must be equal (when dividing, disregard the remainder). For example, ISCNs 106000 through 106005 could be assigned to two TSs in any combination of two and four or three and three. However, ISCN 106006 (the next member of DSL GROUP 06 assigned to PSU SHELF 1) could not be assigned to either of these TSs and neither could any other ISCN be assigned to either of these TSs. If the PROTOCOL HANDLER TYPE is "PH128", the only restriction on the ISCN is that all members assigned to a given TS must be in the same DSL GROUP and have the same PSU SHELF assignment (ISCN [1,3] must be equal).

2.18 REL PIDB

Description: Enter the PIDB (Peripheral Interface Data Bus) number.

Valid REL PIDB Entries

Entry	Description

0 - 11	Software Release 5E11 and earlier: OE types "I" or "K".
1 - 5	Software Release 5E12 and later: OE type "E".

Data Rules:

If any of the TS, QTR TS, or REL PIDB fields are entered, all three must be entered.

The REL PIDB number must be assigned on the EQISLU form (5731 Record) with a PIDB TYPE of "PSU" and a PSU SHELF matching the PSU SHELF entered in the ISCN field.

The D and/or B Channels that are assigned manually (i.e. not assigned by ODA) cannot be assigned to conflicting DPIDB time slots or quarter time slots. Each SM/ISLU or SM/IDCU DPIDB time slot can only be assigned once. (Note, D channels are allocated to quarter time slots, therefore up to four assignments can be made before a time slot is considered full. However, these four assignments must be unique.)

2.19 EXTERNAL NAME

This field is used by Recent Change as a verify only field.

SEC. 7A: 5964 RECORD
CONFIGURATION GROUP DEFINITION FORM - CFGGRP

1. GENERAL

The 5964 Record is available with 5E4(2) and later Software Releases. It is used to assign BRCS (Business and Residence Customer Service) feature actions to CPE (Customer Premises Equipment) user terminal buttons.

This form allows the user to assign BRCS feature actions to a maximum of 2032 buttons. The 2032 buttons are divided into 8 components with 254 buttons in each component. Features are assigned to the 254 buttons in groups of 30.

The features assigned to a feature button must be assigned to the terminal that this Configuration Group is associated with on the appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), CLUSTR (5600 Record) or BFG (5625-1/7 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and office name on each record.

2.2 * CONFIG GRP

Description: This field is used to enter the name of the configuration group. For 5E5 and later, the configuration group must be assigned on DSLUSR forms (5908 Records) to provide common button features to groups of ISDN terminals.
Valid Entries: 1 - 8 characters

2.3 * CPE COMPONENT

Description: This field is used to enter the component number. The component number identifies a unit which is comprised of a maximum of 254 buttons on a CPE (Customer Premises Equipment) terminal. Please refer to the documentation provided with the CPE to determine the proper component number.
Valid Entries: 0 - 7

2.4 * RANGE

Description: This field is used to enter the range value. The value entered is a number within a 30 button range. The BUTTON fields will then be numbered accordingly. Each form accommodates 30 button assignments within the 254 BUTTONs of a COMPONENT.

For example, if RANGE is any value from 1 to 30, the BUTTON fields will be numbered from 1 to 30. If RANGE is any number between 241 and 254 the BUTTON fields will be numbered from 241 to 254. BUTTON numbers above 254 are illegal.
Valid Entries: 1 - 254

2.5 GRP TYPE

Description: This field indicates whether the Configuration Group is applicable to Standard (Bellcore) BRI users or Custom (AT&T) BRI users.

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later
Required Field.
Default: STD
Valid Entries:

Valid GRP TYPE Entries

Entry	Definition
CUSTOM	This configuration is valid only for Custom (AT&T) BRI users.
STD	This configuration is valid only for Standard (Bellcore) BRI users.

Data Rules:

All CFGGRP forms for the same CONFIG GRP must have the same GRP TYPE.

CUSTOM:
If GRP TYPE is "CUSTOM", the CONFIG GRP can be assigned only on DSLUSR forms defined for custom BRI users, where DSL CLS is not set to "STD" on the corresponding DSL form.

STD:
If "STD" is entered, CPE COMPONENT must be 0.

If GRP TYPE is "STD", the CONFIG GRP can be assigned only on DSLUSR forms defined for standard BRI users, where DSL CLS is set to "STD" on the corresponding DSL form; also, CPE COMPONENT on this CFGGRP form must be 0.

For 5E9(2) and later, Feature Button ICOM (Intercom) features may not be assigned to standard BRI users; only Call Appearance ICOM features may be assigned. If GRP TYPE is "STD", features entered in the BUTTON LIST FEATURE field must be defined on a CAICOM form (5984 Record), and not on an ICMFD form (5960-1 Record).

2.6 RMK

Description: This field is used for any descriptive comment.
Valid Entries: 1 - 32 characters

BUTTON LIST

The following fields (Section 2.7 - Section 2.10) comprise the BUTTON LIST. The BUTTON LIST is a list of buttons (from 1 to 254 in groups of 30) to which BRCS FEATURES may be assigned. The ACTION and PARAM values entered will determine the functionality of the button.

2.7 BUTTON

Description: This field is populated automatically depending on the value of RANGE.

2.8 FEATURE

Description: This field is used to enter a BRCS feature name. The FEATURE must be assigned on a feature definition form (e.g., MWFD (5606-1/2 Record), DRFD (5606-1 Record), etc.) with the same FEATURE name.
Valid Entries: 1 - 8 characters

For 5E15 and later, when FEATURE is entered on this form, it must not be defined on the MWFD form (5602 Record) where the appropriate fields on the MWFD form are set as follows:

- FEATURE OPTIONS fields: ACT/INACT OPTION must be set to "ACT1CA", MULTIWAY CONTROL must be set to "NWAY", and AMAC must be set to "USAGE",
- ENTRY POINT fields: FLASH must be set to "Y", IN MIDDLE must be set to "Y", and OFF HOOK must

Copyright © 2003 Lucent Technologies

be set to "Y", and

- DEFAULT PARAMETER field: N-WAY MAXIMUM must be set to "6".

The feature options on the MWFD form define a USSWC (Usage Sensitive Six-Way Calling) feature which cannot be assigned on this form. USSWC must be assigned on the OFCOPT form (5509 Record). For more information on the USSWC feature, see Division 2, Section 4A553.

2.9 ACTION

Description: This field is used to enter an ACTION code.
Valid Entries: See Figure 1 for valid entries.

Data Rules:

Data rules that apply to specific ACTIONs are included with the ACTION descriptions in Figure 1. FEATURE and PARAM dependencies for ACTION values are shown in Figure 2.

For 5E12 and later, when the CFGGRP forms have an ACTION of "IEHGS" or "IHGS" and the length of PARAM for these BUTTON LIST entries is 3 or 5 digits respectively, the leftmost 3 digits must be an OFFICE CODE defined on the NOC form. When the length of PARAM is 6 or 8 digits respectively, the leftmost 6 digits must be defined as NPA/OFFICE CODE combination on the NOC form.

For 5E12 and later, in addition to previous rule, if there is more than one NOC form with the same value for OFFICE CODE, NPA must be added as the first 3 digits of PARAM (making PARAM 6 or 8 digits).

2.10 PARAM

Description: This field is used to enter a parameter.
Valid Entries:

- For 5E12 and later: 1 - 8 characters (0 - 9, *, #, I, F, O or P)

Data Rules:

PARAM values are required for all of the following ACTIONs except "ACCTUSE":

ACTION	PARAM Values
ACCTUSE	One to four digits. This parameter is optional; it is the dial code that is used to access Account Codes.
AD1USE	One- to four-digit number. First digit in the range 0 - 9, # or *. Digits two to four in the range 0-9. When the first digit is * or #, at least another digit must be entered.
AD2USE	Two- to four-digit number. First digit in the range 0 - 9, # or *. Digits two to four in the range 0-9. When the first digit is * or #, at least two more digits must be entered.
DTPOTSA	One- to four-digit number. First digit in the range 0 - 9, # or *. Digits two to four in the range 0-9. When the first digit is * or #, at least another digit must be entered.
IACOF	01 - 32. This value indicates the IDP alternate code treatment set for the particular dialed code.
IDSS	0. IDSS action must be assigned to Button 1. Buttons 2 to 100 will be built automatically with the IDSS action.
IDTGS	One- to four-digit access code for PFA.
IEHGS	Three-digit office code.
IHGS	Five-digit Hundreds group.
IHOLD	First two digits 00-99 and last digit 0 or 1. The first two digits indicate the amount of time in seconds that a call may remain on hold and the third digit indicates whether this configuration group has Serial Calling. (0 for No, 1 for Yes).
IRLL	Two digit number in the range 00 - 99 indicates the amount of time in seconds that a transferred call may remain unanswered before it will return alerting tone to an ISDN attendant console.
PFUSE	One- to four-digit number. First digit in the range 0-9, # or *. Digits two to four in the range 0-9. When the first digit is * or #, the second digit must be entered.

Copyright © 2003 Lucent Technologies

For 5E5 and later, for offices in retrofit: for each unique CFG GRP, if an action of "IHGS" or "IEHGS" is entered in the ACTION field, there must exist exactly 100 buttons defined with the ACTION of "IDSS" for the same value of CFG GRP.

For 5E10 and later, when ACTION is "ARSUSE", "ARS1USE" or "ARS2USE" and PARAM is entered, GRP TYPE must be "STD".

For 5E10 and later, when ACTION is "ATHUSE" and PARAM is entered, GRP TYPE must be "STD".

Valid ACTION Entries

Entry	Definition
AATOG	Software Release: 5E9(1) and later. Auto Answer On/Off via toggle feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
ACBFBP	Activate/Deactivate/Answer Auto Call-Back. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ACBFBP".
ACCFB	Software Release: 5E5 and later. LASS Automatic Callback deactivation. This feature button allows the user to deactivate the AC (Automatic Callback) feature two ways: The user goes off-hook, receives dial tone, and depresses the feature button; a cancellation announcement is returned and the feature button lamp goes off. The user is on-hook and depresses the feature button; the feature button lamp goes off. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ACCFB".
ACCTUSE	Account code use code.
ACUFB	Software Release: 5E5 and later. LASS Automatic Callback activation. This feature button can be used in two ways: First, to activate the AC (Automatic Callback) feature. The user goes off-hook, receives dial tone, and depresses the feature button; an appropriate response is returned. Possible responses are: Audible alerting - Called party is alerted immediately because the called station is found to be idle. Short-term denial - Reorder tone is given to the user to indicate that network resources are temporarily exhausted or the called party has a feature active that causes the Automatic Callback attempt to be denied (e.g., Call Forwarding Variable). A subsequent attempt by the user to activate the feature may succeed. Long-term denial - An announcement is returned indicating that the Automatic Callback feature is not allowed to the user. Confirmation - An announcement is returned indicating that the Automatic Callback feature has been activated. Second, if the user has one-touch service (ONE TOUCH field on the DSLUSR form (5908 Record) is "Y"), the user may choose to answer the AC ringback while on-hook by depressing this feature button which will activate the speaker-phone. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ACUFB".
AD1CH	Change 1 digit abbreviated dial list.

Copyright © 2003 Lucent Technologies

AD1USE	Use 1 digit abbreviated dial.
AD2CH	Change 2 digit abbreviated dial list.
AD2USE	Use 2 digit abbreviated dial.
ANSBACK	Software Release: 5E9(1) and later. Call Park Answer Back. This action allows the user to answer back a call from any DN within the same terminal group. For more information on Call Park, see Division 2, Section 4A124, or for National ISDN Call Park (5E12 and later), see Division 2, Section 4A258. Data Rules: For 5E12 and later, before a BUTTON LIST ACTION of "ANSBACK" can be assigned to a GRP TYPE of "STD", the National ISDN Call Park feature must be purchased by the office. An SFSYS form must exist with SFID 258 set to "Y".
ARCFB	Software Release: 5E5 and later. LASS Automatic Recall deactivation. This feature button allows the user to deactivate the AR (Automatic Recall) feature two ways: The user goes off-hook, receives dial tone, and depresses the feature button; a cancellation announcement is returned, and the feature button lamp goes off. The user is on-hook, and depresses the feature button; the feature button lamp goes off. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ARCFB".
ARS1USE	Use ARS Phase II Dial Plan 1.
ARS2USE	Use ARS Phase II Dial Plan 2.
ARSUSE	Use ARS via ODP (Office Dialing Plan).
ARUFB	Software Release: 5E5 and later. Lass Automatic Recall activation. For 5E8 and later, this feature button is available for both Custom and Standard ISDN station sets, but its operation is CPE-dependent. Standard BRI users may apply AR to both voice and data service, while custom users are restricted to voice. One-touch service is not available for Standard BRI users. For 5E7 and earlier, this feature button is available to Custom AT&T BRI users and can be used in three ways. First, to activate the AR (Automatic Recall) feature. The user goes off-hook, receives dial tone, depresses the feature button and an appropriate response is returned. Second, to activate the AR (Automatic Recall) feature; while the user is off-hook and receiving busy tone, the feature button is depressed and an appropriate response is returned. Possible responses are: Audible alerting - Called party is alerted immediately because the called station is found to be idle. Short-term denial - Reorder tone is given to the user to indicate that network resources are temporarily exhausted or the called party has a feature active that causes the Automatic Recall attempt to be denied (e.g., Call Forwarding Variable). A subsequent attempt by the user to activate the feature may succeed. Long-term denial - An announcement is returned indicating that the Automatic Recall feature is not allowed to the user. Confirmation - An announcement is returned indicating that the Automatic Recall feature has been activated. Third, if the user has one-touch service (ONE TOUCH field on the DSLUSR form (5908 Record) is "Y"), the user may choose to answer the AR ringback while on-hook by depressing this feature button which will activate the speaker-phone. Data Rules:

Copyright © 2003 Lucent Technologies

	No other ACTION field for the same CONFIG GRP can have an entry of "ARUFB".
ATACTMWI	Activate Message Waiting Indicator by attendant. This feature button is used by an MSC (Message Service Center) attendant to activate the MWI (Message Waiting Indicator) at the user's station set. This feature button can be used in two ways: The call has been forwarded to the attendant. The attendant, while active on the call, depresses the button and the MWI is activated at the user's station set which the call was forwarded from. The attendant depresses the feature button, receives stutter dial tone and then dials the number of the telephone the MWI is to be activated on. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ATACTMWI".
ATDCTMWI	Deactivate Message Waiting Indicator by attendant. This feature button works similarly to the "ATACTMWI" action. The attendant, while active on a call with the message service user, can depress this feature button and deactivate the MWI or the attendant can depress this feature button, receive stutter dial tone and then dial the number of the telephone the MWI is to be deactivated on. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ATDCTMWI".
ATFACT	Software Release: 5E8 and later. Used when a DN wants to activate the ISDN ACVT (Attendant Control of Voice Terminals) feature on itself. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ATFACT".
ATFDCT	Software Release: 5E8 and later. Used when a DN wants to deactivate the ISDN ACVT feature on itself. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ATFDCT".
ATGACT	Software Release: 5E8 and later. Used when a DN wants to activate the ISDN ACVT feature for a group of DNs. The ACVT feature assigned must have an associated restriction group defined. A DN can only activate the ACVT feature for the group it belongs to. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ATGACT".
ATGDCT	Software Release: 5E8 and later. Used when a DN wants to deactivate the ISDN ACVT feature for a group of DNs. The ACVT feature assigned must have an associated restriction group defined. A DN can only deactivate the ACVT feature for the group it belongs to. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ATGDCT".
ATHUSE	Authorization code use code dialed.
AUCUSE	Use Auto-Call Set-Up used with Message Service and Electronic Directory Service features. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "AUCUSE".
AWTUSE	Aggregate work time use. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "AWTUSE".
BITOG	Software Release: 5E9(1) and later. Barge-In via toggle feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".

Copyright © 2003 Lucent Technologies

BNTOG	Activate/Deactivate Call Forward. Data Rules: The FEATURE associated with this feature button must be defined on the CFWFD Form with an ACT TYPE of "CODE" and a DACT TYPE of "CODE".
BPARK	Software Release: 5E9(1) and later. Basic Call Park. This action allows the user active on a call to park the call against the user's DN. For more information on Call Park see Division 2, Section 4A124. When the ACTION is "BPARK", GRP TYPE must be "CUSTOM".
BYGP	Group make busy. This action is used to make all members of an MLHG (Multi-Line Hunt Group) busy. Although a configuration group name with this action may be assigned to all the members of an MLHG the only member that can activate this feature is member number one. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "BYGP".
BYMB	Member make busy. This action is used to make individual members of a hunt group busy. Data Rules: Configuration groups with this action cannot be assigned to terminals of MLHGs with a HUNT type of "ISAT" defined on the MLHGFD form (5604 Record). No other ACTION field for the same CONFIG GRP can have an entry of "BYMB".
BYPO	Position make busy. This action is used with ISDN Attendant Consoles. When the button is depressed, the particular console (position) is made busy. Active calls on the console can be served and calls may be originated from the busy console. Data Rules: Configuration groups with this action can be assigned only to terminals of MLHGs with a HUNT TYPE of "ISAT" defined on the MLHGFD form (5604 Record). No other ACTION field for the same CONFIG GRP can have an entry of "BYPO".
BYRB	Software Release: 5E6 and later. Random make busy. This action is used to make individual members of a hunt group busy. Data Rules: Configuration groups with this action cannot be assigned to terminals of MLHGs with a HUNT TYPE of "ISAT" defined on the MLHGFD form (5604 Record). No other ACTION field for the same CONFIG GRP can have an entry of "BYRB".
CCL	Code calling for call pickup.
CFBN	Software Release: 5E9(1) and later. Call Forwarding Button Action. Data Rules: When the ACTION is "CFBN", GRP TYPE must be "STD"; the corresponding feature must be defined on a CFWFD form with ACT TYPE set to "CDDN", "CDDNC", "CDDNCA", or "CDCA1A", and with DACT TYPE set to "CODE".
CLTOG	Software Release: 5E9(1) and later. Closed On/Off via toggle feature button. For more information on the ACD/BRCS secured feature, see Divison 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
CLWCUSE	Cancel Leave Word Calling. Used with the Message Service feature. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "CLWCUSE".
CNDFBP	Software Release: 5E5 and later. ICLID (Individual Calling Line Identification Calling Number Delivery) activation/ deactivation. This feature button allows the user to activate or deactivate the Calling Number Delivery feature which allows the called party to receive data on an incoming call. The feature button can be used two ways:

Copyright © 2003 Lucent Technologies

	The user goes off-hook, depresses the feature button and an appropriate display message is returned and the button lamp goes on/off. The user is on-hook, depresses the feature button and the button lamp goes on/off. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "CNDFBP".
CNPUSE	Software Release: 5E10 and later. Per-call Calling Name privacy use and cancel (toggle). This value is used by the I-CNAM (ISDN Calling Name) feature. For more information on this feature, see Division 2, Section 1AM on National ISDN features. Data Rules: This ACTION requires the Display WILDCARD feature.
CONF	Software Release: 5E8 and later. Multiway Conference feature for "STD" DSLs when used with Standard ISDN terminals that do not have functional message capability. Data Rules: When ACTION is "CONF", GRP TYPE must be "STD"; no other ACTION field for the same CONFIG GRP can have an entry of "CONF".
COTFBP	Software Release: 5E5 and later. Customer Originated Trace activation. This feature button allows the user to activate the Customer Originated Trace feature. For the COT feature a display module must be available on the station set (DISPLAY field is "Y" on the DSLUSR form). The feature button allows the user to activate the COT feature two ways: The user goes off-hook, depresses the feature button and an appropriate display message is returned. The user can activate COT while active on the call by depressing the feature button during the call and an appropriate display message is returned. Possible display messages are: Successful Activation - A message is displayed indicating a successful activation of the COT request and provides information on any further action the user should take. Trace not Available - A message is displayed indicating that the call has already been traced or invalid data about the call is stored in the history block (e.g., originating and terminating switches are not connected by CCS7 trunks). Buffer full - A message is displayed indicating that the COT message buffer is full and the user should attempt the trace again later. Short-term denial - A message is displayed indicating that network resources are exhausted. A subsequent attempt by the user to activate the feature may succeed. Feature denial - A message is displayed indicating that the Customer Originated Trace feature is not available to the user. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "COTFBP".
CPNBNFBT	Software Release: 5E6 and later. Activate/deactivate Calling Party Number/Billing Number feature by toggle button. Data Rules: The corresponding FEATURE entry must appear on a CPNBNFD form with ACT and DEACT both set to "CODE". No other ACTION field for the same CONFIG GRP can have an entry of "CPNBNFBT".
CPQ1	Use call pickup feature with queue 1.
CPQ2	Use call pickup feature with queue 2.
CPQ3	Use call pickup feature with queue 3.

Copyright © 2003 Lucent Technologies

CPQ4	Use call pickup feature with queue 4.
CTT	Software Release: 5E7 and later. Allows the attendant to make a test call from an Analog line that has been assigned an attendant class of service. The test call will verify the operation of the selected trunk member and the switch translations. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "CTT".
CWDLU	Use a dial call waiting feature. For ISDN Attendant Consoles, this action is used to assign the camp-on feature button. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "CWDLU".
CWLMP	Software Release: 5E9(1) and later. Call Waiting Lamp. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
DCDTVM	Software Release: 5E16 and later. DTVM Direct Connect.
DCTMWI	Software Release: 5E6 and later. Deactivate Message Waiting Indicator. Used with the Message Service feature. A feature button with a built-in lamp assigned this action provides the user with a visual indication that a message is waiting. The MWI (Message Waiting Indicator) can be deactivated by depressing this feature button. If an MWI lamp is provided with the particular set, this action may be associated with the lamp but will not provide the ability of depressing the feature button on the previous case to deactivate the MWI. In this case, it may be desirable to provide a dialed code with this action the PDIT form or IDPDCA form to serve this function. Data Rules: For 5E6 and later, if this action is assigned to two or more feature buttons, the wildcard feature may not be used. For 5E7 and later, if the associated feature is an MDS wildcard feature (/MS*), the same ACTION cannot be assigned to any other BUTTON for the given CONFIG GRP. If the feature is not an MDS wildcard feature, the ACTION and FEATURE combination must be unique across all CFGGRP forms for a given CONFIG GRP.
DLVRMSG	Next segment of the message or match.
DNPUSE	Software Release: 5E4(2) and later. Per-call DN privacy on (use). For 5E5 and later, this action is used for per-call TN privacy. This feature button can be used in two ways: The calling party subscribes to all-call privacy which allows the calling party to prevent delivery of their TN to the called party for all calls (PRIVACY field on the LINE, MLHLN or DSLUSR form is "Y"). The calling party can deactivate all-call privacy on a per-call basis (TN PRIVACY field on the DISPFD form is "Y"), allowing the calling TN to be displayed to the called party. To deactivate all-call privacy on a per-call basis, the user goes off-hook, depresses the feature button, receives a confirmation tone, receives dial tone and then dials the TN. The terminal may not subscribe to all-call privacy which allows the TN of the calling party to be delivered to the called party for all calls (PRIVACY field on the LINE, MLHLN or DSLUSR form is "N"). The calling party can activate per-call privacy on a per-call basis (TN PRIVACY field on the DISPFD form is "Y"), not allowing the calling TN to be displayed to the called party. To activate per-call privacy on a per-call basis, the user goes off-hook, depresses the feature button, receives a confirmation tone, receives dial tone and then dials the telephone number.
DPARK	Software Release: 5E9(1) and later. Directed Call Park. This action allows the user active on a call to park the call against the user's DN or to direct the call to be parked against another directory number within the same terminal group. For more information on Call Park, see Division 2, Section 4A124, or for National ISDN Call Park (5E12 and later), see Division 2, Section 4A258. Data Rules: For 5E12 and later, before a BUTTON LIST ACTION of "DPARK" can be assigned to a GRP TYPE of "STD",

Copyright © 2003 Lucent Technologies

	the National ISDN Call Park feature must be purchased by the office. An SFSYS form must exist with SFID 258 set to "Y".
DPN	Use direct pickup without barge-in.
DPU	Use directed pickup with barge-in. Data Rules: If "DPU" is entered FEATURE must not be the Pickup Originating WILDCARD feature ("/PO*").
DQDUSE	Use Directory Query Display. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "DQDUSE".
DROP	Software Release: 5E8 and later. Multiway Drop feature for "STD" DSLs when used with Standard ISDN terminals that do not have functional message capability. Data Rules: When ACTION is "DROP", GRP TYPE must be "STD"; no other ACTION field for the same CONFIG GRP can have an entry of "DROP".
DTPOTSA	Escape to POTs and give dial tone.
DTVMCF	Software Release: 5E16 and later. DTVM Call Forward.
ECUSE	Software Release: 5E9(1) and later. Event Code via feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
EMUSE	Software Release: 5E9(1) and later. Emergency via dial code or feature button. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
ERCO	Software Release: 5E5 and later. ISDN Executive Ringer Cutoff. This is a secured system optional feature that allows an ISDN keyset user to press a feature button to turn audible ringing on or off for all emergency calls and ring backs from Auto Call Back. When power ringing is turned off by ERCO, a visual alerting at the principal's terminal and the ability to pick up the call will still occur. Data Rules: This feature can only be assigned to an ISDN keyset for a primary shared DN that is assigned on a DSLUSR form (5908 Record). In addition the Configuration Group name defined on this form must be entered in the CONFIG GRP field on the DSLUSR form. No other ACTION field for the same CONFIG GRP can have an entry of "ERCO". ERCO can only be activated when the Secured Feature System Assignment form (5713 Record) indicates that the feature has been purchased.
I1ICOM	ISDN Intercom Group 1 action. This action is related to an entry on an ICMFD form (5960-1 Record) or an ICMLPA form (5960-3 Record) in row one of the GROUP LIST. Data Rules: Terminals assigned this action must have the preconstructed feature /ICM or an equivalent constructed feature assigned on an LINEFA form (5112 Record). No other ACTION field for the same CONFIG GRP can have an entry of "I1ICOM". GRP TYPE must be "CUSTOM."
I2ICOM	ISDN Intercom Group 2 action. This action is related to an entry on an ICMFD or an ICMLPA form in row two of the GROUP LIST. Data Rules:

Copyright © 2003 Lucent Technologies

	Terminals assigned this action must have the preconstructed feature /ICM or an equivalent constructed feature assigned on an LINEFA form. No other ACTION field for the same CONFIG GRP can have an entry of "I2ICOM". GRP TYPE must be "CUSTOM".
I3ICOM	ISDN Intercom Group 3 action. This action is related to an entry on an ICMFD form (5960-1 Record) or an ICMLPA form (5960-3 Record) in row three of the GROUP LIST. Data Rules: Terminals assigned this action must have the preconstructed feature /ICM or an equivalent constructed feature assigned on an LINEFA form. No other ACTION field for the same CONFIG GRP can have an entry of "I3ICOM". GRP TYPE must be "CUSTOM".
I4ICOM	ISDN Intercom Group 4 action. This action is related to an entry on an ICMFD or an ICMLPA form in row four of the GROUP LIST. Data Rules: Terminals assigned this action must have the preconstructed feature /ICM or an equivalent constructed feature assigned on a LINEFA form. No other ACTION field for the same CONFIG GRP can have an entry of "I4ICOM". GRP TYPE must be "CUSTOM".
IACOF	ISDN Attendant Control of Facility action. The feature button assigned this action can be used by the attendant to activate/deactivate the alternate code treatment set for a particular dialed code defined in the IDP. The parameter associated with this action represents the IDP alternate code treatment set for the particular dialed code. Data Rules: An ACOFRF form (5968 Record) must be entered for each feature button defined with this action. A maximum of 32 feature buttons with this action may be assigned per configuration group.
IASPNORM	Software Release: 5E9(1) and later. Normal dialing plan treatment (IDP). For more information on ASP features, see Division 2, Section 1AP. Data Rules: When ACTION is "IASPNORM", GRPTYPE must be "CUSTOM". For every PARAM on this form where ACTION is "IASPNORM", there must be a corresponding TRIG NBR entered on an NSTRIG form (5324 Record) where APPLICATION is "ASP" and AIN REL is "R0". If CONFIG GRP, CPE COMPONENT, and RANGE appear on this form with a BUTTON LIST having ACTION set to "IASPNORM", the FEATURE for that BUTTON LIST must match FEATURE on an ASPFD form (5632-1 Record). For restricted access, this action can be associated with anyone of the following: ASP wildcard feature (/AO*) ASP preconstructed feature ASP constructed feature For unrestricted access, this action can be associated with IDP wildcard feature (/ID*)
IBSYVFY	ISDN Busy Verify action. This action is used with the ISDN Attendant Console Busy Verification of Directory Numbers and Trunks. Data Rules: The FEATURE associated with this attendant action must be a call pickup originating feature (/CPUVO or an equivalent constructed feature) defined on a PUOFD form (5605-1 Record). In order for the barge-in feature to

Copyright © 2003 Lucent Technologies

	be implemented, the terminating line/trunk must have a call pickup terminating feature (/CPUIVT for digital. /CPUVT for analog or an equivalent constructed feature defined on PUTFD form (5605-2 Record). No other ACTION field for the same CONFIG GRP can have an entry of "IBSYVFY".
ICANCEL	ISDN MW Cancel Call action. This action enables the attendant to disconnect the last call of an added call. This button when used in conjunction with call splitting allows the attendant to disconnect the called number of a transferred call and be joined with the calling party.
ICONF	ISDN Conference action. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICONF".
ICRBL1	Intercom Calling Restriction Busy Lamp 1. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICRBL1".
ICRBL2	Intercom Calling Restriction Busy Lamp 2. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICRBL2".
ICRBL3	Intercom Calling Restriction Busy Lamp 3. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICRBL3".
ICRBL4	Intercom Calling Restriction Busy Lamp 4. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICRBL4".
ICRBL5	Intercom Calling Restriction Busy Lamp 5. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICRBL5".
ICRBL6	Intercom Calling Restriction Busy Lamp 6. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ICRBL6".
ICTT	Software Releases: 5E4(2) through 5E6. ISDN Call Through Test action.
IDNACT	Activate/deactivate ISDN ACVT (Attendant Control of Voice Terminals) restrictions for an individual terminal (line). Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "IDNACT".
IDSS	ISDN DSS (Direct Station Select) action. When assigning this action, it is only necessary to assign button one. The other 99 buttons will be automatically assigned by ODA. Button one should be assigned only by an initial office. It is not recommended that you assign button one for retrofit offices, because if you assign button one, you must then assign all the other 99 buttons.
IDTGS	ISDN Direct Trunk Group Selection allows the attendant to select an idle member of a trunk group or simulated facility by depressing a single button on the terminal set. The parameter associated with this action represents up to a four-digit PFA dialed code. Depressing this button is the same as dialing an access code. This feature button may be used in conjunction with a feature button assigned an action of "ISCCOF". In this case, the "ISCCOF" feature button would be depressed first and then the IDTGS button which will restrict the use of a particular trunk group/facility. Data Rules: When this action is entered, a corresponding IPFDCA form (5969 Record) must be defined.
IEHGS	ISDN Extended Hundreds Group Select action. This action is used with the DSS (Direct Station Select) module of an ISDN Attendant Console. This action provides extended selection capabilities to the DSS module by allowing the attendant to select up to 10,000 directory numbers. The parameter associated with this action is the NXX and the parameter associated with the buttons assigned the IDSS action in this case will provide both the hundreds group (thousands and hundreds digits) and station (00-99 within the hundreds group) selected. When

Copyright © 2003 Lucent Technologies

	using the feature button associated with this action, the attendant depresses the button first to select the NXX, next the attendant depresses an IDSS button to select the hundreds group and, finally, the attendant depresses another IDSS button that represents the station to be selected.
IEMEROVR	ISDN Attendant Emergency Override action. The attendant will be able to use the feature button to override terminating restrictions such as Call Forwarding, Series Completion or members of a Multi-Line Hunt Group. Data Rules: The FEATURE associated with this attendant action must be a call pickup originating feature (/CPUEO or an equivalent constructed feature) defined on a PUOFD form. The lines to be overridden must have a call pickup terminating feature (/CPUIEOT for digital, /CPUEOT for analog, or an equivalent constructed feature) defined on a PUTFD form. No other ACTION field for the same CONFIG GRP can have an entry of "IEMEROVR".
IFRLS	ISDN Forced Release Call action. The attendant will be able to use the feature button to tear down a stable call when necessary.
IGACT	Activate/deactivate ISDN ACVT (Attendant Control of Voice Terminals) restrictions for a group of lines. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "IGACT".
IHGS	ISDN Attendant Hundreds Group Select action. The action is used with the DSS (Direct Station Select) module of an ISDN Attendant Console. The parameter associated with this action is the NXX and the thousands and hundreds digits of the hundreds group to be selected. This feature button along with the feature buttons assigned the IDSS action are used to select the desired station (00-99 within the hundreds group). When using the feature button associated with this action, the attendant depresses the button first to select the hundreds group and then depresses an IDSS button to select the station.
IHOLD	ISDN Hold action. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "IHOLD".
IJOIN	ISDN Join Call action. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "IJOIN".
IME	ISDN MW Manual Exclusion action. This action is used with the "IJOIN", "ISPLIT" and "ISTART" actions in order to do attendant call transfer. Manual exclusion is provided for customers that have the automatic bridging transfer option. Manual exclusion allows the attendant to inhibit automatic bridging for one call, therefore, the attendant must manually join the calling and called parties together. When three-way calling with manual bridging is assigned to the ISTART button, then the same multiway feature must be assigned to this button. When automatic bridging is assigned to the ISTART button, then this button must have a manual bridging override assigned. Refer to Figure 2 for the valid combinations between three-way multiway features assigned to the "ISTART" and "IME" ACTIONs. Data Rules: If an ACTION of "IME" is entered, an ACTION of "ISTART" must be defined on this form. No other ACTION field for the same CONFIG GRP can have an entry of "IME".
INIGHT	ISDN Call Forward Night Service action. For the ISDN Attendant Console, the feature button associated with this action provides the Fixed Night Service feature. Data Rules: Member number one of this Multi-Line Hunt (ISAT) Group must have a call forwarding feature (/CFNS or an equivalent constructed feature) defined on the CFWFD form (5614 Record). No other ACTION field for the same CONFIG GRP can have an entry of "INIGHT".
INSUSE	Inspect use. The feature button associated with this action allows the user to display call-related information about any call appearance that has been placed on hold, alerting or active. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "INSUSE".
IRLL	ISDN Release Loop Call action. The attendant uses this feature button to disconnect from a call that has been transferred and to be alerted if the transferred call remains unanswered for a specified amount of time.

Copyright © 2003 Lucent Technologies

	Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "IRLL".
IRLS	ISDN Release Call action. This action disconnects the attendant from the active call and allows the attendant to be available for another call.
ISCCOF	ISDN SCCOF (Selective Customer Control of Facilities) action. This action allows the attendant to impose and remove an access restriction to trunks/facilities. The ISCCOF button may be used in conjunction with the IDTGS button or dialed code to provide this capability. See the "IDTGS" action for more information. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "ISCCOF".
ISPLIT	ISDN Split Call action. Call splitting allows the attendant to consult privately with a called party or a calling party before transferring a call without the other party hearing the conversation. An "ISPLIT" button assigned to an attendant's terminal will activate a lamp when a call goes on splithold. Two types of call splitting are available: 1-way and 2-way. 1-way call splitting does not allow the attendant to toggle between the two parties. 2-way call splitting allows the attendant to toggle between the called party and calling party without the other party hearing. To transfer a call using 1-way automatic call splitting, the attendant will depress the "ISTART" button and the "ISPLIT" button will light steadily, then the attendant depresses the "IME" button and dials the transfer number. If the station is idle, the calling party is still split from the call until the attendant depresses the "ISPLIT" button. After announcing the call, if the called party wishes to talk to the calling party, the attendant depresses the "IJOIN" button and all three parties are connected. The attendant can the disconnect from the call. 1-way manual call splitting is the same as the 1-way automatic call splitting except the "IME" button does not need to be depressed. Transferring a call using 2-way automatic call splitting is the same as 1-way automatic call splitting except that the attendant has the option of either joining all three parties using the "IJOIN" button or toggling between the parties without joining them together by using the "ISPLIT" button. Data Rules: If an action of "ISPLIT" is entered, an ACTION of "ISTART" must be defined on this form. No other ACTION field for the same CONFIG GRP can have an entry of "ISPLIT".
ISTART	ISDN Start action. This action allows the attendant to originate or transfer calls. When used to originate calls, the attendant will depress the button and an idle call appearance will be selected. This action is used with "IJOIN", "ISPLIT" and "IME" actions in order to do attendant call transfer. Three multiway features may be assigned to the "ISTART" button. Refer to Figure 2 for the "IME" action description for valid combinations of multiway features between the "IME" and "ISTART" actions. Data Rules: If an ACTION of "ISTART" is entered, an ACTION of "IME" must be defined on this form. No other ACTION field for the same CONFIG GRP can have an entry of "ISTART".
LGNTOG	Software Release: 5E9(1) and later. Login via toggle feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
LQxDISP	Display status of a numbered MLHG queue (where x represents 1 through 8; i.e., LQ1DISP ... LQ8DISP) on the DSLQMON form (5904 Record). When a feature button associated with a particular action is pressed, the queue

Copyright © 2003 Lucent Technologies

	status data associated with that MLHG is displayed. Data Rules: For 5E6 and later, no other ACTION field for the same CONFIG GRP can have an entry of "LQxDISP".
LSP	Loudspeaker paging for call pick up. The paged party may depress a feature button and be connected to the calling party.
LWCUSE	Use Leave Word Calling. The feature button associated with this action allows a message to be left from the calling party for the called party. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "LWCUSE".
MBTOG	Software Release: 5E9(1) and later. Make Busy via toggle feature button. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
METOG	Toggle Manual Exclusion status. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "METOG". For 5E6 and later, if this action is assigned to two or more feature buttons, the wildcard feature may not be used.
MRDUSE	Start/end Message Retrieval Display. Data Rules: For 5E7 and later, if the associated feature is an MDS wildcard feature (/MS*), the same ACTION cannot be assigned to any other BUTTON for the given CONFIG GRP. If the feature is not an MDS wildcard feature, the ACTION and FEATURE combination must be unique across all CFGGRP forms for a given CONFIG GRP.
MWITD	ISDN Terminal Dialed Code. Data Rules: The FEATURE associated with this action must be a multiway feature (/MWI6WC or an equivalent constructed feature) defined on an MWFD form. For 5E8 and later, ACTION may be "MWITD" only when GRP TYPE is "CUSTOM"; the FEATURE on the MWFD form must have DIAL CODE or BUTTON set to "Y".
NNPRV	Software Release 5E10 and later. Calling Name per-call calling number and name private use. This value supports the I-CNAM (ISDN Calling Name) feature. For more information on this feature, see Division 2, Section 1AM on National ISDN features.
NNPUB	Software Release 5E10 and later. Calling number and name public use. This value supports the I-CNAM (ISDN Calling Name) feature. For more information on this feature, see Division 2, Section 1AM on National ISDN features.
NRMLUSE	Set display mode to normal. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "NRMLUSE".
NXTMSG	Next message.
NXTSEG	Next segment of the message.
OASPNORM	Software Release: 5E9(1) and later. Normal dialing plan treatment (ODP). For more information on ASP features, see Division 2, Section 4A126. Data Rules: When ACTION is "OASPNORM", GRPTYPE must be "CUSTOM". For every PARAM on this form where ACTION is "OASPNORM", there must be a corresponding TRIG NBR entered on an NSTRIG form (5324 Record) where APPLICATION is "ASP" and AIN REL is "R0". If CONFIG GRP, CPE COMPONENT, and RANGE appear on this form with a BUTTON LIST having ACTION set to "OASPNORM", the FEATURE for that BUTTON LIST must match FEATURE on an ASPFD form (5632-1 Record). When this feature is provisioned, it can be associated with anyone of the following:

Copyright © 2003 Lucent Technologies

	ASP wildcard feature (/AO*) ASP preconstructed feature ASP constructed feature
PDTEO	Executive Override Access code.
PDTF	Flash Access code.
PDTFO	Flash Override Access code.
PDTI	Immediate Access code.
PDTP	Priority Access code.
PDTR	Routine Access code.
PFUSE	Use private facilities.
PNTEO	Executive Override precedence code.
PNTF	Flash precedence code.
PNTFO	Flash Override precedence code.
PNTI	Immediate precedence code.
PNTP	Priority precedence code.
PNTR	Routine precedence code.
PODUSE	Print on Demand. Used with the Message Service feature. Data Rules: For 5E6 and later, if this action is assigned to two or more feature buttons the wildcard feature may not be used. For 5E7 and later, if the associated feature is an MDS wildcard feature (/MS*), the same ACTION cannot be assigned to any other BUTTON for the given CONFIG GRP. If the feature is not an MDS wildcard feature, the ACTION and FEATURE combination must be unique across all CFGGRP forms for a given CONFIG GRP.
QCANC	Ringback Queuing Cancel. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCANC".
QCBUSY	Software Release: 5E8 and later. ISAT Queue Busy. ISAT MLHGs with modular queuing may use this action. When the queue for the MLHG is full, the QBUSY lamp is lit on each console having the feature button for the QBUSY lamp. The lamp is extinguished when a queue slot becomes available. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCBUSY".
QCPCWT	Software Release: 5E8 and later. ISAT QUEUE Precedence Call Waiting. ISAT MLHGs with modular queuing may use this action. When one or more calls of priority level higher than routine are in the MLHG queue, the PCWT lamp is lit on each console capable of handling MLPP (Multi-Level Precedence Preemption) and having the feature button for the PCWT lamp. The PCWT lamp is extinguished when no precedence calls higher than routine level remain in the queue for that member. Priority higher than routine is defined as one of the following: executive, priority, immediate, flash, or flash override. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCPCWT".
QCUSE	Calls on queue use. This action is used to display the number of calls in queue. The terminal assigned a feature button with this action must also have an appropriate modular queuing feature and an appropriate display feature in order for this feature button to function properly. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCUSE".
QCW1L	Call Waiting 1st Threshold. The feature button associated with this action will alert the user when a call (or calls) have exceeded the prespecified amount of time in the queue. Data Rules: This threshold value is defined on either a QUFD form (5617-1/2 Records) or a QUGPA form (5617-3/4 Records) in the first row of the CALL WAITING LAMPS field. This action is not used for ISDN Attendant consoles. No other ACTION field for the same CONFIG GRP can have an entry of "QCW1L".
QCW2L	Call Waiting 2nd Threshold. The feature button associated with this action will alert the user when a call (or calls) have exceeded the prespecified amount of time in the queue.

Copyright © 2003 Lucent Technologies

	Data Rules: This threshold value is defined on either a QUFD form or a QUGPA form in the second row of the CALL WAITING LAMPS field. This action is not used for ISDN Attendant consoles. No other ACTION field for the same CONFIG GRP can have an entry of "QCW2L".
QCW3L	Call Waiting 3rd Threshold. The feature button associated with this action will alert the user when a call (or calls) have exceeded the prespecified amount of time in the queue. Data Rules: This threshold value is defined on either a QUFD form or a QUGPA form in the third row of the CALL WAITING LAMPS field. This action is not used for ISDN Attendant consoles. No other ACTION field for the same CONFIG GRP can have an entry of "QCW3L".
QCWARN	Software Release: 5E8 and later. ISAT Queue Warning. ISAT MLHGs with modular queuing may use this action. When a predetermined number of calls are queued, the QWARN lamp is lit on each console having the feature button for the QWARN lamp. The lamp is extinguished when the number of calls in the queue falls below this predetermined number. This threshold is defined on the QUFD or QUGPA form as QWARN THRESHOLD. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCWARN".
QCWT	Call Waiting. ISDN Attendant Multi-Line Hunt Groups with modular queuing (for example, the preconstructed feature /QISATCW) may use this action with a lamp on a console, to indicate that calls are in the queue (the lamp will light upon the first call queued). Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCWT".
QCWW	Call Waiting Warning. ISDN Attendant Multi-Line Hunt Groups with modular queuing (for example, the preconstructed feature /QISATCW) may use this action with a lamp on the console, to indicate that the number of calls in the queue has exceeded a prespecified threshold value defined either on a QUFD form or a QUGPA form. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "QCWW".
RTRV	Software Release: 5E9(1) and later. Call Park Retrieve. This action allows the user to answer a call that is parked against the user's DN. For more information on Call Park see Division 2, Section 4A124. Data Rules: When the ACTION is "RTRV", GRP TYPE must be "CUSTOM".
SAUSE	Software Release: 5E9(1) and later. Service Assist via dial code or feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
SCAFB	Software Release: 5E6 and later. Activate/Deactivate LASS Selective Call Acceptance and Computer Access Restriction Feature Button. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "SCAFB".
SCFFB	Software Release: 5E6 and later. Activate/Deactivate LASS Selective Call Forwarding Feature Button. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "SCFFB".
SCRFB	Software Release: 5E6 and later. Activate/Deactivate LASS Selective Call Rejection Feature Button. Data Rules:

Copyright © 2003 Lucent Technologies

	No other ACTION field for the same CONFIG GRP can have an entry of "SCRFB".
SDAFB	Software Release: 5E6 and later. Activate/Deactivate LASS Selective Distinctive Alert Feature Button. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "SDAFB".
SDNUSE	Invoke a Software Defined Network call. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "SDNUSE".
SEL1XFER	Software Release: 5E8 and later. Transfer to Selective Transfer TN 1 from E911 PSAP (Public Safety Answering Point). Data Rules: When ACTION is "SEL1XFER", GRP TYPE must be "CUSTOM".
SEL2XFER	Software Release: 5E8 and later. Transfer to Selective Transfer TN 2 from E911 PSAP. Data Rules: When ACTION is "SEL2XFER", GRP TYPE must be "CUSTOM".
SEL3XFER	Software Release: 5E8 and later. Transfer to Selective Transfer TN 3 from E911 PSAP. Data Rules: When ACTION is "SEL3XFER", GRP TYPE must be "CUSTOM".
SEL4XFER	Software Release: 5E8 and later. Transfer to Selective Transfer TN 4 from E911 PSAP. Data Rules: When ACTION is "SEL4XFER", GRP TYPE must be "CUSTOM".
SEL5XFER	Software Release: 5E8 and later. Transfer to Selective Transfer TN 5 from E911 PSAP. Data Rules: When ACTION is "SEL5XFER", GRP TYPE must be "CUSTOM".
SEL6XFER	Software Release: 5E8 and later. Transfer to Selective Transfer TN 6 from E911 PSAP. Data Rules: When ACTION is "SEL6XFER", GRP TYPE must be "CUSTOM".
SOTOG	Software Release: 5E9(1) and later. Service Observe via toggle feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121. Data Rules: This ACTION requires the (/*) NULL FEATURE and it requires that GRP TYPE must be "CUSTOM".
STPH	Stop hunt. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "STPH".
TCUSE	Total calls handled use. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "TCUSE".
TODUSE	Time and date use. The feature button assigned this action, when depressed, will display the time and date in the display component on the user's terminal. An appropriate display feature must be assigned to the terminal. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "TODUSE".

Copyright © 2003 Lucent Technologies

TOGDCT	Deactivate all CF Features on line. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "TOGDCT".
TRKUSE	ISDN Attendant Trunk Identification action. The attendant uses the feature button associated with this action to identify the trunk group and the member number that the console is currently active on. This may be a public or private trunk group. This information is displayed on the attendant's terminal; therefore, a display feature must be assigned to the terminal. Data Rules: No other ACTION field for the same CONFIG GRP can have an entry of "TRKUSE".
TSM	For 5E12 and later. Telephone Status Monitor and Select (TSM). This enumeration supports the Telephone Status Monitor and Select Feature. This enumeration requires that the null feature (/*) be used. For more information, see Div. 2 Sec. 4A264.
XFER	Software Release: 5E8 and later. Multiway Transfer feature for "STD" DSLs when used with Standard ISDN terminals which do not have functional message capability. Data Rules: When ACTION is "XFER", GRP TYPE must be "STD"; no other ACTION field for the same CONFIG GRP can have an entry of "XFER".

Copyright © 2003 Lucent Technologies

SEC. 8: DISPLAY AND PRIVACY FORMS

Copyright © 2003 Lucent Technologies

SEC. 8A: 5965 RECORD
DISPLAY AND PRIVACY FEATURE DEFINITION FORM - DISPFD

1. GENERAL

The 5965 Record is available with 5E4(2) and later Software Releases, and allows the calling or called number and the time and date to be displayed at an ISDN station set. This feature pertains only to calls which originate or terminate on the same switch.

With the 5E5 and later Software Releases, this feature expanded to analog lines with special Customer Premises Equipment to display the calling directory number and to inter-switch calls with use of the CCS7 signaling network.

With 5E9(1) and later when the MLHG/TERM(s) on an MLHLN form or CKT MLHG/TERM(s) on a DSLUSR form are assigned a Display feature (as defined on the DISPFD form) on either the MLHLNFA, BFG or an associated CLUSTR form, the MLHG/TERM or CKT MLHG/TERM must also be defined on the MLHLN or DSLUSR form with a CKT LCC/RAX value that corresponds to the following CLASS OF SERVICE on the LCC form:

"ATND", "B911", "LTPCLBCK", "CHGCALL", "COIN", "4WINDIV", "HOTMOTL", "HOTPBX", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN", "TWOPTY", "2PTY".

1.1 TN Privacy Feature

The TN Privacy feature allows the calling party to control display of TN information at the called party's terminal.

Two types of TN Privacy are possible: all-call and per-call.

All-call privacy prevents the TN information from being displayed to the called party for all calls unless the feature is deactivated on a per-call basis.

Per-call privacy allows the TN information to be displayed unless the TN Privacy feature is activated on a per-call basis.

Only one Display feature name is allowed on a LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), or CLUSTR form (5600 Record).

1.2 Preconstructed Display Features

Certain Display features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/) and the slash may not be used as the first character of any feature name other than preconstructed features. A list of preconstructed Display features is contained in Figure 1.

1.3 CLASS OF SERVICE Assignment

For the 5E5 Software Release, if a TN or an MLHG/TERM defined on a corresponding LINE, MLHLN, or DSLUSR form (5908 Record) is assigned a Display Feature on a LINEFA, MLHLNFA, BFG, or associated CLUSTR form, the TN or MLHG/TERM must have an associated LCC/RAX on the LCC form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV", "PBX", "CHGCALL", "SATSTLN", "CALLBK" or "B911".

For 5E6 and later Software Releases, if a TN or an MLHG/TERM defined on a corresponding LINE, MLHLN, or DSLUSR form (5908 Record) is assigned a Display Feature (as defined by the DISPFD form) on either a LINEFA, MLHLNFA, BFG, or an associated CLUSTR form, the TN or MLHG/TERM must have an associated LCC/RAX on the LCC form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND",

Copyright © 2003 Lucent Technologies

"ATND", "4WINDIV", "PBX", "CHGCALL", "SATSTLN", "CALLBK" (for 5E6 through 5E8) or "LTPCLBCK" (for 5E9(1) and later), "B911", "COIN", "HOTMOTL", "TWOPTY", or "2PTY".

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.43.

2. FORM AND RECORD ENTRIES

2.1 * FEATURE

Description: Enter the Display Feature name. There are no restrictions on the valid characters except feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.2 REMARKS

Description: Enter a descriptive comment.
Valid Entries: up to 32 characters

FEATURE OPTIONS

Section 2.3 -Section 2.4 refer to the display feature. These are "no change" fields for information only. The customer is not permitted to change them.

2.3 ACT TYPE

Description: This field indicates if the Display feature can be activated by the customer. An entry of "AUTO" means the feature is always active, and the customer is not permitted to activate the feature.
Default: AUTO
Valid Entries: AUTO

2.4 DEACT TYPE

Description: This field indicates if the Display feature can be deactivated by the customer for one call. An entry of "NONE" means the customer is not permitted deactivation.
Default: NONE
Valid Entries: NONE

PRIVACY

Section 2.5 -Section 2.6 refer to the TN Privacy feature.

2.5 TN PRIVACY

Description: Can the calling party control TN privacy on a per-call basis?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E4(2) only, if this field is "Y", and this feature is assigned to a line form (MLHLN, LINE, DSL or

Copyright © 2003 Lucent Technologies

DSMLHLN), the line must be assigned at least one dialed code (on the PDIT (5300-2 Record) and/or IDPDCA form (5601-1/2 Record)) or a feature button (on the CFGGRP form (5964 Record)) with an ACTION of "DNPUSE" and/or "DNPCAN". The action performed by the dialed code or feature button is determined as follows:

1. If the PRIVACY field on the appropriate line form is "Y" and the dialed code or feature button is defined with an ACTION of "DNPCAN", the calling TN is displayed to the called party on a per-call basis.

2. If the PRIVACY field on the appropriate line form is "N" and the dialed code or feature button is defined with an ACTION of "DNPUSE", the calling TN is not displayed to the called party on a per-call basis.

For 5E5 and later, if this field is "Y", and this feature is assigned to a line form (DSLUSR, LINE or MLHLN), the line must be assigned at least one dialed code (on the PDIT and/or IDPDCA form) or a feature button (on the CFGGRP form) with an ACTION of "DNPUSE". The action performed by the dialed code or feature button is determined as follows:

1. If the PRIVACY field on the appropriate line form is "Y", the calling TN is displayed to the called party on a per-call basis.

2. If the PRIVACY field on the appropriate line form is "N", the calling TN is not displayed to the called party on a per-call basis.

For 5E7 and later Software Releases, if TNs on the LINEFA form have been assigned a display feature (either through LINEFA, BFG, or an associated CLUSTR form(s)) defined on the DISPFD form with TN PRIVACY set to "Y", then there must be a dialed code defined on the IDPDCA or PDIT form with ACTION of "DNPUSE", "CNPUSE", "NNPRV", or "NNPUB".

When the Telephone Numbers (TN) on a LINE form or Circuit Telephone Numbers (CKT TN) on a DSLUSR form are assigned a Per Call Privacy feature on either the LINEFA form, BFG form, or an associated CLUSTR form, and if the PCP feature is defined on a DISPFD form with TN PRIVACY set to "Y", then the TN or CKT TN must also be defined on the LINE form or DSLUSR form with an LCC/RAX value that corresponds to one of the following CLASS OF SERVICEs on the LCC form:

"ATND", "B911", "CALLBK" (for 5E6 through 5E8) or "LTPCLBCK" (for 5E9(1) and later), "B911", "COIN", "CHGCALL", "COIN", "4WINDIV", "HOTMOTL", "HOTPBX", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN", "TWOPTY", "2PTY".

Additionally, the following CLASS OF SERVICEs are valid only when the SFSYS form has SFID 50 set to "S" or (for 5E9(1) and later) has the ACT field for SFID 50 set to "Y":

"CHGCALL", "COIN", "HOTMOTL", "HOTPBX", "TWOPTY", "2PTY".

When the MLHG/TERM(s) on an MLHLN form or CKT MLHG/TERM(s) on a DSLUSR form are assigned to a PCP (Per Call Privacy) feature on the MLHLNFA form, BFG form or an associated CLUSTR form, and if the PCP feature is defined on a DISPFD form with TN PRIVACY set to "Y", then the MLHG/TERM or CKT MLHG/TERM must also be defined on the MLHLN or DSLUSR form with an LCC/RAX value that corresponds to the following CLASS OF SERVICE on the LCC form:

"ATND", "B911", "CALLBK", "CHGCALL", "COIN", "4WINDIV", "HOTMOTL", "HOTPBX", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN", "TWOPTY", "2PTY".

Additionally, the following CLASS OF SERVICEs are valid only when the SFSYS form has SFID 50 set to "S":

Copyright © 2003 Lucent Technologies

"CHGCALL", "COIN", "HOTMOTL", "HOTPBX", "TWOPTY", "2PTY".

2.6 AMA REC

Description: Will billing be usage-sensitive and an AMA record be created?

The billing can be done according to how the subscribing user prefers to be billed or how the Telephone Company decides to bill if the Display feature is generally available.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries:

Valid AMA REC Entries

Entry	Definition
Y	Billing will be usage-sensitive and an AMA record will be created.
N	Billing will be done on a flat-rate basis with no AMA record created.

DISPLAY

Section 2.7 -Section 2.8 refer to the Display feature.

2.7 INSPECT

Description: Can the call information be inspected without answering the call?

INSPECT allows the user to display call information associated with a call appearance placed on hold, alert or active.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E5 and later, TNs and MLHG/TERMs defined on the DSLUSR form (5908-2 Record) and assigned a Display Feature on either a LINEFA, MLHLNFA, BFG, or associated CLUSTR form with this field set to "Y" must have the DISPLAY field set to "Y" on the corresponding DSLUSR form.

For 5E5 and later, if a TN or an MLHG/TERM defined on a corresponding LINE, MLHLN, or DSLUSR form is assigned a Display Feature on a LINEFA, MLHLNFA, BFG, or associated CLUSTR form and this field is set to "Y", the TN or MLHG/TERM must have an associated LCC/RAX on the LCC form with a CLASS OF SERVICE of "ISDN" or "ISATND". In addition, if the CLASS OF SERVICE is "ISDN", the TERM TYPE on the corresponding DSLUSR form must be "TYPEA", "TYPEB", "TYPEC" or "TYPED".

If INSPECT is "Y", and this feature is assigned to a line, the line must be assigned a feature button (on the CFGGRP form) with an ACTION of "INSUSE".

2.8 TIME DATE

Description: Is the time and date allowed to be displayed when a button is pressed?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E5 and later, TNs and MLHG/TERMs defined on the DSLUSR form (5908-2 Record) and assigned a Display Feature on either a LINEFA, MLHLNFA, BFG, or associated CLUSTR form with this field set to "Y" must have the DISPLAY field set to "Y" on the corresponding DSLUSR form.

For 5E5 and later, if a TN or an MLHG/TERM defined on a corresponding LINE, MLHLN, or DSLUSR form is assigned a Display Feature on a LINEFA, MLHLNFA, BFG, or associated CLUSTR form and this field is set to "Y", the TN or MLHG/TERM must have an associated LCC/RAX on the LCC form with a CLASS OF SERVICE of "ISDN" or "ISATND". In addition, if the CLASS OF SERVICE is "ISDN", the TERM TYPE on the corresponding DSLUSR form must be "TYPEA", "TYPEB", "TYPEC" or "TYPED".

If TIME DATE is "Y", and this feature is assigned to a line, the line must be assigned a feature button (on the CFGGRP form) with an ACTION of "TODUSE".

2.9 INSPECT AMA

Description: Should the billing for ISDN Inspect be usage sensitive? This field supports the ISDN Inspect feature. For more information on this feature, see Division 2, Section 1BH.

Required Feild

Software Release: 5E11 and later.
Default: Default Value: N
Valid Entries: Y, N

Data Rules:

When LINEFA or MLHLNFA form(s) have an ISDN Inspect feature, as defined on the DISPFD form with INSPECT AMA set to "Y", the LINEFA form(s) must match a DSLUSR form (TN from the LINEFA matches CKT TN from the DSLUSR form) or (MLHG/TERM from the MLHLNFA matches CKT MLHG/CKT TERM from the DSLUSR form) where the DSL CLS on the corresponding DSL form (OE on the DSLUSR form matches DSL OE on the DSL form) is "STD".

- ***NOTE:*** The ISDN Inspect feature can be assigned on either the LINEFA, MLHLNFA, BFG or CLUSTR forms.

Copyright © 2003 Lucent Technologies

SEC. 9A: 5966 RECORD
LINE IDENTIFICATION FEATURE DEFINITION FORM - LIDFD

1. GENERAL

The 5966 Record is available with 5E4(2) and later Software Releases. It is used to allow the calling number to be displayed at an ISDN station set. This feature pertains only to calls which originate or terminate on the same switch.

For 5E5 and later, this feature will be expanded to analog lines and to inter-switch calls with the use of the CCS7 signaling network.

For 5E5 later, TNs and MLHG/TERMs defined on the DSLUSR form (5908-2 Record) and assigned a Line Identification Feature on either a LINEFA form, MLHLNFA form, BFG form or an associated CLUSTR form must have the DISPLAY field set to "Y" on the corresponding DSLUSR form.

For 5E5 and later, if a TN or an MLHG/TERM defined on a corresponding LINE form, MLHLN form or DSLUSR form is assigned a LID (Line Identification Feature) on a LINEFA form, MLHLNFA form, BFG form or an associated CLUSTR form, then the TN or MLHG/TERM must have an associated LCC/RAX on the LCC form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV", "PBX" or "B911".

Only one Line Identification feature name is allowed on a LINEFA form, MLHLNFA form, BFG form or CLUSTR form.

Certain Line Identification features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature name other than preconstructed features. A list of preconstructed Display features is contained in Figure 1.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.44.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * FEATURE

Description: Enter the Line Identification Feature name.

There are no restrictions on valid characters except that feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Software Release: 5E4(2) and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

If a Line Identification Feature is assigned to a TN on the LINEFA form (5112 Record) or an MLHG/TERM on the MLHLNFA form via a BFG form (5625 Record) or an associated CLUSTR form (5600 Record), then the SM(s) from NUMBER on the LINE form (5109 Record) or MLHLN form (5111) must be defined either

Copyright © 2003 Lucent Technologies

- on an EQDS2P form (5740 Record) with TYPE set to "LDSU2TX"
- or for 5E9(2) and later, on an EQDSC3 form with non-zero TONE XCVRS.

For 5E7 only, TNs may not have the preconstructed features /LIRDAMU, /LIRDNMU, and /LIRMDU, which support the Calling Name Delivery usage sensitive billing option, assigned on either the LINEFA, CLUSTR, or BFG form. These features may only be assigned in 5E8 and later Software Releases.

For 5E6 and later, if TN/SM(s) defined on a LINE input form that are assigned a Line Identification Feature on either a LINEFA form, a BFG form, or an associated CLUSTR form then either

- an EQDS2P input form which has TYPE set to "LDSU2TX" must be defined where the sum of the CIRCUITS EQUIPPED is greater than or equal to five for the given SM
- or for 5E9(2) and later, an EQDSC3 input form(s) must be defined where the sum of the TONE XCVRS is greater than or equal to five for the given SM.

If MLHG/TERM/SM(s) are defined on a MLHLN input form, the MLHG/TERM(s) are assigned a Line Identification Feature on the MLHLNFA, BFG or an associated CLUSTR form, and (for 5E9(2) and later) the corresponding EQIM form has the UNIT TYPE set to a value other than "SM2000", then an EQDS2P input form(s) must be defined where the sum of the CIRCUITS EQUIPPED is greater than or equal to five for the given SM.

For 5E10 and later, if this FEATURE is assigned on a CLUSTER form then, P (autoparm) on the CLUSTR form must be set to "N".

2.3 REMARKS

Description: Enter a descriptive comment of up to 32 characters.

Software Release: 5E4(2) and later
Valid Entries: 1 - 32 characters

2.4 ACT TYPE

Description: This field indicates if the feature can be activated by the customer.

Software Release: 5E4(2) and later
Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	Customer is not permitted to activate the feature.
CODE	Customer is permitted to activate feature with a dial code.

2.5 DEACT TYPE

Description: This field indicates if the Display feature can be deactivated by the customer for one call.

Software Release: 5E4(2) and later
Required Field.
Default: NONE
Valid Entries:

Valid DEACT TYPE Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

NONE	Customer is not permitted deactivation.
CODE	Customer is permitted to activate feature with a dial code.

Data Rules:

"NONE" must be entered when ACT TYPE is "AUTO".

"CODE" must be entered when ACT TYPE is "CODE".

2.6 CALL NBR DELIV PRIM

Description: Should incoming call information only be sent to the terminal where the called TN is the primary TN?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "N" if the CALL NBR DELIV ALL field is "Y".

For the 5E4(2) Software Release, TNs must be defined on the DSL form or the DSMLHLN form if they are assigned a LID (Line Identification Feature) on a LINEFA form, BFG form or an associated CLUSTR form and the corresponding LIDFD form (5966 Record) has the CALL NBR DELIV PRIM field set to "Y".

If a TN or an MLHG/TERM is assigned a LID (Line Identification Feature) and an Electronic Directory Service on a LINEFA form, MLHLNFA form, BFG form or an associated CLUSTR form and the corresponding EDSFD form (5961-1 Record) has the DISP SHRD CLG NAME set to "Y", then this field must be set to "N".

If CID CW set to "Y" on the LINE form, the TN must be assigned a Call Waiting Terminating feature (defined on the CWTFD form with INVOCATION set to "TERM"). Also, the TN must be assigned a Line Identification feature on this form with OUTGO CLD LINE ID set to "N" and either CALL NBR DELIV PRIM set to "Y", CALL NBR DELIV ALL set to "Y", or CNAM set to "Y".

2.7 CALL NBR DELIV ALL

Description: Should incoming call information be sent to all terminals which share the called TN?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "N" if the CALL NBR DELIV PRIM field is "Y".

For the 5E4(2) Software Release, if a TN or an MLHG/TERM is assigned a Line Identification Feature on either a LINEFA form, MLHLNFA form, BFG form or an associated CLUSTR form and the CALL NBR DELIV ALL field is set to "Y" on the corresponding LIDFD form, then the TN or MLHG/TERM must be defined on the corresponding LINE form, MLHLN form or DSLUSR form with the SHARED field set to "Y". If SHARED is "N", the value in the CALL NBR DELIV ALL field is ignored.

For 5E5 and later Software Releases, if a TN (defined on the LINE form or DSLUSR form) or an MLHG/TERM (defined on the MLHLN form or DSLUSR form) is assigned a Line Identification Feature on either a LINEFA form, MLHLNFA form, BFG form or an associated CLUSTR form and the CND NBR

Copyright © 2003 Lucent Technologies

DELIV ALL field is set to "Y" on the corresponding LIDFD form, then the SHARED field must be set to "Y" on the corresponding LINE form, MLHLN form or DSLUSR form.

If a TN or a MLHG/TERM is assigned a LID (Line Identification) feature and an Electronic Directory Service on a LINEFA form, MLHLNFA form, BFG form or an associated CLUSTR form and the corresponding EDSFD form has the DISP PRIM CLG NAME set to "Y", then this field must be set to "N".

If CID CW set to "Y" on the LINE form, the TN must be assigned a Call Waiting Terminating feature (defined on the CWTFD form with INVOCATION set to "TERM". Also, the TN must be assigned a Line Identification feature on this form with OUTGO CLD LINE ID set to "N" and either CALL NBR DELIV PRIM set to "Y", CALL NBR DELIV ALL set to "Y", or CNAM set to "Y".

2.8 OUTGO CLD LINE ID

Description: Is OCLID (Outgoing Called Lined Identification) allowed?

This feature allows the originator of the call to display information about the called party. The information provided consists of the call appearance identifier, called TN, ICI (ISDN Call Identification) and permissions of the called TN.

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CID CW set to "Y" on the LINE form, the TN must be assigned a Call Waiting Terminating feature (defined on the CWTFD form with INVOCATION set to "TERM"). Also, the TN must be assigned a Line Identification feature on this form with OUTGO CLD LINE ID set to "N" and either CALL NBR DELIV PRIM set to "Y", CALL NBR DELIV ALL set to "Y", or CNAM set to "Y".

2.9 AMA REC

Description: Will CND billing be done on a usage-sensitive basis? This field indicates the type of billing to be performed. If AMA REC is "Y", CND billing will be done on a usage-sensitive basis with an AMA record created. If AMA REC is "N", CND billing will be done on a flat-rate basis with no AMA record created.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

2.10 CNAM

Description: Should the calling name be delivered to the terminating line?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ACT SFID 40 field (for 5E9(1) and later) must be set to "Y" on the SFSYS form (5713-1 Record) before non-preconstructed features can have the field CNAM set to "Y".

For 5E8 and later, this field must be "Y" if the CNAM AMA field is "Y".

Copyright © 2003 Lucent Technologies

If CID CW set to "Y" on the LINE form, the TN must be assigned a Call Waiting Terminating feature (defined on the CWTFD form with INVOCATION set to "TERM"). Also, the TN must be assigned a Line Identification feature on this form with OUTGO CLD LINE ID set to "N" and either CALL NBR DELIV PRIM set to "Y", CALL NBR DELIV ALL set to "Y", or CNAM set to "Y".

2.11 CNAM AMA

Description: Will CNAM billing be done on a usage-sensitive basis? This field indicates the type of billing to be performed. If CNAM AMA is "Y", CNAM billing will be done on a usage-sensitive basis with an AMA record created. If CNAM AMA is "N", CNAM billing will be done on a flat-rate basis with no AMA record created.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10: ISDN ATTENDANT CONTROL OF VOICE TERMINALS FORMS

Copyright © 2003 Lucent Technologies

SEC. 10A: 5967-1 RECORD
ISDN ATTENDANT CONTROL OF VOICE TERMINALS
FEATURE DEFINITION FORM - ACVTFD

1. GENERAL

The 5967-1 Record is applicable to 5E4(2) and later Software Releases. The ACVTFD form is used to define the various combinations of options associated with an ACVT (Attendant Control of Voice Terminals) feature.

The Attendant Control of Voice Terminals feature enables the attendant to place or remove a restriction on a TN or a group of TNs, enables the switch to automatically activate or deactivate a restriction on TNs or group of TNs, and allows screening to determine whether the originator and terminator are allowed to communicate with each other.

The feature can be activated manually or automatically. Manual activation by an attendant can be done through a dialed code (on the PDIT and/or IDPDCA form) or a feature button (on the CFGGRP form) with an ACTION of "IDNACT" for an individual TN or "IGACT" for a group of TNs. Automatic activation can be done for customer-specified telephone numbers and times through the Time of Day feature.

Each terminal (line) which is to use the ACVT feature must be assigned an ACVT feature name (defined on the ACVTFD Form, 5967-1 Record) on the appropriate BFG, LINEFA, MLHLNFA form or associated CLUSTR form. A line may not be assigned more than one ACVT feature.

1.1 Feature Assignment

For 5E6 only, when a TN is assigned an ACVT feature (on the LINEFA, BFG, or associated CLUSTR form), an ATT MLHG must be entered on the LINE or DSLUSR form where the TN is defined as TN or CKT TN.

For 5E6 only, when a member of an MLHG is assigned an ACVT feature (on the MLHLNFA, BFG, or associated CLUSTR form), the ATT MLHG must be entered on either the MLHG form or the MLHLN or DSLUSR form as follows:

- For a "UCD" hunt group:
  - ATT MLHG for Member 0001 may be entered on either the MLHG form or on the MLHLN or DSLUSR form.
  - For all other members, ATT MLHG must be entered on the MLHLN or DSLUSR form.
- For an "HTC", "REG", or "PMHG" hunt group:
  - ATT MLHG for Member 0001 must be entered on the MLHG form.
  - For all other members, ATT MLHG must be entered on the MLHLN or DSLUSR form.

For 5E7 and later, when a TN is assigned an ACVT feature that is defined with CONTROL set to "TERM", an ATT MLHG must be entered on the LINE or DSLUSR form where the TN is defined as TN or CKT TN. The ATT MLHG must be defined on a corresponding MLHG form that has an MLHG FEATURE which in turn is defined on an MLHGFD form that has HUNT TYPE set to "ISAT".

For 5E7 and later, when a member of an MLHG is assigned an ACVT feature that is defined with CONTROL set to "TERM", the ATT MLHG must be entered on either the MLHG form or the MLHLN or DSLUSR form as specified below. Also, the ATT MLHG must be defined on a corresponding MLHG form

Copyright © 2003 Lucent Technologies

with an MLHG FEATURE defined on an MLHGFD form that has HUNT TYPE set to "ISAT".

- For a "UCD" hunt group:
  - ATT MLHG for Member 0001 may be entered on either the MLHG form or on the MLHLN or DSLUSR form.
  - For all other members, ATT MLHG must be entered on the MLHLN or DSLUSR form.

- For an "HTC", "REG", or "PMHG" hunt group:
  - ATT MLHG for Member 0001 must be entered on the MLHG form.
  - For all other members, ATT MLHG must be entered on the MLHLN or DSLUSR form.

1.2 Preconstructed Features

Certain ACVT features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed ACVT features is contained in Figure 1 .

1.3 Recent Change View

The corresponding Recent Change View for this form is 12.46.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * FEATURE

Description: Enter the Attendant Control of Voice Terminals feature name. Feature name may not start with a slash (/); names starting with a slash are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.7) define the feature options assigned with the feature to terminals (lines).

2.4 # CONTROL

Description: Indicates the controller of the restrictive attendant feature.

Copyright © 2003 Lucent Technologies

Required Field.
Default: TERM
Valid Entries:

Valid CONTROL Entries

Entry	Definition
ORIG	This entry is used to assign the feature entered in the FEATURE field to an attendant.
TERM	This entry is used to assign the feature entered in the FEATURE field to a non-attendant terminal.

Data Rules:

When CONTROL is set to "ORIG", the following field entries apply:

- ACVT GRP must be blank
- ROUTE INDEX must be blank
- RESTRICT must be "NONE"
- ERROR TYPE must be "TONE"
- ERROR TN must be blank.

Class of Service on the associated LCC form must be set to "ISATND", and an associated CKT TN or CKT MLHG/TERM must be defined on the DSLUSR form.

NOTE: Attendant Controlled Restriction Groups may only be set to "Y" when CONTROL is "ORIG".

When CONTROL is "TERM", the line must have an associated CLASS OF SERVICE on the LCC form of "INDIV", "ISDN" or "4WINDIV".

2.5 AMA CHRG

Description: This field indicates the AMA charging. The default and only value for this field is "FLAT".
Default: FLAT
Valid Entries: FLAT

2.6 ACT TYPE

Description: This field is used to indicate whether or not the Attendant Control feature can be activated by the customer.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	Automatic activation of feature.
CODE	Dial code activation of feature.

Data Rules:

When ACT TYPE is "AUTO", DEACT TYPE must be "NONE". When ACT TYPE is "CODE", DEACT TYPE must be "CODE" or "AUTO".

If ACT TYPE is "CODE", and the feature is assigned to a line, there must be at least one dialed code defined on either the PDIT form (5300-2 Record) or on the IDPDCA form (5601-1/2 Record), with an ACTION of "FTACT" and FEATURE equal to this ACVT feature.

An ACVT feature with ACT TYPE "CODE" and DEACT TYPE "AUTO" cannot be assigned to a CKT TN

Copyright © 2003 Lucent Technologies

defined on a DSLUSR form that has a CLASS OF SERVICE (on the corresponding LCC form) of "ISDN" or "ISATND".

2.7 DEACT TYPE

Description: This field is used to indicate whether or not the Attendant Control feature can be deactivated by the customer.
Default: NONE
Valid Entries:

Valid DEACT TYPE Entries

Entry	Definition
AUTO	Automatic deactivation of feature by dial code for (1) call.
CODE	Dial code deactivation of feature.
NONE	No deactivation allowed for feature.

Data Rules:

When DEACT TYPE is "AUTO" or "CODE", ACT TYPE must be "CODE". When DEACT TYPE is "NONE", ACT TYPE must be "AUTO".

If DEACT TYPE is "AUTO", and the feature is assigned to a line, there must be at least one dialed code defined on either the PDIT form (5300-2 Record) or on the IDPDCA form (5601-1/2 Record), with an ACTION of "FTDCT".

If DEACT TYPE is "CODE", and the feature is assigned to a line, there must be at least one dialed code defined on either the PDIT form (5300-2 Record) or on the IDPDCA form (5601-1/2 Record), with an ACTION of "FTDCT" and FEATURE equal to this ACVT feature.

DEFAULT PARAMETERS

The following fields (Section 2.8 - Section 2.12) define the default parameters assigned with the feature to terminals (lines). These parameters will be assigned to the terminal unless they are overridden by entries on the ACVTLPA or ACVTMPA forms.

2.8 ACVT GRP

Description: Enter an ACVT group name.
Valid Entries: 1 - 8 characters

Data Rules:

The ACVT GRP(s) must be defined on the ACVTGP form if the ACVT GRP(s) are assigned as DEFAULT PARAMETERS on the ACVTFD form. If ACVT GRP is entered, then RESTRICT must be "NONE".

2.9 RESTRICT

Description: Enter a valid type of restriction for Attendant Control of Voice Terminals.
Default: NONE
Valid Entries:

Valid RESTRICT Entries

Entry	Definition
NONE	No attendant control of voice terminal restriction .
OUTGOING	Denies direct dialed calls to the public and private networks. Calls to the attendant, incoming calls and calls to other terminals within the same group are not affected by this restriction.
TRM2TRM	Denies incoming calls from other terminals in the same terminal group. Calls from the attendant and calls from outside the terminal group are allowed. Origination of calls is not affected.
T2OUT	A combination of OUTGOING and TRM2TRM. The terminal can call the attendant or other stations within the terminal group. The terminal can receive calls from the attendant or from other

Copyright © 2003 Lucent Technologies

	terminals that are outside the terminal group.
ALL	Denies all service to an extension number. All incoming and outgoing calls are blocked. In addition the user is not allowed to dial access codes associated with a feature (e.g., activate call forwarding).
INCOMING	Denies all incoming calls from outside or within the terminal group to provide a form of "do-not-disturb" service.
INOUT	A combination of OUTGOING and INCOMING restrictions. All incoming calls are blocked. The user can call the attendant or other terminals within the terminal group.

ERROR TREATMENT

The following fields (Section 2.10 - Section 2.12) define the error treatment assigned with the feature to terminals (lines). These treatments will be assigned to the terminal (lines) unless they are overridden by entries on the ACVTLPA or ACVTMPA forms.

2.10 ERROR TYPE

Description: Enter a valid type of error treatment type.
Default: TONE
Valid Entries:

Valid ERROR TYPE Entries

Entry	Definition
TONE	Tone
ANNC	Announcement
RERTE	Reroute to another TN

Data Rules:

When ERROR TYPE is "TONE", ROUTE INDEX and ERROR TN must be blank. When ERROR TYPE is "ANNC", ROUTE INDEX must be entered and ERROR TN must be blank. When ERROR TYPE is "RERTE", ERROR TN must be entered and ROUTE INDEX must be blank.

2.11 ROUTE INDEX

Description: Enter a valid route index for routing of restricted calls.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

If this field is entered, ERROR TN must be blank.

The ROUTE INDEX entered here must also be defined on an RTIDX form with a ROUTE TYPE of "HUNT".

2.12 ERROR TN

Description: Enter a valid Telephone Number for routing restricted calls.
Valid Entries: 1 - 10 digits (0 to 9, * or #)

Data Rules:

This field is only entered when ERROR TYPE is "RERTE". If ERROR TN is entered, ROUTE INDEX must be blank.

2.13 ATTENDANT CONTROLLED RESTRICTION GROUPS (1-63)

Copyright © 2003 Lucent Technologies

Description: The Attendant Controlled Restriction Groups list consists of a list of up to 63 restriction groups and is used to indicate whether or not this ISDN attendant can control this restriction group.
Default: N
Valid Entries: Y, N

Data Rules:

If any of the 63 restriction groups is "Y", the ISDN attendant must have CONTROL set to "ORIG".

When an MLHG member is assigned an ACVT feature with at least one of the ATTENDANT CONTROLLED RESTRICTION GROUPS set to "Y" on this form or on an ACVTMPA form, then for each restriction group set to "Y", the RESTRICTION GROUP and the MLHG must be specified as RSTRCT GRP and ISAT GRP, respectively, on an ACVTGP form.

SEC. 10B: 5967-2 RECORD
ISDN ATTENDANT CONTROL OF VOICE TERMINALS
GROUP PARAMETERS FORM - ACVTGP

1. GENERAL

The 5967-2 record is applicable to 5E4(2) and later Software Releases. The ACVTGP form is used to define the group parameter data associated with an ACVT (Attendant Control of Voice Terminals) group.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.46.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * ACVT GRP

Description: Enter an ACVT group name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Each ACVT GRP must have a unique RSTRCT GRP/ISAT GRP combination.

2.3 # RSTRCT GRP

Description: Enter a valid ACVT restrictive group number associated with this ACVT group.

Required Field.
Valid Entries: 1 - 63

2.4 # ISAT GRP

Description: Enter a valid ISDN Attendant MLHG number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

The ISAT GRP entered here must also be defined on an MLHG form with a HUNT TYPE of "ISAT" on a corresponding MLHGFD Form.

2.5 RESTRICT

Description: Enter a valid type of restriction for Attendant Control of Voice Terminals.
Default: NONE
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid RESTRICT Entries

Entry	Definition
NONE	No attendant control of voice terminal restriction
OUTGOING	Denies direct dialed calls to the public and private networks. Calls to the attendant, incoming calls and calls to other terminals within the same group are not affected by this restriction.
TRM2TRM	Denies incoming calls from other terminals in the same terminal group. Calls from the attendant and calls from outside the terminal group are allowed. Origination of calls is not affected.
T2OUT	A combination of OUTGOING and TRM2TRM. The terminal can call the attendant or other stations within the terminal group. The terminal can receive calls from the attendant or from other terminals that are outside the terminal group.
ALL	Denies all service to an extension number. All incoming and outgoing calls are blocked. In addition the user is not allowed to dial access codes associated with a feature (e.g. activate call forwarding).
INCOMING	Denies all incoming calls from outside or within the terminal group to provide a form of "do-not-disturb" service.
INOUT	A combination of OUTGOING and INCOMING restrictions. All incoming calls are blocked. The user can call the attendant or other terminals within the terminal group.

2.6 ACTIVE

Description: Is this restriction active for this group? The default and only value for this field is "Y".
Default: Y
Valid Entries: Y

ERROR TREATMENT

The following (Section 2.7 - Section 2.9) define the error treatment assigned with the feature to terminals.

2.7 ERROR TYPE

Description: Enter a valid error treatment type.
Default: TONE
Valid Entries:

Valid ERROR TYPE Entries

Entry	Definition
TONE	Tone
ANNC	Announcement
RERTE	Reroute to another TN.

Data Rules:

When ERROR TYPE is "TONE", ROUTE INDEX and ERROR TN must be blank. When ERROR TYPE is "ANNC", ROUTE INDEX must be entered. When ERROR TYPE is "RERTE", ERROR TN must be entered.

2.8 ROUTE INDEX

Description: Enter a valid route index for routing restricted calls.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If this field is entered, ERROR TN must be blank.

Copyright © 2003 Lucent Technologies

The ROUTE INDEX entered here must also be defined on an RTIDX Form.

2.9 ERROR TN

Description: Enter a valid Telephone Number for routing restricted calls. The TN is a 7-digit number XXXXXXX or a 10 digit number NPAXXXXXXX.
Valid Entries: 7 or 10 digits

Data Rules:

This field is only entered when ERROR TYPE is set to "RERTE". If ERROR TN is entered, ROUTE INDEX must be blank.

SEC. 10C: 5967-3 RECORD
ISDN ATTENDANT CONTROL OF VOICE TERMINALS
TN PARAMETERS - ACVTLPA

1. GENERAL

The 5967-3 record is applicable to 5E4(2) and later Software Releases. The ACVTLPA form associates a Telephone Number with an ACVT (Attendant Control of Voice Terminals) feature and an ACVT group. The ACVTLPA form is used when assigning ACVT feature parameters to non Multi-Line Hunt lines when the default parameters of the ACVTFD form (5967-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.46.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * TN

Description: Enter a valid Telephone Number for the ACVT group.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For 5E12 and later, TN/FEATURE combinations on different ACVTLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ACVTLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the ACVT feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the ACVTFD form.

2.4 ACVT GRP

Description: Enter the name of the ACVT group of which this line is a member.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

This ACVT group name must be defined on the ACVTGP form (5967-2 Record) and must not be on the ACVTFD form.

2.5 ISAT GRP

Description: This is a Recent Change Verify (display) only field. The ISDN Attendant MLHG number is in the range of 1 - 2000 for 5E14 and earlier releases and in the range of 1 - 8191 for 5E15 and later release.

2.6 RESTRICT

Description: Enter a valid type of restriction for Attendant Control of Voice Terminals.
Default: NONE
Valid Entries:

Valid RESTRICT Entries

Entry	Definition
NONE	No attendant control of voice terminal restriction.
OUTGOING	Denies direct dialed calls to the public and private networks. Calls to the attendant, incoming calls and calls to other terminals within the same group are not affected by this restriction.
TRM2TRM	Denies incoming calls from other terminals in the same terminal group. Calls from the attendant and calls from outside the terminal group are allowed. Origination of calls is not affected.
T2OUT	A combination of OUTGOING and TRM2TRM. The terminal can call the attendant or other stations within the terminal group. The terminal can receive calls from the attendant or from other terminals that are outside the terminal group.
ALL	Denies all service to an extension number. All incoming and outgoing calls are blocked. In addition, the user is not allowed to dial access codes associated with a feature (e.g. activate call forwarding).
INCOMING	Denies all incoming calls from outside or within the terminal group to provide a form of "do-not-disturb" service.
INOUT	A combination of OUTGOING and INCOMING restrictions. All incoming calls are blocked. The user can call the attendant or other terminals within the terminal group.
ODCTNRES	Software Release: 5E8 and later. Originating Direct Connect, unrestricted terminations.

Data Rules:

If ACVT GRP is known, RESTRICT must be "NONE".

ERROR TREATMENT

The following fields (Section 2.7 - Section 2.9) define the error treatment assigned with the feature to lines.

2.7 ERROR TYPE

Description: Enter a valid error treatment type.
Default: TONE
Valid Entries:

Valid ERROR TYPE Entries

Entry	Definition
TONE	Tone
ANNC	Announcement
RERTE	Reroute to another TN

Data Rules:

When ERROR TYPE is "TONE", ROUTE INDEX and ERROR TN must be blank. When ERROR TYPE is "ANNC", ROUTE INDEX must be entered. When ERROR TYPE is "RERTE", ERROR TN must be entered.

Copyright © 2003 Lucent Technologies

2.8 ROUTE INDEX

Description: Enter a valid route index for routing restricted calls.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

  For 5E13 and later: 1 - 16382

Data Rules:

If this field is entered, ERROR TN must be blank.

The ROUTE INDEX entered here must also be defined on the RTIDX form (5303 Record) and have the ROUTE TYPE on the RTIDX form set to "HUNT".

2.9 ERROR TN

Description: Enter a valid Telephone Number for routing restricted calls.
Valid Entries: up to 10 digits (0 to 9, * or #)

Data Rules:

This field is only entered when ERROR TYPE is "RERTE".

If ERROR TN is entered, ROUTE INDEX must be blank.

2.10 ATTENDANT CONTROLLED RESTRICTION GROUPS (1-63)

Description: The Attendant Controlled Restriction Groups list consists of a list of up to 63 ACVT restriction groups and indicates whether or not this ISDN attendant can control this ACVT group number.
Default: N
Valid Entries: Y, N

Data Rules:

If any of the 63 restriction groups is "Y", the TN/FEATURE on the ACVTLPA form must be on an ACVTFD input form with CONTROL set to "ORIG".

When any of the 63 restrictive groups is "Y", the following field entries are required:

- ISAT GRP must be blank
- ERROR TN must be blank
- ROUTE INDEX must be blank
- ACVT GRP must be blank
- RESTRICT must be "NONE"
- ERROR TYPE must be "TONE".

SEC. 10D: 5967-4a/4b RECORD
ISDN ATTENDANT CONTROL OF VOICE TERMINALS
MLHG PARAMETERS FORM - ACVTMPA

1. GENERAL

The 5967-4a/4b record is applicable to 5E4(2) and later Software Releases. The ACVTMPA form associates a Multi-Line Hunt Group line with an ACVT (Attendant Control of Voice Terminals) feature and an ACVT group. The ACVTMPA form is used, when assigning ACVT feature parameters to Multi-Line Hunt lines, if the default parameters of the ACVTFD form (5967-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

For 5E6 and earlier, the corresponding Recent Change View for this form is 3.46; for 5E7 and later, the Recent Change View is 1.46.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * MLHG

Description: Enter a valid Multi-Line Hunt Group number.

Required Field.
Valid Entries: For 5E14 and earlier: 1 - 2000

For 5E15 and later: 1 - 8191

2.3 * TERM NBR

Description: Enter a valid Multi-Line Hunt Group Terminal Number.

Required Field.
Valid Entries:
- 1 - 2015, for normal terminals
- 3001 - 3999, for out dial terminals only

Data Rules:

When TERM NBR is set to 3001 - 3999, RESTRICT must not be "TRM2TRM", "ALL", "INCOMING", or "INOUT".

2.4 * FEATURE

Description: Enter the name of the ACVT feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the ACVTFD form.

Copyright © 2003 Lucent Technologies

2.5 ACVT GRP

Description: Enter a name of the ACVT group that this Multi-Line Hunt Group line number is to belong to.
Valid Entries: 1 - 8 characters

Data Rules:

This ACVT group name must be defined on the ACVTGP form and the ACVTFD form.

2.6 ISAT GRP

Description: Enter a valid ISDN Attendant MLHG number.
Valid Entries:

- For 5E14 and earlier: Blank or 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

If ISAT GRP is entered, ACVT GRP must be blank.

The ISAT GRP entered here must also be defined on an MLHG Form with a HUNT TYPE of "ISAT" on a corresponding MLHGFD Form.

2.7 RESTRICT

Description: Enter a valid type of restriction for Attendant Control of Voice Terminals.
Default: NONE
Valid Entries:

Valid RESTRICT Entries

Entry	Definition
NONE	No attendant control of voice terminal restriction.
OUTGOING	Denies direct dialed calls to the public and private networks. Calls to the attendant, incoming calls and calls to other terminals within the same group are not affected by this restriction.
TRM2TRM	Denies incoming calls from other terminals in the same terminal group. Calls from the attendant and calls from outside the terminal group are allowed. Origination of calls is not affected.
T2OUT	A combination of OUTGOING and TRM2TRM. The terminal can call the attendant or other stations within the terminal group. The terminal can receive calls from the attendant or from other terminals that are outside the terminal group.
ALL	Denies all service to an extension number. All incoming and outgoing calls are blocked. In addition the user is not allowed to dial access codes associated with a feature (e.g. activate call forwarding).
INCOMING	Denies all incoming calls from outside or within the terminal group to provide a form of "do-not-disturb" service.
INOUT	A combination of OUTGOING and INCOMING restrictions. All incoming calls are blocked. The user can call the attendant or other terminals within the terminal group.
ODCTNRES	Software Release: 5E8 and later. Originating Direct Connect, unrestricted terminations.

ERROR TREATMENT

The following fields (Section 2.8 - Section 2.10) define the error treatment assigned with the feature to terminals.

2.8 ERROR TYPE

Description: Enter a valid error treatment type.
Default: TONE

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid ERROR TYPE Entries	
Entry	**Definition**
TONE	Tone
ANNC	Announcement
RERTE	Reroute to another TN

Data Rules:

When ERROR TYPE is "TONE", ROUTE INDEX and ERROR TN must be blank. When ERROR TYPE is "ANNC", ROUTE INDEX must be entered. When ERROR TYPE is "RERTE", ERROR TN must be entered.

2.9 ROUTE INDEX

Description: Enter a valid route index for routing restricted calls.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

  For 5E13 and later: 1 - 16382

Data Rules:

If this field is entered, ERROR TN must be blank.

The ROUTE INDEX entered here must also be defined on RTIDX Form.

2.10 ERROR TN

Description: Enter a valid Telephone Number for routing restricted calls.
Valid Entries: 7 or 10 digits

Data Rules:

This field is only entered when ERROR TYPE is set to "RERTE". If ERROR TN is entered, ROUTE INDEX must be blank.

2.11 ATTENDANT CONTROLLED RESTRICTION GROUPS

Description: The Attendant Controlled Restriction Groups list consists of a list of up to 63 ACVT restriction groups and indicates whether or not this ISDN attendant can control this ACVT group number.
Default: N
Valid Entries: Y, N

Data Rules:

If any of the 63 restrictive groups is "Y", the FEATURE on the ACVTMPA form must be on an ACVTFD form with CONTROL set to "ORIG".

When any of the 63 restrictive groups is "Y", the following conditions are required:

- ISAT GRP must be blank
- ERROR TN must be blank
- ROUTE INDEX must be blank

Copyright © 2003 Lucent Technologies

- ACVT GRP must be blank
- RESTRICT must be "NONE"
- ERROR TYPE must be "TONE".

SEC. 11: ISDN ATTENDANT CONTROL OF FACILITIES FEATURES

Copyright © 2003 Lucent Technologies

SEC. 11A: 5968 RECORD
ISDN ATTENDANT CONTROL OF FACILITIES FEATURE ATTRIBUTES FORM - ACOFRF

1. GENERAL

The 5968 Record is available with the 5E4(2), and later Software Releases. It is used to assign the Controling Line for an Attendent Control of Facility Restriction.

For each Feature Button on the CFGGRP form (5964 Record) where ACTION is "IACOF", it is necessary to have a corresponding ACOFRF form. Use the CONFIG GRP, COMPONENT and BUTTON values from the CFGGRP form to build the key field values for this ACOFRF form. It is necessary to define the Equipment Number, Party value and the Alternate Code Treatment Set Number for the line which will control the ACOF Restriction.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * CONFIG GRP

Description: Enter the name of the Configuration Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This Configuration Group Name must exist on a CFGGRP form where this "IACOF" feature button has been defined.

2.3 * CPE COMPONENT

Description: Enter the Terminal Configuration Component number where this "IACOF" feature button has been defined.

Required Field.
Valid Entries: 0 - 7

2.4 * BUTTON

Description: Enter the Feature Button value for this "IACOF" feature button.

Required Field.
Valid Entries: 1 to 254.

2.5 # OE TYPE

Description: Enter the Office Equipment Type for the line that controls this ACOF restriction.

Required Field.

Copyright © 2003 Lucent Technologies

Valid OE TYPE Entries	
Entry	**Definition**
L	Telephone Number is associated with an analog-type Line Equipment Number and NUMBER field must contain an 8- or 10-digit LEN. For 5E9(2) and later the Equipment Number must contain an 10 or 11-digit LEN.
C	Telephone Number is associated with ISLU Line Card Equipment Number and NUMBER field must contain an 8-digit equipment number.
E	

2.6 # NUMBER

Description: Enter the OE Number. This Office Equipment Number must be assigned on a LINE (5109-1 Record), MLHLN (5111-1 Record), DSL (5900-1 Record) or DSMLHLN (5901-1 Record) form.

Required Field.

If OE TYPE is "L", this Line Unit Equipment Number consists of:

OE NUMBER, TYPE L			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Line Unit	LU	X	0 - 7
		XXX	000 - 042 (5E9(2) and later)
Concentrator	CONC	X	0 - 9
Switch Group	SWG	X	0 - 1
Switch	SW	X	0 - 7
Level	LEV	X	0 - 3

If OE TYPE is "C", this ISLU Line Card Equipment Number consists of:

OE NUMBER, TYPE C			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Line Unit	LU	X	0 - 7
Line Group Controller	LGC	XX	00 - 15
Line Card	LC	XX	00 - 31

If OE TYPE is "E", this AIU Equipment Number consists of:

OE NUMBER, TYPE E - 5E11 and later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Unit Number	AIU	XXX	000 - 042
Pack	PACK	XX	00 - 19
Circuit	CKT	XX	00 - 31
			Coin 00-15

Data Rules:

The Equipment Number entered here must have an ID Feature with an IDP Group assigned.

2.7 # PTY

Description: Enter the Party Identifier.

Required Field.

Valid PTY Entries	
Entry	**Definition**
I	Individual
T	Tip
R	Ring
1 - 9, 0	MFR Multi-party

Copyright © 2003 Lucent Technologies

NOTE: Standard 4 and 8 Multiparty Service are not applicable here.

Data Rules:

The PTY value entered here must correspond with the Party value on the LINE or MLHLN form for the above Office Equipment Number. If the Office Equipment Number is a LCEN defined on the DSL or DSMLHLN form, then the PTY value must be "I".

2.8 # ACT SET

Description: Enter the Alternate Code Treatment Set number.

Required Field.
Valid Entries: 1 - 32

Data Rules:

The value entered here must be entered on the CFGGRP form in the PARAM field.

WARNING: Non-BFG Case - Changing the IDP of a port may affect the usage of the ACOF (Attendant Control of Facilities) feature by an ISDN Attendant terminal which uses this port as an ACOF control port.

BFG Case - Changing the IDP group ID of a BFG may affect the usage of the ACOF (Attendant Control of Facilities) feature by an ISDN Attendant terminal which uses a port within the BFG group as an ACOF control port.

SEC. 12: ISDN ATTENDANT PFA DIAL CODE ASSIGNMENT

Copyright © 2003 Lucent Technologies

SEC. 12A: 5969 RECORD
ISDN ATTENDANT PFA DIAL CODE
ASSIGNMENT FORM - IPFDCA

1. GENERAL

The 5969 Record is available with 5E4(2) and later Software Releases. It is used to define the Trunk Group or Simulated Facility Group for a specific PFA dialed code associated with an ISDN Attendant Configuration Group.

For PFA Dial Codes that are associated with a Feature Button, a CFGGRP form (5964 Record) will have an ACTION of "IDTGS" and the PARAM value will be the PFA Dial Code entered in the DIAL CODE field on an IPFDCA form. The value of COMPONENT and BUTTON on this IPFDCA form must match the corresponding CFGGRP form. The IPFDCA form will be keyed by this CONFIG GRP and DIAL CODE.

For PFA Dial Codes that are not associated with a Feature Button on a CFGGRP form, the CONFIG GRP for the ISDN Attendant Group must be entered and the PFA Dial Code must be entered as DIAL CODE; a COMPONENT and BUTTON number must not be entered.

Each CONFIG GRP defined on this form may have a maximum of 16 IPFDCA forms entered with a button assigned.

The combination of CONFIG GRP, PFTYPE and GRPNUM fields entered on this form must be unique.

1.1 Recent Change View

The corresponding Recent Change view for this form is 12.7.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * CONFIG GRP

Description: Enter the ISDN Attendant Configuration Group name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This configuration name must exist on one or more CFGGRP forms.

2.3 * DIAL CODE

Description: Enter a PFA Dial Code, which is a maximum of 5 characters from the following set of characters: 0 - 9, #, *, O, F, I, P.

- ***NOTE:*** The Dial Code may be 5 characters in length only if not associated with a Feature Button.

Required Field.
Valid Entries: 1 - 5 characters

2.4 # PFTYPE

Copyright © 2003 Lucent Technologies

Description: Enter the Private Facility Type.

Required Field.

Valid PFTYPE Entries	
Entry	**Definition**
PHYS	Trunk Group.
SFG	Simulated Facility Group.

2.5 # GRPNUM

Description: Enter the Private Facility Group Number.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000 for trunk group
- number, or 1 - 2000 for SFG number.

Data Rules:

For 5E11 and later, when PFTYPE is "SFG", GRPNUM must be 1 - 2000.

If PFTYPE is "PHYS", this value of GRPNUM must be a TGN defined on a TKGRP form (5202 Record). If PFTYPE is "SFG" this value of GRPNUM must be an SFG NBR defined on a PFASFG form (5609-3 Record) with the associated SFG TYPE not equal to "ICR".

The combination of PFTYPE and GRPNUM must be unique if the associated TKGRP form or PFASFG form has the BW LAMP field equal to "Y".

2.6 COMPONENT

Description: If the Dial Code is defined on a Feature Button, enter the COMPONENT number for which the Feature Button appears.

If the Dial Code is not associated with a Feature Button (DIAL CODE field is 5 characters long), leave this field blank.
Valid Entries: 0 - 7

2.7 BUTTON

Description: If the Dial Code is defined on a Feature Button, enter the BUTTON number for which the Feature Button appears.

If the Dial Code is not associated with a Feature Button (DIAL CODE field is 5 characters long), leave this field blank.
Valid Entries: 1 - 254

GROUP FEATURES (VERIFY ONLY)

The following fields (Section 2.8 - Section 2.11) are used in Recent Change as verify-only fields. These fields can be defined on the PFASFG form and TKGRP form.

2.8 MK BUSY

Description: This field is used in Recent Change as a verify-only field to indicate if SCCOF (Selective Customer Control of Facilities) is on. This allows the attendant to deny access to a privately owned trunk

Copyright © 2003 Lucent Technologies

group or simulated facility group.

2.9 BW LAMP

Description: This field is used in Recent Change as a verify-only field to indicate if busy warning lamp(s) are provided on the attendant's console.

2.10 ISAT MLHG

Description: This field is used in Recent Change as a verify-only field to indicate the ISDN Attendant MLHG that can busy monitor the trunk group or simulated facility group.

2.11 WARN THRSH

Description: This field is used in Recent Change as a verify-only field to indicate the threshold of members in this group that must be busy at any given time before the group busy warning lamp(s) light at the attendant's console.

```

Figure 1 SAMPLE IPFDCA FORM 5E5 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 13: LASS AUTOMATIC CALLBACK FORMS

Copyright © 2003 Lucent Technologies

SEC. 13A: 5970-1 RECORD
LASS AUTOMATIC CALLBACK FEATURE DEFINITION - LSACFD

1. GENERAL

The 5970-1 Record is available with 5E5 and later Software Releases. AC (Automatic Callback) allows the subscriber to automatically call back the last calling party. If the party called back by AC is busy, the network will automatically camp on it. This feature is available between parties served by the same office and between parties served by different offices in the same LATA (Local Access Transport Area) provided there is CCS7 (Common Channel Signaling - Version 7) connectivity between the offices. This feature applies to voice calls only.

Only one AC feature name is allowed on a LINEFA form (5112 Record), MLHLNFA form (5113 Record), BFG form (5625-1 Record) or CLUSTR form (5600 Record).

Certain AC features are predefined and automatically provided in the ODA (Office Database Adminstrator) database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature name other than preconstructed features. A list of preconstructed AC features is contained in Figure Figure 1 .

If the TNs on a LINE form or the CKT TNs on a DSLUSR form are assigned an AC Feature on a LINEFA form, BFG form, or an associated CLUSTR form, then the TN or CKT TN must be defined on the LINE form or DSLUSR form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV" or "PBX" on an LCC form with an associated LCC/RAX value.

If the MLHG/TERMs on an MLHLN form or the CKT MLHG/TERMs on a DSLUSR form are assigned an AC Feature on an MLHNFA form, BFG form, or an associated CLUSTR form, then the MLHG/TERM or CKT MLHG/TERM must be defined on the MLHLN form or DSLUSR form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV" or "PBX" on an LCC form with an associated LCC/RAX value.

For more information on LASS features, refer to Division 2, Section 1Y.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.47.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the AC Feature name. There are no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

Copyright © 2003 Lucent Technologies

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.7) define the feature options.

2.4 AMA REC

Description: Will billing be performed on a usage-sensitive basis with AMA (Automatic Message Accounting) records being created?

If this field is "Y", billing will be usage sensitive and an AMA record will be created. If this field is "N", billing will be done on a flat-rate basis with no AMA record created.

If the AC feature is generally available, billing can be done on a flat rate or usage-sensitive basis according to how the subscribing user prefers to be billed.

Required Field.
Default: N
Valid Entries: Y, N

2.5 INTRA GRP

Description: Is this feature restricted to intra-terminal groups?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is equal to "Y", the lines that are assigned this feature must have a Terminal Group Station Restriction feature assigned to them.

2.6 ACT TYPE

Description: Can the AC feature be activated by the customer? The default and only valid entry is "AUTO".
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	The AC feature is always active. The customer is not permitted to activate this feature.

2.7 DEACT TYPE

Description: Can the AC feature be deactivated by the customer for a single call? The default and only valid entry is "NONE".
Default: NONE
Valid Entries:

Valid DEACT TYPE Entries

Entry	Definition
NONE	The customer is not permitted to deactivate the AC feature for one call.

DEFAULT PARAMETERS

The following field defines the default parameters.

SEC. 13B: 5970-2 RECORD
LASS AUTOMATIC CALLBACK
TN PARAMETERS FORM - LSACLPA

1. GENERAL

The 5970-2 Record is available in 5E5 and later Software Releases. The LSACLPA form associates a Telephone Number with an AC (Automatic Callback) feature. This form is used when assigning AC features to non-Multi-Line Hunt lines when the default parameters of the LSACFD form (5970-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.47.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number for the AC user.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

For 5E12 and later, TN/FEATURE combinations on different LSACLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the LSACLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the AC feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the LSACFD form.

2.4 RNGBK TYPE

Description: This field indicates the AC ringback type.

Required Field.

SEC. 13C: 5970-3 RECORD
LASS AUTOMATIC CALLBACK MLHG PARAMETERS FORM - LSACMPA

1. GENERAL

The 5970-3 Record is available in 5E5 and later Software Releases. The LSACMPA form assigns an AC (Automatic Callback) feature to a Multi-Line Hunt Group line. It is used when assigning AC features to Multi-Line Hunt lines when the default parameters of the LSACFD form (5970-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.47.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM NBR

Description: Enter the Multi-Line Hunt Group Member Number.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

2.4 * FEATURE

Description: Enter the AC Feature name. There are no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features.
Valid Entries: 1 - 8 characters

Data Rules:

This feature name must be defined on the LSACFD form.

2.5 RNGBK TYPE

Description: This field indicates the AC ringback type.

Required Field.
Default: C
Valid Entries:

Valid RNGBK TYPE Entries

SEC. 14: LASS AUTOMATIC RECALL FORMS

Copyright © 2003 Lucent Technologies

SEC. 14A: 5971-1 RECORD
LASS AUTOMATIC RECALL FEATURE DEFINITION - LSARFD

1. GENERAL

The 5971-1 Record is available with 5E5 and later Software Releases. The AR (Automatic Recall) feature allows the subscriber to automatically call back the last called party. If the recalled party is busy, the network will automatically camp on to it. This feature is available between parties served by the same central office and also between parties served by different offices in the same LATA (Local Access Transport Area) provided there is CCS7 connectivity between the switches. For 5E7 and earlier, this feature applies to voice calls only.

Only one AR feature name is allowed on a LINEFA form, MLHLNFA form, BFG form or CLUSTR form.

1.1 Preconstructed AR Features

Certain AR features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/); the slash may not be used as the first character of any feature name other than preconstructed features. The preconstructed AR features are listed beginning in Figure 1.

1.2 Class of Service

If the TNs on a LINE form or the CKT TNs on a DSLUSR form are assigned an AR Feature on a LINEFA form, BFG form, or an associated CLUSTR form, then the TN or CKT TN must be defined on the LINE form or DSLUSR form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV" or "PBX" on an LCC form with an associated LCC/RAX value.

If the MLHG/TERMs on an MLHLN form or the CKT MLHG/TERMs on a DSLUSR form are assigned to an AR Feature on an MLHNFA form, BFG form, or an associated CLUSTR form, then the MLHG/TERM or CKT MLHG/TERM must be defined on the MLHLN form or DSLUSR form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV", or "PBX" on an LCC form with an associated LCC/RAX value.

1.3 LASS Feature Information

For more information on LASS features, refer to Division 2, Section 1Y.

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.48.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the AR feature name. A feature name cannot start with a slash (/), which is reserved for preconstructed feature names. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed, or inserted.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

Section 2.4 - Section 2.9 define the feature options.

2.4 AMA REC

Description: Should the billing be done on a usage sensitive basis? If the AR feature is generally available, the billing can be done on either a usage sensitive or flat rate basis. If "Y" is entered in this field, billing will be usage sensitive and an AMA record will be created; if "N" is entered, billing will be a flat rate and no AMA record will be created.

Required Field.
Default: N
Valid Entries: Y, N

2.5 INTRA GRP

Description: Is this feature restricted to intra-terminal groups only?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If INTRA GRP is "Y", all lines that are assigned this AR feature must also be assigned a TGSR (Terminal Group Station Restriction) feature that is defined on the TGSRFD form (5607-1/2 Record).

2.6 CSV ALW

Description: Will LASS Automatic Recall be allowed for voice service on lines using this feature?

The feature may be assigned on a generally available or subscription basis.

Software Release: 5E8 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If CSV ALW is "N", CSD ALW must be "Y".

2.7 CSD ALW

Description: Will LASS Automatic Recall be allowed for circuit switched data service on lines using this feature?

The feature may be assigned on a generally available or subscription basis.

Software Release: 5E8 and later
Required Field.
Default: Y

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If CSD ALW is "N", CSV ALW must be "Y".

When CSD ALW is "Y", DSL CLS must be "STD" on the DSL form associated with the DSLUSR line assigned the feature.

2.8 ACT TYPE

Description: This field indicates whether or not the AR feature can be activated by the customer. The default and only value is "AUTO"; the feature is always active and cannot be activated by the subscriber.
Default: AUTO
Valid Entries: AUTO

2.9 DEACT TYPE

Description: This field indicates if the AR feature can be deactivated by the customer for a single call. The default and only value is "NONE"; the subscriber is not permitted to deactivate the feature.
Default: NONE
Valid Entries: NONE

DEFAULT PARAMETERS

The following field (Section 2.10) defines the default parameter assigned with the feature to a line. This parameter will be assigned to the line unless it is overridden by an entry on the LSARLPA (5971-2 Record) or LSARMPA (5971-3 Record) form.

2.10 RNGBK TYPE

Description: This field indicates the AR ringback type.

Required Field.
Default: C
Valid Entries:

Valid RNGBK TYPE Entries

Entry	Definition
A	Repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern).
B	Repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on followed by 4 seconds off.
C	Repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4 seconds off.
D	Repeated pattern of 1 second on, 1 second off, 1 second on and 3 seconds off (also known as code 2 ringing).

SEC. 15: LASS CUSTOMER ORIGINATED TRACE FORMS

Copyright © 2003 Lucent Technologies

SEC. 15A: 5972 RECORD
LASS CUSTOMER ORIGINATED TRACE
FORM DEFINITION - LSCOTFD

1. GENERAL

The 5972 Record is available with 5E5 and later Software Releases. The COT (Customer Originated Trace) feature permits the analog and ISDN user to trace an obscene, threatening or harassing call without the intervention of Telephone Company personnel. This feature will not only be available between parties served by the same office, but also between parties served by different offices in the same LATA (Local Access Transport Area) provided there is CCS7 connectivity between the offices.

Only one COT feature name is allowed on a LINEFA form, MLHLNFA form, BFG form or a CLUSTR form.

Certain COT features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature name other than preconstructed features. A list of preconstructed COT features is contained in Figure 1 .

If the TNs on a LINE form or the CKT TNs on a DSLUSR form are assigned a COT Feature on a LINEFA form, BFG form, or an associated CLUSTR form, then the TN or CKT TN must be defined on the LINE form or DSLUSR form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV" or "PBX" on an LCC form with an associated LCC/RAX value.

If the MLHG/TERMs on an MLHLN form or the CKT MLHG/TERMs on a DSLUSR form are assigned a COT Feature on an MLHNFA form, BFG form, or an associated CLUSTR form, then the MLHG/TERM or CKT MLHG/TERM must be defined on the MLHLN form or DSLUSR form with a CLASS OF SERVICE of "INDIV", "ISDN", "ISATND", "ATND", "4WINDIV" or "PBX" on an LCC form with an associated LCC/RAX value.

If CONFIG GRP on the DSLUSR form is defined on the CFGGRP form (5964 Record) with a button assigned the COT feature, then the corresponding DSLUSR form must have DISPLAY set to "Y".

For more information on LASS features, refer to Division 2, Section 1Y.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.49.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the COT Feature name. There are no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.6) define the feature options.

2.4 ACT TYPE

Description: Can the COT feature be activated by the customer? "AUTO" is the only valid entry.

Valid ACT TYPE Entries

Entry	Definition
AUTO	Feature is always active. Customer is not permitted to activate the feature.

2.5 DEACT TYPE

Description: Can the COT feature be deactivated by the customer for one call? The only valid entry is "NONE".

Valid DEACT TYPE Entries

Entry	Definition
NONE	Customer is not permitted deactivation.

2.6 AMA REC

Description: Will the billing be usage-sensitive and will an AMA record be created?

This field indicates the type of billing to be performed. The billing can be done on a flat rate or usage-sensitive basis according to how the subscribing user prefers to be billed or how the Telephone Company decides it will bill if the COT feature is generally available.

If AMA REC is equal to "Y", billing will be usage-sensitive and an AMA record will be created. If AMA REC is equal to "N", billing will be done on a flat rate basis with no AMA record created.

Required Field.
Default: Y
Valid Entries: Y, N

LASS FEATURE ACCESS - LASSFA

1. GENERAL

The 5973 Record is available with the 5E5 Software Release and defines the access modes for each of the LASS features on an SM basis. It is used only for an office retrofit in 5ODA.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.18.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the SM number. Intitally "ALL" should be entered to initialize all SMs and the AM with the same values. This is the only way to enter values into the AM. If "ALL" is not entered, the default value of "UNAVAIL" will be retained on the AM. When "LASSDEF" is entered for the feature fields on this form, the value will default to the value in the AM.

Required Field.
Valid Entries: 1 - 192, or ALL

2.3 # AC

Description: Enter the status of the LASS AC (Automatic Callback) access.

Required Field.
Default: UNAVAIL
Valid Entries:

Valid AC Entries

Entry	Definition
UNAVAIL	Feature is not available for use.
GENAVAIL	Feature is generally available.
LASSDEF	Feature uses the default that was initialized in the AM. If the AM has not been initialized with a value, this enumeration will default to "UNAVAIL". (See SM description.)
SUBSCR	Feature must be purchased, a service order is required for availability.
TEMPUNAVAIL	Feature is temporarily unavailable.

2.4 # AR

Description: Enter the status of the AR (Auto Recall) feature access.

Required Field.
Default: UNAVAIL
Valid Entries:

Valid AR Entries

Entry	Definition
UNAVAIL	Feature is not available for use.
GENAVAIL	Feature is generally available.
LASSDEF	Feature uses the default that was initialized in the AM. If the AM has not been initialized with a value, this enumeration will default to "UNAVAIL". (See SM description.)

Copyright © 2003 Lucent Technologies

SUBSCR	Feature must be purchased, a service order is required for availability.

SEC. 17: DSL DEFAULT SERVICE FORMS

Copyright © 2003 Lucent Technologies

SEC. 17A: 5974 RECORD
DSL DEFAULT SERVICE FORM - DFLTSRV

1. GENERAL

The 5974 Record is available with 5E5 and later Software Releases. Default Service allows unknown CPE (Customer Premises Equipment) on a DSL (Digital Subscriber Line) subscribing to Default Service to originate ACSR, BRI Test Line, BRIV (Basic Rate Inferface Verification), Repair (611), Access to 108 Test Line, Business Office (811), and Emergency (911) calls. Terminations to the user will be denied with default service.

A DSL subscribes to Default Service by entering a DFLTSRV group name on a DSL form (5907 Record). A maximum of 255 DFLTSRV forms may be defined for the office.

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.15.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * DFLT SRV

Description: Enter the default service group name. The first character of the DFLT SRV name may not be a slash (/).

The 5ESS Switch software treats the DFLT SRV group name as a BRCS Feature group name and gives it an internal identifier which is transparent to the user. A BFG form (5625 Record) will not be applied.
Valid Entries: 1 - 7 characters

Data Rules:

The DFLT SRV must not match a BFGN defined on a BFG form (5625-1). It must not be
- "ABORT",
- "ACTBFG",
- "CLEANUP",
- "NONTGID",
- "NONE"(for 5E10 and later),
- "SETUP" or
- "TEMP".

2.3 # LCC

Description: Enter the Line Class Code that describes the class-of-service.

Required Field.
Valid Entries: 3 alphanumeric characters

Data Rules:

The combination of LCC and RAX must be defined on an LCC form (5306 Record) where CLASS OF SERVICE is "ISDN", TERMINATING TREATMENT is "INDIV", and LINE SCREENING is "N".

Copyright © 2003 Lucent Technologies

2.4 # RAX

Description: Enter the rate area number for routing and charging.

Required Field.
Valid Entries:

5E14 and earlier: 1 - 99

5E15 and later: 1 - 999

Data Rules:

The combination of LCC and RAX must be defined on an LCC form (5306 Record) where CLASS OF SERVICE is "ISDN", TERMINATING TREATMENT is "INDIV", and LINE SCREENING is "N".

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.5 # BILL TN

Description: Enter a TN (Telephone Number) for billing. Enter a valid seven-digit TN if calls are to be billed to a TN within the local office. Enter a valid ten-digit number if calls are to be billed to a TN outside the local office.

The telephone number may be in any of the following formats:

- NXXXXXX - Where NXX is a valid office code defined on the NOC input form.
- NPANXXXXXX - Any ten digit number is acceptable, however normal expected values are valid NPA and NXX codes.
- ZXXXXXX - Where Z is 0 or 1. This is normally used for OUTWATS billing purposes.

Required Field.
Valid Entries: 7 or 10 digits

2.6 USE CNT

Description: This field represents the number of users this default service has. It is a Recent Change/Verify Only field.

SEC. 18: LASS SELECTIVE CALL ACCEPTANCE FORMS

Copyright © 2003 Lucent Technologies

SEC. 18A: 5975 RECORD
LASS SELECTIVE CALL ACCEPTANCE FEATURE DEFINITION RECORD - LSCAFD

1. GENERAL

This form is available with 5E6 and later Software Releases. It allows a business or residential subscriber the ability to only accept calls from a user-defined list of TNs. When the SCA (Selective Call Appearance) feature is activated, all calls terminating to the user will be screened. The TNs that fail LASS (Local Area Signaling Serivces) SCA screening will be routed to an announcement or forwarded to a customer changeable TN.

The screen list can be created, activated or deactivated during a user's SLE (Screen List Editing) session. An SLE session, which is accessed by dial code, enables the user to add or update the TN list, to change the NAT (Non-Acceptance Treatment), or to activate/deactivate the feature.

A feature button may be assigned to the user, but it will only provide toggle activation/deactivation capabilities.

This feature may be provided for:

- intraswitch calls.
- interswitch calls provided there is CCS7 or Primary Rate Interface connectivity between the originating and terminating offices.

Either this feature or a CAR (Computer Access Restriction) feature defined on the LSCARFD form may be assigned to a user. Only one SCA/CAR feature may be assigned to a line.

The line (defined on a LINE, DSLUSR or MLHLN form) this feature is assigned to must have a CLASS OF SERVICE of "INDIV", "4WINDIV", "ISDN", or "PBX" assigned on the associated LCC form (5306 Record).

For more information on LSF (LASS Selective Features), refer to Division 2, Section 1Z.

LASS SELECTIVE CALL FORWARDING
FEATURE DEFINITION RECORD - LSCFFD

1. GENERAL

This form is available with 5E6 and later Software Releases. It allows a business or residential subscriber the ability to forward incoming calls where the CPN (Calling Party Number) matches a TN (Telephone Number) in a user-defined list of TNs. The TNs that fail LASS (Local Area Signaling Services) SCF (Selective Call Forwarding) screening will be forwarded to a customer-changeable TN.

The screen list can be created, activated or deactivated during a user's SLE (Screen List Editing) session. An SLE session, which is accessed by dial code, enables the user to add or update the TN list, to change the forward to DN or to activate/deactivate the feature.

A feature button may be assigned to the user but it will only provide toggle activation/deactivation capabilities.

This feature may be provided for intraswitch calls and for interswitch calls provided there is CCS7 (Common Channel Signaling 7) connectivity or PRI (Primary Rate Interface) connectivity between the originating and terminating offices.

The line (defined on a LINE, DSLUSR or MLHLN form) to which this feature is assigned must have a CLASS OF SERVICE of "INDIV", "4WINDIV", "ISDN" or "PBX" assigned on the associated LCC form (5306 Record).

For more information on LSF (LASS Selective Features), refer to Division 2, Section 1Z.

LASS COMPUTER ACCESS RESTRICTION FEATURE DEFINITION RECORD - LSCARFD

1. GENERAL

This form is available with 5E6 and later Software Releases. It allows a business or residential subscriber to restrict the access of calling parties to the customer's computer. This provides the customer control over who can access the computer. CAR (Computer Access Restriction) allows the user to create a list of TNs which will be screened when the feature is active. The TNs that fail LASS (Local Area Signaling Services) CAR screening will be routed to an announcement or forwarded to a customer changeable TN.

The screen list can be created, activated or deactivated during a user's SLE (Screen List Editing) session. An SLE session, which is accessed by dial code, enables the user to add or update the TN list, to change the NAT (Non-Acceptance Treatment), or to activate/deactivate the feature.

A feature button may be assigned to the user but it will only provide toggle activation/deactivation capabilities.

This feature may be provided for:

- intraswitch calls.
- interswitch calls, provided there is CCS7 connectivity or Primary Rate Interface connectivity between the originating and terminating offices.

Either this feature or the SCA (Selective Call Acceptance) feature found on the LSCAFD form may be assigned to a user. Only one SCA/CAR feature may be assigned to a line.

The line (defined on a LINE, DSLUSR or MLHLN form) this feature is assigned to must have a CLASS OF SERVICE of "INDIV", "4WINDIV", "ISDN", or "PBX" assigned on the associated LCC form (5306 Record).

This feature is not available on a Generally Available basis.

For more information on LSF (LASS Selective Features), refer to Division 2, Section 1Z.

SEC. 23A: 5980 RECORD
DISPLAY MESSAGE RECORD - DISPMSG

1. GENERAL

The 5980 Record is available with 5E6 and later Software Releases. This record defines all of the ISDN display messages that will be displayed on the user's ISDN terminal for LASS (Local Area Signaling Services) features. These display messages are used by call processing when the customer using the LASS feature has an ISDN terminal with display capability. For more information on LASS Features, refer to Division 2, Section 1Y and Division 2, Section 1Z.

1.1 Default Input Data

With 5E6 and later Software Releases, a default set of input Displays are available for LASS features.

- ***NOTE:*** For 5E7 and later, if FEATURE ID 536 is activated on RC View 8.22, SLE displays marked as "5E7 and later" and SLE displays marked with an asterisk are supplied to the end user from Figure 2. When FEATURE ID 536 is active, pack position 2 on the EQRAP form (5822 Record) must have the MC5D143A30, L23 pack installed.

1.2 Recent Change View

The corresponding Recent Change View is 8.65.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * DISP TYPE

Description: Enter the feature that is going to receive the displays.

Software Release: 5E7 and later
Valid Entries:

Valid DISP TYPE Entries

Entry	Definition
AC	LASS Automatic Callback
COT	LASS Customer Originated Trace
INSP	Inspect LASS feature display messages
SLE	LASS Screen List Editing features

2.3 * DISP ID

Description: This field is used to uniquely define an ISDN display message. Figures 1 and 2 show the standard set of input data that is provided for this form.

Valid DISP ID Entries - 5E7 and later

Entry	Definition
1 - 5	DISP TYPE of "AC"
1 - 6	DISP TYPE of "COT"
1 - 12	Software Release: 5E9(2) and earlier. DISP TYPE of "INSP"
1 - 15	Software Release: 5E10 and later. DISP TYPE of "INSP"
1 - 189	DISP TYPE of "SLE"

2.4 MESSAGE

Copyright © 2003 Lucent Technologies

Description: Enter a 1 to 40 character message that will be displayed to an ISDN user during a LASS SLE session. If a TN is to be displayed along with the message, the '~' character must be entered to represent the TN or the number of entries in the Screening List.
Valid Entries: 1 to 40 characters

Data Rules:

The user must have CLASS OF SERVICE with a value of "ISDN" assigned on the LCC Form (5306 Record). Also, the associated DSLUSR form must have the DISPLAY field set to "Y", indicating the terminal has display capabilities.

AC (Automatic Callback):
If DISP TYPE is "AC", DISP ID 2 must have a message with 31 or less characters if TN is a ten-digit number, or 29 or less characters if TN is a twelve-digit number.

COT (Customer Originated Call Trace):
If DISP TYPE is "COT", DISP ID 1 must have a message with 29 or less characters.

INSP (Inspect):
For 5E10 and later, if SFID ACT 225 on the SFSYS form is "Y", indicating National ISDN -3 features are activated, then MESSAGE on the DISPMSG form with keys of DISP TYPE equal "INSP" and DISP ID of 006 should read: "Activate/deactivate ID Features". This data rule supports the National ISDN - 3 Calling Name for BRI feature. For more information on this feature, see Division 2, Section 1AM on provisioning National ISDN features.

SLE (Screen List Editing):
If DISP TYPE is "SLE":

- DISP IDs, 150, 152, 155, 157, 171, 172, 173, 174, 175, and 176 must have a message with 39 or less characters.
- DISP IDs 116, 118, 119, 122, 135, 136, 137, 163 and 164 must have a message with 23 or less characters.

DISP TYPE	DISP ID	MESSAGE	Software Release
AC	001	To call last number, dial 1 now.	5E7 and later
AC	002	To call ~, dial 1 now.	5E7 and later

SEC. 24: LASS SELECTIVE FEATURE SCREENING

Copyright © 2003 Lucent Technologies

SEC. 24A: 5981 RECORD
LASS SELECTIVE FEATURE SCREENING LIST RECORD - LSSLE

1. GENERAL

This form is available with 5E6 and later Software Releases. It allows the operating company to define initial Screen List information (e.g., LASS Screen List TNs, Non-Acceptance Treatments for a particular user (line or multi-line hunt terminal)). This form is usually used during a retrofit , but it may be used by the operating company to set up a customer's Screening Lists if the information is known in advance.

For more information on LASS features, refer to Division 2, Section 1Z.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.48.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 (*) TN

Description: Enter the telephone number of the LSF (LASS Selective Feature) user.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

Either this field or the MLHG/TERM fields must be entered.

If the TN entered here is a Secondary Only TN defined on the SHTN form (5902 Record), the feature must be assigned to the line by subscription (not as a Generally Available feature) via a LINEFA, BFG or CLUSTR form.

For 5E12 and later, TN/FEATURE combinations on different LSSLE forms can not be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the LSSLE form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 (*) MLHG

Description: Enter the Multi-Line Hunt Group number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

Either the MLHG/TERM fields or the TN field must be entered.

Copyright © 2003 Lucent Technologies

2.4 (*) TERM

Description: Enter the Multi-Line Hunt Group terminal number.
Valid Entries: 1 - 2047

Data Rules:

Either the MLHG/TERM fields or the TN field must be entered.

If this field has a value greater than 1, the associated TN must be defined on an MLHLN, DSLUSR or MULTITN form with the NONHUNT field set to "Y".

2.5 * FEATURE

Description: Enter the feature name of the LASS Selective Feature (i.e., SCA, CAR, SCR, SCF, or SDA).

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

If the MLHG/TERM fields are entered, the feature must be assigned to the Multi-Line Hunt Line via the MLHLNFA form (5113 Record). Otherwise, the feature must be assigned as a generally available feature on the LASSOP form, or it must be assigned on a subscription basis to the line via the LINEFA, BFG or CLUSTR form.

The TN or MLHG/TERM must not have more than one of the same LASS features assigned to it.

2.6 FEAT TYPE

Description: This field indicates what LSF (LASS Selective Feature) is assigned to the user. This field is a text-only field in ODA. It is a read-only field on RC View 4.48. The possible display values are "SCA" for Selective Call Acceptance, "CAR" for Computer Access Restriction, "SCF" for Selective Call Forwarding, "SCR" for Selective Call Rejection and "SDA" for Selective Distinctive Alert.

2.7 ACC MODE

Description: This field indicates the type of access that is provided to the user. This field is a text-only field in ODA. It is a read-only field on RC View 4.48. The possible display values are "SUBSCR" or "GENAVAIL".

2.8 MAX LST SZE

Description: This field indicates how many TNs may be entered on a Screen List. This field is a text-only field in ODA. It is a read-only field on RC View 4.48. The possible display values are from 3 - 31 and are provided from RC View 8.21.

2.9 NAT

Description: This field indicates the type of Non-Acceptance Treatment that will be provided to the called party after a LASS SLE screening failure. This field applies to SCA and CAR only.

Valid NAT Entries

Entry	Definition
ANNC	Announcement.
FWD	Call Forward.

Data Rules:

Copyright © 2003 Lucent Technologies

If this field is entered, the corresponding FEATURE must be defined on the LSCAFD form (5975 Record) for SCA or the LSCARFD form (5979 Record) for CAR.

If "ANNC" is entered, a FWDTODN must not be specified.

If "FWD" is entered, a FWDTODN must be specified.

2.10 FWDTODN

Description: This field indicates where the calls will be forwarded for LASS Selective Call Forwarding. This field applies to the SCF and SCA/CAR features.
Valid Entries: 1 - 32 characters (0 - 9, *, #)

Data Rules:

If this field is entered, the corresponding FEATURE must be defined on the LSCAFD form (5975 Record) for SCA, the LSCARFD form (5979 Record) for CAR, or the LSCFFD form (5976 Record) for SCF.

2.11 BSRING

Description: Should the base station ringing (Ping Ring) be provided for forwarded calls?
Valid Entries: Y, N

Data Rules:

If this field is entered, the corresponding FEATURE must be defined on the LSCFFD form (5976 Record).

2.12 HARSH TRMT

Description: Should a harsh announcement be returned to the called party after a LASS SCR screening failure? If "N" is entered, a gentle announcement will be returned.
Valid Entries: Y, N

Data Rules:

If this field is entered, the corresponding FEATURE must be defined on the LSCRFD form (5977 Record) for SCR.

2.13 LST ACT

Description: Is the feature active for this user? This field is a text-only field in ODA, but it may be entered on RC View 4.48. The possible display values are "Y" or "N".

SCREENING LIST ENTRIES (SL)

The following two fields (Section 2.14 - Section 2.15) are used to enter the TNs and their type:

2.14 TN

Description: Enter a 10-digit TN, which will be screened during the activation of a LASS Selective Feature.
Valid Entries: 10 digits

Data Rules:

If this field is entered, the DN TYPE must be entered.

Duplicate TNs may not be entered on the list.

Copyright © 2003 Lucent Technologies

2.15 DN TYPE

Description: This field indicates what type of TN was entered on the previous field.

Valid DN TYPE Entries

Entry	Definition
DNSEVEN	A 7-digit telephone number.
DNPRIV	A 7- or 10-digit private telephone number.
DNTEN	A 10-digit telephone number.
DNEXT	A 1- to 7-digit extension (not used by ODA or RC/V).
DNNUNXT	10-digit TN for the next extension on the Screening List.
NUEXT	The next extension (1- to 7-digit TN) on the Screening List.

Data Rules:

If this field is entered, the Selective Screening List TN must be entered.

For initial offices, only "DNTEN" and "DNPRIV" may be entered.

For every "NUEXT" entry there must be a "DNNUNXT" entered.

SEC. 25: CALLING PARTY NUMBER/BILLING NUMBER FORMS

Copyright © 2003 Lucent Technologies

SEC. 25A: 5982 RECORD
CALLING PARTY NUMBER/BILLING NUMBER FEATURE FORM - CPNBNFD

1. GENERAL

The 5982 Record is available in 5E6 and later Software Releases. It is used to define the options associated with the CPN/BN (Calling Party Number/Billing Number) feature. These options include the feature name, method of feature activation or deactivation, feature options, billing options and shared DN options.

Each line or MLHG that uses a CPN/BN feature must have a CPN/BN feature name definition on this form (5982 Record) and a feature assignment on the appropriate LINEFA (5112 Record) or MLHLNFA (5113 Record) form and associated CLUSTR (5600 Record) or BFG forms (5625-1/7 Record). The AC (Authorization Code) on these forms must be set to "N".

1.1 Predefined Features

Certain CPN/BN features are predefined and automatically provided in the ODA database at the time of office registration. These are preconstructed features. Preconstructed feature names all start with a slash (/) and the first character of any feature other than preconstructed features. A list of the preconstructed features is contained in Figure 1.

1.2 ISDN Button Or Dial Codes

When the ACT or DEACT fields on this form are set to "CODE", an ISDN button can be set up or dialed codes can be used to activate or deactivate a CPN/BN feature. When "CODE" is entered on this form, the ACTION field on the Individualized Dialing Plan (IDPDCA form (5601-1/2 Record)) or the Office Dialing Plan (PDIT form (5300-2 Record)) must have an entry of "ACTCPNBN" (activate) or "DCTCPNBN" (deactivate) and either the preconstructed CPN/BN wildcard feature (*/CP) or the specific feature assigned to the TN or MLHG MEMB.

1.3 Line And MLHG Considerations

Each line or MLHG which uses a CPN/BN feature must have a CLASS OF SERVICE of "INDIV", "ISDN" or "ISATND" assigned on an LCC form (5306 Record).

Since an analog line or MLHG cannot use CPN/BN data, a CPN/BN feature assigned to an unshared analog line or MLHG has no functionality. A CPN/BN feature also has no functionality when a SHRD DN is set to "PRIMARY" and is assigned to a shared analog line or MLHG that is primary.

1.4 Recent Change View

The corresponding Recent Change View is 12.52.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the CPN/BN Feature Name. The Feature Name may be from 1 to 8 characters long with no restrictions on the valid characters, except that Feature Names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be inserted, deleted or changed.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: This field may be used for any descriptive comment which consists of up to 32 alphanumeric, blank or special characters (except the double quote).
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.8) define the options for this feature.

2.4 ACT

Description: This field indicates the activation type for this feature.

Required Field.
Default: AUTO
Valid Entries:

Valid ACT Entries

Entry	Definition
AUTO	This feature is automatically activated.
CODE	This feature can be activated through dialed code or feature buttons.

Data Rules:

When this field is "AUTO", DEACT must have an entry of "NONE".

When this field is "CODE", DEACT must also have an entry of "CODE".

2.5 DEACT

Description: This field indicates the deactivation type for this feature.

Required Field.
Default: NONE
Valid Entries:

Valid DEACT Entries

Entry	Definition
NONE	This feature cannot be deactivated.
CODE	This feature can be deactivated through dialed codes or feature buttons.

2.6 #CPN BN

Description: This field describes the CPN/BN option subscribed to by this feature.

Required Field.

Valid CPN BN Entries

Entry	Definition
CPNONLY	Calling Party Number Only Option
BNONLY	Billing Party Number Only Option
CPNPREF	Calling Party Number Preferred Option
BNPREF	Billing Number Preferred Option

2.7 BILLING

Description: This field describes the type of billing to be used for this CPN/BN feature.

Copyright © 2003 Lucent Technologies

If "USAGESEN" is selected, a billing record is generated every 24 hours with a count of the number of CPNs and BNs delivered to the user. Also included is a count of the number of CPNs and BNs that could not be delivered because they were either unavailable or private.

If the feature is deactivated, the counts will not be made.

Required Field.
Default: FLATRATE
Valid Entries:

Valid BILLING Entries

Entry	Definition
FLATRATE	Flat rate billing
USAGESEN	Usage-sensative billing

2.8 SHRD DN

Description: This specifies whether CPN/BN data is sent to all terminals sharing a DN or to the primary terminal only.

Required Field.
Default: PRIMARY
Valid Entries:

Valid SHRD DN Entries

Entry	Definition
PRIMARY	Send CPN/BN data to primary terminal only.
ALL	Send CPN/BN data to all terminals sharing the DN.

Data Rules:

This field must be set to "ALL" for any analog shared DN, analog shared TN or analog shared MLHG terminal to use CPN/BN data.

SEC. 26A: 5983 RECORD
REDIRECTING NUMBER DELIVERY FORM - RNDFD

1. GENERAL

The 5983 Record is available with 5E8 and later Software Releases. It is used to define feature options associated with the RND (Redirecting Number Delivery) feature.

When a customer assigned an RND feature receives a forwarded call, the first and last forwarded DNs (Directory Numbers) are delivered to the called party.

A line or MLHG (Multi-Line Hunt Group) member may be assigned an RND feature on the appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), CLUSTR (5600 Record), or BFG (5625).The A field on the feature assignment form must be set to "Y". On the LINE and MLHLNFA forms the M field must also be set to "Y".

Only one RND feature can be assigned per LINEFA or MLHLNFA form.The AC (Authorization Code) on these forms, or on the CLUSTR form, must be set to "N".

The RND feature may not be assigned to trunks via the TRUNKFA (5205 Record) or TKGRPFA form (5206 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.59.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * FEATURE

Description: Enter the RND feature name. The feature name may not start with a slash (/), which is reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 alphanumeric characters

2.4 ACT

Description: This field determines how the feature will be activated. On this form the default and only activation type is "AUTO". An RND feature is automatically active and ready to use when assigned. It cannot be activated by the subscriber.
Default: AUTO
Valid Entries: AUTO

2.5 DEACT

Description: This field determines how the feature will be deactivated. On this form the default and only deactivation type is "NONE". An RND feature cannot be deactivated by the subscriber.

SEC. 27A: 5985 RECORD
ATS FEATURE BUTTON SERVICE DESCRIPTION FORM - SRVCDESC

1. GENERAL

The 5985 Record is available with 5E9(1) and later Software Releases, and defines all actions and their service descriptions for ATS (Automatic Terminal Setup). This form is used to override the default service descriptions. Refer to Figure 1.

The ATS feature supports National ISDN 2, downloading certain parameters essential for terminal operation on a National ISDN (standard) BRI upon request from the terminal. This feature minimizes the number of steps the user or installer must take to establish service. ATS minimizes the number of parameters a customer must enter into an ISDN terminal.

Standard default data has been provided by the 5ESS Switch.

For further information about ATS, see Division 2, Section 1AM.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.32.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ACTION

Description: Enter the ATS feature button action ID. For a list of valid entries see Figure 1.

Required Field.

Data Rules:

One and only one SRVCDESC form for each of the ACTIONs in Figure 1 must exist in an office.

2.3 # SERVICE DESC

Description: Enter the ATS Feature Button Action Service Description. There is no lower to upper conversion for characters. In the default data, a text string with all capital letters is for a 5ESS-only feature action, and a text string with mixed upper and lower cases is for a Bellcore-defined feature action; but the customer may overwrite the text string according to local preference. Figure 1 shows the default Service Description for each ACTION.

Required Field.
Valid Entries: 1 - 20 characters

ORIGINATING SWITCH CALLING NAME

1. GENERAL

The 5986 Record is available with 5E13 and later Software Releases. The CNAM form allows calling names (corresponding to calling numbers) to be provisioned on the switch.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.65.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 CKT TN

Description: Enter the circuit telephone number of the calling party.

Required Field.
Valid Entries: XXXXXXX or NXXXXXXXXX, where N is 2 - 9 and X is 0 - 9

Data Rules:

When the first three digits of the 7-digit CKT TN(s) field are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, then the 7-digit CKT TN must be a 10-digit CKT TN with the NPA/OFFICE CODE defined on the NOC form.

The CNAM form is used by the Originating Switch Calling Name feature which is a secured feature. The ACT field for SFID 318 on the SFSYS form (Record 5713-1) must be set to "Y" before data can be entered on the CNAM form.

When CKT TN(s) are assigned on the CNAM form, the CKT TN(s) must be defined as a TN on the LINE form, a TN on the MLHLN form, a LISTED TN or SUBTN1 on the MLHG form, a CKT TN or CKT MLHG TN on the DSLUSR form, or a secondary only TN on the SHTN form.

When CKT TN(s) assigned on the CNAM form is also defined as a CKT TN on the LINE form with the INTERCEPT field (ICP) equal to "Y", the OE TYPE and NUMBER on the LINE form must be entered.

When CKT TN(s) are assigned on the CNAM form and also defined as a CKT TN on the MLHLN form with the INTERCEPT field (ICP) equal to "Y", the OE TYPE and NUMBER on the MLHGLN form must be entered.

When CKT TN(s) are assigned on the CNAM form and also defined as a CKT TN on the DSLUSR form with the INTERCEPT field (ICP) equal to "Y", the OE TYPE on the DSLUSR form must be entered.

When CKT TN(s) assigned on the CNAM form are also defined as a LISTED TN or SUBTN1 on the MLHG form, MPTYPE on the MLHG form must not be entered and the associated FEATURE NAME on the MLHLN must be "ISAT", "MUPH", or "UCD".

2.3 NAME

Description: Enter the name of the calling party.

Copyright © 2003 Lucent Technologies

Valid Entries: Blank or up to 15 characters

2.4 PRIVACY IND

Description: Is the calling party a private name?

DIGITAL CELLULAR SWITCH PARAMETERS FORM - APXPARM

1. GENERAL

The APXPARM form (5050 Record) is available for 5E9(1) and later Software Releases. It is used to administer global parameters that are required when a 5ESS Switch is functioning as a digital cellular switch in a cellular network.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 * OFFICE ID

Description: The office identifier may be the common language office name.

Required Field.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

Only one APXPARM form may be defined for an office. Its OFFICE ID must match the OFFICE ID on the OFCOPT form (5509 Record).

2.3 DISC TIMER

Description: The disconnect acknowledgement timer is used to set the amount of time in seconds the 5ESS Switch will wait for a response from the ECP (Executive Cellular Processor) complex when a disconnect occurs.
Valid Entries: 5 - 25 (seconds)

2.4 INC CALL RESP TIMER

Description: The incoming call response timer is used to set the amount of time in seconds the 5ESS Switch will wait for a response from the ECP (Executive Cellular Processor) complex on an incoming call.
Valid Entries: 10 - 120 (seconds)

2.5 ECP POINT CODE

Description: This field is used to assign a point code to the ECP (Executive Cellular Processor) that connects to this 5ESS Switch which serves as a DCS (Digital Cellular Switch). The point code consists of three 3-digit segments (the Network Indicator, the Cluster Region and Type, and the Cluster Member number); each segment must be in the range 0 - 255.
Valid Entries: 9 digits

Data Rules:

When SFID ACT 130 on the SFSYS form (5713 Record) is "Y", ECP POINT CODE must be entered; when SFID ACT 130 is "N", ECP POINT CODE must not be entered.

Copyright © 2003 Lucent Technologies

2.6 INTER VENDOR TRK LIMIT

Description: This field specifies the number of ATEP (Autoplex Task Execution Process) terminal processes available to the ECP (Executive Cellular Processor) when requesting the loopback or restoration of inter-vendor trunks.

This limit, therefore, specifies the maximum number of simultaneous test sessions.
Valid Entries: 1 - 20

2.7 MAX TRK TESTS PER HOUR

Description: This field limits the maximum duration (in hours) of tasks performed by the AATA (Autoplex Automatic Task Administrator). AATA tasks subject to this time limit include trunk test demand, inter-vendor loopback, and dedicated switch connection loopback requests.
Default: 24
Valid Entries: 0 - 168 (hours)

TERM MTCE TRK TST OPT

The following fields These fields (Section 2.8 - Section 2.12) are used for terminal maintenance trunk test options.

2.8 TIME

Description: This field indicates whether local time or Greenwich Mean Time will be used for ATTS (Automatic Trunk Test Scheduler) schedules.

Required Field.
Default: LOCAL
Valid Entries:

Valid TIME Entries

Entry	Definition
LOCAL or L	Local time.
UTC or U	Universal Time Coordinated (Greenwich Mean Time).

2.9 BSY TRK ON RETRY LIST

Description: Put busy trunks on the retry list? This field determines if test calls that abort due to a busy status during ATTS sessions will be put on a retry list.

Required Field.
Default: Y
Valid Entries: Y, N

2.10 DEFAULT LANGUAGE

Description: The DEFAULT LANGUAGE field is used to specify a default language code for playing announcements for the mobile subscribers.

Software Release: 5E13 and later
Valid Entries:

For 5E14 and earlier: 1, 2, 6, 7

For 5E15 and later: 1 - 255

Copyright © 2003 Lucent Technologies

See tables below.

Copyright © 2003 Lucent Technologies

- ***NOTE:*** For 5E15 and later, any four languages can be selected.

Data Rules:

For 5E13 and later, when DEFAULT LANGUAGE is entered, it must be defined as "LANGUAGE CODE" on the FIXRTRAF form (5058 Record).

2.11 AMPS DCS GSM

Description: The AMPS (Advanced Mobile Phone Service) DCS (Digital Cellular Switch) GSM (Global Switching Module) field indicates the type of platform used within the DCS for CCS (Common Channel Signaling Subsystem) transport. The type is indicated by the number "0" for CNI (Common Network Interface) platform and a number from "1- 192" GSM for PSU platform. This field was added to support the Wireless Support of SS7/PSU feature. (For more detailed information about this feature, see Division 2, Section 7AY.)

Software Release: 5E15 FR 1and later
Valid Entries: Blank, or 0, or 1 - 192

- ***NOTE:*** Enter a number from 0 to 192; where 0 is for CNI Platform and 1 - 192 GSM is for PSU Platform.

Data Rules:

- When AMPS DCS GSM is entered, ECP POINT CODE must be entered.
- When a value of "1 - 192" is entered in the AMPS DCS GSM field on this form, "PSU" or "ALL" must be entered in the COMMON CHAN SIG field on the OFCOPT form (5509 Record).
- When "0" is entered in the AMPS DCS GSM field on this form, "CNI" or "ALL" must be entered in the COMMON CHAN SIG field on the OFCOPT form (5509 Record).
- When a value of "1 - 192" is entered in the AMPS DCS GSM field on this form, the GSM must be defined on the CCGSM form (6008 Record).

2.12 MAX REL CONFIG

Description: Is this AMPS DCS Global SM configured for maximum reliability? This field was added to support the Signaling Only GSM (99-5E-7776) feature. See Division 2, Section 8X.

Software Release: 5E15 FR 3 and later
Valid Entries: Y, N

Data Rules:

When "Y" is entered, the following non-signaling forms must not be defined for the corresponding Global SM:

EQLU (19.1)
EQTU (19.2)
EQDU (19.4)
EDQDNU-S (19.14)
EQAIU (19.16)
EQPLTU (19.24)

SEC. 1B: 5051 RECORD
ECP ANNOUNCEMENT ROUTE INDEX FORM - APXANNC

1. GENERAL

The APXANNC form (5051 Record) is available for 5E9(1) and later Software Releases. It is used to associate an identification number from the ECP (Executive Cellular Processor) to a route index for an announcement. This form is populated when the switch is serving as a digital cellular switch in a cellular network.

An APXANNC form can be entered only if SFID ACT 130 on the SFSYS form (5713 Record) is "Y". When SFID ACT 130 is "Y", at least one APXANNC form must be submitted.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.38.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 * ECP INDEX

Description: The Executive Cellular Processor index is an announcement number sent from the Executive Cellular Processor to a 5ESS Switch serving as a digital cellular switch in a cellular network.

Required Field.
Valid Entries: 1 - 127

2.3 BARGE IN RTI

Description: The Barge-in Route Index specifies a route to an announcement trunk that has barge-in capability.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

Either or both BARGE IN RTI and NON BARGE IN RTI must be entered.

When BARGE IN RTI is entered, it must be defined in the ROUTE INDEX field on an RTIDX form (5303 Record). The TRUNK GROUP NUMBER on the RTIDX form must be defined in the TGN field of a TKGRP form (5202 Record). On the TKGRP form the TRKCLS must be "ANNCMNT", BARGE IN must be "Y", and CYCLES must be 0 or not entered. TKGRP form is found by matching TGN on the TKGRP form with the TRUNK GROUP NUMBER on the RTIDX form. (RTIDX form is found by matching ROUTE INDEX with BARGE IN RTI on the APXANNC form).

For 5E10 and later, BARGE IN RTI must not equal NON BARGE IN RTI.

2.4 NON BARGE IN RTI

Description: The Non-Barge-in route index specifies a route to an announcement trunk that does not have

Copyright © 2003 Lucent Technologies

barge-in capability.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

Either or both BARGE IN RTI and NON BARGE IN RTI must be entered.

When NON BARGE IN RTI is entered, it must be defined in the ROUTE INDEX field on an RTIDX form. The TRUNK GROUP NUMBER on the RTIDX form must be defined in the TGN field of a TKGRP form. On the TKGRP form the TRKCLS must be "ANNCMNT", BARGE IN must be "N", and CYCLES must be 0 or blank.

2.5 ROUTE TYPE

Description: The fixed route type is used to specify a fixed route type for the announcement.

Software Release: 5E13 and later
Required Field.
Default: APXTANN
Valid Entries:

Valid ROUTE TYPE Entries

Entry	Definition
APXTANN	Autoplex Tones and Announcements
DCSnnn	Digital Cellular Switch Treatment nnn.

Data Rules:

For 5E13 and later, when ROUTE TYPE is "APXTANN", BARGE IN RTE must not equal NON BARGE IN RTI.

SEC. 1C: 5052 RECORD
ATTS TEST SESSION SCHEDULE DATA FORM - ATSDATA

1. GENERAL

The ATSDATA form (5052 Record) is available for 5E9(1) and later Software Releases. It is used to provide data that defines a test session in a certain test schedule to be invoked by ATTS (Automatic Trunk Testing Scheduler) for the purpose of performing automated trunk testing over a specific range of equipped members of a specified trunk group.

Test sessions within the same ATTS schedule cannot overlap. The START HOUR and START MINUTE of one ATSDATA form cannot fall between the start and stop times of another ATSDATA form defined for the same SCHEDULE, WEEK, and DAY.

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.9.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 * SCHEDULE

Description: This field specifies the individual ATTS schedule for which this test session is defined.

Required Field.
Valid Entries: 1 - 20

2.3 * WEEK

Description: This field specifies the week within the individual ATTS schedule when the test session is to begin executing.

Required Field.
Valid Entries: 1 - 8

2.4 * DAY

Description: This field specifies the day within the given WEEK when the test session is to begin executing.

Required Field.
Valid Entries: 1 - 7

2.5 * START HOUR

Description: This field specifies the hour within the given DAY when the test session is to begin executing.

Required Field.
Valid Entries: 0 - 23

Data Rules:

START HOUR may not be greater than STOP HOUR.

Copyright © 2003 Lucent Technologies

2.6 * START MINUTE

Description: This field specifies the minute within the given START HOUR when the test session is to begin executing.

Required Field.
Valid Entries: 0 - 59

2.7 # STOP HOUR

Description: This field specifies the hour within the given DAY when the test session is to stop executing.

Required Field.
Valid Entries: 0 - 23

Data Rules:

STOP HOUR must be greater than or equal to START HOUR.

2.8 # STOP MINUTE

Description: This field specifies the minute within the given STOP HOUR when the test session is to stop executing.

Required Field.
Valid Entries: 0 - 59

Data Rules:

When START HOUR and STOP HOUR are the same, STOP MINUTE must be greater than START MINUTE.

2.9 # TGN

Description: This field identifies the individual Trunk Group Number to be tested during the test session. Every ATSDATA form(s) must have a matching TKGRP form (matching TGN values).

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN must be defined on a TKGRP form (5202 Record).

An ATSDATA form(s) must not have an associate TKGRP form where the TRKCLS is "IVBST", "A2", or "A5".

For 5E15 and later, an ATSDATA form(s) must not have an associated TKGRP form where the TRKCLS is "A5", "SVC", "FRBC", "BCM", "ADT", "PKTPIPE", "3GPD", "PCF", or "ISLPM".

2.10 MEMB LOW

Description: This field specifies the first in a range of members of the specified trunk group to be tested during this session.
Default: 0

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 1951

Data Rules:

MEMB LOW may not be greater than MEMB HIGH.

2.11 MEMB HIGH

Description: This field specifies the last in a range of trunk group members to be tested during the session.

MEMB HIGH must be populated with a value in the range 0 through the member number of the highest numbered trunk equipped in the group, or 1952. When the special value 1952 is entered in MEMB HIGH, and MEMB LOW is 0, all equipped trunks in the specified trunk group will be tested.
Valid Entries: 0 - 1952

Data Rules:

The MEMB HIGH value must be less than the highest trunk member number assigned to the trunk group. The highest trunk member is determined by summing the MEMB and QTY fields on the TRUNK form (assigned to the TGN) that has the greatest MEMB number.

2.12 ORDER

Description: This field indicates the sequence in which the trunk group members will be tested, either ascending or descending.

Required Field.
Default: ASCENDING
Valid Entries:

Valid ORDER Entries

Entry	Definition
ASCENDING	Test the trunks in ascending order.
DESCENDING	Test the trunks in descending order.

2.13 LINK

Description: Should this test session begin executing immediately when the previous session completes its execution early?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Two test sessions from the same ATTS schedule may be linked only if the stop time (STOP HOUR and STOP MINUTE) of the first form matches the start time (START HOUR and START MINUTE) of the second form. Test sessions are linked if their respective ATSDATA forms have the same SCHEDULE, WEEK, and DAY; and the LINK field of the later one is set to "Y".

2.14 SKIP

Description: Should the test session be skipped when its scheduled starting time arrives?

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.15 ATME TRAN TEST

Description: This field specifies the type of transmission test to be performed on all members of the trunk group equipped on ATME (Automatic Transmission Measuring Equipment).

This field is reserved for future use; currently, no value can be entered into it.

2.16 ATME SIG TEST

Description: This field specifies the type of signaling test to be performed on all members of the given trunk group equipped on ATME (Automatic Transmission Measuring Equipment).

This field is reserved for future use; currently, no value can be entered into it.

SEC. 1D: 5053 RECORD
ATTS TEST SESSION SCHEDULE PARAMETERS FORM - ATSPARM

1. GENERAL

The ATSPARM form (5053 Record) is available for 5E9(1) and later Software Releases. It is used to define parameters and options that control ATTS (Automatic Trunk Test Scheduler) test sessions on a per schedule basis.

The Automatic Trunk Test Scheduler is a secured feature that must be purchased before an ATSPARM form can be entered. ATTS can be purchased as a separate feature (SFID 134) or as part of the Autoplex secured feature (SFID 130). The ACT field must be set to "Y" for one of these features on the SFSYS form (5713 Record).

An ATSPARM form must be entered for each unique SCHEDULE that appears on an ATSDATA form (5052 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 * SCHEDULE

Description: This field specifies the individual ATTS schedule for which this test session is defined.

Required Field.
Valid Entries: 1 - 20

2.3 # TEST TYPE

Description: This field specifies the type of test to be performed during the test session associated with the ATTS Schedule.

Required Field.

Valid TEST TYPE Entries

Entry	Definition
CONT	Continue.
NINV	Non-inverting.
NSYS	Non-synchronous.
PB	Permanent Busy.
SHCT	Software Release: 5E10 and later. Speech Handler trunk PCM loop back test.This enumeration supports the CDMA (Code Division MultipleAccess) feature. For more information on this feature, seeDivision 2, Section 8B.
SYS	Synchronous.
102LB	102 loop-back test.
105	105 test.

2.4 MAX MISC ABORTS

Description: This field specifies the maximum number of consecutive aborted trunk test attempts allowed per test session. It is used as a threshold which, when reached, causes a test session to terminate.

Copyright © 2003 Lucent Technologies

Required Field.
Default: 20
Valid Entries: 1 - 20

2.5 MAX CONGESTION

Description: This field specifies the maximum number of consecutive trunk test attempts per test session which are allowed to result in detection of congestion. It is used as a threshold which, when exceeded, causes a test session to terminate.

Required Field.
Default: 20
Valid Entries: 1 - 20

2.6 MAX ANS TIME OUT

Description: This field specifies the maximum number of consecutive trunk test attempts per test session which are allowed to result in the director timing out while waiting for an answer or equivalent signal from the far end. It is used as a threshold which, when exceeded, causes a test session to terminate.

Required Field.
Default: 20
Valid Entries: 1 - 20

2.7 MAX DIR TIME OUT

Description: This field specifies the maximum number of consecutive trunk test attempts per test session which are allowed to result in the director timing out while waiting for an event other than receipt of an answer or equivalent signal from the far end. It is used as a threshold which, when exceeded, causes a test session to terminate.

Required Field.
Default: 20
Valid Entries: 1 - 20

2.8 MAX LOOPS

Description: This field specifies the maximum number of passes that should be performed per test session through a list of trunks associated with aborted tests for which another test attempt should be made. It is used as a threshold which causes a test session to terminate when trunks remain on the list after the specified maximum number of passes through the list have been made. If this field is left blank, the retry list will be turned off.
Valid Entries: 1 - 20

2.9 RETRY ON ABORT

Description: Should the test be retried when it aborts?

Required Field.
Default: N
Valid Entries: Y, N

2.10 RETEST ON FAILURE

Description: Should the test be immediately repeated when it fails?

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.11 COUNT BUSY ABORTS

Description: Should tests that abort because the trunk is busy be included in the counter associated with the threshold for miscellaneous aborted tests?

Required Field.
Default: N
Valid Entries: Y, N

2.12 PRINT REPORT

Description: This field specifies how to output in real time the result of each test.

Valid PRINT REPORT Entries

Entry	Definition
PFA	Print all results.
FA	Print non-passing results only.
A	Print aborted results only.
F	Print failing results only.
P	Print passing results only.

2.13 SESSION COUNT

Description: This is a Recent Change only field which specifies the number of the test schedule defined on the ATSDATA form.

