Additionally, the following CLASS OF SERVICEs are valid only when the SFSYS form has SFID 50 ACT set to "Y":

- "CHGCALL",
- "COIN",
- "HOTMOTL",
- "HOTPBX",
- "TWOPTY",
- "2PTY"

4.15 SCA GA ALW

Description: Is the Generally Available LASS Selective Call Acceptance feature available to this user?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "4WINDIV" or "PBX", then ODA assigns a "Y" in this field. Otherwise, a value of "N" is assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", "4WINDIV" or "PBX".

4.16 SCF GA ALW

Description: Is the Generally Available LASS Selective Call Forwarding feature available to this user?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "4WINDIV" or "PBX", then ODA assigns a "Y" in this field. Otherwise, a value of "N" is assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", "4WINDIV" or "PBX".

4.17 SCR GA ALW

Copyright © 2003 Lucent Technologies

Description: Is the Generally Available LASS Selective Call Rejection feature available to this user?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "4WINDIV" or "PBX", then ODA will assign a "Y" in this field. Otherwise, a value of "N" will be assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", "4WINDIV" or "PBX".

4.18 SDA GA ALW

Description: Is the Generally Available LASS Selective Distinctive Alert feature available to this user?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", or "PBX", then ODA will assign a "Y" in this field. Otherwise, a value of "N" will be assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", or "PBX".

4.19 ALT LANG

Description: Should the alternate language DSU2-RAF LASS announcements be used? This field supports the Alternate Language LASS Announcement feature, for more information on this feature see Division 2, Section 4A119.

Software Release: 5E8 and later
Default: N
Valid Entries: Y, N

Data Rules:

When ALT LANG is set to "Y", two FIXRT forms must be defined: one with "ALSLE" entered in FIXED ROUTE TYPE and one with "AL2LVL" entered in FIXED ROUTE TYPE.

LINE forms with an ALT LANG field set to "Y" indicate that the Alternate Language LASS Announcement Special Feature is to be used. It is a secured feature and must be purchased by the office before this field can be set to "Y". An SFSYS form must exist with SFID 119 ACT set to "Y".

4.20 UCR

Description: Is Unidentified Call Rejection assigned? When UCR is set to "Y", all calls to this line that are marked with a presentation status of private will be rejected without alerting the called party. Rejected calls will be routed to an uninterruptible announcement by means of the FIXRT form (Record 5301-1) with FIXED ROUTE TYPE of "UCRDENY".

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

SFID 47 must be set to "S" (SFID 47 must have ACT set to "Y" for 5E9(1) and later) on the SFSYS form (5713-1 Record) before UCR can be set to "Y".

UCR must be "N" when OE TYPE and NUMBER have not been entered.

When UCR is "Y", SHARED must be "N".

For 5E6 and later, UCR can be set to "Y" only when the TNs on this form have the LCC and RAX defined on an LCC form where CLASS OF SERVICE is "INDIV", "4WINDIV" or "PBX".

5. FORM ENTRIES - 5109-4 RECORD

5.1 BASE AND CONTROL, OFFICE

Enter the Base and Control Number and Office Name.

5.2 INDEX KEY

Description: The TN.
Valid Entries: 7 digits, 0 - 9.

LTSB

The following fields (Section 5.3 - Section 5.8) define LTSB (Line Time Slot Bridging) requirements. LTSB provides a software emulation of traditional metallically bridged two-party lines and off-premise extensions. A complete explanation of the feature and its associated translation requirements appears in Division 2, Section 1AC of this Guide. A member of an LTSB group cannot be a member of any other multi-party service. LTSB is available with 5E5 and later.

For 5E8 and later, LTSB is allowed with IDCU lines. When LTSB is used for IDCU lines, the OE must be in RT format, that is, LTSB is not allowed when the OE is in PUB43801 format (DS1 segment of the OE).

For 5E7 and later, IALT (Intra-Switch Analog Line Transfer) provides the ability to duplicate the line data associated with a TN, including per-line BRCS features, on an associate (new) OE number. The duplicate data assignment helps to minimize any outage associated with a move of analog OE numbers on a 5ESS Switch. This is a no change field. Provisioning of this feature is done via Recent Change. For more information, see Division 2, Section 4A80.

5.3 ASSOC OE TYPE

For 5E12 and later, this field has been renamed ASSOC OE. For information, see the ASSOC OE field description.

5.4 NUMBER

For 5E12 and later, this field has been renamed ASSOC OE. For information, see the ASSOC OE field description.

5.5 ASSOC OE

Description: This field has an entry for TYPE and an entry for NUMBER. The Associate Office Equipment indicates the port of the companion member in a 1-TN LTSB group or a 2-TN LTSB group. The port of the other member is entered in the TYPE and NUMBER fields on this LINE form.

Software Release: 5E12 and later

Copyright © 2003 Lucent Technologies

Valid Entries: **TYPE:**

The valid entries for this field are dependent upon the value entered in the ASSOC OE field.

If "A" is entered in the ASSOC OE TYPE field, then the entry in this field will be comprised of:

Valid TYPE Entries

Entry	Definition
A	Software Release: 5E12 and later. TR303/DNUS equipment number (INEN). See Division 2, Section 9J. Software Release: 5E13 and later. TSI Nail-Up of Consecutive DS0s for DNU-S. See Division 2, Section 4A349.
C	For a port that resides on Z-card within an ISLU (Integrated Services Line Unit) or within a RISLU (Remote Integrated Services Line Unit)
E	Software Release: 5E11 and later. The TN is associated with an AIU (Access Interface Unit).
G	Software Release: 5E8 and later. For a port that resides on IDCU Equipment with a 10-digit equipment number (GEN) for a remote terminal or a PUB43801.
L	For a port that resides on a Line Unit.
S	For a port that resides on an Integrated or Universal SLC (Subscriber Line Carrier).

NUMBER:

LINE EQUIPMENT NUMBER, TYPE "A"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Network Unit-Synchronous Optical Unit	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Remote Line	LINE	XXXX	0001-2048

If "A" is entered in the ASSOC OE TYPE field on the LINE or MLHLN, form(s) then the SM, DNUS, and RT values assigned to OE NUMBER[1,6] must correspond to the SM, UNIT NUMBER[2,2], and RT EX values assigned on any RTERM form.

If "C" is entered in the ASSOC OE TYPE field, then the entry in this field will be comprised of:

LINE EQUIPMENT NUMBER, TYPE "C"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Line Unit	LU	X	0-7
Line Group Controller	LGC	XX	00-15
Line Card	LC	X	00-31

If "C" is entered in the ASSOC OE TYPE field and a 1-TN LTSB group is being defined, then the SM, LU, LGC and LC values must match, respectively, the SM, (R)ISLU, LGC and POS values on an ISLULC form (5942 Record). Additionally, the POS value in the LINE CARDS list must have the corresponding TYPE set to "ZLC" or "SZLC" and the EQST field set to "O".

If "E" is entered in the ASSOC OE TYPE field, this AIU Equipment Number consists of:

OE NUMBER, TYPE E

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	AIU	XXX	000 - 104
Pack	PACK	XX	00 - 19
Circuit	CKT	XX	00 - 31
			Coin 00 - 15

Copyright © 2003 Lucent Technologies

When ASSOC OE TYPE is "E", and 1-TN LTSB is assigned (no second LINE form with an OE TYPE and NUMBER to match this ASSOC OE TYPE and NUMBER exists), then TYPE on the EQAIUP form (5746 Record) must be "AIZLP" or "AICLP".

If "G" is entered in the ASSOC OE TYPE field, this IDCU Equipment Number residing on a Remote Terminal consists of:

OE NUMBER, TYPE G - Remote Terminal

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	X	0 - 7 (5E10 and earlier)
		XX	00 - 42 (5E11 and later)
Remote Terminal	RT	XX	01 - 31
Line	LINE	XXXX	0001 - 2048

When Telephone Numbers(s) are assigned on the LINE input form(s) to IDCU equipment where ASSOC OE is entered assigning 1-TN LTSB to this TN and "G" is entered in the ASSOC OE TYPE field, the ASSOC OE NUMBER(s) must correspond to a Channel Unit position (i.e., CU XX/YY) with a value defined on the RTERM form. Note that the last two digits of the LINE NO. are determined by the CU XX/YY value (where XX is odd number range of 01-95 and YY is an even number of XX + 1). Both LINE NO. (POS) values in the pair are assignable for CU XX/YY type equal to "FSR", "MP", "SP", "SPOTS", "SF1" (5E9(1)), "DFXS" (5E9(2) and later), "SSV00" or "SSV10". Only the lower (odd) numbered LINE NO. value is assignable for CU XX/YY type equal to "COIN", "FXS" or "FXSLS". Errors will be reported for RTERM forms where RT INTERFACE equal to "TR008".

OE NUMBER TO RTERM CORRESPONDENCE

OE	RTERM
NUMBER[1, 3]	SM
NUMBER[4, 4]	UNIT NUMBER
NUMBER[5, 6]	RT EX
NUMBER[7, 8]	For OE TYPE equal to "M"
NUMBER[7, 10]	For OE TYPE equal to "G": POS value for CU XX/YY type equal to FSR, MP, SP, SPOTS, COIN, FXS, FXSLS, SSV00, SSV10

*Note: SF1 applies to 5E9(1) and DFXS applies to 5E9(2) and later; both indicate Dual FX Plugs.

If "L" is entered in the ASSOC OE TYPE field, then the entry in this field will be comprised of:

LINE EQUIPMENT NUMBER, TYPE "L"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Line Unit	LU	X	0 - 7 (5E9(1) and earlier)
		XXX	000 - 042 (5E9(2) and later)
Concentrator	CON	X	0-9
Switch Group	SWG	X	0-1
Switch	SW	X	0-7
Level	LEV	X	0-3

If "L" is entered in the ASSOC OE TYPE field and a 1-TN LTSB group is being defined, then the SM and LU values must match, respectively, the SWITCHING MODULE and LINE UNIT values on an EQLUP form (5711 Record). Additionally, the CON value must match an LU GRID X value (X = 0 to 9) with an EQUIPMENT STATUS of "G" or "O".

Copyright © 2003 Lucent Technologies

If "M" is entered in the ASSOC OE TYPE field, this IDCU Equipment Number residing on a Remote Terminal consists of:

OE NUMBER, TYPE M - Remote Terminal

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	X	0 - 7
Remote Terminal	RT	XX	01 - 31
Line	LINE	XX	01 - 99

When Telephone Numbers(s) are assigned on the LINE input form(s) to IDCU equipment where ASSOC OE is entered assigning 1-TN LTSB to this TN and "M" is entered in the ASSOC OE TYPE field, the ASSOC OE NUMBER(s) must correspond to a Channel Unit position (i.e., CU XX/YY) with a value defined on the RTERM form. Note that the last two digits of the LINE NO. are determined by the CU XX/YY value (where XX is odd number range of 01-95 and YY is an even number of XX + 1). Both LINE NO. (POS) values in the pair are assignable for CU XX/YY type equal to "FSR", "MP", "SP", "SPOTS", "SF1" (5E9(1)), "DFXS" (5E9(2) and later), "SSV00" or "SSV10". Only the lower (odd) numbered LINE NO. value is assignable for CU XX/YY type equal to "COIN", "FXS" or "FXSLS". Errors will be reported for RTERM forms where RT INTERFACE equal to "TR008".

OE NUMBER TO RTERM CORRESPONDENCE

OE	RTERM
NUMBER[1, 3]	SM
NUMBER[4, 4]	UNIT NUMBER
NUMBER[5, 6]	RT EX
NUMBER[7, 8]	For OE TYPE equal to "M"
NUMBER[7, 10]	For OE TYPE equal to "G": POS value for CU XX/YY type equal to FSR, MP, SP, SPOTS, COIN, FXS, FXSLS, SSV00, SSV10

*Note: SF1 applies to 5E9(1) and DFXS applies to 5E9(2) and later; both indicate Dual FX Plugs.

If "S" is entered (representing an Integrated SLC number) in the ASSOC OE TYPE field, then the entry in this field will be comprised of:

Integrated SLC EQUIPMENT NUMBER, TYPE "S"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Carrier Line Unit	DCLU	X	0-7
Remote Terminal	RT	XX	01-32
Line	LINE	XX	01-96

The RT value may only exceed 6 if the Integrated SLC is defined on a DCLURT form (5118 Record).

If "S" is entered in the ASSOC OE TYPE field and a 1-TN LTSB group is being defined, then the SLC must be defined on the SLCRT form (5106 Record) and the SLCCU form (5107 Record). The SM, DCLU and RT values must match the SM, DCLU and REMOTE TERMINAL values on a SLCRT form, respectively, and match the INTERFACE MODULE, DCLU and REMOTE TERMINAL values on a SLCCU form, respectively. Additionally, the LINE value must match a POS value, in the CHANNEL UNITS list of the SLCCU form, where a CU TYPE is entered.

Data Rules:

If either the ASSOC OE or the NUMBER field have an entry, then both fields must have an entry.

If the LEAD PORT or MAN EXCL field is set to "Y", then the ASSOC OE TYPE and NUMBER fields must have entries.

There are numerous fields, on the LINE form, that are affected by entries being made in the ASSOC OE

Copyright © 2003 Lucent Technologies

and NUMBER fields. If entries are made in the ASSOC OE and NUMBER fields, then the following conditions apply:

- OE TYPE/NUMBER must be entered
- OE TYPE/NUMBER must not be the same as ASSOC OE
- OE TYPE must be "A", "C", "E", "G", "L", or "S" for LTSB.
- if OE TYPE is "G", the OE NUMBER must not be in a PUB43801 format
- COIN must be "N" (LTSB only supports service classes of "INDIV", "TWOPTY", "2PTY"
- GNDREF must be "N"
- ATT MLHG must not be entered
- RBV TGN must be entered
- CARRIER GRP ALM must be entered
- The AC ALW and AR ALW fields will be assigned a value of "N".
- The CIDIAL field must be set to "ALLOW", "DENY" or "REQ".
- The SLEEVE LEAD CKT field must not have an entry.
- The FGA, BUSY MONITOR and SHARED fields must be set to "N".
- For 5E12 and earlier, NO DIAL must be "N".

The combination of entries in the ASSOC OE and NUMBER fields must not be duplicated in the ASSOC OE and NUMBER fields on any other LINE form.

When TN(s) are assigned on the LINE form with an ASSOC OE entry that assigned 1-TN LTSB to a TN (1-TN LTSB means that there is not a second LINE form with an OE TYPE and NUMBER to match this ASSOC OE and NUMBER) and the ASSOC OE is "S" which corresponds to a SLC equipment number (SLEN), the ASSOC OE NUMBER must correspond to a Channel Unit Position with a known value defined on the SLCCU form. Note that LINE NO. values (last two digits of the NUMBER field on the LINE form) are determined by the CU TYPE value. Both LINE NO. (POS) values in the pair are assignable for CU TYPE equal to "SP", "MP", "SPOTS", "FSR", "SF1" (5E9(1)) or "DFXS" (5E9(2) and later). Only the lower (odd) numbered LINE NO. value is assignable for CU TYPE equal to "COIN", "FXS", "FXSLS", "SSV00" or "SSV10".

5E5 and later:

When LINE forms have 1-TN LTSB (Line Time Slot Bridging) assigned and a corresponding LINEFA form has BRCS FEATURES assigned, the following features are allowed if they have the correct options or parameter values required by the 1-TN case of LTSB.

BRCS Features - 5E5 and later

Feature	Form	Field Entries
Call Forwarding Using Call Forwarding Variable	CFWFD	FORWARD CONDITION = "BOTH"
Call Waiting Terminating with Flash Allowed	CWTFD	INVOCATION = "TERM" FLASH ON FORWARD = "Y"
Multi-Way Calling not invoked by Call Pickup Terminating	MWFD	
One and Two-Digit Speed Calling that is	SCFD	SC SHARED = "Y"

Copyright © 2003 Lucent Technologies

Shared		

BRCS Features - 5E6 and later

Feature	Form	Field Entries
LASS Automatic Callback	LSACFD	
LASS Automatic Recall	LSARFD	
LASS Selective Call Acceptance	LSCAFD	
LASS Selective Call Forwarding	LSCFFD	
LASS Selective Call Rejection	LSCRFD	
LASS Selective Distinctive Alerting	LSDAFD	

If ASSOC OE is entered:

- ATT MLHG must not be entered.
- OE TYPE must be "C", "E", "G", or"L".

5E6 and later:

If ASSOC OE TYPE is entered, then AC ALW and AR ALW must be "N".

- ***NOTE:*** The last two digits of the LINE NO are determined by the CU value (xx/yy), where xx is in the odd number range of 01-95 and yy is xx + 1. Note that both LINE NO. (POS) values in the pair are assignable for CU xx/yy type equal to "FSR", "MP", "SP", "SSV00", "SSV10" "SF1" (5E9(1)), "DFXS" (5E9(2) and later) or SPOTS". Only the lower (odd) numbered LINE NO. value is assignable for CU xx/yy type equal to "COIN", "FXS", or "FXSLS".

5E8 and later:

If ASSOC OE is entered, RBV TGN must not be entered.

The ASSOC OE TYPE on the LINE form must be blank as LTSB (Line Time Slot Bridging) is not allowed on PUB43801. If OE TYPE is equal to a "G" or "M" unit which has TR008 RTs defined on the RTERM form (5174 Record), the ASSOC OE (TYPE/NUMBER) must correspond to a CU (Channel Unit) position with a known value defined on the RTERM form.

5E9(1) and later:

When a TN is defined on a LINE form with an ASSOC OE TYPE and NUMBER specified for LTSB (Line Time Slot Bridging), and a second LINE form with an OE TYPE and NUMBER which matches the ASSOC OE TYPE and NUMBER from the first LINE form, 2 TN LTSB is assigned to both lines. The AC ALW and AR ALW fields on either of these LINE forms must not have an entry of "Y". Neither LASS Auto Callback or LASS Auto Recall is supported for 2-TN LTSB lines.

5E11 and later:

When ASSOC OE is entered, CARRIER GRP ALM cannot be entered.

The ASSOC OE TYPE and NUMBER on the LINE form must not match an OE TYPE and NUMBER on the MLHLN form.

When LINE and/or MLHLN forms have an ASSOC OE TYPE and NUMBER for LTSB entered, the same ASSOC OE TYPE and NUMBER cannot be duplicated on two or more forms. Each ASSOC OE TYPE and NUMBER must be unique.

When a TN(s) is defined on a LINE form with an ASSOC OE TYPE and NUMBER entered assigning 1-TN Line Time Slot Bridging (LTSB) to this TN and the corresponding LINEFA form has one or more of the following BRCS features entered, SFID 262 ACT must be set to "Y" on the SFSYS form since 1-TN LTSB assigned with these BRCS features is a secured feature (IBDS, Package 1).

Copyright © 2003 Lucent Technologies

The BRCS features for this secured feature are the following:

BRCS Features

Feature	Form	Field Entries
Call Forwarding: Busy Line and Don't Answer	CFWD	FWD CONDITION = "BUSY" or "IDLE"
Incoming Line Identification	LIDFD	CNAM,, CALL NBR DELIV PRIM,, or CALL NBR DELIV ALL = "Y"
Message Service System	MSFD	
Display Feature Per-Call Privacy	DISPFD	TN PRIV = "Y"

When LINE forms have an LTSB (1-TN Line Time Slot Bridging) feature assigned (an ASSOC OE TYPE and NUMBER were entered), the SFID 262 ACT field on the SFSYS form must be set to "Y" before the SERHLN field can be entered since the Series Completion with 1-TN LTSB is a secured feature.

5E12 and later:

For a TN(s) defined on a LINE form, when an ASSOC OE is entered assigning a 1-TN LTSB, and the corresponding LINEFA form has one or more of the following BRCS features assigned, the 1-TN LTSB with these features is the secured feature, IBDS (Internally Bridged Dual Services), Package 2. Therefore, SFID 263 ACT field on the SFSYS form must be set to "Y". In addition, the 1-TN LTSB with IBDS, Package 1 is a secured feature, which is required for IBDS, Package 2 features. Therefore, SFID 262 ACT field must be set to "Y" before the SFID 263 ACT field can be set to "Y".

Valid BRCS Features

Feature	Form	Entries
Dial Call Waiting Call Waiting Originating	CWTFD	INVOCATION= "CODE", "ORIG", or "TERM", and CW DELUXE="N", and FLASH ON FORWARD="Y".
LASS Customer Originating Trace	LSCOTFD	
Distinctive Ringing	DRFD	
Individualized Dialing Plan	IDFD	
Message Detail Recording	MDRFD	
Private Facilities Access without Queueing	PFAFD	
Terminal Group Station Restriction	TGSFRFD	

1-TN LTSB with the Calling Identity Delivery on the Call Waiting feature is part of the IBDS, Package 2 feature which is a secured feature. Therefore, when a LINE form has LTSB assigned, the SFID 263 ACT field on the SFSYS form must be set to "Y" before CID CW can be set to "Y" on the LINE form.

Queueing is not allowed for 1-TG LTSB. For a TN(s) defined on a LINE form with an ASSOC OE entered, which is assigned 1-TN LTSB and a PFA (Private Facility Access) feature is assigned on the corresponding LINEFA form, then QUEUE ALLOWED or PRIORITY QUEUE must be "N" on the BFG and PFALPA forms. In addition, QUEUE ALLOWED or PRIORITY QUEUE must be "N" on the PFAFD form, unless these parameters are overridden on the corresponding BFG or PFLPA forms. For 5E13 and later, when the ACT field for SFID 280 on the SFSYS form is set to "Y", queueing is allowed, (i.e., QUEUE ALLOWED and PRIORITY QUEUE can be "Y").

5E13 and later:

The following checks for SFID 280 are related to the IBDS3 (Internally Bridged Dual Service - Package 3) feature. For more information on this feature, see Division 2, Section 4a280.

Copyright © 2003 Lucent Technologies

If the ASSOC OE on the LINE form is entered, NO DIAL must "N", unless the ACT field for SFID 280 on the SFSYS form is set to "Y". If SFID 280 is set to "Y", ASSOC OE can be "HOTN".

The ACT field for SFID 280 on the SFSYS form must be set to "Y" when the TNs defined on a LINE form with the ASSOC OE TYPE and NUMBER entered, assigning 1-TN or 2-TN LTSB (Line Time Slot Bridging) to the TN, and the corresponding LINEFA form has one or more of the following BRCS features entered:

Valid BRCS Features

Feature	Form
Account Codes	ACCTFD
Automatic Route Selection	ARSFD
Advanced Services Interface	ASIFD
Authorization Codes	ATHFD
Bulk Calling Line Identification	BCLIDFD
Call Waiting Deluxe	CWTFD (CW DELUXE = "Y"
Time of Day	TODFD

When a LINE form(s) has the ASSOC OE entered that matches an OE on another LINE form, this assigns 2-TN LTSB (Line Timeslot Bridging). When 2-TN LTSB is assigned, the NO DIAL field on the same LINE form must be set to "N".

5E15 and later:

The following checks for SFID 575 are related to the LTSB Interworking with Home Intercom feature. For more information on this feature, see Division 2, Section 4A575.

When the TN is defined on a LINE form with ASSOC OE TYPE and NUMBER entered, assigning 1-TN LTSB (Line Time Slot Bridging) to the TN and this TN is also assigned Home Intercom as a BRCS feature on a corresponding LINEFA, CLUSTR , or BFG form, then the ACT field for SFID 575 on the SFSYS form must be set to "Y".

When the ACT field for SFID 575 on the SFSYS form is set to "Y", the ACT field for SFID 280 must also be set to "Y", since the LTSB Interworking with Home Intercom feature depends on the IBDS (Internally Bridged Dual Service) Package 3 feature.

5E16 and later:

When ASSOC OE is entered, OE TYPE must be "A", "C", "E", "G", "L", "S", or "Y" for LTSB.

5.6 LEAD PORT

Description: Is the port defined in the OE TYPE and NUMBER fields the lead port for this LTSB group? If a 1-TN LTSB group is being defined, this field must be "Y". If a 2-TN LTSB group is being defined, which requires two LINE forms, one and only one of the forms can have this field must be "Y".

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

5.7 IALT

Description: Is Intra-switch Analog Line Transfer active? This field is a no change field and defaults to "N". For more information, see Division 2, Section 4A80.

WARNING: The IALT feature is not supported during a retrofit. Before a retrofit can be performed, IALT procedures must be complete, and IALT must be "N" on Recent Change View 1.6.

Software Release: 5E7 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N

5.8 MAN EXCL

Description: Can the ports defined in the OE TYPE/NUMBER combination and the ASSOC OE TYPE/NUMBER combination exercise the Manual Exclusion feature? The Manual Exclusion feature is only applicable to 1-TN LTSB groups. The value entered in this field applies to both members of the group. The Manual Exclusion feature is also not applicable to 2-TN LTSB groups. The value entered in this field, on both of the LINE forms required, must be set to "N".

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

4-WIRE SPECIFICATIONS

The following fields Section 5.9 - Section 5.13 are used in DSN (Defense Switched Network) offices. DSN is set by an entry of "Y" the DSN OPTION field on the OFCOPT form (5509 Record). An entry in these fields is only valid for lines that have a CLASS OF SERVICE (LCC form) of "4WINDIV". These fields should be entered only when OE TYPE is "D", "N" or "T".

5.9 ROUTINE RINGING

Description: The type of routine ringing desired for 4-wire access lines.

Valid ROUTING RINGING Entries

Entry	Definition
4WOFF	Offhook alerting
4W24	2-second offhook, 4-second onhook

Data Rules:

For 5E4(2) and later, if CONFERENCE BRIDGE is "Y", then ROUTINE RINGING must be "4WOFF".

5.10 PRIORITY RINGING

Description: The type of priority ringing desired for 4-wire access lines.

Valid PRIORITY RINGING Entries

Entry	Definition
4WOFF	Offhook alerting
4W350	Simple wink - 350ms offhook, 350ms onhook, offhook
4W1650	Continuous 1650ms offhook, 350ms onhook

Data Rules:

For 5E4(2) and later, if CONFERENCE BRIDGE is "Y", then PRIORITY RINGING must be "4W350".

5.11 AUDIBLE RINGING

Description: Does the 4-wire subscriber line equipment provide its own audible ring?
Default: N
Valid Entries: Y, N

5.12 INC. START SIGNAL

Description: The type of incoming start signal required for 4-wire subscriber lines.
Default: DIALTONE

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid INC. START SIGNAL Entries

Entry	Definition
DIAL TONE	Dial Tone.
GRND	Software Release: 5E10 and later. Ground Start Supervision FX Trunk. See the 4-Wire on Lines on DFI feature, Division 2, Section 7W.
LOOP	Software Release: 5E10 and later. Loop Start Supervision FX Trunk. See the 4-Wire on Lines on DFI feature, Division 2, Section 7W.
WINK	Wink Start
WNKDT	Wink Start and Dial Tone

Data Rules:

If CONFERENCE BRIDGE is "Y", then INC. START SIGNAL must be either "WINK" or "WNKDT".

5.13 CONFERENCE BRIDGE

Description: Is the 4-wire subscriber line a conference bridge connection?
Default: N
Valid Entries: Y, N

Data Rules:

If CONFERENCE BRIDGE is "Y", then PRIORITY RINGING must be "4W350".

5.14 ASP ALW

Description: Is this line allowed to originate ASP (Advanced Services Platform; previously PVN, Private Virtual Network) calls via an ODP Feature/Prefix Code trigger?.

Software Release: 5E6 through 5E8
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PVN OFC on the OFCOPT form (5509 Record) is set to "NONE", then this office does not support ASP, and PVN ALW must be "N". PVN ALW may be set to "Y" only if the corresponding LCC form (5306 Record) has a CLASS OF SERVICE of "INDIV" or "ATND".

If PVN ALW is "Y" and NO DIAL is "HOT", then this line is direct-connected to ASP services, and the corresponding LCC form (5306 Record) must have a CLASS OF SERVICE of "INDIV" and a DIGIT ANALYSIS SELECTOR set to PVN DAS on the OFCOPT form (5509 Record).

A line dedicated to ASP services should not be entered as part of a Series Completion Group. When PVN ALW is set to "Y" and SERHLN is entered, then the DIGIT ANALYSIS SELECTOR on the corresponding LCC form (5306 Record) cannot be PVN DAS on the OFCOPT form (5509). Likewise, DIGIT ANALYSIS SELECTOR should not be a DAS equivalent in functionality to the aforementioned PVN DAS (i.e., a virtual ASP DAS).

5.15 SCD SCRNING

Description: This field is set to "Y" by Recent Change if at least one carrier has requested SCD Screening for this line. SCD Screening is a function of the Selective Carrier Denial feature which is available in 5E5 and later Software Releases.

Copyright © 2003 Lucent Technologies

5.16 CLSS

Description: Is the Calling Line Side Supervision active on this line? If "Y" is entered, the calling party will detect a battery reversal upon called party answer, and another battery reversal (returning to normal state) upon called party disconnect. This field is used by the CLSS (Calling Line Side Supervision) feature. CLSS is a secured feature, and must be purchased before it can be assigned.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The SFID 63 ACT field on the SFSYS form must be set to "Y" before CLSS can be set to "Y".

If CLSS is set to "Y" and the LCC/RAX is defined on an LCC form where CLASS OF SERVICE is "INDIV" or "PBX", which qualifies the line for use of LASS GA (Generally Available) features, then the LINE form must have AC ALW, AR ALW, COT ALW, PCP ALW, SCA GA ALW, SCF GA ALW, SCR GA ALW and SDA GA ALW all set to "N" since lines subscribing to CLSS are not compatible with LASS GA features.

If CLSS is set to "Y", this requires that LCC/RAX be defined on an LCC form where CLASS OF SERVICE is "INDIV", "PBX" or "HOTPBX".

CLSS may only be "Y"when:

- OE TYPE/NUMBER is entered.
- ASSOC OE TYPE is not entered.
- BUSY MONITOR is "N".
- SHARED is "N".
- BRCS is "N".
- AC ALW, AR ALW, COT ALW, PCP ALW, SCA GA ALW, SCF GA ALW, SCR GA ALW, and SDA GA ALW are blank or "N".

5.17 MCLD DEACT

Description: Is MCLD (Modified Calling Line Disconnect Procedure for Fraud Protection) deactivated for this line when it is active on this SM?

The MCLD feature is enabled by setting FID 517 to "S" on the FOSYS form (5713-2 Record).

When MCLD is enabled and MCLD DEACT is set to "N", this line will receive Permanent Signal Treatment following expiration of the disconnect timer. This will force the line to go back onhook before originating another call. When MCLD is enabled and MCLD DEACT is set to "Y", this line will receive dialtone following expiration of the disconnect timer.

The MCLD feature applies only to analog lines. For more information, see Division 2, Section 4C.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If OE TYPE and NUMBER have not been entered, then MCLD DEACT must be "N".

5.18 BLK 1PLUS

Description: Enter the type of blocking treatment for this line.

Software Release: 5E6 and later
Required Field.
Default: NONE
Valid Entries:

Valid BLK 1PLUS Entries

Entry	Definition
FULL	Full 1+blocking will be provided for this line. Full blocking will block all 1+ calls except those to an operator.
SPLIT	Split 1+blocking will be provided for this line. Split blocking will block Feature Group D CAC 1+ calls if the carrier dialed is not the pre-subscribed carrier, but will allow 1+ calls to an operator.
NONE	No blocking treatment will be provided for this line.

Data Rules:

If OE TYPE and NUMBER have not been entered, then BLK 1PLUS must be "NONE".

If BLK 1PLUS equals either "FULL" or "SPLIT", the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV", "PBX", "HOTPBX", "HOTMOTL", "COIN", "ATND", "ISDN", "ISATND", or "SATSTLN".

5.19 LONG DST DR

Description: Is distinctive ringing supplied for long distance calls? This field supports the Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls secured feature. For more information on this feature, see Division 2 Section 4A91.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a secured feature that must be purchased by the office before the LONG DST DR field can be changed from its default value on either the LINE, MLHLN, or DSLUSR forms. The SFID 91 ACT field on the SFSYS form (5713-1 Record) mustbe set to "Y", before the LONG DST DR field can be set to "Y".

If the LINE, MLHLN, and/or DSLUSR forms have LONG DST DR set to "Y", the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "ATND", "INDIV", "ISATND", "ISDN", or "PBX".

USTWC

The following fields Section 5.20 - Section 5.22 are used for the secured feature Usage Sensitive 3-Way Calling. For more information concerning this feature, see Division 2, Section 4A156.

5.20 USTWC ALW

Description: Is Usage Sensitive 3-way calling allowed?

Software Release: 5E8 and later

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If USTWC ALW is "Y", then CLSS, NO DIAL, and SHARED must be "N".

If USTWC ALW is set to "Y" on the LINE and/or MLHLN forms, then the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV" or "PBX".

5.21 SUBSCR USTWC

Description: Is this line subscribed to USTWC (Usage Sensitive Three-Way Calling)? This field supports Spontaneous USTWC feature, which is a secured feature (SFID 156). For more information on this feature, see Division 2, Section 4A156.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then:
- CLSS must be "N"
- NO DIAL must be "N"
- SHARED must be "N"

If "Y" is entered for this field on the the LINE and/or the MLHLN form, the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV" or "PBX".

5.22 USTWC ALW XFER

Description: Allow Usage Sensitive Three Way Calling with Call Transfer? This field supports the Per-Use Three Way Calling with Call Transfer feature. This feature is a secured feature. For more information, refer to Division 2, Section 4A577.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When USTWC ALW XFER is "Y", USTWC ALW or SUBSCR USTWC must be "Y"

When USTWC ALW XFER is "Y", ACT field must be "Y" for SFID 577 on the SFSYS form (5713-1 Record).

5.23 CID CW

Description: Assign Calling Identity Delivery on Call Waiting? For more information about this field, see Division 2, Section 4A133, which describes the Calling Identity Delivery on Call Waiting secured feature. This feature requires the purchase and activation of the secured feature Switch-To-CPE Analog Off-Hook FSK Data Interface with the ACT field for SFID 140 set to "Y" on the SFSYS form. For more information about this feature, see Division 2, Section 4A140.

Software Release: 5E9(1) and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If CID CW is "Y", then BRCS must be "Y".

The ACT field for SFID 133 on the SFSYS form (5713-1 Record) must be set to "Y" before CID CW can be set to "Y".

If a TN has CID CW set to "Y" on this form, then the TN must

- be assigned a Call Waiting Terminating feature defined on the CWTFD form with INVOCATION set to "TERM"
- be assigned a Line Identification feature defined on the LIDFD form with OUTGO CLD LINE ID set to "N" and CALL NBR DELIV PRIM, CALL NBR DELIV ALL, or CNAM set to "Y"
- have appropriate features assigned on the LINEFA, CLUSTR, or BFG form.

If CID CW is "Y", the LCC and RAX must be defined on an LCC form with CLASS OF SERVICE of "ATND", "INDIV", "4WINDIV" or "PBX".

NUMBER PORTABILITY

The following fields (Section 5.24 - Section 5.25) were added to accommodate local number portability. This is a secured feature with SFID 199. For more information on Number Portability, see Division 2, Section 4A174.

5.24 LRN INDEX

Description: Enter the index into the LRNINDEX form (5328 Record) for Local Number Portability. LRNs are used to route DNs that have been ported into the office from other switches. AN LRN uniquely identifies an office and rate center. This field supports the Local Number Portability secured feature (SFID 174). For more information concerning this feature, see Division 2, Section 4A174.

Software Release: 5E11 and later
Valid Entries: 1 - 127

Data Rules:

When a TN is assigned on a LINE form and LRN INDEX is entered, then the LRN INDEX must also be entered on the LRNINDEX form (5328 Record).

5.25 PORTED

The PORTED field is used to indicate whether the TN has been ported into this office via the LNP (Local Number Portability) feature. The indicator is used by call processing to determine whether or not to generate an LNP BAF (Bellcore AMA Format) module for originating and terminating IXC access records.

This field was added for the AMA Billing feature. For more information on AMA Billing, see Division 2, Section 4A199.

5.26 NON COND TRIG

Description: The NON COND TRIG field is used to indicate whether or not a call to this DN requires a non-conditional query of the SCP (Service Control Point) prior to routing the call.

Copyright © 2003 Lucent Technologies

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When SERHLN exists, NON COND TRIG must be "N".

When ICP is "Y", NON COND TRIG must be "N".

When NON COND TRIG is "Y":

- the ACT field for SFID 216 must be set to "Y" on the SFSYS form, and if SFID 216 is set to "Y", SFID 174 must also be set to "Y"
- the CLASS OF SERVICE and TERMINATING TREATMENT on the LCC form should be as follows:
  - Valid CLASS OF SERVICE
    - "10PTY", "2PTY", "4PFS", "4PSS", "5PTY", "8PSS", "ATND", "CHGCALL", "COIN", "HOTMOTL", "HOTPBX", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN", "TWOPTY", "4WINDIV"
  - Valid TERMINATING TREATMENT
    - "INDIV", "INWATS", "MLHG", "PARTY"

ADVANCED SERVICES PLATFORM

The following fields (Section 5.27 - Section 5.28) were added to accommodate the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. This is a secured feature with SFID 210. For more information on this feature, see Division 2, Section 4A210.

5.27 OFC OBL INH

Description: The OFC OBL INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by individual lines. It indicates whether the ASP Office Originating Busy Line Office Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating Busy Line Office Trigger is inhibited.

This field was added for the ASP Inhibiting of Originating Busy/No Answer Office Triggers. For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, Section 4A210.

Required Field.

Data Rules:
When the inhibiting feature has not been purchased, OFC OBL INH must be "N".

5.28 OFC ONA INH

Description: Description: The OFC ONA INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by

Copyright © 2003 Lucent Technologies

individual lines. It indicates whether the ASP Office Originating No Answer Office Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating No Answer Office Trigger is inhibited.

This field was added for the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, Section 4A210.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC ONA INH must be "N".

5.29 URT FCD BLK

Description: Should all Unrestricted FCD Codes be blocked from this TN?

- ***NOTE:*** On the LINE, MLHLN, and DSLUSR forms this URT FCD BLK field is intended for use on individual or line attendant lines only.

This field was added for the ASP Unrestricted FCD Trigger feature. For more information, see Division 2, Section 4A572.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The secured feature ASP Unrestricted FCD Code Triggers must be purchased before URT FCD BLK can be changed to "Y" on the LINE form, therefore the ACT field for SFID 572 on the SFSYS form must be "Y".

For 5E15 and later, when the LINE form has "Y" entered in the URT FCD BLK field, a corresponding LCC form must have "INDIV" or "ATND" entered in the CLASS OF SERVICE field. LCC corresponds with a LINE form when the LCC and RAX fields match.

5.30 BLK LN CODE

Description: This is a text only field that indicates if a LNBLKCOD form exists for this TN.

This field was added for the ASP Unrestricted FCD Tigger feature. For more information on, see Division 2, Section 4A572.

Software Release: 5E15 and later

5.31 INHIBIT DEL

Description: Should the deletion of this line be inhibited?

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

NOTE: INHIBIT DEL must be set to "N" before deletion is allowed.

Data Rules:

When INHIBIT DEL field is "Y", OE or RTIDX must be entered.

5.32 CONTEXT ID

Description: This field is used to indicate whether or not a line is set to "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E13: N
- For 5E14 and later: NATIVE

Valid Entries:

Valid CONTEXT ID Entries

Entry for 5E12, 5E13	Entry for 5E14 and later	Description
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the LINE form, the ACT field for SFID (Secured Feature ID) 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

When the CONTEXT ID field is set to "R" or "RESOLD" or, "UNBUNDLED" on the LINE form, there must be an LCC form (5306 Record) where the RAX and LCC has the CLASS OF SERVICE set to one of the following:

- ATND
- CHGCALL
- COIN
- HOTMOTL
- HOTPBX
- INDIV
- ISDN
- ISATND
- PBX
- TWOPTY
- 2PTY

Copyright © 2003 Lucent Technologies

- 4PSS
- 4WINDIV
- 5PTY
- 8PSS
- 10PTY

USAGE SENSITIVE CALL FORWARDING

The following fields (Section 5.33 - Section 5.34) were added to accommodate the Usage Sensitive Call Forwarding feature. This feature is secured with SFID 544. Refer to Division 2, Section 4A544 for further details pertaining to this feature.

5.33 USCF ALW

Description: Allow Usage Sensitive Call Forwarding on the specified line?

Software Release: 5E15 and later
Default: Y
Valid Entries: Blank, Y, or N

NOTE: When this field is left blank, it is defaulted to "Y" provided the following data rules are met. Otherwise, it is populated with "N".

Data Rules:

When USCF ALW is "Y",

- SHARED must be "N",
- CLSS must be "N",
- NO DIAL must be "N",
- ASSOC OE must not be entered.
- RAX and LCC must be defined on the LCC form with CLASS OF SERVICE equal to "INDIV", "4WINDIV" or "PBX".

5.34 USCF ACT

Description: Is Usage Sensitive Call Forwarding active on this line?

Software Release: 5E15 and later
No change field.
Default: N
Valid Entries: Y or N

USAGE SENSITIVE SIX-WAY CALLING

The USSCW ALW field was added to accommodate the Usage Sensitive Six-Way Calling feature. This is a

Copyright © 2003 Lucent Technologies

secured feature with SFID 553. For more information on this feature, see Division 2, Section 4A553.

5.35 USSWC ALW

Description: Should Usage Sensitive Six-Way Calling be allowed? The USSWC ALW field verifies whether or not the Usage Sensitive Six-Way Calling feature is allowed on a specified line. No entry is required; this is an optional field. For more information on this feature, see Division 2, Section 4A553.

Software Release: 5E15 and later
Default: Blank
Valid Entries: Blank, or enter Y or N

Data Rules:

When USSWC ALW is "Y":

- RTI must not be entered
- COIN must be "N"
- NO DIAL must be "N"
- TEST CODE must not be entered
- SA TST ROUTE must be "N"
- SHARED must be "N"
- CLSS must be "N"

On-Hook Data Transmission

5.36 FSK OSI

Description: This field is used to indicate the per-line control of sending the OSI (Open Signaling Interval).

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

For 5E15 and later:

- When GST is "Y", FSK OSI must be "N".
- When FSK OSI is "Y", the LCC and RAX on the LCC form (5306 Record) must have CLASS OF SERVICE equal to "ATND" or "INDIV".
- When FSK OSI is set to "Y", the ACT field for SFID 613 on the SFSYS form (5713-1 Record) must also be set to "Y".

MULTIPLE WORK STATION NUMBERS
With Multiple WSNs 1, 2, 3, and 4, the TLWS form would be submitted with four entries with a Talk and Monitor (T&M) phone assigned to WSN 1, 3, and 4. Note that WSN=1 is the MCC/TLWS; WSN 2=SCC/TLWS; WSN 3 and 4=Supplemental TLWSs

TLWS Form (5511 Record)

SEC. 1J: 5110-1/2/3/4 RECORD MULTI-LINE HUNT GROUP FORM - MLHG

1. GENERAL

The 5110-1/2/3/4 Record is available with 5E2 and later Software Releases, and is used to define Multi-Line Hunt Group information. The 5110-2 Record is used to define MUPH (Multiple Position Hunt) for nondata link attendant console positions.

1.1 MLHG Feature Assignment

Multi-Line Hunt Group features are to be assigned to Multi-Line Hunt Groups not individual lines. They cannot be assigned to the CLUSTR (5600 Record), LINEFA (5112 Record), MLHLNFA (5113 Record) or TRUNKFA (5205 Record) forms.

1.2 Circuit Switching Hunt Types

The 5ESS Switch offers four types of hunting within a Multi-Line Hunt Group: Regular Hunt, Circle Hunt, Uniform Call Distribution, and Multiple Position Hunt.

Regular Hunt is an arrangement in which hunting begins with the Start Hunt Terminal Number and continues sequentially through the last terminal number in the Multi-Line Hunt Group.

Circle Hunt is an arrangement in which hunting begins with the Terminal Number associated with the called number, and continues sequentially through the last terminal number in the Multi-Line Hunt Group. Hunting resumes starting with Terminal Number 1, and continues through the Terminal Number preceding the Start Hunt Terminal Number.

Uniform Call Distribution is an arrangement in which hunting begins when the main Directory Number of a UCD hunt group is dialed. For example, if a call is directed to the main Directory Number, a hunt for an available member would start at the "start hunt member". This is UCD hunt. However, when a Directory Number of a member of a UCD hunt group is dialed, a Circular Hunt starting at the dialed member is made and the UCD hunt is not used. For example, if a call is directed to a member of the UCD hunt group, the UCD function recognizes that the call is not directed to the main Directory Number of the group, and therefore, it does not start the hunt at the "start hunt number"; instead the hunt starts at the member of the dialed Directory Number.

Multiple Position Hunt is an arrangement in which hunting begins when a subgroup Directory Number is dialed. A subgroup is one of the six possible Directory Numbers in a MUPH group of a nondata link attendant console in a Multi-Line Hunt Group. MUPH uses a two stage hunt to complete a call. The first stage of hunting, which begins with the start hunt position, is a circular search for an idle console (position) in the hunt group. The second stage of hunting is a sequential search for an idle line of matching Call Type (subgroup) assigned to that console. Once an idle console (position) with an idle line of the desired Call Type is found using the two stage hunt, the call is then completed. MUPH only allows one call at a time to complete to an idle console.

1.3 Packet Switching Hunt Types

The 5ESS Switch offers two types of hunting for Packet MLHGs. For 5E3 and later, the primary hunt method assigned to all Packet MLHGs is "PSUCD" (Uniform Call Distribution). For 5E8 and later, packet MLHG members may optionally be assigned Linear Hunt TNs as entry points for linear hunting into the MLHG.

With the UCD algorithm, the first member of the MLHG is designated as the start hunt member when the switch is initialized or when the MLHG is created. Hunting begins with this member when the first incoming packet call is placed to the MLHG. When an idle member is found, a start hunt member for the next call is selected via a "pre-hunt". This start hunt member is the first non-busy hunt group member that

Copyright © 2003 Lucent Technologies

is a successor to the hunt group member to which the call was offered. When a subsequent hunt call is made, the UCD hunting algorithm begins at this member. The member may become busy in the interim; for example, enough non-hunted calls to the member or enough originations from the member could have made the member busy for hunting. In this case, hunting would proceed to find the next non-busy member in the normal manner.

The Linear Hunt algorithm for packet MLHGs is similar to the Regular Hunt type for circuit MLHGs. The linear hunt begins with the start hunt terminal and continues sequentially through the last terminal number of the MLHG.

1.4 RSM Stand-Alone Announcements

The Remote Switching Module Stand-Alone Announcement capability provides the RSM with the ability to connect a stand-alone announcement to RSM customers. The type of announcement machines the customer can use are those which are commercially available to connect to the RSM by using lines (LENs) as opposed to a 13A Recorded Announcement machine mounted on a Trunk Unit.

Each port of the announcement machine connects to one line (LEN) on a Line Unit. The lines of this announcement group must be defined as a "local" Multi-Line Hunt Group (each member is assigned to the same SM). The number of simultaneous announcements which can be given is equal to the number of members (terminals) in the MLHG.

The Stand-Alone Announcement is routed to only when RSM goes into Stand-Alone mode. It is not available for general announcement use.

The 5ESS Switch provides these line side RSM announcements on a barge-in basis. Some commercially available announcement machines may have their own non-barge in option which is implemented by not answering the "call" to the announcement port until the beginning of the announcement.

The 5ESS Switch does not provide a forced disconnect treatment for what looks like a standard call to a line. If a subscriber should refuse to go on-hook, then the particular announcement port that the customer is connected to will be indefinitely busy. Some commercially available announcement machines have their own time disconnect option based on the customer exceeding some given number of cycles of the announcement.

A call through a Line Unit has the possibility to be blocked, due to the nature of the space division line concentrator. The subscriber would receive reorder instead of the Line Side Stand-Alone Announcement. To minimize the possibility of line concentrator blocking, it is recommended that the switch owner spread the actual LEN assignment of the MLHG Terminal Number over several Line Concentrators within the RSM.

When all lines in the MLHG, RSM Line Side Stand-Alone Announcement are busy, then reorder instead of busy tone will be provided.

1.5 Initial Offices

For initial offices only, an MLHG must have at least one member defined on an MLHLN (5111 Record), OSPSDSL (5411 Record) or DSMLHLN (5901 Record) form. If the definition is on the MLHLN form, the TERM field must be entered.

If the definition is on the OSPSDSL form: "XDB" must be entered in the SERVICE CLASS field; the MLHG entered in the DSL NAME ID field; and an MLHG member number entered in the DSL NAME RL field. An associated MLHGFD form (5604 Record) must exist with a HUNT TYPE of "PSUCD".

If the definition is on the DSMLHLN form, then the CKT TERM or PKT TERM fields must be entered.

1.6 Release Link Trunks

Copyright © 2003 Lucent Technologies

RLTs (Release Link Trunks) are provided between a main switch and branch switches to enable the attendant to implement Centralized Attendant Services. The 5ESS Switch can function as either a main or a branch switch. Refer to Division 2, Section 1AI, for more information on CAS/RLS.

1.7 Recent Change View

The corresponding Recent Change View for this form is 3.5.

2. FORM ENTRIES - 5110-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and Office Name.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

When assigning Multi-Line Hunt Group Numbers, entries exceeding 999 are not recommended until the range of 1 - 999 is completely exhausted.

When the MLHG has been defined as a Modem Pool Group by entering a value for MPTYPE (excluding "BILL" and "NOBILL") and a CLASS OF SERVICE of "MODEM" on the corresponding LCC form (5306 Record), the matching MLHLN forms (5111 Record) must have CIDIAL set to "REQ".

For 5E15 and later, ACT must be "Y" for SFID 351 in order for MLHG numbers to be in the range of 2001 - 8191.

2.3 # MLHG FEATURE

Description: Enter the Multi-Line Hunt Feature Name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The feature name must be defined on a corresponding MLHGFD form (5604 Record) either as a preconstructed or switch owner constructed feature.

2.4 LISTED TN

Description: Enter the listed Telephone Number of the MLHG.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The LISTED TN must be entered when HUNT TYPE on the MLHGFD form is "REG", "HTC", or "UCD".

Copyright © 2003 Lucent Technologies

For 5E3 and later, it must also be entered when HUNT TYPE is "PSUCD", or "PMHG".

For "REG", "HTC", "PRRG", and "PMHG" the Telephone Number entered here must also be entered in the TN field of the MLHLN form (5111-1 Record) for Terminal 1 of this MLHG. For "UCD" and "PSUCD" the Telephone Number entered here must be unique, i.e., the LISTED TN must not be defined on any LINE (5109 Record), MLHLN (5111 Record), DSMLHLN (5901 Record), DSL (5900 Record) or PSMTN (5925 Record) forms.

An entry is prohibited when Hunt Type is "MUPH" or "ISAT".

If a Packet Switching group is being defined, enter the lowest TN that will serve as a Group Hunt number.

The NXX must be defined as an OFFICE CODE on a NOC form (5501 Record).

For 5E12 and later, if the first 3 digits of the 7-digit LISTED TNs on the MLHG form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, LISTED TN must be a 10- digit TN with the NPA/OFFICE CODE defined on the NOC form.

WARNING: For the LISTED TN(s) on MLHG, there must be at least one corresponding member on the MLHLN form or the TN may not be entered onone or more of the following input forms:

- ACDTN
- ACQS
- AMLBDSL
- DSL
- DSLUSR
- LINE
- MLHG
- MLHLN
- MTNDR
- MULTITN
- PSMTN
- RDTAPORT
- SHTN or
- XAT

2.5 HIGHEST LISTED TN

Description: If more than a single TN is to be used as a Group Hunt number, enter the highest TN. This field is used only if the Multi-Line Hunt Group is a Packet Switching group.

NOTE: This field in Recent Change is LAST LISTED TN.

Software Release: 5E3 and later
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

If only one Group Hunt number is desired, this field may be left blank or the same value specified for LISTED TN may be entered. The HIGHEST LISTED TN must have the same office code and be greater than the LISTED TN.

For 5E8 and later, if HIGHEST LISTED TN is entered, CLIENT TN TYPE cannot be entered.

Copyright © 2003 Lucent Technologies

For 5E12 and later, if the first 3 digits of the 7-digit HIGHEST LISTED TNs on the MLHG form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, or the NOC form does not exist, HIGHEST LISTED TN must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, when the MLHG forms have an entry for LISTED TN and HIGHEST LISTED TN. These TNs must have the same value for NPA and NXX.

For 5E12 and later, when the MLHG forms have an entry for LISTED TN and HIGHEST LISTED TN. HIGHEST LISTED TN must be greater than LISTED TN.

2.6 GROUP TRC

Description: Should call trace be activated for the LISTED TN and SUB TNs of a "UCD", "ISAT", or "MUPH" group? When call trace is activated, it is used to trace all incoming calls to the LISTED TN or SUB TNs of the MLHG. For each call, a record is printed on the Maintenance TTY.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

GROUP TRC can be set to "Y" only when the corresponding MLHGFD form (5604 Record) has HUNT TYPE set to "UCD", "ISAT", or "MUPH".

2.7 # RAX

Description: Enter the Rate Center that should be used for routing and charging. The Rate Area and Line Class Code assignment designates which Digit Analysis Selector will be used for routing and charging of calls.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.8 GROUP MAKE BUSY KEY

Description: If the Multi-Line Hunt Group is equipped with a Group Make Busy Key, enter the Miscellaneous Equipment Number.
Valid Entries: Standard format for a Scan Point Number.

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)

Copyright © 2003 Lucent Technologies

Scan Point Number	SPN	XX	00-30

Data Rules:

For 5E3 and later, Group Make Busy is not allowed on Packet Switching MLHGs; therefore, if HUNT TYPE is set to "PSUCD" on the corresponding MLHGFD form (5604 Record), then the GROUP MAKE BUSY KEY field must not be entered.

2.9 OVERFLOW PEG COUNT REG

Description: If the Multi-Line Hunt Group is equipped with a Remote Message Register to record group overflow, enter the Miscellaneous Equipment Number. When equipped, this register will record overflow when an all Terminal Busy Condition is encountered.

The Distribute Point Number of a register keeps track of calls into an MLHG that deny service (given a busy tone) because all terminals in the group are in use. This register is used as a measurement tool to tell when to add more MLHG members.
Valid Entries: Standard format for a Distribute Point Number.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

If this field has an entry, then OVFLWREG on the associated MLHGFD form must have a value of "Y".

2.10 LOCAL SM

Description: Enter the Switching Module Number for local operation of SM if all members of a Multi-Line Hunt Group are assigned to equipment numbers (LEN, SLEN or LCENs) that are defined on the same Module. A "local" MLHG is a group where each member is assigned to the same Switching Module.

Software Release: 5E5 and later
Valid Entries: 1 - 192

Data Rules:

For 5E5 and later, if a QUEUING FEATURE is entered, it is recommended that the LOCAL SM value equal the QUEUE MODULE value on the corresponding QUFD form (5617 Record) or QUGPA form (5617 Record).

If the Multi-Line Hunt Group is global, this field must be blank. (A "global" MLHG is a group that has its members associated with equipment numbers that are spread over two or more Switching Modules.)

The SM entered must be defined on the EQIM form (5700-1/2 Record).

2.11 SM SA ANNC

Description: Is the Switching Module to provide the Line Side Module Stand-Alone Announcement capability?

Copyright © 2003 Lucent Technologies

Only one Multi-Line Hunt Group per Module site can have the Line Side Stand-Alone Announcement capability. This feature also takes precedence over a 13A Recorded Announcement if both are specified on a given Switching Module.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then the LOCAL SM field must be entered.

The following restrictions apply to the Module Stand-Alone Announcement MLHG and associated terminals:

The MLHG must be local to the Module; LOCAL SM field must equal the Switching Module that all the MLHG terminals are assigned to.

Only one MLHG per Remote Module can have SM SA ANNC field equal to "Y".

The MLHG FEATURE must be defined on an MLHGFD form (5604 Record) with a HUNT TYPE of "UCD" (Uniform Call Distribution).

Each of the individual terminals defined on the MLHLN form (5111 Record) for this Multi-Line Hunt Group must be assigned with the following restrictions:

- FLS (Free service) must equal "Y".
- SUSO (Deny Origination) must equal "Y".
- No custom calling features allowed; BRCS must equal "N".
- OE TYPE must equal "C", "L", or "E" (5E11 and later).
- PTY must equal "I" (Individual) and MFRI must equal "N". Remote Module Line Side Announcement is incompatible with Multi-Frequency Ringing.

2.12 # FEATURE GROUP A

Description: Are the members of this MLHG Feature Group A? FGA (Feature Group A) is an access arrangement to provide line-terminated end-to-end InterLATA (Local Access and Transport Area) service. All members of an MLHG must be either FGA, or non-FGA.

Required Field.
Default: N
Valid Entries: N, Y

Data Rules:

All members of an MLHG with FGA equal to "Y" must have the same signaling type (TTC equal to "Y" or "N").

If Feature Group A (FGA) is set to "Y", every associated MLHLN form must have its OE TYPE set to "C", "L" or "S".

For 5E3 and later, if the Class of Service on the LCC form (5306 Record) is "4WINDIV", then the Feature Group A value must be "N".

Copyright © 2003 Lucent Technologies

2.13 FIRST PREEMPT MEMB

Description: This field is associated with an AUTOVON (Automatic Voice Network). The AUTOVON interface capability is defined using the BRCS feature, Precedence and Preemption. If this MLHG is Preemptable, enter the First Preemptable Multi-Line Hunt Group Member.
Valid Entries: 1 - 2015

Data Rules:

The MLHG is Preemptable if the associated MLHGFD is defined with a Hunt Type of "PRRG". When an MLHG is Preemptable, each terminal in the MLHG must have a Precedence and Preemption BRCS feature assigned and must be either preemptable or non-preemptable as specified on the PPMPA form (5618-4 Record) or as a default parameter on the PPFD form (5618-1 Record). All terminals which are less than the value entered in FIRST PREEMPT MEMB, must be specified as non-preemptable. All terminals which are equal to or greater than the value, must be specified as preemptable.

If a Modem Pool Group is being defined, which is indicated by an entry in the MPTYPE field on this form, then this field must be left blank.

If a Packet Switching Group (DSL members) is being defined, which is indicated by a HUNT TYPE of "PSUCD" on the MLHGFD form, then this field must be left blank.

2.14 REMARKS

Description: Remarks entered for administrative purposes.
Valid Entries: 1 - 16 characters

3. FORM ENTRIES - 5110-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name.

SUBGROUP TNs

At least one of the following SUBTN fields must be entered when an associated HUNT TYPE of "MUPH" or "ISAT" is defined on an MLHGFD form. A maximum of 6 subgroups (SUBTN1-6) are allowed for MUPH hunting and a maximum of 8 subgroups (SUBTN1-8) are allowed for ISAT hunting. These subgroup TNs must be unique within the 5ESS Switch, therefore, they have no associated equipment.

3.2 SUBTN 1-8

Description: Enter a main telephone number for the subgroup.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

SUBTN7 and SUBTN8 are only used for ISAT hunt groups.

If one or more SUBTN is entered, then the LISTED TN field must be

Multiple Position Hunt allows a maximum of 16 positions with a maximum of 32 lines per console (see Figure 1). A console can have up to six subgroups; there are six members in the first two subgroups and

Copyright © 2003 Lucent Technologies

five members in the remaining four subgroups. MUPH requires subgroup Telephone Numbers which are identified with the appropriate entire MUPH subgroup.

If a Modem Pool group is being defined, SUBTNs must not be specified.

For 5E12 and later, if the first 3 digits of the 7-digit SUBTN[x]s (where x = 1-8) on the MLHG form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, SUBTN[x] must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, the SUBTN[x]s (where X = 1-8) on the MLHG form must have a NXX and/or NPA/NXX combination that is an OFFICE CODE and/or NPA/OFFICE CODE combination on a NOC form.

NOTE: Position 1, Subgroup 6 only has four members.

3.3 STATS 24HRS

Description: Should the reinitialization period for the ISAT (ISDN Attendant) Offered Load Statistics be 24 hours? An entry of "Y" indicates that a 24 hour time period has been selected to reinitialize the ISAT load statistics. An entry of "N" indicates that a 30 minute time period has been selected.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

If STATS 24HRS is "Y" then HUNT TYPE must be "ISAT" on the corresponding MLHGFD form.

ISAT CONFIGURATION

Fields Section 3.4 - Section 3.7 refer to Recent Change Display Only fields.

3.4 CONFIG1

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. For an ISAT MLHG the Recent Change field displays a CONFIG GRP name.

3.5 CONFIG2

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. For an ISAT MLHG the Recent Change field displays a CONFIG GRP name.

3.6 CONFIG3

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. For an ISAT MLHG the Recent Change field displays a CONFIG GRP name.

3.7 CONFIG4

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. For an ISAT MLHG the Recent Change field displays a CONFIG GRP name.

MONITORING OPTION

The fields (Section 3.8 - Section 3.10) are used for Monitoring Options.

Copyright © 2003 Lucent Technologies

3.8 # BUSY MONITOR

Description: Can the LISTED TN for this MLHG be monitored by the Busy Lamps of an ISDN Attendant MLHG?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E4(2) and later, if BUSY MONITOR is set to "Y", then MLHG FEATURE must be defined on an MLHGFD form where HUNT TYPE is "HTC", "PMHG", "REG", or "UCD".

For 5E5 and later, if BUSY MONITOR is "Y", the ATT MLHG field must be entered.

An ISDN Attendant Multi-Line Hunt Group can busy monitor a Hundreds Group (Telephone Numbers that share the same first five digits) only if those Telephone Numbers that can be busy monitored do not physically terminate to more than 12 processors (SMs and/or AM). Entering a LISTED TN on an MLHG form causes the AM to be counted as one of the processors.

The following Telephone Numbers can be included in the Hundreds Group, if the BUSY MONITOR field on the form is set to "Y":

- a TN from a LINE form;
- a TN from a MLHLN form;
- a CKT TN from a DSL form;
- a CKT TN from a DSMLHLN form;
- a LISTED TN from an MLHG form;
- a TN (key) from a SHTN form (5902 Record).

The following physical terminations can be included in the Processor count, if the BUSY MONITOR field on the form is set to "Y":

- the first three digits (SM) of the OE NUMBER from a LINE form;
- the first three digits (SM) of the OE NUMBER from a MLHLN form;
- the first three digits (SM) of the LCEN from a DSL form;
- the first three digits (SM) of the LCEN from a DSMLHLN form;
- a LISTED TN from an MLHG form will cause the AM to be counted;
- The first TN in the SHARED LIST on a SHTN form has three possible cases:
  - If the TN matches the CKT TN on a DSL form, then the corresponding first three digits (SM) of the LCEN on that DSL form will be counted;
  - If the TN matches the CKT TN on a DSMLHLN form, then the corresponding first three digits (SM) of the LCEN on that DSMLHLN form will be counted;

Copyright © 2003 Lucent Technologies

- If the MLHG and TERM NBR match the CKT MLHG and CKT TERM on a DSMLHLN form, then the corresponding first three digits (SM) of the LCEN on that DSMLHLN form will be counted.

3.9 ATT MLHG

Description: Enter the Attendant MLHG that can control the MLHG defined on this form.

Software Release: 5E5 and later
Valid Entries: For 5E14 and earlier: 1 - 2000

For 5E15 and later: Blank or 1 - 8191

Data Rules:

The ATT MLHG must have a service class of "ISATND" or "ATND" defined on the LCC form (5306 Record).

If this field is entered, the ATT MLHG must be defined on an MLHG form (5110 Record). The MLHG form must contain an MLHG FEATURE defined with a HUNT TYPE of "ISAT" or "MUPH" on an MLHGFD form (5604 Record). If the associated MLHG form has a HUNT TYPE other than "ISAT", BUSY MONITOR must be "N".

Any MLHG group controlled by an Attendant MLHG must have an MLHG FEATURE associated with a HUNT TYPE other than "ISAT" or "MUPH" on an MLHGFD form (5604 Record). For 5E7 and later if HUNT TYPE is "HTC", "REG", or "PMHG", then the first member of the MLHG (MLHG MEMBER 1) may not be assigned an ATT MLHG or RBV TGN on the DSLUSR or MLHLN form.

For 5E8 and later, if ATT MLHG is entered, RBV TGN must not be entered.

3.10 RBV TGN

Description: Enter the number of the incoming trunk group used to Remote Busy Verify the LISTED TN (DN) of this form. This TGN allows an ISAT (ISDN Attendant) on another 5ESS switch to Busy Verify this DN if the TGN is associated with a LISTED TN.

Software Release: 5E8 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If RBV TGN is entered, ATT MLHG must not be entered, BUSY MONITOR must be "N", LISTED TN must be entered, HIGHEST LISTED TN must not be entered, and SUBGROUP TNs: SUBTN1 must not be entered.

If RBV TGN is entered, there must be a corresponding TKGRP form (5202 Record) with that TGN defined, and that TKGRP form must have TRKCLS set to "ATNDVFY", and TRK DIR must be "INC". Also, for the TGN on the TKGRP form, there must be at least one corresponding TRUNK form (5204 Record) with QTY entered.

If RBV TGN is entered, MLHG FEATURE must equal FEATURE NAME on a corresponding MLHGFD form. The MLHGFD form must not have HUNT TYPE set to "MUPH", "ISAT" or "PSUCD".

3.11 PB GRP

Copyright © 2003 Lucent Technologies

Description: The PB GRP field applies to the Packet Switching Data Business Group Service feature. This feature enables a customer to set up and administer intraswitch PBGs (Packet Business Groups) by assigning a PBG number to each X.25 termination to distinguish between intragroup calls and other calls on the AMA billing record. If a PB GRP number is entered in this field, a value should be entered in the LISTED TN field; this will assign an MLHG to a PBG.

Software Release: 5E5 and later
Valid Entries: 1 - 100

Data Rules:

Leave this field blank if this MLHG is not a member of a PBG. If this field has an entry, then the HUNT TYPE on the corresponding MLHGFD (5604 Record) form must be "UCD" or "PSUCD".

PB GRP must be defined on a PBGRP form (5931 Record).

For 5E9(1) and later, if PB GRP is entered, and the MLHG FEATURE assigned on this form is defined on an MLHGFD form with a HUNT TYPE of "UCD", then MPTYPE must be entered on this form.

3.12 BCLID MLHG ID

Description: Enter a two-character number to be sent as part of the BCLID (Bulk Calling Line Identification) message to the CPE. This number helps identify the Multi-Line Hunt Group customers generating the BCLID message when more than one BCLID customer is coming to the same AP (Application Processor) or CPE. This number is not unique among BCLID customers; if the customer so chooses, the same BCLID MLHG ID can be used for two different MLHG numbers. If no BCLID MLHG ID is defined, no MLHG ID is provided in BCLID messages (see Division 2, Section 1Y for more information about BCLID).

Software Release: 5E8 and later
Valid Entries: 00 - 99

4. FORM ENTRIES - 5110-3 RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name.

QUEUING

The fields (Section 4.2 - Section 4.4) are used to control call queuing for MLHGs.

4.2 Q INDI HNT TNS

Description: Is queuing allowed for calls to individual hunted TNs? (An individual hunted TN is defined as TN on an MLHLN form (5111 Record) with NONHUNT set to "N" or is defined as CKT SWITCHING MLHG TN on a DSLUSR form (5908 Record) with CKT SWITCHING NONHUNT set to "N".)

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Q INDI HNT TNS may be "Y" only when QUEUING ALLOWED is "Y".

For 5E6 and later, if Q INDI HNT TNS is "Y", then the corresponding MLHGFD form must have BEARER

Copyright © 2003 Lucent Technologies

set to "VOICE" and HUNT TYPE set to any value other than "MUPH".

For 5E6 and later, if Q INDI HNT TNS is "Y" and the corresponding MLHGFD form has HUNT TYPE "ISAT", then MLHG must appear as GRP NBR on an ICIPF form (5903 Record) where GRP TYP is "HUNT" and at least one of the HUNTING ICI values is "QUE".

4.3 QUEUING ALLOWED

Description: Is queuing allowed? This field provides the ability to temporarily remove QUEUING ALLOWED from a terminal without deleting its internal data structure.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If a Modem Pool group is being defined, this field must be "N".

If this field is "Y", then a Queuing Feature name must be defined on the QUFD form (5617 Record).

If MPTYPE is known, this field must be "N".

4.4 QFEATURE

Description: Enter the Modular Queuing Feature name.
Valid Entries: 1 - 8 characters

Data Rules:

The Modular Queuing Feature Name must not be the same name as the Multi-Line Hunt Group Feature Name.

The QFEATURE name should be defined on the QUFD form (5617-1/2 Record). The MLHG should also be defined on the QUGPA form (5617 Record) with the QUGPA FEATURE NAME the same as this field. If the field is entered, then the MLHG FEATURE must be defined on an MLHGFD form (5604 Record) with a HUNT TYPE of "HTC", "ISAT", "PMHG", "UCD", or "MUPH".

If a Modem Pool Group is being defined, which is indicated by an entry in the MPTYPE field on this form, then this field must not be entered.

If a QFEATURE is assigned on this MLHG with a HUNT TYPE other than "ISAT" on the MLHGFD form, the QFEATURE must be defined on a QUFD form with a THRESHOLD TYPE set to "T" or blank.

For 5E9(1) and later, when QFEATURE is defined on a QUFD form that has a value entered in the QMON THRESHOLD field, then the MLHG must appear as a MONITORED MLHG on at least one DSLQMON form (5904 Record).

For 5E7 and later, if a QFEATURE on this MLHG form is assigned to the same QUEUE MODULE on a QUFD form (5617-1/2 Record) or a QUGPA form (5617-3/4 Record), the QUEUE SIZE must not exceed 255 per QUEUE MODULE if (for 5E9(2) and later) the corresponding EQIM form (5700 Record) (where SM matches QUEUE MODULE) has UNIT TYPE set to a value other than "SM2000". Queue Size is the sum of the BASIC SIZE + EXTENDED SIZE + ROUTINE SIZE + PRIORITY SIZE on the QUFD or QUGPA forms for each of the QFEATUREs assigned to the same QUEUE MODULE.

For 5E9(2) and later, if QFEATURE is entered and has a HUNT TYPE of "ISAT" on the corresponding MLHGFD form, then corresponding ICIPF forms with GRP TYP of "HUNT" must have the PRIO field entered for every ICI or TGN field entered. A MLHF form corresponds with a MLHGFD form if FEATURE

Copyright © 2003 Lucent Technologies

matches the FEATURE NAME on the MLHGFD form.

MODEM POOLING

The fields (Section 4.5 - Section 4.8) define parameters for an ISDN Modem Pool Group.

4.5 MPTYPE

Description: This field is used to specify the primary attribute of a Modem Pool group. If the Modem Pool members (modems and terminal adaptors) are owned by the switch owner, then enter the baud rate to be used by every modem in the group.

If the Modem Pool members are owned by a private customer who is billed on a usage basis for the Modem Pool equipment, enter the value "BILL". If the Modem Pool members are owned by a private customer who is billed on a flat rate (e.g., period of time) basis for the Modem Pool equipment, enter the value "NOBILL".

Software Release: 5E3 and later
Valid Entries: 300, 1200, 2400, 4800, 9600 (bps);
- BILL, NOBILL

Data Rules:

If this field is entered, then MAINT and MPPFX fields must be entered.

If this field is entered, other field values must be set according to the following table.

Field	Value
QUEUING FEATURE	blank
QUEUE MASTER SWITCH	N
LISTED TN	a valid entry
HIGHEST LISTED TN	blank
FIRST PREEMPT MEMB	blank
MAINT	a valid entry
MPPFX	a valid entry
MPIDP	a valid entry
AP SITE ID	a valid entry
BCID1-6	a valid entry

For 5E6 and later, if MPTYPE is entered, and MLHG FEATURE matches FEATURE NAME on the MLHGFD form, then BEARER must be "VOICE" on the MLHGFD form.

4.6 MPPFX

Description: This field specifies a dialing sequence that instructs the modem to begin dialing. The sequence is determined by the modem manufacturer, therefore, every modem in a Modem Pool group must be from the same manufacturer.

Any printable keyboard character is acceptable with the exception of using the CONTROL key in combination with any other key. Certain keyboard characters have special meaning for the ODA software. Please refer to Division 1, Section 7, Figure 2 "5ODA Data Entry Control Characters", for a list of these characters. If the dialing sequence is a single character and that character is in the aforementioned list, enter a space before or after the character. This will remove the special meaning from the character.

Software Release: 5E3 and later
Valid Entries: 1 - 5 characters

4.7 MAINT

Description: Will the switch owner have the responsibility of maintaining the modems and terminal

Copyright © 2003 Lucent Technologies

adaptors in the Modem Pool? If the equipment is owned by the switch owner, then enter "Y" to indicate that the switch owner will maintain the equipment.

If the equipment is owned by a private customer, but the switch owner will perform the maintenance, enter the value "Y".

If the equipment is owned by a private customer, and the private customer will perform the maintenance, enter a value of "N".

Software Release: 5E3 and later
Valid Entries: Y, N

4.8 MPIDP

Description: Does the office where the group resides support 4-digit dialing to any modem pool member in this modem pool group?

Software Release: 5E4(2) and later
Valid Entries: Y, N

Data Rules:

An entry in this field is permitted only if MPTYPE is known.

RELEASE LINK

The fields (Section 4.9 - Section 4.10) are for Release Link Trunks.

4.9 RLT TYPE

Description: Enter the type of Hold for this trunk.

Required Field.
Default: NONE
Valid Entries:

Valid RLT TYPE Entries

Entry	Definition
NONE	This trunk is not an analog senderized FX trunk appearing as line. Therefore, it cannot be a RLT.
PERM	This RLT is not released when the terminating port answers (the attendant maintains control over the call with 50B or ISDN type consoles).
TEMP	This RLT is released when the terminating port answers (the attendant does not have control over the call).

4.10 RLT FLASH

Description: Should the branch switch send flashes for called party disconnect? "Y" is used if the main switch is a 5ESS with ISDN or status lamps consoles. "N" is used if the main switch is a 5ESS Switch with 50B consoles. When the field is "N", the branch switch will send flashes for called party answer and calling party disconnect.

There is limited signaling between a branch and the main location. Because 50B and ISDN attendant type consoles can only recognize a flash as called party answered this value is set at the branch to control the type of flashes sent to the main switch.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

The field must be "Y" when RLT TYPE is "PERM".

MESSAGE SERVICE CENTER

The following fields (Section 4.12 - Section 4.15) are used for the MSC (Message Service Center) feature. Entries here will determine if the MLHG is an MSC. If the AP SITE ID and/or any of the BCID 1 through BCID 6 fields are entered, then the MLHG must be defined on the MSGP form (5962-2 Record) in the MSG SRV CNTR field. These fields are available in 5E4(2) and later Software Releases.

The CN-ISVM (CENTREX Network - Interswitch Voice Messaging) feature only supports a "Deluxe" MSC (Message Service Center): this requires an API (Application Processor Interface) link. Although a basic MSC could receive voice mail, interswitch MWI (Message Wait Indication) will not work on a basic MSC. For more information on CN-ISVM feature, see Division 2, Section 4A182.

4.11 MSC

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. The Recent Change display only field indicates whether an MLHG is a Message Service Center.

4.12 BCID SCRNING

Description: Is business customer ID screening allowed for this MSC? This field was added with the ISVM (Inter-Switch Voice Messaging) feature (see Div.2, Sec. 1BG). ISVM allows VM service providers to offer voice messaging on an inter-switch basis; however, since ISVM does not support the concept of inter-switch business groups, inter-switch calls would fail this check. For ISVM subscribers, an entry of "N" indicates that the call is forwarded to the MSC without BCID screening.

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

If BCID SCRNING is entered, CLIENT TN TYPE must be entered. Both BCID SCRNING and CLIENT TN TYPE must be entered to allow entries for AP SITE ID and BCID(1-6). When BCID SCRNING is "Y", at least one BCID (1-6) must be entered.

When BCID SCRNING is "N", AP SITE ID must be entered.

4.13 CLIENT TN TYPE

Description: Enter the Client telephone number type. This field was added with the ISVM (Inter-Switch Voice Messaging) feature (see Div. 2, Sec. 1BG). An entry of OCDN represents the Original Called Directory Number. RDN is the Redirecting Directory Number. Only a group DN and the dependent DNs of an MSC MLHG can be assigned a CLIENT TN TYPE. This option is not assigned on a per-member basis.

Software Release: 5E7 and later.
Valid Entries:

Valid CLIENT TN TYPE Entries

Entry	Definition
OCDN	Original Called Directory Number
RDN	Redirecting Directory Number

Data Rules:

If CLIENT TN TYPE is entered, BCID SCRNING must be entered. Both CLIENT TN TYPE and BCID SCRNING must be entered to allow entries for AP SITE ID and BCID[1-6].

Copyright © 2003 Lucent Technologies

When CLIENT TN TYPE is "RDN", AP SITE ID must be entered.

CLIENT TN TYPE cannot be entered when HIGHEST LISTED TN, SUBTN1 or MPTYPE are entered.

When CLIENT TN TYPE is entered, no SUBTNs can be entered.

When CLIENT TN TYPE is entered and the associated HUNT TYPE is "REG", or "HTC" on the MLHGFD form, the correspodning MLHG member 1 defined on either the MLHLN (5111 Record) or DSLUSR form (5908 Record) must have NONHUNT set to "N".

4.14 AP SITE ID

Description: Enter an Application Processor Identification number.

Software Release: 5E4(2) and later
Valid Entries: 1 - 255

Data Rules:

If an MLHG has been assigned as a Message Service Center Group, (indicated by entering a value for AP SITE ID or BCID[1-6]), then:

- if AP SITE ID is entered, a HUNT TYPE of "UCD", "REG", "MUPH", "PMHG" or "HTC" must be assigned on the corresponding MLHGFD form (5604 Record).
- if AP SITE ID is blank and BCID[1-6] is entered, a HUNT TYPE of "UCD", "REG", "HTC", "PMHG" or "ISAT" must be assigned on the corresponding MLHGFD form.

The AP SITE ID must be defined on the DSLAP form (5963 Record).

If the MLHG entry on this form appears in the MSG SRV CNTR field on a MSGP form where DELUXE is "Y", then the AP SITE ID must have an entry.

4.15 INTRA SW OCDN

Description: Is the DN passed to the VMS (Voice Messaging Service) the first DN the call terminates to on this switch (an intra-switch OCDN)? An entry of "N" indicates that the originally dialed DN will be sent to the VMS even if that DN is on another switch (an inter-switch OCDN). The name of this field was changed to INTRA SW DN for 5E9(2) and later, because it can now be used for CLIENT TYPEs of OCDN (Original Called Directory Number) and RDN (Redirecting Directory Number). See INTRA SW DN for valid entries and data rules.

4.16 INTRA SW DN

Description: Should the Intra-switch Directory Number send the VMS the inter-switch DN (OCDN or RDN) or the intra-switch DN (OCDN or RDN). When set to "Y", this allows the delivery of the Near Switch on-switch OCDN or RDN delivery to the VMS. When this field is set to "Y", it blocks the inter-switch OCDN or RDN delivery from a Far Switch and allows the ISVM feature to be assigned to subscribers on the Near Switch with the VMS. ISVM does not have the requirements for BCID (Business Customer ID) and BCID Screening at the Message Service Group (MSG MLHG) and eliminates the need for screening for a BCID on the subscriber's line assignment for MWI (Message Waiting Indicator) activation and deactivation. This option is assignable on a per Message Service Center Group basis. When set to "N", this allows the delivery of Far Switch OCDN or RDN for ISVM subscribers. This allows the delivery of the correct redirecting number to the VMS for off-switch ISVM Subscribers. This option is assigned on a per Message Service Group basis.

When set to "N", this allows the delivery of Far Switch OCDN or RDN for ISVM subscribers. This allows

Copyright © 2003 Lucent Technologies

the delivery of the correct redirecting number to the VMS for off-switch ISVM Subscribers. This option is assigned on a per Message Service Group basis.

Note, the TFOS 554 bit is a per-switch option that controls whether OCDN is to be sent or not. When this bit is set to "Y", it overrides the current INTRA SW DN = "N" and disallows the inter-switch signaling of the OCDN or RDN and only presents the information equivalent to INTRA SW DN = "Y" information for all Message Service Groups on the Switch.

If both INTRA SW DN = "Y" and INTRA SW DN = "N" Message Service Groups are desired on the same switch, set the TFOS 554 bit to "N". When the TFOS 554 bit is set to "Y", INTRA SW DN is effectively set to "Y" or ignored.

Whether OCDN or RDN is sent is controlled by CLIENT TN TYPE field on the MULTITN form (5114 Record). This field applies to CLIENT TN TYPE of "OCDN" and "RDN".

For more information concerning this feature, see Division 2, Section 1BG.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E7 - 5E9(1), if INTRA SW OCDN is "Y", then BCID SCRNING must be "N".

For 5E9(2) and later, if AP SITE ID is not entered, INTRA SW OCDN must be "Y".

4.17 BCID 1 - 6

Description: Enter a Business Customer Identifier.

Software Release: 5E4(2) and later
Valid Entries: 1 - 65535

Data Rules:

The entry in this field must appear as an entry in the BCID field on an MSGP form.

An MLHG is assigned as a Message Service Center Group when a value for AP SITE ID or BCID is entered. When AP SITE ID is blank, and BCID is entered, a HUNT TYPE of "UCD", "REG", "HTC", or "ISAT" must be assigned on the corresponding MLHGFD form.

If an MLHG has been assigned as a Message Service Center Group, (indicated by entering a value for AP SITE ID or BCID[1-6]), then:

- if AP SITE ID is entered, a HUNT TYPE of "UCD", "REG", "MUPH", "PMHG" or "HTC" must be assigned on the corresponding MLHGFD form (5604 Record).
- if AP SITE ID is blank and BCID[1-6] is entered, a HUNT TYPE of "UCD", "REG", "HTC", "PMHG" or "ISAT" must be assigned on the corresponding MLHGFD form. For 5E7 and later if the HUNT TYPE is "ISAT", then on this MLHG form BCID SCRNING must be "Y" and CLIENT TN TYPE must be "OCDN".

4.18 DELAY RING

Description: Should power ringing of the MSC be delayed for 2 seconds? The DELAY RING field is used to indicate whether the power ringing of the MSC MLHG is to be delayed for 2 seconds so that the

Copyright © 2003 Lucent Technologies

AP/VMS (Application Processor/Voice Messaging Service) has time to process the call history information sent from the switch. An entry of "N" indicates do not delay power ringing. The DELAY RING field was added in order to provide the capability of delaying the power ringing of the MSC MLHG.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then AP SITE ID must be entered.

4.19 CPN OVRIDE PRVCY

Description: The CPN OVRIDE PRVCY field is used to indicate whether or not to override a privacy indication of the CPN (Calling Party Number) for both direct and forwarded calls and deliver the CPN in the CHI (Call History Information) message to the AP (Applications Processor) when this MSC (Message Service Center) is setup for ISVM (Interswitch Voice Messaging). This field supports the Line Blocking Enhancement for ISVM secured feature, see Division 2, Section 4A240.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

For 5E11 and later, if the AP SITE ID(s) assigned on the MLHG form (5110-1 Record) have CPN OVRIDE PRVCY equal to "Y", then ISVM must be "Y" on the corresponding DSLAP form.

For 5E11 and later, if CPN OVRIDE PRVCY is "Y" then BCID SCRNING must be entered and BCID SCRNING must be "N" and INTRA SW DN must be "N".

ENHANCED 911

The following fields (Section 4.20) are used for the E911 (Enhanced 911) feature.

4.20 E911 PSAP

Description: Is this an E911 Public Safety Answering Point? This field applies to the secured feature, ISDN PSAP Support. For information on the feature, see Division 2, Section 4A114.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field can be "Y" only if the ISDN PSAP Support secured feature has been purchased; SFID 114 ACT must be set to "Y" on the SFSYS form (5713-1 Record).

When E911 PSAP is "Y", then:

- QFEATURE, MPTYPE, AP SITE ID, and BCID[1-6] cannot be entered;
- MLHG FEATURE must be defined on an MLHGFD form with HUNT TYPE set to "HTC", "REG", or "UCD" and with BEARER set to "VOICE"; and

Copyright © 2003 Lucent Technologies

- the MLHG cannot contain analog members; therefore, no analog members may be defined for this MLHG on the MLHLN form.

4.21 LNR HNT TN

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. For Packet MLHGs the Recent Change field displays the optional Linear Hunt Telephone Number assigned to member 1 of the MLHG.

4.22 LNR COUNT

Description: This field is not used by ODA but appears on the form for consistency with Recent Change View 3.5. For Packet MLHGs the Recent Change field displays the number of Linear Hunt TNs assigned to members of the MLHG.

NUMBER PORTABILITY

This field group was added to support the Number Portability features.

4.23 PORTED

Description: The PORTED field is used to indicate whether the MLHG has been ported into this office via the LNP (Local Number Portability) feature. When this field is set to "Y", all members of the MLHG are considered ported for AMA access billing purposes.

This indicator is used by call processing to determine whether or not to generate an LNP BAF (Bellcore AMA Format) module for originating and terminating IXC access records.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

4.24 NON COND TRIG

Description: The NON COND TRIG field is used to indicate whether or not a call to this DN requires a non-conditional query of the SCP (Service Control Point) prior to routing the call.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NON COND TRIG is "Y", then:

- the ACT field for SFID 216 must be set to "Y" on the SFSYS form, and if SFID 216 is set to "Y", SFID 174 must also be set to "Y"
- at least one TN must be specified in the LISTED TN, HIGHEST LISTED TN, or SUBTN fields
- SERHLN on the MLHLN form must be blank
- SERHLN on the DSLUSR form must be blank
- SERHLN on the SHTN form must be blank

Copyright © 2003 Lucent Technologies

- HUNT TYPE must be "HTC", "ISAT", "MUPH", "REG", or "UCD" on the MLHGFD form

For each MLHG form where NON COND TRIG is "Y", the corresponding MLHG Terminal 1 must have CLASS OF SERVICE and TERMINATING TREATMENT on the LCC form within the set listed below.

MLHG Terminal 1 can be found on either the MLHLN form or as CKT MLHG and CKT TERM on the DSLUSR form. To obtain the corresponding LCC form, match the LCC/RAX (for MLHLN) or CKT LCC/CKT RAX (for DSLUSR).

- Valid CLASS OF SERVICE
  - "10PTY", "2PTY", "4PFS", "4PSS", "5PTY", "8PSS", "ATND", "CHGCALL", "COIN", "HOTMOTL", "HOTPBX", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN", "TWOPTY", "4WINDIV"

- Valid TERMINATING TREATMENT
  - "INDIV", "INWATS", "MLHG", "PARTY"

4.25 CONTEXT ID

Description: This field is used to indicate whether or not a multiline hunt group is set to "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E12 and 5E13: N
- For 5E14: NATIVE

Valid Entries:

Valid CONTEXT ID Entries

Entry for 5E12, 5E13	Entry for 5E14 and later	Description
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

For 5E12 and later:

When the CONTEXT ID field is set to "R" or "RESOLD" or ,"U" or "UNBUNDLED" on the MLHG form, the ACT field for SFID 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the MLHG form, there must be a MLHGFD form (5604 Record) with HUNT TYPE set to "HTC", "ISAT", "MUPH", "PMHG", "REG", or "UCD".

	5E2	5E3	5E4(2) and Later
LCC TT	For hunting terminals, use "MLHG". For Inwats terminals, use "I". For non-hunt terminals, use "INDIV". LCCs can be mixed within any given MLHG.	Use "MLHG" or "I". Must be the same for all terminals.	Same as 5E3
I	If all members of MLHG are I, set MLHG attribute I to "Y". If members of the MLHG are mixed (i.e., some are I and some are hunting terminals), set MLHG attribute I to "N".	Set MLHG attribute I to "Y". (Note: all MLHG members must be I). Set MLHG attribute I to "N" when members are not I. (Note: members cannot be mixed.) Use View 3.3 or Record 5114 to assign a multiple DN. Set attribute I to "Y".	Same as 5E3. Plus: I can be provided by assigning an LCC with with TT of I to an individual line on View 1.1 or Record 5109. The Individual Line can be part of a Series Hunt.
O	Provide outdials by assigning to Terminals 3001 through 3999. Requires hunt type "R", "HTC", or "UCD." Requires LCC with TT equal to "INDIV".	Provide by assigning to Terminals 3001 through 3999. Requires hunt type of "R"	"HTC" or "UCD". Requires LCC with TT equal to "MLHG" or "INWATS".
N	Provide non-hunt with LCC TT of "INDIV".	Provide by setting N to "Y" on View 3.2 or Record 5111-1. Use View 3.3 or Record 5114 to assign a multiple DN. Set attribute N to "Y".	Same as 5E3.

Inwats Simulated Facilities Requirements: An SFG is required for special billing and/or to limit the number of calls to an Inwats number. Follow these steps:

Copyright © 2003 Lucent Technologies

1. Use Recent Change View 7.3 or Record 5609-3 to provision the SFG.
2. Use RC View 10.4 or Record 5304 to provision the MCRI.
3. Use RC View 7.4 or Record 5609-4 to associate the Inwats DN with the MCRI.

SEC. 1K: 5111-1/2/3 RECORD MULTI-LINE HUNT GROUP TERMINAL RECORD - MLHLN

1. GENERAL

The 5111-1/2/3 Record, available with 5E2 and later Software Releases, defines the individual Terminal Numbers assigned to a particular MLHG. Each MLHG/Terminal Number must be assigned an equipment number and specific options and features. Every MLHG Number assigned on the MLHLN form must be defined on the MLHG form (5110-1/2/3 Record).

MLHLN contains Terminal Numbers that are associated with a given MLHG. The 5111-2/3 Record defines supplemental information that is not included on the 5111-1 Record.

1.1 Line Assignments

The assignment of lines to an MLHG is normally determined by the following:

- Non-PBX Class Of Service customers with nine or more lines.
- PBX Class Of Service customers with six or more lines.
- PBX Class Of Service customers with special features, e.g., End Hunt or Make Busy Keys.
- Any Class Of Service customers requiring Circle Hunt, Uniform Call Distribution Hunting, or Multiposition Hunting.
- INWATS.

1.2 LEN/SLEN Assignments

Every MLHG Terminal Number must be assigned a LEN or SLEN. For 5E3 and later, the RAX/LCC combination must be defined on an LCC form (5306 Record) with a TERMINATING TREATMENT of "MLHG" or "INWATS".

1.3 Billing

Lines within an MLHG can be billed to a Group Billing Number, or can be individually billed by Terminal Number.

1.4 Outdial Terminals

Outdial Terminals can be entered on the MLHG form with a terminal number in the range 3001 - 3999. Outdial Terminals are only allowed in Hunt Groups with a HUNT TYPE of "REG", "UCD" or "HTC" as indicated on an MLHGFD form (5604 Record).

1.5 Ground-Start Lines

Most customer lines are loop-start lines that generate an origination by closing the path between the tip and ring at the station set (forming a loop). Scanning is done at the Central Office by applying a voltage between the tip and ring and sensing the loop current flow produced by the customer line origination.

Ground-Start lines (e.g., coin-first coin phones and PBX-CO trunks) generate an origination by grounding the ring conductor at the station set. Scanning is done at the Central Office by applying a voltage with respect to ground on the ring conductor and sensing the current flow in the ring conductor produced by the customer line origination. Since certain PBXs interpret a ground on the tip conductor to mean something else (disconnect, etc.), the tip conductor at the Central Office is disconnected during scanning on

Copyright © 2003 Lucent Technologies

Ground-Start lines. The tip conductor is disconnected under software control in the 5ESS Switch. Thus, any Line Equipment Number may be assigned as Ground Start. Ground-Start should be entered as an equipment option in the GST field.

1.6 Essential Service Protection

TNs that require Essential Service Protection, which is part of the Overload Control Capability, must be assigned to a Line Equipment Number designated as Essential. When a 5ESS Switch is in an overload condition and the Overload Control is turned on, then all lines designated Essential Lines have the Essential Service Protection feature and would receive priority origination scanning.

There is no limit on the quantity of LENs or SLENs that can be assigned as Essential Lines except for the following restriction:

To make sure there is no internal blocking on origination scanning, there should be only one LEN assigned with the EL field equal to Y from a group of four LENs that share the same first seven digits of their LEN. Example:

External LEN breakdown					
SM	LU	CONC	SWG	SW	LEV
1-192	0-7	0-9	0-1	0-7	0-3

There are four level values 0 through 3 for a given 7-digit value of SM/LU/CONC/ SWG/SW. Only one of the four LEVs should have the EL field equal to "Y".

LEN	00	1	3	0	0	4	0
LEN	00	1	3	0	0	4	1
LEN	00	1	3	0	0	4	2
LEN	00	1	3	0	0	4	3

It is recommended that Essential Lines be distributed evenly across the Line Equipment Numbers. Care should be given to assign to an Essential Line only those customers that actually require Essential Service Protection.

1.7 Recent Change Records

For 5E7 and 5E8, the corresponding Recent Change Office records for this form are 5111 and 5111A. The Recent Change 5111 Record defines the individual Terminal Numbers assigned to a particular MLHG with a terminal number in the range of 1 - 2015. The Recent Change 5111A Record defines the Outdial Terminals that can be entered on the MLHG form with a terminal number in the range 3001 - 3999. The ODA 5111 Record defines the 1 - 2015 and 3001 - 3999 terminal numbers.

1.8 Recent Change View

The corresponding Recent Change View for this form is 3.2 for 5E2 - 5E6, or 1.6 for 5E7 and later.

2. FORM ENTRIES - 5111-1 Record

2.1 BASE AND CONTROL, ESS UNIT

Enter the 6-character Base and Control Number, Office Name and MLHG number.

2.2 MEMBER INFORMATION

The information contained in these columns is data that is unique to each Terminal Number in the MLHG. This form contains entries for individual terminals of the group. Common group information is entered on the MLHG form.

2.3 *MLHG

Description: The Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

Entries exceeding 999 are not allowed until positions 1 through 999 have been assigned.

For 5E5 and later, if both this field and the ATT MLHG field are entered, the MLHG must be defined in the MLHG field of an MLHG form such that the MLHG FEATURE is defined on an MLHGFD form that is neither "ISAT" nor "MUPH".

For 5E9(1) and later, when Multiline Hunt Terminals defined on MLHLN forms where MEMB equals 1, are assigned a Call Forwarding Variable Feature or a Call Forwarding Variable Data Feature on the MLHLNFA form, the associated MLHG must be assigned a MLHG FEATURE which is defined on a MLHGFD form that has CF VARIABLE set to "Y".

For 5E12 and later, when the MLHG/TERM(S) on the MLHLN form has an OE Type of "A" or "G", the CLASS OF SERVICE on the corresponding LCC from must not equal "4WINDIV", "TAOPER" or " XDB".

2.4 *TERM

Description: The MLHG Terminal Number.
Valid Entries: 1 - 2015 or 3001 - 3999 (Outdial Terminals Only)

Data Rules:

With 5E4(2) and later, Outdial Terminals cannot be assigned to MLHGs where the HUNT TYPE on the MLHGFD form (5604 Record) is "MUPH".

Terminal Number 1, the main member of the group, must always be defined for each MLHG. Entries exceeding 999 are not allowed until positions 1 through 999 have been assigned.

Because of memory constraints, it is recommended that for 5E2 and later that Terminal Number entries exceeding 32 are not assigned until positions 1 through 32 have been assigned. This recommendation doesn't apply when the HUNT TYPE is "MUPH" on the MLHGFD form.

MLHG members defined on the MLHLN form with an LCC/RAX combination must match an LCC/RAX combination with an associated SERVICE CLASS of "INDIV", "HOTMOTL", "HOTPBX", "PBX", "B911", "CALLBK" for 5E6 or "LTPCLBK" for 5E7 and later, "ATND", "4WINDIV", "MODEM" on the LCC form.

If a TN or MLHG/TERM defined on the LINE or MLHLN form with an OE TYPE ("C", "E", "G", "L", or "S") and NUMBER combination, it cannot be duplicated between Individual MFR or non-MFR lines (PTY is "I" and MFRI is "N" or PTY is 1-9, 0 and MFRI is "Y") or duplicated between an Individual line (MFR or non-MFR) and a multi-party line (PTY set to 1-9, 0, "T", "R", and MFRI is "N").

For 5E9(1) and later, when MLHG/TERMs defined on the MLHLN form have a TN specified and an LCC/RAX combination defined on the LCC form with a TERMINATING TREATMENT of "ASIRA", the following MLHLN form fields must be set:

- OE TYPE/NUMER must be null
- DNY BV must be "N"
- SHARED must be "N"

Copyright © 2003 Lucent Technologies

For 5E9(1) and later, when Multiline Hunt Group Terminals defined on MLHLN forms where TERM equals 1, are assigned a Call Forwarding Busy Feature, Call Forwarding Data Busy Feature, Call Forwarding Precedence Busy Feature, or Call Forward Precedence Calls When Busy Feature on the MLHLNFA form, the associated MLHG must be assigned a MLHG FEATURE which is defined on a MLHGFD form that has CF BUSY set to "Y".

For 5E12 and later, if the MLHG/TERMs on the MLHLN form have SERHLN entered and TN entered, the equivalent 10-digit SERHLN cannot equal the equivalent 10-digit TN on the same MLHLN form.

2.5 #RAX

Description: The Rate Center to be used for routing and charging.
Valid Entries:

- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.6 #LCC

Description: The Line Class Code indicating the class of service for a Terminal Number.
Valid Entries: 3 alphanumeric characters

Data Rules:

A modem that is a member of a Modem Pool group must have a LINE CLASS CODE with a CLASS OF SERVICE of "MODEM" and a TERMINATING TREATMENT of "INDIV" defined on an LCC form.

When CLASS OF SERVICE is "MODEM" on the LCC form, the following fields on this form must be "N": TST LINE, GNDREF, LNEQ, and SHARED.

For 5E7 and 5E8, when the MLHG member is assigned an LCC/RAX combination defined on an LCC form where the Service Class is "CALLBK", the following fields on this form must be set as specified:

- OE TYPE must be:

  "C" or "L";

- SUSO must be "Y"; and
- TTC must be "Y".

For 5E9(1) and later, when the MLHG member is assigned an LCC/RAX combination defined on an LCC form where the Service Class is "LTPCLBCK", the following fields on this form must be set as specified:

- OE TYPE must be:

  "C","E" (5E11 and later), or"L";

- SUSO (Denied Origination) must be "Y";

Copyright © 2003 Lucent Technologies

- TTC must be "Y";
- DNY ROH must be "N";
- DTLBILL must be "N"; and
- COMPL must be "N".

2.7 OE TYPE

Description: A composite line type consisting of all the Equipment Types and Numbers (LEN/SLEN/TEN/DEN/NEN, etc.). This field is necessary for the 4-wire Analog Lines (TEN), 4-Wire Lines on DNU-S (NEN) as of 5E11 and later and 4-wire Digital Lines (DEN) fields added to the MLHLN form with the addition of the DSN (Defense Switched Network), and 4-wire Lines on OIU (Optical Interface Unit) as of 5E16..

Software Release: 5E3 and later
Valid Entries:

Valid OE TYPE Entries

Entry	Definition
A	Softwre Release: 5E12 and later. TN associated with a 10-digit INEN for TR-303 on DNU-S.
C	TN associated with an 8-digit ISLU (ISDN Line Unit).
D	TN associated with an 8-digit, 4-wire DEN (Digital Equipment Number). Software Release: 5E15 and later. The DEN was expanded to 10-digits.
E	Software Release: 5E11 and later: TN associated with an 12-digit AIU (Access Interface Unit).
G	Software Release: 5E8 and later. TN associated with a GEN (GAMA IDCU equipment number); see NUMBER field for details.
L	TN associated with an 8-digit analog LEN (Line Equipment Number).
M	Software Release: 5E8 - 5E9(2). TN associated with an 8-digit IDCU MEN (IDCU equipment number).
N	Software Release: 5E12 and later. TN associated with a 10-digit, 4-Wire Line on DNU-S NEN (Network Equipment Number). Software Release: 5E13 and later. The VT (Virtual Tributary) field defined on the EQVT form (5858 Record) was split which resulted in an 11-digit NEN.
O	Software Release: 5E16 and later. OIUEN (Optical Interface Unit Equipment Number)
S	TN associated with a 7-digit SLEN (SLC-96) Equipment Number. Software Release: 5E15 and later. The SLEN was expanded to 10-digits.
T	TN associated with a 7-digit, 4-wire analog TEN (Trunk Equipment Number).

Data Rules:

If CLASS OF SERVICE on the associated LCC form is "B911", OE TYPE must be "C", "E", "L", or "S".

When "C", "E", "L", or "S" is entered, CLASS OF SERVICE on the associated LCC form cannot be "4WINDIV", "ISATND", "ISDN", "TAOPER" or "XDB".

For 5E7 and later, if OE TYPE is equal to "L", and EL (Essential Line for the Essential Service Protection feature) is set to "Y", only one unique NUMBER in a group of four NUMBER(s) that share a common SM/LU/GRID/SWG/SW value can have EL set to "Y".

For 5E8 and later:

Data rules are listed under the specific enumeration heading as follows:

Copyright © 2003 Lucent Technologies

D or T:
If OE TYPE is "D" or "T", the SM referenced in the OE NUMBER cannot be configured as "BASIC". The SM's corresponding EQIM form must have CONFIGURATION set to "STANDARD" or "LOADED" because a Basic SM cannot be assigned 4-wire lines. For 5E9(2) and later, refer to the table of Configurations for Facilities and Application in Division 8, Section 2 for correct configurations for OE TYPE "D", "N" or "T".

M or G:
If "G" or "M" is entered, the MLHG/MEMB is assignedto IDCU equipment. If the RT INTERFACE is set to "TR008" on the corresponding RTERM form (5174 Record), then the last digits of the OE NUMBER must correspond to the Channel Unit position (i.e., CU XX/YY) defined on the RTERM form. The forms correspond when the OE NUMBER corresponds to the designated fields on the RTERM form. (See format for OE NUMBERs of TYPE "M" and "G".) Note that the last two digits of the OE NUMBER are determined by the CU XX/YY value (where XX is an odd number range of 01-95 and YY is an even number of XX + 1). Both the values in the pair are assignable if CU XX/YY TYPE on the RTERM form is set to

- "DFXS"(5E9(2) and later)
- "FSR"
- "MP"
- "SF1" (5E9(1))
- "SP"
- "SPOTS"
- "SSV00"
- "SSV10"

Only the lower (odd) numbered value is assignable if the CU XX/YY TYPE set to

- "COIN"
- "FXS"
- "FXSLS"

For example:

COMPARISION OF RTERM CU WITH OE NUMBER

RTERM CUXX/YY	LAST DIGITS OF OE NUMBER FOR TYPE "M"	LAST DIGITS OF OE NUMBER FOR TYPE "G"
CU0102	01, 02	0001, 0002
CU0304	03, 04	0003, 0004
CU0506	05, 06	0005, 0006
CU0708	07, 08	0007, 0008
.	.	.
.	.	.
.	.	.
CU9394	93, 94	0093, 0094
CU9596	95, 96	0095, 0096

NOTE: "SF1" applies to 5E9(1) and "DFXS" applies to 5E9(2) and later; both indicate Dual FX Plugs.

If "G" or "M" is entered, then the SM, IDCU, and RT values of the NUMBER field must be defined on an RTERM form; and if the "TR008" is entered in the RT INTERFACE field on the RTERM form, then the GEN or MEN LINE NO values must be assigned to an appropriate IDCU DIGRP with its STATUS set to "O" for operational.The following values must correspond.

LAST DIGITS OF OE NUMBER FOR TYPE "M"	LAST DIGITS OF OE NUMBER FOR TYPE "G"	DIGRP	DIGRP STATUS
01-24	0001-0024	A	EQSTATA = "O"
25-48	0025-0048	B	EQSTATB = "O"
49-72	0049-0072	C	EQSTATC = "O"
73-96	0073-0096	D	EQSTATD = "O"

If "G" or "M" is entered, and the MLHG is assigned to IDCU equipment defined on the RTERM form with

Copyright © 2003 Lucent Technologies

"TR008" entered in the RT INTERFACE field and a Channel Unit Type set to "SP" or "FXSLS", then the value of the GST (Ground Start) field on this form must be "N".

If "G" or "M" is entered and "TR008" is entered in the RT INTERFACE field on the corresponding RTERM form, the MLHG must have the proper RTERM Channel Unit to LCC-Service Class correspondence. The LCC/RAX combination assigned on the MLHLN form must be defined on the LCC form with an associated CLASS OF SERVICE that matches the CUXX/YY type on the corresponding RTERM form. Refer to the following Table for the required correspondence:

LCC TO RTERM CORRESPONDENCE

LCC CLASS OF SERVICE	RTERM CU XX/YY
4PFS, 4PSS, 8PSS	MP, SSV00, SSV10
5PTY	FSR, SSV00, SSV10
B911	SP, SPOTS , SSV00, SSV10
CHGCALL	SP, SPOTS, SSV00, SSV10
COIN	COIN, SSV00, SSV10
HOTMOTL	SPOTS, FXSLS, SSV00, SSV10 SF1 (5E9(1) only) DFXS (5E9(2) and later)
HOTPBX	FXS, FSR, SPOTS, SSV00, SSV10 SF1 (5E9(1) only) DFXS (5E9(2) and later)
INDIV	SP, MP, SPOTS, FSR, FXSLS, SSV00, SSV10 SF1 (5E9(1) only) DFXS (5E9(2) and later)
PBX	FXS, SPOTS, FSR, SSV00, SSV10 SF1 (5E9(1) only) DFXS (5E9(2) and later)
TWOPTY	SP, MP, SSV00, SSV10

- ***NOTE:*** SF1 applies to 5E9(1) and DFXS applies to 5E9(2) and later; both indicate Dual FX Plugs.

When MLHG are being associated with a Channel Unit type equal to "SF1", or "DFXS", and the CLASS OF SERVICE on the associated LCC form is "INDIV", the GST (Ground Start) on the MLHLN form must be "N".

S:
If "S" is entered and the MLHG is defined on the SLCCU form as being associated with a Channel Unit type equal to "FXSLS", the value of the GST (Ground Start) field on the MLHLN form must be "N".

For 5E7 and later, if "S" is entered, the MLHG is assignedto SLEN equipment and must have the proper SLC Channel Unit to LCC-Service Class correspondence. The LCC/RAX combination assigned on the MLHLN form must be defined on the LCC form with an associated CLASS OF SERVICE that matches the CU TYPE on the SLCCU input form. Refer to the following table for the required correspondence:

LCC TO SLCCU CORRESPONDENCE

LCC CLASS OF SERVICE	SLCCU CU TYPE
4PFS, 4PSS, 8PSS	MP, SSV00, SSV10
5PTY	FSR, SSV00, SSV10
ATND	FXS, SP, SPOTS, DFXS
B911	SP, SPOTS , SSV00, SSV10
CHGCALL	SP, SPOTS, SSV00, SSV10
COIN	COIN, SSV00, SSV10
HOTMOTL	SPOTS, FXSLS, SSV00, SSV10, DFXS
HOTPBX	FXS, FSR, SPOTS, SSV00, SSV10, DFXS
INDIV	COIN, SP, MP, SPOTS, FSR, FXSLS, SSV00, SSV10 , DFXS
PBX	COIN, FXS, SPOTS, FSR, SSV00, SSV10, DFXS
TWOPTY	SP, MP, SSV00, SSV10

For 5E8 and later, if "S" is entered,and COIN is defined on the corresponding SLCCU form (5107 Record), and, in addition, either "INDIV" or "PBX" is entered in the CLASS OF SERVICE field on the corresponding LCC form, then this Channel Unit Type/CLASS OF SERVICE combination requires CLSS set to "Y" on this form.

Copyright © 2003 Lucent Technologies

For 5E9(1) and later, if "S" is entered and "DFXS" is entered as a CU TYPE on the corresponding SLCCU form, and in addition, the CLASS OF SERVICE on the associated LCC form is "INDIV", then GST (Ground Start) on this form must be "N".

E:
If "E" is entered, the associated NUMBER must be specified in the AIU format and TYPE on the EQAIUP form (5746 Record) must be "AIZLP" or "AICLP".

N or O:

For 5E13 and later, if "N" is entered, the OE NUMBER must be defined on the EQVT form, VT EQSTAT and DS1S EQSTAT must be "O" and APPLICATION TYPE must be "TRUNK". The associated EQVT form may be found by matching OE NUMBER[1,3] with EQVT SM, OE NUMBER[4] with EQVT DNUS, OE NUMBER[5] with EQVT DATA GROUP, OE NUMBER[6] with EQVT STE, OE NUMBER[7] with EQVT STS, OE NUMBER[8] with EQVT VT GROUP, and OE NUMBER[9] with EQVT VT MEMBER.

2.8 NUMBER

Description: Enter the OE NUMBER.

Software Release: 5E3 and later
Valid Entries: If OE TYPE is "L", the NUMBER field is the Line Equipment Number and consists of:

OE NUMBER, TYPE L

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Line Unit	LU	X	0 - 7
		XXX	000 - 042 (5E9(2) and later)
Concentrator	CONC	X	0 - 9
Switch Group	SWG	X	0 - 1
Switch	SW	X	0 - 7
Level	LEV	X	0 - 3

If OE TYPE is "S", this is SLC-96 Equipment Number and consists of:

OE NUMBER, TYPE S

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Digital Carrier Line Unit	DCLU	X	0 - 7
		XX	0 - 15 (5E15 and later)
Remote Terminal	RT	XX	1 - 32
Line	LINE	XX	1 - 96

For the 5E3 Software Release, the valid range for RT is 1 to 6.

Additionally, the RT value defined on the MLHLN form must correspond to an RT assigned on the SLCRT form.

If OE TYPE is "D", this is the 4-wire Digital Equipment Number.

OE NUMBER, TYPE D
Software Release: 5E5 and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Digital Line Trunk Unit	DLTU	X	0 - 5
		XX	0 - 11 (5E15 and later)
Digital Facility Interface	DFI	XX	1 - 10
Digital Channel	DCHAN	XX	1 - 48

Copyright © 2003 Lucent Technologies

If OE TYPE is "N", this is the 4-wire Line on DNU-S. The DNU-S Networking Equipment Number consists of:

OE NUMBER, TYPE N (5E12 and earlier)			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Digital Networking Unit - SONET	DNU-S	X	0 - 7
Data Group	DG	X	0 - 1
Synchronus Transport Signal	STS	X	0 - 5
Virtual Tributary	VT	XX	01 - 28
Digital Signal Level 0	DS0	XX	01 - 24

When the DCHAN entered is greater than 24, the FAC IND on the EQDUP form must be 3.

OE NUMBER, TYPE N (5E13 and later)			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Digital Networking Unit - SONET	DNU-S	X	0 - 7
Data Group	DG	X	0 - 1
SONET Equipment Termination	STE	X	1 - 6
Synchronus Transport Signal	STS	X	1
Virtual Tributary Group	VTG	X	1 - 7
Virtual Tributary Member	VTM	X	1 - 4
Digital Signal Level 0	DS0	XX	01 - 24

If OE TYPE is "T", this 4-wire analog Trunk Equipment Number consists of:

OE NUMBER, TYPE T Software Release: 5E5 and later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Trunk Unit	TU	XX	0 - 7
Service Group	SVG	X	0 - 1
Pack	PACK	X	0 - 7
Circuit	CKT	X	0 - 3

If OE TYPE is "C", this ISLU Line Card Equipment Number consists of:

OE NUMBER, TYPE C Software Release: 5E5 and later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Line Unit	LU	X	0 - 7
Line Group Controller	LGC	XX	00 - 15
Line Card	LC	XX	00 - 31

For a Modem Pool member, the modem and terminal adaptor must be on the same SM. Therefore, the SM entered in this field, which is for the analog port for a modem, must be the same as the SM entered in the LCEN field, which is for the digital port for the terminal adaptor mate, on the DSMLHLN form.

If OE TYPE is "M", this IDCU Equipment Number consists of:

OE NUMBER, TYPE M Software Release: 5E8 - 5E9(2)			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	001 - 192
Integrated Digital Carrier Unit	IDCU	X	0 - 7

Copyright © 2003 Lucent Technologies

Remote Terminal	RT	XX	01 - 31
Line	LINE	XX	01 - 99

If OE TYPE is "G", this IDCU Equipment Number consists of:

OE NUMBER, TYPE G Software Release: 5E9(2) and earlier			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	001 - 192
Integrated Digital Carrier Line Unit	IDCU	X	0 - 7
Remote Terminal	RT	XX	1 - 31
Line	LINE	XXXX	0001 - 2048

OE NUMBER, TYPE G Software Release: 5E10 and Later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	001 - 192
Integrated Digital Carrier Line Unit	IDCU	XX	00 - 42
Remote Terminal	RT	XX	1 - 31
Line	LINE	XXXX	0001 - 2048

If OE TYPE is "E", this AIU Equipment Number consists of:

OE NUMBER, TYPE E Software Release: 5E11 and Later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Unit Number	AIU	XXX	000 - 042
Pack	PACK	XX	00 - 19
Circuit	CKT	XX	00 - 31
			Coin 00 - 15

For 5E12 and later:

If OE is "A", the INEN Equipment Number consists of:

TR303 on DNU-S, Type A Software Release: 5E12 and Later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Unit Number	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Line	LINE	XXXX	0001-2048

For 5E16 and later:

When OE is "O", the OIUEN Equipment Number consists of:

OE NUMBER, TYPE "O" - (5E16 amnd later)			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Unit Number	OIU	X	0 - 7
Protection Group	PG	X	0 - 9
SONET Terminating Equipment	STE	X	1
High Level Virtual Container	HVC	X	1 - 3
Low Level Virtual Container Group	LVC GRP	X	1 - 7
Low Level Virtual Container Member	LVC MEM	X	1 - 4
Channel	CH	XX	01 - 24

When OE TYPE is "D", "N", "O", or "T", MFRI, FGA, BUSY MONITOR, and ANI7 must be "N" on this form; SERHLN, ATT MLHG, and RBV TGN must be blank.

When OE TYPE is "D", "N", "O", or "T", PTY must be "I".

Copyright © 2003 Lucent Technologies

2.9 TN

Description: A unique Telephone MLHG/Terminal Number
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9
- and X is 0 - 9

Data Rules:

If the MLHG's HUNT TYPE, defined on the MLHGFD form (5604 Record), is "REG" for regular, or "HTC" for Circle Hunt, then the TN field is a required entry for Terminal Number 1 and must equal the entry in LISTED TN on the MLHG form.

Non-Hunt Terminals including Outdial Terminals may or may not have a TN. If no TN is assigned, it is not possible to terminate to this member.

If the member is the modem component of a Modem Pool member (as opposed to the terminal adaptor component), then this is a non-hunt number. This non-hunt number is used solely for Terminal Maintenance on Modem Pool members.

The TN field must be entered and must also be defined on the TLWS form as LOCAL TALK & MONITOR LINE, if MLHLN form entry has an LCC/RAX combination that appears on the LCC form with a Service Class value of "CALLBK" for 5E6 or "LTPCLBCK" for 5E7 and later.

2.10 PTY

Description: A party value that determines the ringing frequency of the customer's telephone. The MFR (Multi-Frequency Ringing) feature allows MLHG members to maintain a Class Of Service of "INDIV", "PBX" or "HOTPBX".

Required Field.
Default: I
Valid Entries:

Valid PTY Entries

Entry	Definition
T	Tip
R	Ring
I	Individual Line (non-MFR)
0 - 9	Individual MFR line (MRFI must be "Y")

Data Rules:

With 5E3 and later, if the CLASS OF SERVICE on the LCC form is "4WINDIV", then the PTY value must be "I". PTY also must be "I" if OETYPE is "D", "N" or "T".

For 5E10 and later, if PTY is blank, PSLIM must be "Y".

2.11 MFRI

Description: Multi-Frequency Ringing-Individual provides varied ringing frequency over five frequencies and three frequency classes, allowing for either bridged or divided ringing. See Figure 2.
Default: N
Valid Entries: Y, N

Data Rules:

An entry of "Y" is required for MFR type lines. When MFRI is "Y", then PTY must equal a value of 0 - 9

Copyright © 2003 Lucent Technologies

corresponding to the correct frequency ringing; and OE TYPE must be "C", "S", or "L".

When MFRI is "Y" and OE TYPE is "G", PTY must be 1 through 5.

When MFRI is "Y" and OE TYPE is "S", PTY value must be between 1 and 4.

Also, all analog lines with MFRI equal to "Y" must have a CLASS OF SERVICE of "INDIV", "PBX" or "HOTPBX" on the LCC form. However, all SLC-96 lines (OE TYPE is "S") with MFRI equal to "Y" must have a CLASS OF SERVICE of "INDIV", only. Furthermore, SLC-96 lines should not be assigned tip-side MFR party values (PTY must be 1 - 4, only).

For 5E10, when MFRI is "Y", OE Type must be "C", "L", "S", "M" or "G".

For 5E11, when MFRI is "Y", OE TYPE must be "C", "E", "G", "L" or "S".

For 5E12 and later, when MFRI is "Y", OE TYPE must be "A", "C", "E", "G", "L" or "S".

For 5E10 and later, when Multiline Hunt Group Terminal(s) on the MLHLN form have the MFRI field set to "Y" which identifies an MFR type of line, all MFR lines must have a NUMBER on the MLHLN form, where OE TYPE is equal to "A", "C", "G", "L" or "S", as defined on the Switching Module with MFR Frequency Class equal to "HAR", "DEC" or "SYN" on the IMINFO Record.

2.12 CIDIAL

Description: The Carrier Interconnect Dialing Permissions.
Default: ALLOW
Valid Entries:

Valid CIDIAL Entries

Entry	Definition
ALLOW	The customer can dial an FGD CAC (Carrier Access Code) or use a PIC (Pre-subscribed InterLATA Carrier) Identification Number, if one is assigned, for Carrier Interconnect calls.
DENY	The customer cannot dial an FGD CAC. To make CI calls, the line must be assigned a PIC.
REQ	The customer must dial an FGD CAC for Carrier Interconnect calls.
TALLOW	Same as "ALLOW", but used for a CI test line only.
TDENY	Same as "DENY", but used for a CI test line only.
TREQ	Same as "REQ", but used for CI test lines only.

Data Rules:

This entry is valid only for ENTYPE of "LEN" or "SLC" and with 5E3 and later, with OE TYPE of "L" or "S". When this field is blank, the CIDIAL entry automatically assigns the ALLOW value.

For 5E9(1) and later, if "REQ" or "TREQ" are entered, then PTC must not be entered.

2.13 PIC

Description: The Pre-subscribed InterLATA Carrier Identification Number.
Valid Entries:

- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

When CIDIAL is "REQ" or "TREQ" (lines that require an FGD CAC), leave this field blank. When CIDIAL is "DENY" or "TDENY" (lines that prohibit an FGD CAC), PIC is a required entry.

For 5E8 and later, PIC must equal CARRIER ID on an ICF form, with the ICF form's FEAT GRP equal to "D".

Copyright © 2003 Lucent Technologies

2.14 PTC

Description: Enter the PTC (Presubscribed IntraLATA Toll Carrier) identification number. The PTC field was added to support the ICLATA (InterLATA Carrier's IntraLATA) Secured Feature. For more information on the ICLATA feature, see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 9999 or leave blank

Data Rules:

When the PTC field is used, an SFSYS form must exist with the ACT field for SFID 149 field set to "Y".

2.15 PLC

Description: Enter the PLC (Presubscribed Local Carrier) code. The PLC field supports the Alternate Local Service Provider Routing feature. For more information on the Alternate Local Service Provider Routing feature, see Division 2, Section 4A269.

Software Release: 5E12 and later.
Valid Entries: Blank, or 0 - 9999.

Data Rules:

The PLC field on the MLHLN form must be defined as CARRIER ID on the ICF form with FEAT GRP equal to "D" .

2.16 UNBUNDLED

Description: Has this line been unbundled from the LEC?
Software Release: 5E12 and later
Default Value: N
Valid Entries: Y, N

Data Rules:

If UNBUNDLED is "Y", then PLC must be entered.

ORIGINATION FEATURES

The following fields (Section 2.17 - Section 2.28) determine the Origination Features and options associated with an MLHG TN.

2.17 TTC

Description: Touch-Tone requirements.
Default: N
Valid Entries: Y, N

2.18 BRCS

Description: Are specific Business and Residence Custom Services assigned to this line?
Default: N
Valid Entries: Y, N

Data Rules:

An entry of "Y" is required if the MLHG/TERM or TN is assigned one or more BRCS on the MLHLNFA

Copyright © 2003 Lucent Technologies

form.

The assigned features are given unique Feature Names on the MLHLNFA form (5113 Record).

For 5E6 -5E8, if this line is dedicated to ASP (Advanced Services Platform; previously PVN, Private Virtual Network) via the default ASP DAS by having DIGIT ANALYSIS SELECTOR on the LCC form (5306 Record) equal to PVN DAS on the OFCOPT form (5509 Record), then BRCS must be "N". If the line is dedicated to ASP via a virtual ASP DAS by having DIGIT ANALYSIS SELECTOR on the LCC form equal to a DAS whose functionality is similar to PVN DAS on the OFCOPT form, then BRCS should be "N". See the ASP DIALING PLAN section of the ASP Feature Description (Division 2, Sections 4A51 and 4A126) for further details on the dangers of assigning BRCS features to lines dedicated to ASP services.

2.19 EL

Description: Will Essential Service Protection be assigned to a LEN or SLEN? This option is part of the Overload Control Capability. Essential Service Protection provides origination priority when the office is in an overload state and the Overload Control Program is activated. Essential Service can be provided for TNs assigned to a LEN, SLEN, or (R)ISLU-Z card designated as Essential.

No special dedicated equipment arrangement is required for SLC-96 (SLENs) or (R)ISLU-Z lines. Lines assigned to LENs have specific dedicated equipment arrangements to prevent blocking when lines assigned essential service attempt to originate calls.

It is recommended that at most one line requiring Essential Service be assigned to LEV 0-3 for a given SM, LU, CONC, SWG, and SW.

If this recommendation is not used, blocking could occur when lines assigned Essential Service attempt to originate. Refer to section Section 1.6 .
Valid Entries: Y, N

2.20 FLS

Description: Will free terminating service be activated?
Default: N
Valid Entries: Y, N

2.21 SUSO

Description: Will Deny or Suspend Originating Service be activated?
Default: N
Valid Entries: Y, N

Data Rules:

If CLASS OF SERVICE on the associated LCC form is "B911", SUSO must be "Y".

If CLASS OF SERVICE is "2PTY" or "TWOPTY" on the associated LCC form (5306 Record), and 2 PARTY ANI is "N" on the associated IMINFO form (5510 Record), then SUSO must be "N"."N" must be entered in this field if "N" is entered in the 2 PARTY ANI field on the associated IMINFO form, and either "2PTY" or "TWOPTY" is entered in the CLASS OF SERVICE field on the associated LCC form.

2.22 DNY ROH

Description: Will Deny Receiver Off-Hook tone be activated?
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.23 PALIT

Description: Will Automatic Line Insulation Testing be prohibited? An entry of "N" indicates that testing is allowed).
Default: N Valid Entries: Y, N

Data Rules:

PALIT can be "Y" or "N" if the MLHG/TERM is defined on an MLHLN form with a CLASS OF SERVICE of "INDIV" defined on an LCC form. PALIT must be "Y" for any other CLASS OF SERVICE.

- **WARNING:** If the line is associated with a universal SLC, even though the CLASS OF SERVICE is "INDIV", PALIT must be be "Y". Disregarding this warning may result in damage to the SLC Central Office Terminal and inaccurate test results.

For 5E7 and later, if "N" is entered (Automatic Line Insulation Test is allowed), then "INDIV", "PBX", "HOTMOTL", "HOTPBX" or "ATND" must be entered in the CLASS OF SERVICE field on the LCC form with an associated LCC/RAX combination.

2.24 PSLIM

Description: Should Subscriber Line and Instrument Measurement testing be prohibited?

This field supports the Trunk Line Workstation Metallic Test Capability feature. See Division 2, Section 4A230.

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

Data Rules:

If PSLIM is "N", the LCC/RAX combination and CLASS OF SERVICE on the LCC form must be "INDIV", "PBX", "HOTMOTL", "HOTPBX" or "ATND".

If RT INTERFACE is set to "TR008" and FTTH ENABLED is set to "Y" on the RTERM form, PSLIM must be "Y".

If OE is not entered, PSLIM must be "Y".

2.25 COMPL

Description: Will Complaint Observing be activated? COMPL is used for customers who question their message-rate bills. After the office is cut over, COMPL is set by Recent Change. This feature is initialized by ODA. When "Y" is entered, a detailed AMA record is generated on all originating answered and unanswered calls from this Multi-Line Hunt line. The only exception is when the call encounters a Charge Index defined with an AMA Call Type of "FREE".

The only difference between this field and the other line type study indicators is the designation set in the AMA record.
Default: N
Valid Entries: Y, N

2.26 SLUS

Description: Will Subscriber Line Usage be activated? After the office is cut over, SLUS is set by Recent Change. This feature is initialized by ODA.

Copyright © 2003 Lucent Technologies

When "Y" is entered, a detailed AMA record is generated on all originating answered and unanswered calls from this Multi-Line Hunt line. The only exception is when the call encounters a Charge Index defined with an AMA Call Type of "FREE".

The only difference between this field and the other line type study indicators is the designation set in the AMA record.
Default: N
Valid Entries: Y, N

2.27 DTLBILL

Description: Will Optional Detail Bill be activated? After the office is cut over, OPT DET BILL is set by Recent Change. This feature is initialized by ODA.

When "Y" is entered, a detailed AMA record is generated on all originating answered and unanswered calls from this Multi-Line Hunt line. The only exception is when the call encounters a Charge Index defined with an AMA Call Type of "FREE".

The only difference between this field and the other line type study indicators is the designation set in the AMA record.
Default: N
Valid Entries: Y, N

2.28 TRAFFIC

Description: Will Traffic Study be activated? TRAFFIC is used typically for coin lines. TRAFFIC is initialized by ODA. After the office is cut over, TRAFFIC is set by Recent Change.

When "Y" is entered, a detailed AMA is generated on all originating answered and unanswered calls from this Multi-Line Hunt line. The only exception is when the call encounters a Charge Index defined with an AMA Call Type of "FREE".

The only difference between this field and the other line type study indicators is the designation set in the AMA record.
Default: N

Valid Entries Y, N

TERMINATING FEATURES

The following fields (Section 2.29 - Section 2.31) determine the Terminating Features and options associated with an MLHG TN.

2.29 ICP

Description: Will Intercept be activated? This field is required for routing terminating calls to Regular Intercept. If ICP is "Y", the MLHG/Terminal Number must be associated with a unique telephone number in the TN field. All calls terminating to this TN are rerouted to Regular Intercept.
Default: N
Valid Entries: Y, N

Data Rules:

A "Y" in this field requires an entry in fields RAX and LCC. ICP may be "Y" in two cases: either with an equipment assignment or without. If it is desired to route terminating calls to Regular Intercept and still maintain the equipment assignment, then the MLHG/TERM is translated with an appropriate ENTYPE of LEN or SLC with the 5E2 Software Release or with an OE TYPE of "L" or "S" with 5E3 and later. If

Copyright © 2003 Lucent Technologies

equipment is not to be assigned to this terminal, then enter "ICP" in ENTYPE.

2.30 DNY BV

Description: Will Deny Busy Verification be activated?
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "Y" if the TN defined on this form has an associated CLASS OF SERVICE of "MODEM" on an LCC form.

2.31 NONHUNT

Description: Is this terminal a Non-Hunt Terminal? Non-hunt allows a line in an MLHG to receive direct calls that do not hunt if the called line is busy.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Non-hunt TNs may be assigned to terminals within an MLHG with the following guidelines:

- Any terminal may be assigned a non-hunting TN.
- A non-hunting TN may be assigned the series completion feature.

Non-hunt TNs interact with the group features in the following ways.

- The group CFV (Call Forwarding Variable) has no effect on the non-hunt TN. If CFV is active for the group, calls to the non-hunt TN are not forwarded as a result of the group CFV.
- The group and member make-busy keys have no effect on the non-hunt TN. If the make-busy keys are operated, calls can still complete to the non-hunt TN.

If NONHUNT is "Y", then the associated TERMINATING TREATMENT on the LCC form must be "MLHG" or "INWATS". All non-outdial terminals with this field set to "Y" must have a TN entered. All outdial terminals must have this field set to "Y".

If NONHUNT is "Y", then the MLHG FEATURE on the MLHG form must be defined on an MLHGFD form with HUNT TYPE equal to "HTC", "UCD", "REG" or "PMHG".

EQUIPMENT

The following fields (Section 2.33 - Section 2.37) refer to equipment types and options used for lines assigned to an MLHG.

2.32 TRC

Description: Description: Will Call Tracing be activated? TRC is initialized by ODA. After the office is cut over, TRC is set by Recent Change.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.33 GST

Description: Is this a Ground-Start line? Refer to 1.5 under the GENERAL section of this form for more information on Ground-Start lines.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E7 and later, if MLHGs and TERMs on the MLHLN form have a matching LCC/RAX combination on an LCC form, and the associated LCC form has a CLASS OF SERVICE of "MODEM", then "N" must be entered in the GST field.

2.34 TST LINE

Description: Will a LEN, SLEN, DEN, TEN or LCEN be put into service during the Pre-Cutover mode? Refer to the IMINFO form (5510 Record) and the COTH form (5513 Record) for Pre- and Post-Cutover status of all TNs in the office. This would be an exception to a group of lines in an SM that has been set to a Pre-Cutover status equal to INACTIVE. This is normally done for test lines - not a live customer.
Default: N
Valid Entries: Y, N

2.35 GNDREF

Description: Is this LEN associated with FX line,Pair Gain, T-carrier or certain Range extended lines? Some common circuits requiring a "Y" option are listed here for convenience. A comprehensive list of affected equipment can be found in the 5ESS Switch Technical Specification 235-900-101.

- Pair Gain lines that are connected to Universal (nonintegrated) SLC-96 with FXO Channel Units for 2-Wire Foreign Exchange Office service (2FX0-SD-3C326 Loop or Ground Start).
- T-Carrier with FX0 Channel Units (SD-3C326, SD-3C126 Loop or Ground Start).

Software Release: 5E3 and later
Default: N
Valid Entries: Y, N

Data Rules:

If GNDREF is "Y", OE TYPE must be "C" or "L".

2.36 RANGEX

Description: Is this line Range Extended from a Central Office? Range Extended lines are those LENs that are connected to an external Range Extension device such as MFT J99343AC, J99343AJ or Larraine CEF6, or equivalent located outside the Central Office.

For hardware requirements, refer to the Interface/Compatibility Guide (235-700-100).

Required Field.
Default:

For 5E9(1) and earlier: N
- For 5E9(2) and later: NONE

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E9(1) and earlier: Y, N
- For 5E9(2) and later: See table below.

Valid Entries:

Valid RANGEX Entries

Entry	Definition
EXT	Externally provided range extension
INT	Internally provided range extension (LU4 only)
NONE	No range extension
PBX	PBX/short loop range extension value (LU4 only)

Data Rules:

For 5E9(1) and earlier, if RANGEX is "Y", OE TYPE must be "C" or "L".

For 5E9(2) and later:

If "EXT" is entered, OE TYPE must be "C" or "L".

If "INT" or "PBX" is entered:

- OE TYPE must be "L",
- LINE UNIT TYPE on the EQLUP form (5711 Record) must be "4AN1" for LU4.

2.37 LNEQ

Description: Line Equip Class to inhibit Fabric Exerciser.

Software Release: 5E3 and later
Default: N
Valid Entries: N (Normal), I (Incompatible)

Data Rules:

LNEQ values other than N require an OE Number of "C" or "L".

MISCELLANEOUS FEATURES

The following fields (Section 2.38 - Section 2.39) include other features and options available to MLHG TNs. These features are continued under MISCELLANEOUS FEATURES Continued in the explanations for Record 5111-2.

2.38 SERHLN

Description: A TN associated with an MLHG Terminal which is part of a Series Completion Group to be hunted to. This TN must be defined on a LINE, MLHG or another MLHLN form.

NOTE: Series Completion hunts linked-list DNs until an idle line is found, or 16 Series Completion attempts have been made.

Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9
- and X is 0 - 9

Data Rules:

Copyright © 2003 Lucent Technologies

If this field is entered, the TN field must be entered and NONHUNT must be "Y". If this field completes to a TN on an MLHG or another MLHLN form, then the associated MLHGFD form must have INWATS equal to "N".

The associated CLASS OF SERVICE on the LCC form must not be "INDIV". The TN field must be defined.

For 5E3 and later, if the associated CLASS OF SERVICE on the LCC from is "4WINDIV" or "MODEM", then this field must be blank.

For 5E6 - 5E8, a line dedicated to ASP services should not be entered as part of a Series Completion Group. When SERHLN is entered and PVN ALW is set to "Y", the DIGIT ANALYSIS SELECTOR on the corresponding LCC form (5306 Record) cannot be equal to PVN DAS on the OFCOPT form (5509)and should not be equal to a DAS equivalent in functionality to the PVN DAS (i.e., a virtual ASP DAS).

With 5E6 and later, the Series Completion feature supports BRI lines for CSV (Circuit-Switched Voice) calls. When SERHLN is entered, NONHUNT must be "Y" and TN must be entered. The TN field cannot be the same as SERHLN. The ICP field must be "N".

For 5E7 and later:

A maximum of 512 TNs can Series Complete to a single TN defined in SERHLN on the input forms of LINE, MLHLN, DSLUSR or SHTN.

If this field is entered, and SERHLN is defined as a TN on another MLHLN or LINE form, then the corresponding LCC form for SERHLN must have a CLASS OF SERVICE equal to

- "2PTY"
- "4PSS"
- "4PFS"
- "5PTY"
- "8PSS"
- "10PTY"
- "ATND"
- "B911"
- "HOTMOTL"
- "HOTPBX"
- "INDIV"
- "PBX"
- "TWOPTY"

and TERMINATING TREATMENT must NOT be "AGING".

If SERHLN is entered, a corresponding LCC input form must have TERMINATING TREATMENT set to "INWATS" or "MLHG" and CLASS OF SERVICE must not be set to "MODEM" or "CALLBK".

For 5E8 only, the SERHLN cannot be a Standard BRI line, an analog line shared to a Standard BRI, or a Secondary Only TN associated with a Standard BRI. That is, the SERHLN may not be defined as a CKT TN or CKT SWITCHING MLHG TN on a DSLUSR form when DSL CLS is "STD" on the corresponding DSL form. It may not be defined as a TN on a LINE or MLHLN form if the TN or MLHG is a key on an SHTN form, and a shared list entry on that form is defined on a DSLUSR form with DSL CLS "STD" on the corresponding DSL form. It may not be defined as a Secondary Only key TN on an SHTN form where any shared list entry is defined on a DSLUSR form with DSL CLS "STD" on the corresponding DSL form.

For 5E8 and later, if SERHLN is entered, one of the following conditions must be satisfied:

1. The SERHLN assigned on MLHLN form must have "N" entered in ICP, and the LCC/RAX must match LCC/RAX on LCC form with a TERMINATING TREATMENT of "INWATS" or "MLHG".

2. The SERHLN matches a CKTTN on DSLUSR form with ICP set to "N".

Copyright © 2003 Lucent Technologies

3. The SERHLN matches a CKT MLHG TN on DSLUSR with ICP set to "N".

4. The SERHLN must be defined on LINE (as TN) with ICP set to "N" and the LCC/RAX must match LCC/RAX on LCC form with a TERMINATING TREATMENT set to "INWATS", "PARTY", "RI", or "INDIV".

5. The SERHLN matches an STN on SHTN form where the SMLHG/SMEMB is not entered and STN does not match the TN in ROW 1 of the SHARED LIST, with ICP = "N".

6. The SERHLN matches a STN on SHTN form where SMLHG/SMEMB is entered, SMLHG/SMEMB does not match the SMLHG/SMEMB in the first rose of the SHARED LIST, and with ICP set "N".

7. The SERHLN assigned on MLHLN form must be defined on the LINE, MLHLN, DSLUSR, SHTN forms or as LISTED TN on MLHG form.

2.39 ALT BILL TN

Description: An Alternate Bill-To Telephone Number used when billing is charged to another line.
Valid Entries: A 7-digit number if calls are to be billed to an alternate number within the local office; a 10-digit number if calls are to be billed to an alternate number outside the local 5ESS office, or a 7-digit 0/1XX-XXXX number for OUTWATS billing purposes.

The TN entered must be in one of the following formats:

Valid ALT BILL TN Entries

Entry	Definition
NXXXXXX	Where NXX is a valid Office Code defined on a NOC input form.
NPANXXXXXX	Any 10-digit number is accepted. Normal expected values are valid NPA and NXX codes.
ZXXXXXX	Where Z is 0 or 1; this identifies the Alternate Billing Number being used for OUTWATS billing purposes. An HNPA is allowed when used for AMA or ANAC purposes.

Data Rules:

If the ALT BILL TN is blank, then a 10-digit Billing Number is built automatically based on the following input conditions:

- If the MLHLN TN field is submitted with a local 7-digit Telephone Number, this optional TN plus its associated NPA is stored at the Billing Number for the MLHG Terminal Number.

- If the optional MLHLN TN field is also blank for this MLHG Terminal Number, the MLHG's HUNT TYPE (defined on the corresponding MLHGFD form), the LISTED TN of the MLHG and MUPH SUBTNs from the MLHG form and the Terminal Number of this MLHG determine the Billing Number.

Case 1 The MLHG's HUNT TYPE from the corresponding MLHGFD form equals "REG" or "HTC". The Billing Number that is stored in memory corresponds to the MLHLN TN value assigned to the (main member) lead terminal of this MLHG. The associated NPA is added on to form a 10-digit number. Note that Lead Terminal Number 1 is required to have the optional TN assigned for "REG" and "HTC" HUNT TYPEs.

Case 2 The MLHG's HUNT TYPE from the corresponding MLHGFD form equals "MUPH" and one or more of the six optional SUBTNx entries are submitted on the associated MLHG form. The Billing Number for the MLHG Terminal Number is constructed from the appropriate SUBTNx (x is 1 - 6) 7-digit TN with added NPA value. The appropriate SUBTNx entry is found from the MUPH Position/Terminal Number/SUBTN value correspondence table described in the MLHG form description. Each of the 511 MUPH Terminal Numbers is associated with a particular SUBTNx value (x is 1 - 6).

Copyright © 2003 Lucent Technologies

Case 3 The MLHG's HUNT TYPE from the corresponding MLHGFD form equals "UCD" and the Terminal 1 (Main Terminal Number of Group) is being built. The Billing Number is constructed from the LISTED TN 7-digit value defined on the corresponding MLHG form plus the TNs NPA value.

Case 4 The MLHG's HUNT TYPE from the corresponding MLHGFD form equals "UCD" and the Terminal Number being built does not equal 1. The Billing Number constructed for this terminal is the same Billing Number that was constructed for Terminal 1 of the MLHG. (Note that this Billing Number uses the result from above Case 3 or the MLHLN TN is known value case, which ever applies to the Terminal Number 1.)

2.40 SUPPL

Description: An indication that supplementary information for the MLHG/TERM is contained on the 5111-2. This field applies only to the 5111-1 Office Record.

Valid SUPPL Entries

Entry	Definition
blank	There is no associated 5111-2 record entry.
2	One or more of the input items on the 5111-2 record is equal to a non-default value.

3. FORM ENTRIES - 5111-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the 6-character Base and Control number, Office Name and the MLHG number.

3.2 INDEX KEY

Description: The MLHG and Terminal Number for which supplementary information is required. Not required for ODA input.

Note: A corresponding 5111-1 Record is required.

MISCELLANEOUS FEATURES Continued

The following fields (Section 3.3 - Section 3.10) include other features and options available to MLHG TNs.

3.3 NO DIAL

Description: The type of NO DIAL Service used.

Valid NO DIAL Entries

Entry	Definition
N	No Dial Service does not apply.
MAN	Manual Line Service is normally a one-party line with manual operation for use of handicapped subscribers. Manual originating lines route the same as if they had dialed a 0- call. When NO DIAL is "MAN", a Call Forwarding feature (defined on a CFWFD form, 5614 Record) cannot be assigned to this line.
HOT	Hot Line or Direct Connection.

Data Rules:

If NO DIAL is "HOT" or "MAN", then SUSO (deny origination) must be "N".

For 5E6 - 5E8, if "HOT" is specified and PVN ALW is set to "N", then the input field HOT LINE TN is required.

For 5E6 - 5E8, when "HOT" is specified and PVN ALW is "Y", then this line is direct-connected to ASP services, so HOT LINE TN cannot be entered and the corresponding LCC form (5306 Record) must have a CLASS OF SERVICE of "INDIV" and a DIGIT ANALYSIS SELECTOR equal to PVN DAS on the

Copyright © 2003 Lucent Technologies

OFCOPT form (5509 Record.

If a CFWFD form (5614 Record) has been assigned to this line, then on the CFWFD form, ACT TYPE must be set to "AUTO" and FWD COND cannot be set to "DBSY", "DIDL" or "DBTH".

3.4 HOT LINE TN

Description: These columns identify the TN to be terminated to for MLHG/TERM having Hot Line Service. Valid Entries: A 7-, 10-, or 11- or 15-digit Hot Line TN. 15 digits (0 - 9, *, #, F, O, I, P) can be entered when MLHG/TERM is assigned a BRCS Precedence and Preemption feature.

HOTLINE TN can be in one of the formats below or listed as a PP feature code followed by Intercom digit string.

CALL TYPE	PP FEATURE CODE	ROUTE	AREA CODE	SWITCH CENTER	LINE #
ROUTINE	X	(1X)	(NPA)	(NXX)	XXXX
PRE-CEDENCE	XP	(1X)	(NPA)	(NXX)	XXXX
PRE-CEDENCE	XP				XXXX

Note: P is any digit or F, O, I, P.

Data Rules:

For 5E6 - 5E8, this field must contain an entry when the NO DIAL field is "HOT" and PVN ALW is "N". This field cannot be entered when NO DIAL is "HOT" and PVN ALW is "N" or when NO DIAL is "N" or "MAN".

3.5 SM REROUTE

Description: Stand-Alone Reroute for MLHG Members. Stand-Alone is allowed on any SM type.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

An entry of "Y" is valid only when both of the following conditions apply:

- The MLHG is global, i.e., members of the MLHG have their associated equipment numbers (LEN, SLEN or LCENs) spread over two or more SMs.
- At least one of the SMs with MLHG Members must be defined on an EQIM form and the STAND ALONE field on the EQIM form must be "Y", if the REMOTE SITE field is "IM" or "HIM", or, if the REMOTE SITE field is "ORM", "TRM" or "RSM", the STAND ALONE PURCHASED? field must equal "Y" on the EQSITE form where the REMOTE SITE value equals the REMOTE SITE value on the EQIM form.

An entry of "Y" allows intramodule calls to MLHG members on the local module to be completed when the module loses the communication link with the host office and is in Stand-Alone mode. The call is rerouted to an available MLHG member assigned to the module in Stand-Alone. If this field is "Y", then a TN must be defined in the TN field.

Although members of an MLHG can be assigned across several SMs in the host and over multiple modules, calls reroute only to members of the MLHG that are assigned to the module which is in the Stand-Alone mode. See Figure 1.

Copyright © 2003 Lucent Technologies

For 5E8 and later, if "Y" is entered then:

- ICP must be "N".
- a value of "INWATS" or "MLHG" must be entered in the TERMINATING TREATMENT field on the LCC form with the associated LCC/RAX combination.

For 5E10 and later, when Multiline Hunt Group Member(s) are defined on the MLHLN form with SM REROUTE equal to "Y", at least one other member of the MLHG must be assigned to an SM with the Stand-Alone Call Processing feature. The SM value of the associated NUMBER on the MLHLN form, where OE TYPE is equal to:

- "C"
- "E" (5E11 and later)
- "G"
- "L"

or

- "S"

must match an SM on the EQIM form where STAND ALONE is set to "Y" or where STAND ALONE PURCHASED is set to "Y" on the associated EQSITE form.

3.6 ANI7

Description: Is Automatic Number Identification 7 available on this line? ANI7 provides the ability to outpulse the ANI information digit 7 to a CAMA or TSPS operator before the billing DN. This enables the operator to do a data base lookup to see how the call should be handled.

Software Release: 5E2 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, if ANI7 is "Y", OE TYPE must be known.

3.7 TR303 NAILUP

Description: Is this line to be provisioned as a nailup for IDCU TR303 RT (Remote Terminals)?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then

- OE TYPE must be entered and must be "M" or "G" (RT lines).
- GST must be "N".
- PTY must be "I" or MFRI must be "Y".

Copyright © 2003 Lucent Technologies

- the LCC/RAX combination assigned on the LINE/MLHLN form must NOT have a CLASS OF SERVICE of "COIN" on the corresponding LCC form.

If the CONTROLLING OE-types/numbers defined on the NAILUP input form with CONTROLLING OE-type equal to "A", or "G", and DDS equal to "Y" are associated with an RTERM form where RT INTERFACE is "TR303", then the corresponding MLHLN form must have the TR303 NAILUP field set to "Y".

Also, if the NON-CONTROLLING OE-types/numbers, defined on the NAILUP input form with NON-CONTROLLING OE-type equal to "A", or "G", and DDS equal to "Y" are associated with an RTERM form where RT INTERFACE is "TR303", then the corresponding MLHLN form must have the TR303 NAILUP field set to "Y".

3.8 BUSY MONITOR

Description: Can the TN entered for this MLHG can be monitored by the Busy Lamps of an ISDN Attendant MLHG?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E5 and later, if BUSY MONITOR is "Y", OE TYPE and ATT MLHG must be entered and the associated CLASS OF SERVICE on the LCC form must be "INDIV".

For the 5E4(2) Software Release, if BUSY MONITOR is "Y", a TN, OE TYPE and ISAT GRP must be entered and the associated CLASS OF SERVICE on the LCC form must be "INDIV".

BUSY MONITOR must be "N" for TERM number 1 of an MLHG.

An ISDN MLHG can busy monitor a Hundreds Group (TNs that share the first five digits) only if those TNs that can be busy monitored do not physically terminate to more than 12 processors (SMs and/or AM). Entering a LISTED TN on an MLHG form causes the AM to be counted as one of the processors.

The following TNs can be included in the Hundreds Group, if the BUSY MONITOR field on the form is set to "Y":

- a TN from a LINE form
- a TN from an MLHLN form
- a CKT TN from a DSL form
- a CKT TN from a DSMLHLN form
- a LISTED TN from an MLHG form
- a TN (key) from a SHTN form.

The following physical terminations can be included in the Processor count, if the BUSY MONITOR field on the form is set to "Y":

- the first three digits (SM) of the OE

  NUMBER from a LINE form

Copyright © 2003 Lucent Technologies

- the first 3 digits (SM) of the OE NUMBER from an MLHLN form
- the first 3 digits (SM) of the LCEN from a DSL form
- the first 3 digits (SM) of the LCEN from a DSMLHLN form
- a LISTED TN from an MLHG form causes the AM to be counted
- the first TN in the SHARED LIST on a SHTN form has three possible cases:
  - if the TN matches the CKT TN on a DSL form, then the corresponding first 3 digits (SM) of the LCEN on that DSL form are counted;
  - if the TN matches the CKT TN on a DSMLHN form, then the corresponding first 3 digits (SM) of the LCEN on that DSMLHLN form are counted;
  - if the MLHG and TERM NBR match the CKT MLHG and CKT TERM on a DSMLHLN form, then the corresponding first 3 digits (SM) of the LCEN on that DSMLHLN form are counted.

3.9 ATT MLHG

Description: The Attendant MLHG that can control the terminal defined on this form.

Software Release: 5E5 and later
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

The ATT MLHG must have a CLASS OF SERVICE "ISATND" or "ATND" defined on the LCC form (5306 Record).

If this field is entered and TERM is 0001, the MLHG must be defined on an MLHG form with ATT MLHG equal to the ATT MLHG on this form.

For 5E7 and later, if ATT MLHG is entered and TERM is 0001 (Terminal 1 of this Multi-Line Hunt Group), the feature assigned on the corresponding MLHGFD form cannot have a HUNT TYPE of "HTC", "REG", or "PMHG".

For 5E8 and later, if ATT MLHG is entered, RBV TGN must not be entered.

3.10 RBV TGN

Description: Enter the number of the incoming trunk group used to Remote Busy Verify the TN (DN) of this form. This TGN allows an ISAT (ISDN Attendant) on another 5ESS Switch to Busy Verify this DN if the TGN is associated with a TN (DN).

Software Release: 5E8 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Copyright © 2003 Lucent Technologies

If RBV TGN is entered, ATT MLHG must not be entered, TN must be entered, and BUSY MONITOR must be "N".

If RBV TGN is entered, there must be a corresponding TKGRP form (5202 Record) with that TGN defined, and that TKGRP form must have TRKCLS set to "ATNDVFY", and TRK DIR must be "INC". Also, for the TGN on the TKGRP form, there must be at least one corresponding TRUNK form (5204 Record) with QTY entered.

If RBV TGN is entered, MLHG must equal MLHG on a corresponding MLHG form. That MLHG form must have MLHG FEATURE equal to FEATURE NAME on a corresponding MLHGFD form, which in turn must not have HUNT TYPE set to "MUPH", "ISAT", or "PSUCD".

If RBV TGN is entered and TERM is 0001 (Terminal 1 of this Multi-Line Hunt Group), the feature assigned on the MLHGFD form cannot have a HUNT TYPE of "HTC", "REG", or "PMHG".

BASIC 911 ESB

The following fields (Section 3.11 - Section 3.13) determine service capabilities for ESB (Emergency Service Bureau) and Basic 911. ESB lines must be marked as denied origination. ESB Attendants can transfer an incoming Basic 911 call to the proper agency via an ordinary POTS two-way line.

The ESB has forced disconnect on all Basic 911 calls and automatic forced hold capability for all Basic 911 call originated from local individual, coin, 2-party or multi-party sources.

The ESB can be set up as a single individual line, as Series Completion or as an MLHG with a minimum of two lines. The recommended ESB arrangement is MLHG with a single main Directory Number for the group.

3.11 RINGBACK

Description: BASIC 911 - ESB ringback capability. An ESB attendant can initiate ringback to a calling party who is in an on-hook or an off-hook condition by a flash (200 - 1100 milliseconds) on 911 calls originating from a local individual, coin, 2-party or multi-party line. This field can be set to "Y" only when the 911 ESB is located in and is served by the local 5ESS Switch.

Required Field.
Default: N
Valid Entries: Y, N

3.12 STATMON

Description: BASIC 911 - ESB Status Monitoring capability. The 5ESS sends calling line status indication to the ESB attendant via DC signaling and/or the presence or absence of low tone. Status is sent if the caller goes on-hook and is capable of being force held or if caller being forced held returns off-hook. This field can be "Y" only when the 911 ESB is located in and served is by the local 5ESS Switch.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y" then the associated Line Class Code - Service Class must be "B911".

3.13 TONDET

Description: Is the 911 ESB capable of detecting low tone? An entry of "Y" means that the 911 Service Bureau has a low tone decoder operating. TONDET should be "N" if the 911 Service Bureau cannot

Copyright © 2003 Lucent Technologies

detect low tone.

Required Field.
Default: N
Valid Entries: Y, N

SCAN AND DISTRIBUTE POINTS

The following fields (Section 3.14 - Section 3.19) list the miscellaneous equipment numbers required to activate specialized features for MLHG lines.

3.14 MESG REGISTER

Description: A Message Register Distribute Point number associated with Hotel/Motel service.
Valid Entries: The Message Register Distribute Point Number consisting of

DISTRIBUTE POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Distribute Point Number	DPN	XX	00 - 31

Data Rules:

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.

Message Register lines cannot be Feature Group A.

3.15 SLEEVE LEAD CKT

Description: A Telephone Terminal Number that requires a Sleeve Lead, such as Hotel/Motel Registers, Remote and MLHG Overflow Registers.
Valid Entries: A Miscellaneous Equipment Number consisting of

DISTRIBUTE POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Distribute Point Number	DPN	XX	00 - 31

Data Rules:

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.

3.16 MAKE BUSY KEY

Description: A Telephone/Member Number that requires a Remote Make Busy Key assignment.
Valid Entries: A Miscellaneous Equipment Number consisting of

Copyright © 2003 Lucent Technologies

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

Data Rules:

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.

This field cannot be entered if the MLHG form has HUNT TYPE equal to "MUPH".

The individual TN is only allowed to have one TN associated with the Scan Point Number, although the MLHG can have up to 32 terminals sharing one Scan Point Number for Make Busy Keys. Each Terminal is assigned to the same Scan Point Number for this application.

3.17 RND MKB

Description: This field is used to assign a scan point number to a Random Make Busy Key. When the scan point is toggled on, artificial busy will be applied to all terminals assigned to this scan point.
Valid Entries: A scan point equipment number consisting of the following:

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

Data Rules:

RND MKB can be entered only if OE TYPE and NUMBER are also entered.

RND MKB can be entered only if TERM is 1 - 2015 (not on an Outdial terminal).

This field cannot be entered if the MLHG form has HUNT TYPE equal "MUPH".

3.18 STOP HUNT KEY

Description: Circuit designation for a Stop Hunt Key.
Valid Entries: A Miscellaneous Equipment Number consisting of

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

Copyright © 2003 Lucent Technologies

Data Rules:

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.

This field cannot be entered if the MLHG form has HUNT TYPE equal to "MUPH".

3.19 DC MKB

Description: Should this analog Multiline Hunt Group member have dial codes for Make Busy? This DC MKB (Dial Code Make Busy) field indicates whether or not this analog Multiline Hunt Group member can have dial codes to enable Make Busy. This field supports the Dial Code Terminal Make Busy for MLHGs feature. For more information on this feature, see Division 2, Section 4A555.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When DC MKB is "Y":

- RND MKB must not be entered.
- STOP HUNT KEY must not be entered.
- SHARED must be "N".
- MAKE BUSY KEY must not be entered.
- TERM must be from 1 - 2015.

For 5E15 and later:

- When DC MKB is entered on this form, the ACT field on the SFSYS form (5713-1 Record) for SFID (Secured Feature ID) 555 must be set to "Y". (For more detailed information on the Dial Code Terminal Make Busy for MLHGs feature, see Division 2, Section 4A555.)
- One of the following two conditions must exist:
  - When DC MKB is entered and TERM is "1", GROUP MAKE BUSY KEY on the MLHG form (5110 Record) must not be entered; or
  - When GROUP MAKE BUSY KEY is entered on the MLHG form (5110 Record), a corresponding MLHLN form (5111 Record) must exist with DC MKB set to "N" when TERM is "1".
- When DC MKB is set to "Y", TERM must have a HUNT TYPE of "HTC", "REG", or "UCD" on the MLHGFD form (5604 Record).

4. FORM ENTRIES - 5111-3 RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

4.2 INDEX KEY

These columns define the MLHG and Terminal Number for which supplementary information is required. Not required for ODA input.

SCAN AND DISTRIBUTE POINTS Continued

The following field lists the miscellaneous equipment numbers required to activate specialized features for MLHG lines.

4.3 CARRIER GRP ALM

Description: The Carrier Group Alarm Scan Point Number assigned to the carrier system of this line.

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

Data Rules:

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.

Do not use a Carrier Group Alarm Scan Point for lines with a SLEN (Integrated SLC 96 Line Equipment Number).

All lines assigned to the same carrier system must share the same Scan Point Number which is defined on a CGASP form (5514 Record). For 5E9(1) and later, ACTION on the CGASP form must be "CON".

Refer to Division 8, Section 1 for procedures to obtain these assignments.

4.4 SHARED

Description: Is this terminal a primary Shared Terminal or does this terminal share a TN with one or more ISDN Lines or Terminals?

Software Release: 5E4(2) and later
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", the associated CLASS OF SERVICE on the LCC form must be "INDIV" and the SM that this Terminal terminates to must be defined on the EQIM form with "LOADED" entered in the CONFIGURATION field.

If this field is "Y", this Terminal must appear on a SHTN form (5902 Record) in the key TN field. If "N", this Terminal cannot appear on a SHTN form.

For 5E11 and later, if this field is "Y", then OE TYPE must be specified.

4.5 PRIVACY

Copyright © 2003 Lucent Technologies

Description: Is all-call privacy in effect? All-call privacy allows the calling party to prevent TN information from being displayed to the called party for all calls. All-call privacy can be deactivated on a per-call basis by entering a "Y" in the TN PRIVACY field on the DISPFD form and assigning a dialed code.

For 5E6 and later, this field is optional. If this field is set to "Y", the presentation status of the calling number will be private. When this field is set to "N", the presentation status of the calling number is public. If the CPNP (Calling Party Number Presentation) feature has not been purchased (FID 50 on the SFSYS form (5713-1 Record) is not set to "S"), a blank PRIVACY field will default to "N". When the CPNP feature has been purchased (FID 50 on the SFSYS form (5713-1 Record)is set to "S"), a blank PRIVACY field will remain blank allowing the presentation status to be determined by either the PRIVACY field on the SCRIDXPA form (5543 Record) or the DN PRIVACY field on the OFCOPT form (5509 Record).

For 5E6 and later, the precedence for determination of call privacy is dependent on the purchase of the CPNP special feature. When the CPNP special feature has not been purchased, the precedence hierarchy is:

1. If DN PRIVACY on the OFCOPT form is "Y", the calling party number presentation status is private.
2. If DN PRIVACY on the OFCOPT form is "N", the calling party number presentation status is determined by the PRIVACY field on this form.

When the CPNP special feature has been purchased, the precedence hierarchy is:

1. If PRIVACY on this form has been entered, it is used to determine the calling party number presentation status.
2. If PRIVACY on this form has not been entered, but an SCRIDXPA form has been entered for the SCREENING INDEX assigned to the LCC form whose LCC and RAX are assigned to this form, then that SCRIDXPA form may be used. If PRIVACY on the SCRIDXPA form has been entered, then that value is used to determine the calling party number presentation status.
3. If PRIVACY on the SCRIDXPA form has not been entered, or no corresponding SCRIDXPA form was found, then DN PRIVACY on the OFCOPT form will be used to determine the calling party number presentation status.

Software Release: 5E4(2) and later
Default: N
Valid Entries: Y, N

4.6 OVRD DNY XFER

Description: This field was added to allow lines to override the Deny Call Transfer feature.

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

When OVRD DNY XFER is set to "Y", this indicates that this line is allowed to override denials during a call transfer.

When the OVRD DNY XFER field is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to "Y".

LASS FEATURES

Copyright © 2003 Lucent Technologies

The following fields (Section 4.7 - Section 4.10) determine if LASS (Local Area Signaling Service) features are activated for this line. LASS is described in detail in Division 2, Section 1Y. LASS features are available with 5E5 and later.

4.7 AC ALW

Description: Is the LASS Automatic Callback feature allowed on this line?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If this field is blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "ISATND", "ATND", "PBX", or "4WINDIV", then ODA assigns a "Y" in this field. Otherwise, a value of "N" is automatically assigned.

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be "ATND", "INDIV", "ISATND", "ISDN", "PBX" or "4WINDIV".

For 5E6 and later, if the MLHG/TERM is assigned a LASS Automatic Callback feature on the MLHLNFA, BFG, or associated CLUSTR form, AC ALW may NOT be "N".

4.8 AR ALW

Description: Is the LASS Automatic Recall feature allowed on this line?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "ISATND", "ATND", "PBX", or "4WINDIV", then ODA assigns a "Y" in this field. Otherwise, a value of "N" is automatically assigned.

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be "ATND", "INDIV", "ISATND", "ISDN", "PBX" or "4WINDIV".

For 5E6 and later, if the MLHG/TERM is assigned a LASS Automatic Recall feature on the MLHLNFA, BFG, or associated CLUSTR form, AR ALW may not be "N".

4.9 COT ALW

Description: Is the LASS Customer Originated Trace feature allowed on this line?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "ISATND", "ATND", "PBX", or "4WINDIV", then ODA assigns a "Y" in this field. Otherwise, a value of "N" is automatically assigned.

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be "ATND", "INDIV", "ISATND", "ISDN", "PBX" or "4WINDIV".

Copyright © 2003 Lucent Technologies

For 5E6 and later, if the MLHG/TERM is assigned a LASS Customer Originated Trace feature on the MLHLNFA, BFG, or associated CLUSTR form, COT ALW may not be "N".

4.10 PCP ALW

Description: Is the LASS ICLID (Individual Calling Line Identification) Per-Call Privacy feature allowed on this line?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "ISATND", "ATND", "PBX", "4WINDIV", "B911", "CALLBK" for 5E6 or "LPTCLBK" for 5E7 and later, "SATSTLN", or "CHGCALL", then ODA assigns a "Y" in this field. Otherwise, a value of "N" is automatically assigned.

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be "ATND", "B911", "CALLBK" for 5E6 or "LPTCLBK" for 5E7 and later, "CHGCALL", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN" or "4WINDIV".

For 5E6 and later:
"Y" may be entered for the additional classes of service: "TWOPTY", "HOTMOTL", "COIN", or "2PTY".

When left blank, this field will be treated as having a value of "Y" for the following additional classes of service: "TWOPTY", "HOTMOTL", "COIN", or "2PTY".

PCP general availability may be allowed or denied via the LASSFA form (5973 Record) and the SCRIDXPA form (5543 Record).

If MLHG/TERMs on an MLHLN form or CKT MLHG/TERMs on a DSLUSR form have a PCP ALW value of "Y", the MLHG/TERM or CKT MLHG/TERM must also be defined on the MLHLN form or DSLUSR form with an LCC/RAX value that corresponds to one of the following CLASS OF SERVICEs on the LCC form (5306 Record): "ATND", "B911", "CALLBK" for 5E6 or "LTPCLBK" for 5E7 and later, "CHGCALL", "COIN", "4WINDIV", "HOTMOTL", "INDIV", "ISATND", "ISDN", "PBX, "SATSTLN", "TWOPTY", or "2PTY".

The CLASS OF SERVICEs "COIN", "HOTMOTL", "TWOPTY", and "2PTY" are valid only when the office has purchased the Calling Party Number Presentation secured feature, the SFSYS form (5713-1 Record) has Secured Feature ID 50 set to "S" or "Y".

4.11 ALT LANG

Description: Should the alternate language DSU2-RAF LASS announcements be used? This field supports the Alternate Language LASS Announcement feature, for more information on this feature see Division 2, Section 4A119.

Software Release: 5E8 and later
Default: N
Valid Entries: Y, N

Data Rules:

If ALT LANG is set to "Y", then two FIXRT forms must be defined: one with "ALSLE" entered in FIXED ROUTE TYPE and one with "AL2LVL" entered in FIXED ROUTE TYPE.

MLHLN forms with an ALT LANG field set to "Y" indicate that the Alternate Language LASS Announcement Special Feature is to be used. It is a secured feature and must be purchased by the office

Copyright © 2003 Lucent Technologies

before this field can be set to "Y". An SFSYS form must exist with SFID 119 ACT set to "Y".

LTSB

The following fields (Section 4.12 - Section 4.17) define LTSB (Line Time Slot Bridging) requirements for 5E11 and later.

LTSB provides a software emulation of traditional metallically bridged two-party lines and off-premise extensions. A member of an LTSB group cannot be a member of any other multi-party service. For more information, see Division 2, Section 4A263.

4.12 ASSOC OE TYPE

For 5E12 and later, this field has been renamed ASSOC OE. See ASSOC OE for more information.

4.13 NUMBER

For 5E12 and later, this field has been renamed ASSOC OE. See ASSOC OE for more information.

4.14 ASSOC OE

Description: This field has an entry for TYPE and an entry for NUMBER. The Associate Office Equipment indicates the port of the companion member in a 1-TN LTSB group. The port of the lead member is entered in the OE on this MLHLN form.

Software Release: 5E11 and later
Valid Entries: **TYPE:**

Valid ASSOC OE Entries

Entry	Definition
A	Software Release: 5E12 and later. TR303/DNUS equipment number (INEN).
C	For a port that resides on Z-card within an ISLU (Integrated Services Line Unit) or within a RISLU (Remote Integrated Services Line Unit).
E	Software Release: 5E11 and later. The TN is associated with an AIU (Access Interface Unit).
G	For a port that resides on IDCU Equipment with a 10-digit equipment number (GEN) for a remote terminal or a PUB43801.
L	For a port that resides on a Line Unit.
O	Software Release: 5E16 and later. OIU (Optical Interface Unit Equipment Number)
S	For a port that resides on an Integrated or Universal SLC (Subscriber Line Carrier).

The following valid entries for the number portion of the ASSOC OE field are dependent upon the type value entered in the preceeding table.

If "A" is entered in the ASSOC OE TYPE field, this TR303/DNUS Equipment Number consists of the following:

NUMBER:

Valid ASSOC OE NUMBER Entries, TYPE A

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Network Unit-Synchronous Optical Unit	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Remote Line	LINE	XXXX	0001-2048

If "A" is entered in the ASSOC OE TYPE field on the DSL, DSLUSR, LINE, MLHLN, TRUNK or MISLINK

Copyright © 2003 Lucent Technologies

form(s) then the SM, DNUS, and RT values assigned to OE NUMBER[1,6] must correspond to the SM, UNIT NUMBER[2,2], and RT EX values assigned on any RTERM form.

- ***NOTE:*** DSL/DSLUSR/MISLINK OE ports must be located on equipment identified on an RTERM form where RT INTERFACE is "TR303".

If "C" is entered in the ASSOC OE TYPE field, this Line Equipment Number consists of the following:

Valid ASSOC OE NUMBER Entries, TYPE C

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Line Unit	LU	X	0-7
Line Group Controller	LGC	XX	00-15
Line Card	LC	X	00-31

If the ASSOC OE TYPE is "C", which corresponds to an ISLU Line Card Equipment Number, then the ASSOC OE NUMBER assigned on the MLHLN form must have a corresponding line card assignment on the ISLULC form with an EQST of "O" and a TYPE of either "ZLC" or "SZLC".

If "E" is entered in the ASSOC OE TYPE field, this AIU Equipment Number consists of the following:

Valid ASSOC OE NUMBER Entries NUMBER, TYPE E

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Analog Interface Unit	AIU	XXX	000 - 042
Pack	PACK	XX	00 - 19
Circuit	CKT	XX	00 - 31

If the ASSOC OE TYPE is "E", then the ASSOC OE NUMBER must be shown as equipped with a TYPE of "AIZLP" on the EQAIUP form.

If "G" is entered in the ASSOC OE TYPE field, this IDCU Equipment Number residing on a Remote Terminal consists of the following:

Valid ASSOC OE NUMBER Entries NUMBER, TYPE G

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	XX	00 - 42
Remote Terminal	RT	XX	01 - 31
Line	LINE	XXXX	0001 - 2048

If the ASSOC OE TYPE is "G" (the ASSOC OE is assigned to IDCU equipment), then the following ASSOC OE NUMBER(s) must correspond to a Channel Unit position (i.e., CU XX/YY) with a known value defined on the RTERM form.

- ***NOTE:*** The last two digits of the ASSOC OE NUMBER are determined by the CU XX/YY value (where XX is an odd number range of 01-95 and YY is an even number of XX + 1). Both the ASSOC OE NUMBER (10,11) line values in the pair are assignable when CUXX or CUYY type is "FSR", "MP", "SP", "SSV00", "SSV10", "DFXS", or "SPOTS". Only the lower (odd) numbered ASSOC OE NUMBER value is assignable when CU XX/YY type is "COIN", "FXS", or "FXSLS". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

ASSOC OE NUMBER

OE	RTERM
NUMBER(1,3)	SM
NUMBER(4,5)	UNIT NUMBER
NUMBER(6,7)	RT EX
NUMBER(8,11)	For OE TYPE = "G": POS value for CU XX/YY type = "FSR", "MP", "SP", "SPOTS", "FXSLS", "SSV00", "SSV10", "DFXS".

Copyright © 2003 Lucent Technologies

OE (Originating Equipment) ports with OE (and/or ASSOC OE) TYPE of "G" on the DSL, DSLUSR, LINE, MLHLN, TRUNK or MISLINK form(s) which have SM/IDCU/RT values assigned to OE NUMBER(1,7) must correspond to the SM/UNIT NUMBER/RT EX values assigned on any RTERM form.

- ***NOTE:*** DSL/DSLUSR/MISLINK OE ports must be located on equipment identified on an RTERM form where RT INTERFACE is "TR303".

If "L" is entered in the ASSOC OE TYPE field, this Line Equipment Number consists of the following:

Valid ASSOC OE NUMBER Entries, TYPE L

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Line Unit	LU	XXX	000 - 042
Concentrator	CON	X	0-9
Switch Group	SWG	X	0-1
Switch	SW	X	0-7
Level	LEV	X	0-3

When TRKOE TYPE is "O" (OIU), this OIU Equipment Number consist of:

TRKOE NUMBER, TYPE O - Equipment

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	OIU	X	0 - 7
Performance Montoring Group	PG	XX	0 - 9
SONET Terminating Equipment	STE	X	1
High Level Virtual Container	HVC	X	1 - 3
Low Level Virtual Container Group	LVC GRP	X	1 - 7
Low Level Virtual Container	LVC GRP	X	1 - 4
Channel	CH	XX	01 - 28

If "L" is entered in the ASSOC OE field and a 1-TN LTSB group is being defined, then the SM and LU values must match, respectively, the SWITCHING MODULE and LINE UNIT values on an EQLUP form (5711 Record). Additionally, the CON value must match an LU GRID X value (X = 0 to 9) with an EQUIPMENT STATUS of "G" or "O".

If the ASSOC OE TYPE is "L" and corresponds to an LEN (Line Equipment Number), the ASSOC OE NUMBER must be shown as equipped on the EQLUP form.

If "S" is entered in the ASSOC OE TYPE field, this Integrated SLC Equipment Number consists of the following:

Valid ASSOC OE NUMBER Entries, TYPE S

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Carrier Line Unit	DCLU	X	0-7
Remote Terminal	RT	XX	01-32
Line	LINE	XX	01-96

The ACT field on SFID 262 on the SFSYS form must be set to "Y" before the ASSOC OE TYPE/NUMBER are entered.

When MAN EXCL field is "Y", then the ASSOC OE field must be entered.

If ASSOC OE is entered, then the following conditions apply:

- AC ALW and AR ALW must be "N"
- ATT MLHG must not be entered

Copyright © 2003 Lucent Technologies

- BUSY MONITOR must be "N"
- CARRIER GRP ALARM cannot be entered
- CIDIAL must be "ALLOW", "DENY" or "REQ"
- CLSS must be "N"
- GNDREF must be "N"
- if OE TYPE is "G", OE TYPE must not be in PUB43801 format
- For 5E11 and 5E12, NO DIAL must be "N"
- OE TYPE and NUMBER must be entered
- OE TYPE and NUMBER must not be the same as ASSOC OE TYPE and NUMBER
- OE TYPE must be "A", "C", "E", "G", "L" or "S" for LTSB (5E12 and later)
- OE TYPE must be "C", "E", "G", "L" or "S" for LTSB (5E11 only)
- RBV TGN must not be entered
- SHARED must be "N"
- SLEEVE LEAD CKT must not be entered

When MFRI is "Y" and ASSOC OE TYPE is "G", then PTY must be 1 - 5.

When an MLHLN form has the 1-TN LTSB assigned, a corresponding MLHLNFA form may have one or more of the following BRCS features assigned if the SFID 262 ACT field on the SFSYS form is set to "Y".

Valid BRCS Features

Feature	Form	Field
Call Forwarding	CFWFD	FORWARD CONDITION= "BUSY",, "IDLE",, or "BOTH".
Display Feature - Per Call Privacy	DISPFD	TN PRIVACY="Y".
Incoming Line Identification	LIDFD	CNAM,, CALL NBR DELIV PRIM,, CALL NBR DELV ALL= "Y".
LASS Selective Call Acceptance	LSCAFD	
LASS Automatic Callback	LSACFD	
LASS Selective Call Distinctive Alert	LSDAFD	
LASS Selective Call Forwarding	LSCFFD	
LASS Automatic Recall	LSARFD	
LASS Selective Call Rejection	LSCRFD	
Message Service System	MSFD	
Multi-Way Calling	MWFD	CALL PICKUP ENTRY POINT="N".
One- Two-Digit Speed Calling	SCFD	SC SHARED="Y".

When an MLHG/TERM(s) is assigned on the MLHLN form(s) where ASSOC OE is entered assigning 1-TN LTSB to this MLHG/TERM:

- the corresponding MLHGFD form must have HUNT TYPE of "REG", "HTC", or "UCD". The MLHLN

Copyright © 2003 Lucent Technologies

form corresponds with the MLHG form if the MLHG fields match. The MLHG form corresponds with MLHGFD form if the MLHG FEATURE field on the MLHG form matches the FEATURE NAME on the MLHGFD form.

- ASSOC OE TYPE and NUMBER on these MLHLN forms must not match an OE TYPE and NUMBER on a different MLHLN form.
- ASSOC OE TYPE and NUMBER on the MLHLN form must not match the OE TYPE and NUMBER on a LINE form.
- When LINE and/or MLHLN forms have an ASSOC OE TYPE and NUMBER for LTSB entered, the same ASSOC OE TYPE and NUMBER cannot be duplicated on two or more forms. Each ASSOC OE TYPE and NUMBER must be unique.

5E12 and later:

The 1-TN LTSB with IBDS Package 1 is a Secured Feature which is required for the IBDS Package 2 features. Therefore, the ACT field for SFID 262 must be set to "Y" before the SFID 263 ACT field can be set to "Y".

When an MLHLN form has the 1-TN LTSB assigned, a corresponding MLHLNFA form may have one or more of the following BRCS features assigned if the SFID 263 ACT field on the SFSYS form is set to "Y".

Valid BRCS Features

Feature	Form	Field
Call Waiting with Dial Call Waiting and Call Waiting Originating	CWTFD	INVOCATION="CODE" or "FLASH",, FLASH ON FORWARD= "Y",, CW DELUXE="N"
LASS Customer Originated Trace	LSCOTFD	
Distinctive Ringing	DRFD	
Individualized Dialing Plan	IDFD	
Message Detail Recording	MDRFD	
Private Facilities Access	PFAFD	
Terminal Group Station Restriction	TGSRFD	

Queueing is not allowed for 1-LTSB. For a MLGH TERM(s) defined on an MLHLN form with an ASSOC OE entered, which is assigned 1-TN LTSB and a PFA (Private Facility Access) feature is assigned on the corresponding MLHLNFA form, then QUEUE ALLOWED or PRIORITY QUEUE must be "N" on the BFG and PFAMPA forms. In addition, QUEUE ALLOWED or PRIORITY QUEUE must be "N" on the PFAFD form, unless these parameters are overridden on the corresponding BFG or PFAMPA forms. For 5E13 and later, when the ACT field for SFID 280 on the SFSYS form is set to "Y", queueing is allowed, (i.e., QUEUE ALLOWED and PRIORITY QUEUE can be "Y").

5E13 and later:

The following checks for SFID 280 are related to the IBDS3 (Internally Bridged Dual Service - Package 3) feature. For more information on this feature, see Division 2, Section 4a280.

The ACT field for SFID 280 on the SFSYS form must be set to "Y" when the MLHG/TERMs are defined on a MLHLN form with the ASSOC OE TYPE and NUMBER entered, (assigning 1-TN LTSB (Line Time Slot Bridging) to the MLHG/TERM), and the corresponding MLHLNFA form has one or more of the following BRCS features entered:

Valid BRCS Features

Feature	Form

Copyright © 2003 Lucent Technologies

Account Codes	ACCTFD
Automatic Route Selection	ARSFD
Advanced Services Interface	ASIFD
Authorization Codes	ATHFD
Bulk Calling Line Identification	BCLIDFD
Time of Day	TODFD

When the ACT field for SFID 280 on the SFSYS form is set to "Y", the ACT field for SFID 263 on the same form must also be set to "Y".

If the ASSOC OE on the MLHLN form is entered, NO DIAL must be "N", unless the ACT field for SFID 280 on the SFSYS form is set to "Y". If SFID 280 is set to "Y", ASSOC OE can be "HOTN".

5E16 and later:

When ASSOC OE is entered, OE TYPE must be "A", "C", "E", "G", "L", "S", or "Y" for LTSB.

When ASSOC OE is "Y" (VEN), NUMBER must be sm[001 - 192] line [00001 - 28800].

4.15 LEAD PORT

Description: The OE is always the lead port for this LTSB group. This is a no change field. For more information, see Division 2, Section 4A80.

Software Release: 5E11 and later

4.16 IALT

Description: Is Intra-Switch Analog Line Transfer active? This field is a no change field and defaults to "N".

Software Release: 5E11 and later

4.17 MAN EXCL

Description: Can the ports defined in the OE TYPE/NUMBER combination and the ASSOC OE TYPE/NUMBER combination exercise the Manual Exclusion feature? The value entered in this field applies to both members of the group.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If MAN EXCL is "Y", ASSOC OE TYPE and NUMBER must be entered.

4-WIRE SPECIFICATIONS

The following fields (Section 4.18 - Section 4.22) are available in 5E3 and later Software Releases. They are used in DSN (Defense Switched Network) offices (indicated by the DSN OPTION field on the OFCOPT form being set to "Y"). An entry in these fields is only valid for lines that have a CLASS OF SERVICE (LCC form) of "4WINDIV". These fields may only be entered when OE TYPE is "D", "N" or "T".

4.18 ROUTINE RINGING

Description: The type of Routine Ringing for 4-wire access lines.

Valid ROUTINE RINGING Entries

Entry	Definition
4WOFF	Off-hook alerting
4W24	2-seconds off-hook, 4 seconds on-hook)

Data Rules:

For 5E4(2) and later, if CONFERENCE BRIDGE is "Y", ROUTINE RINGING must be "4WOFF".

4.19 PRIORITY RINGING

Description: The type of Priority Ringing for 4-wire access lines.

Valid PRIORITY RINGING Entries

Entry	Definition
4WOFF	Off-hook alerting
4W350	Simple wink, 350ms on-hook/off-hook
4W1650	Continuous 1650ms off-hook/350ms on-hook

Data Rules:

For 5E4(2) and later, if CONFERENCE BRIDGE is "Y", PRIORITY RINGING must be "4W350".

4.20 AUDIBLE RINGING

Description: Does the 4-wire subscriber line equipment provide its own Audible Ring?
Default: N
Valid Entries: Y, N

4.21 INC. START SIGNAL

Description: The Incoming Start Signal for 4-wire subscriber lines.
Default: DIALTONE
Valid Entries:

Valid INC. START SIGNAL Entries

Entry	Definition
WINK	Wink Start
WNKDT	Wink Start and Dial Tone
DIALTONE	Dial Tone

Data Rules:

If CONFERENCE BRIDGE is "Y", then INC. START SIGNAL must be either "WINK" or "WNKDT".

4.22 CONFERENCE BRIDGE

Description: Is the 4-wire subscriber line a conference bridge connection?
Default: N
Valid Entries: Y, N

4.23 PVN ALW

Description: The name of this field was changed to ASP ALW in 5E8. This field name applies to 5E6 - 5E7. See ASP ALW for usage information.

4.24 ASP ALW

Description: Is this line allowed to originate ASP (Advanced Services Platform; previously PVN, Private Virtual Network) calls using an ODP Feature/Prefix Code trigger? (This field was called PVN ALW for 5E6 - 5E7).

Copyright © 2003 Lucent Technologies

Software Release: 5E6 - 5E8
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

An entry of "Y" indicates the line is allowed to originate such ASP calls while "N" indicates the line is not allowed to originate such ASP calls.

If PVN OFC on the OFCOPT form (5509 Record) is set to "NONE", then this office does not support ASP and PVN ALW must be "N".PVN ALW may be set to "Y" only if the corresponding LCC form (5306 Record) has a CLASS OF SERVICE of "INDIV", "ISDN" or "ATND".

If PVN ALW is "Y" and NO DIAL is "HOT", then this line is direct-connected to ASP services and the corresponding LCC form (5306 Record) must have a CLASS OF SERVICE of "INDIV" and a DIGIT ANALYSIS SELECTOR equal to PVN DAS on the OFCOPT form (5509 Record).

A line dedicated to ASP services should not be entered as part of a Series Completion Group. When PVN ALW is set to "Y" and SERHLN is entered, then the DIGIT ANALYSIS SELECTOR on the corresponding LCC form (5306 Record) cannot be equal to PVN DAS on the OFCOPT form (5509). Likewise, DIGIT ANALYSIS SELECTOR should not be equal to a DAS equivalent in functionality to the PVN DAS (i.e., a virtual ASP DAS).

4.25 SCD SCRNING

Description: This field is set to "Y" by Recent Change if at least one carrier has requested SCD (Selective Carrier Denial) Screening for this line. SCD Screening is a function of the SCD feature.

Software Release: 5E5 and later

4.26 CLSS

Description: Does this line subscribe to Calling Line Side Supervision? If "Y" is entered, the calling party will detect a battery reversal upon called party answer, and another battery reversal (returning to normal state) upon called party disconnect. This field is used by the CLSS (Calling Line Side Supervision) feature. CLSS is a Secured Feature, and must be purchased before it can be assigned.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

FEATURE ID 63 on the SFSYS form must be set to "S" before CLSS can be set to "Y".

If CLSS is set to "Y", and the LCC/RAX is defined on an LCC form where CLASS OF SERVICE is "INDIV" or "PBX", which qualifies the line for use of LASS GA (Generally Available) features, then the MLHLN form must have AC ALW, AR ALW, COT ALW and PCP ALW all set to "N" since lines subscribing to CLSS are not compatible with LASS GA features.

If CLSS is set to "Y", this requires that LCC/RAX be defined on an LCC form where CLASS OF SERVICE is "INDIV", "PBX" or "HOTPBX".

When CLSS is Y:

Copyright © 2003 Lucent Technologies

- OE TYPE and NUMBER must be entered
- BUSY MONITOR must be "N"
- SHARED must be "N"
- BRCS must be "N"
- AC ALW, AR ALW, COT ALW, and PCP ALW must be blank or "N"

4.27 MCLD DEACT

Description: Is MCLD (Modified Calling Line Disconnect Procedure for Fraud Protection) deactivated for this line when it is active on this SM?

The MCLD feature is enabled by setting FID 517 to "S" on the FOSYS form (5713-2 Record).

When MCLD is enabled and MCLD DEACT is set to "N", this line will receive Permanent Signal Treatment following expiration of the disconnect timer. This will force the line to go back onhook before originating another call. When MCLD is enabled and MCLD DEACT is set to "Y", this line will receive dialtone following expiration of the disconnect timer.

The MCLD feature applies only to analog lines. For more information, see Division 2, Section 4C.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OE and TYPE/NUMBER have not been entered, then MCLD DEACT must be "N".

4.28 BLK 1PLUS

Description: Enter the type of blocking on a line if the office has the 1+ Blocking / 1+ split Blocking special feature.

Software Release: 5E7 and later
Required Field.
Default: NONE
Valid Entries:

Valid BLK 1PLUS Entries

Entry	Definition
FULL	Block all 1+ dialing
SPLIT	Block FGD CAC 1+ if the carrier dialed is not the pre-subscribed carrier.
NONE	No blocking for 1+ on the line

Data Rules:

If OE TYPE and NUMBER are not entered, BLK 1PLUS must be "NONE".

If BLK 1PLUS is set to either "FULL" or "SPLIT", the LCC and RAX fields must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV", "PBX", "HOTPBX", "HOTMOTL", "COIN", "ATND", "ISDN", "ISATND", or "SATSTLN".

4.29 LONG DST DR

Copyright © 2003 Lucent Technologies

Description: Is distinctive ringing supplied for long distance calls?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E8 and later, the Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before the LONG DST DR field can be changed from its default value on either the LINE, MLHLN, or DSLUSR forms. Before "Y" can be entered the ACT field for SFID 91 set to "Y" on the SFSYS form (5713-1 Record).

USTWC

The fields in Section 4.30 through Section 4.32 define Usage Sensitive Three Way Calling Special Features and options.

4.30 USTWC ALW

Description: Is Usage-Sensitive Three-Way Calling allowed?

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then:

- CLSS must be "N".
- NO DIAL must be "N".
- SHARED must be "N".
- the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV" or "PBX".

4.31 SUBSCR USTWC

Description: Is this line subscribed to USTWC (Usage Sensitive Three-Way Calling)? This field supports Spontaneous USTWC feature, which is a secured feature (SFID 156). For more information on this feature, see Division 2, Section 4A156.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then:

- CLSS must be "N".
- NO DIAL must be "N".

Copyright © 2003 Lucent Technologies

- SHARED must be "N".

If the LINE and/or MLHLN forms have SUBSCR USTWC set to "Y" the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV" or "PBX".

4.32 USTWC ALW XFER

Description: Allow Usage Sensitive Three Way Calling with Call Transfer? This field supports the Per-Use Three Way Calling with Call Transfer feature. This feature is a secured feature. For more information, refer to Division 2, Section 4A577.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When USTWC ALW XFER is "Y", USTWC ALW or SUBSCR USTWC must be "Y".

When USTWC ALW XFER is "Y", ACT field must be "Y" for SFID 577on the SFSYS form (5713-1 Record).

4.33 LRN INDEX

Description: Enter the index into the LRNINDEX form (5328 Record) for Local Number Portability. LRNs are used to route DNs that have been ported into the office from other switches. An LRN uniquely identifies an office and rate center. This field supports the Local Number Portability secured feature (SFID 174). For more information concerning this feature, see Division 2, Section 4A174.

Software Release: 5E11 and later
Valid Entries: 1 - 127

Data Rules:

When a Multiline Hunt Group Terminal is assigned on an MLHLN form with LRN INDEX entered, the LRN INDEX must also be entered on the LRNINDEX form (5328 Record).

4.34 NON COND TRIG

Description: The NON COND TRIG field is used to indicate whether or not a call to this DN requires a non-conditional query of the SCP (Service Control Point) prior to routing the call. This is a no change field.

Software Release: 5E11 and later

ADVANCED SERVICES PLATFORM

The following fields (Section 4.35 - Section 4.36) were added to accommodate the ASP Inhibiting of Originating Busy/No Answer Triggers with Extended Ringing feature. This is a secured feature with SFID 210. For more information on this feature, see Division 2, Section 4A210.

4.35 OFC OBL INH

Description: The OFC OBL INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by individual lines. It indicates whether the ASP Office Originating Busy Line Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating Busy Line Trigger is inhibited.

Copyright © 2003 Lucent Technologies

This field was added for the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, Section 4A210.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC OBL INH must be "N".

4.36 OFC ONA INH

Description: The OFC ONA INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by individual lines. It indicates whether the ASP Office Originating No Answer Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating No Answer Office Trigger is inhibited.

This field was added for the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, Section 4A210.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC ONA INH must be "N".

4.37 URT FCD BLK

Description: Should all Unrestricted FCD Codes be blocked from this TN?

NOTE: On the LINE, MLHLN, and DSLUSR forms this URT FCD BLK field is intended for use on individual or line attendant lines only.

This field was added for the ASP Unrestricted FCD Trigger feature. For more information, see Division 2, Section 4A572.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The secured feature ASP Unrestricted FCD Code Triggers must be purchased before URT FCD BLK can be changed to "Y" on the MLHLN form, therefore the ACT field for SFID 572 on the SFSYS form must be "Y".

For 5E15 and later, when the MLHLN form has "Y" entered in the URT FCD BLK field, a corresponding LCC form must have "INDIV" or "ATND" entered in the CLASS OF SERVICE field. LCC corresponds with a MLHLN form when the LCC and RAX fields match.

Copyright © 2003 Lucent Technologies

For 5E15 and later, when the MLHLN forms have "Y" entered in the URT FCD BLK field, a corresponding LNBLKCOD form cannot be entered. LNBLKCOD corresponds with MLHLN form when the TNs match.

4.38 BLK LN CODE

Description: This is a text only field that indicates if a LNBLKCOD form exists for this TN.

This field was added for the ASP Unrestricted FCD Trigger feature. For more information on, see Division 2, Section 4A572.

Software Release: 5E15 and later

4.39 INHIBIT DEL

Description: Should the deletion of this line be inhibited?

Software Release: 5E13 and later
Required Field.
Default: N

NOTE: INHIBIT DEL must be set to "N" before deletion is line oallowed.
Valid Entries: Y, N

Data Rules:

When INHIBIT DEL field is "Y", OE or RTIDX must be entered.

4.40 CONTEXT ID

Description: This field is used to indicate whether or not a multiline hunt group is set to "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E12 and 5E13: N
- For 5E14: NATIVE

Valid Entries:

Valid CONTEXT ID Entries

Entry for 5E12, 5E13	Entry for 5E14 and later	Description
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

For 5E12 and later:

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the MLHLN form, the ACT field for SFID 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the MLHLN form, there must be an LCC form (5306 Record) where the RAX and LCC has the CLASS OF SERVICE set to

Copyright © 2003 Lucent Technologies

one of the following:

- ATND
- CHGCALL
- COIN
- HOTMOTL
- HOTPBX
- INDIV
- ISDN
- ISATND
- PBX
- TWOPTY
- 2PTY
- 4PFS
- 4PSS
- 4WINDIV
- 5PTY
- 8PSS
- 10PTY

USAGE SENSITIVE SIX-WAY CALLING

The USSWC ALW field was added to accommodate the Usage Sensitive Six-Way Calling feature. This is a secured feature with SFID 553. For more information on this feature, see Division 2, Section 4A553.

4.41 USSWC ALW

Description: Should Usage Sensitive Six-Way Calling be allowed? The USSWC ALW field verifies whether or not the Usage Sensitive Six-Way Calling feature is allowed for a specified line. No entry is required; this is an optional field. For more information on this feature, see Division 2, Section 4A553.

Software Release: 5E15 and later
Default: Blank
Valid Entries: Blank, or enter Y or N

Data Rules:

When USSWC ALW is "Y":

- CLSS must be "N"
- NO DIAL must be "N"

Copyright © 2003 Lucent Technologies

- SHARED must be "N"

On-Hook Data Transmission

4.42 FSK OSI

Description: This field is used to indicate the per-line control of sending the OSI (Open Signaling Interval).

Software Release: 5E15 and later
Valid Entries: Y, N, or blank

Data Rules:

For 5E15 and later:

- When GST is "Y", FSK OSI must be "N".
- When FSK OSI is "Y", the LCC and RAX on the LCC form (5306 Record) must have CLASS OF SERVICE equal to "ATND", "INDIV", or "PBX"..
- When FSK OSI is set to "Y", the ACT field for SFID 613 on the SFSYS form (5713-1 Record) must also be set to "Y".

Copyright © 2003 Lucent Technologies

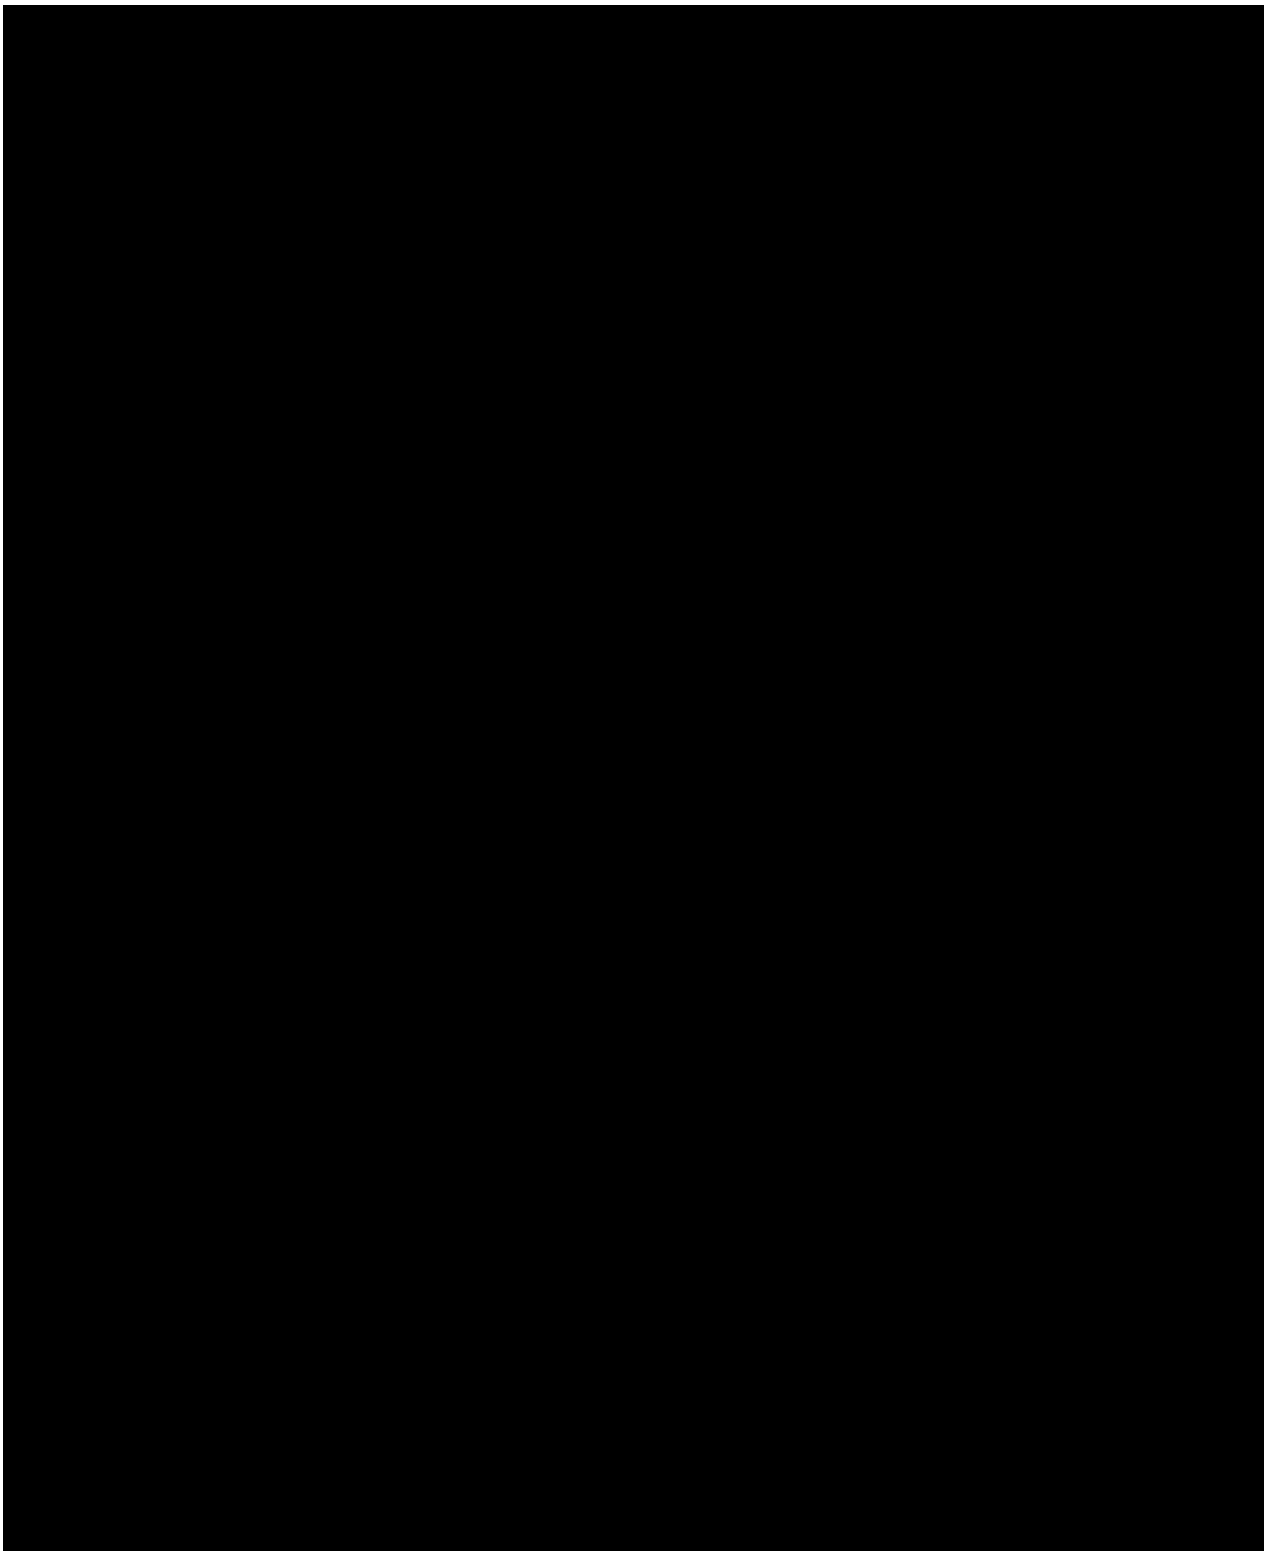

Figure 1 PARTY VALUE/MULTI-FREQUENCY RINGING FEATURE

MLHLN PTY	FREQUENCY CLASS ON IMINFO FORM		
	HARMONIC HAR	SYNCHROMONIC SYN	DECIMONIC DEC
1,6	33.3	30	30
2,7	50	42	40
3,8	66.6	54	50
4,9	16.6	66	60
5,0 (0 IS PTY10)	25	20	20

Copyright © 2003 Lucent Technologies

PTY values 1-5 are ring-side frequencies 1-5.

PTY values 6-9,0 are tip-side frequencies 1-5.

PARTY VALUE LINE/MLHLN PTY	FREQUENCY CLASS VALUES FOR ISLC-96 LINES		
	HARMONIC	SYNCHROMONIC	DECIMONIC
1	25	30	30
2	33.3	42	40
3	50	54	50
4	16.7	20	20

NOTE: Party values 1-4 are ring-side frequencies and are provided based on an option switch of the Frequency Selective Ringing (FSR) Channel Unit.

SEC. 1L: 5112 RECORD
FEATURE ASSIGNMENT TELEPHONE NUMBER FORM - LINEFA

1. GENERAL

The 5112 Record is available with 5E2 and later Software Releases, and defines BRCS (Business and Residence Custom Services) Features to a particular customer Telephone Number.

The LINEFA form assigns up to 48 BRCS Features to a specific Telephone Number. Each feature name can be either a unique feature name or CLUSTER NAME. CLUSTER NAMEs must be defined on the CLUSTR form (5600 Record) where they are expanded into 2 - 16 unique feature names. The total number of unique feature names on this form and associated CLUSTR forms, must not exceed 48.

With 5E6 and later Software Releases, Speed Call (Abbreviated Dialing) features are assigned separately from IDP (Individualized Dialing Plan) features. Prior to this disassociation, a line can be assigned an IDP feature with a Speed Call feature which counts as one feature for that line. However, after a retrofit from the 5E5 Software Release to the 5E6 Software Release, this line may have as many as three features: an IDP feature and up to two SC (Speed Call) features depending on whether or not one-digit or two-digit Speed Call has been assigned.

This may raise the count of Terminal features for that line above the maximum of thirty features. A line only may be assigned up to thirty Terminal features, therefore, use discretion with a LINEFA form that has more than twenty-eight Terminal features (IDP feature included) at the time of retrofit. If the feature count is greater than thirty after retrofit, the SC1 (one-digit Speed Call) feature, if it has been assigned, will be canceled. If SC1 has not been assigned, then SC2 (two-digit Speed Call) will be canceled. If both features have been assigned to this line, both may be canceled.

Wild Card feature Names of the format /AA* (AA equal to alphabetic) are not allowed to be assigned to a Telephone Number on the LINEFA form.

1.1 Recent Change View

The corresponding Recent Change Views for this form are 1.8, 1.11, and 1.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The TN value must be assigned on the LINE form (5109-1/2/3 Record). The TN defined on the LINE form must have its associated BRCS attribute set to "Y", and must be assigned to a LEN or SLEN.

The /LIRDAMU, /LIRDNMU, and /LIRMDU preconstructed features which were created to support the Calling Name Delivery feature were not available for the 5E7 Software Release.

Copyright © 2003 Lucent Technologies

See Div 5, Sec 1C, 1. General, for features allowed on SHTN secondary only lines.

If TNs on this form are assigned HI (Home Intercom) feature(s) on the LINEFA, BFG, or an associated CLUSTR form, then the TN must also be defined on the LINE form (HI feature can be assigned only to ANALOG lines).

For 5E7 and later, if TNs have a Forward to Telephone Number assignment on the CFWLPA form or CFWFD form's default parameters equal to the same TN, there must be an IDP feature assigned to the TN for the Call Forwarding feature to allow forwarding to itself.

For 5E8 and later, TNs assigned an Advanced Service Interface feature via a LINEFA form with R set to "Y", indicating that Remote Access Services (RAS) are desired, and the FEATURE is defined on a CFWFD form; the corresponding CFWFD form must have an ACT TYPE of "CDDN", "CDDNC", "CDDNCA", "CDCA1A" or "CODE" and a DACT TYPE of "CODE".

For 5E10 and later, when TN(s) appear on the LINEFA form with an ASP feature either assigned on the LINEFA or corresponding CLUSTR form, the ASP feature is defined on a ASPFD or ASPLPA form with OHD TRIG NBR entered. The TN is either defined on a LINE form or on a DSLUSR form as CKT TN where DSL CLS on the corresponding DSL form is "STD". Therefore, the only other BRCS features allowed to be assigned to the line are features defined on the ASPFD form with CONTROL equal to "TERM" and those defined on the following forms where the appropriate secured feature(s) has been purchased and corresponding SFID(s) are set to "Y" on the SFSYS form:

- ☐ The Advanced Service Platform (ASP) BRCS/OHD Interworking SFID 137 ACT equals "Y"
  - ☐ CFWFD with FWD COND equals "BUSY", "IDLE", "BOTH", "DBSY", "DIDL" or "DBTH"
  - ☐ CWTFD with INVOKE equals "TERM"
  - ☐ DISPFD
  - ☐ LIDFD
  - ☐ LSACFD
  - ☐ LSARFD
  - ☐ LSCAFD
  - ☐ LSCARFD
  - ☐ LSCFFD
  - ☐ LSCOTFD
  - ☐ LSCRFD
  - ☐ LSDAFD
  - ☐ MWFD with CONTROL not equal to "CODEALT"
- ☐ Additional ASP OHD Interactions with Account Code and CPN/BN SFID 150 ACT equals "Y"
  - ☐ ACCTFD
  - ☐ CPNBNFD
  - ☐ RNDFD

Copyright © 2003 Lucent Technologies

- ASP Network Element Services Signaling (NESS) SFID 185 ACT equals "Y"
  - ASPFD with CONTROL equals "NESS"
- ASP BRCS/OHD Interworking Extensions SFID 226 ACT equals "Y"
  - HIFD
  - MSFD
  - PUOFD with INITIATE equals "IPRDQ"
  - PUTFD with FEATURE FUNCTION equals "CALPU"
  - SCFD

For 5E12 and later, TNs on different LINEFA forms can not be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the LINEFA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, if the TN(s) on the LINEFA form are assigned a Call Pickup Originating feature with DPU TN assignment, defined on the PULPA form or the BFG form, the Call Pickup Originating feature initiated by Predesignated Pickup Group, Directed Pickup, Code Calling or Loud Speaker Paging does not need such an assignment.

For 5E16 and later, if the TN(s) are assigned to the Direct Call Transfer to Voice Mail feature on either the LINEFA form, BFG form, or an associated CLUSTR form, then the ACT field for SFID 586 must be set to "Y" on the SFSYS form.

2.3 BFGN

Description: Enter the BFGN (BRCS Feature Grouping Name).

Refer to the BRCS Feature Description (Division 2, Section 1U) for the restrictions concerning BFG Names.

Software Release: 5E4(2) and later
Valid Entries: 1 - 7 alphanumeric characters.
- The optional SUFFIX is a number between
- 1 - 9.

Data Rules:

The BFGN entered must be defined on a BFG form (5625 Record) as either a SELECTION BFGN or an UNIQUE BFGN.

If a SELECTION BFGN without a SUFFIX is entered, in the BFGN field on the LINEFA form, the best fit selection process is attempted.

If a specific SELECTION BFGN and SUFFIX is entered in the BFGN field on this form and the LINEFA

Copyright © 2003 Lucent Technologies

feature list is empty, all of the features defined by that SELECTION BFGN and SUFFIX combination will be assigned to the subscriber's line. If the LINEFA feature list contains features that are not defined as part of the BFGN and SUFFIX features, these undefined features will be assigned to the line outside of the BFGN.

If a UNIQUE BFGN is entered in the BFGN field and the LINEFA feature list is empty, all of the features defined by that UNIQUE BFGN will be assigned to the subscriber's line. If the LINEFA feature list contains features that are not defined as part of the UNIQUE BFGN features, these undefined features will be assigned to the outside of the BFGN.

Features assigned to subscribers can be a combination of features defined by a BFGN and the features indicated on the LINEFA form. If a specific SELECTION BFGN and SUFFIX or UNIQUE BFGN is entered, it is not necessary to enter features on the LINEFA. If the BFGN entered is a UNIQUE BFGN, a SUFFIX cannot be entered.

Subscribers that have any of the following BRCS Features with the AC (Authorization Code) field set to "Y" on the LINEFA form, will always fail to select a BFG with the matching feature. This use of the Authorization Code is not supported by the BFG capability.

- Account Code
- Attendant (ACVT)
- Authorization Code
- Distinctive Ringing
- Individualized Dialing
- Message Detail Recording
- Multi-Way Call
- Terminal Group and Station Restriction

For 5E14 and later, when BFGN is known and it has a CF (Call Forwarding) feature assigned in the FEATURE LIST on the BFG form where FCCS OPT on either the CFWFD form or the CFWLPA form for the corresponding CF feature is "Y", the following must be true:

- SHARED must be "N"
- SERHLN must be unknown
- ASSOC OE must be unknown

- this TN must be defined on the LINE form
- LINE CLASS CODE and TERMINATING TREATMENT must both be "INDIV" on the LCC form
- this TN must not be defined on the MLHLN form

FEATURE LIST

Fields Section 2.4 -Section 2.8 refer to the Feature List, consisting of up to 48 Feature/Cluster names with the associated initial Activity Status, Master Override Status, Authorization Code and Remote Access Services feature settings.

Copyright © 2003 Lucent Technologies

2.4 FEATURE

Description: Enter the Feature or Cluster name.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

If the feature name used in one of the 48-Feature List rows is a cluster name that is defined on the CLUSTR input form, then fields A and M should be set to "Y" to pass level 1 and 2 error checks. The actual activity status for each feature name assigned to the CLUSTER name is defined on the CLUSTR input form and Master Override Status will be initialized to "Y".

If CKT TNs on DSLUSR form and/or TNs on LINE forms are assigned SC (Speed Call) feature(s) on either the LINEFA, BFG or an associated CLUSTR form, then the TN must also be defined on the LINE or DSLUSR form with an LCC/RAX value that corresponds to a CLASS OF SERVICE of "4WINDIV", "INDIV", "PBX", "ATND", "TWOPTY", "HOTMOTL", "MODEM", "ISDN", "ISATND" on the LCC form.

For 5E12 and later, the following assigments are not premitted if the LINEFA form(s) contain features that can only be assigned to DSLUSR form CKT TN(s) where the corresponding DSL form (DSLUSR form OE matches the DSL form DSL OE) has a DSL CLS of "STD", and these LINEFA form(s) were defined as a DSLUSR form CKT TN where the corresponding DSL form has a DSL CLS which is not "STD", or as a LINE form TN or as a Secondary Only TN on a SHTN form.

If the features were assigned via a BFG or CLUSTR form then the key to that form is included. See the TG-5 (DSL form attribute DSL CLS) for the types of features that can only be assigned to "STD" DSLs.

For 5E12 and later, the following LINEFA form(s) contain features that can not be assigned to:

- A DSLUSR form CKT TN where the corresponding DSL form DSL CLS is set to "STD" (DSLUSR form OE matches the DSL form DSL OE).
- A Primary analog TN, which is shared with a "STD" DSLUSR. This is a LINE form TN which is also a Key TN and matches the entry in the SHARED LIST ROW 1 TN field on a SHTN form, where TN or MLHG/TERM NBR entries in the SHARED LIST (rows 2 through 32) match a DSLUSR form CKT TN or CKT MLHG/CKT TERM where the DSL CLS on the corresponding DSL form is "STD".
- A Secondary ONLY TN, which is shared with an "STD" DSLUSR. This is a SHTN form Key TN that does not match the entry in the SHARED LIST ROW 1 TN, but where TN or MLHG/TERM NBR entries in the SHARED LIST (rows 1 through 32) match DSLUSR form CKT TN or CKT MLHG/CKT TERM where the DSL CLS on the corresponding DSL form is "STD".

The form header has the name of the type of form where the match was found with the LINEFA form that was in error. If the features were assigned via a BFG or CLUSTR form, then the key to that form is included. See the TG5 (DSL form, attribute DSL CLS) for the types of features which cannot be assigned to "STD" DSLs or Primary analog TN(s) shared to "STD" DSLs.

For 5E12 and later, if the following LINEFA form(s) contain ISDN Intercom Features (ICMFD form) that cannot be assigned to "STD" DSLs (DSLUSR forms where the DSL CLS is set to "STD" on the corresponding DSL form, DSLUSR form OE matches DSL form DSL OE) unless there is an entry in the EKTS field of "CACH" for the DSLUSR form, the DSLUSR form(s) which these LINEFA form(s) are associated with (LINEFA form TN matches DSLUSR form CKT TN) did not have a value of "CACH" entered in the EKTS field.

If the features were assigned via a BFG or CLUSTR form then the key to that form is included. See the TG-5 (DSL form, attribute DSL CL in Division 5, Section 1HS) for the types of features that cannot be assigned to "STD" DSLs.

Copyright © 2003 Lucent Technologies

For 5E12 and later, if the following LINEFA form(s) contain features that can only be assigned to:

- "STD" DSLUSR forms (DSLUSR forms where the DSL CLS is set to "STD" on the corresponding DSL form, DSL OE matches DSLUSR form DSLUSR OE) or
- Shared analog LINE forms (LINE forms where SHARED is set to "Y" and the TN is also the Key TN on a corresponding SHTN form which is a Primary shared to STD DSLs only).

And these LINEFA forms are defined for lines on:

- DSLUSR forms where the corresponding DSL CLS was not "STD" or
- Shared analog LINE forms (LINE forms where SHARED is set to "Y" and the TN is also the Key TN on a corresponding SHTN form which is a Primary shared to non STD DSLs) or
- LINE forms with SHARED set to "N" or
- Secondary Only TNs on SHTN forms.

The form where the TN match was found is indicated. If the features were assigned via a BFG or CLUSTR form then the key to that form is included. See the TG-5 (DSL form, attribute DSL CLS in Division 5, Section 1H) for the types of features that can ONLY be assigned to "STD" DSLs or Shared analog lines to STD DSLs.

For 5E14 and later, when FEATURE contains a CF (Call Forwarding) feature or a cluster which includes a CF feature in the FEATURE LIST on the CLUSTR form and FCCS OPT on either the CFWFD form or the CFWLPA form for the corresponding CF feature is "Y", the following must be true:

- SHARED must be "N"
- SERHLN must be unknown
- ASSOC OE must be unknown

- this TN must be defined on the LINE form
- LINE CLASS CODE and TERMINATING TREATMENT must both be "INDIV" on the LCC form
- this TN must not be defined on the MLHLN form

2.5 A

Description: Is the BRCS feature initially active? This is the Activity Status.

For new (initial) 5ESS Switch offices built by 5ODA this field is in the initial Activity Status of the given feature assigned to a terminal. For retrofit office runs by 5ODA, this field represents the current or present active/inactive state of the feature.
Valid Entries: Y, N

Data Rules:

If the FEATURE NAME used in the FEATURE LIST is a real feature name (not a cluster name), then the value of the ACTIVITY STATUS for this FEATURE NAME is based on the following conditions:

If the FEATURE NAME is defined on a ACBFD (5616-1 Record) or ARSFD form (5608-1A/1B Record), then the ACTIVITY STATUS must equal "Y".

Copyright © 2003 Lucent Technologies

If the FEATURE NAME is defined on a CFWFD (5614-1/2 Record), CWTFD (5603-1 Record), DRFD (5606-1 Record), PUOFD (5605-1 Record), PUTFD (5605-2 Record) or TGSRFD form (5607-1/2 Record) with the ACT TYPE equal to "AUTO", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on a TODFD form (5610-1 Record) with the CUSTOMER ACTIVATION equal to "N", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on a IDFD form (5601 Record) with CUST ACT/DEACT IDP equal to "N", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on a MWFD form (5602-1/2 Record) with the ACT/INACT OPTION equal to "ALWACT" or "INACT1CA", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on a CFWFD form with the ACT TYPE equal to "CODE", "CDDN", "CDDNC", or "CDDNCA", then the ACTIVITY STATUS must equal "N".

If the FEATURE NAME is defined on a MWFD form with the ACT/INACT OPTION equal to "ACT1CA", then the ACTIVITY STATUS must equal "N".

If the FEATURE NAME is defined on a CWTFD, DRFD, or TGSRFD form with the ACT TYPE equal to "CODE" and the DACT TYPE equal to "AUTO", then the ACTIVITY STATUS must equal "N".

2.6 M

Description: Is the feature on? This is the Master Override Status.

