2.12 ORIG PICKUP GROUP 4

Description: Enter the queue (Group) that the customer can Originate to Pickup.
Valid Entries: are 2 - 65534

Data Rules:

If TERM PICKUP GROUP is 1 and ORIG PICKUP GROUP 4 is entered, ORIG PICKUP GROUP 1, 2 and

Copyright © 2003 Lucent Technologies

3 must be specified.

When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

If ORIG PICKUP GROUP 4 is entered, then the NUMBER OF PICKUP GROUPS on the associated PUOFD form must be 4.

2.13 # NOTIFY 1

Description: Provide visual notification that a call should be picked up from pickup group 1. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 1 is "Y", ORIG PICKUP GROUP 1 must be entered.

When NOTIFY 1 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 1 can be changed to a "Y".

NOTIFY 1 can be set to "Y" only when the associated Class of Service of the TN is "ISDN".

2.14 # NOTIFY 2

Description: Provide visual notification that a call should be picked up from pickup group 2. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 2 is "Y", ORIG PICKUP GROUP 2 must be entered.

When NOTIFY 2 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 2 can be changed to a "Y".

NOTIFY 2 can be set to "Y" only when the associated Class of Service of the TN is "ISDN".

2.15 # NOTIFY 3

Description: Provide visual notification that a call should be picked up from pickup group 3. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2,

Copyright © 2003 Lucent Technologies

Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 3 is "Y", ORIG PICKUP GROUP 3 must be entered.

When NOTIFY 3 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 3 can be changed to a "Y".

NOTIFY 3 can be set to "Y" only when the associated Class of Service of the TN is "ISDN".

2.16 # NOTIFY 4

Description: Provide visual notification that a call should be picked up from pickup group 4. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 4 is "Y", ORIG PICKUP GROUP 4 must be entered.

When NOTIFY 4 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

NOTIFY 4 can be set to "Y" only when the associated Class of Service of the TN is "ISDN".

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 4 can be changed to a "Y".

2.17 TGN

Description: Enter the Trunk Group Number for Code Calling or Loud Speaker Paging.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

If TGN is entered, ORIG PICKUP GROUP 1 and DIRECT PICKUP TN must not be specified.

If TGN and MEMB are specified, then INITIATE on the associated PUOFD form (5605-1 Record) must be

Copyright © 2003 Lucent Technologies

"CDCAL" or "LDSPKG".

2.18 MEMB

Description: Enter the Trunk Group member number for Code Calling or Loud Speaker Paging.
Valid Entries: 0 - 1951

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

If TGN is entered, MEMB must be specified.

SEC. 6D: 5605-4 RECORD
CALL PICKUP LINE (MLHG/TERM) PARAMETER FORM - PUMPA

1. GENERAL

The 5605-4 Record is available with 5E2 and later Software Releases. It is used to define specific parameters assigned to every Multi-Line Hunt Group line associated with a specific constructed call pickup feature. It is required only if the default parameters assigned on the PUOFD or PUTFD forms are inappropriate.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt member number.
Valid Entries: 1 - 2015 and 3001-3999 (Outdial Terminals only)

Data Rules:

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be one of the following:

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Line to a PBX.
ISDN	Digital Subscriber Line associated ISDN Service.
ISATND	ISDN (Integrated Service Digital Network) attendant.

If the class of service is "ISATND", the INITIATE field on the PUOFD form (5605-1a/b Record) must be "BSYVFY".

2.4 * FEATURE

Description: Enter the feature name. There are no restrictions on the valid characters, except that the first character may not be a slash (/). Feature Names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.5 # TERM PICKUP GROUP

Description: Enter the Terminating Pickup Group. Call Pickup Terminating may be assigned to MLHG terminals.

Required Field.
Default: 1
Valid Entries: 1 - 65534

Data Rules:

This field must have a value of 1 if the FEATURE field on this form appears in the FEATURE NAME field of a PUOFD form. This field must have a value of 2 to 65534 if the FEATURE field on this form appears in the FEATURE NAME field of a PUTFD form with a FEATURE FUNCTION of "CALPU".

2.6 TONE INTERVAL

Description: Enter the barge-in tone repetition interval.
Valid Entries: 0

2.7 TONE DURATION

Description: Enter the barge-in tone duration.
Valid Entries: 900

2.8 DIRECT PICKUP TN

Description: The name of this field was changed to DPU TN in 5E12. This field name applies to 5E11 and earlier. See DPU TN for usage information.

2.9 DPU TN

Description: Enter the Telephone Number served by this office. This field was called DIRECT PICKUP TN for 5E11 and earlier.

Software Release: 5E12 and later
Valid Entries: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If DPU TN is entered, ORIG PICKUP GROUP 1 and TGN must not be specified.

If the DPU TN is entered, the INITIATE field on the PUOFD form must be "IPREDN".

If the first 3 digits of the 7-digit DPU TNs on the PUMPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the DIRECT PICKUP TN must be a 10-digit TN(s).

NXX(s) (the first 3 digits of a 7-digit TN) and/or NPA/NXX combinations (the first 6 digits of a 10-digit TN) from the DPU TN on the PUMPA form must be defined as OFFICE CODE and/or NPA OFFICE CODE on the NOC form.

If the MLHG/TERM(s) is missing the DPU TN assignment on the PUMPA form or in the PUOFD form's default parameters but the Call Pickup Originating Feature with INITIATE equal to "IPREDN" on the PUOFD form, the Directed Pickup TN has to be specified if Call Pickup Originating is initiated by a predesignated TN.

Copyright © 2003 Lucent Technologies

2.10 ORIG PICKUP GROUP 1

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If ORIG PICKUP GROUP 1 is entered, Direct PICKUP TN and TGN must not be specified.

If ORIG PICKUP GROUP 1 is entered, the NUMBER OF PICKUP GROUPS on the PUOFD form (5605-1 Record) must be 1, 2, 3 or 4.

2.11 ORIG PICKUP GROUP 2

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If ORIG PICKUP GROUP 2 is entered, the NUMBER OF PICKUP GROUPS on the PUOFD form (5605-1 Record) must be 2, 3 or 4.

If TERM PICKUP GROUP is 1 and ORIG PICKUP GROUP 2 is specified, then ORIG PICKUP GROUP 1 must be specified.

2.12 ORIG PICKUP GROUP 3

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If ORIG PICKUP GROUP 3 is entered, the NUMBER OF PICKUP GROUPS on the PUOFD form (5605-1 Record) must be 3 or 4.

If TERM PICKUP GROUP is 1 and ORIG PICKUP GROUP 3 is specified, then ORIG PICKUP GROUP 1 and 2 must be specified.

2.13 ORIG PICKUP GROUP 4

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

If ORIG PICKUP GROUP 4 is entered, the NUMBER OF PICKUP GROUPS on the PUOFD form (5605-1 Record) must be 4.

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If TERM PICKUP GROUP is 1 and ORIG PICKUP GROUP 4 is specified, then ORIG PICKUP GROUP 1, 2 and 3 must be specified.

Copyright © 2003 Lucent Technologies

2.14 # NOTIFY 1

Description: Provide visual notification that a call should be picked up from pickup group 1. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 1 is "Y", ORIG PICKUP GROUP 1 must be entered.

NOTIFY 1 can be set to "Y" only when the associated Class of Service of the MLHG/TERM is "ISDN".

When NOTIFY 1 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 1 can be changed to a "Y".

2.15 # NOTIFY 2

Description: Provide visual notification that a call should be picked up from pickup group 2. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 2 is "Y", ORIG PICKUP GROUP 2 must be entered.

NOTIFY 2 can be set to "Y" only when the associated Class of Service of the MLHG/TERM is "ISDN".

When NOTIFY 2 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 2 can be changed to a "Y".

2.16 # NOTIFY 3

Description: Provide visual notification that a call should be picked up from pickup group 3. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When NOTIFY 3 is "Y", ORIG PICKUP GROUP 3 must be entered.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 3 can be changed to a "Y".

NOTIFY 3 can be set to "Y" only when the associated Class of Service of the MLHG/TERM is "ISDN".

When NOTIFY 3 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

2.17 # NOTIFY 4

Description: Provide visual notification that a call should be picked up from pickup group 4. This field was added for the Visual Call Pickup feature (99-5E-2551). For more information on this feature, see Division 2, Section 4A578.

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOTIFY 4 is "Y", ORIG PICKUP GROUP 4 must be entered.

NOTIFY 4 can be set to "Y" only when the associated Class of Service of the MLHG/TERM is "ISDN".

When NOTIFY 4 is set to "Y", no more than 30 ISDN terminals can be assigned to each ORIG PICKUP GROUP.

The ACT field for SFID 578 on the SFSYS form must be set to "Y", before the default value for NOTIFY 4 can be changed to a "Y".

2.18 TGN

Description: Enter the Trunk Group Number for Code Calling or Loud Speaker Paging.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If TGN is entered, ORIG PICKUP GROUP 1 and DIRECT PICKUP TN must not be specified.

If TGN and MEMB are entered, then the INITIATE field on the associated PUOFD form must be "CDCAL" or "LDSPKPG", and the SLVLD SPN associated field on the TRUNK form (5204 Record) must be specified.

2.19 MEMB

Description: Enter the Trunk Group Member Number for Code Calling or Loud Speaker Paging.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 1951

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be entered.

If TGN is entered, MEMB must be specified.

SEC. 6E: 5605-5 RECORD
CALL PICKUP TERMINATING GROUP DATA FORM - PUGD

This section has been removed from the TG-5.

Copyright © 2003 Lucent Technologies

SEC. 7: DISTINCTIVE RINGING FORMS

Copyright © 2003 Lucent Technologies

SEC. 7A: 5606-1 RECORD
DISTINCTIVE RINGING FEATURE DEFINITION FORM - DRFD

1. GENERAL

The 5606-1 Record is available with 5E2 and later Software Releases. It is used to define various combinations of DR (Distinctive Ringing) feature characteristics for assignment to lines or ISDN terminals. DR provides seven ringing patterns. Each combination is given a feature name of one to eight characters which is used to assign the constructed (defined) feature to lines. Certain DR features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed DR features is contained in Figure Figure 1 .

A customer subscribing to a Distinctive Ringing feature may have distinctive ringing cycles based upon whether the incoming call is intra- or inter-terminal group, Dial Call Waiting, Call Waiting Originating or completed over private facilities.

A terminal (line or trunk) must be assigned a Distinctive Ringing feature on the appropriate feature assignment form, LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), TKGRPFA (5206 Record), or TRUNKFA (5205 Record).

When a DR feature is assigned to a TN on a LINE form (5109 form) or to a CKT TN on a DSLUSR form (5908 Record) via a LINEFA, BFG, or associated CLUSTR form, then the TN must have an LCC/RAX defined on the LCC form (5306 form) with a service class of "INDIV", "ATND", "4WINDIV", "PBX", or "ISDN".

Distinctive Ringing features cannot be assigned to members of a Multi-Line Hunt Group that it is a Multiple Position Hunt Group or an ISDN Attendant Terminal Hunt Group. A Multi-Line Hunt Group is one of the above types if the HUNT TYPE on the associated MLHGFD form (5604 Record) is set to "MUPH" or "ISAT".

1.1 Recent Change View

The corresponding Recent Change view for this form is 12.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * FEATURE NAME

Description: Enter the Feature Name. Feature names have no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed, or inserted.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The feature name must be unique and cannot be duplicated on any other BRCS feature definition form.

2.3 REMARKS

Copyright © 2003 Lucent Technologies

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

2.4 ACT TYPE

Description: Enter the method of feature activation.

Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
CODE	Dial code activation.
AUTO	Automatic activation.

Data Rules:

For 5E7 and earlier when ACT TYPE is "CODE", DACT TYPE must be "AUTO" or "CODE"; when ACT TYPE is "AUTO", DACT TYPE must be "NONE" or "CODE".

For 5E7 and later, if Telephone Numbers on the LINEFA form or the MLHG/TERM on the MLHLNFA form are assigned a Distinctive Ringing Feature with the Activation Type entry set to "AUTO" on the DRFD form, the corresponding Initial Activation Status entry on the LINEFA form or the MLHLNFA form, the BFG form, or an associated CLUSTR form must be equal to "Y".

For 5E8 and later when ACT TYPE is "CODE", DACT TYPE must be "CODE".

2.5 DACT TYPE

Description: Enter the method of feature deactivation.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
AUTO	Automatic deactivation.
CODE	Dial code deactivation.
NONE	No feature deactivation.

2.6 ATTENDANT

Description: Is the attendant filtering criteria allowed?

"Y" is the only value allowed except for preconstructed features and those copied from a preconstructed feature using the ODA change-insert feature.
Default: Y
Valid Entries: Y

2.7 INTRA OFF

Description: Is intra-office filtering criteria allowed?

"Y" is the only value allowed except for preconstructed features and those copied from a preconstructed feature using the ODA change-insert feature.
Default: Y
Valid Entries: Y

Copyright © 2003 Lucent Technologies

2.8 INTER OFF

Description: Is inter-office filtering criteria allowed?

"Y" is the only value allowed except for preconstructed features and those copied from the preconstructed feature using the ODA change-insert feature.
Default: Y
Valid Entries: Y

2.9 INTRA TG

Description: Is intra-terminal group filtering criteria allowed?

"Y" is the only value allowed except for preconstructed features and those copied from the preconstructed feature using the ODA change-insert feature.
Default: Y
Valid Entries: Y

2.10 PFA

Description: Is private facility filtering criteria allowed?

"Y" is the only value allowed except for preconstructed features and those copied from the preconstructed feature using the ODA change-insert feature.
Default: Y
Valid Entries: Y

2.11 FEAT TYPE

Description: Enter the feature filtering type.

"NONE" is the only value allowed except for preconstructed features and those copied from the preconstructed feature using the ODA change-insert feature.
Default: NONE
Valid Entries:

Valid FEAT TYPE Entries

Entry	Definition
CWO	Call Waiting Originating.
DCW	Dial Call Waiting.
CFV	Call Forwarding Variable.
MWY	Multiway Calling.
PP	Precedence and Preemption.
NONE	No filtering.

2.12 CHANGE RINGING PATTERN?

Description: Is the customer allowed to change the ringing pattern via a use code?
Default: N
Valid Entries: Y, N

DEFAULT PARAMETER

The following field (Section 2.13) is the only default parameter for DR features.

2.13 RINGING PATTERN TYPE

Description: Enter the DR patterns.
Default: A

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid RINGING PATTERN TYPE Entries

Entry	Definition
A	A repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern) or Pattern 0 for ISDN terminals.
B	A repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on, followed by 4 seconds off or Pattern 1 for ISDN terminals.
C	A repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on, and 4.0 seconds off or Pattern 2 for ISDN terminals.
D	A repeated pattern of 1.0 seconds on, 1.0 seconds off, 1.0 seconds on, and 3.0 seconds off (also known as Code 2 ringing) or Pattern 3 for ISDN terminals.
E	A routine ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
F	A priority ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
P	A precedence ringing pattern of 1640 milliseconds on, 360 milliseconds off, repeated for the duration of the ringing interval or Pattern 5 for ISDN terminals.

SEC. 7B: 5606-2 RECORD
DISTINCTIVE RINGING LINE PARAMETER FORM - DRLPA

1. GENERAL

The 5606-2 Record is available with the 5E2 and later Software Releases. It defines the DR (Distinctive Ringing) parameters for individual lines if the default parameters associated with the DR feature on the DRFD form (5606-1 Record) are inappropriate or unspecified. Do not enter this record if the DR default parameters are acceptable.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.25.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * TN

Description: Enter the Telephone Number of the customer.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The Telephone Number entered here must be defined on the LINE form (5109 Record).

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Non-data Link Console Line or Attendant Line.
INDIV	Individual Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
PBX	Line to a PBX.

For 5E12 and later, TN and FEATURE NAME combinations on different DRLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the DRLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE NAME

Description: Enter the feature name.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

The feature name must be defined on the DRFD form.

2.4 RING PTN

Description: Enter the DR patterns.
Default: A
Valid Entries:

Valid RING PTN Entries

Entry	Definition
A	A repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern).
B	A repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on followed by 4 seconds off.
C	A repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4.0 seconds off.
D	A repeated pattern of 1.0 second on, 1.0 second off, 1.0 second on and 3.0 seconds off (also known as Code 2 ringing).
E	A routine ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
F	A priority ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
P	A precedence ringing pattern of 1640 milliseconds on, 360 milliseconds off, repeated for the duration of the ringing interval.

SEC. 7C: 5606-3 RECORD DISTINCTIVE RINGING LINE (MLHG/TERM) PARAMETER FORM - DRMPA

1. GENERAL

The 5606-3 Record is available with the 5E2 and later Software Releases. It defines the DR (Distinctive Ringing) parameters for individual lines. If the default parameters associated with the DR feature on the DRFD form (5606-1 Record) are inappropriate or unspecified. Do not enter this record if the DR default parameters are acceptable.

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.25.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Enter the Multi-Line Hunt Group Member number.

Required Field.

Data Rules:
The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Line to a PBX.

2.4 * FEATURE

Description: Enter the feature name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The feature name must be defined on the DRFD form.

2.5 RINGING PATTERN TYPE

Description: Enter the DR pattern.
Default: A
Valid Entries:

Valid RING PTN Entries

Entry	Definition
A	A repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern).
B	A repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on, followed by 4 seconds off.
C	A repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on, and 4.0 seconds off.
D	A repeated pattern of 1.0 second on, 1.0 second off, 1.0 second on, and 3.0 seconds off (also known as Code 2 ringing).
E	A routine ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
F	A priority ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
P	A precedence ringing pattern of 1640 milliseconds on, 360 milliseconds off, repeated for the duration of the ringing interval.

SEC. 8: TERMINAL GROUP STATION RESTRICTION FORMS

Copyright © 2003 Lucent Technologies

SEC. 8A: 5607-1/2 RECORD
TERMINAL GROUP AND STATION RESTRICTION - TGSRFD
FEATURE DEFINITION FORM

1. GENERAL

The 5607-1 and 5607-2 Records are available with 5E2 and later Software Releases, and are used to define the Terminal Group and Station Restriction Feature Definition.

Terminal Group and Station Restriction provides a means of grouping two or more terminals to provide station screening. The screening is based on the terminal's membership in a given TG (Terminal Group) and the type of SR (Station Restriction) characteristics of the terminal.

1.1 Terminal Group

A terminal may be either a line or a trunk. A line is a Telephone Number or Multi-Line Hunt Group/Member with associated equipment number. All members of a Trunk Group must be in the same Terminal Group. Terminal Groups can be defined across Switching Modules.

1.2 Station Restriction

SR (Station Restriction) provides a means to restrict calls on the basis of the terminal's membership in a particular Terminal Group and the Station Restriction feature selected. Station Restriction is assigned on a terminal basis and can be originating or terminating.

There are four major SR components that are defined on the input form as Feature Options:

- Customer Control of feature (Activation/Deactivation)
- Originating Restriction
- Terminating Restriction
- Error Treatment (Originating/Terminating)

Each individual member in the Terminal Group (line or trunk) will be assigned Station Restrictions which are defined on the TGSRFD form.

1.3 Class of Service

Every Telephone Number assigned a TGSR Feature on the LINEFA form (5112 Record), and every MLHG/TERM assigned a TGSR Feature on the MLHLNFA form (5113 Record), must also be associated with a Class of Service of "INDIV", "PBX", "HOTPBX", "HOTMOTL", "4WINDIV", "SATSTLN", "ATND", "ISDN", or "ISATND" defined on the LCC form; for 5E8 and later, it may also be "MODEM".

Every CKT TN (Circuit Telephone Number) assigned a TGSR Feature on the LINEFA form and every Circuit MLHG/TERM assigned a TGSR Feature on the MLHLNFA form must be associated with a Class of Service of "ISDN"or "ISATND" on the LCC form.

All Telephone Numbers, Circuit Telephone Numbers, MLHG/TERM Numbers and Circuit MLHG/TERM Numbers assigned as manual lines on the LINE or MLHLN form, and also assigned a TGSR Feature on the LINEFA or MLHLNFA form, must have the TGSR Feature name defined on the TGSRFD form, and must be unrestricted originating (ORIGINATING RESTRICTION of "NONE" and DEFAULT of "NONE").

Every TRUNK/TKGRP assigned a TGSR Feature on the TRUNKFA, TKGRPFA, or CLUSTR form must have the associated TRKCLS entry on the TKGRP form (5202-1 Record) as listed below:

Copyright © 2003 Lucent Technologies

Trunk Class	
AUXTRNK	Auxiliary Service Trunk.
EDSL	Extended Digital Subscriber Line Trunks. This TRKCLS entry is valid only when "Y"is entered in the ACT field for SFID 60 on the SFSYS form (5713-1 Record) to activate the Secured Feature Metro Hub.
EDSLHM	EDSL Trunk for Hotel/Motel TSPS Service. This TRKCLS entry is valid only when "Y"is entered in the ACT field for SFID 60 on the SFSYS form (5713-1 Record) to activate the Secured Feature Metro Hub.
LTOLLCON	Toll Connecting.
PBXDID	PBX Direct Inward Dialing 1 Way Outgoing.
PF	Private Facility.
PFCPE	Private Facility Customer Premise Equipment.
PFLASH	Private Facility Feature Flash.
PFITT	Software Release: 5E3 and later. Private Facility Intertandem Trunk.
PRINTOLL	Primary Intertoll.
TTOLLCON	Toll Completing.

1.4 Preconstructed Features

Preconstructed Feature names are available for the Terminal Group and Station Restriction Feature Definition form. The preconstructed names listed in Figure 3 can only be reviewed through 5ODA on the TGSRFD input form, therefore Default Parameters cannot be specified. The appropriate TGSRLPA, TGSRMPA or TGSRTPA form must be entered to specify the actual Parameter values required on the preconstructed feature name.

1.5 Advanced Services Platform

Due to the nature of ASP (Advanced Services Platform, previously PVN, Private Virtual Network), originating restrictions are overridden for ASP calls so that the SCP (Service Control Point) can perform call screening functions.

1.6 Recent Change View

The corresponding Recent Change View for this form is 12.21.

2. FORM ENTRIES - 5607-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *FEATURE NAME

Description: Enter a Feature Name to define the particular version of the BRCS (Business and Residence Custom Services) Terminal Group and Station Restriction feature. The first character of all preconstructed features is always a slash (/).
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

A Terminal Group Station Restriction Feature name can be assigned to many different terminals (individual lines, MLHG Terminals and Trunks), but each terminal can be assigned only one TGSR Feature name defined on the TGSRFD form.

For 5E9(1) and later, a TGN/MEMB(s) defined on a TKGRP form with its WB RATE field entered can only have, at most, one TGSR Feature assigned.

2.3 REMARKS

Copyright © 2003 Lucent Technologies

Description: Describe the meaning of the feature.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The fields (Section 2.4 - Section 2.5) specify how the feature can be activated and deactivated.

2.4 ACT TYPE

Description: Enter the activation type for the feature.

Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	No customer activation code is needed; the feature is always active and the Originating and Terminating Station Restrictions apply.
CODE	Customer activation by dialing an activation code.

Data Rules:

For 5E7 and later, if "AUTO"is entered for a TGN assigned a Terminal Group and Station Restriction Feature on the TRUNKFA (or CLUSTR) form then the corresponding A field entry for Initial Activation Status on the TRUNKFA (or CLUSTR) form must be "Y".

If "AUTO"is entered for MLHG/TERMS on the MLHLNFA form that are assigned a Terminal Group and Station Restriction Feature, then "Y"must be entered in the corresponding A field for the Initial Activation Status on the MLHLNFA, BFG or associated CLUSTR form.

2.5 DACT TYPE

Description: Enter the deactivation type for the feature.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
NONE	No customer deactivation code (change is prohibited).
CODE	Customer deactivation by dialing a deactivation code.
AUTO	Automatic deactivation, e.g., the customer activates Station Restriction via a dialed code for SR to be active for one call, the call in progress. When the terminal goes back on-hook, SR is automatically deactivated.

Data Rules:

When ACT TYPE is set to "AUTO", DEACT TYPE must be set to "NONE". When ACT TYPE is set to "CODE", DEACT TYPE must be set to "AUTO"or "CODE".

ORIGINATING

The fields (Section 2.6 - Section 2.8) apply to originating Station Restriction.

2.6 RESTRICTION

Description: Enter the Originating Station Restriction Option. Station Restriction applies if the customers TGSR feature is active (on).

Copyright © 2003 Lucent Technologies

Required Field.
Default: NONE
Valid Entries:

Valid RESTRICTION Entries

Entry	Definition
NONE	Originating Unrestricted Option. No originating restrictions on the terminal.
SEMI	Originating Semi-Restricted Option prohibits the completion of calls destined to terminate outside the originating terminal's TG. See Figure 4 for exceptions to Semi-Restricted Options.
FULL	Originating Fully Restricted Option prohibits the completion of all calls destined to terminate outside the originating terminal's TG or the attendant. See Figure 5 for exceptions to Fully Restricted Options.

2.7 DEFAULT

Description: Enter the Originating SR (Station Restriction) Default Option. This SR applies if the customer feature is deactivated (off).

Required Field.
Default: NONE
Valid Entries:

Valid DEFAULT Entries

Entry	Definition
NONE	Originating Unrestricted Option. No originating restrictions on the terminal.
SEMI	Originating Semi-Restricted Option prohibits the completion of calls destined to terminate outside the originating terminal's TG. See Figure 4 for exceptions to Semi-Restricted Options.
FULL	Originating Fully Restricted Option prohibits the completion of all calls destined to terminate outside the originating terminal's TG or the attendant. See Figure 5 for exceptions to Fully Restricted Options.

Data Rules:

Default Restriction is used only when a customer is given ACT TYPE of "CODE"so that the customer can turn the feature on or off. When the SR feature is active, then the Restriction applies. When the SR feature is deactivated, then the default applies.

2.8 ERROR TRTMT

Description: Enter the Originating Station Restriction Error Treatment Option. Error treatment is given whenever a call cannot complete because of SR failure. Station Restriction error treatment will be applied to the originating terminal for both originating and terminating restriction.

Required Field.
Default: TONE
Valid Entries:

Valid ERROR TRTMT Entries

Entry	Definition
TONE	Reorder tone is applied to the terminal to indicate SR error.
RERTE	Reroute to Telephone Number. The call is forwarded to a prearranged Telephone Number if a Station Restriction error is encountered. The individual terminals for the TG of this feature must have the FORWARD TO DN specified on either the TGSRFD or on an individual parameter form (TGSRLPA, TGSRMPA, or TGSRTPA).
ANNC	Announcement if SR error. The individual terminals for the TG of this feature must have the ERROR ANNCMT ROUTE INDEX specified on either the TGSRFD form (in a default parameter) or on an individual parameter form (TGSRLPA, TGSRMPA, or TGSRTPA).

Data Rules:

For 5E5 and later, when a TGSR feature is assigned (via a TRUNKFA/TKGRPFA form) then ORIGINATING ERROR TRTMT and TERMINATING ERROR TRTMT must be set to "TONE"when the corresponding TRKGRP form has INPULSING or OUTPULSING equal to "ISUP7"

Copyright © 2003 Lucent Technologies

For 5E6 and later, when a TGSR feature is assigned (via a TRUNKFA or CLUSTR form), then the TGSR feature must have the ORIGINATING ERROR TRTMT and TERMINATING ERROR TRTMT must be set to "TONE" when the corresponding TKGRP form has TRKCLS equal to "EDSL" or "EDSLHM".

TERMINATING

The fields (Section 2.9 - Section 2.11) apply to terminating Station Restriction.

2.9 RESTRICTION

Description: Enter the Terminating Station Restriction Option. Station Restriction applies if the customers TGSR feature is active (on).

Required Field.
Default: NONE
Valid Entries:

Valid RESTRICTION Entries

Entry	Definition
NONE	Terminating Unrestricted Option. No terminating restrictions on the terminal.
SEMI	Terminating Semi-Restricted Option prohibits the completion of calls originating outside the restricted terminal's TG and destined to terminate to the restricted terminal. There is one exception; the restricted terminal can receive calls from outside the TG if there is intermediate routing (see following note) and the last connection was from the attendant or another terminal in a given TG. See Figure 4 for exceptions to Semi-Restricted Options.
ASPS	Software Release: 5E8 only. Terminating Semi-Restricted, plus ASP (Advanced Services Platform; previously PVN (Private Virtual Network)) originations. This option prohibits the completion of non-ASP calls originating outside of a restricted terminal's TG and destined to terminate to the restricted terminal. ASP calls are always allowed to terminate. There is one exception to the above rules: the restricted terminal can receive calls from outside the TG if there is intermediate routing (see the following note) and the last connection was from the attendant or another terminal in a given TG. See Figure 4 for exceptions to Semi-Restricted Options.
PVNS	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASPS". See the description under "ASPS".
FULL	Terminating Fully Restricted Option prohibits the completion of all calls originating outside the restricted terminal's TG or the attendant to terminate to the restricted terminal. See Figure 5 for exceptions to Fully Restricted Options.
ASPF	Software Release: 5E8 only. Terminating Fully Restricted, plus ASP (Advanced Services Platform; previously PVN (Private Virtual Network)) originations. This option prohibits the completion of all non-ASP calls originating outside either the restricted terminal's TG or the attendant to terminate to the restricted terminal. ASP calls are always allowed to terminate. See Figure 5 for exceptions to Fully Restricted Options.
PVNF	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASPF". See the description under "ASPF".

NOTE: Intermediate routing is that routing which causes a route different from that originally made, i.e., Call Forwarding which creates intermediate routing on the forwarded leg of the call.

2.10 DEFAULT

Description: Enter the Terminating Station Restriction Default Option. This SR applies if the customer TGSR feature is deactivated (off).

Required Field.
Default: NONE
Valid Entries:

Valid DEFAULT Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

NONE	Terminating Unrestricted Option. No terminating restrictions on the terminal.
SEMI	Terminating Semi-Restricted Option prohibits the completion of calls originating outside the restricted terminal's TG and destined to terminate to the restricted terminal. There is one exception, the restricted terminal can receive calls from outside the TG if there is intermediate routing (see the following Note) and the last connection was from the attendant or another terminal in a given TG. See Figure 4 for exceptions to Semi-Restricted Options.
ASPS	Software Release: 5E8 only. Terminating Semi-Restricted, plus (Advanced Services Platform; previously PVN (Private Virtual Network)) originations. This option prohibits the completion of non-ASP calls originating outside of a restricted terminal's TG and destined to terminate to the restricted terminal. ASP calls are always allowed to terminate. There is one exception to the above rules: the restricted terminal can receive calls from outside the TG if there is intermediate routing (see the following Note) and the last connection was from the attendant or another terminal in a given TG. See Figure 4 for exceptions to Semi-Restricted Options.
PVNS	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASPS". See the description under "ASPS".
FULL	Terminating Fully Restricted Option prohibits the completion of all calls originating outside the restricted terminal's TG or the attendant to terminate to the restricted terminal. See Figure 5 for exceptions to Fully Restricted Options.
ASPF	Software Release: 5E8 only. Terminating Fully Restricted, plus ASP (Advanced Services Platform; previously PVN (Private Virtual Network)) originations. This option prohibits the completion of all non-ASP calls originating outside either the restricted terminal's TG or the attendant to terminate to the restricted terminal. ASP calls are always allowed to terminate. See Figure 5 for exceptions to Fully Restricted Options.
PVNF	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASPF". See the description under "ASPF".

NOTE: Intermediate routing is that routing which causes a route different from that originally made, e.g., Call Forwarding which creates intermediate routing on the forwarded leg of the call.

This Default restriction is used only when ACT TYPE is set to "CODE", DACT TYPE is "AUTO"or "CODE", and the feature has been deactivated.

2.11 ERROR TRTMT

Description: Enter the Terminating Station Restriction Error Treatment Option. Error treatment is given whenever a call cannot complete because of SR failure. Station Restriction error treatment will be applied to the originating terminal for both originating and terminating restriction.

Required Field.
Default: TONE
Valid Entries:

Valid ERROR TRTMT Entries

Entry	Definition
TONE	Reorder tone is applied to the terminal to indicate SR error.
RERTE	Reroute to Telephone Number. The call is forwarded to a prearranged Telephone Number if a Station Restriction error is encountered. The individual terminals for the TG of this feature must have the FORWARD TO DN specified on either the TGSRFD or on an individual parameter form (TGSRLPA, TGSRMPA, or TGSRTPA).
ANNC	Announcement if SR error. The individual terminals for the TG of this feature must have the ERROR ANNCMT ROUTE INDEX specified on either the TGSRFD form or on an individual parameter form (TGSRLPA, TGSRMPA, or TGSRTPA).

Data Rules:

For 5E5 and later, when a TGSR feature is assigned (via a TRUNKFA/TKGRPFA form) then ORIGINATING ERROR TRTMT and TERMINATING ERROR TRTMT must be set to "TONE"when the corresponding TRKGRP form has INPULSING or OUTPULSING equal to "ISUP7"

Copyright © 2003 Lucent Technologies

For 5E6 and later, when a TGSR feature is assigned (via a TRUNKFA or CLUSTR form), then the TGSR feature must have the ORIGINATING ERROR TRTMT and TERMINATING ERROR TRTMT must be set to "TONE" when the corresponding TKGRP form has TRKCLS equal to "EDSL" or "EDSLHM".

3. FORM ENTRIES - 5607-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

3.2 * FEATURE NAME

Description: Enter the Feature Name defined on the 5607-1 Record.

DEFAULT PARAMETERS

The Default Parameter values (fields Section 3.3 - Section 3.4) apply automatically to each line (Telephone Number), Multi-Line Hunt Group/Member or Trunk Group/Member that is assigned the TGSR feature. These items are all optional on the feature definition form, but their use is highly recommended to save data entry work with the assignment of individual line and trunk parameter forms.

Any line, Multi-Line Hunt line or trunk that has a Terminal Group Station Restriction feature may override the parameters assigned on this form by entering the parameters on an associated TGSRLPA, TGSRMPA or TGSRTPA form.

3.3 GROUP ID

Description: Enter the Terminal Group Identification number. The Group ID is the value which names the association of two or more terminals to provide screening and restriction criteria.
Valid Entries: 1 - 65535

Data Rules:

If a trunk is a member of a Terminal Group, then all members of the Trunk Group must be members of the same Terminal Group, with the same Group ID.

If the GROUP ID is not assigned on this form, it must be individually assigned to each line, Multi-Line Hunt line and trunk via the associated TGSRLPA, TGSRMPA, and TGSRTPA forms.

For 5E7 and earlier, when members of the same MLHG are assigned a TGSR feature on MLHNLFA, CLUSTR or BFG forms, the feature must have the same GROUP ID on this TGSRFD form or on associated TGSRMPA forms.

3.4 MOH ALW

Description: Is Music on Hold allowed?

Once a call has been placed on hold, this field indicates whether or not music is to be provided to the held party during the hold period. This field is only applicable when Secured Feature ID 64 is set to "S" on the SFSYS form (5713-1 Record).

Software Release: 5E7 and later
Required Field.
Default Values: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If MOH ALW is "Y"for a TGSR feature assigned to a TN or an MLHG/TERM on a LINEFA, MLHLNFA, CLUSTR, or BFG form, then:

- the LCC and RAX of the TN or MLHG/TERM must be defined on a corresponding LCC form with CLASS OF SERVICE of "INDIV", "ATND", "ISDN", "ISATND".
- a GROUP ID must be specified on either the BFG or corresponding TGSRFD, TGSRLPA or TGRSMPA form and have a MUSIC ON HOLD TGN and MEMB assigned on the TGATTD form.

If TGSR features assigned on the BFG form or an associated CLUSTR form have ORIGINATING/TERMINATING ERROR TRTMT set to "ANNC" on the TGSRFD form, a corresponding ORIGINATING/TERMINATING ERROR ANNCMT ROUTE INDEX entry must be made on the TGSRFD form or in the TGSR Parameters on the BFG form.

- ***NOTE:*** The BFG form takes precedence over the TGSRFD form if any of the following BFG form TERMINAL GROUP Parameters are entered:

- GROUP ID
- MOH ALW
- ORIGINATING/TERMINATING FORWARD TO DN
- ORIGINATING/TERMINATING ERROR ANNCMT ROUTE INDEX.

If TGSR features assigned on the BFG form or an associated CLUSTR form have ORIGINATING/TERMINATING ERROR TRTMT set to "RERTE" on the TGSRFD form, a corresponding ORIGINATING/TERMINATING FORWARD TO DN entry must be made on the TGSRFD form or in the TGSR Parameters on the BFG form.

- ***NOTE:*** The BFG form takes precedence over the TGSRFD form if any of the following BFG form TEMINAL GROUP Parameters are entered:

- GROUP ID
- MOH ALW
- ORIGINATING/TERMINATING FORWARD TO DN
- ORIGINATING/TERMINATING ERROR ANNCMT ROUTE INDEX.

FORWARD TO DN

The fields (Section 3.5 - Section 3.6) specify the telephone numbers to which calls will be rerouted when Station Restriction failure occurs.

3.5 ORIGINATING

Description: Originating Forwarded to Directory Number. The Directory Number value is related to the Feature Option field Originating Error Treatment.
Valid Entries: 1 - 32 digits (0 - 9, *, #)

Copyright © 2003 Lucent Technologies

Data Rules:

If Originating ERROR TREATMENT is "RERTE", then an associated Originating Forward to DN must be specified on either the TGSRFD form as a default parameter or as a value on a given line or trunk parameter form (TGSRLPA, TGSRMPA or TGSRTPA).

3.6 TERMINATING

Description: Terminating Forwarded to Directory Number. The Directory Number value is related to the Feature Option field Terminating Error Treatment.
Valid Entries: 1 - 32 digits (0 - 9, *, #)

Data Rules:

If Terminating ERROR TREATMENT is "RERTE", then an associated Terminating Forward to DN must be specified on either the TGSRFD form as a default parameter, as a value on a given line or trunk parameter form (TGSRLPA, TGSRMPA or TGSRTPA).

ERROR ANNCMT ROUTE INDEX

The fields (Section 3.7 - Section 3.8) specify the error announcement route indexes for originating and terminating.

3.7 ORIGINATING

Description: Originating Error Announcement Route Index.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The Route Index value is related to the Originating Error Treatment field. If ORIGINATING ERROR TRTMT is "ANNC", then an associated ORIGINATING ERROR ANNCMT ROUTE INDEX must be specified on either the TGSRFD form as a default parameter, or on a given line or trunk parameter form (TGSRLPA, TGSRMPA or TGSRTPA).

3.8 TERMINATING

Description: Terminating Error Announcement Route Index.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The Route Index value is related to the Terminating Error Treatment field. If TERMINATING ERROR TRTMT is "ANNC", then an associated TERMINATING ERROR ANNCMT ROUTE INDEX must be specified on either the TGSRFD form as a default parameter, or on a given line or trunk parameter form (TGSRFD, TGSRMPA or TGSRTPA).

3.9 DISP RESTRICT

Copyright © 2003 Lucent Technologies

Description: The Display Restriction field is used to indicate the restriction that displays on an ISAT's console for an incoming MBG (Multiswitch Business Group) call. The DISP RESTRICT field was added to support the CENTREX Network feature. For more information on the CENTREX Network secured features, see Division 2, Sections 4A181, 4A182, and 4A183.

Software Release: 5E9(2) and later.
Valid Entries:

Valid DISP RESTRICT Entries

Entry	Definition
TOLL	Attendant display indicates toll calls are restricted.

3.10 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the TGATTD (Terminal Group Attendant and Data) form (5611 Record), RC view (4.4); but ifthat form does not exist or is NULL

SEC. 8B: 5607-3 RECORD
TERMINAL GROUP AND STATION RESTRICTION
LINE (TN) PARAMETER FORM - TGSRLPA

1. GENERAL

The 5607-3 Record is available with 5E2 and later Software Releases, and is used to define a Terminal Group and Station Restriction Line Parameter.

The Line Parameter form is associated with the Terminal Group and Station Restriction Feature Definition form and is keyed by the TN (Telephone Number). Individual TNs assigned a particular TGSR Feature name can be given new specific values for Terminal Group ID, Forwarded to DNs (Originating or Terminating) and Error Announcement Route Indexes (Originating or Terminating) that will replace or overwrite the Default Parameter values that are defined on the TGSR feature Definition form.

There are certain Feature Options that require either a value on a TGSR Feature Definition Default Parameter field or the presence of the associated Line Parameter field.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.29.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * TN

Description: Enter a customer Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The TN must be assigned on an associated Line Feature Assignment form, LINEFA (5112 Record).

The associated Class of Service on the LCC form (5306 Record) must be one of the following:

	Class of Service
ATND	50B Non-Data Link Console Line or Attendant Line.
HOTMOTL	Special Termination at Motel Equipment.
HOTPBX	Special Termination to a Motel.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
SATSTLN	Stand-Alone Test Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.

For 5E12 and later, TN/FEATURE combinations on different TGSRLPA forms cannot be duplicated.

Copyright © 2003 Lucent Technologies

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the TGSRLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the unique Feature name for the TGSR feature defined on the TGSRFD form.
Valid Entries: 1 - 8 characters

2.4 GROUP ID

Description: Enter the Group Identification number.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

If the GROUP ID is not assigned on the associated TGSRFD form (5607-1/2 Record), it must be entered on this form.

2.5 MOH ALW

Description: Is Music on Hold allowed?

Once a call has been placed on hold, this field indicates whether or not music is to be provided to the held party during the hold period. This field is only applicable when Secured Feature ID 64 is set to "S" ("Y" for 5E9(1) and later) on the SFSYS form (5713-1 Record).

Software Release: 5E7 and later
Required Field.
Default Values: N
Valid Entries: Y, N

Data Rules:

If MOH ALW is "Y" for a TGSR feature assigned to a TN or an MLHG/TERM on a LINEFA, MLHLNFA, CLUSTR, or BFG form, then:

- the LCC and RAX of the TN or MLHG/TERM must be defined on a corresponding LCC form with CLASS OF SERVICE of "INDIV", "ATND", "ISDN", "ISATND".
- a GROUP ID must be specified on either the BFG or corresponding TGSRFD, TGSRLPA or TGRSMPA form and have a MUSIC ON HOLD TGN and MEMB assigned on the TGATTD form.

FORWARD TO DN

The fields (Section 2.6 - Section 2.7) specify the telephone numbers to which calls will be rerouted when Station Restriction failure occurs.

2.6 ORIGINATING

Description: Enter the ORIGINATING FORWARD TO DN, Directory Number. An entry corresponds to the associated ORIGINATING ERROR TRTMT field equal to "RERTE" (reroute to DN) on the TGSRFD form.
Valid Entries: 1 - 32 characters (0 - 9, *, or #)

Copyright © 2003 Lucent Technologies

2.7 TERMINATING

Description: Enter the TERMINATING FORWARD TO DN, Directory Number. An entry corresponds to the associated TERMINATING ERROR TRTMT field equal to "RERTE" (reroute to DN) on the TGSRFD form.
Valid Entries: 1 - 32 characters (0 - 9, *, or #)

ERROR ANNCMT ROUTE INDEX

The fields (Section 2.8 - Section 2.9) specify the error announcement route indexes for originating and terminating.

2.8 ORIGINATING

Description: Enter the ORIGINATING ERROR ANNCMT ROUTE INDEX. An entry corresponds to the associated ORIGINATING ERROR TRTMT field equal to "ANNC" (route to special announcement) on the TGSRFD form.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

If the ORIGINATING ERROR TRTMT field on the TGSRFD form is "TONE", then the associated ORIGINATING fields for both FORWARD TO DN and ERROR ANNCMT ROUTE INDEX must be blank.

If the ORIGINATING ERROR TRTMT field on the TGSRFD form is "ANNC", then the associated ORIGINATING field for ERROR ANNCMT ROUTE INDEX must be specified. For any other Originating Error Treatment, this field must be blank.

2.9 TERMINATING

Description: Enter the TERMINATING ERROR ANNCMT ROUTE INDEX. An entry corresponds to the associated TERMINATING ERROR TRTMT field equal to "ANNC" (route to special announcement) on the TGSRFD form.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

For 5E13 and later: 1 - 16382

Data Rules:

If the TERMINATING ERROR TRTMT field on the TGSRFD form is "TONE", then the associated TERMINATING fields for both FORWARD TO DN and ERROR ANNCMT ROUTE INDEX must be blank.

If the TERMINATING ERROR TRTMT field on the TGSRFD form is "ANNC", then the associated TERMINATING field for ERROR ANNCMT ROUTE INDEX must be specified. For any other Terminating Error Treatment, this field must be blank.

2.10 DISP RESTRICT

Description: The Display Restriction field is used to indicate the restriction that displays on an ISAT's console for an incoming MBG (Multiswitch Business Group) call. The DISP RESTRICT field was added to support the CENTREX Network feature. For more information on the CENTREX Network secured

Copyright © 2003 Lucent Technologies

features, see Division 2, Sections 4A181, 4A182, and 4A183.

Software Release: 5E9(2) and later.
Valid Entries:

Valid DISP RESTRICT Entries

Entry	Definition
TOLL	Attendant display indicates toll calls are restricted.

2.11 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the TGATTD (Terminal Group Attendant and Data) form (5611 Record), RC view (4.4); but if that form does not exist or is NULL consult OFCOPT.

SEC. 8C: 5607-4 RECORD
TERMINAL GROUP AND STATION RESTRICTION
LINE (MLHG/TERM) PARAMETER FORM - TGSRMPA

1. GENERAL

The 5607-3 Record is available with 5E2 and later Software Releases. It is used to define Terminal Group and Station Restriction parameters for an MLHG MEMB (Multi-Line Hunt Group Member).

The MLHG/TERM Form is associated with the Terminal Group and Station Restriction Feature Definition Form and is keyed by MLHG/TERM. Individual MLHG/TERMS assigned a TGSR Feature name can be given new specific values for Terminal Group ID, Forward to DNs (originating or terminating) that will replace or overwrite the Default Parameter values that are defined on the TGSR Feature Definition Form.

There are certain Feature Options that require either a value on a TGSR Feature Definition Default Parameter field or the presence of the associated MLHG/TERM Parameter field.

The MLHG/TERM Form is used to distinguish customer lines that have Station Restrictions different from those defined on the TGSRFD Form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.29.

2. FORM AND RECORD ENTRIES

2.1 BASE CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * MLHG

Description: Enter a Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

The MLHG value must be assigned on the Multi-Line Hunt and Member Feature Assignment Form, MLHLNFA (5113 Record).

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Terminal (member) Number.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The terminal value must be assigned on a Multi-Line Hunt and Member Feature Assignment Form, MLHLNFA.

The associated Class of Service on the LCC form (5306 Record) must be one of the following:

Class of Service	
ATND	50B Non-Data Link Console Line or Attendant Line.
HOTMOTL	Special Termination at Motel Equipment.

Copyright © 2003 Lucent Technologies

HOTPBX	Special Termination to a Motel.
INDIV	Individual Line.
ISDN	Software Release: 5E4 and later. Integrated Services Digital Network (ISDN) digital subscriber lines.
ISATND	Software Release: 5E4 and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
SATSTLN	Stand-Alone Test Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.

2.4 *FEATURE

Description: Enter the feature name for the specific TSGR feature, defined on the TGSRFD Form.
Valid Entries: 1 - 8 characters

2.5 GROUP ID

Description: Enter the Terminal Group Identification number.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

If the GROUP ID is not assigned on the associated TGSRFD form (5607-1/2 Record), it must be entered on this form.

2.6 MOH ALW

Description: Is Music on Hold allowed?

Once a call has been placed on hold, this field indicates whether or not music is to be provided to the held party during the hold period. This field is only applicable when Secured Feature ID 64 is set to "S" ("Y" for 5E9(1) and later) on the SFSYS form (5713-1 Record).

Software Release: 5E7 and later
Required Field.
Default Values: N
Valid Entries: Y, N

Data Rules:

If MOH ALW is "Y" for a TGSR feature assigned to a TN or an MLHG/TERM on a LINEFA, MLHLNFA, CLUSTR, or BFG form, then:

- the LCC and RAX of the TN or MLHG/TERM must be defined on a corresponding LCC form with CLASS OF SERVICE of "INDIV", "ATND", "ISDN", "ISATND".
- a GROUP ID must be specified on either the BFG or corresponding TGSRFD, TGSRLPA or TGRSMPA form and have a MUSIC ON HOLD TGN and MEMB assigned on the TGATTD form.

FORWARD TO DN

The fields (Section 2.7 - Section 2.8) specify the telephone numbers to which calls will be rerouted when Station Restriction failure occurs.

2.7 ORIGINATING

Copyright © 2003 Lucent Technologies

Description: Enter the Originating Forward to DN (Directory Number). Note that an entry corresponds to the associated Originating Error Treatment field equal to "RERTE" on the TGSRFD Form, reroute to DN.
Valid Entries: 1 - 32 digits (0 - 9, *, or #)

2.8 TERMINATING

Description: Enter the Terminating Forward to DN (Directory Number). Note that an entry corresponds to the associated Terminating Error Treatment field equal to "RERTE" on the TGSRFD Form, reroute to DN.
Valid Entries: 1 - 32 digits (0 - 9, *, or #)

ERROR ANNCMT ROUTE INDEX

The fields (Section 2.9 - Section 2.10) specify the error announcement route indexes for originating and terminating.

2.9 ORIGINATING

Description: Enter the Originating Error Announcement Index. Note that an entry corresponds to the associated Originating Error Treatment field equal to "ANNC" on the TGSRFD Form, for route to special announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

  For 5E13 and later: 1 - 16382

2.10 TERMINATING

Description: Enter the Terminating Error Announcement Route Index. Note that an entry corresponds to the associated Terminating Error Treatment field equal to "ANNC" on the TGSRFD Form, for route to special announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

  For 5E13 and later: 1 - 16382

Data Rules:

If the Originating or Terminating Error Treatment field on the TGSRFD Form equals "TONE", then the associated Originating/Terminating fields for both FORWARD TO DN and ERROR ANNCMT ROUTE INDEX must be blank.

2.11 DISP RESTRICT

Description: The Display Restriction field is used to indicate the restriction that displays on an ISAT's console for an incoming MBG (Multiswitch Business Group) call. The DISP RESTRICT field was added to support the CENTREX Network feature. For more information on the CENTREX Network secured features, see Division 2, Sections 4A181, 4A182, and 4A183.

Software Release: 5E9(2) and later.
Valid Entries:

Valid DISP RESTRICT Entries

Entry	Definition
TOLL	Attendant display indicates toll calls are restricted.

Copyright © 2003 Lucent Technologies

2.12 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the TGATTD (Terminal Group Attendant and Data) form (5611 Record), RC view (4.4); but if that form does not exist or is NULL consult OFCOPT.

SEC. 8D: 5607-5 RECORD
TERMINAL GROUP AND STATION RESTRICTION
TRUNK PARAMETER FORM - TGSRTPA

1. GENERAL

The 5607-5 Record is available with 5E2 and later Software Releases, and is used to define Terminal Group and Station Restriction Trunk Parameter.

The TGN/MEMB NO Form is associated with the Terminal Group and Station Restriction Feature Definition Form and is keyed by TGN/MEMB. Individual TGN/MEMBs assigned a particular TGSR feature name can be given new specific values for Terminal Group ID, Forward to Directory Numbers (Originating or Terminating) that will replace or overwrite the Default Parameter values that are defined on the TGSR Feature Definition Form.

There are certain Feature Options that require a value on a TGSR Feature Definition Default Parameter field or the presence of the associated Trunk Parameter field.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.29.

2. BASE AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN value must be assigned on a Trunk Feature Assignment Form, TRUNKFA (5205 Record) or on the TKGRPFA form (5206 Record).

The associated TRKCLS entry on the TKGRP form (5202-1 Record) must be one of the following:

Trunk Class	
AUXTRNK	Auxiliary Service Trunk.
EDSL	Extended Digital Subscriber Line Trunks. This TRKCLS is not valid unless Secured Feature ID 60 is activated.
EDSLHM	EDSL Trunk for Hotel/Motel TSPS Service. This TRKCLS is not valid unless Secured Feature ID 60 is activated.
LTOLLCON	Toll Connecting.
PBXDID	PBX Direct Inward Dialing 1 Way Outgoing.
PF	Private Facility.
PFCPE	Private Facility Customer Premise Equipment.
PFLASH	Private Facility Feature Flash.
PFITT	Software Release: 5E3 and later. Private Facility Intertandem Trunk.
PRINTOLL	Primary Intertoll.
TTOLLCON	Toll Completing.

2.3 * MEMB

Copyright © 2003 Lucent Technologies

Description: Enter the TG (Trunk Group) Member Number.
Valid Entries:
- For 5E2: 0 - 1983
- For 5E3 and later: 0 - 1951

Data Rules:

The TG Member Number value must be assigned on a Trunk Feature Assignment Form (TRUNKFA).

2.4 * FEATURE

Description: Enter the feature name for the specific TGSR feature, defined on the TGSR Form.
Valid Entries: 1 - 8 characters

2.5 GROUP ID

Description: Enter the Terminal Group Identification number.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

If the GROUP ID is not assigned on the associated TGSRFD form (5607-1/2 Record), it must be entered on this form.

FORWARD TO DN

The fields (Section 2.6 - Section 2.7) specify the telephone numbers to which calls will be rerouted when Station Restriction failure occurs.

2.6 ORIGINATING

Description: Enter the Originating Forward to DN (Directory Number). Note that an entry corresponds to the associated Originating Error Treatment field equal to "RERTE" on the TGSRFD Form, reroute to DN.
Valid Entries: 1 - 32 digits (0 - 9, *, or #)

2.7 TERMINATING

Description: Enter the Terminating Forward to DN (Directory Number). Note that an entry corresponds to the associated Terminating Error Treatment field equal to "RERTE" on the TGSRFD Form, reroute to DN.
Valid Entries: 1 - 32 digits (0 - 9, *, or #)

ERROR ANNCMT ROUTE INDEX

The fields (Section 2.8 - Section 2.9) specify the error announcement route indexes for originating and terminating.

2.8 ORIGINATING

Description: Enter the Originating Announcement Route Index. Note that an entry corresponds to the associated Originating Error Treatment field equal to "ANNC" on the TGSRFD Form, for route to special announcement.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095

Copyright © 2003 Lucent Technologies

- For 5E13 and later: Blank, or 1 - 16382

2.9 TERMINATING

Description: Enter the Terminating Error Announcement Route Index. Note that an entry corresponds to the associated Terminating Error Treatment field equal to "ANNC" on the TGSRFD Form, for route to special announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If the Originating or Terminating Error Treatment field on the TGSRFD Form equal to "TONE", then the associated Originating/ Terminating fields for both FORWARD TO DN and ERROR ANNCMT ROUTE INDEX must be blank.

2.10 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the TGATTD (Terminal Group Attendant and Data) form (5611 Record), RC view (4.4); but if that form does not exist or is NULL consult OFCOPT.

SEC. 9: AUTOMATIC ROUTE SELECTION FORMS

Copyright © 2003 Lucent Technologies

SEC. 9A: 5608-1A/B RECORDS
AUTOMATIC ROUTE SELECTION FEATURE DEFINITION FORM - ARSFD

1. GENERAL

The 5608-1 Record is available with 5E2 and later Software Releases. It is used to define various combinations of options associated with ARS (Automatic Route Selection), a BRCS feature. With 5E3 and later Software Releases, this record has been expanded into two records, the 5608-1A and 5608-1B, to accommodate additional options and default parameters.

1.1 ARS Features

Each combination is given a feature name of from one to eight characters which is used to assign the constructed (switch owner defined) feature to lines or trunks. Certain ARS features are pre-defined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. Lists of preconstructed features appear in Figure 1 and Figure 2 .

1.2 ARS Capability

The ARS capability is used to route calls based on prespecified choices of facilities such as Tie, FX, OUTWATS or DDD for the 5ESS Switch customer. ARS uses the dialed number to route a call over the first available facility in the customer's prespecified list. The customer can have up to six groups of route patterns and may be allowed to change which group is active manually from a control line or by utilizing the Time Of Day BRCS feature. ARS allows customers to restrict the use of facilities based on an FRL (Facility Restriction Level) associated with each terminal (line or trunk) accessing the ARS capability. The customer can optionally specify which facilities in each route pattern are considered expensive so that any terminal accessing that facility via ARS would receive an Expensive Route Warning Tone.

To use the ARS capability, a terminal must be assigned an ARS feature on the appropriate feature assignment form (e.g., LINEFA form (5112 Record), TKGRPFA form (5206 Record) etc.) and must belong to an ARS group. The ARS Group Name is assigned either as a default parameter defined with an ARS constructed feature on the ARSFD form or on an ARSLPA (5608-3 Record), ARSMPA (5608-4 Record) or ARSTPA (5608-5 Record) form. For 5E2, the ARS group information, defined on the ARSGPA form, is used to indicate the preferred (or initial) route to use for each pattern group based on dialed digits. For 5E3 and later, the preferred route based on dialed digits is defined on the ARSSCRN form (5608-6 Record). For all Software Releases, the ARSGPA form (5608-2 Record) is used to define parameters for the ARS Group.

ARS is normally considered an originating feature in that it is a feature assigned to a terminal so that, when the terminal originates, it may access unique digit analysis and/or unique ARS routing. There exist two cases where the terminal that is being terminated to by Automatic Route Selection routing requires an ARS feature and associated parameters to be assigned. These cases are when the Trunk Group selected requires an outgoing Traveling Class Mark (see the default parameter, TCMOUT on this form) or requires Segmented Signaling (see the ARSSIG form (5608-9 Record)). In both cases, even if the Trunk Group is one-way outgoing, the trunks will require an ARS feature.

1.3 Valid Service Classes

Valid service classes for terminals assigned an ARS feature are as follows. For Software Release availability, see the LCC form (5306 Record) for lines or the TKGRP form (5202-1 Record) for trunks.

Valid CLASS OF SERVICES	
Lines	**Trunks**
INDIV	PF
ATND	PFLASH
PBX	PFITT

Copyright © 2003 Lucent Technologies

4WINDIV	EDSL
ISDN	EDSLHM
ISATND	
MODEM	

1.4 ARS Access

Access to the ARS capability may be automatic (usually for a PBX) or via an Access Code defined in digit analysis as an "ARSUSE" action. Two additional actions associated with ARS Access Codes in 5E3 and later are "ARS1USE" and "ARS2USE", used respectively to indicate that digit analysis should be done in Private Network Dialing Plans 1 and 2. See the PNDP form (5608-10/11 Records). The access type is defined on the ARSFD form under ENTRY.

1.5 Supplementary Services for ISDN CSD

The BRCS Supplementary Services for ISDN CSD (Circuit-Switched Data) calls feature, which is available in 5E6 and later, allows the ARS service originally developed for CSV (Circuit-Switched Voice) calls to apply to CSD calls as well. Use of this feature provides the means to establish CSD calls between BRIs (Basic Rate Interfaces) or PRIs (Primary Rate Interfaces) that are making use of the ARS service. When a line or trunk is assigned ARS service, it may apply to both CSV and CSD calls for that BRI or PRI.

Since ARS groups for CSD and CSV calls are separate, all group options available to a CSV ARS user are also available to a CSD ARS user. The values of these options, which are entered on the ARSGPA form (5608-2 Record) can differ or be the same for each group. Allowing group names to be different prevents ARS CSD GROUPS from being restricted to just duplicating ARS CSV GROUPs.

CSD ARS GROUP may also be assigned through BFGs (BRCS Feature Groups) in the same manner CSV ARS groups are currently assigned.

CSD calls use the same UNP (Uniform Numbering Plan) as CSV calls, that is, even with the existence of both CSD and CSV ARS groups, the UNP for CSV calls will be the only UNP that is used.

Queuing is not supported for CSD ARS calls. Also, different ARS action codes must be used for CSD as follows:

- DARSCP, Change the active pattern group
- DGPACT, Activate the ARS CSD group
- DGPDCT, Deactivate the ARS CSD group
- FRLDMAIN, Activate the CSD Main FRL
- DFRLALT, Activate the CSD Alternate FRL

Existing preconstructed features for CSV calls will also be used for CSD calls (no new preconstructed ARS features). ARS features for both groups will be constructed the same way using the options on this ARSFD form, ARSGPA (5608-2 Record) and/or ARSLPA form (5608-3 Record), ARSMPA form (5608-4 Record) and ARSTPA form (5608-5 Record). For more information concerning the assignment of BRCS features, see Division 2, Section 1F.

1.6 Recent Change View

The corresponding Recent Change View for this form is 12.11.

2. FORM ENTRIES - 5608-1A RECORD

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and the Office Name on each record.

2.2 * FEATURE NAME

Description: This field is used to enter the ARS Feature Name. Feature Names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: This field is used for a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.14) comprise the available Feature Options.

2.4 DACT TYPE

Description: This field is used to indicate whether or not the feature can be deactivated by the subscriber for one call.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
NONE	The subscriber is not permitted deactivation.
CODE	The subscriber is permitted to deactivate the feature by dialing a code.

Data Rules:

When "CODE" is entered, the ENTRY field is usually equal to "AUTO". The code dialed to deactivate the feature must be defined in the subscriber's IDP (Individualized Dialing Plan) Dialed Code Assignment, (5601-1 Record) (if a member of an IDP Group) as Action equal to "ARSDCT". If not a member of an IDP group, the code must be defined with this action in the PDIT form (5300-2 Record).

2.5 GROUP ACT TYPE

Description: This field is used to indicate whether the ARS Group can be activated by the subscriber.
Default: AUTO
Valid Entries:

Valid GROUP ACT TYPE Entries

Entry	Definition
AUTO	Permission is denied.
CODE	The ARS Group can be activated by dialing a code.

Data Rules:

The default and only value is "AUTO", except for ARS features derived from the preconstructed features using the ODA change-insert mode of the review operation.

To use "CODE", the code to be dialed to activate the ARS Group must be defined in the IDPDCA (5601-1 Record) or the PDIT (5300-2 Record), as action equal to "GPACT". The record used is dependent on

Copyright © 2003 Lucent Technologies

whether the customer uses an IDP or the ODP (Office Dialing Plan).

2.6 GROUP DACT TYPE

Description: This field is used to indicate whether the ARS Group can be deactivated by the subscriber.

If the ARS Group has been deactivated via a code and a member of the ARS Group dials a call, that call will be routed based on the ODP as if this was a POTS call. If the entry to the ARS capability is via an ARS Access Code, that code will not be analyzed in the ODP but all subsequent digits will be analyzed.
Default: NONE
Valid Entries:

Valid GROUP DACT TYPE Entries

Entry	Definition
NONE	**Permission denied.**
CODE	**The ARS Group can be deactivated by dialing a code.**

Data Rules:

If GROUP ACT TYPE is "AUTO", GROUP DACT TYPE must be "NONE". If GROUP ACT TYPE is "CODE", GROUP DACT must be "CODE".

To use "CODE", the code to be dialed to deactivate the ARS Group must be defined in the IDPDCA or the PDIT as action equal to "GPDCT" depending on whether or not the customer is a member of an IDP Group.

2.7 ENTRY

Description: This field is used to indicate the customer's ability to access the ARS capability.

Required Field.
Default: CODE
Valid Entries:

Valid ENTRY Entries

Entry	Definition
CODE	ARS routing is used when the customer dials a code.
AUTO	ARS routing is always used.

Data Rules:

When "CODE" is entered, a code must be defined in the IDPDCA or PDIT with ACTION equal to "ARSUSE" depending on whether or not the customer is a member of an IDP Group. Two additional actions associated with ARS Access Codes in 5E3 and later, are "ARS1USE" and "ARS2USE", used respectively to indicate that digit analysis should be done in Private Network Dialing Plan 1 and 2. See the PNDP (5608-10/11 Records) form. Both of these actions may be used in either the IDPDCA or PDIT.

2.8 BAD NUMBER TREATMENT

Description: This field is used to enter the error treatment to be used for inappropriate ARS dialed numbers when the Office Dialing Plan is used to interpret ARS digits.

For 5E2, the ODP is always used. For 5E3 and later, the ODP is used only when the action associated with Code entry ARS is "ARSUSE" or when ODP is specified for Auto entry ARS as a parameter. However, when a PNDP is used, this entry will not be used.

When an ARS number is dialed, the ODP that the originator is assigned to is analyzed to determine a pointer via the POTS Route Index to the appropriate route list. (See the ARSGPA form 5608-2 Record for additional information.) If the POTS Route Index is not defined for the ARS Group on the ARSGPA, then the number dialed is determined to be inappropriate for this group.

Copyright © 2003 Lucent Technologies

The software associated with ARS may also determine that a number is inappropriate if the ODP is used. When the ODP digit analysis tables are read, the Call Type is checked. If the Call Type is "EMER", ARS is ignored and the call is completed as if ARS routing had not been invoked. If the Call Type is "NORMAL", ARS continues processing. If the Call Type is not "EMER" or "NORMAL", the call is considered inappropriate and call termination depends on this entry.

Required Field.

Software Release: 5E3 and later
Default: POTS
Valid Entries:

Valid BAD NUMBER TREATMENT Entries

Entry	Definition
REORD	Route to reorder tone.
ANN	Route to an announcement.
ATT	Used for 5E2 only. Route to the attendant of this customer's Terminal Group
ATDN	Used for 5E3 and later. Route to the attendant of this customer's Terminal Group.
POTS	The dialed digits (not including an ARS Access Code,if dialed) are interpreted in the Office Dialing Plan and the call is treated like a POTS origination.

Data Rules:

If "ANN" is entered, a Route Index that points to an announcement Trunk Group must be entered on the ARSGPA (5608-2 Record) form in the field BAD NUMBER ANNOUNCEMENT.

If "ATT" or "ATDN" is entered, the customer must be assigned to a Terminal Group (see the Terminal Group/Station Restriction BRCS capability) and the Terminal Group must have an Attendant Telephone Number defined on the TGATTD (5611 Record) form.

2.9 FRL TYPE

Description: This field is used to indicate the type of Facility Restriction Level used with this ARS feature.

Required Field.
Default: FIX
Valid Entries:

Valid FRL TYPE Entries

Entry	Definition
FIX	Indicates that the FRL value for all customers with this feature is fixed at 16. (This is the maximum value and thus indicates no blocking will be done based on FRL.)
VAR	Indicates that the FRL permission is defined on a per terminal basis with values of 1 - 16.

2.10 CHANGE ACTIVE PATTERN GROUP

Description: Can the active Pattern Group Number be changed via the TOD (Time of Day) BRCS feature?

Required Field.
Default: N
Valid Entries: Y, N

2.11 CHANGE WARNING TONE

Description: Is the customer permitted to change the warning tone parameter defined for the terminal which is assigned the ARS feature by dialing a code?
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

NOTE: For 5E2 and later the default and only value is N, except for ARS features derived from the preconstructed features using the ODA change-insert mode of the review operation.

2.12 CHANGE ALT FRL

Description: Is the customer permitted to activate and deactivate an Alternate FRL (Facility Restriction Level) table by dialing a code?

The code dialed to deactivate the Alternate FRL table (and therefore activate the Main FRLs) must be defined in the IDPDCA or PDIT with an ACTION equal to "FRLMAIN". For additional information on the Alternate FRL table, see the ARSFRL form (5608-7 Record).

Required Field.

Software Release: 5E3 and later
Default: N
Valid Entries: Y, N

Data Rules:

When this entry equals "Y", the code dialed to activate the Alternate FRL table must be defined in the customer's IDPDCA form (5601-1 Record) (if a member of an IDP Group) with an ACTION equal to "FRLALT". If not a member of an IDP Group, the code must be defined with this ACTION in PDIT (5300-2 Record).

2.13 TCM OPTION

Description: Do any of the private Trunk Groups associated with the ARS Group use TCM (Traveling Class Marks)?

TCMs provide the means to pass FRL information between private network nodes. The TCM is a one or two-digit number appended to the called number digit string. TCMs may be received on trunks incoming to this office or outpulsed on trunks outgoing to the next node. See the default parameters TCM IN, TCM OUT, and DEFAULT TCM on this form. If the TCM in either direction is a one-digit number, it will need conversion provided by the ARSTCM form (5608-8 Record) to or from the two-digit format of the FRL.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E6 and later, this field must be set to "Y" if the ARS GROUP NAME assigned on the ARSTCM form is defined as CSV ARS GROUP or CSD ARS GROUP on this ARSFD form.

2.14 CCSA LIMITATION

Description: Should CCSA SFG (Simulated Facility Group) and private CCSA AMA billing records be used?

If this entry equals "Y", the "CCSA SFG" and special billing will be used only when the ARS originated call is being interpreted in the Private Network Dialing Plan 1 associated with the ARS Group of the terminal. If the initial digits are being interpreted in either the Office Dialing Plan or PNDP 2, then CCSA is not applicable. For additional information, see the PNDP form (5608-10/11 Records) and the PFATG form (5609-2 Record).

Software Release: 5E3 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

3. FORM ENTRIES, 5608-1B RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the Office Name on each record.

DEFAULT PARAMETERS

The following fields (Section 3.2 - Section 3.20) define the default parameters assigned with the feature to terminals (lines or trunks). These parameters will be assigned to the terminal unless they are overridden by entries on the ARSLPA, ARSMPA or ARSTPA forms.

3.2 ARS GROUP NAME

Description: This field is used to insert the name of the ARS Group. The maximum quantity of ARS Groups in an office is 200.

Software Release: 5E5 and earlier
Valid Entries: 1 - 8 characters

Data Rules:

The ARS Group Name must be defined on an ARSGPA (5608-2 Record) form.

3.3 CSV ARS GRP

Description: This field is used to enter the Circuit-Switched Voice ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The ARS Group Name must be defined on the ARSGPA form (5608-2 Record) with GROUP TYPE of "VOICE".

Defining a CSV ARS GRP is not required, however; if a CSD ARS GRP is defined on this form, then a CSV ARS GRP also must be defined.

If CSV ARS GRP is entered, the following fields must be entered: TONE TYPE, ARS SI, USE ALT FRL, ALW MDR RAO, QUEUE ALLOWED and PRIORITY QUEUE.

3.4 CSD ARS GRP

Description: This field is used to enter the name of the Circuit-Switched Data ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The CSD ARS GRP must match an ARS Group Name defined on the ARSGPA (5608-2 Record) form with a GROUP TYPE of "CSD".

Copyright © 2003 Lucent Technologies

There cannot be CSD only groups for ARS service. This field can only be entered if CSV ARS GRP is entered.

If this CSD ARS GRP is to be assigned to a trunk or trunk group via the TRUNKFA or TKGRPFA form and the TRKCLS on the associated TKGRP form is "EDSL" or "EDSLHM", the DATA RATE on the corresponding TKGRP form must be entered.

3.5 TONE TYPE

Description: This field is used to indicate the warning tone to be applied to the ARS call originator if a route marked as an expensive route (as indicated on the MCRTIDX form 5304 Record) is accessed.

Valid TONE TYPE Entries

Entry	Definition
BEEP1	A single beep tone.
NONE	No tone.

3.6 FRL LINE

Description: This field is used to indicate the FRL (Facility Restriction Level) of privilege assigned to the terminal.

If the ARS feature is defined with FRL TYPE equal to "FIX" and FRL LINE has an entry, the entry must be 16. Each ARS route within a route list of a route pattern (which is defined on an MCRTIDX form (5304 Record)) is also assigned an FRL to indicate the minimum level of privilege needed to access the facility. The terminal must have an FRL number greater than or equal to the FRL of the route to succeed.

If the FRL of the terminal is less than the FRL of the route, then Reorder tone is applied. With 5E3 and later, before Reorder tone is given, there may be interactions with Authorization Codes and Queuing, if applicable.
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

3.7 USE ALT FRL

Description: Should the terminal's FRL (Facility Restriction Level) be changed when the Alternate FRL table is activated via a dial code or Time of Day?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

If the associated ARS Group has ALW ALT FRL equal to "N" on the ARSGPA form (5608-2 Record) then this entry must equal "N".

3.8 ARS SI

Description: This field is used to indicate the ARS Screening Index associated with the terminal.

The ARS SIs provide the ability to give different ARS routing treatment to groups of terminals within an ARS Group. The ARS Group Name and each ARS SI for the group must be entered along with all applicable ARS Indexes (found in digit analysis) on the ARSSCRN form (5608-6 Record).

Software Release: 5E3 and later
Valid Entries: 1 - 16 characters

Copyright © 2003 Lucent Technologies

3.9 ALW MDR RAO

Description: Should an AMA billing record be made when the terminal originates a call which finds a Charge Index with an AMA Call Type of "CCSAS", "ETSMDR" or "ETSCCSA"? By setting Allow Message Detail Recording to Revenue Accounting Office to "N", these private billing records will be inhibited for this terminal.

Software Release: 5E3 and later
Valid Entries: Y, N

3.10 PRIVATE DN

Description: This field is used to enter the Private Directory billing number. If entered this number will be used for the Message Detail Recording of private billing records either to the CL (Customer Location) or RAO (Revenue Accounting Office).

Software Release: 5E3 and later
Valid Entries:

- For 5E11 and earlier: enter up to 7 digits, 0 - 9
- For 5E12 and later: enter up to 10 digits, 0 - 9

3.11 TCM IN

Description: This field is used to indicate whether a one or two-digit TCM (Traveling Class Mark) is expected to be received on incoming calls on trunks which are assigned this feature. This parameter is only applicable to trunks. Lines which are assigned this feature (when this field has an entry) will not have the value stored and, therefore, has no effect on the lines.

This feature may be used only when a Private Network Dialing Plan is interpreting the ARS digits. See the PNDP form (5608-10/11 Records).

Software Release: 5E3 and later
Valid Entries:

Valid TCM IN Entries

Entry	Definition
1	Indicates a one-digit TCM.
2	Indicates a two-digit TCM.

Data Rules:

When this field is entered, TCM OPTION must equal "Y" and trunks assigned this feature must be One-Way Incoming or Two-Way.

For 5E6 and later, if a trunk with TRKCLS "EDSL" or "EDSLHM" (on the TKGRP form) is assigned this feature without an overriding ARSTPA form, then TCM IN must be left blank.

3.12 TCM OUT

Description: This field is used to indicate whether a one or two-digit TCM (Traveling Class Mark) is expected to be sent on outgoing calls on trunks which are assigned this feature. This parameter is only applicable to trunks. Lines which are assigned this feature (when this field has an entry) will not have the value stored and, therefore, has no effect on the lines.

Software Release: 5E3 and later
Valid Entries:

Valid TCM OUT Entries

Copyright © 2003 Lucent Technologies

Entry	Definition
1	Indicates a one-digit TCM.
2	Indicates a two-digit TCM.

Data Rules:

For 5E6 and later , if this field is entered, an ARSTCM form must be entered with an ARS GROUP NAME that matches the CSV ARS GROUP defined on this ARSFD form.

When this field is entered, then TCM OPTION must equal "Y" and trunks assigned this feature must be One-Way Outgoing or Two-Way.

For 5E6 and later, if a trunk with TRKCLS "EDSL" or "EDSLHM" (on the TKGRP form) is assigned this feature without an overriding ARSTPA form, then TCM OUT must be left blank.

3.13 DEFAULT TCM

Description: This field is used to specify the Default Traveling Class Mark for any trunk that has TCM OUT specified. The Outgoing TCM is normally determined by the FRL (Facility Restriction Level) of the call. If an FRL is not present, the Default TCM will be used. Such would be the case on a maintenance test call or if the trunk can also be accessed through PFA (Private Facility Access) codes.

Software Release: 5E3 and later
Valid Entries: 0 - 16

Data Rules:

When TCM OUT is 1, this field may be 0 - 7; when TCM OUT is 2 it may be 0 - 16; otherwise, leave it blank.

When this field is entered, trunks assigned this feature without an overriding ARSTPA form must be One-Way Outgoing or Two-Way, i.e., the TRK DIR on the TKGRP form must be "OUT" or "2W".

For 5E6 and later, if a trunk with TRKCLS "EDSL" or "EDSLHM" (on the TKGRP form) is assigned this feature without an overriding ARSTPA form, then DEFAULT TCM must be left blank.

3.14 QUEUE ALLOWED

Description: Is the terminal allowed to queue for the first route in the ARS route list when queuing is active and all routes are busy?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

For 5E9(1) and later when an MLHG member has a "MODEM" class of service, it may not be assigned an ARS feature (on the MLHLNFA, BFG, or associated CLUSTR form) where QUEUE ALLOWED is set to "Y" on the ARSFD, ARSMPA, or BFG form. An MLHG member is defined as MLHG and TERM on an MLHLN form or as CKT MLHG and CKT TERM on a DSLUSR form.

3.15 PRIORITY QUEUE

Description: Should the terminal be allowed to enter the Priority Queue? Incoming trunks and Attendant lines must have Priority Queuing if queuing is provided.

Software Release: 5E3 and later
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

3.16 DIAL PLAN

Description: This field is used only when ENTRY equals "AUTO" to indicate where to analyze the ARS dialed number. See the PNDP form (5608- 10/11 Records) if the Dial Plan is 1 or 2.

For terminals that use an access code to invoke ARS (i.e., ENTRY equals "CODE") the action specified for the access code will determine the dialing plan, therefore, this field must be blank.

Software Release: 5E3 and later
Valid Entries:

Valid DIAL PLAN Entries

Entry	Definition
ODP	The Office Dialing Plan of the terminal will be used.
1	The digits will be interpreted in Private Network Dialing Plan 1.
2	The digits will be interpreted in Private Network Dialing Plan 2.

Data Rules:

If DIAL PLAN is 1 or 2, the DIAL PLAN value and CSV ARS GROUP name defined on this form must be defined on the PNINFO form (5608-12 Record).

3.17 RLT FRL IND

Description: Release Link Trunk Facility Restriction Level indicator. Is the original caller's FRL to be used in place of the attendant's FRL for routing and for the MDR Record?

Required Field.

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

3.18 RLT AMA IND

Description: Release Link Trunk Automatic Message Accounting indicator. Is the original caller's data to be used in place of the attendant's data in the AMA Record?

Required Field.

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

3.19 VOICE ETE

Description: This field is used to enter the End-to-End Q.931 Connectivity option for voice calls using this ARS feature.

Required Field.

Software Release: 5E6 and later
Default: ANY
Valid Entries:

Valid VOICE ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. If no PRI trunks are available, the route will fail.

Copyright © 2003 Lucent Technologies

Data Rules:

When CSV ARS GRP is left blank, VOICE ETE must contain the default value of "ANY".

When this form is entered for an ARS feature assigned to a non-PRI Trunk (the corresponding TKGRP form (5202 Record) has TRKCLS set to some value other than "EDSL" or "EDSLHM") without an overriding ARSTPA form VOICE ETE must be set to the default value of "ANY".

When this ARS feature is assigned to a Line or MLHG Terminal and VOICE ETE is set to any value other than "ANY", then CLASS OF SERVICE on the appropriate LCC form (5306 Record) must be set to one of the following values: "INDIV", "ATND", "PBX", "4WINDIV", ISDN", "ISATND", "MODEM .

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

Since this field does not appear on the BFG form, if a value other than the default of "ANY" is desired, then that value must appear on the ARSFD form or one of the ARS Line Parameter Assignment (ARSLPA, ARSMPA, ARSTPA) forms.

3.20 DATA ETE

Description: Enter the End-to-End Q.931 Connectivity option for data calls using this ARS feature.

Required Field.

Software Release: 5E6 and later
Default: ANY
Valid Entries:

Valid DATA ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI trunks are preferred to route the call. However, if a PRI trunk is not available then any trunk will be used.
REQ	PRI trunks are required to route the call. If no PRI trunks are available, the route will fail.

Data Rules:

When CSD ARS GRP is left blank, DATA ETE must contain the default value of "ANY".

When this form is entered for an ARS feature assigned to a non-PRI Trunk (the corresponding TKGRP form - 5202 Record, has TRKCLS set to some value other than "EDSL" or "EDSLHM"), without an overriding ARSTPA form, VOICE ETE must be set to the default value of "ANY".

When this ARS feature is assigned to a Line or MLHG Terminal and DATA ETE is set to any value other than "ANY", then CLASS OF SERVICE on the appropriate LCC form (5306 Record) must be set to one of the following values: "INDIV", "ATND", "PBX", "4WINDIV", ISDN", "ISATND", "MODEM

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

Since this field does not appear on the BFG form, if a value other than the default of "ANY" is desired, that value must appear on the ARSFD form or one of the ARS Line Parameter Assignment (ARSLPA, ARSMPA, ARSTPA) forms.

SEC. 9B: 5608-2 RECORD
AUTOMATIC ROUTE SELECTION GROUP PARAMETER FORM - ARSGPA

1. GENERAL

The 5608-2 Record is available with 5E2 and later Software Releases and is used to define the group level of information required for the ARS (Automatic Route Selection) BRCS capability.

Each terminal (line or trunk) which is to use the ARS capability must be assigned an ARS feature name (defined on the ARSFD form (5608-1 Record)) on the appropriate feature assignment form, LINEFA, MLHLNFA, TKGRPFA, or TRUNKFA. In addition, each terminal must be assigned to an ARS Group which may be defined as a Default Parameter of the ARSFD form or on an individual terminal basis with the ARSLPA, ARSMPA or ARSTPA forms.

1.1 5E3 and Later Software Releases

Exactly one ARSGPA form is submitted for each ARS Group containing the parameters for the group where one value is appropriate for the group independent of the screening data used to determine the first route of an ARS dialed sequence. The screening data must be defined on the ARSSCRN form (5608-6 Record). Many ARSSCRN forms may need to be entered to define routing for the group.

1.2 Call Processing

When the ARS capability is invoked in the 5E2 Software Release, either automatically or via an Access Code defined with action equal to "ARSUSE", special call processing takes place. The number dialed (excluding any Access Code) is analyzed in the originator's POTS (Plain Old Telephone Service) digit analysis tables, usually a PDIT and LDIT. The Call Type is checked to see if this is an appropriate number for ARS routing. If the Call Type is "EMER", ARS is ignored and the call is completed as if ARS routing had not been invoked. If the Call Type is "NORMAL", ARS continues processing. If the Call Type is not "EMER" or "NORMAL", the call is determined to be inappropriate and the ARSFD form (5608-1 Record) is checked to determine how this call should be treated based on BAD NUMBER TREATMENT. When the Call Type is "NORMAL", the Route Index is read for this digit analysis entry.

Because an ARS call is being processed, the software does not enter the Rate and Route Record as a normal POTS call would. Instead, the POTS ROUTE INDEX is used as a key into the ARS Group Parameter information for the particular ARS Group of which the call originator is a member. (This assumes that the ARS Group is active. If not, the call would have been routed based on the POTS digit analysis entries that were just read and processed just like a POTS call.) If the POTS ROUTE INDEX is not found for the ARS Group, the call is processed based on the BAD NUMBER TREATMENT of the ARSFD form. If the POTS ROUTE INDEX is found, the MC ROUTE INDEX entry is read, based on which Pattern Group is active (e.g., when Pattern Group 3 is active, MC ROUTE INDEX 3 is used.)