```

SEC. 1E: 5054 RECORD
DIGITAL CELLULAR SWITCH - DIGITAL TESTS FORM - DCSDT

1. GENERAL

The DCSDT form (5054 Record) is available for 5E9(1) and later Software Releases. It is used to define digital tests for an automatic trunk test table. The digital test result threshold specified on this form will be used to define the pass/marginal/fail criteria for the tests.

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 * ATTTN

Description: The ATTTN (Automatic Trunk Test Table Number) and its associated test data provides tests to be executed by Trunk APT (Automatic Progression Testing) and by manual trunk testing initiated at the 5ESS Switch.

Required Field.
Valid Entries: 1 - 999

2.3 DURATION

Description: This field specifies the total duration of the test in seconds.

Required Field.
Default: 20
Valid Entries: 1 - 240 (seconds)

Data Rules:

When BIT ERROR RATIO is 5, DURATION must be greater than 1; when 6, DURATION must be greater than 16; and when 7, DURATION must be greater than 159.

2.4 BLOCK SIZE

Description: This field specifies the block size of the digital bit streams used in the test.

Required Field.
Default: 2047
Valid Entries: 1 - 64000

2.5 BIT ERR RATIO

Description: This field specifies the acceptable bit error ratio for the test

Required Field.
Default: 6
Valid Entries: 1 - 7

Copyright © 2003 Lucent Technologies

SEC. 1F: 5055 RECORD
DIGITAL CELLULAR SWITCH - TRANSMISSION TEST FORM - DCSTT

1. GENERAL

The DCSTT form (5055 Record) is available for 5E9(1) and later Software Releases. It is used to define transmission tests for an automatic trunk test table. Tone measurement thresholds and noise or return loss thresholds defined on this form will be used to define the pass/marginal/fail status for the test calls.

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 * ATTTN

Description: The ATTTN (Automatic Trunk Test Table Number) and its associated test data provides tests to be executed by Trunk APT (Automatic Progression Testing) and by manual trunk testing initiated at the 5ESS Switch.

Required Field.
Valid Entries: 1 - 999

2.3 * TEST TYPE

Description: This field identifies the type of test to be performed.

Required Field.

Valid TEST TYPE Entries

Entry	Definition
102LB	102 loop-back test.
105	105 test.
PVELBK	Software Release: 5E15 and later. PHV Voice Encoding Loopback Test. This entry supports the One-Way Audio Detection Tool Phase 2 feature. For more information on this feature, see Division 2, Section 8V.

Data Rules:

When TEST TYPE is "102LB", all fields for the following must be blank: TONE 404 HZ DEV, TONE 2804 HZ DEV, NOISE FAR END, NOISE 1004 FILTER, ECHO RET LOSS, SINGING RET LOSS, HI FREQ RET LOSS.

When TEST TYPE is 105:

- All the TONE 1004 HZ LOSS fields must be in the range -32 to 3.
- Values must be entered in all fields for the following: TONE 404 HZ DEV, TONE 2804 HZ DEV, NOISE FAR END, NOISE 1004 FILTER, ECHO RET LOSS, SINGING RET LOSS, and HI FREQ RET LOSS.

TONE 1004 HZ LOSS AT 0 DBM

Copyright © 2003 Lucent Technologies

These fields (Section 2.4 - Section 2.7) are used to set the TONE 1004 HZ LOSS values.

2.4 # FAIL MIN

Description: This field is used to specify the lower bound of the tone level deemed marginal passed. A tone lower than this value will be deemed failed.

Required Field.
Default: -10
Valid Entries: -48 - 3 (dB)

Data Rules:

FAIL MIN cannot be greater than MARG MIN.

2.5 # MARG MIN

Description: This field is used to specify the lower bound of the tone level deemed passed. A tone lower than this value, but higher than FAIL MIN will be deemed marginal passed.

Required Field.
Default: -9
Valid Entries: -48 - 3 (dB)

Data Rules:

MARG MIN cannot be greater than MARG MAX.

2.6 # MARG MAX

Description: This field is used to specify the upper bound of the tone level deemed passed. A tone higher than this value, but lower than FAIL MAX will be deemed marginal passed.

Required Field.
Default: 0
Valid Entries: -48 - 3 (dB)

Data Rules:

MARG MAX cannot be greater than FAIL MAX.

2.7 # FAIL MAX

Description: This field is used to specify the upper bound of the tone level deemed marginal passed. A tone higher than this value will be deemed failed.

Required Field.
Default: 0
Valid Entries: -48 - 3 (dB)

TONE 404 HZ DEV

These fields (Section 2.8 - Section 2.11) define the deviations for 404 Hz tones detected in the marginal and unacceptable ranges.

2.8 MARG POS

Description: This field is used to specify the positive deviation for a tone detected in the marginal passed

Copyright © 2003 Lucent Technologies

range.
Valid Entries: 0 - 9

2.9 FAIL POS

Description: This field is used to specify the deviation for a tone detected in the failed range.
Valid Entries: 0 - 9

2.10 MARG NEG

Description: This field is used to specify the negative deviation for a tone detected in the marginal range.
Valid Entries: 0 - 9

2.11 FAIL NEG

Description: This field is used to specify the negative deviation for a tone detected in the failed range.
Valid Entries: 0 - 9

TONE 2804 HZ DEV

These fields (Section 2.12 - Section 2.15) define the deviations for 2804 Hz tones detected in the marginal and unacceptable ranges.

2.12 MARG POS

Description: This field is used to specify the positive deviation for a tone detected in the marginal passed range.
Valid Entries: 0 - 9

2.13 FAIL POS

Description: This field is used to specify the deviation for a tone detected in the failed range.
Valid Entries: 0 - 9

2.14 MARG NEG

Description: This field is used to specify the negative deviation for a tone detected in the marginal range.
Valid Entries: 0 - 9

2.15 FAIL NEG

Description: This field is used to specify the negative deviation for a tone detected in the failed range.
Valid Entries: 0 - 9

NOISE NEAR END

These fields (Section 2.16 - Section 2.17) are used to specify the minimum acceptable and minimum immediate action limits for noise at the near end. A value above MIN IACT will be deemed failed. A value above MIN ACC but below MIN IACT will be deemed marginal passed. A value below MIN ACC will be deemed passed.

2.16 # MIN ACC

Description: This field specifies the noise at near end minimum acceptance limit (in dBrnC, a measure in decibels using C-message filters).

Required Field.

Copyright © 2003 Lucent Technologies

Default: 43
Valid Entries: 15 - 55 (dBrnC)

2.17 # MIN IACT

Description: This field specifies the noise at near end minimum immediate action limit (in dBrnC).

Required Field.
Default: 44
Valid Entries: 15 - 55 (dBrnC)

NOISE FAR END

These fields (Section 2.18 - Section 2.19) are used to specify the minimum acceptable and minimum immediate action limits for noise at far end. A value above MIN IACT will be deemed failed. A value above MIN ACC but below MIN IACT will be deemed marginal passed. A value below MIN ACC will be deemed passed.

2.18 MIN ACC

Description: This field specifies the noise at far end minimum acceptance limit (in dBrnC, a measure in decibels using C-message filters).
Valid Entries: 15 - 55 (dBrnC)

2.19 MIN IACT

Description: This field specifies the noise at far end minimum immediate action limit (in dBrnC).
Valid Entries: 15 - 55 (dBrnC)

NOISE 1004 FILTER

These fields (Section 2.20 - Section 2.21) are used to specify the minimum acceptable and minimum immediate action limits for noise with 1004 Hz filter. A value above MIN IACT will be deemed failed. A value above MIN ACC but below MIN IACT will be deemed marginal passed. A value below MIN ACC will be deemed passed.

2.20 MIN ACC

Description: This field specifies the noise with 1004 Hz filter minimum acceptance limit (in dBrnC, a measure in decibels using C-notch filters).
Valid Entries: 34 - 74 (dBrnC)

2.21 MIN IACT

Description: This field specifies the noise with 1004 Hz filter minimum immediate action limit (in dBrnC).
Valid Entries: 34 - 74 (dBrnC)

ECHO RET LOSS

These fields (Section 2.22 - Section 2.23) are used to specify the minimum acceptable and minimum immediate action limits for echo return loss. A value below MIN IACT will be deemed failed. A value above MIN IACT but below MIN ACC will be deemed marginal passed. A value above MIN ACC will be deemed passed.

2.22 MIN ACC

Description: This field specifies the echo return loss minimum acceptance limit.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 40 (dB)

2.23 MIN IACT

Description: This field specifies the echo return loss minimum immediate action limit.
Valid Entries: 0 - 40 (dB)

SINGING RET LOSS

These fields (Section 2.24 - Section 2.25) are used to specify the minimum acceptable and minimum immediate action limits for singing return loss. A value below MIN IACT will be deemed failed. A value above MIN IACT but below MIN ACC will be deemed marginal passed. A value above MIN ACC will be deemed passed.

2.24 MIN ACC

Description: This field specifies the singing return loss minimum acceptance limit.
Valid Entries: 0 - 40 (dB)

2.25 MIN IACT

Description: This field specifies the singing return loss minimum immediate action limit.
Valid Entries: 0 - 40 (dB)

HI FREQ RET LOSS

These fields (Section 2.26 - Section 2.27) are used to specify the minimum acceptable and minimum immediate action limits for high frequency signal return loss. A value below MIN IACT will be deemed failed. A value above MIN IACT but below MIN ACC will be deemed marginal passed. A value above MIN ACC will be deemed passed.

2.26 MIN ACC

Description: This field specifies the high frequency signal return loss minimum acceptance limit.
Valid Entries: 0 - 40 (dB)

2.27 MIN IACT

Description: This field specifies the high frequency signal return loss minimum immediate action limit.
Valid Entries: 0 - 40 (dB)

SEC. 1G: 5056 RECORD
CELLULAR MOBILE CARRIER IDENTIFICATION (CHARGING)

1. GENERAL

The 5056 Record is available with the 5E9(1) Software Release and is Recent Change only. The Cellular Mobile Carrier Identification (Charging) view (10.16) is used to associate a 10-digit billing number with a 2-digit Cellular Mobile Carrier Identification number, in order to facilitate billing of a cellular mobile carrier. The ODA equivalent fields for this form are on the TKGRP form. See BILLING DN and the LATA/TTOLL field section on the TKGRP form.

1.1 Recent Change View

The Recent Change View for this record is 10.16

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CMC ID

Description: Enter the Cellular mobile carrier identification number.

Software Release: 5E9(1) and later.
Required Field.
Valid Entries: 1 - 60

Data Rules:

A CMC ID of 00 is not allowed.

2.3 CMC BILL

Description: Enter the Cellular mobile carrier 10-digit billing number.

Software Release: 5E9(1) and later.
Valid Entries: 10-digit TN

SEC. 1H: 5058 RECORD
FIXED ROUTE TYPE RECORDED ANNOUNCEMENT DATA FORM - FIXRTRAF

1. GENERAL

The 5058 Record is available with the 5E13 and later Software Update. The Fixed Route Type Recorded Announcement form provides capability for specifying announcement data of a fixed route type for a preferred language.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.68.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ROUTE TYPE

Description: The ROUTE TYPE field is used to specify a fixed route type for the announcement within a preferred language code.

Required Field.
Valid Entries: DCS001 - DCS099

2.3 * LANGUAGE CODE

Description: The LANGUAGE CODE field is used to specify the preferred language code using the phrase.

Required Field.
Valid Entries:

For 5E14 and earlier: 1, 2, 6, 7

For 5E15 and later: 1 - 255

See tables below.

Valid LANGUAGE CODE Entries for 5E14 and Earlier

Entry	Definition
Blank	No value.

2.4 # ANNC HDR ID

Description: The ANNC HDR ID field is used to specify a unique announcement header within an announcement application.

Required Field.
Valid Entries: 1 - 131071

Data Rules:

When ANNC HDR ID is entered, it must be defined as HEADER ID on the ANNHD form (5531 Record) with APPLICATION set to "VARRRAF".

When the ANNC HDR ID matches the HEADER ID on the ANNHD form (5531 Record) and the PHR of the PHRASE_LIST on the ANNHD form matches the PHRASE ID on the PHRASE form (5534 Record), the LANGUAGE CODE entered on this form must match the PHRASE form.

SEC. 2: PSU LINK ASSIGNMENT FORMS

Copyright © 2003 Lucent Technologies

SEC. 2A: 5057 RECORD
PSU LINK ASSIGNMENT - PSULNK

1. GENERAL

The 5057 Record is available for 5E10 and later Software Releases. The PSU Link Assignment form is used to define links between packet switch units using PHAs (Protocol Handlers for Asynchronous Transfer Mode). The PHA feature is a Secured Feature that must be purchased by the office before data can be entered on this form. A SFSYS form must be entered with SFID 224 ACT field set to "Y". For more information on the PHA feature, see Division 2, Section 4A224. For more information on the CDMA (Code Division Multiple Access) feature, see Division 2, Section 8B.

The Interswitch Soft Hand-off feature (99-5E-3082) provides the means to interconnect packet switching units of different 5ESS-2000 Switches, either through a direct point-to-point (PSU link-to-PSU link) configuration or through a point-to-Multipoint ATM Network Connection configuration. With the Interswitch Soft Hand-off feature, more 5ESS-2000 switches can be involved which in effect expands the contiguous "soft hand-off" area (see Division 2, Section 8E). To support the Interswitch Soft Hand-off feature, the LINK TYPE field was added to this form to define the PSU link configuration.

Effective with the 5E11 Software Release, the Extended Soft Hand-off Through a Multipoint ATM Network Connection feature (99-5E-3081) provides a means for interconnecting large numbers of packet switching units of the 5ESS-2000 Switch. See Division 2, Section 8D. The CON TYPE field was moved to this form from the EQPSU form (5741-1/2 Record) (Division 8, Section 22) to indicate whether the connection terminates to a point-to-multipoint configuration or to a point-to-point PSU link.

The SD THRESH and SF THRESH fields were added to comply with SONET (Synchronous Optical Network) requirements to make Signal Degrade and Signal Failure parameters configurable by the user. The user can adjust these parameters to match signal conditions on a particular link.

The APS TYPE field was added to support APS (Automatic Protection Switching). When a link is provisioned as duplex (i.e., both channels equipped), APS can occur when SONET defects are detected. "Uni-directional" APS means that the selected channel at one end of the line does not have to be the same as the other end. "Bi-directional" APS means that both ends will always have the same line "on protection." An APS TYPE of "NONE" is similar to Unidirectional except that the PHA will always transmit zeroes in the K1/K2 bytes of the SONET overhead. "NONE" should normally be selected only when the link is provisioned simplex (i.e., one channel provisioned). When the link is duplex, the APS type should be selected to match the PHA or other equipment at the far end of the line. It should be noted that APS will NOT switch away from a defect on one channel if there is already a more severe defect on the other channel.

1.1 Optional Keys

When entering the optional keys for this form, one of the following must be entered:

- NEAR COM ADDR

or

- NEAR SM and PSU.

However, all three may be entered.

In addition, one of the following must be entered:

- FAR COM ADDR

or

Copyright © 2003 Lucent Technologies

- FAR SM and PSU.

However, all three of these may be entered.

1.2 Derived Entries

The values for the 6 optional key fields on this form may be derived from the EQPSU form. The derived values in these fields cannot be duplicated.

The derived values from the EQPSU form are as follows:

- If NEAR COM ADDR is not entered, its derived value is COM ADDR from the EQPSU form via the corresponding PSULNK NEAR SM field.
- If NEAR SM is not entered, its derived value is SWITCHING MODULE from the EQPSU form, where NEAR COM ADDR is matched to EQPSU field COM ADDR.
- If NEAR PSU is not entered, its derived value is 0.
- If FAR COM ADDR is not entered, its derived value is COM ADDR from the EQPSU form via the corresponding PSULNK FAR SM.
- If FAR SM is not entered, and LINK TYPE is "INTRA", its derived value is SWITCHING MODULE from the EQPSU form, where FAR COM ADDR is matched to the EQPSU field COM ADDR.
- If FAR PSU is not entered, and LINK TYPE is "INTRA", its derived value is 0. If LINK TYPE is "INTER", leave FAR PSU blank.

1.3 Recent Change View

The corresponding Recent Change View for this form is 22.22

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 (*) NEAR COM ADDR

Description: Enter the Near Community Address Number that is used to specify the community address for the near PSU (Packet Switch Unit). This value is specified in the COM ADDR field on the Packet Switch Unit form EQPSU (5741 Record). When NEAR COM ADDR is entered, NEAR SM and NEAR PSU can be left blank. Either the one field NEAR COM ADDR, or the two fields NEAR SM and NEAR PSU is enough to designate the NEAR Packet Switching Unit.
Valid Entries: 0 - 254

Data Rules:

Either the one field NEAR COM ADDR, or the two fields NEAR SM and NEAR PSU must be entered.

If NEAR COM ADDR is entered and/or FAR COM ADDR is entered with LINK TYPE set to "INTRA" on the PSULNK form, the COM ADDR must match a COM ADDR on the EQPSU form, and CON TYPE on the PSULNK form must be "POINT".

NEAR COM ADDR must not match FAR COM ADDR. (Note that if NEAR COM ADDR is not entered, its

Copyright © 2003 Lucent Technologies

value is derived from COM ADDR on the EQPSU form by the PSULNK NEAR SM. If FAR COM ADDR is entered, its value is derived from COM ADDR on the EQPSU form by the PSULNK FAR SM.)

If NEAR COM ADDR and NEAR SM are both entered on the PSULNK form, then COM ADDR on the corresponding EQPSU form must equal NEAR COM ADDR.

2.3 (*) NEAR SM

Description: Enter the Near Switching Module which is used to specify the near Switching Module on which the PSU (Packet Switch Unit) is located.

- ***NOTE:*** If NEAR SM is not entered, its value is derived from SWITCHING MODULE on the EQPSU form where the entry in NEAR COMADDR is matched to EQPSU field COM ADDR; NEAR PSU is assumed to be 0.

Valid Entries: 1 - 192

Data Rules:

If NEAR SM is entered, then NEAR PSU must also be entered.

The combination of entries for NEAR SM and NEAR PSU must not equal the FAR SM and FAR PSU entries.

If NEAR SM (and/or FAR SM) is entered, then the SM must be defined on the EQPSU form. On the EQPSU form (5741 Record), COM ADDR must be entered, and CON TYPE on the PSULNK form must be "POINT". Forms correspond if NEAR SM matches SWITCHING MODULE on the EQPSU form.

NEAR SM must not match FAR SM.

For each unique NEAR SM or FAR SM on the PSULNK form, the maximum number of PSULNK forms allowed is 10. Note that if NEAR SM is blank, its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key NEAR COMADR is matched to EQPSU field COM ADDR; NEAR PSU is assumed to be 0. If LINK TYPE is "INTER", it is not necessary to check the FAR SM. Otherwise, if LINK TYPE is "INTRA", and FAR SM is blank, its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key FAR COM ADDR is matched to the COM ADDR field on the EQPSU form; FAR PSU is assumed to be 0.

For each unique NEAR SM on the PSULNK form, the set of corresponding FAR COM ADDR values cannot contain duplicates.

2.4 (*) NEAR PSU

Description: Enter Near PSU (Packet Switch Unit) number.
Valid Entries:

5E15 and earlier: Blank, or enter 0
5E16 and later: Blank, or enter 0 - 1

Data Rules:

If NEAR PSU is entered, then NEAR SM must also be entered.

2.5 (*) FAR COM ADDR

Description: Enter the Far Community Address Number for the far packet switch unit. If FAR COM ADDR is entered, then FAR SM and FAR PSU do not need to be entered. Either the one field FAR COM ADDR, or the two fields FAR SM and FAR PSU, is enough to designate the FAR Packet Switching Unit.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 254

Data Rules:

Either this field FAR COM ADDR, or the two fields FAR SM and FAR PSU, must be entered. If NEAR SM and/or FAR SM is entered, then the SM must be defined on the EQPSU form. On the EQPSU form (5741 Record), COM ADDR must be entered; on the PSULNK form, CON TYPE must be "POINT". Forms correspond if FAR SM matches SWITCHING MODULE on the EQPSU form.

If FAR COM ADDR and FAR SM are both entered on the PSULNK form, then COM ADDR on the corresponding EQPSU form must equal FAR COM ADDR on this form.

For 5E11 and later, when FAR COM ADDR is 0 and CON TYPE is entered, CON TYPE must be "ATMNET."

For 5E11 and later, when FAR COM ADDR is not 0 and CON TYPE is entered, CON TYPE must be "POINT".

For 5E15 FR4 and later, when FAR COM ADDR is 0 and CON TYPE is entered, CON TYPE must be "ATMGW" or "ATMNET".

2.6 (*) FAR SM

Description: Enter the Far Switching Module on which the PSU (Packet Switch Unit) is located.

- ***NOTE:*** If FAR SM is not entered, its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key FAR COM ADDR is matched to EQPSU field COM ADDR; FAR PSU is assumed to be 0.

Valid Entries: 1 - 192

Data Rules:

If FAR SM is entered, then FAR PSU must also be entered.

For each unique NEAR SM or FAR SM on the PSULNK form, the maximum number of PSULNK forms allowed is 10.

For each unique FAR SM on the PSULNK form, the set of corresponding NEAR COM ADDR values cannot contain duplicates. (Note that if FAR SM is blank, and LINK TYPE is "INTRA", its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key FAR COM ADDR is matched to the COM ADDR on the EQPSU form. Otherwise, if LINK TYPE is "INTER", it is not necessary to check the FAR SM. If NEAR COM ADDR is blank, its value is derived from the COM ADDR field on the EQPSU form keyed by the PSULNK NEAR SM.

For 5E11 and later, when FAR SM is entered and CON TYPE is entered, CON TYPE must be "POINT".

2.7 (*) FAR PSU

Description: Enter the Far PSU (Packet Switch Unit) number..
Valid Entries:

5E15 and earlier: Blank, or enter 0
5E16 and later: Blank, or enter 0 - 1

Data Rules:

If FAR PSU is entered, then FAR SM must also be entered.

Copyright © 2003 Lucent Technologies

2.8 LINK TYPE

Description: When PHAs are used in a "point-to-point" configuration, this field indicates whether the FAR PSU community address is in "this" (the same) switch office ("INTRA") or another switch office ("INTER"). When the PHA is used for the "Point-to-multipoint" configuration, this field must be set to "INTER" whether the link is carrying intra-office traffic, inter-office traffic, or both.

Software Release: 5E10 and later
Required Field.
Default: INTRA
Valid Entries:

Valid LINK TYPE Entries

Entry	Definition
INTRA	Link is between PSUs on the same switch.
INTER	Link is between PSUs on different switches.

Data Rules:

When "INTER" is entered and any NEAR field is entered for a channel, NEAR SHELF and NEAR POSITION must be entered.

When "INTER" is entered, FAR SHELF, FAR POSITION and FAR CHL GRP must not be entered for either channel.

When LINK TYPE is "INTER", FAR SM must not be entered.

When LINK TYPE is "INTRA", FAR SHELF must be entered in every row where NEAR SHELF is entered.

When LINK TYPE is "INTRA" and any field is entered for a channel, NEAR SHELF, NEAR POSITION, FAR SHELF, and FAR POSITION must be entered.

LINK TYPE must not be both "INTER" and "INTRA" between the same 2 FAR/NEAR COM ADDR values.

2.9 APS TYPE

Description: Enter the Automatic Protection Switching Type used on the link.

Software Release: 5E11 and later
Required Field.
Default: BIDIRECT
Valid Entries:

Valid APS TYPE Entries

Entry	Definition
NONE	No automatic protection switch type; used for simplex (one channel provisioned). When the link is duplex, the APS type should be selected to match the PHA or other equipment at the far end of the line.
BIDIRECT	Bi-directional; both ends will always have the same line protected.
UNIDIRECT	Uni-directional; the selected channel at one end of the line does not have to be the same as the other end.

2.10 SD THRESH

Description: Enter the Signal Degrade Threshold. This threshold is used to indicate the signal degrade bit-error threshold used for each channel of the PSU link. When this threshold is reached for a channel, the channel will go into a signal degrade condition where recovery action may be taken.

Software Release: 5E11 and later
Required Field.

Valid SD THRESH Entries

Entry	Definition
TENEM5	10E-5.
TENEM6	10E-6.
TENEM7	10E-7.
TENEM8	10E-8.
TENEM9	10E-9.

2.11 SF THRESH

Description: Enter the Signal Failure Threshold. This threshold is used to indicate the signal fail bit-error threshold used for each channel of the PSU link. When this threshold is reached for a channel, the channel will go into a signal fail condition. For example, with the default rate of "TENEM3" (or .001), a condition will be declared when (on the average) at least 1 out of every 1000 bits is received in error.

Software Release: 5E11 and later
Required Field.
Default: TENEM3

TENEM3	10E-3.
TENEM4	10E-4.
TENEM5	10E-5.

CHANNELS

The following CHANNELS list fields (Section 2.12 - Section 2.18) define both channels of the packet switch unit link. The channels are defined by assigning physical PHA1s (Protocol Handlers for Asynchronous Transfer Mode Type 1) and channel groups.

Data Rules:
If any field is entered for a CHANNEL, then NEAR SHELF, NEAR POSITION, FAR SHELF and FAR POSITION must be entered.

NEAR fields must be entered for CHANNEL 1, and FAR fields must be entered for CHANNEL 1.

For each CHANNEL, NEAR fields must all be entered or all blank, the FAR fields must all be entered or all blank.

For each near or far CHANNEL entered:

- the NEAR SM, PSU, SHELF, CHL GRP or FAR SM, PSU, SHELF, CHL GRP must match respectively to SM, PSU, PSU SHELF, GRP on the PSUGP form where PH TYPE is "PHA1".
- the NEAR SM, SHELF, POSITION or FAR SM, SHELF, POSITION must match respectively to SWITCHING MODULE, PSU SHELF, PH on the EQPSUPH form. The corresponding EQPSUPH PROTOCOL HANDLERS entry must have "O" (Operational) entered for EQST and 00000010 (PHA1) entered for PH CLI.

2.12 NEAR SHELF

Description: Enter the packet switch unit shelf where the near PHA1 (Protocol Handler for ATM (Asynchronous Transfer Mode)) 1 is located.
Valid Entries: 0 - 4

Copyright © 2003 Lucent Technologies

Data Rules:

NEAR SHELF and NEAR POSITION must be unique for both channels.

The combination of SHELF and POSITION may not be duplicated within an SM.

The combination of SHELF and CHL GRP may not be duplicated within an SM. Note that if NEAR SM is blank, its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key NEAR COM ADDR is matched to the COM ADDR field on the EQPSU form; NEAR PSU is assumed to be 0. If FAR SM is blank and LINK TYPE is "INTRA", its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key FAR COM ADDR is matched to the COM ADDR field on the EQPSU form, and FAR PSU is assumed to be 0. If LINK TYPE is "INTER", it is not necessary to check the FAR SM.

PSULNK forms can not have a SHELF and CHL GRP which are mixed with the same Protocol Handler from other BRI or PRI DSLs in the same SM, i.e., on the following ODA forms:

- DSLUSR
- MDLNK
- MISLINK
- PSULNK
- QPHPIPE
- TRUNK
- XAT

2.13 NEAR POSITION

Description: Enter the Near Position number where the near protocol handler for ATM (PHA1) is located.
Valid Entries: 0 - 15

Data Rules:

The PHA1 defined for the NEAR POSITION must have an EQSTAT of "O" on the Protocol Handler EQPSUPH form (5742 Record). And, for Recent Change, it must be out of service before adding it to a PSU link or removing it from a PSU link.

2.14 NEAR CHL GRP

Description: Enter the Near Channel Group on the NEAR SHELF for this PSU link channel.

- ***NOTE:*** For Recent Change only, this field can be left blank if desired and an available channel group number on the NEAR SHELF will be selected for the channel of the PSU link. If this field is entered and the PH TYPE on the PSUGP form (5949 Record) is blank for the channel group entered, the PH TYPE will be set to PHA1 on the PSUGP form.

Valid Entries: 0 - 15

2.15 FAR SHELF

Description: Enter the Packet Switch Unit shelf on which the far protocol handler for ATM (PHA1) is located.
Valid Entries: 0 - 4

Data Rules:

FAR SHELF and FAR POSITION must be unique for both channels.

The combination of SHELF and POSITION may not be duplicated within an SM. Note that if NEAR SM is blank, its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key NEAR

Copyright © 2003 Lucent Technologies

COM ADDR is matched to the COM ADDR field on the EQPSU form; NEAR PSU is assumed to be 0. If FAR SM is blank, and LINK TYPE is "INTRA", its value is derived from SWITCHING MODULE on the EQPSU form where PSULNK key FAR COM ADDR is matched to the COM ADDR field on the EQPSU form, and FAR PSU is assumed to be 0. If LINK TYPE is "INTER", it is not necessary to check the FAR SM.

PSULNK forms can not have a SHELF and CHL GRP which are mixed with the SHELF and CHL GRP (the first three characters of ISCNs) from other BRI or PRI DSLs in the same SM, i.e. on the following ODA forms:

- DSLUSR
- MISLINK
- PSULNK
- TRUNK
- XAT

The combination of SHELF and CHL GRP may not be duplicated within an SM.

2.16 FAR POSITION

Description: Enter the position number where the far protocol handler for ATM (PHA1) is located.
Valid Entries: 0 - 15

2.17 FAR CHL GRP

Description: Enter the channel group on the FAR SHELF for this PSU link channel.

- ***NOTE:*** For Recent Change only, this field can be left blank if desired and an available channel group number on the FAR SHELF will be selected for the channel of the PSU link. If this field is entered and the PH TYPE on the PSUGP form (5949 Record) is blank for the channel group entered, the PH TYPE will be set to PHA1 on the PSUGP form.

Valid Entries: 0 - 15

2.18 CON TYPE

Description: Enter the connection type of the PSU links which are defined for this PSU. Both channels should always have the same CON TYPE value unless converting the link from point-to-point to a multipoint ATM Network. When the channel terminates to another PSU, CON TYPE must be "POINT". When the channel terminates to an ATM switch, the value should be ATMNET.

This field supports the PHA for CDMA. For more information on this feature, see Division 2, Section 4A224.

- ***NOTE:*** Effective with the 5E11 Software Release, this field was moved from the EQPSU form (5741-1/2 Record), Division 8, Section 22, and "NOCON" was eliminated as a valid entry.

Software Release: 5E10 and later.
Valid Entries:

Valid CON TYPE Entries

Entry	Name
N or NOCON	Software Release: 5E10 only. No connection type assigned to this PSU.
P or POINT	Software Release: 5E10 and later. Point-to-Point configuration. The PSU link terminates to another PSU link.
ATM[N]ET	Software Release: 5E11 and later. Point-to-Multipoint configuration. The PSU link terminates to an ATM switch.
ATM[G]W	Software Release: 5E15 FR 4 and later. ATM Gateway. The PSU link terminates to an ATM Gateway link. See Division 2, Section 7BH (PSU CA Expansion feature).

Copyright © 2003 Lucent Technologies

Data Rules:

When CON TYPE is "ATMNET" or "ATMGW":

- FAR SM must not be entered.
- FAR fields must not be entered.
- FAR COM ADDR must be 0.
- FAR SHELF must not be entered.
- LINK TYPE must be "INTER".

When CON TYPE is "POINT", FAR COM ADDR must not be 0.

DIV. 8: ENGINEERING ASSIGNMENTS

Copyright © 2003 Lucent Technologies

SEC. 1: EQUIPMENT ASSIGNMENT

1. GENERAL

The sections of this division describe the assignment requirements for the various input forms and records that define the equipment arrangements for a 5ESS Switch office. The forms described here usually have a form name starting with the letters EQ (e.g., EQIM, EQLU, etc). The records are in the 5700 and 5800 Series.

1.1 VIRGOS

For new offices, the equipment data is populated using Lucent Technologies' VIRGOS (Visual Interactive Regional Generation of Specifications) system upon completion of the 384 specification. This may be done automatically using VIRGOS, or manually using the VIRGOS mock specification. The data generated by VIRGOS includes the following:

- Switching Module equipment configurations
- PICB (Peripheral Interface Control Bus) and PIDB (Peripheral Interface Data Bus) assignments
- Circuit pack types and locations
- CLEI (Common Language Equipment Identification) codes
- Equipment status
- CLI (Change Level Indicator) assignments

NOTE: VIRGOS does not generate scanner or distribute assignments.

2. CHANGE LEVEL INDICATORS

The CLIs (Change Level Indicators) are 32 bit numbers, in which each bit may be used independently of other bits in controlling the software. Although most circuits are presently limited to one or two options or versions, with a corresponding limitation in the number of valid CLIs, in general a circuit may be ordered with a combination of options, each with its own CLI bit position.

CLIs are used by the 5ESS Switch software for two purposes:

- To select various software subroutines used to control or diagnose the equipment; and
- To select the appropriate message content (e.g., the CLEI code and pack designation) for displaying TLPs (Trouble Locating Procedures) to the switching personnel.

BTSR CLIs are included with the MCTSI CLI. With the SM-2000 Switch, some core circuit CLIs have been separated. The units that now have unique CLIs include the TSI, TSIS, MH, DX, Memory, DLIs, (E)NLI, and BTSR. The CLNKs have unique CLIs, but are not used. The MCTSI CLI contains the CLI value for the following set of units: MCP, APC, BSN, CI, PI, C/D, and power.

2.1 CLI Assignment Table Layout

The CLI Assignment Tables (beginning with Figure 1) provide current CLI data. This table of valid CLI values is updated whenever new or changed CLI values are received.

Figure 1 is sorted by division and section. The data is displayed in the following manner:

CLI ASSIGNMENT TABLE Layout

Copyright © 2003 Lucent Technologies

Column	Description
FORM	Name of each input form
FIELD	Individual field names for a particular input form.
DEPENDENCIES	When another field entry determines CLI value, a comment to that effect is be made here.
CLI	CLI hexadecimal value. When CLI values must be "OR"ed to obtain the correct value, a note is included in the table.
DESCRIPTION	Descriptive comments.
J-DRAWING	Valid J-Drawing and list combinations.

2.2 SMPU CLI Assignment Table

Figures 2, 3, 4 and 5 are designed to assist in determining the appropriate value for the SMPU CLI field located on the EQIM form. The SMPU CLI Assignment Table and Worksheet eliminate the need to "OR" hexadecimal values. To determine the appropriate SMPU CLI value, first use the Table in Figure 2 to determine the hardware configuration. Enter a check mark in the column titled "CHK" for each applicable hardware configuration. When the table is complete, enter a "1" in all bit positions checked ("BIT"column of the table) on the worksheet (Figure 3). Fill the remaining blank bit positions with zeroes. Using the binary to hexadecimal conversion table on the worksheet, determine the hexadecimal value of each of the sets of binary bits (four each). Some of the hexadecimal values have been filled in because many of the high order bits are not used. When the hexadecimal value has been determined, this is the actual value entered into the SMPU CLI field. Sample completed worksheet and table entries are given in Figures 4 and 5. Figure 6 provides a blank DLI CLI Assignment Table format.

Figure 7 provides translation assignment activity for TRCU2 OLI Boards. This table shows the history and movement of these CLI translations across various ODA screens and Software Releases.

3. SCAN POINT, DISTRIBUTE POINT AND METALLIC TEST BUS ASSIGNMENTS

Since both LUCENT and 5ESS Switch owners make Scan Point, Distribute Point, and Metallic Test Bus assignments to various input forms, the following procedures should be used to avoid duplication of assignments.

3.1 LUCENT ASSIGNMENTS

The equipment forms are populated automatically using VIRGOS or manually using the VIRGOS mock specification.

A. When the VIRGOS to ODA (Office Data Assembler) interface is utilized, the following activities are recommended.

1. Use the "records" command to obtain a copy of the following office records:

Office Record	Description
5840	Scan Point Number Assignment Record
5841	Distribute Point Number Assignment Record
5842	Metallic Test Bus Assignment Record

2. Use the office records to make any required scan, distribute and Metallic Test Bus assignments per engineering assignment rules (SD-5D007-01).

3. Enter data for the following:

- Metallic Test Bus for Line Units on the EQLU form,
- Metallic Test Bus for Trunk Units on the EQTU form,
- Metallic Test Bus for LTD (Local Test Desk) test trunks on the EQTUP form (for Circuit Type (CKTTYP) of TRKTST only),

Copyright © 2003 Lucent Technologies

- Protocol Circuits on the EQPRO form,
- Miscellaneous scan points on the EQSPN form,
- Miscellaneous distribute points on the EQDPN form. Crosschecks may be run, and any errors resolved, at the discretion of the person responsible for the data.

When the data is manually entered from a VIRGOS mock specification, the following activities are recommended.

1. Populate the EQMSU and EQMSP forms.
2. Use the "records" command to obtain a copy of the following office records:

Office Record	Description
5840	Scan Point Number Assignment Record
5841	Distribute Point Number Assignment Record
5842	Metallic Test Bus Assignment Record

3. Use the office records to make any required scan, distribute and Metallic Test Bus assignments per engineering assignment rules (SD-5D007-01).
4. Populate the remaining equipment forms entering the Metallic Test Buses, miscellaneous scan and distribute assignments.
5. Crosschecks may be run, and any errors resolved, at the discretion of the person responsible for the data.

3.2 5ESS SWITCH OWNER ASSIGNMENTS

Throughout the input forms, scan, distribute, MTB (Metallic Test Bus) and LTP (Logical Test Port) assignments may be required. The following activities are recommended to obtain the necessary assignments.

1. Use the "records" command to obtain a copy of the following office records:

Office Record	Description
5271-3	Logical Test Port Assignment Record
5840	Scan Point Number Assignment Record
5841	Distribute Point Number Assignment Record
5842	Metallic Test Bus Assignment Record

2. The output will indicate which points are available for assignments, as well as those already assigned. Use the records to make any required scan, distribute and LTP (Logical Test Port) assignments. The only MTB (Metallic Test Buses) required are for the DC Jacks on the Test Access Unit mounted on the TLWS (Trunk and Line Work Station).
3. The assignments are then entered on the input forms.
4. Maintain a marked copy for use by other personnel responsible for data entry.

FIELD NAME	DEPENDENCIES	CLI (Hex)	DESCRIPTION	J-DRAWING
SM-2000 CLIs:	Enter the hexadecimal sum of appropriate hexadecimal bit values corresponding to the hardware ordered/equipped (also see Figures 43, 44, 45, 46, and 47).	00	(5E9(2)) SM-2000, Release 1, UN538 (32	J5D003NA-1, L10A

J5D003NB-2, L3A and cable groups ED5D500-21, Grp 464 or Grp 465.
TSIS CLI		00	(5E9(2) Time Slot Interchange Slice (KLU1). Recent Change only.	J5D003NB-1, L9A
NOTE: For 5E10 and later, "MCTU3" bit assignments can be 2, 3, 4, 6, 7, 12, 16, 18, 19, 24, 28 and 29; however, bit 7 must be set for "MCTU3" and "SMPU4".FOR MORE INFORMATION ON MCTU3 ASSIGNMENTS, SEE THE MCTU3 CLI VALUES TABLE AT THE END OF THIS SECTION.				
SMPU 0/1 (5E2 through 5E4) IMPU 0/1 (5E5 and later)	Non-SM-2000	01	MCTSI equipped with TN28 memory packs (and either TN875 or TN875B control pack).	J5D003AY-1, L7 or J5D003AA-2, L7

Copyright © 2003 Lucent Technologies

Non-SM-2000	02	MCTSI equipped with TN56 memory packs and thus requires a TN875B (rather than TN875) control pack.	J5D003EC-1, L1 or J5D003AY-1, L8
Non-SM-2000	04	5E2 MCTSI supports Revertive Pulsing feature either as unit type SMSMP20,	J5D003LA-1, L7
		or as unit type SMIMPU3	J5D003EC-1, L1
		or has TN127B and TN315B (rather than TN127 and TN315) packs in earlier units.	J5D003AT-1, L6 or J5D003AB-1, L5
Non-SM-2000	08	5E2 MCTSI equipped for 5E2 power monitor feature either as unit type SMSMP20,	J5D003LA-1, L5
		or as unit type SMMCTU3, or as unit type SMIMPU3,	J5D003LB-1
		or with CN6810 wiring change and SN516 (rather than SN412) in earlier units.	J5D003EC-1, L1 J5D003AT-1, L7+LWA
Non-SM-2000	10	MCTSI equipped for possible connection to an ASU panel either as	
		MC5D154A1 for 5E5,	J5D003LA-1, L20
		or with MC5D153A1B for 5E5,	J5D003EC-1, L41 or J5D003AY-1, L33
		or with MC5D125A1 for 5E4(2),	J5D003LA-1, L5
		or with a MC5D132A1B for 5E4(2),	J5D003EC-1, L39 or J5D003AY-1, L32
		or with a MC5D113A1B for 5E3,	J5D003EC-1, L23 or J5D003AY-1, L24
		or with a MC5D080A1B for 5E2.	J5D003EC-1, L9 or J5D003AY-1, L16
		or with KBN17 (SB20CORE/MCTU3) for 5E10 or with KBN20, KBN21, KBN22 (replaces KBN17). NOTE: For the MCTU3 the CLI defines the total amount of memory on the SB20CORE (KBN17 or KBN20, 21, 22) pack. The memory portion of the CLI is built by or'ing different memory CLI values until the total memory is reached.	J5D003LB-1
Non-SM-2000	40	(5E3) MCTSI is equipped with TN1377 to support the ISLU, RISLU, or PSUCOM interfaces.	J5D003LA-1, L7 or J5D003EC-1, L27
		(5E8) MCTSI is equipped with TN1377 to support the IDCU interface.	

Copyright © 2003 Lucent Technologies

Non-SM-2000	80	(5E2 w/Software Update 86-0052) MCTSI either as unit type SMSMP20	J5D003LA-1, L5
		or is equipped with TN871B and TN875C and wiring change for processor speed up	J5D003EC-1, L33+L34+LWB or J5D003AY-1, L27 + L28 + LM
		or with SMMCTU3	J5D003LB-1
Non-SM-2000	200	(5E2 w/Software Update 87-0057) MCTSI equipped with 4-Mbyte TN2012 memory packs.	J5D003EC-1, L31 + L32 or J5D003AY-1, L26 + LS
Non-SM-2000	400	(5E3) MCTSI is equipped with TN1397 core support pack.	J5D003EC-1, L29 or J5D003AY-1, L25
Non-SM-2000	400000	(SMP23) MCTSI equipped with TN1407 processor core board. MCTU with EMA with MC68020. When combined with DGV32MEGMEM, indicates the MCTSI is equipped with TN1423 processor core board which has 32MB of on-board memory.	J5D003AY-1, L35 or J5D003EC-1, L43
Non-SM-2000	800	(5E3) MCTSI equipped with 410AA power converter (410AA replaces 495FB and 494RA)	J5D003EC-1, LAY
Non-SM-2000	1000	(5E4(2)) MCTSI supports SDLC interrupt option either as unit type SMSMP20 or as SMIMPU3 with TN1617 (rather than TN872),	J5D003LA-1, L5 J5D003EC-1, L36 J5D003LB-1
		or as SMMCTU3 with (KBN20, 21, 22 (replaces KBN17).	
Non-SM-2000	8000	(5E6) MCTU2 is equipped with UN520, SMP20 speed-up (SMP20 DATA CACHE).	J5D003EC-1, L21A
Non-SM-2000	10000	(5E5/5E10) This is the MCTU2/MCTU3 of the second (upper) SM equipped in this cabinet. This is used when two complete SMs are equipped in one cabinet. (NOTE: The list number given specifies the fusing required to support this option - it does not require that this second MCTU2/MCTU3 be equipped.) (NOTE: SMTYPE must be HSM or LSM for two SMs per cabinet.)	J5D003L-1, LBY
Non-SM-2000	40000	Indicates (SMP23/MCTU3) core board is equipped with 32MB of on-board memory.	
Non-SM-2000	80000	(5E10) Indicates MCTU3 core board is equipped with 64MB of on-board memory.	
Non-SM-2000	c0000	(5E10) Indicates MCTU3 core board is equipped with 96 MB of on-board memory.	
Non-SM-2000	1000000	(5E10) Provides APR (Auto Power Recovery) for the service group (to be or'd). UN516B plus wiring.	J5D003LA-1, LDB with LWC.
Non-SM-2000	2000000	(5E10) Indicates SMP23CDMX. Used in combination with DGVSMP12, DGVSMP23, DGV32MEGMEM, DGVPRTI to indicate that the MCTSI is equipped with a TN1423 processor core board which has 32MB of on-board memory, has an extended memory capacity of up to 52MB, has expanded update address bus cable	TN1408(B) indicates ED5D133-20, ED5D715-30, 31. Update Bus Cable Set indicates ED5D647-25, G5.

			DSU2 common board.	or J5D003LA-1, L10
		03	5E4(2) Equipped with MC5D140A1/TN1637 DSU2 common board in a DSU model 1 unit.	J5ED003AE-1, L17
		800009	(5E10) Equipped with TN833C/MC5D085A1C, pumpable and APR.	J5D003EA-1, L4B, L8A, L11A, L14A, L19A, L24A
		800019	(5E12) Equipped with TN1890, TDSC4 pumpable and APR, replaces TN833.	
			NOTE: If DSU on EQDSP form = 0, CLI values must be 0 or 1. If DSU = 0 on the EQDS2P form, CLI values must be 0, 1, 3, 800009, or 8000019.	
BSTR		00	For current production, TN878.	J5D003EC-1, L1 or J5D003LA-1, L5, J5D003AT-1 and J5D003AY-1
		01	5E10 Fast pump bootstrapper, TN1418 NOTE: BTSR cli value for the SMSMP20 and SMMCTU3 need to be populated to DGVNULL even though they do not support a bootstrapper pack.	ED5D715-30, G10

Figure 1 EQIM Form - Div. 8, Sec. 2

FIELD NAME	DEPENDENCIES	CLI (Hex)	DESCRIPTION	J-DRAWING
LINK INTERFACE UNIT CLI		00	Applicable only to an ONTC of CM1 vintage.	J5D006AB-1, L1 or L2 or L3 or L4 or L5 or L6
MESSAGE INTERFACE UNIT CLI		00	For current production.	J5D006AA, L1 and L2
		400	(5E10) SN516B C/D with APR for CM2(C) only. APR only available in CM2(C). Backwards compatible with SN516.	J5D020A-1, L46B, L50, L51; J5D020A-2, L1H

NOTES:

When bit number 10 is set for the MIU CLI (where bits are numbered from 0 to 31 and bit 0 is the right most bit), CM VINTAGE on the EQCORE form mut be 2.

When an office has APR, all CM2(C) until/circuit CLI's must have the APR bit(s) set, including MI, NC2, and TMS CLI's and all PC CLI's.

NETWORK CLOCK UNIT CLI	NOTE: The values listed for the Network Clock Unit CLIs are bitwise assignments. For a combination of hardware, the values must be "OR"ed together to get the actual CLI value.

NOTES:				
For 5E15 and later, with the introduction of the CM3 (Global Message Server), the TMS (Time Multiplex Switch) CLI information was moved to the EQTMS form from the EQCORE form.				
The values listed for the TMS (Time Multiplexed Switch) CLIs are bitwise assignments. For a combination of hardware, the values must be "OR"ed together to get the actual CLI value. When bit number 10 is set (where bits are numbered from 0 to 31 and bit 0 is the right most bit), CM VINTAGE on the EQCORE form must be 2.				
For 5E11 and later, the TMS CLI for an SM-2000 class processor can be: 100, 102, 104, 106, 108, 10a, 10c, 10e, 500, 502, 504, 506, 508, 50a, 50c, or 50e.				
CLI		00	TMS vintage is of the following: 1) All double dual fabric offices with less than 94 SMs 2) Dual fabric offices with less than 30 SMs	J5D020A-1, L1 or L14; or J5D020B-1, L5 or L18
		02	5E2 TMS is equipped with KBN4 (vice KBN1) fabric boards; KBN5 for 5E7 and later.	J5D020A-1, L27 or J5D020B-1, L29 or L32
		00	CM1 TMS Model 1.	J5D001B or J5D001C w/o L12
		20	5E9(1)-5E9(2) CM2C is equipped with	J5D020AJ-5, L18 +

FORM/VIEW	EQORMLINK (17.12)	EQNLI - SM-2000 (18.16)	EQIM - SM (18.1)	EQTMSLINK (17.12)	EQTMSLINK (17.12)	EQTRCUPTH (17.23)
FIELD	TRC CLI	Even/Odd NLI CLI	DLI CLI	TRC & OLI	HOST CLI	REMOTE CLI
GENERIC	5e8.1 to 5e9.1	5e9.2 to 5E11	5E11 and earlier	5E9.1 to 5E11	5E12 & later	5E12 and later
16E2 (L-11)	2	10	10	2	1	10
16E (L-6)	2	10	10	2	2	10
16F2 (L-12)	4	20	20	4	4	20
16F (L-7)	4	20	20	4	4	20
16G (L-8)	8	80	80	8	8	80
16K (L-9)	10	100	100	10	10	100
AKM3 (L-5)	1	8	8	1	1	8
	For 5E9 & later, this form is no longer used; replaced by the EQTMSLINK form.	5E12 & later, only the ENLI CLI value of 01 is shown on this form. Remote TRCU CLIs are shown on the remote section of the EQTRCUPTH (17.23) form.	For 5E12 & later, the value for the remote TRCU is no longer ORd with the CLI value but is shown on the EQTRCUPTH (17.23) for the first & second remote path CLIs (17.23)	For 5E12 & later, the TRCU CLI field is dropped from this form. Host TRCU CLI values are now shown on the first & second host path of the EQTRCUPTH (17.23) form.	For 5E9.1 and earlier, these CLIs are shown on EQORMLINK form. For 5E9.2 to 5E11, these CLIs are shown on the EQTMSLINK form.	For 5E11 & earlier, these CLIs for SMs are shown on the EQIM. For SM-2000, the se CLIs are shown on the EQNLI form.

Figure 53 TRCU ASSIGNMENT TABLE

The following table provides or'd MCTU3 CLI entries that are valid for 1) new installations of MCTU3 (J5D003LB) processors, 2) system upgrades (permanent replacements) of MCTU1 processors with MCTU3 processors (e.g., RSM), and 3) for replacing a MCTU1 processor with a transitional MCTU3 processor so that the MCTU1 and its SMC (Switching Module Controller) cabinet can be removed while the SM is using the MCTU3 processor, allowing the floorspace to be re-used for a SM-2000 SMC cabinet.

SEC. 2: 5700-1/2 RECORD
SWITCHING MODULE EQUIPAGE FORM - EQIM

1. GENERAL

The 5700-1/2 Records are used to define Switching Module Equipage Assignments.

1.1 SM Time Slots

Each non-SM-2000 SM has 512 time slots (TS) available for various functions. Some of these 512 are available on call and some are reserved. In DNS (Digital Network Switch) offices, at least three TS are always required in each SM, one for audible ring, one for precedence audible ring, and one for idle code. Prior to DNS, only two TS were required, one for audible ring and one for idle code.

(Refer to Division 8, Section 22 for more TS information.)

If at least one EQIM form is entered, the IOMI BOARDS field on the ECDOPT form (5706 Record) and the number of EQIM forms submitted must correspond to the following table:

NO. OF EQIM FORMS	IOMI BOARDS
1 - 32	1
33 - 96	2
97 - 160	3
161 - 192	4

For 5E6 and later, MCTU2 SMs can be equipped with a mix of 4, 8, or 16 megabyte memory boards. For 5E9(2) and later, a 32 megabyte memory board was implemented for an SM-2000 class processor; it is not valid for an SM.

For 5E9(1) and later, if CMTYPE is "CM2C" on the ECDOPT form and the TIME MULTIPLEXED SWITCH CLI on the EQCORE form is 20:

- the maximum number of EQIM forms must be 8 or less.
- the maximum number of EQIM forms with SM USAGE of "IM", "" or "ORM" must be 2 or less.
- the maximum number of EQIM forms with SM USAGE of "RSM" must be 6 or less.

1.2 Required Configurations Values

For 5E9(2) and later, Figure 2 shows the valid configuration values for specific facilities and applications. Data rules for the application or facility on the corresponding forms reference this table for the appropriate CONFIGURATION values.

1.3 Maximum ISDN Terminals

For 5E9(2) and earlier, the value assigned in TERMLIM defines the maximum number of ISDN Terminals that are allowed to be simultaneously active per SM. TERMLIM is a no display field on the EQIM form with a default of 2047. In most cases, TERMLIM should be set to this value. The ISDN Terminals are defined as follows:

ISDN Terminal Assignments

Form	SM	Number of Assignments
DSL	OE[1,3]	MTERM defines the quantity of ISDN Terminals per DSL form.
DSLAP	LCEN[1,3]	number of ISDN Terminals is incremented by 1 for each LCEN list element defined.
MISLINK	OE[1,3]	1
OSPSDSL	LCEN[1,3]	1 where SERVICE CLASS is not "XDB"

Copyright © 2003 Lucent Technologies

1.4 Recent Change View

The corresponding Recent Change View for this form is 18.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the SM (Switching Module) Number. For offices equipped with Communications Module 1 (CM1), valid entries are 1 - 48. For offices equipped with CM2 and CM3 valid entries are 1 - 192.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E15 and later, when SM is entered, and SM USAGE equals "ORM" and the processor is not "SM2000", there must not be more than four EQTMSLINK tuples matching the SM on the EQIM form.

The EQCORE form (5701 Record) must be inserted before this form can be inserted/updated.

2.3 SM USAGE

Description: Enter the type of SM (Switching Module).

An SM in a host office can have a mixture of local and host applications. If at least one DFI (Digital Facility Interface) of a DLTU (Digital Line and Trunk Unit) is being used as an umbilical link to an RSM, this field must be defined as "HIM".

An SM with SM USAGE of "ORM" represents an SM that can be physically remote from the host office over standard transmission facilities that connect to a TRCU (Transmission Rate Converter Unit) located in the host office.

An SM with SM USAGE of "TRM" represents an SM that can be remote over extended NCT (Network Control Timing) Links, which presently have a physical limitation of approximately two miles from the host office. This maximum distance will increase as hardware improvements are made to the physical paddle boards associated with the NCT Links.

The ORM and TRM Switching Module types are treated similarly to Local Switching Modules for most feature and call processing applications, but there are some restrictions and exceptions:

- ORM/TRM cannot serve as Host SM (HIM types); therefore, they cannot have a DLTU with associated DFIs that interconnect to RSMs.
- MSU/MMSUs (Metallic Service Unit/Modular Metallic Service Units) are allowed on ORM/TRMs but they cannot be interconnected to any other MSU/MMSU via MTIBs (Metallic Test Interconnect Buses). Colocated ORM/TRMs can share an MSU/MMSU.
- ORM/TRMs can be considered as Routing Modules for Distributed Call Processing.

Required Field.
Default: IM

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid SM USAGE Entries

Entry	Definition
IM	Local Switching Module. Also, enter IM when the SM is a VCDX or DRM.
HIM	Host Switching Module.
RSM	Remote Switching Module.
ORM	Software Release: 5E3 and later. Optically Remote Switching Module. Software Release: 5E9(2) and later: ORM with UNIT TYPE set to an SM-2000 class processor is used for EXM-2000.
TRM	Software Release: 5E3 and later. Two-Mile Optically Remote Switching Module.

Data Rules:

For 5E8 and later, when one or more SMs with SM USAGE of "IM" or "HIM" exist, and there is only one matching EQDCTU form, they must have the same DCTU ROUTE INDEX value entered on the associated IMINFO, excluding the DCTU ROUTE INDEX values that have ROUTE TYPE set to "REORDER" on the RTIDX form.

When SM USAGE is "IM" or "HIM", STAND ALONE and STAND ALONE BILLING must be known.

For 5E9(1) and later, SMs with line units that have SM USAGE of "IM", "ORM", or "TRM", must have a Dial Tone Delay Alarm (External Sanity Monitor) assigned via the LINE form. Two TNs are required, one of which must be a direct connect (NODL set to "HOT"). In addition, the following conditions must be met:

- SUSO must be "N"
- SUST must be "Y"
- PTY must be "I"
- HOT LINE TN must be known and a number
- OE TYPE = "C" or "L"

NOTE: The External Sanity Monitor has been discontinued and is no longer required after 1990.

5E9(2) and later:
SM USAGE must be set to "IM" for a VCDX (Very Compact Digital Exchange) office.

5E10 and later:
RSMs may only have ISTF loopback and ISTF transmit circuit assignments via the EQGDSC3 form (5860 record). See Division 8, Section 63 for RSM EQGDSC3 assignments.

ORM
If SM USAGE is "ORM":

- UNIT TYPE must be "SMPU3", "SMPU4", "MCTU3" or an SM-2000 class processor.
- and UNIT TYPE is "SM2000", then TRCCKT, TRCUNUM, and TRCCLI must be entered on the EQTMSLINK form (5851 Record).

For 5E10 and later, when SM USAGE is "HIM" and UNIT TYPE is "SM2000" on the EQIM form, the maximum number of Inter-SM Nail-Ups for packet switching is 30. If UNIT TYPE is not "SM2000" and SM USAGE is "HIM", the maximum number of Inter-SM Nail-Ups for packet switching is 5.

Copyright © 2003 Lucent Technologies

For 5E11 and later, when SM USAGE is "ORM", then UNIT TYPE must be "SMPU3", "SMPU4", "MCTU3", "SM2000" or "SM2005".

For 5E12 and later, when SM USAGE is "ORM" with a UNIT TYPE of a SM-2000 class processor, the appropriate value for EVEN NLI NLI) CLI, EVEN NLI NLI 1 CLI, ODD NLI NLI 0 CLI, and ODD NLI NLI 1 CLI, depends on the type of TRCU (Transmission Rate Converted Unit) defined on the EQTRCUPTH form associated with that EQNLI form entry. When the TRCU is of type "TRCU3", then EVEN NLI NLI 0 CLI, EVEN NLI NLI 1 CLI, ODD NLI NLI 0 CLI, and ODD NLI NLI 1 CLI, must be 0 hex. When the TRCU is of type "TRCU2", then EVEN NLI NLI 0 CLI, EVEN NLI NLI 1 CLI, ODD NLI NLI 0 CLI, and ODD NLI NLI 1 CLI must be 1 hex.

For 5E15 and later:

When SM USAGE is "ORM" and the processor is not an SM-2000 class processor, the values of SM and NCT EVEN LINK (on EQIM form) must be entered twice on the EQTMSLINK form as SM and LINK (for SIDE 0 and SIDE 1). And the values of SM and NCT ODD LINK (i.e., NCT EVEN LINK plus 1) must be entered twice on the EQTMSLINK form as SM and LINK (for SIDE 0 and SIDE 1). Also, theTMSFP NUM on the EQTMSLINK form must be 0.

2.4 REMOTE SITE

Description: Enter the Remote Site number.
Valid Entries: 1 - 174

Data Rules:

For 5E5 and later, this field is required when the SM USAGE is "RSM", "ORM" or "TRM".

All Switching Modules in the same Remote Cluster must have the same REMOTE SITE value. The value entered in this field must be defined on an EQSITE form (5722 Record). Up to four RSMs can share the same REMOTE SITE if they are in the same Cluster. Each ORM/TRM must have its own unique REMOTE SITE even if co-located. It is suggested that the REMOTE SITE value for an ORM/TRM be the same as the ORM/TRM SM Number.

2.5 EQSTATUS

Description: Enter the Status of the Equipment.

Required Field.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.
S	Special Growth.

Data Rules:

For 5E9(2) and later, if UNIT TYPE is "SM2000" and EQSTAT is not equal to "O", only one EQNLI form can be entered.

2.6 INTERRUPT STATUS

Description: Enter the Interrupt-Inhibit Status.

Required Field.

Copyright © 2003 Lucent Technologies

Default: ALLOW
Valid Entries:

Valid INTERRUPT STATUS Entries

Entry	Definition
A	Allow.
I	Inhibit.

2.7 CONTROL GROUP 1 STATUS

Description: Enter the Control Group 1 Equipment Status. New offices should be "O" or blank. Enter "O" for Operational if Control Group 1 (second CI Board) is equipped on the SM; otherwise, leave blank.

Software Release: 5E9(1) and earlier
Valid Entries:

Valid CONTROL GROUP 1 STATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

If the SM USAGE is "RSM", this field must be "O".

2.8 NCT EVEN LINK

Description: Enter the unique NCT (Network Control Timing) even link number for the SM. Two NCT links, an even and an odd, are associated with each SM. Since the NCT odd link number is always one greater than the NCT even link number, only the even NCT link number is entered on this form.
Valid Entries: 2 - 380, even numbers only

- or for
- VCDX SM-2000: 0

Data Rules:

An entry in this field is required if SM USAGE is equal to "IM", "HIM", "ORM", or "TRM". If the SM USAGE is "RSM", an entry in this field is prohibited.

For 5E8 - 5E9(1), TMS LINKs are assigned on the EQIM form as NCT EVEN LINK. Additional TMS LINKs are derived from these same EQIM form entries in the following manner: an NCT EVEN LINK entry also produces a TMS LINK entry of NCT EVEN LINK + 1 (known as the NCT ODD LINK). All TMS LINK values either entered on these forms OR derived from these form entries must be unique.

For 5E9(1) and later, if CMTYPE on the ECDOPT form is "CM2C" and the TIME MULTIPLEXED SWITCH CLI on the EQCORE form is "20", NCT EVEN LINK must be either 2 or 4.

For 5E9(2) and later:
For an SM-2000 class processor, NCT EVEN LINK must be assigned to the EVEN NLI 0 and the EVEN NLI TMS 0 on the EQNLI form (5853 Record).

TMS LINKS can be assigned on the following three forms:

- EQIM form (5700-1/2 Record) as NCT EVEN LINK
- EQNLI form (5853 Record) as EVEN (or ODD) TMS LINK 0
- EQQLPS form as STARTING QTMSLINK.

Copyright © 2003 Lucent Technologies

- EQTMS form (5866 Record) as FABRIC TYPE.

On each form additional TMS LINKS are derived from the specified link and the TMS configuration. All TMS LINKs entered or derived on these forms must be unique in the switch.

For 5E10 and later:
For a VCDX office on an SM-2000 class processor, the NCT EVEN LINK Number must be 0.

For 5E15 and later, when an office is equipped with a CM3, NCT EVEN LINK must be an even number in the range of 4 thru 368.

2.9 CTS EVEN LINK

Description: Enter the even Control Time Slot Number associated with the even NCT (Network Control Timing) Link. Each SM receives two CTS (Control Time Slot) assignments, an even CTS on the even NCT link, and an odd CTS on the odd NCT link. Since the odd CTS is always one greater than the even CTS, only the even CTS is entered on this form.

The CTS numbers are dependent on the Peripheral Controllers defined on the EQPC form (5703 Record). For the relationship between the Peripheral Controllers and the even and odd CTS numbers, see the section describing the equipage of Peripheral Controllers in Division 8 of this guide. The last Control Time Slot is 254.

The Peripheral Controllers are defined on the EQPC form (5703 Record). However, because of the relationship to the Control Time Slots, a column is shown on the 5700-1 Record for PC - Peripheral Controller. This is intended as an administrative aid. No PC entries are applicable for ODA on the EQIM form.

Required Field.
Valid Entries: 2 - 254, even numbers only

Data Rules:

Invalid Time Slot Numbers are every multiple of 8 (0,8,16,24,...).

For 5E9(1) and later, if CMTYPE on the ECDOPT form is "CM2C" and the TIME MULTIPLEXED SWITCH CLI on the EQCORE form is 20, CTS EVEN LINK must be either 2, 10, 18, 26, 34, 42, 50, or 58 (which corresponds to PC (PERIPHERAL CONTROLLER) NO on the EQPC form (5703 Record).

2.10 EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.11 LOCAL DSU VERTICAL

Description: Enter the vertical equipment location of the bottom of the Local Digital Service Unit on the Switching Module Controller Frame.

Required Field.
Valid Entries: 0 - 84

Copyright © 2003 Lucent Technologies

Valid LOCAL DSU VERTICAL Entries	
Entry	**Definition**
15	6-foot cabinet with UNIT TYPE set to "SMPU4" or an SM-2000 class processor.
24	6-foot cabinet with UNIT TYPE set to "MCTU3" (if SM USAGE is not "ORM").
32	6-foot cabinet.
41	6-foot cabinet with UNIT TYPE set to "SMPU3" (if SM USAGE is not "ORM").
49	6-foot cabinet with 1 shelf IMP (UNIT TYPE set to "SMPU2". 6-foot cabinet with UNIT TYPE set to "SMPU3" (if SM USAGE is "ORM").
58	6-foot cabinet with 2 shelf IMP UNIT TYPE set to "SMPU".
64	7-foot cabinet.

Data Rules:

For 5E5 and later, if UNIT TYPE is "SMPU4" and the corresponding EQDS2P form has a DIGITAL SERVICE UNIT 2 field with the value of "O" and a PACK TYPE with the value of "RVPT", then the LOCAL DSU VERTICAL value must be either 32 or 41. If the corresponding EQDSP form with a DIGITAL SERVICE UNIT value of 0 does NOT have a PACK TYPE value of "RVPT", then the LOCAL DSU VERTICAL must be the same as the value for the MODULE PROCESSOR VERT field.

For UNIT TYPE of "SMPU4", the LDSU vertical position must be set to the cabinet location of the base of the MCTSI complex.

2.12 MODULE PROCESSOR VERT

Description: Enter the vertical equipment location of the bottom of the Switching Module Processor Unit on the Switching Module Controller Frame.

Required Field.
Valid Entries: 0 - 84

The following table provides unit types and appropriate vertical equipment location positions by cabinet size.

Unit Type	Verticle Position/Cabinet Size
SMPU	24 for 6-foot cabinet. 28 for 7-foot cabinet.
SMPU2	24 for 6-foot cabinet. 36 for 7-foot cabinet.
SMPU3	24 for 6-foot or 7-foot cabinet. 41 for 2nd SM in cabinet.
SMPU4/ MCTU2	15 for 6-foot cabinet. 41 for 2nd SM in cabinet.
SM2000	15 for 6-foot cabinet.
MCTU3	5E10 and later. 24 for 6-foot cabinet. 41 for 2nd SM in cabinet.
SM2005	5E11 and later. 15 for 6-foot cabinet.

Data Rules:

If UNIT TYPE is "SM2005", the LDSC3 and GDSC3 boards are located at Vertical Position 15 and UNIT OFFSET on the EQGSC3 and EQGDSC3 forms must be greater than 17, and the BAY field must be "0".

2.13 SMPU MODEL NUMBER

Description: The name of this field was changed to UNIT TYPE for 5E9(2) and later. This field name applies to 5E9(1) and earlier. See UNIT TYPE for usage information.

2.14 UNIT TYPE

Description: Enter the UNIT TYPE for this SM.

Copyright © 2003 Lucent Technologies

NOTE: Prior to 5E9(2), UNIT TYPEs were referred to as SMPU MODEL NUMBERs 1 - 4. Effective with the 5E9(2) Software Release, UNIT TYPE is designated by "SMPU", "SMPU2", "SMPU3", "SMPU4", or "SM2000". All references to SMPU MODEL NUMBER have been changed to UNIT TYPE. Also see Figures 1, 2, and 3 for additional information.

Required Field.

Valid UNIT TYPE Entries

Entry	Definition
1	Software Release 5E9(1) and earlier. See SMPU.
2	Software Release 5E9(1) and earlier. See SMPU2.
3	Software Release 5E9(1) and earlier. See SMPU3.
4	Software Release 5E9(1) and earlier. See SMPU4.
SMPU	Software Release 5E9(2) and later. A two-shelf unit that resides on two shelves of the Switching Module Controller Frame. Associated with J5D003AA-2 and J5D003AB-1.
SMPU2	Software Release 5E9(2) and later. A single shelf unit which resides on a single shelf of the Switching Module Controller Frame. Associated with J5D003AT-1 and J5D003AY-1.
SMPU3	Software Release 5E9(2) and later. SMPU3 combines the Module Processor and Time Slot Interchanger into a single unit that resides on two shelves of the Switching Module Controller Frame. It is also known as the MCTU (Module Controller Time Slot Interchange Unit). Associated with J5D003EC-1.
SMPU4	Software Release 5E9(2) and later. The fourth hardware configuration of the MCTSI utilizing the MC68020 processor. Associated with J5D003LA-1.
SM2000	Software Release 5E9(2) and later. SM-2000 class processor unit; processor boards occupy the entire available space of the unit. Associated with J5D003NA-1 (Modular Fuse Filter Unit and Fan Unit).
MCTU3	Software Release 5E10 and later. MCTSI hardware associated with J-Drawing J5D003LB-1.
SM2005	Software Release 5E11 and later. SM-2000 class processor unit; accommodates as many as 6 LDSC3/GDSC3 boards. Associated with J-Drawing J5D003NG-1.

NOTE: Because the "SM2000" and the "SM2005" units denote the SM-2000 environment, they are referred to as a "SM-2000 class" of SMP units.

Data Rules:

For "SMPU", "SMPU2", and "SMPU3" only one memory board size (2MB or 4MB) can be assigned to an SM.

The maximum addressable memory on a non-SM-2000 SM is 32 MB.

Only the following unit types can have more than one Memory Board type (4MB, 8MB, etc.) specified by the CLI value: "SMPU4", "MCTU3", and an SM-2000 class processor .

If the SM USAGE field is "ORM" (Optically Remote Switching Module), the associated SMPU must be "SMPU3", "SMPU4", or an SM-2000 class processor.

If UNIT TYPE is "SMPU4" and CONFIGURATION is "STANDARD", at least 18 megabytes of memory are required per Controller.

If UNIT TYPE is "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor, BAY on the following equipment forms must be 1:

- EQFIU
- EQLU
- EQMSU
- EQTU

For 5E9(2) and later:
UNIT TYPE must be set to "SMPU4" for a VCDX (Very Compact Digital Exchange) office.

SMPU:
If UNIT TYPE is "SMPU":

- DLI CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- MH 0/MH 1 CLI for SG0/SG1 must not be entered.

SMPU2:
If UNIT TYPE is "SMPU2":

- CONFIGURATION must not be "SM2000",
- LDSU CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- DLI CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- MH 0/MH 1 CLI for SG0/SG1 must not be entered.
- the bit number 7 (processor speed-up) of the IMPU CLI 0/1 must be set, where the bits are numbered from 0 to 31 and bit 0 is the right most bit.

SMPU3:
If UNIT TYPE is "SMPU3":

- CONFIGURATION cannot be "SM2000",
- DLI CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- MH 0/MH 1 CLI for SG0/SG1 must not be entered,
- TSICOM 0 CLI/TSICOM 1 CLI must not be entered,
- LOCAL DSU VERTICAL must be entered.
- the bit number 7 (processor speed-up) of the IMPU CLI 0/1 must be set, where the bits are numbered from 0 to 31 and bit 0 is the right most bit.

SMPU4:
If UNIT TYPE is "SMPU4/MCTU2":

- CONFIGURATION must not be "SM2000",
- LOCAL DSU VERTICAL must be entered,

Copyright © 2003 Lucent Technologies

- LDSU CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- TSICOM 0 CLI/TSICOM 1 CLI must not be entered,
- DLI CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- MH 0/MH 1 CLI for SG0/SG1 must not be entered.

SM2000:
If UNIT TYPE is "SM2000":

- BRD4 CLI and BRD5 CLI for CONTROLLER 0 and CONTROLLER 1 must not be entered,
- if EQSTATUS is "O" for new offices, BRD0 CLI for CONTROLLER 0 and CONTROLLER 1 must be entered.
- CONFIGURATION must be "SM2000",
- NUMBER OF MEM BOARDS must not be entered,
- TSICOM 0 CLI and TSICOM 1 CLI must be entered,
- LDSU CLI on CONTROLLER 0 and CONTROLLER 1 must not be entered,
- LOCAL DSU VERTICAL must not be entered,
- DLI CLI for CONTROLLER 0 and CONTROLLER 1 must not be entered,
- MH 0/MH 1 CLI for SG0/SG1 must be entered,
- SM USAGE must be "IM" or "ORM" (5E9(2) only),
- SM USAGE must be "IM", "ORM", or "HIM" (5E10 and later),
- the EQCORE form must have CM VINTAGE set to 2,
- at least one EQNLI form (5853 Record) must be entered with EVEN NLI set to 0,
- the TMS LNK entry on the EQTMSLINK (5850 Record) form must match an EVEN/ODD NLI TMS LINK 0 value entered or an EVEN/ODD NLI TMS LINK 1 value derived on an EQNLI form,
- at least one pair of EQTSI forms must be entered with TSI BOARD set to 0,
- the SM value can only be entered on the following equipment forms:
  - EQCI
  - EQDCTU(5E9(2) only)
  - EQDI
  - EQDNUS
  - EQDSC3

Copyright © 2003 Lucent Technologies

- EQDS
- EQDSP (where DSU is not 0)
- EQDSP2
- EQDU/EQDUP
- EQIDCU(5E10 and later)
- EQIFAC(5E10 and later)
- EQISAP(5E10 and later)
- EQISLU(5E10 and later)
- EQLU
- EQLUP
- EQMH
- EQMMSP/EQMSP
- EQMSU
- EQMTIB(5E10 and later)
- EQNLI
- EQPSU (5E10 and later)
- EQPSUPH(5E10 and later)
- EQRA(5E10 and later)
- EQSITE
- EQSTE
- EQTSI

Copyright © 2003 Lucent Technologies

- EQTU (5E10 and later)
- EQTUP(5E10 and later)
- EQVT

5E10 and later:
If UNIT TYPE is "SM2000":

- on the corresponding EQPSU form(s), DI0/DI1 PSU TSIU TIMESLOTS must not be entered. It is not necessary to provision PSU TSIU TIMESLOTS on an SM-2000 class processor.
- if EQSTATUS is "O" and IMPU0 and IMPU1 are not 4 in a new office, BRD0 CLI for CONTROLLER 0 and 1 must be entered.
- memory boards must be equipped contiguously.

The maximum number of Network Side Timeslots for an SM-2000 can not be exceeded. The number of available Network Side Timeslots may be found as follows:

- If UNIT TYPE is "SM2000" and SM USAGE is "ORM" on the EQIM form, then the maximum number of Network Side Timeslots is (512 * the number of EQNLI forms with the same SM).
- If UNIT TYPE is "SM2000" and SM USAGE is not "ORM" on the EQIM form, then the maximum number of Network Side Timeslots is (512 * 2 * the number of EQNLI forms with the same SM).

The following forms use Network Side Timeslots as indicated:

- PSISM - Count 1 for each time SM on the EQIM form matches SM on the EQPSU form, and SM on the EQPSU form matches SM on the PSISM form.
- PSISM - Count 1 for each time SM on the EQIM form matches SM on the EQPSU form, and SM on the EQPSU form matches MATE SM on the PSISM form.
- TRUNK - For all TRUNK forms where the associated TRKCLS on the TKGRP form is "PKTPIPE" and TRKOE[1,3] matches the SM value on the EQIM form, count 1 for each

  PACKET PIPE MEMBER TRUNKS TGN/MEMB list entry (up to 8 entries for each TRUNK form are possible) if TRKOE[1,3] on the TRUNK form is not equal to DEN[1,3] on other associated TRUNK forms, newTRUNK, where PACKET PIPE MEMBER TRUNKS TGN/MEMB matches newTRUNK TGN and newTRUNK MEMB.

  Note: All PACKET PIPE MEMBER

  TRUNKS on a TRUNK form will have the same value for DEN[1,3] on the associated newTRUNK forms.

  Also, count 1 for each time SM on the EQIM form matches DEN[1,3] on the newTRUNK form, for each PACKET PIPE MEMBER TRUNKS entry found above, where TRKOE[1,3] for the original "PKTPIPE" TRUNK (TRUNK forms where the associated TRKCLS is "PKTPIPE") is not equal to DEN[1,3] on new TRUNK.

Copyright © 2003 Lucent Technologies

5E10 and later:
If UNIT TYPE is "MCTU3":

- NUMBER OF MEM BOARDS must be blank.
- MODULE PROCESSOR VERT must be 15.
- when the CLI for IMPU0 indicates this SM is the second SM in a cabinet, MODULE PROCESSOR VERT must be 41.

5E11 and later: If UNIT TYPE is "SM2005":

- CONFIGURATION must be "SM2000",
- NUMBER OF MEM BOARDS must be blank,
- TSICOM 0 and TSICOM 1 CLIs must be entered,
- MHO SG0 and MHO SG1 CLIs must be entered,
- SM USAGE must be "HIM", "IM", or "ORM",
- when EQSTATUS is "O" in a new office, BRD0 CLI for CONTROLLER 0 and CONTROLLER 1 must be entered,
- Memory Boards must be equipped contiguously,
- BRD2, BRD3, BRD4 and BRD5 CLIs for CONTROLLER 0 and CONTROLLER 1 must not be entered,
- LDSU CLI on CONTROLLER 0 and CONTROLLER 1 must not be entered,
- LOCAL DSU VERTICAL must not be entered,
- MODULE PROCESSOR VERT must be 15.

5E15 and later:

When UNIT TYPE is "MCTU3", SM USAGE must be "RSM" for an office equipped with a CM3.

When at least one EQIM form (5700 Record) exists with the UNIT TYPE set to "SM2000", the CLI value on the EQTMS form should be entered.

5E16(2) and later:

When an office is equipped with a CM3, UNIT TYPE must be either "SM2000" or "SM2005", or SM USAGE must be "RSM" .

When UNIT TYPE is SM2000, BRD CLI must be 2, 4, or 8.

2.15 NUMBER OF MEM BOARDS

Description: Enter the number of memory boards in each controller of the SM. This field specifies the number of memory boards equipped in an SMPU2 and SMPU3 and should be blank for SMPU4 or an SM-2000 class processor. SMPU4 and SM-2000 memory boards are equipped using the SM MEMORY CONFIGURATION FOR SMPU4/SM2000 field group.

Refer to Figures 1, 2, and 3 for additional memory board configuration information. Also refer to the 5ESS

Copyright © 2003 Lucent Technologies

Switch Administration and Engineering Guidelines (235-070-100) for SM Resource Utilization (Switching Module Processor and Switching Module Memory) for more detailed information.

- ***NOTE:*** For 2Mb boards, a maximum of 12 boards may be entered; for 4Mb boards, a max of 8 boards may be entered.

Valid Entries:

- For 5E8 and earlier: 1 - 12
- For 5E9(1) and later: 0 - 12

Data Rules:

For 5E5 and later, if UNIT TYPE is "SMPU4", this field must be blank and fields under the SM MEMORY CONFIGURATION FOR SMPU4 field group must be entered.

2.16 PI SG 0 EQSTATUS

Description: Enter the equipment status of Service Group 0 of the Packet Interface sub-unit if it is equipped on this SM; otherwise, leave blank.

Software Release: 5E3 and later
Valid Entries:

Valid PI SG 0 EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

An entry is allowed here only if UNIT TYPE is "SMPU3", "SMPU4", "SM2000", "MCTU3", or "SM2005"

New offices and SMs being added for factory testing require the Operational status. During off-line ODA database retrofits, values other than "O" are allowed.

For new offices and equipment additions, when PI SG 0 EQSTATUS is "O", CONFIGURATION must be "LOADED" for 5E9(1) and earlier. For 5E9(2) and later, CONFIGURATION must support Packet Interface, see the table for Configurations for Facilities and Applications.

This field must be "O" if there is a PSU (J5D003BL) equipped on the SM.

For 5E10 and later:
Packet Interface units may only be specified for a UNIT TYPE of "SMPU3", "SMPU4", "MCTU3" and "SM2000".

In new offices and equipment additions, if PI SG 0 EQSTATUS is "O", then CONFIGURATION must be "LOADED" or "SM2000" to support Packet Interface.

2.17 PI SG0 TYPE

Description: Enter the MCTSI (Module Controller/Time Slot Interchange) Unit Packet Interface Type for Side 0.

Software Release: 5E10 and later.
Valid Entries:

Valid PI SG0 TYPE Entries

Entry	Definition
PI1	MCTSI Packet Interface 1
PI2	MCTSI Packet Interface to Subunit Model 2, the enhanced PSU-2 (Packet Switching Unit-2). This value

Copyright © 2003 Lucent Technologies

	supports the CDMA (Code Division Multiple Access) feature. For more information on this feature see Division 2, Section 8B.

Data Rules:

If PI SG0 EQSTATUS is entered, PI SG0 TYPE must be entered.

If PI SG0 EQSTATUS is not entered, PI SG0 TYPE must not be entered.

If CONFIGURATION is "SM2000", then PI SG0 TYPE and PI SG1 TYPE cannot be "PI1".

For 5E10 and later, when EQIM forms have PI SG0 TYPE and/or PI SG1 TYPE set to "PI2", PSU TYPE on the corresponding EQPSU form must not be "PSU1".

2.18 PI SG 1 EQSTATUS

Description: Enter the equipment status of Service Group 1 of the Packet Interface sub-unit if it is equipped on this SM; otherwise, leave blank.

Software Release: 5E3 and later
Valid Entries:

Valid PI SG 1 EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

New offices and SMs being added for factory testing require the Operational status. During off-line ODA database retrofits, values other than "O" are allowed.

For new offices and equipment additions, when PI SG 1 EQSTATUS is "O", CONFIGURATION must be "LOADED" for 5E9(1) and earlier. For 5E9(2) and later, CONFIGURATION must support Packet Interface, see the table for Configurations for Facilities and Applications.

An entry is allowed here only if the UNIT TYPE is "SMPU3" or "SMPU4".

For 5E10 and later:
Packet Interface units may only be specified for a UNIT TYPE of "SMPU3", "SMPU4", "MCTU3" and "SM2000".

In new offices and equipment additions, if PI SG 1 EQSTATUS is "O", CONFIGURATION must be "LOADED" or "SM2000" to support the Packet Interface.

2.19 PI SG1 TYPE

Description: Enter the MCTSI (Module Controller/Time Slot Interchange) Unit Packet Interface Type for Side 1.

Software Release: 5E10 and later.
Valid Entries:

Valid PI SG1 TYPE Entries

Entry	Definition
PI1	MCTSI Packet Interface 1
PI2	MCTSI Packet Interface Subunit Model 2 This value supports the CDMA (Code Division Multiple Access) feature. For more information on this feature see Division 2, Section 8B.

Data Rules:

Copyright © 2003 Lucent Technologies

If PI SG1 EQSTATUS is entered, PI SG1 TYPE must be entered.

If PI SG1 EQSTATUS is not entered, PI SG1 TYPE must not be entered.

If CONFIGURATION is "SM2000", then PI SG0 TYPE and PI SG1 TYPE cannot be "PI1".

2.20 PERCENT OF FREE SM SPACE

Description: This field is used to define the percent of free space for this Switching Module's Static ODD (Office Dependent Data). For ODD data space exceeding 2 megabytes, 30% free space may be excessive (for further information, see the 5ESS Switch Administration and Engineering Guidelines).

Software Release: 5E3 and later
Required Field.
Default: 30
Valid Entries: 6 - 95

- ***NOTE:*** The percent of free SM space must always be at least 256 Kb. Thus, if 30% is less than 256 Kb, the system will automatically raise the percent of free space to equal at least 256 Kb.

  Also, only ODA personnel are allowed to enter the full range of free space values (16 - 95). Regional Engineers are limited to defining only 25 - 40 percent of free space.

SM2000 CLIs

The following Change Level Indicators (fields Section 2.21 - Section 2.25) are applicable to SM-2000 class processors for the MH (Message Handler), the TSICOM (Time Slot Interchanger Common) and TSIS (Time Slot Interchange Slice). For a complete listing of valid CLI values, J-Drawing and list combinations for this field group, see Division 8, Section 1.

For 5E12 and later, the SM-2000 class of processors (see the note following the UNIT TYPE field) have certain combination of bits which can be used together and certain combinations which cannot. There are three ODA data checks (CLI338a,b, and c) which enforce these conditions when populating the IMPU CLI 0/1 field. CLI338a enforces that only valid bits are set. CLI338b enforces the mutual exclusivity of bits 0 and 1. CLI338c enforces that: bit 1 cannot be set; bit 0 must be set for SM2005; bit 2 cannot be set. See the data rules for the IMPU 0/1 CLI fields for more detailed information.

2.21 MH 0 CLI

Description: Enter the Message Handler 0 CLI.

Software Release: 5E9(2) and later
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

If UNIT TYPE is "SM2000":

- this field must be entered
- for 5E10 and later, the MH 0 CLI and MH 1 CLI entries must be 0 for Release 1, on an SM-2000 class processor.

2.22 MH 1 CLI

Description: Enter the Message Handler 1 CLI.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and later
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

If UNIT TYPE is "SM2000":

- this field must be entered
- for 5E10 and later, the MH 0 CLI and MH 1 CLI entries must be 0 for Release 1, or 1 for VCDX on an SM-2000).

2.23 TSICOM 0 CLI

Description: Enter the TSI COMMON 0 CLI.

Software Release: 5E9(2) and later
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

If UNIT TYPE is "SM2000", this field must be entered.

For 5E10 and later:
For a VCDX office on an SM-2000 class processor, TSICOM 0 CLI must be 3 when a TSIU4 is used; it must be 13 when a TSIU4-2 is used.

2.24 TSICOM 1 CLI

Description: Enter the TSI COMMON 1 CLI.

Software Release: 5E9(2) and later
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

If UNIT TYPE is "SM2000", this field must be entered.

For 5E10 and later:
For a VCDX office on an SM-2000 class processor, TSICOM 0 CLI must be 3 when a TSIU4 is used; it must be 13 when a TSIU4-2 is used.

2.25 TSIS CLI

Description: The Timeslot Interchange Slice CLI is a Recent Change Only field.

Software Release: 5E9(2) and later

EEC OPTIONS

2.26 EEC SM

Description: The EEC SM field is used to display whether or not external echo canceler ethernet links are equipped on the SM (Switching Module).

EQUIPMENT CLI'S CONTROLLER 0/1

Copyright © 2003 Lucent Technologies

The Change Level Indicators applicable to various pieces of equipment (fields Section 2.27 - Section 2.30) are presented under each of two Controllers, 0 and 1. For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.27 IMPU

Description: Enter the Switching Module Processor Unit CLIs. Refer to Figures 1, and 2 for dependencies between IMPU CLI and CONFIGURATION fields.

Required Fields.
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

For 5E12 and later,

- only the following bits are valid: bit 0, 1, 2, 3, 6, and 28.
- either bit 0 or bit 1 must be set; however, bit 0 and bit 1 cannot be set simultaneously for "SM2000".
- bit 1 cannot be set and bit 0 must be set for "SM2005", and bit 2 cannot be set.

2.28 DLI

Description: Enter the Dual Link Interface CLIs.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Fields.
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

For 5E9(2) and later:
If "RSM" or "ORM" is NOT entered, and UNIT TYPE is not "SM2000" the CLI values for one or both of the DLI assignments must be 01, 02, 05, 08, 10, 20, 80, 100. 200, 800200, 800600.

If this is a VCDX office, CLI value must be 800.

If SM USAGE equal to "ORM" and UNIT TYPE is not"SM2000" CLI values for one or both of the DLI assignments on the EQIM form must be 0, 1, 2, 5, 8, 10, 20, 80, 100, 200, 800, 800200, or 800600.

2.29 LDSU

Description: Enter the Local Digital Service Unit CLIs. For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Fields.
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

When UNIT TYPE is "SM2000", the LDSU CLI must be blank.

The CLI hexidecimal values for the LDSU assignment0, 1, 3, and 800009.

2.30 BSTR

Copyright © 2003 Lucent Technologies

Description: Enter the Bootstrap Board CLI. The BSTR only appears under Controller 0.

Required Field.
Valid Entries: 0 - 7fffffff (hexadecimal)

Data Rules:

"LOADED" must be entered if one of the following exists for the SM: an EQISLU form (5731 Record) with COMMON CONTROL EQST field equal to "O"; an EQRISLU form with COMMON CONTROL EQST field equal to "O"; an EQDCLU5 form (5808 Record) with CC EQSTAT field equal to "O"; an EQPSU form (5741 Record) with COMMON CONTROL EQST field equal to "O"; an EQRA form (5821 Record) with RAF SERVICE TYPE equal to "CTR" or "DTA", or an EQISTF form (5823 Record).

For 5E5 and later, the value "BASIC" is added. A "BASIC" SM is the same as a "STANDARD" SM with the following exceptions:

- A trunk member may not reside on the SM if it belongs to a trunk group defined on a TKGRP form (5202 Record) with the INPULSING and OUTPULSING fields set to "CCIS6" (non-ISDN Common Channel Signaling).
- The DSNOPT? field on the OFCOPT form (5509 Record) may not be set to "Y", which indicates a Defense Switched Network office.
- A trunk member may not reside on the SM if it belongs to a trunk group defined on a TKGRP form where the TRKCLS field is set to "RMSD3" (Remote Measurement System Device 3, used in TOPAS). TOPAS is the Testing, Operations, Provisioning and Administration System centralized operation for toll offices.
- A CKT TN defined on a DSLUSR form (5908 Record) or a TN defined on a LINE form (5109 Record) may not reside on the SM if it is assigned a Precedence and Preemption feature on a LINEFA form (5112 Record), CLUSTR form (5600 Record) or BFG form (5625 Record).

SM CONFIGURATION

The following fields (Section 2.31 - Section 2.34) describe the Switching Module configuration.

2.31 CONFIGURATION

Description: Enter the Switching Module configuration to support various switch services.

Refer to Figures 1, 2, and 3 for additional information.

Software Release: 5E4(2) and later
Required Field.
Default: STANDARD
Valid Entries:

Valid CONFIGURATION Entries

Entry	Definition
B or BASIC	Includes all analog features, but excludes OSPS, TOLL, and Government features, with the exception of two OSPS features: C-ACD (Commercial-Automatic Call Distributor) and ASHDN (Analog Shared DN).
ST or STANDARD	Includes all of the "Basic" programs, including analog features for OSPS, TOLL, and Government applications.
L or LOADED	Includes all of the "Basic" and "Standard" programs, plus features which provide ISDN services. An SM's configuration may be specified as "LOADED" even when the SM is NOT currently equipped with ISDN hardware
SI or	Software Release 5E11 and later:

Copyright © 2003 Lucent Technologies

SIGNALING	
SM or SM2000	Software Release 5E9(2) and later: Includes "most" of the "Loaded" SM features except OSPS, and includes all ISDN features. OSPS features are not allowed to initiate from SM-2000 (no operator position interface), but an SM-2000 class processor can be used for trunking purposes.

Data Rules:

When CONFIGURATION is "LOADED" and the UNIT TYPE is "SMPU2" or "SMPU3", the CLI for IMPU0 must indicate SMP12 or SMP23.

For 5E9(2) and later:
In new offices and equipment additions, PI SG 0 EQSTATUS must be "O" when CONFIGURATION has a value which supports Packet Interface. (See the table Configurations for Facilities and Applications.)

For ISDN SMs, the ISDNOPT form (5941 Record) must be entered and SENSOR ID 1 and SENSOR ID 2 on the ISDNOPT form must be entered and must be greater than 0.

For 5E10 and later, when CONFIGURATION is "SM2000", PI SG0 TYPE and PI SG1 TYPE cannot be "PI1".

2.32 SM RETROFIT

Description: For 5E5 and later, this field is a Recent Change only field. It indicates which CONFIGURATION to assign a Switch Module when an office retrofits to a new Software Release. Field values are 0, 1, and 2.

For 5E5 and later, the following table illustrates the implications of the SM RETROFIT values:

CONFIGURATION PRE-RETROFIT	SM RETROFIT VALUE	CONFIGURATION POST-RETROFIT
STANDARD	0	STANDARD
STANDARD	1	BASIC
STANDARD	2	LOADED
LOADED	0	LOADED
LOADED	1	BASIC
LOADED	2	STANDARD
BASIC	0	BASIC
BASIC	1	STANDARD
BASIC	2	LOADED

2.33 STAND ALONE

Description: Has the Stand Alone feature been purchased?

The Stand Alone feature allows an SM, when the communication link with the host office is not functional, to continue to process intramodule calls and to optionally reroute an intermodule call to an announcement and to optionally reroute an emergency call.

Without the Stand Alone feature, the SM will route every call origination to reorder.

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If the SM USAGE field is set to "IM" or "HIM", then this field must be entered.

If the SM USAGE field is set to "ORM", "RSM", or "TRM", then this field must not be entered. The STAND ALONE PURCHASED? field on an EQSITE form (5722 Record) should be entered.

Copyright © 2003 Lucent Technologies

If the SM value appears in the LOCAL SM field on an EMRNM form (5108 Record) and the RI field has an entry, then this field must be "Y".

If the SM value appears in the LOCAL SM field of ten or more EMRNM forms, then this field must be "Y". If the SM value appears in the LOCAL SM field of an EMRNM form where the EMER TN entry contains an asterisk (*) or asterisks, then this field must be "Y".

For 5E9(1) and later, if a TGN defined with TRKCLS of "TCITT" on the TKGRP form (5202 Record) and is defined as an RSM (Remote Switching Module) on the EQIM form with STAND ALONE set to "Y" or the associated EQSITE form (5722 Record) has STAND ALONE PURCHASED set to "Y", then the corresponding TRUNK form must have REMOVE TRUNK set to "Y".

2.34 STAND ALONE BILLING

Description: Has Stand-Alone Billing been purchased?

The Stand-Alone Billing feature allows an SM, when the communication link with the host office is not functional, to store billing data. If the Stand-Alone Billing feature is not purchased, the amount of memory to store billing information is 50KB. If the feature is purchased, all the spare memory in the SM is used to store the information.

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If the SM USAGE field is set to "IM" or "HIM", then this field must be entered. If the SM USAGE field is "ORM", "RSM", or "TRM", this field must not be entered. For 5E9(1) and earlier, if "Y" is entered in this field, the STAND ALONE BILLING field must be set to "Y".

RTCD OPTIONS

2.35 BILL SM

Description: The BILL SM field is used to display whether or not the SM supports a RTCD ethernet link to a billing collector system. For more information, see Division 2, Section 4A245.

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

SM MEMORY CONFIGURATION FOR SMPU4/SM2000

Valid with 5E5 and later Software Releases, the following fields (Section 2.36) are used to equip an MCTU2 SM with a mix of 4, 8, and 16 megabyte memory boards for Controllers 0 and 1. For 5E9(2) and later with SM-2000, a 32 megabyte board was added.

The BRDO through BRD5 CLI fields can only be entered if the UNIT TYPE is "SMPU4/MCTU2", or, for 5E9(2) and later, if UNIT TYPE is an SM-2000 class processor. For UNIT TYPE of "SM2000", only BRD0 - BRD3 CLIs are equipped; for UNIT TYPE of "SM2005", only BRD0 - BRD1 CLIs are equipped.

For 5E9(1) and earlier for non-VCDX offices, when the UNIT TYPE is "SMPU4", BRD0 CLI must be entered for Controllers 0 and 1. Memory board zero side 0 and side 1 (circuit positions 30h and 50h) cannot be populated in a VCDX office. These circuit positions are needed by the VCDX Ethernet. Circuit positions for memory boards must begin at 31h for side 0 and 51h for side 1. For VCDX and non-VCDX offices, the memory boards must be equipped contiguously.

Copyright © 2003 Lucent Technologies

2.36 BRD0 through BRD5 CLI

Description: Enter the CLI value for a 4, 8, 16, or 32 megabyte memory board. See Figures 1, 2, and 3, for additional information.

Software Release: 5E5 and later
Valid Entries:

Valid CLI Entries

Entry	Definition
200	4-MB memory board (TN1374).
4000	8-MB memory board (TN1376).
20000	Software Release: 5E6 and later: 16-MB memory board (TN1661).
02	Software Release: 5E9(2) and later: 32-MB memory board (TN1685).
04	Software Release: 5E10 and later: 64-MB memory board (TN1806).

Data Rules:

5E9(2) and later:
Memory Boards for a UNIT TYPE of "SMPU4" must be equipped contiguously.

For a VCDX (Very Compact Digital Exchange) office:

- MEMORY BOARDS BRD0 CLI must not be specified.
- MEMORY BOARDS BRD1 CLI must be specified.

If the office is not a VCDX and UNIT TYPE is "SMPU4", MEMORY BOARDS BRD0 CLI must be specified.

For 5E10 and later:
For VCDX at an SM-2000 office, MEMORY BOARDS BRD0 CLI must not be specified.

2.37 OPSM

Description: This field is used to identify an OSPS Positional SM, so data can be built automatically for installation testing on new OSPS offices. After the testing is complete, the data will be removed unless a request is made to keep it.

Software Release: 5E6 and later
Default: N
Valid Entries: Y, N

Data Rules:

OSPS positions are assigned to ports that include the SM number on the OSPSOP form (5401 Record). Regular positions are assigned to LCENs and Interflow positions are assinged to DENs. For 5E7 and later, "Y" must be entered in the OSPS PSM field, if an OSPS position is assigned to this SM. However, "N" must be entered if OSPS positions are not assigned to this SM. The first three digits of the LCEN or DEN fields on the OSPSOP form match the SM number on the EQIM form.

For 5E7 and later, if OSPS PSM is set to "Y" and SM USAGE is set to "RSM", then it must be the only SM in the cluster.

For 5E8 and later,

- **WARNING:** If "Y" is entered then PSM (Position Switching Module) circuits should be located in the

Copyright © 2003 Lucent Technologies

SM. PSM circuits are the following:

PSM Circuits

Circuit	Form	Field	Entry
Interflow pseudo operator trunks	TKGRP	TRKCLS	"IFOPER"
OSPS Directory Assistance Operator circuits	OSPSDSL	SERVICE CLASS	"DAOPER"
OSPS Directory Assistance Service Computer Data Link	OSPSDSL	SERVICE CLASS	"DASC"
OSPS Administrative Processor Data Link	OSPSDSL	SERVICE CLASS	"OAP"
OSPS Remote Alarm Section Data Link	OSPSDSL	SERVICE CLASS	"RAS"
OSPS Toll and Assistance Operator circuits	OSPSDSL	SERVICE CLASS	"TAOPER"

Navigation help:
To determine if there are any "IFOPER" trunks located in the SM find all of the TRUNK forms that assign trunks in the SM. The EQIM SM points to the first three digits (SM) of the TRUNK DEN. Then check the TKGRP TRKCLS of the trunk group (TKGRP TGN matches TRUNK TGN).

Check the OSPSDSL SERVICE CLASS for the rest of the PSM circuits where EQIM SM points to the first three digits of OSPSDSL LCEN (SM).

For 5E9(2) and later, when OSPS PSM is "Y", CONFIGURATION must support OSPS. (See the table Configurations for Facilities and Applications.)

IWG OPTIONS

2.38 VTOA SM

Description: This field indicates whether or not Voice Telephony over ATM (Asynchronous Transfer Mode) ethernet links are equipped on the SM (Switching Module). This is a no change field.

Software Release: 5E15 and later

BASIC CONFIGURATION

IMPU CLI Bit (hex)	Memory Board Size (in Megabytes)	Type of SM Processor	Maximum Boards Allowed	SMPU MODEL NUMBER Field
2	2	SMP1	8	1,2,3
2	2	SMP12	12	2,3
200	4	SMP1	4	1,2,3
200	4	SMP12	8	2,3
2	2	SMP23	12	2,3
200	4	SMP23	8	2,3

STANDARD CONFIGURATION

IMPU CLI Bit (hex)	Memory Board Size (in Megabytes)	Type of SM Processor	Maximum Boards Allowed	SMPU MODEL NUMBER Field
2	2	SMP12	12	2,3
200	4	SMP12	8	2,3
2	2	SMP23	12	2,3
200	4	SMP23	8	2,3

LOADED CONFIGURATION (Not Recommended)

IMPU CLI Bit (hex)	Memory Board Size (in Megabytes)	Type of SM Processor	Maximum Boards Allowed	SMPU MODEL NUMBER Field
200	4	SMP12	8	2,3
2	2	SMP23	12	2,3
200	4	SMP23	8	2,3

Note: SMP20 SM processor can be equipped with a mix of 4 and 8 megabyte memory boards which are assigned in the fields under the SM MEMORY CONFIGURATION FOR SMPU4.

If the SMP23CDM is equipped, only 32 megabytes of on board memory can be accessed. The maximum addressable memory on a non-SM-2000 SM is 32 megabytes.

Warning: The Loaded Configuration with SMP 12 and 23 Processors is NOT RECOMMENDED because

Copyright © 2003 Lucent Technologies

of the maximum memory limit of 32 megabytes for these two processors.

VCDX CONFIGURATION (5E9(2) and later Software Releases)				
IMPU CLI Bit (hex)	**Memory Board Size (inMegabytes)**	**Type of SM Processor**	**Maximum boards Allowed**	**UNIT TYPE Field**
4000000	16	SMP20	5	SMPU4

Figure 1 DEPENDENCIES BETWEEN IMPU CLI AND CONFIGURATION FIELDS 5E8 AND LATER SOFTWARE RELEASES

Data Rules for the forms (and fields) listed in the table below require the corresponding SM to be configured as shown in the CONFIGURATION column. Note: The entry "SM2000" includes all SM-2000 class processors.

SEC. 3: 5701 RECORD
CORE UNITS RECORD - EQCORE

1. GENERAL

The 5701 Record is used to define Core Unit Assignments in a 5ESS Switch office. It is intended to be used as an Office Record for those 5ESS Switch offices that are not utilizing an Operational Support System (e.g., RMAS) for generation of Office Records.

The Core Units Record is used to define the Message Interface Control Unit, Time Multiplexed Switch and Message Interface Control Unit Subunits.

NOTE: Once this form is inserted for a CM3 (Communication Module Model 3) office, the EQCM3 should be the next form inserted. This allows form checks to be performed on the data in regards to an office being CM2 (Communication Module Model 2) or CM3, instead of appearing during the execution of cross checks.

1.1 Recent Change View

The corresponding Recent Change Views for this form is 17.14.

2. FORM ENTRIES

2.1 *KEY

Description: The only acceptable value for this field is zero.
Valid Entries: 0

2.2 VCDX OFFICE

Description: Is this a VCDX office?

Software Release: 5E9(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When VCDX OFFICE is "Y", the following fields are automatically populated:

- CM VINTAGE is set to 2
- NETWORK CLOCK UNIT CLI is set to 0
- NETWORK CLOCK UNIT CLOCK TYPE is set to "24CHAN2"
- NETWORK CLOCK UNIT OSC TYPE is set to "DOMMED"
- TIME MULTIPLEXED SWITCH CLI is set to 2

and the following must be true:

- VCDX on the ECDOP form must be "Y".
- On the EQIM form (5700 Record):

Copyright © 2003 Lucent Technologies

- One and only one EQIM form must be entered with SM USAGE set to "IM" and CONFIGURATION set to either "SM2000" or "SIGNALING ".
- MEMORY BOARDS BRD0 CLI(s) must not be entered.
- STAND ALONE must be "N".
- STAND ALONE BILLING must be "Y".
- OSPS PSM must not be "Y".
- UNIT TYPE must be "SMPU4".
- MEMORY BOARDS BRD1 CLI(s) on the EQIM form must be specified, and MEMORY BOARDS BRD[2-5] CLI(s) must be assigned continuously.
- IMPU EQUIPMENT CLI's for CONTROLLER 0 and/or CONTROLLER 1 must have bit 26 set to 1 (i.e., IMPU EQUIPMENT CLI's of "*x*4*xxxxxx*" where *x* is any valid value).

- On the RALM form (5516 Record):
  - REMOTE MODULE must match the entry of SM on the EQIM form.
  - SM must match the entry for REMOTE SWITCHING MODULE on the EQRAU form and ALARM TYPE on the EQRAU form must be "ASC".
  - ALARM POINT values 0 - 1, 32 - 54, and 100 - 113, must be assigned on the RALM form.

- On the EQRAU form (5705 Record):
  - ALARM TYPE must be "ASC", and REMOTE SWITCHING MODULE must match the value of SM on the EQIM form.
  - ALARM TYPE must be "ASC" and ASC/RAU VERTICAL must be either 69 or 76.

- On the OFCOPT form (5509 Record):
  - ACG FNL TRMT must be "RT".
  - ASI ON must be "N".
  - ASP OFC must be "NONE".
  - COMMON CHAN SIG must be "N".
  - E911 DAS must be blank.
  - E911 OPTION must be "INACTIVE".
  - OFFICE TYPE must be "N".
  - For 5E12 and earlier, DSN OPTION must be "N".
  - For 5E11 and later, APPLICATION PROCESSOR can only be entered as "NO" or "SM".
  - For 5E10 and later, PRODUCT must be "WNC" or "VCDX".

Copyright © 2003 Lucent Technologies

- On the TKGRP form (5202 Record):
  - LN VIRT cannot be "Y" on any TKGRP form since FTS2000 Network Management Network is not allowed in this office.
  - For 5E10 and earlier, QUEUE FEATURE cannot be entered since trunk queuing is not allowed in the office.
  - When TRKCLASS is not "INAISTRK", "LPTDCTU", "LPTISTFL", "LPTISTFX", "RMSD3", or "TOPAS", LOCAL SM must be entered.
  - HUNT TYPE must not be "UCD", "GUCD", or "BGUCD".
  - The following TRKCLASS entries are not allowed: "CAMOPKEY", "CAMOPTLK", and "CCIS6".
- The following forms must not be populated:
  - EQNLI form (5853 Record).
  - EQSITE form (5722 Record).
  - RDTAPORT form (5911-A Record).
  - RDTATN form (59110-A/B Record).
- ENTITY on the RXSCHD form (5515 Record) must not be 0.
- Since the secured feature ACD BRCS is not allowed in the office, no SFSYS form can exist with field ACT set to "Y" for SFID 121.
- Since the autoplex ECP (Executive Cellular Processor) feature is not allowed in the office, ECP POINT CODE cannot be defined on the APXPARM form (5050 Record).
- For 5E10 and earlier, since simulated facility groups are not allowed in this office, PFASFG forms must not exist.
- For 5E10 and earlier, since no ARS (Automatic Route Selection) feature can be assigned in this office, no TN(s), MLHG/TERM(s) or TGN/MEMB(s) TRUNK GROUP(S) may be assigned an ARS feature on any LINEFA, MLHLNFA, TRUNKFA, TKGRPFA, BFG or an associated CLUSTR form.
- Since polygrid routing is not allowed in a VCDX office, the PPPOLY form cannot be populated.
- For 5E10 and earlier, since no (PFA) Private Facility Access feature can be assigned in this office, no TN(s), MLHG/TERM(s), TGN/MEMB(s), or TRUNK GROUP(S) may be assigned a PFA feature on any LINEFA, MLHLNFA, TRUNKFA, TKGRPFA, BFG or an associated CLUSTR form.
- The equipment in Figure 2 is not allowed in this office.

When VCDX OFFICE is "Y", and UNIT TYPE is "SM2000":

- MH0 SG0 CLI and/or MH0 SG1 CLI on the EQIM form must have bit 0 set to 1 (i.e., MHO CLI's of "*xxxxxxx*1" where *x* is any valid value).
- IMPU EQUIPMENT CLI's, on the EQIM form, for CONTROLLER 0 and/or CONTROLLER 1 must have bit 1 set to 1.

Copyright © 2003 Lucent Technologies

For 5E11 and later, when VCDX OFFICE is "Y", on the OFCOPT form (5509 Record):

- ASI ON must be "N".
- COMMON CHAN SIG must be "NO" or "PSU".
- E911 DAS must be not entered.
- E911 OPTION must be "INACTIVE".

For 5E11 and later, when VCDX OFFICE is "Y" and TRKCLS on the TKGRP form (5202-1/2 Record) is not in the table that follows, LOCAL SM on the TKGRP form must be known.

For 5E12 and later, when an office is being converted from VCDX to 5ESS-2000, VCDX OFFICE must be "N".

LOCAL SM Entries	
Software Release: 5E11 and later	
Data Condition	**Trunk Group Definition**
TRKCLS[1,3] = "LTP"	Local Test Port Trunk
TRKCLS = "EDS" and RDTA GRP = "Y"	Extended Digital Subscriber RDTA Trunk TRKCLS = "INAISTRK"
TRKCLS = "RMSD3"	TAT connected to RSM-D3 Trunk
TRKCLS = "TOPAS"	Test Access Trunk - TOPAS Interface

When VCDX OFFICE is "N",

- A dgn (diagnostic) test schedule must be defined on the RXSCHD form for the Administration Module (ENTITY = 0).
- REMOTE SWITCHING MODULE assigned on an EQRAU form or REMOTE MODULE assigned on an RALM form must be defined on the EQIM form or have SM USAGE on the EQIM form set to "RSM", "ORM" or "TRM".
- REMOTE SWITCHING MODULE assigned on an EQRAU form or REMOTE MODULE assigned on an RALM form must be defined on the EQSITE.
- When UNIT TYPE is "SMPU4" on the EQIM, MEMORY BOARDS BRD0 CLI(s) on the EQIM form must be specified and MEMORY BOARDS BRD[1-5] CLI(s) must be assigned continuously.

For 5E10 and later, PRODUCT (on OFCOPT form) is "WNC" or "VCDX", VCDX OFFICE must be "Y". The Wireless CENTREX and Very Compact Digital Exchange applications can be used only with the VCDX hardware configuration.

When VCDX OFFICE is "Y", TSI BOARD 0 and TSI SLOT 2 must not be assigned on the following forms:

- EQDI (for 5E10 and later),
- EQDNUS and EQPSU (for 5E12 and later) and,
- EQPDXU (for 5E14 and later).

For 5E10 and later, when VCDX OFFICE is "Y" and UNIT TYPE is "MCTU3", bit position 26 must not be set for the IMPU CLIs (controllers 0 and 1). When UNIT TYPE is not "MCTU3", bit position 26 must be set for the IMPU CLIs (controllers 0 and 1).

For 5E11 and later, when VCDX OFFICE is "Y", the EQDS form (5470 Record) should not have any tuples entered.

Copyright © 2003 Lucent Technologies

For 5E12 through 5E13, when all of the following conditions are met:

- COMMON CHAN SIG is "ALL" on the OFCOPT form (5509 Record),
- VCDX OFFICE is "Y" on the EQCORE form and
- WB RATE is entered and INPULSING/OUTPULSING is "DCHN" on the TKGRP form (5202-1/2 Record),

LOCAL SM must be entered on the TKGRP form.

For 5E15 and later

- When VCDX OFFICE is "N" and CM VINTAGE is 2, EXPANDED CMP/APR must be "CMPMEONLY" or "BOTH".
- When either VCDX OFFICE or DRM is "Y":
  - CLI on the EQTMS form (5866 Record) must be 2.
  - neither the QPHPIPE form (5544 Record) nor the CMTMH form (6021 Record) can be entered.
  - a maximum of 8,000 NPOOL forms (5177 Record) may be entered.
- When VCDX OFFICE is "Y", APPLICATION on the CCSTCAP form (5567 Record) or APPLIC on the DSAPP form (5537 Record) must not be "LNACP" or "TNAI".
- When VCDX OFFICE is "N" and DRM is "N", a maximum of 800,000 NPOOL forms (5177 Record) may be entered .
- For 5E16(2) FR 3 and later, when VCDX OFFICE or DRM is set to "Y", ORIG PT CODE for BICC Packet Groups defined on the PKTGRP form (5219 Record) must have a matching OPC or ALIASCP on the CCGSM form 6008 Record).

2.3 DRM

Description: Is this a Distinctive Remote Module?

For more information on this feature see Division 2, Section 4A525.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When DRM is "Y", the following fields are automatically populated:

- CM VINTAGE is set to 2
- NETWORK CLOCK UNIT CLI is set to 0
- NETWORK CLOCK UNIT CLOCK TYPE is set to "24CHAN2"
- NETWORK CLOCK UNIT OSC TYPE is set to "DOMMED"
- TIME MULTIPLEXED SWITCH CLI is set to 2

Copyright © 2003 Lucent Technologies

When an office is being converted from a VCDX office,VCDX OFFICE and DRM must both be "N".

When DRM is "N" and CM VINTAGE is 2, EXPANDED CMP/APR must be "BOTH" or "CMPMEONLY".

When DRM is "Y", VCDX OFFICE must be "N".

When PRODUCT on the OFCOPT form is "DRM", DRM on the EQCORE form must be "Y". DRM application can be used only with the DRM hardware configuration.

When DRM is "Y" the following apply:

- This table specifies the equipment not allowed in this office:

Form	Condition	Key Fields	Equipment Unit
EQDSP	DIGITAL SERVICE UNIT = 0	IM, DSU, SG	Local DSU1 Model 1
EQDU	DLTU TYPE = "DLTU24"	IM, DLTU	DLTU Model 1
EQDUP	FAC IND = 0 and FAC 0 DFI USAGE != "H1" or "H2"	IM, DLTU, DFIPK	DFI (24) Channel Model 1
EQLU	LINE UNIT TYPE = "4AB1"	IM, LU	Analog Line Unit Model 1
EQLU	LINE UNIT TYPE = "4AC1"	IM, LU	Analog Line Unit Model 2
EQMSP	Any form	IM, MSU, SG	MSU Model 1
PSUGP	PH TYPE = "PH1"	IM, PSU, PSUSHELF	Protocal Handler Model 1
PSUGP	PH TYPE = "PH2"	IM, PSU, PSUSHELF	PSUSHELF Protocal Handler Model 2

- On the EQIM form:
  - One and only one EQIM form must be entered with CONFIGURATION set to "SM2000".
  - STAND ALONE must be "N".
  - OSPS PSM must not be "Y".
  - STAND ALONE BILLING must be "Y".
  - When an SM-2000 class processor is specified,
    - MH0 SG0 CLI and MH0 SG1 CLI must be equal to 1 hex or C hex.
    - EQNLI form must not be populated.
    - TSICOM 0 CLI and TSICOM 1 CLI must be 3, 13, 23 or 33 hex.
- EQSITE form should not have any forms entered.
- When the RALM form is populated, SM on the EQIM form must equal REMOTE MODULE on each RALM form.
- TSI BOARD 0 and TSI SLOT 2 must not be assigned on the EQDI form, the EQDNUS form or the EQPSU form. This TSI BOARD and TSI SLOT is reserved in DRM call processing nodes.
- EQDS form should not have any forms entered.
- ENTITY on the RXSCHD form must notbe zero.
- When the RALM form is populated,
  - REMOTE MODULE on the RALM form must equal REMOTE SWITCHING MODULE on the

Copyright © 2003 Lucent Technologies

EQRAU form,

- ALARM TYPE on the EQRAU form must be "ASC".

- When the EQRAU form is populated,
  - RAU VERTICAL on the EQRAU form must be either 69 or 76,
  - ALARM TYPE on the EQRAU form must be set to "ASC",
  - REMOTE SWITCHING MODULE on the EQRAU form must equal SM on the EQIM form.

- On the OFCOPT form:
  - The fields shown in the following table must be populated as specified:

Field	Value
ASI ON	N
COMMON CHAN SIG	NO or PSU
E911 DAS	unknown
E911 OPTION	INACTIVE

  - VIRTUAL SWITCH must be "Y".
  - APPLICATION PROCESSOR can only be entered as "NO" or "SM".
  - PRODUCT must be "DRM".
  - OFFICE TYPE must be "N".

- Polygrid routing is not allowed in the office. The PPPOLY form cannot be populated.
- The secured feature ACD BRCS is not allowed in the office. The SFSYS form cannot exist with SFID 121 set to "Y".
- The following TRKCLS entries are not allowed on the TKGRP form. "CAMOPKEY", "CAMOPTLK", "CCIS6"
- The FTS2000 Network Management Network is not allowed in this office. LN VIRT cannot be set to "Y" on any TKGRP form.
- For 5E15 and later, a maximum of 8,000 NPOOL forms (5177 Record) may be entered
- When TRKCLS on the TKGRP form is not in the table below, then LOCAL SM on the TKGRP form must be known.

Data Condition	Trunk Group Definition
TRKCLS[1,3] = "LTP"	Local Test Port Trunk
TRKCLS = "EDSL" and RDTA GRP = "Y"	Extended Digital Subscriber RDTA Trunk
TRKCLS = "INAISTRK"	Incoming Automatic Intercept Trunk
TRKCLS = "RMSD3"	TAT connected to RSM-D3 Trunk
TRKCLS = "TOPAS"	Test Access Trunk - TOPAS

When COMMON CHAN SIG is set to PSU on the OFCOPT form and DRM is set to "Y" on the EQCORE form and INPULSING and/or OUTPULSING is set to "ISUP7" on the TKGRP form, then the LOCAL SM must be entered on the TKGRP form, and LOCAL SM must have a matching GSM on the CCGSM form. Also, when WB RATE is known and INPULSING and/or OUTPULSING is set to "DCHN" on the TKGRP form and DRM is set to "Y" on the EQCORE form, then LOCAL SM must be entered on the TKGRP form,

Copyright © 2003 Lucent Technologies

and LOCAL SM must have a matching GSM on the CCGSM form.

For offices where both VCDX OFFICE and DRM are "N":

- LOCAL SM must be unknown on the TKGRP form for the TGN that is associated with the terminating SFG.
- When TRK DIR is "2W", "INC" or "OUT", TRKCLS is "EDSL" or "EDSLHM" and LOCAL SM is known on the TKGRP form, NET SPEC FAC TYPE must not be "TPOTS" on the TKEDSLD form.
- For 5E15 and later, a maximum of 800,000 NPOOL forms (5177 Record) may be entered

When EQIM forms indicate a change in the software configuration of the SM after retrofit, and VCDX OFFICE or DRM is "Y" on the EQCORE form, the SM configuration cannot be changed during retrofit.

When the ENETPIPE form is entered, the corresponding EQIM form must specify an SM-2000 class processor and, if SERV TYPE is "RTCD", the EQCORE form must have VCDX OFFICE and DRM both set to "N".

For 5E15 and later, when DRM is set to "Y", the APPLICATION field on the CCSTCAP form (5567 Record) or the APPLIC field on the DSAPP form (5537 Record) must not be set to "LNACP" or "TNAI".

2.4 CM2 COMPACT

Description: Is this a CM2 Compact office? Note that the location of the CM2 Compact is entered in the EQUIPMENT BAY field below.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E14 and earlier, when CM2 COMPACT is "Y":

- for the EQCORE form (5701 Record)
  - TIME MULTIPLEXED SWITCH CLI must be 20,
  - MSG AISLE and TMS AISLE must be equal,
  - TIME MULTIPLEXED SWITCH AISLE must be unknown.
  - TMS CONFIGURATION must be "SNGL",
  - EQUIPMENT BAY must be entered,
  - TMS SHELF EQUIPAGE must not be entered,
  - CM VINTAGE must be 2,
- for the EQIM form (5700 Record)
  - NCT EVEN LINK must be 2 or 4,
  - CTS EVEN LINK must be 2, 10, 18, 26, 34, 42, 50, or 58,

Copyright © 2003 Lucent Technologies

- The maximum number of EQIM forms must be 8,
- The maximum number of EQIM forms with SM USAGE of "IM", "HIM", "TRM" or "ORM" must be 2,
- The maximum number of EQIM forms with SM USAGE of "RM" must be 6,
- when SM USAGE on the EQIM form is not "ORM", NLI 0/1 CLI on the corresponding EQNLI form must have bit 1 set (hex value of 2).

- for the ECDOPT form (5706 Record)
  - CM TYPE must be "CM2C".

- for the EQTMSLINK form (5851 Record)
  - QLI CLI must be 0.

For 5E11 and later, when an office is being converted from a CDX to 5ESS-2000 office, cm2 compact must be "N".

For 5E15 and later:

When an office is CM3, CM2 COMPACT must be "N".

When CM2 COMPACT is "N":

- EQUIPMENT BAY must be blank.
- CM2C SM must be blank.

When CM2 COMPACT is "Y", the following data is required for the EQTMS form (5866 Record):

- FABRIC TYPE must be "SNGL"
- CLI must have a value with bit 5 set (as in 20 hex)
- there can be no entries in the SHELF EQUIPAGE - CM2 list
- AISLE on the EQTMS form must be equal to MSGS AISLE on the EQCORE form.
- QLI CLI must be 0 on all EQTMSLINK forms.

When CM2 COMPACT is "N" and CM VINTAGE is 2:

and SM USAGE is not "ORM" and UNIT TYPE is "SM2000" or "SM2005" on the EQIM form (5700 Record), QLI CLI on all EQTMSLINK forms (5851 Record), must be 100, otherwise QLI CLI must not be 100.

and SM USAGE is "ORM" on the EQIM form, the QLI CLI value on each EQTSMLINK form associated with the SM on this EQIM form, depends on the type of TRCU (Transmission Rate Converter Unit) used in this transmission path. If the TRCU is of type "TRCU3" on the EQTMSLINK form, and UNIT TYPE on the EQIM form is "SM2000" or "SM2005", then QLI CLI must be 100, otherwise QLI CLI must not be 100.

MICU / TMS

Copyright © 2003 Lucent Technologies

The following fields designate Message Interface Control Unit and Time Multiplexed Switch parameters.

2.5 #EQSTATUS

Description: Enter the Status of the Equipment.

Required Field.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

For new offices and units destined for factory testing, "O" (Operational) is the only allowed value. During offline ODA database retrofits, the other values are valid.

2.6 #CM VINTAGE

Description: Enter the Communication Module Vintage number for the office.

Required Field.

Valid CM VINTAGE Entries

Entry	Description
1	CM1.
2	CM2. CM2 allows for the expanded SM range of 1-192. For offices with CM2, both MSG SIZE and TMS SIZE must be 6. For 5E9(1) and later, this value is used for the CDX/CM2C (Compact Digital Exchange).
3	CM3. For 5E15 and later, CM3 replaces the Communication Modules CM1 (Communication Module 1), CM2 (Communication Module 2), CM2C/CDX (Communication Module 2 Compact/Compact Digital Exchange) of the 5ESS switch.

Data Rules:

The CM VINTAGE value entered must be the same as the CM TYPE value entered on the ECDOPT form.

For 5E9(1) and later, when CM VINTAGE is 1, EQUIPMENT BAY on the EQCMTRCU form (5812 Record) must be between 0 and 7.

When CM VINTAGE on the EQCORE form is 2 and EXPANDED CMP/APR is set to "APRONLY" or "BOTH" on the EQCORE form, the bit number 10 (400h) for the CLI must be set on the EQPC form, where the bits are numbered from 0 to 31 and bit 0 is the right most bit.

When "2" is entered, and the CLI is 400 (bit number 10) on the EQPC form, where the bits are numbered from 0 to 31 and bit 0 is the right most bit, EXPANDED CMP/APR must be set to "APRONLY" or "BOTH" on the EQCORE form.

When "2" is entered, the CLI values on the EQPC forms must be 0 or 400 .

When "2" is entered, and QLPS is present, there must be a corresponding EQPIPE form for each SM-2000 as defined on the EQIM form. CTS overflow could result.

For 5E15 and later:

When CM VINTAGE is 2, CM2 COMPACT is "N", and FABRIC TYPE on the EQTMS form is "SNGL", then an entry for SHELF 0 in the SHELF EQUIPAGE - CM2 list on the EQTMS form must exist.

Copyright © 2003 Lucent Technologies

When CM VINTAGE is 2, CM2 COMPACT is "N", and the SM is not equipped with an SM-2000 class processor, the SHELF EQUIPAGE - CM2 list on the EQTMS form (5866 Record) must have the correct entries to support the range of TMSLINKS in the office. Following is the required SHELF EQUIPAGE - CM2 rows for specific ranges of TMSLINKS (NCT EVEN LINK) defined on the EQIM form (5700 Record) needed for FABRIC TYPE of "DUAL" defined on the EQTMS form.

Shelf Equipage Row Requirements - SM
for "DUAL" Fabric Type

TMSLINKs Equipped	SHELF EQUIPAGE - CM2 (row required)
2 - 61	1 and 2
62 - 125	3 and 4
126 - 189	5 and 6
190 - 253	7 and 8
254 - 317	9 and 10
318 - 381	11 and 12

When CM VINTAGE is 2, and CM2 COMPACT is "N" on this form, and FABRIC TYPE on the EQTMS form is "SNGL", and the SM is not equipped with an SM-2000 class processor, the NCT EVEN LINK values assigned on the EQIM form requires the following SHELF EQUIPAGE - CM2 on the EQTMS form.

Shelf Equipage Row Requirements - SM
for "SNGL" Fabric Type

LINKs EQUIPPED	SHELF EQUIPAGE - CM2 (row required)
2 - 31	1
32 - 61	2
62 - 93	3
94 - 125	4
126 - 157	5
158 - 189	6

When CM VINTAGE is 2 and CM2 COMPACT is "N" on the EQCORE form, and FABRIC TYPE on EQTMS is "DUAL", and the SMs are equipped with SM-2000 class processors, the NLI TMS LINKs entered on the EQNLI form (5853 Record) requires the following SHELF EQUIPAGE - CM2 be entered on the EQTMS form.

Shelf Equipage Row Requirements - SM2000
for "DUAL" Fabric Type

TMSLINKs Equipped	SHELF EQUIPAGE - CM2 (row required)
2 - 61	1 and 2
62 - 125	3 and 4
126 - 189	5 and 6
190 - 253	7 and 8
254 - 317	9 and 10
318 - 381	11 and 12

When CM VINTAGE is 2 and CM2 COMPACT is "N" on the EQCORE form, and FABRIC TYPE on EQTMS is "SNGL", and the SMs are equipped with SM-2000 class processors, the NLI TMS LINKs entered on the EQNLI form (5853 Record) require the following SHELF EQUIPAGE - CM2 be entered on the EQTMS form.

Shelf Equipage Row Requirements - SM2000
for "SNGL" Fabric Type

LINKs EQUIPPED	SHELF EQUIPAGE - CM2 (row required)
2 - 31	1
32 - 61	2
62 - 93	3
94 - 125	4
126 - 157	5
158 - 189	6

When CM VINTAGE is 2:

Copyright © 2003 Lucent Technologies

- MSGS CLI must not be entered.
- MSGS AISLE must be entered.
- CLOCK TYPE must be "24CHAN2" or "STDLNE2.
- for the SM-2000 SMs on the EQPIPE form (5544 Record), these SMs must exist on the EQIM form (5700 Record) with SM-2000 class processor and an EQSTATUS of "O" (Operational).
- a QLPS Gateway must first be defined on SIDE 0 with a PC NO. of 32 and on SIDE 1 with a PC NO. of 32 on the EQPC form before any other QLPS Gateways can be defined.
- the REFERENCE value on each NCLKREF form must be unique.
- QLPS Gateways for PC NO. of 33 can be defined on the EQPC form with an EQSTATUS of "O" (Operational) if there are QLPS Gateways of 32 defined as follows, on two EQPC forms with EQSTATUS of "O":
  - EQPC.SIDE = 0 and EQPC.PC = 32
  - EQPC.SIDE = 1 and EQPC.PC = 32

When CM VINTAGE is 2, and QGWP is "Y" on the EQPC form (5703 Record), an EQPC form must be defined with PC NO equal to 32 or 33.

When CM VINTAGE is 2, and any ENETLINK form tuple exists with SERV TYPE equal "RTCD", then for each EQIM form with an SM-2000 class processor, two corresponding EQPIPE forms (5544 Record) must exist where QLPS NETWORK equal 0 and 1.

When CM VINTAGE is 2, and the ENETPIPE form is entered with SERV TYPE "EEC", if the corresponding EQIM form has EQSTATUS set to "O" and SM USAGE is not set to "ORM", and if 4 EQQLPS form (5854 Record) tuples exist, then two corresponding EQPIPE forms must exist where QLPS NETWORK equal 0 and 1.

When CM VINTAGE is 2, and if a QLPS Gateway is defined on the EQPC form with SIDE equal 0 and PC NO. equal 32, then there must exist an EQPC form with SIDE equal 1 and PC NO. equal 32. Or if an EQPC form exists with SIDE equal 1 and PC NO. equal 32, then there must exist an EQPC form SIDE equal 0, PC NO. equal 32. Also, both EQPC forms must have the same value for EQSTATUS.

When CM VINTAGE is 2, and if a QLPS Gateway is defined on the EQPC form with SIDE equal 0 and PC NO. equal 33, then there must exist an EQPC form with SIDE equal 1 and PC NO. equal 33. Or if an EQPC form exists with SIDE equal 1 and PC NO. equal 33, then there must exist an EQPC form SIDE equal 0, PC NO. equal 33. Also, both EQPC forms must have the same value for EQSTATUS.

QLPS Gateway(s) defined on the EQPC form with a PC NO. of 32 or 33 can not exist unless 4 EQQLPS forms are defined as follows:

ONTC SIDE	QLPS NETWORK
0	0
1	0
0	1
1	1

And the EQSTATUS of these EQQLPS form entries must be "O".

For 5E15 and later, when CM VINTAGE is 3:

Copyright © 2003 Lucent Technologies

- the EQCM3 form (5867 Record) must be inserted after the EQCORE form has been inserted.
- CLOCK TYPE can only be "NCLK3" or "SANC3".
- CLI must not be entered for LINK INTERFACE UNIT and MESSAGE INTERFACE UNIT.
- QLI CLI on all EQTMSLINK forms associated with valid SMs must be 0.
- MSGS CLI must be 0.
- MSGS AISLE must not be entered.
- VCDX OFFICE must be "N".
- EXPANDED CMP/APR must be "NEITHER".
- the EQPC (5703 Record) tuples for SIDE 0 PC N0. 8, and SIDE 1 PC NO. 12 are always required even though there is no need to input this form. The tuples will be built in forward mapping for CM3.
- REFERENCE TYPEs of "24CHAN" and "30CHAN" on NCLKREF forms cannot have the same REFERENCE values.
- four EQQLPS forms must be defined.

When CM VINTAGE is 3 on the EQCORE form, the LINK TYPE on the EQTMSLINK form must be "NCT1" when either:

- The SM is not an SM2000.
- The SM is an SM2000, the corresponding EQIM form's SM USAGE is "'ORM" and the NLI for this LINK has a TRCU PATH HOST TYPE other than "TRCU3" on the EQTRCUPTH form. The EQNLI form contains the TMS LINK number for each NLI.

NOTE:

Depending upon the value of the CM VINTAGE field on this form, an EQCM3 form either exists (indicating a CM3) or doesn't (indicating a CM2). The EQCM3 form's existence is queried by a number of form files to set up internal checks for validating the data required by the CM VINTAGE defined for this office. These form files include EQTMS, EQPC, EQPIPE, EQQLPS, EQNLI, EQTMSLINK and EQIM. This was done to reduce a significant number of crosschecks to form checks and assist in populating CM-related data at the form entry level.

The EQCORE/EQCM3 combination found is invalid and/or one or more of the above-listed form files contain invalid data for the CM defined in this office. A subset of these forms could contain invalid data even if the EQCORE/EQCM3 combination is valid if the combination was altered after some of the forms had been entered. DO NOT attempt to fix only the form files listed in error below. To insure data integrity, all of the form files should be validated via an ODA tool.

To correct this situation, make sure the CM VINTAGE on the EQCORE form is correct. If the value is 2, make sure the EQCM3 form does NOT exist. If the value is 3, make sure the EQCM3 form DOES exist. Then either run the "errforms -u" command against the database (recommended) or re-enter each of the form files listed above and validate the data either by updating each form instance or using the review/validate function on each form instance.

The "errforms" with the -u option ensures that all relevant forms with assignment statements are updated in a CM3 office.

Copyright © 2003 Lucent Technologies

For 5E15 and later, when CM VINTAGE is 2 and NON GLOBAL SM on the CMTMH form (6021 Record) does not have an SM-2000 class processor on the corresponding EQIM form, there must be EQPC forms (5703 Record) entered on SIDE 0 and SIDE 1 with PC NO. set to 32 and EQSTATUS set to "O".

For 5E15 and later, when "3" is entered,

- all RSMs (Remote Switching Modules) in the office must be connected to the HSM (Host Switching Module) via a DNU-S facility. This connection is defined on the RSMLNK form.
- TRCU TYPE on the EQMTRCU form (5812 Record) must be "TRCU3".

2.7 #INTERRUPT STATUS

Description: Enter Interrupt-Inhibit Status.

Required Field.
Default: ALLOW
Valid Entries:

Valid INTERRUPT STATUS Entries

Entry	Description
A	Allow.
I	Inhibit.

2.8 #MSG AISLE

Description: Enter the aisle location of the Message Switch Frame. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. The third and fourth digits, from the left, are the aisle number. It is recommended that floor 00 be used for equipment located in the basement, per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.9 #MSGS CLI

Description: This field is used to store the CM3 (Communication Module 3) MSGS Change Level Indicator.
Valid Entries: 0

2.10 MSGS IPDGN FILE

Description: The MSGS IPDGN FILE (Message Switch Input/Output Processor Diagnostic File) field is a No Change field for CM3 only, that contains the diagnostic image for the MSGS-IP.

Software Release: 5E15 and later

2.11 MSGS APDGN FILE

Description: The MSGS APDGN FILE (Message Switch Application Processor Diagnostic File) field is a No Change field for CM3 only, that contains the MSGS-IP ROM (Read Only Memory), FPGAs (Field-Programmable Gate Arrays), and MSGS-AP debugger code.

Software Release: 5E15 and later

2.12 MSGS IP FILE

Description: This field is a No Change field that contains the image for the MSCU/PPC (Message Switch Control Unit/Pump Peripheral Controller) operational image for the MSGS-IP (Message Switch -

Copyright © 2003 Lucent Technologies

Input/Output Processer) for CM3 only.

Software Release: 5E15 and later

2.13 MSGS AP FILE

Description: This field is a No Change field that contains the operational images for the MSGS-AP (Message Switch -Application Processer) for CM3 only.

Software Release: 5E15 and later

2.14 MSGS ROM FILE

Description: The MSGS ROM FILE (Message Switch Read Only Memory Code File) field is a No Change field that contains the MSGS-IP ROM, FPGAs, and the MSGS-AP debugger code.

Software Release: 5E15 and later

2.15 #TMS AISLE

Description: Enter the aisle location of the Time Multiplexed Switch. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. The third and fourth digits, from the left, are the aisle number. It is recommended that floor 00 be used for equipment located in the basement, per floor plan designation.

- ***NOTE:*** This field is for 5E14 and earlier software releases.

Software Release: 5E14 and earlier
Required Field.
Valid Entries: 0000 - 9999

2.16 #TMS SIZE

Description: Enter the Time Multiplexed Switch Size in feet.

- ***NOTE:*** This field is for 5E14 and earlier software releases.

Software Release: 5E14 and earlier
Required Field.
Valid Entries: 6 or 7 (feet)

Data Rules:

If CM VINTAGE is 2, this field must have a value of 6.

2.17 TMS CONFIGURATION

Description: Enter the Time Multiplexed Switch Configuration.

- ***NOTE:*** This field is for 5E14 and earlier software releases.

Valid TMS CONFIGUATION Entries

Entry	Description
SNGL	Single-Fabric.
DUAL	Dual-Fabric.
DBDL	Software Release: 5E5 and earlier. Double Dual Fabric

Software Release: 5E14 and earlier

Copyright © 2003 Lucent Technologies

Data Rules:

If CM VINTAGE is 1, TMS CONFIGURATION must be blank or "DUAL".

If CM VINTAGE is 2, TMS CONFIGURATION must not be blank.

If "SNGL" is entered and CM2 Compact? is "N", the first pair of Model Numbers must be assigned for UNIT NUMBER 0.

If "SNGL" is entered, the SIDE 0 and SIDE 1 values for UNIT NUMBERS 0 and 1 (if entered) must all be either "TMSU2" or "TMSU3".

If "DUAL" is entered, the first and second pairs of MODEL NUMBERS must be assigned for UNIT NUMBERS 0 and 1.

If "DUAL" is entered, the SIDE 0 and SIDE 1 values for UNIT NUMBERS 0 and 1 must all be either "TMSU2" or "TMSU3".

If "SNGL" is entered, Model Numbers are not valid for UNIT NUMBERS 6 through 11.

If "DUAL" is entered, all rows are valid in sets of two.

For 5E9(1) and later, if CMTYPE on the ECDOPT form (5706 Record) is "CM2C", and TIME MULTIPLEXED SWITCH CLI on the EQCORE form is 20, TMS CONFIGURATION must be "SNGL".

If "SNGL" is entered and CM2 Compact is "N", the first pair of MODEL NUMBERS must be assigned for UNIT NUMBER 0.

For 5E10 and later, if "SNGL" is entered, the following rules must be met when defining the primary NLI Link, EVEN NLI 0, on the EQNLI form:

- The TMS LINK 0 value assigned to EVEN NLI 0 must be a multiple of 8 when TMS LINK 0 is less than 32 (8, 16, 24).
- The {TMS LINK 0 + 2} value assigned to EVEN NLI 0 must be a multiple of 8 when TMS LINK 0 is greater than 31 (38, 46, 54, ...).

LINK INTERFACE UNIT

2.18 #LI CLI

Description: Enter the Change Level Indicator for the Link Interface Unit; eight characters in the hexadecimal numbering system.

Required Field.

Valid Entry: 0 - 7FFFFFFF

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

MESSAGE INTERFACE UNIT

2.19 #MI CLI

Description: Enter the Change Level Indicator for the Message Interface Unit; eight characters in the hexadecimal numbering system.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entry: 0 - 7FFFFFFF

Data Rules:

For 5E10 and later, if the CLI value entered indicates that the bit number 10 (400h) is set, and/or CLI value entered on NETWORK CLOCK UNIT indicates that bit 1 and bit 8 are set (102h), where the bits are numbered from 0 to 31 and bit 0 is the right most bit, then EXPANDED CMP/APR must be "APRONLY" or "BOTH" on the EQCORE form.

If the CLI value entered indicates that the bit number 10 is set, where the bits are numbered from 0 - 31 and bit 0 is the right most bit, CM VINTAGE on the EQCORE form must be "2".

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

NETWORK CLOCK UNIT

The following fields (Section 2.20 - Section 2.22) provide the CLI (Change Level Indicator), CLOCK TYPE, and OSC TYPE for the Network Clock Unit.

2.20 #CLI

Description: Enter the Change Level Indicator for the Network Clock Unit; eight characters in the hexadecimal numbering system.

Required Field.

Valid Entry: 0 - 7FFFFFFF

Data Rules:

If CLI is "xyyyyyzy", where x is 0 - 7, y is 0 - f and z is 8 - f hex, AUTO SYNC must be "Y".

See Figure 1 for more Network Clock Unit dependencies.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.21 #CLOCK TYPE

Description: Enter the Clock Type.

Required Field.

Valid CLOCK TYPE Entries

Entry	Description
24CHAN2	24-Channel Network Clock 2.
DS1	24-Channel DS1 Clock.
NCLK3	Network Clock 3.
SANC3	NCLK3 Stand Alone.
STDALNE	Stand Alone Clock.
STDALNE2	Stand Alone Network Clock 2 (not currently available).

Data Rules:

For the 5E2 Software Release with CM1, "DS1" and "STDALNE" are the only entries allowed.

For 5E2 and later Software Release with CM2, "24CHAN2" and "STDALNE2" are the only entries allowed.

For 5E9(1) and later, if CMTYPE is "CM2" or "CM2C" on the ECDOPT form, and TIME MULTIPLEXED SWITCH CLI on the EQCORE form is 20, and CLOCK TYPE is "24CHAN2", the following conditions must be met:

Copyright © 2003 Lucent Technologies

- The range of values for REFERENCE on the NCLKREF (Network Clock 2 Reference) form (5525 Record) must be 1 - 3.
- There must be at most 3 clock references:
  - At most, one analog and this analog reference must be the first one (i.e., REFERENCE on the NCLKREF form must be 1).
  - If one reference is analog, there must be, at most, 2 digital references.
  - If no reference is analog, there must be, at most, 3 digital references.

For 5E10 and later, if "24CHAN2" is entered, the following must be true:

- There must be at most 2 NCLKREF forms where REFERENCE TYPE is "24CHAN".
- When all of the NCLKREF forms entered have REFERENCE TYPE set exclusively to "24CHAN", the corresponding REFERENCE must be "1" if only 1 form is entered and must be in the range of "1" - "2" if 2 forms are entered.

For 5E15 and later,

When CLOCK TYPE is "24CHAN2" or "30CHAN2", a NCLKREF form (5525 Record) must exist.

When CLOCK TYPE is "24CHAN2" or "STDALNE2", OSC TYPE must be "DOMHI" or "DOMMED".

CLOCK TYPE must match the CLOCK TYPE value on the NCLKREF form (5525 Record).

When CLOCK TYPE is "NCLK3" there can be at most 8 NCLKREF forms.

When CLOCK TYPE is "NCLK3" or "SANC3", OSC TYPE must be "CM3HI".

When CLOCK TYPE is "NCLK3", CLI for NETWORK CLOCK UNIT must be 0.

When CLOCK TYPE is not "NCLK3" or "SANC3", and CLI for NETWORK CLOCK UNIT bit 7 is 0, AUTO SYNC must be "N".

2.22 OSC TYPE

Description: Enter the OSCILLATOR TYPE for the Network Clock.

Valid OSC TYPE Entries

Entry	Description
CM3HI	CM3 High Stability
DOMHI	High Stability.
DOMMED	Medium Stability.

Data Rules:

This field must be left blank when the CLOCK TYPE is "DS1" or "STDALNE". Otherwise, it must be entered.

For 5E15 and later, when OSC TYPE is "DOMMED", NC REF STAB must be "STRATUM3_NAR".

When OSC TYPE is "DOMHI", NC REF STAB must be "'STRATUM2_NAR".

2.23 AUTO SYNC

Copyright © 2003 Lucent Technologies

Description: Is Network Clock 2 Automatic Syncronization available? This feature provides automatic restoration of out-of-service Network Clock references.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When AUTO SYN is "Y", for 5E15 and later, and CM VINTAGE is 2NETWORK CLOCK UNIT CLI must contain "xyyyyyzy", where:

- x = 0 - 7
- y = 0 - f
- z = 8 - f (hexadecimal)

2.24 NC REF STAB

Description: The NC REF STAB field is used to indicate the Network Clock Reference Stability.

Required Field.

Software Release: 5E15 and later
Valid Entries: STRATUM2_NAR, STRATUM3E_NAR, STRATUM3_NAR, STRATUM2_INTL, or STRATUM3_INTL

TIME MULTIPLEXED SWITCH

2.25 #CLI

Description: Enter the Change Level Indicator for the Time Multiplexed Switch; eight characters in the hexadecimal numbering system.

Required Field.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

For 5E14 and earlier, if the CLI entered indicates that the bit number 10 is set, where the bits are numbered from 0 - 31 and bit 0 is the right most bit, CM VINTAGE on the EQCORE form must be 2.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

TMS SHELF EQUIPAGE MODEL NUMBER

The following fields (SIDE 0 and SIDE 1) are for 5e14 and earlier, and are used to equip additional packs. This positional list has two sides of 12 rows each, corresponding to the shelf/bay position in the frame. The TMS SHELF equipage is not used if CM VINT is 1. However, if CM VINT is 2, the TMS SHELF equipage is required.

The number of rows equipped is dependent upon the number of SMs in the office. The Model number must be the same for row 1 and 2 (all "TMSU2" or all "TMSU3"). Rows 3 through 12 can have the MODEL NUMBER mixed.

NOTE: Mixed model numbers are not a recommended configuration for rows 3 through 12. A warning will be issued if they are not the same.

Copyright © 2003 Lucent Technologies

The following table shows the correspondence between the TMS Shelf Equippage and the equipment frame bay and vertical position.

Row	SIDE 0 Bay	SIDE 1 Bay	Vertical Position
1	5	6	32
2	5	6	15
3	4	7	32
4	4	7	15
5	3	8	32
6	3	8	15
7	2	9	32
8	2	9	15
9	1	10	32
10	1	10	15
11	0	11	32
12	0	11	15

Row 1 must be entered when CM VINT is 2 and TMS CONFIGURATION is "SNGL", therefore bays 5 and 6 will have "TMSU2" or "TMSU3" packs in vertical position 32. The vertical position is always 32 in the odd numbered rows and 15 in the even numbered rows.

Because rows 1 and 2 must be entered when CM VINT is 2 and TMS CONFIGURATION is DUAL, bays 5 and 6 will have "TMSU2" or "TMSU3" packs in vertical positions 32 and 15. The vertical position is always 32 in the odd numbered rows and 15 in the even numbered rows.

2.26 SIDE 0/SIDE 1

Description: Enter the MODEL NUMBER for the TMS Shelf equipage. The TMS SHELF equipage is not used if CM VINT is 1.

- ***NOTE:*** This field is for 5E14 and earlier software releases.

Valid UNIT NUMBER Entries

Entry	Description
TMSU2	Used to provision CP KBN2 and KBN24 (both required).
TMSU3	Used to provision CP KBN5 (replacement for CP KBN2 and KBN24).

The following table provides the number of SMs versus TMS SHELF row requirements when TMS CONFIGURATION is "SNGL", CM VINTAGE is 2, and TIME MULTIPLEXED SWITCH CLI is not "0x20h". The number of rows required is tied to the number of TMSU packs required for the size of the (non-CDX) office (i.e., the number of SMs).

SMs vs. TMS Shelf Row Requirements for "SNGL" TMS Configuration

SMs	Rows Required
1 - 15	1.
16 - 30	1 and 2.
31 - 46	1 through 3.
47 - 62	1 through 4.
63 - 78	1 through 5.
79 - 94	1 through 6.

RSMs (Remote Switching Modules) are not counted.

The following table provides the number of SMs versus TMS SHELF row requirements when TMS CONFIGURATION is "DUAL" and CM VINTAGE is 2. The number of rows required is tied to the number of TMSU packs required for the size of the (non-CDX) office (i.e., the number of SMs).

SMs vs. TMS Shelf Row Requirements for "DUAL" TMS Configuration

SMs	Rows Required
1 - 30	1 and 2.
31 - 62	1 through 4.

Copyright © 2003 Lucent Technologies

63 - 94	1 through 6.
95 - 126	1 through 8.
127 - 158	1 through 10.
159 - 190	1 through 12.

RSMs (Remote Switching Modules) are not counted.

The following tables apply to the TMS SHELF EQUIPAGE to support the range of TMSLINKS in an SM-2000 office for "SNGL" configurations.

TMS Shelf Row Requirements - SM2000 for "SNGL" TMS Configuration

TMS LINKs EQUIPPED (EVEN NLI TMS LINK 0)	TMS SHELF EQUIPAGE (row required)
2 - 31	1
32 - 61	2
62 - 93	3
94 - 125	4
126 - 157	5
158 - 189	6

RSMs (Remote Switching Modules) are not counted.

The following tables apply to the TMS SHELF EQUIPAGE to support the range of TMSLINKS in an SM-2000 office for "DUAL" configurations.

TMS Shelf Row Requirements - SM2000 for "DUAL" TMS Configuration

TMSLINKs Equipped (EVEN NLI TMS LINK 0)	TMS SHELF EQUIPAGE (row required)
2 - 61	1 and 2
62 - 125	3 and 4
126 - 189	5 and 6
190 - 253	7 and 8
254 - 317	9 and 10
318 - 381	11 and 12

The NCT EVEN LINK is defined on the EQNLI form (5853 Record).

The following table applies to required TMS SHELF EQUIPAGE rows required for specific ranges of TMSLINKS (NCT EVEN LINK) for an SM using the "SNGL" TMS configuration, CM VINTAGE is 2, and CM2 Compact is "N".

TMS Shelf Row Requirements - SM for "SNGL" TMS Configuration

TMS LINKs EQUIPPED (NCT EVEN LINK)	TMS SHELF EQUIPAGE (row required)
2 - 31	1
32 - 61	2
62 - 93	3
94 - 125	4
126 - 157	5
158 - 189	6

The NCT EVEN LINK is defined on the EQIM form (5700 Record).

Data Rules:

If CM VINT is 1, the TMS SHELF equipage must be blank. If CM VINT is 2, the TMS SHELF equipage is required.

The SIDE 0 and SIDE 1 values for UNIT NUMBER(s) 0 and 1, if entered, must all be the same, either "TMSU2" or "TMSU3".

CM2 Compact

Copyright © 2003 Lucent Technologies

The following field defines the location of the CM2 Compact.

- ***NOTE:*** These fields must be blank for CM3.

2.27 EQUIPMENT BAY

Description: Enter the CM2 Compact equipment location bay number.

Required Field.

Software Release: 5E9(1) and later
Valid Entries: 1, 2, 3, 4, or blank for CM3

Data Rules:

When VCDX OFFICE is set to "Y" on the EQCORE form and UNIT TYPE is set to "SM2000" on the EQIM form, EQNLI form must not be populated.

2.28 CM2C SM

Description: Enter the SM that the CM2 COMPACT resides on.

Software Release: 5E10 and later.
Valid Entries: 1 - 192, or blank for CM3

CMP

These fields are used to define elements of the Communication Module Processor.

2.29 #EXPANDED CMP/APR

Description: Is the Memory Expanded CMP equipped? This field indicates which CMP (Communications Module Processor) is equipped. For 5E8 and later, a memory-expanded CMP (TN1800) is available.

- ***NOTE:*** Recent Change implementation uses view 17.14 where the CLI field must be 1 and PC TYPE must be "CMP".

For 5E10 and later, the APR (Automatic Power Recovery) feature was added. For more information on APR, see Division 2, Section 2W.

With 5E12, the CMP runs out of core board memory if the TN1368 is used. Thus, the TN1800 is required for CM2 or the TN1871 is required for CM1.

- ***NOTE:*** For 5E14 and later, this field was moved from screen 1 to screen 3 in conjuction with the CMP Memory Expansion feature. See Division 2, Section 7AK and the NUMBER OF MEM BOARDS field.

Software Release: 5E10 and later.
Required Field.
Valid Entries: (see table below)

Valid EXPANDED CMP/APR Entries
Software Release: 5E10 and later

Entry	Description
APRONLY	APR (Automatic Power Recovery) is on, CMPME (CMP Memory Expanded) is off.
BOTH	APR is on, CMPME is on.
CMPMEONLY	APR is off, CMPME is on.
NEITHER	APR is off, CMPME is off.

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E10 and later, when EXPANDED CMP/APR is "APRONLY" or "BOTH", CM VINTAGE must be 2.

If "APRONLY" or "BOTH" is entered, and (for 5E15 and later) CM VINTAGE is 2, the bit number 10 (400h) for the CLI must be set on the EQPC form, where the bits are numbered from 0 - 31 and bit 0 is the right most bit.

For 5E14 and earlier, for a CM2 office, when the MESSAGE INTERFACE UNIT CLI on the EQCORE form and/or the TIME MULTIPLEX SWITCH CLI on the EQCORE form is 400 (bit number 10), or the NETWORK CLOCK UNIT CLI is 102 (bit 1 and bit 8; where the bits are numbered from 0 to 31 and bit 0 is the right most bit), EXPANDED CMP/APR must be "APRONLY" or "BOTH" on the EQCORE form.

For 5E15 and later, for a CM2 office, when the MESSAGE INTERFACE UNIT CLI on the EQCORE form and/or the EQTMS CLI is 400 (bit number 10), or the NETWORK CLOCK UNIT CLI is 102 (bit 1 and bit 8; where the bits are numbered from 0 to 31 and bit 0 is the right most bit), EXPANDED CMP/APR must be "APRONLY" or "BOTH" on the EQCORE form. The reverse is also true, that is, in a CM2 office, when EXPANDED CMP/APR is "APRONLY" or "BOTH", the aforementioned CLI values must be entered. Note that in 5E15, the TMS CLI was moved from the EQCORE form to the EQTMS form.

2.30 NUMBER OF MEM BOARDS

Description: This field is used to define the number of memory boards for the CM2. This field was added in conjunction with the CMP Memory Expansion feature. See Division 2, Section 7AK. This field is only valid for CM2 only.

Software Release: 5E14 and later
Valid Entries:

Valid NUMBER OF MEM BOARDS Entries

Entry	Description
2	Software Release: 5E13 to 5E14 retrofit and later: 1 TN1800, plus **2** TN1369s (CLI = 5).
3	Software Release: 5E14 and later 1 TN1800, plus **3** TN1369s (CLI = d); the third board is allowed, but is not required for 5E14 (future development).

Data Rules:

- **CAUTION:** When retrofitting from 5E13 to 5E14, the CMP is required to be equipped with at least two TN1369 boards **before** the retrofit. No ODA checks (i.e., error messages) are provided to test for the second TN1369 during retrofit. Although a third board can be provisioned, it is not required for the 5E14 Software Release. Note also that, for Recent Change, this entry is translated on RC view 17.14 by setting PC TYPE to "CMP", and entering the appropriate CLI value as indicated above.

CM3 ONTC

These fields are used to define or modify options associated with the ONTC (Office Network and Timing Complex) subunits.

2.31 IPDGN FILE

Description: The Input/Output Processor Diagnostic File Name field is a No Change field that contains the diagnostic image for the ONTC-IP.

Software Release: 5E15 and later

2.32 APDGN FILE

Description: The Application Processor Diagnostics File Name field is a No Change field for CM3 only, that contains the diagnostic image for the ONTC-AP.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later

2.33 IP FILE

Description: The Input/Output Processor File field is a No Change field for CM3 only, that contains the operational image for the ONTC-IP.

Software Release: 5E15 and later

2.34 AP FILE

Description: The Application Processor File field is a No Change field for CM3 only, that contains the operational image for the ONTC-AP.

Software Release: 5E15 and later

2.35 ROM FILE

Description: The Read Only Memory File field is a No Change field for CM3 only, that contains the ONTC-IP ROM, FPGAs, and the ONTC-AP debugger code.

Software Release: 5E15 and later

2.36 S0OSC0TBO

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later
Default: 0

2.37 S0OSC1TBO

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later
Default: 0

2.38 S1OSC0TBO

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later
Default: 0

2.39 S1OSC1TBO

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later
Default: 0

2.40 NC SYNC

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later

Copyright © 2003 Lucent Technologies

2.41 CORE

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later
Default: "O"

2.42 MSG SIZE

Description: This is a no display field used for retrofit purposes.

Software Release: 5E15 and later
Default: 6

SEC. 4: 5702 RECORD
MESSAGE INTERFACE CONTROL UNIT NETWORK CLOCK REFERENCE RECORD

NETWORK CLOCK REFERENCE FORM (EQNCREF)

1. GENERAL

The 5702 Record is available with the 5E1 and later Software Releases. It is used to define the Message Interface Control Unit Network Clock Reference status assignments for the TMS (Time Multiplexed Switch) system side.

This record is intended to be used as an Office Record for those 5ESS offices that are not utilizing an Operational Support System (e.g., RMAS) for generation of Office Records.

2. FORM AND RECORD ENTIRES

2.1 *SIDE

Description: Enter the Message Interface Control Unit/Time Multiplexed Switch System Side Number.
Valid Entries: 0 - 1

PRIMARY CLOCK

2.2 EQSTATUS

Description: Enter the Status of the Equipment.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

For new offices and units destined for factory testing, operational is the only allowed value. During off-line ODA database retrofits, the other values are valid.

If the office has a stand alone clock (indicated in the CLOCK TYPE field on the EQCORE form), EQSTATUS should indicate Unequipped.

2.3 INTERRUPT STATUS

Description: Enter the Interrupt-Inhibit Status.
Default: Allow
Valid Entries:

Valid INTERRUPT STATUS Entries

Entry	Definition
A	Allow.
I	Inhibit.

Data Rules:

If the office has a stand alone clock (indicated in the CLOCK TYPE field on the EQCORE form), INTERRUPT STATUS should indicate Inhibit.

SECONDARY CLOCK

2.4 EQSTATUS

Description: Enter the Status of the Equipment.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

For new offices and units destined for factory testing, operational or unequipped are only allowed values. During off-line ODA database retrofits, the other values are valid.

If the office has a stand alone clock (indicated in the CLOCK TYPE field on the EQCORE form), EQSTATUS should indicate Unequipped.

2.5 INTERRUPT STATUS

Description: Enter the Interrupt-Inhibit Status.
Default: Allow
Valid Entries:

Valid INTERRUPT STATUS Entries

Entry	Definition
A	Allow.
I	Inhibit.