This is a software switch under the control of the 5ESS Switch owner, that provides the ability to temporarily remove a BRCS feature from a terminal without physically deleting any of the internal data structures associated with the feature.

When the Master Override Status is "Y", the initial (or current) Activity Status, A, determines whether the feature gets control. If the Master Override Status is "N", the terminal will be treated as if the feature were never assigned.

M should be equivalent to "Y" for all new 5ODA offices and "Y" or "N" for 5ODA retrofit purposes.
Valid Entries: Y, N

2.7 AC

Description: Is the Authorization Code Feature required?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

If AC is "Y" on this form or on an associated CLUSTR form, then exactly one Authorization Code feature (defined on an ATHFD form) must exist on a LINEFA, BFG, or associated CLUSTR form assigned to the TN.

If AC is "Y", and the corresponding feature is neither an ATH feature defined on an ATHFD form nor a cluster name, then the feature must be entered on the ATHFCOS form (5619-4 Record) for the CSV ATH Group associated with this TN. The CSV ATH Group is specified on the ATHLPA, BFG, or ATHFD form. For 5E6 and later, the feature must also be entered on the ATHFCOS form for the CSD ATH Group.

If the corresponding feature is a CLUSTR Name, then each feature with AC of "Y" on the CLUSTR form (5600 Record) must exist on the ATHFCOS form for the CSV ATH Group, and for 5E6 and later the CSD

Copyright © 2003 Lucent Technologies

ATH Group, corresponding to the ATH feature entered on this or the CLUSTR form.

AC must be "N" when an ACSR, ACVT, BCLID, CPNBN, DISP, EDS, HI, Feature Button ICM, LID, MS, or RND feature is assigned in the FEATURE field. If FEATURE is a cluster that contains any of these features, the corresponding AC field(s) must be "N" on the CLUSTR form.

2.8 R

Description: Are RAS (Remote Access Services) requested on the feature?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

The only feature supported by RAS in 5E5 is RACF (Remote Access Call Forwarding). If "Y" is entered, the associated CFWFD form (5614-1/2 Record) must have DACT TYPE set to "CODE", and ACT TYPE set to "CDDN", "CDDNC", CDDNCA", or "CDCA1A"; for 5E6 and later ACT TYPE may also be "CODE".

Figure 1 SAMPLE LINEFA FORM 5E12 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 1M: 5113 RECORD
FEATURE ASSIGNMENT MULTI-LINE HUNT GROUP AND TERMINAL NUMBER FORM - MLHLNFA

1. GENERAL

The 5113 Record is available with 5E2and later Software Releases, and assigns BRCS (Business and Residence Custom Services) features to a particular customer Multi-Line Hunt Group/Terminal combination.

The MLHLNFA form assigns up to 48 BRCS features to a specific MLHG/Terminal combination. Each feature name in the MLHG/Terminal combination can be either a unique feature name or a CLUSTER NAME. CLUSTER NAMEs must be defined on the CLUSTR form (5600 Record) where they are expanded into 2 - 16 unique feature names. The total number of unique feature names on this form and associated CLUSTR forms must not exceed 48.

On the MLHLNFA form, an MLHG member may be assigned no more than 30 features from the following list: CFW, LID, EDS, DR, MS, PP, PUT, TGSR. For 5E7 and later, CPNBN, LSCA, LSCF, LSCR, and LSDA features are included. For 5E8 and later, BCLID and RND features are also included.

Wild Card feature Names of the format /AA* (AA equal to alphabetic) are not allowed to be assigned to a MLHG/TERM on the MLHLNFA form.

1.1 Disassociation of Speed Call and IDP Features

With 5E6 and later Software Releases, Speed Call (Abbreviated Dialing) features are assigned separately from IDP (Individualized Dialing Plan) features. Prior to this disassociation, a line can be assigned an IDP feature with a Speed Call feature which counts as one feature for that line.

This may raise the count of Terminal features for that line above the maximum of thirty features. A line only may be assigned up to thirty Terminal features, therefore, use discretion with a MLHLNFA form that has more than twenty-eight Terminal features (IDP feature included) at the time of retrofit. If the feature count is greater than thirty after retrofit, the SC1 (one-digit Speed Call) feature, if it has been assigned, will be canceled. If SC1 has not been assigned, then SC2 (two-digit Speed Call) will be canceled. If both features have been assigned to this line, both may be canceled.

1.2 Recent Change View

The corresponding Recent Change Views for this form are 1.8, 1.11 and 1.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

The MLHG Number must be assigned on the MLHLN form (5111-1/2 Record). The MLHG defined on the

Copyright © 2003 Lucent Technologies

MLHLN must have its associated BRCS attribute set to "Y" and must be assigned to a LEN or SLEN.

For 5E12 and later, if the MLHG/TERM(s) on the MLHLNFA form are assigned a Call Pickup Originating feature with DPU TN assignment, defined on the PUMPA form or the BFG form, the Call Pickup Originating feature initiated by Code Calling, Loud Speaker Paging, Predesignated Pickup Group or Directed Pickup does not need such an assignment.

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Terminal (Member) Number.
Valid Entries:
- 1 - 2015
- 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The TERM Number must be assigned on the MLHLN form (5111-1/2 Record). The TERM assigned on the MLHLN must have its associated BRCS attribute set to "Y" and assigned to a LEN or SLEN.

For 5E8 and later, MLHGs/TERMs assigned an Advanced Service Interface feature via a MLHLNFA form with R set to "Y" indicating that RAS (Remote Access Services) are desired, and the FEATURE is defined on a CFWFD form; the corresponding CFWFD form must have an ACT TYPE of "CDDN", "CDDNC", "CDDNCA", "CDCA1A" or "CODE" and a DACT TYPE of "CODE".

For 5E9(1) and later, when MLHG/TERM on the MLHLNFA form is assigned a Bulk Calling Line Identification Feature (as defined on the BCLIDFD form) and has a TERM entry greater than 1, there must be either a TN entry on the associated MLHLN form or a (CKT) MLHG TN entry on the associated DSLUSR form and the NONHUNT field on the associated form must be "Y".

For 5E10 and later, when the MLHG/TERM(s) appears on the MLHLN form with a matching MLHG/TERM(s) on the MLHLNFA form with an ASP FEATURE or a CLUSTER containing an ASP feature assigned, and on the associated ASPFD or ASPLPA form an OHD TRIG NBR or TA TRIG NBR has been entered, the corresponding NSTRIG form SERVICE ALWD must not be "CSD".

For 5E10 and later, when MLHG/TERM(s) appear on the MLHLNFA form with an ASP feature either assigned on the MLHLNFA or corresponding CLUSTR form, the ASP feature is defined on a ASPFD or ASPLPA form with OHD TRIG NBR entered.The MLHG/TERM is either defined on a MLHLN form or on a DSLUSR form sa CKT MLHG/TERM where DSL CLS on the corresponding DSL form is "STD". Therefore, the only other BRCS features allowed to be assigned to the line are features defined on the ASPFD form with CONTROL equal to "TERM" and those defined on the following forms where the appropriate secured feature(s) has been purchased and corresponding SFID(s) are set to "Y" on the SFSYS form:

- The Advanced Service Platform (ASP) BRCS/OHD Interworking SFID 137 ACT equals "Y"
  - CFWFD with FWD COND equals "BUSY", "IDLE", "BOTH", "DBSY", "DIDL" or "DBTH"
  - CWTFD with INVOKE equals "TERM"
  - DISPFD
  - LIDFD
  - LSACFD
  - LSARFD

Copyright © 2003 Lucent Technologies

- LSCAFD
- LSCARFD
- LSCFFD
- LSCOTFD
- LSCRFD
- LSDAFD
- MWFD with CONTROL not equal to "CODEALT"

- Additional ASP OHD Interactions with Account Code and CPN/BN SFID 150 ACT equals "Y"
  - ACCTFD
  - CPNBNFD
  - RNDFD

- ASP Network Element Services Signaling (NESS) SFID 185 ACT equals "Y"
  - ASPFD with CONTROL equals "NESS"

- ASP BRCS/OHD Interworking Extensions SFID 226 ACT equals "Y"
  - HIFD
  - MSFD
  - PUOFD with INITIATE equals "IPRDQ"
  - PUTFD with FEATURE FUNCTION equals "CALPU"
  - SCFD

2.4 BFGN

Description: Enter the BFGN (BRCS Feature Grouping Name).

Refer to the BFG Feature Definition (Division 2, Section 1U) for the restrictions concerning BFG Names.

Software Release: 5E4(2) and later
Valid Entries: 1 - 7 alphanumeric characters.
- The optional SUFFIX is a number between
- 1 - 9.

Data Rules:

The BFGN entered must be defined on a BFG form (5625 Record) as either a SELECTION BFGN or an

Copyright © 2003 Lucent Technologies

UNIQUE BFGN.

If a SELECTION BFGN without a SUFFIX is entered in the BFGN field on this form, the best fit selection process is attempted.

If a specific SELECTION BFGN and SUFFIX is entered in the BFGN field on this form and the MLHLNFA feature list is empty, all of the features defined by that SELECTION BFGN and SUFFIX combination will be assigned to the subscriber's line. If the MLHLNFA feature list contains features that are not defined as part of the BFGN and SUFFIX features, these undefined features will be assigned to the line outside of the BFGN.

If a UNIQUE BFGN is entered in the BFGN field on the MLHLNFA form and the MLHLNFA feature list is empty, all of the features defined by that UNIQUE BFGN will be assigned to the subscriber's line. If the MLHLNFA feature list contains features that are not defined as part of the UNIQUE BFGN features, these undefined features will be assigned to the line outside of the BFGN.

Features assigned to subscribers can be a combination of features defined by a BFGN and the features indicated on the MLHLNFA form. If a specific SELECTION BFGN and SUFFIX or UNIQUE BFGN is entered, it is not necessary to enter features on the MLHLNFA. If the BFGN entered is a UNIQUE BFGN, a SUFFIX cannot be entered.

Subscribers that have any of the following BRCS features, with the AC (Authorization Code) field set to "Y" on the MLHLNFA form, will always fail to select a BFG with the matching feature. This use of the Authorization Code is not supported by the BFG capability.

- Account Code
- Attendant (ACVT)
- Authorization Code
- Distinctive Ringing
- Individualized Dialing
- Message Detail Recording
- Multi-Way Call
- Terminal Group and Station Restriction

For 5E14 and later, when BFGN is known and it has a CF (Call Forwarding) feature assigned in the FEATURE LIST on the BFG form, the FCCS OPT field on the CFWFD form for the corresponding CF feature must be "N".

FEATURE LIST

Fields Section 2.5 -Section 2.9 refer to the Feature List, which consists of up to 48 Feature/Cluster names with the associated initial Activity Status, Master Override Status, Authorization Code and Remote Access Services feature settings.

2.5 FEATURE

Description: Enter the feature or cluster name.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

Copyright © 2003 Lucent Technologies

If the feature name used in one of the 48 Feature List rows is a cluster name that is defined on the CLUSTR input form, then fields A and M should be set to "Y" to pass level 1 and 2 error checks. The actual Activity Status for each feature name is defined on the CLUSTR input form and Master Override Status will be initialized to "Y".

For 5E14 and later, when FEATURE contains a CF (Call Forwarding) feature or a cluster which includes a CF feature in the FEATURE LIST on the CLUSTR form, the FCCS OPT field on the CFWFD form, for the corresponding CF feature, must be "N".

2.6 A

Description: Is the BRCS feature initially active? This is the Activity Status.

For a new (initial) 5ESS Switch built by ODA, this field is in the initial Activity Status of the given feature assigned to a terminal. For retrofit office runs by ODA, this field represents the current or present active/inactive state of the feature.
Valid Entries: Y, N

Data Rules:

If the FEATURE NAME used in the FEATURE LIST is a real feature name (not a cluster name), then the value of the ACTIVITY STATUS for this FEATURE NAME is based on the following conditions:

If the FEATURE NAME is defined on the ACBFD (5616-1 Record) or ARSFD form (5608-1A/1B Record), then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on the CFWFD (5614-1/2 Record), CWTFD (5603-1 Record), PUOFD (5605-1 Record) or TGSRFD form (5607-1/2 Record) with the ACT TYPE equal to "AUTO", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on the TODFD form (5610-1 Record) with the CUSTOMER ACTIVATION equal to "N", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on the IDFD form (5601 Record) with CUST ACT/DEACT IDP equal to "N", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on the MWFD form (5602-1/2 Record) with the ACT/INACT OPTION equal to "ALWACT" or "INACT1CA", then the ACTIVITY STATUS must equal "Y".

If the FEATURE NAME is defined on the CFWFD form with the ACT TYPE equal to "CODE", "CDDN", "CDDNC", or "CDDNCA", then the ACTIVITY STATUS must equal "N" .

If the FEATURE NAME is defined on the MWFD form with the ACT/INACT OPTION equal to "ACT1CA", then the ACTIVITY STATUS must equal "N".

If the FEATURE NAME is defined on the CWTFD or TGSRFD form with the ACT TYPE equal to "CODE" and the DACT TYPE equal to "AUTO", then the ACTIVITY STATUS must equal "N".

2.7 M

Description: Is the feature on? This is the Master Override Status.

This is a software switch under the control of the 5ESS Switch owner, that provides the ability to temporarily remove a BRCS feature from a terminal without physically deleting any of the internal data structures associated with the feature.

When the Master Override Status is "Y", the initial (or current) Activity Status, A, determines whether the feature gets control. If the Master Override Status is "N", the terminal will be treated as if the feature were

Copyright © 2003 Lucent Technologies

never assigned. M should be equivalent to "Y" for all new 5ODA offices and "Y" or "N" for 5ODA retrofit purposes.

NOTE: Each unique feature name (not cluster name) must correspond to a BRCS feature name that is defined on one BRCS feature Definition forms described in Division 4.

Valid Entries: Y, N

2.8 AC

Description: Is the Authorization Code feature required?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

If AC is "Y" on this form, a BFG form, or on an associated CLUSTR form for one or more BRCS features, then exactly one Authorization Code feature (defined on an ATHFD form) must exist on an MLHLNFA, BFG, or associated CLUSTR form assigned to the MLHG/TERM.

If MLHG/TERM(s) have the AC field set to "Y" for one or more FEATUREs on the MLHLNFA form, BFG form, or an associated CLUSTR form; then all of these specific FEATUREs must exist on the ATHFCOS form for the CSV ATH GROUP NAME, which is defined on an ATHMPA, BFG or ATHFD form associated with this MLHG/TERM. In addition, the feature must also be entered on the ATHFCOS form for the CSD ATH GROUP.

If the corresponding feature is a CLUSTR name, then each feature with AC of "Y" on the CLUSTR form (5600 Record) must exist on the ATHFCOS form for the ATH GROUP, and for 5E6 and later the CSD ATH Group, corresponding to the ATH feature entered on this or the CLUSTR form.

AC must be "N" when an ACVT, BCLID, CPNBN, DISP, EDS, LID, MS, or RND feature is assigned in the FEATURE field. If FEATURE is a cluster, then for any of these features that appear in the cluster, the corresponding AC field(s) must be "N" on the CLUSTR form.

2.9 R

Description: Are RAS (Remote Access Services) requested on the feature?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If "Y" is entered, the associated CFWFD form (5614-1 Record) must have ACT TYPE set to "CDDN", "CDDNC", "CDDNCA", "CDCA1A", or "CODE", and the DACT TYPE set to "CODE".

Copyright © 2003 Lucent Technologies

SEC. 1N: 5114 RECORD
MULTIPLE TNs FOR MULTILINE HUNT GROUPS FORM - MULTITN

1. GENERAL

The 5114 Record is available with 5E3and later Software Releases. It is used to assign additional Telephone Numbers to a MLHG Main TN, MLHG Subgroup TNs or a MLHG Member.

MULTITN forms must not be assigned to MLHG's that have a HUNT TYPE of "PSUCD" or "PMHG" on the MLHGFD form. The MLHG must not be a Modem Pool Group (the MPTYPE field must be blank on the MLHG form).

To link a MULTITN form to a UCD (Uniform Call Distribution) MLHG main TN, the MULTITN form must be assigned with the SUBTN and TERM fields blank. The corresponding MLHG form must have a value entered in the LISTED TN field.

To link a MULTITN form to an MLHG Subgroup TN, the MULTITN form must be assigned with the MLHG and SUBTN fields entered and the TERM field must be blank.

To link a MULTITN form to an MLHG Member, the MLHG and TERM fields must be entered and the SUBTN field must be blank. The corresponding MLHLN form must have a TN assigned and the ICP field must not be "Y". The corresponding MLHLN form must not have a Class Of Service of "TWOPTY", "4PSS" or "8PSS". Outdial MLHG Members may not be assigned on the MULTITN form.

With 5E6 and later Software Releases, distinctive ringing may be applied to analog MLHG terminals that have multiple TNs.

NOTE: Distinctive ringing may only be applied to Hunt Groups which have a HUNT TYPE of "REG", "HTC", or "UCD" on the associated MLHGFD form (5604 Record).

See Division 2, Section 4A for more information on Multi-Distinctive Ringing II.

1.1 Recent Change View

The corresponding Recent Change/ Verify view is 3.3.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TN

Description: Enter the TN (Telephone Number). The Telephone Number entered here must not be defined on any other Line Assignment form.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For 5E12 and later, TNs on different MULTITN forms can not be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the MULTITN form are equivalent to an OFFICE

Copyright © 2003 Lucent Technologies

CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, a 7-digit TN or NEXT TN on the MULTITN form must have the first 3 digits defined as OFFICE CODE on the NOC form. Also, the first 6 digits of a 10-digit TN or NEXT TN on the MULTITN form must be defined as NPA and OFFICE CODE on the NOC form.

2.3 MLHG

Description: Enter the Multiline Hunt Group Number. This Multiline Hunt Group Number must be defined on an MLHG form.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

2.4 TERM

Description: If this MULTITN form is to be linked to a MLHLN form, enter the appropriate MLHG Terminal Number. If this MULTITN form is to be linked to a Listed TN for an MLHG or linked to a MLHG Subgroup TN, leave this field blank.
Valid Entries: 1 - 2015

2.5 SUBTN

Description: If this MULTITN form is to be linked to an MLHG Subgroup TN, enter the 7-digit SUBTN number from the MLHG form. If this MULTITN form is to be linked to a Listed TN for an MLHG or linked to an MLHG Terminal, leave this field blank.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For 5E12 and later, if the first 3 digits of the 7-digit SUBTNs on the MULTITN form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit SUBTN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.6 INWATS

Description: Is this TN INWATS?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If INWATS is "Y", then NONHUNT and ICP must be "N".

2.7 NONHUNT

Copyright © 2003 Lucent Technologies

Description: Is this TN a Non-Hunt line?

Required Field.
Default: N

Data Rules:

NONHUNT must be "N" for Subgroup TNs and for Lead Terminals (TERM = 1). If NONHUNT is "Y", then INWATS and ICP must be "N".

2.8 ICP

Description: Is this is an Intercept TN? ICP is used to route terminating calls to Regular Intercept.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ICP is "Y" then NONHUNT and INWATS must be "N".

2.9 TRC

Description: Does this TN require a Call Trace?

Required Field.
Default: N
Valid Entries: Y, N

2.10 NEXT TN

Description: This field identifies the next TN for this Listed TN, Subgroup TN or Terminal TN.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For 5E12 and later, if the first 3 digits of the 7-digit NEXT TNs on the MULTITN form are equivalent to an OFFICE CODE on the NOC form, but there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7- digit NEXT TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.11 MDN RING

Description: Enter the ringing pattern assigned to the dependent TN.

Software Release: 5E6 and later
Required Field.
Default: A
Valid Entries:

Valid MDN RING Entries

Entry	Definition
A	Repeated pattern of 2 seconds on and 4 seconds off, (normal ringing pattern).
B	Repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on followed by 4 seconds off.

Copyright © 2003 Lucent Technologies

C	Repeated pattern of 0.3 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on followed by 4 seconds off.
E	Repeated pattern of 0.3 seconds on, 0.2 seconds off, 1 second on, 0.2 seconds off, 0.3 seconds on followed by 4 seconds off.

- ***NOTE:*** The Multi-Distinctive Ringing II feature is secured and can only be assigned to Analog Hunt Groups. ISDN Hunt Groups will receive Ringing Pattern A. Since, multiple TNs assigned to "MUPH" MLHG lines do not have access to distinctive ringing, MDN RING must be set to "A" for MLHG's which have an associated MLHGFD form with HUNT TYPE set to "MUPH".

Lines with class of service "FC 4WIRE INDIV" are not supported.

MESSAGE SERVICE CENTER

The CLIENT TN TYPE field was added with the ISVM (Inter-Switch Voice Messaging) feature (see Div. 2, Sec. 1BG). This feature enhances the components of the MSS (Message Service System) to offer VM service across switches.

2.12 CLIENT TN TYPE

Description: Enter the client telephone number type. This field allows VM (Voice Messaging) users to choose which DN, either the OCDN (Originally Called Directory Number) or the RDN (Redirecting DN), is sent to the VM system. The RDN is the DN of the last forwarding party before a call terminates.

Only a group DN and the dependent DNs associated with the group can be assigned a CLIENT TN TYPE. This option is not assigned on a per-member basis. This field was added with the ISVM (Inter-Switch Voice Messaging) feature which is described in Div. 2, Sec. 1BG.

Software Release: 5E7 and later
Valid Entries:

Valid CLIENT TN TYPE Entries

Entry	Definition
OCDN	Originally Called Directory Number
RDN	Redirecting Directory Number

Data Rules:

When SUBTN is entered, CLIENT TN TYPE cannot be entered. When CLIENT TN TYPE is entered, TERM must not be entered or must be 1, and NONHUNT must be "N".

SEC. 1O: 5115/5115A/5115B RECORDS HUNDREDS GROUP(S) ASSIGNMENT FORM - HGRPAS

1. GENERAL

The HGRPAS form is available in 5E2 and later Software Releases and is used to assign a routing module and/or a route index for a hundreds group. A hundreds group is a set of 7-digit telephone numbers which have the first five digits in common. The first three common digits are referred to as the office code, which is defined in the OFFICE CODE field on a NOC form (5501 Record), the fourth common digit as the thousands digit and the fifth common digit as the hundreds digit. The range of telephone numbers 456-7800 to 456-7899 is an example of a hundreds group.

1.1 Routing Module

When an SM (Switching Module) is designated as the routing module for a particular hundreds group, the designated SM will have the terminating line information for all "defined" telephone numbers within the hundreds group. A listing of "defined" telephone numbers will appear later in this section. Call processing will use the routing module when routing to a telephone number served by this 5ESS Switch. The complete listing of designated routing modules is stored in each SM. When an SM has a call originating on either a line or a trunk, if after digit analysis and screening the determination is to route to a local office code, the SM will determine which SM is the routing module for the hundreds group of the called telephone number. The originating SM will then send a message to the SM that is the routing module requesting the information for terminating a call to the specific telephone number. If the telephone number is defined with a physical port, a path will be set up between the originator and the SM where the physical port resides. The terminating SM may be the originating SM, the routing SM or another SM.

1.2 Remote Modules

In 5E5 and later Software Releases, a remote module can be a routing module under given conditions to be explained later.

1.3 Route Index

When a route index is entered for a particular hundreds group, that indicates the call should not route to a physical line but rather the call routes to a trunk group defined for the route index. Whenever an entire hundreds group is used for one PBX-DID route, the route index entered on this form eliminates submitting one hundred LINE forms (5109-1 Record). The use of this form can therefore save substantial memory and real time used for call processing. Reconstruction to a 7-digit number is still done when the route index is entered here instead of on individual LINE forms.

When a telephone number, within a hundreds group assigned a route index on a HGRPAS form, must be routed in a manner different than the rest of the hundreds group, then the telephone number must be "defined" on a form that allows such definitions. The associated route index on the "defining" form will take precedence over the route index assignment on the HGRPAS form while the remainder of the hundreds group without "defining" forms will continue to apply the route index on the HGRPAS form.

A hundreds group may be assigned both a routing module and a route index. An example of this application is a PBX where the majority of the DNs in the hundreds group are served from the PBX but a few DNs physically terminate in the 5ESS. For this case, the physical terminations would take precedence over the route index. 5ESS Switch call processing will first use the routing module to check if the called DN terminates in the 5ESS Switch Office. If not found, the route index will be used to route the call to a trunk group for termination to the PBX. This call processing functionality applies to both circuit and packet hundreds groups.

The use of 5ESS Switch call processing in this manner can eliminate cumbersome digit analysis tables when DNs in a hundreds group are randomly assigned between switch entities as would be the case in

Copyright © 2003 Lucent Technologies

the above 5ESS Switch/PBX illustration. However, it is important to note that other considerations such as vacant code treatment must be taken into account which could preclude the use of this functionality. In the above example, the PBX is assumed to provide vacant code treatment if the called DN is not a working DN in the PBX.

1.4 Routing Modules Assigned Via Algorithms

The ODA process allows the customer to assign a routing module and/or a route index to any quantity of hundreds groups within the 5ESS Switch. It is not required that the customer enter a HGRPAS form for every hundreds group. The ODA process will apply a series of algorithms to assign a routing module to those hundreds groups that did not receive an assignment on a HGRPAS form. The algorithms pertain strictly to hundreds groups that have telephone numbers specified on "defining" forms. The algorithms do not assign or alter route indexes.

In 5E5 and later Software Releases, the algorithms changed substantially as did the definition of which SMs are eligible to be a routing module. The algorithms determine all the hundreds groups that have defined telephone numbers but are without a customer-assigned routing module. The algorithms then determine all the SMs that are eligible to be a routing module. An operational host SM can always be an eligible routing module.

The RM RTG RSTRCT field on the OFCOPT form (5509 Record) is used to indicate the usage of remote modules (ORM, RSM, TRM) as routing modules. If the field is set to "Y", then an operational remote module may be a routing module if and only if all of the defined telephone numbers within the hundreds group physically reside in the same Remote Site. The Remote Site is specified in the REMOTE SITE field on an EQIM form (5700-1 Record).

If the RM RTG RSTRCT field on the OFCOPT form is set to "N", then an operational remote module may be a routing module regardless of the physical location of the members of the hundreds group.

The assignment process has three major goals:

A. To select a remote module to be the routing module when all or the preponderance (depending on the value in the aforementioned RM RTG RSTRCT field) hundreds group members reside within the same Remote Site. This reduces the routing load on host SMs and avoids the duplication of terminating data on a host SM and a remote SM.

B. To select a routing module (in the host SM case) that has the greatest number of hundreds group members residing in it. When the routing module is also the module where the termination resides, one less SM is involved in the call processing which reduces inter-SM communication and saves real time.

C. To balance the quantity of hundreds groups across the eligible SMs.

An overview of the algorithms that ODA applies for assigning hundreds groups to routing modules follows. There are two distinct sets of algorithms; the choice is entirely dependent on the value in the RM RTG RSTRCT field on the OFCOPT form. Both sets of algorithms observe a "limit". The limit is essentially the quotient of the quantity of hundreds groups and the quantity of eligible SMs. The limit thus serves to balance the loading of hundreds groups across the eligible SMs.

If the value in the field is set to "N", then a remote module can be a routing module regardless of the physical terminations of the members of the hundreds group. In this case, the algorithm has three steps:

- The routing modules indicated on the HGRPAS forms are honored, regardless of any exceeding of the "limit";
- Remaining (unassigned) hundreds groups are assigned to the eligible SM, which is below the limit, where the most terminations within the hundreds group reside;

Copyright © 2003 Lucent Technologies

- Remaining hundreds groups are assigned to the SM with the fewest hundreds groups already assigned to it.

If the value in the RM RTG RSTRCT field is set to "Y", then a remote module can be a routing module if and only if all the terminations within the hundreds group reside within the SM or the remote cluster. In this case, the algorithm has five steps:

- The routing modules indicated on the HGRPAS forms are honored, regardless of any exceeding of the "limit";
- A hundreds group with all its terminations on a single remote cluster will be assigned to the SM within the cluster that has the most terminations within the hundreds group, provided that the SM is below the limit;
- Hundreds groups with host SM terminations will be assigned to that SM, provided that the SM is below the limit;
- A hundreds group with all its terminations on a single remote cluster that was not assigned in Step 2 (because of limit violations) will be assigned to another SM within the cluster if the SM is below the limit;
- Those hundreds groups that were not assigned in the first four steps will be assigned to the host SM with the fewest hundreds groups already assigned to it.

NOTE: The default value of "Y" is normally used in order to prevent Remote Modules from containing Routing Data for Local Modules. When a Remote Module is isolated and contains Routing Data for a Local Module, Digit Analysis cannot be completed for any call needing the Routing Data in the Remote Module.

1.5 Packet Routing

Two additional changes available in 5E5 and later Software Releases are a Packet Routing Module and a SAVE field. The SAVE field is used to indicate which Circuit Routing Module and/or Packet Routing Module customer assignments are to be saved across Retrofit and Large Terminal Growth procedures.

In the 5E5 Software Release, an eligible circuit routing module is one that is defined on an EQIM form with the SM USAGE field set to "IM", "HIM", "ORM", "TRM" or "RSM" and the EQSTATUS field set to "O". An eligible packet routing module is one that is defined on an EQIM form with the SM USAGE field set to "IM", "HIM", "ORM", "TRM" or "RSM", the EQSTATUS field set to "O" and the CONFIGURATION field set to "LOADED". The selection of a remote module as a routing module is dependent upon the value entered in the RM RTG RSTRCT field on the ODAOPT form.

The 5ODA algorithms are only applied to telephone numbers that are defined within the 5ESS Switch. If the HGRPAS form is used to assign only a route index to a hundreds group, but there are not any defined telephone numbers within the hundreds group, the algorithms will not assign a routing module to the hundreds group.

In the 5E5 Software Release, the following form fields are used to define telephone numbers that are in hundreds groups assigned (by the customer or 5ODA) a circuit routing module:

CIRCUIT ROUTING MODULE	
Form (Record)	**TN**
ACQS (5425)	QUOTE TN (last seven digits, only if the AUTO QUOTE field is set to "Y")
DSLUSR (5908)	CKT TN
DSLUSR (5908)	MLHG TN (under CKT SWITCHING heading)

Copyright © 2003 Lucent Technologies

LINE (5109)	TN
MLHG (5110)	LISTED TN
MLHG (5110)	HIGHEST LISTED TN (and all telephone numbers between the LISTED AND HIGHEST LISTED TNs)
MLHG (5110)	SUBTN(1-8) (for TNs defined on a MLHG form, the HUNT TYPE of the MLHG, as defined on a MLHGFD form (5604 Record) must not be set to "PSUCD")
MLHLN (5111)	TN
MTNDR (5550)	TN
MULTITN (5114)	TN
PSMTN (5925)	ACCESS TN
SHTN (5902)	TN (only if TN does not equal the first TN in the SHARED LIST)

In the 5E5 Software Release, the following form fields are used to define telephone numbers that are in hundreds groups assigned (by the customer or 5ODA) a packet routing module:

PACKET ROUTING MODULE	
Form (Record)	**TN**
AMLBDSL (5447-1)	PKT TN
DSL (5907)	TN (under the PERMANENT PACKET B1 heading)
DSL (5907)	TN (under the PERMANENT PACKET B2 heading)
DSLUSR (5908)	DPKT TN
DSLUSR (5908)	MLHG TN (under the D-CHANNEL PACKET SWITCHING heading)
DSLUSR (5908)	ODB TN
MLHG (5110)	LISTED TN
MLHG (5110)	HIGHEST LISTED TN (and all telephone numbers between the LISTED AND HIGHEST LISTED TNs; the HUNT TYPE of the MLHG

In 5E5 and later Software Releases, the 5115 Record lists, for each hundreds group used in the 5ESS Switch, a circuit routing module and/or a packet routing module and/or a route index. Additionally, a SAVE field (to be explained subsequently) appears.

The 5115A Record lists, by SM, all the hundreds groups which use that SM as a circuit routing module.

The 5115B Record lists, by SM, all the hundreds groups which use that SM as a packet routing module.

1.6 Recent Change View

The corresponding Recent Change view for this form is 4.14.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

2.3 * OFFICE CODE

Copyright © 2003 Lucent Technologies

Description: Enter the Office Code.

Required Field.
Valid Entries: 000 - 999

Data Rules:

If the first digit of OFFICE CODE is 0 or 1 then no PKT SM field can be entered.

For 5E12 and later, when the OFFICE CODE and/or NPA/OFFICE CODE combinations are assigned on the HGRPAS input form, they must be defined on the NOC form.

For 5E12 and later, if the HGRPAS forms have an OFFICE CODE defined and there are multiple NOC forms with the same value for OFFICE CODE, NPA will also have to be defined on the HGRPAS form.

2.4 * THOUSANDS DIGIT

Description: Enter the fourth digit of the telephone numbers that comprise the hundred group.

Required Field.
Valid Entries: 0 - 9

2.5 HUNDREDS DIGIT

Description: The fifth digit of the telephone numbers that comprise the hundred group are pre-filled on the HGRPAS form and the 5115 office record.
Valid Entries: 0 - 9

Data Rules:

For 5E12 and later, Route Indexes that are assigned to particular Hundreds Group values on the HGRPAS form for the associated Numbering Plan Area Code, Office Code and Thousands Digit combination, must be defined on the RTIDX input form.

2.6 CKT SM

Description: Enter the Switching Module that will serve as the circuit routing module for the hundreds group. Refer to the GENERAL section to determine which telephone numbers are appropriate for a circuit routing module.

Software Release: 5E5 and later.
Valid Entries: 1 - 192

2.7 PKT SM

Description: Enter the Switching Module that will serve as the packet routing module for the hundreds group. Refer to the GENERAL section to determine which telephone numbers are appropriate for a packet routing module.

Software Release: 5E5 and later.
Valid Entries: 1 - 192

Data Rules:

For 5E9(2) and later, when SM's are defined as PKT SM (packet routing SMs) on the HGRPAS form, then the corresponding EQIM form must have a CONFIGURATION value which supports Packet Switching.

2.8 ROUTE INDEX

Copyright © 2003 Lucent Technologies

Description: Enter the route index value to be applied for calls terminating to the telephone numbers within the hundreds group.

For 5E5 and later Software Releases, this field has meaning only for circuit telephone numbers, as opposed to packet telephone numbers.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

  For 5E13 and later: 1 - 16382

Data Rules:

For 5E5 and later Software Releases, if a HGRPAS form is submitted, then at least one CKT SM or PKT SM or ROUTE INDEX must be entered.

The route index entry must be defined on an RTIDX form (Record 5303).

2.9 PORTED OUT

Description: Is this hundreds group ported out?

When PORTED OUT is left blank, the value is inherited from the corresponding PORTED OUT field on the NOC form. Otherwise, "Y" indicates that this hundreds group is ported out and "N" indicates that it is reserved.

Software Release: 5E14 and later
Valid Entries: Y, N, or blank

Data Rules:

- When PORTED OUT *X* is "Y" (where *X* is 0-9), ROUTE INDEX *X* must not be entered .
- At least one CKT SM, PKT SM, ROUTE INDEX or PORTED OUT value must be entered.
- When any PORTED OUT field is entered, ACT must equal "Y" for SFID 530 on the SFSYS form.

2.10 SAVE

Description: The field is used to indicate that the circuit routing module or packet routing module or both, that are assigned to a particular hundreds group, are to be saved for an office undergoing a Retrofit or a Large Terminal Growth procedure. During the Retrofit or Large Terminal Growth procedures, 5ODA will apply the algorithms, explained in the GENERAL section, that assign routing modules to hundreds groups. An entry in the SAVE field can only be made during a Retrofit or Large Terminal Growth Procedure. The SAVE field must not have an entry for a new office. The 5ODA algorithms will respect the assignments indicated on HGRPAS forms in a new office.

The field is directly related to the HUNDREDS GROUP SM ROUTING ASSIGNMENT field on the ODAOPT form (5523 Record). The HUNDREDS GROUP SM ROUTING ASSIGNMENT field offers the user three options for preserving routing module assignments across Retrofits and Large Terminal Growth procedures. The three choices are:

- REALLOCATE: 5ODA will apply the series of algorithms to every hundreds group in the 5ESS Switch. 5ODA will completely ignore the existing routing module assignments.

Copyright © 2003 Lucent Technologies

- PARTIAL: 5ODA will apply the series of algorithms only to those hundreds groups that are associated with either no entry or an entry of "NONE" in the SAVE field on HGRPAS forms. If the SAVE field has an entry of "CKT", "PKT" or "BOTH", the existing assignment will be preserved.

- PRESERVE: 5ODA will not apply the series of algorithms to any hundreds groups in the 5ESS Switch regardless of the SAVE entries on HGRPAS forms. Every existing assignment will be preserved.

The user, through the combination of the SAVE field on the HGRPAS form and the HUNDREDS GROUP SM ROUTING ASSIGNMENT field on the ODAOPT form, can control which routing module assignments (if any) are to be retained across a Retrofit or Large Terminal Growth procedure.

Software Release: 5E5 and later.
Valid Entries:

Valid SAVE Entries

Entry	Definition
CKT	Save the circuit routing module (CKT SM).
PKT	Save the packet routing module (PKT SM).
BOTH	Save the circuit (CKT SM) and packet routing (PKT SM) modules.
NONE	Do not save the circuit (CKT SM) or packet routing (PKT SM) modules; not entering a value has the same result.

Data Rules:

If "CKT" is entered in this field, then the corresponding CKT SM must have an entry.

If "PKT" is entered in this field, then the corresponding PKT SM must have an entry.

If "BOTH" is entered in this field, then the corresponding CKT SM and PKT SM must have entries.

For 5E12 and later, if the SAVE field on the HGRPAS form, is set to "CKT", "PKT" or "BOTH", and the ROUTING ASSIGNMENT field on the ODAOPT form is equal to "REALLOCATE" or "PRESERVE", the SAVE field will be ignored.

SEC. 1P: 5116 RECORD
EMERGENCY OFFICE TN ASSIGNMENT FORM - EMROFC

1. GENERAL

The 5116 Record is available with 5E2 and later Software Releases.

For 5E4(2) and earlier Software Releases, Remote Site refers to an RSM (Remote Switching Module). For 5E5 and later, Remote Site refers to an RSM, ORM (Optically Remote Module), or TRM (Two-Mile Optically Remote Module).

For 5E4(2) and earlier, the AM (Administrative Module) can reroute up to 100 emergency calls that terminate on any SM (Switching Module) or RSM (Remote Switching Module) that has gone into isolation (Stand-Alone). Calls originated outside an isolated module to an Emergency Office TN within the module will be rerouted using the data input on this form.

For 5E5 and later, the AM can reroute up to 500 emergency calls that terminate on any SM or Remote Module that has gone into Stand-Alone. Calls originated outside an isolated module to an Emergency TN within the module will be rerouted using the data on this form.

For 5E6 and later, the rerouting is accomplished in the CMP (Communication Module Processor) rather than in the AM.

Calls to emergency numbers that originate from a customer assigned to a switching module that is in Stand-Alone or isolation must be rerouted based on data input on an EMRNM form (5108 Record).

For 5E5 and later, if a range of TNs is entered in the EMER TN field and the OUTPULSED DIGITS field is left blank and the RI field is entered, then the dialed digits will be outpulsed over the trunk.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.9.

View 4.9 corresponds to both the EMRNM form (5108 Record) and EMROFC form (5116 Record). When REMOTE SITE is 1 - 174 on View 4.9, it refers to the EMRNM form; when REMOTE SITE is 0, it refers to the EMROFC form.

2. FORM AND RECORD ENTRIES

2.1 * EMERGENCY TN

Description: Enter the required Emergency Telephone Number. This is the number served by a particular Local SM or Remote Module designated as an emergency number requiring rerouting if the SM or Remote Module is in Stand-Alone operation.

Normal expected values are 7- or 10-digit numbers of the type NXX-XXXX or NPA-NXX-XXXX.

If a three-digit code is to be rerouted, the CONV form (5300-4 Record) must be checked to see if the three-digit code is being converted. If it is code converted, enter the converted telephone number instead of the three digit-code.

For 5E5 and later, if stand-alone is available on the Remote Site or Local SM, then a range of Telephone Numbers may be entered for an Emergency Number. Each entry in the emergency routing list is either a TN or a range of TNs that need to have the same alternate routing treatment when a switching module is isolated from the host 5ESS Switch.

To specify a range of telephone numbers, use the wild-card character (*). Possible entries using the

Copyright © 2003 Lucent Technologies

wild-card character are as follows:

- 0
- XXX
- XXX-XXXX
- XXX-XXX-XXXX
- XXXXX-XXX-XXX-XXXX
- XXX-XX**
- XXX-****
- ***-****
- XXX-XXX-XX**
- XXX-XXX-****
- XXX-***-****
- XXXXX-***-***-****

The X is a value 0-9. The wild-card (*) character matches any dialed digit at that position.

When determining the order of precedence for matching emergency routing TNs, if an exact match fails on the entire TN, then partial matches are attempted with wild-card digits (*) in the hundreds group, in the whole office code, in the entire area code, and lastly for all 15 digits.

A range of telephone numbers specified with a wild-card character must not overlap another range of telephone numbers for a remote site or local SM in this relation. If an overlap occurs and the modules in stand-alone are connected by IMTs, a routed number that is overlapped would appear to terminate in both modules. This would result in the number looping through all the members of the IMT group until it is blocked.

After a call has been routed to a fixed route or announcement trunk, reorder is given instead of emergency routing. For example, this would occur when a mis-dialed call to an unassigned TN accesses the routing module for that number. Calls to the Operator or 911 that would have terminated to announcement because of stand-alone condition are allowed to emergency alternate route.

Stand-Alone Test Lines allow testing of emergency number rerouting for an RSM/ORM/SM site when the RSM/ORM/SM site is not in stand-alone mode. The lines must have an LCC (Line Class Code) with a SERVICE CLASS of "SATSTLN" and a TERMINATING TREATMENT of "INDIV". When conducting the stand-alone rerouting test from the RSM/ORM/SM site, the lines may be used to originate and dial each of the emergency numbers which is normally rerouted during stand-alone operation.

Required Field.

Valid Entries:
- 5E9(1) and earlier: 1 - 15 digits (0 - 9, "#", or "*")
- 5E9(2) and later: 1 - 15 digits (0 - 9 or "*")

2.2 * PREFIX

Description: Enter the dialed prefix digit.

Required Field.
Valid Entries: 0, 1, or "NONE"

2.3 ALTERNATE TN

Description: Enter a Alternate Telephone Number to which the calling customer will be routed.
Valid Entries:

Copyright © 2003 Lucent Technologies

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

For 5E3 and earlier, the ALTERNATE TN must be defined on a LINE (5109 Record) or MLHLN form (5111 Record). For 5E4(2) only, it must be defined on a LINE or MLHLN form, or as a circuit switched voice TN on a DSL (5900 Record) or DSMLHLN form (5901 Record). For 5E5 and later, it must be defined on a LINE or MLHLN form, or as a CKT TN or MLHG TN on the DSLUSR form (5908 Record).

The Telephone Number must be associated with an equipment number, i.e., LCEN, LEN, or SLEN, located on another Local SM or Remote Module in the office.

When the ALTERNATE TN is entered, ROUTE INDEX and OUTPULSED DIGITS must be blank.

For 5E10 and later, ALTERNATE TN(s) assigned on the EMROFC form, must be defined on either the LINE or MLHLN forms with an associated NUMBER, where OE TYPE is equal to "A", (5E12 and later) "C", "E" (5E11 and later),"G", "L" or "S"; or on a MLHG form as a LISTED TN or on the DSLUSR form (as CKT TN or CKT SWITCHING MLHG TN) where the OE is entered.

For 5E12 and later, if the first 3 digits of the 7-digit ALTERNATE TNs on the EMROFC form are equivalent to an OFFICE CODE on the NOC form, but there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit ALTERNATE TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.4 ROUTE INDEX

Description: Enter the Route Index associated with the Outgoing Trunk Group to which calling customers will be routed when they call the Telephone Number entered in the EMERGENCY TN field. The physical trunk(s) must be located in a different switching module than the one in which the emergency number normally terminates.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The value entered in this field must be defined on the RTIDX form.

For 5E4(2) and earlier, if an entry is made in this field, OUTPULSED DIGITS must be entered and ALTERNATE TN must be blank.

For 5E5 and later, if this field is entered, the ALTERNATE TN field must be blank.

2.5 OUTPULSED DIGITS

Description: If a Route Index is entered in the ROUTE INDEX field, enter the digits to be outpulsed over the Trunk Group. The digits are subject to digit deletion and prefixing that is defined for the Route Index.
Valid Entries: 1 - 15 digits.

Data Rules:

If this field is entered, the ROUTE INDEX field must be entered and the ALTERNATE TN field must be

Copyright © 2003 Lucent Technologies

blank.

SEC. 1Q: 5117 RECORD
PERSONAL IDENTIFICATION DEFINITION FORM - PIDEF

1. GENERAL

The 5117 Record is available with 5E5 and later Software Releases. The form is used to define the PIN (Personal Identification Number) used by RAS (Remote Access Services) to verify a customer's access to RAS for a particular TN.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.39.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the local telephone number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

If the PIN will be used for the ACSR (Automatic Customer Station Rearrangement) feature, the TN must be defined as a CKT TN on the DSLUSR form. If it will be used for RACF (Remote Access to Call Forwarding), the TN must be defined on the LINE, MLHLN, DSLUSR, or SHTN form.

The TN must be defined on one of the following forms:

For 5E7 only, ACQS, DFLTSRV, DSLUSR (CKT TN or MLHG TN), LINE, MLHG, MLHLN, MTNDR, MULTITN, PSMTN, RDTAPORT, or SHTN form.

For 5E8 and later, ACQS, DSLUSR (CKT TN or MLHG TN), LINE, MLHG, MLHLN, MTNDR, MULTITN, PSMTN, RDTAPORT, or SHTN form.

If the TN is defined on a LINE form, and the corresponding LCC form (5306 Record) has TERMINATING TREATMENT set to "RAPVN", a PIDEF form cannot be entered for that LINE form.

For 5E12 and later, TNs on different PIDEF forms can not be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the PIDEF form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, the TN(s) on a PIDEF form must have a corresponding TN defined on a ACQS, DSLUSR (CKT TN or MLHG TN), LINE, MLHG, MLHLN, MTNDR, MULTITN, PSMTN, RDTAPORT, or SHTN form.

SEC. 1S: 5174-1/2/3/4 RECORD
REMOTE TERMINAL (TR303/TR008) - RTERM

1. GENERAL

The RTERM form (5174 Record) is available with the 5E8 and later Software Releases. It is used by the switch owner to define all remote terminals connected to IDCU (Integrated Digital Carrier Unit) equipment. For 5E12 and later, this form can also be used for remote terminals connected to DNU-S (Digital Networking Unit - Sonet equipment. Two types of RTs (remote terminals) can be connected to an IDCU: TR008 and TR303; however, only the TR303 is applicable to a DNU-S. Effective with the 5E12 Software Release, the screen format was modified to allow additional alarms.

1.1 TR008 RT

A TR008 RT can handle up to 96 analog lines, and from 1 to 5 IFACs (IDCU Facilities) can be connected to a TR008 RT. After a TR008 RT is in and "operational" state, IDCU analog ports can be assigned on the LINE (5109 Record), MLHLN (5111 Record), and TRUNK (5204 Record) forms.

When Telephone Number(s) are assigned on the LINE or MLHLN input forms to IDCU equipment (OE TYPE of "G") the following correspondence must hold on the RTERM input form: the SM/IDCU/RT values of the NUMBER must be defined on an RTERM form and the GEN LINE NO. value must be assigned to an appropriate IDCU DIGRP with its STATUS set to "O" for operational. Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

GEN LINE NO to RTERM Form Correspondence

GEN LINE NO.	RTERM
NUMBER[1,3]	SM
NUMBER[4,5]	UNIT NUMBER
NUMBER[6,7]	RT EX
NUMBER[8,11]	DIGRP - STATUS
0001-0024	A O
0025-0048	B O
0049-0072	C O
0073-0096	D O

1.2 TR303 RT

Some TR303 RTs can handle up to 2048 analog and ISDN lines and from 2 to 28 IFACs can be connected to a TR303 RT. After a TR303 RT is in an "operational" state, the IDCU analog ports can be assigned on the LINE, MLHLN and TRUNK forms, and, IDCU ISDN ports can be assigned on the DSL (5902 Record) and DSLUSR (5908 Record) forms.

All IDCU equipment in an office must use the same OE TYPE (Office Equipment Type). There are two IDCU OE types. OE TYPE of "M" is associated with either an analog or ISDN IDCU Equipment Number with an OE SIZE of 08. OE TYPE of "G" is associated with either an analog or ISDN IDCU equipment number with an OE SIZE of 10. Additional information on OE TYPE can be found in sections where equipment assignments are made (e.g., LINE form (5109 Record). For additional information on OE SIZE, see the OFCOPT form (5509 Record).

1.3 EQIDCU Requirements

When an RTERM form is entered, the related IDCU equipment must be defined on an EQIDCU form (5846 Record). For more information on the EQIDCU form, see Division 8, Section 48.

1.4 EQIFAC Requirements

Any IFAC equipment defined on the RTERM form must be defined on an EQIFAC form (5847 Record). IFAC positions consist of 0-19 for LSI 0 and 20-39 for LSI 1. The PUB43801 field must be set to "N". For more information on the EQIFAC form, see Division 8, Section 49.

Copyright © 2003 Lucent Technologies

For DNU-S, an associated EQVT form (5858 Record) must be defined. See also the UNIT TYPE field for more detailed data rules.

1.5 Recent Change View

The corresponding Recent Change View for this form is 18.15.

2. FORM ENTRIES - 5174-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the identification number of the Switch Module.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For each RTERM form, wher the UNIT TYPE is equal to "IDCU", there must be a corresponding EQIDCU form with matching SM and UNIT NUMBER fields.

For 5E9(2) and later, each value of SM entered on the RTERM form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports IDCU (Integrated Digital Carrier Units).For the CONFIGURATION that supports IDCU see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks). The following applications define the possible LLCB assignments:

LLCB			
Form	**SM**	**SHELF CHL GRP**	**Increment**
AMLBDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	OE[1,3]	PPB1 ISCN[1,3]	by 1 for each PPB1 ISCN defined.
		PPB2 ISCN[1,3]	by 1 for each PPB2 ISCN defined.
		D ISCN[1,3]	by 1 if a matching DSLUSR form is not found
DSLUSR	OE[1,3]	D ISCN[1,3] on the corre- sponding DSL form	by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered.
			by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
		ODB ISCN1[1,3] ODB ISCN2	by 1 if only ODB ISCN1 is entered.
			by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
DSLAP	LCEN[1,3]	ISCN[1,3]	by 1 for each unique LCEN/ISCN combination.
MISLINK	OE[1,3]	SHELF and CHL GRP	by 1 for each MISLINK form.
OSPSDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined.
			by 1 for each unique OSPSDSL form.
RTERM RT INTERFACE is "TR303"	SM	ISCN[1,3]	by 2 for each TMC PRI ISCN and each TMC NPRI ISCN entry.
			by 3 for each EOC PRI ISCN and each EOC NPRI ISCN entry.

Copyright © 2003 Lucent Technologies

TRUNK Where TRKCLS is "IFOPER", "IFTERM" or "EDSL"	DEN[1,3]	ISCN[1,3]	1 for each unique TRUNK form.
XAT	DEN[1,3]	ISCN[1,3]	by 1 for each unique XAT form.

2.3 * UNIT TYPE

Description: Enter the type of host peripheral unit connected to the remote terminal.

Required Field.
Default:

5E8 - 5E11: IDCU
- 5E12 and later: none

Valid Entries:
- 5E8 - 5E11: IDCU
- 5E12 and later: IDCU or DNUS

Data Rules:

When "DNUS" is entered and RT INTERFACE is "TR303", an associated EQVT form (5858 Record) must be defined. All RTFACTRM FACs defined on the RTERM form must exist on an EQVT form with the appropriate APPLICATION TYPE. If the FAC is in position #1 or its position is assigned as the EOC/TMC BKUP RT TERM on the RTERM form, the FAC must have an associated EQVT form with an APPLICATION TYPE of "TR303CTRL". All other FACs on the RTERM form must have an associated EQVT form with an APPLICATION TYPE of "TR303". (The SM, UNIT NUMBER, and FAC of the RTERM form are used to access the associated EQVT form.

For 5E12, the FAC is constructed as "xyzz" where:
- x = EQVT.DATA GROUP
- y = EQVT.STS
- z = EQVT.VT

For 5E13 and later, the FAC is constructed as "abcde" where:
- a = EQVT.DATA GROUP
- b = EQVT.STE
- c = EQVT.STS
- d = EQVT.VT GROUP
- e = EQVT.VT MEMBER

2.4 * UNIT NUMBER

Description: Enter the unit number.

Required Field.
Valid Entries:
- For 5E9(2) and earlier: 0 - 7
- For 5E10 - 5E11: 0 - 42
- For 5E12 and later:
- 0 - 7 (DNUS)
- 0 - 42 (IDCU)

Copyright © 2003 Lucent Technologies

Data Rules:

For each RTERM form, there must be a corresponding EQIDCU form with matching SM and UNIT NUMBER fields.

Equipment Bay and Vertical Position values must be unique within an SM for an assigned UNIT NUMBER.

2.5 * RT EX

Description: Enter the remote terminal external number.

Required Field.
Valid Entries:
- 5E11 and earlier: 1 - 31
- 5E12 and later:
- 1 - 31 (IDCU)
- 1 - 99 (DNUS)

2.6 # RT INTERFACE

Description: Enter the remote terminal interface type.

Required Field.

Valid RT INTERFACE Entries

Entry	Description
TR008 or TR0	Analog remote Terminal.
TR303 or TR3	Analog and ISDN remote terminal.

Data Rules:

TR303 and TR008 remote terminals must be unique for any SM, UNIT NUMBER, and/or PROT LINE fields.

For 5E9(1) only, the channel units on each RTERM forms where RT INTERFACE is "TR008" are divided into 3 blocks, each with 16 consecutive channel units (CU 01/02 to CU 31/32, CU 33/34 to CU 63/64, and CU 65/66 to CU 95/96). If any one or all of the channel units on the same block have an entry, the whole block is considered assigned. For the RTERM forms where RT INTERFACE is "TR303" and RT LINE SIZE is entered the number of assigned blocks for each RTERM form is calculated as (RT LINE SIZE - 1)/32 + 1. The total number of assigned blocks from all the RTERM forms on the same SM must not be greater than 128.

TR303 - When "TR303" is entered:

- all TR008 IFACs must be blank.
- SHELF A, B, C, and D IFACs must be blank.
- PROVISION RT, ACKTIMER, NO RETRANS, UNACK FRAMES, and ACTIVITY TIMER must be entered.
- TMC PRI/NPRI ISCNs or EOC PRI/NPRI ISCNs can be entered only when RT EQSTAT is "O".
- ISCNs from TMC PRI/NPRI and EOC PRI/NPRI must have unique values.
- the SLCALM form (5105 Record) must have a value in the CRITICAL field.

Copyright © 2003 Lucent Technologies

For all TR303 remote terminals, OEs can be assigned to the RT only if the TR303 is equipped (i.e, RT EQSTAT must equal "O" or "G"). In addition, OEs assigned to any TR303 must never have the assigned line value exceed the RT LINE SIZE on the related RTERM form. (The line value is OE NUMBER[8,11] for an OE TYPE of "G".) Originating Equipment (OE) with OE TYPE of "G" on the DSL, DSLUSR, LINE, MLHLN, TRUNK or MISLINK form(s) must have SM/IDCU/RT values assigned to OE NUMBER[1,7] which correspond to the SM, UNIT NUMBER, and RT EX values assigned on an RTERM form where RT INTERFACE is "TR303".

For 5E9(2) and later, each value of SM entered on an RTERM form which has RT INTERFACE set to "TR303" must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports TR303 Remote Terminals. For the CONFIGURATION that supports TR303, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

- for 5E10 and later, INH DSL MAINT must be entered.

For 5E10 and later, when NON - CONTROLLING or CONTROLLING OE - types/numbers defined on the NAILUP input form with CONTROLLING OE-type equal to "G" and DDS equal to "Y" are associated with an RTERM form where RT INTERFACE is "TR303",

- the corresponding MLHLN form must have the TR303 NAILUP field set to "Y".
- the corresponding LINE form must have the TR303 NAILUP field set to "Y".

For 5E10 and later, when MLHG/TERM(s) on the MLHLN form have OE TYPE set to "G" or "A", the CLASS OF SERVICE on the corresponding LCC form can not be equal to any of the following:

- 4WINDIV,
- TAOPER,
- or XDB.

The SM/IDCU/RT values found in the OE NUMBER[1,7] will point to an RTERM form with RT INTERFACE set to "TR303".

TR008 - When "TR008" is entered:

- RT EQSTAT and RT LINE SIZE must not be entered.
- PWR ALM CLASS must not have "CRIT" entered.
- DIGRP A MODE and IFAC must be entered.
- DIGRP A EQSTAT must be either "O" or "G".
- if DIGRP A MODE has
  - "CONC" entered, then DIGRP B MODE must have "CONC" entered, and DIGRP B IFAC must not be entered.
  - "UNCONC" entered, then DIGRP B MODE must not have "CONC" entered.
- if DIGRP B MODE is
  - not entered, then DIGRP B EQSTAT and IFAC must not be entered.

Copyright © 2003 Lucent Technologies

- entered, then DIGRP B EQSTAT must be "G" or "O".
- "UNCONC", then DIGRP B IFAC must be entered.

- if DIGRP B, C, or D EQSTAT is operational, then DIGRP A EQSTAT must be operational.
- if DIGRP C MODE is
  - "CONC", then DIGRP D MODE must have "CONC" entered. Also, DIGRP D IFAC must not be entered, and DIGRP C EQSTAT must have "G" or "O" entered.
  - "UNCONC", then DIGRP D MODE must not have "CONC" entered.
  - entered, then DIGRP C IFAC must be entered.

- if DIGRP C MODE is @dash2 = not entered, then DIGRP C EQSTAT and IFAC must not be entered.
- if DIGRP D MODE is
  - entered, then DIGRP C MODE must be entered, and DIGRP D EQSTAT must be "G" or "O".
  - not entered, then DIGRP D EQSTAT and IFAC must not be entered.
  - "UNCONC", then DIGRP D IFAC must be entered.

- FTTH ENABLED (Fiber To The Home Enabled) must be entered. When "TR008" is entered, and FTTH ENABLED is set to "Y",
  - PALIT on the corresponding LINE form (5109 Record) or MLHLN form (5111 Record) must be "Y".
  - PSLIM on the corresponding LINE form (5109 Record) or MLHLN form (5111 Record) must be "Y".

- ENV ALM1 CLASS, ENV ALM1 COND, ENV ALM2 CLASS, and ENV ALM2 COND must not be entered.
- all TR303 IFACs must not be entered.
- SIGMODE on the Nailup form (5207 Record) must be "A", "AB" or "NOSIG".

For 5E10 and later, when MLHG/TERM(s) on the MLHLN form have OE TYPE set to "G", the CLASS OF SERVICE on the corresponding LCC form can not be equal to any of the following:
- 4WINDIV,
- ISATND,
- ISDN,
- TAOPER or
- XDB.

The SM/IDCU/RT values found in the OE NUMBER[1,7] will point to an RTERM form with RT INTERFACE set to "TR008".

2.7 # RT SID

Copyright © 2003 Lucent Technologies

Description: Enter the remote terminal source identifier.

Required Field.
Valid Entries: 1 - 9999

Data Rules:

The RT SID assigned on this form must be unique to an office.

SIDs (Site Identification Numbers) cannot be duplicated on RTERM and/or SLCRT forms. Each SID number must be unique across all SMs.

2.8 RT MTB

Description: Enter the Remote Terminal Metallic Test Bus.
Valid Entries: a 9-digit MTB number in the following format.

MTB (METALLIC TEST BUS) NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
RT Metallic Test Bus	RT MTB	XX	00-14

Data Rules:

The RT MTB defined on this form must be defined on the EQTBCU form (5811 Record).

The RT MTB defined on this form must be unique.

The RT MTB defined on this form must have a METALLIC SERVICE UNIT assigned on either the EQMSP or EQMMSP forms (5750 Record).

The RT MTB defined on this form must have an MACC (Metallic Access Circuit Pack) assigned on either the EQMSP or EQMMSP forms (5750 Record).

An RT MTB cannot have more than 20 RT assignments.

The MTB pack resides upon an ORM, RSM or TRM. The RTERM and the MTBs must share the same SITE ID (on EQIM form). In addition, if this is a remote SITE ID (i.e., it does not reside in the local office), the MTBs must reside on the Common Resource Module (denoted by MASTER MODULE on corresponding EQSITE form).

- ***NOTE:*** This rule does not apply to co-located ORMs or TRMs.

2.9 RT ID DPN

Description: Enter the Remote Terminal Identification Distribute Point Number.
Valid Entries: a 9-digit Distribute Point Number in the following format.

DPN (DISTRIBUTE POINT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
RT Distribute Point Number	RT ID DPN	XX	00-31

Data Rules:

Copyright © 2003 Lucent Technologies

When RT ID DPN is entered, RT MTB must be entered.

All RT ID DPN assignments must be unique on each SM.

2.10 PWR ALM CLASS

Description: Enter the Power Alarm Classification.

Valid PWR ALM CLASS Entries

Entry	Description
MINOR or MI	Minor alarm classification.
MAJOR or MA	Major alarm classification.
CRIT or C	Critical alarm classification.

Data Rules:

When RT INTERFACE is "TR008", PWR ALM CLASS must not have "CRITICAL" entered.

2.11 PROT LINE

Description: Enter the Protection Line IFAC for the RT.
Valid Entries: 0 - 39

Data Rules:

When RT INTERFACE is "TR303", PROT LINE, if known, must equal an IFAC value.

2.12 CKT TST MTH

Description: Enter the Circuit Test Method.

Default: NONE

Valid CIRCUIT TEST METHOD Entries

Entry	Description
RTU or R	Remote Test Unit.
DIODE or D	Diode Test Method.
SHORT or S	Short Test Method.
NONE or N	None.

Data Rules:

When CKT TST MTH is entered and is not "NONE", RT MTB must be entered.

When CKT TST MTH is not entered or is "NONE", RT MTB must not be entered.

2.13 BER THRES

Description: Enter the Bit Error Ratio threshold for the DS1 protection switch.
Default: 4
Valid Entries: 4 - 7

Data Rules:

For RTs on an IDCU, BER THRES must be entered.

2.14 SUP METHOD

Copyright © 2003 Lucent Technologies

Description: Enter the Suppression Method for the remote terminal.

Valid SUP METHOD Entries

Entry	Description
blank	Software Release: 5E12 and later DNU-S.
TR8ZC	IDCU to TR008, ZCS mode. This mode is used in TR008 RTs that are remoted over 24-channel facilities which require ZCS. These 24-channel facilities include: Fs, ZCS, CCS, and 4K data links.
TR8B8	IDCU to TR008, B8ZS mode. This mode is used in TR008 RTs that are remoted over 24-channel facilities which require B8ZS. These 24-channel facilities include: Fs, B8ZS, CCS, and 4K data links.
303ZC	IDCU to TR303, ZCS mode. This mode is used in TR303 RTs that are remoted over 24-channel facilities which require ZCS. These 24-channel facilities include: Fe, ZCS, CCS, and 4K data links.
303B8	IDCU to TR303, B8ZS mode. This mode is used in TR303 RTs that are remoted over 24-channel facilities which require B8ZS. These 24-channel facilities include: Fe, B8ZS, CCS, and 4K data links.

- ***NOTE:*** As with all transmission facility connections, the SUP METHOD must be consistent across all equipment used throughout the connection from the RT to the 5ESS Switch. For example, if an RT has a SUP METHOD set to "ZCS" or "B8ZS", the type of transmission equipment used (e.g., T1 line repeaters, multiplexers, and fiber links) must be compatible (and optioned) with ZCS or B8ZS signaling, respectively, as well as the 5ESS Switch.

Data Rules:

When RT INTERFACE is "TR008", SUP METHOD must be "TR8ZC" or "TR8B8".

When RT INTERFACE is "TR303", SUP METHOD must be "303ZC" or "303B8.

When RT INTERFACE is "TR303", and DSL assignments are planned, SUP METHOD must be "303B8".

The SUP METHOD is defined for a "TR303" or "TR008" RT, must have IFACs of the same SUP METHOD assigned on the EQIFAC form.

2.15 RT VENDOR

Description: Enter the remote terminal vendor name.
Valid Entries: 1 - 25 characters

TR303 REMOTE TERMINAL

The following fields (Section 2.16 - Section 2.21) define status and alarm class parameters for the TR303 RT.

2.16 RT EQSTAT

Description: Enter the equipment status of the TR303 remote terminal.

Valid RT EQSTAT Entries

Entry	Description
O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

When RT INTERFACE is "TR303", RT EQSTAT must be entered.

When RT INTERFACE is "TR303" and RT EQSTAT is "O", TMC PRI/NPRI ISCNs and EOC PRI/NPRI ISCNs must be entered.

When RT INTERFACE is "TR303", EOC/TMC BKUP must be entered when RT EQSTAT is "G" or "O".

Copyright © 2003 Lucent Technologies

When RT INTERFACE is "TR303", the RT EQSTAT assigned on this form must have IFACs of equal or higher EQSTAT values assigned on the EQIFAC form.

2.17 RT LINE SIZE

Description: Enter the Remote Terminal Line Size.
Valid Entries: 1 - 2048

Data Rules:

When RT INTERFACE is "TR303", RT LINE SIZE must be entered.

If RT LINE SIZE is greater than 99, the OE SIZE on the OFCOPT form must be set to 10.

Any OE numbers assigned to a TR303 RT must not have the assigned line value exceed the RT LINE SIZE defined on this form.

2.18 ENV ALM1 CLASS

Description: This identifies the Environmental Alarm 1 Classification.

Software Release: 5E10 - 5E11
Valid Entries:

Valid ENV ALM1 CLASS Entries

Entry	Description
MINOR or MI	Minor alarm classification.
MAJOR or MA	Major alarm classification.
CRIT or C	Critical alarm classification.

Data Rules:

For TR008, ENV ALM1 CLASS must be blank.

For TR303, ALM1 CLASS and ALM1 COND must be entered when either one is entered.

2.19 ENV ALM1 COND

Description: Enter the Environmental Alarm 1 Condition. The information entered will be output (printed or displayed on a terminal) to provide the site of the TR303 RT and the problem type (e.g., power) which triggered the alarm.

Software Release: 5E10 - 5E11
Valid Entries: 1 - 25 characters

Data Rules:

For TR008, ENV ALM1 COND must be blank.

For TR303, ALM1 CLASS and ALM1 COND must be entered when either one is entered.

2.20 ENV ALM2 CLASS

Description: Enter the Environmental Alarm 2 Classification.

Software Release: 5E10 - 5E11
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid ENV ALM2 CLASS Entries	
Entry	**Description**
MINOR or MI	Minor alarm classification.
MAJOR or MA	Major alarm classification.
CRIT or C	Critical alarm classification.

Data Rules:

For TR008, ENV ALM2 CLASS must be blank.

For TR303, ALM2 CLASS and ALM2 COND must be entered when either one is entered.

2.21 ENV ALM2 COND

Description: Enter the Environmental Alarm 2 Condition.

Software Release: 5E10 - 5E11
Valid Entries: 1 - 25 characters

Data Rules:

For TR008, ENV ALM2 COND must be blank.

For TR303, ALM2 CLASS and ALM2 COND must be entered when either one is entered.

2.22 TR303 BK OUT

Description: This field is used by Recent Change only.

2.23 INH DSL MAINT

Description: Should DSL (Digital Line Subscriber) maintenance be disabled for ISDN loopback test, ISDN corrupt CRC test, and ISDN Performance Monitoring? This field applies to IDCU TR303 Remote Terminals only.

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

Data Rules:

When RT INTERFACE is "TR008", this field must be blank.

When RT INTERFACE is "TR303", this field must be entered.

ENVIRONMENTAL ALARMS (ENVALM)

2.24 CLASS

Description: This field defines the alarm classification.

Software Release: 5E12 and later
Valid Entries: Minor, Major, Critical

2.25 CONDITION

Description: This field can be used for remarks about the alarm.

Software Release: 5E12 and later

Copyright © 2003 Lucent Technologies

Valid Entries: 25 characters or less

3. FORM ENTRIES - 5174-2 RECORD

TR008, SHELVES A - D

The following fields (Section 3.1 - Section 3.4) are used to designate the MODE, EQSTAT, CLI and IFAC for shelves A through D for the TR008 RT.

3.1 MODE

Description: Enter the mode of the remote terminal.
Default: UNCONC
Valid Entries:

Valid MODE Entries

Entry	Description
CONC or C	Concentrated.
UNCONC or U	Unconcentrated.

Data Rules:

When RT INTERFACE is "TR008", the following conditions apply:

- MODE and IFAC are required and must be entered on Shelf A.
- EQSTAT must be either "O" or "G" and must be entered on Shelf A.
- if MODE on Shelf A is "CONC",
  - then MODE on Shelf B must be "CONC".
  - IFAC on shelf B must be blank.
- if MODE on Shelf A is "UNCONC", then MODE on Shelf B must be "UNCONC or unknown."
- if MODE on Shelf C is "CONC", then MODE on Shelf D must be "CONC".
- if MODE on Shelf C is "UNCONC", then MODE on Shelf D must be "UNCONC or unknown."
- if MODE on Shelf B, C or D is not entered, then EQSTAT and IFAC on Shelf B, C or D must not be entered, respectively.
- if MODE on Shelf B, C or D is entered, then EQSTAT on Shelf B, C or D must be "G" or "O", respectively.
- if MODE on Shelf B and D is "UNCONC", then IFAC on Shelf B and D must be entered, respectively.
- if Shelf B, C, or D is "O", then EQSTAT on Shelf A must be "O".
- if MODE on Shelf C is "CONC", then IFAC on Shelf D must be blank.
- if MODE on Shelf C is entered, then IFAC on Shelf C must be entered.
- if MODE on Shelf D is entered, MODE on Shelf C must be entered.

When MODE of SHELF A/C is set to "CONC", then the first/last 48 lines (24 channel units), i.e. CU0102 thru CU4748/CU4950 thru CU9596, share the time slots on the IFAC A/C. Each IFAC only has 24 (0 - 23)

Copyright © 2003 Lucent Technologies

time slots available. Each channel unit entered on the RTERM form where there is a corresponding NAILUP form will have one or two time slots reserved (depending on the value of PATH NUM on the NAILUP form). If the channel unit entered on the RTERM form has no matching NAILUP form, and is a TR008 Mode-II special channel unit (unit type is "COIN", "FXS", "FXSLS", "DIDDPT", "SPOTS", "DID", "SSV00", or "SSV10") the channel unit will also have one time slot reserved. The total number of reserved time slots on the same IFAC can not be greater than 24.

3.2 EQSTAT

Description: Enter the state of the equipment.
Default: O
Valid Entries:

Valid EQSTAT Entries

Entry	Description
O	Operational.
G	Growth.
U	Unequipped.

Data Rules:

When RT INTERFACE is "TR008", the EQSTAT assigned on this form must have IFACs of equal or higher EQSTAT values assigned on the EQIFAC form.

3.3 CLI

Description: Enter the Change Level Indicator value for shelves A through D.
Default: 0
Valid Entries: 0 - 7FFFFFFF

Data Rules:

The correct CLI value is 00000000 for DIGRP A/B/C/D CLI.

3.4 IFAC

Description: Enter the IDCU Facility Connection number.
Valid Entries: 0 - 39

Data Rules:

Shelves A, B, C, and D IFACs and PROT LINE must have unique values entered.

If an IFAC position (0-19 for LSI 0, and 20-39 for LSI 1) is specified, EQSTAT and LSI must be defined on the EQIFAC form.

If the OE on a DSL form is defined on a TR303 remote terminal, then the DS1, PPB1 DS1 and/or PPB2 DS1 entered on the DSL form corresponds with the IFAC entered in the RT IFAC TERMINATION list on the RTERM form with ROW RT TERM equal to the DS1, PPB1 DS1 and/or PPB2 DS1. Also, this IFAC can not equal PROT LINE on this same RTERM form.

Also if the OE on an MISLINK form, the OE is defined on a TR303 remote terminal, then the DS1 entered on the MISLINK form corresponds with the IFAC entered in the RT IFAC TERMINATION list on the RTERM form with ROW RT TERM equal to the DS1. Also, this IFAC can not equal PROT LINE on this same RTERM form.

REMOTE TERMINAL (TR008) CHANNEL UNIT TYPES

The following field (Section 3.5) is used to designate up to forty-eight Channel Unit Types that terminate

Copyright © 2003 Lucent Technologies

on Shelves A through D, for Channel Units CU 01/02 through CU 95/96 for the TR008 RT. The channel units are chosen to match the type of service provided.

3.5 CHANNEL UNIT: 01/02 - 95/96

Description: For Shelves A through D, enter the Channel Unit Types.

Valid CU TYPE Entries

Entry	Dual or Single	Description
COIN	Single	GS (CF) or LS (DTF) coin.
DID	Dual	Dual DID channel CU for TR008 RTs.
DIDDPT	Single	Single channel DID CU for TR008 RTs.
FSR	Dual	Multi-frequency Ringing 5PTY or Individual.
DFXS	Dual	Software Release: 5E9(2) and later. Dual FX Plugs.
FXS	Single	FX ground start for PBX applications.
FXSLS	Single	FX loop start for WATS applications.
MP	Dual	Multi-party.
SF1	Dual	Software Release: 5E9(1) Only. Dual FX Plugs.
SP	Dual	Single party loop start.
SPOTS	Dual	Special POTS - loop and ground start for Individual, PBX or WATS applications.
SSV00	Dual	Generic non-switched special services for nailup only.
SSV10	Dual	Generic non-switched special services for nailup only.

When SPOTS type channel units are assigned to TR008 mode 2 RT, the concentration ratio increases. If 12 SPOTS channel units are assigned, any SP type card on this digroup will no longer have dialtone. The table below shows how the concentration ratio increases with the assignments of SPOTS channel cards per TR008 mode 2 digroup:

Number of SPOTS cards	Available DS1 Timeslots for other type of channel units
0	24
1	22
2	20
3	18
4	16
5	14
6	12
7	10
8	8
9	6
10	4
11	2
12*	0*

* When 12 SPOTS channel units are assigned to a TR008 digroup, there will be no more DS1 timeslots for other type of channel units such as SP. If there are SP cards assigned, they will not have dialtone.

Data Rules:

If Shelf A is "G" or "O", CU 01/02 through CU 23/24 may have equipment entered. If Shelf "B" is "G" or "O", CU 25/26 through 47/48 may have equipment entered. If Shelf C is "G" or "O", CU 49/50 through 71/72 may have equipment entered. If Shelf D is "G" or "O", CU 73 through 96 may have equipment entered.

When CU types from 25 to 48 are entered, IFAC of Shelf B must be entered or MODE of Shelf A must be "CONC".

When CU types from 49 to 72 are entered, IFAC of Shelf C must be entered and MODE of Shelf C must be entered.

Copyright © 2003 Lucent Technologies

When CU types from 73 to 96 are entered, IFAC of Shelf D must be entered or MODE of Shelf C must be "CONC".

When any CHANNNEL UNIT types from 01 to 24 are "SF1" (5E9(1)) or "DFXS" (5E9(2) and later) then MODE of DIGRP A must be "UNCONC".

When any CHANNNEL UNIT types from 25 to 48 are "SF1" (5E9(1)) or "DFXS" (5E9(2) and later) then MODE of DIGRP B must be "UNCONC".

When any CHANNNEL UNIT types from 49 to 72 are "SF1" (5E9(1)) or "DFXS"5E9(2) and later) then MODE of DIGRP C must be "UNCONC".

When any CHANNNEL UNIT types from 73 to 96 are "SF1" (5E9(1)) or "DFXS"5E9(2) and later) then MODE of DIGRP D must be "UNCONC".

RTERM forms with a UNIT TYPE of "IDCU" and CU XX/YY values (where XX ranges from 01-95, and YY ranges from 02-96) set to "SF1"(5E9(1)) or "DFXS"(5E9(2) and later) indicate that this CU TYPE is used by the Dual FX Plugs Special Feature. It is a secured feature and must be purchased by the office before the "SF1" (5E9(1)) or "DFXS"(5E9(2) and later) CU TYPE can be used. An SFSYS form must exist with SFID 144 ACT field set to "Y".

NON-CONTROLING and CONTROLLING OE-types/numbers defined on the NAILUP form, which have a corresponding ILEN defined on a RTERM form with CU XX/YY set to "DID" or "DIDDPT", indicate the trunk is a DID trunk. The nailup of DID trunks is not supported. The corresponding ILEN on a RTERM form is found by matching the first three digits of OE on the NAILUP form to the SM, the fourth and fifth digits of OE to the UNIT NUMBER, and the sixth and seventh digits of OE to the RT EX. The matching channel unit (CU XX/YY) is found by matching the tenth and eleventh digits of OE, when OE TYPE = "G", to XX in CU XX/YY where the value of YY is XX + 1.

5E10 and later:

When Telephone Number(s) assigned on the LINE form is assigned to IDCU equipment (OE TYPE is equal to "G"), the Telephone Number must have the proper RTERM Channel Unit to LCC-Service Class correspondence. The LCC/RAX combination assigned on the LINE form must be defined on the LCC form with an associated Service Class that matches the CUXX/YY type on the RTERM input form. Errors will be reported for RTERM forms where RT INTERFACE is "TR008". Refer to the following Table for the required correspondence:

RTERM Channel Unit to LCC-Service Class correspondence.

LCC SERVICE CLASS	RTERM CU XX/YY
COIN	COIN, FSR, SSV00, SSV10
PBX, HOTPBX	FXS, FSR, SPOTS, DFXS, SSV00, SSV10
HOTMOTL	FXSLS, SPOTS, DFXS, SSV00, SSV10
B911, CHGCALL	SP, SPOTS, SSV00, SSV10
INDIV	FXSLS, SP, SPOTS, FSR, MP, DFXS, SSV00, SSV10
4PFS, 4PSS, 8PSS	MP, SSV00, SSV10
TWOPTY	MP, SSV00, SSV10
5PTY	FSR, SSV00, SSV10

When Telephone Numbers(s) are assigned on the LINE form to NUMBER(S) where OE TYPE is equal to "G", that are defined on the RTERM form as being associated with a Channel Unit type equal to "SP" or "FXSLS", the value of the GST (Ground Start field) on the LINE form must be "N". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

When Telephone Numbers(s) are assigned on the LINE or MLHLN input form(s) to IDCU equipment (OE TYPE is equal to "G"), the OE NUMBER(s) must correspond to a Channel Unit position (i.e., CU XX/YY) with a known value defined on the RTERM form. Note that the last two digits of the LINE NO. are determined by the CU XX/YY value (where XX is odd number range of 01-95 and YY is XX + 1). Both LINE NO. (POS) values in the pair are assignable for CU XX/YY type set to

- FSR,

Copyright © 2003 Lucent Technologies

- MP,
- SP,
- SSV00,
- SSV10,
- DFXS, or
- SPOTS.

Only the lower (odd) numbered LINE NO. value is assignable for CU XX/YY type set to "COIN", "FXS" or "FXSLS". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

OE to RTERM Correspondence

OE	RTERM
NUMBER[1,3]	SM
NUMBER[4,5]	UNIT NUMBER
NUMBER[6,7]	RT EX
NUMBER[8,11]	For OE TYPE set to "G": POS value for CU XX/YY type = COIN, DFXS, FSR, FXS, FXSLS, MP, SP, SPOTS, SSV00, SSV10

When ASSOC OE TYPE equals "G", Telephone Numbers(s) assigned on the LINE input form(s) with a known ASSOC OE entry that assigned 1-TN LTSB to this TN, the ASSOC OE NUMBER(s) must correspond to a Channel Unit position (i.e., CU XX/YY) with a known value defined on the RTERM form. Note that the last two digits of the LINE NO. are determined by the CU XX/YY value (where XX is odd number range of 01-95 and YY is an even number of XX + 1). Both LINE NO. (POS) values in the pair are assignable for CU XX/YY type set to
"FSR",
"MP",
"SP",
"SPOTS",
"DFXS",
"SSV00", or
"SSV10".
Only the lower (odd) numbered LINE NO. value is assignable for CU XX/YY type set to "COIN", "FXS" or "FXSLS". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

OE to RTERM Correspondence

OE	RTERM
NUMBER[1,3]	SM
NUMBER[4,5]	UNIT NUMBER
NUMBER[6,7]	RT EX
NUMBER[8,11]	For OE TYPE set to "G": POS value for CU XX/YY type = FSR, MP, SP, SPOTS, COIN, FXS, FXSLS, SSV00, SSV10, DFXS

When TGN/MEMB(s) are assigned on TRUNK form(s) with a known value for TRKOE where type equals "G", (For equipment number(s) on the RTERM form) the TRKOE(s) must correspond to a Shelf Channel Unit position (i.e., CU XX/YY) value of "DID," or "DIDDPT," defined on the RTERM form(s) where RT INTERFACE is "TR008". Note that line number values of the TRKOE[10,11] (for TRKOE type of "G,") are determined by the CU XX/YY value (where XX is odd number range of 01-95 and YY is XX + 1). Both line number values (i.e., 01 and 02) are assignable for CU XX/YY type set to "DID,". Only the lower (odd) numbered line number value is assignable for CU XX/YY type set to "DIDDPT,". Errors will only be reported for RTERM forms where RT INTERFACE is "TR008".

TRKOE to RTERM Correspondence

TRKOE	RTERM
TRKOE[1,3]	SM
TRKOE[4,5]	IDCU
TRKOE[6,7]	REMOTE TERMINAL
TRKOE[10,11]	For TRKOE type = "G": line value for CU XX/YY = "DID," or "DIDD PT,"

When Telephone Numbers(s) are assigned on the LINE input form to NUMBER(S) where OE TYPE is

Copyright © 2003 Lucent Technologies

equal to "G", that are defined on the RTERM form as being associated with a Channel Unit type equal to "DFXS", and if the CLASS OF SERVICE on the associated LCC form is "INDIV", the GST (Ground Start) field on the LINE form must be "N". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

For 5E10 and later, Multiline Hunt Group Member(s) assigned on the MLHLN input form to IDCU equipment (OE TYPE is equal to "G") must have the proper RTERM Channel Unit to LCC-Service Class correspondence. The LCC/RAX combination assigned on the MLHLN form must be defined on the LCC form with an associated Service Class that matches the CUXX/YY type on the RTERM input form. Errors will be reported for RTERM forms where RT INTERFACE is "TR008". Refer to the following Table for the required correspondence:

RTERM Channel Unit to LCC-Service Class Correspondence

LCC SERVICE CLASS	RTERM CU TYPE
INDIV	SP, MP, SPOTS, FSR, FXSLS, SSV00, SSV10, DFXS
CHGCALL	SP, SPOTS, SSV00, SSV10
TWOPTY	SP, MP, SSV00, SSV10
4PFS, 4PSS, 8PSS	MP, SSV00, SSV10
5PTY	FSR, SSV00, SSV10
HOTPBX	FXS, FSR, SPOTS, SSV00, SSV10, DFXS
HOTMOTL	SPOTS, FXSLS, SSV00, SSV10, DFXS
PBX	FXS, SPOTS, FSR, SSV00, SSV10, DFXS
COIN	COIN, SSV00, SSV10
B911	SP, SPOTS , SSV00, SSV10

When Multiline Hunt Group Member(s) are assigned on the MLHLN input form to IDCU equipment (OE TYPE is equal to "G"), which are defined on the RTERM form as being associated with a Channel Unit type equal to "SP" or "FXSLS", the value of the GST (Ground Start) field on the MLHLN form must be "N". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

For 5E10 and later, when Multiline Hunt Group Member(s) are assigned on the MLHLN input form to IDCU equipment (OE TYPE is equal to "G"), which are defined on the RTERM form as being associated with a Channel Unit type equal to "DFXS", and if the CLASS OF SERVICE on the associated LCC form is "INDIV", the GST (Ground Start) field on the MLHLN form must be "N". Errors will be reported for RTERM forms where RT INTERFACE is "TR008".

4. FORM ENTRIES - 5174-3 RECORD

FTTH RESISTOR VALUES

The following fields (Section 4.1 - Section 4.10) are used to enable the TR008 FTTH (Fiber To The Home) Resistor Values and to designate the minimum and maximum resistor values, in K-Ohms, for the TIP-RING R1, TIP-GROUND R2, and RING-GROUND R3 for nine testing conditions. These fields are automatically defaulted for TR303 and TR008, but are used for TR008 only.

4.1 FTTH ENABLED

Description: Is Fiber to the Home Enabled?
Default: Y
Valid Entries: Y, N

Data Rules:

When FTTH is enabled, all FTTH minimum and maximum resistor values must be entered.

When RT INTERFACE is "TR008", and FTTH ENABLED is set to "Y", PALIT on the corresponding LINE or MLHLN form must be set to "Y".

4.2 PHASE 1 DT FIBR GOOD

Copyright © 2003 Lucent Technologies

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Phase 1 Distant Terminal, Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.3 NO DTM AND FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for No Drop Test Module and Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.4 DROP TEST OK AND FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Drop Test OK and Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.5 NO RINGER AND FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for No Ringer and Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.6 DROP FAILS FEMF/LKG AND FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Drop Fails Foreign Electromotive Force or Leakage, and Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.7 RECVR OFF HOOK AND FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Receiver Off Hook and Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.8 HAZ VOLT DETCTD AT DT AND FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Hazardous Voltage Detected At Distant Terminal and Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.9 PHASE 1 RT FIBR GOOD

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Phase 1 Remote Terminal, Fiber Good for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below following the FIBR OUT OF FRAME field.)
Valid Entries: 1 - 9999

4.10 FIBR OUT OF FRAME

Copyright © 2003 Lucent Technologies

Description: Enter the minimum and maximum resistor values (in K-Ohms) for Fiber Out of Frame for TIP-RING R1, TIP-GRND R2, and RING-GRND R3.
Default: (see default table below)
Valid Entries: 1-9999

Default Values:

Fiber To The Home Resistor Values in k-Ohms

Test Condition	Tip-Ring R1		Tip-Grnd R2		Ring-Grnd R3	
	Min	Max	Min	Max	Min	Max
Phase 1 Dt Fibr Good	0015	0024	0084	0096	0084	0096
No DTM and Fibr Good	0034	0044	0084	0096	0084	0096
Drop Test OK and Fibr Good	0024	0034	0084	0096	0084	0096

5. FORM ENTRIES - 5174-4 RECORD

TR303

The following field provides 28 rows for defining IFAC positions for a TR303 RT.

5.1 RT IFAC TERMINATION

Description: 5E12 and later, the name of this field was changed to RT FAC TERMINATION (RTFACTRM). See RT FAC TERMINATION (RTFACTRM) for usage information.

5.2 RT FAC TERMINATION

Description: For 5E12 and later, this field name was changed from RT IFAC TERMINATION to RT FAC TERMINATION. Enter up to 28 FACs (facility positions) terminating on the remote terminal in the RT TERM IFAC field for rows 1 - 28 in the following formats.
Valid Entries:

- 5E11 and earlier: 0 - 39 (IDCU)

- 5E12:
- IDCU: 0 - 39
- DNUS:
- 0 - 1 (DG)
- 0 - 5 (STS)
- 1 - 28 (DSL)

5E13 and later:

- IDCU: 0 - 39
- DNUS:
- 0 - 1 (DG)
- 1 - 6 (STE)
- 1 (STS)
- 1 - 7 (VTG)
- 1 - 4 (VTM)

Data Rules:

When RT INTERFACE is "TR303", RT TERM row 1 must be entered.

Copyright © 2003 Lucent Technologies

When RT INTERFACE is "TR303", RT TERM row 1 must not equal PROT LINE.

All IFACs must be unique for any SM, UNIT NUMBER combinations on all RTERM forms. The IFAC/FAC may be TR008 IFAC A-D, PROT LINE, or TR303 RT FAC TERMINATION.

If IFAC is between 0 and 19, EQIFAC LSI must be zero and IFAC should match row. If IFAC is between 20 and 39, EQIFAC LSI must be one and should match row.

Each IFAC can have up to 24 (0 - 23) time slots assigned.

TMC AND EOC

The following fields (Section 5.3 - Section 5.4) define the TMC AND EOC (TIME SLOT MANAGEMENT CHANNEL AND EMBEDDED OPERATIONS CHANNEL). These channels provide management and control functions using the LAPD (Link Access Protocol - Level D) parameters. Additional information about the LAPD parameters can be found in the *ISDN BRI Interface Specification (235-900-321).*

There are two sets of TMC and EOC channels - primary and backup. They provide the link between the remote terminal, IDCU, and the PSU. The link between the RT and the IDCU is provided by the first row of the RT IFAC TERMINATION list (i.e., the IFAC entered in the first row carries the primary EOC/TMC channels). The row of the RT IFAC TERMINATION list which is pointed to by the EOC/TMC BKUP RT TERM field contains the backup EOC/TMC channels. These time slots are fixed as referenced in the Pre-Assigned EOC/TMC Assignments table below.

The links between IDCU and the PSU are assigned via the ISCN/DPIDB/TIME SLOT fields. Time slots are either assigned by customer, in which case the DPIB must be assigned, or they are generated by the software. For TR303 ISCN is always a required field.

Following are the TMC/EOC channel assignments automatically assigned by software for both the first and backup channels.

Pre-assigned EOC, TMC, and GUARD TIMESLOTS

SUPPRESSION METHOD	DS1 TIMESLOT FOR EOC	DS1 TIMESLOT FOR TMC	DS1 GUARD TIMESLOT
303ZC	11	23	0, 10, 22
303B8	11	23	NA

5.3 EOC/TMC BKUP RT TERM

Description: This field defines the remote terminal termination for the backup EOC/TMC (the IFAC entered in this field is the backup EOC/TMC). This field is for TR303 remote terminals terminating on an IDCU only.

Required Field.
Default: 3
Valid Entries: 2 - 28

Data Rules:

EOC/TMC BKUP RT RTERM must be entered when RT EQSTAT is "G" or "O".

EOC/TMC BKUP RT RTERM must identify the RT TERM ROW of an IFAC which has been entered.

The IFAC specified in the EOC/TMC BKUP RT RTERM field must not be the same IFAC specified in the PROT LINE field.

5.4 PROVISION RT

Copyright © 2003 Lucent Technologies

Description: Is the remote terminal provisioned by the switch? Enter "N" if it is provisioned by an outside source. This field is for TR303s terminating on an IDCU only.

Required Field.
Default: Y
Valid Entries: Y, N

TMC/EOC LAPD PARAMETERS

The following fields (Section 5.5 - Section 5.10) define TMC/EOC LAPD (Link Access Protocol - Level D) parameters for transferring data from the switch to the TR303 remote terminal.

5.5 ACKTIMER

Description: This field defines the Acknowledgement Timer (in milliseconds) for transmitter frame T200. This is the Layer 2 Acknowledgement Timer. It identifies the number of milliseconds the switch will wait for an acknowledgement signal before a frame will be retransmitted.

Required Field.
Default: 150
Valid Entries: 100 - 350 (milliseconds) in increments of 50

5.6 NO RETRANS

Description: This field defines the number of retransmissions threshold. Enter the number of retransmissions for frame N200.

Required Field.
Default: 3
Valid Entries: 1 - 10

5.7 UNACK FRAMES

Description: This is the Layer 2 Window Size. It defines the number of retransmissions that can be queued before an unacknowledgement signal is required. Enter the number of retransmissions for unacknowledged frames.

Required Field.
Default: 7
Valid Entries: 1 - 7

5.8 SAPI0 FRAME SIZE

Description: This is the maximum I-field size for SAPI0. It defines the maximum size frame for SAPI0 (Service Access Point Identifier 0) that can be sent on the DS1 link between the RT and IDCU equipment. This is the maximum I-field size for SAPI0.

Required Field.
Default: 32
Valid Entries: 32

5.9 SAPI1 FRAME SIZE

Description: This is the maximum I-field size for SAPI1. It defines the maximum size frame for SAPI1 (Service Access Point Identifier 1) that can be sent on the DS1 link between the RT and IDCU equipment. This is the maximum I-field size for SAPI1.

Copyright © 2003 Lucent Technologies

Required Field.
Default: 256
Valid Entries: 256

5.10 ACTIVITY TIMER

Description: This is the Link Assurance Timer. It identifies how often, in seconds, the switch will wait to check the DS1 link when there is no activity on the link.

Required Field.
Default: 10
Valid Entries: 10, 20, or 30

ISCN/DPIDB/TIME SLOT

The following fields (Section 5.11 - Section 5.14) define the Primary and Non-Primary TMC (Time Slot Management Channels) and EOC (Embedded Operations Channels).

These fields define the channel used to report the originations for non-ISDN locally switched calls and to assign a time slot for all locally switched calls and for non-provisioned ISDN B channels.

In order to set up a Channel from the protocol handler to the remote terminal, the ISCN (Integrated Services Channel Number), DPIDB, and the DPIDB time slot are used together to define the Primary (TMC PRI) and Non-Primary (TMC NPRI) Time Slot Management Channels and the Primary (EOC PRI) and Non-Primary (EOC NPRI) Embedded Operations Channels.

The following information applies to this field group.

- Each ISCN must have the proper Packet Switching Unit shelf assigned on the EQIDCU form. The PSU shelf specified by the first digit of the ISCN on the RTERM form must be defined on the EQIDCU form with a PIDB TYPE of "PSU".
- DPIDBs which carry TMC and EOC channels defined on this form must also be defined on an EQIDCU form (5846 Record) with a corresponding PIDB NO. and PIDB TYPE must be set to "PSU".
- The total number of time slot assignments/reservations per DPIDB must not exceed 32 slots; assigned from the RTERM, ODBTS (5905 Record), and DSL (5907 Record).
- SM/ISCN assignments (the first, and, second and third digits), must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form (5949 Record).
- Each ISCN entry must have the first character of the ISCN (the SHELF value) assigned on an EQPSUPH form (5742 Record) on the same SM with a matching PSU SHELF.
- Assignment of the ISCN is required if RT INTERFACE is "TR303"; RT EQSTAT must be either "G" or "O".
- All ISCNs must follow the ISDN rules for ISCNs. These include no mixing of ISCNs from other BRI or PRI DSLs in the same SM and no duplication of ISCNs.
- On an IDCU, the ISCNs for EOC and TMC require full time slots; thus each entry must be a multiple of four.
- The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

  AMLBDSL

Copyright © 2003 Lucent Technologies

DSL

DSLAP

DSLUSR

MISLINK

ODBRES

OSPSDSL

RTERM

XAT

with all TRUNK forms which have a TRKCLS of:

"EDSL"

"IFTERM"

"IFOPER"

However, they can not have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of

"PACKET"

"PKTPIPE"

"SPCHNDLR"

"X75"

"X75P"

Each ISCN entry (TMC PRI, TMC NPRI, EOC PRI or EOC NPRI ISCN(s) on the RTERM form must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

The ISCN must be a unique value within an SM. ISCNs cannot be duplicatedon one or more of the following forms:

- AMLBDSL
- CCLNK

Copyright © 2003 Lucent Technologies

- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

If an SM/ISCNs combination has been assigned,
then the corresponding combination of SM, PSU, PSU SHELF and GRP must be entered on the PSUGP form.

5.11 TMC PRI

Description: This field defines the Primary Time Slot Management Channel. This channel is used to transmit operations, administration, maintenance and provisioning messages between the IDCU and the TR303 RT. Enter the ISCN, DPIDB, TIME SLOT for the Primary TMC.

Valid TMC PRI Entries

Entry	Description
	ISCN
0 - 4	Position 1, PSU shelf.
00 - 15	Position 2-3, Channel group.
000 - 127	Position 4-6, PH channel, in multiples of 4.
12 - 22 or blank	DPIDB. If blank, switch will select the DPIDB.
0 - 31 or blank	TIME SLOT. If blank, switch will select the time slot.

Data Rules:

If the TMC PRI DPIDB is entered, a corresponding PIDB NO. must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

5.12 TMC NPRI

Description: Enter the ISCN, DPIDB, and TIME SLOT for the Non-Primary TMC.

Valid TMC NPRI Entries

Entry	Description
	ISCN
0 - 4	Position 1, PSU shelf.
00 - 15	Position 2-3, Channel group.
000 - 127	Position 4-6, PH channel, in multiples of 4.
12 - 22 or blank	DPIDB. If blank, switch will select the DPIDB.
0 - 31 or blank	TIME SLOT. If blank, switch will select the time slot.

Data Rules:

If the TMC NPRI DPIDB is entered, a corresponding PIDB NO. must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

5.13 EOC PRI

Copyright © 2003 Lucent Technologies

Description: This field defines the Primary Embedded Operations Channel. This channel is used to transmit operations, administration, maintenance and provisioning messages between the IDCU and the PSU for the TR303 RT. Enter the ISCN, DPIDB, and TIME SLOT for the Primary EOC.

Valid EOC PRI Entries

Entry	Description
	ISCN
0 - 4	Position 1, PSU shelf.
00 - 15	Position 2-3, Channel group.
000 - 127	Position 4-6, PH channel, in multiples of 4.
12 - 22 or blank	DPIDB. If blank, switch will select the DPIDB.
0 - 31 or blank	TIME SLOT. If blank, switch will select the time slot.

Data Rules:

If the EOC PRI DPIDB is entered, a corresponding PIDB NO. must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

5.14 EOC NPRI

Description: Enter ISCN, DPIDB, and TIME SLOT for the Non-Primary EOC.

Valid TMC PRI Entries

Entry	Description
	ISCN
0 - 4	Position 1, PSU shelf.
00 - 15	Position 2-3, Channel group.
000 - 127	Position 4-6, PH channel, in multiples of 4.
12 - 22 or blank	DPIDB. If blank, switch will select the DPIDB.
0 - 31 or blank	TIME SLOT. If blank, switch will select the time slot.

Data Rules:

If the EOC NPRI DPIDB is entered, a corresponding PIDB NO. must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

SEC. 1W: 5161-1 RECORD
SLC-96 OFFICE EQUIPMENT RECORD

1. GENERAL

The 5161-1 Record is available with the 5E2 and later Software Releases. It contains data for individual, 2-party and special service lines terminating on Integrated SLC-96 remote terminals. The 5161-1 Record is an ODA output-only Record. The following input forms provide data to this record.

- SLCCU - SLC-96 Channel Unit Assignment Form
- SLCRT - SLC-96 Remote Terminal Form
- LINE - Telephone Number Line Form
- MLHLN - MLHG Line Form

The SLCCU form provides the SM, DCLU, RT, and LINE numbers that represent the specific Integrated SLEN (SLC-96 Line Equipment Number) entries based on the equipped channel Unit Types.

The following channel Unit Types and services are supported in 5E1, Issue 2, Release 2 Software Releases:

CU TYPE	CHANNELS	SERVICE
DUAL - SP	2	Single party
DUAL - MP	2	2, 4, 8 party
DUAL - PCFSR	2	5PTY or Single party MFR (Multi-Frequency Ringing).
SINGLE - COIN	1	Coin
SINGLE - FXS	1	Non-DID PBX
SINGLE - FXSLS	1	WATS

Each equipped dual channel unit provides two SLEN entries, and each equipped single channel unit provides one SLEN entry on the 5161-1 Record. A SLC-96 remote terminal consists of a maximum of 96 lines and connects to a Digital Carrier Line Unit in the 5ESS Switch via a variable number of T1 lines determined by the mode configuration. 5E1, Issue 2, Release 2 Software Releases support Mode 1 (unconcentrated) or Mode 2 (concentrated) remote terminals. A SLEN (SLC-96 Line Equipment Number) is described as follows:

SM	DCLU	RT	LINE
1 - 192	0 - 7	1 - 6	01 - 96

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 - 48. Offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.

The mode for each SLEN is generated from the SLCRT input form. Figure Figure 1 shows the relationship between shelf modes and line assignments.

The LINE or MLHLN input forms provide the remaining data for each SLEN if assigned to a Telephone Number.

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

The office Base and Control Numbers and the Office Name are specified on each record.

2.2 SM

Description: This field contains the Switching Module number. For offices equipped with CM1

Copyright © 2003 Lucent Technologies

(Communication Module 1) valid entries are 1 - 48. For offices equipped with CM2 (Communication Module 2), valid entries are 1 - 192.
Valid Entries: 1 - 192

2.3 DCLU

Description: This field contains the Digital Carrier Line Unit number.
Valid Entries: 0 - 7

2.4 RT

Description: This field contains the Remote Terminal.
Valid Entries: 1 - 6

2.5 LINE

Description: This field contains the line number. Dual channel units terminate two customers lines (i.e., lines 1/2, 3/4, etc.). Single channel units terminate one customer line. In this case the odd numbered line is used (1, 3, etc.) and the even numbered line is unused. Refer to Figure 1 for LINE to SHELF correspondence.

2.6 CUTYPE

Description: This field contains the channel unit type.

Valid CUTYPE Entries

Entry	Definition
COIN	Coin.
FXS	Foreign Exchange Ground Start.
FXSLS	Foreign Exchange Loop Start.
SP	Single Party.
MP	Multi-Party.

2.7 MODE

Description: This field contains the mode of the serving remote terminal shelf group. Modes cannot be mixed within a shelf group.

Valid MODE Entries

Entry	Definition
UNCONC	Mode 1.
CONC	Mode 2.

SLC-96

The following fields will contain data for each SLEN assigned to a working SLC-96 Telephone Number as indicated by an entry on either the LINE or MLHLN input form.

2.8 LCC

Description: This field contains the Line Class Code, which specifies the Class of Service. LCCs are described on the 5306 Record.
Valid Entries: 3 alphanumeric characters

2.9 RAX

Description: This field contains the Rate Center used for routing and charging.
Valid Entries:

For 5E14 and earlier: 1 - 99

Copyright © 2003 Lucent Technologies

For 5E15 and later: 1 - 999

DIRECTORY NUMBERS

These fields (Section 2.10 - Section 2.11) are used to define the Telephone Number or numbers assigned to each SLEN.

2.10 INDIV TN OR RING PARTY 1

Description: This field contains the seven-digit Telephone Number assigned to an individual line or the ring party of a 2-party line or a Multi-Line Hunt line. Each SLEN assigned to 4 or 8 party service has "refer to 5161-2" in this field. A 5161-2 Record is generated for each SLEN assigned to 4 or 8 party service.
Valid Entries: 7 digits

2.11 TIP PARTY 2

Description: This field contains the seven-digit Telephone Number assigned to the tip party of a 2-party line.
Valid Entries: 7 digits

2.12 MLHG

Description: This field contains the Multi-Line Hunt Group number if the line is a member of a Mult-Line Hunt Group.
Valid Entries: 1 - 2000

2.13 MEMB

Description: This field contains the MLHG member number if the line is a member of a Multi-Line Hunt Group.
Valid Entries: 1 - 2015 or

- 3001 - 3999 (Outdial Terminals Only)

2.14 REMARKS

Description: This field contains the remarks indicated on either the LINE or MLHLN input form.

For 5E2 and later, if PTY is "I" on the LINE form, or if PTY is 1 - 4 and MFRI (Multi-Frequency Ringing Individual) is "Y", or if only one Telephone Number entry on the LINE form with PTY of "T" or "R" is present for a given Line Equipment Number, then this is the remark from the LINE form. If both PTY is "T" and "R" are present for a given LEN, then this is the remark from the LINE form for the TN entry on the Line form with PTY of "R".

SEC. 1X: 5161-2 RECORD
SLC-96 OFFICE EQUIPMENT RECORD - 4 AND 8 PARTY

1. GENERAL

The 5161-2 Record is available with the 5E1 and later Software Releases. This record is used to define the Telephone Numbers of a 4 or 8 party Integrated SLC-96 SLEN (Line Equipment Number).

The 5161-1 Record is used to define individual, 2 party or special service lines.

The 5161-2 Record is not intended for ODA input, and therefore has no unique ODA form associated with it. The following input forms provide data to this record:

- SLCCU-SLC-96 Channel Unit Assignment Form
- LINE-Telephone Number Form

The SLCCU form provides the IM, DCLU, RT and LINE numbers that represent the specific Integrated SLEN entries based on the equipped channel unit types.

The following channel unit type is supported multi-party service:

CU TYPE CHANNELS SERVICE

DUAL - MP 2 2, 4, 8 party

Each equipped dual channel unit provides two SLEN entries on the 5161-2 Record.

A SLC-96 Remote Terminal consists of a maximum of 96 lines and connects to a Digital Carrier Line Unit in the 5ESS Switch via a variable number of T1 lines determined by the mode configuration. 5E1 and later Software Releases supports MODE 1 (unconcentrated) or MODE 2 (concentrated) Remote Terminals. A SLEN is described as follows:

- SM DCLU RT LINE

- 1-192 0-7 1-6 01-96

For 5E2, Issue 2 and later Software Releases, offices equipped with CM1 (Communication Module 1) valid entries for SM are 1-48. Offices equipped with CM2 (Communication Module 2), valid entries are 1-192.

The mode for each SLEN is generated from the SLCRT input form. Figure 1 shows the relationship between shelf modes and line assignments.

The LINE input forms provide the remaining data for each SLEN if assigned to a Telephone Number.

2. RECORD ENTRIES

2.1 BASE AND CONTROL GROUP, ESS UNIT

The office base and control group numbers and the office name are specified on each record.

2.2 SM

Description: These columns contain the Switching Module number.
Valid Entries:

- CM1 (Communication Module 1): 1 - 48

Copyright © 2003 Lucent Technologies

- CM2 (Communication Module 2): 1 - 192

2.3 DCLU

Description: These columns contain the Digital Carrier Line Unit number.
Valid Entries: 0 - 7

2.4 RT

Description: These columns contain the Remote Terminal.
Valid Entries: 1 - 6

2.5 LINE

Description: These columns contain the line number assigned to 4 or 8 party service.

2.6 TELEPHONE NUMBERS

Description: These columns are used to define the Telephone Number or numbers assigned to each SLEN serving 4 and 8 party lines.

2.7 PARTY 1 to PARTY 8

These columns contain the seven digit Telephone Number assigned to each of the party lines.

SEC. 1Y: ESS 5171-1 RECORD
OFFICE EQUIPMENT RECORD - 1 AND 2 PARTY

1. GENERAL

The 5171-1 Record is used to define the office Line Unit equipment assignments for Telephone Numbers. This Record is used in offices providing 1- and 2-party service for both MFR (Multifrequency Ringing) and non-MFR customers. The 5171-2 Record is used in offices providing 4- and 8- party service and 5- and 10- party Multi-Frequency Ringing. The 5171-1 Record is not intended for ODA input, but does correspond to entries on the LINE and MLHLN input forms. The EQLU and EQLUP forms define the valid Line Units and associated LENs that are equipped in the office.

A 5ESS Switch Office containing one Switching Module requires 32 5171-1 Records to define the Office Equipment.

An Office Equipment location is described as follows:
- Switching Module - XXX
- Line Unit - X
- Concentrators - X
- Switch Group - X
- Switch - X
- Level - X

The 5ESS Switch offers four concentration ratios for line equipment. They are 4:1, 6:1, 8:1, and 10:1. These ratios are applied based on the number of grids equipped in a Line Unit. 10:1 concentration ratio is available with 5E3 and later Software Releases.

Valid XXXX Entries

Entry	Definition
EQUIPPED CONCENTRATORS	CONCENTRATION RATIO
0-9	10:1
0-7	8:1
0-5	6:1
0-3	4:1

A 5ESS Switch office may not mix concentration ratios. However, a Host 5ESS Switch office may have a different Concentration Ratio than the RSM (Remote Service Module). With 5E3 and later Software Releases, Concentrators 8 and 9 are only valid for LU3 Line Units with Line Unit Type of 3AA1.

2. FORM ENTRIES

2.1 BASE AND CONTROL, OFFICE

Description: Enter the Base and Control number and Office Name on each page of the record.

2.2 SM

Description: Enter the Switching Module number.
Valid Entries: 1 - 192

2.3 LINE UNIT

Description: Enter the Line Unit number.
Valid Entries: 0 - 7

2.4 CONC

Copyright © 2003 Lucent Technologies

Description: Enter the Conc number.
Valid Entries: 0 - 9

2.5 SWITCH GROUP

Description: Enter the Switch Group Number.
Valid Entries: 0 - 1

2.6 SWITCH

Description: The Switch number is pre- printed on the ESS 5171-1 Record.
Valid Entries: 0 - 7

2.7 LEVEL

Description: The level number is pre- printed on the ESS 5171-1 Record.
Valid Entries: 0 - 3

2.8 LCC

Description: The LCC (Line Class Code) is a 3-character alphanumeric that describes the class of service of a Telephone Number. LCC's are described on the ESS 5306 Record.
Valid Entries: 3 characters

2.9 RAX

Description: Enter the Rate Area that should be used for routing and charging.
Valid Entries:

For 5E14 and earlier: 1 - 99

For 5E15 and later: 1 - 999

2.10 DIRECTORY NUMBERS

Description: These columns are used to define the Telephone Number(s) associated with each Line Equipment Number. Enter the 7-digit Telephone Number assigned to one of the following types of lines:

INDIV TN or Ring Party 1:

- Single party line (MFR or non-MFR):
  - MFRI is "Y" and PTY is 1 - 9, 0
  - MFRI is "N" and PTY is "I"
- Two party line-Ring (MFR or non-MFR):
  - MFRI is "N" and PTY is "R"
  - MFRI is "N" and PTY is 1 - 5 and LCC/RAX corresponds to a LCC form with Class Of Service equal to "2PTY".

TIP PARTY 2:

Copyright © 2003 Lucent Technologies

- Two party non-MFR where MFRI is "N" and PTY is "T" and the LCC/RAX corresponds to a LCC input form with Class Of Service equal to "2PTY".
- Two party MFR where MFRI is "N" and PTY is 6 - 9, 0 and the LCC/RAX corresponds to a LCC form with Class Of Service equal to "2PTY".

If the LEN value is associated with one of the following multiparty Class Of Service, then this field indicates the flag name "MULTPTY" and a corresponding 5171-2 Record is generated showing all TNs that share the same LEN:

Multiparty Class Of Service

LCC Form Class Of Service	Multiparty Type
4PFS	4-party fully selective
4PSS	4-party semi selective
8PSS	8-party semi selective
5PTY	5-party MFR (ringside only)
10PTY	10-party MFR

2.11 MLHG

Description: This entry is the MLHG number taken from the MLHLN (Multi-Line Hunt Group Member) form.

2.12 MEMB

Description: This entry is the Member Number taken from the MLHN form. If the Member Number also has a Telephone Number assigned, the TN must be entered in the Party 1 field.

2.13 REMARKS

Description: This field corresponds to the RMK input on the LINE and MLHLN input forms. Print any 16 characters for the following cases:

- If a LEN is assigned on the MLHLN form, then Remarks corresponds directly to RMK input field.
- If a LEN is assigned on LINE form and MFRI is "N", and PTY is "I", then Remarks corresponds directly to RMK input field.
- If an LEN is on the LINE form and MFRI is "Y", and PTY is 1 - 9, 0 (MFR Individual Line), then Remarks corresponds directly to RMK input field.
- If an LEN is on the LINE form and PTY is "T" or "R", but only one of the Telephone Numbers of the 2-parties is assigned, then the Remarks corresponds directly to that assigned Tip or Ring entry.
- If an LEN is on LINE form and MFRI is "N", and PTY is 1 - 9, 0 and LCC/RAX corresponds to Class Of Service equal to "2PTY" (2-party MFR) but only one of the tipside or ringside frequency customers is assigned to the LEN, then the Remarks correspond directly to that entry.
- If an LEN is on the LINE input form and Class Of Service is 2-party (MFR or non-MFR), and both Tip and Ring parties are assigned, then the Remarks field will correspond to the RINGSIDE Telephone Number RMK field.

Remarks will not be printed by 5ODA for multiparty (MFR or non-MFR) entries.
Valid Entries: 1 - 16 characters

Copyright © 2003 Lucent Technologies

SEC. 1Z: ESS 5171-2 RECORD
OFFICE EQUIPMENT RECORD - 4 AND 8 PARTY AND 5 AND 10 PARTY MFR

1. GENERAL

The ESS 5171-2 Record is used to define the office equipment assignments for Telephone Numbers. This record is used in offices providing 4- and 8- party and 5- and 10- party service. The 5ESS 5171-1 Record is used in offices providing 1- and 2- party service. The 5ESS 5171-2 Record is not intended for ODA input, and therefore has no unique ODA form associated with it.

A 5ESS office containing one Switching Module will require 64 ESS 5171-2 Records to define the office equipment.

An Office Equipment location is described as follows:

- Switching Module - XXX
- Line Unit - X
- Concentrator - X
- Switch Group - X
- Switch - X
- Level - X

The 5ESS offers three concentration ratios for line equipment. They are 4:1, 6:1, and 8:1. These ratios are applied based on the number of concentrators equipped in a Line Unit.

EQUIPPED CONCENTRATORS	CONCENTRATION RATIO
0-7	8:1
0-5	6:1
0-3	4:1

A 5ESS Office may not mix concentration ratios. However, a Host 5ESS office may have a different Concentration Ratio than the RSM (Remote Service Module).

Telephone Numbers that require Essential Service Protection, which is part of the Overload Control Capability, must be assigned to a Line Equipment Number that has been designated as Essential. When a 5ESS office is an overload condition and the Overload Control is turned on, then all lines designated Essential Lines have the Essential Service Protection feature and would receive priority origination scanning.

There is no limit on the quantity of LENS or particular LEN values that can be assigned as Essential Lines except for the following restriction:

To make sure there is no internal blocking on origination scanning, there should be only one LEN assigned, EL equal to "Y" Yes from a group of four LENs that share the same first seven digits of their LEN. Example:

External LEN breakdown

SM	LU	CONC	SWG	SW	LEV
1 -192	0 -7	0 - 7	0 - 1	0 - 7	0 - 3

Copyright © 2003 Lucent Technologies

There are four level values 0 through 3 for a given 7-digit value of SM/LU/CONC/SWG/SW. Only one of the four LEVs should have EL equal to "Y".

LEN	00	1	3	0	0	4	0
LEN	00	1	3	0	0	4	0
LEN	00	1	3	0	0	4	2
LEN	00	1	3	0	0	4	3

It is recommended that Essential Lines be distributed evenly across the Line Equipment Numbers. Care should be given to assign to an Essential Line only those customers that actually require Essential Service Protection.

Most customer lines are loop-start lines that generate an origination by closing the path between the tip and ring at the station set (forming a loop). Scanning is done at the Central Office by applying a voltage between the tip and ring and sensing the loop current flow produced by the customer line origination. Ground Start lines (e.g., coin-first coin phones and PBX-CO trunks) generate an origination by grounding the ring conductor at the station set. Scanning is done at the Central Office by applying a voltage with respect to ground on the ring conductor and sensing the current flow in the ring conductor produced by the customer line origination. Since certain PBX's interpret a ground on the tip conductor to mean something else (disconnect, etc.), the tip conductor at the Central Office is disconnected during scanning on Ground Start Lines. The tip conductor is disconnected under software control in the 5ESS. Thus, any Line Equipment Number may be assigned as Ground Start. Ground Start should be entered as an equipment option on the ESS 5100-1 Record.

2. FORM ENTRIES

2.1 BASE AND CONTROL, OFFICE

Enter the Base and Control number and Office Name on each page of the record.

2.2 SM

Description: Enter the Switching Module number.
Valid Entries:
- For CM1: 1 - 48
- For CM2: 1 - 192

2.3 LINE UNIT

Description: Enter the Line Unit number.
Valid Entries: 0 - 7

2.4 CONC

Description: Enter the Concentrator number.
Valid Entries: 0-7.

2.5 SWITCH GROUP

Description: Enter the Switch Group number.
Valid Entries: 0 - 1

Copyright © 2003 Lucent Technologies

2.6 SWITCH

Description: Enter the Switch number taken from the ESS 5171-1 Record for the corresponding multiparty TN entry and is printed on the ESS 5171-2 Record.
Valid Entries: 0 - 7

2.7 LEVEL

Description: Enter the Level number taken from the ESS 5171-1 Record for the corresponding multiparty TN entry and is printed on the ESS 5171-2 Record.
Valid Entries: 0 - 3

2.8 TELEPHONE NUMBERS

Description: These columns are used to display the Telephone Numbers associated with each Office Equipment Location.

2.9 REMARKS

Description: This field may be used to record short comments which consists of alphanumeric and blanks.

These columns are not populated from input form - for machine owner use only.

Copyright © 2003 Lucent Technologies

SEC. 1AA: 5172-1 RECORD
LINE CARD EQUIPMENT NUMBER RECORD

1. GENERAL

The 5172-1 Record is available with 5E4(2) and later Software Releases. It is an ordered listing of LCENs (Line Card Equipment Numbers) that reside on a RISLU (Remote Integrated Services Line Unit) or an ISLU (Integrated Services Line Unit). The only LCENs that appear on this Record are those that are defined on an ISLULC form (5942 Record). Only operational Line Cards have entries; a Line Card is operational if the EQST field on the ISLULC form has an entry of "O" (Operational).

For the 5E4(2) Software Release, LCENs are assigned on the following forms:

- DSL (5900-1 Record)
- DSLAP (5963 Record)
- DSMLHLN (5901-1 Record)
- LINE (5109-1 Record)
- MLHLN (5111-1 Record)
- OSPSDSL (5411 Record)

An OSPSDSL form may have up to two LCENs (LCEN and MATE LCEN).

For 5E5 and later Software Releases, LCENs are assigned on these same forms with the following exception: the DSL form (5907-1 Record) and DSLUSR form (5908-1 Record) replace the DSL form (5900-1 Record) and DSMLHLN form (5901-1 Record).

The LCEN is comprised of a SM (Switching Module), (R)ISLU, LGC (Line Group Controller) and Line Card. The first three digits of the LCEN are the SM, the next digit is the (R)ISLU, the next two digits are the LGC and the last two digits are the Line Card value. The SM, (R)ISLU and LGC numbers are located in the upper right-hand corner of the record.

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 SM

Description: Switching Module number.
Valid Entries: 1-192

2.3 (R)ISLU

Description: (Remote) Integrated Services Line Unit number.
Valid Entries: 1-7

2.4 LGC

Description: Line Group Controller number.
Valid Entries: 01 - 15

2.5 LINE CARD

Description: Values 00 - 31 are preprinted on the record.

Copyright © 2003 Lucent Technologies

2.6 FORM

Description: This column contains the names of the forms used to assign lines to operational ISLU Line Cards. Valid form names are: DSL, DSLAP, DSLUSR (5E5 and later Software Releases), DSMLHLN (5E4(2) Software Release), LINE, MLHLN and OSPSDSL.

2.7 KEY1

Description: The KEY1 column contains the value of the first key field on the corresponding form listed in the FORM column. The following field values may appear:

- CKT TN on the DSL form (optional key - 5E4(2) Software Release)
- DSL OE on the DSL form (5E5 and later Software Releases)
- AP SITE ID on the DSLAP form
- CKT TN on the DSLUSR form (optional key - 5E5 and later Software Releases)
- CKT MLHG on the DSMLHLN form (optional key - 5E4(2) Software Release)
- TN on the LINE form
- MLHG on the MLHLN form.

No value exists for OSPSDSL since its only key field is LCEN which is already included on this Record.

2.8 KEY2

Description: The KEY2 column contains the value of the second key field on the corresponding form listed in the FORM column. The following field values may appear:

- PKT TN on the DSL form (optional key - 5E4(2) Software Release)
- DPKT TN on the DSLUSR form (optional key - 5E5 and later Software Releases)
- CKT TERM on the DSMLHLN form (optional key - 5E4(2) Software Release)
- TERM on the MLHLN form.

2.9 KEY3

Description: The KEY3 column contains the value of the third key field on the corresponding form listed in the FORM column. The following field values may appear: PKT MLHG on the DSMLHLN form (optional key - 5E4(2) Software Release) and ODB TN on the DSLUSR form (optional key - 5E5 and later Software Releases).

2.10 KEY4

Description: The KEY4 column contains the value of the fourth key field on the corresponding form listed in the FORM column. The following field values may appear: PKT TERM on the DSMLHLN form (optional key - 5E4(2) Software Release) and CKT MLHG on the DSLUSR form (optional key - 5E5 and later Software Releases).

2.11 KEY5

Copyright © 2003 Lucent Technologies

Description: This column is available with 5E5 and later Software Releases. The KEY5 column contains the value of the fifth optional key field (CKT TERM) on the DSLUSR form.

2.12 KEY6

Description: This column is available with 5E5 and later Software Releases. The KEY6 column contains the value of the sixth optional key field (DPKT MLHG) on the DSLUSR form.

2.13 KEY7

Description: This column is available with 5E5 and later Software Releases. This column contains the value of the seventh optional key field (DPKT TERM) on the DSLUSR form.

2.14 REMARKS

Description: This column contains remarks entered in the RMK field on the form listed in the FORM column. When the OSPSDSL form is listed, the value of the SERVICE CLASS field on the OSPSDSL form will appear in this column.

Copyright © 2003 Lucent Technologies

SEC. 1AB: 5173 RECORD
TELEPHONE NUMBER ASSIGNMENT RECORD

1. GENERAL

The 5173 Record is an output only record that is used to list all the TNs (Telephone Numbers) assigned in the office. The list is sorted by the TN values.

2. RECORD ENTRIES

2.1 TELEPHONE NUMBER

Description: This field contains the TN.

2.2 TN TYPE

Description: This field specifies if the telephone number is used for circuit ("CKT") or packet ("PKT") service or for both circuit and packet ("BOTH").

2.3 FORM

Description: This field identifies the form on which the telephone number is defined: ACQS, AMLBDSL, DSL, DSLUSR, LINE, MLHG, MLHLN, MTNDR, MULTITN, PSMTN, SHTN, or XAT.

2.4 KEYFIELDS

Description: This field contains the key fields from the form on which the telephone number appears. The keys for each form are listed in the following table.

Form Name	Key Fields
ACQS	NPA + NXX + BEGLINE + ENDLINE (Optional)
AMLBDSL	LCEN
DSL	DLSOE
DSLUSR	CKT TN or CKT MLHG/TERM DPKT TN or DPKT MLHG/TERM ODBTN or ODB MLHG/TERM
LINE	TN
MLHG	MLHG
MLHLN	MLHG/TERM
MTNDR	TN
MULTITN	TN
PSMTN	PKT TN
SHTN	TN MLHG/TERM NBR
XAT	PKT TN PTK MLHG/TERM NBR

Copyright © 2003 Lucent Technologies

SEC. 1AC: 5119 RECORD
MAKE BUSY CALL TERMINATION TYPES - MKBCTT FORM

1. GENERAL

The 5119 Record is available with 5E6 and later Software Releases. The MKBCTT form (Make Busy Call Termination Types) is used to specify the call termination types (hunt only, nonhunt only or both) that are affected by a particular make busy type and scan point, subgroup or terminal:

- **RANDOM MAKE BUSY -** This feature provides the ability to apply artificial busy to any number of members of a non-ISAT MLHG.
- **MEMBER MAKE BUSY -** This feature provides the ability to apply artificial busy to 1 to 32 terminals within a non-ISAT MLHG.
- **POSITION MAKE BUSY** - This feature allows a single terminal within an ISAT MLHG to be made busy.

It is also used to specify the owner for a RMB subgroup. If a particular MMB (Member Make Busy) RMB (Random Make Busy) or PMB (Position Make Busy) feature does not have this form filled out, then the feature is assumed to apply to hunted call terminations only.

This form has a quintuple key set, of which three are entered. The MLHG and make busy feature type are always entered, while one of the following is entered: SPN, SUBGP, TERM.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.9.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MLHG

Description: This field is used to enter the Multi-Line Hunt Group Number to which the CALL TERM TYPE will apply.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * MKB TYPE

Description: This field is used to enter the type of Make Busy features to which the CALL TERM TYPE will apply.

Valid MKB TYPE Entries

Entry	Definition
MEMBER	Member Make Busy.
POSITION	Position Make Busy.
RANDOM	Random Make Busy.

Data Rules:

When MKB TYPE of "POSITION" is entered, the TERM must be entered (SPN and SUBGROUP cannot

Copyright © 2003 Lucent Technologies

be used).

2.4 (*) SPN

Description: This field is used to enter the scan point which is used as a Make Busy Key.
Valid Entries: A scan point number consisting of:

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001 - 192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

Data Rules:

When this optional key is entered it must be assigned at least once as one of the following:
LINE form: MAKE BUSY KEY, RND MKB
MLHLN form: MAKE BUSY KEY, RND MKB
DSLUSR form: RMB, RND MKB

2.5 (*) SUBGP

Description: This field is used to enter the Make Busy Subgroup Number.
Valid Entries: 1 - 255

Data Rules:

When this optional key is entered it must be assigned at least once as one of the following:
DSLUSR form: MMB SUBGP, RMB SUBGP
SHTN form: MMB SUBGP, RMB SUBGP

2.6 (*) TERM

Description: This field is used to enter the MLHG Terminal.
Valid Entries: 1 - 2015

Data Rules:

When this optional key is entered it must be assigned to the following:
DSLUSR form: CKT TERM

2.7 CALL TERM TYPE

Description: This field is used to enter the type of call terminations.
Default: HUNT
Valid Entries:

Valid CALL TERM TYPE Entries

Entry	Definition
HUNT	Calls to hunted DNs that attempt to terminate to a terminal affected by the Make Busy will be treated as if the terminal were busy.
NONHUNT	Call to nonhunted DNs that attempted to terminate to a terminal affected by the Make Busy will be treated as if the terminal were busy.
BOTH	Calls to hunted & nonhunted DNs that attempt to terminate to a terminal affected by the Make Busy will be treated as if the terminal were busy.

Copyright © 2003 Lucent Technologies

Data Rules:

When two or more Make Busy keys, subgroups or buttons affect a single terminal, only one of the make busy features is allowed to affect nonhunt call termination type (CALL TERM TYPE equals "NONHUNT" or "BOTH"), the other make busy features must affect only hunt call termination types (CALL TERM TYPE equal "HUNT").

2.8 RND OWNER

Description: This field is used to enter the MLHG member which owns a Random Make Busy subgroup's activation/deactivation button.
Valid Entries: 1 - 2015

Data Rules:

A RND OWNER can be entered only when the MKB TYPE is "RANDOM" and a SUBGP has been entered.

MLHG and RND OWNER must be defined as CKT MLHG and CKT TERM on a DSLUSR form. The RND SUBGP on the DSLUSR form must equal SUBGP on MKBCTT form. CONFIG GRP on DSLUSR must be defined on a CFGGRP form with at lease one ACTION equal "BYRB". A RMB subgroup owner must be in the subgroup and have a RMB button.

SEC. 1AF: 5177 RECORD
NUMBER POOLING FOR INDIVIDUAL TN - NPOOL

1. GENERAL

1.1 Number Pooling Definition

The Number Pooling for Individual TN form allows the craft to insert, review, update, and delete ported or reserved individual TNs.

1.2 Recent Change View

The corresponding Recent Change View for NPOOL is 1.7.

2. FORM ENTRIES - 5177 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 TN

Description: The TN field is used to enter an individual telephone number.

Software Release: 5E14 and later
Valid Entries: A 7 or 10 digit telephone number of the form *XXXXXXX* or *NXXXXXXXXX* where *N* is a number from 2 to 9 and *X* is a number from 0 to 9.

Data Rules:

- ACT must be "Y" for SFID 530 and for SFID 174 on the SFSYS form.
- TN must have a valid NXX, NPA and/or OFFICE CODE that is defined on the NOC form.
- When TN is 7 digits and the first 3 digits are equal to an OFFICE CODE that is defined on more than one NOC form, a 10 digit TN must be used.
- When either VCDX OFFICE or DRM is "Y" on the EQCORE form, the number of NPOOL forms cannot exceed 8,000.
- When both VCDX OFFICE and DRM are "N" on the EQCORE form, the number of NPOOL forms cannot exceed 800,000.

2.3 PORTED OUT

Description: Is this telephone number ported out?

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

SEC. 2: TRUNK FORMS

Copyright © 2003 Lucent Technologies

SEC. 2A: 5202-1/2/3/4/5/6/7/8/9 RECORD TRUNK GROUP FORM - TKGRP

1. GENERAL

1.1 Trunk Group Definition

The 5202 Records are used to define each Trunk Group in a 5ESS Switch. The trunk information that is entered on these records is information that is common to the entire group. Trunk information for an individual member is entered on a TRUNK form (5204 Record).

1.2 Common Channel Signaling

CCS (Common Channel Signaling) is available with 5E3 and later Software Releases. CCS is identified on a trunk group basis by the INPULSING or OUTPULSING fields equal to "CCIS6" (Domestic North American version) or "ISUP7" (CCIT No. 7 ISDN User Part), unless the trunk group is for SIP-T packet groups, in this case even though it has INPULSING/OUTPULSING set to ISUP7, it does not signal via CCS7.

For 5E7 and later, CCS trunks with INPULSING and/or OUTPULSING equal to "CCIS6" or "ISUP7" require the DEN, TEN or (for 5E9(2) and later) NEN fields to be entered on the corresponding TRUNK form.

1.3 Trunk Classes

For 5E4(2) and later, the following trunk classes were added to the 5202-1 Record: "FIOPR", "FOPRI", "FOPRT", "RAFANNC", "RAFDTA", "RAFCTR", "TCIKT", and "TCITT". Additionally, the TRK DIR value "RAF" was added for the recorded announcement function. These values are for the OSPS (Operator Services Position System) toll and assistance feature.

For 5E4(2) and later, two new trunk classes, "TOPAS" and "RMSD3", were added to the 5202-1 Record. The new values are for toll offices that employ the TOPAS (Testing, Operations, Provisioning and Administration System) Operations System.

For 5E5 and later, the "RAFDTA" trunk class can be used with RACF (Remote Activation of Call Forwarding) and ACSR (Automatic Customer Station Rearrangement).

For 5E5 and later, two new trunk classes, "IFOPER" and "IFTERM", were added for the EDSLs (PRI) of the OSPS Interflow capability. "IFOPER" defines an outgoing Interflow trunk, and "IFTERM" defines an incoming Interflow trunk.

For 5E6 and later, the "RAFDTA" trunk class can be used for ASP (Advanced Services Platform; previously PVN, Private Virtual Network) services and LASS Selective Features.

1.4 EDSL

The EDSL (Extended Digital Subscriber Line) feature is available with 5E4(2) and later Software Releases. EDSL B-channels and D-channels are assigned to trunks with an "EDSL" or "EDSLHM" service class and a Trunk Direction of incoming, outgoing or 2-Way. EDSL features can be assigned on a dedicated basis or Call-by-Call basis. An EDSL B-channel Trunk Group may contain B-channels from more than one T1 facility and Switching Module.

EDSL D-channels will also be assigned to trunks with an EDSL service class and a Trunk Direction of "SGNL". D-channel trunks are nailed-up trunks and are not hunted. D-channels must be in a separate Trunk Group from the B-channels. D-channels are defined on the TRUNK form with 24 or 48 entered in the last two digits of the DEN. B-channels are defined with 01 - 23 as the last two digits of the DEN.

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E12 and later, when TRK DIR is "SGNL", all EDSL/PRI fields must not be entered.

1.5 Release Link Trunks

RLTs (Release Link Trunks) are provided between a main switch and branch switches to enable the attendant to implement Centralized Attendant Services. The 5ESS Switch can function as either a main or a branch switch. See Division 2, Section 1AI for more information on CAS and RLTs.

1.6 CCS7

CCS7 (Common Channel Signaling System Number 7) trunks are trunks which have INPULSING/OUTPULSING equal to "ISUP7", unless the trunk group is for SIP-T packet groups, in this case even though it has INPULSING/OUTPULSING set to ISUP7, it does not signal via CCS7. When installing CCS7 trunks which connect two networks, for example a LEC (Local Exchange Carrier) and a long distance carrier, the following unenforced rules apply.

The TO (Toll Office) must have a TRKCLS of "LATA". A TO is any switch within an IC (InterLATA Carrier) or INC (International Carrier) network.

"LATA" trunks can connect to LEC switches which are either EO (End Office) or AT (Access Tandem) switches. AT switches allow calls to be distributed to or concentrated from appropriate EO(s). The EO or AT end must have a TRKCLS of "IC". An EO or AT is any switch that is within the LEC network.

"IC" trunks can connect to far switches which may be any one of the following carrier types: IC, INC or Consolidated Carrier. Use of these TRKCLS values, for trunks that cross the network boundary, is necessary to utilize the ISDN ISUP7 protocol for internetwork operations.

- ***NOTE:*** CCS7 does not apply to trunk groups associated with SIP-T packet groups , even though they have INPULSING/OUTPULSING set to ISUP7.

1.7 X.75 Gateway

The X.75 Gateway to Public Data Networks with X.121/E.164 Interworking feature, available with 5E6 and later Software Releases, provides X.75 gateway on the switch to interconnect to packet Interexchange carriers (interLATA traffic) and to independent operating companies' packet switch networks (intraLATA traffic). A maximum of 255 X.75 trunk groups may exist at one time. Each X.75 trunk group may contain at most twenty-four trunk members.

1.8 X.75' Packet Trunks

The X.75' packet trunk interface allows a 5ESS Switch owned by a LEC (or similar operating company environment) to connect with a PPSN (Public Packet Switched Network) owned by the same LEC where both switches exist in the same LATA (or in similarly restricted geographical regions of local control). Each 5ESS Switch can access the PPSN by either a direct X.75' interface or via an IP trunk group to another 5ESS Switch that has an X.75' interface.

For 5E8 and later, a maximum of 255 X.75' trunk groups may exist at one time. Each trunk group may have at most twenty-four trunk members.

1.9 Recent Change View

The corresponding Recent Change View for TKGRP is 5.1.

2. FORM ENTRIES - 5202-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and Office Name on each record.

2.2 * TGN

Description: Enter the number of the Trunk Group being defined.
Valid Entries: Specifies the number of trunk groups being defined.

- For 5E14 and earlier: 1 - 4000
- For 5E15(1) and 5E16(1): 1 - 4000, or 7000 - 7999 for BICC group
- For 5E16(2) and later: 1 - 4000

- Maximum number of trunk groups assigned per SM is 120.
- Maximum number of trunk groups with TRKCLS of PACKET is 16.
- Maximum number of trunk groups with TRKCLS of "X75" or "X75P" is 255.
- Maximum number of trunk groups assigned per SM-2000 without QLPS is 120.
- Maximum number of trunk groups assigned per SM-2000 with QLPS is 2000.
- Maximum number of trunk groups assigned per SM-2000 with QLPS is 4000 when using the Increased Number of Trunk Groups (SFID 172) secured feature that has been purchased using the Secured Feature Upgrade View (8.22).
- Maximum number of trunks groups associated with SIP-T (Session Initiation Protocol for Telephones) Packet Groups is 1000.

*RESTRICTED USAGE: Not supported by EADAS. WARNING: Your OS (Operation System) may not support this feature resulting in a loss of Traffic 30 Measurements. This feature was intended for independent LECs only.

Data Rules:

Trunk Groups of Network Management concern, those monitored by the EADAS/NM system, must be numbered less than 1024.

The maximum number of trunk groups that can be assigned to a Switching Module is 120.

For 5E10 and later:

When TGN/MEMB(s) are assigned to a Time of Day Feature on either the TRUNKFA form or an associated CLUSTR form, the Trunk Group (TGN) must also be defined on the TKGRP form with a TRKCLASS of "LATA", "PF", or "PFLASH".

If the TGN is on an ARSTPA form, or if it isassigned an ARS (Automatic Route Selection) feature on either the TRUNKFA form or the TKGRPFA form or an associated CLUSTR form, then all following conditions must hold true:

- The associated TRKCLS on the TKGRP form must be entered as "LATA".
- TGN/MEMB/FEATURE must be defined on ARSTPA where (FRL LINE is set to 16 and DIAL PLAN is set to "ODP") or (FRL LINE not entered, TCM IN not entered and DIAL PLAN is set to "ODP") .
- If ARSTPA form is not found, then the FEATURE must be defined on ARSFD where (FRL LINE is set

Copyright © 2003 Lucent Technologies

to 16 and DIAL PLAN is set to "ODP") or (FRL LINE not entered, TCM IN not entered and DIAL PLAN is set to "ODP") .

- The FEATURE must be defined on ARSFD where ENTRY is set to "AUTO".

For 5E13 and later:

When TGN(s), defined on the TKGRP form, have TRKCLS set to "IC" or "LTOLLCON", the QUEUE FEATURE entered on the TKGRP form must be defined on a QUFD form and the associated QUEUE TYPE must be "HPCOHQ".

When TGN(s), defined on the TKGRP form, has SVC GRP set to "RAS" and ROUTE INDEX on the RTIDX form matches a ROUTE INDEX on the FIXRT form and ROUTE TYPE is set to "2LEVEL", "ACSR", "SLE", or "NPA_SP", then a ANNAPL form must exist with APPLICATION set to "2LEVEL", "ACSR", "LASS", or "NPA_SP".

For 5E15 and later:

When TGN is 7000 - 7999 or 1 - 4000 (for 5E16(2) and later):

- BICC GRP must be equal to TGN.
- The ACT field for SFID 567 on the SFSYS form (5713 Record) must be set to "Y".

When TGNs, defined on the TKGRP form, have a TRKCLS of "3GPD", all corresponding trunk members of this trunk group on the TRUNK form must have a UEN specified.

When TGNs are defined on the TKGRP form with TRKCLS equal to "3GPD", the ACT field for SFID 285 on the SFSYS form (5713 Record) must be set to "Y". This TRKCLS value is used for the CDMA (Code Division Multiple Access) Cellular Packet Data Services secured feature.

When trunk members are defined on the TRUNK form (5204 Record) with a TRKOE where OE TYPE is equal to "U", all associated trunk groups on the TKGRP form (5202 Record) must have a TRKCLS of "A5", "ADT", "PKTPIPE", "FRBC", "IS41", "SPCHNDLR", "3GPD", and "SVC".

When TGN with a known BICC GRP on the TKGRP form uses PSU platform, then GSM derived from the ORIG PT CODE must be entered either as a GLOBAL SM on the CMTMH form or a SM on the MDLNK form, and all SM2K MODULE on the CICDIST form must be entered either as NON GLOBAL SM on the CMTMH form or SM on the MDLNK form.

When TGN with a known BICC GRP on the TKGRP form uses PSU platform, then GSM derived from the ORIG PT CODE must be entered on the CCGSM form as a Host GSM.

When TGN with a known BICC GRP on the TKGRP form uses CNI platform, then DLN on the OFCOPT form must be set to "Y".

For 5E16(1) and later:

- When TGNs are defined on the TKGRP form with TRKCLS equal to "3GPD", then all trunk members on the TRUNK form (5204 Record) must have a TRKOE entered where the OE TYPE is equal to "U" and:
  - the OE corresponds to a Protocol Handler Logical Channel Group with a GRP TYPE of "PHV4" (for 5E15 only) or "PHV5" on the PSUGP form (5949 Record).
  - the last two digits of the OE must be from 0 to 19

Copyright © 2003 Lucent Technologies

Each Service Group (Trunk Group) associated with a BICC Packet Group (defined on the PKTGRP form (5219 Record), must have a DAS assigned on the TKGRP form. Each DAS must have an LDIT assigned on the DAS form (5300 Record) and each SM2K MODULE from the CICDIST form (5217 Record) with the above LDITs must be defined on the SMLDIT form (5315 Record).

2.3 GROUP SIZE

Description: This field indicates the number of members in the Trunk Group. It appears for administrative purposes on the record but is not entered on the form.

Data Rules:

For 5E5 and later, the maximum number of members allowed in a Packet Switch trunk group (TRKCLS "PACKET") is 32.

The maximum number of members allowed in an X.75 or X.75' trunk group (TRKCLS "X75P" or "X75") is 24.

2.4 # TRK DIR

Description: Enter the Trunk Direction for each Trunk Group.

Required Field.

Valid TRK DIR Entries

Entry	Definition
2W	Two Way.
ANN	Announcement.
INC	Incoming.
LTP	Logical Test Port Trunk Group. Specify this Trunk Direction for all Logical Test Port Trunk Groups (TRKCLS begins with "LTP").
OUT	Outgoing.
RAF	Software Release: 5E4(2) and later. Recorded Announcement Function.
SGNL	Software Release: 5E4(2) and later. EDSL (Extended Digital Subscriber Line) D-channel signaling for ISDN.

Data Rules:

For 5E4(2) and later, if the INPULSING or OUTPULSING field has a value of "CCIS6" or "ISUP7", TRK DIR must be entered as "2W", "INC", or "OUT".

2W:
Packet-Switched trunks, TRKCLS of "PACKET" or "X75P", must have a Trunk Direction of "2W".

If "2W" is entered and TRKCLS is NOT one of the following:

- "CST1"
- "CST2"
- "DSC"
- "IDCS"
- "IVTRK"
- "PKTPIPE"
- "PPMEM"
- "SPCHNDLR"

and

- if HUNT TYPE is not "PSUCD", then FAR END NPA must be entered.

Copyright © 2003 Lucent Technologies

- for 5E10 and later:
  - DAS cannot be entered.
  - SCR must be entered.

If "2W" is entered, CAMA PSAP is "N", and TRKCLS is NOT
- "CST1"
- "CST2"
- "DSC"
- "PKTPIPE"
- "PPMEM"
- "SPCHNDLR"

then HUNT TYPE must not be "ANN", "FIFO" or "PRFF".

When TRK DIR is "2W", INPULSING and OUTPULSING must be
- "CCIS6"

When TRK DIR is "2W", INPULSING and OUTPULSING must be
- "CCIS6"
- "DCHN"
- "DCS"
- "DP"
- "ISUP7"
- "MF"
- "RPEO"
- "RPTO"
- "TT"
- or blank.

For 5E9(1) and later, if TRK DIR is "2W" and TRKCLS is not "CST1", "CST2", "DSC", "IDCS", or "IVTRK", and HUNT TYPE is not "PSUCD", then FAR END NPA must be entered.

For 5E10 and later:
If "2W" is entered,

- and INPULSING is NOT

  "ISUP7"

  "CCIS6"

  and TRKCLS is NOT:

  "CST1"

  "CST2"

  "DSC",

Copyright © 2003 Lucent Technologies

"PKTPIPE"

"PPMEM"

"SPCHNDLR"

then GLARE ACTION must be "ALLCTRL" or "NONECTRL"

- and TRKCLS is not

"DSC"

"PACKET"

"X75"

"X75P"

"SPCHNDLR"

then OUTPULSING must be entered.

ANN:
The TRK DIR must be "ANN" for each TGN that matches an RTIDX form's TGN (where that RTIDX form's route index matches a route index on an OSPSCT form [5404 Record]). The TRK DIR entry must be "RAF" if the "RAFEN" field on the TRUNK form is defined.

For 5E6 and later, if the CMD CD field of the CVECT form (5460 Record) is "MUSIC", "DISC", "PROMPT" or "ANNOUNC", then ARG1 on the CVECT form may equal a ROUTE INDEX on the RTIDX form (5303 Record), the TRUNK GROUP NUMBER on the RTIDX form must equal TGN on a TKGRP form and TRK DIR must equal "ANN" on that TRGRP form.

If MUSIC RI on the STINFO form (5402 Record) equals the ROUTE INDEX on the RTIDX form, then TRK DIR must equal "ANN" on the corresponding TKGRP form.

If corresponding TGNs on the TRUNK form have a value in MAXCALLS field, then the TGNs on this form which equal the TGN on the TRUNK form must have TRK DIR equal to "ANN".

INC:
For 5E9(1) and later, when TRK DIR is "INC", INPULSING must be

- "CCIS6"
- "DCHN"
- "DCS"
- "DP"
- "ISUP7"
- "MF"
- "RPEO"
- 169RPTO"
- "TT"
- or blank.

Copyright © 2003 Lucent Technologies

OUT:

When TRK DIR is "OUT", OUTPULSING must be

- "CCIS6"
- "DCHN"
- "DCS"
- "DP"
- "ISUP7"
- "MF"
- "RPEO"
- "RPTO"
- "TT"
- or blank.

For 5E9(1) and later,
if "OUT" if entered, thenIN START DIAL cannot be entered.

For 5E9(2) and later, if "OUT" is entered, and TRKCLS equal to "TSTK", and at least one Trunk Member is defined on the TRUNK form, then all TGN/MEMB(s) must have OUT START DIAL set to "WINK" or unknown.

For 5E10 and later, when TRK DIR is "OUT", FAR END NPA must be entered.

For 5E10 and later, if TRK DIR is "OUT" and HUNT TYPE is

- 2WB
- 2WF
- BGUCD
- GUCD
- MLIDL (5E13 and later)
- PRFL
- PRBL
- UCD

then DCS TRK must be "Y".

For 5E15 and later, when TRK DIR is "OUT", and TRKCLS is not "ADT" or "3GPD", FAR END NPA must be entered.

RAF:

If "RAF" is entered, then

- CARRIER ID must not be entered
- HUNT TYPE must be "FIFO"

SGNL:

If "SGNL" is entered, then:

- BILLING DN must be unknown.
- DATA RATE must be known.
- all EDSL/PRI TRUNKS fields must use the default values.

Copyright © 2003 Lucent Technologies

- GLARE ACTION must not be entered.
- HUNT TYPE must be unknown.
- both INPULSING and OUTPULSING must be "DCHN".
- SCR and ATTTN must be blank.
- TRKCLS must be "EDSL", "IFOPER" or "IFTERM".
- STD RN SRC must be "N".
- Members of the trunk group cannot have the DEN from the TRUNK form entered as C OE or NC OE on an associated NAILUP form.

For 5E10 and later, when TGN(s) are assigned to a PRI (Primary Rate Interface) on the TKGRP form where TRKCLS is equal to "EDSL", "IFOPER" or "IFTERM" and TRK DIR is equal to "SGNL" (the PRI D channel), there is a limit of 31 D-Channel PRIs (TGN/MEMB(s) on the TRUNK form) on SM values (DEN[1,3] or NEN[1,3] on the TRUNK form) that match EQIM SM and have a UNIT TYPE of SM2000, and a limit of 20 PRIs on an SM that does not have a UNIT TYPE of SM2000 on the EQIM form.

For 5E11 and later, when TRK DIR is not "INC" or "2W", CNA OPTION must be "NONE" on this form.

For 5E12 and later, when TRK DIR is "INC", "SGNL", or "LTP", the following RI intercept treatments, assigned on the NOC form (5501 Record), are not valid: REG ICPT RI, BLANK NBR RI, OOS RI, and DENIED TERM RI.

2.5 HUNT TYPE

Description: The HUNT TYPE determines how the Trunk Group will be searched for an available trunk.

For Two-Way trunk groups, it is necessary that the near-end trunk group and the far-end trunk group hunt from opposite ends of their respective trunk group to minimize the glare condition. For example, if the near-end trunk group has a HUNT TYPE of "2WF", the far-end trunk group must have a HUNT TYPE of "2WB".

Valid HUNT TYPE Entries

Entry	Definition
2WF	Two-Way Forward hunt. Trunks will be hunted in numerically ascending order.
2WB	Two-Way Backward hunt. Trunks will be hunted in numerically descending order.
ANNC	Announcement Trunk hunt. A TRKCLS of "ANNCMNT" must be used with this HUNT TYPE.
BGUCD	Software Release: 5E9(1) and later. Backward Circular Sequential. The start hunt member is the last selected member -1. Hunting then continues through the trunk members in a backward direction using circular hunting to the lowest member, then starting over at the highest member. The hunt continues in this manner until an idle member is found or all members are found busy.
FIFO	First-In, First-Out hunt. Used for Outgoing and Logical Test Port Groups except DC Jacks and Callback to Trunk and Line Work Stations. FIFO is also required for Callback to TLWS.
GUCD	Software Release: 5E9(1) and later. Forward Circular Sequential hunt. The start hunt member is the last selected member +1. Hunting then continues through the trunk members in a forward direction using circular hunting to the highest member, then starting over at the lowest member. The hunt continues in this manner until an idle member is found or all members are found busy.
MLIDL	Software Release: 5E13 and later. Most Idle - Least Idle trunk hunting. The number of trunks associated to a trunk group, where the HUNT TYPE equals "MLIDL", cannot exceed 192 members.This entry supports the Trunk Group Hunt Sequence Enhancements feature. For more information, see Division 2, Section 1BT.
PRFF	Idle/preempt First-in First-out hunt. Used for preemptable Outgoing Trunk Groups associated with DSN (Defense Switched Network). The DSN (Defense Switched Network) capability is defined using the BRCS

Copyright © 2003 Lucent Technologies

	feature, Precedence and Preemption. See the 5618 Records.
PRBL	Idle/preempt Backward Linear hunt. Used for preemptable Two-Way Trunk Groups associated with DSN (Defense Switched Network). The DSN (Defense Switched Network) capability is defined using the BRCS feature, Precedence and Preemption. See the 5618 Records.
PRFL	Idle/preempt Forward Linear hunt. Used for preemptable Two-Way Trunk Groups associated with DSN (Defense Switched Network). The DSN (Defense Switched Network) capability is defined using the BRCS feature, Precedence and Preemption. See the 5618 Records.
PSUCD	Software Release: 5E3 and later. Packet Switching Uniform Call Distribution.
UCD	Software Release: 5E9(1) and later. Uniform Call Distribution. The start hunt member is randomly selected, then hunting continues through the trunk members in a forward direction using circular hunting to the highest member, then starting over at the lowest member. The hunt continues in this manner until an idle member is found or all members are found busy.

To improve memory utilization the Recent Change system defines an additional set of HUNT TYPE values for Large Trunk Groups, groups exceeding 192 members. HUNT TYPES from either set may be entered on Recent Change View 5.1; Recent Change will automatically convert between the sets depending on the number of members (see conversions below). ODA does not allow the Large Trunk Group HUNT TYPEs to be entered, but automatically makes the distinction internally based on number of members.

In Digital Cellular Switch trunk groups (DCS TRK is "Y"), trunk member 0 cannot be assigned; therefore, large DCS trunk groups are those exceeding 191 members. Also, since DCS trunks are global trunks, DCS trunk hunting is performed in the AM (Administrative Module).

Large Trunk Group Hunt Types

Small Group (ODA and Recent Change)	Large Group (Recent Change Only)
2WF	LGFD
2WB	LGBD
BGUCD	LBGUCD
GUCD	LUCD
PRFL	PLFL
PRBL	PLBL
PRFF	PLFF
PSUCD	PSLGUCD
UCD	LGUCD

Data Rules:

For 5E9(1) and later, with the exception of E911 CAMA PSAP, "CST1", "CST2", and "DSC" trunk groups, two-way trunk groups may not have a HUNT TYPE of "ANN", "FIFO", or "PREF".

Incoming Trunk Groups do not require a HUNT TYPE entry.

If TRK DIR is "SGNL", the field must not be entered.

Two-Way EDSL and EDSLHM trunks require a HUNT TYPE of
- "2WB"
- "2WF"
- "PRBL" (5E9(2) and later)
- "PRFL" (5E9(2) and later)
- "UCD" (5E9(1) and later)
- "BGUCD" (5E9(1) and later)
- "GUCD" (5E9(1) and later)
- "MLIDL" (5E13 and later)

If the TRKCLS is "IFOPER", then HUNT TYPE must not be entered.

Two-Way CCS trunks where the INPULSING or OUTPULSING field equals "CCIS6" or "ISUP7" must have a HUNT TYPE of
- "2WB"

Copyright © 2003 Lucent Technologies

- "2WF"
- "BGUCD" (5E9(1) and later.)
- "GUCD" (5E9(1) and later.)
- "UCD" (5E9(1) and later.)

For 5E9(1) and later, TRK DIR must be "2W". when HUNT TYPE is:

- "2WB"
- "2WF"
- "BGUCD"
- "GUCD"
- "MLIDL"
- "PRBL"
- "PRFL"
- "UCD"

PSUCD:

When HUNT TYPE is "PSUCD":

- TRKCLS of "PACKET"

  "X75"

  or

  "X75P"must be used.

- INPULSING and OUTPULSING fields must be blank.

- At least one EQPSUPH form (5742 Record) must have an entry of "O" in the EQST field.

For 5E9(2) and later, each TRUNK form with a corresponding HUNT TYPE of "PSUCD" on the TKGRP form, must have a matching EQIM form with the value entered in the CONFIGURATION field of the EQIM form must support packet switching and packet switched trunks for the associated SM. For the CONFIGURATION that supports this TRKCLS value,see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2. The matching TKGRP form is found by matching TGN on the TRUNK form to TGN on the TKGRP form. The matching EQIM form is found by matching the first three digits of the known DEN, LTP, NEN, SLEN, TEN, or TRKOE from the TRUNK form to IM (Interface Module) on the EQIM form.

2.6 SCR

Description: Enter the Screening Index Number to be used for routing and charging of calls.
Valid Entries: 1 - 4095

Data Rules:

A Screening Index is required for all Two-Way and Incoming Trunk Groups.

All combinations of CODE INDEX from one or more LDIT (5300-3/5 Record), RDIT (5300-7/8 Record), INDIT (5309 Record), or MLDIT forms (5300-3 Record), and SCR from the TKGRP form must have corresponding RAR form entries for CDI, SCR, and "NONE" for PFX.

2.7 GLARE ACTION

Copyright © 2003 Lucent Technologies

Description: Will the switch yield if a glare condition occurs on a trunk in this trunk group? When the near end switch and far end switch simultaneously seize a two-way trunk, the trunk experiences a glare condition. One of the switches must give up ("yield") the trunk and find another. The GLARE ACTION field determines how this (the near end) switch will act when it detects glare.

For 5E6 and later, one of the following values must be entered in the GLARE ACTION field.

Valid GLARE ACTION Entries - 5E6 and later

Entry	Definition
ALLCTRL	All near end switch trunks have control; the far end switch always yields.
NONECTRL	The near end switch always yields; far end switch trunks have control.
ODDEVEN	For use with CCS7 trunks only. Control is determined by an ODD/EVEN algorithm that compares the Origination Point Code of the near end switch to the Destination Point Code of the far end switch. The switch with the greatest Point Code controls trunks with even numbered Circuit Identification Codes (defined in the CLCI TRK ID field on the associated TRUNK form) and yields on those with odd numbered CICs; the other switch controls trunks with odd CICs and yields on those with even CICs.

Data Rules:

Since Glare Action applies only to Two-Way trunks, TRK DIR must be "2W" when GLARE ACTION is entered.

For 5E6 and later, for CCS7 trunks (INPULSING or OUTPULSING equal to "ISUP7"), GLARE ACTION must be "ALLCTRL", "NONECTRL" or "ODDEVEN".

WARNING: If GLARE ACTION for CCS7 trunks is set to "ALLCTRL" or "NONECTRL", the connecting office must be on the 5E6 or later Software Release.

GLARE ACTION may not be entered for CCS trunks that have INPULSING or OUTPULSING entered as "CCIS6".

It must be entered as "ALLCTRL" or "NONECTRL" for trunks with INPULSING or OUTPULSING other than "ISUP7" or "CCIS6".

For trunk groups with TRKCLS "X75" or "X75P", GLARE ACTION must be "ALLCTRL". For 5E7 and later, GLARE ACTION must be "ALLCTRL" when TRKCLS is "PACKET". For packet switching trunk groups (IP, X.75 or X.75P) GLARE ACTION is not used. Glare conditions on two-way packet switching trunks do not occur because of the assignment of Logical Channel Numbers (up to 128 per trunk member). Both the near end and far end Logical Channel Numbers are provisioned by the craft and prevent glare conditions from occurring.

2.8 DAS

Description: Enter the Digit Analysis Selector to be used for routing and charging of calls.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

A DAS is required for all Two-Way and Incoming Trunk Groups, except when the TRKCLS is "IFTERM"; then, the DAS field must not be entered.

If incoming or 2-way trunk group(s) are assigned on the TKGRP form with a DAS (Digit Analysis Selector) then the DAS must be defined on the DAS form (5300-1 Record). The DAS can only be defined as a LINE DAS for trunks with a corresponding TRKCLS value of

Copyright © 2003 Lucent Technologies

- "EDSL"
- "EDSLHM"
- "LATA"
- "PF"
- "PFITT"
- "PFLASH"

Otherwise, the DAS must be defined as a TRUNK DAS.

It is recommended that if TRKCLS is "LTPOGTC", "LTPROTL", "LTPCLBCK", or "LTPDFTAC", this DAS should point to a DAS form (5300-1 Record) assigned an LDIT that is populated in every SM where the LTP resides. An LDIT is populated on SMs through the SMLDIT form (5315 Record).

When the specified DAS is the same as PVN DAS on the OFCOPT form (5509 Record), then this trunk group is dedicated to ASP (Advanced Services Platform; previously PVN, Private Virtual Network) and must have TRKCLS set to one of the following values: "EDSL", "PF", "PFLASH", "PFITT". If a trunk group is assigned to a DAS similar in functionality to the PVN DAS, then it should have TRKCLS set to one of the following values: "EDSL", "PF", "PFLASH", "PFITT".

Each DAS assigned on the TKGRP form assigns an LDIT (via the LOCAL DIT field on the corresponding DAS form) to one or more SMs (via the first three digits of the TEN, DEN, or (for 5E9(2) and later) NEN field on all associated TRUNK forms). Each LDIT assigned in this way, and its associated SMs, must be defined on the SMLDIT form.

2.9 # TRKCLS

Description: This field defines the type of traffic carried over the Trunk Group. The 5ESS Switch may be used as a combination Local/Toll Office. Local traffic will be carried over certain Trunk Groups and toll traffic will be carried over others.

Required Field.

Valid Entries for the TRKCLS field are divided into three tables: Local Office Traffic, Toll Office Traffic, and Logical Test Ports. The first table applies to Trunk Groups that carry local office traffic. Refer to Figure 1 for applicable Address Signal and Start Dial Combinations.

Valid TRKCLS Entries (Local Office Traffic)

Entry	Definition
3GPD	Software Release: 5E15 and later High Speed Data Trunks
ACJCK	AC Jack Termination on Trunk and Line Work Station. Refer to Division 2, Section 2H, "Trunk and Line Work Station Access Unit."
ADT	Software Release: 5E12 and later. AUTOPLEX Data Trunk. This TRKCLS supports the CDMA Data Services and the TDMA Data Services - Circuit Mode features. For more information, see Division 2, Section 4A280 and Division 2, Section 4A286, respectively.
AIS	Outgoing to AIS (Automatic Intercept Service).
ATNDVFY	Software Release: 5E8 and later. Remote Busy Verify. Allows the ISDN Attendant the ability to verify lines on remote Switches by way of BVTs (Busy Verify Trunks). The lines on the remote Switch may be busy verified only if they are associated to an incoming ISAT BVT.
ANNCMNT	Outgoing to An Announcement.
A2	Software Release: 5E13 and later. IS-634 A2 Interface. Provides a connection for the OVBS (Other Vendor Base Station) capability. See Division 2, Section 4A191.
A5	Software Release: 5E14 and later. IS-634 A5 Interface. For more information, see Division 2, Section 8I.
BCM	Software Release: 5E12 and later. (Frame Relay) Bearer Channel Member. This TRKCLS supports the CDMA Data Services and

Copyright © 2003 Lucent Technologies

	the TDMA Data Services - Circuit Mode features. For more information, see Division 2, Section 4A280 and Division 2, Section 4A286, respectively.
BUSYVFY	Incoming From a 3C Type Switchboard or TSPS Operator For Busy Line Verification.
CAMA	Outgoing CAMA Trunks to the Serving CAMA office. Specify this Trunk Class for trunks outgoing to an ANAC (Automatic Number Announcement Circuit).
CST1	Software Release: 5E9(1) and later. Autoplex Cell Site 1 trunk.
CST2	Software Release: 5E9(1) and later. Autoplex Cell Site 2 trunk.
DSC	Software Release: 5E9(1) and later. Autoplex Dedicated Switch Connections.
EDSL	Extended Digital Subscriber Line trunk.
EDSLHM	EDSL trunk for Hotel/Motel TSPS service.
EISTRK	Software Release: 5E6 and later. Outgoing trunk to an EIS (External Information System). The discussion of the translations for an EIS trunk is in Division 2, Section 3C.
FRBC	Software Release: 5E12 and later. Frame Relay Bearer Channel. This TRKCLS supports CDMA Data Services - Circuit Mode feature. For more information, see Division 2, Section 4A280,,
IC	Software Release: 5E10 and later. Carrier Trunk.
IDCS	Software Release: 5E9(1) and later. Autoplex Inter-DCS (Digital Cellular Switch) or loop-around trunks.
ISLPM	Software Release: 5E14 and later. ISLPM supports the IS-41 Inter-System Hard Handoff feature and the IS-634 A5 Inter-Vendor feature. For more information, see Division 2, Section 8H.
IS41	Software Release: 5E14 and later. IS41 supports the IS-41 Inter-System Hard Handoff feature. For more information, see Division 2, Section 8H.
IVTRK	Software Release: 5E9(1) and later. Autoplex Inter-Vendor trunks.
LTOLLCON	Local Office End of a Toll Connecting Trunk Incoming, Outgoing or Two-Way.
LTPS96TF	Remote terminal diagnostics.
OGTGDSF	Software Release 5E16(2) and later. Logical Test Port Type that corresponds to GDSF (w/TTF) equipment.
OTOTK	Office-to-Office Test Trunk. Refer to Division 2, Section 2G, for description and requirements.
PACKET	Two-Way Packet-Switched (Internal Protocol) trunks.
PBXDID	Outgoing For PBX Direct-In-Dial.
PCF	Software Release 5E16 FR3 and later. Packet Control Function.
PF	Private Facility Trunks. Incoming, Outgoing, or Two-Way.
PFITT	Private Facility Intertandem Trunks.
PFLASH	Private Facility Trunks with Flash repeating capability. Used for Incoming, Outgoing or Two-Way private trunks.
PFCPE	Private Facility Customer Premise Equipment Trunks, for outgoing trunks to customer premises.
PPMEM	Software Release 5E10 and later. Packet pipe member. This TRKCLS supports CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.
PKTPIPE	Software Release: 5E10 and later. Packet pipe. This TRKCLS supports CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.
RECCMPL	Recording Completing; Outgoing to a 3C Type Switchboard.
RECCMPL	Recording Completing; Outgoing to a 3C Type Switchboard.
SERVICE	Telephone Company Service Facilities (e.g. 411, 611, 811).
SES	Service Evaluation Trunks.
SPCHNDLR	Software Release 5E10 and later. Speech Handler. This TRKCLS supports CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.
SVC	Software Release 5E12 and later. (Frame Relay) Switched Virtual Circuit. This TRKCLS supports the CDMA Data Services and the TDMA Data Services - Circuit Mode features. For more information, see Division 2, Section 4A280 and Division 2, Section 4A286, respectively.
TOLLOPER	Incoming From a 3C Type Toll Switchboard Operator.
TSPS	Outgoing to TSPS Operator Positions.
TSTK	Local Test Desk Test Trunk, incoming or outgoing. Refer to the Division 2, Section 2E ("Local Test

Copyright © 2003 Lucent Technologies

	Desk") and Section 2N ("Coin Station Test Lines").
X75	Software release: 5E6 and Later. Provides X.75 gateway on the switch to interconnect to packet Interexchange carriers (interLATA traffic) and to independent operating companies' packet switch networks (intraLATA traffic).
X75P	Software Release: 5E5 and later. Two-Way X.75' trunk group connecting this 5ESS Switch to a PPSN Switch within the same LATA.

Data Rules for Local Office TRKCLSs:

3GPD:

- When TRKCLS is "3GPD":
  - the ACT field for SFID 285 on the SFSYS form (5713-1 Record) must be set to "Y". This TRKCLS value is used for the CDMA (Code Division Multiple Access) Cellular Packet Data Services secured feature. (For more information on this feature, see Division 2, Section 4A285.)
  - TRK DIR must be "2W" or "OUT".
  - and TRK DIR is "2W", INPULSING must be "DCS".
  - and TRK DIR is "OUT", INPULSING must be unknown.
  - OUTPULSING must be "DCS".
  - FAR END NPA must not be entered
  - DCS RETRY must be "Y".
  - DCS TRK must be "Y".
  - PBX/CPE ID must not be entered
  - DAS must not be entered.
  - SCR must not be entered.
  - GLARE ACTION must be "NONECTRL".
  - BRCS must be "N".
  - VPA TYPE must be "NOVPA".
  - HUNT TYPE must be known.
- For each trunk group of TRKCLS "3GPD", all trunk members for this trunk group must reside on the same Switching Module/PSU (Packet Switch Unit).

ACJCK:
When TRKCLS is "ACJCK", trunk group members must be analog trunks; a value must be entered in the TEN field on the member's TRUNK form. CIRCUIT TYPE on the associated EQTUP form (5720 Record) must be "TRK4EM" (4-wire E&M).

ACJCK trunks must be incoming and must have MF INPLS.

FAR END NPA must not be entered.

Copyright © 2003 Lucent Technologies

For 5E15 FR1 and later, when TRKCLS is "ACJCK":

- AC-JACK 1 OE or AC-JACK 2 OE must be defined on the TLWS form.
- an analog trunk assignment (TEN) or a digital trunk assignment (DEN or NEN) must exist on the TRUNK form (5204 Record).

ADT:
When TRKCLS is "ADT",

- OUTPLS must be "DCS"
- SERV TYPE must be "DATA".
- TRK DIR must be "2W" or "OUT".
- DCS TRK must be "Y"
- DAS must not be entered
- SCR must not be entered
- FAR END NPA must not be entered
- BRCS must be "N"
- DCS RETRY must be "Y"
- PBX ID must not be entered
- GLARE ACTION must not be entered
- VPA TYPE must be "NOVPA" or must not be entered
- HUNT TYPE must be entered.

When TRKCLS is "ADT" and TRK DIR is "2W", INPLS must be "DCS". When TRKCLS is not "ADT" or "SPCHNDLR", SERV TYPE must be "NOSERV".

When TRK DIR is "OUT" and TRKCLS is not "ADT", FAR END NPA must be entered.

When TRK DIR is "2W", CAMA PSAP is "N" and TRKCLS is, not "ADT", "BCM", "CST1", "CST2", "DSC", "FRBC", "PKTPIPE", "PPMEM", "SPCHNDLR" or "SVC", HUNT TYPE, must not be "ANN", "FIFO" or "PRFF".

For 5E13 and later, when TRKCLS is "ADT", the ACT field for SFID 215, SFID 285, or SFID 286 on the SFSYS form that are included in the switch must be set to "Y", while the other SFIDs ACT fields are set to "N".

For 5E14 and later, when TRKCLS is "ADT", all trunk members of this trunk group on the TRUNK form (5204 Record), must have a TRKOE entered with an OE that has a channel assignment in the range of 64 to 95 (channel is the last three digits of the OE). When this OE corresponds to a Protocol Handler Logical Channel Group with a PH TYPE of "PH4" on the PSUGP form (5949 Record), the PH channel assignment is limited to 64 thru 69. When the OE corresponds to a Protocol Handler Logical Channel Group with a PH TYPE of "PHV5" on the PSUGP form, the PH channel assignment is limited to 64 thru 95.

AIS:

Copyright © 2003 Lucent Technologies

A HUNT TYPE of "FIFO" and a TRK DIR of "OUT" must be used with this Trunk Class.

ANNCMNT:
For 5E6 and later when TRKCLS is "ANNCMNT", if the trunk group is a Global Announcement TGN that is entered in the GL ANN TG field of another TKGRP form, it may not have trunks defined on the TRUNK form.If the trunk group is a Global Announcement TGN but is not entered in the GL ANN TG field of any other TKGRP form, then it must have at least one trunk defined on the TRUNK form. A Global Announcement trunk group is defined on the TKGRP form with TRKCLS set to "ANNCMNT" and with GL ANN TG and LOCAL SM left blank; the TGN appears on an RTIDX form with a ROUTE INDEX that is defined on a FIXRT form with FIXED ROUTE TYPE set to "RSMSA".

For 5E8 and later when a member of an "ANNCMNT" trunk group has a TEN assigned on the TRUNK form, CIRCUIT TYPE must be "TRK4EM" (4-wire E&M) on the corresponding EQTUP form.

For 5E9(2) and later, the "ANNCMNT" TRKCLS requires a TEN (Trunk Equipment Number), a DEN (Digital Equipment Number) or a NEN (Networking Equipment Number) assignment on the associated TRUNK form(s).

For 5E12 and later, when TRKCLS is "ANNCMNT", HUNT TYPE must be entered.

ATNDVFY:

- If TRKCLS is "ATNDVFY", then the following fields must be "N":

- ASP ORIG,
- BRCS,
- CAMA PSAP,
- CFN RSTRCT,
- LN CRIT Q,
- LN VIRT,
- LS DLY ANS,
- NI ANNC,
- NI IW REL,
- PRIVACY,
- RLT FLASH,
- SATELLITE,
- UNRES EA

- If TRKCLS is "ATNDVFY", the following fields must be not be entered:

- BILLING DN,
- DATA RATE,
- DEST PT CODE,
- DSN ACT ID,
- HUNT TYPE,
- HUNT TYPE,
- NEND CLLI,
- ORIG PT CODE,
- PBXDID,
- VPA RATE

- CCS7 TYPE must be "BELLCORE" or not entered;

Copyright © 2003 Lucent Technologies

- COIN, SHUTTLE, TRUNK QUERY, and XLT TEST must be "N" or not entered;
- FREE ANS must be "Y";
- LN TYPE must be "NONE";
- SVC GRP must be "NOANNC";
- TRK DIR must be "INC" or "OUT";
- VPA TYPE must not be entered or it must be "NOVPA";
- the corresponding APGFP form (5620-2 Record), where TKGRP TGN equals APGFP GROUP NO/GROUP NAME, must have NUTS/LUTS ACTIVE equal "N".
- If TRKCLS is "ATNDVFY" and TRK DIR is "INC":
  - INPLS must be "MF";
  - ISAT MLHG, INSEP, and DIR CON DN cannot be entered;
  - one TRUNK form must exist with the key TGN that matches the TGN on this TKGRP form. On that TRUNK form:

- TEN or DEN must be entered;
- IDLE STATE must be "ON";
- IN START DIAL must be "WINK";
- OUT START DIAL must not be entered;
- EXT GUARD TIMING and ANSWER DELAY
- TIMING must be "N" or not be entered.

- If TRKCLS is "ATNDVFY" and TRK DIR is "OUT":
  - OUTPLS must be "MF".;
  - ISAT MLHG must be entered.;
  - AML PERCENT and QUEUE FEATURE must not be entered.;
  - ENQUEUE ACT must be "Y" or not entered;.
  - one TRUNK form must exist with the key TGN that matches the TGN on this TKGRP form. On that TRUNK form:

- TEN or DEN must be entered;
- IDLE STATE must be "ON";
- IN START DIAL must not be entered;
- OUT START DIAL must be "WINK";
- EXT. GUARD TIMING and ANSWER DELAY
- TIMING must be "N" or not be entered.

For 5E15 and later, when TRKCLS is "ATNDVFY", CQ/BQ ALW must be "N" or not entered.

Copyright © 2003 Lucent Technologies

A2:

For 5E13 and later, when TRKCLS is "A2",

- SFID 191 must be activated.
- all corresponding trunk members of the respective trunk group must have a DEN or NEN specified.
- IN START DIAL and OUT START DIAL (on the TRUNK form) must not be entered
- an ATSDAT form must not be entered
- TRKCLS must not be "A2", when FAR E911 is "Y"
- the following TKGRP fields must be:
  - TRK DIR must be 2W
  - DCS TRK must be "Y"
  - FAR END NPA must not be entered
  - PBX/CPE ID must not be entered
  - VPA TYPE must not be entered or must be entered as "NOVPA"
  - DAS must not be entered
  - SCR must not be entered
  - INPULSING must be DCS
  - OUTPULSING must be DCS
  - GLARE ACTION must not be entered
  - DATA RATE must be "56K" or "64K".

A5:

For 5E14 and later, when TRKCLS is "A5",

- DAS must not be entered
- SCR must not be entered
- GLARE ACTION must not be entered
- VPA TYPE must be "NOVPA", or not be entered
- DCS TRK must be "Y"
- DCS RETRY must be "Y"
- PBX/CPE ID must not be entered
- TRK DIR must be "2W"

Copyright © 2003 Lucent Technologies

- FAR END NPA must not be entered
- DATARATE must not be entered
- IAPT must be "Y"
- ATTN must be "0"
- INPLS must be "NOSIGNAL"
- OUTPLS must be "NOSIGNAL"

When the TGN field on the TKGRP form matches the TGN field on the TRUNK form, and TRKCLS field is "A5" on the TKGRP form, IN START DIAL must not be entered on the TRUNK form.

When the TGN field on the TKGRP form matches the TGN field on the TRUNK form, and TRKCLS field is "A5" on the TKGRP form, OUT START DIAL must not be entered on the TRUNK form.

For 5E18 and later, when TRKCLS is "A5", "ADT", or "IS41", all corresponding trunk members of these trunk groups (on the TRUNK form (5204 Record)) must have a TRKOE entered where the OE TYPE is "U" and the OE corresponds to a Ptotocol Handler Logical Channel Group with a PH TYPE of "PHV4" or "PHV5" on the PSUGP form (5949 Record).

BCM:
For 5E12 and later, when TRKCLS is "BCM",

- TRK DIR must be "2W"
- DCS TRK must be "N"
- DAS must not be entered
- SCR must not be entered
- INPLS must be "FRBC"
- OUTPLS must be "FRBC"
- FAR END NPA must not be entered
- BRCS must be "N"
- PBX ID must not be entered
- HUNT TYPE must not be entered
- GLARE ACTION must not be entered
- VPA TYPE must be "NOVPA" or must not be entered
- DATA RATE must be "56K" or "64K"

When TRKCLS is "BCM" or "FRBC", INPULSING must be "FRBC" and OUTPULSING must be "BC".

For 5E13 and later, when TRKCLS is "BCM" and associated SVCs have DCS TRK of "Y" on the TKGRP form, an AFAC ID must be entered on all the corresponding EQDUP, EQVT, or EQLVC forms for the respective DEN, NEN, or OIUEN populated on the associated TRUNK form.

Copyright © 2003 Lucent Technologies

- EQDUP forms:
  - If FAC IND is 0 or 1, AFAC ID FAC 0 must be entered.
  - If FAC IND is 3, and the channel number (the last two digits of the DEN on the TRUNK form) is less than 25, AFAC ID FAC 0 must be entered;
  - If FAC IND is 3, and the channel number is greater than 24, AFAC ID FAC 1 must be entered.
- EQVT and EQLVC forms:
  - AFAC ID must be entered.

BUSYVFY:
BUSYVFY trunks must be incoming.

INPLS is required for BUSYVFY trunks.

For 5E10 and later, FAR END NPA must not be entered.

CAMA:
CAMA trunks must have the following:
- FREE TERM must be entered
- HUNT TYPE must be "FIFO"
- OUTPLS must be entered
- OUTPL REQ must be "Y"
- SIGNAL must not be entered
- TRK DIR must be "OUT"

For 5E9(2) and later, if a DEN or NEN is entered on the TRUNK form and the corresponding TKGRP form has TRKCLS of "CAMA", then SUPV on the TRUNK form must be "EM2" or not entered.

CST1:
When TRKCLS is "CST1":

- INPLS must be "DCS"
- OUTPLS must be "DCS"
- DCS TRK must be "Y"
- DCS RETRY must be "N"
- VPA TYPE must be "NOVPA" or blank
- When the TGN on this form matches the TGN on the TRUNK form, then on the TRUNK form:
  - IN START DIAL must not be entered
  - OUT START DIAL must not be entered
- the ACT field for SFID ACT 130 on the SFSYS form must be "Y".

Copyright © 2003 Lucent Technologies

CST2:
When TRKCLS is "CST2":

- INPLS must be "DCS"
- OUTPLS must be "DCS"
- DCS TRK must be "Y"
- DCS RETRY must be "N"
- VPA TYPE must be "NOVPA" or blank
- When the TGN on this form matches the TGN on the TRUNK form, then on the TRUNK form:
  - IN START DIAL must not be entered
  - OUT START DIAL must not be entered
- SFID ACT 130 on the SFSYS form cannot be "N".

DSC:
When TRKCLS is "DSC":

- DCS TRK must be "Y"
- DCS RETRY must be "N"
- VPA TYPE must be "NOVPA" or not entered.
- When the TGN on this form matches the TGN on the TRUNK form, then on the TRUNK form:
  - IN START DIAL must not be entered
  - OUT START DIAL must not be entered
  - The trunk must be a digital trunk; that is, a value must be entered in the DEN field
- SFID ACT 130 on the SFSYS form cannot be "N".
- For 5E9(2) and later, if "DSC" is entered, then DSC NUM must be entered on the NAILUP form(5207 Record).A trunk assigned to the controlling port on a NAILUP form cannot belong to a DSC trunk group unless a value is entered in the DSC NUM field on the corresponding NAILUP form. Forms correspond when DEN on the TRUNK form matches the equipment number portion of the C OE on the NAILUP form, and the TRKCLS on the corresponding TKGRP form is "DSC".

For 5E17 and later, when TRKCLS is "DSC" or "IVTRK", all trunks in the trunk group must be digital, (i.e., DEN, NEN, OIUEN, or DCS TRK must be entered on all associated TRUNK forms).

EDSL:
Each trunk belonging to this trunk group must be defined with a DEN on a TRUNK form. If the group's TRK DIR is "SGNL", an ISCN must also be entered on the TRUNK form.When TRKCLS is not "EDSL" or "EDSLHM", all EDSL/PRI TRUNKS fields must use the default values.

For5E6 and later, when DLTU TYPE is "DLTU24" or "DLTU48" on the EQDU form and the corresponding TKGRP form has TRKCLS of "EDSL", "IFOPER" or "IFTERM", and the following are true:

Copyright © 2003 Lucent Technologies

- INPLS or OUTPULSING is "DCHN",
- TRK DIR is "2W", "INC" or "OUT",

then DATA RATE on the TKGRP form must be "56K", "R64K", "64K" or must not be entered. The EQDU form is found by matching SM and DLTU NUMBER with the first 3 digits and 4th digit respectively of DEN on the TRUNK form.

For5E6 and later, when DLTU TYPE is "DLTU24" or "DLTU48" on the EQDU form and the corresponding TKGRP form has TRKCLS of "EDSL", "IFOPER" or "IFTERM", and the following are true:

- INPLS or OUTPULSING is "DCHN",
- TRK DIR is "SGNL",

then DATA RATE on the TKGRP form must be entered. The EQDU form is found by matching SM and DLTU NUMBER with the first 3 digits and 4th digit respectively of DEN on the TRUNK form.

If TRKCLS is "EDSL" or "EDSLHM" and TRK DIR is "2W", then HUNT TYPE must be

- "2WB"
- "2WF"
- "PRBL" (5E9(2) and later)
- "PRFL" (5E9(2) and later)
- "BGUCD" (5E9(1) and later)
- "GUCD" (5E9(1) and later)
- "UCD" (5E9(1) and later)
- "MLIDL" (5E13 and later)

For 5E9(1) and later:

See "IFOPER" for 5E9(1) and later data rule for LLCB assignments.

For 5E9(2) and later:

If the TRUNK GROUP NUMBER entry on the ROUTE INDEX form matches the TGN entry on the TRUNK GROUP form where TRKCLS is set to "EDSL" or "EDSLHM", the TRK DIR on the TRUNK GROUP form must not be set to "SGNL".

For 5E10 and later:
If "EDSL" is entered,

- DATA RATE must be entered or DATA RATE and WB RATE must be entered.
- the associated MEMBs on the TRUNK form must have the required entry for DEN or NEN.
- and on the TRUNK form:

  ANSWER DELAY TIMING must be "N"

  or not entered

  EXT. GUARD TIMING must be "N"

  IN START DIAL must not be entered

Copyright © 2003 Lucent Technologies

OUT START DIAL must be not be entered

SUPV must be "EM2" or not entered

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

EDSLHM:
Each trunk belonging to this trunk group must be defined as a B-channel with a DEN entered on a TRUNK form; the last two digits of the DEN must be in the range 1 - 23 or 25 - 47.

For 5E6 and later, if the DLTU TYPE is "DLTU24" or "DLTU48" on the corresponding EQDU form, then the DATA RATE on this form must be "56K", "R64K", "64K" or not entered for a TRKCLS of "EDSLHM".

If TRKCLS is "EDSL" or "EDSLHM" and TRK DIR is "2W", then HUNT TYPE must be
- "2WB"
- "2WF"
- "PRBL" (5E9(2) and later)
- "PRFL" (5E9(2) and later)
- "BGUCD" (5E9(1) and later)
- "GUCD" (5E9(1) and later)
- "UCD" (5E9(1) and later)
- "MLIDL"

When DLTU TYPE is "DLTU24" or "DLTU48" on the EQDU form; the corresponding TKGRP form has TRKCLS of "EDSL", "EDSLHM", "PFLASH", "PFITT" or "PF"; and an ASP feature has been assigned on the TRUNKFA or TKGRPFA forms or within a CLUSTER; then DATA RATE must not be entered.A corresponding EQDU form is found by matching the SM and DLTU NUMBER on the EQDU form with the first 3 digits and the 4th digit respectively of the DEN on the TRUNK form (5204 Record).

When "EDSLHM" is entered:

- DATA RATE must be entered or DATA RATE and WB RATE must be entered.
- a B channel must be assigned on the TRUNK form.
- associated MEMBs on the TRUNK form must have the required entry for DEN or NEN.
- a DEN entered on the TRUNK form and a PRI GROUP entered on the TRUNK form that has a PRI TYPE of "CUSTOM" on the associated PRIGRP form, the last two digits of the DEN(s) on the TRUNK form must be in the range of 1 - 23 or 25 - 47, representing a B channel.

  - ***NOTE:*** An asterisk (*) preceding a DEN specifies that it was generated automatically from the TRUNK form because QTY was greater than 1.

- on the TRUNK form:

  ANSWER DELAY TIMING must be "N" or not entered

  EXT. GUARD TIMING must be "N"

  IN START DIAL must not be entered

Copyright © 2003 Lucent Technologies

OUT START DIAL must be not be entered

SUPV must be "EM2" or not entered

FRBC:

When TRKCLS is "FRBC",

- TRK DIR must be "2W"
- DCS TRK must be "N"
- DAS must not be entered
- SCR must not be entered
- INPLS must be "FRBC"
- OUTPLS must be "FRBC"
- FAR END NPA must not be entered
- BRCS must be "N"
- PBX ID must not be entered
- HUNT TYPE must not be entered
- GLARE ACTION must not be entered
- the following must be true for all corresponding trunk members of this trunk group:
  - TRKOE TYPE on the TRUNK form is "U"
  - TRKOE NUMBER on the TRUNK form corresponds to a Protocol Handler Logical Channel Group where PH TYPE on the PSUGP form is "PH4" or "PH22"
- and PH TYPE on the PSUGP form is "PH4", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 015 for all corresponding trunk members of this trunk group.
- and PH TYPE on the PSUGP form is "PH22", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 063 for all corresponding trunk members of this trunk group.
- the total number of SVC (Switched Virtual Circuit) trunks assigned to FRBC trunks on a given PH must not exceed 239.
- PHs (Protocol Handlers) are assigned to "FRBC" trunks. For PH4, a given PH may support at most 16 trunks via the "FRBC" trunks assigned on the TRUNK form (5204 Record).For PH22, a given PH may support at most 64 trunks via the "FRBC" trunks assigned on the TRUNK form.

For 5E16(1) and later, for every TKGRP with TRKCLS equal to "FRBC", all trunk members of the trunk

Copyright © 2003 Lucent Technologies

group on the TRUNK form (5204 Record), must have a TRKOE entered where the OE TYPE is "U" and the OE corresponds to a Protocol Handler Logical Channel Group with a PH TYPE of "PH4" or "PH22" on the PSUGP form (5949 Record).

When HUNT TYPE is not entered and TRKCLS is not "FRBC" or "PKTPIPE", FCS and PROT VIOL must not be entered.

When HUNT TYPE is not entered and TRKCLS is not "FRBC", SABM must not be entered.

IDCS:
When TRKCLS is "IDCS":

- TRK DIR must be "2W"
- DCS TRK must be "Y"
- INPLS must be "MF" or "TT"
- OUTPLS must be "MF" or "TT"
- GLARE ACTION must be "ALLCTRL" or "NONECTRL"
- HUNT TYPE must be entered.
- SPEECH TRMTS must be "N"
- VPA TYPE must be "NOVPA" or blank
- The following fields must be blank: SCR, PBX ID, FAR END NPA
- A TIMING form (5520 Record) must be defined with a SERVICE CLASS of "IDCS"
- SFID ACT 130 on the SFSYS form cannot be "N".

ISLPM:

For 5E14 and later, when TRKCLS is "ISLPM",

- DAS must not be entered
- SCR must not be entered
- GLARE ACTION must not be entered
- VPA TYPE must be "NOVPA" or not be entered
- DATA RATE must be "56K"
- HUNT TYPE must not be "NONE"
- FAR END NPA must not be entered
- PBX/CPE ID must not be entered
- DCS TRK must be "N"
- TRK DIR must be "2W"
- INPLS must not be "NOSIGNAL"

Copyright © 2003 Lucent Technologies

- OUTPLS must not be "NOSIGNAL"
- SERV TYPE must be "NOSERV"
- DCS RETRY must be "N"

When the TGN field on the TKGRP form matches the TGN field on the TRUNK form, and TRKCLS field is "ISLPM" on the TKGRP form, IN START DIAL must not be entered on the TRUNK form.

When the TGN field on the TKGRP form matches the TGN field on the TRUNK form, and TRKCLS field is "ISLPM" on the TKGRP form, OUT START DIAL must not be entered on the TRUNK form.

IS41:

For 5E14 and later, when TRKCLS is "IS41",

- DAS must not be entered
- SCR must not be entered
- GLARE ACTION must be "ALLCTRL" or "NONECTRL"
- VPA TYPE must be "NOVPA" or not be entered
- FAR END NPA must not be entered
- DCS TRK must be "Y".
- DCS RETRY must be "Y"
- PBX/CPE ID must not be entered
- TRK DIR must be "2W"
- HUNT TYPE must be "2WB", 2WF", "ANNC", "BGUCD", "FIFO", "GUCD", "MLIDL", or "UCD".
- SERV TYPE must be "NOSERV"
- INPLS must not be entered
- OUTPULSING must not be entered

When the TGN field on the TKGRP form matches the TGN field on the TRUNK form, and TRKCLS field is "IS41" on the TKGRP form, IN START DIAL must not be entered on the TRUNK form.

When the TGN field on the TKGRP form matches the TGN field on the TRUNK form, and TRKCLS field is "IS41" on the TKGRP form, OUT START DIAL must not be entered on the TRUNK form.

IVTRK:
When TRKCLS is "IVTRK":

- DAS must not be entered
- DCS TRK must be "Y"
- DCS RETRY must be "N"

Copyright © 2003 Lucent Technologies

- FAR END NPA must not be entered
- GLARE ACTION must be "ALLCTRL" or "NONECTRL"
- HUNT TYPE must be entered.
-
- INPLS must be "DCS"
- OUTPLS must be "DCS"
- PBX ID must not be entered
- SCR must not be entered
- SPEECH TRMTS must be "N"
- TRK DIR must be "2W"
- VPA TYPE must be "NOVPA" or blank

When the TGN on this form matches the TGN on the TRUNK form, then on the TRUNK form:
- IN START DIAL must not be entered
- OUT START DIAL must not be entered

The trunk must be a digital trunk; that is, a value must be entered in the DEN field

SFID ACT 130 on the SFSYS form cannot be "N".

LTOLLCON:
Specify this Trunk Class for DDD Access, Toll Completing and Interoffice (Class 5 to Class 5) trunks. DDD Access Trunks are trunks from a Class 5 to a Toll Office which carry noncoin toll traffic. Recording and timing are done at the local office. Operator assistance is never required. Toll Completing Trunks are trunks from a toll office to a Class 5 office. This Trunk Class may also be used for RSMs.

For 5E6 and later, if DLTU TYPE on the corresponding EQDU form (5730 Record) is "DLTU24" or "DLTU48" and the INPLS or OUTPULSING field on this form is "MF", then DATA RATE on this form must be "56K" or not entered. The EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit of the DEN, respectively, on the TRUNK form.

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

For 5E12 and later, when TRKCLS is "LTOLLCON", HUNT TYPE must be entered.

OGTGDSF:
For 5e16(2) and later, when TRKCLS is "OGTGDSF", a FIXRT form must exist with FIXED ROUTE TYPE set to "OGTGDSF".

OTOTK:
A HUNT TYPE of "FIFO" and a TRK DIR of "OUT" must be used with this Trunk Class.

When TRKCLS is "OTOTK", trunk group members must be analog trunks; a value must be entered in the TEN field on members' TRUNK forms.

PACKET:

Copyright © 2003 Lucent Technologies

If "PACKET" is entered:

- COIN must be "N" or not entered
- DATA RATE must be "56K" or "64K"
- DSN ARC ID must be 0 or not entered
- ENQUEUE ACT must be unknown or "N"
- FAR END LATA must equal 0 or not entered
- FAR END NXX must not be entered
- HUNT TYPE must be "PSUCD"
- GLARE ACTION must be "ALLCTRL"
- MK BUSY must be "N" or not entered
- MAKE BUSY KEY must not be entered
- NEXT PSN must be entered
- PACKET trunks must be two-way.
- PBX ID must not be entered
- RETRY must be "N"
- RLT FLASH must be "N"
- RLT TYPE must be "NONE"
- SATELLITE must be "N"

For this Trunk Class, a DEN and ISCN must be defined on the TRUNK form. An IP (Internal Protocol) trunk group connecting this 5ESS Switch to another 5ESS Switch can have a maximum of 32 members on a trunk group. An IP trunk group connecting this 5ESS Switch to a 1PSS can have a maximum of 8 members in a trunk group. For 5E5 and later Software Releases, if "PACKET" is entered in the TRKCLS field and "SGNL" is entered in the TRK DIR field, then an entry is required in the ISCN field of the corresponding TRUNK form.

For 5E5 and later, a maximum of 16 trunk groups can be assigned with a TRKCLS of "PACKET".

For 5E6 and later, IN START DIAL and OUT START DIAL must not be entered on the member TRUNK forms.

For 5E8 and later, when "PACKET" trunks are assigned to an SM that supports packet switching, a value must be entered in the PSN field on the ISDNOPT form (5941 Record); that PSN must be different than the NEXT PSN on the TKGRP form. In addition, the value entered in the CONFIGURATION field of the EQIM form must support packet switching and packet switched trunks for the associated SM. (Other SM/TRUNK GROUP combinations may also meet these criteria.) For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E9(1) and later, if the TRUNK GROUP NUMBER defined on an RTIDX input form has TRKCLS set to "X75", "X75P", or "PACKET" on the associated TKGRP form, then at least one TRUNK input form must be defined for the associated TKGRP form.

For 5E10 and later:

- When "PACKET" is entered, FAR END NPA must not be entered.
- When TGNs are defined with a TRKCLS of

  "PACKET"

  "X75"

  "X75P"

Copyright © 2003 Lucent Technologies

1. there can be a maximum of 25 TGNs with these TRKCLSs per SM, where SM is DEN[1,3] or NEN[1,3] on the corresponding TRUNK form.
2. the DEN or NEN field must be defined on the corresponding TRUNK form(s).

- all members of this Trunk Group must be assigned on the same Switching Module (the first three digits of DEN or NEN on the TRUNK form).
- TRUNK forms which have a TRKCLS of "PACKET" can not have a Protocol Handler (the first three characters of the ISCN)which are mixed with Protocol Handlers from other BRI or PRI DSLs in the same SM. The following "PACKET" TRUNK forms cannot have common a Protocol Handler with the following forms:

  CCLNK

  DSLUSR

  MDLNK

  MISLINK

  PSULNK

  QPHPIPE

  TRUNK

  XAT

PCF:
5E16 FR3 and later

When the TGN on this form matches the TGN on the TRUNK form, then on the TRUNK form:

- IN START DIALand OUT START DIAL must not be entered

When TRKCLS is "PCF":

- DAS, SCR, FAR END NPA, PBX/CPE ID, GLARE ACTION, and DATA RATE must not be entered
- BRCS must be "N".
- VPA TYPE must be "NOVPA" or must not be entered.
- HUNT TYPE must be entered.
- INPULSING must be "PCF".
- OUTPULSING must be "PCF".

Copyright © 2003 Lucent Technologies

- DCS TRK and DCS RETRY must be "Y".
- TRK DIR must be "TWOWAY".
- There must be a trunk member 1 on the TRUNK form (5204 Record) with MEMB equal 1 defined.
- The first seven digits of the TRKOE must match to SM, PSU, SHELF, and CHANNEL GROUP on at least one ETHIP form (5995 Record).
- For a given combination of the first seven digits of the TRKOE (SM, PSU, SHELF, and CHANNEL GROUP) there can be a maximum of 10 trunk groups.
- For a given combination of the first seven digits of the TRKOE (SM, PSU, SHELF, and CHANNEL GROUP) there can be a maximum of 8000 TRUNK forms (5204 Record).
- The CDMA (Code Division Multiple Access) (cellular packet) Data Services feature must be purchaased (Secured Feature ID 285).

When TRKCLS is "PCF" and DCS TRK is "Y", HUNT TYPE must be "2WB", "2WF", "UCD", "GUCD", or "BGUCD".

For every Trunk Group with TRKCLS equal to "PCF", all trunk members of the trunk group on the TRUNK form (5204 Record), must have a TRKOE entered where the OE TYPE is "U" and the OE corresponds to a Protocol Handler Logical Channel Group with a PH TYPE of "PHE2" on the PSUGP form (5949 Record).

For each Trunk Group with TRKCLS equal to "PCF", the trunk members on the TRUNK form (5204 Record) must have a TRKOE entered with an OE TYPE of "U", and TRKOE must be the same for all members of the trunk group.

PF:
Private Facility Customer Premise Equipment trunks (Recorded Telephone Dictation, Radio Paging, Code Calling and Loud Speaker Paging) can be set up with or without sleeve lead supervision. "PF" is used for CPEs that do not require sleeve lead supervision. Use the "PFCPD" for the sleeve lead applications. When "PF" is used for CPE trunks, the following fields must be entered:

- SUPV must be "RB" on the TRUNK form.
- IN START DIAL and OUT START DIAL must be blank on the TRUNK form.
- TRK DIR must be "OUT".
- OUTPLS must be "TT" or "DP".
- These trunks usually have CUT THRU equal to "Y". For 5E6 and later Software Releases, "PFCPE" must be used for all Private Facility Customer Premise Equipment trunks.

For 5E14 and later, when TRKCLS is "PF", "PFLASH", or "PFITT", and MAIN DN is entered, the ACT field for SFID 550, on the SFSYS form (5713-1 Record), must be set to "Y".

PFITT:
This Trunk Class is used with trunk groups between tandem offices with trunks owned or leased by the customer. This Trunk Class cannot be assigned cut-through outpulsing, thus, the value entered in the CUT THRU field must be "N".

"PFITT" trunks must have TRK DIR of
- "2W" "INC" or

Copyright © 2003 Lucent Technologies

- "OUT"

If the trunk group is Outgoing or Two-Way, TRK DIR is "OUT" or "2W", the OUTPULSING signaling can be "DP", "MF", or "TT". For 5E6 and later, it may also be "ISUP7".

If the TRK DIR is "INC" or "2W", the INPULSING signaling can be "DP", "MF" or "TT".

For 5E10 and later, incoming PFITT trunks require INPULSING of
- "DP"
- "ISUP7"
- "MF"
- "NONE" or
- "TT"

PFCPE:
Private Facility Customer Premise Equipment trunks (Recorded Telephone Dictation, Radio Paging, Code Calling and Loud Speaker Paging) can be set up with or without Sleeve lead supervision. A TRKCLS of "PFCPE" is used for all Private Facility Customer Premise Equipment trunks which require sleeve lead supervision. "PF" is used for Customer Premise Equipment trunks that do not have sleeve lead supervision. For all CPE trunks:

- SUPV must be "RB" on the TRUNK form.
- IN START DIAL and OUT START DIAL must be blank on the TRUNK form.
- TRK DIR must be "OUT".
- OUTPLS must be "TT" or "DP".
- These trunks usually have CUT THRU equal to "Y".
- If the trunks have sleeve lead supervision, the SLVD SPN field on the TRUNK forms must be defined. (The Sleeve Lead scan points are specified for each trunk of the Trunk Group on the TRUNK form.) For the "PFCPE" Trunk Class, each trunk member defined on the TRUNK form must have a TEN entered.
- For 5E7 and later, a TEN, DEN, or (for 5E9(2) and later) NEN must be entered on the corresponding TRUNK form.

PFLASH:
For 5E9(1) and later, outgoing "PFLASH" trunks require a HUNT TYPE value, and an OUTPLS of "DP", "MF" or "TT".

Incoming "PFLASH" trunks require INPLS of "DP", "MF", "TT" or "NONE".

If "PFLASH" is entered, TRK DIR must be "INC".

PKTPIPE:
"PKTPIPE", "PPMEM", and "SPCHNDLR" trunk classes support the CDMA (Code Division Multiple Access) feature. This is a secured feature, therefore ACT must be "Y" for SFID 221 on the SFSYS form (5713 Record) before "PKTPIPE" can be entered.

When TRKCLS is "PKTPIPE":

Copyright © 2003 Lucent Technologies

- The following fields must be set as indicated:
  - BRCS must be "N"
  - DCS TRK must be "Y"
  - DCS RETRY must be "N"
  - INPLS must be "PP"
  - OUTPLS must be "PP"
  - TRK DIR must be "2W"
  - VPA TYPE must be "NOVPA" or not entered

- all corresponding trunk members of this trunk group must have at least:

  - for 5E10 and 5E11, two row entries completed in the PACKET PIPE MEMBER TRUNKS list on the TRUNK form (5204 Record).

  - for 5E12, one to eight row entries completed in the PACKET PIPE MEMBER TRUNKS list on the TRUNK form (5204 Record).

- all corresponding trunk members of this trunk group (on the TRUNK form), must have a TRKOE where:

  - OE TYPE is "U"

  - OE channel assignment is in the range of 00 - 11 (channel is the last two digits of the OE)

  - OE corresponds to a Protocol Handler Logical Channel Group with a PH TYPE of "PH4"or "PH22" on the corresponding PSUGP form

    The TRUNK form corresponds to the PSUGP form when

    digits 1 - 3 of the TRKOE match SM entry of PSUGP

    digit 4 matches the PSU

    digit 5 matches PSU SHELF entry

    digits 6 - 7 match GP GRP entry.

- PKTPIPE trunks cannot havea Protocol Handler (the fourth to sixth character of the TRKOE on the TRUNK form) WHICH is also assigned to other BRI or PRI DSLs in the same SM. The "PKTPIPE" TRUNK forms cannot have a common Protocol Handler with the following forms.

  CCLNK

  DSLUSR

  MDLNK

  MISLINK

Copyright © 2003 Lucent Technologies

PSULNK

QPHPIPE

XAT

and the following must NOT be entered:
- DAS
- FAR END NPA
- GLARE ACTION
- HUNT TYPE
- PBX ID
- SABM
- SCR

PHs (Protocol Handlers) are assigned to Packet Pipe trunks. The total number of Packet Pipe Member trunks assigned to these Packet Pipe trunks must not exceed 64. A given PH may support at most 64 Packet Pipe Member trunks via the Packet Pipe trunks.

For 5E13 and later, when TGNs are defined on the TKGRP form with a TRKCLS of "PKTPIPE" and the MEMBs assigned to the TGN on the TRUNK form have 9 or more rows entered on the PSU PIPE MEMBER TRUNKS list, the Packet Pipe Enhancements secured feature must be purchased. A SFSYS form must exist with SFID 317 ACT set to "Y".

PPMEM:
"PKTPIPE", "PPMEM", and "SPCHNDLR" trunk classes support the CDMA (Code Division Multiple Access) feature. This is a secured feature, therefore the ACT field for SFID 221 must be set to "Y" on the SFSYS form (5713 Record) before "PKTPIPE" can be entered.

For 5E10 and later, if "PPMEM" is entered:
- BRCS must be "N"
- DATA RATE must be "56K" or "64K"
- DCS TRK must be "N"
- DCS RETRY must be "N"
- INPLS must be "PP"
- OUTPLS must be "PP"
- TRK DIR must be "2W"
- VPA TYPE must be "NOVPA" or not entered**.**

and the following must NOT be entered:
- DAS
- FAR END NPA
- GLARE ACTION
- HUNT TYPE
- SCR

If "PPMEM" is entered, then:

- all corresponding trunk members of this trunk group (on the TRUNK form), must have a DEN

Copyright © 2003 Lucent Technologies

specified. In addition the values of IN START DIAL and OUT START DIAL on the TRUNK form (5104 Record) must be null.

- Corresponding EQDUP forms are found by first finding all TRUNK forms where a DEN is entered and TGN on the TRUNK form matches TGN on the TKGRP form. There is one EQDUP form for each DFI pack that the trunks are assigned to. The SM, DLTU and DFI PACK NBR on the EQDUP form matches the SM, DLTU and DFI (first 6 digits of the DEN) on the TRUNK form.
  - If FAC IND is 0 or 1 on the EQDUP form, then AFAC ID FAC 0 must be entered.
  - If FAC IND is 3 and the channel number (the last 2 digits of the DEN on the TRUNK form) is less than 25, then AFAC ID FAC 0 must be entered.
  - If FAC IND is 3 and the channel number is greater than 24, then AFAC ID FAC 1 must be entered.

For 5E13 and later, if "PPMEM" is entered:

- an AFAC ID must be entered on all corresponding EQDUP, EQVT, or EQLVC forms for the respective DEN, NEN, or OIUEN populated on the associated TRUNK form.

- EQDUP forms:
  - If FAC IND is 0 or 1, AFAC ID FAC 0 must be entered.
  - If FAC IND is 3, and the channel number (the last two digits of the DEN on the TRUNK form) is less than 25, AFAC ID FAC 0 must be entered;
  - If FAC IND is 3, and the channel number is greater than 24, AFAC ID FAC 1 must be entered.

- EQVT and EQLVC forms:
  - AFAC ID must be entered.

SERVICE:
This Trunk Class may only be specified if the Trunk Group terminates to a local service facility and outpulsing of digits is not required. If digits are to be outpulsed to the service facility, do not use this Trunk Class.

SPCHNDLR:
"PKTPIPE", "PPMEM", and "SPCHNDLR" trunk classes support the CDMA (Code Division Multiple Access) feature. This is a secured feature, therefore the ACT field for SFID 221 must be set to "Y" on the SFSYS form (5713 Record) before "PKTPIPE" can be entered.

If "SPCHNDLR" is entered:
- BRCS must be "N"
- DCS RETRY must be "Y"
- DCS TRK must be "Y"
- IAPT must be "N"
- SERV TYPE must be 8K, 13K, or
- (for 5E11 and later) "EVRC"
- , or (for 5E12 and later) "ACELP", "VSELP"
- TRK DIR must be "2W"

Copyright © 2003 Lucent Technologies

- VPA TYPE must be "NOVPA" or not entered.

If "SPCHNDLR" is entered the following fields must NOT be entered:

- DAS
- FAR END NPA
- GLARE ACTION
- INPLS
- OUTPLS
- PBX ID
- SCR

If "SPCHNDLR" is entered:

- A maximum of 10 separate Trunk Groups of TRKCLS "SPCHNDLR" may have trunk members assigned to a given PSU (Packet Switching Unit).
- all trunk membersfor this Trunk Group must reside on the same PSU.
- all corresponding trunk members of this trunk group (on the TRUNK form), must have a TRKOE entered with a OE TYPE of "U".
  - In addition, for 5E10, the entry on the PSUGP form (5949 Record) that corresponds to the Protocol Handler Logical Group must have a GRP TYPE of "PHV1" or "PHV2" corresponding to SERV TYPE of "8K" or "13K" respectively (on the TKGRP form).
  - in addition, for 5E11 and later, the last two digits of the OE must be in a specific range, dependent upon the type of Protocol Handler for which the specific trunk resides.

	OE Digit Entries
PH TYPE	**OE[7,8]**
PHV1	00 - 11
PHV2	00 - 11
PHV3	00 - 15
PHV4	00 - 31

- TRUNK forms which have a TRKCLS of "SPCHNDLR" defined on the TKGRP form can not have a Protocol Handler (the fourth to sixth characters of the TRKOE) which is also assigned to other BRI or PRI DSLs in the same SM. "SPCHNDLR" TRUNK forms cannot have common Protocol Handlers with the following forms:

  CCLNK

  DSLUSR

  MDLNK

  MISLINK

  PSULNK

Copyright © 2003 Lucent Technologies

QPHPIPE

TRUNK

XAT

SES:
Service Evaluation is a required feature in all local offices which serve more than 3000 lines. In offices which serve less than 3000 lines, this feature is optional. The SES Trunk Group can have a maximum of 4 members which are called Voice Monitor Links. The first Member, defined on a TRUNK form, must be 1.

SVC:

For 5E12 and later, when TRKCLS is "SVC",

- TRK DIR must be "2W"
- DAS must not be entered
- SCR must not be entered
- INPLS must not be entered
- OUTPLS must not be entered
- FAR END NPA must not be entered
- BRCS must be "N"
- PBX ID must not be entered
- GLARE ACTION must not be entered
- VPA TYPE must be "NOVPA" or must not be entered.
- HUNT TYPE must be entered.

When TRKCLS is "SVC" and DCS TRK is "Y", DCS RETRY must be "Y".

For 5E13 and later, when TRKCLS is "SVC" and DSC TRK is "Y", the ACT field for SFID 215, SFID 285, or SFID 286 on the SFSYS form that are included in the switch should be set to "Y", while the other SFIDs ACT fields are set to "N".

TOLLOPER:
For 5E12 and later, when TRKCLS is "TOLLOPER", TRK DIR must be "INC".

TSPS:
If TRKCLS is "CAMA" or "TSPS", then TSPS TYPE must be entered.

If "TSPS" is entered, then:
- the trunks must be outgoing
- the trunks must have a FIFO HUNT TYPE
- MF OUTPLS is required
- OUTPL REQ must be entered
- and an entry is required in the following fields:

Copyright © 2003 Lucent Technologies

- AUDIBLE
- COINRTN INT
- COINRTN FNL
- COINRTN INT
- FREE TERM.

TSTK:
For 5E14 and earlier:
When TRKCLS is "TSTK", trunk group members must be analog trunks; a value must be entered in the TEN field on the members' TRUNK forms.

For 5E15 and later:
When TRKCLS is "TSTK", trunk group members can be either analog (TEN) or digital (DEN).

When TRKCLS is "TSTK" and TRK DIR is "OUT", and TEN is entered,

- HUNT TYPE must be "FIFO"
- OUTPULSING must be blank

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 1 or 25,

- OUT START DIAL on the TRUNK form must be "IMED"
- TRK DIR on the TKGRP form must be "OUT"
- MTB0 and MTB1 on the TRUNK form must not be entered
- HUNT TYPE on the TKGRP must not be entered
- OUTPULSING on the TKGRP form must be "MF".

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 2-13 or 26-37 on the TRUNK form,

- TRK DIR on the TKGRP form must be "OUT" or "INC".
- MTB0 and MTB1 must be entered.

When DEN dchan is set to 1 and there are TGN/MEMBS defined on the TRUNK form with DEN dchan set to 2 - 13, with TRKCLS of "TSTK" on the associated TKGRP form, the DEN dchan that is set to 1 must also have a TRKCLS of "TSTK" on the associated TKGRP form.

When DEN dchan is set to 25 and there are TGN/MEMBS defined on the TRUNK form with DEN dchan set to 26 - 37, with TRKCLS of "TSTK" on the associated TKGRP form, the DEN dchan that is set to 25 must also have a TRKCLS of "TSTK" on the associated TKGRP form.

When TGN/MEMBs defined on the TRUNK form with DEN dchans set to 14 - 24 or 38 - 48, with a TRKCLS of "TSTK" on the associated TKGRP form, these channels cannot be assigned to digital test trunks.

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 1 on the TRUNK form, DENs dchans 14 - 24 cannot be assigned on the CCLNK, LINE, MLHLN, TRUNK or XAT forms.

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 25 on the TRUNK form, DENs dchans 38 - 48 cannot be assigned on the CCLNK, LINE, MLHLN, TRUNK or XAT forms.

When TGN/MEMBs defined on the TRUNK form have the DEN dchan (D-channel) set to 1, TRKCLS of

Copyright © 2003 Lucent Technologies

"TSTK" , and DEN dchans 2 -13 assigned on the CCLNK, LINE, MLHLN, TRUNK or XAT forms, these DENs must also have a TRKCLS of "TSTK"

When TGN/MEMBs defined on the TRUNK form have the DEN dchan (D-channel) set to 25, TRKCLS of "TSTK" , and DEN dchans 26 - 37 assigned on the CCLNK, LINE, MLHLN, TRUNK or XAT forms, these DENs must also have a TRKCLS of "TSTK"

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 2 - 13 on the TRUNK form,

- DEN dchan 1 must be assigned to a MEMB on the TRUNK form.

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 26 - 37 on the TRUNK form,

- DEN dchan 25 must be assigned to a MEMB on the TRUNK form.

When TRKCLS is "TSTK" and the DEN dchan (D-channel) is set to 2-13 or 26-37 on the TRUNK form, and TRK DIR is "OUT"

- HUNT TYPE must be "FIFO"
- OUT START DIAL on the TRUNK form must be "WINK" or blank
- OUTPULSING on the TKGRP form must be "MF" or blank.

X75:
A maximum of 255 TKGRP forms can be entered with this trunk class. Each trunk group may contain at most twenty-four trunk members; each member number must be in the range 0 - 23.

X75 trunk group members may reside on different non-remoted SMs (SM USAGE on EQIM is "IM" or "HIM"). If an X.75 trunk group resides on a remoted SM (SM USAGE on EQIM is "TRM", "ORM" or "RSM"), then all members of the trunk group must reside on the same SM.

On the corresponding TRUNK forms (5204 Record) IDLE STATE must be "ON", EXT GUARD TIMING and ASWER DELAY TIMING must be "N" or left blank, and IN START DIAL and OUT START DIAL must not be entered.

X75 trunks must have entries in the following fields:
- BRCS must be "N"
- DATA RATE must be 56K
- FAR END LATA must not be entered
- GLARE ACTION must be "ALLCTRL"
- HUNT TYPE must be "PSUCD"
- INPLS must be "NONE"
- INSEP must be blank
- OUTPLS must be "NONE"
- REMOTE DNIC must be 1 - 9999
- SATELLITE must be "N"
- TRK DIR must be "2W"

and
- IC PRESELECT and TNIC INDICATOR
- on the TRUNK form (5204 Record)

PBX ID must not be specified when TRKCLS is "X75".

Copyright © 2003 Lucent Technologies

VPA TYPE must be unknown or "NOVPA" when TRKCLS is "X75".

For 5E8 and later, NBR PLAN must be "X121" or "E164".

- ILC SCRN must be entered.

For 5E8 and later, if a ROUTE INDEX defined on the RTIDX form (5303 Record) has a TRUNK GROUP NUMBER and a NEXT ROUTE entered, and the TRUNK GROUP NUMBER is defined on the TKGRP form with a TRKCLS of "X75P" or "X75", then the NEXT ROUTE on that ROUTE INDEX form must be defined as the ROUTE INDEX on another RTIDX form where the TRUNK GROUP NUMBER is defined on the TKGRP form with a TRKCLS set to "X75P", "X75", or "PACKET".

For 5E9(1) and later, if the TRUNK GROUP NUMBER defined on an RTIDX input form has TRKCLS set to "X75", "X75P", or "PACKET" on the associated TKGRP form, then at least one TRUNK input form must be defined for the associated TKGRP form.

For 5E10 and later:
If "X75" is entered:

- FAR END NPA must not be entered.
- X75 trunks cannot have an ISCN SHELF andform can not have an ISCN SHELF and CHL GRP (the first three characters of the ISCN) which are mixed with Protocol Handlers from other BRI or PRI DSLs in the same SM. The "X75" TRUNK forms cannot have a common SHELF and CHL GRP with the following forms:

  CCLNK

  DSLUSR

  MDLNK

  MISLINK

  PSULNK

  QPHPIPE

  XAT

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

For 5E13 and later, when TRKCLS is "X75" or "X75P", DATA RATE must be "56K" or "64K".

X75P:
X75P trunk group members may reside on different non-remoted SMs (SM USAGE on EQIM is "IM" or "HIM"). If an X.75' trunk group resides on a remoted SM (SM USAGE on EQIM is "TRM", "ORM" or "RSM"), then all members of the trunk group must reside on the same SM.

Copyright © 2003 Lucent Technologies

For 5E8 and later, a maximum of 255 TKGRP forms can be entered with this trunk class. Each trunk group may contain at most twenty-four trunk members; each member number must be in the range 0 - 23.