The Route Indexes produced by POTS digit analysis must be sufficiently unique to determine proper ARS routing for all ARS Groups. This may require that duplicate information be defined for two or more Route Indexes, even though they are not required for POTS calls. For instance, Codes 232 and 989 might use the same terminating Trunk Group for POTS calls and, therefore, the LDIT entries for both would have the same Route Index. However, if an ARS Group required unique routing sequences for these codes, then two Route Indexes would be needed as pointers into the Group Parameter information and separate Route Indexes would be entered (and defined identically) in the LDIT for these two codes.

1.3 Recent Change View

The corresponding Recent Change View for this form is 10.5.

2. FORM AND RECORD ENTRIES

Copyright © 2003 Lucent Technologies

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * ARS GROUP NAME

Description: Enter the name of the ARS Group.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E9 and later, the maximum quantity of ARS Groups in an office is 200.

2.3 GROUP STATUS

Description: Is the ARS Group active?
Default: Y
Valid Entries: Y, N

2.4 NUMBER PATTERN GROUPS ALLOWED

Description: Enter the number of Pattern Groups allowed for this ARS Group.

Required Field.
Default: 1
Valid Entries: 1 - 6

Data Rules:

All ARSGPA forms entered into ODA for a particular ARS Group must have the same value for this field.

2.5 ACTIVE PATTERN GROUP NUMBER

Description: Enter the number of the Pattern Group that is active. In the case where GROUP STATUS equals "N", this field indicates which Pattern Group will be active when the ARS Group is activated.

Required Field.
Default: 1
Valid Entries: 1 - 6

Data Rules:

The value entered must be less than or equal to the value entered in NUMBER PATTERN GROUPS ALLOWED.

All ARSGPA forms entered into ODA for a particular ARS Group must have the same value for this field.

2.6 GROUP TYPE

Description: Enter the type of call the ARS group is applicable to.

Required Field.
Default: VOICE
Valid Entries:

Valid GROUP TYPE Entries

Entry	Definition
VOICE	CSV (Circuit-Switched Voice) calls
CSD	CSD (Circuit-Switched Data) calls

Copyright © 2003 Lucent Technologies

2.7 BAD NUMBER ANNOUNCEMENT RTI

Description: Enter the Route Index to be used when a member of this ARS Group dials an inappropriate number for ARS.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

The Route Index entered here will also be used when any ARSSCRN form (5608-6 Record) has a ROUTE TYPE equal to "ANNCE", or when an associated PNINFO form (5608-12 Record) has ERROR TREATMENT equal to "ANNCE".

If a Route Index is entered here, it must be defined on the RTIDX form (5303 Record) and point to an announcement type Trunk Group.

All ARSGPA forms entered into ODA for a particular ARS Group must have the same value (or blank) for this field.

2.8 INHIBIT TOD

Description: Can TOD (Time Of Day) scheduled changes for the ARS Group be temporarily inhibited by the ARS customer through Facilities Management?

Required Field.
Default: N
Valid Entries: Y, N

2.9 ALW ALT FRL

Description: Are Alternate FRLs (Facility Restriction Levels) allowed for this ARS Group?

When the Action "FRLALT" is invoked via either a dialed code or TOD, the Alternate FRLs will be used instead of the FRL assigned to each terminal in the ARS Group. For additional information and restrictions, see the ARSFRL form.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field equals "Y", the Alternate FRLs for this ARS Group must be defined on the ARSFRL form (5608-7 Record).

2.10 ALT FRL ACTIVE

Description: Is the Alternate FRL (Facility Restriction Level) active for this ARS Group?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If ALW ALT FRL equals "N", the terminal FRLs will always be used and this field must equal "N".

If ALW ALT FRL equals "Y", this field may be equal to either "Y" or "N", where "Y" indicates the Alternate FRL table is active and "N" indicates the terminal FRLs (sometimes referred to as the Main FRLs) are active.

2.11 POST QUEUE FRL

Description: Enter the FRL (Facility Restriction Level) to use for Post Queue routing if the queue times out.

The ARS call is placed on queue under the following conditions. ARS routing searches for an idle port in each succeeding route in the route list until a route is found with an FRL which exceeds the originator's FRL or until the end of the route list. The originator's FRL may be either as assigned as the ARS parameter or it may be the Alternate FRL if this group has Alternate FRLs and they are active. If the search through the route list has stopped because the originator's FRL is insufficient, the Authorization Code feature may be invoked to provide a higher FRL for the terminal so that more routes may be searched.

If the Authorization Code feature is not used for this terminal or an idle port still cannot be found, the call will be placed on the queue of the first choice facility if that facility, either a Trunk Group or a Simulated Facility Group, has an active Queue Feature assigned to it and the originating terminal is allowed to queue. See the ARS parameter QUEUE ALLOWED on the ARSFD, ARSLPA, ARSMPA or ARSTPA forms.

If the call remains on queue longer than the timeout value specified current FRL of the terminal is equal to or greater than the FRL specified in THRESH FRL, the FRL will be changed to the FRL value specified in this field. This may be used to upgrade the terminal's FRL so that more routes may be searched on this second routing attempt. If a route is found this time with an FRL greater than currently used for the terminal, the call may not queue again so Reorder tone will be applied. If post queue FRL upgrade is not desired, leave this field blank.
Valid Entries: 0 - 16

Data Rules:

If this entry is specified, THRESH FRL must be specified.

2.12 THRESH FRL

Description: Enter a minimum or Threshold value of the current terminal FRL (Facility Restriction Level) before the FRL will be upgraded to the FRL specified in POST QUEUE FRL.
Valid Entries: 0 - 16

Data Rules:

If this field has an entry, then POST QUEUE FRL must be specified. Additionally, the FRL value entered here must be less than or equal to the POST QUEUE FRL value.

2.13 SAT HOP CNT

Description: Enter the maximum Satellite Hop Count allowed for each call in an ARS group. This represents the maximum number of satellite hops a call can take during its routing. When the maximum Satellite Hop Count is reached or exceeded, then the option specified by the field SAT HOP OPT, also on this form, will determine what action will be taken.

It is suggested, but not required, that all SAT HOP CNT entries within an office be set to the same value.

Copyright © 2003 Lucent Technologies

Required Field.
Default: 2
Valid Entries: 0 - 9

2.14 SAT HOP OPT

Description: Enter the option which will determine what action to take once the Satellite Hop Count has been reached or exceeded.

As an example, consider a call in the process of being routed by an ARS feature whose ARS group has SAT HOP CNT set to 3. The call has passed through 3 satellites so far in the route. The remainder of the route will be handled as follows:

If SAT HOP OPT has been set to "STRICT", then the remainder of the route will not be allowed to pass through any satellites. If the route cannot be completed using only terrestrial facilities, then the route will fail.

If SAT HOP OPT has been set to "PREF", then the remainder of the route will attempt to be made using terrestrial facilities. However, when terrestrial facilities are used up, and satellite facilities exist, the satellite facilities will be used.

If SAT HOP OPT has been set to "ANY", then the remainder of the route will use both terrestrial and satellite facilities, whichever is available.

Required Field.
Default: ANY
Valid Entries:

Valid SAT HOP OPT Entries

Entry	Definition
ANY	Any available route. Once the Satellite Hop Count has been reached, continue to route using either terrestrial or satellite facilities, whichever is available.
PREF	Preferred terrestrial route. Once the Satellite Hop Count has been reached, try to route using terrestrial facilities; if no terrestrial facilities are available, route using satellite facilities.
STRICT	Strictly terrestrial route. Once the Satellite Hop Count has been reached, try to route using terrestrial facilities; if no terrestrial facilities are available, the route will fail.

2.15 LN CUST ID

Description: Enter the LN (Leased Network) Customer ID.

It is the LN ARSID received by the LN Action Control Point from the Network Control Point or received by an LN VIA office in a CCS7 ISUP Initial Address Message. This is the Internal ARS Voice ID assigned to the associated ARS group name when the associated GROUP TYPE is entered as "VOICE" and the Internal ARS Data Group ID assigned to the associated ARS Group Name when the associated GROUP TYPE is entered as "CSD".
Valid Entries: 1 - 255

Data Rules:

An LN CUST ID number can only be defined on a maximum of two ARSGPA forms, of which exactly one GROUP TYPE must be "VOICE".

SEC. 9C: 5608-3 RECORD
AUTOMATIC ROUTE SELECTION LINE (TN) PARAMETER FORM - ARSLPA

1. GENERAL

The 5608-3 Record is available with 5E2 and later Software Releases. It is used when assigning ARS (Automatic Route Selection) features to non-Multi-Line Hunt lines. The ARS feature parameters are assigned to the lines if the default parameters of the ARSFD form (5608-1A/1B Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the line.
Valid Entries:
- For 5E2: NXXXXXX, where N is 2 - 9 and X is 0 - 9.
- For 5E3 through 5E11: XXXXXXX, where X is a number in the range of 0 - 9.
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The associated Class Of Service on the LCC form (5306 Record) must be:

CLASS OF SERVICE	Definition
ATND	50B Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.
MODEM	Software Release: 5E4(2) and later. Packet Switching Modem Pooling.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ARSLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, TN/FEATURE combinations on different ARSLPA forms cannot be duplicated.

2.3 * FEATURE

Description: Enter the name of the ARS feature for which the parameters are to be assigned. The name entered here must be that of an ARS feature defined on the ARSFD form (5608-1A/1B Record).
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.4 * ARS GROUP NAME

Description: This field has been renamed CSV ARS GRP for 5E6 and later.

Enter the name of an ARS Group of which this line is a member.

Software Release: 5E5 and earlier
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ARS Group defined on the ARSGPA form (5608-2 Record). The maximum quantity of ARS Groups in an office is 200.

2.5 # CSV ARS GRP

Description: Enter the name of the CSV (Circuit-Switched Voice) ARS group.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name must be defined with a matching ARS GROUP NAME defined on the ARSGPA form (5608-2 Record) with a GROUP TYPE of "VOICE". Defining a CSV ARS GRP for this port is required.

If this form is entered and CCSA LIMITATION is "Y" on the ARSFD form, the CSV ARS GROUP assigned on this form must match the ARS GROUP NAME defined on the PNINFO form (5608-12 Record) where DIAL PLAN is 1.

2.6 CSD ARS GRP

Description: Enter the name of the CSD (Circuit-Switched Data) ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must be defined with a matching ARS GROUP NAME on the ARSGPA form (5608-2 Record) with a GROUP TYPE of "CSD". Defining a CSD ARS GRP for this port is optional.

If a CSD group is defined the CSD ARS GRP name must not be the same as the CSV ARS GRP name.

2.7 TONE TYPE

Description: Enter the warning tone to be applied to the line if a route marked as an expensive route (as indicated on the MCRTIDX form (5304 Record)) is accessed.

Required Field.
Default: NONE
Valid Entries:

Valid TONE TYPE Entries

Entry	Definition
BEEP1	A single beep tone.
NONE	No tone.

Copyright © 2003 Lucent Technologies

2.8 FRL LINE

Description: Enter the FRL (Facility Restriction Level) of privilege assigned to the line. Each ARS route within a route list of a route pattern (which is defined on an MCRTIDX form (5304 Record)) is also assigned an FRL to indicate the minimum level of privilege needed to access the facility. The line must have an FRL number greater than or equal to the FRL of the route to succeed.

If the FRL of the line is less than the FRL of the route, then Reorder tone is applied. With 5E3 and later, before Reorder tone is given, there may be interactions with Authorization Codes and Queuing, if applicable.

Required Field.
Default: 16
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

Data Rules:

If the ARS feature to which this line is assigned is defined with FRL TYPE equal to "FIX", then the entry must be 16.

2.9 USE ALT FRL

Description: Should the terminal's FRL change when the Alternate FRL table is activated via a dial code or TOD (Time Of Day) feature?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the associated ARS Group has ALW ALT FRL equal to "N" on the ARSGPA form (5608-2 Record), then this entry must equal "N".

2.10 ARS SI

Description: Enter the ARS-SI (Automatic Route Selection Screening Index) associated with the terminal. The ARS SIs provide the ability to give different ARS routing treatment to groups of terminals within an ARS Group.

Software Release: 5E3 and later
Required Field.
Default: 1
Valid Entries: 1 - 16

Data Rules:

The ARS Group Name and each ARS SI for the group must be entered along with all applicable ARS Indexes (found in digit analysis) on the ARSSCRN form (5608-6 Record).

2.11 ALW MDR RAO

Description: Should an AMA (Automatic Message Accounting) billing record be made when the terminal originates a call which finds a Charge Index with an AMA Call Type of "CCSAS", "ETSMDR", or

Copyright © 2003 Lucent Technologies

"ETSCCSA"?

By setting ALW MDR RAO (Allow Message Detail Recording to Revenue Accounting Office) to "N", the private billing records will be inhibited for this terminal.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.12 PRIVATE DN

Description: Enter the Private directory billing number. This number, if entered, will be used for the MDR (Message Detail Recording) of private billing records either to the CL (Customer Location) or RAO.

Software Release: 5E3 and later
Valid Entries:
- For 5E11 and earlier: enter up to 7 digits, 0 - 9
- For 5E12 and later: enter up to 10 digits, 0 - 9

2.13 QUEUE ALLOWED

Description: Is the Terminal allowed to queue for the first route in the ARS route list when queuing is active and all routes are busy? For 5E6 and later, this applies to CSV ARS GRP only.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.14 PRIORITY QUEUE

Description: Should the terminal be in the Priority Queue when queuing is allowed for a terminal? Attendant lines must have Priority Queuing if queuing is provided.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry equals "Y", then QUEUE ALLOWED must be equal to "Y".

2.15 DIAL PLAN

Description: Enter where to analyze the ARS dialed number. This field is used only when the ARS Feature associated with this line is defined with ENTRY equal to "AUTO" on the ARSFD form (5608-1A/1B Record). See the PNDP form (5608-10/11 Records).

Software Release: 5E3 and later
Valid Entries:

Valid DIAL PLAN Entries

Entry	Definition
ODP	Use Office Dialing Plan of the terminal.
1	Digits will be interpreted in PNDP (Private Network Dialing Plan) 1.
2	Digits will be interpreted in PNDP 2.

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E6 and later, if this field is entered for a CSV ARS GROUP, this group must be entered as ARS GROUP NAME on the PNDP form for the corresponding INCOMING DIGITS value and the DIAL PLAN value and CSV ARS GROUP NAME must be defined on the PNINFO form (5608-12 Record).

For terminals that use an access code to invoke ARS (i.e., ENTRY equals "CODE") the action specified for the access code will determine the dialing plan, therefore, this field must be blank.

2.16 VOICE ETE

Description: Enter the ETE (End-to-End) Q.931 Connectivity option for voice calls using this ARS feature.

Software Release: 5E6 and later
Required Field.
Default: ANY
Valid Entries:

Valid VOICE ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI (Primary Rate Interface) trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. If no PRI trunks are available, the route will fail.

Data Rules:

When this ARS feature is assigned to a Line or MLHG Terminal and VOICE ETE is set to any value other than "ANY", then CLASS OF SERVICE on the appropriate LCC form must be set to one of the following values: "INDIV", "ATND", "PBX", "4WINDIV", "ISDN", "ISATND", or "MODEM".

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

2.17 DATA ETE

Description: Enter the ETE (End-to-End) Q.931 Connectivity option for data calls using this ARS feature.

Software Release: 5E6 and later
Required Field.
Default: ANY
Valid Entries:

Valid DATA ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. If no PRI trunks are available, the route will fail.

Data Rules:

When CSD ARS GRP is left blank, then DATA ETE must contain the default value of "ANY".

When this ARS feature is assigned to a Line or MLHG Terminal and DATA ETE is set to any value other than "ANY", then CLASS OF SERVICE on the appropriate LCC form must be set to one of the following values: "INDIV", "ATND", "PBX", "4WINDIV", "ISDN", "ISATND", or "MODEM".

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

SEC. 9D: 5608-4 RECORD
AUTOMATIC ROUTE SELECTION LINE (MLHG/TERM) PARAMETER FORM - ARSMPA

1. GENERAL

The 5608-4 Record is available with 5E2 and later Software Releases. It is used when assigning ARS features to Multi-Line Hunt lines to assign ARS feature parameters to the lines if the default parameters of the ARSFD form (5608-1A/1B Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Member Number of the line.
Valid Entries:
- 1 - 2015
- 3001-3999 (Outdial Terminals Only)

Data Rules:

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be:

CLASS OF SERVICE	Definition
ATND	50B "Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.
MODEM	Software Release: 5E4(2) and later. Packet Switching Modem Pooling.

2.4 * FEATURE

Description: Enter the name of the ARS feature for which the parameters are to be assigned. The name entered here must be that of an ARS feature defined on the ARSFD form (5608-1A/1B Record).
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.5 * ARS GROUP NAME

Description: This field has been renamed CSV ARS GRP for 5E6 and later.

Enter the name of an ARS Group of which this line is a member.

Software Release: 5E5 and earlier
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ARS Group defined on the ARSGPA form (5608-2 Record). The maximum quantity of ARS Groups in an office is 200.

2.6 # CSV ARS GRP

Description: Enter the name of the CSV "(Circuit-Switched Voice) ARS group.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name must be defined with a matching ARS GROUP NAME defined on the ARSGPA form (5608-2 Record) with a GROUP TYPE of "VOICE". Defining a CSV ARS GRP for this port is required.

For 5E6 and later, if this form is entered and CCSA LIMITATION is "Y" on the ARSFD form, the CSV ARS GROUP assigned on this form must match the ARS GROUP NAME defined on the PNINFO form (5608-12 Record) where DIAL PLAN is 1.

2.7 CSD ARS GRP

Description: Enter the name of the CSD "(Circuit-Switched Data) ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must be defined with a matching ARS GROUP NAME on the ARSGPA form (5608-2 Record) with a GROUP TYPE of "CSD". Defining a CSD ARS GRP for this port is optional. If a CSD group is defined the CSD ARS GRP name must not be the same as the CSV ARS GRP name.

2.8 TONE TYPE

Description: Enter the warning tone to be applied to the line if a route marked as an expensive route (as indicated on the MCRTIDX form (5304 Record)) is accessed.

Required Field.
Default: NONE
Valid Entries:

Valid TONE TYPE Entries

Entry	Definition
BEEP1	A single beep tone.
NONE	No tone.

2.9 FRL LINE

Copyright © 2003 Lucent Technologies

Description: Enter the FRL (Facility Restriction Level) of privilege assigned to the line. Each ARS route within a route list of a route pattern (which is defined on an MCRTIDX form (5304 Record)) is also assigned an FRL to indicate the minimum level of privilege needed to access the facility. The line must have an FRL number greater than or equal to the FRL of the route to succeed.

If the FRL of the line is less than the FRL of the route, then Reorder tone is applied. With 5E3 and later, before Reorder tone is given, there may be interactions with Authorization Codes and Queuing, if applicable.

Required Field.
Default: 16
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

Data Rules:

If the ARS feature which this line is assigned is defined with FRL TYPE equal to "FIX", then the entry must be 16.

2.10 USE ALT FRL

Description: Should the terminal's FRL change when the Alternate FRL table is activated via a dial code or TOD (Time Of Day) feature?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the associated ARS Group has ALW ALT FRL equal to "N" on the ARSGPA form (5608-2 Record), then this entry must equal "N".

2.11 ARS SI

Description: Enter the ARS-SI (Automatic Route Selection Screening Index) associated with the terminal. The ARS SIs provide the ability to give different ARS routing treatment to groups of terminals within an ARS Group.

Software Release: 5E3 and later
Required Field.
Default: 1
Valid Entries: 1 - 16

Data Rules:

The ARS Group Name and each ARS SI for the group must be entered along with all applicable ARS Indexes (found in digit analysis) on the ARSSCRN form (5608-6 Record).

2.12 ALW MDR RAO

Description: Should an AMA (Automatic Message Accounting) billing record be made when the terminal originates a call which finds a Charge Index with an AMA Call Type of "CCSAS", "ETSMDR , or "ETSCCSA"?

Copyright © 2003 Lucent Technologies

By setting ALW MDR RAO (Allow Message Detail Recording to Revenue Accounting Office) to "N", the private billing records will be inhibited for this terminal.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.13 PRIVATE DN

Description: Enter the Private directory billing number. This number, if entered, will be used for the MDR (Message Detail Recording) of private billing records either to the CL (Customer Location) or RAO.

Software Release: 5E3 and later
Valid Entries:

- For 5E11 and earlier: enter up to 7 digits, 0 - 9
- For 5E12 and later: enter up to 10 digits, 0 - 9

2.14 QUEUE ALLOWED

Description: Is the Terminal allowed to queue for the first route in the ARS route list when queuing is active and all routes are busy? For 5E6 and later, this applies to CSV ARS GRP only.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.15 PRIORITY QUEUE

Description: Should the terminal be in the Priority Queue when queuing is allowed for a terminal? Attendant lines must have Priority Queuing if queuing is provided.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry equals "Y", then QUEUE ALLOWED must be equal to "Y".

2.16 DIAL PLAN

Description: Enter where to analyze the ARS dialed number. This field is used only when the ARS Feature associated with this line is defined with ENTRY equal to "AUTO" on the ARSFD form (5608-1A/1B Record). See the PNDP form (5608-10/11 Records).

Software Release: 5E3 and later
Valid Entries:

Valid DIAL PLAN Entries

Entry	Definition
ODP	Use Office Dialing Plan of the terminal.
1	Digits will be interpreted in PNDP (Private Network Dialing Plan) 1.
2	Digits will be interpreted in PNDP 2.

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E6 and later, if this field is entered for a CSV ARS GROUP, this group must be entered as ARS GROUP NAME on the PNDP form for the corresponding INCOMING DIGITS value and the DIAL PLAN value and CSV ARS GROUP NAME must be defined on the PNINFO form (5608-12 Record).

For terminals that use an access code to invoke ARS (i.e., ENTRY equals "CODE") the action specified for the access code will determine the dialing plan, therefore, this field must be blank.

2.17 VOICE ETE

Description: Enter the ETE "(End-to-End) Q.931 Connectivity option for voice calls using this ARS feature.

Software Release: 5E6 and later
Required Field.
Default: ANY
Valid Entries:

Valid VOICE ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI (Primary Rate Interface) trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. If no PRI trunks are available, the route will fail.

Data Rules:

When this ARS feature is assigned to a Line or MLHG Terminal and VOICE ETE is set to any value other than "ANY", then CLASS OF SERVICE on the appropriate LCC form must be set to one of the following values: "INDIV", "ATND , "PBX", "4WINDIV", "ISDN", "ISATND", or "MODEM".

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

2.18 DATA ETE

Description: Enter the ETE "(End-to-End) Q.931 Connectivity option for data calls using this ARS feature.

Software Release: 5E6 and later
Required Field.
Default: ANY
Valid Entries:

Valid DATA ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. If no PRI trunks are available, the route will fail.

Data Rules:

When CSD ARS GRP is left blank, then DATA ETE must contain the default value of "ANY".

When this ARS feature is assigned to a Line or MLHG Terminal and DATA ETE is set to any value other than "ANY", then CLASS OF SERVICE on the appropriate LCC form must be set to one of the following values: "INDIV", "ATND", "PBX", "4WINDIV", "ISDN", "ISATND", or "MODEM".

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

SEC. 9E: 5608-5 RECORD
AUTOMATIC ROUTE SELECTION TRUNK (TGN/MEMB)
PARAMETER FORM - ARSTPA

1. GENERAL

The 5608-5 Record is available with 5E2 and later Software Releases. It is used when assigning ARS features to trunks if the default parameters of the ARSFD form (5608-1A/1B Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and the Office Name on each record.

2.2 * TGN

Description: This field is used to enter the Trunk Group Number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202-1 Record) must be:

TKCLS Entry	Definition
PF	Private Facility
PFCPE	Private Facility Customer Premise Equipment
PFLASH	Private Facility Feature Flash
PFITT	Software Release: 5E3 and later. Private Facility Intertandem Trunk
EDSL	Software Release: 5E8 and later. Extended Digital Subscriber Line trunk.
EDSLHM	Software Release: 5E8 and later. EDSL trunk for Hotel/Motel TSPS service.

2.3 * MEMB

Description: This field is used to enter the Trunk Group Member Number of the trunk.

Required Field.
Valid Entries:
- For 5E2 only: 0-1983
- For 5E3 and later: 0-1951

2.4 * FEATURE

Description: This field is used to enter the ARS feature name for which the parameters are to be assigned.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1- 8 characters

Data Rules:

The name entered here must be that of an ARS feature defined on the ARSFD form (5608-1A/1B Record).

2.5 ARS GROUP NAME

Description: This field is used to enter the ARS Group Name. The maximum quantity of ARS Groups in an office is 200. For 5E6 and later this field has been renamed CSV ARS GRP.

Software Release: 5E5 and earlier
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ARS Group defined on the ARSGPA form (5608-2 Record).

2.6 CSV ARS GRP

Description: This field is used to enter the name of the circuit-switched voice ARS group.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name must be defined with a matching ARS GROUP NAME on the ARSGPA form (5608-2 Record) with a GROUP TYPE of "VOICE".

If this form is entered and CCSA LIMITATION is "Y" on the ARSFD form, the CSV ARS GROUP assigned on this form must match the ARS GROUP NAME defined on the PNINFO form (5608-12 Record) where DIAL PLAN is 1.

For 5E7 and later, when this field is not entered, TCM IN and TCM OUT cannot be entered.

2.7 CSD ARS GRP

Description: This field is used to enter the name of the circuit-switched data ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must be defined with a matching ARS GROUP NAME on the ARSGPA form (5608-2 Record) with a GROUP TYPE of "CSD". Defining a CSD ARS GRP for this port is optional. If a "CSD" group is defined, the CSD ARS GRP name must not be the same as the CSV ARS GRP name.

If this CSD ARS GRP is to be assigned to a trunk or trunk group via the TRUNKFA form (5205 Record) or TKGRPFA form (5206 Record) (FEATURE on TRUNKFA form, TKGRPFA form (5206 Record) or CLUSTR form (5600 Record) matches FEATURE on this ARSFD form) and the TRKCLS for the corresponding TGN/MEMB(s) is "EDSL" or "EDSLHM" on the TKGRP form (5202 Record) the DATA RATE on the TKGRP form must be entered.

Copyright © 2003 Lucent Technologies

2.8 TONE TYPE

Description: This field is used to indicate the warning tone to be applied to the trunk if a route marked as an expensive route (as indicated on the MCRTIDX form (5304 Record)) is accessed.

Required Field.
Default: NONE
Valid Entries:

Valid TONE TYPE Entries

Entry	Definition
BEEP 1	A single beep tone
NONE	No tone

2.9 FRL LINE

Description: This field is used to indicate the FRL (Facility Restriction Level) of privilege assigned to the trunk. Each ARS route within a route list of a route pattern (which is defined on an MCRTIDX form (5304 Record)) is also assigned an FRL to indicate the minimum level of privilege needed to access the facility. The trunk must have an FRL number greater than or equal to the FRL of the route to succeed.

If the FRL of the trunk is less than the FRL of the route, then reorder tone is applied. With 5E3 and later Software Releases, before Reorder tone is given, there may be interactions with Authorization Codes and Queuing, if applicable.

Required Field.
Default: 16
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

Data Rules:

If the ARS feature to which this trunk is assigned, is defined with FRL TYPE equal to "FIX", then the entry must be 16.

2.10 USE ALT FRL

Description: Should the terminal's FRL (Facility Restriction Level) be changed when the Alternate FRL table is activated via a dial code or Time of Day?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E6 and later, for the associated ARS Group, or CSV ARS GRP and/or CSD ARS GRP, the entry in this field must match ALW ALT FRL entered on the ARSGPA form (5608-2 Record).

2.11 ARS SI

Description: This field is used to indicate the ARS Screening Index associated with the terminal.

The ARS SIs provide the ability to give different ARS routing treatment to groups of terminals within an ARS Group.

Copyright © 2003 Lucent Technologies

Software Release: 5E3 and later
Required Field.
Default: 1
Valid Entries: 1 - 16

Data Rules:

The ARS Group Name and each ARS SI for the group must be entered along with all applicable ARS Indexes (found in digit analysis) on the ARSSCRN form (5608-6 Record).

2.12 ALW MDR RAO

Description: Should an AMA billing record be made when the terminal originates a call which finds a Charge Index with an AMA Call Type of "CCSAS", "ETSMDR" or "ETSCCSA" ?

By setting ALW MDR RAO (Allow Message Detail Recording to Revenue Accounting Office) to "N", these private billing records will be inhibited for this terminal.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.13 PRIVATE DN

Description: This field is used to enter the Private directory billing number. This Private directory billing number, if entered, will be used for the MDR (Message Detail Recording) of private billing records either to the CL (Customer Location) or RAO (Revenue Accounting Office).

Software Release: 5E3 and later
Valid Entries:
- For 5E11 and earlier: enter up to 7 digits, 0 - 9
- For 5E12 and later: enter up to 10 digits, 0 - 9

2.14 TCM IN

Description: This field is used to indicate whether a one-digit or two-digit TCM (Traveling Class Mark) is expected to be received on incoming calls on this trunk.

Software Release: 5E3 and later
Valid Entries:

Valid TCM IN Entries

Entry	Definition
1	Indicates a one-digit TCM
2	Indicates a two-digit TCM

Data Rules:

This feature may be used only when a Private Network Dialing Plan is interpreting the ARS digits. See the PNDP form (5608-10/11 Records).

When this field is entered, then TCM OPTION on the ARSFD form (5608-1A Record) must equal "Y". Additionally, this trunk must be One-Way Incoming or Two-Way.

When 1 is entered, the ARSTCM form (5608-8 Record) will be used to convert the one-digit TCM to a two-digit FRL (Facility Restriction Level) to be used during call processing.

Copyright © 2003 Lucent Technologies

For 5E6 and later, this field must be left blank when the trunk has a TRKCLS of "EDSL" or "EDSLHM" on the associated TKGRP form (5202 Record).

2.15 TCM OUT

Description: This field is used to indicate whether a one-digit or two-digit TCM (Traveling Class Mark) is expected to be sent on outgoing calls on this trunk.

Software Release: 5E3 and later
Valid Entries:

Valid TCM OUT Entries

Entry	Definition
1	Indicates a one-digit TCM
2	Indicates a two-digit TCM

Data Rules:

When this field is entered the TCM OPTION on the ARSFD form (5608-1A Record) must equal "Y". Additionally, this trunk must be One-Way Outgoing or Two-Way. The field, DEFAULT TCM, must also have an entry.

When 1 is entered, the data determined from the ARSTCM form (5608-8 Record) will be used to convert the two-digit FRL value of the current call to the one-digit TCM required for outpulsing.

For 5E6 and later, if this field is set to "Y" and CSV ARS GROUP and/or CSD ARS GROUP name is assigned on this form, the CSV ARS GRP and/or CSD ARS GROUP name must match the ARS GROUP NAME on the ARSTCM form.

For 5E6 and later, this field must be left blank when the trunk has a TRKCLS of "EDSL" or "EDSLHM" on the associated TKGRP form (5202 Record).

2.16 DEFAULT TCM

Description: This field is used to determine if a Default TCM is used.

The DEFAULT TCM (Traveling Class Mark) is specified for any trunk that has TCM OUT specified. The Outgoing TCM is normally determined by the FRL (Facility Restriction Level) of the call. If an FRL is not present, the default TCM will be used. Such would be the case on a maintenance test call or if the trunk can be accessed through PFA (Private Facility Access) codes.

Software Release: 5E3 and later
Valid Entries:

- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

Data Rules:

Valid entries are 0 - 7 when TCM OUT equals 1 and 1 - 16 when TCM OUT equals 2. Otherwise, leave this field blank.

When this field is entered, the trunk must be One-Way Outgoing or Two-Way, TRK DIR "OUT" or "2W" on the associated TKGRP form (5202 Record).

For 5E6 and later, this field must be left blank when the trunk has a TRKCLS of "EDSL" or "EDSLHM" on the associated TKGRP form.

2.17 QUEUE ALLOWED

Copyright © 2003 Lucent Technologies

Description: Is the terminal allowed to queue for the first route in the ARS route list when queuing is active and all routes are busy?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.18 PRIORITY QUEUE

Description: If queuing is allowed for a terminal, should the terminal be in the Priority Queue? Incoming Trunks must have Priority Queuing if queuing is provided.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry equals "Y", then QUEUE ALLOWED must be equal to "Y".

2.19 DIAL PLAN

Description: This field is used only when the ARS Feature associated with this trunk is defined with ENTRY equal to "AUTO" on the ARSFD form (5608-1A Record). It is used to indicate where to analyze the ARS dialed number.

Software Release: 5E3 and later
Valid Entries:

Valid DIAL PLAN Entries

Entry	Definition
1	The digits will be interpreted in Private Network Dialing Plan 1
2	The digits will be interpreted in Private Network Dialing Plan 2
ODP	The Office Dialing Plan of the terminal will be used

Data Rules:

For more information detailing valid entries please see the PNDP form (5608-10/11 Records).

For 5E6 and later, the DIAL PLAN value and CSV ARS GROUP name must be defined on the PNINFO form (5608-12 Record).

For terminals that use an access code to invoke ARS (i.e., ENTRY equals "CODE"), the action specified for the access code will determine the dialing plan, therefore, this field must be blank.

2.20 RLT FRL IND

Description: Is the original caller's FRL to be used in place of the attendant's FRL for routing and for the MDR Record? Enter the Release Link Trunk Facility Restriction Level indicator.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

This entry must be "Y" if the original caller's FRL is to be used in place of the attendant's FRL for routing and for the MDR Record.

If this field is "Y", then RLT TYPE must not be "NONE" on the associated TKGRP form.

2.21 RLT AMA IND

Description: Is the original caller's data to be used in place of the attendant's data in the AMA Record? Enter the Release Link Trunk Automatic Message Accounting indicator.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This entry must be "Y" if the original caller's data is to be used in place of the attendant's data in the AMA Record.

If this field is "Y", then RLT TYPE must not be "NONE" on the associated TKGRP form.

2.22 VOICE ETE

Description: This field is used to enter the End-to-End Q.931 Connectivity option for voice calls using this ARS feature.

Required Field.
Default: ANY
Valid Entries:

Valid VOICE ETE Entries

Entry	Definition
ANY	The call routes over any available trunk.
PREF	PRI trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. However, if a PRI trunk is not available, the route will fail.

Data Rules:

When this feature is assigned to a non-PRI trunk (the TRKCLS has a value other than "EDSL" or "EDSLHM" on the associated TKGRP form), this field must be set to "ANY".

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

2.23 DATA ETE

Description: This field is used to enter the End-to-End Q.931 Connectivity option for data calls using this ARS feature.

Required Field.
Default: ANY
Valid Entries:

Valid DATA ETE Entries

Entry	Definition
ANY	The Call Routes over any available trunk.
PREF	PRI trunks are preferred to route the call. However, if a PRI trunk is not available, then any trunk will be used.
REQ	PRI trunks are required to route the call. However, if a PRI trunk is not available, the route will fail.

Copyright © 2003 Lucent Technologies

Data Rules:

When CSD ARS GRP is left blank, then DATA ETE must contain the default value of "ANY".

When this feature is assigned to a non-PRI trunk (the TRKCLS has a value other than "EDSL" or "EDSLHM" on the associated TKGRP form) this field must be set to "ANY".

If "REQ" is entered, then there must be PRI trunks in the route list. Also, route selection will be enhanced if the PRIs appear earlier in the route list.

SEC. 9F: 5608-6 RECORD
AUTOMATIC ROUTE SELECTION
GROUP SCREENING FORM - ARSSCRN

1. GENERAL

The 5608-6 Record is available with 5E3 and later Software Releases and is used to determine the initial route of a route list for ARS (Automatic Route Selection) groups.

The ARSSCRN forms are used for all ARS Groups. Digit analysis for the ARS calls may be provided by either the originator's ODP (Office Dialing Plan) or a PNDP (Private Network Dialing Plan). When the ODP is used, the ARS INDEX used as one of the keys into the ARS Screening data is the Route Index normally found in the LDIT form (5300-3/5 Record). When a PNDP is used, the ARS INDEX is a result of a call defined as "ON" or "OFF" in the PNDP form (5608-10/11 Record).

In addition to the ARS GROUP NAME and ARS INDEX, the third key to this data is the ARS SCREENING INDEX. The ARS Screening Index is an ARS terminal parameter which, like the ARS Group Name, may be defined as a default parameter on the ARSFD form (5608-1B Record) or on an individual terminal basis on the ARSLPA (5608-3 Record), ARSMPA (5608-4 Record), or ARSTPA form (5608-5 Record).

This ARS Screening Index is similar to the Screening Indexes used in the POTS application on the RAR form (5301 Record). It provides the ability to subdivide the ARS Group so that different treatments may be given to groups of terminals within the ARS Group which all use the same common ARS Group data and digit analysis.

This may be used to allow a set of terminals within the ARS Group to route with an initial route (an MC Route Index) of a route list while another set of terminals may be "routed" to an announcement, reorder tone or to their attendant. To accomplish this, the first set of terminals could be defined with ARS Screening Index 1 and the second set, ARS Screening Index 2. Then ARSSCRN forms would be required for all ARS INDEX values for the ARS Group with both 1 and 2 indicated for the ARS SCREENING INDEX. The desired routing treatment would then be indicated in the appropriate Pattern Group entry.

Please note, the treatments here are similar to those specified in BAD NUMBER TREATMENT on the ARSFD form (5608-1A Record). These error treatments will be used when the ARS number is being initially analyzed in the ODP. However, if this error treatment is inappropriate for some calls, a different treatment can be given as described above.

When a PNDP is used to analyze the ARS numbers, BAD NUMBER TREATMENT will not be used. If the result of PNDP is an ARS Index, the ARS Index must be defined here on the ARSSCRN form for every ARS Screening Index of the group.

ARS Screening Indexes may also be used so that different subsets of the ARS Group use different route lists. This may be useful for satellite route avoidance. That is, one set of terminals in the ARS Group may not be allowed to route over a Trunk Group which is a satellite route. Another set or sets of the ARS Group do use the satellite route as a first or early route in the route list. FRL (Facility Restriction Level) would not be appropriate in this case because the first set would be blocked before subsequent routes which are allowed.

The ARS Group may be divided into a maximum of 16 subgroups by using ARS Screening Indexes 1 to 16. These indexes should not be confused with the FRL of the terminal and route. Even though they have the same range of values, they are independent uses.

In addition to an error treatment or an initial MC Route of a route list, the ARSSCRN form may also specify an Office Code when the call should be routed to a line in this office. This type of routing may be used when the ARS call that is being translated is in the on-network (private) format of RNX-XXXX and the number is a line defined in this office as NXX-XXXX. This form may provide that transition. The RNX would be translated in a PNDP with a unique ARS Index so this form may specify the Office Code (NXX)

Copyright © 2003 Lucent Technologies

that is defined on the NOC form (5501 Record). The NXX plus the last four digits collected will be used to enter Directory Number translations for line terminations.

Each ARS Group may be defined with 1 to 6 Pattern Groups as specified on the ARSGPA form (5608-2 Record) in NUMBER PATTERN GROUPS ALLOWED. However, only one Pattern Group is active at any given point in time. During call processing, the active Pattern Group is used as the fourth Key to determine the route to be used. Therefore, for each allowed Pattern Group, an entry should be made on each ARSSCRN form. For example, if an ARS Group has four Pattern Groups, a route should be specified in PATTERN GROUP row values of 1 through 4 on every ARSSCRN form input for the ARS Group. If the ARS Group uses only one Pattern Group (which by definition is always active), then the ARSSCRN forms will be defined with entries only in the first row under ARS PATTERN GROUP ROUTES.

1.1 Recent Change View

This corresponding Recent Change view for this form is RC/V 10.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * ARS GROUP NAME

Description: Enter the name of the ARS Group.
Valid Entries: 1 - 8 characters

Data Rules:

The ARS GROUP NAME must be defined on an ARSGPA form (5608-2 Record).

The maximum quantity of ARS Groups in an office is 200.

2.3 * ARS INDEX

Description: Enter the ARS Index. If the Office Dialing Plan is used to analyze the initial ARS dialed or inpulsed digits, then this entry will be a POTS Route Index normally found in LDIT. If a Private Network Dialing Plan is used to analyze the ARS number, then this entry will be an index used by the PNDP to point to the appropriate data in this form in the form of an ARS INDEX.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

2.4 * ARS SCREENING INDEX

Description: Enter the ARS Screening Index.
Default: 1
Valid Entries: 1 - 16

Data Rules:

For each ARS Screening Index assigned to the ARS terminals with the same ARS Group Name, a separate ARSSCRN form must be input.

2.5 CHARGE INDEX

Copyright © 2003 Lucent Technologies

Description: Enter the Charge Index to be used when terminating to a line in this office.
Valid Entries: 1 - 2047

Data Rules:

If a value is entered here, it must be defined on the CGIDX form (5302-1 Record).

If any ROUTE TYPE on this form equals "MCTRAN", this field must be entered; otherwise, leave this field blank.

ARS PATTERN GROUP ROUTES

This group of fields (Section 2.6 - Section 2.9) defines the appropriate ROUTE TYPE (and MCRTI and NXX values as required) for each Pattern Group used for this ARS Group. Each Pattern Group is represented by a row 1 through 6. The rows must be entered in consecutive order and may not exceed the value entered in NUMBER PATTERN GROUPS ALLOWED which is specified on the ARSGPA form (5608-2 Record).

2.6 ROUTE TYPE

Description: Enter the Route Type for each allowed Pattern Group 1 - 6.

Valid ROUTE TYPE Entries

Entry	Definition
ANNCE	Used to route the call to the announcement specified on the ARSGPA form (5608-2 Record) in the field BAD NUMBER ANNOUNCEMENT RTI.
ATDN	Used to route the call to the Attendant of this originator's Terminal Group. If "ATDN" is used, all terminals which access this ARSSCRN form, must be assigned to a Terminal Group ID via the TGSR feature and the Terminal Group must have an Attendant Telephone Number defined on the TGATTD form (5611 Record).
MC	Used to route the call via an MC route list. The first route in the route list is specified in MCRTI.
MCTRAN	Used to route the call to a line in this office. The office code is specified in NXX.
REORDER	Used to route the call to Reorder tone.

2.7 MCRTI

Description: Enter the MC Route Index for each allowed Pattern Group 1 - 6 where ROUTE TYPE equals "MC".
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

Any value entered here must be defined on the MCRTIDX form (5304 Record) as the first route in the route list. Subsequent (or overflow) routes are also defined on the MCRTIDX form. Additionally, on the MCRTIDX form, MC ROUTE TYPE must be set to "MC", "SFG" or "PVN".

2.8 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

2.9 NXX

Copyright © 2003 Lucent Technologies

Description: Enter the Office Code for each allowed Pattern Group 1 - 6 where ROUTE TYPE equals "MCTRAN".
Valid Entries: 3 digits

Data Rules:

Any value entered here must be defined on the NOC form (5501 Record).

For 5E12 and later, when NXX (Office Code) and/or NPA/NXX combinations are assigned on the ARSSCRN form, they must be defined on the NOC form.

For 5E12 and later, if the ARSSCRN forms have a "PATTERN GROUP ROUTES.NXX" defined in the rows indicated by PATTERN GROUP and there are multiple NOC forms with the same value for NXX, "PATTERN GROUP ROUTES.NPA" will also have to be defined in the same row on the ARSSCRN form.

SEC. 9G: 5608-7 RECORD
AUTOMATIC ROUTE SELECTION ALTERNATE FACILITY RESTRICTION LEVELS FORM - ARSFRL

1. GENERAL

The 5608-7 Record is available with 5E3 and later Software Releases. It is used to define the set of FRLs (Facility Restriction Levels) to use for an ARS (Automatic Route Selection) Group.

This form must be submitted for an ARS Group when the ARSGPA form (5608-2 Record) is defined with ALW ALT FRL equal to "Y".

The FRL of the ARS originating terminal is defined as a default parameter of the ARSFD form (5608-1B Record), or on an individual terminal basis as a parameter on the ARSLPA, ARSMPA and ARSTPA forms (5608-3, 5608-4 and 5608-5 Records, respectively). In the case of an originating trunk, the FRL may have been derived from an incoming TCM (Traveling Class Mark). See TCM IN on the ARSFD form or ARSTPA form. When a two-digit TCM is received, it becomes the FRL for that origination. When a one-digit TCM is received, it must be converted to the "two-digit FRL format on the ARSTCM form (5608-8 Record).

The originating terminal FRL, sometimes labeled the FRL of the call, is used during call processing to determine if the originator has sufficient permission to use an ARS route. The route FRL is specified for each route in an ARS route list on the MCRTIDX form (5304 Record) as FRL GROUP. The terminal FRL must be equal to or greater than the route FRL to use the route.

If a PNDP (Private Network Dialing Plan) is used to analyze and collect the ARS digits, an FRL may also be specified on calls that escape to the ODP. Because the call is escaping ARS, an MC Route Index will not be used on the call and, therefore, the FRL Group cannot be used. The FRL specified on the PNDP form (5608-10/11 Records) takes the place of the route FRL and may be used, based on the dialed (or inpulsed) digit string, to require sufficient FRL permission to use the ODP.

If the terminal FRL is less than the FRL of the route, then there is insufficient permission. At this time during call processing, an Authorization Code may be entered to raise the terminal FRL if the originating terminal has an appropriate Authorization Code feature. See the ATHGPA form (5620-2 Record), for requirements on changing the FRL value associated with terminals in an Authorization Code Group. If an Authorization Code is entered to increase the FRL of the call, additional routes in the ARS route list may be used by increasing the level of permission of the terminal.

If no route is available in the route list, either because of insufficient FRL or all the routes in the route list are busy, queuing for the first route in the route list will be invoked. This first route must have a Modular Queuing feature assigned. If the route is a Trunk Group, see the TKGRP form (5202-3 Record), and if an SFG (Simulated Facility Group), see the PFASFG form (5609-3 Record). Queuing will not be invoked if the originating terminal has the ARS parameter, QUEUE ALLOWED, equal to "N". When all possibilities are exhausted, the terminal is given Reorder tone.

The originating terminal FRL, however, may be changed when Alternate FRL is invoked. This may be done either via a dialed code or by TOD (Time Of Day). A code defined in the IDPDCA form (5601-1/2 Record), or in the PDIT form (5300-2 Record), with an action of FRLALT invokes this table of Alternate FRLs. For each possible originating FRL value of 1 to 16, there is a corresponding alternate FRL of 1 to 16. This form then may be used to either raise or lower the FRL of the originating terminal as desired for each FRL value. While the alternate FRL table is in effect, the alternate FRL, instead of the terminal FRL, will be used on origination. The alternate FRL then interacts with Authorization Code and Queuing as discussed above. The original FRLs of the terminals are restored by a code defined with an action of "FRLMAIN". These actions may be automatically invoked via Time Of Day on the TODCD form (5610-2 Record).

If the originating terminal has been defined with the ARS parameter, USE ALT FRL, equal to "N", then the

Copyright © 2003 Lucent Technologies

terminal's FRL value will not be changed even when the Alternate FRL table is invoked.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.8.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * ARS GROUP NAME

Description: Enter the name of the ARS Group. The maximum quantity of ARS Groups in an office is 200.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The group name must be defined on an ARSGPA form (5608-2 Record) with the associated ALW ALT FRL field entered as "Y".

ALTERNATE FACILITY RESTRICTION LEVELS

Fields 2.3 - Section 2.19 are used to enter the Alternate FRLs. For each terminal FRL indicated by ALTFRL x, where x equals 1 through 16, enter the corresponding Alternate FRL to be used when this Alternate FRL table is active.

2.3 ALTFRL 0

Description: Enter the Alternate FRL to be used when the assigned terminal FRL is 0.

Software Release: 5E7 and later
Required Field.
Default: 0
Valid Entries: 0 - 16

2.4 ALTFRL 1

Description: Enter the Alternate FRL to be used when the assigned terminal FRL is 1.

Required Field.
Default: 1
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

2.5 ALTFRL 2

Description: Enter the Alternate FRL to be used when the assigned terminal FRL is 2.

Required Field.
Default: 1
Valid Entries:

Copyright © 2003 Lucent Technologies

- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

2.6 ALTFRL 3

Description: Enter the Alternate FRL to be used when the assigned terminal FRL is 3.

Required Field.
Default: 1
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

2.7 ALTFRL 4

Description: Enter the Alternate FRL to be used when the assigned terminal FRL is 4.

Required Field.
Default: 1
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

2.8 ALTFRL 5

Description: Enter the Alternate FRL to be used when the assigned terminal FRL is 5.

SEC. 9H: 5608-8 RECORD
AUTOMATIC ROUTE SELECTION TRAVELING CLASS MARK CONVERSION TABLE FORM - ARSTCM

1. GENERAL

The 5608-8 Record is available with 5E3 and later Software Releases. It is used to input the FRL (Facility Restriction Level) to be used during call processing on ARS (Automatic Route Selection) calls which originate on private trunks sending a "one-digit TCM (Traveling Class Mark).

This conversion may be needed when communicating with other switching systems because some use a TCM (and FRL) range of 0 to 7. The 5ESS Switch uses an FRL range of 1 to 16.

The ARS feature assigned to the private trunk must have TCM OPTION equal to "Y" to enable this conversion information to be accessed. This information, however, is associated with the ARS Group. One form is input for the group and is used whenever the trunks in the ARS Group are defined with TCM IN equal to 1, indicating a "one-digit TCM is expected on the trunk. The TCM digit is appended to the incoming digit string. A PNDP (Private Network Dialing Plan) must be used to translate the digits. See the PNDP form (5608-10/11 Records).

For each digit 0 through 7, a direct conversion is input on this form to the corresponding "two-digit FRL value.

An inverse of this direct conversion is also automatically built in the database to provide conversion from the 5ESS Switch two-digit FRL to a one-digit TCM. This one-digit TCM will be used on any trunk in this ARS Group that is defined with the ARS parameter, TCM OUT, equal to 1, indicating that a one-digit TCM is expected to be outpulsed on the trunk.

Because the values input of this form are used for conversion on both one-digit TCM to two-digit FRL and "two-digit FRL to one digit TCM, this form is required when any trunk in the ARS Group has either TCM IN or TCM OUT equal to 1.

The conversion for two-digit FRL to one-digit TCM is not always straightforward. The value entered for any TCM will reverse that FRL to the TCM. However, when there are nonconsecutive values entered, any FRL that falls in between will be given the higher value. The following table illustrates this conversion based on the values entered in Figure 2. Note that the values entered in the form must be of increasing numeric value.

2-DIGIT FRL TO 1-DIGIT TCM

Entry	Definition	Entry	Definition
1	0	9	3
2	0	10	4
3	0	11	5
4	0	12	6
5	0	13	7
6	1	14	7
7	2	15	7
8	2	16	7

SEC. 9I: 5608-9 RECORD
AUTOMATIC ROUTE SELECTION
SEGMENTED SIGNALING FORM - ARSSIG

1. GENERAL

The 5608-9 Record is available with 5E3 and later Software Releases. It is used to specify Segmented Signaling, if required, when outpulsing on an ARS (Automatic Route Selection) private facility.

Segmented signaling will be required on a cut-through route to a PBX if the PBX requires incoming digits to be on a phased basis. That is, the 5ESS Switch can be specified to outpulse some digits, pause for some seconds and then outpulse additional digits. From one to four pairs of values for PAUSE and POSITION are submitted on this form so that the specified pause in seconds will be taken before the digit position. By setting the position to 1, this means that the first (or only) pause will be taken before any digits are outpulsed.

This form must be entered for any MC Route Index that is defined with SEGMENTED SIGNALING equal to "Y". See the MCRTIDX form (5304 Record). Additionally, the Trunk Group specified with this indicator on the MCRTIDX form must be defined on the TKGRP form (5202 Record) with CUT THRU equal to "Y".

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.7.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * ARS GROUP NAME

Description: Enter the name of the ARS Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The ARS GROUP NAME must be defined on an ARSGPA form (5608-2 Record). The maximum quantity of ARS Groups in an office is 200.

2.3 * MC ROUTE INDEX

Description: Enter the MC Route Index.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The MC ROUTE INDEX must be defined on the MCRTIDX form (5304 Record) with SEGMENTED SIGNALING equal to "Y" and is used by this ARS Group.

Copyright © 2003 Lucent Technologies

SEGMENTED SIGNALING LIST

Enter up to four pairs of PAUSE and POSITION, (fields Section 2.4 - Section 2.5). Each pair must be sequentially entered such that the position values are in increasing numeric order. Values must be submitted in pairs and at least one pair must be specified.

2.4 PAUSE

Description: Enter the pause in seconds to be taken before the digit position specified in POSITION.
Valid Entries: 1 - 10

2.5 POSITION

Description: Enter the digit position of the outpulsing sequence where the pause specified in this pair is to be done. Indicate the digit the pause comes before.
Valid Entries: 1 - 15

SEC. 9J: 5608-10/11 RECORDS
PRIVATE NETWORK DIALING PLAN FORM - PNDP

1. GENERAL

The 5608-10/11 Records are available with 5E3 and later Software Releases. They are used to provide private digit analysis of both public and private numbers.

PNDPs (Private Network Dialing Plans) may be optionally used for subscribers who are assigned an ARS (Automatic Route Selection) BRCS feature.

If the ARS feature assigned to the terminal is defined on the ARSFD form (5609-1 Record), with ENTRY equal to "AUTO", then the dialing plan used to analyze ARS digits is specified as a default parameter of the ARSFD form or as a parameter of the ARSLPA, ARSMPA or ARSTPA forms (5608-3, 5608-4 or 5608-5 Records), respectively. With this type of ARS feature, exactly one dialing plan is specified. The choices are ODP (the Office Dialing Plan of the originator), 1 (PNDP 1) or 2 (PNDP 2).

If the ARS feature is defined with ENTRY equal to "CODE", the action defined for the access code will indicate which dialing plan to use when interpreting ARS digits. The ARS access code or codes may be defined on the PDIT form (5300-2 Record), or on the IDPDCA form (5601-1/2 Records). An action of "ARSUSE" indicates that the Office Dialing Plan of the originator should be used while the actions "AR1USE" and "ARS2USE" indicate that Private Network Dialing Plan 1 or 2, respectively, should be used. With this type of ARS feature, more than one dialing plan may be used by specifying unique access codes with the desired actions. If two access codes and dialing plans are used, typically, one dialing plan is used for off-network (public) numbers and one dialing plan is used for on-network (private) numbers.

Each ARS Group and PNDP combination must be entered on a PNINFO form (5608-12 Record) to specify the error treatment to be given when the ARS digits are not found in the associated PNDP. (This error treatment does not apply to partial dial. If the caller dials an incomplete digit string, the call will route according to the partial dial error treatment specified for the office.)

Caution should be exercised in defining both the dialed digits in the PNDP and selecting the appropriate error treatment. Any call which results in an error treatment of "USEOFFC" or digits explicitly defined in a PNDP with a Call Type of "USEOFFC" must be able to succeed through the originator's Office Dialing Plan and normal screening on the Rate and Route. It is probably never appropriate to allow on-network numbers to escape to POTS in this manner. Care still needs to be exercised with off-network numbers because of the 1 prefix and Home NPA. If the 1 has not been dialed but is required in LDIT, (5300-3/5 Records), because of prefix resolved conflicts or is required on the RAR form (5301 Record), the dialed digits should be defined in the PNDP with a Call Type of OFF and an ARS Index. This information, when passed back to ARS, should result in an MC Route Index where the 1 can be prefixed. Similarly, the Home NPA, when dialed but inappropriate for the LDIT, can be deleted on an MC Route Index.

Generally, all digits dialed when ARS is invoked and a PNDP is used are treated equally. Special treatment for digits used as prefixes is not provided with a PNDP. In cases where a 1 is included in the digits dialed by the subscriber, it needs to be included in the INCOMING DIGITS of the PNDP. When ARS subsequently routes these calls, if the 1 is inappropriate for outpulsing on any of the routes, it must be deleted on the appropriate MC Route Indexes.

1.1 Common Control Switching Arrangement

There is a special association of PNDP with CCSA (Common Control Switching Arrangement). When a terminal is assigned an ARS Feature with CCSA LIMITATION equal to YES and the call is being interpreted in Private Network Dialing Plan 1, the call will be subject to SFG (Simulated Facility Group) limits and special billing. CCSA SFGs may be specified for calls originating and/or terminating to the CCSA group on the PFATG form (5609-2 Record). When the call is recognized as a CCSA call (i.e., CCSA LIMITATION and PNDP 1), and the call is being routed off the private network, a special AMA billing record will be produced with an AMA Call Type of CCSAS, call code 21. See the AMACT form (5506

Copyright © 2003 Lucent Technologies

Record). The call is determined to be an off-network call if it completes to a service class other than a Private Facility trunk (e.g., "PF", "PFLASH", "PFITT"). The CCSAS AMA record will be made in addition to the public billing record specified for the off-network call by the Charge Index found during call processing. If it is desired to inhibit this private billing record for a terminal, the ARS parameter, ALW MDR RAO should equal "N".

1.2 Traveling Class Mark

When a TCM (Traveling Class Mark) is expected on an incoming ARS trunk, a PNDP must be used for digit interpretation. The PNDP will be informed by ARS that one or two digits are expected and PNDP will collect these digits after the regular PNDP digits are analyzed and collected. The NBR DIGITS field on this form should not include the count of TCM digits.

1.3 Selective Destination Screening

SDS (Selective Destination Screening) is a special digit analysis routine provided with a PNDP to give unique treatment to some codes with fewer form instances to input and, therefore, less memory used. An example may help to illustrate its use. The ARS business customer desires all calls dialed with a given NPA, for example 212, to route via an ARS route sequence except certain NXXs, 555 and 976. Calls dialed 212-555 + 4 digits or 212-976 + 4 digits are to be routed to an announcement. Three PNDP forms will be input for this case. 212 is entered as usual, in this case as a "10-digit, "off-net number with the normal ARS Index. 212555 and 212976 are each entered on separate forms similar to the 212 entry except a unique ARS Index is entered and SELECT DEST SCRN is equal to "Y". During digit analysis, the results indicated by the 212 entry will be used unless the next three digits are 555 or 976; the information entered with 212555 or 212976 would then override the original 212 information. In any case, the resulting data is passed to ARS. The unique treatments are then accomplished through ARS screening and route sequences.

1.4 Off-network and On-network Number Translation

The Private Network Dialing Plan has the ability to translate both off-network numbers and on-network numbers in one PNDP or two. If the subscriber is required to always dial an NPA, including the Home NPA, for off-network numbers, then one PNDP could be used because the two types of numbers could be distinguished. To allow the subscribers to dial off-network numbers within the Home NPA on a "seven-digit basis, two PNDPs should be used (with unique access codes) so the "seven-digit off-network numbers do not conflict with "seven-digit "on-network numbers.

Even when the ARS has a private network with on-network digits, the originating subscriber may be allowed to dial the public off-network number. Translating the appropriate digits with a Call Type of "OFFON" causes the digits to be converted by the PNOFFON form (5608-13 Record), to the on-network number which is subsequently retranslated in the specified PNDP.

1.5 On-network to Off-network Number Conversion

On-network to off-network number conversion is also provided totally with translations, however, it is not a direct result of digit analysis in the PNDP. When the PNDP passes information about an on-network call to ARS, it includes an indication that the current digit string is an on-network number (either because that's what was dialed or it was involved in an off to on conversion). When ARS determines that the route to be used requires an off-network number, such as for OUTWATS or overflow to DDD, then ARS will request an on-network to off-network conversion via the PNONOFF form (5608-14 Record). In this case, the route has already been determined so subsequent translations of the converted number is not required in the PNDP.

1.6 Account Code Digits

A PNDP also provides for Account Code Lead digit or digits if the ARS subscribers also have an Account

Copyright © 2003 Lucent Technologies

Code BRCS feature assigned. Any digit or digits may be translated in the PNDP with a Call Type of ACLD provided the digit sequence is unique and unambiguous within the PNDP. During PNDP digit analysis when the result is ACLD, the first digit is deleted and subsequent digits are collected under the Account Code feature. After the Account Code has been collected, the Account Code feature will return control of subsequent digit analysis to PNDP.

1.7 Recent Change View

The corresponding Recent Change View for this form is 9.21.

2. FORM ENTRIES - 5608-10 RECORD

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and the office name on each record.

2.2 * ARS GROUP NAME

Description: This field is used to enter the name of the ARS Group. The maximum number of ARS Groups in an office is 200.
Valid Entries: 1 - 8 characters

Data Rules:

The valid entries are defined an ARSGPA form (5608-2 Record).

2.3 * DIAL PLAN

Description: This field is used to enter the Private Network Dialing Plan number.

Valid DIAL PLAN Entries

Entry	Definition
1	Digits will be interpreted in PNDP 1 (Private Network Dialing Plan).
2	Digits will be interpreted in PNDP 2 (Private Network Dialing Plan).

Data Rules:

Each unique combination of Dial Plan and ARS Group Name must also be entered on a PNINFO form (5608-12 Record), to specify the treatment to give the call when the digit sequence is not found in the PNDP.

2.4 * INCOMING DIGITS

Description: This field is used to enter the dialed ARS number to be interpreted. The first digit may be *, # or 0-9. All digits except the first digit must be 0-9. There must be a space before or after the * and # symbols in order for them to be entered alone.
Valid Entries:

- For 5E9(2) and earlier: 1 - 15 characters
- For 5E10 and later: 1 - 18 characters

Data Rules:

When the INCOMING DIGITS entered on this form are a beginning substring of another PNDP form with the same ARS GROUP NAME and DIAL PLAN number, then either the PNDP form with the shorter INCOMING DIGIT string must enter the number of digits in its INCOMING DIGIT string in the NBR DIGITS field or the PNDP form with the longer INCOMING DIGIT string entered must have "Y" entered in the SELECT DEST SCRN field.

Copyright © 2003 Lucent Technologies

For 5E10 and later, the number of characters entered in this field cannot be greater than 15 unless the 15 Digit IDDD (International Direct Distance Dialing) secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5713-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.5 CALL TYPE

Description: This field is used to enter the Call Type.

Required Field.

Valid CALL TYPE Entries

Entry	Definition
ACLD	Account Code Lead Digit.
CONFLCT	Conflict to be resolved in 5608-11 Record.
DARS	Deactivate ARS for the current call, used for AUTO entry ARS without an IDP
NSC	Network Service Code.
OFF	Off-network number.
OFFON	Off-network number requiring conversion to an on-network number.
ON	On-network number.
USEOFFC	Use the originator's office Dialing Plan instead of ARS.

2.6 NBR DIGITS

Description: This field is used, for Call Types other than "CONFLCT", to enter the total number of digits expected in the PNDP form, both analyzed and collected. Do not include the ARS access code (if associated with a code entry ARS feature) or Traveling Class Marks which may be received as appended digits to the digit string when inpulsed on some trunks.

When a TCM (Traveling Class Mark) is expected on an incoming ARS trunk, a PNDP must be used for digit interpretation. The PNDP will be informed by ARS that one or two digits are expected and PNDP will collect these digits after the regular PNDP digits are analyzed and collected. The NBR DIGITS field should not include the count of TCM digits, i.e., only 1 - 14 digits are valid with one digit Traveling Class Marks and only 1 - 13 digits are valid with the two digit TCM.
Valid Entries:

- For 5E9(2) and earlier: 1 - 15 digits
- For 5E10 and later: 1 - 18 digits

Data Rules:

The number entered must be equal to or greater than the quantity of digits entered in INCOMING DIGITS.

For Call Type "ACLD", the entry must be equal to the quantity of digits specified in INCOMING DIGITS.

For Call Type "CONFLCT", leave this field blank.

For 5E10 and later, this field cannot have a value greater than 15 digits unless the 15 Digit IDDD (International Direct Distance Dialing) secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5713-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.7 ARS INDEX

Description: This field is used, for Call Types "ON" or "OFF", to enter the ARS INDEX. This entry with the ARS Group Name on this view together with the ARS Screening Index of the originating ARS terminal are used to access the ARSSCRN form (5608-6 Record).
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Copyright © 2003 Lucent Technologies

Data Rules:

For all other Call Types, leave this field blank.

2.8 FRL

Description: This field is used to enter an FRL (Facility Restriction Level) for the digit string being interpreted.

The FRL entered here is used similarly to the FRL Group on the MCRTIDX form (5304 Record). That is, the FRL of the originating terminal will be compared to the FRL entered here. If the FRL of the terminal is equal to or greater than this FRL, escape to the ODP as a POTS call will be successful. If the FRL of the terminal is less than this FRL, the call will route to Reorder tone.

The FRL of the terminal may be specified as a parameter of the ARSLPA, ARSMPA or ARSTPA forms (5608-3, 5608-4 or 5608-5 Records), respectively, or as a default parameter of the ARSFD form (5608-1 Record).
Valid Entries: 0 - 16

Data Rules:

For Call Type "USEOFFC", enter a FRL for the digit string being interpreted.

For all other Call Types, leave this field blank.

2.9 ROUTE TYPE

Description: This field is used to enter the Route Type of a call.

Valid ROUTE TYPE Entries

Entry	Definition
MC	The normal route of the call is not to a line in this office.
MCTRAN	The normal route of the call is to a line in this office.

Data Rules:

For Call Types "ON" or "OFF", enter the Route Type of the call. If the normal route of the call is to a line in this office, enter "MCTRAN", otherwise enter "MC". The Route Type may be overridden during call processing as the call is processed by the ARSSCRU form (5608-6 Record).

For all other Call Types, leave this field blank.

2.10 SELECT DEST SCRN

Description: Is this is a Selective Destination Screening entry?

If this entry equals "Y", then there must be another form entered with the same NBR DIGITS where the INCOMING DIGITS are the same as the first digits entered in INCOMING DIGITS on this form. The INCOMING DIGITS on this form must have at least one more digit entered to be analyzed.

The result of entering "Y" in this field indicates that this particular entry should be selectively screened out and given different treatment than indicated by the form with fewer digits in the INCOMING DIGITS. Calls starting with those same fewer INCOMING DIGITS but which don't find another form with digits indicated with Selective Destination Screening will be given the treatment specified by the first form.

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E6 and later:
If SELECT DEST SCRN is "Y":

- CALL TYPE must be "ON", "OFF , or "USEOFFC". For all other Call Types this entry must be "N".
- and CALL TYPE is "USEOFFC", then FRL must be known.

SELECT DEST SCRN and ARS SDN cannot both be "Y".

2.11 CONVERSION INDEX

Description: This field is used, for Call Type "OFFON", to enter the Conversion Index. This entry will be used with the ARS Group Name to access the PNOFFON form (5608-13 Record), which will delete and prefix digits, on the off-network number defined here, converting that number to its on-network format. The reconstructed number will then be analyzed in either this PNDP form or another provided for the ARS Group. The Dial Plan used is specified by the PNOFFON form.
Valid Entries: 1 - 65535

Data Rules:

For all other Call Types, leave this field blank.

2.12 NSC DN

Description: This field is used, for Call Type "NSC", to enter the Network Service Code replacement Directory Number. The DN entered will replace the digits analyzed and collected on this form and will be subsequently analyzed in the Dialing Plan specified in NSC DIAL PLAN. The DN may be either a valid on-network or off-network number.
Valid Entries: 7 - 11 digits of 0 - 9

Data Rules:

For all other Call Types, leave this field blank.

2.13 NSC DIAL PLAN

Description: This field is used, for Call Type "NSC", to enter the Private Network Dialing Plan of this ARS Group that will analyze the Directory Number entered in NSC DN.
Valid Entries: 1, 2

Data Rules:

For all other Call Types, leave this field blank.

2.14 ARS SDN

Description: Do the incoming dialed digits (INCOMING DIGITS) represent a Software Defined Network call?

Software Release: 5e6 and later.
Required Field.
Default Value: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

This field must be set to "N" when CALL TYPE is "CONFLCT".

SELECT DEST SCRN and ARS SDN cannot both be "Y".

2.15 NODAL 56K

Description: Proprietary field.

2.16 REMARKS

Description: This field is used as deemed locally necessary.
Valid Entries: Up to 16 alphanumeric characters

3. FORM ENTRIES - 5608-11 RECORD

3.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and the office name on each record.

3.2 * ARS GROUP NAME

Description: This field is used to enter the name of the ARS Group. The name must be the same as that from the corresponding 5608-10 Record entry. This information is not required on the PNDP ODA input form.
Valid Entries: 1 - 8 characters.

3.3 * DIAL PLAN

Description: This field is used to enter the Private Network Dialing Plan number. The number must be the same as that from the corresponding 5608-10 Record entry. This information is not required on the PNDP ODA input form.

Valid DIAL PLAN Entries

Entry	Definition
1	Digits will be interpreted in PNDP 1 (Private Network Dialing Plan).
2	Digits will be interpreted in PNDP 2 (Private Network Dialing Plan).

3.4 * INCOMING DIGITS

Description: This field is used to enter the code for which the conflict exists. This must be the same as the INCOMING DIGITS of the Conflict Code on the 5608-10 Record. This information is not required on the PNDP ODA input form.

CONFLICT RESOLUTION TABLE ENTRIES

The following fields (3.5 - 3.11) comprise the Conflict Resolution Table Entries.

3.5 NBR DIGITS

Description: This field is used to enter the total number of digits expected in the PNDP form, both analyzed and collected.
Valid Entries:

- For 5E9(2) and earlier: 1 - 15 digits
- For 5E10 and later: 1 - 18 digits

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5713-1 Record).

3.6 CALL TYPE

Description: This field is used to enter the Call Type.

Valid CALL TYPE Entries

Entry	Definition
DARS	Deactivate ARS for the current call, used for AUTO entry ARS without an IDP.
OFF	Off-network number
OFFON	Off-network number requiring conversion to an on-network number
ON	On-network number
USEOFFC	Use the originator's office Dialing Plan instead of ARS

3.7 ARS INDEX

Description: This field is used, for Call Types "ON" and "OFF", to enter the ARS Index.

This entry with the ARS Group Name on this view together with the ARS Screening Index of the originating ARS terminal are used to access the ARSSCRN form (5608-6 Record).
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

For all other Call Types, leave this field blank.

3.8 FRL

Description: This field is used for Call Type "USEOFFC" to enter a Facility Restriction Level for the digit string being interpreted.

The FRL entered here is used similarly to the FRL GROUP on the MCRTIDX form (5304 Record). That is, the FRL of the originating terminal will be compared to the FRL entered here. If the FRL of the terminal is equal to or greater than this FRL, escape to the ODP as a POTS call will be successful. If the FRL of the terminal is less than this FRL, the call will route to Reorder tone.

The FRL of the terminal may be specified as a parameter of the ARSLPA (5608-3 Record), ARSMPA (5608-4 Record) or ARSTPA forms (5608-5 Records), or as a default parameter of the ARSFD form (5608-1 Record).
Valid Entries: 0 - 16

Data Rules:

For all other Call Types, leave this field blank.

3.9 ROUTE TYPE

Description: This field is used for Call Types "ON" or "OFF" to enter the Route Type of the call. Route Type may be overridden during call processing as the call is processed by the ARSSCRU form (5608-6 Record).

Valid ROUTE TYPE Entries

Entry	Definition
MC	The normal route of the call is not to a line in this office.
MCTRAN	The normal route of the call is to a line in this office.

Copyright © 2003 Lucent Technologies

Data Rules:

For all other Call Types, leave this field blank.

3.10 CONVERSION INDEX

Description: This field is used for Call Type "OFFON" to enter the Conversion Index.

This entry will be used with the ARS Group Name to access the PNOFFON form (5608-13 Record), which will delete and prefix digits, on the off-network number defined here, converting that number to its on-network format. The reconstructed number will then be analyzed in either this PNDP or another provided for the ARS Group. The Dial Plan used is specified by the PNOFFON form.
Valid Entries: 1 - 65535

Data Rules:

For all other Call Types, leave this field blank.

3.11 ARS SDN

Description: Do the incoming dialed digits represented by this CONFLICT RESOLUTION TABLE entry is a Software Defined Network call?

Software Release: 5E6 and later
Valid Entries: Y, N

3.12 NODAL 56K

Description: Proprietary field.

SEC. 9K: 5608-12 RECORD
PRIVATE NETWORK INFORMATION FORM - PNINFO

1. GENERAL

The 5608-12 Record is available with 5E3 and later Software Releases. It is used to define the error treatment associated with a PNDP (Private Network Dialing Plan).

PNDPs may be optionally used for subscribers who are assigned an ARS (Automatic Route Selection) BRCS feature.

If the ARS feature assigned to the terminal is defined on the ARSFD form (5609-1 Record), with ENTRY equal to "AUTO", then the dialing plan used to analyze ARS digits is specified as a default parameter of the ARSFD form or as a parameter of the ARSLPA, ARSMPA, or ARSTPA forms, (5608-3, 5608-4, or 5608-5 Records, respectively). With this type of ARS feature, exactly one dialing plan is specified. The choices are ODP (the Office Dialing Plan of the originator), 1 (Private Network Dialing Plan 1) or 2 (Private Network Dialing Plan 2).

If the ARS feature is defined with ENTRY equal to "CODE", the action defined for the access code will indicate which dialing plan to use when interpreting ARS digits. The ARS access code or codes may be defined on the PDIT form (5300-2 Record) or on the IDPDCA form (5601-1/2 Records). An action of "ARSUSE" indicates that the Office Dialing Plan of the originator should be used while the actions "ARS1USE" and "ARS2USE" indicate that Private Network Dialing Plan 1 or 2, respectively, should be used. With this type of ARS feature, more than one dialing plan may be used by specifying unique access codes with the desired actions. If two access codes and dialing plans are used, typically, one dialing plan is used for off-network (public) numbers and one dialing plan is used for on-network (private) numbers.

For either "AUTO" or "CODE" entry ARS features, when Private Network Dialing Plan 1 or 2 is to be used, then the ARS digits are interpreted on the PNDP form (5608-10/11 Records). If the digits are not found in the PNDP, the call will be given the ERROR TREATMENT which is defined on this form, unless partial dial has occurred. If the caller dials an incomplete digit string, the call will route according to the partial dial error treatment specified for the office.

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 * ARS GROUP NAME

Description: Enter the name of the ARS Group as defined on an ARSGPA form (5608-2 Record). The maximum quantity of ARS Groups in an office is 200.
Valid Entries: 1 - 8 characters

Data Rules:

If this form is submitted, the name entered here together with the DIAL PLAN specified must be entered on one or more PNDP forms (5608-10/11 Records).

2.3 * DIAL PLAN

Description: Enter the Private Network Dialing Plan number.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 2

Data Rules:

If this form is submitted, the DIAL PLAN entered here together with the specified ARS GROUP NAME must be entered on one or more PNDP forms (5608-10/11 Records).

2.4 ERROR TREATMENT

Description: Enter the error treatment to be used when the ARS dialed digits cannot be found in the Private Network Dialing Plan.

Partial dialed digit strings are not subject to this Error Treatment. If 011 is defined in the Private Network Dialing Plan and 0 is not defined, a user dialing a 0 will be subject to partial dial treatment, since 011 is expected to be dialed.

Required Field.
Default: TONE
Valid Entries:

Valid ERROR TREATMENT Entries

Entry	Definition
ANNCE	Used to route the call to the announcement specified on the ARSGPA form (5608-2 Record) in the field BAD NUMBER ANNOUNCEMENT RTI.
ARSODP	ARS will use the ODP. The ODP is used to dodigit analysis. If the Route Index from LDIT is entered inthe ARS IDX field on the ARSSCRN form (5608-6 Record), ARSroutes the call. If the LDIT Route Index is not found onthe ARSSCRN form, treatment is determined from the BAD NUMBER TREATMENT entry on the ARSFD form (5608-1a/bRecord).
ATDN	Used to route the call to the Attendant of this originator's Terminal Group. If "ATDN" is used, all terminals which use this DIAL PLAN, must be assigned to a Terminal Group ID via the TGSR feature, and the Terminal Group must have an Attendant Telephone Number defined on the TGATTD form (5611 Record).
USEOFFC	Used to route the call via the originator's Office Dialing Plan. The call will be treated as if the ARS feature had not been invoked.
TONE	Used to route the call to reorder tone.

SEC. 9L: 5608-13 RECORD
PRIVATE NETWORK OFF NETWORK NUMBER CONVERSION FORM - PNOFFON

1. GENERAL

The 5608-13 Record is available with 5E3 and later Software Releases and is used to convert an off-network number to an on-network number.

The PNOFFON provides the ability to allow the ARS (Automatic Route Selection) subscriber to dial the public, off-network number even though the call is to be analyzed and routed based on the private, on-network digits.

The information on this form is accessed during call processing when digits analyzed on a PNDP form (5608-10/11 Record) indicate a CALL TYPE of "OFFON" with an associated Conversion Index. The ARS Group Name of the PNDP and the Conversion Index are then used as keys to this data where digits are deleted and prefixed, as necessary, to convert the off-net number to its corresponding on-net format. The converted number will then be analyzed in the PNDP of the ARS Group as specified on this form. The PNDP may be the same as the one that initially translated the off-network number or it may be another one used for the ARS Group. For instance, Dial Plan 1 may be used only for off-network numbers while Dial Plan 2 is used for on-network numbers. In this case Dial Plan 1 will initially analyze the off-network dialed digits and this form will indicate that the converted number needs to be analyzed on Dial Plan 2.

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.22.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *ARS GROUP NAME

Description: Enter the name of the ARS Group. The name may be from one to eight characters as defined on an ARSGPA Form, 5608-2 Record. The maximum quantity of ARS Groups in an office is 200.

Software Release: 5E3 and later
Required Field.
Valid Entries: 1 - 8 characters

2.3 *CONVERSION INDEX

Description: Enter the Conversion Index. The Conversion Index entered here is a pointer from at least one PNDP Form, 5608-10 Record, where the Call Type is OFFON.

Software Release: 5E3 and later
Required Field.
Valid Entries: 1 - 65535

2.4 DELETE

Description: Enter the quantity of digits to delete from the off-network number requiring conversion.

Software Release: 5E3 and later
Required Field.
Valid Entries: 3 - 11

Copyright © 2003 Lucent Technologies

2.5 DIGIT PFX

Description: Enter the digits to prefix, after the deletion indicated above, to convert the off-network number to its on-network format. The converted number must be in the format RNX-XXXX where R and N are any digits 2-9 and X is any digit 0-9.

Software Release: 5E3 and later
Required Field.
Valid Entries: 3 - 7 digits

2.6 DIAL PLAN

Description: Enter the Private Network Dialing Plan of this ARS Group that will analyze the number after conversion to the on-network format.

Software Release: 5E3 and later
Required Field.
Valid Entries: 1 or 2

SEC. 9M: 5608-14 RECORD
PRIVATE NETWORK ON NETWORK NUMBER CONVERSION FORM-PNONOFF

1. GENERAL

The 5608-14 Record is available with 5E3 and later Software Releases and is used to convert an on-network number to an off-network number.

During call processing, Automatic Route Selection (ARS) will request this conversion when the number it currently has is an on-network number and the available route in the route list requires an off-network number. Off-network numbers are required on an OUTWATS route or on overflow to DDD.

Typically, the RNX of the on-network number is sufficient to determine the appropriate NPA-NXX which will replace it. In this case, the RNX is entered in ON DIGIT, 3 is entered in DELETE and the NPA-NXX is entered in DIGIT PFX. If a prefix of 1 is required for foreign NPAs in this office, it should also be entered in DIGIT PFX, e.g., 1415232. The number converted to its off-network format of (1) + NPA-NXX-XXXX is given to ARS for use on the selected route. The converted number is not retranslated in the PNDP data. However, ARS will take the digits through the originator's Office Dialing Plan to determine Carrier Interconnect and office routing data.

If it is desired that all station numbers within an RNX be replaced by the station number of the attendant, the RNX is entered in ON DIGIT, 7 is entered in DELETE and the attendant number, (1) + NPA-NXX-YYYY, is entered in DIGIT PFX.

It is also possible to translate on more than the RNX before determining the appropriate requirement for deleting and prefixing of digits. In this case the RNXX or even the entire number RNXXXXX may be entered in ON DIGIT. However, it must be understood that this is similar to a digit interpreter table in that the codes must be nonconflicting. If 2320 is entered, 232 must not also be entered. However, 2321 through 2329, or any subset of these digit strings, could also be entered.

All numbers which have been translated in a PNDP for the ARS Group as an on-network number and have an opportunity to go off-net during ARS routing, must be entered on a PNONOFF Form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.23.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *ARS GROUP NAME

Description: Enter the name of the ARS Group. The name may be from one to eight characters as defined on an ARSGPA form (5608-2 Record). The maximum quantity of ARS Groups in an office is 200.

Software Release: 5E3 and later.
Required Field.
Valid Entries: 1 - 8 characters

2.3 *ON DIGIT

Description: Enter from three to seven digits of the on-network number which requires conversion to its off-network (public) format for an ARS off-net route. The on-network number is in the format RNX-XXXX where R and N are any digits 2-9 and X is any digit 0-9. The RNX is typically sufficient.

Copyright © 2003 Lucent Technologies

Software Release: 5E3 and later.
Required Field.
Valid Entries: 3 - 7 digits

2.4 DELETE

Description: Enter the quantity of digits to delete from the on-network number requiring conversion.

Software Release: 5E3 and later.
Required Field.
Valid Entries: 3 - 7

2.5 DIGIT PFX

Description: Enter the digits to prefix, after the deletion indicated above, to convert the on-network number to its off-network format. The converted number is normally in the format of NXX-XXXX or NPA-NXX-XXXX with an optional 0 or 1 prefix.

Software Release: 5E3 and later.
Required Field.
Valid Entries: 3 - 11 digits

2.6 REMARKS

Description: Optionally enter up to 16 alphanumeric characters as deemed locally necessary.

Software Release: 5E3 and later.
Valid Entries: 1 - 16 characters

Figure 1 SAMPLE PNONOFF FORM 5E3 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 10: PRIVATE FACILITY ACCESS FORMS

Copyright © 2003 Lucent Technologies

SEC. 10A: 5609-1 RECORD
PRIVATE FACILITY ACCESS FEATURE DEFINITION FORM - PFAFD

1. GENERAL

The 5609-1 Record is available with 5E2 and later Software Releases. It is used to define a PFA (Private Facilities Access) feature, associating it with a PFA Group name defined on a PFAGPA form (5609-5 Record). It is the linkage between the feature assignment forms and the group information.

A terminal, line or trunk, may be assigned a PFA feature on the appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), TKGRPFA (5206 Record), or TRUNKFA (5205 Record).