Data Rules:

If the office has a stand alone clock (indicated in the CLOCK TYPE field on the EQCORE form), INTERRUPT STATUS should indicate Inhibit.

CROSS COUPLE CLOCK

2.6 EQSTATUS

Description: Enter the Status of the Equipment.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

For new offices and units destined for factory testing, operational or unequipped are only allowed values. During off-line ODA database retrofits, the other values are valid.

If the office has a stand alone clock (indicated in the CLOCK TYPE field on the EQCORE form), EQSTATUS should indicate Unequipped.

SEC. 5: 5703 RECORD
PERIPHERAL CONTROLLER RECORD - EQPC

1. GENERAL

The 5703 Record is available with the 5E1 and later Software Releases. It is used to define Peripheral Controller Configuration Data.

Both Sides 0 and 1 of the Peripheral Controller Message Switch are identically defined if the office is equipped with Communication Module 1. When the office is equipped with Communication Module 2, the Peripheral Controller Message Switch is defined as stated in Figure 2 .

The table in Figure 1 illustrates the relationship of the Peripheral Controllers to CTSs (Control Time Slots). Each SM (Switching Module) receives two CTS assignments, an even CTS on the even NCT link, and an odd CTS on the odd NCT link. The even CTSs, as shown in the table, are defined on the EQIM form (5700 Record) and not on this EQPC form. They are presented in this section because of the dependency of the CTSs on the Peripheral Controller. The following paragraphs describe the table.

A community is an MSPU (Message Switch Peripheral Unit) in the MSGS (Message Switch) cabinet. Two community numbers are given in the table, the community number for the even CTS, and in parentheses, the community number for the odd CTS. Each community provides up to four PCs (Peripheral Controllers).

Two Peripheral Controller numbers are given in the table, the PC number for the even CTS, and in parentheses, the PC number for the odd CTS. Each PC provides up to eight CTSs as shown. (The odd CTS is always one greater than the even CTS and is not shown in the table.)

PC numbers 8 and above are used to provide CTSs to SMs. They are also known as MMPs (Module Message Processors). The PC numbers for both the even CTS and the odd CTS must be entered on this EQPC form.

PC numbers 4 and 5 in Community 1 are for special use. PC 4 is for the PPC (Pump Peripheral Controller). PC 5 is for the FPC (Foundation Peripheral Controller). Both PC's 4 and 5 must be entered on this EQPC form.

For 5E9(2) and later, PC numbers 32 and 33 are for QGPs (QLPS (Quad-Link Packet Switch) Gateway Processors).

- ***NOTE:*** When an office is equipped with CM3 (Communication Module Model 3), all information will be handled directly by ODA (Office Data Administration) with no input from this form.

1.1 Recent Change View

The corresponding Recent Change Views for this form are 17.2 and 17.14.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SIDE

Description: Enter the Peripheral Controller Message Switch Side.

Required Field.
Valid Entries: 0 - 1

Copyright © 2003 Lucent Technologies

Data Rules:

This form can only be used in a non-CM3 office.

2.3 * PC NO.

Description: Enter the Peripheral Controller Number.

Required Field.

Valid PC NO. Entries

Entry	Definition
4	PPC (Pump Peripheral Controller)
5	FPC (Foundation Peripheral Controller)
8 - 31	MMP (Module Message Processors)
32 - 33	Software Release: 5E9(2) and later. QGP (QLPS (Quad-Link Packet Switch) Gateway Processor). Valid only with CM2.
40 - 63	MMP (Module Message Processors (MMP). Valid only with CM2.

Data Rules:

Zero, two, or four QGPs (QLPS Gateway Processors) may be equipped on a switch. If an EQPC form is defined with PC NO. set to 32 and SIDE set to 0, then another EQPC form must be defined with PC NO. set to 32 and SIDE set to 1; the opposite is also true. Both forms must have the same value for EQSTATUS. Both must be defined before other QLPS Gateway Processors can be defined.

If an EQPC form is defined with PC NO. set to 33 and SIDE set to 0, then another EQPC form must be defined with PC NO. set to 33 and SIDE set to 1; the opposite is also true. Both forms must have the same value for EQSTATUS.

A QLPS Gateway Processor can be defined on the EQPC form (PC NO. is 32 or 33) only if four EQQLPS forms (5854 Records) have been defined with the following key fields and with EQSTATUS set to "O".

ONTC SIDE	QLPS NETWORK
0	0
1	0
0	1
1	1

QLPS Gateway Processors for PC NO. 33 can be defined with EQSTATUS set to "O" only if QLPS Gateway Processors for PC NO. 32 are defined with EQSTATUS set to "O".

When EQPC forms are set to 32 or 33 (indicating QGWP Quad-link GateWay Processor), the QGWP field on the ECDOPT form must be set to "Y".

2.4 EQSTATUS

Description: Enter the Status of the Equipment.

Required Field.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

For new offices and units destined for factory testing, "O" (operational) is the only allowed value. During

Copyright © 2003 Lucent Technologies

offline ODA database retrofits, EQSTATUS may be "O" or "U" but not "G".

2.5 CLI

Description: Enter the Change Level Indicator of the Peripheral Controller. For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Field.
Default: 0
Valid Entries: 0 - 7FFFFFFF

Data Rules:

CLI must be specified whenever EQSTATUS is entered.

2.6 INTERRUPT STATUS

Description: Enter the Interrupt-Inhibit Status.

Required Field.
Default: A
Valid Entries:

Valid INTERRUPT STATUS Entries

Entry	Definition
A	Allow.
I	Inhibit Status.

SEC. 7: 5705 RECORD
REMOTE ALARM UNIT EQUIPAGE RECORD - EQRAU

1. GENERAL

The 5705 Record is available with the 5E1 Release 2 and later Software Releases. It is used to define the information on the RAU (Remote Alarm Unit). This is not an actual unit, but a board in the office alarm unit in the miscellaneous cabinet of a Remote Switching Module.

With 5E2 and later Software Releases this record defines the type of Alarm Unit for a Master Remote Switching Module that has the Alarm Output Option (RSM SITE OPTIONS form). There are two different Alarm Units, the RAU (Remote Alarm Unit) for 5A RSMs and the ASC (Alarm and Status Circuit) for MMRSMs (Multi-module RSMs).

1.1 Recent Change View

The corresponding Recent Change Views for this form are 18.1 and 18.14.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *REMOTE SWITCHING MODULE

Description: Enter the SM (Switching Module) for the Remote Switching Module.

Required Field.

Valid REMOTE SWITCHING MODULE Entries

Entry	Description
1 - 48	Offices equipped with CM1 (Communications Module 1).
1 - 192	Offices equipped with CM2.

2.3 ALARM TYPE

Description: Enter the Alarm Type for this Master Remote Switching Module with the Alarm Output Option (RSM SITE OPTIONS form).

Required Field.

Valid ALARM TYPE Entries

Entry	Description
ASC	Alarm and Status Circuit, applicable to new MMRSMs (Multi-module Remote Switching Modules).
RAU	Remote Alarm Unit

Data Rules:

For 5E9(1) and earlier, when ALARM TYPE is "ASC", RAU BAY and RAU VERTICAL must not be entered.

When ALARM TYPE is "RAU", RAU BAY and RAU VERTICAL must be entered.

For 5E9(2) and later, RAU BAY and RAU VERTICAL must be entered for any ALARM TYPE.

2.4 ASC/RAU STATUS

Description: Enter the status of the Remote Alarm Unit board.

Required Field.

Copyright © 2003 Lucent Technologies

Default: O
Valid Entries:

Valid ASC/RAU STATUS Entries

Entry	Description
G	Growth.
O	Operational. For new offices and units destined for factory testing, "O" is the only allowed value. During offline ODA data base retrofits, the other values are valid.
U	Unequipped.

Data Rules:

For new offices and equipment additions, only "O" is allowed.

2.5 ASC/RAU CLI

Description: Enter the Change Level Indicator for the Remote Alarm Unit board.

Required Field.
Valid Entries: 0 - 7FFFFFFF

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.6 RAU BAY

Description: Enter the Miscellaneous Frame Number on which the OAU (Office Alarm Unit) is mounted.

Required Field for 5E9(2) and later.
Valid Entries: 0 - 2

Data Rules:

For 5E9(1) and earlier, when ALARM TYPE is ASC, then this field should be left blank.

When ALARM TYPE is "RAU", then this field must be entered.

For 5E9(2) and later, RAU BAY and RAU VERTICAL must be entered for any ALARM TYPE.

2.7 RAU VERTICAL

Description: Enter the vertical equipment location of the bottom of the OAU (Office Alarm Unit) in which the RAU (Remote Alarm Unit) is located.

Required Field for 5E9(2) and later.
Valid Entries: 0 - 84

Data Rules:

For 5E9(1) and earlier, if ALARM TYPE is "ASC", then this field should be left blank.

When ALARM TYPE is "RAU", then this field must be entered.

For 5E9(2) and later, RAU BAY and RAU VERTICAL must be entered for any ALARM TYPE.

For 5E9(2) and later,when VCDX OFFICE is "Y" on the EQCORE form (5701 Record), this field must be 69 or 76.

2.8 ASC/RAU AISLE

Description: Enter the floor and aisle location of the miscellaneous cabinet in which the office alarm unit is

Copyright © 2003 Lucent Technologies

located. The valid floor range is 00 - 99. The valid aisle range is 00 - 99.

Required Field.
Valid Entries: 0000 - 9999

```
eqrau                    5ESS Switch                    _

SEC. 8: 5706 RECORD
ECD OPTIONS FORM - ECDOPT

1. GENERAL

The ECDOPT form (Equipment Configuration Database Options) (5706 Record) is applicable to (and required for) all offices. It is required to translate all options in the AM (Administration Module) for initial offices. The translations include:

- The CC (Central Control) Unit
- The office disk system
- The IOPs (Input/Output Processors)
- The VIOPs (Virtual Input/Output Processors)
- The CNI (Common Network Interface) equipment
- The AM interface in the CM2 (Communications Module 2)
- The AM interface in the CM2C/CDX (Compact Digital Switch)

This form reflects the current hardware configuration of the system and describes the attributes and status of all processor and peripheral hardware entered into the UNIX-RTR (Real Time Reliable) Operating System, formerly DMERT (Duplex Multiple Environment Real Time). The fields on this form indicate which items are equipped and, in some cases, the type of equipment used. In effect, this form links the 5ESS to the UNIX-RTR Operating System.

The reproducible 5706 Record has been expanded into the 5706-1/2 Records to provide adequate space for data entry. The records may be reproduced and used as needed. However, if this record is requested in the ODA database using the "records" command, the screen image of the input form will be printed instead of the tabularized records that appear in Figures 1 and 2.

1.1 FLEXIBLE INPUT/OUTPUT PROCESSOR

Available with the 5E4(2) and later Software Releases, Flexible IOP selection is used to define the Input/Output Processor devices associated with the 5ESS Switch.

1.2 SCSI BUS DISK INTERFACE

The 5E6 Software Release introduces the SCSI Bus disk interface which can either replace or co-exist with the SMD (Storage Module Device) disk interface.

1.3 RETROFIT OFFICES

Retrofit offices are modified via the RETINFO form (5845 Record). This form provides an ordering mechanism for Disk Configurations and Optional Disk Layouts in a retrofitting office. For more information about RETINFO, consult the TG-5 Translation Guide, Division 8, Section 47.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL UNIT, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 *KEY

Description: The only valid entry is 0 and is supplied as the default value.

2.3 #AT&T LONG DISTANCE

Description: Specifies whether the office is an AT&T Office with NID (Network ID) 254 or 236. An answer of YES implies long distance. This field is used to determine which temporary CNI (Common Network Interface) data files will be supplied to the CNI database.

Software Release: 5E12 and later
Valid Entries: Y, N

2.4 #CUSTOMER TYPE

Description: This field indicates whether the office is owned by NSD (Network Services Division) or a LEC (Local Exchange Carrier). This field is used to determine which temporary CNI (Common Network Interface) data files will be supplied to the CNI database.

Software Release: 5E5 through 5E11
Required Field.
Valid Entries:

Valid CUSTOMER TYPE Entries

Entry	Definition
NSD	Network Services Division
LEC	Local Exchange Carrier

2.5 #TIME ZONE

Description: Enter the Time Zone in which the 5ESS Switch is located. This entry reflects the hour difference from GMT (Greenwich Mean Time).

Valid TIME ZONE Entries

Entry	Definition
-12 through +12	Hours different from GMT.
EST or -5	Eastern Standard Daylight Time.
CST or -6	Central Standard Daylight Time.
MST or -7	Mountain Standard Daylight Time.
PST or -8	Pacific Standard Daylight Time.
-5S	Software Release: 5E5 and later. Eastern Standard Time (no Daylight Savings Time).
-6S	
-7S	
-8S	

Data Rules:

The TIME ZONE entered on the ECDOPT form must equal the TIME ZONE entered on the OFCOPT form (5509 Record).

2.6 #VCDX

Description: This field specifies if this switch is a Very Compact Digital Exchange.

The 5ESS-2000 Switch VCDX switch is built on the 5ESS-2000 Switch platform. Most of the features supported by the 5ESS-2000 Switch are supported by the VCDX switch. The VCDX switch can meet market need for a highly reliable, very small switch, at a competitive price.

The VCDX switch uses only one SM and a simplex workstation. The workstation provides the AM/CM/CMP functionality. All call processing software runs on the SM (that is, it does not rely on the

Copyright © 2003 Lucent Technologies

AM/CM/CMP) and therefore is not dependent on the simplex workstation.

Software Release: 5E9(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If VCDX is "Y",

- DEVICE TYPES can only be "TTY9-14", " SDL0" and "SDL13".

For 5E10 - 5E13, if VCDX is "Y", DEVICE TYPES can only be "TTY7", "TTY9 -14", "TTY21", "TTY43", " SDL0" and "SDL13".

For 5E14 and later, if VCDX is "Y", DEVICE TYPES can only be "TTY7, 9-14, 18-19, 21, 26-34, 43, 50", "SDL 0, 1, 13".

VCDX/SPC Device Type Restrictions - 5E9(2)

SPC CARD PORT	IOP/PC/SLOT/P	CONTROLLER	DEVICE
2	0232 or SPC2	TTYC11	TTY9
3	0233 or SPC3	TTYC11	TTY10
4	0302 or SPC4	TTYC12	TTY11
5	0303 or SPC5	TTYC12	TTY12
6	0312 or SPC6	TTYC13	TTY13
7	0313 or SPC7	TTYC13	TTY14

VCDX/SPC Device Type Restrictions - 5E10 - 5E11

HSI CARD PORT	IOP/PC/SLOT/P	CONTROLLER	DEVICE
0	2002	SDLC0	SDL0
1	2012	SDLC1	SDL13
2	2022	SDLC2	SDL1
3	2023	SDLC3	SDL6

When VCDX is "Y":

- CM TYPE must not be entered.
- PROCESSOR MEMORY SIZE must be 64.
- PROCESSOR MODEL must be "WORKSTATION".
- IOMI BOARDS must be 1.
- UTIL CKT must be "N".
- RPCN000,320 must be "N".
- MHD4,5 through MHD15 must all be "N".
- SCC O must be "N" and SCC 1 must not be entered.
- MTO must be "DAT".
- MT1 must not be entered.
- IOP2 must be "Y" and IOP3 must be "N".
- For 5E9(2) through 5E13, SCSDC1 through SCSDC1011 must all be "N".
- CLLI must not be entered.
- COLORSCAN2 LINE COUNT must be 24.
- AM ODD MEMORY SIZE must be
  - 6144 (5E11 and earlier).
  - 9216 (5E12).
  - 10240 (5E13 and later).
- MCC BOARD TYPE must be "TN983".

For 5E13 and later:

When VCDX is "Y",

- ALT BOOT DSK must be "N".

Copyright © 2003 Lucent Technologies

- PROCESSOR MEMORY SIZE must be 128.

For 5E14:

NOTE: TTYs are no longer fixed to a port.

When VCDX is "Y":

- SCSDC0 through SCSDC1011 must all be N.
- MCC BOARD TYPE must be UN597. UN597 is the only legal value in 5E14.1. TN983 is no longer valid.
- DEVICE TYPEs can only be "TTY(7, 9-14, 18-19, 21, 26-34, 43, 50)", "SDL0", "SDL1", or "SDL13".

For 5E15 and later:

NOTE: TTYs are no longer fixed to a port.

When VCDX is "Y":

- SCSDC0 through SCSDC1011 must all be N.
- MCC BOARD TYPE must be UN597. UN597 is the only legal value in 5E14.1. TN983 is no longer valid.
- DEVICE TYPEs can only be "TTY(7, 9-14, 18-19, 21, 26-34, 43, 50)", "SDL0", "SDL1", "SDL6" , or "SDL13".
- When DEVICE TYPE is "SDL6", the DEVICE CONTROLLER must be "SDLC3".
- When DEVICE TYPE is "SDL6" the IOP/PC/SLOT/P entry must be 2032.

For 5E13 and later:

When VCDX is "N",:

- CM TYPE must be entered.
- PROCESSOR MEMORY SIZE must be a minimum of:
  - 40 for 5E9(1) - 5E10
  - 48 for 5E11
  - 64 for 5E12 - 5E13
  - 128 for 5E14 and later
- PROCESSOR MODEL must be "3B21D".
- SCSDC1, SCSDC2, SCSDC3 and SCSDC45 must all be "Y".
- AM ODD MEMORY SIZE must be 10240 (5E12 and later)

Copyright © 2003 Lucent Technologies

For 5E15 and later:

When VCDX is "N" and CM TYPE is not "CM3", SCSDC45 must be "Y".

When VCDX is "N" , SCSDC1, SCSDC2, and SCSDC3 must all be set to "Y".

2.7 DRM

Description: Is this a Distinctive Remote Module?

For more information on this feature see Division 2, Section 4A525.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When DRM is "Y", DEVICE TYPEs can only be "TTY(7, 9-14, 18-19, 21, 26-34, 43, 50)", "SDL0", "SDL1", or "SDL13".

DRM/SPC Device Type Restrictions - 5E14 and later

SPC CARD PORT	IOP/PC/SLOT/P	CONTROLLER	DEVICE
2	0202	TTYC11	TTY
3	0203	TTYC11	TTY
4	0212	TTYC12	TTY
5	0213	TTYC12	TTY
6	0222	TTYC13	TTY
7	0223	TTYC13	TTY

DRM/HSI Device Type Restrictions - 5E14 and later

HSI CARD PORT	IOP/PC/SLOT/P	CONTROLLER	DEVICE
0	2002	SDLC0	SDL0
1	2012	SDLC1	SDL13
2	2022	SDLC2	SDL1

When DRM is "Y":

- VCDX must be "N".
- AM ODD MEMORY SIZE must be 10240.
- PROCESSOR MODEL must be "WORKSTATION".
- CM TYPE must not be entered.
- IOMI BOARDS must be 1.
- UTIL CKT must be "N".
- RPCN000, 320 must be "N".
- MHD4, 5 through MHD15 must all be "N".
- SCC O must be "N" and "SCC 1" must not be entered.
- MTO must be "DAT".
- MT1 must not be entered.
- IOP2 must be "Y" and IOP3 must be "N".
- SCSDC0 through SCSDC1011 must all be "N".

Copyright © 2003 Lucent Technologies

- CLLI must not be entered.
- COLORSCAN2 LINE COUNT must be 24.
- ALT BOOT DSK must be "N".

When DRM is N:

- and VCDX is "N", CM TYPE must be entered.
- and VCDX is N, an IOP/PC/SLOT of 030 is not allowed.
- and VCDX is "N", PROCESSOR MODEL must be "3B21D".
- and VCDX is "N", SCSDC0, SCSDC1, SCSDC2, SCSDC3, SCSDC45 must all be "Y".
- and VCDX is "N", AM ODD MEMORY SIZE must be 10240.
- VIOP/PC/SLOT/P must not be entered.
- VIRTUAL DEVICE CONTROLLER must not be entered.
- VIRTUAL DEVICE TYPE must not be entered.

2.8 VCDX ADDL SERIAL PORTS

Description: Is this office equipped with additional VCDX serial ports? For 5E14 and later, this field is replaced by the ADDL SERIAL PORTS field.

Software Release: 5E12 through 5E13
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When VCDX ADDL SERIAL PORTS is "Y", VCDX must be "Y".

When VCDX is "Y" and VCDX ADDL SERIAL PORTS is "Y":

- DEVICE TYPEs can only be TTY: 7, 9-14, 18-19, 21, 28-34, 43, 50, SDL0 and SDL13.
- VCDX/SPC/ADDL SERIAL PORTS restrictions are provided in the following table:

VCDX/SPC Additional Serial Ports Device Type Restrictions - 5E12 - 5E13

SPC CARD PORT	IOP/PC/SLOT/P	CONTROLLER	DEVICE
0	0232	TTYC14	TTY18 TTY28
1	0233	TTYC14	TTY19 TTY29
2	0302	TTYC15	TTY30
3	0303	TTYC15	TTY31
4	0312	TTYC16	TTY32
5	0313	TTYC16	TTY33
6	0322	TTYC17	TTY34
7	0323	TTYC17	TTY50

Copyright © 2003 Lucent Technologies

2.9 ADDL SERIAL PORTS

Description: Is this office equipped with additional serial ports? This field replaced the VCDX ADDL SERIAL PORTS field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

For 5E14 and later, when ADDL SERIAL PORTS is "Y", VCDX must be "Y", or DRM must be "Y".

When VCDX or DRM is "Y" and ADDL SERIAL PORTS is "Y", DEVICE CONTROLLER can only be "TTYC(11-17)", "SDLC0", "SDLC1" or "SDLC2".

When VCDX or DRM is "Y" and ADDL SERIAL PORTS is "N", DEVICE CONTROLLER can only be "TTYC(11-13)", "SDLC0", "SDLC" or "SDLC2".

When VCDX or DRM is "Y", DEVICE TYPEs can only be "TTY(7, 9-14, 18-19, 21, 26-34, 43, 50)", "SDL0", "SDL1", or "SDL13".

VCDX AND DRM/SPC Additional Serial Ports Device Type Restrictions - 5E14 and later

SPC CARD PORT	IOP/PC/SLOT/P	CONTROLLER	DEVICE
0	0232	TTYC14	TTY
1	0233	TTYC14	TTY
2	0302	TTYC15	TTY
3	0303	TTYC15	TTY
4	0312	TTYC16	TTY
5	0313	TTYC16	TTY
6	0322	TTYC17	TTY
7	0323	TTYC17	TTY

2.10 AIR EXTENSION

Description: Is the office equipped with Air Extension?

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

Data Rules:

When AIR EXTENSION is "Y", VCDX must be "Y".

2.11 CM TYPE

Description: Enter the Communication Module Type.

Required Field: 5E9(1) and earlier
Default:

For 5E6 - 5E8: 2
For 5E9(1) and later: CM2
For 5E15 and later: CM3

Valid Entries:

Valid CM TYPE Entries, 5E6 - 5E8

Entry	Definition
1	Communication Module 1.
2	Communication Module 2.

Copyright © 2003 Lucent Technologies

Valid CM TYPE Entries - 5E9(1) and later	
Entry	**Definition**
CM2	Communication Module 2.
CM2C	Communication Module 2, Compact. (for CDX (Compact Digital Switch).

Valid CM TYPE Entries -5E15 and later	
Entry	**Definition**
CM3	Communication Module 3.

Data Rules:

For 5E4(2) and later, the value of CM VINTAGE on the EQCORE form (5701 Record) and the value of CM TYPE on the ECDOPT form must be the same.

For 5E8 and earlier:
If CM TYPE is 1, EQUIPMENT BAY on the EQCMTRCU form (5812 Record) must be between 0 and 7.

For 5E4(2) and later, if LN002,322 is "Y", this field must be 2 (or CM2).

For 5E9(1) and later, if CM TYPE is "CM2":

- EQUIPMENT BAY on the EQCMTRCU form (5812 Record) must be between 0 and 7.
- CM VINTAGE on the EQCORE form must be 2.
- the TIME MULTIPLEX SWITCH CLI on the EQCORE form must be 20.

For 5E9(2) and later, if CM TYPE is "CM2C":

- NLI 0/1 CLI on the EQCORE form must have bit 1 set (0x2).

For 5E10 and later:

- if CM TYPE is "CM2C", CM2C COMPACT on the EQCORE form must be "Y".

For 5E12 and later, if CM TYPE is "CM2C":

- NLI 0/1 CLI on the EQNLI form must have bit 1 set (0x2).

For 5E15 and later, when CM TYPE is CM3:

- IOMI BOARDS must be blank.
- QGWP must be "Y".

WARNING: For 5E15 and later, CM TYPE "CM2" and "CM2C" are being replaced with the "CM3".

2.12 #IOMI BOARDS

Description: Enter the number of IOMI (Input/Output Microprocessor Interface) Boards equipped.

Required Field.
Valid Entries: 1 - 4 (boards)

Data Rules:

If the CM TYPE is 1, the entry in this field must be less than 3.

If at least one EQIM form (5700 Record) is entered, the IOMI BOARDS field on the ECDOPT form and the number of EQIM forms submitted must correspond to the following table:

IOMI BOARDS	Number of EQIM Forms
1	1 - 32
2	33 - 96
3	97 - 160
4	161 - 192

2.13 #QGWP

Description: Is the office equipped with a Quad-link GateWay Processor?

Software Release: 5E9(2) and later.
Default: N
Valid Entries: Y, N

Data Rules:

If QGWP is "Y", CM TYPE must not be "CM2C" and IOMI BOARDS must be greater than 1.

When QGWP is "Y" an EQPC form (5703 Record) must be defined with PC NO equal to 32 or 33 (i.e., QGWP).

For 5E15 and later:

When QGWP is "Y", CM TYPE must be "CM2" or "CM3".

When QGWP is "Y" and CM TYPE is "CM2",

- IOMIBRDS must be greater than 1.
- SCSDC45 must be "Y".

2.14 #PROCESSOR MODEL

Description: The PROCESSOR MODEL field specifies the Administrative Module equipped. For 5E9(1) and later, the 3B21D replaced the 3B20D for all new start offices. For 5E9(1) and earlier, this is a non-entry field. For 5E9(2) and later, this is a required field.

Required Field

Software Release: 5E9(2) and later.
Default: For 5E9(2) and later: 3B21D
Valid Entries:

Valid PROCESSOR MODEL Entries - 5E9(2) and later

Entry	Definition
3B21D	Model 3B21D Processor.
WORK STATION	Workstation used with VCDX (Very Compact Digital Exchange) or DRM (Distinctive Remote Module).

2.15 AUTO PWR RCVY

Description: Is the office equipped with Automatic Power Recovery?

See Division 2, Section 2W for more information on APR.

Copyright © 2003 Lucent Technologies

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, PROCESSOR MODEL must be "3B21D".

2.16 #PROCESSOR MEMORY TYPE

Description: Enter the type of memory board in the 3B Processor.

Required Field.
Default:

- For 5E4(2) and 5E5: TN56
- For 5E6 - 5E8: TN2012
- For 5E9(1) and later: KLW (non-entry)

Valid Entries:

Valid PROCESSOR MEMORY TYPE Entries - 5E4(2) and later

Entry	Definition
1 or TN56	Main Store Memory (UN59C or UN618 packs; 2MB).
2 or TN2012	Main Store Memory (UN618 packs; 4MB).
KLW	Software Release: 5E9(1) and later. "KLW" identifies a family of circuit packs.

Data Rules:

For 5E4(2) and later, if the entry in this field is "TN2012", the UN618 field on this form must be "Y".

2.17 #PROCESSOR MEMORY SIZE

Description: Enter the size of memory (in megabytes) of the Processor.

Required Field.
Default:

- For 5E5 - 5E8: 32
- For 5E9(1)-5E10: 40
- For 5E11 and later: 48
- For 5E12 and later: 64

Valid Entries:

- For 5E5 - 5E8: 32 or 36
- For 5E9(1): 40 (non-entry)
- For 5E9(2) - 5E10: 40 or 64
- For 5E10: 40, 48, 64, or 128
- For 5E11: 48, 64, or 128

  For 5E12 and 5E13: 64, or 128
- For 5E14 and later: 128

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E6 and later, if the PROCESSOR MEMORY TYPE is "TN56", the PROCESSOR MEMORY SIZE must not be greater than 32. If this field is 36, UN618 must be "Y" and PROCESSOR MEMORY TYPE must be "TN2012".

2.18 #UTIL CKT

Description: Is the dual Utility Circuit, equipped? For 5E6 - 5E8 the UN516 circuit pack is used. For 5E9(1) and later the UN379 circuit pack is used.

Software Release: 5E6 and later
Required Field.
Valid Entries: Y, N

2.19 #AM ODD MEMORY SIZE

Description: This field indicates the amount of memory (in kilobytes) to be reserved for the ODD (Office Dependent Data).

Required Field.
Default:

5E15 and earlier: 10240

5E16 and later: 16384

Valid Entries: (see table)

Valid AM ODD MEMORY SIZE Entries

Software Release	VCDX	3B21	DRM
5E9(2) - 5E11	6144	3584	-
5E12	9216	10240	-
5E13	10240	10240	-
5E14 - 5E15	10240	10240	10240
5E16 and later	16384	16384	16384

Data Rules:

The entry in this field must equal the AM ODD MEMORY SIZE entry on the OFCOPT form.

For 5E16 and later:

- When VCDX is "Y", AM ODD MEMORY SIZE must be "16384".
- When DRM is "Y", AM ODD MEMORY SIZE must be "16384".
- When VCDX is "N" and DRM is "N", AM ODD MEMORY SIZE must be "16384".

2.20 #DFC BOARD

Description: This field indicates the Disk File Control Board. Added in 5E11, this field was removed as a 5E12 Software Update.

Software Release: 5E11 - 5E12 Required Field.
Default: UN580B
Valid Entries: UN580 or UN580B

2.21 #DISK DRIVE TYPE

Copyright © 2003 Lucent Technologies

Description: Enter the type of Disk Drive in the office.

Required Field.

Valid DISK DRIVE TYPE Entries - 5E6

Entry	Definition
1 or SCSI600	Small Computer Systems Interface.
2 or SCSI322	Small Computer Systems Interface.
3 or CDC340	340 Mb disk.
4 or CDC300	Control Data 300MB drive (KS-22048, L1).

Valid DISK DRIVE TYPE Entries - 5E7

Entry	Definition
1 or SCSI600	600 Mb Small Computer Systems Interface.
2 or CDC340	340 Mb disk.
3 or SCSI322	300 Mb Small Computer Systems Interface.

Valid DISK DRIVE TYPE Entries - 5E8

Entry	Definition
1 or SCSI600	600 Mb Small Computer Systems Interface.
2 or 3.5I_SCSI	3.5 inch format.

- ***NOTE:*** Effective for 5E6 - 5E8 new ship offices, SCSI600 is the only valid DISK DRIVE TYPE entry. Effective for 5E9(1) through 5E13 new ship offices, "SCSI1GB" (1000 MB) is the only valid DISK DRIVE TYPE entry. For 5E14 and later "SCSI2GB" is the only valid DISK DRIVE TYPE.

Valid DISK DRIVE TYPE Entries

Entry	Definition
SCSI1GB	5E9(1) through 5E13: One gigabyte (1000 Mb).
SCSI2GB	5E14 and later: Two gigabyte(2000 Mb).

2.22 #UN618

Description: Does the memory controller have UN618 or UN59C memory controller boards installed? A "Y" in this field indicates UN618 installed; "N" implies UN59C installed.

- ***NOTE:*** For 5E9(1) and later, with the implementation of the 3B21D processor, this field is not used.

Software Release: 5E4(2) - 5E8
Required Field.
Valid Entries: Y, N

Data Rules:

If the PROCESSOR MEMORY TYPE field is "TN2012", this field must be "Y".

If "N" is entered, "TN56" must be entered in the PROCESSOR MEMORY TYPE field.

CNI EQUIPAGE

The following fields (Section 2.23 - Section 2.25) are used for the Common Network Interface equipment.

2.23 #RPCN000,320

Description: Is the CNI Ring Processor Control Node equipped?

This field (two fields prior to 5E5) determines if the RPCN (Ring Processor Control Nodes) are equipped; they are directly linked to the LINK NODE 001/LINK NODE 326 fields.

Required Field.

Data Rules:

Copyright © 2003 Lucent Technologies

A toll office must have RPCN000,320 equipped. If RPCN000,320 is "Y", at least one Link Node pair must be equipped (LN001,321 through LN006,326).

RPCN000,320 must be equipped before LN001,321 through LN006,326 can be assigned.

If COMMON CHAN SIG on the OFCOPT form is "Y", RPCN000,320 must be equipped (and vice versa).

For 5E8 and earlier, if RPCN000,320 is equipped, DSCH CHANNEL 12 must be equipped.

WARNING: For 5E15 and later, RPCN000,320 is not supported with CM TYPE of "CM3".

2.24 LINK EQUIP

Description: This field determines if the Link Nodes are equipped. With 5E9 (1) and earlier, 5 link node pairs can be provided. With 5E9(2) and later, the maxium number of link nodes is increased to 19 pairs.

Link Nodes are 4.8 or 56 kbs "A-links" to an STP (Signal Transfer Point) and are used for a CNI (Common Network Interface) ring associated with CCS (Common Channel Signaling). Link Nodes are equipped in pairs. For example, LN001 and LN321 equals one pair, etc. Link Node pairs are assigned in the same manner (LN001 and LN321; LN002 and LN322, etc.)
Default: N
Valid Entries: Y, N

2.25 LINK NODE USEAGE

Description: This field defines the way the CNI node operates.

Software Release: 5E3 and later.
Valid Entries:

Valid LINK NODE USEAGE Entries

Entry	Definition
4.8kbs	Software Release: 5E9(1) and earlier. Low-speed signaling link; connects to transmission equipment.
1 or 56kbs	High-speed signaling link; connects to transmission equipment.
IUN	Software Release: 5E9(1) and earlier. Interface Process Message Switch User Node.
DLN	Software Release: 5E3 and later. Direct Link Node; connects to switch; restricted to node 2 only.

Data Rules:

Link Node assignments must conform to the recommended CNI (Common Network Interface) ring configurations (as reflected in the Allowable Node Configuration table below). Nodes cannot be added randomly into the CNI ring, but rather, must be planned carefully to allow for graceful future growth.

For 5E9(1) and earlier, the chart below indicates the allowable equipped node (LN00*32*) configurations. All other node configurations are invalid. The 0 in the left column of the table indicates that RPCN000,320 is equipped (an entry of "Y" in the RPCN000,320 field). 1 through 6 indicate entries of "Y" in fields LN001,321 through LN006,326, respectively.

Allowable Node Configurations

0	1					
0	1		3			
0		2	3			
0	1	2	3			
0	1	2	3			6
0	1	2	3		5	6
0	1	2	3	4	5	6

The following rules reflect the node configurations reflected in the table above.

Copyright © 2003 Lucent Technologies

If LN002,322 is equipped, the LINK NODE USEAGE must be "DLN".

If LN001,321, LN003,323, LN004,324, LN005,325 or LN006,326 are equipped, the corresponding LINK NODE USEAGE must be either "4.8KBS", "56KBS" or "IUN" (and not "DLN").

If either LN001,321, LN002,322, LN003,323, LN004,324, LN005,325 or LN006,326 are not equipped, the corresponding LINK NODE USEAGE must not be entered.

RPCN000,320 must be equipped if LN001,321 through LN006,326 are to be equipped.

If LN002,322 is equipped, LN004,324 must be equipped.

If LN004,324 is equipped, LN005,325 must be equipped.

If LN005,325 is equipped, LN006,326 must be equipped.

If LN006,326 is equipped, LN001,321 through LN003,323 must be equipped.

For 5E9(2) and later, if the Link Node is equipped, LINK NODE USEAGE must be provided.

If the Link Node is unequipped, then the LINK NODE USEAGE field must be blank.

If RPCN000,320 is not equipped. LN004,324 must not be equipped.

If RPCN000,320 is equipped. At least LN004,324 must be equipped.

Link Nodes must be added in the sequence depicted in the following table.

Link Node Equipage Sequence

Equipage Sequence	Link Node
1 (first)	LN004,324
2	LN003,323
3	LN002,322
4	LN001,321
5	LN018,338
6	LN017,337
7	LN016,336
8	LN015,335
9	LN014,334
10	LN013,333
11	LN012,332
12	LN011,331
13	LN028.348
14	LN027,347
15	LN026,346
16	LN025,345
17	LN024,344
18	LN023,343
19	LN022,342
20 (last)	LN021,341

NOTE: If LN001,321 is entered, LN003,323 is required to be equipped instead of LN002,322.

TCP/IP DATALINK SELECTION

The following field Section 2.26 is used to describe the type of link used.

2.26 TRFM RNM OPT

Description: The value of this field indicates which type of link is used for the TCP/IP link.

Software Release: 5E15 and later

Copyright © 2003 Lucent Technologies

Default: NONE
Valid Entries:

Valid TRFM RNM OPT Entries - 5E15 and later

Entry	Definition
BOTH	TRFM and RNM links are the TCP/IP links.
NONE	No TCP/IP links.
RNM	Remote Network Management Link is the TCP/IP link.
TRFM	Traffic Measurement Link is the TCP/IP link.

Data Rules:

When TRFM RNM OPT is "BOTH", "RNM" or "TRFM", DRM must be "Y".

When TRFM RNM OPT is set to "BOTH", "RNM" or "TRFM", then the ACT field for SFID 532 must be set to "Y" on the SFSYS form (5713-1 Record).

The TRFM RNM OPT entered must be equal to the TRFM RNM OPT on the OFCOPT form (5509 Record).

2.27 CLLI

Description: Enter the CLLI (Common Language Location Identifier). The CLLI uniquely identifies existing and proposed buildings which contain personnel and/or equipment, and certain customer locations.

The format for CLLI is as follows:

Valid CLLI Entries

Entry	Definition
PLACE	Character positions 1 through 4.
STATE	Character positions 5 and 6.
BUILDING	Character positions 7 and 8.
ENTITY	Character positions 9 through 11.

Example CHCGILMOCO Entry

Entry	Definition
CHCG	PLACE (Chicago)
IL	STATE (Illinois)
MO	BUILDING (Monroe)
CO	ENTITY (Control Group 0)

For more detailed information on Common Language Location Identifiers, refer to Practice 795-100-100.

2.28 #DISK CONFIG

Description: This field determines the Disk Size.

Required Field.
Valid Entries:

- 5E3 through 5E6: 300A, 340A, 340B and 340C
- 5E7: 340A, 340B, 340C
- 5E8 - 5E9(2): 66 (non-entry)
- 5E10 through 5E13: 11 (non-entry)
- 5E14 - 5E15: 21 (non-entry)
- 5E16 and later: 22 (non-entry)

- ***NOTE:*** The "11" DISK CONFIG entry may be referred to as "1010" in other 5ESS Switch documentation.

The appropriate disk configuration for an office is based on formulas in 5E DOPS which relate to total SM ODD size and AMA requirements of the office. Related information is entered in ODD DISK SIZE on the OFCOPT form.

Copyright © 2003 Lucent Technologies

The relationship between the DISK CONFIGURATION and the ODD DISK SIZE is as follows:

Valid DISK CONFIGURATION Entries

Software Release	Values	ODD DISK SIZE on OFCOPT form
5E5	300A, 340A	14000
	340B	20000
	340C	24000
5E6	300A, 340A	
	340B, 340C	24000
5E7	340A	
	340B, 340C	8992
5E8	SCSI600	8992
5E9(1) through 5E13	SCSI1GB	8992
5E14 and later	SCSI2GB	11600

MOVING HEAD DISKS - MHD 0-15

- ***NOTE:*** TOTAL SIZE IN MEGABYTES

  The fields SM ODD, AMA and DISK ODD (KB) are not enterable. The data in these fields are calculated internally from the DISK CONFIGURATION and MOVING HEAD DISKS fields (MHD 0-15).

  Refer to the 5E DOPs Users Guide (5D5-060-100) for more information.

The MHD fields (Section 2.29 - Section 2.30) are used indicate the equipage of Moving Head Disks. For 5E6 - 5E8, the MHD fields consist of two columns, "EQUIPAGE" and "OPTIONING". The values entered into these two fields are dependent upon the value entered into the DISK CONFIGURATION field. Fields MHD 0 through MHD 13 must be assigned in pairs (such as MHD 0,1 and MHD 4,5).

A minimum of two pairs of disks are required. "Y" must always be entered in the MHD0,1 EQUIPAGE and MHD2,3 EQUIPAGE fields.

All information must be entered in sequence. For example, if "Y" is entered in the MHD6,7 EQUIPAGE field, "Y" must be entered in the MHD4,5 EQUIPAGE field.

- ***NOTE:*** There is no OPTIONING field associated with the SCSI322 and SCSI600 DISK EQUIPAGE field for MHD 14, 15 because these are on-line spares which are not required to be equipped in sequence with, or in relation to, MHD0,1 thru MHD12,13 or MHD16,17 thru 30,31. MHD 14 provides an on-line backup for disk 0; disk 15 provides an on-line backup for disk 1.

2.29 OPTIONING

Description: The name of this field was changed to PCT SMODD/AMA (Percent Switching Module Office Dependent Data/Automatic Message Accounting) in 5E8. See PCT SMODD/AMA below for usage information.

2.30 PCT SMODD/AMA

Description: The PCT SMODD/AMA (disk optioning) column sets the use of disk memory.

For 5E6 and 5E7, multiple disk optioning (1,2, or 3) is supported in all 340 configurations for DISK CONFIGURATIONs "340A", "340B" or "340C". Other than the minimum required disk pairs (MHD0,1 and MHD2,3), additional disks can be configured as indicated in the 5E6 and 5E7 valid entries below.

For 5E8 and later, 8992 is the only valid DISK CONFIGURATION. Valid disk optioning (1 - 5) is indicated in the 5E8 and later valid entries below.

Software Release: 5E6 and later.

Copyright © 2003 Lucent Technologies

Required Field.
Default:

- For MHD0,1: R
- For MHD2,3: R

NOTE: MHD0,1 and MHD2,3 cannot be entered.

Valid Entries:

Valid PCT SMODD/AMA Entries
5E6 - 5E7

Entry	Definition
blank	Unknown disk optioning.
R	Required.
1	AMA (Automatic Message Accounting).
2	Half AMA/half ODD (Office Dependent Data).
3	ODD (Office Dependent Data).

Valid PCT SMODD/AMA Entries
5E8 - 5E9(2)

Entry	Definition
1	00% SMODD; 100% AMA.
2	25% SMODD; 75% AMA.
3	50% SMODD; 50% AMA.
4	75% SMODD; 25% AMA.
5	100% SMODD; 0% AMA.

Valid PCT SMODD/AMA Entries
5E10 and later

Entry	Definition
1	00% SMODD; 100% AMA.
2	25% SMODD; 75% AMA.
3	50% SMODD; 50% AMA.

Data Rules:

For 5E8 - 5E9, SMODD, if equipped, must precede AMODD. That is, the following sequence must be used when defining the PCT SMODD/AMA. If a 5 is entered, it must be the first entry in the PCT SMODD/AMA field. Any other 5 used, must follow the first 5 entry. Then, a mixed option can be selected using 2, 3, or 4. Only one of these (2, 3, or 4) can be entered per office. Following the 2, 3, or 4 entry, one or more 1(s) can be entered. See table.

Valid PCT SMODD/AMA Sequence

SMODD	SMODD/AMODD	AMODD
Entry 1	Entry 2, 3, or 4	Entry 1
0 or more	0 or 1	0 or more

The 5 DOPS symbols can be related to the above choices in the following ways:

The DSK6100 field provides the number of Disk Pairs using the 5 option.

The DSKSPL6 field provides the mixed option in the following way:

- If the field contains the 0.00, make no entry;
- Or, if the field contains 0.25, enter a value of 2;
- Or, if the field contains 0.50, enter a value of 3;
- Or, if the field contains 0.75, enter a value of 4.
- The DSK6000 field provides the number of Disk Pairs using the 1 option.

Copyright © 2003 Lucent Technologies

For 5E2 through 5E7, the following sequence must be used when defining the PCT SMODD/AMA. If "300A" is entered in the DISK CONFIGURATION field,

- The entries in the MHD0,1 and MHD2,3 OPTIONING fields must be "R" and the corresponding MHD EQUIPAGE field must be "Y".
- "N" must be entered in MHD4,5, MHD6,7, MHD8,9, MHD10,11 and MHD12,13 EQUIPAGE fields.
- No entries are permitted in the MHD4,5, MHD6,7, MHD8,9, MHD10,11 and MHD12,13 OPTIONING fields (these columns must each be blank).

If "340A" is entered in the DISK CONFIGURATION field,

- The entries in the MHD0,1 and MHD2,3 OPTIONING fields must be "R" and the corresponding MHD EQUIPAGE field must be "Y".
- If the MHD4,5 EQUIPAGE field is "Y", the entry in the MHD4,5 OPTIONING field must be 1 or 2.
- If the MHD6,7, MHD8,9, MHD10,11 or MHD12,13 EQUIPAGE field is "Y", the entry in the corresponding MHD OPTIONING field must be 1.
- If the MHD4,5, MHD6,7, MHD8,9, MHD10,11 or MHD12,13 EQUIPAGE field is "N", the entry in the corresponding MHD OPTIONING field must be left blank.
- If a MHD OPTIONING field is entered, the corresponding MHD EQUIPAGE field must have a value of "Y".

If "340B" or "340C" is entered in the DISK CONFIGURATION field,

- The entries in the MHD0,1, MHD2,3 and MHD4,5 OPTIONING fields must be "R" and the corresponding MHD EQUIPAGE field must be "Y".
- If the MHD6,7 EQUIPAGE field is entered as "Y", the entry in the MHD6,7 OPTIONING field must be either 1, 2, or 3.
- If the MHD8,9, MHD10,11, or MHD12,13 EQUIPAGE field is entered as "Y", the entry in the corresponding MHD OPTIONING field must be 1.
- If the MHD6,7, MHD8,9, MHD10,11, or MHD12,13 EQUIPAGE field is entered as "N", the entry in the corresponding MHD OPTIONING field must be blank.
- If a MHD OPTIONING field is entered, the corresponding MHD EQUIPAGE field must have a value of "Y".

For 5E10 and later,

- when MHD4,5 has PCT SMODD option of 2, then PCT SMODD for MHD6,7 can only be option 1.
- when MHD6,7 has PCT SMODD option of 2, then PCT SMODD for MHD8,9 can only be option 1.
- when MHD8,9 has PCT SMODD option of 2, then PCT SMODD for MHD10,11 can only be option 1.
- when MHD10,11 has PCT SMODD option of 2, then PCT SMODD for MHD12,13 can only be option 1.
- PCT SMODD for MHD6,7 can only be option 3 if MHD4,5 has PCT SMODD option of 3.

Copyright © 2003 Lucent Technologies

- PCT SMODD for MHD8,9 can only be option 3 if MHD6,7 has PCT SMODD option of 3.
- PCT SMODD for MHD10,11 can only be option 3 if MHD8,9 has PCT SMODD option of 3.
- PCT SMODD for MHD12,13 can only be option 3 if MHD10,11 has PCT SMODD option of 3.
- When MHD4, 5 has PCT SMODD option of 1, then PCT SMODD for MHD6, 7 can only be option 1.
- When MHD6, 7 has PCT SMODD option of 1, then PCT SMODD for MHD8, 9 can only be option 1.
- When MHD8, 9 has PCT SMODD option of 1, then PCT SMODD for MHD10, 11 can only be option 1.
- When MHD10, 11 has PCT SMODD option of 1, then PCT SMODD for MHD12, 13 can only be option 1.

MOVING HEAD DISKS SCSI600 OR SCSI322 ONLY - MHD 16-31

For 5E6 - 5E8, for offices equipped with a SCSI600 or SCSI322 DISK DRIVE TYPE, the DISK EQUIPAGE field is used to indicate whether the MHD pairs are equipped. A "Y" or "N" is entered in each of the seven MHD pair fields: MHD16,17 through MHD30,31. There is no OPTIONING field for MHD 16-31 because they are entirely AMA-configured.

2.31 DISK EQUIPAGE

Description: Are any of the MHD pair fields MHD16,17 through MHD30, 31 equipped?

Software Release: 5E6 - 5E8
Required Field.
Valid Entries: Y, N
Default Value: N

Data Rules:

If any MHDs (16-31) are equipped, the office must have "IOP2" set to "Y".

- If "Y" is entered in the MHD16,17 DISK EQUIPAGE field, "Y" must be entered in the MHD12,13 DISK EQUIPAGE field. (As noted above, MHD14 and 15 are for on-line spares and thus may be equipped in any sequence.)
- If "Y" is entered in the MHD18,19 DISK EQUIPAGE field, "Y" must be entered in the MHD16,17 DISK EQUIPAGE field.
- If "Y" is entered in the MHD20,21 DISK EQUIPAGE field, "Y" must be entered in the MHD18,19 DISK EQUIPAGE field.
- If "Y" is entered in the MHD22,23 DISK EQUIPAGE field, "Y" must be entered in the MHD20,21 DISK EQUIPAGE field.
- If "Y" is entered in the MHD24,25 DISK EQUIPAGE field, "Y" must be entered in the MHD22,23 DISK EQUIPAGE field.
- If "Y" is entered in the MHD26,27 DISK EQUIPAGE field, "Y" must be entered in the MHD24,25 DISK EQUIPAGE field.

Copyright © 2003 Lucent Technologies

- If "Y" is entered in the MHD28,29 DISK EQUIPAGE field, "Y" must be entered in the MHD26,27 DISK EQUIPAGE field.
- If "Y" is entered in the MHD30,31 DISK EQUIPAGE field, "Y" must be entered in the MHD28,29 DISK EQUIPAGE field.

EVEN/ODD SPU

For 5E9(1) and later, the following fields (Section 2.32 - Section 2.33) define the SPU (SCSI Peripheral Unit) position of the MHDs. When a pair of MHDs is added, there is an even one and an odd one (i.e., MHD4 is even and MHD5 is odd for MHD4,5). The even MHD is always positioned on the lower growth unit and the odd MHD is positioned on the upper growth unit.The lower growth unit uses SBUS 0 and SBUS 2. The upper growth unit uses SBUS 1 and 3. Each MHD pair which is equipped, must have an entry in the EVEN SPU field associated with its MHD number.

It is only necessary to enter EVEN SPU positions as the ODD one is automatically populated, based on its EVEN SPU entry. The ODD SPU is always 1 plus the EVEN SPU value.

The restrictions for designating SPU positions are provided in the table below. Also refer to the "Valid/Invalid IOP/PC/SLOT/P Entries" tables provided with the IOP/PC/SLOT/P field description for a summary of related even/odd SPU entries.

Disk Software Restrictions

MHD	SPU
4	4 or 20
6	18
8	20 or 24
10	22
12	26
14	4 or 20 or 24

Data Rules:
SPU assignments for the MHDs cannot be duplicated by IOP/PC/SLOT assignments on the FLEX IOP LIST. The following table summarizes invalid SPU combinations.

Invalid Combinations of SPUs and Flex PC Slots - 5E9(1) and later

EVEN SPU	IOP/PC/SLOT(P)	ODD SPU	IOP/PC/SLOT(P)
04	031 or 032	05	131 or 132
20	232 or 233	21	332 or 333
22	230 or 231	23	330 or 331
24	222 or 223	25	322 or 323
26	220 or 221	27	320 or 321

For 5E9(2) and later, MHD or IOP/PC/SLOT assignments in the above table must also not duplicate MT1 SPU assignments.

2.32 EVEN SPU

Description: Enter the EVEN SPU SCSI Peripheral Unit position.
Valid Entries: 4, 18, 20, 22, 24, 26

Data Rules:

If EQUIPAGE is "N", SPU must be blank.

If MHD8,9 is equipped and MHD14 is equipped, and MHD4 SPU is 20, then MHD14 SPU must be 4 and MHD8 SPU must be 24.

If MHD14 SPU is 20 then MHD8,9 must be unequipped.

Copyright © 2003 Lucent Technologies

If MHD14 SPU is 4, MHD4,5 must be "N" or MHD4 SPU must be 20.

If MHD14 SPU is 20, MHD4,5 must be "N" or MHD4 SPU must be 4.

If MHD14 SPU is 24, MHD4 SPU must be 20 or MHD8 SPU must be 20.

If MHD4 SPU is 20 and MHD8,9 is equipped, MHD8 SPU must be 24.

For 5E9(1) and later,

- if MHD8,9 is equipped and MHD4 SPU is 4, MHD8 SPU must be 20.
- if MHD4 SPU is greater than 17, SCSDC16 must be "Y".
- if MHD6 SPU is entered, SCSDC16 must be "Y".
- if SCSDC16 is "Y", either MHD4 SPU must be greater than 17 or MHD6 SPU must be entered.

2.33 ODD SPU

Description: This is a non-entry field which is automatically calculated (EVEN SPU plus 1). Thus, the entries in this field will be 5, 19, 21, 23, 25, or 27.

SWITCHING CONTROL CENTER

The following fields (Section 2.34 - Section 2.35) are used to set up the SCC 0 and 1 (Switching Control Center 0 and 1). The SCC provides facilities to administer, monitor, control and maintain the 5ESS Switch from a centralized remote location.

2.34 #SCC 0

Description: Is SCC 0 (Switching Control Center 0) equipped on the office?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

SCC 0 is located on IOP 0, Community 0, Slot 0 and Channel Position 1.

2.35 SCC 1

Description: Is SCC 1 (Switching Control Center 1) equipped on the office?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

SCC 1 is located on IOP 1, Community 0, Slot 0 and Channel Position 1.

SCAN POINT & SIGNAL DISTRIBUTOR CONTROLLER

The following fields (Section 2.36 - Section 2.43) define indicate whether or not Scan Points exist for various hardware. SCSDC boards are used to monitor the operation of the system and are required in all offices.

Copyright © 2003 Lucent Technologies

2.36 SCSDC0

Description: The only acceptable value in this field is "Y" to indicate that a scan point exists.

For 5E6 and later Software Releases, this field is automatically populated.

Required Field.
Valid Entries: Y
Default Value: Y

Data Rules:

SCSDC0 is located on IOP 0, COMMUNITY 0, SLOT 2.

2.37 SCSDC1

Description: The only acceptable value in this field is "Y" to indicate that a scan point exists.

For 5E6 and later Software Releases, this field is automatically populated.

Required Field.
Valid Entries: Y
Default Value: Y

Data Rules:

SCSDC1 is located on IOP 1, COMMUNITY 0, SLOT 2.

2.38 SCSDC2

Description: The only acceptable value in this field is "Y" to indicate that a scan point exists.

For 5E6 and later Software Releases, this field is automatically populated.

Data Rules:

SCSDC2 is located in IOP 0, COMMUNITY 0, SLOT 1.

Required Field.

Valid Entries: Y
Default Value: Y

2.39 SCSDC3

Description: The only acceptable value in this field is "Y" to indicate that a scan point exists.

For 5E6 and later Software Releases, this field is automatically populated.

Required Field.
Valid Entries: Y
Default Value: Y

Data Rules:

This entry is required when located in IOP 1, COMMUNITY 0, SLOT 1.

2.40 SCSDC45

Copyright © 2003 Lucent Technologies

Description: The only acceptable entry for this field is "Y".

Required Field.
Default:

For 5E14 and earlier: Y
For 5E15 and later: N

Valid Entries: Y
Default Value: Y

Data Rules:

SCSDC4 is located in IOP 0, COMMUNITY 1, SLOT 0, and SCSDC5 is located in IOP 1, COMMUNITY 1, SLOT 0.

The SCSDC45 entry is required in all CM1 and CM2 offices for alarming and craft control of CM1 hardware.

For 5E5 and earlier, CM2 offices with 9 or more Module Message Processor (MMP) Communities (or greater than 128 SMs) per side installed should have SCSDC45 equipped.

For 5E6 and later, SCSDC45 is always required for the CMPU and is thus automatically populated.

WARNING: For 5E15 and later, SCSDC45 is not needed in and office with CM TYPE of "CM3".

2.41 #SCSDC67

Description: SCSDC 6 and 7 are optional telephone operating company-assigned boards. These SCSDCs can be ordered for miscellaneous alarms.

Required Field.
Valid Entries: Y, N
Default Value: 5E8 only: Y

Data Rules:

SCSDC6 is located in IOP 0, COMMUNITY 1, SLOT 1 and SCSDC7 is located in IOP 1, COMMUNITY 1, SLOT 1.

2.42 #SCSDC89

Description: SCSDC 8 and 9 are required for offices equipped with CNI (Common Network Interface) cabinets or CM2 offices. CNI cabinets are determined by the equipage of RPCN000,320.

Required Field.
Valid Entries: Y, N
Default Value: Y

Data Rules:

SCSDC8 is located in IOP 0, COMMUNITY 1, SLOT 2 and SCSDC9 is located in IOP 1, COMMUNITY 1, SLOT 2.

For 5E6 - 5E8, if CM TYPE on this form is 2, SCSDC89 must be "Y".

For 5E9(1) and later, if CM TYPE on this form is CM2, SCSDC89 must be "Y".

For 5E6 - 5E8, SCSDC89 are also required in offices equipped with SCSI322 disks having any of the

Copyright © 2003 Lucent Technologies

MHDs in the second community equipped (MHDs 16-31).

2.43 #SCSDC1011

Description: Is the SCSDC1011 equipped?

Required Field.
Valid Entries: Y, N
Default Value: Y

Data Rules:

SCSD10 is located in IOP 0, COMMUNITY 1, SLOT 3 and SCSD11 is located in IOP 1, COMMUNITY 1, SLOT 3. If CM TYPE is 1, SCSDC1011 must be "N".

For 5E6 - 5E8, if CM TYPE on this form is 2, SCSDC1011 must be "Y". For 5E9(1) and later, if CM TYPE on this form is CM2, SCSDC1011 must be "Y".

2.44 #SCSDC16

Description: Is the SCSDC16 equipped?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When MHD4 SPU is greater than 17, SCSDC16 must be "Y".

When MHD6 SPU is entered, SCSDC16 must be "Y".

When SCSDC16 is "Y", either MHD4 SPU must be greater than 17, or MHD6 SPU must be entered.

For 5E10 and later, when SCSDC16 is "Y", either MHD4 or MHD14 or MHD15 or MT1 must be equipped in SPU 18-27 or MHD6 SPU must be known.

MAGNETIC TAPE DEVICES

The following optional fields (Section 2.45 - Section 2.49) are used to define Magnetic Tape Controllers 0 and 1.

2.45 #MTC0

Description: The MTC0 field name was changed to MT0 in 5E9(1). This field name applies to 5E8 and earlier. The MT0 is located in: IOP 0, COMMUNITY 0, SLOT 3. Enter the type of magnetic tape drive one. See MT0 for 5E9(1) and later usage information.

Valid MTC0 Entries, 5E6 - 5E8

Entry	Definition
1 or Keystone III	Read/write only in high density (6250bpi).
2 or Enhanced Keystone III	Buffered keyboard which offers significantly better performance than the unbuffered version.

2.46 #MT0

Description: Enter the type of magnetic tape controller for drive one. The MT0 is located in: IOP 0,

Copyright © 2003 Lucent Technologies

COMMUNITY 0, SLOT 3.

Software Release: 5E9(1) and later.
Valid Entries:

Valid MT0 Entries, 5E9(1)

Entry	Definition
1 or SCSI9TRK	Keystone III; read/write only in high density (6250bpi) with SCSI9TRK interface.

Valid MT0 Entries, 5E9(2) and later

Entry	Definition
1 or SCSI9TRK	Keystone III; read/write only in high density (6250bpi) with SCSI9TRK interface.
2 or DAT	Digital Audio Tape.

2.47 MTC1

Description: The MTC1 field name was changed to MT1 in 5E9(1). This field name applies to 5E8 and earlier. See MT1 for 5E9(1) usage information.

Valid MTC1 Entries, 5E6 - 5E8

Entry	Definition
1 or Keystone III	Read/write only in high density (6250bpi).
2 or Enhanced Keystone III	Buffered keyboard which offers significantly better performance than the unbuffered version.

Data Rules:

If MTC1 is equipped, it is located in IOP 1, COMMUNITY 0, SLOT 3. IOP1, PCO 0, SLOT 3 has been assigned to MTC1 (second magnetic tape). If it is not installed, the slot can be used for other devices, SDL or TTY.

2.48 MT1

Description: This field indicates the type of magnetic tape drive two.

Valid MT1 Entries, 5E9(1) and later

Entry	Definition
1 or SCSI9TRK	Keystone III; read/write only in high density (6250bpi) with SCSI9TRK interface.

Valid MT1 Entries, 5E9(2) and later

Entry	Definition
1 or SCSI9TRK	Keystone III; read/write only in high density (6250bpi) with SCSI9TRK interface.
2 or DAT	Digital Audio Tape

Data Rules:

If MT1 is equipped, it is located in IOP 1, COMMUNITY 0, SLOT 3. IOP1, PCO 0, SLOT 3 has been assigned to MT1 (second magnetic tape). If it is not installed, the slot can be used for other devices, SDL or TTY.

If MT1 is "DAT", MT1 SPU must be entered.

2.49 MT1 SPU

Description: This field indicates the position of the DAT (Digital Audio Tape) for the MT1.

Software Release: 5E9(2) and later.

Copyright © 2003 Lucent Technologies

Valid Entries: 5, 21, or 25

Data Rules:

The position of the MT1 SPU cannot duplicate the position of the MHD or IOP/PC/SLOT/P positions.

For 5E10 and later, when MT1 SPU is 21 or 25, SCSDC16 must be "Y".

MAINTENANCE TELETYPEWRITER

The following fields (Section 2.50 - Section 2.52) are used to determine the characteristics of the maintenance teletypewriter.

2.50 #MCC BOARD TYPE

Description: Enter the MCC (Master Control Center) Board Type. Note that the UN583 automatically equips the entire set of IOP/PC Replacement and DFC (Disk File Controller) Replacement boards. Note that this field was removed for 5E9(1)-5E9(2) and readded in 5E10.

Software Release: 5E10 and later.
Valid Entries:

- For 5E12 and earlier: TN983 or UN583
- For 5E13: TN983 or UN597
- For 5E14 and later: UN597

Data Rules:

For 5E10 through 5E13, when PROCESSOR MODEL is "3B21D", MCC BOARD TYPE must not be "TN983".

If "UN583" or "UN597" is not entered, the fourth digit of the IOP/PC/SLOT/P must be "2" or "3".

2.51 #MTTY TYPE

Description: Enter the type of MTTY (maintenance terminal) used in the office. The MTTY is also referred to as the MCC (Master Control Center).

Required Field.
Default:

5E4(2) - 5E8: COLOR SCAN2
Valid Entries:

Valid MTTY TYPE Entries, 5E4(2) - 5E8

Entry	Definition
1 or OLD B&W	Black and White terminal.
2 or COLOR SCAN10	Color Scan terminal.
3 or VT100	VT100 terminal.
4 or COLOR WECOKS	Color WECO KS terminal.
5 or COLOR SCAN2	Color Scan2 terminal.

Copyright © 2003 Lucent Technologies

NOTE: For 5E4 - 5E8, for new ship offices, "COLOR SCAN2" is the only valid option.

Data Rules:

If "COLOR SCAN2" is entered, the COLOR SCAN2 LINE COUNT must be entered.

Valid MTTY TYPE Entries - 5E9(1) and later

Entry	Definition
1 or ATT/260C	Color terminal replacing Color Scan2.
2 or OLD B&W	Black and white terminal.
3 or COLOR SCAN10	Color Scan10 terminal.
4 or VT100	VT100 terminal.
5 or WECO KS	Color WECO KS terminal.
6 or COLOR SCAN2	Color Scan2 terminal.

NOTE: For 5E9(1) and later, for new ship offices, "ATT/260" is the only valid entry.

When MTTY TYPE is "COLOR SCAN2" or "ATT/260C", COLORSCAN2 LINE COUNT must be entered.

2.52 COLORSCAN2 LINE COUNT

Description: This field defines the number of lines that will appear on the terminal screen.

Software Release: 5E6 and later
Default: 24
Valid Entries: 24 or 47 (lines)

Data Rules:

For 5E6 - 5E8, if the MTTY TYPE is "COLORSCAN2", COLORSCAN2 LINE COUNT must be entered.

For 5E9(1) and later, if the MTTY TYPE is "COLOR SCAN2" or "ATT/260C", COLORSCAN2 LINE COUNT must be entered.

2.53 ALT BOOT DSK

Description: Is the Alternate Boot Disk feature equipped? Before this feature can be activated, Secured Feature 284 must be set to "Y". See Division 2, Section 4A284.

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Data Rules:

When ALT BOOT DSK is "Y", SFID 284 ACT must be "Y" on the SFSYS form.

When ALT BOOT DSK is "Y", MCC BOARD TYPE must be "UN597".

When ALT BOOT DSK is "Y", MHD14 or MHD15 must be "Y".

INPUT/OUTPUT PROCESSOR EQUIPAGE

Copyright © 2003 Lucent Technologies

The following fields (Section 2.54 - Section 2.55) are used to indicate if the office is equipped with additional IOPs. (IOPs 0 and 1 are equipped with all offices and thus are not specified on this form.) For 5E9(1) and later, SPUs 18-27 are logically part of the Disk File Controller System. Thus, equipping IOPs 2 and 3 is not required to support Disk Drives in SPUs 18-27. However, if Disk Drives are not equipped in SPUs 18-27 and IOP 2 or 3 is grown in, those slots are still available for use as IOP peripheral communities.

2.54 #IOP2

Description: Does the office have an IOP2? Each office may have 4 IOPs (numbered 0, 1, 2 and 3). IOPs 0 and 1 are required, while 2 and3 are optional.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E6 - 5E8, IOP2 is required for equipped SCSI disks and for any equipped MHDs in 2nd community (MHDs 16-31).

2.55 #IOP3

Description: Does the office have an IOP3?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and earlier, IOP2 must be equipped before IOP3 can be equipped.

FLEXIBLE IOP SELECTION

The following fields (Section 2.56 - Section 2.63) are used to define the variable ports in the Input/Output Processor. The Flexible IOP Selection enables the addition and deletion of IOP devices within IOP communities. Available with 5E4(2) and later, Optional IOP devices are not restricted to preassigned slots.

The IOP/PC/SLOT is reserved for SCSDC17 (SCAN POINT and SIGNAL DISTRIBUTOR CONTROLLER). SCSDC17 will automatically be provided to the user if the DISK TYPE is a SCSI322. Entries 2122/2123 are not allowed.

Refer to ECD/SG Data Base Manual (No. 235-600-3XX, where XX is the generic) for the standard association of controller to device (what the recommended configuration was before Flexible IOP Selection). Note that Flexible IOP Selection may vary from the standard configuration presented in the document referenced above.

2.56 IOP/PC/SLOT/P

Description: This field is a 4-digit number that defines the IOP/PC/SLOT/P selection. Each office may have 4 IOPs (Input/Output Processors). Each IOP contains 4 PCs (Peripheral Controllers). Each PC contains 4 SLOTs. The SLOTs are occupied by a DEVICE CONTROLLER. For offices with MCC BOARD TYPE of "TN983", two ports are available (2 and 3). For offices with MCC BOARD TYPE of "UN583" or "UN597" , 4 ports are available (0, 1, 2, 3).

Copyright © 2003 Lucent Technologies

Valid IOP/PC/SLOT/P Entries	
Component	**Entry**
IOP	0, 1, 2, or 3
PC	0, 1, 2 or 3
SLOT	0, 1, 2 or 3

Valid Port Entries	
Component	**Entry**
P(ORT)	2 or 3; when MCC BOARD TYPE is "TN983".
P(ORT)	0, 1, 2, or 3; when MCC BOARD TYPE is "UN583" or "UN597".

The following table contains invalid IOP/PC/SLOT/P entries that must not be used for FLEXIBLE IOP assignments:

Invalid IOP/PC/SLOT/P(ort) Entries	
Entry	**Entry**
0002/0003	1002/1003
0012/0013	1012/1013
0022/0023	1022/1023
0032/0033 Note: Valid for 5E9(1) and later	1102/1103
0102/0103	1112/1113
0112/0113	1122/1123
0122/0123	1132/1133
0132/0133	1332/1333
0302/0303, except for VCDX	0332/0333
2000/3000	

NOTE: Also refer to the Invalid Combinations of SPUs and FLEX PC Slots table provided in the discussion of the EVEN/ODD SPU fields.

Data Rules:

Once an IOP/PC/SLOT/P(ORT) is assigned, it may not be used again.

If the IOP/PC/SLOT/P(ORT) is entered, the DEVICE CONTROLLER and the DEVICE TYPE must also be entered.

If the IOP/PC/SLOT is unique, the DEVICE CONTROLLER must be unique.

If an IOP2 or IOP3 value is not assigned, the entry in the IOP/PC/SLOT/P field must not begin with a 2 or 3.

If there are two magnetic tape drives in the office, an entry in the IOP/PC/SLOT/P field of 1032 or 1033 may not be assigned.

2.57 DEVICE CONTROLLER

Description: Once an IOP/PC/SLOT/P(ORT) is assigned, a device controller is assigned. Two types of controllers are accepted: SDLC (Synchronous Data Link) and TTYC (Teletypewriter Controller). Any SDLC can be used to control an SDL DEVICE TYPE, and any TTYC can be used to control a TTY DEVICE TYPE.

Valid DEVICE CONTROLLER Entries	
Entry	**Entry**
SDLC0	TTYC11
SDLC2	TTYC12
SDLC3	TTYC13
SDLC4	TTYC14
SDLC5	TTYC15
SDLC6	TTYC16
SDLC7	TTYC17
SDLC8	TTYC18
SDLC9	TTYC19
SDLC32	TTYC20

Copyright © 2003 Lucent Technologies

SDLC34	TTYC21
SDLC36	TTYC22
SDLC38	TTYC23
SDLC40	TTYC24
SDLC42	TTYC25
TTYC26	TTYC27
TTYC28	TTYC29

Data Rules:

If the DEVICE CONTROLLER is entered, the IOP/PC/SLOT/P(ORT) must be entered. If the DEVICE CONTROLLER is entered, the DEVICE TYPE must be entered. If the DEVICE TYPE is entered, the DEVICE CONTROLLER must be entered.

A teletypewriter controller must control a device of the same type (TTY). A synchronous data link controller must control a device of the same type (SDL). In other words, if the DEVICE CONTROLLER entry begins with "TTY...", the DEVICE TYPE entry must begin with "TTY...". (The same condition applies to "SDL..." entries.)

If DEVICE TYPE is "TTY7", LOCAL TRAF MEAS CHANNEL on the OFCOPT form must be equipped.

2.58 DEVICE TYPE

Description: For 5E9(2) and earlier, up to two DEVICE TYPES can be assigned to each DEVICE CONTROLLER. 5E10 and later with MCC BOARD TYPE of "UN583" or "UN597", up to four DEVICE TYPES can be assigned.

Once a DEVICE TYPE is assigned, it cannot be used again. If the DEVICE TYPE is entered, the IOP/PC/SLOT/P(ORT) must be entered. If the DEVICE TYPE is entered, the DEVICE CONTROLLER must be entered.

For offices with MCC BOARD TYPE of "TN983", an SDLC can control up to two SDLs. However, an SDLC is required for every AMA (Automatic Message Accounting) or NP (Network Protocol) type of SDLs. Note that NP, SDL, and AMA SDLs cannot share the same controller. However, SDL9 and SDL18 can share a controller. Each TTYC DEVICE CONTROLLER controls up to two TTY DEVICE TYPES. The BAUD RATE for each "TTY" must be known. The BAUD RATE range for the two "TTYs" controlled by a "TTYC" is 300, 1200, 2400, 4800 and 9600. The exceptions are the printer DEVICE TYPES (i.e., TTY43, TTY45). A device type must agree with its controller type; protocols should not be mixed.

- A TTYC (TN74B) supports all TTY types
- A SDLC (TN75C) supports all SDL types
- A SDLC (TN82) supports SDL8 and SDL13

For offices with MCC BOARD TYPE of "UN583" or "UN597", SDLCs can control up to 4 SDLs and therefore mixing restrictions are not applicable. The UN583 or the UN597 is a multi-purpose board which supports all device/controller options.

Customers are allowed to input either the **device type** or **device name**.

SDL Device Type/Device Name Cross-Reference

Device Type	Name	Protocol	Baud Rate
SDL0	SCAN	SDL	4800
SDL1	SCC	SDL	1200

Entry	Definition
SDL0	This device type entry indicates whether SCANS is equipped. Software Change Administration and Notification System is the standard mechanism used for distribution of BWMs (Broadcast Warning Messages) to the SCCS (Switching Control Center System) and program updates (binary data) to the 5ESS Switch. SCANS provides generic overwrite information under control of the SCCS.
SDL1	Software Release : 5E14 and later. This device type entry indicates whether SCC (Switching Control Center) is equipped for this office. VCDX or DRM only.
SDL2	This device type entry indicates the equipage of a port for the Integrated MLT-2. The entry must be designated in the IMLT-2 field on the OFCOPT form.
SDL3	This device type entry indicates whether EADAS is equipped. If the EADAS LINK is equipped on the OFCOPT form, it must be equipped on the ECDOPT form (and vice versa). If SDL3 is equipped, the BAUD RATE (variable) must be entered. The EADAS (Engineering and Administration Data Acquisition System) collects, stores and analyzes traffic data and works with downstream systems like TDAS (Traffic Data Analysis System) for engineering reports and further analysis of data.
SDL4	This device type entry indicates whether any CTTU (Centralized Trunk Test Unit) is equipped for this office. If a CTTU form (5518 Record) exists, SDL4 must be equipped.
SDL5	This device type entry indicates whether a RNMS (Remote Network Management System) is equipped for this office.
SDL6	Software Release: 5E14 and later: This NP device type entry indicates whether ATPRC (CONNECTVU ATP Recent Change) is equipped.
SDL8	This device type entry indicates whether AMA Datalink2 is equipped. If SDL8 is equipped, the BAUD RATE

Copyright © 2003 Lucent Technologies

	(variable) must be entered.
SDL9	This NP device type entry indicates whether RMAS is equipped. If RMAS SUPPORT is equipped on the OFCOPT form, it must be equipped on the ECDOPT form and vice versa. RMAS (Remote Memory Administration System) provides a centralized, improved human interface for the change, administration and verification of the database stored in Electronic Switching Systems.
SDL11	This SDL device type entry indicates whether SES (Service Evaluation System) 2 is equipped. If there is a TKGRP form with a TRKCLS of "SES", SDL11 must be equipped. The SES mechanizes the evaluation of network services by using large-scale sampling procedures and provides reports of equipment blockage and failure, no supervision and call completion analysis to downstream systems.
SDL13	This AMA device type entry indicates whether AMA Datalink1 is equipped. If SDL13 is equipped, the BAUD RATE (variable) must be entered.
SDL14	This NP device type entry indicates whether MACOSS is equipped. SDL14 can only be equipped in CNI-equipped offices. If SDL14 is assigned, RPCN000,320 must be equipped.
SDL18	This NP device type indicates whether OSPSRL is equipped.
SDL20	This SDL device type entry indicates whether RMS01 is equipped. If a trunk group has been defined on the TKGRP form with a TRKCLS of "RMSD3", SDL20 must be entered.
SDL25	This NP device type entry indicates whether TOPAS0 is equipped. SDL25 can only be equipped in CNI-equipped offices. If SDL25 is assigned, RPCN000,320 must be equipped. If a trunk group has been defined on the TKGRP form with a TRKCLS of "TOPAS", SDL25 or SDL26 must be entered.
SDL26	This NP device type entry indicates if TOPAS1 is equipped. SDL26 can only be equipped in CNI-equipped offices. If SDL26 is assigned, RPCN000,320 must be equipped. If a trunk group has been defined on the TKGRP form with a TRKCLS of "TOPAS", SDL25 or SDL26 must be entered.
SDL32	This NP device entry indicates whether APDL01 is equipped.
SDL34	This NP device type entry indicates whether APDL02 is equipped.
SDL36	This NP device type entry indicates whether APDL03 is equipped.
SDL38	This NP device type entry indicates whether APDL04 is equipped.
SDL40	This NP device type entry indicates whether APDL05 is equipped.
SDL42	This NP device type entry indicates whether APDL06 is equipped.
TTY7	This entry indicates whether TRAFFPRT is equipped. If the LOCAL TRAF MEAS CHANNEL field on the OFCOPT form is "Y", TTY7 must be equipped.
TTY8	This entry indicates whether SLC 96 FRED is equipped. This terminal is also entered as a TMT (Transmission Maintenance Terminal) which is used with integrated SLC 96 (Integrated Subscriber Loop Carrier 96) facilities.
TTY9	This entry indicates whether STLWS 5 is equipped. Software Release: 5E6 and earlier. If there is a TLWS form for STLWS 5 (Work Station Number 7), TTY9 must be equipped. Software Release: 5E7 - 5E8. If there is a TLWS form with a DEVICE ID of "j", TTY9 must be equipped.
TTY10	This entry indicates whether STLWS 6 is equipped. Software Release: 5E6 and earlier. If there is a TLWS form for STLWS 6 (Work Station Number 8), TTY10 must be equipped. Software Release: 5E7 - 5E8. If there is a TLWS form for STLWS 6 with a DEVICE ID of "k", TTY10 must be equipped.
TTY11	This entry indicates whether STLWS 1 is equipped. Software Release: 5E6 and earlier. If there is a TLWS form for STLWS 1 (Work Station Number 3), TTY11 must be equipped. Software Release: 5E7 - 5E8. If there is a TLWS form for STLWS 1 with a DEVICE ID of "l", TTY11 must be equipped.
TTY12	This entry indicates whether STLWS 2 is equipped. Software Release: 5E6 and earlier. If there is a TLWS form for STLWS 2 (Work Station Number 4), TTY12 must be equipped. Software Release: 5E7 - 5E8. If there is a TLWS form for STLWS 2 with a DEVICE ID of "l", TTY12 must be equipped.
TTY13	This entry indicates whether STLWS 3 is equipped. Software Release: 5E6 and earlier. If there is a TLWS form for STLWS 3 (Work Station Number 5), TTY13 must be equipped. Software Release: 5E7 - 5E8. If there is a TLWS form with a DEVICE ID of "n", TTY13 must be equipped.
TTY14	This entry indicates whether STLWS 4 is equipped. Software Release: 5E6 and earlier. If there is a TLWS form for STLWS 4 (Work Station Number 6), TTY14 must be equipped. Software Release: 5E7 - 5E8.

Copyright © 2003 Lucent Technologies

	If there is a TLWS form with a DEVICE ID of "o", TTY14 must be equipped.
TTY15	This entry indicates whether RCV RSB is equipped. A RCV RSB (Recent Change and Verify, Repair Service Bureau) terminal is capable of performing all RCV operations as well as a subset of MCC commands.
TTY16	This entry indicates whether RCV NAC is equipped.
TTY17	This entry indicates whether ALIT/RSB is equipped. The Automatic Line Insulation Testing/Repair Service Bureau performs direct connect tests through the 5ESS Switch without the use of auxiliary test equipment. These results are available at RSBs, as well as at the office MCC, SCC and office belt line. The terminal is located at a remote site.
TTY18	This entry indicates whether RCV SCC is equipped. Recent Change and Verify, Switching Control Center (RCV SCC) is a general maintenance terminal. All commands can be executed from this terminal.
TTY19	This entry indicates whether RCV SCC/CIC is equipped. Recent Change and Verify, Switching Control Center/Circuit Input Center is a general maintenance terminal. All commands can be executed from this terminal.
TTY20	This entry indicates whether BELT LINE A is equipped. A belt line is provided in the Central Office to permit maintenance personnel to communicate with the system from locations other than the MCC.
TTY21	This entry indicates whether LOCAL RCV is equipped. Local Recent Change and Verify is a general maintenance terminal. All commands can be executed from this terminal.
TTY22	This entry indicates whether REMOTE RCV is equipped. Remote Recent Change and Verify is a Recent Change only terminal. It is restricted to Recent Change commands.
TTY23	Software Release: 5E11 and later. This entry indicates whether the BALANCE feature is equipped.
TTY26	Software Release: 5E14 and later. This entry equips the CALEA Input TTY
TTY27	Software Release: 5E14 and later. This entry equips the CALEA Output TTY
TTY28	Software Release: 5E7 and later. This entry equips STLWS 7.
TTY29	Software Release: 5E7 and later. This entry equips STLWS 8.
TTY30	Software Release: 5E7 and later. This entry equips STLWS 9.
TTY31	Software Release: 5E7 and later. This entry equips STLWS 10.
TTY32	Software Release: 5E7 and later. This entry equips STLWS 11.
TTY33	Software Release: 5E7 and later. This entry equips STLWS 12.
TTY34	Software Release: 5E7 and later. This entry equips STLWS 13.
TTY43	This entry equips a OFFRECPRT (On-line Office Record Print Channel) terminal.
TTY45	This entry equips a COT (Customer Originated Trace) terminal.
TTY46	This entry equips a BELT LINE B terminal.
TTY50	Software Release: 5E7 and later. This entry equips STLWS 14.

2.59 LOGIN TERMINAL

Description: Will the terminal have password protection?

This field allows the terminal to provide password protection. Each TTY DEVICE TYPE, except TTY7, TTY23, TTY27, TTY43, and TTY45 (terminals with printers), must specify if a login terminal and password may be enabled.
Default: N
Valid Entries: Y, N

Data Rules:

An entry is not allowed in the LOGIN TERMINAL field when "SDL" is entered in the DEVICE TYPE field.

If any SDL device type, or TTY7, TTY23, TTY27 TTY43, or TTY45 is entered, LOGIN TERMINAL must be blank and AUTH CHK must be blank.

If DEVICE TYPE is "TTY26" then LOGIN must be "N".

2.60 AUTH CHK

Description: Enter the type of Authority Checking for Flexible IOP. Authority checking defines the type of device security. This feature allows input messages to be divided into categories corresponding to different maintenance or administrative job functions which can then be assigned to specific devices.

Software Release: 5E9(1) and later.
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid AUTH CHK Entries

Entry	Description
U	User. The device is configured to have both login/password and user authority. Users in this mode are restricted to executing commands in command groups assigned both to their login and to the device. If no restrictions are placed on the device, user restrictions still apply and command logging and alarming can still occur.
T	Terminal. The device is configured to have both login/password and terminal authority. Users in this mode are restricted to executing commands in command groups assigned to the device. If no restrictions are placed on the device, command logging and alarming can still occur.
N	None. The device is configured with login/password enabled but authority checking disabled. (This is the mode which existed prior to 5E9(1).) Access to terminals configured this way is blocked until the system administrator assigns logins via "admin". Devices configured with neither login nor authority checking have a terminal display with no login prompt and with no restrictions.

Data Rules:

If LOGIN TERMINAL is "N", AUTH CHK must be "T" or "N".

If LOGIN TERMINAL is "Y", AUTH CHK must be "T", "N", or "U".

if DEVICE TYPE is "TTY26" then AUTH CHK must be "t"

2.61 QTYOF LINES

Description: This field indicates the number of lines that will appear on the screen. A Teletypewriter Controller can control up to two teletypewriters.

Software Release: 5E6 and later
Valid Entries: 24 or 47

Data Rules:

A QTYOF LINES must be entered for all TTY types except DEVICE TYPES TTY7, TTY43, and TTY45 (terminals with printers).

2.62 BAUD RATE

Description: This field sets the data-link speed. For the AMA (Automatic Message Accounting) channels only, the data-link connection is also set. The entry depends on the application (i.e., DEVICE TYPE).
Valid Entries:

Valid BAUD RATE Entries

Entry	Device Type
2400, 4800, or 9600	SDL3.
4800dial, 9600dial, or 9600pri	SDL8 and SDL13 for TN75C.
56000sw or 56000pri	SDL8 and SDL13 for TN82.
300, 1200, 2400, 4800, 9600, or 19200	
blank	TTY27, TTY43, or TTY45, and all SDLs except SDL3, SDL8, and SDL13.

"Dial" refers to a dial-up phone line, "PRI" refers to a private phone line and "SW" refers to an Accunet-switched 5B (Lucent Techologies).

Data Rules:

Copyright © 2003 Lucent Technologies

If the DEVICE TYPE used by a particular DEVICE CONTROLLER has a BAUD RATE of 9600, no other DEVICE TYPE can be assigned to that DEVICE CONTROLLER, except VCDX, DRM or MCC BOARD type of "UN583" or "UN597".

If the DEVICE TYPE is "SDL8" or "SDL13", the BAUD RATE must be entered. If the DEVICE TYPE is not "SDL3", " SDL8", or "SDL13", the BAUD RATE must be blank. Note that this restriction does not exist for MCC BOARD TYPE of "UN583" or "UN597".

2.63 TERM TYPE

Description: If the assigned DEVICE TYPE is a Supplementary Work Station ("TTY9" to "TTY14"), the TERM TYPE must be entered. If the DEVICE TYPE is not from " TTY9" to "TTY14", the TERM TYPE must not be entered.

Valid TERM TYPE Entries

Entry	Definition
BW	Black and White.
CL	Color.

VIRTUAL IOP SELECTION

The following fields (Section 2.64 - Section 2.66) are used to define Virtual TTYs for the DRM (Distinctive Remote Module). Only DRM currently supports the ordering of VIRTUAL TTYs. Virtual IOP Selection allows a user at an ASM (Administrative Services Module) that is remotely located from the DRM to open a window that acts as a cut-through to the DRM and provides UNIX, RC/V, or STLWS (Supplementary Trunk Line Work Station) functionality as if a local physical TTY was being used. For more information on the DRM feature see Division 2, Section 4A525.

2.64 VIOP/PC SLOT/P

Description: This field is a 4-digit number that defines the VIOP/PC/SLOT/P selection. Only VIOP 0 is currently supported. All four ports are valid.

Software Release: 5E14 and later
Valid Entries:

Valid IOP/PC/SLOT/P Entries

Component	Entry
IOP	0
PC	0, 1, 2 or 3
SLOT	0, 1, 2 or 3
PORT	0, 1, 2 or 3

Data Rules:

VIOP/PC/SLOT/P must be unique.

If VIOP/PC/SLOT is unique, VIRTUAL DEVICE CONTROLLER must be unique. If VIOP/PC/SLOT is not unique, VIRTUAL DEVICE CONTROLLER must not be unique.

When VIOP/PC/SLOT/P are entered, VIRTUAL DEVICE CONTROLLER must be entered.

When VIOP/PC/SLOT/P are entered, VIRTUAL DEVICE TYPE must be entered.

2.65 VIRTUAL DEVICE CONTROLLER

Description: Enter the VTTYC (Virtual Teletypewriter Controller).

Software Release: 5E14 and later
Valid Entries: VTTYC0-10 or VTTYC30-34

Copyright © 2003 Lucent Technologies

Data Rules:

When VIRTUAL DEVICE CONTROLLER is entered, VIOP/PC/SLOT/P must be entered.

When VIRTUAL DEVICE CONTROLLER is entered, VIRTUAL DEVICE TYPE must be entered.

2.66 VIRTUAL DEVICE TYPE

Description: Enter the Virtual Device Type. VTTY7 (Traffic Printer), VTTY23 (Balance), VTTY43 (Office Records Printer), and VTTY45 (COT) are permanently assigned devices. The remaining VTTYs are dynamically provisioned as UNIX, RC/V, or STLWS when a cut-through window is requested.

Software Release: 5E14 and later
Valid Entries:

NOTE: Users are allowed to input the device type or the device name.

NOTE: VTTYs and TTYs with the same channel ids cannot be equipped at the same time.

TTY Device Type/Device Name Cross-Reference

Device Type	Name
VTTY0	
VTTY2	
VTTY7	VTRAFFPRT
VTTY9	
VTTY10	
VTTY11	
VTTY12	
VTTY13	
VTTY14

VTTY58	
VTTY59	
VTTY60	
VTTY61	
VTTY62	
VTTY63	
VTTY64	
VTTY65	
VTTY66	

Data Rules:

VIRTUAL DEVICE TYPE must be unique.

When VIRTUAL DEVICE TYPE is entered, VIOP/PC/SLOT/P must be entered.

When VIRTUAL DEVICE TYPE is entered, VIRTUAL DEVICE CONTROLLER must be entered.

TTYs AND VTTYs THAT CANNOT BE EQUIPPED AT THE SAME TIME

PHYSICAL TTY	VIRTUAL TTY A	VIRTUAL TTY B
TTY7	VTTY7	
TTY22	VTTY22	
TTY23	VTTY23	
TTY43	VTTY43	
TTY45	VTTY45	
TTY9	VTTY9	VTTY62
TTY10	VTTY10

Figure 4 SAMPLE ECDOPT FORM 5E16 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 9: 5710 RECORD
LINE UNIT EQUIPAGE FORM - EQLU

1. GENERAL

The 5710 Record is available with 5E2 and later Software Releases. It is used to define SM (Switching Module) and LU (Line Unit) assignments in a 5ESS Switch.

1.1 Recent Change View

The Recent Change View for this form is 19.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Each value entered in this field on the EQLU or EQLUP forms must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports Line Units.

2.3 *LINE UNIT

Description: Enter the Line Unit Number.

NOTE: For 5E9(2) and later, 0 - 7 is used for SMs; 0 - 42 is used for SM-2000.

Required Field.
Valid Entries:
- 5E9(1) and earlier: 0 - 7
- 5E9(2) and later: 0 - 42

Data Rules:

If LINE UNIT is greater than 7, LINE UNIT TYPE must be "4AC1" (Model 2), or "4AD1" (Model 3).

Line Units share the same unit number range with (R)ISLUs and IDCUs. Therefore, unit numbers assigned on this form may not be assigned on any EQISLU, EQRISLU, or EQIDCU form with the same SM number.

2.4 #EQUIPMENT STATUS

Description: Enter the status of the equipment. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA database retrofits, the other values are valid.

Required Field.

Valid EQUIPMENT STATUS Entries

Copyright © 2003 Lucent Technologies

Entry	Definition
O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

For 5E9(2) and later, the EQSTAT on a matching EQDI form (where DATA GROUP on this form is defined as DI on the EQDI form) must be greater than or equal to the EQUIPMENT STATUS value on this form (i.e., "O" is greater than "G" which is greater than "U").

2.5 #LINE UNIT TYPE

Description: Enter the Line Unit Type. The Line Unit Type corresponds to the last four characters of the J-Drawing identifying number.

Required Field.

Valid LINE UNIT TYPE Entries

Entry	Description
4AB1	2-Shelf Model 1 Line Unit.
4AC1 or 4AC2	2-Shelf Model 2 Line Unit.
4AD1	2-Shelf Model 3 Line Unit. Provides a 10:1 concentration ratio.

Data Rules:

For 5E9(2) and later, if UNIT TYPE on the EQIM form (5700 Record) is "SM2000", LINE UNIT TYPE must be "4AD1".

2.6 #EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries:

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinent aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

Data Rules:

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

Copyright © 2003 Lucent Technologies

2.7 #UNIT VERTICAL

Description: Enter the Vertical Equipment Location that specifies the bottom of the unit. The recommended values for this are:

- 5E9(1) and earlier: 15, 24, 32, 41, 49, 58, 69, 76
- 5E9(2) and later: 7, 15, 24, 32, 41, 49, 58, 69, 76

Required Field.
Valid Entries: 0 - 84

2.8 #EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.9 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

SERVICE GROUPS 0 and 1

The following fields (Section 2.10 - Section 2.14) define the Control and Data Groups, the Control and Data Ports, and the Metallic Test Buses for Service Groups 0 and 1. All five entries for each Service Group must be assigned.

2.10 CONTROL GROUP

Description: Enter the Control Group Number.

- ***NOTE:*** For 5E9(2) and later, 0 - 1 is used for SMs; 0 - 3 is used for SM-2000.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries:
- 5E9(1) and earlier: 0 - 1
- 5E9(2) and later: 0 - 3

Data Rules:

The combination of Control Group and Control Port values must be unique for the two Service Groups.

The Control Group value must be the same for both Service Groups 0 and 1.

For 5E9(1) and earlier, if CONTROL GROUP is 0 for a SWITCHING MODULE (defined on an EQIM form) where UNIT TYPE is not "SM2000"), CONTROL PORT may not be 0 or 1; these ports are reserved for the LDSU (Local Digital Service Unit).

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.11 # CONTROL PORT

Description: Enter the Control Port Number. Even numbered Control Ports are in Service Group 0. Odd numbered Control Ports are in Service Group 1.

Required Field.
Valid Entries: 0 - 22

Data Rules:

The Control Group Number and Control Port Number combination must be unique for the two Service Groups.

Control Port 22 may not be assigned since consecutive even/odd Control Ports are required and Control Port 23 is invalid.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.12 #DATA GROUP

Description: Enter the Data Group Number.

Copyright © 2003 Lucent Technologies

NOTE: For 5E9(2) and later, 0 - 1 is used for SMs; 0 - 5 is used for SM-2000.

Required Field.

Valid Entries:

- 5E9(1) and earlier: 0 - 1
- 5E9(2) and later: 0 - 5

Data Rules:

The Data Group value must be the same for both Service Groups 0 and 1.

For 5E9(2) and later, the Data Group value must be defined as DI on an EQDI form (5849 Record).

For 5E9(1) and earlier the combination of DATA GROUP 1 and DATA PORT 15 for Service Group 0 or Service Group 1 are reserved for SMs (i.e., cannot be assigned to SM-2000).

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.13 # DATA PORT

Description: Enter the Data Port Number. Even numbered Data Ports are in Service Group 0. Odd numbered Data Ports are in Service Group 1.

NOTE: For 5E9(2) and later, 0 - 15 is used for SMs; 0 - 23 is used for SM-2000.

Required Field.

Valid Entries:

- 5E9(1) and earlier: 0 - 15
- 5E9(2) and later: 0 - 23

Data Rules:

The Data Group Number and Data Port Number combination must be unique for the two Service Groups.

For 5E9(1) and earlier the combination of DATA GROUP 1 and DATA PORT 15 for Service Group 0 and Service Group 1 are reserved for SMs (i.e., cannot be assigned to SM-2000).

2.14 #METALLIC TEST BUS

Description: Enter the Metallic Test Bus Equipment assignment. Metallic Test Bus Point 15 of every MACC pack, is reserved for general internal MSU and MMSU diagnostics. Protocol or diode resistor tests are included in general internal diagnostics. Assign the Metallic Test Bus Equipment per SD-5D007-01.

Required Field.

This number consists of:

Valid METALLIC TEST BUS Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 5
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15

Copyright © 2003 Lucent Technologies

			(Regular) 00 - 31 (Modular)
Bus	BUS	XX	00 - 14

Data Rules:

The Metallic Test Bus assignment must be a unique value for each Service Group.

For 5E9(2) and earlier, Line Unit Service Group 0 and 1 require MTB assignments from an MSU/MMSU associated with Service Group 0 and 1, respectively.

If the MTB pack resides upon an ORM, RSM, or TRM, the EQLU and the MTBs must share the same SITE ID (on the EQIM form). If this is a remote SITE ID (does not reside in the local office), the MTBs must reside on the Common Resource Module (denoted by MASTER MODULE on a corresponding EQSITE form (5722 Record)). This rule does not apply to co-located ORMs/TRMs sharing resources as co-located ORMs/TRMs and ORMs/TRMs which are not co-located are not distinguishable (in static data).

SEC. 10: 5711 RECORD
LINE UNIT PACK EQUIPAGE FORM - EQLUP

1. GENERAL

The 5711 Record is available with the 5E1 and later Software Releases. It is used to define Line Unit pack assignments in a 5ESS Switch.

The Line Unit Pack Equipage Record contains information needed to initialize the pack equipment configuration of Line Units.

Line Units (EQLU (5710 Record) and EQLUP forms), Integrated Services Line Units (EQISLU form (5731 Record)) and Remote Integrated Services Line Units (EQRISLU form (5732 Record)) share the same unit number range.

1.1 Recent Change

The corresponding Recent Change/Verify view for this form is 20.1

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

2.3 *LINE UNIT

Description: Enter the Line Unit Number. For 5E9(2) and later, for Classic SMs, 0 - 7 is used; for SM-2000, 0 - 42 is used.

Required Field.
Valid Entries:
- 5E9(1) and earlier: 0 - 7
- 5E9(2) and later: 0 - 42

Data Rules:

Unit numbers assigned on this form may not be assigned on the EQISLU or EQRISLU forms with the same switching module number.

For 5E9(2) and later, when LINE UNIT is greater than 7 (i.e, SM-2000), LINE UNIT TYPE must be "4AD1".

2.4 LINE UNIT TYPE

Description: Enter the Line Unit Type.

Required Field.
Default: 4AC2
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid LINE UNIT TYPE Entries	
Entry	**Definition**
4AB1	2-shelf Model 1 Line Unit.
4AC1 or 4AC2	2-shelf Model 2 Line Unit. Note that the 4AC1 and 4AC2 LUs contain the same physical packs.
4AD1	2-Shelf Model 3 Line Unit. Provides a 10:1 concentration ratio.

Data Rules:

For 5E9(2) and later, if UNIT TYPE on the EQIM form (5700 Record) is "SM2000", LINE UNIT TYPE must be "4AD1".

2.5 LU CONC RATIO

Description: Enter one of the four Line Unit Concentration Ratios.

Required Field.
Default: 8:1
Valid Entries: 10:1, 8:1, 6:1, or 4:1

Data Rules:

Ratio 4:1 is not valid when the Line Unit Type is "4AB1".

Ratio 10:1 is valid only when Line Unit Type is "4AD1".

LINE UNIT GRIDS

The following fields (Section 2.6 - Section 2.7) define the STATUS and the CHANGE LEVEL INDICATOR for each Line Unit Grid (0 - 9).

The number of equipped (Operational) Grids is directly related to the desired Line Unit Concentration Ratio.

Line Unit Concentration Ratio	**Grids Equipped**
10:1	0-9
8:1	0-7
6:1	0-5
4:1	0-3

Only TN1058 and TN1058B Grid packs can be used with Carbon Block Protectors. TN1048, TN1058 and TN1058B Grid packs may be used with Gas Tube Protectors.

If LU CONC RATIO is "4AC1" or "4AC2" and TN1038, TN1048, TN1058, or TN1058B Grid packs are used, the TN842B Common Board must be used. The TN838 Grid pack may be used with either the TN842 or TN842B Common Board.

If LU CONC RATIO is "4AD1" and TN1048, TN1058, or TN1058B Grid packs are used, the UN322 Common Board must be used.

- ***NOTE:*** TN1048 and TN1058 (TN1058B, etc.) Grid packs cannot be mixed on the same Line Unit.

2.6 EQUIPMENT STATUS

Description: Enter the status of the Line Unit Pack.

Valid EQUIPMENT STATUS Entries	
Entry	**Definition**
G	Growth.
O	Operational.

Copyright © 2003 Lucent Technologies

U	Unequipped.

For new offices and units destined for factory testing, Operational is the only allowed value. During offline ODA data base retrofits, the other values are valid.

2.7 CHANGE LEVEL INDICATOR

Description: For each Grid enter the Change Level Indicator.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Data Rules:

If EQUIPMENT STATUS contains an entry, CHANGE LEVEL INDICATOR must contain an entry and vice versa.

HIGH LEVEL SERVICE CIRCUIT

The following fields (Section 2.8 - Section 2.9) define the STATUS and the CHANGE LEVEL INDICATOR for High Level Service Units for Service Groups 0 and 1 for Packs 0, 1, and 2.

2.8 EQUIPMENT STATUS

Description: Enter the status of the High Level Service Circuit.

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

For 5E9(1) and earlier, High Level Service Circuits 00, 01, 10, and 11 must always be equipped (Operational).

For 5E9(2) and later, High Level Service Circuits 00, and 10, must always be equipped (Operational).

For new offices and units destined for factory testing, Operational is the only allowed value. During offline ODA data base retrofits, the other values are valid.

2.9 CHANGE LEVEL INDICATOR

Description: For each High Level Service Center enter the Change Level Indicator.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Data Rules:

If EQUIPMENT STATUS contains an entry, CHANGE LEVEL INDICATOR must contain an entry.

REQUIRED CIRCUIT PACKS - CLI

The following fields (Section 2.10 - Section 2.21) define the Change Level Indicator for each of the required circuit packs. For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1. The table below indicates required circuit packs by type of LU.

Required Circuit Packs by LU Type

Copyright © 2003 Lucent Technologies

Circuit Pack	4AB1	4AC1	4AC2	4AD1
Common Board	X	X	X	X
Channel Board	X	X	X	X
Channel CKT	X	X	X	X
Linearization	X	X	X	X
Concentrator	X	-	-	-

TEST PAD	X	-	-	-
GDX CONTROLLER	X	-	-	-
DIODE TEST	X	-	-	-

2.10 COMMON BOARD

Description: Enter the CLI for the Common Board circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.11 CHANNEL BOARD

Description: Enter the CLI for the Channel Board circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.12 CHANNEL CKT

Description: Enter the CLI for the Channel Circuit circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.13 LINEARIZATION

Description: Enter the CLI for the Linearization circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.14 CONCENTRATOR

Description: Enter the CLI for the Concentrator circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.15 GDX ACCESS CKT

Description: Enter the CLI for the GDX Access Circuit circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.16 600 OHM TEST

Description: Enter the CLI for the 600 OHM Test circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.17 900 OHM TEST

Description: Enter the CLI for the 900 OHM Test circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.18 2K OHM TEST

Description: Enter the CLI for the 2K OHM Test circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.19 TEST PAD

Copyright © 2003 Lucent Technologies

Description: Enter the CLI for the Test Pad circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.20 GDX CONTROLLER

Description: Enter the CLI for the GDX Controller circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.21 DIODE TEST

Description: Enter the CLI for the Diode Test circuit pack.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

SEC. 11: 5712 RECORD
CONSTRUCTED FEATURE LIMIT FORM - CFL

1. GENERAL

The CFL (Constructed Feature Limit) form is applicable to 5E2(1) and later Software Releases. The input form is optional and is under control of the S.E.E. for insert, update and delete purposes. The switch owner can only read (review) the form to see if it is present or absent from the input data base. There is only one fixed value form instance which is based on whether the customer has purchased the BRCS Feature Construction package. (Refer to the appropriate DOPS output item.)

The S.E.E. is responsible for doing an insert on the CFL form if and only if the customer has purchased the BRCS Construction package. Inserting this form into the data base forces the internal Constructed Feature Limit to 9999. If the form is not submitted, then the CFL is set to zero.

Constructed Features are those BRCS Feature Names that are assigned on the following list of Feature Definition forms and do not start with the slash character "/". Features defined on the ID (Individualized Dialing) and PFA (Private Facility Access), are not counted towards the constructed Feature Limit.

Feature Definition Forms	
ACBFD	Automatic Callback Feature Definition
ACCTFD	Call Forwarding Feature Definition
ACVTFD	ISDN Attendant Control of Voice Terminals Feature Definition
ARSFD	Automatic Route Selection Feature Definition
ATHFD	Authorization Code Feature Definition
CFWFD	Call Forwarding Feature Definition
CWTFD	Call Waiting Feature Definition
DISPFD	Display and Privacy Feature Definition
DRFD	Distinctive Ringing Feature Definition
EDSFD	Electronic Directory Service Feature Definition
ICMFD	SDN Intercom Feature Definition
LIDFD	Line Identification Feature Definition
MDRFD	Message Detail Recording Feature Definition
MLHGFD	Multi-Line Hunt Group Feature Definition
MSFD	Message Service System Feature Definition
MWFD	Multiway Feature Definition
PPFD	Precedence and Preemption Feature Definition
PUOFD	Pickup Originating Feature Definition
PUTFD	Pickup Terminating Feature Definition
QUFD	Modular Queuing Feature Definition
TGSRFD	Terminal Group/Station Restriction Feature Definition
TODFD	Time of Day Feature Definition

The Constructed Feature Limit is set internally by the presence or absence of the CFL form and is not shown on either the input screen or on the 5712 Record.

The Record Number, 5712, has been assigned to this form to provide for output when the "records" command is used in the ODA data base. However, the screen image of the input form will be printed and a reproducible record is not provided. The record (screen) contains only the single key value of zero if the form is present.

2. FORM ENTRIES

2.1 * KEY

Enter the key value which is always 0 (zero). Insert form if BRCS Construction was purchased; else do not submit the form.

SEC. 13: 5720 RECORD
TRUNK UNIT EQUIPMENT RECORD
TRUNK UNIT EQUIPAGE FORM (EQTU)
TRUNK UNIT PACK EQUIPAGE FORM (EQTUP)

1. GENERAL

The 5720 Record is available with 5E2(2) and later Software Releases. It is used to define Trunk Unit Assignments. For 5E10 and later, trunk units are applicable to SM2000.

This record is intended to be used as an Office Record for those 5ESS offices that are not utilizing an Operational Support System (e.g. RMAS) for generation of Office Records.

The Trunk Unit Equipment Record is used to define the Interface Module, Trunk Unit, Service Group, and Pack Position.

2. FORM ENTRIES - EQTU

2.1 BASE AND CONTROL GROUP, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Interface Module Number.

Required Field.
Valid Entries: 1 - 192

2.3 *TRUNK UNIT

Description: Enter the Trunk Unit Number.

Required Field.
Valid Entries: 0 - 7

2.4 *SERVICE GROUP

Description: Enter the Service Group Number.

Required Field.
Valid Entries: 0 - 1

Data Rules:

If SERVICE GROUP is 0, Control Port must be a even number.

If SERVICE GROUP is 1, Control Port must be a odd number.

For 5E2(2) through 5E9(2), if SERVICE GROUP is 0, the MTB assignment must be from SERVICE GROUP 0 of an MSU.

For 5E2(2) through 5E9(2), if SERVICE GROUP is 1, the MTB assignment must be from SERVICE GROUP 1 of an MSU.

2.5 EQUIPMENT STATUS

Copyright © 2003 Lucent Technologies

Description: Enter the Status of the Equipment. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA data base retrofits, the other values are valid.

Required Field.
Default: 0
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

2.6 CONTROL GROUP

Description: Enter the Control Group Number.

Required Field.

NOTE: For 5E10 and later, 0 - 1 is used for SMs; 0 - 3 is used for SM-2000.

Required Field.
Valid Entries:
- 5E9(2) and earlier: 0 - 1
- 5E10 and later: 0 - 3

Data Rules:

If CONTROL GROUP is 0, Control Ports 0 and 1 must be blank; they are reserved for the Local DSU.

For 5E10 and later, if CONTROL GROUP is greater than 1, the associated EQIM form must has a UNIT TYPE set to "SM2000".

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.7 CONTROL PORT

Description: Enter the Control Port Number.

Required Field.
Valid Entries: 0 - 22

Data Rules:

Control Port assignments must be unique for the same SM.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are

Copyright © 2003 Lucent Technologies

assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.8 DATA GROUP

Description: Enter the Data Group Number.

Required Field.

NOTE: For 5E10 and later, 0 - 1 is used for SMs; 0 - 5 is used for SM-2000.

Required Field.
Valid Entries:
- 5E9(2) and earlier: 0 - 1
- 5E10 and later: 0 - 5

Data Rules:

For 5E9(2) and earlier, the combination of DATA GROUP 1 and DATA PORT 15 cannot be assigned, it is reserved.

For 5E10 and later, if DATA GROUP is greater than 1, UNIT TYPE on the EQIM form must be set to an SM-2000 class processor.

For 5E10 and later, the combination of DATA GROUP set to 1 and DATA PORT set to 15 for SERVICE GROUP 0 or SERVICE GROUP 1 cannot be assigned where UNIT TYPE is set to an SM-2000 class processor on the corresponding EQIM form. DATA GROUP 1 and DATA PORT 15 are reserved for SMs.

2.9 DATA PORT

Description: Enter the Data Port Number.

Required Field.
Valid Entries: 0 - 15

Data Rules:

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.10 METALLIC TEST BUS

Description: Enter the Equipment assignment for the Metallic Test Bus.

This number consists of an 9-digit number as indicated below:

Valid MTS 0 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Regular MSU)

Copyright © 2003 Lucent Technologies

			00-31 (Modular MSU)
BUS	BUS	XX	00-14
			00-14 (Modular MSU)

- ***NOTE:*** Metallic Test Bus Point 15 of every MACC pack is reserved for general MSU and MMSU diagnostics. Protocol test or diode resistor test are included in general internal diagnostics.

Data Rules:

For 5E9(1) and later, if this pack resides on an ORM, RSM or TRM, the MTB assigned to this unit must terminate to an SM with the same value of SITE ID on an EQIM form (5700 Record). And, if this is a remote SITE ID, the MTBs must reside on the Common Resource Module (denoted by MASTER MODULE on a corresponding EQSITE form (5722 Record).

2.11 EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries:

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

Data Rules:

EQUIPMENT BAY and UNIT VERTICAL values within the same SM must be unique.

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

2.12 UNIT VERTICAL

Description: Enter the Vertical Equipment Location that specifies the bottom of the unit. Enter the same Equipment Location for both Service Groups of a given unit number (e.g. Service Groups 0 and 1 of a Trunk Unit would indicate the same Vertical Equipment Location on the Trunk Unit Equipage Form (EQTU)).

Recommended positions are as follows:
- For 7-foot cabinets: 22, 30, 39, 48, 56, 65, 74
- For 6-foot cabinets: 7, 15, 24, 32, 41, 49, 58

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 00 - 84

Data Rules:

EQUIPMENT BAY and UNIT VERTICAL values within the same SM must be unique.

2.13 EQUIPMENT AISLE

Description: Enter the Equipment Aisle Number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 00 - 99

2.14 CONTROL/DATA CIRCUIT CLI

Description: Enter the Control/Data Circuit Change Level Indicator. This circuit is provided as part of the basic unit per Service Group. Refer to Division 8, Section 1 for a list of CLI values.

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.15 TEST ACCESS CIRCUIT CLI

Description: Enter the Test Access Circuit Change Level Indicator. This circuit is provided as part of the basic unit per Service Group.

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

2.16 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

Copyright © 2003 Lucent Technologies

3. FORM ENTRIES - EQTUP

3.1 *PACK POSITION

Description: Enter the Trunk Unit Pack Number.

Required Field.
Valid Entries: 0 - 7

3.2 CIRCUIT TYPE

Description: Enter the Circuit Type (Hardware).

Valid CIRCUIT TYPE Entries

Entry	Definition
TRKLO	Loop Outgoing Trunk.
TRKLI	Loop Incoming Trunk.
TRK2EM	2-Wire E&M Trunk.
TRK4EM	4-Wire E&M Trunk.
TRKTST	Test Trunk Circuit.
TKLOTOL	Loop Outgoing Trunk (Toll).
TKLITOL	Loop Incoming Trunk (Toll).
TK2ETOL	2-Wire E&M Trunk (Toll).
TK4ETOL	4-Wire E&M Trunk (Toll).

Data Rules:

If CIRCUIT TYPE is TRKTST, EQSTAT "2" and "3" must be blank, and MTB0 and MTB1 must be entered.

If CIRCUIT TYPE is not TRKTST, EQSTAT "2" and "3" must be entered, and MTB0 and MTB1 must be blank.

3.3 CHANGE LEVEL INDICATOR

Description: Enter CLI value.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

3.4 CLEI

Description: Enter the Common Language Equipment Identification. See the appropriate J-Drawing for the applicable CLEI codes.

3.5 CKT 0/1/2/3 STATUS

Description: Enter the status of the circuit. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA data base retrofits, the other values are valid.

Required Field (for CKT 0, 1).
Default: O (for CKT 0, 1)
Valid Entries:

Valid CKT 0/1/2/3 STATUS Entries

Entry	Definition
U	Unequipped.
O	Operational.
G	Growth.

3.6 MTB0

Description: For each Circuit 0 or 1 of a Test Trunk (CIRCUIT TYPE is TRKTST), enter the Equipment Assignment for Metallic Test Bus 0.

Copyright © 2003 Lucent Technologies

This number consists of an 9-digit number as indicated below:

Valid MTS 0 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Non-Modular MSU)
			00-31 (Modular MSU)
BUS	BUS	XX	00-14
			00-15 (Modular MSU)

Data Rules:

The Metallic Test Bus 15 is a fixed assignment to a Diode/Resistor pair circuit and cannot be specified.

3.7 MTB1

Description: Enter the MTB1 value. For each Circuit 0 or 1 of a Test Trunk (CIRCUIT TYPE is TRKTST), enter the Equipment Assignment for Metallic Test Bus 1.

This number consists of an 9-digit number as indicated below:

Valid MTS 1 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
BUS	BUS	XX	00-14
			00-15 (Modular MSU)

Data Rules:

The Metallic Test Bus 15 is a fixed assignment to a Diode/Resistor pair circuit and cannot be specified.

MTB0 and MTB1 for circuits 0 and 1 must not be duplicated.

MTBs assigned to LTD test trunks must specify the same IM, MSU, PK POS, BUS and have MTB0 on MSU SG0 and MTB1 on MSU SG1.

SEC. 14: 5721 RECORD
TOPAS TERMINAL EQUIPMENT DSX ASSIGNMENT FORM - EQDSX

1. GENERAL

The 5ESS Switch 5721 Record is available with Release 5E4 and later Software Releases. The TOPAS CLLI (Common Language Location Identifier) Form is used by toll offices that employ the TOPAS (Testing, Operations, Provisioning and Administration System) Operations System. The TOPAS Operations System provides circuit order and testing administration for circuits terminating on a 5ESS Switch.

The 5ESS Switch 5721 Record is used to define Switching Module Equipment assignment to a DSX Frame Plate Connector. There will be one Record for each Switching Module, Digital Line/Trunk Unit and DFI Pack combination.

The combination of SM, DLTU and DFI, entered in the first three fields of the EQDSX input form, must be defined in the SWITCHING MODULE, DLTU and DFI PACK NUMBER fields, respectively, on an EQDUP Form (5730 Record).

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

2.3 * DLTU

Description: Enter the Digital Line/Trunk Unit number.

Required Field.
Valid Entries:
- 5E14 and earlier: 0 - 5
- 5E15 and later: 0 - 11

2.4 * DFI

Description: Enter the Digital Facility Interface pack number.

Required Field.
Valid Entries: 1 - 16

DSX FRAME LOCATION

The combination of the following fields (Section 2.5) -
(Section 2.9) define the DSX FRAME LOCATION and this instance of the EQDSX input form must not be duplicated on any other instance of the EQDSX input form.

2.5 # FLOOR NBR

Description: Enter the DSX frame floor location number.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 00 - 99, two alphabetic characters, including spaces or 1 character

2.6 # AISLE NBR

Description: Enter the DSX frame aisle location number.

Required Field.
Valid Entries:
- 000 - 999, or
- two or three alphabetic characters, including a space(s)

2.7 # BAY NBR

Description: Enter the DSX frame bay location number.

Required Field.
Valid Entries:
- 00 - 99, or
- two alphabetic characters, including a space

2.8 # PANEL NBR

Description: Enter the DSX panel (plate) location number.

Required Field.
Valid Entries: 00 - 99, or two letters characters form A - J

The combinations of the letters are as follows:

- "E" must be followed by any letter, except "I" or "O"
- "G" must be followed by any letter, except "I" or "O"
- "W" through "Z" or "H" followed by any letter, except "I", "O", or "W" through "Z"
- "H" followed by any letter except "I", "O", or "W" through "Z"
- "J" followed by "A" or "B"

2.9 # JACK POS NBR

Description: Enter the position number within the DSX panel (plate).

Required Field.
Valid Entries: 0 - 999

SEC. 15: 5722 RECORD
REMOTE SITE OPTIONS FORM - EQSITE

1. GENERAL

With 5E4(2) and earlier Generic programs, Remote Modules can be contained in a cluster of 1-4 RSMs (Remote Switching Modules). Each of these clusters is called a Remote Site. For 5E5 and later Software Releases, Remote Site refers to a cluster of 1 to 4 RSMs, a single ORMs (Optically Remote Modules) or a single TRMs (Two-Mile Optically Remote Modules). Collocated ORM/TRMs will consist of multiple single module clusters.

The Stand-Alone call processing options will be applied on a Remote Site basis rather than on an individual Remote Module basis. In 5E5 and later Software Releases, to specify Stand-Alone call processing on a Host (SM USAGE is "HIM" on an EQIM form) or Local Switching Module (SM USAGE is "IM" on an EQIM form), the STAND ALONE field on an EQIM form (5700 Record) must be set to "Y". Additionally, if Stand-Alone billing is desired, the STAND ALONE BILLING field on an EQIM form must be set to "Y".

For 5E4(2) and earlier Software Releases, Remote Site refers to Remote Switching Modules (RSMs). For 5E5 and later Software Releases, Remote Site refers to Remote Switching Modules, Optically Remote Modules or Two-Mile Optically Remote Modules.

Remote Alarm Options for the Master Module can be designated on this form. For more information on Remote Alarm Options, please refer to Division 8, Section 7.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * REMOTE SITE

Description: Enter the identification number of the set of Remote Modules that comprise the Remote Site Cluster.
Valid Entries: 1 - 74

2.3 MASTER MODULE

Description: Enter the Switching Module number of the Master Module of this Remote Site, if one exists.
Valid Entries: 1 - 192

Data Rules:

The MASTER MODULE must be entered when the ALARM INPUT OPTION or the ALARM OUTPUT OPTION is "Y" and the MASTER MODULE must be defined on an EQRAU form (5705 Record).

If an EQRCLK form (5723 Record) exists for a Remote Module of this Remote Site, the RSM entered on the EQRCLK form must match the MASTER MODULE on this form for this Remote Site.

2.4 STAND ALONE PURCHASED?

Description: This field name is available with 5E5 and later Software Releases. If Stand-Alone call processing was purchased for this site, enter "Y". Otherwise enter "N". Caution should be observed when entering this field because this option may only be set with the ODA process; this is not a Recent Changeable item.

Copyright © 2003 Lucent Technologies

Required Field
Valid Entries: Y - N

Data Rules:

When Stand-Alone is purchased, a Fixed Route Type of "RSMSA" must be defined on a FIXRT form (5301-1 Record).

For more detailed information on Stand-Alone operation, see the RSM Stand-Alone call processing section (Division 2, Section 1C).

2.5 STAND ALONE BILLING PURCHASED?

Description: If Stand-Alone Billing was purchased for this site, enter "Y"; otherwise, enter "N". Caution should be observed when entering this field because this option can only be set by the ODA process. This is not a Recent Changeable item.

Required Field.
Valid Entries: Y - N

Data Rules:

Stand-Alone Billing may only be "Y" if STAND ALONE PURCHASED is also "Y".

For more detailed information on Stand-Alone operation, see the RSM Stand-Alone call processing section (Division 2, Section 1C).

2.6 ALARM INPUT OPTION

Description: If the REMOTE SITE has the ALARM INPUT OPTION, enter "Y "; otherwise, enter "N".

Required Field.
Valid Entries: Y - N

Data Rules:

If this field is "Y", an entry in the MASTER MODULE field is required.

For more detailed information on the ALARM INPUT OPTION, see Division 3, Section 5P.

2.7 ALARM OUTPUT OPTION

Description: If the REMOTE SITE has the ALARM OUTUT OPTION, enter "Y"; otherwise, enter "N".

Required Field.
Valid Entries: Y - N

Data Rules:

If this field is "Y", an entry in the MASTER MODULE field is required.

For more detailed information on the ALARM OUTPUT OPTION, see Division 3, Section 5P.

2.8 ALARM AUDIBLE TIMING

Description: If the REMOTE SITE has the ALARM OUTPUT OPTION, enter the Remote Alarm Audible Timing in seconds.
Valid Entries: 5 - 300 (seconds)

Copyright © 2003 Lucent Technologies

Data Rules:

If ALARM OUTPUT OPTION is "Y", this entry is required. If ALARM OUTPUT OPTION is "N", this field must not be entered.

2.9 ALARM OUTPUT SITE

Description: This field is only applicable to collocated ORMs or TRMs that are sharing the RAU (Remote Alarm Unit) of another collocated ORM/TRM. This field is populated in the collocated ORM/TRM not equipped with the RAU. Enter the ORM/TRM Remote Site where remote alarms from this Remote Site will be routed to. Valid entries are 1 to 174. The input value must represent an ORM or TRM Remote Site with the Remote Alarm Unit assigned.
Valid Entries: 1 - 174

Data Rules:

ALARM OUTPUT SITE must not equal REMOTE SITE.

ALARM OUTPUT SITE must be left blank if ALARM INPUT OPTION IS "Y" or ALARM OUTPUT OPTION IS "Y".

ALARM OUTPUT SITE, if entered, must be defined in the REMOTE SITE field on an EQIM form where SM USAGE is "ORM" or "TRM".

ALARM OUTPUT SITE, if entered, must be defined in the REMOTE SITE field on another EQSITE form where MASTER MODULE is entered.

2.10 REMARK

Description: This field may be used for any descriptive comment which consists of alphanumerics, blanks, or special characters.

SEC. 16: 5723-1/2 RECORD
REMOTE CLOCK DATA FORM (EQRCLK)

1. GENERAL

The RCU (Remote Clock Unit) is available with 5E2 and later Software Releases. It is an option of Multi-module Remote Switching Module Sites. The RCU meets the timing requirements for carrying data over digital trunks. These trunks, for example, might connect the RSM to another digital switch. Error free transmission of data over digital trunks requires that both switches be synchronized. The RCU for Multi-module RSMs provides the means for keeping the RSM Site synchronized during periods of stand-alone operation.

1.1 Recent Change View

The corresponding Recent Change View for this form is 20.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *RSM

Description: Enter the number of the Remote Switching Module where the RSM is physically located. This must be the Master Module of the RSM Site.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The RSM must also be defined on exactly two RCLKREF (5519 Record) forms with REFERENCE set to 1 and REFERENCE set to 2, respectively.

2.3 CLOCK TYPE

Description: Enter the type of clock.

Required Field.

Valid CLOCK TYPE Entries

Entry	Definition
24CHAN2	24-channel domestic clock.
STDALNE2	Stand-alone.

2.4 OSCILLATOR TYPE

Description: Enter the type of oscillator.

Required Field.
Default: DOMMED
Valid Entries:

Valid OSCILLATOR TYPE Entries

Entry	Definition
DOMMED	Medium stability; typically used for local offices.
DOMHI	High stability; typically used for toll applications.

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E3 and later, the only valid entry is "DOMMED".

2.5 CLOCK CLI

Description: Enter the Change Level Indicator.

Required Field.
Valid Entries: 0 - 7fffffff (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.6 EQPT STATUS

Description: Enter the status of the RCU. For new offices and units destined for factory testing, "O" is the only allowed value. During off-line ODA database retrofits, the other values are valid.

Required Field.

Valid EQPT STATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

2.7 EQPT BAY

Description: Enter the Equipment location Bay.

Required Field.
Valid Entries: 0 - 4

Data Rules:

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

2.8 EQPT UN VERT

Description: Enter the Equipment Vertical location that specifies the bottom of the Unit.

Valid EQPT UN VERT Entries

Entry	Definition
22,30,39,48,56,65,74	7 foot cabinets.
15,24,32,41,49,58	6 foot cabinets.

2.9 EQPT AISLE

Description: Enter the Equipment Aisle location. This entry consists of a floor and aisle number. The first and second digits are the floor number. The valid range for floor number is 00 - 99. The last two digits are the aisle number. The valid range for aisle number is 00 - 99. It is recommended that floor 00 be used for equipment located basement per floor plan designation.

Required Field.
Valid Entries: 0000-9999

2.10 INTF UNIT

Description: The Interface Unit field is a Recent Change only field. This field was added to support the

Copyright © 2003 Lucent Technologies

5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.
Valid Entries: 0 -8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

2.11 CONT GRP SIDE 0

Description: Enter the Control Group number.

Required Field.
Valid Entries: 0 - 1

Data Rules:

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.12 CONT PORT SIDE 0

Description: Enter the Control Port number.

Required Field.
Valid Entries: 0 - 22.

Data Rules:

The control group and control port combination must be unique for the two sides of the clock.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.13 CONT GRP SIDE 1

Description: Enter the Control Group number.

Required Field.
Valid Entries: 0 - 1

Copyright © 2003 Lucent Technologies

2.14 CONT PORT SIDE 1

Description: Enter the Control Port number.

Required Field.
Valid Entries: 0 - 22

Data Rules:

The control group and control port combination must be unique for the two sides of the clock.

SIDE 0 PRIMARY (MSU SG 0) POINTS

The following fields (Section 2.15 - Section 2.23) define the primary scan and distribute points assignments for Service Group 0. The formats of the scan and distribute point numbers are provided in the tables below.

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU/MMSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Scan Point Number	DPN	XX	00-30

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU/MMSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

2.15 CLK PWR W SP

Description: Enter the scan point assignment for SIDE 0 CLOCK POWER W. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.16 CLK PWR Y SP

Description: Enter the scan point assignment for SIDE 0 CLOCK POWER Y. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.17 CLK MAN OVERRIDE SP

Description: Enter the scan point assignment for SIDE 0 CLOCK MANUAL OVERRIDE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: (See Scan Point Table above)

2.18 CLK REQ OOS SP

Description: Enter the scan point assignment for SIDE 0 CLOCK REQUEST OUT OF SERVICE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.19 OSC X PWR SP

Description: Enter the scan point assignment for SIDE 0 OSCILLATOR X POWER. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.20 OSC Y PWR SP

Description: Enter the scan point assignment for SIDE 0 OSCILLATOR Y POWER. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.21 CLK OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 0 CLOCK OUT OF SERVICE. This point must be assigned on Service Group 0 of the MSU/MMSU.

2.22 CLK REQ IN PROG DP

Description: Enter the distribute point assignment for SIDE 0 CLOCK REQUEST IN PROGRESS. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.23 OSC OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 0 OSCILLATOR OUT OF SERVICE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

SIDE 1 PRIMARY (MSU SG 0) POINTS

The following fields (Section 2.24 - Section 2.32) define the primary scan and distribute points assigned to Service Group 0 of their Metallic Service Unit.

2.24 CLK PWR W SP

Description: Enter the scan point assignment for SIDE 1 CLOCK POWER W. This point must be assigned on Service Group 0 of the MSU.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: (See Scan Point Table above)

2.25 CLK PWR Y SP

Description: Enter the scan point assignment for SIDE 1 CLOCK POWER Y. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.26 CLK MAN OVERRIDE SP

Description: Enter the scan point assignment for SIDE 1 CLOCK MANUAL OVERRIDE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.27 CLK REQ OOS SP

Description: Enter the scan point assignment for SIDE 1 CLOCK REQUEST OUT OF SERVICE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.28 OSC X PWR SP

Description: Enter the scan point assignment for SIDE 1 OSCILLATOR X POWER. This point must be assigned on Service Group 0 of the MSU/MMSU.

2.29 OSC Y PWR SP

Description: Enter the scan point assignment for SIDE 1 OSCILLATOR Y POWER. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.30 CLK OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 1 CLOCK OUT OF SERVICE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.31 CLK REQ IN PROG DP

Description: Enter the distribute point assignment for SIDE 1 CLOCK REQUEST IN PROGRESS. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.32 OSC OUT OF SERV DP

Copyright © 2003 Lucent Technologies

Description: Enter the distribute point assignment for SIDE 1 OSCILLATOR OUT OF SERVICE. This point must be assigned on Service Group 0 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

SIDE 0 DUPLEX (MSU SG 1) POINTS

The following fields (Section 2.33 - Section 2.41) define the duplex scan and distribute points assigned to Duplex Service Group 1 of the Metallic Service Unit.

Required Field.

2.33 CLK PWR W SP

Description: Enter the scan point assignment for SIDE 0 CLOCK POWER W. This point must be assigned on Service Group 1 of the MSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.34 CLK PWR Y SP

Description: Enter the scan point assignment for SIDE 0 CLOCK POWER Y. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.35 CLK MAN OVERRIDE SP

Description: Enter the scan point assignment for SIDE 0 CLOCK MANUAL OVERRIDE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.36 CLK REQ OOS SP

Description: Enter the scan point assignment for SIDE 0 CLOCK REQUEST OUT OF SERVICE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.37 OSC X PWR SP

Description: Enter the scan point assignment for SIDE 0 OSCILLATOR X POWER. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.38 OSC Y PWR SP

Description: Enter the scan point assignment for SIDE 0 OSCILLATOR Y POWER. This point must be assigned on Service Group 1 of the MSU/MMSU.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: (See Scan Point Table above)

2.39 CLK OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 0 CLOCK OUT OF SERVICE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.40 CLK REQ IN PROG DP

Description: Enter the distribute point assignment for SIDE 0 CLOCK REQUEST IN PROGRESS. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.41 OSC OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 0 OSCILLATOR OUT OF SERVICE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

SIDE 1 DUPLEX (MSU SG 1) POINTS

The following fields (Section 2.42 - Section 2.50) define the primary scan and distribute points assignments for Service Group 1 of their Metallic Service Unit.

2.42 CLK PWR W SP

Description: Enter the scan point assignment for SIDE 1 CLOCK POWER W. This point must be assigned on Service Group 1 of the MSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.43 CLK PWR Y SP

Description: Enter the scan point assignment for SIDE 1 CLOCK POWER Y. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.44 CLK MAN OVERRIDE SP

Description: Enter the scan point assignment for SIDE 1 CLOCK MANUAL OVERRIDE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.45 CLK REQ OOS SP

Copyright © 2003 Lucent Technologies

Description: Enter the scan point assignment for SIDE 1 CLOCK REQUEST OUT OF SERVICE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.46 OSC X PWR SP

Description: Enter the scan point assignment for SIDE 1 OSCILLATOR X POWER. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.47 OSC Y PWR SP

Description: Enter the scan point assignment for SIDE 1 OSCILLATOR Y POWER. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Scan Point Table above)

2.48 CLK OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 1 CLOCK OUT OF SERVICE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.49 CLK REQ IN PROG DP

Description: Enter the distribute point assignment for SIDE 1 CLOCK REQUEST IN PROGRESS. This point must be assigned on Service Group 1 of MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

2.50 OSC OUT OF SERV DP

Description: Enter the distribute point assignment for SIDE 1 OSCILLATOR OUT OF SERVICE. This point must be assigned on Service Group 1 of the MSU/MMSU.

Required Field.
Valid Entries: (See Distribute Point Table above)

Copyright © 2003 Lucent Technologies

SEC. 17: 5730-1/2/3/4/5 RECORD
DIGITAL LINE/TRUNK UNIT EQUIPAGE FORM - EQDU
DIGITAL LINE/TRUNK UNIT PACK EQUIPAGE FORM - EQDUP

1. GENERAL

For 5E5 and later, the 5730 Record was split into two records: 5730-1 for the EQDU form and 5730-2 for the EQDUP form. These forms are used to define equipment location information for the Digital Line/Trunk Units.

The Digital Line/Trunk Unit Record is used to define the Switching Module, Digital Line/Trunk Units, and the Digital Facility Interface Pack Number.

For 5E5 and later, a DFI-2 (Digital Facility Interface-2) is available. The DFI-2 allows two T1 lines to terminate on the DLTU2 (Digital Line and Trunk Unit-2). The two T1 lines are specified as Facility 0 and Facility 1 on the EQDUP form. Facility 0 utilizes channels 1 to 24. Facility 1 utilizes channels 25 to 48. For 5E8 and later, DFI-2 PM GRP was added to provide performance monitoring capability for DFI-2 facilities. For more information on the performance monitoring for DFI-2, see the PMTHRESH form (5948 Record).

1.1 Carrier Group Alarm Hash Indexes

TheCGA (Carrier Group Alarm) data is associated with the VT/DS1 and STE/STS facilities. For 5E9(2) and later, only 522 hash indexes are available per switching module. One hash index is allocated to each instance of the following for a specific SM:

- 1 per each pair STE/STS on a specified SM (EQSTE form). (The EQSTE form is associated with the DNU-S.)
- 1 per each VT (Virtual Tributary) on a specified SM (EQVT form). (The EQVT form is associated with the DNU-S.)
- 1 per each DFI (Digital Facility Interface) of a DLTU (Digital Line/Trunk Unit) where FAC IND is 0 or 1, and DFI TYPE is not "H1" or "H2", i.e., DFI USAGE of "H1" and "H2" are not counted (EQDUP form). (The EQDUP form is associated with DLTU.)
- 1 per each DFI-2 (2 per EQDUP form) where FAC IND is 3. (The EQDUP form is associated with DLTU.)
- 1 per pack - POS, EQST, CLI, CLEI combination. (30 packs per DCLU on EQDCLP form) (The EQDCLP form is associated with DCLU.)
- 1 per IFAC - EQSTAT, SUP MTHD, PUB43801 combination. (20 per IDCU on the EQIFAC form) (The EQIFAC form is associated with IDCU.)

1.2 Recent Change View

The corresponding Recent Change Views for this form are 19.4 and 20.4

2. FORM ENTRIES - EQDU FORM
5730-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * SM

Description: Enter the Switching Module number.
Valid Entries: 1 - 192

Data Rules:

For 5E8 and later, each Switching Module (which is not an SM-2000 class processor) has 512 TS (Time Slots) available for variousfunctions. Some of these 512 are available on call and some are reserved.

- At least two TS are always required in each SM, one for audible ring and one for idle code.
- In DSN (Defense Switched Network) offices, at least three TS are always required in each SM, one for audible ring, one for precedence audible ring and one for idle code. SMs cannot have more than 509 time slots assigned to equipment.
- Each of the forms listed below may utilize a number of initialized time slots. These TS should NOT be shared with any other applications.
  - EQDCLU - Digital Carrier Line Unit Equipage Form
  - EQDSP - Digital Service Unit Pack Equipage Form
  - EQDUP - Digital Line/Trunk Unit Pack Equipage Form
  - EQIDCU - Integrated Digital Carrier Unit Equipage Form
  - EQISLU - Integrated Services Line Unit Equipage Form
  - EQISTF - Integrated Services Test Function Form
  - EQLU - Line Unit Equipage Form
  - EQPSU - Packet Switching Unit Equipage Form
  - EQRA - Recorded Announcement Function Common Circuit & Services Form
  - EQTUP - Trunk Unit Pack Equipage Form

For 5E9(2) and later, when the SM value matches the SM value on an EQIM form with an SM-2000 class processor UNIT TYPE , DLTU TYPE must be "DLTU48".

When the SM value matches the SM value on an EQIM form with an SM-2000 UNIT TYPE, and if DFI USAGE for FAC 0 or Fac 1 is entered on the EQDUP form, the value of the DFI USAGE must be "TRUNK" or "HOST" (for 5E10 and later).

For 5E10 and later, when XAT forms have an OE TYPE of "D" and an OE entered, indicating a DEN(s) assignment, and the CHAN for this DEN is greater than 24 (OE[7,8]) a DIGITAL LINE/TRUNK UNIT TYPE of "DLTU48" on the corresponding EQDU form is required.

2.3 * DLTU NUMBER

Description: Enter the Digital Line/Trunk Unit Number.
Valid Entries:

5E14 and earlier: 0 - 5

Copyright © 2003 Lucent Technologies

5E15 and later: 0 - 11

2.4 # DLTU TYPE

Description: Enter the Digital Line/Trunk Unit Type.

Software Release: 5E3 and later
Required Field.
Valid Entries:

Valid DLTU TYPE Entries

Entry	Definition
DLTU24	DLTU with 10 DFIs.
DLTURH	Remote Integrated Services Line Unit DLTU with 16 DFIs.
DLTU48	Software Release: 5E5 and later. DLTU2 with 10 DFI2s.

Data Rules:

For 5E8 and later, when DLTU TYPE is "DLTU24" or "DLTU48" and the corresponding TKGRP form has:
- TRKCLS of "EDSL", "IFOPER", or "IFTERM",
- INPULSING or OUTPULSING of "DCHN",
- TRK DIR of "2W", "INC", or "OUT",
- ASP ALW of "N",

then DATA RATE on the TKGRP form must be "56K", "R64K", "64K", or must not be entered.

For 5E8 and later, when DLTU TYPE is "DLTU24" or "DLTU48" and the corresponding TKGRP form has:
- TRKCLS of "EDSL", "IFOPER", or "IFTERM",
- INPULSING or OUTPULSING of "DCHN",
- TRK DIR of "SGNL",
- ASP ALW of "N",

then DATA RATE on the TKGRP form must be entered.

For 5E8 and later, when DLTU TYPE is "DLTU24" or "DLTU48" and the corresponding TKGRP form has:
- TRKCLS of "EDSL", "IFOPER", or "IFTERM",
- INPULSING or OUTPULSING of "DCHN",
- TRK DIR of "2W", "INC", or "OUT"
- ASP ALW of "Y",

then DATA RATE on the TKGRP form must not be entered.

For 5E9(2) and later, a DLTU on an SM-2000 class processor must be a DLTU2; DLTU TYPE must be "DLTU48".

For 5E9(2) and later, when DLTU TYPE is "DLTU24" or "DLTU48", OUTPULSING on the corresponding TKGRP form must not be equal to "RPTO".

When DLTU TYPE is "DLTU48", CBL SERIES and CBL DISTANCE must be entered.

2.5 # EQUIPMENT BAY

Description: Enter the Equipment Bay location number.

Required Field.
Valid Entries:
- 5E9(1) and earlier: 0 - 4

Copyright © 2003 Lucent Technologies

- 5E9(2) and later: 0 - 208

Valid EQLBAY Entries, 5E9(2) and later

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinent aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

2.6 # EQUIPMENT UNIT VERTICAL

Description: Enter the Vertical Equipment location that specifies the bottom of the unit. Recommended values are based on cabinet type:

5E9(1) and earlier:
- For 7-foot cabinets: 22, 30, 39, 48, 56, 65, 74
- For 6-foot cabinets: 15, 24, 32, 41, 49, 58

For 5E9(2) and later:
- For 7-foot cabinets: 22, 30, 39, 48, 56, 65, 74
- For 6-foot cabinets: 7, 15, 24, 32, 41, 49, 58

Required Field.
Valid Entries: 0 - 84

2.7 # EQUIPMENT AISLE

Description: Enter the Equipment Aisle, consisting of a floor and aisle number.

The first and second digits from the left are the floor number. Valid floor numbers are 00 - 99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

The third and fourth digits are the aisle number. Valid aisle numbers are 00 - 99.

Required Field.
Valid Entries: 0000 - 9999

2.8 CSU

Description: Is DLTU located on a Combined Services Unit? For more information on the Combined Services Unit feature, see Division 2, Section 7F.

Software Release: 5E10 and later
Required Field.
Default Value: N
Valid Entries: Y, N

Data Rules:
When CSU is "Y", DLTU TYPE must be "DLTU48".

When an EQDU form is entered with CSU set to "Y", no other EQDU form may be entered on the same SM that also has CSU set to "Y".

When an EQDU form is entered with CSU set to "Y", all corresponding EQDUP forms with matching SM and DLTU values must have DFI PACK NBR less than 6.

For an SM with a CSU (Combined Services Unit), all equipment assignments for the CSU on that SM must specify the same combination of AISLE, BAY, VERT POS values. Therefore, the EQDU, EQGDSC3,

Copyright © 2003 Lucent Technologies

EQMSU, or EQRA forms which have CSU set to "Y" must have equipment assignments that specify one location for the same CSU on a particular SM.

2.9 CBL SERIES

Descrition: Indicate the series type of cable between the DLTU2 and the DSX (Digital Cross Connect Bay).

Data Rules:
This field can only be entered when DLTU TYPE is "DLTU48".

When CBL SERIES is "1249S", CBL DISTANCE must be 0 - 450.

When CBL SERIES and/or CBL DISTANCE are entered, DLTU TYPE must be "DLTU48".

2.10 CBL DISTANCE

Description: Enter the distance between the DLTU2 and the DSX (Digital Cross Connect Bay). This distance is measured from the center of the DSX bay to the center of the DLTU2 shelf.

Software Release: 5E5 and later
Valid Entries: 0 - 650 (feet)

Data Rules:

This field can only be entered when DLTU TYPE is "DLTU48".

3. FORM ENTRIES - EQDUP FORM 5730-2/3 RECORD

3.1 * SM

Description: Enter the Switching Module number.
Valid Entries: 1 - 192

Data Rules:

For 5E8 and later, each Switching Module (which is not an SM-2000) has 512 TS (Time Slots) available for variousfunctions. Some of these 512 are available on call and some are reserved.

- At least two TS are always required in each SM, one for audible ring and one for idle code.
- In DSN (Defence Switched Network) offices, at least three TS are always required in each SM, one for audible ring, one for precedence audible ring and one for idle code. SMs cannot have more than 509 time slots assigned to equipment.
- Each of the forms listed below may utilize a number of initialized time slots. These TS should NOT be shared with any other applications.
  - EQDCLU - Digital Carrier Line Unit Equipage Form
  - EQDSP - Digital Service Unit Pack Equipage Form
  - EQDUP - Digital Line/Trunk Unit Pack Equipage Form
  - EQIDCU - Integrated Digital Carrier Unit Equipage Form
  - EQISLU - Integrated Services Line Unit Equipage Form

Copyright © 2003 Lucent Technologies

- EQISTF - Integrated Services Test Function Form
- EQLU - Line Unit Equipage Form
- EQPSU - Packet Switching Unit Equipage Form
- EQRA - Recorded Announcement Function Common Circuit & Services Form

EQTUP - Trunk Unit Pack Equipage Form

3.2 * DLTU

Description: Enter the DLTU number.
Valid Entries:

5E14 and earlier: 0 - 5
5E15 and later: 0 - 11

3.3 * DFI PACK NBR

Description: Enter the Digital Facility Interface Pack Number.
Valid Entries: 1 - 16

Data Rules:

(See also the paragraph Section 1.1 on Carrier Group Alarm.)

If DFI USAGE is "H1", DFI PACK NUMBER must be less than 5. If DFI USAGE is "H2", DFI PACK NUMBER must be greater than 4. If DFI USAGE is "H1", then this field must be less than 5. If DFI USAGE is "H2", this field must be greater than 4.

If DFI USAGE is "HOST", "TRUNK", "RDFI" or "CDFI", this field must be less than 11.

3.4 FAC IND

Description: Indicate the facility to be used.

For a DFI, the valid entry is 0, which indicates that the DFI can terminate one T1 facility (24 channels) per DLTU circuit pack. This value must be entered when DFI USAGE is "H1" or "H2".

For a DFI-2, the valid entries are 1 and 3. The DFI-2 can terminate two T1 facilities (48 channels) per DLTU2 circuit pack. A value of 1 entered in this field indicates that Facility 0 (channels 1-24) is utilized. A value of 3 indicates that Facility 0 and Facility 1 are utilized. Facility 0 uses channels 1-24 and Facility 1 uses channels 25-48.

Required Field.
Default: 0
Valid Entries: 0, 1 or 3

Data Rules:

For 5E5 and later, on an RSM all Digital Facility Interface packs for umbilicals and/or ICLs (Intra-Cluster Links) must be the same type, i.e. they must all be DFIs or all be DFI-2s. The EQDUP forms with DFI USAGE "RDFI" or "CDFI" for the RSM must all have FAC IND 0 or all have FAC IND 1 or 3.

FAC IND on an SM2000 class processor (UNIT TYPE on the EQIM form is defined as an SM2000 class

Copyright © 2003 Lucent Technologies

processor) must be 1 or 3.

For 5E10 and later, if 0 is entered, then the CLI value must be 0, 3, 8, or b.

3.5 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

3.6 # CONTROL GROUP

Description: Enter Control Group Number. For 5E9(2) and later, 0 - 1 is used for SMs; 0 - 3 is used for SM-2000s.

Required Field.
Valid Entries:
- 5E9(1) and earlier: 0 - 1
- 5E9(2) and later: 0 - 3

Data Rules:

If the DFI (DFI USAGE of "RDFI") is assigned to DLTU 0, then this field must be 1 when the DFI PACK NBR is 1 - 4.

For 5E9(2) and later, if CONTROL GROUP is 0 for an SM (SM is defined on an EQIM form where UNIT TYPE is not an SM-2000 class processor), CONTROL PORT may not be 0 or 1. These ports are reserved for the LDSU.

For 5E10 and later, CONTROL GROUP/PORT must not equal FAC 0 EC CI or FAC 1 EC CI.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

3.7 # CONTROL PORT

Description: Enter the Control Port Number.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 22

Data Rules:

For an SM (i.e., non-SM-2000), if CONTROL GROUP is 0, this field must not be 0 or 1.

If the DFI (DFI USAGE is "RDFI"), see Figure 2 for required assignments.

For 5E10 and later, CONTROL GROUP/PORT must not equal FAC 0 EC PICB or FAC 1 EC PICB.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

3.8 # CLI

Description: Enter the Change Level Indicator.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Field.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

The correct CLI values when FAC IND is 0 are listed in Division 8, Section 1 for DFI TYPEs "TRUNK", "CDFI", "RDFI", "H1", and "H2", a hexadecimal value of 0, 1, 3, 8 or b.

3.9 CLEI

Description: Enter the Common Language Equipment Identification. See the appropriate J-Drawing for the applicable CLEI codes.

Required Field.
Valid Entries: 10 characters

APT TESTING

The following fields (Section 3.10 - Section 3.11) are added to support the APT (Automatic Progression Testing) Enhancements feature. For more information see, Division 2, Section 2AD.

3.10 ALG FAC 0

Description: This field indicates the algorithm used in APT for the DS1s (Digital Signal Level 1) related to facility 0.

Software Release: 5E16 FR2 and later

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid ALG FAC 0 Entries

Entry	Definition
1ONLY	Test One Only (test one trunk only on the DS1, independently whether test passes or fails and then move to a trunk on another DS1).
FULL	Full (test all trunks on the DS1, independently whether test passes or fails, and then move to a trunk on another DS1).
NOTST	No Test (APT should not perform any tests on the DS1).
SUCC	Stop on Success (test one trunk on the DS1 and then move to a trunk on another DS1 if test passes, or test next trunk on the same DS1 if test fails).

Data Rules:

When ALG FAC 0 is entered, FAC 0 DFI USAGE must be "'TRUNK" and FAC 0 APPL must not be entered.

3.11 ALG FAC 1

Description: This field indicates the algorithm used in APT for the DS1 related to facility 1.

Software Release: 5E16 FR2 and later
Valid Entries:

Valid ALG FAC 1 Entries

Entry	Definition
1ONLY	Test One Only (test one trunk only on the DS1, independently whether test passes or fails and then move to a trunk on another DS1).
FULL	Full (test all trunks on the DS1, independently whether test passes or fails, and then move to a trunk on another DS1).
NOTST	No Test (APT should not perform any tests on the DS1).
SUCC	Stop on Success (test one trunk on the DS1 and then move to a trunk on another DS1 if test passes, or test next trunk on the same DS1 if test fails).

Data Rules:

When ALG FAC 1 is entered, FAC 1 DFI USAGE must be "'TRUNK" and FAC 1 APPL must not be entered.

All FAC 1 entries must be blank when FAC IND is 0 or 1.

FAC 0 / FAC 1

The following fields (Section 3.12 - Section 3.23) are used to define up to two T1 facilities. For 5E5 and later, a DFI-2 is available. The DFI-2 allows two T1 lines to terminate on the DLTU2 (Digital Line and Trunk Unit-2). The two T1 lines are specified as Facility 0 and Facility 1 on this form. Facility 0 utilizes channels 1 to 24. Facility 1 utilizes channels 25 to 48.

The FAC 0 column is used for defining a DFI (24 channels) or for defining Facility 0 on a DFI-2. The FAC 1 column is used for defining Facility 1 on a DFI-2.

3.12 DFI USAGE

Description: Enter the DFI Usage. This field is required when FAC 0 or FAC 1 is defined.

Valid DFI USAGE Entries

Entry	Definition
CDFI	The DFI is on an RSM and is providing an ICL (Intra-Cluster Link) to a mate RSM within the same RSM Site.
H1	The DFI is used with RISLU to remote a common control PICB and a TSI PIDB.
H2	The DFI is used with RISLU to remote a TSI PIDB.
HOST	The DFI is on a Host Switching Module and is providing an umbilical from the Host for the RSM.
RDFI	The DFI is on an RSM (Remote Switching Module) and is being used to provide an umbilical from the RSM

Copyright © 2003 Lucent Technologies

	to the Host Switching Module. See Figure 2 for required RDFI assignments.
TRUNK	The DFI is being used to provide trunk circuits.

Data Rules:

(See also the paragraph Section 1.1 on Carrier Group Alarm.)

CDFI:
For 5E10 and later, if "RDFI" or "CDFI" is entered FAC 0/1 DFI MODE must be "ZCS" or "B8ZS" if FAC IND is 0, 1 or 3.

H1:
If DFI USAGE is "H1", DFI PACK NUMBER must be less than 5.

H2:
If DFI USAGE is "H2", DFI PACK NUMBER must be greater than 4. For a DFI2, the DFI USAGE defined for FAC 0 must be the same as the DFI USAGE for FAC 1.

HOST:
An SM (defined on an EQIM form where UNIT TYPE is not an SM-2000 class processor) may have no more than 20 FAC 0 and/or FAC 1 DFI USAGE(s) set to "TRUNK" or "HOST".

RDFI:
For 5E10 and later, if "RDFI" or "CDFI" is entered FAC 0/1 DFI MODE must be "ZCS" or "B8ZS" if FAC IND is 0, 1 or 3.

TRUNK:
An SM (defined on an EQIM form where UNIT TYPE is not an SM-2000 class processor) may have no more than 20 FAC 0 and/or FAC 1 DFI USAGE(s) set to "TRUNK" or "HOST".

For 5E9(2) and later, if DFI USAGE is entered for an SM-2000 class processor, DFI USAGE must be "TRUNK".

For 5E10 and later, if DFI USAGE is entered for an SM-2000 class processor, DFI USAGE must be "TRUNK" or "HOST".

For 5E10 and later, if "TRUNK" is entered, FAC 0/1 DFI MODE must be
- "64K"
- "D4"
- "D464"
- "D4NO"
- "FE"
- "FE8Z"
- "FE64"
- "FEB7"

3.13 EQUIPMENT STATUS

Description: Enter the Status of the Equipment. For new offices and units destined for factory testing, "O" (Operational) is the only allowed value. During off-line ODA database retrofits, the other values are valid.

Valid EQUIPMENT STATUS Entries

Entry	Definition
O	Operational (initial ODA)
G	Growth (ODA growth)
U	Unequipped

Data Rules:

Copyright © 2003 Lucent Technologies

This field is required when FAC 0 or FAC 1 is defined.

With 5E5 and later, for a new office (operational) or an equipment addition (growth),

- when FAC IND is 0 or 1 and DFI USAGE is
  - "CDFI"
  - "HOST"

  "RDFI" or
  - "TRUNK",

  EQUIPMENT STATUS must be "O".
- when FAC IND is 3 and FAC 0 or 1 DFI USAGE is
  - "CDFI"
  - "HOST"

  "RDFI" or
  - "TRUNK",

  FAC 0 or 1 EQUIPMENT STATUS must be "O".
- when FAC IND is 3 and FAC 1 DFI USAGE is "RDFI" or "CDFI",

  FAC 1 EQUIPMENT STATUS must be "O" or "G".

3.14 DATA GROUP

Description: Enter the Data Group Number. For 5E9(2) and later, 0 - 1 is used for SMs; 0 - 5 is used for SM-2000s.
Valid Entries:
- 5E9(1) and earlier: 0 - 1
- 5E9(2) and later: 0 - 5

Data Rules:

The DATA GROUP/PORT combination entered for FAC 0 must not match the DATA GROUP/PORT combination entered for FAC 1.

This field must be blank if DFI USAGE is "RDFI" or "CDFI"; otherwise, this field must be entered.

3.15 DATA PORT

Description: Enter the Data Port Number. For 5E9(2) and later, 0 - 15 is used for SMs; 0 - 23 is used for SM-2000s.
Valid Entries:

Copyright © 2003 Lucent Technologies

- 5E9(1) and earlier: 0 - 15
- 5E9(2) and later: 0 - 23

Data Rules:

If DATA GROUP is 1 for a non-SM-2000 class processor, DATA PORT may not be 15.

This field must be blank if DFI USAGE is "RDFI" or "CDFI"; otherwise, this field must be entered.

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

3.16 VRBS

Description: Will the CGA (Carrier Group Alarm) conditioning mode be Verbose?

The verbose conditioning mode prints an individual craft message as each carrier group port is removed from, or restored to, service by CGA.

If VRBS is "N", normal conditioning will occur.

- **WARNING:** CGA verbose messages, like other output messages on the 5ESS Switch, are subject to brevity control. If the number of messages printed has exceeded the limit for the message class during a 15 minute period, further messages will not print.

Valid Entries: Y, N

3.17 CLFI

Description: Enter a Common Language Facility ID or a name that identifies the T1 facility. The name will appear on the MCC (Master Control Center).

Valid Entry: 1 - 12 characters

3.18 STUFFING PATTERN

Description: Enter the Channel Assignment Stuffing pattern. Each Digital Facility Interface Pack is assigned to a PIDB (Peripheral Interface Data Bus) in one of two Data Groups (0 or 1). Since a Digital Facility Interface Pack has only 24 circuits, and the Data Group has 32 available Time Slots, eight Time Slots are unused (idle). The Stuffing Pattern indicates this Time Slot assignment.

To prevent Time Slot blockage, spread the four patterns (A, B, C, D) evenly over all the Digital Facility Interface Packs assigned to a Data Group. Each pattern can be repeated up to three times per Data Group.

Valid STUFFING PATTERN Entries

Entry	Definition
A	Indicates Time Slots 0, 4, 8, 12, 16, 20, 24 and 28 are idle.
B	Indicates Time Slots 1, 5, 9, 13, 17, 21, 25 and 29 are idle.
C	Indicates Time Slots 2, 6, 10, 14, 18, 22, 26 and 30 are idle.
D	Indicates Time Slots 3, 7, 11, 15, 19, 23, 27 and 31 are idle.

Data Rules:

DFIs assigned to OSPS RISLUs must have a STUFFING PATTERN of "A".

This field must be entered for RISLU DFIs (DFI USAGE is "H1" or "H2") defined in the FAC 0 column.

Copyright © 2003 Lucent Technologies

This field must be blank for all other DFI USAGES; ODA will automatically assign stuffing patterns.

3.19 DFI MODE

Description: Enter the Digital Facility Interface (T1 carrier) transmission mode.

This field is required when FAC 0 or FAC 1 is defined. The DFI MODE entered for FAC 0 can be different from the DFI MODE entered for FAC 1.

Glossary for DFI Mode terms:

- B8ZS: Bipolar 8 Zero Substitution
- CCS: Common Channel Signaling
- ZCS: Zero Code Suppression

- ***NOTE:*** 1:Applications that do not send signaling along the same path as data, e.g., ISDN and CCS7, automatically upgrade a 56K data rate to 64K. The 5ESS Switch application software upgrades the data rate to 64K by disabling rob-bit signaling on a per-channel basis. (Rob-bit signaling is the method traditionally used by trunks to send control signals along the same path as data. When an application such as ISDN or CCS7 sends the signal along another route, the rob-bit signaling is inhibited, reclaiming the PCM (Pulse Coded Modulation) bits "robbed" for signaling, and increasing the data rate to 64K.) If a 56K restricted channel mode is upgraded in this manner by application software, the resulting mode is 64K restricted channel which means that the user still cannot send zero bytes.

- ***NOTE:*** 2: When the 56K/64K clear channel capability (B8ZS line coding) is enabled by an application, the user must ensure that ALL equipment in the transmission path, including multiplexers, repeaters, etc., are optioned for the B8ZS line coding. The failure to do so will result in interfaces such as RSMs, RISLUs, and PRI D-channels failing to initialize. All other types of data transmission sending zero octets will also be corrupted by failing to option the transmission path correctly.

The data rate is upgraded to 64K based on trunk group parameters such as the following:

- Common Channel Signaling System 7; OUTPULSING equal to "ISUP7"
- Extended Digital Subscriber Line Trunk; TRKCLS equal to "EDSL"
- EDSL Trunk for Hotel/Motel TSPS Service; TRKCLS equal to "EDSLHM"
- Two-Way Packet-Switched; Internal Protocol (Local and Toll); TRKCLS equal to "PACKET"

- ***NOTE:*** 3: For 5E9(1) only, the 56K clear/56K restricted modes (FE and FE8Z) for OSPS RISLUs can be changed to 64K clear/64K restricted modes (ZCS and B8ZS) but not vice versa.

Valid DFI MODE Entries	
D4 Compatible Modes	
Entry	**Definition**
D4	56K restricted channel transmission; cannot send zero bytes, rob-bit, with ZCS. Always 56K.
64K	56K/64K clear channel transmission; can send zero bytes, rob-bit, with B8ZS. See Notes 1 and 2 above.
D464	56K/64K restricted channel transmission; cannot send zero bytes, rob-bit, with ZCS. See Note 1 above.
D4NO	56K restricted channel transmission; cannot send zero bytes, rob-bit, no ZCS. Always 56K.

Valid DFI MODE Entries	
Extended Super Frame Compatible Modes	
Entry	**Definition**
B8ZS	64K clear channel transmission on the umbilical timeslots. B8ZS, CCS, 4K data link.

	Used in RISLUs and RSMs that are remoted over 24-channel facilities with or without multiplexers. All umbilicals to an RSM must be set to this mode to allow 64K clear data calls to and from the RSM. See Note 3 above.
FE	56K restricted channel transmission; cannot send zero bytes, rob-bit, no ZCS. Always 56K. If DFI USAGE is "H1" or "H2", this mode can only be used for OSPS RISLUs remoted over 24-channel facilities that require ZCS. OSPS initializes its DFI's such that ZCS is activated for this mode. See Note 3 above.
FE8Z	56K/64K clear channel transmission; can send zero bytes, rob-bit, with B8ZS. If DFI USAGE is "H1" or "H2", this mode can only be used for OSPS RISLUs remoted over 24-channel facilities that do not require ZCS. FE8Z is the recommended DFI mode for CCS7 and Primary Rate Interface trunks utilizing Extended Super Frame format with B8ZS. However, if the PRI DFI resides on an RSM, all RSM umbilicals must be set to B8ZS to allow inter-SM 64K clear data calls. See Notes 1, 2 and 3 above.
FEB7	56K restricted channel transmission; cannot send zero bytes, rob-bit, with ZCS. Always 56K.
FE64	56K/64K restricted channel transmission; cannot send zero bytes, rob-bit, with ZCS. See Note 1 above.
ZCS	64K restricted channel transmission on the umbilical timeslots. CCS, 4K data link. Used in RISLUs and RSMs that are remoted over 24-channel facilities that require ZCS, due to the presence of B8ZS-compatible multiplexers. See Note 3 above.

- ***NOTE:*** 4: All modes operate over 24-channel facilities and are equipped with AMI (Alternate Mark Inversion).

Data Rules:

Please refer to Figure 2 for valid combinations of DFI MODE, DFI USAGE and DLTU TYPE.

DFI MODE must be "ZCS", or "B8ZS" when DFI USAGE is "CDFI" or "RDFI".

3.20 FIU SUBGROUP

Description: Enter the Facility Interface Usage Subgroup assignment.
Valid Entries: A or B

Data Rules:

The FIU SUBGROUP/PORT combination entered for FAC 0 must not match the FIU SUBGROUP/PORT combination entered for FAC 1.

This field must be entered if DFI USAGE is "RDFI" or "CDFI"; otherwise, this field must be blank. If DFI USAGE is "RDFI", see Figure 2 for required assignments.

3.21 FIU PORT

Description: Enter the Facility Interface Usage Port assignment.
Valid Entries: 0 - 9

Data Rules:

This field must be entered if DFI USAGE is "RDFI" or "CDFI"; otherwise, this field must be blank.

3.22 DFI-2 PM GRP

Description: Enter the name of the DFI-2 performance monitoring group.

Software Release: 5E8 and later
Valid Entries: 1 - 8 characters

Data Rules:

FAC0 and FAC1 DFI-2 PM GRP must not equal "/DF2GDEF".

Copyright © 2003 Lucent Technologies

When FAC IND is 0, FAC 0 and FAC 1 DFI-2 PM GRP must be blank.

When FAC IND is 1, FAC 1 DFI-2 PM GRP must be blank.

When DFI-2 PM GRP is entered, the corresponding PMTHRESH form (5948-3 Record) must be entered with PM TYPE of "DFI2".DC255

3.23 AFAC ID

Description: The AFAC ID (Advanced Mobile Phone Service Facility Identifier) is used to communicate maintenance information to the ECP (Executive Cellular Processor) complex for the facility of a DFI. A Digital Line/Trunk is assigned to an AUTOPLEX facility if there is an entry in the AFAC ID field. All users on the DFI must be DCS (Digital Cellular Switch) trunks when a value is entered in AFAC ID.

Software Release: 5E9(1) and later
Valid Entries:

- For 5E13 and earlier: 1 - 880
- For 5E14: 1 - 4080
- For 5E15 and later: 1 - 4500

Data Rules:

When an AFAC ID is entered, DFI USAGE must be "TRUNK".

AFAC IDs must be unique across EQDUP forms.

For 5E13 and later, AFAC IDs must be unique across EQDUP and EQVT forms.

DLTUs (Digital Line/Trunk Units) with Digital Line/Trunks assigned to AUTOPLEX facilities must:

- be located on SMs which are operational,
- have a CONFIGURATION on the EQIM form set to either "LOADED" or an SM-2000 class processor,
- be equipped with a pumpable LDSU (Local Digital Service Unit). (An SM is equipped with a pumpable LDSU if an EQDS2P form exists where SWITCHING MODULE on the EQDS2P form matches SM on the EQIM form.)The LDSU CLI on the EQIM form:
- where CONFIGURATION is "LOADED", must be 1, 3, or 80009 (hexadecimal) for CONTROLLER 0 and CONTROLLER 1.
- where CONFIGURATION is an SM-2000 class processor, must be 0 for CONTROLLER 0 and CONTROLLER 1.

For 5E11 and later, if the AFAC ID field is entered, the specified SM must meet one of the following sets of conditions:

- EQIM CONFIGURATION must be "LOADED" or "SIGNALING", EQIM EQSTATUS must be "O", EQIM CONTROLLER 0 LDSU CLI must have a value of 1, 3 or 80009 hex, and EQIM CONTROLLER 1 LDSU CLI must have a value of 1, 3 or 80009 hex, OR
- EQIM CONFIGURATION must be an SM-2000 class processor, EQIM EQSTATUS must be "O", and

Copyright © 2003 Lucent Technologies

EQDSC3 CLI must have a value of 0 for the same SM.

4. FORM ENTRIES - EQDUP FORM 5730-4 RECORD

4.1 * SM

Description: Enter the Switching Module number.
Valid Entries: 1 - 192

4.2 * DLTU

Description: Enter the DLTU number.
Valid Entries: 0 - 5

4.3 * DFI PACK NBR

Description: Enter the Digital Facility Interface Pack Number.
Valid Entries: 1 - 16

FAC 0/1 ECHO CANCELER PACKS

The following fields (Section 4.4 - Section 4.17) apply to Echo Canceler Units. These fields support the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.

Echo Canceler fields must all be known or all be unknown.

All FAC 1 entries must be blank when FAC IND is 0 or 1.

If Echo Cancelers are defined on this form, then a corresponding EQECSU form must be entered for this SM.

4.4 ECSU

Description: Enter the unit number for the ECU on Facility 0/1. The ECU (Echo Canceler Unit) is a single shelf unit which can contain up to 20 Echo Canceling circuits. The circuit for the Echo Canceler on DFI (Digital Facility Interface) Facility 0/1 is located on this unit.

Software Release: 5E10 and later.
Valid Entries: 0 - 5

Data Rules:

Echo Canceler fields must all be known or all be unknown.

If Echo Cancelers are defined on this form, then a corresponding EQECSU form must be entered for the same SM and the ECSU entries must match.

EQDUP form(s) cannot duplicate FAC 0 and/or FAC 1 Echo Canceler Board assignments on the same SM. FAC 0/1 ECSU and POS entries must be unique on the same SM.

4.5 POS

Description: Enter the EC5 (Echo Canceler 5) card slot number for the Echo Canceler circuit position on Facility 0/1. The Position for Facility 0/1 field indicates the Echo Canceler circuit for Facility 0/1 on the DFI.

Copyright © 2003 Lucent Technologies

Software Release: 5E10 and later.
Valid Entries: 1 - 20

4.6 EC CI

Description: Enter the control interface number for Echo Canceler circuit for Facility 0/1 of the DFI.

Software Release: 5E10 and later.
Valid Entries:
- For SM: 0 - 1
- For SM-2000: 0 - 3

Data Rules:

CONTROL GROUP must not equal FAC 0 EC CI or FAC 1 EC CI.

FAC 0 EC CI must not equal FAC 1 EC CI.

4.7 EC PICB

Description: Enter the Peripheral Interface Control Bus for the Echo Canceler circuit on Facility 0/1 of the DFI.

Software Release: 5E10 and later.
Valid Entries: 0 - 22

Data Rules:

CONTROL PORT must not equal FAC 0 EC PICB or FAC 1 EC PICB.

FAC 0 EC PICB must not equal FAC 1 EC PICB.

4.8 EC CLI

Description: Enter the change level indicator value for echo canceler circuit on Facility 0/1 of the DFI.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Software Release: 5E10 and later.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

The CLI values for the FAC 0 EC CLI and/or FAC 1 EC CLI assignments for the ECHO CANCELER is a hexadecimal value of 0, 1, 2, 3, 8, 9, a, or b.

If FAC 0/1 EC CLI is an odd number designating it as the two board configuration, then FAC 0/1 POS must be an odd number.

4.9 END PATH

Description: Enter the end path value in MS (Milliseconds) that indicates how much Echo Canceler delay is needed for the echo canceler circuit.

Software Release: 5E10 and later.
Valid Entries: 16MS, 32MS, or 64MS.

4.10 TONE DIS

Copyright © 2003 Lucent Technologies

Description: Enter the tone disabling value used to indicate the state of the tone disabling function for the Echo Canceler on facility 0/1.

Software Release: 5E10 and later.
Valid Entries:

Valid TONE DIS Entries	
Entry	**Definition**
NOTONE	No tone can disable echo cancellation.
RVRTONE	Reverse tone disables echo cancellation.
STRVTONE	Straight and reverse tones disable echo cancellation.

4.11 ALPHA VAL

Description: Enter the alpha value in DB (Decibells) that defines the alpha value or return loss used by the Echo Canceler for Facility 0/1.

Software Release: 5E10 and later.
Valid Entries: 0 - 6 (DB)

4.12 TRAN MATCH

Description: Is transient noise matching turned on for the Echo Canceler on Facility 0/1? An entry of "N" indicates the transient noise matching is off.

Software Release: 5E10 and later.
Valid Entries: Y, N

4.13 NB ENGDT

Description: Is narrow band energy detection turned on for the echo canceler on Facility 0/1? An entry of "N" indicates it is off.

Software Release: 5E10 and later.
Valid Entries: Y, N

4.14 RSD ECTL

Description: Is the residual echo control or center clipping turned on for the Echo Canceler on Facility 0/1? An entry of "N" indicates it is off.

Software Release: 5E10 and later.
Valid Entries: Y, N

4.15 TRAN EN

Description: Is the transient echo control enabled on the echo canceler on Facility 0/1? An entry of "N" indicates it is disabled.

Software Release: 5E10 and later.
Valid Entries: Y, N

4.16 EC BYP

Description: Will the Echo Canceler devices be bypassed? The Echo Canceler bypass setting is used to bypass the Echo Canceler devices on Facility 0/1.

WARNING: In order for the setting of this variable to take effect via Recent Change, the DFI which

Copyright © 2003 Lucent Technologies

is paired with Echo Canceler must be restored or a full/selective initialization must take place.

Software Release: 5E10 and later.
Valid Entries: Y, N

4.17 EC MODE

Description: Enter the interface mode for the Echo Canceler on Facility 0/1.

Software Release: 5E10 and later.
Valid Entries:

Valid EC MODE Entries

Entry	Definition
FAC	Echo Canceler pointing towards the facility.
TSI	Echo Canceler pointing towards the time slot interchange (SM).

Data Rules:

If FAC 0/1 EC MODE is entered it must be "FAC".

An SM which has SM USAGE entered as "RSM" and bit 1 (where bit 0 is the least significant bit) of DLI CLI 0 set to 1 on the EQIM form, requires 4 Control Timeslot umbilicals to be defined on the EQDUP form as follows:

DLTU	DFI	DFI USAGE	CONTROL GROUP	CONTROL PORT	DFI TRANSMISSION MODE	FIU SUBGROUP	FIU PORT
0	1	RDFI	1	19	Note 1	A	0
0	2	RDFI	1	18	Note 1	B	0
0	3	RDFI	1	17	Note 1	A	1
0	4	RDFI	1	16	Note 1	B	1

An SM which has SM USAGE entered as "RSM" and bit 1 (where bit 0 is the least significant bit) of DLI CLI 0 set to 0 on the EQIM form, requires a maximum of 2 Control Timeslot umbilicals (Minimally Configured RSM) to be defined on the associated EQDUP form as follows:

DLTU	DFI	DFI USAGE	CONTROL GROUP	CONTROL PORT	DFI TRANSMISSION MODE	FIU SUBGROUP	FIU PORT
0	1	RDFI	1	19	Note 1	A	0
0	2	RDFI	1	18	Note 1	B	0

Note 1: ZCS, B8ZS or RZBTS for 5E5 and later.

SEC. 18: 5731 RECORD
INTEGRATED SERVICES LINE UNIT EQUIPAGE FORM - EQISLU

1. GENERAL

The 5731 Integrated Service Line Unit Equipage Record and EQISLU form are available with the 5E3 and later Software Releases. They are used to define ISLU (Integrated Services Line Unit) assignments in a 5ESS Switch.

With 5E4(2) and later Software Releases, for every unique combination of Switching Module and PSU Shelf on the EQISLU form (5731 Record), there must be an EQPSUPH form (5742 Record) with a corresponding Switching Module and PSU Shelf.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Each Switching Module entered on this form must be defined on the EQIM form where the value entered for CONFIGURATION supports Integrated Services.

2.3 * ISLU NUMBER

Description: Enter the Integrated Services Line Unit Number.

Required Field.
Valid Entries: 0 - 7 for ISLU, or 0 - 41 for ISLU2

Data Rules:

ISLUs share the same unit number range with RISLUs, LUs, and IDCUs. Therefore, unit numbers assigned on this form may not be assigned on any EQRISLU, EQLU, or EQIDCU form with the same SM number.

For 5E10 and later, any EQISLU form(s) with ISLU NUMBER greater than 7 must be assigned to an SM where the corresponding UNIT TYPE is "SM-2000".

2.4 UNIT TYPE

Description: Enter the ISLU type.

Software Release: 5E10 and later.
Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: ISLU or ISLU2

Data Rules:

ISLU NUMBER must be between 0 and 7 when UNIT TYPE is "ISLU".

2.5 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.6 CONTROL GROUP

Description: For 5E9(2) and earlier: Enter the Control Group Number. Both Service Groups are defined with the same input form so the value entered here represents the assigned Control Group for both Service Groups.

For 5E10 and later: Enter Control interface group number.

Required Field.
Valid Entries:

- For 5E9(2) and earlier: 0 - 1
- For 5E10 and later: 0 - 1 for SM
- or 0 - 3 for SM-2000

Data Rules:

For 5E10 and later, only SM-2000 can use CONTROL GROUP values greater than 1.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.7 CONTROL PORT

Copyright © 2003 Lucent Technologies

Description: Enter the Control Port number assigned to Service Group 0. Since Service Group 0 and Service Group 1 require consecutive Control Port Numbers on the same Control Group, the value for the Service Group 1 will be inferred from the value entered here for Service Group 0. If the Control Group value is 0, Control Ports 00 and 01 cannot be assigned because they are reserved for the Local Digital Service Unit.

Required Field.
Valid Entries: 0 - 20, even numbers only

Data Rules:

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.8 EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries:

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

Data Rules:

When one ISLU is mounted in an EQUIPMENT BAY, it must be at EQUIPMENT VERTICAL position 36.

For 5E10 and later, when two ISLU2s are mounted in the same SWITCHING MODULE and EQUIPMENT BAY, the bottom ISLU2 must be mounted at EQUIPMENT VERTICAL position 7 and the top ISLU2 must be mounted at EQUIPMENT VERTICAL position 41.

Copyright © 2003 Lucent Technologies

For 5E10 and later,

- when one ISLU2 is mounted in an EQUIPMENT BAY and PRODUCT on the OFCOPT form is NOT equal to "WNC" EQUIPMENT VERTICAL must be 7.
- when one ISLU2 is mounted in an EQUIPMENT BAY and PRODUCT on the OFCOPT form is equal to "WNC" EQUIPMENT VERTICAL must be either 7 or 41.

2.9 EQUIPMENT VERTICAL

Description: Enter the Vertical Equipment Location that specifies the bottom of the unit. Expected values are 36 for the first ISLU and 7 for a second ISLU. If two ISLUs are mounted in the same SM and Equipment Bay, the bottom ISLU is mounted in location 7, and the top ISLU is mounted in location 36.

Software Release: 5E4(2) and later
Required Field.
Valid Entries: 0 - 84

2.10 EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of a floor and aisle number. The first two digits are the floor number and the last two digits are the aisle number. Valid floor numbers are 00 to 99. It is recommended that Floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.11 COMMON CONTROL EQST

Description: Enter the Equipment Status of the ISLU's Common Control Boards. Both Common Control Boards have the same status.

New 5ESS Switch offices and units being added for factory testing require the Operational state.

Required Field.
Default: O.
Valid Entries:

Valid COMMON CONTROL EQST Entries

Entry	Definition
U	Unequipped
G	Growth
O	Operational

2.12 COMMON DATA EQST

Description: Enter the Equipment Status of the ISLU's Common Data Boards. Both Common Control Boards have the same status.

Required Field.
Default: O
Valid Entries:

Valid COMMON DATA EQST Entries

Entry	Definition
U	Unequipped
G	Growth
O	Operational

Copyright © 2003 Lucent Technologies

Data Rules:

New 5ESS Switch Offices and units being added for factory testing require the Operational state. During off-line ODA database retrofits, values other than "O" may exist; but if they do, the EQST entered here must be lower than or equal to the COMMON CONTROL EQST. The hierarchy of Equipment Status, from lowest to highest, are Unequipped, Growth and Operational. The equipment status of the PIDBs on the PIDBs list must not be greater than the COMMON DATA EQST.

2.13 COMMON CONTROL CLI

Description: Enter the Change Level Indicator for the Common Control Boards (both boards must have the same CLI). For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Field.
Valid Entries: 0 - 7fffffff (hexadecimal)

2.14 COMMON DATA CLI

Description: Enter the Change Level Indicator for the Common Data Boards (both boards must have the same CLI). For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Field.
Valid Entries: 0 - 7fffffff (hexadecimal)

2.15 D-CHANNEL TYPE

Description: Enter the D-channel Type.

Required Field.

Valid D-CHANNEL TYPE Entries

Entry	Definition
TSIU	Cut-through the TSIU (Time Slot Interchange Unit)
PSU	Directly connected to a Packet Switching Interface Unit

Data Rules:

If "TSIU" is entered, there must be at least one PIDB TYPE of "DUAL", and there may not be any PIDB TYPEs of "PSU".

If "PSU" is entered, there must be at least one PSU PIDB TYPE entered.

2.16 CD CONFIGURATION

Description: Enter the Common Data configuration.

The "ACTSTBY" entry is the recommended option for OSPS and Pinnacle (Commercial) ACD. (For more information on CACD features see Division 2, Section 3D.)

Required Field.

Valid CD CONFIGURATION Entries

Entry	Definition
ACTSTBY	Active/Standby
LDSHRD	Load Shared

Data Rules:

Copyright © 2003 Lucent Technologies

If "ACTSTBY" is entered, there must be at least one PIDB TYPE of "DUAL" entered, and a SHRD PIDB TYPE entry is not allowed.

If "LDSHRD" is entered, there must be at least one SHRD PIDB TYPE entered.

PIDBs

PIDBs (fields Section 2.17 - Section 2.21) are to be equipped in pairs of the same PIDB TYPE and relative PIDB NO. on the two sides. The entries on this form are for Side 0 only, since the assignments for Side 1 can be inferred from the assignments for Side 0. PIDB NO. 0 is always required and must have a PIDB TYPE of "DUAL" or "SHRD". If PIDB NO. 1 is entered, it must have a PIDB TYPE of "DUAL" or "SHRD".

PIDBs of PIDB TYPE "DUAL" or "SHRD" connect to the TSIU (Time Slot Interchange Unit) and the assignments to the same PIDB NO. on the two sides must be made to the same DATA GROUP with Side 0 assigned to an even numbered DATA PORT and Side 1 assigned to the next higher odd numbered DATA PORT. PIDBs of type "PSU" connect to the PSU with the same relative PIDB NO. assigned to the same PSU SHELF and DF POS Number.

If B-Channel traffic is to be carried on the ISLU, there must be at least one PIDB TYPE of either "DUAL" or "SHRD". D-Channel traffic requires at least one PIDB TYPE of either "DUAL" or "PSU".

Note that if D TIMESLOTs and/or B TIMESLOTs have not been assigned via DSL, DSLAP, MISLINK, or OSPSDSL forms, ODA's automatic time slot assignment algorithm allocates four timeslots to each SM/ISLU/LGC (Line Group Controller) configuration for each PIDB from the ISLU to the PSU as follows: EN (Equipment Numbers) assigned to LGCs 0 - 7 (the 5th and 6th digit of the EN is the LGC) get timeslots on odd numbered EQISLU PIDBs and EN assigned to LGCs 8 - 15 get timeslots on even numbered EQISLU PIDBs, each with a PIDB TYPE of "PSU".

2.17 PIDB TYPE

Description: Enter the type of PIDB.

Valid PIDB TYPE Entries

Entry	Definition
DUAL	Dual PIDB.
SHRD	Shared Load PIDB.
PSU	Direct PIDB to a PSU.

Data Rules:

For valid combinations of PIDB TYPE and other fields, see Figure 1.

If PIDB TYPE is "DUAL", CD CONFIGURATION must be "ACTSTBY".

For 5E8 and later, if PIDB TYPE is "PSU":

- the corresponding EQPSU form must have a matching PSU SHELF and the PSU SHELF 0/1 EQSTAT must be "O". An EQISLU form corresponds with an EQPSU form when the SM numbers are the same.
- there must be an EQPSUPH form with the same SWITCHING MODULE and PSU SHELF combination as this form.

For 5E10 and later, if PIDB TYPE is "PSU":

- neither the PSU SHELF SIDE 0 CLI or the PSU SHELF SIDE 1 CLI values may be 3 ("PSU" PIDB TYPEs cannot be associated with data fanout multiple PIDB PSU shelves).

Copyright © 2003 Lucent Technologies

For 5E12 and later, if PIDB TYPE is "PSU":

- PSU SHELF/DF POS assignments cannot be duplicated among the EQAIU, EQIDCU, and/or the EQISLU forms for specified SMs.

2.18 DATA GROUP

Description: **For 5E9(2) and earlier:** For PIDBs of type "DUAL" or "SHRD", enter the assigned DATA GROUP Number.

For 5E10 and later: Enter the Data interface number.
Valid Entries:
- For 5E9(2) and earlier: 0 - 1
- For 5E10 and later: 0 or 1 for an SM
- or 0 to 5 for an SM-2000

Data Rules:

For PIDBs of type "PSU", leave this field blank.

For 5E10 and later, only SM-2000 SMs can use DATA GROUP values greater than 1.

For 5E10 and later, the combination of DATA GROUP 1 and DATA PORT 14 can not be assigned on the EQISLU forms whose corresponding EQIM form has a UNIT TYPE other than "SM-2000". Assigning this combination for SERVICE GROUP 0 automatically results in the combination of DATA GROUP 1 and DATA PORT 15 being assigned to SERVICE GROUP 1. The combination of DATA GROUP 1 and DATA PORT 15 is reserved for classic SMs.

2.19 DATA PORT

Description: For PIDBs of type "DUAL" or "SHRD", enter the Data Port Number.
Valid Entries:
- For 5E9(2) and earlier: 0 - 15, even numbers only For 5E10 and later: 0 - 15 for an SM, or enter 0 - 23 for an SM-2000.

Data Rules:

For PIDBs of type "PSU", leave this field blank.

For 5E10 and later, only SM-2000 can use DATA PORT values greater than 15.

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.20 PSU SHELF

Description: For PIDBs of type "PSU", enter the PSU SHELF to which the PIDB is connected.
Valid Entries: 0 - 5

Data Rules:

For PIDBs of types other than "PSU", leave this field blank.

Copyright © 2003 Lucent Technologies

2.21 DF POS

Description: Enter the Data Fanout Position of the PIDB connection.
Valid Entries: 0 - 10

Data Rules:

For PIDBs of type "PSU", valid entries are 0 to 10. For PIDBs of types other than "PSU", leave this field blank.

VALID COMBINATIONS OF PIDB TYPE AND OTHER FIELDS

PIDB TYPE	DATA GROUP	DATA PORT	PSU SHELF	DF POS
DUAL	R	R (Note 2)	P	P
PSU	P	P	R	R (Note 1)
SHRD	R	R (Note 2)	P	P

Note 1: Valid values 0 - 5.
Note 2: Even numbered DATA PORTS only.

R = Required
P = Prohibited

Figure 3 SAMPLE EQISLU FORM 5E15 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 19: 5732 RECORD
REMOTE INTEGRATED SERVICES LINE UNIT
EQUIPAGE FORM - EQRISLU

1. GENERAL

The EQRISLU form (Remote Integrated Services Line Unit Equipage (5732 Record)) is available with 5E3 and later Software Releases. It is used to define Remote Integrated Services Line Unit assignments in a 5ESS Switch.

For 5E10 and later, when the OE defined on a DSLAP form or LCEN defined on an OSPSDSL form or the DSL OE defined on a DSL form are associated with an EQRISLU form, the DSL, DSLAP or OSPSDSL input forms must not have the D TIMESLOT or B TIMESLOT information assigned.

For 5E10 and later, when the DSL, DSLAP and OSPSDSL forms have unassigned D TIMESLOTs and/or B TIMESLOTS, ODA assigns these values. The ODA assignment requires that LCENs (DSL OE on the DSL form) assigned to LGCs 0 - 7 (Note: the fifth and sixth digit of the LCEN/DSL OE is the LGC) get timeslots on odd numbered EQISLU PIDBs and that LCENs assigned to LGCs 8 thru 15 get timeslots on even numbered EQISLU PIDBs, each with a PIDB TYPE of "PSU". If there are either no odd numbered PIDBs for LGC 0 - 7 or even numbered PIDBs for LGC 8 - 15 on this ISLU, a cross check error occurs.

1.1 Recent Change View

The corresponding Recent Change View for this form is 22.9.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Each Switching Module entered on this form must be defined on an EQIM form (5700-1 Record). For 5E4(2) and later, the value must be defined on an EQIM form with the CONFIGURATION field set to "LOADED". For 5E9(2) and later, the value entered must be a configuration that supports RIS (Remote Integrated Services). See the Configurations for Facilities and Applications table in Division 8, Section 2.

For 5E9(1) and later, each SM (Switching Module) can have up to 5 PSU Shelfs. Each Shelf can have up to 16 PH (Protocol Handlers). Shelfs and PHs are defined by the first 3 digits of the ISCN field. Each PH can be assigned up to 32 timeslots. PH time slot for On Demand B Channel, Packet BChannel, Packet D Channel, EDSL, IFOPER, and IFTERM can be assigned on the following forms:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- OSPSDSL
- RTERM

Copyright © 2003 Lucent Technologies

- TRUNK
- XAT

The following data rule is not executed on an SM-2000, because provisioning of nailed-up time slots is not required on an SM-2000. On a PSU1 , each Data Interface in a SM can have a maximum of 128 nailed-up time slots reserved for the following applications:

Data Interface for Nailed-up Timeslots

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms (CMDA application).
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3 digits of LCEN match SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3 digits of LCEN (on the DSLAP or OSPSDSL form) or OE (on the DSL or MISLINK form) match SM on an EQRISLU form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms (CMDA application).
X.25	Defined on the XAT forms.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

These time slots can be reserved by entering the rows RPTSS0 to RPTSS7 on the EQPSU form. The quantity of time slots reserved (i.e. the number entered) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D channel only takes a quarter of a time slot.

Also, the reserved time slots must be entered such that for any given SHELF, (defined by the first digit of ISCN field or by the SHELF field on the MISLINK form), the time slots assigned to that SHELF must not be duplicated in the same vertical (column) position if they appear in more than one row (RPTSS0 through RPTSS7).

2.3 *RISLU NUMBER

Description: Enter the RISLU Number.

Required Field.
Valid Entries: 0 - 7

Data Rules:

RISLUs share the same unit number range with ISLUs, Line Units, and IDCUs. Therefore, unit numbers assigned on this form may not be assigned on any EQISLU, EQLU, or EQIDCU form with the same SM number.

2.4 #RISLU SITE

Description: Enter the Remote Integrated Services Line Unit Site Number.

Required Field.
Valid Entries: 500 - 999

Copyright © 2003 Lucent Technologies

Data Rules:

The RISLU SITE must be defined on a RISITE form (5902 Record).

2.5 #HOST DLTU

Description: Enter the Remote Integrated Services Line Unit Digital Line/Trunk Unit Number.

Required Field.
Valid Entries: 0 - 5

Data Rules:

Only two matching entries are allowed per SM indicating that only two RISLUs can be hosted on an SM/DLTU.

This DLTU must be defined on an EQDU form (5730 Record) with a DIGITAL LINE/TRUNK UNIT TYPE of "DLTURH" in the same SM.

2.6 INTF UNIT

Description: The Interface Unit field was added to support the 5E15 Optically Extended Control and Data Unit feature. It is a Recent Change only field. See Division 2, Section 9V.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

2.7 #COMMON CONTROL GROUP

Description: Enter the Control Group Number of the PICB that is being remoted to the RISLU via a DFI-H1. Both sides (Service Groups) are defined by the same input form so the value entered here represents the assigned Control Group for both Service Groups.

Required Field.
Valid Entries: 0 and 1

2.8 #COMMON CONTROL PORT

Description: Enter the Control Port Number (Service Group 0) of the PICB that is being remoted to the RISLU via a DFI-H1. Since Side 0 and Side 1 require Consecutive Control Port Numbers on the same Control Group, the value for Side 1 will be inferred from the value entered here for Side 0.

Required Field.
Valid Entries: even numbers in the range 0 to 20

Data Rules:

Control Port 22 is not allowed since the next higher port assigned to Side 1 would be 23, which is not a valid assignment.

Control Ports 0 and 1 cannot be assigned to Control Group 0 since Control Group 0, Ports 0 and 1 are reserved for the Local Digital Service Unit (DSU).

Copyright © 2003 Lucent Technologies

The COMMON CONTROL GROUP and COMMON CONTROL PORT combination must be unique, for the given SWITCHING MODULE, within the 5ESS Switch.

2.9 #EQUIPMENT BAY

Description: Enter the Equipment Location Bay number.

Required Field.

Software Release: 5E4(2) and later
Valid Entries:
- For 5E4(2) only: 0 - 4
- For 5E5 only: 0, 2, 3, 4
- For 5E6 and later: 0 - 4

2.10 #EQUIPMENT AISLE

Description: Enter the Equipment Aisle Number.

This entry consists of a floor and aisle number. The first and second digits from the left are the floor number. Valid floor numbers are 00 to 99. The third and fourth digits from the left are the aisle number. Valid aisle numbers are 00 to 99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation. The EQUIPMENT BAY and EQUIPMENT AISLE combination must be unique, for the given SWITCHING MODULE, within the 5ESS Switch.

Software Release: 5E4(2) and later
Required Field.
Valid Entries: 00 - 99

2.11 #CD CONFIGURATION

Description: Enter the Common Data Configuration.

For OSPS (Operator Service Position System) applications, the option "SPROSPS" designates that one of the RISLU remoting facilities be used as a spare, whereas the option "ROSPS" implies that there will be no spare remoting facility. Use of a spare facility is STRONGLY RECOMMENDED (option "SPROSPS"). If no spare facility is provided, then service disruption will occur whenever a facility carrying traffic is removed from service, whether due to a fault or manual request. The choice of providing a spare facility can be made ONLY when the RISLU is initially configured; that is, Recent Change CANNOT be used to update the Common Data Configuration option on a RISLU already configured in the system.

If the "SPROSPS" option is engineered for eight active plus one standby DFI pairs, diagnostic phases 11 and 20 of the spare DFI diagnostics will output the CATP (Conditional All Tests Pass) output message which indicates that all tests were not performed to avoid impact to customer service.

Valid CD CONFIGURATION Entries

Entry	Description
RACTSTBY	
ROSPS	RISLU active standby, OSPS application.
SPROSPS	RSILU active standby, OSPS with sparing.

Data Rules:

If the "SPROSPS" option is selected, all DFI-H1s and DFI-H2s must be connected to the same DI board (DATA GROUP on the EQDUP form - 5730 Record), and they must all have the same stuff code pattern (STUFFING PATTERN on the EQDUP form). This is a required form.

If RISLU is to be configured as a Universal RISLU (non-OSPS), "RACTSTBY" must be specified.

Copyright © 2003 Lucent Technologies

RISLU OSPS applications are identified by the assignment of "ROSPS" or "SPROSPS" to the CD CONFIGURATION field of the EQRISLU form. Any and all D channels on an OSPS application will be mapped internally according to the following rules.

- The D channel assignments for RISLUs which are associated with OSPS are grouped, internally, into piggy-back groups. D channels which are in a piggy-back group will share time slots. D channels which are not in the same piggy-back group can not share timeslots.
- D channels are grouped together in threes (three to a time slot) if the HOST/REM DFIs have "ZCS" signaling (DFI MODE on the EQDUP form). Otherwise the D channels are grouped four to a time slot.
- D channels are in the same piggy-back group if they are assigned in the same SM, RISLU, LGC, if the first 3 digits of the ISCN are identical and if the LC number is grouped 0 - 7, 8 - 15, 16 - 23 or 24 - 31 (eg: LC 3 and 6 are in the same group, LC 9 and 17 are not). D channels should be packed (in the same piggy-back group) if possible. If they are not packed, an excessive number of time slots may be used.

2.12 #COMMON CONTROL EQST

Enter the Equipment Status of the RISLU's Common Control Boards (both Common Control Boards have the same status).

Required Field.

Valid COMMON CONTROL EQST Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:
New 5ESS Switches and units being added for factory testing require the Operational state.

If these boards are equipped in Service Group 1 (COMMON CONTROL GROUP is 1 on this form), the Equipment Status value cannot be greater than the CONTROL GROUP 1 STATUS value entered on the EQIM form. The hierarchy of Equipment Status, from lowest to highest, are Unequipped, Growth and Operational.

2.13 #COMMON DATA EQST

Description: Enter the Equipment Status of the RISLU's Common Data Boards (both Common Data Boards have the same status).

Required Field.

Default value: O (Operational)

Valid COMMON DATA EQST Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

New 5ESS Switches and units being added for factory testing require the Operational state. During off-line ODA database retrofits, values other than "O" may exist. If they do exist, the EQST entered here must be lower than or equal to the COMMON CONTROL EQST.

Copyright © 2003 Lucent Technologies

If these boards are equipped in Service Group 1 (COMMON CONTROL GROUP is 1 on this form), the Equipment Status value cannot be greater than the CONTROL GROUP 1 STATUS value entered on the EQIM form.

The hierarchy of Equipment Status, from lowest to highest, are Unequipped, Growth and Operational. If the COMMON CONTROL EQST is "U", the COMMON DATA EQST must be "U". If COMMON CONTROL EQST is "G", then either "U" or "G" must be entered.

2.14 #REMOTE CLOCK EQST

Description: Enter the Equipment Status of the RISLU Remote Clock Boards (both boards have the same status).

Required Field.
Default: O (Operational)
Valid Entries:

Valid REMOTE CLOCK EQST Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

New 5ESS Switches and units being added for factory testing require the Operational state. During off-line ODA database retrofits, values other than "O" may exist. If they do exist, the EQST entered here must be lower than or equal to that of the DFI-H1 pack remoting the COMMON CONTROL PICB.

If these boards are equipped in Service Group 1 (COMMON CONTROL GROUP is 1 on this form), the Equipment Status value cannot be greater than the CONTROL GROUP 1 STATUS value entered on the EQIM form.

Furthermore, the Equipment Status of the Remote Clock boards cannot be greater than the EQUIPMENT STATUS value entered on the EQDUP form (5730 Record).

The hierarchy of Equipment Status, from lowest to highest, are Unequipped, Growth and Operational.

2.15 #COMMON CONTROL CLI

Description: Enter the Change Level Indicator for the Common Control Boards (both boards must have the same CLI).

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal).

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.16 COMMON DATA CLI

Description: Enter the Change Level Indicator for the Common Data Boards (both boards must have the same CLI).

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal).

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.17 REMOTE CLOCK CLI

Copyright © 2003 Lucent Technologies

Description: Enter the Change Level Indicator for the RISLU Remote Clock Boards (both boards must have the same CLI).

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal).

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.18 PIDBs

Description: Enter the Peripheral Interface Data Buses.

Each of the two Common Data Boards on each side (Service Group) of the RISLU provide for termination of 6 PIDBs. The relative PIDB numbers are 0 to 5 on CD 1 and 6 to 12 on CD 2 (on each side). There is no indication of the CD number on the input form, since both CDs are always equipped. PIDBs are to be equipped in pairs with the same relative PIDB NO. on the two sides. The entries on this form are for Side 0 only, since the assignments for Side 1 can be inferred from the assignments for Side 0. PIDB NO. 0 and 1 are always required, and their respective HOST DFI PACK POS values must be between 1 and 4. Their respective REM. DFI PACK values must be between 1 and 2.

PIDB NO. 2 to 11 must have HOST DFI PACK POS values, if entered, between 5 and 16. Their respective REM. DFI PACK values, if entered, must be between 3 and 12.

The HOST DFI PACK POS and REM. DFI PACK values must be unique.

2.19 HOST DFI PACK POS

Description: Enter the Pack Position (within the DLTU-RH) of the DFI-H1 or DFI-H2 that is remoting the PIDB to the RISLU.
Valid Entries: 1 - 16.

Data Rules:

PIDB NO. 0 and 1 requires a DFI-H1 pack, and this pack must be in pack position 1-4. PIDB Nos. 2 to 11 are optionally equipped with DFI-H2 packs and these packs must be in pack positions 5-16. A DLTU-RH can accommodate up to 16 DFIs and 4 DFI-H1s (2 RISLUS) and up to a total of 12 DFI-H2s. The same DFI pack cannot use more than one PIDB.

The DFI-H1 and DFI-H2 packs have the following requirements:

All RISLU DFI packs on this RISLU must appear on the same DLTU-RH (HOST DLTU on this form).

All RISLU DFI Packs on this RISLU must have the same DFI TRANSMISSION MODE defined on an EQDUP form.

RISLU DFI packs must have the STUFFING PATTERN on the EQDUP form spread uniformly across the DFIs assigned to a particular RISLU with the exception of RISLUs with the OSPS sparing option (CD CONFIGURATION is "SPROSPS") which must have the same STUFFING PATTERN for all DFIs on a RISLU.

For 5E10 and later, HOST DFI PACK POS values must be in ascending order (packs must be assigned from left to right in the frame).

2.20 REM. DFI PACK POS

Description: Enter the Pack Position of the DFI-R1 or DFI-R2 (at the RISLU site) that carries the PIDB. Each DFI-H1 requires a DFI-R1 and each DFI-H2 requires a DFI-R2. They are equipped in matching pairs with each set remoting the same PIDB.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 12

Data Rules:

PIDB Nos. 0 and 1 must have DFI-R1 packs in pack position 1-2. PIDB Nos. 2-4 must have DFI-R2 packs in pack position 3-12.

For a given PIDB NO., the user must enter both the HOST DFI PACK POS and the REM. DFI PACK POS or the user must not enter both. An entry in only one of the fields is not permitted.

For 5E10 and later, REM. DFI PACK POS values must be in ascending order (packs must be assigned from left to right in the frame).

SEC. 20: 5733 RECORD
(REMOTE) INTEGRATED SERVICES LINE UNIT
LINE GROUP CONTROLLER EQUIPAGE FORM - EQLGC

1. GENERAL

The 5733, (Remote) Integrated Services Line Unit Line Group Controller Equipage Record, is available with 5E4, Issue 1 and later Software Releases. It is used to define the Line Group Controllers equipped on Remote or Local Integrated Services Line Units in a 5ESS Switch.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * SWITCHING MODULE

Description: Enter the Switching Module number.
Valid Entries: 1 - 192.

Data Rules:

Each Switching Module entered on this form must be defined on the EQIM form.

2.3 * (R)ISLU NUMBER

Description: Enter the Integrated Services Line Unit (ISLU) or Remote Integrated Services Line Unit (RISLU) number.
Valid Entries: 0 - 7.

Data Rules:

Any value entered here must have a corresponding entry on the EQISLU or EQRISLU input form.

For 5E10 and later, ISLU numbers on the EQLGC form must either be defined on the EQISLU or the EQRISLU form, or be defined on an EQISLU form with a UNIT TYPE other than "ISLU".

LINE GROUP CONTROLLERS

Up to sixteen Line Group Controllers (LGCs) can be equipped on each ISLU or RISLU. For each equipped LGC, enter the following fields.

2.4 EQST

Description: Enter the equipment status of the LGC.

Valid EQST Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

New offices and equipment additions require the Operational status. During off-line ODA database retrofits, values other than "O" may exist; but if they do, the EQST value entered here must be lower than or equal to the COMMON DATA EQST value on the EQISLU or EQRISLU form. The hierarchy of

Copyright © 2003 Lucent Technologies

equipment status, from lowest to highest, are Unequipped, Growth and Operational.

2.5 CLI

Description: Enter the Change Level Indicator of the LGC. For a complete listing of valid CLI values, J-Drawing and list combinations, see Division~8, Section~1.
Valid Entries: 0 - 7fffffff (hexadecimal).