When TRKCLS is "X75P" then:
- COIN must be "N" or not entered
- DATA RATE must be 56K
- DSN ARC ID must be 0 or not entered
- ENQUEUE ACT must "N" or not entered
- FAR END LATA must equal 0 or not entered
- FAR END NXX must not be entered
- GLARE ACTION must be "ALLCTRL"
- HUNT TYPE must be "PSUCD"
- INSEP must be blank
- MK BUSY must be "N" or not entered
- MAKE BUSY KEY must not be entered
- PBX ID must not be entered
- RLT FLASH must be N
- RLT TYPE must be NONE
- SATELLITE must be "N"
- TRK DIR must be "2W"
- VPA TYPE must be blank or "NOVPA"

and
- TNIC INDICATOR and ACCESS CHAR
- on the TRUNK form (5204 Record) must have an entry.

For 5E6 and later, when TRKCLS is "X75P", fields on the member TRUNK forms must be set as follows:

- ANSWER DELAY TIMING must be "N" or not entered
- EXT GUARD TIMING must be "N" or not entered
- IDLE STATE must be "ON"
- IN START DIAL must not be entered
- OUT START DIAL must not be entered

For 5E8 and later, NBR PLAN must be "X121" or "E164".

For 5E8 and later, if "X75P" is entered, and if "Y" is entered in the following fields or the following fields are not entered on the TRUNK form (5204 Record):
- ACCESS CHAR
- TRANS SUB NET CNT
- CLEAR SUB NET ID

then the X75' trunks must have UTILITY MARKER set to "Y" on the TRUNK form.

For 5E9(1) and later, if the TRUNK GROUP NUMBER defined on an RTIDX input form has TRKCLS set to "X75", "X75P", or "PACKET" on the associated TKGRP form, then at least one TRUNK input form must be defined for the associated TKGRP form.

For 5E10 and later:

- When TRKCLS is "X75P", FAR END NPA must not be entered.

Copyright © 2003 Lucent Technologies

- When a TGN is defined on a TKGRP input form with TRKCLS set to "X75" or "X75P", at least one MEMB must be defined on a TRUNK form with the first three digits of DEN or NEN matching an SM defined on an EQIM input form where SM USAGE equals "RSM", "ORM", or "TRM". All MEMBs associated with this TGN must have the same first three digits of DEN or NEN.
- "X75P" trunks cannot have an ISCN SHELF andCHL GRP (the first three charactersof the ISCN) which are mixed with Protocol Handlers from other BRI or PRI DSLs in the same SM. The following "X75P" TRUNK forms cannot have common SHELF and CHL GRP.

  AMLBDSL

  CCLNK

  DSL

  DSLAP

  DSLUSR

  MDLNK

  MISLINK

  ODBRES

  OSPSDSL

  PSISM

  PSULNK

  QPHPIPE

  RTERM

  XAT

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must not be "NONE" on this form.

General:
For 5E6 and later, TRKCLS must be "PACKET", "X75P" or "X75" if at least one of the following fields is entered on the TRUNK form (5204 Record): OCU LOOPBACK, CSU LOOPBACK, LAPB ADDR, WINDOW SIZE, RETRANS N2, ACK TIME T1 and IDLE TIME T3. TRKCLS must be "X75P" or "X75" if LINK ID or HIGH PVC LCN is entered on the TRUNK form.

Copyright © 2003 Lucent Technologies

If OUTPULSING or INPULSING is entered as "CCIS6", then TRKCLS must be "LTOLLCON", "TTOLLCON", "PRINTOLL", "SCINTOLL", "BVINTOLL", or "BVTOLLCM", and BRCS must be "N".

When a trunk group is entered on an ARSTPA form with QUEUE ALLOWED "Y", the TRKCLS on this form must be "PF", "PFITT", "PFLASH" or "EDSL".

For 5E4(2) and later, if trunks in this group are assigned a Precedence and Preemption feature on the TRUNKFA form or associated CLUSTR form, then the TRKCLS entered here must agree with the DSN (Defense Switched Network) TRUNK TYPE on the PPFD (5618-1 Record) or PPTPA (5618-5) form as follows. If TRUNK TYPE is "OFFNET", "TIEPNID", "TIERNID", or "VONPNID", then TRKCLS must be "LTOLLCON". If TRUNK TYPE is "SATINID" or "SATPID", TRKCLS must be "PBXDID"; and if TRUNK TYPE is "VONRNID", TRKCLS must be "LTOLLCON", "PF", "PFITT", or "PFLASH".

For 5E10 and later,the following forms:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- RTERM
- XAT

along with all TRUNK forms which have a TRKCLS of "EDSL", "IFTERM" or "IFOPER" defined on the TKGRP form can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM. However, they cannot have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from CCLNK forms,

- MDLNK forms,
- PSISM forms,
- PSULNK forms, or
- TRUNK forms which have a TRKCLS of
- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

defined on the TKGRP form.

Each Switching Module (SM) can have up to 5 PSU SHELFs. On the EQIM form, when UNIT TYPE is not "SM2000" each PSU SHELF can be assigned up to (32 times X) timeslots for the following table of applications. (Note: X represents the number of PIDBs, 0 to 4, provisioned per shelf.)

For 5E10 and later, the following data rule is not executed on an SM-2000, because provisioning of nailed-up timeslots is not required on an SM-2000. Each DI (Data Interface) in a SM can have a maximum of 256 nailed-up timeslots reserved for the application in the following table. These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the following applications. Note that a D channel only takes a quarter of a time slot.

The time slots are reserved for the following applications:

Timeslots Reserved for Applications

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on

Copyright © 2003 Lucent Technologies

	TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

The following data rule is not executed on an SM-2000, provisioning of nailed-up time slots is not required on an SM-2000.On a PSU1 , each Data Interface in a SM can have a maximum of 128 nailed-up time slots reserved for the following applications:

Timeslots Reserved for Applications

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

These time slots can be reserved by entering the rows RPTSS0 to RPTSS7 on the EQPSU form. The quantity of time slots reserved (i.e. the number entered) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D channel only takes a quarter of a time slot.

Also, the reserved time slots must be entered such that for any given SHELF, (defined by the first digit of ISCN field or by the SHELF field on the MISLINK form), the time slots assigned to that SHELF must not be duplicated in the same vertical (column) position if they appear in more than one row (RPTSS0 through RPTSS7).

The following Trunk Class entries apply to Trunk Groups which carry toll office traffic. Refer to Figure 2 for applicable Address Signal and Start Dial combinations.

Valid TRKCLS Entries (Toll Office Traffic)

Copyright © 2003 Lucent Technologies

Entry	Definition
AUXTRNK	Toll to Special Services. Outgoing.
BVINTOLL	Busy Verification on Intertoll Trunks. Outgoing.
BVTOLLCM	Busy Verification on Toll Completing Trunks. Outgoing.
BUSYVFY	Busy Verification on Primary Intertoll Trunks. Incoming.
CAMOPKEY	Outgoing CAMA Operator Keying Trunks.
CAMOPTLK	Outgoing CAMA Operator Talking Trunks.
CAMAONI	Incoming CAMA, Operator Number Identification.
CAMAANI	Incoming CAMA, Automatic Number Identification.
DIOR	Software Release: 5E6 and later. Direct International Originations.
FIOPR	Software Release: 5E4(2) and later. Intermediate Switch Point for incoming operator trunks.
FOPRI	Software Release: 5E4(2) and later. Intermediate Switch Point for outgoing operator trunks to OSPS.
FOPRT	Software Release: 5E4(2) and later. Intermediate Switch Point for outgoing operator trunks to TSPS.
FXROTL	Foreign Exchange line from a nearby Central Office to a toll or tandem office having no Directory Numbers. Used for ROTL in the toll or tandem office. Refer to Division 2, Section 2I.
IC	Interexchange Carrier Trunks. Incoming, Outgoing or Two-Way for direct connection between an AT (Access Tandem) and a Carrier.
IFOPER	Software Release: 5E5 and later. Originating end of an OSPS EDSL (PRI) trunk, defined on the originating OSPS Interflow switch.
IFTERM	Software Release: 5E5 and later. Terminating end of an OSPS EDSL (PRI) trunk, defined on the receiving end OSPS Interflow switch.
INAISTRK	Software Release: 5E6(2) and later. Listing Services incoming Automatic Intercept System trunk.
LATA	Intertoll Trunks from a LATA.
PRINTOLL	Primary Intertoll Connecting Trunks. Incoming, Outgoing, or Two-Way. For use by AT&T.
RAFANNC	Software Release: 5E4(2) and later. Recorded announcement function frame.
RAFCTR	Software Release: 5E4(2) and later. RAF coin tone receiver.
RAFDTA	Software Release: 5E4(2) and later. RAF dial-through announcement.
SCINTOLL	Secondary Intertoll Connecting Trunks. Incoming, Outgoing, or Two-Way.
SPAB800	Software Release: 5E5 and later. Special Access Basic 800 Service.
SPAM800	Software Release: 5E5 and later. MEGACOM 800 Service, a volume discount service.
SPAMEG	Software Release: 5E5 and later. MEGACOM Service is a volume discount service.
SPAWATS	Software Release: 5E5 and later. Special Access WATS (Wide Area Telecommunications Service).
TCIKT	Software Release: 5E4(2) and later. OSPS transfer CAMA incoming keying trunks.
TCITT	Software Release: 5E4(2) and later. OSPS transfer CAMA incoming talking trunks.
TTOLLCON	Toll Connecting Trunk. Incoming, Outgoing, or Two-Way. Used in an AT (Access Tandem) office for trunk groups from end offices or other tandems. Also used by Long Distance Platform feature (SFID 165) for trunks between two toll switches.

Data Rules for Toll Office TRKCLSs:

AUXTRNK:
Applications include: Rate and Route Trunks One-Way from the 5ESS Switch toll office to cord switchboards or desks through which Rate and Route operators are reached; Directory Assistance Trunks, One-Way from the 5ESS Switch toll office to a No. 5 ACD through which Directory Assistance operators are reached. A HUNT TYPE of "FIFO" and a TRK DIR of "OUT" must be used with this Trunk Class.

BVINTOLL:

Copyright © 2003 Lucent Technologies

A HUNT TYPE of "FIFO" and a TRK DIR of "OUT" must be used with this Trunk Class.

BVTOLLCM:
A HUNT TYPE of "FIFO" and a TRK DIR of "OUT" must be used with this Trunk Class.

BUSYVFY:
BUSYVFY trunks must be incoming.

INPULSING is required for BUSYVFY trunks.

For 5E10 and later, FAR END NPA must not be entered.

CAMAANI:
For 5E6 and later, when TRKCLS is "CAMAANI", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "CAMAONI".

CAMAANI trunks must be incoming and the following apply:

- INPULSING must be entered
- ORIG NPA must be entered
- OFFCODE 1 must be entered

CAMA trunk office codes must be entered in sequential order. The office codes associated with CAMA trunks cannot be duplicated.

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

CAMAONI:
For 5E6 and later, when TRKCLS is "CAMAONI", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "CAMAONI".

For 5E11 and later, when TRKCLS is "CAMAONI":

- TRK DIR must be "INC".
- INPULSING must be specified.

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

CAMOPKEY:
This Trunk Class is used in conjunction with Trunk Class "CAMOPTLK" to establish the CAMA Operator Trunks which carry CAMA ONI traffic. A CAMA Operator connection consists of a Keying Trunk used to key the calling number into the CAMA office and a Talking Trunk over which the CAMA operator is able to obtain the calling number. Each Trunk Class (CAMOPKEY or CAMOPTLK) requires a separate One-Way Outgoing Trunk Group. These Trunk Groups must have the same number of members. A HUNT TYPE of "FIFO" and a TRK DIR of "OUT" must be used with this Trunk Class.

For 5E6 and later, when TRKCLS is "CAMOPKEY", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "CAMAONI".

For 5E7 and later, trunk members of a trunk group with a TRKCLS of "CAMOPKEY" or "TCIKT" must reside on the same Switching Module as the trunk member that has the TALKING TRUNK TGN and MBR NO entered, i.e. the first three digits of the DEN, TEN, or (for 5E9(2) and later) NEN must be the same.

CAMOPTLK:

Copyright © 2003 Lucent Technologies

These Trunks are associated with CAMA Operator Keying Trunks. See above description for CAMOPKEY Trunk Class.

For 5E7 and later, trunk members of a trunk group with a TRKCLS of "CAMOPTLK" or "TCITT", must reside on the same Switching Module as the trunk member that has the KEYING TRUNK TGN and MBR NO entered, i.e. the first three digits of the DEN, TEN, or (for 5E9(2) and later) NEN must be the same.

DIOR:
"DIOR" must have an associated OPRTK form (5417 Record) with an entry of "Y" in the DIOR NPA field and an entry from 100 to 199 in the ORIG NPA field. Other restrictions are explained on that form.

For 5E8 and later, if "DIOR", "FIOPR", "FOPRI", or "INAISTRK" is entered, the members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports incoming AIS trunks. For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E10 and later, if "DIOR" is entered and TRK DIR is "INC", then FAR END NPA must not be entered.

FIOPR:
TGNs that are defined with a TRKCLS of "FIOPR" must have a corresponding OPRTK form (5417 Record) defined; they must have a TIMING form (5520 Record) defined with matching TGNs and a SERVICE CLASS of "FIOPR".

A TGN defined with a TRKCLS of "FIOPR" must have INPULSING set to "MF" or "DP". It must have a corresponding OPRTK form (5417 Record); it must also have a TIMING form (5520 Record) with matching TGN and a SERVICE CLASS of "FIOPR".

For 5E8 and later, if "DIOR", "FIOPR", "FOPRI", or "INAISTRK" is entered, the members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports incoming AIS trunks. For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

FOPRI:
For 5E8 and later,if "DIOR", "FIOPR", "FOPRI", or "INAISTRK" is entered, the members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports incoming AIS trunks. For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

IC:
Used for direct connections with a Carrier, except when the Trunk Group is outgoing to an Operator Service Position use TSPS for Trunk Class, or when the Trunk Group is outgoing to a FGB (Feature Group B) Carrier requesting ANI use CAMA for Trunk Class. For carrier calls in an EAEO (Equal Access End Office) which route via an Access Tandem (i.e., they are not directly connected to the Carrier), the Trunk Class of "LTOLLCON" should be used.

For 5E6 and later Software Releases, if the TRKCLS is "IC" and the Trunk Group is Outgoing or Two-Way (TRK DIR "OUT" or "2W"), the OUTPULSING signaling may be "MF", "CCIS6", or "ISUP7". If the TRK DIR is "INC" or "2W", the INPULSING signaling may be "MF", "CCIS6", or "ISUP7".

- ***NOTE:*** FGB signaling with ANI is not valid on a tandem connection.

When TRKCLS is "IC", CARRIER ID must be entered, and for 5E8 and later, FEAT GRP must be entered.

For 5E6 and later, if DLTU TYPE on the corresponding EQDU form (5730 Record) is "DLTU24" or "DLTU48" and the INPULSING or OUTPULSING field on this form is "MF", then DATA RATE on this form must be "56K" or not entered. The EQDU form is found by matching the SM and the DLTU NUMBER with the first 3 digits and the 4th digit of the DEN, respectively, on the TRUNK form.

Copyright © 2003 Lucent Technologies

For 5E6 and later, when TRKCLS is "IC", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "INVNODIG".

IFOPER:
Note that there is a limit of 20 PRIs to an SM, although this limit may be lower due to traffic engineering constraints.

If "IFOPER" is entered in the TRKCLS field,

- then on the corresponding TRUNK forms: DEN must be specified; the SUPV, IN START DIAL, and OUT START DIAL fields must be blank; and the EXT GUARD TIMING and ANSWER DELAY TIMING fields must be "N" or blank.

- for 5E7 and later, if "IFOPER" is entered and it is assigned to a B-channel (for a B-channel, the last 2 digits of the DEN are in the range of 1-23 or 25-47), then a corresponding OSPSOP form must be entered, where the DEN of the corresponding TRUNK form (TGN on this form matches TGN on the TRUNK form) matchesthe DEN on the OSPSOP form.

- and if "SGNL" is entered in the TRK DIR field, each member of the trunk group must be a D-channel. On the corresponding TRUNK forms, the ISCN and PSCLI fields must be specified, and the last two digits of the DEN field must be 24 or 48.

- and if "OUT" is entered in the TRK DIR field, then each member of that trunk group must be a B-channel. On the corresponding TRUNK forms the last two digits of the DEN field must be in the range 1 to 23 or 25 to 47.

- for 5E6 and later, and if the DLTU TYPE is "DLTU24" or "DLTU48" on the corresponding EQDU form(5730 Record), the INPULSING or OUTPULSING field on this form is "DCHN", and TRK DIR is "2W", "INC", or "OUT", then DATA RATE on this form must be "56K", "R64K", "64K", or not entered. If "DLTU24" or "DLTU48" is entered in DLTU TYPE on the corresponding DLTU form (5730 Record), "DCHN" is entered in the INPULSING or OUTPULSING field on this form, and TRK DIR is "SGNL", then the DATA RATE field on this form must not be entered. The corresponding EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit respectively of the DEN on the TRUNK form (5204 Record).

- For 5E8 and later, OSPS PSM field on the EQIM form must be "Y"for Switching Modules in which Interflow pseudo operator trunks are located. Therefore, if "IFOPER" is entered, then OSPS PSM must be "Y" on the EQIM form(s) corresponding to the Switching Modules (SMs) in which the "IFOPER" trunks are located.

Navigation help: TRUNK forms assign trunk group members (TGN on the TRUNK forms matches the TKGRP TGN) to SMs and trunk equipment. The SM part of the DEN (first three digits) on the TRUNK forms point to the SM on an EQIM form.

- for 5E9(2) and later, the trunk members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports incoming AIS trunks. For the CONFIGURATION that supports this TRKCLS value,see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E10 and later:
If "IFOPER" is entered:

- the associated MEMBs on the TRUNK form must have the required entry for DEN.

- and have TGN/MEMBs on the TRUNK form whose DEN[1,3] or NEN[1,3] values match an SM on the EQIM form with UNIT TYPE of SM2000, is not allowed.

Copyright © 2003 Lucent Technologies

- on the TRUNK form:

  ANSWER DELAY TIMING must be "N" or not entered

  EXT. GUARD TIMING must be "N"

  IN START DIAL must not be entered

  OUT START DIAL must bE

  SUPV must be "EM2" or not entered

For 5E9(1) and later: each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks).

For 5E11 and later, when TRKCLS is "IFOPER" and TRK DIR is "OUT", OUTPULSING must be "DCHN".

The following applications define the possible LLCB assignments. These application cannot use more than 384 LLCBs.

LLCB Assignments

Form	SM SHELF CHL GRP	LLCB Count
AMLBDSL	SM is the first three digits of LCEN SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of PPB1 ISCN.	The count is incremented by 1 for each PPB1 ISCN defined.
DSL	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of PPB2 ISCN.	The count is incremented by 1 for each PPB2 ISCN defined.
DSL	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of D ISCN.	If a matching DSLUSR form is not found the count is incremented by 1.
DSLAP	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 1 for each unique OE/ISCN combination.
DSLUSR	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of D ISCN on the corresponding DSL form.	The count is incremented by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered. The count is incremented by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
DSLUSR	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of ODB ISCN1 and/or ODB ISCN2.	The count is incremented by 1 if only ODB ISCN1 is entered. The count is incremented by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
MISLINK	SM is the first three digits of OE SHELF and CHL GRP are the SHELF and CHL GRP fields, respectively.	The count is incremented by 1 for each MISLINK form.
OSPSDSL	SM is the first three digits of LCEN. SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined. Otherwise, the count is incremented by 1 for each unique OSPSDSL form.
RTERM	Where RT INTERFACE is "TR303" SM is SM SHELF/CHL GRP is the first three digits of TMC PRI ISCN, TMC NPRI ISCN,	The count is incremented by 2 for each TMC PRI ISCN and for each TMC NPRI ISCN entry. The count is incremented by 3 for each EOC PRI

Copyright © 2003 Lucent Technologies

	EOC PRI ISCN or EOC NPRI ISCN.	ISCN and for each EOC NPRI ISCN entry.
TRUNK	TRKCLS equals to "IFOPER", "IFTERM" or "EDSL" on the TKGRP form. SM is the first three digits of DEN or NEN SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 1 for each unique TRUNK form.
XAT	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 1 for each unique XAT form.

IFTERM:
Note that there is a limit of 20 PRIs to an SM, although this limit may be lower due to traffic engineering constraints.

If "IFTERM" is entered in the TRKCLS field, then on the corresponding TRUNK forms: DEN must be specified; the SUPV, IN START DIAL, and OUT START DIAL fields must be blank; and the EXT GUARD TIMING and ANSWER DELAY TIMING fields must be "N" or blank.

For 5E6 and later, if the DLTU TYPE is "DLTU24" or "DLTU48" on the corresponding EQDU form (5730 Record), the INPULSING or OUTPULSING field on this form is "DCHN", and TRK DIR is "2W", "INC", or "OUT", then DATA RATE on this form must be "56K", "R64K", "64K", or not entered. If "DLTU24" or "DLTU48" is entered in DLTU TYPE on the corresponding DLTU form (5730 Record), "DCHN" is entered in the INPULSING or OUTPULSING fields on this form, and TRK DIR is "SGNL", then the DATA RATE field on this form must not be entered. The corresponding EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit respectively of the DEN on the TRUNK form (5204 Record).

If "SGNL" is entered in the TRK DIR field, each member of the trunk group must be a D-channel. On the corresponding TRUNK forms, the ISCN and PSCLI fields must be specified, and the last two digits of the DEN field must be 24 or 48.

If "INC" is entered in the TRK DIR field, then each member of that trunk group must be a B-channel. On the corresponding TRUNK forms the last two digits of the DEN field must be in the range 1 to 23 or 25 to 47.

For 5E6 and later, if TRKCLS is "IFOPER" or "IFTERM", there must be a corresponding INFLTADP form (5452 Record) where DCHTGN or BCHTGN in the OSPS LIST equals TGN on this TKGRP form.

See "IFOPER" for 5E9(1) and later data rule for LLCB assignments.

For 5E10 and later:
If "IFTERM" is entered, then:

- the associated MEMBs on the TRUNK form must have the required entry for DEN.
- and have TGN/MEMBs on the TRUNK form whose DEN[1,3] or NEN[1,3] values match an SM on the EQIM form with UNIT TYPE of SM2000, is not allowed.
- on the TRUNK form:

  ANSWER DELAY TIMING must be "N" or not entered

  EXT. GUARD TIMING must be "N"

  IN START DIAL must not be entered

Copyright © 2003 Lucent Technologies

OUT START DIAL must be entered

SUPV must be "EM2" or not entered

INAISTRK:
For 5E6(2) and later, if TRKCLS is "INAISTRK" then the following conditions must be met.

- The following fields must be "N":

ACP SDN

AUDIBLE

BARGE IN

BRCS

BW LAMP

COINRTN FNL

COINRTN INT

CUT THRU

FREE ANS

FREE TERM

HOLD BUSY

INC TND WINK

INTER SM TRK

LN VIRT

LS DLY ANS

OUTPLS REQ

PRIVACY

Copyright © 2003 Lucent Technologies

RETRY

SATELLITE

SDN STAT GRP

TRUNK QUERY

UNRES EA

XLT TEST

- The following fields must not be entered if "INAISTRK" is entered:

BUSY LAMP

CARRIER ID

CYCLES

DATA RATE

DSN ARS ID

ENQUEUE ACT or it must be "N"

FAR END LATA

FAR END NPA

FAR END NXX

FEND CLLI

HUNT TYPE

LOCAL RSM

MAKE BUSY KEY

NEND CLLI

NEXT PSN

Copyright © 2003 Lucent Technologies

ORIG LATA

PBX ID

SIGNAL

TRUNK CHAR

TSPS TYPE

VPA RATE

WARN THRESH

- If the following fields are entered they must be "NONE":

  OUTPULSING

  RLT TYPE

- The following fields must be "NONE":

  LN TYPE

  NCD SCREENING

- CCS7 TYPE must be "BELLCORE".
- DIR CON DN must be 6, 7, or 8 for incoming seizure only trunks.
- INPULSING must be "NONE", "MF" or "DP".
- SVC GRP must be "NOANNC".
- TRK DIR must be "INC".
- VPA TYPE must not be entered, or VPA TYPE is "NOVPA".

If TRKCLS is "INAISTRK" on the TKGRP form, the following forms are affected:

- APGFP form:

  The corresponding APGFP form is found by matching GROUP NO/GROUP NAME of APGFP with TGN of TKGRP form and GROUP/FACILITY TYPE of APGFP form must be "TRKG".

  - NUTS/LUTS ACTIVE on the APGFP form must be "N".
  - SHT THRESHOLD on the APGFP form must be 0.

Copyright © 2003 Lucent Technologies

- LHT THRESHOLD on the APGFP form must be 0.

- TRUNK form:

  The corresponding TRUNK form is found by matching the TGN value with the TGN value on this form.

  If the trunk members on a TRUNK form belong to a trunk group which has a TRKCLS value of "INAISTRK", the members must not be assigned to an SM on an EQIM form with a CONFIGURATION of "BASIC". Also, if the INPULSING field on the TKGRP form is equal to "NONE", then the associated TRUNK form(s) must have IN START DIAL set to "DIRC". Conversely, if the INPULSING field on this form is not equal to "NONE", then the associated TRUNK form(s) cannot have IN START DIAL set to "DIRC".

  If TRK DIR on the TKGRP form is equal to "OUT", then the associated TRUNK form(s) must have IN START DIAL set to "DIRC", "IMED", "WINK" or "DLAY".

  The associated TRUNK form(s) must not have OUT START DIAL set to "STOP".

  Also, the associated TRUNK forms must have ANSWER DELAY TIMING set to "N".

- TIMING form:

  At least one TIMING form must be submitted with a SERVICE CLASS of "INAISTRK". SIGNAL TYPE on the TIMING form equals the INPULSING on the TKGRP Form and START SIGNAL on the TIMING form equals the IN START DIAL on the TRUNK form.

For 5E8 and later, if "DIOR", "FIOPR", "FOPRI", or "INAISTRK" is entered, the members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports incoming AIS trunks. For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E15 and later, when TRKCLS is "INAISTRK", CQ/BQ ALW must be "N".

LATA:
Used by an Interexchange Carrier switch on Incoming or Two-Way Trunk Groups from an Equal Access End Office or Access Tandem. Also used by the Interexchange Carrier for CMC (Cellular Mobile Carrier) Trunk Groups. If any Trunk Group is defined with this Trunk Class, the Fixed Route Type of "ESMRT" must be defined on the FIXRT form (5301-1 Record). For 5E5 and later, an entry of "LATA" requires an entry of "Y" in the OFFICE TYPE field of the OFCOPT form (5509 Record) indicating that this is a Toll office. For 5E6 and later, if the Trunk Group is Outgoing or Two-Way, TRK DIR is "OUT" or "2W", the OUTPULSING signaling may be "MF", "CCIS6", or "ISUP7". If the TRK DIR is "INC" or "2W", the INPULSING signaling may be "MF", "CCIS6", or "ISUP7"

For 5E6 and later, if DLTU TYPE on the corresponding EQDU form (5730 Record) is "DLTU24" or "DLTU48" and the INPULSING or OUTPULSING field on this form is "MF", then DATA RATE on this form must be "56K" or not entered. The EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit of the DEN, respectively, on the TRUNK form.

For 5E6 and later, when TRKCLS is "LATA", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "ESMRT".

PRINTOLL:
For use by AT&T only. Specify this Trunk Class for trunks that interconnect two toll offices. All Primary Intertoll Trunks can carry the Ring Forward and Ring Back Signals. For 5E5 and later, an entry of "PRINTOLL" requires an entry of "Y" in the OFFICE TYPE field of the OFCOPT form (5509 Record) indicating that this is a Toll office.

Copyright © 2003 Lucent Technologies

For 5E6 and later, if DLTU TYPE on the corresponding EQDU form (5730 Record) is "DLTU24" or "DLTU48" and the INPULSING or OUTPULSING field on this form is "MF", then DATA RATE on this form must be "56K" or not entered. The EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit of the DEN, respectively, on the TRUNK form.

RAFANNC:
For 5E6 and later, the TKGRP form with a TRKCLS of "RAFANNC" cannot be assigned AOCs (Announcement Only Channels) with RAFs that have a RAF SERVICE TYPE of "DTA" or "CTR" unless the AOC field has a value of "Y" on the EQRA form (5821 Record).

For 5E8 and later, when TRKCLS is "RAFANNC":
- QUEUE FEATURE cannot be entered
- RETRY must be "N"
- SVC GRP must be "AOC" or "DA"

RAFCTR:
For 5E5 and later, when the TRKCLS is "RAFCTR", and RAF EN is entered on the TRUNK form, then the RAF ENs must be assigned according to the stuffing patterns shown on the 5271-4 Record. See Division 3, Section 2Q, for more information on stuffing patterns.

For 5E8 and later, when TRKCLS is "RAFCTR":
- ENQUEUE ACT must not be "Y"
- QUEUE FEATURE must not be entered
- PBX ID must be unknown (5E9(1) and later)
- SVC GRP must be "COIN"
- TRK DIR must be "RAF"

RAFDTA:
For 5E5 and later, when the TRKCLS is "RAFDTA", and RAF EN is entered on the TRUNK form, then the RAF ENs must be assigned according to the stuffing patterns shown on the 5271-4 Record. See Division 3, Section 2Q, for more information on stuffing patterns.

For 5E8 and later, when TRKCLS is "RAFDTA":
- PBX ID must be unknown (5E9(1) and later)
- RETRY must be "N"
- SVC GRP must be
- "ACCS"
- "ACSR"
- "ASP"
- "RAS"

If TRKCLS is "RAFDTA" and SVC GRP is "ACCS", then QUEUE ALLOWED must be "Y".

SPAB800:
Special Access Basic 800 service allows calls that terminate at a 5ESS Toll Switch to be routed to the customer's PBX over a dedicated trunk group. The called party will be billed for the call.

SCINTOLL:
These trunks interconnect the 5ESS Switch toll office with a manual switchboard or TSPS. The 5ESS Switch toll office and the switchboard or TSPS are of equal class and are associated as a single unit.

Secondary Intertoll Trunk applications include:

Copyright © 2003 Lucent Technologies

- Toll Tandem Trunks One-Way from a switchboard or TSPS to the 5ESS Switch toll office.
- OA (Operator Assistance) and LW (Leave Word) Trunks One-Way from the 5ESS Switch toll office to an OA or LW operator at a switchboard or TSPS.
- Residual Trunks One-Way from the 5ESS Switch to a switchboard are used by the originating operator to reach another operator to assist in call completion.
- Delayed Call Trunks are used by a TSPS operator to reach both the calling and called parties by establishing two separate connections through the serving 5ESS Switch toll office. The called and calling parties are joined at the TSPS through the delayed call trunk circuit which has two separate and distinct incoming trunk appearances in the 5ESS Switch toll office.

For 5E6 and later, if DLTU TYPE on the corresponding EQDU form (5730 Record) is "DLTU24" or "DLTU48" and the INPULSING or OUTPULSING field on this form is "MF", then DATA RATE on this form must be "56K" or not entered. The EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit of the DEN, respectively, on the TRUNK form.

SPAM800:
MEGACOM 800 is similar to the Special Access Basic 800 service except that the customer must supply the direct connection to the 5ESS Toll Switch. The called party will be billed for the call.

SPAMEG:
MEGACOM is similar to WATS service except that there is no subscription to a band and the customer must supply the direct connection to the 5ESS Toll Switch. The 5ESS Switch will process the call like a WATS band 6 call. For this Trunk Class, the SPA BILL DN and SPA SUPV fields must be entered.

SPAWATS:
Special Access WATS is similar to regular switched WATS except Special Access WATS allows a customer's PBX (digital or analog) to connect directly to the 5ESS Toll Switch via a T1 carrier. Special Access WATS customer's calls will be incoming to the 5ESS Toll Switch via this dedicated trunk group. The 6th digit of the SPA BILL DN will determine the customer's subscribed band number. For this Trunk Class, the SPA BILL DN and SPA SUPV fields must be entered.

TCIKT:
TGNs defined with a TRKCLS of "TCIKT" must have a TCITG form (5422 Record) defined with matching TGNs.

For 5E7 and later, trunk members of a trunk group with a TRKCLS of "CAMOPKEY" or "TCIKT" must reside on the same Switching Module as the trunk member that has the TALKING TRUNK TGN and MBR NO entered, i.e. the first three digits of the DEN, TEN, or (for 5E9(2) and later) NEN must be the same.

TCITT:
TGNs defined with a TRKCLS of "TCITT" must have a TCITG form (5422 Record) defined with matching TGNs.

For 5E7 and later, trunk members of a trunk group with a TRKCLS of "CAMOPTLK" or "TCITT" must reside on the same Switching Module as the trunk member that has the KEYING TRUNK TGN and MBR NO entered, i.e. the first three digits of the DEN, TEN, or (for 5E9(2) and later) NEN must be the same.

For 5E8 and later, each member of this trunk group is defined as MEMB on a TRUNK form where KEYING TRUNK TGN and KEYING TRUNK MBR NO are entered. The keying trunk must be defined as TGN and MEMB on another TRUNK form.

For 5E9(1) and later, "TCITT" trunk group members must be defined with REMOVE TRUNK set to "Y" on the TRUNK form when the trunk is located on an SM for which the EQIM form has STAND ALONE set to "Y" or the associated EQSITE form (5722 Record) has STAND ALONE PURCHASED set to "Y".

Copyright © 2003 Lucent Technologies

TTOLLCON:
Specify this Trunk Class for DDD Access and Toll Completing Trunks. DDD Access Trunks are trunks from a Class 5 to a toll office which carry non-coin toll traffic. Also specify this Trunk Class for trunks at an Access Tandem or local tandem switch for trunks from a class 5 office or another tandem. Also specify this Trunk Class for the trunks between two Long Distance Platform switches using the LDP feature (SFID 165 on the SFSYS form set to "Y"). Recording and timing are done at the local office. Operator assistance is never required. Toll Completing Trunks are trunks from a toll office to a Class 5 office. This Trunk Class may also be used for RSMs.

For 5E6 and later, when TRKCLS is "TTOLLCON" and TRK DIR is "2W", OUTPULSING must be "MF", "DP", "TT", "CCIS6", or "ISUP7".

For 5E6 and later, if DLTU TYPE on the corresponding EQDU form (5730 Record) is "DLTU24" or "DLTU48" and the INPULSING or OUTPULSING field on this form is "MF", then DATA RATE on this form must be "56K" or not entered. The EQDU form is found by matching the SM and DLTU NUMBER with the first 3 digits and the 4th digit of the DEN, respectively, on the TRUNK form.

For 5E11 and later, when TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

For 5E13 and later, when TRKCLS is "TTOLLCON", QUEUE FEATURE is known, and LN TYPE is "NONE" or is unknown on the TKGRP form, the QUEUE TYPE must be set to "REROUTE" or "HPCOHQ" on the corresponding QUFD form. QUEUE FEATURE on the TKGRP form matches FEATURE NAME on the QUFD form.

General:
For 5E6 and later Software Releases, if the RAF TYPE on the 5271-4 Record is "ANN", "CTR" or "DTA", the associated TKGRP form must have a TRKCLS with a value of "RAFANNC", "RAFCTR" or "RAFDTA", respectively.

If OUTPULSING or INPULSING is entered as "CCIS6", then TRKCLS must be "LTOLLCON", "TTOLLCON", "PRINTOLL", "SCINTOLL", "BVINTOLL", or "BVTOLLCM", and BRCS must be "N".

For 5E4(2) and later, if trunks in this group are assigned a Precedence and Preemption feature on the TRUNKFA form or associated CLUSTR form, then the TRKCLS entered here must agree with the DSN (Defense Switched Network) TRUNK TYPE on the PPFD form (5618-1 Record) or PPTPA form (5618-5 Record) as follows. If TRUNK TYPE is "NONRCD" or "RCD", TRKCLS must be "PRINTOLL"; if TRUNK TYPE is "EOINID", "EOPNID", or "EORNID", then TRKCLS must be "TTOLLCON".

The following Trunk Class entries apply to Trunk Groups which are used as Logical Test Ports. Logical Test Ports identify the existence and location of specific types of test equipment such as ALIT Circuits, DC Jacks, TTF Circuits, etc. The Software Release uses these LTPs to establish connections between a testing facility and a line or trunk to be tested.

Valid TRKCLS Entries (Logical Test Ports)

Entry	Definition
LTPALIT	Logical Test Port for the Automatic Line Insulation Test Circuit. Refer to Division 2, Section 2A, "Automatic Line Insulation Testing (ALIT)."
LTPCLBCK	Logical Test Port for Remote Call Back to the TLWS (Trunk and Line Work Station). Also used for IMLT-2 Callback Route.
LTPDCJCK	Logical Test Port for DC Jacks on the Trunk and Line Work Station. Refer to Division 2, Section 2H, "Trunk and Line Work Station Test Access Unit."
LTPDCTU	Logical Test Ports for the DCTU (Directly Connected Test Unit). Refer to Division 2, Section 2J, which describes the DCTU feature.
LTPDFTAC	Logical Test Port required for the DFTAC (Distributing Frame Test Access Controller) circuit of the integrated MLT-2 feature. Refer to Division 2, Section 2S, "Integrated Mechanized Loop Testing System (IMLT-2)."
LTPDGTTF	Logical Test Port required for Diagnostics using the TTF (Transmission Test Facility). Refer to Division 2, Section 2L, "Channel Circuit Diagnostics."

Copyright © 2003 Lucent Technologies

LTPELSTF	Software Release: 5E3 and later. Logical Test Port required for Electronic Loop Segregation using the TTF. Refer to Division 2, Section 2P, "Electronic Segregation (ELS)."
LTPICTC	Logical Test Port for Incoming Test Call, e.g. 100, 102, or 105 Test Lines or Station Ringer. Refer to Division 2, Section 2D, "Terminating Test Lines,," and Section 2F, "Station Ringer Touch-Tone Tests (SRTT)."
LTPISTFL	Software Release: 5E3 and later. Logical Test Port for the DSU2 Integrated Services Test Function Loopback. Refer to Division 2, Section 2C, "Outgoing Transmission Test Calls."
LTPISTFX	Software Release: 5E3 and later. Logical Test Port for the DSU2 Integrated Services Test Function Transmission. Refer to Division 2, Section 2B, "Automatic Progression Testing (APT),," and Section 2C, " Outgoing Transmission Test Calls."
LTPMSU	Logical Test Port for the Metallic Access Junctors on the Metallic Service Unit. Refer to Division 2, Section 2A, "Automatic Line Insulation Testing (ALIT),," and Section 2H, "Trunk and Line Work Station Test Access Unit (TLWS)."
LTPOGTC	Logical Test Port for Outgoing Test Call Originated from a Trunk and Line Work Station. Refer to Division 2, Section 2B, "Automatic Progression Testing (APT),," and Section 2C, "Outgoing Transmission Test Calls."
LTPOTOTF	Software Release: 5E3 and later. Logical Test Port for Office-to-Office Testing using the TTF. Refer to Division 2, Section 2G, "Office-To-Office Testing (OTO)."
LTPROTL	Logical Test Port for Incoming Calls Originated from a Remote Office Test Line. Refer to Division 2, Section 2I, "Remote Office Test Line (ROTL)."
LTPSLIM	Software Release: 5E10 and later. Subscriber Line and Instrument Measurement Test LTP. Refer to Div. 2, Section 4A230.
LTPS96TF	Software Release: 5E3 and later. Logical Test Port required for SLC96 Remote Terminal Diagnostics. Refer to Division 2, Section 2L, "Channel Circuit Diagnostics."
LTPWSTTF	Logical Test Port for Interactive Trunk and Line Work Station Testing Using the TTF. Refer to Division 2, Section 2H, "Trunk and Line Work Station Test Access Unit."
RMSD3	Software Release: 5E4 and later. Digital Test Access Trunk connected from a 5ESS Switch to a RMS-D3 test device over a T1.
TOPAS	Software Release: 5E4 and later. Digital Test Access Trunk connected from a 5ESS Switch to an RMS-D3 test device over a T1. This is only used when a Trunk Group with a TRKCLS of "RMSD3" cannot be used.

Data Rules for Logical Test Port TRKCLSs:

LTPCLBCK:
For 5E6 and later, when the TRKCLS is "LTPCLBCK", NEND CLLI must not be entered, INC TND WINK must be "N", TRUNK QUERY and XLT TEST must not be entered or must be entered as "N", and VPA TYPE must not be entered or must be "NOVPA".

For 5E7 and later, when TRKCLS is "LTPCLBCK", a FIXRT form must exist with FIXED ROUTE TYPE set to "CALLBACK".

For 5E9(1) and later, if "LTPCLBCK" or "LTPDFTAC" is entered, and if one or more corresponding TRUNK forms are entered, then one of those TRUNK forms must be defined with MEMB set to 0.

For 5E15 and later, CQ/BQ ALW must not be entered or must be entered as "N" for LTPCLBCK trunks.

LTPDFTAC:
For 5E9(1) and later, if "LTPCLBCK" or "LTPDFTAC" is entered, and if one or more corresponding TRUNK forms are entered, then one of those TRUNK forms must be defined with MEMB set to 0.

LTPICTC:
For 5E6 and later, if an RTIDX form has TRUNK GROUP NUMBER assigned to the TKGRP form with TRKCLS equal to "LTPICTC", the following fields on the RTIDX form should be assigned as shown:
- ROUTE TYPE equals "HUNT" or "TEST",

Copyright © 2003 Lucent Technologies

- DIGITS TO BE DELETED equals 0,
- PREFIX DIGITS not entered,
- ANI OUTPULSING equals "N",
- OVERLAP OUTPULSING equals "N",
- SIGNALING PROTOCOL equals "TRAD", and
- CI ROUTE TYPE equals "OTHER",

In addition, for 5E7 and later, the value of NEXT ROUTE must not be entered, or if a NEXT ROUTE is entered, it must point to a RTIDX form with ROUTE TYPE of "REORDER".

For 5E6 and later, when TRKCLS is "LTPICTC", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "ICTSTCL".

LTPISTFL:
For 5E6 and later, when TRKCLS is "LTPISTFL", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "ISTFLB".

For 5E7 and later, when TRKCLS is "LTPISTFL" and assigned to a ROUTE INDEX on the RTIDX form, the ROUTE INDEX (RTI on the LINE form) must be assigned to a TN on a LINE form. The value of the TEST CODE field must be either "INV" or "NINV".

For 5E9 and later, when TRKCLS is "LTPISTFL" or "LTPISTFX" and assigned to a ROUTE INDEX on the RTIDX form, the ROUTE INDEX (RTI on the LINE form) must be assigned to a TN on a LINE form. The value of the TEST CODE field must be either "INV" or "NINV".

LTPISTFX:
For 5E6 and later, when TRKCLS is "LTPISTFX", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "ISTFXMIT".

For 5E9 and later, when TRKCLS is "LTPISTFX" or "LTPISTFL" and assigned to a ROUTE INDEX on the RTIDX form, the ROUTE INDEX (RTI on the LINE form) must be assigned to a TN on a LINE form. The value of the TEST CODE field must be either "INV" or "NINV".

LTPOGTC:
For 5E7 and later, when TRKCLS is "LTPOGTC", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "APT".

LTPROTL:
For 5E3 and later, when the TRKCLS is "LTPROTL", TRUNK CHAR, FEND CLLI, and NEND CLLI must not be entered. FREE ANS and INC TND WINK must be "N". TRUNK QUERY and XLT TEST must not be entered or must be entered as "N". VPA TYPE must not be entered or must be entered as "NOVPA". For 5E6 and later, SVC GRP must be entered as "NOANNC".

For 5E10 and later, every 5 Trunk Group members that are assigned a Logical Test Port (LTP) on the TRUNK form(s) and are associated with a TRKCLS of "LTPS96TF", "LTPROTL", and "LTPDGTTF" on the TKGRP form(s) for a particular SM, there must exist a corresponding TTF responder board defined on the EQDSP form(s) for the SM. This 5 to 1 ratio must be maintained for the proper operation of the trunk groups.

For 5E15 and later, CQ/BQ ALW must not be entered or must be entered as "N" for LTPROTL trunks.

LTPS96TF:
FIXRT form must exist with FIXED ROUTE TYPE set to "S96CTST".

For 5E10 and later, every 5 Trunk Group members that are assigned a Logical Test Port (LTP) on the TRUNK form(s) and are associated with a TRKCLS of "LTPS96TF", "LTPROTL", and "LTPDGTTF" on the TKGRP form(s) for a particular SM, there must exist a corresponding TTF responder board defined on the EQDSP form(s) for the SM. This 5 to 1 ratio must be maintained for the proper operation of the trunk

Copyright © 2003 Lucent Technologies

groups.

LTPSLIM:
For 5E12 and later, the IM specified in the LTP on the trunk form must be equipped with an MMSU (Modular Metallic Service Unit) containing a SLIM pack on the EQMMSP form (5750 Record) for the IM value, or the TGN must have a Route Index on the RTIDX form (5303 Record) that matches a SLIM RI on the EQAIUP form (5746 Record).

LTPWSTTF:
For 5E6 and later, when TRKCLS is "LTPWSTTF", at least one FIXRT form must exist with FIXED ROUTE TYPE set to "INTTF".

RMSD3:
A maximum of three Trunk Groups with TRKCLS of "RMSD3" are allowed.

For 5E9(1) and later, if "RMSD3", "TOPAS", or "TSTK" is entered, then "ON" must be entered in the IDLE STATE fieldon the corresponding TRUNK form (5204 Record).

For 5E9(2) and later, an SM assigned on the EQIM form must have a CONFIGURATION that supports "RMSD3". For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E15 and later, when TRKCLS is RMSD3 or TOPAS, then CQ/BQ ALW must be blank.

TOPAS:
Only one Trunk Group with TRKCLS of "TOPAS" is allowed.

For 5E9(1) and later, if "RMSD3", "TOPAS", or "TSTK" is entered, then "ON" must be entered in the IDLE STATE fieldon the corresponding TRUNK form (5204 Record).

For 5E15 and later, when TRKCLS is RMSD3 or TOPAS, then CQ/BQ ALW must be blank.

TSTK:
For 5E9(1) and later, if "RMSD3", "TOPAS", or "TSTK" is entered, then "ON" must be entered in the IDLE STATE fieldon the corresponding TRUNK form (5204 Record).

2.10 CARRIER ID

Description: Enter the InterLATA Carrier ID.
Valid Entries:
- 5E9(1) and later:
- 0 - 9999

Data Rules:

It is required when TRKCLS is "IC". It is also required when the Trunk Group is an LTP type used for IMLT-2 Callback when a carrier is needed for routing the Callback Telephone Number (when the subsequent Type of CI Call is other than NONCI, INTRA or PRIV). In this case, the Trunk Class is "LTPCLBCK" and is pointed to by the Fixed Route Type of "CALLBACK". In all other cases, leave this field blank.

CARRIER ID cannot be entered on TKGRP forms with TRKCLS of "LTOLLCON", "PRINTOLL", "SCINTOLL" or "TTOLLCON" unless OSPS TA is "Y" on the OSPSOPT form.

CARRIER ID can only be entered if TRKCLS is one of the following:
- "IC"
- "LATA"(5E10 and later)

Copyright © 2003 Lucent Technologies

- "LTOLLCON"
- "LTPCLBCK"
- "LTPDFTAC"
- "LTPPROTL"
- "PRINTOLL"
- "SCINTOLL"
- "TSPS".
- "TTOLLCON"

For 5E3 and later, if the CARRIER ID is specified for a TRKCLS of "LTPDFTAC", "LTPCLBCK" or "LTPROTL", then a BILLING DN must be entered. If the CARRIER ID is not specified, the BILLING DN must not be entered.

For 5E8 and later, when CARRIER ID is entered:

- FEAT GRP must be entered;
- CARRIER ID should equal CARRIER ID on an ICF form,and
- FEAT GRP should equal the ICF form's FEAT GRP.

For 5E15 and later, when CARRIER ID is entered, TRKCLS must be "CAMA", "LATA", "LTOLLCON", "LTPCLBCK", "LTPDFTAC", "LTPROTL", "PF", "PRINTOLL", "SCINTOLL", "TSPS", or "TTOLLCON".

2.11 FEAT GRP

Description: Enter the Feature Group for the CARRIER ID. (See Division 2, Section 1AY for information about Feature Groups B and D.)

Software Release: 5E8 and later
Valid Entries:

Valid FEAT GRP Entries

Entry	Definition
B	Feature Group B Carrier
D	Feature Group D Carrier

Data Rules:

When FEAT GRP is entered, CARRIER ID must be entered.

If CARRIER ID and FEAT GRP are entered the CARRIER ID and FEAT GRP must be defined on the ICF form (5305 Record).

For 5E11 and later, when FEAT GRP is "B" or "D", CNA OPTION must be "NONE"

2.12 # FREE ANS

Description: Should Answer Supervision be returned, for billing purposes, on the trunk group for calls to a free line or trunk. "Y" must be entered for trunk groups directly connected to a carrier and for trunk groups which handle carrier traffic and serve offices with free line service.

- ***NOTE:*** A PBX or end-office off the 5ESS Switch does not receive answer supervision when routing to TSPS (0+ or 0- calls). when FREE ANS is "N" (the default). With FREE ANS set to "Y", the off-hook from the TSPS to request ANI is sent back as answer supervision.

Copyright © 2003 Lucent Technologies

Required Field.

- ***NOTE:*** In some cases there are other vendor switches that require answer supervision to maintain the talk path even though the call is free. For E911 calls where there is a ISUP (Integrated Services User Part) trunk origination at the E911 tandem, FREE ANS should be set to "Y" on the incoming ISUP trunk to ensure that answer supervision is sent back to the originating switch.

Default: N
Valid Entries: Y, N

Data Rules:

If the TRK DIR is "RAF", this entry must be "N".

If TRKCLS is "RMSD3" or "TOPAS" this entry must be "N".

2.13 # INC TND WINK

Description: This field is used only in an AT (Access Tandem) to specify whether or not the first wink from an International Carrier should be passed to the EAEO (Equal Access End Office). At the AT, on an Incoming or Two-Way Trunk Group from an EAEO, enter "Y" (Yes) if the EAEO is programmed to recognize, and therefore expects, the first wink back on an International Carrier Interconnect call. (If the originating EAEO is a 5ESS Switch, this will be specified with EXTRA START WINK equal to "Y" on the OFCOPT form [5509 Record].) In all other cases, (e.g., the EAEO does not expect the wink, this is not an AT, etc.), enter "N".

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the TRK DIR is "RAF", INC TND WINK must be "N".

If TRKCLS is "RMSD3" or "TOPAS", INC TND WINK must be "N".

2.14 ATTTN

Description: Enter the ATTTN (Automatic Trunk Test Table Number), defined on a Trunk Group basis.
Valid Entries: 1 - 999

Data Rules:

If ATTTN is entered,a corresponding AUTO form is required where the entry in the ATTTN field on the TKGRP form equals the AUTOMATIC TRUNK TEST TABLE NUMBER entry on the AUTO form.

When ATTTN is entered for a trunk group with An ATTTN value may be entered only for the following TRKCLSs:

- "ATNDVFY"
- "CAMA"
- "CST1"
- "CST2"
- "EDSL"
- "EDSLHM"
- "FOPRI"
- "FOPRT"
- "IC"
- "IFOPER"

Copyright © 2003 Lucent Technologies

- "IDCS"
- "IVTRK"
- "LATA"
- "LTOLLCON",
- "PBXDID"
- "PF"
- "PFLASH"
- "PFITT"
- "PRINTOLL"
- "SCINTOLL"
- "SPCHNDLR"
- "TSPS"
- "TTOLLCON"

The following TRKCLS values normally require an ATTTN value if the corresponding TRK DIR is "OUT" or "2W":

- "ATNDVFY"
- "CAMA"
- "EDSL"
- "EDSLHM"
- "FOPRI"
- "FOPRT"
- "IC"
- "IFOPER"
- "LATA"
- "LTOLLCON"
- "PBXDID"
- "PF"
- "PFITT"
- "PFLASH"
- "PRINTOLL"
- "SCINTOLL"
- "TSPS"
- "TTOLLCON

For 5E4(2) and later, an ATTTN that is entered for a non-CCS trunk group (OUTPULSING other than "ISUP7" and "CCIS6") may not have an AUTOMATIC PROGRESSION TEST TYPE of "CONT" on the AUTO form.

For the TRKCLS of "TSPS" which terminates on an OSPS "FIOPR" TRKCLS, the test numbers associated with that ATTTN must adhere to the format (10x, 958-10x, or 959-10x) that is defined on the AUTO form (5505 Record). The ATTTN field must not be entered if TRK DIR is "INC", "ANN", "SGNL", or "RAF", or if TRKCLS is not listed above.

An ATTTN may be assigned to outgoing OSPS EDSL (PRI) B-channel trunk groups (TRKCLS of "IFOPER" and TRK DIR of "OUT"). The ATTTN field must be left blank for OSPS EDSL (PRI) D-channel trunk groups (TRKCLS "IFOPER" or "IFTERM" and TRK DIR "SGNL") and incoming OSPS EDSL B-channel trunk groups (TRKCLS "IFTERM" and TRK DIR "INC").

For 5E9(1) and later, when ATTTN is entered for a trunk group with TRKCLS "IFOPER", "EDSL", or "EDSLHM", an associated AUTO form must be entered; the AUTOMATIC PROGRESSION TEST TYPE on the AUTO form must be "INV", "NINV", or blank.

For 5E9(1) and later, when ATTTN is entered for a DCS (Digital Cellular Switch) trunk group (DCS TRK is

Copyright © 2003 Lucent Technologies

"Y"), the following rules apply.

- If the trunk group is CCS (OUTPULSING is "CCIS6" or "ISUP7"), an AUTOMATIC PROGRESSION TEST TYPE entered on the corresponding AUTO form must be "CONT", "PB", "105", or "NINV".
- The AUTOMATIC PROGRESSION TEST TYPE on the AUTO form may be "102LB" only if TRKCLS on this form is "CST2" or "IVTRK".
- If the trunk group has TRKCLS set to "CST2" or "IVTRK", AUTOMATIC PROGRESSION TEST TYPE on the AUTO form must be "102LB" or "NINV".If the test is "NINV", the NINV TYPE TEST field on the AUTO form must be blank.
- If the trunk group has TRKCLS set to a value other than "CST2" or "IVTRK", and AUTOMATIC PROGRESSION TEST TYPE on the AUTO form is "NINV", then NINV TYPE TEST must be entered on that form.
- If the trunk group has TRKCLS set to "CST1", AUTOMATIC PROGRESSION TEST TYPE on the AUTO form must be 105, and the 105 TYPE TEST field on the AUTO form must be blank.
- If the trunk group has a TRKCLS other than "CST1", and AUTOMATIC PROGRESSION TEST TYPE is 105 on the corresponding AUTO form, a value must be entered in 105 TYPE TEST field on the AUTO form.
- if ATTN is entered, DCS TRK is "Y", and
  - AUTOMATIC PROGRESSION TEST TYPE is 105 on the corresponding AUTO input form, then a DCSTT form (5055 Record) must be entered with the same ATTN value and TEST TYPE of 105. The ATTTN field on the TKGRP form corresponds to AUTOMATIC TRUNK TEST TABLE NUMBER on the AUTO form and to ATTTN on the DCSTT form.
  - AUTOMATIC PROGRESSION TEST TYPE is "102LB" on the corresponding AUTO form, then a corresponding DCSTT form must be entered with the same ATTN value and TEST TYPE of "102LB". ATTTN corresponds to the AUTOMATIC TRUNK TEST TABLE NUMBER on the AUTO form and to ATTTN on the DCSTT form.
  - and AUTOMATIC PROGRESSION TEST TYPE is "NINV" on the AUTO form, then a DCSDT form must be entered with the same ATTN value. ATTTN corresponds to the AUTOMATIC TRUNK TEST TABLE NUMBER on the AUTO form and to ATTTN on the DCSDT form.

For 5E9(1) and later, if a CCS trunk group (INPULSING or OUTPULSING is "CCIS6" or "ISUP7") has DCS TRK set to "N", then if an AUTOMATIC PROGRESSION TEST TYPE is entered on a corresponding AUTO form, it must be "CONT" or "PB".

For 5E12 and later, when ATTTN is not entered and TRKCLASS is not "SPCHNDLR", IAPT must be "Y".

2.15 TERA RCVY

Description: TERA (Trunk Error Analysis) provides analysis of call irregularities and maintenance events (Trunk Facility Operational Test and Circuit Diagnostic Test results) having a high probability of errors resulting from trunk or service circuit failures.

MDII (Machine Detected Inter-Office Irregularities) are analyzed by two methods. Peer Group analysis recognizes when a member in a group of equipment is experiencing a significantly higher error rate than other members of the equipment group. Quick Check analysis recognizes consecutive errors on a particular circuit.

Copyright © 2003 Lucent Technologies

Upon failing analysis, recovery action is taken on the circuit.

Software Release: 5E3 and later
Valid Entries:

Valid TERA RCVY Entries

Entry	Definition
NOA	No action taken; no report is generated; and trunk is not removed from service.
RMV	Removes the trunk which failed analysis without performing an operational test.
RPT	No recovery action beyond reporting that a trunk has received an excessive number of MDIIs.
TST	Operational test may be performed when a trunk reaches MDII. "TST" is only valid when an entry has been made in the ATTTN field.

Data Rules:

If a value is entered in the ATTTN field and the TERA RCVY field is left blank, TERA RCVY will be defaulted to the "TST" value.

If both the ATTTN and TERA RCVY fields are left blank, TERA RCVY will be defaulted to the "RPT" value.

If TRK DIR is "RAF", then this field must be "NOA".

2.16 # IAPT

Description: Should Automatic Progression Testing be inhibited when an ATTTN is specified?

Required Field.
Valid Entries: Y, N

Data Rules:

If ATTTN is left blank, IAPT must be "Y".

For 5E11 and later:
"Y" must be entered if:

- if ATTTN is not entered and TRKCLS is not "SPCHNDLR".
- if DCS TRK is "Y" and TRKCLS is not "SPCHNDLR".

2.17 CALLMON INH

Description: Inhibit call monitor testing?

Software Release: 5E9(1) and later.
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If IAPT is "Y", then CALLMON INH must be Y.

2.18 INSEP

Description: Enter the Incoming Separation Class Number. This entry is applicable for the Division of Revenue Feature and must be specified on the 5308 Record.
Valid Entries: 1 - 255

Copyright © 2003 Lucent Technologies

Data Rules:

An INSEP is required for all Two-Way and Incoming Trunk Groups.

If INSEP is assigned, it must be defined on the Traffic Separation Cell Grouping, TRFSEP form (5308 Record).

INSEP 0 is used by the Software Release whenever no INSEP is provided by the incoming line or trunk translations. INSEP 63 is used by the Switch for calls that are not applicable to DOR (i.e. busy, reorder etc.). These values (0, 63) should not be assigned.

2.19 INPULSING

Description: Enter the Pulsing Type on Incoming or Two-Way Trunk Groups.

Valid INPULSING Entries

Entry	Definition
CCIS6	CCIS6 Signaling.
DCHN	Software Release: 5E3 and later. D-channel signaling for DSLs. This value is used for TRKCLSs of "EDSL", "EDSLHM", "IFOPER" and "IFTERM" and only under certain conditions. See Figures 1 and 2 for acceptable entry details.
DCS	Software Release: 5E9(1) and later. Autoplex Digital Cellular Switch.
DP	Dial Pulse
ISUP7	ISDN CCITT7 Signaling. Warning: For incoming ISUP7 trunks at an Originating Access Tandem office or at an Originating Toll office that handles international traffic, the CKT CODE must be defined on a CKTCODE (5311 Record) form and populated in a RTIDX (5303 Record) form. This rule applies in 5E6 and later Software Releases. It is not RC/ODA enforceable.
MF	Multifrequency
NONE	No inpulsing. Used only for Direct Connect Trunks, therefore, a number must be specified in DIR CON DN.
PP	Software Release: 5E10 and later. Packet Pipe signaling for CDMA (Code Division Multiple Access). For more information on CDMA, see Division 2, Section 8B.
RPEO	Revertive Pulsing End Office
RPTO	Revertive Pulsing Tandem Office
TT	Touch Tone.

Data Rules:

If TRKCLS is "X75", "X75P", or "PACKET", INPULSING must not be entered.

DP: If "DP" is entered in the INPULSING field, then neither "D0M" nor "D0P" may be entered in the TRK TYPE field of the corresponding OPRTK form (5417 Record).

For 5E6 and later, when TRKCLS is "PF" and TRK DIR is "INC" or "2W", INPULSING must be "DP", "MF", "TT", "NONE", or "ISUP7". ISUP7 can only be assigned if trunks are a part of a Leased Network with LN TYPE set to a value other than blank or "NONE".

CCIS6 or ISUP7 (non-SIP-T)
For 5E7 and later, CCS trunks with INPULSING and/or OUTPULSING equal to "CCIS6" or "ISUP7" require the the DEN or TEN fields, or for ISUP7 only (5E9(2) and later), the NEN field entered on the corresponding TRUNK form.

For 5E7 and later, if the CCS Trunk Groups (INPULSING/OUTPULSING is "CCIS6" or "ISUP7") have the VPA RATE set to 12, 50, or 100, then all the corresponding trunks assigned on the TRUNK form must be physically located on a Switching Module equipped with a local DSU2 (Digital Service Unit 2) or DSC3 (Digital Service Circuit 3) Tone Transceiver. The TRUNK TEN, DEN, or NEN value must have the SM value defined on an EQDS2P form (5740 Record) with at least one DSC TYPE list entry equal to "LDSU2TX", or on at least one EQDSC3 form (5852 Record) with a non-zero value entered in the TONE XCVRS field.

Copyright © 2003 Lucent Technologies

For 5e9(1) and later, if the CCS Trunk Groups defined on the TKGRP form with either or both of the INPULSING/OUTPULSING fields equal to "CCIS6", and they share the same FEND CLLI value; then all of the Trunk Group Members defined on the TRUNK form for these same TGN values must have their CLCI TRK ID entered and the value must be unique in the range 0 - 9999.

For 5E9(2) and later, if "CCIS6" is entered, the trunk group members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports CCIS6 signaling. For the CONFIGURATION that supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E15 and later, when INPULSING/OUTPULSING fields show CCS signaling CQ/BQ ALW, XLT TEST, VPA RATE, and VPA TYPE fields must all be set to known values.

For 5E16(2) and later, when INPULSING or OUTPULSING is set to "ISUP7", LOCAL SM and ORIG PT CODE is entered, and no matching OPC or ALIAS PC can be found on the CCGSM form (6008 Record), then one of the following conditions must exist:

- OPC from the OFCOPT form (5509 Record) where the COMMON CHAN SIG is set to "ALL" or "CNI" must match ORIG PT CODE from the TKGRP form (5202 Record) or,
- ALIAS POINT CODE form the ALIASPC form must match the ORIG PT CODE.

MF:
If TRKCLS is "RMSD3" or "TOPAS", this field must be "MF".

PP:
For 5E10 and later, if "PP" is entered, a TRKCLS of "PKTPIPE" or "PPMEM" must be entered.

RP:
Restrictions for RP trunks are as follows:

- Trunk Group must be One-Way.
- Trunks must be digital.
- When designated "RPEO" address signal, Outgoing Trunk Groups must terminate to an End Office and Incoming Trunk Groups must originate from an End Office.
- When designated "RPTO" address signal, Outgoing Trunk Groups must terminate to a Tandem Office and Incoming Trunk Groups must originate from a Tandem Office.
- IN START DIAL must be "IMED" and OUT START DIAL must be null on the TRUNK form.
- TRKCLS must be "LTOLLCON".
- For 5E10 and later, TGNs on the TKGRP form that have INPULSING and/or OUTPULSING of "RPEO" or "RPTO", and have TGN/MEMBs on the TRUNK form whose DEN[1,3] values match SM on the EQIM form with UNIT TYPE of SM2000, is not allowed.

TT:
INPULSING can be Touch Tone ("TT") only if TRKCLS is
- "LTOLLCON"
- "PF"
- "PFITT"
- "PFLASH"
- "SPAB800"
- "SPAM800"

Copyright © 2003 Lucent Technologies

- "SPAMEG"
- "SPAWATS"
- "TTOLLCON"

2.20 OUTPULSING

Description: Enter the Pulsing Type on Outgoing and Two-Way Trunk Groups.

Valid OUTPULSING Entries

Entry	Definition
CCIS6	CCIS6 Signaling.
DCHN	Software Release: 5E3 and later. D-channel signaling for DSLs. This value is used for TRKCLSs of "EDSL", "EDSLHM", "IFOPER", and "IFTERM", only under certain conditions. See Figures 1 and 2 for acceptable entry details.
DCS	Software Release: 5E9(1) and later. Autoplex Digital Cellular Switch.
DP	Dial Pulse.
ISUP7	ISDN CCITT7 Signaling.
MF	Multifrequency.
NONE	No outpulsing. This value can only be used if TRK DIR is "OUT" and TRKCLS is "LTOLLCON" or "TTOLLCON".
PP	Software Release: 5E10 and later. Packet Pipe signaling for CDMA (Code Division Multiple Access). For more information on CDMA, see Division 2, Section 8B.
RPEO	Revertive Pulsing End Office.
RPTO	Revertive Pulsing Tandem Office.
TT	Touch Tone. This value can only be used if TRKCLS is "PBXDID".

Data Rules:

If TRKCLS is "X75", "X75P", or "PACKET", OUTPULSING must not be entered.

For 5E6 and later, when TRKCLS is "PF" and TRK DIR is "OUT" or "2W", OUTPULSING must be "DP", "MF", "TT", "NONE", or "ISUP7". ISUP7 can only be assigned if trunks are a part of a Leased Network with LN TYPE set to a value other than blank or "NONE".

TRKCLS of PF and PFLASH can use an OUTPULSING value of "TT" or "DP" when CUT THRU is "Y".

CCIS6 or ISUP7:
For 5E7 and later, CCS trunks with INPULSING and/or OUTPULSING equal to "CCIS6" or "ISUP7" require the the DEN or TEN fields or for ISUP7 only (5E9(2) and later), the NEN field entered on the corresponding TRUNK form.

For 5E6 and later, if GLARE ACTION is "ODDEVEN", then OUTPULSING must be "ISUP7".

For 5E7 and later, if the CCS Trunk Groups (INPULSING/OUTPULSING is "CCIS6" or "ISUP7") have the VPA RATE set to 12, 50 or 100, then all the corresponding trunks assigned on the TRUNK form must be physically located on a Switching Module equipped with a local DSU2 (Digital Service Unit 2) or DSC3 (Digital Service Circuit 3) Tone Transceiver. The TRUNK TEN, DEN, or NEN value must have the SM value defined on an EQDS2P form (5740 Record) with at least one DSC TYPE list entry equal to "LDSU2TX", or on at least one EQDSC3 form (5852 Record) with a non-zero value entered in the TONE XCVRS field.

For 5E9(1) and later, if the CCS Trunk Groups defined on the TKGRP form with either or both of the INPULSING/OUTPULSING fields equal to "CCIS6", and they share the same FEND CLLI value; then all of the Trunk Group Members defined on the TRUNK form for these same TGN values must have their CLCI TRK ID entered and must be unique in the range 0 - 9999.

For 5E9(2) and later if "CCIS6" is entered, the trunk group members must be assigned to an SM on an EQIM form with a CONFIGURATION which supports CCIS6 signaling. For the CONFIGURATION that

Copyright © 2003 Lucent Technologies

supports this TRKCLS value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

For 5E11 and later, if "CCIS6" is entered, LOCAL RSM must not be entered.

For 5E12 and later, when INPULSING/OUTPULSING equals "ISUP7" showing CCS7 signaling, thus both the DEST PT CODE and ORIG PT CODE entries must be entered.

PP:
For 5E10 and later, if "PP" is entered, a TRKCLS of "PKTPIPE" or "PPMEM" must be entered.

RP:
Restrictions for RP trunks are as follows:

- Trunk Group must be One-Way.
- Trunks must be digital.
- When designated "RPEO" address signal, Outgoing Trunk Groups must terminate to an End Office and Incoming Trunk Groups must originate from an End Office.
- When designated "RPTO" address signal, Outgoing Trunk Groups must terminate to a Tandem Office and Incoming Trunk Groups must originate from a Tandem Office.
- IN START DIAL must be null and OUT START DIAL must be "IMED" on the TRUNK form.
- TRKCLS must be "LTOLLCON".
- For 5E10 and later, TGNs on the TKGRP form that have INPULSING and/or OUTPULSING of "RPEO" or "RPTO", and have TGN/MEMBs on the TRUNK form whose DEN[1,3] values match SM on the EQIM form with UNIT TYPE of SM2000, is not allowed.

TT:
For 5E10 and later, OUTPULSING may be "TT" only if TRKCLS is:
- "IDCS"
- "LTOLLCON"
- "PBXDID"
- "PF"
- "PFCPE"
- "PFITT"
- "PFLASH"
- "TTOLLCON"

2.21 # SATELLITE

Description: Does this Trunk Group use Satellite facilities?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TRKCLS is "RMSD3" or "TOPAS", then this field must be "N".

2.22 # HOLD BUSY

Copyright © 2003 Lucent Technologies

Description: For certain Outgoing Secondary Intertoll Trunks, the trunk is "held busy" until an on-hook is received from the terminating trunk. Is this condition required? (This feature applies to Toll applications only.)

Required Field.
Default: N
Valid Entries: Y, N

2.23 FAR END NPA

Description: Specify the terminating NPA for Outgoing and Two-Way Trunk Groups. This field is required for the Network Management Trunk Group Control Feature.
Valid Entries: 200 - 999

Data Rules:

If this is an Originating Screening Office for INWATS, i.e., ORIG SCREEN OFF equals "Y" on the OFCOPT form, then FAR END NPA must also be specified for Incoming Trunk Groups for the following set of conditions:

- ORIG SCREEN OFF or SERV SWITCH PT? on the OFCOPT form (5509 Record) is set to "Y"
- TRK DIR is set to "INC"
- and TRKCLS is *NOT* one of the following:

  "ACJCK",

  "BUSYVFY"

  "DIOR"

  "INAISTRK"

  "LTOLLCON"

  "RMSD3"

  "TOPAS"

  "TSTK"

For an SSP (Service Switching Point) office (SERV SWITCH PT equals "Y" on the OFCOPT form) and/or an OSPS office, the FAR END NPA must be specified for Incoming and Two-Way SSP trunk groups (including those with a TRKCLS of "FIOPR"). In addition, for 5E5 and later, the FAR END NPA must be entered when SERV SWITCH PT on the OFCOPT form is "Y", TRK DIR on this form is "INC", and TRKCLS is not "DIOR", "TOPAS", nor "RMSD3", nor, for 5E7 and later, "INAISTRK".

NOTE: A single 5ESS Switch may not provide both OSO (Originating Screening Office) and SSP (Service Switching Point) services at the same time.

Copyright © 2003 Lucent Technologies

If TRKCLS is "ANNCMNT", "RMSD3" or "TOPAS", this field must not be entered.

If TRKCLS is "DIOR", this field must be equal to the NM DEFAULT NPA on the OFCOPT form (5509 Record).

For 5E9(1) and later, if TRK DIR is "2W" and TRKCLS is not "CST1", "CST2", "DSC", "IDCS", or "IVTRK", then SCR and FAR END NPA must be entered.

When TRK DIR is "2W" and HUNT TYPE is not "PSUCD", FAR END NPA must be entered.

For 5E10 and later, FAR END NPA must be entered for all outgoing trunks if TRKCLS is NOT "PKTPIPE" or "PPMEM".

2.24 LOCAL SM

Description: If the Trunk Group defined on this form is "local" within a Switching Module, that is, all its members are assigned equipment numbers (TENs or DENs) in the same SM, then enter the 3-digit SM number in this field. The SM may be a remote module, e.g., an RSM or ORM; or it may be an SM in the host office. This feature allows more efficient call processing of local Trunk Groups.

This feature allows more efficient call processing of local trunk groups.

This field can also be used to provide additional alternate routes in a route list.

Software Release: 5E5 and later
Valid Entries: 1 - 192

Data Rules:

When the LOCAL SM is entered, it must be defined on an EQIM form.

If the Trunk Group is "global", that is, its members have equipment numbers in different SMs, then leave this field blank.

It must also be blank for CCS trunk groups (INPULSING or OUTPULSING is "CCIS6" or "ISUP7"), Logical Test Port trunks (TRKCLS is "LTP"), and Outgoing CAMA operator trunks (TRKCLS is "CAMOPKEY" or "CAMOPTLK").

An SM number must be entered in this field when a value is entered in GL ANN TG.

For 5E7 and later, if this field is entered, all members of the trunk group assigned on the TRUNK form must have their associated SMequipment value (the first three digits of the TEN, DEN, or (for 5E9(2) and later) NEN field) equal to the numeric SM value entered in this field.

For 5E11 and later, when VCDX OFFICE is set to "Y" on the EQCORE form and TRKCLS on the TKGRP form (5202-1/2 Record) is not in the table below, then LOCAL SM on the TKGRP form must be known.

LOCAL SM Entries	
Software Release: 5E11 and later	
Data Condition	**Trunk Group Definition**
TRKCLS[1,3] = "LTP"	Local Test Port Trunk
TRKCLS = "EDS" and RDTA GRP = "Y"	Extended Digital Subscriber RDTA Trunk TRKCLS = "INAISTRK"
TRKCLS = "RMSD3"	TAT connected to RSM-D3 Trunk
TRKCLS = "TOPAS"	Test Access Trunk - TOPAS Interface

2.25 GL ANN TG

Description: When the Trunk Group defined on this form is a local announcement group (TRKCLS is "ANNCMNT" and LOCAL SM is entered), then the number of a global announcement trunk group must be entered in this field. The local announcements will be used in place of the global announcements.

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The GL ANN TG must be different than the TGN defined on this form. It must be an announcement trunk group defined on another TKGRP form with TRK DIR equal to "ANN" and with LOCAL SM and GL ANN TG left blank.

No route index is allowed to point to the local announcement trunk group. The route index must reference the global announcement trunk group entered in the GL ANN TG field. Calls originated in the SM (or RSM Site) and destined for the global announcement group will terminate to the local group and use the SM's (RSM Site's) version of the announcement.

No more than one local trunk group may be defined with the same GL ANN TG in any given SM or Remote Site. Although a specific GL ANN TG value can be assigned on more than one TKGRP form, the combined LOCAL SM and GL ANN TG fields must be unique on each form. Further, the LOCAL SM must be defined on an EQIM form; when a REMOTE SITE is specified on that form, the combined SM and REMOTE SITE must be unique.

For engineering considerations concerning local announcement trunk groups, see the RSM Stand-Alone Call Processing feature section in Division 2, Section 1C, of this guide. Also see the Multimodule RSM Stand-Alone Call Processing and Billing section in Division 2, Section 1J, for a discussion of local trunk groups at an MMRSM site.

For 5E11 and later, GL ANN TG may be entered only when the LOCAL RSM is entered.

2.26 BRCS

Description: Will BRCS features be assigned to this Trunk Group?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, a Feature Assignment Trunk Group form, TKGRPFA (5206 Record), must be completed for this Trunk Group.

If TRKCLS is "EDSL", "EDSLHM", "IFOPER", "IFTERM", "RMSD3" or "TOPAS", then this field must be "N". If TRK DIR is "ANN" or "LTP", this field must be "N". For CCS trunks, this field must be "N".

For 5E6 and later, BRCS must equal "N" when INPULSING or OUTPULSING is "ISUP7", LN TYPE is "N" and TRKCLS is not "LTOLLCON".

For 5E6 and later, if this trunk group is dedicated to ASP (Advanced Services Platform) via the default ASP DAS by having DAS equal to PVN DAS on the OFCOPT form (5509 Record), then BRCS must be "N" here and on the corresponding TRUNK form.. If the trunk is dedicated to ASP via a virtual ASP DAS by having a DAS whose functionality is similar to PVN DAS on the OFCOPT form, then BRCS should be "N". See the ASP DIALING PLAN section in the ASP feature description, Division 2, Sections 4A51 and 4A126, for further details on the dangers of assigning BRCS features to trunks dedicated to ASP services.

2.27 TOPAS TP NBR

Description: This field is the TOPAS (Testing, Operations, Positioning and Administration) Operations System TP (Test Position) Number. The field is used by Recent Change only and cannot be accessed by ODA.

Copyright © 2003 Lucent Technologies

PACKET NETWORK TRUNKING

2.28 PKT GRP

Description: The PKT GRP field is used to specify the Packet Group Number. This field was added to support the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. For more information, see Division 2, Section 7BX.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 7000 - 7999

Data Rules:

For 5E16(2) and later, when PKT GRP is entered:

- TRKCLS must be "LTOLLCON" or "TTOLLCON"
- TRK DIR must be "2W"
- INPULSING must be "ISUP7"
- OUTPULSING must be "ISUP7"
- GLARE ACTION must be "ODDEVEN"
- HUNT TYPE must be "2WB" or "2WF"
- DAS must be entered
- SCR must be entered
- LOCAL SM must not be entered
- VPA TYPE must be "NOVPA" or must not be entered
- VPA RATE must be 0 or must not be entered
- CFN RSTRCT must be "N"
- E9111 TYPE must be "NONDED"
- LDP must be "N"
- ASP TOLL must be "N"
- CARRIER TRIG must be "N"
- TRIG NBR must not be entered
- ASP ORIG must be "N"
- UNRES EA must be "N"
- LN TYPE must be "NONE" or must not be entered
- AUD RNG must be "N"
- LS DLY ANS must be "N"

Copyright © 2003 Lucent Technologies

- ☐ MAKE BUSY KEY must not be entered
- ☐ PRIVACY must be "N"
- ☐ MAI must be "S"
- ☐ API CODE must not be entered
- ☐ CT FOR DT must be "N"
- ☐ REL LINK INIT must be "N"
- ☐ BRCS must be "N"
- ☐ INC TND WNK must be "N"
- ☐ SEND LD CIC must be "N"
- ☐ XLT TEST must be "N"
- ☐ RERTE Q INH must be "N"
- ☐ QUEUE ALLOWED mustt be "N"
- ☐ DCS' TRK must be "N"
- ☐ AML PERCENT must not be entered
- ☐ IAPT must be "Y"
- ☐ WB RATE must not be entered
- ☐ SS7 ISUP OPER must be "N"
- ☐ PBX/CPE ID must not be entered
- ☐ DSN ARC ID must be 0 or must not be entered
- ☐ SHUTTLE must be "N"
- ☐ BUSY LAMP must not be entered
- ☐ BW LAMP must be "N"
- ☐ WARN THRESH must not be entered
- ☐ RTCD REQ must be "N"
- ☐ FAR END LATA must be 0 or must not be entered
- ☐ COIN must be "N" or must not be entered
- ☐ TERA RCVY must be "NOA"
- ☐ INTER SM TRK must be "N"
- ☐ OUTAGE RPT must be "N"
- ☐ MINT SIG TYPE must not be entered

Copyright © 2003 Lucent Technologies

- TRK ICI must not be entered
- MBG ID must not be entered
- SPEECH TRMTS must be "N"
- ISAT MLHG must not be entered
- RCD 3PT1 ITC must not be entered
- AML ALARM must be "MAJOR"
- SATELLITE must be "N"
- ATTN must not be entered
- CQ/BQ ALW must be "N"

For 5E16(2) and later, when PKT GRP is not entered, DIFF SERV must not be entered.

For 5E16(2) FR 3 and later, when PKT GRP is entered, BICC GRP and SIPT GRP must not both be "Y".

2.29 BICC GRP

Description: As of the 5E16(2) release, the BICC GRP field is replaced with the PKT GRP field on this form (see the PKT GRP field for usage information). The BICC GRP field is used to specify the bearer path for packet switched calls. This field was added to support the ATM Global Routing and Signaling feature (99-5E-7554). This feature is made available in 5E15 Feature Release 1. For more information, see Division 2, Section 4A257.

Software Release: 5E15 and later
Valid Entries: Blank, Y, N

Data Rules:

When BICC GRP is not entered:

- If INPULSING or OUTPULSING is "ISUP7", then VPA TYPE must be entered with a value other than "NOVPA".
- If INPULSING and OUTPULSING are not "ISUP7", then VPA TYPE must not be entered or must equal "NOVPA".
- If INPULSING or OUTPULSING equals "ISUP7", TRUNK QUERY, XLT TEST, VPA RATE, and VPA TYPE fields must all be entered.

When BICC GRP is entered:

- TRKCLS must be "LTOLLCON" or "TTOLLCON".
- TRK DIR must be "2W".
- INPULSING must be "ISUP7".
- OUTPULSING must be "ISUP7".
- GLARE ACTION must be "ODDEVEN".

Copyright © 2003 Lucent Technologies

- HUNT TYPE must be "2WB", or "2WF".
- DAS must be entered.
- SCR must be entered.
- LOCAL SM must not be entered.
- VPA TYPE must be "NOVPA" or must not be entered.

BICC GRP can only be entered when the ACT field for SFID 567 or SFID 684 on the SFSYS form (5713-1 Record) is set to "Y".

Each BICC GRP entered has to be defined as a valid TGN.

When BICC GRP is entered, trunk members are not allowed on the TRUNK form in the MEMB field for this TGN.

The number of BICC GRP entered must not exceed the maximum number of BICC GRP for an office (256).

When TGN and BICC GRP are equal, the DEST PT CODE and the ORIG PT CODE pair must be unique between all BICC Groups.

For a given BICC GRP, the BICC Group and the Service Group forms must all have the same values of HUNT TYPE, FEND CLLI, NEND CLLI, DEST PT CODE, and ORIG PT CODE.

For 5E16(2) FR 3 and later, when BICC GRP is "Y" (DEST PT CODE and ORIG PT CODE entered), and SIPT GRP is "N" (DEST PT CODE and ORIG PT CODE entered) for a given TGN, the PKTGRP form (5219 Record) must be defined as a BICC Packet Group.

When BICC GRP is "Y", SIPT GRP must be "N" and SIPT GRP is "Y", BICC GRP must be "N".

2.30 SIPT GRP

Description: This field specifies whether or not the packet group (PKT GRP) defined on the PKTGRP form (5219 Record) is a SIP Packet Group. This field supports the SIP for Packet Trunking feature. For more information see Division 2, Section 4A684.

Software Release: 5E16(2) FR 3 and later
Valid Entries: Blank, Y, N

Data Rules:

When SIPT GRP is "Y", HUNT TYPE must be "2WF", and DEST PT CODE and ORIG PT CODE must not be entered.

2.31 DIFF SERV

Description: This field specifies the Diff Serv Code Point. The DIFF SERV field supports the OIU - IP (Optical Interface Unit - Internet Protocol feature. This feature is made available in 5E16 Feature Release 3. (See Division 2, Section 7BX.)

Software Release: 5E16(2)
Valid Entries: Blank, or enter hexadecimal number 0 - 3f

When PKT GRP is not entered, DIFF SERV must not be entered.

3. FORM ENTRIES - 5202-2 RECORD

Copyright © 2003 Lucent Technologies

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 * TGN

Description: Enter the number of the Trunk Group being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

3.3 TRUNK CHAR

Description: Enter the Common Language Circuit Identifier which represets the Trunk Group characteristics. Valid entries are any alphanumeric characters or dashes to define the trunk type, pulsing type and direction, etc.

Software Release: 5E3 and later
Valid Entries:

TRUNK CHAR Format

Character Positions	Location
1, 2	Traffic Class
3, 4	Office Class
5, 6	Traffic Use
7 - 13	Trunk Type Modifier
14, 15	Pulsing Type and Direction

3.4 FEND CLLI

Description: Enter the Far-end Common Language identifier for the trunk group.

The RNMC (Remote Network Management Center) automatically queries the 5ESS Switch for the FEND CLLI and uses this field to determine trunk group far-end locations in order to perform Network Traffic Management Activities. Therefore, it is important that this field be populated accurately for all trunk groups.

The format for Far End CLLI is as follows PPPPSSBBEEE, where PPPP is place, SS is state, BB is the building, and EEE is the entity.

Example: CHCGILMOCG0.

FEND CLLI Format

Character Positions	Location	Example
1 - 4	Place	CHCG (Chicago)
5, 6	State	IL (Illinois)
7, 8	Building	MO (Monroe)
9 - 11	Entity	CG0 (Control Group 0)

Software Release: 5E3 and later
Valid Entries: 11 alphanumeric characters

Data Rules:

Copyright © 2003 Lucent Technologies

An entry must be made if XLT TEST is set to "Y". A valid entry must be made for all CCIS6 trunk groups.

For more detailed information on Common Language Location Identifiers, see Practice 795-100-100.

3.5 PBX/CPE ID

Description: This field contains the numerical identifier for a PBX or class II CPE located at the far end of a trunk group. For each trunk group connected to the same PBX or class II, the PBX/CPE ID must be the same. The PBX/CPE ID and trunk group number should be entered on the PBXID form (5213 Record). This form contains a list of PBX/CPE IDs already assigned, the trunk group they have been assigned to and an indication whether or not CPNs are to be screened for PRIs.
Valid Entries: 1 - 4095

Data Rules:

When CPN SCRN is "Y", then PBX ID must be entered.

PBX ID may also be entered if the far end is connected to some other type of CPE (Customer Premise Equipment) instead of a PBX. As with a PBX, the PBX ID must be entered when the CPE is to transmit a CPN that will be screened.

3.6 REMARKS

Description: These columns may contain any remarks deemed locally necessary.
Valid Entries: 1 - 16 characters

OPERATOR TRUNKS

These fields (Section 3.7 - Section 3.13) define the features assigned to Operator Trunks and are only required for the following Operator Type Trunk Classes: "AIS", "CAMA", "RECCMPL", "SERVICE", and "TSPS".

3.7 OUTPL REQ

Description: Is outpulsing required?
Valid Entries: Y, N

Data Rules:

Outpulsing is not required on a Recording-Completing Operator Trunk Group or Service Circuits.

An entry is permitted only for operator trunks.

3.8 AUDIBLE

Description: Should audible ring be returned to the calling party on an operator connection? Audible ring is normally required on a Recording-Completing Trunk Group, or a Service Trunk if the Service Trunk terminates at a Switchboard.
Valid Entries: Y, N

Data Rules:

An entry is permitted only for operator trunks.

If the TRK DIR is "RAF", this entry must be blank or "N".

3.9 SIGNAL

Copyright © 2003 Lucent Technologies

Description: This field defines the type of Operator Signaling.

Valid SIGNAL Entries

Entry	Definition
WINKONLY	Provide ringback signal on non-Coin Operator Trunks.
INBAND	Provide coin control and ringback signals on Coin Operator Trunks.
EXINBND	Expanded Inband; provide operator released and operator attached signals in addition to coin control and ringback signals on Coin Operator Trunks.

Data Rules:

If TRKCLS is "AIS", "CAMA" or "SERVICE", then this field must be blank.

If TRK DIR is "RAF", SIGNAL must be blank.

3.10 FREE TERM

Description: Are calls over this trunk free, i.e. no billing? Free Terminating service on an Operator Trunk Group is determined by an entry of "Y" or "N". An entry is permitted only for Outgoing Trunk Groups which have coin origination and terminate at an operator. A "Y" in this field, for coin originated traffic, will initiate coin return. For shared trunk groups where traffic is both coin and non-coin, and a billing record is desired for the non-coin traffic, this entry should be "N". Coins in this case are returned by defining a code index for free coin calls on the RAR form (5301 Record).
Valid Entries: Y, N

Data Rules:

If the TRK DIR is "RAF", this entry must be blank or "N". If TSPS TYPE is "DACHARG", then this field must be "N".

3.11 COINRTN INT

Description: Will Initial Coins be returned?
Valid Entries: Y, N

Data Rules:

An entry is required for Recording Completing and TSPS trunks and prohibited for all other trunk types.

If TRK DIR is "RAF", this entry must be blank or "N".

3.12 COINRTN FNL

Description: Will Final Coins be returned?
Valid Entries: Y, N

Data Rules:

An entry is required for Recording Completing and TSPS trunks and prohibited for all other trunk types.

If the TRK DIR is "RAF", this entry must be blank or "N".

3.13 TSPS TYPE

Description: This field defines the type of traffic being carried over the TSPS Trunk Group.

Valid TSPS TYPE Entries

Entry	Definition
COMBINED	Combines all Call Types (0+, 1+, 0-) but having separate Trunk Groups for Coin and Non-Coin Traffic. 0+, 0-: Coin only to TSPS; 0+, 0-, 1+: Non-Coin only to TSPS.
SUPERCOMB	Combines all Call Types (0+, 1+, 0-) in a single Trunk Group. For both Coin and Non-Coin

Copyright © 2003 Lucent Technologies

	Traffic.
DACHARG	Directory Assistance Charging.

Data Rules:

If TRK DIR is "RAF", this field must be blank.

ANNC TRUNKS

These fields (Section 3.14 - Section 3.21) define the features assigned to Announcement Trunks.

3.14 CYCLES

Description: This field defines the number of times an announcement is to be given.

An entry is required for announcement trunks.
Valid Entries: 0 - 7

Data Rules:

If CYCLES is 0, then the BARGE IN field must not be "Y".

If TRK DIR is "RAF", this field must be blank. If TRKCLS is not "ANNCMNT", this field must not be entered.

For 5E6 and later, if "MUSIC" is entered in the CMD CD field on a corresponding CVECT form (5460 Record), then CYCLES must equal 0, and BARGE IN must equal "Y". The RTIDX form equals the TGN on this form. If "DISC", "ANNOUNC" or "PROMPT" is entered in the CMD CD field on the corresponding CVECT form, then CYCLES cannot equal 0. CYCLES is "1" for "PROMPT". See Division 2, Section 3B for translation information on Call Vectoring.

MUSIC RI on the STINFO form (5402 Record) corresponds to ROUTE INDEX on the RTIDX form, where TRUNK GROUP NUMBER on RTIDX form corresponds to the TGN on this form.

3.15 BARGE IN

Description: Will the announcement barge in? When an announcement barges in, the originating party begins hearing the announcement immediately. When BARGE IN is "N", and AUD RNG is set to "Y", audible ring is given until the beginning of the message cycle is received. If "N" is entered in AUD RING, then silence is heard until the beginning of the message cycle.
Valid Entries: Y, N

Data Rules:

An entry is required for announcement trunks. If TRKCLS is not "ANNCMNT", this entry must not be entered.

If the TRK DIR is "RAF", this entry must be blank or "N".

If this field is "Y", then "N" must be entered in the AUD RNG field.

For 5E6 and later, if "MUSIC" is entered in the CMD CD field on a corresponding CVECT form (5460 Record), then CYCLES must equal 0, and BARGE IN must equal "Y". See Division 2, Section 3B for translation information on Call Vectoring.

3.16 AUD RNG

Description: Should audible ring be given to the originating party when waiting for the beginning of the message cycle on a non-barge-in announcement? An entry is required for announcement trunks.

Copyright © 2003 Lucent Technologies

Software Release: 5E4(2) and later
Valid Entries: Y, N

Data Rules:

If an "N" is entered in the BARGE IN field, then "Y" (Yes) is normally entered in this field except when the announcement is used for Local Coin Overtime Prompt.

If TRK DIR is "RAF", AUD RING must be either "N" or not entered. If TRKCLS is not "ANNCMNT", AUD RING must not be entered.

15A Announcement trunks are allowed to have AUD RNG set to "N".

3.17 SVC GRP

Description: This field indicates the type of RAF announcement the trunk is routing. It only applies to trunks terminating at a DSU2-RAF.

Software Release: 5E5 and later
Required Field.
Default: NOANNC
Valid Entries:

Valid SVC GRP Entries

Entry	Definition
ACCS	OSPS Automated Calling Card Service.
ACSR	Automatic Customer Station Rearrangement.
ASP	Software Release: 5E8 and later. Advanced Services Platform.
COIN	OSPS Automatic Coin Service.
DA	OSPS Directory Assistance.
NOANNC	No Announcement assigned to the Trunk Group.
RAS	Remote Access Service.

Data Rules:

If the TRKCLS is "RAFDTA", "RAFANNC", or "RAFCTR", a corresponding SVC GRP must be entered. Also, the associated ROUTE INDEX (defined on the RTIDX form) must be assigned a specific FIXED ROUTE TYPE defined on an associated FIXRT form (5301 Record). The dependencies are:

TRKCLS	SVC GRP	FIXED ROUTE TYPE	QUEUE ALLOWED
RAFDTA	ACCS	ROACCS	Y
	RAS	2LEVEL	N
	ACSR	RAS or ACSR	N
	RAS	(See Data Rules)	N
	ASP	NSANNC (5E9(2) and earlier)	N
	RAS	ACSR	N
	RAS	SLE	N
RAFANNC	DA	OSPSDA	N
	DA	OSPSEIS	N
RAFCTR	COIN	ROCOIN	N

- ***NOTE:*** The SVC GRP of "RAS" must be entered when the trunk group is supporting:

  - LASS SLE (Screen List Editing) announcements.
  - RACF (Remote Activation to Call Forwarding) announcements.
  - Any combination of RACF, LASS and ACSR announcements.

When the trunk group is supporting RAS announcements (and its combinations), the associated route

Copyright © 2003 Lucent Technologies

index, defined on the RTIDX form (5303 Record), must be assigned to the ANNC RTI on the RASRTI form (5538 Record).

If TRKCLS is not "RAFDTA", "RAFANNC", or "RAFCTR", then SVC GRP must be "NOANNC".

For 5E9(2) and later, the following SVC GRP values can not be members of more than one trunk group:
- "ACCS"
- "AOC"
- "COIN"
- "DA"

Also,RAF (Recorded Announcement Function) circuits in these service groups must be located in Switching Modules (SMs) with a LOADED configuration (CONFIGURATION is "LOADED" on the corresponding EQIM form). To find the corresponding EQIM form, TGN points to TGN on the TRUNK Form, and the SM part of TRUNK RAF EN (first three digits) points to EQIM SM.

3.18 MAXCALLS

Description: Enter the maximum number of calls allowed to concurrently connect to this music or announcement port at the same time.

- ***NOTE:*** When a blank is entered for an announcement trunk, call processing will allow 32 concurrent connections to the trunk.

Software Release: 5E6 and later
Valid Entries: 0 - 60

Data Rules:

If TRKCLS is not "ANNCMNT", then MAXCALLS must be blank.

3.19 RETRY

Description: Should the switch software retry when it fails to connect to an announcement port?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TRKCLS is not "ANNCMNT", then RETRY must be "N".

3.20 CASCADING

Description: Does the trunk group use the 15A Cascading Announcement secured feature? For trunk groups connected to the cascading announcement circuits, the calls are routed to the announcement that plays next, thereby minimizing the delay between the camp-on to the announcement trunk and the actual connection to the announcement. This field supports the 15A Announcement secured feature. For more information on this feature, see Division 2, Section 4A118.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y,N

Data Rules:

Copyright © 2003 Lucent Technologies

15A Announcement is a secured feature and must be purchased by the Office before the 15A Announcement data can be assigned. Therefore, "Y" cannot be entered until the ACT field for SFID 118 on the SFSYS form has been set to "Y".

If "Y" is entered, then:
- BARGE IN must be "N"
- CYCLES must be 1
- MAXCALLS must be 60
- TRKCLS must be "ANNCMNT"

If "Y" is entered, all the corresponding TGN/MEMB(s) defined on TRUNK form(s) must have MAXCALLS set to 60 or not entered.

15A Announcement trunks are allowed to have the AUD RNG field on this form set to "N".

3.21 RAF MBRS

Description: This field displays the number of RAF trunk members (as opposed to SAS trunk members) that are in the announcement trunk group. This field cannot be entered. For more information on the SAS (Service Announcement System) feature, see Division 2, Section 3 J.

Software Release: 5E9(2) and later.
Default: 0
Valid Entries: 0 - 4095

CAMA TRUNKS

These fields (3.22 - 3.23) define Incoming CAMA ONI and ANI Trunk Groups for combined Local/Toll operation.

3.22 ORIG NPA

Description: Enter the Originating NPA (Numbering Plan Area).
Valid Entries: 200 - 999

Data Rules:

An entry is required in this field for an Incoming CAMA Trunk Group.

For 5E7 and later, a value must be entered in this field for a dedicated E911 incoming trunk group (E911 TYPE is "DED", "DIRANI", or "DIRNOANI") if its TRKCLS is "CAMAANI". The ORIG NPA field is used by E911 call processing when the ORIG NPA field is sent to the ESA (E911 Service Adjunct) in the query for the ESN (Emergency Service Number).

3.23 OFFCODE 1-8

Description: Up to eight originating Office Codes (NXX) may be associated with each Incoming CAMA Trunk Group. Enter the first to eighth Office Code in these columns. Office Codes must be entered in sequential order.
Valid Entries: 3 digits, each in the range 0 - 9

Data Rules:

For 5E7 and later, a dedicated E911 incoming trunk group (E911 TYPE is "DED", "DIRANI", or "DIRNOANI") with TRKCLS "CAMAANI" must have one OFFCODE entered; this OFFCODE is not used in

Copyright © 2003 Lucent Technologies

E911 call processing.

4. FORM ENTRIES - 5202-3 RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

4.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

MISCELLANEOUS FEATURES

These fields (4.3 - Section 4.20) concern direct connect trunks, originating private trunk billing, and OSPS Listing Services.

4.3 DATA RATE

Description: This field identifies the data rate the trunk group is capable of handling for an interswitch ISDN data call. Data trunks are interoffice digital trunks designated to transmit data to/from ISDN CPE (Customer Premise Equipment). For 5E11 and later, also see special considerations below for the interaction between the DATA RATE and DFI MODE when PRI D-channel trunk members are assigned to both DFIs and DNU-S units.

MF (Multifrequency) trunks can carry either voice or data, but not both. If OUTPULSING or INPULSING is "MF" and a DATA RATE of 56K is assigned, only data can be carried on this trunk group; voice cannot be carried on an MF trunk that has a data rate assigned.

CCS7 and EDSL trunks can carry both voice and data. If OUTPULSING or INPULSING is "ISUP7", or if TRKCLS is "EDSL" and TRK DIR is not "SGNL", then both voice and data can be carried on the same trunk when a data rate is assigned.

Software Release: 5E3 and later
Valid Entries:

Valid DATA RATE Entries

Entry	Definition
56K	For any trunk able to carry 56 kb/s data calls.
R64K	For any trunk able to carry restricted 64 kb/s data calls.
64K	For any trunk able to carry 64 kb/s data calls.

Valid DATA RATE Entries for PACKET Trunks (5E5 and later)

Entry	Definition
56K	Provided when a D3/D4 channel bank is used.
64K	Provided when a direct T1 carrier connection between two 5ESS Switches is used.

Data Rules:

When DATA RATE is entered, and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", "TTOLLCON",

Copyright © 2003 Lucent Technologies

"IC", or "LATA", then TRK DIR must be "2W", "INC" or "OUT".

DATA RATE must not be entered if TRK DIR is "RAF" or if TRKCLS is "RMSD3" or "TOPAS". It must be entered if TRK DIR is "SGNL".

For 5E5 and later, when TRKCLS is "PACKET") (an IP trunk group), DATA RATE must be "56K" or "64K"; when TRKCLS is "X75P", it must be "56K". For 5E6 and later, when TRKCLS is "X75", DATA RATE must be "56K".

For 5E7 and later, DATA RATE may be entered only if TRKCLS is one of the following:

- "CST1"
- "CST2"
- "DSC"
- "EDSL"
- "EDSLHM"
- "IC"
- "IDCS"
- "IFOPER"
- "IFTERM"
- "IVTRK"
- "LATA"
- "LTOLLCON"
- "PRINTOLL"
- "SCINTOLL"
- "TTOLLCON"
- "PACKET"
- "PF"
- "PFITT"
- "PFLASH"
- "X75"
- "X75P"
- "PPMEM" (5E10 and later)

For 5E10 and later, when TGN/MEMBs are defined on the TRUNK form that have a DATA RATE value entered on its associated TKGRP form, and the TRKCLS on the TKGRP form is either

- "EDSL"
- "EDSLHM"
- "IFTERM", or
- "IFOPER",

and the DEN field is entered on the TRUNK form, this DATA RATE value must correspond with a DFI MODE entered on the EQDUP form according to the following table:

Corresponding DFI MODES

DATA RATE	DFI MODE
56K	D4, FEB7, 64K, FE8Z, D464, OR FE64
R64K	D464, FE64, 64K OR FE8Z
64K	FE8Z OR 64K

For 5E10 and later, Packet Pipe Member ("PPMEM") trunk class is valid for the following data rates and dfi modes:

DATA RATE	DFI MODE
56K	D4, FEB7, D464, FE8Z

Copyright © 2003 Lucent Technologies

64K	D464, FE8Z

For 5E11 and later, when PRI D-channel trunk members are assigned to both DFIs and DNU-S units, special consideration must be made to the interaction between the DATA RATE and DFI MODE. When assigning TGN/MEMBs with a TRK DIR of "SGNL" (PRI D-channel trunk assignment), the signaling on this type of trunk is done via HDLC (High Level Data Link Control) encoding. If the trunk is a NEN, the DATA RATE field determines whether the HDLC encoded data is inverted or non-inverted. Valid DATA RATE and HDLC encoding entries for PRI D-channel trunks assigned to a DNU-S are as follows:

ENTRY	HDLC ENCODING
56K	Inverted
R64K	Inverted
64K	Non-Inverted

Caution must be exercised whenever PRI D-channel trunk members within the same trunk group are assigned to both DNU-S and DFI circuits. The DFI MODE controls the HDLC encoding for PRI D-channel trunks assigned to DFIs. The DATA RATE is only used for DNU-S trunk groups. Whenever mixing trunk members on both DFIs and DNU-S, the following combinations are allowed.

DFI MODE	DATA RATES
D4	56K
FEB7	56K
D464	56K or R64K
FE64	56K or R64K
64K	64K
FE8Z	64K

For 5E13 and later, when DATA RATE is "64K" for a TRKCLS value of "X75" or "X75P" on this form, the ACT field for SFID (Secured Feature ID) 542 on the SFSYS form (5713-1 Record) must be set to "Y". Since the DATA RATE value of "64K" on this form is used by the 64Kbps X.75/X.75 Trunk Group special feature, SFID 542 must be activated before the DATA RATE may be set to "64K" (see Division 2, Section 4A542).

For 5E13 and later, DATA RATE may be entered only if TRKCLS is one of the following:

- "A2"
- "BCM"
- "CST1"
- "CST2"
- "DSC"
- "EDSL"
- "EDSLHM"
- "IC"
- "IDCS"
- "IFOPER"
- "IFTERM"
- "IVTRK"
- "LATA"
- "LTOLLCON"
- "OTOTK"
- "PRINTOLL"
- "SCINTOLL"
- "TTOLLCON"
- "PACKET"
- "PF"
- "PFITT"
- "PFLASH"
- "X75"
- "X75P"
- "PPMEM"

Copyright © 2003 Lucent Technologies

4.4 INVERSION

Description: Should this packet pipe use inverted data? The INVERSION field is used to indicate if the packet pipe uses inverted data. This is decided on a trunk group basis and is sent to the PH4 on initialization of packet pipes.

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TRKCLS is "PKTPIPE", INVERSION must be "Y"

When TRKCLS is "ATMPP", INVERSION must be "N".

When TRKCLS is not "A5", "FRB"', "IS41" or "PKTPIPE", INVERSION must be "N".

When TGNs are defined on the TKGRP form with a TRKCLS of "PKTPIPE" and the MEMBs assigned to the TGN on the TRUNK form have 9 or more rows entered on the PSU PIPE MEMBER TRUNKS list on the TRUNK form, the Packet Pipe Enhancements secured feature must be active with the SFID 317 ACT field set to "Y" on the SFSYS form (5713-1).

When the SFID 317 ACT field is set to "Y" on the SFSYS form (5713-1), the Packet Pipe Enhancements secured feature is active:

- For PSUGP forms representing PH4s which have exceeded their capacity for CDMA trunk routing, the count of Packet Pipe trunks which use this PH4 may not exceed 32.
- When no Trunk Groups have been provisioned with SERV TYPE of "ACELP" or "VSELP", the number of calls the PH4 can handle many not exceed 85.
- When one or more Trunk Groups have been provisioned with SERV TYPE of "ACELP" or "VSELP", the number of calls the PH4 can handle many not exceed 90.
- The number of possible CDMA calls is dependent upon the presence of Trunk Group SERV TYPEs of "8K", "13K", "ACELP", "DATA", "EVRC", or "VSELP" in the switch, the DATA RATE of the Packet Pipe Member trunks which point to this PH4.
- TRUNK forms which are associated with the above PSUGP forms (the first six digits of the TRKOE on the TRUNK form match the SM, PSUSHELF, and CHANNEL GROUP of the PSUGP) specify Packet Pipe Trunks.

4.5 WB RATE

Description: Enter the wideband data rate transmitted by this trunk group for wideband calls. Wideband data rates reflect different multiples of DS0 channels at 64Kb/s each.

Software Release: 5E9(1) and later
Valid Entries:

Valid WB RATE Entries

Entry	Definition
384K	Trunk group designated to carry 384 kb/s wideband data calls. Uses 6 DS0 channels.
1536K	Trunk group designated to carry 1536 kb/s wideband data calls. Uses 24 DS0 channels.
384/1536K	Trunk group designated to carry 384 kb/s or 1536 kb/s wideband data calls.
MULTIRATE or M	Trunk group designated to carry multirate wideband data calls. Uses 2 to 24 DS0 channels, depending upon the needs of the call.

Copyright © 2003 Lucent Technologies

Data Rules:

Because WB RATE is a secured feature, this field may not be entered unless an SFSYS form (5713-1 Record) exists with SFID 125 set to "Y".

If WB RATE is "MULTIRATE", WB TSA TYPE must be entered.

If WB RATE is entered and OUTPULSING is "ISUP7", GLARE ACTION must be "ALLCTRL" or "NONECTRL", and WB TSA TYPE must be "FLOAT" or must not be entered.

If WB RATE is entered, the TGN defined on this form can only have, at most, one TGSR and/or one IDP feature assigned to it on the TRUNKFA form, or associated CLUSTR form.

If WB RATE is entered:

- DATA RATE must be "64K",
- DEDICATED SRV, ENQUEUE ACT, LOCAL SM, and QUEUE FEATURE must not be entered,
- HUNT TYPE must be "2WF" or "2WB",
- LN TYPE must be "NONE" or not entered,
- RDTA GRP must be "N" or not entered,
- TRK DIR must be "2W",
- TRKCLS must be "IC", "LTOLLCON", "EDSL", or "TTOLLCON", and
- both INPULSING and OUTPULSING must be either "ISUP7" or "DCHN".

When WB RATE is entered for a trunk group, each member defined on the TRUNK form must have a matching EQDUP form (5730 Record) where the FAC 0 DFI MODE or FAC 1 DFI MODE is "FE8Z".

For 5E10 and later, when Wideband trunk members residing in the same trunk group that are within the same wideband trunk block and have a DEN assigned, they must be assigned to the same SM, DLTU, DFI, FAC, and PRI GROUP. Note that only EDSL wideband trunk members can have an associated PRI GROUP. Therefore, the PRI GROUP must not be entered for ISUP7 wideband trunk members.

4.6 WB TSA TYPE

Description: Enter the Wideband Time Slot Assignment Type.

Three types of Wide Band Time Slot Assignments are allowed for wideband capable trunk groups. If the WB RATE field is entered and the WB TSA TYPE field is left blank, a "fixed" time slot assignment is used. The "fixed" time slot assignment scheme is the default.

The WB TSA TYPE field is used in conjunction with the HUNT TYPE field to determine if forward or backward hunting should be accomplished. Wideband capable trunk groups using ISUP7 signaling can only use a wideband hunt type that is fixed (i.e., leave the WB TSA TYPE blank) or "FLOAT". Wideband capable PRI trunks (i.e., TRKCLS of "EDSL" on the TKGRP form), can use all three wideband hunt types.

All channels must be contained within a single facility and a single wideband trunk group.

Software Release: 5E9(1) and later
Valid Entries:

Valid WB TSA TYPE Entries

Entry	Definition
blank	Fixed wideband time slot assignment. When the WB RATE field is entered and WB TSA TYPE is left blank, calls will start on certain "fixed" time slots (or channels) within a wideband trunk block: slots 1, 7, 13, and 19). With fixed hunting, a call will not skip intermediate trunk members. Therefore, if a wideband call needs 6 DS0 channels to attain the data rate of 384Kbps, and the call setup process selects channel 7, then channels 7, 8, 9, 10, 11, and 12 will be used. Note that fixed hunting only supports calls using 6 DS0 channels (384Kb/s) or 24 DS0 channels (1.536Mb/s).
FLEX or FLE	Flexible wideband time slot assignment. A WB TSA TYPE entry of "FLEX" allows wideband calls to select any trunk member as the first channel used. The time slots chosen can also be selected with gaps in the sequence. Therefore, if a wideband call hunts channel 12, it may also hunt channels 14 and 17.
FLOAT or FLO	Floating wideband time slot assignment A WB TSA TYPE entry of "FLOAT" allows wideband calls to be started on any channel within the wideband trunk block but demands that the trunk channels be selected in a contiguous manner.

Data Rules:

If WB TSA TYPE is entered, WB RATE must be "MULTIRATE".

4.7 DIR CON DN

Description: This field is used for Direct Connect trunks which are Incoming or Two-Way.

This field also has specific considerations for the PRI Call By Call Service Selection For FX/Tie feature for 5E9(1) and later:

- For calls originating on an FX/Tie that terminate to a DPBX via a PRI, this field must be populated with a 1 to 15-digit DN. For these calls, digit analysis is not performed on any called digits. To determine the DPBX's PRI trunk group, digit analysis is instead performed on the digits entered in this field. A route index is then obtained that points to the desired PRI.
- Digits entered in this field could be any digit strings currently defined in the digit analysis tables (LDIT, RDIT, INDIT) that have a route index pointing to the PRI trunk group.
- A 7-digit DN may also be entered. This DN would be defined on a LINE form with an assigned route index that points to the PRI trunk group.
- Digits entered as DIR CON DNs are not outpulsed to the DPBX. The only functionality for these digits is to determine the route index that points to the DPBX's PRI trunk group.

Valid Entries: 1 - 15 digits predetermined for this Trunk Group. DIR CON DNs are typically 1, 3, 7, 8, 10, 11-digit or IDDD DNs.

Data Rules:

The IN START DIAL on the TRUNK form (5204-1 Record) must be "DIRC" for all trunk members of this Trunk Group. It may be used for incoming calls on FX Trunks. If this field has an entry, the Trunk Group being defined must have: INPULSING equal to "NONE"; TRK DIR equal to "2W" or "INC"; and TRKCLS must be "PF", "PFLASH" or "LTOLLCON". The appropriate Trunk Class combined with a START SIGNAL of "DIRC" and a SIGNAL TYPE of "NONE" must be specified on the TIMING form (5520 Record).

For 5E9(1) and later, when DIR CON DN is entered, TRKCLS must be "PF", "PFLASH", "PFITT" or "LTOLLCON".

When DIR CON DN is specified, TRKCLS is not "INAISTRK", FACILITY TYPE is "TIE", and CUT THRU is "N" or blank, INPULSING must be "NONE", "DP", "MF", or "TT", or not entered.

When DIR CON DN is specified, TRKCLS is not "INAISTRK", and either FACILITY TYPE is not "TIE" or

Copyright © 2003 Lucent Technologies

CUT THRU is "Y", INPULSING must be "NONE" or not entered.

4.8 FACILITY TYPE

Description: Enter the facility type of FX/Tie trunk.

Software Release: 5E9(1) and later
Valid Entries:

Valid FACILITY TYPE Entries

Entry	Definition
FX or F	Foreign Exchange
TIE or T	Tie trunk group

Data Rules:

If FACILITY TYPE is entered, TRKCLS must be "PF" or "PFLASH".

4.9 FACILITY NBR

Description: Enter the facility number to identify the FX or Tie trunk group.

Software Release: 5E9(1) and later
Valid Entries: 1 - 99999

Data Rules:

If FACILITY NBR is entered, FACILITY TYPE and DIR CON DN must be entered.

If FACILITY NBR is entered, API CODE must not be entered.

4.10 RTE NBR PLAN

Description: Enter the numbering plan type to use for the direct connect DN, if the DIR CON DN field is entered. This field is used to identify the numbering plan as a private numbering plan, as the North American Numbering plan, or as an international numbering plan. This field is used by the public and private switched networks to identify the type of translation to apply to the address digits.

Software Release: 5E9(1) and later
Valid Entries:

Valid RTE NBR PLAN Entries

Entry	Definition
APN	Action Point Numbering Plan for private numbering plans.
INTL	International Numbering Plan.
NANP	North American Numbering Plan.

Data Rules:

If RTE NBR PLAN is entered, DIR CON DN must be entered.

4.11 BILLING DN

Description: This field associates a Billing Directory Number with an originating private Trunk Group which has a Trunk Class of "LATA", "PF" or "PFLASH".
Valid Entries: 7 digit TN; or

- 10 digit TN (NPAXXXXXXX)
- where NPA is: 200 - 999

Data Rules:

Copyright © 2003 Lucent Technologies

BILLING DN is also used to associate a billing number with an originating CMC (Cellular Mobile Carrier) Trunk Group. An entry is required if both CMC and BILL TRKGRP equal "Y". The Billing DN entered is expected to be 10 digits and a limit of 60 unique billing numbers may be used for CMC.

For 5E3 and later, BILLING DN may be used for Trunk Groups with a Trunk Class of "PFITT". With DSN (Defense Switched Network) offices (DSN OPTION field set to "Y" on the OFCOPT form), a Billing DN may be associated with Trunk Groups with a Trunk Class of "LTOLLCON", "PRINTOLL" or "TTOLLCON".

For 5E4(2) and later, BILLING DN may be entered only if TRKCLS is "LTOLLCON" "PF", "PFITT", "PFLASH", "PRINTOLL", "EDSL", "EDSLHM", "TTOLLCON", "LTPCLBCK", "LTPROTL", or "LTPDFTAC". For 5E5 and later, BILLING DN may also be entered when TRKCLS is "LATA". For 5E8 and later, BILLING DN may also be entered when TRKCLS is "PBXDID".

For 5E4(2) and later, BILLING DN must be entered for Trunk Groups with a TRKCLS of "EDSL" or "EDSLHM" and a TRK DIR of "INC" or "2W".

For 5E7 and later, a BILLING DN should be entered for CAMA PSAP trunk groups (CAMA PSAP is "Y"); otherwise, calls routed from this trunk group through an IDP will not be billed properly.

For 5E11 and later:
When BILLING DN is entered, TRKCLS must be "CAMAANI", "CAMAONI", "EDSL", "EDSLHM", "IC", "LATA", "LTOLLCON", "LTPCLBCK", "LTPDFTAC", "LTPROTL", "PBXDID", "PF", "PFITT", "PFLASH", "PRINTOLL", "TOLLCON", "X75", "X75P" of "INC", or "2W".

4.12 LS DLY ANS

Description: Should answer supervision be relayed to the originating office? This field is used by OSPS Listing Services. If it is set to "Y", answer supervision is relayed upon receipt of a billing indicator from an external vendor system. If it is set to "N", answer supervision is relayed upon operator position seizure.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

4.13 MLT ISLC OPT

Description: Is the enhanced signal provided on the "No Test" trunk for non-integrated Mechanized Loop Test System? If "N" is entered the basic signal is provided. This field supports the Improved DLC Status Indications to MLT feature. The enhanced signal provides two new combinations of ring ground/tone signal in order to provide and identify the status of "DN is ISLC (Integrated Subscriber Loop Carrier) with Carrier Alarm" and "DN is ISLC Test Pair is Busy" on top of the basic "DN is on Intercept" status. This field supports the Improved DLC Operational Status Indications feature. For more information on this feature, see Division 2, Section 2V.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then
- TRKCLS must be "TSTK"
- TRK DIR must be "INC"

Copyright © 2003 Lucent Technologies

4.14 FGD CIC SZ

Description: Enter the expected size for the incoming CIC for two-way or incoming TTOLLCON, LTOLLCON, or LATA trunk classes. If this field is not entered, a 3 digit CIC is allowed.

Software Release: 5E9(1) and later
Valid Entries:

Valid FGD CIC SZ Entries

Entry	Definition
BOTH or B	Three or four digit CIC expected.
FOUR or F	Four digit CIC expected.

Data Rules:

If FGD CIC SZ is entered, TRK DIR must be "2W" or "INC", and TRKCLS must be "TTOLLCON","LTOLLCON" or "LATA".

4.15 SPEECH TRMTS

Description: Havespeech treatments been assigned to this trunk group? ISDN routing and digit analysis require "speech" and 3.1 kHz audio bearer capability calls to be routed differently. 3.1 kHz calls equate to voiceband data, e.g., facsimile and modems. It is important to maintain the integrity of the bit stream for 3.1 kHz audio calls, therefore, no "speech" treatments should be applied to a 3.1 kHz audio call. This field should be set to "Y" if the trunk group has speech treatments assigned to ensure that 3.1 kHz audio calls will NOT be routed over the speech trunk groups. No data checks are made to verify that the trunk group actually has "speech" treatments. However, by setting this field to "Y" the trunk group is restricted to carrying only "speech" calls.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DATA RATE is entered, SPEECH TRMTS must be "N".

4.16 EON MC RI

Description: Proprietary field.

4.17 RERTE Q INH

Description: Should re-route queuing be inhibited? The RERTE Q INH field is used to indicate if the call can attempt to queue or if it should send the release message back to the upstream switch. A value of N indicates that queuing is not inhibited and the call will attempt to queue. A value of Y indicates that queuing is inhibited, and a release message will be sent back to the upstream switch. For more information, see Div. 2 Sec. 4A217.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When RERTE Q INH is "Y", TRKCLS must be "TTOLLCON".

4.18 CNA MOD 164

Copyright © 2003 Lucent Technologies

Description: Is the ability to record the Chargeable Account Number in an appended BAF module 164 active?

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Data Rules:

When CNA MOD 164 is "Y", then CNA OPTION must not be "NONE".

4.19 CALEA

Description: The CALEA field was added to support the CALEA (Communication Assistance for Law Enforcement Act) feature, both wireline and wireless applications. The CALEA field is used to indicate whether the trunk group is reserved for CALEA or not. If "Y", all trunk members are for CALEA use. If "N", all trunk members are not for CALEA use.

Is this trunk group supporting the Communications Assistance for Law Enforcement Act?

For more information see Division 2, Section 4A509 for the wireline application or Division 2, Section 4A529 for the wireless application.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When CALEA is "Y":

- TRK DIR must be "OUT"
- HUNT TYPE must be "UCD"
- OUTPLSING must not be entered or "NONE"
- INPLSING must not be entered or "NONE"
- TRKCLS must be "PF"
- ATTN must not be entered
- When CALEA is "Y" and DCS TRK is "N" LOCAL SM must be entered.

When trunk groups are defined with CALEA set to "Y", the corresponding trunk group members must NOT have an OUT START DIAL entered.

The wireline application, CALEA Core, is secured and must be purchased by the office before the CALEA field on the TKGRP form can be set to "Y". A SFSYS form must exist with SFID 509 ACT set to "Y".

The wireless application, CALEA Phase III, is also secured and must be purchased by the office before CALEA is set to "Y" and DCS TRK is set to "Y". A SFSYS form must exist with SFID 529 ACT set to "Y".

When TGNs are assigned on the TKGRP form with CALEA equal to "Y" and DCS TRK equal to "Y", the MEMBs of the matching TGNs on the TRUNK form must be on the same SM; (SM is the first three digits of the DEN or NEN).

Copyright © 2003 Lucent Technologies

4.20 REL LINK INIT

Description: Is the trunk group allowed to initiate release link processing? This field is used to indicate whether or not the trunk group is eligible for release link processing.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When REL LINK INIT is "Y":

- TRKCLASS must be "LATA" , "TTOLLCON", "PF", "PFITT", PFLASH", "EDSL", or "EDSLHM"
- TRK DIR must be "INC" or "2W"
- and TRKCLASS is "LATA" or "TTOLLCON", then INPULSING must be "ISUP7" or "MF"

When REL LINK INIT is "Y", the ACT field on the SFSYS form (5713-1 Record) for SFID 520 or SFID 521 must be set to "Y". In addition, since SFIDs 520 and 521 depend on the Long Distance Platform Basic Call Processing for Toll feature, the ACT field on the SFSYS form for SFID 165 must also be set to "Y".

4.21 SEND LD CIC

Description: Send Long Distance Carrier ID Code to terminating end office? The SEND LD CIC field was added to support the LD CIC (Long Distance Carrier Identification Code) in Terminating Tandem feature. This field is used for the outgoing trunk group to indicate whether or not the carrier ID of the trunk group used to ingress the switch is sent, in the carrier identification parameter, over the outgoing trunk group to the terminating end office.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The SEND LD CIC field is used by the LD CIC at Terminating Tandem special feature and must not be entered unless the SFSYS form (5713-1 Record) has ACT set to "Y" for SFID 524. (For more information on this feature, see Division 2, Section 4A524.)

When SEND LD CIC is "Y":

- TRK DIR must be "OUT" or "2W"
- TRKCLS must be "TTOLLCON"
- OUTPULSING must be "ISUP7"

4.22 ROUTE IND

Description: The ROUTE IND (Route Indicator) field is used to establish the proper AMA (Automatic Message Accounting) call record. This field was added to support the Billing and Comptrollers feature (99-5E-7984). This feature is made available in 5E15 Feature Release 3. For more information, see Division 2, Section 4A601.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later
Valid Entries:

Valid ROUTE IND Entries

Entry	Definition
D	Direct
T	Tandem

PFA TRUNK FEATURES

The fields (Section 4.23 - Section 5.3) apply to Private Facility Access trunks.

4.23 BUSY LAMP

Description: Enter the nine-digit DPN (Distribute Point Number) associated with the Busy Lamp. A Busy Lamp is associated with a customer Trunk Group. It is located on the customer premises and is turned on under the following conditions:

- when the MAKE BUSY KEY has been turned on. The BUSY LAMP is under switch control and shows the status of the Make Busy Key.
- when the trunk group BUSY LAMP feature indicates, on a private facility group basis, when the facility group is entirely in use. The feature is applicable when private facilities are provided with access on a dial-up or an ARS ARS (Automatic Route Selection) basis. The switching system activates a light on the customer premises to indicate when all trunks are busy in a private facility gorup. There is one lamp per private facility group.

Distribute Point consists of:

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Distribute Point Number	DPN	XX	00 - 31

Data Rules:

This entry must be blank if the TRK DIR is "RAF".

This entry must be blank if TRKCLS is "RMSD3" or "TOPAS".

4.24 MAKE BUSY KEY

Description: The Trunk Group Make Busy Key is associated with a customer Trunk Group. The Make Busy Key is located on the customer premises and is provided to enable the customer to make their private Trunk Group in an all-members-busy condition by activating the key. Enter the nine-digit Scan Point Number associated with the Make Busy Key.

Scan Point Number consists of:

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 - 1
Service Group	SVG	X	0 - 1

Copyright © 2003 Lucent Technologies

Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

Data Rules:

This entry must be blank if the TRK DIR is "RAF".

This entry must be blank if TRKCLS is "RMSD3" or "TOPAS".

5. FORM ENTRIES - 5202-4 RECORD

5.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

5.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

PFA TRUNK FEATURES

5.3 CUT THRU

Description: Is Cut-Thru to a trunk active on this Trunk Group?
Valid Entries: Y, N

Data Rules:

A trunk with cut-thru active may only be accessed by a line or trunk using a PFA or ARS feature.

- ***NOTE:*** No entry is treated exactly like the value "N". A value of "Y" applies only to trunks with TRKCLS set to "PF", "PFLASH" or "PFCPE", and applies to all trunks in the group.

When this field is "Y", the OUTPULSING field must be "TT" or "DP.

This entry must be blank or "N" if the TRK DIR is "RAF".

For 5E6 and later, when CUT THRU is "Y": if TRK DIR is "2W" or "OUT", OUTPULSING must be "TT" or "DP"; if TRK DIR is INC, OUTPULSING must be blank.

LATA/TTOLL

The fields (Section 5.4 - Section 5.7) apply to toll trunk groups from a LATA (Local Access and Transport Area) and AMA capabilities for Cellular Mobile Carrier interconnections.

5.4 CMC

Copyright © 2003 Lucent Technologies

Description: Is this a CMC (Cellular Mobile Carrier) Trunk Group?
Default: N
Valid Entries: Y, N

Data Rules:

When CMC is "Y", TRKCLS must equal "LATA", "TTOLLCON" (for 5E9(1) and later) or "PF". When BILLING DN is entered and BILL TRKGRP is "Y", CMC must be "Y".

CMC must be "Y" when CMC ID is defined.

5.5 CMC ID

Description: CMC ID is the Cellular Mobile Carrier Identification number. It can be entered by the user or left blank, in which case ODA will automatically generate a value when CMC is "Y".

Software Release: 5E9(1) and later
Valid Entries:
- For 5E9(1) through 5E13: 1 - 60
- For 5E14 and later: 1 - 1023

Data Rules:

When CMC ID is entered, CMC must be "Y".

When CMC is "Y", BILL TRKGRP is "Y", BILLING DN is known and TRKCLS is "LATA", CMC ID must be 1 - 60.

When CMC ID is greater than 60, ACT must be "Y" on the SFSYS form for SFIDs 128, 160, 167 and 538.

For 5E13 and earlier, a maximum of 60 CMC IDs is allowed per office.

For 5E14 and later, a maximum of 1023 CMC IDs is allowed per office.

5.6 ORIG CMC

Description: Enter the billing type for originating CMC (Cellular Mobile Carrier) calls. This field supports the AMA Capabilities for Type 2A and Type 2B CMC Interconnections secured features (SFID 128 and 160, respectively). For more information on these features, see Division 2, Sections 4A128 and 4A160.

Software Release: 5E9(1) and later
Valid Entries:

Valid ORIG CMC Entries

Entry	Definition
2A	AMA (Automatic Message Accounting) for Type 2A Cellular Interconnection. Connections to a land-based tandem switch, local or access. Provides connections to and from co-located lines in the tandem, inter-Lata carriers, and other CMCs having terminations within the LATA.
2B	AMA for Type 2B Cellular Interconnection. Connections to a telephone company end office. Provides connections only to and from terminals served by the end office, including lines, private trunks and other CMCs having terminations within the switch itself.
T1	Software Release: 5E10 and later. AMA for Type 1 Cellular interconnection. The trunk direction can be either 2-way ("2W") or outgoing ("OUT"). This value supports the AMA Capabilities for Type 1 Cellular Access. For more information on this feature, see Division 2, Section 4A167.

Data Rules:

Copyright © 2003 Lucent Technologies

ORIG CMC must not be entered unless the SFSYS form (5713-1 Record) has ACT set to "Y" for SFID 128 or SFID 160.

When ORIG CMC is "2A":
- BILLING DN must be entered
- CMC must be "Y"
- OUTPULSING must be "MF" or "ISUP7"
- TRK DIR must be "OUT" or "2W"
- TRKCLS must be "TTOLLCON"

If "2B" is entered:
- BILLING DN must be entered
- CMC must be "Y"
- OUTPULSING must be "MF" or "ISUP7"
- TRK DIR must be "OUT" or "2W"
- TRKCLS must be "TTOLLCON"

"2B" is associated with Type 2B Cellular Interconnections special feature. This feature is secured and must be purchased by the office before this field can have a value of "2B", i.e., the ACT field for SFID 160 must be "Y" on the SFSYS form (5713-1 Record).

If TERM CMC is entered and OUTPULSING is "ISUP7", SFID 160 must be activated.

For 5E11 and later, when ORIG CMC is "2A", "2B", "T1", CNA OPTION must be "NONE" on this form.

5.7 TERM CMC

Description: Enter the billing type for terminating CMC (Cellular Mobile Carrier) calls.

Software Release: 5E9(1) and later
Valid Entries:

Valid TERM CMC Entries

Entry	Definition
2A	AMA for Type 2A Cellular Interconnection. See description in ORIG CMC above.
2B	AMA for Type 2B Cellular Interconnection. See description in ORIG CMC above.
T1	Software Release: 5E10 and later. AMA for Type 1 Cellular interconnection. The trunk direction can be either 2-way ("2W") or Incoming ("INC"). This value supports the AMA Capabilities for Type 1 Cellular Access. For more information on this feature, see Division 2, Section 4A167.

Data Rules:

TERM CMC must not be entered unless the SFSYS form (5713-1 Record) has ACT set to "Y" for SFID 128.

If "2A" is entered:
- BILLING DN must be entered
- CMC must be "Y"
- INPULSING must be "MF" or "ISUP7"
- TRK DIR must be "INC" or "2W"
- TRKCLS must be "TTOLLCON"

Copyright © 2003 Lucent Technologies

If "2B" is entered:
- BILLING DN must be entered
- CMC must be "Y"
- INPULSING must be "MF"or "ISUP"
- TRK DIR must be "INC" or "2W"
- TRKCLS must be "TTOLLCON"

"2B" is associated with Type 2B Cellular Interconnections special feature. This feature is secured and must be purchased by the office before this field can have a value of "2B", i.e., the ACT field for SFID 160 must be "Y" on the SFSYS form (5713-1 Record).

If TERM CMC is entered and INPULSING is "ISUP7", SFID 160 must be activated.

For 5E11 and later, when TERM CMC is "2A", "2B", "T1", CNA OPTION must be "NONE" on this form.

For 5E11 and later, when TERM CMC is "T1":

- TRKCLS must be "PF".
- CMC must be "Y".
- BILLING DN must be entered.
- TRK DIR must be "INC" or "2W".
- INPULSING must be "MF".

LATA TRUNKS

The fields (Section 5.8 - Section 5.12) apply to toll trunk groups from a LATA (Local Access and Transport Area).

5.8 BLK NO ANI

Description: Should calls received on this Trunk Group without ANI (Automatic Number Identification) be blocked? This field is used by an Interexchange Carrier switch on calls direct from an Equal Access End Office or via an Access Tandem with Equal Access Signaling.
Valid Entries: Y, N

Data Rules:

If "Y" is entered, TRKCLS must be "LATA".

The Fixed Route Type of "ESMRT" will be invoked during call processing to block the call. See the FIXRT form (5301-1 Record).

5.9 BILL TRKGRP

Description: Should a billing record be made for Trunk Groups with TRKCLS set to "LATA"?
Valid Entries: Y, N

Data Rules:

If "Y" is entered and CMC equals "Y", then an entry must be made in BILLING DN.

Copyright © 2003 Lucent Technologies

5.10 # NCD SCREENING

Description: Enter the Screening type for Network Call Denial. This field is used by Interexchange Carrier switches to screen the calling number and block calls to the Carrier's network if the originator is a nonpaying customer. Common Channel Signaling is used via the STP/NCP (Signal Transfer Point / Network Control Point) to determine nonpayers. Therefore, if screening is used, COMMON CHAN SIG must equal "Y" on the OFCOPT form. This field was originally created to support the NCD (Network Call Denial) feature. However, the feature that is now available for use has been renamed NAI (Network Access Interrupt). This field activates the NAI feature on a per trunk group basis if SFID (Secured Feature ID) 380 is activated. For more information on the NAI feature, see Division 2, Section 4A380.

Required Field.
Default: NONE
Valid Entries:

Valid NCD SCREENING Entries

Entry	Definition
NONE	No screening.
MAP	Screen calls for NCD with LATA mapping. Valid for Trunk Groups with TRKCLS set to "CAMAANI". If "MAP" is entered, ORIG LATA must have an entry.
NOMAP	Screen calls for NCD without LATA mapping. Valid for Trunk Groups with TRKCLS set to "LATA".

Data Rules:

If any TGN is defined with the values "MAP" or "NOMAP", the Fixed Route Type of "NCD" must be defined on the FIXRT form.

If the TRK DIR is "RAF", this entry must be "NONE".

5.11 ORIG LATA

Description: This field associates an Originating LATA identification with an Incoming CAMAANI Trunk Group when Network Call Denial Screening is required. In this case, NCD SCREENING equals "MAP". The Trunk Class of CAMAANI would be used at the Interexchange Carrier on direct Trunk Groups originating at nonconforming end offices. (For conforming offices, i.e., Equal Access End Offices, the Trunk Groups incoming to the Carrier, either directly or via an Access Tandem, would have a Trunk Class of "LATA" with NCD SCREENING equal to "NOMAP" or "NONE" and this field left blank.)

For calls from these nonconforming end offices, even if the originator would have been determined to be a nonpayer, blocking must not occur when the originating and terminating LATA is the same. The ORIG LATA value will be compared to a TERM LATA value specified on the LDIT form (5300-3/5) for certain Call Types. If the values are equal, then NCD Screening will not be done.
Valid Entries: 2 - 15

Data Rules:

If the TRK DIR is "RAF", this entry must be blank.

5.12 UTT

Description: Is this a utility telemetry trunk? This field is used for the Suppressed Ringing secured feature. For more information concerning this feature, see Division 2, Section 4A186.

Software Release: 5E9(2) and later
Required.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

When UTT is "Y",

- TRK DIR must be "INC",
- TRKCLS must be "LATA",
- INPULSING must be "MF",
- BRCS must be "N".

When TGNs are defined on this form with UTT set to "Y", the associated TRUNK form(s), found by matching TGN entries, must have IN START DIAL set to "WINK" and BRCS set to "N".

The Suppressed Ringing secured feature must be purchased and the SFID 186 ACT field set to "Y" before the UTT field can be set to "Y".

When TGNs defined on the TKGRP form with UTT set to "Y" and no UTTKGRP defined, then the TGNs will have the following default parameters assigned:

- CTI DIG = 70
- ST = 0
- STP = 50
- ST2P = 100
- MAX CALL TIME = 20

To change these defaults, a UTTKGRP form must be defined for the TGNs.

CCS TRUNKS

The following fields (Section 5.13 - Section 5.18) are available with 5E3 and later Software Releases, and are valid only with CCS (Common Channel Signaling) trunk groups.

5.13 TRUNK QUERY

Description: This field has been replaced by CQ/BQ ALW.

5.14 CQ/BQ ALW

Description: Should the circuit trunk query/BICC group query (5E15 and later) interoffice audit be allowed to run on this CCS trunk group?
Valid Entries: Y, N

Data Rules:

If the TRK DIR is "RAF", this entry must be blank or "N".

For 5E9(2) and later, if "Y" is entered then INPULSING or OUTPULSING must be "CCIS6" or "ISUP7".

For 5E15 and later:

- CQ/BQ ALW must be blank for RAF trunks.
- When CQ/BQ ALW is set to "Y", then the INPULSING or OUTPULSING value must be set to "ISUP7".

Copyright © 2003 Lucent Technologies

- When BICC GRP is entered and is not equal to TGN, CQ/BQ ALW must be "N".

5.15 XLT TEST

Description: Should the translation test interoffice audit be run for this CCS trunk group?
Valid Entries: Y, N

Data Rules:

If the TRK DIR is "RAF", this entry must be blank or "N".

5.16 NEND CLLI

The format for Near End Common Language Location Identifier is as follows. As an example, CHCGILMOCG0 meets the field specifications.

NEND CLLI Field Format

Character Positions	Information	Example
1 - 4	Place	CHCG (Chicago)
5 - 6	State	IL (Illinois)
7 - 8	Building	MO (Monroe)
9 - 11	Entity	CG0 (Control Group 0)

Data Rules:
A valid non-blank entry must be entered for all CCIS6 Trunk Groups. If XLT TEST is "Y", then this field must be entered. This field must not equal FEND CLLI.

For more detailed information on Common Language Location Identifiers, see Practice 795-100-100.

If the TRK DIR is "RAF", this entry must be blank.

5.17 VPA RATE

Description: Indicates the amount of time spent to conduct the VPA (Voice Path Assurance) Test. The following values are valid with CCS trunks. For non-CCS trunk groups leave blank.

Data Rules:

If VPA TYPE is set to "NOVPA", then VPA RATE must be set to 0.

The VPA test requires tone transceiver circuits to be defined in the DSU (Digital Services Unit) in each SM (Switching Module) that contains members of CCS trunk groups. For CCS trunks where the INPULSING and OUTPULSING fields are set to "CCIS6" or "ISUP7" and the VPA RATE is set to 12, 50 or 100, the corresponding trunks assigned on the TRUNK forms must be physically located on an SM (Switching Module) that is equipped with a local DSU2 Tone Transceiver. The TEN (Trunk Equipment Number) or the DEN (Digital Equipment Number) value must have the SM value defined on the Digital Service Unit Pack Equipage form, EQDS2P form (5740 Record), with at least one DSC TYPE list entry equal to "LDSU2TX", or for 5E9(2) and later, at least one EQDSC3 (Local Digital Service Circuit 3) form (5852 Record) with non-zero TONE XCVRS entered.

Valid VPA RATE Entries

Entry	Definition
0	0% VPA test not done.
12	VPA test done 12.5% of the time.
50	VPA test done 50% of the time.
100	VPA test done 100% of the time.

If the TRK DIR is "RAF", this entry must be blank.

If both the INPULSING and OUTPULSING fields are blank, or if either field contains a value other than

Copyright © 2003 Lucent Technologies

"CCIS6" or "ISUP7", then VPA RATE must be blank or 0.

5.18 VPA TYPE

Description: This field determines the type of Voice Path Assurance test to be performed on this trunk group. It indicates what type of switch (2-wire or 4-wire) is connected at the far-end of the trunk.
Default: NOVPA

- ***NOTE:*** The ICL (Inserted Connection Loss) is the signal loss of the circuit referenced to the nominal impedance of the offices which the circuit interconnects. This reflects all gains or losses from the originating switch's outgoing appearance through the circuit to the outgoing appearance of the terminating switch with the circuit terminating in the nominal office impedance.

For 5E5 and later, the VPA TYPE entry indicates what type of switch (2-wire or 4-wire) is connected at the near end and the far end of the trunk. For example, "4W2WL0" indicates the 5ESS Switch on the near end is a 4-wire switch and the switch at the far end is a 2-wire switch. A 5ESS Switch may be indicated as a 2-wire switch, if it is emulating a 2-wire switch.
Valid Entries:

Valid VPA TYPE Entries
(5E5 and later)

Entry	Definition
NOVPA	VPA test is not run for this Trunk Group.
4W4WL0 (4WICL0)	4-wire switch at the near-end and 4-wire switch at the far-end of the trunk ICL = 0dB. (See the Note below this table.)
4W4WL1 (4WICL1)	ICL = 0.1 - 0.8 dB
4W4WL2 (4WICL2)	ICL = 0.9 - 1.7 dB
4W4WL3 (4WICL3)	ICL = 1.8 - 2.9 dB
4W2WL3 (2WICL4)	4-wire switch at the near-end and 2-wire switch at the far-end of the trunk ICL = 0.0 - 4.0 dB
4W2WL4 (2WICL5)	ICL = 4.1 - 5.5 dB
4W2WL5 (2WICL6)	ICL = 4.1 - 5.5 dB HI LOSS
2W4WL0	2-wire switch at the near-end and 4-wire switch at the far-end of the trunk ICL = 0 dB
2W4WL1	ICL = 0.1 - 0.8 dB
2W4WL2	ICL = 0.9 - 1.7 dB
2W4WL3	ICL = 1.8 - 2.9 dB
2W2WL3	2-wire switch at the near-end and 2-wire switch at the far-end of the trunk ICL = 0.0 - 4.0 dB
2W2WL4	ICL = 4.1 - 5.5 dB
2W2WL5	ICL = 4.1 - 5.5 dB HI LOSS

- ***NOTE:*** Data Rules:

  - when INPULSING or OUTPULSING is "ISUP7", VPA TYPE must be entered with a value other than "NOVPA";
  - when INPULSING or OUTPULSING is "CCIS6", VPA TYPE must be entered as "4W4WL0", "4W4WL1", "4W4WL2", "4W4WL3", "4W2WL3", "4W2WL4" or "4W2WL5";
  - when neither INPULSING nor OUTPULSING is "CCIS6" or "ISUP7", VPA TYPE must be entered as "NOVPA" or must not be entered;
  - when TRKCLS is "RMSD3" or "TOPAS", VPA TYPE must be entered as "NOVPA" or must not be entered.

CCITT7

Copyright © 2003 Lucent Technologies

The fields (Section 5.19 - Section 5.25) apply to CCS7 trunk groups.

5.19 DEST PT CODE

Description: An entry in this field indicates the signaling point for which the CCS message is intended. For the AT&T Communications Network, a point code will be assigned by the CCIS Network Administration Center for each switch. For other networks using the T1 CCS standards for System 7, this will be a 9-digit decimal number. For 5E13 and later, the ISUP7 Loop-Around Intra-Module Trunk feature was added (see Division 2, Section 7AE and the IMT valid entry table below).

The following is the format of DEST PT CODE for AT&T Communications offices:

DEST PT CODE Format for AT&T Communications Offices

Subfield	Valid Entries
Network Indicator	000 - 255
Cluster Region	00 - 31
Cluster Type	0 - 7
Cluster Member	000 - 255

The following is the format of DEST PT CODE for other networks:

DEST PT CODE Format for other networks

Subfield	Valid Entries
Network Indicator	000 - 255
Cluster Region and Type	000 - 255
Cluster Member	000 - 255

The following is the format of DEST PT CODE for an intermodule trunk:

DEST PT CODE Format for an intermodule trunk

Subfield	Valid Entries
Network Indicator	000
Near SM Number	1 - 192
Far SM Number	1 - 192

The following is the format of DEST PT CODE for an intra-module trunk:

Valid IMT Entries - 5E13 and later - SM-2000 Only

Definition	Format	Valid Entries
Network Indicator	XXX	001 - 254
Cluster Number	XXX	000 - 255
Member	XXX	000 - 255

Data Rules:

This field is required for CCS trunks with signaling type "ISUP7"; for non-CCS trunk groups leave blank.

If the TRK DIR is "RAF", this entry must be blank.

For 5E8 and later, if the OPC (Originating Point Code) field on the OFCOPT form indicates the office is using the T1 CCS format, the DEST PT CODE on this form must be in the T1 CCS format.

If the OPC field on the OFCOPT form indicates that the office is using the AT&T format, then the DEST PT CODE must be in the correct format based on the first three digits of the OPC field. If those digits are 236 or 254, the DEST PT CODE must be in AT&T format, otherwise the T1 CCS format will be used.

For 5E9(1) and later:

If DEST PT CODE specifies an inter-office trunk, then the OPC on the OFCOPT form (5509 Record) must be entered.

Copyright © 2003 Lucent Technologies

If the OPC on the OFCOPT form is entered and indicates the office is in the AT&T format, but the Network ID (the first 3 digits) of the DEST PT CODE do not match the Network ID of the OPC, then the DEST PT CODE values must be in the T1 CCS format.

For 5E11 and later, when VCDX OFFICE is set to "Y" on the EQCORE form, and DEST PT CODE on this form is entered, the corresponding POINT CODE on the PC form must also be entered.

For 5E12 and later, when DEST PT CODE is known and in the IMT format, the seventh, eighth, and nineth digits of DEST PT CODE must not be equal to the fourth, fifth, and sixth digits of the DEST PT CODE.

For 5E14 and later:

DEST PT CODE cannot equal either the OPC on the CCGSM form or the ALIASPC from the APCLIST on the CCGSM form for the same GSM.

When DEST PT CODE is entered, one of the following matches must exist:

- a matching POINT CODE on the PC form,
- a matching CLUSTER on the CLU form and CLUSTER is defined as the concatenation of attributes NETWORK and CLUSTER, or
- a matching NETWORK on the NID form.

For 5E15 and later:

When the first three digits of DEST PT CODE on the TKGRP form are not equal to "000", the number of SS7 trunks supported by an Island GSM (GSM on the CCGSM form is not defined as a GLOBAL SM on the CMTMH form or only one GLOBAL SM is defined for this GSM) cannot exceed 65,536 and the number of SS7 trunks supported by a Host GSM (GLOBAL SM is defined more than once on the CMTMH form for this GSM) cannot exceed 128,000.

5.20 ORIG PT CODE

Description: An entry in this field indicates the signaling point which is the source of the CCS message. It has the same format as the DEST PT CODE and will be assigned in the same manner. ORIG PT CODE cannot be equal to DEST PT CODE. An Originating Point Code identifies an entire office, therefore, all CCS trunks defined in this office with an ORIG PT CODE entered must have the same value entered in this field.

- ***NOTE:*** Care must be taken to ensure that the Originating Point Code assigned to all trunk groups matches the Originating Point Code in the CNI equipment data which can only be defined on Recent Change View 15.1. Failure to do so could result in a substantial amount of Recent Change effort.

Valid Entries: 9 digits

- Digits for AT&T:
- [236,254][00-31][0-7][000-255]
- Digits for non-AT&T:
- [001-235,237-253,255][000-255][000-255]

Data Rules:

This field is required for CCS trunks with signaling type "ISUP7"; for non-CCS trunks leave blank.

For 5E9(1) and later:

A non-ATT office which has COMMON CHAN SIG on the OFCOPT form, may have only one Origination

Copyright © 2003 Lucent Technologies

Point Code for its CCS7 Trunk Groups. Thus, ORIG PT CODE on the TKGRP form must be the same on all TKGRP forms where it has been entered and it must match the OPC on the OFCOPT form.

If the TRK DIR is "RAF", this entry must be blank.

If the OPC on the OFCOPT form indicates the office is using the AT&T format, then all the ORIG PT CODE values must be in the AT&T format.

If OPC on the OFCOPT form is blank and the ORIG PT CODE indicates the office is using the format for:

- T1 CCS, then the corresponding DEST PT CODE values must also be in the T1 CCS format.
- AT&T,the corresponding DEST PT CODE value must be in the correct format based on the first 3 digits. If those digits are 236 or 254 and match the first 3 digits of the corresponding ORIG PT CODE, then the DEST PT CODE must be in the AT&T format.
- AT&T, but the Network ID (the first 3 digits of the DEST PT CODE) do not match the Network ID of the ORIG PT CODE, then the corresponding DEST PT CODE value must be in the T1 CCS format.

If OPC on the OFCOPT form indicates the office is using the AT&T format and COMMON CHAN SIG is also entered on the OFCOPT form, then all the ORIG PT CODE values that do not equal the OPC on the OFCOPT form, must match an alias point code for NI LATA Routing in AT&T network. They are used for Network Interconnect messages only. The alias point codes are identical to the CNI data structure.

For 5E11 and later, the OPC entered this form must match the OPC entered on the CCGSM form.

For 5E12 and later, when the ORIG PT CODE and DEST PT CODE specify different networks in the first three digits of the point code, the DEST PT CODE must be in the ANSI format, and the fourth, fifth, and sixth digits of the DEST PT CODE must be between 0 and 255.

For 5E14 and later, ORIG PT CODE must match an OPC or ALIAS PC on the CCGSM form for a GSM or ALIAS POINT CODE on the ALIASPC form.

For 5E15 and later, when ORIG PT CODE and LOCAL SM are both entered on this form, the ORIG PT CODE entered on the TKGRP form must match the OPC entered on the CCGSM form.

5.21 CONTROL TYPE

Description: Enter the Control Type (Transfer Prohibit Action). CONTROL TYPE is used when an outgoing ISUP7 trunk is selected to route out of an office but the associated SS7 dynamic routing (i.e., signaling link, signal transfer point, etc.) to the far point code is marked TFP (Transfer Prohibited). Before attempting to re-route to the next route, CONTROL TYPE is checked to determine whether to skip the current trunk and attempt a re-route on an alternate route, or if the call should be canceled without attempting a re-route.

The setting for CONTROL TYPE should be based on the network topology. The decision for setting CONTROL TYPE is up to the data administrator. Several possible scenarios are described below that can be used as guidelines for determining how CONTROL TYPE should be set.

1. CONTROL TYPE should be set to "CANCEL", if the far office only uses ISUP7 trunks, but the ISUP7 trunks are inaccessible due to a failure. Under these circumstances, calls should not be rerouted because the far switch cannot accept incoming calls via ISUP7 trunks. Rerouting such calls could possibly cause congestion on the indirect routes.
2. CONTROL TYPE should be set to "SKIP", if the available alternate routes do not use ISUP7 signaling. Although the far office is not accessible using ISUP7 trunks, non-ISUP trunks may be able to reach the far office and complete the call.

Copyright © 2003 Lucent Technologies

3. CONTROL TYPE should be set to "SKIP", if dual tandems are connected to a far office. Although the first tandem may not be able to reach the far office via ISUP, the second tandem may be able to. Or, the second tandem may have non-ISUP signaling which is capable of routing the traffic.

Software Release: 5E8 and later
Valid Entries:

Valid CONTROL TYPE Entries

Entry	Definition
SKIP	Skip this trunk and attempt a re-route on the alternate route.
CANCEL	Do not attempt any reroutes. Cancel the call.

Data Rules:

CONTROL TYPE must be entered for outgoing ISUP7 trunks.

CONTROL TYPE must not be entered for non-ISUP7 outgoing trunks.

5.22 CCS7 TYPE

Description: Enter the ISUP7 Protocol Type indicator. This is used by call processing software to trigger network specific handling of certain ISUP7 messages and parameters.

A value of "ATT" indicates that an RII (Routing Information Indicator) and DLDN (Dialed Directory Number) will be sent if known. It also means the CPN parameter will be handled as the billing number if the network is operating in "old" mode.

A value of "BELLCORE" means that ISUP7 messages and parameters will be handled as specified by Bellcore. For example, the CPN and CHG parameters will be sent when known. Also, the OLI (Originating Line Identity) parameter, when known, will be sent with a value showing the service ID of the call. It also means the FAC REJ message will not be sent when MA-UUI is dropped. RBOC network-specific handling of parameters occurs when CCS7 TYPE is set to "BELLCORE".

Generally, all trunk groups that are in a local exchange carrier environment are populated with a value of "BELLCORE". Conversely, all trunk groups that are in the AT&T environment are populated with a value of "ATT" except "LTOLLCON" trunks that have a value of "BELLCORE".

Software Release: 5E6 and later
Default: For 5E7 and later: BELLCORE
Valid Entries:

Valid CCS7 TYPE Entries

Entry	Definition
BELLCORE	Software Release: 5E7 and later Handle ISUP7 parameters as specified by Bellcore.
ATT	Software Release: 5E7 and later Handle ISUP7 parameters as specified by AT&T.

Data Rules:

For 5E7 and later, if TRKCLS is "LATA" or "IC", CCS7 TYPE must be "BELLCORE".

"ATT" must be entered if the Network Indicator portion of the ORIG PT CODE is 254.

5.23 RCD 3PT1 ITC

Description: Recode "3.1kHz Audio" Bearer Capability. Enter the bearer capability ("SPEECH" or "3PT1KHZ") to be sent out for outgoing ISUP7 calls with a bearer capability equal to "3.1kHz audio". (See Division 2, Section 1W for more information on this capability.)

Copyright © 2003 Lucent Technologies

RCD 3PT1 ITC only applies to calls that have the following conditions:

- the bearer capability of the outgoing call is 3.1kHz audio,
- this is an originating end office serving a non-ISDN originator or a local tandem which received the call via an incoming inband signaling speech trunk, and
- an outgoing ISUP7 trunk was selected.

If no value has been defined, the RCD 3PT1 ITC field on the OFCOPT form (5509 Record) will determine the bearer capability value to be sent out.

Software Release: 5E8 and later
Valid Entries:

Valid RCD 3PT1 ITC Entries

Entry	Definition
SPEECH or S	Recode to "speech"
3PT1KHZ or 3	Send out as is, i.e. 3.1kHz audio

Data Rules:

RCD 3PT1 ITC must not be entered for Non-ISUP trunks, for One-Way Incoming ISUP7 trunks, or if this is a TOLL office.

5.24 ISUP MLD

Description: Is the ISUP MLD (Message Loop Detection) active? This field is used to activate and deactivate the ISUP-MLD capability on a per-SS7 trunk group basis. The ISUP MLD and MAX HOP CNT fields have been added to support the ISUP Message Loop Detection feature. If this field is not entered, ISUP MLD is set to "Y" for SS7 trunks when the feature is purchased. For more information on this feature, see Division 2, Section 4A163.

Software Release: 5E11
Valid Entries: Y, N

Data Rules:

If "Y" is entered:
- MAX HOP CNT must be entered
- OUTPULSING must be "ISUP7"

The ISUP MLD and MAX HOP CNT fields on the TKGRP form are used by the ISUP Multiple Loop Detection Special Feature. It is a secured feature that must be purchased by the office before the ISUP MLD may be "Y" or MAX HOP CNT may be entered. The ACT field for SFID 163 must be set to "Y" on an SFSYS form (5713-1 Record).

5.25 MAX HOP CNT

Description: Enter the maximum number of SS7 interexchange circuits allowed per ISUP call. ISUP MLD SS7 Interexchange Hop Counter is assignable on a per SS7 trunk group basis. The initial value must be greater than the maximum number of circuits that would normally be used to complete the call. The ISUP MLD and MAX HOP CNT fields have been added to support the ISUP Message Loop Detection feature. For more information on this feature, see Division 2, Section 4A163.

Software Release: 5E11 and later.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 20

Data Rules:

The ISUP MLD and MAX HOP CNT fields on the TKGRP form are used by the ISUP Multiple Loop Detection Special Feature. It is a secured feature that must be purchased by the office before the ISUP MLD may be "Y" or MAX HOP CNT may be entered. The ACT field for SFID 163 must be set to "Y" on an SFSYS form (5713-1 Record).

If "ISUP7" is entered in OUTPLS and MAX HOP CNT is not entered, 20 will automatically be entered in MAX HOP CNT.

5.26 PLATFORM

Description: This field indicates whether or not the platform is CNI or PSU. This is a display only field for ODA.

Software Release: 5E15 and later

When the number of ISUP trunks on both PSU and CNI platforms exceed 100,000, the ACT field for SFID 622 on the SFSYS form (5713-1 Record) must be set to "Y", and there should not be any ISUP trunks on a CNI platform in that office. More than 256,000 ISUP trunks on PSU platform is not allowed.

CENTREX NETWORK

The following fields (Section 5.27 - Section 6.4) support the CENTREX Network secured features. For more information on CENTREX Network see Division 2, Section 4A181, Division 2, Section 4A182, and Division 2, Section 4A183.

5.27 MBG ID

Description: Enter the MBG (Multi-switch Business Group) Identifier associated with this trunk group. This trunk group is dedicated to MBG call traffic. If this field is entered, then MBG network specific information is included in the outgoing SS7 IAM message. If this field is not entered then the trunk group is not associated with an MBG.

Software Release: 5E9(2) and later.
Valid Entries: 2 - 65535

Data Rules:

If MBG ID is entered, then

- the MBG must be defined on the MBG form (5633 Record) and CNS on that form must be set to "Y".
- the SFID 183 ACT field must be set to "Y" on the SFSYS form (5713-1 Record). The MBG ID field on the TKGRP form is used by the CENTREX Network Special secured feature, which must be purchased by the office before the MBG ID field can have an entry.

For 5E12 and later, when MBG ID is entered and OUTPULSING is not "ISUP7":

- TRKCLS must be "EDSL" or "EDSLHM".
- VPN ACCESS must be "Y".

6. FORM ENTRIES - 5202-5 RECORD

Copyright © 2003 Lucent Technologies

6.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

6.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

CENTREX NETWORK

6.3 OVFL MC RTIDX

Description: The Overflow MC Route Index is used to re-route overflow MBG calls to the PSTN (Public Switched Telephone Network).

Software Release: 5E9(2) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If this field is entered, then

- MBG ID must be entered
- it must be defined as MC ROUTE INDEX on an MCRTIDX form (5304 Record)

6.4 TRK ICI

Description: The Trunk ICI (Incoming Call Identifier) is used to identify the off-net trunk type incoming to the MBG network. This information is converted to the appropriate ICI and displayed on the terminal of the ISAT (ISDN attendant) for the called party.

Software Release: 5E9(2) and later.
Valid Entries:

Valid TRK ICI Entries

Entry	Definition
FTS	Identify trunk group as an FTS-2000 (Federal Telecommunications System 2000) trunk group.
FX	Identify trunk group as an FX (Foreign Exchange) trunk group.
TIE	Identify trunk group as a TIE trunk group.

CCS7 EQUAL ACCESS

The following CCS7 EQUAL ACCESS fields (Section 6.5 - Section 6.10) are available with 5E6 and later Software Releases.

Copyright © 2003 Lucent Technologies

6.5 CPN RSTRCT

Description: Calling Party Number Restriction. Should this field prevent the Calling Party Number from being transmitted to the next office in the CCS7 ISUP7 IAM (Initial Address Message)?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field is used only when TRKCLS is "LATA". If TRKCLS is not "LATA", CPN RSTRCT must be "N".

If OUTPULSING is not "ISUP7", then CPN RSTRCT must be "N".

6.6 CHG RSTRCT

Description: Charge Number Restriction. Should this field prevent the Charge Number from being transmitted to the next office in a CCS7 ISUP7 IAM (Initial Address Message)?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field is used only when TRKCLS is "LATA". If TRKCLS is not "LATA", CHG RSTRCT must be "N".

If OUTPULSING is not "ISUP7", then CHG RSTRCT must be "N".

6.7 ATP IC RSTRCT

Description: Should the passing/accepting of the ATP (ISUP7 Access Transport Parameter) be prohibited?

If "N" is entered the ATP will be passed or accepted by the switch.

The ATP may be included in any of the following ISUP7 messages: IAM (Initial Address Message), ACM (Address Complete Message), ANM (Answer Message), CPG (Call Progress Message), or REL (Release Message).

- ***NOTE:*** This field is only used by the operational software at network boundaries. Therefore, this field should be optioned for trunks with a TRKCLS of "LATA" or "IC".

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ATP IC RSTRCT is "Y", INPULSING and OUTPULSING must be "ISUP7".

If ATP IC RSTRCT is "Y", TRKCLS must be "LATA" or "IC".

If TRKCLS is "LATA", then UUI IC RSTRCT and ATP IC RSTRCT must be equal.

Copyright © 2003 Lucent Technologies

6.8 UUI IC RESTRCT

Description: Should the passing/accepting of the UUI (User to User Information Parameter) be prohibited?

If "N" is entered the UUI will be passed/accepted by the switch.

User to User Information Signaling transfer allows ISDN customers to exchange user data transparently through the network, in the UUI of an ISUP7 message, during call setup and call clearing.

The UUI may be included in any of the following ISUP7 messages: IAM (Initial Address Message), ACM (Address Complete Message), ANM (Answer Message), CPG (Call Progress Message), or REL (Release Message).

NOTE: This field is only used by the operational software at network boundaries. Therefore, this field should be optioned for trunks with a TRKCLS of "LATA" or "IC".

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If UUI IC RSTRCT is "Y", INPULSING and OUTPULSING must be "ISUP7".

If UUI IC RSTRCT is "Y", then TRKCLS must be "LATA" or "IC".

If TRKCLS is "LATA", then UUI IC RSTRCT and ATP IC RSTRCT must be equal.

6.9 NI ANNC

Description: If a call cannot be routed to a valid destination from an IXC (Inter-exchange Carrier), should inband tone be applied?

If "N" is entered, a CCS7 Release Message with a cause of no route to destination (3) will be sent to the preceding exchange instead of busy tone.

The value entered in this field will be checked by the operational software for called number screening failures that consist of the following:

- the call originates from a non-ISDN interface.
- the call route consists only of ISUP7 trunks.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

6.10 NI IW REL

Description: If a call cannot be routed to a valid destination from an IXC (Inter-exchange Carrier), should a network interconnect interworking release message be sent? If "Y" is entered, a CCS7 Release Message with a cause of no route to destination (3) will be sent to the preceding exchange; otherwise, a busy tone will be sent.

The value entered in this field will be checked by the operational software for called number screening

Copyright © 2003 Lucent Technologies

failures that consist of the following:

- the call originates from a non-ISDN interface.
- the call route consists of a combination of ISUP7 trunks interworked to other signal protocol trunks (e.g., MF).

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

NI IW REL may be "Y" only if INPULSING and OUTPULSING are "ISUP7", and TRKCLS is "IC".

MODULAR QUEUING TRUNKS

The following fields (Section 6.11 - Section 6.13) are used for Modular Queuing trunks.

6.11 QUEUE ALLOWED

Description: Is queuing allowed for this Trunk Group?
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the Queue Feature name must be defined on a QUFD form (5617-1 Record).

For 5E5 and later, if TRKCLS is "RAFDTA" and SRV GRP is "ACCS", QUEUE ALLOWED must be "Y"; if TRKCLS is "RAFDTA" and SRV GRP is some other value, QUEUE ALLOWED must be "N". See Data Rules under the SRV GRP field for allowable SRV GRP values on RAFDTA trunk groups.

If the TRKCLS is "RAFANNC" or "RAFCTR", then QUEUE ALLOWED must be "N" or blank.

If this field is "Y", then TRK DIR must be "2W", "OUT" or "RAF" and the QUEUE FEATURE field must be entered.

If Ringback queuing is allowed for this trunk group, TRK DIR must have a value of "OUT".

For 5E6 and later, if QUEUE ALLOWED is "Y" and LN TYPE is "NONE" or is not entered, then TRKCLS must be "PF", "PFITT", "PFLASH", "RAFDTA", "BVTOLLCM", or "BVINTOLL".

For 5E13 and later, when QUEUE ALLOWED is "Y" and LN TYPE is "NONE" or not entered, TRKCLS must be "BVINTOLL","BVTOLLCM", "IC", "LATA", "LTOLLCON", "PF", "PFITT", "PFLASH", "RAFDTA", or "TTOLLCON".

For 5E13 and 5E14, when QUEUE ALLOWED is "Y", TRKCLS must be "BVINTOLL", "BVTOLLCM","IC", "EDSL", "LATA", "LTOLLCON", "PF", "PFITT", "PFLASH", "RAFDTA", or "TTOLLCON".

NOTE: For 5E15 and later, when Egress Queuing is being provisioned, TTRKCLS must be "PBXDID", "PF:, "PFLASH", "PFITT", "EDSL", or "RDSLHM" and when Office Queuing is being provisioned, TRKCLS must be "IC", "LTOLLCON:, "TTOLLCON", or "LATA"

6.12 ENQUEUE ACT

Description: Will queuing be allowed on the Trunk Group? This field enables or disables queuing for the trunk group. Also, it enables or disables queuing for the AP Facilities Management feature. If this field is

Copyright © 2003 Lucent Technologies

left blank, it will be set to a "Y" by ODA. If ENQUEUE ACT is set to "N" and the queuing feature has been assigned, queuing will not be allowed on the trunk group.
Valid Entries: Y, N

Data Rules:

If the TRK DIR is not "2W" or "OUT", this field must be blank.

If TRKCLS is "RMSD3" or "TOPAS", this field must be blank.

For 5E6 and later, this field is used differently for Leased Networks. Entering "N" for this field may still allow queuing for critical users in the LN.

6.13 QUEUE FEATURE

Description: Name of the Queue feature assigned to this Trunk Group. The feature must be defined on a QUFD form (5617-1,2 Record).
Valid Entries: 1 - 8 characters

Data Rules:

If TRKCLS is "RMSD3", "TOPAS", "RAFANNC" or "RAFCTR", this field must be blank.

For 5E5 and later, if TRKCLS is "RAFDTA" and SVC GRP is "ACCS", then this field must be entered.

For 5E7 and later when TRKCLS is "EDSL", the QUEUE FEATURE entered in this field must be defined on a QUFD form where QUEUE TYPE is "OFFHK".

For 5E9(2) and later, if a QFEATURE on this MLHG form is assigned to the same QUEUE MODULE on a QUFD form (5617-1/2 Record) or a QUGPA form (5617-3/4 Record), the QUEUE SIZE must not exceed 255 per QUEUE MODULE if the corresponding EQIM form (5700 Record), where SM matches QUEUE MODULE, has UNIT TYPE set to a value other than "SM2000". Queue Size is the sum of the BASIC SIZE + EXTENDED SIZE + ROUTINE SIZE + PRIORITY SIZE on the QUFD or QUGPA forms for each of the Q FEATURES assigned to the same QUEUE MODULE.

When QUEUE FEATURE is known on the TKGRP form and the QUEUE TYPE is set to "HPCOHQ" on the corresponding QUFD form, the GETS High Probability of Call Completion Secured Feature must be purchased by the office. A SFSYS form must exist with SFID 279 ACT set to "Y".

For 5E13 and 5E14, when TRKCLS is "IC", "LATA" or "LTOLLCON", QUEUE FEATURE is known, and LN TYPE is "NONE" or is unknown on the TKGRP form, the QUEUE TYPE must be set to "HPCOHQ" on the corresponding QUFD form. QUEUE FEATURE on the TKGRP form matches FEATURE NAME on the QUFD form.

- ***NOTE:*** For 5E15 and later, Private Facility Egress Queuing can be performed on a GETS call terminating to a PF/PRI trunk with any of the following classes of service: PBXDID, PF, PFLASH, PFITT, EDSL, or EDSLHM. Office Queuing for Public Trunks can be performed on a GETS call attempting to egress the switch over a trunk group with any of the following classes of service: IC, LTOLLCON, TTOLLCON, or LATA. The user should ensure there are sufficient trunk groups in the office with the respective classes of service for both Egress Queuing and Office Queuing.

6.14 INH GETS OFC Q

Description: This field is used to determine whether or not calls to a particular Trunk Group are allowed or excluded from using the GETS Queuing resource.

Software Release: 5E15 and later

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

For 5E15 and later, when INH GETS OFC Q is "Y", TRKCLS must be "EDSL", "EDSLHM", "IC", "LATA", "LTOLLCON", "PBXDID", "PF", "PFITT", "PFLASH", or "TTOLLCON".

DSN TRUNKS

The following fields (Section 6.15 - Section 6.17) are applicable to DSN (Defense Switched Network) trunk groups, available with 5E3 and later Software Releases. If entries are made in these fields, then the DSN OPTION field on the OFCOPT form must be set to "Y".

6.15 DSN ARC ID

Description: Enter the ID of the ARC (Alternate Route Cancellation) Control Table entry associated with this trunk group. ARC ID entries are defined on the DSNCO form (5618-8 Record).
Valid Entries: 0 - 63

Data Rules:

If the office is not a DSN office, DSN ARC ID must be 0 or blank.

If TRK DIR is "RAF", this field must be 0 or blank.

For 5E7 and later, if TRKCLS is "INAISTRK", the field must be blank; if TRKCLS is "PACKET" or "X75P", it must be 0 or blank.

For 5E8 and later, if TRKCLS is "ATNDVFY", DSN ARC ID must be blank.

6.16 SHUTTLE

Description: Should the office verify that the call is originated and terminated on two distinct trunk groups? This is used in DSN (Defense Switched Network) offices on trunk groups between switches that support dual homed PBXs or End Offices.
Default: N
Valid Entries: Y, N

Data Rules:

If SHUTTLE is "Y", then HUNT TYPE must be "2WF", "2WB", "PRFL" or "PRBL".

If TRK DIR is "RAF", SHUTTLE must be either "N" or not entered.

6.17 MLPP STAGE

Description: The MLPP (Multi-level Precidence and Preemption) STAGE field is used to designate an MLPP SS7 (Signaling System 7) trunk group as either a Stage 1 or Stage 2 trunk group.
Valid Entries:

MLPP STAGE Valid Entries

Entry	Definition
STAGE[1]	The Stage 1 Protocol send/receives the PP Level in the Calling Party Category.
STAGE[2]	The Stage 2 Protocol send/receives the PP Level in the MLPP Precedence Parameter.

Data Rules:

Copyright © 2003 Lucent Technologies

When MLPP STAGE is entered:

- WB RATE must not be entered.
- TRK DIR must be "2W".
- HUNT TYPE must be "PRBL", "PRFL".
- TRKCLS must be "LTOLLCON", "PRINTOLL", or "TTOLLCON".
- INPULSING must be "ISUP7" and OUTPULSING must be "ISUP7".
- CCS7 TYPE must be "BELLCORE".

IMMEDIATE START ANNOUNCEMENT

The following field activates the Immediate Start Announcement Interface for PINNACLE ACD (Automatic Call Distributor) feature.

6.18 IMM START ANN

Description: Is this an Immediate Start Announcement trunk group? This field supports the Immediate Start Announcement Interface for PINNACLE ACD feature. See Division 2, Section 1BX.

Software Release: 5E12 SU and later.
Default: N
Valid Entries: Y, N

Data Rules:

When IMM START ANN is "Y",
- TRKCLS must be "LTOLLCON"
- AUD RNG must be "Y"
- TRK DIR must be "OUT"
- HUNT TYPE must be "FIFO"
- INPULSING must be either blank or "NONE"
- OUTPULSING must be "MF"
- CASCADING must be "Y"
- MAXCALLS must be blank
- CYCLES must be blank.

6.19 RTCD REQ

Description: The RTCD REQ field is used to indicate whether or not RTCD (Real Time Call Detail) billing records are generated for this trunk group.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12, when RTCD REQ is "Y", TRKCLS must be "EDSL", "IC", "LATA", "PF", or "TTOLLCON".

For 5E12 and later, when RTCD REQ is "Y", ENET LINK NBR must be defined on an ENETLINK form where SERV TYPE equals "RTCD".

For 5E13 and later, when RTCD REQ is "Y", TRKCLS must be "EDSL", "EDSLHM", "IC", "LATA", "PF", or

Copyright © 2003 Lucent Technologies

"TTOLLCON".

EDSL/PRI TRUNKS

The following fields (Section 6.20 - Section 7.23) are applicable to EDSL (Extended Digital Subscriber Line) Trunk Groups. If entries are made in these fields, the TRKCLS entered must be "EDSL" or "EDSLHM".

If TRK DIR is "SGNL", then the PIC, CI DIAL, STA ID, UUI and CODE SET7 fields must be blank and the CBC field must be "N". If the TRKCLS is not "EDSL" or "EDSLHM", then the PIC, CI DIAL, STA ID, UUI and CODE SET7 fields must be blank, and the CBC field must be "N" or blank.

6.20 STA ID

Description: This field pertains to the delivery of the station ID or CPN (Calling Party Number) and applies to outgoing and two-way PRI (Primary Rate Interface) trunk groups only. It does NOT apply to incoming PRI trunk groups.

Software Release: 5E4(2) and later
Valid Entries: TRAN

Data Rules:

This field has an interaction with the CPN BN OPT field. The CPN BN OPT field has precedence over STA ID.

If the CPN BN OPT field is set to "NONE", and this field is set to "TRAN", the station ID, also referred to as the CPN (Calling Party Number), will be delivered over this PRI. The number will only be delivered over the PRI if made available by the originating station.

If the station ID is marked private, this field has an interaction with the PRI PRVT field on the LASSOP (5945 Record) form. If the PRI PRVT field is set to "Y", the number will be sent marked private. If PRI PRVT is set to "N", the station ID will not be sent.

If the CPN BN OPT field is set to "NONE", and this field is blank, the station ID will not be delivered over the PRI. In this case, the PRI PRVT field on the LASSOP form is not used.

Refer to Division 2, Section 1BL on Privacy Features for additional information.

6.21 UUI

Description: Can the Trunk Group send/receive User-to-User Information? UUI will only be passed if both the originating and terminating trunks allow UUI.

Software Release: 5E4(2) and later
Valid Entries: Y, N

Data Rules:

If this field is blank, the field defaults to "N".

6.22 CODE SET7

Description: The value "CODE7" indicates that the Trunk Group can send/receive CODESET 7 information. This is associated with UUI. If this field is blank, the Trunk Group cannot send/receive CODESET 7.

Copyright © 2003 Lucent Technologies

Software Release: 5E4(2) and later
Valid Entries: CODE7

6.23 SDN DAS

Description: Enter the DAS (Digit Analysis Selector) to be used for SDN Call-by-Call.

Software Release: 5E6 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Population of this attribute with a non-null value is optional. If the SDN dialing plan cannot be included in the DAS (also on this form), then SDN DAS will be used as an alternate DAS.

6.24 CBC

Description: Is the Call-by-Call feature available for this Trunk Group? The Call-by-Call feature allows a group of trunks to be assigned multiple features on a per call basis.

Software Release: 5E4(2) and later
Default: N
Valid Entries: Y, N

Data Rules:

CBC must be "N" or blank when DEDICATED SRV is entered. Call-by-Call SFGs are assigned on the TKEDSLD form (5209 Record).

6.25 DEDICATED SRV

Description: Enter the PRI dedicated service type.

Software Release: 5E6 and later
Valid Entries:

Valid DEDICATED SRV Entries

Entry	Definition
I800	International 800 Service
ILDS	International Long Distance Service and World Zone 1 calls outside of the continental U.S.
INWATS	INWATS Service
MEGACOM	MEGACOM Service
M800	MEGACOM 800 Service
NOVA	Dial-it NOVA Service
OUTWATS	OUTWATS
SDN	Software Defined Network Service for non-ACP

Data Rules:

A value can only be entered in this field when the TRKCLS is "EDSL" or "EDSLHM" and the TRK DIR is not "SGNL".

When DEDICATED SRV is entered, CBC must be blank or "N" and ACP SDN must be blank or "N".

ETN (Electronic Tandem) or SDN (Software Defined Network) traffic can be routed over dedicated PRI facilities if the call originated from an ETS (Electronic Tandem Switch) node.

6.26 VOICE CUT THRU

Copyright © 2003 Lucent Technologies

Description: This field identifies the cut through procedure to be used for Circuit-Switched Voice calls.

The cut through option to be used for a call is determined by the cut through option in the office at the originating end of the call.

Cutting through in the backward direction allows the originating end to hear tones and announcements received from the terminating end.

Cutting through in the forward direction allows the originating end to speak/send data and be heard/received at the terminating end.

There is no delayed cut through option for CSV calls.

Software Release: 5E6 and later
Required Field.
Default: NORMAL
Valid Entries:

Valid VOICE CUT THRU Entries

Entry	Definition
NORMAL	Normal cut through procedures. The path is cut in the backward direction when the call originates. The path is cut in both directions when the terminating end answers and all appropriate protocol messages have been received at the originating end.
EARLY	Early cut through procedures. The path is cut in both directions when the call originates.

Data Rules:

In a private office, the "EARLY" option is usually used. If the "NORMAL" option is used, then the originating caller may not be able to dial digits in response to tones and announcements.

In a public office the "NORMAL" option will usually be used. If the "EARLY" option is used, a private office connected to a public office via the PRI could commit fraud when a call originates in the public office and terminates in the private office. The private office could effect this fraud by failing to send select protocol messages, resulting in a talking path established and put into use without billing being generated.

If TRKCLS is not "EDSL" or "EDSLHM", then VOICE CUT THRU must contain the default value of "NORMAL".

6.27 DATA CUT THRU

Description: This field identifies the cut through procedure to be used for Circuit-Switched Data calls.

The cut through option to be used for a call is determined by the cut through option in the office at the originating end of the call.

Cutting through in the backward direction allows the originating end to hear tones and announcements received from the terminating end.

Cutting through in the forward direction allows the originating end to speak/send data and be heard/received at the terminating end.

Software Release: 5E6 and later
Required Field.
Default: NORMAL
Valid Entries:

Valid DATA CUT THRU Entries

Entry	Definition
NORMAL	Normal cut-thru procedures. The path is cut in the backward direction when the call originates. The

	path is cut in both directions when the terminating end answers and all appropriate protocol messages have been received at the originating end.
EARLY	Early cut-thru procedures. The path is cut in both directions when the call originates.
DELAY	Delayed cut-thru procedure. The path is cut through in both directions, but only after the terminating end answers and all appropriate protocol messages have been received at the originating end.

Data Rules:

In a private office, the "EARLY" option is usually used. If the "NORMAL" option is used, then the originating caller may not be able to dial digits in response to tones and announcements.

In a public office the "DELAY" or "NORMAL" option is usually used. If the "EARLY" option is used, a private office connected to a public office via the PRI could commit fraud when a call originates in the public office and terminates in the private office. The private office could effect this fraud by failing to send select protocol messages, resulting in a talking path established and put into use without billing being generated.

The "DELAY" option is used to prevent fraud which may occur if the "NORMAL" option is used. When a public office uses the "NORMAL" option, then a private office connected to the public office via the PRI could commit fraud when a call originates in the public office and terminates in the private office. The private office could effect this fraud by failing to send select protocol messages, resulting in a talking path established and put into use without billing being generated. Since not all appropriate protocol messages would have been received, the path is cut-thru only in the backward direction (originating end can receive but cannot send), which is sufficient only for One-Way data transmission from the private office to the public office.

If data rate is not entered, the DATA CUT THRU must be the default value of "NORMAL".

If TRKCLS is not "EDSL" or "EDSLHM", the DATA CUT THRU must contain the default value of "NORMAL".

6.28 APPLICATION

Description: This field specifies that a PRI (Primary Rate Interface) is being used for an application that requires special handling of the PRI. When a PRI B-channel is connected to an IWF (Inter-Working Function) or INBLDG (In-Building) as part of the architecture of the CDMA Voice or TDMA VIS (Vocoder in Switch), APPLICATION should be set to "IWF" or "INBLDG". For more information on this feature, see Division 2, Section 4A280.

Software Release: 5E12 and later.
Valid Entries:

Valid APPLICATION Entries - 5E12 - 5E13

Entry	Definition
IWF	Inter-Working Function

Valid APPLICATION Entries - 5E14 and later

Entry	Definition
Blank	Not Used
IWF	Inter-Working Function
INBLDG	In-Building Application

Data Rules:

When APPLICATION is "IWF",

- TRKCLS must be "EDSL" or "EDSLHM"
- TRK DIR must not be "SGNL"
- VOICE CUT THRU must be "EARLY"

Copyright © 2003 Lucent Technologies

- BRCS must be "N"
- and if DCS TRK is "Y", DCS RETRY must be "Y".

When TGNs are defined on this form with TRKCLS of "EDSL" or "EDLSHM" and APPLICATION of "IWF", each corresponding D-channel trunk member that is signaling for the associated B-channels of this trunk group (on TRUNK form) must have Q921 PROC and Q931 PROC assigned as "NETWORK".

NOTE: For 5E12 and later, when "IWF" is entered for a DEN on the TRUNK form, the values of FAC 0 EC CLI and FAC 1 EC CLI on the EQDUP form must be 0.

For 5E14 and later, for B-channels, when APPLICATION is "INBLDG" or "IWF":

- TRKCLS must be "EDSL" or "EDSLHM"
- DCS TRK must be "Y" and DCS RETRY must be "N".

For 5E14 and later, for D-channels, when TRKCLS is "EDSL" or "EDSLHM", and TRK DIR is not "INC", "OUT", or "2W":

- APPLICATION must not be entered
- DCS TRK must be "N"
- HUNT TYPE must be blank
- DCS RETRY must be "N".

For 5E14 and later, when the APPLICATION field is "INBLDG", the ACT field on the SFSYS form (5713-1) for SFID 221 (for CDMA) or SFID 259 (for TDMA VIS) must be set to "Y". In addition, since SFIDs 221 and 259 depend on the DCS (Digital Cellular Switch) feature, the ACT field on the SFSYS form for SFID 130 must also be set to "Y".

6.29 MAIN DN

Description: This field contains a default directory number that should be used when a user-provided CPN is discarded or when the user does not provide a CPN on Circuit-Switched Voice and Circuit-Switched Data calls.

MAIN DN should only be populated when the far office is a PBX (Private Branch Exchange) and the near office is a public switch (central office or toll office). MAIN DN should be filled with the main directory number of the PBX or some other number which can be called.

Software Release: 5E6 and later
Valid Entries: a 10-digit directory number in the form NPANXXXXXX
- where NPA is: 200 - 999

Data Rules:

If MAIN DN is entered, then TRK DIR must be set to "2W" or "INC". If TRKCLS is not "EDSL" or "EDSLHM", then MAIN DN cannot be entered.

6.30 CPN BN OPT

Description: This field indicates the CPN/BN (Calling Party Number/Billing Number) option subscribed to

Copyright © 2003 Lucent Technologies

by a PRI. This option specifies whether the CPN and BN should be delivered for Circuit-Switched Voice or Circuit-Switched Data calls. This option is assigned at the near end switch and depends on the number that the far end switch wishes to receive.

Software Release: 5E6 and later
Required Field.
Default: NONE
Valid Entries:

Valid CPN BN OPT Entries

Entry	Definition
NONE	No CPN/BN option on this PRI. Neither CPN nor BN is sent on outgoing calls.
CPNONLY	CPN only option. Only the CPN will be sent. If the CPN is not available, no number is sent.
CPNPREF	CPN preferred option. The CPN is sent if it is available, otherwise, the BN is sent if it is available. If neither the CPN or the BN is available, then no number is sent. The Billing Number may be populated with XXX-000-0000 (where XXX is the far end NPA of the incoming trunk) depending on the type of call and what information is received about the calling party.
BNONLY	BN only option. Only the BN is sent. If it is not available, then no number is sent. The Billing Number may be populated with XXX-000-0000 (where XXX is the far end NPA of the incoming trunk) depending on the type of call and what information is received about the calling party.
BNPREF	BN preferred option. The BN is sent if it is available, otherwise, the CPN is sent if it is available. If neither the CPN or the BN is available, then no number is sent. The Billing Number may be populated with XXX-000-0000 (where XXX is the far end NPA of the incoming trunk) depending on the type of call and what information is received about the calling party.
CPNUP	Only the CPN is sent, if it is available, and the CPN will be considered user-provided and not screened. This option should be used on PRIs where the near office is a PBX and the far office is a public switch (central office or toll office). If the CPN is not available then no number is sent.

Data Rules:

In a private network (PBX to PBX), the "BNONLY" option should not be assigned to PRIs connecting the private switches for customers that want to receive the calling party number from both callers within the private network and callers outside of the private network. See Table 1 for a description of how to assign CPN BN OPT for different switch configurations interconnected via PRIs. If TRKCLS is not "EDSL" or "EDSLHM", the CPN BN OPT must contain the default value of "NONE". If a value other than "NONE" is entered, then TRK DIR must be set to "2W" or "OUT".

6.31 PRIV OVER

Description: May private DNs be sent over a PRI? Private DNs should not be sent from a public switch (central office or toll office) to a private network switch (PBX) except in special cases where the PBX has agreed not to send the number to the terminating party. To block private numbers from being sent over a PRI, set PRIV OVER to "N". To allow private numbers to be sent over a PRI, set PRIV OVER to "Y".

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then TRK DIR must be set to "2W" or "OUT".

If TRKCLS is not "EDSL" or "EDSLHM", then PRIV OVER must contain the default value of "N".

If "Y" is entered, CPN BN OPT must not be "NONE".

NOTE: PRIV OVER is not used in conjunction with STA ID, only with CPN BN OPT. If PRI OVER is set to "Y", CPN BN OPT must be set to other than "NONE".

Copyright © 2003 Lucent Technologies

6.32 CPN SCRN

Description: Should a user-provided CPN be screened on incoming calls over this PRI for Circuit-Switched Voice and Circuit-Switched Data calls?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

CPNs received in a public switch (PBX) may or may not be screened. When CPN SCRN is set to "Y", then the PBX ID field (also on this form) must be entered. The PBX ID value must appear on a SCRNRNG form (5212 Record) which will define the valid DNs that CPN will be screened against. If "Y" is entered, then TRK DIR must be set to "2W" or "INC".

CPNs received in a private switch should not be screened since they may have already been screened by a public switch and since the CPN could have come from anywhere in the public network. CPNs received in a public switch from another public switch should not be screened for the same reason.

Figure 3 contains suggested CPN SCRN assignments for different switch configurations interconnected via PRIs.

If TRKCLS is not "EDSL" or "EDSLHM", then CPN SCRN must contain the default value of "N".

6.33 CPN DISC

Description: Should a user-provided CPN be discarded and replaced with a network provided CPN when certain criteria are met during incoming calls over this PRI for Circuit-Switched Voice and Circuit-Switched Data calls? These criteria are met when a user-provided CPN is screened and fails, or when a user-provided CPN is not screened.

When CPN DISC is set to "N", the user-provided CPN is never discarded and is used as the CPN. When CPN DISC is set to "Y" and the above-mentioned criteria met, then the user-provided CPN will be discarded and replaced with a network-provided DN (if one is available). This network-provided DN should be entered as the MAIN DN.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

User-provided CPNs on calls to public switches (central office or toll office) from private switches (PBX) should be discarded if screening fails or is not done.

User-provided CPNs on calls to public switches from another public switch should not be discarded, because they should not be screened.

User-provided CPNs on calls to private switches from public switches or another public switch should not be discarded, because they should not be screened.

Figure 3 contains suggested CPN DISC assignments for different switch configurations interconnected via PRIs.

If TRKCLS is not "EDSL" or "EDSLHM", then CPN SCRN must be "N". If "Y" is entered, then TRK DIR

Copyright © 2003 Lucent Technologies

must be set to "2W" or "INC".

6.34 INHIBIT TCM

Description: Should the TCM (Traveling Class Mark) be inhibited from being sent to the far-end switch for calls routed by ARS over a PRI trunk? If "Y", the TCM will not be sent; if "N", it will be sent.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

NOTE: The TCM will always be sent for calls routed by ARS over a PRI. This field should be set to "Y" when all of the following conditions are met to prevent an assert:

- The trunk is a PRI (TRKCLS = "EDSL" or "EDSLHM).
- The calls are routed by ARS over the PRI.
- An Interexchange Carrier is at the far-end of the PRI.
- The calls are leaving the private network (off-net).

6.35 RDTA GRP

Description: Is this trunk group a Remote Digital Test Access trunk group? RDTA uses the Remote Protocol Access feature to set up a connection on an ISDN line or trunk which is then used for testing.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If RDTA GRP is "Y", then

- the following fields on the TKGRP form must have these entries:

  BRCS must be "N"

  CBC must be "N"

  DATA RATE must be entered

  INSEP must be blank

  PBX ID must not be entered

  PRIVACY must not be "Y"

  TRK DIR must be "2W" or "OUT"

Copyright © 2003 Lucent Technologies

TRKCLS must be "EDSL"

- and TRK DIR is "OUT", GLARE ACTION and BILL DN must not be entered.
- and TRK DIR is "2W", GLARE ACTION must be "ALLCTRL" or "NONECTRL".
- all corresponding TRUNK forms must have a BRCS entry of "N" and their DENs entered on the RDTAPORT form with the OE NUMBER field containing an OE TYPE of "D".
- the value of this TGN must not be entered on any MCRTIDX form (5304 Record) or any RTIDX form (5303 Record) as TRUNK GROUP NUMBER.

For 5E10 and later, when the TGN/MEMB(s) defined on the TRUNK form have RDTA GRP set to "Y" on its associated TKGRP form, BRCS must be set to "N" on the TRUNK form, and the value of DEN or NEN on the TRUNK form must be entered on an RDTAPORT form (as OE NUMBER) where OE TYPE is set to "D" or "N", respectively.

6.36 E911 CPN

Description: If this is an "EDSL" or "EDSLHM" trunk group, will it use the Calling Party Number instead of the trunk billing number for E911 queries? "Y" indicates that the Calling Party Number will be used; "N" indicates that the trunk billing number will be used.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When E911 CPN is "Y", TRK DIR must be "INC" or "2W", and TRKCLS must be "EDSL" or "EDSLHM".

7. FORM ENTRIES - 5202-6 RECORD

7.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

7.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

EDSL/PRI TRUNKS

7.3 CI DIAL

Description: Enter the Carrier Interconnect Dialing Permissions for this Trunk Group. If this field is left

Copyright © 2003 Lucent Technologies

blank, the value "ALLOW" will be placed in the 5ESS Switch memory.

Software Release: 5E4(2) and later
Valid Entries:

Valid CI DIAL Entries

Entry	Definition
ALLOW	Indicate that the customer is allowed to dial an FGD CAC (Carrier Access Code), or use a PIC (Presubscribed InterLATA Carrier) identification number if one is assigned, when making a Carrier Interconnect call.
DENY	Indicates that the customer is not allowed to dial a CAC. To make CI calls, the line must be assigned a PIC.
REQ	Indicates that the customer is required to dial a CAC when making a Carrier Interconnect call.
TALLOW	Same as ALLOW, but is used for a CI test line only.
TDENY	Same as DENY, but is used for a CI test line only.
TREQ	Same as REQ, but is used for a CI test line only.

7.4 PIC

Description: Enter the Presubscribed InterLATA Carrier ID to be assigned to this Trunk Group.

Software Release: 5E4(2) and later
Valid Entries:

For 5E9(1) and later: 0 - 9999

Data Rules:

If TRKCLS is "EDSL" and TRK DIR is "OUT", then this field must be blank.

For 5E9(2) - 5E11, if PIC is entered with a TRKCLS of either "EDSL" or "EDSLHM" and TRK DIR is not "SGNL", then the PIC must be defined on the IFC form as a CARRIER ID.

For 5E12 and later, when TKGRP forms have a TRKCLS of either "EDSL" or "EDSLHM", a TRK DIR that is not "SGNL", and the PIC field is entered, the PIC must be defined on the ICF form as CARRIER ID with FEAT GRP equal to "D".

7.5 PTC

Description: Enter the Presubscribed Intra-LATA Toll Carrier. The PTC field supports the Intra-LATA PIC secured feature. For more information on the Intra-LATA PIC feature see Division 2, Section 4A149.

Software Release: 5E9(1) and later
Valid Entries: 0 - 9999

Data Rules:

ICLATA is a secured feature that must be purchased by the office before the field can be entered, therefore the ACT field for SFID 149 must be set to "Y", before PTC can be entered.

7.6 PLC

Description: Enter the PLC (Presubscribed Local Carrier) code. The PLC field supports the Alternate Local Service Provider Routing feature. For more information on the Alternate Local Service Provider Routing feature, see Division 2, Section 4A269.

Software Release: 5E12 and later.
Valid Entries: Blank, or 0 - 9999.

Data Rules:

Copyright © 2003 Lucent Technologies

When PLC is entered, UNBUNDLED must be "Y".

When GRP TYPE is "SGNL", all the fields for the EDSL/PRI TRUNKS must not be entered and PLC must not be entered. UNBUNDLED must also be "N".

When PLC is entered, TRKCLS must be "EDSL" or " EDSLHM".

The PLC field on the TKGRP form must be defined as CARRIER ID on the ICF form with FEAT GRP equal to "D" .

7.7 UNBUNDLED

Description: Has this line been unbundled from the LEC?

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

When UNBUNDLED is "Y", PLC must be entered.

When GRP TYPE is "SGNL", UNBUNDLED must be "N".

When UNBUNDLED is "Y", TRKCLS must be "EDSL" or " EDSLHM".

7.8 DIR CON IC

Description: Is this PRI directly connected to an Inter Exchange Carrier?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y,N

Data Rules:

When DIR CON IC is entered and TRKCLS is "EDSL" or "EDSLHM", TRK DIR must be "INC", "OUT" or "2W".

Before the DIR CON IC field can be set to "Y", the InterLATA Carrier's InterLATA Capability secured feature or the Alternate Service Provider secured feature or the InterLATA Carrier's InterLATA Capability secured feature must be purchased and the SFID 149 ACT field or the SFID 269 ACT field must be set to "Y" on the SFSYS form.

7.9 CPN BILLING

Description: Is Calling Party Number allowed to be used as billing number? The CPN BILLING field was added to support the CPN (Calling Party Number) Billing on PRI special feature. This field indicates whether the CPN (Calling Party Number) provided from the far office in the SETUP message over a PRI should be used as the billing number in the AMA record. The default option is to use the BILLING DN assigned to the trunk group in the AMA record. The CPN must pass screening before it is used in the AMA record.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

"N" must be entered if TRKCLASS is not "EDSL" or "EDSLHM".

WARNING: If CPN BILLING is "Y" and CPN SCRN is "N", screening of the Calling Party Number is not be performed.

7.10 ALLOW AMA

Description: Should AMA recording be allowed? The ALLOW AMA field is used to specify whether AMA recording is inhibited or allowed for unconnected unanswered calls. An unconnected unanswered call occurs when the calling party abandons the call before the called party answers. This field applies only to wideband calls.

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

Data Rules:

When ALLOW AMA is "Y", WB RATE must be entered.

7.11 ALW DATA ONLY

Description: Restrict origination to data calls only? The ALLOW DATA ONLY field is used to indicate whether a PRI trunk has restricted origination to data calls only. The ALW DATA ONLY field was added to support the Data Only PRI feature. This feature was first made available in a 5E10 Software Update. For more information on this feature, see Division 2, Section 4A206.

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ALW DATA ONLY is "Y", DATA RATE must be entered.

The Allow Data Only On This PRI Trunk feature is a Secured Feature that must be purchased by the office before data can be entered and/or changed for the ALW DATA ONLY field on the TKGRP form. The SFID 206 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before the ALW DATA ONLY field can be set to "Y".

7.12 STD RN SRC

Description: Are the PRI RN IE(s) (Primary Rate Interface Redirecting Number Information Elements) populated from SS7 ISUP OCN (Original Called Number), RN (Redirecting Number) and RI (Redirection Information) parameters? This field supports the Redirecting Number for PRI secured feature (SFID 161). For more information on this feature, see Division 2, Section 4A161.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered:

Copyright © 2003 Lucent Technologies

- UUI must be "Y"
- TRKCLS must be "EDSL" or "EDSLHM"

When TRK DIR is "SGNL", STD RN SRC must be "N".

7.13 RN SCRN

Description: This field indicates whether a Redirecting Number should be screened against a range(s) of numbers associated with the PRI (Primary Rate Interface) on originations, over the PRI for circuit switched voice, and circuit switched data calls. When an RN is received in the SETUP message on originations over a PRI, this indicator specifies whether it should be screened or not. Screening for the RN is similar to that of a user-provided CPN (Calling Party Number).

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When RN SCRN is "Y":

- NPA SOURCE must be entered.
- PBX/CPE ID must be entered.
- PBX ID must match the PBX ID on the SCRNRNG form (5212 Record).

When RN SCRN, RN DISC, or RN BILLING is "Y":

- TRRKCLS must be "EDSL" or "EDSLHM".
- TRK DIR must be "INC" or "2W".
- the ACT field for SFID 244 on the SFSYS form (5713-1 Record) must also be set to "Y".

7.14 RN DISC

Description: This field indicates whether a Redirecting Number should be discarded. If RN DISC is set to "Y", only the number received in the PRI RN IE that is not screened, or is screened and fails screening, will be discarded. If RN DISC is "N", the number in the PRI RN IE will not be discarded.

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

7.15 RN BILLING

Description: This field indicates whether a Redirecting Number should be used as a billing DN(Directory Number). If RN BILLING is set to "Y", and the number in the PRI RN IE passes screening (or is not screened with a 7 or 10 digit RN), the call will be billed against the number in the RN IE. If RN BILLING is set to "Y", and the number does not pass screening, the CPN billing will apply, if set. If RN BILLING is not set or is set to "N", existing PRI billing applies.

Copyright © 2003 Lucent Technologies

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

7.16 HM TAX

Description: Is there a tax for Hotel/Motel calls?

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When HM TAX is "Y" and TRKCLS is "EDSL", CBC must be "Y".

The ISDN PRI Hotel/Motel and Selected Class of Call Screening feature is a Secured Feature that must be purchased by the office before the HM TAX field on the TKGRP form can be set to "Y". A SFSYS form must exist with SFID 219 ACT set to "Y".

7.17 CNAM ALW

Description: Is Calling Name Delivery for PRI allowed? This field supports the Calling Name for ISDN PRI secured feature (SFID 220). For more information on this feature, see Division 2, Section 4A220.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When CNAM ALW is "N", CNAM AMA must be "FLATRATE".

When CNAM ALW is "Y", TRK DIR must be "2W" or "OUT".

7.18 CNAM AMA

Description: Enter the Calling Name Billing option. This field supports the Calling Name for ISDN PRI secured feature (SFID 220). For more information on this feature, see Division 2, Section 4A220.

Software Release: 5E11 and later.
Required Field.
Default: FLATRATE
Valid Entries:

Valid CNAM AMA Entries

Entry	Definition
FLATRATE	Flatrate-rate billing
USAGESEN	Usage sensitive billing

Data Rules:

When CNAM AMA is "USAGESEN", a 10-digit BILLING DN must be entered.

7.19 PCN ALW

Copyright © 2003 Lucent Technologies

Description: Is privacy of Calling Name allowed? This field supports the Calling Name for ISDN PRI secured feature (SFID 220). For more information on this feature, see Division 2, Section 4A220.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When PCN ALW is "N", PCN AMA must be "FLATRATE".

When PCN ALW is "Y", TRK DIR must be "2W" or "INC".

7.20 PCN AMA

Description: Enter the Privacy of Calling Name billing option. This field supports the Calling Name for ISDN PRI secured feature (SFID 220). For more information on this feature, see Division 2, Section 4A220.

Software Release: 5E11 and later.
Required Field.
Default: FLATRATE
Valid Entries:

Valid PCN AMA Entries

Entry	Definition
FLATRATE	Flatrate-rate billing
USAGESEN	Usage sensitive billing

Data Rules:

When PCN AMA is "USAGESEN", a 10-digit BILLING DN must be entered.

7.21 EDS CND

Description: Is Electronic Directory Service Calling Name Delivery allowed? This field supports the Calling Name for ISDN PRI secured feature (SFID 220). For more information on this feature, see Division 2, Section 4A220.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When EDS CND is "Y", TRK DIR must be "2W" or "OUT".

When EDS CND is "Y", EDS GRP must be entered.

7.22 EDS GRP

Description: Enter the Electronic Directory Service group name. This field supports the Calling Name for ISDN PRI secured feature (SFID 220). For more information on this feature, see Division 2, Section 4A220.

Software Release: 5E11 and later.
Valid Entries: 1 to 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

When the TKGRP form has an entry in the EDS GRP field, a corresponding EDSGP form must exist where EDS GRP matches the EDS GRP on the TKGRP form.

The Calling Name for ISDN PRI is a Secured Feature that must be purchased by the office before the following TKGRP form field names CNAM ALW, CNAM AMA, PCN ALW, PCN AMA or EDS CND can be changed from their default values or an entry can be made in the EDS GRP field. A SFSYS form must exist with SFID 220 ACT set to "Y".

7.23 NPA SOURCE

Description: The NPA SOURCE field is used to indicate the numbering plan area code source of the CPN (Calling Party Number) to the PRI (Primary Rate Interface) trunk originating software. The NPA SOURCE is used on PRI trunk originations when the CPN is 7 digits and the NXX of the CPN is non-unique. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later.
Valid Entries:

Valid NPA SOURCE Entries

Entry	Definition
BASENPA	use the base numbering plan area
CPN10DIGITS	the CPN on the incoming PRI trunk must always be 10 digits
FENPA	use the far end numbering plan area

Data Rules:

When CPN SCRN is "Y", NPA SOURCE must be entered.

When NPA SOURCE is "FENPA", FAR END NPA must be entered.

When RN SCRN is "Y", NPA SOURCE must be entered.

7.24 B CHAN NEG

Description: Is the "negotiation" of the B-channel allowed? This field allows the user to be connected to a different B-channel than the one offered when the 5ESS Switch offers a call over an ISDN PRI interface. For more information on this feature, see Division 2, Section 6K.

Software Release: 5E14 and later.
.
Default: N
Valid Entries: Y, N

7.25 PASS OLI

Description: Should the Originating Line Information be passed with the SETUP message to this termination?
Required

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When PASS OLI is "Y", TRKCLS must be "EDSL" or "EDSLHM".

Copyright © 2003 Lucent Technologies

When PASS OLI is "Y", ACT must be "Y" for SFID 556 on the SFSYS form.

When PASS OLI is "Y", DCHAN DESIG on the TRUNK form must not be entered.

7.26 DISP CNTRL

Description: The DISP CNTRL field is used to define whether or not Calling Name is delivered using the Meridian NI-1 format Display Information Element instead of the Standard NI-3 Facility Information Element. This field supports the PRI (Primary Rate Interface) Calling Name for the Canadian Market feature. For more information on this feature, see Division 2, Section 4A604.

Software Release: 5E16 and later.
.
Default: N
Valid Entries: Y, N

Data Rules:

When DISP CNTRL is "Y", TRKCLS must be "EDSL" or "EDSLHM".

7.27 SN TRK

Description: Proprietary field.

SSP800 TRUNKS

The following fields (Section 7.28 - Section 7.30) are available for 5E4(2) and later Software Releases, and are valid only with SSP (Service Switching Point) trunk groups. SSP trunks must have a TRK DIR of "INC" or "2W".

7.28 FAR END LATA

Description: An entry in this field provides the identity of the FAR END LATA. This designation is required for SSP (Service Switching Point) trunk groups. For non-SSP trunk groups, leave this field blank.
Valid Entries: 0 or 100 - 999

7.29 FAR END NXX

Description: An entry in this field provides the identity of the FAR END NXX code. This designation is required for SSP (Service Switching Point) trunk groups which serve a single NXX code.
Valid Entries: 200 - 999

Data Rules:

If this field is entered, then FAR END NPA and FAR END LATA must be entered. If the trunk group connects to an office which serves more than one NXX code, leave this field blank. For non-SSP trunk groups, leave this field blank.

7.30 COIN

Description: Is the SSP (Service Switching Point) traffic on the trunk group entirely COIN originated?

Data Rules:

If a "Y" is entered in this field, then FAR END LATA and FAR END NPA must be entered. If TRK DIR is "RAF", COIN must be either "N" or not entered.

RELEASE LINK

Copyright © 2003 Lucent Technologies

The fields (Section 7.31 - Section 7.32) apply to Release Link trunk groups.

7.31 RLT TYPE

Description: Enter the type of Hold for this trunk.

Required Field.
Default: NONE
Valid Entries:

Valid RLT TYPE Entries

Entry	Definition
NONE	This trunk is not a RLT.
PERM	This RLT is not released when the terminating port answers (the attendant maintains control over the call with 50B or ISDN type consoles).
TEMP	This RLT is released when the terminating port answers (the attendant does not have control over the call after answer).

Data Rules:

When the value in this field is "PERM" or "TEMP", then TRK DIR must be "INC" or "2W" depending if this switch is at the main or branch of the Attendant arrangement.

When the value in this field is "PERM" or "TEMP", then TRKCLS must be "PFLASH", CUT THRU must be "N" or not entered, TRK DIR must be "2W", BRCS must be "Y" and INPULSING must be "TT".

When the value in this field is "PERM" or "TEMP" and TRK DIR is "2W", then on the associated TRUNK form(s) IN START DIAL must be "DLTN" and "OUT" START DIAL must be blank (Tie Trunk at a branch).

When the value in this field is "PERM" or "TEMP" and TRK DIR is "INC" and INPULSING is "DP", "MF", "TT", then on the associated TRUNK form(s) OUT START DIAL must be blank (Tie Trunk at a main).

When the value in this field is "PERM" or "TEMP" and TRK DIR is "INC" and INPULSING is "NONE", then on the associated TRUNK form(s) IN START DIAL must be "DIRC" and OUT START DIAL must be blank (FX Trunk at a main).

When the value of this field is "PERM" or "TEMP" and TRK DIR is "2W" and BRCS is "Y", then BRCS multiway features as defined on the MWFD form (5602 Record) and BRCS call waiting features defined on the CWTFD form (5614 Record) with INVOCATION of "ORIG" may be assigned to the trunk on a TKGRPFA form (5206 Record) or TRUNKFA form (5205 Record). Specific call waiting parameters may be specified on the CWTTPA form (5603-4 Record).

7.32 RLT FLASH

Description: Will a branch switch send flashes for called party disconnect? If RLT FLASH is "N", a branch switch will send flashes only for called party answer and calling party disconnect. This is used if the main switch is a 5ESS Switch with 50B or ISDN consoles.

There is limited signaling between a branch and the main location. Because 50B and ISDN attendant type consoles can only recognize a flash as called party answered, this value is set at the branch to control the type of flashes sent to the main switch.

Required Field
Default: N
Valid Entries: Y, N

Data Rules:

It can only be "Y" if RLT TYPE is "PERM".

Copyright © 2003 Lucent Technologies

MORE MISCELLANEOUS FEATURES

The following fields (Section 7.33 - Section 8.10) support miscellaneous features.

7.33 ACP SDN

Description: Is this a dedicated incoming trunk group to an SDN (Software Defined Network) at an ACP (Action Control Point)? Only a 5ESS Switch ACP (ACT PT SDN on the OFCOPT form is "Y") will be allowed to have "Y" entered in this field.
Default: N
Valid Entries: Y, N

Data Rules:

When this field is "Y", TRK DIR must be "INC" or "2W", TRKCLS must be "CAMAANI", "CAMAONI", "EDSL", "LATA" or "PF", BRCS must be "N" and CBC must be "N".

When this field is "Y" and the TRKCLS is "PF", then the ANI field on the TRUNK form must be "Y".When this field is "Y" and TRKCLS is "PF" or "EDSL", then a 10-digit BILLING DN must be entered.

This field must be blank or "N" when DEDICATED SRV is entered.

For 5E6 and later, ACP SDN must be "N" when LN TYPE contains a value other than NULL.

CCS (Common Channel Signaling) may not have ACP SDN entered as "Y". If INPULSING or OUTPULSING is entered as "ISUP7" or "CCIS6", ACP SDN must not be entered or must be entered as "N".

7.34 SDN STAT GRP

Description: Is a SGD (Station Group Designator) to be forwarded from the originating PBX to the 5ESS Switch ACP in the Software Defined Network? The SGD is a digit at the end of the dialed digit string that indicates the group where the station belongs.

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then TRKCLS must be "PF" and ACP SDN must be "Y".

7.35 SPA BILL DN

Description: Enter a 10-digit Special Access Customer billing telephone number. This field must be entered only for Special Access WATS and MEGACOM Trunk Groups (TRKCLS of "SPAWATS" or "SPAMEG") that are incoming to this office from a customer's PBX. This billing number is used to identify the service subscribed to by the Special Access customer.

Software Release: 5E5 and later
Valid Entries: a 10-digit telephone number NPA-0/1XY-XXXX.

SPA BILL DN Format

For Special Access WATS (TRKCLS of "SPAWATS")

Digits	Value
1 - 3	NPA of the customer
4	0 - no intrastate service is allowed 1 - full intrastate service is allowed

Copyright © 2003 Lucent Technologies

5	Reserved for future use
6	0 - no interstate service is allowed 1 - 6 - the interstate service band subscribed to by the customer
7 - 10	0 - 9. Used with the NPA to identify the customer.

SPA BILL DN Format
For MEGACOM Service (TRKCLS of "SPAMEG")

Digits	Value
1 - 3	NPA of the customer
4	0 - no intrastate service is allowed 1 - full intrastate service or permissive in-state routing is allowed. In-state routing allows a customer to place calls to NPAs within the same state as the customer premises as long as the calls do not originate from stations within that state.
5	9 - indicates that the customer has signed a letter of agreement for permissive in-state routing 0 - indicates no in-state routing
6	6 - indicates that interstate service band 6 is allowed.
7	0 - 9. Service mode identifier.
8 - 10	0 - 9. Used with the NPA to identify the customer.

Data Rules:

The NPA entered for this SPA Billing TN must be defined on a SPABS form (5319 Record).

7.36 SPA SUPV

Description: Will answer supervision be returned on this Special Access WATS or MEGACOM trunk group?

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

This field must be entered only for Special Access WATS and MEGACOM Trunk Groups (TRKCLS of "SPAWATS" or "SPAMEG"). This field must be entered for a Special Access WATS trunk group (TRKCLS of "SPAWATS"). This field must be "Y" for a MEGACOM trunk group (TRKCLS of "SPAMEG").

8. FORM ENTRIES - 5202-7 RECORD

8.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

8.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

MORE MISCELLANEOUS FEATURES

8.3 ANI6

Copyright © 2003 Lucent Technologies

Description: Should the ANI6 digits 6 or 06 be outpulsed? ANI6 indicates to the operator system that calls may require special screening. This capability provides the ability based on the originating Trunk Group or OUTWATS SFG to optionally outpulse ANI6 digits when making an OUTWATS SFG call or a trunk origination when the trunk class of service is "PF", "PFITT", "PFLASH". Traditionally, ANI6 indicates that the call is from a Hotel/Motel customer.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

If ANI6 is "Y": ANI7 must not be "Y"; TKRKCLS must be "PF", "PFITT", or "PFLASH"; TRK DIR must be "INC" or "2W"; and DATA RATE must not be entered.

8.4 ANI7

Description: Should the ANI7 digits 7 or 07 be outpulsed? ANI7 indicates to the operator system that calls may require special screening. Traditionally, ANI7 indicates that the call is from a coin phone.

This capability provides the ability based on the originating Trunk Group or OUTWATS SFG to optionally outpulse ANI7 digits when making an OUTWATS SFG call or a trunk origination when the trunk class of service is "PF", "PFITT", "PFLASH".

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

If ANI7 is "Y":

- ANI6 must not be "Y"
- TKRKCLS must be "PF", "PFITT",or "PFLASH"
- TRK DIR must be "INC" or "2W"
- DATA RATE must not be entered.

8.5 ANI TYPE

Description: This field is not used at this time and therefore no data can be entered. It may be used in a later software release.

8.6 PRIVACY

Description: Is the received directory number private? This field is an all-call privacy indicator. All-call privacy allows the calling party to prevent TN information from being displayed to the called party for all calls. This privacy may be deactivated by dialed code on a per call basis.

This field also applies to Network Interconnect calls entering an Access Tandem Office. When a call (and its billing number) arrives at an Access Tandem on an EAMF trunk and is routed out on a CCS7 trunk, the PRIVACY field determines whether the AT will mark the billing number's CCS7 presentation parameter "private".

Copyright © 2003 Lucent Technologies

This field also applies to an EDSL/PRI call.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

8.7 INTER SM TRK

Description: Is the trunk group an intermodule trunk group?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the intermodule trunks must be defined on the IMTRK form (5210 Record).

For more information on intermodule trunking, refer to the Inter-Module Trunking feature description in Division 2, Section 1N.

If "Y" is entered and DEST PT CODE is known, then DEST PT CODE must be in Intermodule Trunk format.

For 5E7 and later, if "Y" is entered and INPULSING or OUTPULSING is equal to "ISUP7", then the MEMBs of the matching TGNs on the TRUNK form must be on the same SM; SM is the first three digits of the TEN, DEN, or (for 5E9(2) and later) NEN.

INTER SM TRK must be "N" when TRKCLS is "INAISTRK".

8.8 MAI

Description: Enter the MAI (Mode of Access Indicator) which is used to indicate whether FGD (Feature Group D) access is "switched" or "direct". The MAI field supports the OSPS Feature Group D Incoming Signaling for Special Applications, Release 2 feature. For more information on this feature see Division 2, Section 4A373.

Software Release: 5E9(1) and later.
Required Field.
Default: S
Valid Entries:

Valid MAI Entries

Entry	Definition
D	Direct - trunk group is connected directly to traffic originator.
S	Switched - trunk group is connected to a switched network.

8.9 API CODE

Description: Enter the API (Access Provider Identifier) code for a Feature Group D trunk group. The API CODE field supports the Feature Group D Incoming Signaling for Special Applications, Release 2 feature. For more information on this feature see Division 2, Section 4A373.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 9999

Data Rules:

Copyright © 2003 Lucent Technologies

API CODE must not be entered if FACILITY NBR is entered.

8.10 ASI PROXY

Description: Is the trunk group capable of carrying ASI Proxy traffic?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ASI PROXY equals "Y",

- TRKCLS must be "PFLASH", TRK DIR must be "OUT", and OUTPULSING must be "TT";
- All associated TRUNK forms must have OUT START DIAL equal to either "IMED" or "WINK";
- The associated RTIDX form (having TRUNK GROUP NUMBER defined on this TKGRP form) must have ROUTE TYPE equals "HUNT".

ISDN ATTENDANT

The following fields (Section 8.11 - Section 8.14) are applicable to ISDN Attendant trunk groups, available with 5E4(2) and later Software Releases.

8.11 MK BUSY

Description: Is Selective Customer Control of Facilities is on? This feature allows the attendant to deny access to a privately owned trunk group by making the trunk group busy.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(1) and later, MK BUSY must be blank if TRKCLS is "RMSD3" or "TOPAS".

For 5E11 and later, when MK BUSY is "Y":

- ISAT MLHG must be entered.
- MAKE BUSY KEY must not be entered.

8.12 BW LAMP

Description: Are trunk group busy warning lamp(s) provided for this group on the attendant's console? If "Y" is entered, the lamp will light whenever the threshold of idle members in a Trunk Group is less than or equal to the threshold value entered in the WARN THRESH field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then ISAT MLHG must be entered.

Copyright © 2003 Lucent Technologies

8.13 ISAT MLHG

Description: Enter the ISDN Attendant MLHG that can busy monitor this trunk group.
Valid Entries: For 5E14 and earlier: 1 - 2000

For 5E15 and later: Blank or 1 - 8191

Data Rules:

If an ISAT MLHG is entered, it must be defined on a MLHG form with a MLHG FEATURE associated with a HUNT TYPE of "ISAT".

8.14 WARN THRESH

Description: Indicate the threshold of members of this group that must be idle at any given time before the trunk group busy warning lamp(s) will light at the attendant's console.
Valid Entries: 0 - 1952

LEASED NETWORK

The following Leased Network fields (Section 8.15 - Section 8.18) are available with 5E6 and later Software Releases. For more information on the Leased Network feature, see Division 2, Section 1O.