1.1 PFA Features

Some PFA features have been preconstructed and appear in Figures 1 through 4. If a preconstructed feature is used, the terminal parameter forms must be entered to identify the PFA Group Name. PFA constructed (switch owner defined) features do not count toward the office's Contructed Feature Limit.

The PFA Group name entry is actually a default parameter. The PFA parameter forms of PFALPA (5609-6 Record), PFAMPA (5609-7 Record), and PFATPA (5609-8 Record) have been included for consistency with other BRCS features. However, the PFAFD form with the Group name assignment eliminates the need for the parameter forms.

Each terminal (line or trunk) may be assigned only one PFA feature, even though the feature may be associated with multiple sets of private facilities. This is resolved on the PFAGPA form with the various dial code accesses. This also means that one PFA feature will be used for all codes in the IDPDCA form (5601-1/2 Record) with ACTION equal to "PFUSE".

A terminal must be assigned a PFA feature when dial code access is required. That is, to access any of the facilities defined in the PFAGPA form, the terminal must have a PFA feature. Other forms in the 5609 Record series do not require a PFA feature. They are the PFATG (5609-2 Record), PFASFG (5609-3 Record), and PFAINWT (5609-4 Record) forms, and are included here because of the inter-relatedness of the Simulated Facility Groups.

1.2 PFA Dial Access

The PFA feature allows customers to have dial access to various types of public and private switching arrangements. These include dial access to FX trunks, OUTWATS, tie trunks and tandem tie trunk networks, CCSA (Common Control Switching Arrangement) networks, ETS (Electronic Tandem Switching) networks, and EPSCS (Enhanced Private Switched Communications Service) networks. While the 5ESS Switch allows access to CCSA, ETS and EPSCS networks, it does not currently support its use as a CCSA, ETS or EPSCS switching node.

PFA also provides dial access to equipment provided on the customer premises, such as radio paging and recorded telephone dictation equipment.

1.3 ISDN Circuit-Switched Data Calls

The BRCS Supplementary Services for ISDN CSD (Circuit-Switched Data) calls feature, which is available in 5E6 and later Software Releases, allows the Private Facilities Access feature originally developed for CSV (Circuit-Switched Voice) calls to apply to CSD calls, as well.

Use of this feature provides the means to establish CSD calls between BRIs (Basic Rate Interfaces) or PRIs (Primary Rate Interfaces) that are making use of the Private Facilities Access service. When a BRI or PRI is assigned PFA service, the service may apply to both CSV and CSD calls for that BRI or PRI.

Copyright © 2003 Lucent Technologies

Since PFA groups for CSD and CSV calls are separate, all group options available to a CSV PFA user are also available to a CSD PFA user. The values of these options, which are entered on the PFAGPA form (5609-5 Record), can differ or be the same for each group.

CSD PFA groups may also be assigned through BFGs (BRCS Feature Groups) in the same manner CSV PFA groups are currently assigned.

The following CSD PFA calls are not supported:

- Radio paging
- Recorded telephone dictation
- Calls using Foreign Exchange carriers

Also, Queueing is not supported for CSD PFA calls.

Existing preconstructed features for CSV calls will also be used for CSD calls (no new preconstructed PFA features). For more information concerning the assignment of BRCS features, see Division 2, Section 1F.

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * FEATURE NAME

Description: Enter the PFA (Private Facility Access) Feature Name. PFA Feature Names have no restrictions on the valid characters, except that the first character may not be a slash (/).
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

DEFAULT PARAMETERS

The following fields (Section 2.4 - Section 2.8) define the default parameters assigned with the feature to terminals (lines or trunks). These parameters will be assigned to the terminal unless they are overridden by entries on the PFALPA, PFAMPA or PFATPA forms. For PFA it is recommended that the PFA Group name be entered here, eliminating the need for the parameter forms.

2.4 PFA GROUP

Description: For 5E6 and later, this field is renamed CSV PFA GRP.

Enter the name of the PFA Group.

Software Release: 5E5 and earlier
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.5 CSV PFA GRP

Description: Enter the name of the Circuit-Switched Voice PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The CSV PFA GRP must match a PFA GROUP defined on the PFAGPA form (5609-5 Record) with a GROUP TYPE of "VOICE".

Defining a CSV PFA GRP is not required; however, if a CSD PFA GRP is defined on this form, then a CSV PFA GRP also must be defined.

2.6 CSD PFA GRP

Description: Enter the name of the Circuit-Switched Data PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

If CSD PFA GRP is entered, CSV PFA GRP must also be entered; the two group names must be different.

CSD PFA GRP must match a PFA GROUP defined on the PFAGPA form (5609-5 Record) with a GROUP TYPE of "CSD".

2.7 QUEUE ALLOWED

Description: Is queuing of outgoing trunks allowed for this PFA feature? If "N" is entered, calls originating from this PFA feature cannot be queued.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.8 PRIORITY QUEUE

Description: Does this PFA feature have a priority option? An entry of "Y" indicates that the calls in queue for this feature can be prioritized.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PRIORITY QUEUE is "Y", QUEUE ALLOWED must be "Y".

SEC. 10B: 5609-2 RECORD
PFA TERMINAL GROUP FORM - PFATG

1. GENERAL

The 5609-2 Record is available with 5E2 and later Software Releases. It is used to associate a BRCS Terminal Group, from the Terminal Group Station Restriction feature, to an SFG (Simulated Facility Group). The SFGs provide limited access for ESSX service and to six-port conference circuits.

ESSX service is a means of simulating the Central Office access trunks that a PBX (Private Branch Exchange) uses to access the Central Office. ESSX is used for a customer group that has line appearances in the 5ESS Switch for each of their telephones, but they wish to limit the number of calls originating and/or terminating to these lines. ESSX limits are achieved through the use of SFGs.

In the 5ESS Switch, ESSX limits the quantity of simultaneous calls to and/or from numbers outside the customer's Terminal Group, or calls that are placed without using the intercom feature of the IDP (Individualized Dialing Plan) capability.

The ESSX service can be incoming only, outgoing only or two-way. If a customer has two-way ESSX, there can be separate SFGs for incoming and outgoing, an SFG which serves both, or hunting arrangements which incorporate both types.

When a member of a Terminal Group originates a call, the PFATG form is checked to see if there is an entry for its Terminal Group ID in ORIG MC ROUTE INDEX. An entry signifies that this Terminal Group has originating (outgoing) ESSX. With outgoing ESSX, the 5ESS Switch checks to see if the call is an intercom call. (An intercom call is identified in the IDPDCA form (5601-1/2 Record) with an action of "ICMUSE".) If it is an intercom call, the terminal that the call is terminating to is checked to see if it belongs to the same Terminal Group. Only calls which are both intercom and within the Terminal Group are exempt from the SFG limit. Also, calls incoming to or outgoing from the Terminal Group over private facilities (e.g. FX, tie lines) are not restricted by the SFG. For all other calls, outgoing ESSX applies and the ORIG MC ROUTE INDEX is used for the MCRTIDX form (5304 Record) to determine which SFG to use. If all the "ports" of this SFG are busy, the NEXT MC ROUTE INDEX on the MCRTIDX form is checked to see if another ESSX SFG should be tried or if the call should route to reorder tone.

Similar processing takes place when calls are terminating to a Terminal Group except that TERM MC ROUTE INDEX on this form is checked to see if the Terminal Group has terminating (incoming) ESSX.

When a member of a Terminal Group initiates a six-port conference call, the PFATG form is checked to find the SIXPORT SFG entry for its Terminal Group ID. The Terminal Group has limited access to the six-port conference circuits in this office. The SFG limits the number of six-port conference circuits that the specified Terminal Group can use simultaneously. To use a six-port conference circuit, the Terminal Group member must also be assigned a BRCS Multiway feature such as "/MW6WC" or its equivalent.

To be a member of a Terminal Group, a terminal must be assigned a TGSR (Terminal Group Station Restriction) BRCS feature. The Terminal Group ID is assigned as a default parameter of the TGSRFD form (5607-1/2 Record) or on a TGSRLPA (5607-3 Record), TGSRMPA (5607-4 Record), or TGSRTPA form (5607-5 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 7.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * TERMINAL GROUP ID

Description: Enter the Terminal Group ID number.

Required Field.
Valid Entries: 1 - 65535

2.3 ORIG MC ROUTE INDEX

Description: If Outgoing ESSX service is required for this Terminal Group, enter an MC Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The MC Route Index must be defined on an MCRTIDX form with an MC ROUTE TYPE of "SFG".

2.4 TERM MC ROUTE INDEX

Description: If Incoming ESSX service is required for this Terminal Group, enter an MC Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The MC Route Index must be defined on an MCRTIDX form with an MC ROUTE TYPE of "SFG".

2.5 CCSA ORIG MC RTI

Description: If Originating CCSA (Common Control Switching Arrangement) is required for this Terminal Group, enter an MC Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The MC Route Index must be defined on an MCRTIDX form with an MC ROUTE TYPE of "SFG".

2.6 CCSA TERM MC RTI

Description: If Terminating CCSA (Common Control Switching Arrangement) is required for this Terminal Group, enter an MC Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Copyright © 2003 Lucent Technologies

Data Rules:

The MC Route Index must be defined on an MCRTIDX form with an MC ROUTE TYPE of "SFG".

2.7 SDN MC ROUTE INDEX

Description: If access to an SDN (Software Defined Network) is required for this Terminal Group, enter an MC Route Index.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The MC Route Index must be defined on an MCRTIDX form with an MC ROUTE TYPE of "SFG".

2.8 SIXPORT SFG

Description: If access to six-port conference circuits is required for this Terminal Group, enter an SFG Number.
Valid Entries: 1 - 2000

Data Rules:

The SFG Number must be defined on a PFASFG form (5609-3 Record) with an SFG TYPE of "6PORT".

2.9 EON MC RI

SEC. 10C: 5609-3A/B RECORD
SIMULATED FACILITY GROUP FORM - PFASFG

1. GENERAL

The 5609-3 Record is available with 5E2 and later Software Releases. It is used to define SFG (Simulated Facility Groups) which allow controlling access to physical groups such as lines, trunks and special circuits. SFGs may be used for OUTWATS, INWATS, ESSX, EDSL, CCSA, SDN, Megacom, Megacom 800 and six-port conference circuits.

In order to obtain access to the associated feature or facility, an idle member of the Simulated Facility Group must be available. The hunting method for SFGs is similar to the linear hunt of a Trunk Group. Each member of either an SFG or a Trunk Group is marked as busy or idle. The difference is that the SFG members do not have an associated piece of equipment, e.g., a DEN or a TEN. It is software only, hence, the name simulated.

When an SFG is used, the customer is allowed limited access to a physical set of equipment. The number of simultaneous accesses is not allowed to exceed a prespecified limit. That limit is essentially the SFG SIZE specified on this form. This limit is usually less than the number of members in the physical facility, e.g., the number of terminals in an INWATS MLHG. It is possible to set the SFG SIZE to a number that is equal to or greater than the physical members available. However, calls would never be blocked at the simulated level.

1.1 OUTWATS Simulated Facility Groups

An OUTWATS SFG may be associated with either an ARS (Automatic Route Selection) route list, a PFA (Private Facility Access) dial access, or, for 5E4(2) and later, EDSL trunk groups. For any of these features, the MCRTIDX form (5304 Record) contains the SFG Number that points to this form. When the SFG is used for OUTWATS, two additional fields of the PFASFG form are used if access of an SFG "port"is successful. These are the WATS BILLING NUMB/SPECIAL BILL NBR and SCREENING INDEX/SCRN IDX. The Screening Index is required so that band screening may be done and the appropriate Charge Index may be determined in the RAR form (5301 Record). The WATS Billing Number is an optional entry if it is desired that a Special Billing Number associated with the SFG be used.

It is possible to avoid duplicating RAR forms for physical OUTWATS lines and OUTWATS SFGs even though different billing is to be done. This is done by using a WATS Charge Index ("FGDWBL"or "WATSB") described as Group Billing. These Charge Indexes were designed so that if a Group Billing Number (i.e., the WATS BILLING NUMB/SPECIAL BILL NBR on the PFASFG form) is not found, the Billing Number of the terminal is used. Because the physical OUTWATS line does not access the PFASFG form, it can never collect the WATS BILLING NUMB/SPECIAL BILL NBR and, therefore, will always use the terminal billing number.

For ARS and PFA OUTWATS calls which do access the PFASFG form, if the Charge Index indicates Group Billing but no WATS Billing Number has been entered, the Terminal Billing Number is used.

1.2 INWATS Simulated Facility Groups

An INWATS SFG can be used to terminate INWATS calls to a MLHG (Multi-Line Hunt Group). For 5E4(2) and later, it also can be used to terminate INWATS calls to a trunk group. For an INWATS SFG, the MCRTIDX form contains the SFG Number that points to this form. The PFAINWT form (5609-4 Record), is the initial trigger for using an SFG for terminating INWATS calls to a Multi-Line Hunt Group.

For 5E4(2) and later, INWATS SFGs used for terminating to non-EDSL trunk groups use the called (terminating) number as the billing number if no billing number is specified in the SFG, EDSL trunk groups use the billing number of the trunk group if no billing number is specified in the SFG.

The WATS BILLING NUMB/SPECIAL BILL NBR may also be used for an INWATS SFG. If access of an

Copyright © 2003 Lucent Technologies

INWATS SFG "port"is successful, the WATS BILLING NUMB/SPECIAL BILL NBR entered will be used for the terminating INWATS billing record. If an entry is not made in WATS BILLING NUMB/SPECIAL BILL NBR, the billing number of the Multi-Line Hunt line terminal that the call terminates to will be used.

1.3 ESSX and Six-Port Conference Circuit SFGs

ESSX and six-port conference circuit SFGs are associated with a Terminal Group on a PFATG form (5609-2 Record). For six-port conference SFGs, the PFATG form contains the SFG Number that points to this form. For ESSX (incoming, outgoing, or two-way), the MCRTIDX form contains the SFG Number.

1.4 Selective Customer Control of Facilities and Trunk Group Busy Lamps

SCCOF (Selective Customer Control of Facilities) and TGBL (Trunk Group Busy Lamps) may be used for Simulated Facility Groups similar to the way they are used for physical equipment groups. With SCCOF, by operating a key on the customer premises, the customer can prevent calls from using a given facility (including simulated) by making the facility appear to be in an all-members-busy condition. Normal operation of the facility resumes when the key is released. If the facility is equipped with a TGBL on the customer premises, the lamp will be lit when the key is operated and extinguished when the key is released just as it is when all of the SFG members are really in use. MAKE BUSY KEY and BUSY LAMP should be entered for SCCOF and TGBL, respectively. They are both optional fields and one may be entered without the other if only one of the capabilities is desired.

1.5 Intercom Calling Restriction SFGs

For ICR (Intercom Calling Restriction) SFGs, an IDPLPA form (5601-6 Record) or an IDPMPA form (5601-7 Record), contains the SFG Number that points to this form. Additional fields (TRACK SM, AMA BILL, ICR ACTIVATE, ATT TN, ICR ACTION and ICR OVFL BILL) have been added for ICR SFGs.

The values entered in the ICR ACTION field must not be duplicated for one or more SFG numbers.

If a busy lamp is used to indicate when all members of the ICR SFG are busy, one of the following must be true.

Terminal Type	Field		
	BUSY LAMP	ATT TN	ICR ACTION
Analog Terminal	req entry	blank	blank
ISDN Attendant Console	blank	req entry	req entry

If a busy lamp is not used, then the BUSY LAMP, ATT TN and ICR ACTION fields must all be blank.

1.6 Recent Change View

The corresponding Recent Change View for this form is 7.3.

2. FORM ENTRIES - 5609-3A RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SFG NBR

Description: Enter the SFG (Simulated Facility Group) Number.
Valid Entries: 1 - 2000

Data Rules:

Copyright © 2003 Lucent Technologies

If SFG SIZE is in the range of 97 to 1984, then the SFG NBR must be 1 - 500.

If SFG SIZE is in the range of 1 to 96, then the SFG NBR may be 1 - 2000.

2.3 # SFG TYPE

Description: Enter the Type of SFG.

Required Field.

Valid SFG TYPE Entries

Entry	Definition
CNSOVFL	Software Release: 5E9(2) and later . CENTREX Network Special overflow used with an MC route index for Network overflow. This value supports the CENTREX Network secured features. For more information on these features see Division 2, Sections 4A181, 4A182, and 4A183.
EDSL	Software Release: 5E4(2) and later. Extended Digital Subscriber Line.
EOPAT	Software Release: 5E3 and later. End Office Precedence Access Threshold.
E911LNE	Software Release: 5E7 and later. Enhanced 911 Line SFG. Required for E911, this SFG limits the total number of simultaneously active 911 calls that originated from lines or from PBX trunks (trunk groups assigned an E911 TYPE of "PBXNONDED"on the TKGRP form). When the number of active calls exceeds SFG SIZE, additional 911 call attempts from lines and PBX trunks will receive reorder treatment.
E911TRK	Software Release: 5E7 and later. Enhanced 911 Trunk SFG. Required for E911, this SFG limits the total number of simultaneously active 911 calls originated from trunk groups assigned an E911 TYPE of "NONDED"on the TKGRP form. When the maximum number of calls are active, additional 911 call attempts from non-dedicated trunks will receive reorder treatment.
ICR	Software Release: 5E4(2) and later. Intercom Calling Restriction.
IESSX	Incoming ESSX service associated with a Terminal Group.
INCCSA	Software Release: 5E3 and later. Incoming CCSA service associated with a Terminal Group.
INFX	Software Release: 5E9(1) and later. Incoming EDSL (Extended Digital Subscriber Line) SFG from a Foreign Exchange trunk.
INTIE	Software Release: 5E9(1) and later. Incoming EDSL SFG from a Tie trunk.
INWATS	Used for Terminating INWATS service to a MLHG; or, for 5E4(2) and later, terminating INWATS to a trunk group.
MEGACOM	Software Release: 5E6 and later. Megacom.
M800	Software Release: 5E6 and later. Megacom 800.
NETPAT	Software Release: 5E3 and later. Network Precedence Access Threshold.
OESSX	Outgoing ESSX service associated with a Terminal Group.
OUTCCSA	Software Release: 5E3 and later. Outgoing CCSA service associated with a Terminal Group.
OUTFX	Software Release: 5E9(1) and later. Outgoing EDSL SFG to a Foreign Exchange trunk.
OUTTIE	Software Release: 5E9(1) and later. Outgoing EDSL SFG to a Tie trunk.
OUTWATS	Outward WATS service associated with PFA or ARS Groups; or, for 5E4(2) and later, OUTWATS service associated with an EDSL Hunt Group.
SDN	Software Release: 5E3 and later. Software Defined Networks.
2WCCSA	Software Release: 5E3 and later. Two-Way CCSA, an SFG used for both Incoming and Outgoing CCSA.
2WESSX	Two-Way ESSX, an SFG used for both Incoming and Outgoing ESSX.
2WFX	Software Release: 5E9(1) and later. 2-way EDSL SFG and/or a Foreign Exchange trunk.

Copyright © 2003 Lucent Technologies

2WTIE	Software Release: 5E9(1) and later. 2-way EDSL SFG and/or a Tie trunk.
6PORT	Six-Port conference circuits associated with a Terminal Group.
HM	Software Release: 5E11 and later. Hotel Motel This entry supports the ISDN PRI Hotel/Motel and Selected Class of Call Screening secured feature, see Diviision 2, Section 4A219.
SCOCS	Software Release: 5E11 and later. Selected Class of Call Screening This entry supports the ISDN PRI Hotel/Motel and Selected Class of Call Screening secured feature, see Diviision 2, Section 4A219.

Data Rules:

When SFG TYPE is "HM", "M800", "MEGACOM", "OUTWATS" or "SCOCS", SCRN IDX must be entered.

If SFG TYPE is "HM"or "SCOCS", "QUEUE ALLOWED" must be "N"or not entered.

ISDN PRI Hotel/Motel and Selected Class of Call Screening are secured features. They must be purchased before "HM"or "SCOCS" can be entered in the SFG TYPE field on the PFASFG form. The ACT field for SFID 219 on the SFSYS form must be set to "Y".

For 5E7 and later, if SFG TYPE is "E911LNE"or "E911TRK", SFG SIZE must be 1 through 511; BUSY LAMP, MAKE BUSY KEY, and ISAT MLHG must be left blank; and BW LAMP and MK BUSY must be "N" or blank. These SFG NBRs are specified in the E911 LN SFG and E911 TRK SFG fields on the OFCOPT form (5509 Record) and must not appear on MCRTIDX forms.

For 5E9(1) and later, if SFG TYPE is "OUTFX", "OUTTIE", "2WFX", or "2WTIE", RTI must be entered. The RTI must be defined as ROUTE INDEX on an RTIDX form where a TRUNK GROUP NUMBER is entered and is defined as TGN on a TKGRP form. If SFG TYPE on this PFASFG form is "OUTFX"or "2WFX", FACILITY TYPE on the TKGRP form must be "FX"; if SFG TYPE is "OUTTIE" or "2WTIE", FACILITY TYPE must be "TIE".

If SFG TYPE is not "OUTFX", "OUTTIE", "2WFX", or "2WTIE", RTI cannot be entered.

SFG RTIs assigned on a PFASFG form must be defined on an RTIDX form.

If MCRTIDX forms have an SFG NUMBER defined on a PFASFG form with an SFG TYPE of "INFX", "INTIE", "OUTFX", "OUTTIE", "2WFX", or "2WTIE", then

- NEXT ROUTE cannot be entered on the MCRTDIX form.
- the MCRTIDX form with NEXT MC ROUTE INDEX entered may overflow to another MCRTIDX form keyed by this MC ROUTE INDEX value (call this overflow form MCRTDIX'). This MCRTDIX' form must also have an SFG NUMBER defined on a PFASFG form (call it PFASFG') where the SFG TYPE is as follows:

	SFG TYPE
PFASFG	**PFASFG'**
2WFX, 2WTIE	2WFX, 2WTIE
INFX, INTIE	INFX,INTIE, INWATS, 2WFX, 2WTIE, EDSL
OUTFX, OUTTIE	OUTFX, OUTTIE, OUTWATS, 2WFX, 2WTIE, EDSL
HM	HM
SCOCS	SCOCS

CONSOVFL:
For 5E9(2) and later, if "CNSOVFL" is entered, then:
- BUSY LAMP must not be entered
- BW LAMP must be "N"or not entered
- ENQUEUE ACT must be "N"

Copyright © 2003 Lucent Technologies

- MAKE BUSY KEY must not be entered
- MDR ACT must not be entered
- MK BUSY must be "N"or not entered
- Q FEATURE must not be entered
- QUEUE ALLOWED must be "N"

2.4 # SFG SIZE

Description: Enter the number of members in the SFG.

Required Field.
Valid Entries:
- For 5E7 and earlier: 1 - 1984
- For 5E8 and later: 1 - 1984, 9999

Data Rules:

When SFG TYPE is "E911LNE" or "E911TRK", SFG SIZE must be 1 to 511.

For 5E8 and later, when SFG SIZE is 9999, indicating that the SFG is of unlimited size, then

- SFG TYPE must be "INWATS", "OUTWATS", "INCCSA", "OUTCCSA" or "2WCCSA"
- QUEUE ALLOWED must be N or not entered
- WARN THRESH can not be entered.

2.5 BUSY LAMP

Description: Enter a DPN (Distribute Point Number) if a lamp at the customer premises is provided to indicate to the customer when all members of the SFG are busy.
Valid Entries: 9 digits. See the following table for the format of a Distribute Point Number.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

The pack that the scan point resides on must be defined on an EQMSP or an EQMMSP form (5750 Record) with a PACK TYPE of "DIST".

A DPN, if entered, must be unique. Refer to Division 8, Section 43 of this guide.

2.6 MAKE BUSY KEY

Description: Enter an SPN (Scan Point Number) if a key at the customer premises is provided to enable the customer to make the Simulated Facility Group in an all-members-busy condition by activating the key.
Valid Entries: 9 digits. See the following table for the format of a Scan Point Number.

Copyright © 2003 Lucent Technologies

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Scan Point Number	SPN	XX	00-30

Data Rules:

For offices equipped with CM1 (Communications Module 1), valid SM entries are 1 - 48; for offices equipped with CM2 (Communications Module 2), valid SM entries are 1 - 192.

If SFG TYPE is "ICR", this field must be blank.

The pack that the scan point resides on must be defined on an EQMSP or an EQMMSP form (5750 Record) with a PACK TYPE of "SCAN".

An SPN, if entered, must be unique. Refer to Division 8, Section 42 of this guide.

2.7 SFG BILL NUM

Description: SFG BILL NUM field is used to specify the ten digit number used when billing SFG (Simulated Facility Groups) services.

Software Release: 5E11 and later
Valid Entries: NPAXXXXXXX.

Data Rules:

When SFG BILL NUM is entered, SFG TYPE must be "HM", "INCCSA", "INWATS", "OUTCCSA", "OUTWATS", "SCOCS" or "2WCCSA".

2.8 SPECIAL BILL NBR

Description: Enter a ten-digit TN (Telephone Number) to be used for billing when the SFG TYPE is "OUTWATS", "INWATS", "INCCSA", "OUTCCSA" or "2WCCSA".

If this is an OUTWATS SFG, an OUTWATS Billing TN may be entered. It will be used for billing even if a group billing AMA CALL TYPE is not entered on a CGIDX form (5302-1 Record).

If this is an INWATS SFG, an INWATS Billing TN may be entered. It will be used in place of the Multi-Line Hunt line billing number to bill the terminating call. For 5E4(2) and later, this TN will be used for billing the terminating call instead of the trunk group billing number if the SFG is associated with a trunk group.

If a CCSA SFG is specified, an alternate billing number may be entered. It will be used instead of the terminal billing number.

Software Release: 5E10 and earlier.
Valid Entries: 10 digits

2.9 SCRN IDX

Description: Enter a Screening Index Number.
Valid Entries: 1 - 4095

Data Rules:

Copyright © 2003 Lucent Technologies

The Screening Index entered must be defined on a RAR form (5301 Record).

If the SFG TYPE is "OUTWATS", "M800" or "MEGACOM", this is a required entry. If the SFG TYPE is "EDSL"or "SDN", this is an optional entry. If the SFG TYPE is not "OUTWATS", "M800", "MEGACOM", "EDSL" or "SDN", an entry is prohibited.

When SCRN IDX is entered, SFG TYPE must be "EDSL", "HM", "M800", "MEGACOM", "OESSX", "OUTWATS", "SCOCS", "SDN" or "2WESSX".

For 5E4(2) and later, if this field is entered, the SFG TYPE must be set to "OUTWATS", "EDSL", "IESSX" or "OESSX".

2.10 QUEUE ALLOWED

Description: Is queuing allowed for this SFG Group?

Software Release: 5E3 and later.
Valid Entries: Y, N

Data Rules:

If Y is entered, the QUEUE FEATURE name must be defined on a QUFD form (5617-1 Record).

If this field is "Y", then SFG TYPE must be "OUTWATS" and the Q FEATURE must be entered.

For 5E3 and later, if the SFG TYPE field is not "OUTWATS", the QUEUE ALLOWED and Q FEATURE fields must not be entered.

For 5E3 and later, if this field is set to "Y", then the Q FEATURE entry on this form must appear in the FEATURE field on a QUFD form (5617-1 Record) where the GROUP TYPE entry is set to "SFG".

2.11 ENQUEUE ACT

Description: Should queuing be enabled? This field is used to enable or disable queuing for the SFG. It is also used in conjunction with the AP Facilities Management feature to enable and disable queuing. If this field is left blank, it will be set to a "Y"by ODA.

If ENQUEUE ACT is set to "N"and the queuing feature has been assigned, queuing will not be allowed on the SFG.

Software Release: 5E3 and later.
Valid Entries: Y, N

2.12 Q FEATURE

Description: Enter the queue name assigned to this SFG Group.

Software Release: 5E3 and later.
Valid Entries: 1 - 8 characters

Data Rules:

This feature must be defined on a QUFD form.

If this field is entered, then QUEUE ALLOWED must be "Y".

For 5E9(2) and later, if a QFEATURE on this MLHG form is assigned to the same QUEUE MODULE on a QUFD form (5617-1/2 Record) or a QUGPA form (5617-3/4 Record), the QUEUE SIZE must not exceed

Copyright © 2003 Lucent Technologies

255 per QUEUE MODULE if the corresponding EQIM form (5700 Record), where SM matches QUEUE MODULE, has UNIT TYPE set to a value other than "SM2000". Queue Size is the sum of the BASIC SIZE + EXTENDED SIZE + ROUTINE SIZE + PRIORITY SIZE on the QUFD or QUGPA forms for each of the Q FEATURES assigned to the same QUEUE MODULE.

2.13 TRACK SM

Description: Enter the SM on which this ICR SFG data will reside. ICR SFG data will be located in this SM, making it unnecessary to go to the AM (Administration Module) to hunt for an ICR SFG number.

Software Release: 5E4(2) and later
Valid Entries: 1 - 192

Data Rules:

The value entered in this field must be defined in the SM field on an EQIM form (5700-1 Record) where the EQSTATUS field is set to "O" (Operational).

If SFG TYPE is not "ICR", then this field must be blank.

For 5E9(1) and later:

A TRACK SM can only support a maximum of 65535 ICR (Intercom Calling Restriction) Members (SFG SIZE).

If AMA BILL is set to "Y", then no more than 50 PFASFG forms can have the same TRACK SM value.

2.14 AMA BILL

Description: Is an AMA Billing record of all intercom calls allowed?

Software Release: 5E4(2) and later.
Valid Entries: Y, N

Data Rules:

If SFG TYPE is not "ICR", this field must be blank

2.15 ICR ACTIVATE

Description: Should the ICR (Intercom Calling Restriction) feature be activated? This field is used to activate and deactivate the ICR feature.

Software Release: 5E4(2) and later.
Valid Entries: Y, N

Data Rules:

If SFG TYPE is not "ICR", then this field must be blank.

2.16 ATT TN

Description: Enter an ISDN Attendant Console telephone number.

Software Release: 5E4(2) and later
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9

Copyright © 2003 Lucent Technologies

- and X is 0 - 9

Data Rules:

If SFG TYPE is not "ICR", this field must be blank. If ATT TN is entered, ICR ACTION must be entered and the BUSY LAMP field must be blank.

For 5E5 and later, the ATT TN entry must be defined as a CKT TN with a TERM TYPE of "ATND"and the CONFIG GRP field entered on a DSLUSR form (5908-1 Record). The associated CLASS OF SERVICE on a LCC form must be "ISATND".

For 5E12 and later, if the first 3 digits of the 7-digit ATT TNs on the PFASFG form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE or the NOC form does not exist, the 7-digit ATT TN(s) must be entered as a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.17 ICR ACTION

Description: Enter an ICR (Intercom Calling Restriction) Action to indicate which lamp will be lit on the ISDN Attendant Console when all members of the ICR SFG are busy.

Software Release: 5E4(2) and later
Valid Entries:

Valid ICR ACTION Entries

Entry	Definition
ICRBL1	Intercom Calling Restriction Busy Lamp 1
ICRBL2	Intercom Calling Restriction Busy Lamp 2
ICRBL3	Intercom Calling Restriction Busy Lamp 3
ICRBL4	Intercom Calling Restriction Busy Lamp 4
ICRBL5	Intercom Calling Restriction Busy Lamp 5
ICRBL6	Intercom Calling Restriction Busy Lamp 6

Data Rules:

If SFG TYPE is not "ICR", then this field must be blank. If ICR ACTION is entered, then ATT TN must be entered.

The combination of an ATT TN entry and an ICR ACTION entry must be unique. The combination can appear on only one PFASFG form instance.

If an ICR ACTION is entered, then it must be defined on a CFGGRP form.

2.18 ICR OVFL BILL

Description: Is ICR Overflow Billing desired?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y"is entered in this field, the entry in the SFG TYPE field must be "ICR".

2.19 ALT SFC

Description: Enter an Alternate SFC (Service Feature Code) for an INWATS SFG. When an ALT SFC is

Copyright © 2003 Lucent Technologies

entered for a particular SFG, it will be substituted for the default SFC of 8 in the AMA records for that SFG. If an ALT SFC is not entered, then the default SFC of 8 will be used in the AMA record.

Software Release: 5E6 and later
Valid Entries: 800 - 999

Data Rules:

ALT SFC can only be entered when SFG TYPE is "INWATS". A maximum of 150 PFASFG forms in an office can have ALT SFC entered.

ALT SFC is used by the Enhanced INWATS-Type AMA Records secured feature and hence cannot be entered unless this feature has been purchased. This is indicated by setting FEATURE ID 39 to "S"(for 5E9(1) and later, SFID 39 must have ACT set to "Y") on the SFSYS form (5713 Record).

2.20 LINE DAS

Description: Enter the Line DAS associated with this SFG. An entry in this field requires an SFG TYPE of "OUTWATS". LINE DAS, added with the DAS on an OUTWATS SFG feature, allows users access to more than one PDIT, INDIT or LDIT and routes calls using a different dialing plan than the one associated with the originating line. Division 2, Section 1BE contains a full feature description of this capability.

Software Release: 5E7 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

A LINE DAS must be defined on a DAS form (5604-3 Record).

If LINE DAS is entered, then SFG TYPE must be "OUTWATS".

If entered, LINE DAS must not have the same entry as the PVN DAS on the OFCOPT form (5509 Record).

- **WARNING:** The corresponding LOCAL DIT on the matching DAS form should be entered on an SMLDIT form (5106 Record) where the List of Switching Modules contains all SMs in the office. Note: If all potential users of this SFG reside in a subset of SMs in the office then the entry of this subset of SMs on the SMLDIT form is sufficient.

2.21 TRK DAS

Description: Enter the Trunk DAS associated with this SFG. An entry in this field requires an SFG TYPE of "OUTWATS". TRK DAS, added with the DAS on an OUTWATS SFG feature, allows users access to more than one PDIT, INDIT or LDIT and routes calls using a different dialing plan than the one associated with the originating trunk.

Software Release: 5E7 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

TRK DAS, if entered, must be defined on a DAS form (5603-4 Record).

Copyright © 2003 Lucent Technologies

If TRK DAS is entered, then SFG TYPE must be entered.

A TRK DAS must not have the same entry as a PVN DAS on the OFCOPT form.

WARNING: The corresponding LOCAL DIT on the matching DAS form should be entered on an SMLDIT form (5106 Record) where the List of Switching Modules contains all SMs in the office. Note: If all potential users of this SFG reside in a subset of SMs in the office, the entry of this subset of SMs on the SMLDIT form is sufficient.

2.22 MDR GRP

Description: Enter the MDR GRP associated with this SFG. The entries of MDR GRP and MDR ACT allow the end customer to assign an MDR GRP on an SFG basis. This enables them to generate MDR records on a group basis and only when the SFG is utilized for the call.

Software Release: 5E8 and later
Valid Entries: 1 - 8 characters

Data Rules:

This field should be left blank if this capability is not used. An entry in this field requires SFG TYPE to be "OUTWATS". When MDR GRP is entered, MDR ACT must also be entered.

The MDR GRP entered must be defined on the MDRGP form (5624-2 Record), and either ORIG PRIV or INC PRIV on the MDRGP form must be "Y".

MDR GROUP STATUS on the MDRGP form (5624-2 Record) is not applicable to MDR GRP which is assigned SFG TYPE "OUTWATS".

2.23 MDR ACT

Description: Should the Message Detail Recording group be activated?

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field should be left blank if the MDR capability is not used. When MDR ACT is entered, MDR GRP must also be entered.

2.24 RTI

Description: Enter the route index for PRI Call-by-Call originations.

Software Release: 5E9(1) and later.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382.

Data Rules:

For 5E9(1) and later, if SFG TYPE is "OUTFX", "OUTTIE", "2WFX", or "2WTIE", RTI must be entered.

If SFG TYPE is not "OUTFX", "OUTTIE", "2WFX", or "2WTIE", RTI cannot be entered.

Copyright © 2003 Lucent Technologies

3. FORM ENTRIES - 5609-3B RECORD

ISDN ATTENDANT

The MK BUSY, BW LAMP, ISAT GRP and WARN THRESH fields (Section 3.1 - Section 3.4) are applicable to ISDN Attendant Simulated Facility Groups. The fields are available with 5E4(2) and later.

3.1 MK BUSY

Description: Is Selective Customer Control of Facilities on? This feature allows the attendant to deny access to a Simulated Facility Group.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(2) and later, when this field is "Y", the MAKE BUSY KEY field must be entered on this form.

3.2 BW LAMP

Description: Are Simulated Facility Group busy warning lamp(s) provided for this group on the attendant's console? If "Y"is entered, the lamp will light whenever the threshold of idle members in an SFG is less than or equal to the threshold value entered in the WARN THRESH field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", an ISAT GRP must be entered.

3.3 ISAT GRP

Description: Enter the ISDN Attendant MLHG that can busy monitor this SFG.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

If the BW LAMP field is set to "Y", then this field must be entered.

If an ISAT GRP is entered, it must be defined on a MLHG form (5110-1 Record) with a MLHG FEATURE defined on a MLHGFD form (5604 Record) with a HUNT TYPE of "ISAT".

3.4 WARN THRESH

Description: Indicate the threshold of members of this group that must be idle at any given time before the Simulated Facility Group busy warning lamp(s) will light at the attendant's console.
Valid Entries: 0 - 1984

Data Rules:

If the BW LAMP field is set to "Y", then the WARN THRESH field must be entered.

If the BW LAMP field is set to "N", then the WARN THRESH field must not be entered.

SEC. 10D: 5609-4 RECORD
INWATS SIMULATED FACILITY TN FORM - PFAINWT

1. GENERAL

The 5609-4 Record is available with 5E2 and later Software Releases. It is used to associate an MLHG (Multi-Line Hunt Group) with an SFG (Simulated Facility Group) to limit the quantity of simultaneous calls terminating to the MLHG as INWATS calls. For 5E4(2) and later Software Releases, it is used to limit the quantity of calls terminating to a trunk group as INWATS calls.

When an incoming call is terminating to a Multi-Line Hunt Group, it first must be determined if this is an INWATS MLHG. This is defined on the associated MLHGFD form (5604 Record), with INWATS equal to "Y" or "N". If it is "Y", then the PFAINWT form is checked to see if there is limited access via an SFG. When an incoming call is terminating to a trunk group, the terminating TN is used as a key to determine whether or not a search for a matching PFAINWT form is performed. This TN must be defined on a LINE form (5109 Record); this LINE form must have a corresponding LCC form (5306 Record) where the TERMINATING TREATMENT is "TINWATS". The terminating Telephone Number also is used as the key to this information when terminating to an MLHG. If the PFAINWT form is not found, there is unlimited access to the terminals in the Multi-Line Hunt Group or trunk group.

If the form is found, the MC Route Index is used to access the MCRTIDX form (5304 Record) to determine which SFG to use. If all the "ports" of this SFG are busy, the NEXT MC ROUTE INDEX on the MCRTIDX form is checked to see if another INWATS SFG should be tried next or if the call should route to Reorder tone.

The terminals of the INWATS MLHG must all have a Line Class Code defined with a terminating treatment of "INWATS". However, they do not require any specific BRCS feature for INWATS termination.

- ***NOTE:*** AMA Call Code 008 is generated for any terminating port marked "INWATS" or "TINWATS". The 008 AMA record is used to bill the terminating subscriber for these types of calls (typically 800 calls).

1.1 Recent Change View

The corresponding Recent Change view for this form is 7.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number used to access the Multi-Line Hunt Group or Trunk Group as a terminating INWATS call. The TN may be any valid seven-digit Telephone Number served by this office.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits of the TN must be defined in the OFFICE CODE field of a NOC form (5501 Record).

Copyright © 2003 Lucent Technologies

If the TN is defined in the LISTED TN or in a SUBTN field on an MLHG form (5110 Record), then the associated MLHGFD form must have the INWATS field set to "Y".

If this TN is defined on a MULTITN form (5114 Record), then the value for INWATS on the corresponding MULTITN form must be "Y".

If the TN is defined on a LINE form (5109 Record), then the associated LCC form (5306 Record) must have the TERMINATING TREATMENT field set to "TINWATS". If the TN is defined on an MLHLN form (5111 Record), then the associated MLHGFD form must have the INWATS field set to "Y".

For 5E12 and later, TNs on different PFAINWT forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the PFAINWT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 MC ROUTE INDEX

Description: Enter the MC Route Index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

The MC ROUTE INDEX entered must be defined on an MCRTIDX form (5304 Record) with an MC ROUTE TYPE of "SFG".

The MC ROUTE INDEX entered must not be assigned to a TERMINAL GROUP ID on a PFATG form (5609-2 Record).

5ESS Switch _

SEC. 10E: 5609-5 RECORD
PRIVATE FACILITY ACCESS GROUP FORM - PFAGPA

1. GENERAL

1.1 Terminal Assignments

The 5609-5 Record is available with 5E2 and later Software Releases. It is used to define the group information for PFA (Private Facilities Access). Each terminal (line or trunk) which is to use the PFA capability must be assigned a PFA feature name defined on the PFAFD form (5609-1 Record) on the BFG, LINEFA, MLHLNFA, TKGRPFA, or TRUNKFA forms.

In addition, each terminal must be assigned to a PFA Group which may be defined as the default parameter of the PFAFD form, or on an individual terminal basis with the PFALPA, PFAMPA, or PFATPA forms. The preconstructed PFA feature provided does not define the PFA Group. Therefore, if the preconstructed feature is used, individual parameter forms must be entered for each terminal. PFA constructed features do not count toward the Constructed Feature Limit. See the CFL form (5712 Record) in Division 8 of this guide.

1.2 Circuit-Switched Calls

One PFA Group name is used for multiple PFA Access Codes on a group basis. However, for 5E6 and later Software Releases, one PFA group applies to either CSV (Circuit-Switched Voice) or CSD (Circuit-Switched Data) calls; one group cannot be used for both types (GROUP TYPE is "VOICE" or "CSD"). If the PFA call originator belongs to an IDP (Individualized Dialing Plan) Group, the PFA Access Codes are first translated in the IDPDCA form (5601-1/2 Record) with ACTION of "PFUSE", and the associated PFA feature name.

- ***NOTE:*** In the IDPDCA form, the Dialing State should equal "NORMAL", even though additional digits may be dialed. With an ACTION of "PFUSE",the responsibility of collecting digits is passed to the PFA capability. "PFUSE" is also allowed in the ODP (Office Dialing Plan) (see the PDIT form (5300-2 Record)) for customers who do not have an IDP.

1.3 Routing and Screening

In addition to specifying digit collection on a per Access Code basis, the PFAGPA also defines the RI (Route Index) or MC RI and the Code Index to use when the call enters the RAR form (5301 Record). (PFA dial codes used to access OUTWATS are an exception; special routing and screening in this case are discussed in Section 1.4 .)

For 5E6 and later Software Releases, the same RI can be used for CSV and CSD calls. However, if the same index is used, all calls must be routed through a PRI.

An MC RI is required for access to OUTWATS so the SFG (Simulated Facility Group) can be determined. An MC RI might also be used if for some reason an overflow route is an MC RI.

In all other cases, the additional information found on the MCRTIDX form (5304 Record) is not required, and therefore a RI should be entered and defined on an RTIDX form (5303 Record).

The CI (Code Index) entered on the PFAGPA form, and the originator's SI (Screening Index) are used in combination with a Prefix of "NONE" to determine the appropriate entry in the RAR form (5301 Record) to read. The primary purpose of reading the RAR form is to determine the CI. Usually, "REGL" would be found on the RAR form to indicate that the RI (or MC RI) from the PFAGPA form should be used. The Dialing Plan Access Treatment categories may be used on the IDPDCA form (5601-1/2 Record) to allow or disallow certain members of the IDP from accessing the PFA routes. Therefore, it should not be necessary to "screen out" originators via a Special RI in the RAR.

Copyright © 2003 Lucent Technologies

1.4 OUTWATS

When the PFA dial code is used to access OUTWATS, the call does not go directly to the RAR form. In this case, the Digit Collection Type is "P" for POTS digit analysis. The MCRTIDX form is accessed which would be defined with an SFG and a Carrier ID. The PFASFG form (5609-3 Record) contains the SI to be used. If access of an SFG "port" is successful, the call processing uses the originator's ODP to collect the additional digits. The call from this point on looks like a POTS call with a PIC of the Carrier ID on the MCRTIDX form, accessing the ICF and CDIM forms as necessary, and entering the RAR form. The SI from the PFASFG form will be used and line screening will be set to "Y" so that WATS band screening will be done. See the MCRTIDX and PFASFG forms for additional information on OUTWATS.

1.5 Senderized Tie Trunks

When the PFA dial code is used to access a nonoverlap senderized Tie Trunk, the PFA Group information needs to define specific digit collection items so that it can be determined when the proper number of digits have been dialed. For this case, DIG COLL is usually "FIX" or "VAR". "XY" might also be appropriate. Signal conversion and OLP (Overlap Outpulsing) should be "N". When dialing is done (and the correct number of digits have been dialed or received based on DIG COLL), the RI, or MC RI and Code Index, are used to continue call processing as described in Section 1.3 .

When the PFA dial code is used to access an overlap senderized Tie Trunk, the same information as the nonoverlap case is needed, except that OVLP OPLS, attempt OLP, is "Y". The number of digits to collect before attempting to overlap outpulse must also be known. This is entered in OVLP DIGS. For OLP to occur, the RTIDX (or MCRTIDX) specified must have OLP equal to "Y". If it is "N", the call will proceed like the nonoverlap case.

1.6 Cut-through Tie Trunks

When the PFA dial code is used to access a cut-through Tie Trunk, DIG COLL will be "N" for collect no digits. After normal routing and screening procedures, an outgoing trunk is seized and the talking connection completed. This trunk must belong to a TG with Cut-Through equal to "Y" (see the TKGRP form (5202-3 Record)). When the call originator dials succeeding digits, the 5ESS Switch does not analyze or count the digits, but must pass them through the switch and out on to the trunk.

If the originating digits are Touch-Tone and the digits sent out on the trunk are Touch-Tone, the 5ESS Switch will pass the digits through the switch. If either end (or both ends) are not Touch-Tone (e.g., DP (Dial Pulse)), then the 5ESS Switch must perform signal conversion. Signal conversion is only used for access to cut-through facilities. This is indicated by setting SIG CONV to "Y". The value entered in SIG CONV TIME is the end of dialing time out in seconds. This specifies the amount of time that the 5ESS Switch will wait between digits dialed. When this time expires, the 5ESS Switch assumes that the end of dialing has occurred and signal conversion is no longer provided. If the SIG CONV is "Y", and both ends are Touch-Tone, the 5ESS Switch knows that signal conversion is not needed and ignores the entry. However, if SIG CONV is "N", and either end is DP, the call will fail. Therefore, it is recommended that SIG CONV equals "Y" for all cut-through cases.

For private facility cut-through trunks that are not FX (Foreign Exchange) or CPE (Customer Premises Equipment), valid combinations of IN START DIAL and OUT START DIAL values are described in the TRUNK form. When the IN START DIAL and OUT START DIAL are both "WINK", the customer will not receive second dial tone from the far office. If the SCND DIAL TONE field is "Y", the customer will receive second dial tone before the trunk has been set up and may result in the first several digits dialed being dropped if the customer dials immediately after receiving second dial tone. Therefore, it is not recommended to enter "Y" in the SCND DIAL TONE field for cut-through facilities. In general, PFA allows the prefixing of digits on cut-through trunking, however, its use may produce undesirable results. When an OUT START DIAL of "IMED" and an IN START DIAL of "DLTN" is assigned and digits are prefixed, second dial tone will not be heard by the originator. Deletion of dial tone will not be heard by the originator. Deletion of digits on the RTIDX form is not allowed for cut-through facilities.

Copyright © 2003 Lucent Technologies

1.7 Common Control Switching Arrangement Networks

When the PFA dial code is used to access a CCSA (Common Control Switching Arrangement) network, the information required is either the overlap or nonoverlap senderized Tie Trunk application. For CCSA access, DIG COLL may be XY, where X equals 7 digits for on network, and Y equals 10 digits for off network. The typical application has the following fields with the indicated values:

Field	Value
X DIGS	7
Y DIGS	10
NTH POS	2
NTH DIG1	0
NTH DIG2	1

This table indicates that if the 2nd digit received (NTH POS) is a 0 or 1 (NTH DIG1 and 2), collect 10 digits (Y DIGS). If the 2nd digit received is not a 0 or 1 (i.e., it is not an Numbering Plan Area), then this call is on the private network so collect 7 digits (X DIGS).

1.8 Electronic Tandem Switching Networks

When the PFA dial code is used to access an ETS (Electronic Tandem Switching) network, the call should be treated as a cut-through Tie Trunk.

1.9 Enhanced Private Switched Communication Service Networks

When the PFA dial code is used to access an EPSCS (Enhanced Private Switched Communication Service) network, the information required for cut-through Tie Trunk is applicable. A special requirement for EPSCS access is the need to outpulse the Billing Number of the originating terminal to the receiving switch before the call is cut-through. This is called Automatic Station Calling Identification, and is invoked when the TG that this call is outgoing on has ANI (Automatic Number Identification) equal to "Y". See the TKGRP form (5202-3 Record).

1.10 Foreign Exchange Access

When the PFA dial code is used to access an FX trunk, the information is basically the same as the Tie Trunk applications. FX service allows a customer to have a line appearance on a Central Office which is in a service area different than the one that normally serves the customer. When the call originator dials an FX PFA Access Code, the FX trunk is seized (this is the normal serving office), and the far end (the foreign office) is cross connected to line equipment. Seizure on the trunk causes an origination on the line, similar to a regular line going off hook. Special signaling takes place between the two offices and must be specified as GS (Ground Start) or LS (Loop Start). This is indicated on the TRUNK form (5204-1 Record) for IN START DIAL and OUT START DIAL. The OUT START DIAL assigned to the FX trunk and the FX line must be configured compatibly. For example, if OUT START DIAL is "GRND", then the FX line should be GS. Outpulsing on an FX trunk can be "TT" or "DP". An FX trunk can be cut-through or senderized.

If this is one-way incoming or two-way FX trunk, additional information is required. Someone calls the DN (Directory Number) associated with the line in the foreign office. Termination to the line causes a trunk origination at the normal serving office. By entering a Direct Connected DN on the TKGRP form (5202-3 Record), the call may terminate to a line in this office. The IN START DIAL on the TRUNK form has "DIRC" which triggers this. Because the signaling of Ground or Loop must be known for a one-way incoming, "GRND" or "LOOP" is entered in OUT START DIAL.

1.11 Customer Premises Equipment Access

When the PFA dial code is used to access CPE, the information required is similar to the cut-through Tie Trunk application. CPE trunks may be configured senderized, but the more common arrangement is cut-through. Examples of CPE are Radio Paging which broadcasts a radio signal to a pocket pager, and Recorded Telephone Dictation which allows the originator to record and edit verbal dictation sessions.

Copyright © 2003 Lucent Technologies

Interpretation of any dialed digits following cut-through of the connection that control the page or dictation session are the responsibility of an interface trunk circuit which resides on customer premises. If the trunks require Sleeve Lead Scan Points for supervision of the trunks, then the TG must be defined with a Trunk Class of PFCPE. Otherwise, the Trunk Class PF may be used (see the TKGRP form). The only special requirement on the PFAGPA form is in the case of recorded dictation, the signal conversion should not be released. This is accomplished by setting SIG CONV TIME to 0. Office-to-office trunking with SIG CONV TIME of 0 and the use of call pickup for recorded dictation trunks is not allowed.

1.12 Trunk Access

Two Trunk Classes are for Tie Trunks and FX Trunks. These are PF and PFLASH. PFLASH allows flash repeating capabilities. PFCPE is for CPE that require Sleeve Lead supervision. To enable incoming calls from a Tie Trunk to access preliminary digit analysis types that are available in PDIT but not INDIT, it is permitted for Trunk Classes of PF and PFLASH to enter a Line Type Digit Analysis Selector on the TKGRP form (5202-1 Record).

1.13 PFA Trunk Access

When alternate routing is required for PFA trunk access, the trunk associated with the alternate route must have the same characteristics as the primary route's trunk. For example, if a primary route points to a cut-through trunk, then the alternate RI should also point to a cut-through trunk. A recorded dictation trunk can only have another recorded dictation trunk as the alternate route.

CFPF (Call Forwarding Over Private Facilities) calls may be routed to an ETS over non-senderized trunks (cut-through) assuming the terminating trunk has the ARS (Automatic Route Selection) feature assigned to it.

1.14 Recent Change View

The corresponding Recent Change View for this form is 7.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *PFA GROUP

Description: Enter the name of the PFA Group.

Required Field.
Valid Entries: 1 - 8 characters (no restriction)

2.3 *DIALCODE

Description: Enter the Dial Code used to access PFA.

Required Field.
Valid Entries: 1 - 5 digits (#, *, 0 - 9)

Data Rules:

This Access Code must be defined with action equal to PFUSE in the IDPDCA form (5601-1/2 Record) or in the PDIT form (5300-2 Record), depending on whether the call originator has an IDP or uses the ODP.

2.4 SAVE ACD

Copyright © 2003 Lucent Technologies

Description: Is the Access Code to be saved?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the entry is "Y", then the Access Code is part of the called number. Subsequent digits collected will be appended to the Access Code, and subsequent digit counts must include the quantity of digits in the Access Code.

2.5 SCND DIAL TONE

Description: Should Second Dial Tone be given?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

It is recommended that this field be "N" for access to cut-through trunks.

2.6 DIG COLL

Description: Enter the Digit Collection type.

Required Field.

Valid DIG COLL Entries

Entry	Definition
N	Used for cut-through. Subsequent digits are not analyzed or collected. SIG CONV and SIG CONV TIME are usually entered.
P	Used for the OUTWATS case, digits should be collected based on POTS digit analysis. ROUTE TYPE must be "MC".
FIX	Used when a fixed number of digits are to be collected. The fixed number must be entered in NUMB DIGS.
VAR	Used when a variable number of digits are to be collected. MAX DIGS, MIN DIGS, and INT DIG TIME must have entries.
XY	Used when two quantities of digits are to be collected based on the value of a digit collected. May be used for CCSA access. X DIGS, Y DIGS, NTH POS, NTH DIG1, and NTH DIG2 must have entries.

Data Rules:

For 5E5 and later:
If the DIG COLL is equal to "VAR", "XY", or "FIX", and the ROUTE TYPE on this PFAGPA form is equal to "MC", then the MC ROUTE INDEX on the matching MCRTIDX form (5304 Record) must equal the ROUTE INDEX on this PFAGPA form, and, the TRUNK GROUP NUMBER on the MCRTIDX form (5304 Record) must match the TGN on the TKGRP form (5202 Record), and, the CUT THRU field on the TKGRP form (5202 Record) must be "N" or blank.

If DIG COLL is "N" and ROUTE TYPE is "HUNT", then the ROUTE INDEX on this PFAGPA form must equal the ROUTE INDEX on the matching RTIDX form (5303 Record) and the TRUNK GROUP NUMBER on the RTIDX form (5303 Record) must match the TGN on the TRKGP form (5202 Record), and, CUT THRU on the TRKGP form (5202 Record) must be "Y".

If DIG COLL is "N" and ROUTE TYPE is "MC", then the ROUTE INDEX on this PFAGPA form must equal the MC ROUTE INDEX on the matching MCRTIDX form (5304 Record), and, the TRUNK GROUP NUMBER on the MCRTIDX form (5304 Record) must equal the TGN on the TKGRP form (5202 Record),

Copyright © 2003 Lucent Technologies

and, CUT THRU on the TKGRP form (5202 Record) must be "Y".

If DIG COLL is "VAR", "XY", or "FIX" and ROUTE TYPE is "HUNT", then the ROUTE INDEX on this PFAGPA form must equal the ROUTE INDEX on the matching RTIDX form (5303 Record), and, the TRUNK GROUP NUMBER on the RTIDX form (5303 Record) must equal the TGN on the TKGRP form (5202 Record), and, CUT THRU on the TKGRP form (5202 Record) must be "N" or unknown.

2.7 ROUTE INDEX

Description: Enter the value of the RI or MC RI. The field ROUTE TYPE indicates which this is.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

PFA Access to OUTWATS requires an MC RI. Other types of access may use either, but it is normally a RI.

2.8 GROUP TYPE

Description: Enter the type of call the PFA group is applicable to.

Software Release: 5E6 and later
Required Field.
Default: VOICE
Valid Entries:

Valid GROUP TYPE Entries

Entry	Definition
VOICE	"CSV calls
CSD	"CSD calls

Data Rules:

Defining a CSV PFA group is not required, however, if a CSD PFA group is defined, then a CSV PFA group also must be defined.

2.9 ROUTE TYPE

Description: Enter the Type of Route entered in ROUTE INDEX.

Required Field.

Valid ROUTE TYPE Entries

Entry	Definition
HUNT	The number is a POTS RI defined on the RTIDX form (5303 Record).
MC	The number is an MC RI defined on the MCRTIDX form (5304 Record).

Data Rules:

For 5E5 and later, if ROUTE TYPE is "MC" and DIG COLL is "P", the matching MCRTIDX form (5304 Record) must have a MC ROUTE TYPE set to "SFG."

2.10 CODE INDEX

Description: Enter the Code Index to be used to enter the RAR form (5301 Record).

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 4095

Data Rules:

For all types of Digit Collection, this is a required entry.

For 5E4(2) and later, if CODE INDEX is blank, ROUTE TYPE must be "MC".

2.11 SIG CONV

Description: Is signal conversion needed?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When DIG COLL is "N", indicating a cut-through mode, signal conversion is required if either the originating or terminating side of the call is not Touch-Tone. "Y" is normally expected to be entered when DIG COLL is "N" because there is no interference with the call when both ends are Touch-Tone but will be available in case one end is not. If "Y" is entered, SIG CONV TIME must also be entered. For types of DIG COLL other than "N", enter "N".

2.12 SIG CONV TIME

Description: Enter the time in seconds to wait after each digit before deciding that dialing is over and no more signal conversion is required.
Valid Entries: 0, 4 - 12

Data Rules:

Leave this field blank unless SIG CONV is "Y". A value of 0 is used for cases where the Signal Conversion is required for the length of the call, such as would be the case for recorded dictation.

2.13 OVLP OPLS

Description: Is OLP to be attempted on this route?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, OVLP DIGS must be entered. In order for OLP to be successful, the RTIDX (or MCRTIDX) form must be defined with OLP equal to "Y".

If DIG COLL is "P" or "N", OVLP OPLS must be "N".

For 5E5 and later if OVLP OPLS is "Y", DIG COLL may not be "P" or "N".

2.14 OVLP DIGS

Description: Enter the number of digits to collect before starting OLP.
Valid Entries:

- For 5E9(2) and earlier: 1 - 15

Copyright © 2003 Lucent Technologies

- For 5E10 and later: 1 - 18

Data Rules:

Leave this field blank unless OVLP OPLS equals "Y".

When a value is entered and DIG COLL is:

- "FIX", the value must be less than the value entered in NUMB DIGS.
- "VAR", the value must be less than the value entered in MIN DIGS.
- "XY", the value must be greater than or equal to the NTH POS, and less than or equal to the value in both X DIGS and Y DIGS.

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.15 NUMB DIGS

Description: Enter the number of digits to collect.
Valid Entries:
- For 5E9(2) and earlier: 1 - 15
- For 5E10 and later: 1 - 18

Data Rules:

Leave this field blank unless DIG COLL is "FIX".

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.16 MAX DIGS

Description: Enter the maximum number of digits to collect.
Valid Entries: 1 - 15

Data Rules:

Leave this field blank unless DIG COLL is "VAR". If entered, the value must be greater than the value entered in MIN DIGS.

2.17 MIN DIGS

Description: Enter the minimum number of digits to collect.
Valid Entries:
- For 5E9(2) and earlier: 1 - 15
- For 5E10 and later: 1 - 18

Data Rules:

Leave this field blank unless DIG COLL is "VAR". If entered, the value must be less than the value entered in MAX DIGS.

Copyright © 2003 Lucent Technologies

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.18 INT DIG TIME

Description: Enter the interdigital timing in seconds.
Valid Entries: 4 - 12

Data Rules:

Leave this field blank unless DIG COLL is "VAR". Digit collection through the MIN DIGS value is done by regular office timing defined on the TIMING form (5520 Record). The seconds entered here specify the interdigital timing interval for collection of any further digits up to the quantity specified in MAX DIGS. An interdigital timeout after the reception of the minimum digits signifies that dialing is complete.

2.19 X DIGS

Description: Enter the digits to collect if there is no match of dialed number to the number in NTH DIG1 or NTH DIG2 for the NTH POS.
Valid Entries:
- For 5E9(2) and earlier: 1 - 15
- For 5E10 and later: 1 - 18

Data Rules:

Leave this field blank unless DIG COLL is "XY".

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.20 Y DIGS

Description: Enter the digits to collect if there is a match of dialed number to the number in either NTH DIG1 or NTH DIG2 for the NTH POS.
Valid Entries:
- For 5E9(2) and earlier: 1 - 15
- For 5E10 and later: 1 - 18

Data Rules:

Leave this field blank unless DIG COLL is "XY". If entered, this value must not equal the value in X DIGS.

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.21 NTH POS

Description: Enter the digit position of the dialed number to check the values found in NTH DIG1 and NTH DIG2 to see if X DIGS should be collected or Y DIGS should be collected.
Valid Entries:
- For 5E9(2) and earlier: 1 - 15
- For 5E10 and later: 1 - 18

Copyright © 2003 Lucent Technologies

Data Rules:

Leave this field blank unless DIG COLL is "XY". If entered, this value must be less than or equal to both of the values found in X DIGS and Y DIGS.

For 5E10 and later, this field cannot have a value greater than 15 unless the 15 Digit IDDD secured feature has been purchased by the office. Therefore, the SFID 223 ACT field must be set to "Y" on the SFSYS form (5317-1 Record). For more information on this feature, see Division 2, Section 4A223.

2.22 NTH DIG1

Description: Enter the first value of the nth digit, in the NTH POS.
Valid Entries: 0 - 9

Data Rules:

Leave this field blank unless DIG COLL is "XY". If the Nth Digit of the dialed digit string is equal to either the digit entered in NTH DIG1 or NTH DIG2, the number of digits to collect is the value of Y DIGS. If the nth digit does not match, the number of digits to collect is the value of X DIGS.

2.23 NTH DIG2

Description: Enter the second value of the nth digit, in the NTH POS.
Valid Entries: 0 - 9

Data Rules:

Leave this field blank unless DIG COLL is "XY". If the Nth Digit of the dialed digit string is equal to either the digit entered in NTH DIG1 or NTH DIG2, the number of digits to collect is the value of Y DIGS. If the nth digit does not match, the number of digits to collect is the value of X DIGS.

2.24 QUEUE REQUEST

Description: Is queuing requested for this PFA group?

Software Release: 5E3 and later
Default: N
Valid Entries: Y, N

CFPF

Fields Section 2.25 - Section 2.33 are fields associated with CFPF (Call Forwarding Over Private Facilities).

2.25 ETS TRK IND

Description: Is this PFA GROUP associated with an ETS trunk for the CFPF?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

To have CFPF this field must be "Y".

Copyright © 2003 Lucent Technologies

When "Y" is selected, the termination side of the trunk must have Auto ARS.

When ETS TRK IND is "Y", then DIG COLL must be "N".

When ETS TRK IND is "N", the fields associated with CFPF via ETS cut-through trunks must be entered as follows:

Field	Entry
ACCT CODE LNGTH	blank
ATH CODE LNGTH	blank
ATH ALW	N
ATH PROMPT	NONE
LEAD ACCT CODE	blank
PAUSE1	0
PAUSE2	0
PAUSE3	0

When ETS TRK IND is set to "Y", the TRUNK GROUP NUMBER on the associated TKGRP form (5202 Record) must have CUT THRU set to "Y".

2.26 ACCT CODE LNGTH

Description: Enter the number of digits in the Account Code used with the Account Code Feature assigned to the associated ETS cut-through trunk.

The ACCT CODE LENGTH will consist of the number of digits in the LEAD ACCT CODE plus the number of digits used for an account code. These are the digits that are expected at the destination end of the trunk.

Software Release: 5E5 and later
Valid Entries: 1 - 15

Data Rules:

When an ACCT CODE LNGTH is entered, PAUSE2 must have a nonzero value and ETS TRK IND must be "Y".

2.27 ATH CODE LNGTH

Description: Enter the number of digits in the Authorization Code that are to be saved and outpulsed if ATH ALW is set to "Y". These digits are the digits that are expected at the destination end of the trunk.

Software Release: 5E5 and later
Valid Entries: 1 - 15

Data Rules:

This field must be entered when the destination trunk is expecting an authorization code (ATH ALW of "Y").

When an ATH CODE LNGTH is entered, PAUSE3 must have a nonzero value and ETS TRK IND must be "Y".

2.28 ATH ALW

Description: Is the destination end of the trunk is expecting an Authorization Code to be sent?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When ATH ALW is "Y", ATH CODE LNGTH must be entered, ATH PROMPT must not be "NONE" and ETS TRK IND must be "Y".

2.29 ATH PROMPT

Description: Enter the type of prompt that will be given to the user to indicate that the Authorization Code should be entered.

Software Release: 5E5 and later
Required Field.
Default: NONE
Valid Entries:

Valid ATH PROMPT Entries

Entry	Definition
BEEP1	One Beep
BEEP2	Two Beeps
BEEP3	Three Beeps
LEAVE	Party Leaving Tone
DIAL	Dial Tone
NONE	No Tones

Data Rules:

When this field is not "NONE", ETS TRK IND must be "Y" and ATH ALW must be "Y".

2.30 LEAD ACCT CODE

Description: Enter the three digits which may precede the account code digits. These are the digits that are expected at the destination end of the trunk.

Software Release: 5E5 and later
Valid Entries: 0 - 9 (the first digit may also be * or #)

Data Rules:

If this field is entered, the length of this field must be less than or equal to the ACCT CODE LNGTH and ETS TRK IND must be "Y".

2.31 PAUSE1

Description: Enter the length of time in seconds used to delay the digit outpulsing so that the termination end of a CFPF ETS is ready to collect digits. This is the time that is expected at the destination end of the trunk.

Software Release: 5E5 and later
Required Field.
Default: 0
Valid Entries: 0 - 10

Data Rules:

When PAUSE1 has a nonzero value, DIG COLL must be "N" and ETS TRK IND must be "Y".

2.32 PAUSE2

Description: Enter the first intermediate pause in seconds required for CFPF/ETS segmented signaling. It

Copyright © 2003 Lucent Technologies

is used to cause a delay between the account code and the DN digit sequences for CFPF. This is the time that is expected at the destination end of the trunk.

Software Release: 5E5 and later
Required Field.
Default: 0
Valid Entries: 0 - 10

Data Rules:

When PAUSE2 has a nonzero value, ACCT CODE LNGTH must be greater than zero, DIG COLL must be "N" and ETS TRK IND must be "Y".

2.33 PAUSE3

Description: Enter the second intermediate pause in seconds required for CFPF/ETS segmented signaling. It is used to cause a delay between the DN and the authorization code digit sequences for the use of CFPF. This is the time that is expected at the destination end of the trunk.

Software Release: 5E5 and later
Required Field.
Default: 0
Valid Entries: 0 - 10

Data Rules:

When PAUSE3 has a nonzero value, ATH CODE LNGTH must be greater than zero, DIG COLL must be "N" and ETS TRK IND must be "Y".

SEC. 10F: 5609-6 RECORD
PRIVATE FACILITY ACCESS LINE (TN)
PARAMETER FORM - PFALPA

1. GENERAL

The 5609-6 Record is available with 5E2 and later Software Releases and is used to define Private Facility Access Line Parameters. The Line Parameter Form is used when a PFA constructed feature is assigned to a non-Multi-Line Hunt line and the desired parameters are different from the default parameters on the PFAFD form (5609-1 Record).

It is recommended that the default parameter, PFA Group name, be defined on the PFAFD form for the specific (constructed) PFA feature name. Then when the PFA feature name is assigned to a line on the LINEFA form (5112 Record) the default parameter will apply to that line without submitting a PFALPA form.

PFA constructed features do not count toward the office's Constructed Feature Limit. Therefore, there is no advantage to be gained in submitting a -PFALPA form. It is shown here for consistency with other BRCS features.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the line.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	Definition
ATND	50B Non-data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Software Release: 5E3 and later. Line to a PBX.

For 5E12 and later, TN/FEATURE combinations on different PFALPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the PFALPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or

Copyright © 2003 Lucent Technologies

the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the PFA feature for which the parameters are to be assigned.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a PFA feature defined on the PFAFD form (5609-1 Record).

2.4 PFA GROUP

Description: For 5E6 and later, this field is renamed CSV PFA GRP.

Enter the name of the PFA Group of which this line is a member.

Software Release: 5E5 and earlier
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of a PFA Group defined on one or more PFAGPA forms (5609-5 Record).

2.5 CSV PFA GRP

Description: Enter the name of the Circuit-Switched Voice PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must match a PFA GROUP defined on the PFAGPA form (5609-5 Record) with a GROUP TYPE of "VOICE". Defining a CSV PFA GRP for this port is not required; however, if a CSD PFA GRP is defined on this form, then a CSV PFA GRP also must be defined.

2.6 CSD PFA GRP

Description: Enter the name of the Circuit-Switched Data PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must match a PFA GROUP on the "PFAGPA form (5609-5 Record) that has a GROUP TYPE of "CSD". There cannot be CSD only groups for PFA service. This field can only be entered if CSV PFA GRP is entered.

The CSD PFA GRP name must differ from the CSV PFA GRP name; they cannot be the same.

2.7 QUEUE ALLOWED

Description: Is queuing allowed for this PFA feature? If "N" is entered, then calls originating from this PFA feature cannot be queued.

Software Release: 5E3 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

2.8 PRIORITY QUEUE

Description: Does this PFA feature have a priority option? An entry of "Y" indicates that the calls in queue for this feature can be prioritized.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PRIORITY QUEUE is "Y", then QUEUE ALLOWED must be "Y".

SEC. 10G: 5609-7 RECORD
PRIVATE FACILITY ACCESS LINE (MLHG/TERM)
PARAMETER FORM - PFAMPA

1. GENERAL

The 5609-7 Record is available with 5E2 and later Software Releases and is used to define Private Facility Access Multi-Line Hunt line parameters. The Line Parameter Form is used when a PFA constructed feature is assigned to a Multi-Line Hunt line, and the desired parameters are different from the default parameters on the PFAFD form (5609-1 Record).

It is recommended that the default parameter, PFA Group name, be defined on the PFAFD form for the specific (constructed) PFA feature name. Then when the PFA feature name is assigned to a Multi-Line Hunt line on the MLHLNFA form (5113 Record) the default parameter will apply without submitting a PFAMPA form.

PFA constructed features do not count toward the office's Constructed Feature Limit. Therefore, there is no advantage to be gained in submitting a PFAMPA form. It is shown here for consistency with other BRCS features.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Member Number of the line.
Valid Entries: 1 - 2015; 3001 - 3999 (for Outdial Terminals only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	Definition
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Software Release: 5E3 and later. Line to a PBX.

Copyright © 2003 Lucent Technologies

2.4 *FEATURE

Enter the name of the PFA feature for which the parameters are to be assigned.

Data Rules:
The name entered here must be that of a PFA feature defined on the PFAFD form (5609-1 Record).

2.5 PFA GROUP

Description: For 5E6 and later, this field has been renamed CSV PFA GRP.

Enter the name of the PFA Group of which the Multi-Line Hunt line is a member.

Software Release: 5E5 and earlier
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of a PFA Group defined on one or more PFAGPA forms (5609-5 Record).

2.6 CSV PFA GRP

Description: Enter the name of the Circuit-Switched Voice PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must match a PFA GROUP defined on the PFAGPA form (5609-5 Record) with a GROUP TYPE of "VOICE". Defining a CSV PFA GRP for this port is not required; however, if a CSD PFA GRP is defined on this form, then a CSV PFA GRP also must be defined.

2.7 CSD PFA GRP

Description: Enter the name of the Circuit-Switched Data PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must match a PFA GROUP on the PFAGPA form (5609-5 Record) with a GROUP TYPE of "CSD". There cannot be CSD only groups for PFA service; this field can only be entered if CSV PFA GRP is entered.

The CSD PFA GRP name must differ from the CSV PFA GRP name; they cannot be the same.

2.8 QUEUE ALLOWED

Description: Is queuing allowed for this PFA feature? If "N" is entered, then any calls originating from this PFA feature cannot be queued.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.9 PRIORITY QUEUE

Description: Does this PFA feature have a priority option? An entry of "Y" indicates that the calls in queue for this feature can be prioritized.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PRIORITY QUEUE is "Y", then QUEUE ALLOWED must be "Y".

SEC. 10H: 5609-8 RECORD
PRIVATE FACILITY ACCESS TRUNK (TGN/MEMB)
PARAMETER FORM - PFATPA

1. GENERAL

The 5609-8 Record is available with 5E2 and later Software Releases and is used to define Private Facility Access Trunk parameters. The Trunk Parameter Form is used when a PFA constructed feature is assigned to a trunk and the desired parameters are different from the default parameters on the PFAFD form (5609-1 Record).

It is recommended that the default parameter, PFA Group name, be defined on the PFAFD Form for the specific (constructed) PFA feature name. Then when the PFA feature name is assigned to the Trunk Group via the TKGRPFA form (5206 Record) or to the individual trunk via the TRUNKFA form (5205 Record) the default parameter will apply to that trunk without submitting a PFATPA Form.

PFA constructed features do not count toward the office's Constructed Feature Limit. Therefore, there is no advantage to be gained in submitting a -PFATPA Form. It is shown here for consistency with other BRCS features.

1.1 Recent Change View

The corresponding Recent Change View for this form is 6.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number of the trunk.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202-1 Record) must be one of the following.

TRKCLS	Definition
PF	Private Facility.
PFCPE	Private Facility Customer premise Equipment.
PFLASH	Private Facility Feature Flash.
PFITT	Software Release: 5E3 and later. Private Facility Inter-Tandem Trunk.
EDSL	Software Release: 5E8 and later. Extended Digital Subscriber Line trunk.
EDSLHM	Software Release: 5E8 and later. EDSL for Hotel/Motel TSPS service.

2.3 * MEMB

Description: Enter the Trunk Group Member Number of the trunk.
Valid Entries:

Copyright © 2003 Lucent Technologies

For 5E3 and later: 0 - 1951

2.4 * FEATURE

Description: Enter the name of the PFA feature for which the parameter is to be assigned.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a PFA feature defined on the PFAFD form (5609-1 Record).

2.5 CSV PFA GRP

Description: Enter the name of the Circuit-Switched Voice PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must match a PFA GROUP defined on a PFAGPA form (5609-5 Record) with a GROUP TYPE of "VOICE". Defining a CSV PFA GRP for this port is not required; however, if a CSD PFA GRP is defined on this form, then a CSV PFA GRP also must be defined.

2.6 CSD PFA GRP

Description: Enter the name of the Circuit-Switched Data PFA group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name must match a PFA GROUP on the PFAGPA form (5609-5 Record) with a GROUP TYPE of "CSD". There cannot be CSD only groups for PFA service; this field can only be entered if CSV PFA GRP is entered.

The CSD PFA GRP name must differ from the CSV PFA GRP name; they cannot be the same.

2.7 QUEUE ALLOWED

Description: Is queuing allowed for this PFA feature? If "N" is entered, then any calls originating from this PFA feature cannot be queued.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.8 PRIORITY QUEUE

Description: Does this PFA feature have a priority option? An entry of "Y" indicates that the calls in queue for this feature can be prioritized.

Software Release: 5E3 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If PRIORITY QUEUE is "Y", then QUEUE ALLOWED must be "Y".

PRIVATE FACILITY ACCESS GROUP DATA FORM - PFAGD

This section has been removed from the TG-5.

Copyright © 2003 Lucent Technologies

SEC. 11: TIME OF DAY FORMS

Copyright © 2003 Lucent Technologies

SEC. 11A: 5610-1 RECORD
TIME OF DAY FEATURE DEFINITION FORM - TODFD

1. GENERAL

The TODFD form is available with 5E2 and later Software Releases. The TOD feature allows a subscriber to control (i.e., preschedule) various aspects of other BRCS (business/residential) features through the use of dial codes. This feature allows the customer to set both the time and day for a particular action to occur. For example, for a specified day and time, a subscriber may wish to use the TOD feature to change an Interexchange Carrier for an IDP (Individual Dialing Plan) group, or simply, to activate or deactivate a feature, such as call forward night service. The TOD feature cannot be included in a BRCS Feature Group or assigned to a line that has a BRCS Feature Group.

Each TOD feature which is to act upon another BRCS feature must be defined. For each TOD Feature established, the TODFD form provides three basic types of feature information:

- Maximum Action Points, and Zero and One Parameter Codes - limitations on the feature.
- Control Group Data - BRCS features that TOD can have an effect upon.
- Subscriber-controlled functions - changes to the TOD schedule that the subscriber can effect.

It should be noted that, although the TODFD form establishes the unique permissions and contraints on a particular TOD Feature, a TODCL (Time of Day Code List) form (5610-2 Record) is required to identify the features and actions that are scheduled to occur on a particular line, terminal, or trunk (see Feature Name below).

1.1 Maximum Action Points and Parameter Codes

Action Points are tags used to identify each action or set of actions that are to occur on a given day and time. Each unique line, terminal, or trunk can have from one to thirty-two Action Points, but cannnot have more than eight TOD actions occurring at a single time for a specific Action Point.

Specific TOD Actions are designated via the Zero and One Parameter Codes on the TODCL form. Zero Parameter Codes designate "activate" and "deactivate" actions on a feature; One Parameter Codes designate actions which modify selected attributes of a BRCS feature. The TODFD form establishes limitations on the number of Action Points and Parameter Codes for a TOD feature; the TODCL form assigns specific actions to a given line, terminal of trunk. For a listing of the valid entries for TOD actions (i.e., Zero and One Parameter Codes), see the TODCL form.

For more detailed information on customer interaction with BRCS features for both the (ODP) Office Dialing Plan and the IDP Plan, see Divsion 2, Section 1F. For information defining dialed codes associated with ODPs (Office Dialing Plans), see Division 3, Section 3B (PDIT form, 5300-2 Record). For information defining codes associated with IDPs (Individual Dialing Plans), see the IDPDCA form (5601-1/2 Record; Division 4, Section 2B).

1.2 Control Group Data

The Control Group fields include: Control Line Private, Control Trunk, Control IDP Group, Control ARS Group, Control ATH Group, Control ACCT Group, Control ACVT Group, and Customer Activation. These parameters specify the BRCS features and/or groups that TOD can have an effect upon. These permissions are specific to the Feature Name. When a particular control field is set to "Y", this indicates that the TOD feature can control various options of that feature.

1.3 Subscriber-Controlled Parameters

Copyright © 2003 Lucent Technologies

The subscriber-controlled parameters define the allowable TOD Code Lists parameters that can be changed by the subscriber using dial codes. Dial codes must be defined in the PDIT form (5300-2 Record) or the IDPDCA form (5601-1/2 Record). Subscriber-controlled parameters include: Change Action Time, Change OWS (One Week Schedule), Change Code List, Add 0 Parm Code, Add 1 Parm Code, Delete 0 Parm Code List, Delete 1 Parm Code List, Delete All Lists, Default Code List Name. These parameters provide the subscriber with internal control assigned by the switch owner.

1.4 Feature Name

TOD features are assigned to a given line, terminal, or trunk via the LINEFA (Line Feature Assignment) form (5112 Record), the MLHLNFA (Multi-Line Hunt Group Member Feature Assignment) form (5113 Record), or to the TKGRPFA (Feature Assignment Trunk Group (5206 Record), respectively.

In addition, the TOD Code List associated with this feature must be assigned to the TODLPA (TOD Line Parameter) form (5610-3 Record), the TODMPA (TOD MLHG Terminal Parameter) form (5610-4 Record), and the TODTPA (TOD Trunk (TGN/MEMB) Parameter form (5610-5 Record) for line, terminal, or trunk, respectively.

1.5 Time of Day and Allocation of Memory

When the TOD feature is being used to control a group type of data, the feature is normally assigned to only one line or terminal for that group. When the TORC (Time Of Day Originated Recent Change) is applied to the group data, any line/terminal that uses that group will be affected. If the TOD feature controls group type data, the control field for the affected feature(s) should be set to "Y". All other control fields are set to "N". In this case, it is only necessary to assign the TOD feature to a single line (control line) that uses the group data. All other lines that use the group data do not require assignment to the TOD feature. This means, in terms of memory, that even though group data is redundantly populated as described above, the group data consists of only one line and thus memory allocation is kept to a minimum.

If the TOD feature controls line private data, the control field for the Line Private would be marked "Y". If TOD controls both group and line private data, only the affected control fields should be marked "Y". If any of the group type control fields are invalidly set to "Y" and the TOD feature does not control the features(s), significant additional memory allocation could result requiring unexpected and needless memory growth. This situation could result when TOD controls line private data (e.g., activation/deactivation of CFW (Call Forward) feature and one or more of the group control fields is also set to "Y" but TOD group control is not required. For example, if a hundred line centrex only desires TOD control of CFW on each line, and those same 100 lines are assigned to an ARS feature with the CONTROL ARS GROUP field set to "Y", then in addition to allocating memory for the line private data, significant additional memory will be allocated for ARS group data for 100 lines as described above. This additional allocation could ultimately result in Recent Change failure and a need for memory growth.

Another data item that significantly impacts on memory allocation is the MAX ACTION POINTS field. This field should only be set to the actual number of action points required by a TOD customer. This field has a default value of eight on all the preconstructed TOD features. If the customer requires only two action points (e.g., activation of CFW at 1800 and deactivation of CFW at 0800 on a dialy basis), then customization should be used to build a TOD feature specifying only two action points. Memory for TOD code list data for each line assigned a TOD feature is allocated based on the number of action points. In the above example, if MAX ACTION POINTS is eight, then memory is required for 800 code list entries, whereas if MAX ACTION POINTS is two, only 200 code list entries are required.

1.6 Recent Change View

The corresponding Recent Change View for this form is 12.22.

2. FORM AND RECORD ENTRIES

Copyright © 2003 Lucent Technologies

2.1 BASE AND CONTROL, UNIT

Enter the BASE and CONTROL GROUP number and office name (UNIT) on each record.

2.2 *FEATURE NAME

Description: Enter the TOD Feature Name. There are no restrictions on the valid characters except that feature names with a slash (/) are reserved for preconstructed features.
Valid Entries: 1 - 8 characters.