```

SEC. 21: 5740 RECORD
DIGITAL SERVICE UNIT EQUIPAGE FORM (EQDS)
DIGITAL SERVICE UNIT PACK EQUIPAGE FORM (EQDSP)
DIGITAL SERVICE UNIT 2 PACK EQUIPAGE FORM (EQDS2P)

1. GENERAL

The 5740 Record is available with the 5E2 and later Software Releases. It is used to define DSU (Digital Service Unit) assignments. Each DSU must have unique Equipment Bay and Vertical Equipment locations per Interface Module.

1.1 Recent Change View

The Recent Change View for this form is 18.0.

2. FORM ENTRIES FOR DIGITAL SERVICE UNIT EQUIPAGE - EQDS

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *INTERFACE MODULE

Description: Enter the Interface Module (i.e., Switching Module) Number.

Required Field.
Valid Entries: 1 - 192.

Data Rules:

Equipment units within the same SM must be assigned to unique Equipment Bay and Vertical Position values.

2.3 *DIGITAL SERVICE UNIT

Description: Enter the Digital Service Unit Number. This field is for GDSUs (Global DSUs) only as ODD (Office Dependent Data) for the Local DSU is automatically generated. Pack information for the Local DSU is defined on the EQDSP form.

Required Field.
Valid Entries: 0 -7

Data Rules:

No more than 128 GDSUs can be supported by the office.

2.4 *SERVICE GROUP

Description: Enter the Service Group Number.

Required Field.
Valid Entries: 0 or 1

2.5 EQUIPMENT STATUS

Description: Enter the status of the equipment.

Copyright © 2003 Lucent Technologies

Valid EQUIPMENT STATUS Entries	
Entry	**Definition**
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

For new offices and units destined for factory testing, "O" is the only allowed value. During offline ODA database retrofits, the other values are valid.

2.6 INTF UNIT

Description: The Interface Unit field was added to support the 5E15 Optically Extended Control and Data Unit feature. This is a Recent Change only field. See Division 2, Section 9V.
Valid Entries: 0 -8

Data Rules:

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

2.7 CONTROL GROUP

Description: Enter the Control Group Number.

Required Field.
Valid Entries: 0 or 1

2.8 CONTROL PORT

Description: Enter the Control Port Number.

Required Field.
Valid Entries: 0 - 22.

Data Rules:

CONTROL PORT numbers entries must be unique per SM.

2.9 DATA GROUP

Description: Enter the Data Group Number. These entries must be unique per SM.

Required Field.
Valid Entries: 0 or 1

2.10 DATA PORT

Description: Enter the Data Port number.

Required Field.
Valid Entries: 0 - 15

Data Rules:

Copyright © 2003 Lucent Technologies

Data Port numbers must be unique per SM.

2.11 EQUIPMENT BAY

Description: Enter the location of the Equipment Bay.

Required Field.
Valid Entries:
- 5E9(1) and earlier: 0 - 4

Valid EQUIPMENT BAY Entries,5E9(2) and later

Entry	Definition
0 - 14	SMC aisle.
100 - 014	Back panel; wiring position.
200 - 208	Front panel; door position.

Data Rules:

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

2.12 UNIT VERTICAL

Description: Enter the locations of the Vertical Unit which specifies the bottom of the unit.

Required Field.

Valid UNIT VERTICAL Entries, 5E9(1) and earlier

Entry	Definition
15 - 58	6 foot cabinets.
22 - 70	7 foot cabinets.

Valid UNIT VERTICAL Entries, 5E9(2) and later

Entry	Definition
7 - 58	6 foot cabinets.
22 - 70	7 foot cabinets.

Data Rules:

Locations of the Vertical Units must be identical for all of the same DSU and IM Service Groups.

2.13 EQUIPMENT AISLE

Description: Enter the Equipment Aisle Number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.14 DSU COMMON CIRCUIT CLI

Description: Enter the Digital Service Unit Common Circuit Change Level Indicator. This circuit is provided as part of the basic unit per Service Group.

Required Field.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

Copyright © 2003 Lucent Technologies

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

3. FORM ENTRIES FOR DIGITAL SERVICE UNIT PACK EQUIPAGE - EQDSP

3.1 *INTERFACE MODULE

Description: Enter the Interface Module Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The INTERFACE MODULE (Switching Module) value entered on this form must equal the INTERFACE MODULE value entered on the EQDS form (5740 Record).

This value must be defined on the EQIM form (5700 Record).

3.2 *DIGITAL SERVICE UNIT

Description: Enter the Digital Service Unit number. This field is for Local and Global Digital Service Units for EQDSP.

Required Field.
Valid Entries: 0 - 7

Data Rules:

The DSU value entered on this form must equal the DSU value entered on the EQDS form (5740 Record).

Global DSU's must be numbered consecutively beginning with 1 for each IM on the EQDS form.

3.3 *SERVICE GROUP

Description: Enter the Service Group Number.

Required Field.
Valid Entries: 0 or 1

Data Rules:

The SERVICE GROUP value entered on this form must equal the SERVICE GROUP value entered on the EQDS form (5740 Record).

PACK

The following fields (Section 3.4 - Section 3.9) define the circuit packs associated with the DSU.

3.4 POSITION

Description: Enter the pack position.
Valid Entries: 0 - 7

Data Rules:

If an entry is made in either POSITION, TYPE, STATUS, CLI or CLEI, then POSITION, TYPE, STATUS, CLI and CLEI must all have an entry for each equipped pack.

Copyright © 2003 Lucent Technologies

3.5 TYPE

Description: Enter the Circuit Type (Hardware) for each Pack Position.

Valid TYPE Entries

Entry	Definition
UTD2	2 Circuit Universal Tone Decoder Pack.
UTD4	4 Circuit Universal Tone Decoder Pack.
UTG	Universal Tone Generator.
RVPT	Revertive Pulsing Transceiver Pack (2-way).
TTFRESP	Transmission Test Facility Responder.
TTFPROC	Transmission Test Facility Processor.
TTFTGEN	Transmission Test Facility Tone Generator.
CONF2	2-circuit Conference Pack.
CONF5	5-circuit Conference Pack.
TTFINTF	Transmission Test Facility Interface Board.
UCC1032	6-Port Conference Pack.

Data Rules:

For Local Digital Service Units, "UTD2", "UTD4", "UTG", and "RVPT" above are the only Pack Types permitted.

Each Service Group on the Local Digital Service Unit must have one "UTG" pack, and at least one "UTD2", or "UTD4" pack, and a maximum of one "RVPT".

With 5E2 and later Software Releases, Service Group 0 and 1 are not required to have the same number of UTD Circuits in each as long as they are off by only one. An "RVPT" pack should be provided on each Service Group of the LDSU servicing Revertive Pulsing Trunks. The "UTG" pack should be located in pack Position 0 with the "UTD2", and "UTD4" packs starting in pack Position 1. The RVPT pack must be located in pack Position 7.

The total number of UTD circuits ("UTD2" equals 2 circuits/packs; "UTD4" equals 4 circuits/packs) plus the number of equipped "RVPT" circuits (refer to CIRCUITS EQUIPPED in this section) must be equal to 32 or less.

If "UTG" or "RVPT" are entered, then CIRCUITS EQUIPPED must have an entry. For 5E5 and later Software Releases, if "RVPT" is entered, CIRCUITS EQUIPPED must be 2 through 24.

For each unique combination of INTERFACE MODULE and DIGITAL SERVICE UNIT, if SERVICE GROUP 0 (or 1) is equipped with one or more PACK TYPES of "RVPT", then SERVICE GROUP 1 (or 0) must also be equipped with one or more PACK TYPES of "RVPT".

The "UTD2" packs must not be mixed with "UTD4" packs in the same Service Group or Digital Service Unit.

Global Digital Service Units are equipped with the Transmission Test Facility (TTF) and Conference Packs. The basic Transmission Test Facility consists of four packs, designated by "TTFPROC", "TTFTGEN", "TTFINTF", and "TTFRESP", with provision for two additional responders.

Conference Packs are equipped as follows:

A. Transmission test facilities with one or two responders. Three valid combinations are allowed:

   1. 3 two-circuit conference packs only
   2. 1 two-circuit conference pack; 1 six-port conference pack
   3. 1 five-circuit conference pack

B. Transmission Test Facilities with three responders. Two configurations are allowed:

Copyright © 2003 Lucent Technologies

1. A maximum of two 2-circuit 3-port conference packs only
2. One 6-port conference circuit pack only

C. No Transmission Test Facilities. The following five combinations are allowed:

1. Five two-circuit 3-port conference circuits packs
2. Two five-circuit 3-port conference circuits packs
3. 3 two-circuit 3-port conference circuit packs; 1 6-port conference circuit
4. One two-circuit 3-port conference circuit pack; 2 6-port conference circuit packs
5. 1 6-port conference pack; 1 five-circuit 3-port conference circuit pack

3.6 STATUS

Description: Enter the status of the equipment.

Valid STATUS Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

For new offices and units destined for factory testing, "O" is the only allowed value. During offline ODA database retrofits, the other values are valid.

3.7 CIRCUITS EQUIPPED

Description: Enter the number of circuits to be equipped for this pack type. This entry is required only for pack types "UTG" and "RVPT". Both of these pack types have a maximum number of 32 equipable circuits per pack. However, they are equipped on a per circuit basis.
Valid Entries: 0 - 32

Data Rules:

For 5E5 and later Software Releases, the sum of equipped "UTG" circuits and the number of equipped "RVPT" circuits must be 32. If "UTG" or "RVPT" is entered, then CIRCUITS EQUIPPED must have an entry. If "RVPT" is entered, then CIRCUITS EQUIPPED must be 2 through 24.

For RVPT, 0 or 2-32 may be entered; 1 is not allowed.

3.8 CLI

Description: Enter the Common Level Indicator.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

3.9 CLEI

Copyright © 2003 Lucent Technologies

Description: Enter the Common Language Equipment Identification. See the appropriate J-Drawing for applicable CLEI codes.

4. FORM ENTRIES FOR DIGITAL SERVICE UNIT 2 PACK EQUIPAGE - EQDS2P

The DSU2-LDSUF (Digital Service Unit Model 2-Local Digital Service Unit Function) is applicable with 5E2 and later Software Releases and is a replacement of the original LDSU hardware (DSU1). The DSC (Digital Service Circuit) is the heart of the DSU2 architecture. This single circuit will perform all the functions of a service group of the LDSU. Each DSC of the DSU2-LDSUF has seven DSPs (Digital Signal Processors) on it. Each of these DSPs will perform a single function such as Tone Generation or Tone Decoder.

As of 5E4(2) and later Software Releases, this record is also used to assign CAMA (Centralized Automatic Message Accounting) tone decoder circuits for the OSPS (Operator Services Position System) toll and assistance feature.

If an incoming transfer CAMA trunk terminates on an SM, it should have a DSU2-LDSUF unit in the SM, and it should have a certain number of CAMA tone decoder circuits in both service groups of the DSU2-LDSUF unit of the same SM. CAMA tone decoder circuits are specified with a circuit type of "LDSU2CTD" on the EQDS2P form.

For 5E3 and later, this record is also used to assign Tone Transceiver circuits for the CCS (Common Channel Signaling) trunk signaling feature. If Common Channel Signaling (CCIS6 or ISUP7) trunks terminate on an SM, that SM must be equipped with a DSU2-LDSUF unit. The DSU2-LDUSF unit is typically equipped with five Tone Transceivers in each of its two Service Groups.

Tone Transceiver circuits are used to generate, loop back, and detect the tones used in Voice Path Assurance checks or Continuity Test calls over CCS trunks. The Tone Transceiver also provides VBDGs (Voice Band Data Generators) as part of the Analog Message Waiting Indicator feature, and provides signaling for the ICLID (Individual Calling Line Identification) feature. The Analog Message Waiting Indicator feature allows the called party to be notified of an incoming call by lighting an indicator on their analog phone set. The ICLID feature allows the called party to receive information about an incoming call or allows the calling party to prevent the delivery of their DN (Directory Number) to the terminating station set.

CAMA tone decoder circuits are used to decode the tone from a CAMA to identify whether the call is due to ANIF (Automatic Number Identification Failure) or ONI (Operator Number Identification).

4.1 *SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The entered SM value must be defined on the EQIM form (5700 Record).

4.2 *DIGITAL SERVICE UNIT 2

Description: Enter the Digital Service Unit Number for either the Local or Global Digital Service Unit for EQDSP. Global Digital Service Unit numbering begins with 1 for each Switching Module.

Required Field.
Valid Entries: 0 - 7

Data Rules:

Copyright © 2003 Lucent Technologies

DSU must be zero if TYPE is equal to "LDSU2TG", "LDSU2TD", "LDSU2TX", or "LDSU2CTD".

4.3 *SERVICE GROUP

Description: Enter the Service Group number.

Required Field.
Valid Entries: 0 or 1

DIGITAL SERVICE CIRCUITS (DSC)

The following fields (Section 4.4 - Section 4.8) define the Digital Service Circuits for the DSU2.

4.4 DSP

Description: Enter the Digital Signal Processor number.
Valid Entries: 0 - 6

Data Rules:

Each DSP must be unique.

Only one DSP can be assigned to "LDSU2TG" per Service Group, but a "LDSU2TG" is not required in each SG. "LDSU2TG", "LDSU2TD", "LDSU2TX", or "LDSU2CTD" DSPs must be equipped in consecutive DSP positions beginning with DSP 0.

4.5 TYPE

Description: Enter the Type of DSP.

Valid TYPE Entries

Entry	Description
LDSU2TG	DSU Model 2 Tone Generator.
LDSU2TD	DSU Model 2 Tone Decoder.
LDSU2TX	Software Release: 5E3 and later. DSU Model 2 Tone Transceiver. There must be a Tone Transceiver in each Service Group (SG0 and SG1) per SM.
LDSU2CTD	Software Release: 5E4(2) and later. DSU Model 2 CAMA Transfer Decoder DSP.
LDSU2VBS	Software Release: 5E9(2) and later. DSU Model 2 Voice Band Service.

4.6 STATUS

Description: Enter the status of the equipment.

Valid STATUS Entries

Entry	Definition
O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

For new offices and units destined for factory testing, "O" is the only allowed value. During offline ODA database retrofits, the other values are valid.

4.7 CLI

Description: Enter a valid Common Level Indicator value.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For a list of valid CLI values, refer to Division 8, Section 1.

4.8 CIRCUITS EQUIPPED

Description: Enter the number of circuits to be equipped.

Valid CIRCUITS EQUIPPED Entries

Entry	Definition
1-5	
1-8	
1-10	For LDSU2CTD.
1-31	For LDSU2TG per DSP, where at least 9 per Service Group are required to complete calls and provide all system tones.

Data Rules:

Only one DSP may be assigned "LDSU2TG" per SG, but an "LDSU2TG" is not required in each SG.

For 5E9(1) and earlier, the seven DSPs located in the DSC can have a maximum of 31 "LDSU2TG" circuits, and a maximum of 30 "LDSU2TD", "LDSU2CTD", and "LDSU2TX" circuits, respectively or collectively.

However, if any DSPs are partially equipped with "LDSU2TD", "LDSU2TX," or "LDSU2CTD" circuits, it must be the last equipped DSP of that type.

For 5E9(2) and later, a maximum of 30 total equipped "LDSU2TD", "LDSU2CTD", "LDSU2TX", and "LDSU2VBS" circuits, are allowed.

SEC. 22: 5741-1/2 RECORD
PACKET SWITCHING UNIT EQUIPAGE FORM - EQPSU

1. GENERAL

The Packet Switching Unit Equipage Record is available with 5E3 and later Software Releases. It is used to define the PSUs equipped in a 5ESS Switch. For 5E5 and later, it is also used to reserve a pool of dedicated peripheral timeslots for the exclusive use of the PSU equipped in a 5ESS Switch.

The PSU houses the Protocol Handlers and switches packet type data. Only one PSU may be equipped on any given SM (Switching Module). For 5E5 and later, the equipment status of the Protocol Handler circuit is entered on the EQPSUPH form (5742 Record) in the EQST field. When an EQPSUPH form contains an EQST entry of "O" (Operational), all eight possible days must be defined on the PSRATE form (5922 Record) in order to define billing. Conversely, if no EQPSUPH form is operational, the following constraints must be observed in order to avoid system errors indicating invalid (improper sequence) provisioning conditions:

- MLHG form (5110 Record) must not be entered with HUNT TYPE set to "PSUCD" on the corresponding MLHGFD form (5604 Record),
- PSRATE form must not be entered,
- RTIDX form (5303 Record) must not be entered with DESTINATION PSN entered,
- TKGRP form (5202 Record) must not be entered with HUNT TYPE set to "PSUCD".

Refer to Division 2, Section 1BK for a discussion of these two issues.

For 5E10 and later, when TGN(s) are defined with a TRKCLS of "PACKET" on the TKGRP form, the Switching Module (the first three digits of DEN or NEN on the TRUNK form) that is associated with the TGN(s) must contain a PSU (Packet Switch Unit) defined on the EQPSU form.

For 5E10 and later, when TGN/MEMB(s) on the TRUNK form have a TRKCLS of "X75" or "X75P" on the associated TKGRP form, the SWITCHING MODULE that is associated with the TGN (DEN[1,3] or NEN[1,3] on the TRUNK form), must contain a Packet Switch Unit (PSU) defined on the EQPSU form.

1.1 Recent Change View

The Recent Change View for this form is 22.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SWITCHING MODULE

Description: Enter the SM (Switching Module) number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Each SM entered on this form must be defined on an EQIM (Switching Module Equipage) form (5700 Record).

Copyright © 2003 Lucent Technologies

For 5E4(2) - 5E9(1), the CONFIGURATION field on the corresponding EQIM form must be set to "LOADED".

For 5E9(2) and later, for the CONFIGURATION that supports this SM, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E9(1) and later, each SM (Switching Module) can have up to 5 PSU Shelves. Each Shelf can have up to 16 PH (Protocol Handlers). Shelves and Channel Groups are defined by the first 3 digits of the ISCN field. Each PH can be assigned up to 32 timeslots. To determine PHs which have more than 32 timeslots assigned, check the On Demand B Channel, Packet B Channel, Packet D Channel, EDSL, IFOPER, and IFTERM on the over-loaded PHs in the following forms and fields:

Assigned PHs

Form	Fields
AMLBDSL	LCEN
DSL	DSL OE
DSLAP	AP SITE ID
DSLUSR	TN and CKTTN or CKTMLHG/CKTTERM, TN and DPKTTN or DPKTMLHG/DPKTTERM, TN and ODBTN or ODBMLHG/ODBTERM
MISLINK	OE
OSPSDSL	LCEN
RTERM	SM UNIT TYPE, UNIT NUMBER, RTEX
TRUNK	TGN, MEMB
XAT	PKT TN, PKT MLHG, TERM NBR

For 5E10 and later, if the UNIT TYPE (on the EQIM form) is not "SM2000", then:

- the following criteria must be met:

  value of EQUIPMENT BAY must be 0 - 4.

  value of CONTROL GROUP must be 0 or 1.

  values of PIDB 0/1/2/3 DG must be 0 or 1.

  values of PIDB 0/1/2/3 DP must be 0 - 14.

- the combination of the {CONTROL GROUP, CONTROL PORT} fields cannot be {0,0} or {0,1}. For SMs which are not SM-2000 class processors, PICB 0 and 1 are reserved for the local digital service unit.

For the applications in the table below:

- For 5E10 and later, each DI (Data Interface) in a SM can have a maximum of 256 nailed-up timeslots reserved for the application in the following table. These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the following applications. Note that a D channel only takes a quarter of a time slot. This data rule is not executed on an SM-2000 class processor, because provisioning of nailed-up time slots is not required for SM-2000 class processors.

- To meet the "vertical assignment condition", the reserved timeslots must be entered such that for any given SHELF (defined by the first digit of ISCN field or by the SHELF field on the MISLINK form), the timeslots assigned for that SHELF may be duplicated in the same vertical (column) position only as many times as the SHELF has PIDBs assigned. That is, if SHELF 1 has 2 DIO PIDBs assigned, a given vertical position (0-31) in a row (DIO PSU TSIU, RPTSSO - RPTSS7) may not be used more than twice for that shelf.

- Each SM (Switching Module) can have up to 5 PSU SHELFs (defined by the first digit in the ISCN

Copyright © 2003 Lucent Technologies

field). Each PSU SHELF can be assigned up to (32 times X) timeslots for the following applications (where X represents the number of PIDBs, 0 to 4, provisioned per shelf):

Assigned Timeslots	
Application	**Forms**
CCLNK	Software Release: 5E11 and later. Defined on the CCLNK form. This value supports the VCDX CCS7 on the PSU feature. For more information, see Division 2, Section 7L.
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3 digits of the LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3 digits of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

2.3 * PSU

Description: Packet Switching Unit Number. This field supports the Double PSU Packet Bus feature (99-5E-7797). For more information on this secured feature, see Division 2, Section 4A607.

Software Release: 5E16 and later.
Required Field.
Valid Entries: 0 - 1

Data Rules:

For 5E16 and later, when PSU is "1":

- PSU TYPE must be "PSU2".
- the ACT field on the SFSYS form (5713-1 Record) for SFID 607 must be set to "Y" (see the Double PSU Packet Bus feature in Division 2, Section 4A607).

2.4 # PSU TYPE

Description: As of the 5E18(1) release, the PSU TYPE field is replaced with the SG 0 TYPE and SG 1 TYPE fields. See SG 0 TPYE and SG 1 TYPE below for usage information.

2.5 INTF TYPE

Description: This field specifies the interface type for the Packet Switch Unit. This is a no_change field.

Software Release: 5E18(1) and later

Copyright © 2003 Lucent Technologies

Default: PICB
Valid Entries: PICB, ETHERNET, or PKTBUS

2.6 COM ADDR

Description: Enter the Community Address assigned to a PSU. The COM ADDR specifies the community address assigned to this PSU. It is used as an address for this PSU in a PSU network.

Software Release: 5E10 and later.
Valid Entries: 0 - 254

Data Rules:

If a number is not entered in this field, the SM number is used as the address.

COM ADDR values on the EQPSU form must be unique.

2.7 CRIT PSU

Description: Is this PSU to be designated as a critical PSU? This field is used to designate whether or not a PSU is considered a critical unit to this SM. A "Y" in this field implies that the SM cannot perform call processing functions without the PSU. Thus, the SM will attempt everything possible, up to a full initialization, to get the PSU operational. If this field is "N", the PSU recovery does not escalate to SM initialization. This field supports the PSU Reliability Enhancements feature (99-5E-4553). See Division 2, Section 7AI.

Software Release: 5E14 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E14 and later, for each PSU on the EQPSU form with the CRIT PSU set to "Y", there must be at least one logical CHANNEL GROUP assigned on the CCLNK form. If no logical channel groups are assigned, CRIT PSU must be "N".

2.8 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

Copyright © 2003 Lucent Technologies

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.9 CON TYPE

Description: Enter the connection type of the PSU LINKs which are defined for this PSU. This field supports the PHA (Protocol Handler for Asynchronous Mode) feature for CDMA (Code Division Multiple Access). For more information on this feature see Division 2, Section 4A224.

- ***NOTE:*** For 5E11 and later, this field was moved to the PSULNK form (5057 Record), Division 7, Section 2A.

Software Release: 5E10 and later.
Required Field.
Default: NOCON
Valid Entries:

Valid CON TYPE Entries

Entry	Definition
NOCON	No connection type assigned to this PSU.
POINT	The links on this PSU are point-to-point links. Point-to-point links require that this PSU have direct connections to every other PSU it may communicate with.

2.10 #CONTROL GROUP

Description: Enter the Control Group Number. Since both Service Groups on the same unit must be assigned to the same Control Group, this entry is the Control Group for both Service Groups 0 and 1.

Required Field.
Valid Entries:
- For SM: 0 - 1
- For SM-2000: 0-3

Data Rules:

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.11 #CONTROL PORT

Description: Enter the Control Port number assigned to Service Group 0. The assignment for Service Group 1 of the unit is the next higher odd numbered control port on the same control group and is inferred from this entry for Service Group 0.

Required Field.
Valid Entries: even numbers in the 0 to 22 range

Data Rules:

If the CONTROL GROUP is set to 0, then the CONTROL PORT must be not be set to 0 or 1. Those ports are reserved for the LDSU (Local Digital Service Unit).

The combination of the SWITCHING MODULE, CONTROL GROUP and CONTROL PORT must not be

Copyright © 2003 Lucent Technologies

duplicated within the 5ESS Switch.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.12 #EQUIPMENT BAY

Description: Enter the Equipment Location Bay number.

Required Field.
Valid Entries:

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

2.13 #EQUIPMENT VERTICAL

Description: Enter the Vertical Equipment Location that specifies the bottom of the unit.

Required Field.
Valid Entries: 0 - 84

The table below provides the expected values for 6- and 7-foot cabinents, respectively.

Valid EQUIPMENT VERTICAL Entries

Cabinet Size	Location
6-foot	7, 15, 24, 32, 41, 49, 58.
7-foot	22, 30, 39, 48, 56, 65, 74.

Data Rules:

The combination of the SWITCHING MODULE, EQUIPMENT BAY and EQUIPMENT VERTICAL must not be duplicated within the 5ESS Switch.

Copyright © 2003 Lucent Technologies

2.14 #EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle number. This entry consists of a floor and aisle number. The first two digits are the floor number and the last two digits are the aisle number. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 to 9999.

2.15 SG 0 TYPE

Description: Enter the SG 0 TYPE. This field supports PSU2 which provides enhanced messaging capacity in the PSU. The new hardware is designed to be growable/degrowable into existing installations or equipped in new environments where performance needs dictate.

A PSU2 is allowed on an SM-2000 class processor. For 5E10 and later, the valid entry range for fields CI, DI, and PIDB have been expanded to allow a PSU2 to reside on an SM-2000 class processor. The following table provides the SM ranges of these fields compared to the new range allowed with an SM-2000 class processor.

Field Name	SM Range	SM2000 Range
CI	0 - 1	0 - 3
DI	0 - 1	0 - 5
PIDB	0 - 15	0 - 23

This field supports PSU2E (5E18(1)) and represents the side 0 type of the Packet Switching Unit.

Software Release: 5E10 and later.
Required Field.
Default: PSU1
Valid Entries:

Valid PSU TYPE Entries	
Entry	**Definition**
PSU1	Packet Switch Unit type 1
PSU2	Packet Switch Unit type 2. This enhanced PSU supports an improvement in the aggregate message handling capacity on the order of tenfold.
PSU2E	Packet Switch Unit type 2E. This entry supports the PSU2E PF3/CF3 feature. See Division 2, Section 7CE.

Data Rules:

PSU1:
For 5E10 and later, if "PSU1" is entered, a maximum of 160 DI0/DI1 PSU TSIU TIMESLOTS may be set on each EQPSU input form.

If "PSU1" is entered, the only types of Protocol Handlers that may be assigned to a PSU1 are:

- PH2, PH3 and PH4 for 5E13.
- PH2, PH3, PH4, and PH22 for 5E14.

(Protocol Handlers are assigned on the EQPSUPH form, designated by appropriate CLI values (See Division 8, Section 23).)

If "PSU1" is entered, the SG 0 COMMON CONTROL CLI and SG 1 COMMON CONTROL CLI values must be 0, 800006, or 80000000 hex.

5E18(1) and later:

- SG 0 TYPE and SG 1 TYPE must equal the same value.

Copyright © 2003 Lucent Technologies

- when SG 0 TYPE and SG 1 TYPE is "PSU2E", the SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI values must be 104 or 304.
- when double PSU configurations (two tuples on the EQPSU form, one for PSU equal 0 and another for PSU equal 1) exist, SG 0 TYPE and SG 1 TYPE must not be "PSU1".
- when SG 0 TYPE and SG 1 TYPE is "PSU2" or "PSU2E", PI SG0 TYPE and PI SG1 TYPE on the EQIM form (5700 Record) must be "PI2".
- when SG 0 TYPE and SG 1 TYPE is "PSU1", the only Protocol Handlers that can be assigned to a PSU1 on the EQPSUPH form (5742 Record) are PH2, PH3, PH4, and PH22.
  - PH2 is designated by a PH CLI of 0x100.
  - PH3 is designated by a PH CLI of 0x200 or 0xa00.
  - PH4 is designated by a PH CLI of 0x1800.
  - PH22 is designated by a PH CLI of 0x2800.
- when SG 0 TYPE and SG 1 TYPE is "PSU1", the only Protocol Handlers that can be assigned to a PSU2E on the EQPSUPH form are PHV4, PHV5, PH3, PH4, PH22, PHA2, and PHE2.
  - PHV4 is designated by a PH CLI of 0x8.
  - PHV5 is designated by a PH CLI of 0x20.
  - PH3 is designated by a PH CLI of 0x200 0xa00.
  - PH4 is designated by a PH CLI of 0x1800.
  - PH22 is designated by a PH CLI of 0x2800.
  - PHA2 is designated by a PH CLI of 0x10000.
  - PHE2 is designated by a PH CLI of 0x20000.
- when SG 0 TYPE and SG 1 TYPE is "PSU1", the only Protocol Handlers that can be assigned to a PSU2E on the EQPSUPH form are PHV4, PHV5, PH4, PH22, PHA1, PHA2, and PHE2.
  - PHV4 is designated by a PH CLI of 0x8.
  - PHV5 is designated by a PH CLI of 0x20.
  - PH4 is designated by a PH CLI of 0x1800.
  - PH22 is designated by a PH CLI of 0x2800.
  - PHA1 is designated by a PH CLI of 0x10.
  - PHA2 is designated by a PH CLI of 0x10000.
  - PHE2 is designated by a PH CLI of 0x20000.
- when SG 0 TYPE and SG 1 TYPE is "PSU2E" , the EQPSUPH form can only have up to 5 PH22s per each half of the shelf (PH ROW 1 - 8 is the first half and ROW 9 - 16 is the second half). PH22 is designated by a PH CLI of 0x2800.

Copyright © 2003 Lucent Technologies

When SG 0 TYPE and SG 1 TYPE is "PSU2E", the ACT field for SFID 130 on the SFSYS form (5713-1 Record) must be set to "Y".

The following data rule is not executed on an SM-2000 class processor, because provisioning of nailed-up timeslots is not required on SM-2000 class processors. For a PSU1, each Data Interface in a SM can have a maximum of 128 nailed-up timeslots reserved for the following applications:

Timeslots Reserved for Applications

Application	Definition
CCLNK	Software Release: 5E11 and later. Defined on the CCLNK form.
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

These timeslots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of timeslots reserved (i.e. the number of entries set to 1) must be greater than or equal to the quantity of timeslots assigned for the above applications. Note that a D channel only takes a quarter of a timeslot.

Also, the reserved timeslots must be entered such that for any given SHELF (defined by the first digit of the ISCN), the timeslots assigned for a SHELF may be duplicated in the same vertical (column) position only as many times as the SHELF has PIDBs assigned. For example, if SHELF 1 has 2 DI0 PIDBs assigned in the PIDB field, then a given vertical position (0-31) in the DI0 PSU TSIU TIMESLOTS field (RPTSS0 - RPTSS7) may not be used more than twice for that shelf.

PSU2: "PSU2" must be entered if:

- DI is greater than 1
- PIDB is greater than 15
- EQUIPMENT BAY is greater than 4
- SG0 CI or SG1 CI is greater than 1.

If "PSU2" is entered, then :

- the SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI values must be 3.
- the values of PI SG0 TYPE and PI SG1 TYPE (on the EQIM form) must be "PI2"

Copyright © 2003 Lucent Technologies

- the SG 0 COMMON CONTROL CLI and SG 1 COMMON CONTROL CLI value must be 0.
- the only types of Protocol Handlers that may be assigned to a PSU2 on the EQPSUPH form are:
  - PHV1, PHV2, PHV3, PHA1, PH3, and PH4 for 5E11.
  - PHV1, PHV2, PHV3, PHV4, PHA1, PH3, and PH4 for 5E12 and 5E13.
  - PHV1, PHV2, PHV3, PHA1, PH3, and PH4, and PH22 for 5E14.
  - PHV1, PHV2, PHV3, PHV4, PHV5, PHA2, PHE2, PH3, PH4, PH22, PH31, and PH33 for 5E16(2).
  - PHV1, PHV2, PHV3, PHV4, PHV5, PHV6, PHA1, PHA2, PHE2, PH3, PH4, PH22, and PH31 for 5E18.

  PHV1 is designated by a PH CLI of 1.

  PHV2 is designated by a PH CLI of 2 or 4.

  PHV3 is designated by a PH CLI of 4.

  PHV4 is designated by a PH CLI of 8.

  PHV5 is designated by a PH CLI of 20.

  PHV6 is designated by a PH CLI of 40.

  PHA1 is designated by a PH CLI of 10.

  PHA2 is designated by a PH CLI of 10000.

  PHE2 is designated by a PH CLI of 20000.

  PH3 is designated by a PH CLI of 200 or a00.

  PH4 is designated by a PH CLI of 1800.

  PH22 is designated by a PH CLI of 2800.

  PH31 is designated by a PH CLI of 8800.

  PH33 is designated by PH CLI of 880

For 5E12 and later:

- for DF2 connectivity, PSU2 must be entered.

For 5E16 and later:

- PH31's may only reside on DF2 (Data Fanout with PCT) versions on the PSU Shelf.

5E18(1) and later:

When SG 0 TYPE and SG 1 TYPE is not "PSU2E", INTF TYPE must be "PICB".

2.16 #SG 0 COMMON CONTROL EQST

Copyright © 2003 Lucent Technologies

Description: Enter the Equipment Status of the PSU Service Group 0 Common Control Board. New 5ESS Switch offices and equipment additions require the Operational status. During off-line ODA database retrofits, values other than "O" may exist.

Required Field.
Default: O
Valid Entries:

Valid SG 0 COMMON CONTROL EQST Field

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

If the SG 1 COMMON CONTROL EQST field is "O" (Operational), then the SG 0 COMMON CONTROL EQST field must also be "O".

If the SG 1 COMMON CONTROL EQST field is "G" (Growth), then the SG 0 COMMON CONTROL EQST field must be "O" or "G".

2.17 #SG 0 COMMON CONTROL CLI

Description: Enter the Change Level Indicator of the PSU Service Group 0 Common Control Board.

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Data Rules:

For 5E10 and later:

- if "PSU1" is entered in the PSU TYPE field, the SG 0 COMMON CONTROL CLI and SG 1 COMMON CONTROL CLI values must be 0, 1, or 800006.
- if "PSU2" is entered in the PSU TYPE field, the CLI value for both service groups is 0.

2.18 SG 1 TYPE

Description: This field supports PSU2E (5E18(1) and represents the side 1 type of the Packet Switching Unit.

Software Release: 5E10 and later.
Required Field.
Default: PSU1
Valid Entries:

Valid PSU TYPE Entries

Entry	Definition
PSU1	Packet Switch Unit type 1
PSU2	Packet Switch Unit type 2. This enhanced PSU supports an improvement in the aggregate message handling capacity on the order of tenfold.
PSU2E	Packet Switch Unit type 2E. This entry supports the PSU2E PF3/CF3 feature. See Division 2, Section 7CE.

2.19 #SG 1 COMMON CONTROL EQST

Copyright © 2003 Lucent Technologies

Description: Enter the Equipment Status of the PSU Service Group 1 Common Control Board. New 5ESS Switch offices and equipment additions require the Operational status. During off-line ODA database retrofits, values other than "O" may exist.

Required Field.
Default: O
Valid Entries:

Valid SG 1 COMMON CONTROL EQST Field

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.20 #SG 1 COMMON CONTROL CLI

Description: Enter the Change Level Indicator of the PSU Service Group 1 Common Control Board.

Required Field.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Data Rules:

For 5E10 and later, the SG 0 COMMON CONTROL CLI and SG 1 COMMON CONTROL CLI values for both service groups are 0 or 1.

PIDBs

The following fields (Section 2.21 - Section 2.26) define PIDBs (Peripheral Interface Data Buses). For 5E9(2) and earlier, each Service Group of the PSU provides for the termination of five PIDBs, one on each of five shelves. For 5E10 and later, up to 20 PIDBs can be terminated, up to 4 on each shelf.

PIDBs are to be equipped in pairs, one on each Service Group. All PIDBs entered on this form connect to the TSIU (Time Slot Interchange Unit). The PIDBs connecting the ISLU (Integrated Services Line Unit) and the PSU are assigned on the EQISLU form (5731 Record). Assignments to Side (Service Group) 1 of a PSU shelf of the PSIU are algorithmically related to the assignments for Side 0 and can be inferred from the Side 0 assignments. Therefore, only the Side 0 assignments are entered on this form. When the EQPSU form is entered, PIDB 0 entries are always required for PSU SHELF 0.

For 5E8 and later, the IDCU (Intergrated Digital Carrier Unit) was introduced for interface to RTs (Remote Terminals). IDCU PIDBs are assigned to the PSU on the EQIFAC form (5847 Record).

2.21 PIDBs

Description: Enter the PIDB field information for the shelf position. Each Switching Module can have up to 5 PSU SHELFs (defined by the first digit in the ISCN (Integrated Services Channel Number)).

Data Rules:

For 5E10 and later:
For each SHELF entry:

- all field segments for a particular PIDB (0 - 3) must be entered or left blank.
- all entered DI values must be the same.
- PIDB fields must be entered sequentially (PIDB 0 before PIDB 1, etc.; if PIDB 2 is operational, PIDB 1

Copyright © 2003 Lucent Technologies

must be operational, etc.)

- if PIDB 1 entries are made, the SHLF SIDE0 CLI and SHLF SIDE1 CLI must designate DF-MP (Data Fanout-Multiple PIDBs) for a PSU shelf.
- the number of timeslots that can be assigned on each PSU SHELF is:
  - 32 times the number of PIDBs (0 - 4) for an SM, or
  - 31 times the number of PIDBs (0 - 4) for an SM-2000 class processor.

Timeslots can be assigned for the following applications:

Timeslots Assigned to Applications

Application	Definition
CCLNK	Software Release: 5E11 and later. Defined on the CCLNK form.
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

2.22 SHLF SIDE 0 EQST

Description: Enter the Equipment Status of Side 0 of the PSU shelf. New 5ESS Switch offices and equipment additions require the Operational status. During off-line ODA database retrofits, values other than "O" may exist; but if they do, the EQST value here must be lower than or equal to the lower of the two COMMON CONTROL EQST values. The hierarchy of equipment status, from lowest to highest, are Unequipped, Growth and Operational.

Valid SHLF SIDE 0 EQST Field

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.23 SHLF SIDE 0 CLI

Description: Enter the Change Level Indicator of Side 0 of the PSU shelf.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E10 - 5E11, valid CLI values for both SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI are 0, 3, 800006, or 800007.

For 5E12 and later, valid CLI values for both SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI are 0, 3, 104, 800006, or 800007.

For 5E12 and later, if SHLF SIDE0/1 CLI designates DF2 connectivity:

- PIDB/SLOT must be 0 - 3.
- PIDB 1, PIDB 2, and PIDB 3 fields must be blank.
- bit position 8 (100h) and bit position 2 (004h) must be "or'd" to yield a CLI value of 104.

When PH CLI on the EQPSUPH form is 2800 (PH22), the hexadeciaml value for both SHLF SIDE 0 CLI and SHLF SIDE 1 CLI must be 104 or 304.

For valid CLI values,Drawing and list combinations, see Division 8, Section 1.

For 5E18 and later, when SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI is 3, SG 0 TYPE and SG 1 TYPE must be "PSU2".

2.24 SHLF SIDE 1 EQST

Description: Enter the Equipment Status of Side 1 of the PSU shelf.

New 5ESS Switch offices and equipment additions require the Operational status. During off-line ODA database retrofits, values other than "O" may exist; but if they do, the EQST value here must be lower than or equal to the lower of the two COMMON CONTROL EQST values. The hierarchy of Equipment Status, from lowest to highest, are Unequipped, Growth and Operational.

Valid SHLF SIDE 1 EQST Field

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.25 SHLF SIDE 1 CLI

Description: Enter the Change Level Indicator of Side 1 of the PSU shelf.
Valid Entries: 0 to 7FFFFFFF (hexadecimal)

Data Rules:

For 5E10 - 5E11, valid CLI values for both SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI are 0, 3, 800006, or 800007.

For 5E12 and later, valid CLI values for both SHLF SIDE 0 CLI and/or SHLF SIDE 1 CLI are 0, 3, 104, 800006, or 800007.

For 5E12 and later, if SHLF SIDE0/1 CLI designates DF2 connectivity:

- PIDB/SLOT must be 0 - 3.
- PIDB 1, PIDB 2, and PIDB 3 fields must be blank.
- bit position 8 (100h) and bit position 2 (004h) must be "or'd" to yield a CLI value of 104.

Copyright © 2003 Lucent Technologies

When PH CLI on the EQPSUPH form is 2800 (PH22), the hexadeciaml value for both SHLF SIDE 0 CLI and SHLF SIDE 1 CLI must be 104 or 304.

2.26 CONNECT TYPE

Description: The Connectivity Type field is a Recent Change only field. If DF2 (Data Fan 2) connectivity (defined by the CLI) is equipped, it must be equipped for both SHLF SIDE0 and SIDE1

Software Release: 5E12 and later

PIDB

For 5E9(2) and earlier, two fields (DATA GROUP and DATA PORT) were used to define the PIDB for each PSU shelf. For 5E10 and later, the following fields (Section 2.27 - Section 2.35) define the DG (Data Group), DP (Data Port), and ST (Equipment Status) for PIDB0 - PIDB3 on each PSU shelf.

For 5E12 and later, the field group of PIDB0/PCT was added to accommodate expansion of PSU capacity by increasing the number of time slots available between the SM-2000 TSIU and each PSU shelf from 128 to 768. Three fields were added to accommodate this change: DI/TSIS, PIDB/SLOT, and EQ.

2.27 DATA GROUP

Description: The name of this field was changed to DG in 5E10. This field name applies to 5E9(2) and earlier. See DG for usage information.

PIDB0/PCT

The following fields (Section 2.28 - Section 2.30) were added to support the Data Fan 2 PSU Capacity Expansion feature which increases the number of time slots available between the SM-2000 TSIU and each PSU shelf from 128 to 768. See Division 2, Section 7T.

2.28 DI/TSIS

Description: Enter the DI/TSIS.

Software Release: 5E12 and later
Valid Entries:
- For DI: 0 - 5
- For TSIS: 0 - 9

Data Rules:

Each PSU Shelf TSI/SLOT entered on the EQPSU form must be defined on the EQTSI form. The matching EQTSI form must have an EQSTAT value that is greater than or equal to the PIDB/PC EQ defined on the EQPSU form (i.e., "O" is greater than "G", which is greater than "U").

2.29 PIDB/SLOT

Description: Enter the PIDB/SLOT.

Software Release: 5E12 and later
Valid Entries:
- For PIDB: 0 - 22 (even)
- For SLOT: 0 - 3

Data Rules:

Copyright © 2003 Lucent Technologies

If SHLF SIDE0/1 CLI designates DF2 connectivity, PIDB/SLOT must be 0 - 3.

2.30 EQ

Description: Enter status of the equipment.

Software Release: 5E12 and later
Valid Entries:

Valid EQ Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

2.31 DG

Description: Enter the assigned DATA GROUP (Data Interface) number for PIDB 1, PIDB 2, and/or or PIDB 3. This field was called DATA GROUP for 5E9(2) and earlier.

The corresponding field on the RC view 22.2 is DI (Data Interface).
Valid Entries:
- For SM: 0 and 1
- For SM-2000: 0 - 5

Data Rules:

The combination of DATA GROUP 1 and DATA PORT 14 can only be assigned on the EQPSU forms whose SM is equipped with an SM-2000 class processor. The DATA GROUP/DATA PORT assignment on the EQPSU form also reserves the next sequential DATA PORT value. DATA GROUP 1, DATA PORT 15 is reserved for classic SMs.

2.32 DATA PORT

Description: The name of this field was changed to DP in 5E10. This field name applies to 5E9(2) and earlier. See DP for usage information.

2.33 DP

Description: Enter the Data Port assignment (Peripheral Interface Data Bus number) for Service Group 0. This field was called DATA PORT for 5E9(2) and earlier.

The corresponding field on the RC view 22.2 is PIDB.
Valid Entries:
- For 5E9(2) and earlier: even numbers 0 - 15
- For 5E10 and later: even number 0 - 23

Data Rules:

The combination of the DG (DATA GROUP) and DP (DATA PORT) entries must be unique in the PIDB list.

The combination of the SWITCHING MODULE, DG (DATA GROUP) and DP (DATA PORT) entries must be unique in the 5ESS Switch.

Only even numbered Data Ports are allowed since the entries on this form are for shelf Service Group 0. The data port value is automatically incremented for Service Group 1.

Copyright © 2003 Lucent Technologies

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.34 ST

Description: For 5E12 and later, the name of this field was changed to EQ. See EQ for usage information.

2.35 EQ

Description: For 5E11 and earlier, this field was called ST (status). Enter the PIDB equipment status.

The corresponding field on the RC view 22.2 is PIDB EQSTAT.

Software Release: 5E10 and later.
Valid Entries:

Valid ST Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

If PSU EQSTAT is "G", PIDB ST in the PIDBs list must be "G" or "U". If PSU EQSTAT is "U", PIDB ST must be "U".

Only Operational, "O", status is allowed in new offices and equipment additions.

DI0 PSU TSIU TIMESLOTS and DI1 PSU TSIU TIMESLOTS

The DI0 PSU TSIU TIMESLOTS and DI1 PSU TSIU TIMESLOTS lists are used to reserve timeslots, on Data Interfaces 0 and 1 respectively, for those applications which require a reserved timeslot.

Each list has four rows (for 5E9(2) and earlier), or eight rows (for 5E10 and later). Each row consists of 32 positions with each position equating to a single time slot. The 32 positions are divided into eight groups of four positions each. The positions cannot be defined singly; they must be defined in groups of four. An entry of 1 in a position reserves the time slot. An entry of 0 in a position leaves the time slot available for applications other than those requiring a reserved time slot. The carriage return key can be used to skip over a group of four timeslots; this has the same affect as entering four zeros.

Each list is comprised of 256 timeslot positions (8 rows of 32). One Data Interface can reserve 128 out of the 256 available time slots. However, the total quantity of reserved time slots, on Data Interface 0 and Data Interface 1, cannot exceed 160; for 5E10 and later this applies if "PSU1" is entered as the PSU TYPE. Division 2, Section 1BK provides further information on engineering considerations needed to make these assignments.

See also the Data Rules for the SM field for more timeslot information.

2.36 DI0 PSU TSIU TIMESLOTS

Description: Enter the DI0 PSU TSIU TIMESLOTS.
Valid Entries: 0 or 1

Data Rules:

Each SM (which is not an SM-2000 class processor) has 2 DIs (Data Interfaces). Each DI has 16 Data

Copyright © 2003 Lucent Technologies

Ports for terminating up to 16 PIDBs. The PIDBs are used as communication links between the peripheral units and a Data Interface. Each PIDB has 32 TSs (Time Slots), numbered 0 thru 31. Each DI is restricted to no more than 256 TSs: either 8 fully active Data Ports (8 * 32 TSs = 256 TSs) or a combination of fully active and partially active Data Ports (for a total of 256 TSs).

The SMs on the forms listed below cannot exceed the maximum capacity of 256 total TSs (with no more than 8 active parallel TSs) per Data Interface.

The following table specifies the number of PIDB TSs required by each peripheral unit and the name of the input form where the unit is defined:

Maximum Capacity Timeslots

Form	Peripheral Unit	Time Slots/Data Interface
EQDCLU	DCLU	32 TSs for LCRs 8:1 - 9:1.
EQDCLU	DCLU	64 TSs for LCRs 4.5:1 and lower.
EQDSP	DSU	Between 0 and 15 TSs (user-specified, where DSU 0).
EQDUP	DLTU	24 TSs per DFI-1 pack.
EQDUP	DLTU	24 or 48 TSs per DFI-2 pack.
EQGDSC3	GDSC3	32 TS.
EQIDCU	IDCU	32 TSs.
EQISLU	ISLU	32 TSs per DATA PORT.
EQISTF	DSU2-ISTF	31 TSs.
EQLU	LU	64 TSs.
EQPSU 5E10 and later	PSU	Between 0 and 256 TSs (user-specified).
EQRA	DSU2-RAF	32 TSs per DTA or CTR w/AOC.
EQRA	DSU2-RAF	20 TSs per DTA or CTR.
EQRA	DSU2-RAF	32 TSs per ANN.
EQTUP	TU	Between 0 and 4 TSs (user-specified).

Time Slots are assigned to the Peripheral units in sets of 32 (by PIDB).

2.37 DI1 PSU TSIU TIMESLOTS

Description: Enter the DI1 PSU TSIU TIMESLOTS.
Valid Entries: 0 or 1

Data Rules:

See Data Rule for DI0 PSU TSIU TIMESLOTS.

2.38 AVAILABLE TS

Description: This is a Recent Change Only field. In Recent Change, the AVAILABLE TIMESLOTS row indicates how many (0-8) channels are available for each timeslot on the specified DI. Channels may be reserved for other SM-units, or may have been reserved for this PSU.

SEC. 23: 5742 RECORD
PACKET SWITCHING UNIT PROTOCOL
HANDLER PACK EQUIPAGE FORM - EQPSUPH

1. GENERAL

The 5742 Packet Switching Unit Protocol Handler Pack Equipage Record is available with 5E3 and later Software Releases. It is used to define the Packet Switching Unit Protocol Handlers equipped in the 5ESS Switch.

The number of operational PHs (EQST 0) defined on the EQPSUPH form for this SWITCHING MODULE and PSU SHELF combination minus the number of DSL GROUPS (see next paragraph) for this SWITCHING MODULE and PSU SHELF must be greater than or equal to the MINIMUM NUMBER OF SPARE PHs.

DSL GROUPS are the value expressed in the second and third digits of the following fields:

- D ISCN, PPB1 and/or PPB2 ISCN on a DSL form (5907 Record);
- ODB ISCN, ISCN1 and ISCN2 on a DLSUSR form (5908 Record);
- ISCN on a OSPSDSL form (5411 Record);
- ISCN (in LINK DATA list) on a DSLAP form (5963 Record);
- TMC PRI and NPRI ISCNs, EOC PRI and NPRI ISCNs on an RTERM form (5174 Record).

1.1 Protocol Handler 3

The PH3 feature, available in 5E6 and later Software Releases, increases existing PH2 (Protocol Handler 2) processor memory from 1 MB to 4 MB to increase throughput and reduce packet delay. The PH3 will function the same as the existing PH2, therefore, PH2s and PH3s will be allowed on the same Packet Switching Unit (PSU) shelf in the PSU.

1.2 Recent Change View

The corresponding Recent Change views for this form are 22.3 and 22.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 *SWITCHING MODULE

Description: The SM Number.
Valid Entries: 1 - 192

Data Rules:

Each SM entered on this form must also be defined on the EQPSU form (5741-1/2 Record) for the PSU on this SM.

2.3 * PSU

Copyright © 2003 Lucent Technologies

Description: Enter the Packet Switching Unit Number. This field supports the Double PSU Packet Bus feature (99-5E-7797). (See Division 2, Section 4A607.)

Software Release: 5E16(1) and later.
Required Field.
Valid Entries: 0 - 1

Data Rules:

When PSU is "1":

- PH CLI must be 00001800 (PH4), 00002800 (PH22), 00000010 (PHA1), 00000008 (PHV4), 00010000 (PHA2), 00000008 (PHV4), 00000020 (PHV5), or 00020000 (PHE2).
- PH2 MIN SPARE must be left blank.
- PH3 MIN SPARE must be left blank.
- PH31 MIN SPARE must be left blank.
- PH33 MIN SPARE must be left blank.
- PHV1 MIN SPARE must be left blank.
- PHV2 MIN SPARE must be left blank.
- PHV3 MIN SPARE must be left blank.

2.4 *PSU SHELF

Description: Enter the PSU SHELF number on which the Protocol Handler is equipped.
Valid Entries: 0 - 4

Data Rules:

The PSU SHELF defined here must also be defined on the EQPSU form.

The number of PHs on each shelf must be greater than or equal to the number of channel groups reserved on a SMPH (Switching Module Protocol Handler) hardware type.

PROTOCOL HANDLERS

These fields (Section 2.5 - Section 2.6) are used to define the Equipment Status of the Protocol Handlers.

For each Protocol Handler entry for 5E6 and later, both EQST and PH CLI must be entered. If both are not entered, then leave these fields blank.

2.5 EQST

Description: Enter the Equipment Status of the Protocol Handler circuit. New offices and equipment additions require the Operational status. The hierarchy of Equipment Status, from lowest to highest, are Unequipped, Growth and Operational.

Valid EQST Entries

Entry	Definition
U	Unequipped
G	Growth
O	Operational

Copyright © 2003 Lucent Technologies

Data Rules:

During off-line ODA database retrofits, values other than 'O' may exist when the EQST value entered here is lower than or equal to the two SHLF SIDE EQST values for the given shelf on the EQPSU form.

2.6 PH CLI

Description: Enter the PH CLI (Change Level Indicator) value. For a listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Valid Entries: 0 - 7fffffff (hexadecimal)

Valid PH CLI Entries

PH	CLI Entry
PH2	100
PH3	200 or a00
PH4	1800
PH22	2800
PH31	8800
PH33	880
PHV1	1
PHV2	2
PHV3	4
PHV4	8
PHV5	20
PHV6	40
PHA1	10
PHA2	10000
PHE2	20000

Data Rules:

When PH CLI is 100, PH2 MIN SPARE must be entered and must be greater than 0. When PH CLI is 200, PH3 MIN SPARE must be entered and must be greater than 0.

The number of operational PHV2s assigned for a given PSU Shelf, minus the number of PHV2 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PHV2 MIN SPARE value specified for that PSU Shelf. (i.e., No. of Operational PHV2s - No. of PHV2 Logical Groups >= PHV2 MIN SPARE).

The number of PHV2 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PHV2". The PHV2 MIN SPARE value is specified on the EQPSUPH form.

The number of operational PH3s assigned for a given PSU Shelf, minus the number of PH3 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PH3 MIN SPARE value specified for that PSU Shelf (i.e., No. of Operational PH3s - No. of PH3 Logical Groups >= PH3 MIN SPARE). The number of PH3 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH3".

There can be at most 8 PH CLI fields with a value of 10 (hexadecimal) when EQST is "0".

The number of operational PHV3s assigned for a given PSU Shelf, minus the number of PHV3 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PHV3 MIN SPARE value specified for that PSU Shelf (i.e., No. of Operational PHV3s - No. of PHV3 Logical Groups >= PHV3 MIN SPARE). The number of operational PHV3s is obtained from the EQPSUPH form where PH CLI is 00000004 and EQST is "O". The number of PHV3 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PHV3". The PHV3 MIN SPARE is specified on the EQPSUPH form.

The number of operational PHV4s assigned for a given PSU Shelf, minus the number of PHV4 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PHV4 MIN SPARE value specified for that PSU Shelf (i.e., No.of Operational PHV4s - No.of PHV4 Logical Groups >= PHV4 MIN

Copyright © 2003 Lucent Technologies

SPARE). The number of operational PHV4s is obtained from the EQPSUPH form where PH CLI is 00000008 and EQST is "O". The number of PHV4 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PHV4". The PHV4 MIN SPARE is specified on the EQPSUPH form.

The number of operational PHV5s assigned for a given PSU Shelf, minus the number of PHV5 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PHV5 MIN SPARE value specified for that PSU Shelf (i.e., No. of Operational PHV5s - No.of PHV5 Logical Groups >= PHV5 MIN SPARE). The number of operational PHV5s is obtained from the EQPSUPH form where PH CLI is 00000020 and EQST is "O". The number of PHV5 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PHV5". The PHV5 MIN SPARE is specified on the EQPSUPH form.

When PH CLI is 2800 (PH22), the hexadecimal value for both SHLF SIDE 0 CLI and SHLF SIDE 1 CLI on the EQPSU form must be 104 or 304.

When PH CLI on this form is 1 (PHV1), 2 (PHV2), 4 (PHV3), 8 (PHV4), 10000 (PHA2), or 20000 (PHE2), the hexadeciaml value for both SHLF SIDE 0 CLI and SHLF SIDE 1 CLI on the EQPSU form (5741 Record) must be 3, 104 or 304.

2.7 PH2 MIN SPARE

Description: Enter the number of PH2s that are to be designated as spares on this PSU shelf.

Software Releases: 5E6 and later
Valid entries are 0 - 15

Data Rules:

The number of spare and assigned PH2s cannot be greater than the number of PH2s actually equipped on the EQPSUPH form.

2.8 PH3 MIN SPARE

Description: Enter the number of PH3s that are to be designated as spares on this PSU shelf.

Software Releases: 5E6 and later
Valid entries: 0 - 15

Data Rules:

The number of spare and assigned PH3s cannot be greater than the number of PH3s actually equipped on the EQPSUPH form.

For 5E10 and later, the number of operational PH3s assigned for a given PSU Shelf minus the number of PH3 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PH3 MIN SPARE specified for that PSU Shelf.

For a given PSU Shelf:

The number of operational PH3s - the number of Ph3 Logical Groups greater than or equal to PH3 MIN SPARE.

The number of operational PH3s is obtained from the EQPSUPH form where PH CLI is 200 or a00, and EQST is "O". The number of PH3 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH3".

2.9 PH4 MIN SPARE

Copyright © 2003 Lucent Technologies

Description: Enter the minimum number of spare PH4s for this PSU shelf. This field supports the provisioning of the minimum number of spare protocol handlers for PH4s.

Software Release: 5E10 and later
Valid Entries: 0 - 15

Data Rules:

The number of spare and assigned PH4s cannot be greater than the number of PH4s actually equipped on the EQPSUPH form.

For 5E10 and later, the number of operational PH4s assigned for a given PSU Shelf minus the number of PH4 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PH4 MIN SPARE specified for that PSU Shelf.

For a given PSU Shelf:

The number of operational PH4s - the number of PH4 Logical Groups = PH4 MIN SPARE.

The number of operational PH4s is obtained from the EQPSUPH form where PH CLI is 1800 and EQST is "O". The number of PH4 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH4".

2.10 PH22 MIN SPARE

Description: Enter the minimum number of spare PH22s for this PSU shelf.

Software Release: 5E14 and later
Valid Entries: 0 - 15

Data Rules:

The number of spare and assigned PH22s cannot be greater than the number of PH22s actually equipped on the EQPSUPH form.

For 5E14 and later, the number of operational PH22s assigned for a given PSU Shelf minus the number of PH22 Logical Groups assigned to that PSU Shelf, must be greater than or equal to the PH22 MIN SPARE specified for that PSU Shelf.

For a given PSU Shelf:

The number of operational PH22s - the number of PH22 Logical Groups = PH22 MIN SPARE.

The number of operational PH22s is obtained from the EQPSUPH form where PH CLI is 2800 and EQST is "O". The number of PH22 Logical Groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH22".

2.11 PH31 MIN SPARE

Description: This field indicates the number of operational minimum PH31 spares to be set aside for backup use. This field is added to support the SAAL (Signaling ATM (Asynchronous Transfer Mode) Adaptation Layer) SS7 (Signaling System 7) High Speed Signaling Links feature (99-5E-7451). For more information on this feature, see Division 2, Section 4A670.

Software Release: 5E16(2) and later
Valid Entries: 0 - 15

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E16(2) FR 1, the number of operational PH31s are obtained from the EQPSUPH form where PH CLI is "00008800" and EQST is "O". The number of PH31 logical groups assigned is obtained from the PSUGP form (5949 Record) where PH TYPE is "PH31".

PH31s and PH33s can only reside on DF2 (Data Fanout with PCT) versions of the PSU Shelf.

2.12 PH33 MIN SPARE

Description: This field indicates the number of operational minimum PH33 spares for this PSU shelf set aside for backup use. This field is added to support the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information on this feature, see Division 2, Section 4A684.

Software Release: 5E16(2) FR 3 and later
Valid Entries: 0 - 15

Data Rules:

For 5E16(2) FR 3, the number of operational PH33s are obtained from the EQPSUPH form where PH CLI is "0000880" and EQST is "O". The number of PH33 logical groups assigned is obtained from the PSUGP form (5949 Record) where PH TYPE is "PH33".

2.13 PHV1 MIN SPARE

Description: Enter the minimum number of spare protocol handlers for voice (version 1) (8 kilobit vocoder) for this PSU shelf. This field supports the provisioning of the minimum number of spare protocol handlers for voice for the CDMA feature. For more information on this feature see Division 2, Section 8B.

Software Release: 5E10 and later
Valid Entries: 0 - 15

2.14 PHV2 MIN SPARE

Description: Enter the minimum number of spare protocol handlers for voice (version 2) (13 kilobit vocoder) for this PSU shelf. This field was added to support the provisioning of the minimum number of spare protocol handlers for voice for the CDMA feature. For more information on this feature see Division 2, Section 8B.

Software Release: 5E10 and later
Valid Entries: 0 - 15

2.15 PHV3 MIN SPARE

Description: Enter the minimum number of spare protocol handlers for voice (version 3) (8 or 13 kilobit vocoder) for this PSU shelf. This field was added to support the provisioning of the minimum number of spare protocol handlers for voice for the CDMA feature. For more information on this feature, see Division 2, Section 8F.

Software Release: 5E11 and later
Valid Entries: 0 - 15

2.16 PHV4 MIN SPARE

Description: Enter the minimum number of spare protocol handlers for voice (version 4) (8 or 13 kilobit vocoder) for this PSU shelf. This field was added to support the provisioning of the minimum number of spare protocol handlers for voice for the CDMA feature. For more information on this feature, see Division 2, Section 8J.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later.
Valid Entries: 0 - 15

2.17 PHV5 MIN SPARE

Description: Enter the minimum number of spare protocol handlers for voice (version 5) (8 or 13 kilobit vocoder) for this PSU shelf. This field was added to support the provisioning of the minimum number of spare protocol handlers for voice for the PHV5 feature. For more information on this feature, see Division 2, Section 8AB.

Software Release: 5E16(1) and later.
Valid Entries: 0 - 15

2.18 PHA2 MIN SPARE

Description: This field indicates the number of PHA2s there are on a particular shelf. This field supports the PHA2/PHE2 on PH30 feature. For more information on this feature, see Division 2, Section 5BM.

Software Release: 5E16(1) and later.
Valid Entries: 0 - 15

2.19 PHE2 MIN SPARE

Description: This field indicates the number of PHE2s there are on a particular shelf. This field supports the PHA2/PHE2 on PH30 feature. For more information on this feature, see Division 2, Section 5BM.

Software Release: 5E16(1) and later.
Valid Entries: 0 - 15

Data Rules:

When the SIP for Packet Trunking has been purchased (SFID 684 has been acivated), then the total number of operational PHE2s on the EQPSUPH form (5744 Record) cannot exceed 48 per SWITCHING MODULE and PSU combination, else total number of operational PHE2s on the EQPSUPH form cannot exceed 10 per SWITCHING MODULE and PSU combination.

2.20 PHV6 MIN SPARE

Description: This field specifies the minimum number of spare PHV6s for the assigned PSU shelf.

Software Release: 5E18(1) and later
Valid Entries: 0 - 15

Data Rules:

The number of operational PHV6s assigned for a given PSU Shelf minus the number of PHV5 Logical groups assigned to that PSU Shelf, must be greater than or equal to the PHV6 MIN SPARE specified for that PSU Shelf.

2.21 BRI RDTA PIDB TS

Description: Enter the number of PIDB timeslots reserved for the BRI RDTA (Remote Digital Test Access) feature on this PSU Shelf.

Software Release: 5E7 and later
Valid Entries: 2, 4, or 6

SEC. 24: 5824 RECORD
INTEGRATED SERVICES ANALOG PACK EQUIPAGE FORM - EQISAP

1. GENERAL

The 5824 Record is available with the 5E3 and later Generic Programs. It is used to define ISLU (Integrated Services Line Unit) or RISLU (Remote Integrated Services Line Unit) analog circuit packs. The circuit packs that can be defined using this form are MAN (Metallic Access Network), RG (Ringing Generator) and HLSC (High Level Service Circuits). If the ISLULC (ISLU Line Card Assignment) form (5942 Record) is equipped with analog Z-Cards or digital U-Cards, the EQISAP form must be assigned with ISMAN (Integrated Services Metallic Access Network) and ISHLSC (Integrated Services High Level Services Circuit) Circuit Pack Types.

If the MTBs are assigned to ISAPs which reside upon an ORM, RSM or TRM, the EQISAP and the MTBs must share the same SITE ID (defined on the EQIM form). In addition, if this is a remote SITE ID (does not reside in the local office), the MTBs must reside on the Common Resource Module (denoted by MASTER MODULE on a corresponding EQSIT form). This rule does not apply to co-located ORMs/TRMs sharing resources (as co-located ORMs/TRMs are not distinguishable from ORMs/TRMs which are not co-located).

For 5E10 and later, when ISLULB form(s) are submitted with U Boards, 1 or 2 (2 if LG is in both 0-7 and 8-15 ranges, 1 if LG is in only one range) EQISAP input forms must be defined with:

- Matching SWITCHING MODULE
- ISLU TYPE is "ISLU2"
- Matching ISLU NUMBER
- CIRCUIT PACK TYPE is "ISMAN"
- CIRCUIT PACK NUMBER is 00 if LG is in 0 - 7; is 01 if LG is in 8 - 15
- EQUIPMENT STATUS associated with U Board. The following is the list of valid association of statuses between U Board and "ISMAN".

SPARE U BOARD STATUS	ISMAN STATUS
U	U, G, O
G	G, O
O	O

For 5E10 and later, when ISLULB form(s) are submitted with spare U Boards, 1 to 4 (depending on the LG and Board position) EQISAP input forms must be defined with

- Matching SWITCHING MODULE
- ISLU TYPE is "ISLU2"
- Matching ISLU NUMBER
- CIRCUIT PACK TYPE is "ISMAN"
- CIRCUIT PACK NUMBER is
  - 00 if LG is 0 and Board is 0
  - 01 if LG is 8 and Board is 0

Copyright © 2003 Lucent Technologies

- 10 if LG is 7 and Board is 3
- 11 if LG is 15 and Board is 3

- EQUIPMENT STATUS associated with the spare U Board. The following is the list of valid association of statuses between the spare U Board and "ISMAN".

SPARE U BOARD STATUS	ISMAN STATUS
U	U, G, O
G	G, O
O	O

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Switching Module Number.
Valid Entries: 1 - 192

Data Rules:

The SWITCHING MODULE must be defined on an EQISLU form (5731 Record) or EQRISLU form (5732 Record).

2.3 *(R)ISLU TYPE

Description: Enter the type of this Switching Module.
Default: ISLU
Valid Entries:
- For 5E9(2) and earlier: ISLU or RISLU
- For 5E10 and later: ISLU, ISLU2 or RISLU

Data Rules:

For a (R)ISLU TYPE of "RISLU" or "ISLU", (R)ISLU NUMBER must be between 0 and 7.

If ISLU TYPE is "ISLU2", CIRCUIT PACK TYPE must not be "ISRG".

2.4 *(R)ISLU NUMBER

Description: Enter the Integrated Services Line Unit Number.
Valid Entries:
- For 5E9(2) and earlier: 0 to 7
- For 5E10 and later: 0 - 7 for ISLU, or 0 - 42 for ISLU2.

Data Rules:

The (R)ISLU NUMBER must be defined on an EQISLU form (5731 Record) or EQRISLU form (5732 Record).

2.5 *CIRCUIT PACK TYPE

Copyright © 2003 Lucent Technologies

Description: Enter the type of Integrated Services Analog Circuit Pack.

Valid CIRCUIT PACK TYPE Entries

Entry	Description
ISMAN	Integrated Services Metallic Access Network.
ISRG	Integrated Services Ringing Generator.
ISHLSC	Integrated Services High Level Services Circuit.

Data Rules:

If the EQISAP form is submitted with Circuit Pack Type of "ISMAN", the ISLULC form must be submitted with Z/U-Cards in any one of the Line Group Controller (LGC) card positions for this SM and (R)ISLU.

If CIRCUIT PACK TYPE is "ISMAN", and if METALLIC TEST BUS 0 is entered, the CIRCUIT PACK NUMBER must be 00 or 11. If METALLIC TEST BUS 1 is entered, CIRCUIT PACK NUMBER must be 01 or 10.

If an ISLULC form is submitted with Z/U-cards and the LGC in the range of 0 - 7, EQISAP forms must be submitted with MAN Pack 0 assigned (CIRCUIT PACK NUMBER is 00 and 10). If LGC is in the range of 8 - 15, EQISAP forms must be submitted with MAN Pack 1 assigned (CIRCUIT PACK NUMBER is 01 and 11).

ISMAN Circuit Pack Types must be assigned in pairs of Circuit Pack Numbers. The pairs of Circuit Pack Numbers are 00 and 10 or 01 and 11. That is, if a MAN Pack 0 is assigned, then it must be assigned on both Service Groups. A similar rule applies to MAN Pack 1. If only "U" cards are equipped, MAN 00 is required for LGC 00-07 and MAN 01 is required for LGC 08-15.

Every MAN (Metallic Access Network) board has 16 Line Group Buses, 4 Test Buses, 1 Metallic Test Bus, 1 Spare Bus, 1 200 OHM Test Bus, 1 2K OHM Test Bus and 1 Ringing Generator Bus.

If the EQISAP form is submitted with Circuit Pack Type of "ISHLSC" or "ISRG", then another EQISAP form must be submitted with "ISMAN" Circuit Pack Type with the same SWITCHING MODULE, (R)ISLU TYPE and (R)ISLU NUMBER.

2.6 *CIRCUIT PACK NUMBER

Description: Enter the Circuit Pack Number. Circuit Pack Number is made up of the Service Group Number and the circuit number. Service Group is represented by the first character of this field and circuit number is represented by the second character.
Valid Entries: 00, 01, 02, 10, 11 and 12.

Data Rules:

A maximum of one Ringing Generator may be assigned per Service Group. Valid Circuit Pack Numbers for Circuit Pack Type of "ISRG" are 00 and 10.

The Metallic Access Network (MAN) consists of two circuit packs in each Service Group. The MAN contains the access buses used to connect circuits, to provide network paths for ringing, call tests, diagnostics and line testing. Valid Circuit Pack Numbers for Circuit Pack Type of "ISMAN" are 00, 01, 10 and 11.

Each Service Group can be equipped with a maximum of three High Level Service Circuits. Valid Circuit Pack Numbers for Circuit Pack Type of "ISHLSC" are 00, 01, 02, 10, 11 and 12.

2.7 EQUSTAT

Description: Enter the Equipment Status.

Required Field.

Copyright © 2003 Lucent Technologies

Default: O
Valid Entries:

Valid EQUSTAT Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

For new offices and units destined for factory testing, Operational is the only allowed value. During off-line ODA database retrofits, the other values are valid.

Equipment Status for "ISRG" depends upon the "ISMAN" status. If status for ISMAN is U, G or O, then status for ISRG must be U. If status for ISMAN is G or O, then status for ISRG must be G. If status for ISMAN is O, then status for ISRG must be O.

Equipment Status for "ISMAN" and "ISHLSC" depend upon the associated COMMON CONTROL EQST field on either the EQISLU or EQRISLU forms. If status for COMMON CONTROL EQST is U, G or O, then status for ISMAN and ISHLSC must be U. If status for COMMON CONTROL EQST is G or O, then status for ISMAN and ISHLSC must be G. If status for COMMON CONTROL EQST is O, then status for ISMAN and ISHLSC must be O.

2.8 CLI

Description: Enter the eight-digit hexadecimal Change Level Indicator Number of the ISMAN, ISRG and ISHLSC Circuit Pack Types.

Required Field.
Valid Entries: 0 to 7FFFFFFF

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.9 METALLIC TEST BUS 0

Description: Enter the MTB 0.

Data Rules:

For 5E9(2) and earlier, Metallic Test Bus 0 must be assigned to Service Group 0.

If a METALLIC TEST BUS 0 value is assigned for Service Group 0, then another EQISAP form must be defined with the same SWITCHING MODULE, (R)ISLU TYPE and (R)ISLU NUMBER entered on this form for a METALLIC TEST BUS 1 value that is assigned to the corresponding pack in Service Group 1. If MTB0 is entered, then MTB1 must not be input on the same form. Valid Circuit Pack Numbers associated with MTB0 numeric are 00 and 11.

If CIRCUIT PACK NUMBERs 00 and 11 are assigned to the same SWITCHING MODULE, (R)ISLU TYPE and (R)ISLU NUMBER, then the METALLIC TEST BUS 0 value must be the same on the two EQISAP forms.

This number consists of an 9-digit number as indicated below:

Valid MTS 0 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Regular MSU)

Copyright © 2003 Lucent Technologies

			00-31 (Modular MSU)
BUS	BUS	XX	00-14

This field is valid only for Circuit Pack Type of "ISMAN". MTBs greater than 3000 ohms are not valid on RISLUs.

2.10 METALLIC TEST BUS 1

Description: For 5E9(2) and earlier, Metallic Test Bus 1 must be assigned to Service Group 1.

If a METALLIC TEST BUS 1 value is assigned for Service Group 1, then another EQISAP form must be defined with the same SWITCHING MODULE, (R)ISLU TYPE and (R)ISLU NUMBER entered on this form for a METALLIC TEST BUS 0 value that is assigned to the corresponding pack in Service Group 0. If MTB1 is entered, then MTB0 numeric must not be input on the same form. Valid Circuit Pack Numbers associated with MTB1 are 10 and 01.

If CIRCUIT PACK NUMBERs 10 and 01 are assigned to the same SWITCHING MODULE, (R)ISLU TYPE and (R)ISLU NUMBER, then the METALLIC TEST BUS 1 value must be the same on the two EQISAP forms.

This number consists of an 9-digit number as indicated below:

Valid MTS 1 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
BUS	BUS	XX	00-14

This field is valid only for Circuit Pack Type of "ISMAN". MTBs greater than 3000 ohms are not valid on RISLUs.

SEC. 25: 5750 RECORD
METALLIC SERVICE UNIT EQUIPMENT RECORD
METALLIC SERVICE UNIT EQUIPAGE FORM (EQMSU)
METALLIC SERVICE UNIT PACK EQUIPAGE FORM (EQMSP)
MODULAR METALLIC SERVICE UNIT PACK EQUIPAGE FORM (EQMMSP)
METALLIC TEST INTERCONNECTION BUS EQUIPAGE FORM (EQMTIB)

1. GENERAL

The 5750 Record is used to define MSU (Metallic Service Unit) assignments from the EQMSU and the EQMTIB (5E10 and later), EQMSP or EQMMSP forms.

All MSUs in an office connect to an MTIB (Metallic Test Interconnection Bus). The MTIB provides the ability to interconnect MSUs and MSUSGs (Metallic Service Unit Service Groups) when more than one MSUSG must be used in a metallic connection. To provide this capability, the switch processing requires data defining the sequence in which the MSUs are connected to the MTIBs. Data describing this sequence is entered on the EQMSU form. For 5E9(2) and later, all MSU functions are provided by the Modular MSU.

For 5E14 and later, The FLEX DCTU CON field was added to provide additional MTIB paths to enhance availability of test setups in the MMSU. See Division 2, Section 7AL.

1.1 Recent Change View

The corresponding Recent Change View for the EQMSU and EQMTIB forms is 19.7. The corresponding Recent Change View for the EQMSP and EQMMSP forms is 20.7.

2. FORM ENTRIES - EQMSU

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 *INTERFACE MODULE

Description: Enter the Switching Module Number.
Valid Entries:
- 1 - 48: for CM1 (Communications Module 1)
- 1 - 192: for CM2 (Communications Module 2)

2.3 *METALLIC SERVICE UNIT

Description: Enter the Metallic Service Unit Number.
Valid Entries: 0 - 1

2.4 *SERVICE GROUP

Description: Enter the Service Group Number.
Valid Entries: 0 and 1

2.5 MSU TYPE

Description: Enter the Metallic Service Unit Type.

Required Field.

Copyright © 2003 Lucent Technologies

Valid MSU TYPE Entries	
Entry	**Description**
R	Regular.
M	Modular. Note: For 5E9(2) and later, all MSU functions are provided by the Modular MSU.

2.6 EQUIPMENT STATUS

Description: Enter the status of the equipment. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA database retrofits, the other values are valid.

Required Field.
Default: O
Valid Entries:

Valid EQUIPMENT STATUS Entries	
Entry	**Description**
G	Growth.
O	Operational.
U	Unequipped.

2.7 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 -8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.8 CONTROL GROUP

Description: Enter the Control Group Number.

Required Field.
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid CONTROL GROUP Entries, 5E9(2) and later

Entry	Definition
0 - 1	SM.
0 - 3	SM-2000.

Data Rules:

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.9 CONTROL PORT

Description: Enter the Control Port Number.

Required Field.
Valid Entries: 0 - 22.

Data Rules:

The Control Group Number and Control Port Number combination must be unique for the two Service Groups.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.10 EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries:
- 5E9(2) and later: 0 - 208

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinent aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry	Type
000 - 004	SM

Copyright © 2003 Lucent Technologies

000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

Data Rules:

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

2.11 EQUIPMENT VERTICAL

Description: Enter the Vertical Equipment Location that specifies the bottom of the unit.

Required Field.
Valid Entries: 0 - 84

5E9(2) and later:
- 7 foot cabinets - 22, 30, 39, 48, 56, 65, 74
- 6 foot cabinets - 7, 15, 24, 32, 41, 49, 58

2.12 EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement, per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.13 CSU

Description: Is the MSU located on a CSU (Combined Services Unit)? For more information on the Combined Services Unit feature, see Division 2, Section 7F.

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When CSU is "Y", SERVICE GROUP must be 0.

For an SM with a CSU, all equipment assignments for the CSU on that SM must specify the same combination of AISLE, BAY, VERT POS values. Therefore, the EQDU, EQGDSC3, EQMSU, or EQRA forms which have CSU set to "Y" must have equipment assignments that specify one location for the same CSU on a particular SM.

When an EQMSU form is entered with CSU set to "Y", no other EQMSU form may be entered on the same SM.

Copyright © 2003 Lucent Technologies

When an EQMSU form is entered with CSU set to "Y", the corresponding EQMMSP form with matching INTERFACE MODULE, METALLIC SERVICE UNIT and SERVICE GROUP values

- must not have any entries for GROWTH SHELF 1, GROWTH SHELF 2 or GROWTH SHELF 3.
- must not have any entries in the PACK EQUIPMENT LIST for SHELF POSITIONS 8 - 31.
- must not have any entries in the PACK EQUIPMENT LIST with SHELF TYPE values other than "MACC", "SCAN", "DIST" or "GDXC" for SHELF POSITIONS 0 - 7.
- must have an entry for MTIB BASIC SHELF.

Any SERVICE GROUP assigned within an INTERFACE MODULE on an EQMSU form which has CSU set to "N" must be assigned in pairs and with the same EQUIPMENT VERTICAL and EQUIPMENT BAY.

2.14 FLEX DCTU CON

Description: Is the Flexible Directly Connected Test Unit Connection to MSU enabled? See Division 2, Section 7AL.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Valid FLEX DCTU CON Entries

Entry	Definition
Y	Many to 1 MTB/PMU port connection.
N	1 to 1 MTB/PMU port connection.

Data Rules:

When "Y" is entered,

- for all EQPMU MTB AO - MTB D0 assignments for a particular MSU which has a MTB that resides on Shelf 0, the same pack position on shelves 1, 2 and 3 must either be equipped with a "MACC" pack or must be vacant.

  NOTE: The exception to the above data rule occurs in cases where the shelf is a non-metallic shelf (i.e., scan and distribute packs only). In such cases, the switch will allow scan or distribute packs in the slots reserved for the MACC pack; no cross check error will be encountered.

- all EQPMU MTB assignments to MSU's with Flexible DCTU Connectivity must be to MACC packs on shelf 0 only (pack numbers 0 - 7)

2.15 MTIB POSITION

Description: This field identifies the start, intermediate, and end position of the MTIB.

Valid MTIB POSITION Entries

Entry	Description
S or START	"START" is used if this Service Group equals 1, this MSU is not located on an RSM, and this Service Group is equipped with at least one MTIB pack.
E or END	"END" is used if this Service Group equals 0, this MSU is not located on an RSM, and this Service Group is equipped with at least one MTIB pack.

Data Rules:

Copyright © 2003 Lucent Technologies

Leave blank if this Service Group (0 or 1) either occupies an intermediate point on the MTIB, is located on an RSM, or does not have at least one MTIB pack equipped (SCAN and/or Distribute Packs only).

When Service Group 0 is the end of the MTIB, enter END in the Position field. Otherwise leave the Position field blank. Position cannot be START for Service Group 0.

When the Service Group 1 is the start of the MTIB, enter START in the Position field. Otherwise leave the Position field blank. Position cannot be END for Service Group 1.

2.16 ADJACENT MTIB IM

Description: If this MSU is an intermediate point in the MTIB, indicate the adjacent SM number. A Service Group 1 is cabled from a preceding adjacent SM and a Service Group 0 is cabled to a succeeding adjacent SM.

Software Release: 5E9(2) and earlier.
Valid Entries:
- 1 - 48: For CM1 (Communications Module 1)
- 1 - 192: For CM2 (Communications Module 2)

Data Rules:

Leave blank for any one of the following conditions:

- If this Service Group is the start or end of the MTIB.
- If this MSU is located on an RSM.
- If this MSU is not equipped with an MTIB pack (SCAN and/or Distribute Packs only).

Refer to Figures 2 and 3 for examples.

2.17 ADJACENT MTIB MSU

Description: If this MSU is an intermediate point in the MTIB, indicate the adjacent MSU number. A Service Group 1 is cabled from a preceding adjacent MSU and a Service Group 0 is cabled to a succeeding adjacent MSU.

Software Release: 5E9(2) and earlier.
Valid Entries: 0 and 1

Data Rules:

Leave blank for any one of the following conditions:

- If this Service Group is the start or end of the MTIB.
- If this MSU is located on an RSM.
- If this MSU is not equipped with an MTIB Pack (SCAN and/or Distribute Packs only).

Refer to Figures 2 and 3 for examples.

2.18 MSU COMMON CIRCUIT CLI

Description: Enter the MSU Common Circuit Change Level Indicator. This circuit is provided as part of

Copyright © 2003 Lucent Technologies

the basic unit per Service Group.
Valid Entries: 0 to 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

3. FORM ENTRIES - EQMSP

For 5E9(1) and earlier, when MSU TYPE is "R" on the EQMSU form, for a given Service Group, the following field information, for each equipped pack, is entered on the EQMSP form. The INTERFACE MODULE, MSU and SG key fields on this form must be the same as the associated fields on the EQSU form.

3.1 MTIB PACK EQSTATUS

Description: Enter the equipment status for the MTIB pack. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA database retrofits, the other values are valid. If MTIB pack is not equipped, leave blank.

Valid MTIB PACK EQSTATUS Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

3.2 MTIB PACK CLI

Description: Enter the MTIB PACK CLI. If MTIB pack is not equipped, leave blank.
Valid Entries: 0 to 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

PACK EQUIPMENT LIST

The following fields (Section 3.3 - Section 3.6) define the circuit packs associated with the MSU.

3.3 POS

Description: Enter the Metallic Service Unit Pack Position Number.
Valid Entries: 0 - 15

3.4 TYPE

Description: Enter the type of MSU Pack for each position.

Valid TYPE Entries

Entry	Description
SCAN	Scan Point Circuit Pack.
DIST	Distribute Point Circuit Pack.
ALIT	Automatic Line Insulation Test Pack.
GDXC	Gated Diode Crosspoint Compensator Pack.
MACC	Metallic Access Circuit Pack.
DFTC	Distributing Frame Test Access Circuit.

Data Rules:

To minimize metallic path cabling, MACC packs should be equipped in the first three positions of each MMSU shelf.

If a GDXC pack is equipped in Shelf 0-3, an ALIT pack must be equipped on the same MSU/SG, unless the ALIT is exclusively for SLC-96.

Copyright © 2003 Lucent Technologies

A maximum of three MACC packs may be equipped per shelf. If a GDXC or ALIT pack is equipped in Shelf 0-3, a MACC pack on the same MSU/SG must also be equipped.

If Shelf 0, 1, 2 or 3 is equipped with at least one MACC, ALIT, DFTC, GDXC or SLIM pack, the MTIB pack must also be provided. If the shelf is unequipped or equipped with only SCAN and/or DIST packs, the MTIB pack is not required.

If a "MACC" pack is equipped and resides upon an ORM, TRM, or RSM, the remote modules must also be Common Resource Modules (denoted by MASTER MODULE on a corresponding EQSITE form).

3.5 EQST

Description: Enter the status of the equipment for each pack position. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA database retrofits, the other values are valid.
Default: O
Valid Entries:

Valid EQST Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

3.6 CLI

Description: Enter the Change Level Indicator for the pack position. This circuit is provided as part of the basic unit per Service Group.
Valid Entries: 0 - 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

For 5E3 and later, if the MSU Pack Type is MACC and EQST is "O", then the Modular MSU has Metallic Access capability and is equipped with an MA pack, MTIBAX (MTIB Access) pack and protocol circuit.

4. FORM ENTRIES - EQMMSP

When MSU type is "M" on the EQMSU form, for a given Service Group, the following field information, for each equipped pack, is entered on the EQMMSP form. The INTERFACE MODULE, MSU and SG key fields on this form must be identical to the same key fields on the EQSU form. Note that each EQMMSP form must have a corresponding EQMSU form.

MTIB SHELVES

There are four shelvesSection 4.1 - Section 4.2 consisting of a Basic Shelf and three Growth shelves.

The following is the Shelf and Pack Position Relationship:

Pack Equipment Relationship

Shelf	Shelf Number	Pack Position
Basic Shelf	0	00-07
Growth Shelf 1	1	08-15
Growth Shelf 2	2	16-23
Growth Shelf 3	3	24-31

A status and CLI value is required for each shelf.

4.1 EQST

Description: If MTIB (BASIC SHELF), MTIB (GROWTH SHELF 1), MTIB (GROWTH SHELF 2), or MTIB

Copyright © 2003 Lucent Technologies

(GROWTH SHELF 3) is equipped with an MTIB pack, enter its equipment status.

For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA database retrofits, the other values are valid.
Default: O
Valid Entries:

Valid EQST Entries

Entries	Descriptions
G	Growth.
O	Operational.
U	Unequipped.

4.2 CLI

Description: If MTIB (BASIC SHELF), MTIB (GROWTH SHELF 1), MTIB (GROWTH SHELF 2), or MTIB (GROWTH SHELF 3) is equipped with an MTIB pack and its EQST is known, enter the CLI value.
Valid Entries: 0 - 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

PACK EQUIPMENT LIST

The following fields (Section 4.3 - Section 4.5) define the Pack Equipment List for Modular MSU for the combined pack entries on the EQMMSP form for MTIB (BASIC SHELF), MTIB (GROWTH SHELF 1), MTIB (GROWTH SHELF 2), or MTIB (GROWTH SHELF 3). If any of these are equipped, enter the TYPE, EQST, and CLI values for each.

4.3 TYPE

Description: Enter the type of MSU Pack for each position.

Valid TYPE Entries

Entry	Description
[AL]IT	Automatic Line Insulation Test Pack.
[DF]TC	Distributing Frame Test Access Circuit.
[DI]ST	Distribute Point Circuit Pack.
[GD]XC	Gated Diode Crosspoint Compensator Pack.
[MA]CC	Metallic Access Circuit Pack.
[SC]AN	Scan Point Circuit Pack.
[SL]IM	Software Release: 5E10 and later Subscriber Line and Instrument Measurement Pack.

Data Rules:

If TYPE is "SLIM":

- SLIM ROUTE INDEX must be entered on the IMINFO form.
- each pack entered must have 3 LTP assignments associated with a TRKCLS set to "LTPSLIM" on the TKGRP form. For these LTPs, the SM specified in the LTP on the TRUNK form must equal the SM on the EQMMSP form.
- and if, Basic Shelf and/or Growth Shelf 1, 2, or 3 is equipped, a MACC pack must also be equipped on the same MSU/SG.

When MSUs are mounted on either a Local SM or a Host SM and also have one or more MACC packs assigned via the corresponding EQMMSP form (PACK TYPE set to "MACC"), then MSUs require a corresponding EQMTIB form entered.

Copyright © 2003 Lucent Technologies

4.4 EQST

Description: Enter the status of the equipment for each pack position. For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA database retrofits, the other values are valid.
Default: O
Valid Entries:

Valid EQST Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

4.5 CLI

Description: Enter the Change Level Indicator for the pack position. This circuit is provided as part of the basic unit per Service Group.
Valid Entries: 0 - 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

5. FORM ENTRIES - EQMTIB

5.1 *SM

Description: Enter the Switching Module Number.

Software Release: 5E10 and later.
Valid Entries: 1 - 192

Data Rules:

Each EQMTIB form must have at least one corresponding EQMSU form with matching SM and MSU values. In addition, EQMTIB forms must be associated with EQIM forms where SM USAGE is "HIM " or "IM" . All EQMTIB forms must be associated with Switching Modules that are not remote.

5.2 *MSU

Description: Enter the Metallic Service Unit
Valid Entries: 1 - 0

5.3 SHELF

Description: Enter the MSU type. This is a no change field.
Default: 0

5.4 EQSTST

Description: Enter the equipment status. This is a display only field.

5.5 CLI

Description: Enter the Change Level Indicator. This is a display only field.

5.6 PREV SM

Description: Enter the previous MTIB interface module.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 192

Data Rules:

When PREV SM is "SM", then PREV MSU must not equal "MSU".

When PREV SM equals NEXT SM, then PREV MSU must not equal NEXT MSU.

If and only if there is one EQMTIB form for the office, then the following fields must not be entered:

- MTIB CONNECTION PREV SM
- MTIB CONNECTION PREV MSU
- MTIB CONNECTION NEXT SM
- MTIB CONNECTION NEXT MSU

When there is only one EQMITB form for the office, the CSU field on the corresponding EQMSU form must be "N".(This represents an MTIB access network where the start is on service group 1 of this MSU and the end is on service group 0 of the same MSU).

For each EQMTIB form that specifies a NEXT SM, NEXT MSU combination, there must be a second EQMTIB form which has key fields SM and MSU equal to the NEXT SM and NEXT MSU of the first form and with PREV SM and PREV MSU equal to the SM and MSU values of the first form.

Example: If for one EQMTIB form SM/MSU is 001/0 and NEXT SM/MSU is 002/1, then there must be a second EQMTIB form where SM/MSU is 002/1 and PREV SM/MSU is 001/0. (See Figure 4).

The entries in PREV SM/MSU or NEXT SM/MSU must not be duplicated on more than one EQMTIB form.

There may be only one MTIB access network for a given office. Therefore, all EQMTIB form tuples should be linked together to form a single contiguous chain via the MTIB NEXT SM/MSU and MTIB PREV SM/MSU assignments. Breaks in the chain are not allowed. One and only one of the EQMTIB forms must have MTIB PREV SM/MSU blank (this is the start of the MTIB metallic access network). One and only one of the EQMTIB forms must have MTIB NEXT SM/MSU blank (this is the end of the MTIB metallic access network).

If the PREV SM/PREV MSU connection is entered, the NEXT SM/NEXT MSU connection must not be entered and vice versa.

5.7 PREV MSU

Description: Enter the previous MTIB metallic service unit.
Valid Entries: 0 - 1

Data Rules:

The PREV MSU and the NEXT MSU cannot be duplicated for the same SM.

5.8 NEXT SM

Description: Enter the next MTIB interface module.
Valid Entries: 1 - 192

Data Rules:

When NEXT SM is "SM", then NEXT MSU must not equal "MSU".

Copyright © 2003 Lucent Technologies

5.9 NEXT MSU

Description: Enter the next MTIB metallic service unit.
Valid Entries: 0 - 1

Data Rules:

The NEXT MSU and the PREV MSU cannot be duplicated for the same SM.

SEC. 26: 5751 RECORD
DIRECTLY CONNECTED TEST UNIT FORM - EQDCTU

1. GENERAL

The DCTU (Directly Connected Test Unit) provides metallic access testing capabilities to users via a CRT (Cathode Ray Tube) at the TLWS (Trunk and Line Work Station). The DCTU is available with 5E1 and later Software Releases.

The DCTU performs both DC (Direct Current) and sub-audio measurement capabilities for the integrated testing of loops, trunks and special service facilities, office related maintenance testing capability measurements of Direct Current voltages, resistance and capacitance of facilities that is controlled by the SM (Switching Module).

A DCTU may be configured with a maximum of three PMUs (Precision Measurement Units). Each PMU has four ports. A metallic path is established from a port through a metallic access pack in a Metallic Service Unit to the line or trunk to be tested. The PMU assignments are entered on the 5752-1/2 Record, Precision Measurement Unit Form (EQPMU).

If the 5751 Record is supplied, there must be a Route Index defined on the IMINFO form (5510 Record).

For every DCTU circuit (as defined in the 5751 Record) defined in a SM, there must be a trunk defined on the TRUNK form (5202 Record) with a Logical Test Port defined on the SM containing the DCTU, and with a Trunk Class of "LTPDCTU" on the TKGRP form (5202 Record).

1.1 Recent Change View

The Recent Change View for this form is 19.9.

2. FORM AND RECORD ENTRIES

2.1 *SWITCHING MODULE

Description: Enter the SM in which the Directly Connected Test Unit is mounted.
Valid Entries: 1 - 192

2.2 DCTU STATUS

Description: Enter the equipage status of the DCTU. For new offices and units destined for factory testing, Operational is the only allowed value. During offline ODA database retrofits, the other values are valid.
Default: O
Valid Entries:

Valid DCTU STATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

2.3 DCTU CLI

Descrtiption: Enter the DCTU Change Level Indicator.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.4 INTF UNIT

Copyright © 2003 Lucent Technologies

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.5 CONTROL GROUP

Description: Enter the Control Group to which the DCTU is assigned.

NOTE: For 5E9(2) and later, 0 - 1 is used for SMs; 0 - 3 is used for SM-2000s.
Valid Entries:
- 5E9(1) and earlier: 0 - 1
- 5E9(2) and later: 0 - 3

Data Rules:

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.6 CONTROL PORT

Description: Enter the Control Port to which the DCTU is assigned.
Valid Entries: 0 - 22

Data Rules:

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors

Copyright © 2003 Lucent Technologies

reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.7 EQUIPMENT BAY

Description: Enter the Bay of the frame in which the DCTU is mounted.
Valid Entries:
- 5E9(1) and earlier: 0 - 4
- 5E9(2) and later: 0 - 208

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinent aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

Data Rules:

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

2.8 EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle Number of the frame in which the DCTU is mounted. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.
Valid Entries: 0000 - 9999

SEC. 27: 5752 RECORD
PRECISION MEASUREMENT UNIT FORM (EQPMU)

1. GENERAL

The 5752 Record is available with the 5E1 and later Software Releases. It is used to defined PMUs (Precision Measurement Units) associated with the DCTU (Directly Connected Test Unit).

Prior to the 5E14 Software Release, each PMU has four ports/circuits. These ports/circuits furnish access to the MTB (Metallic Test Bus) and EAN (Equipment Access Network). These in turn connect any PMU port/circuit to any other PMU port/circuit on the same DCTU. Port/Circuit 0 and 1 information should be entered on the 5752-1 Record and Port/Circuit 2 and 3 information should be entered on 5752-2 Record. This form is used to make the metallic port assignments.

For new offices and units destined for factory testing, all EQSTATUS entries must be "O" (Operational). During offline ODA database retrofits, the other valid values are acceptable provided:

A. All EQSTATUS entries contain the same value, and

B. The EQSTATUS values on the EQPMU form are lower than, or equal to, in the equipment status hierarchy than the DCTU STATUS on the EQDCTU form (5751 Record). The hierarchy from lowest to highest is "U" (Unequipped), "G" (Growth) and "O" (Operational).

Effective with 5E14 and later Software Releases, the DCTU Bus Feature (99-5E-4720) is available (see Division 2, Section 7AL). This feature modified the screen format and functionality to allow each DCTU PMU port to access up to four MA packs on different MMSU (Multiple Metallic Service Unit) shelves within the same MMSU service group. Thus, four MTB fields and Ports A through D are used to define the DCTU PMUs and the LO DPN field was changed to LO DPN A - D to accommodate this feature modification.

1.1 Recent Change View

The Recent Change View for this form is 20.9.

2. FORM AND RECORD ENTRIES

2.1 *SWITCHING MODULE

Description: Enter the Switching Module in which the Precision Measurement Unit is mounted.

Required Field.
Valid Entries: 1 - 192

2.2 *PMU

Description: Enter the Precision Measurement Unit Number.

Required Field.
Valid Entries:
5E13 and earlier: 1 - 3
5E14 and later: 0 - 2

2.3 PMU EQSTATUS

Description: Enter the equipage status of the Precision Measurement Unit.

Required Field.

Copyright © 2003 Lucent Technologies

Default: O

Valid PMU EQSTATUS Entries	
Entry	**Definition**
U	Unequipped.
G	Growth.
O	Operational.

2.4 PMU CLI

Description: Enter the Change Level Indicator of the Precision Measurement Unit.

Required Field.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)
For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.5 EAN EQSTATUS

Description: Enter the equipage status of the Equipment Access Network.

Required Field.

Default: O

Valid EAN EQSTATUS Entries	
Entry	**Definition**
U	Unequipped.
G	Growth.
O	Operational.

DCTU A-D/Port A-D/MTB

Effective with the 5E14 Software Release, the DCTU Bus Feature (99-5E-4720) is available (see Division 2, Section 7AL). This feature modified the existing MTB field to allow each DCTU PMU port to access up to four MA packs on different MMSU shelves within the same MMSU service group. Twelve new MTB fields were added to the screen to the existing 4 MTB fields. The MTB A0, B0, C0 and D0 (Section 2.7 - Section 2.10) are input fields. The remaining twelve MTB fields provide display-only, system-calculated data based on entries in the MTB A0, B0, C0, and D0 fields.

- ***NOTE:*** To avoid repetition, because the format and valid entries for the MTB A0 - AD fields are identical, data entry instructions are provided once (only at the MTB A0) field.

2.6 MTB

Description: Enter the Metallic Test Bus assignment for each metallic port/circuit.

- ***NOTE:*** For 5E14 and later, this field name was changed to MTB A0 through MTB D0. See the MTB A0 field for data entry information.

Required Field.

2.7 MTB A0

Description: Enter the Metallic Test Bus assignment for each metallic port/circuit.

Required Field.

Software Release: 5E14 and later
Valid Entries:

DISTRIBUTE POINT NUMBER		

Copyright © 2003 Lucent Technologies

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
Distribute Point Number	DPN	XX	00-14

Data Rules:

If the MTB for this pack resides on an ORM (Optically Remote Module) for an SM or an EXM-2000, an RSM (Remote Switching Module) or a TRM (Two-Mile Remote Module) unit, the MTB assigned to this unit must terminate to an SM with the same value of SITE ID and this SM must be the Common Resource Module (denoted by MASTER MODULE on a corresponding EQSITE form (5722 Record)). This check does not apply to co-located ORMs/TRMs sharing resources as it is not possible (in static data) to distinguish co-located ORMs/TRMs from ORMs/TRMs which are not co-located.

The MTB and DPN for DCTU A, B, C, and D, respectively, must reside on the same SM.

2.8 MTB B0

Description: Enter the Metallic Test Bus assignment for each metallic port/circuit.

Required Field.
Valid Entries: See the MTB A0 field, DISTRIBUT POINT table.

Data Rules:

The MTB and DPN for DCTU A, B, C, and D, respectively, must reside on the same SM.

2.9 MTB C0

Description: Enter the Metallic Test Bus assignment for each metallic port/circuit.

Required Field.
Valid Entries: See the MTB A0 field, DISTRIBUTE POINT table.

Data Rules:

The MTB and DPN for DCTU A, B, C, and D, respectively, must reside on the same SM.

2.10 MTB D0

Description: Enter the Metallic Test Bus assignment for each metallic port/circuit.

Required Field.
Valid Entries: See the MTB A0 field, DISTRIBUTE POINT table.

Data Rules:

The MTB and DPN for DCTU A, B, C, and D, respectively, must reside on the same SM.

LO DPN A - LO DPN D

Effective with the 5E14 Software Release, the DCTU Bus Feature (99-5E-4720) is available (see Division 2, Section 7AL). This feature modified the existing MTB field which in turn caused the existing LO DPN fields to be renamed (Section 2.12 - Section 2.15). See the LO DPN A field for usage information.

NOTE: To avoid repetition, because the format and valid entries for the LO DPN fields are identical, data entry instructions are provided once (only at the LO DPN A) field.

Copyright © 2003 Lucent Technologies

2.11 LO DPN

Description: Enter the LO (Low) Distribute Point Number. The LO DPN actually designates two DPNs, the Low DPN and the High DPN (LO DPN + 1).

- ***NOTE:*** For 5E14 and later, this field name was changed to LO DPN A - LO DPN D. See the LO DPN A field for usage information.

Required Field.

2.12 LO DPN A

Description: Enter the LO DPN A number.

Required Field.

Software Release: 5E14 and later
Valid Entries:

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
Distribute Point Number	DPN	XX	00-14

Data Rules:

The MTB and DPN for DCTU A, B, C, and D, respectively, must reside on the same SM.

For 5E13 and earlier, the DPN for circuit 0, 1, 2, or 3 must not be assigned to point 31 on the MSU board.

LO DPN assignments for circuits 0, 1, 2 and 3 must be unique.

If one LO DPN is entered, all four LO DPNs must be entered.

For 5E14 and later, the DPN for DCTU A, B, C, and D, respectively, must not be assigned to point 31 on the MSU board.

LO DPN assignments for DCTU A, B, C, and D must be unique.

2.13 LO DPN B

Description: Enter the LO DPN B number.

Required Field.
Valid Entries: See the LO DPN A field, DISTRIBUTE POINT table.

2.14 LO DPN C

Description: Enter the LO DPN C number

Required Field.
Valid Entries: See the LO DPN A field, DISTRIBUTE POINT table.

2.15 LO DPN D

Copyright © 2003 Lucent Technologies

Description: Enter the LO DPN D number.

Required Field.
Valid Entries: See the LO DPN A, DISTRIBUTE POINT table.

SEC. 28: 5753 RECORD
FACILITY INTERFACE UNIT FORM - EQFIU

1. GENERAL

The Facility Interface Unit Form is used to provide Facility Interface Buses to a DLTU (Digital Line Trunk Unit) providing T1 Carrier umbilicals from a RSM (Remote Switching Module) and is available with the 5E1 and later Software Releases.

1.1 Recent Change View

The corresponding Recent Change View for this form is 20.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

2.3 *FIU SERVICE GROUP

Description: Enter the Facility Interface Unit Service Group Number.

Required Field.
Valid Entries: 0 or 1

2.4 EQUIPMENT STATUS

Description: Enter the Status of the Equipment.

Valid EQUIPMENT STATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

For new offices and units destined for factory testing, operational is the only allowed value. During offline ODA data base retrofits, the other values are valid.

2.5 EQUIPMENT CLI

Description: Enter the Change Level Indicator of the equipment.
Valid Entries: 0 to 7FFFFFFF hex

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.6 INTF UNIT

Description: The Interface Unit field was added to support the 5E15 Optically Extended Control and Data Unit feature. This is a Recent Change only field. See Division 2, Section 9V.
Valid Entries: 0 - 8

Copyright © 2003 Lucent Technologies

2.7 CONTROL GROUP

Description: Enter the Control Group Number.

Data Rules:

Both FIU Service Groups must be assigned to Control Group 1.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.8 CONTROL PORT

Description: Enter the Control Port Number.
Valid Entries: 20 or 21

Data Rules:

Service Group 0 must be assigned to Control Port 20. Service Group 1 must be assigned to Control Port 21.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.9 EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Valid Entries are: 0 - 4

2.10 UNIT VERTICAL

Description: Enter the Equipment Location Vertical Position Number.
Valid Entries: 0 - 84

2.11 EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of a floor and aisle number.
Valid Entries: 0000 - 9999

Data Rules:

Copyright © 2003 Lucent Technologies

It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

SEC. 30: 5810 RECORD
DIGITAL CARRIER LINE UNIT EQUIPMENT RECORD
DIGITAL CARRIER LINE UNIT EQUIPAGE FORM (EQDCLU)
DIGITAL CARRIER LINE UNIT PACK EQUIPAGE FORM (EQDCLP)

1. GENERAL

The 5810 Record is used to define equipment information for the DCLU (Digital Carrier Line Unit). This record is generated by two input forms: EQDCLU and EQDCLP.

The DCLU terminates SLC-96 RTs (Remote Terminals). A maximum of six RTs (576 lines) can be connected to a DCLU, three per Service Group. A DCLU may be arranged with one of two LCRs (Line Concentration Ratios), 4.5:1 and 9:1. A DCLU with an LCR of 4.5:1 requires two data port assignments and a 9:1 DCLU requires only one. A DCLU can be arranged with only one LCR. For (5E9(2) and later, the FACILITY ID field was added to optionally identify the DCLU facility.

1.1 Carrier Group Alarm Hash Indexes

The CGA (Carrier Group Alarm) data is associated with the VT/DS1 and STE/STS facilities. For 5E9(2) and later, only 522 hash indexes are available per switching module. One hash index is allocated to each instance of the following for a specific SM:

- 1 per each pair STE/STS on a specified SM (EQSTE form). (The EQSTE form is associated with the DNU-S.)
- 1 per each VT (Virtual Tributary) on a specified SM (EQVT form). (The EQVT form is associated with the DNU-S.)
- 1 per each DFI (Digital Facility Interface) of a DLTU (Digital Line/Trunk Unit) where FAC IND is 0 or 1, and DFI TYPE is not "H1" or "H2", i.e. DFI USAGE of "H1" and "H2" are not counted (EQDUP form). (The EQDUP form is associated with DLTU.)
- 1 per each DFI-2 (2 per EQDUP form) where FAC IND is 3. (The EQDUP form is associated with DLTU.)
- 1 per pack - POS, EQST, CLI, CLEI combination. (30 packs per DCLU on EQDCLP form) (The EQDCLP form is associated with DCLU.)
- 1 per IFAC - EQSTAT, SUP MTHD, PUB43801 combination. (20 per IDCU on the EQIFAC form) (The EQIFAC form is associated with IDCU.)

The sum of the above total number of allocated hash indexes (instances) cannot be greater then 522 for any one specific SM.

1.2 Recent Change View

The corresponding Recent Change views for this form are 19.6 and 20.6.

2. FORM ENTRIES - EQDCLU

2.1 BASE AND CONTROL , ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *SWITCHING MODULE

Copyright © 2003 Lucent Technologies

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

2.3 *DIGITAL CARRIER LINE UNIT

Description: Enter the Digital Carrier Line Unit Number.

Required Field.
Valid Entries:

5E14 and earlier: 0 - 7 (SM)
5E15 and later: 0 - 15 (SM-2000)

Data Rules:

See paragraph Section 1.1 on Carrier Group Alarm Hash Indexes.

DCLUs share the same unit number range with IDCUs. Therefore, unit numbers assigned on this form may not be assigned on any EQIDCU form with the same SM number.

2.4 *SERVICE GROUP

Description: Enter the Service Group Number.

Required Field.
Valid Entries: 0 or 1

2.5 EQUIPMENT STATUS

Description: Enter the Equipment Status of the DCLU.

Required Field.

Valid EQUIPMENT STATUS Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

If S-DFIs are defined on the EQDCLP form, but the corresponding T1 lines and RT assignments from the SLCRT form (5106 Record) are not present at this time, then set the Equipment Status to "G". If the corresponding S-DFIs are assigned on the SLCRT form, the Equipment Status should equal "O".

2.6 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on

Copyright © 2003 Lucent Technologies

the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.7 #CONTROL GROUP

Description: Enter the Control Group Number.

Required Field.
Valid Entries: 0 or 1

Data Rules:

CONTROL GROUP 0, Ports 0 and 1 may not be assigned on this form. They are reserved for the local DSU.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.8 CONTROL PORT A

Description: Enter the Control Port A Number.

Required Field.
Valid Entries: 0 - 22.

Data Rules:

Control Port A and B must not be identical.

Service Group 0 requires even port numbers, and Service Group 1 requires odd port numbers. For 5E4(2) and later, this field must be less than 22.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify

Copyright © 2003 Lucent Technologies

Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.9 #CONTROL PORT B

Description: Enter the Control Port B Number.

Required Field.
Valid Entries: 0 - 22

Data Rules:

Control Port A and B must not be identical.

Service Group 0 requires even port numbers, and Service Group 1 requires odd port numbers. For 5E4(2) and later, this field must be less than 22.

2.10 #DATA GROUP

Description: Enter the Data Group number.

Required Field.
Valid Entries: 0 or 1

2.11 #DATA PORT A

Description: Enter the Data Port A number.

Required Field.
Valid Entries: 0 - 15

Data Rules:

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.12 DATA PORT B

Description: Enter the Data Port B number. Data Port B is required only if the DCLU is arranged with a 4.5:1 LCR (Line Concentration Ratio). Leave blank for a 9:1 LCR.
Valid Entries: 0 - 15

2.13 #EQUIPMENT BAY

Description: Enter the Equipment Location Bay number.

Required Field.
Valid Entries:

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000

Copyright © 2003 Lucent Technologies

A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

Data Rules:

If 1 is entered, UNIT TYPE on the EQIM form (5700 Record) must be "MCTU3", "SMPU3", "SMPU4", or an SM-2000 class processor.

For 5E16 and later releases, when INTG UNIT is 0 EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.14 #EQUIPMENT VERTICAL

Description: Enter the vertical equipment location that specifies the bottom of the unit.

Required Field.
Valid Entries: 0 - 84

2.15 #EQUIPMENT AISLE

Description: Enter the Equipment Location Aisle number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.16 #COMMON CONTROL CIRCUIT CLI

Description: Enter the CLI (Change Level Indicator) for the Common Control Circuit.

Required Field.
Valid Entries: 0 to 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

3. FORM ENTRIES - EQDCLP

3.1 INTERFACE MODULE

Description: Enter the INTERFACE MODULE. This must be the same value as entered in the INTERFACE MODULE field on the EQDCLU form.

Required Field.
Valid Entries: 1 - 192

3.2 DCLU NUMBER

Description: Enter the DCLU NUMBER. This must be the same value as entered in the DIGITAL CARIER LINE UNIT field on the EQDCLU form.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries:
- 5E14 and earlier: 0 - 7
- 5E15 and later: 0 - 15

PACK

Up to 30 DCLU packs may be equipped on this form. The following fields (Section 3.3 - Section 3.7) define the position, equipment status, CLI and CLEI for each pack. For 5E9(2) and later, the FACILITY ID field was added to this form to optionally provide a description of the DCLU facility.

3.3 POSITION

Description: Enter the SLC DFI Pack Position.
Valid Entries:
- DCLU Service Group 0: 0 - 14
- DCLU Service Group 1: 15 - 29

3.4 EQST

Description: Enter the equipment status of the DCLU. For new offices and units destined for factory testing, "O" is the only allowed value. During offline ODA database retrofits, values "G" and "U" are valid.

Valid EQST Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

If the S-DFI is not assigned on an SLCRT form (5106 Record), EQST must be "G".

3.5 CLI

Description: Enter the CLI (Change Level Indicator) for the SLC DFI Pack.
Valid Entries: 0 - 7FFFFFFF, hexadecimal

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

3.6 CLEI

Description: Enter the Common Language Equipment Identification Number. See the appropriate J-drawing for the applicable CLEI code.
Valid Entries: 10 characters

3.7 FACILITY ID

Description: Enter the description for the DCLU facility. This field may be left blank.

Software Release: 5E9(2) and later.
Valid Entries: up to 25 characters.

SEC. 31: 5811 RECORD
TEST BUS CONTROL UNIT EQUIPMENT RECORD - EQTBCU

1. GENERAL

The 5811 Record is used to define Metallic Test Bus, Scan Point and Distribute Point assignments for Test Bus Control Units.

Distribute and Scan points must be unique within the 5ESS Switch.

The assignment of MTBs (Metallic Test Buses) for TBCUs (Test Bus Control Units) should be evenly spread between MSU/MMSU (Metallic Service Unit/Modular MSU) shelves and service groups that have metallic testing. This should be done to increase efficiency of ALIT (Automatic Line Instilation Testing) and to prevent a loss of metallic testing if a service group goes out of service.

1.1 Recent Change View

The corresponding Recent Change View for this form is 18.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL GROUP, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *METALLIC TEST BUS

Description: Enter the MTB (Metallic Test Bus) assignment for a TBCU (Test Bus Control Unit).

Required Field.

This number consists of:

Valid METALLIC TEST BUS Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular)
			00 - 31 (Modular)
Bus	BUS	XX	00 - 14

Data Rules:

Metallic Test Bus Point 15 of every MACC (Metallic Access) (pack is reserved for general internal MSU and MMSU diagnostics). Protocol test or diode resistor test are included in general internal diagnostics.

The MTB assignment must be defined on the EQMSP or EQMMSP form (5750 Record) with "MACC" entered in the TYPE field.

2.3 TBCU SCAN POINT

Description: Enter the Scan Point Number assigned to the TBCU.

Required Field.

Copyright © 2003 Lucent Technologies

This number consists of:

Valid TBCU SCAN POINT Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular)
			00 - 31 (Modular)
SPN	Scan Point Number	XX	00 - 30

Data Rules:

The Scan Point must be assigned to the same SM, MSU and Service Group as the Metallic Test Bus.

The SPN (Scan Point Number) must be defined on the EQMSP or EQMMSP form with "SCAN" entered in the TYPE field.

2.4 DPN 1 TO REMOVE DIODE AND CUT THRU TO SLC MTB

Description: Enter the assigned Distribute Point Number.

Required Field.

This number consists of:

Valid DPN 1 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular)
			00 - 31 (Modular)
DPN	Distribute Point Number	XX	00 - 31

Data Rules:

The Distribute Point must be assigned to the same SM, MSU and SVG as the Metallic Test Bus.

The DPN (Distribute Point Number) must be defined on the EQMSP or EQMMSP form with "DIST" entered in the TYPE field.

2.5 DPN 2 TO CUT THRU AND GIVE CHNL TEST RESULT

Description: Enter the assigned Distribute Point Number.

Required Field.

This number consists of:

Valid DPN 2 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15

Copyright © 2003 Lucent Technologies

			(Regular) 00 - 31 (Modular)
DPN/SPN	Distribute Point Number/Scan Point Number	XX	00 - 31

Data Rules:

The Distribute Point must be assigned to the same SM, MSU and SVG as the Metallic Test Bus.