8.15 LN TYPE

Description: The LN TYPE indicates if the trunk group is on a Leased Network and if it queries the NCP (Network Control Point) database for routing and charging information for incoming calls. Enter the LN (Leased Network) Trunk Type.
Default: NONE
Valid Entries:

Valid LN TYPE Entries

Entry	Definition
QRY	A Leased Network trunk that queries the NCP database.
NOQRY	A Leased Network trunk that does not query the NCP database.
IMT	A Leased Network Inter-Machine trunk, a trunk that connects two switches within the Leased Network.
NONE	Not a Leased Network trunk.

Data Rules:

When LN TYPE is "QRY", the following restrictions apply:

- If QUEUE ALLOWED is "Y", TRKCLS must be "PF", "PFLASH", "LATA", "TTOLLCON" or "EDSL".
- If TRKCLS is "PF" or "EDSL", then BILLING DN must be 10 digits.
- If OUTPULSING or INPULSING is "ISUP7", then TRKCLS must be "LATA", "PF" or "TTOLLCON", and BRCS must be "Y".
- If OUTPULSING or INPULSING is "DP", "MF", "TT", "RPEO" or "RPTO", then TRKCLS must be "PF", "PFLASH", "LATA" or "CAMAANI", and BRCS must be "Y".
- When TRK DIR is "INC", and INPULSING is not entered or is entered as "DCHN" or "NONE", then TRKCLS must be "EDSL", and BRCS must be "Y".
- When TRK DIR is "OUT", and OUTPULSING is not entered or is entered as "DCHN" or "NONE", then TRKCLS must be "EDSL", and BRCS must be "Y".
- When TRK DIR is "2W", and INPULSING or OUTPULSING is not entered or is entered as "DCHN" or "NONE", then TRKCLS must be "EDSL", and BRCS must be "Y".

Copyright © 2003 Lucent Technologies

When LN TYPE is "NOQRY", the following restrictions apply:

- If QUEUE ALLOWED is "Y", TRKCLS must be "EDSL", "PFLASH" or "PF".
- If OUTPULSING or INPULSING is "DP", "MF", "TT", "RPEO" or "RPTO", then TRKCLS must be "PF" or "PFLASH", and BRCS must be "Y".
- When TRK DIR is "INC", and INPULSING is not entered or is entered as "DCHN" or "NONE", then TRKCLS must be "EDSL", and BRCS must be "Y".
- When TRK DIR is "OUT", and OUTPULSING is not entered or is entered as "DCHN" or "NONE", then TRKCLS must be "EDSL", and BRCS must be "Y".
- When TRK DIR is "2W", and INPULSING or OUTPULSING is not entered or is entered as "DCHN" or "NONE", then TRKCLS must be "EDSL", and BRCS must be "Y".

When LN TYPE is "IMT", the following restrictions apply:

- If QUEUE ALLOWED is "Y", TRKCLS must be "PFITT".
- If OUTPULSING or INPULSING is entered as "ISUP7", then TRKCLS must be "PFITT", and BRCS must be "Y".
- If OUTPULSING or INPULSING is "DP", "MF", "TT", "RPEO" or "RPTO", then TRKCLS must be "PFITT", and BRCS must be entered as "Y".

When LN TYPE is "NONE" or is not entered, the following restrictions apply:

- If OUTPULSING or INPULSING is "ISUP7", then TRKCLS must be "TTOLLCON", "PRINTOLL", "SCINTOLL", "BVINTOLL", "BVTOLLCM", "IC", or "LATA", and BRCS must be "N".

LN TYPE cannot be "NOQRY" when OUTPULSING or INPULSING is "ISUP7".

When the following restrictions on the TKGRP form refer to an assigned ATH (Authorization Code) feature or ARS feature, they imply assignment on a TRKGRPFA, TRUNKFA or CLUSTR form. Parameter values for these forms are defined on either the associated feature definition (FD) form or a parameter (PA) form. BRCS parameter forms override feature definition forms. An "EDSL" trunk group and its member trunks can be assigned ATH (Authorization Code) features only if the trunk group is a Leased Network group that does not query a Network Control Point database (LN TYPE "NOQRY").

When a Leased Network trunk group (LN TYPE "QRY", "NOQRY" or "IMT"), or one of its members, is assigned both an ATH (Authorization Code) feature and an MDR feature, the ATH FOR MDR on the associated ATHTPA or ATHFD form must be "N".

When a trunk group that does not belong to a Leased Network (LN TYPE "NONE" or blank), is assigned an MDR (Message Detail Recording) feature, the TRKCLS on this form may not be "LATA" or "CAMAANI".

When a trunk group belongs to a Leased Network (LN TYPE "QRY", "NOQRY" or "IMT"), and has INPULSING "ISUP7", then it must have at least one trunk assigned on the TRUNK form. The trunk group or one of its members must be assigned an ARS feature, and the TCM IN field on the associated ARSTPA or ARSFD form must be left blank. Similarly, if the trunk group has OUTPULSING "ISUP7", the TCM OUT field must be blank. If the LN TYPE is "QRY, the DIAL PLAN field on the ARSTPA or ARSFD form must be "ODP".

Copyright © 2003 Lucent Technologies

When an "EDSL" trunk group is not a Leased Network group (LN TYPE "NONE" or blank), and the group or one of its member trunks is assigned an ARS feature, the QUEUE ALLOWED field on the associated ARSTPA or ARSFD form must be "N".

When a trunk group is assigned an ARS feature, and the QUEUE ALLOWED field on the associated ARSFD form is "Y", the TRKCLS on this form must be "PF", "PFLASH", "PFITT", "EDSL", "LATA", "CAMAANI" or "TTOLLCON".

When a trunk group or one of its members is assigned an ARS feature, and the QUEUE ALLOWED field on the associated ARSTPA or ARSFD form is "Y", then:

- if the trunk group's TRKCLS is "EDSL", it must be a Leased Network access trunk group (LN TYPE "QRY" or "NOQRY").
- if the TRKCLS is "LATA", "CAMAANI" or "TTOLLCON", the LN TYPE must be "QRY".

When a trunk group or one of its members is assigned an ARS feature, and the trunk group has LN TYPE:

- "NONE" (or blank), then the TRKCLS must be "PF", "PFITT", "PFLASH", "EDSL" or "EDSLHM".
- "QRY", then the TRKCLS must be "PF", "PFLASH", "LATA", "CAMAANI", "EDSL", or "TTOLLCON".
- "NOQRY", then the TRKCLS must be "PF", "PFLASH" or "EDSL".

When a trunk group has LN TYPE "QRY" or it has LN TYPE "IMT" with INPULSING "ISUP7", then if the trunk group or one of its members is assigned an ARS feature, the CSV ARS GRP must not be entered on the corresponding ARSTPA or ARSFD form. Also, the trunk group and its members may not be assigned an ATH feature.

When a trunk group has LN TYPE "QRY" and is assigned an ARS feature, the following fields on the ARSTPA or ARSFD form must be entered as "N": ALT FRL, RLT FRL IND and RLT AMA IND. The Leased Network ACP retrieves this information from the NCP.

When a trunk group has LN TYPE "QRY", TRK DIR "INC" or "2W", and for 5E8 and later, INPULSING other than "ISUP7" and "CCIS6", then it must have at least one trunk member defined on the TRUNK form. There must be one TIMING form with the trunk group's TRKCLS and INPULSING and the trunk's IN START DIAL.

When an "EDSL" trunk group has LN TYPE "NOQRY", and TRK DIR "INC" or "2W", it must have at least one trunk member defined on the TRUNK form. There must be one TIMING form with SERVICE CLASS "EDSL", START SIGNAL "NONE" and SIGNAL TYPE "DCHN".

When LN TYPE is "QRY", "NOQRY", or "IMT", the trunks in this trunk group may not reside on an SM with a basic configuration, i.e. for each trunk in this group, the first three digits of the TEN, DEN, SLEN, or (for 5E9(2) and later) NEN on the TRUNK form must be an SM defined on an EQIM form where the CONFIGURATION field is not "BASIC".

8.16 LN VIRT

Description: Is this a Leased Network virtual on-net trunk group?

Required Field.
Default: N

Data Rules:

For virtual on-net calls, the Leased Network Trunk type must be "QRY". If LN VIRT is "Y", LN TYPE must

Copyright © 2003 Lucent Technologies

be "QRY".

8.17 LN GROUP

Description: This field is the Leased Network group name, used to define a set of ARS (Automatic Route Selection) Groups which share a Trunk Group, in particular, an LN CCS7 interoffice trunk group.
Valid Entries: 1 to 8 characters

Data Rules:

If an LN GROUP is entered, it must be defined on an LNARSGD form (5214 Record).

For LN trunk groups that query the NCP (Network Control Point) and for LN interoffice trunk groups with CCS7 inpulsing, LN GROUP must be entered. That is, if LN TYPE is entered as "QRY", or if LN TYPE is entered as "IMT" with INPULSING "ISUP7", LN GROUP must be entered.

If LN TYPE is entered as "IMT" and the associated INPULSING is not "ISUP7", or if LN TYPE is entered as "NOQRY" or is not entered, LN GROUP must not be entered.

8.18 LN CRIT Q

Description: Will an outgoing trunk group support critical user queuing? The field is used in call processing only when the incoming trunk is defined as a Leased Network trunk. "Y" indicates that a Leased Network incoming trunk may queue for this trunk only if the incoming trunk is defined as a Leased Network critical user, i.e. FRL (Facility Restriction Level) is 14. "N" indicates that all Leased Network incoming trunks may queue for this trunk.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When LN CRIT Q is entered as "Y", QUEUE FEATURE must be entered, and both QUEUE ALLOWED and ENQUEUE ACT must be "Y".

When LN CRIT Q is "Y", QUEUE FEATURE must be defined on a QUFD form (5617-1 Record) with QUEUE TYPE "OFFHK".

ENHANCED 911

The following fields (Section 8.19 - Section 8.30) apply only to the E911 feature. For information regarding E911, see Division 2, Section 1BD.

8.19 E911 TYPE

Description: Enhanced 911 Trunk Type. This field describes the kind of E911 support this Trunk Group will provide.

Software Release: 5E7 and later
Required Field.
Default: NONDED
Valid Entries:

Valid E911 TYPE Entries

Entry	Definition
NONDED	Non-dedicated trunk group. E911 calls incoming over this trunk group will be counted against the E911 trunk SFG limit. The E911 TRK SFG is specified on the OFCOPT form (5509 Record) and defined on the PFASFG form (5609-3 Record).

Copyright © 2003 Lucent Technologies

PBXNONDED	Non-dedicated PBX trunk group. E911 calls incoming over this trunk group will be counted against the E911 line SFG limit. The E911 LN SFG is specified on the OFCOPT form and defined on the PFASFG form.
DED	E911 dedicated trunk group.
DIRANI	E911 dedicated direct connect trunk group with ANI. The dialed digits are not transmitted.
DIRNOANI	E911 dedicated direct connect trunk group without ANI. Neither the dialed digits nor the ANI digits are transmitted.
1ANPD	E911 trunk type that handles 911 calls incoming to a 5ESS Switch from a 1A ESS Switch.
TNDM_TNDM	E911 dedicated tandem to tandem trunk. TNDM_TNDM assigned to an incoming ISUP7 TG at the terminating E911 Tandem Switch allows the called DN (in the ISUP7 IAM) to be used for routing to the Primary PSAP.
WLNONDED	Non-dedicated wireless E911 trunk type to allow an ISUP7 trunk group as a non-dedicated wireless E911 connection. This provisioning allows, for a wireless E911 call, the use of digit analysis for the digits in the Called Party Number field in ISUP7 IAM (Initial Address Message) to route the call instead of by-passing digit analysis.

Data Rules:

When E911 TYPE is "DED", "DIRANI", or "DIRNOANI", TRK DIR must be "INC" and ESCO must be entered.

When E911 TYPE is "DIRANI" or "DIRNOANI", TRKCLS must be "CAMAANI"; members of the trunk group may not have an IN START DIAL of "DIRC" on the TRUNK form.

For 5E11 and later, if E911 TYPE is "DED", "DIRANI" or "DIRNOANI", it is recommended that AML ALARM be set to "CRITICAL".

When E911 TYPE is "DED", TRKCLS must be "CAMAANI", "LTOLLCON", or "TTOLLCON". If TRKCLS is "LTOLLCON" or "TTOLLCON", INPULSING must be "ISUP7".

For 5E12 and later:

- When E911 TYPE is "1ANPD", "DED", "DIRANI", or "DIRNOANI", TRK DIR must be "INC" and ESCO must be entered.
- When E911 TYPE is "1ANPD", "DIRANI", or "DIRNOANI", TRKCLS must be "CAMAANI".
- When E911 TYPE is "1ANPD", "DIRANI", or "DIRNOANI", and CH IN START is "Y", IN START DIAL must not be "DIRCON".
- When TRK DIR is not "2W", "OUT", or "ANN", or TRK DIR is "INC" and E911 TYPE is not "1ANPD", "DED", "DIRANI", "DIROANI", or TNDM_TNDM then AML PERCENT must not be entered.

When E911 is TNDM_TNDM:

- TRK DIR must be "INC",
- TRKCLS must be "LTOLLCON" or "TTOLLCON",
- INPULSING must be "ISUP7",
- ESCO must be entered.

The SFID 330 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before the E911 TYPE field can be set to "TNDM_TNDM".

Tandem to Tandem E911 is a secured feature requiring that the ACT field for SFID 330 be set to "Y" on the SFSYS form (5713-1 Record) to enable the feature. The ACT field for SFID 61 must be set to "Y" to

Copyright © 2003 Lucent Technologies

activate the Enhanced E911 secured feature before the ACT field for SFID 330 can be set to "Y".

For 5E13 and later:

When E911 TYPE is "WLNONDED",

- TRKCLS must be "LTOLLCON" or "TTOLLCON".
- INPULSING must be "ISUP7", "NONE", or not entered.
- OUTPULSING must be "ISUP7", "NONE", or not entered.

When E911 TYPE is "WLNONDED" and OUTPULSING is "NONE" or not entered, INPULSING must be "ISUP7".

When E911 TYPE is "WLNONDED" and INPULSING is "NONE" or not entered, OUTPULSING must be "ISUP7".

The SFID 298 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before the E911 TYPE field on the TKGRP can be set to "WLNONDED".

8.20 ESCO

Description: Emergency Service Central Office Number. This field identifies the originating office or calling area of an E911 caller. It is used to retrieve an ESN (Emergency Service Number) which determines routing and selective transfer information for the E911 call.

When a 911 call arrives at the E911-serving office on a trunk group not assigned an ESCO, the call is associated with an ESCO from the DAS form (5300-1 Record).

Software Release: 5E7 and later
Valid Entries: 1 - 999

Data Rules:

ESCO must be defined on an ESCO form (5541 Record).

8.21 CAMA PSAP

Description: Is this Trunk Group a link to a CAMA PSAP (Centralized Automatic Message Accounting Public Safety Answering Point)?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When CAMA PSAP is "Y", other fields on this TKGRP form must be set according to the following table.

Field Name	Entry
ABND TIMER	must be entered
BILLING DN	should be entered
BW LAMP	"N" or blank
CAMA PSAP	"Y"
COIN	"N" or blank
CUT THRU	"N" or blank
DATA RATE	blank
E911 TYPE	"NONDED"

Copyright © 2003 Lucent Technologies

ENQUEUE ACT	"Y" or blank
ESCO	blank
FAR END LATA	blank
HUNT TYPE	"2WF", "2WB", or "FIFO"
INPULSING	"TT"
INTER SM TRK	"N"
ISAT MLHG	blank
LN TYPE	"NONE" or blank
OUTPULSING	"MF"
PBX ID	blank
QUEUE ALLOWED	"N" or blank
QUEUE FEATURE	blank
RLT TYPE	"NONE"
TRK DIR	"2W"
TRKCLS	"PFLASH"
UNRES EA	"N"
WINK START	must be entered

If "Y" is entered, then:

- each trunk in this trunk group must be defined on a TRUNK form with ANI set to "N", IN START DIAL "DLTN", OUT START DIAL "WINK", IDLE STATE "ON", and ANSWER DELAY TIMING "N" or blank.
- the members of the trunk group may be assigned IDP, MW, and SC features via a TRUNKFA, TKGRPFA, or associated CLUSTR form; they may not be assigned ARS, ATH, ACCT, PFA, PP, MDR, TGSR, or TOD features. For an explanation of feature interactions on PSAP trunks, see "E911 Emergency Service" in the ***5ESS Switch Local and Toll System Features*** document, 235-190-115.

When CAMA PSAP is "Y" and a value is entered in the ATTTN field, then ATTTN must match the AUTOMATIC TRUNK TEST TABLE NUMBER on an AUTO form (5505-1/2 Record) where AUTOMATIC PROGRESSION TEST TYPE is "PB", the PERMANENT BUSY test value is 8, and other test values are blank.

8.22 ENH PSAP SIG

Description: The Enhanced Public Safety Answering Point Signaling field indicates whether or not the trunk designated as a CAMA (Centralized Automatic Message Accounting) PSAP uses enhanced CAMA signaling.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ENH PSAP SIG is "Y", CAMA PSAP must be "Y".

When ENH PSAP SIG is "Y", the ACT fields for both SFID 61 and SFID 299 on the SFSYS form must be "Y".

When ENH PSAP SIG is set to "Y" and ATTTN matches the AUTOMATIC TRUNK TEST TABLE NUMBER on the AUTO form, AUTOMATIC PROGRESSION TEST TYPE must be "PB", PERMANENT BUSY TEST must be "48", and all other test values on this AUTO form must be blank.

When ENH PSAP SIG is "N", CAMA PSAP is "Y", and ATTTN matches the AUTOMATIC TRUNK TEST TABLE NUMBER on the AUTO form, the AUTOMATIC PROGRESSION TEST TYPE must be "8", and all other test values must be blank on this AUTO form.

8.23 TEN DIG ONLY

Copyright © 2003 Lucent Technologies

Description: The Ten Digit Only field is used to support the Wireless E911 feature. See Division 2, Section 4A298.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When TEN DIG ONLY is "Y", ENH PSAP SIG must be "Y".

8.24 PSAP RERTE TN

Description: Public Safety Answering Point Reroute Telephone Number. This field is a 7- or 10-digit telephone number used to reroute calls that terminate to a busy PSAP. A PSAP may be busy because of traffic or because the customer or PSAP has activated a make busy key assigned to the PSAP trunk group.

The MAKE BUSY KEY, PSAP RERTE TN, and RERTE ACT fields determine whether or not call forwarding options will be assigned to the PSAP trunk group. Three options are available.

- Night service and/or power failure call forwarding only. This feature forwards calls to the RERTE TN only if a scan point specified in the MAKE BUSY KEY is activated due to night service or a PSAP power failure. To provision this feature a 7- or 10-digit telephone number must be entered in the RERTE TN field, a scan point number must be entered in the MAKE BUSY KEY field, and RERTE ACT must be "N".

- Traffic-busy forwarding only. This feature forwards calls to the RERTE TN only if the PSAP is traffic-busy. To provision this feature, a 7- or 10-digit telephone number must be entered in the RERTE TN field, the MAKE BUSY KEY field must be blank, and RERTE ACT must be "Y".

- Night service/power failure and traffic-busy forwarding. This feature forwards calls to the RERTE TN if either the scan point specified in the MAKE BUSY KEY is activated (night service or power failure), or the PSAP is traffic-busy. To provision this feature a 7- or 10-digit telephone number must be entered in the RERTE TN field, a scan point number must be entered in the MAKE BUSY KEY field, and RERTE ACT must be "Y".

These features take precedence over E911 alternate routing. If the switch attempts but fails to complete an E911 call to the primary PSAP (specified in the caller's ESN form), it determines if it should route to the PSAP RERTE TN. If rerouting fails or is not required, the switch then routes to an alternate PSAP TN specified in the ESN form.

Software Release: 5E7 and later
Valid Entries: 7 or 10 digits

Data Rules:

PSAP RERTE TN is only applicable for trunk groups with CAMA PSAP set to "Y". When PSAP RERTE TN is entered, CAMA PSAP must be "Y".

8.25 RERTE ACT

Description: Reroute Activation. Is reroute allowed for a busy PSAP? If this field is "Y", the PSAP RERTE TN will be used if a call terminates to a busy PSAP.

Software Release: 5E7 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field is applicable only for trunk groups where CAMA PSAP is "Y" and PSAP RERTE TN is entered. When RERTE ACT is "Y", PSAP RERTE TN must be entered.

8.26 WINK START

Description: Wink Start Timer. This field indicates the number of seconds the switch will wait for the PSAP to send a start outpulsing signal (a wink). The recommended value for this field is 16.

If CAMA PSAP is "Y" and WINK START is not entered, the software will set WINK START to 16.

Software Release: 5E7 and later
Valid Entries: 4 - 20 (seconds)

Data Rules:

This field is only applicable for trunk groups with CAMA PSAP set to "Y". When WINK START is entered, CAMA PSAP must be "Y".

8.27 ABND TIMER

Description: This field indicates the number of seconds the switch will keep the PSAP ringing after the caller abandons a 911 call. The recommended value for this field is 18.

If CAMA PSAP is "Y" and ABND TIMER is not entered, the software will set ABND TIMER to 18.

Software Release: 5E7 and later
Valid Entries: 0 - 31 (seconds)

Data Rules:

This field is only applicable for trunk groups with CAMA PSAP set to "Y". When ABND TIMER is entered, CAMA PSAP must be "Y".

8.28 BCLID FEATURE

Description: Enter the BCLID (Bulk Calling Line ID) feature name. (See Division 2, Section 1Y for more information on BCLID)

Software Release: 5E8 and later
Valid Entries: 1 - 8 characters

Data Rules:

If this field is entered:

- TRKCLS must be "EDSL", "EDSLHM", "PBXDID", "PF", "PFLASH", or "PFITT", and
- BILLING DN must be 10 digits long.

BCLID FEATURE must be entered if BILLING DN is entered and TRKCLS is "PBXDID".

If this field is entered, then:

Copyright © 2003 Lucent Technologies

- this feature must be defined as a feature on the BCLIDFD form,and
- if BCLID GRP is not entered, then BCLID GRP on the BCLIDFD form must be specified.

8.29 BCLID GRP

Description: Enter the BCLID (Bulk Calling Line ID) group name.

Software Release: 5E8 and later
Valid Entries: 1 - 8 characters

Data Rules:

If BCLID GRP is entered then BCLID FEATURE must be entered.

If BCLID GRP is entered, then it must match a BCLID GRP entry on the BCLIDGP form (5629-2 Record).

8.30 OUTAGE RPT

Description: This field allows the emergency service personnel the ability to designate specific trunk groups to be monitored for 100% OOS (Out of Service) conditions.

Software Release: 5E11 and later
Valid Entries: Y, N

Data Rules:

When OUTAGE RPT is "Y", the ACT field on the SFSYS form (5713-1 Record) must be "Y" for SFID 293 or SFID 294.

PACKET SWITCHING

The following fields (Section 8.31 - Section 8.33) define Packet Switching trunk attributes.

8.31 NBR PLAN

Description: The NBR PLAN field indicates the Numbering Plan Mode of the X.75 and X.75' interfaces. For 5E6, NBR PLAN replaces the X75P MODE field.

Software Release: 5E6 and later
Required Field
Default: NONE

- ***NOTE:*** For 5E8 and later, the only valid mode of interworking between numbering plans is Escape Code.

Valid Entries:

Valid NBR PLAN Entries

Entry	Definition
X121 or X	Software Release: 5E8 and later Indicates that X.121 is the native numbering plan and that the escape code mode of operation is in use.
E164 or E	Software Release: 5E8 and later. Indicates that E.164 is the native numbering plan and that the escape code mode of operation is in use.
NONE	Trunks that are neither X75 nor X75' must have this value.

Data Rules:

If TRKCLS is not "X75" or "X75P", then X75P MODE must be "NONE".

Copyright © 2003 Lucent Technologies

For 5E8 and later, if TRKCLS is "X75" or "X75P", then NBR PLAN must be "X121" or "E164".

8.32 NEXT PSN

Description: Enter the PSN (Packet Switch Number) of the next switch which is directly connected to this switch via an IP (Internal Protocol) trunk group. Only one IP trunk group can connect two switches, therefore, the PSN entered in this field must not be assigned to another IP trunk group. The PSN entered in this field must not be the PSN of this switch which is defined on the ISDNOPT form (5941 Record) in the PSN field.

Software Release: 5E5 and later
Valid Entries: 1 - 255

Data Rules:

This field must be entered when TRKCLS is "PACKET", otherwise, this field must be blank.

8.33 PKT MODULE

Description: This field appears only on the Recent Change view and identifies the Switching Module where packet switching trunk members reside. For non-packet switching trunk groups, PKT MODULE should be set to zero.

Packet switching trunk groups have TRKCLS set to "PACKET", "X75", or "X75P". For "PACKET" trunk groups, all trunk members must reside on the same SM, and PKT MODULE must contain the SM number.

For "X75" and "X75P" trunk groups, if the trunk members reside on more than one non-remote SM, PKT MODULE must be zero. If an "X75" or "X75P" trunk group contains trunk members on a remote SM, then all trunk members must reside on that SM, and PKT MODULE must be set to the SM number.

LEVEL 2 THRSH

The following fields (Section 8.34 - Section 8.36) are valid with 5E5 and later Software Releases. These fields contain the threshold values used by Level 2 error handling for X.75' and IP trunk groups. These fields must be entered when the TRKCLS is "PACKET" or "X75P".

8.34 FCS

Description: Indicate the threshold value for the ratio of frames received with a bad FCS (Frame Check Sequence) to the total number of frames received.
Valid Entries: 0 - 5

8.35 SABM

Description: Indicate the threshold value for the maximum number of SABM (Set Asynchronous Balanced Mode) frames received in a 30-second period.
Valid Entries: 0 - 10

8.36 PROT VIOL

Description: Indicate the threshold value for the maximum number of Level 2 protocol violations detected in a 30-second period.
Valid Entries: 0 - 100

9. FORM ENTRIES - 5202-8 RECORD

9.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and Office Name on each record.

9.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

X.75 TRUNKS

The following fields (Section 9.3 - Section 9.11) define X.75 trunk groups.

9.3 REMOTE DNIC

Description: Enter the Data Network Identification Code to be associated with the remote end of this X.75 trunk group. Packet routing is based on the RPOA DNIC if the RPOA utility is present in the route request message. If the utility is not present, packet routing is based on the called address.

Software Release: 5E6 and later
Valid Entries: 1 - 9999

Data Rules:

If "X75" is not entered, REMOTE DNIC must be left blank.

9.4 SEGMENT SIZE

Description: Enter X.75 Internetwork AMA Segment size. This field is used to determine the number of segments in AMA billing records. This field can only be entered for X.75 trunk groups. If this field is not entered for X.75 trunk groups, a default value of 64 will be automatically assigned to this trunk group.

Software Release: 5E8 and later
Valid Entries: 16, 64, 128 or 256 (octets)

Data Rules:

If SEGMENT SIZE is entered, TRKCLS must be "X75".

9.5 CUG LIST ID

Description: Enter the X.75 CUG (Closed User Group) List ID. This field is used to assign a Closed User Group List to this X.75 trunk group and can only be entered for X.75 trunk groups.

Software Release: 5E8 and later
Valid Entries: 1 - 1600

Data Rules:

If CUG LIST ID is entered, TRKCLS must be "X75".

If CUG LIST ID is entered on the TKGRP form, then it must be defined on the X75CUG form (5930

Copyright © 2003 Lucent Technologies

Record).

9.6 CUG SCRN

Description: Is X.75 CUG (Closed User Group) screening allowed?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CUG SCRN is "Y", then:

- TRKCLS must be "X75", and
- CUG LIST ID must be entered.

If TGN/MEMB(s) defined on the TRUNK form (5204 Record), correspond to a TGN defined on the TKGRP form where TRKCLS is "X75" and CUG SCRN is "Y", then CUG or CUG OUTGOING must be "Y" or unknown on the TRUNK form.

9.7 ILC SCRN

Description: Enter the type of screening for X.75 IntraLATA Competition. If this field is set to "ON" and the RPOA (Registered Private Operating Facility) utility on the X.75 trunk is provisioned, then the packet trunk call arriving at the X.75 interface may be screened (depending on how the ILC field on the ISDNOPT form (5941 Record) is entered) as an X.75 interface. If this field is set to "OFFTR" and the RPOA utility on this X.75 trunk is provisioned, then the switch will honor the RPOA that is in the CRP (Call Request Packet) regardless of the ILC field entry on the ISDNOPT form. If this field is set to "OFFDN" and both the RPOA utility and the IECP utility are not present in the CRP, then the call is routed based on the directory number in the CRP.

Software Release: 5E8 and later
Valid Entries:

Valid ILC SCRN Entries

Entry	Definition
ON	ILC Screening is active and TR301 compliant.
OFFTR	ILC Screening is inactive and TR448 compliant.
OFFDN	ILC Screening is inactive and is not TR448 Compliant.

Data Rules:

ILC SCRN may only be entered if TRKCLS is "X75".

9.8 NUI IN VFY

Description: Enter the treatment for X.75 Packet Switching NUI (Network User ID) incoming verified calls. The NUI provides the supplementary network user identification for charging the virtual call usage. When this field is set to "PASS" the switch will transmit the CRP (Call Request Packet) as is. When this field is set to "CLEAR", the switch clears the CRP containing the NUI utility. When this field is set to "DELETE", the switch removes the NUI utility from the CRP before delivering the call set-up packet. If this field is not entered for X.75 trunk groups (TRKCLS is "X75"), an internal default of "PASS" is automatically assigned.

Software Release: 5E8 and later
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid NUI IN VFY Entries	
Entry	**Definition**
CLEAR or C	Clear the packet call containing the NUI ID.
DELETE or D	Delete the NUI ID.
PASS or P	Pass the NUI ID.

Data Rules:

If NUI IN VFY, NUI IN UNVFY, NUI OUT VFY, or NUI OUT UNVFY is entered, TRKCLS must be "X75".

9.9 NUI IN UNVFY

Description: Enter the treatment for X.75 Packet Switching NUI (Network User ID) incoming unverified calls. The NUI provides supplementary network user identification for charging the virtual call usage. When this field is set to "PASS", the switch transmits the CRP (Call Request Packet) as is. When this field is set to "CLEAR", the switch clears the CRP containing the NUI utility.

If this field is not entered for X.75 trunk groups, an internal default of "CLEAR" is automatically assigned.

Software Release: 5E8 and later
Valid Entries:

Valid NUI IN UNVFY Entries	
Entry	**Definition**
CLEAR or C	Clear the packet call containing the NUI ID.
PASS or P	Pass the NUI ID.

Data Rules:

If NUI IN VFY, NUI IN UNVFY, NUI OUT VFY, or NUI OUT UNVFY is entered, TRKCLS must be "X75".

9.10 NUI OUT VFY

Description: Enter the X.75 Packet Switching NUI (Network User ID) treatment for outgoing verified calls. The NUI provides supplementary network user identification for charging the virtual call usage. When this field is set to "PASS", the switch transmits the CRP (Call Request Packet) as it is. When this field is set to "CLEAR", the switch clears the CRP containing the NUI utility. When this field is set to "DELETE", the switch removes the NUI utility from the CRP before delivering the call set-up packet.

If this field is not entered for X.75 trunk groups (TRKCLS is "X75"), an internal default of "PASS" is automatically assigned.

Software Release: 5E8 and later
Valid Entries:

Valid NUI IN VFY Entries	
Entry	**Definition**
CLEAR or C	Clear the packet call containing the NUI ID.
DELETE or D	Delete the NUI ID.
PASS or P	Pass the NUI ID.

Data Rules:

If NUI IN VFY, NUI IN UNVFY, NUI OUT VFY, or NUI OUT UNVFY is entered, TRKCLS must be "X75".

9.11 NUI OUT UNVFY

Description: Enter the treatment for X.75 Packet Switching NUI (Network User ID) outgoing unverified calls. The NUI provides supplementary network user identification for charging the virtual call usage. When this field is set to "PASS", the switch transmits the CRP (Call Request Packet) as is. When this field is set to "CLEAR", the switch clears the CRP containing the NUI utility.

Copyright © 2003 Lucent Technologies

If this field is not entered for X.75 trunk groups (TRKCLS is set to "X75"), then an internal default of "CLEAR" is automatically assigned.

Software Release: 5E8 and later
Valid Entries:

Valid NUI IN UNVFY Entries

Entry	Definition
CLEAR or C	Clear the packet call containing the NUI ID.
PASS or P	Pass the NUI ID.

Data Rules:

If NUI IN VFY, NUI IN UNVFY, NUI OUT VFY, or NUI OUT UNVFY is entered, TRKCLS must be "X75".

CELLULAR DATA

The following fields (Section 9.12 - Section 9.20) define data for the Digital Advanced Mobile Phone Service feature.

9.12 DCS TRK

Description: Is this a DCS (Digital Cellular Switch) trunk group?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

IF SFID ACT 130 on the SFSYS form is "N", DCS TRK cannot be "Y".

If DCS TRK is "Y":

- then HUNT TYPE must be

  "2WB"

  "2WF"

  "ANN"

  "BGUCD"

  "GUCD" or

  "MLIDL" "UCD"

  or not entered.

- and INPULSING is "TT", DCS DIGCNT must be entered. If DCS TRK is "Y" and INPULSING is not "TT", DCS DIGCNT may not be entered.

Copyright © 2003 Lucent Technologies

- the AFAC ID must be entered on all corresponding EQDUP, EQVT, or EQLVC forms for the respective DEN, NEN, or OIUEN (TRKOE with TRKOETYPE = "0") populated on the associated TRUNK form.
  - EQDUP forms:
    - If FAC IND is 0 or 1, AFAC ID FAC 0 must be entered.
    - If FAC IND is 3, and the channel number (the last two digits of the DEN on the TRUNK form) is less than 25, AFAC ID FAC 0 must be entered.
    - If FAC IND is 3, and the channel number is greater than 24, AFAC ID FAC 1 must be entered.
  - EQVT and EQLVC forms:
    - AFAC ID must be entered.

For 5E10 and later, if DCS TRK is "Y" and TRKCLS is not "SPCHNDLR", then IAPT must be "Y".

For 5E12 and later:

If DCS TRK is "Y", then ISUP MLD must be "N".

When DCS TRK is "Y" and TRKCLS is "A5", "ADT", "IDCS", "IS41", "IVTRK", "SVC", or "3GPD", HUNT TYPE must be "2WB", "2WF", "ANNC", "'BGUCD", "FIFO", "GUCD", "MLIDL", or "UCD".

When DCS TRK is "Y" and TRKCLS is not "A5", "ADT", "IDCS", "IS41", "IVTRK", "SVC", or "3GPD", HUNT TYPE must be "2WB", "2WF", "ANNC", "'BGUCD", "FIFO", "GUCD", "MLIDL", or "UCD".

For 5E13 and later,

- if DCS TRK is "N" and TRKCLS is not equal to "BCM" or "PPMEM", and TRK DIR is not equal to "SGNL" on a TKGRP form, AFAC ID must not be entered for all corresponding EQDUP or EQVT forms.
- if DCS TRK is "Y", an AFAC ID must be entered on all corresponding EQDUP or EQVT forms for the respective DEN or NEN populated on the associated TRUNK form.

For 5E14 and later,

- When DCS TRK is "Y" and TRKCLS is "IS41", then DCS RETRY must be "Y".

  When DCS TRK is "N", TRKCLS is not equal to BCM, ISLPM, or PPMEM

9.13 DCS RETRY

Description: Should a retry be attempted on a trunk in this DCS trunk group?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

IF SFID ACT 130 on the SFSYS form is "N", DCS RETRY cannot be "Y".

9.14 DCS DIGCNT

Description: This field specifies the number of incoming digits for a DCS trunk. For 5E10 and later the valid entries are changed to support the Inter-MSC Tandem Support for International Calls feature. For more information on this feature, see Division 2, Section 8C.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E9(1) - 5E9(2): 1 - 26
- For 5E10 and later: 1 - 28

Data Rules:

IF SFID ACT 130 on the SFSYS form is "N", DCS DIGCNT must be blank.

If DCS TRK is "Y" and

- INPULSING is "TT", then DCS DIGCNT must be entered.
- INPULSING is not "TT", then DCS DIGCNT must not be entered.

9.15 CONT TEST

Description: Should a continuity test be run on a DCS Cell Site 1 trunk?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TRKCLS is not "CST1", CONT TEST must be "N".

9.16 SERV TYPE

Description: Enter the type of service for this trunk group with a TRKCLS of "SPCHNDLR" (speech handler for CDMA trunks). This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.

Software Release: 5E10 and later.
Required Field.
Default: NOSERV
Valid Entries:

Valid SERV TYPE Entries

Entry	Definition
3G1XPD	Software Release 5E15 and later. 3G-1X High Speed Data trunk groups.
8K	Software Release: 5E10 and later. 8K voice service for SPCHNDLR trunk groups.
13K	Software Release: 5E10 and later. 13K voice service for SPCHNDLR trunk groups.
ACELP	Software Release: 5E12 and later.

Copyright © 2003 Lucent Technologies

	Algebraic Code Excited Linear Predictive Algorithm Vocoder for SPCHNDLR trunk groups.
CEV13	Software Release: 5E16(1) and later. CDMA EVRC and 13K Vocoder.
DATA	Software Release: 5E12 and later. This trunk group is being used for AUTOPLEX data.
EVRC	Software Release: 5E11 and later. Enhanced Variable Rate Coding for SPCHNDLR trunk groups.
NOSERV	No service is provided by the trunk
TACVS	Software Release: 5E16(1) and later. TDMA ACELP and VSELP Vocoder.
VSELP	Software Release: 5E12 and later. Vector Sum Excited Linear Predictive Algorithm Vocoder for SPCHNDLR trunk groups.

Data Rules:

When TRKCLS is "SPCHNDLR", SERV TYPE must be:

For 5E10: "8K", or "13K"

For 5E11: "8K", "13K", or "EVRC",

For 5E12: "8K", "13K", "ACELP", "EVRC", or "VSELP"

For 5E10 and 5E11, "NOSERV" must be entered if TRKCLS is not "SPCHNDRL".

For 5E12 and later:

- When SERV TYPE is "DATA", TRKCLS must be "ADT".
- When TRKCLS is "ADT", SERV TYPE must be "DATA".
- When TRKCLS is not "ADT" or "SPCHNDLR", SERV TYPE must be "NOSERV".

For 5E15 and later:

- when TRKCLS is not "3GPD", "ADT", "PCF", or "SPCHNDLR", SERV TYPE must be "NOSERV".
- when TRKCLS is "3GPD", SERV TYPE must be "3G1XPD".

Speech Handler Trunk group members must have a corresponding PSUGP form or the corresponding PSUGP form must have a PH TYPE (on PSUGP) which is appropriate for the value of SERV TYPE (on TKGRP). The following table defines the PH TYPEs (on PSUGP) which are valid for each value of SERV TYPE (on TKGRP).

Valid PH TYPE Entries

SERV TYPE	PH TYPE
8K	PHV1, PHV3, PHV4
13K	PHV2, PHV3, PHV4
ACELP	PHV4
CEV13	PHV5
DATA	PHV1, PHV2, PHV3, PHV4
EVRC	PHV3, PHV4
SME13	PHV6
TACVS	PHV5
VSELP	PHV4

PHV1s, PHV2s, PHV3s, and PHV4s, for 5E12 are exclusively used for Speech Handler trunks via UEN assignment on the TRUNK form (TRKOE where OE TYPE is equal to "U");

For 5E13 and later, when the Packet Pipe Enhancements secured feature has been purchased, a SFSYS form exists with SFID 317 ACT set to "Y". The PSUGP form represents PH4sand PH22s. The PH4 or

Copyright © 2003 Lucent Technologies

PH22 must not exceed its capacity for CDMA trunk routing. The count of Packet Pipe Member trunks assigned to all Packet Pipe trunks which use a PH4 may not exceed 32. The count of Packet Pipe Member trunks assigned to all Packet Pipe trunks which use a PH22 may not exceed 64. However, when no Trunk Groups have been provisioned with SERV TYPE of "ACELP" or "VSELP", the number of CDMA calls the PH4 or the PH22 can handle must not exceed 84 . Also, when one or more Trunk Groups have been provisioned with SERV TYPE of "ACELP" or "VSELP", the number of CDMA calls the PH4 can handle may not exceed 90 and the number of CDMA calls the PH22 can handle must not exceed 240.

The number of possible CDMA calls is dependent upon the presence of Trunk Group SERV TYPEs of "8K", "13K", "ACELP", "DATA", "EVRC" or "VSELP" in the switch, the DATA RATE of the Packet Pipe Member Trunks and the number of Packet Pipe Member trunks which point to this PH4 or PH22. See Division 2, Section 4a317 for more information on the Packet Pipe Enhancements feature.

For 5E15 and later, when unique PHs (OE [1-6]) are assigned to a different TRKCLS and/or SERV TYPE, a given PH must be assigned to the same TRKCLS and SERV TYPE when the PH TYPE is a PHV (i.e., any of the various Protocol Handler for Voice PH TYPEs) assigned on the TRUNK form (5204 Record) with an OE TYPE equal to "U".

- ***NOTE:*** The TRKCLS values "SVC" and "ADT" are excluded. SVCs must be assigned to a logical PH Channel with a "FRBC" trunk, and ADTs must be assigned to a logical PH Channel group with existing "SPCHNDLR" trunks.

For 5E16(1) and later:

- when TRKCLS is "SPCHNDLR", SERV TYPE must be "8K", "13K", "ACELP", "CEV13", "EVRC", "TACVS", or "VSELP".

- when SERV TYPE is "ACELP", "TAVCS", or "VSELP", the ACT field for SFID 259 on the SFSYS form (5713-1 Record) must be set to "Y". The "ACELP", "TACVS", and VSELP" SERV TYPEs support the Switch Based TDMA Vocoders feature and are used exclusively for TDMA Vocoder services (see Division 2, Section 4A259).

For 5E18(1) and later, when SERV TYPE is "SME13", PH TYPE on the PSUGP form (5949 Record) must be "PHV5" or "PHV6".

- ***NOTE:*** A SERV TYPE of "TACVS" is not currently supported. The valid entry "TACVS" for the SERV TYPE field may potentially be supported for future use.

9.17 DCS NOTIFY

Description: Is a notification from the ECP (Executive Cellular Processor) required? This field cannot be entered. It will be automatically entered as follows:

- This field is automatically set to "Y" if TRKCLS is

  "CTS1"

  "CST2"

  "IVTRK",

  "PKTPIPE"

  "SPCHNDLR"

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

9.18 ISG

Description: Is this an Information Services Gateway Trunk? This field supports the Information Services Gateway feature. For more information on this feature, see Division 2, Section 4C19.

Software Release: 5E9(2) and later.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, TRKCLS must be "IDCS".

9.19 ICOS TRK

Description: The ICOS TRK field indicates whether or not this trunk group will support ICOS (Increased Court Ordered Surveillance) traffic.

Software Release: 5E11 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When ICOS TRK is "Y", TRKCLS must be "IDCS".

9.20 FAR E911

Description: Is far end of DCS trunk dedicated for E911 traffic?

Software Release: 5E10 and later.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then:
- DCS TRK must be "Y"
- OUTPLS must be "MF"
- TRKCLS must not be
- "CST1"
- "CST2"
- "DSC"
- "IDCS"
- "IVT"
- TRKCLS must not be

ADV SVC PLATFORM

The following fields (Section 9.21 - Section 9.26) are applicable to ASP (Advanced Services Platform;

Copyright © 2003 Lucent Technologies

previously PVN, Private Virtual Network), available with 5E6 and later Software Releases.

9.21 TRIG NBR

Description: Enter the Network services trigger number.

Software Release: 5E9(1) and later
Valid Entries: 1 - 255

Data Rules:

If TRIG NBR is entered, TRKCLS must be "LATA", "LTOLLCON", "PRINTOLL", or "TTOLLCON", and TRK DIR must be "2W" or "INC".

TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form.

For 5E12 and later, when TRIG NBR is not entered and MBG TRANSPORT is "Y":

- LDP must be "Y".
- INPULSING or OUTPULSING must be "ISUP7".
- TRKCLS must be "LATA".

9.22 UNRES EA

Description: Will ASP originations on this trunk group be using only EA (Equal Access) signaling with unrestricted dialing (i.e., it might not conform to standard EA signaling rules)? This field must be set to "Y" to handle ASP calls originated from a customer PBX, since the PBX may not have included the necessary prefix digits (such as 1+ or 011).

Furthermore, this field may be used to identify ASP calls over interoffice trunks. See Division 2, Sections 4A51 and 4A126 for more information.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PVN OFC on the OFCOPT form (5509 Record) is set to "NONE", then this office does not support ASP, and UNRES EA must be "N".

9.23 ASP TOLL

Description: Should all calls incoming over this toll trunk group generate an OHD (Off-Hook Delay) SCP Info_Collected query? This field is used with the ASP Trunk Trigger for TOLL secured feature. For more information concerning this feature, see Division 2, Section 4A159.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ASP TOLL is "Y":

Copyright © 2003 Lucent Technologies

- TRIG NBR must be entered,
- TRKCLASS must be "TTOLLCON",
- INPLS must be "ISUP7".

For every TRIG NBR on the TKGRP form where ASP TOLL is "Y", there must be a corresponding TRIG NBR entered on a NSTRIG form where AIN REL is "R0D1".

9.24 IP TRK

Description: Is this an Intelligent Peripheral Trunk? This field indicates that the Trunk Group is an Intelligent Peripheral Interface and is eligible to participate in the (STR(E)) Send To Resource External operation. This field supports the AIN SSP STOR (Send To Outside Resource (Local)) secured feature. For more information on this feature, see Division 2, Section 4A229.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When IP TRK is "Y", TRKCLASS must be "EDSL" if ASPTOLL is "Y".

Since the STOR (Send To Outside Resource) feature requires that the office have ASP functionality before STOR data can be assigned, IP TRK must be "N" until ASP OFC on the OFCOPT has been set to "SSP".

Since STOR (Send To Outside Resource) is a secured feature and must be purchased by the office before STOR data can be assigned, IP TRK must be "N" until SFID 126 ACT and SFID 229 ACT on the SFSYS form have been set to "Y".

9.25 IP MEAS

Description: Are Intelligent Peripheral Measurements to be taken? This field indicates whether per-IP measurements shall be taken for the Trunk Group that is designated as an IP. This field supports the AIN SSP STOR (Send To Outside Resource (Local)) secured feature. For more information on this feature, see Division 2, Section 4A229.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When IP MEAS is "Y", IP TRK must be "Y".

Since the number of trunk groups marked for measurement for the STOR (Send To Outside Resource) feature must not exceed 25, the number of TKGRP forms where IP MEAS is "Y" must not exceeded 25.

9.26 CARRIER TRIG

Description: Will the trigger number defined on the ASP TRIG NBR field of the ICF form be used for the Carrier Routing by Facility Presence feature? This field supports the Carrier Routing / Call Processing by Facility Presence Special Feature. For more information on this feature see Division 2, Section 4A243.

Copyright © 2003 Lucent Technologies

Software Release: 5E11 and later.
Default: N
Valid Entries: Y, N

Data Rules:

Carrier Routing/Call Processing by Facility Presence is a secured feature that must be purchased by the office before CARRIER TRIG on the TKGRP form can be set to "Y". A SFSYS form must exist with SFID 243 ACT set to "Y".

9.27 CUT THRU TRIG

Description: The CUT THRU TRIG field is used to specify the Long Distance Platform cutthrough trigger number.

Software Release: 5E13 and later.
Valid Entries: 1 - 255

Data Rules:

When CUT THRU TRIG is entered,

- LDP must be "Y".
- TRKCLS must be "LATA".
- TRIG NBR must be defined on a NSTRIG form where APPLICATION equals "ASP" and AIN REL equals "ROD1".

9.28 URT FCD BLK

Description: Should all Unrestricted FCD Codes be blocked from this trunk group?

This field was added for the ASP Unrestricted FCD Trigger feature. For more information, see Division 2, Section 4A572.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When URT FCD BLK is "Y", TRKCLS must be "PF", "PFITT" or "PFLASH".

The secured feature ASP Unrestricted FCD Code Triggers must be purchased before URT FCD BLK can be changed to "Y" on the TKGRP form, therefore the ACT field for SFID 572 on the SFSYS form must be "Y".

When URT FCD BLK is "Y" on the TKGRP form, then the corresponding TGN cannot be used on the TKBLKCD form.

LOCAL NUMBER PORTABILITY

The following fields (Section 9.29 - Section 9.32) apply to LNP (Local Number Portability) secured feature (SFID 174) available with 5E11 and later Software Releases. For more information on this feature, see Division 2, Section 4A174.

Copyright © 2003 Lucent Technologies

9.29 LRN DAS

Description: Enter the LRN DAS (Local Routing Number Digit Analysis Selector) which is used to specify the digit analysis selector used when analyzing the LRN (Local Routing Number) received in the IAM (Initial Address Message) of an incoming ISUP7 trunk. The SIG PNUM and LRN DAS fields have been added to support the LNP (Local Number Portability) feature. For more information on this feature, see Division 2, Section 4A174.

Software Release: 5E11 and later.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

The Local Number Portability feature is a secured feature that must purchased, and the SFID 174 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field is entered.

When this field is entered, LRN DAS must be entered on the DAS form (5300-1 Record).

When this field is entered, The corresponding DAS form must have LOCAL DIT entered. Also LOCAL DIT must be defined as LDIT on the corresponding SMLDIT form (5315 Record) for every operational SM in the office. This must be accomplished by entering an SMLDIT form with this LDIT value as the key and by entering each operational SM (as defined on EQIM forms where EQSTATUS is "O") into the LIST OF SWITCHING MODULES. The following is a list of SMs which have not been entered into the LIST OF SWITCHING MODULES on the appropriate SMLDIT form.

9.30 SIG PNUM

Description: Is the ported DN signaled on outgoing CCS7 trunks using normal ISUP signaling? Normally, the LRN (Location Routing Number) method expects to signal the LRN in the Called Party Number parameter of the IAM (Initial Address Message). The LRN is a 10-digit number that uniquely identifies a switching office and rate center. The SIG PNUM and LRN DAS fields have been added to support the LNP (Local Number Portability) feature. For more information on this feature, see Division 2, Section 4A174.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, OUTPLS must be "ISUP7".

9.31 CNA OPTION

Description: Enter the Connecting Network Access AMA recording option. The CNA OPTION field is used for incoming or two-way trunks to indicate whether or not CNA (Connecting Network Access) AMA records should be generated for incoming calls on the trunk group. For more information on this feature, see Division 2, Section 4A180.

Software Release: 5E11 and later.
Required Field.
Default: NONE
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid CNA OPTION Entries	
Entry	**Definition**
COND	CNA AMA records should only be generated for incoming calls which result in a LNP (Local Number Portability) SCP (Service Control Point) database query.
UNCOND	CNA AMA records should only be generated for all calls incoming over the trunk group.
NONE	CNA AMA records should not be generated for incoming calls over the trunk group.

Data Rules:

The Number Portability - Basic LRN AMA feature is a secured feature. This feature must be purchased and SFID 180 ACT set to "Y" on the SFSYS form (5713-1 Record) before "COND" or "UNCOND" can be entered in this field.

For 5E11 and later, when LDP is "Y", CNA OPTION must be "NONE" on this form.

When TRKCLS is not "CAMAANI", "CAMAONI", "EDSL", "LTOLLCON", "TTOLLCON", "X75", or "X75P", CNA OPTION must be "NONE" on this form.

When TRK DIR is not "INC" or "2W", CNA OPTION must be "NONE" on this form.

When FEAT GRP is "B" or "D", CNA OPTION must be "NONE".

9.32 PORTED

Description: The PORTED field is used to indicate whether the TN has been ported into this office via the NP feature. The indicator is used by call processing to determine whether or not to generate an NP BAF (Bellcore AMA Format) module for originating and terminating IXC access records.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

When PORTED is "Y", TRKCLS must be "PBXDID", "PF", "PFLASH", "PFCPE", "EDSL" or "EDSLHM".

LONG DISTANCE PLATFORM

Prior to 5E12, this was the TOLL DIGITAL EXCHANGE field group, the field group name was changed to LONG DISTANCE PLATFORM.

The following fields are applicable to LDP (Long Distance Platform), available with 5E10 and later Software Releases. For more information on this feature, see Division 2, Section 4A235.

9.33 TDX

Description: With 5E12 and later, this field name is changed to LDP. The TDX field indicates whether this trunk is part of a LDP network. Is this a LDP Trunk?

Software Release: 5E10 through 5E11.
Default: N
Valid Entries: Y, N

Data Rules:

The TDX field on the TKGRP form is used by the Toll Digital Exchange Special Feature in a LDP office. It is a secured feature that must be purchased by the office before the field can be set to "Y". An SFSYS form must exist with SFID 165 ACT set to "Y".

Copyright © 2003 Lucent Technologies

For 5E11, when TDX is "Y", CNA OPTION must be "NONE" on this form.

When TDX is "Y":
- ASP TOLL must be "N"
- CMC must be "N"
- LN TYPE must be "NONE"
- NCD SCRN must be "NONE"
- TRKCLS must be "IC"
- "LATA",
- or "TTOLLCON"

- and TRKCLS is "IC",
  - TRK DIR must be "OUT" or "2W".
  - OUTPULSING must be "ISUP7" or "MF"

- and TRKCLS is "LATA" or "TTOLLCON", TRK DIR must be "INC", "OUT" or "2W".
- and TRKCLS is "LATA"
  - and TRK DIR is "INC" or "2W", INPULSING must be "ISUP7" or "MF".
  - and TRK DIR is "OUT" or "2W", OUTPULSING must be "ISUP7" or "MF".

- and TRKCLS is "TTOLLCON"
  - and TRK DIR is "INC" or "2W", INPULSING must be "ISUP7".
  - and TRK DIR is "OUT" or "2W", OUTPULSING must be "ISUP7".
  - TERM BILL must be "N".

When TDX on the TKGRP form is "Y", then TDX CARRID on the OFCOPT form must be entered . Also the TDX CARRID on the OFCOPT form must be defined on the ICF form with the corresponding FEAT GRP equal to "D".

When TDX on the TKGRP form is "Y", then there must exist an ANITBL form with NPA equal to "000", NXX equal to "000" and LINE equal to "0000".

When TGN(s), defined on TKGRP form(s), do not have a LN TYPE entered or have LN TYPE entered as "NONE" and TDX is entered as "N", if the TGN is on an ARSTPA form, or if it is assigned an Automatic Route Selection (ARS) Feature on either the TRUNKFA form or the TKGRPFA form or an associated CLUSTR form, the associated TRKCLS on the TKGRP form must be entered as "PF", "PFITT", "PFLASH", "EDSL", or "EDSLHM".

When TGN(s), defined on TKGRP form(s), do not have a LN TYPE entered or have LN TYPE entered as "NONE" and TDX entered as "Y", if the TGN is on an ARSTPA form, or if it is assigned an Automatic Route Selection (ARS) Feature on either the TRUNKFA form or the TKGRPFA form or an associated CLUSTR form, then all following conditions must hold true:

- The associated TRKCLS on the TKGRPform must be entered as "LATA".
- TGN/MEMB/FEATURE must be defined on ARSTPA where (FRL LINE equals 16 and DIAL PLAN

Copyright © 2003 Lucent Technologies

equals "ODP") or (FRL LINE not entered, TCM IN not entered and DIAL PLAN equals "ODP") .

- If ARSTPA form is not found then the FEATURE must be defined on ARSFD where (FRL LINE equals 16 and DIAL PLAN equals "ODP") or (FRL LINE not entered, TCM IN not entered and DIAL PLAN equals "ODP") .
- The FEATURE must be defined on ARSFD where ENTRY equals "AUTO".

9.34 LDP

Description: Prior to 5E12, this was the TDX field. With 5E12 and later, this field name was changed to LDP. The LDP field indicates whether this trunk is part of a LDP network. Is this a LDP Trunk?

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

Data Rules:

The LDP field on the TKGRP form is used by the Toll Digital Exchange Special Feature in a LDP office. It is a secured feature that must be purchased by the office before the field can be set to "Y". An SFSYS form must exist with SFID 165 ACT set to "Y".

For 5E12 and later, when LDP is "Y", CNA OPTION must be "NONE" on this form.

For 5E12 and later, when LDP on the TKGRP form is "Y", there must be two LDPCTBL forms. One of the LDPCTBL forms must have LDP CARRIER set to 10000 with CARRIER PRESUBSCD equal to "Y" and the second LDPCTBL form must have LDP CARRIER set to 10000 with CARRIER PRESUBSCD equal to "N".

When LDP is "Y":
- ASP TOLL must be "N"
- CMC must be "N"
- LN TYPE must be "NONE"
- NCD SCREENING must be "NONE"
- TRKCLS must be "IC"
- "LATA",
- or "TTOLLCON"

- and TRKCLS is "IC",
  - TRK DIR must be "OUT" or "2W".
  - OUTPULSING must be "ISUP7" or "MF".
- and TRKCLS is "LATA" or "TTOLLCON", TRK DIR must be "INC", "OUT" or "2W".
- and TRKCLS is "LATA",
  - and TRK DIR is "INC" or "2W", INPULSING must be "ISUP7" or "MF".
  - and TRK DIR is "OUT" or "2W", OUTPULSING must be "ISUP7" or "MF".
- and TRKCLS is "TTOLLCON",

Copyright © 2003 Lucent Technologies

- and TRK DIR is "INC" or "2W", INPULSING must be "ISUP7".
- and TRK DIR is "OUT" or "2W", OUTPULSING must be "ISUP7".
- TERM BILL must be "N".

When LDP on the TKGRP form is "Y", then TDX CARRID on the OFCOPT form must be entered . Also the TDX CARRID on the OFCOPT form must be defined on the ICF form with the corresponding FEAT GRP equal to "D".

When LDP on the TKGRP form is "Y", then there must exist an ANITBL form with NPA equal to "000", NXX equal to "000" and LINE equal to "0000".

When a TGN(s), defined on a TKGRP form(s), does not have a LN TYPE entered or have LN TYPE entered as "NONE" and LDP is entered as "N", if the TGN is on an ARSTPA form, or if it is assigned an Automatic Route Selection (ARS) Feature on either the TRUNKFA form or the TKGRPFA form or an associated CLUSTR form, the associated TRKCLS on the TKGRP form must be entered as "PF", "PFITT", "PFLASH", "EDSL", or "EDSLHM".

When a TGN(s), defined on a TKGRP form(s), does not have a LN TYPE entered or have LN TYPE entered as "NONE" and LDP entered as "Y", if the TGN is on an ARSTPA form, or if it is assigned an Automatic Route Selection (ARS) Feature on either the TRUNKFA form or the TKGRPFA form or an associated CLUSTR form, then all following conditions must hold true:

- The associated TRKCLS on the TKGRPform must be entered as "LATA".
- TGN/MEMB/FEATURE must be defined on ARSTPA where (FRL LINE equals 16 and DIAL PLAN equals "ODP") or (FRL LINE not entered, TCM IN not entered and DIAL PLAN equals "ODP") .
- If ARSTPA form is not found, then the FEATURE must be defined on ARSFD where (FRL LINE equals 16 and DIAL PLAN equals "ODP") or (FRL LINE not entered, TCM IN not entered and DIAL PLAN equals "ODP") .
- The FEATURE must be defined on ARSFD where ENTRY equals "AUTO".

For 5E15 and later, when LDP is "N", and DAL ACCESS is "Y", the ACT field for SFID 126, and SFID 272 on the SFSYS form must be "Y".

9.35 PASS ANI

Description: The PASS ANI field is used to indicate whether to pass the ANI (Automatic Number Identification) when egressing the LDP (Long Distance Platform) network on a LATA (Local Access Transport Area) MF (Multi-Frequency) trunk to a LEC (Local Exchange Carrier) or PBX (Private Branch Exchange).

Software Release: 5E13 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When PASS ANI is "Y",

- LDP must be "Y",

- TRKCLS must be "Y", and
- OUTPULSING must be "MF".

9.36 ANI PROCESS

Description: Should routing be based on the ANI table?

Software Release: 5E10 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When ANI PROCESS is "Y", LDP must be "Y".

The ANI PROCESS field on the TKGRP form is used by the Toll Digital Exchange with ANI Table Processing Special Feature in a LDP (Long Distance Platform) office. It is a secured feature that must be purchased by the office before the field can be set to "Y". An SFSYS form must exist with SFID 165 ACT and SFID 235 ACT set to "Y".

For 5E15 and later, when ANI PROCESS is "Y", TRKCLS must be "EDSL", "EDSLHM", "LATA", or "PF".

9.37 TERM BILL

Description: Should this LDP trunk have an AMA billing record produced at the terminating LDP office?

Software Release: 5E10 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When TERM BILL is "Y":
- LDP must be "Y"
- FREE TERM must be "N"

9.38 MINT SIG TYPE

Description: MINT (Multi-vendor Intra-Network Trunk) signaling type that will be used by all trunk group members. For more information, see Div. 2 Sec. 4A217.

Software Release: 5E12 and later.
Valid Entries:

Valid MINT SIG TYPE Entries

Entry	Definition
ALPHA	Signaling used over MINT's that have the MINT SIG field set to ALPHA. The ALPHA SS7 signaling format populates a new Network-Specific IAM (Initial Address Message) parameter that contains the following information: queue indicator, T-NSC, O-NSC and route search limit. The T-NSC and O-NSC fields are larger than the fields used by BETA MINT signaling. For ALPHA MF signaling, the queue indicator, satellite indicator and T-NSC are prepended to the Called Party Number digit string.
BETA	Signaling used over MINT's that have the MINT SIG field set to BETA. The BETA SS7 signaling format populates a new Network-Specific IAM parameter that contains the following information: queue indicator, T-NSC, O-NSC and route search limit. For BETA MF signaling, the queue indicator, satellite indicator and T-NSC are prepended to the Called Party Number digit string.
GAMMA	Signaling used over MINT's that have the MINT SIG field set to GAMMA. The GAMMA (MF and

Copyright © 2003 Lucent Technologies

	SS7) signaling format prepends queue indicator, satellite indicator and T-NSC to the Called Party Number digits.
blank	Empty field.

Data Rules:

When MINT SIG TYPE is entered,

- TRKCLS must be "TTOLLCON".
- INPULSING and OUTPLSING must be "ISUP7" or "MF".
- ASP TOLL must be "N",
- CCS7 TYPE must be "BELLCORE",
- LDP must be "N",
- DCS TRK must be "N",
- LN TYPE must be "NONE" or must not be entered,
- ASP CARR TRIG must be "N",
- TRIG NBR must not be entered.
- LRN DAS must not be entered.

When RTE SEARCH LMT is entered on the RTIDX form, OUTPULSING must be "ISUP7" and MINT SIG TYPE must be "ALPHA" or "BETA" on the corresponding TKGRP form.

When TERM NSC is known on the RTIDX form, MINT SIG TYPE must be known on the TKGRP form. In addition, when MINT SIG TYPE is "BETA" on the corresponding TKGRP form, TERM NSC must be between 0 and 15 on the RTIDX form.

When MINT SIG TYPE is set to "ALPHA" on the TKGRP form, the MINT- ALPHA feature must be purchased by the office. A SFSYS form must exist with SFID 217 ACT set to "Y".

When MINT SIG TYPE is set to "BETA" on the TKGRP form, the MINT- ALPHA and the MINT-BETA features must be purchased by the office. A SFSYS form must exist with SFID 217 ACT and SFID 247 ACT set to "Y".

When MINT SIG TYPE is set to "GAMMA" on the TKGRP form, the MINT- ALPHA and the MINT-GAMMA features must be purchased by the office. A SFSYS form must exist with SFID 217 ACT and SFID 248 ACT set to "Y".

When MINT SIG TYPE and QUEUE FEATURE are known on the TKGRP form, the QUEUE TYPE must be set to "REROUTE" on the corresponding QUFD form.

The TGN entered on the TGNTNSC form must be defined on the TKGRP form with INPULSING set to "MF" or "ISUP7" and MINT SIG TYPE is known.

When TRUNK GROUP NUMBER is entered on the RTIDX form, and OUTPULSING is "MF" and MINT SIG TYPE is entered on the corresponding TKGRP form, SIGNALING PROTOCOL must be "TRAD" on the RTIDX form.

When TRUNK GROUP NUMBER is entered on the RTIDX form, and OUTPULSING is "ISUP7" and MINT SIG TYPE is entered on the corresponding TKGRP form, SIGNALING PROTOCOL must not be "FGB" on the RTIDX form.

Copyright © 2003 Lucent Technologies

When MINT SIG TYPE is entered LN TYPE must be "NONE".

When MINT SIG TYPE is known on the TKGRP form, the Basic LDP (Long Distance Platform) feature must be purchased by the office. A SFSYS form must exist with SFID 165 ACT set to "Y".

9.39 NETWORK IND

Description: The NETWORK IND field specifies whether or not the trunk group crosses a network boundary. This field is one of the criteria for determining if the NST (SS7 Network Specification Termination) parameter is sent back on an incoming trunk. For more information, see Division 2, Section 4A287.

Software Release: 5E13 and later.
Valid Entries:

Valid NETWORK IND Entries

Entry	Definition
ON	The outgoing trunk is within the network.
OFF	The outgoing trunk crosses a network boundary.
blank	Empty field.

Data Rules:

When NETWORK IND is entered, only one of the following must be true: MINT SIG TYPE must be entered, DAL ACCESS must be "Y", DAL EGRESS must be "Y", VPN ACCESS must be "Y", or LDP must be "Y".

9.40 ACCT PROMPT

Description: The ACCT PROMPT field provides the Long Distance Platform (LDP) Account Code prompt type for incoming or two-way trunk groups where the LDP Account Code feature is active for the 400Hz Carrier Tone feature. ACCT PROMPT and CT FOR DT fields were added to support the 400Hz Carrier Tone feature. This feature was first made available in a 5E13 Software Update. For more information on this feature see Division 2, Section 4A165.

Software Release: 5E13 and later
Default: GLOBAL
Valid Entries:

Valid ACCT PROMPT Entries

Entry	Definition
ANNC	SAS (Service Announcement System) announcement.
BEEP2	Prompt of two audible beeps.
CARRIER	400Hz carrier tone.
GLOBAL	Use prompt specified by ACCTPROMPT on the OFCOPT form.

Data Rules:

When ACCT PROMPT is not "GLOBAL", ANI PROCESS must be Y.

For 5E13 later, when the TKGRP forms have ACCT PROMPT set to CARRIER, the CARRIER TONE on the OFCOPT form must be set to "Y".

For 5E13 later, when the TKGRP forms have ACCT PROMPT set to "ANNC", exactly one FIXRT form must exist with FIXED ROUTE TYPE set to "TACCT".

9.41 CT FOR DT

Description: Activation status for carrier tone to be applied instead of dial tone for an incoming or a two-way trunk group. Should 400Hz carrier tone be provided for dial tone?

Copyright © 2003 Lucent Technologies

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Data Rules:

When CT FOR DT is "Y", TRKCLS must be "IC", "LAT", "PF", "PFITT", "PFLASH", or "TTOLLCON".

When CT FOR DT is "Y", TRK DIR must be "TWOWAY" or "INCOM".

For 5E13 and later, when the TKGRP forms have CT FOR DT set to "Y", the CARRIER TONE field on the OFCOPT form must be set to "Y".

10. FORM ENTRIES - 5202-9 RECORD

10.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

10.2 * TGN

Description: Enter the number of the Trunk Groups being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

LONG DISTANCE PLATFORM

10.3 PREF NPA

Description: The PREF NPA field allows the user the ability to choose whether to prefix the NPA designated on the incoming trunk group, the NPA of the incoming ANI or neither to a seven-digit number incoming to the switch on a LATA class trunk group.

Software Release: 5E12 and later.
Valid Entries: Valid Values: Blank, ANI, or FAR

Data Rules:

When PREF NPA is entered,

- VPN ACCESS must be "N".
- TRKCLS must be "EDSL", "EDSLHM", "LATA", or "PF".
- LDP must be "Y".

When PREF NPA is "FAR" FAR END NPA must be entered.

When VPN ACCESS is "Y" PREF NPA must be blank.

Copyright © 2003 Lucent Technologies

AML

The following fields (Section 10.4 - Section 10.5 11.15) support Automatic Maintenance Limits.

10.4 AML PERCENT

Description: The Automatic Maintenance Limit Percent is the percentage of trunks within a Trunk Group that can be removed from service automatically by the 5ESS Switch. Prior to 5E4(2) the customer could not specify the AML Percent; the AML Percent was determined by algorithms. The algorithms are still applied if the customer does not wish to override them by specifying a value in the AML PERCENT field. The algorithms are as follows (TG QTY represents the quantity of members in a Trunk Group):

- If TG QTY is 1, then AML PERCENT is 0.
- If TG QTY is between 2 and 16, then AML PERCENT is (TG QTY + 3) divided by 4.
- If TG QTY is greater than 16, then AML PERCENT is (TG QTY + 23) divided by 8.

NOTE: Remainders are ignored by the algorithms.

If the algorithm result is satisfactory, do not enter a value in the AML PERCENT field.

This field is used only if TRK DIR is "2W" "ANN" or "OUT". In addition, for 5E11 and later, TRK DIR is "INC" and E911 TYPE is "DED", "DIRANI" or "DIRNOANI".

Software Release: 5E4(2) and later
Valid Entries: 0 - 100 or blank.

Data Rules:

If TRKCLS is "EDSL" or "EDSLHM" and TRK DIR is "2W" or "OUT", then AML PERCENT must be set to 100.

If TRKCLS is "IFOPER", entry in this field is optional and may be a value from 0 to 100.

AML PERCENT can be specified only if TRK DIR is "2W", "ANN" or "OUT", or for 5E11 and later, TRK DIR is "INC" and E911 TYPE is "DED", "DIRANI", or "DIRNOANI".

When TRKCLS is "ATNDVFY" and TRK DIR is "OUT", AML PERCENT cannot be entered.

10.5 AML ALARM

Description: Enter the AML (Automatic Maintenance Limit) Alarm level. This field allows for AML alarm levels to be set.

Software Release: 5E11 and later.
Required Field.
Default: MAJOR
Valid Entries:

Valid AML ALARM Entries

Entry	Definition
CRITICAL	CRITICAL alarm level
MAJOR	MAJOR alarm level
MINOR	MINOR alarm level

Data Rules:

Copyright © 2003 Lucent Technologies

The (E911) Trunk Failure Alarms feature is a secured feature that must be purchased by the office before AML ALARM may be changed from "MAJOR" to either "CRITICAL" or "MINOR". The ACT field for SFID 193 must be set to "Y" on the SFSYS form (5713-1 Record).

It is recommended that AML ALARM be set to "CRITICAL", if E911 TYPE is "DED", "DIRANI" or "DIRNOANI".

VIRTUAL PRIVATE NETWORK

The fields Section 10.6 - Section 10.7 apply to Virtual Private Network/

10.6 VPN ACCESS

Description: The VPN ACCESS field indicates that a particular trunk is part of a VPN (Virtual Private Network).
Default: N
Valid Entries: Y, N

For 5E11 and later, when VPN ACCESS is "Y" and TRIG NBR is entered:

- BRCS must be "N".
- TRKCLS must be "EDSL" or "EDSLHM".

For 5E11 and later, when VPN ACCESS is "N" and TRIG NBR is entered, TRKCLS must be "LATA", "LTOLLCON", "PRINTOLL", or "TTOLLCON".

For 5E15 and later, when VPN ACCESS is "N", DAL ACCESS is "Y", and TRIG NBR is entered, TRKCLS must be "LATA", "LTOLLCON", "PRINTOLL", or "TTOLLCON".

For 5E11 and later, when VPN ACCESS is "N" and TRIG NBR is not entered, LDP must be "Y".

10.7 MBG TRANSPORT

Description: The MBG TRANSPORT field is used to indicate whether or not MBG (Multi-switch Business Group) information will be transported between an EO (End Office) and VPN (Virtual Private Network) switches. MBG information is required for making VPN-MBG calls.
Default: N
Valid Entries: Y, N

W

DAL/SPECIAL PBX

The fields Section 10.8 - Section 10.12 apply to Direct Access Links.

10.8 DAL ACCESS

Description: Is this a Direct Access Link trunk group? (For more information, see Division 2, Section 4A272.)

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E12 and later:

When VPN ACCESS is "N", TRIG NBR is entered and DAL ACCESS is "N", TRKCLS must be "LATA", "LTOLLCON", "PRINTOLL", or "TTOLLCON".

When DAL ACCESS is "Y":

- TRK DIR must be "2W" or "INC",
- TRKCLS must be "EDSL", EDSLHM, or "PF",
- CMC must be "N",
- ASP TOLL must be "N",
- CARRIER TRIG must be "N",
- VPN ACCESS must be "N",
- BRCS must be "N",
- TRIG NBR must be entered.

When DAL ACCESS is "Y" and TRKCLS is "PF", INPULSING must be "MF" or "TT".

Direct Access Link is a secured feature requiring that the ACT field for SFID 272 be set to "Y" on the SFSYS form (5713-1 Record) to activate the feature. The ACT field for SFID 126 must also be set to "Y" to activate the ASP Release 0.1B secured feature before the ACT field before SFID 272 can be set to "Y".

When the TKGRP form (5202 Record) has DAL ACCESS set to "Y" and TRIG NBR entered, then the TRIG NBR must be defined on the corresponding NSTRIG form (5324 Record) with APPLICATION set to "ASP" and AIN REL set to "R0D1".

For 5E15 and later:

When DAL ACCESS is "Y" and LDP is "N", TRIG NBR must be entered.

When DAL ACCESS is "Y" and LDP is "Y", TRIG NBR must not be entered.

When DAL ACCESS is "Y" and LDP is "Y", CUT THRU TRIG must not be entered.

When DAL ACCESS is "Y", LDP is "Y", and TRKCLS is "PF",

- BILLING DN must be 10 digits long.
- BILLING DN must be NXXXXXXXX where N=2-9 and X=0-9.

When DAL ACCESS is "Y", LDP is "Y", TRKCLS is "PF", and CARRIER ID is entered, FEAT GRP must be "D".

When DAL ACCESS is "Y", LDP is "Y", TRKCLS is "EDSL" or "EDSLHM", INPULSING must be "DCHN".

When DAL ACCESS is "Y", LDP is "Y", and TRKCLS is "EDSL" or "EDSLHM", FAR END NPA must be entered.

When DAL ACCESS is "Y", the ACT field for SFID 165 and SFID 10, on the SFSYS form must also be "Y".

10.9 DAL EGRESS

Copyright © 2003 Lucent Technologies

Description: Is this an egressing DAL trunk? For more information, see Division 2, Section 4A287.

Software Release: 5E13 and later.
Default: Y
Valid Entries: Y, N

Data Rules:

When DAL EGRESS is "Y", TRKCLS must be "EDSL", "EDSLHM", "PF", "PFITT", or "PFLASH".

When DAL EGRESS is "Y", LN TYPE must be "NONE".

When DAL EGRESS is "Y", TRK DIR must be "2W" or "OUT".

When DAL EGRESS is "Y" and TRKCLS is "PF", "PFITT", or "PFLASH", "OUTPULSING" must be "MF" or "TT".

When DAL EGRESS is "Y", SFID 287 ACT must be "Y" on the SFSYS form (5713-1 Record).

10.10 LINE BUSY

Description: Is line busy treatment provided for a call when all trunks are busy? For more information, see Division 2, Section 4A287.

Software Release: 5E13 and later.
Default: Y
Valid Entries: Y, N

Data Rules:

When LINE BUSY is "Y", TRKCLS must be "EDSL", "EDSLHM", "PF", "PFITT", or "PFLASH".

When LINE BUSY is "Y", LN TYPE must be "NONE".

When LINE BUSY is "Y", TRK DIR must be "2W" or "OUT".

When LINE BUSY is "Y" and TRKCLS is "PF", "PFITT", or "PFLASH", OUTPULSING must be "MF" or "TT".

When LINE BUSY is "Y", the ACT field for SFID 250 must be "Y" on the SFSYS form (5713-1 Record).

10.11 SPECIAL PBX

Description: The Special PBX field is used to identify whether or not to send the DNIS (Dialed Number Identification Services) protocol to the PBX (Private Branch Exchange). This is to distinguish PBXs that can only accept the standard protocol, versus the DNIS protocol.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, when SPECIAL PBX is "Y":

- TRKCLS must be "EDSL", "EDSLHM", "PF", "PFITT", or "PFLASH".
- TRK DIR must be "2W" or "OUT".

Copyright © 2003 Lucent Technologies

- CUT THRU must not be entered or be "N".

When SPECIAL PBX is "Y" and TRKCLS is "'PF", "PFTT", or "PFLAS", OUTPULSING must be "'MF" or "T".

When SPECIAL PBX is "Y" and TRKCLS is "'EDSL" or "EDSLHM",, or "PFLAS", CPN BN OPT must not be "NONE".

When SPECIAL PBX is "Y" and TRKCLS is "'EDSL" or "EDSLHM",, or "PFLAS", CPN BN OPT must not be "NONE".

10.12 DNIS USER

Description: The DNIS USER field is used to identify whether or not the trunk is a DNIS subscribed trunk for the Transport of Original Dialed Number feature.

Software Release: 5E13 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When DNIS USER is "Y", TRKCLS must be "EDSL", "EDSLHMPF", or "PF".

When DNIS USER is "Y", TRK DIR must be "OUT" or "2W".

10.13 CONTEXT ID

Description: This field is used to indicate whether or not a trunk group is set to "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E12 and 5E13: N
- For 5E14: NATIVE

Valid Entries:

Valid CONTEXT ID Entries

Entry for 5E12, 5E13	Entry for 5E14 and later	Description
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

For 5E12 and later:

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the TKGRP form, TRKCLS must be "EDSL", "EDSLHM", "PBXDID", "PF", "PFCPE", "PFITT", or "PFLASH".

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the TKGRP form, the ACT field for SFID (Secured Feature ID) 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

SEC. 2B: 5203 RECORD
TRUNK TRANSMISSION CLASS RECORD - TRKCL

1. GENERAL

The 5203 Record is used to determine the value of digital loss to be inserted on each connection through the 5ESS Switch. The far end offices which interface with the 5ESS Switch operate under various configurations and operating levels. To interface properly, the 5ESS Switch must insert a specified amount of digital loss dependent upon the type of connecting offices and trunks. The 5203 Record has been designed to provide the necessary data to the 5ESS Switch so that the proper loss can be inserted. Transmission levels may be affected by office options POFFLOSS or CPE and line option ELSLOSS.

1.1 Transmission Class

The key to this record is the Transmission Class. Each Transmission Class uniquely defines a specific set of characteristics that apply to various trunks in the office. The following is a suggested procedure for engineering the data required on the 5203 Record.

A. Construct a table listing all possible configurations of the 5ESS Switch with its far end offices.

B. The Trunk to Line Digital Loss and Trunk to Trunk Digital Loss tables, in Figure 1 and Figure 2 respectively, provide applicable data for Far End Transmission Level Point, Near End Transmission Level Point, Trunk Type and Far Office Toll Class.

C. Assign a Transmission Class starting at 1 for each unique set of characteristics. This Transmission Class may then be used as input to the Trunk Member information on the 5204 Record.

The values entered on this form should be determined by customer (operating company) engineers. The information contained in this section is provided to aid the customer engineer in setting the values of these fields to obtain the desired digital loss insertion characteristics for each trunk transmission class. Specific values for each of these fields are suggested for an application with no special transmission requirements.

1.2 Recent Change View

The corresponding recent change view for this form is 5.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TRANSMISSION CLASS

Description: Enter the Transmission Class Number. Transmission Class is required for all Trunk Types including Announcement Trunks and Test Trunks. Transmission Class is not required for AC Jack assignments or Trunk Group members with a LTP (Logical Test Port) specified.

Required Field.
Valid Entries: 1 - 99

2.3 FAR END TRANSMISSION LEVEL POINT

Description: Enter the Transmission Level Point of the far end office. This is used to determine the digital loss to be inserted toward the line on trunk to line connections.

Copyright © 2003 Lucent Technologies

An exception to this is that ISDN lines, including OSPS attendants, never receive digital loss except for conference connections.

Figure 1 shows the Trunk to Line digital loss as a function of the far end type.

Far end transmission level point also affects the far to near digital loss pad during transmission tests. See Figure 2 .

Deviations from recommended values may be necessary based on individual Transmission requirements.

Required Field.

Valid FAR END TRANSMISSION LEVEL POINT Entries

Entry	Definition
N2	Far end office is analog Toll/Tandem for trunks using digital facilities.
N3	Far end office is digital Toll/Tandem for trunks using digital facilities.
0	Far end office is Local/Tandem for trunks using digital facilities.
3	Software Release: 5E3 and later. All far-end connections, for trunks using analog facilities.Also for digital trunks connecting to a PBX.
5	Far end office is No. 1 Trunk Concentrator for trunks using digital facilities.

2.4 NEAR END TRANSMISSION LEVEL POINT

Description: Enter the Transmission Level Point of the near end office.

The near end TLP (Transmission Level Point) is used to determine loss only on trunk-trunk connections. The valid values of near end TLP are TLP0 and TLPN3. If both trunks have a near end TLP of TLPN3, no digital loss is inserted in either direction. If either trunk in the connection has near end TLP set to TLP0, loss may be inserted when connecting a digital trunk to an analog trunk. The amount of loss is a function of trunk type and far end toll class. See FAR OFFICE TOLL CLASS for details. The suggested value for near end TLP is TLP0 for all trunks in a local 5ESS Switch and for trunks that carry only local traffic in a local/toll 5ESS Switch. It is suggested that near end TLP be set to TLPN3 for all trunks in a toll 5ESS Switch and for trunks that carry at least some toll traffic in a local/toll 5ESS Switch. The amount of loss inserted is a function of TRUNK TYPE and FAR OFFICE TOLL CLASS (see Figure 3).

Required Field.

Valid NEAR END TRANSMISSION LEVEL POINT Entries

Entry	Definition
0	For trunks in a local 5ESS Switch office, or, trunks which carry local traffic *only* in a local/toll 5ESS office.
N3	For trunks performing both local and toll functions in a local/toll 5ESS office, or, trunks performing toll *only* functions in a local/toll 5ESS office.

2.5 TRUNK TYPE

Description: TRUNK TYPE is used in conjunction with FAR OFFICE TOLL CLASS in determining loss on trunk-trunk connections when either trunk has a NEAR END TLP equal to TLP0. See FAR OFFICE TOLL CLASS for details. TRUNK TYPE has two valid values: DIGITAL and ANALOG.

It is recommended that trunks that use digital facilities throughout be set to DIGITAL and trunks that use analog facilities be set to ANALOG.

Valid TRUNK TYPE Entries

Entry	Definition
ANALOG	A trunk that uses Analog facilities.Also for digital trunks connecting to a PBX.
DIGITAL	A trunk that uses Digital Transmission facilities.

2.6 FAR OFFICE TOLL CLASS

Description: Enter the Toll Class of the far end office.

FAR OFFICE TOLL CLASS is used in conjunction with TRUNK TYPE to determine loss only on

Copyright © 2003 Lucent Technologies

trunk-trunk connections when either trunk has its NEAR END TLP set to TLP0. FAR OFFICE TOLL CLASS is a numerical value, 0 - 5, that identifies toll class of the far end office. 5 - denotes local or tandem. This should also be used for tie trunks when the 5ESS Switch is being used as a PBX. 1, 2, 3, 4 - denotes toll office. The table in Figure 2 gives the digital loss that is inserted in trunk-trunk connections when either trunk has a NEAR END TLP other than TLPN3

Required Field.

Valid FAR OFFICE TOLL CLASS Entries

Entry	Definition
1 - 4	Toll Offices
5	Local or Tandem offices and is also valid for tie trunks when the 5ESS Switch is being used as a PBX.

TRUNK TO LINE DIGITAL LOSS FOR 5E3 AND LATER SOFTWARE RELEASES

FAR END TLP	N3	N2	N1	0	1	2	3	4	5
LOSS (dB)	6	5	4	3	2	1	0	7	8

The above table show the digital loss inserted in the direction from the trunk to the line as a function of far end transmission level point.

Figure 1 TRUNK TO LINE DIGITAL LOSS

SEC. 2C: 5204 RECORD
TRUNK FEATURES AND ASSIGNMENTS RECORD - TRUNK

1. GENERAL

The 5204 Record is used to define each member of a Trunk Group in a 5ESS Switch Office. The trunk information that is entered on this record is unique to the individual member of a Trunk Group. Trunk information that is common to the entire Trunk Group is entered on the TKGRP form (5202 Record).

1.1 CCS Trunks

When members of CCS (Common Channel Signaling) trunk groups are added to an SM (Switching Module), that SM must have tone transceivers defined in its DSU (Digital Services Unit). The TEN (Trunk Equipment Number), the DEN (Digital Equipment Number), or the NEN (Networking Equipment Number) value must have an SM value defined on an EQDS2P form (5740 Record) with at least one TYPE in the DIGITAL SERVICE CIRCUITS list equal to "LDSU2TX".

1.2 Equipment Numbers

A trunk must be assigned one of the following: a TEN (Trunk Equipment Number), DEN (Digital Equipment Number), SLEN (SLC Line Equipment Number), LTP (Logical Test Port) number, TRKOE (Trunk Office Equipment) Type, NEN (Networking Equipment Number) and Number for IDCU (Integrated Digital Carrier Units or RAF EN (Recorded Announcement Function Equipment Number). The trunk may not be assigned more than one of these equipment numbers.

1.3 TEN Assignments

Trunk Equipment Numbers represent individual trunk circuits on an analog trunk unit. A trunk unit consists of two Service Groups (0 and 1) with each Service Group having eight pack positions (0 to 7) equipped with up to eight circuit packs of various types. Each circuit pack has four circuits with the exception of the LTD (Local Test Desk) test trunk pack which has only two circuits. Analog trunk circuits are engineered in such a manner as to spread trunks of a given type across as many trunk units as possible. This is done to ensure maximum reliability when assigning trunks to particular Trunk Groups. Therefore, the following recommended guidelines are offered when arranging trunk groups:

- Spread the trunks of a given Trunk Group across as many trunk units as possible.
- Within a trunk unit, spread trunks across both Service Groups as evenly as possible.
- Within a Service Group, spread trunks across as many circuit packs (of the same type) as evenly as possible. It is also recommended that if an analog Trunk Group has ten or more members in it, the trunks should be spread equitably among the SMs. The following is an example of the recommended spread. If you have 3 SMs, SM1, SM2 and SM3 and a total of 72 trunks, then trunk members 0, 3, 6, ..., 69 should be assigned to SM1, trunk members 1, 4, 7, ..., 70 should be assigned to SM2 and trunk members 2, 5, 8, ..., 71 should be assigned to SM3. This will allow equal traffic over all SMs, rather than heavy traffic on one or two SMs and very little traffic on the remaining SMs.

1.4 Fractional DS1/ISDN PRI Interface

Effective with the 5E9(1) Software Release, the Fractional DS1/ISDN Switching Via PRI (Primary Rate Interface) feature was introduced. This feature provides the capability to initiate wide band calls, 128 kb/s through 1536 kb/s, using ISDN (PRI-based) customer premises equipment connected to either a PRI or a ISUP trunk group. A wide band trunk group must have sufficient members defined in each wide band trunk block to carry the wide band traffic intended for the trunk group. (A wide band trunk block is defined as a set of trunk members from a single trunk group that are assigned to the same T1 facility.) For

Copyright © 2003 Lucent Technologies

example, a 384K wide band data rate requires at least 6 trunk block members; a 1536K and 1536K wide band data rate requires at least 24 members, etc. (See Division 2, Section 6C for a more detailed discussion of this feature.)

1.5 DEN Assignments

A DEN (Digital Equipment Number) represents an individual channel on a DFI (Digital Facility Interface) pack. The DFIs are mounted on DLTUs (Digital Line and Trunk Units) which are normally spread over several SMs in the office. A trunk unit consists of six DLTUs (0 to 5) per SM with each DLTU equipped up to ten DFIs (1 to 10). Effective with 5E14 and later, SM-2000 is supported. Effective with 5E15 and later, the number of DLTUs supported is 12 (0 to 11). Each DFI connects to a particular T1 Carrier facility and consists of 24 channels (1 to 24). Therefore, the spreading of DFI channels within a Trunk Group is limited to those DFIs connecting to one or more T1 facilities serving a particular destination. When more than one T1 span serves a particular destination, the spans should be assigned to DFIs on different DLTUs.

It is also recommended that if more than one T1 span is used for a particular Trunk Group, the trunks should be spread equitably among the SMs. The following is an example of the recommended spread. If you have 3 SMs, SM1, SM2 and SM3 and a total of 72 trunks, then trunk members 0, 3, 6, ..., 69 should be assigned to SM1, trunk members 1, 4, 7, ..., 70 should be assigned to SM2 and trunk members 2, 5, 8, ..., 71 should be assigned to SM3. This will allow equal traffic over all SMs, rather than heavy traffic on one or two SMs and very little traffic on the remaining SMs.

Care must be taken to use only "trunk" DFIs when assigning DENs. These DFIs are defined by an entry of "T" in the USAGE field of the EQDUP form (5730 Record).

For 5E4(2) and later, if the TRKCLS field on the TKGRP form (5202-1 Record) is "RMSD3", then the 24 DENs in the group should be on the same DFI.

For 5E5 and later, a DFI-2 (Digital Facility Interface-2) is available. The DFI-2 will allow two T1 lines to terminate on the DLTU2 (Digital Line and Trunk Unit-2). The two T1 lines will be specified as Facility 0 and Facility 1 on the EQDUP form. Facility 0 is determined by entering a DEN with a Digital Channel number of 1 to 24. Facility 1 is determined by entering a DEN with a Digital Channel Number of 25 to 48. It is recommended to spread DEN assignments across DFIs.

For 5E9(2) and later, if "RMSD3" is entered in the TRKCLS field on the TKGRP form and DENs assigned on the TRUNK form, the members on the trunk form must be assigned on the same SM, DLTU, and DFI and assigned sequentially on all DCHANS 01-24 or 25-48.

For 5E10 and later, when TGN/MEMBs are defined on the TRUNK form with a DEN assigned and have a TRKCLS equal to "EDSL", "IFOPER", or "IFTERM" on the corresponding TKGRP form, the value of DFI MODE on the associated EQDUP form must be "D4", "FEB7", "FE8Z", "64K", "D464", or "FE64".

1.6 SLEN Assignments

An Integrated SLEN (SLC Equipment Number) represents a PBXDID trunk termination on an Integrated SLC Remote Terminal. For information about SLEN assignment see the SLCCU form (5107 Record).

1.7 NEN Assignments

For 5E9(2) - 5E12, the NEN (Networking Equipment Number) is a 10-digit OE for digital trunks on the DNU-S (Digital Networking Unit - SONET). The NEN is composed of the Switching Module number, the DNU-S number, the Data Group number, the STS (Synchronous Transport Signal), the VT (Virtual Tributary), and the DS0 (Digital Signal Level 0). For more information on the DNU-S, see Division 2, Section 9C. See Division 8, Section 60 (EQVT form) for correlation between DNUS - TMUX Virtual Tributary number as assigned in 5ESS Switch and the VT1.5's position within the SONET Virtual Tributary Groups.

Copyright © 2003 Lucent Technologies

For 5E13 and later, the numbering scheme for the VT was modified to an 11-digit NEN for the DNU-VT Group Number feature (see Division 2, Section 9Q) and the NEN field on this form.

1.8 TRKOE Assignments

Effective with 5E8 and later, Trunk Office Equipment assignments were added to support IDCU (Integrated Digital Carrier Unit) RTs (Remote Terminals). The TRKOE field is a two segment field which specifies the equipment type and the equipment number. TRKOE TYPE "G" signifies an IDCU unit with a 10-digit equipment number (GEN) for a remote terminal. TRKOE TYPE "M" signifies an analog IDCU unit with an 8-digit equipment number (MEN) for a remote terminal.

1.9 LTP Assignments

Logical Test Port trunks are software-only trunks and, as such, require entries in the following columns of the 5204 Record: Trunk Group Number, Member Number, and Logical Test Port.

Logical Test Ports identify the existence and location of specific types of test equipment such as ALIT circuits, DC Jacks, TTF circuits, etc. The operational software uses these LTPs to establish connections between a testing facility and a line or trunk to be tested. Refer to Division 2, Section 2, for a description of and requirements for each LTP function.

1.10 RAF EN Assignments

A RAF EN (Recorded Announcement Function Equipment Number) represents an individual channel on a DSU2 RAF (Digital Service Unit 2 Recorded Announcement Function). Each DSU2 may be equipped with a maximum of 4 RAFs and up to 2 DSU2 units may be equipped with RAFs per SM. 32 channels may be assigned per RAF with just ANN (Announcement) channels. 20 channels may be assigned per RAF with DTA (Dial Through Announcement) channels, or RAFs with CTR (Coin Tone Receiver) channels. ANN, DTA, and CTR channels may not be mixed within an RAF.

For 5E6 and later, if "Y" is entered in the AOC field on the corresponding EQRA form (5821 Record), then a maximum of 32 AOCs (Announcement Only Channels) may be assigned per DTA or CTR RAF.

RAF DTA/CTR channels require a staggered assignment pattern which will enable 3 DTA/CTR RAFs to only use a total of 2 time slots at any one time, so that available resources are efficiently used.

Channels defined on the same SM and RAF must be assigned to the same Trunk Group. It is recommended that if any channels on a RAF are assigned, then all channels on the RAF be assigned. See Division 3, Section 2Q (5271-4 Record), when assigning announcement trunks to RAF channels.

1.11 EDSL Trunks

For EDSL (Extended Digital Subscriber Line) trunk groups with TRKCLS set to "EDSL" or "EDSLHM" on a TKGRP form, a DEN should be defined on this form with "ON" entered in the IDLE STATE field and the SUPV, IN START DIAL, OUT START DIAL, EXT. GUARD TIMING and ANSWER DELAY TIMING fields not entered.

1.12 DSL

For 5E4(2), all DSLs assigned to the same combination of SM (first three digits of an LCEN/DEN), PSU SHELF (first digit of an ISCN) and DSL GROUP (second and third digits of an ISCN) must have the same data rate. The following table shows which forms allow the definition of a DSL; which fields define the combination of SM, PSU SHELF, and DSL GROUP; and which data rates are permissible.

FORM	FIELDS	DATA RATE
AMLBDSL	LCEN, B1 ISCN	64KB (Notes 1, 2)
DSL	LCEN, D ISCN	16KB (Note 1)
	LCEN, B1 PKT ISCN	56KB or 64KB (Note 3)

Copyright © 2003 Lucent Technologies

	LCEN, B2 PKT ISCN	56KB or 64KB (Note 4)
DSLAP	LCEN, ISCN	16KB (Note 1)
DSMLHLN	LCEN, D ISCN	16KB (Note 1)
	LCEN, B1 PKT ISCN	56 or 64KB (Note 3)
	LCEN, B2 PKT ISCN	56 or 64KB (Note 4)
OSPSDSL	LCEN, ISCN	16KB (Note 1)
PSISM	SM, ISCN	64KB (Note 1)
	MATE SM, MATE ISCN	64KB (Note 1)
TRUNK	DEN, ISCN	56KB (Notes 1, 5)
	DEN, ISCN	56KB, 64KB (Notes 1, 6)
	DEN, ISCN	56K, R64KB, 64KB (Notes 1, 7)

- ***NOTE:*** 1. The data rate is pre-set by 50DA.
- ***NOTE:*** 2. SERVICE CLASS on the OSPSDSL form, with matching LCEN, must be "XDB".
- ***NOTE:*** 3. Selected in B1 PKT RATE field.
- ***NOTE:*** 4. Selected in B2 PKT RATE field.
- ***NOTE:*** 5. If TRKCLS on TKGRP form is "X75" or "X75P".
- ***NOTE:*** 6. If TRKCLS on TKGRP form is "PACKET".
- ***NOTE:*** 7. If TRKCLS on TKGRP form is "EDSL".

1.13 Logical Channel Numbers

LCNs (Logical Channel Numbers) are defined on this form for X.75P and X.75 trunks. LCNs represent SVCs (Switched Virtual Circuits) and/or PVCs (Permanent Virtual Circuits) which are used to connect CPE devices with each other in order to transmit packet switched data.

Each B-channel can define 127 possible LCNs for the purpose of establishing simultaneously active SVCs (Switched Virtual Circuits) and/or PVCs (Permanent Virtual Call/Circuits). The circuits are used to connect CPE devices with each other in order to transmit Packet-Switched Data.

SVCs exist only for the period of the call. The CPE device and the PH must interact, through CCITT specified packet communication, to set up each call, and clear the SVC after each call.

A PVC exists between CPE devices until the customer deems otherwise. There is no need to set up each call or to clear the PVC after each call.

There is a system limitation of 128 simultaneously active SVCs and/or PVCs for each PH. Congestion on the network, due to contention for available SVCs or PVCs, is handled through CCITT specified procedures, which will be explained later.

There are four categories of LCNs (PVCs and SVCs). A PVC is a permanent, two-way connection between CPE devices. An incoming SVC can only receive incoming data. A two-way SVC can transmit outgoing data or receive incoming data. An outgoing SVC can only transmit outgoing data. The terms incoming and outgoing are used from the perspective of the PH.

The CCITT has specified a required order of assigning the four categories of LCNs.

The lowest numbers (1 to x) can be used for the PVCs, if the customer wishes to have PVCs. The HIGH PVC LCN field (Highest PVC LCN) indicates the highest numbered LCN that is a PVC. For example, if the HIGH PVC LCN field is 7, that means that LCNs 1 through 7 are PVCs.

The next highest range of numbers for LCNs belongs to the incoming only SVCs. This range is indicated in the LOW INCOMING LCN field (Lowest Incoming LCN) and the HIGH INCOMING LCN field (Highest Incoming LCN).

Copyright © 2003 Lucent Technologies

The next highest range of numbers for LCNs belongs to the two-way SVCs. This range is indicated in the LOW 2W LCN field (Lowest Two-Way LCN) and the HIGH 2W LCN field (Highest Two-Way LCN).

The highest range of numbers for LCNs belongs to the outgoing only SVCs. This range is indicated in the LOW OUTGOING LCN field (Lowest Outgoing LCN) and the HIGH OUTGOING LCN field (Highest Outgoing LCN).

As an example, an ISCN (Integrated Services Channel Number) could define its 127 associated LCNs as follows:

HIGH PVC LCN = 7 (LCNs 1 to 7 are PVCs)

LOW INCOMING LCN = 8 HIGH INCOMING LCN = 15 (LCNs 8 to 15 are incoming SVCs)

LOW 2W LCN = 16 HIGH 2W LCN = 100 (LCNs 16 to 100 are two-way SVCs)

LOW OUTGOING LCN = 101 HIGH OUTGOING LCN = 127 (LCNs 101 to 127 are outgoing SVCs)

If PVCs are not desired, LCN 1 is available for an incoming SVC.

If PVCs and incoming SVCs are not desired, LCN 1 is available for a two-way LCN.

If PVCs, incoming SVCs, and two-way SVCs are not desired, LCN 1 is available for outgoing LCNs.

The CCITT, to minimize call collisions, has specified that a CPE device should start its search algorithm for an available LCN (SVCs only) with a two-way SVC or outgoing SVC. The PH should start its search algorithm with the highest numbered SVC that is in a ready state.

Either the HIGH PVC LCN field or the LOW INCOMING LCN and HIGH INCOMING LCN field combination or the LOW 2W LCN and HIGH 2W LCN field combination, or the LOW OUTGOING LCN and HIGH OUTGOING LCN field combination must be entered. If this is not done, there will not be any LCNs to carry packets.

1.14 E911 CAMA PSAP Trunks

Trunks that belong to an E911 CAMA PSAP trunk group (CAMA PSAP set to "Y" on the TKGRP form) must be defined on this form with IN START DIAL "DLTN", OUT START DIAL "WINK", IDLE STATE "ON", and ANSWER DELAY TIMING "N" or not entered.

If a CAMA PSAP trunk is defined with a TEN that matches the equipment number (INTERFACE MODULE, TRUNK UNIT, SERVICE GROUP, AND PACK POSITION) on an EQTUP form, and the CIRCUIT TYPE on the EQTUP form is "TRKLO" or "TKLOTOL", then TRK DIR on the TKGRP form must be "2W". When other applications use circuits "TRKLO" or "TKLOTOL", TRK DIR on the TKGRP form must be "OUT".

1.15 Recent Change View

The corresponding Recent Change View for this form is 5.5.

2. FORM ENTRIES - 5204-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *TGN

Description: Enter the Trunk Group Number.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 4000

Data Rules:

Trunk Group numbers exceeding 999 are allowed only when all numbers in the range of 1 to 999 has been completely exhausted.

All DSU2-RAF ports (channels) on the same DSU2-RAF must be assigned to the same TGN (Trunk Group Number) on TRUNK forms, with the following one exception, the AOC (Announcement Only Channels) on DTA or CTR RAFs as defined on the EQRA form may be assigned to a different trunk group.

When MUSIC RI on the STINFO form (5402 Record) has an entry and/or "MUSIC", "PROMPT", "DISC" or "ANNOUNC" is entered in the CMD CD field with an ARG1 on the CVECT form (5460 Record), then TGN must equal the TRUNK GROUP NUMBER on an RTIDX form where ROUTE INDEX on the RTIDX form equals MUSIC RI on the STINFO form and/or ARG1 on the DVECT form. In addition, the first member, MEMB, must equal 0 on this form. Also, TRK DIR must equal "ANN" on the corresponding TKGRP form, where TGN on the TKGRP form equals TGN on this form.

For TGN/MEMB with a SLEN entry (representing Digital Carrier Line Unit equipment) and a TRKOE TYPE of "G" or "M" (representing IDCU equipment), the TGN must be defined on the TKGRP form withthe following attributes set as indicated:

- CUT THRU must be blank or "N",
- DAS must be blank,
- DATARATE must be blank,
- HOLD BUSY must be "N",
- INPULSING must be blank,
- OUTPULSING must be "DP" or "TT",
- SCR must be blank,
- TRKCLS must be "PBXDID",
- TRK DIR must be "OUT", and
- VPARATE must be blank.

- when TGN/MEMBs are defined with DEN assigned on this form, and TRKCLS is "X75" or "X75P" and DATA RATE is "56K" on the TKGRP form (5202 Record), then FAC 0 DFI MODE or FAC 1 DFI MODE (whichever is appropriate) on the EQDUP form (5730-2/3/4/5 Record) must be entered with one of the following values:
  - "64K"
  - "D4"
  - "D464"
  - "FE8Z"
  - "FE64"
  - "FEB7"

- when TGN/MEMBs are defined with DEN assigned on this form, and TRKCLS is "X75" or "X75P" and DATA RATE is "64K" on the TKGRP form (5202 Record), then FAC 0 DFI MODE or FAC 1 DFI MODE (whichever is appropriate) on the EQDUP form (5730-2/3/4/5) must be "64K" or "FE8Z".

- when TGN/MEMBs are defined with NEN entered on this form, and TRKCLS is "X75" or "X75P" and

Copyright © 2003 Lucent Technologies

DATA RATE is "64K" on the TKGRP form (5202 Record), then ZCS on the EQVT form (5858 Record) must be "N".

2.3 *MEMB

Description: Enter the number of the member within the Trunk Group.

Required Field.
Valid Entries: 0 - 1951

Data Rules:

For 5E3 and later, a QTY entry plus the MEMB must not be greater than 1951.

Trunk members in a Packet Switched trunk group (TRKCLS is "PACKET" or "X75P" on the TKGRP form) should be assigned contiguously.

For 5E5 and later, the maximum number of members allowed in a Packet Switched IP trunk group (TRKCLS is "PACKET" on the TKGRP form) is 32.

The maximum number of members allowed in an X.75P trunk group (TRKCLS is "X75P" on the TKGRP form) is 24.

The maximum number of members allowed in an X.75 trunk group (TRKCLS is "X75P" or "X75" on the TKGRP form) is 24.

All members of a Packet Switched IP trunk group (TRKCLS is "PACKET" on the TKGRP form) must reside on the same SM.

Members of an X.75P or X.75 trunk group may reside on different nonremoted SMs (SM USAGE on EQIM form is "IM" or "HIM"). When members of an X.75P or X.75 trunk group reside on a remoted SM (SM USAGE ON EQIM form is "ORM", "TRM" or "RSM"), all members of the trunk group must reside on the same SM.

For 5E6 and later, if MUSIC RI on the STINFO form (5402 Record) has an entry and/or "MUSIC", "PROMPT", "DISC", or "ANNOUNC" is entered in the CMD CD field with ARG1 on the CVECT form (5460 Record), the first member, MEMB, must equal 0 on this form and TGN must equal the TRUNK GROUP MEMBER on an RTIDX form (5303 Record) where ROUTE INDEX on the RTIDX equals MUSIC RI on the STINFO form and/or ARG1 on the CVECT form. Also, TRK DIR must equal "ANN" on the corresponding TKGRP form, where TGN on the TKGRP form equals TGN on this form.

For 5E9(1) and later, the following rules are associated with assignment of members in a wide band trunk group:

- TGNs entered on this form where WB RATE is equal to "MULTIRATE" on the TKGRP form need to be assigned to at least two trunk members within each wideband trunk block to achieve the full data rate desired.

- TGNs entered on this form where WB RATE set to "1536K" or "384/1536K" on the TKGRP form need to be assigned, at minimum, a full wideband trunk block (24 TGN/MEMBs defined on the TRUNK form) to achieve the full data rate desired.

- TGNs defined on the TKGRP form where WB RATE is "384K" need to be assigned at least 6 trunk members within each wideband trunk block (6 TGN/MEMBs defined on the TRUNK form) to achieve the full data rate desired.

- At most, one TGSR and/or one IDP feature can be assigned to a wideband (assigned on the TKGRP

Copyright © 2003 Lucent Technologies

form) trunk group member.

- TGNs entered on this form with "WB RATE" entered on a corresponding TKGRP form must have a matching EQDUP form (5730 Record) where the corresponding FAC 0 DFI MODE or FAC 1 DFI MODE (which ever is appropriate) is "64K" or "FE8Z".
- TGNs entered on this form with a corresponding TKGRP form with WB RATE entered and TRKCLS set to "EDSL" must have a matching PRIGRP form (5211 Record) within a wideband trunk block where PRI TYPE is "STD".
- TGNs entered on this form with "WB RATE" entered on a corresponding TKGRP form within the same wideband trunk block must be assigned to the same SM, DLTU, DFI, FAC, and PRI GROUP.
- TGNs entered on this form with "WB RATE" entered on a corresponding TKGRP form must have their DEN values defined on the TRUNK form such that (DEN{7,8} modulo 24) must equal ((MEMB+1) modulo 24). Note that "modulo 24" means: take the remainder after division by 24. The following table provides an example of this rule:

Numbering of Trunk Members of a Wideband Trunk Group

Member NBR	Channel Number
0	1
1	2
.	.
.	.
.	.
23	24
24	1
25	2
.	.
.	.

For ISUP trunk groups, trunk members must also be numbered sequentially and associated with the channel numbers specified in the DEN field. Also values of CLCI TRK ID must be sequential and synchronized with the channel numbers. The following table provides an example of ISUP7 trunk group data.

Numbering of Trunk Members of a Wide Band
ISUP7 Trunk Group

Member NBR	Channel Number	CLCI TRK ID
0	1	101
1	2	102
.	.	.
.	.	.
.	.	.
23	24	123
24	1	124
25	2	125
.	.	.
.	.	.
.	.	.
48	24	147
.	.	.
.	.	.
.	.	.

2.4 QTY

Description: The QTY (Quantity) field specifies the number of trunks to be inserted. It allows up to 24 trunks to be defined at one time.

Software Release: 5E3 and later
Required Field.
Default: 1
Valid Entries: 1 - 24

Copyright © 2003 Lucent Technologies

Data Rules:

A QTY greater than 1 may be specified only for trunks that have TEN DEN, or NEN equipment numbers. Beginning with corresponding field values in the form, ODA assigns sequential Trunk Group MEMB (Member Numbers), TENs/DENs/NENs (Equipment Numbers), and CLCI TRK ID (Common Language Identity Numbers) to the new trunks.

The last trunk in the series is assigned a MEMB number equal to the sum of the MEMB field plus the QTY field minus 1, a number that must not exceed 1951. Equipment numbers are assigned to successive circuits (for TENs) or channels (for DENs/NENs). For example: after a trunk with a DEN is assigned to the last channel in a DFI, the next trunk is assigned to the first channel in the following DFI. When the DFI is the last in the DLTU, the trunk is assigned to the first DFI channel of the next DLTU.

If QTY is greater than 1, it must not be great enough that DEN increments the SM. Equipment numbers assigned as a result of the QTY field must be on the same Switching Module: the QTY field must not be a value that will cause the SM to be incremented, e.g., a trunk with DEN 00151024 cannot have QTY greater than 1 since the second trunk would have to be assigned to SM 002 (DEN = 00200101).

When computing the DEN field, ODA checks the EQDU form (5730 Record) to determine whether the maximum number of channels is 24 or 48. If an EQDU form is not found, ODA assumes 24 channels unless the channel number entered on the form is greater than 24; then it assumes 48.

The following example shows two TRUNK forms with QTY greater than 1. Although ODA expands the forms to eight entries on the Office Record, updates and changes must be made to the two original input forms.

FORM ENTRIES

TGN	MEMB	QTY	TEN/DEN	CLCI TRK ID
7	2	3	0020001	
19	0	5	00100647	75

OFFICE RECORD

TGN	MEMB	QTY	TEN/DEN	CLCI TRK ID
7	2	3	0020001	
7	3	3	0020002	
7	4	3	0020003	
19	0	5	00100647	75
19	1	5	00100648	76
19	2	5	00100701	77
19	3	5	00100702	78
19	4	5	00100703	79

When QTY is greater than 1, the following fields must not be entered:

LOGICAL TEST PORT
- RAF EN
- SLEN
- CGASPN
- OTODPN1
- OTODPN2
- OTODPN3
- OTODPN4
- SLVLD SPN
- ISCN
- KEYING TRUNK TGN
- KEYING TRUNK TGN NO
- TALKING TRUNK TGN
- TALKING TRUNK MBR NO
- BAND
- PRIMARY SL GROUP

Copyright © 2003 Lucent Technologies

- PRIMARY SL MEMB
- PRIMARY SL VLINK
- MATE SL GROUP
- MATE SL MEMB
- MATE SL VLINK

Also, when QTY is greater than 1, the following fields must have values as listed:

- BRCS: N
- Q921 PROC: NETWORK
- Q931 PROC: NETWORK

For 5E4(2) and later, if the TRKCLS field on the TKGRP form (5202-1 Record) is "RMSD3", the Trunk Group must have exactly 24 members. Therefore, QTY should be set to 24.

For 5E4(2) and later, if the TRKCLS field on the TKGRP form (5202-1 Record) is "TOPAS", the Trunk Group must have no more than 5 members. Therefore, QTY should be 5 or less.

For 5E9(2) and later, when QTY is greater than 1, it must not be great enough that NEN increments the SM, i.e. if the 4 - 8 digits of the NEN is 71528, then the the 9 - 10 digits of the NEN plus the entry in QTY minus 1 (QTY - 1) must not be greater than 24. (If NEN[4,8] = 71528, then NEN[9,10] + (QTY - 1) or = 24)

2.5 TRKOE

Description: This is a two-segment field consisting of the trunk equipment type and equipment number. The first segment specifies the equipment type. The second segment specifies the trunk originating equipment number.

Software Release: 5E8 and later.
Valid Entries:

Valid TRKOE Equipment Type Entries

Entry	Definition
G	Software Release: 5E8 and later. The TN is associated with IDCU TRKOE and the number segment must contain a 10-digit equipment number (GEN) for an RT. Software Release: 5E10 and later. an 11-digit equipment number is required.
M	Software Release: 5E8 - 5E9(2). The TN is associated with IDCU TRKOE and the number segment must contain an 8-digit equipment number (MEN) for an RT.
O	Software Release: 5E16(2) and later. OIUEN (Optical Interface Unit Equipment Number)
U	Software Release: 5E10 and later. The TN is associated with IDCU TRKOE and the number segment must contain an 10-digit equipment number (UEN) for Packet Pipe or Speech Handler trunks. This value supports the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B
F	Software Release: 5E15 and later. TRUNK/PLTU equipment number PLTEN (PCT (Peripheral Control and Timing) Line and Trunk Unit Equipment Number). This value supports the MSM (Multi-Service Module) on PLTU (PCT Line and Trunk Unit) feature. For more information on this feature, see Division 2, Section7AP.
U	Software Release 5E16(2) and later. Packet Pipe or Speech Handler trunks (UEN).
V	Software Release: 5E16(2) and later. Virtual Equipment Number.

Copyright © 2003 Lucent Technologies

When TRKOE TYPE is "G", this IDCU Equipment Number residing on an RT consists of:

TRKOE NUMBER, TYPE G - Remote Terminal

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	XX	00 - 42
Remote Terminal	RT	XX	01 - 31
Line	LINE	XXXX	0001 - 2048

When TRKOE TYPE is "M", this IDCU Equipment Number residing on an RT consists of:

TRKOE NUMBER, TYPE M - Remote Terminal

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	X	0 - 7
Remote Terminal	RT	XX	01 - 31
Line	LINE	XX	01 - 99

When TRKOE TYPE is "O", this OIUEN Equipment Number consists of:

TRKOE NUMBER, TYPE O - Equipment

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	OIU	X	0 - 7
Protection Group	PG	X	0 - 9
SONET Terminating Equipment	STE	X	1
High Level Virtual Container	HVC	X	1 - 3
Low Level Virtual Container Group	LVC GRP	X	1 - 7
Low Level Virtual Container Member	LVC MEM	X	1 - 4
Channel	CH	XX	01 - 24

When TRKOE TYPE is "U" (UEN), TRKOE NUMBER for Packet Pipe or Speech Handler trunks consists of the following:

TRKOE NUMBER, TYPE U - Packet Pipe or Speech Handler Trunks

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001 - 192
Packet Switch Unit	PSU	X	0 - 1
Shelf	SHELF	X	0 - 4
Channel Group Number	CHGRP	XX	00 - 15
Channel Number	CHANNEL	XXX	000 - 095

TRKOE NUMBER, TYPE F - TRUNK/PLTU equipment number PLTEN (PCT (Peripheral Control and Timing) Line and Trunk Unit Equipment Number).

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001 - 192
PCT Line and Trunk Unit	PLTU	XXX	000 - 035
PCT Facility Interface	PCTFI	X	0 - 2
Tributary	TRIB	XX	01 - 28
Channel Number	CHAN	XX	01 - 24

For 5E16(2) and later, if OE is set to "UEN", this OE Number consists of:

OE Number, Type U (5E16(2) and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Packet Switching Unit	PSU	X	0 - 1
Shelf	SH	X	0 - 4
Channel Group	CHGRP	XX	01 - 15
Channel	CHAN	XXX	001 - 127

Data Rules:

When SLEN is entered, TRKOE must not be entered.

When TRKOE is entered, all other equipment types must not be entered (TEN, DEN, SLEN, LTP and RAF EN).

Copyright © 2003 Lucent Technologies

When a TGN/MEMB is assigned on the TRUNK form to an SLEN (representing DCLU equipment) or to a TRKOE with a type of "G" (representing IDCU equipment), the TGN defined on the TKGRP form must be associated with the attributes defined as follows:

- CUT THRU must be "N" or not entered
- DAS must not be entered
- DATARATE must not be entered
- HOLD BUSY must be "N"
- INPULSING must not be entered
- OUTPULSING must be "DP" or "TT"
- SCR must not be entered
- TRK DIR must be "OUT"
- TRKCLS must be "PBXDID"
- VPARATE must not be entered

TRKOE TYPE "U":
When TRKOE TYPE is "U",

- IDLE STATE must be "ON".
- the following must not be entered:

  BAND

  IN START DIAL

  CGASPN

  OTODPN1

  OTODPN2

  OTODPN3

  OTODPN4

  OUT START DIAL

  Primary and/or Mate CC1S6 link-pairs

- the following must be "N" or not entered:

  ANSWER DELAY TIMING

  BRCS

  EXT. GUARD TIMING

Copyright © 2003 Lucent Technologies

- the Originating Equipment Numbers must be unique. I.e, the Originating Equipment number must not be duplicated on another TRUNK form.
- all associated trunk groups on the TKGRP form (5202 Record), must have a TRKCLS of "AS", "ADT", "PKTPIPE", "FRBC", "IS41", "SPCHNDLR", "3GPD", "SVC", or "PCF".
- OE TYPE cannot be duplicated on more than one TRUNK form.

When TRKOE TYPE is "U", TRKCLS on the TKGRP form (5202-1/2/3/4/5/6/7/8/9 Record) is "FRBC" and PH TYPE on the PSUGP form (5949 Record) is "PH4", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 015 for all corresponding trunk members of this trunk group.

When TRKOE TYPE is "U", TRKCLS on the TKGRP form (5202-1/2/3/4/5/6/7/8/9 Record) is "FRBC" and PH TYPE on the PSUGP form (5949 Record) is "PH22", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 063 for all corresponding trunk members of this trunk group.

For 5E16(2) and later, when TRKOE is "U", each UEN must be uniquely assigned.

TRKOE TYPE "F":

- When QTY is greater than 1, it must not be great enough that a TRKOE TYPE of "F" increments the SM.
- When TRKOE TYPE is "F" and SUPV is entered, SUPV must be "EM2" or "RB".
- When SLEN is known or TRKOE TYPE is "A", "F", or "G", then CGASPN must not be entered.
- When ISCN is entered, DEN, NEN or TRKOE TYPE "F", "O", or "V"must be entered.
- When PRI GROUP is entered, DEN, NEN or TRKOE TYPE "F", "O", or "V" must be entered.
- When IN START DIAL or OUT START DIAL is "GRND" or "LOOP", DEN, NEN or TRKOE TYPE "F" or "O"must be entered.

TRKOE TYPE "O":

For 5E16(2) and later, when TRKOE is "O", and SUPV is entered, SUPV must be "RB".

For 5E16(2) and later, TRKOE must have a matching OIU SM, OIU, PROTECTION GRP, HVC, VT GROUP, and VT MEMBER on the EQLVC form (5763 Record).

When DCHN DESG is entered and TRKOE is "O", the last two digits of TRKOE must be 24.

5E17(1) and later:

When TRKOE is "O" (OIUEN):

- and the DCS TRK is "N", TRKCLS is "BCM", "ISLPM", or "PPMEM", and TRK DIR is a value other than "SGNL" on the TRKGRP form, then the AFAC ID must be entered on the EQLVC form (5764 Record).
- and TRKCLS is set to "A2" and DATA RATE is "64K" on the TKGRP form, then ZCS on the EQLVC form must be "N".

TRKOE TYPE is "V":

Copyright © 2003 Lucent Technologies

TRKOE NUMBER, TYPE V - VEN
(5E16(2) and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001 - 192
Facility	FAC	XXXX	0001 - 1008

For 5E16(2) and later:

When TRKOE TYPE is "V", SERV TYPE must be "CFS" on the ENETLINK form (5827 Record) for SM of TRKOE NUMBER.

All members of the Trunk Group must have either a virtual ("V") or non-virtual TRKOE TYPE.

When TRKOE TYPE is "V" (VEN), the TRKCLS on the TRKGRP form (5202 Record) must be as follows:

- "BVINTOLL",
- "BVTOLLCM",
- "EDSL",
- "EDSLHM",
- "IC",
- "LATA",
- "LTOLLCON",
- "PF",
- "PFITT"
- "PRINTOLL",
- "SCINTOLL", or
- "TTOLLCON".

When TRKOE TYPE is "V" (VEN), INPULSING and OUTPULSING on the TKGRP for (5202 Record) must be "DCHN", or "ISUP7".

When QTY is greater than 1 and TRKOE is known, TRKOE must be "F", "M", "O", or "V".

When SLEN is known or TRKOE type is "A", "F", "G", or "O", CGASPN must not be known.

2.6 TEN

Description: Enter the Trunk Equipment Number representing a specific Analog Trunk Circuit located on a Trunk Unit. Refer to Division 3, Section 2G, Trunk Equipment Number (5271-1 Record), to identify the restrictions for trunk assignments.
Valid Entries: a 7-digit TEN equipment number

TEN (TRUNK EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module (See Note)	SM	XXX	1-48 (CM1) 1-192

Copyright © 2003 Lucent Technologies

			(CM2)
Trunk Unit	TU	X	0-7
Service Group	SVG	X	0-1
Pack	PACK	X	0-7
Circuit	CKT	X	0-3

- ***NOTE:*** The number of SMs that can be provisioned on the switch is dependent on whether the switch is equipped with a CM1 or CM2 Communications Module.

When assigning TENs, certain Trunk Classes specified on the TKGRP form require Trunk Circuit Types as follows:

TRUNK CLASS	TRUNK CIRCUIT TYPE
ACJCK	4W E&M
ANNCMNT	4W E&M
TSTK	LTD Test Trunk
OTOTK	2W Loop Supv Outgoing
SES	2W Loop Supv Outgoing
BTBTK	2W Loop Supv Outgoing

The following Analog Trunk Packs have 4 circuits per pack except the LTD Test Trunk which has 2 circuits per pack.

ANALOG TRUNK PACKS	
SN 102	2-wire Loop Supv Outgoing
SN 103	2-wire Loop Supv Incoming
SN 104	4-wire E&M
SN 105	2-wire E&M
SN 107	LTD Test Trunk
SN 112	Toll 2-wire Loop Supv Outgoing
SN 113	Toll 2-wire Loop Supv Incoming
SN 114	Toll 4-wire E&M
SN 115	Toll 2-wire E&M

Analog and Digital Trunks may be assigned in the same Trunk Group.

Data Rules:

For 5E9(1) and later when a TEN is entered on a TRUNK form, the corresponding TKGRP form cannot have a value entered in the DATA RATE field.

2.7 DEN

Description: For a Digital Trunk, enter the Digital Equipment Number. Refer to Division 3, Section 2H, Digital Equipment Number (5271-2 Record), to identify the restrictions for digital trunk assignments.
Valid Entries: an 8-digit DEN

DEN (DIGITAL EQUIPMENT NUMBER)			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Digital Line Trunk Unit	DLTU	X	0 - 5 (5E14 and earlier)
		XX	0-11 (5E15 and later)
Digital Facility Interface	DFI	XX	01-10
Digital Channel	PACK	XX	01-48

Data Rules:

When the DCHAN entered is greater than 24, the FAC IND on the EQDUP (5730 Record) form must be 3.

Analog and Digital Trunks may be assigned in the same Trunk Group.

For Packet Switched trunks (TRKCLS is "PACKET", "X75", or "X75P" on the TKGRP form) the SM entered

Copyright © 2003 Lucent Technologies

in this field must be defined on the EQPSU form.

All members of a Packet Switched IP trunk group (TRKCLS is "PACKET" on the TKGRP form) must reside on the same SM.

Members of an X.75 or X.75P trunk group may reside on different nonremoted SMs (SM USAGE on EQIM is "IM" or "HIM"). When members of an X.75 or X.75P trunk group reside on a remoted SM (SM USAGE on EQIM is "ORM", "TRM" or "RSM"), all members of the trunk group must reside on the same SM.

When the trunk belongs to a trunk group defined with TRKCLS "EDSL" or "EDSLHM" on the TKGRP form, the DEN cannot be entered as C OE or NC OE on a NAILUP form (5207 Record).

For 5E9(1) and later, when a DEN is entered on a TRUNK form, and the DLTU is defined on an EQDU form (5730 Record) where DLTU TYPE is not "DLTU24" or "DLTU48", then the corresponding TKGRP form cannot have a value entered in the DATA RATE field.

For 5E9(2) and later, if "RMSD3" is entered in the TRKCLS field on the TKGRP form and DEN is entered, the members on the trunk form must be assigned on the same SM, DLTU, and DFI and assigned sequentially on all DCHANS 01-24 or 25-48.

For 5E13 and later, when DEN is entered on this form, and the TKGRP form (5202 Record) has TRKCLS set to "A2" and DATA RATE is set to "56K", DFI MODE on the EQDUP form (5730 Record) must be "D4", "FEB7", "FE8Z", "FE", "64K", or "FE64".

For 5E13 and later, when DEN is entered on this form, and the TKGRP form (5202 Record) has TRKCLS set to "A2" and DATA RATE is set to "64K", DFI MODE on the EQDUP form (5730 Record) must be "64K" or FE8Z".

For 5E13 and later, office to office distribute points must be assigned to analog or digital trunks.

WARNING: It is recommended that office to office trunks and their associated distribute points be located on the same SM.

2.8 NEN

Description: Enter the NEN (Networking Equipment Number) for a DNU-S (Digital Networking Unit - SONET).

Software Release: 5E9(2) and later.
Valid Entries:
- 5E12 and earlier: 10-digit NEN
- 5E13 and later: 11-digit NEN

NEN (Networking Equipment Number) - 5E12 and earlier

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNU-S	X	0-7
Data Group	DG	X	0-1
Synchronous Transport Signal	STS	X	0-5
Virtual Tributary	VT	XX	01-28
Digital Signal Level 0	DS0	XX	01-24

NEN (Networking Equipment Number) - 5E13 and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNU-S	X	0-7
Data Group	DG	X	0-1
SONET Termination Equipment	STE	X	1-6

Copyright © 2003 Lucent Technologies

Synchronous Transport Signal	STS	X	1
Virtual Tributary Group	VTG	X	1-7
Virtual Tributary Member	VTM	X	1-4
Digital Signal Level 0	DS0	XX	01-24

Data Rules:

If QTY is greater than 1, it must not be great enough that the NEN increments the SM. Therefore, if the number representing DNU-S, DG, STS, and VT in the NEN format above is 71528, then the digits entered for DS0 in the NEN format above plus digits entered for QTY minus 1 cannot be greater than 24, (i.e., DS0 + QTY - 1 25).

The NENs (Networking Equipment Numbers) must be uniquely assigned on the TRUNK form. Trunks must have one and only one of the following entered TEN, DEN, NEN, SLEN, TRKOE, LTP or RAF EN.

DNU-S trunks do not require CGASPN assignments. Therefore, if NEN is entered, CGASPN cannot be entered.

If either IN START DIAL or OUT START DIAL is "GRND" or "LOOP", then DEN or NEN must be entered.

If REMOVE TRUNK is set to "Y", then TEN, DEN, or NEN must be entered.

TKGRP(s) having members with a NEN or a DEN (5E13 and later) defined must have TRKCLS equal to one of the following:

- "A2"
- "ACJCK"
- "AIS"
- "ANNCMNT"
- "ATNDVFY"
- "AUXTRNK"
- "BCM"
- "BUSYVFY"
- "BVINTOLL"
- "BVTOLLCM"
- "CAMA"
- "CAMAANI"
- "CAMAONI"
- "CAMOPKEY"
- "CAMOPTLK"
- "CST1"
- "CST2"
- "DIOR"
- "DSC"
- "EDSL"
- "EDSLHM"
- "EISTRK"
- "FIOPR"
- "FOPRI"
- "IC"
- "IDCS"
- "INAISTRK"
- "ISLPM"
- "IVTRK"
- "LATA"
- "LTOLLCON"
- "OTOTK"

Copyright © 2003 Lucent Technologies

- "PACKET"
- "PBXDID"
- "PF"
- "PFCPE"
- "PFITT"
- "PFLASH"
- "PRINTOLL"
- "RECCMPL"
- "RMSD3"
- "SCINTOLL"
- "SERVICE"
- "SES"
- "SPAB800"
- "SPAM800"
- "SPAMEG"
- "SPAWATS"
- "TOLLOPER"
- "TOPAS"
- "TSPS"
- "TTOLLCON"
- "X75"
- "X75P"

If DEN or NEN is entered and the corresponding TKGRP form has TRKCLS of "CAMA", then SUPV on the TRUNK form must be "EM2" or not entered.

If NEN is entered, then OUTPULSING must not be equal to "RPTO"on the corresponding TKGRP form.

If a NEN has been assigned on the TRUNK form, then an associated VT must exist on the EQVT form with VT EQSTAT and DS1S EQSTAT both set to "O".

For 5E12 and earlier, the associated EQVT form may be found by matching the following:

- the first three digits of the NEN

  with EQVT SM,

- the fourth digit of the NEN

  with EQVT DNUS,

- the fifth digit of the NEN

  with EQVT DATA GROUP,

- the sixth digit of the NEN

  with EQVT STS and

- the seventh and eighth digits of the NEN

  with EQVT VT.

For 5E13 and later, the associated EQVT form may be found by matching the following:

- the first three digits of the NEN

Copyright © 2003 Lucent Technologies

with EQVT SM,

- the fourth digit of the NEN

  with EQVT DNUS,

- the fifth digit of the NEN

  with EQVT DATA GROUP,

- the sixth digit of the NEN

  with EQVT STE,

- the seventh digit of the NEN

  with EQVT STS,

- the eighth digit of the NEN

  with EQVT VT GROUP, and

- the ninth digit of the NEN

  with EQVT VT MEMBER.

For 5E10 and later, when EQUIPMENT TYPE is "DNUS", the corresponding eight left most digits of NEN on the TRUNK form must be entered in the PRIGRP form FACILITY LIST as SM, EQUIPMENT NUMBER[1,1], EQUIPMENT NUMBER[2,2], EQUIPMENT NUMBER[3,3], and EQUIPMENT NUMBER[4,5] respectively.

For 5E10 and later, wideband trunk members residing in the same trunk group that are within the same wideband trunk block must be assigned to the same type of equipment (i.e. they must all have a DEN assigned, or they must all have a NEN assigned on the TRUNK form).

TGN/MEMBs defined on the TRUNK form whose corresponding TKGRP form has WB RATE entered are considered to be wideband trunk members. A wideband trunk block is 24 consecutive wideband trunk members. Trunk block 0 is members 0 thru 23 defined on the TRUNK form. Trunk block 1 is members 24 thru 47 defined on the TRUNK form, and so on.

For 5E10 and later, wideband trunk members with an entry for NEN must have their NEN values defined on the TRUNK form such that (NEN[9,10] modulo 24) equals ((MEMB+1) modulo 24). (Note, the result of modulo division is the remainder when dividing two integer values.)

For example, if this trunk block begins with MEMB set to "0" (i.e. the first member of wideband trunk block 1), then MEMB "0" must have the last two digits of the NEN set to "01". MEMB 1 must have the last two digits of its NEN set to "02" ... and MEMB 23 must have the last two digits of its NEN set to 24.

For 5E10 and later, wideband trunk members residing in the same trunk group that are within the same wideband trunk block and have a NEN assigned, must be assigned to the same SM, DNUS, DG, STS, VT, and PRI GROUP (SM, DNUS, DG, STS and VT are represented on the TRUNK form by NEN[1,8]).

For 5E10 and later, when TGN/MEMBs on the TRUNK form have an entry for NEN, PRI GROUP entered and DCHN DESG left blank (defining an EDSL B- channel trunk), if the two right-most digits of NEN, entered on the TRUNK form, are set to 24 and the PRI GROUP, entered on the TRUNK form, is defined on a PRIGRP form, the PRI TYPE, on the PRIGRP form, must be set to "STD".

Copyright © 2003 Lucent Technologies

For 5E10 and later, any TGN(s) assigned on the TKGRP form with a TRKCLS equal to "EDSLHM" must have a B channel assigned on the TRUNK form. Trunk group members that have a TRKCLS equal to "EDSLHM" on the TKGRP form, a NEN entered on the TRUNK form, and a PRI GROUP entered on the TRUNK form that has a PRI TYPE of CUSTOM on the associated PRIGRP form, the last two digits of the NEN(s) on the TRUNK form must be in the range of 01-23, representing a B channel.

For 5E12 and later, if the NEN is being equipped for the VT (Virtual Tributary) and the DS1S (Digital Signal Level 1 SONET) facility on a DNU-S (Digital Networking Unit - SONET), the associated VT must be defined on the EQVT form (5858 Record) with VT EQSTAT and DS1S EQSTAT set to "O" and APPLICATION TYPE set to "TRUNK". The associated EQVT form is found by matching NEN[1,3] with EQVT SM, NEN[4] with EQVT DNUS, NEN[5] with EQVT DATA GROUP, NEN[6] with EQVT STS and NEN[7,8] with EQVT VT.

For 5E13 and later, when NEN is entered on this form, and the TKGRP form (5202 Record) has TRKCLS set to "A2" and DATA RATE is set to "64K", ZCS on the EQVT form (5858 Record) must be "N".

For 5E15 and later, when BTBDIST1 is entered and DEN or NEN is entered, SUPV must be "RB", IDLE STATE must be "ON", and OUT START DIAL must be "WINK".

2.9 SLEN

Description: Trunks can be assigned an Integrated SLEN (SLC Line Equipment Number).

Software Release: 5E6 and later
Valid Entries: an 8-digit SLEN

SLEN (SLC LINE EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Carrier Line Unit	DCLU	X	0-7 (5E14 and earlier)
		XX	0-15 (5E15 and later)
Remote Terminal	RT	XX	01-06
Line Number	LN	XX	01-96

Data Rules:

A trunk needs to be assigned a SLEN if it is a DID (Direct Inward Dialing) facility terminating on an Integrated SLC remote terminal. A DID facility is a one-way trunk with loop reverse battery signaling supporting either dual-pulse or dual-tone multi-frequency outpulsing. If a SLEN is entered on this form, a TKGRP form (5202 Record) must be entered for this trunk with a TRKCLS of "PBXDID", a TRK DIR of "OUT", HOLD BUSY "N", and OUTPULSING set to "DP" or "TT".

The SLEN must be defined on a SLCCU form (5107 Record) and a SLCRT form (5106 Record). The CU TYPE for the corresponding line must be "DID" or "DIDDPT".

2.10 LTP

Description: For a software-only Trunk, enter the Logical Test Port Number. Refer to Division 8, Section 1 for procedures to obtain these assignments. Refer to Division 2 for a description of and requirements for Logical Test Port assignments.
Valid Entries: a 6-digit LTP Number

LTP (LOGICAL TEST PORT NUMBER)

Equipment	Valid Entries
Switching Module	1-192
Logical Test Port	000-255

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

For 5E10 and later, the Switching Module(s) specified in the logical test port number must be equipped with transmission test facilities on the EQDSP form with a DSU TYPE of "TTFPROC", or on the EQGDSC3 form with a CONFIGURATION of 2, 5 or 8 on SM2000 or a CONFIGURATION of 2, 5, 7 or 8 on SM.

2.11 RAF EN

Description: Enter the Recorded Announcement Function Equipment Number.

Software Release: 5E3 and later
Valid Entries: a 6-digit RAF EN

RAF EQUIPMENT NUMBER (RAF EN)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Recorded Announcement Function	RAF	X	0-7
Channel	CHAN	XX	01-31

Data Rules:

This field must be entered if "RAF" is entered in the TRK DIR field on the TKGRP form.

If QTY is greater than 1, an entry in this field is not permitted.

For 5E6 and later, if RAF EN is entered on the TRUNK form, then RAF (Recorded Announcement Function) trunk assignments for DTA (Dial Through Announcement) channels or CTR (Coin Tone Receiver) channels must follow an assignment pattern as explained in Division 8, Section 35, and shown on the RAF Equipment Number form (5271-4 Record).

For 5E6 and later, when RAF EN is assigned to a trunk group where TRKCLS on the corresponding TKGRP form is "RAFDTA" and SVC GRP is

- "ACCS",
- "AOC",
- "COIN", or
- "DA",

then the SM (first three digits of the RAF EN) must be defined as a loaded SM on the EQIM form (CONFIGURATION is "LOADED").

For 5E9(1) and later, if RAF EN is entered, do not enter a CLCI TRK ID.

For 5E9(2) and later, RAF or SAS units with SVC GRPs of

- "ACCS",
- "AOC",
- "COIN", or
- "DA",

on the TKGRP form, either all SVC GRPs must be the same or they must be one of the following two valid combinations:

- if "ACCS" is entered for a SVC GRP on the TKGRP form for the unit, then all TKGRP forms associated with this unit have "ACCS" or "ACCS" and "AOC" entered for the SVC GRP.

- if "AOC" is entered for the SVC GRP on the TKGRP form for the unit, then all TKGRP forms

Copyright © 2003 Lucent Technologies

associated with this unit must have

"AOC",

"AOC" and "ACCS", or

"AOC" and "COIN"

entered in the SVC GRP field.

- if "COIN" is entered for the SVC GRP on the TKGRP form for the unit, then all TKGRP forms associated with this unit must have "COIN" or "COIN" and "AOC" entered in the SVC GRP field.
- if "DA" is entered for the SVC GRP on the TKGRP form for the unit, then all TKGRP forms associated with this unit must have "DA" entered in the SVC GRP field.

A SVC GRP for a RAF or SAS unit is found by matching SWITCHING MODULE on the EQRA form to the first three digits of RAF EN on the TRUNK form and UNIT NUMBER on the EQRA form to the fourth digit of RAF EN on the TRUNK form. The desired TKGRP form is then found by matching TGN on the TRUNK form to TGN on the TKGRP form.

For each RAF EN on a TRUNK form that has a match on an EQRA form where UNIT TYPE is "SAS", there must be a CHANNEL assigned on the EQRA form.

2.12 TRANS CLASS

Description: Enter the Transmission Class Number. This number represents the Trunk Type, the Transmission Level, and the Toll Class of the Trunk Member.
Valid Entries: 1 - 99

Data Rules:

If a value is entered in this field, the value must also appear in the TRANSMISSION CLASS field on the TRKCL form (5203 Record).

For 5E4(2) and later, if the TRKCLS field on the TKGRP form (5202-1 Record) is "RMSD3" or "TOPAS", the TRUNK TYPE field on the corresponding TRKCL form (5203 Record) must be "DIGITAL".

This field must not be entered if RAF EN is entered.

For 5E6 and later, if "LTP", "ACJCK", "RAFCTR", "RAFDTA", or "RAFANNC" is entered in the TRKCLS field on the TKGRP form, then the TRANS CLASS field must be blank; for 5E8 and later, TRANS CLASS must also be blank if TRKCLS is "TSTK".

2.13 SUPV

Description: This field defines the type of supervision for the trunk.

Valid SUPV Entries

Entry	Definition
RB	Reverse Battery. Required for Loop Incoming, Outgoing or Test Trunks.
EM2	Required for E&M type trunks when Type 2 signaling or Type 1 for digital trunks is desired. Ground on SB Lead originates at the Trunk Circuit.
EM3	Required for E&M type trunks when Type 3 signaling is desired. Ground on SB Lead originates at the Signaling circuit.
EM4	Software Release: 5E7 and later.

Copyright © 2003 Lucent Technologies

	E&M option 4.
EM5	Software Release: 5E7 and later. E&M option 5.

Data Rules:

For DENs and LTPs, this field should be left blank; a value of "EM2" will be automatically assigned.

For 5E8 and later, if SLEN is entered or if TRKOE TYPE is "G" or "M", SUPV must be "RB".

2.14 IDLE STATE

Description: This field defines the condition of a trunk when it is in an idle state. Onhook is defined as battery on the ring, while Offhook is defined as battery on the tip.

If dial pulse terminating channel units are used for CCS7 trunks, IDLE STATE should be offhook. Not using "OFF" in such a connection could result in a poorer quality transmission path.

Required Field.
Default: ON
Valid Entries:

Valid IDLE STATE Entries

Entry	Definition
ON	Onhook
OFF	Offhook

Data Rules:

When dial pulse terminating Channel Units are used for CCS7 trunks, this field should be set to "OFF".

2.15 IN START DIAL

Description: This field describes the signal transmitted from the 5ESS Switch office to indicate when dialing will commence on Incoming or Two Way Trunk Groups.

For FX trunks, IN START DIAL should be "GRND" rather than "LOOP". Ground start FX trunks are able to detect supervision. Loop start FX trunks cannot detect or return supervision, and the trunk will not be released on unanswered calls.

Valid IN START DIAL Entries

Entry	Definition
IMED	Immediate Dial.
WINK	Wink Start Signaling.
DLAY	Delay Dial.
DLTN	Dial Tone.
DIRC	Incoming Direct Connect Trunks.
GRND	FX trunk with Ground Start supervision.
LOOP	FX trunk with Loop Start supervision.
WNKDT	Software Release: 5E3 and later. Wink Start and Dial Tone.
ANSDTONE	Software Release: 5E4(2) and later. Answer Supervision/Dial tone. This value provides answer supervision along with dial tone start signal on incoming trunks when the 5ESS Switch is configured as a PBX.

Data Rules:

If this field equals "DIRC", then the DIR CON DN field of the associated TKGRP form must contain a valid Telephone Number. Additionally, if this is an FX trunk with a TRKCLS of "PF" or "PFLASH", then OUT START DIAL must equal "GRND" or "LOOP" and it must have a DEN (Digital Equipment Number).

Copyright © 2003 Lucent Technologies

For 5E8 and later, if SLEN is entered or if TRKOE TYPE is "G" or "M", IN START DIAL must be blank.

For private facility trunks that are not CPE or FX and have a TRKCLS of "PF" or "PFLASH" entered on the TKGRP form, if the CUT THRU field on the TKGRP form is "Y" on the outgoing end of the trunk, then the following is a list of valid combinations of OUT START DIAL and IN START DIAL values.

OUT START DIAL (Outgoing End)	IN START DIAL (Incoming End)
IMED	DLTN
WINK	WINK
WINK	WNKDT

The recommended arrangement of start signals for cut-through operation is an OUT START DIAL value of "IMED" on the outgoing end and an IN START DIAL of "DLTN" on the incoming end.

When "WNKDT" is entered, the TRKCLS field the TRKCLS must be "TTOLLCON", "PF", or "PFLASH".

If PVN ALW on the corresponding TKGRP form (5202 Record) is set to "Y", then IN START DIAL cannot be "DIRC", "GRND", or "LOOP".

For 5E7 and later, IN START DIAL must be blank when TRK DIR is "OUT" on the corresponding TKGRP form.

For 5E7 and later, when TRKCLS on the corresponding TKGRP form is "INAISTRK":

- IN START DIAL must be "DIRC", "IMED", "WINK", or "DLAY". If INPULSING on the TKGRP form is "NONE", IN START DIAL must be "DIRC"; if INPULSING is not "NONE", IN START DIAL must not be "DIRC".
- a TIMING form (5520 Record) must exist where SERVICE CLASS is "INAISTRK", SIGNAL TYPE matches the value of the INPULSING field on the TKGRP form, and START SIGNAL matches the value of the IN START DIAL field on this TRUNK form.

2.16 OUT START DIAL

Description: This field describes the signal received from the far-end office to indicate when dialing will commence. It is defined for all Outgoing or Two Way Trunks. It is also defined for Incoming only trunks when IN START DIAL equals "DIRC" and the Trunk Class of the associated Trunk Group is "PF" or "PFLASH".

Valid OUT START DIAL Entries

Entry	Definition
IMED	Immediate Dial
WINK	Wink Dial
DLAY	Delay Dial
STOP	Immediate Dial with Stop/Go. Used for Outgoing Trunks to a Tandem Office (Step-By-Step or Register-Only Tandem Offices) or to any office that does not have Immediate Dial Pulse Receiver capability.
GRND	FX trunk with Ground Start supervision
LOOP	FX trunk with Loop Start supervision

Data Rules:

For 5E6 and later, if this trunk connects to an EIS (External Information Systems), then no entry is allowed in OUT START DIAL on this form. EIS trunks have a TRKCLS entry of "EISTRK" on the TKGRP form.

If OUT START DIAL equals "GRND", IN START DIAL must equal "GRND" or "DIRC" or must not be entered. If OUT START DIAL equals "LOOP", IN START DIAL must equal "LOOP" or "DIRC" or must not be entered. No entry in both cases applies to Outgoing only trunks. If "GRND" or "LOOP" is specified here, the trunk must have a DEN (Digital Equipment Number).

Copyright © 2003 Lucent Technologies

When OUT START DIAL is "GRND", the "A" signaling bit will always be set to 1 causing a false indication of off-hook while testing with the TLWS (Trunk and Line Work Station).

For 5E6 and later, if this trunk is a member of a Trunk Group defined on the TKGRP form with TRKCLS "PF", "PFLASH", or "PFCPE" and CUT THRU set to "Y", then OUT START DIAL must be "IMED", "WINK", "GRND", "LOOP", or blank.

For 5E7 and later, if this trunk is a member of a Trunk Group defined on a TKGRP form with TRKCLS "INAISTRK", OUT START DIAL must not be "STOP".

For 5E8 and later, if SLEN is entered or if TRKOE TYPE is "G" or "M", OUT START DIAL must be "WINK", "DLAY", or "IMED".

2.17 CGASPN

Description: Enter the Carrier Group Alarm Scan Point Number assigned to the carrier system of this trunk. All trunks assigned to the same carrier system must share the same Scan Point Number and be defined with a TEN (Trunk Equipment Number). Refer to Division 8, Section 1, for procedures to obtain these assignments.
Valid Entries: 9 digits in the following format

CGASPN (CGA Scan Point Number)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Scan Point Number	SPN	XX	00-30

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

For 5E9(1) and later, if CGASPN is entered then the corresponding CGASP form must have "CON" entered in the ACTION field.

2.18 OTODPN

The fields OTODPN1, OTODPN2, SLC OTODPN3, and SLC OTODPN4 that appear after the CGASPN field on Screen 1 of the form are documented under the section for the 5204-2 Record.

2.19 CLCI TRK ID

Description: Enter the Common Language Trunk Identifier. This entry is required for all CCS trunks.
Valid Entries: 0 - 9999

Data Rules:

If the trunk members are CCS7 trunks (INPULSING/OUTPULSING equals "ISUP7" on the TKGRP form), then each trunk must have a unique CLCI TRK ID for a given OPC/DPC combination on the TKGRP form.

If the trunk members are CCIS6 trunks (INPULSING/OUTPULSING equals "CCIS6" on the TKGRP form), then each trunk on which the interoffice translation test audit may be run must have a unique CLCI TRK ID. (The corresponding TKGRP form will have an entry in the NEND CLLI field.)

For 5E9(1) and later:

Copyright © 2003 Lucent Technologies

- Do not enter a CLCI TRK ID if RAF EN is entered.

- Wide band ISUP trunk group members that belong to the same wideband trunk block must have consecutive CLCI TRK ID values entered.When defining wideband ISUP trunk group members within a wideband trunk block, the CLCI TRK ID values entered must be defined in a consecutive manner beginning with the first member defined in the wideband trunk block. Wide band TGN/MEMBs belong to an ISUP trunk group if they have an entry in the WB RATE field on the corresponding TKGRP form and an OUTPLS entry of "ISUP7". A wideband trunk block consists of 24 consecutive wideband trunk members. Trunk block 0 corresponds with members 0 - 23 defined on the TRUNK form. Trunk block 1 corresponds with members 24 - 47 defined on the TRUNK form, and so on.

2.20 BRCS

Description: Does the trunk have BRCS (Business and Residence Custom Services) features assigned?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E3 and later, if QTY is greater than 1, then BRCS must be "N".

If BRCS is set to "Y", the associated TRUNKFA form (5205 Record) is required to assign the actual BRCS feature names to the given TGN/member combination.

For most situations, all trunks in a particular Trunk Group will be assigned the same set of BRCS features or there will not be any feature name assigned at all. The recommended method of data entry for this case is to set the BRCS field on the TKGRP form to "Y" and make one corresponding TKGRPFA form (5206 Record) entry that defines all of the BRCS feature names that are common to all members of the Trunk Group. The corresponding trunk forms would have the BRCS field set to "N" by default.

If a particular Trunk Member is assigned a different set of BRCS features than the majority of the Trunk Members, then set the BRCS field to "Y" and assign the feature names on the TRUNKFA form. It is important to remember that the TRUNKFA Feature Names take precedence over TKGRPFA Feature Names if both forms are present for the same Trunk Group.

Both DEN and TEN type trunks may be associated with BRCS. LTP type trunks may never be associated with BRCS either here or via the TKGRP forms.

For 5E4(2) and later, if the TRKCLS field on the TKGRP form (5202-1 Record) is "RMSD3", "TOPAS", "EDSL" or "EDSLHM", then BRCS must be "N".

For 5E6 and later, if this trunk is dedicated to ASP (Advanced Services Platform) via the default ASP DAS by having DAS on the corresponding TKGRP form (5202 Record) equal to PVN DAS on the OFCOPT form (5509 Record), then BRCS must be "N". If the trunk is dedicated to ASP via a virtual ASP DAS by having DAS on the TKGRP form equal to a DAS whose functionality is similar to PVN DAS on the OFCOPT form, then BRCS should be "N". See the ASP DIALING PLAN section in the ASP feature description, Division 2, Sections 4A51 and 4A126, for further details on the dangers of assigning BRCS features to trunks dedicated to ASP services.

2.21 SLVD SPN

Description: Sleeve Lead Scan Point is associated with the PFA (Private Facilities Access) BRCS feature. The scan point is used to monitor customer premise equipment for the PFA feature.
Valid Entries: See the following format for a Scan Point Number.

Copyright © 2003 Lucent Technologies

SLVD SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Scan Point Number	SPN	XX	00-30

Data Rules:

The following trunk restrictions must be followed:

- The trunk type must be an analog TEN value.
- If a sleeve lead is required for control of Supervision, then the associated TRKCLS value on the corresponding TKGRP form must equal "PFCPE" which designates that customer premise equipment is present and requires Sleeve Lead Supervision. Therefore, every trunk in a Trunk Group with TRKCLS set to "PFCPE" requires this entry. The physical trunk does not have to be assigned any BRCS features.
- SUPV must equal "RB".
- The TRK DIR field on the TKGRP form must be "OUT".
- The IN START DIAL and OUT START DIAL fields must be blank.
- If Sleeve Lead Supervision is not required for the Customer Premise Equipment, the Trunk Group should have TRKCLS set to "PF" and this field should not be entered.

With 5E3 and later Software Releases, if QTY is greater than 1, then an entry in this field is not permitted.

2.22 REMOVE TRUNK

Description: Does this trunk have to be removed and busied during module stand-alone operation?

Software Release: 5E4(2) and later
Default: N

Data Rules:

If "Y" is entered in this field, then an entry is required in either the TEN or DEN fields.

Also, if "Y" is entered, the TRKCLS field on the corresponding TKGRP form must have an entry of "TCITT", "FIOPR", or "DIOR".

If this field is "Y", the STAND ALONE field must be set to "Y" on the associated EQIM form (5700-1/2 Record) or the STAND ALONE PURCHASED? field must be set to "Y" on the associated EQSITE form (5722 Record).

2.23 ISCN

Description: Enter the Integrated Services Channel Number of this Trunk.

Software Release: 5E3 and later
Valid Entries: See the following format for an ISCN Number.

ISCN consists of:

Copyright © 2003 Lucent Technologies

INTEGRATED SERVICES CHANNEL NUMBER (ISCN)		
Equipment	**Format**	**Valid Entries**
SHELF	X	0-4
CHL GRP	XX	0-15
CHL	XXX	0-127

Data Rules:

If this field is entered, then DEN must also be entered.

If QTY is greater than 1, then an entry in this field is not permitted.

An ISCN must be a unique value within a given SM. ISCNs cannot be duplicatedon one or more of the following forms:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

Enter PH Channel 0 for interswitch trunks and EDSL D-channels. The entire Protocol Handler is dedicated to these facilities, so they can only have one channel assigned and that channel has to be PH Channel 0.

If the trunk defined on this form is assigned an ISCN, the trunk must be a PRI or packet switching trunk, indicated on the TKGRP form with a TRKCLS of "EDSL", "IFOPER", or "IFTERM" and TRK DIR of "SGNL", or with a TRKCLS of "PACKET", "X75P", or "X75".

Trunks belonging to a trunk group that has a TRKCLS of "PACKET", "X75", or "X75P" cannot have combinations of ISCN SHELF and CHL GRP entries that duplicate those for the same SM on AMLBDSL, DSL, DSLAP, DSLUSR, ODBRES, OSPSDSL, RTERM, or XAT forms, or on TRUNK forms where TRKCLS is "EDSL", "IFTERM", or "IFOPER".

For Packet Switched trunks (TRKCLS is "PACKET", "X75P" or "X75" on the TKGRP form), the SM entered in this field must be defined on the EQPSU form. Also, for packet switched trunks, a DEN must be entered for this TGN.

For 5E7 and later, a value of 000 for the last three digits of ISCN is only required for "PACKET", "X75", and "X75P" trunks on a PH2.

For 5E7 and later, "PACKET", "X75", and "X75P" trunks on a PH3 must have the last three digits of the ISCN in the range of 000 to 020 in multiples of 4 (000,004,008,012,016,020 are valid). This allows a maximum of 6 trunk members per PH3. It is recommended to have a maximum of 4 trunk members per

Copyright © 2003 Lucent Technologies

PH3 for X75 and X75P trunks. The trunk class must be the same for trunk members on a PH3.

For 5E16(2) and later, when ISCN is entered, DEN must be known, NEN must be known, or TRKOE type must be "F" ,"'O" or "V".

2.24 PSCLI

Description: Enter the protocol software change level indicator.

Software Release: 5E5 and later
Valid Entries: PSIFO

Data Rules:

This field is used only for OSPS EDSL D-channels and is required when the corresponding TKGRP form has a TRKCLS of "IFTERM" or "IFOPER" and a TRK DIR of "SGNL".

2.25 INHIBIT DEL

Description: This field is used to indicate whether or not deletion is inhibited for this trunk member.

Software Release: 5E13 and later
Valid Entries: Y, N

- ***NOTE:*** INHIBIT DEL must be set to "N" before deletion of this trunk member will be allowed.

2.26 LEAST IDLE

Description: Is this a trunk member of a trunk group having a HUNT TYPE of "MLIDL" (Most Idle - Least Idle) as belonging to one of two subgroups, either the most idle trunk queue or the least idle trunk queue?

A trunk must be assigned to one, and only one, of these two subgroups before it can be hunted using MLIDL trunk hunting. For more information, see Division 2, Section 1BT.

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

- ***NOTE:*** "Y" is for trunk member hunted on a least idle basis, "N" is for trunk member hunted on a most idle basis.

Data Rules:

When LEAST IDLE is set to "Y" on a TRUNK form the HUNT TYPE on the related TKGRP form must be "MLIDL". The TRUNK form and the TKGRP form are related through the TGN attribute.

2.27 OTODPN 1

Description: If the trunk is associated with Office-to-Office Testing, assign two distribute points, one for OTODPN 1 and one for OTODPN 2, from the same distribute pack.

It is recommended that the Loop Outgoing Trunks (SN102) and their associated Distribute Points selected for Office-to- Office Testing be located in the same Switching Module. This would reduce real time delay caused by message communication between SMs.

Refer to Division 8, Section 1, for procedures to obtain these assignments.

A digital trunk interface, in conjunction with an IAD (Integrated Analog to Digital Converter) or D4 channel

Copyright © 2003 Lucent Technologies

bank, serves as a replacement for the SN102 OTO (Office to Office) analog trunk circuit in the new office supporting 5E13 and beyond. For more information, see Division 2, Section 1BZ.

Software Release: 5E3 and later
Valid Entries: See the following format for a Distribute Point Number.

DISTRIBUTE POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-30

Data Rules:

With 5E3 and later Software Releases, if QTY is greater than 1, then an entry in OTODPN 1 is not permitted.

For 5E13 and later:

- Office to Office distribute points must be assigned to analog or digital trunks.
- When OTODPN1 and DEN are entered, then SUPV must be "RB", IDLE START must be "ON" and OUT START DIAL must be "WINK".
- When OTODPN1 and TEN are entered, then SUPV must be "RB", IDLE START must be "ON" and OUT START DIAL must be "WINK" or "IMED".

WARNING: It is recommended that office to office trunks and their associated distribute points be located on the same SM.

2.28 OTODPN 2

Description: If the trunk is associated with Office-to-Office Testing, assign two distribute points, one for OTODPN 1 and one for OTODPN 2, from the same distribute pack. Refer to Division 8, Section 1, for procedures to obtain these assignments.

Software Release: 5E3 and later
Valid Entries: See the following format for a Distribute Point Number.

DISTRIBUTE POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-30

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in OTODPN 2 is not permitted.

2.29 SLC OTODPN 3

Copyright © 2003 Lucent Technologies

Description: If the trunk is associated with Office-to-Office testing of Integrated SLC, assign two additional distribute points, one for SLC OTODPN 3 and one for SLC OTODPN 4. If possible, all four distribute points should be assigned from the same distribute pack. All four points MUST be assigned on the same Switching Module.

Refer to Division 8, Section 1, for procedures to obtain these assignments.

Software Release: 5E3 and later
Valid Entries: See the following format for a Distribute Point Number.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-30

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in SLC OTODPN 3 is not permitted.

- ***NOTE:*** All members, of any given Trunk Group for Office-to-Office test, must be assigned the same number of Office-to-Office distribute points. Trunk Groups with four distribute points may be used for Integrated SLC Office-to-Office testing. Only trunks with four distribute points may be used for Integrated SLC Office-to-Office testing.

2.30 SLC OTODPN 4

Description: If the trunk is associated with Office-to-Office testing of Integrated SLC, assign two additional distribute points, one for SLC OTODPN 3 and one for SLC OTODPN 4. If possible, all four distribute points should be assigned from the same distribute pack. All four points MUST be assigned on the same Switching Modules.

Refer to Division 8, Section 1 for procedures to obtain these assignments.

Software Release: 5E3 and later
Valid Entries: See the following format for a Distribute Point Number.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-30

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in SLC OTODPN 4 is not permitted.

- ***NOTE:*** All members, of any given Trunk Group for Office-to-Office test, must be assigned the same number of Office-to-Office distribute points. Trunk Groups with four distribute points may be used for any Office-to-Office testing. Only trunks with four distribute points may be used for Integrated SLC Office-to-Office testing.

Copyright © 2003 Lucent Technologies

CAMA OPERATOR TRUNKS

These fields (Section 2.31 - Section 2.35) are used to associate Incoming CAMA ONI (Operator Number Identification) Trunks. A CAMA Operator Trunk consists of a Keying Trunk which is used to key the calling number into the CAMA Office and a Talking Trunk which is used to obtain the calling number from the calling party.

2.31 TRAF SAMPLED

Description: Is traffic sampling desired? Traffic Sampling for incomplete (unanswered) CAMA calls may be specified on an Incoming CAMA Trunk in a 5ESS Switch Toll Office. This condition will be indicated in the study indicator of the billing record.
Valid Entries: Y, N

2.32 KEYING TRUNK TGN

Description: If the trunk being defined is a Talking Trunk, enter the Trunk Group Number of the associated Keying Trunk.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

If both KEYING TRUNK TGN and KEYING TRUNK MBR NO fields are entered, then the combination of these two fields must be unique.

2.33 KEYING TRUNK MBR NO

Description: If the trunk being defined is a Talking Trunk, enter the Member number of the associated Keying Trunk.
Valid Entries: 0 - 1951

Data Rules:

Trunk members exceeding 999 are allowed only if the range 0 to 999 has been exhausted.

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

If both KEYING TRUNK TGN and KEYING TRUNK MBR NO fields are entered, then the combination of these two fields must be unique.

2.34 TALKING TRUNK TGN

Description: If the trunk being defined is a Keying Trunk, enter the Trunk Group Number of the associated Talking Trunk.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

Trunk Group Numbers exceeding 999 are allowed only if the range 1 to 999 has been completely exhausted.

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

If TALKING TRUNK TGN and TALKING TRUNK MBR NO fields are entered and the TRKCLS field has a value of "CAMOPKEY" or "TCIKT" on the associated TKGRP form, the combination of the two fields must be unique.

If this field is entered, the TALKING TRUNK MBR NO field must be entered.

2.35 TALKING TRUNK MBR NO

Description: If the trunk being defined is a Keying Trunk, enter the Member number of the associated Talking Trunk.
Valid Entries: 0 - 1951

Data Rules:

Trunk members exceeding 999 are allowed only if the range 0 to 999 has been exhausted.

If TALKING TRUNK TGN and TALKING TRUNK MBR NO fields are entered and the TRKCLS field has a value of "CAMOPKEY" or "TCIKT" on the associated TKGRP form, combination of the two fields must be unique.

If this field is entered, the TALKING TRUNK TGN field must be entered.

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

EDSL/PRI TRUNKS

The following fields (Section 2.36 - Section 2.39) define the protocol procedures to be used by ISDN PRI trunks.

2.36 PRI GROUP

Description: This field indicates the PRI GROUP number that this trunk member is associated with. The six left-most digits of DEN and 0 (if the two right-most digits of DEN are 1 - 24) must be defined in the PRI GRP FACILITY LIST as SM/DLTU/DFI/FAC. The six left-most digits of DEN and 1 (if the two right-most digits of DEN are 25-48) must be defined in the PRIGRP FACILITY LIST as SM/DLTU/DFI/FAC.
Valid Entries:

- For 5E9(2) and earlier: 1 - 4096
- For 5E10 and later: 1 - 4095

Data Rules:

For 5E9(2) and earlier, if PRI GROUP is entered, DEN must be entered.

For 5E10 and later, if PRI GROUP is entered, DEN or NEN must be entered.

PRI GROUP must be entered, when TRKCLS on the corresponding TKGRP form is "EDSL" or "EDSLHM".

If an EDSL or EDSLHM B-Channel trunk (PRI GROUP entered and DCHN DESG is blank) is defined with the two right-most digits set to 24 or 48, the PRI GROUP must be defined on a PRIGRP form (5211 Record) with PRI TYPE set to "STD".

Copyright © 2003 Lucent Technologies

If an EDSL or EDSLHM B-channel trunk is defined, there must exist another TRUNK form with the same PRI GROUP and DCHN DESG entered (EDSL D-Channel).

For 5E10 and later, the maximum number of PRI and OSPS D-Channels can not be exceeded. A PRI D-Channel is one where both PRI GROUP and DCHN DESG are entered on the TRUNK form (a DEN or NEN may be used). An OSPS D-Channel is one where DEN[7,8] on the TRUNK form is 24 or 48, and TRKCLS on the corresponding TKGRP form is "IFOPER" or "IFTERM" (only DEN may be used). If DEN[1,3] or NEN[1,3] values on the TRUNK form match SM on the EQIM form where UNIT TYPE is an SM-2000 class processor, then the maximum number of PRI and OSPS D-Channels on the TRUNK form per SM is 640. If UNIT TYPE on the EQIM form is not "SM2000", then the maximum number of PRI and OSPS D-Channels on the TRUNK form per SM is 20.

For 5E10 and later, when TGN/MEMBs have PRI GROUP entered and DCHN DESG is blank on the TRUNK form, indicating that they are EDSL B-Channels, a maximum of 3,000 EDSL B-Channels may be assigned to an SM with an SM-2000 class processor on the EQIM form, and a maximum of 479 EDSL B-Channels otherwise. The maximum can not be exceeded. SM is found by matching DEN[1,3] or NEN[1,3] on the TRUNK form with SM on the EQIM form.

The maximum number of PRI D-Channels can not be exceeded. A PRI D-Channel is one where both PRI GROUP and DCHN DESG are entered on the TRUNK form (a DEN or NEN may be used). If DEN[1,3] or NEN[1,3] values on the TRUNK form match SM on the EQIM form where UNIT TYPE is an SM-2000 class processor, the maximum number of PRI D-Channels on the TRUNK form per SM cannot be exceeded as indicated:

- For 5E10 only, the maximum is 31
- For 5E11 and later, the maximum is 127

If UNIT TYPE on the EQIM form is not an SM-2000 class processor", the maximum number of PRI D-Channels on the TRUNK form per SM is 20.

The PRI GRP and eight left most digits of the OE on the TRUNK from where TRKOE OE TYPE is "O" must be entered on the PRIGRP form FACILITY LIST as SM, EQUIPMENT NUMBER, respectively, with EQUIPMENT TYPE set to "OIU".

For 5E16 and later, when PRI GROUP is entered, DEN, NEN, or OIUEN must be entered.

2.37 DCHN DESG

Description: This field indicates whether or not the D-Channel trunk is a Primary or Secondary D-channel for a PRI GROUP. If only one D-channel trunk is present for the PRI GROUP, the value "PRIM" is recommended. This field is applicable to "EDSL" D-channel trunk members only.

Software Release: 5E9(1) and later
Valid Entries:

Valid DCHN DESG Entries

Entry	Definition
PRIM	Primary.
SEC	Secondary.

Data Rules:

If DCHN DESG is entered, ISCN, PRI GROUP, Q921 PROC and Q931 PROC must be entered, QTY must be 1 and the two right-most digits of DEN must be 24 or 48.

If DCHN DESG is not entered, Q921 PROC and Q931 PROC must not be entered.

Copyright © 2003 Lucent Technologies

DCHN DESG must be entered when, TRKCLS on the corresponding TKGRP form is "EDSL" and TRK DIR must be "SGNL".

If two TRUNK forms are defined for the office with the same PRI GROUP and DCHN DESG entered, one TRUNK form must have DCHN DESG set to "PRIM" and the other with DCHN DESG set to "SEC" and the PRI GROUP must be defined on a PRIGRP form (5211 Record) with PRI TYPE set to "STD". There can exist, at most, two TRUNK forms with the same value for PRI GROUP and with DCHN DESG entered for the office.

For 5E10 and later, when DCHN DESG is entered, the last two digits of NEN must be 24.

For 5E10 and later, when DCHN DESG is entered, the last two digits of DEN must be either 24 or 48.

2.38 Q921 PROC

Description: This attribute indicates which Q.921 protocol procedures are to be used by this PRI D-channel. This field applies to D-channel trunks that are members of a trunk group with TRKCLS on the TKGRP form (5202 Record) set to "EDSL" (Extended Digital Services Line). For all other trunk types, this field must be blank.

Required Field for 5E8 and earlier.
Default: For 5E8 and earlier: NETWORK
Valid Entries:

Valid Q921 PROC Entries

Entry	Definition
NETWORK	Network Side procedures
USER	User Side procedures

Data Rules:

On a given PRI, one end must be designated as User Side while the other end must be designated as Network Side.

If Q921 PROC is "USER", then on the associated TKGRP form, TRKCLS must be "EDSL" and the last two digits of DEN (DEN[7,8]) must be either 24 or 48.

If Q921 PROC is "U", then QTY must be 1.

2.39 Q931 PROC

Description: This attribute indicates which Q.931 protocol procedures are to be used for PRI CSV and CSD calls associated with the PRI D-channel. This field applies to D-channel trunks that are members of a trunk group with TRKCLS on the TKGRP form (5202 Record) set to "EDSL" (Extended Digital Services Line). For all other trunk types, this field must be blank.

Required Field for 5E8 and earlier.
Default: For 5E8 and earlier: NETWORK
Valid Entries:

Valid Q931 PROC Entries

Entry	Definition
NETWORK	Network Side procedures
SYMUSER	User Side procedures

Data Rules:

If Q921 PROC is "USER", then Q931 PROC must be "SYMUSER".

If Q931 PROC is "SYMUSER", then on the associated TKGRP form, TRKCLS must be "EDSL" and the

last two digits of DEN (DEN[7,8]) must be either 24 or 48.

If Q931 PROC is "SYMUSER", then QTY must be 1.

ANNC TRUNKS

For 5E6 and later, the following fields (Section 2.40 - Section 2.41) give parameters for Announcement Trunks.

2.40 MUSIC SOURCE

Description: Does the the trunk act as a MUSIC SOURCE? Applications for MUSIC SOURCE trunks include delay tones for modular queuing features.

Software Release: 5E6 and later
Required Field.
Default: N

Data Rules:

When MUSIC SOURCE is set to "Y", then TRK DIR must be set to "ANN".

2.41 MAXCALLS

Description: Enter the maximum number of calls that can be connected to this announcement/music port at the same time. Any attempt to attach additional calls will fail. An entry of 0 will not display on the Recent Change View and it will default to 32.

For the Music on Hold secured feature (see Division 2, Section 4A64) available with 5E7 and later, this field indicates the maximum number of simultaneous inter-SM paths that can be connected to this music source. Once an inter-SM path is established from a particular SM to the music source, multiple users on that SM may be concurrently connected to the music source via the already established inter-SM path.

Software Release: 5E6 and later
Valid Entries: 0 - 60

Data Rules:

A corresponding TKGRP form (5202 Record) where TGN fields on the TKGRP form and this form are equal, must have TRK DIR field equal to "ANN".

CCIS6 TRUNK SIGNALING

Fields Section 2.42 - Section 2.45 apply only to CCS trunks with CCIS6 signaling.

All CCS trunks with CCIS6 signaling are required to be identified with a routing label that uniquely identifies the CCS trunk. The label is made up of three parts:

- Signaling Link Group: the CNI signaling link associated with this trunk.
- Signaling Link Member: the member within the Signaling Link Group.
- Signaling Link Virtual Link: the physical link is represented by eight virtual links.

Each CCS trunk is associated with two links, a Primary Link and a Mate Link, known as a Link Pair. Each must also be assigned a Band and Member Number for a given signaling link. The Band Number is submitted on the TRUNK form, but the Band Member Number is assigned internally. A Band Number can

Copyright © 2003 Lucent Technologies

be assigned to 16 trunk members per Link Pair combination.

The values of BAND, PRIMARY and MATE LINKS are presently administered and supplied by the CNAC (CCIS Network Administration Center). These fields are required only for CCIS6 trunks in 5E3 and later offices that interface with the CCS CNI ring database.

2.42 BAND

Description: Enter the Band Number for CCIS6 signaling. A particular Band Number can be associated with up to 16 trunk Member Numbers that share the same Primary/Mate Link Pair combination. The Band Number must be a common value for each of the Link Pair combinations.
Valid Entries: 0 - 511

Data Rules:
For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

PRIMARY AND MATE LINKS

The following fields (Section 2.43 - Section 2.45) specify the Primary and Mate Signaling Links for CCS trunks with CCIS6 signaling. The SL GROUP, MEMB, and VLINK values must be specified in pairs; one set of values for the Primary Link and one set for the Mate Link. The combinations of Primary Link values cannot equal that of the Mate Link for a particular trunk member.

2.43 SL GROUP

Description: Enter the Signaling Link Group for CCIS6 links.
Valid Entries: 0 - 63

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

2.44 SL MEMB

Description: Enter the Signaling Link Member within the Signaling Link Group.
Valid Entries: 1 - 15

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

2.45 SL VLINK

Description: Signaling Link Virtual Link. If the CCIS6 messages are using a 4.8 Kbs link, then the SL VLINK must equal 0. If a 56 Kbs link is used, then the physical link is divided into eight virtual links and valid entries are 0 - 7.
Valid Entries: 0 - 7

Data Rules:

For 5E3 and later, if QTY is greater than 1, then an entry in this field is not permitted.

DSN FEATURES

The following fields (Section 2.46 - Section 2.47) are applicable in offices with the DSN (Defense Switched Network) feature, available in 5E3 and later Software Releases.

Copyright © 2003 Lucent Technologies

2.46 EXT. GUARD TIMING

Description: Will Extended Guard Timing be performed on this trunk?
Valid Entries: Y, N

Data Rules:

When SLEN is entered TRKOE TYPE is "G" or "M", EXT. GUARD TIMING must be "N" or blank.

2.47 ANSWER DELAY TIMING

Description: Will Answer Delay Timing be performed on this trunk?
Valid Entries: Y, N

Data Rules:

If this trunk belongs to a trunk group defined on a TKGRP form with TRKCLS "INAISTRK", ANSWER DELAY TIMING must not be "Y".

When SLEN is entered or if TRKOE TYPE is "G" or "M", ANSWER DELAY TIMING must be "N" or blank.

TSPS TRUNKS

The following field applies only to trunks with trunk class "TSPS".

2.48 NO EXSIG

Description: If this is a TSPS trunk, should the expanded inband signaling field on the OFCOPT form be ignored?

When EXPANDED INBAND SGNLING is "Y" on the OFCOPT form, the SIGNAL field on the TKGRP form is treated as if it were set to "EXINBND", no matter what value is really assigned. If NO EXSIG is set to "Y" when EXPANDED INBAND SGNLING is "Y", EXPANDED INBAND SGNLING is ignored, and the signaling type specified in the SIGNAL field is used. This allows the telephone company to override the office parameter on a per-trunk basis.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If NO EXSIG is "Y", TRKCLS on the corresponding TKGRP form must be "TSPS", and EXPANDED INBAND SGNLING on the OFCOPT form must be "Y".

PACKET SWITCHING

The following fields (Section 2.49 - Section 2.55) are available with 5E5 and later Software Releases and refer to Level 2 and loopback parameters for packet switched trunks. These fields may be entered only when TRKCLS on the TKGRP form is "PACKET", "X75", or "X75P".

For all trunks in a "PACKET" trunk group (TRKCLS is "PACKET" on the TKGRP form) the following fields must be entered: OCU LOOPBACK, CSU LOOPBACK, LAPB ADDR, WINDOW SIZE, RETRANS N2, ACK TIME T1, AND IDLE TIME T3; IN START DIAL and OUT START DIAL must not be entered.

2.49 OCU LOOPBACK

Copyright © 2003 Lucent Technologies

Description: Is OCU (Office Channel Unit) loopback testing allowed on this trunk member?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

When a Packet Switched trunk group (TRKCLS is "PACKET", "X75", or "X75P" on the TKGRP form) has a DATA RATE of "64K" on the TKGRP form, this field must be "N".

2.50 CSU LOOPBACK

Description: Is CSU (Channel Service Unit) loopback testing allowed on this trunk member?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

When a Packet Switched trunk group (TRKCLS is "PACKET", "X75", or "X75P" on the TKGRP form) has a DATA RATE of "64K" on the TKGRP form, this field must be "N".

2.51 LAPB ADDR

Description: Should Link Address A be used by the Level 2 protocol for a packet switched trunk? If "Y" is entered, Link Address A, which indicates a command frame will be used. If "N" is entered, Link Address B, which indicates a response frame will be used.

The address field identifies a frame as either a command or a response. Command frames are sent with the remote STE address and response frames are sent with the local STE address.

For an IP, X.75, or X.75' trunk (TRKCLS is "PACKET", "X75", or "X75P" on the TKGRP form) that connects two 5ESS Switches, this field must be populated with a "Y" on one switch and "N" on the other. Similarly, for an IP trunk that connects the 5ESS Switch and a 1PSS office, or an X.75 or X.75' trunk that connects the 5ESS Switch and a PPSN (Public Packet Switched Network, e.g. Tymnet), the value in this field must be the opposite of the value on the 1PSS or PPSN side.

Software Release: 5E5 and later
Valid Entries: Y, N

2.52 WINDOW SIZE

Description: Indicate the maximum quantity of sequentially numbered LAPB (Link Access Procedure B) Level 2 I-frames (Information) which the STE (Signaling Terminal) can have unacknowledged at any time. I-frames, which are data packets, are numbered sequentially applying Modulo 8 arithmetic. Modulo 8 arithmetic is strictly concerned with remainders when dividing by 8. For example, 27 Modulo 8 equals 3 because three is the remainder when 27 is divided by eight.

Software Release: 5E5 and later
Valid Entries: 2 - 7

2.53 RETRANS N2

Description: The N2 value is the maximum number of attempts made by the STE (Signaling Terminal) to successfully transmit a frame at the LAPB (Link Access Procedure B) Level 2.

Software Release: 5E5 and later
Valid Entries: 2 - 15

Copyright © 2003 Lucent Technologies

2.54 ACK TIME T1

Description: The T1 timer is the period of time that the originating STE waits to receive an acknowledgement for a frame from the terminating STE. The time unit is a tenth of a second.

Software Release: 5E5 and later
Valid Entries: 20 - 200, even numbers only

2.55 IDLE TIME T3

Description: Once an idle channel condition is detected, the STE will wait for a period of time, T3, for detection of a return to the active state. The duration of the T3 timer must be greater than the duration of the T1 timer to ensure that retransmission efforts are not aborted. The time unit is a full second.

Software Release: 5E5 and later
Valid Entries: 3 - 30

Data Rules:

The duration entered in the IDLE TIME T3 field must be greater than the duration in the ACK TIME T1 field. (Remember that the time unit of this field is seconds, while the time unit of ACK TIME T1 is tenths of a second.)

X.75P/ X.75 TRUNKS ONLY

The following fields (Section 2.56 - Section 2.70) are available with 5E5 and later Software Releases and refer to X.75P and X.75 packet-switched trunks, X.75 packet switched trunks are available for 5E6 and later Software Releases.

The following fields must only be defined when TRKCLS on the TKGRP form is "X75P" or "X75". At least one of the following fields must be entered for X.75P trunks: LINK ID, HIGH PVC LCN, or 2 WAY LCN.

For 5E8 and later, when X.75P and X.75 TRUNK ONLY fields are entered, all PACKET SWICHING FIELDS must be entered.

2.56 LINK ID

Description: Enter the Gateway LINK ID for an X.75P or X.75 PVC (Permanent Virtual Circuit).

Software Release: 5E5 and later
Valid Entries: 1 - 255

Data Rules:

All LINK IDs entered on this form must be unique.

When this field is entered, the HIGH PVC LCN field must be entered.

2.57 SEND THRUPUT CLASS

Description: Enter the sending throughput class which is the bit per second rate at which a virtual call will send data.

Software Release: 5E5 and later
Required Field.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600, or 19200.

Copyright © 2003 Lucent Technologies

2.58 RCV THRUPUT CLASS

Description: Enter the receive throughput class which is the bits per second rate at which a virtual call will receive data.

Software Release: 5E5 and later
Required Field.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600, or 19200.

2.59 SEND PKT SIZE

Description: Enter the send packet size, the maximum number of data bytes that can be sent in a packet.

Software Release: 5E5 and later
Required Field.
Default: 128
Valid Entries: 128, 256

2.60 RCV PKT SIZE

Description: Enter the receive packet size, the maximum number of data bytes that can be received in a packet.

Software Release: 5E5 and later
Required Field.
Default: 128
Valid Entries: 128, 256

2.61 SEND PKT WINDOW SIZE

Description: Enter the number of data packets that the STE can have unacknowledged, on a sending basis, at any time.

Software Release: 5E5 and later
Required Field.
Default: 2
Valid Entries:
- 5E8 and earlier: 2 or 3
- 5E9(1) and later: 1 - 7

2.62 RCV PKT WINDOW SIZE

Description: Enter the number of data packets that the STE can have unacknowledged, on a receiving basis, at any time.

Software Release: 5E5 and later
Required Field.
Default: 2
Valid Entries:
- 5E8 and earlier: 2 or 3
- 5E9(1) and later: 1 - 7

2.63 HIGH PVC LCN

Copyright © 2003 Lucent Technologies

Description: Enter the Highest LCN (Logical Channel Number) that can be assigned to a PVC (Permanent Virtual Circuit).

Software Release: 5E5 and later
Valid Entries: 1 - 127

Data Rules:

When this field is entered, the LINK ID field must be entered.

If this field is entered, then a corresponding X75PVC form (5926 Record) may be entered with a value entered in the LCN field which is less than or equal to the value entered in this field.

For X.75P and X.75 trunks, when this field and the 2 WAY LCN fields are entered, the LOW 2 WAY LCN field must be greater than the HIGH PVC LCN field.

For 5E6 and later, when TRKCLS on the TKGRP form is "X75", at least one of the following fields must be entered: HIGH PVC LCN, LOW LCN INCOMING, LOW LCN 2 WAY or LOW LCN OUTGOING.

2.64 LCN HI TO LOW

Description: Will outgoing calls over this trunk go out on the highest available LCN and incoming calls come in on the lowest available LCN? When this field is set to "N" outgoing calls will go out on the lowest available LCN, and incoming calls will come in on the highest available LCN.

Software Release:
For X.75: 5E6 and later
For X.75': 5E8 and later
Valid Entries: Y, N

Data Rules:

When LCN HI TO LOW is entered at least one set of the LCN LOW/HI entries under the X.75'/X.75 TRUNK ONLY heading must be entered.

If LCN HI TO LOW is "Y", then
- HIGH 2 WAY LCN must be less than LOW OUTGO ING LCN.
- HIGH INCOMING LCN must be less than LOW 2 WAY LCN.
- HIGH INCOMING LCN must be less than LOW
- OUTGOING LCN.

If LCN HI TO LOW is "N", then
- HIGH OUTGOING LCN must be less than LOW 2 WAY LCN.
- HIGH 2 WAY LCN must be less than LOW
- INCOMING LCN.
- HIGH OUTGOING LCN must be less than LOW
- INCOMING LCN.

2.65 LOW INCOMING LCN

Description: Enter the lowest incoming LCN for this X.75 trunk.

Software Release:
For X.75: 5E6 and later
For X.75': 5E8 and later

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 127

Data Rules:

If this field is entered, HIGH LCN INCOMING must be entered.

At least one of the following fields must be entered for an X.75 trunk: HIGH PVC LCN, LOW LCN INCOMING, LOW LCN 2 WAY or LOW LCN OUTGOING.

2.66 HIGH INCOMING LCN

Description: Enter the highest incoming LCN for this X.75 trunk.

Software Release:
For X.75: 5E6 and later
For X.75': 5E8 and later
Valid Entries: 1 - 127

Data Rules:

If this field is entered, LOW LCN INCOMING must be entered.

2.67 LOW 2 WAY LCN

Description: Enter the lowest 2-Way LCN (Logical Channel Number) for this X.75 trunk.

Software Release:
For X.75: 5E5 and later
For X.75': 5E8 and later
Valid Entries: Valid Entries: 1 - 127

Data Rules:

When this field is entered, the HIGH 2 WAY LCN field must be entered in order to define a range of two-way LCNs.

When both the HIGH PVC LCN and the 2 WAY LCN fields are entered, the LOW 2 WAY LCN field must be greater than the HIGH PVC LCN field.

At least one of the following fields must be entered for an X.75 trunk: HIGH PVC LCN, LOW INCOMING LCN, LOW 2 WAY LCN, or LOW OUTGOING LCN.

2.68 HIGH 2 WAY LCN

Description: Enter the highest 2-Way LCN (Logical Channel Number) for this X.75 trunk.

Software Release:
For X.75: 5E5 and later
For X.75': 5E8 and later
Valid Entries: 1 - 127

Data Rules:

When this field is entered, the LOW 2 WAY LCN field must be entered in order to define a range of two-way LCNs. The value entered in this field must be greater than or equal to the value entered in the LOW 2 WAY LCN field.

2.69 LOW OUTGOING LCN

Copyright © 2003 Lucent Technologies

Description: Enter the lowest outgoing LCN for this X.75 trunk.

Software Release:
For X.75: 5E6 and later
For X.75': 5E8 and later
Valid Entries: 1 - 127

Data Rules:

If this field is entered, HIGH LCN OUTGOING must be entered.

At least one of the following fields must be entered for an X.75 trunk: HIGH PVC LCN, LOW LCN INCOMING, LOW LCN 2 WAY or LOW LCN OUTGOING.

2.70 HIGH OUTGOING LCN

Description: Enter the highest outgoing LCN for this X.75 trunk.

Software Release:
For X.75: 5E6 and later
For X.75': 5E8 and later
Valid Entries: 1 - 127

Data Rules:

If this field is entered, LOW LCN OUTGOING must be entered.

PACKET SWITCHING X.75P/X.75 UTILITY INDICATORS

The following fields (Section 2.71 - Section 2.85) are available with 5E5 and later Software Releases and indicate which utilities are supported on an X.75P or X.75 trunk; X.75 packet switched trunks are available for 5E6 and later Software Releases. The following fields must be defined only when TRKCLS on the TKGRP form is "X75P" or "X75". For 5E8 and later, see Division 2, Section 5C for more information on Packet Trunk Interface Standardization.

2.71 CALL ID

Description: Is the Call Identifier indicator provisioned? The call identifier is a unique identifying number for each virtual circuit established.

Software Release: 5E5 and later
Valid Entries: Y, N

2.72 THRUPUT CLASS

Description: Is the throughput class indicator provisioned? The throughput class indicator can be used by any STE for specifying the throughput classes on a per call basis. If particular throughput classes are not requested, the default throughput class values will be used.

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If THRUPUT CLASS is "N", both SEND THRUPUT CLASS and RCV THRUPUT CLASS must be 9600.

2.73 WND SZ

Copyright © 2003 Lucent Technologies

Description: Is the window size indicator provisioned? The window size indicator can be used by any STE for negotiating the window sizes for each direction of transmission. If particular window sizes are not requested, the default window size values will be used.

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If WND SZ is "N", both SEND PKT WINDOW SIZE and RCV PKT WINDOW SIZE must be 2.

2.74 PACKET SIZE

Description: Is the packet size indicator provisioned? The packet size indicator can be used by any STE for negotiating the packet sizes for each direction of transmission. If particular packet sizes are not requested, the default packet size values will be used.

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

If PACKET SIZE is "N", both SEND PKT SIZE and RCV PKT SIZE must be 128.

2.75 FAST SELECT

Description: Is the fast select indicator provisioned? The fast select indicator is used for indicating that the fast select user facility applies to a particular call. The fast select feature, with no response restriction, allows a STE to respond directly with call connected packet of 128 bytes of data and clear a call request packet with 128 bytes of data.

Software Release: 5E5 and later
Valid Entries: Y, N

2.76 CUG

Description: Is the closed user group indicator provisioned? The closed user group indicator allows the establishment of virtual calls by CPEs which are members of an international CUG (Closed User Group).

Software Release: 5E5 and later
Valid Entries: Y, N

2.77 CUG OUTGOING

Description: Is the CUG (Closed User Group) with outgoing access indicator provisioned? The CUG outgoing access indicator allows the establishment of virtual calls by CPEs which are members of an international closed user group. A CUG with outgoing access allows members of a CUG to originate virtual calls to CPE devices that do not belong to any CUG (e.g., public network) or to CPE devices that belong to a CUG with Incoming Access.

Software Release: 5E5 and later
Valid Entries: Y, N

2.78 REVERSE CHARGE

Description: Is the reverse charge indicator provisioned? The reverse charge indicator allows virtual calls to be established internationally, when the called CPE will accept the charges for the call.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Valid Entries: Y, N

2.79 ADDR MOD NOTIFY

Description: Is the called line Addressed Modified Notification provisioned? The called line Addressed Modified Notification indicator is used to indicate reasons why the called address in the call connected or clear request packet may be different from the one specified in the call request packet.

Software Release: 5E5 and later
Valid Entries: Y, N

2.80 CLR NETWORK ID

Description: Is the Clearing Network Identification code provisioned? The CNIC (Clearing Network Identification Code) indicator provides additional information on the origin of the clear request packet.

Software Release: 5E5 and later
Valid Entries: Y, N

2.81 TNIC INDICATOR

Description: Is the Transit Network Indicator provisioned? The TNIC utility indicates the number of networks that the packet has transited through.

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

For 5E8 and later, if TNIC INDICATOR is "N", then NUI BEFORE and NUI AFTER must be "N".

X75 and X75P trunks must have TNIC INDICATOR entered.

2.82 UTILITY MARKER

Description: Is the utility marker indicator provisioned? Utility markers separate X.75P and X.75 utilities to determine the beginning and ending of the signaling protocol. These utilities are supported after the utility marker to allow the 5ESS Switch to connect other switches that support these utilities in accordance with pre-1988 CCITT standards.

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

For 5E6 and later, this field must be set to "Y" for an X75 trunk that has TDI AFTER, TDS AFTER, TARIFF AFTER, IN RPOA AFTER, or OUT RPOA AFTER set to "Y" or blank and for 5E8 and later, NUI AFTER.

If UTILITY MARKER is "N" then the following fields may not be "Y":
- ACCESS CHAR (5E8 and later)
- CLEAR SUB NET ID
- IC PRESELECT
- NUI AFTER (5E8 and later)
- PROTOCOL CONV
- X75 ID UTILITY

Copyright © 2003 Lucent Technologies

For 5E10 and later, when Trunk member(s) defined on the TRUNK form belong to a Trunk Group with a Trunk Class of "X75" (the TRKCLS field on the TKGRP form), X75 Trunks must have UTILITY MARKER set to "Y" if any of the following fields are "Y".

- TDI AFTER
- TDS AFTER
- TARIFF AFTER
- IN RPOA AFTER
- OUT RPOA AFTER
- IC PRESELECT

For 5E10 and later, when Trunk member(s) defined on the TRUNK form belong to a Trunk Group with a Trunk Class of "X75P", (the TRKCLS field on the TKGRP form). X75 Trunks must have UTILITY MARKER set to "Y" if any of the following fields are "Y" or blank.

- ACCESS CHAR
- TRANS SUB NET CNT
- CLEAR SUB NET ID
- PROTOCOL CONV
- X75 ID UTILITY
- IC PRESELECT

2.83 UTILITY FLD SIZE

Description: Enter the X.75/X.75P Trunk Utility Facility Field Length. (See Division 2, Section 5C for more information on Packet Trunk Interface Standardization.)

Software Release: 5E8 and later
Valid Entries:

Valid UTILITY FLD SIZE Entries

Entry	Definition
BASIC or B	Basic Facility/Utility Size. The basic Utility Field Size cannot exceed 63 octets and the Facility Field cannot exceed 109 octets.
EXTENDED or E	Extended Facility/Utility Size. The extended Utility Field Size could exceed 63 octets and/or the Facility Field could exceed 109 octets provided the length of the combined facility and utility fields does not exceed 172 octets. If the length does exceed 172 octets, the call will be cleared.

2.84 NUI BEFORE

Description: Should the NUI (Network User ID) exist before the Utility Marker?

If this field is left blank and NUI AFTER is "N" or left blank for X.75 or X.75P trunks, an internal default of "Y" is assigned to this field.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field can only be entered for X.75 or X.75P trunks.

If this field is "Y", then NUI AFTER must not be "Y".

If TNIC INDICATOR is "N", then NUI BEFORE and NUI AFTER must be "N".

If a trunk member(s) defined on the TRUNK form belongs to a Trunk Group with a Trunk Class of "X75P"

Copyright © 2003 Lucent Technologies

(the TRKCLS field on the TKGRP form), and the ACCESS CHAR field on this TRUNK form is set to "N", then NUI BEFORE must be set to "N" and NUI AFTER must be set to "N" or blank.

If NUI is not to be supported for this X.75 or X.75P trunk, then both NUI BEFORE and NUI AFTER fields must be "N".

2.85 NUI AFTER

Description: Should the NUI (Network User ID) exist after the Utility Marker?

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field can only be entered for X.75 or X.75P trunks that have UTILITY MARKER set to "Y".

If this field is "Y", then NUI BEFORE must "N".

If TNIC INDICATOR is "N", then NUI BEFORE and NUI AFTER must be "N".

If a trunk member(s) defined on the TRUNK form belongs to a Trunk Group with a Trunk Class of "X75P" (the TRKCLS field on the TKGRP form), and the ACCESS CHAR field on this TRUNK form is set to "N", then NUI BEFORE must be set to "N" and NUI AFTER must be set to "N" or not entered.

If UTILITY MARKER is "N", NUI AFTER must not be "Y".

If NUI is not to be supported for this X.75 or X.75P trunk, then both NUI BEFORE and NUI AFTER fields must be "N".

2.86 IC PRESELECT

Description: Is the Inter-exchange Carrier preselected for this trunk? Inter-Exchange Carrier (IC) Preselection Indication is a service that a Bell Operating Company (BOC) can offer to a direct-connected Packet Switched Network. This service will enable a network which is directly connected to the 5ESS ISDN sub-network, via X75 or X75P, to support IC preselection for its users (even though it may not have the routing logic necessary to determine if an IC is required to complete the call). The direct-connected network can pass the end-user's IC preselection value in the IC Preselection Indication utility over the X75 or X75P interface to the 5ESS ISDN sub-network. The 5ESS sub-network will then determine whether an IC is needed to complete the call. If an IC is needed, the IC identified in the IC Preselection Indication utility will be used to complete the call.

Software Release: 5E10 and later
Valid Entries: Y, N

Data Rules:

For 5E9(2) and earlier, this field is only applicable for X.75 trunks.

For 5E10 and later, this field applies to both X75 and X75P trunks.

If UTILITY MARKER is "N", this field cannot be "Y".

For 5E10 and later, when Trunk member(s) defined on the TRUNK form belong to a Trunk Group with a Trunk Class other than "X75" (the TRKCLS field on the TKGRP form), non-X75 Trunks must leave the following PACKET SWITCHING X.75 ONLY UTILITY INDICATORS fields blank.

- TDI BEFORE
- TDI AFTER

Copyright © 2003 Lucent Technologies

- TDS BEFORE
- TDS AFTER
- TARIFF BEFORE
- TARIFF AFTER
- IN RPOA BEFORE
- IN RPOA AFTER
- OUT RPOA BEFORE
- OUT RPOA AFTER
- RPOA DEL SEND
- RPOA DEL RCV
- TNIC CONFIG
- X75 ID

For 5E10 and later, when Trunk member(s) defined on the TRUNK form, belong to a Trunk Group with a Trunk Class of either "X.75" or "X.75P" (the TRKCLS field on the TKGRP form), X.75 and X.75' Trunks must have IC PRESELECT entered.

PACKET SWITCHING X.75P ONLY UTILITY INDICATORS

The following fields (Section 2.87 - Section 2.95) are available with 5E5 and later Software Releases and apply only to X.75P packet switched trunks. These fields must be defined only when TRKCLS on the TKGRP form is "X75P".

Either the X.75P Only Utility Indicators or X.75 Only Utility Indicators may be specified, but not both.

For 5E10 and later, when Trunk member(s) defined on the TRUNK form belong to a Trunk Group with a Trunk Class other than "X.75" (the TRKCLS field on the TKGRP form), non-X75 Trunks must leave the following PACKET SWITCHING X.75 ONLY UTILITY INDICATORS fields blank.

- TDI BEFORE
- TDI AFTER
- TDS BEFORE
- TDS AFTER
- TARIFF BEFORE
- TARIFF AFTER
- IN RPOA BEFORE
- IN RPOA AFTER
- OUT RPOA BEFORE
- OUT RPOA AFTER
- RPOA DEL SEND
- RPOA DEL RCV
- TNIC CONFIG
- X75 ID

2.87 TARIFF UTILITY

Description: Is the tariff utility indicator provisioned? The tariff utility indicator sends the called party information about the services provided to the calling party. The information that may be sent is an indication of the serving protocol and access line type. This is used for the AMA billing record.

Software Release: 5E5 and later
Valid Entries: Y, N

2.88 TRANSIT DELAY IND

Description: Is the Transit Delay Indicator provisioned? The Transit Delay Indicator is used to indicate the

Copyright © 2003 Lucent Technologies

transit delay of the virtual circuit. Packet delays occur all along the path of a virtual circuit, therefore, in order to determine expected performance, all sources of delay must be measured.

Software Release: 5E5 and later
Valid Entries: Y, N

2.89 TRANSIT DELAY SEL

Description: Is the Transit Delay Selector provisioned?

Software Release: 5E6 and later
Valid Entries: Y, N

2.90 RPOA UTILITY

Description: Is the RPOA (Recognized Private Operating Agency) indicator provisioned? This utility provides a means to store the identity of up to seven transit RPOA networks in the path from the calling network to the called network.

Software Release: 5E5 and later
Valid Entries: Y, N

2.91 ACCESS CHAR

Description: Is the Access Characteristics indicator provisioned? The Access Characteristics utility is used in a Call Request, Call Connect, or Clear Request packet on an X.75P packet trunk to send billing data within the operating company sub-network packet.

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

X.75P trunks must have ACCESS CHAR entered.

If ACCESS CHAR is "Y", UTILITY MARKER must be "Y".

2.92 TRANS SUB NET CNT

Description: Should the Transit Subnetwork Count Utility Indicator be enabled? In 5E8, X.75P to X.75P transit subnetwork switching is supported. Call looping among subnetworks could arise in a LEC network due to this support. The transit subnetwork count utility can be used to detect invalid looping conditions during transit switching situations within a LEC network.

If this field is left blank for an X.75P trunk and the UTILITY MARKER is "Y", then an internal default of "Y" will be assigned.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field is only applicable for X.75P trunks and cannot be set to "Y" if UTILITY MARKER is set to "N".

2.93 CLEAR SUB NET ID

Description: Is the Clearing Subnetwork ID Utility supported on this X.75P interface? If this field is left blank for an X.75P trunk and the UTILTY MARKER is set to "Y", then an internal default of "Y" is

Copyright © 2003 Lucent Technologies

assigned.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field is only applicable for X.75P trunks and cannot be set to "Y" if UTILITY MARKER is set to "N".

2.94 PROTOCOL CONV

Description: Is protocol conversion allowed on this X.75P interface? The purpose of this utility is to supplement the protocol information passed in the Access Characteristic utility with additional information that allows protocol screening to be performed. If this field is left blank for an X.75P trunk and the UTILTY MARKER is set to "Y", then an internal default of "Y" is assigned.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field is only applicable for X.75P trunks and cannot be set to "Y" if UTILITY MARKER is set to "N".

2.95 X.75 ID UTILITY

Description: Is the X.75 Identification utility for X.75P trunks supported on this X.75P interface? This field determines if the X.75 ID should be passed through X.75P trunks. If this field is left blank for an X.75P trunk and the UTILTY MARKER is set to "Y", then an internal default of "Y" is assigned.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field is only applicable for X.75P trunks and cannot be set to "Y" if UTILITY MARKER is set to "N".

PACKET SWITCHING X.75 ONLY UTILITY INDICATORS

The following fields (Section 2.96 - Section 2.110) are available with 5E6 and later Software Releases and refer to X.75 packet-switched trunks only. These fields must only be defined when TRKCLS on the TKGRP form is "X.75".

Either the X.75P Only Utility Indicators or X.75 Only Utility Indicators may be specified, but not both.

For 5E6 and 5E7, the default for the utilities was placing the indicator "AFTER" the utility marker. For 5E8 and later, the default is placing the indicator before the utility marker.

2.96 TDI BEFORE

Description: Is the Transit Delay Indicator supported before the utility marker?

Software Release: 5E6 and later
Valid Entries: Y, N

2.97 TDI AFTER

Description: Is the Transit Delay Indicator supported after the utility marker?

Copyright © 2003 Lucent Technologies

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If TDI AFTER is not entered for an X.75 trunk, it will be treated as if it was set to "Y".

The TDI cannot be supported both before and after the utility marker; therefore, TDI BEFORE and TDI AFTER cannot both be set to "Y". When TDI BEFORE is "Y", TDI AFTER must be "N".

2.98 TDS BEFORE

Description: Is the Transit Delay Selector supported before the utility marker?

Software Release: 5E6 and later
Valid Entries: Y, N

2.99 TDS AFTER

Description: Is the Transit Delay Selector supported after the utility marker?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If TDS AFTER is not entered for an X.75 trunk, it will be treated as if it was set to "Y".

The TDS cannot be supported both before and after the utility marker; therefore, TDS BEFORE and TDS AFTER cannot both be set to "Y". When TDS BEFORE is "Y", TDS AFTER must be "N".

2.100 TARIFF BEFORE

Description: Is the Tariff Indicator supported before the utility marker?

Software Release: 5E6 and later
Valid Entries: Y, N

2.101 TARIFF AFTER

Description: Is the Tariff Indicator supported after the utility marker?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If TARIFF AFTER is not entered for an X.75 trunk, it will be treated as if it was set to "Y".

The TARIFF cannot be supported both before and after the utility marker; therefore, TARIFF BEFORE and TARIFF AFTER cannot both be set to "Y". When TARIFF BEFORE is "Y", TARIFF AFTER must be "N".

2.102 IN RPOA BEFORE

Description: Is the Incoming RPOA Indicator supported after the utility marker? For 5E8 and later for an X.75 trunk, if IN RPOA BEFORE is not entered, the system software will automatically set it to "Y".

Software Release: 5E6 and later
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E6 and 5E7, if IN RPOA BEFORE is "Y", IN RPOA AFTER and OUT RPOA AFTER must be "N".

For 5E8 and later, if IN RPOA BEFORE is not entered or is "Y", OUT RPOA AFTER must not be "Y".

2.103 IN RPOA AFTER

Description: Is the Incoming RPOA Indicator supported after the utility marker? For 5E6 and 5E7 for an X.75 trunk, if IN RPOA AFTER is not entered, the system software will automatically set it to "Y".

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

For 5E6 and 5E7, if IN RPOA AFTER is not entered or is "Y", OUT RPOA BEFORE must not be "Y".

For 5E8 and later, if IN RPOA AFTER is "Y", IN RPOA BEFORE and OUT RPOA BEFORE must be "N".

2.104 OUT RPOA BEFORE

Description: Is the Outgoing RPOA Indicator supported before the utility marker? For 5E8 and later for an X.75 trunk, if OUT RPOA BEFORE is not entered, the system software will automatically set it to "Y".

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

For 5E6 and 5E7 if OUT RPOA BEFORE is "Y", OUT RPOA AFTER must be "N".

2.105 OUT RPOA AFTER

Description: Is the Outgoing RPOA Indicator supported after the utility marker? For 5E6 and 5E7 for an X.75 trunk, if IN RPOA AFTER is not entered, the system software will automatically set it to "Y".

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

For 5E8 and later, if OUT RPOA AFTER is "Y", OUT RPOA BEFORE must be "N".

2.106 RPOA DEL SEND

Description: Should the RPOA (Registered Private Operating Agency) be deleted before sending the packet to the remote STE (Signaling Terminal)? If this field is set to "N", the 5ESS Switch X.75 STE passes the RPOA Selection utility or the sequence of RPOA Selection utilities (without deletion) in the transmitted X.75 CRP (Call Request Packet). If this field is not entered for an X.75 trunk member, then an internal default of "Y" is assigned. (See Division 2, Section 5C for more information on Packet Trunk Interface Standardization.)

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

This field is only applicable for X.75 trunks.

If RPOA DEL SEND is "Y" or not entered, either OUT RPOA BEFORE must be "Y" or not entered, or OUT RPOA AFTER must be "Y".

2.107 RPOA DEL RCV

Description: Should the RPOA be deleted when the packet is received by this X.75 interface from the remote STE? When this field is set to "Y", the 5ESS Switch X.75 STE discards the RPOA Selection utility (or the first RPOA Selection Utility in a sequence of RPOA Selection utilities) when it is received in an X.75 CRP, and if the contents of the RPOA parameter field identifies the network as the 5ESS Switch ISDN subnetwork.

If this field is not entered for an X.75 trunk member, then an internal default of "Y" is assigned.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field is only applicable for X.75 trunks.

If this field is "Y" or not entered, then either IN RPOA BEFORE must be "Y" or not entered, or IN RPOA AFTER must be "Y".

2.108 TNIC CONFIG

Description: Enter the TNIC (Transit Network Identification Code) Configuration. These TNIC CONFIG values are used to detect looping within the network. The TNIC CONFIG value is used when the switch receives an IP (Internal Protocol) Call Request Packet that contains a TNIC or ATNIC (AT&T defined TNIC) facility or a sequence of TNIC or ATNIC facilities. If this field is not entered and the CRP has duplicate TNICs, the call is cleared.

NOTE: Up to Seven unique TNIs may be present in the CRP.

If the 5ESS Switch X.75 STE determines that the network is a transit network, then the STE checks for a TNIC utility with a parameter field value that matches the TNIC field on the ISDNOPT form (5941 Record) before transmitting an X.75 CRP to the remote X.75 STE over an X.75 packet trunk.

- If "SHARED" is entered in the TNI parameter (TNIC CONFIG field on the TRUNK form) then the following occurs:
  - if the X.75 CRP to be transmitted contains at least one instance of a TNIC utility with the parameter field value matching the TNIC of the transit network 5ESS Switch, then the transit network 5ESS Switch X.75 STE does not insert its TNIC value into the X.75 CRP to be transmitted.
  - if the X.75 CRP to be transmitted does *NOT* contain a TNIC utility with the parameter field value matching the TNIC of the transit network 5ESS Switch, then the transit network 5ESS Switch X.75 STE inserts the TNIC utility into the X.75 CRP.

- If "UNIQUE" is entered in the TNI parameter (TNIC CONFIG field on the TRUNK form) then the following occurs:
  - if the X.75 CRP to be transmitted contains at least one instance of a TNIC utility with the parameter field value matching the TNIC of the transit network 5ESS Switch, then the transit network 5ESS Switch X.75 STE clears the virtual call request because looping may occur.

Copyright © 2003 Lucent Technologies

- if the X.75 CRP to be transmitted does *NOT* contain a TNIC utility with the parameter field value matching the TNIC of the transit network 5ESS Switch, then the transit network 5ESS Switch X.75 STE inserts the TNIC utility into the X.75 CRP.

Software Release: 5E8 and later
Valid Entries:

Valid TNIC CONFIG Entries

Entry	Definition
SHARED or S	The TNIC Configuration is shared.
UNIQUE or U	TNIC Configuration is unique.

Data Rules:

This field is only applicable for X.75 trunks.

2.109 X.75 ID

Description: Enter the 11-digit X.75 Trunk Interface Identification Number. This number is used to uniquely identify the X.75 trunk member used in a call and is used by the RAO (Revenue Accounting Office) to determine appropriate billing for packet calls in network configurations where the called address is not sufficient to indicate the Inter-exchange Carrier or other X.75 connected entity to be billed.

If this field is not entered for an X.75 trunk member then an internal default of 0 will be assigned.

Software Release: 5E8 and later
Valid Entries: 00000000000 - 99999999999

Data Rules:

This field is only applicable for X.75 trunks.

2.110 IC PRESELECT

Description: Is the Inter-exchange Carrier preselected for this trunk? Prior to 5E10, this field was part of Packet Switching X.75 Only Utility Indicators. For 5E10 and later, this field is part of Packet Switching X.75/X.75P Utility Indicators.

Software Release: 5E8 through 5E9(2)
Valid Entries: Y, N

Data Rules:

This field is only applicable for X.75 trunks.

If UTILITY MARKER is "N", this field cannot be "Y".

MISCELLANEOUS

Fields Section 2.111 - Section 2.112 refer to miscellaneous fields.

2.111 MF LOSS

Description: Enter the Multifrequency outpulsing additional dB loss. This field indicates any additional dB loss for multifrequency outpulsing. The additional loss can be specified in 1dB increments over a range of 0 to 7dB. This will provide a net loss range of -10dB to -17dB.

Copyright © 2003 Lucent Technologies

Software Release: 5E7 and later
Required Field.
Default: 0
Valid Entries: 0 - 7 (dB)

Data Rules:

When MF LOSS is greater than 0, then the corresponding TKGRP form must have
- OUTPULSING set to "MF" or "TT".
- TRKCLS cannot be "ATNDVFY" (for 5E9(1) and later)
- TRK DIR set to "OUT" or "2W"

2.112 ANI

Description: Is Automatic Number Identification provided on this Trunk Group? A value of "Y" applies only to trunks associated with TRKCLS (on TKGRP) set to "PF" or "PFLASH" and applies to all trunks in the group. It is used to outpulse ACSI (Automatic Customer Station Identification) before Cut Through.

Software Release: 5E6 and later
Default: N
Valid Entries: Y,N

Data Rules:

When SLEN is known, ANI must be "N".

If ANI equals "Y", TGN must be defined on the TKGRP form with a TRKCLS of "PF", "PFITT", or "PFLASH"; for 5E7 and later, it may also be "LTOLLCON".

If TGN(s) are defined on the TKGRP form with ACP SDN equals "Y", and TRKCLS equals "PF", all associated TGN/MEMB(s) must be defined on TRUNK with ANI equals "Y".

If TGN(s) are defined on the TKGRP form with CAMA PSAP equals "Y", all associated TGN/MEMB(s) must be defined on TRUNK with ANI equals "N".

All members of a trunk group must have the same value specified for ANI.

EEC OPTION

2.113 *EEC ACTIVE*

Description: This field is used to indicate whether EEC (External Echo Cancellation) is active for the trunk.

DIGITAL TEST TRUNKS

The following fields (Section 2.114 - Section 2.115) define digital test trunks. These fields support the No Test Trunk feature. See Divsion 2, Section 7AS.

2.114 MTB0

Description: This field is used to define the Metallic Test Bus 0 for digital test trunks.

Software Release: 5E15 and later.
Valid Entries:

Valid MTB0 Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192

Copyright © 2003 Lucent Technologies

Metallic Service Unit	MSU	X	0 - 1
Service Group	SG	X	0 - 1
Board Number	BRD	XX	00 - 31
Bus Number	BUS	XX	00 - 14

Data Rules:

When MTB0/MTB1 is entered, DEN must be entered.

When MTB0 or MTB1 is entered, both must be entered.

MTB0 and MTB1 must be unique and reside on the same SM.

When MTB0 and MTB1 are entered, TRKCLS on the TKGRP form must be "TSTK".

MTB0 and MTB1 cannot be assigned to DFI channel 1 and 25; these are reserved for the control channel.

2.115 MTB1

Description: This field is used to define the Metallic Test Bus 1.

Software Release: 5E15 and later.
Valid Entries: See the Valid Entries table for MTB0.

Data Rules:

See Data Rules for the MTB0.

PACKET PIPE MEMBER TRUNK

The following fields (Section 2.116 - Section 2.117) list the packet pipe member trunks (up to 8 entries). These fields support the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B.

2.116 TGN

Description: Enter the trunk group number for the packet pipe member trunk.

Software Release: 5E10 and later.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

When PACKET PIPE MEMBER TRUNKS list is entered, then the DATA RATE fields on the corresponding TKGRP forms must all have the same value. A corresponding TKGRP form is found by matching the TGN on PACKET PIPE MEMBER TRUNKS to TGN on the TKGRP form.

For 5E12 and later:

When TGN is entered in a ROW of the PPMTRUNK list, MEMB must also be entered in that ROW.

When TGN is entered in PPMTRUNK list, it should not equal TKGRP.

2.117 MEMB

Copyright © 2003 Lucent Technologies

Description: Enter the trunk member number for the packet pipe member trunk.

Software Release: 5E10 and later.
Valid Entries: 0 - 1951

Data Rules:

For a PACKET PIPE MEMBER TRUNK entries both a TGN and MEMB must be entered.

A given trunk member cannot be assigned to the PACKET PIPE MEMBER TRUNKS list more than once, i.e. the PACKET PIPE MEMBER TRUNK assignments must be unique.

If the trunk members of this trunk group have one or more row entries completed in the PACKET PIPE MEMBER TRUNKS list, then "PKTPIPE" must be entered in the TKKCLS of the corresponding TKGRP form. Forms correspond if TGN entries match.

The trunk members entered on this list must all reside on the same DFI or DNU-S facility; therefore,

- The first six digits of the DEN must be identical for each trunk member entered on the Packet Pipe Member Trunk List. And, the last two digits must be 01 - 24 or 25 - 48.

If PACKET PIPE MEMBER TRUNKS list is entered on the TRUNK form, then a matching TRUNK form must have a corresponding TKGRP form where TRKCLS is "PPMEM".

- A matching TRUNK form is found by matching the TGN and MEMB on PACKET PIPE MEMBER TRUNKS on the TRUNK form to TGN and MEMB on another TRUNK form.
- A corresponding TKGRP form is found by matching the TGN on PACKET PIPE MEMBER TRUNKS to TGN on the TKGRP form.

All Packet Pipe Members must be assigned the same DATA RATE on the corresponding TKGRP form.

For 5E10 and later:

If any of the Packet Pipe Members on the PPM TRUNK list reside on an RSM all must reside on the RSM.

All of the Packet Pipe Members assigned to a specific Packet Pipe Trunk must reside on the same DFI and facility. The DFI and facility are specified by the DEN. The first 6 characters designate the DFI, characters 7 and 8 designate the facility. 01 - 24 designate FAC0 and 25 - 48 designate FAC1.

For 5E12 and later:

When MEMB is entered in a ROW of the PPMTRUNK list, TGN must also be entered in that ROW.

For 5E13 and later:

The first nine digits of the NEN must be identical for each trunk member entered on the Packet Pipe Member Trunk List and must reside on the same VT assigned to a DNU-S; up to 28 Packet Pipe Members can be assigned on the same VT.

2.118 PACKET PIPE TGN

Description: This is a Recent Change Verify only field for Packet Pipe Member trunk group numbers.

2.119 PACKET PIPE MEMB

Description: This is a Recent Change Verify only field for Packet Pipe Member trunk member numbers.

SEC. 2D: 5205 RECORD
FEATURE ASSIGNMENT
TRUNK GROUP MEMBER NUMBER RECORD
- TRUNKFA

1. GENERAL

The 5205 Record is available with 5E2 and later Software Releases, and is used to assign 1 to 48 BRCS features to a particular member of a Trunk Group. The TGN member must be defined on a TRUNK form (5204 Record) with the BRCS field set to "Y" (Yes).

1.1 Speed Call Features

For 5E6 and later Software Releases, Speed Call (Abbreviated Dialing) features are assigned separately from IDP (Individualized Dialing Plan) features. Prior to this disassociation, a trunk can be assigned an IDP feature with a Speed Call feature which counts as one feature for that trunk. However, after a retrofit from the 5E5 Software Release to the 5E6 Software Release, this trunk may have as many as three features: an IDP feature and up to two SC (Speed Call) features depending on whether or not one-digit or two-digit Speed Call has been assigned.

This may raise the count of Terminal features for that trunk above the maximum of thirty features. A trunk only may be assigned up to thirty Terminal features, therefore, use discretion with a TRUNKFA form that has more than twenty-eight Terminal features (IDP feature included) at the time of retrofit. If the Terminal feature count is greater than thirty after retrofit, the SC1 (one-digit Speed Call) feature, if it has been assigned, will be canceled. If SC1 has not been assigned, then SC2 (two-digit Speed Call) will be canceled. If both features have been assigned to this line, both may be canceled.