2.3 REMARKS

Description: Enter a descriptive comment as necessary.
Valid Entries: 1 - 32 characters

2.4 MAX ACTION POINTS

Description: Enter the maximum number of Action Points for this TOD feature.

Required Field.
Default: 8
Valid Entries: 1 - 32

2.5 MAX ZERO PARM CODES

Description: Zero Parameter Codes are defined on the TODCL form. They are used to specify TOD "activate" and "deactivate" actions that can be associated with a TOD Code List. Enter the maximum number of Zero Parameter codes that can be entered on each TODCL form for this TOD Feature. For 5E2 only, the only allowed value is zero and this field cannot be entered.

- ***NOTE:*** The sum of the two fields must not equal zero. Thus, for 5E2 only, since the Max Zero Parm Code is defaulted to zero and cannot be changed, the Max One Parm Code must be greater than zero.

Required Field.
Default:
- For 5E2 only: 0
- For 5E3 and later: 8

Valid Entries: 0 - 8

2.6 MAX ONE PARM CODES

Description: One Parameter Codes are defined on the TODCL form. They are used to specify TOD actions which can modify a feature. (e.g., change the active pattern group for an ARS group, or change the Interexchange Carrier for an IDP group). Enter the maximum number of One Parameter Codes that can be entered on each TODCL form for this TOD Feature.

Required Field.
Default:
- For 5E2 only: 1
- For 5E3 and later: 8

Valid Entries: 0 - 8

2.7 CONTROL LINE PRIVATE

Copyright © 2003 Lucent Technologies

Description: Can the TOD feature change line private data? For 5E2 only, "N" is the only allowed value and this field cannot be entered.

Required Field.
Default: N
Valid Entries: Y, N

- ***NOTE:*** For CONTROL LINE PRIVATE, CONTROL TRUNK, CONTROL IDP GROUP, CONTROL ARS GROUP, CONTROL ATH GROUP, CONTROL ACCT GROUP, and CONTROL ACVT all seven fields cannot be set to "N". At least one of these fields must be set to "Y".

2.8 CONTROL TRUNK

Description: Can the TOD feature change trunk data?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.9 CONTROL IDP GROUP

Description: Can the TOD feature change IDP (Individual Dialing Plan) Group data? For 5E2 through 5E6, "N" is the only allowed value and this field cannot be entered.

Required Field.
Default: N
Valid Entries:
- For 5E7 and later: Y, N

2.10 CONTROL ARS GROUP

Description: Can the TOD feature change ARS (Automatic Route Selection) Group data? For 5E2 only, "Y" is the only allowed value and this field cannot be entered.

Required Field.
Default: N

- For 5E2 only: Y
- For 5E3 and later: N

Valid Entries: Y, N

2.11 CONTROL ATH GROUP

Description: Can the TOD feature change ATH Group data?

- ***NOTE:*** TOD for CONTROL ATH GROUP can be temporary deactivated via the "INHIBIT TOD" field on the ATHGP (Authorization Code Group Definition) form (5619-2 Record).

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.12 CONTROL ACCT GROUP

Copyright © 2003 Lucent Technologies

Description: Can the TOD feature change Account Group data?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

2.13 CONTROL ACVT

Description: Can the TOD feature change the Attendant Control of Voice Terminals feature?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

2.14 CUSTOMER ACTIVATION

Description: Can the customer activate/deactivate the TOD feature via a dialed code?

Required Field.
Default: N
Valid Entries: Y, N

2.15 CHANGE ACTION TIME

Description: Can the customer change the Action Time (for a given Action Point) via a dialed code?

Required Field.
Default: Y
Valid Entries: Y, N

2.16 CHANGE OWS

Description: Can the customer change the One Week Schedule (for a given Action Point) via a dialed code?

Required Field.
Default: Y
Valid Entries: Y, N

2.17 CHANGE CODE LIST

Description: Can the customer change the TOD code list?

Software Release: 5E3 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

When CHANGE CODE LIST is "N" the fields ADD 0 PARM CODE, ADD 1 PARM CODE, DELETE 0 PARM LIST, DELETE 1 PARM LIST, and DELETE ALL LISTS must be "N".

When CHANGE CODE LIST is "Y", at least one of the fields: ADD 0 PARM CODE, ADD 1 PARM CODE, DELETE 0 PARM LIST, DELETE 1 PARM LIST, and DELETE ALL LISTS must be "Y".

Copyright © 2003 Lucent Technologies

When either of the add or delete parameter code fields, or the DELETE ALL LISTS field is "Y", the CHANGE CODE LIST field must be "Y".

2.18 ADD 0 PARM CODE

Description: Can the customer add to the Zero Parameter Code List (for a given Action Point) via a dialed code? For 5E2 only, "N" is the only allowed value and this field cannot be entered.

Required Field.
Default:
- For 5E2 only: N
- For 5E3 and later: Y

Valid Entries: Y, N

Data Rules:

When ADD 0 PARM CODE is "Y", the DELETE 0 PARM LIST must be "Y".

When ADD 0 PARM CODE is "N", the DELETE 0 PARM LIST must be "N".

2.19 ADD 1 PARM CODE

Description: Can the customer add to the One Parameter Code List (for a given Action Point) via a dialed code?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

When ADD 1 PARM CODE is "Y", the DELETE 1 PARM LIST must be "Y".

When ADD 1 PARM CODE is "N", the DELETE 1 PARM LIST must be "N".

2.20 DELETE 0 PARM LIST

Description: Can the customer delete the Zero Parameter Code List (for a given Action Point) via a dialed code? For 5E2 only, "N" is the only allowed value and this field cannot be entered.

Required Field.
Default:
- For 5E2 only: N
- For 5E3 and later: Y

Valid Entries: Y, N

Data Rules:

When DELETE 0 PARM CODE is "Y", the ADD 0 PARM LIST, and CHANGE CODE LIST must be "Y".

If CHANGE CODE LIST is "Y" and DELETE ALL LISTS is "N", then both the ADD 0 PARM CODE field and the DELETE 0 PARM LIST fields must be equal.

2.21 DELETE 1 PARM LIST

Description: Can the customer delete the One Parameter Code List (for a given Action Point) via a dialed

Copyright © 2003 Lucent Technologies

code?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If CHANGE CODE LIST is "Y" and DELETE ALL LISTS is "N", then the ADD 1 PARM CODE field must equal the DELETE 1 PARM LIST field.

2.22 DELETE ALL LISTS

Description: Can the customer delete the Zero Parameter Code List and the One Parameter Code List (for a given Action Point) via a dialed code?

For 5E2 only, "N" is the only allowed value and this field cannot be entered.

- ***NOTE:*** This is a single dialed code which will delete both Parameter Code Lists of a given Action Point.

Required Field.
Default:

For 5E2 only: N
- For 5E3 and later: Y

Valid Entries: Y, N

Data Rules:

If CHANGE CODE LIST is "Y" and DELETE ALL LISTS is "N", then the ADD 0 PARM CODE and the ADD 1 PARM CODE must be equal.

2.23 DEFAULT CODE LIST NAME

Description: This field designates the method used by system processing to determine a default TOD Code List Name when no Code List Name has been specified on a corresponding TOD parameter assignment record (i.e., TODLPA, TODMPA, or TODTPA). If this field has been entered and if no code list name for this feature has been specified on a line, terminal, or trunk parameter form, the system will create a unique TOD code list name as outlined in the table below. If this field has been left blank, no default code list name will be created and a TOD code list name must be entered on the line, terminal, or trunk form.
Default: TN

The following table identifies the method used by system processing to determine a TOD code list name when one of the three valid entry values (TN, EN, or TK) is entered.
Valid Entries:

Valid DEFAULT CODE LIST NAME Entries

Entry	Definition
TN	If TN is entered, a TOD Code List Name will be generated (defaulted) which will consist of the letter "T" followed by the TN assigned to the corresponding LINE or MLHLN form.
EN	Software Release: 5E7 and earlier. If EN (Equipment Number) is entered, a TOD Code List Name will be generated (defaulted) which will consist of the TEN, DEN, LEN, or SLEN fields associated with the corresponding LINE, TRUNK, or MLHLN form.
TK

SEC. 11B: 5610-2 RECORD
TIME OF DAY CODE LIST DEFINITION FORM - TODCL

1. GENERAL

The TODCL form is available with the 5E2 and later Software Releases. It is used to define the TOD activities that will occur on a particular line, terminal, or trunk group at a specified time. This is done by associating these activities to a TOD Code List Name established for the line, terminal, or trunk. Each time interval is identified by assigning a unique Action Point. The two key fields for the TODCL form are: the CODE LIST NAME and the ACTION POINT number.

1.1 Code List Name

A Code List Name is assigned to each Line, Trunk or MLHG Terminal that is to have a TOD feature. This is accomplished using the appropriate TOD Parameter form: TODLPA (5610-3 Record) for lines, TODMPA (5610-4 Record) for terminals, or TODTPA (5610-5 Record) for trunks. The Code List Name is used to define the TOD activities that will occur for a Line, Terminal, or Trunk. The Code List Name entered on the TODCL must be the same as the Code List Name assigned to the respective parameter form, if any. If no parameter form is available, and if "TN" has been designated as the DEFAULT CODE LIST NAME on the TODFD form (5610-1 Record), for 5E11 and earlier software releases, the Code List Name will default to a "T", followed by a 7-digit Telephone Number. For 5E12 and later, a "T" is followed by a 10-digit Telephone Number. If "EN" is designated, the Code List Name will default to an 8-digit Equipment Number; if "TK" is designated, the Code List Name will default to a Trunk Group Member and Member Number.

1.2 Action Point

Action Points are assigned to the Code List Name to distinguish TOD activities occurring at different times. An Action Point is an identifying number assigned to an Action Time to associate one or more TOD feature activities scheduled to occur at the same time. Each Code List Name can have up to thirty-two Action Points. However, the number of TOD feature actions which can occur within a given Action Point (day/time) is limited to eight. The switch owner may also limit the actual number of Action Points that can exist for a specific TOD feature. This is done via the MAX ACTION POINTS field on the TODFD (TOD Feature Definition) form (5610-1 Record).

The scheduling parameters which define each Action Point consists of an ACTION TIME, ONE-WEEK SCHEDULE, a ZERO PARAMETER CODE LIST, and/or a ONE PARAMETER CODE LIST.

TOD feature can have as many TODCL forms as numerically specified by the MAXIMUM ACTION POINTS field on the TODFD form that defines the TOD feature.

1.3 Parameter Code Lists

The ZERO and ONE PARAMETER CODE LISTS are used to specify four major fields for the TOD feature: the dial CODE the customer would use to manually trigger the activity, the BRCS FEATURE affected, the ACTION to take place, and the USE IDP? indicator which specifies whether the customer's IDP (Individual Dialing Plan) is to be used to analyze the dial code. If any one of these four fields is populated, all must be populated.

For the ODP, the dial CODE, BRCS FEATURE, and ACTION are defined using the PDIT (Prefix/Feature Digit Interpreter) form (5300-2 Record) (See Division 3, Sections 3B.) For the IDP, the dial CODE, BRCS FEATURE, and ACTION are defined using the IDPDCA (Individualized Dialing Plan Dialed Code Assignment) form (5601-1/2 Records). (See Division 4, Section 2B.)

The ZERO PARAMETER CODE LIST is used to specify either an "activate" or "deactivate" type of activity on a specified BRCS feature. The ONE PARAMETER CODE LIST is used to specify a "modify" type

Copyright © 2003 Lucent Technologies

activity on a specified BRCS feature. In addition to the dial CODE, the ONE PARAMETER CODE LIST also requires that an additional code (called PARAMETER) be entered to specify the type of modifying activity. Recall that the maximum number of activate/deactivate and/or modify actions that can be assigned to an Action Point for a given Code List Name cannot exceed eight.

When the customer uses the dial codes, the feature is said to be CORCable (Customer Originated Recent Change). When the TOD feature uses these dial codes, the feature is TORCed (Time of Day Originated Recent Change). Thus, the feature that TOD is to affect must be CORCable. See Division 2, Section 1F for a composite list of all dial code actions.

For 5E9(1) and later, if the code list is applied to a trunk group, USE IDP? on this form is "N", and DAS from the TKGRP form is defined on a DAS form where a PDIT is entered, then the PDIT and the corresponding CODE, FEATURE, and ACTION from this TODCL form must be defined in the ODP on a PDIT form as PDIT, DIGITS TO INTERPRET, FEATURE, and ACTION, respectively.

1.4 Recent Change View

The corresponding Recent Change View for this form is 4.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and office name (UNIT) on each record.

2.2 *CODE LIST NAME

Description: Enter the unique Code List Name assigned to the TOD feature for this line, trunk, or MLHG terminal.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: 1 - 11 characters

2.3 *ACTION POINT

Description: Enter the Action Point Number for this TODCL form.
Valid Entries: 1 - 32

Data Rules:

The number entered here must not exceed the value of the MAX ACTION POINTS entry on the TODFD form that defines the TOD Feature for this line or terminal.

2.4 ACTION TIME

Description: Enter the Action Time for this Action Point. This specifies the actual time that the TORCs specified on this TODCL form are to be executed.

The time entered must be military time and only at quarter hour intervals (i.e., 0015 specifies 12:15 a.m., 0230 specifies 2:30 a.m., 1200 specifies 12 noon, 2045 specifies 8:45 p.m., and 2400 specifies 12 midnight). A special value of 9999 designates a null action time.

Required Field.
Valid Entries: 0015 - 2400, 9999

2.5 IDP NAME

Copyright © 2003 Lucent Technologies

Description: Enter the IDP Name if an Individualized Dialing Plan is to translate CORCs (Customer Originated Recent Changes) to the TODCL form. The IDP Name should be the same as the IDP Group Name if an IDP feature was assigned to this line or terminal (IDP Group Name is assigned on either the IDPLPA form (5601-6 Record), IDPMPA form (5601-7 Record), IDPTPA form (5601-8 Record) or IDFD form (5601 Record)).
Valid Entries: 1 - 8 characters

Data Rules:

If an IDP Name was entered on any other TODCL form with this Code List Name, the IDP Name should be consistent and must also be the IDP group associated with the line, terminal or group. For 5E7 and later, if any USE IDP? is "Y", an IDP Name must be entered.

For 5E6 only, the IDP NAME and the corresponding CODE, FEATURE and ACTION list entries must be defined in the IDP on the IDPDCA form, or, the PDIT on a corresponding DAS form and the CODE, FEATURE and ACTION must be defined in the ODP on the PDIT form as PDIT, DIGITS TO INTERPRET, FEATURE and ACTION, respectively. The PDIT can be found by matching DAS on the TODCL form with DAS on a DAS form where PDIT is entered.

2.6 DAS

Description: Enter the Digit Analysis Selector to be used when an Office Dialing Plan is used to translate CORCs to the TODCL form.

Required Field.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

If entered, this should be the same DAS that appears on the LCC form (5306 Record) for this line or MLHG terminal. For Trunk Terminals, the DAS entered should be the same DAS that appears on the TKGRP form (5202-1/2 Record) for the associated TGN/MEMB.

2.7 VALID LIST

Description: Is the TODCL form a valid Code List and is it to be linked to the customer's TOD feature? For ODA, this entry should always be entered as Y.

Required Field.
Default: Y
Valid Entries: Y, N

ONE WEEK SCHEDULE

The following fields (2.8 - 2.14) define the days of the week (Monday through Sunday) that this TOD Code List will be active.

Enter "Y" in the following fields which correspond to the days of the week that the codes in this action point are to be executed, otherwise enter "N".

For example, if this TOD Code List is to be active Monday through Friday, the fields SAT and SUN would both be entered as "N" while the remaining fields (MON-FRI) would be entered as "Y".

2.8 MON

Copyright © 2003 Lucent Technologies

Description: Will the Code List be active Monday?

Required Field.
Default: N
Valid Entries: Y, N

2.9 TUE

Description: Will the Code List be active Tuesday?

Required Field.
Default: N
Valid Entries: Y, N

2.10 WED

Description: Will the Code List be active Wednesday?

Required Field.
Default: N
Valid Entries: Y, N

2.11 THU

Description: Will the Code List be active Thursday?

Required Field.
Default: N
Valid Entries: Y, N

2.12 FRI

Description: Will the Code List be active Friday?

Required Field.
Default: N
Valid Entries: Y, N

2.13 SAT

Description: Will the Code List be active Saturday?

Required Field.
Default: N
Valid Entries: Y, N

2.14 SUN

Description: Will the Code List be active Sunday?

Required Field.
Default: N
Valid Entries: Y, N

ZERO PARAMETER CODE LIST

The following fields (2.15 - 2.18) define the Zero Parameter Codes consisting of 1) the Dial CODE, 2)

Copyright © 2003 Lucent Technologies

whether or not an IDP is used to translate the Code, 3) the FEATURE that this Code will affect, and 4) the ACTION represented by this Code.

If a Wild Card feature is used, the feature must be of the type assigned to the line, terminal, or trunk, otherwise, the feature must be the exact feature assigned to the line, terminal, or trunk. Each non-null entry must have a corresponding entry in the IDP or ODP.

The number of rows completed on this TODCL must not exceed the number specified in the MAX ZERO PARM CODES on the TODFD form for this TODCL form.

The fields CODE, FEATURE, and ACTION are all required if any one of these fields are entered for a given row. For 5E7 and later, the USE IDP? field must also be entered.

For 5E3 and later, at least one entry must be populated in either the Zero Parameter Code List or the One Parameter Code List.

2.15 CODE

Description: Enter the dial code the customer would dial to activate or deactivate a BRCS feature. The first digit entered can be a *, # or a 0-9. All remaining digits must be 0-9.

Software Release: 5E3 and later
Valid Entries: 1 - 4 digits

2.16 USE IDP?

Description: Will an IDP be used to translate this CODE into a FEATURE and ACTION? If "N" is entered, an ODP (Office Dialing Plan) is used to translate this code.

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

For 5E7 and later, if USE IDP? is "Y", IDP NAME must be entered.

2.17 FEATURE

Description: Enter the BRCS Feature name that will be activated/deactivated by the CODE in this row. The Feature name entered here must be assigned to this line or terminal and it must have customer activation/deactivation capability.

Software Release: 5E3 and later
Valid Entries: 1 - 8 characters

Data Rules:

The feature entered must also be defined on a LINEFA form (5112 Record), MLHLNFA form (5113 Record), TRUNKFA form (5205 Record), or an associated CLUSTR form (5600 Record).

For 5E9(1) and later, when a scheduled call forwarding feature activation (or deactivation) is assigned to a Standard DSL line or a Standard DSL Multi-Line Hunt Group line, the ACT TYPE on the CFWFD form must be "CODE", "CDDN", "CDDNC", "CDDNCA", or "CDCA1A", and the DACT TYPE must be "CODE". If the scheduled call forwarding feature is assigned to a Custom DSL line or Custom DSL MLHG line, both ACT TYPE and DACT TYPE must be "CODE".

2.18 ACTION

Copyright © 2003 Lucent Technologies

Description: Enter the activate/deactivate Action to be taken by the CODE.

Required Field.

- ***NOTE:*** The Software Release in the Valid Entries table below refers to the use of these features for TOD.

Valid Zero Parameter ACTION Entries

Entry	Definition
ACCTACT	Software Release: 5E3 and later. Account Code feature activation.
ACCTDCT	Software Release: 5E3 and later. Account Code feature deactivation.
ACTCPNBN	Software Release: 5E6 and later. Activate CPN/BN feature.
ALTACT	Software Release: 5E3 and later. Activate Alternate Parameter set.
ATHACT	Software Release: 5E3 and later. Authorization Code feature activation.
ATHDCT	Software Release: 5E3 and later. Authorization Code feature deactivation.
ATHINS	Software Release: 5E3 and later. Authorization Code in service.
ATHOOS	Software Release: 5E3 and later. Authorization Code out of service.
CNDACT	Software Release: 5E6 and later. ICLID Calling Number Delivery activation.
CNDDCT	Software Release: 5E6 and later. ICLID Calling Number Delivery deactivation.
DALTACT	Software Release: 5E6 and later. Activate alternate parameter set for CSD (ARS).
DCTCPNBN	Software Release: 5E6 and later. Deactivate CPN/BN feature.
DFRLALT	Software Release: 5E6 and later. Alternate FRL feature is active for CSD (ARS).
DGPACT	Software Release: 5E6 and later. Activate an ARS group for CSD.
DGPDCT	Software Release: 5E6 and later. Deactivate an ARS group for CSD.
DMAINACT	Software Release: 5E6 and later. Activate main parameter set for CSD (ARS).
FRLALT	Software Release: 5E3 and later. Alternate FRL (Facility Restriction Levels) feature is active.
FRLDMAIN	Software Release: 5E6 and later. Main FRL feature is active for CSD (ARS).
FRLMAIN	Software Release: 5E3 and later. Alternate FRL (Facility Restriction Levels) feature is not active.
FTACT	Activate BRCS feature.
FTDCT	Deactivate BRCS feature.
GPACT	Software Release: 5E3 and later. Activate an ARS group. Software Release: 5E4(2) and later. Activate an ACVT group. Software Release: 5E7 and later. Activate IDP Group.
GPDCT	Software Release: 5E3 and later. Deactivate an ARS group. Software Release: 5E4(2) and later. Deactivate an ACVT group. Software Release: 5E7 and later. Deactivate IDP Group.
MAINACT	Software Release: 5E3 and later. Activate Main Parameter set.

Copyright © 2003 Lucent Technologies

TGACT	Software Release: 5E6 and later. Activate a Terminal Group feature.
TGDCT	Software Release: 5E6 and later. Deactivate a Terminal Group feature.

Data Rules:

When ACTION is "ACCTACT", "ACCTDCT", "ATHACT", "ATHDCT", "ATHINS", "ATHOOS", the CONTROL LINE PRIVATE or CONTROL TRUNK fields must be "Y" on the TODFD form (5610-1 Record).

When ACTION is "ACTCPNBN", "CNDACT", "CNDDCT", "DCTCPNBN", "FTACT", "FTDCT", "TGACT", or "TGDCT", the CONTROL LINE PRIVATE field must be "Y" on the TODFD form (5610-1 Record).

When ACTION is "ALTACT" or "MAINACT", the CONTROL ATH GROUP or CONTROL ACCT GROUP fields must be "Y" on the TODFD form (5610-1 Record).

When ACTION is "DALTACT" or "DMAINACT", the CONTROL ATH GROUP field must be "Y" on the TODFD form (5610-1 Record).

When ACTION is "DFRLALT", "DGPACT", "DGPDCT", "FRLALT", "FRLDMAIN", or "FRLMAIN", the CONTROL ARS GROUP field on the TODFD form (5610-1 Record).

When ACTION is "GPACT" or "GPDCT", the CONTROL ARS GROUP, CONTROL ACVT GROUP, or CONTROL IDP GROUP fields must be "Y" on the TODFD form (5610-1 Record).

ONE PARAMETER CODE LIST

For 5E3 and later, the ONE PARAMETER CODE LIST fields (2.20 - 2.24) are displayed in the following order: 1) the dial CODE the customer will use to activate the feature, 2) a USE IDP? indicator, 3) a FEATURE, 4) an ACTION, and 5) a PARAMETER to be passed to the One Parameter Feature. If any one of these five fields is entered, all of them must be entered.

If a Wild Card feature is used, the feature must be of the type assigned to the line, terminal, or trunk, otherwise, the feature must be the exact feature assigned to the line, terminal, or trunk. Each non-null entry must have a corresponding entry in the IDP or ODP.

The number of rows completed on this TODCL form must not exceed the number specified in the MAX ONE PARM CODES on the TODFD form that defines this TOD feature.

For 5E3 and later, there must be at least one entry in either the Zero Parameter Code List or the One Parameter Code List. For 5E7 and later, if USE IDP? is "Y", IDP NAME must be entered.

2.19 CODE

Description: Enter the dial code the customer will enter to identify the action to be taken with the One Parameter Feature. The first digit entered can be a *, # or a 0-9. All remaining digits must be 0-9.
Valid Entries: 1 - 4 digits

2.20 USE IDP?

Description: Will an IDP be used to translate this CODE into a FEATURE and ACTION? If "N" is entered, an ODP (Office Dialing Plan) is used to translate this code.
Valid Entries: Y, N

Data Rules:

For 5E7 and later, if USE IDP? is "Y", IDP NAME must be entered.

Copyright © 2003 Lucent Technologies

2.21 FEATURE

Description: Enter the BRCS feature name that will be affected by the associated ACTION.

Software Release: 5E3 and later
Valid Entries: 1 - 8 characters

Data Rules:

The feature entered here must also be defined on a LINEFA, MLHLNFA, TRUNKFA, or an associated CLUSTR form.

2.22 ACTION

Description: Enter the ACTION representing the type of change that will occur for the BRCS feature.

Valid One Parameter ACTION Entries

Entry	Definition
ACTON	
ACTOFF	Software Release: 5E7 and later. Set ACT in IDP off.
ARSCP	
ATHREQ	
ATHNRQ	
DARSCP	Software Release: 5E6 and later. Change ARS pattern group number for CSD.
GRPCARCH	Software Release: 5E7 and later. Change carrier group in IDP.

Data Rules:

If ACTION is "ARSCP" or "DARSCP":

- The PARAMETER entry must be in the range 1 - 6, and
- the CONTROL ARS GROUP field must be "Y" on the TODFD form (5610-1 Record).

If ACTION is "ACTON" or "ACTOFF", then the PARAMETER entry must be in the range of 01 - 32.

If ACTION is "ACTON", "ACTOFF", or "GRPCARCH", the CONTROL IDP GROUP field must be "Y" on the TODFD form (5610-1 Record).

If ACTION is "ATHREQ" or "ATHNRQ", CONTROL LINE PRIVATE or CONTROL TRUNK fields must be "Y" on the TODFD form (5610-1 Record) and the feature name assigned to the line, terminal, or trunk.

For 5E8 and earlier, if ACTION is "GRPCARCH", then the PARAMETER entry must be in the range 000 - 999. For 5E9(1) and later, if ACTION is "GRPCARCH", then the PARAMETER entry must be in the range 0000 - 9999.

2.23 PARAMETER

Description: Enter the parameter to be passed to the One Parameter Feature for this code.

Required Field.

Valid PARAMETER Entries

Entry	Definition
1 - 6	Parameter designation for ARS patterns only.
01 - 32	Software Release: 5E3 and later. Parameter designation for ACT category.
000 - 999	Software Release: 5E3 - 5E8.

Copyright © 2003 Lucent Technologies

	Primary Carrier.
0000 - 9999	Software Release: 5E9(1) and later. Primary Carrier.
1 - 8 Characters	Software Release: 5E3 and later. Name of the feature assigned to the line owning this code list.

Data Rules:

For 5E3 and later, if the One Parameter ACTION is "ATHREQ" or "ATHNRQ", then the PARAMETER may be a feature name defined on the ATHFCOS form (5619-4 Record).

When the PARAMETER is 1 - 6 and ACTION is "ARSCP" or "DARSCP", then the parameter entered must be less than or equal to the NUMBER PATTERN GROUPS ALLOWED field on the ARSGPA form (5608-2 Record) for the associated ARS GROUP NAME.

When the PARAMETER is 000 - 999 (5E3 - 5E8) or 0000 - 9999 (5E9(1) and later), it must equal CARRIER ID (the key) on an ICF form (5305 Record), and for 5E8 and later, FEAT GRP on the ICF form must also equal "D".

When the PARAMETER field is 01 - 32, the A.C.T. ALLOWED? field must be "Y" on the IDPGP form (5601-4 Record) for the IDP group that is on the line that owns this code list.

SEC. 11C: 5610-3 RECORD
TIME OF DAY LINE PARAMETER FORM - TODLPA

1. GENERAL

The 5610-3 Record is available with the 5E2 and later Software Releases. A TODLPA form must be entered for each individual line that is to have a TOD (Time of Day) feature. The TODLPA form specifies the TOD feature name and the TOD Code List name for a specific line. The key to this form is the Telephone Number of the line that is to have a TOD feature.

The other two entries are the feature name and the Code List name. The feature name assigned to this line must also appear on the LINEFA form or on a CLUSTR form assigned to this line. This TOD feature name must be defined on the TODFD (TOD feature Definition) form. Each Code List name assigned to a line, a Trunk Group member or an MLHG terminal must be unique. To insure that unique Code List names are used, it is recommended that the telephone number assigned to this line on the LINE form be used as the Code List name. The Code List name assigned here will be used as one of the keys to the TODCL (TOD Code List) form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the line that is to have a TOD feature.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

	Class of Service
ATND	50B non-data link console line or attendant line.
INDIV	Individual line.
PBX	Line to a PBX.
SATSTLN	Stand-alone test line.
4WINDIV	4-wire individual line or 4-wire manual PBX.
ISDN	ISDN Digital Subscriber Line.

For 5E12 and later, TN/FEATURE combinations on different TODLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the TODLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 FEATURE

Copyright © 2003 Lucent Technologies

Description: Enter the TOD feature name.

Required Field.
Valid Entries: 1 - 8 characters

2.4 CODE LIST NAME

Description: Enter the TOD Code List name. If the DEFAULT CODE LIST NAME entry on the TODFD form that defines this TOD feature is marked "EN" (Equipment Number), the Equipment Number that is assigned to this line must be entered. If the DEFAULT CODE LIST NAME entry on the TODFD form (5610-1 Record) that defines this TOD feature is marked "TN" (Telephone Number), the Telephone Number that is assigned to this line must be entered.
Valid Entries:

- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: 1 - 11 characters

SEC. 11D: 5610-4 RECORD TIME OF DAY MLHG TERMINAL PARAMETER FORM - TODMPA

1. GENERAL

The 5610-4 Record is available with the 5E2 and later Software Releases. A TODMPA form must be entered for each MLHG terminal that is to have a TOD feature. The TODMPA form defines the TOD feature name and the TOD Code List name for a specific MLHG terminal. The two keys to this form are the MLHG number and the terminal number of the MLHG terminal that is to have a TOD feature.

The other two entries are the feature name and the Code List name. The feature name assigned to this MLHG terminal must also appear on the MLHLNFA form or on a CLUSTR form assigned to this MLHG terminal. This TOD feature name must be defined on the TODFD form. Each Code List name assigned to an MLHG terminal, a Trunk Group member or a line must be unique. To insure that unique Code List names are used, it is recommended that the LEN or SLEN assigned to this MLHG terminal on the MLHLN form be used as the Code List name. The Code List name assigned here will be used as one of the keys to the TODCL form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group of the terminal that is to have a TOD feature.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Terminal number.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated CLASS OF SERVICE on a LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
PBX	Line to a PBX.
SATSTLN	Stand-Alone Test Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
ISDN	ISDN Digital Subscriber Line.

Copyright © 2003 Lucent Technologies

2.4 FEATURE

Description: Enter the TOD Feature name.

Required Field.
Valid Entries: 1 - 8 characters

2.5 CODE LIST NAME

Description: Enter the TOD Code List Name. If the DEFAULT CODE LIST NAME entry on the TODFD form that defines this TOD feature is marked "EN", the LEN or SLEN that is assigned to this MLHG terminal must be entered.

Required Field.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: 1 - 11 characters

SEC. 11E: 5610-5 RECORD
TIME OF DAY TRUNK (TGN/MEMB)
PARAMETER FORM - TODTPA

1. GENERAL

The 5610-5 Record is available with 5E3 and later Software Releases. A TODTPA form must be entered for each trunk that is to have a TOD feature. The TODTPA form defines the TOD feature name and the TOD Code List name for a specific trunk.

The FEATURE NAME assigned to this trunk must also appear on the TRUNKFA form or the TKGRPFA form or on a CLUSTR form assigned to this trunk. This TOD feature name must be defined on the TODFD form. Each Code List name assigned to the trunk, MLHG terminal or a line must be unique. To ensure that unique Code List names are used, it is recommended that the DEN or TEN assigned to this trunk on the TRUNK form be used as the Code List name. The Code List name assigned here will be used as one of the keys to the TODCL form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202 Record) must be "PF" (Private facility) or "PFLASH" (Private facility feature flash).

2.3 * MEMB

Description: Enter the Trunk Group Member number of the trunk.

Required Field.
Valid Entries: 0 - 1951

2.4 FEATURE

Description: Enter the TOD Feature name. There are no restrictions on the valid characters, except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.5 CODE LIST NAME

Description: Enter the TOD Code List Name. If the Default Code List Name on the TODFD form is "TK", then the TGN should be entered in the first four characters of the field and the Member Number should be entered in the last four characters of the field.

Required Field.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: 1 - 11 characters

SEC. 12: TERMINAL GROUP ATTENDANT FORMS

Copyright © 2003 Lucent Technologies

SEC. 12A: 5611 RECORD
TERMINAL GROUP ATTENDANT FORM - TGATTD

1. GENERAL

The 5611 Record is available with 5E2 and later Software Releases. It is used to define information (such as attendant DN, Source Billing, and SDN DAS) on a Terminal Group basis.

The Terminal Groups (Group IDs) must be defined on TGSRFD forms (5607-2 Record). The Attendant TN can be an individual line or a Multi-Line Hunt Group, with a CLASS OF SERVICE of "ATND" on the LCC form (5306 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *GROUP ID

Description: Enter the Terminal Group Identification Number.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

This number must be defined on the TGSRFD, TGSRLPA or TGSRMPA forms (5607 Records). All members of a Multi-Line Hunt Group must be in one Terminal Group.

2.3 ATTENDANT TN

Description: Enter the Telephone Number of the Attendant of the BRCS (Business and Residence Custom Services) Terminal Group.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

If ATTENDANT TN is assigned on this form, it must also be defined on the LINE form, the MLHLN form, or the DSLUSR form as CKT TN or CKT MLHG TN, or on the MLHG form as a listed TN or as a MUPH SUBGROUP TN with an associated equipment number on member 1.

For 5E12 and later, if the first 3 digits of the 7-digit ATND TNs on the TGATTD form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE or the NOC form does not exist, the 7-digit ATND TN(s) must be entered as a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.4 SRC BILL

Copyright © 2003 Lucent Technologies

Description: Will the source party's billing TN replace the attendant's billing TN in the billing record during an intra-terminal group call extension via the attendant?

If "Y" is entered, the attendant's TN will be replaced in the billing record by the source party's billing TN. If "N" is entered, the attendant TN will remain in the billing record.

Software Release: 5E6 and later
Default: N
Valid Entries: Y, N

2.5 SDN DAS

Description: Enter the DAS (Digit Analysis Selector) that will be used for SDN (Software Defined Network) Originations from analog and BRI lines within this Terminal Group. This DAS is used to route only SDN calls originated via a dialed code (ACTION on the PDIT form (5300-2 Record) or IDPDCA form (5601-1 Record) is set to "SDNUSE") or a feature button (ACTION on the CFGGRP form (5964 Record) is set to "SDNUSE"). This DAS is not used to route SDN calls via Automatic Route Selection.

When SDN calls are routed via this SDN DAS, the route indexes and code indexes on the ICF form (5305 Record) do not replace any previously obtained route index and code index.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

The SDN DAS must be defined as the DIGIT ANALYSIS SELECTOR on a DAS form (5300-1 Record). The LOCAL DIT entered on that DAS form cannot appear on an LDIT or MLDIT form (5300-3 Record) where the TYPE OF CI CALL is "PSNCI" or "PSCAR". The LOCAL DIT must also appear on the SMLDIT form (5315 Record) along with all SMs which have Lines or MLHG Terminals which are members of the Terminal Groups specified by GROUP ID. The SM number may be obtained from the first three digits of the OE NUMBER field on the LINE, MLHLN and DSLUSR forms.

Also, on the LDIT or MLDIT form, CALL TYPE should be set to "NORMAL".

For 5E12 and later, each SDN DAS assigned on the TGATTD form assigns an LDIT (via the LOCAL DIT field on the corresponding DAS form) to one or more SMs (via the first three digits of the OE or OE NUMBER field on the specified LINE, MLHLN, and DSLUSR forms). When the LINE, MLHLN, and DSLUSR forms have been assigned a TGSR feature (defined on a TGSRFD form), and the GROUP ID from the TGATTD form has been assigned on a corresponding BFG, TGSRFD, TGSRLPA, or TGSRMPA form, then each LDIT assigned in this way, and its associated SMs, must be defined on the SMLDIT form.

2.6 MBG ID

Description: This field cannot be entered. It is a Recent Change verify field for View 4.4. For more information on MBG see CENTREX Network secured feature section in Division 2, Section 4A181. Also see the MBG form, Division 4, Section 22A.

The MBG ID uniquely identifies a Multiswitch Business Group on a switch wide basis. It is defined on the MBG form, which is used by the CENTREX Network. CENTREX Network is a Secured Feature that must be purchased by the office before CENTREX Network data can be entered on this form. Therefore, the ACT field for SFID 181 on the SFSYS form (5713-1 Record) must be set to "Y".

Software Release: 5E9(2) and later.

MUSIC ON HOLD

Copyright © 2003 Lucent Technologies

The TGN and MEMB fields (Section 2.7 - Section 2.9) are applicable to the Music on Hold secured feature and define the music source that is to provide music to the held party once a call has been placed on hold. These fields are only applicable when Secured Feature ID 64 is set to "S" ("Y" for 5E9(1) and later) on the SFSYS form (5713-1 Record).

2.7 TGN

Description: Enter the trunk group used as the music source.

Software Release: 5E7 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Before data can be entered in this field, the ACT field for Secured Feature ID 64 must be set to "Y" on the SFSYS form (5713-1 Record).

If either TGN or MEMB is entered, then both must be entered.

When a GROUP ID is defined on this form with MUSIC ON HOLD TGN and MEMB entered, the TGN and MEMB must be defined on a corresponding TRUNK form (5204 Record) with MUSIC SOURCE set to "Y".

WARNING: For 5E11 and later, the selected music (on hold) source (TGN and MEMB) must not be shared by any other music source. Therefore, the TGN from the TGATTD form (5611 Record) should not match the TRUNK GROUP MEMBER from the RTIDX form (5643 Record).

2.8 MEMB

Description: Enter the trunk member used as the music source.

Software Release: 5E7 and later
Valid Entries: 1 - 1951

Data Rules:

Before data can be entered in this field, the ACT field for Secured Feature ID 64 must be set to "Y" on the SFSYS form (5713-1 Record).

If either TGN or MEMB is entered, then both must be entered.

When a terminal GROUP ID is defined on this form with MUSIC ON HOLD TGN and MEMB entered, the TGN and MEMB must be defined on a corresponding TRUNK (5204 Record) form with MUSIC SOURCE set to "Y".

2.9 NO SOFT HOLD

Description: Prohibit Music on Hold during soft hold? This field specifies whether to prohibit music on soft hold for custom ISDN lines in this terminal group. Enter "Y" to prohibit or "N" to allow music on soft hold for custom ISDN lines in this terminal group that are being either transferred or conferenced.

WARNING: MOH (Music On Hold) is a Secured Feature that must be enabled. If the MOH feature is not enabled, music will not be provided even if this field is set to "N". For more information on the MOH feature, see Division 2, Section 4A64.

Software Release: 5E10 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default Values: N
Valid Entries: Y, N

Data Rules:

When NO SOFT HOLD is "Y", TGN and MEMB must be entered.

CALL PARK

The following fields (Section 2.10 - Section 2.11) specify the answer back or retrieve timeout limit for ring back of a parked call. These fields are applicable when SFID 124 ACT field is set to "Y" on the SFSYS form (5713-1 Record).

2.10 PARK TIME

Description: Enter the answer back or retrieve timeout limit for ring back of a parked call for non-attendant lines in the terminal group.

Software Release: 5E9(1) and later
Valid Entries: 30 - 360 in 30 second increments

2.11 ATND PARK TIME

Description: Enter the attendant answer back or retrieve timeout limit for ring back of a call parked against the terminal group attendant's DN or a DN with attendant class of service.

Software Release: 5E9(1) and later
Valid Entries: 30 - 360 in 30 second increments

2.12 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the OFCOPT (Office Option) form (5509 Record), RC view (8.1).

NUMBER PORTABILITY

2.13 *PORTED

Description: The PORTED field is used to indicate whether members of a given terminal group have been ported into this office via the Number Portability (NP) feature. This indicator is used by call processing to determine whether or not to generate an NP Bellcore AMA Format (BAF) module for originating and terminating IXC (Inter-Exchange Carrier) access records.

Required Field.

Copyright © 2003 Lucent Technologies

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

2.14 OVRD DNY XFER

Description: The OVRD DNY XFER field was added to allow terminal groups to override the "Deny Transfer of Digit Screened Calls" feature.

Required Field.

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

When OVRD DNY XFER is set to "Y", this indicates that this terminal group is allowed to override denials during a call transfer.

When the OVRD DNY XFER field is set to "Y", the ACT field for SFID 291 on the SFSYS form must also be set to "Y".

2.15 CONTEXT ID

Description: This field is used to indicate whether or not a terminal group is "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E12 and 5E13: N
- For 5E14: NATIVE

Valid Entries:

Valid CONTEXT ID Entries

Entry for 5E12, 5E13	Entry for 5E14 and later	Description
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the TGAATD form, the ACT field for SFID (Secured Feature ID) 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

2.16 CTE ALW

Description: The CTE (Call Transfer Enhancement) ALW (Allowed) field is used to indicate whether or not the CTE option is allowed on this Terminal Group.

Software Release: 5E16(2) and later
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When the CTE ALW is set to "Y", the ACT field for SFID 588 on the SFSYS form (5713-1 Record) must also be set to "Y".

SEC. 13: MULTIPOSITION HUNT BUSY KEY FORM

Copyright © 2003 Lucent Technologies

SEC. 13A: 5612 RECORD
MULTIPOSITION HUNT BUSY KEY FORM - MUPHKEY

1. GENERAL

The 5612 Record is available with 5E2 and later Software Releases. It is used to assign Position Make Busy Keys on a Multi-Line Hunt Group and Position basis.

The MUPHKEY form is used only when the field HUNT TYPE is equal to "MUPH" on the MLHGFD form (5604 Record). If the MUPHKEY form is present, the Multi-Line Hunt Group is found on the MLHG form (5110 Record) by matching the FEATURE NAMEs between the MLHGFD and the MLHG forms.

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

Examine all MLHGFD forms for HUNT TYPE equal to "MUPH", then use an MLHGFD preconstructed feature to match an entry on the MLHGFD form (5604 Record) to get the associated Multi-Line Hunt Group value. This MLHG value must then be defined in this field.

2.3 * POSITION

Description: Enter the position of the console which is assigned the Position Make Busy Key.

Required Field.
Valid Entries: 1 - 16

2.4 POS BUSY SPN

Description: Enter the unique position scan point for each position.
Valid Entries: a 9 digit scan point in the following format.

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192 (See Note)
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
Scan Point Number	SPN	XX	00-30

NOTE: For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1 -

SEC. 14A: 5613 RECORD
FEATURE KEY FUNCTION LIST FORM - FTRKEY

1. GENERAL

The 5613 Record is available with 5E2 and later Software Releases. This miscellaneous record is used to assign a scan point which controls a state of a feature on a line. It allows any line to be associated with a scan point that is tied to a feature key which can be turned on or off for any call forwarding or IDP features. A particular SPN must be associated with a feature key.

1.1 Recent Change View

The corresponding Recent Change view for this form is 4.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * FTR SPN

Description: Enter the Feature Key Scan Point Number.

Required Field.
Valid Entries: a 9-digit scan point in the following format.

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192 (See Note)
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
Scan Point Number	SPN	XX	00-30

- ***NOTE:*** For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1-48; for offices equipped with CM2, valid entries are 1-192.

2.3 TN

Description: Enter the Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

Either TN or MLHG and MEMB must be entered. If a TN is entered, MLHG and MEMB must not be entered.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the FTRKEY form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.4 MLHG

Description: Enter the Multi-Line Hunt Group Number.

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

2.5 TERM

Description: Enter the Multi-Line Hunt Group terminal number.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only).

2.6 FEATURE

Description: Enter the feature name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Each entry in this field must be defined on a CFWFD form (5614-1/2 Record) or IDPFD form (5601 Record).

ON/OFF HOOK FUNCTION

The following fields (Section 2.7 - Section 2.10) define the on/off hook key function. The hook function will look through that line's keys to see if the currently deleted feature is referenced. If such a reference is found, the scan point will be deassigned and the key will no longer function.

The on hook action indicates the key is depressed and the off hook action indicates the key is released.

ON HOOK FUNCTION

2.7 ACTION

Description: Enter the Attendant and Multi-Line Hunt Group feature action for the on hook action function.

Required Field.

Valid ACTION Entries

Entry	Definition
FTACT	Activate BRCS feature.
FTDCT	Deactivate BRCS feature.
ACTON	Activate Alternate Code Treatment.
ACTOFF	Deactivate Alternate Code Treatment.

Data Rules:

If the on hook ACTION is activate, then the off hook ACTION must be deactivate. If the off hook ACTION is deactivate, off hook ACTION must be activate.

For 5E8 and later, if on hook ACTION is "FTACT" or "FTDCT", the feature must be defined on the CFWFD form with ACT TYPE set to "KEY".

2.8 PARAMETER

Description: Enter the Alternate Code treatment set for the on hook parameter function.
Valid Entries: 1 - 32

Data Rules:

Copyright © 2003 Lucent Technologies

If on hook parameter is not entered, then off hook parameter must not be entered.

If the on hook parameter is not specified, the off hook action must be activate or deactivate.

If the on hook parameter is entered, then the off hook parameter must also be entered.

With 5e7 and later, if the on hook parameter is entered, then the off hook parameter must also be entered and equal to the on hook parameter.

OFF HOOK FUNCTION

2.9 ACTION

Description: Enter the Attendant and Multi-Line Hunt Group feature action for the off hook action function.

Required Field.

Valid ACTION Entries

Entry	Definition
FTACT	Activate BRCS feature
FTDCT	Deactivate BRCS feature
ACTON	Activate Alternate Code Treatment
ACTOFF	Deactivate Alternate Code Treatment

Data Rules:

If on hook action is activate, off hook action must be deactivate. If on hook action is deactivate, off hook action must be activate.

For 5E8 and later, if off hook ACTION is "FTACT" or "FTDCT", the feature must be defined on the CFWFD form with ACT TYPE set to "KEY".

2.10 PARAMETER

Description: Enter the Alternate Code treatment set for off hook parameter function.
Valid Entries: 1 - 32

Data Rules:

If the on hook parameter is not entered, then the off hook parameter must not be entered.

If the on hook parameter is not specified, the off hook action must be activate or deactivate.

If the on hook parameter is entered, then the off hook parameter must also be entered.

With 5E7 and later, if the on hook parameter is entered, the off hook parameter must be entered and equal to the on hook parameter.

SEC. 15: CALL FORWARDING FORMS

Copyright © 2003 Lucent Technologies

SEC. 15A: 5614-1/2 RECORD
CALL FORWARDING FEATURE DEFINITION FORM - CFWFD

1. GENERAL

The 5614-1/2 Records are available with the 5E2 and later Software Releases. In general, the Call Forwarding feature allows calls completing to a customer's Directory Number to be redirected to another number. It is used to define a number of separate, but related features, by selecting various feature options for Call Forwarding. The provided features are Call Forwarding Variable for POTS, Call Forwarding within group only, Call Forwarding Variable for Centrex, Call Forwarding Incoming only, Call Forwarding over Private Facilities, Call Forwarding Busy Line all calls, Call forwarding Busy Line incoming only, Call Forwarding Don't Answer all calls variable timing, Call Forwarding Don't Answer incoming only variable timing, remote Call Forwarding, night service, power failure transfer attendant, Call Forwarding Variable with Confirmation Tone similar to 1A ESS. Each feature is given a feature name from one to eight characters which is used to assign the constructed (defined) feature to lines. Certain Call Forwarding features are predefined, and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed Call Forwarding features is attached.

1.1 Multi-Line Hunt Groups

If the Call Forwarding feature is to be applied to a Multi-Line Hunt Group, the following applies: Call Forwarding Features, Call Forward Variable or Call Forward Busy Line, with FWD CONDITION of "BOTH", "PRCV", "BUSY", "PRCB" or "PBSY"can only be assigned to members whose TERM value is 1. These features are assigned to Terminal 1, but they apply to all members of the group in the same manner. Call Forward Don't Answer features can be assigned to any member of the group, but apply only to the terminal assigned.

1.2 Lines

A terminal (line) must be assigned a Call Forwarding feature on the appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), or CLUSTR (5600 Record).

1.3 Circuit Switched Data

For 5E6 and later, the Call Forwarding feature is available to CSD (Circuit Switched Data) subscribers. This means that a subscriber on an ISDN BRI (Basic Rate Interface) can now receive CSD calls that would normally terminate to the subscriber's base station.

1.4 Call Forwarding Busy Line Options

For 5E7 and later, the IMB (Inhibit Make Busy) and ILB (Inhibit Line Busy) options are available for Call Forwarding Busy Line features. These options (implemented through fields CFIMB, CFILB, and OVF CFI) can be used to eliminate operational differences between CFBL (Call Forwarding Busy Line) features on the 1A ESS Switch and 5ESS Switch.

If a CFBL-IMB feature is assigned to a line or MLHG (Multi-Line Hunt Group), it will inhibit CFBL treatment when the make busy key or feature button is on. If a CFBL-ILB feature is assigned to a line or MLHG, it will inhibit CFBL when the line is busy and the make busy key or feature button is off.

CFBL-IMB: The CFBL-IMB option inhibits CFBL when the subscriber activates a make busy key. If the feature is assigned to an individual line, the line must have an individual make busy key. If the feature is assigned to an MLHG, the MLHG must have a group make busy key or feature button.

When a subscriber on an individual line activates the make busy key, all calls to that line are routed to a

Copyright © 2003 Lucent Technologies

busy (or overflow) tone. When the make busy key is off, if the phone is on hook, calls are received normally; if the phone is off hook, calls are forwarded, i.e. CFBL occurs,

Similarly for an MLHG, when the group make busy key is activated, all huntable calls to the MLHG are routed to busy (or overflow). When the group make busy key is off, if a huntable member is available, calls are received normally; if no huntable member is available, calls are forwarded.

CFBL-ILB: The CFBL-ILB option forwards all calls when the make busy key is on and inhibits CFBL when the make busy key is off. When a subscriber on an individual line activates the make busy key, all calls are forwarded. When the subscriber's make busy key is off, if the phone is on hook, calls are received normally; if the phone is off hook, calls receive busy (or overflow) tone. The scenario is similar for an MLHG with a group make busy key.

MLHG Notes: Because CFBL for an MLHG applies only to the entire group, make busy keys that apply only to individual members of an MLHG do not interact with CFBL-IMB and CFBL-ILB. Also, group make busy keys/feature buttons do not make no-hunt DNs in an MLHG busy; therefore, an IMB/ILB feature does not apply to these no-hunt DNs.

1.5 Recent Change View

The corresponding Recent Change View for this form is 12.12.

2. FORM ENTRIES - 5614-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *FEATURE NAME

Description: Enter the feature name.
Valid Entries: Feature names may be from one to eight characters long, with no restrictions on the valid characters except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: Up to 32 characters

ACTIVATION

The following fields (Section 2.4 - Section 2.7) specify when and how the call forwarding feature will be activated.

2.4 FWD CONDITION

Description: Forward condition specifies the condition under which a called line should be forwarded.

Required Field.
Default: BOTH
Valid Entries:

Valid FWD CONDITION Entries

Entry	Definition
ACDI	Software Release: 5E9(1) and later. Forward when idle back to the head of the same ACD queue. For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.

Copyright © 2003 Lucent Technologies

BUSY	Forward only when the line associated with the Directory Number is busy.
IDLE	Forward only when the line associated with the Directory Number is idle, after a specified number of seconds of ringing has occurred.
BOTH	Forward if the line associated with the Directory Number is busy or if the line is idle after a specified number of seconds of ringing has occurred.
DBSY	Software Release: 5E6 and later. Forward when busy for CSD (Circuit Switched Data) calls.
DIDL	Software Release: 5E6 and later. Forward when Idle for CSD.
DBTH	Software Release: 5E6 and later. Forward when Busy or Idle for CSD.
PBSY	Used only for lines which have also been assigned a Precedence and Preemption BRCS feature; see the PPFD form (5618-1 Record). Forward to the AUTOVON attendant when the line associated with the Directory Number is busy, the terminating call is a Precedence call and the line does not have the PP parameter IMMED PREEMPTION equal to yes.
PIDL	Used only for lines which have also been assigned a Precedence and Preemption BRCS feature; see the PPFD form (5618-1 Record). Forward to the AUTOVON attendant when the line associated with the Directory Number is idle after a specified number of seconds of ringing has occurred and the terminating call is a Precedence call.
PRCB	Software Release: 5E3 and later. Forward precedence calls when busy.
PRCI	Software Release: 5E3 and later. Forward precedence calls when idle.
PRCV	Software Release: 5E3 and later. Forward precedence calls when busy or idle.

Data Rules:

If "DBSY", "DIDL", or "DBTH" is entered, ATTENDANT must be "N", CFPF ALW must be "N", and ACT TYPE must be "CODE", "AUTO" or "CDDN".

If "PBSY" or "PIDL" is entered, then ACT TYPE must equal "AUTO", DACT TYPE must equal "NONE" and Attendant must equal "N".

If "BUSY", "PBSY", "PRCB", "BOTH", or "PRCV" is entered in this field, then 0 must be entered in the DON'T ANSWER TIMING field.

Only one in the following pairs of Call Forwarding Variable Features can be assigned to a BFG (5625 Record) or an associated CLUSTR (5600 Record) form: "BUSY" or "DBSY", "IDLE" or "DIDL", "BOTH" or "DBTH".

A maximum of one feature from each of the types described below is allowed to be assigned to a BFG(s) or the associated CLUSTR(s) with more than one Call Forwarding Variable Feature defined on this form.

- Type 1:
  - FWD CONDITION = "BUSY", "DBSY", "PRCB"or "PBSY".
- Type 2:
  - FWD CONDITION = "IDLE", "DIDL", "ACDI", "PRCI" or "PIDL".
- Type 3:
  - FWD CONDITION = "BOTH", "DBTH", or "PRCV".

If TNs on the LINEFA form (5112 Record) are assigned either a Call Forwarding when Idle, Call Forwarding when Idle for CSD, Call Forwarding Precedence Call to Attendant when Idle, Call Forwarding Precendence Call when Idle, or a Call Forwarding when Idle Return to Queue feature on this form, i.e., "IDLE", "DIDL", "PIDL", "PRCI", or "ACDI" is entered in this field, then DON'T ANSWER TIMING on the

Copyright © 2003 Lucent Technologies

CFWLPA form (5614-3 Record) must be in the range of 4 - 60 seconds.

When assigning a Call Forwarding Busy Feature ("BUSY"), Call Forward Busy or Idle Feature ("BOTH"), or Forward Precedence When Busy or Idle Feature ("PRCV") to an MLHG/TERM, the feature must have the CALL SELECTION fields on this form set to "Y". When assigning a Forward When Busy for CSD Feature ("DBSY"), Forward When Busy or Idle for CSD Feature ("DBTH"), Forward When Busy For PP Feature ("PBSY"), or Forward Precedence Call When Busy Feature ("PRCB") to an MLHG/TERM, ATTENDANT must be "N"and the remaining CALL SELECTION fields must be "Y".

When any of the following features is assigned to an MLHG/TERM on an MLHNFA form, DON'T ANSWER TIMING must be 0 or blank on the CFWFD or CFWMPA form: Call Forwarding When Busy ("BUSY"), Call Forwarding When Busy for PP ("PBSY"), Call Forwarding Precedence Call When Busy ("PRCB"), Call Forwarding When Busy for CSD ("DBSY"), Call Forwarding When Busy or Idle for CSD ("DBTH"), Call Forwarding When Busy or Idle ("BOTH").

MLHGs assigned a Call Forwarding Busy, Call Forwarding Data Busy or Call Forwarding Precedence Busy feature on the MLHNFA form must have CF BUSY set to "Y"on the MLHGFD form.

When an MLHG/TERM has been assigned a Call Forwarding Busy feature via an MLHLNFA, BFG, or associated CLUSTR form, and the feature has FWD CONDITION set to "DBSY", "DIDL", or "DBTH", then the BEARER field on the MLHGFD form (5604 Record) must be "CSD". If the FWD CONDITION is not "DBSY", "DIDL", or "DBTH", then BEARER must be "VOICE". If FWD CONDITION is "BOTH" or "PRCV", all CALL SELECTION fields on the CFWFD form must be "Y".

For 5E6 and later, an MLHG/TERM may not be assigned a Call Forwarding feature that has FWD CONDITION set to "PRCI"or "PRCV".

ACDI - For 5E9(1) and later, if "ACDI"is entered, then:

- ACT TYPE must be "AUTO"
- ATTENDANT must be "Y"
- BASE STA RING IND must be "N"
- CFPF ALW must be "N"
- CHANGE FWD TO DN must be "N"
- DACT TYPE must be "NONE"
- DN SCREENING must be "N"
- DON'T ANSWER TIMING must be 4 - 60 seconds
- FWD TO DN cannot be entered
- INTRA OFFICE must be "Y"
- INTRA TERMINAL GROUP must be "Y"
- INTER OFFICE must be "Y"
- MDNL EMSI must be "N"
- PRIVATE FACILITY ACCESS must be "Y"
- SEQ ACT FWD LEGS must be 1
- SIMUL INTEROFF FWD CALLS must be 1
- SIMUL INTRAOFF FWD CALL must be 1.

CKT TNs on the DSLUSR form that have an entry in the ACD POS NUM field must have one and only one CFW feature with FWD CONDITION of "ACDI" on the associated CFWFD form, that is assigned on the LINEFA form, CLUSTR form or associated BFG form, and ACTIVE must be "Y".

CFW features with a FWD CONDITION of "ACDI"may only be assigned to CKT TNs defined on the DSLUSR form with ACD POS NUM entered.

If Telephone Numbers are assigned a CFW feature on the LINEFA form, CLUSTR form or BFG form, with FWD CONDITION of "ACDI"on this form, then:

Copyright © 2003 Lucent Technologies

- BASE STA RING IND must be "N", and SIMUL INTEROFF FWD CALLS, SIMUL INTRAOFF FWD CALLS and SEQ ACT FWD LEGS must all be 1 on the associated CFWLPA form. LINEFA, CLUSTR, or BFG form (associated by the name of the cluster, or BFG on the LINEFA form) is associated with CFWLPA form with the same TN.

- the FORWARD TO DN field must not be entered on the associated CFWLPA form.

If lines are assigned a Call Forwarding feature with FWD CONDITION set to a value other than "ACDI", then the FORWARD TO DN should be assigned on the CFWLPA form or in the default parameters of this form when ACT TYPE is "AUTO" or "KEY"or when ACT TYPE is "CODE"and CHANGE FWD TO DN is set to "N".

MLHG/TERMs which are assigned a CFW Feature on the MLHLNFA form, CLUSTR form or BFG form, may not have a CFW feature with a FWD CONDITION of "ACDI"on the associated CFWFD form.

For 5E8 and later, if TNs on the LINEFA form(s) or Multiline Hunt Group Terminals on the MLHLNFA are assigned a Call Forwarding Feature with both

- FWD CONDITION value other than "ACDI"

- and the Initial Activation Status and Master Activation Status on the LINEFA or MLHLNFA, BFG or associated CLUSTER form(s) are set to "Y" (Note that neither BFG nor CLUSTR forms have Master Activation Status) then the TN(s) or MLHG/TERM(s) must be defined with a Forward to DN on either CFWLPA or CFWFD form.

For 5E10 and later, when TNs have a Call Waiting Deluxe feature assigned on the LINEFA, CLUSTR and/or BFG form, and the Call Waiting Deluxe feature has the DFLT OPT parameter set to "CALLFWD" on either the CWTFD, CWTLPA or BFG form, this requires that a Call Forwarding feature with FWD CONDITION equal to "IDLE"must also be assigned to these TNs.

For 5E12 and later:

- When FWD CONDITION is "ACDI", "PIDL", or "PRCI", DON'T ANSWER TIMING must be 4 - 60.

- When FWD CONDITION is "DIDL" or "IDLE", DON'T ANSWER TIMING must be either 0 or 4 - 60.

- When FWD CONDITION is "ACDI", "PIDL", or "PRCI", and TNs on the LINEFA form (5112 Record) are assigned one of these features, the corresponding CFWLPA form (5614-3 Record) must have DON'T ANSWER TIMING set to 4 - 60.

- When FWD CONDITION is "PIDL", and MLHGs/TERMs on the MLHLNFA form (5113 Record) are assigned the PIDL feature, the corresponding CFWMPA form (5614-4 Record) must have DON'T ANSWER TIMING set to 4 - 60.

- When FWD CONDITION is either "DIDL" or "IDLE", and TNs on the LINEFA form (5112 Record) are assigned one of these features, the corresponding CFWLPA form (5614-3 Record) must have DON'T ANSWER TIMING set to either 0 or 4 - 60.

- When FWD CONDITION is either "DIDL" or "IDLE", and MLHGs/TERMs on the MLHLNFA form (5113 Record) are assigned one of these features, the corresponding CFWMPA form (5614-4 Record) must have DON'T ANSWER TIMING set to either 0 or 4 - 60.

For 5E15 and later, when the FEATURE NAME field value equals the value in the USCF FEAT field on the OFCOPT form (5509 Record), FWD CONDITION must be "BOTH".

2.5 ACT TYPE

Copyright © 2003 Lucent Technologies

Description: Enter the Activation type.

Required Field
Default: CODE
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	Automatic Activation. The feature is active and ready to use when assigned. It is not activated by the subscriber.
CODE	Dialed Code Activation. The feature is activated when the subscriber dials a code.
CDDN	The feature is activated when the subscriber dials a code followed by the DN to which calls are to be forwarded.
CDDNC	The feature is activated when the subscriber dials a code followed by the DN to which calls are to be forwarded. A call is automatically completed to the DN but does not require an answer to complete activation.
CDDNCA	The feature is activated when the subscriber dials a code followed by the DN to which calls are to be forwarded. A call is automatically completed to the DN. Unless the forward-to DN is in the same terminal group as the originator, an answer is required to complete activation on the first attempt. The feature may be activated in the event of a no-answer condition by making a second activation attempt to the same DN within two minutes of the first.
CDCA1A	The feature is similar to CFW features with ACT TYPE "CDDNCA", but it provides transparency between CFW activation on the 5ESS Switch and the 1A ESS Switch.
KEY	The feature is activated by a scan point connected to a subscriber controlled key.

CODE: The feature is activated by the subscriber dialing a code. Calls are forwarded to a prestored DN. When the system recognizes the activation code, a confirmation tone followed by Dial Tone is returned to indicate successful activation. In the instance of an unsuccessful activation attempt, reorder is returned to the station.

CDDN: The feature is activated by the subscriber dialing a code. When the system recognizes the activation code, it returns recall Dial Tone to the customer, who then enters the Telephone Number to which calls will be forwarded. The system checks that the TN meets the Directory Number screening criteria. If the screening criteria are not met, the system returns reorder and the feature remains inactive. If the screening criteria are met, the system returns a confirmation tone signifying that the feature is active. After the confirmation tone has been provided, Dial Tone is returned to the station.

CDDNC: The feature is activated by the subscriber dialing a code. When the system recognizes the activation code, it returns recall Dial Tone to the customer, who then enters the Telephone Number to which calls will be forwarded. The system checks that the TN meets the Directory Number screening criteria. If the screening criteria are not met, the system returns reorder and the feature remains inactive. If the screening criteria are met, the system returns a confirmation tone signifying that the feature is active. After the confirmation tone has been provided, the system automatically completes a call to the entered Telephone Number. Normal call processing follows, allowing the customer to verify the forwarded to Directory Number.

CDDNCA: The feature is activated by the subscriber dialing a code. When the system recognizes the activation code, it returns recall Dial Tone to the customer, who then enters the Telephone Number to which calls will be forwarded. The system checks that the TN meets the Directory Number screening criteria. If the screening criteria are not met, the system returns reorder and the feature remains inactive. If the screening criteria are met, the system automatically completes a "courtesy"call to the entered Telephone Number. Unless the forward-to DN is in the same terminal group as the originator, the call must be answered. When the call is answered, the feature is activated. If the call is not answered, the dialing party has two minutes to begin a second attempt. If the customer repeats the previous steps within the two minute period, a confirmation tone is returned to the station followed by a Dial Tone, activating the feature. No automatic call completion is performed on this second activation attempt. If the forwarded to Telephone Number proves to be invalid, the station is notified of the fact and the feature remains inactive.

Copyright © 2003 Lucent Technologies

When the forward-to DN is in the same terminal group as the originating DN, the confirmation tone is given on the first activation attempt and a courtesy call is completed. The feature is activated whether or not the courtesy call is answered.
During CFV activation if the forward-to DN is that of a Message Service Center, the feature is activated, confirmation is given, and no courtesy call is made.

CDCA1A The feature is activated by dialing a code. This feature provides CFV (Call Forwarding Variable) as it is provided in the 1A ESS Switch. Functionally, this feature is identical to the current CFV feature provided in the 5ESS Switch with the following exceptions:

- Confirmation tone is applied to the Call Forwarding Subscriber on the first activation attempt immediately after the forward to DN (Directory Number) is dialed, when activating the CFV feature to a station outside the subscriber's group.

- Error treatment is applied to the Call Forwarding Subscriber if the forward to DN given on the second activation attempt is different from the forward to DN given on the first attempt. Used to indicate the type of activation allowed for this feature is by dialing a code. Then, once the system recognizes the activation code, recall Dial Tone is returned to the station. The station then enters the Telephone Number. The system checks whether or not the specified Telephone Number meets the Directory Number Screening criteria. If the Directory Number Screening criteria are not met, the system returns reorder and the feature remains inactive. However, if the Directory Number Screening criteria are met, the system returns a confirmation tone to the station. The confirmation tone signifies the feature is active. After the confirmation tone has been provided, Dial Tone is returned to the station.

Data Rules:

If a CFW feature with ACT TYP "CODE"is assigned to a line, then if FWD TO DN is not entered, CHANGE FWD TO DN must be set to "Y"(Yes).

If a CFW feature with ACT TYPE other than "KEY"or "AUTO" is assigned to a line, the line should normally be assigned an IDP (Individualized Dialing Plan); at least one dialed code on the corresponding IDPDCA form (5601-1/2 Record) should have ACTION equal to "FTACT" and FEATURE equal to this Call Forwarding feature.

If the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "FTACT" and FEATURE equal to this Call Forwarding feature.

For 5E7 and later, if ACT TYPE is "AUTO", the corresponding initiation activation status (i.e., Feature Active or Not-Act?) entry on the MLHLNFA, BFG, or CLUSTR form must be "Y".

For 5E15 and later, when the FEATURE NAME field value equals the value in the USCF FEAT field on the OFCOPT form (5509 Record), ACT TYPE must be "CDDNCA" or "CDCA1A".

2.6 DACT TYPE

Description: Enter the Deactivation type.

Required Field.
Default: CODE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
CODE	The feature is deactivated by dialing a code.
NONE	The feature cannot be deactivated from the customer's station. It can only be deactivated by a service order request through the switch owner.
AUTO	The switch automatically deactivates the feature. This option is valid only after an activate code has been dialed. After the customer activates the feature and completes a call, the switch automatically deactivates

Copyright © 2003 Lucent Technologies

	the feature.
KEY	The feature is deactivated by scan point, where scan point is controlled by keys.

Data Rules:

If ACT TYPE is "AUTO", then DACT TYPE must equal "NONE" or "CODE".

If ACT TYPE is "CODE"or "CDDN", then DACT TYPE must equal " CODE"or "AUTO".

If ACT TYPE is "CDCA1A", "CDDNC"or "CDDNCA", then DACT TYPE must equal "CODE".

If ACT TYPE is "KEY", then DACT TYPE must equal "KEY".

If DACT TYPE is "CODE"and this feature is assigned to a line, then the line should normally be assigned an IDP (Individualized Dialing Plan); at least one dialed code of the IDP on the IDPDCA form (5601-1/2 Record) should have ACTION equal to "FTDCT"and a FEATURE associated with the dialed code on the IDPDCA form equal to this Call Forwarding feature. If the ACTION is equal to "CFDCT", the FEATURE associated with the dialed code on the IDPDCA form must be that of the Call Forward "wild-card" feature (/CF*).

Alternatively, if the line is not assigned an IDP, then the PDIT form (5300-2 Record) used by the line should contain at least one dialed code with an ACTION equal to "FTDCT"and a FEATURE associated with the dialed code on the PDIT form equal to this Call Forwarding feature, or an ACTION equal to "CFDCT"and the FEATURE associated with the dialed code on the PDIT form must be than of the Call Forward "wild-card"feature (/CF*).

For 5E15 and later, when the FEATURE NAME field value equals the value in the USCF FEAT field on the OFCOPT form (5509 Record), DACT TYPE must be "CODE".

2.7 CFPF ALW

Description: Is a customer allowed to forward calls over private facilities? The private facilities may be accessed via FX, CCSA, OUTWATS, PFA, or ARS.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A customer with a CFPF (Call Forward over Private Facilities) feature may also have an Account and/or Authorization feature defined on the appropriate Feature Assignment form. When CFPF ALW is "Y", the ACT TYPE must not be "CDDNCA"or "CDCA1A".

When CFPF ALW is "Y", the FWD CONDITION must NOT be:

- "PRCI",
- "DBSY",
- "DIDL", or
- "DBTH".

For 5E9(1) and later, if CFPF ALW is "Y", FWD CONDITION must not be "PRCI".

For CFPF/DA:

Copyright © 2003 Lucent Technologies

For 5E9(1) and later, the CFPF/DA (Call Forwarding Over Private Facilities/Don't Answer) feature is available as a secured feature (SFID 155). If this feature is purchased, FWD CONDITION must be "IDLE" and CFPF ALW must be "Y". The following restrictions also apply:

- if CFPF ALW is "Y", and FWD CONDITION is not "IDLE", and DN SCREENING is "Y", then DNSK, DNSL or DNSO must be "Y".
- if CFPF ALW is "Y", and FWD CONDITION is "IDLE", and DN SCREENING is "Y", then DNSK must be "N"and DNSL or DNSO must be "Y".
- if CFPF ALW is "N"and DN SCREENING is "Y", DNSK, DNSL and DNSO must be "N".

For more information on the CFPF/DA feature, See Division 2, Section 4A155.

For 5E10 and later, when CKT TN(s) and or CKT MLHG/TERMs on the DSLUSR form have DSL CLS set to "STD"on the DSL form (OE from DSLUSR form matches DSL OE on the DSL form), and are assigned a CFWFD feature with CFPF ALW set to "Y"on the CFWFD form, a SFSYS form must exist with SFID 225 (National ISDN 5E10 BRI Package) set to "Y". This feature is a Secured Feature that must be purchased by the office before a CFWFD feature with CFPF ALW set to "Y"may be assigned.

For 5E15 and later, when the FEATURE NAME field value equals the value in the USCF FEAT field on the OFCOPT form (5509 Record), CFPF ALW must be "N".

CHANGE OPTIONS

Fields Section 2.8 - Section 2.9 determine if the subscriber will be able to change specific call forwarding options.

2.8 CHANGE DON'T ANSWER TIMING

Description: Should the customer be allowed to change the don't answer timing on the Call Forwarding feature? When this field is "Y" (Yes), the customer may dial a code and then specify the value of the don't answer ringing time.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CHANGE DON'T ANSWER TIMING is "Y"(Yes) and this feature is assigned to a line, then the line should normally be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP on the IDPDCA form should have ACTION equal to "CFDATCH" and have FEATURE associated with the dialed code on the IDPDCA form equal to this Call Forwarding feature.

Alternately, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "CFDATCH"and FEATURE associated with the dialed code on the PDIT form equal to this Call Forwarding feature.

2.9 CHANGE FWD TO DN

Description: Change Forward to Directory Number. Should the customer be allowed to change the "forward to"Telephone Number on a specific Call Forwarding feature without first having to deactivate and then re-activate the specific feature?

Required Field.
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If CHANGE FWD TO DN is "Y"(Yes) and this feature is assigned to a line, then the line should normally be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP (on the IDPDCA) should have ACTION equal to "CFDNCH"and have FEATURE associated with the dialed code on the IDPDCA form equal to this Call Forwarding feature.

Alternatively, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "CFDNCH"and FEATURE associated with the dialed code on the PDIT form equal to this Call Forwarding feature.

- ***NOTE:*** The only allowed value is "N", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

CALL SELECTION

Call selection specifies the conditions under which a called line should be forwarded, based on the Class Of Service of the incoming call. Any combination of the following five non-exclusive options (Section 2.10 - Section 2.14) may be specified.

If the Call Forwarding feature is assigned to a Multi-Line Hunt line, then ATTENDANT, INTRA OFFICE, INTER OFFICE, INTRA TERMINAL GROUP, and PRIVATE FACILITY ACCESS must equal "Y"(Yes).

2.10 ATTENDANT

Description: Should forwarding of calls from an attendant within the same Terminal Group be allowed?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If two or more Call Forwarding features with the same FWD CONDITION are assigned to a subscriber, only one of the features may have ATTENDANT set to "Y". An exception to this rule is the /CFNS feature which may be assigned in conjunction with another Call Forwarding feature which has ATTENDANT set to "Y".

2.11 INTRA OFFICE

Description: Will the customer be allowed to forward an intraoffice call? The incoming call is an intraoffice, non-private facility call; the incoming call and the called line are not members of the same Terminal Group.
Default: Y
Valid Entries: Y, N

Data Rules:

If two or more Call Forwarding features with the same FWD CONDITION are assigned to a subscriber, only one of the features may have INTRA OFFICE set to "Y". An exception to this rule is the /CFNS feature which may be assigned in conjunction with another Call Forwarding feature that has INTRA OFFICE set to "Y".

- ***NOTE:*** The default and only value for this field is "Y", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Copyright © 2003 Lucent Technologies

2.12 INTER OFFICE

Description: Will the customer be allowed to forward an interoffice call? The incoming call is an interoffice, non-private facility call, and the trunk bringing the call to the switch and the called line are not members of the same Terminal Group.
Default: Y
Valid Entries: Y, N

Data Rules:

If two or more Call Forwarding features with the same FWD CONDITION are assigned to a subscriber, only one of the features may have INTER OFFICE set to "Y". An exception to this rule is the /CFNS feature which may be assigned in conjunction with another Call Forwarding feature that has INTER OFFICE set to "Y".

- ***NOTE:*** The default and only value for this field is "Y", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

2.13 INTRA TERMINAL GROUP

Description: Will the customer be allowed to forward an intraterminal group call? The incoming call belongs to the same Terminal Group as the called line and neither are part of a private facility.
Default: Y
Valid Entries: Y, N

Data Rules:

If two or more Call Forwarding features with the same FWD CONDITION are assigned to a subscriber, only one of the features may have INTRA TERMINAL GROUP set to "Y". An exception to this rule is the /CFNS feature which may be assigned in conjunction with another Call Forwarding feature that has INTRA TERMINAL GROUP set to "Y".

- ***NOTE:*** The default and only value for this field is "Y", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

2.14 PRIVATE FACILITY ACCESS

Description: Will the customer be allowed to forward a call from a private facility? The incoming call must be from a private facility.
Default: Y
Valid Entries: Y, N

Data Rules:

If two or more Call Forwarding features with the same FWD CONDITION are assigned to a subscriber, only one of the features may have PRIVATE FACILITY ACCESS set to "Y". An exception to this rule is the /CFNS feature which may be assigned in conjunction with another Call Forwarding feature that has PRIVATE FACILITY ACCESS set to "Y".

- ***NOTE:*** The default and only value for this field is "Y", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

3. FORM ENTRIES - 5614-2 RECORD

Copyright © 2003 Lucent Technologies

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

3.2 DN SCREENING

Description: Will the DNs (Directory Numbers) to which calls are forwarded be screened? "Y"(Yes) indicates that one or more of the following fields (DNSA through DNSQ) will prohibit calls from being forwarded to certain types of DNs. "N"(No) indicates there will be no screening; calls can be forwarded to any DN.

Required Field for 5E9(1) and later.
Default: Y
Valid Entries: Y, N

Data Rules:

When DN SCREENING is "Y", at least one of the DNSA through DNSQ fields must be "N".

For 5E9(1) and later, if DN SCREENING is "N", all options (DNSA through DNSQ) must be "Y".

For 5E9(1) and later, if DN SCREENING is "Y"and CFPF ALW is "Y", then DNSK, DNSL, or DNSO must be "Y". If DN SCREENING is "Y"and CFPF ALW is "N", then DNSK, DNSL and DNSO must be "N".

3.3 DNSA

Description: Should the customer be allowed to forward calls to members of the same Terminal Group?
Default: Y
Valid Entries: Y, N

- ***NOTE:*** The only allowed value is "Y", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

3.4 DNSB

Description: Should the customer be allowed to forward calls to an intraoffice DN that is not an intragroup DN?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.5 DNSC

Description: Should the customer be allowed to forward calls to an intra-LATA DN that is not an intragroup or intraoffice DN?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.6 DNSD

Description: Should the customer be allowed to forward calls to an inter-LATA DN that is not an international DN?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.7 DNSE

Description: Should the customer be allowed to forward calls to an international DN?

Copyright © 2003 Lucent Technologies

Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.8 DNSF

Description: Should the customer be allowed to forward calls to a type X11 DN (e.g. 411, 911)?
Default: N
Valid Entries: Y, N

NOTE: The only allowed value is "N", except for Call Forwarding features derived from the preconstructed features using the ODA change-insert mode of the review operation.

3.9 DNSG

Description: Should the customer be allowed to forward calls to the POTS or IC (Interexchange Carrier) operator?
Default: N
Valid Entries: Y, N (See Note in Section 3.8)

3.10 DNSH

Description: Should the customer be allowed to forward calls to an ODP (Office Dialing Plan) or IDP (Individualized Dialing Plan) feature code? The code may be with or without subsequent parameters.
Default: N
Valid Entries: Y, N (See Note in Section 3.8)

3.11 DNSI

Description: Should the customer be allowed to forward calls to an IDP Intercom number?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.12 DNSJ

Description: Should the customer be allowed to forward calls to an IDP Abbreviated Dial code?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.13 DNSK

Description: Should the customer be allowed to forward calls to a Private Facility Access Code for a nonsenderized facility? The Private Facility Access Code may be followed by additional digits, but these digits are not subject to screening. The forward to DN is screened during the entry for a speed call list entry and during the activation of CFPF (Call Forwarding over Private Facilities).

Required Field.
Default: N
Valid Entries: Y, N

For 5E5 and later, both "Y"and "N" may be entered. (See Note in Section 3.8).

3.14 DNSL

Description: Should the customer be allowed to forward calls to a Private Facility Access Code for a senderized facility? The PFA Code may be followed by additional digits, but these digits are not subject to screening. This entry is screened during the entry of a speed call list entry and during the activation of CFPF (Call Forwarding over Private Facilities).

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

For 5E5 and later, both "Y"and "N"may be entered. (See Note in Section 3.8).

Data Rules:

For 5E5 and later, if "Y"is entered, then CFPF ALW must be "Y".

3.15 DNSM

Description: Should the customer be allowed to forward calls to an IDP POTS Access Code?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.16 DNSN

Description: Should the customer be allowed to forward calls to a specific Carrier Access Code (10xxx) followed by parameters that conform to other DN screening options?
Default: Y
Valid Entries: Y, N (See Note in Section 3.3)

3.17 DNSO

Description: Should the customer be allowed to forward calls to an ARS Access Code? The Private Facility Access Code may be followed by additional digits, but these digits are not subject to screening. This entry is screened during the entry of a speed call list entry and during the activation of CFPF (Call Forwarding over Private Facilities).

Required Field.
Default: N
Valid Entries: Y, N

For 5E5 and later, both "Y"and "N"may be entered. (See Note in Section 3.8).

Data Rules:

For 5E5 and later Software Releases, if "Y" is entered, then CFPF ALW must be "Y".

3.18 DNSP

Description: Should a PP precedence code (followed by a telephone number) be allowed to be stored in the Abbreviated Dial List?
Default: N
Valid Entries: Y, N

3.19 DNSQ

Description: Is the forward to number restricted to a port that can receive AUTOVON calls?
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then DNSA must be "Y".

Copyright © 2003 Lucent Technologies

DEFAULT PARAMETERS

The following fields (Section 3.20 - Section 3.36) define the default parameters assigned with the feature to lines. These parameters will be assigned to the line unless they are overridden by entries on the CFWLPA (5614-3 Record) or CFWMPA (5614-4 Record) forms.

3.20 FORWARD TO DN

Description: The Directory Number to which calls will be forwarded.
Valid Entries: Up to 32 characters (0 - 9, *, and/or #)

Data Rules:

The FORWARD TO DN will be translated during call processing using the originator's dialing plan(s). Therefore, if the originator has an Individualized Dialing feature with an IDP group, the digits entered must be successful using the IDPDCA form entries. For example, if the originator normally dials an intercom digit string of four digits to call a phone, then the four digits should be entered here to forward to the same phone.

If FWD TO DN is specified, then ACT TYPE must equal "AUTO", "CODE", or "KEY".

For 5E5 and later, when CFPF ALW is "Y", this field can contain the following codes in many different dialing sequences:

- PFA access code
- Account Code use code
- Authorization Code use code
- ARS use code
- Directory Number

The account and authorization codes are entered in the ACCT CODE and ATH CODE fields.

3.21 ACCT CODE

Description: Enter the Account Code used by Call Forwarding Over Private Facility for the invocation of CFPF.

Software Release: 5E5 and later
Valid Entries: Up to 15 characters (0 - 9, #, and *)

Data Rules:

When ACCT CODE is entered, then CFPF ALW must be "Y"and FORWARD TO DN must contain an Account Use code along with the DN and other use codes.

When this field is entered, an associated Account feature (5623-1 Record) must be assigned to the associated LINEFA, MLHLNFA, BFG or associated CLUSTR form with the feature active to allow calls to be forwarded with this account code.

3.22 ATH CODE

Description: This field allows the Authorization Code used by Call Forwarding Over Private Facilities to be defaulted for CFPF invocations.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Valid Entries: 1 - 15 digits

Data Rules:

When ATH CODE is entered, then CFPF ALW must be "Y"and FORWARD TO DN must contain an Authorization Use code along with the DN and other use codes.

When this field is entered, an associated Authorization feature (5619-1 Record) must be assigned to the associated LINEFA, MLHLNFA, BFG or associated CLUSTR form with the feature active to allow calls to be forwarded with this authorization code.

3.23 DON'T ANSWER TIMING

Description: This field specifies the Don't Answer Ring Time, the maximum time (seconds) the phone will ring before an unanswered call is forwarded.