The DPN must be defined on the EQMSP or EQMMSP form with "DIST" entered in the TYPE field.

2.6 DPN 3 TO GIVE CHNL TEST RESULT EXCEPT "NO RESPONSE"

Description: Enter the assigned Distribute Point Number.

Required Field.

This number consists of:

Valid DPN 3 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular) 00 - 31 (Modular)
DPN	Distribute Point Number	XX	00 - 31

Data Rules:

The Distribute Point must be assigned to the same SM, MSU and SVG as the Metallic Test Bus.

The DPN must be defined on the EQMSP or EQMMSP form with "DIST" entered in the TYPE field.

2.7 DPN 4 TO GIVE CHNL TEST RESULT OF GOOD MPTY OR COIN

Description: Enter the assigned Distribute Point Number.

Required Field.

This number consists of:

Valid DPN 4 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular) 00 - 31 (Modular)
DPN	Distribute Point Number	XX	00 - 31

Data Rules:

Copyright © 2003 Lucent Technologies

The Distribute Point must be assigned to the same SM, MSU, and SVG as the Metallic Test Bus.

The DPN must be defined on the EQMSP or EQMMSP form with "DIST" entered in the TYPE field.

2.8 DPN 5 TO GIVE CHNL TEST RESULT OF "NO RESPONSE"

Description: Enter the assigned Distribute Point Number.

Required Field.

This number consists of:

Valid DPN 4 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular)
			00 - 31 (Modular)
DPN	Distribute Point Number	XX	00 - 31

Data Rules:

The Distribute Point must be assigned to the same SM, MSU, and SVG as the Metallic Test Bus.

The DPN must be defined on the EQMSP or EQMMSP form with "DIST" entered in the TYPE field.

SEC. 32: 5812 RECORD
TRANSMISSION RATE CONVERTER UNIT EQUIPAGE FORM - EQCMTRCU

1. GENERAL

The 5812 Record is available with the 5E3 and later Software Releases. It is used to define the physical location of the TRCU (Transmission Rate Converter Unit), TRCU2 (TRCU Version 2) or the TRCU3 (TRCU Version 3) for up to two ORMs (Optically Remote Switching Modules). For more information, see Division 2, Section 9N.

TRCUs are physically located in a Miscellaneous Cabinet in the host office. TRCUs are required if the Office has any ORMs. The TRCU connects between a CM2/TMS (Communication Module 2/Time Multiplexed Switch) via NCTs (Network Control Timing Links) and the external ORM.

For 5E9(2) and later, an SM field was added to this form to define a TRCU2 for an EXM-2000 (EXtended switching Module-2000) to provide SM-2000 functionality at a remote location through an optical connection.

NOTE: TRCU2 must be used when provisioning EXM-2000. In addition, the EQCMTRCU form must be entered for hardware residing on the TMS (Local TRCU, SM = 0) and for the hardware residing on the EXM (Remote TRCU, SM = 1 - 192). When specifying the local and remote TRCU information, the same TRCU number must be used for both sides. For ORM, the EQCMTRCU form must be entered for hardware residing on the TMS (Local TRCU, SM = 0) only. The following table illustrates this rule:

Valid TRCU Entries (5E12 and earlier)

TRCU Number	SM	TRCU Type	Defintion
1	000	TRCU	Local TRCU, ORM (SM 1).
2	000	TRCU2	Local TRCU2, EXM-2000 (SM 2).
2	002	TRCU2	Remote TRCU2, EXM-2000 (SM 2).

The TRCU2 for an SM and the TRCU2 for an EXM-2000 must be unique. EXM-2000 TRCU2s cannot be duplicated on two different SMs. In addition, the UNIT TYPE and SM USAGE fields on the EQIM form must be defined to reflect either an SM or SM-2000. Corresponding TRCU2 NCT links must be defined on the EQORMLINK form (5813 Record) for 5E9(1) and earlier, or the EQTMSLINK form (5851 Record) for 5E9(2) and later.

For 5E12 and later, a new TRCU3 replaces the discontinued TRCU2.

CAUTION: For 5E15 and later, with the introduction of CM3, the EQCORE form (5701 Record) must be defined before the EQCMTRCU form can be defined.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.18.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *TRCU NUMBER

Description: Enter the Transmission Rate Converter Unit Number. One TRCU can support two ORMs. The TRCU acts as an interface between the ORM's transmission facility and the TMS.

Copyright © 2003 Lucent Technologies

It is recommended that TRCU values be assigned sequentially starting with 1.

Required Field.
Valid Entries:
- For 5E12 and earlier: 1 - 96
- For 5E12 and later: 1 for classic ORM, or
- 1 - 96 for SM-2000

Data Rules:

The value entered in this field must also appear in the TRCU NUMBER field on an EQORMLINK form. Each TRCU NUMBER on an EQORMLINK form must be defined in the TRCU NUMBER field of an EQCMTRCU form.

For 5E12 and later, when UNIT TYPE is "SM2000" or "SM2005" and IMTYPE is "ORM" on the EQIM form, and EQUIPMENT BAY and UNIT VERTICAL are entered on the corresponding EQCMTRCU form, these fields are required to have certain, specific values if the TRCU TYPE is "TRCU2". The following table shows these required combinations:

TRCU2 LOCATION COMBINATIONS

TRCU NUMBER	EQUIPMENT BAY	UNIT VERTICAL
1	1	45
2	1	53
3	1	62
4	2	45
5	2	53
6	2	62

2.3 *SM

Description: Enter the Switching Module number. This field is used to define local or remote TRCUs or TRCU2s for an SM, an SM-2000, or an EXM-2000.

Software Release: 5E9(2) and later.
Required Field.
Valid Entries:

Valid SM Entries

Entry	Defintion
0	Local TRCU/TRCU2; SMs and SM-2000.
1 - 192	Local/Remote TRCU2; Optically Remote SM-2000 (i.e., EXM-2000).

Data Rules:

If SM is greater than 0, the TRCU NUMBER must be defined on a corresponding EQTMSLINK form (5813 Record).

If SM is greater than 0, the value of the TRCU NUMBER cannot be duplicated on any other EQCMTRCU form where SM is greater than 0.

When SM is greater than 0, UNIT TYPE must be "SM2000" and SM USAGE must be ORM on the EQIM form (5700 Record).

When SM is greater than 0, TRCU TYPE must be TRCU2.

When SM is 0, EQLBAY must be 0 - 11.

For 5E12 and later, when SM is 0, EQLAISLE, EQLBAY and EQLUNVER must be entered.

For 5E12 and later, when SM is not 0 and TRCU TYPE is "TRCU" or "TRCU2", TRCU NUM must be 1 - 6.

Copyright © 2003 Lucent Technologies

For 5E12 and later, when SM is not 0 and TRCU TYPE is "TRCU3", EQL AISLE, EQLBAY and EQLUNVER must all be entered.

For 5E12 and later, when SM is not 0 and TRCU TYPE is "TRCU3", TRCU NUMBER must be 1 or 7 - 14.

2.4 TRCU TYPE

Description: Enter the Transmission Rate Converter Unit Type.

Required Field
Default: TRCU
Valid Entries:

Valid TRCU TYPE Entries

Entry	Defintion
TRCU	Transmission Rate Converter Unit Type 1
TRCU2	Transmission Rate Converter Unit Type 2
TRCU3	Transmission Rate Converter Unit Type 3 (5E12 and later). For more information, see Division 2, Section 9N.

Data Rule:
When defining EQCMTRCU forms for an EXM-2000, TRCU TYPE must be "TRCU2" for both local TRCU (SM = 0) and remote TRCU (SM = the number of the EXM-2000).

When "TRCU" is entered, the assigned TRCU NUMBERs must be entered on the EQTMSLINK form with TRC CLI set to 0.

When "TRCU2" is entered, and is assigned to an ORM, the assigned TRCU NUMBERs must be entered on the EQTMSLINK form with TRC CLI values equal to 1, 2, 4, 8, or 10.

For 5E12 and later, when the entry CM VINTAGE is set to "1" on the EQCORE form, the entry TRCU TYPE cannot be "TRCU3" on the EQCMTRCU form(s) for CM1 offices.

For 5E12 and later, when EQUIPMENT BAY and UNIT VERTICAL are entered on the EQCMTRCU form, these fields are required to have certain, specific values if the TRCU TYPE is "TRCU" or "TRCU2". If the corresponding EQIM form has a UNIT TYPE that is not "SM2000" or "SM2005" and its IMTYPE is "ORM", then EQUIPMENT BAY must be "1" and UNIT VERTICAL must be equal to MODULE PROCESSOR VERT + 17 on EQIM.

2.5 EQLAISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of two, two-digit entries which define the floor and aisle number. The first and second digits (from the left) are the floor number. The third and fourth digits (from the left) are the aisle number. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 00 - 99 (for both the floor and the aisle number)

Data Rules:

For 5E12 and later, when SM is not 0 and TRCU TYPE is "TRCU" or "TRCU2" on the EQCMTRCU form, and EQUIPMENT AISLE is entered, EQUIPMENT AISLE is required to be equal to EQUIPMENT AISLE on the corresponding EQIM form.

Navigation help: SM on EQCMTRCU points to SM on EQIM.

2.6 EQLBAY

Copyright © 2003 Lucent Technologies

Description: Enter the Equipment Location Bay number of the Miscellaneous Cabinet that contains the TRCU.

Required Field.
Valid Entries:

- 5E9(1) and earlier: 0 - 11
- 5E9(2) and later: 0 - 208

Valid EQLBAY Entries, 5E9(2) and later

Entry	Definition
0 - 11	Switching Module (non-SM-2000).
0 - 14	SM-2000/EXM-2000; SM Cabinent aisle.
100 - 104	SM-2000/EXM-2000; Back panel; wiring position.
200 - 208	SM-2000/EXM-2000; Front panel; door position.

2.7 EQLUNVER

Description: Enter the Vertical Equipment Location that specifies the bottom of the TRC Unit. The recommended values are based on cabinet type:

5E9(1) and earlier:
- 7-foot cabinets: 22, 30, 39, 48, 56, 65, 74.
- 6-foot cabinets: 15, 24, 32, 41, 49, 58.

5E9(2) and later:
- 7-foot cabinets: 22, 30, 39, 48, 56, 65, 74.
- 6-foot cabinets: 7, 15, 24, 32, 41, 49, 58.

Required Field.
Valid Entries: 0 - 84

SEC. 33: 5813 RECORD
NCT LINK BETWEEN CM2/TMS TRCU ORM EQUIPAGE FORM - EQORMLINK

1. GENERAL

The 5813 Record is available with 5E9(1) and earlier Software Releases to define an ORM (Optically Remote Switching Module) for an SM. Effective with the 5E9(2) Software Release, the functionality of this form was replaced by the EQTMSLINK form (5851 Record) to define an ORM for both the SM and an SM-2000. For SM-2000, an ORM is referred to as an EXM-2000 (EXtended SM-2000); see Division 8, Section 53. For 5E9(1) and earlier, this record is used to define the CLI (Circuit and Change Level Indicator) data for the NCT (Network Control Timing) Links to a TRCU (Transmission Rate Converter Unit). The ORM can be remoted up to 100 miles from the host office over a standard transmission facility. An ORM, indicated by an SM USAGE value equal to "ORM" on an EQIM form (5700 Record), requires TRCU hardware to provide a proper interface of the NCT Link to the standard transmission facility.

There are four TRC CKTs associated with a TRCU, and a maximum of two ORMs can be specified for a given TRCU. Each ORM requires two TRC CKTs. It is recommended to assign TRC CKTs 0 and 1 to the first required ORM and TRC CKTs 2 and 3 to the optional second ORM.

Whenever there is an SM USAGE of "ORM" defined on an EQIM form, then a corresponding EQORMLINK form must be entered.

The fields associated with the first, required ORM (ORM NUMBER, NCT EVEN LINK, TMS 0 TRC CKT, TMS 0 TRC CLI, TMS 1 TRC CKT and TMS 1 TRC CLI) are all required.

The fields associated with the second, optional ORM must all be entered or all be left blank.

1.1 Recent Change View

The Recent Change View for this form is 18.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and office name on each record.

2.2 *TRCU NUMBER

Description: Enter the TRCU Number. The TRCU Number is assigned in a sequential order starting with 1. These TRCU(s) are located in the Miscellaneous Cabinet in the host office as defined on an EQCMTRCU form (5812 Record).
Valid Entries: 1 - 96

Data Rules:

The value entered in this field must also appear in the TRCU NUMBER field on an EQCMTRCU form. Each TRCU NUMBER entered on an EQCMTRCU form must appear in the TRCU NUMBER field of an EQORMLINK form.

2.3 ORM NUMBER

Description: Enter the Switching Module Number of the ORM.
Valid Entries: 1 - 192

Data Rules:

Copyright © 2003 Lucent Technologies

The value entered here must be defined in the SM field of an EQIM form with the corresponding SM USAGE equal to "ORM".

An ORM NUMBER entry may only appear once on an EQORMLINK form. Thus, if two ORM NUMBER entries are the same on one EQORMLINK form, or if an ORM NUMBER entry on one EQORMLINK form appears on another EQORMLINK form, an error will be induced.

2.4 NCT EVEN LINK

Description: Enter the Even NCT Link number which is connected between the TRCU and the TMS (Timed Multiplexed Switch). This should correspond to the NCT EVEN LINK value defined on an EQIM form where the SM entry equals the ORM NUMBER entry on this form.
Valid Entries: 2 - 380 (even numbers)

Data Rules:

The same value may not be used for both NCT EVEN LINKS on one EQORMLINK form.

2.5 TMS 0 TRC CKT

Description: Enter a TRC CKT value from the TMS Side 0. There are a maximum of four TRC CKTs defined on one EQORMLINK form. Each TRC CKT value on a single form must be unique.
Valid Entries: 0 - 3

2.6 TMS 0 TRC CLI

Description: Enter the eight-digit hexadecimal Change Level Indicator number of the TRCU from TMS Side 0.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

2.7 TMS 1 TRC CKT

Description: Enter a TRC CKT value from Side 1.
Valid Entries: 0 - 3

2.8 TMS 1 TRC CLI

Description: Enter the eight-digit hexadecimal Change Level Indicator number of the TRCU from TMS side 1.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

SEC. 34: 5820 RECORD
MISCELLANEOUS DISTRIBUTE POINT NUMBER EQUIPAGE FORM -EQDPN

1. GENERAL

The 5820 Record is available with the 5E1 and later Software Releases. It is used to define Miscellaneous Distribute Point Number Assignments.

One, and only one Distribute Point Number is required for the Dial Tone Delay Alarm Circuit.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.7.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL GROUP, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *DISTRIBUTE POINT NUMBER

Description: Enter the Distribute Point Number.

Required Field.

This number consists of:

Valid Distribute Point Number Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular)
			00 - 31 (Modular)
PT	Distribute Point Number	XX	00 - 31

2.3 ASSIGNED CIRCUIT NAME

Description: Enter the appropriate Circuit Name.

Default: DTDA (Dial Tone Delay Alarm)
Valid Entries: DTDA

2.4 ASSIGNED CIRCUIT LEAD DESIGNATION

Description: Enter the appropriate Circuit Lead Designation.
Default: RSTDP (Restore Distribute Point, Dial Tone Delay Alarm)
Valid Entries: RSTDP

SEC. 35: 5821 RECORD
RECORDED ANNOUNCEMENT FUNCTION FORM - EQRA

1. GENERAL

The 5821 Record is available with 5E3 and later Software Releases. The Recorded Announcement Function Capability performs independent playback of pre-recorded, variable length and variable content announcements. The dial-through capability receives and detects Touch-Tone signals.

The EQRA form defines the RAF (Recorded Announcement Function) unit, and the SAS (Service Announcement System) services unit. If a RAF unit is defined on this form, then a corresponding EQRAP form (5822 Record) must be defined for the RAF circuit packs.

When this form is defined, a corresponding TRUNK form (5204 Record) must be entered with a RAF EN defined.

When an EQRA form is assigned to an SM where the value of UNIT TYPE is not an SM-2000 class processor (on the corresponding EQIM form), the following criteria must be met:

- CONTROL GROUP must be 0 or 1
- DATA GROUP must be 0 or 1
- DATA PORT must be 0 - 15
- EQUIPMENT BAY must be 0 - 4

1.1 Recent Change View

The corresponding RC/V view to this form is 19.10 and 20.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * SWITCHING MODULE

Description: Enter the Switching Module number.
Valid Entries: 1 - 192

Data Rules:

Value must be defined on a EQIM form (5700 Record).

2.3 * RAF UNIT

Description: The name of this field was changed to UNIT NUMBER in 5E9(2). This field name applies to 5E3 - 5E9(1). See UNIT NUMBER for usage information.

2.4 * UNIT NUMBER

Description: Enter the Unit Number used to specify the announcement function number. (This field was called RAF UNIT for 5E3 - 5E9(1).)

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 7

2.5 # UNIT TYPE

Description: Enter the Unit Type used to specify the announcement function unit type.

Software Release: 5E9(2) and later.
Required Field.
Default: RAF
Valid Entries:

Valid UNIT TYPE Entries

Entry	Definition
RAF	Recorded Announcement Function
SAS	Service Announcement System

Data Rules:

RAF - If UNIT TYPE is "RAF", then:
- ANN CNT must be 0.
- CLI must be entered (5E10 and later)
- DTA CNT must be 0.
- SERVICE TYPE must be entered.
- TDEC CNT must be 0.

SAS - If UNIT TYPE is "SAS," then:
- AOC must be "N".
- CLI must be entered (5E10 and later)
- SERVICE CNT must be 0.
- SERVICE TYPE must not be entered.

If EQUIPMENT STATUS is "O" and UNIT TYPE is "SAS", then the sum of the entries for DTA CNT + ANN CNT + TDEC CNT must be between 1 and 32.

The minimum configuration for a SAS PSG is one SAS control board and one SAS memory board. Every entry on the EQRA form with UNIT TYPE set to "SAS", must have a corresponding entry on the EQSASP form (the corresponding EQSASP form is found by matching SWITCHING MODULE and UNIT NUMBER on the EQRA form to SM and UNIT NUMBER on the EQSASP form).

The number of matching TRUNK forms for each EQRA form, where UNIT TYPE equals "SAS", must equal the sum of DTA CNT, ANN CNT, and TDEC CNT. The matching TRUNK forms are found by matching SWITCHING MODULE and UNIT NUMBER on the EQRA form to the first 3 digits of RAF EN and the 4th digit of RAF EN, respectively, on the TRUNK form.

For 5E10 and later, when UNIT TYPE is "SAS", DTA CNT, ANN CNT and TDEC CNT must all be entered.

When an EQRA(s) form is assigned to an SM where the value of UNIT TYPE is an SM-2000 class processor (on the corresponding EQIM form), the UNIT TYPE on the EQRA form must be "SAS".

2.6 # EQUIPMENT STATUS

Description: Enter the Equipment Status.

Required Field.

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth

Copyright © 2003 Lucent Technologies

O	Operational
U	Unequipped

Data Rules:

For 5E9(2) and later, if EQUIPMENT STATUS is "O" and UNIT TYPE is "SAS", then the sum of the entries for DTA CNT + ANN CNT + TDEC CNT must be between 1 and 32.

2.7 CLI

Description: Enter the CLI indicator for the recorded announcement function.

Software Release: 5E10 and later
Valid Entries: 0 - 7fffffff

Data Rules:

CLI must be entered if UNIT TYPE is "RAF".

CLI must not be entered if UNIT TYPE is "SAS".

2.8 INTF UNIT

Description: This field provides the Interface Unit number.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.9 # CONTROL GROUP

Description: Enter the Control Group number.

Required Field.
Valid Entries:
- For 5E9(2) and earlier: 0 or 1

Copyright © 2003 Lucent Technologies

- For 5E10 and later: SM: 0 - 1
- SM-2000: 0 - 3

Data Rules:

The Control Group and Control Port combinations must be unique for this RAF Unit and all other units assigned to a given SM value.

Control Group 0, Ports 00 and 01 may not be assigned on this form. They are reserved for the Local DSU.

2.10 # CONTROL PORT

Description: Enter the RAF Peripheral Control Port number.

Required Field.
Valid Entries: 0 - 22

Data Rules:

If CONTROL GROUP is O, then CONTROL PORT must not be 0 or 1 because they are reserved for the Local DSU.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.11 # DATA GROUP

Description: Enter the Data Group number.

Required Field.
Valid Entries:
- For 5E9(2) and earlier: 0 - 1
- For 5E10 and later: SM: 0 - 1
- SM-2000: 0 - 5

Data Rules:

The Data Group and Data Port combinations must be unique for this RAF or SAS Unit and all other units assigned to a given SM value.

2.12 # DATA PORT

Description: Enter the RAF or SAS Peripheral Data number.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E9(2) and earlier: 0 - 15
- For 5E10 and later: SM: 0 - 15
- SM-2000: 0 - 23

Data Rules:

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.13 # UNIT OFFSET

Description: Enter the pack location number of the Common Board (TN1841) within the Digital Services Unit Shelf. The values that are normally used for a RAF are 1, 5, 10 or 14 or SAS for any value except 0 and 17.

Required Field.
Valid Entries: 1 - 16

2.14 # EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries:

Valid EQUIPMENT BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQUIPMENT BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

2.15 # EQUIPMENT UNIT VERTICAL

Description: Enter the Equipment Location Vertical Position Number that specifies the bottom of the unit. The only the following entries are expected for:

- 6-foot cabinets - 7, 15, 24, 32, 41, 49, 58
- 7-foot cabinets - 22, 30, 39, 48, 56, 65, 74

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 84

2.16 # EQUIPMENT AISLE

Description: Enter the 4-digit Equipment Aisle Number.

Required Field.
Valid Entries: A 4-digit Equipment Aisle Number in the following format. It is recommended that floor 00 be used for equipment located in the basement.

EQUIPMENT AISLE NUMBER

Position	Format	Valid Entries
Floor	XX	00 - 99
Aisle	XX	00 - 99

2.17 CSU

Description: Is a SAS (Service Announcement System) unit located on a CSU (Combined Services Unit)? For more information on the Combined Services Unit feature, see Division 2, Section 7F.

Software Release: 5E10 and later
Required Field.
Valid Entries: Y, N
Default Value: N

Data Rules:

When CSU is "Y", UNIT TYPE must be "SAS" and UNIT OFFSET must be 11.

If CSU is "N" and UNIT TYPE is "RAF,

- if RAF is 0 or 4, then UNIT OFFSET must be 01.
- if RAF is 1 or 5, then UNIT OFFSET must be 10.
- if RAF is 2 or 6, then UNIT OFFSET must be 05.
- if RAF is 3 or 7, then UNIT OFFSET must be 14.

When an EQRA form is entered with CSU set to "Y", no other EQRA form may be entered on the same SM that also has CSU set to "Y".

RAF SERVICES

The following fields (Section 2.18 - Section 2.20) define RAF SERVICES attributes.

2.18 SERVICE TYPE

Description: Enter the RAF Service Type.

Required Field for 5E9(1) and earlier.

Valid SERVICE TYPE Entries

Entry	Definition
ANN	Announcement Service without the dial-through capability using thirty-two channels.
DTA	Dial through Service using twenty channels by digit receivers. This feature allows digits to be dialed while an announcement is being played. The announcement is terminated when the first digit is detected.
CTR	Coin Tone receiver using twenty channels. This feature allows coin tones to be received while an announcement is being played. The announcement is terminated when the first digit is detected.

Copyright © 2003 Lucent Technologies

Data Rules:

Channels defined on the same SM and RAF Unit must be assigned to the same Trunk Group.

For 5E6 and later Software Releases, if "ANN" is entered, then AOC field must be "N" and SERVICE CNT must be 1-32.

For 5E8 and later:

- if "ANN" or "CTR" is entered, then the corresponding EQRAP form (corresponding forms have the same Switching Modules and same RAF Units) APPLICATION field cannot be "BRCS-RAS", "ISDN-ACS", "BRCS-SLE", "ASP", or "BRCS-2LV".
- if "DTA" (Dial Through Announcement) is entered and the AOC (Announcement Only Channels) field is set to "Y", then on the corresponding EQRAP form the RAF UNIT APPLICATION is either "BRCS-RAS", "ISDN-ACS", "BRCS-SLE", "BRCS-2LV" or "ASP". These APPLICATION(s) cannot have AOC set to "Y". There are no Announcement Only Channels for these APPLICATION(s).

For 5E9(2) and later:
If UNIT TYPE is "RAF", SERVICE TYPE must be entered.

If UNIT TYPE is "SAS", SERVICE TYPE must not be entered.

2.19 SERVICE CNT

Description: Enter the number of service channels to be initialized on this RAF for the SERVICE TYPE entry ("ANN", "DTA", or "CTR" services).

Required Field.
Default: 0
Valid Entries:

Valid SERVICE CNT Entries

Entry	Definition
1 - 32	for SERVICE TYPE of "ANN"
0 - 20	for SERVICE TYPE of "DTA" or "CTR"

Data Rules:

If the AOC field is "Y", then the valid entries are 0-20 for SERVICE TYPE of "DTA" or "CTR". If AOC field is "N", then for a SERVICE TYPE of "DTA" or "CTR", the valid entries are 1-20.

The quantity of RAF assignments on TRUNK forms cannot exceed the SERVICE CNT on the corresponding EQRA form. The TRKCLS on the associated TKGRP form is "RAFANNC".

For 5E9(2) and later, if UNIT TYPE is "SAS", then SERVICE CNT must be 0.

2.20 AOC

Description: Should the unused channels on RAF units of SERVICE TYPE "DTA" or "CTR" be initialized and assigned as AOC (Announcement Only Channels) on this DTA or CTR? If AOC is "Y", all channels not initialized as "DTA" or "CTR" service types will be initialized as AOC and can be assigned on the TRUNK form (5204 Record).

Example If SERVICE TYPE is "DTA", SERVICE CNT is 15 and AOC is "Y", then 15 channels on this RAF unit are initialized as service type "DTA" and up to 15 channels may be assigned on the TRUNK form to "DTA" service type. Seventeen channels will be initialized as AOC and up to 17 AOCs may be assigned on the TRUNK form.

Copyright © 2003 Lucent Technologies

Example If SERVICE TYPE is "CTR", SERVICE CNT is 20 and AOC is "Y", then 20 channels on this RAF unit will be initialized as service type "CTR" and up to 20 channels may be assigned on the TRUNK form to "CTR" service type. Twelve channels will be initialized as AOC and up to 12 AOCs may be assigned on the TRUNK form.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Channels on the same RAF unit of the same service type must be assigned to the same trunk group on the TKGRP form, with the exception of AOC (Announcement Only Channels) on "DTA" or "CTR" RAFs as defined on the EQRA form may be assigned to a different trunk group. The TRKCLS must be "RAFANNC" for the AOC trunk group.

2.21 PATTERN

This is an output-only field that appears only on the office record and specifies the stuffing pattern assigned to this RAF Unit. For information on stuffing pattern assignment, please refer to Division 3, Section 2Q.

SAS SERVICES

The following fields (Section 2.22 - Section 2.24) define SAS SERVICES RAFs.

2.22 DTA CNT

Description: Enter the number of the DTA (Dial Through Announcement) channels for the SAS.

Software Release: 5E9(2) and later.
Default: 0
Valid Entries: 0 - 32

Data Rules:

If UNIT TYPE is "RAF", then DTA CNT must be 0.

If EQUIPMENT STATUS is "O" and UNIT TYPE is "SAS", then the entries on the DTA CNT field plus the entries on the ANN CNT field and the TDEC CNT field must be between 1 and 32, e.g. DTA CNT + ANN CNT + TDEC CNT must equal a number between 1 and 32.

2.23 ANN CNT

Description: Enter the number of the ANN (Announcement) channels for the SAS.

Software Release: 5E9(2) and later.
Default: 0
Valid Entries: 0 - 32

Data Rules:

If UNIT TYPE is "RAF", then the ANN CNT must be 0.

If EQUIPMENT STATUS is "O" and UNIT TYPE is "SAS", then the entries on the DTA CNT field plus the entries on the ANN CNT field and the TDEC CNT field must be between 1 and 32, e.g. DTA CNT + ANN CNT + TDEC CNT must equal a number between 1 and 32.

Copyright © 2003 Lucent Technologies

2.24 TDEC CNT

Description: Enter the number of the TDEC (Tone Decoder) channels for the SAS.

Software Release: 5E9(2) and later.
Default: 0
Valid Entries: 0 - 32

Data Rules:

If UNIT TYPE is "RAF", TDEC CNT must be 0.

If EQUIPMENT STATUS is "O" and UNIT TYPE is "SAS", then the entries on the DTA CNT field plus the entries on the ANN CNT field and the TDEC CNT field must be between 1 and 32, e.g. DTA CNT + ANN CNT + TDEC CNT must equal a number between 1 and 32.

CHANNEL LIST

For 5E9(2) and later, the following fields (Section 2.25 - Section 2.26) show the assignments of the SAS service type for channels 0 - 31. These (CHANNEL LIST) fields are display only and not for customer input. For initial offices these fields are automatically populated. For growth offices, SWITCHING MODULES which have SAS units will have the CHANNEL LIST populated with the appropriate SAS SERVICES. The CHANNEL LIST on the EQRA form provides the user with an easy way to verify the SAS SERVICES which are assigned on specific CHANNELS.

2.25 CHANNEL

Description: This is a no-change field showing the channel to which a SAS service has been assigned.

2.26 SERVICE

Description: This is a no-change field showing the SAS service that has been assigned to a specific channel.

Figure 2 SAMPLE EQRA FORM 5E15 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 36: 5822 RECORD
RECORDED ANNOUNCEMENT FUNCTION PACK FORM - EQRAP

1. GENERAL

The 5822 Record is available with 5E3 and later Software Releases.

This form is used to define the RAF (Recorded Announcement Function) circuit packs. The RAF unit is defined on the EQRA form (5821 Record).

1.1 Recent Change View

The corresponding Recent Change Views for this form are 20.10 and 20.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and
Office Name on each record.

2.2 * SWITCHING MODULE

Description: Enter the SM (Switching Module) number.
Valid Entries: 1 - 192

Data Rules:

The entry must be defined on an EQIM form (5700-1 Record).

2.3 * RAF UNIT

Description: The name of this field was changed to UNIT NUMBER in 5E9(2). This field name applies to 5E9(1) and earlier. See UNIT NUMBER for usage information.

2.4 UNIT NUMBER

Description: Enter the Metallic Service Unit number. (This field was called RAF UNIT for 5E9(1) and earlier.)
Valid Entries: 0 - 7

Data Rules:

For 5E9(1) and earlier, the SM and RAF combination must be defined on a EQRA form. For 5E9(2) and later, the SWITCHING MODULE and UNIT NUMBER pair(s) on the EQRAP form must be defined on an EQRA form where "RAF" must be entered as the UNIT TYPE on the EQRA form.

For 5E9(1) and earlier, an EQRA form cannot be submitted without a corresponding EQRAP form. For 5E9(2) and later, an EQRA form, with UNIT TYPE set to "RAF", cannot be submitted without a corresponding EQRAP form.

2.5 # APPLICATION

Description: Enter the type of announcements supported by the announcement storage circuit packs (TN1053 and TN1054).

For example, if the office requires RACF for a 5E5 office, the TN1053 pack 1 must have a MICROCODE of

Copyright © 2003 Lucent Technologies

"5D142A10", "5D142A20" or equivalent. The TN1054 pack 2 must have a MICROCODE of "5D143A10", "5D143A20", "5D143A30" or equivalent. The TN1054 pack 3 may have a MICROCODE of "5D155XXX", if customized announcements are required. XXX is the CIN (Customer Identification Number). Refer to Figure Figure 1 for suggested values for the APPLICATION.

A service group is defined by the RAF packs that are controlled by the RAF controller pack TN833. All packs in a service group must have the same APPLICATION text entry. This entry may be any 8 characters. However, the values given in Figure Figure 1 are the recommended values with the caveat that if more than one pack is in a service group, only one of the recommended values can be used for that group, or a text entry that describes the service group, e.g., "BRCS".

The recommended values, with their corresponding J-drawings, can be found in Figure Figure 1 of this section. In Figure Figure 1 , the Software Release indicates when the particular feature (not the APPLICATION) is available.

- ***NOTE:*** RAFs with OSPS applications must reside on a loaded SM. The other applications may reside on a basic, standard, or loaded SM.

Software Release: 5E4(2) and later
Required Field.
Valid Entries: 1 - 8 characters (A - Z, 0 - 9, dash (-),
- or underscore (_))

Data Rules:

For 5E6 and 5E7, the ASP (Advanced Services Platform; previously PVN, Private Virtual Network) feature requires an APPLICATION of "ASP" or "PVN". For 5E8 and later, only "ASP" is allowed.

For 5E7 and later, to use the new announcements for the LASS Screen List Editing Feature or for the ACSR Feature the hardware must be upgraded. The EQRAP form for the APPLICATION of "BRCS-SLE", "BRCS_SLE" or "ISDN-ACS"must have the value 5D143A30 entered in the MICROCODE field for PACK 2. This corresponds to an upgraded TN1054 board which must be installed in the RAF before the 5E7 Software Release or subsequent retrofit.

If the EQRA form SERVICE TYPE field has either "ANN" or "CTR" entered, then the corresponding EQRAP form APPLICATION field cannot be "BRCS-RAS", "ISDN-ACS", "BRCS-SLE", "ASP", or "BRCS-2LV".

For 5E8 and later, OSPS-TA applications require two microcode entries. OSPS-TA customized announcements require three microcode entires.

PACK

Fields Section 2.6 - Section 2.7 relate to announcement storage circuit packs. A RAF is equipped with one to three announcement storage circuit packs. The TN1053 circuit pack should be defined as pack 1 and must always be entered. TN1054 circuit packs should be defined as Packs 2 and 3.

Each PACK entered must have EQSTAT (5E3 and later) and MICRO-CODE (5E4(2) and later) entered.

Each PACK entered, in a new office, must have EQSTAT set to "O" (Operational).

2.6 EQSTAT

Description: Enter the Equipment Status.

Valid EQSTAT Entries

Entry	Definition
G	Growth

Copyright © 2003 Lucent Technologies

O	Operational
U	Unequipped

Data Rules:

The Equipment Status on the EQRAP form must be less than or equal to the Equipment Status on the EQRA form.

EQSTAT must be "O" for ODA initial offices.

2.7 MICRO-CODE

Description: Enter the micro-code number of the circuit pack.

See Figure 1 for the required microcode information needed for announcement applications.

Software Release: 5E4(2) and later
Valid Entries: 8 characters, (A - Z, 0 - 9)

Data Rules:

For each PACK entered, both EQSTAT and MICRO CODE must be entered.

DSU2-RAF Common Control for MC5D058A1 TN833 RAF Common Board (J5D003EA1, List 1)

First Release	Feature	List	APPLICATION (EQRAP)	MICRO-CODE (EQRAP)			SERVICE TYPE (EQRA)

1:A customized pack may be used for 5E6 and Later Software Releases: List 15A;

Copyright © 2003 Lucent Technologies

(MICRO-CODE=5D155xxx; xxx indicates the Customer Identification Number shown on the label attached to the pack). For 5E5 and later Software Releases, the customized pack may be used for OSPS-TA (list 15A).

2:List 20 provides MECH (More Efficient Call Handling), OSPS-TA, and OSPS-CTR announcements.

3:List 22 provides RACF and 2-Level COT/AC announcements.

4:These packs must be used with List 12 (provides RACF only) or List 22.

5:List 18 provides the ACSR (Automatic Customer Station Rearrangement) and standard 5E6 LASS (Local Area Signaling Services) announcements.

6:List 23 provides ACSR and Bellcore Compliant SLE announcements.

7:With 5E6 only, Limited 2-Level COT/AC is available.

8 Memory board 5D172A10[L24] is an optional board containing additional OSPS-TA announcement phrases for 5e7 and later Software Releases. It must appear as the second board with 5D114A40[L10] as the first board.

9 When memory board 5D172A10[L24] is used with memory board 5D155A10[L15], the two may be equipped in any order in the second and third positions.

10 5D172A10 (list 24) is the optional board for 5E7 and 5E8.

11 5D172A20 (list 24) is the optional board for 5E8.

SEC. 37: 5823 RECORD
INTEGRATED SERVICES TEST FUNCTION FORM - EQISTF

1. GENERAL

The 5823 Record is available with 5E3 and later Software Releases. The DSU2 RAF Integrated Services Test Function Assignment form is used to define the ISTF (Integrated Services Test Function) unit.The EQISTF form is used to provide Loopback and Transmission testing of the Digital trunks and ISDN type DSLs (Digital Subscriber Lines).

The ISTF is a single board which mounts in the DSU2 shelf in certain predefined slot (04, 13, 08 and 17) positions. Each ISTF board is capable of handling a maximum of 3 transmission services. The number of ISTF boards required depends upon the customer's needs. The ISTF can be co-located in a service group with RAF announcements as long as there is no announcement board in the second TN1054 slot. Note that the ISTF can only be mounted in the DSU2 shelf.

Loopback and transmission circuits for ISTF services are defined on this form. However, ports are allocated to these circuits on the TRUNK forms which belong to the trunk group of "LTPISTFL" (lookpback) or "LTPISTFX" (transmission) assigned on the TKGRP form. Each TRUNK form represents one port. The sum total of Trunk Group members (TRUNK forms) with an associated TKGRP TRKCLS of "LTPISTFL" (LOOPBACK SERVICES) and "LTPISTFX" (TRANSMISSION SERVICES) cannot exceed the sum total of LOOPBACKISTF SERVICES and TRANSMISSION services indicated on the EQISTF forms.

1.1 Recent Change View

The Recent Change View for this form is 19.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 *SWITCHING MODULE

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

2.3 *ISTF NUMBER

Description: Enter the ISTF Unit Number.

Required Field.
Valid Entries: 0 - 3

Data Rules:

For 5E5 and later, when this field is entered, the LOOPBACKISTF SERVICES or the TRANSMISSION field must be entered.

2.4 EQUIPMENT STATUS

Description: Enter the status of the equipment. For new offices and units destined for factory testing, "0" (Operational) is the only allowed value. During offline ODA database retrofits, the other values are valid.
Default: O

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries:

Valid EQUIPMENT STATUS Entries	
Entry	**Definition**
O	Operational.
G	Growth.
U	Unequipped.

2.5 EQUIPMENT BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries: 0 - 4

2.6 EQUIPMENT UNIT VERTICAL

Description: Enter the vertical equipment location that specifies the bottom of the unit. The recommended values for this are:

6-foot cabinets:
- 15, 24, 32, 41, 49, 58

7-foot cabinets:
- 22, 30, 39, 48, 56, 65, 74

Required Field.
Valid Entries: 0 - 84

2.7 EQUIPMENT AISLE

Description: Enter the equipment location aisle number. This entry consists of a floor and aisle number. The first and second digits from the left are the floor number. Valid floor numbers are 00-99. The third and fourth digits from the left is the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.8 UNIT OFFSET

Description: The Unit Offset field is displayed on the input EQISTF input screen, but cannot be manually accessed for data entry. The value is automatically generated at the time of form entry based upon the value entered in the corresponding ISTF NUMBER field (see the chart below). The values are 04, 08, 13 and 17. The UNIT OFFSET represents the slot number in the DSU2 shelf. This data is printed on the input screen and office record for informational purposes only.

UNIT OFFSET Values	
ISTF NUMBER	**UNIT OFFSET**
0	04
1	13
2	08
3	17

2.9 CHANGE LEVEL INDICATOR

Description: Enter the Change Level Indicator number. This is a hexadecimal number value in the range

Copyright © 2003 Lucent Technologies

of 0 - 7FFFFFFF. For valid CLI values, see Division 8, Section 1 for equipment assignment.

Required Field.
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

2.10 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 -8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

2.11 CONTROL GROUP

Description: Enter the Control Group Number.

Required Field.
Valid Entries: 0 - 1

Data Rules:

The combination of Control Group and Control Port values must be unique for the two Service Groups.

Control Group 0, Ports 00,01 cannot be assigned, they are reserved for the local DSU.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.12 CONTROL PORT

Description: Required Field.

Data Rules:

The Control Group Number and Control Port Number combination must be unique for the two Service Groups.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form,

Copyright © 2003 Lucent Technologies

the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.13 DATA GROUP

Description: Enter the data group number. Each ISTF unit requires a unique assignment of the combined Data Group/Port value per Switching Module.

Required Field.
Valid Entries: 0 - 1

Data Rules:

When this field is 1, CONTROL PORT cannot be 15.

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.14 DATA PORT

Description: Enter the Data Port Number.

Required Field.
Valid Entries: 0 - 15

2.15 LOOPBACKISTF SERVICES

Description: Enter the Number of ISTF Loopback Services required. It is recommended that the maximum value be entered in this field because each ISTF unit has a total of 32 channels (one is reserved for equipment testing) available for assignment at any one time for both the Loopback and Transmission services. The chances of encountering an equipment blockage are very low. Leave the field empty if no Loopback Services are to be assigned.
Valid Entries: 1 - 31

Data Rules:

For 5E9(1) and later, the sum total of Trunk Group members (TRUNK forms) with an associated TKGRP TRKCLS of "LTPISTFL" (LOOKBACK SERVICES) and "LTPISTFX" (TRANSMISSION SERVICES) cannot exceed the sum total of LOOPBACKISTF SERVICES and TRANSMISSION services indicated on the EQISTF forms.

2.16 TRANSMISSION

Description: Enter the Number of Transmission Services required. It is recommended that the maximum value be entered in this field because each ISTF unit has a total of 32 channels (one is reserved for equipment testing) available for assignment at any one time for both the Loopback and Transmission services. The chances of encountering an equipment blockage are very low. Leave the field empty if no transmission services are to be assigned.
Valid Entries: 1 - 3

Data Rules:

For 5E9(1) and later, the sum total of Trunk Group members (TRUNK forms) with an associated TKGRP

Copyright © 2003 Lucent Technologies

TRKCLS of "LTPISTFL" (LOOKBACK SERVICES) and "LTPISTFX" (TRANSMISSION SERVICES) cannot exceed the sum total of LOOPBACKISTF SERVICES and TRANSMISSION services indicated on the EQISTF forms.

SEC. 38: 5814-1/2/3 RECORD TRANSMISSION RATE CONVERTER UNIT PATH FORM - EQTRCUPTH

1. GENERAL

The TRCU (Transmission Rate Control Unit) Path view is used to define the path between the host and remote TRCU for a TRCU model 1, TRCU model 2, or TRCU model 3, in the SM, SM-2000 or SM-2005 unit types . This form is effective with the 5E12 and later Software Releases. For more information, see Division 2, Section 9N.

Data Rules:
Every EQTRCUPTH form must have a corresponding EQIM form that has an IM TYPE that is set to "ORM".

For 5E15 and later, the EQCORE form (5701 Record) must be defined before the EQTRCUPTH form can be defined.

1.1 Recent Change View

The corresponding Recent Change view for this form is 17.23.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: The SM field is used to specify a switching module to which the TRCU is connected. The SM must be an ORM, an SM-2000 or an SM-2005.
Valid Entries: 1 - 192

2.3 *EVEN LI

Description: The EVEN LI field specifies the even-numbered TRCU path connecting the host and remote TRCU units.
Valid Entries: 0 - 22

2.4 FIRST PATH

Description: The FIRST PATH field specifies the even-numbered TRCU path connecting the host and remote TRCU units. This is a no change field.

2.5 NEXT PATH

Description: The NEXT PATH field specifies the odd-numbered TRCU next path connecting the host and remote TRCU units. This is a no change field.

2.6 HOST RMK

Description: The FIRST PATH HOST RMK field can be used to specify a brief note about the first path host connection.
Valid Entries: Blank, or enter up to 49 alphanumeric characters.

Copyright © 2003 Lucent Technologies

2.7 REMOTE RMK

Description: The FIRST PATH REMOTE RMK field can be used to specify a brief note about the first path remote connection.
Valid Entries: Blank, or enter up to 49 alphanumeric characters.

2.8 HOST RMK

Description: The NEXT PATH HOST RMK field can be used to specify a brief note about the next path host connection.
Valid Entries: Blank, or enter up to 49 alphanumeric characters.

TRCU FIRST PATH

Data Rules:
HOST NUM and HOST TYPE entries and REMOTE NUM and REMOTE TYPE entries under TRCU FIRST PATH and TRCU NEXT PATH on the EQTRCUPTH form require corresponding entries on the EQCMTRCU form.

Navigational help:

- HOST NUM entered under TRCU FIRST PATH or TRCU NEXT PATH points to TRCU NUMBER on EQCMTRCU where SM on EQCMTRCU is zero (0). HOST TYPE entered under TRCU FIRST PATH or TRCU NEXT PATH must match TRCU TYPE on that same EQCMTRCU form.
- REMOTE NUM entered under TRCU FIRST PATH or TRCU NEXT PATH points to TRCU NUMBER on EQCMTRCU where SM on EQCMTRCU is the same as SM on EQTRCUPTH. REMOTE TYPE entered under TRCU FIRST PATH or TRCU NEXT PATH must match TRCU TYPE on that same EQCMTRCU form.

Every EQTRCUPTH form must have unique HOST NUM/HOST CKT entries under TRCU FIRST PATH and TRCU NEXT PATH.

Every EQTRCUPTH form must have unique REMOTE NUM/REMOTE CKT entries under TRCU FIRST PATH and TRCU NEXT PATH for each SM.

2.9 EVEN TCTS

Description: The EVEN TCTS field specifies the even TRCU3 control time slot number. This is a no change field.

2.10 HOST TYPE

Description: The HOST TYPE field specifies the type, or model of host TRCU (Transmission Rate Converter Unit) Host unit.
Valid Entries: TRCU, TRCU2 or TRCU3

Data Rules:

When any one of HOST TYPE or REMOTE TYPE under TRCU FIRST PATH or TRCU NEXT PATH is "TRCU3", all must be "TRCU3".

When HOST TYPE under TRCU FIRST PATH is "TRCU3", HOST CKT under TRCU FIRST PATH must be 0 - 2.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2", HOST CKT under TRCU FIRST PATH must be 0 or 2.

Copyright © 2003 Lucent Technologies

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2", REMOTE CKT under TRCU FIRST PATH must be 0 or 2.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2", HOST CKT under TRCU NEXT PATH must be 1 or 3.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2", REMOTE CKT under TRCU NEXT PATH must be 1 or 3.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2" and HOST CKT under, TRCU FIRST PATH is 0, HOST CKT under TRCU NEXT PATH must be 1.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2" and HOST CKT under, TRCU FIRST PATH is 2, HOST CKT under TRCU NEXT PATH must be 3.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2" and REMOTE CKT under, TRCU FIRST PATH is 0, REMOTE CKT under TRCU NEXT PATH must be 1.

When HOST TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2" and REMOTE CKT under, TRCU FIRST PATH is 2, REMOTE CKT under TRCU NEXT PATH must be 3.

When HOST TYPE is "TRCU3", TIME MULTIPLEX SWITCH CLI on the EQCORE form must not be set to 20 hex.

When HOST TYPE is "TRCU3", the CLI value on the EQTMS form must not be 20.

2.11 HOST CLI

Description: The HOST CLI field is used to specify the change level indicator associated with the host TRCU first path.
Valid Entries: Enter hexadecimal 0 to 7FFFFFFF.

See Division 8, Section 1, for CLI values.

2.12 HOST NUM

Description: The HOST NUM field is used to specify the TRCU first path host TRCU unit number.
Valid Entries: 1 - 96

Data Rules:

When HOST NUM under TRCU FIRST PATH and TRCU NEXT PATH are equal, HOST TYPE under TRCU FIRST PATH and TRCU NEXT PATH must be of the same type.

HOST NUM and HOST CKT combinations under TRCU FIRST PATH and TRCU NEXT PATH must be unique.

2.13 HOST CKT

Description: The HOST CKT field is used to specify the TRCU first path host TRCU circuit number.
Valid Entries: 0-3

2.14 REMOTE TYPE

Description: The REMOTE TYPE field specifies the type, or model of remote TRCU unit.
Valid Entries: TRCU, TRCU2 or TRCU3

Copyright © 2003 Lucent Technologies

Data Rules:

When REMOTE TYPE under TRCU FIRST PATH is "TRCU3", REMOTE NUM under TRCU FIRST PATH must be 1 or 7 - 14, or 254 for null unit.

When REMOTE TYPE under TRCU FIRST PATH is "TRCU3", REMOTE CKT under TRCU FIRST PATH must be 0 - 2.

When REMOTE TYPE under TRCU FIRST PATH is "TRCU" or "TRCU2", REMOTE NUM under TRCU FIRST PATH must be 1 - 6, or 254 for null unit.

2.15 REMOTE CLI

Description: The REMOTE CLI field is used to specify the change level indicator associated with the TRCU first path.
Valid Entries: Valid values are blank or hexadecimal 0 to 7FFFFFFF.

See Division 8, Section 1, for CLI values.

2.16 REMOTE NUM

Description: The REMOTE NUM field is used to specify the TRCU first path TRCU unit number.
Valid Entries: 1 - 14

Data Rules:

When REMOTE NUM under TRCU FIRST PATH and TRCU NEXT PATH are equal, REMOTE TYPE under TRCU FIRST PATH and TRCU NEXT PATH must be of the same type.

REMOTE NUM and REMOTE CKT combinations under TRCU FIRST PATH and TRCU NEXT PATH must be unique.

2.17 REMOTE CKT

Description: The REMOTE CKT field is used to specify the TRCU first path remote TRCU circuit number.
Valid Entries: 0 - 3

TRCU NEXT PATH

2.18 ODD TCTS

Description: The ODD TCTS field specifies the odd TRCU3 control time slot number. This is a no change field.

2.19 HOST TYPE

Description: The HOST TYPE field specifies the type, or model of host TRCU unit.
Valid Entries: TRCU, TRCU2 or TRCU3

Data Rules:

When HOST TYPE under TRCU NEXT PATH is "TRCU3", HOST CKT under TRCU NEXT PATH must be 0 - 2.

When HOST TYPE under TRCU NEXT PATH is "TRCU" or "TRCU2", HOST CKT under TRCU NEXT PATH must be 1 or 3.

2.20 HOST CLI

Copyright © 2003 Lucent Technologies

Description: The HOST CLI field is used to specify the change level indicator associated with the host TRCU next path.
Valid Entries: Valid values are blank or hexadecimal 0 to 7FFFFFFF.

See Division 8, Section 1, for CLI values.

2.21 HOST NUM

Description: The HOST NUM field is used to specify the TRCU next path host TRCU unit number.
Valid Entries: 1 - 96

2.22 HOST CKT

Description: The HOST CKT field is used to specify the TRCU next path host TRCU circuit number.
Valid Entries: 0 - 3

2.23 REMOTE TYPE

Description: The REMOTE TYPE field specifies the type, or model of remote TRCU unit.
Valid Entries: TRCU, TRCU2, or TRCU3

Data Rules:

When REMOTE TYPE under TRCU NEXT PATH is "TRCU3", REMOTE NUM under TRCU NEXT PATH must be 1 or 7 - 14, or 254 for null unit.

When REMOTE TYPE under TRCU NEXT PATH is "TRCU3", REMOTE CKT under TRCU NEXT PATH must be 0 - 2.

When REMOTE TYPE under TRCU NEXT PATH is "TRCU" or "TRCU2", REMOTE NUM under TRCU NEXT PATH must be 1 - 6, or 254 for null unit.

2.24 REMOTE CLI

Description: The REMOTE CLI field is used to specify the change level indicator associated with the TRCU next path.
Valid Entries: Valid values are blank or hexadecimal 0 to 7FFFFFFF.

See Division 8, Section 1, for CLI values.

2.25 REMOTE NUM

Description: The REMOTE NUM field is used to specify the TRCU next path TRCU unit number.
Valid Entries: 1 - 96

2.26 REMOTE CKT

Description: The REMOTE CKT field is used to specify the TRCU next path remote TRCU circuit number.
Valid Entries: 0 - 3

SEC. 42: 5840, 5840-1, 5840A RECORD
SCAN POINT NUMBER ASSIGNMENT RECORD
DUPLICATE SPN ASSIGNMENTS RECORD
CIRCUIT SPN ASSIGNMENT RECORD

1. GENERAL

1.1 Scan Point Number Assignment Record

The Scan Point Number Assignment Record (5840 Record) is generated from a combination of many ODA input forms and defines all the possible or available scan points that are defined as operational on the EQMSP or EQMMSP ODA input forms. This record also reflects the peripheral unit, trunk or line customer that any particular SPN is assigned to.

1.2 Duplicate SPN Assignments Record

The Duplicate SPN Assignments Record (5840-1 Record) defines the operational scan points that are assigned to the Multiple Carrier Group Alarm or Make Busy key customers. It is generated when specific SPN assignments are duplicated on the LINE, MLHLN or TRUNK ODA input forms.

1.3 Circuit SPN Assignment Record

The Circuit SPN Assignment Record (5840A Record) reformats and re-sorts the information that is defined on the 5840 Record. This format is used by installation for crossconnect definitions. The 5840A Record is sorted in order of circuit type and circuit reference number. Unassigned scan points are not presented.

2. ENTRIES - 5840 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 SM

Description: The Switching Module Number.
Valid Entries: 1 - 192

2.3 MSU

Description: The Regular or Modular Metallic Service Unit Number.
Valid Entries: 0 - 1

2.4 SG

Description: The Service Group Number.
Valid Entries: 0 - 1

2.5 PACK POSITION

Description: The Metallic Service Unit Pack Position Number.
Valid Entries:

- Regular MSU: 00 - 15
- Modular MSU: 00 - 31

2.6 SCAN POINT

Copyright © 2003 Lucent Technologies

Description: The Scan Point Number.

SPN (Scan Point) 31 is reserved for current sensing and is not available for assignment purposes. It will always have a circuit type of DNA (Do Not Assign).
Valid Entries: 00 - 30

2.7 CIRCUIT TYPE

Description: A unique identifier which reflects the ODA input form or customer assigned to the particular Scan Point. There are three types that allow duplicate assignments for the same Scan Point. These valid duplications are Trunk Carrier Group Alarms, Line and MLHG Carrier Group Alarms and Individual Make Busy keys of a given MLHG. These three instances require the supplementary 5840-1 Record to provide the unique form identifiers (key fields) of all the duplicates.

Valid CIRCUIT TYPE Entries

Entry	Definition
LINE CGA	A unique Carrier Group Alarm associated with an analog line defined on the LINE input form. The line must be equipped with a LEN.
MLHG CGA	A unique Carrier Group Alarm associated with a member of a Multi-Line Hunt Group on the MLHLN input form. The member must be equipped with a LEN.
TRUNK CGA	A unique Carrier Group Alarm associated with an analog trunk member on the TRUNK input form.
MULT CGA	This Carrier Group Alarm SPN is duplicated on either the TRUNK form or on the LINE/MLHLN forms. Refer to 5840-1 for complete assignments. May be duplicated up to 24 times.
MISC	Scan Point associated with a general or miscellaneous alarm. The Scan Point is assigned on the MSUSP Form (5530 Record).
PROTOCOL	Fixed Scan Point for the Protocol Circuit which is associated with Metallic Access Packs located on a Regular Metallic Service Unit. Assigned to Point 00 of the SCAN pack located in the lowest Pack Position on the MSU. The SCAN Packs are assigned on the EQMSP form.
MKBYKEY	A unique Individual Make Busy key SPN value that is assigned to either a unique LINE form or a unique MLHLN form (Member of a Multi-Line Hunt Group).
MULT	This Individual Make Busy key has been validly duplicated on a maximum of 32 members of the particular Multi-Line Hunt Group on the MLHLN form. Refer to 5840-1 for assignments.
SPHTKEY	A unique Stop Hunt key associated with a member of a Multi-Line Hunt Group assigned on the MLHLN form.
GRPBSYKEY	A unique Group Make busy Key associated with a particular Multi-Line Hunt Group assigned on the MLHG form.
R13A	13A Recorded Announcement circuit assigned on the MSUSP Form (5530 Record). One unique SPN is required for each equipped Message Module (maximum of eight Message Modules per R13A Unit).
DNA	Do Not Assign. Point 31 of each equipped Scan Pack is reserved and not available for assignment.
TBCU	A unique Scan Point associated with the Test Bus Control Unit and assigned on the EQTBCU input form, one required for each unit. This point is associated with the SLC-96 Remote Terminals.
REM ALM	Remote Alarm Scan Points defined on the EQMSU input form and associated with RSMs (Remote Switching Modules). Two entire scan boards per Service Group of one MSU (Regular or Modular) are reserved for RSM alarms. Refer to RALM input form for specific Alarm SPN assignments on the RSM/Scan Board.
FTRKEY	A unique feature key SPN value that is assigned to a unique FTRKEY Form. It can turn on or off any BRCS Call Forwarding or IDP feature.
POSMKBUSY	A unique Position Make Busy SPN value associated with a particular Multi-Line Hunt Group and position assigned on the MUPHKEY Form. It is assigned when Hunt Type equals "MUPH" on the MLHGFD Form.
BDOC PWR	Scan Point associated with Broadcast Dynamic Overload Control power. The Scan Point is assigned on the MSUSP Form.
MSU PWR	Scan Point associated with an MSU Power alarm. The Scan Point is assigned on the MSUSP Form.
NMF PWR	Scan Point associated with Network Management frame power alarm. The Scan point is assigned on the MSUSP Form.
CSD MKBYKEY	Software Release: 5E5 and earlier.

Copyright © 2003 Lucent Technologies

	A unique individual Circuit Switch Data Make Busy Key SPN that is assigned on a DSMLHLN or DSLUSR form.
CSD MBR MKB	Software Release: 5E6 and later. A unique individual Circuit Switch Data Make Busy Key SPN that is assigned on a DSLUSR form.
MULT CSD BSY KEY	Software Release: 5E5 and earlier. This individual Circuit Switch Data Make Busy Key has been validly duplicated on a maximum of 32 members of the particular Circuit Multi-Line Hunt Group on the DSMLHLN or DSLUSR form. Refer to the 5840-1 record for assignments.
MULT CSD RND MKB	Software Release: 5E6 and later. This individual Circuit Switch Data Make Busy Key has been validly duplicated on a maximum of 32 members of the particular Circuit Multi-Line Hunt Group on the DSLUSR form. Refer to the 5840-1 record forassignments.
CSD SHPTKEY	A unique Circuit Switch Data Stop Hunt Key associated with a member of a Circuit Multi-Line Hunt Group assigned on the DSMLHLN or DSLUSR form.

2.8 CIRCUIT REFERENCE NUMBER

Description: The unique identifier that corresponds to the key value of the input form that the Scan Point is assigned on.

Valid CIRCUIT REFERENCE NUMBER Entries

CIRCUIT TYPE	CIRCUIT REFERENCE NUMBER
LINE CGA	TN: 7-digit Telephone Number assigned on LINE input form that is associated with a unique Carrier Group Alarm SPN.
MLHG CGA	MLHG: Multi-Line Hunt Group Number, MEMB: Multi-Line Hunt Group Member Number which are assigned on the MLHLN input form and associated with a unique Carrier Group Alarm SPN.
TRUNK CGA	TGN: Trunk Group Number, MEMB: Trunk Group Member Number which are assigned on the TRUNK input form and associated with a unique Carrier Group Alarm SPN.
MULT CGA	Refer to 5840-1 Record for unique identifiers associated with duplicated CGA SPNS.
MISC CGA	Scan point as defined on the CGASP form: MJOP - Major Alarm point normally open MJCL - Major Alarm point normally closed MNOP - Minor Alarm point normally open MNCL - Minor Alarm point normally closed.
MISC	Scan Point as defined on the MSUSP Form: MJOP - Major Alarm Scan Point normally open. MJCL - Major Alarm Scan Point normally closed. MNOP - Minor Alarm Scan Point normally open. MNCL - Minor Alarm Scan Point normally closed.
PROTOCOL	Leave blank.
MKBYKEY	If the Make Busy key is associated with a unique SPN on the LINE input form, enter TN: 7-digit Telephone Number. If the Make Busy key is associated with a unique SPN on the MLHLN input form, enter MLHG: Multi-Line Hunt Group Number, MEMB: Multi-Line Hunt Group Member Number.
MULT BSY KEY	Refer to 5840-1 Record for unique identifiers associated with duplicated Make Busy keys in a Multi-Line Hunt Group.
SPHTKEY	MLHG: Multi-Line Hunt Group Number, MEMB: Multi-Line Hunt Group Member Number which are assigned on the MLHLN input form and associated with a unique Stop Hunt key SPN.
GRPBSYKEY	MLHG: Multi-Line Hunt Group Number assigned on the MLHG input form and associated with a unique Group Make Busy key SPN.
13RA	Refer to EQSPN input form.
R13A	Refer to MSUSP Form.
DNA	Reserved point.
TBCU	MTB: Metallic Test Bus key assigned on EQTBCU input form associated with a unique Test Bus Control SPN for SLC-96 testing.
REM ALM	SCANBD 0 if the SPN assigned to Remote Alarm Scan Board 0 on the EQMSU input form. SCAN BD 1 if the SPN is assigned to Remote Alarm Scan Board 1 on the EQMSU input form.

Copyright © 2003 Lucent Technologies

FTRKEY	Leave blank - SPN is key to the form.
POSMKBUSY	Dual keys assigned on MUPHKEY input form: MLHG - Multi-Line Hunt Group Number 1 - 2000 MLPOS - Position of the console 1-16.
BDOC PWR	Refer to MSUSP input form.
MSU PWR	Refer to MSUSP input form.
NMF PWR	Refer to MSUSP input form.
CSD MKBYKEY	If the Circuit Switch Data Make Busy Key is associated with a unique SPN that is assigned on a DSMLHLN or DSLUSR form, enter: CKT MLHG/TERM: Circuit Multi-Line Hunt Group/Member PKT MLHG/TERM: Packet Multi-Line Hunt Group/Member.
MULT CSD BSY KEY	Refer to the 5840-1 record for unique identifiers associated with duplicated Circuit Switch Data Make Busy Keys in a Circuit Multi-Line Hunt Group.
CSD SPHTKEY	CKT MLHG/TERM: Circuit Multi-Line Hunt Group/Member PKT MLHG/TERM: Packet Multi-Line Hunt Group/Member. Which are assigned on the DSMLHLN or DSLUSR form and associated with a unique Circuit Switch Data Stop Hunt Key SPN.

3. ENTRIES - 5840-1 RECORD

3.1 GENERAL

The 5840-1 Record displays duplicate scan point information assigned to CGA (Carrier Group Alarms) and MLHG (Multi-Line Hunt Group) Member Make Busy and Random Make Busy keys. SPNs with duplicate assignments are initially captured on the 5840 Record. Circuit Type Mult CGA defines TRUNK and LINE/MLHLN form duplications. Circuit Type MULT RND MKB defines MLHLN Member Make Busy key duplications.

3.2 BASE AND CONTROL ESS UNIT

Enter the Base and Control Number and the office name on each record.

3.3 SM

Description: The Switching Module Number.
Valid Entries: 1 - 192

3.4 MSU

Description: The Regular or Modular Metallic Service Unit Number.
Valid Entries: 0 - 1

3.5 SG

Description: The Service Group Number.
Valid Entries: 0 - 1

3.6 PACK POSITION

Description: The Metallic Service Unit "SCAN" Pack position as defined on the EQMSP or EQMMSP form.
Valid Entries:

- 00 - 15 for Regular MSU
- 00 - 31 for Modular MSU

3.7 SCAN POINT

Description: The Scan Point Number that has been multiply assigned.

Copyright © 2003 Lucent Technologies

Valid Entries: 00 - 30

3.8 NUMBER

Description: This field uses a fixed value of 01-32. Up to 24 trunks or lines may share the same Carrier Group Alarm SPN. Up to 32 MLHG Members in the same Multi-Line Hunt Group may share the same Member Make Busy key SPN. Up to 2015 MLHG Members may share the same Random Make Busy key SPN.

3.9 CIRCUIT TYPE

Description: A unique identifier that reflects the ODA input form the SPN is assigned to. The types are directly related to the 5840 Record based on the shared SPN value. Valid circuit type names for the duplicate SPNs associated with office record 5840:

Valid CIRCUIT TYPE Entries

5840	5840-1
MULT CGA and SPN duplication on the trunk. CGASPN	TRUNK CGA - Carrier Group Alarm SPN is duplicated on 2 - 24 trunk input form.
MULT CGA and SPN duplication on the line. CCGASPN	LINE CGA - Carrier Group Alarm SPN is duplicated on 2 - 24 LINE and/or MLHLN Input forms. This is one of the LINE duplicates.
MULT CGA and SPN duplication on the MLHLN. CGASPN	MLHG CGA - Carrier Group Alarm SPN is duplicated on 2 - 24 LINE and/or MLHLN input forms. This is one of the MLHLN duplicates.
MULT BSY KEY SPN duplication on the MLHLN MKBYKEY	MAKEBSYKEY - Individual Member Make Busy key SPN is duplicated on 2 - 32 MLHLN input forms with common MLHG value.
MULT MBR MKB duplication on the MLHLN. MKBYKEY	MBR MKB - Individual Member Make Busy key SPN is duplicated on 2 - 32 MLHLN input forms with common MLHG value.
MULT RND MKB duplication on the MLHLN form RNDMKB	RND MKB - Individual Random Make Busy key SPN is duplicated on 2 - 32 MLHLN input forms with common MLHG value.
MULT CSD MBR MKB duplication on the DSLUSR form. MKBYKEY	CSD MBR MKB Individual Member Make Busy key is duplicated up to 2015 Circuit Multi-Line Hunt Group members in the same Circuit Multi-Line Hunt group.
MULT CSD RND MKB duplication on the DSLUSR form. RNDMKB	CSD RND MKB - Individual Random Make Busy Key is duplicated up to 2015 Circuit Multi-Line Hunt Group in the same Circuit Multi-Line Hunt group.

3.10 ASSIGNED TO KEY

Description: The unique identifier or key that corresponds to the input form key that the SPN is assigned on.

Valid ASSIGNED TO KEY Entries

5840-1 CIRCUIT TYPE	ASSIGNED TO KEY
TRUNK CGA	
LINE CGA	TN: 7-digit Telephone Number assigned on the LINE input form.
MLHG CGA	MLHG: Multi-Line Hunt Group Number, MEMB: Multi-Line Hunt Group Member Number assigned on the MLHLN form.
RND MKB	Software Release 5E6 and later. MLHG: Multi-Line Hunt Group Number. MEMB: Multi_Line Hunt Group Member Number which are assigned on the MLHLN input form and associated with a unique Key SPN.
CSD RND MKB KEY	Software Release: 5E6 and later. CKT MLHG/TERM: Circuit Multi-Line Hung Group/Member. PKT MLHG/TERM: Packet Multi-Line Hunt Group/Member. Which are assigned on the DSMLHLN or DSLUSR form and associated with a unique Circuit Switch Data Random Make Busy Key SPN.
MAKE BUSY KEY	Software Release: 5E5 and earlier. MLHG: Multi-Line Hunt Group Number MEMB: Multi-Line Hunt Group Member Number assigned on the MLHLN form.
MBR MKB	Software Release: 5E6 and later. MLHG: Multi-Line Hunt Group Number MEMB: Multi-Line Hunt Group Member Number assigned on the MLHLN form. Previously called

Copyright © 2003 Lucent Technologies

	MAKE BUSY KEY.
CSD MAKE BUSY KEY	Software Release: 5E5 and earlier. CKT MLHG/TERM: Circuit Multi-Line Hunt Group/Member assigned on the DSMLHLN or DSLUSR form. PKT MLHG/TERM: Packet Multi-Line Hunt Group/Member assigned on the DSMLHLN or DSLUSR form.
CSD MBR MAKE BUSY KEY	Software Release: 5E6 and later. CKT MLHG/TERM: Circuit Multi-Line Hunt Group/Member assigned on the DSMLHLN or DSLUSR form. PKT MLHG/TERM: Packet Multi-Line Hunt Group/Member assigned on the DSMLHLN or DSLUSR form. This Key replaces "CSD MAKE BUSY KEY".

4. ENTRIES - 5840A RECORD

Office Record 5840A reformats and re-sorts the same information that is defined on the 5840 Record. This format is used by installation for crossconnect definitions. Only the assigned scan points are to be shown.

This record is sorted by Circuit Type and Circuit Reference Number combination. The Scan Point Number (SPN) is defined as (SM, MSU, SG, Pack Position, Pack Number) and may be duplicated for certain Circuit Types.

Copyright © 2003 Lucent Technologies

SEC. 43: 5841 RECORD
DISTRIBUTE POINT NUMBER ASSIGNMENT RECORD

1. GENERAL

The 5841 Record is available with 5E9 and later Software Releases.

The Distribute Point Number Assignment Record identifies all the possible or available distribute points that are defined as operational on either the EQDPN, EQMSP, EQMMSP, EQTBCU, RALM, PGTC, EQRCLK, LINE, MLHG, MLHLN, TLWS, TRUNK, PFASFG, or TKGRP ODA input forms.

1.1 Recent Change View

This form is not associated with a Recent Change View.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL GROUP, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 SM

Description: This field defines the Switching Module Number.

Required Field: Valid Entries: 1 - 192

2.3 MSU

Description: This field defines the Regular or Modular Metallic Service Unit Number.
Valid Entries: 0 - 1

2.4 SG

Description: This field defines the Service Group Number.
Valid Entries: 0 - 1

2.5 PACK POSITION

Description: This field defines the Metallic Service Unit Pack Position Number.
Valid Entries:
- 00-15 for Regular MSU
- 00-31 for Modular MSU

2.6 DISTRIBUTE POINT

Description: This field defines the Distribute Point Number.
Valid Entries: 0 - 31

2.7 CIRCUIT TYPE

Description: This field is a unique identifier that defines the type of circuit the distribute point is assigned.

Valid CIRCUIT TYPE Entries

Entry	Definition
PROTOCOL	Five fixed Distribute Points associated with one or more MACC (Metallic Access) packs on

Copyright © 2003 Lucent Technologies

	a regular MSU (Metallic Service Unit). Assigned to points 00-04 of the DIST pack located in the lowest pack position on the MSU. The DIST packs are assigned on the EQMSP form.
MSGREG	Message Register distribute points assigned on the line and MLHLN (Multi-Line Hunt Line) forms.
SLVLDCKT	Sleeve Lead Circuit distribute points assigned on the line and MLHLN (Multi-Line Hunt Line) forms.
OVFMSGREG	Overflow Message Register distribute points assigned on the MLHG (Multi-Line Hunt Group) form.
JK1CUTTHRU	DC Jack 1 Cut Thru distribute point assigned on the TLWS(Trunk Line Work Station) form.
JK1DIODE	DC Jack 1 Diode distribute point assigned on the TLWS form.
JK2CUTTHRU	DC Jack 2 Cut Thru distribute point assigned on the TLWS form.
JK2DIODE	DC Jack 2 Diode distribute point assigned on the TLWS form.
DTDA	Dial Tone Delay Alarm circuits require two distribute points for 5E1
BTBDIST1	One of two distribute points required for Office-to-Office Trunk Testing and assigned on the TRUNK form.
BTBDIST2	One of two distribute points required for Office-to-Office Trunk Testing and assigned on the TRUNK form.
OTODPN1	One of two distribute points required for Office-to-Office Trunk Testing and assigned on the TRUNK form. Valid for 5E9 and later Software Releases.
OTODPN2	One of two distribute points required for Office-to-Office Trunk Testing and assigned on the TRUNK form. Valid for 5E9 and later Software Releases.
REM	Remote Alarm for RSM require 16 fixed assigned distribute points 00-15 specified on the EQMSU form.
TBCU	A Test Bus Control Unit requires 5 distribute points.

2.8 CIRCUIT REFERENCE NUMBER

Description: This field defines the unique identifier that corresponds to a key value of the input form that the distribute point is assigned.

Valid CIRCUIT REFERENCE NUMBER Entries

CIRCUIT TYPE	CIRCUIT REFERENCE NUMBER
PROTOCOL	Leave blank.
MSGREG	If the Message Register is associated with a unique DPN on the line form enter LINE: and the 7-digit Telephone Number. If the Message Register is associated with a unique DPN on the Multi-Line Hunt member form enter MLHLN: Multi-Line Hunt Group
SLVLDCKT	If the Sleeve Lead is associated with a unique DPN on the line form enter LINE: and the 7-digit Telephone Number. If the Sleeve Lead is associated with a unique DPN on the Multi-Line Hunt member form enter MLHLN: Multi-Line Hunt Group
REM	Enter "DIST BD:" signifying one of the Remote Alarm Distribute Point assignments from the EQMSU input form.
TBCU	Enter "MTB:" the Metallic Test Bus assigned on the EQTBCU input form
TBCU	Enter "MTB:" the Metallic Test Bus assigned on the EQTBCU input form
TBCU	Defines the "MTB:" the Metallic Test Bus assigned on the EQTBCU input form
OVFMSREG	Defines the "MLHG:" and the associated Multi-Line Hunt Group Number.
JK1CUTTHRU	Defines the "TLWS:" and the associated workstation number.
JK1DIODE	Defines the "TLWS:" and the associated workstation number.
JK2CUTTHRU	Defines the "TLWS:" and the associated workstation number.
JK2DIODE	Defines the "TLWS:" and the associated workstation number.
DTDA	Defines the "EQDPN:" and the assigned circuit lead designation.
BTBDIST1	Defines the "TGN:"
BTBDIST2	Defines the "TGN:"
OTODPN1	Defines the "TGN:" the Trunk Group Number from the TRUNK form
OTODPN2	Defines the "TGN:"
TBCU	Defines the "MTB:" the Metallic Test Bus assigned on the EQTBCU input form
TBCU	Defines the "MTB:" the Metallic Test Bus assigned on the EQTBCU input form

Copyright © 2003 Lucent Technologies

SEC. 44: 5842, 5842A RECORD
METALLIC TEST BUS ASSIGNMENT RECORD
CIRCUIT MTB ASSIGNMENT RECORD

1. GENERAL

The 5842 and 5842A Records are output only records available with 5E2 and later Software Releases.

The Metallic Test Bus Assignment Record (5842 Record) identifies all Metallic Test Bus points that are defined as operational on either the EQMSP or EQMMSP forms. Each MACC (metallic access) pack defines 16 possible metallic access points which are printed on one page of the 5842 Record.

Each of the 16 metallic access points made operational by a MACC pack may be assigned to one of many peripheral type units. The 5842 Record shows the peripheral unit, trunk, or line associated with each MTB (Metallic Test Bus) assignment.

The Circuit MTB Assignment 5842A Record reformats and re-sorts the information defined on the 5842 Record. The 5842A is sorted in order of circuit type and circuit reference number.

2. ENTRIES - 5842 RECORD

2.1 BASE AND CONTROL, ESS UNIT

The Base and Control Number and the office name.

2.2 SM

Description: The Switching Module number.
Valid Entries: 1 - 127.

2.3 MSU

Description: The Regular or Modular Metallic Service Unit number.
Valid Entries: 0 - 1

2.4 SG

Description: The Service Group number.
Valid Entries: 0 - 1

2.5 PACK POSITION

Description: The Metallic Service Unit Pack Position number.

Valid entries are:
- For Regular MSU: 00-15
- For Modular MSU: 00-31

2.6 BUS POINT

Description: The MTB (Metallic Test Bus) point number.
Valid Entries: 00 - 16

2.7 CIRCUIT TYPE

Description: A unique identifier that defines the type of circuit the MTB point is assigned.

Copyright © 2003 Lucent Technologies

Valid CIRCUIT TYPE Entries

Entry	Definition
DMTB PROTOCOL	Dedicated Metallic Test Bus Protocol. The reserve DMTB Protocol circuit assignment is point 15 on every MACC (Metallic Access) pack in a Regular or Modular MSU.
DCJK1	Direct Current Jack 1 MTB assignment is specified on the TLWS (Trunk Line Work Station) form.
DCJK2	Direct Current Jack 2 MTB assignment is specified on the TLWS (Trunk Line Work Station) form.
ISMAN	Software Release: 5E3 and later. Two MAN (Metallic Access Network) MTB point assignments are specified on the Integrated Services Analog Pack Equipage form, EQISAP (5824 Record).
LTDTST	Four Local Test Desk Test Trunk MTB point assignments are specified on the Trunk Unit Equipment form, EQTUP.
LU	Two Line Unit MTB point assignments are specified on the Line Unit Equipage form, EQLU.
NTTU	Two No Test Trunk Unit MTB point assignments are specified on the Trunk form, TRUNK.
PGTC	Two MTB point assignments are specified on the Pair Gain Test Controller Form, PGTC (5503 Record).
PMU	Four MTB point assignments are required for PMU (Precision Measurement Unit) and are specified on the Precision Measurement Unit form, EQPMU.
TBCU	The MTB point assignment on the Test Bus Control Unit form, EQTBCU, corresponds to a SLC-96 Remote Terminal specified on the SLC-96 Remote Terminal form, SLCRT.
TU	One Trunk Unit MTB point assignment is specified on the Trunk Unit Equipage form, EQTU.

2.8 CIRCUIT REFERENCE NUMBER

Description: The unique identifier that corresponds to a key value on the input form that the Metallic Test Bus point is assigned. Valid entries for the CIRCUIT REFERENCE NUMBER are dependent on the circuit type as shown in the following table.

Valid CIRCUIT REFERENCE NUMBER Entries

CIRCUIT TYPE	CIRCUIT REFERENCE NUMBER
DMTB PROTOCOL	Blank.
DCJK1	"TLWS:" work station number, "DEVID:" device identifier from the TLWS form.
DCJK2	"TLWS:" work station number, "DEVID:" device identifier from the TLWS form.
ISMAN	Software Release: 5E3 and later. "IM:" the Switching Module, "TYPE:" the Switching Module type, "ISLU:" the Integrated Services Line Unit number, "PKTYPE:" the Integrated Services analog circuit pack type, "PACK:" the Integrated Services analog circuit pack position number assigned on the EQISAP form.
LTDTST	"SM:" the Switching Module, "TU:" the trunk unit, "SG:" the service group, "PACK" the pack position number for test 0 MTB 0, or test 0 MTB 1, or test 1 MTB 0 and test 1 MTB 1 assigned on the EQTUP form.
LU	"SM:" the Switching Module, "LU:" the Line Unit, "SG:" the service group number from the LINE form.
NTTU	"TGN:" trunk group number. "MEMB:" trunk group member number. "DEN:" digital equipment number. "NEN:" network equipment number.
PGTC	"PGTC:" the Pair Gain Test Controller frame number, or "PGTCTRK:" the Pair Gain Test Controller trunk number assigned on the PGTC form.
PMU	"SM:" the Switching Module, "PMU:" the precision measurement unit, "MTB: 0" or "MTB: 1" or "MTB: 2" or "MTB: 3" for the MTB assignment on the EQPMU form.
TBCU	"SM:" the Switching Module,

Copyright © 2003 Lucent Technologies

	"DCLU:" the digital carrier line unit, "RT:" the remote terminal assigned on the SLCRT form.
TU	"SM:" the Switching Module, "TU:" the trunk unit, "SG:" the service group number from the EQTU form.

3. ENTRIES - 5842A RECORD

The CIRCUIT MTB ASSIGNMENT RECORD (5842A Record) reformats and re-sorts the same information that is defined on the 5842 Record. This format is used by installation for crossconnect definitions.

This record is sorted by CIRCUIT TYPE and CIRCUIT REFERENCE NUMBER combination. The MTB (Metallic Test Bus) Point Number is defined as SM, MSU, SG, pack position, and point number for all circuit types.

Copyright © 2003 Lucent Technologies

SEC. 45: 5843 RECORD
CONTROL, DATA AND FACILITY PORT ASSIGNMENT RECORD

1. GENERAL

The 5843 Record is an output-only record which displays the Control Port Assignments, Data Port Assignments, and Facility Port Assignments. Control Port and Data Port Assignments are defined for all Software Releases. These port assignments should be identified for each SM (Switching Module).

CONTROL PORT ASSIGNMENTS

1.1 BASE AND CONTROL, ESS UNIT

Description: Displays the Base and Control Number and the Office Name.

1.2 SM

Description: This is the Switching Module number from the EQIM form.

Valid Values: 1 - 192

1.3 CG0 and CG1

Description: These two columns display the port numbers of Control Group 0 and Control Group 1 (if equipped).

Valid Values: 0 - 22

1.4 UNIT TYPE

Description: These columns display the type of unit assigned to the port. The valid Unit Types are as follows:

Valid UNIT TYP Entries

Entry	Definition
DCLU	Digital Carrier Line Unit.
DCTU	Directly Connected Test Unit.
DLTU	Digital Line/Trunk Unit.
DSU	Digital Service Unit.
FIU	Facility Interface Unit.
IDCU	Software Release: 5E8 and later. Integrated Digital Carrier Unit.
ISLU	Integrated Services Line Unit.
ISTF	Integrated Services Test Function.
LU	Line Unit.
MSU	Metallic Service Unit.
PSU	Packet Switching Unit.1
RAF	Recorded Announcement Function Unit.
RCLK	Remote Clock Unit.
TU	Trunk Unit.

1.5 UNIT NUMBER

Description: These columns display the unit number of the named unit. Refer to the specific unit form for the valid unit numbers.

1.6 DFI OR SG

Description: These columns display the Digital Facility Interface pack number if the unit is a Digital Lines Trunk Unit, or the Service Group of the unit. Refer to the specific unit form for the valid Service Group

Copyright © 2003 Lucent Technologies

Numbers.

DATA PORT ASSIGNMENTS

The second set of columns displays the Data Port Assignments.

1.7 DG0 AND DG1

Description: These columns display the port numbers of Data Group 0 and Data Group 1.

Valid Values: 0 - 15

1.8 UNIT TYPE

Description: These columns display the type of unit assigned to this Data Port. Because DCTU, FIU, MSU and RCLK do not receive Data Ports, these are not included in the following valid Unit Types.

Valid UNIT TYP Entries

Entry	Definition
DCLU	Digital Carrier Line Unit.
DLTU	Digital Line/Trunk Unit.
DSU	Digital Service Unit.
IDCU	Software Release: 5E8 and later. Integrated Digital Carrier Unit.
ISLU	Integrated Services Line Unit.
ISTF	Integrated Services Test Function.
LU	Line Unit.
PSU	Packet Switching Unit.1
RAF	Recorded Announcement Function Unit.
TU	Trunk Unit.

1.9 UNIT NUMBER

Description: These columns display the Unit Number of the named unit. Refer to the specific unit form for the valid Unit Numbers.

1.10 DFI OR SG

Description: These columns display the Digital Facility Interface pack number if the unit is Digital Line/Trunk Unit, or the Service Group of the unit.

Refer to the specific unit form for the valid Service Group Numbers.

1.11 STUFFPAT

Description: If the unit is a Digital Line/Trunk Unit, the Stuffing Pattern will be displayed.

Valid Values: A, B, C or D.

FACILITY PORT ASSIGNMENTS

The third set of columns displays the Facility Interface Port Assignments. This information is required only if the SM is a Remote Switching Module.

1.12 FIU SGA AND FIU SGB

Description: These columns display the port number of Facility Interface Unit Subgroup A and Subgroup B.

Valid Values: 0 - 9

Copyright © 2003 Lucent Technologies

1.13 UNIT TYPE

Description: DLTU is the only valid unit type.

1.14 UNIT NUMBER

Description: These columns display the unit number of the Digital Line/Trunk Unit.

Valid Values: 0 and 1

1.15 DFI

Description: These columns display the Digital Facility Interface pack number assigned to the port.

Valid Values: 1 - 10

Copyright © 2003 Lucent Technologies

SEC. 46: 5844 RECORD
ISCN ASSIGNMENT RECORD

1. GENERAL

The 5844 Record, available with 5E4(2) and later Software Releases, is used as an inventory of assigned ISCNs (Integrated Services Channel Numbers). This record is not used for ODA input.

ISCNs are placed on this record when the Switching Module value assigned on an EQPSUPH form (5742 Record) matches the first three digits of an LCEN assigned on a form where an ISCN is assigned and when the PSU SHELF value assigned on the EQPSUPH form matches the first digit of the assigned ISCN. This 5844 Record displays the ISCN, the associated form, and key field.

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Description: The Base and Control Number and Office Name on each record.

2.2 SM

Description: The Switching Module number.

Valid Values: 1 - 192

2.3 PSU SHELF

Description: The Packet Switching Unit Shelf number.

valid values: 0 - 15

2.4 ISCN

Description: The Integrated Services Channel Number. The ISCN represents the PSU shelf, channel group, and channel located in the PSU. ISCNs are defined as follows:

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		Format	Valid Entries
PSU Shelf	-	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127

2.5 FORM

Description: This column contains the form names on which the ISCNs have been assigned. For 5E5 and later, the following forms are used to assign ISCNs:

- AMLBDSL (5447 Record)
- DSL (5907 Record)
- DSLAP (5963 Record)
- DSLUSR (5908 Record)
- ODBRES (5906 Record)
- OSPSDSL (5411 Record)

Copyright © 2003 Lucent Technologies

- PSISM (5920 Record)
- RTERM (5174 Record)
- TRUNK (5204 Record)
- XAT (5909 Record)

2.6 LCEN

Description: The Line Card Equipment Number is an 8-digit equipment number. It is the key field from the AMLBDSL and OSPSDSL forms. See format below.

2.7 DSLOETYPE/DSLOE

Description: This is the DSL Office Equipment Type and Office Equipment Number from the DSL and DSLUSR forms. The DSL OE TYPEs are provided in the table below.

DSL OE TYPE/DSLOE

Value	Definition
I	The DSL OE TYPE is associated with an 8-digit LCEN for a (R)ISLU (Remote)Integrated Services Line Unit.
G	Software Release: 5E8 and later. The DSL OE is associated with a 10-digit ILEN for a remote terminal or PUB43801. This designation accommodates up to 2048 lines.
M	Software Release: 5E8 and later. The DSL OE is associated with an 8-digit ILEN for a remote terminal or PUB43801. This designation accommodates 99 lines or less.

If an "I" is entered, the OE number consist of:

LINE CARD EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
(Remote) Integrated Services Line Unit	(R)ISLU	X	0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

If a "G" is entered, the OE number consist of:

IDCU REMOTE TERMINAL NUMBER, TYPE G

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	X	0-7
Remote Terminal	RT	XX	01-31
Line	LINE	XXXX	0001-2048

If an "M" is entered, the OE number consist of:

IDCU REMOTE TERMINAL NUMBER, TYPE M

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	X	0-7
Remote Terminal	RT	XX	01-31
Line	LINE	XX	01-99

2.8 AP SITE ID

Description: This is the Application Processor Site ID value from the DSLAP form.

Valid Values: 1 - 255

2.9 CKT TN

Copyright © 2003 Lucent Technologies

Description: This is the CKT TN value from the DSLUSR form.

Valid Values: 7 digits

2.10 CKT MLHG

Description: This is the CKT MLHG value from the DSLUSR form.

Valid Values: 1 - 2000

2.11 CKT TERM

Description: This is the CKT TERM value from the DSLUSR form.

Valid Values: 1 - 2015 or 3001 - 3999

2.12 DPKT TN

Description: This is D-channel Packet TN value from the DSLUSR.

Valid Values: 7 digits

2.13 DPKT MLHG

Description: This is the D-channel Packet MLHG value from the DSLUSR form.

Valid Values: 1 - 2000

2.14 DPKT TERM

Description: This is the D-channel Packet TERM value from the DSLUSR form.

Valid Values: 1 - 2015

2.15 ODB TN

Description: This is the On Demand B-channel TN value from the DSLUSR form.

Valid Values: 7 digits

2.16 ODB MLHG

Description: This is the On Demand B-channel MLHG value from the DSLUSR form.

Valid Values: 1 - 2000

2.17 ODB TERM

Description: The On Demand B-channel TERM value from the DSLUSR form.

Valid Values: 1 - 2015

2.18 SHELF

Description: This is the PSU SHELF value assigned on the ODBRES form. This value should match the PSU SHELF value defined on the EQPSUPH form.

Valid Values: 0 - 4

Copyright © 2003 Lucent Technologies

2.19 CHL GRP

Description: This is the Channel Group value from the ODBRES form.

Valid Values: 00 - 15

2.20 DLT

Description: This is the Data Link Terminal value from the PSISM form.

Valid Values: 1 - 160

2.21 UNIT TYPE

Description: This field identifies the unit as an IDCU RT (Remote Terminal) from the RTERM form.

Software Release: 5E8 and later
Valid Entries: Valid Values: IDCU

2.22 UNIT NUMBER

Description: This is the IDCU RT number from the RTERM form.

Software Release: 5E8 and later
Valid Entries: Valid Values: 0 - 7

2.23 RT EX

Description: This is the RT External number.

Valid Values: 1 - 31

2.24 TGN

Description: This is the TGN value from the TRUNK form.

Valid Values: 1 - 2000

2.25 MEMB

Description: This is the MEMB value from the TRUNK form.

Valid Values: 0 - 1951

2.26 PKT TN

Description: This is the Packet TN value from the DSLUSR form.

Valid Values: 7 digits

2.27 PKT MLHG

Description: This is the Packet MLHG value from the DSLUSR or XAT form.

Valid Values: 1 - 2000

2.28 PKT TERM

Copyright © 2003 Lucent Technologies

Description: This is the Packet TERM value from the DSLUSR or XAT form.

Valid Values: 1 - 2015

Copyright © 2003 Lucent Technologies

SEC. 47: 5845 RECORD
RETROFIT INFORMATION FORM - RETINFO

1. GENERAL

The 5845 Record is available with 5E3 and later Software Releases. This form provides an ordering mechanism for Disk Configurations and Optional Disk Layouts in a retrofitting office. A retrofitting office cannot use this form to change a disk drive from simplex software backup to duplex active. This can be done using standard growth procedures between the preliminary and final ECD (Equipment Configuration Data) dumps. AMA and SM ODD capacities for each Disk Configuration and for each Optional Disk Layout are provided to the switch owner in the 5ESS Switch Administration Guidelines, 5D5-070-100, along with appropriate engineering rules. These guidelines are applicable to both installing and retrofitting offices.

An additional feature of the RETINFO form is to display the SM ODD, AMA and DISK ODD capacity that an office has requested on the form. Once the switch owner has completed the DISK TYPE and ("REQUIRED" OR "OPTIONAL") OPTIONING fields for MHD0,1 through MHD12,13, the total megabyte capacity is displayed in the SM ODD and AMA fields. This allows the switch owner to verify that the capacity they desire has in fact been ordered. The current PHYSICAL AM MEMORY SIZE, the DISK SIZE, and the EQUIPAGE fields for MHD0,1 through MHD12,13 are populated on the form from the retrofitting offices ECD dump. This information cannot change during a retrofit so these fields are no-change fields.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * KEY

Description: Enter the key value for this form. The only valid entry is 0 and is supplied as the default value.
Default: 0

2.3 OLD PHYSICAL AM MEMORY SIZE

Description: This field is automatically populated from the retrofitting office's ECD dump. This field is the size of old memory (in megabytes) of the 3B Processor. This is a no change field.

Software Release: 5E9(1) and later
Valid Entries: 48, 64, or 128

Data Rules:

For 5E11 thru 5E14, this field must be 48 for a "VCDX" HARDWARE PLATFORM.

For 5E15 and later, OLD PHYSICAL AM MEMORY SIZE must be 96 for "VCDX" HARDWARE PLATFORM.

2.4 HARDWARD PLATFORM

Description: This field is automaticaly populated from the retrofitting office's ECD dump. This is a no change field.

Software Release: 5E10 and later

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E15 and later, OLD PHYSICAL AM MEMORY SIZE must be 96 for VCDX

2.5 DISK CONFIGURATION

Description: This field replaces the DISK SIZE and DISK TYPE fields for 5E8 and later. It is populated automatically and cannot be changed. It applies only to the MHD0,1 - MHD30,31, excluding MHD14 and MHD15. For valid DISK CONFIGURATION information, refer to the DISK CONFIG field in Division 8, Section 8.

Software Release: 5E8 and later
Valid Entries:
- 5E10 and later: 66 or 11

TOTAL SIZE IN MEGABYTES

The following fields (Section 2.6 - Section 2.8) will automatically display the total SM ODD and the AMA capacity (in megabytes) the switch owner has requested by completing all other fields on this form. The DISK ODD (KB) field displays the total DISK ODD for the DISK CONFIGURATION (in kilobytes). Once all other fields on this form are completed and the switch owner activates the validate key, information for these three fields is displayed. Refer to the PCT SMODD/AMA field in Division 8, Section 9 for equippage information.

2.6 SM ODD

Description: The total SM ODD capacity is based on the Disk Configuration, the total number of disks equipped and optional layouts. This information is automatically displayed. This is a no change field.

Software Release: 5E6 and later

2.7 AMA

Description: The total AMA capacity is based on the Disk Configuration, the total number of disks equipped and optional layouts. This information will be automatically displayed. This is a no change field.

Software Release: 5E6 and later

2.8 DISK ODD (KB)

Description: Total Disk ODD per Disk Configuration in kilobytes. This is a no change field.

Software Release: 5E6 and later

MOVING HEAD DISKS

Moving Head Disks fields (Section 2.9 - Section 2.14) are automatically displayed. MHDs are displayed and equipped in pairs. The EQUIPAGE field is used to indicate whether or not a pair is equipped. MHD0,1 and MHD2,3 must always be equipped.

The NEW OPTIONING and OLD OPTIONING fields are used to indicate whether the MHD is required by the office to meet necessary memory requirements or if it is an optional disk pair to provide extra memory and/or extra AMA space. Note that the optioning fields only apply to MHD0,1 - MHD12,13.

For 5E8 and later, note that the NEW OPTIONING field name, applicable to MHD0,1 - MHD12,13, was changed to NEW PERCENT SMODD/AMA.

Copyright © 2003 Lucent Technologies

2.9 MHD0,1 EQUIPAGE

Description: Is MHD0,1 equipped? This field will be automatically populated from the retrofitting office's ECD dump. This field indicates if Moving Head Disk 0 and 1 is equipped. This is a no change field.

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

This field must always be set to "Y".

2.10 MHD2,3 EQUIPAGE

Description: Is MHD2,3 equipped? This field will be automatically populated from the retrofitting office's ECD dump. This field indicates if Moving Head Disk 2 and 3 is equipped, "Y" (Yes) or "N" (No). This field must always be set to "Y". This is a no change field.

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

This field must always be set to "Y".

2.11 MHD4,5 - MHD30,31 EQUIPAGE

Description: This field will be automatically populated from the retrofitting office's ECD dump. They indicate which Moving Head Disk pairs are equipped. Refer to Division 8, Section 8 for equippage information.

2.12 DISK SIZE

Description: This field is automatically populated from the retrofitting office's ECD dump. A 3 represents 340 or SCSI322. A 6 represents SCSI600. This is a no change field.

Software Release: 5E8 and later

2.13 MHD4,5 - MHD12,13 NEW PERCENT SMODD/AMA

Description : MHD4,5 - MHD12,13 new disk usage optioning. This is a no change field.

Valid NEW PERCENT SMODD/AMA Entries
5E8 - 5E9(2)

Entry	Definition
R	Required
1	0% SMODD
2	25% SMODD
3	50% SMODD
4	75% SMODD
5	100% SMODD

Valid NEW PERCENT SMODD/AMA Entries
5E10 and later

Entry	Definition
R	Required
1	0% SMODD
2	25% SMODD
3	50% SMODD

For 5E10 and later, if DISK CONF is 11, enter 1 - 3. If DISK CONF is 63 or 66, enter 1 - 5.

Copyright © 2003 Lucent Technologies

2.14 MHD4,5 - MHD12,13 OLD OPTIONING

Description: MHD4,5 - MHD12,13 old disk usage optioning. This is a no change field.

Software Release: 5E8 and later

Copyright © 2003 Lucent Technologies

SEC. 48: 5846 RECORD
INTEGRATED DIGITAL CARRIER UNIT
EQIDCU FORM

1. GENERAL

The 5846 Record is available with the 5E8 Software Release. It is used to define the IDCU (Integrated Digital Carrier Unit) and the LSI (Loop Side Interface) packs, ELI (Electric Line Interface) packs, and the PIDBs (Peripheral Interface Data Buses) associated with the IDCU.

NOTE: In the absence of an IDCU feature section in Division 2, the following discussion (including EQIFAC and RTERM Requirements, and IDCU Originating Equipment) is provided for general information.

IDCU equipment can be attached to standard or loaded SMs (Switching Modules). However, when providing analog (as with DCLU), it may be mounted in an SM with a standard configuration, but when this unit functions with ISDN, it must be mounted in an SM with a loaded configuration.

Using IFACs (IDCU Facilities), IDCU equipment provides for both analog and ISDN ports which can be attached to either PUBs (Peripheral Unit Buses) or to RTs (Remote Terminals). IDCU equipment can be provisioned to accommodate up to 40 IFAC connections. Provisioning of PUBs requires only the EQIFAC form (5847 Record). There are no restrictions to the number of PUB IFAC connections.

Provisioning of RTs also requires that the RTERM form (5174 Record) be defined. The RTERM form identifies the IFAC connections defined on the EQIFAC form. After an RT is defined on the RTERM form, an IDCU port can be defined as indicated below:

IDCU Port/Equipment Assignments

ODA Form	RT/IFAC Type	OE Format
LINE (5109)	TR008 TR303	RT
LINE (5109)	DS1	PUB43801
MLHLN (5111)	TR008 TR303	RT
TRUNK (5204)	TR008 TR303	RT
DSL (5902)	TR303	RT
DSLUSR (5908)	TR303	RT

Port assignments cannot be assigned to IDCU equipment unless the related PUB43801 IFAC or RTERM IFACs are defined and are "operational". Port assignments cannot be duplicated on the same SM.

1.1 EQIFAC Requirements

Each EQIFAC form can define up to 20 IFAC connections. Two EQIFAC forms may be used with each EQIDCU form to define up to 40 IFACs per IDCU. IFACs defined on the EQIFAC form with PUB43801 set to "N" are connected to remote terminals. A TR008 remote terminal can have up to 5 IFACs connected to it. A TR303 remote terminal can have from 2 to 28 IFACs connected to it.

An IFAC defined on the EQIFAC form with PUB43801 set to "Y" will be connected to DAC equipment. PUB43801 ports can be defined on the LINE form directly from operational IFACs of the EQIFAC form.

1.2 RTERM Requirements

Two types of remote terminals can be defined on the RTERM form: TR008 and TR303. The TR008 remote terminal can have from 1 to 5 IFACs defined on the EQIFAC form connected to it. Up to 96 analog lines can be assigned on a TR008 when OE SIZE on the OFCOPT form (5509 Record) is set to accommodate an 8-digit Office Equipment number. A TR303 remote terminal can have from 2 to 28 IFACs defined on the EQIFAC form connected to it. Up to 2048 analog and ISDN lines can be assigned to a TR303 when OE

Copyright © 2003 Lucent Technologies

SIZE on the OFCOPT form is set to accommodate a 10-digit Office Equipment number.

1.3 IDCU Originating Equipment

For operational TNs to be assigned via IDCU remote terminal ports, the EQIDCU must be operational, the EQIFAC must have operational IFACs assigned, and an RTERM form must be operational and connected to the IDCU equipment with the operational IFACs defined on the EQIFAC form.

If an IDCU remote terminal or PUB is to be provisioned, the same OE TYPE of either "G" (10-digit) or "M" (8-digit) must be specified for all associated assignment forms. The OE TYPE is dictated by the OE SIZE on the OFCOPT form (5509 Record).

IDCU ports can be assigned the functionality of all analog and ISDN ports. However, IDCU does not support OSPS.

1.4 PIDB Assignments

PIDB (Peripheral Interface Data Bus) assignments are equipped in pairs of the same PIDB TYPE and relative PIDB NO. on the two sides of both Service Groups. The entries on this form are only for SG0 (Service Group 0), since the assignments for SG1 (Service Group 1) can be inferred from the assignments for SG0.

Two types of PIDBs can be defined for IDCU on the EQIDCU form - DUAL or PSU. D-Channel traffic requires at least one PIDB TYPE of "PSU". For TR303 RTs, EOCs/TMCs also require at least one PIDB TYPE of "PSU".

PIDBs of PIDB TYPE "DUAL" connect to the TSIU (Time Slot Interchange Unit) and the assignments to the same PIDB NO. on the two sides must be made to the same DI SHLF with SG0 assigned to an even numbered PIDB and SG1 assigned to the next higher odd numbered PIDB. The PIDB TYPE of "DUAL" is the only type allowed in PIDB NO. positions of 1 - 11. PIDB NO. 0 is always required and must have a PIDB TYPE of "DUAL".

PIDBs of PIDB TYPE "PSU" connect to the PSU with the same relative PIDB NO. assigned to the same PSU SHLF and DFPOS. The PIDB TYPE of "PSU" is the only type allowed in PIDB No. positions of 16 - 22. PIDBs of type "PSU" must have the PSU SHELF and DFPOS defined on the EQPSU (5741 Record) and EQPSUPH (5742 Record) forms.

PIDB NO. 12 - 15 positions can be shared by both "DUAL" and "PSU". If the PIDB TYPE is "PSU", there are special restrictions due to space availability on the backplane. If positions 12 - 15 are "PSU", then a specific PIDB NO. must not be entered. The table below provides allowable configurations.

Valid LSI0 EQSTAT Entries

PIDB NO.	PIDB TYPE	PIDB NO.	PIDB TYPE
8	Dual	12	Dual or Unassigned
9	Dual	13	Dual or Unassigned
10	Dual	14	Dual or Unassigned
11	Dual	15	Dual or Unassigned
15	PSU	11	Unassigned
16	PSU	10	Unassigned
17	PSU	9	Unassigned
18	PSU	8	Unassigned

1.5 Recent Change View

The corresponding Recent Change View for this form is 19.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switch Module identification number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For each SM assignment, there must be a corresponding EQIM form (5700 Record).

For 5E9(2) and later, each value of SM entered on the EQIDCU and EQIFAC forms must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports Integrated Digital Carrier Units.

2.3 * IDCU

Description: Enter the Integrated Digital Carrier Unit identification number.

Required Field.
Valid Entries:
- 5E9(2) and earlier: 0 - 7
- 5E10 and later: 0 - 42 (SM-2000 only)

Data Rules:

Equipment unit number assignments cannot be duplicated among the EQIDCU (5846 Record), EQDCLU (5810 Record), EQISLU (5731 Record), EQLU (5710 Record), and EQRISLU (5732 Record) forms for a specified SM.

2.4 IDCU EQSTAT

Description: Enter the status of the IDCU equipment.

Required Field.
Default: O
Valid Entries:

Valid IDCU EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.5 #IDCU CLI

Description: Enter the Change Level Indicator for this IDCU.

Required Field.
Valid Entries: 0 - 7FFFFFFF

2.6 # EQL BAY

Description: Enter the equipment location bay number.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid EQL BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQL BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

2.7 # EQL UNVER

Description: Enter the equipment location unit vertical position.

Required Field.
Valid Entries: 0 - 84

2.8 # EQL AISLE

Description: Enter both the equipment floor and aisle number.

Required Field.
Valid Entries: 0000-9999

2.9 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQL BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.10 #MAP X

Copyright © 2003 Lucent Technologies

Description: This field is a Recent Change only field on View 19.12. It cannot be entered in ODA.

This field is used to hold data that will be given to the Lucent Secured Feature Administrator when obtaining a Passsword for PIDB growth. This field supports the PIDB Growth Control feature. For more information on this feature, see Division 2, Section 7E.

Software Release: 5E9(1) and later.

2.11 PIDB LIMIT

Description: Indicates the maximum number of operational Peripheral Interface Data Buses allowed on the IDCU. This field supports the PIDB Growth Control feature. For more information on this feature, see Division 2, Section 7E.

Software Release: 5E9(1) and later.
Required Field.
Valid Entries: 4, 8, 12, or 16

Data Rules:

More DI/PIDB assignments can not be made than are allowed by the value of PIDB LIMIT.

For 5E10 and later, if PIDB TYPE is "PSU", neither the PSU SHELF SIDE O CLI or the PSU SHELF SIDE 1 CLI values may be 3 ("PSU" PIDB TYPEs cannot be associated with data fanout multiple PIDB PSU shelves).

2.12 PASSWORD

Description: This field is a Recent Change only field on View 19.12. It cannot be entered in ODA.

IDCU PIDB limit control password. This field is used to specify the password required to make more PIDBs operational than allowed by the current limit. The password can be obtained from the Lucent Secured Feature Administrator in order to allow PIDB growth beyond the PIDB limit. This field supports the PIDB Growth Control feature. For more information on this feature, see Division 2, Section 7E.

Software Release: 5E9(1) and later.

SERVICE GROUP 0

The following fields (Section 2.13 - Section 2.18) define IDCU parameters specific to SG0.

2.13 # CTRL GROUP

Description: Enter the Control Group interface number.

Required Field.
Valid Entries:
- For 5E9(2) and earlier: 0 or 1
- For 5E10 and later: 0 - 1 for SM or
- 0 - 3 for SM-2000.

Data Rules:

If CTRL GROUP is 1, the EQSTAT assigned on this form must be less than or equal to the CONTROL GROUP 1 STATUS assigned on the corresponding EQIM form.

CONTROL GROUP numbers assigned on the following forms must be defined as CI on an EQCI

Copyright © 2003 Lucent Technologies

form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O"' is greater than "G" which is greater than "U").

2.14 # CTRL PORT

Description: Enter the Control Port identification.

The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form.

Required Field.
Valid Entries: even number 0 - 20

Data Rules:

Control Port assignments cannot be duplicated on a SM.

Control Port assignments cannot be duplicated on the following forms: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQRISLU (5732 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record).

For 5E12 and later, for the EQAIU, EQIDCU, EQISLU, EQRISLU and EQPSU forms, two control ports are assigned based on the Control Port entered on the form. The first is the Control Port entered on the form, the second Control Port is one plus the Control Port entered on the form. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors. Non-SM-2000 class processors reserve Control Group/Control Port 0/0 and 0/1 for the Local Digital Service unit. No other unit may specify Control Group/Control Port 0/0 or 0/1 for non-SM-2000 class processors.

2.15 LSI0 EQSTAT

Description: Enter the equipment status of the SG0 LSI0 (Loop Side Interface 0) pack.

Valid LSI0 EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

SG0 LSI0 EQSTAT must be lower than or equal to ELI0 EQSTAT.

2.16 LSI1 EQSTAT

Description: Enter the equipment status of the SG0 LSI1 (Loop Side Interface 1) pack.

Valid LSI1 EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.17 LSI0 CLI

Copyright © 2003 Lucent Technologies

Description: Enter the LSI0 CLI value.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

The correct CLI value is 00000000.

2.18 LSI1 CLI

Description: Enter the LSI1 CLI value.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

The correct CLI value is 00000000.

ELECTRIC LINE INTERFACE 0

The following fields (Section 2.19 - Section 2.21) define the ELI 0 packs.

2.19 EQSTAT

Description: Enter the status of the ELI0 equipment.

Valid ELI0 EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

ELI0 EQSTAT must be lower than or equal to IDCU EQSTAT.

2.20 CBL SERIES

Description: Enter the cable series used for this ELI0.
Valid Entries: 609S or 1249S

2.21 CBL DISTANCE

Description: Enter the distance (in feet) to the DSX panel for this ELI0.
Valid Entries:
- 0 - 655, for 609S Cable
- 0 - 450, for 1249S Cable

SERVICE GROUP 1

The following fields (Section 2.22 - Section 2.27) define IDCU parameters specific to Service Group 1.

2.22 CTRL GROUP

Description: This field is automatically entered with an identical value as CTRL GROUP for Service Group 0.

Copyright © 2003 Lucent Technologies

2.23 CTRL PORT

Description: This field is automatically entered with a value one greater than CTRL GROUP for Service Group 0.

2.24 LSI0 EQSTAT

Description: Enter the equipment status of the SG1 LSI0 (Loop Side Interface 0) pack.

Valid LSI1 EQSTAT

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

SG0 LSI1 EQSTAT must be lower than or equal to ELI0 EQSTAT.

2.25 LSI1 EQSTAT

Description: Enter the equipment status of the SG1 LSI1 (Loop Side Interface 1) pack.

Valid LSI1 EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.26 LSI0 CLI

Description: Enter the SG1 LSI0 CLI value.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

The correct CLI value is 00000000.

2.27 LSI1 CLI

Description: Enter the SG1 LSI1 CLI value.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

The correct CLI value is 00000000.

ELECTRIC LINE INTERFACE 1

The following fields (Section 2.28 - Section 2.30) define the ELI1 packs.

2.28 EQSTAT

Description: Enter the status of the ELI 1 equipment.

Valid EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Copyright © 2003 Lucent Technologies

Data Rules:

ELI1 EQSTAT must be lower than or equal to IDCU EQSTAT.

2.29 CBL SERIES

Description: Enter the cable series used for this ELI1.
Valid Entries: 609S or 1249S

2.30 CBL DISTANCE

Description: Enter the distance (in feet) to the DSX panel for this ELI1.
Valid Entries:

- 0 - 655, for 609S cable
- 0 - 450, for 1249S cable

Data Rules:

For PIDB N0s 9 - 14, CBL SERIES and CBL DISTANCE are not required.

PIDB NUMBER (PIDB)

The following fields (Section 2.31 - Section 2.34) define the PIDBs (Peripheral Interface Data Buses). Before any DPIDBs can be assigned to the IDCU, a PSU with protocol handlers must exist on the IDCU's SM. PIDB and DFPOS (Data Fanout Positions) values depend upon the entry in the PIDB TYPE field. Allowable configurations are provided below in the Valid PIDB Number Combinations table (see the PIDB/DFPOS field).

2.31 PIDB TYPE

Description: The PIDB TYPE can be either a DUAL (Dual) unit or a PSU (Packet Switch Unit). Enter the type of PIDB.

Valid PIDB TYPE Entries

Entry	Description
DUAL	TSIU (Time Slot Interchange Unit) PIDB.
PSU	PSU (Packet Switched Unit) PIDB.

Data Rules:

If PIDB TYPE is "PSU", an EQPSU form (5741 Record) and a EQPSUPH form (5742 Record) must be defined with the same SM and PSU SHELF combination.

If PIDB TYPE is "PSU", a corresponding RTERM form (5714 Record) must exist with the following time slot management fields entered: TMC PRI DPIDB, TMC NPRI DPIDB, EOC PRI DPIDB and EOC NPRI DPIDB.

If PIDB TYPE is "PSU", the PSU SHELF/DF POS assignments on the EQIDCU, EQISLU, and/or EQAIU forms for a specified SM must be unique.

If PIDB TYPE is "PSU", a matching PSU SHELF must be assigned on the EQPSU form and EQSTAT must be "O".

EQAIU, EQIDCU, or EQISLU forms with PIDB TYPE of "PSU" must have a corresponding EQPSUPH form with the same SWITCHING MODULE and PSU SHELF combination.

Copyright © 2003 Lucent Technologies

For 5E10 and later, when the D ISCN and/or PPB1/PPB2 ISCN are assigned on the DSL form, and/or ISCN1 and/or ISCN2 are assigned on the DSLUSR form, and/or SHELF/CHL GRP/CHL combinations are assigned on the MISLINK OE with an originating equipment type of "G", each ISCN or SHELF/CHL GRP/CHL combination must have a proper Packet Switching Unit shelf assigned on the EQIDCU form. The PSU shelf specified by the first digit of the ISCN on either the DSL or DSLUSR forms or by the entry in the SHELF field on the MISLINK form must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

2.32 EQSTAT

Description: Enter the status of the ELI PIDB.

Valid EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.33 DI/PSU SHLF

Description: The DI/PSU SHLF field specifies whether the DI or the PSU is used. Enter the value of the DI or PSU SHLF used.
Valid Entries:

- For 5E9(2) and earlier: 0 - 1, DUAL, for DI (Direct)
- For 5E9(2) and earlier: 0 - 4, PSU, for Packet Switched Unit (PSU)
- For 5E10 and later: DI: 0 - 1 for SM or 0 - 5 for SM-2000
- For 5E10 and later: PSU SHLF: Enter 0 - 4.

Data Rules:

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

2.34 PIDB/DFPOS

Description: The PIDB/DFPOS (PIDB/Data Fanout Positions) field specifies whether a PIDB or a DFPOS is used.
Valid Entries: (see Valid PIDB Number Combinations table below)

The entries in this field depend upon the PIDB TYPE. If "DUAL" is entered, the PIDB data port must be populated. If "PSU" is entered, the DFPOS field must be populated. Enter the PIDB number or the Data Fanout Position.

Valid PIDB Number Combinations 5E9(2) and earlier

PIDB TYPE	Positions	EQSTAT	DI or PSU SHLF	PIDB or DFPOS
DUAL	11 - 0	O,G,U	DI=0,1	PIDB= 0-14
DUAL	15 - 12	O,G,U	DI=0,1	PIDB= 0-14
PSU	15 - 12	O,G,U	PSU SHLF=0-4	DFPOS= 0-5
PSU	22 - 16	O,G,U	PSU SHLF=0-4	DFPOS= 0-5

Valid PIDB Number Combinations 5E10 and later

PIDB	Pos	EQSTAT	DI or	DI or	PIDB or	PIDB or

TYPE			PSU SHLF for SM	PSU SHLF for SM2000	DFPOS for SM	DFPOS for SM2000
DUAL	11 - 0	O,G,U	DI=0,1	DI=0-5	PIDB = 0-14	PIDB = 0-22
DUAL	15 - 12	O,G,U	DI=0,1	DI=0-5	PIDB =0-14	PIDB = 0-22
PSU	15 - 12	O,G,U	PSU SHLF = 0-4	PSU SHLF = 0-4	DFPOS = 0-5	DFPOS = 0-5
PSU	22 - 16	O,G,U	PSU SHLF = 0-4	PSU SHLF = 0-4	DFPOS = 0-5	DFPOS = 0-5

SEC. 49: 5847 RECORD
IDCU FACILITY EQUIPMENT - EQIFAC

1. GENERAL

The 5847 Record is available with the 5E8 Software Release. It is used to initially provision and to support the growth of an IDCU (Integrated Digital Carrier Unit) Facility. The IFAC (IDCU Facility) is the connection between the IDCU and the RT (Remote Terminal) or PUB (Peripheral Unit Bus). A fully loaded IDCU system has four LSI (Loop Side Interface) packs (two LSI packs per Service Group). Each LSI pair terminates up to twenty IFACS, for a maximum of forty IFACs per IDCU.

Additional information about each IFAC which is defined on the EQIFAC form include: operational status, performance monitoring group, facility identification, suppression method and whether the IFAC is connected to an RT or to a PUB which includes switched or non-switched special circuits (burglar or fire alarms, ATM circuits, etc). Ports cannot be assigned through IDCU equipment unless the related IFACs are in the operational state on the EQIFAC form.

IFACs defined on the EQIFAC form may be attached to either RTs or to PUBs (i.e., PUB43801). IFACs defined on the EQIFAC form with the PUB43801 field set to "N" may be connected to RTs or reserved for later remote terminal use. An RT must be defined on the RTERM form (5174 Record).

IFACs defined on the EQIFAC form with the PUB43801 field set to "Y" may be connected to special circuit facilities such as DACS or reserved for later use. Special circuit facilities can be defined on the LINE form (5109 Record) directly from IFACs defined on the EQIFAC form.

Performance thresholds allowed for an IFAC (IDCU facility) are defined in the PM GRP (Performance Monitoring Group) field on the EQIFAC form. The office default threshold value is FACDEF. If a unique range is required for a given IFAC, a new PM GRP name is defined on the PMTHRESH form (5948 Record).

1.1 EQIDCU Requirements

Related IDCU equipment must be defined on an EQIDCU form (5846 Record) before an EQIFAC form is defined.

1.2 RTERM Requirements

Remote Terminals of type TR008 or TR303 are defined on the RTERM form (5174 Record). The TR008 remote terminal can have from 1 to 5 IFACs connected and will handle up to 96 analog lines. The TR303 remote terminal can have from 2 to 28 IFACs connected and will handle up to 2048 analog and ISDN lines.

After the related EQIDCU, EQIFAC and RTERM forms are defined and in the operational state, analog IDCU ports can be defined on the LINE (5109 Record), MLHLN (5111 Record), and TRUNK (5204 Record) forms. ISDN IDCU ports can be defined on the DSL form (5902 Record) or the DSLUSR form (5908 Record). PUB ports are defined on the LINE form.

1.3 Carrier Group Alarm Hash Indexes

The CGA (Carrier Group Alarm) data is associated with the VT/DS1 and STE/STS facilities. For 5E9(2) and later, only 522 hash indexes are available per switching module. One hash index is allocated to each instance of the following for a specific SM:

- 1 per each pair STE/STS on a specified SM (EQSTE form). (The EQSTE form is associated with the DNU-S.)
- 1 per each VT (Virtual Tributary) on a specified SM (EQVT form). (The EQVT form is associated with

Copyright © 2003 Lucent Technologies

the DNU-S.)

- 1 per each DFI (Digital Facility Interface) of a DLTU (Digital Line/Trunk Unit) where FAC IND is 0 or 1, and DFI TYPE is not "H1" or "H2", i.e. DFI USAGE of "H1" and "H2" are not counted (EQDUP form). (The EQDUP form is associated with DLTU.)
- 1 per each DFI-2 (2 per EQDUP form) where FAC IND is 3. (The EQDUP form is associated with DLTU.)
- 1 per pack - POS, EQST, CLI, CLEI combination. (30 packs per DCLU on EQDCLP form) (The EQDCLP form is associated with DCLU.)
- 1 per IFAC - EQSTAT, SUP MTHD, PUB43801 combination. (20 per IDCU on the EQIFAC form) (The EQIFAC form is associated with IDCU.)

The sum of the above total number of allocated hash indexes (instances) cannot be greater then 522 for any one specific SM.

1.4 Recent Change View

The corresponding Recent Change View for this form is 20.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switching Module identification number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For each SM assignment, there must be a corresponding EQIM form (5700 Record).

2.3 * IDCU

Description: Enter the IDCU identification number.

Required Field.
Valid Entries: 0 - 7

Data Rules:

IDCUs share the same unit number range with Line Units, (R) ISLUs and DCLUs. Therefore, unit numbers assigned on this form may not be assigned on any EQLU, EQISLU, EQRISLU, or EQDCLU form with the same SM number.

2.4 * LSI

Description: Enter the Loop Side Interface circuit number identification.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 or 1

Data Rules:

If an IFAC position (0 - 19 for LSI 0, and 20-39 for LSI 1) is specified, EQSTAT and LSI must be entered.

IFAC

The following fields (Section 2.5 - Section 2.9) are rows in the IFAC field group used to define the IDCU facility (DS1) connections. From 1 to 20 IFACs can be connected to each LSI on the IDCU. If any field in an IFAC row is specified, then EQSTAT, SUP MTHD and PUB43801 must be specified.

- ***NOTE:*** The IFAC fields are completed by the switch owner. The switch owner will determine what type of interface is required for the remote equipment connected to the IDCU.

2.5 EQSTAT

Description: Enter the status of the equipment.

Valid EQSTAT Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

- ***NOTE:*** Only "O" is allowed in new offices and equipment additions.

Data Rules:

If EQSTAT is "G" or "O", a corresponding EQIDCU form (5846 Record) must exist with LSI EQSTAT defined as shown in the following table.

Valid LSI/EQSTAT Combinations

IFAC EQSTAT	LSI	IFAC NUM	IFAC	EQIDCU LSI EQSTAT
G	0	0 - 19	0 - 19	LSI0 = G,O
O	0	0 - 19	0 - 19	LSI0 = O
G	1	0 - 19	20 - 39	LSI1 = G,O
O	1	0 - 19	20 - 39	LSI1 = O

For 5E9(2) and later, see paragraph Section 1.3 on Carrier Group Alarms.

2.6 PM GRP

Description: Enter the group name of the Performance Monitoring threshold.
Valid Entries: 1 - 8 characters

Data Rules:

When PM GRP is entered, a corresponding PMTHRESH form (5948 Record) must exist with PM TYPE of "IFAC".

If PM GRP is not entered, the office default of FACDEF for IFAC is used. If the office default for IFAC is not defined, the generic default of /FACGDEF for IFAC is used.

2.7 FACILITY ID

Description: Enter the IDCU facility identifier.
Valid Entries: 1 - 25 characters

2.8 SUP MTHD

Copyright © 2003 Lucent Technologies

Description: Enter the Suppression Method.

Valid SUP MTHD Entries

Entry	Description
D4	IDCU to PUB43801, D4 ZCS mode. 56K restricted transmission; cannot send zero bytes, D4, rob-bit, with ZCS (see Note below).
FE8Z	IDCU to PUB43801, FE B8ZS mode. 56K clear channel transmission; can send zero bytes, Fe, rob-bit, with B8ZS. FE8Z is the recommended SUP MTHD for CCS7 and Primary Rate Interface trunks utilizing extended super frame format with B8ZS.
64K	IDCU to PUB43801, D4 B8ZS mode. 64K clear channel transmission; can send zero bytes, Fe, with B8ZS. This value is the same as FE8Z, except rob-bit is disabled by nail-up software.
FEB7	IDCU to PUB43801, FE ZCS mode. 56K restricted transmission; cannot send zero bytes, Fe, rob-bit, with ZCS (see Note below).
TR8ZC	IDCU to TR008, ZCS mode. This mode is used in TR008 RTs that are remoted over 24-channel facilities which require ZCS. These 24-channel facilities include: Fs, ZCS, CCS, and 4K data links. (See SUP MTHD Note: below.)
TR8B8	IDCU to TR008, B8ZS mode. This mode is used in TR008 RTs that are remoted over 24-channel facilities which require B8ZS. These 24-channel facilities include: Fs, B8ZS, CCS, and 4K data links. (See SUP MTHD Note: below.)
303ZC	IDCU to TR303, ZCS mode. This mode is used in TR303 RTs that are remoted over 24-channel facilities which require ZCS. These 24-channels include: Fe, ZCS, CCS, and 4K data links. (See SUP MTHD Note: below.)
303B8	IDCU to TR303, B8ZS mode. This mode is used in TR303 RTs that are remoted over 24-channel facilities which require B8ZS. These 24-channel facilities include Fe, B8ZS, CCS, and 4K data links. (See SUP MTHD Note: below.)

- ***NOTE:*** Applications that do not send signaling along the same path as data, e.g., ISDN and CCS7, automatically upgrade a 56K data rate to 64K. The 5ESS Switch application software upgrades the data rate to 64K by disabling rob-bit signaling on a per-channel basis. (Rob-bit signaling is the method traditionally used by trunks to send control signals along the same path as data. When an application such as ISDN or CCS7 sends the signal along another route, the rob-bit signaling is inhibited, reclaiming the PCM bits "robbed" for signaling, and increasing the data rate to 64K.)

Data Rules:

When the IFAC defined on this form is assigned to an RT INTERFACE of "TR008" on the RTERM form (5714 Record), SUP MTHD must be "TR8ZC" or "TR8B8" on this form.

When the IFAC defined on this form is assigned to an RT INTERFACE is "TR303" on the RTERM form (5714 Record), SUP METHOD must be "303ZC" or "303B8" on this form.

If ISDN service is planned for this TR303, SUP MTHD must be "303B8".

The SUP METHOD defined for a "TR303" or a "TR008" RT must have IFACS of the same SUP METHOD assigned on the RTERM form.

- ***NOTE:*** As with all transmission facility connections, the SUP MTHD must be consistent across all equipment used throughout the connection from the RT to the 5ESS Switch. For example, for an RT with a SUP MTHD set to "ZCS" or "B8ZS", the type of transmission equipment used (e.g., T1 line repeaters, multiplexers, and fiber links) must be compatible (and optioned) with ZCS or B8ZS signaling, respectively, as well as the 5ESS Switch.

If PUB43801 is "Y", enter "FEB8", "FE8Z", "D4", or "64K".

If PUB43801 is "N", enter "TR8ZC", "TR8B8", "303ZC", or "303B8".

2.9 PUB43801

Copyright © 2003 Lucent Technologies

Description: Is this IDCU facility used on a PUB43801 interface?
Valid Entries: Y, N

Data Rules:

If PUB43801 is "Y", the IFAC (number) cannot be defined on the RTERM form (5174 Record).

SEC. 50: 5848 RECORD CONTROL INTERFACE - EQCI

1. GENERAL

The 5850 Record is available with the 5E9(2) and later Software Releases. It is used to define PICBs (Peripheral Interface Control Buses). In the SM-2000 class processors, the CI is similar to the CI in the SM. The PICB allows the SMP (Switching Module Processor) to send messages to and get responses from the peripheral units. One CI is required in an SM-2000. The major difference between the CI in the SM-2000 class processors and in the SM is that the SM-2000 processors allow for up to 4 active CIs. This allows for a maximum of 92 PICBs.

1.1 Recent Change View

The corresponding Recent Change View for this form is 18.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.3 *MC

Description: Enter the Module Control number.

Required Field.
Valid Entries: 0 - 1

2.4 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5853 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

2.5 *CI

Description: Enter the Control Interface group number.

Required Field.

Copyright © 2003 Lucent Technologies

Valid CI Entries	
Entry	**Definition**
0 - 1	SM.
0 - 3	SM-2000 class procesors.

Data Rules:

The Control Interface numbers assigned on this form must have an associated CONTROL GROUP number defined on an equipment form.

CI values for an SM with an SM-2000 class processor must be entered in pairs, for MC 0 and MC 1.

CI pairs entered on this form for an SM-2000 class processor must be entered in sequential order (CI 0 must be entered before CI 1).

If CI is 0 - 1 (SM), the CI pair for CI 0 must be entered.

If CI is 0 - 3 (SM-2000 class processor), the CI pair for CI 0 must be entered.

If CI is 2 or 3, the corresponding EQIM form must have UNIT TYPE set to an SM-2000 class processor.

For RSMs which are not equipped with SM-2000 class processors, the CI pair for CI 0 and CI 1 must be entered.

2.6 EQSTAT

Description: Enter the status of the unit.

Required Field.
Default: O
Valid Entries:

Valid EQSTAT Entries	
Entry	**Definition**
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

The EQSTAT value assigned on this form must equal or be greater than ("O" is greater than "G", which is greater than "U") the EQSTAT value on a corresponding equipment form.

2.7 #CLI

Description: This is the Change Level Indicator. Prior to 5E11, this was a Recent Change only field. For 5E11 and later, this field was changed to a entry field.
Valid Entries: 5E10: non-entry 5E11 and later: 0 or 1

See the EQCI form in Division 8, Section 1.

SEC. 51: 5849 RECORD
DATA INTERFACE - EQDI

1. GENERAL

The 5849 Record is available with the 5E9(2) and later Software Releases. It is used to define both DIs (Data Interfaces) for the SM, and DXs (Data EXpansion) for the SM-2000 class processors. For SM-2000 class processors, the DX (Data EXpansion) terminates PIDBs (Peripheral Interface Data Buses) from peripheral units as does the DI (Data Interface) in the SM.

Like the DIs in the SM, the DXs are duplicated within the MCTSI (Module Control Time Slot Interchanger)—that is, the PCT (Peripheral Control and Timing) link to the TSI is not duplicated. The PIDB connections to the DX(s) in each MCTSI provide for duplication from the peripheral units. Any unit that requires PIDBs will impact the ports on the DXs. With a maximum of 6 DXs, there is a total of 144 PIDB ports (6 * 24) in the SM-2000. One DX is always required for LDSUF (DSU3, 2 DSC3 packs) in the SM-2000. Up to 6 DXs may be equipped. The table below shows the impact of the peripheral units on the DX ports compared to the DI in the SM.

EQUIPMENT	SM	SM-2000
LDSUF	0	4/DSC3 2DSC3 required
LU3	2	2
DLTU2	1-20	1-20
MMSU	0	0
DCTU	0	0
DNU-S	N/A	0
PIDB Ports	31 (on 2 DI)	24-144 (on -1 - 6 DX)

1.1 Recent Change View

The corresponding Recent Change View for this form is 18.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.3 *MC

Description: Enter the Module Controller number.

Required Field.
Valid Entries: 0 or 1

2.4 *INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQDI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

2.5 *DI

Description: Enter the Data Interface number.

Required Field.

Valid DI Entries

Entry	Definition
0 - 1	
0 - 5	SM-2000 class processors.

Data Rules:

For SMs not equipped with SM-2000 class processors, the DI values for DI 0 and DI 1 must be entered, and must be entered in pairs (for both MC of 0 and MC of 1), and must be entered sequentially (DI pair for DI 1 cannot be entered) before DI pair has been entered.

If DI is 2 - 5, or TSI BOARD and TSI SLOT are entered, the corresponding EQIM form must have UNIT TYPE set to an SM-2000 class processor.

For SMs with UNIT TYPE set to "SM2000", the TSI BOARD must be 0 and TSI SLOT must be 1.

2.6 EQSTAT

Description: Enter the status of the unit.

Required Field.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

2.7 #CLI

Description: Enter the Change Level Interface value.

Required Field.
Valid Entries: 0 - 7fffffff (hex)

Data Rules:

For 5E11 and later,

Copyright © 2003 Lucent Technologies

- if an SM-2000 class processor is defined on the EQIM form, the CLI value entered must be 10 hex, if bit 4 of the TSICOM 0 CLI/TSICOM 1 CLI is set on the corresponding EQIM form. Otherwise the CLI value entered must be 0.

- if an SM-2000 class processor is not defined on the EQIM form, the CLI must equal the IMPU CONTROLLER 0 or 1 CLI (depending on an MC value of 0 or 1) entered on the EQIM form.

SM-2000 CLASS PROCESSORS

The following fields (Section 2.8 - Section 2.9) are used to define SM-2000 configurations.

2.8 TSI BOARD

Description: Enter the Time Slot Interchange Board.
Valid Entries: 0 - 9

Data Rules:

The combination of TSI BOARD and TSI SLOT on the EQDI form must be duplicated for each pair of DI values (i.e., when defining this DI on this SM for an MC of 0 and an MC of 1, the TSI BOARD and TSI SLOT must be the same.

For 5E14 and earlier, the combination of TSI BOARD and TSI SLOT entries on the EQDI form, the EQDNUS form, the EQOIUP form, the EQPSU form, and/or EQNLI form must not be duplicated on any other EQDI form (except if entered as the second of a DI pair), on the same or any other EQNLI form, or any EQPSU form, oa any EQDNUS form for a given SM.

For 5E15 and later, the combination of TSI BOARD and TSI SLOT entries on the EQDI form, EQDNUS form, EQIWG form, EQPDXU form, EQPSU form, EQPCTP form, EQXCDU form, and/or the EQNLI form, must not be duplicated on any other EQDI form (except if entered as the second of a DI pair) on the same or any other EQNLI form, on the same or any other EQPDXU form (except when entering a PCTDX1 entry on the EQPDXU form where the XAIU CONFIG field on the EQPDXU form is equal to "LOW"), or on any of the following forms for a given SM:

EQOIUP (5E16(2) and later)
EQPSU,
EQPCTP,
EQDNUS, or
EQXCDU.

For 5E16(2) and later, the combination of TSI BOARD and TSI SLOT entries on the EQDI form, the EQDNUS form, the EQOIUP form, the EQPSU form, and/or EQNLI form must not be duplicated on any other EQDI form (except if entered as the second of a DI pair), on the same or any other EQNLI form, or any EQPSU form, oa any EQDNUS form for a given SM.

2.9 TSI SLOT

Description: Enter the Time Slot Interchange Slot number.
Valid Entries: 0 - 3

For 5E10 and later, when TSI SLOT is 0, TSI BOARD must not be 0.

SEC. 52: 5850 RECORD
TIME SLOT INTERCHANGE EQUIPAGE (SM-2000 MODULES) - EQTSI

1. GENERAL

The 5850 Record is available with the 5E9(2) and later Software Releases. It is used to define the Time Slot Interchange equipage for SM-2000 class processors. SMs equipped with SM-2000 class processors must have at least one pair of EQTSI forms entered with TSI BOARD set to 0. At least one TSI Board (Board 0) is required for each SM-2000 class processor. Up to 10 TSI Boards (also referred to as TSI Slices) can be assigned.

1.1 Recent Change View

The corresponding Recent Change View for this form is 18.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

SM-2000 units must be defined on the EQIM form (5700 Record) using the UNIT TYPE field.

SMs equipped with SM-2000 class processors must have at least one pair of EQTSI forms entered with TSI BOARD set to 0.

2.3 *MC

Description: Enter the Module Controller number.

Required Field.
Valid Entries: 0 - 1

2.4 *TSI BOARD

Description: Enter the Time Slot Interchange Board number. Each TSI BOARD value per SM must be entered for both an MC of 0 and an MC of 1. Each TSI board terminates up to 4 TSI links. TSI boards must be grown sequentially. See Figure 1.

Required Field.
Valid Entries: 0 - 9

Data Rules:

TSI BOARD values must be entered in pairs.

TSI Board 0 must be entered before TSI Board 1.

Copyright © 2003 Lucent Technologies

2.5 EQSTAT

Description: Enter the status of the equipment.

Required Field.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

The EQSTAT value for the EVEN NLI TSI BOARD on the EQNLI form (5853 Record) must equal or be greater than ("O" is greater than "G", which is greater than "U") the EQSTAT value on this form.

2.6 #CLI

Description: Enter the Change Level Indicator value. See Division 8, Section 1 of the TG-5 for CLI values.

Required Field.
Valid Entries: 7fffffff (hex)

FIXED ASSIGNMENTS TO THE TSI ON AN SM2000

TSI BOARD/SLICE	TSI SLOT/LINK	USE	INDEX	COMMENTS
0	0	MCP	0	Always required
0	1	DX	0	Always required
0	2	NLI	0	Always required in non VCDX (see NOTE)
0	2	LOOP	0	Always required in VCDX (see NOTE)
0	3	NLI	1	Always required in non VCDX

Note: The NLI and LOOP usage of SLOT 2 on BOARD 0 is mutually exclusive.

SEC. 53: 5851 RECORD
TMS LINK EQUIPAGE - EQTMSLINK

1. GENERAL

The 5851 Record is available with 5E9(2) and later Software Releases. For 5E9(2) and later, the 5851 Record is used instead of the EQORMLINK form (5813 Record). It is used to translate the TMS (Time Multiplexed Switch) links for the ORM (Optical Remote Module), the SM-2000, and the EXM-2000 (SM-2000 ORM).

This form is not required for an SM or an RSM (Remote Switching Module). However, this form replaces the EQORMLINK form for ORM applications. Particular fields on this form are unique to ORM/EXM-2000; they are identified in the field description.

For each odd QLI board on a given TMS SHELF, the preceding QLI board must be the same QLI type (i.e., if board 3 on TMS SHELF 0 is a QLI1, then QLI Board 2 on TMS SHELF 0 must be a QLI1). See Figure 2. The TMS LINKS are defined on the EQTMSLINK form for SM-2000 class processors and ORMs. The TMS LINKS for local SMs and host SMs are defined on the EQIM form (5700 Record).

Data Rules:
For 5E12 and later, SM(s) assigned on the EQIM input form where SM USAGE equals "ORM" and the processor is not an SM-2000 class processor, there can be no more than four EQTMSLINK input forms matching the SM on the EQIM input form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SIDE

Description: This field identifies the CM2 side of the link between the CM2 and the SM-2000. Enter the Controller Module number.

Required Field.
Valid Entries: 0 or 1

Data Rules:

A side 0 and a side 1 EQTMSLINK form must be entered for each TMS link.

2.3 * TMSFP NUM

Description: This field indicates the Time Multiplex Switch Fabric Pair number.

Required Field.

Software Release: 5E16(2) and later
Valid Entries:

0 for CM2
0 - 3 for CM3

Copyright © 2003 Lucent Technologies

Data Rules:

When office has a CM2, TMSFP NUM must be 0.

When TMSFP NUM is entered, the value entered must be defined on the EQTMS form (5866 Record).

2.4 *TMS LNK

Description: The TMS LNK field was changed to LINK for 5E15 and later. See LINK below for usage information.

2.5 *LINK

Description: Prior to 5E15, the name of this field was TMS LNK. Enter the Time Multiplexed Switch Link number. For SM-2000 class processors, with a single fabric CM2, use 8 to 31 and 38 to 189; for SM-2000 class processors with a dual fabric CM2, use 6 to 381. See Figure 1.

Required Field.
Valid Entries:

For 5E14 and earlier, 2 - 381
For 5E15 and later, for CM2
Single Fabric: 2 - 189
Dual Fabric: 2 - 381
For 5E15 and later, for CM3: 4 - 371

Data Rules:

For SM-2000 and EXM-2000, the TMS LNK value entered on this form must have a corresponding value entered or derived on an EQNLI form (5853 Record) with a matching SM entry.

When a combination of TMSFP NUM and LINK entries are entered (or derived from an EQNLI form), the corresponding QLI CLI must match all other QLI CLI entries associated with other TMSFP NUM and LINK values on that same EQNLI form.

When a TMS LNK entry for a SIDE of 0 has a corresponding TRCCKT/TRCUNUM entry, the matching EQTMSLINK form for a SIDE of 1 must have the same TRCUNUM entry, and its TRCCKT entry must equal the TRCCKT entry for side 0 plus 1.

TMS LNK entries must have an associated entry on the EQCMTRCU form (5812 Record). For every ORM which is not an EXM-2000, the TRCU NUMBER entered on this form must exist as TRCU NUMBER on an associated EQCMTRCU form and SM must be 0.

For 5E15 and later, the TMSFP NUM and LINK combination on the EQTMSLINK form associated with an SM which is equipped with an SM2000 class processor must match a TMSFP NUM and EVEN/ODD NLI TMS LINK 0 value entered, or a TMSFP NUM and EVEN/ODD NLI TMS LINK 1 value derived on an EQNLI form. (NOTE: TMS LINK 1 values are NOT derived for CDX SM2000 or for optically remoted SM2000s.)

For 5E12 and later, each LINK entry on the EQTMSLINK form must have a matching EQTMSLINK form defined for the same SIDE and TMSFP NUM for LINK plus 1. Each odd LINK entry on the EQTMSLINK form must have a matching EQTMSLINK form defined for the same SIDE and TMSFP NUM for LINK minus 1.

For 5E13 and later, when the TMS LNK is set to 8-11, 16-19, or 24-27, and the QLICLI is 100, the NCT EVEN LINK of 6 and 7, 14 and 15, or 22 and 23 on the EQIM form must not be on the QLI1 board. Note

Copyright © 2003 Lucent Technologies

also the following conditions:

- A QLICLI value of 0 on the EQTMSLINK form represents a QLI1 board.
- A QLICLI value of 100 on the EQTMSLINK form represents a QLI2 board.
- When IMTYPE is not "ORM" and UNIT TYPE is not "SM2000" on the EQIM form, a QLI1 board is used.
- When IMTYPE is "ORM" on the EQIM form, QLICLI on the EQTMSLINK form is used where NCT EVEN LINK matches TMSLNK on the EQTMSLINK form.

Also note that not all TMS link assignments are represented on the EQTMSLINK form. Some TMS link assignments are only represented on the EQIM form as an NCT EVEN LINK. All TMS links for SM-2000 and ORMs are represented on the EQTMSLINK form. All TMS links for non-SM-2000s that are also not ORMs are represented only as an NCT EVEN LINK on the EQIM form. (If an error message is encountered, the text of the message (pcd51) will indicate the TMS link assignment in error.)

For 5E15 and later:

TMSFP NUM and LINK values must be entered in pairs on the EQTMSLINK form. These LINK values must be defined on an EQTMSLINK form for both SIDE 0 and SIDE 1, and the SM must be the same on both forms.

Each LINK entry on the EQTMSLINK form associated with an SM which is equipped with an SM-2000 class processor, must match an EVEN/ODD NLI TMS LINK 0 value entered or EVEN/ODD NLI TMS LINK 1 value derived on an EQNLI form (5853 Record).

Each even LINK entry on the EQTMSLINK form must have a matching EQTMSLINK form defined for the same SIDE for LINK + 1. And each odd LINK entry on the EQTMSLINK form must have a matching EQTMSLINK form defined for the same SIDE for LINK - 1.

When a LINK value on the EQTMSLINK form is entered or derived on an EQNLI form, then the QLI CLI entry on the EQNLI form, must match all other QLI CLI entries associated with other LINK values on that same EQNLI form.

When CM VINTAGE on the EQCORE form is 2, the LINK values entered on the EQTMSLINK form where LINK TYPE is not "NCT1" must meet the following criteria:

- Use the TMSFP NUM value to find the corresponding EQTMS form. If FABRIC TYPE is "SNGL" then LINK must not equal 2, 3, 32 or 33
- Use the TMSFP NUM value to find the corresponding EQTMS form. If FABRIC TYPE is "DUAL" then LINK must not equal 2, 3, 4 or 5.

2.6 LNKTYPE

Description: The Link Type field is a Recent Change Only field. The name of this field is being changed to LINK TYPE for 5E15 and later.

2.7 #LINK TYPE

Description: Prior to 5E15, the name of this field was LNKTYPE and it was a Recent Change only field. For 5E15 and later it is used as a data format for the Time Mulitplexed Switch Link.
Valid Entries: NCT1 or NCT2

Data Rules:

Copyright © 2003 Lucent Technologies

When an office is equipped with CM2 and QLI CLI is 100h, then LINK TYPE must be "NCT2".

LINK TYPE must be "NCT1" for a CM2 where QLI CLI is not 100h.

When CM VINTAGE is 3 on the EQCORE form, the LINK TYPE on the EQTMSLINK form must be "NCT1" when either:

- The SM is not an SM2000
- The SM is an SM2000, the corresponding EQIM form's SM USAGE is "ORM" and the NLI for this LINK has a TRCU PATH HOST TYPE other than "TRCU3" on the EQTRCUPTH form. The EQNLI form contains the TMS LINK number for each NLI.

-

- An NCT link can be viewed as the physical connection between the TMS and an SM. Prior to SM-2000, all non-remote SMs used NCT1 links with bandwidth equivalent to a single TMSLNK. Most SM-2000s, on the other hand, are connected to the TMS via NCT2 links which provide twice the bandwidth. Each NCT2 link is therefore associated with two TMSLNKs, and (at least) twice as many TMSLNKs must be allocated for an SM-2000 as a non-SM-2000.
- In the following case(s), SM-2000s are still connected to the TMS via NCT1 (rather than NCT2) links:
-
  - SM-2000s that are remoted via transmission rate converter unit model 2 (TRCU2) hardware.
  - an SM-2000 in a communication module model 2 compact (CM2C) office.

2.8 #QLI CLI

Description: Enter the Quad Link Interface CLI value.

Required Field.
Valid Entries: 0 - 7fffffff (hex)

Data Rules:

The QLI CLI entered must match all other QLI CLI entries associated with this TMS LNK.

If UNIT TYPE is set to a SM-2000 class processor on the corresponding EQIM form and the EQCORE form as a CM2 Compact value of "Y", the QLI CLI must be 0.

If UNIT TYPE is set to a SM-2000 class processor and SM USAGE is not "ORM", and the EQCORE form has a CM2 Compact value of "N", QLI CLI must be 100 on the form.

For 5E15 and later, when an office is equipped with CM3, QLI CLI must be set to 0 and LINK must be greater than or equal to 4, and less than or equal to 371.

See Division 8, Section 1 for CLI values.

2.9 #SM

Copyright © 2003 Lucent Technologies

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.10 EQSTAT

Description: Enter the status of the TMS LNK unit.

Required Field.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

Initial offices must have EQSTAT set to "O".

2.11 TRCU PATH

Description: This is a no change field showing the TRCU path index associated with this TMS link. For more information, see Division 2, Section 9N.

2.12 TRCCKT

Description: Enter the Transmission Rate Converter Unit Circuit number. For 5E12 and later, to support TRCU3, this field is now on the EQTRCUPATH form and is called HOST CKT.

Software Release: 5E11 and earlier
Valid Entries: 0 - 3

Data Rules:

When either TRCCKT, TRCUNUM, or TRCCLI is entered, all must be entered.

TRCCKT, TRCUNUM, and TRCCLI must be entered when SM USAGE on the EQIM form is "ORM" (for ORMs and EXM-2000s); otherwise this field must be blank.

The combination of TRCCKT and TRCUNUM must not be duplicated on any other EQTMSLINK form except when entering the second of a TMS LNK pair.

If TRCUNUM and TRCCKT are entered, a second EQTMSLINK form entry for the same SIDE value must be made where its TMS LNK entry equals the original TMS LNK entry plus or minus 1 (plus 1 if the original TMS LNK entry is an even value; minus 1 if the original TMS LNK entry was an odd value); and, the second EQTMSLINK form must have SM, TRCUNUM, and TRCCKT values that match those from the original EQTMSLINK form.

2.13 TRCUNUM

Description: Enter the Transmission Rate Converter Unit number to interface NCT Links to an ORM or EXM-2000. For 5E12 and later, to support TRCU3, this field is now on the EQTRCUPATH form and is called HOST NUM.

Software Release: 5E11 and earlier

Copyright © 2003 Lucent Technologies

Valid Entries: Valid Entries: 1 - 96

Data Rules:

When either TRCCKT, TRCUNUM, or TRCCLI is entered, all must be entered.

The combination of TRCCKT and TRCUNUM must not be duplicated on any other EQTMSLINK form except when entering the second of a TMS LNK pair.

TRCCKT, TRCUNUM, and TRCCLI must be entered when SM USAGE on the EQIM form is "ORM".

For each matching EQTMSLINK form (using EVEN NLI TMs LINK 0 and ODD TMS LINK 0 from the EQNLI form), the TRCU NUMBERS on the EQTMSLINK form must be assigned on the EQCMTRCU form for the Local TRCU (SM equal to "0") and the EXM-2000 remote TRCU (SM equal to the value of the SM from the EQNLI form).

For the ORM that is an EXM-2000, the TRUC NUMBER entered on this form must exist as TRCU NUMBER on two separate EQCMTRCU forms. One EQCMTRCU form where SM is 0, the second EQCMTRCU form where SM equals SM from this EQTMSLINK form.

2.14 TRCCLI

Description: Enter the Transmission Rate Converter CLI value. For 5E12 and later, to support TRCU3, this field is now on the EQTRCUPATH form and is called HOST CLI.

Software Release: 5E11 and earlier
Valid Entries: Valid Entries: 0 - 7fffffff (hex)

Data Rules:

When either TRCCKT, TRCUNUM, or TRCCLI is entered, all must be entered.

See Division 8, Section 1 for CLI values.

2.15 FABRIC TYPE

Description: This is a Recent Change Only field.

FIXED ASSIGNMENTS TO THE TSI ON AN SM2000

TSI BOARD/SLICE	TSI SLOT/LINK	USE	INDEX	COMMENTS
0	0	MCP	0	Always required
0	1	DX	0	Always required
0	2	NLI	0	Always required in non VCDX (see NOTE)
0	2	LOOP	0	Always required in VCDX (see NOTE)
0	3	NLI	1	Always required in non VCDX

Note: The NLI and LOOP usage of SLOT 2 on BOARD 0 is mutually exclusive.
Figure 1 FIXED ASSIGNMENTS TO THE TSI ON AN SM2000

*These boards must be QLI1 boards, if assigned, due to FPC and PPC.
This table shows the relationship between TMS LINKS and TMS SHELF/QLI board numbers. The left hand column represents the TMS SHELF number. Each TMS SHELF consists of 8 QLI boards, numbers 0-7. The header across the top represents the QLI board numbers for the TMS SHELF. Example, TMS LINK number 40 resides on TMS SHELF 1, QLI board number 2.

SEC. 54: 5852 RECORD
LOCAL DIGITAL SERVICE CIRCUIT 3 (SM-2000) - EQDSC3

1. GENERAL

The 5852 Record is available with the 5E9(2) and later Software Releases. It is used to define the DSC3 unit to provide the LDSUF (Local Digital Services Unit Function) to expand tone generators and decoders required for the expanded capacity of the SM-2000. Each DSC3 has four duplex PIDBs (Peripheral Interface Data Buses) for a total of 128 time slots of data and one duplex PICB (Peripheral Interface Control Buses) for control. This provides four times the number of time slots that the DSC2 supports. The DSC3 connects (via PIDBs/PICBs) to the TSI (Time Slot Interchanger) and the SMP (Switching Module Processor) via the DX (Data eXpander) and CI (Control Interface) links, respectively.

When this form is entered, UNIT TYPE on the EQIM form (5700 Record) must be set to an SM-2000 class processor. PACK NUMBER values for each combination of SM and DSU must be entered in sequential order. For example, PACK NUMBER 1 cannot be entered for an SM and DSU until PACK NUMBER 0 is entered for the same SM and DSU.

See Division 2, Section 9A for more detailed information on the DSC3.

1.1 Recent Change View

The Recent Change View for this form is 19.18.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E10 and later, the combination of SM, BAY, VERTPOS and UNIT OFFSET must be unique among EQDSC3 and EQGDSC3 forms (5860 Record).

2.3 *DSU

Description: Enter the DS Unit 3 number. The only valid entry is 0.

Required Field.
Valid Entries: 0

Data Rules:

All DSUs for a given SM must have the same AISLE, BAY and VERTPOS values.

2.4 *PACK NUMBER

Description: Enter the DS Circuit 3 pack number.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 5

Data Rules:

PACK NUMBER values for each combination of SM and DSU on this form must be entered in sequential order.

2.5 #UNIT OFFSET

Description: Enter the position of the DS Circuit 3 pack on the DSU3.

Required Field.
Valid Entries:
- 5E10 and earlier: 0 - 17
- 5E11 and later: 0 - 23

Data Rules:

UNIT OFFSET cannot be used on any other EQDSC3 form defined on the same DSU and SM.

For 5E11 and later, UNIT OFFSET must be 18 - 23 if UNIT TYPE is "SM2005".

2.6 EQSTAT

Description: Enter the status of the unit.

Required Field.

Default Value. O

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

When EQSTAT is not "O", DIGIT RCVRS, TONE OUTPLS, TONE XCVRS, CAMA and VOICE BAND DATA must be 0.

Low-Level Virtual Containers with trunks assigned to Autoplex facilities must have an EQSTAT of "O" for the associated Switching Module.

2.7 #CLI

Description: Enter the Change Level Indicator value.

Required Field.

Default: 0
Valid Entries: 0 - 7fffffff (hex)

2.8 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, EQUIPMENT BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.9 #CI

Description: Enter the Control Interface group number.

Required Field.
Valid Entries: 0 - 3

Data Rules:

When this field is entered, the CI pair for CI 0 must be entered on the EQCI form (5848 Record).

CI (or CONTROL GROUP) numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O" is greater than "G" which is greater than "U").

2.10 #PICB

Description: Enter the Peripheral Interface Control Bus number.

Required Field.
Valid Entries: 0 - 22

2.11 #AISLE

Description: Enter the aisle (and floor) where the DSU3 is located. The floor is designated 00 - 99 and the aisle is designated 00 - 99.

Required Field.
Valid Entries: 0000 - 9999

2.12 #BAY

Description: Enter the Bay number where the DSU3 is located.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 208

Valid BAY Entries 5E9(2) - 5E16(1)	
Entry	**Definition**
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000 class processor; SM Cabinent aisle.
100 - 104	SM-2000 class processor; Back panel; wiring position.
200 - 208	SM-2000 class processor; Front panel; door position.

Valid BAY Entries for 5E16(2) and later			
Entry			**Type**
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

2.13 #VERTPOS

Description: Enter the Vertical Position where the DSU3 is located. Recommended positions are as follows:

For 7-foot cabinets: 22,30, 39, 48, 56, 65, 74
- For 6-foot cabinets: 7, 15, 24, 32, 41, 49, 58

Required Field.
Valid Entries: 00 - 84

2.14 #DI

Description: Enter the Data Interface number.

Required Field.
Valid Entries: 0 - 5

Data Rules:

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

PIDB LIST/ROW PIDB

This field group defines the PIDB numbers for rows 1 - 4. Each PIDB row must be unique.

2.15 #PIDB

Description: Enter the PIDB for rows 1 - 4.

Required Field.
Valid Entries: 0 - 23

FEATURE GRP SVC CNT

Copyright © 2003 Lucent Technologies

The following fields (Section 2.16 - Section 2.20) define the number (count) of feature group services assigned. Note that the values entered for service counts cannot exceed the 10 DSP (Digital Service Pack) limit. The following restrictions establish pack limitations:

- 1 DSP provides a maximum of 64 Tone Generators.
- 1 DSP provides a maximum of 16 Tone Decoders and/or CAMA tone generator.
- 1 DSP provides a maximum of 16 Tone Transceivers.
- 1 DSP provides a maximum of 8 VBS generators.

2.16 #DIGIT RCVRS

Description: Enter the number of Digit Receivers assigned to the DSC3. This service count defines the number of incoming circuits and uses incoming time slots.

Required Field.
Valid Entries: 0 - 127

Data Rules:

DIGIT RCVRS plus TONE XCVRS plus CAMA must not be greater than 127.

2.17 #TONE OUTPLS

Description: Enter the number of Tone Outplusers assigned to the DSC3. This service count defines the number of outpulsing circuits and uses outgoing time slots.

Required Field.
Valid Entries: 0 - 127

Data Rules:

TONE OUTPLS plus TONE XCVRS plus VOICE BAND DATA cannot be greater than 127.

2.18 #TONE XCVRS

Description: Enter the number of Tone Transceivers assigned to the DSC3. This service count defines the number of transceiver circuits and uses both incoming and outgoing time slots.

Required Field.
Valid Entries: 0 - 127

Data Rules:

TONE OUTPLS plus TONE XCVRS plus VOICE BAND DATA cannot be greater than 127.

DIGIT RCVRS plus TONE XCVRS plus CAMA must not be greater than 127.

2.19 #CAMA

Description: Enter the number of Centralized Automatic Message Accounting services assigned to the DSC3. This service count defines the number of CAMA tone generator circuits and uses incoming time slots.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 127

DIGIT RCVRS plus TONE XCVRS plus CAMA must not be greater than 127.

2.20 #VOICE BAND DATA

Description: Enter the number of Voice Band Data services assigned to the DSC3. This service count defines the number of VBD assurance circuits and uses outgoing time slots.

Required Field.
Valid Entries: 0 - 127

Data Rules:

TONE OUTPLS plus TONE XCVRS plus VOICE BAND DATA cannot be greater than 127.

SEC. 55: 5853 RECORD
NETWORK LINK INTERFACE GROWTH (SM-2000) - EQNLI

1. GENERAL

The 5853 Record is available with 5E9(2) and later Software Releases. It is used to define the NLI (Network Link Interface) which terminates the NCT2 (Network Control and Timing Links 2) from the SM-2000 (Switching Module-2000) TSI (Time Slot Interchanger) to the TMSU (Time Multiplexedn Switch Unit) of the CM2. For the SM-2000, the NLI is an optical interface; for the EXM-2000, the NLI is an electrical interface. One EQNLI form is required for each duplicated pair of NCT2 links for the SM-2000.

NOTE: Each EQNLI form that is associated with an optically remoted SM equipped with an SM-200 class processor must have EQCMTRCU assignments as follows: For each matching EQTMSLINK form (using EVEN NLI TMS LINK0 and ODD NLI TMS LINK0 from EQNLI), the TRCU NUMBERs on the EQTMSLINK form must be assigned on the EQCMTRCU form for the Local TRCU (key SM - 0) and the remote TRCU (key SM = SM from EQNLI).

1.1 Recent Change View

The Recent Change View for this form is 18.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the Switching Module.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM entered must have a corresponding EQIM form (5700) with UNIT TYPE set to an SM-2000 class processor.

The EQCORE form (5701 Record) must be inserted before this form can be inserted/updated.

2.3 *EVEN NLI

Description: Enter the even NLI. This field identifies the even network link interface number of the NCT2 links. An EVEN NLI of 0 represents the even NLI associated with the primary NCT2 links. The primary NCT2 links are always required. EVEN NLI 0 and ODD NLI 1 are referred to as "primary" NCT2 links. An EVEN NLI of 2 through 22 (even values only) represents an even NLI associated with a secondary NCT2 link. The secondary NCT2 links are optional.

Required Field.
Valid Entries: 0 - 22 (even values)

Data Rules:

All TMS LINK values entered and/or derived from these forms must be unique.