1.2 Relation to the TKGRPFA Form

BRSC features assigned via the TRUNKFA form override all BRCS features assigned via the TKGRPFA form (5206 Record). That is, if BRCS features are assigned to the Trunk Group via the TKGRPFA form, but a TRUNKFA form is submitted for some particular member of the Trunk Group (say member 1), all members except member 1 will have the BRCS features listed on the TKGRPFA form, but member 1 will be assigned only the BRCS features listed on the TRUNKFA form. If no TKGRPFA form is submitted for the Trunk Group, only those members for which a TRUNKFA form is submitted will be assigned BRCS features.

1.3 Feature Assignment

All feature names explicitly defined on the TRUNKFA form or indirectly through cluster names, on the CLUSTR form, must be unique. No duplications are allowed for a given TGN/Member Number combination. Each cluster name must be defined on the CLUSTR form, where it is expanded into two through sixteen unique feature names. Each unique feature value (not cluster name) must correspond to a BRCS feature name that is defined on one of the BRCS feature definition forms described in Division 4. The total number of unique feature names on this form and associated CLUSTR forms must not exceed 48.

Only one IDFD (Individualize Dialing) feature can be assigned to the TRUNKFA. It is also normally expected that all trunk members of a given Trunk Group will share the exact same set of BRCS feature names.

Wild Card Feature Names of the format "/AA*" (AA equals two upper case alphabetic letters) are not allowed to be assigned to a TGN MEMB on the TRUNKFA form.

1.4 Recent Change View

Copyright © 2003 Lucent Technologies

The corresponding Recent Change View for this form is 5.11.

2. FORM ENTRIES - 5205 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN value must also be defined on the TRUNK form with BRCS equal to "Y" and assigned to either a DEN or TEN.

2.3 * MEMB

Description: Enter the Trunk Member Number.
Valid Entries: 0 - 1951

Data Rules:

The Trunk Member Number must be defined on the TRUNK form with BRCS equal to "Y" and assigned to either a DEN or TEN.

FEATURE LIST

This (fields Section 2.4 - Section 2.7) is a list of 48 possible feature/cluster names along with the associated initial activation state and a master override status.

2.4 FEATURE

Description: Enter the Feature or Cluster Name.
Valid Entries: 1 - 8 alphanumeric characters

For 5E15 and later, when FEATURE is entered on this form, it must not be defined on the MWFD form (5602 Record) where the appropriate fields on the MWFD form are set as follows:

- FEATURE OPTIONS fields: ACT/INACT OPTION is set to "ACT1CA", MULTIWAY CONTROL is set to "NWAY", and AMAC is set to "USAGE",
- ENTRY POINT fields: FLASH is set to "Y", IN MIDDLE is set to "Y", and OFF HOOK is set to "Y", and
- DEFAULT PARAMETER field: N-WAY MAXIMUM is set to "6".

The feature options on the MWFD form define a USSWC (Usage Sensitive Six-Way Calling) feature which cannot be assigned on this form or any of the associated CLUSTR forms (5600 Record). USSWC must be assigned on the OFCOPT form (5509 Record). For more information on the USSWC feature, see Division 2, Section 4A553.

2.5 A

Copyright © 2003 Lucent Technologies

Description: Activity Status. Is the BRCS feature initially active or inactive? This value is under the switch owner's control and is feature dependent.

For initial 5ESS Switch offices built by 5ODA, this field is the initial activity status of the given feature assigned to a terminal. For retrofit offices run by 5ODA, this field represents the current or present active/inactive state of the feature.
Valid Entries: Y, N

Data Rules:

If the FEATURE name used in the FEATURE LIST is a real feature name (not a cluster name), then the value of the Activity Status for this FEATURE name is based on the following condition:

- If the FEATURE name is defined on an ARSFD form, then the A must be "Y";
- If the FEATURE name is defined on a TGSRFD form with the ACT TYPE equal to "AUTO", then A must be "Y";
- If the FEATURE name is defined on an IDFD form with CUST ACT/DEACT IDP equal to "N", then A must be "Y";
- If the FEATURE name is defined on an MWFD form with the ACT/INACT OPTION equal to "ALWACT" or "INACT1CA", then A must be "Y";
- If the FEATURE name is defined on an MWFD form with the ACT/INACT OPTION equal to "ACT1CA", then A must be "N";
- If the FEATURE name is defined on a TGSRFD form with the ACT TYPE equal to "CODE" and the DACT TYPE equal to "AUTO", then A must be "N".

2.6 M

Description: Master Override Status. Is the feature turned on?

This is a software switch under the switch owner's control which provides the ability to temporarily unassign a BRCS feature from a terminal without physically deleting any of the internal data structures associated with the feature. When M is "Y", the initial (or current) Activity Status, A, determines whether the feature gets control. If the Master Status is off, "N", the terminal will be treated as if the feature was never assigned.

M should equal "Y" for all new 5ODA offices. If M equals "N" for a new 5ODA office, then TRUNKFA forms that are assigned FEATURE and/or CLUSTER Names with the associated Master Switch equal to "N" turns the customers BRCS feature off. This is an allowed condition for initial ODA runs, but it should be verified that the feature should be disabled.

M can equal "Y" or "N" for 5ODA retrofit purposes.

- ***NOTE:*** For cluster entries on TRUNKFA form, if the feature name used in one of the 48 feature list rows is really a cluster name which has been defined on the CLUSTR input form, then the fields A (Activity Status) and M (Master Override) are "don't care" fields. However, a "Y" should be entered in both fields to pass level 1 and 2 error checks. The actual status for each feature name assigned to the cluster name is defined on the CLUSTR form and Master Override Status will be initialized to "Y".

Valid Entries: Y, N

2.7 AC

Copyright © 2003 Lucent Technologies

Description: Authorization Code Feature. Is the Authorization Code feature required?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

If there is at least one feature on this form or the corresponding CLUSTR forms with AC of "Y", then there must be one (only one) Authorization Code Feature on this form or the CLUSTR, defined on the ATHFD form (5619-1 Record).

If AC is "Y" and the corresponding feature is not an ATH Feature defined on ATHFD or a CLUSTER name then the feature must be entered on the ATHFCOS form (5619-4 Record) for the ATH Group corresponding to the ATH Feature entered on this or the CLUSTR form.

If the corresponding feature is a CLUSTER name, then each feature with AC of "Y" on the CLUSTR form (5600 Record) must exist on the ATHFCOS form for the CSV ATH Group, and for 5E6 and later the CSD ATH Group, corresponding to the ATH feature entered on this or the CLUSTR form.

AC must be "N" when a Display feature is assigned in the FEATURE field. If FEATURE is a cluster, then for any display feature that appears in the cluster, the corresponding AC field must be "N" on the CLUSTR form.

SEC. 2E: 5206 RECORD FEATURE ASSIGNMENT TRUNK GROUP RECORD

1. GENERAL

The 5206 Record is available with 5E2 and later Software Releases, and is used to assign 1 to 48 BRCS features to a particular Trunk Group. The Trunk Group value must be defined on a TKGRP form (Record 5202) with the BRCS field set to "Y".

1.1 Speed Call Features

For 5E6 and later Software Releases, Speed Call (Abbreviated Dialing) features are assigned separately from IDP (Individualized Dialing Plan) features. Prior to this disassociation, a trunk can be assigned an IDP feature with a Speed Call feature which counts as one feature for that trunk. However, after a retrofit from the 5E5 Software Release to the 5E6 Software Release, this trunk may have as many as three features: an IDP feature and up to two SC (Speed Call) features depending on whether or not one-digit or two-digit Speed Call has been assigned.

This may raise the count of Terminal features for that trunk above the maximum of thirty features. A trunk only may be assigned up to thirty Terminal features, therefore, use discretion with a TKGRPFA form that has more than twenty-eight Terminal features (IDP feature included) at the time of retrofit. If the Terminal feature count is greater than thirty after retrofit, the SC1 (one-digit Speed Call) feature, if it has been assigned, will be canceled. If SC1 has not been assigned, then SC2 (two-digit Speed Call) will be canceled. If both features have been assigned to this line, both may be canceled.

1.2 Feature Assignment

All feature names explicitly defined on the TKGRPFA form or indirectly through cluster names, on the CLUSTR form, must be unique. No duplications are allowed for a given Trunk Group. Each cluster name must be defined on the CLUSTR form, where it is expanded into two through sixteen unique feature names. Each unique feature value (not cluster name) must correspond to a BRCS feature name that is defined on one of the BRCS feature definition forms described in Division 4. The total number of unique feature names on this form and associated CLUSTR forms must not exceed 48.

Features assigned via the TKGRPFA form will be automatically assigned to each trunk in the group, except when an individual trunk has features assigned via the TRUNKFA form. In that case, only those features assigned via the TRUNKFA form will apply to the individual trunk, but those assigned via the TKGRPFA form will apply to all other members of the group.

- ***NOTE:*** Only one IDP Individualized Dialing Plan feature, defined on the IDFD form, can be assigned to the TKGRPFA.

1.3 Wildcard Features

Wild Card Feature Names of the format "/AA*" (AA equals two upper case alphabetic letters) are not allowed to be assigned to a TKGRPFA Form.

1.4 Recent Change View

The corresponding Recent Change View for this form is 5.4.

Enter the Base and Control Number and Office Name on each record.

2.2 * TRUNK GROUP

Description: Enter the Trunk Group Number.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The Trunk Group value must also be defined on the TKGRP form with BRCS equal to "Y".

FEATURE LIST

This (fields Section 2.3 - Section 2.5) is a list of 48 possible feature/cluster names along with the associated initial activation state.

2.3 FEATURE

Description: Enter the Feature or Cluster Name.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

For 5E9(1) and later, a trunk group member defined on a TKGRP form with its WB RATE field entered can only have, at most, one TGSR and/or one IDP feature.

For 5E15 and later, when FEATURE is entered on this form, it must not be defined on the MWFD form (5602 Record) where the appropriate fields on the MWFD form are set as follows:

- FEATURE OPTIONS fields: ACT/INACT OPTION is set to "ACT1CA", MULTIWAY CONTROL is set to "NWAY", and AMAC is set to "USAGE",
- ENTRY POINT fields: FLASH is set to "Y", IN MIDDLE is set to "Y", and OFF HOOK is set to "Y", and
- DEFAULT PARAMETER field: N-WAY MAXIMUM is set to "6".

The feature options on the MWFD form define a USSWC (Usage Sensitive Six-Way Calling) feature which cannot be assigned on this form or any associated CLUSTR form (5600 Record). USSWC must be assigned on the OFCOPT form (5509 Record). For more information on the USSWC feature, see Division 2, Section 4A553.

2.4 A

Description: Is the BRCS feature initially active or inactive? This value is controlled by the switch owner and is feature dependent.

For initial 5ESS offices built by 5ODA, this field is the initial activity status of the given feature assigned to a terminal. For retrofit offices run by 5ODA, this field represents the current or present active/inactive state of the feature.

For cluster entries on TKGRPFA form: if the feature name used in one of the 48 feature list rows is really a cluster name which has been defined on the CLUSTR form, then the field A (Activity Status) is a "don't care" field. However, a "Y" should be entered to pass level 1 and 2 error messages. The actual status for each feature name assigned to the cluster name is defined on the CLUSTR form.

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If the FEATURE NAME used in the FEATURE LIST is a real feature name (not a cluster name), then the value of the Activity Status for this FEATURE NAME is based on the following conditions:

- if the FEATURE NAME is defined on an ARSFD form, the Activity Status must equal "Y";
- if the FEATURE NAME is defined on a TGSRFD form with the ACT TYPE equal to "AUTO", the Activity Status must equal "Y";
- if the FEATURE NAME is defined on an IDFD form with CUST ACT/DEACT IDP equal to "N", the Activity Status must equal "Y";
- if the FEATURE NAME is defined on an MWFD form with the ACT/INACT OPTION equal to "ALWACT" or "INACT1CA", the Activity Status must equal "Y";
- if the FEATURE NAME is defined on an MWFD form with the ACT/INACT OPTION equal to "ACT1CA", the Activity Status must equal "N";
- if the FEATURE NAME is defined on a TGSRFD form with the ACT TYPE equal to "CODE" and the DACT TYPE equal to "AUTO", the Activity Status must equal "N";
- if the FEATURE NAME is defined on an ATHFD form (5619-1 Record) with ACT TYPE equal to "AUTO", Activity Status must equal "Y".

2.5 AC

Description: Is the Authorization Code Feature required?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

If there is at least one feature on this form or the corresponding CLUSTR form with AC of "Y", then there must be exactly one Authorization Code feature on this or the CLUSTR form, defined on the ATHFD form (5619-1 Record).

If AC is "Y", and the corresponding feature is neither an ATH feature defined on an ATHFD form nor a cluster name, then the feature must be entered on the ATHFCOS form (5619-4 Record) for the CSV ATH Group associated with this trunk group. The CSV ATH Group is specified on the ATHLPA, BFG, or ATHFD form. For 5E6 and later, the feature must also be entered on the ATHFCOS form for the CSD ATH Group.

If the corresponding feature is a Cluster Name, then each feature with AC of "Y" on the CLUSTR form (5600 Record) must exist on the ATHFCOS form for the CSV ATH Group, and for 5E6 and later the CSD ATH Group, corresponding to the ATH feature entered on this or the CLUSTR form (5600 Record).

AC must be "N" when a Display feature is assigned in the FEATURE field. If FEATURE is a cluster, then for any display feature that appears in the cluster, the corresponding AC field must be "N" on the CLUSTR form.

SEC. 2F: 5207 RECORD
NAIL-UP AND HAIRPIN SPECIFICATION - NAILUP

1. GENERAL

The NAILUP form (5207 Record) is available with the 5E3 Software Release. The NAILUP form contains data to directly link ("nailup") two ports. The Controlling Port is the port requesting the nailup connection; the Non-Controlling port is the port receiving the nailup connection. The nailup connection assigns a semi-permanent path through the SM (or the SM and the CM) from a port on one piece of peripheral equipment to a port on another piece of peripheral equipment.

The nailup capability provides special services lines with the use of dedicated paths through the switching machine from one transmission facility to another. Such possibilities arise when a special service is either a non-local switched type or a non-switched type which must traverse an office enroute to its terminating switch or customer equipment. A service so implemented is referred to as nailed-up through the switch because the transmission path is guaranteed and signalling information is not subjected to normal call-processing functions.

The nailup feature does not support logical port types associated with coin phones, transmission test functions, DC jacks or automatic testing equipment.

Effective with the 5E4(2) and later Software Releases, integrated SLC circuits are supported.

With the 5E8 Software Release, nailup supports two new equipment types ("GEN" and "MEN") for IDCU (Integrated Digital Carrier Unit) facilities and provides what is called a "hairpin"connection where both ports are connected to the same IDCU. Hairpin has the same function as nailup except that it does not use SM time slot resources. (Note that for 5E10 and later, "MEN" (OE TYPE of "M") is discontinued and the nailup of DID (Direct Inward Dialing) trunks is not supported.

To accommodate the inclusion of IDCU hairpin connections and nailup connections, this form was reorganized, its title changed to reference hairpin, and most field names were changed to reflect the new organization. The name of the NAILUP form was changed to NAILUP AND HAIRPIN SPECIFICATION and the form was reorganized to accommodate a new 5ESS Switch peripheral unit called the IDCU (Integrated Digital Carrier Unit).

The IDCU's major function is to connect remote terminals to the 5ESS Switch. It supports TR008 (analog) and TR303 (analog and ISDN) remote terminals. To support IDCU, "hairpin" connections were added. Hairpin connections are a subset of nailup in which both ends of the connections are on the same IDCU, and in which case, no SM TSI resources are used in making the connection. The traditional nailup connection using TSI resources is also supported for IDCU equipment.

The SM and IDCU must be defined on an EQIDCU form (5846 Record), and the remote terminal defined on the RTERM form (5174 Record). For information on defining IDCU connections (i.e., IFACs (IDCU Facilities)), see the EQIFAC form (5847 Record).

Effective as a 5E13 Software Update, the TSI Nail-up of Consecutive DS0s for DNU-S feature (99-5E-7395) is available as a secured feature (SFID 349). See Division 2, Section 4A349. For this feature, OE TYPE of "A", "N", and "D" are used.

1.1 Recent Change View

The corresponding Recent Change View for this form is 7.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and office name on each record.

CONTROLLING PORT DATA

2.2 *C OE (Type)

Description: The OE field is a two segment field. The first segment is a one-character entry for the type of equipment. The second segment is a composite (up to 11 digits) of various equipment. Enter the type of equipment.

Required Field.

Valid C OE TYPE Entries

Entry	Description
A	Software Release: 5E12 and later. TR-303/DNU-S equipment number (INEN). See Division 2, Section 9J. Software Release: 5E13 and later. TSI Nail-Up of Consecutive DS0s for DNU-S. See Division 2, Section 4A349.
D	Software Release: 5E3 and later. DEN (Digital trunk equipment number), digital 4-wire line.
G	Software Release: 5E8 and later. The OE is associated with an IDCU Equipment Number and Number field must contain a 10-digit equipment number (GEN) for a remote terminal or a PUB43801. For 5E10 and later an 11-digit equipment number is required.
N	Software Release: 5E12 and earlier. NEN (Network Equipment Number) which is the 10-digit equipment number for digital trunks on the DNU-S (Digital Networking Unit - SONET). Software Release: 5E13 and later. The VT (Virtual Tributary) field defined on the EQVT form (5858 Record) was split which resulted in an 11-digit NEN. For more information on DNU-S, see Division 2, Section 9C and Division 2, Section 9Q.
O	Software Release: 5E16(2) and later. OIUEN (Optical Interface Unit Equipment Number)
S	Software Release: 5E4(2) and later. SLEN (Subscriber Loop Carrier equipment number). Note that if a SLEN is defined on a SLCCU form with CU TYPE set to "DID" or "DIDDPT", DID (Direct Inward Dialing) trunks is not supported.
T	Software Release: 5E3 and later. TEN (Analog trunk equipment number), analog 4-wire line.

Data Rules:

TYPE D, G, S, T

When the CONTROLLING OE-type and the NON-CONTROLLING OE-type are both "D", "G", "S", or "T", the NON-CONTROLLING OE-number must not be the same as CONTROLLING OE-number.

TYPE G or S

If the CONTROLLING OE-type or the NON-CONTROLLING OE-type is "G" or "S" a corresponding OE type/number must be defined on the MLHLN or LINE input form.

If C OE or NC OE is defined on a TR008 (Mode-I) RT or is a PUB43801, the DS1/DS0 assignments are fixed. Any incorrectly assigned values will be corrected by the system. Additionally, for PUB43801, the C PATH DS1, C PATH1 DS0 and C PATH2 DS0 are directly obtained from the C OE. Thus, C PATH DS1 must equal C OE DS1 minus 51, C PATH1 DS0 must equal C OE LINE minus 1, and C PATH 2 DS0 must equal C OE LINE. If these fields are not entered, they will be selected by the system.

Copyright © 2003 Lucent Technologies

TYPE D, N, T, S

5E13 and later:

If C/NC OE is "D", "N", "T" or "S", then:

- PATH NUM must be 1
- the following must not be entered:

  C/NC ZCS

  C/NC PATH DS1

  C/NC PATH1 DS0

  C/NC PATH2 DS0

For 5E10 and later, the nailup of DID trunks is not supported. Thus, the controlling port cannot have a corresponding ILEN defined on a RTERM form with CU XX/YY set to "DID" or "DIDDPT". The corresponding ILEN on an RTERM form is found by matching the first three digits of C OE, the fourth and fifth digits of C OE, and the sixth and seventh digits of C OE from the NAILUP form to SM, UNIT NUMBER, and RT EX on the RTERM form, respectively. The matching channel unit (CU XX/YY) is found by matching the tenth and eleventh digits of C OE when OE TYPE is set to "G" to XX in CU XX/YY where the value of YY is XX + 1.

TYPE A

When C OE is "A", C PATH DS1 must be entered as:
- dg [0-1]
- sts [0-5]
- ds1 [01-28]

When "A" is entered, ZCS2 must not be entered.

For 5E13 and later, when C OE is "A", C PATH DS1 must be entered as:
- dg [0-1]
- ste [1-6]
- sts [1]
- vtg [1-7]
- vtm [1-4]

When C OE and NC OE are "A", both OEs must be on the same SM.

For 5E13 and later, when C OE or NC OE is "A", and the associated C OE or NC OE is equal to "N" or "D", SFID ACT 349 must be set to "Y" on the SFSYS form. SFID 349 controls the TSI Nail-up of Consecutive DSOs for DNU-S feature (see Division 2, Section 4A349).

TYPE D

For 5E13 and later, when C OE or NC OE is "D", PATH NUM is 2, and HAIRPIN is "N",

Copyright © 2003 Lucent Technologies

- there must be a corresponding NEN + 1 assigned on a TRUNK form.
- the C/NC OE[1,3] value must correspond to an SM which is equipped with an SM-2000 class processor (see UNIT TYPE on the EQIM form (5700 Record).

TYPE G

For 5E12 and later, when C OE is "G", C PATH DS1 must be 0-39.

The value of digits seven through ten of C/NC OE on NAILUP forms which have a NC OE TYPE of "G" and matches an RTERM form with a TR303 interface, must be less than or equal to the value of RT LINE SIZE on the matching RTERM form.

When the CONTROLLING PORT(s) on NAILUP form(s), have an C OE TYPE of "G", and have a C OE entered which matches to either the DSL, DSLUSR, MISLINK, or TRUNK form, the NAILUP form with C OE TYPE set to "G" may be used to nailup only LINE and MLHLN OE NUMBERs with the same OE TYPE.

CONTROLLING PORT(s) on NAILUP form(s), with a C OE TYPE of "G", must match an OE TYPE/NUMBER defined on a LINE or MLHLN form:

- The C OE must have a matching Channel Unit position with a known Channel Unit Type defined on the RTERM form.
- The NC OE must have a matching Channel Unit position with a known Channel Unit Type defined on the RTERM form.

A matching RTERM form can be found by matching the first three digits of NC OE, the fourth and fifth digits of NC OE, and the sixth and seventh digits of NC OE from the NAILUP form to SM, UNIT NUMBER, and RT EX on the RTERM form, respectively. If RT INTERFACE is "TR008" then the matching Channel Unit position is found by matching the tenth and eleventh digits of NC OE, when NC OE TYPE is "G", to XX in CU XX/YY where the value of YY is XX + 1.

CONTROLLING PORT(s) and NON-CONTROLLING PORTS on NAILUP form(s), with a C OE TYPE of "G", must match an OE TYPE/NUMBER defined on LINE or MLHLN forms. If the C OE has a matching RTERM form with an RT INTERFACE of "TR303", then the value of digits 8 - 11 of C OE on NAILUP forms must be less than or equal to the value of RT LINE SIZE on the matching RTERM form. A matching RTERM form can be found by matching the first three digits of C OE, the fourth and fifth digits of C OE, and the sixth and seventh digits of C OE from the NAILUP form to SM, UNIT NUMBER, and RT EX on the RTERM form, respectively.

When NON-CONTROLLING PORT(s) on NAILUP form(s), with an NC OE TYPE of "G", have an NC OE entered which matches either the DSL, DSLUSR, MISLINK, or TRUNK form, the NC OEs on the NAILUP form with NC OE TYPE set to "G" may be used to nailup only LINE and MLHLN OE NUMBERs with the same OE TYPE.

TYPE G

If either the CONTROLING OE or NON-CONTROLLING OE type and number defined on the NAILUP form have a CONTROLING or NON-CONTROLLING OE type equal to "G" or "A", the DDS field is set to "Y", and they are associated with an RTERM form where RT INTERFACE is "TR303", then the corresponding MLHLN form must have the TR303 NAILUP field set to "Y". The RTERM form corresponds to this form if the SM field on the RTERM form matches the first three digits of the OE field on this form. The MLHLN form corresponds if the OE NUMBER on that form matches the OE field on this form.

Controlling ports with C or NC OE TYPEs of "G" can only be assigned to "G" or "M" on the LINE and

Copyright © 2003 Lucent Technologies

MLHLN forms, but cannot be assigned to "G" OEs on the DSL, DSLUSR, or TRUNK forms.

Controlling ports with C or NC OE TYPEs of "G" or "M" must have a C or NC OE entered which matches an OE TYPE/NUMBER defined on a LINE or MLHLN form, a TRKOE originating equipment type/originating equipment number defined on the TRUNK form, or a DSL originating equipment type/originating equipment number defined on the DSL or DSLUSR form. The C or NC OE must have a matching Channel Unit position with a known Channel Unit Type defined on the RTERM form.

TYPE N
For 5E9(2) and later, if the CONTROLLING OE or NON-CONTROLLING OE (types/numbers) defined on this form has a CONTROLLING OE or NON-CONTROLLING OE type equal to "N", then:

- a corresponding NEN must be found on the TRUNK form (5204-1 Record).
- and if a corresponding NEN is defined on a TRUNK form then the INPULSING or OUTPULSING fields on the associated TKGRP form cannot be "CCIS6" or "ISUP7" indicating CCS trunks.

For 5E10 and later, when TGN/MEMB(s) have NEN entered on the TRUNK form and a TRKCLS of "EDSL" or "EDSLHM" on the corresponding TKGRP form, the NEN on the TRUNK form can not be entered as C OE or NC OE on a NAILUP form

As a 5E13 Software Update, when C OE or the NC OE is "N", PATH NUM is 2, and HAIRPIN is "N", there must be a corresponding NEN + 1 assigned on a TRUNK form.

TYPE S
If the C OE or the NC OE-type is "S", the SIGNALLING MODE must not be "ABCD" and there must be a corresponding SM/DCLU/REMOTE TERMINAL defined on the SLCRT form (5106 Record).

If a corresponding C or NC SLEN is defined on a SLCCU form with CU TYPE set to "DID" or "DIDDPT" (which indicates a Direct Inward Dialing trunk), nailup of DID trunks is not supported.

For 5E15 and later, if the C or NC OE-type is "S", and a C or NC OE Number is defined indicating a SLCRT (1 - 6), a corresponding SM/DCLU/Remote Terminal must be defined on a SLCRT form.

TYPE T
If the C OE-type or the NC OE-type is "T", the SIGNALLING MODE must be "A" or "NOSIG" and C and NC INITIAL SIGNAL must be 00 and FINAL SIGNAL must be 11.

If C OE is "T", C INIT SIG, must be 00, C FINAL SIG must be 11, and C TRWRD must be "UAC".

2.3 C OE (Number)

Description: Enter the line Equipment Number.

Required Field.

If OE is "A", enter the INEN Equipment Number of the port requesting the nailup connection:

TR-303 on DNU-S, Type A (5E13 and later)			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Unit Number	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Line	LINE	XXXX	0001-2048

If OE type is "D", enter the Digital Equipment Number of the port requesting the nail-up connection. This number should also appear on a TRUNK form (5204 Record).

OE NUMBER, TYPE "D"		
Equipment	**Format**	**Valid**

Copyright © 2003 Lucent Technologies

			Entries
Switching Module	SM	XXX	001 - 192
Digital Line Trunk Unit	DLTU	X	0 - 5 (5E14 and earlier)
		XX	0 - 11 (5E15 and later)
Digital Facility Interface	DFI	XX	01 - 10
Digital Channel	DCHAN	XX	01 - 48

If OE type is "G", and the OE resides on a remote terminal, enter the IDCU Equipment Number of the port requesting the nail-up connection. This number should also appear on the LINE form (5109-1 Record) or MLHLN form (5111 Record).

This IDCU Equipment Number residing on a remote terminal consists of:

OE NUMBER, TYPE "G" - Remote Terminal (5E9(2) and earlier)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	X	0 - 7
Remote Terminal	RT	XX	01 - 31
Line	LINE	XXXX	0001 - 2048

OE NUMBER, TYPE "G" - Remote Terminal (5E10 and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	XX	00 - 42
Remote Terminal	RT	XX	01 - 31
Line	LINE	XXXX	0001 - 2048

If OE type is "G", and the OE is a PUB43801, enter the IDCU Equipment Number of the port requesting the nail-up connection. This number should also appear on the LINE form (5109-1 Record).

This IDCU Equipment Number residing on a PUB43801 consists of:

OE NUMBER, TYPE "G" - PUB43801 (5E10 and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	XX	00 - 42
DS1	DS1	XX	51 - 90
Line	LINE	XXXX	0001 - 0024

If OE type is "N", enter the Network Equipment Number of the port requesting the nail-up connection.

OE NUMBER, TYPE "N" (5E12 and earlier)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Digital Networking Unit - SONET	DNU-S	X	0-7
Data Group	DG	X	0-1
Synchronous Transport Signal	STS	X	0-5
Virtual Tributary	VT	XX	01-28
Digital Signal Level 0	DS0	XX	01-24

OE NUMBER, TYPE "N" (5E13 and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Digital Networking Unit - SONET	DNU-S	X	0-7
Data Group	DG	X	0-1
SONET Termination Equipment	STE	X	1-6
Synchronous Transport Signal	STS	X	1
Virtual Tributary Group	VTG	X	1-7
Virtual Tributary Member	VTM	X	1-4
Digital Signal Level 0	DS0	XX	01-24

When OE TYPE is "O", enter the OIUEN of the port requesting the nail-up connection.

OE NUMBER, TYPE "O" - (5E16 and later)

Equipment		Format	Valid Entries

Copyright © 2003 Lucent Technologies

Switching Module	SM	XXX	1 - 192
Unit Number	OIU	X	0 - 7
ProtectionGroup	PG	X	0 - 9
SONET Terminating Equipment	STE	X	1
High Level Virtual Container	HVC	X	1 - 3
Low Level Virtual Container Group	LVC GRP	X	1 - 7
Low Level Virtual Container Member	LVC MEM	X	1 - 4
Channel	CH	XX	01 - 24

If OE type is "S", enter the SLC Equipment Number of the port requesting the nail-up connection. This number should also appear on the LINE form (5109-1 Record) or MLHLN form (5111 Record).

This SLC Equipment Number consists of:

OE NUMBER, TYPE "S"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001 - 192
Digital Carrier Line Unit	DCLU	X	0 - 7 (5E14 and earlier)
		XX	0 - 15 (5E15 and later)
Subscriber Loop Carrier Remote Terminal	RT	XX	01 - 06
Line	LINE	XX	01 - 96

When C OE and NC OE is "S", then Path NUM must be 1.

When C OE and NC OE is "S", C/NC ZCS, C/NC PATH DS1, C/NC PATH1 DS0, and C/NC PATH2 DS0 must not be entered.

If a "T" is entered in the OE type field, enter the Trunk Equipment Number of the port requesting the nail-up connection. This number should also appear on TRUNK form (5204 Record).

OE NUMBER, TYPE "T"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Trunk Unit	TU	X	0 - 7
Service Group	SVG	X	0 - 1
Pack	PACK	X	0 - 7
Circuit	CKT	X	0 - 3

When C OE and NC OE is "T", then Path NUM must be 1.

When C OE and NC OE is "T", C/NC ZCS, C/NC PATH DS1, C/NC PATH1 DS0, and C/NC PATH2 DS0 must not be entered.

2.4 C LOSS

Description: This is the Controlling Port's outgoing loss. The 5ESS Switch owner engineer, in designing the end-to-end circuit, determines the loss value for the switch's piece of the entire circuit.

Required Field: .
Default: 0.0 dB

Value Entries: 0 - 7.0 in 0.5 increments,
- where actual loss in dB = loss x 0.5 dB.

2.5 C INIT SIG

Description: This is the Controlling Port's initial signal. It specifies the A/B signalling bit patterns to be sent

Copyright © 2003 Lucent Technologies

for the first 2.5 seconds of the carrier failure condition of a Nailed-up channel.

This value will vary depending on the type of carrier and the type of channel unit at the end of the connection. The 5ESS Switch Owner engineer determines the correct bit pattern which will be applied during carrier failure.

Software Release: 5E4(2) and later
Required Field.
Default: 00
Valid Entries: 00, 01, 10, 11,
- 0000, 0010, 0101, 1010, or 1111

2.6 C FINAL SIG

Description: This is Controlling Port's final signal. It specifies the A/B signalling bit applied after 2.5 seconds of carrier failure of a nailup channel.

This value will vary depending on the type of carrier and the type of channel unit at the end of the connection. The 5ESS Switch Owner engineer determines the correct bit pattern which will be applied during carrier failure.

Software Release: 5E4(2) and later
Required Field.
Default: 11
Valid Entries: 00, 01, 10, 11,
- 0000, 0010, 0101, 1010, or 1111

2.7 C TRWRD

Description: Indicate the trouble word to be sent during carrier failure. The 5ESS Switch Owner engineer determines which trouble word will be applied.
Default: UAC
Valid Entries:

Valid C TRWRD Entries

Entry	Description
M or MUX	DDS MUX out-of-service code.
T or TRB	Trouble word for series 2000/3000.
UA or UAC	Unassigned channel code.
UM or UMC	DDS unassigned multiplex code.

2.8 C ZCS

Description: Is the Controlling port's zero-code-suppression enabled? ZCS ensures that 16 contiguous 0 bits are not received in the transmission bit stream; here it only pertains to IDCU ports.

This field is only used for OE type of "G". Only OE type of "G" can be set to either "Y" or "N". All other equipment types must always be "N".

If the C OE on this NAILUP form is an IDCU port that is not a PUB, then the use of the C ZCS field on this NAILUP form is dependent on the suppression method specified on the RTERM form (5174 Record) in the SUP METHOD field. (Use the value of C OE on this form to find the correct key fields for the RTERM form).

Copyright © 2003 Lucent Technologies

The C ZCS field can only be used to turn off zero code suppression that was specified for the DS1s of the RT EX (Remote Terminal External Number) on the RTERM form; it cannot be used to turn on zero code suppression. (Note, this field overrides the C DS1 time slot only; it has no impact on the rest of the DS1 time slots.) Specifying a SUP METHOD of "TR8ZC" or "303ZC" on the RTERM form also specifies that zero code suppression should be used for the DS1, while a SUP METHOD of "TR8B8" or "303B8" specifies that zero code suppression should not be used for the DS1. Therefore, the only time the value specified for the C ZCS field on this NAILUP form impacts zero code suppression is if the C ZCS field is set to "N" and the SUP METHOD field on the RTERM form is "TR8ZC" or "303ZC".

The table below summarizes the interaction of the values of the C ZCS field on this NAILUP form and the SUP METHOD field on the RTERM form.

IDCU NON-PUB PORT		
SUP MTHD FIELD ON RTERM FORM	**C ZCS FIELD ON** NAILUP FORM	**IS ZERO CODE SUPPRESSION USED FOR** THE C DS1 TIME SLOT ON NAILUP?
TR8ZC, 303ZC	Y or blank	Yes
TR8ZC, 303ZC	N	No
TR8B8, 303B8	Y, N or blank	No

If the C OE on this NAILUP form is an IDCU port that is a PUB, then the use of the C ZCS field on this form is dependent on the suppression method specified on the EQIFAC form (5847 Record) in the SUP MTHD field. (Use the value of C OE on this form to find the correct key fields for the EQIFAC form.)

The table below summarizes the interaction of the values of the C ZCS field on this NAILUP form and the SUP MTHD field on the EQIFAC form.

IDCU PUB PORT		
SUP MTHD FIELD ON EQIFAC FORM	**C ZCS FIELD ON** NAILUP FORM	**IS ZERO CODE SUPPRESSION USED FOR** THE C DS1 TIME SLOT ON NAILUP?
D4, FEB7, TR8ZC, 303ZC	Y or blank	Yes
D4, FEB7, TR8ZC, 303ZC	N	No
64K, FE8Z, TR8B8, 303B8	Y, N or blank	No

Valid Entries: Y, N

Data Rules:

ZCS can only be disabled for IDCU hardware. This field must be blank for all other hardware types.

When C OE is "A", C ZCS must not be entered.

2.9 C PATH DS1

Description: This field is only used for OE types "G" or "M". It specifies the controlling port's DS1 IFAC (IDCU Facility) for nailup or hairpin path 1. It identifies the facility used by the controlling port to connect the IDCU to the remote terminal.

The C PATH DS1, C PATH1 DS0, and C PATH2 DS0 fields can be entered or, if left blank, the system will choose the values for these fields depending upon whether PATH NUM is 1 or 2. For example, if PATH NUM is 1, either enter values in both C PATH DS1 and C PATH1 DS0, or leave both blank and the system will choose the values for these fields. (Note also that when PATH NUM is 1, the C PATH2 DS0 and NC PATH2 DS0 fields must be blank.) Similarly, if PATH NUM is 2, either enter values in C PATH DS1, C PATH1 DS0, and C PATH2 DS0, or leave all three blank and the system will choose the values for these fields.
Valid Entries: 0 - 39

The DS1 entered on the NAILUP form must correspond to an IFAC entered in the RT IFAC

Copyright © 2003 Lucent Technologies

TERMINATION list on the appropriate RTERM form.

The DS1 entered on the NAILUP form must correspond to an FAC entered in the RT FAC TERMINATION list on the appropriate RTERM form.

The DS1 entered cannot be the PROT LINE on the same RTERM form.

2.10 C PATH1 DS0

Description: This field is only used for OE types "G" or "M". It identifies the timeslot (DS0) on the IDCU facility (DS1) that will be used by the controlling port for path 1.
Valid Entries: 0 - 23

2.11 C PATH2 DS0

Description: This field is only used for OE type "G" and is only entered when PATH NUM is 2. It specifies the controlling port's DS0 for dual-DDS (Digital Data Service) hairpin path 2. It identifies the timeslot (DS0) on the IDCU facility (DS1) used by the controlling port for path 2.
Valid Entries:

- 5E8 and earlier: 0 - 23
- 5E9(1) and later: 0 - 18

NON-CONTROLLING PORT DATA

2.12 #NC OE (Type/Number)

- ***NOTE:*** See C OE for CONTROLLING PORT DATA - identical usage.

2.13 NC LOSS

- ***NOTE:*** See C LOSS for CONTROLLING PORT DATA - identical usage.

2.14 NC INIT SIG

2.20 NC PATH2 DS0

NOTE: See C PATH2 DS0 for CONTROLLING PORT DATA - identical usage.

FOR BOTH PORTS

2.21 #SIGMODE

Description: Signalling Mode indicates if any signalling is to be passed and the amount. For data circuits, no signalling is passed. When signalling must pass through, three types of signals are possible: 2-state (A), 4-state (AB), and 16-state (ABCD).

NOTE: If both the Controlling and Non-Controlling Port has an OE of "N", then SIGMODE is "don't care", i.e. any signaling mode may be entered.

Required Field.

Valid SIGMODE Entries

Entry	Description
A	2-state.
AB	4-state.
ABCD	16-state.
NOSIG	No signaling mode.

Data Rules:

If either the Controlling or Non-Controlling Port has an OE type of "T", the SIGMODE must be "A" or "NOSIG".

A SIGMODE value of "ABCD", used for an OE type of "D", requires that both the Controlling and Non-Controlling Ports have a corresponding DFI MODE of "FE" or "FE8Z" on the EQDUP form (5730 Record).

If SIGMODE is "NOSIG", "A" or "AB", the corresponding DFI mode on the EQDUP form must be "D4", "64K", "FE", "FE8Z", or "FEB7" which is required for DEN's only.

The 5ESS Switch is designed to accommodate ABCD signalling or 64KB clear transmission through inter RSM, RSM to HOST and inter Switching Module connections.

For SLEN's defined on an SLCRT form, the SIGMODE must not be "ABCD". Therefore, if C OE or NC OE equipment type is "S", SIGMODE must be "A", "AB", or "NOSIG".

If the RT INTERFACE on the RTERM form is "TR008" and C OE or NC OE on the NAILUP form is "M" or "G" (indicating IDCU equipment), SIGMODE must be "A", "AB" or "NOSIG".

If SIGMODE is "NOSIG", C INT SIG and NC INT SIG must be 00, and C FINAL SIG and NC FINAL SIG must be 11.

If SIGMOD is "ABCD", C INIT SIG, NC INIT SIG, C FINAL, and NC FINAL SIG must be either 0000, 0010, 0101, 1010, or 1111.

If SIGMOD is "A", C INIT SIG, NC INIT SIG, C FINAL, and NC FINAL SIG must be either 00 or 11.

If SIGMOD is "AB", C INIT SIG, NC INIT SIG, C FINAL, and NC FINAL SIG must be either 00, 01, 10, or 11.

For 5E10 and later, when NAILUP forms have a C OE or NC OE of "G" indicating an IDCU OE, and the corresponding RTERM form has RT INTERFACE set to TR008, the SIGMODE on the NAILUP forms must be "A", "AB" or "NOSIG".

Copyright © 2003 Lucent Technologies

2.22 HAIRPIN

Description: Is this connection a hairpin?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "N" for all non-IDCU equipment types.

When HAIRPIN is "Y", C LOSS and NC LOSS must be 0.0.

When HAIRPIN is "Y", the C OE and NC OE must be on the same SM and IDCU.

When HAIRPIN is "Y", C PATH2 DS0 must be 0-18.

2.23 DDS

Description: Is Digital Data Service used?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DDS is "N", PATH NUM must be 1.

If DDS is "Y", SIGMODE must be NOSIG.

If DDS is "Y" and HAIRPIN is "N" and OE is not "A", PATH NUM must be 1.

2.24 PATH NUM

Description: Enter the number of channels (paths) used in the hairpin or nailup.

Required Field.
Default: 1
Valid Entries: 1 or 2

Data Rules:

PATH NUM must be 1 for all nailup ports.

When PATH NUM is 1, C PATH2 DS0 and NC PATH2 DS0 must not be entered.

When PATH NUM is 2 and C OE is "A", C LOSS must be 0.0.

When PATH NUM is 2 and HAIRPIN is "N", C OE and NC OE must both have an OE type of "A" and must both be on the same SM.

For 5E13 and later, when PATH NUM is 2 and HAIRPIN is "N":

- C OE and NC OE must both have an OE type of "A", "D", or "N".
- and C OE or NC OE is either "D" or "N", then C OE and NC OE must have an equipment type of "A".

Copyright © 2003 Lucent Technologies

- and C OE or NC OE is "D", the DCHAN portion of the DEN must not be 24 or 48.
- and C OE or NC OE is "N", the DS0 portion of the NEN must not be 24.

The value of 2 is only valid for Dual Path DDS terminating on TR008 RTs or on PUB43801 facilities.

If PATH NUM is 2, and C OE or NC OE is either a PUB43801 or on a TR008 RT, the port subsequent to C OE or NC OE must exist and must not be used on any of the LINE or MLHLN forms.

For 5E9(1) and later, if PATH NUM is set to 2 and the CONTROLLING or NON-CONTROLLING OE-types/numbers have RT INTERFACE set to "TR008", this combination indicates a dual path digital data service. Dual path digital data services require consecutive equipment numbers. Therefore, the corresponding ILENs are defined on a RTERM form cannot have CU XX/YY set to

- "COIN"
- "FXS"
- "FXSLS"
- "DIDDPT"

because these are single-channel Channel Units, which have only one equipment number defined and are therefore invalid for dual path digital data services. The corresponding ILEN on a RTERM form is found by matching the first three digits of C OE, the fourth digit of C OE, and the fifth and sixth digits of C OE from the NAILUP form to SM, UNIT NUMBER, and RT EX on the RTERM form, respectively. The matching channel unit (CU XX/YY) is found by matching the seventh and eight digits of C OE, when C OE TYPE is "M", or the nineth and tenth digits of C OE, when C OE TYPE is "G", to XX in CU XX/YY where the value of YY is XX + 1.

For 5E9(1) and later, when the NAILUP form PATH NUM is set to 2, the last two digits of the OE (used to assign time slots) for a TR008 (Mode-I) are restricted from using time slots 19, 22 or 23. The following list of last two digits will result in the use of one of these time slots and is therefore invalid: 11, 21, 23, 35, 45, 47, 59, 69, 71, 83, 93, or 95.

For 5E9(2) and earlier, if PATH NUM is 2, and C OE or NC OE is on a TR008 RT, the C OE or NC OE must be an odd line number (e.g., C OE {7,8} must be an odd number when C OE or NC OE is "M" or C OE or NC OE {7,10} must be an odd number when C OE or NC OE type is "G").

For 5E10 and later, when the NAILUP form has PATH NUM set to 2 (indicating dual-DDS Hairpin) and C OE is on a TR008 Remote Terminal, this requires C OE to be an odd line number, i.e. C OE[8,11] must be an odd number when C OE type is "G".

For 5E10 and later, when the NAILUP form PATH NUM is set to "2" (indicating dual-DDS Hairpin) and NC OE is on a TR008 Remote Terminal, this requires NC OE to be an odd line number. i.e. NC OE[8,11] must be an odd number when NC OE type is "G".

If PATH NUM is 2 for CONTROLLING OE entries on a NAILUP form, then the associated C PATH DS1 value cannot match the PROT LINE field on the corresponding RTERM form. The RTERM form corresponds if the first 3 digits of the C OE on this form matches the entry in the SM field on the RTERM form. In addition for the NON-CONTROLLING OE entries on a NAILUP form, if PATH NUM is 2, the associated NC PATH DS1 value cannot match the PROT LINE field on the corresponding RTERM form.

2.25 DSC NUM

Description: When the 5ESS Switch serves as a DCS (Digital Cellular Switch), the DSC NUM field is used to assign a number to a Dedicated Switch Connection between a cell site and an ECP (Executive Cellular Processor) complex. Its value must be entered when the nailup is a dedicated switch connection.

Software Release: 5E9(1) and later
Valid Entries:

Copyright © 2003 Lucent Technologies

5E12 and earlier: 1 - 444
5E13 and later: 1 - 9999

Data Rules:

The DSC NBR must be unique or blank.

When DSC NUM is entered, the controlling and non-controlling OEs must both be DENs and DSC trunks. For the controlling OE, the DEN on the TRUNK form must match the C OE on the NAILUP form; the TRKCLS on the corresponding TKGRP form (TGN on the TKGRP form matches the TGN on the TRUNK form) must be "DSC". Likewise, for the non-controlling OE, the DEN on the TRUNK form must match the NC OE on the NAILUP form; the TRKCLS on the corresponding TKGRP form must be "DSC".

SEC. 2G: 5271-1 RECORD
TRUNK EQUIPMENT NUMBER RECORD

1. GENERAL

The 5271-1 Record is an output-only record and is used to identify the location of analog trunk equipment.

Digital Trunks use digital equipment which is identified on the Digital Equipment Record (5271-2 Record). Analog and Digital trunks may be combined in the same Trunk Group. Logical Test Port trunks use a Logical Test Port location and are identified on the Logical Test Port Record (5271-3 Record).

1.1 Restrictions

Any SM that is fully loaded with trunks, is required to allow one time slot for idle code and one for audible ring. This means that 510 trunks are the maximum number of trunks available for assignment rather than 512, which is the total number of time slots in an SM. 8 Trunk Units per SM or 1 DLTU with 8 DFIs, plus 5 trunk units per SM, are examples of an SM fully loaded with trunks.

An Analog Trunk equipment location consists of:

TRUNK EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 48 (CM1)
			1 - 192 (CM2)
Trunk Unit	TU	X	0 - 7
Service Group	SG	X	0 - 1
Pack	PACK	X	0 - 7
Circuit	CKT	X	0 - 3

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

The Base and Control Number and Office Name appear on each page of the record.

2.2 SM

Description: This field contains the Switching Module Number. For offices equipped with CM1 (Communication Module 1), the valid values are 1 - 48. For offices equipped with CM2 (Communication Module 2), the valid values are 1 - 192.
Valid Entries: 1 - 192

2.3 TRUNK UNIT

Description: This field contains the Trunk Unit Number.
Valid Entries: 0 - 7

2.4 SWITCH GROUP

Description: This field contains the Switch Group Number.
Valid Entries: 0 - 1

2.5 PACK

Description: This field contains the pack numbers 0 - 7, which are preprinted on the 5271-1 Record.

2.6 CKT

Description: This field contains the circuit numbers 0 - 3, which are preprinted on the 5271-1 Record.

Valid KEY 2 Entries

Entry	Definition
TERM	MLHLN Form
MEMB	TRUNK Form

2.10 QTY

Description: The QTY field applies only to the TRUNK form and is a method of defining up to 24 trunks, with consecutive physical locations, at a time. QTY specifies the number of trunk member defined.
Valid Entries: 1 - 24

2.11 REMARKS

Description: This field contains any comments deemed locally necessary.

Copyright © 2003 Lucent Technologies

SEC. 2H: 5271-2 RECORD
DIGITAL EQUIPMENT NUMBER RECORD

1. GENERAL

The 5271-2 Record is an output-only record and is used to identify the location of digital trunk equipment.

Analog Trunks use analog equipment which is identified on the Trunk Equipment Record (5271-1 Record). Analog and Digital trunks may be combined in the same Trunk Group. Logical Test Port trunks use a Logical Test Port location and are identified on the Logical Test Port Record (5271-3 Record).

1.1 Restrictions

Any SM that is fully loaded with trunks, is required to allow one time slot for idle code and one for audible ring. This means that 510 trunks are the maximum number of trunks available for assignment rather than 512, which is the total number of time slots in an SM. An SM with 1 DLTU which has 8 DFIs, plus 5 TUs, is an example of a SM that is fully loaded with trunks.

Care should also be taken when assigning digital channels. The sequence in which the channels are transmitted depends on the type of carrier system. Refer to Figure 1 for the sequences.

A Digital Equipment Location consists of an 8-digit number in the following format.

DLTU (Digital Line Trunk Unit)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Digital Line Trunk Unit	DLTU	X	0 - 5
Digital Facility Interface	DFI	XX	01 - 10
Digital Channel	CHAN	XX	01 - 48

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

The Base and Control Number and Office Name appear on each page of the record.

2.2 SM

Description: This field contains the Switching Module Number. In an office equipped with CM1 (Communication Module 1), the valid values are 1 - 48. In an office equipped with CM2 (Communication Module 2), the valid values are 1 - 192.
Valid Entries: 1 - 192

2.3 DLTU

Description: This field contains the Digital Line Trunk Unit Number.
Valid Entries: 0 - 5

2.4 DFI

Description: This field contains the Digital Facility Interface Number.
Valid Entries: 1 - 10

2.5 DIGITAL CHANNEL

Description: The Digital Channel Number assignments depend on the type of carrier system being used for that Trunk Group. The difference in the sequence in which the digital channels are transmitted for D4, D2 and D1D are illustrated in Figure 1 .

SEC. 2I: 5271-3 RECORD
LOGICAL TEST PORT RECORD

1. GENERAL

The 5271-3 Record is an output-only record and is used to identify the Logical Test Port locations. Software-only trunks require an LTP assignment.

Digital and Analog equipment assignments are identified on the 5271-1 and 5271-2 Records, respectively.

The following trunk classes require a Logical Test Port Assignment: "LTPMSU", "LTPALIT", "LTPROTL", "LTPICTC", "LTPWSTTF", "LTPOGTC", "LTPCLBCK", "LTPDCJCK", "LTPOTOTF", "LTPESTF", "LTPDGTTF", "LTPDCTU", "LTPS96TF", "LTPISTFL", "LTPISTFX" and "LTPDFTAC".

A Logical Test Port location consists of the following components.

LOGICAL TEST PORT			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Logical Test Port	LTP	XXX	0-255

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

The Base and Control number and Office Name appear on each page of the record.

2.2 SM

Description: This field contains the Switching Module Number. In an office equipped with CM1 (Communication Module 1), the valid values are 1 - 48. In an office equipped with CM2 (Communication Module 2), the valid values are 1 - 192.
Valid Entries: 1 - 192

2.3 LTP

Description: This field contains the Logical Test Port Number.
Valid Entries: 0 - 255

2.4 TRK GRP NUM

Description: This field contains the Trunk Group Number assigned to each LTP location. Trunk Group Numbers exceeding 999 are allowed only if the range from 1 - 999 has been exhausted.
Valid Entries: 1 - 2000

2.5 TRK MEM NUM

Description: This is the Trunk Member Number assigned to each LTP location. Trunk members exceeding 999 are allowed only if the range from 0 - 999 has been exhausted.
Valid Entries: 0 - 2047

2.6 REMARKS

Description: This field may contain any comments deemed locally necessary.

Copyright © 2003 Lucent Technologies

SEC. 2K: 5209 RECORD
EDSL CALL-BY-CALL FEATURES FORM - TKEDSLD

1. GENERAL

The 5209 Record is available with 5E4(2) and later Software Releases, defines EDSL (Extended Digital Subscriber Line) Call-by-Call features assigned to a B-channel trunk group.

Call-by-Call feature allows a trunk group to be assigned multiple features. Any trunk in a Call-by-Call group can be used for any Call- by-Call feature subscribed to by the group.

In order to have these Call-by-Call SFGs assigned to a trunk group, the TGN must be defined on a TKGRP form (5202 Record) with a TRKCLS of "EDSL" or "EDSLHM", and "Y" entered in the CBC field.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.34.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group number.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The value entered here must be defined on a TKGRP form where, for 5E9(1) and later, CBC must be set to "Y".

When TGN(s), NET SPEC FAC TYPE(s), BAND(s), and CARRIER ID(s) are assigned on the TKEDSLD form, the corresponding CARRIER ID(s) on the ICF form with FEAT GRP set to "D" must be defined.

2.3 * NET SPEC FAC TYPE

Description: Enter the EDSL Call-by-Call service type.

Valid NET SPEC FAC TYPE Entries

Entry	Definition
M800 or M8	Software Release: 5E6 and later. Megacom 800 Service.
MAXOWATS or MA	Maximal band OUTWATS uses the maximum band that's subscribed to the trunk group.
OPOTS or OP	Originating POTS.
ORIGFX or ORIGF	Software Release: 5E9(1) and later. Originating from PRI to FX.
ORIGTIE or ORIGT	Software Release: 5E9(1) and later. Originating from PRI to Tie.
OWBAND or OW	OUTWATS with a specific band number.
SDN or S	Software Release: 5E6 and later. Software Defined Network Service.
TERMFX or TERMF	Software Release: 5E9(1) and later. Terminating from FX to PRI.
TERMTIE or TERMT	Software Release: 5E9(1) and later.

Copyright © 2003 Lucent Technologies

	Terminating from Tie to PRI.
TPOTS or TP	Terminating POTS including DID.
HM	Software Release: 5E11 and later. Hotel Motel This entry supports the ISDN PRI Hotel/Motel and Selected Class of Call Screening secured feature, see Diviision 2, Section 4A219.
SCOCS	Software Release: 5E11 and later. Selected Class of Call Screening This entry supports the ISDN PRI Hotel/Motel and Selected Class of Call Screening secured feature, see Diviision 2, Section 4A219.

Data Rules:

For 5E11 and later, the number of unique combinations of NET SPEC FAC TYPE, BAND, CARRIER ID, FACILITY NBR, BEARER CAP and SCOCS SERVICE cannot exceed 1023 for all the TKEDSLD forms.

If NET SPEC FAC TYPE is "OWBAND", then BAND must be entered. Otherwise, BAND must not be entered.

For 5E11 and later, when NET SPEC FAC TYPE is "HM" or "SCOCS", BEARER CAP must be entered.

For 5E11 and later, when NET FAC TYPE is "SCOCS", SCOCS SERVICE must be entered.

If "TERMFX", "TERMTIE", or "TPOTS" is entered, TRK DIR on the TKGRP form must be "2W" or "OUT".

If "OPOTS", "ORIGFX", "ORIGTIE", "OWBAND", "MAXOWATS", "SDN", or "M800" is entered, TRK DIR on the TKGRP form must be "2W" or "INC".

If "OPOTS", "OWBAND", "MAXOWATS", "SDN", or "M800" is entered, the MC RTI value on this form must be defined on an MCRTIDX form (5304 Record). The SFG NUMBER on the MCRTIDX form must be defined on a PFASFG form (5609-3 Record) where the SCRN IDX is entered.

For 5E9(1) and later, if NET SPEC FAC TYPE is "ORIGFX", "ORIGTIE", "TERMFX", or "TERMTIE", FACILITY NBR must be entered.

When the TKEDSLD forms have a NET SPEC FAC TYPE of "ORIGFX", "ORIGTIE", "TERMFX" or "TERMTIE", and the MC RTI has been defined on a MCRTIDX form with a MC ROUTE TYPE of "SFG", the SFG NUMBER on the MCRTIDX form must be defined on a PFASFG form whose SFG TYPE must be one of the following values based on NET SPEC FAC TYPE on the TKEDSLD form:

Valid NET SPEC FAC TYPE and SFG TYPE Combinations

NET SPEC FAC Type	SFG Type
ORIGFX	OUTFX or 2WFX
TERMFX	INFX or 2WFX
ORIGTIE	OUTTIE or 2WTIE
TERMTIE	INTIE or 2WTIE

- ***NOTE:*** In all cases, BAND and CARRIER ID will not have been entered on the TKEDSLD form.

For 5E11 and Later:
ISDN PRI Hotel/Motel and Selected Class of Call Screening are secured features. They must be purchased before "HM" or "SCOCS" can be entered in the NET SPEC FAC TYPE field on the TKEDSLD form. A SFSYS form must exist with SFID 219 ACT set to "Y".

When the TKEDSLD forms have a NET SPEC FAC TYPE of "TERMFX", "TERMTIE" or "TPOTS", the associated TKGRP form TRK DIRs must be "2W" or "OUT".

When the NET SPEC FAC TYPE field on the TKEDSLD input form is equal to "OPOTS", "OWBAND", "MAXOWATS", "SDN" or "M800", the SCRN IDX field on the PFASFG input form must be entered. The MC RTI field on the TKEDSLD must match the MC ROUTE INDEX field on the MCRTIDX input form. In turn, the corresponding SFG NUMBER field on the MCRTIDX form must match the SFG NBR field on the

Copyright © 2003 Lucent Technologies

PFASFG input form.

When the TKEDSLD forms TGN(s), BAND(s), CARRIER ID(s), MC RTI(s) are assigned and NET SPEC FAC TYPE is equal to :

- "OPOTS" or "TPOTS" and on the corresponding MCRTIDX form and MC ROUTE TYPE equals "SFG", the SFG NUMBER(s) on the MCRTIDX form must have a corresponding SFG NBR defined on the PFASFG form, where SFG TYPE equals "EDSL".
- "SDN", and on the corresponding MCRTIDX form and MC ROUTE TYPE equals "SFG", the SFG NUMBER(s) on the MCRTIDX form must have a corresponding SFG NBR defined on the PFASFG form, where SFG TYPE equals "SDN".
- "M800", and on the corresponding MCRTIDX form and MC ROUTE TYPE equals "SFG", the SFG NUMBER(s) on the MCRTIDX form must have a corresponding SFG NBR defined on the PFASFG form, where SFG TYPE equals "M800".
- "MAXOWATS" or "OWBAND" and on the corresponding MCRTIDX form and MC ROUTE TYPE equals "SFG", the SFG NUMBER(s) on the MCRTIDX form must have a corresponding SFG NBR defined on the PFASFG form, where SFG TYPE equals "OUTWATS".

When the TKEDSLD form has NET SPEC FAC TYPE set to "HM" or "SCOCS" and BEARER CAP is set to "56CLR", the corresponding TKGRP form where TGN matches the TGN on the TKEDSLD form, the value of DATA RATE must be entered.

When the TKEDSLD form has a NET SPEC FAC TYPE of "HM" or "SCOCS", and the MC RTI has been defined on a MCRTIDX form with a MC ROUTE TYPE of "SFG", the SFG NUMBER on the MCRTIDX form must be defined on a PFASFG form where SFG TYPE matches NET SPEC FAC TYPE on the TKEDSLD form.

2.4 (*) BAND

Description: Enter the OUTWATS band number.
Valid Entries: 0 - 255

Data Rules:

If NET SPEC FAC TYPE is "OWBAND", then BAND must be entered. Otherwise, BAND must not be entered.

2.5 (*) CARRIER ID

Description: Enter the InterLATA Carrier ID.
Valid Entries:
- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

When CARRIER ID is entered, it must be defined on an ICF form (5305-1 Record); for 5E8 and later, FEAT GRP on the ICF form must be "D". CARRIER ID must also be entered on an MCRTIDX form (5304 Record) where the MC ROUTE TYPE is "SFG".

2.6 (*) FACILITY NBR

Description: Enter the Facility number for the FX or Tie trunk group.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later
Valid Entries: 1 - 99999

Data Rules:

When FACILITY NBR is entered, NET SPEC FAC TYPE must be "ORIGFX", "ORIGTIE", "TERMFX", or "TERMTIE".

2.7 (*) BEARER CAP

Description: The BEARER CAP field is used to specify the bearer capability being used during the call to determine voice or data and the speed at which data is sent.

Software Release: 5E11 and later
Valid Entries:

Valid BEARER CAP Entries

Entry	Definition
SPEECH	Speech bearer capability
3PT1KHZ	3.1 kHz Audio bearer capability
56CLR	56-kbps clear bearer capability
64CLR	64-kbps clear bearer capability

Data Rules:

When BEARER CAP is entered, NET SPEC FAC TYPE must be "HM" or "SCOCS".

When the TKEDSLD forms have BEARER CAP set to "64CLR", the corresponding (TGN on the TKEDSLD matches TGN on the TKGRP) TKGRP forms DATA RATE field must be "64K".

2.8 (*)SCOCS SERVICE

Description: The SCOCS SERVICE field is used to specify the service identification level associated with the SCOCS (Selected Class Of Call Screening) service.

Software Release: 5E11 and later
Valid Entries: 1 to 99999, or leave blank

Data Rules:

When SCOCS SERVICE is entered, NET SPEC FAC TYPE must be "SCOCS".

2.9 # MC RTI

Description: Enter the route index for the NET SPEC FAC TYPE.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

MC RTI must be defined as the MC ROUTE INDEX on an MCRTIDX form where the TRUNK GROUP NUMBER is not entered and "SFG" or "REORD" is entered in the MC ROUTE TYPE field.

For valid NET SPEC FAC TYPE and SFG TYPE combinations, see table in Section 2.3 .

Copyright © 2003 Lucent Technologies

When the CARRIER IDs and MC RTIs are assigned on the TKEDSLD form, the MC RTI should be defined on a MCRTIDX form, with the same CARRIER ID assigned and MC ROUTE TYPE equal to "SFG".

SEC. 2L: 5210 RECORD
INTER SM TRUNKING - IMTRK

1. GENERAL

The 5210 Record is available with 5E5 and later Software Releases.

This form is used to define each terminating end for inter-module trunk group members. The inter-module trunk groups entered on this form must be defined on a TKGRP form (5202 Record) with "Y" in the INTER SM TRK field.

For the TGN and MATE TGN to exist simultaneously, the following must be true: one must be an incoming trunk and the other an outgoing trunk, or both must be 2-way trunks.

For more information on Inter-module Trunking, please refer to Division 2, Section 1n.

1.1 Recent Change View

The Recent Change View corresponding to this form is 5.46.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: Enter the Switching Module associated with the inter-module trunk.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM must be defined on an EQIM form (5700-1/2 Record). The SM entered in this field cannot be the same as the SM entered in the MATE SM field.

2.3 * TGN

Description: Enter the Trunk Group Number associated with the inter-module trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN entered cannot be the same as the TGN entered in the MATE TGN field. The TGN/MEMB must not be duplicated on another IMTRK form.

For 5E7 and later, if SM/TGN/MEMBs and MATE SM/TGN/MEMBs are assigned on the IMTRK form, then the SM value must match the first three digits of a TEN, DEN, or (for 5E9(2) and later) NEN and TGN/MEMBs must match TGN/MEMB entry on a TRUNK form.

Copyright © 2003 Lucent Technologies

2.4 * MEMB

Description: Enter the Trunk Group Member associated with the inter-module trunk.

Required Field.
Valid Entries: 0 - 1951

2.5 # MATE SM

Description: Enter the Switching Module associated with the other end of the inter-module trunk group. MATE SM indicates where the other end of this inter-module trunk group member physically terminates.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM must be defined on an EQIM form (5700-1/2 Record).

For 5E7 and later, if SM/TGN/MEMBs and MATE SM/TGN/MEMBs are assigned on the IMTRK form, then the SM value must match the first three digits of a TEN, DEN, or (for 5E9(2) and later) NEN and TGN/MEMBs must match TGN/MEMB entry on a TRUNK form.

2.6 # MATE TGN

Description: Enter the Trunk Group Number associated with the other end of the inter-module trunk group.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The MATE TGN/MEMB must not be duplicated on another IMTRK form.

2.7 # MATE MEMB

Description: Enter the Trunk Group member associated with the other end of the inter-module trunk group.

Required Field.
Valid Entries: 0 - 1951

SEC. 2M: 5211 RECORD
PRIMARY RATE INTERFACE GROUP ASSIGNMENT - PRIGRP

1. GENERAL

This record is available for the 5E9(1) and later Software Releases. Prior to 5E9(1), the D-channel signaling entity only assigns calls to channels on the DS1 facility containing that D-channel. This is called FAS (Facility Associated Signaling) which supports the following configuration:

- 1 D-channel and up to 23 B-channels.

The 5E9(1) and later Software Release continues to support this configuration (referred to as "Custom") which is CCITT and ANSI compatible but not compatible with Bellcore's expansion of these standards.

For 5E9(1) and later, National ISDN PRI is available which is compatible with Bellcore's current technical requirements (i.e., TR1268).

1.1 NFAS (Non-Facility Associated Signaling)

The National ISDN PRI feature allows the D-channel signaling entity to assign calls to B-channels on more than one facility (including the one containing the D-channel). This is referred to as NFAS. Specifically, National ISDN PRI supports the following PRI configurations:

- 1 D-channel and up to 23 B-channels (supports Bellcore requirements); without NFAS.
- 1 D-channel and up to 479 B-channels; with NFAS.
- 2 D-channels and up to 478 B-channels; with NFAS and D-Channel Backup.

1.2 D-Channel Backup Option

When NFAS is employed, the reliability of the signaling performance for the PRIs controlled by the D-channel may be unacceptable. The DCBU capability is suggested to improve the reliability of the D-channel control signaling.

DCBU permits continued access to the network, even if one of the D-channels fails, by transferring the signaling information to a back-up D-channel. DCBU allows a customer to designate a pair of D-channels in separate DS1 facilities as a mated pair. Both D-channels must terminate on the same SM.

1.3 Recent Change View

The corresponding Recent Change view for this form is 5.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 *PRI GROUP

Description: Enter the PRI GROUP number.

Required Field.
Valid Entries:

Copyright © 2003 Lucent Technologies

- For 5E9(2) and earlier: 1 - 4096
- For 5E10 and later: 1 - 4095

2.3 #PRI TYPE

Description: Enter the PRI TYPE.

Required Field.

Valid PRI TYPE Entries

Entry	Definition
CUSTOM or C	Custom (AT&T/ LUCENT). Compatible with CCITT and ANSI standards; not compatible with Bellcore expansion on these standards.
STD or S	National ISDN PRI (standard Bellcore compatible).

Data Rules:

For 5E10 and later, when the TGN/MEMBs on the TRUNK form have an entry for DEN, PRI GROUP entered and DCHN DESG is left blank (This defines an EDSL B-channel trunk), and the two right-most digits of DEN, entered on the TRUNK form, are set to 24 or 48, the PRI GROUP, entered on the TRUNK form, must be defined on a PRIGRP form. Therefore, the PRI TYPE on the PRIGRP form must be set to "STD".

NOTE: An asterisk (*) preceding a DEN specifies that it was generated automatically from the TRUNK form because QTY was greater than 1.

If PRI TYPE is "CUSTOM", exactly one facility in FACILITY LIST must be entered. If PRI TYPE is "STD", at least one facility in FACILITY LIST must be entered.

When PRI TYPE is "CUSTOM", B CHAN SERV must be blank.

For 5E12, when PRI TYPE is "CUSTOM", STD NSF IE must be "N".

For 5E13 and later, when PRI TYPE is "CUSTOM", STD NSF IE must be "N" or not entered.

2.4 B CHAN SERV

Description: Can B-Channel Service messages be sent to a STD PRI? This field supports the B-Channel Availability Signaling Procedures feature and is valid only with a "STD" PRI TYPE. This field interacts with the RETRY SERV field on the ISDNOPT form (5941 Record).

For more information on the B-Channel Signaling Availability Procedures feature, see Division 2, Section 6I.

Software Release: 5E12 and later
Valid Entries: Blank, Y, N

Data Rules:

When B CHAN SERV is entered, PRI TYPE must be "STD".

When this field is blank, B CHAN SERV is not activated.

When "Y" is entered, PRI TYPE must be "STD". When "N" (or blank) is entered, PRI TYPE must be "STD".

2.5 STD NSF IE

Description: This field is used to specify whether a PRI (Primary Rate Interface) group will use Bellcore

Copyright © 2003 Lucent Technologies

Standard NSF IE Interpretation. This field option is only available for National or Standard ISDN (Integrated Services Digital Network) PRIs.

Software Release: 5E12 and later
Default: N (5E12), or Blank (5E13)
Valid Entries: Y, N (5E12) or Blank, Y, N (5E13)

Data Rules:

For 5E12 and later, when STD NSF IE is "Y", PRI TYPE must be "STD".

D-CHANNEL INFORMATION

The DCHN DESG, TGN and MEMB NBR fields are accessed via the Recent Change view; they are shown here for display only.

TBCT SERVICE PARAMETERS

The following fields (Section 2.6 - Section 2.9) define the Two B-Channel Transfer calls allowed over an ISDN (Integrated Services Digital Network) PRI (Primary Rate Interface).

2.6 TBCT ACTIVE

Description: The TBCT ACTIVE field indicates if TBCT is active on this PRI group.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y,N

Data Rules:

The ACT field for SFID 214 must be set to "Y" on the SFSYS form before the TBCT ACTIVE can be set to "Y" on the PRIGRP form.

2.7 MAX ACT TBCT

Description: The MAX ACT TBCT field indicates the maximum number of active transfers allowed.

Software Release: 5E13 and later
Default: 0
Valid Entries: Blank (for no limit), 0 - 60000

2.8 MAX TBCT REQS

Description: The MAX TBCT REQS field indicates the maximum valid transfer requests accepted per 10 second intervals.

Software Release: 5E13 and later
Default: 0
Valid Entries: Blank (for no limit), 0 - 500

2.9 TBCT SERV GRP

Description: The TBCTSERVGRP field indicates the TBCT service group number to which this PRI group is assigned.

Software Release: 5E13 and later

Copyright © 2003 Lucent Technologies

Valid Entries: Blank, 1 - 99999

Data Rules:

A maximum of 100 PRIGRP forms are allowed in a TBCT SERV GRP.

In order to be in the same TBCT SERV GRP, SM in ROW 1 of the FACILITY LIST must be the same for all PRIGRP forms.

2.10 NOTIFY CTRL

Description: Should the controller be notified of the clearing of a transferred call?

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY CTRL is "Y", TBCT ACTIVE must be "Y".

The ACT field for SFID 214 must be set to "Y" on the SFSYS form before the NOTIFY CTRL can be set to "Y" on the PRIGRP form.

FACILITY LIST (FACLIST)

The following fields (Section 2.11 - Section 2.16) define the facilities (T1s) that may be assigned to a PRI Group. If any D-channel or B-channel trunk member is added to the PRI, the corresponding equipment number (the combination of SM, DLTU, DFI and FAC) must exist on this list. When a facility list row is entered, all facility list items must be entered for that row. SM, DLTU, DFI and FAC combinations must also be unique. The SM, DLTU, DFI and FAC combination must be defined on a EQDUP form (5730 Record) as SM, DLTU and DFI PACK NBR, and FAC IND, respectively.

For 5E10 and later, the DLTU, DFI and FAC fields have been replaced with the EQUIPMENT field. This modification allows the assignment of DNU-S facilities to a PRI group.

2.11 SM

Description: Enter the Switching Module number.
Valid Entries: 1 - 192

Data Rules:

The SM value must be the same for all facilities in the list.

For 5E9 and later, each value of SM entered on the FACILITY LIST must have a corresponding EQIM form with the same SM value where the value entered for EQSTATUS is "O" and the value entered for CONFIGURATION supports Primary Rate Interface groups.

2.12 DLTU

Description: Enter the Digital Line/Trunk Unit number.

Software Release: 5E9(2) and earlier
Valid Entries:
- 5E14 and earlier: 0 - 5
- 5E15 and later: 0 - 11

Copyright © 2003 Lucent Technologies

Data Rules:

The DLTU, DFI and FAC combination must be unique for each row within that PRI group.

2.13 DFI

Description: Enter the Digital Facility Interface pack number.

Software Release: 5E9(2) and earlier
Valid Entries: 1 - 10.

Data Rules:

The DLTU, DFI and FAC combination must be unique for each row within that PRI group.

2.14 FAC

Description: Enter the Facility number. FAC 0 is for channels 1-24 and FAC 1 is for channels 25-48.

Software Release: 5E9(2) and earlier
Valid Entries: 0 - 1

Data Rules:

If a PRI group is assigned, at least one facility must be assigned. The DLTU, DFI and FAC combination must be unique for each row within that PRI group.

When FAC is 0, DFI USAGE on the EQDUP form (5730 Record) for FAC 0 must be "TRUNK" and EQUIPMENT STATUS must be "O".

When FAC is 1, DFI USAGE on the EQDUP form for FAC 1 must be "TRUNK" and EQUIPMENT STATUS must be "O".

2.15 EQUIPMENT

Description: Enter the Equipment Number. The EQUIPMENT field is used to specify the equipment number (composite equipment number consisting of Equipment Type and Equipment Number). Enter EQUIPMENT in the following format:

Software Release: 5E10 and later
Valid Entries:

Valid Equipment Type Entries

Entry	Definition
DLTU	Digital Trunk Equipment Number for PRI
DNUS	Networking Equipment Number
OIU	Optical Interface Unit
PLTU	PCT Line/Trunk Unit Equipment
VIRT	Virtual Equipment.

If Equipment Type is set to "DLTU", this Equipment Number consists of:

Equipment Number, Type DLTU

Equipment		Format	Valid Entries
Digital Line Trunk Unit	DLTU	X	0 - 5 (5E14 and earlier)
		XX	0 - 11 (5E15 and later)
Digital Facility Interface	DFI	XX	01 - 10
Facility	FAC	X	0 - 1

Copyright © 2003 Lucent Technologies

If Equipment Type is set to "DNUS", this Equipment Number consists of:

Equipment Number, Type DNUS - 5E12 and earlier

Equipment		Format	Valid Entries
Digital Networking Unit - SONET	DNUS	X	0 - 7
Data Group	DG	X	0 - 1
Synchronous Transport Signal number	STS	X	0 - 5
Virtual Tributary	VT	XX	01 - 28

Equipment Number, Type DNUS - 5E13 and later

Equipment		Format	Valid Entries
Digital Networking Unit - SONET	DNUS	X	0 - 7
Data Group	DG	X	0 - 1
Synchronous Termination Equipment number	STE	X	1 - 6
Synchronous Transport Signal number	STS	X	1
Virtual Tributary Group	VTG	X	1 - 7
Virtual Tributary Member	VTM	X	1 - 4

When OE TYPE is "O", the OIU Equipment Number consists of:

OE NUMBER, TYPE "O" - (5E16(2) and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	OIU	X	0 - 7
ProtectionGroup	PG	X	0 - 9
SONET Terminating Equipment	STE	X	1
High Level Virtual Container	HVC	X	1 - 3
Low Level Virtual Container Group	LVC GRP	X	1 - 7
Low Level Virtual Container Member	LVC MEM	X	1 - 4
Channel	CH	XX	01 - 24

Data Rules:

SM and EQUIPMENT combinations in FACILITY LIST must be unique.

When EQUIPMENT Type or EQUIPMENT Number is entered, both must be entered.

For 5E10 and later, when the PRIGRP forms have FACILITY LIST entries assigned, with EQUIPMENT Type of "DLTU". The SM/EQUIPMENT NUMBER[1,1] / EQUIPMENT NUMBER[2,3] entered on the PRIGRP form, must be defined on an EQDUP form as SM/DLTU/DFI PACK NBR.

When EQUIPMENT NUMBER[4,4] on the PRIGRP form is 0, then under the FAC 0 header on the EQDUP form DFI USAGE must be "TRUNK" and EQUIPMENT STATUS must be "O".

When EQUIPMENT NUMBER[4,4] on the PRIGRP form is 1, then under the FAC 1 header on the EQDUP form DFI USAGE must be "TRUNK" and EQUIPMENT STATUS must be "O".

For 5E10 and later, PRI GROUPs assigned on TRUNK forms must be defined on a PRIGRP form. When EQUIPMENT TYPE is "DLTU", the corresponding six left most digits of DEN on the TRUNK form must be entered in the PRIGRP form FACILITY LIST as SM | EQUIPMENT NUMBER[1,1] | EQUIPMENT NUMBER[2,3] respectively.

When the two right-most digits of DEN, entered on the TRUNK form, are 1-24 then the corresponding EQUIPMENT NUMBER[4,4] entry on the PRIGRP form must be 0.

When the two right-most digits of DEN, entered on the TRUNK form, are 25-48 then the corresponding EQUIPMENT NUMBER[4,4] entry on the PRIGRP form must be 1.

- ***NOTE:*** An asterisk (*) preceding a DEN specifies that it was generated automatically from the TRUNK form because QTY was greater than 1.

For 5E13 and later, for EQUIPMENT TYPE of "DNUS", the SM, EQUIPMENT NUMBER[1,1], EQUIPMENT NUMBER[2,2], EQUIPMENT NUMBER[3,3], EQUIPMENT NUMBER[4,4], EQUIPMENT

Copyright © 2003 Lucent Technologies

NUMBER[5,5], EQUIPMENT NUMBER[6,6], entered on the the PRIGRP form must be defined on an EQVT form as SM, DNUS, DATA GROUP, STE, STS, VT GROUP AND VT MEMBER, respectively and VT EQSTAT and DS1S EQSTAT must both be "O".

For 5E16 and later, when EQUIPMENT is "VIRT", SERV TYPE must be "CFS" on the ENETLINK form (5827 Record) for SM of the EQUIPMENT number.

For 5E16 and later, EQUIPMENT number with type "OIU" must be unique.

For 5E16 and later, when EQUIPMENT is "OIU", the SM number must have a matching OIU SM, OIU, PROTECTION GRP, HVC, VT GROUP, and VT MEMBER defined on the EQLVC form (5764 Record).

2.16 INTERFACE ID

Description: Enter the Interface Identifier.I NTERFACE ID is not used for Custom PRI message exchange but is provided on this form for data consistency with National ISDN PRIs. It is recommended that 0 be entered for Custom PRIs.

For Standard PRIs, INTERFACE ID is used in message exchange and the assignment of interface IDs per facility must be exactly the same at the switch at the other end of the PRI.
Valid Entries: 0 - 127.

Data Rules:

The INTERFACE ID must be unique for each row within that PRI group.

SEC. 2N: 5212 RECORD
CALLING PARTY NUMBER
SCREENING RANGES FORM - SCRNRNG

1. GENERAL

The 5212 Record is available in 5E6 and later Software Releases. It is used to define ranges of valid telephone numbers which are used to screen CPNs (Calling Party Numbers) delivered over PRIs (Primary Rate Interfaces).

A CO (Central Office) may receive CPNs over a PRI interface from a PBX or other CPE (Customer Premise Equipment). These CPNs are screened to determine if a valid CPN was sent by the PBX or CPE. A CPN must fall within one of the defined SCREENING RANGES to pass screening. A CPN not in one of the defined SCREENING RANGES will fail screening.

To indicate that CPNs received from a PBX or CPE should be screened, the CPN SCRN field should be set to "Y" on the TKGRP form (5202 Record) for the PRI. The PBX/CPE ID value on the TKGRP form above is used as the key to this SCRNRNG form.

It should be noted that the far-end office may not send the CPN in the full 10-digit NPANXXXXXX form (i.e., NPA or NXX may not be included). For administrative purposes, the NPA CODE and OFFICE CODE fields of the NOC (Normalized Office Code) form (5501 Record) should be entered to prevent unintended screening failures.

For a further discussion of the CPN screening feature and its options, consult the CPN SCRN, CPN DISC and MAIN DN fields on the TKGRP form (5202 Record). Additionally, a list of PBX/CPE IDs, the trunk groups that use them, and an indicator identifying whether or not screening has been selected can be obtained from thePBXID form (5213 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 7.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PBX/CPE ID

Description: This field contains the numerical identifier for a PBX or other CPE (Customer Premise Equipment) for which CPN (Calling Party Number)/RN (Redirect Number)/OCN (Original Called Number) screening is to be done.
Valid Entries: 1 - 4095

SCREENING RANGES

This 20-element list contains four fields, NPA, NXX, LOW and HIGH. These fieldsSection 2.3 - Section 2.6 are used to define up to 20 valid phone number ranges. Each SCREENING RANGE spans on one NPA-NXX, and is delimited by the LOW and HIGH boundary fields (inclusive). A range defined as:

NPA	NXX	LOW	HIGH
312	555	4123	7568

will define the telephone numbers (312) 555-4123 through and including (312) 555-7568 as CPNs that will pass screening.

Copyright © 2003 Lucent Technologies

Two SCREENING RANGES list elements cannot overlap. At least one SCREENING RANGES list element must be entered. Each SCREENING RANGES list element must have all or none of its component fields entered. Within a SCREENING RANGE list element, LOW must be less than or equal to HIGH.

2.3 NPA

Description: Enter the Number Planning Area code for the range. Valid NPAs consist of three digits in the format [2-9] [0-1] [0-9].
Valid Entries: 3 digits

- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

2.4 NXX

Description: Enter the office code for the range. Valid NXXs consist of three digits in the format [2-9] [0-9] [0-9].
Valid Entries: 3 digits

2.5 LOW

Description: Enter the last four digits of the lower boundary TN (inclusive). Values entered for LOW must be less than or equal to values entered for HIGH.
Valid Entries: 4 digits

2.6 HIGH

Description: Enter the last four digits of the higher boundary TN (inclusive).
Valid Entries: 4 digits

SEC. 2O: 5213 RECORD
PBX ID ASSIGNMENT RECORD

1. GENERAL

The 5213 Record is an output-only record available with 5E6 and later Software Releases. It is used to display which PBX IDs (Identifiers) have been used, the Trunk Groups that have been assigned these PBX IDs and whether or not CPN screening is being done on the assigned Trunk Groups.

All data for the 5213 Record is entered on the TKGRP form (5202 Record). Further information on the fields used in this record is contained in the TKGRP form.

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

The Base and Control Number and Office Name are specified on each record.

2.2 PBX ID

Description: This field contains the numerical identifier for a PBX or other CPE (Customer Premise Equipment) for which CPN (Calling Party Number) screening is to be done.
Valid Entries: 1 - 4095

2.3 TGN

Description: This field contains the Trunk Group Number which was assigned the PBX ID.
Valid Entries: 1 - 2000

2.4 CPN SCRN

Description: This field indicates whether or not CPNs will be screened for PRIs.
Valid Entries: Y, N

SEC. 2P: 5214 RECORD
LEASED NETWORK ARS GROUP
DEFINITION RECORD - LNARSGD

1. GENERAL

The 5214 Leased Network ARS Group Definition Record is available with 5E6 and later Software Releases. It defines a Leased Network Group, listing all ARS customers that belong to the Leased Network.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * LN GROUP

Description: The LN GROUP name defines a set of ARS Groups that share a Trunk Group, in particular, an LN CCS7 interoffice trunk group.

Required Field.
Valid Entries: 1 - 8 characters.

2.3 ARGPNAME

Description: The ARS Group ID list consists of up to 100 internal ARS Group IDs. The internal ARS Group ID list must contain at least one but no more than one hundred entries. Each entry must be unique.
Valid Entries: 1 - 8 characters

Data Rules:

An ARGPNAME entered on the LNARSGD form must be defined on the ARSGPA form (5608-2 Record) with the LN CUST ID entered.

SEC. 2Q: 5271-4 RECORD
RECORDED ANNOUNCEMENT FUNCTION - RAF

1. GENERAL

The 5271-4 Record is an output-only record and is available with the 5E4(2) and later Software Releases. It shows the RAF (Recorded Announcement Function) equipment location for each member of an announcement trunk group. This record must be referred to when assigning trunks to RAF circuits on the TRUNK form (5204 Record). The Trunk Classes (TRKCLS field on the TKGRP form) for announcement trunks connecting to RAF circuits are "RAFANNC", "RAFCTR" or "RAFDTA".

A RAF equipment location consists of:

RAF			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
RAF Unit Number	□	X	0 - 7
RAF Circuit Number	□	XX	00 - 31

2. RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field contains the Base and Control Number and Office Name on each record.

2.2 SM

Description: This field contains the Switching Module number, which is defined on an EQIM form (5700 Record).
Valid Entries: 1 - 192

2.3 RAF UN

Description: This field contains the Recorded Announcement Function Unit number.
Valid Entries: 0 - 7

2.4 DATA GROUP

Description: This field contains the Data Group Number.
Valid Entries: 0 or 1

2.5 PATTERN

Description: This field contains the stuffing pattern assigned. A value is designated in this field if the RAF TYPE is "CTR" or "DTA". When the RAF TYPE is "ANN", this field is blank.

A stuffing pattern is a mechanism to economize on time slots since not all 32 time slots associated with a PIDB are utilized. DTA/CTR RAFs use less than two-thirds of the time slots associated with their PIDBs and can, therefore, take advantage of stuffing. When three DTA/CTR RAFs exist on the same SM and Data Group, and each RAF uses a different stuffing pattern, two PIDBs worth of time slots are used instead of three.

Channel Assignments for DSU2-RAF DTA Announcement Ports:

CHANNELS

SEC. 2R: 5215 RECORD
UTILITY TELEMETRY TRUNK GROUP FORM - UTTKGRP

1. GENERAL

The 5215 Record is available with the 5E9(2) and later Software Releases. This record is used to define the parameters for a Utility Telemetry Trunk Group.

This form is used for the Suppressed Ringing secured feature. For more information on this feature, see Division 2, Section 4A186.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 (*) TGN

Description: Enter the Trunk Group Number.

Software Release: 5E9(2) and later
Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

When TGN is defined on this form, a TKGRP form must be defined with the same TGN and UTT must be "Y" on the TKGRP form.

Before using this form, the Suppressed Ringing secured feature must be purchased and the SFID 186 ACT field set to "Y" on the SFSYS form (5713-1 Record).

2.3 CTI DIG

Description: Enter the call type information digit off-hook TIU (Telemetry Interface Unit) type.

Software Release: 5E9(2) and later
Required Field.
Default: 70
Valid Entries: 00 - 99

2.4 ST

Description: Enter the ringing duration in milliseconds for a start pulse digit.

Software Release: 5E9(2) and later
Required Field.
Default: 0
Valid Entries: 0 - 999

Copyright © 2003 Lucent Technologies

2.5 STP

Description: Enter the ringing duration in milliseconds for a start pulse prime digit.

Software Release: 5E9(2) and later
Required Field.
Default: 50
Valid Entries: 0 - 999

2.6 ST2P

Description: Enter the ringing duration in milliseconds for a start pulse prime 2 digit.

Software Release: 5E9(2) and later
Required Field.
Default: 100
Valid Entries: 0 - 999

2.7 MAX CALL TIME

Description: Enter the maximum call time duration in seconds.

Software Release: 5E9(2) and later
Required Field.
Default: 20
Valid Entries: 1 - 999 seconds

SEC. 2T: 5217 RECORD
CALL INSTANCE CODE DISTRIBUTION FORM - CICDIST

1. GENERAL

The 5217 Record is available with the 5E15 and later Software Releases. The CICDIST (Call Instance Code Distribution) form specifies SM2000 (Switching Module 2000) modules in an office for CIC block distribution.

This form is used for the ATM Global Routing and Signaling secured feature which is available with 5E15 Feature Release 1. For more information on this feature, see Division 2, Section 4A567.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.70.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: Key for the form.

Software Release: 5E15 and later
Required Field.
Default: 1
Valid Entries: 1

Data Rules:

Key must be 1 for this form.

CIC DISTRIBUTION (CICDIST)

These fields are used to specify SM-2000 modules in an office for CIC (Call Instance Code) block distribution.

2.3 SM2K MODULE

Description: CICDIST is a list of up to 23 SM2000s in the office. The service provider must specify the SM2000 modules over which CICs are to be distributed.

Software Release: 5E15 and later
Required Field.
Valid Entries: Blank, or 1 - 192

Data Rules:

At least 1 SM2000 MODULE number in the CIC DISTRIBUTION list must be entered.

SM2000 MODULES in CIC DISTRIBUTION list must be unique.

The CICDIST form can only be entered when the ACT field for SFID 567 is set to "Y" on the SFSYS form (5713 Record).

Copyright © 2003 Lucent Technologies

Each SM2000 MODULE entered on the CICDIST form must also be defined on the EQIM form (5700 Record) with CONFIGURATION set to "SM2000".

When the CICDEF form is entered, at least one SM2000 MODULE must be provisioned for CIC distribution on the CICDIST form.

2.4 INH DIST

Description: This field indicates whether or not an SM-2000 should use the CIC (Call Instance Code) Redistribution process. This field was added to support the BICC (Bearer Independent Call Control) Static CIC Allocation feature. For more information on this feature, see Division 2, Section 7BF.

Software Release: 5E16 and later
Valid Entries: Y, N

When INH DIST is entered, SM2K MODULE must also be entered.

INH DIST must be "N" for at least one SM2K MODULE.

LTG CIC DISTRIBUTION (LTGCICDIST)

The LTG (Large Terminal Growth) CIC (Call Instance Code) DISTRIBUTION section is a list of up to 23 SM-2000 switching modules in the office over which CICs are distributed. This list is no display and is used only during Large Terminal Growth.

2.5 SM2K MODULE

Description: The SM2K MODULE is a no change field which specifies the SM-2000 modules over which CICs are to be distributed. This field was added to support the Large Terminal Growth for IVTOA (Integrated Voice Telephony Over ATM (Asynchronous Transfer Mode) feature. (For more detailed information on this feature, see Division 2, Section 1CO.

SEC. 2U: 5218 RECORD
BICC GRP CIC DEFINITION FORM - CICDEF

1. GENERAL

The 5218 Record is available with the 5E15 and later Software Releases. The BICC (Bearer Independent Connection Control) Group CIC (Call Instance Code) Definition form is used to populate ATM packet CICs for a BICC group.

This form is used for the ATM Global Routing and Signaling secured feature which is available with 5E15 Feature Release 1. For more information on this feature, see Division 2, Section 4A567.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.72.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * BICC GRP

Description: The BICC GRP field is used to designate the bearer channel which carries voice calls over the packet switched network to a given destination.

Software Release: 5E15 and later
Required Field.
Valid Entries: 7000 - 7999

Data Rules:

Each BICC GRP entered has to be defined as a TGN on the TKGRP form (5202 Record)

2.3 # BASE CIC

Description: The BASE CIC field is used to indicate the base call instance code.

Software Release: 5E15 and later
Required Field.
Valid Entries: 1 - 4294967039 (up to 10 digits)

2.4 # TOTAL CICS

Description: The TOTAL CICS field is used to indicate the number of CICs to be allocated for the BICC GRP.

Software Release: 5E15 and later
Required Field.
Valid Entries: 256 - 65536, in multiples of 128

Data Rules:

TOTAL CICS entered cannot exceed the maximum number of CIC blocks for an office (131072).

WARNING: The maximum number of CIC blocks per SM-2000 module cannot exceed 6000. CIC blocks are displayed on the CICDEF form, where the number of blocks is TOTAL CICS/128. The SM-

SEC. 2X: 5275 RECORD
BLOCKED TRUNK GROUP ASP FCD CODES - TKBLKCD

1. GENERAL

The 5275 Record is available with 5E15 and later Software Releases, and provides private facility trunk groups the capability of blocking selected (unrestricted FCD) triggers by those users who show no interest in using specific services and do not want to access them by inadvertently dialing the trigger code. This form was added to support the ASP Unrestricted FCD Trigger feature. See Division 2, Section 4A572 for more information.

The TKBLKCD form is used by the secured feature ASP Unrestricted FCD Trigger (SFID 572). Therefore, when the TKBLKCD form is used, the ACT field for SFID 572 on SFSYS form must be set to "Y".

1.1 Recent Change View

The corresponding Recent Change Views for this form is 5.65.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number for which certain ASP FCD codes will be blocked.
Valid Entries: Enter 1 - 4000

Data Rules:

When TGN is entered, at least one FCD CODE must be entered.

When URT FCD BLK is "Y" on the TKGRP form, then the corresponding TGN cannot be used on the TKBLKCD form.

When TGN field is entered on the TKBLKCD form, the same TGN must be entered on the TKGRP form and have TRKCLS of "PF", "PFITT" or "PFLASH".

BLOCKED CODES LIST

Field Section 2.3 refers to the BLOCKED CODES LIST, consisting of up to 32 FCD triggers.

2.3 FCD CODE

Description: Enter the ASP unrestricted FCD code to be blocked.
Valid Entries: Enter Blank, or 1 to 7 dialable digits (0 - 9,* or #). If # or * are entered as single characters, they must be preceded by a space.

Data Rules:

At least one FCD CODE must be entered.

FCD CODE must be unique in BLOCKED CODES LIST.

Copyright © 2003 Lucent Technologies

SEC. 2Y: 5221 RECORD
LTG TO PRESERVE SM2K AND CADN FOR BICC - LTGPCI

1. GENERAL

The 5221 Record is available with the 5E15 and later Software Releases. The LTGPCI (Large Terminal Growth to Preserve SM2K and CADN (Call Instance Block Circuit Administration) for BICC (Bearer Independent Call Control Group)) form preserves the SM2K and CADN values during the LTG (Large Terminal Growth) for IVOTA (Integrated Voice and Telephony Over ATM (Asynchronous Transfer Mode)) data.

This form is used for the Large Terminal Growth for IVTOA feature which is available with 5E15 Feature Release 4. For more information on this feature, see Division 2, Section 1CO.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.75.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *BICC GRP

Description: As of the 5E16(2) release, the BICC GRP field is replaced with PKT GRP field. See the PKT GRP field on this form for usage information.The BICC (Bearer Independent Call Control Group) field specifies the bearer channel that carries traffic over the packet ATM network.

Software Release: 5E15 - 5E16(1)
Required Field.
Valid Entries: 7000 - 7999

2.3 *PKT GRP

Description: The PKT GRP field indicates the number of packet group that carries traffic over the packet ATM network. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature. This feature is made available in 5E16 Feature Release 3. (See Division 2, Section 7BX.)

Software Release: 5E16(2) and later
Required Field.
Valid Entries: 7000 - 7999

2.4 *BLK INDX

Description: The BLK INDX (Call Instance Code Block Index) field indicates the index number of the CIC (Call Instance Code) block. A CIC block contains 128 CICs.

Software Release: 5E15 and later
Required Field.
Valid Entries: 0 - 511

2.5 SM2K

Description: The SM2K (SM-2000 Switching Module) field indicates the SM-2000 Switching Module on which a given CIC (Call Instance Code) block is distributed. This is a no change field.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later
Valid Entries: 1 - 192

2.6 CADN

Description: The CADN (Call Instance Block Circuit Administration) field indicates the status of the CIC (Call Instance Code) block after switch initialization. This is a no change field.

Software Release: 5E15 and later
Valid Entries:

Valid CADN Entries

Entry	Definition
TMIIS	Put port in-service following a full initialization.
TMIOCB	Put port in OOS/CADN/BLKD (Out of Service/Circuit Administration/Blocked) state after initialization.
TMIOCD	Put port in OOS/CADN/DSBLD(Out of Service/Circuit Administration/Disabled) state after initialization.
TMIOCL	Put port in OOS/CADN/LKDO (Out of Service/Circuit Administration/Locked Out) state after initialization.

SEC. 2Z: 5222 RECORD
LTG TO PRESERVE CADN FOR CIC - LTGCADN

1. GENERAL

The 5222 Record is available with 5E15 and later Software Releases. The LTG (Large Terminal Growth) to Preserve CADN (Call Instance Block Circuit Administration) for CIC (Call Instance Code) form preserves the CADN values during the LTG for IVOTA (Integrated Voice and Telephony Over ATM (Asynchronous Transfer Mode)) data.

This form is used for the Large Terminal Growth for IVTOA feature which is available with 5E15 Feature Release 4. For more information on this feature, see Division 2, Section 1CO.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.76.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *BICC GRP

Description: As of the 5E16(2) release, the BICC GRP field is replaced with the PKT GRP field. See the PKT GRP field on this form for usage information. BICC (Bearer Independent Call Control Group) field specifies the bearer channel that carries traffic over the packet ATM network.

Software Release: 5E15 - 5E16(1)
Required Field.
Valid Entries: 7000 - 7999

2.3 *PKT GRP

Description: The PKT GRP (Packet Group Number) field is used to specify the number of packet group that carries traffic over the packet ATM network. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature. This feature is made available in 5E16 Feature Release 3. (See Division 2, Section 7BX.)

Software Release: 5E15 - 5E16(1)
Required Field.
Valid Entries: 7000 - 7999

SEC. 3: ROUTING AND CHARGING FORMS

Copyright © 2003 Lucent Technologies

SEC. 3A: 5300-1 RECORD
DIGIT ANALYSIS SELECTOR FORM - DAS

1. GENERAL

The 5300-1 Record is used to define each DAS (Digit Analysis Selector) in a 5ESS Switch. It is intended to be used as an office record and as a source document for data entry into the DAS form.

1.1 Digit Analysis

The DAS is the initial step in the analysis and routing of dialed digits. The DAS is indexed from either a Line Class Code on an LCC form (5306 Record) or a Trunk Group on a TKGRP form (5202-1 Record). The DAS provides one of two outputs: (1) a PDIT and an LDIT, or (2) an INDIT and an LDIT. A description of each follows.

- The PDIT (Prefix/Feature Digit Interpreter Table) is used to interpret Standard Prefixes (0+, 1+), Operator Codes (0- and 010) and Feature Access Codes (72, 73, etc.). For the complete list of codes, see the PDIT form (5300-2 Record).
- The INDIT (Incoming Trunk Preliminary Digit Interpreter Table) is used to interpret digits received from an incoming or two-way Trunk Group. The INDIT is defined on the INDIT form (5309 Record).
- The LDIT (Local Digit Interpreter Table) is used to interpret all codes dialable from local telephones or accessible by Incoming or two-way Trunks. The LDIT is defined on an LDIT form (5300-3 Record).

1.2 Digit Analysis Selector

The DAS (Digit Analysis Selector) may be numbered from 1 - 254. This provides flexibility in routing not only between Rate Centers but also, where tariffed, within a Rate Center. The DAS number is selected based on inputs from a Line Class Code or a Trunk Group.

1.3 Trunk Groups

Certain Trunk Groups may be assigned a LINE Digit Analysis Selector. These Trunk Groups must have a Trunk Class of "PF", "PFLASH", "PFITT", "EDSL" or "EDSLHM". This assignment might be used if it is desired that the incoming trunks have the same digit analysis capabilities as an originating line in this office.

1.4 IDP Digit Analysis

The terminal's (line or trunk) Digit Analysis Selector might be used for subsequent digit analysis if the terminal belongs to an IDP (Individualized Dialing Plan) Group. This option is available as a BRCS feature.

1.5 CCS Trunks

Digit analysis is invoked for incoming CCS (Common Channel Signaling) trunks based on TCM (Traveling Class Mark) information contained in the IAM (Initial Address Message) of the incoming call. For CCIS6 or ISUP7 calls, TCM information is used to determine if the call is in either the Direct Egress or International Outbound routing categories. CCIS6 and ISUP7 calls are those calls originating on trunks with either "CCIS6" or "ISUP7" in the INPULSING field of a TKGRP form (5202 Record), i.e., trunks carrying CCIS6 and ISDN-UP calls.

1.6 Special DAS Values

Specific DAS values exist as of 5E4(2) and later Software Releases. These values must be defined if

Copyright © 2003 Lucent Technologies

routing other than the routing specified by the incoming trunk is required. Specific DAS values will override the DAS value defined on the TKGRP form. The following lists services and features which require these DAS values:

DAS Value	Service/Feature
81	International outbound. Fully-coded addressing. Used to translate international data calls (CCIS6 and ISUP7).
82	CSDC (Circuit-Switched Data Capability). Dedicated/direct egress for international outbound calls (CCIS6 and ISUP7).
88	Software Release: 5E5 and later. ACP (Action Control Point) in an SDN (Software Defined Network). A 5ESS Switch that is an ACP will use this DAS to determine if a query should be sent to the NCP (Network Control Point) for routing information.
89	Dedicated egress - voice. Used to route SDN and direct connect calls throughout the PSN (Public Switched Network) to a terminating toll switch. At the terminating switch, Dedicated Egress Voice is used to translate SDN and direct connect voice calls and route them to a directly connected PBX, via direct egress, or to a local office, via switched egress (CCIS6 and ISUP7).
90	Dedicated egress - data. Used to route SDN calls through the PSN to a terminating toll switch. At the terminating switch, Dedicated Egress Data is used to translate the SDN data call and route it to a directly connected PBX, via direct egress, or to a local office, via switched egress (CCIS6 and ISUP7).
91	64 KB Clear - Single Circuit. Voice or data (ISUP only).
92	64 KB Restricted - Single Circuit. Restricted to data only (ISUP7 only).
97	Dedicated Egress - Voice - CCS7 Preferred. Required for Alliance Teleconferencing (ISUP7 only).
98	Dedicated Egress - Data - CCS7 Preferred, 56 kbps (ISUP7 only).

If any trunks are assigned an INPULSING or OUTPULSING of "ISUP7" on the TKGRP form, then DAS values 81, 82, 89, 90, 91, 92, 97 and 98 must be defined on this form.

If any trunks are assigned an INPULSING or OUTPULSING of "CCIS6" on the TKGRP form, then DAS values 81, 82, 89 and 90 must be defined on this form.

1.7 Foreign Area Translator

For 5E6 and later Software Releases, operating companies can make use of a FAT (Foreign Area Translator) LDIT during digit analysis. The FAT/LDIT performs further digit analysis on LDITs that are interpreting common dialed or inpulsed digit strings.

The LINE DAS LOCAL DIT or TRUNK DAS LOCAL DIT values assigned on this DAS form cannot equal the LDIT value assigned on a SMLDIT form (5315 Record) where FAT = "Y". In other words, an LDIT defined as a FAT/LDIT cannot be assigned to a DAS. FAT/LDITs can only be pointed to by other LDITs. For more information concerning the implementation and use of the FAT/LDIT see Division 2, Section 1AO.

1.8 Recent Change View

The corresponding Recent Change View for this form is 9.1

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * DIGIT ANALYSIS SELECTOR

Description: Enter the Digit Analysis Selector number.
Valid Entries:

For 5E14 and earlier: 1 - 99

Copyright © 2003 Lucent Technologies

For 5E15 and later: 1 - 254

LINE DAS

Complete this section (fields Section 2.3 - Section 2.4) if the Digit Analysis Selector is indexed from a Line Class Code. When the LINE DAS section is completed, the TRUNK DAS section must be blank.

2.3 PREFIX/FEATURE DIT

Description: The PDIT (Prefix/Feature Digit Interpreter Table) is used to define Standard Prefixes (0+, 1+), Operator Codes (0- and 010) and Feature Access Codes (72, 73, etc.). At least one PDIT is required in every 5ESS Switch which has lines. When a 1 is entered in these columns, the ODA system will provide standard Prefix/Feature Digit Interpreter Table data.
Valid Entries: 1 - 999

2.4 LOCAL DIT

Description: Enter the LDIT (Local Digit Interpreter Table) number. The LDIT defines all codes that are dialable by local lines or accessible by Incoming or two-way Trunks.
Valid Entries: 1 - 999

Data Rules:

The LDIT must be defined on an LDIT form (5300-3 Record) and/or on an IDDD form (5307 Record).

TRUNK DAS

Complete this section (fields Section 2.5 - Section 2.6) if the Digit Analysis Selector is indexed from an Incoming or two-way Trunk Group. When the TRUNK DAS section is completed, the LINE DAS section must be blank.

2.5 INC. TRUNK PRELIMINARY DIT

Description: Enter the INDIT (Incoming Trunk Preliminary Digit Interpreter Table) number. The INDIT defines the type of routing to be used for incoming trunk calls.
Valid Entries: 1 - 999

2.6 LOCAL DIT

Description: Enter the LDIT (Local Digit Interpreter Table) number. These columns are normally used for Local Tandem Trunks which inpulse 7 or 10 digits. The same LDIT used for a Line DAS may be used.
Valid Entries: 1 - 999

Data Rules:

When the TRUNK DAS section is specified, an Incoming Trunk Preliminary DIT entry is required along with a Local DIT entry.

2.7 PKT SW

Description: This is a Recent Change only field and indicates whether this DAS is used for packet switching.

2.8 ESCO

Description: Emergency Service Central Office Number. This field identifies the originating office or

Copyright © 2003 Lucent Technologies

calling area of an E911 caller. It is used to retrieve an ESN (Emergency Service Number) which, in turn, determines routing to the proper emergency bureau.

Software Release: 5E7 and later
Valid Entries: 1 - 255

Data Rules:

ESCO must be defined on an ESCO form (5541 Record).

2.9 REMARKS

Description: This field may contain any entries deemed locally necessary.
Valid Entries: 1 - 16 characters

SEC. 3B: 5300-2 RECORD
PREFIX/FEATURE DIGIT INTERPRETER FORM - PDIT

1. GENERAL

The 5300-2 Record is used to define the Prefix/Feature Digit Interpreter in a 5ESS Switch.

The purpose of PDIT is to provide information defining feature and operator access and to provide prefix information for dialed codes which will be analyzed in the LDIT (Local Digit Interpreter Table). Digit analysis for all line originated calls in a 5ESS Switch start in PDIT. At least the first digit of every valid dialable code must be represented in PDIT.

1.1 Initial Data

Standard codes, normally used in an office, are provided by the ODA system for PDIT 001. See Figure 2. This data is provided whenever an office is initialized for a new start or during a retrofit. Once this initial set of data is provided, it may be changed if required.

For a retrofit, the data within a form is not changed. However, if any forms are missing, they will appear again on the new generic side. If an office requires a PDIT that is significantly different from the standard forms, it is recommended that instead of modifying PDIT 001 another PDIT be defined (e.g., 002) for assignment. PDIT 001 may be deleted in its entirety if not assigned in this office.

Codes are added for BRCS (Business and Residence Custom Service) feature access and for CI (Carrier Interconnect).

The codes starting with 10X represent the FGD CACs (Carrier Access Codes) added for the Carrier Interconnect feature. The FGD CAC format is 10XXX or 101XXXX, where XXX or XXXX is the CIC (Carrier Identification Code). The values allowed in the office for the CIC and CAC depend on the value of the FGD PHASE field on the OFCOPT form; the PDIT form is not affected. See the OFCOPT form and Division 2, Section 1BI for more information on the FGD CAC. These numbers will be translated in the Inter-LATA Carrier Feature Record, ICF form (5305 Record), instead of LDIT.

1.2 IDDD Operator Digits

Customers may incorrectly dial 0 + the FGD CAC, (rather than correctly dialing the FGD CAC only) to reach a vendor other then their PIC. For an equal access office which does not use 010 for an IDDD operator, the route index should be the fixed route index to an announcement such as the "VACANT" code announcement.

1.3 Recent Change View

The corresponding Recent Change View for this form is 9.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PDIT

Description: Enter the Prefix/Feature Digit Interpreter Table Number.
Valid Entries: 1 - 999

2.3 * DIGITS TO INTERPRET

Copyright © 2003 Lucent Technologies

Description: Enter the Prefix/Feature dialed digits.
Valid Entries:
- 1 - 7 digits (0 - 9, *, or #); or
- 10X followed by 1 to 5 digits (0 - 9, *, or #)

Data Rules:

Carrier Interconnect (10X) calls cannot have a CALL TYPE of "IDDDOPR" or "OPRECAL."

When at least one PDIT form is entered with "10X" as the first 3 digits of DIGITS TO INTERPRET, a FIXRT form must be defined with FIXED ROUTE TYPE equal "INV10XX".

DIGITS TO INTERPRET must be greater than 2.

2.4 # CALL TYPE

Description: Enter the PDIT Call Type.

Required Field.

Valid CALL TYPE Entries

Entry	Definition
CICUT	Cut through to carrier. Used for FGD CAC + # dialed calls. Such calls are cut through to the specified carrier based on the carrier specific code index, and Route Index found on the ICF form.
COMB	Combined Feature and LDIT Call Type. Used whenever the specified Digits To Interpret provide access to a feature if dialing stops (4 second timing) or, if dialing continues. The Digits To Interpret less any Digits To Be Deleted will be re-interpreted in the Local Digit Interpreter Table (normally along with additional digits). For example, if Digits 23 are specified as a COMB Call Type with Feature Type SC2 and no digits deleted in the PDIT entry, the LDIT form must contain at least one entry with its initial Digits equal to 23. LDIT will normally have ten such entries, one for each 3-digit code starting with 23. If entered, TYPE OF CI CALL must be "NONCI".
EMER	911 Emergency Service Bureau.
FEATURE	Used for PDIT entries defining Access Codes for features such as Speed Calling, Call Forward Variable Activate, etc. This Call Type is used in two instances. (1) Whenever the feature Access Code is absolutely unambiguous and no further dialed digits are expected. If additional digits are dialed, they will be ignored. (2) Whenever another PDIT entry is specified with starting digits which are the same as the Digits To Interpret in this entry (i.e., When digit interpretation is to be continued in PDIT). For example, if a Feature Call Type is specified for Digit 2 and another PDIT entry is specified with Digits 23, and if dialing stops after the Digit 2, the Feature Type treatment for the Digit 2 PDIT entry will be given. If a digit 3 is dialed following the 2, the Digits 23 PDIT entry will determine the Call Treatment. (The Digits 23 entry will normally be of a Call Type COMB in the USA.)
IDDDOPR	Used for calls to the IDDD Operator (dial 010).
LDIT	Used for an entry with the first digit(s) of a three or six digit code which will be interpreted in the LDIT or as a Country Access Code on the IDDD form (5307 Record). The Digits To Interpret specified on this entry, less any Digits To Be Deleted, will be reinterpreted along with any additional dialed digits in the Local Digit Interpreter Table.
NORMAL	Advanced Services Platform. Used only for ASP triggers (see Division 2, Section 1AP).
OPER	Used for the operator Access Code (e.g. dial 0).
OPRECAL	Used for the operator recall code (dial 110). Operator Recall is used on 0+ calls to recall the operator in order to obtain billing information or to place another call. The operator recall code may only be used by customers with the Three-Way Calling Feature. A customer without Three-Way Calling simply flashes the switchhook and the operator is recalled. A customer with Three-Way Calling flashes the switchhook and then dials the operator recall code, 110.
PSDONE	Indicates a Packet Switching Call which does not need any further digit analysis to determine its destination. PSDONE should be entered if routing can be determined by the RPOA (Recognized Private Operating Agency) or by the first 3 digits of the called number. The TYPE OF CI CALL determines if the call is intraLATA or interLATA.

Copyright © 2003 Lucent Technologies

Data Rules:

Refer to Figure 1 for dependencies between this field and other fields.

When CALL TYPE is entered, PDIT must be entered and must be greater than 0.

CICUT - When CALL TYPE is "CICUT":

- and TRIG NBR is entered, NATURE OF NBR must not be entered.
- TYPE OF CI CALL must be "CICUT" and PREFIX must be "NONE".
- CODE INDEX must be entered and must be greater than 0.

COMB- When CALL TYPE is "COMB":

- PREFIX must be entered.
- DIGITS TO BE DELETED must be entered.
- DESEP must be 0 or 63.
- FEATURE must be entered.
- ACTION must be entered.
- TYPE OF CI CALL must be "NONCI".
- and ACTION is not "AD1USE" or "AD2USE", DIGITS TO INTERPRET must not be "10X".

EMER - When CALL TYPE is "EMER":

- TYPE OF CI CALL must be "INTRA".
- CODE INDEX must be entered.
- TRIG NBR must be entered.
- ACTION must not be entered.
- FEATURE must not be entered.
- PREFIX must be "NONE".
- TRIG NBR must be entered.
- POLYGRID must be "N".
- DIGITS TO INTERPRET must not be "10X".

PSDONE - This call type is used when no further digit analysis is required. The call routes to the next switch. The following table shows the routing requirements:

CI Call Type	CODE INDEX and ROUTE INDEX	PSDNICRI 5921 Record	RTIDX 5303 Record	TKGRP 5202 Record
PSCAR	Not Applicable	Required	From PSDNICRI 5921 Record	From RTIDX 5303 Record
PSNCI	Required	Not Applicable	From PDIT 5300-2	From RTIDX

Copyright © 2003 Lucent Technologies

			Record	5303 Record

When CALL TYPE is PSDONE:

- PREFIX must be "NONE".
- DESEP must be 0 or not entered.
- TYPE OF CI CALLS must be "PSNCI" or "PSCAR".
- and TYPE OF CI CALLS is "PSNCI", ROUTE INDEX must be entered and CODE INDEX must be greater than 0.
- and TYPE OF CI CALLS is "PSCAR", ROUTE INDEX and CODE INDEX must not be entered.

IDDDOPER - When CALL TYPE is "IDDDOPER":

- NATURE OF NBR must be "IDOP" or not entered.
- CODE INDEX must be entered and must be greater than 0.
- DIGITS TO INTERPRET must not be "10X".
- TYPE OF CI CALL must be "NONCI".
- ASP OFC on the OFCOPT form is "SSP", and CALL TYPE is "IDDDOPR", NATURE OF NBR must be "IDDD" or not entered.

LDIT - When CALL TYPE is "LDIT":

- TRIG NBR must not be entered.
- TYPE OF CI CALL must not be entered.
- PREFIX must be entered.
- DIGITS TO BE DELETED must be entered.
- DESEP must be 0 or not entered.
- CODE INDEX must not be entered.
- ROUTE INDEX must not be entered.
- and TRIG NBR is entered or ESC CODE is "Y", PREFIX must be "0+".

NORMAL - When CALL TYPE is "NORMAL":

- TYPE OF CI CALL must be "NONCI".
- CODE INDEX must be entered and must be greater than 0.
- DIGITS TO INTERPRET must not be "10X".
- TRIG NBR must be entered.
- DESEP must not be entered.

Copyright © 2003 Lucent Technologies

- PREFIX must be "NONE".
- POLYGRID must be "N".

OPER - When CALL TYPE is "OPER":

- and TYPE OF CI CALL is "INTER", NATURE OF NBR must be "ICOP" or not entered.
- and TYPE OF CI CALL is "INTRA", NATURE OF NBR must be "BCOP" or not entered.
- and POLYGRID is "Y", TYPE OF CI CALL must be "NONCI".
- and POLYGRID is "N", TYPE OF CI CALL must be "INTER", "INTRA", or "TOLL".
- ASP OFC on the OFCOPT form is "SSP", and TYPE OF CI CALL on this form is "INTRA", NATURE OF NUMBER must be "BCOP" or not entered.
- PREFIX must be "NONE" or "0+".
- TYPE OF CI CALL must not be "CICUT".
- FEATURE must not be entered.
- ACTION must not be entered.
- CODE INDEX must be entered and must be greater than 0.
- ROUTE INDEX must be entered.
- DIGITS TO BE DELETED must not be "10X".

2.5 TYPE OF CI CALL

Description: This field is used to define the type of CI (Carrier Interconnect).

Valid TYPE OF CI CALL Entries

Entry	Definition
CICUT	Used for calls dialed FGD CAC + #. These calls are cut through to the carrier specified from the CAC.
INTER	Used for calls destined for outside the LATA. These calls must be routed via an InterLATA Carrier.
INTRA	Used for calls destined for within the LATA. These calls are handled by the LEC (Local Exchange Company).
NONCI	Used for calls for which carrier selection is irrelevant.
PSCAR	For PS (Packet Switched) calls, indicates that an IC (Interexchange Carrier) is required. If the DNIC of the IC is given in the RPOA (Recognized Private Operating Agency) selection field, that DNIC is used to route the call. If the DNIC is not given in the RPOA, then the preselected IC is used, given by the IECP DNIC field on the DSLUSR form (5908 Record). The route index is assigned to the DNIC on the PSDNICRI form (5921 Record), therefore the ROUTE INDEX and CODE INDEX must not be entered on this form. The preselected (default) IC is selected at the time of the service order. If the DNIC is not given in the RPOA or entered in the IECP DNIC field, then the PS call is cleared.
PSNCI	For packet switched calls, indicates a carrier interconnect does not apply, therefore a ROUTE INDEX and a CODE INDEX must be specified on this form.
TOLL	Intra-LATA toll. A Intra-LATA toll call within the LATA. When the TYPE OF CI CALL field is set to "TOLL" a SFSYS form must exist with SFID 149 set to "Y".

Data Rules:

Copyright © 2003 Lucent Technologies

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

- Packet Switching TYPE OF CI CALLs, "PSCAR" and "PSNCI", cannot be mixed with non-Packet Switching TYPE OF CI CALLs within a single DAS.

2.6 ACTION

Description: Enter the action to be taken when the DIGITS TO INTERPRET have been dialed. This field only applies when CALL TYPE is "COMB" or "FEATURE". For other CALL TYPEs, leave it blank.

Valid ACTION Entries

Entry	Definition
AAOFF	Auto Answer Off via dial code. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
AAON	Auto Answer On via dial code. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
ACBCANC	Cancel auto-callback camp-on.
ACBUSE	Use auto-callback to camp-on to busy line.
ACCANC	LASS Automatic Callback deactivation. This dialed code allows the user to deactivate the AC (Automatic Callback) feature. The user goes off-hook, enters the dialed code, and receives a cancellation announcement.
ACCTACT	Activate account code feature.
ACCTDCT	Deactivate account code feature.
ACCTUSE	Account code use code dialed.
ACDXFER	Transfer call to ACD, followed by ACD DN for the Transfer to ACD from ARU Special Feature. For more information see Division 2 Section 4A71.
ACSRCAN	This ACTION currently unavailable and goes to reorder. Cancel ACSR move.
ACSROFF	Allows a member of an ACSR group with GRP CNTRL set to "Y" on the ACSRFD form (5959-1 Record) to deactivate ACSR for the entire group.
ACSRON	Allows a member of an ACSR group with GRP CNTRL set to "Y" on the ACSRFD form to activate ACSR for the entire group.
ACSRUSE	Allows an ACSR user to invoke an ACSR move.
ACSRVFY	Allows an ACSR user to verify the status of the ACSR move on the queue.
ACTCPNBN	Activate the CPN/BN feature.
ACTGMB	Software Release: 5E15 and later. Activate Group Make Busy
ACTMMB	Software Release: 5E15 and later. Activate Member Make Busy
ACTOFF	Set ACT in IDP off.
ACTON	Set ACT in IDP on.
ACTSTH	Software Release: 5E15 and later. Activate Stop Hunt
ACUSE	LASS Automatic Callback activation. This dialed code allows the user to activate the AC (Automatic Callback) feature. The user goes off-hook, enters the dialed code, and receives an appropriate response.
AD1USE	Use 1 digit abbreviated dial. (See Note 1)
AD1CH	Change 1 digit abbreviated dial list. (See Note 1)
AD2CH	Change 2 digit abbreviated dial list. (See Note 1)
AD2USE	Use 2 digit abbreviated dial. (See Note 1)
AIUSE	Agent Intercom via dial code. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
ALTACT	Activate alternate parameter set.
ANSBACK	National ISDN Call Park Answer Back. For more information, see Division 2, Section 4A258.
AQCUSE	ACD Queue Calling via dial code. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
ARCANC	LASS Automatic Recall cancellation.
ARSCP	Change ARS pattern group number.
ARSDCT	Deactivate ARS feature for one call.
ARS1USE	Use Automatic Route Selection with Private Network Dialing Plan 1.
ARS2USE	Use Automatic Route Selection with Private Network Dialing Plan 2.
ARSUSE	Use Automatic Route Selection with the Office Dialing Plan.
ARUSE	LASS Automatic Recall activation. This dialed code allows the user to activate the AR (Automatic Recall) feature. The user goes off-hook, enters the dialed code, and receives an appropriate response.
ASITOG	ASI (Advanced Service Interface) Proxy implicit mode toggle. A dialed code defined in the office as

Copyright © 2003 Lucent Technologies

	a CORC (Customer Originated Recent Change) allows the user to activate or deactivate the ASI Proxy implicit mode feature. The system response is a stutter dial tone. See Division 2, Section 4A93 for more information about ASI.
ASIUSE	ASI Proxy explicit mode activation. This dialed code allows the user to activate the ASI Proxy feature in the explicit mode. The user goes off-hook, enters the dialed code, and receives an immediate connection to an ASI trunk (no dial or confirmation tone).
ASPDNC	No further digits are collected and an immediate query is sent to the SCP. A response is received and the call is routed.
ASPNORM	Digit collection and digit analysis on the collected digits are performed. A query is then launched to the SCP. A response is received and the call is routed.
ASPVAR	Digits are collected until interdigit timing expires. A query is launched and a response is received from the SCP. The call is routed.
ASPUSE	Access the ASP (Advanced Services Platform; previously PVN, Private Virtual Network) default dialing plan. The ASP default dialing plan is part of the ODP and is specified via the ASP DAS field on the OFCOPT form (5509 Record). This action will result in an ASP origination only if the line or trunk is allowed to originate ASP calls, which is specified by setting ASP ALW to "Y" on the LINE (5109 Record), MLHLN (5111 Record), DSLUSR (5908 Record), SHTN (5902 Record), or TKGRP (5202 Record) form.
ATACTMWI	Activate Message Waiting Indicator by attendant. This dialed code is used by an MSC (Message Service Center) attendant to activate the MWI (Message Waiting Indicator) at the user's station set. The attendant enters the dialed code, receives stutter dial tone, and then dials the number of the telephone the MWI is to be activated on.
ATDCTMWI	Deactivate Message Waiting Indicator by attendant. This dialed code works similarly to the "ATACTMWI" action. The attendant can enter the dialed code, receive stutter dial tone, and then dial the number of the telephone the MWI is to be deactivated on.
ATFACT	ISDN attendant activate ACVT (Attendant Control of Voice Terminals) feature for individual DN.
ATFDCT	ISDN attendant deactivate ACVT feature for individual DN.
ATGACT	ISDN attendant activate ACVT feature for group of DNs. The ACVT feature assigned must have an associated restriction group defined. A DN can only activate the ACVT feature for the group to which it belongs.
ATGDCT	ISDN attendant deactivate ACVT feature for group of DNs. The ACVT feature assigned must have an associated restriction group defined. A DN can only deactivate the ACVT feature for a group to which it belongs.
ATHACT	This ACTION is used to activate the Authorization Code feature. This ACTION will automatically set the A field to "Y" on the associated line or trunk assignment form, e.g., LINEFA, TRUNKFA, or TKGRPFA forms.
ATHDCT	This ACTION is used to deactivate the Authorization Code feature. This ACTION will automatically set the A field to "N" on the associated line or trunk assignment form, e.g., LINEFA, TRUNKFA, or TKGRPFA forms.
ATHINS	This ACTION is used to put a line or trunk "In Service" by automatically setting the ATH FIRST field to "N" on the associated ATHLPA, ATHMPA, or ATHTPA form. When the ATH FIRST field is set to "N", an Authorization Use Code and the Authorization Code is not needed before the TN is entered.
ATHNREQ	This ACTION is used to automatically set the AC field to "N" on the associated line or trunk assignment form, e.g., LINEFA, TKGRPFA, or TRUNKFA forms. When the AC field has a value of "N", an Authorization Use Code and an Authorization Code is not needed before a feature, e.g., Call Forwarding, can be used. The features must be specified on the ATHFCOS form and they must be dial code activated.
ATHOOS	This ACTION is used to put a line or trunk "Out Of Service" by automatically setting the ATH FIRST field to "Y" on the associated ATHLPA, ATHMPA, or ATHTPA form. When the ATH FIRST field is set to "Y", an Authorization Use Code and the Authorization Code is needed before the TN is entered.
ATHREQ	This ACTION is used to automatically set the AC field to "Y" on the associated line or trunk assignment form. When the AC field has a value of "Y", an Authorization Use Code and an Authorization Code is needed before a feature, e.g., Call Forwarding, can be used. The features must be specified on the ATHFCOS form and they must be Access Code activated.
ATHUSE	This ACTION is used as the Authorization Use Code for the Authorization Code Feature defined on the ATHFD form (5619-1 Record).
AUCUSE	Auto Call Set Up used with Message Service and Electronic Directory Service features.
BBTLUSE	This ACTION is used for billed BRITL (Basic Rate Interface Dial Up Test Line).
BSYACT	Software Release: 5E16(2) and later.

Copyright © 2003 Lucent Technologies

	Activates all Call Forwarding Busy feature's prestored DNs.
BSYDCT	Software Release: 5E16(2) and later. Deactivates all Call Forwarding Busy feature's prestored DNs.
BTLUSE	This ACTION is used for nonbilled BRITL.
CCL	Code calling for call pickup.
CFDATCH	Change Call Forward Don't Answer timing.
CFDCT	Deactivate all Call Forwarding features with prestored DNs.
CFDNCH	Change Forward-to DN.
CFVACT	Activate all call forwarding variable features.
CFVDCT	Deactivate all call forwarding variable features.
CLOFF	Closed Off via dial code. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
CLON	Closed On via dial code. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
CLWCUSE	Cancel Leave Word Calling. Used with the Message Service feature.
CNDACT	ICLID (Individual Calling Line Identification) Calling Number Delivery activation. This dialed code allows the user to activate the Calling Number Delivery feature which allows the called party to receive data on an incoming call. The user goes off-hook, enters the dialed code, and receives a confirmation tone.
CNDDCT	ICLID (Individual Calling Line Identification) Calling Number Delivery deactivation. This dialed code allows the user to deactivate the Calling Number Delivery feature which allows the called party to receive data on an incoming call. The user goes off-hook, enters the dialed code, and receives a confirmation tone.
CNPUSE	Toggle for NAME privacy per-call (for DISP). This action is used in the Analog Calling Name Delivery Feature. See Division 2 Section 4A40 for more information.
COTUSE	Customer Originated Trace activation. This dialed code allows the user to activate the Customer Originated Trace feature. The user goes off-hook, enters the dialed code, and receives an appropriate response.
CPQ1	Use call pickup feature with queue 1.
CPQ2	Use call pickup feature with queue 2.
CPQ3	Use call pickup feature with queue 3.
CPQ4	Use Call pickup feature with queue 4.
CSACT	Software Release: 5E14 and later. Activate call screening.
CSDCT	Software Release: 5E14 and later. Deactivate call screening.
CSTOG	Software Release: 5E16(2) and later. Used to toggle between activating and deactivating the FCCS (Forwarded Call - Call Screening) Enhancement feature. For more infomation, see Division 2, Section 4A592.
CTT	Used for both Analog and ISDN Call Through Test. Allows the attendant to make a test call from an Analog line that has been assigned an attendant class of service. The test call will verify the operation of the selected trunk member and the switch translations.
CWDLU	Use a dial call waiting feature. For ISDN Attendant Consoles, this action is used to assign the camp-on dialed code.
CWOACT	Activate all call waiting originating features.
CWDACT	Deactivate all call waiting originating features.
CWTACT	Activate all call waiting terminating features.
CWTDCT	Deactivate all call waiting terminating features.
CWXCH	Change call waiting tone repetition interval.
DAACT	Software Release: 5E16(2) and later. Activates all Call Forwarding Don't Answer feature's prestored DNs.
DADCT	Software Release: 5E16(2) and later. Deactivates all Call Forwarding Don't Answer feature's prestored DNs.
DALTACT	Activate alternate parameter set for CSD.
DARSCP	Change the active ARS pattern group number for CSD.
DBDACT	Activate all busy/idle data call forwarding features.
DBDDCT	Deactivate all busy/idle data call forwarding features.
DCDTVM	Software Release: 5E16(2) and later. DTVM Direct Connect.
DCTCPNBN	Activate the CPN/BN feature via dialed code.
DCTGMB	Software Release: 5E15 and later. Deactivate Group Make Busy
DCTMMB	Software Release: 5E15 and later. Deactivate Member Make Busy
DCTMWI	Deactivate Message Waiting Indicator. Used with the Message Service feature. The MWI (Message Waiting Indicator) can be deactivated by entering this dialed code. If an MWI lamp is

Copyright © 2003 Lucent Technologies

	provided with the station set, this action may be associated with the lamp and can be used to deactivate the lamp.
DCTSTH	Deactivate Stop Hunt
DFRLALT	Activate the CSD alternate FRL.
DGPACT	Activate the ARS CSD group.
DGPDCT	Deactivate the ARS CSD group.
DMAINACT	Activate main parameter set for CSD.
DNPUSE	Activate per call TN privacy use.
DPN	Use directed pickup without barge-in.
DPU	Use directed pickup with barge-in.
DRPCH	Change ringing pattern.
DTVMCF	Software Release: 5E16(2) and later. DTVM Call Forward.
EAVMUSE	Software Release: 5E15 and later. Allows Easy Access to Voice Mail.
EMER	Emergency.
EMUSE	Emergency via dial code or feature button. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.
FRLALT	Activate the Alternate FRL Table.
FRLDMAIN	Activate the CSD main FRL.
FRLMAIN	Activate the Main FRL Table.
FTACT	Activate BRCS feature. (See Note 1)
FTDCT	Deactivate BRCS feature. (See Note 1)
GPACT	Activate IDP, ARS, or ACVT.
GPDCT	Deactivate IDP, ARS, or ACVT.
GRPCARCH	Change group carrier in IDP.
HIDHOLD	This action allows a customer to activate the Dialable Hold feature which is a subset of the Home Intercom feature.
HIRINGA	This action is used to apply ringing pattern A for the Selective Intercom Dialing feature which is a subset of the Home Intercom feature. Provides repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern).
HIRINGB	This action is used to apply ringing pattern B for the Intercom Code Dialing and Selective Intercom Dialing features. Provides repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on, followed by 4 seconds off.
HIRINGC	This action is used to apply ringing pattern C for the Selective Intercom Dialing feature which is a subset of the Home Intercom feature. Provides repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on, followed by 4 seconds off.
HIRINGG	This action is used to apply ringing pattern G for the Selective Intercom Dialing feature which is a subset of the Home Intercom feature. Provides repeated pattern of 0.3 seconds on, 0.2 seconds off, 1 second on 0.2 seconds off, 1 second on 0.2 seconds 0.3 seconds on, followed by 4 seconds off.
IBSYVFY	ISDN Busy Verify action. This action is used with the ISDN Attendant Console Busy Verification of Directory Numbers and Trunks. The FEATURE associated with this attendant action must be a call pickup originating feature (/CPUVO or equivalent constructed feature). To implement the barge-in feature, the terminating line/trunk must have a call pickup terminating feature (/CPUIVT for digital, /CPUVT for analog, or equivalent constructed feature).
IDNACT	Activate/deactivate ISDN ACVT (Attendant Control of Voice Terminals) restrictions for an individual terminal (line).
IEMEROVR	ISDN Attendant Emergency Override action. The FEATURE associated with this attendant action must be a call pickup originating feature (/CPUEO or equivalent constructed feature). The lines to be overridden must have a call pickup terminating feature (/CPUIEOT for digital, /CPUEOT for analog, or equivalent constructed feature). The attendant will be able to use the dialed code to override terminating restrictions such as Call Forwarding, Series Completion or members of a multiline hunt group.
IGACT	Activate/deactivate ISDN ACVT (Attendant Control of Voice Terminals) restrictions for a group of lines.
INSUSE	Inspect use.
LDNDCT	Deactivate all LDNs for MUPH or ISAT groups with CF variable feature at once.
LSFNOSYM	This action is used by the LSF (LASS Selective Features) to access the SLE (Screen List Editing) session. This ACTION will prompt the user via announcements for digits rather than an asterisk or a pound sign during the SLE session.
LSFSYM	This action is used by the LSF (LASS Selective Features) to access the SLE (Screen List Editing) session. This ACTION will prompt the user via announcements for an asterisk or a pound sign rather than digits during the SLE session.
LSP	Loudspeaker paging for call pickup. The paged party may enter a dialed code and be connected to

Copyright © 2003 Lucent Technologies

	the calling party.
LWCUSE	Leave Word Calling. The dialed code associated with this action allows a message from the calling party to be left for the called party.
MAINACT	Activate Main parameter set.
MDRACT	MDR Feature activation code.
MDRDCT	MDR Feature deactivation code.
MDROFF	MDR Group Status off.
MDRON	MDR Group Status on.
MEOFF	Dialed Code Request - Manual Exclusion Off.
MEON	Dialed Code Request - Manual Exclusion On.
MWITD	ISDN Terminal Dialed Code.
MWSOH	Start multiway feature off hook.
MWSPL	Split last added party from multiway call.
NNPRV	Force per-call NAME and TN private (for DISP). This action is used in the Analog Calling Name Delivery Feature. See Divison 2 Section 4A40 for more information.
NNPUB	Force per-call NAME and TN public (for DISP). This action is used in the Analog Calling Name Delivery Feature. See Divison 2 Section 4A40 for more information.
PFUSE	Use private facilities.
PODUSE	Print On Demand. Used with the Message Service feature.
RBQCAN	Ringback queuing cancel.
RGQVFY	Ringback queuing verify.
SAUSE	Service Assist via dial code or feature button. For more information on ACD/BRCS secured feature, see Division 2, Section 4A121.
SDNUSE	Invoke a Software Defined Network call.
SEL1XFER	Transfer to Selective Transfer TN 1 from E911 PSAP (Public Safety Answering Point).
SEL2XFER	Transfer to Selective Transfer TN 2 from E911 PSAP.
SEL3XFER	Transfer to Selective Transfer TN 3 from E911 PSAP.
SEL4XFER	Transfer to Selective Transfer TN 4 from E911 PSAP.
SEL5XFER	Transfer to Selective Transfer TN 5 from E911 PSAP.
SEL6XFER	Transfer to Selective Transfer TN 6 from E911 PSAP.
SRGACT	Software Release: 5E16(2) and later. Activate Simultaneous Ringing.
SRGDCT	Software Release: 5E16(2) and later. Deactivate Simultaneous Ringing.
SRGNOSYM	Software Release: 5E16(2) and later. Simultaneous Ringing SLE No Symbols.
SRGSYM	Software Release: 5E16(2) and later. Simultaneous Ringing SLE Symbols.
TD1PAD	Add 1 parameter code.
TDACT	Activate a Time-Of-Day feature.
TDADZP	Add zero parameter code.
TDATCH	Change Time-Of-Day Action Time.
TDDALL	Delete all code lists.
TDDCT	Deactivate a Time-Of-Day feature.
TDDEL1P	Delete 1 parameter code list.
TDOWCH	Change One Week Time-Of-Day Schedule.
TDZPDEL	Delete zero parameter code list.
TGACT	Activate a terminal group feature.
TGDCT	Deactivate a terminal group feature.
UCRACT	Activate UCR (Unidentified Call Rejection).
UCRDCT	Deactivate UCR (Unidentified Call Rejection).
US3WC	Activate Usage Sensitive Three-Way Calling.

- ***NOTE:*** 1:These actions are required in all line offices and have fixed digit codes. For further information, see the BRCS FEATURES section in Division 2 of this guide.

ACUSE, ARUSE: After subscribers dial an "ACUSE" (or "ARUSE") code, they may receive the following responses:

- Audible alerting. The called party is alerted immediately because the called station is found to be idle.
- Short-term denial. Reorder tone is given to the user to indicate that network resources are temporarily exhausted or the called party has a feature active that causes the Automatic Callback (or Automatic Recall) attempt to be denied, e.g., Call Forwarding Variable. A subsequent attempt by the user to activate the feature may succeed.
- Long-term denial. An announcement is returned indicating that the Automatic Callback (or Automatic Recall) feature is not allowed to the user.

Copyright © 2003 Lucent Technologies

- Confirmation. An announcement is returned indicating that the Automatic Callback (or Automatic Recall) feature has been activated.

COTUSE: After subscribers dial a "COTUSE" code, they may receive the following responses:

- Successful activation. An announcement is returned indicating a successful activation of the COT request and provides information on any further action the user should take.
- Trace not available. An announcement is returned indicating that the call has already been traced or invalid data about the call is stored in the history block, e.g., originating and terminating switches are not connected by CCS7 trunks.
- Buffer full. An announcement is returned indicating that the COT message buffer is full and the user should attempt the trace again later.
- Short-term denial. Reorder tone is given to the user to indicate that network resources are exhausted. A subsequent attempt by the user to activate the feature may succeed.
- Feature denial. Reorder tone is given to the user to indicate that the Customer Originated Trace feature is not available to the user.

DNPUSE: The "DNPUSE" action is used for per-call TN privacy; the dialed code can be used in two ways.

- The calling party subscribes to all-call privacy which allows the calling party to prevent delivery of their TN to the called party for all calls (PRIVACY field on the LINE, MLHLN, or DSLUSR form is "Y"). The calling party can deactivate all-call privacy on a per-call basis (TN PRIVACY field on the DISPFD form is "Y"), allowing the calling TN to be displayed to the called party. To deactivate all-call privacy on a per-call basis, the user goes off-hook, enters the dialed code, receives a confirmation tone, receives dial tone, and then dials the TN.
- The terminal may not subscribe to all-call privacy which allows the TN of the calling party to be delivered to the called party for all calls (PRIVACY field on the LINE, MLHLN, or DSLUSR form is "N"). The calling party can activate per-call privacy on a per-call basis (TN PRIVACY field on the DISPFD form is "Y"), not allowing the calling TN to be displayed to the called party. To activate per-call privacy on a per-call basis, the user goes off-hook, enters a dialed code, receives a confirmation tone, receives dial tone and, then dials the telephone number.

Data Rules:

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

When ACTION is "ATACTMWI", "ATDCTMWI", "AUCUSE", "BTLUSE", "AAON", "AAOFF", "AIUSE", "AQCUSE", "CLON", "CLOFF", "EMUSE", "SAUSE", "BBTLUSE", "MEOFF", "MEON", "SDNUSE", "UCRACT", or "UCRDCT" then FEATURE must be the NULL FEATURE (/*).

Actions "CNPUSE", "NNPRV", and "NNPUB", must be used with the feature defined on the DISPFD form and have TN PRIVACY set to "Y" on the DISPFD form for the feature being used. The wildcard feature /DI* may also be used with TN PRIVACY set to "N" on the DISPFD form.

For 5E15 and later:

- When ACTION is "ACTGMB", "ACTMMB", "ACTSTH", "DCTGMB", "DCTMMB", or "DCTSTH", CALL TYPE must be "FEATURE".
- When ACTION is "ACTGMB", "ACTMMB", "ACTSTH", "DCTGMB", "DCTMMB", or "DCTSTH",

Copyright © 2003 Lucent Technologies

FEATURE must be "/*".

ACDXFER - When ACTION is "ACDXFER" the feature must be null feature, (/*).

ACTCPNBM - When ACTION is "ACTCPNBN", the corresponding FEATURE entry must appear on a CPNBNFD form (5982 Record) with ACT set to "CODE".

AD1USE - An ACTION of "AD1USE" requires DIGITS TO INTERPRET to be one digit or one digit preceded by carrier prefix (10X).

AD2USE - An ACTION of "AD2USE" requires DIGITS TO INTERPRET to be two digits or digits preceded by carrier prefix (10X).

ASPDNC, ASPNORM, ASPVAR - When ACTION is "ASPDNC", "ASPNORM", or "ASPVAR",

- CALL TYPE must be "FEATURE",
- TRIG NBR must be entered, and
- ASP OFC on the OFCOPT form must be "SSP".
- For 5E15 and later , FEATURE must be set to "/*". In 5E15 the ACTION field was modified to allow the values of ASPDNC, ASPNORM, and ASPVAR when FEATURE is set to "/*" in order to support the ASP Unrestricted FCD Code feature. For more information, see Division 2, Section 4A572.
- For 5E15 and later, when, FEATURE is "/*" and ACTION is "ASPDNC", "ASPNORM", or "ASPVAR" the ACT field for SFID 572 on the SFSYS form must be "Y".
- For 5E15 and later, when the PDIT form ACTION field is set to "ASPDNC", "ASPNORM", or "ASPVAR" and FEATURE set to "/*". This form must have TRIG NBR defined on the NSTRIG form where APPLICATION is "ASP" and AIN REL is "R0D1".

ASPUSE - When ACTION is "ASPUSE", ASP OFC on the OFCOPT form (5509 Record) must equal "BILLNAP", "NOBILLNAP", or "SSP".

ATFACT, ATFDCT, ATGACT, ATGDCT -

- If IDPDCA forms contain these ACTION entries or conflict resolution ACTION entries, they must be consistent with the corresponding FEATURE entry on the ACVTFD form.
- These BUTTON ACTIONs require a FEATURE name that is defined on the ACVTFD form.
- If these specific ACTION values are entered on the CFGGRP form, the combination of CONFIG GRP and ACTION must be unique.

BSYACT, BSYDCT, CFDATCH, CSTOG, DAACT, DADCT: - For 5E16(2) and later, ACTION can only be "BSYACT", "BSYDCT", "CFDATCH", "CSTOG", "DAACT", or "DADCT" when the ACT field for SFID 592 on the SFSYS form (5713-1 Record) has been set to "Y".

- ***NOTE:*** The following actions can only be assigned to dial codes on the PDIT form (RC/V 9.2) when the ACT field for SFID 592 is set to "Y": "BSYACT", "BSYDCT", "CFDATCH", "CSTOG", "DAACT", or "DADCT" (when being assigned to dial codes, all five actions can only be associated with the /CF* feature). Also, the existing action "CFDATCH" can now be associated with the /CF* feature on the PDIT form (RC/V 9.2) when the ACT field for SFID 592 is set to "Y" (originally, "CFDATCH" could only be associated with non-wildcard CF features. When the ACT field for SFID 592 is set to "Y", the action can be associated with both the /CF* feature and the non-wildcard CF

Copyright © 2003 Lucent Technologies

features.)

BTLUSE, BBTLUSE: - When "BTLUSE" or "BBTLUSE" is entered, then:

- CALL TYPE must be "FEATURE" for this ACTION.
- TYPE OF CI CALL must be "NONCI" for this ACTION.
- DIGITS TO INTERPRET must contain only the digits 0-9 and may begin with 10X.

When ACTION is "BBTLUSE", the DSL which is being tested, must have BRITL ALW set to "Y" on the corresponding DSLUSR form.

CSACT, CSDCT - When ACTION is "CSACT" or "CSDCT", FEATURE must be "/CF*".

DCTCPNBN - When ACTION is "DCTCPNBN", the corresponding FEATURE entry must appear on a CPNBNFD form (5982 Record) with DEACT set to "CODE".

EAVMUSE - When ACTION is "EAVMUSE", the corresponding FEATURE entry must appear on a MSFD form (5962-1 Record).

HIDHOLD - When ACTION is "HIDHOLD", the DIAL HOLD field must be "Y" on the associated HIFD form (5628 Record).

HIRINGA, HIRINGC, HIRINGG - When ACTION is "HIRINGA", "HIRINGC", or "HIRINGG", the SEL ICM DIAL field must be "Y" on the associated HIFD form (5628 Record).

When ACTION is "HIRINGB", the ICM CODE DIAL field must be "Y" and the SEL ICM DIAL field may be "Y" on the associated HIFD form.

IBSYVFY - When ACTION is "IBSYVFY", the associated call pickup originating feature must be defined on a PUOFD form (5605-1 Record). If the terminating line or trunk is assigned a call pickup terminating feature, that feature must be defined on a PUTFD form (5605-2 Record).

IEMEROVR - When ACTION is "IEMEROVR", the associated call pickup originating feature must be defined on a PUOFD form. The call pickup terminating feature assigned to the lines to be overridden must be defined on a PUTFD form.

SELnXFER - When ACTION is "SELnXFER", where n is 1 - 6, CALL TYPE must be "FEATURE" or "COMB"; and FEATURE must be "/*".

For 5E16(2) and later, when a PDIT form contains ACTION entries which are inconsistent with the corresponding FEATURE entry, either the FEATURE is not found on the appropriate Feature Definition FORM or the FORM level restrictions are not met. (Refer to the Prefix/Feature Digit Interpreter section for the valid combinations of ACTION and FEATURE and the corresponding restrictions).

2.7 FEATURE

Description: Enter the name of a feature or abbreviated dial list which is to be accessed or affected by this dialed code. The feature name entered may be a constructed or preconstructed feature.

The set of preconstructed features includes "wild-card" features which may be entered as valid features in dialing plans (either individualized or the office dialing plan) but may not be assigned to lines or trunks. These wild-card features' names should be entered into dialing plans whenever a dialed code is to affect a feature associated with the terminal (line or trunk) dialing the code rather than a feature specified in the dialing plan itself. For example, if a dialed code's ACTION is 'AD1CH' (change the 1-digit Abbreviated Dial List) and it is desired that dialing the code allows the customer to change his AD list regardless of the specific ID feature containing the AD list, the ID wild-card feature name, /ID*, would be entered as the

Copyright © 2003 Lucent Technologies

FEATURE. If, on the other hand, it is desired that access to the code would allow changes only to a specific ID's AD list, then the specific ID feature's name would be entered as the FEATURE. The specific feature definition form on which the feature is defined depends upon the value of the ACTION field entry as shown in Figure 3.

Those ACTIONs where the FEATURE TYPE is indicated as "Any non-wild-card feature name" require a specific FEATURE name and the wild-card feature may not be entered here.

For those actions for which the FEATURE TYPE is "Any feature name", either the wild-card feature name or a specific feature name may be entered. It is recommended that the wild-card feature always be used; no cases are presently envisioned in which a non-wild-card feature would be appropriate.

For the cases where FEATURE TYPE is "Any wild-card feature name", only a wild-card feature name may be entered.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be defined on one of the BRCS feature definition forms.

2.8 CODE INDEX

Description: This field is used to define the Code Index.
Valid Entries: 1 - 4095

Data Rules:

Valid Entries are 1 for CALL TYPE "OPER", 2 for CALL TYPE "IDDDOPR", and 3 - 4095 for CALL TYPE "CICUT".

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

All combinations of CODE INDEX, PREFIX from the PDIT form, and SCREENING INDEX from the LCC form (5306 Record) must have corresponding RAR form (5301 Record) entries for CDI, PFX, and SCR.

When a CODE INDEX is entered, a ROUTE INDEX entered, and POLYGRID is "N", then a corresponding RAR form must exist where the CDI entry matches the CODE INDEX on this form.

CODE INDEX on this form or MLDIT on the INDIT form (5309 Record), CODE INDEX or CDI on an RDIT or LDIT form, or WITH ANI or WITHOUT ANI on an AISCLS form must equal INC CDI on an INFLDEST form (5448 Record).

2.9 ROUTE INDEX

Description: Enter the Regular Route Index.

ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries: 1 - 16382

Data Rules:

Refer to Figure 1 for dependencies between the CALL TYPE field and this field. If the resultant call is a carrier call, the Route Index will normally be overridden by a Carrier Specific Route Index on the ICF or CDIM form. The entry here is provided for consistency in the data base.

2.10 POLYGRID?

Description: If this is a DSN (Defense Switched Network) office, should polygrid routing be used? "Y"

Copyright © 2003 Lucent Technologies

should be entered for DSN offices to indicate polygrid routing. "N" should be entered for non-DSN offices.

Software Release: 5E3 and later
Required Field.
Valid Entries: Y, N
Default Value: N

Data Rules:

This field is used only in DSN offices; the DSN OPTION field must be "Y" on the OFCOPT form.

- POLYGRID may be "Y" only when CALL TYPE is "OPER", "IDDDOPR", "OPRECAL", or "CICUT", otherwise POLYGRID must be "N".
- When POLYGRID is "Y", TYPE OF CI CALL must be "NONCI".

2.11 DESEP

Description: This field is used to define the Destination Separations Index for Call Types "CICUT", "OPER", and "IDDDOPR". It is prohibited for all other Call Types.
Valid Entries: 1 - 255

Data Rules:

If a DESEP is entered, it must be defined on the TRFSEP form (5308 Record).

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.12 PREFIX

Description: This field is used to define which prefix entry on a RAR form will be used to screen the call.
Valid Entries: 0, 1, or NONE

Data Rules:

PREFIX is a required entry only for Call Types "PSDONE", "LDIT", "COMB", and "CICUT". If CALL TYPE is "CICUT", "PSDONE" or "QUERY" then PREFIX must be "NONE". It is allowed, but only used by the AIN pre-query screening feature to determine if pre-query screening needs to be done, for Call Types "OPER" and "IDDDOPR". It is prohibited for all other Call Types.

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

2.13 DIGITS TO BE DELETED

Description: This field is used to define the Digits to be Deleted. Enter the number of digits to delete from the dialed code prior to the local digit interpretation. The FGD CAC for carrier calls, if any, does not get interpreted in LDIT, so digit deletion does not include these digits.
Valid Entries: 1 - 7

Valid DIGITS TO BE DELETED Entries

Entry	Definition
0	for 01+ IDDD Operator Assisted Calls and for 011+ IDDD Station-To-Station Calls.
1	

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

Copyright © 2003 Lucent Technologies

2.14 NATURE OF NBR

Description: Enter the nature of the number for ASP query formulation.

Software Release: 5E9 and later
Valid Entries:

Valid NATURE OF NBR Entries

Entry	Definition
IDDD or IDD	International
NATL or N	Domestic
PRIV or P	Private
ICOP or IC	IEC Operator
BCOP or B	BOC Operator
IDOP or IDO	IDDD Operator

Data Rules:

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

When CALL TYPE is "LDIT", NATURE OF NBR cannot be entered.

2.15 TRIG NBR

Description: Enter the Network Services Trigger Number.

Software Release: 5E8 and later
Valid Entries: 1 - 255

Data Rules:

Refer to Figure 1 for dependencies between the CALL TYPE field and this field.

TRIG NBR must equal TRIG NBR on an NSTRIG form (5324 Record).

If APPLICATION on the corresponding NSTRIG form equals "ASP" and SERV KEY equals "CDPN", ALT GBL TITLE must be known on NSTRIG.

If APPLICATION on the corresponding NSTRIG form is "E911", TYPE OF CI CALL must equal "INTRA".

2.16 PREF TRIG NBR

Description: Enter the Prefix Services Trigger Number. This field was added to support the AIN Operator Services Trigger feature. See Division 2, Section 4A584.

Software Release: 5E16(2) and later
Valid Entries:
- For 5E16(2) and later: 1 - 255

Data Rules:

When PREF TRIG NBR is known, PREFIX must be "0+" or CALL TYPE must be "IDDDOPR" or "OPER".

2.17 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When ESC CODE is "Y", CALL TYPE must be "EMER", "OPER", "IDDDOPR" or "OPRECAL".

2.18 DFLT RT

Description: The DFLT RT field is used to identify the type of default routing treatment to be used for the ASP Default Routing for 3/6/10-Digit Triggers (Phase 1) Special Feature. When the ASP Special Feature has been purchased, this field can be used to specify the type of default routing to occur when an ASP specific digit trigger query fails.

Software Release: 5E9(1) and later
Default: NONE
Valid Entries:

Valid DFLT RT Entries

Entry	Definition
ANNC	Default route to announcement (or tone). The call will route to either a tone or announcement, depending on what is defined for the route.
DLDN	Default route to dialed DN. The call will route to the DN dialed (or the DN being routed to if the call came from a trunk).
NONE	No default routing. No special default routing will take place, and normal call treatment will send the call to reorder or NCA (No Circuits Available).

Data Rules:

ANNC:
When "ANNC" is entered for DFLT RT, then a FIXRT form must be defined with FIXED ROUTE TYPE set to "DFLTRT".

NONE:
When DFLT RT is not "NONE", TRIG NBR must be entered.

When the PDIT forms have a DFLT RT entry other than "NONE", the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

For 5E16(2) and later:

- When DFLT RT is not "NONE", TRIG NBR or PREF TRIG NBR must be entered.
- When the PDIT forms have a DFLT RT entry other than "NONE", and a known value for PREF TRIG NBR, the corresponding TRIG NBR must be defined on a NSTRIG form. In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".
- When the PDIT forms has a known value for PREF TRIG NBR, the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1" and ASP OFC on the ASPOPT form not set to "NONE".
- When the PDIT forms have a DFLT RT entry other than "NONE" and TRIG NBR is known, the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

2.19 INH OBL

Description: Is the ASP originating busy line office trigger inhibited? This field supports the Call Screening

Copyright © 2003 Lucent Technologies

for ASP Originating Busy/No Answer Triggers. For more information concerning this feature, see Division 2 Section 4A212.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When INH OBL is "Y", CALL TYPE must be "EMER", "IDDDOPR", "OPER" or PREFIX must be 0+, or 1+.

The SFID 212 ACT field on the SFSYS form (5713-1 Record) must be "Y" before "Y" can be entered in this field.

2.20 INH ONA

Description: Is the ASP originating no answer office trigger inhibited? This field supports the Call Screening for ASP Originating Busy/No Answer Triggers. For more information concerning this feature, see Division 2 Section 4A212.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When INH ONA is "Y", CALL TYPE must be "EMER", "IDDDOPR", "OPER" or PREFIX must be 0+, or 1+.

The SFID 212 ACT field on the SFSYS form (5713-1 Record) must be "Y" before "Y" can be entered in this field.

2.21 ANI BYPASS

Description: Will ANI Table options be ignored? An entry of "N" indicates TDX ANI Table options will be processed. This field supports the TDX (Toll Digital Exchange) ANI Table Call Processing Feature. This is a secured feature with SFID 235. For more information on this feature, see Division 2, Section 4A165.

Software Release: 5E10 and later
Default: N

Valid Values: Y, N

2.22 DENY XFER

Description: This field is used to indicate if call transfers to a particular digit string should be denied.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

- When DENY XFER is "Y", CALL TYPE must not be "EMER".
- When DENY XFER is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to

Copyright © 2003 Lucent Technologies

"Y". "Y" being set on the SFSYS form indicates that the "Deny Transfer of Digit Screened Calls" feature has been purchased.

2.23 REMARK

Description: This field may contain any remarks deemed locally necessary.
Valid Entries: 1 - 16 characters

CALL TYPE	TYPE OF CI CALL	ACTION	FEATURE TYPE/NAME	CODE INDEX	ROUTE INDEX	PREFIX	DIGITS TO DELETE	TRIG NBR	NATURE OF NBR	ESC CODE

SEC. 3C: 5300-3a/3b/5a/5b RECORD
LOCAL DIGIT INTERPRETER TABLE FORM - LDIT
MULTIPLE LOCAL DIGIT INTERPRETER TABLE FORM - MLDIT

1. GENERAL

The 5300-3 and 5300-5 Records are used to define all area, office and service codes (NPA, NXX, X11, etc.) in a 5ESS Switch. Any code from one to fifteen digits in length may be defined. The LDIT serves as both a "local" and "foreign" area translator.

The LDIT (Local Digit Interpreter Table) is used for further digit interpretation. For line originated calls, the LDIT is used after the the PDIT (Prefix/ Feature Digit Interpreter Table). For trunk originated calls, the LDIT is used after the INDIT (Incoming Trunk Digit Preliminary Interpreter Table) when the LDIT(Y or N)? field equals "Y" (Yes) on the INDIT form (5309 Record).

1.1 Interpreted Digits

One to fifteen digits may be interpreted. The number of digits depends on how many digits are required before the destination route can be determined. However, for each digit level interpreted, the successive preceding digit levels must be fully expanded (0 - 9) as well as the final digit level. If a number such as 872 - 2813 needs to be routed differently than all other numbers in 872, then 872X, 872XX, 872XXX and 872XXXX (where X is 0 - 9) would be required entries on the LDIT form.

1.2 Rate and Route

The LDIT form provides a Code Index and Regular Route Index (or Office Code) which, when combined with a Screening Index, is used as an input to the RAR form (5301 Record). The Regular Route Index is used if the RTI field is "REGL" on the RAR form. If this route is not to be used for a particular class of subscribers, a Special Route Index is entered on the RAR form which overrides the Regular Route Index or Office Code.

1.3 Conflict Codes

Code Conflicts occur whenever the destination of a call, normally identified by the first three inpulsed digits, depends upon the remaining number of inpulsed digits and not upon their value. Code Conflicts occur when an office code in the local area is the same as a foreign NPA. For Local/Toll offices the concept is extended to include cases where the first three digits may be followed by three digits (NPA + Operator Code), four digits (NXX-XXXX), five digits (NPA + Leave Word Operator Code), six digits (NPA + Toll Tandem Codes + Operator Code) or seven digits (NPA + NXX-XXXX). In the NPA/NXX Code Conflicts, the destination indexes for the two conflicting codes is normally different. For the extended case, the destination indexes may be the same for all cases or the destination indexes may be different. The 5ESS Switch treats each distinct case based upon the entries provided on the 5300-5 Record and the 5300-3 Record form. Therefore, each case must be entered on the Conflict Resolution Record and in the Conflict Resolution section of LDIT form even though the destination indexes provided on all entries may be identical.

1.4 Ambiguity Codes

Ambiguities occur whenever the destination of a call depends, at some point in the impulsing, upon whether or not any additional digits are received. As an example, if two entries are provided on the LDIT, one for impulsed digits 023 and another for 023 - 161, an ambiguity occurs after the digit three is received. The ambiguity is resolved by timing. If no more digits are received within a specified interval, the call times out and its given the treatment specified on the 023 LDIT entry. Otherwise, digit analysis continues as more digits are received. For any two LDIT entries in which ambiguity occurs, the entry with the shorter of the inpulsed codes must have a NBR OF DIGITS entry which is exactly equal to the number of digits in the INCOMING DIGITS field.

Copyright © 2003 Lucent Technologies

No ambiguity may occur when the TYPE OF CI CALL is "SAC".

1.5 Conversion Codes

Up to four codes defined on the 5300-3 Record may be converted to any other code for outpulsing from the 5ESS Switch. The normal application of code conversion is for the 411, 611, 811 and 911 3-digit Service Codes. These codes are indicated on the 5300-3 Record with CALL TYPEs of "LOCDA", "REPAIR", "BUSOFC" and "EMER", respectively. The converted codes for these Call Types must be defined on the CONV form (5300-4 Record). Since the 5ESS Switch generic software always replaces the dialed digits for these Call Types with the code defined on the 5300-4 Record, the 5300-4 Record must always be completed with entries for these CALL TYPEs even though no code conversion is really required. In such cases, the 5300-4 Record entries must contain the same digits as the dialed code. The converted code is not re-interpreted by the digit analysis call processing software; it is simply used for any required outpulsing subject to digit deletion and prefixing by the Route Index translations, or for Directory Number translations.

1.6 Dial and Access Codes

The 5300-3 Record should contain an entry for every dialable code. This includes NPAs, NXXs and the N11 Service Codes. Feature and operator access codes (e.g., 72, 73, 0 and 1 prefixes, IDDD prefixes, etc.) must not be defined here, but on the PDIT form (5300-2 Record).

1.7 Multiple Local Digit Interpreter Table

MLDIT (Multiple Local Digit Interpreter Table), available with 5E3 and later Software Releases, is similar to LDIT but allows multiple entries of incoming digits to be input when they have common attributes. Conflict or IMPLIED NPA entries are not allowed on the MLDIT form. Entries made on the MLDIT form can only be reviewed on the MLDIT form. The 5300-3 Record will incorporate both LDIT and MLDIT entries.

1.8 Call Types

With 5E4(2) and later, two new values are added to the CALL TYPE field that correspond to inward calls. Inward calls are calls that arrive from a distant operator to an OSPS (Operator Services Position System) operator so that the operator can provide billing validation assistance or complete calls that have experienced difficulties.

With 5E4(2) and later, seven new CALL TYPEs were added to handle test calls in toll offices that employ the TOPAS (Testing, Operations, Provisioning and Administration System) operation system.

1.9 Operator Special-Dialed Codes

If an operator is not allowed to use 4-digit OSDCs (Operator Special-Dialed Codes), then distinguishing a number of the form NPA-TTC-OSDC from NPA-NXX-XXXX, the 5300-5 Record is used to separate the two.

The 5300-3 Record data must be populated so that a call originating on an RSM routes out of the same RSM. The 5300-3 Record also has to be populated with the digit analysis data needed to accept and route residual calls.

1.10 Fully Coded Addressing

Available with 5E5 and later, all international outbound calls will be processed using FCA (Fully Coded Addressing). FCA is a CCS (Common Channel Signaling) single-stage protocol used to route international outbound calls in a uniform manner through the domestic network. With FCA, when an international outbound call is routed to a 5ESS Toll Switch, the 5ESS Toll Switch will collect all the dialed digits and route the call as a CCS single-stage call towards a 4ESS ISC (International Switching Center). CALL

Copyright © 2003 Lucent Technologies

TYPEs associated with FCA are "STG1FCA" and "IDDDFCA".

1.11 Foreign Area Translator

For 5E6 and later, operating companies can make use of a FAT (Foreign Area Translator) LDIT during digit analysis. The FAT/LDIT performs further digit analysis on LDITs that are interpreting common dialed or inpulsed digit strings. For more information concerning the implementation and use of the FAT/LDIT, see Division 2, Section 1AO.

1.12 Timing Delay

TDAC (Timing Delay For All Calls) is used to eliminate Interdigit timing and to allow Overlap Outpulsing for CONFLCT CALL TYPEs. Conflicts are resolved in two ways - prefix and timing.

A conflict is prefix resolved when the dialed prefix matches the prefix entered in the PREFIX field. For the prefix resolved case, call processing will assume the call has been dialed with the quantity of digits specified in the NBR OF DIGITS field.

For the two conflict entry case, the conflict is also prefix resolved if the PREFIX field is blank, NBR OF DIGITS is known, and a prefix of NONE or 1+ is dialed.

Timing is used to resolve all other conflict scenarios.

Division 2, Section 4C1 discusses the translations for "Special" Features. TDAC translations are found in this section. The TDAC Conflict Resolution Table in Figure 2 represents the result of dialed calls which are interpreted by an LDIT form as Conflict Resolved calls based upon:

- the PREFIX entry on the LDIT form;
- the NBR OF DIGITS entry on the LDIT form;
- and the actual dialed prefix by the end user.

1.13 OSPS International Outbound Calls

If the LDIT field for OSPS international outbound calls is the same as the LDIT for the non-OSPS Toll international outbound calls, see the IDDD form (5307 Record) for the translations to populate the OSPS feature.

1.14 Call Type for Directory Assistance

For 5E7 and later, calls dialed as 5551212, 15551212, or FGD CAC (Carrier Access Code) + 5551212 will be blocked when translated with an LDIT form having TYPE OF CI CALL "INTER", NBR OF DIGITS 7, and CALL TYPE "DA". To successfully translate these calls, the TYPE OF CI CALL must be "INTRA" and the CALL TYPE "DA".

1.15 Recent Change View

The corresponding Recent Change View for the LDIT form is 9.3.

The corresponding Recent Change View for the MLDIT form is 9.15.

2. FORM ENTRIES - 5300-3a RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

Copyright © 2003 Lucent Technologies

2.2 *LDIT

Description: Enter the Local Digit Interpreter Table Number. The number selected is based upon entries on the DAS form (5300-1 Record)
Valid Entries: 1 - 999

2.3 *INCOMING DIGITS

Description: When using the MLDIT or LDIT form, enter the digits to be interpreted.
Valid Entries: 1 to 15 digits

2.4 RANGE

This field is only used on the MLDIT form. The last three digits specified in the INCOMING DIGITS field through the digits specified in this field will possess the assignments made on Screen 2 of the MLDIT form.

2.5 CALL TYPE

Description: Enter the Call Types to be used. Please refer to Figure 1 for field dependencies per CALL TYPE.

Required Field.
Default: NORMAL
Valid Entries:

Valid CALL TYPE Entries

Entry	Definition
100	Incoming 100 Type Test Calls
101	Incoming 101 Type Test Calls
102	Incoming 102 Type Test Calls
103	Incoming 103 Type Test Calls
104	Incoming 104 Type Test Calls
105	Incoming 105 Type Test Calls
106	Software Release: 5E3 and later. 106 Test Calls for DSN (Defense Switched Network) offices only.
104R	Incoming Call to a RMS-D3 104 Test Line
105R	Incoming Call to a RMS-D3 105 Test Line
109R	Incoming Call to a RMS-D3 109 Test Line
606R	Incoming Call to a RMS-D3 606 Test Line
101R	Incoming Call to a RMS-D3 101 Test Line
101TP	Incoming Call to a Specific RMS-D3 101 Test Position
101TAT	Incoming Call to a Specific RMS-D3 101 Test Position and TAT
211	Software Release: 5E15 and later. Dial 211.
311	Software Release: 5E15 and later. Dial 311.
900	Software Release: 5E5 and later. 900 calls. This CALL TYPE, is used to prevent a LASS AR (Automatic Recall) user from camping-on to this line.
ADDON	Software Release: 5E4(2) and later. Add-on for Alliance Teleconferencing.
APSDN	Software Release: 5E5 and later. ACP (Action Control Point) for a SDN (Software Defined Network). This value indicates that a query should be sent to the NCP (Network Control Point). The NCP will return a routing telephone number.
AUTINW	Software Release: 5E4(2) and later. Automated Inward Call. Calls with this call type are originated by a distant operator and are routed to an automated query.
BBRITL	Software Release: 5E6 and later. This ACTION is used for billed BRITL (Basic Rate Interface Dial Up Test Line).
BRITL	Software Release: 5E5 and later. This ACTION is used for non-billed BRITL.
BUSOFC	Business Office (811)

Copyright © 2003 Lucent Technologies

CONFLCT	Conflicting NXX and NPA Code - either prefix resolved or timing resolved. Refer to Division 2, Section 4C1 for the description for the TDAC feature and also see Figure 2 in this section.
CSTL	Coin Station Test Line
DA	555 Directory Assistance. Note: A CALL TYPE of "NORMAL" should be used with DA calls (i.e.,,555-1212, NPA-555-1212) that are preceded by an FGD CAC.
DA2VDT	Directory Assistance calls routed to Video Display Terminal.
ECP	Software Release: 5E9(1) and later. Mobile originated call on a 5ESS Switch serving as a Digital Cellular Switch for an ECP (Executive Cellular Processor).
EMER	911 Emergency Service Bureau
FAT	Software Release: 5E6 and later. Foreign Area Translator. When a CALL TYPE of "FAT" is entered, call processing will "escape" to the FAT/LDIT for further digit interpretation.
HNPAD	Home NPA (Numbering Plan Area) dialed in error.
IC1	Incoming 101 Call to Work Station 1
IC2	Incoming 101 Call to Work Station 2
IC3	Incoming 101 Call to Work Station 3
IC4	Incoming 101 Call to Work Station 4
IC5	Incoming 101 Call to Work Station 5
IC6	Incoming 101 Call to Work Station 6
IC7	Incoming 101 Call to Work Station 7
IC8	Incoming 101 Call to Work Station 8
IC9	Software Release: 5E8 and earlier Incoming 101 Call to Work Station 9 associated with CTTU (Central Trunk Test Unit). Software Release: 5E9(1) and later Incoming 101 Call to Work Station 9. Note: Effective with 5E9(1), IC33 is associated with CTTU (Central Trunk Test Unit).
IC10	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 10.
IC11	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 11.
IC12	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 12.
IC13	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 13.
IC14	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 14.
IC15	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 15.
IC16	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 16.
IC17	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 17.
IC18	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 18.
IC19	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 19.
IC20	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 20.
IC21	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 21.
IC22	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 22.
IC23	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 23.
IC24	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 24.
IC25	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 25.
IC26	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 26.
IC27	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 27.

Copyright © 2003 Lucent Technologies

IC28	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 28.
IC29	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 29.
IC30	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 30.
IC31	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 31.
IC32	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 32.
IC33	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 33 associated with CTTU (Central Trunk Test Unit).
IDDDFCA	Software Release: 5E5 and later. International Direct Distance Dialing FCA call.
IDDDSTS	Software Release: 5E3 and later. International Direct Distance Dialing Station to Station.
INV	Software Release: 5E3 and later. ISTF (Integrated Services Test Function) Inverted Loopback test.
INWATS	INWATS (800+)
LNACP	Software Release: 5E6 and later. ACP (Action Control Point) for a LN (Leased Network).
LOCDA	Local Directory Assistance (411)
LTD	Local Test Desk
MEETME	Software Release: 5E4(2) and later. Alliance Teleconferencing meet-me call.
NINV	Software Release: 5E3 and later. ISTF (Integrated Services Test Function) Non-Inverted Loopback test.
NORM555	Software Release: 5E16 and later. Dial (1) + 555 - XXXX
NORMAL	This value is used for all other types of calls and indicates normal call processing. Intraoffice and interoffice (usually seven or ten digit) calls require no special handling by the Software Release.
NS800	Software Release: 5E4(2) and later. Number Service (SSP800) type call.
OCTL	Open Circuit Test Line
OPINW	Software Release: 5E4(2) and later. Operator-assisted Inward Call. Calls with this call type are originated by a distant operator and are routed to an OSPS operator position.
OPNIT	Operator-assisted DA/Non-ISP call to the VDT.
OSOIWTS	Originating Screening Office INWATS (see Note)
PB	Incoming Permanent Busy Type Test Calls
RELAY	Software Release: 5E15 and later. 711 Relay/Hearing Impaired Service.
REPAIR	Repair Service Bureau (611)
SDNA	Software Release: 5E3 and later. Software Defined Network outgoing calls from the NAP (Network Access Point).
SDNE	Software Release: 5E3 and later. Software Defined Network incoming calls to the NAP (Network Access Point).
SPAB800	Software Release: 5E5 and later. Special Access Basic 800 Service.
SPAM800	Software Release: 5E5 and later. MEGACOM 800 Service.
SRTT	Station Ringer Touch-Tone Test
STG1FCA	Software Release: 5E5 and later. First Stage of a Fully Coded Addressing international outbound call.
SYN	Incoming Synchronous Type Test Calls
VACANT	Vacant NPA, NXX and Service Codes
WETESTC	Software Release: 5E8 and later. Test call associated with 5ESS library programs.

Data Rules:

Call Types "LOCDA", "REPAIR", "BUSOFC" and "EMER" require a corresponding entry on the CONV form.

For 5E3 and later, the MLDIT form requires a CALL TYPE entry. A CALL TYPE of "CONFLCT" is not

Copyright © 2003 Lucent Technologies

allowed on the MLDIT form.

For 5E5 and later, if a CALL TYPE of 100, 101, 101R, 101TAT, 101TP, 102, 103, 104, 104R, 105, 105R, 106, 109R, 606R, IC1, IC2, IC3, IC4, IC5, IC6, IC7, IC8, IC9, INV, NINV, PB or SYN is entered, then ROUTE INDEX on the RTIDX form, which corresponds to the ROUTE INDEX on this form, must have a ROUTE TYPE of "TEST".

A digit string used for test CALL TYPEs must be used for the same test CALL TYPE in all LDITs in which the digit string is defined. This applies to digit strings defined on LDIT, MLDIT and RDIT forms (5300-7/8 Record).

A terminating test line ("10x", "PB", or "SYN") must be defined in the office as a CALL TYPE on an RDIT, LDIT, or MLDIT form, or as TEST CODE on a LINE form (5109-1/2/3 Record).

For 5E12 and later, when CALL TYPE of "SPAB800", "SPAM800", "IDDDFCA" or "IDDDSTS" is entered, CI TYPE must be "NONCI".

For 5E13 and later, when CALL TYPE is "SDNE", ROUTE INDEX is entered, and PORTED IN is "N", OFFICE CODE cannot be entered.

ADDON: If "ADDON" is entered in the CALL TYPE field, then FIXRT forms (5301 Records) must be submitted with FIXED ROUTE TYPES of "ATCANIF" and "ATCINT".

For 5E7 and later, if CALL TYPE or CONFLICT RESOLUTION CALL TYPE is "ADDON" or "MEETME", then ORIG SCREEN OFF is "Y" on the OFCOPT form and OSPS DA is "Y" on the OSPSOPT form.

APSDN: This value can only be used when a 5ESS Switch is an ACP (ACT PT SDN field on the OFCOPT form is "Y").

AUTINW: This is a valid call type only if the OSPS TA parameter is set to "Y" on the OSPSOPT form.

BBRITL: The DSL which is being tested must have BRITL ALW set to "Y" on the corresponding DSLUSR form.

CONFLCT: For 5E3 and later, when CALL TYPE is "CONFLCT", NBR OF DIGITS is specified, and PREFIX is blank, there must be exactly two CONFLICT RESOLUTION entries.

For 5E9(1) and later:

If CALL TYPE is "CONFLCT", then the DFLT RT on Screen 1 must be "NONE".

If "CONFLCT" or "FAT" are entered in CALL TYPE and "SAC" is entered in TYPE OF CI CALL, then LDIT or MLDIT forms with the above values cannot have INCOMING DIGITS which are the starting digits of:

- INCOMING DIGITS on another LDIT or MLDIT form
- IDDD PREFIX / COUNTRY ACCESS CODE combination on the IDDD form

This restriction applies only to LDIT, MLDIT, IDDD forms sharing the same LDIT value.

For 5E10 and later:

When CALL TYPE is "CONFLCT", ANI BYPASS must be "N".

For 5E11 and later:

When CALL TYPE is not "CONFLCT", CONFLICT RESOLUTION entries cannot be made.

When CALL TYPE is "CONFLCT", then:

Copyright © 2003 Lucent Technologies

- LNP TRIG NBR must not be entered.
- GEO PORT must be "N".
- PORTED IN must be "N"
- HOME LRN must be "N"
- LRN SCREENING must be "N"
- IHN DNT must be "N"
- ESC CODE must be "N"
- DFLT RT must be "NONE"
- CONFLICT RESOLUTION ANI BYPASS must be "N"
- ROUTE INDEX is prohibited.
- OFFICE CODE is prohibited.
- At least two CONFLICT RESOLUTION entries must be made.

For 5E13 and later, when CALL TYPE is "CONFLCT", NPA SPLIT ANNC must be "N".

For 5E14 and later, when CALL TYPE is "CONFLCT", REL LINK must be "N".

EMER: If a CALL TYPE of "EMER" or "NORMAL" is entered, a TRIG NBR is defined on an NSTRIG form and APPLICATION on the NSTRIG form is "E911" or "800", then ROUTE INDEX and OFFICE CODE on the LDIT or MLDIT form cannot be entered. If APPLICATION on the NSTRIG form is "ASP", then ROUTE INDEX or OFFICE CODE on the LDIT or MLDIT form must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered.

For 5E11 and later, when CALL TYPE is "EMER" and TYPE OF CALL is "INTRA", TRIG NBR must match a TRIG NBR on the NSTRIG form where APPLICATION is "E911."

FAT: When CALL TYPE is "FAT", the value of INCOMING DIGITS on this LDIT form must be in the range 200 - 999 since this represents the FAT/LDIT table number (FAT/LDITs must be in this range); and must be equal to the LDIT value defined on an SMLDIT form (5315 Record) where the FAT field has an entry of "Y" (Yes). Digit interpretation continues on the FAT/LDIT represented by the value of INCOMING DIGITS; therefore, this value of INCOMING DIGITS cannot be expanded on the local LDIT table.

The "FAT" call type cannot be entered on an LDIT pointed to by another FAT/LDIT (a FAT/LDIT cannot point to another FAT/LDIT). Also, the "FAT" call type is not applicable to the CONFLICT RESOLUTION TABLE or the MLDIT form (5300-5 Record).

Code Conversion call types ("EMER", "LOCDA", "REPAIR" or "BUSOFC") cannot be assigned on FAT/LDITs.

For 5E8 and later, if CALL TYPE is "FAT", RDIT cannot be entered.

For 5E9(1) and later, if "CONFLCT" or "FAT" are entered in CALL TYPE and "SAC" is entered in TYPE OF CI CALL, then LDIT or MLDIT forms with the above values cannot have INCOMING DIGITS which are the starting digits of:

- INCOMING DIGITS on another LDIT or MLDIT form

Copyright © 2003 Lucent Technologies

- IDDD PREFIX / COUNTRY ACCESS CODE combination on the IDDD form

This restriction applies only to LDIT, MLDIT, IDDD forms sharing the same LDIT value.

For 5E11 and later, when CALL TYPE is "FAT", POLYGRID must be "N".

IDDDFCA: This value is used for the address sequence of an international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA. A DAS (Digit Analysis Selector) of 81 will be used instead of the DAS associated with the incoming trunk group. This Call Type may be assigned to incoming digit sequences CC + NN or 0/1X + CC + NN. CC is the Country Code. NN is the National Number. 0/1X is the ISC (International Switching Center) prefix code.

If "IDDDFCA" is entered, then "Y" must be entered in the OFFICE TYPE on the OFCOPT form (5509 Record).

IDDDSTS: Used for multistage international outbound calls which are routed to a MF trunk, CCIS6 trunk or CCS7 ISUP trunk. This value may be assigned to codes which require two-stage call handling at a toll or tandem office. Two-stage call handling includes an acknowledgement wink before the second stage of digits is sent. Also used in a tandem or toll office when the digits inpulsed on the trunk, typically from a TSPS, are 011 + padded Country Code.

For 5E5 and later, this value can be used for:

- A Local office (OFFICE TYPE on the OFCOPT form is "N") where the incoming digits are 011 + (7 - 12 digits).
- A Toll office (OFFICE TYPE on the OFCOPT form is "Y") which will not use FCA (Fully Coded Addressing). Possible incoming digits are 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international call.
- A 5ESS Gateway switch that requires an FCA international outbound call to leave the office on an MF trunk must assign this CALL TYPE to the digit sequence CC + NN. CC is the Country Code. NN is the National Number. ISTF (Integrated Services Test Function) Inverted Loopback test.

LNACP: This value indicates that a query should be sent to the LN NCP (Network Control Point). The NCP will return routing and charging information. This value can only be used when the Leased Network DAS field is entered on the OFCOPT form (5509 Record).

MEETME: If "MEETME" is entered in the CALL TYPE field, then FIXRT forms (5301 Records) must be submitted with FIXED ROUTE TYPES of "ATCANIF" and "ATCINT".

For 5E7 and later, if CALL TYPE or CONFLICT RESOLUTION CALL TYPE is "ADDON" or "MEETME", then ORIG SCREEN OFF is "Y" on the OFCOPT form and OSPS DA is "Y" on the OSPSOPT form.

NORM555: For 5E16 and later, when CALL TYPE is "NORM555", TRIG NBR and CODE INDEX must be entered.

NORMAL: See "EMER" above.

OPINW: The OSPS TA field on the OSPSOPT form must be "Y".

OSOIWTS: If this Call Type is used, COMMON CHAN SIG and ORIG SCREEN OFF must be "Y" and the HOME NPA must be specified on the OFCOPT form (5509 Record). See the ONPA form (5312 Record) for related information.

For 5E7 and later, when CALL TYPE is "OSOIWTS", TYPE OF CI CALL must be "NONCI", "INTER", or

Copyright © 2003 Lucent Technologies

"INTRA".

If at least one RDIT, LDIT or MLDIT form exists with a CALL TYPE of "OSOIWTS", FIXED ROUTE TYPE must equal "UIA" on a FIXRT form.

- ***NOTE:*** OSOIWTS is used by an Inter-LATA Carrier switch to do originating screening for INWATS digits inpulsed as 800 or 00X plus 7 digits. If this Call Type is used, COMMON CHAN SIG and ORIG SCREEN OFF must be "Y" and the HOME NPA must be entered on the OFCOPT form (5509 Record). See the ONPA form (5312 Record) for related information.

SPAB800: Special Access Basic 800 service allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAB800" on the TKGRP form).

SPAM800: MEGACOM 800 service is a volume discount service which allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAM800" on the TKGRP form). MEGACOM 800 service is similar to Special Access Basic 800 service except that the customer must supply the dedicated trunk group to the 5ESS Toll Switch.

STG1FCA: This value should be used for the first stage of a multi- stage international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA (Fully Coded Addressing. This Call Type may be assigned to incoming digit sequences 1NX + XXX + CCC, 1NX + XXXX + CCC, 011 + PCC, or 18X. 1NX is the customer direct dialed digits. XXX is the 3-digit international carrier. XXXX is the 4-digit international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international code.

For 5E9(1) and later in Recent Change: If "STG1FCA" is entered, then the NBR OF DIGIT field must be 3, 6, 9, or 10.

VACANT: Attempts to dial codes defined as "VACANT" will result in vacant code treatment. In addition, ASP will consider these codes invalid pre-query.

Switch owners may need to define RNX codes that are considered "VACANT" in the normal dialing plan but are treated as "NORMAL" for purposes of ASP pre-query. For these codes, the user should receive "VACANT" code treatment if the number is dialed directly. To accomplish this, CALL TYPE should be set to "NORMAL" and the ROUTE INDEX set to the ROUTE INDEX from the FIXRT form (5301-1 Record) where the FIXED ROUTE TYPE is equal to "VACANT". To identify the RNX codes defined in this manner, it is recommended that the REMARK field should be set to "RNX VAC/ASP QRY".

For 5E15 and later, CALL TYPE on the LDIT/MLDIT forms can be set to "RELAY" only if the ACT field for SFID 594, on the SFSYS form is set to "Y".

2.6 TYPE OF CI CALL

Description: Enter the type of CI (Carrier Interconnect) call. See Figure 1 for appropriate entries per Call Type.

On the MLDIT form, this is a required entry.

Valid TYPE OF CI CALL Entries

Entry	Definition
COMP	Used for calls to a geographical area where the LEC (Local Exchange Carrier) and ICs (Inter-LATA Carriers) compete on an equal basis. Such calls must be routed by a carrier, but this "carrier" may be the LEC. If the subscriber wants to be routed via the LEC, the subscriber must either be presubscribed to the LEC or dial an explicit FGD CAC.
CONFL	Used for cases where the call may be either INTER (Inter-LATA) or INTRA (Intra-LATA), depending on the dialed prefix. See Data Rules for more information.
INTER	Used for calls destined for outside the LATA. Such calls must be routed via a carrier, not the LEC. If the carrier is to be determined by an external database (e.g. AIN database query), "NONCI" should be used since carrier selection is irrelevant in this switch.

Copyright © 2003 Lucent Technologies

INTRA	Used for calls destined for within the LATA. Usually routed via the LEC. If other carriers are permitted and accept Intra-LATA calls, an explicit FGD CAC must be dialed (not presubscription) to access the carriers for these calls.
INTRM	Software Release: 5E8 and later. FGB Interim call is used for an incoming trunk call dialed by the originator as 950XXXX. The 950 digits are entered in the INCOMING DIGITS. The XXXX represents a Carrier Identification Code. These calls may be from a non-EAEO and less than the seven digits may be received as would then be reflected in the INCOMING DIGITS. When "INTRM" is entered, the last four digits inpulsed (i.e., the Carrier Identification Code) will be used to enter the ICF form (5305 Record) to access the Carrier's FGB CDI and FGB RTI. Because "INTRM" is also a valid entry in the LDIT form, it may be optionally used instead of the INDIT form.
NONCI	Used for calls for which carrier selection is irrelevant.
PRIV	Used for EAS (Extended Area Service) calls where the local calling area extends into the neighboring LATA. These Inter-LATA calls are treated as INTRA (routed by the LEC) except when the subscriber explicitly dials an FGD CAC for an IC. When the FGD CAC is dialed, the call is treated as INTER.
PSCAR	Software Release: 5E3 and later. For PS (Packet Switched) calls, indicates that an IC (Interexchange Carrier) is required. If the DNIC of the IC is given in the RPOA (Recognized Private Operating Agency) selection field, that DNIC is used to route the call. If the DNIC is not given in the RPOA, then the preselected IC is used, given by the IECP DNIC field on the DSLUSR form (5908 Record). The route index is assigned to the DNIC on the PSDNICRI form (5921 Record), therefore the ROUTE INDEX and CODE INDEX must not be entered on this form. The preselected (default) IC is selected at the time of the service order. If the DNIC is not given in the RPOA or entered in the IECP DNIC field, then the PS call is cleared.
PSNCI	Software Release: 5E3 and later. For packet switched calls, indicates a carrier interconnect does not apply, therefore a ROUTE INDEX and a CODE INDEX must be specified on this form.
SAC	Used for SACs (Service Access Codes), e.g., 800 and 900 codes. Each six digit SAC code (800/900 + NXX) is assigned to a specific carrier. The Code Index and Route Index from this form, the LDIT, will be used to route the call. When this Type of CI Call is specified, the Carrier Identification must be entered in SAC OWNER. SAC may not be specified in an ambiguous case.
TCONF	Software Release: 5E9(1) and later. Intra-LATA toll conflict. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TCONF", a SFSYS form must exist with SFID 149 set to "Y".
TOLL	Software Release: 5E9(1) and later. Toll calls within the LATA. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TOLL", a SFSYS form must exist with SFID 149 set to "Y".
WZ1	Used for calls outside the continental United States, but within World Zone 1 (e.g., Canada).

Data Rules:

This field must be entered for all CALL TYPEs except "CONFLCT" and "FAT"

CONFL: Call processing will look ahead at other records to determine if the call should be treated as Intra-LATA or Inter-LATA. When no prefix has been dialed, the ROUTE INDEX value of this LDIT entry will be compared to the RTI value entered in the No Prefix column of the originator's Rate and Route form (5301 Record). If the RTI value equals the ROUTE INDEX value or is REGL, it is considered a match and treated as an Intra-LATA call. If the RTI is not equal to the ROUTE INDEX value, there is no match and therefore the call will be treated as an Inter-LATA call. When a 1 prefix has been dialed, the process is the same as the No Prefix case, except the RTI value found in the 1+ Prefix column of the RAR is used for comparison. When a 0 prefix has been dialed, the comparison technique is inappropriate. In this case, the 0+ Prefix entry in the RAR will be read. The RTI value in that entry will be analyzed to determine whether or not it is an Announcement Route Index. If it is an announcement, the call will be processed as an Inter-LATA call. If it is not, the call will be treated as an Intra-LATA call. When the zero plus call should be treated as an Inter-LATA carrier call and therefore the RAR has an announcement type Route Index, care must be taken to make sure the associated CBLK entry equals No.

Copyright © 2003 Lucent Technologies

PSCAR: When using this type of CI Call, the CALL TYPE must be "NORMAL" or "900".

PSNCI: When this TYPE OF CI CALL is used, a CALL TYPE of "NORMAL", "900" or "VACANT" must be entered.

Packet Switching TYPE OF CI CALLs ("PSCAR" and "PSNCI") cannot be mixed with non-Packet Switching TYPE OF CI CALLs within a single DAS.

For 5E8 and later, if TYPE OF CI CALL is "PSCAR" or "PSNCI", TRIG NBR must not be entered.

For 5E9(1) and later, if "PSNCI" or "PSCAR" are entered in the CI TYPE CONFLICT RESOLUTION ENTRIES then NBR OF DIGITS and PREFIX cannot be entered.

SAC: When this TYPE OF CI CALL is used, a CALL TYPE of "INWATS", "NORM555", "NORMAL", "900" or "DA" must be entered.

For 5E8 and later, if TYPE OF CI CALL is "SAC", RDIT cannot be entered.

For 5E9(1) and later, if "CONFLCT" or "FAT" are entered in CALL TYPE and "SAC" is entered in TYPE OF CI CALL, then LDIT or MLDIT forms with the above values cannot have INCOMING DIGITS which are the starting digits of:

- INCOMING DIGITS on another LDIT or MLDIT form
- IDDD PREFIX / COUNTRY ACCESS CODE combination on the IDDD form

This restriction applies only to LDIT, MLDIT, IDDD forms sharing the same LDIT value.

WZ1: All forms with TYPE OF CI CALL equals "WZ1" which have the first three digits (that is, the NPA (Numbering Plan Area)) in the INCOMING DIGITS fields must have the same value for WZ1 REGION.

For 5E6 and later, this type of Carrier Interconnect is allowed on FAT/LDITs, however, instead of this value (WZ1) being related to the first three digits of INCOMING DIGITS, it is related to the FAT/LDIT table number.

For 5E9(1) through 5E14, when CALL TYPE is "LOCDA", "BUSOFC", or "REPAIR", TYPE OF CI CALL must be "INTER", "INTRA", or "TOLL".

For 5E12 and later, "IDDD" is not a valid value for TYPE OF CI CALL.

For 5E15 and later, when CALL TYPE is "BUSOFC", "LOCDA", "RELAY", or "REPAIR", TYPE OF CI CALL must be "INTER", "INTRA", or "TOLL".

2.7 NBR OF DIGITS

Description: Enter the total number of digits expected excluding the dialed prefix.

On the MLDIT form, this is a required entry for 5E4(2) and later.
Valid Entries: 1 - 15 or 1 - 18 if IDDD15 functionality is available

Data Rules:

If a value is entered in this field, it must be equal to or greater than the quantity of digits entered in the INCOMING DIGITS field.

For the CALL TYPE of "CONFLCT", where the conflict is prefix resolved, enter the total number of digits expected for the entry associated with the prefix value entered under PREFIX. Refer to Division 2, Section 4C1 for the description for the TDAC feature and also see Figure 2 in this section.

Copyright © 2003 Lucent Technologies

For CALL TYPEs of "FAT", this field must be blank.

For 5E8 and later, if NBR OF DIGITS is 0 through 6, 8, or 9, and TRIG NBR matches TRIG NBR on an NSTRIG form (5324 Record) where SERV KEY is "CDPN" and APPLICATION equals "ASP", ALT GBL TITLE on NSTRIG must be entered.

For 5E12 and later, when FAT on the corresponding SMLDIT form is "Y", then NBR OF DIGITS must be equal to 4 or 7.

For 5E12 and later, when FAT on the corresponding SMLDIT form is "N", then NBR OF DIGITS on the MLDIT form must be equal to 3, 7 or 10.

For 5E12 and later, when FAT on the corresponding SMLDIT form is "N" and the CONFRES.CI TYPE on the LDIT form is not "IDDD", then NBR OF DIGITS on the MLDIT form must be equal to 3, 7 or 10.

2.8 RDIT

Description: Enter the Remaining Digits Interpreter Table number.

Software Release: 5E8 and later
Valid Entries: 1 - 999

Data Rules:

If RDIT is entered:

- NBR OF DIGITS must be greater than the length of INCOMING DIGITS,
- CALL TYPE cannot be "FAT",
- For LDIT forms, RDIT and INCOMING DIGITS must equal RDIT and PREVIOUS DIGITS on an RDIT form, and
- For MLDIT forms, RDIT and the digit string derived from INCOMING DIGITS and RANGE must equal RDIT and PREVIOUS DIGITS on an RDIT form.

2.9 CODE INDEX

Description: The Code Index combined with a Screening Index is used as an input to the Rate and Route Tables.

For 5E6 and later, the CODE INDEX determines whether or not pre-query call screening will be performed for SSP/800 calls. If CALL TYPE is "NS800" and a value is entered in CODE INDEX, then pre-query screening will be performed. The screening index from the originating line or trunk, along with the dialed prefix and this CODE INDEX, will be used to access the RAR form. When the RTI from the associated RAR form is "REGL", the normal SSP/800 query and call processing will occur. When the RTI contains a numbered route index, the call will be routed to that RTI.

For 5E8 and later, CODE INDEX is now a real Code Index and no longer a pointer to the DISERV form (5321 Record).
Valid Entries: 3 - 4095

Data Rules:

This field must be blank if the CALL TYPE is "VACANT", "CONFLCT", "FAT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN" or "CSTL".

Copyright © 2003 Lucent Technologies

If the CODE INDEX is entered, it must match the CDI field on an RAR form (5301 Record).

Code Index 1 (0-) and Code Index 2 (010) may not be entered on the LDIT Record.

All combinations of CODE INDEX, PREFIX from the PDIT form, and SCREENING INDEX from the LCC form (5306 Record) must have corresponding RAR form entries for CDI, PFX, and SCR.

All combinations of CODE INDEX and SCR from the TKGRP form must have corresponding RAR form entries for CDI, SCR, and "NONE" for PFX.

For 5E8 and later, either CODE INDEX or CDI on this form or an RDIT form, or CODE INDEX on a PDIT or INDIT form, or WITH ANI or WITHOUT ANI on an AISCLS form must equal INC CDI on an INFLDEST form (5448 Record).

2.10 ROUTE INDEX

Description: This field indicates the Regular Route Index to be used for routing the call except when a Special Route Index entered on the RAR overrides it. The Regular Route Index is the route which is used by the majority of call originators to complete the call.

For 5E8 and later, the ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

When the CALL TYPE is "VACANT", "NS800", "CONFLCT", "FAT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN" or "CSTL", this field must be blank. When the CALL TYPE is other thanthose just listed, an entry is required in this field or in the OFFICE CODE field.

2.11 POLYGRID

Description: Is polygrid routing used for DSN (Defense Switched Network) offices?

Enter "N" for non-DSN offices.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CALL TYPE is "FAT", and TYPE OF CI CALL is "PSCAR" or "PSNCI", POLYGRID must be "N".

If the LDIT or MLDIT forms have a ROUTE INDEX entered, and POLYGRID is "Y", then the DSN OPTION field on the OFCOPT form must be "Y".

2.12 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Copyright © 2003 Lucent Technologies

Data Rules:

When NPA is entered, OFFICE CODE must be entered.

For 5E12 and later, when the OFFICE CODES and/or NPA/OFFICE CODE combinations are assigned on the LDIT and/or MLDIT forms, they must be defined on the NOC form.

2.13 OFFICE CODE

Description: Enter an Office Code (NXX) served by the 5ESS Switch (i.e., defined on the NOC form). If an Office Code is entered, it will be entered to "route" the call to a Directory Number of this NXX in this office except when overridden by a Special Route Index entered in the Route Index field of the RAR form.
Valid Entries: 3 digit NXX (N = 2 - 9, X = 0 - 9)

Data Rules:

When the Call Type is "VACANT", "NS800", "CONFLCT", "FAT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN", "SPAB800", "SPAM800", "IDDDFCA", "IDDDSTS" and "CSTL", this field must be blank. When the Call Type is other than these, an entry is required in this field or in ROUTE INDEX.

For 5E12 and later, if the LDIT forms have an OFFICE CODE defined and there are multiple NOC forms with the same value of OFFICE CODE, NPA must also be defined on the LDIT form.

2.14 DESEP

Description: This field is used to define the Destination Separations Index for Call Types other than "VACANT", "CONFLCT", "FAT", "HNPAD", "LTD", "SRTT", "OCTL", or "CSTL". It is only required for Division of Revenue study.
Valid Entries: 1 - 255

Data Rules:

If a DESEP is entered, it must be defined on the Traffic Separation Cell Grouping TRFSEP form (5308 Record).

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.15 PREFIX

Description: This field is only entered on the LDIT form. For a CALL TYPE of "CONFLCT", where the conflict is prefix resolved, enter the prefix associated with the quantity of digits entered in the NBR OF DIGITS field. Each of the values affects call processing as follows: Refer to Division 2, Section 4C1 for a description of the TDAC feature and also to Figure 2 in this section.

Entry	Effect on Call Processing
Blank	If NBR OF DIGITS is known, and the call is dialed with NONE or 1+ prefix, the conflict is prefix resolved. The conflict is timing resolved if 0+ is dialed. If NBR OF DIGITS is blank, the conflict is timing resolved regardless of the prefix dialed.
NONE	Results in the conflict being prefix resolved if call is dialed with no prefix. NBR OF DIGITS determines the quantity of digits to collect. Conflict is timing resolved for any other dialed prefix.
1+	Results in the conflict being prefix resolved if call is dialed with a 1 prefix. NBR OF DIGITS determines the quantity of digits to collect. Conflict is timing resolved for any other dialed prefix.
0+	Results in the conflict being prefix resolved if call is dialed with a 0 prefix. NBR OF DIGITS determines the quantity of digits to collect. Conflict is timing resolved if any other prefix is dialed.

Normally, a 1 is the prefix value.
Valid Entries: 0, 1, NONE

Copyright © 2003 Lucent Technologies

Data Rules:

This field must be blank when the CALL TYPE is "FAT".

2.16 WZ1 REGION

Description: For codes with a TYPE OF CI CALL equal to WZ1, enter a World Zone 1 region. This digit is used in the first stage of outpulsing for INCs (International Carriers) on either a direct connection or via an Access Tandem. The first stage of outpulsing has a format of KP + 1NX + XXX + 01R + ST, where R is the World Zone 1 region. (1NX is a spare toll center code entered on the Route Index as prefix digits. XXX is the Carrier Identification Code.) For other than WZ1 types, leave this field blank.
Valid Entries: 0 - 9

2.17 TERM LATA

Description: This field is used as the Inter-LATA Carrier when Network Call Denial Screening is required on incoming CAMAANI Trunk Groups.

Valid TERM LATA Entries

Entry	Definition
1	Indicates LATAs not subtending the switch
2 - 31	Software Release: 5E5 and later. Indicates a subtending LATA of the switch.

Data Rules:

If TYPE OF CI CALL is "PSCAR" or "PSNCI", then this field must be blank.

If CALL TYPE is "LNACP", this field must be blank.

If TERM LATA is specified, COMMON CHAN SIG must equal Yes on the OFCOPT form (5509 Record).

When the CALL TYPE is "NORMAL", "DA", "IDDDSTS", "AUTINW", "OPINW" or "INWATS", enter an appropriate value to indicate, based on incoming digits, the destination of this call.

The TERM LATA value is compared to an ORIG LATA value specified on the TKGRP form (5202-3 Record).

2.18 SAC OWNER

Description: For codes with a TYPE OF CI CALL equal to "SAC", enter the Carrier Identification Code of the carrier "owning" the Service Access Code, or "LEC" for a Local Exchange Carrier. The ICF form (5305 Record) will be accessed to check the validity of the Carrier ID and to determine if overlap outpulsing might be required. However, routing will be done based on the Code Index and Route Index of the LDIT, not the ICF.
Valid Entries:

- For 5E8 and earlier: 0 - 999 or "LEC"
- For 5E9(1) and later: 0 - 9999 or "LEC"

Data Rules:

SAC OWNER must be specified for "SAC" TYPE OF CI CALL and is allowed only for "SAC" TYPE OF CI CALL.

For 5E8 and later, if SAC OWNER or CONFLICT RESOLUTION SAC OWNER is assigned on the LDIT form, then they must be defined as CARRIER IDs on an ICF form with FEAT GRP = "D".

Copyright © 2003 Lucent Technologies

2.19 NATURE OF NBR

Description: Enter the nature of the number. This field is used during query formulation of Network Services calls, and is populated only for ASP SSP offices.

Software Release: 5E8 and later
Valid Entries:

Valid NATURE OF NBR Entries

Entry	Definition
IDDD or I	International
NATL or N	National
PRIV or P	Private

Data Rules:

For 5E8, if NATURE OF NBR is entered, TRIG NBR must be entered.

NATURE OF NUMBER must be entered when ASP OFC on OFCOPT is "SSP", and TRIG NBR equals TRIG NBR on an NSTRIG form where APPLICATION is "ASP".

2.20 TRIG NBR

Description: Enter the Network Services trigger number.

Software Release: 5E8 and later
Valid Entries:

- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

Data Rules:

If TRIG NBR is entered:

- it must equal TRIG NBR on an NSTRIG form,
- TERM LATA cannot be entered, and CODE INDEX must also be entered,
- if RDIT is also entered, CALL TYPE cannot be "CONFLCT",
- if APPLICATION on the corresponding NSTRIG form is "E911", CALL TYPE must be "EMER", and TYPE OF CI CALL must be "INTRA";
- if NBR OF DIGITS is neither 7 nor greater than 9, and SERV KEY on the corresponding NSTRIG form equals "CDPN", ALT GBL TITLE on NSTRIG must be entered and APPLICATION on NSTRIG must be "ASP";
- if a CALL TYPE of "EMER" or "NORMAL" is entered, a TRIG NBR is defined on an NSTRIG form, and APPLICATION on the NSTRIG form is "E911" or "800", then ROUTE INDEX and OFFICE CODE on the LDIT or MLDIT form cannot be entered. If APPLICATION on the NSTRIG form is "ASP", then ROUTE INDEX or OFFICE CODE on the LDIT or MLDIT form must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered.
- For 5E8 only, if ASP OFC on an OFCOPT form is "SSP", and APPLICATION on the corresponding NSTRIG form is "ASP", NATURE OF NBR must be entered.

For 5E9(1) and later, when TRIG NBR is entered, NBR OF DIGITS must be 3, 7, or 10.

Copyright © 2003 Lucent Technologies

For 5E12 and later, when TRIG NUM on the LDIT/MLDIT forms is entered and the associated NSTRIG form with the same TRIG NUM has an APPLICATION of "ASP", then INCOMING DIGITS on the LDIT/MLDIT forms must have a first digit of "2", "3", "4", "5", "6", "7", "8", or "9".

For 5E15 and later, when CALL TYPE is "RELAY", TRIG NBR must not be entered.

2.21 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ESC CODE must equal "N" for CALL TYPE of "CONFLCT".

2.22 DFLT RT

Description: The DFLT RT field is used to identify the type of default routing treatment to be used for the ASP Default Routing for 3/6/10-Digit Triggers (Phase 1) Special Feature. When the ASP Special Feature has been purchased, this field can be used to specify the type of default routing to occur when an ASP specific digit trigger query fails.

Software Release: 5E9(1) and later
Default: NONE
Valid Entries:

Valid DFLT RT Entries

Entry	Definition
ANNC or A	Default route to announcement (or tone). The call will route to either a tone or announcement, depending on what is defined for the route.
DLDN or D	Default route to dialed DN. The call will route to the DN dialed (or the DN being routed to if the call came from a trunk).
NONE or N	No default routing. No special default routing will take place, and normal call treatment will send the call to reorder or NCA (No Circuits Available).

Data Rules:

ANNC: If "ANNC" is entered in the DFLT RT or CONFLICT RESOLUTION ENTRIES DFLT RT field, then a FIXRT form (5301-1 Record) must be defined with FIXED ROUTE TYPE set to "DFLTRT".

NONE: If DFLT RT is not "NONE" and CALL TYPE is not "CONFLCT", then TRIG NBR must be entered.

If DFLT RT is not "NONE" in CONFLICT RESOLUTION ENTRIES, then TRIG NBR must be entered.

For 5E9(2) and earlier, if an LDIT form has a DFLT RT or CONFLICT RESOLUTION ENTRIES DFLT RT other than "NONE", the corresponding TRIG NBR must be defined on the NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1".

For 5E10 and later, when the LDIT forms have a DFLT RT entry or a CONFLICT RESOLUTION ENTRIES DFLT RT entry other than "NONE", the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

If an MLDIT form has a DFLT RT other than "NONE", the corresponding TRIG NBR must be defined on the NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1".

Copyright © 2003 Lucent Technologies

2.23 REMARK

Description: This 16-character field may contain any remarks deemed locally necessary.
Valid Entries: 1 to 16 characters (optional)

3. FORM ENTRIES - 5300-3b RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

3.2 *LDIT

Description: Enter the Local Digit Interpreter Table Number. The number selected is based upon entries on the DAS form (5300-1 Record)
Valid Entries: 1 - 999

3.3 *INCOMING DIGITS

Description: When using the MLDIT or LDIT form, enter the digits to be interpreted.
Valid Entries: 1 to 15 digits

3.4 NPA SPLIT ANNC

Description: Should caller be given a warning announcement if dialing a 7-digit or 10-digit number during permissive period of NPA (Numbering Plan Area) Split?

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NPA SPLIT ANNC is set to "Y", NBR OF DIGITS must be "7" or "10".

When NPA SPLIT ANNC or CONFRES.NPA SPLIT ANNC is set to "Y":

- the ACT field for SFID 347 on the SFSYS form (5713-1 Record) must be set to "Y". (For more information, see Division 2, Section 4A347, for the Announcement on Detection of NPA Split feature.)
- the APPLICATION field on the ANNAPL form (5529 Record) must be set to "NPA_SP".
- the FIXED ROUTE TYPE field on the FIXRT form (5301-1 Record) must be set to "NPA_SP". (The FIXRT form must have a record with NPA_SP.)

IMPLIED NPAs

Description: Implied NPAs are used for NM (Network Management) code controls. When code control is to be put into effect for some specific code (incoming digits), the NPA implied by any dialed code must be known to enable the NM software to block these calls.

Implied NPAs are also used for the Carrier Interconnect capability. On a Direct Trunk Group to the Carrier, if the implied NPA is the Home NPA, the CI software will outpulse the 7-digit number (i.e., without the NPA). If the implied NPA is other than the HNPA, the CI software will include the NPA when outpulsing to the carrier. On a connection through an Access Tandem, 10 digits will always be outpulsed.

Copyright © 2003 Lucent Technologies

Implied NPAs may be entered only for 7-digit calls, i.e., when either NBR OF DIGITS or NBR DIG on one of the conflict resolution entries is equal to 7. In addition, a minimum of three digits must be entered in the INCOMING DIGITS field.

The implied NPA for a specific code may depend on the dialed prefix as well as the code itself. If implied NPAs are entered on the LDIT form for any prefix, these NPAs will be the NPAs used for code control.

If an NPA is not entered on the LDIT form, NM will use the DEFAULT NPA from the OFCOPT form as the implied NPA. The NPA which has been specified as the DEFAULT NPA on the OFCOPT form may not be entered as any IMPLIED NPA on the LDIT form.

If AMB is entered under IMPLIED NPA, the NPA of the calling party as defined on the NOC form (Record 5501), will be used as the implied NPA. This entry would be used in offices serving subscribers in two (or more) area codes and the subscribers have similar dialed codes to reach different destinations (i.e., the same codes in different NPAs). For example, if the subscriber is in Area Code 312 and dials 979, the call would complete to a different place than a subscriber (also served by the same office) in Area Code 815 dialing 979. In this case, the subscriber's NPA is the implied destination NPA.

For 5E6 and later, an IMPLIED NPA is not allowed to be entered on an LDIT functioning as a FAT/LDIT.

If more than three digits are interpreted on the LDIT form for 7-digit calls, every LDIT form with the same value of LDIT and the same first three digits of INCOMING DIGITS, must have identical entries in the IMPLIED NPAs fields.

The IMPLIED NPA fields are not available on the MLDIT form.

3.5 PREFIX

Description: This field is only entered on the LDIT form. Enter the prefix.
Valid Entries: 0, 1, NONE

Data Rules:

This field must be entered when an entry is made for NPA.

3.6 NPA

Description: This field is only entered on the LDIT form. Enter the Numbering Plan Area.
Valid Entries: AMB or any valid NPA;

- 200 - 999

Data Rules:

An entry is permitted only when NBR OF DIGITS equals 7 or a conflict resolution entry has NBR DIG equal to 7.

For 5E12 and later, when the OFFICE CODES and/or NPA/OFFICE CODE combinations are assigned on the LDIT and/or MLDIT forms, they must be defined on the NOC form.

3.7 ANI BYPASS

Description: Will ANI Table options be ignored? An entry of "N" indicates TDX ANI Table options will be processed. This field supports the TDX (Toll Digital Exchange) ANI Table Call Processing Feature. This is a secured feature with SFID 235. For more information on this feature, see Division 2, Section 4A165.

Software Release: 5E10 and later
Default Value: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

LOCAL NUMBER PORTABILITY

For 5E11 and later, fields (Section 3.8) - (Section 3.13) support the Local Number Portability feature. For more information, see Division 2, Section 4A174.

3.8 LNP TRIG NBR

Description: Enter the LNP trigger number. The LNP trigger number is a conditional trigger which initiates a query to the SCP (Service Control Point) based on further routing determinations and checks following the trigger detection.

Software Release: 5E11 and later
Valid Entries: Blank or 1 - 255

Data Rules:

Local Number Portability is s secured feature. This feature must be purchased and SFID 174 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be entered on either an LDIT/MLDIT form or CONFLICT RESOLUTION on an LDIT form.

When LNP TRIG NBR is entered, TYPE OF CI CALL must be:
- "INTER"
- "INTRA"
- "TOLL"
- "COMP"
- "PRIV"
- "NONCI"
- "TCONF"
- or "CONFL".

When both LNP TRIG NBR and TRIG NBR are entered either on an LDIT/MLDIT form or CONFLICT RESOLUTION on an LDIT form, TRIG NBR must be defined as TRIG NBR (whichever is entered) on the NSTRIG form (5324 Record) which has APPLICATION set to "ASP".

When LNP TRIG NBR is entered either on an LDIT/MLDIT form or CONFLICT RESOLUTION on an LDIT form, LNP TRIG NBR must be defined as TRIG NBR on the NSTRIG form (5324 Record) where APPLICATION is "ASP" and AIN REL is "R0D1".

For 5E13 and later, when LNP TRIG NBR or CONFRES.LNP TRIG NBR, TYPE OF CI CALL or CONFRES.TYPE OF CI CALL can be "INTER" only when the ACT field for SFID 303 on the SFSYS form (5713-1 Record) is set to "Y".

For 5E12 and later, when LNP TRIG NUM on the LDIT/MLDIT forms is entered and the associated NSTRIG form with the same TRIG NUM has an APPLICATION of "ASP", then INCOMING DIGITS on the LDIT/MLDIT forms must have a first digit of "2", "3", "4", "5", "6", "7", "8", or "9".

3.9 GEO PORT

Description: Has geographically porting occurred for at least one DN associated with this LDIT entry?

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When GEO PORT is "Y", LNP TRIG NBR must be entered.

3.10 PORTED IN

Description: Is at least one DN termination in this office which is associated with this LDIT digit translation have a route index (instead of an office code) that is provisioned for this LDIT translation?

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Local Number Portability is a secured feature. This feature must be purchased and SFID 174 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be entered on either an LDIT/MLDIT form or, CONFLICT RESOLUTION on an LDIT form.

When PORTED IN is "Y", TYPE OF CI CALL must be:
- "INTER"
- "INTRA"
- "TOLL"
- "COMP"
- "PRIV"
- "NONCI"
- "TCONF"
- or "CONFL".

When PORTED IN is "Y", ROUTE INDEX must be entered.

When PORTED IN is "Y", OFFICE CODE must be entered.

For 5E13 and later, when PORTED IN or CONFRES.PORTED IN is "Y", TYPE OF CI CALL or CONFRES.TYPE OF CI CALL can be "INTER" only when the ACT field for SFID 303 on the SFSYS form (5713-1 Record) is set to "Y".

3.11 HOME LRN

Description: Is this a home location routing number? This field is set to "Y" when the LRN represents this switch or a rate center in this switch.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

3.12 LRN SCREENING

Description: Should the screening attributes be used for LRN? This field is set to "Y" when the LRN is a rate center in this switch which would imply that the TYP CI CALL and CDI from analysis of this LRN should be used.

Software Release: 5E11 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

3.13 INH DNT

Description: Should the processing of dialed number triggers be inhibited?

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

3.14 NODAL IDX

Description: Proprietary field.

3.15 DN PREFD

Description: Proprietary field.

3.16 GETS HPC

Description: Is GETS (Government Emergency Telecommunication Service) HPC (High Probability Call Completion Service) required? The GETS HPC field is used as an indicator to mark GETS HPC calls so that enhanced functionality provided by other HPC capabilities (e.g., Trunk Queuing, ISUP Signaling, Exemption from Network Management Controls) can be invoked. When set to "Y", calls translated to this address receive special treatment resulting in a higher probability of call completion. For more information, see Division 2, Section 4A279.

The use of HPC Network Capabilities is restricted in the United States and U.S. Territories to National Security/Emergency Preparedness (NS/EP) users authorized by the Office of the Manager, National Communication System (OMNCS). Telco deployment of these HPC Network Capabilities must be co-ordinated with the OMNCS at the following address:

Office of the Manager
National Communication System
Attn: GETS Program Office
701 South Courthouse Rd
Arlington, VA, 22204-2198
email: gets@ncs.gov

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E13 and later, when the LDIT/MLDIT/RDIT forms' GETS HPC is "Y" or CONFLICT RESOLUTION GETS HPC is "Y", and TRIG NBR or CONFLICT RESOLUTION TRIG NBR is known, then the associated NSTRIG form (associated through TRIG NBR) must have APPLICATION set to "ASP" and ASP TOLL FREE must be "N".

For 5E13 and later, when the LDIT/MLDIT/RDIT/INDIT forms' GETS HPC is "Y" or CONFLICT RESOLUTION GETS HPC is "Y", GETS HPC or CONFLICT RESOLUTION GETS HPC can be "Y" only when the GETS High Probability of Call Completion Secured Feature has been purchased. A SFSYS form must exist with SFID 279 ACT set to "Y".

Copyright © 2003 Lucent Technologies

3.17 DENY XFER

Description: This field is used to indicate if call transfers to a particular digit string should be denied. This field supports the Deny Transfer of Digit Screened Calls feature. See Division 2, Section 291.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later:

- When DENY XFER is "Y", CALL TYPE must not be "EMER".
- When DENY XFER on the LDIT form is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to "Y".

3.18 REL LINK

Description: Is this a release link directory assistance number? This field is used to indicate whether or not the digits being translated map to a release link directory assistance number.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When REL LINK is "Y":

- CALL TYPE must be "DA", "LOCDA", "NORM555", or "NORMAL".
- One of the following two conditions must exist:
  - For the Release Link for Toll Office feature using ANSI (American National Standards Institute) standard signaling, the ACT field for SFID 520 on the SFSYS form (5713-1 Record) must be set to "Y"; or
  - For the Release Link for Toll Office feature using TOPS (Operating System for DMS (Data Management System)) nonstandard signaling, the ACT field for SFID 521 on the SFSYS form must be set to "Y".