Required Field for 5E5 and later.
Default: 0
Valid Entries: 0 - 60

Data Rules:

With 5E5 and later, this field must have a value of 4 to 60 when FWD CONDITION has a value of "IDLE"or "PIDL" to allow the terminal to be rung at least once before it is considered idle and the call is forwarded.

If FWD CONDITON is "IDLE", "DIDL", "PIDL", "PRCI", or "ACDI", then the entry in this field must be in the range of 4 - 60 seconds.

3.24 SIMUL INTEROFF FWD CALLS

Description: Enter the maximum number of simultaneously active interoffice calls allowed between the base station and the forward to DN.
Default: 1
Valid Entries: 1 - 99

Data Rules:

If the forward to directory number resides in an MLHG, it is recommended that the valid entries are from 1 to the maximum number of lines within the MLHG. Entering the value of the maximum size of the MLHG allows efficient use of all terminals within the forward to MLHG. If the base TN is terminal 1 in an MLHG, the entry can be defined as the size of the base MLHG to ensure that the number of simultaneously forwarded calls is equivalent to the number of calls that could be completed to the MLHG without the call forwarding feature being present.

3.25 SIMUL INTRAOFF FWD CALLS

Description: Enter maximum number of simultaneously active intraoffice calls allowed between the base station and forward to DN.
Default: 99
Valid Entries: 1 - 99

3.26 SEQ ACT FWD LEGS

Description: Enter the maximum number of Call Forwarding legs allowed to be sequentially forwarded. The SEQ ACT FWD LEGS limit is exceeded if any individual line in a Call Forwarding chain has its limit exceeded.
Default: 5

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 32

3.27 BASE STA RING IND

Description: Should the Base Station Ring Indicator be allowed? Base station ringing indicator is a normal ring of 0.5 second duration which is applied to an idle line indicating that an incoming call to that line is being forwarded.
Default: Y
Valid Entries: Y, N

3.28 MDNL ENHANCED

Description: Is the enhanced version of the MDNL (Multiple Directory Numbers Per Line) feature supported? If "Y"is entered, the enhanced version of MDNL service is supported. If "N"is entered, the basic MDNL service or no MDNL service is supported.

This field replaces the DDNCFI field.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y"is entered, the FWD CONDITION field must have a value of "BOTH".

If "Y" is entered, the associated LINE form must have a "Y" entered in the SHARE field.

If "N" is entered, the MDNL FWD and MDNL RCF fields must have the same value.

3.29 MDNL FWD

Description: This field indicates which TNs will be forwarded for lines assigned MDNL features.

Software Release: 5E6 and later
Required Field.
Default: ALL
Valid Entries:

Valid MDNL FWD Entries

Entry	Definition
ALL	The Master TN and its Dependent TNs will be forwarded.
DEPEND	The Dependent TNs will be forwarded only.
MASTER	The Master TN will be forwarded only.

Data Rules:

If "DEPEND"is entered, the MDNL ENHANCED field must have a value of "Y".

If "MASTER"is entered and the MDNL ENHANCED field has a value of "N", the FWD CONDITION field must have a value of "BOTH".

3.30 MDNL RCF

Description: For lines that have the MDNL feature, this field specifies if calls to the Master TN and/or Dependent TNs can be forwarded via Remote Activation (e.g., RACF, ACF).

Software Release: 5E6 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: ALL
Valid Entries:

Valid MDNL RCF Entries

Entry	Definition
ALL	The Master TN and its Dependent TNs can be forwarded.
DEPEND	Only the Dependent TNs can be forwarded.
MASTER	Only the Master TN can be forwarded.

Data Rules:

If "DEPEND"is entered, the MDNL ENHANCED field must have a value of "Y".

3.31 CFDA AFTER CW

Description: Will unanswered call waiting calls be forwarded to a remote DN when a CFDA feature is assigned to the line?

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

If CFDA AFTER CW is "Y"then FWD CONDITION must be "IDLE".

If the Secured Feature ID is not set to "S"on the SFSYS form (5713 Record), the value of CFDA AFTER CW must be blank or "Y" when FWD CONDITION equals "IDLE"and must be "N"for all other cases.

If CFDA AFTER CW is set to "Y", the line cannot be defined on a DSLUSR form (5908 Record).

If CFDA AFTER CW is set to "Y", the TN cannot be defined on the LINE form (5109-1/2/3 Records) with SHARED equal to "Y".

When CFDA AFTER CW is not entered, it is set to "Y"for unshared analog lines with CFDA features and "N"for all other lines.

3.32 CFIMB

Description: Should the Call Forward Inhibit Make Busy option be included in this feature? When a Call Forwarding Busy Line feature has the CFIMB option, it inhibits call forwarding while the Make Busy Key (or Feature Button) is on. Calls arriving after the subscriber has activated the make busy key or feature button receive busy or reorder tone as specified in the OVF CFI field. For more information on the IMB feature, refer to Section 1.4 , "Call Forwarding Busy Line Options", at the beginning of this section.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A Call Forward feature may not have both the Inhibit Make Busy and Inhibit Line Busy options. When CFILB is "Y", CFIMB must be "N".

The Inhibit Make Busy option applies only to Call Forwarding Busy Line features. When CFIMB is "Y", FWDCOND must be "BUSY".

A CFBL-IMB feature is assigned to a line or MLHG by service order and cannot be activated or deactivated by the subscriber. When CFIMB is "Y", ACT TYPE must be "AUTO", and DACT TYPE must

Copyright © 2003 Lucent Technologies

be "NONE".

A TN that is assigned a CFBL-IMB feature must have a make busy key. When a TN is assigned a CFBL feature (via a LINEFA, BFG, or associated CLUSTR form) that has the IMB option set to "Y", the MAKE BUSY KEY must be entered on the LINE form (5109 Record).

An MLHG that is assigned a CFBL-IMB feature must have a group make busy key or feature button. When an MLHG/TERM is assigned a CFBL feature (via an MLHLNFA, BFG, or associated CLUSTR form) that has the IMB option set to "Y", it must also be assigned a group make busy key/button in one of two ways:

- the GROUP MAKE BUSY KEY on the corresponding MLHG form (5110 Record) may be entered; or
- if Member 1 of the MLHG is defined on a DSLUSR form (5908 Record), there may be a corresponding entry on a CFGGRP form (5964 Record) with ACTION set to "BYGP".

A CFBL-IMB feature may be assigned to regular, circular, and UCD Multi-Line Hunt Groups. The MLHG FEATURE assigned on the MLHG form must be defined on an MLHGFD form (5604 Record) with HUNT TYPE equal to "REG", "HTC", or "UCD".

3.33 CFILB

Description: Should the Call Forward Inhibit Line Busy option be included in this feature? When a Call Forwarding Busy Line feature has the CFILB option, it inhibits call forwarding while the Make Busy Key (or Feature Button) is off.

Calls arriving when the make busy key is on will be forwarded. Calls arriving when the line is busy, but the make busy key is off, will not be forwarded; the caller will receive busy or reorder tone as specified in the OVF CFI field. For more information on the ILB feature, refer to Section 1.4 , "Call Forwarding Busy Line Options", at the beginning of this section.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A Call Forward feature may not have both the Inhibit Make Busy and Inhibit Line Busy options. When CFIMB is "Y", CFILB must be "N".

The Inhibit Line Busy option applies only to Call Forwarding Busy Line features. When CFILB is "Y", FWDCOND must be "BUSY".

A CFBL-ILB feature is assigned to a line or MLHG by service order and cannot be activated or deactivated by the subscriber. When CFILB is "Y", ACT TYPE must be "AUTO", and DACT TYPE must be "NONE".

A TN that is assigned a CFBL-ILB feature must have a make busy key. When a TN is assigned a CFBL feature (via a LINEFA, BFG, or associated CLUSTR form) that has the ILB option set to "Y", the MAKE BUSY KEY must be entered on the LINE form.

An MLHG that is assigned a CFBL-ILB feature must have a group make busy key or feature button. When an MLHG/TERM is assigned a CFBL feature (via an MLHLNFA, BFG, or associated CLUSTR form) that has the IMB option set to "Y", it must also be assigned a group make busy key/button in one of two ways:

- the GROUP MAKE BUSY KEY on the corresponding MLHG form may be entered; or
- if Member 1 of the MLHG is defined on a DSLUSR form, there may be a corresponding entry on a

Copyright © 2003 Lucent Technologies

CFGGRP form with ACTION set to "BYGP".

A CFBL-ILB feature may be assigned to regular, circular, and UCD Multi-Line Hunt Groups. The MLHG FEATURE assigned on the MLHG form must be defined on an MLHGFD form with HUNT TYPE equal to "REG", "HTC", or "UCD".

3.34 OVF CFI

Description: Should overflow (reorder) tone be returned to a caller when the call is not forwarded because of CFIMB or CFILB? If this field is "N", the caller will receive a busy tone.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This option only applies to Call Forward Busy Line features having the Inhibit Make Busy or the Inhibit Line Busy option. If OVF CFI is "Y", either CFIMB or CFILB must be "Y".

3.35 FCCS OPT

Description: Is the Forwarded Call - Call Screening option active for this call forwarding feature?

Software Release: 5E14 and later
Required field.
Default: N
Valid Entries: Y, N

Data Rules:

When FCCS OPT is "Y", the following must be true:

- ACT TYPE must be "AUTO" or "CODE"
- DACT TYPE must be "CODE" or "NONE"
- CHANGE FWD TO DN must be "N"
- FWD CONDITION must be "BUSY"or "IDLE"
- The ACT field must be "Y" for SFID 526 on the SFSYS form

For 5E16 and later, when FCCS OPT is set to "Y" and ACT TYPE is set to "CODE" or DACT TYPE is set to "CODE", then the ACT field for SFID 592 on the SFSYS form (5713-1 Record) must be set to "Y".

For 5E16 and later, when the ACT field for SFID 592 is set to "Y" on the SFSYS form, the ACT field for SFID526 on the SFSYS form must also be set to "Y".

3.36 CFDARC

Description: Activate the Call Forward Don't Answer Ring Control option? This field specifies whether or not the Call Forwarding Don't Answer Ring Control is active for this line.

Software Release: 5E12 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When CFDARC is "Y":

- the ACT field for SFID 335 on the SFSYS form (5713-1 Record) must be set to "Y".
- FWD CONDITION must be "DIDL", "IDLE", "PIDL", or "PRCI".
- CHANGE DON'T ANSWER TIMING must be "Y".

3.37 CFV ALERT

Description: This field indicates whether the Call Forwarding Variable Alert option is active for this feature.

Software Release: 5E12 and later
Valid Entries: Y, N

Data Rules:

When CFV ALERT is set to "Y":

- the ACT field for SFID 341 on the SFSYS form (5713-1 Record) must also be set to "Y".
- FWD CONDITION must be set to "BOTH".

MDNL CALL WAITING

The following fields (Section 3.38 - Section 3.40) support the MDR/CW/CF Interaction Enhancement (FAX Ring) Feature. This is a secured feature using SFID 535. For more information on this feature, see Division 2, Section 4A535.

3.38 INH CF MASTER

Description: Is Call Forwarding inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CF MASTER must be "N".

If INH CF MASTER is "Y", then INH CF DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

When INH CF MASTER is "Y" FWD CONDITION must be BOTH, BUSY, or IDLE.

3.39 INH CF DEPEND

Description: Is Call Forwarding inhibited for the depend TN of a line using MDR?

Copyright © 2003 Lucent Technologies

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CF DEPEND must be "N".

If INH CF DEPEND is "Y", then INH CF MASTER must be "N".

When INH CF DEPEND is "Y" FWD CONDITION must be BOTH, BUSY, or IDLE.

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

3.40 INHIBIT MDNL CF

Description: This field is used in determining whether or not Call Forwarding is inhibited for the master telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CF must be "NONE".

When INHIBIT MDNL CF is DEPEND OR MASTER, FWD CONDITION must be BOTH, BUSY, OR IDLE.

SEC. 15B: 5614-3 RECORD
CALL FORWARDING LINE (TN) PARAMETER FORM - CFWLPA

1. GENERAL

The 5614-3 Record is available with 5E2 and later Software Releases. It defines parameters for a constructed Call Forwarding Feature that will be assigned to lines (which are not multi-line hunt group lines). This record is required only if the default parameters assigned on the CFWFD (Call Forwarding Feature Definition) form are inappropriate.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *TN

Description: Enter the Telephone Number of the line.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The line may not be an MLHG line.

The associated CLASS OF SERVICE on a LCC form (5306 Record) must be one of the following:

Class of Service	
ATND	50B Non-Data Link Console Line or Attendant Line
INDIV	Individual Line
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
SATSTLN	Stand-Alone Test Line
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Software Release: 5E3 and later. Line to a PBX.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the CFWLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 *FEATURE

Description: Enter the Feature Name.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

This field must be defined on the CFWFD form (5614-1/2 Record).

For 5E12 and later, TN/FEATURE combinations on different CFWLPA forms cannot be duplicated.

2.4 FORWARD TO DN

Description: Enter the Forward To Directory Number.
Valid Entries: Up to 32 characters (0 - 9, *, and/or #)

Data Rules:

If FORWARD TO DN is specified, then ACT TYPE on the CFWFD form must equal "AUTO", "CODE", or "KEY".

If FORWARD TO DN is specified as a 7-digit Telephone Number, then FORWARD TO DN must not equal the 7-digit Telephone Number which was entered in the TN field; Call Forwarding does not allow forwarding to itself.

The FORWARD TO DN entered will be translated during call processing using the originator's dialing plan(s). Therefore, if the originator has an Individualized Dialing feature with an IDP group, the digits entered must be successful using the IDPDCA form (5601-1 Record) entries. For example, if the originator normally dials an intercom digit string of four digits to call a phone, then the four digits should be entered here to forward to the same phone.

For 5E5 and later, when CFPF ALW is "Y" on the associated CFWFD form, this field can contain the following codes in many different dialing sequences:

- PFA access code
- Account Code use code
- Authorization Code use code
- ARS use code
- Directory Number

The account and authorization codes are entered in the ACCT CODE and ATH CODE fields.

2.5 ACCT CODE

Description: Enter the Account Code used by Call Forwarding Over Private Facility for the invocation of CFPF.

Software Release: 5E5 and later
Valid Entries: Up to 15 characters (0 - 9, #, and/or *)

Data Rules:

When ACCT CODE is entered, then CFPF ALW must be "Y" on the associated CFWFD form and FORWARD TO DN must contain an Account Use code along with the DN and other use codes.

When this field is entered, an associated Account Code feature defined on the ACCTFD form (5623-1 Record), must be assigned on the associated LINEFA, MLHLNFA, BFG, or CLUSTR form with the feature active to allow calls to be forwarded with this account code.

2.6 ATH CODE

Copyright © 2003 Lucent Technologies

Description: Allows the Authorization Code used by Call Forwarding Over Private Facilities to be defaulted for CFPF invocations.

Software Release: 5E5 and later
Valid Entries:
- For 5E5 - 5E7: 1 - 15 characters (0 - 9, #, *)
- For 5E8 and later: 1 - 15 digits

Data Rules:

When ATH CODE is entered, then CFPF ALW must be "Y" on the associated CFWFD form and FORWARD TO DN must contain an Authorization Use code along with the DN and other use codes.

When this field is entered, an associated Authorization feature (5619-1 Record) must be assigned on the associated LINEFA, MLHLNFA, BFG, or CLUSTR form with the feature active to allow calls to be forwarded with this authorization code.

2.7 DON'T ANSWER TIMING

Description: For the Call Forward Don't Answer feature, enter the time delay (in seconds) before a call will be forwarded.
Default: 30
Valid Entries: 0 - 60

Data Rules:

If DON'T ANSWER TIMING is greater than 0, then FWD CONDITION on the CFWFD form must equal "IDLE", "PRCI" or "PIDL".

For 5E5 and later, this field must have a value of 4 to 60 when the associated CFWFD form has a FWD CONDITION with a value of "IDLE" or "PIDL". This allows the terminal to be rung at least once before it is considered idle and the call is forwarded. During a retrofit to 5E5, if this field has a value of 0 to 3 and the above conditions are met, the field will be evolved to the value of 4.

2.8 SIMUL INTEROFF FWD CALLS

Description: Enter the maximum number of simultaneously active interoffice calls allowed between base station and forward to DN.
Default: 1
Valid Entries: 1 - 99

Data Rules:

If the forward to directory number resides in an MLHG, it is recommended that the valid entries are from 1 to the maximum number of lines within the MLHG. Entering the value of the maximum size of the MLHG allows efficient use of all terminals within the forward to MLHG. If the base TN is terminal 1 in an MLHG, the entry can be defined as the size of the base MLHG to ensure that the number of simultaneously forwarded calls is equivalent to the number of calls that could be completed to the MLHG without the call forwarding feature being present.

2.9 SIMUL INTRAOFF FWD CALLS

Description: Enter the maximum number of simultaneously active intraoffice calls allowed between base station and forward to DN.
Default: 99
Valid Entries: 1 - 99

Copyright © 2003 Lucent Technologies

2.10 SEQ ACT FWD LEGS

Description: Enter the maximum number of Call Forwarding legs allowed to be sequentially forwarded.
Default: 5
Valid Entries: 1 - 32

Data Rules:

The SEQ ACT FWD LEGS limit is exceeded if any individual line in a Call Forwarding chain has its own limit exceeded.

2.11 BASE STA RING IND

Description: Should the Base Station Ringing Indicator be allowed? The Base Station Ringing Indicator is a normal ring of 0.5 seconds duration which is applied to an idle line indicating that an incoming call to that line is being forwarded.
Default: Y
Valid Entries: Y, N

2.12 # FORWARD MULTIPLE TN'S?

Description: For lines that are assigned the MDNL (Multiple Directory Numbers Per Line) feature, should calls that terminate to the Dependent TNs defined on the MTNDR form (5550 Record) be Call Forwarded? A value of "Y" indicates that calls to both the Master TN and Dependent TNs will be call forwarded. A value of "N" indicates that only calls that terminate to the Master TN will be call forwarded; calls to the Dependent TNs will not be call forwarded.

If there are no multiple TNs associated with the TN defined on this form, then enter the default value.

Software Release: 5E4(2) only
Required Field.
Default: Y
Valid Entries: Y, N

2.13 DDNCFI

Description: Dependent DN Call Forwarding Inhibit. Should Call Forwarding be inhibited for Dependent TNs on lines assigned the MDNL (Multiple Directory Numbers Per Line) feature? A value of "Y" indicates that only calls terminating to the Master TN will be call forwarded; calls to the Dependent TNs will not be call forwarded. A value of "N" indicates that calls to both the Master TN and Dependent TNs will be call forwarded.

Software Release: 5E5 only
Default: N
Valid Entries: Y, N

Data Rules:

When this field is "Y", the FWD CONDITION on the associated CFWFD form must be "BOTH".

2.14 ANNC RTI

Description: This field is not used. For 5E7 and later, it was removed from the form.

Software Release: 5E5 and 5E6 only

2.15 MDNL ENHANCED

Copyright © 2003 Lucent Technologies

Description: Is the enhanced version of the MDNL (Multiple Directory Numbers Per Line) feature supported? If "Y" is entered, the enhanced MDNL service is supported. If "N" is entered, only basic MDNL service or no MDNL service is supported.

This field replaces the DDNCFI field.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, the FWD CONDITION field on the CFWFD form must have a value of "BOTH", and the associated LINE form must have a "Y" in the SHARE field.

If "N" is entered, the MDNL FWD and MDNL RCF fields must have the same value.

For 5E9(1) and later, when CFWLPA form(s) exist for the office with MDNL ENHANCED set to "Y"', SFID 37 on the SFSYS form must have ACT set to "Y"'.

2.16 MDNL FWD

Description: For lines that have the MDNL feature, this field indicates if calls to the Master TN and/or Dependent TNs will be forwarded.

Software Release: 5E6 and later
Required Field.
Default: "ALL"
Valid Entries:

Valid MDNL FWD Entries

Entry	Definition
ALL	The Master TN and its Dependent TNs will be forwarded.
DEPEND	The Dependent TNs will be forwarded only.
MASTER	The Master TN will be forwarded only.

Data Rules:

If "DEPEND" is entered, the MDNL ENHANCED field must have a value of "Y".

If "MASTER" is entered and the MDNL ENHANCED field has a value of "N", the FWD CONDITION field must have a value of "BOTH".

2.17 MDNL RCF

Description: For lines that have the MDNL feature, this field indicates if calls to the Master TN and/or Dependent TNs will be forwarded when activated via a Remote Access feature, e.g. RACF, ACF.

Software Release: 5E6 and later
Required Field.
Default: ALL
Valid Entries:

Valid MDNL RCF Entries

Entry	Definition
ALL	The Master TN and its Dependent TNs will be forwarded.
DEPEND	The Dependent TNs will be forwarded only.
MASTER	The Master TN will be forwarded only.

Data Rules:

Copyright © 2003 Lucent Technologies

If "DEPEND" is entered, the MDNL ENHANCED field must have a value of "Y".

2.18 CFDA AFTER CW

Description: Will the line have unanswered call waiting calls forwarded to a remote DN when there is a CFDA feature assigned to the line?

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

If the Secured Feature ID is not set to "S" on the SFSYS form (5713 Record) the value of CFDA AFTER CW must be either blank or set to "Y" for unshared analog lines that have a CFDA feature FWD CONDITION equal to "IDLE".

If CFDA AFTER CW is set to "Y", the TN must be assigned to a CFDA feature that is defined on the CFWFD form (5614-1/2 Records) with a FWD CONDITION of "IDLE".

If CFDA AFTER CW is set to "Y", the line cannot be defined on a DSLUSR form (5908 Record).

If CFDA AFTER CW is set to "Y", the TN cannot be defined on the LINE form (5109-1/2/3 Records) with SHARED equal to "Y".

When CFDA AFTER CW is not entered, it is set to "Y" for unshared analog lines with CFDA features and "N" for all other lines.

For 5E9(1) and later, the CFDA AFTER CW field on the CFWLPA form is used by the Call Forwarding Don't Answer after Call Waiting feature. It is a secured feature and must be purchased by the office before the default values may be changed. If an SFSYS form does not exist with SFID 62 ACT set to "Y"', the CFDA AFTER CW field must be set to either blank or "Y"' if the TN is defined on the LINE form with the SHARED field equal to "N"' and the feature is defined on the CFWFD form with the FWD CONDITION field set to "IDLE"'.

2.19 CFIMB

Description: Should the Call Forward Inhibit Make Busy option be activated? If CFIMB is "Y", the CFBL (Call Forwarding Busy Line) feature assigned to this line will be inhibited when the subscriber has made the line busy by activating the Make Busy Key. Incoming calls in that case will be routed to busy (or overflow) tone as determined by the OVF CFI field. If the make busy key is off, incoming calls receive the normal CFBL treatment.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A Call Forward feature may not have both the Inhibit Make Busy and Inhibit Line Busy options. If CFILB is "Y", CFIMB must be "N".

The Inhibit Make Busy option applies only to Call Forwarding Busy Line features. If CFIMB is "Y", the CFBL feature assigned to this line must be defined on a CFWFD form with FWDCOND set to "BUSY".

A CFBL-IMB feature is assigned to a line by service order and cannot be activated or deactivated by the subscriber. If CFIMB is "Y", the CFBL feature assigned to this line must be defined on a CFWFD form

Copyright © 2003 Lucent Technologies

with ACT TYPE "AUTO" and DACT TYPE "NONE".

A TN that is assigned a CFBL-IMB feature must have a make busy key. When a TN is assigned a CFBL feature (via a LINEFA, BFG, or associated CLUSTR form) and has the IMB option set to "Y", the MAKE BUSY KEY must be entered on the LINE form (5109 Record).

2.20 CFILB

Description: Should the Call Forward Inhibit Line Busy option be activated? If CFILB is "Y", the CFBL (Call Forwarding Busy Line) feature assigned to this line will be inhibited when the line is busy and the subscriber has not activated the Make Busy Key. Incoming calls in that case will be routed to busy or overflow tone, as determined by the OVF CFI field. If the make busy key is on, incoming calls receive the normal CFBL treatment.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A Call Forward feature may not have both the Inhibit Make Busy and Inhibit Line Busy options. If CFIMB is "Y", CFILB must be "N".

The Inhibit Line Busy option applies only to Call Forwarding Busy Line features. If CFILB is "Y", the CFBL feature assigned to this line must be defined on a CFWFD form with FWDCOND set to "BUSY".

A CFBL-ILB feature is assigned to a line by service order and cannot be activated or deactivated by the subscriber. If CFILB is "Y", the CFBL feature assigned to this line must be defined on a CFWFD form with ACT TYPE "AUTO" and DACT TYPE "NONE".

A TN that is assigned a CFBL-ILB feature must have a make busy key. When a TN is assigned a CFBL feature (via a LINEFA, BFG, or associated CLUSTR form) and has the ILB option set to "Y", the MAKE BUSY KEY must be entered on the LINE form (5109 Record).

2.21 OVF CFI

Description: Should overflow (reorder) tone be returned to a caller when the call is not forwarded because of CFIMB or CFILB? If this field is "N", the caller will receive a busy tone.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This option only applies to Call Forward Busy Line features having the Inhibit Make Busy or the Inhibit Line Busy option. If OVF CFI is "Y", either CFIMB or CFILB must be "Y".

2.22 FCCS OPT

Description: Is the Forwarded Call - Call Screening feature option active on this line?

Software Release: 5E14 and later
Required field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When FCCS OPT is "Y", the following must be true:

On the CFWFD form:

- ACT TYPE must be "AUTO" or "CODE"
- DACT TYPE must be "CODE" or "NONE"
- CHANGE FWD TO DN must be "N"
- FWD CONDITION must be "BUSY"or "IDLE"

On the LINE form:

- SHARED must "N"
- SERHLN must be unknown
- ASSOC OE must be unknown
- this TN must be defined

On the LCC form, LINE CLASS CODE and TERMINATING TREATMENT must both be "INDIV".

This TN must not be defined on the MLHLN form.

For 5E16 and later:

When FCCS OPT is "Y" and on the CFWFD form (5614-1 Record) the ACT TYPE or DACT TYPE field is set to "CODE", the ACT field for SFID 592 on the SFSYS form (5713-1 Record) must be set to "Y".

When FCCS OPT is "Y" and on the CFWFD form (5614-1 Record) the ACT TYPE field is set to "AUTO" or the DACT TYPE is set to "NONE", the ACT field for SFID 526 on the SFSYS form must be set to "Y".

When FCCS OPT is "Y" and on the CFWFD form (5614-1 Record), FWD CONDITION must be set to "BUSY" or "IDLE", ACT TYPE must be set to "AUTO" or "CODE", DACT TYPE must be set to "CODE" or "NONE", and CHANGE FWD TO DN must be set "N".

On the SFSYS form the ACT field must be "Y" for SFID 526.

2.23 CFDARC

Description: Activate the Call Forward Don't Answer Ring Control option? This field specifies whether or not the Call Forwarding Don't Answer Ring Control is active for this line.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When CFDARC is "Y":

- the ACT field for SFID 335 on the SFSYS form (5713-1 Record) must be "Y".
- the corresponding CFWFD form (5614-1/2 Record) must have FWD CONDITION set to "DIDL",

Copyright © 2003 Lucent Technologies

"IDLE", "PIDL", or "PRCI", and CHANGE DON'T ANSWER TIMING set to "Y".

2.24 CFV ALERT

Description: This field indicates whether the Call Forwarding Variable Alert option is active for this line.

Software Release: 5E12 and later
Valid Entries: Y, N

Data Rules:

When CFV ALERT is set to "Y", the ACT field for SFID 341 on the SFSYS form (5713-1 Record) must also be set to "Y".

When CFV ALERT is set to "Y", FWD CONDITION on the CFWFD form (5614-1/2 Record) must be set to "BOTH".

2.25 INH CF MASTER

Description: Is Call Forwarding inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CF MASTER must be "N".

If INH CF MASTER is "Y", then INH CF DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.26 INH CF DEPEND

Description: Is Call Forwarding inhibited for the dependent TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CF DEPEND must be "N".

If INH CF DEPEND is "Y", then INH CF MASTER must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.27 INHIBIT MDNL CF

Description: This field is used in determining whether or not Call Forwarding is inhibited for the master telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Copyright © 2003 Lucent Technologies

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CF must be "NONE".

SEC. 15C: 5614-4 RECORD
CALL FORWARDING LINE (MLHG/TERM) PARAMETER FORM - CFWMPA

1. GENERAL

The 5614-4 Record is available with the 5E2 and later Software Releases. It is used to define specific parameters assigned to every Multi-Line Hunt Line assigned a specific constructed Call Forwarding feature. It is required only if the default parameters assigned on the CFWFD form are inappropriate.

1.1 CFW Assignment Restrictions

The following are restrictions for Call Forwarding features assigned to Multi-Line Hunt lines:

- Only one Call Forwarding Busy (FWD CONDITION equals "BUSY" on the CFWFD form) and one Call Forwarding Variable (FWD CONDITION equals "BOTH" on the CFWFD form) can be assigned to Multi-Line Hunt lines.
- If a Call Forwarding Busy is assigned to a Multi-Line Hunt line, then CF BUSY on the associated MLHGFD form must be "Y".
- If a Call Forwarding Variable feature is assigned to Multi-Line Hunt lines, then CF VARIABLE on the associated MLHGFD form must be "Y".
- If a Call Forwarding feature with forward to Directory Number specified on either CFWFD form or CFWMPA form is assigned to Multi-Line Hunt lines, and the associated HUNT TYPE on the MLHGFD form does not equal "MUPH", then forward to Directory Number must not be the same as LISTED TN on the associated MLHG form.
- If a Call Forwarding feature with forward to Directory Number specified on either CFWFD form or CFWMPA form is assigned to Multi-Line Hunt Lines, and the associated Hunt Type on MLHGFD form equals MUPH, then forward to Directory Number must not be the same as SUBTN(i), where i ranges from 1 to 6 and SUBTN(i) is specified on the associated MLHG form.

1.2 Recent Change View

The corresponding Recent Change View for this form is 3.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *MLHG

Description: Enter a four digit Multi-Line Hunt Group Number.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 *TERM

Description: Enter the Multi-Line Hunt Member Number.

Copyright © 2003 Lucent Technologies

Valid Entries: 4-digits

Data Rules:

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be one of the following:

CLASS OF SERVICE	
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network (ISDN) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
SATSTLN	Stand-Alone Test Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Software Release: 5E3 and later. Line to a PBX.

2.4 *FEATURE

Description: Enter the Feature Name.
Valid Entries: 1 - 8 characters

2.5 FORWARD TO DN

Description: Enter the Forward To Directory Number.
Valid Entries: up to 32 characters (0 - 9, *, and/or #)

Data Rules:

If FORWARD TO DN is specified, then ACT TYPE on the CFWFD form must equal "AUTO", "CODE", or "KEY".

For 5E3 and later, the FORWARD TO DN is required when the FWD CONDITION on the CFWFD form (5614-1 Record) is "BUSY", "IDLE", or "BOTH".

The FORWARD TO DN will be translated during call processing using the originator's dialing plan(s). Therefore, if the originator has an Individualized Dialing feature with an IDP group, the digits entered must be successful using the IDPDCA form entries. For example, if the originator normally dials an intercom digit string of four digits to call a phone, then the four digits should be entered here to forward to the same phone.

For 5E5 and later, when CFPF ALW is "Y" on the associated CFWFD form, this field can contain the following codes in many different dialing sequences:

- PFA access code
- Account Code use code
- Authorization Code use code
- ARS use code
- Directory Number

The account and authorization codes are entered in the ACCT CODE and ATH CODE fields.

2.6 ACCT CODE

Copyright © 2003 Lucent Technologies

Description: Enter the Account Code used by Call Forwarding Over Private Facility for the invocation of CFPF.

Software Release: 5E5 and later
Valid Entries: up to 15 characters (0 - 9, *, and/or #)

Data Rules:

When ACCT CODE is entered, then CFPF ALW must be "Y" on the associated CFWFD form and FORWARD TO DN must contain an Account Use code along with the DN and other use codes.

When this field is entered, an associated Account Code feature defined on the ACCTFD form (5623-1 Record) must be assigned on the associated LINEFA, MLHLNFA, BFG, or CLUSTR form with the feature active to allow calls to be forwarded with this account code.

2.7 ATH CODE

Description: This field allows the Authorization Code used by Call Forwarding Over Private Facilities to be defaulted for CFPF invocations.

Software Release: 5E5 and later
Valid Entries:
- For 5E5 - 5E7: 1 - 15 characters (0 - 9, *, #)
- For 5E8 and later: 1 - 15 digits

Data Rules:

When ATH CODE is entered, then CFPF ALW must be "Y" on the associated CFWFD form and FORWARD TO DN must contain an Authorization Use code along with the DN and other use codes.

When this field is entered, an associated Authorization feature defined on the ATHFD form (5619-1 Record) must be assigned to the associated LINEFA, MLHLNFA, BFG, or CLUSTR form with the feature active to allow calls to be forwarded with this authorization code.

2.8 DON'T ANSWER TIMING

Description: For the Call Forward Don't Answer feature, enter the time delay (in seconds) before a call will be forwarded.
Default: 30
Valid Entries: 0 - 60

Data Rules:

If this field is greater than 0, then FWD CONDITION on the CFWFD form must be equal to "IDLE", "PRCI" or "PIDL".

For 5E5 and later, this field must have a value of 4 to 60 when the associated CFWFD form has a FWD CONDITION with a value of "IDLE" or "PIDL" to allow the terminal to be rung at least once before it is considered idle and the call is Forwarded. During a retrofit to 5E5, if this field has a value of 0 to 3 and the above conditions are met, this field will be evolved to the value of 4.

2.9 SIMUL INTEROFF FWD CALLS

Description: Enter maximum number of simultaneously active interoffice calls allowed between base station and forward to DN.
Default: 1
Valid Entries: 1 - 99

Copyright © 2003 Lucent Technologies

Data Rules:

If the forward to directory number resides in a MLHG, it is recommended that the valid entries are from 1 to the maximum number of lines within the MLHG. Entering the value of the maximum size of the MLHG allows efficient use of all terminals within the forward to MLHG. If the base TN is terminal 1 in a MLHG, the entry can be defined as the size of the base MLHG to ensure that the number of simultaneously forwarded calls is equivalent to the number of calls that could be completed to the MLHG without the call forwarding feature being present.

2.10 SIMUL INTRAOFF FWD CALLS

Description: Enter maximum number of simultaneously active intraoffice calls allowed between the base station and forward to DN.
Default: 99
Valid Entries: 1 - 99

2.11 SEQ ACT FWD LEGS

Description: Enter maximum number of Call Forwarding legs allowed to be sequentially forwarded. The SEQ ACT FWD LEGS limit is exceeded if any individual line in a Call Forwarding chain has its limit exceeded.
Default: 5
Valid Entries: 1 - 32

2.12 BASE STA RING IND

Description: Should the Base Station Ringing Indicator be allowed? The Base Station Ringing Indicator is a normal ring of 0.5 seconds duration which is applied to an idle line indicating that an incoming call to that line is being forwarded.
Default: Y
Valid Entries: Y, N

2.13 ANNC RTI

Description: This field is not used. For 5E7 and later, it was removed from the form.

Software Release: 5E5 and 5E6 only

2.14 CFDA AFTER CW

Description: Will the line have unanswered call waiting calls forwarded to a remote DN when there is a CFDA feature assigned to the line?

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

If the Secured Feature ID is not set to "S" on the SFSYS form (5713 Record) the value of the CFDA AFTER CW must be either blank or set to "Y" for unshared analog MLHG terminals.

If CFDA AFTER CW is set to "Y", the MLHG/TERM must be assigned a CFDA feature that is defined on the CFWFD form with a FWD CONDITION of "IDLE".

If CFDA AFTER CW is set to "Y", the MLHG/TERM cannot be defined on a DSLUSR form (5908 Record).

When CFDA AFTER CW is not entered, it is set to "Y" for unshared analog lines with CFDA features and

Copyright © 2003 Lucent Technologies

"N" for all other lines.

2.15 CFIMB

Description: Should the Call Forward Inhibit Make Busy option be activated? If CFIMB is "Y", the CFBL (Call Forwarding Busy Line) feature assigned to this MLHG will be inhibited when the subscriber has made the line busy by activating the group Make Busy Key or Feature Button. Incoming calls in that case will be routed to busy (or overflow) tone as determined by the OVF CFI field. When the make busy key or feature button is not activated, incoming calls receive the normal CFBL treatment.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A Call Forward feature may not have both the Inhibit Make Busy and Inhibit Line Busy options. If CFILB is "Y", CFIMB must be "N".

The Inhibit Make Busy option applies only to Call Forwarding Busy Line features. If CFIMB is "Y", the FEATURE on this form must be defined on a CFWFD form with FWDCOND set to "BUSY".

A CFBL-IMB feature is assigned to a MLHG by service order and cannot be activated or deactivated by the subscriber. If CFIMB is "Y", the FEATURE on this form must be defined on a CFWFD form with ACT TYPE "AUTO" and DACT TYPE "NONE".

An MLHG that is assigned a CFBL-IMB feature must have a group make busy key or feature button. When an MLHG/TERM is assigned a CFBL feature (via an MLHLNFA, BFG, or associated CLUSTR form) and has the IMB option set to "Y", it must also be assigned a group make busy key/button in one of two ways:

- the GROUP MAKE BUSY KEY on the corresponding MLHG form (5110 Record) may be entered; or
- if Member 1 of the MLHG is defined on a DSLUSR form (5908 Record), there may be a corresponding entry on a CFGGRP form (5964 Record) with ACTION set to "BYGP".

A CFBL-IMB feature may be assigned to regular, circular, and UCD Multi-Line Hunt Groups. The MLHG FEATURE assigned on the MLHG form must be defined on an MLHGFD form (5604 Record) with HUNT TYPE equal to "REG", "HTC", or "UCD".

2.16 CFILB

Description: Should the Call Forward Inhibit Line Busy option be activated? If CFILB is "Y", the CFBL (Call Forwarding Busy Line) feature assigned to this MLHG will be inhibited when the MLHG is busy and the subscriber has NOT activated the group Make Busy Key or Feature Button. Incoming calls in that case will be routed to busy (or overflow) tone, as determined by the OVF CFI field, when the MLHG is busy. If the make busy key or feature button is on, incoming calls receive the normal CFBL treatment.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

A Call Forward feature may not have both the Inhibit Make Busy and Inhibit Line Busy options. If CFIMB is

Copyright © 2003 Lucent Technologies

"Y", CFILB must be "N".

The Inhibit Line Busy option applies only to Call Forwarding Busy Line features. If CFILB is "Y", the FEATURE on this form must be defined on a CFWFD form with FWDCOND set to "BUSY".

A CFBL-ILB feature is assigned to a MLHG by service order and cannot be activated or deactivated by the subscriber. If CFILB is "Y", the FEATURE on this form must be defined on a CFWFD form with ACT TYPE "AUTO" and DACT TYPE "NONE".

An MLHG that is assigned a CFBL-ILB feature must have a group make busy key or feature button. When an MLHG/TERM is assigned a CFBL feature (via an MLHLNFA, BFG, or associated CLUSTR form) and has the IMB option set to "Y", it must also be assigned a group make busy key/button in one of two ways:

- the GROUP MAKE BUSY KEY on the corresponding MLHG form may be entered; or
- if Member 1 of the MLHG is defined on a DSLUSR form, there may be a corresponding entry on a CFGGRP form with ACTION set to "BYGP".

A CFBL-ILB feature may be assigned to regular, circular, and UCD Multi-Line Hunt Groups. The MLHG FEATURE assigned on the MLHG form must be defined on an MLHGFD form with HUNT TYPE equal to "REG", "HTC", or "UCD".

2.17 OVF CFI

Description: Should overflow (reorder) tone be returned to a caller when the call is not forwarded because of CFIMB or CFILB? If this field is "N", the caller will receive a busy tone.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This option only applies to Call Forward Busy Line features having the Inhibit Make Busy or the Inhibit Line Busy option. If OVF CFI is "Y", either CFIMB or CFILB must be "Y".

2.18 FCCS OPT

Description: This field is used to determine whether or not THE FCCS (Forwarded Call - Call Screening) feature option be used. This is a No Change field.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

2.19 CFDARC

Description: Activate the Call Forward Don't Answer Ring Control option? This field specifies whether or not the Call Forwarding Don't Answer Ring Control is active for this line.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

When CFDARC is "Y":

- the ACT field for SFID 335 on the SFSYS form (5713-1 Record) must be set to "Y".
- the corresponding CFWFD form (5614-1/2 Record) must have FWD CONDITION set to "DIDL", "IDLE", "PIDL", or "PRCI", and CHANGE DON'T ANSWER TIMING set to "Y".

2.20 CFV ALERT

Description: This field indicates whether the Call Forwarding Variable Alert option is active for this line.

Software Release: 5E12 and later
Valid Entries: Y, N

Data Rules:

When CFV ALERT is set to "Y", the ACT field for SFID 341 on the SFSYS form (5713-1 Record) must also be set to "Y".

When CFV ALERT is set to "Y", FWD CONDITION on the CFWFD form (5614-1/2 Record) must be set to "BOTH".

2.21 INH CF MASTER

Description: Is Call Forwarding inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CF MASTER must be "N".

If INH CF MASTER is "Y", then INH CF DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.22 INH CF DEPEND

Description: Is Call Forwarding inhibited for the depend TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CF DEPEND must be "N".

If INH CF MASTER is "Y", then INH CF DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.23 INHIBIT MDNL CF

Description: This field is used in determining whether or not Call Forwarding is inhibited for the master

Copyright © 2003 Lucent Technologies

telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CF must be "NONE".

SEC. 16: MEASUREMENTS PARAMETER DEFINITION FORM

Copyright © 2003 Lucent Technologies

SEC. 16A: 5615 RECORD
MEASUREMENTS PARAMETER DEFINITION RECORD - MEASPDF

1. GENERAL

The 5615 Record is available with the 5E2 and later Software Releases. It is used to define measurements for various groups of features. With this capability the customer will be able to determine the impact of a given feature environment on the office with a great deal of flexibility. The features that the customer can control measurements for are:

- Constructed BRCS Features
- Individualized Dialing Plan Groups
- Terminal Groups
- Multi-Line Hunt Groups
- Attendant Multi-Line Hunt Groups
- Simulated Facility Groups (PFA)

Measurement groups must correspond to group numbers or feature names defined on the proper feature definition or parameter forms. The following list of modular features and their forms correspond to features that can be measured. If a measurement type is selected for measurement it must have been defined on one of these forms:

A. CONFT (Constructed Features)

Following is a list of feature definition forms for the constructed (including preconstructed) features which can be measured. These are the only constructed features which can be measured as such. The MLHG, Terminal Group and ARS constructed features cannot be measured as constructed feature members.

1. CFWFD - Call Forwarding

   Feature Definition form

   (5614-1/2 Record)

2. CWTFD - Call Waiting

   Feature Definition form

   (5603-1 Record)

3. DRFD - Distinctive Ringing

   Feature Definition form

   (5606-1 Record)

4. IDFD - Individualized Dialing

   Feature Definition form

   (5601 Record)

Copyright © 2003 Lucent Technologies

5. MWFD - Multiway Calling

   Feature Definition form

   (5602-1/2 Record)

6. PUOFD - Call Pick-up Originating

   Feature Definition form

   (5605-1a/b Record)

7. PUTFD - Call Pick-up Terminating

   Feature Definition form

   (5605-2a/b Record)

B. IDP Group Names must be defined on an IDFD form.

C. Terminal Groups must be defined as a GROUP ID with values of 1 - 65535 on either a TGSRFD form (5607-1/2 Record), a TGSRLPA form (5607-3 Record), a TGSRMPA form (5607-4 Record) or a TGSRTPA form (5607-5 Record).

D. Multi-Line Hunt Groups must be defined on an MLHG form (5110-1 Record).

E. Attendant Multi-Line Hunt Groups are MLHG Numbers defined on an MLHG form where the associated MLHG Members are assigned on MLHLN forms (5111-1 Record) with an LCC and RAX combination that is defined on an LCC form (5306 Record) with a CLASS OF SERVICE equal to "ATND".

1.1 Recent Change View

The corresponding Recent Change view for this form is 13.3.

2. FORM AND RECORD ENTRIES

2.1 * MEASUREMENT TYPE

Description: Enter the type of measurement.

Valid MEASUREMENT TYPE Entries

Entry	Definition
ACSR	Software Release: 5E5 and later. Automatic Customer Station Rearrangement Group, which is defined on an ACSRGP form (5959-2 Record). A maximum of 25 MEASPDF forms may be entered with MEASUREMENT TYPE set to "ACSR".
ATTGP	Multi-Line Hunt Groups defined on an MLHG form whoseassociated Members or Terminal Numbers are assigned a Classof Service of "ATND" or "ISATND"for Attendant Service. A maximum of 200 measurement-type entries of "ATTGP" are allowed.
CONFT	Preconstructed or switch constructed Feature Names. A maximum of 100 measurement-type entries of "CONFT" are allowed.
IDGP	Individualized Dialing Plan Group Name defined on an IDPGP and associated Individualized Dialing Feature Definition forms. A maximum of 150 measurement-type entries of "IDGP" are allowed.
LNQAN	Line Queue Announcements defined on a QUGPA form with matching GROUP NUMBER and a GROUP TYPE of "LINE". A maximum of 100 measurement-type entries of "LNQAN" are allowed.
LNQU	Line Queue defined on a QUGPA form (5617-3/4 Record) with matching GROUP NUMBER and a GROUP TYPE of "LINE". A maximum of 100 measurement-type entries of "LNQU" are allowed.
MLHGP	Multi-Line Hunt Group Numbers defined on an MLHG form. A maximum of 200 measurement-type

Copyright © 2003 Lucent Technologies

	entries of "MLHGP" are allowed.
PFAGP	Simulated Facility Group Number defined on a PFASFG form (5609-3 Record) associated with the Private Facility capability. A maximum of 200 measurement-type entries of "PFAGP" are allowed.
PPGP	Precedence and Preemption Group which is defined as a special Terminal Group on a PPSCRN form (5618-2 Record) where all associated members are also assigned a PP feature. Up to 10 PP Groups may be specified.
SFQAN	Software Release: 5E3 and later. SFG Queue Announcements defined on a QUGPA form with matching GROUP NUMBER and a GROUP TYPE of "SFG". A maximum of 75 measurement-type entries of "SFQAN" are allowed.
SFQU	Software Release: 5E3 and later. SFG Queue defined on a QUGPA form with matching GROUP NUMBER and a GROUP TYPE of "SFG". A maximum of 75 measurement-type entries of "SFQU" are allowed.
TERMGP	Terminal Group Numbers, defined as a GROUP ID on the Terminal Group Station Restriction forms. A maximum of 200 measurement-type entries of "TERMGP" are allowed.
TKQAN	Software Release: 5E3 and later. Trunk Queue Announcements defined on a QUGPA form with matching GROUP NUMBER and a GROUP TYPE of "TRK". A maximum of 75 measurement-type entries of "TKQAN" are allowed.
TKQU	Software Release: 5E3 and later. Trunk Queue defined on a QUGPA form with matching GROUP NUMBER and a GROUP TYPE of "TRK". A maximum of 75 measurement-type entries of "TKQU" are allowed.

Data Rules:

For every MEASUREMENT TYPE entered, either a NAME or a GROUP NUMBER must be specified. Both of these fields cannot be entered for a single MEASUREMENT TYPE.

If MEASUREMENT TYPE is "ATTGP", "PFAGP", "MLHGP", "TERMGP", "PPGP", "LNQU", "LNQAN", "TKQU", "TKQAN", "SFQU" or "SFQAN", then a GROUP NUMBER must be specified.

If MEASUREMENT TYPE is "ACSR", "CONFT" or "IDGP", then NAME must be specified with an ACSR Group Name, a BRCS Feature Name or an IDP Group Name.

For 5E7 and later if MEASUREMENT TYPE is "LNQU" OR "LNQAN", at least one MLHG member must be assigned to the MLHG represented by the GROUP NUMBER.

2.2 (*) NAME

Description: Optional key field which is dependent on the value of the MEASUREMENT TYPE field as follows.

MEASUREMENT TYPE	NAME
ACSR	Software Release: 5E5 and later. Enter the ACSR GRP defined on an ACSRGP form.
CONFT	Enter valid BRCS Feature Names from any of the following Feature Definition forms: CFWFD, CWTFD, DRFD, IDFD, MWFD, PUOFD, PUTFD.
IDGP	Enter the IDP GROUP NAME defined on an IDPGP form (5601-4 Record).

2.3 (*) GROUP NUMBER

Description: Optional key field which is dependent on the value of the MEASUREMENT TYPE field as follows.

MEASUREMENT TYPE	GROUP NUMBER
MLHGP, ATTGP, LNQU, or LNQAN	Enter valid MLHG Number in the range of 1 - 1 for 5E14 and earlier or 1 - 8191 for 5E15 and later.
PFAGP, SFQU, or SFQAN	Enter a valid SFG Number in the range 1 - 2000.
TERMGP or PPGP	Enter a valid Terminal Group ID in the range 1 - 65535.
TKQU or TKQAN	Enter a valid Trunk Group Number in the range 1 - 2000.

SEC. 17: AUTOMATIC CALL-BACK FEATURE FORMS

Copyright © 2003 Lucent Technologies

SEC. 17A: 5616-1 RECORD
AUTOMATIC CALL-BACK FEATURE DEFINITION FORM - ACBFD

1. GENERAL

The 5616-1 Record is available with the 5E2 and later Software Releases. It is used to define various combinations of Automatic Call-Back options for assignment to lines and/or trunks. Each combination is given a feature name of one to eight characters which is used to assign the constructed (defined) feature to lines. Certain ACB features are pre-defined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/) and the slash may not be used as the first character is any feature other than preconstructed features. A list of the preconstructed ACB features is contained in Figure 1 .

The Automatic Call-Back feature enables a calling party encountering a busy station to dial an activation code and be automatically called back when the called station becomes idle.

The ACB features can be assigned only to lines that have a Class of Service of "INDIV", "PBX" or "4WINDIV" on the LCC form (5306 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 12.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name.

2.2 * FEATURE

Description: Enter the automatic call-back feature name. There are no restrictions on the valid characters except that feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed, or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

2.4 INTRAGROUP CALLBACK ONLY

Description: Is camp-on allowed only within the originator's Terminal Group? Enter "N" to indicate that a line assigned this feature can camp-on a line outside of the originator's terminal group (but within the 5ESS office).
Valid Entries: Y, N

Data Rules:

If this field is "Y", then this ACB Feature, which is assigned on the associated feature form (LINEFA, MLHLNFA or CLUSTR), must also have a TGSR (Terminal Group Station Restriction) feature defined on the TGSRFD form.

Copyright © 2003 Lucent Technologies

2.5 FLAT RATE

Description: Is billing at a flat rate? "Y" is the default and only value allowed.
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered, neither a camp-on charge nor a connection charge is allowed. If "N" is entered, either a camp-on or a connection charge, or both must be "Y".

2.6 CAMP-ON CHARGE

Description: Is the customer billed for each use of Automatic Call-Back, i.e. each time the customer camps on to another line? Enter "N" if not. "N" is the default and only allowed entry.
Default: N
Valid Entries: Y, N

Data Rules:

This item must be "N" if FLAT RATE is "Y".

2.7 CONNECTION CHARGE

Description: Is the customer billed for each connection to a camped-on line? Enter "N" if not. "N" is the default and only allowed entry.
Default: N
Valid Entries: Y, N

Data Rules:

This item must be "N" if FLAT RATE is "Y".

DEFAULT PARAMETERS

The default parameters (fields Section 2.8 - Section 2.9) are automatically assigned to lines when the lines are assigned the Automatic Call-Back feature unless an ACBLPA form is entered with the line to specify a different set of parameters.

2.8 RINGING PATTERN

Description: Enter the pattern of ringing to be given to the originator when the camped-on line becomes idle.
Default: C
Valid Entries:

Valid RINGING PATTERN Entries

Entry	Definition
A	For a ringing pattern of 2 seconds on, 4 seconds off, repeated for the duration of the ringing interval.
B	For a ringing pattern of 0.8 seconds on, 0.4 seconds off, repeated for the duration of the ringing interval.
C	For a ringing pattern of 0.4 seconds on, 0.2 seconds off, repeated for the duration of the ringing interval.
D	For a ringing pattern of 1 second on, 1 second off, 1 second on, 3 seconds off, repeated for the duration of the ringing interval.
E	For a routine ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
F	For a priority ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
P	For a precedence ringing pattern of 1640 milliseconds on, 360 milliseconds off, repeated for the duration of the ringing interval.

Copyright © 2003 Lucent Technologies

2.9 RINGING INTERVAL

Description: Enter the interval (in seconds) of ringing to be provided to the originator when the camped-on line becomes idle.
Default: 24
Valid Entries: 24, 30, 36, 42 and 48 (seconds)

SEC. 17B: 5616-2 RECORD AUTOMATIC CALL-BACK LINE (TN) PARAMETERS FORM - ACBLPA

1. GENERAL

The 5616-2 Record is available with 5E2 and later Software Releases. It is used when assigning ACB features to non-Multi-Line Hunt lines when the default parameters associated with the ACB feature (defined on an ACBFD form) are inappropriate or unspecified. Do not enter this record if the ACBFD form (5616-1 Record) default parameters are acceptable.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the line.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The Telephone Number entered here must be defined on a LINE form (5109 Record).

The TN entered must also be entered in the TN field on a LINEFA form (5112 Record).

The associated CLASS OF SERVICE on an LCC form (5306 Record) must be one of the following.

Class of Service	
Entry	**Definition**
INDIV	Individual Line
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Line to a PBX.

For 5E12 and later, TN/FEATURE combinations on different ACBLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ACBLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the ACB feature for which the parameters are to be assigned. The name entered here must be that of a non-"wild card" ACB feature defined on an ACBFD form.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 8 characters

Data Rules:

The feature entered must appear on a LINEFA form or a CLUSTR form (5600 Record) or a BFG form (5625 Record) which is associated with the TN on this form.

2.4 RINGING PATTERN

Description: Enter the pattern of ringing to be given to the originator when the camped-on line becomes idle.

Required Field.
Default: C
Valid Entries:

Valid RINGING PATTERN Entries

Entry	Definition
A	For a ringing pattern of 2 seconds on, 4 seconds off, repeated for the duration of the ringing interval.
B	For a ringing pattern of 0.8 seconds on, 0.4 seconds off, repeated for the duration of the ringing interval.
C	For a ringing pattern of 0.4 seconds on, 0.2 seconds off, repeated for the duration of the ringing interval.
D	For a ringing pattern of 1 second on, 1 second off, 1 second on, 3 seconds off, repeated for the duration of the ringing interval.
E	For a routine ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a CLASS OF SERVICE of "4WINDIV" on an LCC form.
F	For a priority ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a CLASS OF SERVICE of "4WINDIV" on an LCC form.
P	For a precedence ringing pattern of 1640 milliseconds on, 360 milliseconds off, repeated for the duration of the ringing interval.

2.5 RINGING INTERVAL

Description: Enter the interval (in seconds) of ringing to be provided to the originator when the camped-on line becomes idle.

Required Field.

SEC. 17C: 5616-3 RECORD
AUTOMATIC CALL-BACK LINE (MLHG/TERM)
PARAMETER FORM - ACBMPA

1. GENERAL

The 5616-3 Record is available with the 5E2 and later Software Releases. It is used when assigning ACB feature parameters to Multi-Line Hunt lines if the default parameters associated with the ACB feature (on the ACBFD Form) are inappropriate or unspecified. Do not enter this record if the ACBFD default parameters are acceptable.

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group member number of the line.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
INDIV	Individual Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Line to a PBX.

2.4 * FEATURE

Description: Enter the name of the ACB feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ACB feature defined on the ACBFD Form. The name of the ACB "wild-card" feature may not be used here.

Copyright © 2003 Lucent Technologies

2.5 RINGING PATTERN

Description: Enter the pattern of ringing to be given to the originator when the camped-on line becomes idle.
Default: C
Valid Entries:

Valid RINGING PATTERN Entries

Entry	Definition
A	For a ringing pattern of 2 seconds on, 4 seconds off, repeated for the duration of the ringing interval.
B	For a ringing pattern of 0.8 seconds on, 0.4 seconds off, repeated for the duration of the ringing interval.
C	For a ringing pattern of 0.4 seconds on, 0.2 seconds off, repeated for the duration of the ringing interval.
D	For a ringing pattern of 1 second on, 1 second off, 1 second on, 3 seconds off, repeated for the duration of the ringing interval.
E	For a routine ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
F	For a priority ringing pattern associated with the Customer Premise Equipment. Valid with DSN (Defense Switched Network) Offices with a Class of Service of "4WINDIV" on the LCC form.
P	For a precedence ringing pattern of 1640 milliseconds on, 360 milliseconds off, repeated for the duration of the ringing interval.

2.6 RINGING INTERVAL

Description: Enter the interval (in seconds) of ringing to be provided to the originator when the camped-on line becomes idle.
Default: 24
Valid Entries: 24, 30, 36, 42 and 48 (seconds)

1. GENERAL

The 5617-1a/b/c Records are available with 5E2 and later Software Releases to define Modular Queuing features.

Certain Modular Queuing features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. The preconstructed Modular Queuing features are shown beginning with Figure 1.

1.1 MLHG Queuing Features

Modular Queuing provides queuing for calls attempting to terminate to the listed Directory Number of an MLHG (Multi-Line Hunt Group) when all of the terminals of the MLHG are busy.

When queuing is desired for a Multi-Line Hunt Group, the Modular Queuing Feature is assigned on the MLHG form (5110-1 Record) as the QUEUING FEATURE. Queuing is allowed for MLHGs that have a circlular or uniform call distribution hunt type specified by the MLHG FEATURE and defined on the MLHGFD form (5604 Record).

Call Waiting Lamps may be associated with this feature to give a visual indication at the customer premise of the MLHG that at least one queued call has been waiting on queue for the specified threshold.

If the MLHG which is assigned a queuing feature is also assigned an OVERFLOW PEG COUNT REG, the message register will peg when calls terminating to the group are given busy treatment because the queue was full.

1.2 Trunk Group and SFG Queuing Features

For 5E3 and later, in addition to queuing for MLHGs, Modular Queuing may be defined to provide queuing for outgoing private facilities, either a physical trunk group or an SFG (Simulated Facility Group). Queuing may be either Off-Hook or Ringback.

Off-Hook Queuing provides that when queuing is invoked, the originating port must remain off-hook while waiting for the queued-for facility.

Ringback Queuing provides that when the busy facility may be queued for, the originator of the call will be given a confirmation tone indicating that if the customer hangs up within 6 seconds, the call will be put on queue. If the originator remains off-hook longer than 6 seconds, the call will not be queued. If the originator has invoked queuing by going on-hook, when the queued-for facility becomes available, the originating station is rung with a distinctive pattern and upon answer, the original call is completed. Only non-priority lines may use Ringback Queuing.

Dial codes may be provided in association with Ringback Queuing so that the originator may verify that the call has been queued or, if the call has been queued, to cancel queuing. These codes, specified with an ACTION of "RBQVFY" or "RBQCAN", respectively, may be defined on either the IDPDCA form (5601-1/2 Records) or on the PDIT form (5300-2 Record).

The queue may be divided into two sections, routine and priority, each with its own delay treatment and size. The priority section, if provided, must be off-hook while the routine section may be either off-hook or ringback.

Queuing for outgoing private facilities is associated with either PFA (Private Facility Access) or ARS

Copyright © 2003 Lucent Technologies

(Automatic Route Selection) BRCS feature capabilities.

When queuing is desired for a facility associated with PFA, the PFAGPA form (5609-5 Record) must be specified with QUEUE REQUEST equal to "Y". The facility designated by the ROUTE INDEX and ROUTE TYPE must have a Modular Queuing Feature assigned. If the facility is a trunk group, the feature is assigned on the TKGRP form (5202 Record) as QUEUE FEATURE. If the facility is an SFG, the feature is assigned on the PFASFG form (5609-3 Record) also as QUEUE FEATURE. Queuing will then be invoked if the facility is busy and the port which originated the PFA call has QUEUE ALLOWED equal to "Y" as its PFA parameter. Another PFA parameter, PRIORITY QUEUE, specifies whether the call should be placed in the routine section of the queue when equal to "N", or in the priority section when equal to "Y".

When queuing is desired for ARS, the facility specified for a first route in an ARS route list must have a Modular Queuing feature assigned. If the facility is a trunk group, the feature is assigned on the TKGRP form (5202 Record) as QUEUE FEATURE. If the facility is an SFG, the feature is assigned on the PFASFG form (5609-3 Record) also as QUEUE FEATURE. To enable ARS queuing, the port which originated the ARS call must have its ARS parameter, QUEUE ALLOWED, equal to "Y" and PRIORITY QUEUE is "Y" or "N". Queuing for the facility of the first route will then be invoked if all the routes in the route list are busy or if the call has failed to route because of insufficient FRL (Facility Restriction Level). Queuing caused by insufficient FRL will take place after a possible FRL upgrade through an Authorization Code feature if provided. When an ARS call has been queued for the first route and an idle port in the facility is not available before timeout (see ROU Q TIMEOUT and PRI Q TIMEOUT), a second attempt through the route list will be made if the Modular Queuing parameter of POST Q TREAT equals "ALTR". The originating ARS port may have its FRL upgraded for this second attempt through the route list if the port has an FRL equal to or greater than the value specified as THRESH FRL on the associated ARSGPA form (5608-2 Record). The port FRL will then be changed to the POST QUEUE FRL also specified on the ARSGPA form.

1.3 Switching (Queuing) Modules

Switching Modules (SMs) provide the queuing mechanism or place for the calls to queue while waiting for an idle port in the queued for group. The SM that holds the queue is specified by QUEUE MODULE.

All announcements that are used for the queuing feature must be located on the Queue Module. That is, the announcement trunks must have an equipment number specified on the TRUNK form (5204 Record) which have the Switching Module equal to the associated Queue Module.

Each Queue Module has a maximum of 255 queue slots to hold calls for queuing. Therefore, the sum of BASIC SIZE plus EXTENDED SIZE (for MLHGs) and ROUTINE SIZE plus PRIORITY SIZE (for trunk groups and SFGs) of all queuing specified with the same QUEUE MODULE must not exceed 255.

A maximum of 100 MLHG queues may be assigned to the same Queue Module. A maximum of 100 TGN and/or SFG queues may be assigned to the same Queue Module. A maximum of 500 queues may be defined in any office.

1.4 ISAT MLHG Queuing Features

ISAT (ISDN Attendant) console Multi-Line Hunt Groups, with modular queuing, use ICIs (Incoming Call Identifiers) and priorities associated with each ICI, defined on the ICIPF form (5903 Record), to queue calls. Calls to a busy attendant in an ISAT group will be placed in a queue. When an attendant becomes idle that serves the particular ICI of the queued call, the call will be removed from the queue and placed to the idle attendant. Priorities, assigned on the ICIPF form, will be used to determine the order in which queued calls are served. For more information, see the "ISDN Attendant Features" section in Division 2, Section 1T.

ISDN Attendant consoles also make use of call waiting lamps. The call waiting lamps on the ISAT console operate based on the number of calls in the queue. The Calls Waiting lamp will light whenever one or

Copyright © 2003 Lucent Technologies

more calls are queued. The Calls Waiting Warning lamp will light based on a specified threshold of calls queued. Two fields have been added to accommodate these types of call waiting lamps; they are, LAMP TYPE and THRESHOLD TYPE. The lamp type entry for ISDN Attendant consoles is "FB" (for feature button) and the threshold type is "N" (for number of calls in queue). The calls waiting threshold value is specified as a default parameter in the first row of the CALL WAITING LAMPS fields, in the field titled THRESHOLD. The DPN field is left blank for feature button applications.

The CFGGRP form (5964 Record) is used to assign modular queuing actions to feature buttons for ISDN Attendant consoles. Actions "QCWT" (Calls Waiting) and "QCWW" (Calls Waiting Warning) are used to assign the call waiting lamps to the ISDN Attendant configuration group(s). Action "QCUSE" may also be used in conjunction with an appropriate display feature. The feature button assigned the "QCUSE" action will be used to display the number of calls waiting in queue for each ICI.

1.5 ISDN Non-Attendant Queuing Features

ISDN station sets, other than attendant consoles, also make use of modular queuing, but threshold values are based on time in queue, not number of calls in queue. The LAMP TYPE for these sets would also be "FB" and THRESHOLD TYPE would be "T" (for time in queue). The threshold entry for these call waiting lamps represents a timing value (in seconds). Actions associated with the modular queuing feature buttons on these sets are, "QCW1L" (first threshold), "QCW2L" (second threshold), "QCW3L" (third threshold) and "QCUSE", if desired.

1.6 Recent Change View

The corresponding Recent Change View for this form is 12.40.

2. FORM ENTRIES - 5617-1a RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * FEATURE NAME

Description: Enter the Modular Queuing Feature Name. Feature Names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Modular Queuing Features associated with Multi-Line Hunt Groups are assigned on the MLHG form (5110 Record). For 5E3 and later, Modular Queuing Features may also be associated with a Trunk Group or a Simulated Facility Group and are assigned, respectively, on the TKGRP form (5202 Record) or the PFASFG form (5609-3 Record).
Valid Entries: 1 - 8 characters

Data Rules:

Modular Queuing Feature names defined on the QUFD form are not assigned to individual ports (TNs, MLHG Terminals, or Trunk Group Members) on the Feature assignment forms. Therefore, these features may not be assigned on any of the following forms: CLUSTR, LINEFA, MLHLNFA, TKGRPFA or TRUNKFA.

If a feature name is defined on the QUFD form and is assigned as a Queuing Feature on the MLHG form, but no corresponding feature name is defined on the QUGPA form, either the BASIC SIZE or EXTENDED SIZE values must be defined on the QUFD form.

When FEATURE is "/QRERTE", QUEUE TYPE must be "REROUTE".

Copyright © 2003 Lucent Technologies

When FEATURE is "/QRERTE", ROU Q TIMEOUT must be 2.

When QUEUE FEATURE is known on the TKGRP form and the QUEUE TYPE is set to "REROUTE" on the corresponding QUFD form, the Reroute Queuing feature must be purchased by the office. A SFSYS form must exist with SFID 249 ACT set to "Y".

For 5E13 and later, when FEATURE is "/HPCQ30":

- QUEUE TYPE must be "HPCOHQ".
- SPECIAL DELAY TREATMENT must be "Y".
- PRIORITY DELAY TREATMENT must be"N".
- ROUTINE SIZE must be 5.
- ROU Q TIMEOUT must be 30.
- PRE DELAY TONES must be "IDLE".
- INTER DELAY TONES must be "IDLE".
- POST DELAY TONES must be "IDLE".

For 5E13 and later, when FEATURE is "/HPCQ15":

- QUEUE TYPE must be "HPCOHQ".
- SPECIAL DELAY TREATMENT must be "N".
- PRIORITY DELAY TREATMENT must be "N".
- ROUTINE SIZE must be 5.
- ROU Q TIMEOUT must be 15.

For 5E13 and later, when the FEATURE NAME on the QUGPA form equals a FEATURE NAME on the QUFD form where QUEUE TYPE is "HPCOHQ", the GROUP TYPE must be "TRK" and the SERV PROT TIME must be 0 on the corresponding QUGPA form. In addition, when FEATURE NAME is "/HPCQ15" and the QUEUE TYPE is "HPCOHQ" on the QUFD form, the ROUTINE SIZE must be 5 and the ROU Q TIMEOUT must be 15 on the corresponding QUGPA form. When FEATURE NAME is "/HPCQ30" and the QUEUE TYPE is "HPCOHQ" on the QUFD form, the ROUTINE SIZE must be 5 and the ROU Q TIMEOUT must be 30 on the corresponding QUGPA form.

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.12) define modular queuing feature options.

2.4 # GROUP TYPE

Description: Enter the type of group to which queuing will be applied.

Copyright © 2003 Lucent Technologies

Required Field.

Valid GROUP TYPE Entries

Entry	Definition
LINE	Software Release: 5E2 and later. Multi-Line Hunt Groups.
TRK	Software Release: 5E3 and later. Trunk Groups.
SFG	Software Release: 5E3 and later. Simulated Facility Groups.

Data Rules:

For 5E3 and later, if the GROUP TYPE is "LINE", then QUEUE TYPE must be "MLHG" (or for 5E6 and later, it may also be "CSD"), PRIORITY QUEUE and PRIORITY DELAY TREATMENT must be "N", and the following fields must be blank: SERV PROT TIME, ROUTINE SIZE, ROU Q TIMEOUT, PRIORITY SIZE, PRI Q TIMEOUT, NUMBER OF PRI ANNOUNCEMENTS, RINGBACK TYPE, RINGBACK INTERVAL, RETRY TIMEOUT and POST Q TREAT.

If the GROUP TYPE is "TRK" or "SFG", QUEUE TYPE must be "OFFHK", "RGBK", "BLV" or "DSU", and the following fields must be blank: BASIC SIZE (for 5E6 and later, BASIC SIZE may be 1), EXTENDED SIZE, and NUM OF CALL WAITING LAMPS.

For 5E13 and later, when GROUP TYPE is "TRK", QUEUE TYPE must be "BLV", "DSU", "HPCOHQ", "OFFH", "REROUTE", or "RGBK".

2.5 # QUEUE TYPE

Description: Enter the Queue Type.

When QUEUE TYPE is "BLV" or "DSU", the following fields will be set automatically to "N": SPECIAL DELAY TREATMENT, PRIORITY QUEUE, and PRIORITY DELAY TREATMENT.

Required Field.

Valid QUEUE TYPE Entries

Entry	Definition
BLV	Software Release: 5E4(2) and later. Busy Line Verify.
CSD	Software Release: 5E6 and later. Circuit-Switched Data call.
DSU	Software Release: 5E4(2) and later. Digital Services Unit 2 - Recorded Announcement Function.
MLHG	Multi-Line Hunt Group.
OFFHK	Off-Hook.
RGBK	Ringback.
REROUTE	Software Release: 5E12 and later. Reroute Queuing - The LDP switch searches all outgoing routes within the route search limit for an available route.
HPCOHQ	Software Release: 5E13 and later. GETS HPC (Government Emergency Telecommunications Service High Probability of Completion) off-hook queuing. For more information, see Division 2, Section 4A279.

Data Rules:

When QUEUE TYPE is "CSD", GROUP TYPE must be "LINE".

If GROUP TYPE is "TRK" or "SFG", this field must be "OFFHK", "RGBK", "BLV" or "DSU", to describe whether the call originator must remain off-hook while the call is queued or whether the originator must go on-hook to invoke queuing and will subsequently be rung back when ready to dequeue. These entries apply only to the routine section of a queue. If a priority section is defined for the queue, it is always off-hook and does not have a field to define the type of queue. Note that if a priority section is not defined

Copyright © 2003 Lucent Technologies

for the queue, the entire queue is considered routine. Also, a priority section may not exist without a routine section.

CSD:
When "CSD" is entered, EXTENDED SIZE must be blank, SPECIAL DELAY TREATMENT must be "N", and GROUP TYPE must be "LINE".

RGBK:
When "RGBK" is entered, SPECIAL DELAY TREATMENT must be "N" and the associated trunk group must be one-way outgoing. "error: QUEUING (62)"

QUEUE TYPE must equal "RGBK" if the QUEUING FEATURE(s) has been assigned through TKGRP or PFASFG form(s) and the corresponding QUEUING FEATURE(s) is defined with RETRY TIMEOUT greater than zero on the QUGPA form.

REROUTE:
When QUEUE TYPE is "REROUTE", GROUP TYPE must be "TRK"

When QUEUE TYPE is "REROUTE", PRIORITY QUEUE must be "N".

When QUEUE TYPE is "REROUTE", SPECIAL DELAY TREATMENT must be "N".

When QUEUE TYPE is "REROUTE", PRIORITY DELAY TREATMENT must be "N".

When QUEUE TYPE is "REROUTE", ROUTINE SIZE must be 1 - 10.

When QUEUE TYPE is "REROUTE", ROU Q TIMEOUT must be 1 - 15.

HPCOHQ:
When QUEUE TYPE is "HPCOHQ",

- GROUP TYPE must be "TRK"
- PRIORITY QUEUE must be "N"
- THRESHOLD VALUE must not be entered

When QUEUE TYPE is "HPCOHQ" on the QUFD form, and the QUEUE FEATURE is known on the TKGRP form, the TRKCLS must be "IC", "LATA", "LTOLLCON", or "TTOLLCON", the LN TYPE must be "NONE" or unknown on the corresponding TKGRP form where QUEUE FEATURE matches FEATURE NAME on the QUFD form. In addition, the TERM MC ROUTE INDEX and CCS TERM MC RTI must not be entered on the associated PFATG form. This Trunk Group cannot be assigned a Terminal Group ID.

2.6 QUEUE INTERFLOW

Description: Is Queue Interflow allowed? Queue Interflow provides for one queue requesting help from another queue and giving help to another queue.

- ***NOTE:*** The default and only value is "N", except for Modular Queuing features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Valid Entry: N

2.7 CALL WAITING LAMPS

Description: Are Call Waiting Lamps allowed?

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

Call Waiting Lamps are applicable only when GROUP TYPE is "LINE". If GROUP TYPE is "SFG" or "TRK", CALL WAITING LAMP must be "N".

If this field is "N", the NUMBER OF CALL WAITING LAMPS, LAMP TYPE, and THRESHOLD TYPE fields must be blank. If this field is "Y", values must be entered in LAMP TYPE and THRESHOLD TYPE.

For 5E6 and later, this field must be "N" when QUEUE TYPE is "CSD". Also, for 5E6 and later, when an MLHG form has assigned a HUNT TYPE of "ISAT" on a corresponding MLHGFD form and CALL WAITING LAMPS is set to "Y", then LAMP TYPE must be "FB" and THRESHOLD TYPE must be "N" on the QUFD form.

2.8 # SPECIAL DELAY TREATMENT

Description: Is Special Delay Treatment allowed?

Standard audible ringing is applied to the call originator

- when QUEUE TYPE is "MLHG" and this field equals "N",
- or when QUEUE TYPE is "MLHG" or "OFFHK" and no announcements are associated with the queue when this field equals "Y".

Silence (i.e. no treatment) is given to the call originator, when QUEUE TYPE is "OFFHK" and this field equals "N".

Required Field.
Valid Entries: Y, N

Data Rules:

When QUEUE TYPE equals "RGBK", SPECIAL DELAY TREATMENT is not applicable and must equal "N".

When SPECIAL DELAY TREATMENT is "Y", announcements may be associated with the queue and may be defined as parameters on this form or on the QUGPA form (5617-3/4 Records). If the QUEUE TYPE is "OFFHK", the announcements are applicable to the routine section of the queue.

If SPECIAL DELAY TREATMENT is "N", then the NUMBER OF ANNOUNCEMENTS must be blank.

When QUEUE TYPE is "CSD", SPECIAL DELAY TREATMENT must be "N".

2.9 PRIORITY QUEUE

Description: Does this queue have a priority section?

If this field equals "Y", terminals that access this queue and are defined as priority originators will use the priority section of the queue which, on the average, experience a shorter delay time in the queue than non-priority originators using the routine section of the queue. To define an originator as priority, the parameter, PRIORITY QUEUE, should be defined as "Y" on the associated ARS (Automatic Route Selection) or PFA (Private Facility Access) forms. Attendant lines and trunks are usually considered candidates for priority queuing when it is defined.

Software Release: 5E3 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When GROUP TYPE is "LINE", this field must equal "N".

PRIORITY QUEUE must equal "N" if QUEUING FEATURE(s) that have been assigned through TKGRP or PFASFG form(s) and corresponding QUEUING FEATURE(s) are defined with SERV PROT TIME equals zero or is not entered on the QUGPA or on the QUFD form.

If the SERV PROT TIME is greater than zero, then PRIORITY QUEUE must equal "Y" .

2.10 PRIORITY DELAY TREATMENT

Description: Can announcements be defined for the priority section of the queue?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PRIORITY QUEUE equals "N", this field must equal "N".

2.11 LAMP TYPE

Description: Enter the type of call waiting lamp(s) associated with this feature.

Software Release: 5E4(2) and later
Valid Entries:

Valid LAMP TYPE Entries

Entry	Definition
FB	Used with ISDN station sets to indicate that the call waiting lamp is provided via a feature button on the set. An appropriate action must be assigned on the CFGGRP form associated with lines using this lamp type. The CALL WAITING LAMPS DPN field must be left blank for feature button applications.
DP	Used to indicate that the call waiting lamps associated with this feature are provided via a distribute point.

Data Rules:

For 5E6 and later, when a QFEATURE is assigned on an MLHG form (5110 Record) and is defined on the QUFD form with a LAMP TYPE of "DP", the first DPN for CALL WAITING LAMPS on the QUFD form must be entered.

2.12 THRESHOLD TYPE

Description: Enter the type of threshold value for the call waiting lamps associated with this feature. An entry in this field will determine whether the CALL WAITING LAMPS THRESHOLD field represents a timing value or a number of calls in queue.

Software Release: 5E4(2) and later
Valid Entries:

Valid THRESHOLD TYPE Entries

Entry	Definition
N	Call waiting lamps will operate based on a threshold of the number of calls queued.
T	Call waiting lamps will operate based on a threshold of the amount of time calls are queued.

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E5 and later, when THRESHOLD TYPE is "N", only one call waiting lamp may be defined; no more than one THRESHOLD may be entered.

CHARGES

The following fields (Section 2.13 - Section 2.16) define charges associated with the queuing feature.

2.13 USAGE SENSITIVE

Description: Is there a usage sensitive charge? This field is used for billing purposes.

- ***NOTE:*** The default and only value is "N", except for Modular Queuing features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Valid Entry: N

2.14 DEACTIVATION

Description: Is there a usage charge for deactivation?

- ***NOTE:*** The default and only value is "N", except for Modular Queuing features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Valid Entry: N

2.15 USAGE FREQUENCY

Description: Is there a usage charge for usage frequency?

- ***NOTE:*** The default and only value is "N", except for Modular Queuing features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Valid Entry: N

2.16 DURATION

Description: Is there a usage charge for duration of use?

- ***NOTE:*** The default and only value is "N", except for Modular Queuing features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Valid Entry: "N"

DEFAULT PARAMETERS

The following fields (Section 2.17 - Section 4.14) define the default parameters assigned with the feature to the Multi-Line Hunt Group, Trunk Group or Simulated Facility Group. These parameters will be assigned to the group unless they are overridden by entries on the QUGPA form (5617-3/4 Record).

If a QUGPA parameter assignment form is entered for any given group, all entries on that form will be used for the group. None of the default parameters entered here on the QUFD form will be used.

2.17 BASIC SIZE

Description: Enter the Basic Size of the queue when the queue is defined for a group type of "LINE".

Copyright © 2003 Lucent Technologies

BASIC SIZE plus EXTENDED SIZE is the total size or number of queue slots made available to queue calls simultaneously for this MLHG queue. For instance, if BASIC SIZE is 10 and EXTENDED SIZE is left blank, 10 calls may be queued while waiting for an idle MLHG terminal. If the queue is full with 10 queued calls, an attempt to queue the eleventh call will overflow the queue and the originator is given busy tone.
Default: 1
Valid Entries: 1 - 255

Data Rules:

For a group type of "SFG" or "TRK", this field must be blank.

2.18 EXTENDED SIZE

Description: Enter the extended size of the queue when the queue is defined for a group type of "LINE".
Valid Entries: 1 - 255

Data Rules:

EXTENDED SIZE is specified only when the incoming side of any FX trunk group is defined with the listed directory number of the queued-for MLHG in DIR CON DN on the TKGRP form (5202 Record). In this case, the EXTENDED SIZE is defined as the size of the trunk group(s), so that an incoming seizure on any of these trunks and subsequent completion to the MLHG direct connect telephone number ensures that the trunk call will be queued.

EXTENDED SIZE must be blank when GROUP TYPE is "SFG" or "TRK", or QUEUE TYPE is "CSD".

2.19 QUEUE MODULE

Description: Enter the Queue Module to indicate which switching module in this office will be designated to hold and service the queue being defined.
Valid Entries: 1 - 192

Data Rules:

The value entered must be defined as a valid switching module on the EQIM form (5700-1/2 Records).

If QUEUE MODULES are defined with a TGN and MEMB combination on one or more of Delay, Flexible First or Priority Announcements, then for each TGN and MEMB combination a matching TRUNK form should be defined with the corresponding first three digits of the TEN or DEN equal to QUEUE MODULE.

2.20 QMON THRESHOLD

Description: Depending on whether the number of calls in the queue is greater or less than the threshold warning value, the QTWL (Queue Threshold Warning Lamp) on the console monitoring of this MLHG is turned on or off. The QTWL does not indicate how long the calls have been queued. A lit threshold warning lamp simply indicates that the number of calls in the queue has exceeded the threshold value.

The QTWLs provided by the CSD (Circuit-Switched Data) feature and existing call waiting lamps are not related. Call waiting lamps are only provided for voice queues and not for CSD queues. Call waiting warning lamps are lit when the call is in the queue for some specified time. QTWLs are available for both CSD and voice queuing.

Software Release: 5E6 and later
Valid Entries: 1 - 255

Data Rules:

When this field is entered, either BASIC SIZE or EXTENDED SIZE must be entered. QMON THRESHOLD

Copyright © 2003 Lucent Technologies

must not be greater than the sum of BASIC SIZE and EXTENDED SIZE.

EXTENDED SIZE must be blank when QUEUE TYPE is "CSD". The extended queue size reserves room in the queue for calls arriving over FX (foreign exchange) facilities. FX facilities do not support CSD calls.

2.21 NUMBER OF CALL WAITING LAMPS

Description: Enter the Number of Call Waiting Lamps allowed.
Valid Entries: 1 - 3

Data Rules:

This field may be entered only if the GROUP TYPE is "LINE". When GROUP TYPE is "TRK" or "SFG", this field must be blank.

If CALL WAITING LAMPS is "N", this field must be blank.

When a number is entered in this field, no more than that number of CALL WAITING LAMPS (THRESHOLD and DPN) may be defined.

For 5E4(2) and later, when "N" is entered in the THRESHOLD TYPE field, the NUMBER OF CALL WAITING LAMPS must be 1 or not entered.

CALL WAITING LAMPS

One, two or three lamps (fields Section 2.22 - Section 2.23) may be associated with each queue. One queue is identified for each MLHG. Up to three delay thresholds, in ascending order may be specified. Only one lamp will be lit, corresponding to the longest delay currently experienced.

For 5E5 and later, when "N" is entered in the THRESHOLD TYPE field, define one row or leave blank.

2.22 THRESHOLD

Description: Enter the Call Waiting Threshold.