TMS LINKs are assigned on three forms: the EQIM form (5700-1/2 Record) as NCT EVEN LINK, on the

Copyright © 2003 Lucent Technologies

EQNLI form (for SM-2000 only) as EVEN/ODD NLI TMS LINK 0, and on the EQQLPS form (per QLPS NETWORK) as STARTING QTMSLINK. Additional TMS LINKs are derived from these same form entries. An NCT EVEN LINK entry also derives a TMS LINK entry of NCT EVEN LINK +1 (known as the NCT ODD LINK). An EVEN or ODD NLI TMS LINK 0 entry on the EQNLI form derives another TMS LINK entry of either EVEN/ODD TMS LINK 0 +2 or EVEN/ODD TMS LINK 0 +4 (when the SM-2000 is not optically remoted, or is not CDX). This is dependent upon the value of the TMS TYPE on the EQCORE form. If TMS TYPE is "SNGL", 2 is added; if "DUAL", 4 is added.

QTMSLINK 2, QTMSLINK 3 and QTMSLINK 4 are derived from STARTING QTMSLINK (per QLPS NETWORK) on the EQQLPS form. The value of each of these derived QGMSLINKs is also dependent on TMS TYPE from the EQCORE form. If TMS TYPE is "SNGL", 1, 2 and 3, respectively, are added to the STARTING QTMSLINK value; if TMS TYPE is "DUAL", 2, 4 and 6, respectively, are added.

For 5e16(2) and later, the TMSFP NUM and TMS LINK combination entered and/or derived from the forms mentioned above must be unique.

When EVEN NLI is 0, the EVEN NLI TMS LINK 0 entry must match the NCT EVEN LINK value on the corresponding EQIM form and the ODD NLI TMS LINK 0 entry must match the NCT EVEN LINK value on the EQIM form plus 1.

For a single SM-2000 class processor, even NLIs must be equipped in sequential order (NLI 4 cannot be equipped before NLI 2.)

If EVEN NLI is 0, EQSTAT must be "O".

For 5e16(2) and later, when office is a CM2, EVEN NLI entries made on the EQNLI form must be made in sequential, even valued, order for an SM. For example, an EVEN NLI of 4 cannot be entered until an EVEN NLI of 2 is entered.

2.4 ODD NLI

Description: The ODD NLI is automatically populated with the next highest odd integer above the EVEN NLI value entered. The ODD NLI of 1 represents the odd NLI associated with the primary NCT/NCT2 links which are always required.

2.5 EQSTAT

Description: Enter the status of the equipment.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

2.6 * TMSFP NUM

Description: This field indicates the Time Multiplex Switch Fabric Pair number.

Required Field.

Software Release: 5E16(2) and later
Valid Entries:

0 for CM2
0 - 3 for CM3

Copyright © 2003 Lucent Technologies

Data Rules:

When EVEN NLI is 0, TMSFP NUM must be 0.

When office has a CM2, TMSFP NUM must be 0.

EVEN NLI (E)

The following fields (Section 2.7 - Section 2.12) define the even NLI. Each NLI (even and odd) is assigned to a port on a TSI slice. A TSI link connects each NLI to a TSI slice. The TSI BOARD field identifies the TSI slice to which this NLI is assigned. The TSI BOARD field for the ODD NLI is automatically populated with the value equal to the TSI BOARD field for the EVEN NLI. The even and odd NCT2 links of the same NCT2 link pair must terminate to the same TSI slice.

2.7 #TSI BOARD

Description: Enter the TSI Board for the even NLI.

Required Field.
Valid Entries: 0 - 9

Data Rules:

When the EVEN NLI is 0, indicating the primary NCT2 links, the TSI Board must be 0.

When the EVEN NLI is 2 - 22 (even values only), indicating secondary NCT2 links, the TSI BOARD may be 1 - 19.

For a given SM, the combination of TSI BOARD and TSI SLOT entries on the EQDI form, the EQPDXU form, the EQDNUS form, and for the EQNLI form must not be duplicated on any other EQDI form (except if entered as the second of a DI pair), on the same or any other EQNLI form, on the same or any other EQPDXU form (except when entering a PCTDX1 where the XAIU CONFIG is equal to "LOW"), or on any EQDNUS form.

2.8 #TSI SLOT

Description: Enter the TSI Slot for the even NLI. Each NLI (even and odd) is assigned to a port on a TSI slice. The TSI SLOT field identifies the port on the TSI slice to which this NLI is assigned (i.e., slot equals port). The even and odd NCT2 links of the same NCT2 link pair must terminate to coupler port positions (e.g., ports 0,1 and/or 2,3) on the same TSI slice.

Required Field.
Valid Entries: 0 or 2

Data Rules:

When the EVEN NLI is 0, indicating the primary NCT2 links, the TSI SLOT must be 2.

When the EVEN NLI is 2 - 22 (even values only), indicating secondary NCT2 links, the TSI SLOT may be 0 or 2.

2.9 #TMS LINK 0

Description: Enter the Time Multiplex Switch Link 0 for the EVEN NLI. This field identifies the TMS link 0 number (first even TMS link or lowest even TMS link) associated with the even NLI. Even NLI TMS LINK 0 entries on this form are entered, and even NLI TMS LINK 1 entries are derived from them by adding either 2 or 4 to the TMS LINK 0 value based upon the value of the TMS CONFIGURATION on the EQCORE form (5701 Record). If TMS CONFIGURATION is "SNGL", 2 is added to the even NLI TMS LINK 0 entry;

Copyright © 2003 Lucent Technologies

if TMS CONFIGURATION is "DUAL", 4 is added.

For example,

- for "SNGL" fabric, the valid entries range from 8 - 28 and 38 - 186 in increments of 4 (e.g., 8, 12, 16 or 38, 42, 46, etc.).
- for "DUAL" fabric, the valid enries range from 6 or 8 to 374 or 376 in increments of 8 (e.g., 6, 8, 14, 16, 22, 24, 30, 32, etc.).

Required Field.
Valid Entries:
- 5E9(2): 6 - 380 (even values)
- 5E10 and later: 2 - 380 (even values)

Data Rules:

Each combination of TMSFP NUM and EVEN/ODD NLI TMS LINK 0 value entered (and each combination of TMSFP NUM and EVEN/ODD NLI TMS LINK 1 value derived) on this EQNLI form must be entered as TMS LNK on a matching EQTMSLINK form for the appropriate SM. The matching EQTMSLINK forms must have an SM entry equal to the SM entry on the this EQNLI form.

For 5E15 and later:

When an office is equipped with a CM3 (Communication Module 3), the EQTMS form's (5866 Record) SHELF EQUIPAGE - CM3 SHELF defines the valid range of the TMS LINK O EVEN/ODD NLI assigned on the EQNLI form (5853 Record). The EQTMS form is found using the TMSFP NUM value on the EQNLI form. In addition, if the EQSTAT for this shelf is "G", then the EQSTAT on the EQNLI form must also be "G". The link to shelf relationship is as follows:

- If TMS LINK 0 EVEN NLI is an even number from 84-176, SHELF = 1
- If TMS LINK 0 EVEN NLI is an even number from 180-272, SHELF = 2
- If TMS LINK 0 EVEN NLI is an even number from 276-368, SHELF = 3

NOTE: The link range for SHELF 0 is not checked since EQSTAT for SHELF 0 must always be "O" in a CM3 office.

When an office is equipped with CM2, EVEN NLI TMS LINK 0 must be an even number between 4 and 376, and have FABRIC TYPE exceptions of 4 for "DUAL", and 32 for "SNGL".

When an office is equipped with CM3, EVEN NLI TMS LINK 0 must be an even number between 4 and 370.

2.10 TMS LINK 1

Description: The value displayed in this field is automatically populated and is derived from the EVEN NLI TMS 0 entry. It identifies the TMS link 1 number (second even TMS link or highest even TMS link) associated with the even NLI. For example:

- For "SNGL" fabric, the EVEN NLI - TMS 1 value will equal the EVEN NLI TMS LINK 0 value plus 2 (TMS LINK 0 + 2 = TMS LINK 1).
- For "DUAL" fabric, the EVEN NLI - TMS LINK 1 value will equal the EVEN NLI TMS LINK 0 value plus 4 (TMS LINK 0 + 4 = TMS LINK 1).

Copyright © 2003 Lucent Technologies

TMS LINK 1 values only apply to local SM-2000s; they are not derived for optically remote SM-2000s (EXM-2000s).

- ***NOTE:*** For CM3, the TMSLINK 1 value will equal the LINK 0 value plus 2.

Data Rules:

If TMS CONFIGURATION on the EQCORE form (5701) is "SNGL", 2 is added to the EVEN NLI TMS 0 value entered. If TMS CONFIGURATION is "DUAL", 4 is added to the EVEN NLI TMS 0 value entered.

2.11 #NLI 0 CLI

Description: Enter the Change Level Indicator for the NLI 0 board. The BKD1 paddle board (NLI) is used to terminate NCT2 links on an SM-2000 in a host 5ESS-2000 Switch.

Required Field.
Valid Entries: 0 - 7fffffff (hex)

Refer to Division 8, Section 1 for a complete listing of CLI values and associated J-drawings.

2.12 #NLI 1 CLI

Description: Enter the Change Level Indicator for the NLI 1 CLI.

Required Field.
Valid Entries: 0 - 7fffffff (hex)

Refer to Division 8, Section 1 for a complete listing of CLI values and associated J-drawings.

ODD NLI (O)

The following fields (Section 2.13 - Section 2.18) define the odd NLI.

2.13 TSI BOARD

Description: The TSI Board for the odd NLI is automatically populated with the same value entered for the Even NLI TSI Board.

Required Field.
Valid Entries: 0 - 9

2.14 TSI SLOT

Description: The TSI Slot for the odd NLI is automatically populated with the next highest integer above the even TSI SLOT value entered. The values displayed will be either 1 or 3.

Required Field.

2.15 TMS LINK 0

Description: The Time Multiplex Switch Link 0 for the odd NLI 0 is automatically populated with the next highest integer above the odd TMS Link 0 value entered. The value displayed will be odd numbers in the range 7 - 381.

- ***NOTE:*** This value can be changed; however, it is not recommended.

Odd NLI TMS LINK 0 entries on this form are entered, and odd NLI TMS LINK 1 entries are derived from

Copyright © 2003 Lucent Technologies

them by adding either 2 or 4 to them based on the value of the TMS CONFIGURATION on the EQCORE form (5701 Record). If TMS CONFIGURATION is "SNGL", 2 is added to the odd NLI TMS LINK 0 entry; if TMS CONFIGURATION is "DUAL", 4 is added.

Data Rules:

Each EVEN/ODD NLI TMS LINK 0 value entered (and each EVEN/ODD NLI TMS LINK 1 value derived) on this EQNLI form must be entered as TMS LNK on a matching EQTMSLINK form (5851 Record) for the appropriate SM. The matching EQTMSLINK forms must have an SM entry equal to the SM entry on this EQNLI form.

2.16 TMS LINK 1

Description: This is a display only field. The value displayed in this field is automatically populated and is derived from the EVEN NLI TMS LINK 0 entry. TMS LINK 1 values only apply to local SM-2000s; they are not derived for optically remote EXM-2000s.

- ***NOTE:*** If TMS CONFIGURATION on the EQCORE form (5701) is "SNGL", 2 is added to the EVEN NLI TMS 0 value entered. For example:

  - For "SNGL" fabric, the ODD NLI - TMS 1 value will equal the ODD NLI - TMS LINK 0 value plus 2 (TMS LINK 0 + 2 = TMS LINK 1).

  - For "DUAL" fabric, the ODD NLI - TMS LINK 1 value will equal the ODD NLI - TMS LINK 0 value plus 4 (TMS LINK 0 + 4 = TMS LINK 1).

- ***NOTE:*** For CM3, the TMSLINK 1 value will equal the LINK 0 value plus 2.

2.17 #NLI 0 CLI

Description: Enter the Change Level Indicator for the NLI 0.

Required Field.
Valid Entries: 0 - 7fffffff (hex)

Refer to Division 8, Section 1 for a complete listing of CLI values and associated J-drawings.

2.18 #NLI 1 CLI

Description: Enter the Change Level Indicator for the NLI 1 CLI.

Required Field.
Valid Entries: 0 - 7fffffff (hex)

Refer to Division 8, Section 1 for a complete listing of CLI values and associated J-drawings.

SEC. 56: 5854 RECORD
QLPS BOARD FORM - EQQLPS

1. GENERAL

The 5854 Record is available with the 5E9(2) and later Software Releases. It is used to define a QLPS (Quad-Link Packet Switch) board.

QLPS is an overlay network that provides high bandwidth message transport between SM-2000s and between SM-2000s and existing processors. A QLPS network consists of two QLPS boards, one installed on each side of the ONTC (Office Network and Timing Complex). One side is always the active QLPS and the other is the standby QLPS for the network during normal operation.

An EQQLPS form can be entered only if CM VINTAGE is 2 or 3, and TIME MULTIPLEXED SWITCH CLI is 00000100 on the EQCORE form (5701 Record) (for 5E14 and earlier), or the CLI on the EQTMS form (5866 Record) (for 5E15 and later) is 0000100. In addition, the QGWP (Quad-Link Gateway Processor) field on the ECDOPT form (5706 Record) must be "Y".

An appropriate EQPIPE form (5544 Record) must be entered to complete the definition of the QLPS network for a CM2 (Communication Module Model 2) office only. For CM3 offices, the population of the data is handled in forward mapping. For more information, see Division 2, Section 9D, Quad-Link Packet Switch Network.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.19.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ONTC SIDE

Description: Enter the ONTC (Office Network and Timing Complex) Side on which the QLPS hardware is being installed.

NOTE: Four of these forms should exist for CM3.

Required Field.
Valid Entries: 0, 1

Data Rules:

The EQCORE form (5701 Record) must be inserted before this form can be inserted/updated.

2.3 * QLPS NETWORK

Description: Enter the QLPS Board, identified by the number of its QLPS Network.

Required Field.
Valid Entries: 0, 1

Data Rules:

EQQLPS forms for the same QLPS NETWORK must have the same STARTING QTMSLINK.

Copyright © 2003 Lucent Technologies

2.4 # TMS CONFIGURATION

Description: Enter the TMS (Time Multiplexed Switch) configuration.

Required Field.

Valid TMS CONFIGURATION Entries

Entry	Description
SNGL	Single fabric.
DUAL	Dual fabric.

Data Rules:

TMS CONFIGURATION must be same as the TMS CONFIGURATION on the EQCORE form.

When an office is equipped with CM3, TMS CONFIGURATION must be "DUAL".

2.5 # STARTING QTMSLINK

Description: Enter the number of the first TMS Link to the QLPS board. Each QLPS board on an ONTC side occupies four TMS links. The first must be entered here; the remaining three are automatically assigned by the system in the QTMSLINK 2, QTMSLINK 3, and QTMSLINK 4 fields.

For single fabric, enter 4 - 28 or 34 - 186 in increments of 4. For dual fabric, network 0, enter 6 - 374 in increments of 8; for dual fabric, network 1, enter 7 - 375 in increments of 8.

Required Field.
Valid Entries: 4 - 375

Data Rules:

TMS LINKS can be assigned on three forms: on the EQIM form (5700-1/2 Record) as NCT EVEN LINK, on the EQNLI form (5853 Record) as EVEN (or ODD) TMS LINK 0, and on the EQQLPS form as STARTING QTMSLINK. On each form additional TMS LINKS are derived from the specified link and the TMS configuration. All TMS LINKs entered or derived on these forms must be unique in the switch.

2.6 QTMSLINK 2

Description: This field is the second QTMSLINK to the QLPS board and cannot be entered by the switch owner. For single fabric, this field is automatically set to STARTING QTMSLINK + 1; for dual fabric, it is set to STARTING QTMSLINK + 2.

2.7 QTMSLINK 3

Description: This field is the third QTMSLINK to the QLPS board and cannot be entered by the switch owner. For single fabric, this field is automatically set to STARTING QTMSLINK + 2; for dual fabric, it is set to STARTING QTMSLINK + 4.

2.8 QTMSLINK 4

Description: This field is the fourth QTMSLINK to the QLPS board and cannot be entered by the switch owner. For single fabric, this field is automatically set to STARTING QTMSLINK + 3; for dual fabric, it is set to STARTING QTMSLINK + 6.

2.9 EQSTAT

Description: Enter the equipment status of the QLPS board.

Required Field.

Copyright © 2003 Lucent Technologies

Default: G
Valid Entries:

Valid EQSTAT Entries	
Entry	**Description**
G	Growth.
O	Operational.

Data Rules:

EQSTAT must be "O" for new offices and for offices with equipment additions.

EQSTAT cannot be "G" for offices during a retrofit.

For 5E14 and later, when this form exists, the EQSTAT must be "O" before any QPH (QLPS Protocol Handler) pipes can be defined on the QPHPIPE form.

2.10 CLI

Description: Enter the Change Level Indicator, which identifies the version of the QLPS hardware.

For a complete listing of valid CLI values, J-Drawing and list combinations, see Division 8, Section 1.

Required Field.
Default: 0
Valid Entries: 0 - 7FFFFFFF

```

Copyright © 2003 Lucent Technologies

SEC. 57: 5855 RECORD
DIGITAL NETWORKING UNIT SONET (SM-2000) - EQDNUS

1. GENERAL

The 5855 Record is available with 5E9(2) and later Software Releases. This form is used to define the equipage information for the DNU-S (Digital Networking Unit-SONET) in an SM-2000. The DNU-S provides SONET (Synchronous Optical Network) capabilities by allowing a maximum of 12 STS (Synchronous Transport Signal) links to terminate to the switch. Each STS link carries 28 DS1S (Digital Signal level 1 SONET) facilities.

This form supports the DNU-S feature. For more information on DNU-S, see Division 2, Section 9C.

1.1 Data Groups

DNU-S has two data groups. DG0 (the first data group) is equipped and operational first. Then, as more capacity is needed DG1 (the second data group) is grown.

1.2 Equipment Status

The EQSTAT fields on this form can either be in the Growth state, "G", the Operational state, "O", or the Unequipped state "U". "O" is considered the highest state, "G" the middle state, and "U" the lowest state. Form checks (level 2 checks) for equipment states reference this hierarchy. For example: "CC0 EQSTAT and CC1 EQSTAT must be greater than or equal to DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT" would equate to the following:

- if DG0 CD 0 EQSTAT is "O"
- or DG0 CD 1 EQSTAT is "O",
- then CC0 EQSTAT must be "O"
- and CC1EQSTAT must be "O".

and:

- if DG0 CD 0 EQSTAT is "G"
- or DG0 CD1 EQSTAT is "G",
- then CC0 EQSTAT must be "O" or "G",
- and CC1 EQSTAT must be "O" or "G".

The 5855-1 and 5855-2 Records show the relationship of the equipment states for EQDNUS EQSTAT fields.

1.3 Recent Change View

The corresponding Recent Change View for this form is 19.14.

2. FORM ENTRIES 5855-1/2 RECORDS

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SM

Description: The SM field is used to specify the switching module number for an SM-2000.

Required Field.
Valid Entries: 1 - 192

Copyright © 2003 Lucent Technologies

Data Rules:

The total number of EQDNUS forms with the same SM number must not be greater than four.

Each SM entered on this form must be assigned on an EQIM form with the same SM number.

Each value of SM entered on the EQDNUS, EQSTE, and EQVT forms must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports Digital Networking Unit-SONET. The only value for CONFIGURATION which supports DNU-S is "SM2000".

2.3 * DNUS

Description: Enter the DNU-S (Digital Networking Unit SONET) unit number, which indicates the circuit location for DNU-S in the SM-2000.

Required Field.
Valid Entries: 0 - 7

2.4 # EQL BAY

Description: Enter the Equipment Location Bay number of the frame on which the DNU-S resides.

Required Field.
Valid Entries: 1 - 14, 90 - 104, 200 - 208

2.5 # EQL UNVER

Description: Enter the Equipment Location Unit Vertical Position of the frame on which the DNU-S resides. Only 7, 15, 24, 32, 41, 49, or 58 are expected in a 6 foot cabinet.

Required Field.
Valid Entries: 0 - 84

2.6 # EQL AISLE

Description: Enter the Equipment Location Aisle Number which is used to specify the aisle position of the frame on which the DNU-S resides. The first 2 digits are the floor location and the last 2 digits are the aisle location; i.e., enter 00 - 99 for floor and 00 - 99 for aisle.

Required Field.
Valid Entries: 0000 - 9999

2.7 CC0 EQSTAT

Description: Enter the Common Controller 0 Equipage State on the DNU-S.

Required Field.
Default: O
Valid Entries:

Valid CC0 EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

Copyright © 2003 Lucent Technologies

Initial and growth offices must have CC0 EQSTAT and CC1 EQSTAT set to "O".

If CC0 EQSTAT is "U" or CC1 EQSTAT is "U", then both must be "U". CC0 EQSTAT and CC1 EQSTAT must be greater than or equal to DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT, therefore:

- If DG0 CD 0 EQSTAT or DG0 CD 1 EQSTAT is "O" then, CC0 EQSTAT and CC1 EQSTAT must be "O".
- If DG0 CD 0 EQSTAT or DG0 CD 1 EQSTAT is "G", then CC0 EQSTAT and CC1 EQSTAT must be "O" or "G".

If "G" or "O" is entered, then the required EQMH form must have a matching SM number, and both MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT must be "O".

The EQDNUS forms with CC0 EQSTAT of "G" or "O" and/or the EQAIU forms with AIU TYPE of "EAIU", and TSPFAC0/TSPFAC1 row 1 EQSTAT of "G" or "O", and/or the EQAIU forms with AIU TYPE of "XAIU" and XAIUTSGRP row 1 EQSTAT of "G" or "O" must not exceed the channel capacity of EQMH form(s) with a matching SM number. Each MH provides up to 31 channels."

2.8 CC1 EQSTAT

Description: Enter the Common Controller 1 equipage state on the DNU-S.

Required Field.
Default: O
Valid Entries:

Valid CC1 EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

Initial and growth offices must have CC0 EQSTAT and CC1 EQSTAT set to "O".

If CC0 EQSTAT is "U" or CC1 EQSTAT is "U", then both must be "U".

CC0 EQSTAT and CC1 EQSTAT must be greater than or equal to DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT, therefore:

- If DG0 CD 0 EQSTAT or DG0 CD 1 EQSTAT is "O", then CC0 EQSTAT and CC1 EQSTAT must be "O".
- If DG0 CD 0 EQSTAT or DG0 CD 1 EQSTAT is "G", then CC0 EQSTAT and CC1 EQSTAT must be "O" or "G".

2.9 CC0 CLI

Description: Enter a hexadecimal number for the Common Control 0 Change Level Indicator for the DNU-S.

Required Field.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

Copyright © 2003 Lucent Technologies

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

2.10 CC1 CLI

Description: Enter the hexadecimal Common Control 1 Change Level Indicator for DNU-S.

Required Field.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

DATA GROUP 0 (DG0) and DATA GROUP 1 (DG1)

The following fields (Section 2.11 - Section 2.21) define the equipage information for the Data Group 0 (5855-1 Record) and Data Group 1 (5855-2 Record). The Data Groups consist of CD (Common Data), the Spare and Service TMUXs (Transmission Multiplexers), the PCT LINKS and SFI (STSX-1 Facility Interface) components.

DG0 must be grown in DNU-S first. As more capacity is needed, DNU-S can then grow in DG1.

For DG0:
Initial and growth offices must have DG0 CD 0 EQSTAT, DG0 CD 1 EQSTAT, DG0 FI 0 EQSTAT, DG0 FI 1 EQSTAT and DG0 STMX EQSTAT all set to "O".

If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL0 CD 0 EQSTAT and PCTL0 CD 1 EQSTAT.

For DG1:
If any of the following is entered, they all must be entered:

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT (for PCT LINK 0), and also the CLI fields associated with each of these EQSTAT fields.

If any of the following is "U" they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT

Copyright © 2003 Lucent Technologies

- STMX EQSTAT

and (for PCT LINK 0) both PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT.

Initial and growth offices must have the following EQSTAT values set to "O" if any of them are entered:

- DG1 CD 0 EQSTAT
- DG1 CD 1 EQSTAT
- DG1 FI 0 EQSTAT
- DG1 FI 1 EQSTAT
- DG1 STMX EQSTAT

See the 5855-1 and 5855-2 Records for cross reference of equipment states of DG0/1 fields with CC0/1 EQSTAT, PCTL0/1 EQSTAT, and DG0/1TMX EQSTAT fields.

2.11 CD 0 EQSTAT

Description: Enter the Data Group Common Data 0 Equipage State on the DNU-S.

Required Field for DG0.
Default: O
Valid Entries:

Valid CD 0 EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

For DG0:
CC0 EQSTAT and CC1 EQSTAT must be greater than or equal to DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT.

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 STMX EQSTAT.

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 FI 0 EQSTAT and DG0 FI 1 EQSTAT.

For PCTL0 PCT LINK 0, the PCTL0 CD 0 EQSTAT must equal DG0 CD 0 EQSTAT.

For all PCT LINK rows, DG0 CD 0 EQSTAT must be greater than or equal to PCTL0 CD 0 EQSTAT.

For DG1:
Before DG1 CD 0 EQSTAT or DG1 CD 1 EQSTAT can be entered, DG0 FI 0 EQSTAT, DG0 FI 1 EQSTAT, and DG0 STMX EQSTAT must be "O".

Initial and growth offices must have the following EQSTAT values set to "O" if any of them are entered:

- DG1 CD 0 EQSTAT
- DG1 CD 1 EQSTAT
- DG1 FI 0 EQSTAT
- DG1 FI 1 EQSTAT
- DG1 STMX EQSTAT

DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 STMX EQSTAT.

Copyright © 2003 Lucent Technologies

DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 FI 0 EQSTAT and DG1 FI 1 EQSTAT.

For all PCT LINK rows, DG1 CD 0 EQSTAT must be greater than or equal to PCTL1 CD 0 EQSTAT.

For all PCT LINK rows, DG1 CD 0 EQSTAT must be greater than or equal to PCTL1 CD 0 EQSTAT.

For PCTL1 PCT LINK 0, the PCTL1 CD 0 EQSTAT must equal DG1 CD 0 EQSTAT.

If "G" or "O" are entered, then the required EQMH form must have a matching SM number, and both MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT must be equal to "O".

2.12 CD 1 EQSTAT

Description: Enter the Common Data 1 Equipage State on the DNU-S.

Required Field for DG0.
Default: O
Valid Entries:

Valid CD 1 EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

Initial and growth offices must have CD 1 EQSTAT set to "O".

For DG0:
If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT,

and (for PCT LINK 0) both PCTL0 CD 0 EQSTAT and PCTL0 CD 1 EQSTAT.

Initial and growth offices must have the following all set to "O":

- DG0 CD 0 EQSTAT
- DG0 CD 1 EQSTAT
- DG0 FI 0 EQSTAT
- DG0 FI 1 EQSTAT
- DG0 STMX EQSTAT

CC0 EQSTAT and CC1 EQSTAT must be greater than or equal to DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT.

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 STMX EQSTAT.

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 FI 0 EQSTAT and DG0 FI 1 EQSTAT.

PCT LINK:
For PCTL0 PCT LINK 0, the PCTL0 CD 1 EQSTAT must equal DG0 CD 1 EQSTAT.

Copyright © 2003 Lucent Technologies

For all PCT LINK rows, DG0 CD 1 EQSTAT must be greater than or equal to PCTL0 CD 1 EQSTAT.

For DG1:
Before DG1 CD 0 EQSTAT or DG1 CD 1 EQSTAT can be entered, DG0 FI 0 EQSTAT, DG0 FI 1 EQSTAT, and DG0 STMX EQSTAT must be "O".

If any of the following is entered, they all must be entered:

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT (for PCT LINK 0). In addition, the CLI fields associated with each of these EQSTAT fields must be entered.

If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT.

DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 STMX EQSTAT.

DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 FI 0 EQSTAT and DG1 FI 1 EQSTAT.

PCT LINK:
For PCTL1 PCT LINK 0, the PCTL1 CD 1 EQSTAT must equal DG1 CD 1 EQSTAT.

For all PCT LINK rows, DG1 CD 1 EQSTAT must be greater than or equal to PCTL1 CD 1 EQSTAT.

Initial and growth offices must have the following EQSTAT values set to "O" if any of them are entered:

- DG1 CD 0 EQSTAT
- DG1 CD 1 EQSTAT
- DG1 FI 0 EQSTAT
- DG1 FI 1 EQSTAT
- DG1 STMX EQSTAT

2.13 CD 0 CLI

Description: Enter the hexadecimal Common Data 0 Change Level Indicator for the DNU-S.

Required Field for DG0.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexdecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI

Copyright © 2003 Lucent Technologies

values.

2.14 CD 1 CLI

Description: Enter the hexadecimal Common Data 1 Change Level Indicator for the DNU-S.

Required Field for DG0.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexdecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

2.15 FI TYPE

Description: Enter the Facility Interface Type.
Default: SFI
Valid Entries: SFI

2.16 FI 0 EQSTAT

Description: Enter the Facility Interface 0 Equipage State for the DNU-S.

Required Field for DG0.
Default: O
Valid Entries:

Valid FI 0 EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

For DG0:
If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL0 CD 0 EQSTAT and PCTL0 CD 1 EQSTAT.

Initial and growth offices must have

- DG0 CD 0 EQSTAT
- DG0 CD 1 EQSTAT
- DG0 FI 0 EQSTAT
- DG0 FI 1 EQSTAT
- DG0 STMX EQSTAT all set to "O".

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 FI 0 EQSTAT and DG0 FI 1 EQSTAT.

Copyright © 2003 Lucent Technologies

For DG1:
Before DG1 CD 0 EQSTAT or DG1 CD 1 EQSTAT can be entered, DG0 FI 0 EQSTAT, DG0 FI 1 EQSTAT, and DG0 STMX EQSTAT must be "O".

Initial and growth offices must have the following EQSTAT values set to "O" if any of them are entered:

- DG1 CD 0 EQSTAT
- DG1 CD 1 EQSTAT
- DG1 FI 0 EQSTAT
- DG1 FI 1 EQSTAT
- DG1 STMX EQSTAT

If any of the following is entered, they all must be entered:

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT (for PCT LINK 0), and also the CLI fields associated with each of these EQSTAT fields.

If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT.

DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 FI 0 EQSTAT and DG1 FI 1 EQSTAT.

2.17 FI 1 EQSTAT

Description: Enter the Facility Interface 1 Equipage State on the DNU-S.

Required Field for DG0.
Default: O
Valid Entries:

Valid FI 1 EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

For DG0:
If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT

- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL0 CD 0 EQSTAT and PCTL0 CD 1 EQSTAT.

Initial and growth offices must have

- DG0 CD 0 EQSTAT
- DG0 CD 1 EQSTAT
- DG0 FI 0 EQSTAT
- DG0 FI 1 EQSTAT
- DG0 STMX EQSTAT all set to "O".

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 FI 0 EQSTAT and DG0 FI 1 EQSTAT.

For DG1:
Before DG1 CD 0 EQSTAT or DG1 CD 1 EQSTAT can be entered, DG0 FI 0 EQSTAT, DG0 FI 1 EQSTAT, and DG0 STMX EQSTAT must be "O".

Initial and growth offices must have the following EQSTAT values set to "O" if any of them are entered:

- DG1 CD 0 EQSTAT
- DG1 CD 1 EQSTAT
- DG1 FI 0 EQSTAT
- DG1 FI 1 EQSTAT
- DG1 STMX EQSTAT

If any of the following is entered, they all must be entered:

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT (for PCT LINK 0), and also the CLI fields associated with each of these EQSTAT fields.

If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT.

DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 FI 0 EQSTAT and DG1 FI 1 EQSTAT.

2.18 FI 0 CLI

Copyright © 2003 Lucent Technologies

Description: Enter the hexadecimal Facility Interface 0 Change Level Indicator for the DNU-S.

Required Field for DG0.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

2.19 FI 1 CLI

Description: Enter the hexadecimal Facility Interface 1 Change Level Indicator for the DNU-S.

Required Field for DG0.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

2.20 STMX EQSTAT

Description: Enter the Spare Transmission Multiplexer Equipage State on the DNU-S.

Required Field for DG0.
Default: O
Valid Entries:

Valid STMX EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

For DG0:
If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL0 CD 0 EQSTAT and PCTL0 CD 1 EQSTAT.

DG0 CD 0 EQSTAT and DG0 CD 1 EQSTAT must be greater than or equal to DG0 STMX EQSTAT.

For all DG0TMX rows, DG0TMX EQSTAT must not exceed the value of DG0 STMX EQSTAT.

DG1:
DG1 CD 0 EQSTAT and DG1 CD 1 EQSTAT must be greater than or equal to DG1 STMX EQSTAT.

Before DG1 CD 0 EQSTAT or DG1 CD 1 EQSTAT can be entered:

Copyright © 2003 Lucent Technologies

- DG0 FI 0 EQSTAT
- DG0 FI 1 EQSTAT
- DG0 STMX EQSTAT must be "O"

Initial and growth offices must have:

- DG0 CD 0 EQSTAT
- DG0 CD 1 EQSTAT
- DG0 FI 0 EQSTAT
- DG0 FI 1 EQSTAT
- DG0 STMX EQSTAT all set to "O".

Initial and growth offices must have the following EQSTAT values set to "O" if any of them are entered:

- DG1 CD 0 EQSTAT
- DG1 CD 1 EQSTAT
- DG1 FI 0 EQSTAT
- DG1 FI 1 EQSTAT
- DG1 STMX EQSTAT

If any of the following is entered, they all must be entered:

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT (for PCT LINK 0), and also the CLI fields associated with each of these EQSTAT fields.

If any of the following is "U", they all must be "U":

- CD 0 EQSTAT
- CD 1 EQSTAT
- FI 0 EQSTAT
- FI 1 EQSTAT
- STMX EQSTAT

and (for PCT LINK 0) both PCTL1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT.

For all DG1TMX rows, DG1TMX EQSTAT must not exceed the value of DG1 STMX EQSTAT.

2.21 STMX CLI

Description: Enter the hexadecimal Spare Transmission Multiplexer Change Level Indicator on the DNU-S.

Required Field for DG0.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI

Copyright © 2003 Lucent Technologies

values.

3. FORM ENTRIES 5855-3 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

DATA GROUP 0/1 TMX (DG0TMX/DG1TMX)

The following fields (Section 3.2 - Section 3.4) define the Service and Spare TMUXs (Transmission Multiplexers) list (0 - 5) connected to Data Group 0/1. Entries include equipage status and change level indicator for each TMUX. Please note that the spare TMUX for data group 0/1 is not included in this list, but it is specified in the STMX EQSTAT and STMX CLI fields.

3.2 TMX NUMBER

Description: Enter the Transmission Multiplexer Numbering for data group 0 and data group 1.
Valid Entries: 0 - 5

3.3 EQSTAT

Description: Enter the Equipage State for transmission multiplexers numbered 0 - 5 in data group 0 or data group 1. Do not enter the field if no data is associated with this piece of hardware.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

DG0TMX:
Initial and growth offices must have EQSTAT set to "O".

If either EQSTAT or CLI in the DG0TMX list is entered, then both in that row must be entered.

For all DG0TMX rows, DG0TMX EQSTAT must not exceed the value of DG0 STMX EQSTAT.

DG1TMX:
Initial and growth offices must have EQSTAT set to "O".

If either EQSTAT or CLI in the DG1TMX list is entered, then both in that row must be entered.

For all DG1TMX rows, DG1TMX EQSTAT must not exceed the value of DG1 STMX EQSTAT.

3.4 CLI

Description: The CLI (Change Level Indicator) hexadecimal number specifies the transmission multiplexer change level indicator number for transmission multiplexers numbered 0 to 5 in Data Group 0.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI

Copyright © 2003 Lucent Technologies

values.

If either EQSTAT or CLI in the DG0TMX list is entered, then both in that row must be entered.

If either EQSTAT or CLI in the DG1TMX list is entered, then both in that row must be entered.

PCT LINKS DATA GROUP 0/1 (PCTL0/1)

The following fields (Section 3.5 - Section 3.9) define a list (numbered 0 - 5) of PCT (Peripheral Control and Timing) links connected to Data Group 0 for PCT LINKS DATA GROUP 0 and Data Group 1 for PCT LINKS DATA GROUP 1. Entries include the TSIS (Time Slot Interchanger Slice) board and slot locations, and the equipage states and change level indicators for the PCT connections to both Common Data 0 and Common Data 1.

3.5 PCT LINK

Description: Peripheral Control and Timing Link on Data Group 0/1 Number specifies the number of the peripheral control link on DNU-S Data Group 0/1.
Valid Entries: 0 - 5

Data Rules:

The total number of PCT LINKs (EQDNUS forms with entries in PCTL0/1, TSISBRD and TSISSLOT) in an SM-2000 must not be greater than the entry in the MAX ALLOWABLE FOR SM field on the EQIM form (5700 Record).

3.6 TSIS BRD

Description: Enter the Peripheral Control and Timing Link on Data Group 0/1 Time Slot Interchange Slice Board Number connected to the peripheral control link on DNU-S Data Group 0/1.
Valid Entries: 1 - 9

Data Rules:

TSIS BRD and TSIS SLOT combinations must be unique for PCTL0 and PCTL1.

The combination of TSI BRD and TSI SLOT entries on the EQDI form, the EQPDXU form, the EQDNUS form, and/or the EQNLI form must not be duplicated on any other EQDI form (except when entering the second of a DI pair), on the same or any other EQNLI form, on the same or any other EQPDXU form (except when entering a PCTDX1 where the XAIU CONFIG is equal to "LOW"), or on any EQDNUS form for a given SM.

Each PCTL TSIS BRD entered on the EQDNUS form must be defined on the EQTSI form and the matching EQTSI form must have an EQSTAT value that is greater than or equal to the PCTL0 CD 0 EQSTAT/CD 1 EQSTAT defined on the EQDNUS form (i.e., "O" is greater than "G" which is greater than "U").

For PCTL0:
If TSIS BRD or TSIS SLOT is entered in the PCTL0 list, then:

- both must be entered in that row.
- CD 0 EQSTAT or CD 1 EQSTAT in that row must be entered.
- CD 0 CLI or CD 1 CLI in that row must be entered.

PCTL1:

Copyright © 2003 Lucent Technologies

If TSIS BRD or TSIS SLOT in list PCTL1 is entered, then:

- both must be entered in that row.
- CD 0 EQSTAT or CD 1 EQSTAT in that row must be entered.

3.7 TSIS SLOT

Description: The Peripheral Control and Timing Link Interface on Data Group 0 Time Slot Interchange Slice Slot Number field is used to specify the time slot interchanger slice slot number connected to the peripheral control link on DNU-S Data Group 0/1.
Valid Entries: 0 - 3

Data Rules:

TSIS BRD and TSIS SLOT combinations must be unique for PCTL0 and PCTL1.

The combination of TSI BRD and TSI SLOT entries on the EQDI form, the EQDNUS form, and/or EQNLI form must not be duplicated on any other EQDI form (except when entering the second of a DI pair), on the same or any other EQNLI form, or on any EQDNUS form for a given SM.

For PCTL0:
If TSIS BRD or TSIS SLOT is entered in the PCTL0 list, then:

- both must be entered in that row.
- CD 0 EQSTAT or CD 1 EQSTAT in that row must be entered.
- CD 0 CLI or CD 1 CLI in that row must be entered.

PCTL1:
If TSIS BRD or TSIS SLOT in list PCTL1 is entered, then:

- both must be entered in that row.
- CD 0 EQSTAT or CD 1 EQSTAT in that row must be entered.

3.8 CD 0/1 EQSTAT

Description: The Peripheral Control and Timing Link Interface on Data Group 0/1 Common Data 0/1 Equipage State is used to specify the equipage state of the peripheral link on the DNU-S Data Group 0/1 Common Data 0/1.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

For PCTL0:
Initial and growth offices must have CD 0 EQSTAT and CD 1 EQSTAT set to "O".

If CD 0 EQSTAT or CD 1 EQSTAT in list PCTL0 is entered, then TSIS BRD and TSIS SLOT in that row

Copyright © 2003 Lucent Technologies

must be entered.

If CD 0 EQSTAT in list PCTL0 is entered, CD 0 CLI in that row must be entered.

If CD 1 EQSTAT in list PCTL0 is entered, CD 1 CLI in that row must be entered.

PCTL0 CD 0 EQSTAT must equal DG0 CD 0 EQSTAT and PCTL0 CD 1 EQSTAT must equal DG0 CD 1 EQSTAT.

For PCTL1:
Initial and growth offices must have CD 0 EQSTAT and CD 1 EQSTAT set to "O".

If CD 0 EQSTAT or CD 1 EQSTAT in list PCTL1 is entered, then TSIS BRD and TSIS SLOT in that row must be entered.

If CD 0 EQSTAT in list PCTL1 is entered, CD 0 CLI in that row must be entered.

If CD 1 EQSTAT in list PCTL1 is entered, then CD 1 CLI in that row must be entered.

PCTL1 CD 0 EQSTAT must equal DG1 CD 0 EQSTAT and PCTL1 CD 1 EQSTAT must equal DG1 CD 1 EQSTAT.

For all PCT LINK rows:

- DG0 CD 0 EQSTAT must be greater than or equal to PCTL0 CD 0 EQSTAT.
- DG0 CD 1 EQSTAT must be greater than or equal to PCTL0 CD 1 EQSTAT.
- DG1 CD 0 EQSTAT must be greater than or equal to PCTL1 CD 0 EQSTAT.
- DG1 CD 1 EQSTAT must be greater than or equal to PCTL1 CD 1 EQSTAT.

3.9 CD 0/1 CLI

Description: Peripheral Control and Timing Link Interface on Data Group 0/1 Common Data 0/1 Change Level Indicator Number is used to specify the change level indicator hexadecimal number for the peripheral link on the DNU-S Data Group 0/1 Common Data 0/1.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

For PCTL0: If CD 0 CLI in list PCTL0 is entered, then CD 0 EQSTAT in that row must be entered.

If CD 1 CLI in list PCTL0 is entered, then CD 1 EQSTAT in that row must be entered.

For PCTL1: If CD 0 CLI in list PCTL1 is entered, then CD 0 EQSTAT in that row must be entered.

If CD 1 CLI in list PCTL1 is entered, then CD 1 EQSTAT in that row must be entered.

SEC. 58: 5856 RECORD
MESSAGE HANDLER (SM-2000) - EQMH

1. GENERAL

The 5856 Record is available with the 5E9(2) and later Software Releases. The Message Handler (SM-2000) form is used to equip the message handler for an SM-2000 class processor. The Message Handler MH1 is responsible for providing the messaging interface for the DNU-S.

The Message Handler can only be grown on an SM-2000 class processor.

This form has been added to support the DNU-S feature.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.13.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SM

Description: The SM field is used to specify the switching module number.

Required Field.
Valid Entries: 1 - 192

2.3 *MH

Description: The MH field is used to specify the message handler number.

Required Field.
Default: Null
Valid Entries: 1 or 2

Data Rules:

Each SM with MH values defined on the EQMH form has a maximum of 31 SPYDER-T timeslots available for allocation (bit 0 is reserved). The SM cannot exceed the maximum capacity of 31 total timeslots. A maximum of 6 Timeslots are allowed per equipped DNU-S. Six timeslots are allocated per each EQDNUS form, three timeslots are allocated per each CC side if "U" is not entered in CC0 EQSTAT or CC1 EQSTAT fields.

For 5E12 and later, when MH is 1 on the EQMH form, MH SIDE 0 CLI and MH SIDE 1 CLI must be 0 or, when MH is 2, MH SIDE 0 CLI and MH SIDE 1 CLI can be 0 or 3.

2.4 MH SIDE 0 EQSTAT

Description: The MH SIDE 0 EQSTAT field is used to specify the equipage state of the message handler on side 0.

Required Field.
Default: O
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid MH SIDE 0 EQSTAT Entries	
Entry	**Definition**
G	Growth
O	Operational
U	Unequipped

Data Rules:

Initial and growth offices must have MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT set to "O".

If MH SIDE 0 EQSTAT is "U", MH SIDE 1 EQSTAT cannot be "O".

If MH SIDE 1 EQSTAT is "U" or not entered, MH SIDE 0 EQSTAT cannot be "O".

2.5 MH SIDE 0 CLI

Description: Enter the MH SIDE 0 CLI hexadecimal number for the change level indicator for the message handler on Side 0.

Required Field.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

2.6 MH SIDE 1 EQSTAT

Description: Enter the equipage state of Side 1 of the Message Handler.

Valid MH SIDE 1 EQSTAT Entries	
Entry	**Definition**
G	Growth
O	Operational
U	Unequipped

Data Rules:

Initial and growth offices must have MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT set to "O".

If MH SIDE 0 EQSTAT is "U", then MH SIDE 1 EQSTAT cannot be "O".

If MH SIDE 1 EQSTAT is "U" or not entered, then MH SIDE 0 EQSTAT cannot be "O".

If MH SIDE 1 EQSTAT is entered, MH SIDE 1 CLI must be entered.

2.7 MH SIDE 1 CLI

Description: Enter the hexadecimal change level indicator for the Message Handler on Side 1.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values.

If MH SIDE 1 CLI is entered, then MH SIDE 1 EQSTAT must be entered.

SEC. 59: 5857-1/2 RECORD
DIGITAL NETWORKING UNIT SONET FOR STE AND STS (SM2000) - EQSTE

1. GENERAL

The 5857-1/2 Record is available with 5E9(2) and later Software Releases. The DNU-S (Digital Networking Unit-SONET) for STE (SONET Termination Equipment) and STS (Synchronous Transport Signal) form defines the STE facility in the DNU-S. For more information on DNU-S, see Division 2, Section 9C.

STSX-1 interface consists of the STE, STS-1 Path VT1.5 Path, and the DS1 Path, all of which are terminated by the DNU-S.

The STE is the facility that terminates the SONET Section and Line layers. It is the parent of the STS-1, VT1.5s, and DS1s.

The STS is the basic SONET building block and implies a rate and format, not a transmission medium. It is the child of the STE and parent of the VT1.5s and DS1s.

The CGA (Carrier Group Alarm) data is associated with the VT/DS1 and STE/STS facilities. Included in the CGA data is a hash index into an internal TM (Terminal Maintenance) data structure. The hash indexes are automatically assigned during the RC/V and ODA processing. During de-growth, RC initializes the associated hash indexes to "N". The hash index is transparent to the user, i.e, no hash index office data is entered via RC or ODA. However, only 522 hash indexes are available per switching module. One hash index is allocated to each instance of the following for a specific SM:

- 1 per each pair STE/STS on a specified SM (EQSTE form). (The EQSTE form is associated with the DNU-S.)
- 1 per each VT (Virtual Tributary) on a specified SM (EQVT form). (The EQVT form is associated with the DNU-S.)
- 1 per each DFI (Digital Facility Interface) of a DLTU (Digital Line/Trunk Unit) where FAC IND is 0 or 1, and DFI TYPE is not "H1" or "H2", i.e., DFI USAGE of "H1" and "H2" are not counted (EQDUP form). (The EQDUP form is not associated with the DNU-S.)
- 1 per each DFI-2 (2 per EQDUP form) where FAC IND is 3.
- 1 per pack - POS, EQST, CLI, CLEI combination; 30 packs per DCLU on EQDCLP form (the EQDCLP form is not associated with the DNU-S).
- 1 per IFAC - EQSTAT, SUP MTHD, PUB43801 combination; 20 per IDCU on the EQIFAC form) (the EQIFAC form is not associated with the DNU-S).

The sum of the above total number of allocated hash indexes (instances) cannot be greater then 522 for any one specific SM.

1.1 Recent Change View

The corresponding Recent Change View for this form is 20.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * SM

Description: Enter the switching module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The maximum number of DNU-S Performance Monitoring Groups may not be more than 50 unique PM GROUP names per SM from the combination of PM GROUP(s) defined on EQSTE form(s) as STE PM GROUP, and defined on EQVT form(s) as VT PM GROUP and DS1S PM GROUP.

For each SM entered on this form, a corresponding SM must be entered on the EQIM form SM.

2.3 * DNUS

Description: Enter the digital networking unit SONET number.

Required Field.
Valid Entries: 0 - 7

2.4 * DATA GROUP

Description: Enter the DNU-S data group number.

Required Field.
Valid Entries: 0 - 1

2.5 * STE

Description: Enter the SONET termination equipment number on the DNU-S.

Required Field.
Valid Entries:
- 5E12 and earlier: 0 - 5
- 5E13 and later: 1 - 6

2.6 STE EQSTAT

Description: Enter the STE (SONET termination equipment) equipage state on the DNU-S.

Required Field.
Default:

For ODA: O
- For RC: G

Valid Entries:

Valid STE EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

Initial and growth offices must have STE EQSTAT and STS EQSTAT set to "O".

Copyright © 2003 Lucent Technologies

If STS EQSTAT is "O", then STE EQSTAT must be "O".

If STS EQSTAT is "G", then STE EQSTAT must be "O" or "G".

The STE EQSTAT value cannot be greater than the corresponding DG0TMX/DG1TMX EQSTAT for the matching DG0TMX/DG1TMX TMX NUMBER (where STE matches the TMX NUMBER) on the EQDNUS form, and the EQDNUS form must be defined for the STE value. Since the TMUX number on this form is the same in DATA GROUP 0 and DATA GROUP 1, the DATA GROUP field on the EQSTE form must be used to determine the corresponding DATA GROUP TMUX number to compare against on this form.

Also the STE EQSTAT cannot be greater than the DG0/DG1 FI 0 EQSTAT and FI 1 EQSTAT on the associated EQDNUS form.

2.7 STE PM GROUP

Description: Enter the SONET termination equipment line and section performance monitoring group assigned to the STE. (See also DNUPM form, Division 5, Section 5L.)

Required Field.
Default: STEDEF
Valid Entries: 1 - 8 characters.

Data Rules:

The STE PM GROUP cannot be "/STEGDEF".

If the STE PM GROUP is entered, then the corresponding DNUPM form(s) must be defined with PM TYPE of "STE". DNUPM form corresponds with this form if PM GROUP on the DNUPM form matches the STE PM GROUP on this form.

2.8 STE FACILITY ID

Description: Enter the facility identifier on the STE.
Valid Entries: 1 - 25 characters.

2.9 LI CLI

Description: Enter the hexadecimal link interface change level indicator on the facility.

Required Field.
Default: 0
Valid Entries: 0 - 7FFFFFFF (hexadecimal)

Data Rules:

For the first hardware version the only valid value is 0. Later hardware versions will require other CLI values. See Division 8, Section 1 for CLI values.

2.10 LINE BUILD OUT

Description: Is line build out required? The cable length and type determine if line build out is required. Line build out is a signal attenuation function provided in the transmit path of the STSX-1 interface. Signal attenuation is needed to prevent excessive signal strength at the electrical cross connect panel when using short coax cable lengths. When the LINE BUILD OUT field is set to "Y", attenuation is active. When the LINE BUILD OUT field is set to "N", no attenuation is applied. The following table indicates the cable length thresholds that require attenuation.

Copyright © 2003 Lucent Technologies

Cable Length vs Line Build Out

Cable Type	LINE BUILD OUT	
	Cable Length For "Y" Entered	Cable Length For "N" Entered
735A	<< = 120 feet	>> 120 feet
734A	<< = 225 feet	>> 225 feet
728A	<< = 225 feet	>> 225 feet

NOTE: If an electrical cross connect is located between the DNU-S and SONET transmission equipment, cable length refers to the distance between the DNU-S and the electrical cross connect. Otherwise, cable length refers to the total distance between the DNU-S and the SONET transmission equipment.

Required Field.
Default: N
Valid Entries: Y, N

2.11 STS EQSTAT

Description: Enter the synchronous transport signal equipage state on the DNU-S.

Required Field.
Default:

For ODA: O
For RC: G

Valid Entries:

Valid STS EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

Initial and growth offices must have STE EQSTAT and STS EQSTAT set to "O".

If STS EQSTAT is "O", STE EQSTAT must be "O".

If STS EQSTAT is "G", STE EQSTAT must be "O" or "G".

STS PATH TRACE (STS)

The following fields provide the capability to add a character string to identify the STS path from either the transmit or expected signal.

2.12 TRANSMIT

Description: Enter identifying characters for the transmit STS Path Trace. This field supports the STS Path Trace feature. See Division 2, Section 9R.

Software Release: 5E13 and later
Valid Entries: up to 62 characters

2.13 EXPECTED

Description: Enter identifying characters for the expected STS Path Trace. This field supports the STS Path Trace feature. See Division 2, Section 9R.

Copyright © 2003 Lucent Technologies

Software Release: 5E13 and later
Valid Entries: up to 62 characters

SEC. 60: 5858 RECORD
DIGITAL NETWORKING UNIT SONET VIRTUAL TRIBUTARY (SM2000) - EQVT

1. GENERAL

The 5858 Record is available with 5E9(2) and later Software Releases.

The DNU-S (Digital Networking Unit - SONET) Virtual Tributary (SM-2000) form is used for the equipage of the VT (Virtual Tributary) and the DS1S (Digital Signal Level 1 SONET) facility on a DNU-S - feature number (99-5E-1427). For more information on DNU-S, see Division 2, Section 9C.

Effective with the 5E13 and later Software Releases, the DNU-S VT Group Number feature (99-5E-4424) introduced a new VT facility (DS1) numbering scheme for DNU-S provisioning. The VT field was split and renamed VT GROUP and VT MEMBER. A new STE (SONET Termination Equipment) field was added, and the "NEN" OE Number field defined for trunks was modified accordingly. To accommodate this change, a conversion of the former VT field number to the new VT GROUP and VT MEMBER number is applied (see the conversion table provided at the VT field). For more information on the 99-5E-4424 feature, see Division 2, Section 9Q.

Effective as a 5E13 and later Software Update, the RSM (Remote Switching Module) on DNU-S feature (99-5E-4209) is added. For this feature, a new APPLICATION TYPE ("RSM") was added to provide the capability to assign a Remote Switching Module to DS1 facilities terminating on a DNU-S. This feature only applies to DNU-S units that utilize the SFI (STS Facility Interface). For more information, see Division 2, Section 9S.

Also added as a 5E13 and later Software Update is the Wireless Trunks on DNU-S feature (99-5E-3553). For this feature, a new field, AFAC ID, was added to define the Autoplex Facility Identifier for wireless trunks. For more information, see Division 2, Section 8L.

The SONET digital switch interface terminates the STSX-1 interface for the intraoffice environment. It is a 51.84 Mb/s electrical interface which carries intraoffice trunks because it is limited to a maximum of 900 feet. However, the actual digital trunks may be "interoffice" since the digital trunk in a DS0, within the DS1 facility, may terminate on another switch, using the SONET transmission equipment for the physical wire connection.

The trunks carried by the STSX-1 interface are digital: the DNU-S does not support analog trunks.

The STSX-1 interface is made up of the following layers:

- STE (SONET Termination Equipment)
  - Section
  - Line
- STS-1 Path
- VT Path
- DS1 Path

The Section and Line layers have been combined and are referred to as the STE (SONET Termination Equipment). The STE, as well as the STS-1, VT, and DS1 are each considered to be a separate "facility".

The VT1.5, a 1.728 Mb/s facility, carries one DS1 (1.544 MB/s). The VT tributaries consist of asynchronous mapped DS1s in a floating mode of operation.

Copyright © 2003 Lucent Technologies

The DS1S facility is similar to existing DS1 (Digital Signal Level 1) facilities. It is a 1.544 Mb/s facility which carries up to 24 DS0s (64 kb/s).

1.1 Carrier Group Alarm Hash Indexes

The CGA (Carrier Group Alarm) data is associated with the VT/DS1 and STE/STS facilities. For 5E9(2) and later, only 522 hash indexes are available per switching module. One hash index is allocated to each instance of the following for a specific SM:

- 1 per each pair STE/STS on a specified SM (EQSTE form). (The EQSTE form is associated with the DNU-S.)
- 1 per each VT (Virtual Tributary) on a specified SM (EQVT form). (The EQVT form is associated with the DNU-S.)
- 1 per each DFI (Digital Facility Interface) of a DLTU (Digital Line/Trunk Unit) where FAC IND is 0 or 1, and DFI TYPE is not "H1" or "H2"; i.e., DFI USAGE of "H1" and "H2" are not counted (EQDUP form). (The EQDUP form is associated with DLTU.)
- 1 per each DFI-2 (2 per EQDUP form) where FAC IND is 3. (The EQDUP form is associated with DLTU.)
- 1 per pack - POS, EQST, CLI, CLEI combination. (30 packs per DCLU on EQDCLP form) (The EQDCLP form is associated with DCLU.)
- 1 per IFAC - EQSTAT, SUP MTHD, PUB43801 combination. (20 per IDCU on the EQIFAC form) (The EQIFAC form is associated with IDCU.)

The sum of the above total number of allocated hash indexes (instances) cannot be greater than 522 for any one specific SM.

1.2 Recent Change View

The corresponding Recent Change View for this form is 20.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the switching module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Only 50 unique PM GROUP names are allowed per SM from the combination of PM GROUPs defined on EQSTE forms as STE PM GROUP, and defined on EQVT forms as VT PM GROUP and DS1S PM GROUP.

Each SM entered on this form must also be entered on an EQIM form.

Each value of SM entered on the EQDNUS, EQSTE, and EQVT forms must have a corresponding EQIM

Copyright © 2003 Lucent Technologies

form with the same SM value where the value entered for CONFIGURATION supports Digital Networking Unit-SONET. The "SM2000" value for CONFIGURATION supports Digital Networking Unit-SONET.

2.3 * DNUS

Description: Enter the DNU-S (Digital Networking Unit SONET) number.

Required Field.
Valid Entries: 0 - 7

2.4 * DATA GROUP

Description: Enter the DNU-S (Digital Networking Unit SONET) data group number.

Required Field.
Valid Entries: 0 - 1

2.5 * STE

Description: Enter the STE (SONET Termination Equipment) number. This field was implemented at the time of the DNU-S VT Group Number feature to comply with Bellcore requirement R6-3 [938] for numbering conventions. (See Division 2, Section 9Q.)

Software Release: 5E13 and later
Required Field.
Valid Entries: 1 - 6

2.6 * STS

Description: Enter the STS (Synchronous Transport Signal) number. This field was modified at the time of the DNU-S VT Group Number feature to comply with Bellcore requirement R6-3 [938] for numbering conventions. (See Division 2, Section 9Q.)

Required Field.
Default:

5E13 and later: 1
Valid Entries:
- 5E12 and earlier: 0 - 5
- 5E13 and later: 1 (only valid entry)

2.7 * VT

Description: Enter the VT (Virtual Tributary) number on the DNU-S. For 5E13 and later, the VT field was replaced by the VT GROUP and VT MEMBER fields to support the DNU-S VT Group Number feature to satisfy Bellcore requirement R6-2 [361v2] for numbering conventions. (See Division 2, Section 9Q.)

The TMUX (Transmission Multiplexer) circuit pack maps the 28 possible VT entries into a SONET STS1 signal format of seven groups of four. The 28 VT entries in this field are organized into those groups as shown in the following two tables.

NOTE: Prior to 5E13, the VT field was used to enter the VT. Effective with the 5E13 Software Release, the VT GROUP and VT MEMBER fields are used.

DNUS - TMUX
VT Entry Correspondence with
SONET Signal Group and Member Number

Copyright © 2003 Lucent Technologies

VT Entry	SONET Signal	
	Group Number Entry	VT1.5 Member Number Entry
1	1	1
2	2	1
3	3	1
4	4	1
5	5	1
6	6	1
7	7	1
8	1	2
9	2	2

22	1	4
23	2	4
24	3	4
25	4	4
26	5	4
27	6	4
28	7	4

The following table shows the same relationship of VT entries to the 7 groups of 4 VT1.5 members in a matrix which provides the position of the VT1.5s within the STS.

SONET Signal Group	VT1.5 Members			
	1	2	3	4
1	VT = 01	VT = 08	VT = 15	VT = 22
2	VT = 02	VT = 09	VT = 16	VT = 23
3	VT = 03	VT = 10	VT = 17	VT = 24
4	VT = 04	VT = 11	VT = 18	VT = 25
5	VT = 05	VT = 12	VT = 19	VT = 26
6	VT = 06	VT = 13	VT = 20	VT = 27
7	VT = 07	VT = 14	VT = 21	VT = 28

2.8 *VT GROUP

Description: Enter the Virtual Tributary Group number. This field supports the DNU-S VT Group Number feature. (See Division 2, Section 9Q.)

Software Release: 5E13 and later
Required Field.
Valid Entries: 1 - 7

2.9 *VT MEMBER

Description: Enter the Virtual Tributary Member number. This field supports the DNU-S VT Group Number feature. (See Division 2, Section 9Q.)

Software Release: 5E13 and later
Required Field.
Valid Entries: 1 - 4

2.10 VT EQSTAT

Description: Enter the virtual tributary equipage state.

Copyright © 2003 Lucent Technologies

Required Field.
Default:

For ODA: O
- For RC: G

Valid Entries:

Valid VT EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

During an INSERT operation in Recent Change, VT EQSTAT must not be "O".

Initial and growth offices must have VT EQSTAT and DS1S EQSTAT set to "O".

If "O" is entered, then DS1S EQSTAT must be "G" or "O".

If "G" is entered, DS1S EQSTAT must be "G".

If "U" is entered, then DS1S EQSTAT must be "U".

The value entered in VT EQSTAT cannot be greater than the corresponding PCTL0/PCTL1 CD 0 EQSTAT. In addition, it cannot be greater then CD 1 EQSTAT for the matching PCTL0/PCTL1 PCTLINK on the EQDNUS form (5855 Record). (STS on this form matches PCTLINK on the EQDNUS form). Both CD 0 EQSTAT and CD 1 EQSTAT must be entered and must be greater than or equal to VT EQSTAT. In addition, if VT EQSTAT is "G", then both CD 0 EQSTAT and CD 1 EQSTAT must be defined and must be "O" within the associated DATA GROUP (PCTL0/PCTL1).

For all VT values, the STS EQSTAT field must be entered on the EQSTE form and VT EQSTAT cannot be greater than the corresponding STS EQSTAT found by matching EQVT SM/DNUS/DATA GROUP/STS fields with EQSTE SM/DNUS/DATA GROUP/STE fields. In addition, if VT EQSTAT is "G", then STS EQSTAT must be "O".

For 5E12 and earlier:

- When PRIGRP forms have FACILITY LIST entries assigned with EQUIPMENT TYPE of "DNUS", the SM, EQUIPMENT NUMBER[1,1], EQUIPMENT NUMBER[2,2], EQUIPMENT NUMBER[3,3], and EQUIPMENT NUMBER[4,5] entered on the PRIGRP form must be defined on an EQVT form as SM, DNUS, DATA GROUP, STS, and VT, respectively. VT EQSTAT and DS1S EQSTAT must both be "O".

For 5E13 and later:

- When PRIGRP forms have FACILITY LIST entries assigned with EQUIPMENT TYPE of "DNUS", the SM, EQUIPMENT NUMBER[1,1], EQUIPMENT NUMBER[2,2], EQUIPMENT NUMBER[3,3], and EQUIPMENT NUMBER[4,4], EQUIPMENT NUMBER[5,5], and EQUIPMENT NUMBER[6,6], entered on the PRIGRP form must be defined on an EQVT form as SM, DNUS, DATA GROUP, STE, STS, VT GROUP, and VT MEMBER, respectively. VT EQSTAT and DS1S EQSTAT must both be "O".

2.11 VT PM GROUP

Description: Enter the virtual tributary performance monitoring group.

Copyright © 2003 Lucent Technologies

Required Field.
Default: VT1DEF
Valid Entries: 1 - 8 characters

Data Rules:

"/VT1GDEF" cannot be entered.

If a VT PM GROUP is defined, then a corresponding DNUPM form must be defined with PM TYPE of "VT1". Forms correspond if the VT PM GROUP on this form matches the PM GROUP on the DNUPM form.

No more than 50 unique PM GROUP names are allowed per SM from the combination of PM GROUPs defined on EQSTE forms as STE PM GROUP, and defined on EQVT forms as VT PM GROUP and DS1S PM GROUP.

2.12 VT TYPE

Description: The VT TYPE field is used to specify the type of the virtual tributary. For 5E9(2) - 5E12, "ASYNC" indicating asynchronous is automatically entered in this field and cannot be changed. For 5E13 and later, the Byte-Synchronous value was added to support the DNU-S Support for B-Sync DS1 Mapping to VT1.5 feature (99-5E-4151).
Default: ASYNC
Valid Entries:
- 5E9(2) and later: [A]SYNC
- 5E13 and later: [B]SYNC

NOTE: If VT TYPE is "BSYNC", the far end and any network elements along the path, must also be setup/compatible with "BSYNC".

2.13 VT MODE

Description: The VT MODE field specifies the mode of the virtual tributary. The only valid value is "RB" (robbed bit), which is automatically entered and cannot be changed.
Default: RB
Valid Entries:
- 5E12 and earlier: RB (Robbed Bit)
- 5E13 and later: DMI (DMI mode)

Data Rules:

When DMI is entered, APPLICATION TYPE must be "RSM".

2.14 VT SIZE

Description: The VT SIZE field is used to specify the size of the virtual tributary. The only valid value is 1.5, which is automatically entered and cannot be changed.

Virtual Tributary Line Rates

Optical Carrier Level	Electrical Equivalent	Line Rate (Mb/s)
VT1.5	DS-1 (1.544Mb/s)	1.728

Default: 1.5
Valid Entries: 1.5

Copyright © 2003 Lucent Technologies

2.15 DS1S EQSTAT

Description: Enter the DS1S equipage state of the DNU-S.

Required Field.
Default:

For ODA: O
- For RC: G

Valid Entries:

Valid DS1S EQSTAT Entries

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

During a Recent Change INSERT operation the DS1S EQSTAT must not be "O".

Initial and growth offices must have VT EQSTAT and DS1S EQSTAT set to "O".

2.16 DS1S PM GROUP

Description: Enter the Digital Signal Level 1 SONET performance monitoring group.

Required Field.
Default: DS1SDEF
Valid Entries: 1 - 8 characters

Data Rules:

DS1S PM GROUP cannot be "/DS1SGDF".

If DS1S PM GROUP is entered on this form, then it must be entered in the PM GROUP field on the DNUPM form with a PM TYPE of "DS1S".

No more than 50 unique PM GROUP names are allowed per SM from the combination of PM GROUPs defined on EQSTE forms as STE PM GROUP, and defined on EQVT forms as VT PM GROUP and DS1S PM GROUP.

2.17 DS1S FACILITY ID

Description: Enter the DS1S FACILITY ID used to identify the digital signal level 1 SONET facility.
Valid Entries: 1 - 25 characters

2.18 APPLICATION TYPE

Description: This field supports multiple applications of a DS1 on the DNU-S. Enter the Application Type.

This field supports the TR303 on DNU-S feature. See Division 2, Section 9J.

Software Release: 5E12 and later.
Required Field.
Valid Entries:

Valid APPLICATION TYPE Entries

Entry	Definition
AIUC	Extended Access Interface Unit Control.

Copyright © 2003 Lucent Technologies

AIUD	Extended Access Interface Unit Data.
IWU	Inter-Working Unit. Supports the 99-5E-7880 feature in a 5E16 Feature Release.
IWG	Inter-Working Gateway. Supports the 99-5E-8010 feature in a 5E15 Feature Release.
RSM	5E13 Software Update: Supports the 99-5E-4209 feature: SM and RSM via the DNU-S.
TRUNK	Digital trunk facility.
TR303	Control facility TR303 RDT (Remote Digital Terminal).
[TR303C]TRL	Data facility TR303 RDT.

Data Rules:

When "TR303" or "TR303CTRL" is entered, FRAME must be "ESF" and ZCS must be "N".

When "AIUC" or "AIUD" is entered, FRAME must be "ESF" and ZCS must be "N".

When "RSM" is entered,

- VT MODE must be "DMI"
- FRAME must be "ESF"
- ZCS must be "N" .

NOTE: When "RSM" is not entered, VT MODE must be "RB".

DS1 SIGNALING (DS1S)

The following fields (Section 2.19 - Section 2.20) define the Level 1 SONET Facility signaling attributes. The table below provides the relationship of line coding and framing formats between the DFI and the DNU-S VT1.5. It shows the effect of these codings to the HDLC (High Level Data Link Control) format of the D-channel. The DNU-S VT1.5 equivalent to the DLTU DFI MODE is a combination of the ZCS field of the VT1.5, the DNU-S DS1 Frame, and the D-channel DATA RATE field on the TKGRP form (5202 Record). The first three columns of the table are related to the DNU-S VT1.5.

Line Coding and Framing Formats for DFI and DNU-S VT1.5

DNU-S DS1S FRAME	DNU-S DS1S ZCS	DATA RATE	DFI MODE	LINE CODING	FRAMING FORMAT	HDLC ENCODING
SF	Y	56K	D4	ZCS	SF/D4	Inverted.
ESF	Y	56K	FEB7	ZCS	ESF	Inverted.
SF	Y	R64K	D464	ZCS	SF/D4	Inverted.
ESF	Y	R64K	FE64	ZCS	ESF	Inverted.
SF	N	64K	64K	B8ZS	SF/D4	Noninverted.
ESF	N	64K	FE8Z	B8ZS	ESF	Noninverted.

2.19 # FRAME

Description: Enter the type of framing for the DS1 SONET facility signaling.

Required Field.

Valid FRAME Entries

Entry	Definition
ESF	Extended Super Frame.
SF	Super Frame.

2.20 ZCS

Description: Should zero code suppression be in effect on this DS1S?

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when TGN/MEMBs defined on the TRUNK form have NEN entered, and have a TRKCLS of "EDSL" and DATA RATE of 64K on the associated TKGRP form, ZCS on the associated EQVT form must be "N".

For 5E10 and later, when TGN/MEMBs defined on a TRUNK form have an entry for NEN, where the corresponding TKGRP form has WB RATE entered there must be a matching EQVT form where FRAME is "ESF" and ZCS is "N".

WIRELESS TRUNKS

2.21 AFAC ID

Description: Enter the Autoplex Facility Identifier. This feature was added for the Wireless Trunks on DNU-S feature. See Division 2, Section 8L.

Software Release: 5E13 and later
Valid Entries:

- For 5E13 and earlier: 1 - 1023
- For 5E14: 1 - 4080
- For 5E15 and later: 1 - 4500

Data Rules:

For 5E13 and later:

- When AFAC ID is entered, APPLICATION TYPE must be "TRUNK".
- AFAC IDs must be unique across EQDUP and EQVT forms in an office.
- An EQDSC3 form (5852 Record) must exist with the EQSTAT attribute set to "O" for the associated SM.
- AFAC ID must not be entered on EQDUP or EQVT forms under the following TKGRP form conditions:
- DCS TRK is "N",
- TRKCLS is not equal to "BCM" or "PPMEM", and
- TRK DIR is not "SGNL".

APT TESTING

This field supports the APT (Automatic Progression Testing) Enhancements feature. For information on this feature see, Division 2, Section 2AD.

Copyright © 2003 Lucent Technologies

2.22 ALGORITHM

Description: This field is used for the DS1 (Digital Signal Level 1) in APT (Automatic Progression Testing).

Software Release: 5E16(2) and later
Valid Entries:

Valid ALGORITHM Entries

Entry	Definition
1ONLY	Test One Only (test one trunk only on the DS1, independently whether test passes or fails and then move to a trunk on another DS1).
FULL	Full (test all trunks on the DS1, independently whether test passes or fails, and then move to a trunk on another DS1).
NOTST	No Test (APT should not perform any tests on the DS1).
SUCC	Stop on Success (test one trunk on the DS1 and then move to a trunk on another DS1 if test passes, or test next trunk on the same DS1 if test fails).

Data Rules:

ALGORITHM can only be entered when APPLICATION TYPE is "TRUNK".

SEC. 61: 5859 RECORD
EQUIPMENT SUBUNIT □ SAS MEMORY PACK - EQSASP

1. GENERAL

The 5859 Record is available with 5E9(2) and later Software Releases. This record defines the equipage information for the SAS (Service Announcement System) memory packs and the cards within the memory pack.

1.1 Recent Change View

The corresponding Recent Change View for this form is 20.26

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the switching module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Every entry on this form must have a corresponding entry on the EQRA form where UNIT TYPE is set to "SAS". The corresponding EQRA form is found by matching SM and UNIT NUMBER on the EQSASP form to the SWITCHING MODULE and UNIT NUMBER on the EQRA form.

2.3 * UNIT NUMBER

Description: Enter the service announcement system unit number.

Required Field.
Valid Entries: 0 - 7

2.4 * PACK NUMBER

Description: Enter the service announcement system pack position.

Required Field.
Valid Entries: 1 - 4

Data Rules:

The PACK NUMBER entries on the EQSASP forms that have the same SM and UNIT NUMBER must be sequential starting with one.

2.5 # EQSTAT

Description: Enter the memory pack equipage state.

Required Field.

Valid EQSTAT Entries

Copyright © 2003 Lucent Technologies

Entry	Definition
G	Growth
O	Operational
U	Unequipped

Data Rules:

The entry for EQSTAT must be less than or equal to the EQUIPMENT STATUS on the corresponding EQRA form: "O" is greater than "G" which is greater than "U". The corresponding EQRA form is found by matching SM and UNIT NUMBER on the EQSASP form to SWITCHING MODULE and UNIT NUMBER on the EQRA form.

2.6 CLI

Description: Enter the hexadecimal CLI (Change Level Indicator) for the service announcement system memory pack. See Division 8, Section 1 for CLI values.

Required Field.

Defaut Value: 00000000
Valid Entries: 00000000 - 7FFFFFFF (hexadecimal)

2.7 APPLICATION

Description: Enter the application name for service announcement system.
Valid Entries: 1 - 8 of the following characters:
- (2, A-Z, - or _)

Data Rules:

APPLICATION must be specified when defining a memory flash card.

If APPLICATION is entered, then CARDS EQUIP must be greater then 0.

2.8 CARDS EQUIP

Description: Enter the number of SAS memory flash cards equipped.

Required Field.
Default: 0
Valid Entries: 0 - 8

Data Rules:

The sum of the number of entries in MEMORY CARD LIST must equal the entry in this field.

If CARDS EQUIP is entered, then APPLICATION must be entered.

MEMORY CARD LIST (MCL)

The following fields (Section 2.9 - Section 2.10) define the list of memory flash card densities and version numbers.

2.9 SIZE

Description: Enter the Card size specifying the memory flash card density.

Valid SIZE Entries	
Entry	**Definition**

Copyright © 2003 Lucent Technologies

FR1 - FR64	Densities for Flash RAM
SR1 - SR64 and SR512	Densities for Static RAM

Data Rules:

If SIZE is entered, then CODE must also be entered. If SIZE is not entered, then CODE cannot be entered.

2.10 CODE

Description: Enter the card code specifying the memory flash card version number.
Valid Entries: 9 digits

Data Rules:

Each CODE entry in MEMORY CARD LIST must be unique.

SEC. 62: 5743 RECORD
ECHO CANCELER UNIT EQUIPAGE - EQECSU

1. GENERAL

The 5743 Record is available with the 5E10 Software Release. It is used to define the characteristics of an Echo Canceler Unit. This form supports Echo Canceler Units for the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.15

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM must be defined on an EQIM form.

If EQDUP forms have Echo Cancelers defined, then a corresponding EQECSU form must exist with the same SM entry and unit number.

2.3 * ECSU

Description: Enter the Echo Canceler Unit number.

Required Field.
Valid Entries: 0 - 5

Data Rules:

If this form is entered, a corresponding EQDUP form must exist having the same unit number as the entry in this field and the same SM number.

2.4 # EQLAISLE

Description: Enter the Equipment location (floor and aisle) number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00-99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00-99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 0000 - 9999

2.5 # EQLBAY

Copyright © 2003 Lucent Technologies

Description: Enter the equipment location bay number

Required Field.
Valid Entries:
- For SM: 0 - 4
- For SM-2000: 0 - 215

Data Rules:

The Equipment Bay and Vertical Position values must be unique within an SM. More than one Unit cannot be assigned the same equipment bay and vertical position within the same Switching Module.

2.6 # EQLUNVER

Description: Enter the equipment location unit vertical position number of the unit (circuit pack).

Required Field.
Valid Entries: 00 to 84

```
eqecsu                    5ESS Switch        _

```

Figure 1 SAMPLE EQECSU FORM 5E10 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 63: 5860 RECORD
GLOBAL DIGITAL SERVICE CIRCUIT 3 - EQGDSC3

1. GENERAL

The 5860 Record (Global Digital Service Circuit 3) is available with the 5E10 and later Software Releases. It is used to define the GDSF (Global Digital Service Function) on the DSU3 for the SM and the SM-2000 class processor. There is a maximum of 1 DSU3 per SM and 2 per SM-2000 class processor. The GDSF includes the following services:

- Conference Circuits (3 and 6 Ports)
- Tone Generators
- Tone Transceivers
- Guard-Data-Guard Transceivers
- ISTF Loop Back
- ISTF Transmitter

See Figure 1. for GDSF service configurations by equipment type.

Each DSC3 has four duplex PIDBs (Peripheral Interface Data Buses) for a total of 128 time slots of data and one duplex PICB (Peripheral Interface Control Buses) for control. This provides four times the number of time slots that the DSC2 supports. The DSC3 connects (via PIDBs/PICBs) to the TSI (Time Slot Interchanger) and the SMP (Switching Module Processor) via the DX (Data EXpander) and CI (Control Interface) links, respectively.

For an SM-2000 class processor, UNIT TYPE on the EQIM form (5700 Record) must be set to an SM-2000 class processor. PACK NUMBER values for each combination of SM and DSU must be entered in sequential order for SM-2000 (i.e., PACK NUMBER 1 cannot be entered for an SM and DSU until PACK NUMBER 0 is entered for the same SM and DSU).

For 5E11 and later, RSMs (Remote Switching Modules) may only have ISTF loopback and ISTF transmit circuit assignments via a EQGDSC3 form. Valid RSM EQGDSC3 assignments are provided in the following table:

Valid RSM ISTF/ISTF Entries

SM TYPE	CONFIGURATION	# of 3 PORTS	# of 6 PORTS
SM-2000	4 or 7	0	0
non-SM-2000	4 or 6	0	0

The SM-2005 unit can accommodate up to 6 LDSC3/GDSC3 boards.

See Division 2, Section 7G for more information on the GDSF. This form is also used to define the GDSF on a CSU (Combined Services Unit). See Division 2, Section 7F.

1.1 Recent Change View

The Recent Change View for this form is 19.19.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 *SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.3 *GDSF PACK NUM

Description: Enter the GDSF Pack Number.

Required Field.

Valid GDSF PACK NUM Entries

Entry	Description
0	SM.
0 - 31	SM-2000.

Data Rules:

The values of GDSF PACK NUM must be sequential per SM, beginning with 0.

When UNIT TYPE on the EQIM form is not an SM-2000 class processor, GDSF PACK NUM must be 0.

For SM-2000 class processors, all four PIDB LIST PIDB values must be entered. For non-SM-2000 class processors, no more than two PIDB LIST PIDB values are allowed.

2.4 #UNIT OFFSET

Description: Enter the Unit Offset number.

Required Field.
Valid Entries:
- 5E10 and earlier: 13 for SM; 0-17 for an SM-2000 class processor

5E11 and later: 13 for SM; 0-23 for an SM-2000 class processor

Data Rules:

UNIT OFFSET and PICB must both be even, or both be odd.

UNIT OFFSET values must not be duplicated on another EQGDSC3 form defined for the same DSU3 and SM.

When UNIT TYPE on the EQIM form is not an SM-2000 class processor, UNIT OFFSET must be 13.

UNIT OFFSET must not be 10 or 19. These positions are exclusively for LDSC3 packs.

When UNIT OFFSET is greater than 17, the BAY field must be "0" and VERTPOST must be 15.

2.5 EQSTAT

Description: Enter the status of the unit.

Required Field.

Default Value. O

Valid EQUIPMENT STATUS Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

For initial offices, EQSTAT must be "O".

If EQSTAT is not "O", NUM OF 3 PORTS, NUM OF 6 PORTS, and CONFIGURATION must be 0 or blank.

2.6 #CLI

Description: Enter the Change Level Indicator value. Refer to Division 8, Section 1 for the appropriate CLI value.

Required Field.

Default: 0
Valid Entries: 0 - 7fffffff (hex)

Data Rules:

When UNIT TYPE on the EQIM form is not an SM-2000 class processor, CLI must be 0.

For 5E16(2) FR 1 and later, when GDSF2 is equipped with UN363 packs, CLI must be 0, and with UN590 packs, the CLI must be 1.

2.7 #AISLE

Description: Enter the aisle (and floor) where the DSU3 is located. The floor is designated 00 - 99 and the aisle is designated 00 - 99.

Required Field.
Valid Entries: 00 - 99

2.8 #BAY

Description: Enter the Bay number where the DSU3 is located.

Required Field.
Valid Entries: 0 - 208

Valid BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	SM.
0 - 14	SM-2000 class processor; SM Cabinet aisle.
100 - 104	SM-2000 class processor; Back panel; wiring position.
200 - 208	SM-2000 class processor; Front panel; door position.

Valid BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,

2.9 #VERTPOS

Description: Enter the Vertical Position where the DSU3 is located. Recommended positions are as follows:

For 7-foot cabinets: 22, 30, 39, 48, 56, 65, 74
- For 6-foot cabinets: 7, 15, 24, 32, 41, 49, 58

Required Field.
Valid Entries: 00 - 84

2.10 CSU

Description: Is the GDSF located on a CSU (Combined Services Unit)? For more information on the Combined Services Unit feature, see Division 2, Section 7F.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and earlier, when CSU is "Y":

- UNIT OFFSET must be 13.
- no other EQGDSC3 form may be entered on the same SM that also has CSU of "Y".
- UNIT TYPE on the EQIM form must not be "SM2000"
- no other EQGDSC3 form may be entered on the same SM that also has CSU set to "Y".

When CSU is set to "N", the corresponding SM must have a UNIT TYPE with an SM-2000 class processor.

For 5E11 and later, for a Wireless Centrex Application:

- GDSF PACK NUM must be 0 or 1,
- CSU must be "Y".

For 5E11 and later, for a non-Wireless Centrex Application:

- GDSF PACK NUM must be 0 or 1,
- CSU must be "Y",
- UNIT OFFSET must be 13.

NOTE: A Wireless Centrex Application is indicated by PRODUCT set to "WNC" on the OFCOPT form (5509 Record).

2.11 #CONFIGURATION

Description: Enter the configuration of the GDSF Pack.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 8

Data Rules:

If CONFIGURATION is 2, 4, or 5, the number of CONFERENCE circuits must be 0 or blank.

2.12 NUM OF 3 PORT

Description: Enter the quantity of 3 Ports required. Note that each 3 Port (time slots in clusters of three) is equal to three conference circuits. An entry of 1 provides 3 conference circuits; an entry of 2 provides six conference circuits, etc.

Required Field.
Valid Entries: blank, 0 - 42

2.13 NUM OF 6 PORT

Description: Enter the quantity of 6 Ports required. Note that each 6 Port (time slots in clusters of six) is equal to 6 conference circuits. For example, an entry of 1 provides 6 conference circuits; an entry of 2 provides 12 conference circuits, etc.

Required Field.
Valid Entries: blank, 0 - 21

2.14 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.

Required Field.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form for the same Switching Module. In addition, the EQSTAT value on the EQCI must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form (5853 Record). (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

For 5E16(2) and later, when INTF UNIT is 0, BAY must be 000 - 014, 100 - 104, or 200 - 208.

2.15 #CI

Description: Enter the Control Interface group number.

Required Field.

Valid CI Entries

Entry	Description
0 - 1	SM.
0 - 3	SM-2000 class processor.

Copyright © 2003 Lucent Technologies

Data Rules:
The value of the CI/PICB fields must not be 0/0 or 0/1. These values are reserved for the LDSU on non-SM2000 class processors.

CI (CONTROL GROUP) numbers assigned on the following forms must be defined as CI on an EQCI form: EQDCTU (5751 Record), EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record), EQFIU (5753 Record), EQMSU (5750 Record), EQRCLK (5723 Record). Furthermore, the EQSTAT on the matching EQCI form must be greater than or equal to the equipment status value on the equipment form (i.e., "O" is greater than "G" which is greater than "U").

2.16 #PICB

Description: Enter the Peripheral Interface Control Bus number.

Required Field.
Valid Entries: 0 - 22

Data Rules:

PICB and UNIT OFFSET must both be even, or both be odd.

2.17 #DI

Description: Enter the Data Interface number.

Required Field.
Valid Entries:
- 0 - 1 for SM
- 0 - 5 for an SM-2000 class processor

Data Rules:

The following forms cannot have a duplicate Data Port assignment on the same Switching Module: EQDCLU (5810 Record), EQDS (5740 Record), EQDSC3 (5852 Record), EQDUP (5730-2), EQGDSC3 (5860 Record), EQIDCU (5846 Record), EQISLU (5731 Record), EQISTF (5823 Record), EQLU (5710 Record), EQPSU (5741 Record), EQRA (5821 Record), EQTU (5720 Record).

PIDB LIST

This field group defines the PIDB numbers for rows 1 - 4. Each PIDB row must be unique.

2.18 #PIDB

Description: Enter the PIDB for rows 1 - 4.

Required Field.
Valid Entries:
- 0 - 15 for SM
- 0 - 23 for an SM-2000 class processor

Data Rules:

At least one PIDB must be entered.

Copyright © 2003 Lucent Technologies

When only 1 PIDB is equipped and CONFIGURATION is 1, the number of Conference Circuits cannot exceed 32 (see Note below).

When only 1 PIDB is equipped and CONFIGURATION is 2, 4, or 5, the number of Conference Circuits must be 0 or blank.

When only 1 PIDB is equipped and CONFIGURATION is 6 or 7, the number of Conference Circuits cannot exceed 24 (see Note below).

When only 1 PIDB is equipped and CONFIGURATION is 8, the number of Conference Circuits cannot exceed 12 (see Note below).

When only 1 or 2 PIDBs are equipped, CONFIGURATION must not be 3.

When only 2 PIDBs are equipped, and CONFIGURATION is 1, the number of Conference Circuits cannot exceed 64 (see Note below).

When only 2 PIDBs are equipped, and CONFIGURATION is 6 or 8, the number of Conference Circuits cannot exceed 30 (see Note below).

When only 2 PIDBs are equipped, and CONFIGURATION is 7, the number of Conference Circuits cannot exceed 48 (see Note below).

When 4 PIDBs are equipped, and CONFIGURATION is 1, the number of Conference Circuits cannot exceed 128 (see Note below).

When 4 PIDBs are equipped, and CONFIGURATION is 2 or 5, the number of Conference Circuits cannot exceed 30 (see Note below).

When 4 PIDBs are equipped, and CONFIGURATION is 4 or 8, the number of Conference Circuits cannot exceed 60 (see Note below).

When 4 PIDBs are equipped, and CONFIGURATION is 7, the number of Conference Circuits must be 0.

When 4 PIDBs are equipped, CONFIGURATION must not be 3 or 6.

When 4 PIDBs are equipped and CONFIGURATION is 3, 4, 6, or 8, the number of conference circuits cannot exceed 24 (see Note below).

- ***NOTE:*** The number of conference circuits is determined by the value entered in the NUM OF 3 PORT field x 3, plus the value entered in the NUM OF 6 PORT field x 6.

GLOBAL DIGITAL SERVICES FUNCTION SM-2000 CONFIGURATIONS - 4 PIDBs

SEC. 64: 5745-1/2 RECORD ACCESS INTERFACE UNIT - EQAIU

1. GENERAL

The 5745 Record is available with the 5E11 Software Release. It is used to define the AIU (Access Interface Unit) (see Division 2, Section 7K). Effective with the 5E12 and later Software Releases, ISDN capability was added for the AIU (see Division 2, Section 9K). Additionally, for 5E12 and later, the Remote AIU feature is available (see Division 2, Section 9O). Effective with the 5E14 and later Software Releases, ADSL (Asymmetric Digital Subscriber Line) on the AIU and Broadband for the AIU are provided. These features are also available as 5E11, 5E12, and 5E13 Software Releases (see Division 2, Section 7AF). For 5E14 and later, the XAIU (MultipleXed Access Interface Unit) feature was implemented (See Division 2, Section 9T).

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switch Module identification number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For each SM assignment, there must be a corresponding EQIM form (5700 Record).

When an EQAIU form is assigned to an SM where the value of UNIT TYPE is not defined as an SM-2000 class processor on the corresponding EQIM form, the following conditions must be met:

- AIU must be less than 15
- EQL BAY must be 0 - 4
- CI must be 0 or 1
- RING GEN LOC must be less than 15
- The "DI" segment of the DI/DFPOS field must be 0 or 1 when PIDB TYPE is "AIU".

When an EQAIU form is assigned to a UNIT TYPE of "SM-2000", a maximum of 43 AIUs can be assigned.

For 5E14 and later:

For each SM assignment with AIU TYPE set to "XAIU", there must be a corresponding EQIM form (5700 Record) that must be an SM-2000 class processor.

For each SM assignment with AIU TYPE set to "XAIU", there must not be more than 31 XAIUs assigned.

Copyright © 2003 Lucent Technologies

2.3 * AIU

Description: Enter the Access Interface Unit identification number.

Required Field.

Valid AIU - 5E11 Entries

Entry	Description
0 - 14	SM.
0 - 42	SM-2000.

Valid AIU - 5E12 and later Entries

Entry	Description
0 - 14	SM.
0 - 127	SM-2000.

2.4 AIU TYPE

Description: This field was added to accommodate multiple AIU types. Enter the AIU TYPE.

Software Release: 5E12 and later
Required Field.
Default: AIU
Valid Entries:

Valid AIU TYPE Entries

Entry	Description
[A]IU	AIU feature.
[E]AIU	AIU Remote feature. Requires an SM-2000 class processor (when EQSTAT is set to either "O" or "G") defined on the EQIM form.
[X]AIU	Software Release: 5E14 and later Multiplexed AIU feature. Requires an SM-2000 class processor when AIUs are remotely used.

Data Rules:

If "AIU" is entered:

- COMDAC STATE, SITE ID, CBL SERIES and CBL DISTANCE must not be entered.
- CI and PICB must be entered.
- Row 1 of LOCAL TIME SLOT GROUP (PIDB) list must be entered.
- REMOTE COMDAC 0/1 TIME SLOT GROUP (TSPFAC0/TSPFAC1) list must not be entered.
- TEST PACK 0/1 must be "N"
- for every EQAIUP form, the EQAIUP EQSTAT must be less than the TIME SLOT GROUP (PIDB) (row 1) EQSTAT (EQSTAT state of "G" is less than the state of "O").

For 5E14 and later:

- row 1 of TIME SLOT GROUP must be unique within TIME SLOT GROUP (PIDB) list.
- RCOMDAC0 EXT REF and RCOMDAC1 EXT REF must be "N".
- and MTB0 is entered, row 1 PIDB.EQSTAT must be "G" or "O".
- and MTB1 is entered, row 1 PIDB.EQSTAT must be "G" or "O".

Copyright © 2003 Lucent Technologies

For 5E15 and later:

- INTF UNIT must be entered.

If "EAIU" is entered:

- CI and PICB must not be entered.
- COMDAC STATE and SITE ID must be entered.
- LOCAL TIME SLOT GROUP (PIDB) list must not be entered.
- CBL DISTANCE and CBL SERIES must be entered.
- a RISITE form with the same SITE ID must be entered.
- and REMOTE COMDAC 0/1 TIME SLOT GROUP has a TRANSPORT TYPE of "DLTU", there must be an EQDUP form with a matching SM, DLTU, PK and FAC to define the transport DFI.
- and REMOTE COMDAC 0/1 TIME SLOT GROUP has a TRANSPORT TYPE of "DNUS", there must be a matching EQVT form entered to define the transport DNU-S.
- and TSPFAC0 row 1 EQSTAT of "G" or "O", there must be an EQMH form defined with a matching SM number, or both MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT must be "O".
- and TSPFAC0/TSPFAC1 row 1 EQSTAT of "G" or "O" and/or the EQAIU forms with AIU TYPE of "XAIU" and XAIUTSGRP row 1 EQSTAT of "G" or "O", the maximum channel capacity defined on the EQMH form with a matching SM number is 31 channels.
- for every EQAIUP form, the EQAIUP EQSTAT must be less than the REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) row 1 EQSTAT on the AIU form (EQSTAT state of "G" is less than the state of "O").

For 5E13 and later:

- ***NOTE:*** The SM, DLTU/DNUS, PK/DG, FAC/STE, STS, VTG and VTM on the EQAIU form match the SM, DNUS, DATA GROUP, STE, STS, VT GROUP and VT MEMBER on the EQVT form.

- REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) row 1 must point to a control DFI (on a EQDUP form) or DNU (on an EQVT form). If the COMDAC STATE is "DUPLEX", REMOTE COMDAC 1 TIME SLOT GROUP (TSPFAC1) row 1 must also point to a control DFI or DNU. (An EQDUP form will match SM, DLTU and DFI PACK NUMBER and will have FAC 0 or FAC 1 APPL set to "AIUC".) (An EQVT form will match SM, DNUS, DATA GROUP, STE, STS, VT GROUP and VT MEMBER and will have an APPLICATION TYPE of "AIUC".)
- REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) rows 2 - 6 (if equipped) must point to a data DFI (on a EQDUP form) or DNU (on an EQVT form). If the COMDAC STATE is "DUPLEX", REMOTE COMDAC 1 TIME SLOT GROUP (TSPFAC1) rows 2 - 6 (if equipped) must also point to a control DFI or DNU. (An EQDUP form will match SM, DLTU and DFI PACK NUMBER and will have FAC 0 or FAC 1 APPL set to "AIUD".) (An EQVT form will match SM, DNUS, DATA GROUP, STE, STS, VT GROUP and VT MEMBER and will have an APPLICATION TYPE of "AIUD".)
- REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) rows 1 - 6 (if equipped) entries must be unique. If the COMDAC STATE is "DUPLEX", REMOTE COMDAC 1 TIME SLOT GROUP

Copyright © 2003 Lucent Technologies

(TSPFAC1) rows 1 - 6 (if equipped) must be unique. Entries must also be unique across REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) and REMOTE COMDAC 1 TIME SLOT GROUP (TSPFAC1) lists.

- When AIU TYPE is not "EAIU", REMOTE TIME SLOT GROUP (TSPFAC0 and TSPFAC1) lists must not be entered.

For 5E15 and later:

- INTF UNIT must not be entered.

If "XAIU" is entered:

For 5E14 and later:

- CI and PICB must not be entered.
- COMDAC STATE, SITE ID, CBL SERIES and CBL DISTANCE must not be entered.
- TEST TYPE 0 and TEST TYPE 1 must be "N".
- RCOMDAC0 EXT REF and RCOMDAC1 EXT REF must be "N".
- PDXU and SHELF must be entered.
- EQSTAT in row 1 of TIME SLOT GROUP (XAIUTSGRP) list must be entered.
- and SHELF equals 2 or 5, XAIU CONFIG must not be set to "HIGH".
- and EQSTAT in row 1 of the TIME SLOT GROUP (XAIUTSGRP) is entered, there must be an EQPDXU form (5868 Record) with PCTDX0 and PCTDX1 EQSTAT equal to or greater than the EQAIU EQSTAT in row 1 of the TIME SLOT GROUP.
- and XAIUTSGRP row 1's EQSTAT of "G" or "O" must have a matching SM number, or both MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT must not equal to "O".
- with one or more entries in the XAIUTSGRP list where TSGRP NO is 2 - 5 and EQSTAT is "G" or O", there must be a corresponding EQPDXU form with XAIU CONFIG set to "HIGH".

When AIU TYPE is not "XAIU", PDXU, and SHELF must not be entered.

When AIU TYPE is not "XAIU", EQL BAY must not be 900 - 999.

For 5E15 and later:

If "XAIU" is entered:

- INTF UNIT must not be entered.
- EQL BAY must not be "0".

2.5 BROADBAND

Description: Is the AIU unit Broadband capable? See Division 2, Section 7AF.

Software Release: 5E11 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

2.6 EMERG STAND ALONE

Description: Does the AIU have Emergency Stand Alone capability? See Division 2, Section 9AA.

Software Release: 5E15 FR 3
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered,

- AIU TYPE must be "EAIU"

2.7 AIU SIZE

Description: This field was added for the AIU Remote feature. Enter the AIU SIZE. See Division 2, Section 90.

Software Release: 5E12 and later
Required Field.
Default: 600
Valid Entries:

Valid AIU SIZE Entries

Entry	Description
500	Equipment size designation.
600	Equipment size designation (domestic).

Data Rules:

When "500" is entered, there is a maximum of 14 packs (EQAIUP forms) that can be equipped.

2.8 # EQL AISLE

Description: Enter both the equipment floor and aisle number.

Required Field.
Valid Entries: 0000 - 9999

2.9 # EQL BAY

Description: Enter the equipment location bay number.

Required Field.

Valid EQL BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid EQL BAY Entries for 5E16(2) and later

Entry	Type
000 - 004	SM

Copyright © 2003 Lucent Technologies

000 - 014, A00 - A14, D00 - D14, G00 - G14, K00 - K14, N00 - N14, R00 - R14, U00 - U14, X00 - X14,	100 - 104, B00 - B04, E00 - E04, H00 - H04, L00 - L04, P00 - P04, S00 - S04, V00 - V04, Y00 - Y04,	200 - 208, C00 - C08, F00 - F08, J00 - J08, M00 - M08, Q00 - Q08, T00 - T08, W00 - W08, Z00 - Z08	SM-2000

Valid Entries:

Data Rules:

When AIU TYPE is "AIU" and INTF UNIT is 0, EQL BAY must be 000 - 014, 100 - 104 , 200 - 208 or 900 - 999.

When AIU TYPE is "EAIU" or "XAIU", EQL BAY must be 000 - 014, 100 - 104, 200 - 208 or 900 - 999.

When INTF UNIT is greater than 0, the value in the PRIMARY UNIT field on the EQXCDU form (5832 Record) determines the allowed values for EQL BAY as indicated in the *Valid EQL BAY Entries for 5E16 and later* table displayed previously.

2.10 # EQL UNVER

Description: Enter the equipment location unit vertical position. Two AIUs can be identified as having identical vertical positions, either front or back of a cabinet (on a given EQL AISLE/EQLBAY). However, greater than two AIUs with identical vertical positions is not allowed.

Required Field.
Valid Entries:
- 5E11: 0 - 84
- 5E12 and later: 15, 32, or 49

2.11 # CABINET

Description: Enter the location of the AIU unit within the cabinet.

Required Field.

Valid CABINET Entries

Entry	Description
[B]ack or R	Software Release 5E11 and earlier: Mounted in the wiring side of the cabinet.
[R]ear or R	Software Release 5E12 and later. Mounted in the wiring side of the cabinet.
[F]ront or F	Mounted in the equipment side of the cabinet.

2.12 EQSTATUS

Description: Enter the operational status of the equipment unit.

Software Release: 5E11 only
Required Field.
Default: O
Valid Entries:

Valid EQSTATUS Entries

Entry	Description

U	Unequipped.
G	Growth.
O	Operational.

2.13 CLI

Description: For 5E15 FR 3 and later, this field name was changed to COMDAC CLI to clearly identify that it is associated with the Common Data And Control circuit. See the COMDAC CLI field below for usage information.

2.14 COMDAC CLI

Description: Enter the Change Level Indicator for this AIU. Refer to Division 8, Section 1 for valid CLI values. This field name was changed to COMDAC CLI in 5E15 FR3.

Required Field.
Valid Entries: 0 - 7FFFFFFF

Data Rules:

For 5E11 and later, the COMDAC CLI value for the "AIU" is 00.
For 5E12 and later, the COMDAC CLI value for the "RAIU" is 01.
For 5E14 and later, the COMDAC CLI value for the "XAIU" is 04.

2.15 MTB0

Description: Enter the Metallic Test Bus - Service Group 0.

Required Field.
Valid Entries:
- 5E11: Enter the MTBO number as below.
- 5E12 and later: Blank, or enter the MTBO
- number as below.

METALLIC TEST BUS - 0

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 31
Bus	BUS	XX	00 - 14

Data Rules:

If MTB0 is entered, row 1 TSPFAC0.EQSTAT must be "G" or "O".

2.16 MTB1

Description: Enter the Metallic Test Bus - Service Group 1.

Required Field.

Valid Entries:
- 5E11: Enter the MTBO number as below.
- 5E12 and later: Blank, or enter the MTBO
- number as below.

Copyright © 2003 Lucent Technologies

METALLIC TEST BUS - 1			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 31
Bus	BUS	XX	00 - 14

Data Rules:

If MTB1 is entered, row 1 TSPFAC1.EQSTAT must be "G" or "O".

2.17 INTF UNIT

Description: Enter the Interface Unit number. This field was added to support the 5E15 Optically Extended Control and Data Unit feature. See Division 2, Section 9V.
Valid Entries: 0 - 8

Data Rules:

When INTF UNIT is greater than 0, it must be defined on the EQXCDU form (5832 Record) for the same Switching Module. In addition, the EQSTAT value on the EQCI form (5848 Record) must not exceed the MOD CTL SG0/1 EQSTAT on the EQXCDU form. (EQSTAT of "O" is greater than EQSTAT of "G", and EQSTAT of "G" is greater than EQSTAT of "U".)

The SM/INTF UNIT/DATA GRP combinations entered on this form must be defined on a EQDI form or a EQXCDU form. Also, the EQSTAT on the matching EQDI or EQXCDU form must be greater than or equal to the equipment status value ("O", "G", or "U") on this form (e.g., "O" is greater than "G" which is greater than "U"). Note also that when INTF UNIT is greater than 0 and DATA GRP is 0, these Data Groups are defined on the EQXCDU form.

When INTF UNIT is greater than 0, CI must not be 3.

For 5E16(2) and later, when INTF UNIT is 0, EQL BAY must be 000 - 014, 100 - 104, 200 - 208, or 900 - 999.

2.18 CI

Description: Enter the Control Interface number.

Required Field.
Valid Entries:
- 5E11: SM: 0 - 1
- SM-2000 class processor: 0 - 3

5E12: Blank, or

SM: 0 - 1

SM-2000 class processor: 0 - 3

2.19 PICB

Description: Enter the Peripheral Interface Control Bus number.

Required Field.
Valid Entries:
- 5E11: 0 - 20 (even numbers)
- 5E12 and later: Blank, or 0 - 20 (even numbers)

Copyright © 2003 Lucent Technologies

RING GENERATOR

2.20 RING GEN LOC

Description: Enter the Ring Generator Location.

Required Field.
Valid Entries:
- 5E11: 0 - 42
- 5E12 and later: Blank, or 0 - 42

Data Rules:

A Ring Generator cannot be defined on more than 6 EQAIU forms (itself and 5 other AIUs).

A pair of Ring Generators can be used by more than one AIU; however, AIU RING GEN LOCs must be assigned to use their own ring generators before assigned to other AIUs. The value represented by RING GEN LOC must correspond to the AIU number on an EQAIU form (the host AIU) with either RING GEN LOC equal to the AIU on that form or where RING GEN LOC is unknown.

For 5E11 only, If a RING GEN LOC is specified on the EQAIU form, a EQAIUP form must be found for the same SM with its AIU value the same as RING GEN LOC, and APPL PACK NUM must be 17 or 19, and EQSTAT must be "G" or "O", and TYPE must be equal to "AIRG".

2.21 EXT RG0 EQSTAT

Description: Enter the equipment status of Ring Generator 0.

Software Release: 5E12 and later
Required Field.
Valid Entries: Blank, or as indicated in table below:

Valid EXT RG0 EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

If entered, RING GEN LOC must be known and RING GEN LOC must be the same as AIU unit number.

There can only be one RING GEN 0 assigned.

If EXT RG0 EQSTAT is entered, RING GEN LOC must be the same as AIU unit number.

2.22 EXT RG1 EQSTAT

Description: Enter the equipment status of Ring Generator 1.

Software Release: 5E12 and later
Required Field.
Valid Entries:

Valid EXT RG1 EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.

Copyright © 2003 Lucent Technologies

O	Operational.

Data Rules:

If entered, RING GEN LOC must be known and RING GEN LOC must be the same as AIU unit number.

There can only be one RING GEN 1 assigned.

If EXT RG1 EQSTAT is entered, RING GEN LOC must be the same as AIU unit number.

REMOTE COMDAC

2.23 COMDAC STATE

Description: Enter the state of the remote common data control.

Software Release: Required Field.
Valid Entries: [S]IMPLEX or [D]UPLEX

Data Rules:

If "SIMPLEX" is entered, REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) row 1 must be entered.

If "SIMPLEX" is entered, REMOTE COMDAC 1 TIME SLOT GROUP (TSPFAC1) list must not be entered.

If "SIMPLEX" is entered, MTB1 must not be entered.

If "DUPLEX" is entered, REMOTE COMDAC 0 TIME SLOT GROUP (TSPFAC0) row 1 must be entered.

If "DUPLEX" is entered, REMOTE COMDAC 1 TIME SLOT GROUP (TSPFAC1) row 1 must be entered.

If "DUPLEX" is entered for a given row, TSPFAC0.EQSTAT must be the same as TSPFAC1.EQSTAT for that row.

If "DUPLEX" is entered for a given row, TSPFAC1.EQSTAT must be the same as TSPFAC0.EQSTAT for that row.

If "DUPLEX" is entered, both TSPFAC0 and TSPFAC1 lists must have equal number of rows defined.

For 5E14 and later:

When COMDAC STATE is "DUPLEX" and row 1 of TSPFAC1.EQSTAT is set to "O", TSPFAC0.EQSTAT in row 1 must be "O".

When COMDAC STATE is "DUPLEX" and row 1 of TSPFAC1.EQSTAT is set to "G", TSPFAC0.EQSTAT in row 1 must be "G" or "O".

When COMDAC STATE is "DUPLEX" and row 2 of TSPFAC1.EQSTAT is set to "O", TSPFAC0.EQSTAT in row 2 must be "O".

When COMDAC STATE is "DUPLEX" and row 2 of TSPFAC1.EQSTAT is set to "G", TSPFAC0.EQSTAT in row 2 must be "G" or "O".

When COMDAC STATE is "DUPLEX" and row 2 of TSPFAC1.EQSTAT is set to "U", TSPFAC0.EQSTAT in row 2 must be entered.

When COMDAC STATE is "DUPLEX" and row 2 of TSPFAC1.EQSTAT is not entered, TSPFAC0.EQSTAT in row 2 must not be entered.

When COMDAC STATE is "DUPLEX" and row 3 of TSPFAC1.EQSTAT is set to "O", TSPFAC0.EQSTAT

Copyright © 2003 Lucent Technologies

in row 3 must be "O".

When COMDAC STATE is "DUPLEX" and row 3 of TSPFAC1.EQSTAT is set to "G", TSPFAC0.EQSTAT in row 3 must be "G" or "O".

When COMDAC STATE is "DUPLEX" and row 3 of TSPFAC1.EQSTAT is set to "U", TSPFAC0.EQSTAT in row 3 must be entered.

When COMDAC STATE is "DUPLEX" and row 3 of TSPFAC1.EQSTAT is not entered, TSPFAC0.EQSTAT in row 3 must not be entered.

When COMDAC STATE is "DUPLEX" and row 4 of TSPFAC1.EQSTAT is set to "O", TSPFAC0.EQSTAT in row 4 must be "O".

When COMDAC STATE is "DUPLEX" and row 4 of TSPFAC1.EQSTAT is set to "G", TSPFAC0.EQSTAT in row 4 must be "G" or "O".

When COMDAC STATE is "DUPLEX" and row 4 of TSPFAC1.EQSTAT is set to "U", TSPFAC0.EQSTAT in row 4 must be entered.

When COMDAC STATE is "DUPLEX" and row 4 of TSPFAC1.EQSTAT is not entered, TSPFAC0.EQSTAT in row 4 must not be entered.

When COMDAC STATE is "DUPLEX" and row 5 of TSPFAC1.EQSTAT is set to "O", TSPFAC0.EQSTAT in row 5 must be "O".

When COMDAC STATE is "DUPLEX" and row 5 of TSPFAC1.EQSTAT is set to "G", TSPFAC0.EQSTAT in row 5 must be"G" or "O".

When COMDAC STATE is "DUPLEX" and row 5 of TSPFAC1.EQSTAT is set to "U", TSPFAC0.EQSTAT in row 5 must be entered.

When COMDAC STATE is "DUPLEX" and row 5 of TSPFAC1.EQSTAT is not entered, TSPFAC0.EQSTAT in row 5 must not be entered.

When COMDAC STATE is "DUPLEX" and row 6 of TSPFAC1.EQSTAT is set to "O", TSPFAC0.EQSTAT in row 6 must be "O".

When COMDAC STATE is "DUPLEX" and row 6 of TSPFAC1.EQSTAT is set to "G", TSPFAC0.EQSTAT in row 6 must be "G" or "O".

When COMDAC STATE is "DUPLEX" and row 6 of TSPFAC1.EQSTAT is set to "U", TSPFAC0.EQSTAT in row 6 must be entered.

When COMDAC STATE is "DUPLEX" and row 6 of TSPFAC1.EQSTAT is not entered, TSPFAC0.EQSTAT in row 6 must not be entered.

2.24 RCOMDAC0 EXT REF

Description: Is the remote comdac 0 receiving external clock references?

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

2.25 RCOMDAC1 EXT REF

Description: Is the remote comdac 1 receiving external clock references?

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later
Required Field.
Default:
Valid Entries: Y, N

2.26 SITE ID

Description: Enter the EAIU site identification.

Software Release: 5E12 and later
Valid Entries: Blank, or 500 - 999

Data Rules:

For 5E12 and later, within the indicated SITE ID, there cannot be both a MTB and an External AIU Test Pack. For each site, if at least one EQAIUP form has TYPE set to "AIUTSTP", no EQAIU forms can have a TEST TYPE 0 or 1 set to "M". Further, duplicate testing equipment assignments are not alowed at the same site.

2.27 CBL SERIES

Description: Enter the type of cable series used to connect the backplane to the DSX.

Software Release: 5E12 and later
Required Field.
Valid Entries: Blank, or 600S, 609S, or 1249S

Data Rules:

If CBL SERIES is entered, CBL DISTANCE must be entered.

If CBL SERIES is 1249S, CBL DISTANCE must be 0 - 450.

If CBL SERIES is 600S, CBL DISTANCE must be 0 - 650.

If CBL SERIES is 609S, CBL DISTANCE must be 0 - 655.

2.28 CBL DISTANCE

Description: Enter the cable distance between the DLTU and DSX panel.

Required Field.

Valid CBL DISTANCE Entries

Entry	Description
0 - 450	1249S Series.
0 - 650	600S Series.
0 - 655	609S Series.

Data Rules:

If CBL DISTANCE is entered, CBL SERIES must be entered.

BUS USE

2.29 TEST TYPE 0

Description: Enter the test type.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries:

Valid TEST TYPE Entries

Entry	Description
E	External.
M	Metallic Test Bus.
N	No Equipment.
T	Test Pack.

Data Rules:

If TEST TYPE 0/1 is "E", "N", or "T", MTB0/1 must be unknown for the EAIU.

If TESTTYPE 0/1 is "T":

- there must be an EQAIUP form at the same site with TYPE set to "AIUTSTP".

If TEST TYPE 0/1 is "M", TEST TYPE 0/1 MTB0/1 must be known.

2.30 TEST TYPE 1

Description: Enter the type of test pack.

Software Release: 5E12 and later
Required Field.
Default: N

Required Field.
Valid Entries:

Valid TEST TYPE Entries

Entry	Description
E	External.
M	Metallic Test Bus.
N	No Equipment.
T	Test Pack.

TIME SLOT GROUP (PIDB)

The following fields (Section 2.31 - Section 2.34) define the PIDBs (Peripheral Interface Data Buses) for the AIU.

2.31 PIDB TYPE

Description: Enter the PIDB TYPE.

- ***NOTE:*** For the 5E11 Software Release, only the DI (Data Interface) capability is available; the DFPOS (Data Fan Position for the PSU SHLF (Packet Switching Unit Shelf) is not available. For 5E12 and later, the PSU SHLF capability is available.

Valid Entries:
- 5E11 Software Release: AIU
- 5E12 Software Release: AIU or PSU

Data Rules:

For 5E11, if PIDB TYPE is entered:

Copyright © 2003 Lucent Technologies

- DI/DFPOS, PIDB/PSU SHLF and EQSTAT fields must be entered.
- PIDB of PIDB/PSU SHLF must be an even number.

If PIDB TYPE is not entered, DI/DFPOS, PIDB/PSU SHLF and EQSTAT fields must not be entered.

For 5E12 and later, if PIDB TYPE is entered:

- DI/DFPOS, PIDB/PSU SHLF and EQSTAT fields can be entered or left blank.
- combinations of PIDB TYPE, DI/DFPOS and PIDB/PSU SHLF must be unique within a LOCAL TIME SLOT GROUP (PIDB) list.

If PIDB TYPE is "PSU":

- PIDB/PSU SHLF must be 0 - 4.
- an EQPSUPH form must be defined with the same SM and PSU SHELF combination.
- an EQPSU form must be defined with matching PSU SHELF and the PSU SHELF 0/1 EQSTAT must be "O" on the EQPSU form.
- the PSU SHELF SIDE 0 or 1 CLI values must not be 3 ("PSU" PIDB TYPEs cannot be associated with data fanout multiple PIDB PSU shelves).
- the PSU SHELF/DF POS assignments must not duplicate assignments of the EQAIU, EQIDCU and/or EQISLU form for a specified SM.

TSGRP NO 0 in LOCAL TIME SLOT GROUP (PIDB) must have a PIDB TYPE of "AIU".

NOTE: The total number of timeslots, per DPIDB, cannot be greater than 32. ODA error message "ISDN(287a/b/c)" is generated whenever more than 32 timeslots have been assigned/reserved. ISDN(287a) details the overloaded DPIDBs and ISDN(287b) lists all the nailed up timeslots that have been manually or automatically assigned. ISDN(287c) provides all the timeslots reserved on the ODBTS form. Timeslots reserved on the ODBTS form will need to be re-assigned to correct the DPIDBs in error. ISDN(287a/b/c) is a companion error message to "ISDN(288a/b/c)" which is generated when D and/or B Channel TIMESLOTS cannot be assigned by ODA because of a lack of DPIDB timeslots which are assigned on the EQAIU form with a PIDB TYPE of "PSU").

For 5E14 and later, TSGRP NO 0 in TIME SLOT GROUP (PIDB) must have a PIDB TYPE of "AIU".

2.32 DI/DFPOS

Description: This field is used to define the DI/DFPOS fields. See Note in the PIDB TYPE field above.

Valid DI Entries

Entry	Description
0 - 1	DI - SM.
0 - 5	DI - SM-2000 class processor.
0 - 5	DFPOS.

2.33 PIDB/PSU SHLF

Description: This field is used to define the PIDB/PSU SHELF fields. See Note in the PIDB TYPE field above.

Copyright © 2003 Lucent Technologies

Valid PIDB/PSU SHLF Entries - 5E11

Entry	Name
0 - 14 (even)	PIDB - SM.
0 - 22 (even)	PIDB - SM-2000 class processor.

Valid PIDB/PSU SHLF Entries - 5E12 and later

Entry	Name
0 - 14 (even)	PIDB - SM.
0 - 22 (even)	PIDB - SM-2000 class processor.
0 - 4	PSU Shelf.

2.34 EQSTAT

Description: Enter the status of the PIDB.

Valid PIDB EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

If PIDB.EQSTAT is "G" or "O", MTB0 and MTB1 must be known.

If PIDB.EQSTAT in rows 2 - 6 is "G" or "O", EQSTAT in row 1 must be "O".

REMOTE COMDAC 0/1 TIME SLOT GROUP (TSPFAC0/1)

2.35 TRANSPORT TYPE

Description: Enter the Transport Type.

Software Release: 5E12 and later
Valid Entries:

Valid TRANSPORT TYPE Entries

Entry	Description
[DL]TU	Digital Line Trunk Unit.
[DN]US	Digital Networking Unit - SONET.

Data Rules:

For 5E12:
If TSPFAC0/1.TRANSPORT TYPE is entered, TSPFAC0/1.EQSTAT must be entered.

If TSPFAC0/1.TRANSPORT TYPE is "DLTU":

- TSPFAC0/1.DLTU/DNUS must be 0 - 5.
- TSPFAC0/1.PK/DG must be 1 - 10.
- TSPFAC0/1.FAC/STS must be 0 - 1.
- TSPFAC0/1.VT must not be entered.
- combinations of DLTU/DNUS, PK/DG, and FAC/STS must be unique within the REMOTE COMDAC 0/1 Time SLOT GROUP (TSPFAC0/1) list.

Copyright © 2003 Lucent Technologies

- combinations of DLTU/DNUS, PK/DG, and VT must be unique within the REMOTE COMDAC 0/1 Time SLOT GROUP (TSPFAC0/1) list.
- combinations of DLTU/DNUS, PK/DG, and FAC/STS must be unique within the REMOTE COMDAC 0/1 Time SLOT GROUP (TSPFAC0/1) list.
- combinations of DLTU/DNUS, PK/DG and FAC/STS must be unique between the TSPFAC0 list and TSPFAC1 list.

If TSPFAC0/1.TRANSPORT TYPE is "DNUS":

- TSPFAC0/1.PK/DG must be 0 - 1.
- TSPFAC0/1.VT must be 1 - 28.
- combinations of DLTU/DNUS, PK/DG and FAC/STS must be unique between the TSPFAC0 list and TSPFAC1 list.

For 5E13 and later, if TRANSPORT TYPE is blank, TSPFAC0 DLTU/DNUS, PK/DG, FAC/STE, STS, VT GROUP, VT MEMBER, and EQSTAT must be blank.

If TSPFAC0/1.TRANSPORT TYPE is "DLTU":

- TSPFAC0/1.FAC/STE must be 0 - 1.
- TSPFAC0/1.STS must not be entered.
- TSPFAC0/1.VTG and VTM must not be entered.
- combinations of DLTU/DNUS, PK/DG and FAC/STE must be unique between the TSPFAC0 list and TSPFAC1 list.

If TSPFAC0/1.TRANSPORT TYPE is "DNUS":

- TSPFAC0/1.FAC/STE must be 1 - 6.
- TSPFAC0/1.FAC/STS must be 1.
- TSPFAC0/1.VTG must be 1 - 7.
- TSPFAC0/1.VTM must be 1 - 4.
- combinations of DLTU/DNUS, PK/DG, FAC/STE, STS, VTG, and VTM must be unique between the TSPFAC0 list and TSPFAC1 list.
- combinations of DLTU/DNUS, PK/DG, and FAC/STS must be unique within the REMOTE COMDAC 0/1 TIME SLOT GROUP (TSPFAC0/1) list.

2.36 DLTU/DNUS

Description: Enter the DLTU or DNUS number.

Software Release: 5E12 and later
Valid Entries:

Valid DLTU/DNUS Number Entries

Entry	Description
Blank	Not used.
5E12 - 5E14: 0 - 5 5E15 and later: 0 - 11	DLTU.
0 - 7	DNUS.

2.37 PK/DG

Description: Enter the DFI pack or DNUS data group number.

Valid PK/DG Entries

Entry	Description
Blank	Not used.
1 - 10	DFI pack.
0 - 1	DNUS data group number.

2.38 FAC/STS

Description: Enter the DFI facility or DNUS synchronous transport signal number. For 5E13 and later, this field was modified to support the DNU-S VT Group Number feature. See STS below. Also see Division 2, Section 9Q.

Software Release: 5E12 only
Valid Entries:

Valid FAC/STS Entries

Entry	Description
Blank	Not used.
0 - 1	DFI facility.
0 - 5	DNU-S facility.
1 - 6	DNU-S termination equipment number.

2.39 FAC/STE

Description: Enter the DFI facility or DNU-S Termination Equipment number. This field was added in 5E13 to support the DNU-S VT Group Number feature. See Division 2, Section 9Q.

Software Release: 5E13 and later
Valid Entries:

Valid FAC/STE Entries - 5E13 and later

Entry	Description
Blank	Not used.
0 - 1	DFI FACility.
1 - 6	DNU-S Termination Equipment number.

2.40 STS

Description: Enter synchronous transport signal number. This field was added in 5E13 to support the DNU-S VT Group Number feature. See Division 2, Section 9Q.

Software Release: 5E13 and later
Valid Entries: Blank or 1

2.41 VT

Description: Enter the Virtual Tributary. For 5E13 and later, this field was split into the VTG and VTM fields to support the DNU-S VT Group Number feature. See Division 2, Section 9Q.

Software Release: 5E12 only
Valid Entries: Blank, or 1 - 28

Copyright © 2003 Lucent Technologies

2.42 VTG

Description: Enter the Virtual Tributary Group number. This field was added in 5E13 to support the DNU-S VT Group Number feature. See Division 2, Section 9Q.

Software Release: 5E13 and later
Valid Entries: 1 - 7

2.43 VTM

Description: Enter the Virtual Tributary Member number. This field was added in 5E13 to support the DNU-S VT Group Number feature. See Division 2, Section 9Q.

Software Release: 5E13 and later
Valid Entries: 1 - 4

2.44 EQSTAT

Description: Enter the Transport Type.

Software Release: 5E12 and later

Data Rules:

If TSPFAC0.EQSTAT in rows 2 - 6 is "G" or "O", TSPFAC0.EQSTAT in row 1 must be "O".

EQSTAT of row1 REMOTE COMDAC0 AND REMOTE COMDAC 1 cannot be "U".

2.45 XAIU CONFIG

Description: This field is used to identify whether or not the AIU is to be remotely used. AIUs can be remotely used only if the Switching Module is of type SM-2000. This is a Display Only field that was added to support the XAIU (Multiplexed Access Interface Unit) feature. For more information on this feature, see Division 2, Section 9T.

Software Release: 5E14 and later
Valid Entries:

XAIU Configuration Table

Configuration	Fiber Link	AIUs/ Cabinet	Line Concentration	Call Volume
Low traffic 5E14 and later	Two half-PCTs	6	approx. 5:1	7 CCS or less
Medium 1 (Option 2) traffic 5E14 FR 6, 5E15 FR2 and later 99-5E-7727	Two half-PCTs	4	approx. 3.3:1	12 CCS or less
Medium (Option 1) traffic 5E14 FR3, 5E15 BMI and later 99-5E-7726	Two full PCTs	6	approx. 2.5:1	14 CCS or less
High traffic 5E14 and later	Two full PCTs	4	approx. 1.7:1	21 CCS or less

Data Rules:

For the 5E14 Software Release:

- When XAIU CONFIG is "HIGH", SHELF must not be 2 or 5.

Copyright © 2003 Lucent Technologies

- When XAIU CONFIG is "LOW", no more than 2 rows of the TIME SLOT GROUP (XAIUTSGRP) may be entered.
- When XAIU CONFIG is "MED", no more than 4 rows of the TIME SLOT GROUP (XAIUTSGRP) may be entered.

For 5E14 Feature Releases and later:

- When XAIU CONFIG is "MED" (Option 1), no more than 4 rows of the TIME SLOT GROUP (XAIUTSGRP) may be entered.
- When XAIU CONFIG is "MED1" (Option 2), no more than 3 rows of the TIME SLOT GROUP (XAIUTSGRP) may be entered.

2.46 PDXU

Description: The PCT (Peripheral Control and Timing) Data Exchanger Unit is used to specify which PDXU is being used.

WARNING: The combination of SM/PDXU must be defined on the EQPDXU form (5868 Record).

Software Release: 5E14 and later
Valid Entries: Blank, or 0 - 35

Data Rules:

When PDXU is entered, this PDXU must be defined on an EQPDXU form (5868 Record).

The combination of PDXU and SHELF entries on this form where the AIU TYPE is "XAIU", must be unique for a given SM.

2.47 SHELF

Description: This field defines the XAIU shelf number.

Software Release: 5E14 and later
Valid Entries: Blank, or 0 - 5

Data Rules:

For 5E14 Feature Releases and later, when SHELF is equal to "2" or "5", XAIU CONFIG must not be set to "MED1" or "HIGH" on the corresponding EQPDXU form.

2.48 TSGRP LIMIT

Description: This field identifies the number of XAIU Time Slot Groups allowed.The values used depend upon the PASSWORD provided to the customer. This is a display only field. If XAIU CONFIG is LOW, then TSGRP LIMIT can be a value up to 2. If XAIU CONFIG is HIGH, then TSGRP LIMIT can be a value up to 6.

Software Release: 5E14 and later

2.49 PASSWORD

Description: This field is the secured feature password and is used to specify the number of XAIU TGSGRPs allowed. This is a display only field.

Copyright © 2003 Lucent Technologies

Software Release: 5E14 and later

TIME SLOT GROUP (XAIUTSGRP)

2.50 EQSTAT

Description: This field is used to determine the XAIU Time Slot Group equipage state.

Software Release: 5E14 and later
Valid Entries:

Valid EQSTAT Entries - 5E14 and later

Entry	Description
G	Grow
O	Operational
U	Unequipped

Data Rules:

EQSTAT of TIME SLOT GROUP (XAIUTSGRP) row 1 cannot be "U".

When XAIUTSGRP.EQSTAT in rows 2 - 6 is "G" or "O", XAIUTSGRP.EQSTAT in row 1 must be "O".

The number of TIME SLOT GROUP (XAIUTSGRP) rows entered must not be greater than TSGRP LIMIT.

```

SEC. 65: 5746 RECORD
ACCESS INTERFACE UNIT PACK - EQAIUP

1. GENERAL

The 5746 Record is available with the 5E11 Software Release. It is used to define the AIU (Access Interface Unit) packs. For 5E12 and later, Remote AIU is made available. See Division 2, Section 9O.

1.1 Recent Change View

The corresponding Recent Change View for this form is 20.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switch Module identification number.

Required Field.
Valid Entries: 1 - 192

2.3 * AIU

Description: Enter the Access Interface Unit identification number.

Required Field.

Valid AIU Entries - 5E11

Entry	Description
0 - 14	SM.
0 - 42	SM-2000.

Valid AIU Entries - 5E12 and later

Entry	Description
0 - 14	SM.
0 - 127	SM-2000.

The SM/AIU combination entered on this form must be defined on a corresponding EQAIU form.

The AIU entered must have its RING GEN LOC defined on the matching EQAIU form.

2.4 * APPL PACK NUM

Description: Enter the Application Pack Number (slot number).

Required Field.
Valid Entries: 0 - 19

Data Rules:

If 17 or 19 is entered, and TYPE is "AIRG", the associated EQAIU form must have an AIU SIZE of 600.

If 11 or 13 is entered, and TYPE is "AIRG", the associated EQAIU form must have an AIU SIZE of 500.

2.5 * TYPE

Copyright © 2003 Lucent Technologies

Description: This field defines the pack type. The following conditions must be observed when equipping RG (Ring Generator) and application packs:

- An AIU with RG packs must use its own RG packs before any other AIU can be assigned to use those packs. (For example, if 2 RG packs are operational on AIU 1 and no AIU, including AIU 1, is currently using those packs (i.e., no AIU on that SM has RING GEN LOC set to 1), then RING GEN LOC 1 cannot be set for AIU 2).
- If an application pack (besides RG packs) exists on an AIU, then both pack 17 and 19 of the RING GEN LOC AIU must be operational.
- If application packs (besides RG packs) do not exist on an AIU, then both pack 17 and 19 of the RING GEN LOC AIU must be operational or growth.
- An AIU with two operational RG packs must use its own RG packs.

Required Field.

Valid TYPE Entries

Entry	Definition
[AIC]LP	5E11 Software Update: Coin pack. AIU feature.
AIGLC	5E11-5E12 Software Update: ATM Feeder Multiplexer pack.
AIGLP	5E11-5E12 Software Update: Asymmetric Digital Subscriber Line pack.
[AIR]G	5E11 Software Release: Ring generator pack. Must be used in pairs.
[AIUAD]SLLP	5E13 Software Update and 5E14 and later Software Releases: Asymmetric digital subscriber line pack.
[AIUAF]M	5E13 Software Update and 5E14 amd later Software Releases: ATM feeder multiplexer pack.
[AIUT]STP	5E12 Software Update: AIU Integrated Metallic Test Pack feature. Test packs are only valid on External AIUs. There can be only one test pack per site on a remote AIU.
[AIU]LP	5E12 Software Update: AIU ISDN pack.
[AIZ]LP	5E11 Software Release: Analog application pack.

Data Rules:

For 5E11 only, when TYPE is "AIRG", APPL PACK NUM must be 17 or 19. See also 5E12.

For 5E11 - 5E12:

When TYPE is "AIGLP",

- at least one "AIGLC" pack must exist for the same SM and AIU.

When TYPE is "AIGLC" or "AIGLP",

- EQSTAT must be "U".
- BROADBAND on the EQAIU form must be "Y".

Copyright © 2003 Lucent Technologies

When TYPE is "AIRG",

- and APPL PACK NUM is 17, for the same SM/AIU combination, APPL PACK NUM 16 and 18 must not be assigned and APPL PACK NUM 19 can only have a TYPE of "AIRG".
- For 5E11 only, when TYPE is "AIRG", and APPL PACK NUM is 19, for the same SM/AIU combination, there must be another EQAIUP form with APPL PACK NUM of 17 and TYPE of "AIRG".
- When TYPE is "AIZLP" or "AICLP", for the same SM/AIU combination, there must be two other EQAIUP forms defined with TYPE of "AIRG", and APPL PACK NUM of 17 and 19 must be known.

For 5E12 and later:

When TYPE is "AICLP" or "AIZLP",

- at least one Ring Generator serving this AIU must be operational. An EQAIUP form must exist for this AIU with TYPE equal to "AIRG", and EQSTAT equal to "O", or an EQAIU form must exist for this AIU with either EXT RGO EQSTAT or EXT RG1 EQSTAT equal to "O", or RING GEN LOC does not point to another AIU with an operational RG.

When TYPE is "AIRG",

- APPL PACK NUM must be 17 or 19.
    - If APPL PACK NUM 11 is assigned for the same SM/AIU combination, APPL PACK NUM position 10 cannot be assigned. If APPL PACK NUM 13 is assigned, APPL PACK NUM position 12 cannot be assigned.

When TYPE is "AIRG", and a Ring Generator is assigned,

- AIU EQSTAT must be "O".

When TYPE is "AIUTSTP",

- SLIM RI must be known, and must be defined on the RTIDX form with ROUTE TYPE equal to "HUNT".
- there must be at least 3 LTP assignments on the TRUNK form that are associated with a TRKCLS equal to "LTPSLIM" on the TKGRP form. For these LTPs, the SM on the EQAIUP form must correspond with the first three digits of the LTP on the TRUNK form.

When TYPE is "AIULP",

- at least one TSGRP NO must be entered with PIDB TYPE of "PSU" on the EQAIU form.

When TYPE is "AIURPLP",

- the last two digits of the Equipment Numbers with OE TYPE of "E" must be between 00 and 11 on the DSL, DSLAP, or RDTAPORT forms (NOTE: OE = aaabbbcc, where aaa= SM, bbb= AIU, cc = APPL PACK NUM).

For 5E13 and later:

Copyright © 2003 Lucent Technologies

When TYPE is "AIUADSLLP",

- at least one "AIUAFM" pack must exist for the same SM and AIU.

When TYPE is "AIUADSLLP" or "AIUAFM",

- EQSTAT must be "U".
- BROADBAND on the EQAIU form must be "Y".

2.6 EQSTAT

Description: Enter the status of the pack.

Required Field.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Description
U	Unequipped.
G	Growth.
O	Operational.

2.7 CLI

Description: Enter the Change Level Indicator for the pack. Refer to Division 8, Section 1 for CLI values.

Required Field.
Valid Entries: 0 - 7FFFFFFF

2.8 SEAL CUR

Description: This field was added for the AIU ISDN feature. Should sealing current be sent to the line pack?

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When SEAL CUR is "Y", TYPE must be "AIULP".

2.9 SLIM ROUTE INDEX

Description: This field was added for the AIU Test Pack feature. Enter the SLIM Route Index number.

Required Field.
Default: 0
Valid Entries:

For 5E11: Blank, or 0 - 8191
For 5E12 and later: Blank, or 0 - 4095

Data Rules:

Copyright © 2003 Lucent Technologies

When SLIM ROUTE INDEX is greater than 0, TYPE must be "AIUTSTP".

For 5E12 and later, when SLIM ROUTE INDEX is entered, the index must be defined on an RTIDX form.

SEC. 66: 5826 RECORD
ETHERNET PIPE - ENETPIPE

1. GENERAL

The 5826 Record is available with the 5E12 and later Software Releases. It is used to enable the craft to review and update the ethernet links connected to an MH (Message Handler). This form supports the RTCD (Real Time Call Detail) platform and the STS-I External Echo Cancellation features. For more information on these features, see Division 2, Section 4a245 and Division 2, Section 9P respectively.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: The SM field is used to specify the switching module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E12 and later:

- only one ENETPIPE form tuple is allowed per SM.
- when the ENETPIPE form is entered, the EQIM form must have the SM defined as an SM-2000 class processor.
- when the ENETPIPE form is entered, two corresponding EQPIPE forms must exist where QLPS NETWORK is equal 0 and 1.
- when the ENETPIPE form is entered, the corresponding EQMH form must exist where:
  - MH = 2
  - MH SIDE 0 EQSTAT = "O"
  - MH SIDE 0 CLI = 3
  - MH SIDE 1 EQSTAT = "O" and
  - MH SIDE 1 CLI = 3

2.3 * ENET PIPE

Description: The ENET PIPE field is used to specify the number of the external ethernet pipe.

Required Field.

Copyright © 2003 Lucent Technologies

Default: 0
Valid Entries: 0

2.4 MH

Description: The MH field is used to specify the message handler number.

2.5 EIB TYPE

Description: The EIB TYPE field is used to describe the type of external ethernet interface board.

2.6 # SERV TYPE

Description: The SERV TYPE field is used to specify the ethernet link service type.

Required Field.
Valid Entries:

- 5E13 and 5E14: EEC (External Echo Canceler) or RTCD (Real Time Call Detail)
- 5E15 and later: EEC, RTCD, or VTOA (Voice Telephony Over ATM (Asynchronous Transfer Mode))

Data Rules:

For 5E13 and later:

- When SERV TYPE is "EEC", MANAGED HUB must be "Y".
- When SERV TYPE is "EEC", EIB IP ADDR 0, EIB IP ADDR 1, HUB IP ADDR 0 and HUB IP ADDR 1 must equal respectively 192.11.200.5, 192.11.201.6, 192.11.200.250 and 192.11.201.250.
- When SERV TYPE is "RTCD", only one such ENETPIPE form tuple is allowed per office.

For 5E15 and later, when SERV TYPE is "VTOA", MANAGED HUB must be "Y".

For 5E16 and later:

- When SERV TYPE is "CFS", EIB IP ADDR 0 and EIB IP ADDR 1 must be entered.
- When SERV TYPE is "CFS" and MANAGED HUB is "Y", HUB IP ADDR 0 and HUB IP ADDR 1 must be entered.
- When SERV TYPE is "CFS", the ACT field for SFID 602 on the SFSYS form (5713-1 Record) must be set to "Y".

For 5E16(2) and later, SERV TYPE must be "CFS", "EEC", or "RTCD".

2.7 DUPLEX HUB

Description: The DUPLEX HUB field is used to indicate if the hub has a duplex or simplex configuration.

2.8 MANAGED HUB

Description: The MANAGED HUB field is used to indicate if the hub is managed or unmanaged.

Required Field.

Copyright © 2003 Lucent Technologies

Default: Y
Valid Entries: Y,N

Data Rules:

For 5E13 and later:

- When MANAGED HUB is "N", then HUB HW ADDR 0 and HUB HW ADDR 1 must not be entered.
- When MANAGED HUB is "Y", then HUB HW ADDR 0 and HUB HW ADDR 1 must be entered.

2.9 EIB IP ADDR 0

Description: The EIB IP ADDR 0 field is used to indicate the internet protocol address that the side 0 EIB receives on and the hub/far end transmits to.

2.10 EIB IP ADDR 1

Description: The EIB IP ADDR 1 field is used to indicate the internet protocol address that the side 1 EIB receives on and the hub/far end transmits to.

2.11 EIB HW ADDR 0

Description: The EIB HW ADDR 0 field is used to specify the ethernet address for the side 0 EIB.

2.12 EIB HW ADDR 1

Description: The EIB HW ADDR 1 field is used to specify the ethernet address for the side 1 EIB.

2.13 HUB IP ADDR 0

Description: The HUB IP ADDR 0 field is used to indicate the internet protocol address that the hub connected to the side 0 EIB receives on and the side 0 EIB transmits to.

2.14 HUB IP ADDR 1

Description: The HUB IP ADDR 1 field is used to indicate the internet protocol address that the hub connected to the side 0 EIB receives on and the side 1 EIB transmits to.

2.15 HUB HW ADDR 0

Description: The HUB HW ADDR 0 field is used to specify the ethernet address for the hub connected to the side 0 EIB.
Valid Entries: 00 - ff hex

Data Rules:

For 5E13 and later, HUB HW ADDR 0 and HUB HW ADDR 1 must have different values.

2.16 HUB HW ADDR 1

Description: The HUB HW ADDR 1 field is used to specify the ethernet address for the hub connected to the side 1 EIB.
Valid Entries: 00 - ff hex

SEC. 67: 5827 RECORD
ETHERNET LINKS - ENETLINK

1. GENERAL

The 5827 Record is available with the 5E12 and later Software Releases. It is used to enable the craft to review and update the ethernet links connected to an MH (Message Handler). This form supports the RTCD (Real Time Call Detail) platform and the STS-I External Echo Cancellation features. For more information on these features, see Division 2, Section 4a245 and Division 2, Section 9P respectively.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: The SM field is used to specify the switching module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E12 and later:

- When the ENETLINK form tuple is entered, a corresponding ENETPIPE form tuple must exist with the same SERV TYPE.
- Only one ENETLINK form tuple is allowed where SERV TYPE is equal "RTCD".

2.3 * ENET PIPE

Description: The ENET PIPE field is used to specify the number of the external ethernet pipe.

Required Field.
Default: 0
Valid Entries: 0

2.4 * ENET LINK NBR

Description: The ENET LINK NBR field is used to specify the external ethernet link number.

Required Field.
Default: 0
Valid Entries: 0 - 69

Data Rules:

For 5E12 and later, when RTCD OFC on the OFCOPT form is set to "Y", ENET LINK NBR 0 must be defined on an ENETLINK form where SERV TYPE is equal "RTCD".

Copyright © 2003 Lucent Technologies

For 5E13 and later, when ENET LINK NBR is an odd number other than 1, ENET LINK NBR 1 must exist.

2.5 MH

Description: The MH field is used to specify the message handler number.
Default: 2
Valid Entries: 2

2.6 # SERV TYPE

Description: The SERV TYPE field is used to specify the ethernet link service type.

Required Field.
Default: RTCD
Valid Entries:

- 5E14 and earlier: EEC (External Echo Canceler) or RTCD (Real Time Call Detail)
- 5E15 and later: EEC, RTCD, or VTOA (Voice Telephony Over ATM (Asynchronous Transfer Mode))

Data Rules:

For 5E13 and later:

SERV TYPE must equal SERV TYPE on the ENETPIPE form.

When SERV TYPE is "RTCD":

- ENET LINK NBR must be "0".
- DUPLEX must be the same value as DUPLEX HUB on the ENETPIPE form.

When SERV TYPE is "EEC":

- SND PORT and RCV PORT must be "1500".
- DUPLEX must be "N".
- IP ADDR 0 SIDE 0 element 4 and IP ADDR 0 SIDE 1 element 4 must equal ENET LINK NBR plus 150.
- DUPLEX must be the same as DUPLEX HUB on the ENETPIPE form.

For 5E15 and later, when SERV TYPE is "VTOA", ENET LINK NBR must be "0 - 5".

For 5E16 and later:

- When SERV TYPE is "CFS", IP ADDR 0 SIDE 0 and IP ADDR 1 SIDE 0 must be entered.
- When SERV TYPE is "CFS", IP ADDR 0 SIDE 1 and IP ADDR 1 SIDE 1 must be entered.

2.7 DUPLEX

Description: The DUPLEX field is used to indicate if the far end system associated with this ethernet link is duplex or simplex.

Copyright © 2003 Lucent Technologies

2.8 SND PORT

Description: The SND PORT field is the starting port from which data will be transmitted to the far end system.

2.9 RCV PORT

Description: The RCV PORT field is the starting port from which data will be received from the far end system.

2.10 NUM PORTS

Description: The NUM PORTS field is the number of consecutive send and receive ports.

2.11 IP ADDR 0 SIDE 0

Description: The IP ADDR 0 SIDE 0 field is the first internet protocol address for side 0 to which the ethernet interface board (EIB) transmits and on which the far end receives.

2.12 IP ADDR 1 SIDE 0

Description: The IP ADDR 1 SIDE 0 field is the second internet protocol address for side 0 to which the ethernet interface board (EIB) transmits and on which the far end receives.

2.13 HW ADDR 0 SIDE 0

Description: The HW ADDR 0 SIDE 0 field is the first ethernet hardware address for side 0 of this ethernet link.

Required Field.
Valid Entries: 00 - ff hex

Data Rules:

HW ADDR 0 SIDE 0 and HW ADDR 0 SIDE 1 must have the same values.

HW ADDR 0 SIDE 0 and HW ADDR 1 SIDE 0 must not have the same values.

HW ADDR 0 SIDE 0 and HW ADDR 0 SIDE 1 must be the same for this SERV TYPE.

2.14 HW ADDR 1 SIDE 0

Description: The HW ADDR 1 SIDE 0 field is the second ethernet hardware address for side 0 of this ethernet link.

Required Field.
Valid Entries: 00 - ff hex

Data Rules:

HW ADDR 1 SIDE 0 and HW ADDR 1 SIDE 1 must have the same values for this SERV TYPE.

2.15 IP ADDR 0 SIDE 1

Description: The IP ADDR 0 SIDE 1 field is the first internet protocol address for side 1 to which the ethernet interface board (EIB) transmits and on which the far end receives.

2.16 IP ADDR 1 SIDE 1

Copyright © 2003 Lucent Technologies

Description: The IP ADDR 1 SIDE 1 field is the second internet protocol address for side 0 to which the ethernet interface board (EIB) transmits and on which the far end receives.

2.17 HW ADDR 0 SIDE 1

Description: The HW ADDR 0 SIDE 1 field is the first ethernet hardware address for side 1 of this ethernet link.

Required Field.
Valid Entries: 00 - ff hex

2.18 HW ADDR 1 SIDE 1

Description: The HW ADDR 1 SIDE 1 field is the second ethernet hardware address for side 1 of this ethernet link.

Required Field.
Valid Entries: 00 - ff hex

Data Rules:

SEC. 68: 5861 RECORD
DNUS TO EEC EQUIPAGE - DNU2EEC

1. GENERAL

The 5861 Record is available with the 5E13 and later Software Releases. It allows the craft to associate an STS (Synchronous Transport Signal) on DNU-S (Digital Network Unit - SONET) with an Ethernet Link and to activate echo cancellation on packs in the connected Neptune.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM must be defined on an EQIM form.

When SM is entered (DNU2EEC form exist), this SM must be defined as an SM-2000 class processor with EQSTATUS set to "O" (Operational).

When SM USAGE of SM defined on the EQIM form equals "ORM", then ENET SM must have the same value as SM.

2.3 * DNUS

Description: This field is used to specify the DNU-S number.

Required Field.
Valid Entries: 0 - 7

2.4 * DATA GROUP

Description: This field is used to specify the DNU-S data group number.

Required Field.
Valid Entries: 0 or 1

2.5 * STE

Description: This field is used to specify the SONET termination equipment number on the data group.

Required Field.
Valid Entries: 1 - 6

Copyright © 2003 Lucent Technologies

2.6 * STS

Description: This field is used to specify the STS-1 number on the STE (SONET Terminating Equipment) on the DNU-S.

Required Field.
Default: 1
Valid Entries: 1

2.7 # ENET SM

Description: This field is used to specify the Ethernet Link SM (Switching Module) number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Only one DNU2EEC form tuple can be assigned to an ENET SM, ENET PIPE, ENET LINK NBR, NEPT STS combination.

When ENET SM is entered, the ENET SM must be defined as an SM-2000 class processor with EQSTATUS set to "O" (Operational).

When SM USAGE of ENET SM defined on the EQIM form equals "ORM", then ENET SM must have the same value as SM.

2.8 ENET PIPE

Description: This field is used to specify the External Ethernet Pipe number.
Default: 0

2.9 # ENET LINK NBR

Description: This field is used to specify the External Ethernet Link number.

Required Field.
Valid Entries: even numbers between 0 - 68

2.10 NEPT STS

Description: This field is used to specify the Neptune STS number.
Default: 1

Required Field.
Valid Entries: 1 - 3

2.11 ACTIVE VT GROUPS

Description: This field is used to specify whether echo cancellation is active on the Neptune VT (Virtual Terminal) group.
Default: N
Valid Entries: Y,N

Copyright © 2003 Lucent Technologies

```

SEC. 69: 5866 RECORD
TIME MULTIPLEXED SWITCH UNIT - EQTMS

1. GENERAL

The 5866 Record is available with the 5E15 and later Software Releases. It is used to support the CM3 (Communication Module 3) base feature (renamed Global Messaging Server). For more information on this feature, see Division 2, Section 7AN. The TMS data on this form previously existed on the EQCORE form and was moved to this form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TMS NBR

Description: The TMS NBR field was changed to TMSFP NUM for 5E16(2) and later. See the TMSFP NUM field below for usage information.

Software Release: 5E15 and later

2.3 * TMSFP NUM

Description: This field contains the TMSFP (Time Multiplex Switch Fabric Pair) number. The TMS NBR field was renamed to TMSFP NUM and modified to expand the range of values to support the CM3 NxTMS (N times TMS) feature. For more information on this feature, see Division 2, Section 7BO.

Software Release: 5E16(2) and later
Default: 0
Valid Entries:

0 for CM2
0 - 3 for CM3

Data Rules:

ODA form EQCORE (5701 Record) must be inserted before this form can be inserted/updated.

An EQTMS form with TMSFP NUM equal to 0 must exist in every office.

When an office has CM2, TMSFP NUM must be 0.

2.4 # AISLE

Description: This field contains the equipment location (floor and aisle) number.

Software Release: 5E15 and later
Required Field.
Valid Entries:
- 00 - 99 for floor number

Copyright © 2003 Lucent Technologies

- 00 - 99 for aisle number

2.5 BAY

Description: The BAY field contains the equipment location bay number.

Software Release: 5E15 and later
Valid Entries:

Valid BAY Entries

Office	Entry
CM2	Blank
CM3	0 - 3

Data Rules:

When an office is a CM2 office,

- BAY must NOT be entered.

When an office is a CM3 office,

- BAY must be entered.
- For 5E16(2) and later, BAY must equal TMSFP NUM.

2.6 CAB CONFIG

Description: This field contains the cabinet configuration number.

Software Release: 5E15 and later
Valid Entries:

Valid CAB CONFIG Entries

Office	Entry
CM2	Blank
CM3	F - for front-to-back S - for side-to-side

Data Rules:

When an office is a CM2 office, CAB CONFIG must not be entered.

When an office is a CM3 office, CAB CONFIG must be entered.

2.7 #FABRIC TYPE

Description: This field contains the TMS fabric configuration number.

Software Release: 5E15 and later
Valid Entries:

Valid FABRIC TYPE Entries

Entry	Definition
D	Dual.
S	Single.

Data Rules:

Copyright © 2003 Lucent Technologies

When FABRIC TYPE is "SNGL",

- SHELF EQUIPAGE - CM2 SIDE 0 and SIDE 1 for SHELFs 6, and 8-11 can not be entered.

When FABRIC TYPE is "SNGL", and CM VINTAGE on the EQCORE form is 2 and CM2 COMPACT is "N", this combination requires an entry for SHELF 0 in the SHELF EQUIPAGE - CM2 list on this form.

When FABRIC TYPE is "SNGL",

- SHELF EQUIPAGE - CM2 SHELF 0 must be entered when 1 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 1 must be entered when 2 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 2 must be entered when 3 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 3 must be entered when 4 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 4 must be entered when 5 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 5 must be entered when 6 or more shelves are equipped.

When FABRIC TYPE is "DUAL",

- SHELF EQUIPAGE - CM2 SHELF 0 and SHELF 1 must be entered.
- SHELF EQUIPAGE - CM2 SHELF 2 and SHELF 3 must be entered when 3 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 4 and SHELF 5 must be entered when 5 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 6 and SHELF 7 must be entered when 7 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 8 and SHELF 9 must be entered when 9 or more shelves are equipped.
- SHELF EQUIPAGE - CM2 SHELF 10 and SHELF 11 must be entered when 11 or more shelves are equipped.

When an office is being converted from single fabric to dual fabric, FABRIC TYPE must be "DUAL".

When FABRIC TYPE is "SNGL", the following rules must be met when defining the primary NLI Link, EVEN NLI 0, on the EQNLI form:

- The TMS LINK 0 value assigned to EVEN NLI 0 must be a multiple of 8 when TMS LINK 0 is less than 32 (8, 16, 24).
- The TMS LINK 0 + 2 value assigned to EVEN NLI 0 must be a multiple of 8 when TMS LINK 0 is greater than 31 (38, 46, 54, ...).

When offices are equipped with CM3, FABRIC TYPE must be "DUAL".

When FABRIC TYPE is "SNGL", for each odd QLI board on a given TMS SHELF, the preceeding QLI board must be the same QLI type (i.e., if board 3 on the TMS SHELF 0 is a QLI1, then QLI board 2 on TMS SHELF 0 must be a QLI1.

Copyright © 2003 Lucent Technologies

NOTE: A QLI CLI value of 100 represents a QLI2 board and a QLI CLI value of 0 represents a QLI1 board.

2.8 #CLI

Description: The Change Level Indicator field is used to contain the CLI.

Software Release: 5E15 and later
Required Field.
Valid Entries: 0 - 7FFFFFFF hexadecimal

Data Rules:

When an office is equipped with a CM3, the CLI must be 500.

For 5E15 and later, when the CLI value is 20 (indicates CDX):

- on the EQTMS form (5866 Record)
  - MSG AISLE on the EQCORE form (5701 Record) and AISLE on the EQTMS form must be equal,
  - FABRIC TYPE must be "SNGL", and
  - CDX switches with ORSMs (Optically Remote SMs) may not have a TRCU (Transmission Rate Converter Units Type) of "TRCU3" on the EQCMTRCU form (5812 Record).
- on the EQIM form (5700 Record)
  - CTS EVEN LINK must be 2, 10, 18, 26, 34, 42, 50, or 58.
  - The maximum number of EQIM forms must be less than or equal to 8.
  - The maximum number of EQIM forms with SM USAGE of "IM", "HIM", "TRM" or "ORM" must be less than or equal to 2.
  - The maximum number of EQIM forms with SM USAGE of "RM" must be less than or equal to 6.
- on the EQCORE form (5701 Record)
  - CM VINTAGE must be set to 2 and CM2 COMPACT must be set to "Y".

When CLI has a value in which bit 5 is set (as in 20 hex), then the CM2 COMPACT field on the EQCORE form must be "Y".

SHELF EQUIPAGE - CM3

2.9 EQSTAT

Description: The EQSTAT field provides the equipage status of the shelf.

Software Release: 5E15 and later
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth

Copyright © 2003 Lucent Technologies

O	Operational

Data Rules:

EQSTAT must be "G" or "O".

SHELF EQUIPAGE - CM2

The following two fields (Section 2.10 - Section 2.11) are used to enter the shelves and their equipage status.

2.10 SIDE 0

Description: This field describes the shelf equipment for side 0.

Software Release: 5E15 and later.
Valid Entries: TMSU2 or TMSU3

Data Rules:

When SHELF EQUIPAGE - CM2 SIDE 0 or SIDE 1 is assigned, both SIDE 0 and SIDE 1 must be entered.

SHELF EQUIPAGE - CM2 SIDE 0 or SIDE 1 values for SHELF 0, must both be the same, either "TMSU2" or "TMSU3".

SHELF EQUIPAGE - CM2 SIDE 0 or SIDE 1 values for SHELF 1, must both be the same, either "TMSU2" or "TMSU3".

SHELF EQUIPAGE - CM2 SIDE 0 or SIDE 1 values for SHELF 0 and SHELF 1 must all be the same, either "TMSU2" or "TMSU3".

SHELF EQUIPAGE - CM3 entries are not allowed for CM2 offices.

WARNING: SHELF EQUIPAGE - CM2 SIDE 0 or SIDE 1 values for SHELFs 2-11, must both be the same, either "TMSU2" or "TMSU3".

When an office is equipped with CM2, the SHELF EQUIPAGE - CM2 list must have the correct entries to support the range of TMSLINKS in the office. The following table depicts the rows required for specific ranges of TMSLINKS (STARTING QTMSLINK, QTMSLINK 2, QTMSLINK 3, QTMSLINK4) defined on the EQQLPS form (5854 Record), and a FABRIC TYPE of "DUAL" on the EQTMS form.

SHELF EQUIPAGE - CM2 Row Requirements for "DUAL" FABRIC TYPE

TMSLINKs Equipped	SHELF EQUIPAGE - CM2 (required rows)
2 - 61	1 and 2
62 - 125	3 and 4
126 - 189	5 and 6
190 - 253	7 and 8
254 - 317	9 and 10
318 - 381	11 and 12

SHELF EQUIPAGE - CM2 Row Requirements for "SNGL" FABRIC TYPE

TMS LINKs EQUIPPED	SHELF EQUIPAGE - CM2 (required rows
2 - 31	1
32 - 61	2
62 - 93	3
94 - 125	4

Copyright © 2003 Lucent Technologies

126 - 157	5
158 - 189	6

When an office is equipped with CM2 and the FABRIC TYPE is "SNGL", the maximum assigned NCT EVEN LINK value on an EQIM form (5700 Record) should not exceed 188.

2.11 SIDE 1

Description: This field describes the shelf equipment for side 1.

Software Release: 5E15 and later
Valid Entries: TMSU2 or TMSU3

SEC. 70: 5828 RECORD
QPH PIPE ASSIGNMENT - QPHPIPE

1. GENERAL

The 5828 Record is available with the 5E14 and later Software Releases. It provides the basic description of the SM (Switching Module) side of the QLPS (Quad-Link Packet Switch) pipe connecting the QPH (QLPS Protocol Handler) to the QLPS network.This form was created to support the SS7 (Signaling System 7) - PSU (Packet Switch Unit) Architectural Enhancements (99-CP-4246). For more information on this feature, see Division 2, Section 7AG.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GLOBAL SM

Description: This GLOBAL SM field is used to specify a GSM (Global Switching Module) number which supports national SS7 signaling.

Software Release: 5E14 and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

Each GLOBAL SM, PSU SHELF, and CHANNEL GROUP that is entered defines a QPH on a QLPH NETWORK. Both QLPS NETWORK 0 and QLPS NETWORK 1 combined can have at the most 16 unique QPHs defined on one GLOBAL SM.

There can be a maximum of 59 QPHs in an office.

When SERVICE TYPE is "CCS" on the QPHPIPE form, GLOBAL SM must be defined on the CCGSM form and the EQIM form must have an SM2000 class processor with the EQSTATUS set to "O" and the SM USAGE set to "IM" or "HIM".

When GLOBAL SM, PSU SHELF, CHANNEL GROUP, and PH TYPE are entered, the values must be equal to the SM, PSU SHELF, CHANNEL GROUPS GRP TYPE, and CHANNEL GROUPS PH TYPE on the PSUGP form, respectively.

The QPHPIPE form and/or CMTMH form cannot be entered for a VCDX office when VCDX OFFICE is set to "Y" on the EQCORE form.

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form (5742 Record) on the same SM and have a matching PSU SHELF.

2.3 * PSU SHELF

Description: This PSU SHELF field is used to specify the PSU (Packet Switch Unit) shelf position on the SM (Switching Module) which supports national SS7 Signaling.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 4

2.4 * CHANNEL GROUP

Description: This CHANNEL GROUP field is used to specify the logical port position of the PH (Protocol Handler).

Required Field.
Valid Entries: 0 - 15

2.5 * QLPS NETWORK

Description: This QLPS NETWORK field is used to specify the QLPS Network number.

Required Field.
Valid Entries: 0 or 1

2.6 PH TYPE

Description: This PH TYPE field is used to display the Protocol Handler Type.

Required Field.
Default: PH22
Valid Entries: PH22

Data Rules:

When DEMO on the SIPGSM form is set to "Y, "PH TYPE and SERVICE TYPE fields on this form are not allowed for SIP-T GSMs .

2.7 SERVICE TYPE

Description: This field is the Quad-Link Packet Switch Service Type used to distinguish between CCS (Common Channel Signaling) and SIP. This field supports the SIP (Session Initiation Protocol) for Packet Trunking feature. For more information see Division 2, Section 4A684.

Required Field.

Software Release: 5E16(2) FR 3 and later
Default: CCS
Valid Entries:

Valid SERVICE TYPE Entries

Entry	Definition
CCS	Common Channel Signaling
SIPT	Session Initiation Protocol for Telephones

Data Rules:

When SERVICE TYPE is "SIPT", GLOBAL SM must be defined on the SIPGSM and QGCON forms (5880/5829 Records).

SEC. 71: 5867 RECORD
COMMUNICATION MODULE MODEL 3 - CM3

1. GENERAL

The 5867 Record is available with the 5E15 and later Software Releases. It is used to assist in the population of CM3 (Communication Module Model 3) - dependent data on other forms. This form is populated in CM3 offices only. It supports the CM3 Base feature. For more information on this feature, see Division 2, Section 7AN.

NOTE: This form should only be used for CM3 offices. It should be entered only after the EQCORE form (5866 Record) so that form level checking can be performed on the data ranges instead of during the time of level 3 checking.

1.1 Recent Change View

This form does not have a corresponding Recent Change View.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * EQSTAT

Description: The EQSTAT field provides the equipage status of the CM3.

Software Release: 5E15 and later
Required Field.
Default: O
Valid Entries: O

Data Rules:

EQSTAT can only be "O".

SEC. 72: 5868 RECORD
PCT DATA EXCHANGER UNIT - EQPDXU

1. GENERAL

The 5868 Record is available with the 5E14 Software Release. It is used to define the PDXU (PCT (Peripheral Control and Timing) Data Exchanger Unit). This form was added to support the XAIU (Multiplexed Access Interface Unit) feature. For further information on this feature, see Division 2, Section 9T.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: This field is used to specify the SM (Switching Module) to which the PDXU is connected.

Required Field.

Software Release: 5E14 and later
Valid Entries: 1 - 192

Data Rules:

For each SM assignment, there must be a corresponding EQIM form (5700 Record) that must be an SM-2000 class processor.

When an EQAIU form is assigned to a UNIT TYPE of "SM-2000", a maximum of 43 AIUs can be assigned.

2.3 * PDXU

Description: This field is used to specify the PCT Data Exchanger Unit being used.

Required Field.

Software Release: 5E14 and later
Valid Entries: 0 - 35

2.4 # EQL AISLE

Description: This field is used to specify the aisle number where the PDXU is located.

Required Field.

Software Release: 5E14 and later
Valid Entries: 00 - 99 for Floor, and 00 - 99 for Aisle

2.5 # EQL BAY

Description: This field is used to specify the bay number where the PDXU is located.

Copyright © 2003 Lucent Technologies

Required Field.

Software Release: 5E14 and later
Valid Entries:

Valid EQL BAY Entries

Entry	Description
0 - 4	SM
0 - 14, 100 - 104, 200 - 208, 999 - 999	SM-2000 Class Processor.

2.6 EQL UNVER

Description: This field is used to specify the vertical position number where the PDXU is located.

Required Field.

Software Release: 5E14 and later
Default: 11
Valid Entries: 11

2.7 # XAIU CONFIG

Description: This field is used to specify the Traffic Configuration supported by the PDXU.

Required Field.

Software Release: 5E14 and later
Valid Entries:

XAIU Configuration Table

Configuration	Fiber Link	AIUs/ Cabinet	Line Concentration	Call Volume
Low traffic 5E14 and later	Two half-PCTs	6	approx. 5:1	7 CCS or less
Medium 1 (Option 2) traffic 5E14 FR 6, 5E15 FR2 and later 99-5E-7727	Two half-PCTs	4	approx. 3.3:1	12 CCS or less
Medium (Option 1) traffic 5E14 FR3, 5E15 BMI and later 99-5E-7726	Two full PCTs	6	approx. 2.5:1	14 CCS or less
High traffic 5E14 and later	Two full PCTs	4	approx. 1.7:1	21 CCS or less

Data Rules:

For the 5E14 Software Release:

- When XAIU CONFIG is "LOW", PCTDX0.TSI BOARD and PCTDX0.TSI SLOT must equal PCTDX1.TSI BOARD and PCTDX1.TSI SLOT, respectively.
- When XAIU CONFIG is not "LOW", PCTDX0.TSI BOARD and PCTDX0.TSI SLOT must not equal PCTDX1.TSI BOARD and PCTDX1.TSI SLOT, respectively.

For the 5E14 Feature Releases and later:

Copyright © 2003 Lucent Technologies

- When XAIU CONFIG is "LOW" or "MED1", PCTDX0.TSI BOARD and PCTDX0.TSI SLOT must equal PCTDX1.TSI BOARD and PCTDX1.TSI SLOT, respectively.
- When XAIU CONFIG is "MED" or "HIGH", PCTDX0.TSI BOARD and PCTDX0.TSI SLOT must NOT equal PCTDX1.TSI BOARD and PCTDX1.TSI SLOT, respectively.

2.8 LINK CAPACITY

Description: This field is used to identify whether the PDXU is at its FULL or HALF traffic capacity. This is a display only field.

Software Release: 5E14 and later
Valid Entries: HALF or FULL

PCTDX0

2.9 # EQSTAT

Description: This field is used to define the Equipment Status of PCTDX0.

Software Release: 5E14 and later
Required Field.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Description
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

When PCTDX1 EQSTAT is "O", PCTDX0 EQSTAT must be "O".

When EQSTAT is entered, CLI, TSI BOARD, and TSI SLOT must all be entered.

When EQSTAT is not entered, CLI, TSI BOARD, and TSI SLOT must not be entered.

2.10 # CLI

Description: This field is used to specify the change level indicator of the PCTDX0. This indicator is used by diagnostics to determine the associated circuit board.

Required Field.

Software Release: 5E14 and later
Valid Entries: 0 - 7FFFFFFF hexadecimal

Data Rules:

When the CLI value for PCTDX0 and PCTDX1 is entered, the CLI value must be 00000000.

2.11 # TSI BOARD

Description: This field is used to specify the Time Slot Interchanger board number.

Required Field.

Copyright © 2003 Lucent Technologies

Software Release: 5E14 and later
Valid Entries: 1 - 9

Data Rules:

Each PCTDX0 TSI BOARD entered must be defined on the EQTSI form and the matching EQSTI form must have an EQSTAT value that is greater than or equal to the PCTDX0 EQSTAT defined on the EQPDXU form.

2.12 # TSI SLOT

Description: This field is used to specify the Time Slot Interchanger slot number.

Required Field.

Software Release: 5E14 and later
Valid Entries: 0 - 3

PCTDX1

2.13 EQSTAT

Description: This field is used to define the Equipment Status of PCTDX0.

Software Release: 5E14 and later
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Description
Blank	No Value
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

When PCTDX1 EQSTAT is "G", PCTDX0 EQSTAT must be "G" or "O".

2.14 CLI

Description: This field is used to specify the change level indicator of the PCTDX0. This indicator is used by diagnostics to determine the associated circuit board.

Software Release: 5E14 and later
Valid Entries: Blank, or 0 - 7FFFFFFF hexadecimal

2.15 TSI BOARD

Description: This field is used to specify the Time Slot Interchanger board number.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 9

Data Rules:

Each PCTDX1 TSI BOARD entered must be defined on the EQTSI form and the matching EQSTI form must have an EQSTAT value that is greater than or equal to the PCTDX0 EQSTAT defined on the EQPDXU form.

Copyright © 2003 Lucent Technologies

2.16 TSI SLOT

Description: This field is used to specify the Time Slot Interchanger slot number.

Software Release: 5E14 and later
Valid Entries: Blank, or 0 - 3

SEC. 73: 5869 RECORD
PCT LINE/TRUNK UNIT- EQPLTU

1. GENERAL

1.1 PCT Line/Trunk Unit

The PCT (Peripheral Control and Timing) Line/Trunk form is used to define equipment location information for the PCT line/trunk units. This form was created to support the MSM (Multi Service Module) on PLTU (PCT Line and Trunk (virtual) Unit. For more information on this feature see Division 2, Section 7AP. This feature was first made available in the 5E15 software release.

1.2 Recent Change View

The corresponding Recent Change View for EQPLTU is 19.24.

2. FORM ENTRIES - 5869 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: The SM field is used to indicate the switching module number.
Valid Entries: 1 - 192

Data Rules:

Switching Module assignment(s) can only be assigned to a SM-2000 type processor.

2.3 *PLTU

Description: The PLTU field is used to specify the peripheral control and timing line/trunk unit number.
Valid Entries: 0 - 35

Each PLTU entered must be defined on the EQPCTP form for the same SM.

2.4 TRANSPORT TYPE

Description: The TRANSPORT TYPE field is used to specify the transport equipment type.
Default: PDS
Valid Entries: PDS (Packet Driver Solution)

Data Rules:

When TRANSPORT TYPE is "PDS", TRANSPORT VERPOS must be 15, 29, 32, 44, 49 or 59.

When TRANSPORT TYPE is "PDS", TRANSPORT BAY must be 0-14, 90-99, 100-104, 200-208 or 900-999.

2.5 #TRANSPORT ESM

Description: The TRANSPORT ESM (Equipment Switching Module) field is used to indicate the switching module of the transport equipment.
Valid Entries: 1-192

Copyright © 2003 Lucent Technologies

Data Rules:

On the EQPLTU form(s) the TRANSPORT ESM must be defined as an SM with an SM-2000 Class Processor on the EQIM form(s).

2.6 #TRANSPORT AISLE

Description: The TRANSPORT AISLE is used to specify the aisle number of the transport equipment.
Valid Entries: Enter floor 00-99 aisle 00-99

2.7 #TRANSPORT BAY

Description: The TRANSPORT BAY is used to specify the bay number of the transport equipment.
Valid Entries: Enter 00 - 14, 90 - 99, 100 - 104, 200 - 208, or 900 - 999

2.8 #TRANSPORT VERPOS

Description: The TRANSPORT VERPOS is used to specify the vertical position number of the transport equipment.
Valid Entries: Enter 15, 29, 32, 44, 49 or 59

```

SEC. 74: 5870 RECORD
PCT LINK PACK- EQPCTP

1. GENERAL

1.1 PCT Link Pack

The PCT (Peripheral Control and Timing) Link Pack form provides the PCT Link Pack information. This form was created to support the MSM (Multi Service Module) on PLTU (PCT Line and Trunk (virtual) Unit. For more information on this feature, see Division 2, Section 7AP. This feature was first made available in the 5E15 software release.