4. FORM ENTRIES - 5300-5a RECORD

4.1 BASE AND CONTROL, ESS UNIT

Description: Enter the Base and Control Number and the office name on each record.

CONFLICT RESOLUTION

Description: Conflict Resolution entries are only entered on the LDIT form.

For 5E3 and later, when CALL TYPE is "CONFLCT", NBR OF DIGITS is specified, and PREFIX is blank,

Copyright © 2003 Lucent Technologies

there must be exactly two CONFLICT RESOLUTION entries.

For 5E8, for each row of the CONFLICT RESOLUTION ENTRIES list, if NON is entered, TRIG NBR must be entered.

For 5E8 and later, for each row of the CONFLICT RESOLUTION ENTRIES list:

- if TRIG NBR is entered, TERM LATA cannot be entered; and
- if RDIT is entered, NBR DIG must be greater than the length of INCOMING DIGITS.

For 5E9(1) and later, for each row of the CONFLICT RESOLUTION ENTRIES list, when TRIG NBR is entered, NBR DIG must be 3, 7, or 10.

For 5E12 and later:

- when CALL TYPE is "CONFLCT" and CI TYPE is "IDDD", at least three CONFLICT RESOLUTION ENTRIES must be made.
- when any CONFLICT RESOLUTION ENTRY for CALL TYPE is "IDDDSTS" and CI TYPE is "IDDD", all entries must have the same values.
- each row of the CONFLICT RESOLUTION ENTRIES must use consecutive digits in the NBR DIG field when CONFLICT RESOLUTION entries for CALL TYPE is "IDDDSTS" and CI TYPE is "IDDD".

4.2 LDIT

Description: Enter the Local Digit Interpreter Table number. The LDIT must be the same as that from the corresponding 5300-3 Record entry.
Valid Entries: 1 - 999

4.3 INC DIGITS

Description: Enter the code for which the conflict exists. This must be the same as the INCOMING DIGITS of the Conflict Code on the 5300-3 Record. This information is not required as a separate entry on the LDIT form.
Valid Entries: 1 to 15 digits

4.4 NBR DIG

Description: Enter the total number of digits expected excluding any prefix. If the code in conflict is prefix resolved, exactly one of the codes conflict resolution entries must have NBR DIG equal to NBR OF DIGITS entered on screen 1 of this form, 5300-3 Record.
Valid Entries: 1 - 15 or 1 - 18 if IDDD15 functionality is available

Data Rules:

For 5E8 and later, if NBR DIG is 0 through 6, 8, or 9, and SERV KEY on the corresponding NSTRIG form is "CDPN", then on that NSTRIG form, APPLICATION is "ASP" and ALT GBL TITLE must be entered.

For 5E12 and later, when NBR DIG in the CONFLICT RESOLUTION ENTRIES is more than 15, the ACT field for SFID 223 on the SFSYS form (5713-1) must be set to "Y".

For 5E12 and later, when FAT on the corresponding SMLDIT form is "Y", then NBR OF DIGITS must be equal to 4 or 7.

Copyright © 2003 Lucent Technologies

4.5 CALL TYPE

Description: Enter the Call Type to be used. Please refer to Figure 1 for field dependencies per CALL TYPE.

Valid CALL TYPE Entries

Entry	Definition
211	Software Release: 5E15 and later. Dial 211.
311	Software Release: 5E15 and later. Dial 311.
900	Software Release: 5E5 and later. 900 calls. This CALL TYPE, is used to prevent a LASS AR (Automatic Recall) user from camping-on to this line.
ADDON	Software Release: 5E4(2) and later. Alliance Teleconferencing add-on calls.
APSDN	Software Release: 5E5 and later. ACP (Action Control Point) for a SDN (Software Defined Network). This value indicates that a query should be sent to the NCP (Network Control Point). The NCP will return a routing telephone number.
AUTINW	Software Release: 5E4(2) and later. Automated Inward Call. Calls with this call type are originated by a distant operator and are routed to an automated query.
BBRITL	Software Release: 5E6 and later. This ACTION is used for billed BRITL (Basic Rate Interface Dial Up Test Line).
BRITL	Software Release: 5E5 and later. This ACTION is used for non-billed BRITL.
BUSOFC	Business Office (811)
CSTL	Coin Station Test Line
DA	555 Directory Assistance. Note: A CALL TYPE of "NORMAL" should be used with DA calls (i.e.,,555-1212, NPA-555-1212) that are preceded by an FGD CAC.
ECP	Software Release: 5E9(1) and later. Mobile originated call on a 5ESS Switch serving as a Digital Cellular Switch for an ECP (Executive Cellular Processor).
EMER	911 Emergency Service Bureau.
HNPAD	Home NPA (Numbering Plan Area) dialed in error.
IDDDFCA	Software Release: 5E5 and later. International Direct Distance Dialing FCA call.
IDDDSTS	Software Release: 5E3 and later. International Direct Distance Dialing Station to Station.
INWATS	INWATS (800+) LNACP
LOCDA	Local Directory Assistance (411)
LTD	Local Test Desk
MEETME	Software Release: 5E4(2) and later. Alliance Teleconferencing meet-me call.
NORM555	Software Release: 5E16 and later. Dial (1) + 555 - XXXX
NORMAL	All others
NS800	Software Release: 5E4(2) and later. Number Service (SSP800) type call.
OCTL	Open Circuit Test Line
OPNIT	Operator-assisted DA/Non-ISP call to the VDT.
OPINW	Software Release: 5E4(2) and later. Operator-assisted Inward Call. Calls with this call type are originated by a distant operator and are routed to an OSPS operator position.
RELAY	Software Release: 5E15 and later. 711 Relay/Hearing Impaired Service.
REPAIR	Repair Service Bureau (611)
SDNA	Software Release: 5E3 and later. Software Defined Network outgoing calls from the NAP (Network Access Point).
SDNE	Software Release: 5E3 and later. Software Defined Network incoming calls to the NAP (Network Access Point).
SPAB800	Software Release: 5E5 and later. Special Access Basic 800 Service.
SPAM800	Software Release: 5E5 and later.

Copyright © 2003 Lucent Technologies

	MEGACOM 800 Service.
SRTT	Station Ringer Touch-Tone Test
STG1FCA	Software Release: 5E15 and later. First Stage of an IDDD call.
VACANT	Vacant NPA, NXX and Service Codes

Data Rules:

900:

For 5E13 and later, when "900" or "NORMAL" is entered, RTI is entered and PORTED IN is "N", NXX cannot be entered.

ADDON: For 5E7 and later, when the MLDIT forms have a CALL TYPE of "ADDON" or "MEETME", these call types are allowed only when ORIG SCREEN OFF is "Y" on the OFCOPT form and OSPS DA is "Y" on the OSPSOPT form.

For 5E8 and later, if CONFLICT RESOLUTION CALL TYPE is "ADDON" or "MEETME", then a FIXRT form is required with a FIXED ROUTE TYPE of "ATCNIF".

APSDN: This value can only be used when a 5ESS Switch is an ACP (ACT PT SDN field on the OFCOPT form is "Y").

AUTINW: The OSPS TA field on the OSPSOPT form must be "Y".

BBRITL: The DSL which is being tested must have BRITL ALW set to "Y" on the corresponding DSLUSR form.

CONFLCT: For 5E8 and later, if CALL TYPE is "CONFLCT", RDIT and TRIG NBR cannot be entered.

For 5E9(1) and later, if "CONFLCT" or "FAT" are entered in CALL TYPE and "SAC" is entered in TYPE OF CI CALL, then LDIT or MLDIT forms with the above values cannot have INCOMING DIGITS which are the starting digits of:

- INCOMING DIGITS on another LDIT or MLDIT form
- IDDD PREFIX / COUNTRY ACCESS CODE combination on the IDDD form

This restriction applies only to LDIT, MLDIT, IDDD forms sharing the same LDIT value.

EMER: For 5E8 and later, if a CONFLICT RESOLUTION ENTRY with a CALL TYPE of "EMER" or "NORMAL" is entered, and a TRIG NBR defined on an NSTRIG form with an APPLICATION on the NSTRIG form is "E911" or "800", then RTI and NXX on the LDIT form cannot be entered. If APPLICATION on the NSTRIG form is "ASP", then RTI or NXX on the LDIT form must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered.

IDDDFCA: This value is used for the address sequence of an international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA. A DAS (Digit Analysis Selector) of 81 will be used instead of the DAS associated with the incoming trunk group. This Call Type may be assigned to incoming digit sequences CC + NN or 0/1X + CC + NN. CC is the Country Code. NN is the National Number. 0/1X is the ISC (International Switching Center) prefix code.

If "IDDDFCA" is entered, then "Y" must be entered in the OFFICE TYPE on the OFCOPT form (5509 Record).

IDDDSTS: Used for multistage international outbound calls which are routed to a MF trunk, CCIS6 trunk or CCS7 ISUP trunk. This value may be assigned to codes which require two-stage call handling at a toll or tandem office. Two-stage call handling includes an acknowledgement wink before the second stage of digits is sent. Also used in a tandem or toll office when the digits inpulsed on the trunk, typically from a

Copyright © 2003 Lucent Technologies

TSPS, are 011 + padded Country Code.

For 5E5 and later, this value can be used for:

- A Local office (OFFICE TYPE on the OFCOPT form is "N") where the incoming digits are 011 + (7 - 12 digits).
- A Toll office (OFFICE TYPE on the OFCOPT form is "Y") which will not use FCA (Fully Coded Addressing). Possible incoming digits are 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international call.
- A 5ESS Gateway switch that requires an FCA international outbound call to leave the office on an MF trunk must assign this CALL TYPE to the digit sequence CC + NN. CC is the Country Code. NN is the National Number. ISTF (Integrated Services Test Function) Inverted Loopback test.

LNACP: This value can only be used when the Leased Network DAS field is entered on the OFCOPT form (5509 Record).

MEETME: If "MEETME" is entered in the CALL TYPE field, then FIXRT forms (5301 Records) must be submitted with FIXED ROUTE TYPES of "ATCANIF" and "ATCINT".

For 5E7 and later, when the MLDIT forms have a CALL TYPE of "ADDON" or "MEETME", these call types are allowed only when ORIG SCREEN OFF is "Y" on the OFCOPT form and OSPS DA is "Y" on the OSPSOPT form.

Also, see "ADDON" above.

NORM555: For 5E16 and later, when CALL TYPE is "NORM555", CDI and TRIG NBR must be entered.

NORMAL: See "EMER" above.

For 5E13 and later, when "NORMAL" or "900" is entered, RTI is entered and PORTED IN is "N", NXX cannot be entered.

NS800: For 5E11 and later, when CONFLICT RESOLUTION CALL TYPE is "NS800",

- TYPE OF CI CALL must be "NONCI"
- RTI must not be entered
- NXX must not be entered.

OPINW: The OSPS TA field on the OSPSOPT form must be "Y".

SPAB800: Special Access Basic 800 service allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAB800" on the TKGRP form).

SPAM800: MEGACOM 800 service is a discount service which allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAM800" on the TKGRP form). MEGACOM 800 service is similar to Special Access Basic 800 service except that the customer must supply the dedicated trunk group to the 5ESS Toll Switch.

STG1FCA: This value should be used for the first stage of a multi- stage international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA. This Call Type may be assigned to incoming digit sequences 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is

Copyright © 2003 Lucent Technologies

the Pseudo Country Code. 18X indicates an international call.

VACANT: Attempts to dial codes defined as "VACANT" will result in vacant code treatment. In addition, ASP will consider these codes invalid pre-query.

Switch owners may need to define RNX codes that are considered "VACANT" in the normal dialing plan but are treated as "NORMAL" for purposes of ASP pre-query. For these codes, the user should receive "VACANT" code treatment if the number is dialed directly. To accomplish this, CALL TYPE should be set to "NORMAL" and the ROUTE INDEX set to the ROUTE INDEX from the FIXRT form (5301-1 Record) where the FIXED ROUTE TYPE is equal to "VACANT". To identify the RNX codes defined in this manner, it is recommended that the REMARK field should be set to "RNX VAC/ASP QRY".

4.6 RDIT

Description: Enter the Remaining Digits Interpreter Table number.

Software Release: 5E8 and later
Valid Entries: 1 - 999

Data Rules:

If RDIT is entered, RDIT and INCOMING DIGITS must equal RDIT and PREVIOUS DIGITS on an RDIT form.

4.7 TYPE OF CI CALL

Description: Enter the CI (Carrier Interconnect) type of call. See Figure 1 for appropriate entries per Call Type.

Valid TYPE OF CI CALL Entries

Entry	Definition
COMP	Used for calls to a geographical area where the LEC (Local Exchange Carrier) and ICs (Inter-LATA Carriers) compete on an equal basis. Such calls must be routed by a carrier, but this "carrier" may be the LEC. If the subscriber wants to be routed via the LEC, the subscriber must either be presubscribed to the LEC or dial an explicit FGD CAC.
CONFL	Used for cases where the call may be either INTER (Inter-LATA) or INTRA (Intra-LATA), depending on the dialed prefix. Inter-LATA calls are dialed with a 1 prefix, while Intra-LATA calls are dialed with no prefix.
IDDD	Sofware Release: 5E12 and later. Used for International Direct Distance Dialing calls.
INTER	Used for calls destined for outside the LATA. Such calls must be routed via a carrier, not the LEC.
INTRA	Used for calls destined for within the LATA. Usually routed via the LEC. If other carriers are permitted and accept Intra-LATA calls, an explicit FGD CAC must be dialed (not presubscription) to access the carriers for these calls.
INTRM	Software Release: 5E8 and later. FGB Interim call is used for an incoming trunk call dialed by the originator as 950XXXX. The 950 digits are entered in the INCOMING DIGITS. The XXXX represents a Carrier Identification Code. These calls may be from a non-EAEO and less than the seven digits may be received as would then be reflected in the INCOMING DIGITS. When "INTRM" is entered, the last four digits inpulsed (i.e., the Carrier Identification Code) will be used to enter the ICF form (5305 Record) to access the Carrier's FGB CDI and FGB RTI. Because "INTRM" is also a valid entry in the LDIT form, it may be optionally used instead of the INDIT form.
NONCI	Used for calls for which carrier selection is irrelevant.
PRIV	Used for EAS (Extended Area Service) calls where the local calling area extends into the neighboring LATA. These Inter-LATA calls are treated as INTRA (routed by the LEC) except when the subscriber explicitly dials an FGD CAC for an IC. When the FGD CAC is dialed, the call is treated as INTER.
PSCAR	Software Release: 5E3 and later. For packet switched calls, a Packet Switch INTERLATA Carrier call uses the preselected IECP (Interexchange Carrier). When using this type of CI Call, the CALL TYPE must be "NORMAL" or "900". For 5E11 and later, when TYPE OF CI CALL is "PSNCI" or "PSCAR" NBR OF DIGITS and PREFIX cannot be entered.

Copyright © 2003 Lucent Technologies

PSNCI	Software Release: 5E3 and later. For Packet Switching calls, Packet Switch non-carrier tandem traffic, where carrier interconnect does not apply. When using this type of CI call the CALL TYPE must be "NORMAL", "900" or "VACANT". For 5E11 and later, when TYPE OF CI CALL is "PSNCI" or "PSCAR" NBR OF DIGITS and PREFIX cannot be entered.
SAC	Used for SACs (Service Access Codes), e.g., 800 and 900 codes. Each six digit SAC code (800/900 + NXX) is assigned to a specific carrier. The Code Index and Route Index from this form, the LDIT, will be used to route the call. When this Type of CI Call is specified, the Carrier Identification must be entered in SAC OWNER. SAC may not be specified in an ambiguous case.
TCONF	Software Release: 5E9(1) and later. Intra-LATA toll conflict. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TCONF", a SFSYS form must exist with SFID 149 set to "Y".
TOLL	Software Release: 5E9(1) and later. Toll calls within the LATA. This entry supports the Intra-LATA capability. With TYPE OF CI CALL set to "TOLL", a SFSYS form must exist with SFID 149 set to "Y".
WZ1	Used for calls outside the continental United States, but within World Zone 1 (e.g., Canada).

Data Rules:

Packet Switching CI TYPEs ("PSCAR" and "PSNCI") cannot be mixed with non-Packet Switching CI TYPEs within a single DAS.

SAC When TYPE CI CALL is "SAC", CALL TYPE must be "900", "DA", "INWATS", "NORM555", or "NORMAL".

WZ1: All forms with CI TYPE equals "WZ1" which have the first three digits (that is, the NPA (Numbering Plan Area)) in the INC DIGITS fields must have the same value for WZ1 REG.

For 5E6 and later, this type of Carrier Interconnect is allowed on FAT/LDITs, however, instead of this value (WZ1) being related to the first three digits of INCOMING DIGITS, it is related to the FAT/LDIT table number.

For 5E8 and later,

- if CI TYPE is "PSCAR" or "PSNCI", TRIG NBR must not be entered, and
- if CI TYPE is "SAC", RDIT must not be entered.

For 5E9(1) and later, when CALL TYPE is "OSOIWTS", TYPE OF CI CALL must be "INTER", "INTRA", "NONCI", "TCONF, or "TOLL".

For 5E9(1) and later, when CALL TYPE is "LOCDA", "BUSOFC", or "REPAIR", TYPE OF CI CALL must be "INTER", "INTRA", or "TOLL".

For 5E11 and later, if TYPE OF CI CALL is not "NORMAL" or "900", if RTI is entered, NXX cannot be enetered.

For 5E12 and later,

- when CALL TYPE is "IDDDSTS", TYPE OF CI CALL must be "NONCI" or "IDDD".
- when CALL TYPE is "SPAB800", "SPAM800", or "IDDDFCA", TYPE OF CI CALL must be "NONCI".
- when TYPE OF CI CALL in the CONFLICT RESOLUTION ENTRIES is "IDDD", the ACT field for SFID 325 on the SFSYS form (5713-1) must be set to "Y".
- when TYPE OF CI CALL in the CONFLICT RESOLUTION ENTRIES is "IDDD", RDIT, NBR OF DIGITS and PREFIX must not be entered, and INCOMING DIGITS must begin with "01".

Copyright © 2003 Lucent Technologies

For 5E13 and later, when TYPE OF CI CALL is not "PSCAR", and ROUTE INDEX is entered and PORTED IN is "N", OFFICE CODE must not be entered for this CALL TYPE.

For 5E15 and later, when CONFRES.CALL TYPE is "BUSOFC", "LOCDA", "RELAY", or "REPAIR", CONFRES.CI TYPE must be "INTER", "INTRA", or "TOLL".

4.8 CDI

Description: The Code Index combined with a Screening Index is used as an input to the Rate and Route Tables. Code Index 1 (0-) and Code Index 2 (010) may not be entered on the LDIT Record.

For 5E8 and later, CODE INDEX is a real Code Index and no longer a pointer to the DISERV form (5321 Record).
Valid Entries: 3 - 4095

Data Rules:

This field must be blank if the CALL TYPE is "VACANT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN" or "CSTL".

All combinations of CODE INDEX, PREFIX from the PDIT form, and SCREENING INDEX from the LCC form must have corresponding RAR form entries for CDI, PFX, and SCR.

All combinations of CODE INDEX and SCR from the TKGRP form must have corresponding RAR form entries for CDI, SCR, and "NONE" for PFX.

For 5E8 and later, either CODE INDEX or CDI on this form or an RDIT form, or CODE INDEX on a PDIT or INDIT form, or WITH ANI or WITHOUT ANI on an AISCLS form must equal INC CDI on an INFLDEST form (5448 Record).

4.9 RTI

Description: This field indicates the Regular Route Index to be used for routing the call except when a Special Route Index entered on the RAR overrides it. The Regular Route Index is the route which is used by the majority of call originators to complete the call.

For 5E6 and later, the SSP/800 feature uses the RTI (or NXX) field when the SCP query response requests LEC routing, even when CI TYPE is "INTER".

For 5E8 and later, the ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

The CODE INDEX from this form must appear on a DISERV form (5321 Record) and if SERV TYPE is set to "NOQRY" on that DISERV form, then this ROUTE INDEX field must be entered. A SERV TYPE of "NOQRY" will occur at a NAP (Network Access Point) and the ROUTE INDEX must be entered to route to an SSP (Service Switching Point).

When the CALL TYPE is "VACANT", "HNPAD", "LTD", "APSDN", "SRTT", "OCTL" and "CSTL", this field must be blank.

When the Call Type is other than those listed above, this field or the OFFICE CODE field must be entered.

Copyright © 2003 Lucent Technologies

For 5E13 and later, when RTI is entered and PORTED IN is "N", NXX cannot be entererd for this CALL TYPE.

4.10 POLY

Description: Is polygrid routing used for DSN (Defense Switched Networks)?

"N" should be entered for non-DSN offices.

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

For 5E11 and later, POLY must be "N" or not entered for Packet Switching.

4.11 NPA

Description: Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Data Rules:

When NPA is entered, NXX must be entered.

For 5E12 and later, when the NXX and/or NPA/NXX combinations are assigned on the LDIT and/or MLDIT forms, they must be defined on the NOC form.

4.12 NXX

Description: Enter an Office Code (NXX) served by the 5ESS Switch (i.e., defined on the NOC form). If an Office Code is entered, it will be entered to "route" the call to a Directory Number of this NXX in this office, except when overridden by a Special Route Index entered in the Route Index field of the RAR form.

For 5E6 and later, the SSP/800 feature uses the NXX (or RTI) field when the SCP query response requests LEC routing, even when CI TYPE is "INTER".

Data Rules:

When the CALL TYPE is "VACANT", "HNPAD", "LTD", "SRTT", "APSDN", "SPAB800", "SPAM800", "IDDDFCA", "IDDDSTS", "OCTL" and "CSTL", this field must be blank. When the Call Type is other than these, an entry is required in this field or in the ROUTE INDEX field.

For 5E12 and later, when the LDIT forms have a "CONFLICT RESOLUTION.NXX" defined in the rows indicated by NBR DIGS, and there are multiple NOC forms with the same value of NXX, "CONFLICT RESOLUTION.NPA" must also be defined in the same row on the LDIT form.

4.13 DESEP

Description: Enter the Destination Separations Index for calls other than "VACANT", "HNPAD", "LTD", "SRTT", "OCTL" or "CSTL". It is only required for Division of Revenue Study.
Valid Entries: 1 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

If a DESEP is entered, it must be defined on the 5308 Record.

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

4.14 WZ1 REG

Description: For codes with a TYPE OF CI CALL equal to WZ1, enter a World Zone 1 region. This digit is used in the first stage of outpulsing for INCs (International Carriers) on either a direct connection or via an Access Tandem. The first stage of outpulsing has a format of KP + 1NX + XXX + 01R + ST, where R is the World Zone 1 region. (1NX is a spare toll center code entered on the Route Index as prefix digits. XXX is the Carrier Identification Code.) For other than WZ1 types, leave this field blank.
Valid Entries: 0 - 9

4.15 TERM LATA

Description: This field is used as the Inter-LATA Carrier when Network Call Denial Screening is required on incoming CAMAANI Trunk Groups. The TERM LATA value is compared to an ORIG LATA value specified on the TKGRP form (5202-3 Record).

Valid TERM LATA Entries

Entry	Definition
1	Indicates LATAs not subtending the switch
2 - 31	Software Release: 5E5 and later. Indicates a subtending LATA of the switch.

Data Rules:

If TYPE OF CI CALL field is "PSNCI" or "PSCAR", then this field must be blank.

If CALL TYPE is "LNACP", this field must be blank.

If TERM LATA is specified, COMMON CHAN SIG must equal to "Y" on the OFCOPT form (5509 Record).

When the Call Type is "NORMAL", "AUTINW", "OPINW" or "DA", enter an appropriate value to indicate, based on incoming digits, the destination of this call.

4.16 NON

Description: Enter the nature of the number. This field is used during query formulation of Network Services calls, and is populated only for ASP SSP offices.

Software Release: 5E8 and later
Valid Entries:

Valid NON Entries

Entry	Definition
IDDD or I	International.
NATL or N	National.
PRIV or P	Private.

Data Rules:

6For 5E8, if NON is entered, TRIG NBR must be entered for the same entry.

When ASP OFC on OFCOPT is "SSP", and TRIG NBR is entered, and APPLICATION on the corresponding NSTRIG form is "ASP", NON must be entered.

4.17 TRIG NBR

Copyright © 2003 Lucent Technologies

Description: Enter the Network Services trigger number.

Software Release: 5E8 and later
Valid Entries:
- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

Data Rules:

If TRIG NBR is entered:

- it must equal TRIG NBR on an NSTRIG form,
- if NBR DIG is neither 7 nor greater than 9, and SERV KEY on the corresponding NSTRIG form is "CDPN", then on that NSTRIG form APPLICATION equals "ASP" and ALT GBL TITLE must be entered;
- if APPLICATION on the corresponding NSTRIG form is "E911", CALL TYPE must be "EMER" and CI TYPE must be "INTRA";
- for 5E8 only, if ASP OFC on an OFCOPT form is "SSP", and APPLICATION on the corresponding NSTRIG form is "ASP", NON must be entered.

For 5E8 and later, if a CONFLICT RESOLUTION ENTRY with a CALL TYPE of "EMER" or "NORMAL" is entered, a TRIG NBR defined on an NSTRIG form, and APPLICATION on the NSTRIG form is "E911" or "800", then RTI and NXX on the LDIT form cannot be entered. If APPLICATION on the NSTRIG form is "ASP", then RTI or NXX on the LDIT form must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered.

For 5E12 and later, when CONFLICT RESOLUTION ENTRY, TRIG NUM on the LDIT/MLDIT forms is entered and the associated NSTRIG form with the same TRIG NUM has an APPLICATION of "ASP", then INCOMING DIGITS on the LDIT/MLDIT forms must have a first digit of "2", "3", "4", "5", "6", "7", "8", or "9".

For 5E15 and later, when CONFRES.CALL TYPE is "RELAY", CONFRES.TRIG NBR must not be entered.

4.18 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Default: N
Valid Entries: Y, N

4.19 SAC OWNER

Description: For codes with a TYPE OF CI CALL equal to "SAC", enter the Carrier Identification Code of the carrier "owning" the Service Access Code, or "LEC" for a Local Exchange Carrier. The ICF form (5305 Record) will be accessed to check the validity of the Carrier ID and to determine if overlap outpulsing might be required. However, routing will be done based on the Code Index and Route Index of the LDIT, not the ICF.
Valid Entries:
- For 5E8 only: 0 - 999 or "LEC"
- For 5E9(1) and later: 0 - 9999 or "LEC"

Data Rules:

Copyright © 2003 Lucent Technologies

For CONFLICT RESOLUTION ENTRY, when CI TYPE is "SAC", SAC OWNER must be entered. And conversely, if CI TYPE is not "SAC", SAC OWNER cannot be entered.

If SAC OWNER or CONFLICT RESOLUTION SAC OWNER is assigned on the LDIT form, then they must be defined as CARRIER IDs on an ICF form with FEAT GRP = "D".

For 5E11 and later, when CI TYPE is not "NORMAL" or "900", if RTI is entered, NXX cannot be entered.

4.20 DFLT RT

Description: The DFLT RT field is used to identify the type of default routing treatment to be used for the ASP Default Routing for 3/6/10-Digit Triggers (Phase 1) Special Feature. When the ASP Special Feature has been purchased, this field can be used to specify the type of default routing to occur when an ASP specific digit trigger query fails.

Software Release: 5E9(1) and later
Default: NONE
Valid Entries:

Valid DFLT RT Entries

Entry	Definition
ANNC or A	Default route to announcement (or tone). The call will route to either a tone or announcement, depending on what is defined for the route.
DLDN or D	Default route to dialed DN. The call will route to the DN dialed (or the DN being routed to if the call came from a trunk).
NONE or N	No default routing. No special default routing will take place, and normal call treatment will send the call to reorder or NCA (No Circuits Available).

Data Rules:

When DFLT RT is not "NONE", either "TRIG NBR" or "LNP TRIG NBR" must be entered.

For 5E10 and later, when the MLDIT forms have a DFLT RT entry entry other than "NONE", the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

4.21 ANI BYPASS

Description: Will ANI Table options be ignored? An entry of "N" indicates TDX ANI Table options will be processed. This field supports the TDX (Toll Digital Exchange) ANI Table Call Processing Feature. This is a secured feature with SFID 235. For more information on this feature, see Division 2, Section 4A165.

Software Release: 5E10 and later
Default Value: N
Valid Entries: Y, N

5. FORM ENTRIES - 5300-5b RECORD

5.1 BASE AND CONTROL, ESS UNIT

CONFLICT RESOLUTION

Description: Enter the Base and Control Number and the office name on each record.

5.2 LDIT

Description: Enter the Local Digit Interpreter Table number. The LDIT must be the same as that from the corresponding 5300-3 Record entry.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 999

5.3 INC DIGITS

Description: Enter the code for which the conflict exists. This must be the same as the INCOMING DIGITS of the Conflict Code on the 5300-3 Record. This information is not required as a separate entry on the LDIT form.
Valid Entries: 1 to 15 digits

LOCAL NUMBER PORTABILITY

For 5E11 and later, fields (Section 5.4) - (Section 5.9) support the Local Number Portability feature. For more information, see Division 2, Section 4A174.

5.4 LNP TRIG NBR

Description: Enter the LNP trigger number. The LNP trigger number is a conditional trigger which initiates a query to the SCP (Service Control Point) based on further routing determinations and checks following the trigger detection.

Software Release: 5E11 and later
Required Field.
Default: IGN
Valid Entries: IGN (ignore), or 1 - 255

Data Rules:

Local Number Portability is a secured feature. This feature must be purchased and SFID 174 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be entered on either an LDIT/MLDIT form or CONFLICT RESOLUTION on an LDIT form.

When LNP TRIG NBR is entered, TYPE OF CI CALL must be:
- "INTER"
- "INTRA"
- "TOLL"
- "COMP"
- "PRIV"
- "NONCI"
- "TCONF"
- or "CONFL".

When both LNP TRIG NBR and TRIG NBR are entered either on an LDIT/MLDIT form or CONFLICT RESOLUTION on an LDIT form, TRIG NBR must be defined as TRIG NBR (whichever is entered) on the NSTRIG form (5324 Record) which has APPLICATION set to "ASP".

When LNP TRIG NBR is entered either on an LDIT/MLDIT form or CONFLICT RESOLUTION on an LDIT form, LNP TRIG NBR must be defined as TRIG NBR on the NSTRIG form (5324 Record) where APPLICATION is "ASP" and AIN REL is "R0D1".

For 5E12 and later, when CONFRES.LNP TRIG NUM on the LDIT/MLDIT forms is entered and the associated NSTRIG form with the same TRIG NUM has an APPLICATION of "ASP", then INCOMING DIGITS on the LDIT/MLDIT forms must have a first digit of "2", "3", "4", "5", "6", "7", "8", or "9".

For 5E13 and later, when LNP TRIG NBR or CONFRES.LNP TRIG NBR is entered, TYPE OF CI CALL or CONFRES.TYPE OF CI CALL can be "INTER" only when the ACT field for SFID 303 on the SFSYS form (5713-1 Record) is set to "Y".

Copyright © 2003 Lucent Technologies

5.5 GEO PORT

Description: Has geographically porting occurred for at least one DN associated with this LDIT entry?

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When GEO PORT is "Y", LNP TRIG NBR must be entered.

5.6 PORTED IN

Description: Is at least one DN termination in this office which is associated with this LDIT digit translation have a route index (instead of an office code) that is provisioned for this LDIT translation?

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Local Number Portability is a secured feature. This feature must be purchased and SFID 174 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be entered on either an LDIT/MLDIT form or, CONFLICT RESOLUTION on an LDIT form.

When PORTED IN is "Y", TYPE OF CI CALL must be:
- "INTER"
- "INTRA"
- "TOLL"
- "COMP"
- "PRIV"
- "NONCI"
- "TCONF"
- or "CONFL".

When PORTED IN is "Y", ROUTE INDEX must be entered.

When PORTED IN is "Y", OFFICE CODE must be entered.

For 5E13 and later, when PORTED IN or CONFRES.PORTED IN is "Y", TYPE OF CI CALL or CONFRES.TYPE OF CI CALL can be "INTER" only when the ACT field for SFID 303 on the SFSYS form (5713-1 Record) is set to "Y".

5.7 HOME LRN

Description: Is this a home location routing number? This field is set to "Y" when the LRN represents this switch or a rate center in this switch.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

5.8 LRN SCRN

Description: Should the screening attributes be used for LRN? This field is set to "Y" when the LRN is a rate center in this switch which would imply that the TYP CI CALL and CDI from analysis of this LRN should be used.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

5.9 INH DNT

Description: Should the processing of dialed number triggers be inhibited?

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

5.10 GETS HPC

Description: Is GETS (Government Emergency Telecommunication Service) HPC (High Probability Call Completion Service) required? The GETS HPC field is used as an indicator to mark GETS HPC calls so that enhanced functionality provided by other HPC capabilities (e.g., Trunk Queuing, ISUP Signaling, Exemption from Network Management Controls) can be invoked. When set to "Y", calls translated to this address receive special treatment resulting in a higher probability of call completion. For more information, see Division 2, Section 4A279.

The use of HPC Network Capabilities is restricted in the United States and U.S. Territories to National Security/Emergency Preparedness (NS/EP) users authorized by the Office of the Manager, National Communication System (OMNCS). Telco deployment of these HPC Network Capabilities must be co-ordinated with the OMNCS at the following address:

Office of the Manager
National Communication System
Attn: GETS Program Office
701 South Courthouse Rd
Arlington, VA, 22204-2198
email: gets@ncs.gov

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When GETS HPC in CONFLICT RESOLUTION ENTRIES is "Y"

- NBR DIG must be 10.
- CALL TYPE must be "NORMAL".
- CI TYPE must be "COMP", "CONFL", "INTER", "INTRA", "NONCI", "PRIV", "SAC", "TCONF", "TOLL", or "WZ1".

Copyright © 2003 Lucent Technologies

5.11 DENY XFER

Description: This field is used to indicate if call transfers to a particular digit string should be denied.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, when DENY XFER in CONFLICT RESOLUTION ENTRY (CONFRES) is "Y", CALL TYPE must be "EMER".

For 5E14 and later, for each row of the CONFLICT RESOLUTION ENTRIES (CONFRES) list, when DENY XFER is "Y", CALL TYPE must not be "EMER".

5.12 NPA SPLIT ANNC

Description: Should caller be given a warning announcement if dialing a 7-digit or 10-digit number during permissive period of NPA (Numbering Plan Area) Split?

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NPA SPLIT ANNC in CONFLICT RESOLUTION ENTRIES is "Y", NBR DIG must be "7" or "10".

5.13 REL LINK

Description: Is this a release link directory assistance number? This field is used to indicate whether or not the digits being translated map to a release link directory assistance number.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For each row of the CONFLICT RESOLUTION ENTRIES (CONFRES) list, when REL LINK is "Y":

- CALL TYPE must be "DA", "LOCDA", "NORM555", or "NORMAL".
- One of the following two conditions must exist:
  - For the Release Link for Toll Office feature using ANSI (American National Standards Institute) standard signaling, the ACT field for SFID 520 on the SFSYS form (5713-1 Record) must be set to "Y"; or
  - For the Release Link for Toll Office feature using TOPS (Operating System for DMS (Data Management System)) nonstandard signaling, the ACT field for SFID 521 on the SFSYS form must be set to "Y".

Copyright © 2003 Lucent Technologies

CALL TYPE	NBR OF DIGITS	TYPEs OF CI CALL	CODE INDEX	ROUTE INDEX	OFFICE CODE	DESEP
100	3 or 6	NONCI	required	optional	optional	
101	3 or 6	NONCI	required	optional	optional	
101R	3 or 6	NONCI	required	optional	optional

Figure 3 TDAC CODE CONFLICT RESOLUTION TABLE EXAMPLES

CALL TREATMENTS:

Copyright © 2003 Lucent Technologies

1. Treatment based on 7 digit conflict entry.

2. Results in either misrouted call or vacant number error treatment. Since conflict is prefix resolved, call processing collects quantity of digits specified in NBR OF DIGITS field (first 7 digits in this case). Hence if 416-220-1000 is dialed, call processing would attempt termination to 416-2201.

3. Treatment based on 10 digit conflict entry.

4. Partial dial error treatment. Since conflict is prefix resolved, call processing collects quantity of digits specified in NBR OF DIGITS field (10 digits in this case). However, fewer than 10 digits are dialed.

5. Treatment based on 6 digit conflict entry.

6. Results in either misrouted call or vacant number error treatment. Since conflict is prefix resolved, call processing collects quantity of digits specified in NBR OF DIGITS field (first 6 digits in this case). Hence if 416-xxxx or 416-xxx-xxxx is dialed, call processing would attempt termination to 416-xxx.

7. Partial dial error treatment. Since conflict is prefix resolved, call processing collects quantity of digits specified in NBR OF DIGITS field (7 digits in this case). However, only 6 digits are dialed.

SEC. 3D: 5300-4 RECORD
CODE CONVERSION FORM - CONV

1. GENERAL

The 5300-4 Record is available with 5E2 and later Software Releases, and is used to associate a Local Digit Interpreter Table call type with a code conversion number.

Whenever a code is dialed which is defined in the Local Digit Interpreter Table with a call type of "LOCDA", "REPAIR", "BUSOFC" or "EMER", the 5ESS Switch will substitute the digits dialed with the Code Conversion Number entered on this form. This substitution is performed after digit interpretation is complete. The Code Conversion digits are not re-interpreted and the Code Index provided by the original dialed digits is used for screening. All Local Digit Interpreter entries with the above call types require a corresponding code conversion entry, whether the code conversion number is the same as or different from the dialed code.

1.1 Foreign Area Tranlator

For 5E6 and later, operating companies can make use of a FAT (Foreign Area Translator) LDIT during digit analysis. The FAT/LDIT performs further digit analysis on LDITs (5300-3 Records) that are interpreting common dialed or inpulsed digit strings. Code conversion call types are not allowed to be assigned on FAT/LDITs. For more information concerning the implementation and use of the FAT/LDIT, see Division 2, Section 1AO.

1.2 Recent Change View

The corresponding Recent Change view for this form is 9.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number, office name and page number on each record.

2.2 * DAS

Description: Enter the Digit Analysis Selector number. The DAS is defined on the 5300-1 Record.

Required Field.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

2.3 * CALL TYPE

Description: Enter the Call Type associated with the Dialed Digits to be converted.

Required Field.

Valid CALL TYPE Entries

Entry	Definition
BUSOFC	Business Office
EMER	Emergency Service Bureau
LOCDA	Local Directory Assistance
RELAY	Relay
REPAIR	Repair

Copyright © 2003 Lucent Technologies

Data Rules:

Code conversion CALL TYPES which are used on the LDIT/MLDIT (5300 Record) forms that also have OFFICE CODE entered must have a corresponding entry on the CONV form. An entry on the DAS form is necessary to make this correspondence.

For 5e15 and later, code conversion CALL TYPEs "BUSOFC", "EMER", "LOCDA", "RELAY", or "REPAIR" which are used on the LDIT/RDIT/MLDIT forms that also have OFFICE CODE entered must have a corresponding entry on the CONV form. An entry on the DAS form is necessary to make this correspondence.

For 5E15 and later, CALL TYPE can be set to "RELAY" only if the ACT field for SFID 594, on the SFSYS form is set to "Y".

2.4 # CONV TN

Description: Enter the number to which the service access code is to be converted. Normally, three, seven, or ten digits are appropriate.
Valid Entries: 3 - 10 digits

2.5 RMK

Description: This field may contain any remarks deemed locally necessary.
Valid Entries: 16 characters

2.6 # DA CONV TN

Description: Should digit analysis be performed on this converted TN? This field is added to support the Code Conversion Expansion for N11 (99-5E-7878) feature. See Division 2, Section 4A594 for more information.
Default: N
Valid Entries: Y, N

When DA CONV TN is "Y", CALL TYPE must be "RELAY".

SEC. 3E: 5300-6 RECORD
CARRIER DESTINATION MAPPING FORM - CDIM

1. GENERAL

The 5300-6 Record is applicable to 5E2 and later Software Releases and defines carrier specific Code Indexes and Routes Indexes for the CI (Carrier Interconnect) capability.

This record is used in two cases. If the office is an AT (Access Tandem), this Record defines the carrier specific Code Indexes and Route Indexes for all carriers the AT is tandeming calls to from EAEOs (Equal Access End Offices). In the second case, an EAEO uses this Record to obtain carrier-specific Code Indexes and Route Indexes for any carrier that has DIG ROUTING equal to "Y" on the ICF form (5305 Record).

1.1 Access Tandem Offices

For Access Tandem offices, the CDIM Form is checked whenever the INDIT form has an entry of "INC" or "AVT" in the TYPE OF CI CALL. The Code Index from the INDIT entry plus the Carrier Identification Number inpulsed from the EAEO are the keys to the CDIM Form where the carrier specific Code Index and Route Index outputs for the RAR form (5301 Record) are found. Every valid combination of INDIT Code Index with "INC" or "AVT", and Carrier Identification Numbers which are valid for this AT must be entered on this form.

1.2 Equal Access End Offices

For the EAEO using the CDIM Form instead of, or in addition to, the ICF Form for a carrier, CDIM entries are keyed by Code Indexes found in the regular digit analysis forms, PDIT, LDIT, and IDDD.

If the carrier's specific Code Index/Route Index pairs are entered on the ICF Form, the CDIM Form will be used for exception cases when DIG ROUTING equals "Y" on the ICF Form. In this case, the ICF pair is selected first, based on the type of CI call. Then, when an entry is found for the call on the CDIM, the CDIM carrier-specific Code Index/Route Index pair overrides the ICF pair. If an entry is not found on the CDIM, the ICF pair is used.

Code Indexes found on the digit analysis forms (PDIT, LDIT and IDDD) are candidates for entry on the CDIM Form. For each Code Index found on those forms, where the TYPE OF CI CALL is "CONFL", "INTER", "WZ1", "PRIV", or "COMP", that Code Index may be entered in the first field of this form. If the carrier accepts IntraLATA or Cut Through calls as indicated on the carrier's ICF Form, then the Code Indexes for "INTRA" or "CICUT" may be entered. If the carrier is a CARRIER TYPE of "CONSOL", then the Code Index from the IDDD Forms may be entered. If the carrier has an ACCESS TYPE of "BOTH", then the Code Index for "TRANS" may be entered.

If the carrier's specific Code Index/Route Index pairs are not entered on the ICF Form, then all possible digit analysis Code Indexes, which may be used for this carrier as outlined above, must be entered on the CDIM Form.

1.3 Long Distance Carriers

If the CDIM Form is being used for the carrier which is providing long distance service before Carrier Interconnect, the population of the CDIM is very specific. For those Types of CI Call which are applicable to this carrier, the Code Index is entered on the CDIM. Initially, the Carrier Code Index is identical to the Code Index, and the Carrier Route Index is the same as the Route Index appearing with the Code Index assigned in the digit analysis forms. This match ensures calls continue to be translated and routed the same as they were before the Carrier Interconnect application. Then the Carrier Code Index and Carrier Route Index entries can be changed on a per digit analysis Code Index basis to accomplish a gradual transition to Equal Access signaling. It also allows for transition when the 5ESS Switch is homed on more

Copyright © 2003 Lucent Technologies

than one toll switch of this carrier.

1.4 Recent Change View

The corresponding Recent Change View for this form is 9.7.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CODE INDEX

Description: Enter the Code Index assigned in the regular digit analysis forms.
Valid Entries: 1 - 4095

2.3 * CARRIER ID

Description: Enter the InterLATA Carrier ID.
Valid Entries:

- 5E7 and earlier: 0 - 999
- 5E8:
- 0 - 999 for Feature Group D
- 0 - 9999 for Feature Group B
- 5E9(1) and later: 0 - 9999

Data Rules:

With 5E4 - 5E7, this CARRIER ID must not be equal to any CARRIER ID on the ICF form (5305 Record) , where a corresponding CARRIER TYPE equals "PSEUDO".

For 5E8 and later, this CARRIER ID, with FEAT GRP equals "D", must not be equal to any CARRIER ID on the ICF form (5305 Record) , where a corresponding CARRIER TYPE equals "PSEUDO", and the ICF form's FEAT GRP equals "D".

2.4 * FEAT GRP

Description: Enter the Feature Group type. See Division 2, Section 1AY for a description of Feature Groups B and D.

Software Release: 5E8 and later
Required Field.
Valid Entries:

Valid FEAT GRP Entries

Entry	Definition
B	Feature Group B
D	Feature Group D

Data Rules:

For 5E8, when FEAT GRP is "D", CARRIER ID must be 0 - 999. For 5E9(1) and later, when FEAT GRP is "D", CARRIER ID must be 0 - 9999.

2.5 CARRIER CODE INDEX

Copyright © 2003 Lucent Technologies

Description: The name of this field was changed to CARRIER CDI in 5E8. This field name applies to 5E7 and earlier. See CARRIER CDI for usage information.

2.6 # CARRIER CDI

Description: Enter the Carrier Code Index assigned to this carrier call. (This field was called CARRIER CODE INDEX for 5E7 and earlier).

Required Field.
Valid Entries: 1 - 4095

Data Rules:

For 5E8 and earlier, for non-DSN offices, CARRIER CDI must equal a CDI on an RAR form.

2.7 CARRIER ROUTE INDEX

Description: The name of this field was changed to CARRIER RTI in 5E8. This field name applies to 5E7 and earlier. See CARRIER RTI for usage information.

2.8 # CARRIER RTI

Description: Enter the Carrier Route Index assigned to this call. An entry here is considered the Regular Route Index and is used if the entry found in the RAR form has ROUTE INDEX equal to "REGL". A Special Route Index may be entered in the RAR form which would override this entry, the CARRIER ROUTE INDEX. (This field was called CARRIER ROUTE INDEX for 5E7 and earlier).

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

2.9 REMARKS

Description: Enter any comments deemed locally necessary.
Valid Entries: up to 16 characters

SEC. 3F: 5301 RECORD
RATE AND ROUTE FORM - RAR

1. GENERAL

The 5301 Record, available for 5E2 and later Software Releases, is used to define the routing and charging for each Code Index and Screening Index combination in a 5ESS Switch. The 5301 is intended to be used as an office record and as a source document for data entry into the RAR ODA Input Form.

The Screening Index and Code Index create a matrix for routing and charging which is represented on the 5301 Record. A Screening Index is associated with an originating class of service (Line Class Code for lines or Trunk Group Record for trunks) and is used as an index into the Rate and Route Tables. A Code Index is associated with dialed digits (Local Digit Interpreter for lines or Incoming Digit Interpreter for trunks) and is also used as an index into the Rate and Route Tables.

The output from the Rate and Route Record is a Charge Index and a Route Index. These two indexes are selected based on the prefix dialed (no prefix, 1+ prefix or 0+ prefix). Thus, the 5301 Record allows for three distinct Charge Index and Route Index combinations for routing and charging.

During call processing, the Route Index and Charge Index are known after the appropriate Rate and Route entry is read. However, the Route Index may not always be specifically found in the Rate and Route. The Regular Route Index is found in the digit analysis entry and will be used if the Rate and Route entry is "REGL". If the Regular Route Index is inappropriate for the type of originator or for the prefix type, then a Special Route Index should be entered in the Rate and Route form to override the Regular Route Index. Thus, the Rate and Route form is used primarily for screening and to output the specific Charge Index. For additional information see "Revised Routing and Screening for 5E2 Software Release" in Division 2, Section G of this guide.

All possible Screening Index and Code Index combinations should be entered on the 5301 Record. Code indexes 1 and 2 have special applications in the 5ESS Switch. Code Index 1 is used for all 0- calls; Code Index 2 is used for 010 (IDDD operator) calls.

The screening index used with the OSO-INWATS feature (ORIG SCREEN OFF field is "Y" on the OFCOPT form), will be calculated by adding 100 to the screening index associated with the incoming trunk group.

For OSPS offices, each RAR form must have a corresponding OSPS Rate and Route (ORAR) form (5405 Record) with matching values for SCR, CDI and PFX. For the CACD (Commerical Automatic Call Distribution) feature, the RAR form is used to detect a free call to a CACD agent (charge index is "FREE") or to determine if routing data would, if used, lead to INWATS data and a simulated facilities group.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.10.

2. FORM AND RECORD ENTRIES

2.1 * SCR

Description: Enter the Screening Index number.
Valid Entries: 1 - 4095

2.2 * CDI

Description: Enter the Code Index number.

Code indexes 1 and 2 have special applications in the 5ESS Switch. For line originations, Code Index 1 is

Copyright © 2003 Lucent Technologies

used for all 0- calls; Code Index 2 is used for 010- IDDD Operator calls. These Code Indexes (1 and 2) must be defined by the Operating Company.

For the SSP/800 feature in 5E6 and later, when LEC routing is specified in an NS800 routing response, and CI TYPE (on the LDIT form) is "INTER" for digits matching the translated 800 number, this CDI field matches the NS CDI specified in the ICF form.
Valid Entries: 1 - 4095

2.3 PFX

Description: The 5ESS Switch provides routing and charging based on the Prefix dialed. Enter the applicable prefix.

Valid PFX Entries

Entry	Definition
NONE	No prefix is dialed.
0	0 prefix is dialed.
1	1 prefix is dialed.

Data Rules:

When the Screening Index is referenced from the TKGRP form, the only required prefix entry is "NONE". 0- calls use a "NONE" PFX entry. Prefix entries of 0 and 1 are optional.

When the Screening Index is referenced from the LCC form, entries are usually required for all three prefix cases: "NONE", 0, and 1. This is determined by the existence of code indexes from one or more PDIT, LDIT or IDDD forms and prefix entries from any PDIT Forms which are associated with this Screening Index. Any allowed combination of code index and prefix determines this requirement.

2.4 RTI

Description: For each prefix ("NONE", 0, or 1) which is to use the Regular Route Index or the 5ESS Switch Office Code found in digit analysis, enter "REGL". If the call should terminate to a Route Index other than the Regular Route Index, or terminate to a Route Index instead of the 5ESS Office Code, enter that Special Route Index.

NOTE: Because the valid range is being reduced with the 5E3 Software Release, a warning message will appear on the ODA screen when a value greater than 3617 is used for the 5E2 Software Release.

Valid Entries:
- For 5E10 and earlier: REGL, or 1 - 3617
- For 5E11 and 5E12: REGL, or 1 - 4095
- For 5E13 and later: Blank, REGL, or 1 - 16382

Data Rules:

If a Special Route Index is entered, it will override the Route Index or Office Code found in digit analysis. For calls which are to be rerouted to the originator's Terminal Group attendant (i.e., the TDV field equals "ATT"), leave this field blank.

2.5 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Copyright © 2003 Lucent Technologies

2.6 NXX

Description: An entry in this field is used only if it is necessary to override a 5ESS Switch Office Code entered in digit analysis with another 5ESS Switch Office Code. An Office Code means an NXX code served by this office and defined on the NOC Form.

For 5E3 and later, the format for an Office Code is XXX, where X is a number from 0 - 9.
Valid Entries: 3 digits

Data Rules:

If an NXX is entered, an entry in RTI is prohibited.

For 5E12 and later, if the RAR forms have a "SCRNDATA.NXX" defined in the rows indicated by PFX and there are multiple NOC forms with the same value for NXX, "SCRNDATA.NPA" will also have to be defined in the same row on the RAR form.

For 5E12 and later, when the NXX and/or NPA/NXX combinations are assigned on the RAR form, they must be defined on the NOC form.

2.7 CHGI

Description: For each Prefix ("NONE", 0, 1), enter the Charge Index number to be used for charging.

- ***NOTE:*** Because the valid range is being reduced with the 5E3 Software Release, a warning message will appear on the ODA screen when a value greater than 2047 is used for the 5E2 Software Release.

Valid Entries:
- For 5E2 only: 1 - 4095
- For 5E3 and later: 1 - 2047

2.8 TDV

Description: Enter the Toll Diversion requirements.

Valid TDV Entries

Entry	Definition
ATT	Reroute the call to the attendant of the originator's Terminal Group.
RVB	Return reverse battery on the line toward the PBX. For toll diversion to take place in the case of "RVB", the Line Class Code of the originator must have a Class Of Service of "HOTPBX" or "PBX", and the PBX must be equipped to recognize the battery reversal. The PBX may allow the call to continue and therefore C BLK in this case should equal "N".
N	No diversion is required.

Data Rules:

If "ATT" is entered, the RTI and NXX fields must be blank, and C BLK must be "Y".

If "ATT" is entered, the terminals (lines or trunks) which are assigned to the associated Screening Index must be members of a BRCS Terminal Group (i.e., the terminal must have a TGSR feature assigned on its LINEFA, MLHLNFA, TKGRPFA, or TRUNKFA form.) Additionally, a TGATTD form (5611 Record) must be entered which indicates the attendant's Telephone Number to which this call will be rerouted.

2.9 CST

Description: Enter the Class of Service Tone. If a tone is entered, that tone will be given to the distant end upon answer condition. A tone might be applicable when the termination is to a non-TSPS operator, to alert the operator to a separate Class of Service.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries:

Valid CST Entries	
Entry	**Definition**
H	High Tone
L	Low Tone
N	No Tone

2.10 IECR

Description: Should a special two digit ANI information number be outpulsed on the Trunk Group? This field is used for IECR (Inter-exchange Carrier Restriction), which is also known as non-payer screening. The far end should be an OS (Operator Service) facility equipped for long term OS signaling, so it can recognize the special ANI information digits as an indication the call originator is a non-payer.
Valid Entries: Y, N

2.11 C BLK

Description: C BLK (Carrier Block) is used in conjunction with LINE SCREENING on the LCC form. When Line Screening is "Y", and the call is a carrier call, the RAR entry associated with the regular digit analysis forms (PDIT, LDIT and IDDD) is used first.
Valid Entries: Y, N

If C BLK is "Y", the call will be processed based on entries on this form as follows:

RTI	Call Treatment
REGL	REORDER
Blank	REORDER (assuming OFFCOD is also blank)
Non-zero	Routing based on non-zero RTI

If C BLK is "N", then call processing will read the RAR entry for the Carrier Specific Code Index.

In addidtion to the LINE SCREENING field being set to "Y" on the LCC form (5306 Record), LINE SCREENING may be set to "Y" on a per carrier call basis under one of the following conditions:

- 10 digits are dialed without a 1 or 0 prefix.
- 7 digits are dialed.
- The LCC has a Class of Service equal to "CHGCALL", and the ICF (InterLATA Carrier Feature) form for the Carrier has CAC SCRNING equal to "Y".

2.12 RMK

Description: This field may contain any Remarks deemed locally necessary.
Valid Entries: 1 - 16 characters

2.13 NONE CONF

Description: The NONE CONF field is used to specify the none prefix conflict resolution identification value. This field supports the Inter-LATA Carrier's Intra-LATA Capability Special Feature. For more information on this feature see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries:

Valid NONE CONF Entries	
Entry	**Definition**
I	INTER - Interlata traffic only

Copyright © 2003 Lucent Technologies

T	TOLL - Toll calls

Data Rules:

The NONE CONF, ZERO PLUS CONF and ONE PLUS CONF fields on the RAR form are used by the Inter-LATA Carrier's Intra-LATA Capability Special Feature. It is a secured feature that must be purchased by the office before these fields can be entered. A SFSYS form must exist with SFID 149 set to "Y".

2.14 ZERO PLUS CONF

Description: The ZERO PLUS CONF field is used to specify the zero plus prefix conflict resolution identification value. This field supports the InterLATA Carrier's Intra-LATA Capability Special Feature. For more information on this feature see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries:

Valid ZERO PLUS CONF Entries

Entry	Definition
I	INTER - Interlata traffic only
T	TOLL - Toll calls

Data Rules:

When ZERO PLUS CONF is entered, "0+" must be a Prefex.

The NONE CONF, ZERO PLUS CONF and ONE PLUS CONF fields on the RAR form are used by the Inter-LATA Carrier's Intra-LATA Capability Special Feature. It is a secured feature that must be purchased by the office before these fields can be entered. A SFSYS form must exist with SFID 149 set to "Y".

2.15 ONE PLUS CONF

Description: The ONE PLUS CONF field is used to specify the one plus prefix conflict resolution identification value. This field supports the InterLATA Carrier's Intra-LATA Capability Special Feature. For more information on this feature see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries:

Valid ONE PLUS CONF Entries

Entry	Definition
I	INTER - Interlata traffic only
T	TOLL - Toll calls

Data Rules:

When ZERO PLUS CONF is entered, "0+" must be a Prefex.

The NONE CONF, ZERO PLUS CONF and ONE PLUS CONF fields on the RAR form are used by the Inter-LATA Carrier's Intra-LATA Capability Special Feature. It is a secured feature that must be purchased by the office before these fields can be entered. A SFSYS form must exist with SFID 149 set to "Y".

SEC. 3G: 5301-1 RECORD
FIXED ROUTE TYPE FORM - FIXRT

1. GENERAL

The 5301-1 Record is available with 5E2 and later Software Releases and is used to define Routing and Charging treatment of Fixed Route Types.

Various routing conditions may be encountered in the processing of a call, e.g., permanent signal, partial dial, etc. The terminating treatment of these types of calls are user defined. If one of these conditions can be encountered during call processing, then the associated Fixed Route Type must be defined by the Telephone Company as terminating to either a tone, an announcement, or a trunk group. Generally, most of the Fixed Route Types will be required for all offices. When Software Release and other restrictions are applicable, they will be noted with the description of each Fixed Route Type.

1.1 Announcements or Trunk Group Assignments

A Fixed Route Type that is assigned to an announcement or a trunk group must have a route index and a charge index assignment. Fixed Route Types that are assigned a Tone Type of "REORDER" must also have a route index and a charge index assignment. Route index and charge index assignments are prohibited for all other Fixed Route Types. In addition, the route index on a Fixed Route Type that is assigned a TONE TYPE of "REORDER" must contain a ROUTE TYPE of "REORDER" on the RTIDX form (5303 Record).

Since there are no route indexes with predefined meanings in the 5ESS Switch, the TELCO may select any available route index number. However, it is recommended that the first 100 route indexes (1 - 100) be reserved for Fixed Route Type assignments.

1.2 Tone Source

All tones are supplied by the UTG (Universal Tone Generator) Service Circuit. UTG Circuits are provided in the Local Digital Service Unit.

1.3 DSN Offices

For DSN (Defense Switched Network) Offices, where DSN OPT is "Y" on the OFCOPT form, FIXRT forms must be defined for the following FIXED ROUTE TYPEs: "DSNICA", "PPBPC", "PPBPR", "PPUAP", "PPPAL", and "PPVAC". For 5E7 and later, each of these forms must have TONE? set to "N" and TONE TYPE blank.

In addition, a fixed route of "PPNAV" must be defined where, for 5E7 and later, either TONE? is "N" and TONE TYPE is blank, or TONE? is "Y" and TONE TYPE is "PRMPTON".

1.4 Recent Change View

The corresponding Recent Change View for this form is 10.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FIXED ROUTE TYPE

Description: Enter the Fixed Route Type.

Copyright © 2003 Lucent Technologies

An entry of "ACSR" is necessary to use the Limited 2-Level COT/AC (Customer Originating Trace/Automatic Callback) Secured Feature Announcements. Refer to Division 2, Section 4A for details.

Valid FIXED ROUTE TYPE Entries

Entry	Definition
10XXERR	Software Release: 5E7 and earlier. Routes to tones or announcements for calls in which 10XXX was dialed, but 9501XXX should have been dialed.
2LEVEL	Software Release: 5E7 and later. Routes to LASS COT (Customer Originated Trace) and LASS AC (Automatic Callback) announcements given by the DSU2-RAF-DTA (Digital Service Unit Model 2 - Recorded Announcement Function - Dial Through Announcement).
950ERR	Software Release: 5E7 and earlier. Routes to tones or announcements for calls in which 9501XXX was dialed but call should have been dialed with the 10XXX prefix. (See "OEASERR" for 5E8 and later.)
ACSR	Software Release: 5E5 and later. Automatic Customer Station Rearrangement. Routes to the ACSR announcements given by the DSU2-RAF-DTA.
ACT	Alternative Code Treatment announcement. Used when the ACT Set of an IDP Group has an Announcement Treatment.
ACTUCR	Software Release: 5E6 and later. Routes to an announcement when UCR (Unidentified Call Rejection) has been activated by means of a dial code.
AL2LVL	Software Release: 5E8 and later. LASS Alternate announcement 2 level for DSU2-RAF announcments. "AL2LVL" and "ALSLE" support the Alternate Language LASS Announcement secured feature. For more information on this feature, see Division 2, Section 4A119.
ALSLE	Software Release: 5E8 and later. LASS Alternate announcement SLE DSU2-RAF routing. "AL2LVL" and "ALSLE" support the Alternate Language LASS Announcement secured feature. For more information on this feature, see Division 2, Section 4A119.
ANSTO	Routes to a tone or announcement for timeouts while awaiting an answer on FGD International or FGB calls.
APT	Automatic Progression Testing. Routes outgoing operational test calls initiated from TLWS or by APT.
ATCANIF	Software Release: 5E4(2) and later. Alliance Teleconferencing® routes to tones or announcements for calls experiencing ANIF (Automatic Number Identification Failure). The TCA (Telephone Company Administrator) may choose to send it to an announcement for reorder tone on a 13A announcement unit.
ATCINT	Software Release: 5E4(2) and later. Alliance Teleconferencing® routes to an intercept announcement. The exact treatment will be provided by the TCA, but routing to a 13A announcement unit is expected.
BADDATA	Routes to tone or announcement when routing couldn't be completed because of bad data.
BLANK	Software Release: 5E6 and later. Blank number intercept. Routes to tone or announcement for attempting to terminate to a vacant number. This fixed route type is used if the NOC is not defined in an office, and therefore a BLANK NUMBER RTI cannot be found.
BUSY	Software Release: 5E6 and later. Routes to a 60 IPM busy tone or sends a release message over an ISUP7 (ISDN User Part 7) trunk that crosses a network boundary. When "BUSY" is entered, the PLAY ANNC field determines whether the busy tone is played or the ISUP7 message is sent to a previous switch. This fixed route should also be defined for offices in the LEC Network. This fixed route is used to provide treatment for calls forwarded over ISUP trunks that terminate to a BUSY station.
CAC	Routes to a tone or announcement for invalid calls from a Charge-A-Call line.
CALLBACK	IMLT-2 callback route.
CAMAONI	Centralized Automatic Message Accounting Operator Number Identification. Routes to CAMA operator keying trunk group.
CFVACT	Software Release: 5E10 and earlier Call Forward already activated. Note that this field is not allowed for 5E11 and later.
CGC	Software Release: 5E3 and later. Routes to tones or announcements when a CGC (Circuit Group Congestion) backward fail

Copyright © 2003 Lucent Technologies

	message is received on a CCS (Common Channel Signaling) trunk.
CSACT	Software Release: 5E16 and later. FCCS (Forwarded Call - Call Screening) activation announcement. See Division 2, Section 4A526.
CSDCT	Software Release: 5E16 and later. FCCS deactivation announcement. See Division 2, Section 4A526.
CSFAIL	Software Release: 5E16 and later. FCCS unassigned or failure announcement.
CSTL	Coin Station Test Line. Routes to first available member of a trunk group containing outgoing LTD (Local Test Desk) test trunk circuits wired to CSTL. Used for CSTL test calls originating from coin lines.
CWDBUSY	Software Release: 5E9(1) and later. Provides Call Waiting Deluxe Busy Announcement.For more information on the Call Waiting Deluxe Secured Feature, see Division 2, Section 4A145
CWDDFANC	Software Release: 5E10 and later. Provides Call Waiting Deluxe Default Announcement. For more information on the Call Waiting Deluxe Secured Feature, see Division 2, Section 4A145
CWDHOLD	Software Release: 5E9(1) and later. Provides Call Waiting Deluxe Hold Announcement. For more information on the Call Waiting Deluxe Secured Feature, see Division 2, Section 4A145.
CWDREMDR	Software Release: 5E10 and later. Provides Call Waiting Deluxe Reminder Announcement. For more information on the Call Waiting Deluxe Secured Feature, see Division 2, Section 4A145
DCOFHK	Routes to a tone or announcement when no second start dial wink has been received on a direct trunk from an InterLATA carrier.
DCTUCR	Software Release: 5E6 and later. Routes to an announcement when UCR (Unidentified Call Rejection) has been deactivated by means of a dial code.
DFLTFAIL	Software Release: 5E5 and later. Routes to reorder or announcements (error treatment) for denied calls made on an ISDN BRI line with default service.
DFLTRT	Software Release: 5E9(1) and later. ASP Default Routing for 3/6/10-Digit Triggers.
DGRESP	Routes to TTF responder used by Line Unit Channel Circuit and Trunk Diagnostics to define TTF responders.
DGTGEN	Routes to TTF Tone Generator used by Line Unit Channel Circuit and Trunk Diagnostics to define TTF Tone Generators.
DPAT	Dialing Plan Access Treatment error announcement. Used when an originator in an IDP dials a code prohibited by its DPAT code.
DSNICA	Software Release: 5E3 and later. Routes to the DSN (Defense Switched Network) Isolated Code Announcement for Network Management.
EA1	Routes to Emergency Announcement 1 for NDC (Network Data Collection) OS (Operations System) or NTM (Network Traffic Management) OS.
EA2	Routes to Emergency Announcement 2 for NDC OS or NTM OS.
ELSRESP	Software Release: 5E3 and later. Routes to TTF responder used by the ELS capability to periodically determine the loaded/non-loaded characteristics of lines terminated on a Line Unit. ELSRESP is required for any analog line on any unit (except ISLC). This will include LU, ISLU, and AIU.
ESMRT	Equal Access Signaling Mis-route for the IEC (Interexchange Carrier) switch. Used when the wrong information digits are received from an Equal Access End Office on either a direct trunk or via an Access Tandem.
HNPAD	Routes calls when the HNPA was dialed in error.
HOSTSA	Routes calls which would normally terminate on an RSM (Remote Switching Module) of this office, but cannot because the communication link has been lost, between the host and the RSM. (The call is not originating in the RSM). Usually routed to an announcement in the host office. This Fixed Route Type is required for offices with RSMs.
IC102	Routes to a 102 Test Line for the No. 2 Service Evaluation system.
ICROTL	Routes an incoming call to ROTL on a foreign exchange line from a nearby Central Office. Used only for toll and tandem offices which have no Directory Numbers.
ICSRTT	Incoming Station Ringer Touch Tone test.
ICTSTCL	Software Release: 5E3 and later.

Copyright © 2003 Lucent Technologies

	Routes incoming Transmission Test Calls on CCS trunks.
IDPERR	IDP error announcement. Used when an originator in an IDP dials an undefined code.
IECFAIL	Routes to a tone or announcement when a termination failure occurred during signaling.
INSID	Routes coin calls where insufficient initial coin deposit is received.
INTTF	Interactive test access from TLWS (Trunk And Line Work Station).
INV10XX	Routes for the following FGD CAC dialing errors: □An IEC Identification Number was dialed on an international call; □An International Carrier Identification Number was dialed on a domestic call. □Software Release: 5E8 and earlier: An unassigned carrier ID was dialed.
INVCAC	Software Release: 5E9(1) and later. Routes FGD carrier calls if 101 is not dialed by a user in an office where FGD PHASE equals "POSTPHASE" (see the OFCOPT form (5509 Record)).
INVDIG	Provides tone or announcement treatment when invalid digits are dialed. The fixed Route Type is set to INVDIG when an invalid digit string containing a "#" or "*" is received during digit reception on a line or trunk.
INVNODIG	Routes to a tone or announcement when an invalid number of digits are received from an InterLATA carrier.
INVPIC	Routes to a tone or announcement for calls from lines with a PIC (Pre-subscribed InterLATA Carrier) when the following error conditions exist: □The PIC is an International Carrier, but a domestic call was dialed; □The PIC was an IEC, but an international call was dialed.
ISTFLB	Software Release: 5E3 and later. Routes to a test line service of the ISTF (Integrated Services Test Facility) Loopback.
ISTFXMIT	Software Release: 5E3 and later. Routes to a transmission test service of the ISTF.
LCOP	Routes to Local Coin Overtime Prompt.
MISRLRN	Misrouted LRN (Location Routing Number). For 5E13 and later, provides announcement or tone routing when cause code 26 is received in a CCS RELease message for misrouted LRN.
NCA	Routes to National Congestion Announcement (or No Circuits Available) for NDC OS or NTM OS.
NCC	Software Release: 5E6 - 5E8 only. No circuit to Carrier announcement. Routes to a special tone or announcement when a trunk to an IEC is not available.
NCD	Network Call Denial. Used when NCD Screening results in a message from the Network Control Point/Signal Transfer Point that the originator is a non-payer of the IEC.
NNC	Software Release: 5E3 and later. Routes to tones or announcements when a National Network Trunk Congestion message is received on a CCS trunk.
NO10XX	Routes FGD CAC dialed calls with the following error conditions: □The call is intraLATA, but the carrier is interLATA; □An FGD CAC was dialed for a Service Access Code call; □An FGD CAC was dialed on an N11 (other than 911) call; □The line is not allowed to dial an FGD CAC; □An FGD CAC was dialed for a Transition (TRANS) call.
NO911	Routes to tone or announcement for offices not providing 911 Emergency Services. This entry is not used and is no longer required.
NOACK	Routes to a tone or announcement when no acknowledging wink has been received from a carrier.
NODLTN	Indicates that no dial tone could be applied to the originator due to unavailability of switch resources (e.g., a UTG). Normally routed to an unavailable resources announcement, or a local overload announcement.
NOSSD	Routes to a tone or announcement when no second start dial wink has been received from an International Carrier.
NOSTART	Routes to a tone or announcement when no start signal has been received from a carrier.
NOXMTR	Routes calls when no transmitter (UTG) is available for outpulsing.
NPA_SP	Software Release: 5E13 and later. Numbering Plan Split Announcement.
NSANNC	Software Release: 5E6 and later. Number Services Announcement. Routes to the Advanced Services Platform announcements given by the DSU2-RAF-DTA.
NWBLK	Network blocked. Routes calls between two SMs when the path through the TMS is blocked.
OEASERR	Software Release: 5E8 and later. Operator equal access signaling error.
OGTGDST	Software Release: 5E16(2) and later.

Copyright © 2003 Lucent Technologies

	Terminal maintenance test calls requiring GDSF test equipment.
OGTRANS	Outgoing transmission test calls.
OLSPD	Software Release: 5E4(2) and later. Routes to a tone or announcement for 1+ calls from stations denied sent paid DDD billing.
OSANITO	Routes to a tone or announcement when a timeout occurs while waiting for an Automatic Number Identification request from an Operator Facility.
OSPSDA	Software Release: 5E3 and later. Routes to an OSPSDA announcement given by the DSU2-RAF.
OSPSEIS	Software Release: 5E6 and later. OSPS External Information System. Routes to OSPS Listing Services announcements given by the DSU2-RAF. This routes via the trunk hunt mechanisms to an idle RAF port from a trunk group defined on the TKGRP form.
OTOTTF	Software Release: 5E3 and later. Office-to-Office Transmission Test Facility. Routes to a TTF tone decoder during Office-to-Office testing of lines being transferred from a Crossbar Switch or ESS Switch to the 5ESS Switch. The tone decoder is used to detect traffic busy test blockage conditions on the line under test. This value is not required if the Switch has no lines or if the Switch being replaced is a Step-by-Step Switch. Otherwise, this value is required.
OVLD	Routes calls denied due to system overload.
PCPDENY	Software Release: 5E7 and later. Route used for announcements when attempting to use per-call privacy and use of per-call privacy has been denied.
PDIAL	Provides partial dial tone or announcement routing treatment.
PERMSIG	Provides permanent signal tone or announcement routing.
PFXERROR	1+ prefix not permitted. Provides tone or announcement routing when the calling party dials a prefix when it should be omitted. Not currently used.
PFXREQD	For 5E11 and 5E12, provides announcement or tone routing when cause code 26 is received in a CCS RELease message for misrouted LRN (Location Routing Number). Otherwise, unused.
PPBPC	Precedence and Preemption Blocked Precedence. Associated with an AUTOVON (Automatic Voice Network) or DSN. Routes to an announcement when a precedence call with equal or higher precedence prevents a call from being completed.
PPBPR	Precedence and Preemption Blocked Preemption. Associated with an AUTOVON or DSN. Routes to an announcement when a non-preemptable call prevents completion of a precedence call.
PPNAV	Precedence and Preemption Non-AUTOVON. Used to provide treatment to a non-AUTOVON subscriber when the call with an AUTOVON subscriber has been preempted so that a priority government call can be completed. (The AUTOVON subscriber receives preemption tone which requires no FIXRT Type.) Normally sent to an announcement.
PPPAL	Software Release: 5E3 and later. Routes to an announcement when a call is blocked due to the precedence access threshold limit being exceeded.
PPUAP	Precedence and Preemption Unauthorized Precedence. Associated with an AUTOVON or DSN. Routes to an announcement when a caller is attempting to make a call with an unauthorized precedence level.
PPVAC	Precedence and Preemption Vacant Code. Associated with an AUTOVON or DSN. Routes to an announcement when a call can't be completed as dialed.
RASI	Software Release 5E8 and later. Provides routing for the Remote Access to Advanced Service Interface feature.
REORDER	Reorder Tone or announcement.
REQ10XX	Routes to tone or announcement for calls requiring an FGD CAC but the FGD CAC was not dialed.
REVOHANN	Software Release 5E9(1) and later. Provides routing to a tone or announcement when a terminating multi-party line goes off-hook after being rung back due to Multi-Party Revertive Ringing. Available for the REA Revertive Announcement feature. This feature allows the 5ESS Switch to provide an announcement instead of busy tone before revertive ringing when a Multi-Party subscriber calls a number on the same party line.
REVRBANN	Software Release 5E9(1) and later. Provides routing to a tone or announcement when an originating multi-party line is going to be rung back due to Multi-Party Revertive Ringing. Available for the REA Revertive Announcement feature.
ROACCS	Software Release: 5E4(2) and later. OSPS ACCS (Automated Calling Card Service).

Copyright © 2003 Lucent Technologies

ROAOC	Software Release: 5E6 and later. Route to OSPS MECH announcements.
ROCOIN	Software Release: 5E4(2) and later. OSPS Coin DSU2 (Digital Service Unit Model 2) Routing.
RSMSA	RSM/ORM/TRM - Stand-Alone. This Fixed Route Type is required if the Stand-Alone call processing option has been purchased for any Remote Site. Routes calls originated at the RSM/ORM/TRM when the RSM/ORM/TRM is in Stand-Alone call processing mode and the destination of the call is outside of the Remote Site. It is usually routed to an announcement at the Remote Site.
RTGTRBL	Indicates that an indeterminate internal call handling failure has occurred. Must be routed to an announcement trunk group (TRK DIR field on TKGRP form equal to "ANN") or to Reorder.
S96CTST	TTF used by the SLC96 Channel Unit Diagnostic capability.
SCD	Software Release: 5E5 and later. Routes to a tone or announcement for calls blocked by SCD (Selective Carrier Denial) screening which is a function of the SCD feature.
SEC	Software Release: 5E3 and later. Switching Equipment Congestion. Routes to tones or announcements when an SEC backward fail message is received on a CCS trunk.
SLE	Software Release: 5E6 and later. Screen List Editing. Routes to LASS (Local Area Signaling Services) Screen List Editing announcements given by the DSU2-RAF-DTA.
SSDE	Routes to tone or announcement when a Special Service Access Code was Dialed in Error and shouldn't have been dialed.
SSDOFHK	Routes to a tone or announcement when an off-hook instead of a second start dial wink is received from a carrier.
SSI	Software Release: 5E3 and later. Send Special Information. Routes to tones or announcements when a Send Special Information Tone backward fail message is received on a CCS trunk.
TACCT	Software Release: 5E11 and later. TDX (Toll Digital Exchange) account code used in a LDP (Long Distance Platform) office.
TSTTRK	Routes first available member of a trunk group containing outgoing LTD test trunk circuits. Used during line originated LTD calls.
UCRDENY	Software Release: 5E7 and later. Routes to an announcement when a call is rejected by UCR (Unidentified Call Rejection).
UIA	Unauthorized INWATS Announcement. Used in an Originating Screening Office when the INWATS Data Base sends a message that the originating Numbering Plan Area is out of band for the 800 number. This type is required for offices that perform SSP 800 query messages. For more information on SSP 800 translations, see Division 2, Section 1X.
VACANT	Vacant Code. Software Release: 5E9(1) and later: Routes for an unassigned carrier ID FGD CAC dialing error.
WATSDND	Routes to tone or announcement for calls that are denied WATS usage.

Data Rules:

For 5E5 and later, if the FIXED ROUTE TYPE is not routed to the DSU2-RAF, then the SVC GRP field on the associated TKGRP form should be entered as "NOANNC". If the FIXED ROUTE TYPE entered in this field is routed to the DSU2-RAF, then the following values are needed on the associated TKGRP form:

FIXED ROUTE TYPE ENTRY	**TKGRP form**		
	SVC GRP	**TRKCLS**	**TRK DIR**
ACSR	ACSR	RAFDTA	RAF
ACSR	RAS (See Note)	RAFDTA	RAF
NSANNC	ASP	RAFDTA	RAF
OSPSDA	DA	RAFANNC	RAF
ROACCS	ACCS	RAFDTA	RAF
ROCOIN	COIN	RAFCTR	RAF
SLE	RAS	RAFDTA	RAF
2LEVEL	RAS	RAFDTA	RAF

- ***NOTE:*** A SVC GRP with a value of "RAS" is used with ACSR when the same trunk group also supports LASS and/or RAS (Remote Access Service) announcements.

Copyright © 2003 Lucent Technologies

For 5E9(1) and later, each FIXED ROUTE TYPE in the following table must be associated with a specific TRKCLS. The ROUTE INDEX must be defined on an RTIDX form, and the TRUNK GROUP NUMBER on that form must be defined on a TKGRP form with the TRKCLS that is specified in the table below.

FIXED ROUTE TYPE	TRKCLS
APT	LTPOGTC
CALLBACK	LTPCLBCK
CSTL	TSTK
DGRESP	LTPDGTTF
DGTGEN	LTPDGTTF
ELSRESP	LTPELSTF
IC102	LTPICTC
ICSRTT	LTPICTC
INTTF	LTPWSTTF
OGTRANS	LTPOGTC
OTOTTF	LTPOTOTF
S96CTST	LTPS96TF
TSTTRK	TSTK

For 5E13 and later, when FIXED ROUTE TYPE entered in this field is set to a value in the following table, the ROUTE INDEX entered on this form must correspond to a RTIDX form (5303 Record) with TRUNK GROUP NUMBER entered. The TRUNK GROUP NUMBER entered on the RTIDX form must match a TGN on a TKGRP form (5202 Record) with SVC GRP set to a corresponding value in the table that follows, and TRK DIR must be "RAF".

FIXED ROUTE TYPE ENTRY	TKGRP FORM SVC GRP ENTRY
ROACCS	ACCS
OSPSDA or OSPSEIS	DA
ROCOIN	COIN
ACSR	ACSR or RAS
2LEVEL	RAS
SLE	RAS
NSANNC	ASP
NPA SP	RAS

The following data rules are listed for specific FIXED ROUTE TYPE entries:

10XERR: Required if any LDIT or MLDIT form (5300-3/5 Record) has "TRANS" entered in the TYPE OF CI CALL field.

950ERR: Required if any LDIT or MLDIT form (5300-3/5 Record) has "TRANS" entered in the TYPE OF CI CALL field.

ACT: Required if any IDPACT form (5601-3 Record) has TREATMENT equal to "ANNC".

ACTUCR: If FIXED ROUTE TYPE is "ACTUCR", TONE must be "N".

AL2LVL or ALSLE: If "AL2LVL" or "ALSLE" is entered, then
- TONE must be "N" and
- ROUTE INDEX must be entered.

For 5E8 and later, a FIXED ROUTE TYPE of "ALSLE" or "AL2LVL", requires an RTIDX form with the ROUTE TYPE equal to "HUNT", and a TKGRP form with TRKCLS equal to "RAFDTA".

ANSTO: Required if any ICF (InterLATA Carrier Feature) or CDIM (Carrier Destination Index Mapping) form exists in the office.

APT: Required in all offices. The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPOGTC".

ATCANIF: The value of "ATCANIF" will point to a route index, which will point to a trunk group. Required when CALL TYPE is set to "ADDON" or "MEETME" on the LDIT or MLDIT form.

Copyright © 2003 Lucent Technologies

ATCINT: The value of "ATCINT" will point to a route index, which will point to a trunk group. Required when CALL TYPE is set to "ADDON" or "MEETME" on the LDIT or MLDIT form.

BADDATA: Required in all offices.

BLANK: Tones are prohibited for an entry of "BLANK". If "BLANK" is entered, TONE must be "N".

If there is a TKGRP form(s) with INPULSING or OUTPULSING entered as "ISUP7", there must be a FIXRT form with FIXED ROUTE TYPE entered as "BLANK".

For 5E9(1) and later, when FIXED ROUTE TYPE is "BLANK", and the ROUTE INDEX on this form is defined on an RTIDX form where a TRUNK GROUP NUMBER is entered, then on the related TKGRP form the TRK DIR must be "2W" or "OUT".

CAC: Required in all offices.

CALLBACK: TONE field must be "N". Also, for 5E8 and earlier, the ROUTE INDEX must be defined on an RTIDX form, and the trunk group on that form must point to a TKGRP form where TRKCLS is "LTPCLBCK".

CAMAONI: If a trunk group with TRKCLS "CAMAANI", "CAMAONI", or "CAMOPKEY" is defined for the office, a FIXED ROUTE TYPE of "CAMAONI" must be defined on this form and must provide a route index pointing to the trunk group. In addition, for "CAMAOPKEY" trunk groups, one or more of the CAMAONI Trunk Trouble code numbers must be specified on the OFCOPT form (5509 Record).

If the office has "CAMAANI" and/or "CAMAONI" Incoming trunk groups, but does not have a "CAMOPKEY" trunk group (and no CAMAONI Trunk Trouble codes), this Fixed Route Type provides a route index for tandeming Operator Number Identification calls. Normally, this will point to a CAMA or TSPS trunk group, but may point to a tone or an announcement.

This fixed route type is required if any TKGRP form (5202 Record) exists with a TRKCLS field equal to "CAMANI", "CAMAONI" or "CAMOPKEY"; the TONE field must be "N".

CGC: Required if there are any TKGRP entries with INPULSING/OUTPULSING equal to "ISUP7".

CSACT, CSDCT, CSFAIL:
For 5E16 and later:

When FIXED ROUTE TYPE is "CSACT", "CSDCT", or "CSFAIL", TONE? must be "N".

When FIXED ROUTE TYPE is "CSACT", "CSDCT", or "CSFAIL", the ROUTE INDEX must be entered and there must be a matching ROUTE INDEX on the RTIDX form (5303 Record) and on this RTIDX form the TRUNK GROUP NUMBER must be entered, and have a matching TGN on the TKGRP form with TRK DIR equal to "ANN".

CSTL: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "TSTK". Required if any LDIT or MLDIT form (5300-3/5 Record) is entered with a CALL TYPE of "CSTL".

CWDBUSY, CWDDFANC, CWDHOLD, and CWDREMDR: When FIXED ROUTE TYPE is "CWDBUSY", "CWDDFANC", "CWDHOLD", or "CWDREMDR" then

- TONE must be "N"
- ROUTE INDEX must be entered
- the ROUTE INDEX on this form must be defined on the RTIDX form where ROUTE TYPE is "HUNT" and the TRUNK GROUP NUMBER on the RTIDX form must be defined on the TKGRP form where TRK DIR is "ANN".

Copyright © 2003 Lucent Technologies

DCOFHK: Required if any ICF or CDIM form (5300-6 Record) exists in the office.

DCTUCR: If FIXED ROUTE TYPE is "DCTUCR", TONE must be "N".

DENYORIG: If FIXED ROUTE TYPE is "DENYORIG", TONE must be "N".

DFLTFAIL: If DFLTFAIL is entered, and TONE is "Y", then TONE TYPE must be "REORDER", and both ROUTE INDEX and CHARGE INDEX must be entered. The ROUTE INDEX must be defined on an associated RTIDX form (5303 Record) with ROUTE TYPE set to "HUNT".

If a ROUTE INDEX is entered, it must be defined on an RTIDX form with ROUTE TYPE set to "REORDER" or "HUNT". If the ROUTE TYPE is "HUNT", the TRUNK GROUP NUMBER on the RTIDX form must match a TGN defined on a TKGRP form where TRK DIR is "ANN".

DGRESP: Required in all offices. The associated route index must point to a Trunk Group on the TKGRP form with a TRKCLS of "LTPDGTTF".

DGTGEN: Required in all offices. The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPDGTTF".

DPAT: Required if any IDPGP form (5601-4 Record) has a DPAT TREATMENT equal to "ANNC".

DSNICA: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form).

EA1: For 5E14 and earlier - Required if the OFCOPT form field EADAS LINK has a value of "Y".
For 5E15 and later - Required if the OFCOPT form fields, TRFM LINK or RNM LINK has a value of "Y".

EA2: For 5E14 and earlier - Required if the OFCOPT form field EADAS LINK has a value of "Y".
For 5E15 and later - Required if the OFCOPT form fields, TRFM LINK or RNM LINK has a value of "Y".

ELSRESP: Required if any EQLU form (5710 Record) is entered. The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPELSTF".

ESMRT: Required if any TKGRP form has a TRKCLS of "LATA".

HNPAD: Required if any LDIT or MLDIT form (5300-3/5 Record) entry contains a CALL TYPE of "HNPAD".

HOSTSA: This Fixed Route Type will point to a route index which, in turn, points to the trunk group containing the general stand-alone announcement at the Host. This Fixed Route Type is required for all offices and applies to any RSM or Switching Module that goes into stand-alone operation.

A FIXED ROUTE TYPE of "HOSTSA" is required on the FIXRT form for all offices where any of the following conditions are true on the EQIM form:

- the SM USAGE field is set to "RSM".
- the STAND ALONE field is set to "Y".
- the STAND ALONE field is unknown but on the associated EQSITE form, the STAND ALONE PURCHASED? field is set to 'Y'.

IC102: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPICTC". Required for all multi-module offices if any trunk group has a TRKCLS of "SES".

ICROTL: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPROTL".

Copyright © 2003 Lucent Technologies

ICSRTT: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPICTC". Required if any LDIT or MLDIT form (5300-3/5 Record) entry contains a CALL TYPE of "SRTT".

ICTSTCL: TONE field must be "N". The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPICTC". Required if there are any TKGRP entries with INPULSING/ OUTPULSING equal to "ISUP7" or "CCIS6". For 5E7 and later, if ROUTE INDEX is entered, the ROUTE INDEX must be defined on an RTIDX form with ROUTE TYPE set to "HUNT" or "TEST".

IDPERR: Required if any IDPGP form has a STANDARD ERROR TREATMENT equal to "ANNC".

IECFAIL: Required if any ICF or CDIM form exists in the office.

INSID: Required if an EQLU form (5710 Record) or EQDCLU form (5810 Record) is entered.

INTTF: Required in all offices. The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPWSTTF".

INV10XX: Required if any ICF or CDIM form exists in the office.

For 5E9(1) and later, except for 911 calls, if the calling party (either an ISDN or a non-ISDN) dials a CAC that refers to an unassigned CIC, the caller shall receive VACANT code treatment.

INVCAC: Required if FGD PHASE equals "POSTPHASE" on the OFCOPT form.

INVDIG: Required in all offices.

INVNODIG: If a trunk group on the TKGRP form has TRKCLS "IC", a FIXED ROUTE TYPE of "INVNODIG" must be defined on this form.

INVPIC: Required if any ICF or CDIM form exists in the office.

ISTFLB: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPISTFL".

ISTFXMIT: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPISTFX".

LCOP: Required if an EQLU form (5710 Record) or EQDCLU form (5810 Record) is entered. The associated route index must point to a trunk group on the TKGRP form with the CYCLES field equal to 1.

NCA: For 5E14 and earlier - Required if the OFCOPT form field EADAS LINK has a value of "Y".
For 5E15 and later - Required if the OFCOPT form fields, TRFM LINK or RNM LINK has a value of "Y".

NCD: Required if any TKGRP form has an NCD SCREENING of "MAP" or "NOMAP".

NNC: Required if there are any TKGRP entries with INPULSING/OUTPULSING equal to "ISUP7" or "CCIS6".

NO10XX: Required if any ICF or CDIM form exists in the office.

NOACK: Required if any ICF or CDIM form exists in the office.

NODLTN: Required in all offices.

NOSSD: Required if any ICF or CDIM form exists in the office.

NOSTART: Required if any ICF or CDIM form exists in the office.

Copyright © 2003 Lucent Technologies

NOXMTR: Required in all offices.

NPA_SP: For 5E13 and later, when FIXED ROUTE TYPE is "NPA_SP", ROUTE INDEX must be entered.

NSANNC: This value can only be entered when ASP OFC, on the OFCOPT form (5509 Record) is set to "SSP". For 5E9(2) and earlier, if the ASP OFC value is "SSP", then there must be a FIXRT form entered where FIXED ROUTE TYPE is "NSANNC".

For 5E10 and later, an entry with FIXED ROUTE TYPE equal to "NSANNC"for an SSP office is no longer required. However it must be provisioned if routing to a RAF/SAS is desired.

If "NSANNC" is entered:

- CHARGE INDEX must not be entered.
- the corresponding RTIDX form must have ROUTE TYPE equals "HUNT".

NWBLK: Required in all offices. For an RSM, if all RSM-Host time slots are busy, the route index should point to a Trunk Group for an announcement or reorder on that RSM.

If a ROUTE INDEX is entered, it must be defined on an RTIDX form with ROUTE TYPE set to "REORDER" or "HUNT". If the ROUTE TYPE is "HUNT", the TRUNK GROUP NUMBER on the RTIDX form must match a TGN defined on a TKGRP form where TRK DIR is "ANN".

For 5E9(1) and earlier, calls receiving Network Blocking terminating treatment must route to an announcement if the LEC IW REL field on the OFCOPT form is set to "N". If LEC IW REL is set to "YES", a preceding switch provides the terminating treatment.

OEASERR: If "OEASERR" is entered, then there must be a corresponding RTIDX form (5303 Record), where the ROUTE INDEX on this form matches the ROUTE INDEX on the RTIDX form. The ROUTE TYPE on the corresponding RTIDX form must be "HUNT" or "REORDER". In addition, the corresponding TKGRP form (5202 Record), i.e., TGN on TKGRP form matches the TRUNK GROUP NUMBER on the RTIDX form, must have "ANN" entered in the TRK DIR field.

If OSPS TA is "Y" on OSPSOPT form (5424 Record), and OFFICE TYPE is "Y" and OFFICE CARRIER is 288 on the OFCOPT form (5509 Record), then at least one FIXRT form must have a FIXED ROUTE TYPE of "OEASERR".

OGTRANS: Required in all offices. The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPOGTC".

OLSPD: Required in all OSPS offices.

OSANITO: Required if any ICF or CDIM form exists in the office.

OSPSDA: This entry is required for offices with the OSPSDA feature available with 5E4(2) and later.

OSPSEIS: This trunk group must be defined as an RAF announcement group. However, the RAFANNC service class may be used by more than one application. TONE TYPE must NOT be "REORDER" when "OSPSEIS" is entered.

A corresponding RTIDX form (5303 Record) is required for each FIXRT form with a FIXED ROUTE TYPE of "OSPSEIS", where the ROUTE INDEX field on the RTIDX form matches the ROUTE INDEX field on the FIXRT form and the ROUTE TYPE field on the RTIDX form is "HUNT". A corresponding TKGRP form is required for each FIXRT form with a FIXED ROUTE TYPE field of "OSPSEIS". The TGN field on the TKGRP form must match the TRUNK GROUP NUMBER on a RTIDX form. The ROUTE INDEX field on the RTIDX form must match the ROUTE INDEX field on the FIXRT form. Also, the TRK DIR field on the TKGRP form must be "RAF".

Copyright © 2003 Lucent Technologies

A second RTIDX form may be required for each FIXRT form with a FIXED ROUTE TYPE of "OSPSEIS" for overflow conditions. The ROUTE INDEX field of the second RTIDX form must match the NEXT ROUTE field on the first RTIDX form. The ROUTE INDEX field on the first RTIDX form matches the ROUTE INDEX field on the FIXRT form. The ROUTE TYPE field on the second RTIDX form must be "HUNT" or "REORDER". If the ROUTE TYPE field is "HUNT" on the second RTIDX form, then a corresponding TKGRP form is required where the TGN field matches the TRUNK GROUP NUMBER field on the second RTIDX form and the TRK DIR field on the TKGRP form is "RAF". See Division 2, Section 3C for a discussion of translations for EIS.

OTOTTF: The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPOTOTF".

OVLD: Required in all offices.

PDIAL: Required in all offices.

PERMSIG: Required in all offices.

PPBPC: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form (5509 Record)). Required in offices that have any line, Multi-Line Hunt Line or Trunks assigned Precedence and Preemption BRCS features.

PPBPR: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form (5509 Record)). Required in offices that have any line, Multi-Line Hunt Line or Trunks assigned Precedence and Preemption BRCS features.

PPNAV: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form (5509 Record)). Required in offices that have any line, Multi-Line Hunt Line or Trunks assigned Precedence and Preemption BRCS features. TONE TYPE must be "PRMPTON".

PPPAL: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form).

PPUAP: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form (5509 Record)). Required in offices that have any line or Multi-Line Hunt Lines assigned Precedence and Preemption BRCS features.

PPVAC: Required in all DSN offices (indicated by DSN OPTION field set to "Y" on the OFCOPT form (5509 Record)). Required in offices that have any line, Multi-Line Hunt Lines or Trunks assigned Precedence and Preemption BRCS features.

RASI: If "RASI" is entered, then TONE must be "N" and PLAY ANNC must be "N".

If "RASI" is entered and a ROUTE INDEX is entered:

- the ROUTE INDEX must be defined on an RTIDX form with a ROUTE TYPE of "HUNT" or "REORDER",
- the RTIDX has a ROUTE TYPE of "HUNT" and the TRUNK GROUP NUMBER on the RTIDX form is entered, then the TRUNK GROUP NUMBER must be defined as a TGN on the TKGRP form with "ANN" or "RAF" entered in the TRK DIR field on the TKGRP.

REORDER: Required in all offices. The specified route index must have a ROUTE TYPE of "REORDER" on the RTIDX form (5303 Record). TONE field must be "Y".

REQ10XX: Required if any ICF or CDIM form exists in the office.

REVOHANN, REVRBANN: Revertive Ringback Announcement and Revertive Offhook Announcement

Copyright © 2003 Lucent Technologies

must be enabled by FID 578 on the FOSYS form.

The default Revertive Offhook Treatment is a distinctive tone, currently three Call Waiting beeps.

If the customer desires to have an announcement for Revertive Offhook Treatment instead of the distinctive tone, FID 579 must be enabled on the FOSYS form. If the customer has selected an announcement for Revertive Offhook Treatment, when the called party answers the announcement will begin. If the calling party goes offhook while the announcement is still playing, both parties will continue to hear announcement until the announcement finishes. Similarly, if the customer has selected distinctive tone for Revertive Offhook Treatment, both parties may hear the tone if they are both offhook at the same time.

If the "REVRBANN" fixed route announcement is not defined, the customer will hear BUSY tone.

If the originator stays offhook for 10 seconds after the "REVRBANN" announcement has finished, the caller will hear BUSY tone.

If the "REVOHANN" fixed route announcement is not defined, the called party will hear Call Waiting Tone 3.

ROCOIN: An OSPSOPT form (5424 Record) must be defined with the OSPA TA and the ACTS field equal to "Y".

In addition, if "Y" is entered for the TA and ACTS fields on the OSPSOPT form, the RAF trunk groups (TRK DIR is "RAF" on the TKGRP form) require a FIXRT form with a FIXED ROUTE TYPE of "ROCOIN".

RSMSA: Required if the RSM STAND ALONE PURCHASED field on the EQSITE form (5722 Record) is "Y".

RTGTRBL: Required in all offices. When this route type is entered, the ROUTE INDEX field must also be entered. The ROUTE INDEX must be defined on an RTIDX form with ROUTE TYPE set to "REORDER" or "HUNT". If the ROUTE TYPE is "HUNT", the TRUNK GROUP NUMBER on the RTIDX form must match a TGN defined on a TKGRP form where TRK DIR is "ANN".

S96CTST: Required if the office serves Integrated SLC96 lines. Required if an SLCRT form (5106 Record) has been entered. The associated route index must point to a trunk group on the TKGRP form with a TRKCLS of "LTPS96TF".

SCD: A FIXED ROUTE TYPE OF "SCD" must be defined on this form if SCD SCRNING of "Y" on at least one ICF form (5305 Record). Also, for 5E6 and later, if SCD is entered in this field, then the TONE ? field must be "N".

SEC: Required if there are any TKGRP entries with INPULSING/ OUTPULSING equal to "ISUP7" or "CCIS6".

SLE: For 5E6 and later, TONE must be "N" and PLAY ANNC must be "N".

SSDE: Required in all offices.

SSDOFHK: Required if any ICF or CDIM form exists in the office.

SSI: Required if there are any TKGRP entries with INPULSING/OUTPULSING equal to "ISUP7".

TACCT: When FIXED ROUTE TYPE is "TACCT", ROUTE INDEX must be entered, TONE TYPE must not be entered, TONE must be "N", and PLAY ANNC must be "N".

When FIXRT forms exist with a FIXED ROUTE TYPE of "TACCT", the ROUTE INDEX on the FIXRT form must be defined on the RTIDX form with a ROUTE TYPE of "HUNT". It also requires the TRUNK GROUP NUMBER on the RTIDX form to be defined on the TKGRP form with a TRK DIR of "RAF".

Copyright © 2003 Lucent Technologies

TSTTRK: Required if any LDIT or MLDIT form (5300-3/5 Record) contains a CALL TYPE of "LTD". The associated route index must point to a Trunk Group on the TKGRP form with a TRKCLS of "TSTK".

UCRDENY: If FIXED ROUTE TYPE is "UCRDENY", TONE must be "N".

UIA: Required if any LDIT or MLDIT form (5300-3/5 Record) has a CALL TYPE of "OSOIWTS".

VACANT: Required in all offices.

For 5E9(1) and later, A FIXED ROUTE TYPE may not be assigned to a ROUTE INDEX that has a corresponding ROUTE INDEX on an RTIDX form with a ROUTE TYPE of "DNTRAN".

For 5E9(1) and later, when the FIXRT form has a FIXED ROUTE TYPE of "DFLTRT" and the ROUTE INDEX is defined on a RTIDX form with a ROUTE TYPE of "HUNT" and TRUNK GROUP NUMBER on the RTIDX form is entered, then the TGN on the TRGRP form must match the TRUNK GROUP NUMBER and TRK DIR must be "ANN".

2.3 # TONE?

Description: Does the Fixed Route Type provide a tone from a Universal Tone Generator?

Required Field.
Valid Entries: Y, N

Data Rules:

If "Y" is entered and the FIXED ROUTE TYPE is "ESMRT", "NCD" or "UIA", then TONE TYPE must be "REORDER".

When "Y" is entered, TONE TYPE must be entered.

For 5E16 and later, when "N" is entered,

- TONE TYPE must not be entered.
- ROUTE INDEX must be entered.

This field must be "N" when FIXED ROUTE TYPE is "NSANNC".

2.4 TONE TYPE

Description: Enter the type of tone to which the Fixed Route Type should be terminated. This field should only contain an entry when TONE is "Y".

Valid TONE TYPE Entries

Entry	Definition
ROH	Receiver Off Hook Tone.
REORDER	120 IPM Tone. ROUTE TYPE must be "REORDER" on RTIDX form with this TONE TYPE.
BUSY	60 IPM Tone.
PRMPTON	Software Release: 5E4(2) and later. AUTOVON Preemption Tone.
DSNROH	Software Release: 5E3 and later. AUTOVON/DSN permanent tone.

2.5 ROUTE INDEX

Description: Assign a route index for announcement or trunk group terminations. It is required when the FIXED ROUTE TYPE is assigned a TONE TYPE of "REORDER" or if the TONE field is "N". This field

Copyright © 2003 Lucent Technologies

must be blank when the FIXED ROUTE TYPE is assigned a TONE TYPE other than "REORDER".
Valid Entries:

- For 5E10 and earlier: 1 - 3817
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

If a ROUTE INDEX is entered, it must defined on the corresponding RTIDX form as a ROUTE INDEX.

For 5E9(1) and later, when the FIXRT form has a FIXED ROUTE TYPE of "DFLTRT" and a ROUTE INDEX is entered, the ROUTE INDEX must be defined on a RTIDX form with a ROUTE TYPE of "HUNT" or "REORDER".

2.6 CHARGE INDEX

Description: This field is used to assign a CI for Announcement or Trunk Group terminations.

- ***NOTE:*** If there is no entry in this field, it indicates there is no data. On Recent Change View 10.1, an entry of 0 indicates there is no data.

Valid Entries: 1 - 2047

Data Rules:

This field must be entered if the FIXED ROUTE TYPE is assigned a TONE TYPE of "REORDER" or if the TONE field is "N".

This field must be not be entered when the FIXED ROUTE TYPE is assigned a TONE TYPE other than "REORDER".

2.7 PLAY ANNC

Description: Should a tone or announcement be played on an ISUP7 trunk which crosses a network boundary?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

FIXED ROUTE TYPE	CAPABILITY	REQUIREMENTS	SOFTWARE RELEASE
10XXERR	Carrier ID	Required if any LDIT or MLDIT form (5300-3/5 Record) has "TRANS" entered in the TYPE OF CI CALL field.	5E7 and earlier
2LEVEL	2-Level AC/COT		5E7 and later
950ERR	OSPS Equal Access	See "OEASERR" for 5E8 and later Required if any LDIT or MLDIT form (5300-3/5 Record) has "TRANS" entered in the TYPE OF CI CALL field.	5E7 and earlier
ACSR	ACSR (Automatic Customer Station Rearrangement)		5E5 and later
ACT	ACSR	Required if any IDPACT form (5601-3 Record) has TREATMENT equal to "ANNC".	5E2 and later

Copyright © 2003 Lucent Technologies

ACTUCR	UCR		5E6 and later
AL2LVL	LASS Alternate Language Announcement	Required for SF119	5E8 and later
ALSLE		Required for SFID 119	5E8 and later
ANSTO	CI (Carrier Interconnect)	Required before CI is activated. Required if any ICF (InterLATA Carrier Feature) or CDIM (Carrier Destination Index Mapping) form exists in the office.	5E2 and later
APT	Test	Required in all offices. Required if office runs Automatic Progression Testing	5E2 and later
ATCANIF	AT (ALLIANCE Teleconferenc-ing)	Required when CALL TYPE is set to "ADDON" or "MEETME" on the LDIT or MLDIT form.	5E4(2) and later
ATCINT	AT	Required when CALL TYPE is set to "ADDON" or "MEETME" on the LDIT or MLDIT form.	5E4(2) and later
BADDATA	Base Required	Required in all offices	5E2 and later
BLANK	CCS Required	Required in all offices Required if "ISUP7" is entered in a TKGRP form(s) with the INPULSING or OUTPULSING fields on the TKGRP form.	5E6 and later
BUSY	CCS		5E6 and later
CAC	Charge-a-call	Required in all offices.	5E2 and later
CALLBACK	LTP	Required in all offices with IMLT-2	5E2 and later
CAMAONI	Base	Required if a trunk group with TRKCLS "CAMAANI", "CAMAONI", or "CAMOPKEY" is defined for the office	5E2 and later <$!deleted via IMR 530623 CFVACT, CFDA, , 5E2 and later>
CGC	CCS	Required if there are any TKGRP entries with INPULSING/OUTPULSING equal to "ISUP7".	5E3 and later
CSTL	Coin	Required for a TKGRP form with a TRKCLS of "TSTK". Required if any LDIT or MLDIT form (5300-3/5 Record) is entered with a CALL TYPE of "CSTL".	5E2 and later
CWDBUSY	Call Waiting Deluxe		5E9(1) and later.
CWDHOLD	Call Waiting Deluxe		5E9(1) and later.
DCOFHK	CI	Required before CI is activated. Required if any ICF or CDIM form (5300-6 Record) exists in the office.	5E2 and later
DCTUCR	UCR (Unidentified Call Rejection)		5E6 and later
DENYORIG	UCR		5E5 and 5E6 only
DFLTFAIL	MDSL (Multi-point DSL)		5E5 and later
DGRESP	LTP (Logical Test Port)	Required in all offices	5E2 and later
DGTGEN	LTP	Required in all offices	5E2 and later
DPAT	IDP	Required if any IDPGP form (5601-4 Record) has a DPAT TREATMENT equal to "ANNC".	5E2 and later
DSNICA	DSN	Required in all DSN offices	5E3 and later
EA1	EADAS	Required if the OFCOPT form field EADAS LINK has a value of "Y".	5E2 and later
EA2	EADAS	Required if the OFCOPT form field EADAS LINK has a value of "Y".	5E2 and later
ELSRESP	LTP	Required in all offices equipped with a 4AC LINE UNIT. Required if any EQLU form (5710 Record) is entered.	5E3 and later
ESMRT	Equal Access Signaling	Required if any TKGRP form has a TRKCLS of "LATA".	5E2 and later
HNPAD	Base	Required if any LDIT or MLDIT form (5300-3/5 Record) entry	5E2 and later

Copyright © 2003 Lucent Technologies

		contains a CALL TYPE of "HNPAD".	
HOSTSA	RSM	Required for offices with RSMs	5E2 and later
IC102	LTP	Required for all multi-module offices if any trunk group has a TRKCLS of "SES".	5E2 and later
ICROTL	LTP		5E2 and later
ICSRTT	LTP	Required in all offices. Required if any LDIT or MLDIT form (5300-3/5 Record) entry contains a CALL TYPE of "SRTT".	5E2 and later
ICTSTCL	CCS Test	Required if there are any TKGRP entries with INPULSING/ OUTPULSING equal to "ISUP7" or "CCIS6".	5E3 and later
IDPERR	IDP	Required if any IDPGP form has a STANDARD ERROR TREATMENT equal to "ANNC".	5E2 and later
IECFAIL	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
INSID	Coin	Required in all offices equipped with a LINE UNIT or a DCLU. Required if an EQLU form (5710 Record) or EQDCLU form (5810 Record) is entered.	5E2 and later
INTTF	TLWS	Required in all offices.	5E2 and later
INV10XX	Carried ID	Required if any ICF or CDIM form exists in the office.	5E2 and later
INV10XX	FGD CIC	Routes FGD CAC dialing error.	
INVCAC	FGD CIC	Required if FGD PHASE equals ``POSTPHASE'' on the OFCOPT form (5509 Record).	5E9(1) and later
INVDIG	Base Required	Required in all offices.	5E2 and later
INVNODIG	IEC (Interexchange Carrier)	Required if a trunk group has a TRKCLS of "IC".	5E2 and later
INVPIC	PIC (Presubscribed InterLATA Carrier)	Required if any ICF or CDIM form exists in the office.	5E2 and later
ISTFLB	ISTF (Integrated Services Test Facility)		5E3 and later
ISTFXMIT	ISTF		5E3 and later
LCOP	Coin	Required in all offices having either a LINE UNIT or a DCLU. Required if an EQLU form (5710 Record) or EQDCLU form (5810 Record) is entered.	5E2 and later
MISRLRN	CCS		5E11 and later
NCA	EADAS	Required if the OFCOPT form field EADAS LINK has a value of "Y".	5E2 and later
NCC	IEC		5E6 and later
NCD	IEC	Required if any TKGRP form has an NCD SCREENING of "MAP" or "NOMAP".	5E2 and later
NNC	CCS	Required if "ISUP7" or "CCIS6" is entered in the INPULSING/OUTPULSING fields on the TKGRP form.	5E3 and later
NO10XX	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
NO911	911	no longer required	5E2 and later
NOACK	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
NODLTN	Base Required	Required in all offices.	5E2 and later
NOSSD	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
NOSTART	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
NOXMTR	Base Required	Required in all offices.	5E2 and later
NSANNC	ASP	For 5E9(2) and earlier	required if ASP OFC is "Y" on the OFCOPT form (5509 Record).
NWBLK		Required in all offices.	5E2 and later
OEASERR	OSPS Equal Access	Required if this office is an AT&T Toll and Assistance office	5E8 and later
OGTRANS	Base Required	Required in all offices.	5E2 and later
OLSPD	DDD	Required in all OSPS offices.	5E4(2) and later

Copyright © 2003 Lucent Technologies

OSANITO	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
OSPSDA	OSPS DA	Required for offices with the OSPSDA feature	5E3 and later
OSPSEIS	OSPS EIS		5E6 and later
OTOTTF	Crossbar or ESS	not required if the Switch has no lines or if the Switch being replaced is a Step-by-Step Switch, otherwise, this value is required.	5E3 and later
OVLD	Base Required	Required in all offices.	5E2 and later
PCPDENY	2-Level COT		5E7 and later
PDIAL	Base Required	Required in all offices.	5E2 and later
PERMSIG	Base Required	Required in all offices.	5E2 and later
PFXREQD	CCS		5E11 and later
PPBPC	AUTOVON DSN	Required in all DSN offices	5E2 and later
PPBPR	AUTOVON, DSN	Required in all DSN offices	5E2 and later
PPNAV	AUTOVON	Required in all DSN offices	5E2 and later
PPPAL	AUTOVON DSN	Required in all DSN offices	5E3 and later
PPUAP	AUTOVON DSN	Required in all DSN offices	5E2 and later
PPVAC	AUTOVON DSN	Required in all DSN offices	5E2 and later
RASI	Remote Access to Advanced Service Interface		5E8 and later
REQ10XX	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
REORDER	Base Required	Required in all offices.	5E2 and later
REVOHANN	REA Revertive Announcement		5E9(1) and later
REVRBANN	REA Revertive Announcement		5E9(1) and later
ROACCS	OSPS ACCS	Required in all OSPS offices	5E4(2) and later
ROAOC	OSPS MECH	Required in all OSPS offices with DSU2- RAFs with coin tone receivers or tone decoders	5E6 and later
ROCOIN	OSPS TA	Required in all OSPS offices with DSU2- RAFs with coin tone receivers	5E4(2) and later
RSMSA	RSM ORM TRM	required if the Stand-Alone call processing option has been purchased for any Remote Site.	5E2 and later
RTGTRBL	Base Required	Required in all offices.	5E2 and later
S96CTST	SLC96	Required if the office serves Integrated SLC96 lines. Required if an SLCRT form (5106 Record) has been entered.	5E2 and later
SCD	SCD (Selective Carrier Denial)	Required if SCD SCRNING of "Y" on at least one ICF form (5305 Record).	5E5 and later
SEC	CCS	Required if there are any TKGRP entries with INPULSING/ OUTPULSING equal to "ISUP7" or "CCIS6".	5E3 and later
SLE	LASS		5E6 and later
SSDE	Base Required	Required in all offices.	5E2 and later
SSDOFHK	CI	Required before CI can be activated. Required if any ICF or CDIM form exists in the office.	5E2 and later
SSI	CCS	Required if there are any TKGRP entries with INPULSING/OUTPULSING equal to "ISUP7".	5E3 and later
TSTTRK	LTP	Required if any LDIT or MLDIT form (5300-3/5 Record) contains a CALL TYPE of "LTD".	5E2 and later
UCRDENY	UCR		5E7 and later
UIA	INWATS 800	Required in all Toll OSO offices for which LDIT or MLDIT form (5300-3/5 Record) has a CALL TYPE of "OSOIWTS". Required in offices that perform SSP 800 query messages.	5E2 and later
VACANT	Base Required	Required in all offices.	5E2 and later
VACANT	FGD CIC		5E9(1) and later
VFYERR	2-Level COT	See "PCPDENY for 5E7 and later	5E6 only
WATSDND	WATS	Not currently used	5E2 and later

SEC. 3H: 5300-7a/7b/8a/8b RECORD REMAINING DIGIT INTERPRETATION FORM - RDIT

1. GENERAL

The 5300-7/8 Record is available with 5E8 and later Software Releases.

The RDIT input form contains information for the translation of remaining dialed digit strings for digit analysis. RDIT translation is an extension of primary digit analysis that ascertains whether or not the remaining digit string is a selective dialing request.

1.1 RDIT Operation

RDIT translates digits collected but not translated in LDIT.

RDIT is used to translate selective dialed strings.

As an example, assume the numbers 555-xxxx go to routing set A. Under RDIT, the dialed string 555-1000 is defined as going to routing set B. In this case, all 555-xxxx numbers where xxxx does not equal 1000 still go to routing set A.

The advantage over using LDIT without RDIT is that LDIT would have to fully translate to a seven-digit string (involving dozens of LDIT forms in this example). With RDIT, only an LDIT for 555 and an RDIT for 5551000 need to be specified. RDIT defines the selective dialed strings.

When an LDIT indicates an RDIT exists, but the dialed string is not defined within the RDIT, then routing information from LDIT is used to route the call. For the example above, the string 555-2000 is dialed and 555 indicates an RDIT is present, but the RDIT does not define the remaining digits of 2000. RDIT will therefore not override the LDIT information, and 555-2000 will use routing set A.

Almost all types of routing definable in primary digit analysis can be defined also in RDIT (except FATs (Foreign Area Translators) or SACs (Service Access Codes)).

1.2 Recent Change View

The corresponding Recent Change View for this form is 9.9.

2. FORM ENTRIES - 5300-7A RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * RDIT

Description: Enter the Remaining Digits Interpreter Table Number.

Required Field.
Valid Entries: 1 - 999

2.3 * PREVIOUS DIGITS

Description: Enter the digits defined on the LDIT (5300-3/5 Record) or MLDIT form (5300-3 Record) as INCOMING DIGITS.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

Copyright © 2003 Lucent Technologies

2.4 * REMAINING DIGITS

Description: Enter the remaining digits.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

2.5 # CALL TYPE

Description: Enter the Call Types to be used. Please refer to Figure 1 for field dependencies per CALL TYPE.

Required Field.
Default: NORMAL
Valid Entries:

Valid CALL TYPE Entries

Entry	Definition
100	Incoming 100 Type Test Calls.
101	Incoming 101 Type Test Calls.
102	Incoming 102 Type Test Calls.
103	Incoming 103 Type Test Calls.
104	Incoming 104 Type Test Calls.
105	Incoming 105 Type Test Calls.
106	106 Test Calls for DSN (Defense Switched Network) offices only.
104R	Incoming Call to a RMS-D3 104 Test Line.
105R	Incoming Call to a RMS-D3 105 Test Line.
109R	Incoming Call to a RMS-D3 109 Test Line.
606R	Incoming Call to a RMS-D3 606 Test Line.
101R	Incoming Call to a RMS-D3 101 Test Line.
101TP	Incoming Call to a Specific RMS-D3 101 Test Position.
101TAT	Incoming Call to a Specific RMS-D3 101 Test Position and TAT.
211	Software Release: 5E15 and later. Dial 211.
311	Software Release: 5E15 and later. Dial 311.
900	900 calls. This CALL TYPE, prevents a LASS AR (Automatic Recall) user from camping-on to this line.
ADDON	Add-on for Alliance Teleconferencing.
APSDN	ACP (Action Control Point) for an SDN (Software Defined Network). This value indicates a query should be sent to the NCP (Network Control Point). The NCP will return a routing telephone number.
AUTINW	Automated Inward Call. Calls with this call type are originated by a distant operator and are routed to an automated query.
BBRITL	This ACTION is used for billed BRITL (Basic Rate Interface Dial Up Test Line).
BRITL	This ACTION is used for non-billed BRITL.
BUSOFC	Business Office (811).
CONFLCT	Conflicting NXX and NPA Code - either prefix resolved or timing resolved.
CSTL	Coin Station Test Line.
DA	555 Directory Assistance. Note: A CALL TYPE of "NORMAL" should be used with DA calls (i.e., 555-1212, NPA-555-1212) preceded by an FGD CAC.
DA2VDT	Directory Assistance calls routed to Video Display Terminal.
ECP	Software Release: 5E9(1) and later. Mobile originated call on a 5ESS Switch serving as a Digital Cellular Switch for an ECP (Executive Cellular Processor).
EMER	911 Emergency Service Bureau.
HNPAD	Home NPA (Numbering Plan Area) dialed in error.
IC1	Incoming 101 Call to Work Station 1.
IC2	Incoming 101 Call to Work Station 2.
IC3	Incoming 101 Call to Work Station 3.
IC4	Incoming 101 Call to Work Station 4.
IC5	Incoming 101 Call to Work Station 5.
IC6	Incoming 101 Call to Work Station 6.
IC7	Incoming 101 Call to Work Station 7.
IC8	Incoming 101 Call to Work Station 8.
IC9	Software Release: 5E8 and earlier Incoming 101 Call to Work Station 9 associated with CTTU (Central Trunk Test Unit).

Copyright © 2003 Lucent Technologies

	Software Release: 5E9(1) and later Incoming 101 Call to Work Station 9. Note: Effective with 5E9(1), IC33 is associated with CTTU (Central Trunk Test Unit).
IC10	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 10.
IC11	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 11.
IC12	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 12.
IC13	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 13.
IC14	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 14.
IC15	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 15.
IC16	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 16.
IC17	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 17.
IC18	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 18.
IC19	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 19.
IC20	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 20.
IC21	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 21.
IC22	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 22.
IC23	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 23.
IC24	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 24.
IC25	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 25.
IC26	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 26.
IC27	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 27.
IC28	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 28.
IC29	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 29.
IC30	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 30.
IC31	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 31.
IC32	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 32.
IC33	Software Release: 5E9(1) and later. Incoming 101 Call to Work Station 33 associated with CTTU (Central Trunk Test Unit).
IDDDFCA	International Direct Distance Dialing FCA call.
IDDDSTS	International Direct Distance Dialing Station to Station.
INV	ISTF (Integrated Services Test Function) Inverted Loopback test.
INWATS	INWATS (800+)
LNACP	ACP (Action Control Point) for a LN (Leased Network).
LOCDA	Local Directory Assistance (411).
LTD	Local Test Desk.
MEETME	Alliance Teleconferencing meet-me call.
NINV	ISTF (Integrated Services Test Function) Non-Inverted Loopback test.
NORM555	Software Release: 5E16 and later. Dial (1) + 555 - XXXX
NORMAL	This value is used for all other types of calls and indicates normal call processing. Intraoffice and interoffice (usually seven or ten digit) calls require no special handling by the Software Release.
NS800	Number Service (SSP800) type call.

Copyright © 2003 Lucent Technologies

OCTL	Open Circuit Test Line.
OPINW	Operator-assisted Inward Call. Calls with this call type are originated by a distant operator and are routed to an OSPS operator position.
OPNIT	Operator-assisted DA/Non-ISP call to the VDT.
OSOIWTS	Originating Screening Office INWATS.
PB	Incoming Permanent Busy Type Test Calls.
RELAY	Software Release: 5E15 and later. 711 Relay/Hearing Impaired Service.
REPAIR	Repair Service Bureau (611).
SDNA	Software Defined Network outgoing calls from the NAP (Network Access Point).
SDNE	Software Defined Network incoming calls to the NAP (Network Access Point).
SPAB800	Special Access Basic 800 Service.
SPAM800	MEGACOM 800 Service.
SRTT	Station Ringer Touch-Tone Test.
STG1FCA	First Stage of a Fully Coded Addressing international outbound call.
SYN	Incoming Synchronous Type Test Calls.
VACANT	Vacant NPA, NXX and Service Codes.
WETESTC	Test call associated with 5ESS Switch library programs.

Data Rules:

Call Types "LOCDA", "REPAIR", "BUSOFC" and "EMER" require a corresponding entry on the CONV form (5300-4 Record).

If a CALL TYPE of "100", "101", "101R", "101TAT", "101TP", "102", "103", "104", "104R", "105", "105R", "106", "109R", "606R", "IC1", "IC2", "IC3", "IC4", "IC5", "IC6", "IC7", "IC8", "IC9", "INV", "NINV", "PB" or "SYN" is entered, ROUTE INDEX on the RTIDX form (5303 Record), which corresponds to the ROUTE INDEX on this form, must have a ROUTE TYPE of "TEST".

A digit string used for test CALL TYPEs must be used for the same test CALL TYPE in all LDITs in which the digit string is defined. This applies to digit strings defined on LDIT, MLDIT and RDIT forms.

Test CALL TYPEs require that NBR OF DIGITS exactly equal the number of PREVIOUS and REMAINING DIGITS.

A terminating test line ("10x", "PB", or "SYN") must be defined in the office as a CALL TYPE on an RDIT, LDIT, or MLDIT form, or as TEST CODE on a LINE form (5109 Record).

When CALL TYPE is "NORMAL" or "900",

- CDI must be entered, and
- either RTI NXX must be entered.

When CALL TYPE is not "DA", "NORMAL", "AUTINW", "OPINW", or "900", TERM LATA cannot be entered.

When CALL TYPE is not "CONFLCT", NBR OF DIGITS must be greater than or equal to the sum of the lengths of PREVIOUS DIGITS and REMAINING DIGITS.

The following CALL TYPEs require a FIXRT form (5301-1 Record) with the FIXED ROUTE TYPE listed:

- "CSTL" with FIXED ROUTE TYPE of "CSTL",
- "HNPAD" with FIXED ROUTE TYPE of "HNPAD",
- "LTD" with FIXED ROUTE TYPE of "TSTTRK", and
- "SRTT" with FIXED ROUTE TYPE of "ICSRTT".

ADDON: If "ADDON" is entered in the CALL TYPE field, FIXRT forms (5301 Records) must be submitted

Copyright © 2003 Lucent Technologies

with FIXED ROUTE TYPES of "ATCANIF" or "ATCINT".

APSDN: This value can only be used when a 5ESS Switch is an ACP (ACT PT SDN field on the OFCOPT form (5509 Record) is "Y").

AUTINW: This is a valid call type only if the OSPS TA parameter is set to "Y" on the OSPSOPT form (5424 Record).

BBRITL: The DSL which is being tested must have BRITL ALW set to "Y" on the corresponding DSLUSR form (5908 Record).

CONFLCT: If CALL TYPE is "CONFLCT", NBR OF DIGITS is specified, and PREFIX is blank, there must be exactly two CONFLICT RESOLUTION entries.

When CALL TYPE is "CONFLCT", NATURE OF NBR (5E8 only) and TRIG NBR cannot be entered.

For 5E9(1) and later, when CALL TYPE is "CONFLCT", then ESC CODE on the first screen must be "N".

For 5E11 and later, when CALL TYPE is "CONFLCT",

- LNP TRIG NBR must be "IGN" or must not be entered.
- at least two rows of CONFLICT RESOLUTION ENTRIES list must be entered.
- GEO PORT must be "N".
- PORTED IN must be "N".
- HOME LRN must be "N".
- LRN SCREENING must be "N".
- INH DNT must be "N".

For 5E13 and later, when CALL TYPE is "CONFLCT", NPA SPLIT ANNC must be "N".

For 5E14 and later:

- when CALL TYPE is "CONFLCT", then REL LINK must be "N".
- when CALL TYPE is "CONFLCT", at least two rows on the CONFLICT RESOLUTION ENTRIES (CONFRES) list must be entered.

EMER: For 5E11 and later, when CALL TYPE is "EMER", LNP TRIG NBR must be "IGN" or not entered.

IDDDFCA: This value is used for the address sequence of an international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA. A DAS (Digit Analysis Selector) of 81 will be used instead of the DAS associated with the incoming trunk group. This Call Type may be assigned to incoming digit sequences CC + NN or 0/1X + CC + NN. CC is the Country Code. NN is the National Number. 0/1X is the ISC (International Switching Center) prefix code.

IDDDSTS: Used for multistage international outbound calls which are routed to an MF trunk, CCIS6 trunk or CCS7 ISUP trunk. This value may be assigned to codes which require two-stage call handling at a toll or tandem office. Two-stage call handling includes an acknowledgement wink before the second stage of digits is sent. Also used in a tandem or toll office when the digits inpulsed on the trunk, typically from a TSPS, are 011 + padded Country Code.

This value can be used for:

Copyright © 2003 Lucent Technologies

- A Local office (OFFICE TYPE on the OFCOPT form is "N") where the incoming digits are 011 + (7 - 12 digits).
- A Toll office (OFFICE TYPE on the OFCOPT form is "Y") which will not use FCA (Fully Coded Addressing). Possible incoming digits are 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international call.
- A 5ESS Gateway switch that requires an FCA international outbound call to leave the office on an MF trunk must assign this CALL TYPE to the digit sequence CC + NN. CC is the Country Code. NN is the National Number.

LNACP: This value indicates a query should be sent to the LN NCP (Network Control Point). The NCP will return routing and charging information. This value can only be used when the Leased Network DAS field is entered on the OFCOPT form (5509 Record).

MEETME: If "MEETME" is entered in the CALL TYPE field, FIXRT forms (5301 Records) must be submitted with FIXED ROUTE TYPES of "ATCANIF" or "ATCINT".

NORM555: For 5E16 and later, when CALL TYPE is "NORM555", TRIG NBR and CODE INDEX must be entered.

NS800: CALL TYPE of "NS800" requires an OFCOPT form with SERV SWITCH PT of "Y".

OPINW: The OSPS TA field on the OSPSOPT form must be "Y".

OSOIWTS: If this Call Type is used, COMMON CHAN SIG and ORIG SCREEN OFF must be "Y" and the HOME NPA must be specified on the OFCOPT form (5509 Record). See the ONPA form (5312 Record) for related information.

FIXED ROUTE TYPE must equal "UIA" on a FIXRT form if at least one RDIT, LDIT or MLDIT form exists with a CALL TYPE of "OSOIWTS".

If CALL TYPE is "OSOIWTS", TYPE OF CI CALL must be "NONCI", "INTER", or "INTRA".

- ***NOTE:*** OSOIWTS is used by an InterLATA Carrier switch to do originating screening for INWATS digits inpulsed as 800 or 00X plus 7 digits. If this Call Type is used, COMMON CHAN SIG and ORIG SCREEN OFF must be "Y" and the HOME NPA must be entered on the OFCOPT form (5509 Record). See the ONPA form (5312 Record) for related information.

SPAB800: Special Access Basic 800 service allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAB800" on the TKGRP form (5202 Record)).

SPAM800: MEGACOM 800 service is a volume discount service which allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAM800" on the TKGRP form). MEGACOM 800 service is similar to Special Access Basic 800 service except the customer must supply the dedicated trunk group to the 5ESS Toll Switch.

STG1FCA: This value should be used for the first stage of a multi- stage international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y")which will use FCA. This Call Type may be assigned to incoming digit sequences 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international code.

For 5E15 and later, CALL TYPE can be set to "RELAY" only if the ACT field for SFID 594, on the SFSYS form is set to "Y".

Copyright © 2003 Lucent Technologies

2.6 TYPE OF CI CALL

Description: Enter the type of CI (Carrier Interconnect) call. See Figure 1 for appropriate entries per Call Type.

Valid TYPE OF CI CALL Entries

Entry	Definition
COMP	Used for calls to a geographical area where the LEC (Local Exchange Carrier) and ICs (InterLATA Carriers) compete on an equal basis. Such calls must be routed by a carrier, but this "carrier" may be the LEC. If the subscriber wants to be routed via the LEC, the subscriber must either be presubscribed to the LEC or dial an explicit FGD CAC.
CONFL	Used for cases where the call may be either INTER (InterLATA) or INTRA (IntraLATA), depending on the dialed prefix. See Data Rules for more information.
INTER	Used for calls destined for outside the LATA. Such calls must be routed via a carrier, not the LEC.
INTRA	Used for calls destined for within the LATA. Usually routed via the LEC. If other carriers are permitted and accept IntraLATA calls, an explicit FGD CAC must be dialed (not presubscription) to access the carriers for these calls.
INTRM	FGB Interim call is used for an incoming trunk call dialed by the originator as 950XXXX. The 950 digits are entered in the PREVIOUS DIGITS. The XXXX represents a Carrier Identification Code. These calls may be from a non-EAEO and less than the seven digits may be received as would then be reflected in the PREVIOUS DIGITS. When "INTRM" is entered, the last four digits inpulsed (i.e., the Carrier Identification Code) will be used to enter the ICF form (5305 Record) to access the Carrier's FGB CDI and FGB RTI.
NONCI	Normal tandem traffic or feature activation codes.
PRIV	Used for EAS (Extended Area Service) calls where the local calling area extends into the neighboring LATA. These InterLATA calls are treated as INTRA (routed by the LEC) except when the subscriber explicitly dials an FGD CAC. When the FGD CAC is dialed, the call is treated as INTER.
PSCAR	Used for Packet Switching Carrier calls.
PSNCI	Used for Packet Switching Non-Carrier calls.
TCONF	Software Release: 5E9(1) and later. Intra-LATA toll conflict. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TCONF", a SFSYS form must exist with SFID 149 set to "Y".
TOLL	Software Release: 5E9(1) and later. Toll calls within the LATA. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TOLL", a SFSYS form must exist with SFID 149 set to "Y".
WZ1	Used for calls outside the continental United States, but within World Zone 1 (e.g., Canada).

Data Rules:

This field must be entered for all CALL TYPEs except "CONFLCT".

When TYPE OF CI CALL is "PSCAR" or "PSNCI", TRIG NBR cannot be entered.

When TYPE OF CI CALL equals "COMP", "CONFL", "INTER", "PRIV", "TRANS", or "WZ1", an ICF form (5305 Record) must exist.

CONFL: Call processing will look ahead at other records to determine if the call should be treated as IntraLATA or InterLATA. When no prefix has been dialed, the ROUTE INDEX value of this LDIT entry will be compared to the RTI value entered in the No Prefix column of the originator's Rate and Route form (5301 Record). If the RTI value equals the ROUTE INDEX value or is "REGL", it is considered a match and treated as an IntraLATA call. If the RTI is not equal to the ROUTE INDEX value, there is no match and therefore the call will be treated as an InterLATA call. When a 1 prefix has been dialed, the process is the same as the No Prefix case, except the RTI value found in the 1+ Prefix column of the RAR is used for comparison. When a 0 prefix has been dialed, the comparison technique is inappropriate. In this case, the 0+ Prefix entry in the RAR will be read. The RTI value in that entry will be analyzed to determine whether or not it is an Announcement Route Index. If it is an announcement, the call will be processed as an InterLATA call. If it is not, the call will be treated as an IntraLATA call. When the zero plus call should be treated as an InterLATA carrier call and therefore the RAR has an announcement type Route Index, care must be taken to make sure the associated CBLK entry equals "N".

PSCAR: When using this type of CI Call, the CALL TYPE must be "NORMAL" or "900", and ROUTE

Copyright © 2003 Lucent Technologies

INDEX, OFFICE CODE, and CODE INDEX cannot be entered.

PSNCI: When TYPE OF CI CALL is "PSNCI", CALL TYPE must be "NORMAL", "900", or "VACANT".

Packet Switching TYPE OF CI CALLs, "PSCAR" and "PSNCI", cannot be mixed with non-Packet Switching TYPE OF CI CALLs within a single DAS.

WZ1: All forms with TYPE OF CI CALL equals "WZ1" which have the first three digits (that is, the NPA (Numbering Plan Area)) in the PREVIOUS DIGITS fields must have the same value for WZ1 REG.

For 5E9(1) and later, when CALL TYPE is "OSOIWTS", TYPE OF CI CALL must be "INTER", "INTRA", "NONCI", "TCONF"or "TOLL".

For 5E9(1) through 5E14, when CALL TYPE is "LOCDA", "BUSOFC", or "REPAIR", TYPE OF CI CALL must be "INTER", "INTRA", or "TOLL".

For 5E15 and later, when CALL TYPE is "BUSOFC", "LOCDA", "RELAY", or "REPAIR", TYPE OF CI CALL must be "INTER", "INTRA", or "TOLL".

2.7 NBR OF DIGITS

Description: Enter the total number of digits expected excluding the dialed prefix.
Valid Entries: 1 - 15

Data Rules:

If a value is entered in this field, it must be equal to or greater than the quantity of digits entered in the INCOMING DIGITS and REMAINING DIGITS fields.

For the CALL TYPE of "CONFLCT", where the conflict is prefix resolved, enter the total number of digits expected for the entry associated with the prefix value entered under PREFIX.

2.8 CODE INDEX

Description: The Code Index combined with a Screening Index is used as an input to the Rate and Route Tables.

The CODE INDEX determines whether or not pre-query call screening will be performed for SSP/800 calls. If CALL TYPE is "NS800" and CODE INDEX is greater than 0, pre-query screening will be performed. The screening index from the originating line or trunk, along with the dialed prefix and this CODE INDEX, is used to access the RAR form (5301 Record). When the RTI from the associated RAR form is "REGL", the normal SSP/800 query and call processing will occur. When the RTI contains a numbered route index, the call will be routed to that RTI.

CODE INDEX is a real Code Index and not a pointer to the DISERV form (5321 Record).
Valid Entries: 3 - 4095

Data Rules:

This field must be blank if the CALL TYPE is "VACANT", "CONFLCT", "HNPAD", "LTD", "SRTT", "OCTL", "OSOIWTS", "APSDN" or "CSTL".

All combinations of CODE INDEX, and RDTA SCRN IDX from the OFCOPT form must have corresponding RAR form entries for SCR and CDI.

Code Index 1 (0-) and Code Index 2 (010) may not be entered on the LDIT Record.

2.9 ROUTE INDEX

Copyright © 2003 Lucent Technologies

Description: This field indicates the Regular Route Index to be used for routing the call except when a Special Route Index entered on the RAR overrides it. The Regular Route Index is the route which is used by the majority of call originators to complete the call.

The ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

When the CALL TYPE is "VACANT", "NS800", "OSOIWTS", "CONFLCT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN" and "CSTL", this field must be blank. When the CALL TYPE is other than those just listed, an entry is required in this field or in the OFFICE CODE field.

ROUTE INDEX must be defined on an RTIDX form, and should not have a ROUTE TYPE of "BUSY" or "REORDER" on that form. If ROUTE TYPE is "HUNT", the TRK DIR pointed to must not be "ANN".

2.10 POLYGRID

Description: Is polygrid routing used for DSN (Defense Switched Network) offices?

Enter "N" for non-DSN offices.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If a ROUTE INDEX assigned with POLYGRID equals "Y", that ROUTE INDEX must equal POLY RT NUM on a PPPOLY form (5618-7 Record).

When RDIT forms have a ROUTE INDEX entered, and POLYGRID is "Y". The DSN OPTION on the OFCOPT form must be "Y".

2.11 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NXX growth to 8000 secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Data Rules:

When NPA is entered, OFFICE CODE must be entered.

For 5E12 and later, when the OFFICE CODES and/or NPA/OFFICE CODE combinations are assigned on RDIT forms, they must be defined on the NOC form.

2.12 OFFICE CODE

Description: Enter an Office Code (NXX) served by the 5ESS Switch (i.e., defined on the NOC form (5501 Record)). If an Office Code is entered, it will be entered to "route" the call to a Directory Number of this NXX in this office except when overridden by a Special Route Index entered in the Route Index field of the

Copyright © 2003 Lucent Technologies

RAR form.
Valid Entries: 3 digit NXX (N = 2 - 9, X = 0 - 9)

Data Rules:

When the Call Type is "VACANT", "NS800", "OSOIWTS", "CONFLCT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN", "SPAB800", "SPAM800", "IDDDFCA", "IDDDSTS" or "CSTL", this field must be blank. When the Call Type is other than these, an entry is required in this field or in ROUTE INDEX.

For 5E12 and later, if the RDIT forms have an OFFICE CODE defined and there are multiple NOC forms with the same value of OFFICE CODE, NPA must also be defined on the RDIT form.

2.13 DESEP

Description: This field defines the Destination Separations Index for CALL TYPES other than "VACANT", "CONFLCT", "HNPAD", "LTD", "SRTT", "OCTL", "OSOIWTS" or "CSTL". It is only required for Division of Revenue study.
Valid Entries: 1 - 255

Data Rules:

If a DESEP is entered, it must be defined on the Traffic Separation Cell Grouping TRFSEP form (5308 Record).

If TYPE OF CI CALL is "PSCAR" or "PSNCI", this field must be blank.

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.14 WZ1 REG

Description: For codes with a TYPE OF CI CALL equal to WZ1, enter a World Zone 1 region. This digit is used in the first stage of outpulsing for INCs (International Carriers) on either a direct connection or via an Access Tandem. The first stage of outpulsing has a format of KP + 1NX + XXX + 01R + ST, where R is the World Zone 1 region. (1NX is a spare toll center code entered on the Route Index as prefix digits. XXX is the Carrier Identification Code.) For other than WZ1 types, leave this field blank.
Valid Entries: 0 - 9

2.15 TERM LATA

Description: This field is used at the InterLATA Carrier when Network Call Denial Screening is required on incoming CAMAANI Trunk Groups.

Valid TERM LATA Entries

Entry	Definition
1	Indicates LATAs not subtending the switch
2 - 15	Indicates a subtending LATA of the switch.
2 - 31	Indicates a subtending LATA of the switch.

Data Rules:

If TYPE OF CI CALL is "PSCAR" or "PSNCI", this field must be blank.

If CALL TYPE is "LNACP", this field must be blank.

If TERM LATA is specified, COMMON CHAN SIG must equal "Y" on the OFCOPT form (5509 Record).

When the CALL TYPE is "NORMAL", "DA", "IDDDSTS", "AUTINW", "OPINW" or "INWATS", enter an

Copyright © 2003 Lucent Technologies

appropriate value to indicate, based on incoming digits, the destination of this call.

The TERM LATA value is compared to an ORIG LATA value specified on the TKGRP form (5202 Record).

2.16 NATURE OF NBR

Description: Enter the nature of the dialed number.

Software Release: 5E8 and later
Valid Entries:

Valid NATURE OF NBR Entries

Entry	Definition
IDDD or I	International
NATL or N	Domestic
PRIV or P	Private

Data Rules:

For 5E8 only, when NATURE OF NBR is entered, TRIG NBR must be entered.

2.17 TRIG NBR

Description: Enter the Network Services trigger number as defined on the NSTRIG form.
Valid Entries:

- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

Data Rules:

When TRIG NBR is entered, TERM LATA cannot be entered.

For 5E8 only, if ASP OFC on an OFCOPT form equals "SSP", and TRIG NBR equals TRIG NBR on an NSTRIG form where APPLICATION equals "ASP", NATURE OF NBR must also be assigned.

If TRIG NBR equals TRIG NBR on an NSTRIG form with APPLICATION equal to "E911", CALL TYPE must equal "EMER" and TYPE OF CI CALL equal "INTRA".

For a CALL TYPE of "EMER" or "NORMAL", if TRIG NBR is entered and APPLICATION on the corresponding NSTRIG form

- is "E911" or "800", ROUTE INDEX and OFFICE CODE cannot be entered;
- is "ASP", ROUTE INDEX or OFFICE CODE must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered.

If TRIG NBR equals TRIG NBR on an NSTRIG form with SERV KEY equal to "CDPN", and NBR OF DIGITS is neither 7 nor greater than 9, ALT GBL TITLE on NSTRIG must be known.

For 5E15 and later, when CALL TYPE is "RELAY", TRIG NBR must not be entered.

2.18 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.19 DFLT RT

Description: The DFLT RT field is used to identify the type of default routing treatment to be used for the ASP Default Routing for 3/6/10-Digit Triggers (Phase 1) Special Feature. When the ASP Special Feature has been purchased, this field can be used to specify the type of default routing to occur when an ASP specific digit trigger query fails.

Software Release: 5E10 and later
Default Value: NONE

Valid DFLT RT Entries

Entry	Definition
ANNC	Default route to announcement (or tone). The call will route to either a tone or announcement, depending on what is defined for the route.
DLDN	Default route to dialed DN. The call will route to the DN dialed (or the DN being routed to if the call came from a trunk).
NONE	No default routing. No special default routing will take place, and normal call treatment will send the call to reorder or NCA (No Circuits Available).

Data Rules:
For 5E9(2) and earlier, if an RDIT form has a DFLT RT or CONFLICT RESOLUTION ENTRIES DFLT RT entry other than "NONE", the corresponding TRIG NBR must be defined on the NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1"

For 5E10 and later, when the RDIT forms have a DFLT RT entry or a CONFLICT RESOLUTION ENTRIES DFLT RT entry other than "NONE", the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

2.20 ANI BYPASS

Description: Will ANI Table options be ignored? An entry of "N" indicates TDX ANI Table options will be processed. This field supports the TDX (Toll Digital Exchange) ANI Table Call Processing Feature. This is a secured feature with SFID 235. For more information on this feature, see Division 2, Section 4A165.

Software Release: 5E10 and later
Default: N

Valid Values: Y, N

2.21 REMARKS

Description: This field may contain any remarks deemed locally necessary.
Valid Entries: 1 - 16 characters

3. FORM ENTRIES - 5300-7B RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

3.2 * RDIT

Description: Enter the Remaining Digits Interpreter Table Number.

Required Field.
Valid Entries: 1 - 999

Copyright © 2003 Lucent Technologies

3.3 * PREVIOUS DIGITS

Description: Enter the digits defined on the LDIT or MLDIT form as INCOMING DIGITS.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

3.4 * REMAINING DIGITS

Description: Enter the remaining digits.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

LOCAL NUMBER PORTABILITY

For 5E11 and later, fields (Section 3.5) - (Section 3.10) support the Local Number Portability feature. For more information, see Division 2, Section 4A174.

3.5 LNP TRIG NBR

Description: Enter the LNP trigger number. The LNP trigger number is a conditional trigger which initiates a query to the SCP (Service Control Point) based on further routing determinations and checks following the trigger detection. The "IGN" entry means to ignore the LNP TRIG NBR, GEO PORT and PORTED IN attributes and inherit these attributes from the LDIT form.

Software Release: 5E11 and later
Required Field.
Default: IGN

Valid Values: IGN or 1 - 255

Data Rules:

Local Number Portability is a secured feature. This feature must be purchased and SFID 174 ACT on the SFSYS form (5713-1 Record) must be "Y" before LNP TRIG NBR and the CONFLICT RESOLUTION field for LNP TRIG NBR can be set to "Y".

When LNP TRIG NBR is "IGN", both PORTED IN and GEO PORT must be "N".

When LNP TRIG NBR is 1 - 255, TYPE OF CI CALL must be"INTER", INTRA", "TOLL", "COMP", "PRIV", "NONCI", "TCONF" or "CONFL".

When both LNP TRIG NBR and TRIG NBR or both CONFLICT RESOLUTION TRIG NBR and CONFLICT RESOLUTION LRN TRIG NBR are entered on this form, the TRIG NBR or CONFLICTION RESOLUTION TRIG NBR (whichever is entered) must be defined on an NSTRG form (5324 Record) which has APPLICATION set to "ASP".

When either LNP TRIG NBR or CONFLICT RESOLUTION LRN TRIG NBR is entered on this form, the LNP TRIG NBR or CONFLICTION RESOLUTION LNP TRIG NBR (whichever is entered) must be defined as TRG NBR on an NSTRG form (5324 Record) which has APPLICATION set to "ASP" and AIN REL "R0D1".

For 5E13 and later, when LNP TRIG NBR or CONFRES.LNP TRIG NBR is entered, TYPE OF CI CALL or CONFRES.TYPE OF CI CALL can be "INTER" only when the ACT field for SFID 303 on the SFSYS form is set to "Y".

Copyright © 2003 Lucent Technologies

3.6 GEO PORT

Description: Any geographically ported DNs? This field, when set to "Y", indicates geographic porting has occurred for at least one DN associated with this RDIT entry.

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

Data Rules:

When GEO PORT is "Y", LNP TRIG NBR must be 1 - 255.

3.7 PORTED IN

Description: Any ported DN terminations? This field, when set to "Y", indicates that there exists at least one DN termination in this office associated wtih this RDIT digit translation even though a route index (not an office code) is provisioned for this RDIT translation.

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

Data Rules:

Local Number Portability is a secured feature. This feature must be purchased and SFID 174 ACT on the SFSYS form (5713-1 Record) must be "Y" before these fields can be set to "Y".

When PORTED IN is "Y", LNP TRIG NBR must be 1 - 255.

When PORTED IN is "Y", ROUTE INDEX must be entered.

For 5E13 and later, when PORTED IN or CONFRES.PORTED IN is "Y", TYPE OF CI CALL or CONFRES.TYPE OF CI CALL can be "INTER" only when the ACT field for SFID 303 on the SFSYS form is set to "Y".

3.8 HOME LRN

Description: Is this a home location routing number? This field is set to "Y" when the LRN represents this switch or a rate center in this switch.

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

3.9 LRN SCREENING

Description: Use screening attributes for LRN? This field is set to "Y" when the LRN a rate center in this switch which would imply that the TYP CI CALL and CDI from analysis of this LRN should be used.

Software Release: 5E11 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: N

Valid Values: Y, N

3.10 INH DNT

Description: Inhibit processing of dialed number triggers?

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

3.11 GETS HPC

Description: Is GETS (Government Emergency Telecommunication Service) HPC (High Probability Call Completion Service) required? The GETS HPC field is used as an indicator to mark GETS HPC calls so that enhanced functionality provided by other HPC capabilities (e.g., Trunk Queuing, ISUP Signaling, Exemption from Network Management Controls) can be invoked. When set to "Y", calls translated to this address receive special treatment resulting in a higher probability of call completion. For more information, see Division 2, Section 4A279.

The use of HPC Network Capabilities is restricted in the United States and U.S. Territories to National Security/Emergency Preparedness (NS/EP) users authorized by the Office of the Manager, National Communication System (OMNCS). Telco deployment of these HPC Network Capabilities must be co-ordinated with the OMNCS at the following address:

Office of the Manager
National Communication System
Attn: GETS Program Office
701 South Courthouse Rd
Arlington, VA, 22204-2198
email: gets@ncs.gov

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E13 and later, when the LDIT/MLDIT/RDIT forms' GETS HPC is "Y" or CONFLICT RESOLUTION GETS HPC is "Y", and TRIG NBR or CONFLICT RESOLUTION TRIG NBR is known, then the associated NSTRIG form (associated through TRIG NBR) must have APPLICATION set to "ASP" and ASP TOLL FREE must be "N".

For 5E13 and later, when the LDIT/MLDIT/RDIT/INDIT forms', GETS HPC is "Y" or CONFLICT RESOLUTION GETS HPC is "Y", GETS HPC or CONFLICT RESOLUTION GETS HPC can be "Y" only when the GETS High Probability of Call Completion Secured Feature has been purchased. A SFSYS form must exist with SFID 279 ACT set to "Y".

3.12 DENY XFER

Description: This field is used to indicate if a call transfers to a particular digit string should be denied.

Software Release: 5E12 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later:

- When DENY XFER is "Y", CALL TYPE must not be "EMER".
- When DENY XFER on the LDIT form is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to "Y". "Y" being set on the SFSYS form indicates that the "Deny Transfer of Digit Screened Calls" feature has been purchased.

3.13 REL LINK

Description: Is this a release link directory assistance number? This field is used to indicate whether or not the digits being translated map to a release link directory assistance number.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When REL LINK is "Y":

- CALL TYPE must be "DA", "LOCDA", "NORM555", or "NORMAL".
- One of the following two conditions must exist:
  - For the Release Link for Toll Office feature using ANSI (American National Standards Institute) standard signaling, the ACT field for SFID 520 on the SFSYS form (5713-1 Record) must be set to "Y"; or
  - For the Release Link for Toll Office feature using TOPS (Operating System for DMS (Data Management System)) nonstandard signaling, the ACT field for SFID 521 on the SFSYS form must be set to "Y".

3.14 NPA SPLIT ANNC

Description: Should caller be given a warning announcement if dialing a 7-digit or 10-digit number during permissive period of NPA (Numbering Plan Area) Split?

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NPA SPLIT ANNC is set to "Y", NBR OF DIGITS must be "7" or "10".

When NPA SPLIT ANNC or CONFRES.NPA SPLIT ANNC is set to "Y":

- the ACT field for SFID 347 on the SFSYS form (5713-1 Record) must be set to "Y". (For more

Copyright © 2003 Lucent Technologies

information, see Division 2, Section 4A347, for the Announcement on Detection of NPA Split feature.)

- the APPLICATION field on the ANNAPL form (5529 Record) must be set to "NPA_SP".
- the FIXED ROUTE TYPE field on the FIXRT form (5301-1 Record) must be set to "NPA_SP".

4. FORM ENTRIES - 5300-8A RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

4.2 * RDIT

Description: Enter the Remaining Digits Interpreter Table Number.

Required Field.
Valid Entries: 1 - 999

4.3 * PREVIOUS DIGITS

Description: Enter the digits defined on the LDIT or MLDIT form as INCOMING DIGITS.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

4.4 * REMAINING DIGITS

Description: Enter the remaining digits.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

CONFLICT RESOLUTION

Fields Section 4.5 -Section 4.18 refer to conflict resolution entries.

4.5 NBR DIG

Description: Enter the total number of digits expected excluding any prefix. If the code in conflict is prefix resolved, exactly one of the code's conflict resolution entries must have NBR DIG equal to NBR OF DIGITS entered on screen 1 of this form, 5300-7 Record.

Data Rules:

For each row of the CONFLICT RESOLUTION ENTRIES list, NBR DIGS must be greater than or equal to the sum of the lengths of PREVIOUS DIGITS and REMAINING DIGITS.

4.6 CALL TYPE

Description: Enter the Call Type to be used. Please refer to Figure 1 for field dependencies per CALL TYPE.

Valid CALL TYPE Entries

Entry	Definition
211	Software Release: 5E15 and later. Dial 211.
311	Software Release: 5E15 and later.

Copyright © 2003 Lucent Technologies

	Dial 311.
900	900 calls. This CALL TYPE, prevents a LASS AR (Automatic Recall) user from camping-on to this line.
ADDON	Alliance Teleconferencing add-on calls.
APSDN	ACP (Action Control Point) for an SDN (Software Defined Network). This value indicates a query should be sent to the NCP (Network Control Point). The NCP will return a routing telephone number.
AUTINW	Automated Inward Call. Calls with this call type are originated by a distant operator and are routed to an automated query.
BBRITL	This ACTION is used for billed BRITL (Basic Rate Interface Dial Up Test Line).
BRITL	This ACTION is used for non-billed BRITL.
BUSOFC	Business Office (811).
CSTL	Coin Station Test Line.
DA	555 Directory Assistance. Note: A CALL TYPE of "NORMAL" should be used with DA calls (i.e., 555-1212, NPA-555-1212) preceded by an FGD CAC.
ECP	Software Release: 5E9(1) and later. Mobile originated call on a 5ESS Switch serving as a Digital Cellular Switch for an ECP (Executive Cellular Processor).
EMER	911 Emergency Service Bureau.
HNPAD	Home NPA (Numbering Plan Area) dialed in error.
IDDDFCA	International Direct Distance Dialing FCA call.
IDDDSTS	International Direct Distance Dialing Station to Station.
INWATS	INWATS (800+).
LOCDA	Local Directory Assistance (411).
LTD	Local Test Desk.
MEETME	Alliance Teleconferencing meet-me call.
NORM555	Software Release: 5E16 and later. Dial (1) + 555 - XXXX
NORMAL	All others.
OCTL	Open Circuit Test Line.
OPNIT	Operator-assisted DA/Non-ISP call to the VDT.
OPINW	Operator-assisted Inward Call. Calls with this call type are originated by a distant operator and are routed to an OSPS operator position.
RELAY	Software Release: 5E15 and later. 711 Relay/Hearing Impaired Service.
REPAIR	Repair Service Bureau (611).
SDNA	Software Defined Network outgoing calls from the NAP (Network Access Point).
SDNE	Software Defined Network incoming calls to the NAP (Network Access Point).
SPAB800	Special Access Basic 800 Service.
SPAM800	MEGACOM 800 Service.
SRTT	Station Ringer Touch-Tone Test.
STG1FCA	First Stage of a Fully Coded Addressing international outbound call.
VACANT	Vacant NPA, NXX and Service Codes.

Data Rules:

The following CALL TYPEs require a FIXRT form with the FIXED ROUTE TYPE listed:

- "CSTL" with FIXED ROUTE TYPE of "CSTL",
- "HNPAD" with FIXED ROUTE TYPE of "HNPAD",
- "LTD" with FIXED ROUTE TYPE of "TSTTRK", and
- "SRTT" with FIXED ROUTE TYPE of "ICSRTT".

CALL TYPEs "LOCDA", "REPAIR", "BUSOFC" and "EMER" require a corresponding entry on the CONV form (5300-4 Record).

APSDN: This value can only be used when a 5ESS Switch is an ACP (ACT PT SDN field on the OFCOPT form is "Y").

AUTINW: The OSPS TA field on the OSPSOPT form must be "Y".

BBRITL: The DSL which is being tested must have BRITL ALW set to "Y" on the corresponding DSLUSR form.

Copyright © 2003 Lucent Technologies

EMER: For 5E11 and later, when CALL TYPE is "EMER", LNP TRIG NBR must be "IGN" or not entered.

IDDDFCA: This value is used for the address sequence of an international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA. A DAS (Digit Analysis Selector) of 81 will be used instead of the DAS associated with the incoming trunk group. This Call Type may be assigned to incoming digit sequences CC + NN or 0/1X + CC + NN. CC is the Country Code. NN is the National Number. 0/1X is the ISC (International Switching Center) prefix code.

IDDDSTS: Used for multistage international outbound calls which are routed to an MF trunk, CCIS6 trunk or CCS7 ISUP trunk. This value may be assigned to codes which require two-stage call handling at a toll or tandem office. Two-stage call handling includes an acknowledgement wink before the second stage of digits is sent. Also used in a tandem or toll office when the digits inpulsed on the trunk, typically from a TSPS, are 011 + padded Country Code.

This value can be used for:

- A Local office (OFFICE TYPE on the OFCOPT form is "N") where the incoming digits are 011 + (7 - 12 digits).
- A Toll office (OFFICE TYPE on the OFCOPT form is "Y") which will not use FCA (Fully Coded Addressing). Possible incoming digits are 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international call.
- A 5ESS Gateway switch that requires an FCA international outbound call to leave the office on an MF trunk must assign this CALL TYPE to the digit sequence CC + NN. CC is the Country Code. NN is the National Number.

MEETME: If "MEETME" is entered in the CALL TYPE field, FIXRT forms (5301 Records) must be submitted with FIXED ROUTE TYPES of "ATCANIF" and "ATCINT".

NORM555: For 5E16 and later, when CALL TYPE is "NORM555", TRIG NBR and CDI must be entered.

OPINW: The OSPS TA field on the OSPSOPT form must be "Y".

SPAB800: Special Access Basic 800 service allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAB800" on the TKGRP form).

SPAM800: MEGACOM 800 service is a discount service which allows calls that terminate at a 5ESS Toll Switch to be routed to a customer's PBX over a dedicated trunk group (TRKCLS of "SPAM800" on the TKGRP form). MEGACOM 800 service is similar to Special Access Basic 800 service except the customer must supply the dedicated trunk group to the 5ESS Toll Switch.

STG1FCA: This value should be used for the first stage of a multi- stage international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form is "Y") which will use FCA. This Call Type may be assigned to incoming digit sequences 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international call.

4.7 CI TYPE

Description: Enter the type of CI (Carrier Interconnect) call. See Figure 1 for appropriate entries per Call Type.

Valid CI TYPE Entries	
Entry	**Definition**

Copyright © 2003 Lucent Technologies

COMP	Used for calls to a geographical area where the LEC (Local Exchange Carrier) and ICs (InterLATA Carriers) compete on an equal basis. Such calls must be routed by a carrier, but this "carrier" may be the LEC. If the subscriber wants to be routed via the LEC, the subscriber must either be presubscribed to the LEC or dial an explicit FGD CAC.
CONFL	Used for cases where the call may be either INTER (InterLATA) or INTRA (IntraLATA), depending on the dialed prefix. See Data Rules for more information.
INTER	Used for calls destined for outside the LATA. Such calls must be routed via a carrier, not the LEC.
INTRA	Used for calls destined for within the LATA. Usually routed via the LEC. If other carriers are permitted and accept IntraLATA calls, an explicit FGD CAC must be dialed (not presubscription) to access the carriers for these calls.
INTRM	FGB Interim call is used for an incoming trunk call dialed by the originator as 950XXXX. The 950 digits are entered in the PREVIOUS DIGITS. The XXXX represents a Carrier Identification Code. These calls may be from a non-EAEO and less than the seven digits may be received as would then be reflected in the PREVIOUS DIGITS. When "INTRM" is entered, the last four digits inpulsed (i.e., the Carrier Identification Code) will be used to enter the ICF form (5305 Record) to access the Carrier's FGB CDI and FGB RTI.
NONCI	Normal tandem traffic or feature activation codes.
PRIV	Used for EAS (Extended Area Service) calls where the local calling area extends into the neighboring LATA. These InterLATA calls are treated as INTRA (routed by the LEC) except when the subscriber explicitly dials an FGD CAC for an IC. When the FGD CAC is dialed, the call is treated as INTER.
PSCAR	Used for Packet Switching Carrier calls.
PSNCI	Used for Packet Switching Non-Carrier calls.
TCONF	Software Release: 5E9(1) and later. Intra-LATA toll. Toll calls within the LATA. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TCONF", a SFSYS form must exist with SFID 149 set to "Y".
TOLL	Software Release: 5E9(1) and later. IntraLATA toll conflict. This entry supports the Intra-LATA PIC capability. With TYPE OF CI CALL set to "TOLL", a SFSYS form must exist with SFID 149 set to "Y".
WZ1	Used for calls outside the continental United States, but within World Zone 1 (e.g., Canada).

Data Rules:

This field must be entered for all CALL TYPEs except "CONFLCT".

When CI TYPE is "PSNCI" or "PSCAR",

- CALL TYPE must be "NORMAL" or "900", and
- TRIG NBR cannot be entered.

When TYPE OF CI CALL equals "COMP", "CONFL", "INTER", "PRIV", "TRANS", or "WZ1", an ICF form must exist.

CONFL: Call processing will look ahead at other records to determine if the call should be treated as IntraLATA or InterLATA. When no prefix has been dialed, the ROUTE INDEX value of this LDIT entry will be compared to the RTI value entered in the No Prefix column of the originator's Rate and Route form (5301 Record). If the RTI value equals the ROUTE INDEX value or is "REGL", it is considered a match and treated as an IntraLATA call. If the RTI is not equal to the ROUTE INDEX value, there is no match and therefore the call will be treated as an InterLATA call. When a 1 prefix has been dialed, the process is the same as the No Prefix case, except the RTI value found in the 1+ Prefix column of the RAR is used for comparison. When a 0 prefix has been dialed, the comparison technique is inappropriate. In this case, the 0+ Prefix entry in the RAR will be read. The RTI value in that entry will be analyzed to determine whether or not it is an Announcement Route Index. If it is an announcement, the call will be processed as an InterLATA call. If it is not, the call will be treated as an IntraLATA call. When the zero plus call should be treated as an InterLATA carrier call and therefore the RAR has an announcement type Route Index, care must be taken to make sure the associated CBLK entry equals "N".

PSCAR: When using this type of CI Call, the CALL TYPE must be "NORMAL" or "900".

PSNCI: When this TYPE OF CI CALL is used, a CALL TYPE of "NORMAL", "900" or "VACANT" must be

Copyright © 2003 Lucent Technologies

entered.

Packet Switching CI TYPEs "PSCAR" and "PSNCI", cannot be mixed with non-Packet Switching CI TYPEs within a single DAS.

WZ1: All forms with CI TYPE equals "WZ1" which have the first three digits (that is, the NPA (Numbering Plan Area)) in the PREVIOUS DIGITS fields must have the same value for WZ1 REG.

For 5E15 and later, when CONFRES.CALL TYPE is "BUSOFC", "LOCDA", "RELAY", or "REPAIR", CONFRES.CI TYPE must be "INTER", "INTRA", or "TOLL".

4.8 CDI

Description: The Code Index combined with a Screening Index is used as an input to the Rate and Route Tables. Code Index 1 (0-) and Code Index 2 (010) may not be entered on the RDIT Record.

CODE INDEX is a real Code Index and not a pointer to the DISERV form (5321 Record).
Valid Entries: 3 - 4095

Data Rules:

This field must be blank if the CALL TYPE is "VACANT", "HNPAD", "LTD", "SRTT", "OCTL", "APSDN" or "CSTL".

All combinations of CDI and RDTA SCRN IDX from the OFCOPT form must have corresponding RAR form entries for SCR and CDI.

4.9 RTI

Description: This field indicates the Regular Route Index to be used for routing the call except when a Special Route Index entered on the RAR overrides it. The Regular Route Index is the route which is used by the majority of call originators to complete the call.

The SSP/800 feature uses the RTI (or NXX) field when the SCP query response requests LEC routing, even when CI TYPE is "INTER".

The ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

When the CALL TYPE is "VACANT", "HNPAD", "LTD", "APSDN", "SRTT", "OCTL" and "CSTL", this field must be blank.

When the Call Type is other than those listed above, this field or the OFFICE CODE field must be entered.

ROUTE INDEX must be defined on an RTIDX form, and should not have a ROUTE TYPE of "BUSY" or "REORDER" on that form. If ROUTE TYPE is "HUNT", the TRK DIR pointed to must not be "ANN".

4.10 POLY

Description: Is polygrid routing used for DSN (Defense Switched Network) offices?

Enter "N" for non-DSN offices.
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If an RTI assigned with POLY equals "Y", that RTI must equal POLY RT NUM on a PPPOLY form.

When CI TYPE is "PSNCI" or "PSCAR", POLY cannot be entered.

4.11 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NXX growth to 8000 secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Data Rules:

When NPA is entered, NXX must be entered.

4.12 NXX

Description: Enter an Office Code (NXX) served by the 5ESS Switch (i.e., defined on the NOC form). If an Office Code is entered, it will be entered to "route" the call to a Directory Number of this NXX in this office, except when overridden by a Special Route Index entered in the Route Index field of the RAR form.

The SSP/800 feature uses the NXX (or RTI) field when the SCP query response requests LEC routing, even when CI TYPE is "INTER".

Data Rules:

When the CALL TYPE is "VACANT", "HNPAD", "LTD", "SRTT", "APSDN", "SPAB800", "SPAM800", "IDDDFCA", "IDDDSTS", "OCTL" or "CSTL", this field must be blank. When the Call Type is other than these, an entry is required in this field or in the ROUTE INDEX field.

For 5E12 and later, if the RDIT forms have a "CONFLICT RESOLUTION.NXX" defined in the rows indicated by NBR DIGS and there are multiple NOC forms with the same value of NXX, "CONFLICT RESOLUTION.NPA" must also be defined in the same row on the RDIT form.

4.13 DESEP

Description: Enter the Destination Separations Index for calls other than "VACANT", "HNPAD", "LTD", "SRTT", "OCTL" or "CSTL". It is only required for Division of Revenue Study.
Valid Entries: 1 - 255

Data Rules:

If a DESEP is entered, it must be defined on the TRFSEP form (5308 Record).

4.14 WZ1 REG

Description: For codes with a TYPE OF CI CALL equal to WZ1, enter a World Zone 1 region. This digit is used in the first stage of outpulsing for INCs (International Carriers) on either a direct connection or via an Access Tandem. The first stage of outpulsing has a format of KP + 1NX + XXX + 01R + ST, where R is the World Zone 1 region. (1NX is a spare toll center code entered on the Route Index as prefix digits. XXX is the Carrier Identification Code.) For other than WZ1 types, leave this field blank.
Valid Entries: 0 - 9

4.15 TERM LATA

Copyright © 2003 Lucent Technologies

Description: This field is used as the InterLATA Carrier when Network Call Denial Screening is required on incoming CAMAANI Trunk Groups. The TERM LATA value is compared to an ORIG LATA value specified on the TKGRP form (5202 Record).

Valid TERM LATA Entries

Entry	Definition
1	Indicates LATAs not subtending the switch
2 - 15	Indicates a subtending LATA of the switch.
2 - 31	Indicates a subtending LATA of the switch.

Data Rules:

If TYPE OF CI CALL field is "PSNCI" or "PSCAR", this field must be blank.

If TERM LATA is specified, COMMON CHAN SIG must equal to "Y" on the OFCOPT form (5509 Record).

When the Call Type is "NORMAL", "AUTINW", "OPINW" or "DA", enter an appropriate value to indicate, based on incoming digits, the destination of this call.

4.16 NON

Description: Enter the nature of the dialed number. This value is used in the conflict resolution table during query formulation of Network Services calls.

Software Release: 5E8 and later
Valid Entries:

Valid NON Entries

Entry	Definition
IDDD or I	International
NATL or N	Domestic
PRIV or P	Private

Data Rules:

For 5E8 only, when NON is entered, TRIG NBR must be entered.

4.17 TRIG NBR

Description: Enter the Network Services trigger as defined on the NSTRIG form.
Valid Entries:

- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

Data Rules:

For each row of the CONFLICT RESOLUTION ENTRIES list, when TRIG NBR is entered,

- TERM LATA cannot be entered, and
- CDI must also be entered.

For 5E8 only, if ASP OFC on an OFCOPT form equals "SSP", and TRIG NBR equals TRIG NBR on an NSTRIG form where APPLICATION equals "ASP", NON must also be assigned.

If TRIG NBR equals TRIG NBR on an NSTRIG form with SERV KEY equal to "CDPN", and NBR DIG is neither 7 nor greater than 9, ALT GBL TITLE on NSTRIG must be known.

If TRIG NBR equals TRIG NBR on an NSTRIG form with APPLICATION equal to "E911", CALL TYPE

Copyright © 2003 Lucent Technologies

must equal "EMER" and CI TYPE equal "INTRA".

For a CALL TYPE of "EMER" or "NORMAL", if TRIG NBR is entered and APPLICATION on the corresponding NSTRIG form

- is "E911" or "800", ROUTE INDEX or NXX cannot be entered;
- is "ASP", ROUTE INDEX or NXX must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered.

For 5E15 and later, when CONFRES.CALL TYPE is "RELAY", CONFRES.TRIG NBR must not be entered.

4.18 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

4.19 DFLT RT

Description: The DFLT RT field is used to identify the type of default routing treatment to be used for the ASP Default Routing for 3/6/10-Digit Triggers (Phase 1) Special Feature. When the ASP Special Feature has been purchased, this field can be used to specify the type of default routing to occur when an ASP specific digit trigger query fails.

Software Release: 5E10 and later
Default: NONE
Valid Entries:

Valid DFLT RT Entries

Entry	Definition
ANNC	Default route to announcement (or tone). The call will route to either a tone or announcement, depending on what is defined for the route.
DLDN	Default route to dialed DN. The call will route to the DN dialed (or the DN being routed to if the call came from a trunk).
NONE	No default routing. No special default routing will take place, and normal call treatment will send the call to reorder or NCA (No Circuits Available).

Data Rules:

For 5E9(2) and earlier, if an RDIT form has a DFLT RT or CONFLICT RESOLUTION ENTRIES DFLT RT entry other than "NONE", the corresponding TRIG NBR must be defined on the NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1"

For 5E10 and later, when the RDIT forms have a DFLT RT entry or a CONFLICT RESOLUTION ENTRIES DFLT RT entry other than "NONE", the corresponding TRIG NBR must be defined on a NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

When DFLT RT is not "NONE", either TRIG NBR must be entered or LNP TRIG NBR must be 1 - 255.

4.20 ANI BYPASS

Description: Will ANI Table options be ignored? An entry of "N" indicates TDX ANI Table options will be processed. This field supports the TDX (Toll Digital Exchange) ANI Table Call Processing Feature. This is

Copyright © 2003 Lucent Technologies

a secured feature with SFID 235. For more information on this feature, see Division 2, Section 4A165.

Software Release: 5E10 and later
Default: N

Valid Values: Y, N

5. FORM ENTRIES - 5300-8B RECORD

5.1 BASE AND CONTROL, ESS UNIT

CONFLICT RESOLUTION

Enter the Base and Control Group Number and Office Name on each record.

5.2 * RDIT

Description: Enter the Remaining Digits Interpreter Table Number.

Required Field.
Valid Entries: 1 - 999

5.3 * PREVIOUS DIGITS

Description: Enter the digits defined on the LDIT or MLDIT form as INCOMING DIGITS.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

5.4 * REMAINING DIGITS

Description: Enter the remaining digits.

Required Field.
Valid Entries: up to 15 digits (0 - 9)

5.5 LNP TRIG NBR

Description: Enter the LNP trigger number. The LNP trigger number is a conditional trigger which initiates a query to the SCP (Service Control Point) based on further routing determinations and checks following the trigger detection. checks following the trigger detection. The "IGN" entry means ignore.

Software Release: 5E11 and later
Required Field.
Default: IGN

Valid Values: IGN, or 1 - 255

Data Rules:

When LNP TRIG NBR is entered, CI TYPE must be "INTER", INTRA", "TOLL", "COMP", "PRIV", "NONCI", "TCONF", or "CONFL".

5.6 GEO PORT

Description: Any geographically ported DNs? This field, when set to "Y", indicates geographic porting has occurred for at least one DN associated with this RDIT entry.

Copyright © 2003 Lucent Technologies

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

Data Rules:

When GEO PORT is "Y", LNP TRIG NBR must be 1 - 255.

5.7 PORTED IN

Description: Any ported DN terminations? This field, when set to "Y", indicates that there exists at least one DN termination in this office associated wtih this LDIT digit translation even though a route index (not an office code) is provisioned for this RDIT translation.

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

Data Rules:

When PORTED IN is "Y", CI TYPE must be "INTER", INTRA", "TOLL", "COMP", "PRIV", "NONCI", "TCONF", or "CONFL".

When PORTED IN is "Y", RTI must be entered.

When PORTED IN is "Y", OFFICE CODE must be entered.

5.8 HOME LRN

Description: Is this a home location routing number? This field is set to "Y" when the LRN represents this switch or a rate center in this switch.

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

5.9 LRN SCRN

Description: Use screening attributes for LRN? This field is set to "Y" when the LRN a rate center in this switch which would imply that the TYP CI CALL and CDI from analysis of this LRN should be used.

Software Release: 5E11 and later
Required Field.
Default: N

Valid Values: Y, N

5.10 INH DNT

Description: Inhibit processing of dialed number triggers?

Software Release: 5E11 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N

Valid Values: Y, N

5.11 GETS HPC

Description: Is GETS (Government Emergency Telecommunication Service) HPC (High Probability Call Completion Service) required? The GETS HPC field is used as an indicator to mark GETS HPC calls so that enhanced functionality provided by other HPC capabilities (e.g., Trunk Queuing, ISUP Signaling, Exemption from Network Management Controls) can be invoked. When set to "Y", calls translated to this address receive special treatment resulting in a higher probability of call completion. For more information, see Division 2, Section 4A279.

The use of HPC Network Capabilities is restricted in the United States and U.S. Territories to National Security/Emergency Preparedness (NS/EP) users authorized by the Office of the Manager, National Communication System (OMNCS). Telco deployment of these HPC Network Capabilities must be co-ordinated with the OMNCS at the following address:

Office of the Manager
National Communication System
Attn: GETS Program Office
701 South Courthouse Rd
Arlington, VA, 22204-2198
email: gets@ncs.gov

Data Rules:

When GETS HPC in CONFLICT RESOLUTION ENTRIES is "Y"

- NBR DIG must be 10
- CALL TYPE must be "NORMAL"
- CI TYPE must be "COMP", "CONFL", "INTER", "INTRA", "NONCI", "PRIV", "SAC", "TCONF", "TOLL", or "WZ1"

5.12 DENY XFER

Description: This field is used to indicate if call transfers to a particular digit string should be denied.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later:

- When DENY XFER in CONFLICT RESOLUTION ENTRY (CONFRES) is "Y", CALL TYPE must be "EMER".
- When DENY XFER on the LDIT form is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to "Y". "Y" being set on the SFSYS form indicates that the "Deny Transfer of Digit Screened Calls" feature has been purchased.

Copyright © 2003 Lucent Technologies

5.13 REL LINK

Description: Is this a release link directory assistance number? This field is used to indicate whether or not the digits being translated map to a release link directory assistance number.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For each row of the CONFLICT RESOLUTION ENTRIES (CONFRES) list, when REL LINK is "Y":

- CALL TYPE must be "DA", "LOCDA", "NORM555", or "NORMAL".
- One of the following two conditions must exist:
  - For the Release Link for Toll Office feature using ANSI (American National Standards Institute) standard signaling, the ACT field for SFID 520 on the SFSYS form (5713-1 Record) must be set to "Y"; or
  - For the Release Link for Toll Office feature using TOPS (Operating System for DMS (Data Management System)) nonstandard signaling, the ACT field for SFID 521 on the SFSYS form must be set to "Y".

5.14 NPA SPLIT ANNC

Description: Should caller be given a warning announcement if dialing a 7-digit or 10-digit number during permissive period of NPA (Numbering Plan Area) Split?

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NPA SPLIT ANNC in CONFLICT RESOLUTION ENTRIES is "Y", NBR DIG must be "7" or "10".

Figure 3 SAMPLE RDIT FORM 5E14 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 3I: 5302-1 RECORD
CHARGE INDEX EXPANSION FORM - CGIDX

1. GENERAL

The 5302-1 Record is available in 5E2 and later Software Releases and is used to define Charge Indexes. This record must be completed for each Charge Index that is assigned on an RAR form (5301 Record).

Several AMA (Automatic Message Accounting) Call Types are available for OUTWATS billing to distinguish between IntraLATA (Local Access And Transport Area) and InterLATA calls. If a SPECIAL BILL NBR is defined on a PFASFG form (5609-3 Record), this number will be used as the billing number. If a SPECIAL BILL NBR is not defined, the terminal's billing number will be used.

Other AMA Call Types are available for additional billing requirements of Carrier Interconnect. For calls originating from a coin telephone and destined for a carrier, a FGBOL (Feature Group B Originating LATA) or FGDOL (Feature Group D Originating LATA) billing record is needed. For these Feature Group originating calls, the Charge Index is defined with an MBI TYPE equal to "C", and a CNCHG form (5302-4 Record) must also be entered. FGBOL and FGDOL Charge Indexes may also be defined for non-coin use.

For 5E6 and later Software Releases, operating companies can make use of two fields (ALT SFC and ALT CC) on this form to control the recording of an SFC (Service Feature Code) or CC (Call Code). The ALT SFC field is used to identify a specific feature invoked during a call; ALT CC is used to identify a specific service provided to an end user.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CHARGE INDEX

Description: Enter the Charge Index being defined.

Required Field.
Valid Entries:

For 5E3 and later: 1 - 2047

2.3 # AMA CALL TYPE

Description: Enter the AMA Call Type assigned to the Charge Index. Valid entries for this field are a subset of the AMA CALL TYPEs defined on the AMACT form (5506 Record).

Required Field.

Valid AMA CALL TYPE Entries

Entry	Definition
ATTSP	AT&T Station Paid. Used by an IEC (Interexchange Carrier) switch on calls from an Equal Access End Office or Access Tandem using Equal Access Signaling, or from directly connected lines.Call Type 60.
CCSAS	Software Release: 5E3 and later. CCSA (Common Control Switching Arrangement) Sampling. Call code 21.

Copyright © 2003 Lucent Technologies

CFPFNA	No Simulated Answer for Call Forwarding over PrivateFacilities. Same as "TANTTK" except call processing does notgenerate simulated answer. Call code 32.
CMC	Software Release: 5E4(2) and later. Cellular Mobile Carrier.Used for billing when an incoming call originates on a Trunk Groupdefined on a TKGRP form (5202 Record) with the CMC field set to "Y". Call Code 306.
DA411	Local Directory Assistance calls. When used for coin, this field must also contain an MBI (Message Billing Index) assigned on aCNCHG form. Call code 9.
DA555	Toll Directory Assistance calls. When used for coin, this field must also contain an MBI assigned on a CNCHG form. Call code 33.
DMRT	Detail billed, message rate, timed. Call code 5.
DMRTM	Detail billed, message rate, timed, includes an MBI. Call code 1.
DMRUM	Detail billed, message rate, untimed, includes an MBI. Call code 3.
ETCCSA	Software Release: 5E3 and later. Electronic Tandem CCSA. Call code 99.
ETMDR	Software Release: 5E3 and later. Electronic Tandem Message Detail Recording (via Revenue Accounting Office). Call code 85.
FGBOL	Feature Group B Originating LATA. Call code 134.
FGBTL	Feature Group B Terminating LATA. Call code 135.
FGDOL	Feature Group D Originating LATA. Call code 110.
FGDTL	Feature Group D Terminating LATA. Call code 119.
FGDWBL	Feature Group D WATS (Wide Area Telephone Service) Originating LATA. Used for interLATA calls with a Group Billing Number. Call code 114.
FR	Flat-rate calls. This AMA Call Type should be used for local calls from telephone subscribers having flat-rate service. AMA CALL TYPE "FREE" should be used for free calls from a flat-rate line. Call code 67. (Recorded only if under study.)
FREE	Free calls. This AMA CALL TYPE should be used for all free calls from non-coin lines. Free calls from coin lines should be assigned AMA CALL TYPE "LOCN". Calls to Traffic Service Position System, tones, announcements, business office and free terminating line service are normally designated as free. Call code 74. (Recorded only if under study.)
FX	Foreign Exchange. Call code 11.
ICVPN	Software Release: 5E6 and later. Originating Access to an IEC Private Virtual Network. Call code 263.
ISDATA	Software Release: 5E3 and later. ISDN data intraLATA Circuit-Switched calls. Call code 072.
ISDNOL	Software Release: 5E3 and later. ISDN data originating interLATA Circuit-Switched calls. Call code 117.
ISDNTL	Software Release: 5E3 and later. ISDN data terminating interLATA Circuit-Switch calls. Call code 121.
LOCN	Local coin calls. This AMA CALL TYPE should be used for all calls from coin lines except calls to local or toll Directory Assistance. For those calls, AMA CALL TYPEs "DA411" and "DA555" should be used. "FGBOL" and "FGDOL" may also be defined for coin calls. This AMA CALL TYPE must contain an MBI assigned on a CNCHG form. A "C" must be entered in the MBI TYPE field for this AMA CALL TYPE. Call code 41.
MRTM	Message rate, timed, includes an MBI. Call code 2.
MRUM	Message rate, untimed, includes an MBI. Call code 4.
PSVC	Software Release: 5E4(2) and later. ISDN Packet SwitchingVirtual Call. Call code 080 (5E4(2) and 5E5). Call code 180(5E6 and later).
PSIVC	Software Release: 5E4(2) and later. ISDN Packet Switching Intra Group Virtual Call. Call code 378.
SP	Station paid. Provides details for a direct dialed, station paid 7 or 10-digit call. Call code 6.
TANTTK	Tandem Tie Trunk calls. Call code 32.
WATISB	WATS individual station paid. Used for intraLATA calls with a Station Billing Number. Call code 7.
WATSB	WATS using a Special Billing Number. It is for intraLATA calls with a Group Billing Number. Call code 68.
WATSBL	WATS station billed interLATA. Used for interLATA calls with a Station Billing Number. Call code 111.

2.4 MBI TYPE

Description: Enter the MBI (Message Billing Index) Type.

Required Field.

Valid MBI TYPE Entries

Entry	Definition
C	Coin use only. Allowed only for AMA CALL TYPEs of "DA411", "DA555", "LOCN", "FGBOL", and "FGDOL".

Copyright © 2003 Lucent Technologies

M	Message Register use only. Allowed only for AMA CALL TYPEs of "DMRT", "DMRTM", "DMRUM", "FR", "MRTM", or "MRUM".
N	Non-coin, non-Message Register use only.

Data Rules:

If a "C" or "M" is entered, an MBI/WATS BAND must be entered.

2.5 MBI/WATS BAND

Description: Enter either an MBI Number, or a WATS Band Number.
Valid Entries: 0 - 9 for WATS, 1 - 255 for MBI

Data Rules:

An entry is required in this field when the MBI TYPE is "C" or "M", or when the AMA CALL TYPE is "WATSB".

For an MBI TYPE of "C", the MBI entered in this field must be defined on the CNCHG form. This record provides coin charge information which is used on the AMA record. This is determined by the value entered in the INCLUDE MBI/WATS BAND field on the AMACT form (5506 Record) for the specified AMA CALL TYPE. Normally, the MBI will not be included on the AMA record.

For an MBI TYPE of "M", the MBI entered in this field must be defined on an MREG form (5302-5 Record). This record provides Message Register data. If the MBI is to be used as a Hotel/Motel message register, it must be defined on the MREG form. In addition, the MBI may or may not be included on the AMA record. This is determined by the value entered in the INCLUDE MBI/WATS BAND field on the AMACT form for the specified AMA CALL TYPE. WATSB", "WATISB", "WATSBL" or "FGDWBL"; however, the values 0 - 9 are usually used; 1 - 255 for all other AMA CALL TYPEs.>

2.6 WATS TYPE

Description: Enter the WATS Type.

Valid WATS TYPE Entries

Entry	Definition
MT	Measured Time.
FB	Full Business Day.

Data Rules:

This field requires an entry for AMA CALL TYPEs "WATSB", "WATISB", "WATSBL", and "FGDWBL". An entry is prohibited for all other AMA CALL TYPEs.

2.7 DATA CHARGE INDEX

Description: Enter the charge index associated with ISDN Circuit-Switched data calls. This index provides a means to charge data calls differently from a voice call.

If the data call is to be charged the same as a voice call, this index should have the same value as the CHARGE INDEX entry. For voice calls, this field can be left blank or have the same value as the CHARGE INDEX field.

If this field is left blank, it will be defaulted to the CHARGE INDEX value.

Software Release: 5E3 and later
Valid Entries: 1 - 2047

Data Rules:

Copyright © 2003 Lucent Technologies

If the DATA CHARGE INDEX value is the same as the CHARGE INDEX value on another CGIDX form, the DATA CHARGE INDEX field on the other CGIDX form must be left blank. The DATA CHARGE INDEX entered must be defined on another CGIDX form as the key if it differs from the CHARGE INDEX entry.

2.8 REMARKS

Description: Enter any descriptive comments deemed locally necessary.
Valid Entries: up to 16 characters

2.9 ALT SFC

Description: Enter the Alternate SFC (Service Feature Code) used to identify a specific feature of the service invoked in a call.

Software Release: 5E6 and later
Valid Entries: 800 - 999

2.10 ALT CC

Description: Enter the Alternate Service Call Code used to identify a specific service provided to an end user.

Software Release: 5E6 and later
Valid Entries: 800 - 999

2.11 MAX OWATS

Description: Is this a Maximal Subscribed OUTWATS charge index?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "N" when AMA CALL TYPE is not "WATSB", "FGDWBL", "WATISB", or "WATSBL".

SEC. 3K: ESS 5302-3 RECORD
MESSAGE REGISTER RATE RECORD - RATE

1. GENERAL

The 5302-3 Record is available with 5E2 and later Software Releases and is used to define the Charge Rate assigned to the 24 hours of the day for Message Registers.

The Message Register Rate Record provides charge data for each day of the week and holiday in half-hour increments. This permits the user to have flexibility in Message Register Charging.

For an initial office, ODA builds the RATE forms. Therefore, minimal changes need to be made by the user. See Figure 1 for RATE entries built by ODA.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.15.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and Office Name on each record.

2.2 * DAY

Description: Enter day of the week or holiday.

The days of the week and holiday are preprinted on the 5302-3 Record.

Required Field.

Valid DAY Entries

Entry	Definition
MON	Monday
TUE	Tuesday
WED	Wednesday
THU	Thursday
FRI	Friday
SAT	Saturday
SUN	Sunday
HOL	Holiday

2.3 RATE

Description: The 24 hours of the day, in half hour increments, are preprinted on the form. For each DAY/TIME period, enter the Charge Rate.

SEC. 3L: 5302-4 RECORD
COIN CHARGE FORM - CNCHG

1. GENERAL

The 5302-4 Record is available with 5E2 and later Software Releases, and is used for a Message Billing Index that is assigned to a Coin Charge Index.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.13.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MBI

Description: Enter the Message Billing Index number assigned to the Coin Charge Index. Message Billing Indexes are assigned on the 5302-1 Record.

Required Field.
Valid Entries: 1 - 255

2.3 COIN CALL TYPE

Description: Enter the Type of Coin Call.

Valid COIN CALL TYPE Entries

Entry	Definition
FREE	Used for free calls which do not require operator inbandor expanded inband signaling. These calls donot require an initial coin deposit. Ifa coin is deposited, it is returned.
LOCL	Local coin calls which require aninitial coin deposit to complete thecall. Not timed.
LOVT	Local timed coin calls which require an initialcoin deposit to complete the call.The initial coin deposit is collected 30seconds before the end of the initialtime period. At the end of theinitial time period, the LCOP (Local CoinOvertime Prompt) announcementis connected to both parties of thecall. If there is no additional coindeposit within 30 second, the call isdisconnected.
OPR	Any call which uses a Route Index associated with a TrunkGroup that has a trunk classof either "TSPS" or "RECCMPL". The coinis collected or returned based uponoptions set for the operatorTrunk Group.The converse is also true: if theCOIN CALL TYPE is not "OPR", itmay not be associated with either "TSPS"or "RECCMPL".

2.4 INITIAL MINUTES

Description: Initial Minutes are entered only when the Call Type is "LOVT". This field defines the duration in minutes of the initial time period. An entry of 0 indicates that the initial period is not timed.
Valid Entries: 0 - 7 (minutes)

2.5 OVERTIME MINUTES

Description: Overtime Minutes are entered only when the Call Type is "LOVT". This field defines the duration in minutes of the overtime period. An entry of 0 indicates that the overtime period is not timed.
Valid Entries: 0 - 7 (minutes)

SEC. 3M: 5302-5 RECORD MESSAGE - MREG

1. GENERAL

The 5302-5 Record is available with 5E2 and later Software Releases, and is used to define Message Billing Index numbers assigned to Message Registers.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.14.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MBI

Description: Enter the Message Billing Index number assigned to the Message Register. Message Billing Indexes are assigned on the 5302-1 Record.
Valid Entries: 1 - 255

MESSAGE REGISTER DATA

These fields (Section 2.3 - Section 2.7) are used to assign the rate and the initial and overtime charging for Message Registers.

For each charge rate (night, evening, and day) enter the following information.

2.3 * RATE

Description: Enter the Charge Rate.

Required Field.