For 5E4(2) and later, the threshold specified here may represent either an amount of time calls are in queue or a number of calls in queue. When the THRESHOLD TYPE field is set to "N", the threshold value entered here will represent the acceptable number of calls in queue before the ISDN Attendant's calls waiting warning lamp lights (the lamp will light when this threshold has been exceeded). When "T" is entered in the THRESHOLD TYPE field, the threshold value entered here will represent an amount of time (in 6-second intervals) calls are in queue.
Valid Entries: 1 - 255

Data Rules:

For 5E4(2) and later, when a THRESHOLD value is entered and LAMP TYPE is "DP", the corresponding DPN must be entered; if LAMP TYPE is "FB", the DPN may not be entered.

For 5E5 and later, when THRESHOLD TYPE is "N", THRESHOLD may be 1 - 255; when THRESHOLD TYPE is "T", THRESHOLD may be 1 - 31.

2.23 DPN

Description: For each Call Waiting Lamp Threshold specified, enter a unique DPN (Distribute Point Number) in the following format.

DISTRIBUTE POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192

Copyright © 2003 Lucent Technologies

Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU) 00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

In offices equipped with CM1 (Communication Module 1), valid entries for SM are 1-48. In offices equipped with CM2 (Communication Module 2), valid entries are 1-192.

A DPN may be entered only if the corresponding THRESHOLD has been entered.

Each DPN must be unique. It cannot be assigned on another form except that DPNs can be duplicated between QUFD and QUGPA forms when these forms have the same FEATURE and GROUP TYPE.

For 5E4(2) and later, when "FB" (feature button) is entered in the LAMP TYPE field, DPN must be blank.

3. FORM ENTRIES - 5617-1b RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

3.2 FEATURE NAME

Description: Enter the Modular Queuing Feature Name. This name must be the same as that from the corresponding 5617-1 Record entry. This information is not required on the QUFD input form.

3.3 NUMBER OF ANNOUNCEMENTS

Description: Enter the Number of Announcements allowed (excluding the flexible first announcement).
Valid Entries: 1 - 4

Data Rules:

If this field is entered, then SPECIAL DELAY TREATMENT must be equal to "Y". The announcement or announcements to be used are defined in DELAY ANNOUNCEMENTS, one row for each announcement.

If this field is not entered, then the tone interval before the first announcement must not be specified in PRE DELAY TIMING or it must equal 0.

If this field is not entered or is equal to 1, then the tone interval between announcements must not be specified in INTER DELAY TIMING or it must equal 0.

3.4 PRE DELAY TONES

Description: Indicate the Tone emitted before the first announcement.
Default: AUD
Valid Entries:

Valid PRE DELAY TONES Entries

Entry	Definition
AUD	Audible Ringing Tone
IDLE	No tone

3.5 PRE DELAY TIMING

Copyright © 2003 Lucent Technologies

Description: Enter the Tone intervals before the first announcement, where each interval represents a 6-second duration.

If the DELAY ANNOUNCEMENTS TYPE is "BARGE", then the tone interval before the first announcement will be equal to the number of 6-second intervals indicated in this field.

If the DELAY ANNOUNCEMENTS TYPE is "NBARGE", then the tone interval before the first announcement will be equal to the number of 6-second intervals indicated in this field plus the amount of time it takes to cycle to the beginning of the announcement.
Default: 0
Valid Entries: 0 - 20 (6-second intervals)

3.6 INTER DELAY TONE

Description: Enter the Tone emitted between announcements.
Default: AUD
Valid Entries:

Valid INTER DELAY TONE Entries

Entry	Definition
AUD	Audible Ringing Tone
IDLE	No Tone
MUS	Music

3.7 INTER DELAY TIMING

Description: Enter the Tone intervals between announcements where each interval represents a 6-second duration.
Default: 0
Valid Entries: 0 - 20 (6-second intervals)

3.8 POST DELAY TONES

Description: Enter the Tone emitted after the announcement(s).
Default: AUD
Valid Entries:

Valid POST DELAY TONES Entries

Entry	Definition
AUD	Audible Ringing Tone
IDLE	No Tone
MUS	Music

MUSIC SOURCE

The following fields (Section 3.9 - Section 3.10), which are available for 5E6 and later software releases, are used to describe the music source for delay tones of "MUS".

3.9 TGN

Description: Enter the trunk group number of the trunk to be used as a music source for music delay tones.

Software Release: 5E6 and later
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

If TGN is entered, then music source MEMB must also be entered. A TGN can only be entered when GROUP TYPE is "LINE", QUEUE TYPE is "MLHG", and INTER or POST DELAY TONES is "MUS", and must be entered when INTER or POST delay tones equal "MUS". The TGN and MEMB must be defined on the TRUNK form (5204-1/2 Records) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE and MUSIC SOURCE is "Y" on the TRUNK form.

3.10 MEMB

Description: Enter the trunk group member number of the trunk to be used as a music source for music delay tones.

Software Release: 5E6 and later
Valid Entries: 0 - 1951

Data Rules:

If music source MEMB is entered, then music source TGN must also be entered.

ISDN ATTENDANT

The next two fields (Section 3.11 - Section 3.12) define warning lamps for the ISDN Attendant Group Overload Warning feature. For information on this feature refer to Division 2, Section 1T.

3.11 QWARN THRESHOLD

Description: Enter the threshold for the QWARN feature button lamp. When the number of calls in the queue exceeds the threshold value, the QWARN feature button lamps on the appropriate ISAT terminals are turned on. When the number of calls in the queue falls below the threshold value, the QWARN feature button lamps on the appropriate ISAT terminals are turned off.

The QWARN feature button lamp is defined on the CFGGRP form (5964 Record) using an ACTION of "QCWARN". Refer to Division 6, Section 7A, for more information on this ACTION value.

Software Release: 5E8 and later
Valid Entries: 1 - 251

Data Rules:

If QWARN THRESHOLD is entered, BASIC SIZE must be entered; the QWARN THRESHOLD value must be less than (BASIC SIZE - 3). The number 3 indicates the number of queue slots reserved from the basic portion of the queue for emergency calls. This value is hard-coded in the call processing code.

The QWARN THRESHOLD is applicable only to ISAT Multi-Line Hunt Groups. If QWARN THRESHOLD is entered, FEATURE NAME can be assigned in the QFEATURE field of an MLHG form only if HUNT TYPE is set to "ISAT" on the corresponding MLHGFD form.

If QWARN THRESHOLD is entered, CALL WAITING LAMP must be "Y", GROUP TYPE must be "LINE", and QUEUE TYPE must be "MLHG".

3.12 QBUSY DPN

Description: Enter a unique ISAT Queue Busy DPN (Distribute Point Number). When QBUSY DPN is entered, if the queue is full, the distribution point will cause a lamp to be lit. This lamp is not the same as the QBUSY feature button lamp on the ISAT terminal.

Software Release: 5E8 and later

Copyright © 2003 Lucent Technologies

Valid Entries: a 9-digit Distribute Point equipment number in the following format.

DISTRIBUTE POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

If QBUSY DPN is entered, CALL WAITING LAMP must be "Y", GROUP TYPE must be "LINE", and QUEUE TYPE must be "MLHG".

If QBUSY DPN is entered, it must be unique, i.e., it cannot be assigned on any other form.

If QBUSY DPN is entered, it must be a distribution point defined on the EQMSP or EQMMSP form with TYPE set to "DIST".

The QBUSY DPN is applicable only to ISAT Multi-Line Hunt Groups. If QBUSY DPN is entered, FEATURE NAME can be assigned in the QFEATURE field of an MLHG form only if HUNT TYPE is set to "ISAT" on the corresponding MLHGFD form.

DELAY ANNOUNCEMENTS

Delay Announcements (fields Section 3.13 - Section 3.16) are assigned on a per queue basis. Delay Announcements can be shared by several queues.

Each row under DELAY ANNOUNCEMENTS defines the announcement trunk to be used. The quantity of announcements (rows) specified must not exceed the value entered in NUMBER OF ANNOUNCEMENTS. When any field in a row is specified, all of the fields in the row must be entered.

3.13 TYPE

Description: Enter the Announcement Type.

Valid TYPE Entries	
Entry	**Definition**
BARGE	Barge-In.
NBARGE	No Barge-In, where the customer will hear the announcement from the beginning of the message.

3.14 CYCLES

Description: Enter the number of times the announcement is to be given.
Valid Entries: 0 - 4

3.15 TGN

Description: Enter the Trunk Group Number of the announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Copyright © 2003 Lucent Technologies

The TGN must be defined on the TKGRP form (5202 Record) with a TRK DIR equal to "ANN".

3.16 MEMB

Description: Enter the Trunk Member of the Announcement Trunk Group.
Valid Entries: 0 - 2047.

Data Rules:

This member must be defined on the TRUNK form (5204 Record) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE.

FLEXIBLE FIRST ANNOUNCEMENT

The Flexible First Announcement (fields Section 3.17 - Section 3.21) may be specified to provide an alternate announcement to the first announcement defined in DELAY ANNOUNCEMENTS. If specified, the Flexible First Announcement is used for the next call into the queue when the longest call already queued has been waiting in the queue for the amount of time as specified by THRESHOLD VALUE. If any field under Flexible First Announcement is entered, they all must be entered.

3.17 TYPE

Description: Enter the Announcement Type of the Flexible First Announcement.

Valid TYPE Entries

Entry	Definition
BARGE	Barge-In.
NBARGE	No Barge-In, where the customer will hear the announcement from the beginning of the message.

3.18 CYCLES

Description: Enter the number of times the Flexible First Announcement is to be given.
Valid Entries: 0 - 4

3.19 TGN

Description: Enter the Trunk Group Number of the Flexible First Announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN must be defined on the TKGRP form (5202 Record) with a TRK DIR equal to "ANN".

3.20 MEMB

Description: Enter the Trunk Member of the Flexible First Announcement Trunk Group.
Valid Entries: 0 - 1951

Data Rules:

This member must be defined on the TRUNK form (5204 Record) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE.

3.21 THRESHOLD VALUE

Description: Enter the Threshold Value associated with the Flexible First Announcement. When the

Copyright © 2003 Lucent Technologies

longest queued call has waited this value, the next call into the queue will hear the Flexible First Announcement.
Valid Entries: 1 - 200 (6-second intervals)

DEFAULT PARAMETERS FOR TGN/SFG

The following fields (Section 3.22 - Section 4.14) define parameters for queuing features associated with trunk groups and simulated facility groups.

3.22 SERV PROT TIME

Description: Enter the Service Protection Time in seconds.

This field is called SERV PROT CLK on the Recent Change View and in the 5ESS Switch feature documents.

It is used when a queue has both a routine section and a priority section. It provides a means of ensuring that routine calls are not completely blocked from being serviced because of priority calls. Service Protection applies to both off-hook and ringback queuing. The expiration of the Service Protection Time does not cause routine calls to be dequeued immediately. Rather, this will cause the appropriate indicators to be set so that the next available port in the queued for facility will be used for the call waiting at the head of the routine queue section instead of a priority call. 0 indicates no timing or Service Protection.

Software Release: 5E3 and later
Valid Entries: 0 - 2047 (seconds)

Data Rules:

If GROUP TYPE equals "LINE", this field must be left blank.

If a non-zero value is entered in this field, then PRIORITY QUEUE must be equal to "Y".

3.23 ROUTINE SIZE

Description: Enter the size of the routine section of the queue when the queue is defined for a group type of "TRK" or "SFG". ROUTINE SIZE indicates the number of queue slots made available to queue routine calls simultaneously for the queued-for trunk group or Simulated Facility Group. The routine section of a queue may be either Ringback or Off-Hook.

Software Release: 5E3 and later
Valid Entries: 1 - 255

Data Rules:

For a group type of "LINE", this field must be blank.

For 5E6 and later, when both PRIORITY SIZE and ROUTINE SIZE are entered, their sum must not exceed 255.

3.24 ROU Q TIMEOUT

Description: Enter the Routine Queue Timeout in seconds. 0 indicates no timeout.

This field indicates the maximum time that a routine call can remain in the queue. If a Private Facility Access call has been dequeued because of this timeout and the queue is off-hook, the originator will be given reorder tone. An Automatic Route Selection call on timeout is subject to POST Q TREAT which will indicate either Reorder or Alternate Treatment.

Copyright © 2003 Lucent Technologies

Because of the software scanning function, the timeout value specified is the approximate time which timeout will occur within thirty seconds.

Software Release: 5E3 and later
Valid Entries: 0 - 4095 (seconds)

Data Rules:

If group type is "LINE", this field must be blank.

If QUEUE TYPE is "RGBK", this field, if entered, must be less than or equal to 1770.

4. FORM ENTRIES - 5617-1c RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

4.2 PRIORITY SIZE

Description: Enter the Size of the priority section of the queue. 0 indicates no priority queuing.

Priority Size indicates the number of queue slots made available to queue priority calls simultaneously for the queued-for Trunk Group or Simulated Facility Group. If a Priority Section is provided, it will be off-hook.

Software Release: 5E3 and later
Valid Entries: 0 - 255

Data Rules:

If PRIORITY QUEUE equals "Y" and this field is entered, it must be greater than zero. If PRIORITY QUEUE is "N", this field must be 0 or blank.

For 5E6 and later, when both PRIORITY SIZE and ROUTINE SIZE are entered, their sum must not exceed 255.

4.3 PRI Q TIMEOUT

Description: Enter the Priority Queue Timeout in seconds. 0 indicates no timeout.

This field indicates the maximum time that a priority call can remain in the queue. If a Private Facility Access call has been dequeued because of this timeout, the originator will be given Reorder tone. An Automatic Route Selection call on timeout is subject to POST Q TREAT which will indicate either reorder ("REORDER") or alternate treatment ("ALTR").

Because of the software scanning function, the timeout value specified is the approximate time which timeout will occur within thirty seconds.

Software Release: 5E3 and later
Valid Entries: 0 - 4095 (seconds)

Data Rules:

If group type is "LINE", this field must be blank.

4.4 NUMBER OF PRI ANNCMTS

Copyright © 2003 Lucent Technologies

Description: Enter the Number of Priority Announcements allowed for the priority section of the queue.

Software Release: 5E3 and later
Valid Entries: 0 - 3

Data Rules:

If this field is nonzero, then PRIORITY DELAY TREATMENT must equal "Y". The announcement or announcements to be used are defined in PRIORITY ANNOUNCEMENTS, one row for each announcement.

PRIORITY ANNOUNCEMENTS

Priority Announcements (fields Section 4.5 - Section 4.8) are applicable to 5E3 and later Software Releases and are assigned on a per-queue basis for those queues that have priority sections. These announcements do not have to be unique and may be shared with other queues. Each row under PRIORITY ANNOUNCEMENTS defines the announcement trunk to be used. The quantity of announcements (rows) specified must not exceed the value entered in NUMBER OF PRI ANNCMTS. When any field in a row is specified, all of the fields in the row must be entered.

4.5 TYPE

Description: Enter the Announcement Type of the Priority Announcement.

Software Release: 5E3 and later
Valid Entries:

Valid TYPE Entries

Entry	Definition
BARGE	Barge-In.
NBARGE	No Barge-In, where the customer will hear the announcement from the beginning of the message.

4.6 CYCLES

Description: Enter the number of times the Priority Announcement is to be given.

Software Release: 5E3 and later
Valid Entries: 0 - 4

4.7 TGN

Description: Enter the Trunk Group Number of the Priority Announcement.

Software Release: 5E3 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN must be defined on the TKGRP form (5202 Record) with a TRK DIR equal to "ANN".

4.8 MEMB

Description: Enter the Trunk Member of the Priority Announcement Trunk Group.

Software Release: 5E3 and later
Valid Entries: 0 - 1951.

Copyright © 2003 Lucent Technologies

Data Rules:

This member must be defined on the TRUNK form (5204 Record) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE.

4.9 RINGBACK TYPE

Description: Enter the distinctive ringing pattern to be used to ringback customers in a Ringback Queue. The pattern, when entered, is independent of the Distinctive Ringing BRCS feature capability and, thus, does not require the queuing customer to have a Distinctive Ringing feature assigned.

Software Release: 5E3 and later
Valid Entries:

Valid RINGBACK TYPE Entries

Entry	Definition
A	2 seconds on, 4 seconds off (normal ringing).
B	800 ms on, 400 ms off, 800 ms on, 4 seconds off.
C	400 ms on, 200 ms off, 400 ms on, 200 ms off, 800 ms on, 4 seconds off.
D	1 second on, 1 second off, 1 second on, 3 seconds off.
P	Software Release: 5E4(2) and later. 1640 ms on, 360 ms off.

Data Rules:

This field may be entered only when the QUEUE TYPE is "RGBK".

4.10 RINGBACK INTRVL

Description: Enter the time limit in seconds for ringing back customers in a Ringback Queue. This field, when entered, indicates how long to apply ringing to the customer's telephone when that customer is in a Ringback Queue and can be dequeued or serviced with the queued-for facility. If the customer does not answer the telephone within the time limit, the call will be removed from the queue without being served.

Software Release: 5E3 and later
Valid Entries: 18, 24, 30, 36, 42, and 48 (seconds)

Data Rules:

This field may be entered only when the QUEUE TYPE is "RGBK".

4.11 RETRY TIMEOUT

Description: Enter the Retry Timeout in seconds for attempting to ringback customers in a Ringback Queue when they have gone back off-hook. This field, when entered, indicates how long to wait for a customer who is in a ringback queue if, while waiting for the queued-for facility, the customer answers or originates another call. With the customer's line busy, it cannot be rung-back. If the customer does not hang up within the time specified, the call will be removed from the queue without being served. 0 indicates no timeout.

Because of the software scanning function, the timeout value specified is the approximate time which timeout will occur within thirty seconds.

Software Release: 5E3 and later
Valid Entries: 0 - 1023 (seconds)

Data Rules:

This field may be entered only when the QUEUE TYPE is "RGBK".

Copyright © 2003 Lucent Technologies

4.12 POST Q TREAT

Description: Enter the Post Queue Treatment to be given ARS (Automatic Route Selection) calls that have timed out of the queue. A call in the routine section of the queue will time out based on the value entered in ROU Q TIMEOUT. A call in the priority section of the queue will time out based on the value entered in PRI Q TIMEOUT.

When "ALTR" is entered and the call that has been queued was invoked through ARS, then the queued-for facility is the first route in a route list. Alternate Treatment indicates that upon timeout, a second attempt should be made through the route list. The FRL (Facility Restriction Level) of the ARS originator may be upgraded for this second attempt through the entries POST QUEUE FRL and THRESH FRL of the originator's ARS Group Data on the ARSGPA form (5608-2 Record).

Software Release: 5E3 and later
Valid Entries:

Valid POST Q TREAT Entries

Entry	Definition
REORDER	Reorder Tone
ALTR	Alternate Treatment

Data Rules:

If group type is "LINE", this field must be blank.

4.13 SADA

Description: Should the Service After Delay Announcement feature be activated?

This feature allows the first announcement of a delay treatment be completely played before the call is made available to a hunt group. This field must be set to "Y" if the Service After Delay Announcement feature is active for any hunt group with queuing; otherwise, enter "N".

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If SADA is "Y", GROUP TYPE must be "LINE". If GROUP TYPE is not "LINE", or the NUMBER OF ANNOUNCEMENTS field is blank, then SADA must be "N".

4.14 ANNC BILL

Description: Does billing occur at the time of announcement? This Announcement Billing indicator field is part of the Service After Delay Announcement feature.

Software Release: 5E5 and later
Required Field.
Default: Y

Value Entries: Y, N

Data Rules:

Enter "N" if billing occurs when the call is connected to a hunt group member. Also, enter "N" if the GROUP TYPE is "SFG" or "TRK".

Copyright © 2003 Lucent Technologies

SEC. 18B: 5617-3/4 RECORD
MODULAR QUEUING GROUP PARAMETER FORM - QUGPA

1. GENERAL

The 5617-3/4 Records are available with 5E2 and later Software Releases. They define the Modular Queuing parameters for a group if the default parameters associated with the Modular Queuing feature on the QUFD form (5617-1 Record) are inappropriate or unspecified. This record need not be filled out if the Modular Queuing default parameters are acceptable.

For 5E3 and later, in addition to queuing for MLHGs, Modular Queuing may be defined to provide queuing for outgoing private facilities, either a physical Trunk Group or an SFG (Simulated Facility Group).

If a QUGPA parameter assignment form is entered for any given group, all entries on that form will be used for the group. None of the default parameters entered on the QUFD form will be used.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.40.

2. FORM ENTRIES - 5617-3 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * GROUP NUMBER

Description: Enter the number of the group that the Modular Queuing feature is assigned to and that these parameters are associated with.
Valid Entries: Valid entries for GROUP NUMBER are dependent upon the software release and the value of GROUP TYPE. Refer to the following table for a breakdown:

Valid GROUP NUMBER Entries			
GROUP TYPE	5E10	5E11	5E15
LINE	1 - 2000	1 - 2000	1 - 8191
TRK	1 - 2000	1 - 4000	0 - 4000
SFG	1 - 2000	1 - 2000	1 - 2000

Data Rules:

When GROUP TYPE is "LINE", the number entered is a Multi-Line Hunt Group that must be defined with the specified Modular Queuing feature on the MLHG form (5110 Record).

When GROUP TYPE is "TRK", the number entered is a Trunk Group that must be defined with the specified Modular Queuing feature on the TKGRP form (5202 Record).

When GROUP TYPE is "SFG", the number entered is a Simulated Facility Group that must be defined with the specified Modular Queuing feature on the PFASFG form (5609-3 Record).

For 5E15 and later:

When GROUP NUMBER does not equal 0,

- OFC Q NUM TRK GRPS must be 0.
- EGR Q NUM TRK GRPS must be 0.
- OFC Q TIMEOUT must be 0.

Copyright © 2003 Lucent Technologies

- EGR Q TIMEOUT must be 0.
- OFC Q SIZE must be unknown.
- EGR Q SIZE must be unknown.

When GROUP NUMBER equals 0,

- GROUP TYPE must be "TRK".
- ROUTINE SIZE must not be specified.
- PRIORITY SIZE must not be specified.
- ROU Q TIMEOUT must not be specified.
- PRI Q TIMEOUT must not be specified.

When GROUP NUMBER equals 0, GROUP TYPE is "TRK", and OFC Q NUM TRK GRPS equals 0, then EGR Q NUM TRK GRPS must not be 0.

When GROUP NUMBER equals 0, GROUP TYPE is "TRK", and EGR Q NUM TRK GRPS equals 0, then OFC Q NUM TRK GRPS must not be 0.

When GROUP NUMBER equals 0 and GROUP TYPE is "TRK", then SERV PROT TIME must not be specified.

When GROUP NUMBER equals 0 and GROUP TYPE is "TRK", both OFC Q NUM TRK GRPS and EGR Q NUM TRK GRPS must not be 0.

When GROUP NUMBER equals 0 and OFC Q NUM TRK GRPS does not equal 0, both OFC Q TIMEOUT and OFC Q SIZE must not be 0.

When GROUP NUMBER equals 0 and EGR Q NUM TRK GRPS does not equal 0, both EGR Q TIMEOUT and EGR Q SIZE must not be 0.

2.3 * GROUP TYPE

Description: Enter the type of group to which queuing will be applied.

Valid GROUP TYPE Entries

Entry	Definition
LINE	Multi-Line Hunt Groups.
TRK	Software Release: 5E3 and later. Trunk Groups.
SFG	Software Release: 5E3 and later. Simulated Facility Groups.

Data Rules:

For 5E11 through 5E14, when GROUP TYPE is "LINE" or "SFG", GROUP NUMBER must be 1 - 2000. For 5E15 and later, when GROUP TYPE is "LINE", GROUP NUMBER must be 1 - 8191; when GROUP TYPE is "SFG", GROUP NUMER must be 1 - 2000.

When the value entered in the GROUP TYPE field is "LINE", then the value entered in the GROUP NUMBER field must appear in the MLHG field on an MLHG form. Additionally, the entry in the FEATURE NAME field on this form must appear in the QUEUING FEATURE field on the MLHG form.

Copyright © 2003 Lucent Technologies

When GROUP TYPE is "LINE", then the BASIC SIZE and/or the EXTENDED SIZE fields must have entries.

For 5E15 and later, when GROUP TYPE is defined as "TRK" or "SFG" and GROUP NUMBER does not equal 0, then ROUTINE SIZE must be defined.

2.4 FEATURE NAME

Description: Enter the Feature Name which has been defined on the QUFD form.

Required Field.
Valid Entries: 1 - 8 characters

2.5 BASIC SIZE

Description: Enter the Basic Size of the queue when the queue is defined for a Group Type of "LINE".

Basic Size plus Extended Size is the total size or number of queue slots made available to queue calls simultaneously for this MLHG queue. For instance, if Basic Size is 10 and Extended Size is left blank, 10 calls may be queued while waiting for an idle MLHG terminal. If the queue is full with 10 queued calls, an attempt to queue the eleventh call will overflow the queue and the originator is given busy tone.
Valid Entries: 1 - 255

Data Rules:

For a Group Type of "SFG" or "TRK", this field must be blank.

2.6 EXTENDED SIZE

Description: Enter the Extended Size of the queue when the queue is defined for a GROUP TYPE of "LINE".

Extended Size is specified only when the incoming side of any FX Trunk Group is defined with the listed Directory Number of the queued-for MLHG in DIR CON DN on the TKGRP form (5202 Record). In this case, the Extended Size is defined as the size of the Trunk Group(s), so that an incoming seizure on any of these trunks and subsequent completion to the MLHG direct connect telephone number ensures that the trunk call will be queued.
Valid Entries: 1 - 255

Data Rules:

For a GROUP TYPE of "SFG" or "TRK", this field must be blank.

2.7 QUEUE MODULE

Description: Enter the Queue Module to indicate which Switching Module in this office will be designated to hold and service the queue being defined.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The value entered must be defined as a valid Switching Module on the EQIM form (5700-1/2 Records).

If QUEUE MODULE is entered with a TGN and MEMB combination on one or more of the DELAY ANNOUNCEMENTS, FLEXIBLE FIRST ANNOUNCEMENT or PRIORITY ANNOUNCEMENTS then for each TGN and MEMB combination a matching TRUNK form should be defined with corresponding

Copyright © 2003 Lucent Technologies

TEN[1,3], DEN[1,3] or NEN[1,3] equal to QUEUE MODULE.

2.8 QMON THRESHOLD

Description: Depending on whether the number of calls in the queue is greater or less than the threshold warning value, the QTWL (Queue Threshold Warning Lamp) on the console monitoring this MLHG is turned on or off. The QTWL does not indicate how long the calls have been queued. A lit threshold warning lamp simply indicates that the number of calls in the queue has exceeded the threshold value.

The QTWLs provided by the CSD (Circuit-Switched Data) feature and existing call waiting lamps are not related. Call waiting lamps are only provided for void queues and not for CSD queues. Call waiting warning lamps are lit when the call is in the queue for some specified time. QTWLs are available for both CSD and voice queuing.

Software Release: 5E6 and later
Valid Entries: 1 - 255

Data Rules:

When this field is entered, either BASIC SIZE or EXTENDED SIZE must be entered. QMON THRESHOLD must not be greater than the sum of BASIC SIZE and EXTENDED SIZE.

EXTENDED SIZE must be blank when QUEUE TYPE is "CSD". The extended queue size is used to reserve room in the queue for calls arriving over FX (Foreign Exchange) facilities. FX facilities do not support CSD calls.

2.9 NUM OF CALL WAITING LAMPS

Description: Enter the Number of Call Waiting Lamps.
Valid Entries: 1 - 3

Data Rules:

This field may be entered only if the GROUP TYPE is "LINE". When GROUP TYPE is "TRK" or "SFG", this field must be blank.

A value in NUM OF CALL WAITING LAMPS determines the maximum number of THRESHOLD values that may be entered in CALL WAITING LAMP rows.

For 5E4(2) and later, when "N" is entered in the THRESHOLD TYPE field on a QUFD form, this field must be 1.

CALL WAITING LAMPS

One, two or three lamps (fields Section 2.10 - Section 2.11) may be associated with each queue. There is one queue identified for each MLHG. Up to three delay thresholds, in ascending order, may be specified. Only one lamp will be lit, corresponding to the longest delay currently experienced.

2.10 THRESHOLD

Description: Enter the Call Waiting threshold.

For 5E4(2) and later, the THRESHOLD value may represent either an amount of time calls are in queue or the quantity of calls in queue. When the THRESHOLD TYPE field on a QUFD form is set to "N", THRESHOLD represents the acceptable number of calls in queue before the ISDN Attendant's call waiting warning lamp will light (the lamp will light when this threshold has been exceeded). When "T" is entered in the THRESHOLD TYPE field on a QUFD form, threshold represents an amount of time calls are in queue.

Copyright © 2003 Lucent Technologies

For 5E5 and later, when "N" is entered in THRESHOLD TYPE, THRESHOLD may be 1 - 255 (calls). When "T" is entered in THRESHOLD TYPE, THRESHOLD may be 1 - 31 (6-second intervals).
Valid Entries: 1 - 255

Data Rules:

For 5E5 and later, if THRESHOLD is entered and DPN is not entered, the QUFD form for the FEATURE assigned to this group must have LAMP TYPE set to "FB".

2.11 DPN

Description: If a DPN (Distribute Point Number) is to be associated with the corresponding Call Waiting Lamp Threshold, enter a unique DPN in the following format.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

For offices equipped with CM1 (Communication Module 1), valid entries for SM are 1-48. For offices equipped with CM2 (Communication Module 2), valid entries are 1-192.

For 5E4(2) and later, when "FB" (Feature Button) is entered in the LAMP TYPE field on a QUFD form, DPN must be blank.

For 5e5 and later, if DPN is entered, the QUFD form for the FEATURE assigned to this group must have LAMP TYPE set to "DP".

2.12 NUMBER OF ANNOUNCEMENTS

Description: Enter the Number of Announcements allowed (excluding the flexible first announcement).
Valid Entries: 1 - 4

Data Rules:

If this field is entered, then SPECIAL DELAY TREATMENT must be equal to "Y" on the associated QUFD form (5617-1/2 Records). The announcement or announcements to be used are defined in DELAY ANNOUNCEMENTS, one row for each announcement.

If this field is not entered, then Tone Interval before the First Announcement must not be specified in PRE DELAY TIMING or it must equal 0.

If this field is not entered or is equal to 1, then the Tone Interval Between Announcements must not be specified in INTER DELAY TIMING or it must equal 0.

For 5E9(1) and later, if NUMBER OF ANNOUNCEMENTS is not entered, then TGN from DELAY ANNOUNCEMENTS must not be entered.

2.13 PRE DELAY TONES

Copyright © 2003 Lucent Technologies

Description: Enter the Tone emitted before the first announcement.
Default: AUD
Valid Entries:

Valid PRE DELAY TONES Entries

Entry	Definition
AUD	Audible Ringing Tone
IDLE	No Tone

2.14 PRE DELAY TIMING

Description: Enter the Tone intervals before the first announcement where each interval represents a six-second duration.
Default: 0
Valid Entries: 0 - 20 (6-second intervals)

2.15 INTER DELAY TONE

Description: Enter the Tone emitted between announcements.
Default: AUD
Valid Entries:

Valid INTER DELAY TONE Entries

Entry	Definition
AUD	Audible Ringing Tone
IDLE	No Tone
MUS	Music

2.16 INTER DELAY TIMING

Description: Enter the Tone interval between announcements where each interval represents a six-second duration.
Default: 0
Valid Entries: 0 - 20 (6-second intervals)

2.17 POST DELAY TONE

Description: Enter the Tone emitted after the announcements.
Default: AUD
Valid Entries:

Valid POST DELAY TONE Entries

Entry	Definition
AUD	Audible Ringing Tone
IDLE	No Tone
MUS	Music

MUSIC SOURCE

The following fields (Section 2.18 - Section 2.19) are used to describe the music source for delay tones of "MUS".

2.18 TGN

Description: Enter the trunk group number of the trunk to be used as a music source for music delay tones.

Software Release: 5E6 and later
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

If TGN is entered, then music source MEMB must also be entered. A TGN can only be entered when GROUP TYPE is "LINE" and INTER or POST DELAY TONES is "MUS".

The TGN and MEMB must be defined on the TRUNK form with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE and MUSIC SOURCE equals "Y" on TRUNK form.

2.19 MEMB

Description: Enter the trunk group member number of the trunk to be used as a music source for music delay tones.

Software Release: 5E6 and later
Valid Entries: 0 - 1951

Data Rules:

If music source MEMB is entered, then music source TGN must also be entered.

ISDN ATTENDANT

The next two fields (Section 2.20 - Section 2.21) define warning lamps for the ISDN Attendant Group Overload Warning feature. For information on this feature, refer to Division 2, Section 1T.

2.20 QWARN THRESHOLD

Description: Enter the threshold for the QWARN feature button lamp. When the number of calls in the queue exceeds the threshold value, the QWARN feature button lamps on the appropriate ISAT (ISDN Attendant) terminals are turned on. When the number of calls in the queue falls below the threshold value, the QWARN feature button lamps on the appropriate ISAT terminals are turned off.

The QWARN feature button lamp is defined on the CFGGRP form (5964 Record) using an ACTION of "QCWARN". Refer to Division 6, Section 7A, for more information on this ACTION value.

Software Release: 5E8 and later
Valid Entries: 1 - 251

Data Rules:

If QWARN THRESHOLD is entered, BASIC SIZE must be entered; the QWARN THRESHOLD value must be less than (BASIC SIZE - 3). The number 3 indicates the number of queue slots reserved from the basic portion of the queue for emergency calls. This value is hard-coded in the call processing code.

The QWARN THRESHOLD is applicable only to ISAT Multi-Line Hunt Groups. If QWARN THRESHOLD is entered, GROUP NUMBER can only be defined as a Multi-Line Hunt Group on an MLHG form if HUNT TYPE is set to "ISAT" on the corresponding MLHGFD form.

If QWARN THRESHOLD is entered, the corresponding QUFD form must have CALL WAITING LAMPS set to "Y" and QUEUE TYPE set to "MLHG".

2.21 QBUSY DPN

Description: Enter a unique ISAT Queue Busy DPN (Distribute Point Number). When QBUSY DPN is entered, if the queue is full, the distribution point will cause a lamp to be lit. This lamp is not the same as

Copyright © 2003 Lucent Technologies

the QBUSY feature button lamp on the ISAT terminal.

Software Release: 5E8 and later
Valid Entries: a 9-digit Distribute Point equipment number in the following format.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

If QBUSY DPN is entered, GROUP TYPE must be "LINE".

If QBUSY DPN is entered, it must be unique, i.e., it cannot be assigned on any other form.

If QBUSY DPN is entered, it must be a distribution point defined on the EQMSP or EQMMSP form with TYPE set to "DIST".

The QBUSY DPN is applicable only to ISAT Multi-Line Hunt Groups. If QBUSY DPN is entered then GROUP NUMBER can only be defined as a Multi-Line Hunt Group on an MLHG form with HUNT TYPE set to "ISAT" on the corresponding MLHGFD form.

If QBUSY DPN is entered, the corresponding QUFD form must have CALL WAITING LAMPS set to "Y" and QUEUE TYPE set to "MLHG".

3. FORM ENTRIES - 5617-4 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

3.2 GROUP NUMBER

Description: Enter the Group Number. This number must be the same as that from the corresponding 5617-3 Record entry. This information is not required on the QUFD form.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 through 5E14: 1 - 4000
- For 5E15 and later: 1 - 8191 for LINE (MLHG), 1 - 2000 for SFG, or 1 - 4000 for TRK.

3.3 GROUP TYPE

Description: Enter the type of group to which queuing will be applied. This entry must be the same as that from the corresponding 5617-3 Record entry. This information is not required on the QUFD form.

Valid GROUP TYPE Entries

Entry	Definition
LINE	Multi-Line Hunt Groups.
TRK	Software Release: 5E3 and later. Trunk Groups.
SFG	Software Release: 5E3 and later. Simulated Facility Groups.

Copyright © 2003 Lucent Technologies

Data Rules:

When GROUP TYPE is "LINE", the following conditions must be true on a corresponding QUFD form: the QUEUE TYPE field must be "CSD" or "MLHG" when EXTENDED SIZE is blank; if EXTENDED SIZE is entered, QUEUE TYPE cannot be "CSD".

3.4 FEATURE NAME

Description: Enter the Modular Queuing Feature Name.
Valid Entries: 1 - 8 characters

DELAY ANNOUNCEMENTS

Delay Announcements (fields Section 3.5 - Section 3.8) are assigned on a per-queue basis but can be shared by several queues.

Each row under DELAY ANNOUNCEMENTS defines the announcement trunk to be used. The quantity of announcements (rows) specified must not exceed the value entered in NUMBER OF ANNOUNCEMENTS. When any field in a row is specified, all of the fields in the row must be entered.

3.5 TYPE

Description: Enter the Announcement Type.

Valid TYPE Entries

Entry	Definition
BARGE	Barge-In.
NBARGE	No Barge-In, where the customer will hear the announcement from the beginning of the message.

3.6 CYCLES

Description: Enter the number of times the Announcement is to be given.
Valid Entries: 0 - 4

3.7 TGN

Description: Enter the Trunk Group Number of the Announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN must be defined on the TKGRP form (5202 Record) with a TRK DIR equal to "ANN".

For 5E9(1) and later, the quantity of DELAY ANNOUNCEMENTS TGN must be the same as the NUMBER OF ANNOUNCEMENTS.

3.8 MEMB

Description: Enter the Trunk Member of the Announcement Trunk Group.
Valid Entries: 0 - 1951

Data Rules:

This member must be defined on the TRUNK form (5204 Record) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE.

Copyright © 2003 Lucent Technologies

FLEXIBLE FIRST ANNOUNCEMENT

The Flexible First Announcement (fields Section 3.9 - Section 3.13) may be specified to provide an alternate announcement to the first announcement defined in DELAY ANNOUNCEMENTS. If specified, the Flexible First Announcement is used for the next call into the queue when the longest call already queued has been waiting in the queue for the amount of time as specified by THRESHOLD VALUE. If any field under Flexible First Announcement is entered, they all must be entered.

3.9 TYPE

Description: Enter the Announcement Type of the Flexible First Announcement.

Valid TYPE Entries

Entry	Definition
BARGE	Barge-In.
NBARGE	No Barge-In, where the customer will hear the announcement from the beginning of the message.

3.10 CYCLES

Description: Enter the number of times the Flexible First Announcement is to be given.
Valid Entries: 0 - 4

3.11 TGN

Description: Enter the Trunk Group Number of the Flexible First Announcement.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN must be defined on the TKGRP form (5202 Record) with a TRK DIR equal to "ANN".

3.12 MEMB

Description: Enter the Trunk Member of the Flexible First Announcement Trunk Group.
Valid Entries: 0 - 1951

Data Rules:

This member must be defined on the TRUNK form (5204 Record) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE.

3.13 THRESH VALUE

Description: Enter the Threshold Value associated with the Flexible First Announcement. When the longest queued call has waited this value, the next call into the queue will hear the Flexible First Announcement.
Valid Entries: 1 - 200 (6-second intervals)

3.14 SERV PROT TIME

Description: Enter the Service Protection Time in seconds. 0 indicates no timing or Service Protection.

This field is used when a queue has both a routine section and a priority section. It provides a means of ensuring that routine calls are not completely blocked from being serviced because of priority calls. Service Protection applies to both off-hook and ringback queuing. The expiration of the Service

Copyright © 2003 Lucent Technologies

Protection Time does not cause routine calls to be dequeued immediately. Rather, this will cause the appropriate indicators to be set so that the next available port in the queued-for facility will be used for the call waiting at the head of the routine queue section instead of a priority call.

Software Release: 5E3 and later
Valid Entries: 0 - 2047 (seconds)

Data Rules:

If GROUP TYPE equals "LINE", this field must be left blank.

If a non-zero value is entered in this field, then PRIORITY QUEUE must be equal to "Y" on the associated QUFD form.

3.15 ROUTINE SIZE

Description: Enter the size of the Routine section of the queue when the queue is defined for a group type of "TRK" or "SFG". The Routine section of a queue may be either ringback or off-hook.

Software Release: 5E3 and later
Valid Entries: 1 - 255

Data Rules:

For a group type of "LINE", this field must be blank.

For 5E6 and later, when both PRIORITY SIZE and ROUTINE SIZE are entered, their sum cannot exceed 255.

3.16 ROU Q TIMEOUT

Description: Enter the Routine Queue Timeout in seconds. 0 indicates no timeout.

This field indicates the maximum time that a routine call can remain in the queue. If a Private Facility Access call has been dequeued because of this timeout and the queue is off-hook, the originator will be given reorder tone. An Automatic Route Selection call on timeout is subject to POST Q TREAT, which will indicate either Reorder or Alternate Treatment.

Because of the software scanning function, the timeout value specified is the approximate time which timeout will occur within thirty seconds.

Software Release: 5E3 and later
Valid Entries: 0 - 4095 (seconds)

Data Rules:

If group type is "LINE", this field must be blank.

If QUEUE TYPE on the associated QUFD form is "RGBK", this entry must be less than or equal to 1770.

3.17 PRIORITY SIZE

Description: Enter the size of the Priority section of the queue. 0 indicates no priority queuing.

Software Release: 5E3 and later
Valid Entries: 0 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

If a Priority Section is provided, it should be off-hook.

If PRIORITY QUEUE on the associated QUFD form is equal to "Y", this entry must be greater than zero.

For 5E6 and later, when both PRIORITY SIZE and ROUTINE SIZE are entered, their sum cannot exceed 255.

3.18 PRI Q TIMEOUT

Description: Enter the Priority Queue Timeout in seconds. 0 indicates no timeout.

This field indicates the maximum time that a priority call can remain in the queue. If a Private Facility Access call has been dequeued because of this timeout, the originator will be given Reorder tone. An Automatic Route Selection call on timeout is subject to POST Q TREAT which will indicate either Reorder or Alternate Treatment.

Because of the software scanning function, the timeout value specified is the approximate time which timeout will occur within thirty seconds.

Software Release: 5E3 and later
Valid Entries: 0 - 4095

Data Rules:

If GROUP TYPE is "LINE", this field must be blank.

3.19 NUM OF PRI ANNCMTS

Description: Enter the number of Priority Announcements allowed for the Priority Section of the queue.

Software Release: 5E3 and later
Valid Entries: 0 - 3

Data Rules:

If this field is non-zero, PRIORITY DELAY TREATMENT must "Y". The announcement or announcements to be used are defined in PRIORITY ANNOUNCEMENTS, one row for each announcement.

PRIORITY ANNOUNCEMENTS

Priority Announcements (fields Section 3.20 - Section 3.23) are applicable to 5E3 and later Software Releases and are assigned on a per-queue basis for those queues that have Priority sections. These announcements do not have to be unique and may be shared with other queues. Each row under PRIORITY ANNOUNCEMENTS defines the announcement trunk to be used. The quantity of announcements (rows) specified must not exceed the value entered in NUM OF PRI ANNCMTS. When any field in a row is specified, all of the fields in the row must be entered.

3.20 TYPE

Description: Enter the Announcement Type of the Priority Announcement.

Software Release: 5E3 and later
Valid Entries:

Valid TYPE Entries

Entry	Definition
BARGE	Barge-In
NBARGE	No Barge-In, where the customer will hear the announcement from the beginning of the message.

Copyright © 2003 Lucent Technologies

3.21 CYCLES

Description: Enter the number of times the Priority Announcement is to be given.

Software Release: 5E3 and later
Valid Entries: 0 - 4

3.22 TGN

Description: Enter the Trunk Group Number of the Priority Announcement.

Software Release: 5E3 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN must be defined on the TKGRP form (5202 Record) with a TRK DIR equal to "ANN".

3.23 MEMB

Description: Enter the Trunk Member of the Priority Announcement Trunk Group.

Software Release: 5E3 and later
Valid Entries: 0 - 1951

Data Rules:

This member must be defined on the TRUNK form (5204 Records) with an equipment number specified such that the SM of the trunk is equal to the value entered in QUEUE MODULE.

3.24 RINGBACK TYPE

Description: Enter the distinctive ringing pattern to be used to ringback customers in a Ringback Queue. The pattern is independent of the Distinctive Ringing BRCS feature capability and thus does not require the queuing customer to have a Distinctive Ringing feature assigned.

Software Release: 5E3 and later
Valid Entries:

Valid RINGBACK TYPE Entries

Entry	Definition
A	2 seconds on, 4 seconds off (normal ringing).
B	800 ms on, 400 ms off, 800 ms on, 4 seconds off.
C	400 ms on, 200 ms off, 400 ms on, 200 ms off, 800 ms on, 4 seconds off.
D	1 second on, 1 second off, 1 second on, 3 seconds off.
P	Software Release: 5E4(2) and later. 1640 ms on, 360 ms off.

Data Rules:

This field may be entered only when the QUEUE TYPE on the QUFD is "RGBK".

3.25 RINGBACK INTRVL

Description: Enter the time limit in seconds for ringing back customers in a Ringback Queue. This field indicates how long to apply ringing to the customer's telephone when that customer is in a Ringback Queue and can be dequeued or serviced with the queued-for facility. If the customer does not answer the

Copyright © 2003 Lucent Technologies

telephone within the time limit, the call will be removed from the queue without being served.

Software Releases: 5E3 and later
Valid Entries: 18, 24, 30, 36, 42, and 48 (seconds)

Data Rules:

This field may be entered only when the QUEUE TYPE on the QUFD form is "RGBK".

3.26 RETRY TIMEOUT

Description: Enter the Retry Timeout in seconds for attempting to ringback customers in a Ringback Queue when they have gone back off-hook. 0 indicates no timeout.

This field indicates how long to wait for a customer who is in a Ringback Queue, if while waiting for the queued-for facility, the customer answers or originates another call. With the customer's line busy, it cannot be rungback. If the customer does not hang up within the time specified, the call will be removed from the queue without being served.

Because of the software scanning function, the timeout value specified is the approximate time which timeout will occur within thirty seconds.

Software Release: 5E3 and later
Valid Entries: 0 - 1023 (seconds)

Data Rules:

This field may be entered only when the QUEUE TYPE on the QUFD form is "RGBK".

3.27 POST Q TREAT

Description: Enter the Post Queue Treatment to be given ARS (Automatic Route Selection) calls that have timed out of the queue. A call in the routine section of the queue will timeout based on the value entered in ROU Q TIMEOUT. A call in the priority section of the queue will timeout based on the value entered in PRI Q TIMEOUT.

When "ALTR" is entered and the call that has been queued was invoked through ARS, then the queued-for facility is the first route in a route list. Alternate Treatment indicates that upon timeout, a second attempt should be made through the route list. The FRL (Facility Restriction Level) of the ARS originator may be upgraded for this second attempt through the entries POST QUEUE FRL and THRESH FRL of the originators ARS Group Data on the ARSGPA form (5608-2 Record).

Software Release: 5E3 and later
Valid Entries:

Valid POST Q TREAT Entries

Entry	Definition
REORDER	Reorder Tone
ALTR	Alternate Treatment

Data Rules:

If GROUP TYPE is "LINE", this field must be blank.

3.28 OFC Q NUM TRK GRPS

Description: This field indicates the total number of trunk groups for which GETS calls can be queued in the Office Queuing Resource at any one time.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later.
Valid Entries: 0 - 500

Data Rules:

When GROUP NUMBER equals 0 and OFC Q NUM TRK GRPS does not equal 0, both OFC Q TIMEOUT and OFC Q SIZE must not be 0.

3.29 EGR Q NUM TRK GRPS

Description: This field indicates the total number of trunk groups for which GETS calls can be queued in the Egress Queuing Resource at any one time.

Software Release: 5E15 and later.
Valid Entries: 0 - 500

Data Rules:

When GROUP NUMBER equals 0 and GROUP TYPE is "TRK", either OFC Q NUM TRK GRPS or EGR Q NUM TRK GRPS must not be 0.

When GROUP NUMBER equals 0 and EGR Q NUM TRK GRPS does not equal 0, both EGR Q TIMEOUT and EGR Q SIZE must not be 0.

Both the EGR Q NUM TRK GRPS and the OFC Q NUM TRK GRPS on the QUGPA form must be 0 to 255 for a Classic SM and 0 to 500 for SM2000.

3.30 OFC Q TIMEOUT

Description: This field indicates the maximum number of seconds that a call can remain in the GETS Queuing Resourse for Office Queuing.

Software Release: 5E15 and later.
Default: 15
Valid Entries: 0 - 90 seconds

3.31 EGR Q TIMEOUT

Description: This field indicates the maximum number of seconds that a call can remain in the GETS Queuing Resourse for Egress Queuing.

Software Release: 5E15 and later.
Default: 30
Valid Entries: 0 - 90 seconds

3.32 OFC Q SIZE

Description: This field indicates the number of queue slots made available to GETS OFC Q calls.

Software Release: 5E15 and later.
Default: 5
Valid Entries: 0 - 255

3.33 EGR Q SIZE

Description: This field indicates the number of queue slots made available to GETS EGR Q calls.

Software Release: 5E15 and later.

Copyright © 2003 Lucent Technologies

Default: 5
Valid Entries: 0 - 255

Data Rules:

For 5E15 and later, when the sum of (EGR Q SIZE * EGR Q NUM TRK GRPS) and (OFC Q SIZE * OFC Q NUM TRK GRPS) on the QUGPA form must not be greater than 255 on an SM, and 4000 on an SM-2000.

3.34 SADA

Description: Should the Service After Delay Announcement feature be activated?

The feature allows the first announcement of a delay treatment to be completely played before the call is made available to a hunt group. This field must be set to "Y" if the Service After Delay Announcement feature is active for any hunt group with queuing; otherwise, enter "N".

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the NUMBER OF ANNOUNCEMENTS field is blank or GROUP TYPE is not "LINE", then SADA must be "N". If SADA is "Y", GROUP TYPE must be "LINE".

3.35 ANNC BILL

Description: Does billing occur at the time of announcement? This Announcement Billing indicator field is part of the Service After Delay Announcement feature.

Software Release: 5E5 and later
Required Field.
Default: Y

Value Entries: Y, N

Data Rules:

Enter "N" if billing occurs when the call is connected to a hunt group member. Also, enter "N" if the GROUP TYPE is "SFG" or "TRK".

SEC. 19: PRECEDENCE AND PREEMPTION FORMS

Copyright © 2003 Lucent Technologies

SEC. 19A: 5618-1A/1B RECORD PRECEDENCE & PREEMPTION FEATURE DEFINITION FORM - PPFD

1. GENERAL

The 5618-1 Precedence and Preemption Feature Definition Record is available with the 5E2 and later Software Release. The Precedence and Preemption feature is used in DSN (Defense Switched Network) Interface switches to provide direct precedence dialing of calls and precedence treatment for terminating calls such as automatic preemption and the redirection of calls to an DSN Interface attendant associated with the dialed line.

A terminal (line or trunk) must be assigned a Precedence and Preemption Feature on the appropriate feature assignment forms: LINEFA form (5112 Record), MLHLNFA form (5113 Record), BFG form (5625 Record), TKGRPFA form (5206 Record) or TRUNKFA form (5205 Record).

Lines served by the 5ESS Switch (excluding a Satellite PBX) may have rotary, 12 or 16 button DTMF (Dual Tone Multi Frequency) terminals. The 16-button set, which is applicable only to DSN subscribers includes 4 additional digit values of "O" "F" I" and "P" used to indicate precedence level.

Precedence Level	Definition
O	Flash Override
F	Flash
I	Immediate
P	Priority

Special dialing patterns include DSN access codes, route codes, and DSN area codes. These special digits and codes must be translated in the Individualized Dialing Plan Dial Code Assignment IDPDCA form (5601-1/2 Records). With 5E3 and earlier, every line that has a Precedence and Preemption feature assigned to it must have an Individualized Dialing Feature with IDP Group equal to "Y". A PP (Precedence and Preemption) group is a Terminal Group where all of the members have a PP feature. With 5E3 and earlier, the line must also have a Terminal Group/Station Restriction Feature TGSRFD form (5607-1 Record). When defining the line on the LINE form (5109-1 Record), or the MLHLN form (5111-1 Record), the Line Class Code and Rate Area assigned must result in a Class of Service of "INDIV" or "ATND" on an LCC form (5306 Record) and Party must be "I" for Individual. When Multi-Line Hunt Lines have a Precedence and Preemption Feature assigned, all terminals of the group must have a PPFD and the Multi-Line Hunt Group must be assigned an MLHG Feature which has been defined on the MLHGFD form (5604 Record) with HUNT TYPE equal to "PRRG".

Lines which are defined for the Satellite PBX subscribers must also belong to the IDP Group and Terminal Group defined for the line at the 5ESS DSN Interface and, therefore, require the IDFD and TGSRFD Features described above. However, the satellite subscriber may only directly place routine DSN calls. When precedence calls are desired, these subscribers must access the DSN Attendant at the Interface Switch. The Class of Service may be "PBX" or "INDIV" and Party must be "I".

When a PPFD is defined with default parameters and the feature is assigned on a LINEFA form (5112 Record) or a MLHLNFA form (5113 Record), the line will be assigned all of the default parameters except TRUNK TYPE (this parameter is only applicable to trunks) unless the default parameters are overridden by values specified on a PPLPA form (5618-3 Record) or a PPMPA form (5618-4 Record), as appropriate.

1.1 Tie Trunks

For tie trunks to and/or from the DSN Network Switch, the Trunk Group must be defined on a TKGRP form (5202-1 Record) with a TRKCLS of "LTOLLCON". OUTPULSING must be "TT" and INPULSING may be "DP" or "TT". All trunks in the Trunk Group must belong to the Terminal Group of the lines via a TGSR feature. These Trunk Groups may be Incoming, Outgoing, or Two-Way and must have an TRUNK TYPE defined on either this form, the PPFD as a default parameter or on the PPTPA form (5618-5 Record). The TRUNK TYPE must be either "VONPNID" or "VONRNID" where the latter may be used only for routine

Copyright © 2003 Lucent Technologies

DSN calls. When the TRUNK TYPE is "VONPNID", all levels of precedence are appropriate. On an incoming call from the DSN Network Switch with the TRUNK TYPE "VONPNID", the first digit received is the precedence digit and the subsequent digits must translate to an ACTION of "ICMUSE" in the IDPDCA. (If not, the Fixed Route Type of "PPVAC" is invoked.) With 5E3 and earlier, these trunks must have an Individualized Dialing Feature with IDP Group equal to Yes.

1.2 MLPP on PRI Trunks

For 5E9(2) and later, the MLPP (Multi-level Precedence and Preemption) feature allows a call with higher priority to preempt a PRI B-channel.If the preempted B-channel is needed for the subsequent connection, it is preempted for reuse. If it is not needed for the subsequent connections, it is preempted to clear. MLPP has the ability to mark each B-channel with a precedence level which uniquely identifies the current call. It also provides the transport of precedence level across the PRI. Each B-channel supports the five precedence levels.

In order for the MLPP feature to operate and the unique dialing plan of the DSN to be handled, a contructed BRCS feature is assigned to each end of a trunk group. The MLPP feature defines the MLPP trunk type. The switch uses the trunk type to decide how to populate the SETUP message.

The originating switch can be a DSN (Defense Switched Network) or a commercial office. A PRI MLPP trunk type ("MLPPCQ", "MLPPDQI , "MLPPDQO", "MLPPPQ") must be assigned, with a TRKCLS of "EDSL" on the TKGRP form. The Precedence limit (PREC LIMIT field) must be assigned.

1.3 Trunks to a Satellite PBX

For trunks outgoing to a Satellite PBX, the Trunk Group must be defined on the TKGRP form (5202-1 Record) with a TRKCLS of "PBXDID". With 5E3 and earlier, all trunks in the Trunk Group must belong to the Terminal Group of the lines via a TGSR Feature. These trunks must have an TRUNK TYPE defined on either this form, the PPFD, as a default parameter or on the PPTPA form (5618-5 Record). The TRUNK TYPE must be either "SATINID" or "SATPID". Since only routine calls can terminate directly to the "SATINID" type, precedence calls are redirected to the Attendant via the ATDN CDI specified on this form. Precedence calls may terminate directly on a "SATPID" type and, additionally, if the precedence call is not answered within a specified time, the call is routed to the Attendant via entries in FORWARD TIME and ATDN CDI.

1.4 Attendant Lines

The Attendant lines for the PP Group are expected to be defined in a Multiposition Hunt Type MLHG. Using unique DN (Directory Numbers) for different call types, which may be directed to the six subgroups of the MUPH group, enables the attendant to prioritize the answering of calls at the console. Examples of six possible subgroups are:

- DN for precedence calls.
- DN for routine calls.
- DN for non-DSN calls.
- Call Forwarding to an Attendant DN for precedence calls to a busy line.
- Call Forwarding to an Attendant DN for precedence calls to an idle line.
- Dial 0 for the Attendant, reconstructed DN.

A PP member defined with an Attendant Class of Service has the ability to override the precedence level of a line by Attendant Through Dialing, i.e., by dialing the precedence access code (subject to the authorized precedence level of the Attendant) and then dialing the remaining digits or cutting out of the

Copyright © 2003 Lucent Technologies

call allowing the originating line to dial subsequent digits.

1.5 Digit Interpretation

Initial digit interpretation for a member of a PP group must be done in the IDPDCA form (5601-1/2 Record). Provisions have been made in the IDP to translate the special digit sequence of an DSN user. The general format of an DSN Interface user originating a precedence call to the DSN Network Switch is a feature code which may be combined with a precedence digit, a Route Code, an DSN area code, followed by a seven-digit DSN telephone number. This digit string may be represented as follows:

Where: (F+)(P) + (1X) + (NYX) + NNX + XXXX

Digit String	Definition
F	Feature access code
P	Precedence digit, usually any single digit 0 to 4
1X	Route code, where X = 0 to 9
NYX	DSN area code, same structure as an NPA
NNX	DSN switch center code
XXXX	Line number

The IDP is normally built with a feature code (e.g., 7) for routine DSN calls. Another feature code (e.g., 8) is designated for precedence calls, however, there are several important differences. In this case, this code is normally translated together with several second digits signifying the level of precedence. As an example, 80 could be used for flash override precedence calls, while 81 through 83 are used for the other precedence levels. These may be translated for a second dial tone following the 8 or without by selecting the appropriate ACTION in IDPDCA, such as "PAFO" or "PPFO".

Alternately, subscribers may be equipped with 16-button telephone sets which include the DTMF (Dual Tone Multi Frequency) digits of O, F, I, and P. These digits may also be translated in the IDP to indicate access to Flash Override, Flash, Immediate and Priority precedence calls.

Each time a PP user attempts to make a precedence call, the dialed precedence is checked against that user's authorized precedence. The user's authorization may be specified either as a default parameter on this form or on the appropriate parameter form, PPLPA or PPMPA.

When the precedence digit is not dialed but instead retrieved as part of a stored DN from an Abbreviated Dial List, no check is made on the user's authorized level. (If the DNs are stored in ADLIST through an "AD1CH" or "AD2CH" IDP Action, a precedence level check is made at the time of the CORC (Customer Originated Recent Change). This means that an originator may place an Abbreviated Dial call with a higher than authorized level of precedence to certain numbers if the originator shares a list but does not CORC the stored DNs or the DNs are stored via Recent Change.)

If a Route Code is subsequently dialed, these digits must also be translated in the IDP. The DIALING STATE of "PAUSE" was added to the IDPDCA to tell call processing it is necessary to go back through the IDPDCA with the next set of digits. PAUSE would be used with the above example of the digits 80, so the information can be collected on the feature access plus precedence level and then another pass through IDPDCA is made to translate the Route Code which indicates the routing treatment to be given specific types of calls.

If the next digits are an DSN area code, these will be translated in the IDPDCA as any of PP1AREA through PP5AREA. These are representations of the five possible geographic areas for DSN. These IDP designations are mapped into a corresponding Code Index value defined on this form.

For any given DSN call, the Code Index translated from the DSN area code indicator, the Route Code and the Precedence Level are used as keys along with the originator's Screening Index and the Terminal Group ID of the PP Group as an index into the PPSCRN form (5618-2 Record). The output of the PPSCRN form is the route or destination to take. Destinations include the tie trunk to the DSN Network Switch, the Attendant, or a failure route to an announcement or to Reorder. An DSN call does not get translated in the RAR form (5301 Record) as normal calls do.

Copyright © 2003 Lucent Technologies

1.6 Auto ARS and PP Features

Auto ARS and PP features are incompatible on the same line. If the PP feature is assigned, then ARS is not recognized and the call proceeds as a PP call. For additional information about the interaction of these features, see the "Automatic Route Selection" section of the Business and Residence Modular Features Feature Document, AT&T 235-190-101.

1.7 Recent Change View

The corresponding Recent Change View for this form is 12.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and the Office Name on each record.

2.2 *FEATURE NAME

Description: This field is used to enter the Precedence and Preemption Feature Name. The first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA data base, but may not be deleted, changed or inserted.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: This field is used to enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (2.4 - 2.12) define the available feature options.

2.4 NON AV PREC LEVEL

Description: This field is used to enter the precedence level of calls involving a non-DSN line or trunk. If a line with this feature is involved in a call with a non-DSN line (or trunk), only calls with a higher precedence level than the one entered here may preempt the call.

Required Field.

Valid entries in order of increasing precedence are:

Valid NON AV PREC LEVEL Entries

Entry	Definition
R	Routine
P	Priortiy
I	Immediate
F	Flash
FO	Flash Override

2.5 FORWARD TIME

Description: This field is used to enter the number of seconds before a precedence call on a trunk from the end office to a satellite PBX is forwarded to an attendant. 0 means to immediately forward. Used for PBXDID outgoing trunks to a PP Trunk Group with a TRUNK TYPE of "SATPID". The call will be translated based on the entry in ATDN CDI.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 60 seconds

2.6 ATDN CDI

Description: This field is used to enter a Code Index to be used to route precedence calls to an Attendant. For 5E3 and later, do not enter a Code Index if there is not an attendant to route calls to.

Required Field for 5E2 only.
Valid Entries: 1 - 4095

Data Rules:

The Code Index entered here must be specified on the PPSCRN form for each terminal group in which this feature is assigned.

2.7 AREA1 CDI

Description: This field is used to enter a Code Index to be used to route calls made to DSN geographic area 1.
Valid Entries: 1 - 4095

Data Rules:

The Code Index entered here must be on a PPSCRN form for each Terminal Group in which this feature is assigned.

If AREA1 CDI is specified and this feature is assigned to a line, then the line should be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP (on the IDPDCA form) should have ACTION equal to "PP1AREA" and a FEATURE associated with the dialed code on the IDPDCA form must be the precedence and preemption wild-card feature (/PP*) or equal to this precedence and preemption feature.

2.8 AREA2 CDI

Description: This field is used to enter a Code Index to be used to route calls made to DSN geographic area 2.
Valid Entries: 1 - 4095

Data Rules:

The Code Index entered here must be on a PPSCRN form for each Terminal Group in which this feature is assigned.

If AREA2 CDI is specified and this feature is assigned to a line, then the line should be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP (on the IDPDCA form) should have ACTION equal to "PP2AREA" and a FEATURE associated with the dialed code on the IDPDCA form must be the precedence and preemption wild-card feature (/PP*) or equal to this precedence and preemption feature.

2.9 AREA3 CDI

Description: This field is used to enter a Code Index to be used to route calls made to DSN geographic area 3.
Valid Entries: 1 - 4095

Data Rules:

The Code Index entered here must be on a PPSCRN form for each Terminal Group in which this feature is

Copyright © 2003 Lucent Technologies

assigned.

If AREA3 CDI is specified and this feature is assigned to a line, then the line should be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP (on the IDPDCA form) should have ACTION equal to "PP3AREA" and a FEATURE associated with the dialed code on the IDPDCA form must be the precedence and preemption wild-card feature (/PP*) or equal to this precedence and preemption feature.

2.10 AREA4 CDI

Description: This field is used to enter a Code Index to be used to route calls made to DSN geographic area 4.
Valid Entries: 1 - 4095

Data Rules:

The Code Index entered here must be on a PPSCRN form for each Terminal Group in which this feature is assigned.

If AREA4 CDI is specified and this feature is assigned to a line, then the line should be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP (on the IDPDCA form) should have ACTION equal to "PP4AREA" and a FEATURE associated with the dialed code on the IDPDCA form must be the precedence and preemption wild-card feature (/PP*) or equal to this precedence and preemption feature.

2.11 AREA5 CDI

Description: This field is used to enter a Code Index to be used to route calls made to DSN geographic area 5.

Valid Entires: 1 - 4095

Data Rules:

The Code Index entered here must be on a PPSCRN form for each Terminal Group in which this feature is assigned.

If AREA5 CDI is specified and this feature is assigned to a line, then the line should be assigned an IDP (Individualized Dialing Plan) and at least one dialed code of the IDP (on the IDPDCA form) should have ACTION equal to "PP5AREA" and a FEATURE associated with the dialed code on the IDPDCA form must be the precedence and preemption wild-card feature (/PP*) or equal to this precedence and preemption feature.

2.12 CROSSOVER

Description: Can ports without DSN network privileges be connected to DSN trunks without assistance from the attendant? This field must be "Y" in a DSN office.

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

LINE DEFAULT PARAMETERS

The following fields (2.13-2.27) define the default parameters assigned with the feature to lines. These parameters will be assigned to the lines unless they are overridden by entries on the PPLPA or PPMPA forms. The default parameters are optional; however, if any are entered, the default parameter entries

Copyright © 2003 Lucent Technologies

must be consistent with one another.

2.13 AV TIE TRUNK PREC LEVEL

Description: This field is used to indicate the highest authorized Precedence Level of a call originated by a line with this feature to the DSN Network over an DSN Tie Trunk.

If a value is not entered (here or on the PPLPA or PPMA form), the line may not originate calls to the DSN Network.

When a line with this feature originates an DSN call to the DSN Network, the precedence of the digits analyzed in the IDPDCA will be checked against this entry to determine if the originator has sufficient permission.

Software Release: 5E2 only
Valid Entries: Valid entries in order of increasing precedence are:

Valid AV TIE TRUNK PREC LEVEL Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash
FO	Flash Override

Data Rules:

If ORIGINATE AV CALLS is "Y" then AV TIE TRUNK PREC LEVEL must be entered. If ORIGINATE AV CALLS is "N" then AV TIE TRUNK PREC LEVEL must not be entered.

Related Actions specified on the IDPDCA are as follows, where the first ACTION includes a second Dial Tone and the latter does not:

Action	Second Dial Tone	No Second Dial Tone
R(Routine)	PAR	PPR
P(Priortiy)	PAP	PPP
I(Immediate)	PAI	PPI
F(Flash)	PAF	PPF
F(Flash Override)	PAFO	PPFO

2.14 PREC COI

Description: This field is used to indicate the highest authorized precedence of a call originating on this line to a port in the same community of interest group.

If a value is not entered (here or on the PPLPA or PPMPA form), the line may not originate calls to the DSN Network.

When a line with this feature originates an DSN call to the DSN Network, the precedence of the digits analyzed in the IDPDCA will be checked against this entry to determine if the originator has sufficient permission.

Software Release: 5E3 and later
Valid Entries: Valid entries in order of increasing precedence are:

Valid PREC COI Entries

Entry	Definition
R	Routine
P	Priortiy
I	Immediate
F	Flash
FO	Flash Override

Copyright © 2003 Lucent Technologies

Data Rules:

If this field or COI GROUP ID is entered, then both fields must be entered.

Related Actions specified on the IDPDCA are as follows, where the first ACTION includes a second Dial Tone and the latter does not:

Action	Second Dial Tone	No Second Dial Tone
R(Routine)	PAR	PPR
P(Priortiy)	PAP	PPP
I(Immediate)	PAI	PPI
F(Flash)	PAF	PPF
F(Flash Override)	PAFO	PPFO

2.15 LOCAL AV PREC LEVEL

Description: This field is used to enter the highest authorized Precedence Level of a call originated by a line with this feature to another line in the 5ESS office with a PP feature.

Software Release: 5E2 only
Required Field.
Default: R

Valid entries in order of increasing precedence are:
Valid Entries:

Valid LOCAL AV PREC LEVEL Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash
FO	Flash Override
E	Executive

Data Rules:

Related Actions specified in the IDPDCA form are as follows:

Action	Second Dial Tone	No Second Dial Tone
R(Routine)	PAR	PPR
P(Priortiy)	PAP	PPP
I(Immediate)	PAI	PPI
F(Flash)	PAF	PPF
FO(Flash Overide)	PAFO	PPFO
E(Executive)	PAEO	PPEO

2.16 PREC NON COI

Description: This field is used to indicate the highest authorized precedence level of a call originating on this line to a non-community of interest group destination.

Software Release: 5E3 and later
Required Field.
Default: R

Valid entries in order of increasing precedence are:
Valid Entries:

Valid PREC NON COI Entries

Entry	Definition
R	Routine
P	Priortiy
I	Immediate
F	Flash

Copyright © 2003 Lucent Technologies

FO	Flash Overide
E	Executive

Related Actions specified in the IDPDCA form are as follows:

Action	Second Dial Tone	No Second Dial Tone
R(Routine)	PAR	PPR
P(Priortiy)	PAP	PPP
I(Immediate)	PAI	PPI
F(Flash)	PAF	PPF
FO(Flash Overide)	PAFO	PPFO
E(Excutive)	PAEO	PPEO

2.17 PREEMPTABLE LINE

Description: Can a line with this feature be preempted? If a line is assigned this feature and a PPLPA form (5618-3 Record) or PPMPA form (5618-4 Record)is not submitted and no entry is made in this field, "Y" will be assumed.
Valid Entries: Y, N

Data Rules:

If Multi-Line Hunt lines are assigned PP features, all preemptable lines in the group must have higher terminal numbers than nonpreemtable lines.

2.18 IMMED PREEMPTION

Description: Is immediate preemption in effect for preemption lines? Immediate preemptable allows calls of an appropriate priority terminating to the line to preempt regardless of call waiting or call forwarding - busy line being in effect.

If a line is assigned this feature and a PPLPA or PPMPA form is not submitted and no entry is made in this field, "Y" will be assumed.
Valid Entries: Y, N

Data Rule
If PREEMPTABLE LINE is "N", then this field must be equal to "N".

2.19 PREC CPU

Description: Can precedence calls to the line be picked up using the call pickup feature?

If a line is assigned this feature and a PPLPA or PPMPA form is not submitted and no entry is made in this field, "N" will be assumed. If a "Y" is entered and a PPLPA or PPMPA form is not submitted, a line with this feature also requires a call pickup terminating feature.
Valid Entries: Y, N

2.20 FWD IAGP PREC

Description: Will an intra-terminal group precedence call to a line with this feature be forwarded when the line is busy or does not answer?

If a line is assigned this feature and a PPLPA or PPMPA form is not submitted and no entry is made in this field, "N" will be assumed. If a "Y" is entered here or on a PPLPA or PPMPA form, a line with this feature also requires either a Call Forwarding - Don't Answer PP feature or a Call Forwarding Busy PP feature.
Valid Entries: Y, N

2.21 RECEIVE AV CALLS

Description: Can a PP line with this feature receive calls from the DSN Network? For a DSN office, "Y"

Copyright © 2003 Lucent Technologies

must be entered. If "Y" is entered, this line also requires a Call Forwarding - Don't Answer PP feature.

Software Release: 5E2 only
Required Field.
Default: Y
Valid Entries: Y, N

2.22 TERM NETWK CALLS

Description: Can a PP line with this feature receive calls from the DSN Network? If "Y" is entered, this line also requires a Call Forwarding - Don't Answer PP feature. For a DSN office, "Y" must be entered.

Software Release: 5E3 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.23 ORIGINATE AV CALLS

Description: Can a PP line with this feature originate calls to the DSN Network?

Software Release: 5E2 only
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then AV TIE TRUNK PREC LEVEL must be entered. If "N" is entered, then AV TIE TRUNK PREC LEVEL must not be entered.

2.24 ORIG NETWK CALLS

Description: Can a PP line with this feature originate calls to the DSN Network?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the office is a DSN office, "Y" must be entered.

2.25 DIRECT STA SELECT

Description: Can a line with this feature have the Direct Station Select feature?

A line with Direct Station Select may not dial anything other than the abbreviated dial codes. No more than one digit is recognized by the switch for any single phone call.

If "Y" is entered, this line must also have a 1-digit no change abbreviated dial list and an IDP that will accommodate the abbreviated dial codes.

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When a PP feature with DIRECT STA SELECT set to "Y" on this form or on a PPLPA of BFG form is assigned to a line, a 1-digit speed call feature must be assigned to the line on a LINEFA, BFG, or associated CLUSTR form; when the PP feature is assigned to an MLHG/TERM, the 1-digit speed call feature must be assigned to the terminal on an MLHLNFA, BFG or associated CLUSTR form. For 5E7 and later, if the line or MLHG terminal is a Secondary Only Shared TN (MLHG/TERM), the Speed Call feature must be assigned to the Primary TN (MLHG/TERM).

2.26 COI GROUP ID

Description: This field is used to enter the Community of Interest Group ID. A COI is a group of subscribers who generate the majority of their traffic in calls to each other.

Software Release: 5E3 and later
Valid Entries: 1 - 20.

Data Rules:

If this field or PREC COI is entered, then both fields must be entered.

2.27 HOT LINE

Description: This field must have an entry if the line is a hot line. Hot line service is used when the forward number is that of another hot line or when a station only wishes to accept calls from other hot lines.

Hot line subscribers can be described as master, slave or neither. Typically, hot line subscribers are paired, where each hot line has the number of the other stored as its forward number. When both subscribers attempt to originate calls at the same time, the master hot line takes precedence over the slave hot line.

Software Release: 5E3 and later
Valid Entries:

Valid HOT LINE Entries

Entry	Definition
MV	Master voice hot line used for pairing.
MD	Master data hot line used for pairing.
SV	Slave voice hot line used for pairing.
SD	Slave data hot line used for pairing.
HV	Voice hot line that is neither a master or slave, used when hot lines are not paired.
HD	Data hot line that is neither a master or slave, used when hot lines are not paired.

Data Rules:

If entry is made in this field, the LCC form associated with the TN or MLHG/TERM must have a CLASS OF SERVICE of either "INDIV" or "4WINDIV".

A CKT TN or a CKT MLHG / CKT TERM defined on the DSLUSR form (5908 Record) cannot be assigned a hot line Precedence and Preemption feature.

TRUNK DEFAULT PARAMETERS

The following fields (2.28 - 2.32) define the default parameters assigned with the feature to trunks. These parameters will be assigned to the trunks unless they are overridden by entries on the PPLPA, PPMPA or PPTPA forms. The default parameters are optional, however, if any are entered, the default parameter entries must be consistent with one another.

2.28 TRUNK TYPE

Copyright © 2003 Lucent Technologies

Description: This field is used to indicate the DSN trunk type for trunks that are assigned this feature.

Software Release: 5E3 and later
Valid Entries:

Valid TRUNK TYPE Entries

Entry	Definition
EOINID	End Office Immediate Diversion Network In-Dialing.
EOPNID	End Office Precedence Diversion Network In-Dialing.
EORNID	End office Immediate Dialing Diversion Network In-Dialing.
MLPPCQ	Software Release: 5E9(2) and later. MLPP (Multi-Level Precedence and Preemption) Commercial Q.931/DSS1 for PBX or LEC. DSS1 (Digital Subscriber Signaling Number 1) is layer 3 ISDN protocol on BRIs and PRIs. The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
MLPPDQI	Software Release: 5E9(2) and later. Multi-Level Precedence and Preemption DSN Q.931/DSS1 IPR (Incoming PRI). The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
MLPPDQO	Software Release: 5E9(2) and later. Multi-Level Precedence and Preemption DSN Q.931/DSS1 OPR (Outgoing PRI). The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
MLPPPQ	Software Release: 5E9(2) and later. Multi-Level Precedence and Preemption Polygrid Q.931/DSS1. The Polygrid trunk is used to interconnect DSN switches. The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
NONRCD	Inter Switch Trunks without Route control digit.
OFFNET	Off-Network.
RCD	Route Control Digit.
SATINID	Satellite Immediate Network In-Dialing.
SATPID	Satellite Priority In-Dialing.
TIERNID	Tie Trunk Routine Network In-Dialing.
TIEPNID	Tie Trunk Precedence Network In-Dialing.
VONPNID	Tandem Precedence Network In-Dialing.
VONRNID	Tandem Routine Network In-Dialing.

Data Rules:

If a trunk is assigned this feature, either this field must be entered, or a PPTPA form must be submitted with an entry in its corresponding field.

For 5E9(2) and later:

- if TRUNK TYPE is "MLPPCQ", "MLPPDQI , "MLPPDQO", "MLPPPQ", NONRCD", "OFFNET", "RCD", "SATINID", SATPID", "TIERNID" ,"TIEPNID", "VONPNID" or "VONRNID", then ESP must be "N".

- If TRUNK TYPE is "MLPPCQ", "MLPPDQI , "MLPPDQO" or "MLPPPQ", then PREC LIMIT must be "F", "FO", "I", P" or "R".

- If a trunk group is assigned to a Precedence and Preemption Feature on either the TKGRPFA form or an associated CLUSTR form with a TRUNK TYPE of"MLPPCQ", "MLPPDQI", "MLPPDQO or "MLPPPQ" on either the PPFD form or PPTPA form; then the TGN must also be defined on the TKGRP form with a HUNT TYPE of "PRFL", "PRBL", PLFL", or "PLBL".

When trunks are assigned a Precedence and Preemption Feature on either the TRUNKFA form or an associated CLUSTR form with a TRUNK TYPE on either the PPFD form or the PPTPA form, then the TRKCLS on the associated TKGRP form must be as follows:

Copyright © 2003 Lucent Technologies

TRUNK TYPE	TRKCLS TKGRP FORM
EOINID	TTOLLCON
EOPNID	TTOLLCON
EORNID	TTOLLCON
MLPPCQ	EDSL
MLPPDQI	EDSL
MLPPDQO	EDSL
MLPPPQ	EDSL
NONRCD	PRINTOLL
OFFNET	LTOLLCON
RCD	PRINTOLL
SATINID	PBXDID
SATPID	PBXDID
TIEPNID	LTOLLCON
TIERNID	LTOLLCON
VONRNID	PF
	PFLASH
	PFITT
	LTOLLCON

2.29 PREC LIMIT

Description: This field is used to indicate the maximum authorized precedence level for the trunk.

Software Release: 5E3 and later
Default: R
Valid Entries:

Valid PREC LIMIT Entries

Entry	Definition
I	Immediate
F	Flash
FO	Flash Override
P	Priortiy
R	Routine

Data Rules:

Each TRUNK TYPE can only have the following values:

TRUNK TYPE	Value
EOINID	FO, F, I, P, R
EOPNID	FO, F, I, P, R
EORNID	R
MLPPCQ	F, FO, I, P, or R
MLPPDQI	F, FO, I, P, or R
MLPPDQO	F, FO, I, P, or R
MLPPPQ	F, FO, I, P, or R
NONRCD	FO
OFFNET	FO
RCD	FO
SATINID	FO
SATPID	FO
TIERNID	FO, F, I, P, R
TIEPNID	FO, F, I, P, R
VONPNID	FO, F, I, P, R
VONRNID	FO, F, I, P, R

2.30 ESP

Description: Is this trunk allowed preferential treatment under load conditions?

Software Release: 5E3 and later
Default: N

Valid Entries; Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If TRUNK TYPE is "MLPPCQ", MLPPDQI", "MLPPDQO", "MLPPPQ", "NONRCD", OFFNET", "RCD", "SATINID", "SATPID", TIERNID" ,"TIEPNID", "VONRNID" or, "VONPNID", ESP must be "N".

2.31 PRIORITY RINGING

Description: This field is used to enter the type of trunk signal required to cause a priority ring.

Software Release: 5E3 and later
Required Field.
Valid Entries:

Valid PRIORTIY RINGING Entries

Entry	Definition
4WOFF	Off-hook alerting.
4W350	Simple wink 350 milliseconds off-hook, 350 milliseconds on-hook,,off-hook.
4W1650	Continuous 1650 milliseconds off-hook, 350 milliseconds on-hook.
NORING	No ringing is to be supplied.

Data Rules:

If TRUNK TYPE is "EOINID", then "4WOFF", "4W350" or "4W1650" must be entered.

SEC. 19B: 5618-2 RECORD
PRECEDENCE AND PREEMPTION SCREENING FORM - PPSCRN

1. GENERAL

The 5618-2 Precedence and Preemption Screening Record is available with the 5E2 and later Software Releases. It is used to define the routing treatment for calls associated with the DSN (Defense Switched Network) Precedence and Preemption feature.

When call processing attempts to route an DSN (Defense Switched Network) call, the data on this form is used to obtain the route or destination and to screen the call. On a POTS call, most of this data would be obtained in the RAR form (5301 Record). The RAR form is not used for an DSN (Defense Switched Network) call.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SCR

Description: Enter a screening index.

The Screen Indexes entered on this form are generally also entered on the RAR form since the originating line (or trunk) may be making either an DSN (Defense Switched Network) or a non-DSN (Defense Switched Network) call. A Screening Index is assigned to a line via the LCC form (5306 Record), and to a Trunk Group on the TKGRP form (5202 Record).

Required Field.
Valid Entries: 1 - 4095

2.3 * CDI

Description: Enter the Code Index.

The Code Index may be associated with either an Attendant or one of the DSN (Defense Switched Network) geographic areas 1-5. These Code Indexes are specified on the PPFD form (5618-2 Record) and are triggered through digit analysis entries in the IDPDCA form (5601-1/2 Records). For more information on DSN (Defense Switched Network) digit analysis see the section on PPFD.

Required Field.
Valid Entries: 1 - 4095

2.4 * AV ROUTE CODE

Description: Enter the DSN (Defense Switched Network) Route Code.

The values entered here correspond to the PNTRC action code in the originator's Individualized Dialing Plan defined on a IDPDCA form.

Required Field.
Valid Entries: 0 - 9

Copyright © 2003 Lucent Technologies

2.5 * PRECEDENCE LEVEL

Description: Enter an DSN (Defense Switched Network) Precedence Level.

The values entered here correspond to the PNTR, PNTP, PNTI, PNTF, PNTFO, and PNTEO (or the PDTR, PDTP, PDTI, PDTF, PDTFO, and PDTEO second dial tone versions) action codes in the originator's Individualized Dialing Plan defined on a IDPDCA form.

Required Field.

Valid entries appear in the following table in order of increasing precedence.

Valid PRECEDENCE LEVEL Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash
FO	Flash Override
E	Executive

Data Rules:

When the Precedence Level is "E", then Route Type must not equal "MC", "HUNT" or "POLYGRD".