1.2 Recent Change View

The corresponding Recent Change View for EQPCTP is 20.17.

2. FORM ENTRIES - 5870 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 SM

Description: The SM field is used to indicate the switching module number.
Valid Entries: 1 - 192.

Data Rules:

Switching Module assignment(s) can only be assigned to a SM2000-type processor.

2.3 PLTU

Description: The PLTU field is used to specify the peripheral control and timing line/trunk unit number.
Valid Entries: 0 - 35

Data Rules:

A PLTU entered on the EQPCTP form must be defined on the EQPLTU form for the same Switching Module.

2.4 PCTFI

Description: The PCTFI field is used to specify the peripheral control and timing facility interface number.
Valid Entries: 0 - 2

Data Rules:

On the EQPCTP form there can be no more than 36 PCTFIs created per SM.

PCTFIs must be defined on the EQPCTP form for the same SM and PLTU.

2.5 TSI BOARD

Description: The TSI BOARD field is used to specify the number of the time slot interface board.
Description of the field.
Valid Entries: 0 - 9

Copyright © 2003 Lucent Technologies

Each TSI BOARD must be defined on the EQTSI form for the same SM.

2.6 TSI SLOT

Description: The TSI SLOT field is used to specify the number of the time slot interface slot.
Valid Entries: 0 - 3

PCT TERMINAL EQUIPMENT (TE0)

The following fields provide PCT Terminal Equipment attributes for side 0. Refer to Section 2.7 - Section 2.13 for individual field information.

2.7 TE0 EQSTAT

Description: The TE0 EQSTAT field is used to indicate the equipage state of the side 0 PCT terminal equipment.
Valid Entries:

TE1 EQSTAT Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

Data Rules:

When either TE0 EQSTAT or TE1 EQSTAT is set to "U", both TE0 EQSTAT and TE1 EQSTAT must be "U".

On the EQPCTP input form, the TE0 EQSTAT and TE1 EQSTAT must be greater than or equal to EQSTAT on the EQPCTT form, (i.e., "O" is greater than "G" which is greater than "U").

2.8 TE0 CLI

Description: The TE0 CLI field is used to specify the change level indicator of the side 0 PCT terminal equipment.
Valid Entries: Enter 0 to 7FFFFFFF.

Data Rules:

TE0 CLI and TE1 CLI must have the same value.

2.9 TE0 TRACE ID

Description: The TE0 TRACE ID field is used to indicate the position of the link at the far end from the side 0 PCT terminal equipment.
Valid Entries: 0 - 15

2.10 TE0 HORIZONTAL

Description: The TE0 HORIZONTAL field is used to specify the horizontal offset in tenths of an inch from the left side of the side 0 PCT terminal equipment.
Valid Entries: 0 - 255

2.11 TE0 VERTICAL

Description: The TE0 VERTICAL field is used to specify the vertical offset in tenths of an inch from the bottom of the side 0 PCT terminal equipment.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 255

2.12 TE0 DEPTH

Description: The TE0 DEPTH field is used to specify the depth offset in inches from the front of the side 0 PCT terminal equipment.
Valid Entries: 0 - 255

2.13 TE0 PACK CODE

Description: The TE0 PACK CODE field is used to specify the apparatus code for the pack of the side 0 PCT terminal equipment.
Valid Entries: Enter up to 19 alphanumeric characters.

PCT TERMINAL EQUIPMENT (TE1)

The following fields provide PCT Terminal Equipment attributes for side 1. Refer to Section 2.14 - Section 2.20 for individual field information.

2.14 TE1 EQSTAT

Description: The TE1 EQSTAT field is used to indicate the equipage state of the side 1 PCT terminal equipment.
Valid Entries:

TE1 EQSTAT Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

2.15 TE1 CLI

Description: The TE1 CLI field is used to specify the change level indicator of the side 1 PCT terminal equipment.
Valid Entries: Enter 0 to 7FFFFFFF.

Data Rules:

TE0 CLI and TE1 CLI must have the same value. Insert checks that compare different fields on this form.

2.16 TE1 TRACE ID

Description: The TE1 TRACE ID field is used to indicate the position of the link at the far end from the side 1 PCT terminal equipment.
Valid Entries: 0 - 15

2.17 TE1 HORIZONTAL

Description: The TE1 HORIZONTAL field is used to specify the horizontal offset in tenths of an inch from the left side of the side 1 PCT terminal equipment.
Valid Entries: 0 - 255

2.18 TE1 VERTICAL

Description: The TE1 VERTICAL field is used to specify the vertical offset in tenths of an inch from the bottom of the side 1 PCT terminal equipment.
Valid Entries: 0 - 255

Copyright © 2003 Lucent Technologies

2.19 TE1 DEPTH

Description: The TE1 DEPTH field is used to specify the depth offset in inches from the front of the side 0 PCT terminal equipment.
Valid Entries: 0 - 255

2.20 TE1 PACK CODE

Description: The TE1 PACK CODE field is used to specify the apparatus code for the pack of the side 0 PCT terminal equipment.
Valid Entries: Enter up to 19 alphanumeric characters

SEC. 75: 5871-1/2 RECORD
PCT LINK TRIBUTARY- EQPCTT

1. GENERAL

1.1 PCT Link Tributary

The PCT Link Tributary form contains PCT Link Tributary information. This form was created to support the MSM (Multi Service Module) on PLTU (PCT Line and Trunk (virtual)) Unit. For more information on this feature see Division 2, Section 7AP. This feature was first made available in the 5E15 software release.

1.2 Recent Change View

The corresponding Recent Change View for EQPCTT is 20.27.

2. FORM ENTRIES - 5871 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 SM

Description: The SM field is used to indicate the switching module number.
Valid Entries: 1 - 192

Data Rules:

Switching Module assignment(s) can only be assigned to a SM-2000 type processor.

2.3 PLTU

Description: The PLTU field is used to specify the peripheral control and timing line/trunk unit number.
Valid Entries: 0 - 35

2.4 PCTFI

Description: The PCTFI field is used to specify the peripheral control and timing facility interface number.
Valid Entries: 0 - 2

Data Rules:

A PCTFI entered on the EQPCTT form must be defined on the EQPCTP form for the same Switching Module and PLTU.

VIRTUAL TRIBUTARIES (1-28)

Brief description of the what the fields in this group are for. Refer to Section 2.5 - Section 2.9 for individual field information.

2.5 TRIBUTARY

Description: The TRIBUTARY field is used to specify the T1 tributary number.
Valid Entries: 1 - 28

Data Rules:

Copyright © 2003 Lucent Technologies

When TRIBUTARY is known, EQSTAT must be entered.

When TRIBUTARY is known, APPLICATION TYPE must be entred.

Duplicate TRIBUTARIES can not be assigned in the TRIBUTARY LIST.

2.6 EQSTAT

Description: The EQSTAT field is used to indicate the equipage state of the T1 tributary.
Valid Entries:

EQSTAT Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

2.7 APPLICATION TYPE

Description: The APPLICATION TYPE field is used to indicate the application type of the T1 tributary.
Valid Entries: Enter TRUNK

2.8 FACILITY NAME

Description: The FACILITY NAME field is used to indicate the carrier facility of the T1 tributary.
Valid Entries: Enter up to 25 alphanumeric characters.

2.9 APT ALG

Description: This field is used for the DS1 (Digital Signal Level 1) in APT (Automatic Progression Testing). This field supports the APT Enhancements feature. For information on this feature see, Division 2, Section 2AD.

Software Release: 5E16(2) and later
Valid Entries:

Valid APT ALG Entries

Entry	Definition
1ONLY	Test One Only (test one trunk only on the DS1, independently whether test passes or fails and then move to a trunk on another DS1).
FULL	Full (test all trunks on the DS1, independently whether test passes or fails, and then move to a trunk on another DS1).
NOTST	No Test (APT should not perform any tests on the DS1).
SUCC	Stop on Success (test one trunk on the DS1 and then move to a trunk on another DS1 if test passes, or test next trunk on the same DS1 if test fails).

Data Rules:

APT ALG can only be entered when APPLICATION TYPE is "TRUNK".

SEC. 78: 5544 RECORD
MH PIPE ASSIGNMENT FORM - EQPIPE

1. GENERAL

The 5544 Record is available with the 5E9(2) and later Software Releases. It is used to assign QLPS (Quad-Link Packet Switch) MH (Message Handler) pipes in an SM-2000 office.

An SM-2000 Message Handler pipe is a high bandwidth path for message transport between a QLPS QTMSLNK (a port connection on the QLPS board of the TMS (Time Multiplex Switch)) and a given QLPS endpoint, that is, an MH (Message Handler) in an SM-2000. It is a physical path that sustains HDLC (High Level Data Link Control) traffic from the QLPS to the MH. When an SM-2000 Message Handler pipe is assigned, the operational software determines what resources are available for the pipe: QTMSLNKs and HDLC channels and timeslots on the QTMSLNKs.

New pipes cannot be assigned during a retrofit.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * QLPS NETWORK

Description: Enter the QLPS Board to which the pipe is assigned.

Required Field.
Valid Entries: 0, 1

Data Rules:

Two EQQLPS forms (5854 Record) must exist for the QLPS NETWORK entered here, one each for ONTC SIDE 0 and ONTC SIDE 1. On both forms EQSTAT must be "O".

For 5E15 and later:

This form can only be used in a non-CM3 office, since all the data for CM3 is handled by forward mapping.

The EQCORE form (5701 Record) must be inserted before this form can be inserted/updated.

2.3 * SM2000 SM

Description: Enter the SM-2000 on which the pipe is being defined.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM-2000 must be defined on an EQIM form (5700-1/2 Record) where UNIT TYPE is "SM2000" and EQSTATUS is "O".

Each SM-2000 entered defines a MH Pipe from an SM-2000 class processor Switching Module to a QLPS

Copyright © 2003 Lucent Technologies

NETWORK. Similarly, each GLOBAL SM, PSU SHELF, and CHANNEL GROUP combination entered on the QPHPIPE form defines a QPH Pipe from a GSM (Global Switching Module) to a QLPS NETWORK. There is a limit to the number of pipes that can be defined on each QLPS NETWORK. There are 30 available pipes for each TMSLINK (QTMSLINK). There are 4 TMSLINKSs defined on each QLPS NETWORK for a total of 120 pipes for each QLPS NETWORK. Each TMSLINK has a total of 224 timeslots that can be utilized between the 30 pipes defined on that TMSLINK.

SEC. 80: 5599 RECORD
CDMA OFFICE OPTIONS - CDMAOPT

1. GENERAL

The 5599 Record is available with the 5E15 and later Software Releases. It is used to control the parameters for the Echo Cancellation for CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 4A552.

- **WARNING:** Echo Cancellation will not be done on PHV1 (Protocol Handler for Voice 1), PHV2, and PHV3.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.75.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: Enter the key value which is always 0.

Software Release: 5E15 and later
Valid Entries: 0

2.3 ECHO CANCELLATION

Description: This field determines whether the echo canceler is active or disabled.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ECHO CANCELLATION is "Y", the ACT field for SFID 552 on the SFSYS form (5713-1 Record) must also be set to "Y".

For 5E16 and later, when ECHO CANCELLATION or AC ECHO CTRL is "Y", EVRC IMAGE must be 1 through 3.

- **WARNING:** Electrical Echo Cancellation is not supported on PHV1s, PHV2s, or PHV3s.

2.4 DC REMOVER

Description: The Direct Current removal field determines if filtering is provided on the receive signal (i.e., the signal encoded by the vocoder).

Software Release: 5E15 and later
Required Field.
Default: Y
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.5 NONLINEAR PROC

Description: The NLP (Nonlinear Processor field indicates whether residual echo is removed after adaptive filtering.

Software Release: 5E15 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.6 NLP NOISE FILL

Description: The NLP (Nonlinear Processor) NOISE FILL field indicates the background noise level on the receive side, and inserts a matching noise when the NLP is active.

Software Release: 5E15 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.7 ECHO TAIL LENGTH

Description: This field indicates the maximum tail delay that can be accommodated by the echo canceler. Tail delay is the maximum time taken by the signal to arrive at the receive port once it leaves the transmit port.

Software Release: 5E15 and later
Required Field.
Default: 64
Valid Entries: 16, 32, 48, or 64 ms.

2.8 NLP ACT THRESHOLD

Description: The NLP determines when the decoder output power level is greater than the encoder input power level, by the selected thresholds. This threshold is the NLP activation threshold.

Software Release: 5E15 and later
Required Field.
Default: 19
Valid Entries: 11-16, 18-20, 22, 24, or 26 db.

2.9 AGGR ADAPT RATE

Description: The Aggressive Mode Adaptation Rate indicates the adaptive filter's convergence to the new echo path, when the echo canceler is operating in the fast converging mode at the beginning of a call.

Software Release: 5E15 and later
Required Field.
Default: 16384
Valid Entries: 0 - 16384 step size

AGGR ADAPT RATE must be greater than or equal to NORMAL ADAPT RATE.

2.10 NORMAL ADAPT RATE

Description: The Normal Mode Adaptation Rate indicates the adaptation rate after aggressive mode operation has completed. Best performance is achieved when this value is below 8000.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later
Required Field.
Default: 6144
Valid Entries: 0 - 16384

2.11 AGGR MODE DURATION

Description: The Aggressive Mode Duration field indicates the number of samples of filter adaptation from the beginning of a call.

Software Release: 5E15 and later
Required Field.
Default: 3
Valid Entries: 1 - 4

2.12 FORWARD LINK ALC

Description: This field is the Receiver Gain that indicates the gain or loss applied to the encoder input.

Software Release: 5E15 and later
Required Field.
Default: 0
Valid Entries: (-12) - (+12)

2.13 REVERSE LINK ALC

Description: This field is the Transmitter Gain Adjustment that indicates the gain or loss applied to the decoder output.

Software Release: 5E15 and later
Required Field.
Default: 0
Valid Entries: (-12) - (+12)

2.14 HYBRID RET LOSS TH

Description: The ERL (Echo Return Loss) indicates the loss in signal power that occurs in the echo path due to hybrid attenuation.

Software Release: 5E15 and later
Required Field.
Default: 6
Valid Entries: 0 - 10

2.15 MAX NOISE FILL LEVL

Description: The Maximum Nonlinear Processor Noise Fill Level determines the maximum level of noise inserted when the NLP is removing residual echo.

Software Release: 5E15 and later
Required Field.
Default: -39
Valid Entries: (-39) - (-72) in 3 dB increments

EL ECHO CANCELLATION (G.168-2000)

The following fields (Section 2.16 - Section 2.21) provides the ability to distinguish between existing

Copyright © 2003 Lucent Technologies

electrical echo cancellations. These fields support the G.168-2000 Compliance and Acoustic Echo Cancellation on PHV5 (Protocol Handler for Voice - Version 5). For more information, see Division 2, Section 4A599.

2.16 NE SPCH DET TH

Description: The NE SPCH DET TH (Near-end speech detector threshold) field indicates the minimum network ERL (Echo Return Loss) needed for the EEC (Electrical Echo Cancellation) to properly converge to the echo path. The threshold is applied to the level difference between the reverse direction (far-end) and forward direction (near-end) signals. The EEC adaptation is frozen when the threshold is exceeded.

Software Release: 5E16 and later
Default: 6
Valid Entries: 0 - 15

2.17 AGGR ADPT RATE

Description: The AGGR ADPT RATE (Aggressive Adaptation Rate) field indicates how quickly the adaptive filter can converge to the new echo path when the canceller is operating in aggressive mode (i.e., the fast convergence mode at the beginning of a call).

Software Release: 5E16 and later
Default: 10
Valid Entries: 0 - 15

Data Rules:

AGGR ADPT RATE must be greater than or equal to NRML ADAPT RATE.

2.18 NRML ADPT RATE

Description: The NRML ADPT RATE (Normal Adaptation Rate) field indicates the adaptation rate after aggressive mode operation has completed.

Software Release: 5E16 and later
Default: 4
Valid Entries: 0 - 15

2.19 AGGR NLP TH

Description: The AGGR NLP TH (Aggressive Nonlinear Processor Threshold) field indicates the power level difference between the reverse and forward direction signals for activating the NLP (Nonlinear Processor) during aggressive mode.

Software Release: 5E16 and later
Default: 1
Valid Entries: 0 - 15

2.20 NRML NLP TH

Description: The NRML NLP TH (Normal Nonlinear Processor Threshold) field indicates the power level difference between the reverse and forward direction signals for activating the NLP (Nonlinear Processor) after aggressive mode operation has completed.

Software Release: 5E16 and later
Default: 7
Valid Entries: 0 - 15

Copyright © 2003 Lucent Technologies

2.21 DBL-TALK CTRL

Description: The DBL-TALK CTRL (Double-Talk Robustness Control) field indicates aggressiveness of double-talk robustness algorithm.

Software Release: 5E16 and later
Default: 3
Valid Entries: 0 - 15

2.22 PHV6 ECHO PATH DELAY

Description: This field specifies the PHV6 ((Protocol Handler for Voice 6) electrical echo path delay time in milliseconds. This field support the PHV6 feature. For information on this feature see, Division 2, Section 7CD.

Software Release: 5E18(1) and later
Default: 64
Valid Entries: 64 or 128 milliseconds

ACOUSTIC ECHO CANCELLATION

The following fields (Section 2.23 - Section 2.27) supports the G.168-2000 Compliance and Acoustic Echo Cancellation for PHV5 (Protocol Handler for Voice - Version 5) feature. For more information, see Division 2, Section 4A599.

2.23 AC ECHO CTRL

Description: The AC ECHO CTRL (AEC (Acoustic Echo Control)) field indicates whether AEC is active.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

Data Rules:

- **WARNING:** Acoustic Echo Cancellation is not supported on PHV1s, PHV2s, PHV3s, or PHV4s.

2.24 REV LINK AGC

Description: The REV LINK AGC (Reverse Link AGC (Automatic Gain Control)) field indicates whether AGC in the reverse direction is active.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

2.25 FRWD LINK AGC

Description: The FRWD LINK AGC (Forward Link AGC (Automatic Gain Control)) field indicates whether AGC in the forward direction is active.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

2.26 REV LINK NS

Description: The REV LINK NS (Reverse Link NS (Noise Suppression)) field indicates whether NS/NR

Copyright © 2003 Lucent Technologies

(Noise Reduction) is active.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

2.27 REV LINK NC

Description: The REV LINK NC (Reverse Link NS (Noise Compensation)) field indicates whether NC is active.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

PACKET BUS OCCUPANCY

The following fields (Section 2.28 -Section 2.30) provide information that is relevant to the Packet Bus Occupancy Measurements feature. For more information on this feature see, Division 2, Section 1CS.

2.28 PB OCC 1TH

Description: This field indicates the lower threshold of pack bus occupancy and is expressed as a percentage.

Required Field.

Software Release: 5E17.1 FR 1
Default: 70
Valid Entries: 0 - 99

2.29 PB OCC 2TH

Description: This field indicates the higher threshold of pack bus occupancy and is expressed as a percentage.

Required Field.

Software Release: 5E17.1 FR 1
Default: 80
Valid Entries: 1 - 100

Data Rules:

PB OCC 2TH must be greater than PB OCC 1TH.

2.30 PB INT

Description: This field indicates the packet bus sampling interval in milliseconds.

Required Field.

Software Release: 5E17.1 FR 1
Default: 5
Valid Entries: 1, 2, 3, 4, 5, 6, 8, 10, 12, 15, 20, 24, 25, 30, 40, 50, 60, 75, 100, 120, 125, 150, 200, 250, 300, 375, 500, 600, 750, or 1000 in milliseconds.

ISUP

Copyright © 2003 Lucent Technologies

This field supports the CIC (Carrier Identification Code) Routing Solution feature. For more information see, Division 2, Section 2AH.

2.31 SEND CI PARM

Description: This field is used to indicate whether or not the CIC should be sent in the CIC parameter. Required field.

Software Release: 5E17.1 FR 3 and later
Valid Entries: Y, N

REVERSE DTMF

The following fields (Section 2.32 - Section 2.34) provide Reverse DTMF (Dual Tone Multi-Frequency) Tone Programmability and are available with 5E15 and later Software Releases. See Division 2, Section 8B for more information. For 5E13 and 5E14 these fields existed on the OFCOPT form (5509 Record).

2.32 OVERRIDE

Description: Do you want to override the CDMA mobile on/off duration?

When this field is "Y", the mobile on/off duration values can be overriden with the provisioned values in the LENGTH ON and LENGTH OFF fields.

When this field is "N", the mobile on/off duration is not overriden.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When OVERRIDE is "N", REV LEN ON must not be entered.

When OVERRIDE is "N", REV LEN OFF must not be entered.

When OVERRIDE is "Y", REV LEN ON must be entered.

When OVERRIDE is "Y", REV LEN OFF must be entered.

2.33 REV LEN ON

Description: The REV LEN ON field is used to indicate the DTMF (Dual Tone Multi-Frequency) on duration, in milliseconds, for CDMA.

Software Release: 5E15 and later
Valid Entries: 100, 150, 200, 250, 300, 350 or blank

2.34 REV LEN OFF

Description: The REV LEN OFF field is used to indicate the Dual Tone Multi-Frequency off duration, in milliseconds, for CDMA

Software Release: 5E15 and later
Valid Entries: 50, 100, 150, 200 or blank

EVRC APPLICATION

Copyright © 2003 Lucent Technologies

The following fields (Section 2.35 - Section 2.37) supports the Forward Channel DTMF for CDMA (Code Division Multiple Access) feature for the 5E15 and later Software Releases. For more information, see Division 2, Section 8W.

2.35 EVRC IMAGE

Description: The EVRC (Extended Variable Rate Coder) IMAGE field is used to indicate what CDMA EVRC features are activated.

Software Release: 5E15 and later
Default: 0
Valid Entries:

Valid EVRC IMAGE Entries

Entry	Definition
0	TTY/TDD and FTC DTMF
1	TTY/TDD and EC
2	FTC DTMF and EC

2.36 TTY/TDD ACT

Description: The TTY/TDD ACT field indicates whether or not a TTY/TDD feature is active.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

For 5E16 and later, when TTY/TDD ACT is "Y", EVRC IMAGE must be 0, 1, or 3.

- **WARNING:** TTY/TDD is not supported on PHV1s, PHV2s, or PHV4s.

2.37 PPEE ACT

Description: The PPEE (Packet Pipe Engineering Enhancements) ACT field indicates whether or not the PPEE feature is active. This field was added to support the Packet Pipe Engineering Enhancements feature. This feature increases the number of call legs carried by a packet pipe. (For more information on this feature, see Division 2, Section 4A317.)

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

The PPEE ACT field is used by the Packet Pipe Engineering Enhancements secured feature, therefore when this field is set to "Y", the ACT field for SFID 317 on the SFSYS form (5713-1 Record) must also be set to "Y". (For more information on this feature, see Division 2, Section 4A317.)

When the Packet Pipe Engineering Enhancements feature is active for PSUGP forms (5949 Record) representing PH4s which have exceeded their capacity for CDMA trunk routing, the count of Packet Pipe Member trunks assigned to all Packet Pipe trunks which use this PH4 may not exceed 32. However, when no Trunk Groups have been provisioned with a SERV TYPE of "ACELP" or "VSELP", the number of CDMA calls the PH4 can handle may not exceed 84. In addition, only (1) 16-wide PP with 64kb data rate on a FRPH can be 90. Also, when one or more Trunk Groups have been provisioned with a SERV TYPE of "ACELP" or "VSELP", the number of CDMA calls the PH4 can handle may not exceed 90. The number of possible CDMA calls is dependent upon:

Copyright © 2003 Lucent Technologies

- the presence of Trunk Group SERV TYPEs of "8K", "13K", "ACELP", "DATA", "EVRC", or "VSELP" in the switch.
- the DATA RATE of the Packet Pipe Member Trunks and the number of Packet Pipe Member trunks which point to this PH4. (See Division 2, Section 4A317.)

When the TRUNK form specifies Packet Pipe Trunks associated with PSUGP forms that represent PH4s which have exceeded their capacity for CDMA trunk routing, the first six digits of the TRKOE field on the TRUNK form must match the SM, PSU SHELF, and CHANNEL GROUP fields on the PSUGP form.

2.38 REMOVE PP LIMIT CHK

Description: This field is used to indicated whether or not to remove Packet Pipe limit checks.

Software Release: 5E17 and later
Default: N
Valid Entries: Y, N

Data Rules:

When the ACT field for SFID 259 (indicating a TDMA office) is set to "Y" on the SFSYS form (5713-1 Record), REMOVE PP LIMIT CHK must be set to "N".

FORWARD DTMF

The following fields (Section 2.39 - Section 2.40) supports the Forward Channel DTMF for CDMA (Code Division Multiple Access) feature for the 5E15 and later Software Releases. For more information, see Division 2, Section 8W.

2.39 FWD LEN ON

Description: The FWD LEN ON field indicates the Forward Traffic Channel DTMF on duration, in milliseconds for CDMA.

Software Release: 5E15 and later
Default: 95
Valid Entries: 95, 150, 200, 250, 300 or 350

2.40 FWD LEN OFF

Description: The FWD LEN OFF field indicates the Forward Traffic Channel DTMF off duration, in milliseconds for CDMA.

Software Release: 5E15 and later
Default: 60
Valid Entries: 60, 100, 150 or 200

2.41 SEND VP RDI

Description: The field is used as an indicator for virtual path remote defects

Software Release: 5E17(1) FR1 and later
Required field.
Default: ON
Valid Entries: ON, OFF

Copyright © 2003 Lucent Technologies

2.42 SEND VC RDI

Description: The field is used as an indicator for virtual channel remote defects

Software Release: 5E17(1) FR1 and later
Required field.
Default: ON
Valid Entries: ON, OFF

2.43 SUBNET ID

Description: This field indicates the number of office wide subnetwork identifiers.

Software Release: 5E17(1) FR1 and later
Required field.
Default: 0
Valid Entries: 0 - 3

Data Rules:

When SUBNET ID on this form is 0, NETWORK 0 on the PSUGW form (5991 Record) must not be entered.

When SUBNET ID on this form is 1, NETWORK 1 on the PSUGW form must not be entered.

When SUBNET ID on this form is 2, NETWORK 2 on the PSUGW form must not be entered.

When SUBNET ID on this form is 3, NETWORK 3 on the PSUGW form must not be entered.

SEC. 81: 5873 RECORD
FACILITY TO EEC EQUIPAGE - FAC2EEC

1. GENERAL

The 5873 Record is available with the 5E14 and later Software Releases. It is used to associate a 24 channel DFI (Digital Facility Interface) or DFI-2 on a DLTU (Digital Line And Trunk Unit) or DLTU (2) with a DS1 (Digital Signal 1) port on a particular QECLI (Quad Echo Canceller Line Interface) pack on an EEC (External Echo Canceller). This form supports the DLTU External Echo Cancellation feature. For more information on this feature, see Division 2, Section 4A550.

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: The SM field is used to specify the switching module number.

Software Release: 5E14 and later
Valid Entries: 1 - 192

Data Rules:

When this form is entered, the EQIM form (5700 Record) must exist with an SM-2000 class processor, and the EQSTAT is set to "O".

When this form is entered, an EQDUP form (5730 Record) must exist with DFI USAGE set to "TRUNK".

When this form is entered, an EQDUP form must exist.

2.3 * DLTU

Description: This field is used to specify the Digital Line and Trunk number.

Software Release: 5E14 and later
Valid Entries: 0 - 5

Data Rules:

The DLTU on this form must have a DLTU TYPE of "DLTU24" or "DLTU48" on the EQDU form (5730 Record).

2.4 * DFI

Description: This field is used to specify the Digital Facility Interface pack number.

Software Release: 5E14 and later
Valid Entries: 1 - 10

2.5 * FACILITY

Copyright © 2003 Lucent Technologies

Description: This field is used to specify which facility on a DFI or DFI-2 to use.

Software Release: 5E14 and later
Valid Entries: 0 or 1

ETHERNET LINK

These fields (Section 2.9 - Section 2.10) define the ethernet associated with the DLTU External Echo Cancellation feature.

2.6 # ENET SM

Description: This field is used to specify the ethernet Switching Module that hosts the External Echo Canceller.

Software Release: 5E14 and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

When ENET SM is entered, this SM must exist on the EQIM form with an SM-2000 class processor, and the EQSTAT equal to be "O".

The combination of ENET SM, ENET PIPE, and ENET LINK NBR may occur on this form, or on the DNU2EEC form, but not both.

2.7 ENET PIPE

Description: This field is a No Change field that is used to specify the External Ethernet Pipe number.

Software Release: 5E14 and later
Required Field.
Default: 0

2.8 # ENET LINK NBR

Description: This field is used to specify the External Ethernet Link number.

Software Release: 5E14 and later
Required Field.
Valid Entries: 0 - 69

EXTERNAL ECHO CANCELLER

These fields (Section 2.9 - Section 2.10) define the Quad Echo Canceler Line Interface pack and port numbers associated with the DLTU External Echo Cancellation feature.

2.9 # QECLI

Description: The QECLI (Quad Echo Canceller Line Inter) field is used to specify the External Echo Canceller QECLI pack number.

Software Release: 5E14 and later
Required Field.
Valid Entries: 0 - 10

Copyright © 2003 Lucent Technologies

2.10 # QECLI PORT

Description: This field is used to specify the External Echo Canceller port on the QECLI pack.

Software Release: 5E14 and later
Required Field.
Valid Entries: 0 - 3

```

SEC. 82: 5874 RECORD
INTER WORKING GATEWAY FORM - EQIWG

1. GENERAL

The 5874 Record is available with the 5E15 and later Software Releases. It is used to define the units of Interworking Gateway which is the bridge between a Switching Module and an ATM (Asynchronous Transfer Mode) switch. This form was added to support the Digital Network Unit-SONET 18 (DNU-S) interface to the Inter-Working Gateway (IWG).

1.1 Recent Change View

The corresponding Recent Change View for this form is 19.26.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SM

Description: This field is used to specify the SM (Switching Module) number.

Software Release: 5E15 and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E15 and later:

- Only six EQIWG form tuples are allowed per SM.
- When this form is entered and SM and IWG are not equipped with an SM-2000 class processor, the corresponding EQIM form (5700 Record) must be set to an SM-2000 class processor.
- When SM is entered on this form, SM must be defined on the EQIM form (5700 Record).
- When SM, IWG, and OC-3 DG do not have the appropriate OC-3 AESA entry, each OC-3 AESA entered on this form must not be duplicated on another EQIWG form.

2.3 UNIT TYPE

Description: This field is used to specify the IWG (Interworking Gateway) or IWU (Inter-Working Unit) used by the SM.

Software Release: 5E16 and later
Required Field.
Valid Entries: IWG or IWU

Data Rules:

For 5E16 and later, when UNIT TYPE is "IWU",

- UNIT NUMBER must be 1 - 5.

Copyright © 2003 Lucent Technologies

- OC3 DG 1 AESA must not be entered.
- OC3 DG 2 AESA must not be entered.

When a EQIWG form exist with a UNIT TYPE of "IWG", therefore at least one CICDIST form must exist.

2.4 * UNIT NUMBER (5E15 and earlier, field name was IWG)

Description: This field is used to specify the IWG (Interworking Gateway) number used by the SM.

Software Release: 5E15 and earlier
Required Field.
Valid Entries: 0 - 5 for IWG; 1 - 5 for IWU

2.5 # UNIT SM (5E15 and earlier, field name was IWG SM)

Description: This field is used to indicate the physical SM where the IWG resides.

Software Release: 5E16 and later
Required Field.
Valid Entries: 1 - 192

2.6 # AISLE (5E15 and earlier, name was IWG AISLE)

Description: This field is used to specify the aisle number of the IWG.

Software Release: 5E16 and later
Required Field.
Valid Entries:
- For Floor: 0 - 99
- For Aisle: 0 - 99

2.7 # BAY (5E15 and earlier, name was IWG BAY)

Description: This field is used to specify the bay number of the IWG.

Software Release: 5E16 and later
Required Field.
Valid Entries: Enter 0 - 14, 90 - 99, 100 - 104, 200 - 208, or 900 - 999

2.8 VER POSITION (5E15 and earlier, name was IWG VERPOS)

Description: This field is used to specify the Vertical Position number of the IWG.

Software Release: 5E16 and later
Required Field.
Valid Entries: 0 - 84

2.9 ENET PIPE

Description: This field is used to specify the number of the External Ethernet Pipe. This is a no change field.

Software Release: 5E15 and later
Valid Entries: 0

Copyright © 2003 Lucent Technologies

2.10 ENET LINK

Description: This field is used to specify the number of the External Ethernet Link. This is a no change field.

Software Release: 5E15 and later
Valid Entries: 0 - 5

Data Rules:

For 5E15 and later, when ENET LINK and ENET PIPE are entered on this form, a corresponding ENETLINK form tuple must exist where the SERV TYPE is equal to "VTOA".

2.11 CLI (5E15 and earlier, name was IWG CLI)

Description: This field is used to specify the change level indicator for the Interworking Gateway. It is a no change field.

Software Release: 5E15 and later
Valid Entries: 0

OC-3 DATAGROUP (OC3)

These fields (Section 2.12 - Section 2.14) define the OC-3 (Optical Carrier-3) Data Group link information associated with the IWG.

2.12 DG

Description: This field is used to specify the data group used by OC3. This is a no change field.

Software Release: 5E15 and later
Valid Entries: 0 - 3

2.13 EQSTAT

Description: This field is used to specify the equipment status of OC3.

Software Release: 5E15 and later
Valid Entries:

Valid EQSTAT Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

- When OC3 DG 0 EQSTAT or OC3 DG 0 AESA is entered, both of these fields must be entered.
- When OC3 DG 1 EQSTAT or OC3 DG 1 AESA is entered, both of these fields must be entered.
- OC3 DG 2 EQSTAT and OC3 DG 3 EQSTAT must not be entered.

2.14 AESA

Description: This field is used to specify the address of ATM (Asynchronous Transfer Mode) end system which is used by each OC3.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later
Valid Entries: 0 - ff (hex)

Data Rules:

- When any element of AESA is entered, all elements must be entered.[QUESTION: Should this be in the ODIN? I don't see it}
- OC3 DG 2 EQSTAT/AESA and OC3 DG 3 EQSTAT/AESA must not be entered.

FACILITY INTERFACES

The fields in (Section 2.15 - Section 2.19) are used to specify the DNUS (Digital Networking Unit SONET) facilities that interface with the IWG.

2.15 FACILITY

Description: This field is used to specify the number of the facility that interfaces with the IWG. FACILITY is a no change field.

Software Release: 5E15 and later
Valid Entries: 1 - 5

2.16 DNUS

Description: The DNUS field is used to specify the digital networking unit SONET number of the IWG facility.

Software Release: 5E15 and later
Valid Entries: 0 - 7

Data Rules:

- When DNUS, DATA GROUP, STE or STS in any ROW of IWG FACILITY INTERFACES is entered, all fields in that ROW must be entered.
- DNUS, DATA GROUP, STE and STS combinations must be unique for all FACILITY INTERFACES entries.

2.17 DATA GROUP

Description: This field is used to specify the data group number of the DNUS for the IWG.

Software Release: 5E15 and later
Valid Entries: 0 or 1

2.18 STE

Description: The STE field specifies the SONET termination equipment number.

Software Release: 5E15 and later
Valid Entries: 1 - 6

SEC. 83: 5831 RECORD
APCX EQUIPAGE FORM - EQAPCX

1. GENERAL

The Application Controller Expansion Unit form is available for 5E15 and later. The form supports the OXU (Optically Extended Control and Data Unit) feature (99-5E-4822). The OXU can only be assigned for SM-2000 class processors (see UNIT TYPE on the EQIM form). See Division 2, Section 9V.

1.1 Recent Change View

The corresponding Recent Change View is 18.18.

2. FORM AND RECORD ENTRIES - 5831 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The entered SM must be defined on a EQIM form.

2.3 *MC

Description: Enter the Module Controller number.

Required Field.
Valid Entries: 0 or 1

2.4 UNIT TYPE

Description: Enter the UNIT TYPE. The only valid value is "APCO" (Application Processor Optical Extension) unit.
Default: APCO

2.5 EQSTAT

Description: Enter the status of the equipment.
Valid Entries:

Valid EQSTATUS Entries

Entry	Definition
U	Unequipped.
G	Growth.
O	Operational.

2.6 #CLI

Description: Enter the Change Level Indicator. See Division 8, Section 1 for valid CLI values.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 through 7fffffff hexadecimal.

```

SEC. 84: 5832
EXTENDED CONTROL AND DATA UNIT EQUIPAGE FORM - EQXCDU

1. GENERAL

The 5832 Record is available with 5E15 and later Software Releases. It is used to define the Extended Control and Data Unit. This form supports the OXU (Optically Extended Control and Data Unit (99-5E-4822) feature. See Division 2, Section 9V.

For each EQXCDU form, there must be two corresponding EQAPCX forms (5831 Record) for Module Controller 0 and Module Controller 1 for the same Switching Module.

1.1 Recent Change View

The Recent Change View for this form is 18.19.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SM

Description: Enter the Switching Module Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM entered must be defined on the EQIM form (5700 Record).

EQXCDU forms can only be assigned on SM-2000 class processors (see UNIT TYPE on the EQIM form).

For 5E16(2) and later:

When SM and INTF UNIT on this form matches the SM and INTF UNIT on the following forms:

- EQDCLU,
- EQDCTU,
- EQDSC3,
- EQDU/EQDUP,
- EQGDSC3,
- EQIDCU,
- EQISLU,
- EQLU,
- EQMSU,
- EQPSU,

Copyright © 2003 Lucent Technologies

- EQRA, and/or
- EQTU,

the EQUIPMENT BAY on these forms, must match the BAY on this form.

When SM and INTF UNIT on this form matches the SM and INTF UNIT on the following forms:

- EQDU/EQDUP,
- EQGDSC3,
- EQMSU, and/or
- EQRA,

the CSU on these forms, must be set to "N".

2.3 *INTF UNIT

Description: Enter the Interface Unit number.
Valid Entries: 1 - 8

Data Rules:

When INTF UNIT is greater than 0 on any equipment form, there must be a corresponding EQXCDU form.

2.4 PRIMARY UNIT

Description: Enter the Primary Unit number.
Valid Entries: 0 - 8

Data Rules:

5E16(2) and later:

When PRIMARY UNIT is 0, BAY must be 000 - 014, 100 - 104, or 200 - 208.

When PRIMARY UNIT is 1, BAY must be A00 - A14, B00 - B04, or C00 - C08.

When PRIMARY UNIT is 2, BAY must be D00 - D14, E00 - E04, or F00 - F08.

When PRIMARY UNIT is 3, BAY must be G00 - G14, H00 - H04, or J00 - J08.

When PRIMARY UNIT is 4, BAY must be K00 - K14, L00 - L04, or M00 - M08.

When PRIMARY UNIT is 5, BAY must be N00 - N14, P00 - P04, or Q00 - Q08.

When PRIMARY UNIT is 6, BAY must be R00 - R14, S00 - S04, or T00 - T08.

When PRIMARY UNIT is 7, BAY must be U00 - U14, V00 - V04, or W00 - W08.

When PRIMARY UNIT is 8, BAY must be X00 - X14, Y00 - Y04, or Z00 - Z08.

2.5 UNIT TYPE

Description: Enter the Unit Type. The only valid value is OXU.

Copyright © 2003 Lucent Technologies

Required Field.
Default: OXU

2.6 # AISLE

Description: Enter the Equipment Location Aisle Number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00 - 99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00 - 99. It is recommended that floor 00 be used for equipment located in the basement per floor plan designation.

Required Field.
Valid Entries: 00 - 99

2.7 #BAY

Description: Enter the Equipment Location Bay Number.

Required Field.
Valid Entries:

Valid BAY Entries, 5E9(2) - 5E16(1)

Entry	Definition
0 - 4	Switching Module (non-SM-2000).
0 - 14	SM-2000; SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

Valid BAY Entries for 5E16(2) and later

Entry			Type
000 - 004			SM
000 - 014,	100 - 104,	200 - 208,	SM-2000
A00 - A14,	B00 - B04,	C00 - C08,	
D00 - D14,	E00 - E04,	F00 - F08,	
G00 - G14,	H00 - H04,	J00 - J08,	
K00 - K14,	L00 - L04,	M00 - M08,	
N00 - N14,	P00 - P04,	Q00 - Q08,	
R00 - R14,	S00 - S04,	T00 - T08,	
U00 - U14,	V00 - V04,	W00 - W08,	
X00 - X14,	Y00 - Y04,	Z00 - Z08	

2.8 #VERTPOS

Description: Enter the Vertical Equipment Location that specifies the bottom of the unit. The recommended values for this are:

7, 15, 24, 32, 41, 49, 58, 69, 76

Required Field.
Valid Entries: 0 - 84

2.9 #MODCTL SG0 CLI

Description: Enter the CLI value for the Module Controller Service Group 0. See Division 8, Section 1 for valid CLI values.

Required Field.
Valid Entries: Enter 0 through 7fffffff hexadecimal.

2.10 MODCTL SG0 EQSTAT

Copyright © 2003 Lucent Technologies

Description: Enter the status for the Module Controller Service Group 0.
Default: O
Valid Entries:

Valid MODCTL SG0 EQSTAT Entries

Entry	Definition
O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

The MODCTL SG0 EQSTAT entered must not be greater than the EQSTAT on the EQAPCX form for the same SM and Module Controller 0 (e.g., "O" is greater than "G" which is greater than "U").

2.11 #MODCTL SG1 CLI

Description: Enter the CLI value for the Module Controller Service Group 1. See Division 8, Section 1 for valid CLI values.

Required Field.
Valid Entries: Enter 0 through 7fffffff hexadecimal.

2.12 MODCTL SG1 EQSTAT

Description: Enter the status for the Module Controller Service Group 1.
Default: O
Valid Entries:

Valid MODCTL SG1 EQSTAT Entries

Entry	Definition
O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

The MODCTL SG1 EQSTAT entered must not be greater than the EQSTAT on the EQAPCX form for the same SM and Module Controller 1 (e.g., "O" is greater than "G" which is greater than "U").

OXU DI0 INFO

The following fields (Section 2.13 - Section 2.18) define the DI (Data Interface) CLI and Equipment Status information.

2.13 #DIO SG0 CLI

Description: Enter the DI0 SG0 Change Level Indicator. See Division 8, Section 1 for valid CLI values.
Valid Entries: Enter 0 through 7fffffff hexadecimal.

2.14 DI0 SGO EQSTAT

Description: Enter the status for the Data Interface Service Group 0.

Required Field.
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
O	Operational.
G	Growth.
U	Unequipped.

Copyright © 2003 Lucent Technologies

2.15 #DI0 SG1 CLI

Description: Enter the Data Enterface 0 Service Group 1 Change Level Indicator. See Division 8, Section 1 for valid CLI values.

Required Field.
Valid Entries: Enter 0 through 7fffffff hexadecimal.

2.16 DI0 SG1 EQSTAT

Description: Enter the status for the Data Interface 0 Service Group 1.

Required Field.
Valid Entries:

Valid DI0 SG1 EQSTAT Entries

Entry	Definition
O	Operational.
G	Growth.
U	Unequipped.

2.17 #DI0 TSI BOARD

Description: Enter the Data Interface 0 Time Slot Interchanger Board.
Valid Entries: 0 - 9

Data Rules:

The combination of TSI BOARD and TSI SLOT entries on the following forms:
EQDI
EQDNUS
EQIWG
EQPDXU
EQPSU
EQPCTP
EQXCDU and/or
EQNLI
must not be duplicated on any other EQDI form (except when entering the second of a DI pair); on the same or any other EQNLI form; on the same or any other EQPDXU form (except when entering a PCTDX1 where the XAIU CONFIG is equal to "LOW"); or on any EQPSU, EQPCTP, EQDNUS, or EQXCDU form for a given SM.

When DI0 TSI BOARD is 0, and DI0 TSI SLOT is 3 on the EQXCDU form, VCDX OFFICE must be set to "Y" on the EQCORE form. Only in a VCDX office can TSI BOARD = 0 be used for OXU assignments. In non-VCDX offices, TSI BOARD = 0 is reserved for NLI, DX and MH assignment.

2.18 #DI0 TSI SLOT

Description: Enter the Data Interface 0 Time Slot number.

Required Field.
Valid Entries: 0 - 3

Data Rules:

Copyright © 2003 Lucent Technologies

SEC. 85: 5760 Record
OPTICAL INTERFACE UNIT FORM - EQOIU

1. GENERAL

The 5760 Record is available with 5E16(2) and later Software Releases. It is used to define the assignment and location of an OIU (Optical Interface Unit). This form supports the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 19.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OIU SM

Description: The OIU SM (Optical Interface Unit) (Switching Module) field is used to indicate to which SM the OIU is assigned.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

OIU SM must be defined as an SM with SM-2000 class processor on the EQIM form.

2.3 * OIU

Description: This field is used to assign the unit number for an OIU unit.

Software Release: 5E16(2) and later
Valid Entries: 0 - 7

2.4 # AIP SM

Description: This field is used to specify the SM number for the desired AIP (Any Media Interface Platform).

Required Field.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

AIP SM and AIP must be defined on the EQAIP form (5761 Record).

Copyright © 2003 Lucent Technologies

2.5 # AIP

Description: This field is used to specify the AIP unit number.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: 0 - 15

2.6 # CLI

Description: The CLI (Change Level Indicator) field is used to specify the change level indicator of the OIU. This is a no change field.

Software Release: 5E16(2) and later
Valid Entries: 0

Data Rules:

CLI must be 0.

SEC. 86: 5761 Record
OPTICAL FACILITY INTERFACE PACK FORM - EQOIUP

1. GENERAL

The 5761 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete OFI (Optical Facility Interface) packs. This form supports the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 20.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OIU SM

Description: The OIU SM (Optical Interface Unit) (Switching Module) field is used to indicate to which SM the OIU is assigned.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

OIU SM and OIU must be defined on the EQOIU form (5760 Record).

OIU SM must be defined as SM on the EQMH form (5856 Record) with both MH SIDE 0 EQSTAT and MH SIDE 1 EQSTAT set to "O".

2.3 * OIU

Description: This field is used to indicate the OIU unit number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 7

2.4 * PROTECTION GRP

Description: This field is used to define the Protection group number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 9

Data Rules:

PROTECTION GRP must be unique for each AIP SM and AIP set on the EQOIU forms (5760 Record).

Copyright © 2003 Lucent Technologies

2.5 # OFI 0 CLI

Description: The Optical Facility Interface 0 Change Level Indicator field is used to specify the change level indicator of the OFI (Optical Facility Interface). This indicator is used by system software to determine the hardware version of the associated circuit board.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: 0

Data Rules:

OFI 0 CLI and/or OFI 1 CLI must be 0.

2.6 # OFI 1 CLI

Description: The Optical Facility Interface 1 Change Level Indicator field is used to specify the change level indicator of the OFI (Optical Facility Interface). This indicator is used by system software to determine the hardware version of the associated circuit board.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: 0

2.7 #PACK TYPE

Description: This field is used to specify the type of pack being inserted. This is a no change field.

Software Release: 5E16(2) and later
Default: OFI24
Valid Entries: OFI24 or OFIPKT

Data Rules:

For 5E16(2) and later, when PACK TYPE is "OFI24":

- CP INHIBIT must be "N".
- BNID must be blank.

2.8 PAYLOAD TYPE

Description: This field is used to define the type of facility that will be connected. This is a no change field.

Software Release: 5E16(2) and later
Default: OC3

2.9 SERVICE TYPE

Description: This field is used to define the type of traffic that will be carried. This is a no change field.

Software Release: 5E16(2) and later

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E16(2) and later, when SERVICE TYPE is "IPV4", OFILINK PCT 1 must exist before OFILINK PCT 2.

OFI PCT LINK (OFILINK)

The OFI LINK list is used to assign PCT (Peripheral, Control and Timing) links to the OFI.

2.10 TSI BOARD

Description: The Time Slot Interchange Board field is used to specify the TSI board a PCT link is connected to.

Software Release: 5E16(2) and later
Valid Entries: 1 - 9

Data Rules:

Row 1 of the OFI PCT LINK list must be entered.

Combinations of TSI BOARD/TSI SLOT must be unique within the OFI PCT LINK list.

TSI BOARD must be defined as a TSI BOARD with EQSTAT set to "O" on the EQTSI form.

2.11 TSI SLOT

Description: The Time Slot Interchange Slot field is used to specify the TSI slot a PCT link is connected to.

Software Release: 5E16(2) and later
Valid Entries: 0 - 3

2.12 EQSTAT 0

Description: The Equipment Status 0 field defines the state of the link on side 0.

Software Release: 5E16(2) and later
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

EQSTAT 0 and 1 of ROW 1 OFI PCT LINK list cannot be "O" during insert.

2.13 EQSTAT 1

Description: The Equipment Status 1 field defines the state of the link on side 1.

Software Release: 5E16(2) and later
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

Copyright © 2003 Lucent Technologies

EQSTAT 0 must not be greater than EQSTAT 1 in any row.

EQSTAT of row 1 must not be less than EQSTAT rows 2 or 3 on any side.

2.14 BNID

Description: The Bearer Network Identification number field is used to define the Bearer Network ID associated with this OFI. This field supports the OIU-IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). See Division 2, Section 7BX.

Software Release: 5E16(2) and later
Valid Entries: Blank, or enter 1 - 512

Data Rules:

For 5E16(2) and later, BNID must be entered when PACK TYPE is "OFIPKT".

2.15 MAX ENG TS

Description: The Maximum Engineerable Time Slots field is used to define the maximum engineerable time slots. This field supports the OIU-IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). See Division 2, Section 7BX.

Software Release: 5E16(2) and later
Valid Entries: Blank, or enter 672 - 2016

Data Rules:

For 5E16(2) and later:

- MAX ENG TS must be blank:
  - when SERVICE TYPE is not "IPV4"
  - during insert and when SERVICE TYPE is not "IPV4"
- When MAX ENG TS is entered and one OFI PCT LINK exists, MAX ENG TS must be between 672 and 720.
- When MAX ENG TS is entered and two OFI PCT LINKS exist, MAX ENG TS must be between 672 and 1488.
- When MAX ENG TS is entered and three OFI PCT LINKS exist, MAX ENG TS must be between 672 and 2016.
- When MAX ENG TS is entered, OFI PCT LINK EQSTAT 0 must be "0".

2.16 CP INHIBIT

Description: The Call Processing Inhibit field is used specify the call processing inhibit. This field supports the OIU-IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). See Division 2, Section 7BX.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

SEC. 87: 5762 Record
OIU SONET TERMINATING EQUIPMENT FORM - EQOSTE

1. GENERAL

The 5762 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete OIU (Optical Interface Unit) STEs (SONET (Synchronous Optical Network) Terminating Equipment). This form supports the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 20.29.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OIU SM

Description: The OIU SM (Optical Interface Unit) (Switching Module) field is used to indicate to which SM the OIU is assigned.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

OIU SM, OIU, and PROTECTION GRP must be defined on the EQOIUP form (5761 Record).

OIU SM must be defined as an SM with SM-2000 class processor on the EQIM form (5700 Record).

2.3 * OIU

Description: This field is used to specify the OIU unit number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 7

2.4 * PROTECTION GRP

Description: This field is used to define the APS (Automatic Protection Switching) group number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 9

2.5 STE

Copyright © 2003 Lucent Technologies

Description: This field is used to indicate the SONET Terminating Equipment number. This is a no change field.

Software Release: 5E16(2) and later
Default: 1

2.6 STE TYPE

Description: This' field is used to indicate the SONET (Synchronous Optical Network) Termination Equipment Type.

Software Release: 5E16(2) and later
Valid Entries:

Valid STE TYPE Entries

Entry	Definition
OC3	Optical Carrier Level 3.
OC3C	Optical Carrier Level 3 Concatenated signal.

2.7 # STE 0 EQSTAT

Description: The Equipment Status for side 0 of the STE.
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

STE 0 EQSTAT and STE 1 EQSTAT must be equal.

2.8 # STE 1 EQSTAT

Description: The Equipment Status for side 1 of the STE.
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

2.9 PM GROUP

Description: This field is used to assign a performance monitoring group for this STE.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric characters

Data Rules:

PM GROUP must be defined as PM GROUP on the OIUPM form (5767 Record) where CKT TYPE equals "OC3".

Copyright © 2003 Lucent Technologies

2.10 CGA GROUP

Description: This field is used to assign a Carrier Group Alarm group for the STE.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric characters

Data Rules:

CGA GROUP must be defined as CGA GROUP on the CGATIME form (5766 Record) with SONET TYPE set to "Y".

2.11 CLFI

Description: The Common Language Facility Identifier field is used to assign a descriptive name to this facility.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 25 alphanumeric characters

2.12 PAYLOAD TYPE

Description: This field is used to designate what type of payload the STE carriers. This is a no change field.

Software Release: 5E16(2) and later
Default: STS1FAC

AUTOMATIC PROTECTION SWITCHING

2.13 SF THRESHOLD

Description: The SF (Signal Fail) Threshold field is used to specify the bit error rate at which SF is declared.
Required field.

Software Release: 5E16(2) and later
Default: 3
Valid Entries:

Valid SF THRESHOLD Entries

Entry	Definition
3	Ten to the power -3
4	Ten to the power -4
5	Ten to the power -5

2.14 SD THRESHOLD

Description: The SD (Signal Degrade) Threshold field is used to specify the bit error rate at which SD is declared.
Required field.

Software Release: 5E16(2) and later
Default: 5
Valid Entries:

Valid SD THRESHOLD Entries

Entry	Definition
5	Ten to the power -5

Copyright © 2003 Lucent Technologies

6	Ten to the power -6
7	Ten to the power -7
8	Ten to the power -8
9	Ten to the power -9

2.15 APS INHIBIT

Description: The Automatic Protection Switching Inhibit field indicates whether or not APS should be inhibited.
Required field.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

2.16 APS ARCH

Description: The Automatic Protection Switching Architecture field is used to specify the APS architecture.

Required field.

Software Release: 5E16(2) and later
Default: 1PLUS1
Valid Entries:

Valid APS ARCH Entries

Entry	Definition
1PLUS1	1+ 1 full duplex

Data Rules:

When APS ARCH is "1P1DBSF", APS MODE must be "UNIDIRECT".

2.17 APS MODE

Description: The Automatic Protection Switching Mode field is used to indicate whether or not the traffic channel selection is done based on local conditions only, or if it is also dependent on remote conditions.

Required field.

Software Release: 5E16(2) and later
Default: UNIDIRECT
Valid Entries:

Valid APS MODE Entries

Entry	Definition
BIDIRECT	bi-directional APS mode
UNIDIRECT	uni-directional APS mode

Data Rules:

When APS MODE is "BIDIRECT", APS ARCH must be "1PLUS1".

SEC. 88: 5763 Record
HIGH LEVEL VIRTUAL CONTAINER FORM - EQHVC

1. GENERAL

The 5763 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete HVCs (High Level Virtual Containers). This form supports the the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 20.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OIU SM

Description: The OIU SM (Optical Interface Unit) (Switching Module) field is used to indicate to which SM the OIU is assigned.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

OIU SM, OIU, and PROTECTION GRP must be defined on the EQOSTE form (5762 Record) where the EQHVC form's HVC TYPE is equal to the EQOSTE form's PAYLOAD TYPE.

2.3 * OIU

Description: This field is used to specify the OIU unit number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 7

2.4 * PROTECTION GRP

Description: This field is used to define the APS (Automatic Protection Switching) group number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 9

2.5 STE

Description: This field is used to indicate SONET Terminating Equipment. This is a no change field.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Default: 1

2.6 * HVC

Description: This field is used to assign a number to an HVC (High Level Virtual Container).

Software Release: 5E16(2) and later
Valid Entries: 1- 3

2.7 HVC TYPE

Description: The HVC (High Level Virtual Container) TYPE field is used to specify the type of HVC. Required field.

Software Release: 5E16(2) and later
Default: STS3C
Valid Entries:

Valid HVC TYPE Entries

Entry	Definition
STS1FAC	OIU STS-1 (Synchronous Transport Signal 1) Facility
STS3C	OIU Synchronous Transport Signal Facility.

Data Rules:

When HVC TYPE is "STS1FAC", PAYLOAD TYPE must be "VT1".

When HVC TYPE is "STS3C", HVC must be 1.

When HVC TYPE is "STS3C", PAYLOAD TYPE must be "OIUSAAL" or "PPPLNK".

2.8 # HVC EQSTAT

Description: This field is used to set the equipment status of an HVC.
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid HVC Equipment Status Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

HVC EQSTAT must be greater than or equal to LVC EQSTAT on the EQLVC form (5764 Record) (i.e., "O" is greater than "G" which is greater than "U").

HVC EQSTAT must be no greater than the STE 0 EQSTAT and/or STE 1 EQSTAT on the EQOSTE form (5762 Record).

2.9 PM GROUP

Description: This field is used to assign a performance monitoring group to this HVC.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric characters

Copyright © 2003 Lucent Technologies

Data Rules:

PM GROUP and HVC TYPE must be defined as PM GROUP on the OIUPM form (5767 Record) where CKT TYPE equals the HVC TYPE.

PM GROUP must not equal "OSTEDEF", OSTEGDF", "OSTS1GD", "OVT1DEF", OVT1GDF", "ODS1EDF", ODS1EGD", "ODS1SDF", or "ODS1SGD".

2.10 CGA GROUP

Description: This field is used to assign a Carrier Group Alarm group to this HVC.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 9 alphanumeric characters

Data Rules:

CGA GROUP must be defined as CGA GROUP on the CGATIME form (5766 Record) with SONET TYPE set to "Y".

CGA GROUP must not equal "SDHGDEF", "CNTGDEF", or "CNTDEF".

2.11 CLFI

Description: This field is used to assign a descriptive name to this facility.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 25 alphanumeric characters

2.12 PAYLOAD TYPE

Description: This field is used to designate what type of payload the HVC carries.
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid HVC TYPE Entries

Entry	Definition
OIUSAAL	Optical Interface Unit Signaling ATM (Assynchronous Transfer Mode) Adaptation Layer facility.
PPPLNK	Point-to-Point Link facility.
VT15	Virtual Tributary at the 1.5 level facility

Data Rules:

When PAYLOAD TYPE is "VT15" SLBL must be "EQHV", "UNEQHV", or "VT".

When PAYLOAD TYPE is "PPPLNK", SLBL must be "EQHV", "PPPWS", or "UNEQHV".

When PAYLOAD TYPE is "OIUSAAL", SLBL must be "ATM", "EQHV", or "UNEQHV".

2.13 SLBL

Description: The Signal Label field is used to specify the signaling label for this facility.
Required field.

Software Release: 5E16(2) and later
Default: VT
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid SLBL Entries	
Entry	**Definition**
ATM	ATM Structure
EQHV	Equipped - non-specific
PPPWS	PPP with scrambling Structure
UNEQHV	Unequipped or supervisory-unequipped.
VT	VT - Structured STS-1 SPE

2.14 PLM INH

Description: The Inhibit Payload Label Mismatch field is used to specify whether or not reports for payload label mismatches should be inhibited for this HVC.
Required field.

Software Release: 5E16(2) and later
Default: Y
Valid Entries: Y, N

2.15 TIM INH

Description: The Inhibit Trace Identifier Mismatch field is used to specify whether or not reports for trace identifier mismatches should be inhibited for this HVC.
Required field.

Software Release: 5E16(2) and later
Default: Y
Valid Entries: Y, N

PATH TRACE (J1)

2.16 SIZE

Description: This field is used to specify the maximum length of the TRANSMIT and EXPECTED values. This is a no change field.

Software Release: 5E16(2) and later
Default: 64

2.17 TRANSMIT

Description: This field is used to specify the J1 transmitted path trace value.
Valid Entries: Blank, or 1 - 62 alphanumeric characters

2.18 EXPECTED

Description: This field is used to specify the J1 expected path trace value.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 62 alphanumeric characters

SEC. 89: 5764 Record
LOW LEVEL VIRTUAL CONTAINER FORM - EQLVC

1. GENERAL

The 5764 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete LVCs (Low Level Virtual Containers) and their associated container information. This form supports the OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information on this feature, see Division 2, Section 7BQ.

1.1 Recent Change View

The Recent Change View for this form is 20.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OIU SM

Description: The OIU SM (Optical Interface Unit) (Switching Module) field is used to indicate to which SM the OIU is assigned.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

OIU SM, OIU, PROTECTION GRP, STE, and HVC must be defined on the EQHVC form (5763 Record).

2.3 * OIU

Description: This field is used to indicate the OIU unit number

Software Release: 5E16(2) and later
Valid Entries: 0 - 7

2.4 * PROTECTION GRP

Description: This field is used to define the APS (Automatic Protection Switching) group number.

Software Release: 5E16(2) and later
Valid Entries: 0 - 9

2.5 STE

Description: This field is used to indicate SONET Terminating Equipment. This is a no change field.

Software Release: 5E16(2) and later
Default: 1

2.6 * HVC

Copyright © 2003 Lucent Technologies

Description: This field is used to indicate an HVC (High Level Virtual Container).

Software Release: 5E16(2) and later
Valid Entries: 1- 3

2.7 * VT GROUP

Description: This field is used to specify a Virtual Tributary Group.

Software Release: 5E16(2) and later
Valid Entries: 1- 7

2.8 * VT MEMBER

Description: This field is used to specify a Virtual Tributary Member.

Software Release: 5E16(2) and later
Valid Entries: 1- 4

2.9 LVC TYPE

Description: This field is used to specify the type of LVC (Low-level Virtual Container). This is a no change field

Software Release: 5E16(2) and later
Default: VT15

VIRTUAL CONTAINER (VC)

2.10 # EQSTAT

Description: This field is used to set the equipment status of this LVC.
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid LVC Equipment Status Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

2.11 PM GROUP

Description: This field is used to assign a performance monitoring group to this LVC.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric characters

Data Rules:

PM GROUP must be defined as PM GROUP on the OIUPM form (5767 Record) where CKT TYPE equals "VT15".

2.12 CGA GROUP

Description: This field is used to assign a Carrier Group Alarm group to the LVC.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric characters

Data Rules:

CGA GROUP must be defined as CGA GROUP on the CGATIME form (5766 Record) with SONET TYPE set to "Y".

2.13 SLBL

Description: The Signal Label field is used to specify the signaling label for this facility.
Required field.

Software Release: 5E16(2) and later
Default: ASYNC
Valid Entries:

Valid SLBL Entries

Entry	Definition
ASYNC	Asynchronous
BYSYN	Byte Synchronous
EQLV	Equipped - non-specific

2.14 PLM INH

Description: The Inhibit Payload Label Mismatch is used to specify whether or not reports for payload label mismatches should be inhibited for this LVC.
Required field.

Software Release: 5E16(2) and later
Default: Y
Valid Entries: Y, N

2.15 PAYLOAD TYPE

Description: This field is used to designate what type of payload the LVC carries. This is a no change field.

Software Release: 5E16(2) and later
Default: DS1

WIRELESS TRUNKS

This field supports the AUTOPLEX (Lucent Registered Trademark for its Cellular Switching Systems) Wireless on OIU (Optical Interface Unit) feature. For more information see, Division 2, Section 7CC.

2.16 AFAC ID

Description: The AFAC ID (Autoplex Facility Identifier) field is used to communicate maintenance information to the ECP (Executive Cellular Processor) complex of an OIU. This identifier must be unique for each AUTOPLEX OIU.

Software Release: 5E17(1) FR 2 and later
Valid Entries: 1 - 4500 or blank

Data Rules:

When AFAC ID is entered, APPLICATION TYPE must be "TRUNK" and PAYLOAD TYPE must be "DS1".

AFAC IDs must be unique across EQDUP, EQVT, and EQLVC forms in an office.

Copyright © 2003 Lucent Technologies

APT TESTING

This field supports the APT (Automatic Progression Testing) Enhancements feature. For information on this feature see, Division 2, Section 2AD.

2.17 ALGORITHM

Description: This field is used for the DS1 (Digital Signal Level 1) in APT (Automatic Progression Testing).

Software Release: 5E16 FR 2 and later
Valid Entries:

Valid ALGORITHM Entries

Entry	Definition
1ONLY	Test One Only (test one trunk only on the DS1, independently whether test passes or fails and then move to a trunk on another DS1).
FULL	Full (test all trunks on the DS1, independently whether test passes or fails, and then move to a trunk on another DS1).
NOTST	No Test (APT should not perform any tests on the DS1).
SUCC	Stop on Success (test one trunk on the DS1 and then move to a trunk on another DS1 if test passes, or test next trunk on the same DS1 if test fails).

Data Rules:

ALGORITHM can only be entered when APPLICATION TYPE is "TRUNK".

CONTAINER (C)

2.18 # EQSTAT

Description: This field is used to set the equipment status of this CNTR (Container).
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid CNTR Equipment Status Entries

Entry	Definition
G	Growth.
O	Operational.
U	Unequipped.

Data Rules:

When CONTAINER EQSTAT is "G", VIRTUAL CONTAINER EQSTAT must be "G" or "O".

When CONTAINER EQSTAT is "O", VIRTUAL CONTAINER EQSTAT must be "O".

2.19 PM GROUP

Description: This field is used to assign a performance monitoring group to this Container.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 9 alphanumeric characters

Data Rules:

PM GROUP must be defined as PM GROUP on the OIUPM form (5767 Record) where CKT TYPE equals "DS1".

Copyright © 2003 Lucent Technologies

2.20 CGA GROUP

Description: This field is used to assign a Carrier Group Alarm group to the Container.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 9 alphanumeric characters

Data Rules:

CGA GROUP must be defined as CGA GROUP on the CGATIME form (5766 Record) with SONET TYPE set to "N".

2.21 MODE

Description: This field defines the signaling mode of the Virtual Container. This is a no change field.

Software Release: 5E16(2) and later
Default: RB

2.22 CLFI

Description: This field is used to assign a descriptive name to the container associated with this Virtual Container.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 25 alphanumeric characters

2.23 APPLICATION TYPE

Description: This field is used to designate what application this container will be used for. This is a no change field.

Software Release: 5E16(2) and later
Default: TRUNK

DS1 SIGNALING

2.24 # FRAME

Description: This field is used to specify the data signaling format for this container facility.
Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid FRAME Entries

Entry	Definition
ESF	Extended Super Frame format
SF	Super Frame format

2.25 ZCS

Description: This field is used to specify whether or not the digital signal level 1 SONET (Synchronous Optical Network) facility signaling zero code suppression is on.
Required field.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

SEC. 90: 5765 Record
ANY MEDIA INTERFACE PLATFORM FORM - EQAIP

1. GENERAL

The 5765 Record is available with 5E16(2) and later Software Releases. It is used to define assignments and locations for Any Media Interface Platform Units. This form supports the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 19.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * AIP SM

Description: The AIP SM (Access Interface Platform Switching Module field is used to specify the SM number where the AIP is located.

Required Field.
Valid Entries: 1 - 192

Data Rules:

AIP SM must be defined as an SM with SM-2000 class processor on the EQIM form.

2.3 * AIP

Description: This field is used to indicate the AIP unit number.
Valid Entries: 0 - 15

2.4 # EQL AISLE

Description: The Equipment Location Aisle field is used to assign the equipment location (floor and aisle) number. This entry consists of a floor and aisle number. The first and second digits, from the left, are the floor number. Valid floor numbers are 00 - 99. The third and fourth digits, from the left, are the aisle number. Valid aisle numbers are 00 - 99.
Required field.
Valid Entries:

00 - 99 for floor number
00 - 99 for aisle number

2.5 # EQL BAY

Copyright © 2003 Lucent Technologies

Description: This field is used to assign the Equipment Location Bay number.

Required field.
Valid Entries:

Valid EQLBAY Entries, 5E9(2) and later

Entry	Definition
0 - 14	SM-2000; SM Cabinet aisle.
90 - 99	SM-2000;SM Cabinet aisle.
100 - 104	SM-2000; Back panel; wiring position.
200 - 208	SM-2000; Front panel; door position.

2.6 # EQL VERPOS

Description: This field is used to assign the height of the AIP unit within the bay, in inches above the floor.

Required Field.
Valid Entries: 15, 32, or 49

2.7 # CABINET

Description: This field is used to assign the cabinet reference where the AIP is located.

Required Field.
Valid Entries: FRONT or REAR

SEC. 91: 5829 RECORD
GENERAL GSM/NGSM CONNECTIVITY - QGCON

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form provides the basic description of the Switching Module side of the GQPH (Generalized QLPS Protocol Handler) pipe connecting to the GQPH network.

1.1 Recent Change View

The Recent Change View for this form is 17.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 # GSM

Description: This field specifies the GSM (Global Switching Module) where data is read.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

Data Rules:

The GSM entered on this form must be defined on at least 2 sets of QPHPIPE forms (5828 Record) for both QLPS NETWORK 0 and QLPS NETWORK 1. The GLOBAL SM, PSU SHELF, and CHANNEL GROUP must be the same within each set of the QPHPIPE forms and SERVICE TYPE must be "SIPT".

2.3 * SERVICE TYPE

Description: This field is used to indicate whether or not the service type is SIPT.

Required Field.
Default: SIPT
Valid Entries: SIPT

NON-GSM LIST

This list represents the non-GSMs.

2.4 SM2000

Description: This field is used to display non-GSMs.
Valid Entries: 1 - 192

Data Rules:

SMs in NON GSM list must be unique.

GSM must also be listed in a NON GSM list.

Copyright © 2003 Lucent Technologies

MHs in the NON-GSM list must be SM2000s that have MH Pipes provisioned on the EQPIPE form (5544 Record).

SEC. 92: QLPS TIMESLOT USAGE - QTUV

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the QLPS (Quad-Link Packet Switch) feature. This form is used to preserve timeslot assignment on a QTMSLINK to a QLPS board in an SM-2000 office.

1.1 Recent Change View

There is no Recent Change View for this form.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 # QLPS NETWORK

Description: This field specifies the Quad-link Packet Switch Network number.
Required field.

Software Release: 5E16(2) FR3 and later
Valid Entries: 0 or 1

2.3 * QTMSLINK

Description: This field represents one of four TMS (Time Multiplex Slot) link numbers.

Required Field.

Software Release: 5E16(2) FR 3 and later
Valid Entries:

4 - 28 or 34 - 186 in increments of 4 for single fabric and 6 - 374 for network 0 or,
7 - 375 for network 1 in increments of 8 for dual fabric.

2.4 * TIMESLOT

Description: This field represents the time slot number being used.

Required Field.

Software Release: 5E16(2) FR 3 and later
Valid Entries: 0 - 255

2.5 HDLC

Description: This field represents the High Level Data Link Control Channel number.

Software Release: 5E16(2) FR 3 and later
Valid Entries: 1 - 30

2.6 QEND PT

Description: This field represents the endpoint number for QPH/GQPH pipes (same as SM-2000 value for

Copyright © 2003 Lucent Technologies

MH pipes).

Software Release: 5E16(2) FR 3 and later
Valid Entries:

1 - 192 for SM-2000 or for MH pipes or,
197 - 255 for endpoint number for QPH/GQPH pipes

2.7 TYPE

Description: This field represents the QLPS pipe type.

Software Release: 5E16(2) FR 3 and later
Valid Entries: CCS, MH, or SIPT

Data Rules:

When TYPE is "MH", QENDPT must be 1 - 192.

When TYPE is "CCS" or "SIPT" QENDPT must be 197 - 255.

DIV. 9: COMMON CHANNEL SIGNALING

Copyright © 2003 Lucent Technologies

SEC. 1: CNI IMPLEMENTATION ON THE 5ESS SWITCH

Copyright © 2003 Lucent Technologies

SEC. 1A: CNI IMPLEMENTATION ON THE 5ESS-2000 SWITCH

1. INTRODUCTION

The CNI (Common Network Interface) network allows signaling information to be transmitted between switches. The signaling information controls basic interswitch calls (ISUP Routing) and handles CCS7 applications such as LASS and NS800 (Global Title Routing). The following section provides information needed to connect the 5ESS-2000 Switch to the CNI network to provide ISUP routing and Global Title routing for the 5ESS-2000 Switch. Refer to documents: 256-015-200 (CCS7 Network - Database and Routing Document) and 235-190-120 (Common Channel Signaling Service Features) for a detailed description of Common Channel Signaling services.

1.1 CNI Terms

The following terms are used in this section and in the following Division 9 sections:

- A signaling point is a switch, STP (Signal Transfer Point), or SCP (Service Control Point) that sends and receives CCS7 signaling messages to other signaling points in the network.
- A Point Code is a 9-digit number that uniquely identifies a signaling point in the CCS7 network. The Point Code provides the address information (e.g., identification of originating or terminating point) that is needed to route signaling messages throughout the network.
- A CLLI (Common Language Location Identification) is an 11-character code, which is similar to a Point Code, that uniquely identifies a switch, STP or a SCP in the network.
- A signaling link is a data link that connects two signaling points in a CCS7 network.
- A signaling Link Set consists of all CCS7 signaling links between two particular signaling points.
- A Combined Link Set refers to all CCS7 signaling links that connect a switch to an STP pair or to all the CCS7 signaling links that connect an STP to another STP pair.
- A Cluster is a group of signaling points within a network. A cluster may have up to 255 signaling points.
- An SCP is a centralized database that provides call routing information needed for some CCS7-based features.
- The STP is used as a switching point between offices, SCPs and other STPs in the CCS7 network
- GTTs (Global Title Translations) are used to obtain routing information for CCS7 based features.

1.2 Sample CNI Translations

Figure 1 shows a sample CNI configuration used as an illustration for the sample data provided in the following Division 9 Sections. The following RC Views should be entered for this configuration:

A. The LOCAL POINT CODE and LOCAL CLLI should be defined on RC View 15.1.

B. The link nodes and their corresponding LINKSETs and COMBINED LINKSET should be defined on RC View 15.2.

C. All of the Non-local networks must be defined on RC View 15.12.

D. The cluster information should be entered on RC View 15.9 for each STP, SCP and ISUP trunk.

Copyright © 2003 Lucent Technologies

E. For 5E8 and earlier, the member information should be entered on RC View 15.13 for small network routing. For 5E9(1) and later, member information should be entered on RC View 15.18 for small network routing, or for the FPCR feature if it is activated.

F. The subsystem numbers for each CCS7 based applications must be defined on RC view 8.17 and 15.10. Also, SUBSYSTEM 3 must be entered for 5E6 and later Software Releases.

G. The Global Title Translator must be defined on RC View 15.11 for the STPs where Global Title Translations are performed.

2. RECENT CHANGE SEQUENCING

1. Install or grow the CNI as covered in the Installation Engineering Handbook 555 (new start) or 555A (growth).

   The temporary CNI-related data files are created based on user input gathered in response to a series of (AT&T or LEC) office environment- and hardware equipage-related prompts. These prompts are generated by a script invoked at the RC/V terminal or STLWS (Supplementary Trunk and Line Work Station). This temporary data is used to facilitate installation of the CNI Ring without the need for office-specific data. Refer to the Installation Handbook for procedures to install temporary data files.

   The temporary data must be replaced with actual, complete, site-specific functional data before placing the ring in service.

2. For 5E8 and earlier Software Releases, populate the Network File. The following parameters are populated for the specific releases.

   - STP Indicator: Set to 0. Applies to 5E4(2) and later Software Releases.
   - STD_PC (Standard Point Code Indicator): Set to 1 for LEC networks and 0 for AT&T networks. Applies to 5E4(2) and later Software Releases.
   - Initialize the CNI with a level 4 initialization to bring the network file data into memory.

3. Populate RC View 15.1 (Office Data). See Division 9, Section 2A.

4. Populate RC View 15.2 (Link Node Data). See Division 9, Section 2B.

   Enter a view for each signaling link node connected to the adjacent STP pair.

   Note:

   The signaling link node must be out-of-service and the MAJOR STATE field must be set to "UNA" before the link information can be updated.

5. Populate RC View 15.3 (Logical to Physical). See Division 9, Section 2C.

   Populate a view for each signaling link that transmits CCIS6 trunk signaling messages over high (56 kbs) or low speed links (4.8 kbs).

6. Populate RC View 15.12 (Nonlocal Network IDs for 5E6 - 5E8 Software Releases, or Network

Copyright © 2003 Lucent Technologies

Routing Data for 5E9(1) and later Software Releases, in any of the following situations. See Division 9, Section 2L.

- The 5ESS-2000 Switch is routing CCS7 messages to another network.
- Global Title Translations are performed in an STP that is located in another network.
- An SCP used for CCS7-based features is located in another network.
- A far end office is located in another network (ISUP Trunks RC View 5.1).
- A switch in another network is being sent TCAP messages for LASS.

7. Populate RC View 8.15 (CCS Office Parameters), if APSDN or NS800 is provided by the switch.
8. Populate the Recent Change View 15.10 (Subsystem Numbers); for 5E6 and later Software Releases, subsystem Number 3 is needed for ISUP flow control when using SS7-based features. See Division 9, Section 2J.

When using CCS7-based features (LASS, LIDB, NS800, APSDN and ASP), the Subsystem Numbers must correspond with the network subsystem values and the values assigned to the particular applications (e.g. LASS) on RC View 8.17.

1. Populate the RC View 15.11 (Global Title Translation) when Global Title Translations are to be done using Capability Codes (Alias Point Codes) or if translations are not to be done at the local STP pair. See Division 9, Section 2K.

   If no entry is made in the 15.11 View, the Global Title Translations are performed at the local STP pair. The point codes are stored in the general translator, 256.

   Note: The TRANSLATION TYPE must correspond with the value assigned to the applications on RC View 8.17.
2. Populate RC View 8.17 (Direct Signaling Application), if the subsystem numbers are assigned on RC View 15.10.
3. Populate RC View 15.9 (Cluster Routing Data) for each of the following. See Division 9, Section 2I.
   - Each local STP cluster.
   - Each far-end office cluster (ISUP trunks defined on RC View 5.1).
   - Each STP where Global Title Translations are performed.
   - Each SCP (Service Control Point) where routing information is stored CCS7 based features (LIDB, NS800, APSDN and ASP).
   - Each switch where LASS TCAP messages are sent.
4. For 5E8 and earlier, populate RC View 15.13 (Small Nonlocal Network Cluster and Member Table for 5E6, and Small Network Cluster and Member Table for 5e7 - 5E8 Software Releases) in the following cases; otherwise, RC View 15.9 should be used to enter cluster information. See Division 9, Section 2M.
   - The local STP pair resides within the switch's small network.

Copyright © 2003 Lucent Technologies

- The local STP pair resides in another small network.

5. For 5E9(1) and later, populate RC View 15.18 for the following cases.

6. RC Views 15.4 through 15.8 are initialized with an extensive set of standard input data. The existing report data should not be manipulated but a customized measurement report may be created by entering the following views:

   - Define a new USER VIEW on RC View 15.5. See Division 9, Section 2E.
   - If restrictions are needed on specific measurements, define an Exception Table on RC View 15.6 (see Division 9, Section 2F) for the USER View defined on RC View 15.5.
   - Schedule the report on RC View 15.8 (see Division 9, Section 2G) using one of the corresponding REPORT TYPEs.

Note:

Only Non-Fixed Format reports can be modified or created. Fixed-Format Reports cannot be modified or created.

3. CNI FEATURES - 5E9(1) AND LATER

New and Modified RC Views

RC View	Record Number	Div.	Sec.
8.22	5713	3	5AR
15.1	5011	9	2A
15.2	5012	9	2B
15.9	5019	9	2I
15.12	5022	9	2L
15.14	5024	9	2N
15.15	5025	9	2O
15.16	5026	9	2P
15.17	5027	9	2Q
15.18	5028	9	2R

3.1 RCPTP Feature Definition

The RCPTP (Recent Change of Protocol Timers and Parameters) feature allows customers to change and verify the CCS7 MTP (Message Transfer Part) and SCCP (Signaling Connection and Control Part) protocol timers and thresholds, two critical event parameters, an ANSI Point Code flag, and for NSD, the values of the CCITT protocol timers used in the ISC (International Switching Center).

Before 5E9(1), these timers and thresholds could be changed only via a network file, a process that required a CNI initialization and system reboot to activate the changes. To eliminate these service-impacting procedures, this feature replaces the network file with a set of new and modified Recent Change views through which the parameters can be maintained in a real-time environment.

3.2 RCPTP Translation Requirements

15.1 View (5011 Record) - This Office Identification View identifies the local office and its function in the CCS network. For 5E9(1) and later this view, which is entered only once for each office, has three new fields.

- ANSI STD PC IND: This is a verify-only field that indicates whether or not the local office point code format is represented in ANSI. The ANSI format is used only in LEC networks; non-ANSI format is

Copyright © 2003 Lucent Technologies

used only in AT&T networks.

- CRIT EVENT NUMBER: This field limits the number of CNCE (CCS Network Critical Event) messages that will be printed on the ROP during the time interval specified in the CRIT EVENT TIMER field.

- CRIT EVENT TIMER: This field specifies the time interval (in seconds) for the CRIT EVENT NUMBER field defined previously.

15.14 View (5024 Record) - This Protocol Office Timers View is new for 5E9(1) and later. It is used to define a set of CSS7 timers: T1.111.4 MTP (Message Transfer Part) and T1.112.4 SCCP (Signaling Connection and Control Part) protocol timers.

15.15 View (5025 Record) - This Protocol Link Set Timers View is new for 5E9(1) and later. It is used to define T1.111.4 and T1.111.7 timers for individual link sets or for all link sets in the office.

15.16 View (5026 Record) - This Protocol Link Set Thresholds View is new for 5E9(1) and later. It is used to set T1.111.4 thresholds to detect and monitor congestion for a specific link set for specific link set or for all link sets in the office.

15.17 View (5027 Record) - This Protocol Link Parameters View is new for 5E9(1) and later. It is used to set T1.111.3 Link protocol timers and SUERM (Signal Unit Error Rate Monitor) thresholds for a single link, a link set, or all links in the office.

3.3 ELINK Feature Definition

The ELINK (Extended Access Links and Alternate A-Link Set Routing) feature is a secured feature, which must be purchased by the switch owner and then be activated by an Lucent Technologies SEE (System Equipment Engineer). The Secured Feature ID for ELINK is 131.

The ELINK feature allows a 5ESS-2000 Switch in a LEC CCS network to connect the signaling links between SEPs (Signaling End Points) and non-home STPs. STPs that are connected to the switch via links designated as type "A" are considered Primary STPs or Home STPs. Those connected to the switch via links designated as type "E" are considered Other STPs.

With this feature E-links provide additional routes to destinations, minimizing SEP isolation. They serve as alternate routes in the event of failed A-link sets. Likewise, A-link sets serve as alternate routes for failed E-link sets.

E-links may be used to route traffic directly to Other STP pairs or quads from SEPs, using fewer intermediate STPs and improving call processing and network performance.

3.4 ELINK Translation Requirements

8.22 View (5713 Record) - This Secured Feature System Assignment View is used to enable Secured Features. Secured Features are the optional service features that can be purchased in addition to the features included in the current Software Release. After an Lucent Technologies SEE (System Equipment Engineer) has determined that a switch owner has purchased a secured feature, the SEE can activate the feature on the switch. The ELINK feature is activated by setting the ACT field to "Y" for SFID (Secured Feature ID) 131.

15.1 View (5011 Record) - This Office Identification View identifies the local office and its function in the CCS network. For 5E9(1) and later, the LOW PRI SRST field was added to set the timer (in seconds) for the SRST (Signaling Route Set Test) message transmission interval for alternate or lower priority routes.

15.2 View (5012 Record) - This Link Information View is used to define signaling links. Each link node equipped on the CNI ring must be defined on this view. Since CNI links are equipped in pairs, an even

Copyright © 2003 Lucent Technologies

number of signaling links is always entered.

For 5E9(1) and later, a LINK TYPE value of "E" is available when secured features ELINK and FPCR (Full Point Code Routing) have been purchased. A-links are used between the 5ESS-2000 Switch and an adjacent STP; E-links are used between the 5ESS-2000 Switch and a non-adjacent STP.

15.9 View (5019 Record) - This Cluster Routing Data View is used to define data for CCS7 message routing based on the Network ID and cluster. This view supports cluster level routing to local networks and to non-local networks.

For 5E9(1) and later, the fields ALT1 ROUTE and ALT2 ROUTE were added. They specify the link sets to be used for the first and second alternate routes between the 5ESS-2000 Switch and the STP.

15.12 View (5022 Record) - This Network Routing Data View is used to define all the non-local networks that send or receive CCS7 messages to or from the local 5ESS-2000 Switch.

For 5E9(1) and later, the fields ALT1 ROUTE and ALT2 ROUTE were added. They specify the link sets to be used for the first and second alternate routes between the 5ESS-2000 Switch and the STP.

3.5 NILATA Feature Definition

The NI (Network Interconnect) LATA Routing feature is only for the Lucent Technologies NSD (Network Services Division) network. It allows more than one point code to be assigned for InterLATA routing to and from the InterExchange Carrier's toll switch office. This feature provides the capability to associate a unique point code with each LATA, allowing circuit- or call-associated CCS7 messages to be routed via the SPOI (Signaling Point of Interface), as required in the MFJ (Modification of Final Judgement). A SPOI is a legal and logical separation point where a LEC's (Local Exchange Carrier's) signaling link meets an Interexchange Carrier's signaling link.

Before 5E9(1), each AT&T toll switch had one office point code. With the NI LATA Routing feature, multiple point codes can be assigned to the toll switch. In addition to the switch's true point code which can serve a single LATA, point codes may be assigned to serve other LATAs. These additional point codes are called "alias point codes". A maximum of 16 point codes (one true point code and up to 15 alias point codes) are allowed to support the LATA routing feature for each LEC STP served by the switch.

Recent Change View 15.1 supports both the true point code and alias point codes.

When an OPC (Origination Point Code) is entered for a CCS7 trunk group on View 5.1, it must be specified on View 15.1 as either a true or alias point code. Furthermore, an alias point code cannot be deleted from View 15.1 if that point code is specified as the OPC for an existing trunk group.

3.6 NILATA Translation Requirements

15.1 View (5011 Record) - This Office Identification View identifies the local office and its function in the CCS network. This view is entered only once for the office.

For 5E9(1) and later, fifteen ALIAS PC fields were added to this view. These alias point codes can be assigned only on an AT&T toll switch and are in addition to the local office point code. The purpose of the alias point codes is to facilitate LATA routing of cicuit- or call-associated messages.

3.7 FPCR Feature Definition

The FPCR (Full Point Code Routing) feature is a secured feature, which must be purchased by the switch owner and then be activated by an Lucent Technologies SEE (System Equipment Engineer). The Secured Feature ID for FPCR is 132.

The FPCR (Full Point Code Routing) feature provides a 5ESS-2000 Switch in a LEC network with the

Copyright © 2003 Lucent Technologies

capability to directly route traffic on specific combined link sets to other STP pairs based upon the DPC (Destination Point Code). This feature increases the efficiency of the network and complies with a legal requirement to directly route certain traffic as designated by law.

3.8 FPCR Translation Requirements

8.22 View (5713 Record) - This Secured Feature System Assignment View is used to enable Secured Features. Secured Features are the optional service features that can be purchased in addition to the features included in the current Software Release. After an Lucent Technologies SEE (System Equipment Engineer) has determined that a switch owner has purchased a secured feature, the SEE can activate the feature on the switch. The FPCR feature is activated by setting the ACT field to "Y" for SFID (Secured Feature ID) 132.

15.9 View (5019 Record) - This Cluster Routing Data View is used to define data for CCS7 message routing based on the Network ID and cluster. This view supports cluster level routing to local networks and to non-local networks.

For 5E9(1) and later, the following enumerations were added to the ROUTING FLAG field: "CLU_O", "POPCLU", and "UPOPCLU".

15.12 View (5022 Record) - This Network Routing Data View is used to define all the non-local networks that send or receive CCS7 messages to or from the local 5ESS-2000 Switch.

For 5E9(1) and later, the following enumerations were added to the ROUTING FLAG field: "NTWK" and "NTWK_O".

15.18 View (5024 Record) - This Member Routing Data View is new for 5E9(1) and later. It is used to define information for CCS7 message routing based on the Network ID, cluster number, and member number of the point code. The view supports member level routing to local (intra-) and nonlocal (inter-) networks.

3.9 Routing to STP in Small Network

Although routing to an STP in a small network is not a new feature, the method of provisioning this routing has changed with the 5E9(1) Software Release.

For 5E8 and earlier, View 15.13, the Small Network Cluster and Member Table View was used to enter the cluster and member information for small network populated cluster/member routing. For 5E9(1) and later, this view is no longer available.

For 5E9(1) and later, to enter routing data to the STP pair located in the small network, either View 15.9 or View 15.18 can be used. If View 15.18 is used, only the routing data to the STP pair can be populated when the office does not purchase the ELINK and FPCR secured features.

4. CCS7 CAPACITY IMPROVEMENT

4.1 Feature Definition

The CCS7 Capacity Improvement feature is available for 5E9(2) and later and is assigned feature number 99-5E-1136. This feature increases the CCS7 call capacity by upgrading all hardware from SSI (Small Scale Integration) to IRN (Integrated Ring Node) technology. The CNI ring frame is still a single cabinet, but SSI equipment shelves are replaced by either IRN 5-node or 8-node shelves.

The bottom shelf can contain five nodes, namely, a Ring Peripheral Controller Node, three Link Nodes, and a Direct Link Node. In addition, the upper two shelves can be configured with eight Link Nodes each, allowing a total of 19 link pairs on the CNI Ring.

Copyright © 2003 Lucent Technologies

With these changes the maximum number of CCS7 link terminations is increased from 5 to 19 pairs. The number of groups is increased from 2 to 6.

4.2 Translation Requirements

New and Modified Views			
RC View	**Record Number**	**Div.**	**Sec.**
15.2	5012	9	2B
15.3	5013	9	2C
15.17	5027	9	2Q

To accommodate additional link nodes, the valid entry ranges have been expanded for the GROUP and MEMBER fields on three views: Link Information (View 15.2), Logical to Physical (View 15.3), and Protocol Link Parameters (View 15.17). See the corresponding TG-5 sections for specific values and restrictions.

SEC. 2: CNI DATA BASE RECENT CHANGE VIEWS

Copyright © 2003 Lucent Technologies

SEC. 2A: 5011 RECORD
OFFICE IDENTIFICATION (VIEW 15.1) - RC_CNIOFF

1. GENERAL

This view is used to identify the local office and its function with respect to its place in the CCS network. This view may be entered only once for each office.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *OFFICE IDENTIFICATION

Description: The 8-character alphanumeric office identification.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E5 and later, this ID must correspond with the OFFICE ID defined on the OFCOPT form (RC view 8.1, 5509 Record).

2.3 LOCAL FUNCTION

Description: This is a function code identifying the type of office. 0 indicates no function. and is the only value used for LEC networks. A value of 1 is commonly used in the AT&T network.
Valid Entries: 0 - 32767

2.4 REGION NUMBER

Description: This field defines the codes for routing messages across a network. The digits from this field are the 4th and 5th digits of the LOCAL POINT CODE field. The number 32 indicates no region and is used for a LEC network that does not require a region identification in the LOCAL POINT CODE. The other entries are used for routing messages across the AT&T network regions. AT&T has defined seven regions within their network.
Valid Entries: 00 - 32

2.5 LIS DESTINATION

Description: This 5-digit number shows the link integrity destination or node number where administration of encryption information is performed.

The value 0 indicates none and is used by LEC telephone companies that do not have encrypted links. AT&T has encrypted links for military applications and must have a value from 1 through 32767 entered.

Software Release: 5E5 and 5E6
Valid Entries: 0 - 32767

2.6 LOCAL POINT CODE

Description: This 9-digit number is the point code assigned to this particular office. The number is divided into either three or four subfields depending on whether the office is a LEC or an AT&T switch.

Copyright © 2003 Lucent Technologies

The network identifiers for the network may be provided by the ANSI T1S1 committee.
Valid Entries: 9-digit point code in the following format: AAABBCDDD

LOCAL POINT CODE			
Type	**Format**	**Valid Entries**	**Description**
LEC Large Networks	AAA	005 -253	Network ID
	BBC	000 - 255	Cluster ID
	DDD	000 - 255	Member Number
LEC Small Networks	AAA	001-004	Network ID
	BBC	000 - 255	Cluster ID
	DDD	000 - 255	Member Number
AT&T Networks	AAA	254	Network ID
	BB	00 - 31	Region Number
	C	0 - 7	Cluster ID
	DDD	000 - 255	Member Number

Data Rules:

The AT&T Region Number, BB, must match the REGION NUMBER entry on this view.

2.7 LOCAL CLLI

Description: This 11-character code is the Common Language Location Identifier assigned to the particular office. The CLLI is useful in uniquely identifying switches, STPs and SCPs in the network and is useful in reports and trunk diagnostics.
Valid Entries: An 11-digit code in the following format: AAAABBCCDDD

LOCAL CLLI	
Format	**Definition**
AAAA	The first four alphabetic characters represent the city or place
BB	The next two alphabetic characters represent the state
CC	The next two alphanumerics represent the building identifier
DDD	the last three alphanumerics represent the company or building subdivision

Data Rules:

This code should agree with the CLLI codes other switches, STPs and SCPs will use to reference this switch.

2.8 ANSI STD PC IND

Description: Is the point code format represented in ANSI format? The ANSI Standard Point Code Indicator is a verify-only field that is used to specify the local office point code format. The point code format is represented in either ANSI or non-ANSI format. The ANSI format is used in LEC networks only, and the non-ANSI format is used in AT&T networks only. The field contains a "Y" for LEC networks and "N" for AT&T networks.

Software Release: 5E9(1) and later

Data Rules:

When ANSI STD PC IND is "Y", ALIAS PCs cannot be entered.

2.9 CRIT EVENT NUMBER

Description: The CRIT EVENT NUMBER specifies the maximum number of CNCE (CCS Network Critical Event) messages that will be printed on the ROP during a specified time interval. When the number of messages exceeds this threshold, some messages will be dropped and will not appear on the ROP. The time interval is defined in the CRIT EVENT TIMER field.

Software Release: 5E9(1) and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: 5
Valid Entries: 1 - 32767

2.10 CRIT EVENT TIMER

Description: The CRIT EVENT TIMER specifies the time interval used to manage the number of printed CNCE messages. See the description for the CRIT EVENT NUMBER field above.

Software Release: 5E9(1) and later
Required Field.
Default: 60
Valid Entries: 1 - 3600 (seconds)

2.11 LOW PRI SRST

Description: The LOW PRI SRST field determines the time interval for transmitting SRST (Signaling Route Set Test) messages for alternate, or lower priority, routes that are unavailable. When a non-current alternate route is unavailable, SRST messages are sent at regular intervals until the route becomes available.

Software Release: 5E9(1) and later
Required Field.
Default: 600
Valid Entries: 0 - 86400, in increments of 30 (seconds)

NI LATA ROUTING FOR AT&T ONLY

The list of ALIAS PC fields allows up to 15 alias point codes.

2.12 ALIAS PC

Description: Alias point codes are point codes assigned to the AT&T toll switch only. These are in addition to its local office point code. The purpose of alias point codes is to facilitate LATA routing of circuit- or call-associated messages. They are used for NI (Network Interconnect) messages only.

The 9-digit code should be in the AT&T format as follows.

ALIAS PC

Description	Valid Entries
Network ID	254
Region Number	00 - 31
Cluster ID	0 - 7
Member	000-255

Software Release: 5E9(1) and later
Valid Entries: 9 digits

SEC. 2B: 5012-1/2 RECORD
LINK INFORMATION (VIEW 15.2) - RC_LCDT

1. GENERAL

This view is used to define the signaling links. Each link node that is equipped on the CNI ring must be defined on this view. Since the CNI links are equipped in pairs, there is always an even number of signaling links entered with this view.

NOTE: The signaling link must be out of service and the MAJOR STATE field must be set to "UNA" to update the link information.

2. FORM ENTRIES - 5012-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *GROUP

Description: This field indicates which group the link node is attached to. For 5E9(1) and earlier, the CNI cabinet has two groups (00 and 32); for 5E9(2) and later, it has six groups (00, 01, 02, 32, 33, 34). A link pair must have a link on two of these groups.

Required Field.
Valid Entries:
- For 5E9(1) and earlier: 00 and 32
- For 5E9(2) and later: 00, 01, 02, 32, 33, 34

2.3 *MEMBER

Description: This indicates the particular link node that is being used in the group.

Normally values 1 and 3 through 8 are used for link nodes. Node position 0 is always the RPCN (Ring Peripheral Controller Node) and 2 is reserved for a DLN (Direct Link Node). If an office is not planning for a DLN, the 2 position may be used for a link node.

Required Field.
Valid Entries:
- For 5E9(1) and earlier: 1 - 6
- For 5E9(2) and later: 1 - 8

Data Rules:

For 5E9(2) and later, when GROUP is 0 or 32, MEMBER must be in the range 1 - 6, inclusive.

2.4 LINK SPEED

Description: This field indicates the actual link speed in kbps multiplied by 100. The only values supported by the 5ESS Switch are 48 and 560.

All CCS7 links are high speed and must have a value of 560 entered.
Valid Entries: 24, 48, and 560

Copyright © 2003 Lucent Technologies

2.5 ENCRYPTED

Description: This field indicates whether or not the links are encrypted. Local Exchange Carrier links are currently not encrypted and should have "NOTENC" entered. Typically, AT&T links are encrypted and must have "ENC" entered.

Valid ENCRYPTED Entries

Entry	Definition
NOTENC	Not encrypted
ENC	Encrypted

2.6 #LINK TYPE

Description: This field indicates the type of link used for signaling between the 5ESS Switch and a signaling end point. For 5E8 and earlier, the A-links are the only links used between a 5ESS Switch and the STP; therefore, the value of "A" should be entered. For 5E9(1) and later, either the A-links or E-links may be specified. A-links are used between the 5ESS Switch and an adjacent STP; E-links are used between the 5ESS Switch and a non-adjacent STP; F-links are used between two signaling end points.

Valid LINK TYPE Entries

Entry	Definition
A	A-links, Links used between a 5ESS Switch and an adjacent STP.
E	E-links, Links used between a 5ESS Switch and an non-adjacent STP.
F	F-links, Links used between two signaling end points.

2.7 FAR - END FUNCTION

Description: This 5-digit number identifies the function of the far node (usually an STP). For CCS7 links in an LEC environment, this field should be set to 0.
Valid Entries: 0 - 32767

2.8 FAR - END STP

Description: This field is used for load balancing. The 5ESS Switch supports only the "EVEN" and "ODD" values. All links between the 5ESS Switch and one of the STP pair, called a link set, must have the same value (for example, "EVEN"). The links from the 5ESS Switch to the other local STP in the pair, another link set, must have the other value "ODD".

Valid FAR - END STP Entries

Entry	Definition
EVEN	Value designating link between 5ESS Switch and one of the STP pair
ODD	Value designating link between the 5ESS Switch and the other (not the "EVEN") of the STP pair
NOSTP	No STP link

2.9 FAR - END REGION

Description: This 2-digit code designates the far-end region. If the far-end office is in a LEC network, the code 32 is used. Several codes are used to designate the various AT&T regions.
Valid Entries: 00 - 32

2.10 FAR - END PNT CODE

Description: This 9-digit code designates the point code of the STP at the far-end of the link.

The point code is divided three subfields for LEC networks and four subfields for AT&T networks.
Valid Entries: 9 digits

2.11 MATE GROUP

Description: This field specifies the link node group that is mated or paired with the group entered in the GROUP field. Since link node groups are not mated for LEC offices, the value 00 must be entered for

Copyright © 2003 Lucent Technologies

them. For AT&T offices, the alternate group in the pair (pairs 00 and 32, 01 and 33, 02 and 34) must be entered here.
Valid Entries:
- For 5E9(1) and earlier: 00 and 32
- For 5E9(2) and later: 00, 01, 02, 32, 33, 34

2.12 MATE MEMBER

Description: This field identifies the link node position within the paired link. For LEC offices, this field should be left blank. For AT&T offices, the MATE MEMBER should have the same number as the MEMBER field.
Valid Entries:
- For 5E9(1) and earlier: 1 - 6
- For 5E9(2) and later: 1 - 8

2.13 FAR - END CLLI

Description: This 11-character code is the Common Language Location Identifier assigned to the far-end STP. The CLLI is useful in uniquely identifying switches, STPs and SCPs in the network and is useful in reports and trunk diagnostics.

- The first four alphabetic characters represent the city or place,
- the next two alphabetic characters represent the state,
- the next two alphanumerics represent the building identifier and
- the last three alphanumerics represent the company or building subdivision.

Valid Entries: 11 characters

2.14 MAJOR STATE

Description: This is the code used to indicate the status of the link. This field must be set to "UNA" before any CNI links can be added, deleted or changed.

Valid MAJOR STATE Entries

Entry	Definition
UNE	Software Release: 5E9(1) and earlier. Unequipped.
UNA	Unavailable and cannot be used to carry traffic.
AVL	Available for normal traffic.

Data Rules:

The signaling link must be Manual Out of Service (MOOS) to update this field. (This is done with an 5ESS Switch Input Message.)

3. FORM ENTRIES - 5012-2 RECORD

CCIS6 SIGNALING

The following fields (Section 3.1 - Section 3.6) apply to CCIS6 signaling across low speed links (LINK SPEED = 48) and must be left blank for CCS7 or CCIS6 signaling across high speed links (LINK SPEED

Copyright © 2003 Lucent Technologies

= 560).

3.1 DUAL VFL

Description: This field indicates how the messages are transmitted over the DUAL VFLs.
Valid Entries: SIMPLEX or DUPLEX

3.2 LAYER NUMBER

Description: When a CCIS6 link is assigned to a pool, it must be assigned a unique layer number for the specified pool. A pool may be assigned as many as 19 layers.
Valid Entries: 1 - 19

3.3 VOICE ACCESS TEST

Description: This field is used to load balance the link nodes across four voice access test circuits.
Valid Entries: 1 - 4

3.4 SELF LOOPED

Description: This field indicates what type of synchronization a link has. For a link to operate successfully, the end office is set to "SYUEVEN" and the STP is set to "SYUODD". This prevents the CCIS6 links from being accidentally cross connected (self-looped) and appearing to be in service.

Valid SELF LOOPED Entries

Entry	Definition
SELFL	Self Looped
SYUEVEN	Synchronization even
SYUODD	Synchronization odd

3.5 POOL NUMBER

Description: This value is the link set between the 5ESS Switch and the local STP at the far-end. All signaling links to the same STP must have the same link set. The link pair to the other STP must have a different value.
Valid Entries: 1 - 255

3.6 COMBINED POOL

Description: All links in a link set must be in the same combined link set. Only one combined link set is allowed. This value must be different from the two-link set values. A value of 0 indicates that no COMBINED LINK SET is assigned.
Valid Entries: 0 - 255

CCS7 SIGNALING

The following fields (Section 3.7 - Section 3.9) apply to CCS7 or CCIS6 signaling across high speed links (LINK SPEED = 560) and must be left blank for a CCIS6 signaling across low speed links (LINK SPEED = 48).

3.7 LINK SET

Description: This value is the link set between the 5ESS Switch and the local STP at the far-end.

All signaling links to the same STP must have the same link set. The link pair to the other STP must have a different value.
Valid Entries:

- 5E5 and 5E6: 0 - 255

Copyright © 2003 Lucent Technologies

- 5E7 and later: 0 - 511

3.8 COMBINED LINK SET

Description: All links in a link set must be in the same combined link set. Only one combined link set is allowed for each STP pair. This value must be different from the two-link set values.
Valid Entries:
- 5E5 and 5E6: 0 - 255
- 5E7 and later: 0 - 511

3.9 SIGNAL LINK CODE

Description: This 2-digit number is similar to a circuit identification code of trunks. The value agrees with the corresponding value at the node on the other end of the signaling link. This is a member number within a link set at the adjacent STP.
Valid Entries: 0 - 15

SEC. 2C: 5013 RECORD
LOGICAL TO PHYSICAL (VIEW 15.3) - RC_PHYS

1. GENERAL

This view is used to assign logical links to CCIS6 links or to CCS7 links that are used to transport CCIS6 messages (ECIS6 or DCIS6).

A single CCS7 link can have up to 8 logical CCIS6 links assigned. This view must also be populated for CCIS6 links and only LOGICAL LINK VL0 should be assigned.

NOTE: Before this form can be entered, the associated link node must be made manually out-of-service and the corresponding RC/V view 15.2 must have MAJOR STATE set to "UNA".

1.1 Updating Or Deleting Logical Links

Logical links cannot be manipulated while active trunks are assigned. If the trunk counter (trk_cntr attribute in the lab6_pci relation) of the number of CCIS6 trunks currently using a link contains a value of 1 or greater, then trunks are assigned for this logical link. Any attempt to delete this view while a trunk is assigned to a logical link will fail. Also, any attempt to update a logical link to a value of 0 if a trunk is assigned to that logical link will fail.

2. FORM ENTRIES - 5013 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *GROUP

Description: This field indicates which group the link node is attached to. For 5E9(1) and earlier, the CNI cabinet has two groups (00 and 32); for 5E9(2) and later it has six groups (00, 01, 02, 32, 33, 34). A link pair must have a link on two of these groups.

Required Field.
Valid Entries:
- For 5E9(1) and earlier: 00 and 32
- For 5E9(2) and later: 00, 01, 02, 32, 33, 34

2.3 *MEMBER

Description: This field indicates the particular link node being used on the CNI frame. Normally values 1 and 3 through 8 are used for link nodes. Node position 0 is always the RPCN and 2 is reserved for a DLN.

Required Field.
Valid Entries:
- For 5E9(1) and earlier: 1 - 6
- For 5E9(2) and later: 1 - 8

Data Rules:

For 5E9(2) and later, when GROUP is 0 or 32, MEMBER must be in the range 1 - 6, inclusive.

Copyright © 2003 Lucent Technologies

2.4 LOGICAL LINK

Description: This field indicates the logical link identification number.

A maximum of 8 unique logical links may be assigned to a CCS7 signaling link. A maximum of 1 logical link may be assigned to a CCIS6 signaling link.
Valid Entries: 1 - 2047

LOGICAL TO PHYSICAL

SEC. 2D: 5014 RECORD
CRITICAL EVENTS VIEW 15.4 - RC_CET

1. GENERAL

This view is used to report CNCE (CCS (Common Channel Signal) Network Critical Events). A CCS critical event is an event occurring in the network as a result of an abnormality in the networks operation. The event is immediately outputted to the user, recorded to log files and forwarded to an appropriate center to be analyzed.

This view is already populated with an extensive set of standard input data which is considered to be appropriate for the 5ESS Switch and should not be manipulated.

2. FORM ENTRIES - 5014

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *EVENT NAME

Description: This field indicates what critical event will be printed in the report. A 12-character name or a 2-digit code that translates into one of the prestored events may be entered (refer to FIGURE 1 of this section for the valid entries).

2.3 DESTINATION

Description: This field indicates where the report will be sent.
Valid Entries: 000 - 255

Data Rules:

If the DESTINATION is specified, the MESSAGE TYPE and THRESHOLD must also be specified.

If more than one output list is specified, the numbers utilized for DESTINATION must be in ascending order (e.g., 1, 2, 3, 4, 5, ...).

2.4 MESSAGE TYPE

Description: This field indicates what type of critical event report will be printed.
Valid Entries:

Valid Report Entries

Entry	Definition
CMCESPRT	A short report will be printed with EVENT NAME, local or network time, identification of the associated hardware (point code, link set or group and member).
CMCELPRT	A long report will be printed with the same information as the short report with the addition of CLLI, link speed, link type, link protocol. If applicable, the report may also include the VFL identification, function number or subsystem number.

2.5 THRESHOLD

Description: This field indicates whether or not the report will be printed. With a THRESHOLD equal to 1, the report will always be printed and if 0 is entered, the report will be printed only on demand.

SEC. 2E: 5015 RECORD
USERS VIEW DESCRIPTORS (VIEW 15.5) - RC_UVDT

1. GENERAL

This view is used to develop a table which contains a list of measurements that will be used in the measurement report. RC views 15.5 through 15.8 are used in conjunction to produce the measurement reports.

This view is already populated with an extensive set of standard input data considered to be appropriate for the 5ESS-2000 Switch. The standard data should not be manipulated but it may be necessary to create a customized report with this view.

- ***NOTE:*** Only Non-Fixed Format Reports can be updated or created. Non-Fixed Format Reports are indicated by a REPORT TYPE of "CMNFLPMEX", "CMNFDISKEX", "CMNFDISK" or "CMNFLPM" on the associated RC/V View 15.8 (see Division 9, Section 2h).

2. FORM ENTRIES - 5015 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *VIEW NAME

Description: This field is used to uniquely identify a measurement view in the UVDT (Users View Descriptor Table).

Required Field.
Valid Entries: 1 - 10 characters

2.3 MEASUREMENT ID

Description: This field is used to enter which measurements will be reported with this measurement view. A maximum of 30 entries can be selected and assigned to a view. The entries may be entered by using the MEASUREMENT ID name or value (refer to FIGURE 1 in this section). The descriptions for the entries in FIGURE 1 may be found in Lucent 5D5-190-120, CCS7 MEASUREMENTS AND REPORTS section.

SEC. 2F: 5016 RECORD EXCEPTION (VIEW 15.6) RC_EXCP

1. GENERAL

This view is used to build the Exception Table. This view allows a threshold to be assigned to the measurements on the Users View (defined on RC View 15.5). Also, a particular VIEW may be assigned to more than one group which enables a view to be printed at different thresholds. If a measurements threshold is exceeded, all measurements on the view will be placed into the report. Otherwise, a report will not be generated for this view.

This view is already populated with an extensive set of standard input data considered to be appropriate for the 5ESS Switch. The standard data should not be manipulated, but it may be necessary to create a customized report with an Exception Table.

- ***NOTE:*** Only Non-Fixed Format Reports can be updated or created. Non-Fixed Format Reports are indicated by a REPORT TYPE of "CMNFLPMEX", "CMNFDISKEX", "CMNFDISK" or "CMNFLPM" on the associated RC/V view 15.8 (see Division 9, Section 2H). Customized reports with exceptions must use a REPORT TYPE of "CMNFLPMEX" or "CMNFDISKEX".

2. FORM ENTRIES - 5016 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *GROUP NAME

Description: This field uniquely identifies a list of exceptions that are stored in the Exception Table.
Valid Entries: 1 - 16 characters

2.3 VIEW NAME

Description: This field indicates which form will have an Exception Table.
Valid Entries: 1 - 10 characters

2.4 MEASUREMENT ID

Description: This field is used to enter the measurements into the Exception Table.
Valid Entries:

The values of the MEASUREMENT IDs which have been assigned to the corresponding VIEW NAME (refer to FIGURE 1 in Division 9, Section 2E for the valid entries).

2.5 THRESHOLD

Description: This field is used to assign a threshold to a measurement type.
Valid Entries: 0 - 32767

- ***NOTE:*** If one of the thresholds is reached, a report will be generated.

SEC. 2G: 5017 RECORD
HISTORY FILE DESCRIPTOR (VIEW 15.7) RC_HFDT

1. GENERAL

This view is used to set up the history file descriptor table. The HFDT contains information which is used to construct history files that are added or copied to other history files to create new history files at certain intervals during the day. The history files contain the measurements which have been collected during the specific interval.

This view is already populated with an extensive set of standard input data which is considered to be appropriate for the 5ESS Switch. The standard input data should not be manipulated or customized because it may affect the reports that are using the same history file.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *RECORD NUMBER

Description: Enter the CNI history file descriptor table 5-digit record number.

Required Field.
Valid Entries: 0 - 29999

2.3 HISTORY FILE

Description: The name the CNI history file record.
Valid Entries: 1 - 14 characters

2.4 # ACTION

Description: The action for the CNI history file descriptor.

Required Field for 5E7 and later.

Valid ACTION Entries

Entry	Definition
ADD	Overwrite the history file and accumulate data from the source file into the history file to increase the time covered.
COPY	Does not increase the time period covered.
NULL	No action.

2.5 # DISPOSITION

Description: Enter the CNI history table descriptor table disposition. This is determined by the ACTION field. The DISPOSITION attribute value allows the system to determine what to do with the field value assigned to the attribute ACTION.This condition is necessary when the scheduler table does not use the updated HISTORY FILE. The process, therefore, does not need to proceed to the scheduler table. The DISPOSITION attribute value must be known.

Required Field for 5E7 and later.

Valid DISPOSITION Entries

Entry	Definition
CONT	Continue (the process proceeds according to the scheduler table)

Copyright © 2003 Lucent Technologies

VOID	No effect on the process
STOP	The process terminates

Data Rules:

If ACTION is "ADD" or "NULL", this field must be "VOID".

IF ACTION is "COPY", this field must not be equal to "VOID".

2.6 SOURCE NAME

Description: Enter the name of the CNI history table descriptor source file. The source file is an intermediate file used to build the history files.
Valid Entries: 1 - 14 characters

2.7 WHEN

Description: A 3-digit number 001 to 288 to identify the 5 minute interval when the SOURCE file should be added or copied into a HISTORY file. The values indicate 5 minute intervals beginning at midnight, e.g., an entry of 13 is 5 minutes after 1:00 A.M.
Valid Entries: 1 - 288 (5 minute intervals)

2.8 COVERAGE

Description: Enter a 3-digit number to identify the 5 minute interval for the CNI history file descriptor table coverage. This entry indicates when a history file has accumulated its full interval.
Valid Entries: 001 - 288

Data Rules:

If ACTION is "COPY", a value of 0 should be entered.

2.9 # REPEAT

Description: This field indicates whether or not the history files will be updated at specific intervals.

Required Field for 5E7 and later.

Valid REPEAT Entries

Entry	Definition
REPEAT	The specified ACTION will be repeated by a 5-minute multiple of the value entered in the WHEN field e.g., if WHEN is 12; the ACTION will be repeated every hour beginning at midnight.
NOREPEAT	The specified ACTION takes place at the time specified by the 5-minute multiple of the value entered in the WHEN field beginning at midnight e.g., if WHEN is 10; the ACTION will occur at 00:50.

SEC. 2H: 5018 RECORD
SCHEDULE REPORTING (VIEW 15.8) RC_SCHD

1. GENERAL

This view is used to schedule the reports for generation and for printing. This view is already populated with a set of default values considered to be appropriate for the 5ESS Switch. The existing data should not be manipulated, however, it may be necessary to create a new report and it must be scheduled with this view.

When creating a customized report:

1. For a view with an Exception Table, use a REPORT TYPE of "CMNFLPMEX" or "CMNFDISKEX".

2. For a view with no Exception Table, use a REPORT TYPE of "CMNFDISK" or "CMNFLPM".

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *REPORT NAME

Description: Enter the CNI schedule table name.

Required Field.
Valid Entries: 1 - 16 characters

2.3 DESTINATION

Description: This field indicates where the report will be sent for printing or for analyzing. Enter the 3-digit number to show CNI schedule table destination.
Valid Entries: 000 - 255

2.4 REPORT TYPE

Description: This field represents the type of report generator that will be used to generate the report. Either the report generator or its translation may be entered.
Valid Entries:

- For 5E5 only: 0 - 40
- For 5E6 and later: 0 - 4, 6 - 10
- For 5E9(1) and later: 0 - 4, 6 - 10, 13

Valid REPORT TYPE Entries

REPORT GENERATOR	TRANSLA-TION	MEANING
AM30MPR	0	Signaling link 30-minute marginal performance report
AMMPR	1	Machine performance report
AMSEPR	2	Signaling equipment performance report
AMSNPR1	3	Signaling network performance report part 1
AMSNPR2	4	Signaling network performance report part 2 (available links only)
CMNFDISK	6	Regular nonfixed format disk report
CMNFDISKEX	7	Exception nonfixed format disk report
CMNFLPM	8	Regular nonfixed format 5-minute report
CMNFLPMEX	9	Exception nonfixed format 5-minute report

Copyright © 2003 Lucent Technologies

CMRINGEX	10	Ring exception report
DMMPR	13	Software Release: 5E9(1) and later. Signaling link 15 minute machine resource performance report

2.5 GROUP NAME

Description: Enter the name of the CNI MOCT (Measurement Output Control Table) group from View 15.6. Leave blank if the exception report does not exist.
Valid Entries: 1 - 16 charaters

2.6 VIEW NAME

Description: Enter the CNI MOCT view name (from View 15.5).
Valid Entries: 1 - 10 characters

2.7 HISTORY FILE

Description: Enter CNI history file name (defined on RC View 15.7 or "LPM", "L15M") which is to be used for the measurement report.
Valid Entries: 1 - 14 characters

2.8 ACTIVATION TIME

Description: This field indicates when the report will be run. Enter the schedule table activation time. The values are minutes, with 0 beginning at midnight.
Valid Entries: 0 - 1440 (minutes)

2.9 REPEAT

Description: Enter the number of times the report will be generated in a day (i.e., an hourly report can be generated 24 times). If this field has a value of 0, the report will be generated by demand only.
Valid Entries: 1 - 288

2.10 EMPTY

Description: This field indicates whether or not an empty report will be printed.

Valid EMPTY Entries

Entry	Definition
1	An empty report will be printed.
0	An empty report will not be printed.

2.11 POLLAUTO

Description: Enter the output method for polling.

Valid POLLAUTO Entries

Entry	Definition
0	Polled
1	Automatic
2	Both

2.12 PRT DELAY

Description: Enter the number of seconds to delay the printing of the report (the maximum is 300 seconds).
Valid Entries: 0 - 300 (seconds)

Copyright © 2003 Lucent Technologies

SEC. 2I: 5019 RECORD
CLUSTER ROUTING DATA (VIEW 15.9) RC_CLUST

1. GENERAL

This view defines the data necessary for CCS7 message routing based on the Network ID and cluster (middle 3 digits of the Point Code for LEC networks and the 6th digit for AT&T networks). This view supports cluster level routing to local and nonlocal networks.

The FLAG/ROUTING FLAG value on this view defines how signaling route status (i.e. TFP TransFer Prohibit, TFA TransFer Allow) is recorded for this network ID and cluster. Based on FLAG/ROUTING FLAG values the recording of route status is done at the cluster or member level and affects the routing of CCS7 messages.

A Nonlocal Network ID is an ID other than the local Network ID that is assigned on RC View 15.1 in the LOCAL POINT CODE field.

To send a CCS7 message to any point code, the cluster routing data for that destination must be assigned as follows:

- for each local adjacent STP cluster.
- for each large nonlocal adjacent STP.
- for each local network and cluster combination that contains members which are far-end offices terminating CCS trunks from the 5ESS office.
- for each STP where Global Title Translations are performed.
- for each SCP (Service Control Point) where routing information is stored for CCS7 based features (LIDB, NS800, APSDN and ASP).
- for each switch in the local network where LASS TCAP messages are sent.

NOTE: A cluster member table need only be populated once for any one cluster. For example, NS800 data base queries are routed to a particular cluster member and ISUP trunk signaling is routed to another member of the same cluster; the cluster member table is populated only once.

NOTE: The maximum number of nonlocal populated clusters (clusters in nonlocal network IDs) allowable is 384. The maximum number of local populated clusters is 128.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Description: Enter the Base and Control Number and Office Name on each record.

2.2 *NID

Description: This field represents the Network ID of the switch, STP or SCP that will be receiving the CCS7 messages. This is the first 3 digits of the DPC (Destination Point Code).
Valid Entries: 1 - 254

2.3 *CLUSTER

Description: This field provides the specific CLUSTER in the Local or Nonlocal Network where the CCS messages are to be sent. This is the second 3 digits of the DPC.

Copyright © 2003 Lucent Technologies

NOTE: All Destination Point Codes that are entered on View 15.2 should have a cluster entry here.

For the LEC Network, enter 000 - 255. For the AT&T Network, this field contains both the Region and Cluster ID values. The first two digits represent the region with values from 00 through 31. The third digit is the Cluster ID number. Its range is from 0 through 7.

Required Field.

Valid CLUSTER Entries

Network	Format	Valid Entries
LEC	XXX	000 - 255
AT&T	XXY	000 - 317
	Region ID XX	00 - 31
	Cluster ID Y	0 - 7

2.4 # FLAG

Description: This field indicates the type of routing that will take place. The name of this field was changed to ROUTING FLAG in 5E9(1). The FLAG field name applies to 5E8 and earlier.

Software Release: 5E8 and earlier
Required Field for 5E7 - 5E8.
Valid Entries:

Valid FLAG Entries

Entry	Definition
CLS	Software Release: 5E7 - 5E8. Combined Linkset is used when routing to a local/nonlocal nonadjacent STP in a large network. When that cluster only has 1 member.
CPOPC	Software Release: 5E7 - 5E8. Cluster Level Only Populated Cluster is used when infrequently routing to a nonlocal populated cluster (small number of members). This conserves on memory because network management is only provided at the cluster level.
LS	Software Release: 5E7 - 5E8 Link Set is used for a single link to a local/nonlocal adjacent STP in a large network.
RPOPC_C	Software Release: 5E7 - 5E8. Remote Populated Cluster Level Routing is used for all other routing. Network management is provided at the member level.

CAUTION: A FLAG value of CLS may only be used for describing a route to a cluster when that cluster contains a SINGLE member. If the cluster contains (or ever would contain) MORE THAN ONE member the flag value CLS is NOT correct and would have a negative impact on the network. (Typically used to describe routes to non-adjacent STPs)

CAUTION: A FLAG value of CPOPC has very limited application. This FLAG value causes network management to be done on a cluster level for a populated cluster (i.e. if a transfer prohibit, restrict, or allow is received for any member in the cluster it is ignored. Only Transfer Cluster messages TCP/TCR/TCA are processed). Incorrect use of this routing flag would have a negative impact on the network. One application of this FLAG may be for describing routes to clusters on which you do not wish to keep Network Management status at the member level such as for LASS connectivity outside the local network.

2.5 # ROUTING FLAG

Description: This field indicates the type of routing that will take place. This field was called FLAG for 5E8 and earlier.

Software Release: 5E9(1) and later
Required Field.
Valid Entries:

Valid ROUTING FLAG Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

CLU_O	Software Release: 5E9(1) and later. Routing is based on only the network cluster fields of the point code. It is used to identify cluster-only routing clusters.
POPCLU	Software Release: 5E9(1) and later. Routing is based on the network, cluster, and member (if the member is exceptional) fields of the point code. It is used to identify populated clusters. A populated cluster is a group of signaling points, all of which have the same network and cluster in their point codes.
UPOPCLU	Software Release: 5E9(1) and later. Routing is based on the network and cluster fields of the point code. It is used to identify unpopulated clusters. An unpopulated cluster is a signaling point in a network that has a unique cluster number.

CAUTION: A ROUTING FLAG value of UPOPCLU may only be used for describing a route to a cluster when that cluster contains a SINGLE member. If the cluster contains (or ever would contain) MORE THAN ONE member the ROUTING FLAG value UPOPCLU is NOT correct and would have a negative impact on the network. (Typically used to describe routes to adjacent and non-adjacent STPs)

CAUTION: A ROUTING FLAG value of CLU_O has very limited application. This ROUTING FLAG value causes network management to be done on a cluster level for a populated cluster (i.e. if a transfer prohibit, restrict, or allow is received for any member in the cluster it is ignored. Only Transfer Cluster messages TCP/TCR/TCA are processed). Incorrect use of this routing flag would have a negative impact on the network. One application of this ROUTING FLAG may be for describing routes to a cluster on which you do not wish to keep Network Management status at the member level such as for LASS connectivity outside the local network.

5E8 AND EARLIER , TO 5E9 AND LATER, FLAG VALUE EQUIVALENCIES

GENERIC	FLAG VALUE	DESCRIPTION
5E8	CLS	Software Release: 5E7 - 5E8. Combined Linkset is used when routing to a local/nonlocal nonadjacent STP in a large network. When that cluster only has 1 member.
5E9	UPOPCLU	Software Release: 5E9(1) and later. Routing is based on the network and cluster fields of the point code. It is used to identify unpopulated clusters. An unpopulated cluster is a signaling point in a network that has a unique cluster number.
5E8	CPOPC	Software Release: 5E7 - 5E8. Cluster Level Only Populated Cluster is used when infrequently routing to a nonlocal populated cluster (small number of members). This conserves on memory because network management is only provided at the cluster level.
5E9	CLU_O	Software Release: 5E9(1) and later. Routing is based on only the network cluster fields of the point code. It is used to identify cluster-only routing clusters.
5E8	LS	Software Release: 5E7 - 5E8 Link Set is used for a single link to a local/nonlocal adjacent STP in a large network.
5E9	UPOPCLU	Software Release: 5E9(1) and later. Routing is based on the network and cluster fields of the point code. It is used to identify unpopulated clusters. An unpopulated cluster is a signaling point in a network that has a unique cluster number.
5E8	RPOPC_C	Software Release: 5E7 - 5E8. Remote Populated Cluster Level Routing is used for all other routing. Network management is provided at the member level.
5E9	POPCLU	Software Release: 5E9(1) and later. Routing is based on the network, cluster, and member (if the member is exceptional) fields of the point code. It is used to identify populated clusters. A populated cluster is a group of signaling points, all of which have the same network and cluster in their point codes.

2.6 # LS

Copyright © 2003 Lucent Technologies

Description: The name of this field was changed to PRI ROUTE in 5E9(1). The LS field name applies to 5E7 - 5E8. See PRI ROUTE for usage information.

2.7 # PRI ROUTE

Description: This field tells what specific link (or linkset) will be used for the routing of the messages. For 5E9(1) and later, if this field is 0, CCS7 message routing is done on the member level only.

This field was called LS in 5E7 - 5E8.

Required Field for 5E7 and later.
Valid Entries:
- For 5E7 - 5E8: 1 - 511
- For 5E9(1) and later: 0 - 511

Data Rules:

If "LS" is entered in the FLAG field, use the LINK SET value on the 15.2 View corresponding to the particular local STP. Otherwise, for 5E7 and later, use the same COMBINED LINK SET value that is used on the 15.2 View that corresponds to the local STP.

For 5E9(1) and later, if PRI ROUTE is the same as the LINK SET value on the corresponding 15.2 View, then the following must be true.

- The NID on this view must match the first three digits (network identifier) of the FAR END PNT CODE on the 15.2 View, and the CLUSTER must match the middle three digits (cluster number) of the FAR END PNT CODE.

- If the link set is part of a combined link set (i.e., a value is entered in the COMBINED LINK SET field of the 15.2 View), and the combined link set contains another direct linkset (i.e., another LINK SET is associated with the same COMBINED LINK SET on a 15.2 View), then the other LINK SET must be the ALT1 ROUTE on this view. The ALT2 ROUTE may be entered only if the ELINK secured feature has been activated through Secured Feature ID 131 on the 8.22 View.

- If the link set is not part of a combined link set (i.e., a value is not entered in the COMBINED LINK SET field on the 15.2 View), then ALT1 ROUTE and ALT2 ROUTE may be entered only if the ELINK feature has been activated through Secured Feature ID 131 on the 8.22 View.

If the PRI ROUTE matches the COMBINED LINK SET value on the 15.2 View, and the NID value is greater than 4, then the NID and CLUSTER values may not match the network identifier and cluster number of the corresponding FAR END PNT CODE on the 15.2 View. ALT1 ROUTE and ALT2 ROUTE may be entered only if the ELINK feature has been activated through Secured Feature ID 131 on the 8.22 View.

When PRI ROUTE is 0, ALT1 ROUTE must be blank. When PRI ROUTE is greater than 0, it may not be the same as ALT1 ROUTE or ALT2 ROUTE.

CAUTION: If the PRI ROUTE field is set to 0, message routing is done on the member level ONLY and ONLY to those members with data populated on the 15.18 recent change view. When the PRI ROUTE field is set to 0, messages will not be routed to members of the cluster that do not have 15.18 data populated.

A/E-LINK

The following two fields (Section 2.8 - Section 2.9) support the Extended Access Links and Alternate A-Link Set Routing feature.

Copyright © 2003 Lucent Technologies

2.8 ALT1 ROUTE

Description: The ALT1 ROUTE field specifies the link set to be used as the first alternate route between the 5ESS Switch and the STP.

Software Release: 5E9(1) and later
Valid Entries: 1 - 511

Data Rules:

When a value is entered in ALT1 ROUTE, it may not be the same as PRI ROUTE or ALT 2 ROUTE.

If ALT1 ROUTE is blank, ALT2 ROUTE must also be blank.

2.9 ALT2 ROUTE

Description: The ALT2 ROUTE field specifies the linkset to be used as the second alternate route between the 5ESS Switch and the STP.

Software Release: 5E9(1) and later
Valid Entries: 1 - 511

SEC. 2J: 5020 RECORD
SUBSYSTEM INFORMATION (VIEW 15.10) RC_SST

1. GENERAL

This view is available with the 5E5 Software Release and defines the requirements for internal routing of incoming CCS7 messages used for CCS7 based features (SSP800, LASS, LIDB, ASP, and APSDN). One screen display is entered for each subsystem number used for the CCS7 based features.

The Signaling Application View 8.17 (5537 Record) must be entered for each CCS7 based feature. The 15.10 view and the 15.11 view must be inserted prior to the 8.17 Recent Change View (DSAPP form (5537 Record)). The CNI database is not a relational database, therefore it does not directly interface with the 5ESS Switch relational database. Due to the differences between the two databases, if the 8.17 view is populated prior to the 15.10 and 15.11 views, the application is marked as prohibited and no call processing will occur for those application type calls. If 8.17 is entered before 15.10 and 15.11, the views must be deleted and then reinserted in the proper sequence.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Description: Enter the Base and Control Number and Office Name on each record.

2.2 *SUBSYSTEM

Description: This is a subsystem number used internally for routing CCS7 SCCP signaling messages or for internal CNI message routing.
Valid Entries:
- For 5E5 and 5E6: 0, 2 - 7, or 232 - 255
- For 5E7 and later: 2 - 3, 5 - 7, 232 - 255

Data Rules:

For 5E6 and later, SUBSYSTEM 3 must be defined to notify the network when the CMP is out of service for ISUP Routing.

SIGNAL ADDRESS

The following fields (Section 2.3 - Section 2.4) define the signaling addresses.

2.3 SIG GRP ADR

Description: This field tells CNI where to distribute incoming SCCP signaling messages for this SSN. The address is always set to 64 (the logical address of the 3B processor).

NOTE: Even if a subsystem wants to receive messages in the DLN, the Signaling Address is still set to 64, and the LOCAL INDEX field is used to direct the messages to the DLN.

Valid Entries: 0 - 64

2.4 SIG MEM ADR

Description: This field tells CNI where to distribute incoming SCCP signaling messages for this SSN. The member is always set to 0 to access the 3B processor.
Valid Entries: 0 - 15

2.5 SIG CHAN

Copyright © 2003 Lucent Technologies

Description: This field tells CNI where to distribute incoming SCCP signaling messages for this SSN. The channel is the IMS channel number. For 5E5 and earlier a value of 128 should be entered. For 5E6 and later a value of 160 should be entered.
Valid Entries: 42 - 255

2.6 LOCAL INDEX

Description: This field is an index into a table of functions which the subsystem wants to have executed when an incoming message is received at a CCS7 node. There are 16 possible functions to choose from.

If the DLN is equipped, enter 14; otherwise enter 15.
Valid Entries: 0 - 15

Data Rules:

If "N" is entered in the DLN field on the OFCOPT form (5509 Record), then LOCAL INDEX must be 15. If "Y" is entered in the DLN field on the OFCOPT form, then DLNs (Direct Link Nodes) are equipped and LOCAL INDEX must be 14.

2.7 WANT PAUSE

Description: Does this subsystem want to receive pause and resume primitives from SCCP management? If "Y" is entered pause is received. If "N" is entered no pause is received. This field should have "N" entered, indicating to CNI that pause and resume primitives should not be received.
Valid Entries: Y, N

2.8 SIMP DUPL

Description: This field indicates whether a subsystem is a duplex system, i.e., it has a mate, or simplex system, i.e., it does not have a mate.

This field should always be set to "S".

Valid SIMP DUPL Entries

Entry	Definition
D	Duplex
S	Simplex

2.9 MGMT CHAN

Description: This field tells CNI where to send interprocess SCCP management primitives (traffic mix updates, UIS/UOS primitives about SSNs in the network, etc.). The channel is the IMS channel number.

NOTE: This channel must not be the same as the Signaling Channel.

For 5E5 and earlier, a value of 127 should be entered. For 5E6 and later, a value of 159 should be entered.
Valid Entries: 42 - 255

2.10 MATE SSN

Description: This field indicates the subsystem mate.

This field should always have a value of 0 entered.
Valid Entries: 0, 232 - 252, or 254

2.11 MATE PTCODE

Copyright © 2003 Lucent Technologies

Description: This is the mate point code.

This field should always have a value of "000000000" entered.
Valid Entries: a 9-digit point code

MANAGEMENT ADDRESS

The following fields (Section 2.12 - Section 2.13) tell CNI where to send interprocess SCCP management primitives (traffic mix updates, UIS/UOS primitives about SSNs in the network, etc.).

2.12 MGMT GRP ADR

Description: This field tells CNI where to send interprocess SCCP management primitives (traffic mix updates, UIS/UOS primitives about SSNs in the network, etc.).

The address should be set to 64 (logical address of the 3B processor).
Valid Entries: 0 - 64

2.13 MGMT MEM ADR

Description: This field tells CNI where to send interprocess SCCP management primitives (traffic mix updates, UIS/UOS primitives about SSNs in the network, etc.).

The member should have a value of 0 entered to access the 3B processor and for SCCP signaling applications.
Valid Entries: 0 - 15

SEC. 2K: 5021 RECORD
GLOBAL TITLE TRANSLATION (VIEW 15.11) RC_CNIGTT

1. GENERAL

This view is used to set up the relationship between the CCS service desired and the STPs that are dedicated to provide the Global Title translation for that feature. A separate display of this view is populated for the NS800, LASS, ASP and LIDB features if Global Title Translations use a capability code (alias point code) or the Global Title Translations are not done at the adjacent STP pair.

In the 5E4(2) Software Release, the point codes or the capability code of the STP pair (where Global Title Translations are performed) can be defined in the Network File parameters, GTXPCA and GTXPCB. If the GTXPCA and GTXPCB are not entered, the Global Title Translations will be performed at the adjacent STPs point codes.

In 5E5 and later Software Releases, this view will be used rather than the Network File parameters. For new start offices, the adjacent STP point codes will be defaulted in the general translator, 256.

- ***NOTE:*** Following a retrofit from the 5E4(2) Software Release, the general translator, 256, will be populated with the Network File parameters, GTXPCA and GTXPCB. The Translation Type used for NS800 (defined on RC view 8.17) should be assigned here with the Point Codes of the STPs where GTTs are performed. The general translator, 256, should then be updated with the Point Codes of the adjacent STP pair. Further retrofits will restore the values entered on this view.

The 15.10 view and the 15.11 view must be inserted prior to the 8.17 Recent Change View (DSAPP form (5537 Record)). The CNI database is not a relational database, therefore it does not directly interface with the 5ESS Switch relational database. Due to the differences between the two databases, if the 8.17 view is populated prior to the 15.10 and 15.11 views, the application is marked as prohibited and no call processing will occur for those application type calls. If 8.17 is entered before 15.10 and 15.11, the views must be deleted and then reinserted in the proper sequence.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *TRANSLATION TYPE

Description: This is the global title translator index used by the STP along with other data (800NXX for SSP800) to look up a Destination Point Code and Subsystem number for TCAP functions for SSP800, LASS and LIDB.

This value must be consistent with RC View 8.17 and the Global Title STP's database. Routing data (View 15.9) is required for those point codes that are not located in the adjacent STP pair.
Valid Entries: 0 - 256

2.3 # PC1

Description: This is a 9-digit point code that represents one of the STPs where Global Title translations are done for TCAP functions.

Required Field.
Valid Entries: 9-digit point code

2.4 # PC2

Copyright © 2003 Lucent Technologies

Description: This 9-digit point code represents the other STP where Global Title translations are done for TCAP functions.

The values for PC1 and PC2 may be the same or different depending on whether other translation types are provided. If no other translation types are provided, the default translation type is 256 with PC1 and PC2 being the values of the adjacent STP pair.

NOTE: Where Capability Codes (Alias Point Codes) are used, PC1 must be equal to PC2.

Required Field.
Valid Entries: 9-digit point code

GLOBAL TITLE TRANSLATION

*1. TRANSLATION TYPE 256

SEC. 2L: 5022 RECORD
NETWORK ROUTING DATA (VIEW 15.12) RC_NLNIDS

1. GENERAL

This view is introduced with the 5E5 Software Release. This view is used to define all of the nonlocal networks that are sending or receiving CCS7 messages from the local 5ESS Switch.

A Nonlocal Network ID is an ID other than the Local Network ID that is assigned on RC View 15.1 in the LOCAL POINT CODE field.

Nonlocal network identifications are required under the following conditions:

- When the 5ESS Switch is routing to another network.
- When Global Title Translations are performed in an STP that is located in another network.
- When an SCP that is used for CCS7 based features is located in another network.
- When a far-end office is located in another network (ISUP Trunks RC View 5.1).
- When a switch in another network is being sent TCAP messages for LASS.

- ***NOTE:*** The maximum number of defined nonlocal network IDs is 24 for 5e15 and earlier and 64 for 5e16(1) and later

- ***NOTE:*** This form must be entered before routing information is defined on View 15.9 and for 5E6 - 5E8 on View 15.13, or for 5E9(1) and later on View 15.18.

2. FORM AND RECORD ENTRIES - 5E5 SOFTWARE RELEASE ONLY

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *OFFICE

Description: Enter the office identification. This should be consistent with Recent Change View 15.1.

Software Release: 5E5 only
Required Field.
Valid Entries: 1 - 8 characters

2.3 NLNID1

Description: This field represents the Nonlocal Network ID where CCS messages are to be routed. A 0 is entered in this field to indicate that no network is assigned.

Software Release: 5E5 only
Valid Entries: 0 - 254

2.4 NLNID2

Description: This field represents the Nonlocal Network ID where CCS messages are to be routed. A 0 is entered in this field to indicate that no network is assigned.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 only
Valid Entries: 0 - 254

2.5 NLNID3

Description: This field represents the Nonlocal Network ID where CCS messages are to be routed. A 0 is entered in this field to indicate that no network is assigned.

Software Release: 5E5 only
Valid Entries: 0 - 254

2.6 NLNID4

Description: This field represents the Nonlocal Network ID where CCS messages are to be routed. A 0 is entered in this field to indicate that no network is assigned.

Software Release: 5E5 only
Valid Entries: 0 - 254

2.7 NLNID5

Description: This field represents the Nonlocal Network ID where CCS messages are to be routed. A 0 is entered in this field to indicate that no network is assigned.

Software Release: 5E5 only
Valid Entries: 0 - 254

3. FORM AND RECORD ENTRIES - 5E6 - 5E8 SOFTWARE RELEASES

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 *NLNID

Description: This field represents the Nonlocal Network ID where CCS messages are to be routed.

The small network IDs are defined as Nonlocal Network IDs (1 - 4) and their routing is handled by View 15.13.

Software Release: 5E6 - 5E8
Required Field.
Valid Entries: 1 - 254

3.3 FLAG

Description: This field provides data concerning the type of routing that will be used.

Software Release: 5E6 and later

Valid FLAG Entries

Entry	Definition
NCLUSTER	Indicates the routing data is maintained at the cluster level and the cluster information should be entered on RC View 15.9 or 15.13. This value is recommended to allow network management at the nonlocal member level.
CLS	Indicates routing data is maintained at the network level only and cluster information cannot be entered on the RC View 15.9 and 15.13.

Copyright © 2003 Lucent Technologies

3.4 PREFLS

Description: This field indicates which link set will be used for routing.

Software Release: 5E6 - 5E8
Valid Entries:
- For 5E6 only: 0 - 255
- For 5E7 - 5E8: 0 - 511

Data Rules:

When the FLAG field has "NCLUSTER" entered, the value for PREFLS should be 0.

When the FLAG field has "CLS" entered, this field should have a value from the COMBINED LINK SET field which is assigned on the 15.2 View.

4. FORM AND RECORD ENTRIES - 5E9(1) AND LATER SOFTWARE RELEASES

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

4.2 * NID

Description: The NID field specifies the network identifier of a point code to which CCS messages are routed.

Software Release: 5E9(1) and later
Required Field.
Valid Entries: 1 - 254

4.3 # ROUTING FLAG

Description: The ROUTING FLAG field specifies the CNI (Common Network Interface) routing flag, which is used to determine the level of routing to be performed.

Software Release: 5E9(1) and later
Required Field.
Valid Entries:

Valid ROUTING FLAG Entries

Entry	Definition
NTWK	Routing data is based on the network, cluster, and possibly member fields of the point code.
NTWK_O	Routing is based on the network field of the point code only.

Data Rules:

When the ROUTING FLAG is "NTWK", PRI ROUTE must be 0; when ROUTING FLAG is "NTWK_O", PRI ROUTE must not be 0.

4.4 # PRI ROUTE

Description: The PRI ROUTE field specifies the CNI linkset number used for the primary route between the 5ESS Switch and the STP. The value 0 indicates the routing is done at the cluster or member level.

Software Release: 5E9(1) and later

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 511

Data Rules:

When PRI ROUTE is 0, ALT1 ROUTE must be blank.

When PRI ROUTE is greater than 0, it may not be the same as ALT1 ROUTE or ALT2 ROUTE.

A/E-LINK

The following two fields (Section 4.5 - Section 4.6) support the Extended Access Links and Alternate A-Link Set Routing feature.

4.5 ALT1 ROUTE

Description: The ALT1 ROUTE field specifies the CNI linkset number for the first alternate route between the 5ESS Switch and the STP.
Valid Entries: 1 - 511

Data Rules:

When a value is entered in ALT1 ROUTE, it may not be the same as PRI ROUTE or ALT2 ROUTE.

If ALT1 ROUTE is blank, ALT2 ROUTE must be blank.

4.6 ALT2 ROUTE

Description: The ALT2 ROUTE field specifies the CNI linkset number for the second alternate route between the 5ESS Switch and the STP.
Valid Entries: 1 - 511

SEC. 2M: 5023 RECORD
SMALL NETWORK CLUSTER AND MEMBER TABLE (VIEW 15.13) RC_SMNID

1. GENERAL

This view is available with 5E6 - 5E8 Software Releases. For 5E9(1) and later, it is replaced by the Member Routing View, 15.18.

This view is used to enter the cluster/member information needed for small network populated cluster/member routing.

For 5E6 - 5E8 this view should be entered when the 5ESS Switch is connected to an adjacent STP pair in a small network. Otherwise, RC View 15.9 should be used for small and large network routing.

The small non-local network ids (SMNIDS 1 through 4) must be previously defined using View 15.12 before subsequent cluster/member routing information can be manipulated.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *NLNID

Description: The name of this field was changed to SMNIDS in 5E7. This field name applies to 5E6. See SMNIDS for usage information.

2.3 *SMNIDS

Description: The Small Network ID entered here indicates to which non-local small network the CCS messages will be routed. (This field was called NLNIDS for 5E6).
Valid Entries: 1 - 4

2.4 *CLUSTER

Description: Enter the cluster value that indicates to which cluster within the small network the CCS messages will be routed.
Valid Entries: 0 - 255

2.5 FLAG

Description: This field indicates what type of routing will be performed. The only valid entry is "SMPOP_M", which indicates Small Populated cluster/member level routing.
Valid Entries: SMPOP_M

2.6 LS

Description: This field represents the Linkset number between the local switch and the STPs. This field is normally the COMBINED LINK SET defined on RC View 15.2 which is linked to the small network STP pairs.
Valid Entries:

- For 5E6 only: 1 - 255
- For 5E7 and later: 1 - 511

Copyright © 2003 Lucent Technologies

2.7 MEMBER1

Description: This field represents the member number for one of the adjacent STP pairs.
Valid Entries: 1 - 255

2.8 FLAG1

Description: This field indicates what type of routing will be performed. This field should be "LS" if routing is to be done.

Valid FLAG1 Entries

Entry	Definition
LS	Routing is maintained for a single link to an adjacent STP
NO_RTE	No routing data is maintained

2.9 LS1

Description: This field represents the Linkset number from the local switch to the adjacent STP.
Valid Entries:

- For 5E6 only: 0 - 255
- For 5E7 and later: 0 - 511

Data Rules:

If the value of the FLAG1 field is "NO_RTE", this field must have the value 0 entered. Otherwise, a value from 1 - 511 should be entered.

2.10 MEMBER2

Description: This field represents the member number for the other adjacent STP.
Valid Entries: 1 - 255

2.11 FLAG2

Description: This field indicates what type of routing will be performed. This field should be "LS" if routing is to be done.

Valid FLAG2 Entries

Entry	Definition
LS	Routing is maintained for a single link to an adjacent STP
NO_RTE	No routing data is maintained

2.12 LS2

Description: This field represents the Linkset number from the local switch to the other adjacent non-local STP.
Valid Entries:

- For 5E6 only: 0 - 255
- For 5E7 and later: 0 - 511

Data Rules:

If the value of the FLAG1 field is "NO_RTE", this field must have the value 0 entered. Otherwise, a value from 1 - 511 should be entered.