Valid RATE Entries

Entry	Definition
D	Day Rate
E	Evening Rate
N	Night Rate

2.4 INITIAL MINUTES

Description: Enter the duration, in minutes, of the initial time period.
Valid Entries: 0 - 7 (minutes)

2.5 INITIAL M.R. PEGS

Description: Enter the initial time period Message Register pulses.
Valid Entries: 0 - 15

2.6 OVERTIME MINUTES

Description: Enter the duration, in minutes, of the Overtime Period.
Valid Entries: 0 - 7 (minutes)

Copyright © 2003 Lucent Technologies

2.7 OVERTIME M.R. PEGS

Description: Enter the overtime period Message Register pulses.
Valid Entries: 0 - 15

```

SEC. 3P: 5303-1/2 RECORD
ROUTE INDEX FORM - RTIDX

1. GENERAL

The 5303 Record is used to define each Route Index in a 5ESS Switch. The 5303 record is intended to be used as an office record and as a source document for data entry into the RTIDX form.

A Route Index is the output from a Rate and Route Table and is used to define the routing of a call. A Telephone Number may also contain a Route Index for applications requiring special routing (e.g., PBX-DID (Private Branch Exchange-Direct Inward Dialing)).

The Route Index may be an output of the digit analysis form or carrier interconnect form entries as a Regular Route Index, or it may be a Special Route Index found in the Rate and Route Table which overrides the Regular Route Index. A Route Index may also come from a PFAGPA form (5609-5 Record).

The RTIDX form defines the type of routing, the Trunk Group Number to be used, the number of digits to be deleted or prefixed, and an alternate Route Index number.

1.1 Fixed Route Types

Fixed Route Types may require a Route Index assignment. The first one hundred route indexes should be reserved for Fixed Route Types. When a Fixed Route Type is translated as a tone, a Route Index is not required. However, when it is translated as an Announcement or a Trunk Group, a ROUTE INDEX must be assigned. Fixed Route Types are defined on the FIXRT form (5301-1 Record).

1.2 Recent Change View

The corresponding Recent Change View for this form is 10.2. (See also DTRTX (5314 Record) Division 3, Section 3AA for 10.2.)

2. FORM ENTRIES 5303-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

2.2 *ROUTE INDEX

Description: Enter the number of the Route Index being defined.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

- ROUTE INDEX cannot exceed 3617 unless the Increased Number of Trunk Groups feature has been purchased and the ACT field for SFID 172 on the SFSYS form is set to "Y".
- ROUTE INDEX cannot exceed 4095 unless the LDP Routing Enhancement feature has been purchased and the ACT field for SFID 189 on the SFSYS form is set to "Y".
- ROUTE INDEX cannot be deleted when it is used as an RTI or an RTIDX on the RTLIST form.

Copyright © 2003 Lucent Technologies

2.3 ROUTE TYPE

Description: These columns define the type of routing treatment.

Required Field.

Valid ROUTE TYPE Entries

Entry	Definition
HUNT	Hunt for an idle trunk member.
DNTRAN	Software Release: 5E5 and later. Directory Number Transaction. Used for Inter-module trunks secondary routes across NCT links. If an originating call with this ROUTE TYPE terminates on the same switch, the call will terminate across the NCT links. When routing to another switch, a call with this ROUTE TYPE will fail.
BUSY	Busy tone.
MAINT	This is a Recent Change Entry. See "TEST" for the definition.
REORDER	Reorder tone.
TEST	Toll Test calls. For Recent Change View 10.2, enter "MAINT" .

Data Rules:

HUNT - For 5E9(1) and later, ROUTE TYPE must be "HUNT" when the associated trunk group is defined on a TKGRP form with TRKCLS set to "LTPCLBCK", "LTPDCTU", "PACKET", "RAFANNC", "RAFCTR", or "RAFDTA"; it must be "HUNT" or "TEST" when TRKCLS is "LTPISTFL" or "LTPISTFX".

For 5E13 and earlier, when ROUTE TYPE is "HUNT" and the TRUNK GROUP NUMBER is defined as a TGN on the TKGRP form with IMT set to "N", the NEXT ROUTE on the RTIDX form must match the ROUTE INDEX on a second RTIDX form.

TEST - For 5E5 and later, A ROUTE TYPE of "TEST" must be entered when the associated LDIT form has a CALL TYPE of 100, 101, 101R, 101TAT, 101TP, 102, 103, 104, 104R, 105, 105R, 106, 109R, 606R, IC1, IC2, IC3, IC4, IC5, IC6, IC7, IC8, IC9, INV, NINV, PB, or SYN.

DNTRAN - For 5E9(1) and later, a FIXED ROUTE TYPE may not be assigned to a ROUTE INDEX that has a corresponding RTIDX form with ROUTE TYPE of "DNTRAN".

For 5E12 and earlier:

- when ROUTE TYPE is set to "DNTRAN" and CI ROUTE TYPE is set to "NMFAIL", NEXT ROUTE must be defined as the NOC on the NOC form.
- when ROUTE TYPE is set to "DNTRAN" and CI ROUTE TYPE is "NMFAIL", another RTIDX form must exist with ROUTE TYPE set to HUNT and the NEXT ROUTE must match the ROUTE INDEX on the RTIDX form.

For 5E13 only:

- when ROUTE TYPE is set to "DNTRAN" and CI ROUTE TYPE is set to "CALLFORWARD", NEXT ROUTE must be defined as a valid NOC on a NOC form.
- when ROUTE TYPE is set to "DNTRAN" and CI ROUTE TYPE is set to "CALLFORWARD", another RTIDX form must exist with ROUTE TYPE set to "HUNT" and the NEXT ROUTE must match the ROUTE INDEX on the corresponding RTIDX form. In addition, the INTER SM TRK must be set to "N" on the TKGRP form and TRUNK GROUP NUMBER on the RTIDX form must match the TGN on the TKGRP form.

For 5E13 and later:

Copyright © 2003 Lucent Technologies

When ROUTE TYPE is not "DNTRAN",

- NEXT ROUTE must be 1 - 16382.
- the value of NEXT ROUTE must not be the same as the key ROUTE INDEX.

When ROUTE TYPE is "DNTRAN", NEXT ROUTE must be 1 - 8190.

2.4 # TRUNK GROUP NUMBER

Description: Enter the Trunk Group Number assigned to the Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 - 5E14: 1 - 4000
- For 5E15: 1 - 4000 for circuit trunk groups or 7000 - 7999 for BICC groups
- For 5E16(2) and later: 1 - 4000
- Entries greater than 999 are allowed only when the range of 1- 999 is completely exhausted.

Data Rules:

The trunk group must be defined on a TKGRP form (5202 Record) where TRK DIR is not "INC".

If ROUTE TYPE is "HUNT" or "TEST", this field must be entered; otherwise, it must be blank.

If the ROUTE TYPE is "TEST", the associated TKGRP form must have a TRKCLS of "LTPICTC" entered.

If the TRUNK GROUP NUMBER is defined on the TKGRP form with TRKCLS of "PACKET", "X75P" or "X75", then the following fields on the RTIDX form must be assigned as follows:
- ROUTE TYPE: "HUNT"
- DIGITS TO BE DELETED: 0 (zero)
- PREFIX DIGITS: not entered
- ANI OUTPULSING: "N"
- OVERLAP OUTPULSING: "N"
- SIGNALING PROTOCOL: "TRAD"
- CI ROUTE TYPE: "OTHER"

When TRKCLS is "LTPICTC" on the corresponding TKGRP form, the following fields must be set as specified:
- ROUTE TYPE: "HUNT" or "TEST"
- DIGITS TO BE DELETED: 0
- PREFIX DIGITS: blank
- ANI OUTPULSING: "N"
- OVERLAP OUTPULSING: "N"
- SIGNALING PROTOCOL: "TRAD"
- CI ROUTE TYPE: "OTHER"; for 5E7 and later,
- it may also be "GENANN".

Additionally, for 5E7 and later, the NEXT ROUTE on this form must either be blank or it must point to another RTIDX form where ROUTE TYPE is "REORDER".

For 5E7 and later, when TRKCLS on the corresponding TKGRP form is "LTPISTFL" or "LTPISTFX", the following fields must be set as specified:

ROUTE TYPE: "HUNT"
- DIGITS TO BE DELETED: 0

Copyright © 2003 Lucent Technologies

- PREFIX DIGITS: blank
- ANI OUTPULSING: "N"
- OVERLAP OUTPULSING: "N"
- SIGNALING PROTOCOL: "TRAD"
- CI ROUTE TYPE: "OTHER".

For 5E7 and later, if TRUNK GROUP NUMBER is defined on a TKGRP form with a TRKCLS of "TSPS", then SIGNALING PROTOCOL on the RTIDX form cannot be "INC" or "FGB".

For 5E9(1) and later, if the TRUNK GROUP NUMBER is assigned as a TGN on the TKGRP form with a TRKCLS of "LTPDCTU", the CI ROUTE TYPE on this RTIDX form must be "OTHER". In addition, if a NEXT ROUTE is entered on this RTIDX, it should match with the ROUTE INDEX on another RTIDX form where ROUTE TYPE is "REORDER" or null.

For 5E12 and earlier, when a TRUNK GROUP NUMBER is entered and is assigned as TGN on the TKGRP form, and INTER SM TRK is "Y" on the TKGRP form and NEXT ROUTE matches the ROUTE INDEX on a second RTIDX form and ROUTE TYPE is "DNTRAN" on the second RTIDX form, there must be a corresponding NOC form. The NOC form is found by matching NEXT ROUTE on the RTIDX form with the NOC on the NOC form.

For 5E12 and later, when TRUNK GROUP NUMBER is entered, the TRUNK GROUP NUMBER must be defined on the TKGRP form.

For 5E12 and later, when TRUNK GROUP NUMBER is entered, and TRKCLS on the corresponding TKGRP form is "OTOTK", ROUTE TYPE must be "HUNT" and DIGITS TO BE DELETED must be in the range of 0 - 10 on the RTIDX form.

For 5E13 and later, when the TRUNK GROUP NUMBER is entered, NEXT ROUTE must match the ROUTE INDEX on another RTIDX form.

2.5 DIGITS TO BE DELETED

Description: Enter the number of digits to be deleted.

Required Field.
Default: 0
Valid Entries: 0 - 15

Data Rules:

If ROUTE TYPE is "HUNT" or "TEST", this field must be entered. Otherwise, this field must be 0.

This field must be 0 for route indexes which point to Trunk Groups that are Logical Test Ports or have a Trunk Class of "RECCMPL" or "SERVICE".

This field should be 0 if this route index is pointed to by a PFA (Private Facility Access) dial code, defined on a PFAGPA form that is used to access a cut-through trunk (DIG COLL field on the PFAGPA form is "N").

For 5E6 and later, this field must be 0 when SIGNALING PROTOCOL is "EA".

NOTE: If the RTI was generated for a LINE or HGRPS form, the 5ESS Switch reconstructs a 7-digit TN for either line or trunk originated calls. Deleting and prefixing of digits should be based on the reconstructed 7-digit TN.

2.6 PREFIX DIGITS

Copyright © 2003 Lucent Technologies

Description: Enter the digits to be prefixed for outpulsing.
Valid Entries: from 1 to 10 digits

Data Rules:

An entry is allowed in this field if ROUTE TYPE is "HUNT" or "TEST".

This field must be left blank for route indexes which point to Trunk Groups that are Logical Test Ports or have a Trunk Class of "RECCMPL" or "SERVICE".

For Carrier Interconnect calls from an EAEO (Equal Access End Office) to an Access Tandem using equal access signaling, the prefix digits indicate OZZ codes (spare toll center codes) used in the initial outpulsing sequence. 1NX codes (also spare toll center codes) used in the initial outpulsing sequence for international calls, either on a direct or tandem connection, are also indicated by prefix digits.

If a code of "2ZZ" (where Z is any digit 0 - 9) is entered, it will be converted to 0ZZ before it is outpulsed. The 2ZZ code indicates that the called number will be outpulsed as dialed to an Access Tandem when the optional 7-digit Outpulsing feature is active on Shared Trunks (CI ROUTE TYPE is "STG") with EA (Equal Access) signaling (SIGNALING PROTOCOL IS "EA").

RP (Revertive Pulsing) is available and requires special digit prefixing for Trunk Groups with OUTPULSING set to "RPEO" or "RPTO" on the TKGRP form. The appropriate number of digits need to be deleted so there are four remaining digits. For example, if the OUTPULSING equals "RPEO" (i.e., the far end is an end office with RP), a 0 in PREFIX DIGIT, D1, indicates LOW 5 Directory Numbers, and a 5 indicates HIGH 5 Directory Numbers. By using two Route Indexes, one with 0 and one with 5, a Trunk Group may be used to terminate to two Office Codes. If the Trunk Group Outpulsing equals RPTO (i.e., the far end is a tandem office with RP), the Prefix Digits entered in consecutive order in D1, D2 and D3 are the Office Brush, Office Group and LOW 5/HIGH 5 indicator (0 or 5). This allows up to two hundred Office Codes to be accommodated on a Trunk Group.

For 5E7 and later, PREFIX DIGITS must not be entered if CKT CODE is greater than 0.

For 5E9(2) and later, the PREFIX DIGITS field on the RTIDX form must be blank when:

- The SIGNALING PROTOCOL on the RTIDX form is set to "EA".
- The TRUNK GROUP NUMBER on the RTIDX form is entered.
- The matching TKGRP form (found by matching TRUNK GROUP NUMBER of the RTIDX form with the TGN of the TKGRP form) has OUTPULSING set to "ISUP7".
- TRKCLS on the same associated TKGRP form is "IC".

2.7 NEXT ROUTE

Description: Enter the alternate route index. The number of alternate routes supported is not a fixed quantity. Following are the alternate routing configurations currently supported:

- One primary and three alternate routes are supported if the following condition exists:
  - BRCS features or SFGs are assigned to any of the trunk groups in the route list.
- One primary and four alternate routes are supported if all the following conditions exist:

Copyright © 2003 Lucent Technologies

- No BRCS features or SFGs are assigned to any of the trunk groups in the route list
- All trunk groups in the route list are defined as local trunk groups. This is indicated by entering an SM number in the LOCAL SM field on the TKGRP form. In addition, all trunk members in the route list must be located on the same SM. (i.e. The TKGRP form for each trunk group in the route list would specify the same SM in the LOCAL SM field.)

- One primary and five alternate routes are supported if all the following conditions exist: (Refer to an exception to this configuration in the special case that follows).
  - No BRCS features or SFGs are assigned to any of the trunk groups in the route list.
  - All trunk groups in the route list are defined as GLOBAL which is indicated by leaving the LOCAL SM field on the TKGRP form blank. This is true even if all members in a trunk group are on the same SM.

- Special case: One primary and four alternate routes are supported if the following conditions exist:
  - The Route Index for the first route in the route list (primary route) is assigned to a DN on a LINE form.
  - A terminal group is assigned to lines that terminate calls to the route list by dialing the above DN.

    An example of this case would be a route list consisting of PRI trunk groups to support access to Internet service providers. This scenario is often provisioned by assigning the Route Index for the primary route to an "access DN" via the LINE form. Normally, this scenario would provide five alternate routes as previously documented. However, if a terminal group is assigned to lines which access the route list by dialing the access DN, only four alternate routes can be expected.

In any of the above configurations, an additional alternate route may be added to the end of the route list assuming this last route is provisioned as "REORDER" or "BUSY". This is indicated by entering the appropriate treatment in the ROUTE TYPE field on this form.

When an alternate Route Index is defined for PFA (Private Facility Access) trunk, the trunk group associated with the alternate route index must have the same characteristics as the primary trunk group. For example, if a primary route points to a cut-through trunk, then the alternate route index should also point to a cut-through trunk.

For Circuit Switched Data calls, the Alternate Data Route Index is used for the first route, based on the bearer capability of the call. When an "all trunks busy" condition is encountered, the routes that are selected using the NEXT RTI do NOT select different alternate data routes (DATARATE ALT RI) based on the bearer capability, but use the trunk group specified by the selected NEXT RTI. Therefore, the trunk group that is referenced by the NEXT RTI must specifically support data calls for all bearer capabilities that the trunk group on the primary RTI can support. For example, if the Trunk Group pointed to by a particular Route Index supports 64K data calls, then the trunk group that the NEXT RTI points to MUST ALSO support 64K data calls.

If a true alternate Route Index is not required, the NEXT ROUTE INDEX is omitted and reorder will be automatically provided on overflow.

The NEXT ROUTE INDEX for DID-PBX trunks should route to busy.

Announcement Trunk Groups must have a next route index which goes to reorder.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11: 1 - 4095
- For 5E12: 1 - 4095 or Normalized Office Code, 1 - 8190, when MC ROUTE TYPE is "DNTRAN"
- For 5E13 and later: Blank, or 1 - 16382 or Normalized Office Code, 1 - 8190.

Data Rules:

This field should not be entered if the Trunk Group assigned to this Route Index is an X.75' or X.75 Trunk Group (TRKCLS is "X75P" or "X75" on the TKGRP form).

When ROUTE TYPE is not "DNTRAN", then:

- the value entered in this field must not equal the value of the Route Index being defined. That is, a Route Index may not alternate to itself.
- the Route Index entered in this field must be defined on an RTIDX form.
- for 5E13 and later, NEXT ROUTE must be 1 - 16382.

When ROUTE TYPE is "DNTRAN", a NOC (Normalized Office Code) must be entered in this field. The NOC entered must be defined on the NOC form (5501 Record) and, for 5E13 and later, NEXT ROUTE must be 1 - 8190.

Special Access Basic 800 trunk groups (TRKCLS of "SPAB800" on the TKGRP form) and MEGACOM 800 trunk groups (TRKCLS of "SPAM800" on the TKGRP form) must not have a NEXT ROUTE entered.

For 5E5 and later, IP (Internal Protocol) trunk groups may alternate route only to other IP trunk groups. That is, if TRUNK GROUP NUMBER is defined on a TKGRP form with TRKCLS set to "PACKET" (i.e. an IP trunk group), then the value entered in this NEXT ROUTE field must be defined as ROUTE INDEX on another RTIDX form that has a TRUNK GROUP NUMBER entered. That trunk group must also be defined on a TKGRP form that has TRKCLS set to "PACKET".

For DSN (Defense Switched Network) offices, this field should be entered as 0 if the ROUTE INDEX is used on the PPPOLY form (5618-7 Record). This is required for DSN Network Management control CANF.

If the Proportionate Bidding feature has been purchased (SFID 34 on the SFSYS form (5713-1 Record) is set to "S") or "Y", this field cannot be in the range of 1001 - 1032 since Proportionate Bidding route indexes cannot be specified as secondary route indexes.

For 5E7 and later, up to seven RTIDX forms may be associated with each announcement trunk group where TRKCLS is "RAFANNC" or "EISTRK". The first is the primary routing form, which must point to an alternate routing form (NEXT ROUTE matches the ROUTE INDEX on another RTIDX form). Up to six alternate routing forms may be defined. The last form in the group may not have a NEXT ROUTE entered and must have ROUTE TYPE set to "REORDER".

On the primary and all alternate RTIDX forms except the last:

- NEXT ROUTE must match a ROUTE INDEX on one of the other forms. To avoid an infinite loop (never reaching the "REORDER" route), NEXT ROUTE may not point to the primary RTIDX form, and no two NEXT ROUTE values may point to the same RTIDX form;
- When more than one alternate route index is defined, CI ROUTE TYPE must have the same value;
- When TRKCLS on the TKGRP form is "RAFANNC", ROUTE TYPE on these RTIDX forms must be

Copyright © 2003 Lucent Technologies

"HUNT".

For 5E13 and later, when the ACT field for SFID 34 on the SFSYS form is set to "Y", route indexes 1001 through 1032 cannot be assigned as the NEXT ROUTE.

2.8 ANI OUTPULSING

Description: Is ANI (Automatic Number Identification) Outpulsing allowed for this Route Index?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For incoming Trunk Groups (TRK DIR on the TKGRP form is "INC"), this field must be "N".

An entry is allowed in this field if ROUTE TYPE is "HUNT".

2.9 # SIGNALING PROTOCOL

Description: Enter the Signaling Protocol to be used for this Route Index.

Required Field.

Valid SIGNALING PROTOCOL Entries

Entry	Definition
EA	Carrier Interconnect Equal Access signaling. For 5E8 and earlier, this is used in FGD and FGB Transitional Access where CIC (Carrier Identification Code) is 000 - 999. For 5E9(1) and later, this is used in FGD where the CIC is 0000 - 9999, and for Transitional Access where the CIC is 0000 - 0999.
FGB	Carrier Interconnect signaling to Feature Group B carriers that utilize the interim carrier access dialing plan, 950-1XXX. For 5E8 and later, the dialing plan is 950-XXXX.
INC	Carrier Interconnect EA signaling for international calls.
INCM	Software Release: 5E7 and later. Modified EA signaling for international calls. Used in the TAISP (Tandem Access for InterLATA Sent-Paid Coin Calls) feature. For 5E7 and later, a PREF DIG of 1NX is used. Also used for EAOSS (Exchange Access Operator Services System) signaling when LEC OS is set to "Y".
MEA	Software Release: 5E7 and later. Modified EA signaling for domestic calls. Used in the TAISP (Tandem Access for InterLATA Sent-Paid Coin Calls) feature. For 5E7 and later, a PREF DIG of 0ZZ is used. Also used for the EAOSS (Exchange Access Operator Services System) signaling when LEC OS is set to "Y", or EOSS (Exchange Operator Services System) signaling when LEC OS is set to "Y" and no carrier is specified
PNANI	Software Release: 5E7 and later. Automatic Number Identification over Private Facilities special feature. This feature must be purchased by the office.
TRAD	Traditional LAMA/CAMA signaling.

Data Rules:

FGB
If Signaling Protocol is "FGB", the Route Type must be "HUNT".

EA
For 5E7 and later, when SIGNALING PROTOCOL is "EA" and CI ROUTE TYPE is "STG", either PREFIX DIGITS must be entered, or CKT CODE must be greater than 0.

Copyright © 2003 Lucent Technologies

For 5E7 and later, if SIGNALING PROTOCOL is set to "EA" or "INC" and CI ROUTE TYPE is set to "STG", and the TGN on the TKGRP form has an OUTPULSING other than "ISUP7", and TRKCLS other than "TSPS", then the PREFIX DIGITS must be entered and cannot be zero.

INC
When SIGNALING PROTOCOL is "INC" and CI ROUTE TYPE is "DTG" or "STG", either PREFIX DIGITS must be entered, or CKT **CODE must be** greater than 0. In both these cases, if a TRUNK GROUP NUMBER has been entered and is defined on a TKGRP form where OUTPULSING is not "ISUP7" (i.e., not a CCS7 trunk group), then PREFIX DIGITS must be entered.

INCM
For 5E7 and later, when SIGNALING PROTOCOL is "INCM",

- CI ROUTE TYPE must be "DTG" or "STG",
- PREFIX DIGITS must be entered and must be 3 digits long, and
- TRUNK GROUP NUMBER must be entered.

Also, see below for "MEA".

MEA
For 5E7 and later, when SIGNALING PROTOCOL is "MEA":
- CI ROUTE TYPE must be "DTG" or "STG"
- TRUNK GROUP NUMBER must be entered.

When SIGNALING PROTOCOL is "MEA" and CI ROUTE TYPE is "DTG", PREFIX DIGITS cannot be entered.

When SIGNALING PROTOCOL is "MEA" and CI ROUTE TYPE is "STG", PREFIX DIGITS must be entered and must be 3 digits long.

If "MEA" or "INCM" is entered, the TRUNK GROUP NUMBER on this form must be defined as TGN on a TKGRP form with TRKCLS equal to "TSPS", SIGNAL equal to "INBAND" or "EXINBND", and OUTPULSING not equal to "ISUP7".

If SIGNALING PROTOCOL is equal to "MEA" or "INCM" and TRUNK GROUP NUMBER is defined on the TKGRP form with SIGNAL equal to "INBAND", this data combination is used by the EAOSS for Operator Services Calls special f

eature, which is a secured feature and must be purchased by the office before SIGNAL can be set to "INBAND". Either the ACT field for SFID 11 must be set to "Y" on the SFSYS form, or SIGNAL must be set to "EXINBND".

PNANI
For 5E7 and later, for the ANI over PF feature, SIGNALING PROTOCOL must be "PNANI". When "PNANI" is entered, CI ROUTE TYPE must be "OTHER", OVERLAP OUTPULSING must be "N", and ANI OUTPULSING must be "Y". The ANI over PF special feature will allow only the following classes of service on the originating port: "PF", "PFITT" (PF Intertandem Trunk), "INDIV" (Individual line), "ISDN" (digital subscriber line associated with ISDN service), "ATTENDANT" (Attendant line), and "ISATND" (ISDN Attendant). "PNANI" may not be entered unless the ANI over PF secured feature has been activated with FEATURE ID 5 set to "S" or "Y" on the SFSYS form (5713 Record). (See Division 2, Section 4A5 for information on secured features.)

TRAD:
If this Route Index is associated with a PFA dial code (defined on a PFAGPA form), then this field should

Copyright © 2003 Lucent Technologies

be "TRAD".

For traffic to a TSPS office which has not converted to OS Signaling, use "TRAD". For traffic to a TSPS office which has converted to OS Signaling, use "EA". Do not enter "INC" or "FGB" for signaling to a TSPS office.

- ***NOTE:*** Since this form entry is the only data internal to the 5ESS Switch to indicate if the far end TSPS office is expecting "TRAD" or "EA" signaling, this must be verified with the TSPS office prior to definition of the signaling protocol for these trunks.

2.10 FGD CIC 4

Description: Is the SSP (Service Switching Point) capable of handling a four-digit CIC? A value of "Y" means a 4-digit CIC is used; "N" means the 3-digit CIC is still being used. This capability is indicated to the SCP (Service Control Point).

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When FGD CIC 4 is "Y",

- SIGNALING PROTOCOL must be "TRAD", "EA", "MEA", "INC" or "INCM", and TRUNK GROUP NUMBER must be entered.
- If SIGNALING PROTOCOL equals "TRAD", TRUNK GROUP NUMBER must be defined on a corresponding TKGRP form with TRKCLS set to either "EDSL", "EDSLHM", or "IC".

2.11 CI ROUTE TYPE

Description: Enter the Carrier Interconnect Route Description Type.

Sometimes more than one Route Index is required to specify more than one relevant entry in this field, even though they point to the same Trunk Group. For example, if overflow from direct Trunk Groups to carriers and overflow on local company Trunk Groups route to the same announcement, it is necessary to define two Route Indexes to establish proper measurements.

Required Field.
Default: OTHER
Valid Entries:

Valid CI ROUTE TYPE Entries

Entry	Definition
ALTRKBSY	The Route Index points to a tone or announcement because of an all trunks busy condition.
BADLATA	The Route Index points to an announcement due to the IC/INC misrouting the call. This may be a call terminating to an AT from an IC/INC, or to an EAEO if the Trunk Group is direct (not tandem) from an IC/INC.
CALLFORWARD	Forward the call for the Call Forward on Trunks feature. For more information, see Division 2, Section 4A273.
DTG	The Route Index points to a Trunk Group that is direct to an IC (interLATA Carrier) or an INC (International Carrier).
DTGOFL	The Route Index points to a tone or announcement on overflow from a DTG type Route Index.
GENANN	The Route Index points to an unspecified announcement.
ICRSTRCT	The Route Index points to an announcement due to an interLATA Carrier restriction.
NMFAIL	The Route Index points to an announcement due to Network Management blocking.
OTHER	Unspecified Route Type. (Used when the other values are not applicable to the Route Index being defined.) It may not be used for any announcement or tone route.

Copyright © 2003 Lucent Technologies

STG	The Route Index points to a shared Trunk Group from an EAEO to an AT (Access Tandem) and is used for calls bound for an IC/INC.
STGOFL	The Route Index points to a tone or announcement on overflow from a STG type Route Index.

Data Rules:

"OTHER" may not be entered if SIGNALING PROTOCOL is "INC" or "FGB", or for 5E8 and earlier, if ROUTE TYPE is "BUSY" or "REORDER".

If TRKCLS on the TKGRP form is set to either "RAFDTA", "RAFCTR" or "RAFAN", CI ROUTE TYPE must not be "OTHER".

For 5E13 and later, when CI ROUTE TYPE is "CALLFORWARD":

- the ACT field for SFID 273 on the SFSYS form must be set to "Y".
- ROUTE TYPE must be "DNTRAN".
- PREFIX DIGITS must be entered and length of PREFIX DIGITS must be 4.

For 5E14 and later, when CI ROUTE TYPE is "CALLFORWARD",

- the ACT field for SFID 273 on the SFSYS form must be set to "Y".
- TN must be entered.
- ROUTE TYPE must be "DNTRAN".
- PREFIX DIGITS must not be entered, and
- NEXT ROUTE must not be entered.

2.12 TN

Description: This field is used to assign the Call Forward TN associated with this route index.

Software Release: 5E14 and later
Valid Entries: 7-digit or 10-digit TN in the format: XXXXXXX or NXXXXXXXXX
where N = 2 - 9 and X = 0 - 9

Data Rules:

The first 3 digits of a 7-digit TN or the NPA/NXX combination (the first 6 digits of a 10-digit TN) must be defined as OFFICE CODE or NPA/OFFICE CODE, respectively, on a NOC form.

If the TN is 7 digits, there must be only one NOC form with the same value for the OFFICE CODE.

When TN is entered, ROUTE TYPE must be "DNTRAN" and CI ROUTE TYPE must be "CALLFORWARD".

2.13 REMARK

Description: This field may contain any information deemed locally necessary.
Valid Entries: up to 16 characters

2.14 ANI II DIGITS

Description: This field is used to assign ANI (Automatic Number Identification) Flexible Assignment

Copyright © 2003 Lucent Technologies

Number Identification pairs to the Route Index. Flexible Assignment of two ANI pairs is a secured feature. The Feature must be purchased by the office.

Software Release: 5E6 and later
Valid Entries: 0 - 99

Data Rules:

If ANI II DIGITS is entered, then SIGNALING PROTOCOL must be
- For 5E6 and 5E7: "EA" or "INC"
- For 5E8 and later: "EA","INC","MEA" or "INCM"

In addition, ANI OUTPULSING must be "Y".

2.15 LEC OS

Description: Are operator services provided by LEC as opposed to IC? If "N" is entered, then the operator services are provided by the IC. This field was added for the EAOSS Signaling for Operator Services Calls secured feature. For more information on the secured feature see Division 2, Section 4A11. The SFID (Secured Feature ID) is 11. If SFID 11 is activated on the SFSYS form (5713-1 Record) the following type of signaling may be accepted at a 5ESS Switch OSPS office.

LEC OS	SIGNALING PROTOCOL	CI ROUTE TYPE	SIGNALING PROVIDED
Y	INCM	STG	EAOSS
Y	MEA	STG	EAOSS
Y	MEA	STG	EOSS (no carrier specified)
N	INCM	STG	MEA
N	INCM	DTG	MEA
N	MEA	STG	MEA
N	MEA	DTG	MEA

If SFID 11 is not activated only the following signals will be provided:

LEC OS	SIGNALING PROTOCOL	CI CALL TYPE	SIGNALING PROVIDED
N	INCM	STG	MEA
N	INCM	DTG	MEA
N	MEA	STG	MEA
N	MEA	DTG	MEA

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then:
- SIGNALING PROTOCOL must be "INCM"
- or "MEA"
- CI ROUTE TYPE must be "STG"
- ANI OUTPULSING must be "Y"

This field is used by the EAOSS for Operator Services Calls feature. This is a secured feature and must be purchased by the office. Therefore, the ACT field for SFID 11 must be set to "Y" on the SFSYS form (5713-1 Record) before "Y" can be entered in the LEC OS field.

If "Y" is entered, the TRUNK GROUP NUMBER on this form must be defined as TGN on a TKGRP form with OUTPULSING equal to "MF".

2.16 # OVERLAP OUTPULSING

Copyright © 2003 Lucent Technologies

Description: Is Overlap Outpulsing allowed for this Route Index?

Required Field.
Valid Entries: Y, N

Data Rules:

An entry is allowed in this field if ROUTE TYPE is "HUNT".

For incoming Trunk Groups (TRK DIR on the TRKGRP form is "INC"), this field must be "N". If CI ROUTE TYPE is not "DTG", "STG" or "OTHER", then this field must be "N".

If this field is "Y" and SIGNALING PROTOCOL is "TRAD", then the PFAGPA form must have the same Route Index assigned in the ROUTE INDEX field and a ROUTE TYPE of "HUNT" entered.

Overlap Outpulsing may also be used for CI (Carrier Interconnect) calls associated with SIGNALING PROTOCOL values of "EA" and "INC". If Overlap Outpulsing is desired for a CI route, the ICF form (5305 Record) must have OVERLAP or SAC OVERLAP equal to "Y".

When the associated Trunk Group utilizes RP, this field must be "N".

For 5E6 and later, if the TRUNK GROUP NUMBER is defined on a TKGRP form with OUTPULSING entered as "ISUP7" or "CCIS6", the OVERLAP OUTPULSING on this form must be "N".

If the TRUNK GROUP NUMBER is defined on a TKGRP form with TRKCLS entered as "EDSL" or "EDSLHM", the OVERLAP OUTPULSING field on this form must be "N".

2.17 LDP RT LIST KEY

Description: The LDP RT LIST KEY field is a display only field used to indicate whether or not a route list (form RTLIST) exists for this ROUTE INDEX.

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

2.18 EON SUPPRESS CN

Description: Proprietary field.

CCS7 EQUAL ACCESS

Fields Section 2.19 - Section 2.24 refer to CCS7 Equal Access.

2.19 CKT CODE

Description: This field, to be transmitted in the Network Identification field of the TNS (Transit Network Selection) parameter of the CCS7 IAM (Initial Address Message), is a one or two digit circuit code that maps to an 0ZZ, 1NX or 1N'X digit string used in equal access and international signaling. The CKT CODE should be populated for Originating End Offices using equal access signaling over shared trunk groups using ISUP7 and for Originating Access Tandem offices that handle international traffic on incoming ISUP7 trunks.

Software Release: 5E6 and later
Default: 0
Valid Entries: 0 - 15

Data Rules:

Copyright © 2003 Lucent Technologies

When SIGNALING PROTOCOL is "INC", CKT CODE must be 0, 1, 2, or blank.

When the ROUTE INDEX is assigned to CCS7 trunks (OUTPULSING is set to "ISUP7" on the TKGRP form) and SIGNALING PROTOCOL is other than "TRAD" then CKT CODE must be non-zero. In particular, when the SIGNALING PROTOCOL is "INC", CKT CODE must be 1 or 2; when SIGNALING PROTOCOL is "EA" and CI ROUTE TYPE is "STG", CKT CODE must be 1 - 15.

For 5E7 and later, if CKT CODE is greater than 0, PREFIX DIGITS must not be entered.

For 5E9(2) and later, the CKT CODE on the RTIDX form must be entered with a value greater than 0 when:

- The SIGNALING PROTOCOL on the RTIDX form is set to "EA".
- The TRUNK GROUP NUMBER on the RTIDX form is entered.
- The matching TKGRP form (found by matching TRUNK GROUP NUMBER of the RTIDX form with the TGN of the TKGRP form) has OUTPULSING set to "ISUP7".
- TRKCLS on the same associated TKGRP form is "IC".
- The ROUTE DESTINATION TYPE on the RTIDX form is set to "STG".
- The SFID 188 on the SFSYS form is set to "Y".

For 5E9(2) and later, the CKT CODE on the RTIDX form must be 0 or unknown when:

- The SIGNALING PROTOCOL on the RTIDX form is set to "EA".
- The TRUNK GROUP NUMBER on the RTIDX form is entered.
- The matching TKGRP form (found by matching TRUNK GROUP NUMBER of the RTIDX form with the TGN of the TKGRP form) has OUTPULSING set to "ISUP7".
- TRKCLS on the same associated TKGRP form is "IC".
- The SFID 188 on the SFSYS form is set to "N".

2.20 CPN SUBSC

Description: Does the IC/INC (interLATA/International Carrier) subscribe to the CPN (Calling Party Number) parameter?

Enter "Y" if the CPN parameter can be sent in the outgoing IAM (Initial Address Message). Otherwise, enter "N".

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If CPN SUBSC is "Y", then SIGNALING PROTOCOL must not be "TRAD". If CPN SUBSC is "Y", the TRUNK GROUP
NUMBER must be defined on the TKGRP form with OUTPULSING equal to "ISUP7".

If TRUNK GROUP NUMBER is not entered, CPN SUBSC must be "N".

2.21 CSI SUBSC

Description: Should the CSI (Carrier Selection Information) parameter be sent to the IXC (InterLATA Exchange Carrier) in the IAM (Initial Address Message)?

If the OEO (Originating End Office) determines that an IXC is required to complete the call, and if circuit selection results in the selection of a CCS7 outgoing circuit either directly to the IXC or to an AT (Access Tandem), the OEO will mark the circuit busy and formulate an IAM.

Prior to the originating end office sending an IAM, this field will be checked by the operational software to determine if the CSI Parameter should be passed to the IXC in the IAM.

PIC has to be populated depending on the type of origination according to the following table, to allow CSI to populate the IAM message.

ORIGINATION	FORM	FIELD
Analog line	LINE	PIC
	IDPGP	GPIC
	OFCOPT	CARRIER ID
ISDN line	DSLUSR	PIC
	IDPGP	GPIC
	OFCOPT	CARRIER ID
PRI	TKGRP	PIC
	OFCOPT	CARRIER ID

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If SIGNALING PROTOCOL is "FGB" or "TRAD", this field must be "N".

If CSI SUBSC is "Y", OUTPULSING on the TKGRP form (5202 Record) must be "ISUP7".

2.22 ATP SUBSC

Description: Should the ATP (ISUP Access Transport) parameter be sent to the far switch in the IAM?

Q.931 Information Element transfer facilitates the transport of specific Q.931 information elements in the ISUP ATP (Access Transport Parameter) transparently between exchanges in the network.

Prior to sending an IAM message from an OEO, this field will be checked by the operational software to determine if the ATP parameter should be passed to the far switch.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

MF trunks must be "N".

If SIGNALING PROTOCOL is "FGB" or "TRAD", this field must be "N".

If ATP SUBSC is "Y", OUTPULSING on the TKGRP form (5202 Record) must be "ISUP7".

2.23 UUI SUBSC

Description: Should the UUI (User to User Information) parameter be sent to the far switch in the IAM?

The UUI parameter of the an ISUP message allows ISDN customers to exchange user data transparently through the network during call setup and call clearing.

Prior to sending an IAM message from an originating end office, this field is checked by the operational software to determine if the UUI parameter should be passed to the far switch.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

MF trunks must be "N".

If SIGNALING PROTOCOL is "FGB" or "TRAD", this field must be "N".

If UUI SUBSC is "Y", OUTPULSING on the TKGRP form (5202 Record) must be "ISUP7".

2.24 CICP SUBSC

Description: Should the CICP (Carrier Identification Code Parameter) be included in the IAM (Initial Address Message) sent from the originating end office to the far switch?

The CICP SUBSC field supports the Carrier Identification Parameter secured feature (SFID 9). For more information on the Carrier Identification Parameter secured feature, see Division 2, Section 4A9.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field is used by the Carrier Identification Code Parameter special feature. It is a secured feature that must be purchased by the office and the ACT field for SFID 009 on the SFSYS form must be set to "Y" before this field can be set to "Y".

For interworking between Multi Frequency and CCS7 trunks, if CICP SUBSC is "Y", the CICP will not be included in the outgoing IAM if the value of the CICP BLOCK is "Y" on OFCOPT form.

If CICP SUBSC is "Y", then:
- TGN must be entered and must not 0
- SIG PRO must be "EA", "INC", or "MEA"

If "Y" is entered, then the TRUNK GROUP NUMBER must be defined on the TKGRP form where OUTPULSING is "ISUP7".

Copyright © 2003 Lucent Technologies

If "Y" is entered and SIGNALING PROTOCOL is "INC", then TRUNK GROUP NUMBER cannot be defined on the TKGRP form where TRKCLS is "IC".

TRUNK GROUP SELECTION LIST (TGSL)

The following fields are used to administer the TGSL. A TGSL consists of an ordered list of route index values. The end of each TGSL is marked by a null value in the NEXT ROUTE field. Each route index is associated with a TRUNK GROUP NUMBER value. Eight types of TGSLs are supported and are shown in Figure 1 . Trunk groups that are contained in each TGSL must have characteristics that are consistent with the types of calls that use each TGSL. Figure 1 shows the allowed trunk group data for trunk groups that are contained in each of the types of TGSLs. A value of "x" indicates that trunk groups with the indicated data values are legal for the type of TGSL shown. These restrictions are only enforced by the software for the first trunk group in each TGSL, but this should be manually administered for all trunk groups. Note that the entries for the SPEECH ALT RI and DATARATE ALT RI fields cannot be equal.

2.25 SPEECH ALT RI

Description: Enter the Alternate Route Index for a Speech Call. This route index is used when a call has a bearer capability of "speech". For more information on the Routing Based On Bearer Capability see Division 2, Section 1W on CCS7 ISDN User Part Enhancements.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The entry for SPEECH ALT RI must not equal the entry for ROUTE INDEX.

SPEECH ALT RI must not equal the DATARATE ALT RI for the following:
- 56K
- 64K
- R64K
- 384K
- 1536K
- MULTIRATE.

The entry in this field must be defined on a corresponding RTIDX form with a ROUTE TYPE of "HUNT". In addition, there must be a corresponding TKGRP form defined with the SPEECH TRMTS field set to "Y".

DATARATE ALT RI

Fields Section 2.26 - Section 2.31 refer to Alternate Route Indexes for wide band data rates. DATARATE ALT RI entries can be either segregated (data-only) or non-segregated (data and voice) data rates.

For Circuit Switched Data calls, the Alternate Data Route Index is used for the first route, based on the bearer capability of the call. When an "all trunks busy" condition is encountered, the routes that are selected using the NEXT RTI do NOT select different alternate data routes (DATARATE ALT RI) based on the bearer capability, but use the trunk group specified by the selected NEXT RTI. Therefore, the trunk group that is referenced by the NEXT RTI must specifically support data calls for all bearer capabilities that the trunk group on the primary RTI can support. For example, if the Trunk Group pointed to by a particular Route Index supports 64K data calls, then the trunk group that the NEXT RTI points to MUST ALSO support 64K data calls.

Copyright © 2003 Lucent Technologies

Prior to 5E9(1), data rates "56K", "R64K", and "64K" were entered on the DTRTX form (5314 Record).

The following data rules apply collectively to the specific DATARATE ALT RI entries indicated below; and are further illustrated in Figure 1 :

- If any DATARATE ALT RI field entry equals ROUTE INDEX, ROUTE TYPE must be "HUNT".
- When a DATARATE ALT RI field entry for 56K, R64K, and 64K points to a TGN on the TKGRP form (via the RTIDX form) that is defined for segregated traffic (data only), the implied DATA RATE on the RTIDX form (i.e., 56K, R64K, or 64K) must match the DATA RATE on the TKGRP form.
- DATARATE ALT RI entries must not be assigned on any of the following forms: HGRPAS (5115 Record), IDDD (5307 Record), INDIT (5309 Record), LDIT (5300 Record), LINE (5109-1/2/3 Record), MLDIT 5300-3/5 Record), RDIT (5300-7/8 Record), PDIT (5300-2 Record) or RAR (5301 Record). Only "EDSL" and "EDSLHM" type trunk groups or trunks using CCIS6 or ISUP7 signaling are capable of handling non-segregated traffic (both voice and data).
- DATARATE ALT RI field entries for 56K, R64K, and 64K that point to a TGN on the TKGRP form (via the RTIDX form) whose TRKCLS is not "LTOLLCON", "TTOLLCON", "PRINTOLL", "EDSL", "EDSLHM", "IFOPER", "IFTERM", "SCINTOLL", "IC", "LATA", "PF", "PFITT", or "PFLASH"is not permitted.
- When a narrow band DATARATE ALT RI field (56K, R64K, or 64K) points to a Trunk Group via an RTIDX form that is defined on the TKGRP form as an EDSL, CCIS6 or ISUP7 type Trunk Group (capable of handling both voice and data), the DATA RATE on the TKGRP form cannot be less than the implied data rate on the original RTIDX form.
- When a wide band DATARATE ALT RI field (384K, 1536K, or MULTIRATE) points to a Trunk Group via an RTIDX form, the WB RATE field on the TKGRP form must be entered and must correspond with the implied RTIDX wide data rate in the following manner:

DATARATE ALT RI	WB RATE
384K	384K, 384/1536K, or MULTIRATE.
1536K	384/1536K, 1536K, or MULTIRATE.
MULTIRATE	384K, 384/1536K, or 1536K or MULTIRATE.

2.26 56K

Description: Enter the Alternate Route Index for 56 KB/s calls.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

2.27 R64K

Description: Enter the Alternate Route Index for restricted 64 KB/s calls.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Copyright © 2003 Lucent Technologies

2.28 64K

Description: Enter the Alternate Route Index for 64 KB/s calls.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

2.29 384K

Description: Enter the Alternate Route Index for 384 KB/s calls.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

2.30 1536K

Description: Enter the Alternate Route Index for 1536 KB/s calls.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

2.31 MULTIRATE

Description: Enter the Alternate Route Index for Multirate calls.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

3. FORM ENTRIES 5303-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each page of the record.

PACKET SWITCHING

3.2 DESTINATION PSN

Description: This field specifies the Packet Switch Number of the destination switch in a Packet Switching Network. The Destination PSN is the PSN of a 5ESS Switch that resides in the same IP (Internal Protocol) subnetwork as the originating switch. The Destination PSN entered is either the PSN of a 5ESS

Copyright © 2003 Lucent Technologies

Switch where the terminating CPE is located or the PSN of the 5ESS Switch where the gateway trunk group to the PPSN (Public Packet Switched Network) is located.

Software Release: 5E3 and later
Valid Entries: 1 - 255

Data Rules:

If the DESTINATION PSN is entered, then the Trunk Group Number must be entered on this form and defined on the TKGRP form with a TRKCLS of "PACKET".

If no EQPSUPH form (5742 Record) exists with an EQST entry of "O", then this field must not be entered.

For 5E5 - 5E10, a value entered in this field may not be assigned as the DESTINATION PSN on any other RTIDX form. Also, it may not be assigned as the PSN on the ISDNOPT form (5941 Record).

For 5E11 and later, when DESTINATION PSN is entered, a value must be entered for PSN on the ISDNOPT input form (5941 Record).

3.3 RTE SEARCH LMT

Description: The RTE SEARCH LMT field is used to specify how far down the route list the switch will search. The route search limit is sent to the downstream switch.

Valid RTE SEARCH LMT Entries

Entry	Definition
1 - 5	Supported by 5ESS
1 - 15	Other vendors
blank	no entry

Data Rules:

When RTE SEARCH LMT is entered, TRUNK GROUP NUMBER must be entered.

3.4 TERM NSC

Description: The TERM NSC field is used to specify the terminating network selection code for calls exiting the switch on this route. This default TERM NSC will only be included in the signaling if the call does not already have a TERM NSC assigned to it, and is exiting the switch on a MINT route.

Software Release: 5E12 and later.
Valid Entries: 0 - 999 or leave blank

Data Rules:

When TERM NSC is entered, TRUNK GROUP NUMBER must be entered.

When TERM NSC is entered on the RTIDX form, the TERM NSC must be defined on the LDPTNSC form.

When TERM NSC is known on the RTIDX form, MINT SIG TYPE must be known on the TKGRP form. In addition, when MINT SIG TYPE is "BETA" on the corresponding TKGRP form, TERM NSC must be between 0 and 63 on the RTIDX form. TRUNK GROUP NUMBER on the RTIDX form matches TGN on the TKGRP form.

3.5 TDR

Description: Is Time Dependent Route active for this Route Index?

Software Release: 5E12 and later.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When TDR is set to "Y" on the RTIDX form, a corresponding TDR form must exist with ROUTE INDEX matching ROUTE INDEX on the RTIDX form.

When TDR is set to "N" on the RTIDX form, a corresponding TDR form must not be found.

3.6 FNL RT TRIG NBR

Description: The FNL RT TRIG NBR field is used to specify the ASP trigger for the final route.

Software Release: 5E14 and later
Default: BLANK
Valid Entries: Blank, or 1 - 255

Data Rules:

When FNL RT TRIG NBR is entered:

- NEXT ROUTE cannot be entered.
- ROUTE TYPE must be "BUSY", "HUNT", or "REORDER".
- FNL RT TRIG NBR must be defined as TRIG NBR on the NSTRIG form.
- APPLICATION must be "ASP" and AIN REL must be "R0D1" on the NSTRIG form.
- The ACT field for SFID 290 on the SFSYS form must be set to "Y".

3.7 REL LINK TYPE

Description: This field is used to indicate the signaling protocol used for Release Link for Toll calls.

Software Release: 5E14 and later

Valid Entries	
Entry	**Description**
ANSI	Standard Protocol
TOPS	Nonstandard Protocol
BLANK	No release link processing enabled

Data Rules:

When REL LINK TYPE is set to "ANSI", the SFSYS form must have the ACT field for SFID 520 set to "Y".

When REL LINK TYPE is set to "TOPS", the SFSYS form must have the ACT field for SFID 521 set to "Y".

When REL LINK TYPE is entered, TRUNK GROUP NUMBER must be entered.

When REL LINK TYPE is entered, the TRUNK GROUP NUMBER on the RTIDX form must be defined on the TKGRP form and :

- TRKCLS must be "TTOLLCON" or "IC",
- CCS7 TYPE must be unknown or "BELLCORE",
- OUTPULSING must be "ISUP7", and

Copyright © 2003 Lucent Technologies

- TRK DIR must be "OUT" or "2W".

CRITICAL DATA INDICATOR

The following (fields Section 3.8 - Section 3.9) support the RC Translations Protection For Highly Critical Elements feature, see Division 2, Section 1BY for more information.

3.8 CRIT IND

Description: This field supports the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT IND field is used to indicate whether the route index data is critical.

Software Release: 5E13 and later
Required field.
Default: N
Valid Entries: Y, N

3.9 CRIT RMK

Description: This field enhances the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT RMK field is used to enter a remark to explain why this route index data is critical.

Software Release: 5E15 and later
Valid Entries: Enter up to 32 characters

Data Rules:

When the RTIDX form has the CRIT RMK field entered, the SFSYS form SFID 566 ACT field must be set to "Y".

3.10 OMIT CHARGE

Description: This field indicates whether or not the CHG (Charge Number) pemeter should be omited from the SS7 IAM (Initial Address Message) if the DN (Directory Number) of the CPN (Calling Party Number) parameter and CHHG parameter are the same.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

SS7 OPERATOR SERVICES

The following fields (Section 3.11 - Section 3.14) supports the SS7 Using Operator Services feature. For more information see, Division 2, Section 4A603.

3.11 OPERATOR SIG

Description: This field indicates which SS7 Operator Signaling method should be used on this route.

Software Release: 5E16 and later
Valid Entries:

Entry	Defition
blank	Existing method.
BASIC	Basic Nature of Address method.

MOD	Modified Nature of Address method.

Data Rules:

When OPERATOR SIG is entered, TRUNK GROUP NUMBER must be entered.

3.12 OPERATOR ACCESS

Description: This field indicates whether or not Access Signaling Information should be included in the OSI (Operator Services Information) parameter of outgoing IAM involving InterLata carriers on this route.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

When OPERATOR ACCESS is "Y", OPERATOR SIG must be "MOD".

3.13 CONNECTION HOLD

Description: This field indicates whether or not operator Connection Hold is supported on this route.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

3.14 CARRIER ID

Description: This field indicates which carrier is providing Operator Services.

Software Release: 5E16 and later
Valid Entries: 0 - 9999

TRUNK GROUP SELECTION LISTS										
TRUNK GROUP DATA			TYPE OF TGSL							
DATA RATE	WBRATE	SPEECH	RTI*	SPEECH ALT RI	56K	R64K	64K	384K	1536K	MULTI-RATE
Null	Null	Y		X						
Null	Null	N	X							
56K	Null	N	X		X					
R64K	Null	N	X		X	X				
64K	Null	N	X		X	X	X			
64K	384K	N	X		X	X	X	X		X**
64K	1536K	N	X		X	X	X		X	X**
64K	384/1536K	N	X		X	X	X	X	X	X**
64K	MULTIRATE	N	X		X	X	X	X	X	X

Notes: *This is the normal route index value that the TGSL used for speech and 3.1 Khz calls.**Must be at the end of the TGSL. Calls with certain values of N are released (for example, a 384K TG and a multirate call with N not equal to 6).

SEC. 3Q: 5304 RECORD
BRCS - MC ROUTE INDEX EXPANSION FORM - MCRTIDX

1. GENERAL

The 5304 Record is used to determine routing for various BRCS capabilities.

The MCRTIDX (Modular Customization Route Index) is similar to the Route Index defined on the RTIDX form (5303 Record). The MCRTIDX form, however, allows additional information that is required for ARS (Automatic Route Selection) and sometimes used for PFA (Private Facility Access). An MC Route Index is usually required if an SFG (Simulated Facility Group) is used. The only exception is when the SFG is associated with six-port conference circuits. In this case the PFATG form (5609-2 Record) points directly to the SFG Number.

The following list of forms may contain an MCRTIDX which points to this form:

	Form	Record
TKEDSLD	EDSL Call by Call Features	5209
ARSGPA	Automatic Route Selection Group Parameter	5608-2
PFAGPA	Private Facility Access Group	5609-5
PFAINWT	INWATS Simulated Facility TN	5609-4
PFATG	PFA Terminal Group Facility	5609-2
PPSCRN	Precedence and Preemption Screening	5618-2

The MC Route may be defined for accessing a Trunk Group which may be a private facility, an SFG, or as an overflow to POTS routing.

MC Route Indexes defined for overflow to POTS and for OUTWATS SFGs invoke special call processing which is not required for the other cases. In the overflow to POTS case, which may be used as the last route in an ARS route sequence, the MCRTIDX is pointed to from a NEXT MC ROUTE INDEX entry. The MCRTIDX is defined with MC ROUTE TYPE equal to "MC" and CARRIER ID equal to some numeric.

For the OUTWATS SFG case, which is available for EDSL (Extended Digital Subscriber Line) trunks, the MCRTIDX is defined with MC ROUTE TYPE equal to "SFG", the SFG NUMBER entered and a CARRIER ID entered. The EDSL feature, which is available in 5E4(2) and later Software Releases, uses the MC ROUTE INDEX to gain access to SFGs. This route may be any route in an ARS route sequence or may be a unique route from the PFA Group information. If an SFG "port" associated with the OUTWATS SFG is available, then a Screening Index and an optional OUTWATS Billing Number is accessed from the PFASFG form (5609-3 Record). If all of the OUTWATS SFG "ports" are busy, the NEXT MC ROUTE INDEX is checked for the next route.

For both overflow to POTS and the successful access of an OUTWATS SFG "port", the Carrier ID is used to access the appropriate ICF form (5305 Record). From this point on, the call processes like any POTS call would, including checking for consistency between the type of carrier and Type of CI Call. If the ICF form has DIG ROUTING equal to "Y", the CDIM form (5300-6 Record) is accessed for the Carrier's routes. If the Carrier ID is defined as the LEC (Local Exchange Carrier), the calls may route to either lines or trunks based on entries from POTS digit analysis. The call continues by entering the RAR form (5301 Record). The Screening Index from the PFASFG is used for OUTWATS calls and the terminal's Screening Index is used for overflow to POTS calls.

A Carrier ID is required on the MCRTIDX for both of these cases, even when other Carrier Interconnect information has not been entered for this office. Until Carrier Interconnect is active, any Carrier ID may be entered as long as it is defined on an ICF form with one of the test ACCESS TYPEs. This will cause the calls to route as if they were not carrier calls.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.4.

Copyright © 2003 Lucent Technologies

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MC ROUTE INDEX

Description: Enter the number of the MC ROUTE INDEX being defined.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

2.3 # MC ROUTE TYPE

Description: Enter the MC Route Type which defines the routing treatment.

Required Field.

Valid MC ROUTE TYPE Entries

Entry	Definition
ASP	Software Release: 5E8 and later. Used for ASP (Advanced Services Platform; previously PVN (Private Virtual Network)) calls coming from an ARS list. When this route type is used, an ASP origination will occur resulting in either a route to an SSP (Service Switching Point) if at an NAP (Network Access Point) or a query to an SCP (Service Control Point) if at an SSP. This route type cannot be entered when ASP OFC (PVN OFC for 5E6 -5E7) on the OFCOPT form is set to "NONE", since that would indicate that the office does not support ASP.
BUSY	Software Release: 5E7 and later. Busy tone treatment for failure.
DNTRAN	Software Release: 5E5 and later. Used for Inter-module trunks secondary routes across NCT links. When this route type is used, the TN will be completed across the NCT links if the TN terminates on the same Switch. If the TN does not terminate on the host Switch, the call will fail.
MC	Used for hunting a specified Trunk Group or for overflow to POTS.
PVN	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASP". See the description under "ASP".
REORD	Reorder tone.
SFG	Used for hunting a specified Simulated Facility Group.

Data Rules:

ASP
If "ASP" is entered, then the following cannot be entered:
- CARRIER ID
- SFG NUMBER

If "ASP" is entered and ASP OFC set to "SSP" on the OFCOPT form, then the TRUNK GROUP NUMBER, DIGITS TO BE DELETED, PREFIX DIGITS, NEXT ROUTE, and NEXT MC ROUTE INDEX cannot be entered.

BUSY or REORD
If "BUSY" or "REORD"is entered, then the following cannot be entered:
- DIGITS TO BE DELETED
- PREFIX DIGITS

Copyright © 2003 Lucent Technologies

- SFG NUMBER
- TRUNK GROUP NUMBER

If "BUSY" or "REORD"is entered, then PERFORM PREEMPT HUNT must be "N".

MC
If "MC" is entered and TRUNK GROUP is unknown, then CARRIER ID must be entered.

If "MC" is entered, then SFG Number cannot be entered.

If "MC" is entered and TRUNK GROUP NUMBER AND NEXT ROUTE are entered, and the corresponding TKGRP form has INTER SM TRK of "Y" (TGN matches the TRUNK GROUP NUMBER on this form) then the NEXT ROUTE values on the TKGRP are MC ROUTE INDEX values and must be defined on another MCRTIDX form. In addition, it the MC ROUTE TYPE on the second MCRTIDX is "DNTRAN", NEXT ROUTE on that MCRTIDX form must match the NOC on the NOC form.

SFG
If "SFG" is entered, then SFG NUMBER must be entered, and PERFORM PREEMPT HUNT must be "N".

2.4 TRUNK GROUP NUMBER

Description: Enter the Trunk Group Number.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 - 5E14: 1 - 4000
- For 5E15: 1 - 4000 for circuit trunk groups or 7000 - 7999 for BICC groups
- For 5E16 and later: 1 - 4000

NOTE: Entries greater than 999 are allowed only when the range of 1-999 is completely exhausted.

Data Rules:

For 5E4(2) and later, do not enter a value in this field when the MC ROUTE INDEX on this form equals the MC ROUTE INDEX on a TKEDSLD form (5209 Record). Also, if the SFG TYPE value on the PFASFG form (5609-3 Record) is "OUTWATS", "EDSL", "OESSX" or "2WESSX" leave this field blank.

If SFG NUMBER is entered and a PFASFG form is defined with the SFG NUMBER and an SFG TYPE of "EDSL", "MEGACOM" "OUTESSX", "OUTWATS" or "2WESSX" then this field cannot be entered.

When the MC ROUTE TYPE is "MC", either a TRUNK GROUP NUMBER or a CARRIER ID must be entered. When the MC ROUTE TYPE is "REORD" or "DNTRAN", leave this field blank.

If MC ROUTE TYPE is "PVN" and PVN OFC on the OFCOPT form (5509 Record) is "BILLNAP" or "NOBILLNAP", then this field must be entered. When MC ROUTE TYPE is "PVN", the corresponding TKGRP form (5202 Record) must have OUTPULSING set to "MF" or "ISUP7". If MC ROUTE TYPE is "PVN" and PVN OFC on the OFCOPT form is "SSP", then this field cannot be entered since the MC ROUTE TYPE triggers a query to the SCP from this SSP.

If TRUNK GROUP NUMBER is entered, and OUTPULSING is "ISUP7" and MINT SIG TYPE is entered on the corresponding TKGRP form, SIGNALING PROTOCOL must not be "FGB" on the MCRTIDX form.

For 5E12 and later, when TRUNK GROUP NUMBER is entered on the MCRTIDX for, the TRUNK GROUP NUMBER must be defined on the TKGRP form.

For 5E12 and later, when TRUNK GROUP NUMBER is entered on the MCRTIDX form, and

Copyright © 2003 Lucent Technologies

OUTPULSING is "MF" and MINT SIG TYPE is entered on the corresponding TKGRP form, SIGNALING PROTOCOL must be "TRAD" on the MCRTIDX form.

2.5 SFG NUMBER

Description: Enter the Simulated Facility Group Number.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

When the MC ROUTE TYPE is "SFG", this field must have an entry. When the MC ROUTE TYPE is "MC", "DNTRAN", "REORD", or "PVN", leave this field blank. If both the SFG NUMBER and CARRIER ID fields are entered, then a PFASFG form must be entered with the SFG NUMBER and a SFG TYPE of "OUTWATS" or "EDSL". For the 5E5 Software Release, SFG TYPE may also be "OUTWATS", "EDSL", "OESSX" or "2WESSX". In 5E6, SFG TYPE may also be "MEGACOM" or "M800".

For 5E11 and later, when the MCRTIDX input form(s) are defined with known values for the SFG NUMBER and the CARRIER ID there must be PFASFG form(s) defined with an SFG NUMBER as the key and the corresponding SFG TYPE set to "EDSL", "HM", "MEGACOM", "M800", "OESSX", "OUTWATS'", "SCOCS", "SDN", or "2WESSX".

When the MCRTIDX form has SFG NUMBERs defined on PFASFG forms with a SFG TYPE of "INFX", "INTIE", "HM", "OUTFX", "OUTTIE", "SCOCS", "2WFX" or "2WTIE", NEXT ROUTE can not be entered on the MCRTIDX form.

2.6 CHARGE INDEX

Description: Enter the CHARGE INDEX. The CHARGE INDEX is used when the MCRTIDX being defined is used for ARS and is not an OUTWATS SFG or overflow to POTS. OUTWATS SFG and overflow to POTS calls, as well as PFA cases, will use the Charge Index (CHGI) found on the appropriate RAR form (5301 Record). The CHARGE INDEX is also used for overflow to a "2WESSX", "INESSX", "OUTESSX", "2WCCSA", "INCCSA", and "OUTCCSA" SFG.
Valid Entries: 1 - 2047

Data Rules:

For 5E7 and later when TRUNK GROUP NUMBER is entered, CHARGE INDEX must be entered to prevent AMA irregularities.

2.7 CARRIER ID

Description: Enter the InterLATA Carrier ID associated with the CI (Carrier Interconnect) capability.
Valid Entries:
- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

If a CARRIER ID is entered, it must be defined on an ICF form (5305 Record) . In addition, for 5E8 and later, the ICF form's FEAT GRP must be equal to "D".

If both the SFG NUMBER and CARRIER ID fields are entered, then a PFASFG form must be defined with the SFG NUMBER and an SFG TYPE of "OUTWATS" or "EDSL". For 5E5, SFG TYPE may also be "OUTWATS", "EDSL", "OESSX" or "2WESSX". For 5E6, SFG TYPE may also be "MEGACOM" or

Copyright © 2003 Lucent Technologies

"M800".

A CARRIER ID cannot be entered when MC ROUTE TYPE is "PVN".

When CARRIER ID is entered, TRUNK GROUP NUMBER may not be entered.

2.8 DIGITS TO BE DELETED

Description: Enter the number of digits to be deleted from the dialed number before PREFIX DIGITS, if any, are prefixed. This field is used when a TRUNK GROUP NUMBER has been entered. If no digits are to be deleted or if MC ROUTE TYPE is "REORD", leave this field blank. This field should be blank if this Route Index is pointed to by a PFA (Private Facility Access) dial code (defined on a PFAGPA form) that is used to access a cut-through trunk (DIG COLL field on the PFAGPA form is "N").
Valid Entries: 1 - 15

Data Rules:

If MC ROUTE TYPE is "PVN" and PVN OFC on the OFCOPT form (5509 Record) is "SSP", then this field cannot be entered.

2.9 PREFIX DIGITS

Description: Enter digits to be prefixed for outpulsing. If MC ROUTE TYPE is "REORD", leave this field blank.
Valid Entries: up to 10 digits

Data Rules:

If PVN OFC on the OFCOPT form (5509 Record) is "BILLNAP" or "NOBILLNAP" and MC ROUTE TYPE is "PVN", then PREFIX DIGITS must be filled out in one of two ways depending on type of outpulsing available on the trunk group; if OUTPULSING on the associated TKGRP form (associated via TRUNK GROUP NUMBER on this form) is set to "MF", then PREFIX DIGITS must contain the 0ZZ value (where Z = 0 - 9) to be outpulsed; if OUTPULSING on the associated TKGRP form is set to "ISUP7", then PREFIX DIGITS must contain the circuit code (range 00 - 15) to be sent in the CCS IAM (Initial Address Message) message to the SSP for conversion to an 0ZZ or 1NX code via the CKTCODE form (5311 Record, providing that the far end is a 5ESS Switch). If MC ROUTE TYPE is "PVN" and PVN OFC on the OFCOPT form (5509 Record) is "SSP", then this field cannot be entered.

2.10 NEXT ROUTE

Description: Enter the alternate POTS Route Index. This field is checked only when the route is associated with an SFG, an SFG "port" is successfully accessed but the physical trunks are all busy. This is not applicable for OUTWATS SFGs.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11: 1 - 4095
- For 5E12: 1 - 4095 for a Route Index or 1 - 8190 for a Normalized Office Code (MC ROUTE TYPE = "DNTRAN")
- For 5E13 and later: 1 - 16382 for a Route Index or 1 - 8190 for a Normalized Office Code (MC ROUTE TYPE = "DNTRAN")

Data Rules:

If MC ROUTE TYPE is "DNTRAN", then a Normalized Office Code (NOC) must be entered in this field. The NOC entered must be defined on a NOC form (5501 Record).

For DSN (Defense Switched Network) offices, there are two special applications for the NEXT ROUTE

Copyright © 2003 Lucent Technologies

INDEX field. These applications apply when an MC ROUTE INDEX is associated with an SFG that has been defined on the PFASFG form with an SFG TYPE of either "EOPAT" (End Office Precedence Access Threshold) or "NETPAT" (Network Precedence Access Threshold).

- When the SFG TYPE is "EOPAT", the NEXT ROUTE INDEX is actually another MC ROUTE INDEX and must be defined on the MCRTIDX form.
- When the SFG TYPE is "NETPAT", the NEXT ROUTE INDEX is a ROUTE PATTERN value and must be defined on the PPPOLY form (5618-7 Record). Ordinarily, the route index obtained from digit analysis (LDIT) would be used as the ROUTE PATTERN entry on the PPPOLY form, unless a route index value is entered here, which would override the route index obtained from digit analysis.

If MC ROUTE TYPE is "PVN" and PVN OFC on the OFCOPT form (5509 Record) is "SSP", then this field cannot be entered.

2.11 NEXT MC ROUTE INDEX

Description: Enter the alternate MC ROUTE INDEX This field is checked when all of the ports are busy. The ports will be physical trunks if a TRUNK GROUP NUMBER has been entered or they will be simulated if an SFG NUMBER has been entered. An entry here specifies the next route to attempt.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13: 1 - 16382

Data Rules:

If a true alternate MC ROUTE INDEX is not required, the NEXT MC ROUTE INDEX field is left blank and reorder will be automatically provided on overflow for all SFG TYPES defined on a PFASFG form (5609-3 Record) except "INWATS", "IESSX" and "2WESSX". (However, an MCRTIDX should be defined for this office with MC ROUTE TYPE equal to "REORD".) However, if the SFG TYPE is "INWATS", "IESSX" or "2WESSX", and a true alternate MC ROUTE INDEX is not required, then the NEXT MC ROUTE INDEX field is left blank and if it is a LINE TERMINATION then a busy treatment is automatically returned on overflow, and if it is a trunk termination then a REORDER treatment is returned on overflow.

If this field has a value, and MC ROUTE TYPE on this form is "REORD", then reorder will be provided for the three previously mentioned SFG TYPES.

If a NEXT MC ROUTE INDEX is specified, the numeric value must not equal the value of the MC ROUTE INDEX being defined. That is, an MC ROUTE INDEX may not alternate to itself.

When an alternate Route Index is defined for a PFA (Private Facility Access) trunk, the Trunk Group associated with the alternate Route Index must have the same characteristics as the primary Trunk Group. For example, if a primary route points to a cut-through trunk, then the alternate Route Index should also point to a cut-through trunk.

If MC ROUTE TYPE is "PVN" and PVN OFC on the OFCOPT form (5509 Record) is "SSP", then this field cannot be entered.

2.12 SEGMENTED SIGNALING

Description: Will a cut-through indicator for ARS Segmented Signaling be required?

Software Release: 5E3 and later
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If a "Y" is entered, the MC ROUTE TYPE must be "MC" and the TRUNK GROUP NUMBER entered must be defined on the TKGRP form with the CUT THRU field set to "Y".

2.13 OVERLAP OUTPULSING

Description: Is Overlap Outpulsing allowed for this MC ROUTE INDEX? This field is applicable only when a TRUNK GROUP NUMBER has been entered.
Valid Entries: Y, N

2.14 SIGNALING PROTOCOL

Description: Enter the SIGNALING PROTOCOL to be used for this MC ROUTE INDEX. If the TRUNK GROUP NUMBER field is left blank, ODA will use "TRAD" in the 5ESS Switch database. This field is applicable only when a TRUNK GROUP NUMBER has been entered.

Valid SIGNALING PROTOCOL Entries

Entry	Definition
TRAD	Traditional LAMA/CAMA signaling.
EA	Carrier Interconnect Equal Access signaling. For 5E8 and earlier, this is used in FGD and FGB Transitional Access where CIC (Carrier Identification Code) is 000 - 999. For 5E9(1) and later, this is used in FGD where the CIC is 0000 - 9999, and for Transitional Access where the CIC is 0000 - 0999.
INC	Carrier Interconnect Equal Access signaling for international calls.
FGB	Carrier Interconnect signaling to Feature Group B carriers that utilize the Interim Carrier access dialing plan, 950-1XXX. For 5E8 and later, the dialing plan is 950-XXXX.
PNANI	Software Release: 5E7 and later. SIGNALING PROTOCOL "PNANI" is used by the Automatic Number Identification over Private Facilities special feature. This feature must be purchased by the office.

Data Rules:

If TRUNK GROUP NUMBER is not entered, then SIGNALING PROTOCOL cannot be entered.

If this MC Route Index is associated with a PFA dial code (defined on a PFAGPA form), then this field should be "TRAD".

For 5E7 and later, for the ANI over PF feature, SIGNALING PROTOCOL must be "PNANI". When "PNANI" is entered, CI ROUTE TYPE must be "OTHER", OVERLAP OUTPULSING must be "N", and ANI OUTPULSING must be "Y". The ANI over PF special feature will allow only the following classes of service on the originating port: "PF", "PFITT" (PF Intertandem Trunk), "INDIV" (Individual Line), "ISDN" (Digital Subsciber Line associated with ISDN service), "ATTENDANT" (Attendant Line), and "ISATND" (ISDN Attendant). "PNANI" may not be entered unless the ANI over PF secured feature has been activated with FEATURE ID 5 set to "S" on the SFSYS form (5713 Record). (See Division 2, Section 4A5 for information on secured features.)

For 5E7 and later, when SIGNALING PROTOCOL is "EA", CI ROUTE TYPE must be entered and must not be "OTHER".

2.15 FGD CIC 4

Description: Is the SSP capable of handling a four-digit CIC? A value of "Y" means a 4-digit CIC is used; "N" means the 3-digit CIC is still being used. This capability is indicated to the SCP.

Software Release: 5E9(1) and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When FGD CIC 4 is "Y",

- SIGNALING PROTOCOL must be "TRAD", "EA" or "INC", and TRUNK GROUP NUMBER must be entered.
- If SIGNALING PROTOCOL is set to "TRAD", the TRUNK GROUP NUMBER must be defined on a corresponding TKGRP form with TRKCLS set to either "EDSL", "EDSLHM", or "IC".

2.16 CI ROUTE TYPE

Description: Enter the Route Description Type used for the Carrier Interconnect capability (but not just for carrier calls). This field is applicable only when a TRUNK GROUP NUMBER has been entered.

Valid CI ROUTE TYPE Entries

Entry	Definition
OTHER	Unspecified route type; this value should not be used for any announcement or tone route.
DTG	The MC ROUTE INDEX points to a Trunk Group that is direct to an IC (InterLATA) or an INC (International Carrier).
STG	The MC ROUTE INDEX points to a shared Trunk Group from an EAEO (Equal Access End Office) to an AT (Access Tandem) and is used for calls bound for an IC/INC.
DTGOFL	The MC ROUTE INDEX points to a tone or announcement on overflow from a DTG type Route Index.
STGOFL	The MC ROUTE INDEX points to a tone or announcement on overflow from a STG type Route Index.
ALTRKBSY	The MC ROUTE INDEX points to a tone or announcement because of an all trunks busy condition.
GENANN	The MC ROUTE INDEX points to an unspecified tone or announcement.
NMFAIL	The MC ROUTE INDEX points to a tone or announcement due to NM (Network Management) blocking.
BADLATA	The MC ROUTE INDEX points to a tone or announcement due to the IC/INC misrouting the call. This may be a call terminating to an AT from an IC/INC or to an EAEO if the Trunk Group is direct (not tandem) from an IC/INC.
ICRSTRT	The MC ROUTE INDEX points to a tone or announcement due to an InterLATA carrier restriction.

Data Rules:

Sometimes more than one MC ROUTE INDEX is required to specify more than one relevant entry in this field, even though they point to the same Trunk Group. For example, if overflow from direct Trunk Groups to carriers and overflow on local company Trunk Groups route to the same announcement, it is necessary to define two Route Indexes to establish proper measurements.

2.17 FRL GROUP

Description: This field is used only for ARS routes. It indicates the minimum level of FRL (Facility Restriction Level) needed to use this route.

Each terminal which has been assigned an ARS feature has also been assigned an FRL as a default parameter on an ARSFD form or on an ARSLPA, ARSMPA, or ARSTPA form. The terminal must have an FRL number greater than or equal to the FRL of the route to succeed. If the FRL of the terminal is less than the FRL of the route, then reorder tone is applied.

If an FRL is not used, leave this field blank.
Valid Entries: 0 - 16

2.18 WARNING TONE

Description: Has this route been labeled as an expensive route? This field is used for ARS routes only.

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

Each terminal which has been assigned an ARS feature has also been assigned a Tone Type as a default parameter of an ARSFD form or on an ARSLPA, ARSMPA or ARSTPA form. When Warning Tone is Yes, the Tone Type is checked to see what tone, if any, is applicable.

WARNING TONE cannot be "Y" when MC ROUTE TYPE is "PVN".

2.19 PERFORM PREEMPT HUNT?

Description: Is a preemptive hunt of the trunk members to be done? An entry of No indicates that this is a hunt for an idle trunk member. This field is associated with DSN (Defense Switched Network). The DSN (Defense Switched Network) capability is defined using the BRCS feature, Precedence and Preemption.
Valid Entries: Y, N

Data Rules:

If the Trunk Group specified in TRUNK GROUP NUMBER is preemptable, enter "Y".

Enter "N" if MC ROUTE TYPE is "SFG" or "REORD". The Trunk Group is preemptable if the HUNT TYPE specified on the TKGRP form (5202-1 Record) is "PRFF", "PRBL" or "PRFL". If the TRUNK GROUP NUMBER is not entered or it is not preemptable, leave this field blank.

When both an Idle and Preemptive Hunt are to be performed on the same Trunk Group, then two MC ROUTE INDEXs must be defined with "N" or "Y" entered for this field. For example, an idle hunt is to be done on Trunk Group 100, and then a preemptive hunt for a busy trunk with a lower precedence level on the same Trunk Group. Then, MC ROUTE INDEX 10 would be defined with TRUNK GROUP NUMBER equal to 100, NEXT MC ROUTE INDEX equal to 11 and PERFORM PREEMPT HUNT equal to "N". MCRTIDX 11 would be defined with TRUNK GROUP NUMBER equal to 100, NEXT MC ROUTE INDEX blank and PERFORM PREEMPT HUNT equal to "Y". (Additional Trunk Groups may be hunted on an idle and/or preemptive basis. This is controlled via the NEXT MC ROUTE INDEX.) Note that instead of Reorder, the Fixed Route Type of "PPBPC" will be invoked when the NEXT MC ROUTE INDEX is blank.

In the example described above, MCRTIDX 10 would be pointed to by an entry specified on the PPSCRN form (5618-2 Record).

2.20 RTE CAT

Description: Enter the routing category or route numbering plan that the FTS-2000 call will use to complete the call. If no entry is made in this field, then the existing route category or route numbering plan is used. The value entered in this field overrides the routing category or route numbering plan which would have been used if this field been left blank.

This field is used by the FTS-2000 INPA feature. For more information on this feature see Division 2, Section 4C8.

Software Release: 5E9(1) and later.
Valid Entries:

Valid RTE CAT Entries

Entry	Definition
APN	Action Point Numbering Plan
INTL	International Numbering Plan
NANP	North American Numbering Plan

Data Rules:

Copyright © 2003 Lucent Technologies

If this field is entered, then a DAS must be entered on the OFCOPT form (5509 Record).

2.21 CRANKBACK

Description: Can a crankback message be sent to the previous switch? When a Leased Network Inter-machine switch has exhausted the ARS routing list and is unable to route a call, it may send a crankback message to the LN switch that originated the call. The originating switch can then attempt to reroute the call through another switch.

Software Releases: 5E6 and later
Required field.
Default Value: N
Valid Entries: Y, N

Data Rules:

When CRANKBACK is "Y", TRUNK GROUP NUMBER must be entered and must be defined on a TKGRP form (5202 Record) that has LN TYPE set to "IMT". SFG NUMBER on this form must be blank.

If NEXT MC ROUTE INDEX is entered, then CRANKBACK must be "N".

ANI

The following fields Section 2.22 -Section 2.25 refer to the Automatic Number Identification feature. The ANI6 and ANI 7 fields were added with the ANI6/ANI7 on a Trunk Group or an OUTWATS SFG capability.

2.22 ANI OUTPULSING

Description: Is ANI (Automatic Number Identification) Outpulsing allowed for this MC ROUTE INDEX? This field is applicable only when a TRUNK GROUP NUMBER has been entered.
Valid Entries: Y, N

Data Rules:

For 5E7 and later, if TRUNK GROUP NUMBER is not entered, and MC ROUTE TYPE is not "SFG", then ANI OUTPULSING must be "N" or not entered.

2.23 ANI6

Description: Should the ANI6 digits 6 or 06 be outpulsed? ANI6 indicates to the operator system that calls may require special screening. This capability provides the ability based on the originating Trunk Group or OUTWATS SFG to optionally outpulse ANI6 digits when making an OUTWATS SFG call or a trunk origination when the trunk class of service is "PF", "PFITT", or "PFLASH". Traditionally, ANI6 indicates that the call is from a Hotel/Motel customer.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

If ANI6 is "Y", the following must be true:

ANI7 must not equal "Y"
- ANI OUTPULSING must be "Y"
- ANI II DIGITS must not be entered
- MC ROUTE TYPE must be "SFG"
- SFG NUMBER must be defined on a PFASFG

Copyright © 2003 Lucent Technologies

- form must have an SFG TYPE of "OUTWATS".

For 5E11 and later, when the MCRTIDX forms have ANI6 set to "Y", the SFG TYPE on the corresponding PFASFG form must be set to "HM" or "OUTWATS".

2.24 ANI7

Description: Should the ANI7 digits 7 or 07 be outpulsed? ANI7 indicates to the operator system that calls may require special screening. Traditionally, ANI7 indicates that the call is from a coin phone.

This capability provides the ability based on the originating Trunk Group or OUTWATS SFG to optionally outpulse ANI7 digits when making an OUTWATS SFG call or a trunk origination when the trunk class of "PF", "PFITT", or "PFLASH".

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

If ANI7 is "Y", the following must be true:

ANI6 must not equal "Y"
- ANI OUTPULSING must be "Y"
- ANI II DIGITS must not be entered
- MC ROUTE TYPE must be "SFG"
- SFG NUMBER must be defined on a PFASFG
- form must have an SFG TYPE of "OUTWATS".

For 5E11 and later, when the MCRTIDX forms, have ANI7 set to "Y", the SFG TYPE on the corresponding PFASFG form must be set to "SCOCS" or "OUTWATS".

2.25 ANI II DIGITS

Description: Enter ANI pairs assigned to the MC ROUTE INDEX. Flexible ANI is secured feature for Automatic Number Identification.

Software Release: 5E6 and later
Valid Entries: 00 - 99

Data Rules:

If ANI II DIGITS is entered, then:
- MC ROUTE TYPE must be "SFG"
- ANI OUTPULSING must be "Y"

2.26 RTE SEARCH LMT

Description: Enter the Route Search Limit. This field was added to support the 99-5E-3782 feature (Mutli-Vendor Intra-Network Trunk). For more information, see Div. 2 Sec. 4A217.

Software Release: 5E12 and later
Valid Entries: 1 - 15 or blank

Data Rules:

Copyright © 2003 Lucent Technologies

If RTE SEARCH LMT is entered, OUTPULSING must be "ISUP7" and MINT SIG TYPE must be "ALPHA", "BETA" or left blank. A blank means, no route search limit.

2.27 TERM NSC

Description: Enter the Terminating Network Screening index. This field was added to support the 99-5E-3782 feature (Mutli-Vendor Intra-Network Trunk). For more information, see Div. 2 Sec. 4A217.

Software Release: 5E12 and later
Valid Entries: 0 - 999 or blank

Data Rules:

If TERM NSC is entered, the TERM NSC must be defined on the LDPTNSC form (5568 Record).

If TERM NSC is known, MINT SIG TYPE must be known on the TKGRP form. In addition, if MINT SIG TYPE is "BETA" on the corresponding TKGRP form, TERM NSC must be between 0 and 63 on the MCRTIDX form. TRUNK GROUP NUMBER on the MCRTIDX form matches TGN on the TKGRP form.

CRITICAL DATA INDICATOR

The following (fields Section 2.28 - Section 2.29) support the RC Translations Protection For Highly Critical Elements feature, see Division 2, Section 1BY for more information.

2.28 CRIT IND

Description: This field supports the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT IND field is used to indicate whether the route index data is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.29 CRIT RMK

Description: This field enhances the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT RMK field is used to enter a remark to explain why this route index data is critical.

Software Release: 5E15 and later
Valid Entries: Enter up to 32 characters

Data Rules:

When the MCRTIDX form has the CRIT RMK field entered, the SFSYS form SFID 566 ACT field must be set to "Y".

SEC. 3R: 5305-1/2 RECORD
CARRIER ADMINISTRATION FORM - ICF

1. GENERAL

The 5305 Record is available with 5E2 and later Software Releases, and is used to define the characteristics of Inter-LATA (Local Access Transport Area) and Intra-LATA carriers.

The determination of the Carrier Identification Code on a carrier call is done in one of eight ways:

1. The line is presubscribed to a carrier.

   A PIC (Pre-subscribed Inter-LATA Carrier) Identification number is entered on a LINE form (5109 Record).

2. The line belongs to an IDP (Individualized Dialing Plan) which has a GPIC (Group PIC).

   The GPIC is entered on an IDPGP form (5601-4 Record).

3. The office has defined a carrier that is used when the subscriber does not have a PIC or GPIC and has not dialed a carrier access number or prefix.

   The OFFICE CARRIER ID is entered on the OFCOPT form (5509 Record).

4. The line dials a carrier access number in the format of 950-WXXX.

   W is any digit from 0-9 (usually 1), and XXX is the Carrier Identification Code.

5. The line dials a carrier access number in the format of 950-XXXX.

   XXXX is the Carrier Identification Code. This took effect in 5E8 and later, when Feature Group B was expanded. See Division 2, Section 1AY for a description of Feature Groups B and D.

6. The line dials a carrier access prefix in the format 10XXX, where XXX is the Carrier Identification Code.

7. The line dials a carrier access prefix in the format 101XXXX, where XXXX is the Carrier Identification Code.

   This was available in 5E9(1) and later, when Feature Group D was expanded. See Division 2, Section 1BI for a description of Feature Group D expansion.

8. An end-user line is identified as being presubscribed to a CIC (Carrier Identification Code) as its Alternate Local Service Provider. A CIC is entered in the PLC field on the LINE form (5109 Record). See Division 2, Section 4A269 for more information concerning the Alternate Local Service Provider secured feature.

The format 10XXX or 101XXXX is known as the FGD CAC (Carrier Access Code). The value allowed in the office depends on the value of the FGD PHASE field on the OFCOPT form. See the OFCOPT form and Division 2, Section 1BI for more information on the FGD CAC.

1.1 Carrier Definition

Each carrier is defined with CARRIER TYPE, access method and routing information. All carriers used for Carrier Interconnect subscriber access in this office must be defined, including the LEC (Local Exchange Carrier).

Copyright © 2003 Lucent Technologies

1.2 Route Indexes

All Route Indexes assigned on this form must also appear on an RTIDX form (5303-1/2 Record). The carrier's specific Code Indexes and Route Indexes may be entered on this record. Depending on the classification of the call by the regular digit analysis forms (PDIT, LDIT, and IDDD) the appropriate pair of Code Index and Route Index is determined. When the TYPE OF CI CALL is "SAC", the LDIT Code Index and Route Index are used to route the call. For this type of carrier call, the ICF form is checked to determine the validity of the Carrier ID and to see if overlap outpulsing might be required. The Code Index is used with both the originator's Screening Index (defined on the LCC form) and the prefix dialed to determine which Rate and Route entry to use for screening this call. The Route Index is considered to be the Regular Route Index and will be used to route the call if the RTI field on the RAR form (5301 Record) equals "REGL". If the Regular Route Index is inappropriate, a Special Route Index may be entered on the RAR form which will override the Regular Route Index.

1.3 OSPS Toll and Assistance Applications

For a carrier-owned 5ESS Switch that supports an OSPS Toll and Assistance application, an ICF form entry must be defined for the switch owner. However, the routing information for the switch owner is defined using the POTS digit analysis forms (PDIT, LDIT and IDDD). The Code Index and Route Index entries on this form should be set so that using them will cause a call to route to reorder.

1.4 Carrier Destination Mapping

If the Code Index/Route Index classifications are not explicit enough to correctly route calls to the carrier, then the DIG ROUTING field may be entered as "Y". In this case, the Carrier Destination Mapping Record (CDIM form; 5300-6 Record) is used to determine the carrier's specific Code Indexes and Route Indexes. The carrier's Code Indexes and Route Indexes do not require entry on the ICF form when DIG ROUTING is "Y".

The carrier's specific Code Indexes and Route Indexes may be entered on the ICF form, even when DIG ROUTING equals "Y". During call processing on a carrier call, the appropriate Code Index/Route Index pair will be selected from the ICF form. Then if DIG ROUTING is "Y", the CDIM form will be checked next. When an entry is found on the CDIM form for the call in progress, the CDIM form Code Index/Route Index pair will override the ICF form pair. When no entry for this call is found on the CDIM form, call processing will use the pair that was selected from the ICF form. Therefore, the CDIM form may be used to provide exceptions to the ICF form entries.

1.5 LEC Service and Carrier Name

Two new fields, LEC SERVICE and CARRIER NAME, were added with the introduction of OSPS Toll and Assistance features in the 5E4(2) Software Release.

The default inter-LATA and international carrier for a forward number are both specified in the OPRTK form (5417 Record). To utilize OSPS, the LEC SERVICE field of the ICF form (5305 Record) for the carrier must be set to "Y".

On a 5ESS Switch owned by an inter-LATA carrier, no data would normally be defined using this form. The exception to this general rule is for an inter-LATA carrier-owned 5ESS Switch that supports the OSPS TA application. In this case, there must be an ICF form entry for the switch owner (defined in the OFC TYP and OFC CARR fields of the OSPSOPT form (5424 Record). While the routing information defined on this form is not used for call routing, the following fields are used in call processing: CARRIER TYPE, ACCESS TYPE, INTRA-LATA, LEC SERVICE and CARRIER NAME. The following fields are not used and should be set to "N": LONG REC, DIG ROUTING, CUT IND, OVERLAP, SAC OVERLAP and CAC SCRNING.

1.6 Carrier not a Switch Owner

In an OSPS application, when a carrier different from the switch owner is used to route a call,

Copyright © 2003 Lucent Technologies

RSM-specific (Remote Switching Module) data is found in the RSMCAR form (5421 Record). This record is required if any OSPS call from an RSM is to route to this carrier. The data it contains is used in place of the routing information found in the ICF form. This form is not needed for a carrier if operator calls for this carrier are sent to the carrier's own operator system and if the carrier is not used to route any numbers the operator may dial.

1.7 Feature Groups B and D

In 5E8, this form was modified to split administration of the two Feature Groups, B and D. The CARRIER ID field was increased from 3 digits to 4 digits for Feature Group B. A new key field, FEAT GRP, was added to distinguish between Feature Groups B and D.

A new field, MEASUREMENT, was added to indicate if a carrier needs traffic measurements. A new field, TRANS CARRIER, was added to give the Feature Group D transition carrier identification for Feature Group B carriers. Existing fields, TRANSRTI and TRANSCDI were renamed as FGBRTI and FGBCDI, respectively.

In 5e9(1), the CARRIER ID field was increased from 3 digits to 4 digits for Feature Group D.

1.8 Recent Change View

The corresponding Recent Change View for this form is 10.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * CARRIER ID

Description: Enter the FGB/FGD Interexchange Carrier Identification Code.

Required Field.
Valid Entries:
- For 5E8: 0 - 999 for FGD
- 0 - 9999 for FGB
- For 5E9(1) and later: 0 - 9999

Data Rules:

For 5E8 and later, an RSMCAR form (5421 record) is required when CARRIER ID is entered, FEAT GRP equals "D", and the following is true for this ICF form:

- ACCESS TYPE is entered as "BOTH" or "TBOTH",
- DIG ROUTING is entered as "N", and
- CARRIER TYPE is entered as "CONSOL".

The RSMCAR form(s) must have the following fields entered:
- DOMES CDI,
- DOMES RTI,
- FGB CDI,
- FGB RTI,
- INTL CDI,

Copyright © 2003 Lucent Technologies

- INTL RTI,
- SAC CDI,
- and SAC RTI.

2.3 * FEAT GRP

Description: Enter the Feature Group type.

Software Release: 5E8 and later
Required Field.
Valid Entries:

Valid FEAT GRP Entries

Entry	Definition
B	Feature Group B
D	Feature Group D

Data Rules:

For Feature Group B entries:

- ACCESS TYPE must equal one of the following:

  "ITRM"

  "TRAN"

  "TITRM"

  "TTRAN"

- If DIG ROUTING is equal to "N", FGB CDI and FGB RTI are required; and
- No FEAT GRP D fields are allowed.
- SS7 OP CDI and SS7 OP RTI must not be entered.

For Feature Group D entries:

- CARRIER ID must be from 0 - 999 (5E8 only); For PLC (Presubscribed Local Carrier), CARRIER ID must be 0 - 9999 (for 5E12 and later).
- ACCESS TYPE must equal one of the following: "BOTH", "LTRM", "950", "TBOTH", "TLTM", "T950";
- If CARRIER TYPE is "CONSOL", ACCESS TYPE must not be "950" or "T950";
- If SCD SCRNING is "Y", ACCESS TYPE must not be "950" or "T950"; and
- No FEAT GRP B fields are allowed.
- For 5E8 and later , if FEAT GRP is "D", then separate all TREAT forms, with the CARRIER field entered, into groups with the same ORIG STAT TYPE on the TREAT form. There must be at least one TREAT form in each group for each ICF form where the CARRIER on the TREAT form matches the CARRIER ID on the ICF form.

Copyright © 2003 Lucent Technologies

- For 5E12 and later, when any of the PLC (Presubscribed Local Carrier) fields are entered, FEAT GRP must be "D".
- For 5E13 and later, when FEAT GRP is "B", Feature Group D fields must not be entered.

2.4 # ACCESS TYPE

Description: Enter the Carrier Interconnect dialed code Access Type. Two dialing methods are used for accessing the carrier:

1. Interim, where the subscriber dials 950-XXXX, where XXXX is the Carrier Identification Code.
2. Long term, where the subscriber dials the called number prefixed by the FGD CAC (Carrier Access Code).

For more information on Carrier Interconnect activation from a test state to a non-test state, please refer to 235-190-100 (FEATURE DESCRIPTIONS) under the "Toll and Carrier Features - Implementation and Administration".

Required Field.
Default:

ITRM if FEAT GRP equals "B"
- LTRM if FEAT GRP equals "D"

Valid Entries:

Valid Feature Group B ACCESS TYPE Entries

Entry	Definition
ITRM	The carrier accepts only Feature Group B interim calls only.
TRAN	The carrier accepts only the transition dialing access method.
TITRM	The carrier accepts only the interim dialing access method from test lines. Calls from non-test lines are not accepted.
TTRAN	The carrier accepts only the transition dialing access method from test lines. Calls from non-test lines are not accepted.

Valid Feature Group D ACCESS TYPE Entries

Entry	Definition
950	The carrier accepts only the interim dialing access method.
BOTH	The carrier accepts both the interim and long term dialing access methods.
LTRM	The carrier accepts only the long term dialing access method.
T950	The carrier accepts only the interim dialing access method from test lines. Calls from non-test lines are not accepted.
TBOTH	The carrier accepts both the interim and the long term method from test lines. Calls from non-test lines are not accepted.
TLTM	The carrier accepts only the long term dialing access method from test lines. Calls from non-test lines are not accepted.

Data Rules:

If CARRIER TYPE is "CONSOL", then the ACCESS TYPE must not be "950" or "T950".

If the CARRIER TYPE is "INC", the ACCESS TYPE must be "LTRM" or "TLTM".

If the CARRIER TYPE is "LEC", the ACCESS TYPE must be "LTRM".

For 5E8 and later, if CARRIER TYPE is "PSEUDO", then the ACCESS TYPE must be "LTRM" or "TLTM".

For 5E8 and later, for Feature Group B entries:

Copyright © 2003 Lucent Technologies

- If ACCESS TYPE is equal to "TRAN" or "TTRAN":
  - TRANS CARRIER must be entered, and must equal the last three digits of the CARRIER ID, and
  - CARRIER ID must be either "0NNN" or "1NNN".
- If ACCESS TYPE is equal to "ITRM" or "TITRM", TRANS CARRIER is not allowed.

For 5E8 and later, for Feature Group D entries:

- If ACCESS TYPE is "950" or "T950", OVERLAP must be "N", and SACOVLAP must be "N".
- If ACCESS TYPE is "950" or "T950" and CARRIER TYPE is "IC", CUT CI must be "N".

For 5E12 and later, for Feature Group D entries:

When any Presubscribed Local Carrier fields are entered,

- FEAT GRP must be "D"
- CARRIER TYPE must be "IC" or "CONSOL".

2.5 LONG REC

Description: Should the terminating billing record that is generated be detailed (long)? If "N" is entered a short record is generated, which provides a minimum set of billing information and is generated for all answered calls.

The long record provides more detailed information and should be generated when required for study purposes. The long record is generated for answered and unanswered calls and includes the time that trunk seizure is recognized.

Required Field.
Default: N
Valid Entries: Y, N

2.6 MEASUREMENT

Description: Should traffic measurements be done for this carrier?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E8, only 200 ICF forms can be assigned with MEASUREMENT equal to "Y". For 5E9(1) and later, only 500 ICF forms can be assigned with MEASUREMENT equal to "Y".

2.7 DIG ROUTING

Description: Is the CDIM (Carrier Destination Mapping form) checked next for Code Indexes and Route Indexes which may override possible entries on this form? Enter "N" if the carrier's Code Indexes and Route Indexes are only found on this ICF form.

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E4(2) and later, when CARRIER TYPE is "LEC", DIG ROUTING must be "N".

When "Y" is entered and CARRIER TYPE is "PSEUDO", this combination of values is used by the Circuit Switched Trunk feature. Circuit Switched Trunk is a secured feature and must be purchased by the office before data may be built for it. The ACT field for SFID 6 on the SFSYS form (5713-1 Record) must be set to "Y". For more information on this feature, see Division 2 Section 4A6.

For 5E12 and later:
When DIG ROUTING is "N", and OPER MINUS SIGNAL is entered, OPER MINUS CDI and OPER MINUS RTI must be entered.

When DIG ROUTING is "N", and OPER PLUS SIGNAL is entered, OPER PLUS CDI and OPER PLUS RTI must be entered.

When DIG ROUTING is "N", and NORMAL SIGNAL is entered, NORMAL CDI and NORMAL RTI must be entered.

When DIG ROUTING is "N", and LOCDA SIGNAL is entered, LOCDA CDI and LOCDA RTI must be entered.

When DIG ROUTING is "N", and DA SIGNAL is entered, DA CDI and DA RTI must be entered.

When DIG ROUTING is "N", and REPAIR SIGNAL is entered, REPAIR CDI and REPAIR RTI must be entered.

When DIG ROUTING is "N", and BUSOFC SIGNAL is entered, BUSOFC CDI and BUSOFC RTI must be entered.

When DIG ROUTING is "N", and LOCDA CONV DN is entered, LOCDA CDI and LOCDA RTI must be entered.

When DIG ROUTING is "N", and DA CONV DN is entered, DA CDI and DA RTI must be entered.

When DIG ROUTING is "N", and REPAIR CONV DN is entered, REPAIR CDI and REPAIR RTI must be entered.

When DIG ROUTING is "N", and BUS OFC CONV DN is entered, BUS OFC CDI and BUS OFC RTI must be entered.

2.8 LEC SERVICE

Description: Are OSPS TA Operator Services being provided for this carrier? If these services are not being provided, or if the switch does not contain an OSPS TA application, enter "N".

For a carrier-owned 5ESS Switch that supports an OSPS TA application, the INTRA LATA field for the switch owner should be set to "Y".

Software Release: 5E4(2) and later
Required Field for 5E8 and later.
Valid Entries: Y, N

2.9 CARRIER NAME

Copyright © 2003 Lucent Technologies

Description: Enter the name of the Inter-LATA carrier. The special character "&" is allowed. This entry is displayed to OSPS Toll and Assistance operators when handling a call for this carrier, and thus this field must be entered for OSPS TA offices (OSPS TA field on the OSPSOPT form is "Y").

CARRIER ID and CARRIER NAME entries must be uniquely assigned.

Software Release: 5E4(2) and later
Valid Entries: 1 - 7 alphabetic characters

2.10 SEND ANI II

Description: Should the ANI II digits associated with a screen index on the SCRIDXPA form (5543 Record) be sent on calls for this IC? This field applies only to the Flexible ANI Enhancement secured feature which is described in Division 2, Section 4A142.

Software Release: 5E9(1) and later
Default: N
Valid Entries: Y, N

Data Rules:

This field can by "Y" only if the Flexible ANI Enhancement secured feature has been purchased, and SFID 142 is set to "Y" on the SFSYS form (5713-1 Record).

If SEND ANI is "Y" and FEAT GRP is "B", ACCESS TYPE must be "TRAN" or "TTRAN".

2.11 REMARKS

Description: Enter any remarks deemed locally necessary.
Valid Entries: 1 - 16 alphanumeric characters

FEATURE GROUP B ONLY

Fields Section 2.12 -Section 2.14 refer to Feature Group B only (see Division 2, Section 1AY for a description of Feature Groups B and D).

2.12 FGB CDI

Description: Enter the Transition Code Index for calls dialed 950-XXXX to this carrier.
Valid Entries: 1 - 4095

Data Rules:

If FEAT GRP equals "B", and DIG ROUTING equals "N", there must be an FGB CDI.

2.13 FGB RTI

Description: If the Transition Code Index has an entry, enter the Transition Route Index.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

If FEAT GRP equals "B" and DIG ROUTING equals "N", there must be an FGB CDI.

Copyright © 2003 Lucent Technologies

If DIG ROUTING equals "N", there must be an FGB RTI, and there must be a matching Route Index entry on the RTIDX form.

2.14 TRANS CARRIER

Description: Assign a Feature Group D Transition Carrier to a Feature Group B Carrier.

Software Release: 5E8 and later
Valid Entries: 0 - 999

Data Rules:

If FEAT GRP is "B" and ACCESS TYPE is equal to "TRAN" or "TTRAN", TRANS CARRIER is required.

If FEAT GRP is "B" and ACCESS TYPE is equal to "TRAN" or "TTRAN", TRANS CARRIER must equal the last three digits of CARRIER ID.

If FEAT GRP is "B" and ACCESS TYPE is equal to "ITRM" or "TITRM", TRANS CARRIER is not allowed.

If TRANS CARRIER is entered, there must be an entry on another ICF form with FEAT GRP equal to "D" and a CARRIER TYPE of either "CONSOL" or "IC".

SS7 OPERATOR SERVICES

The following fields (Section 2.15 - Section 2.16) supports the SS7 Using Operator Services feature. For more information see, Division 2, Section 4A603.

2.15 SS7 OP CDI

Description: This field indicates the destination index for the Interexchange Carrrier that allows calls to be routed to operator services switches. The following dialing codes are supported:

- 1+555+XXXX
- (101XXXX)+0+(NPA)+XXXX
- (101XXXX)+1+(NPA)+XXXX
- (101XXXX)+411 - for all lines, including restricted/special
- (101XXXX)+(1/0)+411 - for all lines, including restricted/special

Software Release: 5E16 and later
Valid Entries: 1 - 4095

2.16 SS7 OP RTI

Description: This field indicates the route index for the Interexchange Carrrier that allows calls to be routed to operator services switches.

- 1+555+XXXX
- (101XXXX)+0+(NPA)+XXXX
- (101XXXX)+1+(NPA)+XXXX
- (101XXXX)+411 - for all lines, including restricted/special

Copyright © 2003 Lucent Technologies

- (101XXXX)+(1/0)+411 - for all lines, including restricted/special

Software Release: 5E16 and later
Valid Entries: 1 - 16382

FEATURE GROUP D ONLY

Fields Section 2.17 - Section 2.47 refer to Feature Group D only (see Division 2, Section 1AY for a description of Feature Groups B and D).

2.17 CARRIER TYPE

Description: Enter the Carrier Type which defines the type of traffic the carrier accepts.

WARNING: If CARRIER TYPE is set to "CONSOL" or "INC", then, it is expected, but not required, that all IDDD forms (5307 Record) which do not have CALL TYPE set to "QUERY" or "IDDDFCA" will have TYPE CI CALL set to "IDDD" or "PSCAR".

Default: IC
Valid Entries:

Valid CARRIER TYPE Entries

Entry	Definition
CONSOL	Consolidated Carrier, accepts calls within World Zone One (which includes the continental U.S.) and international traffic.
IC	Inter-LATA Carrier, accepts calls within World Zone One.
INC	International Carrier, accepts calls outside the continental U.S.
LEC	Local Exchange Carrier accepts calls within the LATA (Intra-LATA).
PSEUDO	Software Release: 5E4(2) and later Pseudo carrier in access tandem defined for number services calls - SSP (Service Switching Point) and ASP (Advanced Services Platform) calls.

Data Rules:

CONSOL:
If CARRIER TYPE is **"**CONSOL**"**, then

- ACCESS TYPE may not be "950" or "T950";
- if ACCESS TYPE is "BOTH" or "TBOTH":
  - if DIG ROUTING is "N", the following fields are required

    DOMES CDI and DOMES RTI

    INTL CDI and INTL RTI

    ZMINUS CDI and ZMINUS RTI

    ZPLUS CDI and ZPLUS RTI;

  - if SERV SWITCH PT is "Y" on the OFCOPT form, then NS CDI and NS RTI are recommended for 5E6 and later;
- if ACCESS TYPE is "LTRM" or "TLTM"

Copyright © 2003 Lucent Technologies

- if DIG ROUTING is "N", the following fields are required:

  DOMES CDI and DOMES RTI

  INTL CDI and INTL RTI

  ZMINUS CDI and ZMINUS RTI

  ZPLUS CDI and ZPLUS RTI

  INTL OP CDI and INTL OP RTI

- if SERV SWITCH PT is "Y" on the OFCOPT form, then NS CDI and NS RTI are recommended for 5E6 and later.

IC:
If CARRIER TYPE is **"**IC**"** and:

- ACCESS TYPE is "950" or "T950", then
  - the following fields must be "N"

    INTRALATA

    OVERLAP

    SAC OVERLAP

    DIG ROUTING (5E6 and later)

  - the following fields are not allowed

    ASP CDI and ASP RTI

    ASP TF CDI and ASP TF RTI

    DOMES CDI and DOMES RTI

    INTL CDI and INTL RTI

    INTL OP CDI and INTL OP RTI

    NS CDI and NS RTI

    ZMINUS CDI and ZMINUS RTI

Copyright © 2003 Lucent Technologies

ZPLUS CDI and ZPLUS RTI

- ACCESS TYPE is "BOTH" or "TBOTH",
  - and DIG ROUTING is "N" then the following fields are required

    DOMES CDI and DOMES RTI

    ZMINUS CDI and ZMINUS RTI

    ZPLUS CDI and ZPLUS RTI

  - the following fields are not allowed:

    INTL CDI and INTL RTI

    INTL OP CDI and INTL OP RTI

  - if SERV SWITCH PT is "Y" on the OFCOPT form, then NS CDI and NS RTI are recommended for 5E6 and later

- ACCESS TYPE is "LTRM" or "TLTM"
  - and DIGROUTING is "N" then the following fields are required:

    DOMES CDI and DOMES RTI

    ZMINUS CDI and ZMINUS RTI

    ZPLUS CDI and ZPLUS RTI

  - the following fields are not allowed:

    INTL CDI and INTL RTI

    INTL OP CDI and INTL OP RTI

  - if SERV SWITCH PT is "Y" on the OFCOPT form, then NS CDI and NS RTI are recommended for 5E6 and later.

INC:
If CARRIER TYPE is **"**INC**"** then

- INTRA LATA must be "N"

  ACCESS TYPE must be "LTRM" or "TLTM"

Copyright © 2003 Lucent Technologies

- if DIG ROUTING is "N" then the following fields are required:

  INTL CDI and INTL RTI

  ZMINUS CDI and ZMINUS RTI

  INTL OP CDI and INTL OP RTI

- the following fields are not allowed:

  ASP CDI and ASP RTI

  ASP TF CDI and ASP TF RTI

  DOMES CDI and DOMES RTI

  NS CDI and NS RTI

  ZPLUS CDI and ZPLUS RTI

LEC:
If CARRIER TYPE is **"**LEC**"** then

- INTRA LATA must be "Y"

  ACCESS TYPE must be "LTRM" or "TLTM"

  OVERLAP must be "N"

  SAC OVERLAP must be "N"

  SCD SCRNING must be "N"

  DIG ROUTING must be "N" (5E4(2) and later)

  OFC OBL INH must be "N"

  OFC ONA INH must be "N"

  SS7 OP CDI and SS7 OP RTI must not be entered.

- If SERV SWITCH PT on the OFCOPT form is "N", NS CDI and NS RTI must be blank.
- the following fields are not allowed:

Copyright © 2003 Lucent Technologies

DOMES CDI and DOMES RTI

INTL CDI and INTL RTI

INTL OP CDI and INTL OP RTI

ZMINUS CDI and ZMINUS RTI

ZPLUS CDI and ZPLUS RTI

PSEUDO:
If CARRIER TYPE is **"**PSEUDO**"** then

- ACCESS TYPE must be "BOTH"

  ACCESS TYPE must be "TLTM" or "LTRM"

  INTRA LATA must be "Y"

  OVERLAP must be "N"

  SAC OVERLAP must be "N"

  CI CUT must be "N"

  ZPLUS OPT must be "N"

  ZMINUS OPT must be "N"

  OFC OBL INH must be "N"

  OFC ONA INH must be "N"

- the following fields are not allowed:

  DOMES CDI and DOMES RTI

  INTL CDI and INTL RTI

  INTL OP CDI and INTL OP RTI ZMINUS CDI and ZMINUS RTI

  ZPLUS CDI and ZPLUS RTI

Copyright © 2003 Lucent Technologies

- If SERV SWITCH PT on the OFCOPT form is "N", NS CDI and NS RTI must be blank.
- the corresponding CARRIER ID (for 5E8 and later, with FEAT GRP equals "D") may not be used as a CARRIER ID on any CDIM forms having FEAT GRP equals "D" in 5E8 and later.
- if DIG ROUTING is "Y", this combination of values is used by the Circuit Switched Trunk feature. Circuit Switched Trunk is a secured feature and must therefore be purchased by the office before data may be built for it. SFID 6 on the SFSYS form is reserved for Circuit Switched Trunk and must have ACT set to "Y".
- For 5E12 and later, when any of the PLC fields are entered, CARR TP must be "IC" or "CONSOL".

2.18 INTRA LATA

Description: Is the carrier allowed and will the carrier accept intra-LATA calls? For a carrier-owned 5ESS Switch that supports an OSPS TA application, the INTRA LATA field for the switch owner should be set to "Y" if the switch owner has been tariffed to carry operator assisted, automated coin, and automated calling card intra-LATA traffic in a nonemergency. If this is not allowed, this field should be set to "N".

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

INTRA LATA must be "N" if CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950", or if CARRIER TYPE is "INC".

INTRA LATA must be "Y" if CARRIER TYPE is "LEC" or "PSEUDO".

2.19 CI CUT

Description: Will the carrier accept cut-through calls (i.e., calls that are dialed (FGD CAC) + (#))?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, ACCESS TYPE must not be "950" or "T950".

If CUT IND is "Y" and DIG ROUTING is "N", then CUT CDI and CUT RTI must be entered.

2.20 OVERLAP

Description: Does the carrier use overlap outpulsing on at least one of its non-SAC (Service Access Code) routes? (Overlap outpulsing for each specific route is indicated on the 5303 Record - RTIDX form.) Enter "N" if the carrier does not use overlap outpulsing on any of its non-SAC routes.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CARRIER ACCESS is "LEC" or "PSEUDO", this entry must be "N".

Copyright © 2003 Lucent Technologies

OVERLAP must be "N" if CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".

2.21 SAC OVERLAP

Description: Does the carrier use overlap outpulsing on SAC calls?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CARRIER TYPE is "LEC" or "PSEUDO", this entry must be "N".

SAC OVERLAP must be "N" if CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".

2.22 CAC SCRNING

Description: Does the carrier want traditional call processing and screening (which blocks non-free calls) done on calls from Charge-A-Call lines? Enter "N" if the carrier does not want traditional screening. If the entry is "N", then all calls (even calls with prefix dialing errors) will complete to the carrier when originated from a line with CLASS OF SERVICE equal to "CHGCALL" (as defined on the LCC form). Line Screening will never be set to "Y" when CAC SCRNING equals "N".

Required Field.
Default: N
Valid Entries: Y, N

2.23 SCD SCRNING

Description: Does the carrier have the SCD (Selective Carrier Denial) feature? The SCD feature provides a carrier with the ability to selectively inhibit certain calls from lines that have been designated as non-paying subscribers by the carrier itself.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Only 31 carriers can subscribe to the operating company's SCD service at one time, therefore, no more than 31 CARRIER IDs on the ICF form can have SCD SCRNING set to "Y" (for 5E8 and later, FEAT GRP must equal "D").

If "Y" is entered in this field, then "SCD" must be entered in the FIXED ROUTE TYPE field on the FIXRT form (5301 Record).

Enter "N" in the SCD SCRNING field on this ICF form if "LEC" has been entered in the CARRIER TYPE field.

2.24 SENT PAID OVLAP

Description: Does carrier allow overlap outpulsing for sent paid coin calls?

Software Release: 5E7 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When SENT PAID OVLAP is "Y", OVERLAP must be "Y".

2.25 AC ICLATA OVR

Description: Should the Deny Toll Auto Callback on ICLATA feature be overridden for this CARRIER ID? This field supports the Deny Auto Callback on Intra-LATA PIC calls Special Feature, for more information on this feature see Division 2, Section 4A201.

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

2.26 ICLATA OPT

Description: Does the Local Exchange Carrier or the FGD carrier handle 0+ intra-LATA toll and 0- calls? Enter "Y"' for Local Exchange Carrier or "N" for FGD carrier. This field supports the ICLATA (Intra-LATA PIC Capability) Special Feature, for more information on this feature see Division 2, Section 4A149.

Software Release: 5E9(1) and 5E9(2)
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field supports the Inter-LATA Carrier's Intra-LATA Capability Special Feature. It is a secured feature that must be purchased by the office, therefore the ACT field for SFID 149 must be set to "Y" on the SFSYS form (5713-1 Record) before this field can be set to "Y".

2.27 ZPLUS OPT

Description: Are 0+ Intra-LATA toll calls handled by the local exchange carrier? Enter "Y" or "N" for FGD carrier. This field supports the Intra-LATA PIC Capability Special Feature. For more information on this feature see Division 2, Section 4A149.

Software Release: 5E10 and later
Required Field.
Valid Entries: Y, N

Data Rules:

When FEAT GRP is "B", ZPLUS OPT must be "N".

When CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950", ZPLUS OPT must be "N".

When CARRIER TYPE id "INC", ZPLUS OPT must be "N".

When CARRIER TYPE is "PSEUDO", ZPLUS OPT must be "N".

The ZPLUS OPT and ZMINUS OPT fields on the ICF form are used by the Inter-LATA Carrier's Intra-LATA Capability Special Feature. It is a secured feature that must be purchased by the office before the fields can be set to "Y".

2.28 ZMINUS OPT

Copyright © 2003 Lucent Technologies

Description: Are 0- calls handled by local exchange carrier? Enter "Y" or "N" for FGD carrier. This field supports the Intra-LATA PIC Capability Special Feature. For more information on this feature see Division 2, Section 4A149.

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When FEAT GRP is "B", ZMINUS OPT must be "N".

When CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950", ZMINUS OPT must be "N".

When CARRIER TYPE is "INC", ZMINUS OPT must be "N".

When CARRIER TYPE is "PSEUDO", ZMINUS OPT must be "N".

The ZPLUS OPT and ZMINUS OPT fields on the ICF form are used by the Inter-LATA Carrier's Intra-LATA Capability Special Feature. It is a secured feature that must be purchased by the office before the fields can be set to "Y".

2.29 ASP TRIG NBR

Description: The ASP TRIG NBR is an active 0.1 ASP trigger number assigned to the carrier. For incoming calls, if the switch is using Carrier Routing to determine how to route the call, this field will be checked. If this field is present, the switch generates an OHD query for the call and standard ASP call processing is used. This field supports the Carrier Routing / Call Processing by Facility Presence Special Feature. For more information on this feature see Division 2, Section 4A243.

Software Release: 5E11 and later
Valid Entries: 1 - 255

Data Rules:

The ASP TRIG NBR on the ICF form must be defined on the NSTRIG form where AIN REL is "R0D1".

Carrier Routing/Call Processing by Facility Presence is a secured feature that must be purchased by the office before ASP TRIG NBR on the ICF form can be entered. A SFSYS form must exist with SFID 243 ACT set to "Y".

2.30 DOMES CDI

Description: Enter the Domestic Code Index used for calls dialed (FGD CAC) + (1) + 7/10 digits for this carrier.
Valid Entries: 1 - 4095

Data Rules:

DOMES CDI must be entered if:

- CARRIER TYPE is "IC", ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".
- If CARRIER TYPE is "CONSOL", ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

Copyright © 2003 Lucent Technologies

DOMES CDI is not allowed when CARRIER TYPE is "INC", "IC" "LEC" or "PSEUDO", and ACCESS TYPE is "950" or "T950".

2.31 DOMES RTI

Description: If the Domestic Code Index has an entry, enter the Domestic Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

DOMES RTI must be entered if:

- CARRIER TYPE is "IC", and ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

- CARRIER TYPE is "CONSOL", ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

DOMES RTI is not allowed when CARRIER TYPE is "INC", "IC" "LEC" or "PSEUDO", and ACCESS TYPE is "950" or "T950".

If DOMES RTI is entered, it must also be entered on the RTIDX form.

2.32 INTL CDI

Description: Enter the International Code Index for calls dialed (FGD CAC) + 011 + Country Code + variable digits or dialed (FGD CAC) + (1) + 7/10 digits for destinations within World Zone 1, but outside the continental U.S.

In the case of an inter-LATA carrier-owned switch that supports the OSPS TA (Toll and Assistance) feature, the ICF form provides a possible new Code and Route Index for international calls (coming from the INTL CDI and INTL RTI fields, respectively). If the call is being routed out of an RSM, the RSMCAR form (5421 Record) is used to provide RSM-specific data.
Valid Entries: 1 - 4095

Data Rules:

INTL CDI must be entered if:

- CARRIER TYPE is "INC" and DIG ROUTING is "N".

- CARRIER TYPE is "CONSOL", ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N."

INTL CDI is not allowed when CARRIER TYPE is "IC", "LEC" or "PSEUDO", and ACCESS TYPE is "950" or "T950".

2.33 INTL RTI

Description: If the International Code Index has an entry, enter the International Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617

Copyright © 2003 Lucent Technologies

- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

INTL RTI must be entered if:

- CARRIER TYPE is "INC" and DIG ROUTING is "N".
- CARRIER TYPE is "CONSOL", ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

INTL RTI is not allowed when CARRIER TYPE is "IC", "LEC" or "PSEUDO", and ACCESS TYPE is "950" or "T950".

If INTL RTI is entered, then the route index must also be entered on an RTIDX form.

2.34 ZMINUS CDI

Description: Enter the Zero Minus Code Index for this carrier. This is the code index used for 10XXX+0 calls to this carrier. This includes 10XXX+0 calls to a carrier with CARRIER TYPE equal to "INC". Y" for the originator of the call, the digit analysis code index, initially defined by ODA as Code Index 1 for 10X0 and 00 in PDIT (5300-2 Record) and 0 PREFIX entry in the RAR form, will be used.
Valid Entries: 1 - 4095

Data Rules:

ZMINUS CDI is not allowed when CARRIER TYPE is "LEC" or "PSEUDO", or when CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".

ZMINUS CDI must be entered if:

- CARRIER TYPE is "IC" or "CONSOL" and ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".
- CARRIER TYPE is "INC" and DIG ROUTING is "N".

2.35 ZMINUS RTI

Description: If the Zero Minus Code Index has an entry, enter the Zero Minus Route Index.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

ZMINUS RTI is not allowed when CARRIER TYPE is "LEC" or "PSEUDO", or when CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".

ZMINUS RTI is required when:

- CARRIER TYPE is "IC" or "CONSOL" and ACCESS TYPE is "BOTH", "TBOTH", "LTRM", or "TLTM", and DIG ROUTING is "N".

Copyright © 2003 Lucent Technologies

- CARRIER TYPE is "INC" and DIG ROUTING is "N".

If ZMINUS RTI is entered, then the route index must also be entered on an RTIDX form.

2.36 CI CUT CDI

Description: Enter the Cut Through Code Index for calls dialed (FGD CAC) + #.
Valid Entries: 1 - 4095

Data Rules:

CUT CDI must be entered if "Y" is entered in the CUT IND field and "N" is entered in the DIG ROUTING field.

If "N" is entered in the CUT IND field, then the CUT CDI field must be left blank.

2.37 CI CUT RTI

Description: If the Cut Through Code Index has an entry, enter the Cut Through Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

The Route Index entered may not be defined for a Trunk Group with a Trunk Class of "TSPS".

CUT RTI must be entered if "Y" is entered in the CUT IND field and "N" is entered in the DIG ROUTING field.

If "N" is entered in the CUT IND field, then the CUT CDI and CUT RTI fields must be left blank.

If CUT RTI is entered, then the route index must also be entered on an RTIDX form.

2.38 ZPLUS CDI

Description: Enter the Zero Plus Code Index for calls dialed (FGD CAC) + 0 + 7/10 digits to this carrier.
Valid Entries: 1 - 4095

Data Rules:

ZPLUS CDI is not allowed when CARRIER TYPE is "INC", "LEC" or "PSEUDO", or when CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".

ZPLUS CDI must be entered if, CARRIER TYPE is "IC" or "CONSOL" and ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

2.39 ZPLUS RTI

Description: If the Zero Plus Code Index has an entry, enter the Zero Plus Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Copyright © 2003 Lucent Technologies

Data Rules:

ZPLUS RTI is not allowed when CARRIER TYPE is "INC", "LEC" or "PSEUDO", or when CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".

ZPLUS RTI must be entered if CARRIER TYPE is "IC" or "CONSOL" and ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

If ZPLUS RTI is entered, then the route index must also be entered on an RTIDX form.

2.40 INTL OP CDI

Description: Enter the International Operator Code Index for calls dialed (FGD CAC) + 01 + Country Code + variable digits or dialed (FGD CAC) + 0 + 7/10 digits where the destination is within World Zone 1, but outside the continental U.S.
Valid Entries: 1 - 4095

Data Rules:

INTL OP CDI must be entered if:

- CARRIER TYPE is "INC" and DIG ROUTING is "N".
- CARRIER TYPE is "CONSOL", ACCESS TYPE is "LTRM", "TLTM", "BOTH" or "TBOTH" and DIG ROUTING is "N".

INTL OP CDI is not allowed when CARRIER TYPE is "IC", "LEC" or "PSEUDO", and ACCESS TYPE is "950" or "T950".

2.41 INTL OP RTI

Description: If the International Operator Code Index has an entry, enter the International Operator Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

INTL OP RTI must be entered if:

- CARRIER TYPE is "INC" and DIG ROUTING is "N".
- CARRIER TYPE is "CONSOL", ACCESS TYPE is "BOTH", "TBOTH", "LTRM" or "TLTM", and DIG ROUTING is "N".

INTL OP RTI is not allowed when CARRIER TYPE is "IC", "LEC" or "PSEUDO", and ACCESS TYPE is "950" or "T950".

If INTL OP RTI is entered, then the route index must also be entered on an RTIDX form.

2.42 NS CDI

Description: Enter the code index for number service 800 calls.

Copyright © 2003 Lucent Technologies

Software Release: 5E4(2) and later
Valid Entries: 1 - 4095

2.43 NS RTI

Description: Enter the route index for number service 800 calls.

The value of "REGL" can only be entered when the CARRIER TYPE is "LEC" or "PSEUDO" and is used to indicate that the ROUTE INDEX entered on the LDIT/MLDIT form (5300-3/5 Record) should be used. The value of "REGL" was added to the NS RTI field so that if both the NS CDI and NS RTI fields are entered, then only the CODE INDEX on the LDIT/MLDIT form will be overridden with the value entered in the NS CDI field and the value in the ROUTE INDEX field on the LDIT/MLDIT form will be used. For Recent Change view 10.3, "REGL" cannot be entered; Recent Change requires that this field be left blank to indicate the ROUTE INDEX entered on the 9.3 view should be used.

Software Release: 5E4(2) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617 and REGL
- For 5E11 and 5E12: 1 - 4095 and REGL
- For 5E13 and later: 1 - 16382

Data Rules:

When NS RTI is set to "REGL", CARRIER TYPE must be "PSEUDO" or "LEC".

If NS RTI is set to a value other than "REGL", (and for 5E8 and later, FEAT GRP equals "D"), the route index must be entered on the RTIDX form.

2.44 ASP CDI

Description: Enter the code index for ASP (Advanced Services Platform) In an SSP (Service Switching Point), this field is used for the routing of ASP OUTWATS calls and SCP-returned public routes.

Software Release: 5E8 and later
Valid Entries: 1 - 4095

Data Rules:

This field cannot be entered if:

- CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".
- CARRIER TYPE is "INC".
- ASP OFC on the OFCOPT form (5509 Record) is set to "NONE", indicating that this office does not support ASP.

2.45 ASP RTI

Description: Enter the route index for ASP (Advanced Services Platform). In an SSP (Service Switching Point), this field is used for the routing of ASP OUTWATS calls and SCP-returned public routes.

Software Release: 5E8 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

Copyright © 2003 Lucent Technologies

- For 5E13 and later: 1 - 16382

Data Rules:

This field cannot be entered if:

- CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".
- CARRIER TYPE is "INC".

ASP OFC on the OFCOPT form (5509 Record) is set to "NONE", indicating that this office does not support ASP.

If this field is entered, then the route index must be defined on an RTIDX form.

2.46 ASP TF CDI

Description: Enter the ASP (Advanced Services Platform) Toll-free destination index for toll-free calls. In an SSP (Service Switching Point) the ASP TF CDI is used for the routing and charging of ASP (Advanced Services Platform) OUTWATS calls and SCP (Service Control Point) returned public routes if the current trigger is designated as an ASP Toll-free trigger. This field supports the ASP Toll Free Service feature (SFID 236). For more information on this feature, see Division 2, Section 4A236.

Software Release: 5E10 and later
Valid Entries: 1 - 4095

Data Rules:

ASP TF CDI must not be entered if:

- CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".
- CARRIER TYPE is "INC".
- ASP OFC on the OFCOPT form (5509 Record) is set to "NONE", indicating that this office does not support ASP.

2.47 ASP TF RTI

Description: Enter the ASP (Advanced Services Platform Toll-free route index for toll-free calls. In a SSP (Service Switching Point), the ASP TF RTI is used for the routing of ASP OUTWATS calls and SCP returned public routes if the current trigger is designated as an ASP Toll-free trigger. This field supports the ASP Toll Free Service feature (SFID 236). For more information on this feature, see Division 2, Section 4A236.

Software Release: 5E10 and later
Valid Entries:

- For 5E12 and earlier: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

ASP TF RTI must not be entered if:

Copyright © 2003 Lucent Technologies

- CARRIER TYPE is "IC" and ACCESS TYPE is "950" or "T950".
- CARRIER TYPE is "INC".
- ASP OFC on the OFCOPT form (5509 Record) is set to "NONE", indicating that this office does not support ASP.

When the ASP TF RTI(s) has been assigned on an ICF form, it must defined as a ROUTE INDEX on a RTIDX form.

2.48 OFC OBL INH

Description: Is the ASP originating busy trigger inhibited? This field supports the Call Screening for ASP Originating Busy/No Answer Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A212.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The SFID 212 ACT filed on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set to "Y".

2.49 OFC ONA INH

Description: Is the ASP originating no answer trigger inhibited? This field supports the Call Screening for ASP Originating Busy/No Answer Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A212.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The SFID 212 ACT filed on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set to "Y".

PRESUB LOCAL CARRIER (0-)

The PRESUB LOCAL CARRIER fields are used by the Alternate Local Service Provider feature. This is a secured feature that must be purchased before these fields can be entered. The SFID ACT field for SFID 269 on the SFSYS form (5713-1 Record) must be set to "Y" before these fields can be entered.

2.50 OPER MINUS CDI

Description: Enter the Zero Minus Code Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

Copyright © 2003 Lucent Technologies

When either OPER MINUS CDI or OPER MINUS RTI is entered, they must both be entered.

2.51 OPER MINUS RTI

Description: Enter the Zero Minus Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12: Blank or 1 - 4095
- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either OPER MINUS CDI or OPER MINUS RTI is entered, they must both be entered.

2.52 OPER MINUS SIGNAL

Description: Enter the Zero Minus Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter ST or STP

PRESUB LOCAL CARRIER (0+)

2.53 OPER PLUS CDI

Description: Enter the Zero Plus Code Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

When either OPER PLUS CDI or OPER PLUS RTI is entered, they must both be entered.

2.54 OPER PLUS RTI

Description: Enter the Zero Plus Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12: Blank or 1 - 4095
- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either OPER PLUS CDI or OPER PLUS RTI is entered, they must both be entered.

2.55 OPER PLUS SIGNAL

Description: Enter the Zero Plus Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later

Copyright © 2003 Lucent Technologies

Valid Entries: Blank or enter ST or STP

PRESUB LOCAL CARRIER (NONE+/1+)

2.56 INTRASWITCH

Description: Does the Presubscribed Local Carrier route None+/1+ 7/10-digit non-operator assisted intraswitch calls?

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If INTRASWITCH is "Y", then NORMAL CDI, NORMAL RTI, or NORMAL SIGNAL must be entered.

2.57 NORMAL CDI

Description: Enter the Normal Code Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

When either NORMAL CDI or NORMAL RTI is entered, they must both be entered.

2.58 NORMAL RTI

Description: Enter the Normal Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12:Blank or 1 - 4095
- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either NORMAL CDI or NORMAL RTI is entered, they must both be entered.

2.59 NORMAL SIGNAL

Description: Enter the Normal Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter ST or STP

PRESUB LOCAL CARRIER (LOCDA)

2.60 LOCDA CDI

Description: Enter the Local Directory Assistance Code Index for a Presubscribed Local Carrier.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

When either LOCDA CDI or LOCDA RTI is entered, they must both be entered.

2.61 LOCDA RTI

Description: Enter the Local Directory Assistance Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12: Blank or 1 - 4095
- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either LOCDA CDI or LOCDA RTI is entered, they must both be entered.

2.62 LOCDA SIGNAL

Description: Enter the Local Directory Assistance Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter ST or STP

2.63 LOCDA CONV DN

Description: Enter the Local Directory Assistance Conversion Telephone Number for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter up to 15 digits (0-9)

PRESUB LOCAL CARRIER (DA)

2.64 DA CDI

Description: Enter the Directory Assistance Code Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

When either DA CDI or DA RTI is entered, they must both be entered.

2.65 DA RTI

Description: Enter the Local Directory Assistance Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12: Blank or 1 - 4095

Copyright © 2003 Lucent Technologies

- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either DA CDI or DA RTI is entered, they must both be entered.

2.66 DA SIGNAL

Description: Enter the Local Directory Assistance Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter ST or STP

2.67 DA CONV DN

Description: Enter the Local Directory Assistance Conversion Telephone Number for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter up to 15 digits (0-9)

PRESUB LOCAL CARRIER (REPAIR)

2.68 REPAIR CDI

Description: Enter the Repair Service Code Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

When either REPAIR CDI or REPAIR RTI is entered, they must both be entered.

2.69 REPAIR RTI

Description: Enter the Repair Service Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12: Blank or 1 - 4095
- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either REPAIR CDI or REPAIR RTI is entered, they must both be entered.

2.70 REPAIR SIGNAL

Description: Enter the Repair Service Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter ST or STP

Copyright © 2003 Lucent Technologies

2.71 REPAIR CONV DN

Description: Enter the Repair Service Conversion Telephone Number for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter up to 15 digits (0-9)

PRESUB LOCAL CARRIER (BUSOFC)

2.72 BUSOFC CDI

Description: Enter the Business Office Code Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or 1 - 4095

Data Rules:

When either BUSOFC CDI or BUSOFC RTI is entered, they must both be entered.

2.73 BUSOFC RTI

Description: Enter the Business Office Route Index for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries:

- For 5E12: Blank or 1 - 4095
- For 5E13 and later: Blank or 1 - 16382

Data Rules:

When either BUSOFC CDI or BUSOFC RTI is entered, they must both be entered.

2.74 BUSOFC SIGNAL

Description: Enter the Business Office Signal Type for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter ST or STP

2.75 BUSOFC CONV DN

Description: Enter the Business Office Conversion Telephone Number for a Presubscribed Local Carrier.

Software Release: 5E12 and later
Valid Entries: Blank or enter up to 15 digits (0-9)

TANDEM CUT

2.76 TANDEM CUT

Description: The TANDEM CUT field indicates whether the FGD Cut-through call is a Feature Group D Tandem Cut-through call. A Cut-through call is a call that is switched to the carrier without first collecting digits for the call.

Copyright © 2003 Lucent Technologies

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TANDEM CUT is "Y", CIACCTP must not be "950" or "T950".

When TANDEM CUT is "N", then TANDEM CUT CDI and TANDEM CUT RTI must not be entered.

When CARRTP is "IC" and CIACCTP is "950" or "T950", then TANDEM CUT must be "N".

When TANDEM CUT is "Y", ACT fields for SFIDs 512 and 165 must be set to "Y" on the SFSYS form.

2.77 TANDEM CUT CDI

Description: TANDEM CUT CDI is the code destination index used for the FGD Tandem Cut-through call.

Software Release: 5E13 and later
Valid Entries: Blank or 1 - 4095.

Data Rules:

When CARRTP is "PSEUDO", then TANDEM CUT CDI and TANDEM CUT RTI must not be entered.

2.78 TANDEM CUT RTI

Description: TANDEM CUT RTI is the route index used for the FGD Tandem Cut-through call.

Software Release: 5E13 and later
Valid Entries: Blank or 1 - 16382

Data Rules:

When TANDEMCUT is "Y" and DIGROUTING is "N", TANDEM CUT CDI and TANDEM CUT RTI must be entered.

When TANDEM CUT RTI has been assigned, the same ROUTE INDEX must be defined on the RTIDX form.

ANI II SUBSCRIPTION

2.79 TOLLFREE II

Description: Do the Original II digits map to the Tollfree II digits? The TOLLFREE II field indicates if the original II digits shall be mapped to the Tollfree II digits (refer to RC View 8.74). This will enable carriers to compensate pay phone owners for Tollfree calls (translated to a POTS number) originated from pay phones.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TOLLFREE II is "Y", the ACT field for SFID 332 on the SFSYS form must be set to "Y".

When Feature Group is "B", Feature Group "D" field must be entered.

Copyright © 2003 Lucent Technologies

- ***NOTE:*** The Pay Phone Compensation for Tollfree Calls and Tollfree Calling Enhancement for Flexible ANI features are secured features (both under SFID 332) that must be set to "Y" before the TFANI form can be populated.

2.80 DEFAULT II

Description: Are the Originall II digits mapped to the Default II digits? For non-translated Tollfree calls, the DEFAULT II field indicates if the original II digits shall be mapped to the Default II digits (refer to RC View 8.74).

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TOLLFREE II is "Y", the ACT field for SFID 332 on the SFSYS form must be set to "Y".

When Feature Group is "B", Feature Group D field must be entered.

- ***NOTE:*** The Pay Phone Compensation for Tollfree Calls and Tollfree Calling Enhancement for Flexible ANI features are secured features (both under SFID 332) that must be set to "Y" before the TFANI form can be populated.

2.81 CRIT IND

Description: This field supports the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT IND field is used to indicate whether the carrier data is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.82 EONTF TRIG NBR

Description: Proprietary field.

2.83 ESC SA TRIG

Description: Proprietary field.

CRITICAL DATA INDICATOR

The following (fields Section 2.84 - Section 2.85) support the RC Translations Protection For Highly Critical Elements feature, see Division 2, Section 1BY for more information.

2.84 CRIT IND

Description: This field supports the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT IND field is used to indicate whether the carrier data is critical.

Software Release: 5E13 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.85 CRIT RMK

Description: This field enhances the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT RMK field is used to enter a remark to explain why this carrier data is critical.

Software Release: 5E15 and later
Valid Entries: Enter up to 32 characters

Data Rules:

When the ICF form has the CRIT RMK field entered, the SFSYS form SFID 566 ACT field must be set to "Y".

SEC. 3S: 5306 RECORD
LINE CLASS CODE FORM - LCC

1. GENERAL

The 5306 Record is used to define each LCC (Line Class Code) in a 5ESS Switch. A Telephone Number and a Line Equipment Number provide an LCC and Rate Area number. These two inputs are used to access routing and service information contained on this form.

Routing and feature control are described for an LCC in the CLASS OF SERVICE and TERMINATING TREATMENT entries. CLASS OF SERVICE describes originating service and feature handling, while TERMINATING TREATMENT describes terminating service and routing.

1.1 Toll Diversion

For lines requiring Toll Diversion, the service class assigned must be either "PBX" or "HOTPBX". In addition, the Toll Diversion field on the RAR form (5301 Record) must contain an entry.

1.2 Charge-A-Call

For information on the Charge-A-Call feature using a CLASS OF SERVICE of "CHGCALL", refer to Division 2, Section 1A.

1.3 Recent Change View

The corresponding Recent Change View for this form is 4.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * LINE CLASS CODE

Description: Enter the code that describes the class of service, e.g., 1FR, 1PC, DNT.
Valid Entries: 3 alphanumeric characters

2.3 * RATE AREA

Description: Enter the Rate Area center number. This field is used to identify "rate centers" that are established by tariffs for routing and charging. It is used in association with the SCREENING INDEX and the DAS (Digit Analysis Selector) fields on the LCC form (5306 Record). Note that this field is the same (functionally) as the RAX field on the NOC form (5501 Record).
Default: 00 (indicates no RATE AREA number)
Valid Entries:

- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.4 # CLASS OF SERVICE

Copyright © 2003 Lucent Technologies

Description: This field is used to describe originating service and feature handling by Class of Service.

Required Field.

Valid CLASS OF SERVICE Entries

Entry	Definition
ATND	Attendant DN.
B911	Emergency Service Bureau lines for Basic 911 Service.
CALLBK	Software Release: 5E8 and earlier. Call Back Line associated with the Trunk and Line Work Station Local Talk and Monitor phone lines.
CHGCALL	Charge a Call. Provide ANI7 to TSPS.
COIN	Coin
DAOPER	Software Release: 5E5 and later. OSPS directory assistance operator.
HOTMOTL	Hotel-Motel with Message Register capabilities. No toll diversion; provides ANI-6 to TSPS for hotel/motel DN without automatic room ID. For 5E9(1) and later the ANI-6 can be turned off by activating Option Feature ID 628 (enter "Y" in the ACT field for FID 628 on the FOSYS form (5713-2 Record)).
HOTPBX	Hotel-Motel PBX with Message Register capabilities. Checks
HOTPBX	Hotel-Motel PBX with Message Register capabilities. Checks for Toll Diversion; provides ANI-6 to TSPS; and prevents Fabric Exercise Tests.
INDIV	Individual.
ISATND	Software Release: 5E4(2) and later. ISDN (Integrated Service Digital Network) Attendant Terminal.
ISDN	Software Release: 5E3 and later. ISDN Digital Subscriber Line.
LTPCLBCK	Software Release: 5E9(1) and later. Call Back Line associated with the Trunk and Line Work Station Local Talk and Monitor phone lines.
MISLNK	Software Release: 5E5 and later. OSPS Commercial ACD MIS data link.
MODEM	Software Release: 5E3 and later. Packet Switching Modem Pooling.
PBX	Checks for Toll Diversion; prevents Fabric Exercise Tests.
RCDM	Software Release: 5E7 and later. Recent Change Delayed Message.
SATSTLN	Stand-Alone Test Line, for RSM and Local SM use. This test line allows a switching module to emulate the stand-alone or isolation state during normal operation.
TAOPER	Software Release: 5E4(2) and later. OSPS toll and assistance operator VDT.
TEST	Test Lines.
TWOPTY	Two Party.
XAT	Software Release: 5E6 and later. X.25 access to a T1 facility.
XDB	Software Release: 5E4(2) and later. OSPS external data base.
2PTY	2-Party Multi-Frequency Ringing.
4PFS	4-Party Full Selective.
4PSS	4-Party Semi Selective.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX. Allows an entry of "D" or "T" for the OE TYPE field on the LINE form (5109 Record) and MLHLN form (5111-1 Record).
5PTY	5-Party Multi-Frequency Ringing.
8PSS	8-Party Semi Selective.
10PTY	10-Party Multi-Frequency Ringing.

Data Rules:

B911 - If the LINE/MLHLN forms have a LCC/RAX combination that appears on the LCC form with a CLASS OF SERVICE value of "B911", the following LINE/MLHLN feature must be defined:

- OE TYPE must be "A" (5E12 and later), "C", "E", "G", "L", "M" or "S",
- PTY must be "I",

Copyright © 2003 Lucent Technologies

- COIN must be "N",
- SUSO must be "Y",
- SUST must be "N".

CALLBK - If MLHLN form entries have an LCC/RAX combination that appears on the LCC form with a CLASS OF SERVICE value of "CALLBK", then the TN field must be numeric and must also be defined on the TLWS form as Local Talk & Monitor line. (For 5E9(1) and later see "LTPCLBCK".)

DAOPER or **TAOPER** - the LCC/RAX must match the LCC/RAX on an AMLBDSL form. These entries are permitted only for Packet Switching.

INDIV - For EDSL service, the CLASS OF SERVICE is "INDIV".

If "INDIV" is entered, TERMINATING TREATMENT must be "AGING", "ASIRA", "INDIV", "RI", "MLHG", "INWATS", or "TINWATS".

ISATND - For 5E4(2), if CLASS OF SERVICE is "ISATND", a DSMLHLN form (5901 Record) must be defined with a corresponding CKT LCC/RAX and a TERM TYPE of "ATND".

LTPCLBCK - If CLASS OF SERVICE is "LTPCLBCK":

- LINE SCREENING must be "N".
- TERMINATING TREATMENT must be "INDIV", "AGING" or "MLHG".

For 5E8 and earlier, see "CALLBK".

For 5E9(1) and later, if a TN defined on a LINE or MLHLN form has a LCC/RAX combination on the LCC form with a CLASS OF SERVICE of "LTPCLBCK", then:

- the TN must be defined on the TLWS form as LOCAL TALK & MONITOR LINE
- OE TYPE on the LINE form must be "A" (5E12 and later), "C", "E" (5E11 and later), "G", "L", "M" or "S"
- the LINE form must have the following values:

SHARED must be "N"
- NO DIAL must be "N"
- PTY must be "I"
- TTC must be "Y"
- DNY ROH must be "N"
- ANI7 must be "N"
- SERHLN must be blank
- BUSY MONITOR must be "N"
- DNY BV must be "N"
- TRAFFIC must be "N"
- DTLBILL must be "N"
- FGA must be "N"
- SLUS must be "N"
- COMPL must be "N"
- SUSO must be "Y"
- MFRI must be "N"

Copyright © 2003 Lucent Technologies

- For a MLHLN, the following restrictions must hold:
  - OE TYPE on the MLHLN form must be "A" (5E12 and later), "C", "E" (5E11 or later) or "L".
  - MLHG/TERM on the MLHLN form must not be defined on the MULTITN form.
  - FEATURE GROUP A on the corresponding MLHG form must be "N".
  - The MLHLN form must have the following values:

    COMPL must be "N"

    DNY ROH must be "N"

    SERHLN must be unknown

    DNY BV must be "N"

    DTLBILL must be "N"

    NO DIAL must be "N"

    SHARED must be "N"

    SLUS must be "N"

    SUSO must be "Y"

    TRAFFIC must be "N"

MODEM - If CLASS OF SERVICE is "MODEM", OE TYPE on the MLHLN form must be "A", "C", "E", "L", or "S".

RCDM - For 5E7 and later, if CLASS OF SERVICE is "RCDM",

- TERMINATING TREATMENT must be "INDIV".
- LINE SCREENING must be "N".
- If TNs appear on a LINE form where the LCC and RAX are defined on an LCC form with CLASS OF SERVICE set to "RCDM", then for the LINE form:
  - the following fields must be "N":

    MFRI

    BRCS

- and:

  PTY must be "I"

  CIDIAL must be "DENY"

  FLS must be "Y"

  SUST must be "Y"

- The AMLBDSL, DSLUSR, and/or MLHLN forms cannot be assigned an LCC and RAX that are defined on an LCC form with a CLASS OF SERVICE of "RCDM". These forms do not support this CLASS OF SERVICE.
- The MASTER TN on an MTNDR form cannot be defined as a TN on a LINE form where the LCC and RAX appear on an LCC form with CLASS OF SERVICE set to "RCDM".

TAOPER or **XDB** - For ISDN service in OSPS, the CLASS OF SERVICE is "TAOPER" or "XDB." DSLs

Copyright © 2003 Lucent Technologies

with a CLASS OF SERVICE of "XDB" must be configured as packet switching MLHGs. However, it is permissible for each member in the MLHG to have an individual Packet DN. DSLs with a CLASS OF SERVICE of "TAOPER" may have only the LINE CLASS CODE for Packet Switching.

TEST - if TERMINATING TREATMENT is also "TEST", all associated LINE forms with the same LCC/RAX value and ICP set to "N" must have TEST CODE entered.

If "XDB" is entered in the CLASS OF SERVICE field, an OSPSOPT form (5424 Record) must be submitted with "Y" entered in the OSPS TA field.

XAT - When an XAT form (5909 Record) is entered, the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "XAT" and a TERMINATING TREATMENT of "INDIV".

For 5E6 and later, if CLASS OF SERVICE is "XAT", then LINE SCREENING must be "N".

2.5 # TERMINATING TREATMENT

Description: This field is used to describe terminating service and routing.

Required Field.

Valid TERMINATING TREATMENT Entries

Entry	Definition
ASIRA	Software Release 5E8 and later. Advanced Service Interface Remote Access.
AGING	Changed or disconnected TN, routed to Regular Intercept.
INDIV	Individual.
INWATS	INWATS (800 Service). For 5E4(2) and later, this value can be assigned to MLHGs, a POTS line, or a line in a series completion chain.
MLHG	Multi-Line Hunt Group.
PARTY	2, 4, 5, 8, or 10 party.
RAPVN	Software Release: 5E6 - 5E7. ASP (Advanced Services Platform; previously PVN (Private Virtual Network)) DN Trigger. This value can only be assigned to POTS lines, i.e., to lines defined on the LINE form (5109 Record).
RI	Route Index.
TEST	Test Lines, restricted to use with telephone numbers associated with a route index.
TINWATS	Software Release: 5E4(2) and later. Terminating Trunk INWATS (800 Service).

Data Rules:

AGING - When a line or MLHG/TERM is assigned an LCC with TERMINATING TREATMENT set to "AGING", ICP must equal "Y" on the LINE or MLHLN form.

ASIRA - If an LCC/RAX combination with a TERMINATING TREATMENT of "ASIRA" is defined on a LINE form (5109 Record), then the following must be set on the LINE form:

- OE TYPE/NUMBER must not be entered
- SUST must be "N",
- DNY BV must be "Y", and
- SHARED must be "N".

If an LCC/RAX combination with a TERMINATING TREATMENT of "ASIRA" is defined on an MLHLN form (5111 Record), then the following must be set on the MLHLN form:

- OE TYPE/NUMBER must not be entered,
- DNY BV must be "Y", and
- SHARED must be "N".

RI or **TINWATS** - all associated LINE forms with the same LCC/RAX value and ICP set to "N" must have RTI entered.

Copyright © 2003 Lucent Technologies

TINWATS - If an LCC/RAX combination with a TERMINATING TREATMENT of "TINWATS" is defined on a LINE form, then the OE TYPE/NUMBER field must be blank and the RTI should point to a TGN on a TKGRP form with a TRKCLS of "EDSL" or "EDSLHM" and a BILLING DN entered .

For service to EDSLs, the Terminating Treatment is "RI" or "TINWATS".

For valid CLASS OF SERVICE and TERMINATING TREATMENT combinations, see Figure 1 .

2.6 # SCREENING INDEX

Description: Enter the Screening Index to be used for routing and charging of calls. Screening Indexes are defined on the RAR form.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

It is recommended that all lines with a CLASS OF SERVICE of "4PSS", "4PFS" or "8PSS" point to a Screening Index which provides TSPS routing for all message rate and toll calls. Failure to do this may result in billing errors.

2.7 # LINE SCREENING

Description: Does this LCC (Line Class Code) require that the RAR form associated with the regular digit analysis forms (PDIT (5300-2 Record), LDIT (5307 Record), and IDDD (5300-3 Record)) is read first? If LINE SCREENING is "Y", the non-specific code index is used to determine if the call should be allowed before the carrier specific code index and carrier specific Route Index are used in the Rate and Route.

This field is associated with the Carrier Interconnect capability.

For additional information, see the feature section, Revised Routing and Screening for the 5E2 Software Release, in Division 2, Section G of this guide.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

LCCs defined for WATS Bands, Toll Diversion, and Code Restriction have Line Screening set to "Y".

LCCs corresponding to a dedicated line LEN, should have LINE SCREENING entered as "N".

For 5E5 and later, LINE SCREEN must be N if any of the following fields are defined:

- PPB1 LCC/RAX and/or PPB2 LCC/RAX on the DSL form
- DPKT LCC/RAX and/or ODB LCC/RAX on the DSLUSR form
- PKT LCC/RAX on the AMLBDSL form

2.8 # DIGIT ANALYSIS SELECTOR

Description: Enter the Digit Analysis Selector to be used for routing and charging of calls.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

Digit Analysis Selectors are defined on the DAS form (5300-1 Record).

2.9 INSEP

Description: Enter the Incoming (traffic) Separations class (for Division of Revenue study).
Valid Entries: 1 - 255

Data Rules:

If INSEP is assigned, DESEP must also be assigned; and both must be defined on the Traffic Separation Cell Grouping, TRFSEP form (5308 Record).

INSEP 0 is used whenever INSEP is not provided by the incoming line or trunk translations. INSEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.10 DESEP

Description: Enter the Destination (traffic) Separations class (for Division of Revenue study).
Valid Entries: 1 - 255

Data Rules:

If DESEP is assigned, INSEP must also be assigned; and both must be defined on the Traffic Separation Cell Grouping, TRFSEP form (5308 Record).

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.11 LATA

Description: Enter the Local Access and Transport Area number.

This field is used by the secured feature, TCAP Improvements for a Switch Spanning Multiple LATAs (SFID 171). This LATA field is used to specify the LATA to be used by remote RSMs (Remote Switching Modules) residing in LATAs other than the LATA defined as the office default on the OFCOPT form (5509 REcord). This LATA is used so that the host switch can differentiate which calls originate in a given LATA so as to send those calls to the appropriate LEC (Local Exchange Carrier) STP (Signaling Transfer Point, or, to populate the 800 query with the originating lines' LATA. For more information, see Division 2, Section 4A171.
Valid Entries: 100 - 999

2.12 REMARKS

Description: This field may contain any entry deemed locally necessary.
Valid Entries: 1 - 16 characters

SEC. 3T: 5307 RECORD
INTERNATIONAL DIRECT DISTANCE DIALING FORM - IDDD

1. GENERAL

The 5307 Record is used for IDDD (International Direct Distance Dialing) Country Access Codes.

IDDD provides the capability for Direct Distance Dialing points outside the North American Network by the customer without the assistance of an operator. Customer routing and charging for an IDDD call in a 5ESS Switch is routed via TSPS. The TSPS office forwards the call to a Gateway Office or to an Overseas Assistance Operator based on the dialed digits. The composition of an International Number is shown in Figure 1.

IDDD calls are not required to route to TSPS if the CI (Carrier Interconnect) capability is in effect for the office. However, the intended carrier, either on a direct connection or via an Access Tandem, must utilize the INC (International Carrier) signaling protocol. See the RTIDX form (5303 Record) for additional information on signaling protocol.

1.1 International Carrier Signaling

When INC signaling is used, there are several stages of outpulsing. The first stage is KP + 1NX + XXX + CCC + ST. CCC is the 1- to 3-digit Country Code padded to three digits, if necessary, with leading zeroes. For this reason a Carrier Interconnect office must specify all valid Country Access Codes unlike the discussion which follows later.

1.2 Call Type

For 5E5 and later, TYPE CI CALL and CALL TYPE fields have been provided.

1.3 Prefix Digits

An international call is identified by the first digits dialed. If 010 is dialed, and no more digits are received, the call is destined for Overseas Operator Assistance. A station-to-station call is identified by the code 011. A person-to-person, credit card, or bill-to-third-number call is identified by the code 01. For 01 and 011 dialing, from seven to twelve additional digits are expected.

- **WARNING:** Customers may incorrectly dial 0 + the FGD CAC (Carrier Access Code), (rather than correctly dialing the FGD CAC only) to reach a vendor other then their PIC. The format 10XXX or 101XXXX is known as the FGD CAC, where XXX or XXXX is the CIC (Carrier Identification Code). The value allowed in the office depends on the value of the FGD PHASE field (5E9(1) and later) on the OFCOPT form. See the OFCOPT form and Division 2, Section 1BI for more information on the FGD CAC (On this form, CAC refers to Country Access Code (see next section; this warning is the only instance of FGD CAC). For an equal access office which does not use 010 for an IDDD operator, the route index should be the fixed route index to an announcement such as the "VACANT" code announcement.

1.4 Country Access Codes

These additional digits contain a Country Access Code and a National Number. Some countries have a uniform numbering plan while others have a variable number of digits in their numbering plan. This form makes it possible for the 5ESS Switch to identify and screen the CACs (Country Access Codes) for validity. If the CACs are valid, the 5ESS Switch must determine the acceptable number of digits for the associated numbering plan. This is defined on the record as the minimum and maximum number of digits expected.

If it is not desired that the 5ESS Switch screen the Country Access Codes for validity, the calls may be

Copyright © 2003 Lucent Technologies

passed to the TSPS for screening. IDDD forms must still be entered into ODA. However, only the initial digits received after the IDDD prefixes are translated and pointed to TSPS with minimum digits of 7 and maximum digits of 15. Valid initial digits are 2 through 9.

1.5 Code Index

Prefix code 010 (Overseas Operator Assistance) is assigned to Code Index 2 on a PDIT form (5300-2 Record). No IDDD form data is required for this prefix code. The 5ESS Switch owner must assign a Code Index for prefix codes 01 and 011 on the Rate and Route Record (5301 Record). For screening purposes, 01 is treated as a 0+ call, while 011 is treated as a 1+ call. Currently only one Code Index is required to translate all of the IDDD Country Access Codes.

1.6 Digit Interpretation

A station-to-station call is identified by the code 011. A person-to-person, credit card, or bill to third number call is identified by the code 01. For 01 and 011 dialing, from seven to fifteen additional digits are expected. These additional digits are defined in the minimum and maximum number of digits expected fields.

Each Country Access Code must be defined twice, once for the 01 prefix and once for the 011 prefix. The valid CACs are "merged" with the Local Digit Interpreter Table (LDIT) by ODA. Thus, it is possible to have various routing treatments for CACs since the LDIT Number will determine the IDDD call treatment.

1.7 Fully Coded Addressing

For 5E5 and later, all international outbound calls will be processed using FCA (Fully Coded Addressing). FCA is a CCS (Common Channel Signaling) single-stage protocol used to route international outbound calls in a uniform manner through the domestic network. With FCA, when an international outbound call is routed to a 5ESS Toll Switch, the 5ESS Toll Switch will collect all the dialed digits and route the call as a CCS single-stage call towards a 4EES ISC (International Switching Center).

1.8 OSPS International Outbound Calls

The IDDD form populates the two types of OSPS International Outbound digit analysis translations. The two types of international outbound OSPS calls are OSPS MF two-stage international calls, which are sent out of the OSPS using two state signaling, and the FCA (Fully Coded Addressing) calls, which may use either the two-stage MF signaling or may be routed via the CCS network. Both types of calls are covered in the data population on this form.

The LDIT field on this form must have the same entry as the LDIT field on the DAS form (5300-1 Record). The COUNTRY ACCESS CODE field on this form must be filled out for the valid Country Code.

If the LDIT field on this form is the same as the LDIT field for the non-OSPS TOLL international outbound calls, and the non-FCA two-stage feature is being used for OSPS, the TOLL feature populates the incoming digit strings on the LDIT form (5300-3/5 Record) as the PCC (Pseudo Country Code) and the OSPS feature populates the CAC (Country Access Code) on this IDDD form. The PCCs and the CACs are set up so they do not conflict with each other, therefore, they can be entered into the same LDIT using two different forms.

The FCA features always uses a DAS of 81 for both the OSPS and the TOLL. Both the OSPS and the TOLL features must have the CAC defined for DAS of 81. When both features are on the same switch, the IDDD form must be used to enter the CACs. If the OSPS feature is not present on the switch, the TOLL feature may use the LDIT form to enter the CAC. However, if an OSPS will be grown on that switch in the future, the IDDD form should be used to enter the CACs.

For OSPS MF two-stage international calls:

Copyright © 2003 Lucent Technologies

- CALL TYPE field should be "IDDDTSP";
- IDDD PREFIX should be entered as 01 and 011;
- TYPE CI CALL field should be "IDDD".

For FCA calls:

- the CALL TYPE field should be "IDDDFCA";
- IDDD PREFIX should be left blank;
- TYPE CI CALL field should be "NONCI".

The MIN. NBR. DIGITS EXPECTED field should be set to the minimum number of digits that may be dialed for the COUNTRY ACCESS CODE plus the national telephone number. This numeric value is between 4 and 15 digits. The MAX. NBR. DIGITS EXPECTED field should be set to the maximum number of digits that may be dialed for the COUNTRY ACCESS CODE plus the national telephone number. This numeric value is between 7 and 15 digits.

The CODE INDEX field should be set to a value that may be an optional key to call type determination because this value is used to forward this call to the called party.

The ROUTE INDEX field is not used by call type determination, but it may be used to route the call to the forwarded party if CDIM (5300-6 Record), RSMCAR (5421 Record), ICF or RAR forms (5301 Record) do not override it.

The DESEP field is only required for Division of Revenue study. If a DESEP is entered, it must be defined on the TRFSEP form (5308 Record).

1.9 Recent Change View

The corresponding Recent Change View for IDDD is 9.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * LDIT

Description: Enter the Local Digit Interpreter Table number. The LDIT identifies all codes that are dialable. The CACs are "merged" on the LDIT by ODA.

Required Field.
Valid Entries: 1 - 999

2.3 (*) IDDD PREFIX

Description: Enter the IDDD Prefix code, 01 or 011. Any other prefix code will be considered valid but is not normally used in the North American environment. Each prefix value entered must be appropriately defined on a PDIT form with 0 digits deleted.
Valid Entries: 1 - 3 digits

2.4 * COUNTRY ACCESS CODE

Copyright © 2003 Lucent Technologies

Description: The Country Access Code defines the country to which the call is destined. Enter the CAC if it is desired to screen it for validity locally within the 5ESS Switch. Duplicate Country Codes within an LDIT and IDDD prefix are not permitted. The Traffic Routing Guide defines all valid Country Access Codes.

If screening is not desired, enter a digit 2 through 9 which is the range of the first digit of all valid CACs. Screening must be done at the OSPS. If this office is a Carrier Interconnect office, all Country Access Codes must be furnished.

WARNING: For 5E7 and later, when CCS7 signaling is used on incoming calls destined to an IC (International Carrier), an entry on this form is required for each country code. Adding or deleting COUNTRY ACCESS CODEs to or from the IDDD form (5307 Record) requires that the COUNTRY CODEs be added or deleted to or from the PCC form (5318 Record).

Required Field.
Valid Entries: 1 - 3 digits; the first digit must be 2 - 9

2.5 (*) CITY CODE

Description: The CITY CODE field was added to support the IDDD City Code Routing Enhancement feature. This field is used to specify IDDD routing data for a specific city within a foreign country.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 7 digits

Data Rules:

When CITY CODE is entered, then TYPE CI CALL must be "IDDD" and CALL TYPE must be "IDDDSTS" or "IDDDTSP".

When CITY CODE is entered on an IDDD form (call it IDDD1), there must also be another IDDD form (call it IDDD2) having the same keys LDIT, IDDD PREFIX, and COUNTRY ACCESS CODE, but with blank for CITY CODE. In addition, MIN. NBR. DIGITS EXPECTED on IDDD1 must be equal to or greater than MIN. NBR. DIGITS EXPECTED on IDDD2 and MAX. NBR. DIGITS EXPECTED on IDDD1 must be equal to or less than MAX. NBR. DIGITS EXPECTED on IDDD2.

2.6 # MIN. NBR. DIGITS EXPECTED

Description: The entry in this field is dependent on whether the application is IDDD or OSPS.

For IDDD (International Direct Distance Dialing) enter the Minimum Number of Digits that may be dialed for the Country Code plus the National Number. If the exact number of digits expected is known, this value must be entered as both the Minimum and Maximum Number of Digits Expected.

OSPS looks for 3 digits plus the MIN. NBR. DIGITS EXPECTED entry as the minimum length forward number, e.g. if 4 is entered, OSPS expects 7 digits. The values 4 to 6 may only be used by a 5ESS Switch with OSPS Toll and Assistance.

Required Field.
Valid Entries:
- 5E9(2) and earlier: 4 - 12
- 5E10 and later: 4 - 15

Data Rules:

MIN. NBR. DIGITS EXPECTED cannot be greater than MAX. NBR. DIGITS EXPECTED. For 5E10 and later, the value of MIN. NBR. DIGITS EXPECTED cannot

Copyright © 2003 Lucent Technologies

exceed 12 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore the SFID 223 ACT field must be set to "Y" on the SFSYS form (5713-1 Record). For more information on this feature, see Division 2, Section 4A223.

For 5E14 and later, MIN NBR DIGITS EXPECTED must be greater than or equal to the sum of the lengths of COUNTRY ACCESS CODE and CITY CODE.

2.7 # MAX. NBR. DIGITS EXPECTED

Description: Enter the Maximum Number of Digits that may be dialed for the Country Code plus the National Number. If the exact number of digits expected is known, this value must be entered as both the Minimum and Maximum Number of Digits Expected.

Required Field.
Valid Entries:
- 5E9(2) and earlier: 7 - 12
- 5E10 and later: 7 - 15

Data Rules:

For 5E10 and later, the value of MAX. NBR. DIGITS EXPECTED cannot exceed 12 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore the SFID 223 ACT field must be set to "Y" on the SFSYS form (5713-1 Record).For more information on this feature, see Division 2, Section 4A223.

2.8 # CODE INDEX

Description: Enter the Code Index Number to be used for 01+ and 011+ calls. For screening purposes, 01+ is treated as an 0+ call, while 011+ is treated as 1+ call. Code Index 2 is normally used to screen IDDD calls.

For 5E8 and later, CODE INDEX is now a real Code Index and no longer a pointer to the DISERV form (5321 Record).

Required Field.
Valid Entries: 1 - 4095

All combinations of CODE INDEX from one or more LDIT, RDIT (5300-7/8 Record), PDIT, IDDD, or MLDIT forms (5300-3 Record), PREFIX from the PDIT form, and SCREENING INDEX from the LCC form (5306 Record) must have corresponding RAR form entries for CDI, PFX, and SCR.

2.9 ROUTE INDEX

Description: This field is used to indicate the Regular Route Index to be used for routing IDDD calls except when a Special Route Index entered on an RAR form overrides it. The Regular Route Index is the route which is used by the majority of call originators to complete the call.

For 5E8 and later, the ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E6 and later, a ROUTE INDEX must be entered for every CALL TYPE except "QUERY", for which ROUTE INDEX is optional.

2.10 DESEP

Description: Enter an optional Destination Separation Index to be used for 01+ and 011+ calls.
Valid Entries: 1 - 255

Data Rules:

If a DESEP is entered, it must be defined on a TRFSEP form (5308 Record).

A DESEP cannot be entered when CALL TYPE is "QUERY".

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.11 # CALL TYPE

Description: Enter the Call Type to be used. This Call Type will indicate the action to be taken on the receipt of the incoming digits.

Required Field.

Software Release: 5E5 and later
Default: IDDDTSP
Valid Entries:

Valid CALL TYPE Entries

Entry	Definition
IDDDFCA	International Direct Distance Dialing FCA (Fully Coded Addressing) call.
IDDDSTS	International Direct Distance Dialing Station To Station.
IDDTSP	International Direct Distance Dialing TSPS.
NORMAL	Software Release: 5E8 and later. ASP (Advanced Services Platform).
QUERY	Software Release: 5E6 - 5E7. Possible query to an external database.

IDDDFCA: This value is used for the address sequence of an international outbound call incoming to a Toll Switch (OFFICE TYPE on the OFCOPT form (5509 Record) is "Y") which will use FCA. A DAS (Digit Analysis Selector) of 81 will be used instead of the DAS associated with the incoming trunk group. This Call Type may be assigned to incoming digit sequences CC + NN or 0/1X + CC + NN. CC is the Country Code. NN is the National Number. 0/1X is the ISC (International Switching Center) prefix code. If this value is entered, then "NONCI" must be entered in the TYPE CI CALL field, and the IDDD PREFIX field must not be entered.

IDDDSTS: International Direct Distance Dialing Station To Station is used for multi-stage international outbound calls which are routed to an MF trunk, CCIS6 trunk, or CCS7 ISUP trunk. This value may be assigned to codes which require two-stage call handling at a toll or tandem office. Two-stage call handling includes an acknowledgement wink before the second stage of digits is sent. Also used in a tandem or toll office when the digits inpulsed on the trunk, typically from a TSPS, are 011 + padded Country Code.

This value can be used for:

- A Local office (OFFICE TYPE on the OFCOPT form is "N") where the incoming digits are 011 + (7 - 15 digits).
- A Toll office (OFFICE TYPE on the OFCOPT form is "Y") which will not use FCA (Fully Coded Addressing). Possible incoming digits are 1NX + XXX + CCC or 011 + PCC or 18X. 1NX is the

Copyright © 2003 Lucent Technologies

customer direct dialed digits. XXX is the international carrier. CCC is the padded Country Code. PCC is the Pseudo Country Code. 18X indicates an international call.

- A 5ESS Gateway Switch that requires an FCA international outbound call to leave the office on an MF trunk must assign this CALL TYPE to the digit sequence CC + NN. CC is the Country Code. NN is the national number.

IDDTSP: This value is used to route IDDD calls via TSPS like 01 + 7- to 15-digit calls. It is also used for Carrier Interconnect calls to an INC (International Carrier). If this value is entered, then the IDDD PREFIX field must be entered.

QUERY: When CALL TYPE is "QUERY", use the CODE INDEX to locate the corresponding DISERV form (5321 Record) to determine what type of query, if any, should be made.

Data Rules:

For 5E8 and later, if an ICF form has CARRIER TYPE equal to "CONSOL" or "INC", all IDDD forms with CALL TYPE not equal to "NORMAL" or "IDDDFCA" should have TYPE CI CALL set to "IDDD".

For 5E8 and later, if CALL TYPE is not "NORMAL", ROUTE INDEX must be entered.

IDDDTSP: For 5E8 and later, if CALL TYPE is "IDDDTSP", then IDDD PREFIX must be entered.

IDDFCA: For 5E8 and later, if CALL TYPE is "IDDDFCA", then TYPE CI CALL must be "NONCI" and IDDD PREFIX cannot be entered.

NORMAL: For 5E8 and later, if CALL TYPE is "NORMAL":

- DESEP cannot be entered,
- TYPE CI CALL must be "NONCI",
- IDDD PREFIX must be entered, and
- TRIG NBR must be entered.

QUERY: If the CALL TYPE is "QUERY", the CODE INDEX on this form must match the CDI field on a DISERV form (5321 Record), and

- SERV TYPE cannot be "E911" on the DISERV form.
- if SERV TYPE is set to "NOQRY" on that DISERV form, then the ROUTE INDEX field on this form must be entered. A SERV TYPE of "NOQRY" occurs at a NAP (Network Access Point) and the ROUTE INDEX must be entered to route to an SSP (Service Switching Point).
- for 5E7 and later, if "SSP" is entered in the PVN OFC on the OFCOPT form, then "PVNINT" must be entered in the SERV TYPE on the DISERV form.

2.12 TYPE CI CALL

Description: Enter the type of carrier interconnect call.

Software Release: 5E5 and later
Required Field.
Default: IDDD
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid TYPE CI CALL Entries	
Entry	**Definition**
IDDD	Used for calls destined to outside World Zone 1. If this value is entered, at least one ICF form must be defined with a carrier type of "INC" or "CONSOL".
NONCI	Used for calls for where carrier selection is irrelevant.
PSCAR	Software Release: 5E10 and later. Packet Switched international call. This entry supports the 15 Digit IDDD feature. For more information on this feature see Division 2, Section 4A223.

Data Rules:

This field must be set to "NONCI" when CALL TYPE is "IDDDFCA" or "QUERY".

If "PSCAR" is entered, then CALL TYPE must be "IDDDSTS".

2.13 TRIG NBR

Description: Enter the Network Services trigger number.

Software Release: 5E8 and later
Valid Entries:
- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

Data Rules:

If TRIG NBR is entered:

- it must match TRIG NBR on an NSTRIG form (5324 Record) ;
- APPLICATION on the NSTRIG form must not be "E911" ;
- if CALLTYPE is "NORMAL", APPLICATION on the corresponding NSTRIG form must not be "E911";
- for CALL TYPE equal to "NORMAL", if APPLICATION on the corresponding NSTRIG form
  - is "E911" or "800", ROUTE INDEX cannot be entered;
  - is "ASP", ROUTE INDEX must be entered, or ASP DEFAULT ROUTE INDEX on the ODAOPT form must be entered; and
- if SERV KEY on the corresponding NSTRIG form equals "CDPN", then the number of DIGITS EXPECTED on this form must be either 7 or greater than 9 for ALT GBL TITLE on NSTRIG not to be entered.

2.14 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

2.15 DFLT RT

Description: Enter the type of ASP Default Routing for 3/6/10-Digit Triggers.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later.
Required Field.
Default: NONE.
Valid Entries:

Valid DFLT RT Entries	
Entry	**Definition**
ANNC	Default routing to a fixed route "DFLTRT" for an announcement.
DLDN	Default routing to the dialed DN.
NONE	Existing treatment to "reorder" or "no circuits available".

Data Rules:

If "ANNC" or "DLDN" are entered:

- then TRIG NBR must be entered.
- then the secured feature ASP (Advanced Service Platform) Default Routing for 3/6/10-Digit Triggers must be purchased. Therefore the SFID ACT 153 field must be "Y" on the SFSYS form (5713-1 Record).

If "ANNC" is entered, then a FIXRT form (5301-1 Record) must be defined with a FIXED ROUTE TYPE set to "DFLTRT".

When DFLT RT is other than "NONE", the corresponding TRIG NBR must be defined on the NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "R0D1". In addition, if DFLT RT equals "ANNC" then SERVICE ALWD must not be "CSD".

2.16 INH OBL

Description: Is the ASP originating busy trigger inhibited? This field supports the Call Screening for ASP Originating Busy/No Answer Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A212.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The SFID 212 ACT filed on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set to "Y".

2.17 INH ONA

Description: Is the ASP originating no answer trigger inhibited? This field supports the Call Screening for ASP Originating Busy/No Answer Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A212.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The SFID 212 ACT filed on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set

Copyright © 2003 Lucent Technologies

to "Y".

2.18 ANI BYPASS

Description: Will ANI Table options be ignored? An entry of "N" indicates TDX ANI Table options will be processed. This field supports the TDX (Toll Digital Exchange) ANI Table Call Processing Feature. This is a secured feature with SFID 235. For more information on this feature, see Division 2, Section 4A165.

Software Release: 5E10 and later
Default: N

Valid Values: Y, N

2.19 DENY XFER

Description: This field is used to indicate if call transfers to a particular digit string should be denied.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, when DENY XFER is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to "Y". "Y" being set on the SFSYS form indicates that the "Deny Transfer of Digit Screened Calls" feature has been purchased.

2.20 REMARK

Description: This field may contain any remarks deemed locally necessary.

INTERNATIONAL PREFIX	INTERNATIONAL NUMBER (COUNTRY CODE + NATIONAL NUMBER)	TYPE OF INTERNATIONAL CALL
011	7-15 digits	STATION-TO-STATION
010	NONE	INTERNATIONAL OVERSEAS ASSISTANCE OPERATOR
01	7-15 digits	PERSON-TO-PERSON, CREDIT CARD, etc.

SEC. 3U: 5308 RECORD
TRAFFIC SEPARATIONS CELL GROUPING FORM - TRFSEP

1. GENERAL

The Traffic Separations Cell Grouping Record is available with 5E2 and later Software Releases and defines Cell Groupings associated with INSEP/DESEP pairs. Traffic Separations are DOR (Division of Revenue) requirements.

For traffic separations purposes, every incoming or originating call is assigned an INSEP (Incoming Separations) Class and a DESEP (Destination Separations) Class.

The INSEP and DESEP of a call determine the appropriate accumulating counters to be updated. There is a maximum of 256 INSEPs and 256 DESEPs, therefore 65,536 possible INSEP/DESEP pairs. Each pair may update more than one counter, thus intermediate counters are used.

The INSEPs and DESEPs are used as indexes into a matrix. Each matrix element, called a cell, contains a pointer to one intermediate counter, or cell grouping, which should be updated. The intermediate results contained in the cell groupings are periodically accumulated into SSR (Separations Summarization Registers).

Each call, or call attempt, is assigned an INSEP and a DESEP for traffic separations purposes. INSEP assignment is dependent on line or trunk originations. DESEP assignment is dependent on the digits dialed, i.e., the ultimate destination of the call.

After the INSEP/DESEP assignment, the pair is translated to cell groupings. The INSEP/DESEP matrix has a maximum of 256 INSEPs and 256 DESEPs, therefore a maximum of 65,536 cells. Each cell contains an index into 1024 cell groupings.

Most local/toll offices may not need a 256 x 256 matrix. In these cases a 64 x 64 matrix, or 128 x 128 matrix, can be used.

The cell is used as an index into the cell grouping structure. Each cell grouping contains a peg count and usage count. Every possible combination of INSEP/DESEP pair must be assigned to a cell grouping. All calls through the system (toll or otherwise) will be reflected by the summation of the cell groupings.

INSEP and DESEP of 0 is used by the Software Release whenever no INSEP or DESEP is provided by the incoming line or trunk translations. INSEP and DESEP of 63 and a CELL GROUP of 1023 are Switch defaults and are used for calls that are not applicable to DOR (i.e. busy, reorder etc.). INSEP/DESEP values of (0, 63) should not be assigned.

Every call through the 5ESS Switch is recorded in the DOR cell group report. CELL GROUP 0 has always been used as a default cell group for calls that are not applicable to DOR. However, calls with translation problems were also defaulted to cell group 0.

To separate the calls that had translation problems from the calls that are not applicable to DOR, each call is initialized to a "Switch default" INSEP of 63, DESEP of 63 and a CELL GROUP of 1023. If a call is not applicable as a DOR call (i.e. busy , reorder, permanent signal , vacant code etc) then the call is recorded in the Switch default Cell Group 1023 or Cell Groups translated with a INSEP/DESEP value of 63, and all translational problem calls are recorded in default cell group 0.

CELL GROUP 0 is the default cell group. Valid DOR calls that are not assigned an INSEP and/or DESEP value, use INSEP/DESEP 0.

Note: The input message "ALW:DCGRPT" to identifies INSEP and DESEP translation assignments in error.

CELL GROUP 1023 is the Switch default cell group. When a call is not applicable to DOR (i.e. busy,

Copyright © 2003 Lucent Technologies

reorder etc.), the division of revenue cell group 1023 will collect the data.

CELL GROUPs translated with DESEP values of 63 include calls routed to a permanent signal. Because a call to permanent signal never receives a digit with which to read the database for a DESEP value. A Switch default INSEP and DESEP value of 63 is used for non DOR calls. These calls do not use the INSEP or DESEP database values.

The last stage of traffic separations is the summarization of the cell groupings into Separations Summary Registers. For the 5ESS Switch, the SSRs, as well as the mapping from cell grouping to SSR, will reside outside the switch in a downstream processor. The summarization process is an external support function.

See Division 2, Section 1B for more information.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each page of the Record.

2.2 * INSEP

Description: Enter the Incoming Separations Class. The INSEP for trunks is assigned according to the Trunk Group of the origination. For lines, the INSEP is assigned on the LCC Form (5306 Record) based on the Line Class Code and Rate Area.

NOTE: By using the Line Class Code form, INSEP assignments can be changed without changing data on a line by line basis.

Required Field.
Default: 0
Valid Entries: 0 - 254

Data Rules:

INSEP 0 is used whenever INSEP is not provided by the incoming line or trunk translations. INSEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.3 * DESEP

Description: Enter the Destination Separations Class. The DESEP assignment for lines is assigned on the LCC Form (5306 Record) based on the Line Class Code and Rate Area. For trunks, a DESEP is assigned according to the digits dialed.

Required Field.
Default: 0
Valid Entries: 0 - 255

Data Rules:

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

Copyright © 2003 Lucent Technologies

2.4 CELL GROUP

Description: Enter the Traffic Separations Cell Group number. Each cell grouping contains a peg count and usage count.
Valid Entries: 0 - 1023

Data Rules:

Each INSEP and DESEP assigned on other records must be assigned to at least one Cell Group. Every possible combination of INSEP and DESEP must also be assigned to a Cell Group.

CELL GROUP 1023 is the Switch default cell group for non DOR calls and should not be assigned.

CELL GROUPs should not be assigned an INSEP or DESEP value of 63. INSEP/DESEP 63 is used to separate non DOR calls (i.e. Vacant code, Permanant signal, etc.) from a valid DOR call.

CELL GROUP 0 is the default cell group. CELL GROUP 0 should be translated with all possible combinations of: INSEP X - DESEP 0, INSEP 0 - DESEP X, INSEP 0 - DESEP 0:

Where X= 1-62, 64-255

See Figure 1 for a simplified sample of an office with the following assignments.

INSEP	ORIGINATED BY
0	Unassigned
1	Line
2	Trunk

DESEP	DESTINED FOR
0	Unassigned
1	Local number
2	Extended Area Service
3	Home NPA
4	Intrastate
5	Interstate

SEC. 3V: 5309 RECORD
INCOMING TRUNK
PRELIMINARY DIGIT INTERPRETER FORM - INDIT

1. GENERAL

The Incoming Trunk Preliminary Digit Interpretation Record is used to define the initial digit analysis and subsequent treatment of inpulsed digits from all Incoming and Two-Way Trunks based upon the initial digits received.

Set LDIT equal to "N" whenever complete digit analysis is provided by INDIT. That is, whenever LDIT is by-passed and call processing passes directly to the RAR form (5301 Record).

This would normally be the case for a regular 7-digit telephone number when fewer than seven digits are incoming on the trunk. This type of call cannot be translated in LDIT because some or all of the digits of the NXX code have been deleted by the sending office.

The ultimate destination of these calls would typically be to a directory number defined on the Telephone Number Record for this office.

The directory number translation software reconstructs a 7-digit telephone number for either a line or trunk originated call terminating to a line defined with a route index as would be the case for a PBX DID (Direct Inward Dial) group. Therefore, less than 7-digit incoming calls destined for the DID group can use the same entry as the other telephone numbers in the office NXX (i.e., one INDIT entry for the NXX with a single code index). The route index associated with the line is then defined on the RTIDX form (5303 Record) with appropriate digit deletion based on the reconstructed 7-digit telephone numbers.

For any Software Release, it is possible to translate PBX-DID telephone numbers completely in digit analysis, if it is desired, to avoid telephone number translations for these numbers on the LINE form. It is also possible to completely translate EDSL TNs in digit analysis. The EDSL feature is available in 5E4(2) and later Software Releases. To do this, the LDIT would require entries similar to the above description to expand the NXX to the thousands or hundreds digit. If this is a 7-digit incoming office, the INDIT may point to LDIT for these translations. If less than seven digits are expected, both the LDIT and INDIT must break out the NXX and two route indexes would be required for the appropriate digit deletion as described above. If this method is used, it must be remembered that the LINE form was not entered, and therefore no record or verify of the telephone number will exist on a line basis. They will appear to be blank numbers. If one of these numbers is mistakenly assigned as a regular line, calls to the number will be routed to the PBX-DID.

Set LDIT equal to "Y" for incoming calls (usually seven or ten digits) when the ultimate destination is specified on the LDIT form.

The LDIT translations will be those specified for the DAS (Digit Analysis Selector) assigned to the incoming or two-way trunk group on the TKGRP form (5202 Record).

If the office expects seven digits on incoming traffic, either LDIT equal to "Y" or "N" may be used. LDIT equal to "N" would probably be the appropriate choice if the office only allows locally terminating calls on these trunks. "Locally terminating" means telephone numbers which have NXX codes defined on the NOC (Normalized Office Code) form (5501 Record) and would include calls which terminate to a local DID trunk group. By using LDIT equal to "N", the additional call processing step of LDIT would be eliminated for trunk originated calls.

However, if the office tandems traffic, then LDIT equal to "Y" would be appropriate to avoid many duplicate digit analysis entries in both INDIT and LDIT. Both local and tandem codes would be sent to LDIT for digit analysis by entering on the INDIT Record all possible first digits which are acceptable with LDIT equal to "Y". See the example in Figure 2.

Copyright © 2003 Lucent Technologies

NOTE: Caution must be taken when LDIT is used for digit interpretation and the office is translated for Carrier Interconnect. If a TYPE OF CI CALL such as "INTER" is found during digit interpretation, an InterLATA Carrier will be required to route the call. If the OFFICE CARRIER ID is specified on the OFCOPT form (5509 Record) and the route defined for that carrier is appropriate for trunk originations, then this method is acceptable. However, the preferred method is to use separate digit interpretation (i.e., INDIT or unique LDIT) so that "NONCI" may be entered for TYPE OF CI CALL on trunk originated calls.

For both cases of LDIT equal to "Y" and "N", the subsequent screening on the RAR (Rate and Route) form (5301 Record) utilizes the NO PREFIX entries.

1.1 Revertive Pulsing Trunk Groups

For INDITs used for incoming revertive pulsing trunk groups, the INCOMING DIGITS may be a 0 or 5 which represents LOW 5 and HIGH 5 directory numbers, or three digits which indicate the Office Brush, Office Group and LOW 5/HIGH 5 Indicator. If these calls terminate to directory numbers in this office, the INCOMING DIGIT count may be deleted and the appropriate OFFICE CODE entered. If these calls must tandem to another office without RP signaling, the appropriate digits of the NXX must be prefixed on the RTIDX form (5303 Record). It is possible to receive 0 or 5 plus 4 digits from an end office on an RPEO Trunk Group, and outpulse Office Brush, Office Group and 0 or 5 to a tandem on an RPTO Trunk Group and vice versa. The Office Brush and Office Group digits required for outpulsing to the tandem must be prefixed on the RTIDX form. In the second case, the Office Brush and Group digits could be deleted on the INDIT or on the RTIDX form for outpulsing to the end office.

1.2 Recent Change View

The corresponding Recent Change View for this form is 9.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * INC. TRUNK PRELIMINARY DIT

Description: Enter the Incoming Trunk Preliminary Digit Interpreter Table being defined. The Incoming Trunk Preliminary Digits are used for Incoming and Two-Way Trunk Group terminations.
Valid Entries: 1 - 999

2.3 * INCOMING DIGITS

Description: Enter the incoming digits to be interpreted.

For applications where only four digits are received, and the call is to complete to a 7-digit directory number within the 5ESS Switch, the first digit of each equipped thousands group must be defined in these columns. For example, if NXX 355 has the 3XXX, 4XXX, and 5XXX numbers equipped and the office receives 4 digits incoming, then the digits 3, 4, and 5 must be defined.

If the initial digits received from the trunk are not defined on the INDIT form, reorder will be returned.
Valid Entries: 1 - 15 digits

2.4 LDIT

Description: Should the LDIT (Local Digit Interpreter Table) form (5300-3/5 Record) be used to analyze the incoming digits?

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: Y, N

Data Rules:

For 5E8 and later, if LDIT equals "N", RECONSTRUCT must be "N".

For 5E8 and later, if LDIT equals "Y", TRIG NBR must not be entered.

For 5E9(1) and later, when LDIT equals "Y", ESC CODE must be "N".

2.5 RECONSTRUCT

Description: Should the dialed digits be reconstructed for Network Services triggers?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If RECONSTRUCT equals "Y":

- LDIT must be "Y",
- OFFICE CODE must be entered,
- TYPE OF CI CALL, CODE INDEX, IMPLIED NPA, DESEP, and ROUTE INDEX must not be entered, and
- POLYGRID must be "N".

If LDIT equals "Y" and RECONSTRUCT equals "N", OFFICE CODE and NBR OF DIGITS EXPECTED must not be entered.

2.6 BUILD 10 DIGITS

Description: This field indicates whether or not to reconstruct to 10 digits. For trunk originations involving abbreviated incoming signaling (e.g. less than 7 digits), if this field is set to "Y", the incoming digit string will be reconstructed to 10 digits based on the values entered in the OFFICE CODE and NPA fields. The reconstructed 10-digit number is then re-analyzed in LDIT. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

When LDIT is "N", BUILD 10 DIGITS must be "N".

When LDIT is "Y" and BUILD 10 DIGITS is "Y", RECONSTRUCT must be "Y".

2.7 TYPE OF CI CALL

Description: This field is associated with the Carrier Interconnect capability.

Copyright © 2003 Lucent Technologies

Valid TYPE OF CI CALL Entries

Entry	Definition
AVT	Access Via Tandem is used for an incoming trunk call from an EAEO (Equal Access End Office); the digits 0ZZXXX are received. The 0ZZ digits are entered in the INCOMING DIGITS field and represent a spare toll center code. XXX represents a Carrier Identification Code and is not interpreted on the INDIT. The 5ESS Switch, serving as an Access Tandem, tandems the call to the carrier based on entries in the CDIM form (5300-6 Record).
INC	International Carrier call is used for an incoming trunk call from an EAEO; the digits 1NXXXXCCC are received. The 1NX digits are entered in the INCOMING DIGITS field and represent a spare toll center code. XXX represents an International Carrier Identification Code and is not interpreted on the INDIT. CCC represents a padded Country Code and is not interpreted by the 5ESS Switch. The 5ESS Switch, serving as an Access Tandem, tandems the call to the International Carrier based on entries in the CDIM form (5300-6 Record).
EMRR	Emergency Reroute call is used for an incoming trunk call from an EAEO; either of the digit sequences illustrated under "AVT" or "INC" are received. The 5ESS Switch in this case may be either an EAEO or an AT and is used only during an emergency when the originating EAEO cannot route to its AT. Based on the 0ZZ or 1NX codes, the call is routed, without further digit interpretation, to the proper AT. EMRR applies only to Equal Access MF and not to ISUP (SS7) signaling.
INTRM	Software Release: 5E8 and later. FGB Interim call is used for an incoming trunk call dialed by the originator as 950XXXX. The 950 digits are entered in the INCOMING DIGITS. The XXXX represent a Carrier Identification Code. These calls may be from a non-EAEO and less than the seven digits may be received as would then be reflected in the INCOMING DIGITS. When "INTRM" is entered, the last four digits inpulsed (i.e., the Carrier Identification Code) will be used to enter the ICF form (5305 Record) to access the Carrier's FGB CDI and FGB RTI. Because "INTRM" is also a valid entry in the LDIT form, it may be optionally used instead of the INDIT form.
TRANS	Software Release: 5E7 and earlier. Transition call is used for an incoming trunk call dialed by the originator as 950WXXX. The 950W digits, where W may be any digit but is usually 1, are entered in the INCOMING DIGITS. The XXX represent a Carrier Identification Code. These calls may be from a non-EAEO and less than the seven digits may be received as would then be reflected in the INCOMING DIGITS. When "TRANS" is entered, the last three digits inpulsed (i.e., the Carrier Identification Code) will be used to enter the ICF form (5305 Record) to access the Carrier's TRANS CDI and TRANS RTI. Because "TRANS" is also a valid entry in the LDIT form, it may be optionally used instead of the INDIT form.
NONCI	Used for calls for which carrier selection is irrelevant (e.g. locally terminating traffic, local company tandem traffic, calls incoming from a carrier either directly or via an AT).
PSNCI	Software Releases: 5E3 and later. Used for incoming Packet Switch calls. These calls will terminate to a line in the office.

Data Rules:

This field is used only when LDIT equals "N".

For 5E5 and later, if "PSNCI" is selected, then either an OFFICE CODE or a ROUTE INDEX must be entered, but not both.

For 5E7 and later, if TYPE OF CI CALL is "PSNCI", DESEP may not be entered.

2.8 CODE INDEX

Description: If LDIT equals "N", or if destination is DN, then enter the CODE INDEX number to be used on the RAR form (5301 Record); otherwise, leave this field blank.

For 5E8 and later, CODE INDEX is now a real Code Index and no longer a pointer to the DISERV form (5321 Record).
Valid Entries: 1 - 4095

Data Rules:

Copyright © 2003 Lucent Technologies

If any RAR form associated with this INDIT can also be used by lines in this office, then Code Indexes 1 and 2 may not be used.

All combinations of CODE INDEX, and SCR from the TKGRP form must have corresponding RAR form entries for CDI, SCR, and "NONE" for PFX.

For 5E8 and later, either CODE INDEX on this form or an MLDIT (5300-3 Record) or PDIT (5300-2 Record), or CODE INDEX or CDI on RDIT (5300-7/8 Record) or LDIT, or WITH ANI or WITHOUT ANI on an AISCLS form must equal INC CDI on an INFLDEST form (5448 Record).

2.9 ROUTE INDEX

Description: This field is used to indicate the regular route index used for tandem traffic except when a special route index entered on the RAR form (5301 Record) overrides it.

For 5E8 and later, the ROUTE INDEX can be used for routing if the SCP replies to route with it.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

This field is entered only when LDIT equals "N".

No entry should be made in this field when Type of CI Call is "AVT", "INC", or "PSNCI".

2.10 POLYGRID

Description: Should polygrid routing be used? This field is used only in DSN (Defense Switched Network) offices.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this is a DSN office (DSN OPTION set to "Y" on the OFCOPT form), POLYGRID should be "Y". For non-DSN offices, it must be "N".

2.11 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Data Rules:

When NPA is entered, OFFICE CODE must be entered.

For 5E12 and later, when the OFFICE CODES and/or NPA/OFFICE CODE combinations are assigned on the INDIT form they must be defined on the NOC form.

Copyright © 2003 Lucent Technologies

2.12 OFFICE CODE

Description: This field is used for two purposes, either to designate a code served by this 5ESS Switch or for NM (Network Management) code controls.
Valid Entries:

For 5E3 and later: 3 digits

Data Rules:

If LDIT is "N" and this incoming trunk call terminates to a number served by the 5ESS Switch (i.e., defined on the NOC form), then enter the NXX. If an OFFICE CODE is entered but the ROUTE INDEX is not, it will route the call to a directory number of this NXX in this office, except when a special route index or NXX entered on the RAR form (5301 Record) overrides it.

When both a ROUTE INDEX and an OFFICE CODE are entered, it is determined that the OFFICE CODE is being used for Network Management code controls. The OFFICE CODE in this case is used when the INCOMING DIGITS do not contain all of the digits of the NXX's (i.e., when four to six digits are inpulsed) which the NM generic software must know to accomplish control (blocking) by codes. If LDIT equals "Y", then the implied NPA/NXX is determined from the LDIT form and is prohibited here.

If LDIT is "N", and NBR OF DIGITS EXPECTED is 4 or 5, the NM implied NXX may be entered here.

If LDIT is "N", NBR OF DIGITS EXPECTED is 6, and the number of INCOMING DIGITS is two or more, the NM implied NXX may be entered here.

If LDIT is "N", NBR OF DIGITS EXPECTED is 6, and the number of INCOMING DIGITS is one, the NM implied NXX is not currently supported and may not be entered.

When LDIT is "N", and NBR OF DIGITS EXPECTED is greater than 6, the implied NXX is determined from the INCOMING DIGITS.

This field is entered only when LDIT equals "N".

See Figure 1 for a summary of allowable entries and constraints for OFFICE CODE when LDIT equals "N".

For 5E12 and later, if the INDIT forms have an OFFICE CODE defined and there are multiple NOC forms with the same value of OFFICE CODE, NPA will also have to be defined on the INDIT form.

2.13 IMPLIED NPA

Description: This field is used by the NM (Network Management) generic software for code control. It contains the called NPA which is implied by incoming trunk calls and is allowed if LDIT equals "N", and NBR OF DIGITS EXPECTED is between 4 and 7 (inclusive), except for the case when 6 digits are expected and the number of INCOMING DIGITS is one.
Valid Entries: 3 digits

- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

Data Rules:

The NPA which has been specified as the DEFAULT NPA on the OFCOPT form (5509 Record) may not be entered as any IMPLIED NPA on the INDIT form.

When four to six digits are expected and IMPLIED NPA has an entry, then the OFFICE CODE must also have an entry.

Copyright © 2003 Lucent Technologies

See Figure 1 for a summary of allowable entries and constraints for IMPLIED NPA when LDIT equals "N".

2.14 DESEP

Description: This field is used to define the Destination Separations Index.
Valid Entries: 1 - 255

Data Rules:

DESEP is allowed only when LDIT is "N". If entered, DESEP must be defined on the TRFSEP form (5308 Record).

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

2.15 NBR OF DIGITS EXPECTED

Description: Enter the total number of digits expected.
Valid Entries: 1 - 15

Data Rules:

If LDIT is "N", NBR OF DIGITS EXPECTED must be entered. For LDIT trunk destinations, this field must be left blank (since the number of digits expected is entered on the LDIT form).

2.16 # NBR OF DIGITS TO BE DELETED

Description: This field is used to define the number of digits to be deleted after the incoming "steering" digits are analyzed but before either the DN or LDIT translation is begun.

- Incoming Routing Destination - DN; or "N" is entered in LDIT.

For this application, the steering digit(s) is normally deleted since it is no longer required to complete a directory number. This also applies when a call is to complete in the 5ESS Switch Office or is a tandem call. For tandem calls, the steering digits may be deleted here or on the appropriate RTIDX form (5303 Record). The number of digits deleted must be less than or equal to the number of digits expected (NBR OF DIGITS EXPECTED field).

- ***NOTE:*** Any digits deleted here will not appear in the AMA Record if this is a billable call.

- Incoming Routing Destination - LDIT; or "Y" is entered in LDIT.

For this application, 7 or 10 digits are usually expected (except for n11 codes) with no prefix digit(s). Except in the unlikely case that prefixed steering digits are received, no digits should be deleted.

If digits are to be deleted, the number of digits deleted must be less than or equal to the number of digits entered in the INCOMING DIGITS field.

- ***NOTE:*** Any digits deleted here will not appear in the AMA Record if this is a billable call.

Required Field.
Valid Entries: 0 - 15

2.17 TRIG NBR

Copyright © 2003 Lucent Technologies

Description: Enter the Network Services trigger number.

Software Release: 5E8 and later
Valid Entries:
- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

Data Rules:

If TRIG NBR is entered, it must equal TRIG NBR on an NSTRIG form (5324 Record).

If TRIG NBR is entered, TYPE OF CI CALL must be "AVT".

If LDIT is "N", TYPE OF CI CALL is "AVT", and TRIG NBR is entered, then the corresponding NSTRIG form must have APPLICATION equal to "EAASP" (5E8), "ASP" (5E9(1) and later),or "EAOFC".

When TRIG NBR is entered, and NBR OF DIGITS EXPECTED is 0 through 6, 8, or 9, and SERV KEY is "CDPN" on the corresponding NSTRIG form, then ALT GBL TITLE on NSTRIG must be entered.

For 5E8, if TRIGNBR is entered, and ASP OFC on the OFCOPT form is either "BILLNAP" or "NOBILLNAP", ROUTE INDEX must be entered.

2.18 ESC CODE

Description: Is the digit sequence an ASP off-hook delay trigger exception?

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

2.19 NODAL IDX

Description: Proprietary field.

2.20 DN PREFD

Description: Proprietary field.

2.21 GETS HPC

Description: Is GETS (Government Emergency Telecommunication Service) HPC (High Probability Call Completion Service) required? The GETS HPC field is used as an indicator to mark GETS HPC calls so that enhanced functionality provided by other HPC capabilities (e.g., Trunk Queuing, ISUP Signaling, Exemption from Network Management Controls) can be invoked. When set to "Y", calls translated to this address receive special treatment resulting in a higher probability of call completion. For more information, see Division 2, Section 4A279.

The use of HPC Network Capabilities is restricted in the United States and U.S. Territories to National Security/Emergency Preparedness (NS/EP) users authorized by the Office of the Manager, National Communication System (OMNCS). Telco deployment of these HPC Network Capabilities must be co-ordinated with the OMNCS at the following address:

Office of the Manager
National Communication System
Attn: GETS Program Office
701 South Courthouse Rd

Copyright © 2003 Lucent Technologies

Arlington, VA, 22204-2198
email: gets@ncs.gov

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When GETS HPC is "Y", NBR OF DIGITS EXPECTED must be 10.

When GETS HPC is "Y", TYPE OF CI CALL must be "NONCI".

When the LDIT/MLDIT/RDIT/INDIT forms' GETS HPC is "Y" or CONFLICT RESOLUTION GETS HPC is "Y", GETS HPC or CONFLICT RESOLUTION GETS HPC can be "Y" only when the GETS High Probability of Call Completion Secured Feature has been purchased. A SFSYS form must exist with SFID 279 ACT set to "Y".

2.22 REMARKS

Description: These columns may contain any entries deemed locally necessary.
Valid Entries: 1 - 16 characters

ROUTE INDEX entered?	NUMBER OF INCOMING DIGITS	NUMBER OF DIGITS EXPECTED	OFFICE CODE	IMPLIED NPA
N	don't care	1 - 3	RN	P
N	don't care	4 - 7	RN	A
N	don't care	8 - 15	RN	P
Y	1	1 - 3	P	P
Y	1	4 - 5	A	A
Y	1	6	P	P
Y	1	7	P	A
Y	1	8 - 15	P	P
Y	2 - 3	2 - 3	P	P
Y	2 - 6	4 - 6	A	A
Y	2 - 7	7	P	A
Y	2 - 15	8 - 15	P	P

RN - Required and must be defined on the NOC form

A - Any NPA/NXX allowed

P - Prohibited

SEC. 3X: 5311 RECORD
CIRCUIT CODE TO DIGIT TRANSLATION RECORD - CKTCODE

1. GENERAL

The 5311 Circuit Code to Digit Translation Record is available with 5E6 and later Software Releases.

This form is used to translate an incoming circuit code to a 0ZZ, 1NX or 1N'X digit string used for equal access or international signaling.

This form is used to translate the 4 bit circuit code, received in the TNS (Transit Network Selection) parameter of an ISUP7 (Integrated Services Digital Network User Part 7) IAM (Initial Address Message), to a digit value which represents the 0ZZ, or 1NX or 1N'X digit string used in equal access and international signaling. This form is only used for Originating Access Tandem offices with incoming "ISUP7" trunks and Originating Toll offices that handle international traffic on incoming "ISUP7" trunks.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * CKT CODE

Description: Enter the circuit code. This field is the network identification field of the Transit Network Selection parameter.

This field, contained in the Network Identification field of the TNS parameter of the CCS7 IAM, contains a 4 bit circuit code value. A 4 bit value of 0000, is defined in the ISUP7 protocol specification to have a meaning of unspecified. Since all CCS7 subfields have a default value of zero unless otherwise assigned, it is not recommended to use 0 as a meaningful value for CKT CODE.

A CKT CODE value of 1 must be used when PREFIX DIGITS contains the 1NX (international call, no operator requested) standardized string. A CKT CODE value of 2 must be used when PREFIX DIGITS contains the 1N'X (international call, operator requested) standardized string.
Valid Entries: 0 - 15

2.3 # DIG

Description: Enter the 0ZZ or 1NX or 1N'X digit string used in equal access and international signaling. Valid entries are 000 - 099 for domestic calls and 100 - 199 for international calls.

Required Field.
Valid Entries: 000 - 199

```
cktcode                5ESS Switch

SEC. 3Y: 5312 RECORD
ORIGINATING NUMBERING PLAN AREA FORM - ONPA

1. GENERAL

The 5312 Record is applicable to 5E2 and later Software Releases and is used by an INWATS Originating Screening Office (an Interexchange Carrier switch) to associate a 00X code with an originating NPA and vice versa. To use this capability, ORIG SCREEN OFF must equal "Y" on the OFCOPT Form (5509 Record).

The OSO (Originating Screening Office) recognizes an INWATS call for OSO by the CALL TYPE of "OSOIWTS" entered on the LDIT form (5300-3 Record). This call type triggers the software to send a direct signaling message using Common Channel Signaling to the INWATS database. Part of the message specifies the originating NPA.

Usually, the originating NPA can be determined by the ANI (Automatic Number Identification) digit sequence (i.e., the calling number). ANI is sent because the originating office is an Equal Access End Office using Equal Access signaling protocol either on a direct trunk group, or via an Access Tandem, or it is a nonconforming end office on a direct CAMAANI trunk group. If ANI is not sent, then the far end NPA can be determined from the originating trunk group.

However, sometimes the traffic on this incoming trunk group may have originated in multiple NPAs so the FAR END NPA specified on the trunk group would not be correct for all incoming 800 calls. This may be true when nonconforming end offices are not directly connected to this switch but are tandemed either through an Access Tandem or through a tandem switch that does not use Equal Access signaling protocol. If the originating end offices reside in multiple NPAs (and subsequently arrive at the OSO on one trunk group), the tandem switch must delete the 800 digits and prefix a 00X code to the remaining seven digits where the X is a digit representation of the originating NPA. Several unique 00X codes are then outpulsed on one trunk group to the OSO.

The OSO will translate in LDIT the 00X digit strings with the CALL TYPE of "OSOIWTS" when the INWATS database needs to be queried. The digit interpretation is the same as the 800 digit strings. However, call processing will recognize that an 00X-type code translated as "OSOIWTS" requires that the information submitted on this ONPA form must be accessed to determine the originating NPA of the caller.

For either 800 or 00X incoming digit strings, the information sent to and returned from the INWATS database will be the same. If the 800 number is appropriate for the originating NPA, a POTS number will be returned by the INWATS database which will be subsequently interpreted and routed by the OSO. If the 800 number is inappropriate, the message returned will invoke the fixed route type of "UIA" defined on the FIXRT form (5301-1 Record). If the 800 number is not found, the message returned will invoke the fixed route type of "VACANT".

If the OSO has a requirement to screen 800 or 00X codes and return non-Carrier calls to the local company, the inverse of 00X to NPA will be required. This inverse is provided in the database automatically with the values input through the ONPA Form. All INWATS calls that need to be returned to the local company will be outpulsed in the format of 00X plus seven digits. Again, the X is a digit representation of the originating NPA.

By six-digit translating the 800 or 00X original digit string, the OSO can distinguish calls that must be returned from Carrier calls requiring the INWATS database query by using INWATS instead of "OSOIWTS" as the call type in LDIT. When ORIG SCREEN OFF on the OFCOPT Form equal "Y", the 5ESS Switch recognizes the INWATS call type as a call to be routed back to the local company.

If the digit string being interpreted is already in the format 00X-NXX-XXXX, the call may continue processing as it is using the Code Index and Route Index as they appear in the LDIT entry.

Copyright © 2003 Lucent Technologies

If the digit string is in the format of 800-NXX-XXXX, the 800 must be changed to 00X before the digits are outpulsed. To do this, call processing will access the NPA to 00X database information based on the originating NPA. The 800 digits will now be replaced with the appropriate 00X digits and the call routed based on the Code Index and Route Index of the 800 LDIT entry.

For 5E4(2) and later Software Releases, the 5312 Record is also used by the SSP800 (Service Switching Point 800) capability. To use this capability, SERV SWTCH PT must equal "Y" on the OFCOPT form (5509 Record). The 5312 Record is used to specify the originating LATA and indicate if the traffic from the LATA will be exclusively COIN traffic.

- ***NOTE:*** An office cannot serve as an OSO (Originating Screening Office) and a Service Switching Point Office at the same time.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.8.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * INWATS 00X CODE

Description: Enter the INWATS 00X Code, where the X is a digit representation of the Originating NPA entered in the next field.

Required Field.
Valid Entries: 000 - 009

2.3 ORIGINATING NPA

Description: Enter the Originating NPA of the party calling the 800 INWATS number.

Required Field.
Valid Entries: 3 digits
- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

2.4 ORIGINATING LATA

Description: Enter the LATA number where the call originated.
Default: 0
Valid Entries: 0 - 999

2.5 COIN IND

Description: Will the traffic from the LATA be exclusively COIN traffic? If the traffic will be a combination of COIN and other traffic enter "N".
Default: N
Valid Entries: Y, N

SEC. 3Z: 5313 RECORD - CCSRTI

1. GENERAL

The CCSRTI (Common Channel Signaling Route Index) form and the corresponding 5313 Office Record are available with 5E3 and later Software Releases. The CCSRTI input form is used only with CCS type trunks. Every CCS call whose chosen route does not meet the per call restrictions, identified in the CCS IAM message, must have an appropriate entry specified on the CCSRTI form. Given a current ROUTE INDEX corresponding to a trunk group carrying CCS traffic and associated satellite and digital restrictions, an alternate NEW ROUTE INDEX can be specified. This form should not be submitted in offices without CCS trunks.

For 5E6 and later Software Releases, CCSRTI forms can be used only if the COMMON CHAN SIG field on the OFCOPT form (5509 Record) is "Y".

1.1 Recent Change View

The corresponding Recent Change View for CCSRTI is 10.26.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ROUTE INDEX

Description: Enter the Route Index value associated with a Trunk Group Number that carries CCS traffic.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

2.3 * RESTRICTIONS

Description: The RESTRICTIONS field consists of three parts -- Signal Type, Satellite Restriction, and Digital Path Restriction.

Signal Type can take on two values:

- NS: The new route index chosen must be associated with a trunk group that has either CCIS6 or ISUP7 signaling.

- I7: The new route index chosen must be associated with a trunk group that has ISUP7 signaling. This will only happen if the incoming IAM indicates that ISUP7 signaling is required all the way for this call. This restriction only applies to SDN calls for 5E5.

The Satellite Restriction can take on two values:

- SN: The CCS call has not been routed via satellite on any of the prior call legs, thus there are no Satellite Restrictions on the NEW ROUTE INDEX.

- SY: The CCS call has been routed via satellite on a prior call leg and thus the NEW ROUTE INDEX

Copyright © 2003 Lucent Technologies

must point to a TGN with the Satellite field set to "N".

The Digital Path Restriction can take on two values indicating whether a digital path is required for the CCS call.

- PN: A digital path is not required, thus there is no Digital Restriction on the trunks associated with the NEW ROUTE INDEX value.
- PY: A digital path is required to complete the CCS call, thus the NEW ROUTE INDEX must be associated with a TGN on the TKGRP input form that contains all digital trunks (DENs) on the corresponding TRUNK input forms.

Required Field.

Valid RESTRICTIONS Entries			
Entry	**Definition**		
	SIGNAL TYPE	**SATELLITE RESTRICTION**	**DIGITAL PATH RESTRICTION**
NSSNPN	Null	No	No
NSSNPY	Null	No	Yes
NSSYPN	Null	Yes	No
NSSYPY	Null	Yes	Yes
I7SNPN	ISUP7	No	No
I7SNPY	ISUP7	No	Yes
I7SYPN	ISUP7	Yes	No
I7SYPY	ISUP7	Yes	Yes

2.4 NEW ROUTE INDEX

Description: The NEW ROUTE INDEX represents the associated Trunk Group that meets the above call restrictions.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The NEW ROUTE INDEX and ROUTE INDEX value can not be the same.

SEC. 3AA: 5314 RECORD
DATA RATE ROUTE INDEX FORM - DTRTX

1. GENERAL

The 5314 Record is applicable to the 5E4(2) through 5E8 Software Releases. This form is used to define a new route index for ISDN circuit switched data calls or CCS Trunks. Data calls will be routed on a Trunk Group that has a Data Rate defined on the TKGRP form. For a Route Index assigned in Digit Analysis, a new Route Index can be assigned to this call depending on the Data Rate requested. The Data Rate Route Index value must be defined on a RTIDX form and the value of the Next Route Index (if applicable) must be capable of handling this traffic. For 5E9(1) and later, assignment of alternate data route indices for both narrow and wide band data rates is provisioned on the RTIDX form (5303 Record).

1.1 Voice and Data Calls

The value of Data Rate Route Index can be defined on the Digit Interpreter Table forms (PDIT, INDIT, LDIT, IDDD) only if the associated Trunk Group is capable of handling both voice and data calls.

1.2 Recent Change View

The corresponding Recent Change View for this form is 10.2 (See also RTIDX form (5303 Record) Division 3, Section 3P for RC view 10.2.)

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * ROUTE INDEX

Description: Enter the Route Index which is to be replaced by the Data Rate Route Index.

Required Field for 5E4(2) - 5E8 only.
Valid Entries: 1 - 3617

Data Rules:

The Route Index entered here must be defined on a RTIDX form where the ROUTE TYPE must be "HUNT" and must be assigned to an interoffice Trunk Group.

2.3 * DATA RATE

Description: Enter the Data Rate to be used to obtain the Data Rate Route Index for the Route Index above.

Required Field for 5E4(2) - 5E8 only.

Valid DATA RATE Entries

Entry	Definition
56K	For trunks able to carry 56 kb/s data calls.
R64K	For trunks able to carry restricted 64 kb/s data calls.
64K	For trunks able to carry 64 kb/s data calls.

2.4 DATA RATE ROUTE INDEX

Description: Enter the Route Index to replace the key Route Index for the Data Rate defined above.

Copyright © 2003 Lucent Technologies

Required Field for 5E4(2) - 5E8 only.
Valid Entries: 1 - 3617

Data Rules:

The value entered here must be defined on a RTIDX form.

For 5E7 and later, if DATA RATE ROUTE INDEX equals ROUTE INDEX on an RTIDX form, whose TGN is defined on a TKGRP form (5202 Record) where TRK DIR equals "2W" or "OUT", TRKCLS is not "EDSL" or "EDSLHM", and OUTPULSING is not "ISUP7", then it cannot also be assigned as ROUTE INDEX on these forms: HGRPAS (5115 Record), IDDD (5307 Record), INDIT (5309 Record), LDIT (5300-3/5 Record), LINE (5109-1/2/3 Record), MLDIT (5300-3 Record), RDIT (5300-7/8 Record) (5E8 and later), PDIT (5300-2 Record), and RAR (5301 Record).

SEC. 3AB: 5315 RECORD
LDIT AND ASSOCIATED SM LIST - SMLDIT

1. GENERAL

The 5315 Record is available with 5E5 and later Software Releases.

The SMLDIT form is used to associate SM(s) with a particular LDIT (Local Digit Interpreter Table) value. This will allow LDIT information to reside only on the specific SM(s) which require the information, thus optimizing the use of SM memory. For example, if a unique LDIT is defined specifically for an RSM (Remote Switching Module) or ORM (Optically Remote Module) cluster, then that LDIT value could be assigned only to those SMs. The other LDIT values could be assigned to SMs which reside at the Host.

All LDIT values defined on the LDIT form (5300-3 Record) must be entered on an SMLDIT form with a list of SMs where the LDIT information will reside.

It is recommended that this form associate SMs with an LDIT value even though this information is not currently needed on the SMs. It will be needed eventually. This will avoid the need to associate the LDIT information with the SMs during service order or trunk order activity after the office is cutover. By following this recommendation, this form would have to be updated only when a new SM is grown into the office.

The SDN DAS defined on the TKGRP form (5202 Record) and its associated SMs on the TRUNK form (5204 Record) must be defined on the SMLDIT form.

LDIT information is required on an SM when line or trunk terminations on an SM use a particular LDIT to perform digit analysis. LDIT values are associated with line or trunk terminations via the DAS form (5300-1 Record). Each DAS value is assigned to lines or trunks directly or indirectly via an LCC form (5306 Record).

- A DAS value may be assigned directly on one of the following forms and the corresponding SM is determined as follows.
  - TKGRP form (5202 Record) - When a DAS value is entered in the DAS field, then all members of the trunk group, defined on the TRUNK forms (5204 Record), are associated with that DAS value. The SM associated with each trunk member is determined by the first three digits of the TEN or DEN field on the TRUNK form.
  - OSPSDSL form (5411 Record) - When a DAS value is entered in the DAS field, then the associated SM is determined by the first three digits of the MATE LCEN field.
- A DAS value may be assigned indirectly via the LCC form. When a DAS value is assigned on an LCC form, then the corresponding LINE CLASS CODE and RATE AREA combination can be assigned on a LINE, MLHLN, DSL, DSLUSR or AMLBDSL form and the corresponding SM is determined as follows:
  - LINE form (5109 Record) - An LCC/RAX combination is entered and the corresponding SM is determined by the first three digits of the OE NUMBER field.
  - MLHLN form (5111 Record) - An LCC/RAX combination is entered and the corresponding SM is determined by the first three digits of the OE NUMBER field.
  - DSL form (5907 Record) - A PPB1 and/or PPB2 LCC/RAX combination is entered and the corresponding SM is determined by the first three digits of the DSL OE field.
  - DSLUSR form (5908 Record) - A CKT and/or DPKT and/or ODB LCC/RAX combination is entered and the corresponding SM is determined by the first three digits of the OE field.

Copyright © 2003 Lucent Technologies

- AMLBDSL form (5447 Record) - A PKT LCC/PKT RAX combination is entered and the corresponding SM is determined by the first three digits of the LCEN field.

1.1 OSPS and Toll Offices

In addition to the requirements specified above, OSPS and Toll offices may require additional SM entries on this form. The circumstances under which additional entries for SMLDIT forms are required are described below:

- If this is an OSPS office with the Toll & Assistance feature (the OSPS TA field on the OSPSOPT form (5424 Record) is set to "Y"), then every PSM (Position Switching Module) must be entered on every SMLDIT form. PSMs are SMs which have any LCEN(s) defined on an OPARM form (5400 Record), or any LCEN(s) or DEN(s) defined on an OSPSOP form (5401 Record). The first three digits of the corresponding LCEN or DEN field contain the PSM number.

- If this is an OSPS office with the Directory Assistance feature only (the OSPS DA field on the OSPSOPT form is set to "Y", the OSPS TA field on the OSPSOPT form set to "N"), then every PSM must be entered on every SMLDIT form which is associated with an STINFO form (5402-1/2 Records). All of the PSMs can be determined by finding every SM which has any LCEN(s) defined on an OPARM form, or any LCEN(s) or DEN(s) defined on an OSPSOP form. The SMLDIT form is associated with an STINFO form if the LDIT on the SMLDIT form matches the LDIT assigned (via the DAS form's LOCAL DIT) to the DAS value of the DIG ANALYSIS SEL or SEC DIG ANALYSIS field on the STINFO form.

- If this is an AT&T Toll office (the OFFICE TYPE field is "Y" and the OFFICE CARRIER field is 288 on the OFCOPT form (5509 Record)), then all SMs in the office must be assigned on those SMLDIT forms associated with the special Toll DAS values of 81, 82, 89, 90, 91, 92, 97 and 98. An SMLDIT form is associated with one of these Toll DAS values if the DAS is defined on the DAS form, and the corresponding LOCAL DIT field matches the LDIT value on the SMLDIT form.

- If this is an AT&T Toll office (the OFFICE TYPE field is "Y" and the OFFICE CARRIER field is 288 on the OFCOPT form), and has ACT PT SDN on the OFCOPT form set to "Y" (which means that the office serves as an Action Point for the Software Defined Network), then the SMLDIT form associated with the Toll DAS value of 88 must include every SM which has trunks defined on a TKGRP form (5202 Record) with INPULSING set to "ISUP7" or ACP SDN set to "Y". The Toll DAS value is the LOCAL DIT field on the DAS form. The associated SM(s) can be found in the first three digits of the TEN or DEN field on all related TRUNK forms (5204 Record).

1.2 Foreign Area Translator

For 5E6 and later, operating companies can make use of a FAT (Foreign Area Translator) LDIT during digit analysis. The FAT/LDIT performs further digit analysis on LDITs that are interpreting common dialed or inpulsed digit strings. For more information concerning the implementation and use of the FAT/LDIT, see Division 2, Section 1AO.

1.3 Recent Change View

The corresponding Recent Change view for this form is 9.25.

2. BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.1 * LDIT

Copyright © 2003 Lucent Technologies

Description: Enter the LDIT (Local Digit Interpreter Table) number. If this LDIT is going to serve as a FAT/LDIT (FAT is "Y" on this form), enter an LDIT value in the range 200 - 999.
Valid Entries: 1 - 999

Data Rules:

This FAT/LDIT value must not be assigned on the DAS form (5300-1 Record) as LINE DAS LOCAL DIT or TRUNK DAS LOCAL DIT. In other words, it cannot be assigned directly to any lines or trunks in an office.

This LDIT must be defined on an LDIT form.

2.2 PKT SW

Description: This field is for use by Recent Change/Verify only.

2.3 FAT

Description: Does this LDIT function as a FAT/LDIT pointed to by other LDITs to continue digit interpretation?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, the LDIT table number must be in the range 200 - 999, and must not point to another FAT/LDIT.

2.4 LIST OF SWITCHING MODULES

Description: Enter the SM(s) associated with the LDIT.
Valid Entries: 1 - 192

Data Rules:

At least one entry must be made and each entry must be unique.

If FAT is "Y" on this form, the LIST OF SWITCHING MODULES must include all SM lists on all LDITs which make reference to this FAT/LDIT.

The SMs entered must be defined on an EQIM form (5700-1 Record).

SEC. 3AC: 5316 RECORD
COUNTRY CODE PREFIX - CCP

1. GENERAL

The 5316 Record is available with 5E5 and later Software Releases.

This form is used when the calling digits of an international outbound call must be prefixed by a two-digit code (0/1X) in order to prevent misrouting. The two-digit prefix code will identify the appropriate ISC (International Switching Center) to each of the intermediate toll switches in the network.

For 5E5 and later Software Releases, all international outbound calls will be processed using FCA (Fully Coded Addressing). FCA is a CCS (Common Channel Signaling) single-stage protocol used to route international outbound calls in a uniform manner through the AT&T domestic network. With FCA, when an international outbound call is routed to a 5ESS Toll Switch, the 5ESS Toll Switch will collect all the dialed digits and route the call as a CCS single-stage call towards a 4ESS ISC (International Switching Center).

International outbound calls routed through intermediate toll switches (i.e., via switch) may use CCS single stage signaling. CCS single-stage signaling will also be used towards the appropriate ISC.

The digits outpulsed are [0/1X +] CC + NN. The 0/1X is the ISC prefix code. CC is the Country Code. NN is the National Number.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * COUNTRY CODE

Description: Enter a Country Code.
Valid Entries: 1 - 999

2.3 # PREFIX

Description: Enter an ISC (International Switching Center) prefix. The two-digit prefix code will identify the appropriate ISC to route the international outbound call.

Required Field.
Valid Entries: 0 - 19

SEC. 3AD: 5317 RECORD
EAS INFORMATION DIGITS - EASID

1. GENERAL

The 5317 Record is available with 5E5 and later Software Releases.

This form is used to define the EA (Equal Access) Signaling information digits used for international and domestic EA calls. Information digits allow specific types of calls to be allowed or blocked.

A standard set of Information Digits is provided by 5ODA and is shown in Figure 1. If the definition of an Information Digit needs to be changed, this form may be used to change the values.

For 5E5 and later, all international outbound calls will be processed using FCA (Fully Coded Addressing). FCA is a CCS (Common Channel Signaling) single-stage protocol used to route international outbound calls in a uniform manner through the AT&T domestic network. With FCA, when an international outbound call is routed to a 5ESS Toll Switch, the 5ESS Toll Switch will collect all the dialed digits and route the call as a CCS single-stage call towards a 4ESS ISC (International Switching Center).

International calls entering the AT&T network through a 5ESS POP (Point of Presence) Toll Switch may use EA three-stage signaling.

The digits outpulsed in the first-stage are KP + 1NX + XXX + CCC + ST. KP indicates the MF start digit. 1NX is the customer direct dial. XXX is the international carrier. CCC is the padded Country Code. ST is the MF end digit.

The digits outpulsed in the second-stage are KP + [II + ANI +] ST. II is an information digit. ANI is the Automatic Number Identification.

The digits outpulsed in the third-stage are KP + CC + NN + ST. CC is the Country Code. NN is the National Number.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * INFO DIGITS

Description: Enter the EA information digits. Information digits determine the type of calls that are allowed to be international or domestic outbound.

For values of information digits and associated INTL and DOMESTIC entries provided by 5ODA, please refer to Figure 1.
Valid Entries: 0 - 99

Data Rules:

Values 12 - 19 are reserved because they conflict with 1NX, therefore the INTL field must be "EABLOCK" and the DOMESTIC field must be "EAINC".

2.3 INTL

Copyright © 2003 Lucent Technologies

Description: Enter the type of EA international calls allowed based on the information digits.

Required Field.
Default: EABLOCK
Valid Entries:

Valid INTL Entries	
Entry	**Definition**
EA10ANI	Allow a 10-digit ANI.
EA310ANI	Allow a 3 and 10 digit ANI.
EA3ANI	Allow a 3-digit ANI.
EABLOCK	Block Equal Access international calls.
EAINC	International Carrier call.
EANOANI	No ANI sequence.
EATEST	Test Call.

2.4 DOMESTIC

Description: Enter the type of EA domestic calls allowed based on the information digits.

Required Field.
Default: NONEA
Valid Entries:

Valid DOMESTIC Entries	
Entry	**Definition**
EA10ANI	Allow a 10-digit ANI.
EA310ANI	Allow a 3 and 10 digit ANI.
EA3ANI	Allow a 3-digit ANI.
EAALW800	Allow only 800 calls.
EAINC	International Carrier call.
EANOANI	No ANI sequence.
EATEST	Test Call.
NONEA	Traditional call.

SEC. 3AE: 5318 RECORD
PAIRED COUNTRY CODE (PCC)/COUNTRY CODE (CC) - PCC

1. GENERAL

The 5318 Record is available with 5E5 and later Software Releases.

This form is used to convert a PCC (Pseudo Country Code) to a CC (Country Code) or determine the length of a CC. A Pseudo Country Code is the same as a Paired Country Code.

All PCC (Pseudo Country Codes) and CC (Country Codes) must be defined on this form for the FCA (Fully Coded Addressing) feature which is available on a 5ESS Toll Switch.

For 5E5 and later, all international outbound calls will be processed using FCA (Fully Coded Addressing). FCA is a CCS (Common Channel Signaling) single-stage protocol used to route international outbound calls in a uniform manner through the AT&T domestic network. With FCA, when an international outbound call is routed to a 5ESS Toll Switch, the 5ESS Toll Switch will collect all the dialed digits and route the call as a CCS single-stage call towards a 4 ESS ISC (International Switching Center).

International calls entering the AT&T network through a 5ESS POP (Point of Presence) Toll Switch may use traditional two-stage signaling.

The digits outpulsed in the first-stage are 011 + PCC or 18X. The PCC is the Pseudo Country Code. 18X indicates an international call.

The digits outpulsed in the second-stage are KP + CC + NN + ST or KP + PCC + NN + ST. KP indicates the MF start digit. CC is the Country Code. NN is the National Number. ST is the MF end digit.

- ***NOTE:*** For 5E7 and later, when CCS7 signaling is used on incoming calls destined to an International Carrier, an entry on this form is required for each country code. Adding or deleting COUNTRY ACCESS CODEs to or from the IDDD form (5307 Record) requires that the COUNTRY CODEs be added or deleted to or from this form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.18.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PCC/CC

Description: Enter a Paired/Pseudo Country Code or Country Code. The entry can be a 3-digit Pseudo Country Code or a 1-3 digit Country Code.
Valid Entries: 1 - 999

Data Rules:

For 5E6 and later, every PCC form with PCC/CC not entered the same as Country Code on the first PCC form must have a second PCC form that has Country Code matching the first PCC/CC.

2.3 # COUNTRY CODE

Description: Enter a Country Code. If a PCC is entered in the PCC/CC field, then enter the associated CC

Copyright © 2003 Lucent Technologies

in this field. If a CC is entered in the PCC/CC field, then enter the same CC in this field.

Required Field.
Valid Entries: 1 - 999

SEC. 3AF: 5319 RECORD
SPECIAL ACCESS BAND SCREENING FORM - SPABS

1. GENERAL

The 5319 Record is available with 5E5 and later Software Releases. This form is associated with the 5ESS Toll Switch features called Special Access WATS (Wide Area Telecommunications Service) and MEGACOM Service.

Special Access WATS is similar to regular switched WATS except Special Access WATS allows a customer's PBX (digital or analog) to connect directly to the 5ESS Toll Switch via a dedicated trunk group. A Special Access WATS trunk group is defined on a TKGRP form (5202 Record) with a TRKCLS of "SPAWATS".

MEGACOM Service is a volume discount service. MEGACOM is similar to WATS service except that there is no subscription to a band and the customer must supply the dedicated trunk connection to the 5ESS Toll Switch. The 5ESS Switch will process the call like a WATS band 6 call. A MEGACOM trunk group is defined on a TKGRP form with a TRKCLS of "SPAMEG".

This form is used to determine if a Special Access customer is allowed to originate a call to a particular NPA based on the customer's subscribed service band. If the NPA entered in the SPA BILL TN field is different from the NPA called, then this form will be used to see if the call will proceed. The customer's subscribed band service will be compared to the band service associated with the NPA defined on this form.The customer's subscribed band service will be determined from the 6th digit of the Special Access Billing Telephone Number defined in the SPA BILL TN field on the TKGRP form.

If the customer's subscribed service band is equal or higher than the band number associated with the NPA on this form, then the call will proceed. Otherwise, the call will be routed to a vacant code announcement.

1.1 Recent Change View

The Recent Change view that corresponds to this form is 10.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * BILLING NPA

Description: Enter the Special Access customer's NPA (Numbering Plan Area).
Valid Entries: 200 - 999

LIST OF NPAs AND BAND NUMBERS FOR AN NPA PAIRING

The following fields in the list (Section 2.3 - Section 2.4) associate an NPA with a particular WATS band. The NPAs listed are used in conjunction with the BILLING NPA to determine if a call can be completed based on the service band. A maximum of 156 NPAs can be listed.

2.3 NPA

Description: Enter a NPA (Numbering Plan Area) which will be used in conjunction with the BILLING NPA.
Valid Entries: 201 - 999

Copyright © 2003 Lucent Technologies

2.4 BAND

Description: Indicate the WATS service band that the NPA is assigned. The service band assigned to this NPA will be compared to the customer's subscribed service band (digit 6 of the SPA BILL TN defined on the TKGRP form) to determine if the call will proceed.

Valid BAND Entries

Entry	Definition
0	
1	An NPA that is inter-state band 1.
2-6	Standard WATS band values.

SEC. 3AG: 5320 RECORD
SPECIAL ACCESS EXEMPT NXXs FORM - SPAENXX

1. GENERAL

The 5320 Record is available with 5E5 and later Software Releases. This form is associated with the 5ESS Toll Switch features called Special Access WATS (Wide Area Telecommunications Service) and MEGACOM Service.

Special Access WATS is similar to regular switched WATS except Special Access WATS allows a customer's PBX (digital or analog) to connect directly to the 5ESS Toll Switch via a dedicated trunk group. A Special Access WATS trunk group is defined on a TKGRP form (5202 Record) with a TRKCLS of "SPAWATS".

MEGACOM service is a volume discount service. MEGACOM is similar to WATS service except that there is no subscription to a band and the customer must supply the dedicated trunk connection to the 5ESS Toll Switch. The 5ESS Switch will process the call like a WATS band 6 call. A MEGACOM trunk group is defined on a TKGRP form with a TRKCLS of "SPAMEG".

This form is used to exclude specific NXXs in a NPA from being dialed by a Special Access customer. If the NPA dialed is defined on a SPAENXX form, then the NXX dialed will be checked against the list of exempt NXXs on this form. If the NXX dialed is defined on this form, then a vacant code announcement will be returned. Otherwise, the call will proceed.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FAR END NPA

Enter the Numbering Plan Area (NPA) of the exempt NXXs.

LIST OF EXEMPT NXXs FOR THE GIVEN NPA

The following is a list of NXXs for a particular NPA that cannot be dialed by a Special Access customer.

2.3 NXX

Description: Enter the NXXs for a particular NPA that cannot be dialed by a Special Access customer.
Valid Entries: 200 - 999.

Data Rules:

All NXXs listed must be unique.

SEC. 3AH: 5321 RECORD
DESTINATION TO SERVICE TYPE FORM - DISERV

1. GENERAL

The 5321 Record is available with 5E6 and 5E7 Software Releases. This record relates a code destination index to a type of service when the digit analysis tables indicate the possibility of a query to an external database.For 5E8 and later, this form is no longer needed, its functionality replaced by the NSTRIG form (5324 Record). See Division 2, Section 1AP for more information.

The possibility of a query to an external database can be indicated by entering a CALL TYPE of "QUERY" on the LDIT form (5300-3/5 Record), MLDIT form (5300-3 Record), PDIT form (5300-2 Record), or IDDD form (5307 Record). The CODE INDEX entered on the LDIT, MLDIT, PDIT, or IDDD form corresponds to the CDI field on this form.

A DISERV form must be entered for every such LDIT, MLDIT, PDIT, and IDDD form.

The possibility of a query to an external database can also be indicated by entering a TYPE OF CI CALL of "AVT" on an INDIT form (5309 Record). When such an INDIT form is used while translating a call where the 0ZZ-XXX code for EAMF trunks has XXX matching PSEUDO CARR on the OFCOPT form, then the CODE INDEX on the INDIT form will be used to read a DISERV form. Also, when such an INDIT form is used to translate a call where the TNS parameter for CCS7 trunks matches PSEUDO CARR on the OFCOPT form, then the CODE INDEX on the INDIT form will be used to read a DISERV form.

This form is for use with ASP (Advanced Services Platform (ASP; previously PVN, Private Virtual Network) and E911 features. When PVN OFC on the OFCOPT form (5509 Record) is set to "NONE", this form can be entered only if SERV TYPE is "E911".

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CDI

Description: Enter the code destination index.
Valid Entries: 1 - 4095

2.3 SERV TYPE

Description: Enter the service type to be associated with the CDI.

Required Field.

Valid SERV TYPE Entries

Entry	Definition
E911 or 9	Software Release: 5E7. Enhanced 911 query.
NOQRY or N	No query will be generated. This is used at a NAP (Network Access Point) to indicate that no query will be made and the call will be routed to an SSP (Service Switching Point). The ROUTE INDEX on the LDIT (5300-3/5 Record), MLDIT (5300-3 Record), PDIT (5300-2 Record), IDDD (5307 Record), or INDIT (5309 Record) form will be used to route the call to the SSP.
NS800 or 8	Number Services 800 Call. See Division 2.

Copyright © 2003 Lucent Technologies

PVN or P	General ASP. This indicates that further digit collection is required to determine the specific ASP type. This is used to indicate ASP service on the first stage signaling of an EA (Equal Access) call. Further digits will need to be collected and analyzed to determine whether the call should be treated as "PVNON", "PVNDOM", or "PVNINT".
PVNDOM or D	ASP Domestic Off-net (public network). This indicates that an ASP query should be made specifying that a domestic off-net number was dialed.
PVNINT or I	ASP International Off-net (public network). This indicates that an ASP query should be made specifying that an international off-net number was dialed.
PVNON or O	ASP On-net (private network). This indicates that an ASP query should be made specifying that an on-net number was dialed.

Data Rules:

If PVN OFC on the OFCOPT form (5509 Record) is set to "BILLNAP" or "NOBILLNAP", SERV TYPE must be set to "NOQRY" or "E911". If PVN OFC on the OFCOPT form is set to "SSP", then SERV TYPE cannot be set to "NOQRY".

SEC. 3AI: 5322 RECORD
LEASED NETWORK ROUTING RECORD - LNROUT

1. GENERAL

The 5322 Leased Network Routing Record is available with 5E6 and later Software Releases.

It assigns screening indexes for ARS (Automatic Route Selection) call routing on an LN (Leased Network) switch. It assigns separate screening indexes for data and voice calls based upon the switch type, access or via. Up to four LNROUT records may be specified.

A Leased Network switch is "access" if the call originates at the switch, i.e., the call reaches the switch on a trunk belonging to a trunk group defined with LN TYPE "QRY" or "NOQRY" on the TKGRP form (5202 Record), or the call reaches the switch on an ISDN BRI (Basic Rate Interface) line defined with LN TYPE "QRY" or "NOQRY" on the DSLUSR form (5908 Record). The switch is "via" if the call is being routed through a Leased Network toll switch, i.e., the call reaches the switch on an LN Intermachine Trunk, a member of a trunk group defined with LN TYPE "IMT" on the TKGRP form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * LN NODE

Description: The LN NODE specifies the per call switch type, access or via.

Valid LN NODE Entries

Entry	Definition
ACC	Acess
VIA	Via

2.3 * DATA CALL

Description: Is the call a data call? "Y" indicates a data call; "N" indicates a voice call.
Valid Entries: Y, N

2.4 ARS SI

Description: Enter an Automatic Route Screening Index. For Leased Network calls, the ARS SI is used instead of the screening index normally obtained from an ARS form.

Required Field.
Default: 1
Valid Entries: 1 - 16

Data Rules:

The ARS SI must be assigned on an ARSSCRN form (5608-6 Record).

SEC. 3AJ: 5323 RECORD
FLEXIBLE ANI INFORMATION DIGITS ASSIGNMENT FORM - FLEXANI

1. GENERAL

The 5323 Record is available with 5E6 and later Software Releases. This form is associated with the 5ESS Toll Switch feature called FLEXANI (Flexible ANI Information Digits Assignment) feature. The feature allows the assignment of 2-digit ANI pairs to the originating Line Class of Service (via the FLEXANI form), the Route Index (via the RTIDX form, 5303 Record), or the MC Route Index (via the MCRTIDX form, 5304 Record).

Flexible Assignment of 2-digit ANI pairs is a Secured Feature. The Feature must be purchased by the office. The SFSYS form (5713-1 Record) must be entered and the Secured Feature ID 38 must be selected.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SERVCL

Description: This field describes originating service and feature handling by Class of Service.

Required Field.

Valid SERVCL Entries

Entry	Definition
ATND	Software Release: 5E3 and later. Attendant DN.
B911	Software Release: 5E3 and later. Emergency Service Bureau lines for Basic 911 Service.
CALLBK	Software Release: 5E3 and later. Call Back Line associated with the Trunk and Line WorkStation Local Talk and Monitor phone lines.
CHGCALL	Software Release: 5E3 and later. Charge a Call. Provide AN17 to TSPS.
COIN	Software Release: 5E3 and later. Coin.
DAOPER	ISDN Service for OSPS Directory Assistance Operator.
HOTMOTL	Software Release: 5E3 and later. Hotel-Motel - Message Register capabilities. No tolldiversion:provides ANI-6 to TSPS for hotel/motel DN withoutautomatic room ID.
HOTPBX	Software Release: 5E3 and later. Hotel-Motel PBX - Provides ANI-6 to TSPS: checks for TollDiversion, Message Register capabilities, prevents FabricExercise tests.
INDIV	Software Release: 5E3 and later. Individual.
ISATND	Software Release: 5E4(2) and later. ISDN (Integrated Service Digital Network) Attendant Terminal.If this value is entered, then an associated DSMLHLN form(5901 Record) must be defined with a corresponding CKTLCC/RAX and a TERM TYPE of "ATND".

SEC. 3AK: 5324 RECORD
NETWORK SERVICES TRIGGER DEFINITION FORM - NSTRIG

1. GENERAL

The 5324 Record is available with 5E8 and later Software Releases.

The Network Services Trigger Definition form identifies a network service application. This form was created primarily for the ASP network service, but can be used by other network services. The form contains alternate STP (Service Transfer Point) network addressing and information for the switch owner's selectable service key.

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.35.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TRIG NBR

Description: Enter the Network Services Trigger Number. This specifies a unique network service for a certain dialed number defined on any of the digit analysis ODP forms (INDIT (5309 Record), LDIT (5300-3/5 Record), MLDIT (5300-3 Record), PDIT (5300-2 Record), and RDIT (5300-7/8 Record)).

Required Field.
Valid Entries:
- For 5E8: 1 - 127
- For 5E9(1) and later: 1 - 255

2.3 # APPLICATION

Description: Enter the Network Services Trigger application identifying the type of network service to be provided for this trigger number.

Required Field.

Valid APPLICATION Entries

Entry	Definition
ASP or A	Advanced Services Platform treatment
800 or 8	800 services
E911 or E9	E911 services
EAASP or EAA	Software Release: 5E8 only. Inform Equal Access Originations through the SSP that incoming digits require translation with the ASP dialing plan. The type of trigger associated with this is ASP-subscribed, detected at the EO (NAP) and passed on to the SSP. The call is considered a subscribed trunk origination if a trigger is detected in the ASP dialing plan.
EAOFC or EAO	Inform Equal Access Originations through the SSP that incoming digits require translation in the Office Dialing Plan associated with the incoming trunk. The call may encounter an ASP 3/6/10-digit trigger should an ASP trigger be encountered in the "dialed digit" translation. Note that ASP trigger detection is not done at the EO, but at the SSP. The call is considered a 3/6/10-digit trigger trunk origination if a trigger is detected in the office dialing plan.
GSMMAP	Mobile Application Part indicator.

Data Rules:

Copyright © 2003 Lucent Technologies

If APPLICATION is "E911", "EAOFC", or "EAASP" (5E8 only), ALT GBL TITLE and SERV KEY must not be entered.

If APPLICATION is "800", ALT GBL TITLE must not be entered, and SERV KEY must be "CDPN".

For 5E9(1) and later,

- When APPLICATION is "800", ADM ST CD must be "ULK", and AIN REL must be "R0"; an OFCOPT form must exist with SERV SWITCH PT set to "Y".
- When APPLICATION is "ASP", AIN REL must be entered; and
- When APPLICATION is "E911" or "EAOFC", ADM ST CD must be "ULK", and AIN REL must not be entered.

For 5E10 and later, when APPLICATION is not "ASP", SERVICE ALWD and ASP TOLLFREE must not be entered.

For 5E16(2) FR 2 and later, when APPLICATION is "GSMMAP", AIN REL, ALT GBL TITLE, and SERV KEY must not be entered.

2.4 ALT GBL TITLE

Description: Enter the Alternate Global Title. This field is used as a default to route to the appropriate SCP (Service Control Point) database if global title derivation fails. This field is presently used by the ASP application only.
Valid Entries: 10 digits

2.5 SERV KEY

Description: Enter the Service Key. The service key indicates whether the originating ANI or the called party's number is used for service key formulation. This field is presently used by ASP and SSP800 applications.

Valid SERV KEY Entries

Entry	Definition
CDPN or C	Use the calling party number as the service key.
ANI or A	Use the originating ANI as the service key.

2.6 STP TT NBR

Description: Enter the STP Translation Type Number for this particular trigger. If blank, the Translation Type entered for the field TRANS TYPE on the DSAPP form is used. This field applies only to ASP Release 0.1B and later for triggers for 5E9(1) and later.

Software Release: 5E9(1) and later
Valid Entries: 0 - 255

2.7 ADM ST CD

Description: Enter the Administrative State Code.

Software Release: 5E9(1) and later
Required Field.
Default: ULK
Valid Entries:

Valid ADM ST CD Entries

Entry	Definition
LK	Lock/deactivate the ASP service trigger.
ULK	Unlock/activate the ASP service trigger.

Data Rules:

If APPLICATION is not "ASP", ADM ST CD must be "ULK".

2.8 AIN REL

Description: Enter the AIN (Advanced Intelligent Network) release for ASP triggers.

Software Release: 5E9(1) and later
Valid Entries:

Valid AIN REL Entries

Entry	Definition
R0	Advanced Intelligent Network Release 0.
R0D1	Advanced Intelligent Network Release 0.1.

Data Rules:

Since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, AIN REL must not equal "R0D1" until SFID 126 ACT on the SFSYS form has been set to "Y".

When AIN REL is "R0D1", SERV KEY must not be entered. When AIN REL is not "R0D1", STP TT NBR must not be entered.

2.9 POST QUERY SCR

Description: Enter the post query screen index.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 4095

Data Rules:

When POST QUERY SCR is entered, APPLICATION must be "ASP".

For each POST QUERY SCR value entered, a matching SCR value must be entered on the RAR form.

For 5E16(2) FR 2 and later:

- when POST QUERY SCR or POST QUERY DAS is entered, APPLICATION must be "ASP" or "MAP".
- when USE CURR DAS is "Y", APPLICATION must be "ASP" or "MAP".

2.10 ASP TOLLFREE

Description: Is ASP Toll-Free service allowed? This field supports the ASP Toll Free Service feature (SFID 236). For more information on this feature, see Division 2, Section 4A236.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ASP TOLLFREE is "Y",

Copyright © 2003 Lucent Technologies

- APPLICATION must be "ASP"
- AIN REL must be "R0D1".

ASP Toll-Free Service is a secured feature and must be purchased by the office before data can be assigned. Consequently, ASP TOLLFREE on the NSTRIG form must not be "Y" until SFID 236 ACT on the SFSYS form has been set to "Y".