2.6 # ROUTE TYPE

Description: Enter the Route Type for calls accessing this entry.

Required Field.

Valid ROUTE TYPE Entries

Entry	Definition
ATDN	Used when the call is to complete to an attendant of the Terminal Group.
DN	Used when the call is to complete to a telephone within this 5ESS Switch office.
HUNT	Hunt for an idle trunk member.
MC	Used when the call is to route via an MC Route Index.
POLYGRD	Used for Polygrid routing in DSN (Defense Switched Network) offices.
REGL	Used when the call is to route via a regular Route Index.
REORD	Routes the call to Reorder Tone.

Data Rules:

See Figure 1 for dependencies between this and other fields on the form.

If ROUTE INDEX TYPE is "REGL", then RTIDX must not be entered.

For 5E11 and later, when the PPSCRN forms have a ROUTE TYPE of "POLYGRD" and a known ROUTE INDEX, there must be a PPPOLY form with a matching POLY RT NUM.

For 5E11 and later, when PPSCRN forms have a ROUTE TYPE of "HUNT" and a known ROUTE INDEX, there must be RTIDX form with a matching ROUTE INDEX.

2.7 MC ROUTE INDEX

Description: When Route Type is "MC", enter an MC Route Index to route the call to the DSN (Defense Switch Network) Switch.

Software Release: 5E2 only.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Copyright © 2003 Lucent Technologies

Data Rules:

Any entry here must be defined on the MCRTIDX form (5304 Record).

2.8 REGL ROUTE INDEX

Description: When Route Type is "REGRI", enter a REGL Route Index to route the call to a POTS Route Index usually for an announcement to block the call or to a satellite PBX Trunk Group.

Software Release: 5E2 only.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

Any entry here must be defined on the RTIDX form (5303 Record).

2.9 ROUTE INDEX

Description: When Route Type is "MC", enter an MC Route Index to route the call to the DSN (Defense Switched Network) Switch.

This field replaces the MC ROUTE INDEX and REGL ROUTE INDEX fields.

Software Release: 5E3 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The entry must be defined on an MCRTIDX form (5304 Record).

2.10 NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Data Rules:

When NPA is entered, OFFICE CODE must be entered.

2.11 OFFICE CODE

Description: When Route Type is "ATDN", enter the Office Code of an Attendant's Telephone Number served by the 5ESS Switch office.
Valid Entries: 3 digits

Data Rules:

Any entry here must be defined on the NOC form (5501 Record).

Copyright © 2003 Lucent Technologies

For 5E12 and later, if the PPSCRN forms have an OFFICE CODE defined and there are multiple NOC forms with the same value for OFFICE CODE, NPA must also be defined on the PPSCRN form.

For 5E12 and later, when the PPSCRN forms have an OFFICE CODE or NPA/OFFICE CODE combination assigned they must be defined on the NOC form.

2.12 DIGITS

Description: When Route Type is "ATDN", enter the four-digit line number of an Attendant's Telephone Number. The entry in OFFICE CODE, together with the entry in this field, are used to route the call to a line served by this office. (This is expected to be to a subgroup of the MUPH Multi-Line Hunt Group used for the DSN Attendant.)
Valid Entries: 4 digits

2.13 # CHARGE INDEX

Description: Enter the Charge Index for this call.

Required Field.
Valid Entries: 1 - 2047

Data Rules:

This field must be defined on the CGIDX form (5302-1 Record).

2.14 CODE CONTROL

Description: Are DSN (Defense Switch Network) Management Controls in effect?
Valid Entries: Y, N

Data Rules:

This field should equal "N" if the DSN OPTION field on the OFCOPT form (5509 Record) is also "N".

2.15 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 16 characters

Requirements for Route Type

SEC. 19C: 5618-3 RECORD PRECEDENCE AND PREEMPTION LINE (TN) PARAMETER FORM - PPLPA

1. GENERAL

The 5618-3 Precedence and Preemption Line (TN) Parameter Record is available with 5E2 and later Software Releases. It is used to assign specific DSN (Defense Switched Network) PP (Precedence and Preemption) feature parameters to non-Multi-Line Hunt lines. It is required only if the default parameters entered on the PPFD form are inappropriate. If this form is submitted for a given line, all the parameters on this form override all the parameters specified on the PPFD form (5618-1 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the non-Multi-Line Hunt line.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated CLASS OF SERVICE on the LCC form (5306 Record) must be one of the following.

Valid Class of Service	
ATND	50B Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.

For 5E12 and later, TN/FEATURE combinations on different PPLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the PPLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the PP feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

The name entered here must be that of a PP feature defined on a PPFD form.

2.4 PREC COI

Description: This field is used to indicate the highest authorized precedence of a call originating on this line to a port in the same Community of Interest group.

When a line with this feature originates an DSN Call to the DSN Network, the precedence of the digits analyzed in the IDPDCA will be checked against this entry to determine if the originator has sufficient permission.

Related Actions specified in the IDPDCA are as follows, where the first Action includes a second Dial Tone and the latter does not:

- R - PAR, PPR
- P - PAP, PPP
- I - PAI, PPI
- F - PAF, PPF
- FO - PAFO, PPFO

Valid entries for PREC COI appear in the following table in order of increasing precedence.

Valid PREC COI Entries

Entry	Definition
R	Routine
E	Executive
P	Priority
I	Immediate
F	Flash
FO	Flash Override

Data Rules:

If this field is not entered, then the COI GROUP ID field must not be entered. However, if a value is entered in this field, then a COI GROUP ID value must also be entered. If a value is not entered (here or on the PPFD or PPMPA form), the line can still originate calls to the DSN Network.

2.5 PREC NON COI

Description: This field is used to indicate the highest authorized precedence level of a call originating on this line to a non Community of Interest group destination.

Related actions specified in the IDPDCA are the same as those listed under PREC COI with the addition of:

E - PAEO, PPEO

Required Field.
Default: R

Valid entries for PREC NON COI appear in the following table in order of increasing precedence.
Valid Entries:

Valid PREC NON COI Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash

Copyright © 2003 Lucent Technologies

FO	Flash Override
E	Executive.

2.6 PREEMPTABLE LINE

Description: Can a line with this feature be preempted?

Required Field.
Default: Y
Valid Entries: Y, N

2.7 IMMED PREEMPTION

Description: For preemptable lines, is Immediate Preemption in effect? Immediate Preemption allows calls of an appropriate priority terminating to the line to preempt regardless of Call Waiting or Call Forwarding - Busy Line being in effect.

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If PREEMPTABLE LINE is "N", then this field must be equal to "N".

2.8 PREC CPU

Description: Can precedence calls to the line be picked up using the Call Pickup feature?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, this line requires a Call Pickup Terminating feature.

2.9 FWD IAGP PREC

Description: Will an intra-Terminal Group precedence call to a line with this feature be forwarded when the line is busy or does not answer?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, this line also requires either a Call Forwarding - Don't Answer PP feature or a Call Forwarding Busy PP feature.

2.10 TERM NETWK CALLS

Description: Can a PP line with this feature receive calls from the DSN Network?

Required Field.
Default: Y
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If "Y" is entered, this line also requires a Call Forwarding - Don't Answer PP feature. For a DSN office, "Y" must be entered.

2.11 ORIG NETWK CALLS

Description: Can a PP line with this feature originate calls to the DSN Network?

Required Field.
Default: N
Valid Entries: Y, N

2.12 DIRECT STA SELECT

Description: Does a line with this feature have the Direct Station Select feature?

A line with Direct Station Select may not dial anything other than the abbreviated dial codes. No more than one digit is recognized by the switch for any single phone call.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, this line must also have a 1-digit no change abbreviated dial list and an IDP that will accommodate the abbreviated dial codes.

2.13 COI GROUP ID

Description: Enter the Community of Interest Group ID. A COI is a group of subscribers who generate the majority of their traffic in calls to each other.
Valid Entries: 1 - 20

Data Rules:

If a COI GROUP ID is entered, then a value should be entered in the PREC COI field. However, if the PREC COI field is not entered, then this field must not be entered.

2.14 HOT LINE

Description: For 5E4(2) and later, this field must have an entry if the line is a hot line. Hot line service is used when the forward number is that of another hot line or when a station only wishes to accept calls from other hot lines.

Hot line subscribers can be described as master, slave or neither. Typically, hot line subscribers are paired, where each hot line has the number of the other stored as its forward number. When both subscribers attempt to originate calls at the same time, the master hot line takes precedence over the slave hot line.

Valid HOT LINE Entries

Entry	Definition
MV	Master voice hot line used for pairing
MD	Master data hot line used for pairing
SV	Slave voice hot line used for pairing
SD	Slave data hot line used for pairing
HV	Voice hot line that is neither a master or slave; used when hot lines are not paired
HD	data hot line that is neither a master or slave; used when hot lines are not paired

Copyright © 2003 Lucent Technologies

Data Rules:

When an entry is made to this field, the LCC form associated with the TN or MLHG/TERM must have a CLASS OF SERVICE of either "INDIV" or "4WINDIV".

A CKT TN defined on the DSLUSR form (5908 Record) cannot be assigned a hot line Precedence and Preemption feature.

SEC. 19D: 5618-4 RECORD
PRECEDENCE AND PREEMPTION
LINE (MLHG/TERM) PARAMETER FORM - PPMPA

1. GENERAL

The 5618-4 Precedence and Preemption Line (MLHG/TERM) Parameter Record is available with the 5E2 and later Software Releases. It is used to assign specific DSN (Defense Switched Network) PP (Precedence and Preemption) feature parameters to Multi-Line Hunt lines. It is required only if the default parameters entered on the PPFD form are inappropriate. If this form is submitted for a given line, all the parameters on this form override all parameters specified on the PPFD form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number.

Required Field.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter a Multi-Line Hunt Group Terminal number.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line
INDIV	Individual Line
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines
ISATND	ISDN Attendant Terminal
PBX	Line to a PBX
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX

2.4 * FEATURE

Description: Enter the name of the PP feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

The name entered here must be that of a PP feature defined on the PPFD form (5618-1 Record).

2.5 PREC COI

Description: This field is used to indicate the highest authorized precedence of a call originating on this line to a port in the same Community of Interest group. If a value is not entered (here or on the PPFD or PPLPA form), the line may not originate calls to the DSN (Defense Switch Network).

When a line with this feature originates an DSN Call to the DSN, the precedence of the digits analyzed in the IDPDCA will be checked against this entry to determine if the originator has sufficient permission.

Related actions specified in the IDPDCA are as follows where the first action includes a second Dial Tone and the latter does not:

- R - PAR, PPR
- P - PAP, PPP
- I - PAI, PPI
- F - PAF, PPF
- FO - PAFO, PPFO

Valid entries for PREC COI appear in the following table in order of increasing precedence.

Valid PREC COI Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash
FO	Flash Override

Data Rules:

If a PREC COI is specified, then a COI GROUP ID must be entered.

If ORIGINATE AV CALLS is allowed, then PREC COI must be specified. If ORIGINATE AV CALLS is not allowed, then PREC COI must be unspecified.

2.6 PREC NON COI

Description: This field is used to indicate the highest authorized precedence level of a call originating on this line to a non-Community of Interest group destination.

Related actions specified in the IDPDCA are the same as those listed under PREC COI with the addition of:

E - PAEO, PPEO

Required Field.
Default: R

Valid entries for PREC NON COI appear in the following table in order of increasing precedence.
Valid Entries:

Valid NON PREC COI Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate

Copyright © 2003 Lucent Technologies

F	Flash
FO	Flash Override
E	Executive

2.7 PREEMPTABLE LINE

Description: Can a line with this feature be preempted?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If Multi-Line Hunt lines are assigned PP features, all preemptable lines in the group must have higher Terminal Numbers than non-preemptable lines.

2.8 IMMED PREEMPTION

Description: For preemptable lines, is Immediate Preemption in effect? Immediate Preemption allows calls of an appropriate priority terminating to the line to preempt regardless of Call Waiting or Call Forwarding - Busy Line being in effect.

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If PREEMPTABLE LINE is "N", this field must equal to "N".

2.9 PREC CPU

Description: Can precedence calls to the line be picked up using the Call Pickup feature?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Since Multi-Line Hunt lines may not be assigned a Call Pickup Terminating feature, this field must be "N".

2.10 FWD IAGP PREC

Description: Will an intra-Terminal Group precedence call to a line with this feature be forwarded when the line is busy or does not answer?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This is inappropriate for Multi-Line Hunt lines and this field must be "N".

2.11 RECEIVE AV CALLS

Description: Can a line with this feature receive calls from the DSN?

Copyright © 2003 Lucent Technologies

Required Field.
Default: Y
Valid Entries: Y, N

2.12 DIRECT STA SELECT

Description: Does a line with this feature have the Direct Station Select feature? A line with Direct Station Select may not dial anything other than the abbreviated dial codes. No more than one digit is recognized by the switch for any single phone call.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, this Multi-Line Hunt line must also have a 1-digit no change abbreviated dial list and an IDP that will accommodate the abbreviated dial codes.

2.13 ORIGINATE AV CALLS

Description: Can a line with this feature originate calls to the DSN?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then PREC COI must be specified.

2.14 COI GROUP ID

Description: Enter the Community of Interest Group ID. A COI is a group of subscribers who generate the majority of their traffic in calls to each other.
Valid Entries: 1 - 20

Data Rules:

If a COI GROUP ID is entered, then a value should be entered in the PREC COI field.

2.15 HOT LINE

Description: This field must have an entry if the line is a hot line. Hot line service is used when the forward number is that of another hot line or when a station only wishes to accept calls from other hot lines.

Hot line subscribers can be described as master, slave or neither. Typically, hot line subscribers are paired, where each hot line has the number of the other stored as its forward number. When both subscribers attempt to originate calls at the same time, the master hot line takes precedence over the slave hot line

Valid HOT LINE Entries

Entry	Definition
MV	Master Voice hot line used for pairing
MD	Master Data hot line used for pairing
SV	Slave Voice hot line used for pairing
SD	Slave Data hot line used for pairing
HV	Voice hot line that is neither a master or slave; used when hot lines are not paired

Copyright © 2003 Lucent Technologies

HD	Data hot line that is neither a master or slave; used when hot lines are not paired

Data Rules:

If an entry is made in this field, the LCC form associated with the TN or MLHG/TERM must have a CLASS OF SERVICE of either "INDIV" or "4WINDIV".

A CKT MLHG / CKT TERM defined on the DSLUSR form (5908 Record) cannot be assigned a hot line Precedence and Preemption feature.

SEC. 19E: 5618-5 RECORD PRECEDENCE AND PREEMPTION TRUNK PARAMETER FORM - PPTPA

1. GENERAL

The 5618-5 Precedence and Preemption Trunk Parameter Record is available with the 5E2 and later Software Releases. It is used to assign specific DSN (Defence Switched Network) PP (Precedence and Preemption) feature parameters to trunks. It is required only if the default parameters entered on the PPFD form are inappropriate. If this form is submitted for a given trunk, all the parameters on this form override all parameters specified on the PPFD Form.

If any member of a analog Trunk Group is assigned an DSN Precedence and Preemption feature, then all members of the Trunk Group must be assigned such features with the same Hunt Type, which must be one of the following types: "PRFL", "PRBL", "PLFL", and "PLBL".

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TRUNK GROUP

Description: Enter the Trunk Group Number.

Requied Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

2.3 * MEMBER

Description: Enter a Trunk Group Member number.

Required Field.
Valid Entries: 0 - 1951

2.4 * FEATURE

Description: Enter the name of the PP feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a PP feature defined on the PPFD Form (5618-1 Record).

2.5 TRUNK TYPE

Description: Indicate the DSN Trunk Type for trunks that are assigned this feature.

Copyright © 2003 Lucent Technologies

Required Field.

Valid TRUNK TYPE Entries

Entry	Definition
EOINID	End Office - Immediate Network In-Dialing.
EOPNID	End Office/DSN interface Precedence Network In-Dialing.
EORNID	End Office/DSN interface Routine Network In-Dialing.
MLPPCQ	Software Release: 5E9(2) and later. MLPP (Multi-Level Precedence and Preemption) Commercial Q.931/DSS1 for PBX or LEC. DSS1 (Digital Subscriber Signaling Number 1) is layer 3 ISDN protocol on BRIs and PRIs
MLPPDQI	Software Release: 5E9(2) and later. Multi-Level Precedence and Preemption DSN Q.931/DSS1 IPR (Incoming PRI). The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
MLPPDQO	Software Release: 5E9(2) and later. Multi-Level Precedence and Preemption DSN Q.931/DSS1 OPR (Outgoing PRI). The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
MLPPPQ	Software Release: 5E9(2) and later. Multi-Level Precedence and Preemption Polygrid Q.931/DSS1. The Polygrid trunk is used to interconnect DSN switches. The MLPP trunk types are used to support the DSN (Defense Switched Network) MLPP on PRI feature. See Division 2 Section 6G for more information on the MLPP on PRI feature.
NONRCD	Inter Switch Trunks without Route control digit.
OFFNET	Non-DSN Trunks.
RCD	Inter-Switch Trunks with Route Control Digit.
SATINID	Satellite Immediate Network In-Dialing.
SATPID	Satellite Priority In-Dialing.
TIEPNID	Tie Trunk Precedence Network In-Dialing.
TIERNID	Tie Trunk Routine Network In-Dialing.
VONPNID	Tandem Precedence Network In-Dialing.
VONRNID	Tandem Routing Network In-Dialing.

Data Rules:

For 5E9(2) and later, if TRUNK TYPE is "MLPPCQ", "MLPPDQI", "MLPPDQO", "MLPPPQ", "NONRCD", "OFFNET", "RCD", "SATINID", "SATPID", "TIERNID" ,"TIEPNID", "VONPNID" or "VONRNID", then ESP must be "N".

If TRUNK TYPE is "MLPPCQ", "MLPPDQI", "MLPPDQO" or "MLPPPQ", then PREC LIMIT must be "F", "FO", "I", "P" or "R".

Before TRUNK TYPE on the PPTPA form can be set to either "MLPPCQ", "MLPPDQI", "MLPPDQO" or "MLPPPQ", the CENTREX PRI secured feature must be activated on the SFSYS form (5713-1 Record), i.e. the ACT field for SFID 105 must be set to "Y".The assignment of an ID feature to a PRI with an MLPP trunk type is used to analyze the called DN and the precedence level. Therefore, the CENTREX PRI Enhancement secured feature must be activated for proper assignment and operation of the MLPP on PRI feature.

If a trunk group is assigned to a Precedence and Preemption Feature on either the TKGRPFA form or an associated CLUSTR form with a TRUNK TYPE of"MLPPCQ", "MLPPDQI", "MLPPDQO" or "MLPPPQ" on either the PPFD form or PPTPA form; then the TGN must also be defined on the TKGRP form with a HUNT TYPE of "PRFL", "PRBL", "PLFL" or "PLBL".

When trunks are assigned a Precedence and PreemptionFeature on either the TRUNKFA form or an associated CLUSTR form with a TRUNK TYPE on either the PPFD form or the PPTPA form, then the TRKCLS on the associated TKGRP form must be as follows:

TRUNK TYPE	TRKCLS TKGRP FORM
EOINID	TTOLLCON
EOPNID	TTOLLCON

Copyright © 2003 Lucent Technologies

EORNID	TTOLLCON
MLPPCQ	EDSL
MLPPDQI	EDSL
MLPPDQO	EDSL
MLPPPQ	EDSL
NONRCD	PRINTOLL
OFFNET	LTOLLCON
RCD	PRINTOLL
SATINID	PBXDID
SATPID	PBXDID
TIEPNID	LTOLLCON
TIERNID	LTOLLCON
VONRNID	PF
	PFLASH
	PFITT
	LTOLLCON

2.6 PREC LIMIT

Description: Indicate the Precedence Level for Precedence and Preemption Limit.

Required Field.

Valid PREC LIMIT Entries

Entry	Definition
F	Flash
FO	Flash Override
I	Immediate
P	Priority
R	Routine

Data Rules:

If TRUNK TYPE is "SATINID", "SATPID", "OFFNET", "RCD" or "NONRCD", then PREC LIMIT must be "FO".

2.7 ESP

Description: Is a trunk with this feature essential service protected?
Default: N
Valid Entries: Y, N

Data Rules:

If TRUNK TYPE is "MLPPCQ", "MLPPDQI", "MLPPDQO", "MLPPPQ", "NONRCD", "OFFNET", "RCD", "SATINID", "SATPID", "TIERNID" ,"TIEPNID", "VONPNID", or "VONRNID", ESP must be "N".

2.8 PRIORITY RING

Description: Enter a Routine and Priority Ringing Pattern.

Required Field.

Valid PRIORITY RING Entries

Entry	Definition
4WOFF	Off-hook Alerting.
4W24	Continuous 2-second off-hook, 4-second on-hook.
4W350	Simple Wink 350 milliseconds off-hook, 350 milliseconds on-hook, off-hook.
4W1650	Continuous 1650 milliseconds off-hook, 350 milliseconds on-hook.
NORING	No Ringing is to be supplied.

Data Rules:

If TRUNK TYPE is "EOINID", then Priority Ringing must be "4WOFF", "4W350" or "4W1650".

SEC. 19F: 5618-6 RECORD PRECEDENCE AND PREEMPTION COMMUNITY OF INTEREST FORM - PPCOI

1. GENERAL

The 5618-6 Record is available with the 5E3 and later Software Releases. It is used to define the code index for a COI (Community of Interest). A COI in the DSN (Defense Switched Network) is a grouping of subscribers who generate the majority of their traffic in calls to each other.

Each DN/MS (DSN Nodal/Multifunction Switch) is required to support twenty different COIs. Each user on the switch can belong to at most one COI, however a user need not belong to any COI.

Each DN/MS can define its own COIs. These can consist of Area Codes, Switch Center Codes, Individual Telephone Numbers or any combination of these.

SEC. 19G: 5618-7 RECORD
PRECEDENCE & PREEMPTION POLYGRID ROUTING FORM - PPPOLY

1. GENERAL

The 5618-7 Record, available with the 5E3 and later Software Releases, defines routing in the DSN (Defense Switched Network) polygrid network. This form and record are only valid in offices that have the DSN OPTION field on the OFCOPT form set to "Y". The DSN polygrid network is composed of overlapping grids of interconnected switching centers. The polygrid scheme is used for switching between DSN switching centers. All switches in the polygrid network have equal rank; the public switching network, in contrast, is a hierarchical arrangement.

The polygrid pattern has as its fundamental unit the "home grid". The home grid is a set of switches surrounding, and directly connected to, a destination center. The number of switching centers in the home grid can vary according to the home grid's location and traffic needs. In addition to this network of grids, direct trunk groups are established between widely separated centers when the traffic between those centers is sufficient to justify the expense.

For a given destination center, an originating switch checks all predefined routes until an available trunk is selected for the call. The far end of the trunk then becomes the controlling switch, while the previous switch relinquishes control of the routing. The selection process then repeats for the next trunk in the route.

The polygrid plan distinguishes between:

- "exterior routing", used when the originating switch is *not* in the home grid of the destination switch, and
- "interior routing", used when the originating switch is in the destination's home grid.

There are ten possible routes (the direct route plus three triples) that can be defined from the originating switch to the destination switch.

Route control in the polygrid network, depends on the use of the RCD (Route Control Digit) assigned to each route. This decimal digit is generated by each DSN Tandem Switch along a call route. The RCD immediately precedes the address digits transmitted over interswitch trunks. The RCD performs these functions:

- Exercises control over the alternate routing at the next switching center;
- Prevents "shuttle" and "ring around the rosy" ("shuttle" refers to the process of switching a call back-and-forth between the same two switching systems. "Ring around the rosy" refers to the process of switching a call to an office, which then switches to another office, which then switches back to the original office. This can be expanded to any number of offices.); and
- Assists in limiting the number of successive interoffice trunks that may be used on a call.

The administrators of the DSN run a computer program that outputs a listing of the polygrid data to be used at each DSN Tandem Switch. For each destination from a given switch, this listing specifies the trunk groups that comprise the direct route and the three triples of alternate routes, as well as the RCDs to be associated with each route.

The RCDs are assigned based on the following polygrid rules:

- RC-0 (Route Control digit 0) is always used on forward routes;

Copyright © 2003 Lucent Technologies

- RC-1, RC-2, and RC-3 must be used on lateral routes;
- RC-1 and RC-2 are used on the first lateral route, RC-3 on the second or only lateral route; and
- The RCDs are assigned to ensure that once a call arrives at, or originates in, the home grid of the destination switch, subsequent routing does not cause the call to leave the home grid.

A forward route is considered to be a route that advances a call to a switching center that is geographically nearer the destination. Once a call progresses to the home grid of the destination switch, the only forward route available is the direct route to the destination switch. Lateral routes are defined as routes that do not advance the call geographically by the factor required for forward routing.

1.1 Routine Polygrid Routing

Routine calls in the polygrid network use different routing when within the home grid than when outside of it. The possible routes that are searched are controlled by the RCD received from the previous switch (RC-0 is assumed if the call is at the originating switch). This is summarized as follows:

Interior Routing:

- RC-0 - Use direct route plus first triple;
- RC-1 - Use direct route only;
- RC-2 - Use direct route only;
- RC-3 - Use direct route only.

Exterior Routing:

- RC-0 - Use direct route plus first triple;
- RC-1 - Use direct route plus first triple;
- RC-2 - Use direct route plus first triple;
- RC-3 - Use direct route plus first triple.

On routine calls, the routes that make up the first triple are always searched in a fixed order.

1.2 Precedence Polygrid Routing

Precedence calls in the polygrid network also use different routing when within the home grid than when outside of it. The possible routes that are searched are controlled by the RCD received from the previous switch (RC-0 is assumed if the call is at the originating switch). This is summarized as follows:

Interior Routing:

- RC-0 - Use all programmed routes;
- RC-1 - Use direct route plus first triple;
- RC-2 - Use direct route plus second triple;
- RC-3 - Use direct route only.

Copyright © 2003 Lucent Technologies

Exterior Routing:

- RC-0 - Use all programmed routes;
- RC-1 - Use direct route plus first triple, plus second triple;
- RC-2 - Use direct route plus first triple, plus third triple;
- RC-3 - Use direct route plus first triple.

A precedence call originating in an exterior office may have up to ten routes available for routing. This drops to seven available routes once inside the home grid.

1.3 Recent Change View

The corresponding Recent Change View for this form is 10.34.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * POLY RT NUM

Description: Enter the Polygrid route pattern index number.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

2.3 GRID

Description: Enter the Grid type.

Required Field.

Valid GRID Entries

Entry	Definition
INT	Interior to the home grid.
EXA	Software Release: 5E4(2) and later. Exterior A grid route pattern to the home grid.
EXB	Software Release: 5E4(2) and later. Exterior B grid route pattern to the home grid.
EXC	Software Release: 5E4(2) and later. Exterior C grid route pattern to the home grid.
EXT	Software Release: 5E3 only. An exterior grid route pattern.

2.4 ROTATE

Description: Is rotation to be used to select the initial route of a triple on a precedence call?

Required Field.
Default: Y
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.5 IMMED PREEMPT

Description: Is immediate preemptable search required on this route?

Required Field.
Default: N
Valid Entries: Y, N

2.6 ROUTE INDEX

Description: Enter the Route Index for each of the DIRECT and 1ST TRIPLE 1 through 3RD TRIPLE 3 fields.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

At least one of these ten ROUTE INDEXs must be defined.

If the ROUTE INDEX for 1ST TRIPLE 1 through 3RD TRIPLE 3 is blank, ROTATE and IMMED PREEMPT must be "N".

The ROUTE INDEX within each set of triples (e.g., 1ST TRIPLE 1 through 3RD TRIPLE 1) must be unique.

If ROUTE INDEX is specified, all ROUTE CONTROL DIGITS must be entered.

Each ROUTE INDEX must be defined on a RTIDX form (5303 Record).

NOTE: For ROUTE INDEXES populated on this form, the NEXT ROUTE field on the RTIDX form must be left blank in ODA (or set to 0 in Recent Change) for DSN Network Management control CANF (Cancel From).

2.7 ROUTE CONTROL DIGITS

Description: Enter a set of four RCDs (Route Control Digits) for each of the DIRECT and 1ST TRIPLE 1 through 3RD TRIPLE 3 fields.

An explanation of how RCDs are used is contained in Section 1
Valid Entries: 0, 1, 2, or 3

Data Rules:

If the associated ROUTE INDEX is not entered, the ROUTE CONTROL DIGITS must be blank.

SEC. 19H: 5618-8 RECORD
DEFENSE SWITCHED NETWORK
CONNECTED OFFICES FORM - DSNCO

1. GENERAL

The 5618-8 Record is available with the 5E3 and later Software Releases. It is used to define the DSN (Defense Switched Network) offices that have direct routes with this switch and are subject to ARC (Alternate Route Cancellation). The ARC is implemented at the switch having direct trunk groups to the switch in congestion. The ARC can take two forms.

- CANF (Cancel Alternate Route From) - Traffic that terminates in a congested switch is not allowed to alternate route via other switches that reach that switch. However, traffic that is routed through a congested switch is allowed to alternate route.
- CANT (Cancel Alternate Route To) - Traffic that does not terminate in the congested switch is not allowed to access the direct trunks to that switch.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.36.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * KEY

Description: Enter the key value which is always 0.

Required Field.
Valid Entries: 0

NAME/ID PAIRS

This is a list of up to 63 pairs of NAME/ID values (fields Section 2.3 - Section 2.4). The NAME and ID are the DSN ARC identifier and must be unique. If the NAME attribute is defined, the ID must be defined and vice versa.

2.3 NAME

Description: This is the name of a directly connected DSN office subject to ARC.
Valid Entries: 3 alphabetic characters

2.4 ID

Description: This is the ID of a directly connected DSN office subject to ARC.
Valid Entries: 1 - 63

Figure 1 SAMPLE DSNCO FORM 5E5 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 20: AUTHORIZATION CODE FORMS

Copyright © 2003 Lucent Technologies

SEC. 20A: 5619-1 RECORD
AUTHORIZATION CODE FEATURE DEFINITION FORM - ATHFD

1. GENERAL

The 5619-1 Record is available with 5E3 and later Software Releases. It is used to define an ATH (Authorization Code) feature that will restrict dialing privileges to authorized personnel.

A terminal (line or trunk) may be assigned an ATH feature on the appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), TKGRPFA (5206 Record), TRUNKFA (5205 Record), or BFG (5625 Record). The terminal should be assigned to an ATH Group which may be defined as a default parameter of the ATHFD form or on an individual terminal basis with the ATHLPA (5619-5 Record), ATHMPA (5619-6 Record), or ATHTPA form (5619-7 Record).

Each authorization Code Group should have an entry on the ATHAC form (5619-3 Record) to indicate the authorization code associated with the group. An ATHFCOS form (5619-4 Record) should then be entered for each ATH group and FCOS. Each FEATURE entry on the appropriate LINEFA, MLHLNFA, TRUNKFA, TKGRPFA, CLUSTR form(s), which has AC set to "Y", must be entered in the FEATURE LIST on the ATHFCOS form.

Certain Authorization Code features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/); the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed Authorization Code features is contained in Figures 1 and 2.

1.1 ISDN Circuit-Switched Data Calls

The BRCS Supplementary Services for the ISDN CSD (Circuit-Switched Data) calls feature, which is available in 5E6 and later Software Releases, allows the Authorization Codes feature originally developed for CSV (Circuit-Switched Voice) calls to apply to CSD calls as well.

Use of the BRCS Supplementary Services for the CSD calls feature provides the means to establish CSD calls between BRIs (Basic Rate Interfaces) or PRIs (Primary Rate Interfaces) that are making use of the Authorization Codes services. When a line or trunk is assigned Authorization Code service, the service may apply to both CSV and CSD calls for that BRI or PRI.

All group options available to a CSV ATH user are also available to a CSD ATH user. The values of these options, which are entered on the ATHGP form (5608-2 Record), can differ or be the same for each group.

There can be several lines or trunks assigned to a specific ATH group. The subscriber can dial any of the authorization codes defined for the group from any line or trunk in the group. The same or separate, if desired, authorization codes can be used for both CSD and CSV calls.

CSD ATH groups may also be assigned through BFGs (BRCS Feature Groups) in the same manner CSV ATH groups are currently assigned.

Existing preconstructed features for CSV calls will also be used for CSD calls (no new preconstructed ATH features). For more information concerning the assignment of BRCS features, see Division 2, Section 1F.

1.2 Recent Change View

The corresponding Recent Change View for this form is 12.41.

2. FORM AND RECORD ENTRIES

Copyright © 2003 Lucent Technologies

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and the office name on each record.

2.2 * FEATURE NAME

Description: Enter the Authorization Code Feature Name. The only restriction on the Feature Name is that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 to 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.10) specify feature options for the Authorization Code Feature.

2.4 ATH PROMPT

Description: Enter the type of prompt that will be given to the user to indicate when an Authorization Code should be entered.

Required Field.
Default: BEEP1
Valid Entries:

Valid ATH PROMPT Entries

Entry	Definition
BEEP1	One beep
BEEP2	Two beeps
BEEP3	Three beeps
LEAVE	Party leaving tone
DIAL	Dial tone

2.5 CHANGE FCOS

Description: Will the subscriber be allowed to change the FCOS (Feature Class of Service) from "MAIN" to "ALTERNATE" and vice versa via a dialed code?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CHANGE FCOS is "Y" and the feature is assigned to a line or trunk, then the line/trunk should normally be assigned an Individualized Dialing Plan. At least one dialed code of the IDP specified on the IDPDCA form (5601-1/2 Record) must have ACTION equal to "MAINACT" or "ALTACT". The FEATURE associated with these dialed codes should be the FEATURE NAME defined on this form.

Alternately, if the line/trunk is not assigned an IDP, then the PDIT used by the line must contain at least one dialed code with ACTION set to "MAINACT" or "ALTACT". The feature associated with these dialed codes should be the FEATURE NAME defined on this form.

2.6 CHANGE ATH FIRST

Copyright © 2003 Lucent Technologies

Description: Will the subscriber be allowed to change the ATH FIRST field via a dialed code?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CHANGE ATH FIRST is "Y", and the feature is assigned to a line or trunk, then the line/trunk should normally be assigned an Individualized Dialing Plan. At least one dialed code of the IDP specified on the IDPDCA form (5601-1/2 Record) must have an ACTION of "ATHOOS" or "ATHINS". The FEATURE associated with these dialed codes should be the FEATURE NAME defined on this form.

Alternately, if the line/trunk is not assigned an IDP, then the PDIT used by the line must contain at least one dialed code with ACTION "ATHOOS" or "ATHINS". The FEATURE associated with these dialed codes on the PDIT form should be the FEATURE NAME defined on this form.

2.7 ACT TYPE

Description: This field is used to indicate whether or not the ATH feature can be activated by the customer.

Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	No customer activation. Upon assignment the feature is made active and is ready to be used.
CODE	The ATH feature is activated by dialing a code.

Data Rules:

If ACT TYPE is "CODE" and the feature is assigned to a line or trunk, then the line/trunk should normally be assigned an Individualized Dialing Plan. At least one dialed code of the IDP specified on the IDPDCA form (5601-1/2 Record) should have ACTION equal to "ATHACT". The FEATURE associated with the dialed code should be the FEATURE NAME defined on this form.

Alternately, if the line/trunk is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "ATHACT". The FEATURE associated with the dialed code on the PDIT form should be the FEATURE NAME defined on this form.

If Telephone Numbers on the LINEFA forms are assigned an ATH Feature with the ACT TYPE entry set to "AUTO" on the ATHFD form the corresponding Initial Activation Status entry on the BFG, LINEFA or an associated CLUSTR form(s) must be equal to "Y".

If Multi-Line Hunt Group Terminal Numbers are assigned an ATH Feature via MLHLNFA, BFG, or an associated CLUSTR form(s), they also must have the ACT TYPE set to "AUTO" on the ATHFD form. Also the corresponding Initial Activation Status entry via MLHLNFA, BFG or an associated CLUSTR form(s) must be equal to "Y".

If TGN/MEMB(s) are assigned an ATH (Authorization Code) Feature on either the TRUNKFA form or an associated CLUSTR form, the ATH Feature must also be defined on the ATHFD form with ACT TYPE equal to "AUTO". Also the corresponding Initial Activation Status entry on the TRUNKFA or CLUSTR form must be set to "Y".

2.8 DACT TYPE

Description: This field is used to indicate whether or not the subscriber assigned this feature can

Copyright © 2003 Lucent Technologies

deactivate the feature.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
NONE	No customer deactivation is allowed. The feature can never be deactivated from the customer's station.
CODE	The ATH feature is deactivated by dialing a code.

Data Rules:

The subscriber either must be restricted from activating and deactivating the Authorization Code feature or must have the ability to do both. If ACT TYPE is "AUTO", DACT TYPE must be "NONE"; if ACT TYPE is "CODE", DACT TYPE must be "CODE".

If DACT TYPE is "CODE" and the feature is assigned to a line or trunk, then the line/trunk should normally be assigned an Individualized Dialing Plan. At least one dialed code of the IDP specified on the IDPDCA form (5601-1/2 Record) must have ACTION equal to "ATHDCT". The FEATURE associated with the dialed code on the IDPDCA form should be the FEATURE NAME defined on this form.

Alternately, if the line/trunk is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "ATHACT". The FEATURE associated with the dialed code on the PDIT form should be the FEATURE NAME defined on this form.

2.9 AMA OVERRIDE

Description: Should the Authorization Code override the Account Code in the AMA record? If this field is "Y", the Authorization Code will be stored in the Account Code field of the record.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If AMA OVERRIDE is "Y", AMA LENGTH must be entered. If AMA OVERRIDE is "N", AMA LENGTH must be blank.

2.10 AMA LENGTH

Description: This field specifies the length of the Authorization Code that will override the Account Code field in the AMA record. The Authorization Code may be 8 digits or 15 characters.
Valid Entries: 8 or 15

DEFAULT PARAMETERS

The following fields (Section 2.11 - Section 2.16) define the default parameters assigned with the feature to terminals (lines or trunks). These parameters will be assigned to the terminal unless they are overridden by entries on the ATHLPA (5619-5 Record), ATHMPA (5619-6 Record), ATHTPA forms (5619-7 Record).

2.11 ATH GROUP NAME

Description: For 5E6 and later, this field has been renamed CSV ATH GRP.

Enter the name of the ATH Group.

Copyright © 2003 Lucent Technologies

Software Release: 5E3 - 5E5
Valid Entries: 1 - 8 characters

2.12 CSV ATH GRP

Description: Enter the name of the Circuit-Switched Voice ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

Defining a CSV ATH GRP is not required; however, if a CSD ATH GRP is defined on this form, then a CSV ATH GRP must also be defined.

2.13 CSD ATH GRP

Description: Enter the name of the Circuit-Switched Data ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

CSD only groups for ATH service are not allowed. This field can only be entered if CSV ATH GRP is entered.

If a CSD group is defined, the CSD ATH GRP name must not be the same as the CSV ATH GRP name.

2.14 ATH FIRST

Description: Will the customer be required to enter an Authorization Use Code and the Authorization Code before a TN can be dialed on the line?

- ***NOTE:*** 911 calls may be made without an Authorization Use Code and an Authorization Code when this field is set to "Y".

Valid Entries: Y, N

2.15 ATH FOR AMA

Description: Will an Authorization Code be required before allowing AMA recorded calls to proceed?
Valid Entries: Y, N

2.16 ATH FOR MDR

Description: Will an Authorization Code be required before allowing Message Detail Recording to proceed?
Valid Entries: Y, N

SEC. 20B: 5619-2 RECORD
AUTHORIZATION CODE GROUP DEFINITION FORM - ATHGP

1. GENERAL

The 5619-2 Record is available with 5E3 and later Software Releases. The ATHGP form is used to define the group level of information required for the Authorization Code capability.

A terminal (line or trunk) may be assigned an ATH feature, defined on the ATHFD form (5619-1 Record), through an appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), TKGRPFA (5206 Record), or TRUNKFA form (5205 Record). In addition, each terminal should be assigned to an ATH Group which may be defined as a default parameter of the ATHFD form (5619-1 Record) or on an individual terminal basis through the ATHLPA (5619-5 Record), ATHMPA (5619-6 Record), or ATHTPA form (5619-7 Record).

Each authorization Code Group should have an entry on the ATHAC form (5619-3 Record) to indicate the authorization code associated with each group. An ATHFCOS form (5619-4 Record) should then be entered for each ATH group and FCOS. Each feature requiring an authorization code for this group must be entered on the ATHFCOS form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and the office name on each record.

2.2 * ATH GROUP NAME

Description: Enter the name of the ATH Group.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E5 and later, the number of unique ATH Group names is limited to 255 on the corresponding ATHAC form (5619-1 Record).

For 5E6 and later, if a CSV ATH GROUP or CSD ATH GROUP is defined as a default parameter on the ATHFD form, that corresponding name must be entered in this field for the ATHGP form.

2.3 ATH LENGTH

Description: Enter the length of the authorization code(s) assigned to this group.

Required Field.
Valid Entries: 1 - 15

Data Rules:

All authorization codes for an ATH Group must be the same length. An ATHAC form (5619-3 Record) should be entered for each authorization code in the ATH Group. The lengths of the authorization codes must match the length entered in this field.

2.4 ACTIVE FCOS

Copyright © 2003 Lucent Technologies

Description: This field is used to indicate whether the main or alternate FCOS (Feature Class Of Service) is active.

Required Field.
Default: M
Valid Entries:

Valid ACTIVE FCOS Entries	
Entry	**Definition**
M	Main
A	Alternate

Data Rules:

When this field is "A", the ALTERNATE ATH field must be "Y".

2.5 NEST FCOS

Description: This field is used to indicate whether the FCOS (Feature Class Of Service) entries will have a nested structure, i.e., FCOS n contains all features in FCOS 1 through n.

For example, if NEST FCOS is "Y", then an Authorization Code assigned on the ATHAC form, with an FCOS of 3 on the associated ATHFCOS form, authorizes the features and facilities in FCOS 1, 2, and 3. If NEST FCOS is "N", only features and facilities for FCOS 3 are authorized.

Required Field.
Default: N
Valid Entries: Y, N

2.6 ALTERNATE ATH

Description: Does an alternate set of authorization codes and associated privilege sets exist?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When this field is set to "N", ACTIVE FCOS must be "M".

2.7 FAIL MODE

Description: Should calls that require an authorization code be allowed to proceed during a communication failure (e.g., when an SM is in stand-alone, communication is lost to the AM, but enough information is available to process the call)?

Required Field.
Default: N
Valid Entries: Y, N

2.8 ERROR TREATMENT

Description: Enter the error treatment to be given when a call requiring an authorization code in this group fails.

Required Field.
Default: REORD
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid ERROR TREATMENT Entries	
Entry	**Definition**
ANNC	Announcement
REORD	Reorder

Data Rules:

When this field is "ANNC", ANNC ROUTE INDEX must be known.

2.9 ANNC ROUTE INDEX

Description: Enter the route index to be used when ERROR TREATMENT is "ANNC".
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

This route index must be defined on an RTIDX form (5303 Record) with a known Trunk Group Number. The Trunk Group Number on the RTIDX form must match the TGN value on a TKGRP form (5202 Record) with TRK DIR equal to "ANN".

2.10 INHIBIT TOD

Description: Should TOD (Time of Day) be inhibited? This field is used for temporary deactivation of TOD schedules.

Required Field.
Default: N
Valid Entries: Y, N

SEC. 20C: 5619-3 RECORD
AUTHORIZATION CODE DEFINITION FORM - ATHAC

1. GENERAL

The 5619-3 Record is available with 5E3 and later Software Releases. The ATHAC form is used to define each authorization code associated with a specific Authorization Code Group, and its main or alternate feature class of service values. This form should not be entered without an Authorization code feature defined on the ATHFD form (5619-1 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.18.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Group number and the office name on each record.

2.2 * ATH GROUP NAME

Description: Enter the name of the ATH Group.
Valid Entries: 1 - 8 characters

Data Rules:

The ATH GROUP NAME entered here should be that of an ATH GROUP NAME defined on the ATHGP form (5619-2 Record).

2.3 * ATH CODE

Description: This field represents one of the possible authorization codes that can be associated with a given authorization code group(s). The Authorization codes can belong to one or several authorization code groups. All authorization codes belonging to the same group(s) must be the same length, i.e. have the same quantity of digits.
Valid Entries: 1 - 15 digits

Data Rules:

A LEC office may have 1 to 100,000 unique Authorization codes. A TOLL office may have 1 to 250000 unique Authorization Codes. The OFFICE TYPE is defined on the OFCOPT form (5509 Record).

The ATH CODE length (quantity of digits) here must correspond to the ATH LENGTH entry on the ATHGRP form.

2.4 MAIN FCOS

Description: Enter the main FCOS (Feature Class of Service).
Valid Entries: 1 - 16

Data Rules:

The MAIN FCOS or ALTERNATE FCOS must be entered, or both. If MAIN FCOS is entered, an ATHFCOS form (5619-4 Record) must be entered for this ATH GROUP NAME and FCOS.

2.5 ALTERNATE FCOS

Copyright © 2003 Lucent Technologies

Description: Enter the alternative Feature Class of Service.
Valid Entries: 1 - 16

Data Rules:

The MAIN or ALTERNATE FCOS must be entered, or both. If ALTERNATE FCOS is entered, an ATHFCOS form (5619-4 Record) must be entered for this ATH GROUP NAME and FCOS.

SEC. 20D: 5619-4 RECORD AUTHORIZATION CODE FEATURE CLASS OF SERVICE PARAMETER FORM - ATHFCOS

1. GENERAL

The 5619-4 Record is available with 5E3 and later Software Releases. The ATHFCOS form is used to define the restriction and features associated with each FCOS (Feature Class of Service), main/alternate, assigned at an authorization code group.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.19.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control number and the office name on each record.

2.2 *ATH GROUP NAME

Description: This field is used to enter the name of the ATH Group.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH GROUP defined on the ATHGP form (5619-2 Record).

When the TGN/MEMB(s) have the AC field set to "Y" for one or more FEATUREs on the TRUNKFA form or an associated CLUSTR form, all of these specific FEATUREs must exist on the ATHFCOS form for the CSV ATH GROUP NAME associated with this TGN/MEMB.

When the TGN(s) have the AC field set to "Y" for one or more FEATUREs on the TKGRPFA form or an associated CLUSTR form, all of these specific FEATUREs must exist on the ATHFCOS form for the CSV ATH GROUP NAME associated with this TGN.

When the TGN(s) have the AC field set to "Y" for one or more FEATUREs on the TKGRPFA form or an associated CLUSTR form, all of these specific FEATUREs must exist on the ATHFCOS form for the CSD ATH GROUP NAME associated with this TGN.

When the TGN/MEMB(s) have the AC field set to "Y" for one or more FEATUREs on the TRUNKFA form or an associated CLUSTR form, all of these specific FEATUREs must exist on the ATHFCOS form for the CSD ATH GROUP NAME associated with this TGN/MEMB.

2.3 *FCOS

Description: This field is used to enter the Feature Class of Service. Each FCOS entered here may correspond to a main or alternate FCOS on the ATHAC form (5619-3 Record).
Valid Entries: 1 - 16

2.4 FRL

Description: This field is used to enter the Facility Restriction Level value to be used to override the existing FRL value whenever an authorization code is entered.

This FRL may not override the originating FRL if an Alternate FRL is allowed (already active). If an Alternate FRL is active, the ALTFRL value defined for this overriding FRL is used. This ALTFRL value still

Copyright © 2003 Lucent Technologies

may be insufficient in overriding the originating FRL, so the terminal is still denied access to the line (route to Reorder). For information concerning originating and overriding alternate FRLs, see Division 4, Section 9G.
Valid Entries:
- For 5E6 and earlier: 1 - 16
- For 5E7 and later: 0 - 16

Data Rule:
A blank value means do not override.

2.5 DPAT OVR

Description: Is the existing DPAT value to be overridden?
Valid Entries: Y, N

Data Rule:
If "Y" is entered, then there must be an entry for DPAT. If DPAT OVR is "N" or blank, then DPAT must be blank.

2.6 DPAT

Description: This field is used to enter a DPAT value to overrride the dialing plan access treatment. A value of 0 entered here will remove the original DPAT value and set it to null. If the initial DPAT value is 4 and the value entered in this field is 8, then the new DPAT value will be 8.
Valid Entries: 0 - 32

Data Rule:
A value is entered only if DPAT OVR is "Y".

2.7 RESTRICTION TYPE OVR

Description: Is the existing RESTRICTION TYPE value to be overridden?
Valid Entries: Y, N

Data Rule:
If "Y" is entered, then there must be an entry for DPAT. If RESTRICTION TYPE OVR is "N" or blank, then RESTRICTION TYPE must be blank.

2.8 RESTRICTION TYPE

Description: This field is used to enter the station restriction type that will override the present restriction type.
Default: NOVRD
Valid Entries:

Valid RESTRICTION TYPE Entries

Entry	Definition
FULL	Fully restricted origination
NONE	No origination call restriction
SEMI	Semi-restricted origination
NOVRD	Software Release: 5E3 and later. No override of Terminal Group privileges

Data Rules:

A value is entered only if RESTRICTION TYPE OVR is "Y". If the initial RESTRICTION TYPE is "FULL" and the value entered here is "SEMI", then the new RESTRICTION TYPE will be "SEMI".

Copyright © 2003 Lucent Technologies

2.9 TOLL SCREEN INDEX

Description: If a user enters an ATH code when prompted after dialing a DN, then this screen index is used to override the screen index associated with a toll diverted terminal.

If a user enters an ATH code prior to dialing a DN, this screen index will be used to route the call regardless of whether the call placed would have been toll diverted or not.
Valid Entries: 1 - 4095

2.10 AMA

Description: Is the FCOS sufficient to override the AMA (Automatic Message Accounting) restriction?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ATH FOR AMA on the associated ATHFD form (5619-1 Record), ATHLPA form (5619-5 Record), ATHMPA form (5619-6 Record) or ATHTPA form (5619-7 Record) is "Y", then for at least one FCOS, this field should be "Y". If ATH FOR AMA on the associated form is "N", then this field will not be looked at.

2.11 MDR

Description: Is the FCOS sufficient to override the MDR (Message Detail Recording) restriction?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ATH FOR MDR on the associated ATHFD, ATHLPA, ATHMPA or ATHTPA form is "Y", then for at least one FCOS, this field should be "Y". If ATH FOR MDR on the associated form is "N", then this field will not be looked at.

FEATURE LIST

The Feature list (2.12) consists of a list of up to 48 BRCS Feature names (48 rows, each containing a unique BRCS Feature name).

Each terminal (line or trunk) which is to use the ATH capability must be assigned an ATH feature name defined on the ATHFD form, on the appropriate feature assignment form, LINEFA (5112 Record), MLHLNFA (5113 Record), TKGRPFA (5206 Record), TRUNKFA (5205 Record). In addition, each terminal should be assigned to an ATH Group which may be defined as a default parameter of the ATHFD form or on an individual terminal basis with the ATHLPA, ATHMPA, ATHTPA forms.

Each authorization Code Group should have an entry on the ATHAC form, to indicate the authorization code associated with each group. An ATHFCOS form should then be entered for each ATH group and FCOS. Then each FEATURE entry on the appropriate LINEFA, MLHLNFA, TRUNKFA, TKGRPFA, CLUSTR (5600 Record) form(s) with AC set to "Y" must be entered in the FEATURE LIST on the ATHFCOS form.

2.12 FEATURE

Description: This field is used to enter the unique BRCS Feature Name. The FEATURE entered here cannot be a wildcard feature or a Cluster Name.

Copyright © 2003 Lucent Technologies

SEC. 20E: 5619-5 RECORD
AUTHORIZATION CODE LINE PARAMETER FORM - ATHLPA

1. GENERAL

The 5619-5 Record is available with 5E3 and later Software Releases. The ATHLPA form is used to assign ATH feature parameters to non-Multi-Line Hunt lines when the default parameters of the ATHFD form (5619-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.41.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and the office name on each record.

2.2 * TN

Description: Enter the telephone number of the line.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	Definition
ATND	50B Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.

For 5E12 and later, TN and FEATURE NAME combinations on different ATHLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ATHLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE NAME

Description: Enter the Authorization Code Feature Name.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH feature defined on the ATHFD form (5619-1 Record).

2.4 ATH GROUP NAME

Copyright © 2003 Lucent Technologies

Description: For 5E6 and later, this field has been renamed CSV ATH GRP.

Enter the name of the ATH Group.

Software Release: 5E3 - 5E5
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP Forms (5619-2 Record).

2.5 # CSV ATH GRP

Description: Enter the name of the Circuit-Switched Voice ATH group.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record).

2.6 CSD ATH GRP

Description: Enter the name of the Circuit-Switched Data ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record). Defining a CSD ATH GRP for this port is optional. If a CSD group is defined, the CSD ATH GRP name must not be the same as the CSV ATH GRP name.

2.7 # ATH FIRST

Description: Will the customer be required to enter an Authorization Use Code and the Authorization Code before a TN can be dialed on the line? If CHANGE ATH FIRST is "Y" on the associated ATHFD form, the customer may dial a code to change this field.

- ***NOTE:*** 911 calls may be made without an Authorization Use Code and an Authorization Code when this field is set to "Y".

Required Field.
Valid Entries: Y, N

2.8 # ATH FOR AMA

Description: Will an Authorization Code be required before allowing any AMA recorded calls to proceed?

Required Field.
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.9 # ATH FOR MDR

Description: Will an Authorization Code be required before allowing a call recorded by MDR (Message Detail Recording) to proceed?

Required Field.
Valid Entries: Y, N

SEC. 20F: 5619-6 RECORD AUTHORIZATION CODE LINE (MLHG/TERM) PARAMETER FORM - ATHMPA

1. GENERAL

The 5619-6 Record is available with 5E3 and later Software Releases. The ATHMPA form is used to assign ATH (Authorization Code) parameters to Multi-Line Hunt lines when the default parameters of the ATHFD form (5619-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 3.41.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and the office name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Member Number of the line.
Valid Entries: 1 - 2015;
- 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	Definition
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. Integrated Services Digital Network digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.

2.4 * FEATURE NAME

Description: Enter the Authorization Code Feature Name.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH feature defined on the ATHFD form (5619-1 Record).

Copyright © 2003 Lucent Technologies

2.5 ATH GROUP NAME

Description: For 5E6 and later, this field has been renamed CSV ATH GRP.

Enter the name of the ATH Group.

Software Release: 5E5 and earlier
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record).

2.6 # CSV ATH GRP

Description: Enter the name of the Circuit-Switched Voice ATH group.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record).

2.7 CSD ATH GRP

Description: Enter the name of the Circuit-Switched Data ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record).

Defining a CSD ATH GRP for this port is optional. If a CSD group is defined, the CSD ATH GRP name must not be the same as the CSV ATH GRP name.

2.8 # ATH FIRST

Description: Will the customer have to enter an Authorization Use Code and the Authorization Code before a TN can be dialed on the line? If CHANGE ATH FIRST is "Y" on the associated ATHFD form, the customer may dial a code to change this field.

- ***NOTE:*** 911 calls may be made without an Authorization Use Code and an Authorization Code when this field is set to "Y".

Required Field.
Valid Entries: Y, N

2.9 # ATH FOR AMA

SEC. 20G: 5619-7 RECORD
AUTHORIZATION CODE TRUNK (TGN/MEMB)
PARAMETER FORM - ATHTPA

1. GENERAL

The 5619-7 Record is available with 5E3 and later Software Releases. The ATHTPA form is used to assign ATH feature parameters to trunks when the default parameters of the ATHFD form (5619-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.41.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and the office name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number of the trunk.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202-1 Record) must be one of the following.

TRKCLS	Description
PF	Private Facility.
PFLASH	Private Facility Feature Flash.

2.3 * MEMB

Description: Enter the Trunk Group Member Number of the trunk.
Valid Entries:
- For 5E2: 0 - 1983
- For 5E3 and later: 0 to 1951

2.4 * FEATURE NAME

Description: Enter the Authorization Code Feature Name.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH feature defined on the ATHFD form (5619-1 Record).

2.5 ATH GROUP NAME

Description: For 5E6 and later, this field has been renamed CSV ATH GRP.

Enter the name of the ATH Group.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and earlier
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ATH Group defined on one or more ATHGP forms (5619-4 Record).

2.6 # CSV ATH GRP

Description: Enter the name of the Circuit-Switched Voice ATH group.

Software Release: 5E6 and later
Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record).

2.7 CSD ATH GRP

Description: Enter the name of the Circuit-Switched Data ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ATH Group defined on one or more ATHGP forms (5619-2 Record). Defining a CSD ATH GRP for this port is optional.

If CSD ATH GRP is entered, then CSV ATH GRP must also be entered.

2.8 # ATH FIRST

Description: Will the customer have to enter an Authorization Use Code and the Authorization Code before a TN can be dialed on the trunk? If CHANGE ATH FIRST is "Y" on the associated ATHFD form, the customer may dial an access code to change this field.

Required Field.
Valid Entries: Y, N

2.9 # ATH FOR AMA

Description: Is an Authorization code required before allowing AMA recorded calls to proceed?

Required Field.
Valid Entries: Y, N

2.10 # ATH FOR MDR

Description: Is an Authorization Code required before allowing a call recorded by MDR (Message Detail Recording) to proceed?

Required Field.
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

SEC. 21A: 5620-1 RECORD
APPLICATION PROCESSOR CUSTOMER ASSIGNMENT FORM - APCA

1. GENERAL

The 5620-1 Record is available with 5E3 and later Software Releases. This is a BRCS (Business and Residence Custom Services) capability. This record is used to indicate whether or not the features, Traffic Data to Customer Location, Automatic Circuit Assurance 100 second scan, and/or Facilities Management have been purchased.

1.1 Recent Change View

The corresponding Recent Change view for this form is 24.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * BCID

Description: Enter the Business Customer Identification number.

Required Field.
Valid Entries: 1 - 65535

2.3 * AP SITE ID

Description: Enter the Application Processor Site Identification number. This identifies the AP to which the measurements are to be sent.

Required Field.
Valid Entries: 1 - 255

Data Rules:

For the 5E3 Software Release, each BCID and AP SITE ID entered should have a matching combination on the APGFP form (5620-2 Record).

For 5E4(2) - 5E5, if a "Y" is entered in the TRAFFIC DATA TO CUSTOMER LOCATION, AUTOMATIC CIRCUIT ASSURANCE, or FACILITIES MANAGEMENT field, then the BCID/AP SITE ID values must be defined on an APGFP form (5620-2 Record).

2.4 # TRAFFIC DATA TO CUSTOMER LOCATION

Description: Has the Traffic Data to Customer Location feature been activated for this customer?

Required Field.
Default: N
Valid Entries: Y, N

2.5 # AUTOMATIC CIRCUIT ASSURANCE

Description: Has the Automatic Circuit Assurance feature been activated for this customer?

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.6 # FACILITIES MANAGEMENT

Description: Has the Facilities Management feature been activated for this customer?

Required Field.
Default: N
Valid Entries: Y, N

2.7 # HSS

Description: Is the 100 Second Scan feature assigned to this customer?

Software Release: 5E4(2) and later
Required Field.
Default:

For 5E4(2) and 5E5: N
□ For 5E6 and later: Y

Valid Entries: Y, N

Data Rules:

If this field is "Y", the AP SITE ID must also be defined on the DSLAP form (5963 Record).

```
apca                    5ESS Switch
(5620-1)            OFFICE DATA ADMINISTRATION
            APPLICATION PROCESSOR CUSTOMER ASSIGNMENT

*1. BCID                    00235
*2. AP SITE ID                001

#3. TRAFFIC DATA TO CUSTOMER LOCATION   Y
#4. AUTOMATIC CIRCUIT ASSURANCE         N
#5. FACILITIES MANAGEMENT               Y
#6. HSS                     Y
```

SEC. 21B: 5620-2 RECORD
APPLICATION PROCESSOR GROUP/FACILITY PARAMETER FORM - APGFP

1. GENERAL

The 5620-2 record is available with 5E3 and later Software Releases. This record defines parameters for those customers with ACA (Automatic Circuit Assurance), TDCL (Traffic Data to Customer Location) and FM (Facilities Management) features assigned to them.

The Automatic Circuit Assurance feature provides the customer with traffic and trunk measurements pertaining to their private features and facilities. These measurements are useful to the customer for administering engineering and forecasting equipment and trunk needs and can also be used to identify faulty trunks. It allows the customer to specify trunks to be scanned for usage and the trunks that should have their holding times monitored. The customer can specify short and long holding time threshold values and a short holding time call count threshold.

The Traffic Data to Customer Location feature allows customers to specify which private features and/or facilities they wish to receive measurements on, what type of measurements they want and how often they wish to receive the measurement reports. At the times specified by the customer (the end customer) reports containing the measurements requested will be sent to the customer's location.

The Facilities Management feature will permit the customer to manipulate the data for the various features listed on the APFMA form (5620-3 Record).

1.1 Recent Change View

The corresponding Recent Change View is 24.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * BCID

Description: Enter the Business Customer Identification number.

Required Field.
Valid Entries: 1 - 65535

2.3 * AP SITE ID

Description: Enter the Application Processor Site Identification number. This identifies the AP that the measurements are to be sent to.

Required Field.
Valid Entries: 1 - 255

Data Rules:

If the AP SITE ID is entered here and on the APCA (5620 Record) form with "Y" in the HSS field, a matching AP SITE ID should be entered on the DSLAP form (5963 Record). Otherwise, the AP SITE ID entered here should have a matching AP SITE ID on the APCOMM form (5507 Record) or DSLAP form.

2.4 * GROUP/FACILITY TYPE

Copyright © 2003 Lucent Technologies

Description: This entry identifies the groups that are using the various facilities.

Required Field.

Valid GROUP/FACILITY TYPE Entries

Entry	Definition
ACCT	Account Code Groups
ATTG	Attendant Groups
ARSG	Automatic Route Selection Groups
ARSPAT	Software Release: 5E3 and later. Automatic Route Selection Pattern
AUTH	Authorization Code Groups
IDPG	Individualized Dialing Plan Groups
MDR	Message Detail Recording Groups
MLHG	Multi-Line Hunt Groups
MLHGAC	Software Release: 5E4(2) and later. Attendant counts for MLHG
MLHGQC	Software Release: 5E4(2) and later. Queuing counts for MLHG
MQMLHG	Modular Queues for MLHG
MQSF	Modular Queues for SFG
MQT	Modular Queues for Trunks
SFG	Simulated Facility Groups
TERMG	Terminal Groups
TOD	Time Of Day Schedule
TRKG	Trunk Groups

Data Rules:

If GROUP/FACILITY TYPE is "ARSG" then BCID and GROUP NO/GROUP NAME must match ARS GROUP NAME on the ARSGPA form (5608-2 Record).

If GROUP/FACILITY TYPE is "IDPG" then BCID and GROUP NO/GROUP NAME must match IDP GROUP NAME on the IDPGP form (5601-4 Record).

If GROUP/FACILITY TYPE is "ARSPAT" then GROUP NO/GROUP NAME must match the MCRTI on the ARSSCRN form (5608-6 Record).

If GROUP/FACILITY TYPE is "AUTH" then BCID and GROUP NO/GROUP NAME must match BCID and ATH GROUP NAME on the ATHGP form (5619-2 Record).

If GROUP/FACILITY TYPE is "TOD" then GROUP NO/GROUP NAME must match the FEATURE NAME on TODFD form (5610-1 Record).

If GROUP/FACILITY TYPE is "MDR" on the APGFP form and the GROUP NO/GROUP NAME assigned on the APGFP form is also assigned on the MDRGP form (5624-2 Record) as MDR GROUP NAME, then the BCID and AP SITE ID on the MDRGP form must be the same as the BCID and AP SITE ID on the APGFP form.

If GROUP/FACILITY TYPE is "MQSF" or "SFG" then GROUP NO/GROUP NAME must match with the SFG NUMBER on the PFASFG form (5609-3 Record).

If GROUP/FACILITY TYPE is "MQT" or "TRKG" then GROUP NO/GROUP NAME must match with the TGN on the TKGRP form (5202 Record).

If GROUP/FACILITY TYPE is "MLHG" "MQMLHG" or "ATTG" then GROUP NO/GROUP NAME must match with the MLHG on the MLHG form (5110 Record).

If GROUP/FACILITY TYPE is "ATTG" then GROUP NO/GROUP NAME must match with the GROUP NUMBER with MEASUREMENT TYPE of "ATTGP" on MEASPDF form (5615 Record).

If GROUP/FACILITY TYPE is "IDPG" then GROUP NO/GROUP NAME must match with the NAME with MEASUREMENT TYPE of "IDGP" on the MEASPDF form.

Copyright © 2003 Lucent Technologies

If GROUP/FACILITY TYPE is "MLHG" then GROUP NO/GROUP NAME must match with the GROUP NUMBER with MEASUREMENT TYPE of "MLHGP" on the MEASPDF form.

If GROUP/FACILITY TYPE is "TERMG" then:

- For 5E6 only, BCID and GROUP NO / GROUP NAME must match the BCID and GROUP ID on a TGATTD form (5611 record).
- GROUP NO / GROUP NAME must match the GROUP NUMBER with MEASUREMENT TYPE of "TERMGP" on the MEASPDF form.
- For 5E7 and later, the GROUP NO / GROUP NAME must match a GROUP ID on the TGSRLPA, TGSRMPA, TGSRTPA, or BFG form, or on the TGSRFD form if none of the other forms exist.

2.5 * GROUP NO/GROUP NAME

Description: This entry is either the group name or group number depending upon the group entered.

Required Field.

Valid GROUP NO/GROUP NAME Entries 5E11 and Earlier

Entry	Definition
1 - 65535	GROUP NUMBER
1 - 8 characters	GROUP NAME

Valid GROUP NO/GROUP NAME Entries 5E12 through 5E14

Facility Type	Entry	Definition
ARSG, IDPG,AUTH, ACCT, or MDR	1 - 8 character	GROUP NAME
TOD	1 - 11 character	GROUP NAME
TERMG	1 - 65535	GROUP NUMBER
ARSPAT	1 - 4095	GROUP NUMBER
TRKG	1 - 4000	GROUP NUMBER
All Others	1 - 2000	GROUP NUMBER

Valid GROUP NO/GROUP NAME Entries 5E15 and Later

Facility Type	Entry	Definition
ARSG, IDPG,AUTH, ACCT, and MDR	1 - 8 character	GROUP NAME
TOD	1 - 11 character	GROUP NAME
TERMG	1 - 65535	GROUP NUMBER
ARSPAT	1 - 4095	GROUP NUMBER
TRKG and MQT	1 - 4000	GROUP NUMBER
MQSF and SFG	1 - 2000	GROUP NUMBER
All Others	1 - 8191	GROUP NUMBER

Data Rules:

If GROUP/FACILITY TYPE is "TERMG" then the GROUP NUMBER must be in 1-65535. For 5E10 and earlier, if GROUP/FACILITY TYPE is "ACCT" "ARSG", "AUTH", "IDPG", "MDR", "TERMG", or "TOD", then GROUP NUMBER must be 1 to 65535.

For 5E11, when GROUP/FACILITY TYPE is "MQSF" or "SFG", GROUP NO/GROUP NAME must be 1 - 2000.

For 5E15 and later, when GROUP/FACILITY TYPE is "ATTG", "MLHGAC", "MLHGQC", "MQMLHG", or "MLHG", GROUP NO/GROUP NAME must be 1 - 2000.

For 5E11, when GROUP/FACILITY TYPE is "MQT" or "TRKG", GROUP NO/GROUP NAME must be 1 - 4000.

If GROUP/FACILITY TYPE is "ARSPAT", then GROUP NUMBER must be in 1 - 3617.

For 5E11 and later, if GROUP/FACILITY Type is "MLHGAC" or "MLHGQC", then GROUP NUMBER must

Copyright © 2003 Lucent Technologies

correspond to an MLHG on the MLHG form (5110 Record). The corresponding MLHG FEATURE on the MLHG form must be defined on the MLHGFD (5604 Record) such that HUNT TYPE is "ISAT".

For all other Types, GROUP NAME must be 1 to 8 characters.

2.6 # AUTOMATIC CIRCUIT ASSURANCE USE

Description: Will traffic and trunk measurements pertaining to private features and facilities be used?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry is "Y", then GROUP/FACILITY must be "TRKG".

If this entry is "Y", then BCID and AP SITE ID must be defined on the APCA form (5620-1 Record) with AUTOMATIC CIRCUIT ASSURANCE USE set to "Y".

The ACA (Automatic Circuit Assurance) feature must not be assigned to an Announcement Trunk. When AUTOMATIC CIRCUIT ASSURANCE USE is entered as "Y", the GROUP NO entered on the APGFP form must be defined on a TKGRP form (5202 Record) as TGN, and the associated TRKCLS must not be entered as "RAFANNC", "RAFDTA", or "RAFCTR" on the TKGRP form.

2.7 # NUTS/LUTS ACTIVE

Description: Is the NUTS/LUTS (Non-Usage Trunk Scan/Locked-Up Trunk Scan) scanning activated on this trunk group?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry is set to "Y", then AUTOMATIC CIRCUIT ASSURANCE USE must be set to "Y".

If this entry is set to "Y", then GROUP/FACILITY must be "TRKG".

2.8 # SHT ACTIVE

Description: Is Short Holding Threshold active?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry is set to "Y", then AUTOMATIC CIRCUIT ASSURANCE USE must be set to "Y".

If this entry is set to "Y", then GROUP/FACILITY must be "TRKG".

2.9 # LHT ACTIVE

Description: Is Long Holding Threshold active?

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

If this entry is set to "Y", then AUTOMATIC CIRCUIT ASSURANCE USE must be set to "Y".

If this entry is set to "Y", then GROUP/FACILITY must be "TRKG."

2.10 # SHT THRESHOLD

Description: Enter the short holding time threshold value from 0 to 160 seconds, by increments of 2 seconds.

Required Field.
Default: 0
Valid Entries: 0 - 160 (seconds) in increments of 2

Data Rules:

If this entry is greater than 0, then SHT ACTIVE must be "Y".

2.11 # SHT CALL THRESHOLD COUNT

Description: Enter the short holding time call count threshold, by increments of 2 calls.

Required Field.
Default: 0
Valid Entries: 0 - 30 in increments of 2

Data Rules:

If this entry is greater than 0, then SHT ACTIVE must be "Y".

2.12 # LHT THRESHOLD

Description: Enter the long holding time threshold value in hours, by increments of 1 hour.

Required Field.
Default: 0
Valid Entries: 1 - 10 (hours)

If this entry is greater than 0, then LHT ACTIVE must be "Y".

2.13 # TRAFFIC DATA TO CUST LOC USE

Description: Should traffic data measurement reports be sent to customer location?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry is "Y", then BCID and AP SITE ID must be defined on the APCA (5620-1 Record) with TRAFFIC DATA TO CUST LOC USE set to "Y".

2.14 # MEASUREMENT ACTIVE

Copyright © 2003 Lucent Technologies

Description: Will traffic measurements for this group be sent to the AP?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This entry can be "Y" only if TRAFFIC DATA TO CUST LOC USE is set to "Y".

If this entry is "Y", then BCID and AP SITE ID must be defined on the APCA (5620-1 Record) with TRAFFIC DATA TO CUST LOC USE set to "Y".

2.15 # FACILITIES MANAGEMENT USE

Description: Will this feature allow the customer to manipulate the data for the various features listed on the APFMA form (5620-3 Record)?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry is "Y", then BCID and AP SITE ID must be defined on the APFMA form (5620-3 Record).

If this entry is "Y", then BCID and AP SITE ID must be defined on the APGFP form (5620-1 Record) with FACILITIES MANAGEMENT USE set to "Y".

SEC. 21C: 5620-3 RECORD
APPLICATION PROCESSOR FACILITIES MANAGEMENT
ASSIGNMENT FORM - APFMA

1. GENERAL

The 5620-3 Record is available with 5E3 and later Software Releases. This is a BRCS (Business and Residence Custom Services) Capability.

The private network or business customer is given some administrative control over certain assignable features. The 5620-3 Record is used by the switch owner to define which features a particular customer can control.

These features are:

- AC (Authorization Codes)
- ACCT (Account Codes)
- MQ (Modular Queuing)
- ARS (Automatic Route Selection)
- ACA (Automatic Circuit Assurance)
- TDCL (Traffic Data to Customer Location)
- MDR (Message Detail Recording)
- TOD (Time of Day)

1.1 Recent Change View

The corresponding Recent Change view for this form is 24.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * BCID

Description: Enter the Business Customer Identification number.

Required Field.
Valid Entries: 1 - 65535

2.3 * AP SITE ID

Description: Enter the Application Processor Site Identification number. This identifies the AP to which the measurements are to be sent.

Required Field.
Valid Entries: 1 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

Each BCID and AP SITE ID must have a matching BCID and AP SITE ID on the APGFP form (5620-2 Record).

2.4 # AUTOMATIC ROUTE SELECTION

Description: Is Automatic Route Selection administration and control allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.5 # AUTOMATIC CIRCUIT ASSURANCE

Description: Is Automatic Circuit Assurance administration and control allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.6 # AUTHORIZATION CODES

Description: Is Authorization Code administration and control allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.7 # ACCOUNT CODES

Description: Is Account Code administration and control allowed?

Valid Entries: Y, N

2.9 # MODULAR QUEUING

Description: Is Modular Queuing administration and control allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.10 # TRAFFIC DATA TO CUST LOC

Description: Is Traffic Data to Customer Location administration and control allowed?

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.11 # TIME OF DAY

Description: Is Time of Day administration and control allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.12 # MAXIMUM SESSIONS

Description: This indicates the maximum number of simultaneous sessions allowed per BCID.

Required Field.
Default: 1
Valid Entries: 1 - 4

2.13 # TIME OUT

Description: This indicates the automatic FM session termination when no action is seen within the specified time.

Required Field.
Default: 60
Valid Entries: 2 - 120 (minutes)

2.14 # ACSR

Description: Is ACSR (Automatic Customer Station Rearrangement) administration and control allowed?

Currently, the AT&T Application Processor does not support this application. However, other vendors may support it.

Required Field.
Default: N
Valid Entries: Y, N

SEC. 21D: 5620-4 RECORD
100 SECOND SCAN (HSS) ACTIVATION FORM - APHSS

1. GENERAL

The 5620-4 Record is available with 5E4(2) and later Software Releases. The APHSS form is used to define if the HSS (100 Second Scan) feature is activated. For 5E5 and earlier Software Releases, the HSS feature collects usage data on a switching module basis for Leased Network trunk groups. For 5E6 and later, it is expanded to collect usage data on MLHGs, i.e., the number of lines busy within the MLHG.

The HSS capability allows the 5ESS Switch to serve as a switch in a leased network.

Leased network services provide customers with a variety of call processing features as well as centralized NM (Network Management) capabilities.

They are tailored for large business customers and provide dedicated networks to interconnect customer locations and the PSN (Public Switched Network).

HSS is an NM feature which allows customers to monitor the call load on their networks. Information provided from the HSS feature is useful to the customer for the administration and engineering of their private networks.

The HSS capability is responsible for collecting usage data for leased network trunk groups and ISDN BRI (Basic Rate Interface) Multi-Line Hunt Groups every 100 seconds, and sending it to the leased network OS (Operational Support System) via an API (Application Processor Interface).

1.1 Recent Change View

The corresponding Recent Change view for this form is 24.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * GROUP TYPE

Description: Enter the group type to be scanned by the HSS feature.

Required Field.
Default: TRKG
Valid Entries:

Valid GROUP TYPE Entries

Entry	Definition
TRKG	Trunk Groups
MLHG	Software Release: 5E6 and later. Multi-Line Hunt Groups

2.3 * GROUP NBR

Description: Enter the number of the trunk group or MLHG to be scanned by the HSS feature.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later for TRKG: 1 - 4000

Copyright © 2003 Lucent Technologies

- For 5E11 through 5E14 for MLHG: 1 - 2000
- For 5E15 and later for MLHG: 1 - 8191

Data Rules:

For 5E11 through 5E14, when GROUP TYPE is "MLHG", GROUP NBR must be 1 through 2000.

For 5E15 and later, when GROUP TYPE is "MLHG", GROUP NBR must be 1 through 8191.

When GROUP TYPE is "TRKG", GROUP NBR must be defined as a TGN on a TKGRP form (5202 Record) with TRK DIR equal to "OUT", "INC" or "2W". The Trunk Group must also have at least one TRUNK form with a TEN, DEN, or NEN defined.

When GROUP TYPE is "MLHG", GROUP NBR must be defined on the MLHG form (5110 Record) and LOCAL SM must be entered. That is, the MLHG must be a local Multi-Line Hunt Group whose members are all located on the same Switching Module.

2.4 # BCID

Deswcription: Enter a Business Customer Identification.

Required Field.

Data Rules:
The BCID/AP SITE ID values entered must also be defined on the APCA form.

2.5 # AP SITE ID

Description: Enter the Application Processor Site Identification number. This identifies the AP to which the measurements are to be sent.

Required Field.
Valid Entries: 1 - 255

Data Rules:

The AP SITE ID entered here should have a matching AP SITE ID on the DSLAP form (5963 Record).

2.6 # HSS ACTIVE

Description: Is the HSS feature activated on this trunk group or MLHG?

Required Field.
Default: Y
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

SEC. 22A: 5633 RECORD
MULTISWITCH BUSINESS GROUP - MBG

1. GENERAL

The 5633 Record is available with 5E9(2) and later Software Releases. The MBG (Multiswitch Business Group) form defines the data associated with an MBG and the following features:

- CN (CENTREX Network) provides the ability to define a CENTREX group on multiple switches and have CENTREX group features operate across switches.
- CN ISVM (CENTREX Network Interswitch Voice Messaging) provides for the centralized MSS (Mail Service System) for CN MBG customers.
- CN-S (CENTREX Network Special) provides requirements needed by the federal government's DTS-W (Defense Telecommunications System - Washington).

All three of the above are secured features and must be purchased before the feature can be assigned.

The secured feature IDs are as follows:
- CN SFID181
- CN ISVM SFID182
- CN-S SFID183

These features can be assigned to an MBG on this form, if the SFID ACT field for the specific feature has been set to "Y" on the SFSYS form (5713-1 Record).

For more information on these secured features, see Division 2, Section 4A181, Division 2, Section 4A182, and Division 2, Section 4A183.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MBG ID

Description: Enter the MBG ID (Multiswitch Business Group Identifier). The MBG ID uniquely identifies a Multiswitch Business Group on a switch wide basis and implicitly defines a CENTREX Network.

Required Field.
Valid Entries: 2 - 65535

Data Rules:

The MBG form is used by the CENTREX Network feature to define a CENTREX Network. It is a Secured Feature that must be purchased by the office before CENTREX Network data can be entered on this form. Therefore, the ACT field for SFID 181 on the SFSYS form (5713-1 Record) must be set to "Y".

2.3 # TGID

Copyright © 2003 Lucent Technologies

Description: Enter the Terminal Group Identifier. The TGID identifies the terminal group associated with the MBG. All terminals in the terminal group are associated with the MBG if the terminal group is associated with the MBG.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

The TGID must be defined on either the TGSRFD, TGSRLPA, TGSRMPA, TGSRTPA or BFG form.

The TGID cannot be entered on more than one MBG form.

2.4 CNS

Description: Is the CENTREX Network Special feature for Government Screening active for the MBG?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

CN-S is a Secured Feature that must be purchased by the office before CNS can be set to "Y". The ACT for SFID 183 must be set to "Y" on the SFSYS form (5713-1 Record) before "Y" can be entered in the CNS field.

2.5 CNISVM

Description: Is the CENTREX Network for ISVM feature active?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then BCID must be entered. If "N" is entered, then BCID cannot be entered.

The CN ISVM (CENTREX Network Interswitch Voice Mail) feature is a Secured Feature that must be purchased by the office before CNISVM can be set to "Y". The ACT field for SFID 182 on the SFSYS form (5713-1 Record) must be set to "Y", before "Y" can be entered in this field.

2.6 BCID

Description: Enter the BCID (Business Customer Identifier), which is used to send an incoming MBG call to the appropriate voice mail service. This field is used in conjunction with the CN ISVM feature.
Valid Entries: 1 - 65535

Data Rules:

If CNISVM is "Y", then BCID must be entered. If CNISVM is "N", BCID must not be entered.

2.7 PP DISP ONLY

Description: Should the PP (Precedence and Preemption) Display only be used for all calls? The PP format is used for display on an ISAT terminal when a PP feature is assigned to that terminal. If "Y" is entered, then the PP display is used for all calls. If "N" is entered, only PP calls will use the PP display.

Copyright © 2003 Lucent Technologies

Required Field.
Default: Y
Valid Entries: Y, N

2.8 CAMPON CWO

Description: Enter the Camp-on CWO (Call Waiting Originating) feature to be used for ISAT invoked camp-on for an MBGE (Multiswitch Business Group Element). The specified CWO feature applies the call waiting tone to an incoming ISUP7 MBG call.

Required Field.
Default: /CWO
Valid Entries: 1 - 8 characters

Data Rules:

The CWO feature entered must be a preconstructed feature or it must be constructed on the CWTFD form (5603-1 Record). The specified CWO feature must also have the INVOCATION field set to "ORIG" on the CWTFD form.

2.9 CAMPON CWD

Description: Enter the Camp-on CWD (Call Waiting Dialed) feature name used for ISAT invoked camp-on for MBGE. The CWD feature applies the call waiting tone to an incoming ISUP7 MBG call.

Required Field.
Default: /CWD
Valid Entries: 1 - 8 characters

Data Rules:

The CWD feature must be a preconstructed feature or must be constructed on the CWTFD form (5603-1 Record). The CWD feature must also have the INVOCATION field set to "CODE" on the CWTFD form.

2.10 NAME

Description: Enter the network name to be associated with the MBG ID. The name should identify the company name associated with the MBG ID.
Valid Entries: 1 - 8 characters

SEC. 24: ACCOUNT CODE FORMS

Copyright © 2003 Lucent Technologies

SEC. 24A: 5623-1 RECORD
ACCOUNT CODE FEATURE DEFINITION FORM - ACCTFD

1. GENERAL

The 5623-1 Record is available with 5E3 and later Software Releases. It is used to define the various combination of options associated with Account Codes.

1.1 ACCT Capabilities

The ACCT (Account Code) capability allows a customer to include an account number in AMA (Automatic Message Accounting) records, and in MDR (Message Detail Recording) records to the Revenue Accounting office or to customer location. An ACCT is entered as part of the dialing sequence and may be included with the information on the customer's bill. This provides a customer with a mechanism for cost allocation of incoming and outgoing calls, by associating a particular call with a specific customer business account. See Figure 2 for Account Code Dialing Sequence.