SEC. 2N: 5024 RECORD
PROTOCOL OFFICE TIMERS (VIEW 15.14) - RCNIOFTIM

1. GENERAL

This view is available for 5E9(1) and later Software Releases and is used to specify T1.111.4 MTP (Message Transfer Part) Signaling Network functions and messages, as well as provide SCCP (Signaling Connection Control Part) information.

WARNING: Timer changes can be service-affecting. Before modifying timer values on this view, review the CCS7 protocol specifications.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * OFFICE ID

Description: The OFFICE ID uniquely identifies this office.

Required Field.
Valid Entries: 1 - 8 alphanumeric characters

T1.111.4 TIMERS

The following fields (Section 2.3 - Section 2.9) specify the T1.111.4 MTP (Message Transfer Part) Signaling Network functions and messages.

2.3 T8

Description: The T8 field represents the period of time, in milliseconds, that signaling traffic will be prohibited to a particular signaling point.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 800

Valid Entries: 800 - 1200 (milliseconds)

2.4 T10

Description: The T10 field represents the time interval in seconds that will elapse before repeating a signal route-set test message. This test message is repeated to determine if a previously inhibited or restricted signaling end point is still inhibited or restricted.
Default: 30
Valid Entries: 30 - 60 (seconds)

2.5 T11

Description: The T11 field represents the period of time in seconds that signaling traffic will, if possible, be restricted to a particular signaling point.
Default: 30
Valid Entries: 30 - 90 (seconds)

2.6 T16

Copyright © 2003 Lucent Technologies

Description: The T16 field represents the period of time in milliseconds to wait to receive a route-set congestion status update. For each signaling route-set, a congestion status indicating the degree of congestion is assigned. This timer represents the period of time to wait to receive this status information.
Default: 1400
Valid Entries: 1400 - 2000 (milliseconds)

2.7 T18

Description: The T18 field represents the period of time in seconds that signaling traffic will, if possible, be restricted to a particular cluster of signaling points.
Default: 30
Valid Entries: 30 - 90 (seconds)

2.8 T20

Description: The T20 field represents the period of time in milliseconds to wait before repeating a local inhibit test. Local inhibiting is a management function that for maintenance or testing purposes makes a local signaling link unavailable for user-generated signaling traffic.
Default: 120000
Valid Entries: 90000 - 120000 (milliseconds)

2.9 T21

Description: The T21 field represents the period of time in milliseconds to wait before repeating a remote inhibit test. Remote inhibiting is a management function that for maintenance or testing purposes makes a remote signaling link unavailable for user-generated signaling traffic.
Default: 120000
Valid Entries: 90000 - 120000 (milliseconds)

T1.112.4 SCCP TIMERS

The following fields (Section 2.10 - Section 2.13) provide SCCP (Signaling Connection Control Part) information.

2.10 SST

Description: The Signaling Connection Control Part SST field represents the delay in seconds between requests for subsystem information.
Default: 30
Valid Entries: 30 - 90 (seconds)

2.11 SOG

Description: The Signaling Connection Control Part SOG field represents the period of time in seconds to wait before an out of service grant is received from network management.
Default: 30
Valid Entries: 30 - 90 (seconds)

2.12 IGSST

Description: The Signaling Connection Control Part IGSST field represents the delay in seconds between receiving grant to go out of service and actually going out of service.
Default: 30
Valid Entries: 30 - 90 (seconds)

2.13 SRT

Copyright © 2003 Lucent Technologies

Description: The Signaling Connection Control Part SRT field represents the delay in seconds between requests for subsystem routing status information.
Default: 30
Valid Entries: 30 - 90 (seconds)

SEC. 2O: 5025 RECORD
PROTOCOL LINK SET TIMERS (VIEW 15.15) - RCNILSTIM

1. GENERAL

This view is available with 5E9(1) and later Software Releases and is used to specify Link Set Timer information on a per-office basis.

WARNING: Timer changes can be service-affecting. Before modifying timer values on this view, review the CCS7 protocol specifications.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SCOPE

Description: The SCOPE field determines the parameters used in selecting the number of timers to update.

When the view is updated for one linkset (SCOPE is "LS"), the current data values will appear in the fields. When the view is updated for "ALL" link sets, the fields will appear blank since the values may differ among the link sets.

Required Field.

Valid SCOPE Entries

Entry	Definition
LS	One linkset.
ALL	All links.

Data Rules:

If SCOPE is "LS", a value must be entered in the LS field; if SCOPE is "ALL", LS must be blank, and the database operation must be "U".

2.3 (*) LS

Description: The Link Set field defines a set of CCS7 links going to the same destination.
Valid Entries: 1 - 511

T1.111.4 TIMERS

These fields (Section 2.4 - Section 2.15) establish the values for T1.111.4 timers.

2.4 T1

Description: The T1 field defines the interval of time used to avoid messages getting out of sequence during a changeover to the alternative link.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 500

Valid Entries: 500 - 1200, in increments of 100 (milliseconds)

2.5 T2

Copyright © 2003 Lucent Technologies

Description: The T2 field defines the interval of time in milliseconds to wait for changeover acknowledgement.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 700

Valid Entries: 700 - 2000, (milliseconds)

2.6 T3

Description: The T3 field defines the interval of time in milliseconds for CNI to avoid messages getting out of sequence during a changeback.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 500

Valid Entries: 500 - 1200, (milliseconds)

2.7 T4

Description: The T4 field defines the interval of time in milliseconds for CNI to wait for changeback acknowledgement.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 500

Valid Entries: 500 - 1200, (milliseconds)

2.8 T5

Description: The T5 field defines the interval of time in milliseconds for CNI to wait for changeback acknowledgement (second attempt).
Default:
- For LEC Offices: 1000
- For AT&T Offices: 500

Valid Entries: 500 - 1200, (milliseconds)

2.9 T6

Description: The T6 field defines the interval of time in seconds for CNI to avoid messages getting out of sequence during controlled rerouting.
Default:
- For LEC Offices: 10
- For AT&T Offices: 5

Valid Entries: 5 - 12 (tenths of a second)

2.10 T12

Description: The T12 field defines the interval of time in milliseconds for CNI to wait for an uninhibited acknowledgement.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 1500

Valid Entries: 800 - 1500 (milliseconds)

Copyright © 2003 Lucent Technologies

2.11 T13

Description: The T13 field defines the interval of time in milliseconds for CNI to wait for a force uninhibit.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 800

Valid Entries: 800 - 1500 (milliseconds)

2.12 T14

Description: The T14 field defines the interval of time in milliseconds for CNI to wait for an inhibit acknowledgement.
Default:
- For LEC Offices: 3000
- For AT&T Offices: 2000

Valid Entries: 2000 - 3000 (milliseconds)

2.13 T15

Description: The T15 field defines the interval of time in seconds for CNI to wait for repeat signaling route set congestion test.
Default: 3
Valid Entries: 2 - 3 (seconds)

2.14 T17

Description: The T17 field defines the interval of time in milliseconds for CNI to avoid oscillation of initial alignment failure and link restart.
Default:
- For LEC Offices: 1000
- For AT&T Offices: 800

Valid Entries: 800 - 1500 (milliseconds)

2.15 T19

Description: The T19 field defines the interval of time in milliseconds for CNI to fail the link craft referral timer.
Default:
- For LEC Offices: 480000
- For AT&T Offices: 180000

Valid Entries: 180000 - 600000 (milliseconds)

T1.111.7 TIMERS

These fields (Section 2.16 - Section 2.17) establish the values for T1.111.7 timers.

2.16 TIMER 1

Description: The TIMER 1 field defines the interval of time in seconds used by the supervision timer for signaling link test acknowledgement message.
Default: 10
Valid Entries: 4 - 12 (seconds)

Copyright © 2003 Lucent Technologies

2.17 TIMER 2

Description: The TIMER 2 field defines the interval of time in seconds to determine how often a signaling link test message should be sent.
Default: 30
Valid Entries: 30 - 90 (seconds)

SEC. 2P: 5026 RECORD
PROTOCOL LINK SET THRESHOLDS (VIEW 15.16) - RCNILSTHR

1. GENERAL

This view is available with 5E9(1) and later Software Releases and is used to maintain congestion indicator data. This data is used to detect the onset or abatement of link congestion.

WARNING: Threshold changes can be service-affecting. Before modifying values on this view, review the CCS7 protocol specifications.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SCOPE

Description: The SCOPE field determines the parameters used in selecting the number of timers to update.

When the view is updated for one linkset (SCOPE is "LS"), the current data values will appear in the fields. When the view is updated for "ALL" link sets, the fields will appear blank since the values may differ among the link sets.

Required Field.

Valid SCOPE Entries

Entry	Definition
LS	One link set.
ALL	All links.

Data Rules:

If SCOPE is "LS", a value must be entered in the LS field; if SCOPE is "ALL", LS must be blank, and the database operation must be "U".

2.3 (*) LS

Description: The LS (Link Set) field defines a set of CCS7 links going to the same destination.
Valid Entries: 1 - 511.

T1.111.4 LINK CONGESTION CONTROL THRESHOLDS

The following fields (Section 2.4 - Section 2.12) establish threshold values for the onset and abatement of congestion in transmit and retransmit buffers. They also determine when selected messages will be discarded.

CNI follows a 3-level discard strategy. Before transmitting a message, a node checks the message's priority (contained in the service information field) and the congestion state of the transmit buffer. If the priority is less than the congestion level, the message is removed, and a return message may be sent. If the priority of the message is greater than or equal to the congestion level, it is transmitted.

LEVEL 1

The following fields (Section 2.4 - Section 2.6) determine the Level 1 Link Congestion Control Thresholds.

Copyright © 2003 Lucent Technologies

2.4 ABATE 1

Description: The ABATE 1 field defines a transmit or retransmit buffer capacity that indicates abatement of level 1 congestion. Congestion abatement occurs when the buffer content reaches a level less than the predetermined threshold value.
Default: 820
Valid Entries: 200 - 32767

Data Rules:

ABATE 1 must be less than or equal to ONSET 1, and ONSET 1 must be less than or equal to DISCARD 1.

2.5 ONSET 1

Description: The ONSET 1 field defines a transmit or retransmit buffer capacity that indicates the onset for level 1 congestion. Congestion onset occurs when the buffer content increases beyond a predetermined value.

When a buffer reaches this threshold, the node reports the congestion state to the central processor. Network management messages are broadcast to adjacent signaling points to limit messages to the affected node. To avoid further congestion of the buffer, the far-end initiates the discard strategy used by nodes at the discard level.
Default: 3072
Valid Entries: 200 - 32767

Data Rules:

ONSET 1 must be less than or equal to DISCARD 1.

2.6 DISCARD 1

Description: The DISCARD 1 field defines a transmit or retransmit buffer capacity that determines whether, under level 1 congestion conditions, a message should be discarded or transmitted.
Default: 6042
Valid Entries: 200 - 32767

Data Rules:

DISCARD 1 must be less than or equal to ABATE 2.

LEVEL 2

The following fields (Section 2.7 - Section 2.9) determine the Level 2 Link Congestion Control Thresholds.

2.7 ABATE 2

Description: The ABATE 2 field defines a transmit or retransmit buffer capacity that indicates abatement of level 2 congestion. Congestion abatement occurs when the buffer content reaches a level less than the predetermined threshold value.
Default: 7680
Valid Entries: 200 - 32767

Data Rules:

ABATE 2 must be less than or equal to ONSET 2, and ONSET 2 must be less than or equal to DISCARD 2.

Copyright © 2003 Lucent Technologies

2.8 ONSET 2

Description: The ONSET 2 field defines a transmit or retransmit buffer capacity that indicates the onset for level 2 congestion. Congestion onset occurs when the buffer content increases beyond a predetermined value.

When a buffer reaches this threshold, the node reports the congestion state to the central processor. Network management messages are broadcast to adjacent signaling points to limit messages to the affected node. To avoid further congestion of the buffer, the far-end initiates the discard strategy used by nodes at the discard level.
Default: 8295
Valid Entries: 200 - 32767

Data Rules:

ONSET 2 must be less than or equal to DISCARD 2.

2.9 DISCARD 2

Description: The DISCARD 2 field defines a transmit or retransmit buffer capacity that determines whether, under level 2 congestion conditions, a message should be discarded or transmitted.
Default: 10855
Valid Entries: 200 - 32767

Data Rules:

DISCARD 2 must be less than or equal to ABATE 3.

LEVEL 3

The following fields (Section 2.10 - Section 2.12) determine the Level 3 Link Congestion Control Thresholds.

2.10 ABATE 3

Description: The ABATE 3 field defines a transmit or retransmit buffer capacity that indicates abatement of level 3 congestion. Congestion abatement occurs when the buffer content reaches a level less than the predetermined threshold value.
Default: 10855
Valid Entries: 200 - 32767

Data Rules:

ABATE 3 must be less than or equal to ONSET 3, and ONSET 3 must be less than or equal to DISCARD 3.

2.11 ONSET 3

Description: The ONSET 3 field defines a transmit or retransmit buffer capacity that indicates the onset for level 3 congestion. Congestion onset occurs when the buffer content increases beyond a predetermined value.

When a buffer reaches this threshold, the node reports the congestion state to the central processor. Network management messages are broadcast to adjacent signaling points to limit messages to the affected node. To avoid further congestion of the buffer, the far-end initiates the discard strategy used by nodes at the discard level.
Default: 10956
Valid Entries: 200 - 32767

Copyright © 2003 Lucent Technologies

2.12 DISCARD 3

Description: The DISCARD 3 field defines a transmit or retransmit buffer capacity that determines whether, under level 3 congestion conditions, a message should be discarded or transmitted.
Default: 11571
Valid Entries: 200 - 32767

PROTOCOL LINK SET THRESHOLDS

SEC. 2Q: 5027 RECORD
PROTOCOL LINK PARAMETERS (VIEW 15.17) - RCNILKPRM

1. GENERAL

This view is available with 5E9(1) and later Software Releases and is used to modify link protocol timers and SUERM (Signal Unit Error Rate Monitor) threshold values on a per link basis.

WARNING: Timer changes can be service-affecting. Before modifying timer values on this view, review the CCS7 protocol specifications.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SCOPE

Description: The SCOPE field determines the parameters used in selecting the number of timers to update.

When the view is updated for one link (SCOPE is "ONE"), the current data values will appear in the fields. When the view is updated for one or more link sets (SCOPE is "LS" or "ALL"), the fields will appear blank since the values may differ among the link sets.

Required Field.

Valid SCOPE Entries

Entry	Definition
LS	One Link Set.
ONE	One link.
ALL	All links.

Data Rules:

If SCOPE is "LS", a value must be entered in the LS field, and GROUP and MEMBER must be blank.

If SCOPE is "ONE", a value must be entered in the GROUP and MEMBER fields; and LS must be blank.

If SCOPE is "ALL", LS, GROUP, and MEMBER must be blank; the database operation must be "U".

2.3 (*) LS

Description: The LS (Link Set) field defines a set of CCS7 links going to the same destination.
Valid Entries: 1 - 511.

2.4 (*) GROUP

Description: The GROUP field specifies the group to which the link node is attached. For 5E9(1) and earlier, the CNI cabinet has two groups (00 and 32); for 5E9(2) and later, it has six groups (00, 01, 02, 32, 33, 34). A link pair must have a link on two of these groups.
Valid Entries:

- For 5E9(1) and earlier: 0 - 63
- For 5E9(2) and later: 00, 01, 02, 32, 33, 34

2.5 (*) MEMBER

Copyright © 2003 Lucent Technologies

Description: The MEMBER field defines a specific link node being used by a particular group.
Valid Entries:
- For 5E9(1) and earlier: 1 - 15
- For 5E9(2) and later: 1 - 8

T1.111.3 TIMERS

The following fields (Section 2.6 - Section 2.13) establish the values of T1.111.3 timers.

2.6 T1

Description: The T1 field defines the interval of time CNI will wait for the link to be in service after the link is aligned and ready on the near end.
Default: 650
Valid Entries: 650 - 1500 (fiftieths of a second)

2.7 T2

Description: The T2 field defines the interval of time CNI will wait before restarting the alignment procedure.
Default:

For LEC Offices: 575
- For AT&T Offices: 590

Valid Entries: 250 - 700 (fiftieths of a second)

2.8 T3

Description: The T3 field defines the interval of time CNI will wait for the link to be aligned on the far end after the link is aligned on the near end.
Default:

For LEC Offices: 575
- For AT&T Offices: 590

Valid Entries: 250 - 700 (fiftieths of a second)

2.9 T4N

Description: The T4N field is the Normal Prove-In Period Timer. It defines the interval of time CNI will wait to prove error free transmission under normal conditions.
Default: 115
Valid Entries: 104 - 126 (fiftieths of a second)

2.10 T4E

Description: The T4E field is the Emergency Prove-In Period Timer. It defines the interval of time CNI will wait to prove error free transmission under emergency prove-in procedures.
Default: 30
Valid Entries: 27 - 33 (fiftieths of a second)

2.11 T5

Description: The T5 field defines the interval of time CNI sends SIB (Status Indication Busy) during level 2 congestion.

Copyright © 2003 Lucent Technologies

Default: 4
Valid Entries: 4 - 6 (fiftieths of a second)

2.12 T6

Description: The T6 field is the Remote Congestion Timer. It defines the maximum time CNI will wait for an acknowledgement message when CNI is receiving SIB (Status Indication Busy). If the message is not received within the allotted time, CNI will fail the link.
Default: 150
Valid Entries: 150 - 300 (fiftieths of a second)

2.13 T7

Description: The T7 field is the Excessive Delay of Acknowledgement Timer. It defines the maximum time CNI will wait for a message to be acknowledged. If the message is not acknowledged within the allotted time, CNI will fail the link.
Default: 50
Valid Entries: 25 - 100 (fiftieths of a second)

SIGNAL UNIT ERROR RATE MONITOR

The following field (Section 2.14) defines the Signal Unit Error Monitor value.

2.14 SU ERR MON

Description: The SU ERR MON field defines the number of signal unit errors allowed for CNI.
Default:

For LEC Offices: 64
- For AT&T Offices: 192

Valid Entries: 64 - 192

SEC. 2R: 5028 RECORD
MEMBER ROUTING DATA (VIEW 15.18) - RCNIMEM

1. GENERAL

This view is available with the 5E9(1) and later Software Releases and contains the information necessary for CCS7 message routing based on the Network ID, cluster number, and member number of the point code. This view supports member level routing to local (intra-) and nonlocal (inter-) networks.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NID

Description: The NID field specifies the network identifier of a point code to which CCS messages are routed.
Valid Entries: 1 - 254

Data Rules:

For 5E9(1) and later, if NID is between 5 and 254 inclusive, routing data cannot be entered unless the FPCR (Full Point Code Routing) secured feature is activated through Secured Feature ID 132 on the 8.22 View.

If NID is between 1 to 4 inclusive, routing data can be entered without FPCR being activated, if PRI ROUTE matches the LINK SET on the corresponding 15.2 view.

2.3 * CLUSTER

Description: The CLUSTER field specifies the cluster number of a point code to which CCS messages are routed. For AT&T the first two digits are the region number (00 - 31), and the third digit is the Cluster identification (0 - 7). For a LEC (Local Exchange Carrier) the cluster number is 000 - 255.
Valid Entries: 3 digits

2.4 * MEMBER

Description: The MEMBER field specifies the member number of a point code to which CCS messages are routed.
Valid Entries: 0 - 255

2.5 ROUTING FLAG

Description: The ROUTING FLAG field specifies the CNI (Common Network Interface) routing flag which is used to determine the level of routing to be performed. This is a verify-only field. It contains member routing based on the network, cluster, and member fields of the point code. It is used to identify full point code routing members of a populated cluster.

2.6 PRI ROUTE

Description: The PRI ROUTE field specifies the CNI link set used for the primary route between the 5ESS Switch and the STP.
Valid Entries: 1 - 511

Data Rules:

Copyright © 2003 Lucent Technologies

If PRI ROUTE is the same as the LINK SET value on the corresponding 15.2 View, then the following must be true.

- The NID on this view must match the first three digits (network identifier) of the FAR END PNT CODE on the 15.2 View, the CLUSTER must match the middle three digits (cluster number) of the FAR END PNT CODE, and the MEMBER must match the last three digits (member number) of the FAR END PNT CODE.
- If the link set is part of a combined link set (i.e., a value is entered in the COMBINED LINK SET field of the 15.2 View), and the combined link set contains another direct link set (i.e., another LINK SET is associated with the same COMBINED LINK SET on a 15.2 View), then the other LINK SET must be the ALT1 ROUTE on this view. The ALT2 ROUTE may be entered only if the ELINK secured feature has been activated through Secured Feature ID 131 on the 8.22 View.
- If the link set is not part of a combined link set (i.e., a value is not entered in the COMBINED LINK SET field on the 15.2 View), then ALT1 ROUTE and ALT2 ROUTE may be entered only if the ELINK feature has been activated through Secured Feature ID 131 on the 8.22 View.

If PRI ROUTE matches the COMBINED LINK SET value on the 15.2 View, the NID, CLUSTER, and MEMBER values must not match the network identifier, cluster, and member of the corresponding FAR END PNT CODE on the 15.2 View. ALT1 ROUTE and ALT2 ROUTE may be entered only if the ELINK feature has been activated through Secured Feature ID 131 on the 8.22 View.

A/E-LINK

The following fields (Section 2.7 - Section 2.8) support the Extended Access Links and Alternate A-Link Set Routing feature and the Full Point Code Routing feature.

2.7 ALT1 ROUTE

Description: The ALT1 ROUTE field specifies the link set to be used as the first alternate route between the 5ESS Switch and the STP.
Valid Entries: 1 - 511

Data Rules:

If no value is entered in ALT1 ROUTE, ALT2 ROUTE must also be blank.

If ALT1 ROUTE is entered, it must be different than PRI ROUTE. If ALT2 ROUTE is entered, it must be different than PRI ROUTE and ALT1 ROUTE.

2.8 ALT2 ROUTE

Description: The ALT2 ROUTE field specifies the link set to be used as the second alternate route between the 5ESS Switch and the STP.
Valid Entries: 1 - 511

INSERT ONLY

The following field (Section 2.9) is used to facilitate conversion to FPCR (Full Point Code Routing).

2.9 LAST MEMBER

Description: The LAST MEMBER field specifies the upper limit member number to be inserted when the conversion from cluster routing to member (full point code) routing is done on multiple sequential members in the same cluster. In the INSERT operation, the MEMBER field defines the lower limit member number.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 255

Data Rules:

If LAST MEMBER is entered, the database operation must be "I", and LAST MEMBER must be greater than MEMBER.

MEMBER ROUTING DATA

SEC. 3: MISCELLANEOUS RECENT CHANGE VIEWS

Copyright © 2003 Lucent Technologies

SEC. 3A: CCS OFFICE PARAMETERS (VIEW 8.15) - RC_CPARM

1. GENERAL

This view is used to set several SS7 (Signaling System 7) signaling and signaling platform related parameters to determine whether or not certain SS7 signaling platform functions are available in the office.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * OFFICE ID

Description: Enter the office identifier.

Required Field.
Valid Entries: 1 - 8 alphanumeric characters

2.3 CNI EQUIP

Description: Is CNI equipped on the switch?
Default: N
Valid Entries: Y, N

Data Rules:

A "Y" must be entered in this field when any of the following fields have a value of "Y" entered: ACTION POINT, ACT PT SDN, DLN EQUIP and/or SSP.

2.4 DLN EQUIP

Description: Is Direct Link Node equipped on the CNI Ring?

WARNING: The office must have a DLN installed and properly grown before a "Y" can be entered in this field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in this field, the CNI EQUIP field must have a value of "Y" entered.

2.5 DS SPEED

Description: This field indicates the Direct Signaling Link Speed. For LEC offices, a value of 48 is normally used.

NOTE: 560 should be assigned for high speed link nodes used in switch owner networks and for high speed link nodes used solely for credit card checking in LEC offices. Otherwise, the value 48 should be used.
Default: 48
Valid Entries: 48 or 560

2.6 ACT PT SDN

Copyright © 2003 Lucent Technologies

Description: Does this office serve as an ACP (Action Point) for the SDN (Software Defined Network)?

- ***NOTE:*** All SDN ACP offices must be equipped with a CNI (Common Network Interface) to provide CCS (Common Channel Signaling) transport.

Default: N
Valid Entries: Y, N

Data Rules:

Neither ACT PT SDN nor SSP can be set to "Y".

A value of "Y" must be entered in the CNI EQUIP field when ACT PT SDN has a value of "Y".

2.7 SSP

Description: Does the switch provide the NS800 feature?
Default: N
Valid Entries: Y, N

Data Rules:

Neither ACT PT SDN nor SSP can be set to "Y".

A value of "Y" must be entered in the CNI EQUIP field when SSP has a value of "Y".

If this field is "Y", the LATA field must be entered.

2.8 LATA

Description: This field indicates the switch's LATA.
Valid Entries: 100 - 999

Data Rules:

If the SSP field has a value of "Y", this field must be entered.

PVN

The name of this field group was changed to ADV SVC PLATFORM in 5E8. This name applies to 5E7 and earlier. See ADV SVC PLATFORM for usage information.

ADV SVC PLATFORM

The following field is used to define the ASP (Advance Service Platform) parameters. (This field group was called PVN for 5E7 and earlier.)

2.9 PVN RESP

Description: The name of this field was changed to ASP RESP in 5E8. This field name applies to 5E7 and earlier. See ASP RESP for usage information.

2.10 ASP RESP

Description: This is the timer that the Advanced Services Platform uses to wait for a response from the SCP (Switching Control Point) database. This timer is specified in seconds. (This field was called PVN RESP for 5E7 and earlier.)

Software Release: 5E6 and later

Copyright © 2003 Lucent Technologies

Default: 3
Valid Entries: 1 - 5 (seconds)

CCIS6, ISUP, TUP

The following fields (Section 2.11 - Section 2.19) are used to define CCIS6, ISUP and TUP parameters.

2.11 ADDR COMP

Description: This field indicates how long to wait for the CCS Address Complete Message.
Default: 25
Valid Entries: 20 - 30 (seconds)

2.12 ANSWER

Description: This field indicates how long to wait for the CCS Answer Message.
Default: 0
Valid Entries: 0, 2, 3 or 4 (minutes)

2.13 COT

Description: This field indicates how long to wait for the CCS Continuity message.
Default: 12
Valid Entries: 10 - 15 (seconds)

2.14 RLS GRD

Description: This field indicates how long to wait for the CCS Release Guard Message (CCIS6/TUP7 protocols) or for the CCS Release Complete after sending the CCS Released Message (ISUP only).
Default: 10
Valid Entries: 4 - 15 (seconds)

2.15 TRD

Description: This field indicates how long to wait for for possible CCS reanswer (timed release disconnect) after a CCS clearback is received.
Default: 12
Valid Entries: 4 - 15 (seconds)

2.16 TRK QRY AU

Description: This field indicates the value used for the cyclic timer which determines the time between cycles of the CCS Trunk Query interoffice audit.
Default: 60
Valid Entries: 20 - 20000 (seconds)

2.17 COT RETST

Description: This field indicates how long to wait for the Repeated CCS Continuity Test.
Default: 120
Valid Entries: 60 - 180 (seconds)

2.18 RSC SHORT

Description: This field indicates the time interval to wait before resending a CCS Reset Circuit Signal when failing to receive the acknowledgement in response to the initial CCS Reset Circuit Signal sent.
Default: 10

Copyright © 2003 Lucent Technologies

Valid Entries: 4 - 15 (seconds)

2.19 RSC LONG

Description: This field indicates the time interval to wait before resending a CCS Reset Circuit Signal when failing to receive an acknowledgement in response to the initial CCS Reset Circuit Signals sent at intervals defined by this parameter. If an acknowledgement for the signal is not received within the RSC LONG timer interval, the sending of the Reset Circuit Signal will continue at the RSC LONG time interval until maintenance intervention occurs.
Default: 180
Valid Entries: 120 - 1800 (seconds)

CCIS6 ONLY

The following field applies to CCIS6 transmission only.

2.20 BAND AU

Description: This field indicates the value used for the Cyclic Timer which determines the time between cycles of the audit that checks this office's band status data against the network's band status data.
Default: 5
Valid Entries: 1 - 1440 (minutes)

ISUP, TUP ONLY

THe following fields (Section 2.21 - Section 2.26) apply to ISUP and TUP only.

2.21 DIGIT

Description: This field indicates how long to wait for a CCS Subsequent Address Message.
Default: 4
Valid Entries: 3 - 5 (seconds)

2.22 BLO RSND

Description: This field indicates the time interval to wait before resending a CCS Blocking Signal (TUP/ISUP protocols) when failing to receive the acknowledgement in response to the initial CCS Blocking Signal sent.
Default: 10
Valid Entries: 4 - 15 (seconds)

2.23 UBL RSND

Description: This field indicates the time interval to wait before resending a CCS Unblocking Signal (TUP/ISUP protocols) when failing to receive the acknowledgement in response to the initial CCS Unblocking Signal sent.
Default: 10
Valid Entries: 4 - 15 (seconds)

2.24 COT WAIT

Description: This field indicates the time between the initial CCS Continuity Test failure and the first retry.
Default: 5
Valid Entries: 4 - 15 (seconds)

2.25 GBLO RSND

Copyright © 2003 Lucent Technologies

Description: This field indicates the time interval to wait before resending a CCS Maintenance/Hardware Group Blocking Message (TUP/ISUP protocols) when failing to receive the appropriate acknowledgement in response to the initial CCS Maintenance/Hardware Group Blocking Message sent.
Default: 10
Valid Entries: 4 - 15 (seconds)

2.26 GUBL RSND

Description: This field indicates the time interval to wait before resending a CCS Maintenance/Hardware Group Unblocking Message (TUP/ISUP protocols) when failing to receive the appropriate acknowledgement in response to the initial CCS Maintenance/ Hardware Group Unblocking Message sent.
Default: 10
Valid Entries: 4 - 15 (seconds)

ISUP ONLY

The following fields (Section 2.27 - Section 2.34) apply to ISUP only

2.27 RLS COMP

Description: This field indicates how long to wait for the CCS Release Complete Message after sending the Release Message. This is a timer for the overall release sequence for ISUP7.
Default: 60
Valid Entries: 45 - 75 (seconds)

2.28 CRA TIMER

Description: When the OTO (Originating Toll Office) receives CRM (Circuit Reservation Message) from the OAT (Originating Access Tandem), it sends a CRA (Circuit Reservation Acknowledgement) message back to the OAT at which point this timer is set at the OTO. This timer will indicate the elapsed time to wait before an IAM (Initial Address Message) is received from the OTO.
Default: 25
Valid Entries: 20 - 25 (seconds)

2.29 EXM D TIMER

Description: This timer is set by the OAT (Originating Access Tandem) after it sends the IAM (Initial Address Message) to the OTO (Originating Toll Office). The OAT uses this value to provide a delay to ensure that glare, blocking, etc., is not encountered on the outgoing circuit to an OTO. When the timer expires, the OAT sends an EXM (Exit Message) to the EO (End Office).
Default: 300
Valid Entries: 100 - 1200, in intervals of 100 (ms)

2.30 GRS RSND

Description: The circuit group reset acknowledge timer specifies the ISUP group reset message response timer value. This timer is initiated when an ISUP GRS message is sent, and it is canceled when a circuit GRA (group reset acknowledgement) is received from all members specified in the GRS message.

Software Release: 5E9(1) and later
Required Field.
Default: 10
Valid Entries: 4 - 15 (seconds)

2.31 BUSY ANNC

Copyright © 2003 Lucent Technologies

Description: Will a busy tone be sent to the originating exchange when the called party is busy and the call route consists of ISUP trunks interworked to other signal protocol trunks? If BUSY ANNC is "Y", a busy tone will be provided; if "N", a Release Message will be sent.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

2.32 LEC ANNC

Description: Will a tone/announcement be provided to the previous exchange when a failure occurs on an ISUP trunk in the LEC network? This only applies to non-ISDN access calls that have used ISUP trunks all the way. "Y" indicates a tone/announcement will be provided; "N" indicates that a Release Message will be sent to the preceding exchange.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

2.33 LEC IW REL

Description: Will an ISUP Local Exchange Carrier Interworking Release message be provided to the previous exchange when a failure occurs on an ISUP trunk in the LEC network? This only applies to non-ISDN access calls that have not used ISUP trunks exclusively over the full call completion path.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

2.34 RCD 3PT1 ITC

Description: This Recode 3.1 kHz Information Transfer Capability field is used to override the information transfer capability of an outgoing ISUP call only if all the following conditions are met:

- The call has an Information Transfer capability of 3.1 kHz audio;
- The call will be routed over an ISUP trunk;
- The office is a local tandem that received the call on an inband signaling speech trunk, or the office is an originating end office and the originator is non-ISDN; and
- The RCD 3PT1 ITC field on the trunk group view (5.1) has been left blank.

Software Release: 5E8 and later
Required Field.
Default: SPEECH
Valid Entries:

Valid RCD 3PT1 ITC Entries

Entry	Definition
SPEECH	Recode to speech.
3PT1KHZ	Use 3.1 kHz audio without modification.

CCIS6 AND TUP ONLY

The following field applies to CCIS6 and TUP only.

2.35 CLF

Copyright © 2003 Lucent Technologies

Description: This field indicates how long to wait for the CCS Clear Forward message after sending a Backward Fail Message.
Default: 10
Valid Entries: 4 - 15 (seconds)

LEASED NETWORK

The following fields (Section 2.36 - Section 2.39) are available with 5E6 and later Software Releases. They pertain to leased network parameters.

2.36 TIME OUT

Description: This field indicates how long to wait for the TCAP (Transaction Capability Application Part) responded messages from the LN (Leased Network) NCP (Network Control Point). TCAP response message time out.
Default: 4
Valid Entries: 2 - 6 (seconds)

2.37 GLBL TITLE

Description: This field contains the 6-digit global title, which is inserted into the CCS7 (Common Channel Signaling System Number 7) SCCP (Signaling Connection Control Part) header and translated by the STP (Signaling Transfer Point) into a DPC (Destination Point Code) in order to route the TCAP (Transaction Capability Application Part) message to the LN (Leased Network) NCP (Network Control Point).
Default: 0
Valid Entries: 0 - 999999

2.38 DAS

Description: This field will be defined as the DAS to specify the digit tree to use for the vacant code screening for the LN (Leased Network) ACP (Action Point) calls.
Default: 0
Valid Entries:

For 5E14 and earlier: 0 - 99

For 5E15 and later: 0 - 254

2.39 ACTION POINT

Description: This field is used to indicate this office serves as an ACP (Action Point) for LN (Leased Networks).
Default: N
Valid Entries: Y, N

Data Rules:

If this field has a value of "Y", the CNI EQUIP field must have a value of "Y".

ISVM OTPION

The following sets an ISVM (Inter-Switch Voice Messaging) option.

2.40 ISVM TCAP TIMER

Copyright © 2003 Lucent Technologies

Description: The ISVM (Inter-Switch Voice Messaging) TCAP (Transaction Capabilities Application Part) Timer is a global Common Channel Signaling office parameter that specifies the timeout value (in seconds) for TCAP MWI (Message Waiting Indicator) activate/deactivate requests. If the timeout value is set to 3 seconds, the activation or deactivation of an MWI will be done in that specified time.

Software Release: 5E7 and later
Default: 3
Valid Entries: 1 - 10 (seconds)

CCS FEATURES

The following fields are used by the CCS(Common Channel Signaling) feature. They are available for both the CNI-based SS7 signaling platform and for the PSU-based SS7 signaling platform.

2.41 EXPANDED SLS

Description: Is the Expanded Signaling Link Selection feature activated? For more information on this secured feature, see Division 2, Section 4A175. This field on this form defines the feature only for the CNI signaling platform. For the PSU-based SS7 signaling platform, see Division 9, Section 10H.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

If EXPANDED SLS is "Y", SFID 175 must be activated on the SFSYS form (5713 Record).

2.42 IMPROVED SLT

Description: Is the Improved Signaling Test feature activated? For more information on this secured feature, see Division 2, Section 4A176. This field defines the feature for both CNI and PSU-based SS7 signaling platforms.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

If IMPROVED SLT is "Y", SFID 176 must be activated on the SFSYS form (5713 Record).

2.43 MTP NODE RESTART

Description: Is the MTP Node Restart feature activated? For more information on this secured feature, see Division 2, Section 4A177. This field defines the feature for both CNI and PSU-based SS7 signaling platforms.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

If MTP NODE RESTART is "Y", SFID 177 must be activated on the SFSYS form (5713 Record).

SEC. 10: COMMON CHANNEL SIGNALING FORMS

Copyright © 2003 Lucent Technologies

SEC. 10A: 6001 RECORD
LEVEL 3 TIMER PARAMETER- CC7PR

1. GENERAL

The 6001 Record is available with 5E11 and later Software Releases and is used to specify and update the CCITT7 office parameters and MTP Level 3 timers. This form was added to support the VCDX SS7 on the PSU Feature. For more information on this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.2.

2. FORM ENTRIES - 6001-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global switching module used to specify the SM that supports the signaling system.

Data Rules:

When GSM is entered, it must be defined on the CCGSM form (6008 Record).

Required Field.

Valid Entries: 1 - 192

2.3 PROTOCOL

Description: This field specifies protocol type of combined link set. This is a no change field.

Required Field.
Default: C7NATL
Valid Entries: C7NATL

2.4 LINK AFFECT

Description: Enter the the maximum number of attempts to uninhibit or inhibit a link when an acknowledgement is not received.

Required Field.
Default: 2
Valid Entries: 1 - 6

2.5 CONGESTION

Description: Enter the congestion threshold level which specifies the number of messages received by a DPC (Destination Point Code) before a transfer control message is sent.

Required Field.
Valid Entries: 6 - 10

2.6 CO DELAY

Copyright © 2003 Lucent Technologies

Description: Enter the changeover delay which specifies the delay interval used to avoid message mis-sequencing during changeover (to be specified in milliseconds).

Required Field.
Default: 500 (milliseconds)
Valid Entries: 500 -1200

2.7 CO ACK

Description: Enter the changeover acknowledgement. This field is used to specify the maximum wait time for the changeover acknowledgement (to be specified in milliseconds).

Required Field.
Default: 700 (milliseconds)
Valid Entries: 700 - 2000

2.8 CB DELAY

Description: Enter the changeback delay which specifies the delay to avoid message mis-sequencing during changeback. The result of changeback is that signaling traffic is returned from an alternate link to a normal link (to be specified in milliseconds).

Required Field.
Default: 500 (milliseconds)
Valid Entries: 500 - 1200

2.9 CB ACK1

Description: Enter the maximum wait time for the changeback acknowledgement - first attempt (to be specified in milliseconds).

Required Field.
Default: 500 (milliseconds)
Valid Entries: 500 - 1200

2.10 CB ACK2

Description: Enter the maximum wait time for the changeback acknowledgement - second attempt (to be specified in milliseconds).

Required Field.
Default: 500 (milliseconds)
Valid Entries: 500 - 1200

2.11 CRR DELAY

Description: Enter the controlled rerouting delay which is the delay to avoid message mis-sequencing during controlled rerouting (to be specified in milliseconds).

Required Field.
Default: 500 (milliseconds)
Valid Entries: 500 - 1200

2.12 TRANSFER

Description: Enter the maximum wait time "transfer prohibited" can be inhibited (to be specified in milliseconds).

Copyright © 2003 Lucent Technologies

Required Field.
Default: 1000 (milliseconds)
Valid Entries: 800 - 1200

2.13 SRT WAIT

Description: Enter the amount of time to wait before repeating the signaling route test (to be specified in milliseconds).

Required Field.
Default: 30000 (milliseconds)
Valid Entries: 30000 - 60000

2.14 UA WAIT

Description: Enter the maximum wait for the uninhibit acknowledgement (to be specified in milliseconds).

Required Field.
Default: 1000 (milliseconds)
Valid Entries: 800 - 1500

2.15 MSU WAIT

Description: Enter the maximum wait for MSU (Message Signal Unit) during "forced uninhibit" (to be specified in milliseconds).

Required Field.
Default: 1000 (milliseconds)
Valid Entries: 800 - 1500

2.16 INHIBIT ACK

Description: Enter the maximum wait for an inhibit acknowledgement (to be specified in milliseconds).

Required Field.
Default: 3000 (milliseconds)
Valid Entries: 2000 - 3000

2.17 RSC TEST

Description: Enter the time for route set congestion (to be specified in milliseconds).

Required Field.
Default: 3000 (milliseconds)
Valid Entries: 2000 - 3000

2.18 RSC UPDATE

Description: Enter the route set congestion update time (to be specified in milliseconds).

Required Field.
Default: 1400 (milliseconds)
Valid Entries: 1400 - 2000

2.19 LINK RESTART

Description: Enter the maximum wait for a link restart (to be specified in milliseconds).

Copyright © 2003 Lucent Technologies

Required Field.
Default: 1000 (milliseconds)
Valid Entries: 800 - 1500

2.20 LOCAL INHIBIT

Description: Enter the maximum wait time for local inhibit test (to be specified in milliseconds).

Required Field.
Default: 120000 (milliseconds)
Valid Entries: 90000 - 120000

2.21 REMOTE INHIBIT

Description: Enter the maximum wait for remote inhibit test (to be specified in milliseconds).

Required Field.
Default: 120000 (milliseconds)
Valid Entries: 90000 - 120000

3. FORM ENTRIES - 6001-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

3.2 STOP SEND WAIT

Description: Enter the stop send wait timer. This field is used to allow TDTP (traffic diversion terminal process) to die if "stop send" signal is not received (to be specified in milliseconds).

Required Field.
Default: 1000 (milliseconds)
Valid Entries: 800 - 1200

3.3 SLS DELAY

Description: Enter the delay time to avoid message mis-sequencing during SLS (Signaling Link Selection) correction (specified in milliseconds).

Required Field.
Default: 1000 (milliseconds)
Valid Entries: 800 - 1200

3.4 BSNT WAIT

Description: Enter the maximum wait time for BSN (Backward Sequence Number) to arrive during changeover (specified in milliseconds).

Required Field.
Default: 200 (milliseconds)
Valid Entries: 160 - 240

3.5 LEVEL 2 WAIT

Description: Enter the maximum wait time for a message from CCS (Common Channel Signaling) level 2 which indicates that previous unsent messages are now being sent to SMH (Signaling Message Handler) (specified in milliseconds).

Copyright © 2003 Lucent Technologies

Required Field.
Default: 300 (milliseconds)
Valid Entries: 240 - 360

3.6 RC TIME

Description: Enter the maximum time a destination will be marked "remotely congested", after receiving a transfer control message. If the destination stays congested, another transfer control message must be received before the timer expires (specified in milliseconds). Upon receiving a message, the timer is reset to 0.

Required Field.
Default: 8000 (milliseconds)
Valid Entries: 2000 - 24000

3.7 SMH WAIT

Description: Enter the wait time before sending the SMH (Signaling Message Handler) the last sequence number (specified in milliseconds).

Required Field.
Default: 900000 (milliseconds)
Valid Entries: 780000 - 1020000

3.8 ACK LINK TEST

Description: Enter the maximum wait time for the signaling data link test acknowledgement (specified in milliseconds).

Required Field.
Default: 4000 (milliseconds)
Valid Entries: 4000 - 12000

3.9 DELAY LNK TST

Description: Enter the signaling link test delay timer (specified in milliseconds).

Required Field.
Default: 90000 (milliseconds)
Valid Entries: 30000 - 90000

3.10 FALSE LINK CONG

Description: The FALSE LINK CONG timer is used to specify the time used to detect a link in false link congestion.

Required Field.
Default: 30 (seconds)
Valid Entries: 10 - 120 (seconds)

3.11 FALSE LINK REF

Description: This field is used to specify the link alignment procedures start time.

Required Field.
Default: 400 (seconds)
Valid Entries: 180 - 600 (seconds)

Copyright © 2003 Lucent Technologies

MTP RESTART

The following fields (Section 3.12 - Section 3.15) are associated with the Message Transfer Protocol Node Restart feature. For more information about this feature, see Division 2, Section 4a177.

3.12 ANSI TRA WAIT

Description: Enter the Traffic Restart Allowed timer; it is used by ANSI (American National Standards Institute) protocol only. This field specifies the timer at the signaling point that is adjacent to the restarting signaling point, waiting for TRA (Traffic Restart Allowed) messages.

Software Release: 5E14 and later
Required Field.
Default: 32 (seconds)
Valid Entries: 30 - 60

3.13 ANSI TRW WAIT

Description: Enter the Traffic Restart Waiting timer; it is used by ANSI protocol only. This field specifies the timer at the signaling point that is adjacent to the restarting signaling point, waiting for TRW (Traffic Restart Wait) messages.

Software Release: 5E14 and later
Required Field.
Default: 5 (seconds)
Valid Entries: 3 - 60

3.14 ANSI TRA ANSWER

Description: Enter the TRA Sent timer; it is used by ANSI protocol only. This field specifies that the timer has started when a TRA is sent in response to unexpected TRA or TRW messages.

Software Release: 5E14 and later
Required Field.
Default: 62 (seconds)
Valid Entries: 30 - 90

3.15 MTP STPO

Description: Enable MTP STPO (Message Transfer Part Short Term Processor Outage) procedures? This field is used to determine whether or not the MTP short term processor outage procedures are enabled for a particular GSM (Global Switching Module).

Software Release: 5E14 and later
Required Field.
Default: Y
Valid Entries: Y, N

3.16 X-LIST

Description: The field designates the duration a signaling point (cluster member) can remain on a dynamic exception list for a cluster route.

Required Field.
Default: 60 (seconds)
Valid Entries: 20 - 1440 by 5

Copyright © 2003 Lucent Technologies

3.17 LOW PRI SRST

Description: This field specifies the timer for the SRST (Signaling Route Set Test) message transmission interval for routes that are alternate or of a lower priority.

Required Field.
Default: 600 (seconds)
Valid Entries: 0 - 864000 by 30

SEC. 10B: 6002 RECORD
DATA LINK RATE TIMER PARAMETERS FORM - CCPDL

1. GENERAL

The 6002 Record is available with 5E11 and later Software Releases and is used to specify and update the CCITT7 MTP (Message Transfer Part) Level 2 Data Link Rate timers. This form supports the VCDX CCS7 on the PSU feature. For more information on this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.3.

2. FORM ENTRIES - 6002 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * DATA LINK RATE

Description: Enter the Data Link Rate. This field specifies the transmission rate of the data link.

Required Field.
Valid Entries: 56KB or 64KB

2.3 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

When is GSM entered on this form, it must be defined on the CCGSM form (6008 Record).

2.4 ALIGNED READY

Description: Enter the MTP level 2 Aligned Ready Wait Timer. This field is used to specify the maximum time to wait (in milliseconds) for the other side of the connection to align when this side of the connection is already aligned.

Software Release: 5E11 and later
Required Field.
Default: 13000 (milliseconds)
Valid Entries: 13000 - 300000

2.5 NOT ALIGNED

Description: Enter the MTP level 2 Not Aligned Ready Wait Timer. This field specifies the timer used during the Not Aligned state of the initial alignment control.

Required Field.
Default: 115000 (milliseconds)
Valid Entries: 5000 - 150000

Copyright © 2003 Lucent Technologies

2.6 ALIGNED

Description: Enter the MTP level 2 Aligned Wait Timer used during the Aligned state of the initial alignment control.

Required Field.
Default: 11500 (milliseconds)
Valid Entries: 125 - 50000

2.7 EMERG PROVING

Description: Enter the MTP level 2 Emergency Proving Timer used during the Emergency Proving state.

Required Field.
Default: 600 (milliseconds)
Valid Entries: 400 - 3000

2.8 NORM PROVING

Description: Enter the MTP level 2 Normal Proving Timer used during the Normal Proving state when there is no emergency conditions.

Required Field.
Default: 2300 (milliseconds)
Valid Entries: 2300 - 9500

2.9 SENDING SIB

Description: Enter the Status Indication Busy Timer used when the receiving end of a signaling data link detects a congestion situation. This receiving end periodically returns a status indication "busy" to the remote transmitting end of the link. The timer between two of these indications is specified by this timer.

Required Field.
Default: 100 (milliseconds)
Valid Entries: 80 - 250

2.10 REMOTE CONGESTION

Description: Enter the MTP level 2 Remote Congestion Timer specifies the maximum wait time to wait for a remote congestion situation to clear.

Required Field.
Default: 3000 (milliseconds)
Valid Entries: 3000 - 10000

2.11 EXCESS DELAY ACK

Description: Enter the level 3 Excess Delay Acknowledgement Timer. This timer specifies the maximum time to wait for the acknowledgement of a transmitted MSU (Message Signal Unit).

Required Field.
Default: 500 (milliseconds)
Valid Entries: 500 - 2000

Copyright © 2003 Lucent Technologies

(6002) DATA LINK RATE TIMER PARAMETERS

*1. DATA LINK RATE ____
*2. GSM ____
3. ALIGNED READY 13000
4. NOT ALIGNED 11500
5. ALIGNED 11500
6. EMERG PROVING 600
7. NORM PROVING 2300
8. SENDING SIB 100
9. REMOTE CONGESTION 3000
10. EXCESS DELAY ACK 500

SEC. 10C: 6003 RECORD
SIGNALING LINK SET FORM - LNKSET

1. GENERAL

The 6003 Record is available with 5E11 and later Software Releases and is used to define CCS7 signaling link sets. For more information on this feature, see Division 2, Section 7L and Division 2, Section 9L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.5.

2. FORM ENTRIES - 6003 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * LINK SET

Description: Enter the link set number.

Required Field.
Valid Entries: 1 - 255

2.3 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

2.4 APC

Description: Enter the the 9-digit network indicator which specifies the Adjacent Point Code number to which this link is connected in the following format.

For the 5E11 Software Release, APCs can be entered in the ANSI (American National Standards Institute) format only; the AT&T format cannot be entered directly. Thus, if an AT&T point code format is to be used in an ANSI office, it must first be converted to an ANSI format. For 5E12 and later, both formats can be entered directly. Note that Point Codes must be defined on the PC (SIGNALING POINT CODE) form (6006 Record).

Required Field.

Valid ANSI APC Entries - 5E11 and later

Definition	Format	Valid Entries
Network Indicator	XXX	001 - 254
Cluster Number	XXX	000 - 255
Member	XXX	000 - 255

Valid AT&T APC Entries - 5E12 and later

Definition	Format	Valid Entries
Network Indicator	XXX	236-254
Cluster Number	XX	00 - 31
Cluster Type	X	0 - 7
Member	XXX	000 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E14 and later, APC cannot be equal to the ALIAS PC on the CCGSM form for the same GSM.

2.5 PHYSICAL LINKS

Description: This field indicates the number of SS7 links in a link set and is a no change field.
Valid Entries: 0 - 16

2.6 CLS COUNT

Description: This field indicates the number of combined link sets of which the link set is a member and is a no change field.
Valid Entries: 0 - 1

2.7 LINK TYPE

Description: This field indicates the type of link used for signaling between a 5ESS Switch and an adjacent signaling point. A-links are links used between a 5ESS Switch and a local STP (Signal Transfer Point). E-links are links used between a 5ESS Switch and a remote STP. F-links are links used between a 5ESS Switch and another signaling endpoint (i.e., 5ESS Switch and/or a database).

Software Release: 5E14 and later
Required Field.
Default: A
Valid Entries:

Valid Entries-5E14 and later

Entry	Definition
A	A-Link
E	E-Link
F	F-Link

2.8 LINK SET NAME

Description: This field is used as the alphanumeric Identifier of the link set. This field supports the SAAL SS7 High Speed Signaling Links feature. For more information on this feature see Division 2, Section 4A670.

Software Release: 5E16 and later
Valid Entries: 1 to 12 alphanumeric characters

2.9 SAAL HSL COUNT

Description: This is a Display Only field that displays the number of SAAL (Signaling ATM (Automatic Transfer Mode) Adaptation Layer) High Speed SS7 (Signaling System 7) links associated with this Link Set. This field also supports the SAAL SS7 High Speed Signaling Links feature.

Software Release: 5E16 and later
Valid Entries: 0 - 16

2.10 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10D: 6004-1/2 RECORD
SIGNALING LINK SET RECORD - CCLNK

1. GENERAL

The 6004-1/2 Records are available with the 5E11 Software Releases. CCLNK, the external link set member form, is used to define the CCS7 (Common Channel Signaling System No. 7) link sets and members. For more information on this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.6.

2. FORM ENTRIES - 6004-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * LINK SET

Description: Enter the link set number.

Required Field.
Valid Entries: 1 - 255

Data Rules:

The ISCN must be a unique value within an SM. ISCNs cannot be duplicated on one or more of the following forms:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- IPDSL
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- PSULNK
- PSUPIPE
- RTERM
- TRUNK
- XAT

CCLNK and MDLNK forms can share an ISCN SHELF and CHANNEL GROUP on an SM. They cannot have an ISCN SHELF and CHANNEL GROUP which are mixed with Protocol Handler assignments from either of the following forms:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- IPDSL

Copyright © 2003 Lucent Technologies

- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- PSULNK
- PSUPIPE
- QPHPIPE
- RTERM
- TRUNK
- XAT

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form (5742 Record) on the same SWITCHING MODULE and having a matching PSU SHELF.

2.3 * MEMBER

Description: Enter the member number.

Required Field.
Valid Entries: 0 - 15

2.4 * GSM

Description: Enter the Global SM number. GSM field is used to specify the global switching module that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

There can be, at most, 128 CCLNK forms entered with the same GSM.

When GSM, SHELF, CHANNEL GROUP combinations assigned on this form with corresponding SM, PSU, PSU SHELF and GRP combinations assigned on the PSUGP form, the PH TYPE on the PSUGP form must be "PH3" or "PH22".

For 5E14 and later:

- When GSM matches a GSM on a CLU form, the PH TYPE on the PSUGP form must not be set to "PH3".

- When GSM matches a GSM on a NID form, and PH TYPE on the PSUGP form must not be set to "PH3".

2.5 SLC

Description: Enter the signaling link code. The signaling link code is part of the header of a signaling network management message. For 5E16(2) and later this is a Display Only field.

Required Field.
Valid Entries: 0 - 15

Copyright © 2003 Lucent Technologies

Data Rules:

SLCs assigned on the CCLNK form terminating to the same APC on the corresponding LNKSET form must be unique.

2.6 PRIORITY

Description: This field indicates the link priority within the link set. This is a no change field.
Default: 1
Valid Entries: 1

2.7 TRANSM TYPE

Description: Enter the transmission type. This field displays the transmission type for CCS message. This is a no change field.
Default: BASIC
Valid Entries:

Valid TRANSM TYPE Entries

Entry	Definition
BASIC	Basic retransmission will retransmit only once.
CYCLIC	Cyclic retransmisssion will try to retransmit several times if necessary.

2.8 RATE

Description: Enter the data link rate. This field represents the transmission rate of data link.

Required Field.
Valid Entries: 56KB or 64KB

2.9 # OE

Description: Enter OE TYPE and number.

Required Field.

Valid OE TYPE Entries

Entry	Definition
D	DEN (DLTU (Digital Line and Trunk Unit) Equipment Number).
N	NEN (DNU-S (Digital Network Unit - SONET) Equipment Number).
O	Software Release: 5E16(2) and later. OIUEN (Optical Interface Unit Equipment Number)

If OE TYPE is set to "D", this OE number consists of:

Valid OE Number Entries - TYPE D

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Digital Line Trunk Unit	DLTU	X	0 - 5 (5E14 and earlier)
		XX	0 - 11 (5E15 and later)
Digital Facility Interface	DFI	XX	01 - 10
Digital Channel	DCHAN	XX	01 - 48

If OE TYPE is set to "N", this OE number consists of:

Valid OE Number Entries - Type N - 5E12 and earlier

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Digital Networking Unit - SONET	DNU-S	X	0 - 7
Data Group	DG	X	0 - 1
Synchronous Transport Signal	STS	X	0 - 5

Copyright © 2003 Lucent Technologies

Virtual Tributary	VT	XX	01 - 28
Digital Signal Level 0	DS0	XX	01 - 24

Valid OE Number Entries - TYPE N - 5E13 and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNU-S	X	0-7
Data Group	DG	X	0-1
SONET Termination Equipment	STE	X	1-6
Synchronous Transport Signal	STS	X	1
Virtual Tributary Group	VTG	X	1-7
Virtual Tributary Member	VTM	X	1-4
Digital Signal Level 0	DS0	XX	01-24

When OE TYPE is "O", the OIU Equipment Number consists of:

OE NUMBER, TYPE "O" - (5E16 and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	OIU	X	0 - 7
Protection Group	PG	X	0 - 9
SONET Terminating Equipment	STE	X	1
High Level Virtual Container	HVC	X	1 - 3
Low Level Virtual Container Group	LVC GRP	X	1 - 7
Low Level Virtual Container Member	LVC MEM	X	1 - 4
Channel	CH	XX	01 - 24

Data Rules:

When CCLNK and XAT forms have an OE TYPE of "D" and a DEN specified, there must be corresponding DFIs or the DFIs that exist on the EQDUP form must have a FAC 0 specified.

For 5E12 and earlier, when CCLNK and XAT forms have an OE TYPE of "N" and a NEN is specified, there must be a corresponding EQVT form with VT EQSTAT and DS1S EQSTAT both set to "O". The associated EQVT form may be found by matching OE[1,3(SM)] with EQVT SM, OE[4(DNU-S)] with EQVT DNUS, OE[5(DATA GROUP)] with EQVT DATA GROUP, OE[6(STS)] with EQVT STS, and OE[7,8(VT)] with EQVT VT.

For 5E13 and later, when CCLNK and XAT forms have an OE TYPE of "N" and a NEN is specified, there must be a corresponding EQVT form with VT EQSTAT and DS1S EQSTAT both set to "O". The associated EQVT form may be found by matching OE[1,3(SM)] with EQVT SM, OE[4(DNU-S)] with EQVT DNUS, OE[5(DATA GROUP)] with EQVT DATA GROUP, OE[6(STE)] with EQVT STE, and OE[7(STS)] with EQVT STS, OE[8] with EQVT GROUP, and OE[9] with EQVT MEMBER.

For 5E15 and later, the SM number (first three digits of the OE) entered must be defined on the EQIM form with CONFIGURATION set to "LOADED", "SM2000", or "SIGNALING".

For 5E16(2) and later, when OE type is "O", OE must have a corresponding OIU SM, OIU, PROTECTION GRP, HVC, VT GROUP, and VT MEMBER defined on the EQLVC form (5764 Record).

2.10 TRANSRATE

Description: Enter the data link rate. This field represents the transmission rate of the data link (i.e., number of MSUs (Message Signal Unit) transmitted every 20 milliseconds). An entry of 0 denotes an unlimited rate.

Required Field.
Default: 0
Valid Entries: 0 - 8

Copyright © 2003 Lucent Technologies

2.11 # SHELF

Description: Enter the PSU (Packet Switching Unit) shelf on which the protocol handler is equipped.

Required Field.
Valid Entries: 0 - 4

2.12 # CHANNEL GROUP

Description: Enter the PH (Protocol Handler) channel group. This field specifies the logical shelf position of the PH.

Required Field.
Valid Entries: 0 - 15

2.13 # CH GP MEMBER

Description: Enter the channel group member.

Required Field.
Valid Entries: 0 - 3

3. FORM ENTRIES - 6004-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

3.2 H RET ONSET

Description: Enter the retransmission buffer onset (high level onset congestion threshold). When this threshold is reached, the buffer is marked as congested, and a message is sent to the STRM (Signaling Traffic Route Management) process. For multiple congestion levels, when the retransmission buffer occupancy exceeds the value of this threshold, high level congestion treatment is in effect.

Required Field.
Default: 80
Valid Entries: 1 - 100

Data Rules:

H RET ONSET must be greater than H RET ABATE.

3.3 H RET ABATE

Description: Enter the retransmission buffer abatement (high level abatement congestion threshold). When this threshold is reached, the buffer is marked as uncongested (if it was previously marked as congested), and a message is sent to the STRM process. This message indicates the current level of the signaling SDL (Signaling Data Link). For multiple congestion levels, when the retransmission buffer occupancy decreases below the value of this threshold, medium level congestion treatment is in effect.

Required Field.
Default: 65
Valid Entries: 1 - 100

Data Rules:

H RET ABATE must be greater than M RET ONSET.

Copyright © 2003 Lucent Technologies

3.4 H RET DISC

Description: Enter the retransmission buffer discard (high level congestion discard threshold). For multiple congestion levels, when the retransmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

Required Field.
Default: 90
Valid Entries: 1 - 100

Data Rules:

H RET DISC must be greater than H RET ONSET.

3.5 H TRAN ONSET

Description: Enter the transmission buffer onset (high level onset congestion threshold). When congestion does occur, STRM is informed of the current congestion level of the SDL. For multiple congestion levels, when the transmission buffer occupancy exceeds the value of this threshold, high level congestion treatment is in effect.

Required Field.
Default: 80
Valid Entries: 1 - 100

Data Rules
H TRAN ONSET must be greater than H TRAN ABATE.

3.6 H TRAN ABATE

Description: Enter the transmission buffer abatement (high level abatement congestion threshold). When this threshold is reached, the STRM is informed of the current congestion level of the SDL. For multiple congestion levels, when the transmission buffer occupancy decreases below the value of this threshold, medium level congestion treatment is in effect.

Required Field.
Default: 65
Valid Entries: 1 - 100

Data Rules:

H TRAN ABATE must be greater than M TRAN ONSET.

3.7 H TRAN DISC

Description: Enter the transmission buffer discard (high level congestion discard threshold). For multiple congestion levels, when transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

Required Field.
Default: 90
Valid Entries: 1 - 100

Data Rules:

H TRAN DISC must be greater than H TRAN ONSET.

3.8 M RET ONSET

Copyright © 2003 Lucent Technologies

Description: Enter the retransmission buffer onset (medium level onset congestion threshold). This field defines the percent fill, which when exceeded by the retransmission buffer occupancy will trigger the beginning of medium level congestion treatment.

Required Field.
Default: 60
Valid Entries: 1 - 100

Data Rules:

M RET ONSET must be greater than M RET ABATE.

3.9 M RET ABATE

Description: Enter the retransmission buffer abatement (medium level abatement congestion threshold). This field defines the percent fill, which the retransmission buffer occupancy must drop below for medium congestion to abate and/or medium congestion treatment to be in effect.

Required Field.
Default: 40
Valid Entries: 1 - 100

Data Rules:

M RET ABATE must be greater than L RET ONSET.

3.10 M RET DISC

Description: Enter the retransmission buffer discard (medium level congestion discard threshold). For multiple congestion levels, when the retransmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

Required Field.
Default: 75
Valid Entries: 1 - 100

Data Rules:

M RET DISC must be greater than M RET ONSET.

3.11 M TRAN ONSET

Description: Enter the transmission buffer onset (medium level onset congestion threshold). Defines the percent fill, which when exceeded by the transmission buffer occupancy will trigger the beginning of medium level congestion treatment.

Required Field.
Default: 60
Valid Entries: 1 - 100

Data Rules:

M TRAN ONSET must be greater than M TRAN ABATE.

3.12 M TRAN ABATE

Description: Enter the transmission buffer abatement (medium level abatement congestion threshold). Defines the percent fill, which the transmission buffer occupancy must drop below for medium level

Copyright © 2003 Lucent Technologies

congestion to abate and low level congestion treatment to be in effect.

Required Field.
Default: 40
Valid Entries: 1 - 100

Data Rules:

M TRAN ABATE must be greater than L TRAN ONSET.

3.13 M TRAN DISC

Description: Enter the transmission buffer discard (medium level congestion discard threshold). For multiple congestion levels, when the transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

Required Field.
Default: 75
Valid Entries: 1 - 100

Data Rules:

M TRAN DISC must be greater than M TRAN ONSET.

3.14 L RET ONSET

Description: Enter the retransmission buffer onset (low level onset congestion threshold). This field defines the percent fill, which when exceeded by the retransmission buffer occupancy, triggers the beginning of low level congestion treatment.

Required Field.
Default: 30
Valid Entries: 1 - 100

Data Rules:

L RET ONSET must be greater than L RET ABATE.

3.15 L RET ABATE

Description: Enter the retransmission buffer abatement (low level abatement congestion threshold). This field defines the percent fill of the retransmission buffer below which low congestion will abate.

Required Field.
Default: 10
Valid Entries: 1 - 100

3.16 L RET DISC

Description: Enter the retransmission buffer discard (low level congestion discard threshold). For multiple congestion levels, when the retransmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

Required Field.
Default: 55
Valid Entries: 1 - 100

Data Rules:

Copyright © 2003 Lucent Technologies

L RET DISC must be greater than L RET ONSET.

3.17 L TRAN ONSET

Description: Enter the transmission buffer onset (low level onset congestion threshold). Defines the percent fill, which when exceeded by the transmission buffer occupancy, triggers the beginning of low level congestion treatment.

Required Field.
Default: 30
Valid Entries: 1 - 100

Data Rules:

L TRAN ONSET must be greater than L TRAN ABATE.

3.18 L TRAN ABATE

Description: Enter the transmission buffer abatement (low level abatement congestion threshold). Defines the percent fill of the transmission buffer below which low level congestion will abate.

Required Field.
Default: 10
Valid Entries: 1 - 100

3.19 L TRAN DISC

Description: Enter the transmission buffer discard (low level congestion discard threshold). For multiple congestion levels, when the transmission buffer occupancy exceeds the value of this threshold, messages of lower priorities will be discarded.

Required Field.
Default: 55
Valid Entries: 1 - 100

3.20 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10E: 6005 RECORD
COMBINED SIGNALING LINK SET FORM - CLKSET

1. GENERAL

The 6005 Record is available with 5E11 and later Software Releases and is used to define the link sets that comprise the combined link set. This form supports the VCDX CCS7 on the PSU feature. For more information on this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.7.

2. FORM ENTRIES - 6005 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CLS

Description: Enter the combined link set number.

Required Field.
Valid Entries: 256 - 511

Data Rules:

The maximum number of CLKSET form entries allowed in an office is 8.

For each LINK SET entered on the LNKSET forms, there can be at most one CLKSET form with a matching LS1 or LS2.

For 5E14 and later:

- When CLS is entered, it must be defined as a NORMAL LINK SET on a NID form for the same GSM, and LS1 and LS2 on the CLKSET form must each be defined as a LINK SET on a LNKSET form for the same GSM.
- When CLS is entered, it must be defined as a NORMAL LINK SET on a CLU form for the same GSM, and LS1 and LS2 on the CLKSET form must each be defined as a LINK SET on a LNKSET form for the same GSM.

2.3 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E14 and later, when GSM, LS1 and LS2 on this form matches the LINK SET on the LNKSET form (6003 Record), the LINK TYPE on the LNKSET form must be the same.

2.4 # LS1

Copyright © 2003 Lucent Technologies

Description: Enter the 1st link set of combined link set.

Required Field.
Valid Entries: 1 - 255

Data Rules:

LS1 cannot equal LS2.

For each LS1 or LS2 entered on the CLKSET form, there must be a corresponding LNKSET form (6003 Record) where LINK SET equals LS1 or LS2.

2.5 # LS2

Description: Enter the 2nd link set of combined link set.

Required Field.
Valid Entries: 1 - 255

Data Rules:

For each LS1 or LS2 entered on the CLKSET form, there must be a corresponding LNKSET form (6003 Record) where LINK SET equals LS1 or LS2.

2.6 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10F: 6006 RECORD
SIGNALING POINT CODE FORM - PC

1. GENERAL

The 6006 Record is available with 5E11 and later Software Releases and is used to specify the point code and alternate link set routing for PSUs (Packet Switching Units). For more information, see Division 7, Section 2L and Division 2, Section 9L.

For 5E13 and later, the VCDX Loop-Around Intra-Module Trunk feature is available; see Division 2, Section 7AD.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.10.

2. FORM ENTRIES - 6006

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * POINT CODE

Description: Enter the Point Code Number. This field is used to specify and update the point code and alternate link set routing.

For the 5E11 Software Release, point codes can be entered in the ANSI (American National Stardards Institute) format only; the AT&T format cannot be entered directly. Thus, if an AT&T point code format is to be used in an ANSI office, it must first be converted to an ANSI format. For 5E12 and later, both formats can be entered directly. Note that Point Codes must be defined on the PC (SIGNALING POINT CODE) form (6006 Record)

Required Field.
Valid Entries: 9-digit point code in the following format:

Valid ANSI POINT CODE Entries - 5E11 and earlier		
Definition	**Format**	**Valid Entries**
Network Indicator	XXX	001 - 254
Cluster Number	XXX	000 - 255
Member	XXX	000 - 255
Valid ANSI POINT CODE Entries - 5E12 and later		
Definition	**Format**	**Valid Entries**
Network Indicator	XXX	000 - 254
Cluster Number	XXX	000 - 255
Member	XXX	000 - 255

Valid IMT Entries - 5E13 and later □ VCDX/SM-2000 Only		
Definition	**Format**	**Valid Entries**
Network Indicator	XXX	001 - 254
Cluster Number	XXX	000 - 255
Member	XXX	000 - 255

Valid AT&T POINT CODE Entries - 5E12 and later		
Definition	**Format**	**Valid Entries**
Network Indicator	XXX	236-254
Cluster Number	XX	00 - 31
Cluster Type	X	0 - 7
Member	XXX	000 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E14 and later, when POINT CODE is entered, this value cannot be the same as the OPC or any ALIAS PC value entered on the CCGSM form.

2.3 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

2.4 ADJACENT

Description: This field indicates whether this point code is an adjacent point code. This is a no change field.

Required Field.
Default: N
Valid Entries: Y, N

2.5 # NORMAL LINK SET

Description: Enter the Normal Link Set used for routing to this point code.

Required Field.
Valid Entries: 1 - 511

Data Rules:

All the link sets entered on NORMAL LINK SET or ALTERNATE LINK SETS on this form, either directly with values less than 256 or indirectly as a CLS (Combined Link Set) with values greater than 255 which the corresponding CLKSET form has two link sets defined as LS1 and LS2, must all be unique. Also, the number of total unique link sets defined for a given POINT CODE must not be greater than 7.

When NORMAL LINK SET or ALTERNATE LINK SETS entered with values less than 256, indicating a link set, the APC on the corresponding LNKSET form must be entered as the POINT CODE of a PC form. If NORMAL LINK SET or ALTERNATE LINK SETS entered as values greater than 255, indicating a Combined Link Set, check the corresponding CLS on the CLKSET form first. Then use LS1 and LS2 to find the matching LNKSET forms. The APC on the corresponding LNKSET forms must match the POINT CODE on PC forms.

2.6 RESTART OPTION

Description: This field indicates which restart option is currently defined for the APC (Adjacent Point code). It is used during the MTP (Message Transfer Part) inter-linkset changeback to determine which routing data update procedure to use. If the value is "RESTART", the MTP adjacent restart procedures are used for this APC. If the value is "NONE", no restart option is used.

Software Release: 5E14 and later
Required Field.
Default: NONE
Valid Entries:

Valid Entries - 5E14 and later

Entry	Definition
NONE	Do not use a restart method.
RESTART	Use local MTP restart method.

Data Rules:

Copyright © 2003 Lucent Technologies

RESTART OPTION must be "NONE" or "RESTART".

When RESTART OPTION is set to "RESTART", the ACT field for SFID (Secured Feature ID) 177 on the SFSYS form (5713-1) must be set to "Y".

2.7 REMOTE INIT SSN ALW

Description: Activate SCCP (Signaling Connection Control Part) remote initialization of the SSNs at this destination point code? The Remote Initialization Subsystem Number Allowed indicates whether or not the SCCP status of the SSNs at this DPC (Destination Point Code) are initialized as allowed or prohibited after a remote SCCP restart.

Software Release: 5E14 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.8 ALTERNATE LINK SETS

Description: Enter the alternate link sets for routing which can be assigned a priority to this point code when the normal link set becomes unavailable.

Required Field.
Valid Entries: 1 - 511

Data Rules:

ALTERNATE LINK SETS must not equal NORMAL LINK SET.

ALTERNATE LINK SETS must be unique.

All the Link Sets entered on NORMAL LINK SET or ALTERNATE LINK SETS on this form, either directly with values less than 256 or indirectly as a CLS with values greater than 255 on the corresponding CLKSET form which has two link sets defined as LS1 and LS2, must all be unique. Also, the number of total unique Link Sets defined for a given POINT CODE must not be greater than 7.

2.9 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10G: 6007 RECORD
CHANNEL GROUP MEMBER ASSIGNMENT FORM - CHGRPM

1. GENERAL

The 6007 Record is available with 5E11 and later Software Releases and is used to define the CCS (Common Channel Signaling) and message delivery channel groups. This form supports the VCDX CCS7 on the PSU feature. For more information, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.11.

2. FORM ENTRIES - 6007 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the SM (Switching Module) that supports SS7 (Signaling System 7) system.

Required Field.
Valid Entries: 1 - 192

2.3 * SHELF

Description: Enter the PSU (Packet Switching Unit) shelf on which the protocol handler is equipped.

Required Field.
Valid Entries: 0 - 4

2.4 * CHGRP

Description: Enter the PH channel group. This field specifies the logical shelf position of PH (Protocol Handler).

Required Field.
Valid Entries: 0 - 15

ASSIGNMENT TABLE (DSLDATA)

The following fields (Section 2.5 - Section 2.7) specify the channel group member assignment table which is used to define the channel group link information.

The channel group member assignment tableconsists of 4 channel group links 0 - 3.

2.5 TYPE

Description: Enter the channel group type.
Valid Entries: Up to 8 alpha characters

2.6 LINKSET

Description: Enter the Link set number.
Valid Entries: 1 - 255

Copyright © 2003 Lucent Technologies

2.7 MEMBER

Description: Enter the member within the link set.

Software Release: 5E11 and later.
Valid Entries: 0 - 7

SEC. 10H: 6008 RECORD
CCITT7 GLOBAL SM FORM - CCGSM

1. GENERAL

The 6008 Record is available with 5E11 and later Software Releases and is used to specify data used for the global switching module. One CCGSM is entered for each GSM (Global Switching Module), up to a maximum of 16 per office. For more information, see Division 2, Section 7L and Division 2, Section 9L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.1.

2. FORM ENTRIES - 6008 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The CCGSM form must have a matching EQIM form with EQSTATUS of "O".

When this form is defined for the office and the GSM matches the GSM on the CCPDL form, two corresponding CCPDL forms (6002 Record) must exist with DATA LINK RATE set to "56KB" and "64KB".

When this form is entered, CCS must be set to "PSU" on the OFCOPT form (5509 Record).

When GSM is entered on this form, it must be defined on the CC7PR form (6001 Record).

When a CCGSM form is entered,

- there must be a corresponding MDLNK form (6009 Record) entered with the SM on the MDLNK form equal to the GSM on the CCGSM form.
- there must be a corresponding EQIM form (5700-1/2 Record).

For 5E14 and later, for each CCGSM form there must be a CMTMH or MDLNK form with the GLOBAL SM equal to the GSM on the CCGSM form.

2.3 # OPC

Description: Enter the Originating Point Code that is assigned to the GSM (Global Switching Module).

For the 5E11 Software Release, OPCs can be entered in the ANSI (American National Standards Institute) format only; the AT&T format cannot be entered directly. Thus, if an AT&T point code format is to be used in an ANSI office, it must first be converted to an ANSI format. For 5E12 and later, both formats can be entered directly. Note that Point Code must also be defined on the PC (SIGNALING POINT CODE) form (6006 Record).
Valid Entries: 9 - digit point code in the the following format:

Copyright © 2003 Lucent Technologies

Valid ANSI OPC Entries - 5E11 and later		
Definition	**Format**	**Valid Entries**
Network Indicator	XXX	001 - 254
Cluster Number	XXX	000 - 255
Member	XXX	000 - 255

Valid AT&T OPC Entries - 5E12 and later		
Definition	**Format**	**Valid Entries**
Network Indicator	XXX	236 or 254
Cluster Number	XX	00 - 31
Cluster Type	X	0 - 7
Member	XXX	000 - 255

Data Rules:

The OPC entered on the TKGRP must match the OPC entered on this form.

2.4 CONGEST TYPE

Description: This field specifies the congestion type used by the GSM. The default value "MPRT" specifies multiple congestion levels with priorities. This is a no change field.

Required Field.
Default: MPRT
Valid Entries: MPRT

2.5 CONGEST METHOD

Description: Enter the congestion method used by the GSM.

Required Field.
Default: RCT
Valid Entries:

Valid CONGEST METHOD Entries	
Entry	**Definition**
RCT	**Method by which a Route Set Congestion Test message is sent.**
TIMER	**Method of setting a timer and lowering the congestion level after the timer expires.**

2.6 LOAD SHARING

Description: This field specifies the load sharing to be used during changeover. The default value "ANSILS" specifies ANSI 7 Load Sharing. This is a no change field.

Required Field.
Default: ANSILS
Valid Entries: ANSILS

2.7 EXPANDED SLS

Description: This field is used to indicate whether 5 bit SLS or 8 bit SLS load sharing is used.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries:

Valid Entries - 5E14 and later	
Entry	**Definition**
Y	8 bit SLS load sharing.
N	5 bit SLS load sharing.

Copyright © 2003 Lucent Technologies

Data Rules:

When EXPANDED SLS is set to "Y", the PH TYPE on the PSUGP form must not be set to "PH3".

If EXPANDED SLS is "Y", SIF 175 must be activated on the SFSYS form (5713 Record).

2.8 RESTART OPTION

Description: This field specifies that no restart method is used. This is a no change field.

Software Release: 5E14 and later
Required Field.
Default: NONE
Valid Entries: NONE

2.9 SUFFICIENT RTE

Description: This field contains the value for the percentage of signaling routes (received TRAs (Traffic Restart Allowed Message Signaling Units)) that must be made accessible before phase one of the MTP restart can be complete.

Software Release: 5E14 and later
Required Field.
Default: 50
Valid Entries: 0 - 100

2.10 SUFFICIENT LNK

Description: This field contains the value for the percentage of signaling links that must be made accessible before phase one of the MTP restart can be considered completed.

Software Release: 5E14 and later
Required Field.
Default: 50
Valid Entries: 0 - 100

2.11 DEDICATED

Description: This field indicates whether or not the GSM is a dedicated GSM.

Software Release: 5E16(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When DEDICATED GSM on the CCGSM form (6008 Record) is set to "Y":

- the SMs referenced on the SMLDIT form (5315 Record) must not be assigned on the SMLDIT form.
- CKT SM(s) and/or PKT SM(s) on the HGRPAS form (5115 Record) must not be assigned.
- the GSM must be entered on the CMTMH form (6021 Record) as a H0ST GSM.

ALIAS POINT CODES

Copyright © 2003 Lucent Technologies

2.12 ALIAS PC

Description: This field is used to specify the point code number.

Required Field.

Software Release: 5E14 and later
Valid Entries: 9 characters

VALID ALIAS POINT CODES	
Value	Valid Entry
ANSI	[001 - 235, 237 - 253] [000 - 255] [000 - 255
ATT-C	[236, 254] [00 - 31] [0 - 7] [000 - 255]

Data Rules:

ALIAS PC must not match either OPC or ALIAS PC on another CCGSM form.

Each ALIAS PC must be unique.

2.13 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10J: 6009 RECORD
MESSAGE DELIVERY LINK FORM - MDLNK

1. GENERAL

The 6009 Record is available with 5E11 and later Software Releases and is used to specify and update the message delivery link and the "bunny-hop" PH (a link internal to the SM where SS7 messages originate or terminate). For more information, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the SM (Switching Module) of the message delivery link.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For each SM entered on the MDLNK form, there must be a matching GSM entered on the CCGSM form (6008 Record).

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

The ISCN must be a unique value within an SM. ISCNs cannot be duplicatedon one or more of the following forms:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

MDLNK and CCLNK forms can share an ISCN SHELF and CHANNEL GROUP on an SM. They cannot have an ISCN SHELF and CHANNEL GROUP which are mixed with Protocol Handler assignments from any of the following forms:

- AMLBDSL
- DSL

Copyright © 2003 Lucent Technologies

- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

For 5E14 and later:

- When SM matches a GSM on a CLU form, PH TYPE on the PSUGP form must not be set to "PH3".
- When SM matches a GSM on a NID form, PH TYPE on the PSUGP form must not be set to "PH3".

2.3 SHELF

Description: Enter the shelf of MDL (Message Delivery Link).

Required Field.
Valid Entries: 0 - 4

2.4 CHANNEL GROUP

Description: Enter the channel group. This field specifies the shelf position of the MDL (Message Delivery Link).

Required Field.
Valid Entries: 0 - 15

2.5 MEMBER

Description: Enter the channel group member. This field specifies the PH (Protocol Handler) of the message delivery link.

Required Field.
Valid Entries: 0 - 3

2.6 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

SEC. 10K: 6010 RECORD
SCCP NETWORK DEFINITION FORM - CCNET

1. GENERAL

The 6010 Record is available with 5E11 and later Software Releases. The SCCP (Signalling Connection Control Part) network definition form was added to support the VCDX SS7 on the PSU feature. For more information concerning this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

When GSM is entered with SCCP TYPE of "NA7" and PROTOCOL of "C7NATL", it must be defined on the CC7PR form (6001 Record).

When GSM is entered on this form, a corresponding CCGSM form (6008 Record) must exist where the CCGSM GSM equals the CCNET GSM.

When GSM is entered on this form, a corresponding CCSPR form (6011 Record) must exist where the CCSPR GSM equals the CCNET GSM.

2.3 # PROTOCOL

Description: Enter the protocol type. This field is used to specify the SCCP (Signaling Connection Control Part) protocol type.

Required Field.
Valid Entries: C7NATL

Data Rules:

No more than 16 CCNET forms may be entered with PROTOCOL set to "C7NATL".

2.4 # SCCP TYPE

Description: Enter the SCCP type associated with GSM. Currently, there is only one entry for this field.

Required Field.

Valid SCCP TYPE Entries

Entry	Definition
NA7	North American CCS - C7.

SEC. 10L: 6011 RECORD
SCCP PARAMETER DEFINITION FORM - CCSPR

1. GENERAL

The 6011 Record is available with 5E11 and later Software Releases. The SCCP (Signalling Connection Control Part) parameter definition form is used to define individual parameters for a SCCP GSM and was added to support the VCDX CCS7 on the PSU feature. For more information concerning this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

When GSM is defined on this form with PROCESSING set to "Y", it must also be entered on at least one CCTT form (6014 Record) and at least one CCSGT form (6015 Record).

2.3 PROTOCOL

Description: This field indicates the SCCP protocol type. This is a no change field.

Required Field.
Default: C7NATL
Valid Entries: C7NATL

2.4 SCCP TYPE

Description: This field indicates the SCCP type associated with GSM. This is a no change field.

Required Field.
Default: NA7
Valid Entries: NA7

2.5 INIT STATUS

Description: Enter the SCCP initialization status.

Required Field.
Default: GROW
Valid Entries: GROW, OPER

Data Rules:

Copyright © 2003 Lucent Technologies

When INIT STATUS is "GROW", PROCESSING must be "N".

2.6 SUBSYS STATUS TIMER

Description: Enter the SCCP subsystem status timer.

Required Field.
Default: 30
Valid Entries: 30 - 90

2.7 PROCESSING

Description: Should SCCP messages be processed in the PH?

Required Field.
Default: N
Valid Entries: Y, N

2.8 VERSION

Description: This field indicates the SCCP version associated with GSM. This is a no change field.

Required Field.
Default: ATT89
Valid Entries: ATT89

2.9 SUBSYS ALLOW

Description: Enter the subsystem allowed message priority.

Required Field.
Default: 3
Valid Entries: 0 - 3

2.10 SUBSYS PROHIB

Description: Enter the subsystem prohibit message priority.

Required Field.
Default: 3
Valid Entries: 0 - 3

2.11 SUBSYS TEST

Description: Enter the subsystem test message priority.

Required Field.
Default: 2
Valid Entries: 0 - 3

2.12 SUBSYS NORMAL

Description: Enter the subsystem normal message priority.

Required Field.
Default: 0
Valid Entries: 0 - 3

Copyright © 2003 Lucent Technologies

2.13 SUBSYS BACKUP

Description: Enter the subsystem backup message priority.

Required Field.
Default: 0
Valid Entries: 0 - 3

2.14 UNIT DATA

Description: Enter the unit data message priority.

Required Field.
Default: 1
Valid Entries: 0 - 3

2.15 UD SERVICE

Description: Enter the unit data service message priority.

Required Field.
Default: 1
Valid Entries: 0 - 3

SCCP STATUS MGMT

The following fields (Section 2.16 -Section 2.18) provide the signaling connnection control part status management information.

2.16 REMOTE SCCP MGMT

Description: Does this global switching module perform signaling, connection control part management? This field determines whether or not this GSM (Global Switching Module) performs SCCP (Signaling Connection Control Part) management.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

2.17 LOCAL INIT SPEC

Description: Is the initialization value of the subsystem numbers, states-specific per GSM or per PC? This field determines whether or not the initialization value of the SSNs' (Subsystem Numbers') states is specfic per GSM or per PC.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

2.18 LOCAL INIT SSN ALW

Description: Is SSN status initialization allowed? This field determines whether or not the SSN status is initialized as allowed.

Software Release: 5E14 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: Y
Valid Entries: Y, N

2.19 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10M: 6012 RECORD
SCCP PRIMARY/BACKUP DESTINATION FORM - CCPBD

1. GENERAL

The 6012 Record is available with 5E11 and later Software Releases. The SCCP (Signaling Connection Control Part) Primary/Backup Destination Record is used to define the primary and backup destinations for SCCP signaling. For more information, see Division 2, Section 7L and Division 2, Section 9L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM PRIMARY

Description: Enter the Primary GSM (Global Switching Module). This field specifies the Global GSM dedicated as the primary GSM-DPC-SSN (Global Switching Module - Destination Point Code - SubSystem Number).

Required Field.
Valid Entries: 1 - 192

Data Rules:

GSM-DPC-SSN BACKUP must be different from GSM-DPC-SSN PRIMARY.

Each combination of PRIMARY/BACKUP GSM/DPC can be defined with a maximum of nine different SSNs.

The maximum number of unique DESTINATION (PRIMARY or BACKUP) combinations per Global SM is 4095. DESTINATION combinations are entered on this form and consist of PRIMARY/BACKUP GSM, DPC, and SSN.

Each GSM PRIMARY entered on this form must be defined on the CCNET form (6010 Record). If SCCP TYPE set to "NA7" and PROTOCOL set to "C7NATL" on the CCNET form, then DPC PRIMARY on this form must be defined as a POINT CODE on the PC form (6006 Record).

2.3 * DPC PRIMARY

Description: Enter the Primary Destination Point Code. This field specifies the DPC (Destination Point Code) for the primary GSM-DPC-SSN.

For the 5E11 Software Release, DPCs can be entered in the ANSI (American National Standards Institute) format only; the AT&T format cannot be entered directly. Thus, if an AT&T point code format is to be used in an ANSI office, it must first be converted to an ANSI format. For 5E12 and later, both formats can be entered directly. Note that Point Code must also be defined on the PC (SIGNALING POINT CODE) form (6006 Record).

Required Field.
Valid Entries: 9 - digit point code in the following format:

Copyright © 2003 Lucent Technologies

Valid ANSI DPC PRIMARY Entries - 5E11 and later

Definition	Format	Entry
Network indicator	XXX	[001 - 254]
Cluster number	XXX	[000 - 255]
Member	XXX	[000 - 255]

Valid AT&T DPC PRIMARY Entries - 5E12 and later

Definition	Format	Valid Entries
Network Indicator	XXX	236-254
Cluster Number	XX	00 - 31
Cluster Type	X	0 - 7
Member	XXX	000 - 255

Data Rules:

For 5E14 and later:

DPC PRIMARY and DPC BACKUP must not be equal to either the OPC from the CCGSM form or ALIAS PC from the APCLIST on the CCGSM form for the same GSM.

When GSM PRIMARY and DPC PRIMARY do not match a GSM and OPC or GSM and ALIAS PC from the CCGSM form respectively, the DPC PRIMARY must be defined in one of the following three ways:

- as a POINT CODE on the PC form
- as a CLUSTER on the CLU form and a CLUSTER is defined as the concatenation of the attributes NETWORK and CLUSTER, or
- as a NETWORK on the NID form.

When DPC PRIMARY is entered, it must first be defined for the same GSM in one of the following three ways:

- as a POINT CODE on the PC form
- as a CLUSTER on the CLU form and a CLUSTER is defined as the concatenation of the attributes NETWORK and CLUSTER, or
- as a NETWORK on the NID form.

The maximum number of DPC PRIMARYs plus DPC BACKUPs for any given GSM on the CCPBD form cannot exceed a maximum of 2000 tuples per GSM.

2.4 * SSN PRIMARY

Description: Enter the Primary Subsystem Number. This field specifies the SSN for the primary GSM-DPC-SSN.

Required Field.

Valid SSN PRIMARY Entries - 5E11 and later

Definition	Entry
Intermediate	0
Final	2 - 255

2.5 GSM BACKUP

Description: Enter the Backup Global Switching Module. This field specifies the GSM for the backup GSM-DPC-SSN.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 192

Data Rules:

When GSM BACKUP is entered, DPC BACKUP and SSN BACKUP must be entered.

When GSM BACKUP is not entered, DPC BACKUP and SSN BACKUP must not be entered.

When GSM BACKUP is entered on this form, GSM BACKUP must equal GSM PRIMARY.

For each CCPBD form where GSM BACKUP is entered, and DPC PRIMARY is the same as DPC BACKUP, then SSN PRIMARY and SSN BACKUP must be non-zero and different. Otherwise, the SSN PRIMARY and SSN BACKUP must both be 0 or both be non-zero.

5E14 and later:

When GSM BACKUP and DPC BACKUP do not match a GSM and OPC or GSM and ALIAS PC from the CCGSM form respectively, the DPC BACKUP must be defined in one of the following three ways:

- as a POINT CODE on the PC form
- as a CLUSTER on the CLU form and a CLUSTER is defined as the concatenation of the attributes NETWORK and CLUSTER, or
- as a NETWORK on the NID form.

2.6 DPC BACKUP

Description: Enter the Backup Destination Point Code. This field specifies the DPC (Destination Point Code) for the backup GSM-DPC-SSN.

For the 5E11 Software Release, DPCs can be entered in the ANSI format only; the AT&T format cannot be entered directly. Thus, if an AT&T point code format is to be used in an ANSI office, it must first be converted to an ANSI format. For 5E12 and later, both formats can be entered directly. Note that Point Codes must be defined on the PC (SIGNALING POINT CODE) form (6006 Record).

Required Field.
Valid Entries: 9 - digit point code in the following format:

Valid ANSI DPC BACKUP Entries - 5E11 and later

Definition	Format	Entry
Network indicator	XXX	[001 - 254]
Cluster number	XXX	[000 - 255]
Member	XXX	[000 - 255]

Valid AT&T DPC BACKUP Entries - 5E12 and later

Definition	Format	Valid Entries
Network Indicator	XXX	236-254
Cluster Number	XX	00 - 31
Cluster Type	X	0 - 7
Member	XXX	000 - 255

2.7 SSN BACKUP

Description: Enter the Backup Subsystem Number. This field specifies the SSN (SubSystem Number) for the backup GSM-DPC-SSN.

Required Field.

Valid SSN BACKUP Entries - 5E11 and later

Definition	Entry

Copyright © 2003 Lucent Technologies

Intermediate	0
Final	2 - 255

SEC. 10N: 6015 RECORD
SCCP SINGLE GLOBAL TITLE TRANSLATION FORM - CCSGT

1. GENERAL

The 6015 Record is available with 5E11 and later Software Releases. The SCCP (Signaling Connection Control Part) Single Global Translation form is used to maintain the single fixed or primary plus secondary digit string for Global Translations. For more information concerning this feature, see Division 2, Section 7L and Division 2, Section 9L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.25.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system. This field specifies the GSM on which this translation group exists.

Required Field.
Valid Entries: 1 - 192

2.3 * TRANS GROUP

Description: Enter the Translation Group. This field specifies the 2-digit translation group number.

Required Field.
Valid Entries: 0 - 63

2.4 * FIX DIG STR

Description: Enter the Fixed Digit String.

Required Field.
Valid Entries: Up to 6 hexadecimal numbers (0 - 9, A - F)

Data Rules:

FIX DIG STR and/or PRIM PLUS SEC DIG STR must be entered.

When FIX DIG STR is entered, MAX TRANS must be entered.

When FIX DIG STR is not entered,

- MAX TRANS must not be entered
- a CCTGM form (6013 Record) must exist with the same GSM and TRANS GROUP, and NUM FIXED must be set to 0.

The maximum number of FIXED DIG STRs allowed on the CCSGT form per GSM/TRANS GROUP is 100.

Copyright © 2003 Lucent Technologies

For each FIX DIG STR entered on the CCSGT form, the number of CCSGT forms with the same GSM, TRANS GROUP, and FIX DIG STR:

- must have the same value entered for MAX TRANS.
- must not exceed MAX TRANS for that FIX DIG STR.

If a CCGST form has the same GSM and TRANS GROUP as the CCTGM form (6013 Record), the length of the FIX DIG STR on the CCSGT form must be equal to the value of NUM FIXED on the CCTGM form.

2.5 * PRIM PLUS SEC DIG STR

Description: Enter the Primary Plus Secondary Digit String.

Required Field.
Valid Entries: Up to 10 hexadecimal numbers (0 - 9, A - F)

Data Rules:

FIX DIG STR and/or PRIM PLUS SEC DIG STR must be entered.

When PRIM PLUS SEC DIG STR is entered, DEST GSM, DPC and DEST SS NUM must be entered.

When PRIM PLUS SEC DIG STR is not entered, DEST GSM, DPC and DEST SS NUM must not be entered.

The length of PRIM PLUS SEC DIG STR must not exceed the sum of NUM PRIM and NUM SEC on the CCTGM form (6013 Record). For all CCTGM (6013 Record) and CCSGT (6015 Record) forms with the same GSM, the sum of PRIM PLUS SEC DIG STR and MAX TRANS must not exceed 251000.

FIXED DIGIT STRING INFORMATION

The following field describes the maximum number of translation strings.

2.6 MAX TRANS

Description: Enter the maximum number of translation strings. This field specifies the optional primary plus secondary digit string.
Valid Entries: 1 - 131071

PRIME PLUS SEC DESTINATION INFORMATION

The following fields (Section 2.7 - Section 2.9) describe the primary and secondary destination information.

2.7 DEST GSM

Description: Enter the Destination Global Switching Module.
Valid Entries: 1 -192

Data Rules:

The combination of DEST GSM, DPC, and DEST SS NUM must exist as a combination of GSM PRIMARY, DPC PRIMARY, and SSN BACKUP or as a combination of GSM BACKUP, DPC BACKUP, and SSN BACKUP on the CCPBD form (6012 Record)

2.8 DPC

Copyright © 2003 Lucent Technologies

Description: Enter the Destination Point Code.

For the 5E11 Software Release, DPCs can be entered in the ANSI (American National Standards Institute) format only; the AT&T format cannot be entered directly. Thus, if an AT&T point code format is be used in an ANSI office, it must first be converted to an ANSI format. For 5E12 and later, both formats can be entered directly. Note that Point Codes must be defined on the PC (SIGNALING POINT CODE) form (6006 Record).
Valid Entries: 9 - digit point code in the following format:

Valid ANSI DPC Entries - 5E11 and later

Definition	Format	Entry
Network indicator	XXX	[001 - 254]
Cluster number	XXX	[000 - 255]
Member	XXX	[000 - 255]

Valid AT&T OPC Entries - 5E12 and later

Definition	Format	Valid Entries
Network Indicator	XXX	236-254
Cluster Number	XX	00 - 31
Cluster Type	X	0 - 7
Member	XXX	000 - 255

2.9 DEST SS NUM

Description: Enter the Destination Subsystem Number.
Valid Entries:

For 5E11 and later: 0, or 2 - 255

2.10 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.

SEC. 10O: 6014 RECORD
SCCP TRANSLATION TABLE FORM - CCTT

1. GENERAL

The 6003 Record is available with 5E11 and later Software Releases. The SCCP (Signalling Connection Control Part) Translation Table form is used to define whether the global title data in the called party address will receive Global Title Translation or Point Code Extraction treatment. This form supports the VCDX CCS7 on the PSU feature, For more information, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192
Data Rules:
When GSM is defined on this form, it must be defined on the CCNET form (6010 Record).

CALLED PARTY ADDRESS DATA

The following fields (Section 2.3 - Section 2.4) define the global title data in the called party address.

2.3 (*) TRANS TYPE

Description: Enter the Translation Type.

Required Field.
Valid Entries: 0 - 254

2.4 * GLOBAL TITLE IND

Description: This field indicates the Global Title Indicator. This is a no change field.

Required Field.
Default: 2

GLOBAL TITLE TRANSLATIONS

The following fields (Section 2.5 - Section 2.6) define the translation treatment the global title data in the called party address receives.

2.5 # TRANS GROUP

Description: Enter the Translation Group.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 63

Data Rules:

When TRANS GROUP is enterd, the combination of GSM and TRANS GROUP must be entered on the CCTGM form (6013 Record)

2.6 # START GTT DIGIT

Description: Enter the Starting Global Title Translation Digits. This field specifies the starting digits for Global Title Translation.

Required Field.
Valid Entries: 1 - 255

2.7 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

SEC. 10P: 6013 RECORD
SCCP TRANSLATION GROUP MASK FORM - CCTGM

1. GENERAL

The 6013 Record is available with 5E11 and later Software Releases. The SCCP (Signalling Connection Control Part) Translation Group Mask form defines the SCCP GTT (Signaling Connection Control Part Global Title Translation) mask for a translation group. This form supports the VCDX CCS7 on the PSU. For more information concerning this feature, see Division 2, Section 7L.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.25.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: Enter the Global SM (Switching Module) that supports the signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

When GSM is defined on this form, it must also be defined on the CCNET form (6010 Record).

2.3 * TRANS GROUP

Description: Enter the 2-digit Translation Group number.

Required Field.
Valid Entries: 0 - 63

2.4 NUM FIXED

Description: Enter the Number of Fixed Digits. This field specifies the number of fixed address digits.

Required Field.
Valid Entries: 0 - 6

Data Rules:

When NUM FIXED is 0, PRIM PLUS SEC must be entered.

When NUM FIXED is greater than 0, PRIM PLUS SEC must not be entered.

The sum of NUM FIXED, NUM PRIM and NUM SEC must be between 1 and 12.

2.5 NUM PRIM

Description: Enter the Number of Primary Digits. This field specifies the primary address digits.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 10

Data Rules:

The sum of NUM PRIM and NUM SEC must be between 1 and 10.

2.6 NUM SEC

Description: Enter the Number of Secondary Digits. This field specifies the number of secondary address digits.

Required Field.
Valid Entries: 0 - 9

2.7 PRIM PLUS SEC

Description: Enter the Maximun Number of Primary plus Secondary Strings.
Valid Entries: 1 - 131071

Data Rules:

If PRIM PLUS SEC is entered, the number of CCSGT forms (6015 Record) with the same GSM and TRANS GROUP must not exceed PRIM PLUS SEC for this form.

2.8 STRING MATCH

Description: Enter the String Match Method. This field specifies the Global Title Translation string match method.

Required Field.

Valid STRING MATCH Entries

Entry	Definition
FULL	GTT is done on the supplied digits (called address) against the required and optional digits of the translations group. If no match is found, then GTT is done on the supplied digits (called address) against the required digits of the translations group.
PART	GTT is done on the supplied digits (called address) against the required digits of the translations group. If no match is found, then GTT is done on the supplied digits (called address) against the required + optional digits of the translations group.
VAR	GTT is done on the supplied digits (called address) against the required + optional digits of the translations group. If no match is found, then the last digit of the supplied address is overwritten with 0xF and the GTT is redone. This is continued while there is no match and the available digits is greater than the number of required digits.

2.9 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10S: 6019 RECORD
NETWORK ROUTING - NID

1. GENERAL

The 6019 Record is available with the 5E14 Software Release. NID, the Network Routing form, is used to define the MTP (Message Transport Part) network route sets that supports the SS7 (Signaling System 7) PSU (Packet Switch Unit) MTP Routing Enhancements feature. For more information on this feature, see Division 2, Section 4A522.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.8.

2. FORM ENTRIES - 6004-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * NETWORK

Description: This field is used to specify the network code number.

Required Field.
Valid Entries: 1 - 254

2.3 * GSM

Description: The GSM is used to specify the Global Switching Module used to support the CCS7 (Common Channel Signaling, CCITT Version 7) signaling system.

Required Field.
Valid Entries: 1 - 192

2.4 # NORMAL LINK SET

Description: This field is used to specify the normal link set number used for routing to this point code.

Required Field.
Valid Entries: Blank, or 1 - 511

Data Rules:

When NORMAL LINK SET is entered, the value entered must first be defined as LINK SET on the LNKSET form or as a CLS on the CLKSET form for the same GSM.

When NORMAL LINK SET is entered and is less than 256 and ALTERNATE LINK SETS are defined as a CLS on a CLKSET form on the same GSM, the NORMAL LINK SET on the NID form must not be the same value as LS1 or LS2 on the CLKSET form.

ALTERNATE LINK SETS

2.5 SET

Description: This field is used to specify the alternate link set for routing which can be assigned a priority to this point code when the normal link set becomes unavailable.

Copyright © 2003 Lucent Technologies

Valid Entries: Blank, or 1 - 511

Data Rules:

ALTERNATE LINK SETS must be unique.

When ALTERNATE LINK SETS is entered, the value entered must first be defined as LINK SET on the LNKSET form or as a CLS on the CLKSET form for the same GSM.

When ALTERNATE LINK SETS is entered and is less than 256 and ALTERNATE LINK SETS is defined as a CLS on a CLKSET form on the same GSM, the NORMAL LINK SET on the NID form must not be the same value as LS1 or LS2 on the CLKSET form.

When ALTERNATE LINK SETS in row 1 is defined as a CLS on a CLKSET form on the same GSM and have ALTERNATE LINK SETS in row 2 entered with a value less than 256, the ALTERNATE LINK SETS in row 2 must not be the same value as LS1 and LS2 on the CLKSET form.

When ALTERNATE LINK SETS in row 2 is defined as a CLS on a CLKSET form on the same GSM and have ALTERNATE LINK SETS in row 1 entered with a value less than 256, the ALTERNATE LINK SETS in row 1 must not be the same value as LS1 and LS2 on the CLKSET form.

2.6 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10T: 6020 RECORD
CLUSTER ROUTING - CLU

1. GENERAL

The 6020 Record is available with the 5E14 Software Release. CLU, the Cluster Routing form, is used to define the MTP (Message Transport Part) cluster route sets that supports the SS7 (Signaling System 7) PSU (Packet Switch Unit) MTP Routing Enhancements feature. For more information on this feature, see Division 2, Section 4A522.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.9.

2. FORM ENTRIES - 6004-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * NETWORK

Description: This field is used to specify the network code number.

Required Field.
Valid Entries: 1 - 254

2.3 *CLUSTER

Description: This field is used to specify the cluster code number.

Required Field.
Valid Entries:

Valid Cluster Numbers

Entry	Valid Value	Definition
ANSI	[000 - 255]	Cluster number
LEC	[00 - 31]	Region number
	[0 - 7]	Cluster number

2.4 * GSM

Description: The GSM is used to specify the Global Switching Module used to support the CCS7 (Common Channel Signaling, CCITT Version 7) signaling system.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The maxium populated cluster index value cannot exceed the maximum number of tuples per GSM.

2.5 X-LIST

Description: This field indicates whether an X-list should be kept for this cluster routeset or not, to track the remote status of cluster members with a more restrictive status than the cluster as a whole.

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.6 # NORMAL LINK SET

Description: This field is used to specify the normal link set number used for routing to this point code.

Required Field.
Valid Entries: 1 - 511

Data Rules:

When NORMAL LINK SET is entered, the value entered must first be defined as LINK SET on the LNKSET form or as a CLS on the CLKSET form for the same GSM.

ALTERNATE LINK SETS

2.7 SET

Description: This field is used to specify the alternate link set for routing which can be assigned a priority to this point code when the normal link set becomes unavailable.
Valid Entries: Blank, or 1 - 511

Data Rules:

ALTERNATE LINK SETS must be a unique number.

ALTERNATE LINK SETS must not equal NORMAL LINK SET.

When ALTERNATE LINK SETS is entered, the value entered must first be defined as LINK SET on the LNKSET form or as a CLS on the CLKSET form for the same GSM.

2.8 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E15 and later

SEC. 10U: 6021 RECORD
CCS MESSAGE TRANSPORT MESSAGE HANDLER - CMTMH

1. GENERAL

The 6021 Record is available with the 5E15 and later Software Releases. It defines which message handler will be used for CCS (Common Channel signaling) message transport for communication between a GSM (Global Switching Module) and a NGSM (Non-GSM). This form supports the SS7 (Signaling System 7)-PSU (Packet Switch Unit) Architectural Enhancements feature (99-CP-4246). For more information on this feature, see Division 2, Section 7AG. This form also supports the Decouple CCS from GSM Initializations (99-5E-7428) feature. See Division 2, Section 8U.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GLOBAL SM

Description: The GLOBAL SM field is used to specify a GSM (Global Switching Module) number which supports national SS7 signaling.
Valid Entries: 1 - 192

Data Rules:

When GLOBAL SM and NON-GLOBAL SM are set to the same value, MH SM 1 must also be set to this same value.

When GLOBAL SM is equal to NON-GLOBAL SM, MH SM 2 must not be entered.

A GLOBAL SM with a different NON GLOBAL SM entered on the CMTMH form cannot be entered as an SM on a MDLNK form.

When the GLOBAL SM is not equal to the NON-GLOBAL SM on the CMTMH form, the GLOBAL SM must be defined on another CMTMH form where the GLOBAL SM is equal to the NON-GLOBAL SM.

GLOBAL SM must be defined on the QPHPIPE form for both QLPS NETWORK 0 and QLPS NETWORK 1. The GLOBAL SM, PSU SHELF, and CHANNEL GROUP must be the same within each set on the QPHPIPE forms and SERVICE TYPE must be "CCS". Note that there should be 2 sets of QPH Pipes.

The GLOBAL SM and NON GLOBAL SM entered must be defined as SM on the EQIM for with EQSTATUS set to "O".

When the GLOBAL SM on the CMTMH form is a Host GSM where the GLOBAL SM is not equal to the NON GLOBAL SM, the GLOBAL SM and the SM on the ENETPIPE form where SERV TYPE is "EEC" or "RTCD" cannot be the same.

2.3 * NON-GLOBAL SM

Description: This field specifies a NGSM (Non-Global Switching Module) number. A NGSM is a SM equipped with CCS trunks or TCAP (Transaction Capabilities Application Part) applications that generate

Copyright © 2003 Lucent Technologies

CCS messages that need to be transported to the PSU (Packet Switch Unit) on the GSM so that the CCS messages can be sent or received over CCS links.

Required Field.
Valid Entries: 1 - 192

Data Rules:

When the NON GLOBAL SM does not have an SM-2000 class processor on the corresponding EQIM form, the MH SM 1 must be different from the NON GLOBAL SM and must be defined as NON GLOBAL SM on another CMTMH form with the same GLOBAL SM. The NON GLOBAL SM on the CMTMH form must have an SM 2000 class processor.

When the NON-GLOBAL SM has a SM2000 class processor defined on the EQIM form, the NON-GLOBAL SM and the MH SM 1 must be the same and the MH SM 2 must not be entered.

When NON-GLOBAL SM does not have an SM-2000 class processor defined on the EQIM form and CM VINTAGE is 2 on the EQCORE form (5701 Record), there must be EQPC forms (5703 Record) entered on SIDE 0 and SIDE 1 with PC NO. set to 32 and EQSTATUS set to "O".

When the NON GLOBAL SM does not have an SM-2000 class processor on the corresponding EQIM form and the MH SM 2 is entered, the MH SM 2 must be different than the NON GLOBAL SM and must be defined as NON GLOBAL SM on another CMTMH form with the same GLOBAL SM. The NON GLOBAL SM on the CMTMH form must have an SM-2000 class processor.

MESSAGE HANDLERS

The following fields (Section 2.4 - Section 2.5) are used to define the MHs to be used for CMT for communication between a GSM and a NGSM.

2.4 #MH SM 1

Description: This field is used to define the MH SM 1 that will be used for CMT for communication between a GSM and a NGSM.
Valid Entries: 1 - 192

Data Rules:

MH SM 1 and MH SM 2 must be unique.

When MH SM 1 is entered and CM VINTAGE on the EQCORE form is 2, a corresponding EQPIPE form must be defined for both QLPS NETWORK 0 and QLPS NETWORK 1.

2.5 MH SM 2

Description: This field is used to define the MH SM 2 that will be used for CMT for communication between a GSM and a NGSM.
Valid Entries: 1 - 192

Data Rules:

MH SM 2 must be greater than MH SM 1.

2.6 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

SEC. 10V: 6016 RECORD
SAAL HIGH SPEED SS7 LINK - SAALHSL

1. GENERAL

The 6016 Record is available with the 5E16(2) FR 1 (Feature Release 1) and later Software Releases. This form supports the SAAL (Signaling ATM Adaptation Layer) SS7 (Signaling System 7) High Speed Signaling Links feature (99-5E-7451). For more information on this feature, see Division 2, Section 4A670.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.26.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: The Global SM field is used to specify a GSM (Global Switching Module) number which supports SAAL SS7 signaling.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

2.3 * LINK SET

Description: This field is used to specify the link set number.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: 1 - 255

Data Rules:

2.4 * MEMBER

Description: This field is used to specify the member number within the CCS7 (Common Channel Signaling 7) signaling link set.

Software Release: 5E16(2) and later
Valid Entries: 0 - 15

Data Rules:

2.5 # SLC

Copyright © 2003 Lucent Technologies

Description: The Signaling Link Code field is used to specify the signaling link code. The signaling link code is part of the header portion of a signaling network management message. This is a display only field.

Software Release: 5E16(2) and later
Valid Entries: 0 - 15

Data Rules:

PHYSICAL LAYER

The following fields (Section 2.6 - Section 2.13) are used to define the Data Link Layers used for the SAAL SS7 High Speed Signaling Link feature.

2.6 PSU PIPE

Description: This field is used to identify which PSU PIPE is used for the SAAL.

Software Release: 5E16(2) and later
Valid Entries: 1 to 8 alphanumeric characters

Data Rules:

2.7 L1 PSU

Description: The Level 1 Packet Switching Unit field is used ONLY to display the PSU number of the PSU PIPE. This is a RC (Recent Change) only field.

Software Release: 5E16(2) and later
Valid Entries: 0

2.8 L1 SHELF

Description: The Level 1 Shelf field is used ONLY to display the PSU shelf number of the PSU PIPE. This is a RC (Recent Change) only field.

Software Release: 5E16(2) and later
Valid Entries: 0 - 4

2.9 L1 CHGRP

Description: The Level 1 Channel Group field is used ONLY to display the Channel Group number of the PSU PIPE. This is a RC (Recent Change) only field.

Software Release: 5E16(2) and later
Valid Entries: 0 - 15

2.10 L1 CHGRP MEM

Description: The Level 1 Channel Group Member field is used ONLY to display the Channel Group member number of the PSU PIPE. This is a RC (Recent Change) only field.

Software Release: 5E16(2) and later
Valid Entries: 0

Copyright © 2003 Lucent Technologies

2.11 L1 RATE

Description: The Level 1 RATE field is used ONLY to display the rate number of the PSU PIPE. This is a RC (Recent Change) only field.

Software Release: 5E16(2) and later
Valid Entries: 1536KB

2.12 L1 OE

Description: The Level 1 OE (Originating Equipment) field is used ONLY to display the OE number of the first channel of the PSU PIPE. This is a RC (Recent Change) only field.

Software Release: 5E16(2) and later
Valid Entries:

Valid L1 OE Entries

Entry	Definition	Values
D	DEN (Digital Line and Trunk Unit (DLTU) Equipment Number)	(001-192) (000-011) (01-10) (01) where: 001-192 = SM (Switching Module) 000-011 = DLTU (Digital Line and Trunk Unit) 01-10 = DFI (Digital Facility Interface) 01 = DFI
N	NEN (Digital Networking Unit - SONET (Synchronous Optical Network (High Speed Fiber)) (DNU-S) Equipment number)	(001-192) (0-7) (0-1) (1-6) (1) (1-7) (1-4) (01) where: 001-192 = SM (Switching Module) 0-7 = DNU-S (Digital Networking Unit - SONET) 0-1 = DG (Data Group) 1-6 = STE (SONET Termination Equipment) 1 = STE (SynchronousTransport Signal) 1-7 = VTG (Virtual Tributary Group) 1-4 = VTM (Virtual Tributary Member) 01 = DS0 (Digital Signal Level 0)

2.13 # LINK PARM SET

Description: This field is used to specify the SAAL (Signaling ATM (Asynchronous Transfer Mode) Adaption Layer) Link Paramter Set associated with the SAAL High Speed SS7 Link..
Valid Entries: 1 to 8 alphanumeric characters.

2.14 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E16(2) and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 10W: 6017 RECORD
SAAL LINK PARAMETER SET - SAALPRM

1. GENERAL

The 6017 Record is available with the 5E16(2) FR 1 (Feature Release 1) and later Software Releases. This form is used to define values of a High Speed Signaling Link Parameter Set. This form supports the SAAL (Signaling ATM Adaptation Layer) SS7 (Signaling System 7) High Speed Signaling Links feature (99-5E-7451). For more information on this feature, see Division 2, Section 4A670.

1.1 Recent Change View

The corresponding Recent Change View for this form is 16.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * GSM

Description: The GSM (Global Switching Module) field is used to specify a GSM number which supports national SS7 signaling.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

2.3 * PARM SET

Description: The Link Parameter Set name field is used to identify a unique set of SAAL High Speed link parameters.

Required Field.

Software Release: 5E16(2) and later
Valid Entries: Enter up to 8 alphanumeric characters.

2.4 RATE

Description: This field is used to identify the High Speed Link Bit Transfer rate.

Software Release: 5E16(2) and later
Default: 1536KB
Valid Entries: 1536KB

2.5 SIFCAP

Description: The SIFCAP (Service Information Field Capability) field is used to identify the maximum service information capacity for an SAAL High Speed Link..

Software Release: 5E16(2) and later
Default: CCDATA272
Valid Entries: CCDATA272

SSCP - NNI

Copyright © 2003 Lucent Technologies

The following fields (Section 2.6 - Section 2.9) are used to define the time in seconds. One exception is that N1 is not a timer.

2.6 T1

Description: This field is used to indicate the time in seconds between link release and re-establishment during alignment.

Software Release: 5E16(2) and later
Default: 5
Valid Entries: 1 - 15

2.7 T2

Description: This field is used to indicate the time in seconds that a SSCP will attempt alignment.

Software Release: 5E16(2) and later
Default: 120
Valid Entries: 15 - 180

Data Rules:

T2 must be greater than (T3 * N1)/1000000.

2.8 T3

Description: This field is used to indicate the time in microseconds between proving PDUs.

Software Release: 5E16(2) and later
Default: 1000
Valid Entries: 276 - 25000

2.9 N1

Description: This field is used to indicate the number of PDUs sent during normal provisioning.

Software Release: 5E16(2) and later
Default: 60000
Valid Entries: 500 - 500000

2.10 CRIT IND

Description: The Critical Data Indicator field is used to indicate whether or not this form instance data is critical.

Software Release: 5E16(2) and later
Required Field.
Default: N
Valid Entries: Y, N

SSCOP

The following fields (Section 2.11 - Section 2.20) are used to to provide information about the SSCOP (Service Specific Connection Oriented Protocol) SDUs (Scan And Distribution Units) and time intervals in milliseconds that are used.

2.11 MAX SDU SIZE

Copyright © 2003 Lucent Technologies

Description: This field defines the maximum SSCOP (Service Specific Connection Oriented Protocol) SDU (Scan And Distribution Unit) size.

Software Release: 5E16(2) and later
Default: 4096
Valid Entries: 4096 Octets

2.12 MAX UU SIZE

Description: This field defines the maximum SSCOP (Service Specific Connection Oriented Protocol) layer Scan and Distribution UU size.

Software Release: 5E16(2) and later
Default: 4
Valid Entries: 4 Octets

2.13 MAX UNACK PDU

Description: This field defines the maximum number of unacknowledged BGN, END, ER, or RS PDUs.

Software Release: 5E16(2) and later
Default: 4
Valid Entries: 1 - 10

2.14 MAX NO SD PDU

Description: This field defines the maximum number of SD PDUs set between POLL PDUs.

Software Release: 5E16(2) and later
Default: 500
Valid Entries: 5 - 2120

2.15 MAX NO STA PDU

Description: This field defines the maximum number of list elements in a SD PDUs set between POLL PDUs.

Software Release: 5E16(2) and later
Default: 67
Valid Entries: 5 - 2120

2.16 TIMER CC

Description: This field defines the time between transmission of unacknowledged BGN, END, ER, or RS PDUs.

Software Release: 5E16(2) and later
Default: 200
Valid Entries: 100 - 2000

2.17 TIMER KA

Description: This field indicates the keep-alive timer for 3622 cells/second signaling rate.

Software Release: 5E16(2) and later
Default: 100
Valid Entries: 25 - 500

Copyright © 2003 Lucent Technologies

2.18 TIMER NR

Description: This field defines the maximum time interval during which at least one STAT PDU must be received.

Software Release: 5E16(2) and later
Default: 1500
Valid Entries: 200 - 2000

2.19 TIMER POLL

Description: This field indicates the POLL timer for 3622 cells/second signaling rate.

Software Release: 5E16(2) and later
Default: 100
Valid Entries: 25 - 500

2.20 TIMER IDLE

Description: This field indicates the maximum time of the IDLE phase of an SSCOP connection.

Software Release: 5E16(2) and later
Default: 100
Valid Entries: 25 - 1000

SAAL LM/ISERM

The following fields (Section 2.21 - Section 2.31) are used to define information about the SSCOP SDUs.

2.21 LM MAX NRP

Description: This field indicates the maximum number of retransmitted SSCOP PDUs permissible for link provisioning.

Software Release: 5E16(2) and later
Default: 1
Valid Entries: 0 - 10

2.22 LM MIN RR

Description: This field indicates the minimum interval between reports of an SSCOP recovery.

Software Release: 5E16(2) and later
Default: 60
Valid Entries: 30 - 1440

2.23 LM MIN NO C

Description: This field indicates the minimum interval without credit.

Software Release: 5E16(2) and later
Default: 1500
Valid Entries: 1000 - 6000

2.24 LM FORCE PROV

Description: This field indicates the SAAL Management Force Provisioning timer.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Default: 10
Valid Entries: 0 - 20

2.25 ISERM SB SIZE

Description: The ISERM (In-Service Error Rate Monitor) SB SIZE field indicates the ISERM parameter Tsup.

Software Release: 5E16(2) and later
Default: 120
Valid Entries: 10 - 600

2.26 ISERM ST LOSS

Description: This field indicates the ISERM parameter Tloss.

Software Release: 5E16(2) and later
Default: 1300
Valid Entries: 500 - 10000

2.27 ISERM ALPHA

Description: This field indicates the exponential smoothing factor.

Software Release: 5E16(2) and later
Default: 10
Valid Entries: 0 - 100

2.28 ISERM THRESH

Description: This field indicates the threshold for comparing the running quality of service.

Software Release: 5E16(2) and later
Default: 244
Valid Entries: 0 - 1000

2.29 ISERM TAU

Description: This field indicates the error monitoring interval.

Software Release: 5E16(2) and later
Default: 100
Valid Entries: 25 - 250

2.30 ISERM BLK

Description: This field indicates the monitoring interval per block.

Software Release: 5E16(2) and later
Default: 3
Valid Entries: 1 - 25

2.31 ISERM N

Description: This field indicates the monitoring interval after 400 milliseconds of error events.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Default: 9
Valid Entries: 1 - 25

MTP CONGESTION

The following fields (Section 2.32 - Section 2.40) are used to define the numbers of PDUs.

2.32 LVL 1 ABATE

Description: This field indicates the MTP (Message Transfer Part) Congestion Level 1 abatement threshold.

Software Release: 5E16(2) and later
Default: 780
Valid Entries: 0 - 5730

2.33 LVL 1 ONSET

Description: This field indicates the MTP Congestion Level 1 Onset threshold.

Software Release: 5E16(2) and later
Default: 930
Valid Entries: 0 - 5730

Data Rules:

LVL 1 ONSET must be greater than LVL 1 ABATE.

2.34 LVL 1 DISCARD

Description: This field indicates the MTP Congestion Level 1 Discard threshold.

Software Release: 5E16(2) and later
Default: 2490
Valid Entries: 0 - 5730

Data Rules:

LVL 1 DISCARD must be greater than LVL 1 ONSET.

2.35 LVL 2 ABATE

Description: This field indicates the MTP Congestion Level 2 Abate threshold.

Software Release: 5E16(2) and later
Default: 2640
Valid Entries: 0 - 5730

Data Rules:

LVL 2 ABATE must be greater than LVL 1 ONSET.

2.36 LVL 2 ONSET

Description: This field indicates the MTP Congestion Level 2 Onset threshold.

Software Release: 5E16(2) and later

Copyright © 2003 Lucent Technologies

Default: 2790
Valid Entries: 0 - 5730

Data Rules:

LVL 2 ONSET must be greater than LVL 2 ABATE.

LVL 2 ONSET must be greater than or equal to LVL 1 DISCARD.

2.37 LVL 2 DISCARD

Description: This field indicates the MTP Congestion Level 2 Discard threshold.

Software Release: 5E16(2) and later
Default: 4350
Valid Entries: 0 - 5730

Data Rules:

LVL 2 DISCARD must be greater than LVL 2 ONSET.

2.38 LVL 3 ABATE

Description: This field indicates the MTP Congestion Level 3 Abate threshold.

Software Release: 5E16(2) and later
Default: 4500
Valid Entries: 0 - 5730

Data Rules:

LVL 3 ABATE must be greater than LVL 2 ONSET.

2.39 LVL 3 ONSET

Description: This field indicates the MTP Congestion Level 3 Onset threshold.

Software Release: 5E16(2) and later
Default: 4560
Valid Entries: 0 - 5730

Data Rules:

LVL 3 ONSET must be greater than LVL 3 ABATE.

LVL 3 ONSET must be greater than or equal to LVL 2 DISCARD.

2.40 LVL 3 DISCARD

Description: This field indicates the MTP Congestion Level 3 Discard threshold.

Software Release: 5E16(2) and later
Default: 5250
Valid Entries: 0 - 5730

Data Rules:

LVL 3 DISCARD must be greater than LVL 3 ONSET.

MARGINAL PERFORMANCE

The following fields (Section 2.41 - Section 2.44) are used to define the the various thresholds involved with Marginal Performances.

2.41 MTP AC THRESH

Description: The MTP (Message Transfer Part) AC (Automatic Changeover) Threshold field indicates the MTP Marginal Performance threshold for the number of ACs.

Software Release: 5E16(2) and later
Default: 3
Valid Entries: 1 - 32

2.42 RETRANS PDU THRESH

Description: The Retransmitted PDU Threshold field indicates the SSCOP Marginal Performance threshold for a number of SD PDUs requiring retransmission.

Software Release: 5E16(2) and later
Default: 550
Valid Entries: 10 - 1000

2.43 CONNECT SOE THRESH

Description: The Connection Sum-of-errors Threshold field indicates the SSCOP Marginal Performance threshold for connection sum-of-errors counters.

Software Release: 5E16(2) and later
Default: 5
Valid Entries: 1 - 32

2.44 ERROR PDU SOE THRESH

Description: The Error PDU Sum-of-errors Threshold field indicates the SSCOP Marginal Performance threshold for connection sum-of-errors counters.

Software Release: 5E16(2) and later
Default: 2
Valid Entries: 1 - 32

L2 FLOW CONTROL

The following fields (Section 2.45 - Section 2.47) provides information about the SAAL Level 2 Flow Control parameters.are used to define the time in seconds.

2.45 FCI

Description: The Fixed Credit Increment field indicates the SAAL Level 2 Flow Control parameter Nr.

Software Release: 5E16(2) and later
Default: 1200
Valid Entries: 3 - 2000

2.46 EFCAR

Description: The Equivalent Fixed Credit Allocation Rate field indicates the SAAL Level 2 Flow Control

Copyright © 2003 Lucent Technologies

parameter Rpdu.

Software Release: 5E16(2) and later
Valid Entries: 600 - 3622

2.47 ECAF

Description: The Equivalent Fixed Credit Allocation Frequency field indicates the SAAL Level 2 Flow Control parameter bc.

Software Release: 5E16(2) and later
Default: 1
Valid Entries: 1 - 5

Data Rules:

ECAF only allows the value of one.

SEC. 1: 5ESS RECORD NAMES - 5ESS OFFICE RECORDS NUMBERS

1. GENERAL

This section contains the latest listing of 5ESS Switch Record Names. The listing is presented in alphabetical order by ODA Record Name. The listing provides the corresponding Office Record Number, ODA Form Name, and TG-5 Division and Section.

When a Record Name is known, the Division and Section that describes the record can be found in Figure 1; when the Record Number is known, see Division 0, Section 4. If only the Form Name is known, see Division 0, Section 1.

2. RECORD NAME INDEX TABLE

Title	Office Record Number	Form	Division / Section
100 SECOND SCAN (HSS) ACTIVATION FORM	5620-4	aphss	Div. 4 Sec. 21D
5602-4 MULTIWAY CALLING LINE (MLHG/TERM) PARAMETER FORM	5602-4	mwmpa	Div. 4 Sec. 3C

Appendix A:

UPDATE HISTORY

Division 20 of the 5ESS-2000 Switch Translation Guide provides listings of monthly updates made to the TG-5. These monthly listings are issued to highlight the modifications made to guide each month.

The monthly updates provide:

1. the Divisions and Sections modified
2. the Forms and Records affected
3. a brief description of the modifications made.

The monthly update sections within Division 20 are numbered 1 through 12 to correspond to a calendar month. For example, the January update is Section 1, the June update is Section 6, the October update is Section 10, etc.

It is the intent that each monthly update be maintained in the TG-5 for one year, thus providing a 12-month history of modifications made to the guide.

Figure 1 Update History Overview

December Updates for the TG-5

Division	Section	Form/Record	Summary
2	1CS	PSU Bus Occupancy Measurements	Minor editing changes.
2	4A0	Secured Features Descriptions	Removed SFID 613 from the table.
2	4A613	On-Hook Data Transmission without Power Ring	Feature section moved to Division 2, Section 4B1008.
2	4B0	Transparency Features Descriptions	Added OFIDs 999, 1000, 1001, 1008 in the table.
2	4B999	DNIS Enhancemdent for Canada - Part 1	New feature section for 5E15 FR 5 and later.
2	4B1000	DNIS Enhancemdent for Canada - Part 2	New feature section for 5E15 FR 5 and later.
2	4B1001	DNIS Enhancemdent for Canada - Part 3	New feature section for 5E15 FR 5 and later.
2	4B1008	On-Hook Data Transmission without Power Ring	Feature section moved from Division 2, Section 4A613.
2	7BQ	OIU OC-3 - NAR	Added form information to TRANSLATION REQUIREMENTS section.
2	7BX	OIU (Optical Interface Unit) - IP (Internet Protocol)	Removed this section from the TG-5.
3	5AR	SFSYS (5713-1)	Removed SFID 613 from the table.
3	5AS	FOSYS (5713-2)	Added OFIDs 999, 1000, 1001, 1008 to the table.
3	5BG	MEASSUM (5563)	Minor editing changes.
3	5CC	OIUPM (5767)	Added data rules to the CKT TYPE field and also added minor editing changes.
4	15A	CFWFD (5614-1/2)	Modified Preconstructed CF Features Table.
5	3Z	PKTGRP (5219)	Removed this section from the TG-5.
8	1	Equipment Assignment	Added equipment assignment information in Figure 2.
8	80	CDMAOPT (5599)	Minor editing changes.

Figure 2 December 2002 Changes

January Updates for the TG-5

Division	Section	Form/Record	Summary

Copyright © 2003 Lucent Technologies

2	1CP	Support Multiple LEA for CCC Dial Out	New feature section for 5E16(2) FR 2 and later.
2	1CS	PSU Bus Occupany Measuments	Minor editing changes.
2	1CT	CALEA CDC with Voice Band Data	New feature section for 5E16(2) FR 1and later.
2	4A0	Secured Features Descriptions	Added SFIDs 662, 663, 664, and 670 to the table.
2	4A662	CM3 TMS Fabric Expansion	Added section for reference to the CM3 TMS Fabric Expansion feature.
2	4A663	CM3 TMS Fabric Expansion	Added section for reference to the CM3 TMS Fabric Expansion feature.
2	4A664	CM3 TMS Fabric Expansion	Added section for reference to the CM3 TMS Fabric Expansion feature.
2	4A670	SAAL SS7 High Speed Signaling Links	New feature section for 5E16(2) FR 1 and later.
2	4B587	PRI Echo Canceler Options	New feature section for 5E9(1) and later.
2	4B588	PRI Echo Canceler Options	Added reference page.
2	4B713	MCG (Manual Call Gapping) Interaction with LNP	New feature section for 5E11 and later.
2	4B734	Trunk Triggers for Toll	New feature section for 5E12 and later.
2	5O	3G 1X PD Services with MUX PDU and 3G 1X PD Services with 307 2 Kpbs	New feature section for 5E17(1) FR 1 and later.
2	7AS	Semi-Integrated No Test Trunk	Added information for the NTTU form to the TRANSLATION REQUIREMENTS section.
2	7BB	SAAL SS7 High Speed Signaling Links	Moved feature to Division 2, Section 4A670.
2	7BO	CM3 TMS Fabric Expansion	Added new information to each section.
2	7BY	PHA2 PSU to PSU Connectivity	New feature section for 5E17(1) FR 1 and later.
2	8AG	RNC Homed Voice/Data Calls	New feature section for 5E17(1) FR 1 and later.
3	5AR	SFSYS (5713-1)	Added SFIDs 662, 663, 664, and 670 to the table.
3	5BG	MEASSUM (5563)	Added the ATMLNK and ATMQOSPS values to the SECTION NAME field. Also added data rules to this field.
3	5BW	NTTU (5590)	New section for 5E15 and later.
5	3J	PSUGP (5949)	Minor editing change.
5	3Q	PSUGW (5991)	Added data rules to the NETWORK 0 field.
5	3X	INTRAPSU (5992)	New section for 5E17(1) FR 1 and later.
5	3Y	INTERPSU (5993)	New section for 5E17(1) FR 1 and later.
5	3AA	PSUPM (5998)	New section for 5E17(1) FR 1 and later.
5	5O	PSUPIPE (5990)	Minor editing changes.
5	5P	ATMLNK (5592	New section for 5E17(1) FR 1 and later.
8	23	EQPSUPH (5742)	Minor editing changes.
8	80	CDMAOPT (5599)	Added the SEND VP RDI, SEND VC RDI, and SUBNET ID fields and associated data rules.
9	10C	LNKSET (6003)	Minor editing change.
9	10V	SAALHSL (6016)	Minor editing changes.
9	10W	SAALPRM (6017)	Minor editing changes.

Figure 3 January 2003 Changes

March Updates for the TG-5

Division	Section	Form/Record	Summary
2	1CG	Hard-To-Reach	Moved this section to Division 2, Section 4A625
2	1CV	RTCD DSM Storage Expansion	New feature section for 5E16(2) FR 1.
2	4A0	Secured Features Descriptions	Added SFIDs 625, 682, and 685 to the table.
2	4A587	Simultaneous Ringing	Added enhancement information to FEATURE DESCRIPTION section.
2	4A625	Hard-To-Reach	Added SFID information.
2	4A682	High Capacity APT Enhancements	New feature section for 5E16(2) FR 1.
2	4A685	IMLT Access Improvements and Metallic A-Link Blockage Notification	New feature section for 5E16(2) FR 1.
2	4B0	Transparency Features Descriptions	Added OFID 1010 to the table.
2	4B1000	DNIS Enhancement for Canada -	Previously existing section that was accidently overwritten.

Copyright © 2003 Lucent Technologies

		Part 2	
2	4B1001	DNIS Enhancement for Canada - Part 3	Previously existing section that was accidently overwritten.
2	4B1008	On-Hook Data Transmission without Power Ring	Previously existing section that was accidently overwritten.
2	4B1010	Metallic A-Link Blockage Notification	New feature section for 5E16(2) FR 1.
2	7BY	PHA2 PSU to PSU Connectivity	Minor editing changes.
2	8AH	Measurements for PCF on PHE2	New feature section for 5E17(1) FR 2 and later.
3	5I	OFCOPT (5509)	Added the IMLT RETRY and IMLT RDELAY fields.
3	5AE	ANNHD (5531)	Added information to the table under the PHRASES field.
3	5AH	PHRASE (5534)	Added information to the table under the LANGUAGE CODE field.
3	5AR	SFSYS (5713-1)	Added SFIDs 625, 682, and 685 to the table.
3	5AS	FOSYS (5713-2)	Added OFID 1010 to the table.
3	5BD	ANIMOD (5560)	Minor editing changes.
3	5BG	MEASSUM (5563)	Modified the Traffic Section Number for ATMLNK under the SECTION NAME field. Added a new SECTION NAME (PCF) and associated data rules.
9	10T	CLU (6020)	Modified the X-List field description.
9	10V	SAALHSL (6016)	Minor editing changes.
9	10W	SAALPRM (6017)	Minor editing changes.

Figure 4 March 2003 Changes

TRANSLATION GUIDE DIV. 20, SEC. 4
TG-5 April, 2003

April Updates for the TG-5

Division	Section	Form/Record	Summary
1	2	5000 Record Translation Inquiry	Modified contact information and TI form.
2	1X	SSP 800	Corrected Figure 1.
2	2AG	Output Messages for Metallic Path Setup Failures	This section was moved from D2S4A334. The secured option was removed.
2	4A0	Secured Features Description	Added entries to the Secured Features Table for SFID 686.
2	4A551	Multiline Hunt Group Capacity Expansion	New feature section for 5E15 and later.
2	4A633	Digital Cellular Switch Critical Alarms Improvement	Moved this section from Division 2, Section 2AB.
2	4A674	RC/V Security Logging and Verbose Enhancement	Modified the FEATURE DESCRIPTION.
2	4A686	3B21D/RTR High Speed Performance Improvement	New feature section for 5E16(2) FR 1.
2	4B0	Transparency Features Descriptions	Added OFID 1005 to the table.
2	4B748	Standard PRI XMIT Progress Instead of Alerting when Interworking non-ISDN	Modified the Translations Requirements table.
2	4B980	Carrier Compare for VPN	Modified the Translations Requirements table.
2	4B981	NM (Network Management) 3 Digit Reroute	Modified the Translations Requirements table.
2	4B989	Alternate ASP Algorithm Used to Delete an NPA	Modified the Translations Requirements table.
2	4B992	Bypass Subset of Crosschecks during RCV (Recent Change View) 10.10 Screening Delete	Modified the Translations Requirements table.
2	4B994	Canadian 15-Digit International Direct Distance Dialed	Modified the Translations Requirements table.
2	4B996	Precedence and Preemption Terminating Feature Selection Enhancement	Modified the Translations Requirements table.
2	4B1005	IAM Charge Number	New feature section for 5E15, 5E16(1), 5E16(2), and 5E17(1) and later.
2	4B1012	Inhibit CGA (Carrier Group Alarms)	Moved this feature from D2S4A661.

Copyright © 2003 Lucent Technologies

2	5P	3G-1X HSPD with Simultaneous Transmission on F-FCH and F-SCH	New feature section for 5E17(1) FR 2 and later.
2	7BZ	CNI/PSU Support for 128K ISUP Trunks	New section for 5E15 FR 5 (moved from Division 2, Section 4A622).
3	2A	TKGRP (5202)	Added a note to the FREE ANS field.
3	5AR	SFSYS (5713-1)	Added entry to the Secured Features Table for SFID 686.
3	5AS	FOSYS (5713-2)	Added OFID 1005 to the table.
3	5BG	MEASSUM (5563)	Added information for the PHE value to the SECTION NAME.

Figure 5 April 2003 Changes

TRANSLATION GUIDE DIV. 20, SEC. 5
TG-5 May, 2003

May Updates for the TG-5

Division	Section	Form/Record	Summary
2	1CW	Proxy Database Phase II - Proxy Database	New feature section for 5E16(2) FR2 and later.
2	4A0	Secured Features Description	Added entries to the Secured Features Table for SFIDs 624, 689. Removed SFID 622 from the table.
2	4A551	Multiline Hunt Group Capacity Expansion	Added an additional reference.
2	4A609	External Interface Infrastructure Expansion	New feature section for 5E15 and later.
2	4A610	Increased ASM Disk Space For AMADNS	New feature section for 5E15 and later.
2	4A627	Increase Terminal Sessions for Read Only RC on ASM	New feature section for 5E15 and later.
2	4A678	Forwarded Call - Call Screening Announcement Modification	New feature section for 5E16(2) and later.
2	4A689	TCP/IP via ASM for CIA	New feature section for 5E16(2) FR 2 and later.
2	4B0	Transparency Features Descriptions	Added OFS IDs 681, 747, 972, 988, 997, 1004, and 1006 to the table.
2	4B623	Ability to Drop Fully Restricted Terminating Leg of Multiway Call	New section for 5E10 and later.
2	4B681	Transfer Two Outgoing ISUP/PRI Trunks Together	New feature section for 5E13 and later.
2	4B692	Recent Change (Hashsum Failure) Blocking	New feature section for 5E10 and later.
2	4B747	ASP/LDP Module 21 220 Record Enhancement	New feature section for 5E13 and later.
2	4B972	Allow SCP DAL Carrier Compare	New feature section for 5E15 and later.
2	4B984	NPA Split Enhancement	Added an additional reference.
2	4B988	Enhancement for Stand-Alone Routing for International	New feature section for 5E14 and later.
2	4B997	Delete Network Identity Digits on PRI PLI IE	New feature section for 5E15 and later.
2	4B1004	Inhibit Printing of FC2CF_LTM Assert	New feature section for 5E14 and later.
2	4B1006	256 ISUP Tandem Solution	New feature section for 5E16(2) and later.
2	6L	MLPP Support for ISDN Circuit Switched Data Calls	New feature section for 5E16(2) FR2 and later.
2	6M	SS7/ISDN PRI Interworking with T1 CAS Route Digit	New feature section for 5E16(2) FR2 and later.
2	7CA	Growable CMP Memory	New feature section for 5E16(2) FR1 and later.
2	7CB	Large Capacity Switch Class 4/5	New feature section for 5E16(2) FR1 and later.
2	7CC	Autoplex Wireless on OIU	New feature section for 5E17(1) FR 2 and later.
3	2A	TKGRP (5202)	Added data rules to the TRKCLS field of type "BCM", "DSC", and "PPMEM". Also added a data rule to the DCS TRK field.
3	2C	TRUNK (5204)	Added data rules to the TRKOE field the the "O" type.
3	5AR	SFSYS (5713-1)	Added entries to the Secured Features Table for SFIDs, 624, 689. Removed SFID 622 from the table.
3	5AS	FOSYS (5713-2)	Added OFIDs 681, 747, 972, 988, 997, 1004, and 1006 to the

Copyright © 2003 Lucent Technologies

			table.
8	54	EQDSC3 (5852)	Added a data rule to the EQSTAT field.
8	89	EQLVC (5764)	Added the AFAC ID field and associated data rules.

Figure 6 May 2003 Changes

June Updates for the TG-5

Division	Section	Form/Record	Summary
2	1X	Service Switching Point 800	Modified form flow figure.
2	1CW	Proxy Database Phase II - Proxy Database	Modified to move this section to Division 2, Section 4A539.
2	4A539	Proxy Database Phases I and II - Proxy Database	Modified to add the Proxy Database Phase II feature section.
2	6L	MLPP Support for ISDN Circuit Switched Data Calls	Minor editing changes.
2	6M	SS7/ISDN PRI Interworking with T1 CAS Route Digit	Modified the FEATURE DESCRIPTION section and made minor editing changes.
2	8AH	Measurements for PCF on PHE2	Minor editing changes.
2	4B0	Transparency Features Descriptions	Added entries to the Optioned Features Table for OFID 1013.
2	4B1013	SS7 (Signaling System 7) Release Message	New feature section for 5E16(2) and later.
2	8AI	PCF on PHE2 Security	New feature section for 5E17(1) FR 2 and later.
2	8AK	PCF on PHE2 Standards Enhancements	New feature section for 5E17(1) FR 3 and later.
2	8AL	3G-1X HSPD Performance for Chatty Application	New feature section for 5E17(1) FR 3 and later.
3	5AS	FOSYS (5713-2)	Added OFID 10013 to the table.
3	5BG	MEASSUM (5563)	Minor editing changes.
5	3P	IPROUT (5989)	Minor editing change.
5	3S	ETHIP (5995)	Minor editing changes.
5	3T	PCFOPT (5996)	Added three no_change fields (PCF PHE2 LIMIT, PCF PHE2 PROV, and PCF PHE2 PSWD) (99-5E-8494). Added the CELL INFO ORDER and ACT TIME PARM fields (99-5E-8481). Added the INIT TIMER, INACT TIME, REACT COST, LOCAL MARGIN, INTER ARRIVAL and STEP DOWN SIZE fields (99-5E-8398)
5	3V	PDSNCNFG (5997)	Minor editing change and added new form.
8	1	Equipment Assignment	Added information for PH31, PHA2, and PHE2.under the EQPSUPH section.
8	23	EQPSUPH (5742)	Added PHA2 and PHE2 to the table for PC CLI.

Figure 7 June 2003 Changes

July Updates for the TG-5

Division	Section	Form/Record	Summary
2	1CX	RTCD Capacity Compatability with NxTMS	New feature section for 5E16(2) FR 2 and later.
2	4A0	Secured Features Description	Previous changes mistakenly omitted.
2	4A192	ICLID Enhancement for MLHG	Added a note to the Feature Description section.
2	4A693	UN597-9600 Baud ROP Capabilities	New feature section for 5E16(2) FR 2 and later.
2	4B990	256K Trunk Scaling for Large Capacity Tandem	Removed all SFID references.
2	7BZ	CNI/PSU Support for 128k ISUP Trunks	Minor editing change.
2	7CC	AUTOPLEX Wireless Trunks on OIU	Minor editing change.
2	7CD	PHV6 (Protocol Handler for Voice	New feature section for 5E18(1) and later.

Copyright © 2003 Lucent Technologies

		6)	
2	8AJ	GSM Escalation Strategy Modifications	New feature section for 5E16(1) FR 4 and later.
3	2A	TKGRP (5502)	Added a new value and data rule to the SERV TYPE field.
3	2B	TRKCL (5203)	Previous changes mistakenly omitted.
3	5I	OFCOPT (5509)	Added the GSM ESCALATION field and associated data rules.
4	15C	CFWMPA (5614-4)	Previous changes mistakenly omitted.
5	3A	PSISM (5920)	Modified 1 data rule under the ISCN field.
5	3J	PSUGP (5949)	Added the AVAILABLE PHV6 field and a new value to the PH TYPE field. Also added data rules to the PH TYPE field.
8	1	Equipment Assignment	Added new CLI value forl PHV6 to the table.
8	22	EQPSU (5741)	Modified a data rule under the PSU TYPE field.
8	23	EQPSUPH (5742)	Added the PHV6 MIN SPARE field and associated data rule. Also added the PHV6 value to the table for PH CLI.
8	44	METALLIC TEST BUS ASSIGNMENT	Previous changes mistakenly omitted.
8	53	EQTMSLINK (5851)	Added a data rule and a note to the LINK TYPE field.
8	80	CDMAOPT (5599)	Added the PHV6 ECHO PATH DELAY field.
8	89	EQLVC (5764)	Minor editing changes.

Figure 8 July 2003 Changes

August Updates for the TG-5

Division	Section	Form/Record	Summary
2	4A0	Secured Features Description	Added SFID 622 to the table.
2	4A622	CNI/PSU Support for 128K ISUP Trunnks	Moved from Division 2, Section 7BZ.
2	4A990	256K Trunk Scaling for Large Capacity Tandem	Minor editing changes.
2	7BZ	CNI/PSU Support for 128K ISUP Trunnks	Moved section back to Division 2, Section 4A622.
2	7BX	OIU - IP (Optical Interface Unit - Internet Protocol)	New feature section for 5E16(2) and later, Feature Release 3.
2	7CE	PSU2E PF3/CF3	New feature section for 5E18.1 and later.
3	2A	TKGRP (5202)	Added the PKT GRP field and related data rules, "OGTGDSF" valid entry and a data rule for the TRKCLS field, the DIFF SERV field and associated valid entries, and valid entries for the TGN field (5202-1 Record) for 5E16(2) and later. Modified the TGN field for the 5202-1 Record.
3	2Y	LTGPCI (5221)	Added the PKT GRP field to replace the BICC GRP field for 5E16(2) and later.
3	2Z	LTGCADN (5222)	Added the PKT GRP field to replace the BICC GRP field for 5E16(2) and later.
3	3G	FIXRT (5301-1)	Added the "OGTGDSF" valid entry for the FIXED ROUTE TYPE field for 5E16(2) and later.
3	3P	RTIDX (5303)	Modified valid entries for the TGN field for 5E16(2) and later.
3	3Q	MCRTIDX (5304)	Modified the valid entries for the TRUNK GROUP NUMBER field.
3	5I	OFCOPT (5509)	Added the COMFORT NOISE GEN, OPS APM TIMER, TPS APM TIMER, INTG IDENTIFIER, OIU TDM CHBLK CNT, OIU TDM CHBLK LMT, OIU IP CHBLK CNT, and OIU IP CHBLK LMT fields for 5E16(2) and later.
3	5AR	SFSYS (5713-1)	Added SFID 622 to the table.
3	5BG	MEASSUM (5563)	Added "BEARERNET", "IPOIU", and "PKTZ" valid entries and data rules for the SECTION NAME field, and updated the valid entries table for the START1COMP, START2COMP, and START3COMP fields for 5E16(2) and later.
3	5BO	RTLIST (5574)	Modified valid entries for the TGN field for 5E16(2) and later.
3	5CB	CGATIME (5766)	Modified the GENERAL section for 5E16(2) and later.
3	5CC	OIUPM (5767)	Modified the GENERAL section for 5E16(2) and later.
3	5CD	ALRMLVLS	New form to support the OIU IP feature (99-5E-8308) for 5E16(2) and later.

Copyright © 2003 Lucent Technologies

5	3J	PSUGP (5949)	Added data rules to the SM field.
5	3N	IPPROC (5987)	Added valid entries to include OIU and feature entries, a warning, and data rules for the PROCESSOR TYPE FIELD for 5E16(2) and later. Added the OVLD TRIG and PM GROUP fields and related data rules for 5E16(2) and later. Added valid entries for the QUALIFIER 2 and QUALIFIER 3 fields, and for the UDP START PORT field for 5E16(2) and later.
5	AM	BEARERNET (5935)	New form to support the OIU - IP feature (99-5E-8308) for 5E16(2) and later.
8	22	EQPSU (5741)	Added the INTF TYPE field and change the PSU field to be represented in two fields (SG 0 TYPE, and the SG 1 TYPE). Added data rules to the PSU, SG 0 TYPE, SG 1 TYPE, and SHLF SIDE 0 CLI fields.
8	66	ENETPIPE (5826)	Added a data rule to the SERV TYPE field for 5E16(2) and later.
8	85	EQOIU (5760)	Modified the GENERAL section for 5E16(2) and later.
8	86	EQOIUP (5761)	Modified the GENERAL section, added the BNID, MAX ENG TS, and CP INHIBIT fields and related data rules, added a data rule to the SERVICE TYPE field, and added data rules and modified valid entries for the PACK TYPE field for 5E16(2) and later.
8	87	EQOSTE (5762)	Modified the GENERAL section for 5E16(2) and later.
8	88	EQHVC (5763)	Modified the GENERAL section for 5E16(2) and later.
8	90	EQAIP (5765)	Modified the GENERAL section for 5E16(2) and later.

Figure 9 August 2003 Changes

September Updates for the TG-5

Division	Section	Form/Record	Summary
2	1CY	SPOP (Signaling PH (Protocol Handler) Outage Prevention)	New feature section for 5E17 FR3 and later.
2	4A0	Secured Features Description	Added SFIDs 690 and 691 to the table.
2	4A690	ASM Model 1 Support Extension	New feature section for 5E16(2), Feature Release 2.
2	4A691	ASM Model 1 Support Extension	New feature section for 5E16(2), Feature Release 2.
3	5I	OFCOPT (5509)	Modified the Valid Entries for the TMS HUNT field. Added the SPOP field.
3	5AR	SFSYS (5713-1)	Added SFIDs 690 and 691 to the table.
8	1	Equipment Assignment	Added a note to the table for the EQIM form.

Figure 10 September 2003 Changes

October Updates for the TG-5

Division	Section	Form/Record	Summary
1	7	5ODA User Guide	Added Section 7 for new procedures.
2	1DA	Channel Element - Frame Selector Backward Compatibility	New feature section for 5E17(1) FR2 and later.
2	4A0	Secured Features Description	Added SFIDs 684 to the table.
2	4A684	OIU SIP-T	New feature section for 5E16(2) FR 3 and later.
2	8AM	3G-1X HSPD Improved Scheduling	New feature section for 5E17(1) FR3 and later.
3	2A	TKGRP (5202)	Added data rules to the TGN, TRKCLS, INPULSING, and BICC GRP fields. Also added the SIPT GRP field.
3	5I	OFCOPT (5509)	Added the PRACK ENABLED and COUNTRY CODE fields.
3	5AR	SFSYS (5713-1)	Added SFID 684 to the table.
3	5AW	SREINCR (5547)	Added the SIPTBLK and SIPTMAP values to the SOFTWARE RESOURCE and INCREMENTAL VALUE tables.
3	5BG	MEASSUM (5563)	Added the PKTGRP and SCTP values to the SECTION NAME table. Also added a data rule to the SECTION NAME field.

Copyright © 2003 Lucent Technologies

5	3J	PSUGP (5949)	Added the AVAILABLE PH 33 field and added a new value to PH TYPE.
5	3N	IPPROC (5987)	Added the ICMP ERR GEN, IP. FRAGMENT, and MTU INTVL AFT FAIL fields.Also added new value to PROCESSOR TYPE field.
5	3P	IPROUT (5989)	Modified data rule for DEST IP ADDR field and added data rule to the ROUTE METRIC field..
5	3S	ETHIP (5995)	Replaced the GATEWAY IP ADDRESS with GATEWAY IP ADDRESS 1 and 2. And replaced the IP SUBNET MASK with IPSUBNET MASK 1 and 2.
5	3Z	PKTGRP (5219)	New section for 5E16(2) FR 3 and later.
5	3AB	SIPGSM (5880)	New section for 5E16(2) FR 3 and later.
5	3AC	SIPTSMS (5881)	New section for 5E16(2) FR 3 and later.
5	3AD	SIPTPARM (5882)	New section for 5E16(2) FR 3 and later.
5	3AE	PCRGRP (5883)	New section for 5E16(2) FR 3 and later.
5	3AF	IPPING (5884)	New section for 5E16(2) FR 3 and later.
5	3AG	SCTPPARM (5885)	New section for 5E16(2) FR 3 and later.
5	3AH	SCTPNEPF (5886)	New section for 5E16(2) FR 3 and later.
5	3AI	ASSCPARM (5887)	New section for 5E16(2) FR 3 and later.
5	3AJ	SCTPFEPD (5888)	New section for 5E16(2) FR 3 and later.
5	3AK	SCTPASSC (5889)	New section for 5E16(2) FR 3 and later.
5	3AL	ASSOCSET (5890)	New section for 5E16(2) FR 3 and later.
8	3	EQCORE (5701)	Added a data rule to the VCDX OFFICE field.
8	8	ECDOPT (5706)	Added entry for the IOP/PC/SLOT/P field.
8	22	EQPSU (5741)	Added and modified data rules for the SG 0 TYPE (PSU2) field.
8	23	EQPSUPH (5744)	Added data rules to the PSU,PSU SHELF, and PH 31 MIN SPARE fields. Added a new value to the PH CLI field. And added the PH33 MIN SPARE field.
8	70	QPHPIPE (5828)	Added the SERVICE TYPE field and modified data rule for PH TYPE.
8	91	QGCON (5829)	New section for 5E16(2) FR 3 and later.
8	92	QTVU	New section for 5E16(2) FR 3 and later.
9	10U	CMTMH (6021)	Modified a data rule for the GLOBAL SM field.

Figure 11 October 2003 Changes

November Updates for the TG-5

Division	Section	Form/Record	Summary
1	2	Translation Inquiry	Modified the Translation Inquiry contact information.
2	2AH	TST PSLNK	New section for 5E17(1) FR 3 and later.
2	4A0	Secured Features Description	Added SFID 697 to the table.
2	4A175	Expanded SLS	Made minor changes to each section of this file.
2	4A176	Improved SLT (Signaling Link Test)	Minor editing changes.
2	4A177	MTP (Message Transfer Protocol) Node Restart	Minor editing changes.
2	4A684	OIU SIP-T	Modified each section in this file per comments received.
2	4A697	CIC (Carrier Identification Code) Routing Solution	New feature section for 5E17(1) FR3.
3	2A	TKGRP (5202)	Added a data rule to the PKT GRP field.
3	5I	OFCOPT (5509)	Removed the PRACK ENABLED field and made other minor editing changes. Modified descriptions for CCS FEATURES section, and the EXPANDED SLS, IMPROVED SLT, and MTP NODE RESTART fields.
3	5AR	SFSYS (5713-1)	Added SFID 697 to the table.
3	5AW	SREINCR (5547)	Changes values in INCREMENTAL VALUES table for SIPTBLK and SIPTMAP.
3	5BG	MEASSUM (5563)	Moved data rules for PKTGRP and SCTP for the SECTION NAME field to 5E16(2) and later section. Also modified PKTGRP definition in the SECTION NAME table.
5	3N	IPPROC (5987)	Added the PCRGRP form name under list for the PROCESSOR TYPE field.

Copyright © 2003 Lucent Technologies

5	3P	IPROUT (5989)	Modified data rule under the INTERFACE NAME field and moved data rule for ROUTE METRIC to the IPPING form.
5	3S	ETHIP (5995)	Modified data rule under the INTERFACE NAME, PHE LINK, and MTU SIZE fields.
5	3Z	PKTGRP (5219)	Modified GENERAL section and description for PLATFORM field.
5	3AB	SIPGSM (5880)	Removed the ENABLED SIP PROC field and removed data rule under GSM field.
5	3AC	SIPTSMS (5881)	Modified data rule for SM2K MODULE field.
5	3AD	SIPTPARM (5882)	Removed the WAIT FOR PRACK field.
5	3AE	PCRGRP (5883)	Added data rules to SHELF field and also made other minor editing changes.
5	3AF	IPPING (5884)	Added data rule to the INTERFACE NAME field. Moved data rule from ROUTE METRIC field on the IPROUT form to the IP ADDRESS field.
5	3AH	SCTPNEPD (5886)	Added data rule to GSM and ENDPOINT PARM SET NAME fields.
5	3AI	ASSCPARM (5887)	Minor editing changes.
5	3AJ	SCTPFEPD (5888)	Minor editing changes.
5	3AK	SCTPASSC (5889)	Added data rule to the GSM field and also made other minor editing changes.
5	3AL	ASSOCSET (5890)	Minor editing changes.
8	23	EQPSUPH (5744)	Added a data rule to the SHLF SIDE 0 CLI field and other minor editing changes.
8	70	QPHPIPE (5828)	Rewrote data rule for PH TYPE field and made minor editing changes.
8	80	CDMAOPT (5599)	Added the SEND CI PARM field.
8	91	QGCON (5829)	Added data rule to SM2000 field.
9	3A	RC_CPARM	Modified the GENERAL and CCS FEATURES sections, and modified the description for the EXPANDED SLS, IMPROVED SLT, and MTP NODE RESTART fields.
9	10H	CCGSM (6008)	Added data rule to the EXPANDED SLS field. Also made other minor changes.