2.11 SERVICE ALWD

Description: Enter service type allowed for an ASP trigger. This field supports the ASP Interworking with CSD (Circuit Switched Data) feature (SFID 237). For more information on this feature, see Division 2, Section 4A237.

Software Release: 5E10 and later.
Valid Entries:

Valid SERVICE ALWD Entries

Entry	Definition
BOTH	Both CSD (Circuit Switched Data) and voice service.
CSD	Circuit Switched Data service.
VOICE	Voice Service.

Data Rules:

When SERVICE ALWD is "BOTH" or "CSD",

- APPLICATION must be "ASP"
- AIN REL must be "R0D1".

For 5E10 and later, ASP Interworking with CSD is a secured feature and must be purchased by the office before data can be assigned. Consequently, SERVICE ALWD on the NSTRIG form must not be "CSD" until SFID 237 ACT on the SFSYS form has been set to "Y".

2.12 POST QUERY DAS

Description: Enter the Post Query Digit Analysis Selector.

Software Release: Software Release: 5E10 and later.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When POST QUERY DAS is entered, APPLICATION must be "ASP".

When POST QUERY DAS is entered, the entry must be defined as a DIGIT ANALYSIS SELECTOR on a DAS form (5300-1 Record).

When POST QUERY DAS is entered, LOCAL DIT must be entered on the corresponding DAS form (5300-1 Record), and the LOCAL DIT must be defined as LDIT on the corresponding SMLDIT (5315 Record) form for every operational SM in the office. This is accomplished by entering an SMLDIT form with this LDIT value as the key and by entering each operational SM (as defined on EQIM forms (5700-1/2 Record) where EQSTATUS is "O") into the LIST OF SWITCHING MODULES.

Copyright © 2003 Lucent Technologies

The ASP Enhancements to Multiple Rate Center Support feature must be purchased by the office and the SFID 190 ACT field set to "Y" on the SFSYS form (5713-1 Record) before POST QUERY DAS can be entered.

2.13 USE CURR DAS

Description: The USE CURR DAS field is used to specify whether or not the current DAS (Digit Analysis Selector) should be used for post query digit analysis for this trigger. This field only impacts DNTs (Directory Number Triggers). For more information, see Div. 2, Sec. 4A217. Use the current DAS post query?

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When USE CURR DAS is "Y", APPLICATION must be "ASP".

When USE CURR DAS is "Y", POST QUERY DAS must not be entered.

When USE CURR DAS is set to "Y" on the NSTRIG form, the ASP MRC Phase 2 or the Basic LDP (Long Distance Platform) feature must be purchased by the office. An SFSYS form exists with SFID 190 ACT or SFID 165 ACT is set to "Y".

2.14 VPN

Description: Is this a Virtual Private Network trigger?

The VPN field is used to indicate whether or not this is a Virtual Private Network (VPN) trigger. The VPN feature allows the VPN service provider to provision a VPN switch with a new incoming VPN access trunk type and calls received over such a trunk are VPN calls. This allows business subscribers to make long distance calls by use of what appears to them to be their own private network and private network dialing plan. The VPN call is one which encounters a VPN trigger, launches a corresponding SCP query, and (assuming a successful response) generates a VPN AMA record.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When VPN is Y, APPLICATION must be "ASP".

When VPN is Y, AIN REL must be "R0D1".

2.15 DNIS

Description: Is this a DNIS trigger for transport of original dialed number? This field is used to indicate whether or not this is a DNIS trigger for Transport of Original Dialed Number feature.

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When DNIS is "Y", APPLICATION must be "800", or APPLICATION must be "ASP" and ASP TOLLFREE must be "Y".

When DNIS is Y, VPN must be N.

When DNIS is "Y", VPN must be "N".

2.16 EON

SEC. 3AL: 5325 RECORD
PROPORTIONATE BIDDING FORM - PROPBID

1. GENERAL

Available with 5E6 and later Software Releases, the PROPBID form allows the customer to create, on a per Proportionate Bidding route index basis, a list of carriers (up to 4) used to route calls sent to the Proportionate Bidding route index from the digit analysis forms. This form specifies the carriers, what percentage of calls each carrier should handle and the route index each carrier uses to route out of the office.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.37.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PB RTI

Description: Enter the proportionate bidding route index. If this feature is not active (ACTIVE set to "N" on this form), PB RTI is used as the ROUTE INDEX for the call. If this feature is active (ACTIVE set to "Y"), calls routed to the PB RTI are distributed to the CARRIERs in the CARRIER LIST and the CARRIER RTI of the selected carrier is used to route the call.

Required Field.
Valid Entries: 1001 - 1032

Data Rules:

PB RTIs must be defined as ROUTE INDEXes on RTIDX forms (5303 Record) with a ROUTE TYPE of "HUNT", "BUSY" or "REORDER".

2.3 ACTIVE

Description: Is proportionate bidding active for this route index? When ACTIVE is "Y", calls routed to the PB RTI will be distributed to the CARRIERs in the CARRIER LIST. When ACTIVE is "N", calls will be routed based on the RTIDX information associated with the PB RTI.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ACTIVE is "Y", at least one non-zero CARRIER LIST PROPORTION must be entered.

CARRIER LIST

Description: The following fields (Section 2.4 - Section 2.6) are used to specify the carrier, the percentage of calls that carrier will handle and the route index each carrier uses to route out of the office.

2.4 CARRIER

Copyright © 2003 Lucent Technologies

Description: Enter the number of a carrier that routes some portion of the calls. This carrier is an arbitrary numerical identifier and not a CARRIER ID number. It does not have to match a CARRIER ID on the ICF form (5305 Record).
Valid Entries: 1 - 999

Data Rules:

When a CARRIER LIST row has CARRIER entered, CARRIER RTI must also be entered.

CARRIER values must be unique within the list.

2.5 PROPORTION

Description: Enter the proportion of calls, in percentage format, that are handled by the carrier.
Valid Entries: 0 - 100 (%)

Data Rules:

When a CARRIER LIST row has PROPORTION entered, CARRIER and CARRIER RTI must also be entered.

When a non-zero PROPORTION has been entered, the sum of all the PROPORTION values must equal 100.

2.6 CARRIER RTI

Description: Enter the "real" route index that is used to route the call to the carrier. This cannot be a Proportionate Bidding route index. It must be a "real" route index that leads to a carrier.

Valid Entries:
- For 5E10 and earlier: 1 - 1000 and 1033 - 3617
- For 5E11 and later: 1 - 1000 and 1033 - 4095

Data Rules:

When a CARRIER LIST row has CARRIER RTI entered, CARRIER must also be entered.

The CARRIER RTIs must be defined as ROUTE INDEXes on RTIDX forms (5303 Record).

SEC. 3AM: 5328 RECORD
LOCATION ROUTING NUMBER TABLE - LRNINDEX

1. GENERAL

The 5328 Record is available with 5E11 and later Software Releases and is used to associate an LRN (Location Routing Number) index to an LRN number. This form supports the Local Number Portability secured feature (SFID 174). For more information on this feature, see Division 2, Section 4A174.

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.36.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * LRN INDEX

Description: Enter the Location Routing Number Index for ported lines in this office. The LRN INDEX field is used to specify the index into the LRN table to obtain an LRN (Location Routing Number). LRNs are used to route DNs geographically ported into the office from other switches or within the office from other rate centers.

Software Release: 5E11 and later.
Required Field.
Valid Entries: 1 - 127

2.3 * LRN

Description: Enter the Location Routing Number. The LRN field is used to specify the Location Routing Number associated with the LRN index. LRNs are used to route DNs geographically ported into the office from other switches. An LRN uniquely identifies an office and rate center. To handle geographic portability, offices with multiple rate centers should have more than one LRN.

Software Release: 5E11 and later.
Required Field.
Valid Entries: 1 - 10 digit number.

5ESS Switch _

SEC. 4A: 5400-1/2 RECORD
OSPS ADMINISTRATIVE OFFICE PARAMETERS FORM - OPARM

1. GENERAL

The 5400-1/2 Record is available with 5E4(2) and later Software Releases.

This record is used to define administrative parameters of an OSPS (Operator Services Position System), including type of equipment, displays and reports, and the assignment of serving teams.

One 5ESS Switch can support 8 FMCs (Force Management Centers), 32 OSCs (Operator Service Centers), and 1024 active operator positions. No more than 4 OSCs can be assigned to the same SM (Switching Module). Either of two interfaces, an ATA (Asynchronous Terminal Adapter) or an STA (Synchronous Terminal Adapter), can be used with FMCs, which employ AT&T 3B2 Computers.

An OSPS office can generate reports at 15-minute and 24-hour intervals, (including the reports of another office).

If an OPARM form is submitted, an OSPSOPT form (5424 Record) mustexist with "Y" entered in the OSPS DA or OSPS TA field.

Each OPARM form must have an associated OSPSDSL form (5411 Record) such that the value in the LCEN field matches the LCEN value on the OPARM form and the SERVICE CLASS field on the OSPSDSL form except, for 5E7 and later, when the LCEN is 19200000.

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.1.

2. FORM ENTRIES - 5400-2 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and office name on each record.

2.2 * OFFICE TYPE

Description: Enter the office type.

Required Field.

Valid OFFICE TYPE Entries

Entry	Definition
O	OSC (Operator Service Centers).
F	FMC (Force Management Centers).

Data Rules:

If OFFICE TYPE is "F", then:

- OFFICE NUMBER must be in the range of 1 - 8.
- MADE BUSY THR must be 6.
- SPCL RPTS TO FMC must be "N".

When an OPARM form has an OFFICE TYPE of "F" and 24 HR OP AUTO SEND is set to "Y", then 24 HR OP AUTO SEND cannot be set to "Y" on any other OPARM form for the same PSM, i.e. the first 3

Copyright © 2003 Lucent Technologies

digits of the LCEN are identical.

2.3 * OFFICE NUMBER

Description: Enter the Office Number, 1 through 8 for FMC, or 1 through 32 for OSC.

Required Field.
Valid Entries: 1 - 32

2.4 LCEN

Description: Enter the 8-digit RISLU (Remote Integrated Services Line Unit) LCEN (Line Card Equipment Number) according to the following format.

LINE CARD EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Remote Integrated Services Line Unit	RISLU		0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-30 (even numbers only)

Required Field.

Data Rules:

Duplicate LCENs may not be assigned.

For 5E7 and later, if LCEN is 19200000 then:

- 15 MIN PART1 ALLOWED must be "N"
- 15 MIN PART2 ALLOWED must be "N"
- 15 MIN PART3 ALLOWED must be "N"
- 24 HR OP ALLOWED must be "N"
- CALL QUEUE DISPLAY must be "N"
- FMC REPORT PERM must not be entered
- OFFICE TYPE must not be "F"
- OPER PERF DISPLAY must be "N"
- OSC 1-32 REPORT PERM must not be entered
- POS STATUS DISPLAY must be "N"
- SERV TEAM DISPLAY must be "N"
- SERVING TEAMs 1 - 128 cannot be "Y".

For 5E7 and later, an OSPSDSL form must be submitted with an LCEN that matches the LCEN on this OPARM form, except when the LCEN is 19200000.

For 5E7 and later, LCEN cannot be 19200000 on the OPARM form if a corresponding OTRVLD form(s) (matching OFFICE TYPE and OFFICE NUMBER) is submitted.

2.5 SERVICE CLASS

Copyright © 2003 Lucent Technologies

Description: Enter the service class requiring OSPS parameters.

Software Release: 5E7 and later.
Required Field for 5E7 - 5E8.
Valid Entries:

Valid SERVICE CLASS Entries	
Entry	**Definition**
MISLNK	OSPS Commercial ACD Data Link
OAP	OSPS Administrative Processor

Data Rules:

If "MISLNK" is entered, then:

- 15 MIN PART1 ALLOWED must be N.
- 15 MIN PART2 ALLOWED must be N.
- 15 MIN PART3 ALLOWED must be N.
- 24 HR OP ALLOWED must be "N".
- ATA LINK must be Y.
- CALL QUEUE DISPLAY must be N.
- FMC - FORCE REPORT must not be entered.
- FMC REPORT PERM must not be entered.
- OPER PERF DISPLAY must be N.
- OSC 1-32 REPORT PERM must not be entered.
- POS STATUS DISPLAY must be N.
- SERV TEAM DISPLAY must be N.
- SPCL RPTS TO FMC must be N.
- SERVING TEAMs 1-128 must not be entered.

The SERVICE CLASSes on corresponding OPARM and OSPSDSL forms (where the LCENs match) must be the same.

2.6 MADE BUSY THR

Description: The Made Busy Threshold is the number of times within one minute that an operator is allowed to be detected as "made busy" before they are considered "delinquent": 0 - 5 for OSCs, and 6 assigned to FMCs.

Required Field.
Valid Entries: 0 - 6

2.7 SPCL RPTS TO FMC

Description: Should special reports be forwarded to the OAP of FMC?

Copyright © 2003 Lucent Technologies

The Special Reports To Force Management Center Office field indicates whether an OSC (Operator Service Center) office wishes to forward its special reports (manual tickets, emergency call warnings, monitoring call detail records, and emergency call records) to the OAP of its FMC, as defined by the field FMC. "N" is entered for an OSC office that wishes to print its special reports only at its own OAP. "Y" indicates that an OSC office wishes the special reports to be printed at both its own OAP and the OAP of its FMC.

Prior to 5E7, SPCL RPTS TO FMC and ATA LINK fields were combined as one field, OFC DATA LINK TYPE.

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When OFFICE TYPE is "F", SPCL RPTS TO FMC must be "N".

SPCL RPTS TO FMC must be "N" when SERVICE CLASS is "MISLNK".

2.8 ATA LINK

Description: Is the link to OAP an asynchronous terminal adapter?

ATA LINK indicates whether the link to the OAP is connected via an ATA (Asynchronous Terminal Adapter). If not, then it is assumed to be an STA (Synchronous Terminal Adapter). Prior to 5E7, SPCL RPTS TO FMC and ATA LINK fields were combined as one field, OFC DATA LINK TYPE.

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ATA LINK must be "Y" when SERVICE CLASS is "MISLNK".

2.9 MONITOR INDICATION

Description: If this is an OSC office, is an indication to be given to operators that they are being monitored?
Default: N
Valid Entries: Y, N

2.10 CALL QUEUE DISPLAY

Description: Can the OSPS office request the call queue status and performance displays? An entry of "Y" will enable these displays.

The CALL QUEUE DISPLAY consists of a status display and a performance display.

The call queue status display indicates the status of various queues; it displays whether a particular queue is "normal", receiving delay announcements 1, 2 or 3, receiving announcements to reorder, the queue is closed, and the number of calls waiting.

The call queue performance display indicates the average length of time a call is in the queue.

Copyright © 2003 Lucent Technologies

Required Field.
Default: N

Data Rules:

An OAP (OSPS Administrative Processor) must be assigned to the OSC for that center to request the CALL QUEUE DISPLAY; the SERVICE CLASS on the corresponding (by LCEN) OSPSDSL form must be designated as "OAP".

2.11 SERV TEAM DISPLAY

Description: Can the OSPS office request the serving team status and performance displays?

The serving team status display indicates what the worst queue is (in terms of time in queue before an operator is available), and what the status is of that queue (for a serving team).

The serving team performance display provides the serving team number, work time, average delay, and the number of positions occupied (for a particular serving team).

Required Field.
Default: N

Data Rules:

An OAP must be assigned to the OSC for that center to request the SERV TEAM DISPLAY; the SERVICE CLASS on the corresponding (by LCEN) OSPSDSL form must be designated as "OAP".

2.12 POS STATUS DISPLAY

Description: Can the OSPS office request this display?

The POS STATUS DISPLAY consists of a bar graph of requested serving teams with the following three states: the number of operators handling calls, the number of idle operators, the number of operators made busy, as well as the percentages of these states. Also, the display provides the number of occupied positions, and the number of operators with a high frequency of made busy status.

Required Field.
Default: N

Data Rules:

An OAP must be assigned to the OSC for that center to request the POS STATUS DISPLAY; the SERVICE CLASS on the corresponding (by LCEN) OSPSDSL form must be designated as "OAP".

2.13 OPER PERF DISPLAY

Description: Can the OSPS office request this display?

The OPER PERF DISPLAY provides information on an individual operator basis, such as the number of calls handled, average call handling time, and whether individual operators have access to operator-to-position assignment or position-to-operator assignment displays.

Required Field.
Default: N

Data Rules:

An OAP must be assigned to the OSC for that center to request the OPER PERF DISPLAY; the SERVICE CLASS on the corresponding (by LCEN) OSPSDSL form must be designated as "OAP".

Copyright © 2003 Lucent Technologies

An OAP must be assigned to the OSC for that center to request any of the above displays. The SERVICE CLASS on the corresponding (by LCEN) OSPSDSL form must be designated as "OAP".

2.14 OFC DATA LINK TYPE

Description: The entry is a combination of the type of data link and whether or not special reports can be sent to the owning FMC.

For 5E7 and later, this field was divided into two fields, SPCL RPTS TO FMC and ATA LINK.

The data link is either an ATA (Asynchronous Terminal Adaptor) or an STA (Synchronous Terminal Adaptor).

Special Reports have four components:

- Emergency call warning - indicates the operator has received an emergency call.
- Manual ticket - contains billing information on a call.
- Emergency call record - contains complete details on an emergency call.
- Call detail record - contains complete details on a call.

The following table summarizes the entries for this field.

Entry	Special Reports	Link Type
0	N	ATA
1	N	STA
2	Y	ATA
3	Y	STA

Software Release: 5E4(2) - 5E6
Default: 0
Valid Entries: 0 - 3

Data Rules:

If "F" is entered in the OFFICE TYPE field or no entry is made in the FMC - FORCE REPORT field, then only entries of 0 or 1 are allowed.

OSPS REPORTS

The following fields (Section 2.15 - Section 2.30) permit various reports to be received or received and printed for an OSPS office.

If an ALLOW field is marked "N", then the corresponding PRINT field will be assigned a value of "N".

2.15 15 MIN PART1 ALLOW

Description: Can this OSPS office receive this portion of the 15-minute report? Part one of the 15-minute report provides a traffic summary.

Software Release: 5E6 and earlier.
Required Field.
Default: N
Valid Entries: Y, N

2.16 15 MIN PART2 ALLOW

Copyright © 2003 Lucent Technologies

Description: Can this OSPS office receive this portion of the 15-minute report? Part two of the 15-minute report provides a call queue summary.

Software Release: 5E6 and earlier.
Required Field.
Default: N
Valid Entries: Y, N

2.17 15 MIN PART3 ALLOW

Description: Can this OSPS office receive this portion of the 15-minute report. Part three of the 15-minute report provides a serving team summary.

Software Release: 5E6 and earlier.
Required Field.
Default: N
Valid Entries: Y, N

2.18 24 HOUR ALLOW

Description: Can this OSPS office receive the 24-hour report? The 24-hour report provides information about individual operators.

Software Release: 5E6 and earlier.
Required Field.
Default: N
Valid Entries: Y, N

2.19 15 MIN PART1 PRINT

Description: Can this OSPS office print this portion of the 15-minute report?

Software Release: 5E6 and earlier.
Default: N
Valid Entries: Y, N

2.20 15 MIN PART2 PRINT

Description: Can this OSPS office print this portion of the 15-minute report?

Software Release: 5E6 and earlier.
Default: N
Valid Entries: Y, N

2.21 15 MIN PART3 PRINT

Description: Can this OSPS office print this portion of the 15-minute report?

Software Release: 5E6 and earlier.
Default: N
Valid Entries: Y, N

2.22 24 HOUR PRINT

Description: Can this OSPS office print the 24-hour report?

Software Release: 5E6 and earlier.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.23 15 MIN PART1 ALLOWED

Description: Should Part 1 of the 15 minute report be allowed?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

15 MIN PART1 ALLOWED must be "N" when:

- LCEN is 19200000.
- SERVICE CLASS is "MISLNK".

15 MIN PART1 AUTO SEND must be "N" when 15 MIN PART1 ALLOWED is "N".

2.24 15 MIN PART1 AUTO SEND

Description: Should Part 1 of the 15 minute report be sent automatically?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

15 MIN PART1 AUTO SEND must be "N" when 15 MIN PART1 ALLOWED is "N".

2.25 15 MIN PART2 ALLOWED

Description: Should Part 2 of the 15 minute report be allowed?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

15 MIN PART2 ALLOWED must be "N" when:

- LCEN is 19200000.
- SERVICE CLASS is "MISLNK".

15 MIN PART2 AUTO SEND must be "N", when 15 MIN PART2 ALLOWED is "N".

2.26 15 MIN PART2 AUTO SEND

Description: Should Part 2 of the 15 minute report be sent automatically?

Copyright © 2003 Lucent Technologies

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

15 MIN PART2 AUTO SEND must be "N" when 15 MIN PART2 ALLOWED is "N".

2.27 15 MIN PART3 ALLOWED

Description: Should Part 3 of the 15 minute report be allowed?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

15 MIN PART3 must be "N" when:

- LCEN is 19200000
- SERVICE CLASS is "MISLNK".

15 MIN PART3 AUTO SEND must be "N" when 15 MIN PART3 ALLOWED is "N".

2.28 15 MIN PART3 AUTO SEND

Description: Should Part 3 of the 15 minute report be sent automatically?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

15 MIN PART3 AUTO SEND must be "N" when 15 MIN PART3 ALLOWED is "N".

2.29 24 HR OP ALLOWED

Description: Should the 24 hour operator report be allowed?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

24 HR OP ALLOWED must be "N" when:

- LCEN is 19200000.
- SERVICE CLASS is "MISLNK".

Copyright © 2003 Lucent Technologies

24 HR OP AUTO SEND must be "N" when 24 HR OP ALLOWED is "N".

2.30 24 HR OP AUTO SEND

Description: Should the 24 hour operator report be sent automatically?

Software Release: 5E7 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

24 HR OP AUTO SEND must be "N" when 24 HR OP ALLOWED is "N".

3. FORM ENTRIES - 5400-2 RECORD

3.1 FMC - FORCE REPORT

Description: Enter the FMC office number that receives the force reports and (optionally) tickets for printing on the OAP for this OSPS office.
Valid Entries: 1 - 8

Data Rules:

The value entered in this field must be entered in the OFFICE NUMBER field on another OPARM form where the entry in the OFFICE TYPE field is "F".

If "F" was entered in the OFFICE TYPE field, then this field will be blank.

3.2 FMC REPORT PERM

Description: Can each FMC (1 - 8) obtain report/display information? If an FMC can receive the information, enter "Y".
Valid Entries: Y, N

Data Rules:

An OPARM form must exist for each FMC that has "Y" entered in this field.

3.3 OSC REPORT PERM

Description: Can each OSC (1 - 32) obtain report/display information? If an OSC can receive the information, enter "Y".
Valid Entries: Y, N

Data Rules:

An OPARM form must be completed for each OSC that has "Y" entered in this field.

3.4 SERVING TEAM

Description: Is each serving team (1 - 128) represented in this OSPS office? If the serving team is assigned, enter "Y". An FMC/OSC is usually assigned 1 or more serving teams.
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

An STINFO form (5402 Record) must be completed for each serving team designated in this field.

SEC. 4B: 5401 RECORD
OSPS OPERATOR POSITION FORM - OSPSOP

1. GENERAL

The 5401 Record is available with 5E3 and later Software Releases. This record defines each operator position within an OSC (Operator Service Center) within the OSPS, and assigns RISLU (Remote Integrated Service Line Unit) ports. A maximum of 100 operator positions can be assigned to the same SM (Switching Module). For 5E6 and later Software Releases, a maximum of 200 operator positions can be assigned to the same SM for CACD.

For 5E7 and later, every SM having a regular or interflow position assigned to it on the OSPSOP form must have "Y" entered in the OSPS PSM field on the corresponding EQIM form. The SM number on the EQIM form matches the first three digits of the LCEN or DEN field on the OSPSOP form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.32.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * POS NUM

Description: The POS NUM field defines the Absolute position number for the switch. While each OSC can assign its Relative Position Numbers independently, the POS NUM (absolute position number) must be unique within the OSPS.

Required Field.
Valid Entries: 1 - 4095

2.3 # POS TYPE

Description: Enter the type of operator position.

Required Field.

Valid POS TYPE Entries

Entry	Definition
BST	Directory Assistance Operator or ACD/MIS Agent
INT	Interflow Position. For more information on interflow, see OSPS feature sections in Division 2, Section 3. Also see secured feature sections in Divison 2, Section 4A.
OPT	Software Release: 5E6 and later. Listing Services and combined services .

Data Rules:

If "BST" "OPT" or "VDT" are entered in the POS TYPE field, then entries are required in the LCEN, OFC ID and REL PNUM fields. Also, the DEN and OSPS ID fields must not be entered.

For 5E10 and later, if "BST" or "OPT" is entered, then LCEN, OFC ID and REL PNUM must be entered.

BST:
For 5E9(1) and later, if "BST" is entered, then SERVICE CLASS must be "DAOPER" on the corresponding OSPSDSL form (matching LCENs).

Copyright © 2003 Lucent Technologies

INT:
If "INT" is entered in the POS TYPE field, then entries are not allowed in the LCEN, OFC ID and REL PNUM fields, and "N" must be entered in the MON POS field. Also, the DEN and OSPS ID fields must contain entries.

OPT:
For 5E9(1) and later, if "OPT" is entered, then SERVICE CLASS must be "TAOPER" on the corresponding OSPSDSL form (matching LCENs).

OPERATOR POS

The following fields (Section 2.4 - Section 2.8) define operator position fields.

2.4 LCEN

Description: Enter the RISLU LCEN (Line Card Equipment Number) for this operator position.
Valid Entries: An 8-digit LCEN in the following format.

LINE CARD EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
(Remote) Integrated Services Line Unit	(R)ISLU		0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

Data Rules:

The entries in this field must be unique.

This field must be left blank if interflow position is selected.

Entries in this field must exist on an OSPSDSL form (5411 Record). The SERVICE CLASS for each of these entries on the OSPSDSL form must be "DAOPER" or "TAOPER".

Any LCEN entered must be on a Line Card specified on the ISLULC form with an EQST (Equipment Status) of Operational ("O").

For 5E7 and later, "Y" must be entered in the OSPS PSM field on the corresponding EQIM form. The SM number on the EQIM form matches the first three digits of the LCEN or DEN field on this form.

2.5 OFC ID

Description: Enter an OSPS FMC/OSC (Force Management Center / Operator Service Center) Office Number.
Valid Entries:
- FMC: 1 - 8
- OSC: 1 - 32

Data Rules:

This field is required for an operator position type and must be left blank when interflow position is selected. Entries in this field must be defined on an OPARM form (5400-1/2 Record).

The combination of OFC ID and REL PNUM on the OSPSOP form must be unique.

For 5E8 and later, at most four different OFC ID values can be entered on OSPSOP forms having the same first three digits on their LCEN fields that specify the same SM.

2.6 REL PNUM

Copyright © 2003 Lucent Technologies

Description: Enter a unique Relative Position number of the operator position within the OSC.
Valid Entries: 1 - 4095

Data Rules:

For interflow position, this must be left blank.

The combination of OFC ID and REL PNUM values must be unique, i.e., within each OSC or FMC, the REL PNUM entries must be unique. The following two examples illustrate possible approaches:

Example 1:

POS NUMBER	OFC NUMBER	REL POS NUMBER
1	1	1
2	1	2
3	1	3
4	2	1
5	2	2
6	2	3

Example 2:

POS NUMBER	OSC NUMBER	REL POS NUMBER
1	1	1
2	1	2
3	1	3
4	2	4
5	2	5
6	2	6

2.7 MON POS

Enter "Y" Description: Is this operator position used for monitoring?

Data Rules:
The entry must be "N" if interflow position is selected.

2.8 CST INTERFACE

Description: Enter the vendor for the CST (Combined Services Terminal) software. This field is used to provision the Recognition of Customer Provided Terminal. For more information on this feature see Division 2, Section 3C on OSPS Listing Services.

Software Release: 5E9(1) and later
Valid Entries:

Valid CST INTERFACE Entries

Entry	Definition
IBM	Interface used for IBM
VDR	Interface used for Volt Delta

Data Rules:

If this field is entered, POS TYPE must be "OPT".

The total number of OSPSOP forms with an entry in the CST INTERFACE field cannot be greater than the value of MAX DUAL PORT CST field on the OSPSOPT form (5424 Record)

INTERFLOW POS

The following fields (Section 2.9 - Section 2.10) define Interflow position fields. For more information on Interflow see Division 2, Section 3A, 3B, 3C, 3D, 3H, and 3I.

Copyright © 2003 Lucent Technologies

2.9 DEN

Description: Enter the DEN (Digital Equipment Number) for this Interflow position associated with B-channels on the OSPS EDSL.
Valid Entries: An 8-digit DEN in the following format.

LINE CARD EQUIPMENT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	001 - 192
Digital Line Trunk Unit	DLTU		0 - 5
Digital Facility Interface	DFI	XX	01 - 10
Digital Channel	BCHAN	XX	01 - 23 or 25 - 47

Data Rules:

This field must be entered for an interflow position (POS TYPE is "INT") and must not be entered if the operator position is selected (POS TYPE is "OPT", "VDT", or "BST").

Each DEN entered on an OSPSOP form must be unique and must be defined on a TRUNK form (5204 Record). In addition, the related TGN (on the TRUNK form) must be defined on a TKGRP form (5202 Record) with a corresponding TRK DIR of "OUT" and a TRKCLS of "IFOPER".

For 5E7 and later, "Y" must be entered in the OSPS PSM field on the corresponding EQIM form. The SM number on the EQIM form matches the first three digits of the LCEN or DEN field on this form.

2.10 OSPS ID

Description: Enter the OSPS ID number of the receiving interflow switch.
Valid Entries: 1 - 9999

Data Rules:

This field must be entered if POS TYPE is set to "INT" and must be left blank if POS TYPE is "OPT", "BST", or "VDT".

OSPS IDs entered on the OSPSOP form must be defined on an INFLTADP form (5452 Record) along with the B-channel and D- channel trunk group numbers.

ACD/BRCS

For 5E9(1) - 5E10, the following fields (Section 2.11 - Section 2.13) are Recent Change Verify fields for the ACD/BRCS feature. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.The ACD/BRCS data has been moved to forms in Division 4, Section 32.

2.11 ACD LCEN

Description: For 5E9(1) - 5E10, this is a Recent Change Verify only field which displays the line card equipment number associated with an ACD/BRCS Position TN on the 21.32 view. The valid entry is an 8-digit LCEN in the following format:

LINE CARD EQUIPMENT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	001-192
(Remote) Integrated Services Line Unit	(R)ISLU		0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

Data Rules:

This entry must equal an LCEN from view 23.2 or 23.8. In view 23.2 or 23.8, the field ACD POS NUM must

Copyright © 2003 Lucent Technologies

not be 0.

2.12 ACD POS TN

Description: For 5E9(1) - 5E10, this is a Recent Change Verify only field which displays the ACD (Automatic Call Distributor) position telephone number on the 21.32 view. The valid entry is a 7-digit telephone number.

2.13 TGID

Description: For 5E9(1) - 5E10, this is a Recent Change Verify only field which displays the TGID (Terminal Group Identifier) for the ACD/BRCS serving team positions on the 21.32 view. The valid entries are 1 - 65535, or blank.

SEC. 4C: 5402 RECORD
OSPS SERVING TEAM INFORMATION FORM - STINFO

1. GENERAL

The 5402 Record is available with 5E3 and later Software Releases. This record provides information about a serving team. A serving team is a group of operator positions that services one or more call types.

For 5E9(1) - 5E10, only the following fields are applicable to the ACD/BRCS feature:

- AFTER CALL WK
- AUTO CALL DIST?
- E911 PSAP
- #EMRG CONF ALLOW
- EMRG CONF CALL TYPE
- INTRAFLOW ALW
- LIVE MIKE
- MUSIC SELCTD
- OPER TYPE
- PCT INTRAFLOW
- SERVING TEAM
- SERVICE ATTN CALL TYPE
- TGID
- WARN TONE

For 5E11 and later, these fields were moved to the STPARM form (5638 Record).

1.1 Recent Change View

The corresponding Recent Change View for STINFO is 21.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SERVING TEAM

Description: Enter the number of the serving team that will service this call type.

Required Field.
Valid Entries: 1 - 128.

Data Rules:

When the SERVING TEAM entry on this form matches a SUP TEAM in the SUPPORT TEAM LIST on an OSPSCT form, then the OPER TYPE entry on this form must match the OPER TYPE on the OSPSCT form (5404 Record), and the AUTO CALL DIST? entry on this form must match the AUTO CALL DIST entry on the OSPSCT form.

2.3 #OPER TYPE

Description: Enter the Type of Operator.

Software Release: 5E4(2) and later
Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid OPER TYPE Entries

Entry	Definition
DA	Directory Assistance
TA	Toll And Assistance

Data Rules:

When OPER TYPE is "TA", the following assignments will be made by ODA (Office Data Administration):

Assignments Made By ODA

Field	Value
CARRIER DIAL PERM	DENY
CARRIER ID	blank
DAS/C AVAILABLE	N
DIALING PERM INDEX	blank
EMRG CONF ALLOW	N
EXTERNAL DIALING PERM	UNRES
SEC DIG ANALYSIS SEL	0

If "DA" is entered in the OPER TYPE field, then "N" must be entered in both the NON ISP AND TA and NON ISP ONLY fields.

2.4 SERVICE ATTN CALL TYPE

Description: If the serving team is allowed to conference with a service assistant, enter the service assistant's call type.
Valid Entries: 1 - 128

Data Rules:

Each entry in this field must be defined in the OSPS CALL TYPE field on an OSPSCT form (5404 Record). Additionally, the OPER TYPE must match the OPER TYPE on the OSPSCT form.

2.5 #EXTERNAL DIALING PERM

Description: Enter the external dialing permission for the serving team.

Required Field.

Default Value: DENY

Valid EXTERNAL DIALING PERM Entries

Entry	Definition
DENY	Denied external dialing
UNRES	Unrestricted external dialing
RES	Restricted external dialing

Data Rules:

If an OSPSOA form (5403 Record) exists whose SERVING TEAM entry is the same as the SERVING TEAM entry on this STINFO form and the OSPSOA form has a value of "RES" entered in the EXTERNAL DIALING PERM field, then this STINFO form must have a value of "RES" or "UNRES" in the EXTERNAL DIALING PERM field and a value entered in the DIALING PERM INDEX field.

When EXTERNAL DIALING PERM is "UNRES" on this form and "RES" on the corresponding OSPSOA form, then DIALING PERM INDEX must be entered on this form. The corresponding OSPSOA form is found by matching SERVING TEAM on this form with the SERVING TEAM on the OSPSOA form.

2.6 DIALING PERM INDEX

Description: Enter the external dialing permission index.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 64

Data Rules:

If "RES" was entered in the EXTERNAL DIAL PERM field, enter the external dialing permission index for this serving team.

Each entry in this field must be defined on the RESXDL form (5409 Record).

2.7 #EMRG CONF ALLOW

Description: Can the serving team conference emergency calls?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E6 and later, if OPER TYPE is "TA", then this field must be set to "N".

2.8 EMRG CONF CALL TYPE

Description: Enter the emergency conference call type, if "Y" was entered in the EMRG CONF ALLOW field.
Valid Entries: 1 - 128

Data Rules:

If "N" was entered in the EMERG CONF ALLOW field, no entry is allowed in this field.

Each entry in this field must be defined in the OSPS CALL TYPE field on an OSPSCT form (5404 Record). Additionally, the OPER TYPE must match the OPER TYPE on the OSPSCT form.

2.9 #DAS/C AVAILABLE

Description: Does the serving team have a DAS/C (Directory Assistance System Computer)?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

"N" must be entered in this field if "NONE" is entered in the DAS/C VENDOR field or DAS/C VENDOR field is not entered on the OSPSOPT form (5424 Record).

2.10 CARRIER ID

Description: Enter the carrier identification used by this serving team for outgoing interLATA (Local Access and Transport Area) calls.
Valid Entries:

- For 5E3 - 5E8: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

An ICF form (5303 Record) with FEAT GRP equal to "D" must be completed for each carrier identified in

Copyright © 2003 Lucent Technologies

this field.

2.11 HANDOFF ALLOWED

Description: May operators transfer calls to other operators within the same service team.
Default: Y
Valid Entries: Y, N

2.12 TRANSFER ALLOWED

Description: May operators transfer calls to positions outside the service team.
Default: Y
Valid Entries: Y, N

2.13 CONF TRANS ALLOWED

Description: May operators conference to other operators.
Default: N
Valid Entries: Y, N

2.14 #SCREEN INDEX

Description: The screen index field indicates the routing of calls to trunks on outgoing calls.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

Each SCREEN INDEX entered on this form must exist on a RAR form (5301 Record).

2.15 #DIG ANALYSIS SEL

Description: This field determines the originating table for digital analysis of dialed numbers. This field does not affect ACD/BRCS, however, it is a required field and must be entered. Therefore, it is recommended for ACD/BRCS to follow data rules for an entry in this field, although ACD/BRCS will not use this entry.

Required Field.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

Each Digit Analysis Selector value entered on this form must exist on a DAS form (5300-1 Record).

2.16 SEC DIG ANALYSIS SEL

Description: The SEC DIG ANALYSIS SEL field is used for operator special dial codes.
Default: 0
Valid Entries: 0 - 254

For 5E14 and earlier: 0 - 99
For 5E15 and later: 0 - 254

Copyright © 2003 Lucent Technologies

Data Rules:

Each Secondary Digit Analysis Selector value greater than 0 entered on this form must exist on a DAS form.

2.17 CARRIER DIAL PERM

Description: This field specifies the access conditions.

Software Release: 5E4(2) and later
Default: DENY
Valid Entries:

Valid CARRIER DIAL PERM Entries

Entry	Definition
ALLOW	May dial carrier access code or use a PIC (Presubscribed InterLATA Carrier) identification number for interLATA calls.
DENY	Must use a PIC number for interLATA calls.
REQ	Must dial the carrier access code for interLATA calls.
TALLOW	May dial carrier access code or use a PIC number for test lines.
TDENY	Must use a PIC number for test lines
TREQ	Must dial carrier access code for test lines.

2.18 AUTO CALL DIST?

Description: Does this serving team handle commercial ACD (Automatic Call Distribution) calls.

Software Release: 5E4(2) and later
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" was entered in this field, then "DA" must be entered in the OPER TYPE field.

2.19 NON ISP AND TA

Description: Does the serving team allow non-ISP and TA calls.

Software Release: 5E5 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in this field and the OPER TYPE field is set to "TA", then the NON ISP ONLY field must be set to "N". If the OPER TYPE field is set to "DA", then this field must be set to "N".

2.20 NON ISP ONLY

Description: Does the serving team allows only non-ISP calls.

Software Release: 5E5 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If "Y" is entered in the NON ISP AND TA field and "TA" is entered in the OPER TYPE field, then this field must be set to "N". If the OPER TYPE field is set to "DA", then this field must be set to "N".

2.21 INTRAFLOW ALW

Description: Is this serving team allowed to receive intraflowed calls?

Software Release: 5E5 and later.
Default: N
Valid Entries: Y, N

Data Rules:

The following conditions must exist to enable the Intraflow feature: the SERVING TEAM entry on this STINFO form must be defined on the SUP TEAM field of an OSPSCT form (5404 Record), and "Y" must be entered in the INTRAFLOW ALW field of the OSPSOPT form (5424 Record).

2.22 PCT INTRAFLOW

Description: This field indicates the maximum percentage of currently logged-in operators of this serving team that is allowed to handle calls from supporting calls queues.

Software Release: 5E5 and later.
Default: 0(%)
Valid Entries: 0 - 100 (%)

Data Rules:

If "0" is entered in the PCT INTRAFLOW field (or it is left blank), then the INTRAFLOW ALW field is set to "N".

2.23 MUSIC RI

Description: Enter the route index of the music source to be used when a member of the serving team puts a call on hold. This field is for Commercial ACD features only.

Software Release: 5E6 and later.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

If this field is entered, then AUTO CALL DIST? field must be "Y" and OPER TYPE must be "DA".

If MUSIC RI has an entry, then an RTIDX form (5303 Record) must have a ROUTE INDEX entry that equals the entry in this field. In addition, the CI ROUTE TYPE on that RTIDX form must equal "GENANN". Also, the ROUTE INDEX on the RTIDX form must equal a TGN on a TKGRP form (5202 Record) where the TRK DIR field must equal "ANN", the CYCLES field must equal "O" and the BARGE IN field must equal "Y".

An entry in this field also requires a corresponding TRUNK form (5204 Record) be entered where the TGN equals the TRUNK GROUP NUMBER on an RTIDX form and MEMB equals "O" on that TRUNK form. A corresponding TRUNK form is one where the MUSIC RI equals the ROUTE INDEX on the RTIDX form, and the TRUNK GROUP NUMBER on the RTIDX form equals the TGN on the TRUNK form.

Copyright © 2003 Lucent Technologies

For 5E9(1) - 5E10 later, if MUSIC RI is entered, TGID cannot be entered. If MUSIC RI or TGID is entered, then MUSIC SELCTD must also be entered.

For 5E11 and later, MUSIC RI must be entered if MUSIC SELCTD is "Y".

2.24 MUSIC SELCTD

Description: Is music to be provided to the calls on hold?

Software Release: 5E6 and later.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(1) - 5E10, if MUSIC SELCTD is "Y", either TGID or MUSIC RI must be entered. If MUSIC SELCTD is "N", TGID and MUSIC RI cannot be entered.

For 5E11 and later, if "Y" is entered, then MUSIC RI must be entered.

2.25 AFTER CALL WK

Description: Should the after-call work-state (auto make busy) be allowed? If "Y" is entered, then the ACD/BRCS position enters the "Make Busy with ACD call" state whenever the agent answers a hunted call. For more information on the ACD/BRCS feature see Division 2, Section 4A121.

Software Release: 5E9(1) - 5E10
Required Field.
Default: N
Valid Entries: Y, N

2.26 LIVE MIKE

Description: Should a live mike be allowed during service observing? If "Y" is entered then the ACD/BRCS service observer is by default given a 2-way connection when service observing. If "N" is entered, then the ACD/BRCS service observer is by default given a 1-way connection when service observing.

Software Release: 5E9(1) - 5E10
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

LIVE MIKE is a secured feature and may not be set to "Y" on the STINFO form unless "Y" is entered in SFID 4 on the SFSYS form (5713-1 Record).

2.27 WARN TONE

Description: This field specifies whether, during an ACD/BRCS service observe session, a warning tone

- is provided to the observed agent,
- is provided to the observed agent and far party, or
- is not provided to either the agent or the far party.

Copyright © 2003 Lucent Technologies

No entry in this field indicates a warning tone is not provided.

Software Release: 5E9(1) - 5E10
Valid Entries:

Valid WARN TONE Entries

Entry	Definition
1ALL	Agent and far end party hear a warning tone one time.
AGENT	Only the agent being observed hears a warning tone.
ALL	The agent being observed and far end hear a warning tone.

2.28 TGID

Description: Enter the Terminal Group Identication used to associate the serving team with an ACD/BRCS customer.

Software Release: 5E9(1) - 5E10
Valid Entries: 1 - 65535

Data Rules:

If TGID is entered, AUTO CALL DIST? must be "Y".

If MUSIC RI is entered, TGID cannot be entered. If MUSIC RI or TGID is entered, then MUSIC SELCTD must also be entered.

The TGID entry on this form must be defined as a GROUP ID on either the TGSRFD, TGSRLPA, TGSRMPA, TGSRTPA or BFG form.

For 5E9(1) - 5E10, if TGID is entered and MUSIC SELCTD is set to "Y", then the TGID specified must have a Music On Hold TGN and MEMB assigned on the associated TGATTD with a GROUP ID that matches the TGID on this form. For more information on the secured feature Music On Hold see Division 2, Section 4A64.

For 5E9(1) - 5E10, when TGID is not entered, SCREEN INDEX must be entered.

For 5E9(1) - 5E10, when TGID is not entered, DIG ANALYSIS SEL must be entered.

2.29 E911 PSAP

Description: Is this serving team associated with an ACD E911 Public Safety Answering Point?

Software Release: 5E9(1) - 5E10
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

To activate this secured feature, the ACT field for SFID 143 on the SFSYS form (5713-1 Record) must be "Y".

When E911 PSAP is "Y", AUTO CALL DIST must be "Y".

2.30 AUTO CLOSE END ANNC

Description: Is the automated close-end announcement treatment allowed? This field supports the OSPS Closed End Branding for Operator Handling Calls secured feature (SFID 404). For more information on this feature, see Division 2, Section 4A404.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

SEC. 4D: 5403 RECORD
OSPS OPERATOR ASSIGNMENT FORM - OSPSOA

1. GENERAL

The 5403 Record is available with 5E4(1) and later Software Releases.

This record is used to define OSPS (Operator Services Position System) operator positions, assign operators to serving teams and define valid operator actions.

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * OPERATOR ID

Description: Enter the OSPS operator login identification. OPERATOR IDs must consist only of numbers for OPER TYPES of "DA". Values in the range 9000 through 9999 are reserved and are not allowed.

To receive an AMA record with the OPERATOR ID listed, it is recommended that only numbers are entered rather than alphanumerics for the OPERATOR ID.

Required Field.
Valid Entries: 4 alphanumeric characters

2.3 # OPER TYPE

Description: Enter the type of operator.

For 5E6 and later, the Listing Services operator using a BST-LS terminal, should be aware that the only letters a BST-LS can generate are "a" by pressing SHIFT 2, "n" by pressing SHIFT 6, and "y" by pressing SHIFT 9. An example of an OPERATOR ID for a BST-LS terminal would be "123a" or "1234".

Required Field.

Software Release: 5E4(2) and later
Valid Entries:

Valid OPER TYPE Entries

Entry	Definition
DA	Directory Assistance
TA	Toll and Assistance and Listing Services

2.4 DASC OPERATOR ID

Description: Enter the OSPS DASC (Directory Assistance System Computer) operator login identification.
Valid Entries: 1 - 8999

Data Rules:

If OPER TYPE is "TA", no entry is allowed in the DASC OPERATOR ID field. DASC OPERATOR IDs cannot be duplicated for OPER TYPES of "DA".

Copyright © 2003 Lucent Technologies

2.5 # SERVING TEAM

Description: Enter the OSPS Serving Team number that this operator is assigned to.

Required Field.
Valid Entries: 1 - 128

Data Rules:

An STINFO form (5402 Record) must be completed for each OPER TYPE/SERVING TEAM combination on this form.

2.6 EXTERNAL DIALING PERM

Description: Enter the external dialing permission for this operator. If the corresponding entry on the STINFO form is appropriate for the operator, enter the same value.
Default: DENY
Valid Entries:

Valid EXTERNAL DIALING PERM Entries

Entry	Definition
DENY	Denied external dialing
UNRES	Unrestricted external dialing
RES	Restricted external dialing

Data Rules:

If "RES" is entered in this field, then the STINFO form whose SERVING TEAM entry is equal to the SERVING TEAM entry on this form, must have an entry of "RES" or "UNRES" in the SERVING TEAM field and an entry between 1 and 64 in the DIALING PERMISSION INDEX field.

2.7 HANDOFF ALLOWED

Description: Can the operator transfer calls to other operators within the same serving team? If the corresponding entry on the STINFO form is appropriate for the operator, enter the same value.
Default: Y
Valid Entries: Y, N

2.8 TRANSFER ALLOWED

Description: Can the operator transfer calls to positions outside the service team? If the corresponding entry on the STINFO form is appropriate for the operator, enter the same value.
Default: Y
Valid Entries: Y, N

2.9 CONF TRANS ALLOWED

Description: Can the operator conference or transfer to other operators? If the corresponding entry on the STINFO form is appropriate for the operator, enter the same value.
Default: N
Valid Entries: Y, N

Data Rules:

If TRANSFER ALLOWED is "N", then CONF TRANSFER ALLOWED must be "N".

2.10 MNGR PSWD

Description: Enter the manager login identification. For 5E6 and later Software

Copyright © 2003 Lucent Technologies

Releases, if a Listing Services operator is using a BST-LS terminal, the operator should be aware that the only letters a BST-LS can generate are "a" by pressing SHIFT 2, "n" by pressing SHIFT 6, and "y" by pressing SHIFT 9. The password for a BST-LS terminal could be "12ny5".
Valid Entries: 6 alphanumeric characters

Data Rules:

If "TA" is entered in the OPER TYPE field, then the MNGR PSWD must contain at least one alphabetic character. An entry is required in the MNGR PSWD field if "Y" is entered in the MON PERM field.

2.11 MON PERM

Description: Is the operator allowed to monitor calls?
Default: N
Valid Entries: Y, N

```

SEC. 4E: 5404-1/2 RECORD
OSPS CALL TYPE PARAMETERS FORM - OSPSCT

1. GENERAL

The 5404 Record is available with 5E3 Software Release. The 5404-1/2 Records are available with 5E5 and later Software Releases. These records are used to assign call types. Serving teams, delay announcements, and other parameters are assigned to call types.

The following fields are not applicable to the ACD/BRCS feature:

- RECALL CALL TYPE
- BACK ANNC RTI
- COIN RECALL
- COIN NOTIFY
- MECH TYPE
- SVC ID
- LIST SVC RECALL

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *OSPS CALL TYPE

Description: Enter the Call Type.

Required Field.

Valid Entry: 1 - 128

Data Rules:

When the OSPS CALL TYPE entry matches the OSPS CALL TYPE entry on an OPCTO form (5407 Record), the OPER TYPE on the OSPSCT form must be "DA", or "TA" for Listing Services.

When the OSPS CALL TYPE entry matches the CALL TYPE entry on an ACDCTP form (5412 Record), the OPER TYPE on this form must be "TA", and SVC ID must be entered on this form.

When the OSPS CALL TYPE entry matches the APOS CALL TYPE entry on an ACDCTP form (5412 Record), the OPER TYPE on the OSPSCT form must be "TA". and SVC ID must not be entered.

When the OSPS CALL entry matches the CALL TYPE entry in the NEXT CALL TYPE LIST field of an ACDPOL form (5412 Record), the OPER TYPE on this form must be set to "TA".

If an entry is made in the SERVICE ATTN CALL TYPE field on a STINFO form (5402 Record), a corresponding OSPS CALL TYPE entry must be made here.

2.3 #OPER TYPE

Description: Enter the type of operator.

Copyright © 2003 Lucent Technologies

Software Release: 5E4(2) and later
Required Field.
Valid Entries:

Valid OPER TYPE Entries	
Entry	**Definition**
DA	Directory Assistance for OSPS or Commercial Automatic Call Distributor
TA	Toll and Assistance or Listing Services for OSPS

Data Rules:

If **"DA"** is entered, then

- for 5E5 and later, each SERVING TEAM must be defined on a STINFO form (5402 Record), with corresponding entries in the AUTO CALL DIST fields.
- for 5E6 and later, the BACK ANNC RTI field, MECH TYPE field, and SVC ID must NOT be entered.
- for 5E6 and later, if VECTOR ID field is entered on the OPCTO form, 5407 Record, then OPER TYPE must be "DA" and AUTO CALL DIST must be "Y" for corresponding OPCTO and OSPSCT forms. Corresponding forms are those forms where the OSPS CALL TYPE fields match.

If **"TA"** is entered, then

- for a Listing Services call, the BACK ANNC RTI field, MECH TYPE field, and SVC ID field must also be entered.
- for 5E6 and later, OPER TYPE must be "TA", if OSPS SVC CODE on the corresponding SERVDATA form is "INCPT" or "IBMINCPT". The SERVDATA form corresponds to this form if the SVC ID field on this form matches the SVC ID on a SERVDATA form.
- and the OSPS CALL TYPE matches OSPS CALL TYPE of an OPCTO form, then the SVC ID of OSPSCT form must be entered.

2.4 RECALL CALL TYPE

Description: Enter the Recall Call Type. If no entry is made in the RECALL CALL TYPE field, it will be set to the same value that is entered in the OSPS CALL TYPE field.

Required Field.

Valid Entry: 1 - 128

Data Rules:

The RECALL CALL TYPE field is for OSPS "DA" and "TA". An OSPS RECALL CALL TYPE must match an OSPS CALL TYPE on this form or another OSPSCT form. The OPER TYPE entries must match on OSPSCT forms and AUTO CALL DIST entries must match, where the OSPS CALL TYPE entry on one form matches the RECALL CALL TYPE on the other form.

2.5 #SERVING TEAM

Description: Enter the number of the principal serving team that will service this Call Type.

Required Field.

Valid Entry: 1 - 128

Copyright © 2003 Lucent Technologies

Data Rules:

Each OPER TYPE/ SERVING TEAM combination entered here must be defined on a STINFO form (5402 Record). In addition, if the OPER TYPE is "DA", then the AUTO CALL DIST values on this form and the STINFO must be the same.

2.6 SERVICE OBJ

Description: Enter the Service Objective for this Call Type. The Service Objective is the average answer delay, in seconds, that the system will try to achieve for this Call Type. This figure is based on Operator Force Management calculations of anticipated call volume. The entries are in increments of one-tenth of a second.

Required Field.
Default: 10.0
Valid Entries: 0.1 - 60.0 (one-tenth seconds)

2.7 MAX CALLS

Description: Enter the maximum number of calls allowed in a queue for this Call Type.

Required Field.

Default: 30
Valid Entry: 0 - 5000

Data Rules:

The sum of the CLAIM CQDB on the OSPSOPT form (5424 Record) and the MAX CALLs on all the OSPSCT forms must not exceed 5000.

2.8 CALL WAITING ON

Description: The system periodically calculates the average answer delay (in seconds) for each Call Type queue. The call waiting indicator for the Call Type queue will be turned on when the average answer delay is greater than the entry in this field.

Required Field.

Default: 11 (seconds)
Valid Entry: 1 - 1800 (seconds)

2.9 CALL WAITING OFF

Description: The call waiting indicator for the Call Type queue will be turned off when the average answer delay (in seconds) is less than the entry in this field.

Required Field.

Default: 9 (seconds)
Valid Entry: 1 - 1800 (seconds)

Data Rules:

The value of the CALL WAITING ON field must be greater than that of the CALL WAITING OFF field.

2.10 #1ST ANNC RTI

Copyright © 2003 Lucent Technologies

Description: Enter the route index number to the first delay announcement.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The route index entered in this field must be designated in the ROUTE INDEX field of an RTIDX form (5303 Record). The TRUNK GROUP NUMBER on the RTIDX form must match a TGN entry on the TKGRP form and TRK DIR must be "ANN" and LOCAL SM must not be entered on that TKGRP form.

2.11 #1ST ANNC DELAY

Description: The system calculates the expected queue delay (in seconds) for each call that is queued for an operator. Whenever there are two or more calls in a queue, new calls arriving to the queue are eligible for delay announcements in accordance with the length of the expected queue delay. The first delay announcement will be played when the call is first queued if the expected delay exceeds the entry in this field, and does not exceed the entry in the 2ND ANNC DELAY field.

With 5E5 and later Software Releases, 0 may be entered for a forced first announcement.

Required Field.

Default: 15 (seconds)
Valid Entry: 1 - 1800 (seconds)

2.12 #2ND ANNC RTI

Description: Enter the route index number to the second delay announcement.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The route index entered in this field must be designated in the ROUTE INDEX field of an RTIDX form. The TRUNK GROUP NUMBER on the RTIDX form (5303 Record) must match the TGN entry on the TKGRP form (5202 Record). Also, the TRK DIR field must be "ANN" and LOCAL SM must not be entered on that TKGRP form.

2.13 #2ND ANNC DELAY

Description: The call will be routed to the second delay announcement if the expected delay exceeds the entry in this field, and does not exceed the 3RD ANNC DELAY.

Required Field.

Default: 40 (seconds)
Valid Entry: 1 - 1800

Data Rules:

The value entered in this field must be greater than the entry in the 1ST ANNC DELAY field.

Copyright © 2003 Lucent Technologies

2.14 #3RD ANNC RTI

Description: Enter the route index number to the third delay announcement.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The route index entered in this field must match a ROUTE INDEX field of an RTIDX form.For 5E6(2) and later, if AUTO CALL DIST on this form is "N", the TRUNK GROUP NUMBER on the RTIDX form must match a TGN on the TKGRP form; TRK DIR on the TKGRP form must be "ANN", and LOCAL SM must not be entered.

2.15 #3RD ANNC DELAY

Description: The call will be routed to the third delay announcement if the expected delay (in seconds) exceeds the entry in this field.

Required Field.

Default: 60 (seconds)
Valid Entry: 1 - 1800 (seconds)

Data Rules:

The value entered in this field must be greater than the entry in the 2ND ANNC DELAY field.

2.16 #CLOSE DOWN RTI

Description: The CLOSE DOWN RTI is the route index number to a business closed announcement.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The entry in this field must match a ROUTE INDEX field of an RTIDX form. For 5E6(2) and later, if AUTO CALL DIST on this form is "N", the TRUNK GROUP NUMBER on that RTIDX form must match the TGN on a TKGRP form. The TRK DIR on that TKGRP form must be "ANN" and LOCAL SM must be unknown.

2.17 #CALL TYPE OPEN

Description: " Is this Call Type servicing calls?

Required Field.

Default: N
Valid Entry: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If the entry in this field is "N", then an entry is required in the CLOSE DOWN RTI field.

2.18 CALL TYPE NAME

Description: Enter the Call Type Name. Only alphanumeric characters and spaces may be entered. No double quotes or special characters are allowed.

Valid Entry: 1 - 10 characters

Data Rules:

The entry in this field must be unique, it cannot be duplicated on another OSPSCT form.

2.19 BACK ANNC RTI

Description: Enter the route index number to the turn-back announcement.

Software Release: 5E4(2) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

If OPER TYPE is "DA", then this field must not be entered. If OPER TYPE is "TA", then this field must be entered.

The route index entered in this field must be defined as a ROUTE INDEX on an RTIDX form. For 5E8 and later, a TRUNK GROUP NUMBER must be entered on the RTIDX form and must be defined in the TGN field on a TKGRP form where TRK DIR is "ANN".

2.20 AUTO CALL DIST

Description: Is this Call Type used for CACD (Commercial Automatic Call Distribution)?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "TA" was entered in the OPER TYPE field, this field must be "N".

Entries in the AUTO CALL DIST field must match where the OSPS CALL TYPE on one OSPSCT form matches the RECALL CALL TYPE on another.

For 5E6 and later Software Releases, if "N" is entered and the OPER TYPE field is "DA", then a corresponding OPCTO form (5407 Record) is required where the CPND ASSIGNED field is "N". A corresponding OPCTO form is one in which the OSPS CALL TYPE field matches the OSPS CALL TYPE on the OSPSCT form.

For 5E6 and later, when VECTOR ID is entered on an OPCTO form, the associated OSPSCT form (the OSPS CALL TYPEs match) must have "Y" entered for AUTO CALL DIST.

2.21 COIN RECALL

Copyright © 2003 Lucent Technologies

Description: Enter the Coin Recall Number, which is the call type (queue) for coin recall. If no entry is made in this field, then the associated OSPS CALL TYPE value will be used.

Software Release: 5E5 and later
Required Field.
Valid Entries: 1 - 128

Data Rules:

Each value in the COIN RECALL field must be defined as a valid CALL TYPE on the same form or on another OSPSCT form. If it is a CALL TYPE on another OSPSCT form, the OPER TYPE value must be the same on both forms.

2.22 COIN NOTIFY

Description: Enter the Coin Notify Number, which is the specific type of notify coin recall. If no entry is made, the associated OSPS CALL TYPE value will be used.

Software Release: 5E5 and later
Valid Entries: 1 - 128

Data Rules:

Each entry in the COIN NOTIFY field must be defined as a valid CALL TYPE on the same form or on another OSPSCT form. If it is a CALL TYPE on another OSPSCT form, the OPER TYPE value must be the same on both forms.

2.23 MECH TYPE

Description: This entry specifies the MECH (More Efficient Call Handling) queue for the call type.

Software Release: 5E6 and later
Valid Entries: 1 - 128

Data Rules:

If OPER TYPE is "TA", then an entry is required for MECH TYPE. If OPER TYPE is not "TA", do not enter anything in this field.

If MECH TYPE is entered on this OSPSCT form, it must match the OSPS CALL TYPE on this form or on another OSPSCT form. If MECH TYPE matches OSPS CALL TYPE on a different OSPSCT form, then the OPER TYPE fields on both forms must match. The default is the OSPS CALL TYPE on this form.

2.24 SVC ID

Description: Enter the Listing Services identification number. For a a Listing Service such as White Pages or customer name and address, if OPER TYPE is NOT "TA", do NOT make an entry in this field.

Division 2, Section 3c discusses the translations needed for Listing Services.

Software Release: 5E6 and later
Valid Entries: 1 - 1023

Data Rules:

An entry in SVC ID field requires that an OPEISDB form exist for each entry in the SERVING TEAM and SUP TEAM field on the corresponding OSPSCT form. The SVC ID fields on the two forms must be equal and the SERVING TEAM or SUP TEAM field on the OSPSCT form must be equal to SERVING TEAM

Copyright © 2003 Lucent Technologies

field on the OPEISDB form.

If the VECTOR ID field is entered on the OPCTO form, 5407 Record, then this field should be left blank.

When SVC ID is entered, NON ISP ONLY must be "N" on the STINFO form (5402 Record) associated with this OSPSCT form, i.e., the SERVING TEAM on the STINFO form matches either the SERVING TEAM or the SUP TEAM on this form.

2.25 LIST SVC RECALL

Description: Should the service recall type be assigned?

This field provides for the ability to assign the recall call type based on the EIS NAME and SVC ID.

Software Release: 5e6 and later
Required Field.
Valid Entries: Y, N

Data Rules:

If "Y" is entered in this field, then SVC ID field must be entered.

Each EIS NAME and SVC ID on a OPEISDB form may have only one OSPS CALL TYPE on a OSPSCT form used as the Listing Services Recall Call Type.

Call types used as a recall queue identifier type must have the same EIS name assigned to all serving teams for this recall call type.

The recall must be served by the same EIS (External Information System) because only that EIS will have a record of the original call. An EIS is assigned to a SERVING TEAM and SVC ID on the OPEISDB form. Therefore, for each OSPSCT form where LIST SVC RECALL is "Y", a corresponding OPEISDB form must be submitted where the SERVING TEAM and SVC ID fields match on the two forms. A corresponding OPEISDB form must also be submitted for each SUP TEAM entered on the OSPSCT form. The SERVING TEAM and SVC ID fields on the OPEISDB form must match SUP TEAM and SVC ID fields on the OSPSCT form. The EIS NAME must be the same on all corresponding OPEISDB forms.

If LIST SVC RECALL is "Y" on an OSPSCT form, the OSPS CALL TYPE field is used as the SVC ID on this form and the Listing Services Recall Call Type for the EIS NAME on the OPEISDB form that is pointed to by the SERVING TEAM and SVC ID fields on this OSPSCT form.

A second OPEISDB form is required for every OSPSCT form if LIST SVC RECALL is "Y" and if the PRE OPER EIS field entered on the corresponding SERVDATA form is different than the EIS NAME on the first OPEISDB form.

- A corresponding SERVDATA form is found by matching the SVC ID field with the SVC ID field on the OSPSCT form.
- The first OPEISDB form is found by matching the SERVING TEAM and SVC ID fields with SERVING TEAM and SVC ID fields on the OSPSCT form, respectively.
- The second OPEISDB form is found by matching the SVC ID and EIS NAME fields with the SVC ID and PRE OPER EIS fields on the SERVDATA form, respectively.

2.26 INTRAFLOW ALW

Description: Is Intraflow allowed for this call queue?

Software Release: 5E5 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then

- the INTRAFLOW ALW field on the OSPSOPT form (5424 Record) must be set to "Y".
- at least one supporting Serving Team must be entered in the SUP TEAM field in the SUPPORT TEAM LIST. In addition, the SUP TEAMs must be defined on the STINFO form (5402 Record) with INTRAFLOW ALW set to "Y" on the STINFO form.

If no supporting teams are entered, this field should be set to "N". For further information see Division 2, Section 3.

2.27 QUEUE BUSY

Description: Should a busy tone be given to the caller when the call queue is full?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.28 DELAY BUSY

Description: Should a busy tone be given to the caller when the threshold is exceeded?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.29 ANNC ON LVL1

Description: Should an announcement be given instead of audible tone for a level 1 delay?

Software Release: 5E9(1) and later
Default: N
Valid Entries: Y, N

2.30 TGID

Description: This is a Recent Change/Verify only field. This field displays the TGID (Terminal Group Identifier) if it is assigned to an ACD/BRCS serving team. For more information on ACD/BRCS secured feature, see Division 2, Section 4A121. For 5E11 and later, this field was moved to the CQPARM form, Division 4, Section 32E.

Software Release: 5E9(1) - 5E10
Valid Entries: 1 - 65535 or blank

Data Rules:

When the TGID on the OSPS Serving Team view 21.2 is changed, then the TGID is changed to the new value for all of the CALL TYPE(s) that are associated with the SERVING TEAM.

Copyright © 2003 Lucent Technologies

Q DIALING

For 5E9(1) - 5E10, the following field identifies the ACD and DAA TNs if Q DIALING TN field is set to "Y" on the ACD and DAA assignment form, ACDTN, view 4.15. For 5E11 and later, the ACD/BRCS data in this form has been moved to CQPARM form, Division 4, Section 32E.

2.31 ACD OR DAA TN

Description: This field is a Recent Change/Verify only field. It displays the Q DIALING TN, if assigned, for this call type. For 5E11 and later, this field was moved to the CQPARM form, Division 4, Section 32E.

Software Release: 5E9(1) - 5E10.
Valid Entries: 7-digit telephone number

Data Rules:

When "Y" is entered in the Q DIALING TN field on the ACDTN form, view 4.15, the ACD or DAA telephone number value is displayed in this field.

SUPPORT TEAM LIST

This list (fields Section 2.32 - Section 2.33) details the associated supporting Serving Team for INTRAFLOW and its corresponding delay threshold.

2.32 SUP TEAM

Description: Enter the supporting Serving Team for Intraflow.

Software Release: 5E5 and later
Valid Entries: 1 - 128

Data Rules:

This team cannot be the same as the entry in the SERV TEAM field. Support serving team numbers must be unique.

Any team entered here must be entered as the key value SERV TEAM on a STINFO form (5402 Record). In addition, the OPER TYPE on this form must match the OPER TYPE on the STINFO form and the AUTO CALL DIST fields on both forms must the same.

To enable Intraflow, the corresponding STINFO form must have a "Y" in the INTRAFLOW ALW field and the INTRAFLOW ALW field on the OSPSOPT form (5424 Record) must also be set to "Y". In addition, the OPER TYPE on the STINFO form (5402 Record) must be the same as the OPER TYPE on the OSPSCT form.

For 5E9(1) and later, if the entry on this form matches a SERVING TEAM entry on the STINFO form, then the PCT INTRAFLOW on the STINFO form must be entered and INTRAFLOW ALW on that form must be "Y".

2.33 DELAY THRSH

Description: This field indicates the Intraflow delay threshold in seconds for the associated supporting Serving Team. In this list of 1 to 8 thresholds, any value entered here must be equal to or greater than the preceding DELAY THRSH entered.

Software Release: 5E5 and later
Default: 0

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 1800 (seconds)

Data Rules:

If this value is greater than 0, then an entry is required in the corresponding SUP TEAM field.

SEC. 4F: 5405 RECORD
OSPS RATE AND ROUTE FORM - ORAR

1. GENERAL

The 5405 Record is available with 5E3 and later Software Releases. This record is used to define the routing and charging for each OSPS (Operator Services Position System) screening index/code index combination in a 5ESS Switch office.

A screening index is associated with an originating class of service (trunk group). A code index is associated with the interpretation of dialed digits. The two indexes form a matrix that is used to access routing and charging information for an OSPS call.

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control number and office name on each record.

2.2 * SCR

Description: Enter the screening index number.

Required Field.
Valid Entries: 1 - 4095

2.3 * CDI

Description: Enter the code index number.

Required Field.
Valid Entries: 3 - 4095

2.4 PFX

Description: Enter the applicable prefix.

Valid PFX Entries

Entry	Definition
NONE	No prefixed digits.
0	Dial 0+.
1	Dial 1+.

Data Rules:

Duplicate CDI/PFX combinations may not be entered. The "NONE" (no prefix) entry is always required.

2.5 NOC

Description: Enter the OSPS NOC (Normalized Office Code).
Valid Entries: 1 - 511

Data Rules:

Copyright © 2003 Lucent Technologies

If an entry is made in the OSPS CALL ID field, leave this field blank. Any entry in this field must be designated in the OPER NOC field of the OCTA form (5406 Record).

2.6 OSPS CALL ID

Description: Enter the OSPS pre-call identification number.
Valid Entries: 1 - 511

Data Rules:

If an entry is made in the NOC field, leave this field blank. Any entry in this field must be designated in the OSPS CALL ID field of the OPCTO form (5407 Record).

SEC. 4G: 5406 RECORD
OSPS CALL TYPE ASSIGNMENT FORM - OCTA

1. GENERAL

The 5406 record is available with 5E3 and later Software Releases.

This form is used to assign OSPS (Operator Services Position System) Call Type identifications from OSPS NOCs (Normalized Office Codes) and local digits-dialed combinations. The OSPS NOC is assigned on the ORAR form (5405 Record).

1.1 Recent Change View

The corresponding Recent Change View for OCTA is 21.25. For more information on Recent Change Views that correspond to ODA forms, please see Division 0, Section 2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * OPER NOC

Description: Enter the OPER NOC.

Required Field.
Valid Entries: 1 - 511

Data Rules:

An OPER NOC entered on this form must be defined on an ORAR form.

2.3 * LOCDN

Description: Enter the local directory number (without the office code). The LOCDN is the final four digits dialed (to obtain OSPS).

Required Field.
Valid Entries: 0000 - 9999

2.4 OSPS CALL ID

Description: Enter the operator pre-call identification number to be assigned to an OPER NOC/LOCDN combination.

Required Field.
Valid Entries: 1 - 127

Data Rules:

An OSPS CALL ID entered on this form must exist on an OPCTO form (5407 Record). In addition, for 5E6 and later Software Releases, the corresponding OPCTO form must have an entry in the TGN field of 9999.

Copyright © 2003 Lucent Technologies

SEC. 4H: 5407 RECORD
OSPS CALL TYPE FOR TRUNK ORIGINATIONS FORM - OPCTO

1. GENERAL

The 5407 Record is available with 5E3 and later Software Releases.

This form assigns an OSPS (Operator Services Position System) Call Type and a BST (Basic Services Terminal) Display Index to an OSPS call identification value/trunk group combination.

1.1 Recent Change View

The corresponding Recent Change View for OPCTO is 21.23. For more information on Recent Change Views that correspond to ODA forms, please see Division 0, Section 2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OSPS CALL ID

Description: Enter the OSPS pre-call identification value.

Required Field.
Valid Entries: 1 - 511

Data Rules:

OSPS CALL ID entries on this form must exist on an ORAR form (5405 Record) or an OCTA form (5406 Record).

2.3 * TGN

Description: Enter the trunk group number. An entry of 9999 designates all trunk groups.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000 or 9999
- For 5E11 and later: 1 - 4000 or 9999

Data Rules:

Entries in the TGN field of this form (except for 9999) must exist on a TKGRP form (5202 Record).

If 9999 is entered in this field, another OPCTO form cannot exist with the same value for OSPS CALL ID, OSPS CALL TYPE and DISPLAY INDEX.

2.4 # OSPS CALL TYPE

Description: Assign an OSPS call type for this OSPS CALL ID/TGN combination.

Required Field.
Valid Entries: 1 - 128

Data Rules:

Copyright © 2003 Lucent Technologies

Entries in this field must exist on an OSPSCT form (5404 Record).

2.5 # DISPLAY INDEX

Description: Assign a BST display index for this CALL ID/TGN combination.

Required Field.
Valid Entries: 1 - 276

Data Rules:

Entries in this field must exist on an OBSTS form (5408 Record).

2.6 VECTOR ID

Description: Enter the VECTOR ID number to be assigned to the OSPS CALL ID on this form. This field assigns the call vector ID that provides call handling while waiting for a CACD agent. See Division 2, Section 4D for translation information on the Call Vectoring Feature.

Software Release: 5E6 and later
Valid Entries: 1 - 256

Data Rules:

An entry in this field must equal an entry in the VECTOR ID on a CVECT form. In addition, when VECTOR ID is entered on this form, the SVC ID field on the corresponding OSPSCT form (OSPS CALL TYPE on the OSPSCT form is equal to the OSPS CALL TYPE on this form) must be blank, "Y" must be entered in the AUTO CALL DIST field and "DA" must be entered for OPER TYPE.

CALLING PARTY NUMBER DELIVERY (CPND)

For 5E6 and later, the following fields (Section 2.7 - Section 2.9) should be entered for the Calling Party Number Delivery feature.

2.7 CPND ASSIGNED

Description: Has the CPND (Calling Party Number Delivery) feature been assigned to the trunk group or the dialed digits combination associated with this OPCTO form?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rule:
If "N" is entered, CPND TO MIS and CPND TO AGENT must also be "N".

If "Y" is entered, a corresponding OSPSCT form must be entered with the OPER TYPE of "DA" and AUTO CALL DIST must be "Y". To find the corresponding OSPSCT form, match OSPS CALL TYPE on this form to the OSPS CALL TYPE on the OSPSCT form.

2.8 CPND TO MIS

Description: Should the calling party number be sent to the MIS for CACD call?

Software Release: 5E6 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rule:
This field can only be "Y" if the CPND ASSIGNED field is "Y".

2.9 CPND TO AGENT

Description: Should the calling party number be sent to the PTP for CACD call, for possible display on the agent's terminal? The DISPLAY INDEX field on this form determines the display for the agent's terminal.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rule:
This field can only be "Y" if the CPND ASSIGNED field is "Y".

2.10 DAA

Description: Is direct agent access assigned to this CACD call type? Enter "N" if it is not allowed.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 4I: 5408 RECORD
OSPS BASIC SERVICES TERMINAL SEIZURE FORM - OBSTS

1. GENERAL

The 5408 Record is available with 5E3 and later Software Releases.

This record provides information for OSPS (Operator Services Position System) BST (Basic Services Terminal) displays. Display contents, starting positions and lengths are defined per a BST DISPLAY INDEX.

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.26

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control number and office number on each record.

2.2 * DISPLAY INDEX

Description: Enter the BST display index. When the DISPLAY INDEX is 1 - 256, the calling number (if presentation is allowed) is displayed or merged with the text display entered in DISPLAY, if DN START and DN LENGTH are specified. The CPND ASSIGNED and CPND TO AGENT fields on the OPCTO form (5407 record) must also be set to "Y", to present the calling party number to the agent via the seizure display.

When the DISPLAY INDEX is 257 - 276 the called number is displayed.

Required Field.
Valid Entries: 1 - 276

TEXT DISPLAY

The following field defines the text display for the BST.

2.3 DISPLAY

Description: Enter the text display for this BST display index.
Valid Entries: 10 alphanumeric characters, "-" and "/"

Data Rules:

DISPLAY should be blank when BST DISPLAY INDEX is greater than 256.

CALLING/CALLED NUMBER DISPLAY

The following fields (Section 2.4 - Section 2.5) define the calling/called number display.

2.4 DN START

Description: Enter the starting position for the BST display.
Valid Entries:
- 5E3 only: 1 - 15
- 5E4(2) and later: 1 - 10

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E5 and earlier, this field must be left blank if the BST DISPLAY INDEX is less than 257. If the BST DISPLAY INDEX is greater than 256, then the sum of the DN START and DN LENGTH fields must be 16 or less for 5E3 only and 11 or less for 5E4(2) and later.

For 5E5 and later, DN START must be entered when DISPLAY INDEX is between 257 and 276.

2.5 DN LENGTH

Description: Enter the Length of the BST display.
Valid Entries:
- 5E3 only: 1 - 15
- 5E4(2) and later: 1 - 10

Data Rules:

For 5E5 and earlier, this field must be left blank if the BST DISPLAY INDEX is less than 257. If the BST DISPLAY INDEX is greater than 256, then the sum of the DN START and DN LENGTH fields must be 16 or less for 5E3 only and 11 or less for 5E4(2) and later.

For 5E5 and later, DN LENGTH must be entered when DISPLAY INDEX is between 257 and 276.

For 5E6 and later, when DISPLAY INDEX is less than 257 and DN START is not entered, DN LENGTH must not be entered. When DISPLAY INDEX is less than 257 and DN START is entered, then DN LENGTH must be entered.

SEC. 4J: 5409 RECORD
OSPS RESTRICTED EXTERNAL DIALING FORM - RESXDL

1. GENERAL

The 5409 Record is available with 5E4(1) and later Software Releases.

This record defines restricted dialing sequences for an external dialing index. The external dialing index is assigned to an OSPS (Operator Services Position System) serving team in the DIALING PERM INDEX field on an STINFO form (5402 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control number and office name on each record.

2.2 * DIALING PERM INDEX

Description: Enter the restricted external dialing index.

Required Field.
Valid Entries: 1 - 64

2.3 DIALED DIGITS

Description: Enter up to 20 restricted dialing sequences for this DIALING PERM INDEX. The "*" or "#" character may not appear by itself; it must be accompanied by at least one other character or a space.
Valid Entries: 1 - 32 characters (0 - 9, "#" or "*")

Data Rules:

At least one DIALED DIGITS string must be entered.

---

SEC. 4K: 5410 RECORD
OSPS OPERATOR TROUBLE REPORT FORM - OTRVLD

1. GENERAL

The 5410 Record is available with 5E3 and later Software Releases. This record defines OSPS (Operator Services Position System) OTRs (Operator Trouble Reports) and the OTR's destination.

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * OTR ID

Description: Enter the Operator Trouble Report Identification Number. For transmission to an external OTR analysis system, a 3-digit number (001 through 999) is the only valid entry. If "N" is entered in the OSPS TA field on the OSPSOPT form (5424 Record), then this field must be a 3-digit number.

WARNING: The trouble codes "998" and "999" should only be used as described below. The incorrect usage of these trouble codes could cause incorrect billing, asserts, etc.

Trouble code "998" is used when the Back Party on the call is TALKING to the operator but the operator's display shows that the Back Party is on-hook. When entered at the operator position, this trouble code updates the operator's display to show the Back Party as off-hook.

Trouble code "999" is used when the Forward Party on the call is talking to the operator but the operator's display shows that the Forward Party is on-hook. When entered at the operator position, this trouble code updates the operator's display to show the Forward Party as off-hook.
Valid Entries:
- For DA (Directory Assistance): 01 - 999
- For TA (Toll and Assistance): 2 - 3 characters

2.3 # ID IN USE

Description: Is the OTR ID currently in use?

Required Field.
Default: N
Valid Entries: Y, N

2.4 # OTR TO MCC

Description: Is the OTR information to be printed at the MCC (Master Control Center) ROP (Read-Only Printer)?

Required Field.
Default: N
Valid Entries: Y, N

2.5 # OFFICE TYPE

Copyright © 2003 Lucent Technologies

Description: Enter the OSPS Office Type. Enter "F" for a FMC (Force Management Center), or "O" for an OSC (Operator Services Center).

Required Field.
Default: F
Valid Entries:

Valid OFFICE TYPE Entries

Entry	Definition
F	FMC (Force Management Center)
O	OSC (Operator Services Center)

2.6 # OFFICE NUMBER

Description: Enter the OSPS Office Number.

Required Field.
Default: 1
Valid Entries: 1 - 32

Data Rules:

Enter 1 - 8 if "F" is entered in the OFFICE TYPE field, or 1 - 32 if "O" is entered in the OFFICE TYPE field.

Each OFFICE TYPE/OFFICE NUMBER combination entered on the OTRVLD form (5410 Record) must exist on an OPARM form (5400-1/2 Record).

2.7 # OTR TO OKTR

Description: Is this OTR number to be printed at the OKTR (Operator-Keyed Trouble Report) printer?

Required Field.

Software Release: 5E4(2) and later.
Default: Y
Valid Entries: Y, N

Data Rules:

The entry in the OTR to OKTR field must be "Y" unless the entry in the OTR ID field is between 10 and 99, inclusive.

SEC. 4L: 5411 RECORD
OSPS DIGITAL SUBSCRIBER LINE FORM - OSPSDSL

1. GENERAL

The 5411 Record is available with 5E3 and later Software Releases.

1.1 Digital Subscriber Lines External Names

DSLs (Digital Subscriber Lines) are assigned external names instead of directory numbers. The external name consists of an identifier (DATA LINK GRP) and a relative link number (DATA LINK NBR). The identifier for a DSL with an entry in the SERVICE CLASS field of "DASC" (Directory Assistance System/Computer) is its DAS/C number. The identifier for a DSL with a service class of "RAS" (Remote Alarm Section) is its RISLU site number. For an RAS DSL, the entry in the DSL NAME ID field (OSPS DSL Form) must equal the entry in the RISLU SITE field of an EQRISLU form (5732 Record).

1.2 External Information Systems

The DSLs for an EIS (External Information System) require an entry in the DATA LINK GRP field on this form, which must equal the EIS NBR entry on the corresponding EISDATA form (5462-1 Record). An EISDATA form corresponds to this form if EIS NBR on the EISDATA form matches the DATA LINK GRP on this form. A corresponding EISSM form (5462-3 Record) must exist for each OSPSDSL form with the entry "EIS" in the SERVICE CLASS field. The corresponding SM number on the EISSM form must equal the SM portion of the LCEN on this form.

1.3 5E4(2) Toll and Assistance Features

With 5E4(2) and later, six new fields have been added: D RELPIDB, TIMESLOT, QTR TS, MATE LCEN, SCRN IDX and DAS. These changes are necessary for three OSPS Toll and Assistance features: ACQS (Automatic Charge Quotation Service), RTRS (Real Time Rating System) and AMLB (Automated Multi-Leaf Bulletin). The D RELPIDB, TIMESLOT and QTR TS fields were added for the utilization of ISLUs (Integrated Service Line Units). The MATE LCEN, SCRN IDX and DAS fields are germane to a SERVICE CLASS of "AQDSL" only.

1.4 Time and Charge Quotes For Autoquote

In order to send out a time and charge quote to an autoquote establishment, there must be links that connect the switch to these locations. In the process of sending quotes out over links, the 5411 Record is checked to obtain information about the links and ports, such as the digital to analog port relationship.

1.5 Autoquote Hardware

For 5E4(2) and later Software Releases, the 5ESS Switch that services ACQS establishments, to which the information is sent electronically and directly (as indicated by selecting "Y" in the AUTO QUOTE field of the ACQS form), must provide the necessary hardware.

The required hardware, which is used in a unidirectional manner to send time and charge information from the 5ESS Switch to the ACQS establishment, consists of the following:

- A DSL port on an ISLU or a RISLU. The DSL will be defined on this form, with a SERVICE CLASS of "AQDSL".
- A modem connected to the DSL.
- A terminal adaptor, adjoined to the aforementioned modem, which converts the digital data from the DSL to analog data before it is sent to the analog mate port.

Copyright © 2003 Lucent Technologies

- An analog mate port residing on a Z-card on an ISLU or RISLU. The card is an SM105 circuit pack, with four circuits. The analog mate port will be defined on the MATE LCEN field on this form. A telephone number is not associated with this port. A DAS (Digit Analysis Selector) is associated with this port, since this port will "call" to a port on an analog trunk unit. The number it will "call" is defined in the QUOTE TN field of the ACQS form. The DAS will be entered in the DAS field of this form. A Screen Index is also associated with this port.

- An analog trunk port, which is connected via customer premise modem to a printer/computer at the ACQS establishment. This port is defined in the AQEST TEN field on the ACQS form. The associated telephone number is defined in the QUOTE TN field of the ACQS form.

1.6 DSL Ports

The 5ESS Switch has a system maximum of sixteen sets of DSL ports and analog mate ports, joined by a modem and terminal adaptor. ODA will not permit more than sixteen OSPSDSL forms with a value in the MATE LCEN field. Please refer to Division 2, Section 3H of this document for (R)ISLU port assignment recommendations.

1.7 Maximum Number of ACQS Subscribers

The 5ESS Switch has a system maximum of 1,000 ACQS establishments that have direct transmittal of time and charge information; ODA will not permit more than 1,000 ACQS forms with a value in the AQEST TEN field.

1.8 Immediate Charge Information

To handle any calls requiring immediate calculations and charges, an RTRS database is needed which receives queries sent from the switch regarding a specific call and sends back a reply containing the chargeable time and the charges for the call. The 5411 Record contains information about RTRS links and ports so that a direct message can be sent from the switch over the correct links.

If no entry is made in the TIMESLOT field, ODA will make the assignments based on the following conditions: LCENs (Line Card Equipment Numbers) assigned to LGCs (Line Group Controllers) 0 through 7 must be defined as odd-numbered PIDB NO. entries on the EQISLU form (5731 Record) and with a PIDB TYPE of "PSU" (also on the EQISLU form). LCENs assigned to LGCs 8 through 15 must be defined as even-numbered PIDB NOs. on the EQISLU form with a PIDB type of "PSU".

ISCN entries on this form require a PIDB with a PIDB TYPE of "PSU" assigned on the same PSU (Packet Switching Unit) shelf on the EQISLU form as the SHELF specified by the first number in the ISCN field.

All OSPSDSLs assigned to the same SHELF and CHL GRP (ISCN fields) must have the same data rate of 16KB, 56KB, or 64KB.

1.9 Recent Change View

The corresponding Recent Change View for OSPSDSL is 21.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and office name on each record.

2.2 * LCEN

Description: Enter a valid 8-digit (R)ISLU LCEN (Line Card Equipment Number). The LCEN must not be

Copyright © 2003 Lucent Technologies

duplicated on any DSL, DSMLHLN, DSLAP or other OSPSDSL forms.

Refer to Division 2, Section 3H for recommendations for maximizing the efficiency of assigning DSLs on RISLUs and ISLUs.

It is recommended that no more than 16 ISCNs, defined in the ISCN field of an OSPSDSL form or the B1 ISCN field of an AMLBDSL form, be assigned to the same PROTOCOL HANDLER TYPE of "PH128" defined on an EQPSU form (5741 Record) keyed by the first three digits of the LCEN. Duplicate LCENs on OSPSDSL and AMLBDSL forms are counted as only one of the maximum of sixteen.

Those LCENs on OSPSDSL forms, which are assigned to a PROTOCOL HANDLER TYPE of "PH128" defined on the EQPSU form, and equipped in a given SLG, must belong to the same SHELF and CHL GRP (first three digits of ISCN). The SLCs are defined as LCs (0,2,4,6) or (8,10,12,14) or (16,18,20,22) or (24,26,28,30) in any specific LGC on the RISLU.

For LCENs on the OSPSDSL form which are assigned a Protocol Handler on the EQPSU form, it is recommended that those equipped in a given SLG (Sub Line Group), belong to the same DSL group (first three digits of ISCN). An SLG is a set of 4 (R)ISLU LCs (line cards) assigned to the same LGC (Line Group Controller). The LCs are (0,2,4,6) or (8,10,12,14) or (16,18,20,22) or (24,26,28,30).

A SLG (Sub Line Group) is a group of no more than 4 LC (Line Cards)

Growth Order Of SLGs

SLG	LGC 5th And 6th Digit Of LCEN	Line Cards Last 2 Digits Of LCEN
0-15	0-15	16, 18, 10, 22
16-31	0-15	08, 10, 12, 14
32-47	0-15	24, 26, 28, 30
48-63	0-15	00, 02, 04, 06

Valid Entries: 8-digit LCEN in the following format.

LINE CARD EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
(Remote) Integrated Services Line Unit	(R)ISLU		0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	5E4(2) and later 00 - 30 even only

Data Rules:

Duplicate LCENs may not be assigned; the entries in the LCEN and MATE LCEN fields cannot be the same.

An EQPSU form must exist for SMs assigned in the LCEN field. This assignment equips the switching module with packet switch interface units.

The LCEN must be defined as an equipped and operational U or T card on the ISLULC form (5942 Record) with an EQST (Equipment Status) of "O" (Operational) and a LINE CARD TYPE of "TLC", "PULC" or "ULC".

If LCENs are entered on this form that match LCEN entries on an OSPSOP form (5401 Record) then the SERVICE CLASS on the OSPSDSL form must be "DAOPER" or "TAOPER".

For 5E9(2) and earlier, the value assigned in TERMLIM defines the maximum number of ISDN Terminals that are allowed to be simultaneously active per SM. TERMLIM is a no display field on the EQIM form with a default of 2047. In most cases TERMLIM should be set to this value. The ISDN Terminals are defined as follows:

ISDN Terminal Assignments

Form	SM	Number of Assignments

Copyright © 2003 Lucent Technologies

DSL	OE[1,3]	MTERM defines the quantity of ISDN Terminals per DSL form.
DSLAP	LCEN[1,3]	by 1 for each LCEN list element defined.
MISLINK	OE[1,3]	by 1
OSPSDSL	LCEN[1,3]	by 1 where SERVICE CLASS is not "XDB"

The following conditions apply to Switching Modules where the PROTOCOL HANDLER TYPE field on an EQPSU form (5741 Record) is set to "PH16"

- Within any given DSL group, DSLs of any LGC must be assigned members from one and only one of the member number groupings 0-3, 6-9 or 12-15.
- DASCs must be assigned to different LGCs on the same SM. No more than two OSPSDSL forms with a SERVICE CLASS of "DASC" may have the same first three digits in the LCEN field.
- No more than two OSPSDSL forms with a SERVICE CLASS of "RTRS" may have the same first three digits in the LCEN field.

All of the DSLs -
- IDCU DSLs defined on
- DSL
- MISLINK
- and ISLU/ISLU2 DSLs defined on
- DSL
- DSLAP
- MISLINK
- OSPSDSL

on an SM which have identical entries for the first five digits of the OE for ISLU2 or IDCU or first four digits for ISLU; and which also have the same D REL PIDB and D TIMESLOT entries; must, additionally, have the same
- RT for IDCU
- OE[5,6] for ISLU
- LGC for ISLU2

and SHELF/CHL GRP (also defined as the first through third digits of the [D] ISDN) entries.

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks). The following applications define the possible LLCB assignments:

		LLCB	
Form	**SM**	**SHELF CHL GRP**	**Increment**
AMLBDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	OE[1,3]	PPB1 ISCN[1,3]	by 1 for each PPB1 ISCN defined.
		PPB2 ISCN[1,3]	by 1 for each PPB2 ISCN defined.
		D ISCN[1,3]	by 1 if a matching DSLUSR form is not found
DSLUSR	OE[1,3]	D ISCN[1,3] on the correspond- ing DSL form	by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered.
			by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
		ODB ISCN1[1,3] ODB ISCN2	by 1 if only ODB ISCN1 is entered.
			by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
DSLAP	LCEN[1,3]	ISCN[1,3]	by 1 for each unique LCEN/ISCN combination.
MISLINK	OE[1,3]	SHELF and CHL GRP	by 1 for each MISLINK form.
OSPSDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined.

Copyright © 2003 Lucent Technologies

			by 1 for each unique OSPSDSL form.
RTERM RT INTERFACE is "TR30311" SM	ISCN[1,3]	ISCN[1,3]	by 3 for each EOC PRI ISCN and each EOC NPRI ISCN entry.
TRUNK Where TRKCLS is "IFOPER", "IFTERM" or "EDSL"	DEN[1,3]		1 for each unique TRUNK form.
XAT	DEN[1,3]	ISCN[1,3]	by 1 for each unique XAT form.

2.3 # SERVICE CLASS

Description: Enter the OSPS Service Class of the equipment assigned to this LCEN.

Required Field.

Valid SERVICE CLASS Entries

Entry	Definition
AQDSL	Software Release: 5E4(2) and later. Auto-Quote Data Link - D-channel.
DAOPER	Directory Assistance Operator - BST (Basic Services Terminal) position, and ACT (Agent Communication Terminals) for CACD.
DASC	OSPS DASC (Directory Assistance Service Computer).
EIS	Software Release: 5E6 and later. External Information System.
HOBICR	Software Release: 5E4(2) and later. Hotel Billing Information Center record TTY (Teletypewriter) Data Link - D-channel.
HOBICV	Software Release: 5E4(2) and later. Hotel Billing Information Center Voice Quote TTY Data Link - D-channel.
HOBIS	Software Release: 5E4(2) and later. Hotel Billing Information System Data Link - D-channel.
MISLINK	Commercial ACD Data Link is no longer valid on the OSPSDSL and AMLBDSL forms. DSLs with a SERVICE CLASS of "MISLNK" must be provisioned on the MISLINK form.
OAP	OSPS Administrative Processor.
RAS	Software Release: 5E4(2) and later. Remote Alarm Section.
RTRS	Software Release: 5E4(2) and later. Real Time Rating System Data Link - D-channel.
TAOPER	Automated Position.
XDB	Software Release: 5E4(2) and later. External Data Base.

Data Rules:

Duplicate combinations of SERVICE CLASS, DATA LINK GRP and DATA LINK NBR are not allowed.

If the SERVICE CLASS is not "AQDSL," then the SCRN IDX, MATE LCEN and DAS fields must be entered.

For 5E7 and later, if the LCEN on this form matches an LCEN on the OPARM form (except when the LCEN is 19200000), then the SERVICE CLASS fields on these corresponding forms must be the same.

The SERVICE CLASS on AMLBDSL form must match SERVICE CLASS on corresponding OSPSDSL form. Forms correspond if the LCENs match.

AQDSL - If "AQDSL" is entered, then
- LVL2 PROF must be "ATA", and
- DATA LINK GRP must be 1.

DAOPER - For 5E6 and later, if "DAOPER" is entered, then

Copyright © 2003 Lucent Technologies

- EXTERNAL DATA LINK fields LINK GRP and LINK NBR must not be entered.
- AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS may not be entered.
- OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on this form.

DASC - If "DASC" is entered, then LVL2 PROF must be "DASC", and the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

When LCENs have a SERVICE CLASS of "DASC" and they are assigned to the same SM (first three digits of LCEN), then the DATA LINK GRPs must be the same.

Also see **"RTRS"** data rules below.

For 5E6 and later, if "DASC" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on this form..

If "DASC" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on the OSPSDSL form.

EIS - For 5E6 and later , no more than 16 LCENs with a Service Class of "EIS" can be assigned to an SM. If the SERVICE CLASS entry is "EIS" then a corresponding EISDATA form (5462-1 Record) must be submitted where the EIS NBR on the EISDATA form matches the DATA LINK GRP on the OSPSDSL form. Also, a corresponding EISSM form, (5462-3 Record) must exist for each OSPSDSL form, where SERVICE CLASS is "EIS". The SM and NAME on the EISSM form must match the SM portion of the LCEN on the OSPSDSL form and EIS NAME on the EISDATA form respectively.

If "EIS" or "RAS" is entered, then CONFIGURATION must be "LOADED" on the corresponding EQIM form, where the SM on the EQIM form matches the first 3 digits of the LCEN on this form. For 5E9(2) and later, for the CONFIGURATION that supports this value, see the Configurations for Facilities and Applications table for the EQIM form in Division 8, Section 2.

If "EIS" is entered, then the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

For 5E11 and later, if "EIS" is entered and the switching module (first 3 digits of the LCEN) matches an SM on the EISSM form, then the NAME field on the EISSM EIS DATA list must match to EIS NAME on the EISDATA form.

HOBIS - If the SERVICE CLASS class is "HOBIS", then "HOBIS" must be entered in the HOBIS/C field of the OSPSOPT form (5424 Record).

A maximum of eight data links with a SERVICE CLASS of "HOBIS" can be assigned to the same SM (first three digits of LCEN).

HOBICR or **HOBICV** - If the SERVICE CLASS IS "HOBICR" or "HOBICV", then "HOBIC" must be entered in the HOBIS/C field of the OSPSOPT form.

A maximum of eight data links with a SERVICE CLASS of "HOBICR" can be assigned to the same SM (first three digits of LCEN).

A maximum of eight data links with a SERVICE CLASS of "HOBICV" can be assigned to the same SM (first three digits of LCEN).

If "HOBICR" is entered, then LVL2 PROF must be "HOBICR", and the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

Copyright © 2003 Lucent Technologies

HOBICV - If "HOBICV" is entered, then LVL2 PROF must be "HOBICV", and the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

HOBIS - If "HOBIS" is entered, then LVL2 PROF must be "HOBIS", and the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

OAP - The SERVICE CLASS field must be defined as "OAP" for equipment requesting displays defined on the OPARM form (CALL QUEUE DISPLAY, SERVING TEAM DISPLAY, POSITION STATUS DISPLAY and OPERATOR PERFORMANCE DISPLAY fields).

An OSPSDSL form with a SERVICE CLASS of "OAP" must have an associated OPARM form (5400 Record) such that the LCENs on the respective forms are equal.

For 5E6 and later, if "OAP" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on this form.

If "OAP" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on the OSPSDSL form.

For 5E7 and later, if SERVICE CLASS is "OAP":

- then DATA LINK GRP must be entered and DATA LINK NBR must be 0 or 1. If DATA LINK NBR is 1, then DATA LINK GRP must be 1 - 8. If DATA LINK NBR is 0, then DATA LINK GRP must be 1 - 32,
- a corresponding OPARM form must be found by matching LCEN and OFFICE NUMBER on the OPARM form with LCEN and DATA LINK GRP on the OSPSDSL form. If the OFFICE TYPE is "O" or "F" on the OPARM form, the DATA LINK NBR must be 0 or 1 respectively on the OSPSDSL form.
- no more than 4 LCENs with a SERVICE CLASS of "OAP" can be assigned to a single SM. In addition, the LCEN must not be 19200000, and
- LVL2 PROF must be "ATA" and the AUTOQUOTE ANALOG MAT LINE fields, MATE LCEN, SCRN IDX, and DAS, must be not be entered.

RAS - If the SERVICE CLASS is "RAS" and only one RAS for a particular DSL NAME ID is assigned to an SM, an RISITE form (5940 Record) must exist that meets the following conditions:

- SITE ID must match the DSL NAME ID on the OSPSDSL form.
- SM must match the first three digits of the LCEN field on the OSPSDSL form.
- RAS EQUIPPED? field must be set to "Y".
- RAS DUPLEX ACC? field must be set to "N".

If the SERVICE CLASS is "RAS" and two RASs for a particular DSL NAME ID are assigned to an SM, an RISITE form must exist that meets the following conditions:

- SITE ID must match the DSL NAME ID on the OSPSDSL form.
- SM must match the first three digits of the LCEN field on the OSPSDSL form.
- RAS EQUIPPED? field must be set to "Y".
- RAS DUPLEX ACC? field must be set to "Y".

For 5E6 and later, if "RAS" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form.

Copyright © 2003 Lucent Technologies

Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on this form.

RTRS - There are two conditions that must be satisfied when there are exactly two OSPSDSL forms with a SERVICE CLASS of "RTRS" or "DASC" and the SM portion of the LCENs match.

If "RAS" is entered, then CONFIGURATION must be "LOADED" on the corresponding EQIM form. For forms to correspond, the SM on the EQIM form matches the first 3 digits of the LCEN on the OSPSDSL form. For 5E9(2) and later, for the CONFIGURATION that supports this value, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

If "RAS" is entered, then LVL2 PROF must be "ATA", and the AUTOQUOTE ANALOG MATE LINE fields, MATE LCEN, SCRN IDX, and DAS must not be entered.

1. DATA LINK GRP entries must be equal.
2. One DATA LINK NBR must be even and the other odd, with

   (the odd entry) - 1 = (the even entry).

If exactly one OSPSDSL form is entered with a SERVICE CLASS of "RTRS" or "DASC", then the DATA LINK NBR must be an even number.

If "RTRS" is entered, then LVL2PR must be "RTRS" and the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

TAOPER - For 5E6 and later, if "TAOPER" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on this form.

If "TAOPER" is entered, then the AUTOQUOTE ANALOG MATE LINE fields: MATE LCEN, SCRN IDX, and DAS must not be entered.

XDB - See also **OAP**. If "XDB" is entered and FIRMWARE CLI is not entered then LVL2 PROF must be "ISDN", and the AUTOQUOTE ANALOG MATE LINE fields (MATE LCEN, SCRN IDX, and DAS) must not be entered. If FIRMWARE CLI is entered, then LVL2 PROF must be "ATA" and the AUTOQUOTE ANALOG MATE LINE fields must not be entered.

OSPSDSL forms with a SERVICE CLASS of "XDB" require corresponding AMLBDSL forms (5447 Records) with matching LCENs.

A maximum of 160 DSLs with a SERVICE CLASS of "XDB" can be assigned to one SM (first three digits of LCEN) on OSPSDSL forms.

DATA LINK NBR must be entered and be in the range of 1-2015.

For 5E14 and earlier, DATA LINK GRP must be entered and in the range of 1 - 2000. For 5E15 and later, DATA LINK GRP must be entered and in the range of 1 - 8191. For each unique DATA LINK GRP where the corresponding SERVICE CLASS is "XDB", the value must also appear in the MLHG field on an MLHG form (5110 Record). Additionally, the MLHG must have an MLHG FEATURE which appears in the FEATURE field on an MLHGFD form (5604 Record) where the HUNT TYPE field is "PSUCD".

For 5E6 and later, if "XDP" is entered, then OSPS PSM must be "Y" on the corresponding EQIM form. Forms correspond if the SM on the EQIM form matches the first 3 digits of the LCEN on this form.

2.4 # ISCN

Description: Enter a valid 6-digit packet ISCN (Integrated Services Channel Number) DSL location. The PSU (Protocol Handler) Shelf number must correspond to a shelf on the EQPSU form which has a SHLF

Copyright © 2003 Lucent Technologies

SIDE 0/1 EQST of "O".

Each CHL GRP (DSL GROUP) corresponds to a PROTOCOL HANDLER assigned to the PSU SHELF on the EQPSUPH form (5742 Record) with the SWITCHING MODULE equal to this SM and the PSU SHELF equal to the PSU Protocol Handler shelf number.

The CHL is the PSU Protocol Handler member number within the Protocol Handler.

Required Field.
Valid Entries: 6-digit packet ISCN with the following format:

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		**Format**	**Valid Entries**
Shelf	SHELF	X	0 - 4
Channel Group	CHL GRP	XX	00 - 15
Channel	CHL	XXX	5E4(2) and later 000 - 127

Data Rules:

Any combination of SHELF and CHL GRP entered on this form must be defined on an EQPSUPH form.

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

Duplicate ISCNs may not be assigned. ISCNs cannot be duplicated on one or more of the following forms:
- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT

If an SM/ISCNs combination has been assigned, then the corresponding combination of SM, PSU, PSU SHELF and GRP must be entered on the PSUGP form.

For 5E4(2) and later, if "PH16" is entered in the PROTOCOL HANDLER TYPE field of the EQPSU form, then the CHL portion of the ISCN entry must be in the following ranges: 000 - 003; 006 - 009; or 012 - 015. If the SHELF (on the SM where digital subscriber lines are assigned) has 16-channel Protocol Handler packs, the CHL sub-field is limited to the range of 000 - 015.

A duplicate combination of the SM entry (first three digits of the LCEN field) and the first three digits of ISCN is not allowed. Note that if the last three digits of the ISCN field are "000", that combination of SM and the first three digits of the ISCN entry (SHELF and CHL GRP) cannot be assigned on any other form.

The combination of the first three digits of the LCEN field and the first three digits of the ISCN field must be unique within the switch.

The first three digits of the LCEN field and the first three digits of the ISCN field may not be duplicated in the first three digits of the DEN field and the first three digits of the ISCN field, respectively, on a TRUNK form (5204 Record).

Copyright © 2003 Lucent Technologies

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- RTERM
- XAT

with all TRUNK forms which have a TRKCLS of:

- "EDSL"
- "IFTERM"
- "IFOPER"

However, they can not have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of

- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form
- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form.
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2,
- MISLINK - where SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form.
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is "TAOPER" or "DAOPER".
- XAT - where SHELF/CHL GRP is the first three digits of ISCN.

Each SM (Switching Module) can have up to 5 PSU SHELFs. On the EQIM form, when UNIT TYPE is not "SM2000" each PSU SHELF can be assigned up to (32 times X) time slots for the following table of applications. (Note: X represents the number of PIDBs, 0 to 4, provisioned per shelf.)

Timeslots Reserved for Applications

Application	Definition
EDSL	TRKCLS set to "EDSL" on the TKGRP form
IFOPER	TRKCLS set to "IFOPER" on the TKGRP form
IFTERM	TRKCLS set to "IFTERM" on the TKGRP form

Copyright © 2003 Lucent Technologies

IP	TRKCLS set to "PACKET" on the TKGRP form
ISM	PSISM
PKTPIPE	TRKCLS set to "PKTPIPE" on TKGRP form
RISLU B Channel	DSL and AMLBDSL
RISLU D Channel	DSL, DSLAP, MISLINK, and OSPSDSL
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value SPCHNDLR
X.25	XAT
X75	TRKCLS set to "X75" on the TKGRP form
X75P	TRKCLS set to "X75P" on the TKGRP form

For 5E10 and later, each DI (Data Interface) in an SM can have a maximum of 256 nailed-up timeslots reserved for the applications listed in the preceding table (except for the RPA application). These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the following applications. Note that a D channel only takes a quarter of a time slot. This data rule is not executed on an SM-2000, because provisioning of nailed-up timeslots is not required on an SM2000.

2.5 FIRMWARE CLI

Description: Enter the firmware CLI (Change Level Indicator) of the equipment assigned to this LCEN. This diagnostic value is transmitted to the switch upon initialization of the BST and VDT (Video Display Terminal) units.
Default: 000000000
Valid Entries: 000000000

Data Rules:

An entry in this field is not allowed if the SERVICE CLASS is "XDB".

2.6 D RELPIDB

Description: Enter the ISLU D-channel packet switching Peripheral Interface Data Bus number.

Software Release: 5E4(2) and later
Valid Entries: 2 - 11

Data Rules:

Do not enter a value if the LCEN is defined on a RISLU; RISLUs do not have D RELPIDB.

If an entry is made in the D RELPIDB field, then entries must also be made in the TIMESLOT and QTR TS fields. Conversely, if one of these fields is left blank, they all must be blank; ODA will assign the appropriate values.

The combination of D RELPIDB, TIMESLOT and QTR TS fields on this form must not be duplicated on any DSL, DSMLHLN, DSLAP or other OSPSDSL forms.

Entries in the D RELPIDB field must be assigned on the EQISLU form with a PIDB TYPE of "PSU" and a SHELF matching the first digit of the ISCN entry on this form.

2.7 TIMESLOT

Description: Enter the D-channel time slot.

Software Release: 5E4(2) and later
Valid Entries: 0 - 31

Data Rules:

Copyright © 2003 Lucent Technologies

If a TIMESLOT value is entered, it must not equal the LGC portion of the LCEN value plus 16. The LGC is the fifth and sixth digits of the LCEN. The control time slot is the LGC. There must be two control time slots per time slot (an LGC and an LGC + 16).

Do not enter a value if the LCEN resides on a RISLU.

If an entry is made in the TIMESLOT field, then entries must also be made in the D RELPIDB and QTR TS fields. Conversely, if any of these three fields are left blank, they all must be blank; ODA will assign the appropriate values. The combination of D RELPIDB, TIMESLOT and QTR TS fields on this form must not be duplicated on any DSL, DSMLHLN, DSLAP or other OSPSDSL forms.

For 5E8 and later, the LCEN's assigned on the AMLBDSL, DSLAP or OSPSDSL forms, or DSL OE's on the DSL form or OE's on the MISLINK form can not have their D and/or BChannels assigned to conflicting DPIDB time slots or quarter time slots due to manual (vs ODA) time slot assignments. Each SM/ISLU or SM/IDCU DPIDB time slot may be assigned only once. (Note, D channels are allocated to quarter time slots; therefore up to four unique assignments can be made before a time slot is considered full.

When making manual assignments, care must be taken to use assignments as shown in Figure 1, TIMESLOT Assignment vs LGC and D RELPIDB. For example, if manual assingments are being made and the D RELPIDB selected is 11 and the LGC from the OE is 0, then the TIMESLOT assignment must be 1, 9, 17, or 25. B and/or D channel assignments made manually cannot conflict with the ODA assignment algorithm. The ODA algorithm is allocated 4 time slots per DPIDB per SM/ISLU/LGC. The LGCs 00 thru 07 are allocated time slots on the odd numbered DPIDBs while LGCs 08 thru 15 are allocated time slots on the even numbered DPIDBs Manual time slot time slot assignments do not have to follow this algorithm. However, if manual assignments are made, they will use one or more time slots. These manual assignments diminish and may conflict with the time slots available for the ODA assignment algorithm. For example, TS 1, 9, 17 and 25 are the 4 time slots that are allocated to ODA for LGC 0 in any ISLU which has a DPIDB 11 assigned. If a manual assignment is made to TS 9 on DPIDB 11 from any LGC in this ISLU there will only be 3 TS left on PIDB 11 for ODA assignments. Of course other odd numbered DPIDBs will have 4 TS for ODA assignments to LGC 0.

2.8 QTR TS

Description: Enter the D-channel quarter time slot.

Do not enter a value if the LCEN resides on a RISLU.

In order to conserve resources, the assignment of QTR TSs must be "packed." That is, all QTR TSs in a TIMESLOT must be assigned (if possible) before another TIMESLOT is used. To pack the TIMESLOTs, all D-channels on an LGC are candidates for assignments to the same TIMESLOT. No D-channels can be assigned to a TIMESLOT to which a D-channel from another LGC has been assigned.

The D-channels which are assigned to a TIMESLOT must all be in the same CHL GRP (the second and third digits of the ISCN). Furthermore, if the PROTOCOL HANDLER TYPE on the EQPSU form is "PH16," the DSL MEMBERs (the last three digits of the ISCN) of this DSL GROUP, when divided by six, must be equal (when dividing, disregard the remainder).

For example, ISCNs 106000 through 106005 could be assigned to two TIMESLOTs in any combination of two and four or three and three. However, ISCN 106006 (the next member of CHL GRP 06 assigned to SHELF 1) could not be assigned to either of these D TIMESLOTs, and neither could any other ISCN be assigned to either of these TIMESLOTs.

If "PH128" is entered in the PROTOCOL HANDLER TYPE field of the EQPSU form, then the only restriction on the ISCN is that all members assigned to a given TIMESLOT must be in the same CHL GRP, and have the same SHELF assignment (the first three digits of the ISCN must be equal).

Software Release: 5E4(2) and later
Valid Entries: 0 - 3

Copyright © 2003 Lucent Technologies

Data Rules:

If an entry is made in the QTR TS field, then entries must also be made in the D RELPIDB and QTR TS fields. Conversely, if one of these three fields are left blank, they all must be blank; ODA will assign the appropriate values. The combination of D RELPIDB, TIMESLOT and QTR TS fields on this form must not be duplicated on any DSL, DSMLHLN, DSLAP or other OSPSDSL forms.

The QTR TS must be assigned to a D RELPIDB that is defined on the EQISLU form.

2.9 LVL2 PROF

Description: Level 2 parameter profile type.

Software Release: 5E6 and later
Required Field.
Valid Entries:

Valid LVL2 PROF Entries

Entry	Definition
ATA	OSPS Administrative Terminals or Alarm circuit
BST	Terminal
BXV	On DSL B-channel: variable LAPB
DASC	OSPS Directory Assistance System/Computer term
DX	X.25 packet switching on D channel; no voice on D channel; no B channels
EIS1	External Information System profile 1
EIS2	External Information System profile 2
HOBICR	OSPS Hotel Billing Information Center Record TTY
HOBICV	OSPS Hotel Billing Information Center Voice Quote TTY
HOBIS	OSPS Hotel Billing Information System
IFPRI	OSPS Interflow Primary Rate Interface
ISDN	Two B channels and one D channel
PKTSW	Software Release: 5E8 and later. OSPS Video Display Terminal
RTRS	OSPS Real-Time Rating System
XISDN	Voice/data on D Channel, no B Channel

Data Rules:

The following table gives the LVL2 PROF choices available with the corresponding SERVICE CLASS.

SERVICE CLASS	LVL2 PROF
DAOPER	BST or PKTSW
EIS	EIS1 for CCI EIS2 for IBM
TAOPER	BST or PKTSW

For 5E7 and later, if "ATA", "BST", "DASC", "EIS1", "EIS2", "HOBICR", "HOBICV", "HOBIS", "RTRS" are entered, then D CHAN SERV must be "SONLY".

For 5E8 and later, an AMLBDSL form must not be submitted unless LVL2 PROF (on the corresponding OSPSDSL form with matching LCENs) is "ISDN" or "PKTSW".

ISDN - For 5E7 and later, if "ISDN" is entered, then D CHAN SERV must be "ADMIN".

A corresponding AMLBDSL form is required if "ISDN" is entered in this field. Forms correspond if the LCEN on this form and the AMLBDSL match.

PKTSW - For 5E8 and later, if "PKTSW" is entered, then D CHAN SERV must be "SX". Also, a corresponding AMLBDSL form is required if "PKTSW" is entered in this field. Forms correspond if the LCENs on this form and the LCEN on the AMLBDSL form match.

VDT - For 5E7 and later, if "VDT" is entered, then D CHAN SERV must be "SX".

Copyright © 2003 Lucent Technologies

2.10 D CHAN SERV

Description: Enter the type of service on a DSL D-channel.

Required Field.

Valid D CHAN SERV Entries

Entry	Definition
ADMIN	Administration only, no Q.931 or X.25 signaling
SONLY	Q.931 signaling only
SX	Q.931 signaling and X.25 packet signaling

Data Rules:

If "ADMIN" or "SX" is entered , then a corresponding AMLBDSL form must be entered where the LCEN on that form matches the LCEN on this form.

EXTERNAL DATA LINK

The following fields (Section 2.11 - Section 2.12) define DSL data links.

The DATA LINK GRP and DATA LINK NBR fields are used to give a user-friendly "name" to groups of DSL data links. The usage is predominantly for maintenance messages. The DATA LINK GRP is used to identify the group to which the DSL data link belongs. A group must be comprised of DSL data links which are all used for the same purpose. The DATA LINK NBR is used to identify the particular member of the group.

As an example, assume that the 5ESS Switch can have, system wide, 3 groups of 20 DSL data links used for Purpose A and 2 groups of 10 DSL data links used for Purpose B. Purpose A could have DATA LINK GRPs (groups) of 1, 2 and 3 with DATA LINK NBRs (members) from 0 to 19 in each DATA LINK GRP. Purpose B could have DATA LINK GRPs (groups) of 1 and 2 with DATA LINK NBRs (members) from 0 to 9 in each DATA LINK GRP. Notice that using the same group number is not an error if the groups are for different purposes.

However, for an EIS (External Information System), the EIS NBR is the same no matter what the SM is. All group numbers are the same but the data link number could be 0 - 3 on one SM or 4 - 7 on another SM.

The following table defines the allowable entries for the DATA LINK GRP and DATA LINK NBR fields based on the SERVICE CLASS.

SERVICE CLASS	DATA LINK GRP	DATA LINK NBR
AQDSL	1	0 - 15
DASC	1 - 999	5E4(2) and later 0 - 4096
EIS	1 - 16	0 - 999
HOBICR	1 - 999	0 - 4096
HOBICV	1 - 999	0 - 4096
HOBIS	1 - 999	0 - 4096
OAP	5E7 and later 1 - 32	0 - 1
RAS	500 - 999	0 - 4096
RTRS	1 - 999	0 - 4096
XDB	5E14 and earlier: 1 - 2000 5E15 and later: 1 - 8191	1 - 2015

2.11 DATA LINK GRP

Description: Enter the data link DSL external name identification. The valid entries are shown in the preceding table under EXTERNAL DATA LINK.

Software Release: 5E3 and later

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 2001

Data Rules:

The following SERVICE CLASSes must not have an entry in this field: "DAOPER" and "TAOPER".

Only two RAS DSLs can be assigned to an SM on an OSPSDSL form.

2.12 DATA LINK NBR

Description: Enter the relative link portion of the data link DSL external name.

The valid entries are shown in the preceding table under EXTERNAL DATA LINK.

Software Release: 5E3 and later
Valid Entries: 0 - 4096

Data Rules:

The following SERVICE CLASSes must not have an entry in this field: "DAOPER", and "TAOPER".

Only 16 RAS DSLs can be assigned to an SM (first three digits of LCEN field) on OSPSDSL forms.

2.13 SM LINK NBR

Description: This is a verify only field which gives the relative link number on this SM for an EIS link.

AUTOQUOTE ANALOG MATE LINE

The following fields (Section 2.14 - Section 2.16) define analog port mate lines for AUTOQUOTE.

2.14 MATE LCEN

Description: Enter a valid LCEN value, exactly as described in the LCEN field. The MATE LCEN must define a port on a Z-card, as indicated by a selection of "ZLC" on the TYPE field of the ISLULC form.

The 5ESS Switch has a system maximum of 16 sets of DSL ports and analog port mates, joined by a modem and a terminal adaptor. ODA will not permit more than 16 OSPSDSL forms with a value entered in the MATE LCEN field.

Software Release: 5E4(2) and later
Valid Entries: See LCEN field entries

Data Rules:

This field must be entered if the SERVICE CLASS is defined as "AQDSL", and must be left blank if the SERVICE CLASS is not "AQDSL".

The MATE LCEN field must have a value that is different than the value entered in the LCEN field on this form.

The MATE LCEN must not be duplicated on any DSL, DSMLHLN, DSLAP or other OSPSDSL forms.

The SM portion of the MATE LCEN field must match the entry in the ACQS SM field of the corresponding OSPSOPT form.

2.15 SCRN IDX

Description: Enter the Screen Index.

Copyright © 2003 Lucent Technologies

Software Release: 5E4(2) and later
Valid Entries: 1 - 4095

Data Rules:

This field must be entered if the SERVICE CLASS is defined as "AQDSL", and must be left blank if the SERVICE CLASS is not "AQDSL".

2.16 DAS

Description: Enter a DAS (Digit Analysis Selector) value.

Software Release: 5E4(2) and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

This field must be entered if the SERVICE CLASS is defined as "AQDSL;" this field must be left blank if the SERVICE CLASS is not "AQDSL."

The value entered in this field must also be entered in the DIGIT ANALYSIS SELECTOR field on a DAS form (5300 Record).

TS	LGC

Copyright © 2003 Lucent Technologies

SEC. 4M: 5412 RECORD
OSPS ACD CALLTYPE FORM - ACDCTP
OSPS ACD CALLTYPE POOL FORM - ACDPOL

1. GENERAL

The 5412(A-F) Records are available for the 5E4(2) Software Release. This record(s) is used to assign call type information for the OSPS ACD (Automated Call Distribution) feature. Figure 1 shows expected values and combinations for various fields. Deviations from the table entries will induce a warning message.

1.1 Automatic Call Distribution

All OSPS calls require that operator/agent assistance use the ACD software. The ACD matches operator requests with operators by maintaining the status of all operator positions on the switch and the status of all calls awaiting operator assistance. ACD allows switch administrators to separate incoming operator assistance traffic into distinct call type queues that can be handled by distinct teams of operators.

1.2 Toll And Assistance

Toll and Assistance calls arrive on ISP (Intermediate Switch Point) and CAMA (Centralized Automatic Message Accounting) trunks. Call type determination is done based upon how the call arrived at the OSPS, the way that the call was dialed, and whether this is an initial call or a recall. The 5412(A-F) Records are used to select a call type queue based on the details of the call arrival. Once the queue has been determined, the serving team and operator are selected in the same manner as for Directory Assistance calls.

1.3 Interflow

For the 5E5 and later Software Releases, Toll and Assistance calls may be interflowed from one OSPS office to another OSPS office. For information on the Interflow feature, refer to the OSPS Toll and Assistance feature section in Division 2, Section 3E. For these incoming interflow calls, the ACD has been expanded to provide more detailed screening of the call characteristics. This additional screening is provided by the ACDPOL form. This additional screening, provided by the ACDPOL form, is used when the incoming TGN or CDI information necessary to determine if the call type resides in some other OSPS switch (i.e., not the OSPS switch which is determining how the call should be handled). For incoming calls that are not interflowed from another OSPS switch the information provided in the ACDCTP form should be sufficient to determine the call type.

Please reference the OSPS Automatic Call Distributor feature section for more detailed information concerning the use of the ACDCTP and ACDPOL forms and their dependencies.

1.4 Listing Services Intercept

These forms are needed for Listing Services Intercept feature, even though an operator is not needed to handle the call.

1.5 Recent Change View

For 5E7 and later, the corresponding Recent Change Views for these forms is 26.9 and 26.10.

2. ACDCTP FORM - 5412-A/D RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * CALL ORIGIN

Description: Enter the originating class of the call (how the call arrived at the switch). A call could come in over an ISP trunk, a system CAMA trunk or a transfer CAMA trunk. An inward call from another operator can arrive over some other type of inward trunk.

For an "AIS" call, if an intercept call arrives and a destination index is not found for the call on the AISCLS form, then the intercept treatment will be based on the call origination data (SECOND LEVEL is "DEST"), or on the call origination data and incoming trunk group (SECOND LEVEL is "TGRP").

Software Release: 5E5 and later
Required Field.
Valid Entries:

Valid CALL ORIGIN Entries

Entry	Definition
AIS	Software Release: 5E6(2) and later. Incoming intercept calls.
AP	Software Release: 5E9(2) and later. Automated Position Call
CDSU	Software Release: 5E11 and later. This value was "ORIG2" for 5E10. AATLSOS - AAP (Alternate Access to Language Specific Operator Services - Automatic Access Prompting) Service. This value supports the AATLSOS AAP Using CPDL (Call Processing Data Link) Interface. For more information on this feature, see Division 2, Section 4A412.
DA2VDT	DA call to a VDT (Video Display Terminal).
ICS	Software Release: 5E11 and later. Inmate Calling Service. This value supports the ICS (Inmate Calling Service) feature. For more information on this feature, see Division 2, Section 4A385.
INW	Inward. An inward call occurs when a local operator routes a call to a distant operator for information concerning the call. The distant operator may then assist the calling party (busy line verification, etc.). The inward operator is the distant operator.
ISP	Intermediate Switching Point (4x Tandem). A trunk class of FIOPR on the TKGRP form (5202 Record) and a CDI entry of 0 (zero) on the DIOPR form (5418 Record) will enter the OSPS ACD as an ISP call. The most common call arrives on an ISP trunk.
LSTA	Software Release: 5E6(2) and later. Listing Services call using a TA (Toll and Assist) OT (Originating Treatment).
NIT	Non-ISP Non-TA call to a VDT (Video Display Terminal).
OPI	OSPS Operator-initiated. This includes delayed calls and conference calls with another operator when no forward/back party is connected (both internal and external operators).
ORIG2	Software Release: 5E10 only See "CDSU".
ORIG3	Software Release: 5E9(2) - 5E10 Inmate Calling Service. This value was changed to ICS for 5E11. See ICS for data rules. See Division 2, Section 4A385 for more information on the Inmate Calling Service feature.
RES	Residual Call. A residual call occurs when an OSPS operator is recalled by a mobile or marine operator to collect money from the calling party.
SPCL700	Software Release: 5E7 and later. A specialized 700 number. This entry supports the Specialized Handling for 700 Services secured features. For more information on these features, see Division 2, Section 4A69 and Section 4A89.
SYS	CAMA System. This occurs when the local office cannot identify the back number.
XFER	Transferred through CAMA (Centralized Automatic Message Accounting).

Data Rules:

Figure 1 gives the entry combination values for CALL ORIGIN values.

General:
For 5E10 and later:
Unless the CALL ORIGIN is
- "CDSU"

Copyright © 2003 Lucent Technologies

- "ICS"
- "ORIG2"
- "ORIG3"
- "SPCL700"

every ACDCTP form must have a corresponding OSPSCT form with OSPS CALL TYPE equal to CALL TYPE.

If CALL ORIGIN is not one of the following
- "CDSU"
- "ICS"
- "ORIG3"
- "SPCL700"

then CALL TYPE must be less than 129.

For 5E11 and later, CALL TYPE in the NEXT CALL TYPE POOL LIST on the ACDPOL form must be less than 129 if CALL ORIGIN is not "CDSU"
- "ICS"
- "ORIG2"
- "ORIG3"
- "SPCL700"

on the ACDCTP form. ACDCTP form is found by matching PRE CALL ID on ACDCTP form with the PRE CALL ID on the ACDPOL form.

For 5E13 and later:

When CALL ORIGIN on the ACDCTP form is not "SPCL700", "CDSU", or "ICS", CALL TYPE must be less than 129.

At least one ACDCTP form must be submitted for each FLEXACD form.

AIS - If "AIS" is entered:

- DISPLAY INDEX must be entered.
- PREFIX must be "NULLP".
- CARRIER must be "UKWN".
- OSPSID must be 0.
- COIN must be "N".
- either SECOND LEVEL must not be "NONE", or ACD EXPRESSION must not be "Q".
- APOS CALL TYPE must not be entered.
- For 5E8 and later, a SERVDATA form must be entered with OSPS SVC CODE of "INCPT" or "IBMINCPT". (SVC ID of SERVDATA form is matched with SVC ID of OSPSCT form to find SERVDATA form. OSPS CALL TYPE of OSPSCT form is matched with CALL TYPE of ACDCTP form to find OSPSCT form) .
- Conversely if CALL ORIGIN is not "AIS", OSPS SVC CODE cannot be

  "IBMINCPT"

Copyright © 2003 Lucent Technologies

"INCPT"

"INMATE"

"SPCL700"

"SRVC7" (5E10 and earlier).

- For 5E13 and later, there must be an OSPSCT form where CALL TYPE on the FLEXACD form matches OSPS CALL TYPE on the OSPSCT form. Then SVC ID on the OSPSCT form must match the SVC ID on a SERVDATA form. Additionally, OSPS SVC CODE on the SERVDATA form must be "INCPT" or "IBMINCPT".

AIS or LSTA:
If "AIS" or "LSTA" is entered in CALL ORIGIN the following data rules apply:

- and PRE CALL ID is entered, CALL ORIGIN must be the same on all ACDCTP forms with the same PRE CALL ID.
- SVC ID must be entered on the OSPSCT form. An OSPSCT form is required for each ACDCTP form where OSPS CALL TYPE on the OSPSCT form matches CALL TYPE on the ACDCTP form. OPER TYPE must be "TA" on that OSPSCT form.
- SVC ID of OSPSCT form must be the same as the SVC ID of SERVDATA form. (OSPS CALL TYPE of OSPSCT form is matched with CALL TYPE of ACDCTP form.) Conversely if "AIS" or "LSTA" is not entered for CALL ORIGIN, SVC ID must not be entered on the OSPSCT form.
- If APOS CALL TYPE is entered on the ACDPOL form, CALL ORIGIN must not be "SPCL700", "LSTA" or "AIS" on the corresponding ACDCTP form. The forms correspond if the PRE CALL ID field of ACDPOL form matches the PRE CALL ID field of ACDCTP form.

AP
For 5E9(1) only if AP is entered:
PREFIX must be "NULLP"
SECOND LEVEL must be "DEST"

CDSU
If "CDSU" is entered,
- APOS CALL TYPE cannot be entered
- DISPLAY INDEX cannot be entered
- OSPS ID must be 0

For 5E10 only, if "ORIG2" is entered, a SERVDATA form must be entered where SVC ID on the SERVDATA form matches CALL TYPE on the ACDCTP form and OSPS SVC CODE on the SERVDATA form is "SRVC8".

For 5E11 and later, if "CDSU" is entered, a SERVDATA form must be entered where SVC ID on the SERVDATA form matches CALL TYPE on the ACDCTP form and OSPS SVC CODE on the SERVDATA form is "AAP" .

DA2VDT
If "DA2VDT" is entered:

Copyright © 2003 Lucent Technologies

- PREFIX must be "NONE".
- CARRIER must not be "UNKWN".
- DISPLAY INDEX must be entered.

ICS (or ORIG3):
If "ICS" is entered, then:

- OSPS ID must be 0
- APOS CALL TYPE must not be entered
- DISPLAY INDEX must not be entered
- a SERVDATA form must be submitted where SVC ID on the SERVDATA form matches CALL TYPE on the ACDCTP form and OSPS SVC CODE on the SERVDATA form must be "INMATE" ("SRVC7" for 5E10 and earlier).

INW - If "INW" is entered:

- PREFIX must be "NULLP".
- COIN must be "N".
- CARRIER must be "DC".
- DISPLAY INDEX must not be entered.

ISP - If "ISP" is entered:

- DISPLAY INDEX must not be entered.

LSTA - If "LSTA" is entered:

- DISPLAY INDEX must be entered.
- OSPSID must be 0.
- APOS CALL TYPE must not be entered.

For 5E13 and later, at least one ACDCTP form must be submitted for each FLEXACD form, where PRE CALL ID on the ACDCTP form matches the PRE CALL ID on the FLEXACD form.

OPI - If "OPI" is entered:

- PREFIX must be "NULLP", 0, or "0M".
- COIN must be "N".
- CARRIER must be "DC".
- DISPLAY INDEX must not be entered.
- SECOND LEVEL must be "NONE".

Copyright © 2003 Lucent Technologies

- For 5E13 and later, ACD EXPRESSION must equal "Q".

RES
If "RES" is entered:

- DISPLAY INDEX must not be entered.
- For 5E13 and later, ACD EXPRESSION must equal "Q".

SPCL700 - If "SPCL700" is entered:

- OSPS ID must be 0.
- APOS CALL TYPE must not be entered.
- DISPLAY INDEX must not be entered.
- For 5E8 and later, a SERVDATA form must be submitted where SVC ID on the SERVDATA form matches CALL TYPE on the ACDCTP form and OSPS SVC CODE on the corresponding SERVDATA form must be "SPCL700" .
- A SERVDATA form must be submitted where SVC ID on the SERVDATA form matches the CALL TYPE field in the NEXT CALL TYPE POOL LIST on the ACDPOL form, and OSPS SVC CODE on the SERVDATA form must be "SPCL700".
- OSPS SVC CODE on the corresponding SERVDATA form must be "SPCL700". SVC ID on the SERVDATA form matches CALL TYPE in the NEXT CALL TYPE POOL LIST on the ACDPOL form. ACDPOL form is found by matching PRE CALL ID on the ACDCTP form with the PRE CALL ID on the ACDPOL form.
- When PRE CALL ID is entered on one ACDCTP form, and the CALL ORIGIN is "SPCL700", CALL ORIGIN must be "SPCL700" on all ACDCTP forms with the same PRE CALL ID entered.
- For 5E13 and later, a SERVDATA form must be found where CALL TYPE on the FLEXACD form matches the SVC ID on the SERVDATA form. The OSPS SVC CODE on this SERVDATA form must be "SPCL700".

SYS - If "SYS" is entered:

- PREFIX must be "NULLP" or 1. If PREFIX is "NULLP",

CARRIER must be "DC". If PREFIX is 1, CARRIER must be "IC", "LEC", or "UNKWN".

- COIN must be "N".
- DISPLAY INDEX must not be entered.

XFER - If "XFER" is entered:

- PREFIX must be "NULLP".
- COIN must be "N".
- CARRIER must be "DC".

Copyright © 2003 Lucent Technologies

- DISPLAY INDEX must not be entered.
- SECOND LEVEL must not be "DEST".
- For 5E13 and later, ACD EXPRESSION cannot contain call property type "D".

2.3 * PREFIX

Description: Enter the prefix that was originally dialed on the call.

Software Release: 5E5 and later
Required Field.
Valid Entries:

Valid PREFIX Entries

Entry	Definition
0	0+ was dialed
1	1+ was dialed
NULLP	Don't care what prefix was dialed
NONE	No prefixed digits are dialed
0M	0- was dialed
01	Dial "01 + international"
011	Dial "011 + international"

Data Rules:

Figure 1 shows valid combinations of CALL ORIGIN, PREFIX, COIN, and CARRIER fields.

If the entry in the CALL ORIGIN field is "DA2VDT" or "NIT", then the entry in the PREFIX field must be "NONE".

If the entry in the CALL ORIGIN field is "INW" or "XFER", then the entry in the PREFIX field must be "NULLP".

If the entry in the CALL ORIGIN field is "OPI", then the entry in the PREFIX field must be "0", "NULLP" or "0M".

If the CALL ORIGIN is "SYS" and the CARRIER is "DC", then the PREFIX must be "NULLP".

If the CALL ORIGIN is "SYS" and the CARRIER is "IC", "LEC" or "UNKWN", then the PREFIX must be 1.

2.4 * COIN

Description: Is the incoming call a coin call?

Software Release: 5E5 and later
Required Field.
Valid Entries: Y, N

Data Rules:

Figure 1 shows valid combinations of CALL ORIGIN, PREFIX, COIN, and CARRIER fields.

If the entry in the CALL ORIGIN field is "INW", "OPI", "SYS", "AIS", or "XFER", then the entry in the COIN field must be "N".

2.5 * CARRIER

Description: Enter the type of carrier associated with the incoming call.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Required Field.
Valid Entries:

Valid CARRIER Entries

Entry	Definition
DC	Don't care about the carrier type
IC	Interexchange Carrier
LEC	Local Exchange Carrier
UNKWN	Unknown Carrier type

Data Rules:

Figure 2 shows valid combinations of CALL ORIGIN, PREFIX, COIN, and CARRIER fields.

If the associated CALL ORIGIN is equal to "NIT" or "DA2VDT", the CARRIER must not be set to "UNKWN". If the entry in the CALL ORIGIN field is "INW", "OPI", "SYS" or "XFER", the entry in the CARRIER field must be "DC".

2.6 * OSPS ID

Description: Enter the OSPS Switch ID from where the call originated. This OSPS Switch ID uniquely identifies the OSPS Switch from which an interflow call originated.

Software Release: 5E5 and later
Required Field.
Default: 0
Valid Entries: 0 - 9999

Data Rules:

If the call in question originates from a non-interflow OSPS Switch, then this field should be set to 0.

If the OSPS ID field is set to any number greater than zero, then an INFLTAP form must exist with an entry in the OSPS LIST field that equals the OSPS ID field. This check ensures that the OSPS office identified here is the one sending information to this OSPS switch.

2.7 # CALL TYPE

Description: Enter the CALL TYPE number that is to be used to route the incoming call to the proper serving team. For 5E8 and later, enter the call type or the Service ID number for Listing Services.

Software Release: 5E5 and later
Required Field.
Valid Entries:

For 5E8 and later: 1 - 1023

Data Rules:

Every CALL TYPE entered on this form must have a corresponding OSPSCT form with a matching OSPS CALL TYPE field. In addition, the OPER TYPE on the corresponding OSPSCT form must be set to "TA".

For 5E8 and later, every Service ID entered on this form must have a corresponding SERVDATA form with a matching SVC ID field.

2.8 PRE CALL ID

Description: Enter the TA (Toll & Assistance) Pre Call ID used to link the call type determination

Copyright © 2003 Lucent Technologies

information contained upon this ACDCTP form to a common pool of expanded call type information defined on the ACDPOL form, based on the trunk group number and/or destination index of the incoming call.

Software Release: 5E5 and later
Valid Entries: 1 - 127

Data Rules:

Enter a number from 1 to 127 if the incoming calls associated with this CALL ORIGIN reference the pool of common information of expanded call types, otherwise leave blank.

If this field is left blank, then the SECOND LEVEL field must be set to "NONE". If a PRE CALL ID value is entered, then the SECOND LEVEL field must be set to "TGRP" or "DEST".

If PRE CALL ID is entered on one ACDCTP form, and the CALL ORIGIN is
- "CDSU"
- "ICS"
- "ORIG2"
- "ORIG3"
- "SPCL700"

the CALL ORIGIN value must be the same on all of the ACDCTP forms with the same PRE CALL ID value.

For 5E13 and later:

When PRE CALL ID is entered and SECOND LEVEL is "NONE", ACD EXPRESSION must not be "Q".

When PRE CALL ID is not entered, SECOND LEVEL must be "NONE" and ACD EXPRESSION must be "Q".

2.9 DISPLAY INDEX

Description: This is the DA to VDT (Video Display Terminal) and Non-ISP calls VDT display index. The default value for this field is blank, meaning that no VDT displays are required.

Software Release: 5E5 and later
Valid Entries: 1 - 276

Data Rules:

DISPLAY INDEX must be entered if CALL ORIGIN is "AIS", "DA2VDT", or "NIT".

DISPLAY INDEX cannot be entered if CALL ORIGIN is "INW", "INW", "RES", "ISP", or "OPI".

If CALL ORIGIN is equal to "NIT" or "DA2VDT", then this field must contain a number from 1 to 276. In addition, if this field is set to 0 or 1, a corresponding OBSTS form with a matching BST DISPLAY INDEX must be found.

2.10 APOS CALL TYPE

Description: Enter the call type to be served by the Automated Position.

Software Release: 5E7 and later
Valid Entries: 1 - 128

Data Rules:

Copyright © 2003 Lucent Technologies

The APOS CALL TYPE field is used by the Automated Position feature, which is a Secured Feature and must be purchased before it can be assigned. FEATURE ID 65 on the SFSYS form must be set to "S" or "Y", before APOS CALL TYPE can be entered.

APOS CALL TYPE must not be entered if CALL ORIGIN is "SPCL700", "AIS" or "LSTA".

If the APOS CALL TYPE is entered on this form, then there must be an OSPSCT form (5404 Record) where the OSPS CALL TYPE on an OSPSCT form must match the APOS CALL TYPE on this form. In addition, the OPER TA must be "TA" and the SVC ID must not be entered on the OSPSCT form.

2.11 SECOND LEVEL

Description: This field indicates if a second level of call screening information is required to determine the call type associated with this incoming call.

Software Release: 5E5 and later
Required Field.
Default: NONE
Valid Entries:

Valid SECOND LEVEL Entries

Entry	Definition
DEST	Expanded call determination based on an incoming CDI
NONE	Expanded call determination is not required
TGRP	Expanded call determination based on an incoming TGN

Data Rules:

If CALL ORIGIN is equal to "OPI", then SECOND LEVEL must equal "NONE".

If CALL ORIGIN is equal to "XFER", then SECOND LEVEL cannot be equal to "DEST".

If the PRE CALL ID field contains an entry, then "DEST" or "TGRP" must be entered in the SECOND LEVEL field; if the PREC CALL ID field does not contain an entry, then "NONE" must be entered in the SECOND LEVEL field.

3. ACDPOL FORM - 5421B/C/E/F RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

3.2 * PRE CALL ID

Description: This is the TA (Toll & Assistance) Pre Call ID which is used to link the expanded call type determination common pool information contained in this ACDPOL form back to the call type determination information defined upon the ACDCTP form. This record is used when more specific screening of the incoming call's characteristics is required to determine the call type associated with this call.

Software Release: 5E5 and later
Required Field.
Valid Entries: 1 - 127

Data Rules:

At least one NEXT CALL TYPE POOL LIST entry must be entered on each ACDPOL form entry.

For any value of PRE CALL ID entered on the ACDPOL form, a corresponding ACDCTP form with a matching PRE CALL ID value must be found. Duplicate TGN/CDI entries for each unique PRE CALL ID

Copyright © 2003 Lucent Technologies

value are not allowed.

If the PRE CALL ID of the ACDPOL form matches the PRE CALL ID of the ACDCTP form, CALL ORIGIN cannot be "LSTA" or "AIS", and APOS CALL TYPE cannot be entered.

The PRE CALL ID entered on the ACDPOL form cannot have a corresponding PRE CALL ID and CALL ORIGIN of entry "AIS" on the ACDCTP form when DEST IDX is known on OSPSOPT form. (ACDPOL form is found by matching DEST IDX of OSPSOPT with the TGN/CDI of NEXT CALL TYPE POOL LIST of ACDPOL form)

3.3 * SEQ NO

Description: This sequence number allows the user to enter multiple lists associated with the same PRE CALL ID. Start with the value 1 and advance the value sequentially until all required TGNs or CDIs associated with this PRE CALL ID have been entered.

Software Release: 5E5 and later
Required Field.
Valid Entries: 1 - 1314

NEXT CALL TYPE POOL LIST

This is a list of the various TGNs and CDIs that may be associated with a particular PRE CALL ID. For any list entries entered, the following fields (Section 3.4 - Section 3.9) must contain valid data.

3.4 TGRP/DEST

Description: This field indicates whether the information on this list entry is defining TGN or CDI call screening call characteristics that are to be used to determine the call type associated with this PRE CALL ID.

Software Release: 5E5 and later
Valid Entries:

Valid TGRP/DEST Entries

Entry	Definition
DEST	Expanded call determination based on an incoming CDI.
TGRP	Expanded call determination based on an incoming TGN.

Data Rules:

For 5E10 and earlier, if TGRP/DEST is equal to "TGRP", then THIRD LEVEL can only equal "NONE" or "DEST" and TGN/CDI must be in the range of 1 - 2000. If TGRP/DEST is equal to "DEST", then THIRD LEVEL can only equal "NONE" or "TGRP" and TGN/CDI must be in the range of 1 - 4095.

For 5E11 and later, when TGRP/DEST is "TGRP", TGN/CDI must be 1 - 4000.

3.5 TGN/CDI

Description: For TGRP/DEST equal to "TGRP", enter the incoming TGN (Trunk Group Number) of the incoming call. For TGRP/DEST equal to "DEST", enter the CDI (Destination Code Index) for the incoming call.

When a call is interflowed to the receiving switch, the sending switch's FIOPR TGN number is used by the receiving switch for expanded call type determination.

If the receiving switch has an FIOPR TGN with the same TGN number as the sending switch, a conflict may result unless precautions are made. The following will prevent problems when the OSPS APS (Automated Position System) is added to any OSPS switch.

Copyright © 2003 Lucent Technologies

To resolve this conflict, the receiving switch should use the fifth key to ACDCTP form, which is the OSPS ID field. If the OSPS ID field is NOT 000, i.e., it is the OSPS ID of the sending switch, then all calls from that sending switch that match the other four keys will be controlled by the entries on the record on the receiving switch. This information can then be used to match up to a PRE CALL ID that does not use the conflicting TGN number. PRE CALL ID is on the ACDCTP form, and it is the key to the ACDPOL form.

In addition, if the OSPS ID field is 000 on the receiving switch and if there is a matching OSPS ID entry for each sending office, then all non-interflowed calls (calls that originate on the receiving switch) that match the other four keys will be controlled by the entries in this record on the receiving switch.

Software Release: 5E5 and later
Valid Entries:
- For 5E10 and earlier TGN: 1 - 2000
- For 5E11 and later TGN: 1 - 4000
- For CDI: 1 - 4095

Data Rules:

Duplicate TGN/CDI entries for each unique PRE CALL ID value are not allowed.

When DESTINATION INDEX WITH ANI is entered on an AISCLS form, the associated ACDPOL form (where TGRP/DEST is "DEST" and TGN/CDI matches DESTINATION INDEX WITH ANI on the AISCLS form) must have its PRE CALL ID value match the PRE CALL ID on an ACDCTP form. Also the CALL ORIGIN on the ACDCTP form must be set to "AIS".

3.6 CALL TYPE

Description: Enter the Service ID number for Listing Services that is to be used to route the incoming call to the proper serving team. (The Service ID entries are defined in the SVC ID field of the SERVDATA form.)

Software Release: 5E5 and later
Valid Entries: 1 - 1023

Data Rules:

For every CALL TYPE entered on this form, a corresponding OSPSCT form with a matching OSPS CALL TYPE field value must be found; unless for 5E8 and later, the CALL TYPE has a value greater than 128. In addition, the OPER TYPE on this corresponding OSPSCT form must be set to "TA".

For each list element on an ACDPOL form where CALL TYPE is entered, SVC ID must be entered on the associated OSPSCT form when CALL ORIGIN on the associated ACDCTP form is "AIS" or "LSTA". OSPS CALL TYPE on the associated OSPSCT form matches CALL TYPE on the ACDPOL form and PRE CALL ID on the associated ACDCTP form matches PRE CALL ID on the ACDPOL form. Conversely, if CALL ORIGIN on the associated ACDCTP form is not "AIS" or "LSTA", SVC ID must not be entered on the associated OSPSCT form.

For 5E7 and later, CALL TYPE in the NEXT CALL TYPE POOL LIST on the ACDPOL form must be less than 129, if "SPCL700" is NOT entered in the CALL ORIGIN field on the ACDCTP form. The ACDCTP form is found by matching the PRE CALL ID field on the ACDCTP form with the PRE CALL ID field on the ACDPOL form.

3.7 DISPLAY

Description: This is the DA to VDT (Video Display Terminal) and Non-ISP calls VDT display index. An entry in this field is required if a VDT display is to be associated with this incoming call. No entry means

Copyright © 2003 Lucent Technologies

that no VDT displays are required.

Software Release: 5E5 and later
Valid Entries: 1 - 276

Data Rules:

This field requires an entry if the CALL ORIGIN field on the corresponding ACDCTP form equals "NIT" or "DA2VDT". The call is being generated from the call origin; PRE CALL ID on the ACDPOL form equals a PRE CALL ID on the ACDCTP form. In addition, if this field contains an entry, then a corresponding OBSTS form with a matching BST DISPLAY INDEX must be found.

3.8 APOS CALL TYPE

Description: Enter the call type to be served by the Automated Position.

Software Release: 5E7 and later
Valid Entries: 1 - 128

Data Rules:

The APOS CALL TYPE field is used by the Automated Position feature, which is a Secured Feature and must be purchased before it can be assigned. The ACT field for SFID 65 on the SFSYS form must be set to "Y" , before APOS CALL TYPE can be entered.

If the APOS CALL TYPE is entered on this form, then there must be an OSPSCT form (5404 Record) where the OSPS CALL TYPE on an OSPSCT form must match the APOS CALL TYPE on this form. In addition, the OPER TA must be "TA" and the SVC ID must not be entered on the OSPSCT form.

For 5E7 and later, if APOS CALL TYPE is entered on the ACDPOL form, then CALL ORIGIN cannot be "SPCL700", "LSTA", or "AIS" on the corresponding ACDCTP form. Forms correspond if the PRE CALL ID field on the ACDPOL form matches the PRE CALL ID field on the ACDCTP form.

3.9 THIRD LEVEL

Description: This field indicates if a third level of call screening information is required to determine the call type associated with this incoming call.

Software Release: 5E5 and later
Default: NONE
Valid Entries:

Valid THIRD LEVEL Entries

Entry	Definition
DEST	Expanded call determination based on an incoming CDI
NONE	Expanded call determination is not required
TGRP	Expanded call determination based on an incoming TGN

Data Rules:

If TGRP/DEST is equal to "TGRP", then THIRD LEVEL can only equal "NONE" or "DEST". If TGRP/DEST is equal to "DEST", then THIRD LEVEL can only equal "NONE" or "TGRP".

3.10 ACD EXPRESSION

Description: This field defines the call property expression to be used for flexible ACD call type determination.

SEC. 4N: 5413 RECORD
TRUE TRUNK GROUP NPA FORM - PRONXX

1. GENERAL

The 5413 Record is available with 5E4(2) and later Software Releases. When a TGN, assigned on a OPRTK form (5417 Record), serves more than one NPA, then the PROTECTED NXXS field on the OPRTK form must be set to "Y". Those NXXs that are not associated with the NPA in the ORIG NPA field of the OPRTK form are called "protected" NXXs and their actual (or "true") NPA must be identified on the PRONXX form.

If protected NXXs are served by the TGN, the PRONXX form is checked for the true NPA. If there are no protected NXXs, then the NPA is found on the OPRTK form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.13.

2. FORM AND RECORD ENTRIES - 5413 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * TGN NPA

Description: Enter a NPA with an associated protected NXX.
Valid Entries:
- For 5E4(2) - 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

Data Rules:

This value must be entered in the ORIG NPA field of an OPRTK form where the PROTECTED NXXs field has a value of "Y".

2.3 * NXX

Description: Enter the protected NXX. The valid entries are office codes of the format NXX, 0XX or 1XX.
Valid Entries: 3 digits

2.4 # TRUE NPA

Description: Enter the True NPA associated with the protected NXX.
Valid Entries:
- For 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

Data Rules:

The value entered in this field must not be the same as the value entered in the TGN NPA field.

SEC. 4O: 5414 RECORD
NPA-NXX SM ASSIGNMENT AND LATA EXCEPTIONS FORM - NPAMAP

1. GENERAL

The 5414 Record is available with 5E4(2) and later Software Releases.

This record is used to assign an SM (Switching Module), trunk group, exception area index and a LATA (Local Access and Transport Area) to an NPA-NXX combination. For 5E6 and later, NPAs for DIOR (Direct International Originations) can be assigned.

Because the quantity of OLS (Originating Line Screening) data is too great to be stored on each SM, the data is divided among all SMs used for OSPS (Operator Services Position System) traffic by assigning all OLS data for an NPA-NXX to an SM. This assignment is specified on this record. No OLS data can be assigned to a remote SM in this record.

On an operator-initiated call with a valid back number, the NPAMAP form is consulted to see what trunk a call from that back number would arrive on. The DAS and screen index associated with that trunk, found on the TKGRP form (5202 Record), is used for digit analysis and routing. If the NPAMAP form shows that the entered NPA-NXX is for termination only, or if it is not found, the call continues as if not screened, and a warning message is printed.

Using the trunk group that the OSPS call arrived on, the OPRTK form (5417 Record) is checked to determine the default carrier, and if there are any originating exception areas served by that trunk. If there are, then the back number's NPA-NXX is used as the key to this record to see if the call originated in an exception area.

If a forward number is found on the 5414 Record, then the ORIG LATA number on this record is compared to the TERM LATA found in the LDIT form (5300-3 Record). If these LATAs do not match, the inconsistent data is reported to the craft.

Each NPAMAP form submitted must have a TGN assigned that is defined on a TKGRP form with "FIOPR" entered in the TRKCLS field.

1.1 Recent Change View

The corresponding Recent Change view for NPAMAP is 26.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * NPA

Description: Enter the NPA code.

Required Field.
Valid Entries: 100 - 999

2.3 * NXX

Description: Enter the office code that is associated with this NPA. When DIOR NPA is entered, NXX is the originating Country Code.

WARNING: NXXs under 200 do not conform to Network Standards and may cause routing errors.

Copyright © 2003 Lucent Technologies

Valid Entries: 000 - 999

2.4 DIOR NPA

Description: Is the selected NPA for a DIOR (Direct International Origination) trunk group?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NPA is greater than or equal to 200, DIOR NPA must be "N". When NPA is less than 200, DIOR NPA must be "Y".

2.5 # TERM ONLY

Description: Is this NPA-NXX used for terminating only, and is it in the area subtended by the switch? Enter "N" (No) if this NPA-NXX is used for originating and terminating and is in the area subtended by the switch.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the TERM ONLY field, then the TGN, SM, and ORIG LATA fields must be left blank, and the EAI field must be entered. If TERM ONLY is "N", then an entry is required in the SM field.

2.6 SM

Description: Enter the number of the Switching Module that contains the screening data for this NPA-NXX (from the LINESCRN form (5416 Record)).
Valid Entries: 1 - 192

Data Rules:

An entry is made if "N" is entered in the TERM ONLY field; no entry is made if "Y" is entered in the TERM ONLY field.

This entry must not be an RSM (Remote Switching Module). Each entry in this field must be defined on an EQIM form (5700 Record) with EQSTATUS equal to "O" and SM USAGE not equal to "RSM".

2.7 TGN

Description: Enter the Trunk Group Number.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

An entry is made if the 5417 Record is to be used for operator-initiated delay calls. No entry is made if operator-initiated delay calls are not allowed, or if "Y" is entered in the TERM ONLY field.

Copyright © 2003 Lucent Technologies

TGN must not be entered when NPA is less than 200. If TGN is not entered, both LATA and EAI must be entered when NPA is greater than 200.

2.8 ORIG LATA

Description: Enter the number of the originating LATA.
Valid Entries: 1 - 31

Data Rules:

No entry is made if intra/interLATA can be determined from the CI TYPE field of a LDIT form. An entry of 2 to 15 is made if the ORIG LATA is compared with the TERM LATA entry on the LDIT form (to determine intra- or interLATA).

LATA must not be entered when NPA is less than 200. LATA is required when TGN is not entered and NPA is greater than 200.

2.9 EAI

Description: Enter the Exception Area Index.
Valid Entries: 1 - 250

Data Rules:

No entry is made if interLATA calls are not treated as intraLATA. Entries from 1 to 250 are made if "Y" is entered in the TERM ONLY field. Each entry in this field must be defined as either an ORIG EAI or TERM EAI on an EXMAP form (5440 Record).

EAI must not be entered when NPA is less than 200. EAI is required when TGN is not entered and NPA is greater than 200.

2.10 PHRASE ID

Description: Enter the phrase used by the ICO (Independent Company Announcement Branding) feature in providing branding for 0+ intraLATA calls. The phrase should contain the name of the carrier eligible for branding. For more information on ICO, see Division 2, Section 4A95.

Software Release: 5E8 and later.
Valid Entries:

- For 5E8 - 5E9(1): 0 - 16,383, 16,385 - 16,389,
- or 16,500 - 32,767
- For 5E9(2) and later: 1 - 16,383 or 16,600 - 65,530

Data Rules:

If TERM ONLY is "Y", PHRASE ID must not be entered.

PHRASE ID must not be entered if NPA is less than 200.

When PHRASE ID is entered, a corresponding PHRASE form must be entered with a matching PHRASE ID and an APPLICATION of "OSPSTA".

SEC. 4P: 5415 RECORD
SCREEN CODE TABLE FORM - SCRNCODE

1. GENERAL

The 5415 Record is available with 5E4(2)

This record defines billing restrictions on the back number.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * SCRN CODE

Description: Enter the screening code to be used on the LINESCRN form (5416 Record).

An entry of 0 (zero) denotes no screening. Screen code 127 is reserved for testing.

Required Field.
Valid Entries: 0 - 999

Data Rules:

If a SCRN CODE of 0 (zero) is entered, then the following fields must be set to "Y":
- AUTO COLLECT
- BACK CARD NBR
- BACK THIRD NBR
- COLLECT
- DACC ALLOW
- DACC ALT BILL
- DACC PAID
- FORWARD CARD NBR
- FORWARD THIRD NBR
- PAID or DDD

Additionally, TEXT 1 must be "NOT SCREENED," and TEXT 2 and TEXT 3 must be blank.

2.3 PAID OR DDD

Description: Is paid or DDD (Direct Distance Dialing) billing allowed?

Required Field.
Default: Y
Valid Entries: Y, N

2.4 COLLECT

Description: Is collect billing allowed? All collect calls are allowed for a SCREEN CODE of zero.

Copyright © 2003 Lucent Technologies

Required Field.
Default: Y
Valid Entries: Y, N

2.5 AUTO COLLECT

Description: Is automatic collect billing allowed?

Required Field.
Default: Y
Valid Entries: Y, N

2.6 BACK CARD NBR

Description: Is back card number billing allowed?

Required Field.
Default: Y
Valid Entries: Y, N

2.7 BACK THIRD NBR

Description: Is back third number billing allowed?

Required Field.
Default: Y
Valid Entries: Y, N

2.8 FORWARD CARD NBR

Description: Is forward card billing allowed?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.9 FORWARD THIRD NBR

Description: Is forward third number billing allowed?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.10 TEXT

Description: Enter the message displayed at the VDT (Video Display Terminal). Up to 3 lines of text with 49 alphanumeric characters, special characters or spaces are allowed per line. The only restriction is that double quotes may not be used.

Comments, explanations of billing restrictions, and special operator treatments associated with the call are some of the more common text entries.
Valid Entries: 49 characters per line

2.11 DACC PAID

Copyright © 2003 Lucent Technologies

Description: Is paid billing allowed for DACC (Directory Assistance Call Completion) calls? This field and the following two fields are associated with the secured feature OLS DACC. SFID 97 on the SFSYS form must be set to "Y" to enable this feature. (See Division 2, Section 4A97 for more information on this feature.)

Software Release: 5E8 and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.12 DACC ALT BILL

Description: Is alternate billing allowed for DACC calls?

Software Release: 5E8 and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.13 DACC ALLOW

Description: Is DA Call Completion allowed?

Software Release: 5E8 and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.14 ANNC HEADER ID

Description: The ANNC HEADER ID field, in conjunction with the PHRASE ID field, is used to provide a branding announcement for 0+ calls for the CMA (Customized Market Announcement) feature. SFID 96 on the SFSYS form must be set to "Y" to enable this feature. For more information on the CMA feature, see Division 2, Section 4A96.

This branding announcement is given to the customer to provide information on automated calls.

Software Release: 5E8 and later.
Valid Entries:
- For 5E8 -5E9(1): 1 - 255
- For 5E9(2) and later: 1 - 131,071

Data Rules:

When ANNC HEADER ID is entered on the SCRNCODE form, a matching HEADER ID must be entered on the ANNHD form with an APPLICATION of "OSPSTA".

2.15 PHRASE ID

Description: The announcement PHRASE ID is used to provide the branding phrase for 0+ calls for the CMA (Customized Marketing Announcement) feature. The PHRASE ID is part of the branding announcement entered in the ANNC HEADER ID field. The PHRASE ID identifies the specific provider given in the branding announcement to the customer.

Required Field.

Software Release: 5E8 and later.

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E8 - 5E9(1): 0 - 16,383, 16,385 - 16,389,
- or 16,500 - 32,767
- For 5E9(2) and later: 1 - 16,383 or 16,600 - 65,530

When PHRASE ID is entered on the SCRNCODE form, a matching PHRASE ID must be entered on the PHRASE form with an APPLICATION of "OSPSTA".

2.16 ICS TREAT

Description: Is an originating location (i.e. back number) eligible for ICS (Inmate Calling Services) treatment? For more information on this feature see Division 2, Section 4A385.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ICS INTL is "Y", then ICS TREAT must be "Y".

2.17 ICS INTL

Description: Are calls to international numbers from the associated originating location (i.e. back number) eligible for ICS treatment? The ICS TREAT and ICS INTL fields were added to support the ICS (Inmate Calling Services) feature. For more information on this feature, see Division 2, Section 4A385.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ICS INTL is "Y", ICS TREAT must be "Y".

2.18 ACD TRK NUMBER

Description: The ACD TRK NUMBER field is used to specify a "pseudo" trunk group number that can be used during ACD call type determination to route calls to an appropriate operator team. If specified, this number overrides the actual incoming trunk group number for purposes of ACD call type determination only. This field supports the SS7 Signaling for Incoming OSPS Calls from a 4ESS Switch. For more information on this feature see Division 2, Section 3M.

Software Release: 5E10 and later.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

SEC. 4Q: 5416 RECORD
OSPS BACK NUMBER SCREENING FORM - LINESCRN

1. GENERAL

The 5416 Record is available with 5E4(2) and later Software Releases.

This record is used to assign a screen code and routing flag to a line or range of lines. It supplies the SM (Switching Module) that contains a specific Numbering Plan Area/NXX's line screening data. The SM is assigned in the SM field on the NPAMAP form (5414 Record). With the 5E6 Software Release, NPAs for DIOR (Direct International Originations) can be signed.

Once the SM has been determined, the OSPS (Operator Services Position System) sends a query to that SM to retrieve any data that may be in the LINESCRN form (5416 Record) for the back number. Data found may indicate billing restrictions, whether to always route the call to an operator position, whether the call receives ACCS (Automated Calling Card Service) treatment, the originating station type, if the back number is a coin phone, if there is a true billing number to replace the back number or (for 5E5 and later) if the back number is restricted from Subaccount Billing.

Only one LINESCRN form should be submitted per a DN (Directory Number). Additionally, ranges of numbers to be screened must not overlap.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * NPA

Description: Enter a valid 3-digit NPA (Numbering Plan Area).

Required Field.
Valid Entries:
- For 5E6 - 5E8: 100 - 919, middle digit 0 - 1
- For 5E9(1) and later: 100 - 999

Data Rules:

Entries in this field must be defined in the NPA field on an NPAMAP form (5414 Record).

2.3 * NXX

Description: Enter a valid office code.

Required Field.
Valid Entries: 200 - 999

Data Rules:

Entries in this field must be defined in the NXX field on a NPAMAP form.

For 5E6 and later, when DIOR NPA is entered on this form, NXX is the originating Country Code.

Copyright © 2003 Lucent Technologies

2.4 * BEG LINE

Description: Enter the station portion XXXX of the back number to be screened (the local directory number minus the office code).

The first line in a range or an individual line (back number) may be entered in the BEG LINE field. If a range is entered, the last number should be entered in the END LINE field below.

Required Field.
Valid Entries: 0000 - 9999

Data Rules:

LINESCRN forms must not include the same number in more than one range.

2.5 (*) END LINE

Description: Enter the XXXX of the last line (if a range of back numbers are to be screened).
Valid Entries: 0001 - 9999

Data Rules:

Entries in the END LINE field must be greater than entries in the BEG LINE field.

2.6 # SCRN CODE

Description: Enter the screen code number.

An entry of 0 (zero) denotes that line screening will not take place. Screen code 127 is reserved for testing.

Required Field.
Valid Entries: 0 - 999

Data Rules:

Entries in this field must be defined on a SCRNCODE form (5415 Record) to check for billing restrictions. The SCRN CODE must be the same on all forms using the same TRUE BILL TN.

For 5E9(1) and later, if SCRN CODE is 0, then SERVICE CODE must not be entered.

2.7 DIOR NPA

Description: Is the selected NPA for a DIOR (Direct International Origination) trunk group?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ORIG NPA is greater than or equal to 200, DIOR NPA must be "N". When ORIG NPA is less than 200, DIOR NPA must be "Y".

2.8 # TO OPER POS

Description: Are all calls from this back number to be routed to an operator position? This affects only 0+

Copyright © 2003 Lucent Technologies

calls. If this field is set to "Y", calls from this back number will not receive automated calling card service or automated coin service.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

TO OPER POS must be "Y" when NPA is less than 200.

2.9 # COIN LINE

Description: Does this line or range belong to coin lines only and may not be combined with other traffic (such as non-coin, hotel/motel, etc.)?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

COIN LINE must be "N" when NPA is less than 200.

2.10 # ORIG STATION

Description: Enter the type of originating station to be used for AMA (Automatic Message Accounting) records.

Required Field.
Default: UNKNOWN
Valid Entries:

Valid ORIG STATION Entries

Entry	Definition
UNKNOWN	Not "NCNPUB" or "NACQSHOTL".
NCNPUB	Non-coin public.
NACQSHOTL	Non-ACQS hotel.

Data Rules:

ORIG STATION must be "UNKNOWN" when NPA is less than 200.

2.11 TRUE BILL TN

Description: Enter the true billing number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: Enter NXXXXXXXXX where N=2 - 9 and X=0 - 9

Data Rules:

TRUE BILL TN must be blank when NPA is less than 200.

For 5E12 and later, when END LINE is entered, TRUE BILL TN cannot be in the range of NPA + NXX + BEG LINE through NPA + NXX + END LINE.

2.12 SUBACCT BILL

Copyright © 2003 Lucent Technologies

Description: Is Subaccount Billing allowed for this line or range of lines?

Required Field for 5E7 and later.
Default: N
Valid Entries: Y, N

Data Rules:

SUBACCT BILL must be "N" when NPA is less than 200.

2.13 SERVICE CODE

Description: Enter the Service code for Feature Group D Incoming Signaling for Special Applications. The service code may be used to identify specific services or billing arrangements based on the back number. This field supports the Feature Group D Incoming Signaling for Special Applications, Release 2 feature. For more information on this feature, see Division 2, Section 4A373.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 9999

Data Rules:

This field cannot be entered if SCRN CODE is 0.

If this field is entered, END LINE must not be entered.

SEC. 4R: 5417 RECORD
ACCESS TANDEM INCOMING TRUNK GROUPS FORM - OPRTK

1. GENERAL

The 5417 Record is available with 5E4(2)and later Software Releases.

This form is used to define the common information and type of traffic over each trunk group that can access an OSPS (Operator Services Position System) operator. The default interLATA and international carrier for a forward number are both specified on this form. An OPRTK form must be completed for each incoming trunk group in the office that can access the OSPS operator.

1.1 Carrier ID

The OPRTK form also contains the carrier ID used for routing intraLATA, interLATA, and international OS (Operating System) calls. The carrier is determined by ISP (Intermediate Switch Point) and that carrier ID is then used as an index into the DIOPR form (5418 Record).

1.2 Number/Character Entries

In some of the following tables, there are single digit values listed in parentheses after listed entries. These entries may be substituted for the corresponding entry to save data entry keystrokes.

1.3 Recent Change View

The corresponding Recent Change View for this form is 26.26.

2. FORM ENTRIES - 5417-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TGN

Description: Enter the OSPS incoming TGN (Trunk Group Number).
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Each TGN entered on this form must match a TGN entered on the TKGRP form.

For 5E8 and later, OSPS operator trunks defined on OPRTK forms must not be located in BASIC SM (Switching Modules). CONFIGURATION field on the EQIM form (5700 Record) defines the configuration of the SM. The corresponding EQIM form for this TGN is found by the TGN in this field matches the TGN on the TRUNK form (5204 Record). The first three digits (SM) of the TEN or DEN on the corresponding TRUNK form matches the SM entry on the EQIM form.

2.3 # TRKCLS

Description: Enter the trunk classification. See the TKGRP form, Division 3, Section 2A for more detailed definition of trunk classes.

Software Release: 5E6(2) and later

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries:

Typical TRKCLS Entries

Entry	Definition
CAMAANI	Incoming CAMA ANI trunks
CAMAONI	Incoming CAMA ONI trunks
DIOR	Direct International Originations
FIOPR	Intermediate Switch Point for incoming operator trunks.
INAISTRK	Incoming Automatic Intercept system trunk
LATA	Intertoll trunks from a LATA
LTOLLCON	Toll connecting - local office end
PF	Software Release: 5E7 and later Private Facility (PFA Feature)
PRINTOLL	Primary intertoll
SCINTOLL	Secondary intertoll
TTOLLCON	Toll connecting - toll office end

Data Rules:

For 5E7 and later, TRKCLS entries assigned on the OPRTK form must be defined in the TRKCLS field on the TKGRP form.

CAMAANI:
If "CAMAANI" is entered, FROM LOCAL OFC must be entered.

DIOR:
If "DIOR" is entered,

- AATOS SDN NRA must be "N";
- For 5E9(1) and later, ALLOW 7 DIGITS must not be entered.
- ANI must be "Y";
- ACQS SCRN must be "NONE";
- AUTO COIN TRAF must be "N";
- COIN must be "N";
- COIN SIG TYPE must be "N";
- COIN TYPE must be blank;
- EXCEPTION AREAS must be "N";
- FROM LOCAL OFC must be blank.
- INTRA CARR ID cannot be "LEC";
- INTER CARR ID cannot be "LEC";
- INTL CARR ID cannot be "LEC";
- LATA TYPE must be "INTER";
- OL SCRN must be "DED";
- ORIG NPA must be 100-199;
- OS EA SIG must be "N";

Copyright © 2003 Lucent Technologies

- PROTECTED NXXS must be "N";
- START PULSE must be "TURNBACK";
- TRK TYPE must be "DOP";

If TRKCLS is not "DIOR" or "FIOPR", SCRN INDEX must not be entered.

FIOPR:
If TRKCLS is "FIOPR":

- then FROM LOCAL OFC must be entered.
- and if COIN is "Y", then
  - SIG TYPE must be "MW", "IN" or "EX".
  - COIN TYPE must be "D", "C" or "CD".

INAISTRK:
If TRKCLS is "INAISTRK":

- Then the following fields:

  ACQS SCRN must be "NONE";

  ANSWER SUPV must be "Y";

  APOS TREATMENT must be "N";

  AUTO COIN TRAF must be "N";

  CALL COMPL must be "Y";

  COIN must be "N";

  COIN POST PAID must be "N";

  FROM TA SYSTEM must be "N";

  FROM LOCAL OFC must not be entered;

  INTRA CARR ID must not be entered;

  INTER CARR ID must not be entered;

  INTER FOR CC must be "N";

Copyright © 2003 Lucent Technologies

INTL CARR ID must not be entered;

LATA TYPE must be "BOTH";

MECH must be "N";

OL SCRN must be "NONE";

OS EA SIG must be "N";

TRK TYPE must be "INAIS";

- AIS DAS must be entered on the OSPSOPT form.

5E10 and later:

- and LSTG SVC TRAF is "Y", then PROTECTED NXXS must be "N".

TRKCLS must not be "INAISTRK", when TRK TYPE is "D1P".

LATA:
If TRKCLS is "LATA":

- PROTECTED NXXS must be "N" and FROM LOCAL OFC must be entered.

5E9(1) and later:

- if LSTG SVC TRAF is "Y", then ANSWER SUPV must NOT be enterd.
- if LSTG SVC TRAF is "N", then ALLOW 7 DIGITS must be "N".

5E10 and later:

- and LSTG SVC TRAF is "Y", then
  - PROTECTED NXXS must be "N".
  - FROM LOCAL OFC must be entered.
- and LSTG SVC TRAF is "N", then FROM LOCAL OFC must not be entered.

PF:
If TRKCLS is "PF",

- BILLING DN must be entered on the corresponding TKGRP form;
- and LSTG SVC TRAF is "Y", then
  - ANSWER SUPV must not be entered;

Copyright © 2003 Lucent Technologies

- FROM LOCAL OFC must be entered.

- and LSTG SVC TRAF is "N", then
  - AATOS SDN NRA must be "N".
  - ANI must be "Y";
  - ACQS SCRN must be "NONE", "DED", or "ASRCH";
  - AUTO COIN TRAF must be "N";
  - COIN must be "N";
  - COIN POST PAID must be "N";
  - EXCEPTION AREAS must not be entered.
  - FROM LOCAL OFC must not be entered.
  - OL SCRN must be "NONE", "DED", or "ASRCH";
  - SIG TYPE must be "NOCN";
  - TRK TYPE must be "COMB", "D0", "D0P", "D0M" or "D1P".

DIOR, INAISTRK, FIOPR:
If TRKCLS on the TKGRP form is not "INAISTRK", "FIOPR", or "DIOR",

- LSTG SVC TRAF must be "Y";
- TRK TYPE must be "D1P";
- ANSWER SUPV must be "N";
- SIG TYPE must be "NOCN" ;
- COIN TYPE must not be entered.

2.4 # ORIG NPA

Description: Enter the originating NPA associated with this trunk group.

Required Field.
Valid Entries: 100 - 999

Data Rules:

When ORIG NPA is less than 200, DIOR NPA must be "Y".

When the TKGRP form (5202 Record) has a TRKCLS of "DIOR", this field must be from 100 to 199. For 5E6 and later, if the corresponding TKGRP form does not have "DIOR" entered in the TRKCLS field, the ORIG NPA must be between 200 and 999.

2.5 DIOR NPA

Copyright © 2003 Lucent Technologies

Description: Is the selected NPA for a DIOR (Direct International Origination) trunk group?

Software Release: For 5E6 only.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ORIG NPA is greater than or equal to 200, DIOR NPA must be "N". When ORIG NPA is less than 200, DIOR NPA must be "Y".

2.6 # LATA TYPE

Description: Enter the type of LATA (Local Access and Transport Area) traffic that this trunk group is to carry.

Required Field.

Valid LATA TYPE Entries

Entry	Definition
INTRA or INTR	IntraLATA traffic only.
INTER or INTE	InterLATA traffic only.
BOTH or B	Both IntraLATA and InterLATA traffic.

Data Rules:

If "INTER" or "BOTH" is entered in the LATA TYPE field, then there must be an entry in the INTER CARR ID field.

If "INTRA" is entered in the LATA TYPE field, then the INTER CARR ID field must be blank.

For 5E6 and later, when ORIG NPA is less than 200, LATA TYPE must be "INTER".

For 5E6 and later, this field must be "BOTH" when the associated TKGRP form has INPULSING set to "DP".

For 5E9(1) and later:

- If LATA TYPE is "INTRA" and INTRA CARR ID is not 288, ALLOW INTRA DA must be "Y".
- If LATA TYPE is "BOTH" and INTRA CARR ID is not 288, ALLOW INTRA DA must be "Y".
- If LATA TYPE is "INTER", ALLOW INTRA DA must be "N".

2.7 # TRK TYPE

Description: Enter the type of originally-dialed traffic carried on this trunk group.

Required Field.

Valid TRK TYPE Entries

Entry	Definition
COMB or C	Combined (0-,0+,1+) traffic.
D0	Dedicated dial zero traffic.
D0P	0+. Dedicated dial zero plus traffic. (This type is not valid for DP trunks.)
D0M	0-. Dedicated dial zero minus traffic. (This type is not valid for DP trunks.)
D1P or D1	1+. Dedicated dial one plus traffic.
INAIS or I	Incoming Automatic Intercept System (AIS)
SUP or S	Supercombined. (Noncoin/coin 0-,0+,1+) traffic.

Copyright © 2003 Lucent Technologies

Data Rules:

When TRKCLS is not "FIOPR", "DIOR", or "INAISTRK", the trunk group is used for Listing Services and TRK TYPE must be "D1P". The TKGRP form is found by matching TGN on the OPRTK form with TGN on the TKGRP form.

For 5E10 and later, "COMB", "DO", "DOM", "DOP" or "D1P" must be entered if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

DOP - For 5E6 and later, when ORIG NPA is less than 200, TRK TYPE must be "DOP".

The values "D0P" and "D0M" may not be selected if the trunk group is a Dial Pulse trunk group (indicated by an entry of "DP") in the INPULSING field on the TKGRP form. This restriction is needed because of the following scenario: The central office, upon receiving a 0 origination on a dial pulse trunk, immediately seizes an outgoing trunk. However, the central office can't differentiate between 0+ and 0- because the outgoing trunk has been seized.

INAIS - For 5E6 and later, if TRK TYPE is "INAIS", then:

- LATA TYPE must be "BOTH"
- SCRN INDEX must be 0
- SIG TYPE must be "NOCN" or must not be entered
- START PULSE must be "TURNBACK"
- if CALL COMPL is "Y", ANSWER SUPV must be "Y"
- the following must be "Y":

  ANI

  LSTG SVC TRAF
- the following must not be entered:

  COIN TYPE

  INTRA CARR ID

  INTER CARR ID

  INTL CARR ID
- the following must be "NONE":

  ACQS SCRN

  OL SCRN (or not entered)
- the following must be "N":

  AUTO COIN TRAF

  COIN

  COIN POST PAID

  EXCEPTION AREAS

Copyright © 2003 Lucent Technologies

INTER FOR CC

MECH

OS EA SIG

PROTECTED NXXS

SUP - If "SUP" is entered in this field, then "Y" must be entered in the COIN field.

If "SUP" is entered in this field, then either "START2P", "START3P", or "TURNBACK" must be entered in the START PULSE field. If "COMB" is entered in this field, then either "START", "STARTP", or "TURNBACK" must be entered in the START PULSE field.

2.8 # SCRN INDEX

Description: Enter the screening index associated with this incoming trunk group.

The SCRN INDEX field is used during an OSPS operator transfer to an external operator system. A normal zero minus seizure is the most common occurrence for the use of this screen index.

Required Field.
Valid Entries: 0 - 4095

Data Rules:

The value defined in this field must correspond to an entry on the RAR form (5301 Record) to tandem calls out to an external operator switch e.g., TSPS (Traffic Services Position System).

SCRN INDEX must not be entered unless TRKCLS is "DIOR", "FIOPR", or "LATA".

2.9 INTRA CARR ID

Description: Enter the intraLATA carrier identification number associated with the trunk group being defined.

Required Field.
Valid Entries: 0 - 9999 or LEC

Data Rules:

For every entry in this field, a corresponding entry in the CARRIER ID field of a DIOPR form (5418 Record) must exist, and B CARRIER must be "N" on the DIOPR form.

For 5E6 and later, when ORIG NPA is less than 200, INTRA CARR ID cannot be "LEC" (Local Exchange Carrier).

If 0 - 9999 is entered, then the CARRIER ID field on an ICF form must match INTRA CARR ID on this form. In addition for 5E8 and later, "D" must be entered in the FEAT GRP field on at least one ICF form where the CARRIER ID on the ICF form matches this field.

For 5E7 and later, INTRA CARR ID must be entered if LATA TYPE is "BOTH" or "INTRA" and TRK TYPE is not "INAIS".

2.10 INTER CARR ID

Description: Enter the interLATA carrier identification number.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 9999 or LEC

Data Rules:

For every carrier specified in this field, a corresponding entry in the CARRIER ID field of a DIOPR form (5418 Record) must exist, and B CARRIER field must be "N" on the DIOPR form.

For 5E6 and later, when ORIG NPA is less than 200, INTER CARR ID cannot be "LEC" (Local Exchange Carrier).

For 5E6 only, INTER CARR ID must be 0 - 999 if LATA TYPE is "INTRA", OFFICE TYPE is "N" on the OFCOPT form, and OSPS TA is "Y" on the OSPSOPT form.

If 0 - 9999 is entered, then a CARRIER ID on the ICF form must match INTER CARR ID on this form. In addition for 5E8 and later, "D" must be entered in the FEAT GRP field on at least one ICF form where theCARRIER ID on the ICF form matches this field.

For 5E7 and later, INTER CARR ID must be entered if LATA TYPE is "BOTH" or "INTRA" and TRK TYPE is not "INAIS".

2.11 INTL CARR ID

Description: Enter the international carrier identification number.
Valid Entries: 0 - 9999 or LEC

Data Rules:

For every carrier specified in this field, a corresponding entry in the CARRIER ID field of a DIOPR form (5418 Record) must exist, and B CARRIER must be "N" on the DIOPR form.

For 5E6 and later, when ORIG NPA is less than 200, INTL CARR ID cannot be "LEC" (Local Exchange Carrier).

If 0 - 9999 is entered, then a CARRIER ID on an ICF form must match the INTL CARR ID on this form. In addition, for 5E8 and later, there must be at least one ICF form with "D" entered in the FEAT GRP field where the CARRIER ID field on the ICF form matches this field.

2.12 OL SCRN

Description: Enter the type of OLS (Originating Line Screening) to be done on the back number for internal OSPS calls. The actual OLS will begin on the LINESCRN form (5416 Record).
Default: NONE
Valid Entries:

Valid OL SCRN Entries

Entry	Definition
NONE or N	No screened traffic carried by trunks in this trunk group.
DED or D	All traffic is screened.
AIFO or AI	Screened traffic identified by ANI Information digit(s) (0)7.
ASRCH or AS	Screened traffic identified by ANI search. Every back number will be searched on the LINESCRN form (5416 Record).

Data Rules:

If "AIFO" or "ASRCH" is entered in this field, then "Y" must be entered in the ANI field.

For 5E6 and later, when ORIG NPA is less than 200, OL SCRN must be "DED".

2.13 COIN

Copyright © 2003 Lucent Technologies

Description: Does this trunk group carry coin traffic?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "Y" when "SUP" is entered in the TRK TYPE field. If "SUP" is not entered in the TRK TYPE field, enter "Y" if the trunk group carries coin traffic other than postpay coin or if it is dedicated to postpay coin. If the trunk is dedicated to postpay coin, then COIN POST PAID must also be "Y".

Figure 1 shows the type of coin station determined by the combinations of entries in the COIN, TRK TYPE "SUP" (supercombined enumeration), and COIN POST PAID fields and the results of OLS.

If "Y" is entered in this field:

- then "NOCN" cannot be entered in the SIG TYPE field.
- then the entry in the COIN TYPE field must be "C", "D" or "CD".
- If ORIG NPA is less than 200, COIN must be "N".
- for 5E9(1) and later, and if TRKCLS is "FIOPR",
  - then SIG TYPE must be "MW", "IN", or "EX".
  - COIN TYPE must be "D", "C" or "CD".

If "N" is entered in this field, then "NOCN", "MW" or "EX" must be entered in the SIG TYPE field.

For 5E10 and later, "N" must be entered if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

2.14 COIN POST PAID

Description: Does this trunk group carry postpaid coin traffic? Postpaid coin traffic can be carried over coin and noncoin trunk groups.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Postpay coin lines must be identified as coin in the OLS (Originating Line Screening) tables if the trunk group is dedicated noncoin, i.e., COIN is "N". If the trunk group is dedicated to coin, i.e., COIN is "Y" and COIN POST PAID is "Y", then the trunk group is dedicated to postpay and the line numbers need not be in the OLS tables. See Figure 1 to determine if OLS is required. The figure shows that OLS is determined by the entries in the COIN field, COIN POST PAID fields and the "SUP", supercombined enumeration for the TRK TYPE.

if ORIG NPA is less than 200, COIN POST PAID must be "N".

For 5E10 and later, "N" must be entered if LSTG SVC TRAF is "N" and, TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

Copyright © 2003 Lucent Technologies

2.15 COIN TYPE

Description: Enter the coin dial tone response type.

Valid COIN TYPE Entries

Entry	Definition
C	Coin first.
CD	Coin and dial tone first.
D	Dial tone first.

Data Rules:

If "Y" is entered in the COIN POST PAID field and "N" is entered in the COIN field, then COIN TYPE entries must be "D" or "CD".

If "N" is entered in both the COIN POST PAID and COIN fields, then an entry is not allowed in the COIN TYPE field.

For 5E6 and later, when ORIG NPA is less than 200, COIN TYPE must not be entered.

For 5E6 and later, if TRKCLS is not "FIOPR", "DIOR", or "INAISTRK" on the corresponding TKGRP form, then the trunk group is used for Listing Services and COIN TYPE must not be entered. The corresponding TKGRP is found by matching the TGN on the OPRTK form with the TGN on the TKGRP form.

2.16 SIG TYPE

Description: This field is used for two different purposes: 1) to describe the type of coin signaling over this trunk or 2) to describe the type of signaling (only MW or EX allowed) for the ringback (overtime/time and charges) feature when the local office primarily 1A or 1E is using that type of signaling on its end.

Software Release: 5E5 and later
Default: NOCN
Valid Entries:

Valid SIG TYPE Entries

Entry	Definition
NOCN or N	No coin signaling.
MW or M	Multiwink coin signaling.
IN or I	Inband coin signaling.
EX or E	Expanded inband coin signaling.

Data Rules:

If ORIG NPA is less than 200, SIG TYPE must be "NOCN".

If TRKCLS on the corresponding TKGRP form is not "FIOPR", "DIOR", or "INAISTRK", then the trunk group is used for Listing Services and SIG TYPE must be "NOCN" or it must not be entered. The corresponding TKGRP form is found by matching the TGN on this form with the TGN on the TKGRP form.

For 5E10 and later, "NOCN" must be entered if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

2.17 AUTO COIN TRAF

Description: Will ACTS (Automated Coin Toll Service) be used on this trunk group? With ACTS, no operator services are required.

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If this field equals "Y", then "Y" must be entered in either the COIN or the COIN POST PAID field.

If ORIG NPA is less than 200, AUTO COIN TRAF must be "N".

For 5E10 and later, "N" must be entered if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

2.18 ACQS SCRN

Description: Enter the type of ACQS (Automatic Charge Quotation Service) used. Any actual screening will be done on the ACQS form (5425 Record).
Default: NONE
Valid Entries:

Valid ACQS SCRN Entries

Entry	Definition
NONE or N	ACQS traffic is not carried on this trunk group.
DED or D	Only ACQS traffic is carried on this trunk group.
AIFO or AI	ACQS traffic is identified by ANI (Automatic Number Identification) information digits (0)6.
ASRCH or AS	ACQS traffic is identified by ANI search. Every back number will be searched on the ACQS form.

If "AIFO", "ASRCH" or "DED" is entered in this field, "Y" must be entered in the ANI field.

For 5E6 and later, when ORIG NPA is less than 200, ACQS SCRN must be "NONE".

2.19 ANI

Description: Is the ANI (Automatic Number Identification) back number information expected on this trunk group?

The value entered here will override the information obtained from the RTIDX form (5303 Record).

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the OS EA SIG field, then "Y" must be entered in the ANI field.

If ORIG NPA is less than 200, ANI must be "Y".

For 5E10 and later:

"Y" must be entered

- if LSTG SVC TRAF is "Y" and TRKCLS is not "FIOPR".
- if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

2.20 OS EA SIG

Description: Is the equal access operator signaling used on this trunk group?

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If "Y" is entered, then ANI must be "Y".

When AATOS SDN NRA is "Y", OS EA SIG must be "Y".

"N" must be entered if EXCEPTION AREAS is "Y".

If this field is set to "Y", then the corresponding TKGRP form must not have its INPULSING field set to "DP". For "DP" signaling, OS EA SIG must be "N".

2.21 CARR SELEC ENF

Description: Will the carrier selection be enforced for this trunk group?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in this field, then "Y" must be entered in the OS EA SIG field. With "Y" entered in this field, the operator cannot change the carrier identification specified in the INTRA CARR ID, INTER CARR ID, or INTL CARR ID fields.

2.22 START PULSE

Description: Enter the start pulse to be used when a call type cannot be determined due to a transmission failure. Under this condition, a 0-prefix noncoin start will be used. However, start pulses differ depending upon the incoming trunk characteristics. Additionally, the Telephone Company Administrator can choose to and turn back the call (idle the trunk).

When "TURNBACK" is specified and an ANI transmission failure has occurred, the incoming call will be given a reorder tone and the trunk will be idled. When an ANI transmission failure occurs and no digits are received or only one digit is received and that digit is a zero and "TURNBACK" is specified, the call will be treated as a 0- call because of the possibility of the call being associated with an emergency.

Required Field.
Default: TURNBACK
Valid Entries:

Valid START PULSE Entries

Entry	Definition
TURNBACK or 1	Turn back the call. This entry is not valid for 0- calls.
START or 2	Start pulse.
STARTP or 3	Start pulse prime.
START2P or 4	Start pulse double prime.
START3P or 5	Start pulse triple prime.

Data Rules:

For 5E6 and later, when ORIG NPA is less than 200, START PULSE must be "TURNBACK".

3. FORM ENTRIES - 5417-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

3.2 * TGN

Description: Enter the OSPS incoming TGN (Trunk Group Number).
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The incoming trunk group being assigned here must be defined on a TKGRP form (5202 Record) with a TRK DIR of "INC" and a TRKCLS of "FIOPR".

3.3 PROTECTED NXXs

Description: Does this trunk group have any protected NXXs? Enter "Y" if the PRONXX form (5413 Record) will be checked for a TRUE NPA entry.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E6 and later, when ORIG NPA is less than 200, PROTECTED NXXs must be "N".

3.4 EXCEPTION AREAS

Description: Do any exception areas exist in the LATA(s) that this trunk group serves?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the EXCEPTION AREAS field,

- "N" must be entered in the OS EA SIG field;
- "BOTH" must be entered in the LATA TYPE field;
- the EXCEPT DETRM field on the OSPSOPT form must by "Y".

If ORIG NPA is less than 200, EXCEPTION AREAS must be "N".

For 5E10 and later, "N" must be entered

- if LSTG SVC TRAF is "Y" and TRKCLS is not "FIOPR".
- if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".
- EXCEPTION AREAS must not be entered, if LSTG SVC TRAF is "N" and TRKCLS is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

3.5 MECH

Copyright © 2003 Lucent Technologies

Description: Is MECH (More Efficient Call Handling) feature used for incoming trunks to the operator?

Required Field.

Software Release: 5E6 and later
Default: Y
Valid Entries: Y, N

Data Rules:

If TRK TYPE on this form is "INAIS", then MECH must be set to "N".

3.6 FROM LOCAL OFC

Description: Does this trunk come directly from a local office?

Software Release: 5E6 and later
Default: Y
Valid Entries: Y, N

Data Rules:

For 5E10 and later, FROM LOCAL OFC must not be entered if TRKCLS is "PF" and LSTG SVC TRAF is "N".

3.7 ANSWER SUPV

Description: Does the incoming trunk group return answer supervision to the network?

Software Release: 5E6(2) and later
Valid Entries: Y, N

Data Rules:

If TRK TYPE is "INAIS" and CALL COMPL is "Y", then this field must be "Y".

If ORIG NPA entry is less than 200, then this field must by "Y".

ANSWER SUPV must be not be entered, if:

- TRKCLS is NOT "INAISTRK", "LATA" or "PF".
- TRKCLS is "PF" and LSTG SVC TRAF is "Y".

3.8 AATOS SDN NRA

Description: Does this trunk carry AATOS SDN/NRA (Alternate Access To Operator Services Software Defined Network/Network Remote Access) traffic only? If it is set to "N", AATOS SDN/NRA traffic is not carried on this TGN. If it is set to "Y", the trunk group carries only AATOS SDN/NRA.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ORIG NPA is less than 200, AATOS SDN NRA must be "N".

Copyright © 2003 Lucent Technologies

If AATOS SDN NRA is "Y",

- ACQS SCRN must be "NONE" or "ASRCH";
- For 5E9(1) and later, ALLOW 7 DIGITS must not be entered.
- ANI must be "Y";
- AUTO COIN TRAF must be "N";
- COIN must be "N";
- COIN POST PAID must be "N";
- COIN TYPE must not be entered;
- EXCEPTION AREAS must be "N";
- LSTG SVC TRAF must be "N".
- OS EA SIG must be "Y";
- PROTECTED NXXS must be "N";
- SIG TYPE must be "NOCN";
- START PULSE must be "TURNBACK";
- TRK TYPE must be "D0P";

For 5E9(1) and later, if this field is "N", ALLOW 7 DIGITS must be entered for this TRKCLS and TRK TYPE.

For 5E10 and later, "N" must be entered if LSTG SVC TRAF is "N" and "TRKCLS" is "LTOLLCON", "PRINTOLL", "SCINTOLL", or "TTOLLCON".

3.9 APOS TREATMENT

Description: Is Automated Position Treatment provided on this trunk group?

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

The APOS TREATMENT field is used by the Automated Position feature, which is a Secured Feature, and must be purchased before it can be assigned. SFID 65 on the SFSYS form must be set to "S" or "Y" before APOS TREATMENT on this form can be set to "Y". (For more information on the Automated Position Feature, see Division 2, Section 4A on Secured Features.)

If TRKCLS is "INAISTRK", APOS TREATMENT must be "N".

3.10 WIRELESS

Description: Does this trunk carry wireless traffic only?

Software Release: 5E8 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If WIRELESS is "Y", then TRKCLS cannot be "DIOR", "CAMAANI" or "CAMAONI".

3.11 WIRELESS SA

Description: Is the wireless special access activated for this trunk? This field is used by the special feature, FGD Incoming Signaling for Special Application, which provides operator services functions while interfacing over direct trunks from switching offices other than a Class 5 local office. For more information on this feature see Division 2, Section 4A83.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If WIRELESS SA is "Y", then:
- AATOS SDN NRA must be "N"
- ANI must be "Y"
- AUTO COIN TRAF must be "N"
- COIN must be "N"
- COIN POST PAID must be "N"
- SIG TYPE must be "NOCN"
- TRKCLS must be "LATA"
- TRK TYPE must be "COMB", "D0", "D0P",
- "D0M" or "D1P"
- WIRELESS must be "Y".

NOTE: If "Y" is entered, TRKCLS on the corresponding TKGRP form must also be set to "LATA". The form corresponds to a TKGRP form if TGN on this form matches the TGN entry on the TKGRP form.

When SELECTIVE OLS is "Y", WIRELESS SA must be "Y".

3.12 SELECTIVE OLS

Description: Should selective originating line screening be activated for this trunk? This field is used by the special feature, FGD Incoming Signaling for Special Application, which provides operator services functions while interfacing over direct trunks from switching offices other than a Class 5 local office. For more information on this feature see Division 2, Section 4A83.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When SELECTIVE OLS is "Y", WIRELESS SA must be "Y".

3.13 ALLOW 7 DIGITS

Copyright © 2003 Lucent Technologies

Description: Is 7-digit dialing allowed on sequence calls? This field indicates whether 7-digit dialing is allowed on automated sequence calls for this trunk group. For automated sequence calls, OSPS checks the number of digits dialed. 7-digit dialing is not allowed for DIOR or AATOS SDN NRA features.

Software Release: 5E9(1) and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

This field must not be entered if TRUNK TYPE is D1P.

If TRKCLS is "LATA" and LSTG SVC TRAF is "N", then ALLOW 7 DIGITS must be "N".

If "N" is entered, OSPS INPA must be "Y" on the OSPSOPT form.

For 5E10 and later, "N" must be entered if LSTG SVC TRAF is "N" and TRKCLS is "LATA".

3.14 ALLOW INTRA DA

Description: Are intra-LATA DA calls allowed? This field specifies whether calls will be allowed or denied on a per trunk group basis. This field is being used by the DA/LOCDA feature.

Software Release: 5E9(1) and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If LATA TYPE is "INTRA" or "BOTH" and INTRA CARR ID is NOT 288, ALLOW INTRA DA must be "Y".

If LATA TYPE is "INTER", ALLOW INTRA DA must be "N".

3.15 CARRIER CCS

Description: Is the Calling Card Screening by Carrier feature active on this trunk group? The CARRIER CCS field was added to support the Calling Card Screening by Carrier special feature. For more information on this feature see Division 2, Section 4A374.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

3.16 ALLOW AILS

Description: Is AILS (Automated Inward Line Screening) treatment to be applied on this trunk? This field supports the OSPS Automated Inward Line Screening secured feature. (For more information on this feature, see Division 2, Section 4A370.)

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

3.17 WIRELINE

Description: Are wireline/non-TRS (Telephone Relay Service) FGD (Feature Group D) originations allowed? This field supports the FGD Incoming Signaling Release 2 secured feature, which has an SFID 373. (For more information on this feature, see Division 2, Section 4A373.)

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If WIRELINE is "Y", then:
- WIRELESS must be "N"
- WIRELESS SA must be "N"

For 5E9 only, if WIRELINE is "Y", ANSWER SUPV must not be "N".

4. FORM ENTRIES - 5417-3 RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

4.2 * TGN

Description: Enter the OSPS incoming TGN (Trunk Group Number).
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The incoming trunk group being assigned here must be defined on a TKGRP form (5202 Record) with a TRK DIR of "INC" and a TRKCLS of "FIOPR".

LISTING SERVICES

The following fields (Section 4.3 - Section 4.12) define Listing Services options.

4.3 LSTG SVC TRAF

Description: Does this trunk group have TA Listing Services traffic?

Software Release: 5E6(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If LSTG SVC TRAF is "Y",

- CARR SELEC ENF must be "N";

Copyright © 2003 Lucent Technologies

- TRKCLS cannot be "DIOR";
- if TRKCLS is not "FIOPR",
  - COIN TYPE must not be entered.
  - SIG TYPE must be "NOCN";
  - START PULSE must be "TURNBACK";
- and TRKCLS is NOT "INAISTRK", then TRK TYPE must be "COMB", "DO", "DOP", "DOM", or "D1P".
- and TRKCLS is "LATA", then
  - ANSWER SUPV must not be entered.
  - FROM LOCAL OFC must be entered.
- and TRKCLS is "PF", FROM LOCAL OFC must be entered.
- For 5E10 and later: TKGRP INPULSING cannot be "CCIS6" nor "ISUP7" when LSTG SVC TRAF is "Y" on the corresponding OPRTK form. TGNs match on corresponding OPRTK and TKGRP forms.

If LSTG SVC TRAF is "N",

- TRKCLS must be "DIOR", "FIOPR", or "PF";
- INTER FOR CC must be "N";
- FROM TA SYSTEM must be "N";
- CALL COPML must be "N".
- For 5E7 and later, when LSTG SVC TRAF is "N" and TRKCLS is "PF", then:
  - TRK TYPE must be "COMB", "D0", "D0P", "D0M" or "D1P".
  - SIG TYPE must be "NOCN".
  - BILLING DN on the corresponding TKGRP form must be entered. The corresponding TKGRP form is found by matching TGN on the TKGRP form with the TGN on the OPRTK form.
- LSTG SVC TRAF is "N" and TRKCLS is "LATA", then:
  - SIG TYPE must be "NOCN".
  - BILLING DN must be a ten-digit number or must not be entered.

If TRKCLS is not "FIOPR", "DIOR" or "INAISTRK" on the TKGRP form associated with an OPRTK form, the trunk group is used for Listing Services and LSTG SVC TRAF must be "Y". The TKGRP form is found by matching TGN on the OPRTK form with TGN on the TKGRP form.

4.4 FROM TA SYSTEM

Copyright © 2003 Lucent Technologies

Description: Is the Listing Services traffic coming from a Toll and Assist Operator system?

Software Release: 5E6(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TRKCLS is "INAISTRK", FROM TA SYSTEM must be "N".

If LSTG SVC TRAF is "N", FROM TA SYSTEM must be "N".

4.5 CALL COMPL

Description: Is Listing Services call completion allowed?

Software Release: 5E6(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If LSTG SVC TRAF is "N", CALL COPML must be "N".

4.6 INTER FOR CC

Description: Can an interLATA carrier be used for interLATA Listing Services Call Completion calls?

Software Release: 5E6(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "N" if TRKCLS is "INAISTRK", or LSTG SVC TRAF is "N".

If INTER FOR CC is "Y", LATA TYPE must not be "INTRA".

4.7 DA AGGR TRK

Description: Is the DA/DACC (Directory Assistance/DA Call Completion) Enhancements feature active? This field indicates if a trunk group is used as a traffic aggregator for Directory Assistance calls for the OSPS Enhancements to DA and DACC for Wireline and Non-Wireline Users special feature. A traffic aggregator is an entity that collects DA calls from a number of telephone stations and sends them on to an OSPS DA system over a dedicated trunk group. For more information on this secured feature, see Division 2, Section 4A117.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DA AGGR TRK is "Y" then:

Copyright © 2003 Lucent Technologies

- LSTG SVC TRAF must be "Y"
- WLESS DCIS must be "N"
- WLINE DCIS must be "N"

- and AGGR IS CMC is "Y", then

  COIN must be "N".

  COIN POST PAID must be "N"

  OL SCRN must not be "DED"

  SIG TYPE must be "NOCN".

Enhanced DA/DACC is a secured feature, therefore SFID 117 ACT must be set to "Y" on the SFSYS form (5713-1 Record), before the DA AGGR TRK field on the OPRTK form can be set to "Y".

For 5E9(1) and later, if DA AGGR TRK is "Y" then, AGGR ID, AGGR INDEX and AGGR IS CMC must be entered.

4.8 AGGR ID

Description: Enter the ID (Aggregator Identification Index) of the traffic aggregator using this trunk.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 99999

Data Rules:

If DA AGGR TRK is "Y", then AGGR ID, AGGR INDEX and AGGR IS CMC must be entered. The index is passed to the LSDB to identify the aggregator.

If the same AGGRID INDEX value is entered on two or more OPRTK forms, then those forms must also have identical AGGR ID values.

- **WARNING:** AGGR ID is set to blank if DA AGGR TRK, WLINE DCIS, and WLESS DCIS are "N".

4.9 AGGR INDEX

Description: Enter the index to identify the traffic aggregator using this trunk.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 31

Data Rules:

If DA AGGR TRK is "Y", then AGGR ID, AGGR INDEX and AGGR IS CMC must be entered.

4.10 AGGR IS CMC

Description: Is this traffic aggregator a Cellular Mobile Carrier?

Software Release: 5E9(1) and later.
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If DA AGGR TRK is "Y", then AGGR ID, AGGR INDEX and AGGR IS CMC must be entered.

If AGGR IS CMC is "Y", then AGGR NPA and AGGR NXX must be entered. However, if "N" is entered, AGGR NPA and AGGR NXX cannot be entered.

4.11 AGGR NPA

Description: Enter the 3-digit area code for LATA determination of the CMC (Cellular Mobile Carrier). The NPA and NXX are associated with the CMC's MTSO (Mobile Telephone Switching Office). The CMC may have several MTSO's with different NPA/NXXs.

Software Release: 5E9(1) and later.
Valid Entries: 200 - 999

Data Rules:

If AGGR NPA and AGGR NXX values are entered on the OPRTK form, matching NPA and NXX values must be found on the NPAMAP form (5414 Record).

4.12 AGGR NXX

Description: Enter the 3-digit exchange code for LATA determination of the Cellular Mobile Carrier. The NPA and NXX are associated with the CMC's MTSO. The CMC may have several MTSO's with different NPA/NXXs.

Software Release: 5E9(1) and later.
Valid Entries: 200 - 999

Data Rules:

If AGGR NPA and AGGR NXX values are entered on the OPRTK form, matching NPA and NXX values must be found on the NPAMAP form (5414 Record).

4.13 WLINE DCIS

Description: Is wireline direct connect incoming signaling traffic being supported on this trunk group? The fields WLINE DCIS and WLESS DCIS were added to support the Feaure Group D Incoming Signaling for Special Applications, Minnesota Equal Access Network Services Group feature. For more information on this feature see Division 2, Section 4A379.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

WLINE DCIS must be "N" if DA AGGR TRK is "Y".

If WLINE DCIS is "Y":
- AGGR ID must be entered
- ANSWER SUPV must not be entered
- DA AGGR TRK must be "N"
- TRK CLASS must be "LATA"
- WIRELESS must be "N"

Copyright © 2003 Lucent Technologies

- WIRELESS SA must be "N"
- WIRELINE must be "N"
- WLESS DCIS must be "N"

4.14 WLESS DCIS

Description: Is the wireless direct connect incoming signaling traffic being supported on this trunk group. The fields WLINE DCIS and WLESS DCIS were added to support the Feaure Group D Incoming Signaling for Special Applications, Minnesota Equal Access Network Services Group feature. For more information on this feature, see Division 2, Section 4A379.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

WLESS DCIS must be "N" if DA AGGR TRK is "Y".

If "Y" is entered:
- AATOS SDN NRA must be "N"
- AGGR ID must be entered
- ANI must be "Y"
- ANSWER SUPV must be entered
- AUTO COIN TRAF must be "N"
- COIN must be "N"
- COIN POST PAID must be "N"
- DA AGGR TRK must be "N"
- SIG TYPE must be "NOCN"
- TRK CLASS must be "LATA"
- TRK TYPE must be
- "COMB", "D0", ¿D0M", "D0P"
- or "D1P"
- WIRELESS SA must be "N"
- WIRELESS must be "N"
- WIRELINE must be "N"

4.15 CARRIER BRAND

Description: Is carrier specific branding active on this trunk group? This field supports the Carrier Specific Branding on Seizure for ACCS and ACTS feature. For more information on this feature see Division 2, Section 4A378.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

4.16 LS RECONNECT

Description: Is Listing Services Reconnect allowed on this trunk? This field supports OSPS Customer Controlled Reconnect to Directory Assistance/ Listing Services feature. For more information on this feature, see Division 2, Section 4A381.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

4.17 ACCESS ID

Description: Enter the CAP (Competitive Access Provider) Access ID. This ID is used by OSPS when generating AMA records. The ACCESS ID field was added to support the AMA Recording of the Access ID for Competitive Access Provider Calls feature. For more information on this feature, see Division 2, Section 4A392.

Software Release: 5E9(1) and later.
Required Field.
Default: 0
Valid Entries: 0 for LEC or 1 - 255

4.18 SPL ACC SRV ID

Description: Enter the special access service identifier. This field is used to specify a service provider via an access ID, and was added to support the Identification of Calls Originated Through Special Access Methods feature.

Software Release: 5E10 and later.
Required Field.
Default: 0
Valid Entries: 0 - 10

Data Rules:

If 0 is not entered (i.e., 1 - 10 is entered):

- then TRK CLASS must not be "DIOR", "CAMAANI" or "CAMAONI".
- AATOS SDN NRA must be "N".
- INPULSING cannot be set to "ISUP7" on the corresponding TKGRP form, The forms correspond in the TGN fields match. .P

4.19 DA AUTOMATION

Description: Should LS/DA (Listing Service / Directory Assistance) calls be sent to an automated position? This field also supports the Record and Playback secured feature. For more information on this feature, see Division 2, Section 4A415.

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then
- APOS TREATMENT must be "Y"
- LSTG SVC TRAF must be "Y"

Copyright © 2003 Lucent Technologies

4.20 CALL LNP SRC

Description: The CALL LNP SRC field is used to specify one of the following:

- none of the back numbers arriving on this trunk group are in a portable NPA-NXX.
- the LRN PARAMETER should be used for all back number LRNs for calls arriving on this trunk group.
- an LNP query should be made on the back number to determine the back LRN.

Software Release: 5E11 and later
Required Field.
Default: NOPT
Valid Entries: NOPT, OFCD, and QURY

Data Rules:

When CALL LNP SRC is "OFCD", LRN PARAMETER must be entered.

4.21 LRN PARAMETER

Description: The LRN PARAMETER field is used to specify the Location Routing Number (LRN) to be used as a back number for calls arriving on the trunk group. For more information, see Division 2, Section 4A417 (for LEC) or Section 4A419 (for AT&T).

Software Release: 5E11 and later
Valid Entries: NPANXXXXXX or blank

Data Rules:

When CALL LNP SRC is "OFCD", LRN PARAMETER must be entered.

The following Figure examines the trunk variables and OLS (Originating Line Screening) to determine coin treatment.

COIN - Indicates that the trunk carries coin traffic.

TRK TYPE = "SUP" - Indicates the trunk is super-combined.

COIN POST PAID - Indicates the trunk carries Post-pay traffic.

COIN?	TRK TYPE = "SUP"?	COIN POST PAID?	TREATMENT
N	N	N	Call is Non-Coin. OLS is not needed for coin determination.
N	N	Y	OLS entry is used to indicate postpay coin. (See Note).
Y	N	N	Call is pre-pay coin. OLS is not needed for coin determination.
Y	N	Y	
Y	Y	N	If the start pulse indicates coin, the call is treated as pre-pay coin. OLS is not needed for coin determination.
Y	Y	Y	If the start pulse indicates coin, the call is treated as post-pay coin. If OLS is done, OLS should return coin, or an assert is fired.

Note: In this case, an OLS entry is needed to indicate coin. In all other cases, if there is an OLS entry, the results should not contradict the trunk data, or an assert is fired.

SEC. 4S: 5418 RECORD
ACCESS TANDEM CARRIER AND ROUTE INFORMATION FOR PRIMARY AND ALTERNATE TOLL AND ASSISTANCE OPERATOR SERVICES FORM - DIOPR

1. GENERAL

The 5418 Record is available with 5E4(2) and later Software Releases. This record defines the type of carrier and traffic over each carrier group that can access the OSPS (Operator Services Position System) operator.

The 5418 Record contains routing information for a particular carrier identification (key). It also provides data to determine if all call types will be handled by the OS (Operator System) (could have restricted call types). If no call restrictions are present for a carrier identification, then the primary code index and overlap outpulsing indicator will be used to route the call.

If a particular call type is restricted and ISP (Intermediate Switching Point) determines that the restrictions apply to the call, the code index and overlap outpulsing indicator will be overwritten by an alternate value, and the call will be routed normally.

1.1 Recent Change View

The corresponding Recent Change View for this form is 26.25

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * CARRIER ID

Description: Enter the interexchange carrier identification number. This is the intraLATA/interLATA/international carrier identification number from the OPRTK form (5417 Record), LEC (Local Exchange Carrier), or the Feature Group B carrier.

Required Field.

For 5E4(2) - 5E7: 0 - 999 or LEC

For 5E8 only: LEC or
- 0 - 9999 for Feature Group B
- 0 - 999 for Feature Group D

For 5E9(1) and later: LEC or 0 - 9999

Data Rules:

For 5E8 and later:

- If CARRIER ID is 288 or "LEC", B CARRIER must be "N".
- If B CARRIER is set to "Y" then, the CARRIER ID must also be defined on an ICF form with FEAT GRP set to "B".

Copyright © 2003 Lucent Technologies

For 5E8 only, if CARRIER ID is 1000 - 9999, then B CARRIER must be "Y".

2.3 * B CARRIER

Description: Is this a Feature Group B carrier? This is a key field in addition to the CARRIER ID field.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E8 and later:

- If B CARRIER is "N", then the following fields must not be entered:

  C950 1+ ALT CDI

  C950 1+ OVLP

  C950 0+ ALT CDI

  C950 0+ OVLP

  NC950 ALT CDI

  NC950 OVLP

  COIN ALT CDI

  TELECONF ALT CID

  TELECONF OVLP

- If B CARRIER is "Y", COIN ALT CDI, TELECONF ALT CDI, and TELECONF OVLP must not be entered.
- If B CARRIER is set to "Y", then the CARRIER ID must also be defined on an ICF form with FEAT GRP set to "B".

2.4 # PRIM CDI

Description: Enter the primary code index of the OS (Operator System) that handles operator calls for this carrier being defined (or of the announcement if no operator system is assigned).

An entry in this field is used as a key into the RAR form (5301 Record) record to route calls out of the office to an external operator switch.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 4095

Data Rules:

For 5E8 and later:

- If PRIM CDI is not 0, the value must match a value in the CDI field on an RAR form.
- If PRIM CDI is 0, the OSPS TA on the OSPSOPT form must be "Y".

2.5 PRIM OVLP

Description: Will overlap outpulsing be allowed to the primary operator switch (route)?
Default: N
Valid Entries: Y, N

2.6 COIN ALT CDI

Description: Enter an alternate code index for coin traffic (indicating where restricted coin traffic is to be routed).
Valid Entries: 0 - 4095

Data Rules:

The entry in the COIN ALT CDI field must not equal the entry in the PRIM CDI field.

This field should be left blank if the primary OS will route coin traffic. If this field contains a valid entry, the primary OS will be restricted from handling coin traffic.

For 5E8 and later, the value entered in this field must match a value entered in the CDI field on the RAR form. In addition, if 0 is entered, then the OSPS TA field on the OSPSOPT form (5424 Record) must be "Y".

2.7 ACQSAQ ALT CDI

Description: Enter an alternate code index wherer ACQS automatic quote traffic will be routed.
Valid Entries: 0 - 4095

Data Rules:

The entry in the ACQSAQ ALT CDI field must not equal the entry in the PRIM CDI field.

This field should be left blank if the primary OS will route ACQS auto quote traffic. If this field contains a valid entry, the primary OS will be restricted from handling ACQS auto quote traffic.

For 5E8 and later, if 0 is entered in this field, then OSPS TA on the OSPSOPT form (5424 Record) must be "Y". Also, the value entered in this field must match a value entered in the CDI field on an RAR form.

2.8 ACQSVQ ALT CDI

Description: Enter an alternate code index where ACQS voice quote traffic is to be routed.
Valid Entries: 0 - 4095

Data Rules:

The entry in the ACQSVQ ALT CDI field must not equal the entry in the PRIM CDI field.

This field should be left blank is the primary OS will route ACQS voice quote traffic. If this field contains a

Copyright © 2003 Lucent Technologies

valid entry, the primary OS will be restricted from handling ACQS voice quote traffic.

For 5E8 and later, if 0 is entered, then OSPS TA on the OSPSOPT form must be "Y". Also, the value entered in this field must match a value entered in the CDI field on an RAR form.

2.9 NC950 ALT CDI

Description: Enter an alternate code index for noncoin 950 1xxx traffic.
Valid Entries: 0 - 4095

Data Rules:

The entry in the NC950 ALT CDI field must not equal the entry in the PRIM CDI field.

This field should be left blank if the primary OS will be restricted from handling noncoin 950 traffic.

For 5E8 and later, the value entered in this field must match a value entered in the CDI field on the RAR form. In addition, if 0 is entered, then the OSPS TA field on the OSPSOPT form (5424 Record) must be "Y".

2.10 C950 1+ ALT CDI

Description: Enter an alternate code index for coin 950 1+ traffic.
Valid Entries: 0 - 4095

Data Rules:

The entry in the C950 1+ ALT CDI field must not equal the entry in the PRIM CDI field. If an entry is made in this field, then an entry is required in the C950 0+ ALT CDI.

This field should be left blank if the primary OS will be restricted from handling coin 950 1+ traffic.

For 5E8 and later, this field must not be entered if C950 0+ ALT CDI is not entered.

For 5E8 and later, the value entered in this field must match a value entered in the CDI field on the RAR form. In addition if 0 is entered, then the OSPS TA field on the OSPSOPT form (5424 Record) must be "Y".

2.11 C950 0+ ALT CDI

Description: Enter an alternate code index for coin 950 0+ traffic.
Valid Entries: 0 - 4095

Data Rules:

The entry in the C950 0+ ALT CDI field must not equal the entry in the PRIM CDI field. If an entry is made in this field, then an entry is required in the C950 1+ ALT CDI.

This field should be left blank if the primary OS will be restricted from handling coin C950 1+ traffic.

For 5E8 and later, this field must not be entered if 950 0+ ALT CDI is not entered.

For 5E8 and later, the value entered in this field must match a value entered in the CDI field on the RAR form. In addition if 0 is entered, then the OSPS TA field on the OSPSOPT form (5424 Record) must be "Y".

2.12 TELECONF ALT CDI

Description: Enter an alternate code index for teleconferencing traffic.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 4095

Data Rules:

The entry in the TELECONF ALT CDI field must not equal the entry in the PRIM CDI field

This field should be left blank if the primary OS will be restricted from handling teleconferencing traffic.

For 5E8 and later, the value entered in this field must match a value entered in the CDI field on the RAR form. In addition if 0 is entered, then the OSPS TA field on the OSPSOPT form (5424 Record) must be "Y".

2.13 COIN OVLP

Description: Will overlap outpulsing be allowed on calls to the OS handling restricted coin traffic?
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route coin traffic.

For 5E8 and later, if COIN ALT CDI is not entered, COIN OVLP must be "N".

2.14 ACQSAQ OVLP

Description: Will overlap outpulsing be allowed to the alternate ACQS automatic quote?
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route ACQS auto quote traffic.