1.2 ACCT Requirements

Each terminal (line or trunk) which is to use the ACCT capability must be assigned an ACCT feature name (defined on this form) on the appropriate feature assignment form, LINEFA, MLHLNFA, TKGRPFA, TRUNKFA. In addition, each terminal must be assigned to an ACCT Group which may be defined as a default parameter of the ACCTFD form, or on an individual terminal basis with the "ACCTLPA, ACCTMPA, ACCTTPA forms.

An Account Code Group defines the account code length, routing or private facility access code association prompt treatment and error treatment for all lines using that group.

Each terminal may also be assigned to an ACCT Code Association table, defined on the ACCTRTP form (5623-3 Record).

Lines assigned to ACCT features must have an associated Class of Service on the LCC form of "ATND", "INDIV", "ISDN", "ISATND", "PBX" or "4WINDIV".

Certain Account Code features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a (/) and the slash may not be used as the first character of any feature name other than preconstructed features. A list of the preconstructed Account Code features is contained in Figure 1 .

1.3 Recent Change View

The corresponding Recent Change View for this form is 12.42.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 *FEATURE NAME

Description: Enter the Account Code Feature Name. The first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Copyright © 2003 Lucent Technologies

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.8) specify feature options for the Account Code Feature.

2.4 ACT TYPE

Description: Can the ACCT feature be activated by the customer?

Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
AUTO	Used to indicate no customer activation. Upon assignment the feature is made active and is ready to be used.
CODE	The ACCT feature is activated by dialing a code.

Data Rules:

If ACT TYPE is "CODE", then DACT TYPE must be "CODE". If ACT TYPE is "AUTO", then DACT TYPE must be "NONE".

If ACT TYPE is "CODE", and this feature is assigned to a line/trunk, then the line/trunk must be assigned at least one dialed code (on the PDIT and/or IDPDCA Form) with ACTION equal to "ACCTACT", and a FEATURE associated with the dialed code on the PDIT/IDPDCA form equal to this ACCT feature.

2.5 DACT TYPE

Description: Can the subscriber assigned this feature deactivate the feature?

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
NONE	Used to indicate no customer deactivation is allowed. The feature can never be deactivated from the customer's station.
CODE	The ACCT feature is deactivated by dialing a code.

Data Rules:

If DACT TYPE is "CODE", then ACT TYPE must be "CODE". If DACT TYPE is "NONE", then ACT TYPE must be "AUTO".

If DACT TYPE is "CODE", and this feature is assigned to a line/trunk, then the line/trunk must be assigned at least one dialed code (on the PDIT and/or IDPDCA Form) with ACTION equal to "ACCTDCT", and a FEATURE associated with the dialed code on the PDIT/IDPDCA Form equal to this ACCT feature.

2.6 AMA LENGTH

Description: Will a 15-character Account Code or an 8-digit CDAR (Customer Dialed Account Recording) be included in the AMA structure code? If an 8 is entered, a 2 followed by the CDAR will be placed in the AMA record. If a 15 is entered, an 8 followed by the Account Code will be placed in the AMA record.

Required Field.

Copyright © 2003 Lucent Technologies

Default: 8
Valid Entries: 8, 15

Data Rules:

In a DSN office (DSN OPT = "Y" on the OFCOPT form (5509 Record)) if the AMA LENGTH is 15, then the ACCT LENGTH field on the ACCTGP form (5623-2 Record) must be less than or equal to 14. If the AMA LENGTH is 8, then the ACCT LENGTH must be less than or equal to 7.

2.7 CODE ASSOC ALW

Description: Can a dialable sequence be associated with an ACCT use code?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CODE ASSOC ALW is "N", then CODE TABLE NAME must be blank.

2.8 PARM ACT TYPE

Description: Can the active parameter set defined on the ACCTGP form (5623-2 Record) be changed via a dialed code?

Required Field.

Default Values: AUTO

Valid PARM ACT Entries

Entry	Definition
AUTO	The ACCT feature active parameter set defined on the ACCTGP form (5623-2 Record) cannot be changed via a dialed code.
CODE	The ACCT feature active parameter set defined on the ACCTGP form (5623-2 Record) can be changed from main to alternate or alternate to main via a dialed code.

Data Rules:

If PARM ACT TYPE is "CODE", and this feature is assigned to a line/trunk, then the line/trunk must be assigned at least one dialed code (on the PDIT and/or IDPDCA Form) with ACTION equal to "MAINACT" and one with ACTION equal to "ALTACT", and a FEATURE associated with the dialed code on the PDIT/IDPDCA Form equal to this ACCT feature.

DEFAULT PARAMETERS

The following fields (Section 2.9 - Section 2.10) define the default parameters assigned with the feature to terminals (lines or trunks). These parameters will be assigned to the terminal unless they are overriden by entries on the ACCTLPA, ACCTMPA, ACCTTPA Forms.

2.9 #ACCT GROUP NAME

Description: Enter the name of the ACCT Group. The name may be from 1 - 8 characters, with no restrictions on the valid characters. The name entered here must be that of an ACCT Group defined on an ACCTGP form (5623-2 Record).

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

2.10 #CODE TABLE NAME

Description: This field is used to identify the ACCT associated code table name for the port. The name may be from 1 to 8 characters, with no restrictions on the valid characters.
Valid Entries: 1 - 8 characters

Data Rules:

If a CODE TABLE NAME is entered here, then an ACCTRTP form (5623-3 Record), must be entered for this CODE TABLE NAME. If CODE ASSOC ALW is "N", then CODE TABLE NAME must be left blank.

SEC. 24B: 5623-2 RECORD
ACCOUNT CODE GROUP DEFINITION FORM - ACCTGP

1. GENERAL

The 5623-2 Record is available with 5E3 and later Software Releases. It is used to define the group level of information required for the Account Code capability.

Each terminal (line or trunk) which is to use the ACCT capability must be assigned an ACCT feature name (defined on the ACCTFD form, 5623-1 Record) on the appropriate feature assignment form, LINEFA, MLHLNFA, TKGRPFA, TRUNKFA. In addition, each terminal must be assigned to an ACCT Group which may be defined as a default parameter of the ACCTFD form, or on an individual terminal basis with the ACCTLPA, ACCTMPA, ACCTTPA forms.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 *ACCT GROUP NAME

Description: Enter the name of the ACCT Group. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

2.3 ACCT LENGTH

Description: Enter the length of the Account code(s) assigned to this group. All Account codes for an ACCT GROUP must be the same length.

Required Field.
Valid Entries: 1 - 15

2.4 ACTIVE PARM SET

Description: Enter whether the main or alternate parameter set is active.

Required Field.
Default: M
Valid Entries:

Valid ACTIVE PARM SET Entries

Entry	Definition
M	Main
A	Alternate

2.5 TOD INHIBIT

Description: Should the Time of Day schedules be temporarily deactivated? Enter "Y" to inhibit TOD.

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.6 TOLL SI

Description: Enter the Toll Screening Index to override toll diversion to an attendant. For more information about this field, see Division 2, Section 4C28, which describes the "Account Code - Toll Diversion to an Attendant/DPAT" transparency feature.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 4095

2.7 DPAT OVRD

Description: Should DPAT (Dialing Plan Access Treatment) restrictions be overridden? For more information about this field, see Division 2, Section 4C28, which describes the "Account Code - Toll Diversion to an Attendant/DPAT" transparency feature.

Software Release: 5E9(1) and later.
Default: N
Valid Entries: Y, N

PARAMETERS MAIN/ALTERNATE

Both a MAIN and ALTERNATE parameter set must be defined for each ACCT group. The ACTIVE PARM SET field will determine which set is active for this ACCT group. Only one parameter set can be active at a given time. Use the following fields (Section 2.8 - Section 2.16) to define both a MAIN and an ALTERNATE PARAMETER set.

2.8 AMA RECORD

Description: Is the dialed ACCT stored in the AMA record(s) made for the call?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If AMA RECORD is "N", then MDR RECORD must be "Y".

2.9 MDR RECORD

Description: Is the dialed ACCT stored in the MDR record(s) made for the call?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If MDR RECORD is "N", then AMA RECORD must be "Y".

2.10 AMA REQUIRED

Description: Does dialing an ACCT force an AMA record for a call that is not normally recorded?

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If AMA REQUIRED is "Y", then AMA RECORD must be "Y".

2.11 MDR REQUIRED

Description: Does dialing an ACCT force an MDR record for a call that is not normally recorded?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If MDR REQUIRED is "Y", then MDR RECORD must be "Y".

2.12 AMA RESTRICT

Description: Are AMA recorded calls restricted if dialed without an ACCT?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This parameter must be "N" for both MAIN and ALTERNATE parameter sets for those terminals assigned a Precedence and Preemption Feature in addition to an Account Code Feature.

2.13 MDR RESTRICT

Description: Are MDR recorded calls restricted if dialed without an ACCT?

Required Field.
Default: N
Valid Entries: Y, N

This parameter must be "N" for both MAIN and ALTERNATE parameter sets for those terminals assigned a Precedence and Preemption Feature in addition to an Account Code Feature.

2.14 RESTRICT TRT

Description: Enter the error treatment to be given for AMA or MDR restricted calls which fail because an ACCT code was not dialed or an incorrect ACCT code was dialed.

Required Field.
Default: REORD
Valid Entries:

Valid RESTRICT TRT Entries

Entry	Definition
REORD	Reorder
ANNC	Announcement

Data Rules:

If this field is "ANNC", then ANNC INDEX must be known.

Copyright © 2003 Lucent Technologies

2.15 ANNC INDEX

Description: Enter the Announcement Route Index.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

If RESTRICT TRT is "ANNC", then an ANNC INDEX must be entered. If RESTRICT TRT is not "ANNC", then ANNC INDEX must be blank. This ANNC INDEX must be defined on the RTIDX form with a Route Type of "HUNT".

2.16 ACCT PROMPT

Description: Enter the type of prompt that will be given to the user to indicate that the Account Code should be entered.

Required Field.
Default: DIAL
Valid Entries:

Valid ACCT PROMPT Entries

Entry	Definition
BEEP1	One Beep
BEEP2	Two Beeps
BEEP3	Three Beeps
DIAL	Dial Tone
NONE	No Tone

SEC. 24C: 5623-3 RECORD
ACCOUNT CODE ASSOCIATED CODE TABLE PARAMETERS FORM - ACCTRTP

1. GENERAL

The 5623-3 Record is available with 5E3 and later Software Releases. It is used to define the code sequence associated with an ACCT (Account Code) use code for a particular code association table.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 *CODE TABLE NAME

Description: Enter the Code Table Name.
Valid Entries: 1 - 8 characters

3. CODE ASSOCIATIONS

3.1 USE CODE

Description: Enter the unique ACCT use code.
Valid Entries:
- 5E5 and earlier: 1 - 9, # or *
- 5E6 and later: 1 - 9, # or *

Data Rules:

For each USE CODE entered there must be a corresponding CODE SEQ.

If USE CODE is known, then the associated line/trunk (from the ACCTLPA, ACCTMPA, or ACCTTPA form) must have at least one dialed coded (on the PDIT and/or IDPDCA form) with ACTION equal to "ACCTUSE" and a FEATURE associated with the dialed code on the PDIT/IDPDCA form equal to this ACCT feature (from the associated ACCTMPA or ACCTTPA form).

3.2 CODE SEQ

Description: Enter the code sequence. The sequence of digits must be a complete dialable sequence of no more than 10 characters. The sequence can be a TN (Telephone Number), 10XXX, feature code, routing information, ect. Multiple sequences can be stored within the 10 characters if the sequences are complete. An ARS (Automatic Route Service) use code followed by only 3 digits of a 7-digit TN is not allowed.
Valid Entries:
- 5E5 and earlier: 1 - 9, # or *
- 5E6 and later: 1 - 9, # or *

Examples:

Copyright © 2003 Lucent Technologies

83571234 - Where "8" is an ARS access code and
3571234 is the called 7-digit number.

10288 - Where 10288 is a Carrier access code.

3571234 - A 7-digit number.

9 - Escape to POTS.

Data Rules:

For each CODE SEQ entered there must be a corresponding USE CODE.

The associated code(s) must be defined on the PDIT and/or IDPDCA and/or PNDP form.

SEC. 24D: 5623-4 RECORD
ACCOUNT CODE LINE PARAMETER FORM - ACCTLPA

1. GENERAL

The 5623-4 Record is available with 5E3 and later Software Releases. The ACCTLPA form is used when assigning ACCT features to non-Multi-Line Hunt lines to assign ACCT feature parameters to the lines if the default parameters of the ACCTFD form (5623-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.42.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *TN

Description: Enter the Telephone Number of the line.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be:

LCC FORM Entries

Entry	Definition
ATND	50B Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.

For 5E12 and later, TN and FEATURE NAME combinations on different ACCTLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ACCTLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 *FEATURE NAME

Description: Enter the Account Code Feature Name. Feature Name may be from one to eight characters long with no restrictions on the valid characters, except that the first character may not be a slash (/). Feature Names starting with a slash are reserved for preconstructed features.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ACCT feature defined on the ACCTFD form (5623-1 Record).

Copyright © 2003 Lucent Technologies

2.4 ACCT GROUP NAME

Description: Enter the name of the ACCT Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ACCT Group defined on an ACCTGP form (5623-2 Record).

2.5 CODE TABLE NAME

Description: This field is used to identify the ACCT associated CODE TABLE NAME for the port.
Valid Entries: 1 - 8 characters

Data Rules:

If a CODE TABLE NAME is entered here, then an ACCTRTP form (5623-3 Record) must be entered for this CODE TABLE NAME.

If CODE ASSOC ALW defined on the associated ACCTFD form (5623-1 Record) is set to "N", then CODE TABLE NAME must be left blank.

TNs are assigned ACCT (Account Code) features with CODE TABLE NAME entered either on an ACCTLPA, ACCTFD or BFG form. The CODE TABLE NAME is defined on an ACCTRTP form with USE CODEs entered. These USE CODEs and either the specific assigned ACCT feature or the ACCT wild-card feature (/AC*) which is assigned to the line must be defined in the Individualized Dialing Plan (defined on the IDPDCA form) or the Office Dialing Plan (defined on the PDIT form) with an ACTION of "ACCTUSE".

SEC. 24E: 5623-5 RECORD
ACCOUNT CODE LINE (MLHG/TERM) PARAMETER FORM - ACCTMPA

1. GENERAL

The 5623-5 Record is available with 5E3 and later Software Releases. The ACCTMPA form is used when assigning ACCT features to Multi-Line Hunt lines to assign ACCT parameters to the lines if the default parameters of the ACCTFD form (5623-1 Record) are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.42.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and the office name on each record.

2.2 *MLHG

Description: Enter the Multi-Line Hunt Group Number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 *TERM

Description: Enter the Multi-Line Hunt Group Member Number of the line.

Required Field.
Valid Entries: 1-2015 and 3001-3999 (Outdial Terminals Only).

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be:

LCC FORM Entries	
Entry	**Definition**
ATND	50B Non-Data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
PBX	Line to a PBX.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.

2.4 *FEATURE NAME

Description: Enter the Account Code Feature Name. Feature Name may be from one to eight characters long with no restrictions on the valid characters, except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

The name entered here must be that of an ACCT feature defined on the ACCTFD form (5623-1 Record).

2.5 ACCT GROUP NAME

Description: Enter the name of the ACCT Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ACCT Group defined on an ACCTGP form (5623-2 Record).

2.6 CODE TABLE NAME

Description: This field is used to identify the ACCT associated code table name for the port.
Valid Entries: 1 - 8 characters

Data Rules:

If a CODE TABLE NAME is entered here, then an ACCTRTP form (5623-3 Record) must be entered for this CODE TABLE NAME.

If CODE ASSOC ALW defined on the associated ACCTFD form (5623-1 Record) is set to "N", then CODE TABLE NAME must be left blank.

MLHG/TERM (s) are assigned ACCT (Account Code) features with CODE TABLE NAME entered either on an ACCTLPA, ACCTFD or BFG form. The CODE TABLE NAME is defined on an ACCTRTP form with USE CODEs entered. These USE CODEs and either the specific assigned ACCT feature or the ACCT wild-card feature (/AC*) which is assigned to the MLHG/TERM must be defined in the Individualized Dialing Plan (defined on the IDPDCA form) or the Office Dialing Plan (defined on the PDIT form) with an ACTION of "ACCTUSE".

SEC. 24F: 5623-6 RECORD
ACCOUNT CODE TRUNK (TGN/MEMB) PARAMETER FORM - ACCTTPA

1. GENERAL

The 5623-6 Record is available with 5E3 and later Software Releases, and is used to assign ACCT feature parameters to trunks if the default parameters of the ACCTFD Form, 5623-1 Record, are inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.42.

2. FORM AND RECORD ENTRIES - 5623-6 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202-1 Record) must be "PF" or "PFLASH".

2.3 * MEMB

Description: Enter the Trunk Group Member Number of the trunk.

Required Field.
Valid Entries: 0 - 1951

2.4 * FEATURE NAME

Description: Enter the Account Code Feature Name. Feature Name may be from one to eight characters long with no restrictions on the valid characters, except that the first character may not be a slash (/). Feature Names starting with a slash are reserved for pre-contructed features.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a ACCT feature defined on the ACCTFD Form.

2.5 ACCT GROUP NAME

Description: Enter the name of the ACCT Group.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an ACCT Group defined on an ACCTGP Form.

2.6 CODE TABLE NAME

Description: Enter the ACCT associated Code Table Name for the port.
Valid Entries: 1 - 8 characters

Data Rules:

If a CODE TABLE NAME is entered, an ACCTRTP Form must be entered for this CODE TABLE NAME. If CODE ASSOC ALW defined on the associated ACCTFD Form is set to "N", then CODE TABLE NAME must be left blank.

TGNs are assigned ACCT (Account Code) Features on the TKGRPFA form. The ACCT Feature has CODE TABLE NAME entered either on an ACCTTPA or ACCTFD form. The CODE TABLE NAME is defined on an ACCTRTP form with USE CODEs entered. These USE CODEs and either the specific assigned ACCT Feature or the ACCT wildcard feature (/AC*) which is assigned to the trunk must be defined in the Individualized Dialing Plan (defined on the IDPDCA form) or the Office Dialing Plan (defined on the PDIT form) with an Action of "ACCTUSE".

TGN/MEMB(s) are assigned ACCT (Account Code) Features on the TRUNKFA form. The ACCT Feature has CODE TABLE NAME entered either on an ACCTTPA or ACCTFD form. The CODE TABLE NAME is defined on an ACCTRTP form with USE CODEs entered. These USE CODEs and either the specific assigned ACCT Feature or the ACCT wildcard feature (/AC*) which is assigned to the trunk must be defined in the Individualized Dialing Plan (defined on the IDPDCA form) or the Office Dialing Plan (defined on the PDIT form) with an Action of "ACCTUSE".

SEC. 25: MESSAGE DETAIL RECORDING FORMS

Copyright © 2003 Lucent Technologies

SEC. 25A: 5624-1 RECORD
MESSAGE DETAIL RECORDING FEATURE DEFINITION FORM - MDRFD

1. GENERAL

The 5624-1 Record is available with 5E3 and later Software Releases. It is used to define various combinations of options associated with MDR (Message Detail Recording), a BRCS feature.

The MDR to CL (Message Detail Recording to Customer Location) feature supplies detailed call records directly to a customer's location. The MDR records are shipped, in real time, to an AP (Applications Processor) via dedicated data links from the 5ESS switch. The 5ESS switch is responsible for collecting the information for an MDR record, placing it in the proper record format, and shipping the record out over a data link. The AP is responsible for storing and processing the MDR records.

Each combination of MDR options is given a 1 - 8 character feature name, which is used to assign the constructed (switch owner defined) feature to lines or trunks. Each terminal (line or trunk) may be assigned only one MDR feature name.

One MDR feature has been predefined and is automatically provided in the office database at the time of office registration. This is the preconstructed feature. All preconstructed feature names start with a slash (/) which may not be used to start any other feature name. The MDR preconstructed feature appears in Figure 1.

To use the MDR capability, a terminal must be assigned an MDR feature on the appropriate feature assignment form (LINEFA, MLHLNFA, TKGRPFA, TRUNKFA or BFG) and must belong to an MDR group. The MDR group name is assigned either as a default parameter defined with a MDR feature on the MDRFD form or on an MDRLPA, MDRTPA or MDRMPA form.

The MDR group information, defined on the MDRGP form (5624-2 Record), is used to indicate the group name, the group status, the customer's identification, the Application Processor to which the group is assigned, the attempt types allowed and the types of MDR records allowed by the group. The group Application Processor information (AP SITE ID) and the business customer identification (BCID) must also be specified on the APCA form (5620 Record).

The count of the sum total of all MDR records generated and the sum total of all MDR records lost is available to up to twenty-five MDR customers on a daily basis. The MDR customer identification and associated Applications Processor identification for these customers are specified on the MDRCNT form (5624-3 Record).

For 5E6 and later Software Releases, a Trunk Group that is assigned an MDR feature must be defined on a TKGRP form (5202 Record) with one of the following Trunk Classes (TRKCLS): "PF", "PFITT", "PFLASH", "LTOLLCON", "TTOLLCON", "PRINTOLL", "CAMAANI", "LATA", "EDSL" or "EDSLHM".

A Trunk that is assigned an MDR feature must belong to a Trunk Group defined on a TKGRP form with one of the above Trunk Classes or with INTEROFC.

1.1 Recent Change View

The corresponding Recent Change View for MDRFD is 12.33. For more information on Recent Change Views that correspond to ODA forms, please see Division 0, Section 2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

Copyright © 2003 Lucent Technologies

2.2 * FEATURE

Description: Enter the MDR (Message Detail Recording) Feature name. MDR Feature names may be from one to eight characters long, with no restrictions on the valid characters, except that the first character may not be a slash (/) which is reserved for preconstructed features. Preconstructed features may be reviewed but may not be deleted, changed or inserted in the ODA database.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter (optionally) a descriptive comment of up to 32 characters.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.6) define the feature options available to the MDR feature.

2.4 ACT TYPE

Description: Enter the Activation Type of the MDR Feature.

Valid ACT TYPE Entries

Entry	Definition
AUTO	Automatic activation
CODE	Dial code

Data Rules:

AUTO:
If the ACT TYPE is "AUTO", the DACT type must be "NONE" or "CODE".

- If the DACT TYPE is "NONE", MDR is always active.
- If the DACT TYPE is "CODE", MDR can be deactivated for one call by a dialed code.

CODE:
If the ACT TYPE is "CODE", the DACT type must be "AUTO" or "CODE".

- If the DACT TYPE is "CODE", MDR can be activated or deactivated by a dialed code.
- If the DACT TYPE is "AUTO", MDR can be activated for one call by a dial code.

When "CODE" is entered for ACT TYPE, the dialed code must be defined in the subscribers IDP (Individualized Dialing Plan) Dialed Code Assignment on the IDPDCA form (5601-1/2 Record) (if a member of an IDP) or in the Office Dialing Plan on the PDIT form (5300-2 Record) as ACTION equal to "MDRACT".

2.5 DACT TYPE

Description: Enter the Deactivation Type of the MDR Feature.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
AUTO	Automatic deactivation

Copyright © 2003 Lucent Technologies

CODE	Dial code
NONE	No deactivation allowed

Data Rules:

See ACT TYPE description for interactions between ACT TYPEs and DACT TYPEs.

When "CODE" is entered for DACT TYPE the dialed code entered must be defined in the subscribers IDP (Individualized Dialing Plan) Dialed Code Assignment on the IDPDCA form (5601-1/2 Record) (if a member of an IDP) or in the Office Dialing Plan on the PDIT form (5300-2 Record) with ACTION equal to "MDRDCT".

2.6 GRP CHANGE ALLOWED?

Description: Can a dialed code can be used to change the MDR group status? If Group Change Allowed is permitted, MDR group status can be controlled by a dialed code.
Default: N
Valid Entries: Y, N

DEFAULT PARAMETERS

The following field defines the default parameter assigned with the feature to terminals (lines or trunks). This parameter will be assigned to the terminal unless it is overridden by entries on the MDRLPA, MDRMPA or MDRTPA Forms.

2.7 MDR GROUP NAME

Description: Enter the NAME of the MDR Group.
Valid Entries: 1 - 8 characters

SEC. 25B: 5624-2 RECORD
MESSAGE DETAIL RECORDING GROUP FORM - MDRGP

1. GENERAL

The 5624-2 Record is available with 5E3 and later Software Releases. It is used to define the group information for MDR (Message Detail Recording).

Each terminal (line or trunk) that will use the MDR capability must be assigned an MDR feature identification (defined on the MDRFD form (5624-1 Record)) on a LINEFA, MLHLNFA, TKGRPFA, BFG or TRUNKFA form. In addition, each terminal must be assigned to an MDR group which may be defined as the default parameter on the MDRFD form or on an individual terminal basis with the MDRLPA, MDRMPA or MDRTPA forms. The preconstructed MDR feature provided does not specify the MDR group. Therefore, if the preconstructed feature is used, individual parameter forms must be entered for each terminal.

1.1 Recent Change View

The corresponding Recent Change View for MDRGP is 24.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * MDR GROUP NAME

Description: Enter the NAME of the MDR Group.
Valid Entries: 1 - 8 characters

2.3 MDR GROUP STATUS

Description: Enter the MDR status.
Default: ON
Valid Entries:

Valid MDR GROUP STATUS Entries

Entry	Definition
ON	The MDR capability is turned on.
OFF	The MDR capability is turned off.

Data Rules:

If the MDR GROUP STATUS is "ON", the MDR RECORD TYPE ALLOWED? fields are treated as specified for this group (i.e., "Y" or "N"). However, if the MDR GROUP STATUS is "OFF", the MDR RECORD TYPE ALLOWED? fields are all treated as "N".

2.4 #BCID

Description: Enter the Business Customer Identification Number.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

For 5E5 and 5E6, the BCID and AP SITE ID must be defined on an APCA form (5620 Record).

Copyright © 2003 Lucent Technologies

2.5 #AP SITE ID

Description: Enter the Application Processor Site Identification Number to which this MDR group reports.

Required Field.
Valid Entries: 1 - 255

Data Rules:

This AP SITE ID must also be defined on the APCA form (5620 Record), APCOMM form (5507 Record) or the DSLAP form (5963 Record) as AP SITE ID.

2.6 8 HR PASSED

Description: Is an 8-Hour Passed MDR Record is to be generated? An 8-hour passed MDR Record is an additional MDR Record generated for calls that have been in progress for 8 hours or more.

Software Releases: 5E5 and later
Required field.
Default Value: N.
Valid Entries: Y, N

Data Rules:

In order for an 8-Hour Passed MDR Record to be generated, this field must be "Y" and the 8 HR SCAN field on the OFCOPT form must be "Y". If the 8 HR SCAN field on the OFCOPT form is "N", an 8-Hour Passed MDR Record will not be generated, even if the value entered in this field is "Y".

CKT ATTEMPT TYPES

This field group was ATTEMPT TYPES ALLOWED? in 5E5 and earlier Software Releases. The fields Section 2.7 - Section 2.8 are for ATTEMPT TYPES ALLOWED? The field group CKT ATTEMPT TYPES was added with 5E6 and later Software Releases. Fields Section 2.9 - Section 2.14 refer to CKT ATTEMPT TYPES.

2.7 EFFECTIVE ATTEMPTS

Description: Will effective call attempts be recorded for this MDR group?

Software Release: 5E5 and earlier
Default: Y
Valid Entries: Y, N

Data Rules:

Either this and/or INEFFECTIVE ATTEMPTS must be "Y".

2.8 INEFFECTIVE ATTEMPTS

Description: Will ineffective call attempts be recorded for this MDR group? An ineffective attempt is defined as a call with a valid dialing sequence (i.e., not partial dial) that does not complete for some reason (e.g., all facilities are busy).

Software Release: 5E5 and earlier
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

Either this and/or EFFECTIVE ATTEMPTS must be chosen "Y".

2.9 EFF ORIG PRIV

Description: Will effective originating private calls be recorded for this MDR group?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

Either this or INEFF ORIG PRIV must be "Y".

2.10 INEFF ORIG PRIV

Description: Will ineffective Originating Private calls be recorded for this MDR group?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Either this and/or EFF ORIG PRIV must be "Y".

2.11 EFF INC PRIV

Description: Will Effective Incoming Private calls be recorded for this MDR group?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

Either this and/or INEFF INC PRIV must be "Y".

2.12 INEFF INC PRIV

Description: Will Ineffective Incoming Private calls be recorded for this MDR group?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Either this and/or EFF INC PRIV must be "Y".

2.13 EFF PUBLIC

Copyright © 2003 Lucent Technologies

Description: Will Effective Public Calls be recorded for this MDR group?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

Either this and/or INEFF PUBLIC must be "Y".

2.14 INEFF PUBLIC

Description: Will Ineffective Public Calls be recorded for this MDR group?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Either this and/or EFF PUBLIC must be "Y".

2.15 EFF STA STA

Description: This field is reserved for future use.

2.16 INEFF STA STA

Description: This field is reserved for future use.

CKT MDR RECORD TYPES

In 5E5 and earlier Software Releases, this field group was called MDR RECORD TYPE ALLOWED? The fields Section 2.17 - Section 2.19 determine the types of MDR Records that are allowed for this MDR group. At least one of the following MDR Record types must be chosen.

2.17 ORIG PRIV

Description: In 5E5 and earlier Software Releases, this field was called ORIGINATING PRIVATE.

Is the Originating Private MDR Record allowed? An Originating Private MDR Record is generated for calls originating at the 5ESS Switch using an ARS access code (on-net access code or off-net access code), automatic ARS, implied on-net access code (i.e., network access trunk) or a PFA (Private Facility Access) code for a tie trunk, FX, WATS, CCSA or ETS access. A call using an ARS access code (on-net or off-net) or automatic ARS is routed via ARS. If an ARS routed call overflows to DDD, a Public MDR Record is generated instead of an Originating Private MDR Record. The Originating Private MDR Record is available to customers with or without a private network.
Default: Y
Valid Entries: Y, N

2.18 INC PRIV

Description: In 5E5 and earlier Software Releases, this field was called INCOMING PRIVATE.

Is the Incoming Private MDR Record allowed? An Incoming Private MDR Record is generated for calls incoming to the 5ESS Switch via intertandem tie trunk facilities. These calls may be routed over

Copyright © 2003 Lucent Technologies

private/public trunk facilities or terminated at the 5ESS Switch over private/public line facilities. Calls incoming to the 5ESS Switch via intertandem tie trunk facilities are tandem type calls in that they originated at another node in the customers private network. As intertandem tie trunk facilities are applicable only to private networks, the Incoming Private MDR Record is available only to customers with a private network.
Default: N
Valid Entries: Y, N

2.19 PUBLIC

Description: Is the Public MDR Record allowed? A Public MDR Record is generated for calls originating at the 5ESS Switch using an "escape to POTS" access code (e.g., *9) or an implied DDD access (dials straight DDD). This record is also generated for ARS routed calls which overflow to DDD. The Public MDR Record is available to customers with or without a private network.
Default: N
Valid Entries: Y, N

2.20 STA STA

Description: This field is reserved for future use.

PACKET MDR INFORMATION

The following fields Section 2.21 - Section 2.23 determine Message Detail Recording information for packet data calls. These fields were added with the 5E7 Software Release for the Packet MDR.

2.21 PACKET MDR

Description: Can users assigned to this Packet MDR group generate MDR records?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PACKET MDR is "N", MODEM POOL and INTRA PB GRP must also be "N".

Either the PACKET MDR, ORIG PRIV, INC PRIV, or PUBLIC field must be "Y".

If PACKET MDR is "Y", ORIG PRIV is "N", IN PRIV is "N", and PUBLIC "N", then MDR GROUP NAME field must not be entered as MDR GROUP NAME on the following forms:

- the MDRFD form,
- the MDRMPA form,
- the MDRTPA form,
- the MDRLPA form, and
- the BFG form.

2.22 MODEM POOL

Description: Can Modem Pool usage MDR records be generated for the packet lines assigned to this MDR group?

Software Release: 5E7 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.23 INTRA PB GRP

Description: Can Packet MDR records for Intra-Packet Business Groups be generated?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 25C: 5624-3 RECORD
MESSAGE DETAIL RECORDING COUNTS FORM - MDRCNT

1. GENERAL

The 5624-3 Record is available with the 5E3 and later Software Releases. It is used to identify up to twenty-five MDR (Message Detail Recording) customers who are to receive MDR counts. Two counts are provided on a daily basis; they are:

- the sum total of all MDR Originating Private, Incoming Private and/or Public records generated;
- the sum total of all MDR Originating Private, Incoming Private and/or Public records lost.

The MDR customer identification and associated Applications Processor identification for these customers are specified on this form. A definition of the MDR record types is provided with the MDRGP form (5624-2 Record) description.

1.1 Recent Change View

The corresponding Recent Change view for this form is 24.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * KEY

Description: Enter the KEY value which is always "N", and is supplied as the default value.

Required Field.
Default: N
Valid Entries: N

MDR COUNTS LIST

The MDR counts list (fields Section 2.3 - Section 2.4) is a list of up to twenty-five MDR customers that are to receive MDR record counts on a daily basis. This list is made up of the BCID (Business Customer Identification) and the associated APID (AP Identification) of these customers. Each set of BCID/APID specified here must also be specified on the MDRGP form (5624-2 Record) and on the APCA form (5620-1 Record).

2.3 BCID 1 - BCID 25

Description: Enter the Business Customer ID of the customer receiving the MDR counts record.
Valid Entries: 1 - 65535

2.4 APID 1 - APID 25

Description: Enter the Attached Processor ID of the customer receiving the MDR counts record.
Valid Entries: 1 - 255

SEC. 25D: 5624-4 RECORD
MESSAGE DETAIL RECORDING
LINE (TN) PARAMETER FORM - MDRLPA

1. GENERAL

The 5624-4 Record is available with 5E3 and later Software Releases. It is used when assigning MDR (Message Detail Recording) features to non-Multi-Line Hunt lines if the default parameter of the MDRFD form (5624-1 Record) is inappropriate or unspecified.

The line to which this MDR feature is assigned must have a CLASS OF SERVICE of either "INDIV", "PBX", "4WINDIV", or "ATND" defined on an LCC form (5306 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * TN

Description: Enter the seven-digit Telephone Number of the line.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

	Class of Service
ATND	50B Non-Data Link Console Line or Attendant Line
INDIV	Individual Line
ISDN	Integrated Services Digital Network digital subscriber lines
ISATND	ISDN Attendant Terminal
PBX	Line to a PBX
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX

For 5E12 and later, TN/FEATURE combinations on different MDRLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the MDRLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the MDR feature for which the parameter is to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

The name entered here must be that of an MDR feature defined on the MDRFD form (5624-1 Record).

2.4 MDR GROUP NAME

Description: Enter the name of the MDR Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an MDR group defined on the MDRGP form (5624-2 Record).

SEC. 25E: 5624-5 RECORD
MESSAGE DETAIL RECORDING
LINE (MLHG/TERM) PARAMETER FORM - MDRMPA

1. GENERAL

The 5624-5 Record is available with 5E3 and later Software Releases. It is used when assigning MDR (Message Detail Recording) features to Multi-Line Hunt lines if the default parameter of the MDRFD form (5624-1 Record) is inappropriate or unspecified.

The line to which this MDR feature is assigned must have a CLASS OF SERVICE of either "4WINDIV", "INDIV", "PBX", or "ATND" defined on an LCC form (5306 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Member number of the line.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line
INDIV	Individual Line
ISDN	Integrated Services Digital Network digital subscriber lines
ISATND	ISDN Attendant Terminal
PBX	Line to a PBX
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX

2.4 * FEATURE

Description: Enter the name of the MDR feature for which the parameter is to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

The name entered here must be that of an MDR feature defined on the MDRFD form (5624-1 Record).

2.5 MDR GROUP NAME

Description: Enter the name of the MDR Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an MDR group defined on the MDRGP form (5624-2 Record).

SEC. 25F: 5624-6 RECORD
MESSAGE DETAIL RECORDING
TRUNK (TGN/MEMB) PARAMETER FORM - MDRTPA

1. GENERAL

The 5624-6 Record is available with 5E3 and later Software Releases. It is used when assigning MDR (Message Detail Recording) parameters to a trunk group member if the default parameter of the MDRFD form (5624-1 Record) is inappropriate or unspecified.

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202 Record) must be one of the following.

TRKCLS	
LTOLLCON	Toll Connecting
PF	Private Facility
PFITT	Private Facility Intertandem Trunk
PFLASH	Private Facility Feature Flash
PRINTOLL	Primary Intertoll
TTOLLCON	Toll Completing

2.3 * MEMB

Description: Enter the Trunk Group Member number of the trunk.

Required Field.
Valid Entries: 0 - 1951

2.4 * FEATURE

Description: Enter the name of the MDR feature for which the parameter is to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an MDR feature defined on the MDRFD form (5624-1 Record).

Copyright © 2003 Lucent Technologies

2.5 MDR GROUP NAME

Description: Enter the name of the MDR Group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an MDR group defined on the MDRGP form (5624-2 Record).

SEC. 26: BRCS FEATURE GROUPING FORMS

Copyright © 2003 Lucent Technologies

SEC. 26A: 5625-1/2/3/4/5/6/7 RECORD BFG (BRCS FEATURE GROUPING) CONSTRUCTION FORM - BFG

1. GENERAL

The 5625-1/8 Record is available with 5E4(2) and later Software Releases. It is used to specify and construct BFGs for use when assigning subscriber features to analog lines or ISDN terminals. BFG is designed to assist the switch owner in the conservation of Switching Module memory and the improvement of Recent Change response time, and it cannot be used with trunks.

1.1 Speed Call Features

With 5E6 and later, Speed Call (Abbreviated Dialing) features are assigned separately from IDP (Individualized Dialing Plan) features. Prior to this disassociation, a line can be assigned an IDP feature with a Speed Call feature which counts as one feature for that line. However, for 5E6 and later, this line can be assigned up to three features: an IDP feature and up to two SC (Speed Call) features.

After retrofit, an existing IDP feature with Speed Call counts as three separate features. This may raise the count of Terminal features for that line above the maximum of thirty features. A line only may be assigned up to thirty Terminal features, therefore, use discretion with a BFG form that has more than twenty-eight Terminal features (IDP feature included) at the time of retrofit. If the feature count is greater than thirty after retrofit, the one-digit SC1 (Speed Call) feature, if it has been assigned, will be canceled. If SC1 has not been assigned, then two-digit SC2 (Speed Call) will be canceled. If both features have been assigned to this line, both may be canceled.

1.2 Feature Parameter Fields

The feature parameter fields are located on various screens of this form. The BFG form (Screen 1) contains a table of Modular Feature abbreviations and the screen number where their associated parameters are located.

Refer to Figure 1 for the definitions of the parameter types associated with each Modular Feature. For further information on using BFG, please refer to the BFG Feature Definition (Division 2, Section 1U).

1.3 Recent Change View

The Recent Change View for this form is 12.9.

2. FORM ENTRIES - 5625-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

BFG NAME

The following fields (Section 2.2 - Section 2.3) are used to enter a BFG name. BFGN (BFG Name) is the name assigned to a particular constructed BFG. It is recommended that the switch owner establish a consistent naming convention to be used when establishing BFG names. Refer to the BFG feature description, Division 2, Section 1U, for some recommendations.

Restriction: The following names are reserved for internal BFG usage and cannot be assigned as BFG names for either a SELECTION BFGN or a UNIQUE BFGN: ABORT, NONTGID, ACTBFG, SETUP, CLEANUP, TEMP, and NULL.

Copyright © 2003 Lucent Technologies

BFGNs must not be duplicated; a SELECTION BFGN may not match a UNIQUE BFGN.

2.2 (*) SELECTION BFGN

Description: This field is used to enter the SELECTION BFGN and SUFFIX chosen to represent the BFG under construction. BFGN SUFFIX is a number between one and nine that permits the user to construct up to nine BFGs that are related by a common BFG NAME.
Valid Entries: 1 - 7 alphanumeric characters

Data Rules:

If a SELECTION BFGN is entered, then a SUFFIX must be entered. If a SUFFIX is entered, then a SELECTION BFGN must be entered. If a SELECTION BFGN and SUFFIX are entered, then the UNIQUE BFGN must be blank.

2.3 (*) UNIQUE BFGN

Description: This field is used to enter the UNIQUE BFGN chosen to represent the BFG under construction.
Valid Entries: 1 - 7 alphanumeric characters

Data Rules:

If a UNIQUE BFGN is entered, then the SELECTION BFGN and SUFFIX must be blank.

2.4 # LCC

Description: This field is used to enter the LCC (Line Class Code). The LCC entered will be used to do error checks on the constructed BFGN. The BFGN LCC does not have to exactly match the LCC of the subscribers that are assigned this BFGN. The LCC/RAX combination entered must be defined on an LCC form (5306 Record).
Valid Entries: 3 alphanumeric characters

2.5 # RAX

Description: This field is used to enter the RAX (Rate Area Number). The RAX entered will be used to do error checks on the constructed BFGN. The RAX assigned does not have to exactly match the RAX of the subscribers assigned to the BFGN. The LCC/RAX combination entered must be defined on an LCC form (5306 Record).
Valid Entries: For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 999

Data Rules:

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

FEATURE LIST

The following fields (Section 2.6 - Section 2.9) are used to specify the feature names that are to be associated with the BFG under construction. The FEATURE LIST consists of up to 30 Feature/ Cluster names with the associated initial activation state. A minimum of one Feature/Cluster name must be assigned to a BFG.

Assume that only one feature, of a modular feature type, can be assigned to a subscriber line using BFG. If more than one feature of the type can be assigned, the required conditions for assignment will be stated in the BFG feature description (Division 2, Section 1U). If the feature does not require BFG-defined

Copyright © 2003 Lucent Technologies

parameters, then the existing restrictions on the quantity of features are not affected by BFG.

2.6 FEATURE

Description: This field is used to enter the feature or cluster name.

If the name used in one of the feature list rows is a constructed feature, it must be defined on a feature definition form.

If the name used in one of the feature list rows is a cluster name, it must be defined on a CLUSTR form (5600 Record). More than one cluster name may be entered on the BFG Construction form to define BFG features. If a cluster name is the only entry, the cluster name must have at least one feature name defined. A maximum of 30 features, using a combination of individual and cluster name defined features, can be assigned to each BFG.

The cluster name is used for input purposes only. The cluster name entered on the BFG Construction form will not be retained in the switch database. Only the features defined by the cluster name will be stored. Valid Entries: 1 - 8 alphanumeric characters including "/"

Data Rules:

If this field contains a cluster name, the AC fields on the CLUSTR form may not be "Y".

The /LIRDAMU, /LIRDNMU, and /LIRMDU preconstructed features which were created to support the Calling Name Delivery feature were not available for the 5E7 Software Release.

For 5E15 and later, when FEATURE is entered on this form, it must not be defined on the MWFD form (5602 Record) where the appropriate fields on the MWFD form are set as follows:

- FEATURE OPTIONS fields: ACT/INACT OPTION must be set to "ACT1CA", MULTIWAY CONTROL must be set to "NWAY", and AMAC must be set to "USAGE",
- ENTRY POINT fields: FLASH must be set to "Y", IN MIDDLE must be set to "Y", and OFF HOOK must be set to "Y", and
- DEFAULT PARAMETER field: N-WAY MAXIMUM must be set to "6".

The feature options on the MWFD form define a USSWC (Usage Sensitive Six-Way Calling) feature which cannot be assigned on this form. USSWC must be assigned on the OFCOPT form (5509 Record). For more information on the USSWC feature, see Division 2, Section 4A553.

2.7 A

Description: Is the BRCS feature initially active? If a Cluster name is entered in the FEATURE field, then this field should be "Y". The actual activity status for each feature name assigned by the Cluster name is defined on the CLUSTR form.

Refer to the LINEFA, MLHLNFA and CLUSTR forms for further details regarding restrictions and requirements for feature name assignment and activity status.

Valid Entries are: Y, N

2.8 AC

Description: Is an Authorization Code required for this feature? For the Authorization Code feature to operate correctly, an authorization code group must be defined on the Authorization Code Definition form and this feature must be assigned to an authorization group on the Authorization Codes Feature Class of

Copyright © 2003 Lucent Technologies

Service Parameters. There must also be an Authorization Code feature present on the line. (See Data Rules below.)

Software Release: 5E9(1) an later.
Valid Entries: Y, N

Data Rules:

If FEATURE, A, AC or R is entered, then all fields must be entered.

If the AC field is set to "Y", then:

- an Authorization Code Feature must also exist on either an MLHLNFA form, LINEFA form, a BFG form, or an associated CLUSTR form. The Authorization Code Feature must be defined on the ATHFD form, and entered on an MLHLNFA form, a BFG form, a LINEFA form or an associated CLUSTR form.
- the FEATURE must exist on the ATHFCOS form for the CSV ATH GROUP NAME and the CSD ATH GROUP NAME defined on the ATHMPA, BFG or ATHFD form associated with this MLHG/TERM.

When a BFG input form is assigned a feature that is defined on an ACSRFD, ACVTFD, BCLIDFD, CPNBNFD, DISPFD, EDSFD, HIFD, ICMFD, LIDFD, MSFD, or RNDFD form on a BFG form, then AC must be set to "N".

2.9 R

Description: Is Remote Access Service requested on this feature?

Software Release: 5E9(1) and later.
Valid Entries: Y, N

Data Rules:

If FEATURE, A, AC or R is entered, then all fields must be entered.

3. FORM ENTRIES - 5625-2 RECORD

INDIVIDUAL DIALING PLAN

This following fields (Section 3.1 - Section 3.2) are the parameter fields for the Individual Dialing Plan feature.

3.1 IDP GROUP NAME

Description: This field is used to enter the name of the IDP (Individualized Dialing Plan) group.
Valid Entries: 1 - 8 alphanumeric characters

3.2 DPAT CATEGORY

Description: This field is used to enter the DPAT (Dialing Plan Access Treatment) Category.
Valid Entries: 1 - 32

Data Rules:

If this field is entered, the IDP GROUP NAME must be entered.

SPEED CALLING

Copyright © 2003 Lucent Technologies

The following fields (Section 3.3 - Section 3.8) are the parameter fields for the Speed Calling feature.

3.3 SC1 LIST

Description: This field is used to enter the 1-digit Speed Call list name. If the list is shared the SC1 LIST may be any one- to eight-character name except those names that are valid for unshared lists. SC1 LIST may duplicate SC2 LIST. Unshared list names must not be entered for this BFG. If the list is unshared (SC SHARED = "N"), an SC LIST will be reserved for and assigned to each user of the BFG.

Software Release: 5E6 and later
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: up to 11 characters

Data Rules:

Shared SC1 LIST may not be either "A" followed by a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

3.4 SC1 SHARED

Description: Can the 1-digit SC1 LIST be shared among two or more users? If "N" is entered (indicating an unshared list), the SC LIST name must not be entered; an SC LIST will be reserved for and assigned to each user of the BFG.

Software Release: 5E6 and later
Valid Entries: Y, N

3.5 SC1 CODES

This field is used by Recent Change/Verify only.

3.6 SC2 LIST

Description: This field is used to enter the 2-digit Speed Call list name. If the list is shared, then the SC2 LIST may be any one- to eight-character name except those names that are valid for unshared lists. SC2 LIST may duplicate SC1 LIST. Unshared list names must not be entered for this BFG. If the list is unshared (SC SHARED = "N", an SC LIST will be reserved for and assigned to each user of the BFG.

Software Release: 5E6 and later
Valid Entries: For 5E11 and earlier: 1 - 8 characters
For 5E12 and later: up to 11 characters

Data Rules:

Shared SC2 LIST may not be either "A" followed by a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

3.7 SC2 SHARED

Description: Can the 2-digit Speed Call list be shared among two or more users? If "N" is entered (indicating an unshared list), the SC LIST name must not be entered; an SC LIST will be reserved for and assigned to each user of the BFG.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

3.8 SC2 CODES

This field is used by Recent Change/Verify only.

4. FORM ENTRIES - 5625-3 RECORD

TERMINAL GROUP

The following fields (Section 4.1 - Section 4.2) contain the parameter field for the Terminal Group and Station Restriction feature.

4.1 GROUP ID

Description: This field is used to enter the TGID (Terminal Group Identification) number.
Valid Entries: 1 - 65535

4.2 MOH ALW

Description: Is Music on Hold allowed?

Once a call has been placed on hold, this field indicates whether or not music is to be provided to the held party during the hold period. This field is only applicable when Secured Feature ID 64 is set to "S" on the SFSYS form (5713-1 Record).

Software Release: 5E7 and later
Required Field.
Default Values: N
Valid Entries: Y, N

Data Rules:

When MOH ALW is "Y", a non-zero GROUP ID must be entered, and the GROUP ID specified must have a MUSIC ON HOLD TGN and MEMB assigned on the TGATTD form.

If MOH ALW is "Y" for a TGSR feature assigned to a TN or an MLHG/TERM on a LINEFA, MLHLNFA, CLUSTR, or BFG form, then:

- the LCC and RAX of the TN or MLHG/TERM must be defined on a corresponding LCC form with CLASS OF SERVICE of "INDIV", "ATND", "ISDN", "ISATND".
- a GROUP ID must be specified on either the BFG or corresponding TGSRFD, TGSRLPA or TGRSMPA form and have a MUSIC ON HOLD TGN and MEMB assigned on the TGATTD form.

FORWARD TO DN

The following fields (Section 4.3 - Section 4.4) are the Forward to DN parameters for the TGSR (Terminal Group and Station Restriction) feature.

4.3 ORIGINATING

Description: This field is used to enter the Originating Forward To Directory Number.
Valid Entries: 1 - 32 digits, consisting of 0 - 9, * or #

4.4 TERMINATING

Description: This field is used to enter the Terminating Forward To Directory Number.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 32 digits, consisting of 0 - 9, * or #

ERROR ANNCMT ROUTE INDEX

The following fields (Section 4.5 - Section 4.6) are error announcement route index parameters for the TGSR (Terminal Group and Station Restriction) feature.

4.5 ORIGINATING

Description: This field is used to enter the originating error announcement route index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

4.6 TERMINATING

Description: This field is used to enter the terminating error announcement route index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

4.7 DISP RESTRICT

Description: The Display Restriction field is used to indicate the restriction that displays on an ISAT's console for an incoming MBG (Multiswitch Business Group) call. The DISP RESTRICT field was added to support the CENTREX Network feature. For more information on the CENTREX Network secured features, see Division 2, Sections 4A181, 4A182, and 4A183.

Software Release: 5E9(2) and later.
Valid Entries:

Valid DISP RESTRICT Entries

Entry	Definition
TOLL	Attendant display indicates toll calls are restricted.

4.8 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the TGATTD (Terminal Group Attendant and Data) form (5611 Record), RC view (4.4); but if that form does not exist or is NULL consult OFCOPT.

Data Rule:
When CNIGI is entered, a non-zero GROUP ID must be entered.

Copyright © 2003 Lucent Technologies

5. FORM ENTRIES - 5625-4 RECORD

PRIVATE FACILITIES

The following fields (Section 5.1 - Section 5.4) are the parameter fields for the Private Facilities Access feature.

5.1 CSV PFA GRP

Description: This field is used to enter the name of the circuit-switched voice PFA (Private Facilities Access) group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

This name must be defined on a PFAGPA form with GROUP TYPE set to "VOICE". For 5E6 and later, if a CSD PFA GRP is defined on this form, then a CSV PFA GRP also must be defined.

For 5E7 and later, if a PFA feature is assigned to the BFG on a BFG or CLUSTR form, the CSV PFA GRP must be defined either on the BFG form or on the associated PFAFD form.

5.2 CSD PFA GRP

Description: This field is used to enter the name of the circuit-switched data PFA (Private Facilities Access) group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

This name must be defined on a PFAGPA form with GROUP TYPE set to "CSD". There cannot be CSD-only groups for PFA service; this field can only be entered if CSV PFA GRP is entered.

5.3 QUEUE ALLOWED

Description: Are calls from this PFA feature allowed to queue?
Valid Entries: Y, N

Data Rules:

This field must be entered if a PFA GROUP has been entered.

5.4 PRIORITY QUEUE

Description: Does this PFA feature have the priority queuing option?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this entry is "Y", then QUEUE ALLOWED must be "Y". This field must be entered if a PFA GROUP has been entered.

ADVANCED SERVICE INTERFACE

Copyright © 2003 Lucent Technologies

Fields Section 5.5 - Section 5.9 refer to the Advanced Service Interface Proxy feature. If one or more is entered, the FEATURE LIST on either the BFG or associated CLUSTR form must contain the appropriate feature type.

5.5 ASI GRP

Description: Enter the name of the ASI Proxy group to be used by the ASI Proxy feature assigned within this BFG.

Software Release: 5E8 and later
Valid Entries: 1 - 8 characters

Data Rules:

If ASI GRP is not entered, SERV CODE, ASI SID, IP DIAL BILL, EXP DIAL BILL, RMT BILL, RMT SERV CODE and REC SERV CODE cannot be entered.

This ASI GRP must be defined on a corresponding ASIGP form.

5.6 SERV CODE

Description: Enter the service code digits defining the services allowed during implicit mode access to the IP.

Software Release: 5E8 and later
Valid Entries: 1 - 5 characters consisting of:
- 0 - 9, *, #

Data Rules:

If ASI GRP and SERV CODE are both entered, they must be defined on a corresponding ASIGP form.

If an ASI Proxy feature is assigned to a TN and defined on an ASIFD form with IMP ACC equals "Y", then SERV CODE must be entered, if not entered on that ASIFD form, an ASILPA form , or ASIMPA form.

5.7 ASI SID

Description: Enter the Subscriber Identification used to identify the subscriber to the IP. If not specified, the SID is the station TN of the line.

Software Release: 5E8 and later
Valid Entries: 1 - 10 characters consisting of:
- 0 - 9, *, #

5.8 IP DIAL BILL

Description: Does the subscriber want AMA (Automatic Message Accounting) billing records for an otherwise non-billable call dialed by the IP?

Software Release: 5E8 and later
Valid Entries: Y, N

5.9 EXP DIAL BILL

Description: Does the subscriber want AMA records for an explicit connection to the IP?

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

If EXP DIAL BILL equals "Y", EXP ACC must equal "Y" on the corresponding ASIFD form.

REMOTE ACCESS

The following fields (Section 5.10 - Section 5.12) define translations which were added to support the Remote Access to ASI feature. For more information on this feature, see Division 2, Section 4A93.

5.10 RMT BILL

Description: Should an AMA billing record be generated for remote access to Intelligent Peripheral calls?

Software Release: 5E9(1) and later.
Valid Entries: Y, N

5.11 RMT SERV CODE

Description: Enter the Remote Access Service Code used to define the set of services allowed during remote access to the Intelligent Peripheral.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 5 characters consisting of:
- 0 - 9, *, #

Data Rules:

If RMT SERV CODE is entered, then REC SERV CODE must be entered.

5.12 REC SERV CODE

Description: Enter the Remote Access Reconnect Service Code used to define the set of services allowed during a remote reconnect to the Intelligent Peripheral.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 5 characters consisting of:
- 0 - 9, *, #

Data Rules:

If REC SERV CODE is entered, then RMT SERV CODE must be entered.

6. FORM ENTRIES - 5625-5 RECORD

CALL PICKUP ORIG

The Loud Speaker Paging and Code Calling features are not available in BFG at this time. The following fields (Section 6.1 - Section 6.5) are the parameter fields for the Call Pickup Originating feature.

Data Rules:
Only one Call Pickup Originating feature is allowed on a given BFG form or on its associated CLUSTR form(s).

Copyright © 2003 Lucent Technologies

6.1 DIRECT PICKUP TN

Description: This field is used to enter the telephone number of the station that will be directly picked up.

Software Release: 5E11 and earlier.
Valid Entries: 7 digits

6.2 ORIG PICKUP GROUP 1

Description: This field is used to enter the queue (group) that the customer can originate to pickup.
Valid Entries:
- For 5E11 and earlier: 2 - 65535
- For 5E12 and later: 2 - 65534

Data Rules:

If this field is entered, the quantity of pickup groups on the PUOFD form (5605-1 Record) must be 1, 2, 3 or 4.

6.3 ORIG PICKUP GROUP 2

Description: This field is used to enter the queue (group) that the customer can originate to pickup.
Valid Entries: For 5E11 and earlier: 2 - 65535
For 5E12 and later: 2 - 65534

Data Rules:

If this field is entered, the quantity of pickup groups on the PUOFD form (5605-1 Record) must be 2, 3 or 4.

6.4 ORIG PICKUP GROUP 3

Description: This field is used to enter the queue (group) that the customer can originate to pickup.
Valid Entries: For 5E11 and earlier: 2 - 65535
For 5E12 and later: 2 - 65534

Data Rules:

If this field is entered, the quantity of pickup groups on the PUOFD form (5605-1 Record) must be 3 or 4.

6.5 ORIG PICKUP GROUP 4

Description: This field is used to enter the queue (group) that the customer can originate to pickup.
Valid Entries: For 5E11 and earlier: 2 - 65535
For 5E12 and later: 2 - 65534

Data Rules:

If this field is entered, the quantity of pickup groups on the PUOFD form (5605-1 Record) must be 4.

6.6 DPU TN

Description: This field is used to enter the telephone number of the station that will be directly picked up.

Software Release: 5E12 and later.
Valid Entries: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Copyright © 2003 Lucent Technologies

Data Rules:

When DPU TN is entered or DPU DA DGTS is entered both must be entered.

When DPU TN is entered, ORIG PICKUP GROUP 1 must not be entered.

For 5E12 and later, NXX(s) (the first 3 digits of a 7-digit TN) and/or NPA/NXX combinations (the first 6 digits of a 10-digit TN) from the DPU TN on the BFG form must be defined as OFFICE CODE and/or NPA/OFFICE CODE on the NOC form.

For 5E12 and later, if the first 3 digits of the 7-digit DPU TNs on the BFG form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit DPU TN(s) must be entered as a 10-digit DPU TN(s).

CALL PICKUP TERM

The following fields (Section 6.7 - Section 6.9) are the parameter fields for the Call Pickup Terminating feature.

6.7 TERM PICKUP GROUP

Description: This field is used to enter the Terminating Call Pickup group number.
Valid Entries: 2 - 65535

Data Rules:

When this field has an entry, the FEATURE must be a Call Pickup Terminating feature defined on the PUTFD form (5605-2 Record) with a FEATURE FUNCTION of "CALPU".

Only one Call Pickup Terminating feature is allowed on a given BFG form or on its associated CLUSTR form(s).

6.8 TONE INTERVAL

Description: This field is used to enter the barge-in tone interval in seconds. Zero indicates no repetition.
Valid Entries: 0, blank

6.9 TONE DURATION

Description: This field is used to enter the barge-in tone duration in milliseconds.
Valid Entries: 900, blank

7. FORM ENTRIES - 5625-6 RECORD

DISTINCTIVE RINGING

The following field (Section 7.1) is the parameter field for the DR (Distinctive Ringing) feature. If a subscriber requires multiple DR features, only one DR feature may be defined by a BFG and all others must be defined outside of BFG.

7.1 RING PTN

Description: This field is used to enter the DR (Distinctive Ringing) Pattern Type.

Valid RING PTN Entries

Entry	Definition
A	
B	Indicates a repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on and 4 seconds off.
C	Indicates a repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8

Copyright © 2003 Lucent Technologies

	seconds on and 4 seconds off.
D	Indicates a repeated pattern of 1 second on, 1 second off, 1 second on and 3 seconds off (code 2 ringing).
E	For routing ringing pattern associated with Customer Premise Equipment. Valid with DSN (Defense Switched Network) offices with a Class of Service of "4WINDIV" on the LCC form.
F	For a priority ringing pattern associated with Customer Premise Equipment. Valid with DSN (Defense Switched Network) offices with a Class of Service of "4WINDIV" on the LCC form.
P	For a precedence ringing pattern of 1.64 seconds on and 0.36 seconds off repeated for the duration of the ringing interval.

AUTO CALL BACK

The following fields (Section 7.2 - Section 7.3) are the parameter fields for the Automatic Callback feature.

7.2 RINGING PATTERN

Description: This field is used to enter the ACB (Automatic Call Back) ringing pattern.

Valid RINGING PATTERN Entries

Entry	Definition
A	
B	Indicates a repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on and 4 seconds off.
C	Indicates a repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4 seconds off.
D	Indicates a repeated pattern of 1 second on, 1 second off, 1 second on and 3 seconds off (code 2 ringing).
E	For routing ringing pattern associated with Customer Premise Equipment. Valid with DSN (Defense Switched Network) offices with a Class of Service of "4WINDIV" on the LCC form.
F	For a priority ringing pattern associated with Customer Premise Equipment. Valid with DSN (Defense Switched Network) offices with a Class of Service of "4WINDIV" on the LCC form.
P	For a precedence ringing pattern of 1640 milliseconds on and 360 milliseconds off repeated for the duration of the ringing interval.

7.3 RINGING INTERVAL

Description: This field is used to enter the ACB ringing interval for the ringing provided to the originator when the camped-on line becomes idle.
Valid Entries: 24, 30, 36, 42, and 48 (seconds)

AUTOMATIC ROUTE SELECTION

The following fields (Section 7.4 - Section 7.14) contain the parameter fields for the Automatic Route Selection feature.

7.4 CSV ARS GRP

Description: This field is used to enter the name of the circuit-switched voice ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

The name must be defined on an ARSGPA form with GROUP TYPE set to "VOICE". Defining a CSV ARS GRP is not required; however, if a CSD ARS GRP is defined on this form, then a CSV ARS GRP also must be defined.

7.5 CSD ARS GRP

Description: This field is used to enter the name of the circuit-switched data ARS group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Copyright © 2003 Lucent Technologies

Data Rules:

The name must be defined on an ARSGPA form with a GROUP TYPE of "CSD". There cannot be CSD-only groups for ARS service; this field can only be entered if CSV ARS GRP is entered.

7.6 TONE TYPE

Description: This field is used to enter the type of warning tone to be supplied to the originator if a route is marked as an expensive route.

Valid TONE TYPE Entries

Entry	Definition
BEEP1	A single beep tone
NONE	

Data Rule:
For 5E6 and later "BEEP1" is the CSV call response; "NONE" is the CSD response.

If TONE TYPE is entered, then the ARS GROUP NAME must be specified.

7.7 FRL LINE

Description: This field is used to enter the FRL (Facility Restriction Level) of the privilege assigned to the terminal. Each ARS route has an FRL assigned to indicate the minimum FRL needed to access the facility. The terminal must have an FRL number equal to or greater than the FRL assigned to the route.
Valid Entries: 0 - 16

Data Rules:

If FRL LINE is entered, then the ARS GROUP NAME must be specified.

7.8 USE ALT FRL

Description: Should the calling terminal's FRL be changed when the Alternate FRL Table has been activated?
Valid Entries: Y, N

Data Rules:

If USE ALT FRL is entered, then the ARS GROUP NAME must be specified.

For 5E6 and later, if this field is "Y", ALW ALT FRL must also be set to "Y" on the ARSGPA form.

7.9 ARS SI

Description: This field is used to indicate the ARS screening index associated with the terminal.
Valid Entries: 1 - 16

Data Rules:

If ARS SI is entered, then the ARS GROUP NAME must be specified.

7.10 ALW MDR RAO

Description: Should an AMA billing record be produced when the terminal originates a call that finds a charge index with an AMA Call Type of "CCSAS", "ETSMDR" or "ETSCCSA"?
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If ALW MDR RAO is entered, then the ARS GROUP NAME must be specified.

7.11 PRIVATE DN

Description: This field is used to enter the private billing Directory Number to be used for MDR (Message Detail Recording) of private billing records. This directory number can be used for either CL (Customer Location) or RAO (Revenue Accounting Office) entries.
Valid Entries:
- For 5E11 and earlier: enter up to 7 digits, 0 - 9
- For 5E12 and later: enter up to 10 digits, 0 - 9

7.12 QUEUE ALLOWED

Description: Is the terminal allowed to queue for the first available route in the ARS route list when queuing is active and all routes are busy?
Valid Entries: Y, N

Data Rules:

If QUEUE ALLOWED is entered, then the ARS GROUP NAME must be specified.

7.13 PRIORITY QUEUE

Description: Should the terminal be allowed to enter the priority queue?
Valid Entries: Y, N

Data Rules:

If PRIORITY QUEUE is "Y", then QUEUE ALLOWED must be "Y" and the ARS GROUP NAME must be specified.

7.14 DIAL PLAN

Description: This entry specifies the Dialing Plan to be used to analyze the ARS dialed number.

Valid DIAL PLAN Entries

Entry	Definition
ODP	Office Dialing Plan
1	Private Network Dialing Plan 1
2	Private Network Dialing Plan 2

Data Rule:
If ENTRY on the ARSFD form is "CODE", this entry should be blank. The ARS access code will be used to determine the dialing plan to be used.

This entry is only valid when ENTRY on the ARSFD form equals "AUTO".

For 5E6 and later, the DIAL PLAN value and CSV ARS GROUP name defined on this form must be defined on the PNINFO form (5608-12 Record). Also, for 5E6 and later, if this BFG form is entered and CCSA LIMITATION is "Y" on the ARSFD form, the CSV ARS GROUP assigned on this form must match the ARS GROUP NAME defined on the PNINFO form (5608-12 Record) where DIAL PLAN is 1.

8. FORM ENTRIES - 5625-7 RECORD

AUTHORIZATION CODES

The following fields (Section 8.1 - Section 8.5) are the parameter fields for the Authorization Code feature.

Copyright © 2003 Lucent Technologies

8.1 CSV ATH GRP

Description: This field is used to enter the name of the circuit-switched voice ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

Defining a CSV ATH GRP is not required; however, if a CSD ATH GRP is defined on this form, then a CSV ATH GRP also must be defined.

8.2 CSD ATH GRP

Description: This field is used to enter the name of the circuit-switched data ATH group.

Software Release: 5E6 and later
Valid Entries: 1 - 8 characters

Data Rules:

There cannot be CSD-only groups for ATH service; this field can only be entered if CSV ATH GRP is entered.

8.3 ATH FIRST

Description: Should the authorization code be entered immediately following the feature access code?
Valid Entries: Y, N

Data Rules:

If ATH FIRST is entered, then the ATH GROUP NAME must be specified.

8.4 ATH FOR AMA

Description: Should the authorization code be entered before any AMA recorded calls are allowed to proceed?
Valid Entries: Y, N

Data Rules:

If ATH FOR AMA is entered, then the ATH GROUP NAME must be specified.

8.5 ATH FOR MDR

Description: Should the Authorization Code be entered before allowing MDR (Message Detail Recording) to proceed?
Valid Entries: Y, N

Data Rules:

If ATH FOR MDR is entered, then the ATH GROUP NAME must be specified.

ACCOUNT CODE

The following fields (Section 8.6 - Section 8.7) are the parameter fields for the Account Code feature.

8.6 ACCT GROUP NAME

Copyright © 2003 Lucent Technologies

Description: This field is used to enter the Account Code group name.
Valid Entries: 1 - 8 alphanumeric characters

8.7 CODE TABLE NAME

Description: This field is used to indicate the Account Code table name to be used.
Valid Entries: 1 - 8 alphanumeric characters

MESSAGE DETAIL RECORDING

The following field (Section 8.8) is the parameter field for the Message Detail Recording feature.

8.8 MDR GROUP NAME

Description: This field is used to enter the MDR (Message Detail Recording) group name.
Valid Entries: 1 - 8 alphanumeric characters

ELECTRONIC DIRECTORY SERVICE

The following field (Section 8.9) is the parameter field for the Electronic Directory Service feature.

8.9 EDS GRP

Description: This field is used to enter the EDS (Electronic Directory Service) group name.
Valid Entries: 1 - 8 alphanumeric characters

MULTI-WAY CALLING

The following fields (Section 8.10 - Section 8.12) are the parameter fields for the Multi-Way Calling feature.

It is possible to assign more than one Multi-Way Calling feature to a subscriber line using BFG. The first Multi-Way feature encountered on the BFG Construction form will be defined as a part of the BFG. The first Multi-Way feature will use the parameters defined on the BFG Construction form. The second and all additional Multi-Way features, while they are part of the BFG, must reference feature definition forms if they require parameters.

8.10 N-WAYS

Description: This field is used to enter the maximum quantity of terminals allowed in a Multi-Way N-Way call.
Valid Entries: 0, 3, 4, 5, and 6

8.11 TONE DURATION

Description: This field is used to enter the duration of the party departure tone (single beep only) in milliseconds. The normal duration is 300 milliseconds.
Valid Entries: 0, 200, 300, 600, 900, 1200,

- 1500, 1800, 2100, 2400, 2700, 3000,
- 3300, 3600, 3900, 4000

8.12 DIRECT CONN DN

Description: This field is used to enter the direct connection Directory Number. Entries are typically 1, 3, 7, 8, 10, or 11 digits or an IDDD number.
Valid Entries: 1 - 15 digits

Copyright © 2003 Lucent Technologies

Data Rule:
If DIRECT CONN DN is entered, the corresponding MWFD form must have a MULTIWAY CONTROL of "DIRCON".

9. FORM ENTRIES - 5625-8 RECORD

CALL WAITING

Fields Section 9.1 - Section 9.2 refer to the parameter fields for the Call Waiting feature.

9.1 CDPTY TONE INTERVAL

Description: This field is used to enter the interval at which the called party receives beeps when there is a call waiting.
Valid Entries: 0 - 60 seconds

9.2 LONG DIST DT

Description: Long Distance Distinctive Tone specifies whether a distinctive call waiting tone is given when the called party receives a long distance incoming call. This field supports the Call Waiting with Distinctive Tones and Distinctive Ringing for Long Distance Calls special feature. For more information on this feature, see Division 2, Section 4A91.

Software Release: 5E8 and later.
Valid Entries:

Valid LONG DST DT Entries

Entry	Definition
DTONE	Provide normal call waiting treatment for non-long distance calls and call waiting distinctive tone pattern E for long distance calls.
NORMAL	Both local and long distance calls receive the "normal" call waiting tones as specified by the CALLED PTY TONE INTERVAL field on the CWTFD form (5603-1 Record).
ONLY	Provide call waiting distinctive tone pattern E only for long distance calls.

Data Rules:

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before the LONG DST DT field can be entered. A SFSYS form does not exist with If the SFID 91 ACT field is not set to "Y", then the LONG DST DT field must not be entered.

If a CWT Feature assigned on either the TN, LINEFA, MLHLNFA, CLUSTR, or BFG form and the feature has either the INVOCATION field set to "PTRM" or "RTRM" or the INTER OFFICE field set to "N" on the CWTFD form (5603-1 Record), then LONG DST DT must be "NORMAL" or unknown on either the BFG or the corresponding CWTLPA or CWTMPA form. If a CWT feature is assigned through a BFG that has any of the CWT parameters entered, then all CWT parameters on the BFG form are used.

CALL WAITING DELUXE

The following fields define the office parameters for Call Waiting Deluxe. These fields support the Call Waiting Deluxe Phase II Feature. This is a secured feature with SFID 145. For more information on this feature, see Division 2, Section 4A145.

For 5E10 and later, when BFG forms, keyed by BFGN, have a known value other than "OFCALERT" in field ALERT TYPE or have a known value other than "OFCDFLTOPT" in field DFLT OPT or have a known value other than "OFCCONF" in field USG SENS CONF, the Call Waiting feature assigned on this BFG form must be defined on CWTFD form with CW DELUXE equal to "Y".

Copyright © 2003 Lucent Technologies

9.3 ALERT TYPE

Description: Enter the Call Waiting Deluxe Alerting Type. The user and/or the CPE is alerted of an incoming call by way of a tone.

Software Release: 5E10 and later.
Valid Entries:

Valid ALERT TYPE Entries - 5E10 and later

Entry	Definition
OFCALERT	Office value
CWD	SAS only with non-ADSI per-call options allowed
CWD1	SAS & CAS with non-ADSI per-call options restricted
CWD2	SAS & CAS with non-ADSI allowed

9.4 DFLT OPT

Description: Default Service Option is a treatment applied to incoming calls when the user does not select a per-call option.

Software Release: 5E10 and later.
Valid Entries:

Valid DFLT OPT Entries - 5E10 and later

Entry	Definition
OFCDFLTOPT	Office value
CONTRING	Continue providing waiting party audible ringing
CALLFWD	Forward waiting call to CFDA destination
DEFANNC	Connect waiting call to default announcement

9.5 USG SENS CONF

Description: Usage Sensitive Conference is used to track the usage of conferencing.

Software Release: 5E10 and later.
Valid Entries:

Valid USG SENS CONF Entries - 5E10 and later

Entry	Definition
OFCCONF	Office value
NO	Do not provide usage sensitive AMA for conferencing on this line
YES	Provide usage sensitive AMA for conferencing on this line

TALKING CALL WAITING

9.6 TCW

Description: This field is used in determining whether or not Talking Call Waiting is assigned to the Call Waiting feature.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

9.7 INH CW MASTER

Description: Is Call Waiting inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If INVOCATION is not in "TERM" then INH CW MASTER must be "N".

If INH CW MASTER is "Y", then INH CW DEPEND must be "blank" or "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

The following TNs on the LINEFA, BFG or an associated CLUSTR form have been assigned a Call Forwarding feature on the CWTLPA form with INH CW MASTER or INH CW DEPEND set to "Y". If TNs on the LINE form have a PTY value of 0, then with this feature assignment, this TN must have a LCC/RAX combination defined on the LCC form with a TERMINATING TREATMENT of "INDIV" or "INWATS".

The following BFGs have either INH CW MASTER or INH CW DEPEND set to "Y" and therefore must have a feature associated with this BFG defined on the CWTFD Feature Definition form either directly or through a CLUSTER Name on an associated CLUSTR form.

9.8 INH CW DEPEND

Description: Is Call Waiting inhibited for the depend TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CW DEPEND must be "N".

If INH CW DEPEND is "Y", then INH CW MASTER must be blank or N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

9.9 INHIBIT MDNL CW

Description: This field is used in determining whether or not Call Forwarding is inhibited for the master telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CW must be "NONE".

PRECEDENCE AND PREEMPTION

The following fields (Section 9.10 - Section 9.20) are the parameter field for the Precedence and Preemption feature.

Many of the parameters associated with the Precedence and Preemption feature have dependencies. If a parameter entry is made for one of the following, then parameter entries are required for all the following: PREC COI, PREC NON COI, PREEMPTABLE LINE, IMMED PREEMPTION, PREC CPU, FWD IAGP PREC, RECEIVE AV CALLS, DIRECT STA SELECT, ORIGINATE AV CALLS, COI GROUP ID, HOT LINE.

9.10 PREC COI

Copyright © 2003 Lucent Technologies

Description: This field is used to enter the highest authorized precedence level of a call originated from this line to a port in the same COI (Community Of Interest). If a value is not entered, the line may not originate calls to the Autovon Network.

Valid entries are in order of increasing precedence.

Valid PREC COI Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash
FO	Flash Override

Data Rule:
If a PREC COI is specified, then a COI GROUP ID must be entered.

9.11 PREC NON COI

Description: This field is used to enter the highest authorized precedence level of a call originated from this line to a port in a different COI (Community Of Interest). If a value is not entered, the line may not originate calls to the Autovon Network.

Valid entries are in order of increasing precedence.

Valid PREC NON COI Entries

Entry	Definition
R	Routine
P	Priority
I	Immediate
F	Flash
FO	Flash Override
E	Executive

9.12 PREEMPTABLE LINE

Description: Can a line with this feature be preempted?
Valid Entries: Y, N

Data Rule:
If "N" is entered, then IMMED PREEMPTION must also be "N".

9.13 IMMED PREEMPTION

Description: Is Immediate Preemption in effect? Immediate Preemption allows calls of the appropriate priority to preempt, even if Call Waiting or Call Forwarding - Busy Line is in effect.
Valid Entries: Y, N

9.14 PREC CPU

Description: Can Precedence calls be picked up using the Call Pickup feature?
Valid Entries: Y, N

9.15 FWD IAGP PREC

Description: Can an intra-terminal group precedence call, to a line with this feature, be forwarded when the line is Call Forward - Busy or Call Forward - Don't Answer forwarded?
Valid Entries: Y, N

9.16 TERM NETWK CALLS

Copyright © 2003 Lucent Technologies

Description: Can a line with this feature receive incoming calls from the Autovon Network?
Valid Entries: Y, N

Data Rules:

If the DSN OPTION field on the OFCOPT form is "Y", and a Precedence and Preemption feature (defined on a PPFD form) is assigned to this BFG, then TERM NETWK CALLS must be "Y".

9.17 ORIG NETWK CALLS

Description: Can a line with this feature originate calls to the Autovon Network?
Valid Entries: Y, N

Data Rules:

If the DSN OPTION field on the OFCOPT form is "Y", and a Precedence and Preemption feature (defined on a PPFD form) is assigned to this BFG, then ORIG NETWK CALLS must be "Y".

9.18 DIRECT STA SELECT

Description: Can a line with Precedence and Preemption have the Direct Station Selection feature?
Valid Entries: Y, N

Data Rules:

If a "Y" is entered, the line must have an Individualized Dialing feature with a 1-digit no change permitted abbreviated dial list, assigned. A line with this feature may only dial the 1-digit abbreviated dial codes.

9.19 COI GROUP ID

Description: This field is used to enter the COI (Community Of Interest) group ID. A COI is a group of subscribers that originate the majority of their traffic in calls to each other.
Valid Entries: 1 - 20

Data Rules:

If a COI GROUP ID is specified, then a value should be entered in the PREC COI field.

For 5E8 and later, when COI GROUP ID is entered, it must match the CODE INDEX on a PPCOI form (5618-6 Record).

9.20 HOT LINE

Description: This field is used to indicate the type of hot line.

Hot line service is used when the forward number is that of another hot line or when the station only wishes to accept calls from other hot lines. Hot line subscribers can be described as master, slave or neither.

Valid HOT LINE Entries

Entry	Definition
MV	
MD	
SV	
SD	
HV	
HD	

Data Rules:

Copyright © 2003 Lucent Technologies

If HOT LINE is "Y", any TN that is assigned this BFG on a LINEFA form must be associated with an LCC assigned on the LINE form and defined on an LCC form with CLASS OF SERVICE set to "INDIV" or "4WINDIV".

If HOT LINE is "Y", this BFG may not be assigned to a CKT TN or CKT MLHG/TERM defined on a DSLUSR form, nor to an MLHG/TERM defined on an MLHG form. (Hotline Precedence and Preemption features may not be assigned to DSL circuit TNs or to MLHG terminals.)

LASS AUTO CALLBACK

The following field (Section 9.21) is the parameter field for the LASS AUTO CALLBACK feature.

9.21 AC RNGBK TYPE

Description: This field indicates the AC (Automatic Callback) ringback type.

Valid AC RNGBK TYPE Entries

Entry	Definition
A	
B	Indicates a repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on and 4 seconds off.
C	Indicates a repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4 seconds off.
D	Indicates a repeated pattern of 1 second on, 1 second off, 1 second on and 3 seconds off (code 2 ringing).

LASS AUTO RECALL

The following field (Section 9.22) is the parameter field for the LASS AUTO RECALL feature.

9.22 AR RNGBK TYPE

Description: This field indicates the AR (Automatic Recall) ringback type.

Valid AR RNGBK TYPE Entries

Entry	Definition
A	
B	Indicates a repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on and 4 seconds off.
C	Indicates a repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4 seconds off.
D	Indicates a repeated pattern of 1 second on, 1 second off, 1 second on and 3 seconds off (code 2 ringing).

BFG (BRCS Feature Grouping) Parameter Types

SEC. 26B: 5626 RECORD
BFG (BRCS FEATURE GROUPING) SUMMARY REPORT

1. GENERAL

The 5626 Record is available with 5E4(2) and later Software Releases. It is designed to provide information that will be used to aid in the construction of BFGs that will provide the maximum usefulness in the switch. The BFG capability can be used to improve Recent Change response time and conserve Switching Module memory. Please refer to the BFG Feature Description (Division 2, Section 1U) for additional information on BFG.

The information on this record is derived from the following forms:

- LINEFA form (5112 Record)
- MLHLNFA form (5113 Record)
- CLUSTR form (5600 Record)
- TGSRFD form (5607-1/2 Record)
- TGSRLPA form (5607-3 Record)
- TGSRMPA form (5607-4 Record)

1.1 BRCS

The BRCS feature assignment forms (LINEFA and MLHLNFA), where the BFGN is not entered, are examined to determine the features assigned. If a Cluster name was used to assign the features, the feature(s) on the CLUSTR form are retrieved.

1.2 TGSR

A master list of the features from each source for each subscriber is created. The master list is examined to determine if a TGSR (Terminal Group and Station Restriction) feature has been assigned to the subscriber. The TGSR forms (TGSRLPA, TGSRMPA, TGSRFD) are referenced to determine the TGID (Terminal Group Identification Number) assigned to the subscriber. Subscriber lines with a TGID are placed in a category and are grouped by their TGID into sub-categories. Subscriber lines without a TGID are placed in another category. Within both categories, subscribers with identical features are grouped together. After all subscriber lines are examined, the report provides the quantity of users, for subscribers with and without TGIDs, by each unique grouping of assigned features.

1.3 BFG Construction

The purpose of the report is to provide information that will aid in the construction of BFGs that will provide the maximum usefulness in the switch.

The following paragraphs describe the contents of the sample 5626 Record in Figure 1.

The first four output lines are related to subscriber lines with BRCS features but without a TGID assigned. These are typically POTS or small business type service lines.

The remainder of the sample report lines are related to subscriber lines with a TGID assigned. The information is sorted by the TGID.

The USER TOTALS column contains the quantity of users for each group of features listed. Example: 12,100 subscribers with features /CFV and /CWC1 and 450 subscribers in TGID 00005 with features

Copyright © 2003 Lucent Technologies

CFWFEAT5, IDFEAT5 and TGSFEAT5. Within each category the report lines are sorted in ascending quantity of users.

The five FEATURE columns list the feature names derived from the various feature assignment forms. The feature names are sorted with pre-constructed features before constructed features.

2. REPORT HEADING INFORMATION

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 TERMINAL GROUP ID

Description: This column contains the TGID (Terminal Group ID) number associated with the lines. The report is sorted by TGID.

2.3 USER TOTALS

Description: This column contains the quantity of users for each group of features listed. Within each TGID the report lines are sorted in ascending quantity of users.

2.4 FEATURE

Description: The five FEATURE columns list the feature names derived from the various feature assignment forms. The feature names are sorted with pre-constructed features before constructed features.

SEC. 27: SPEED CALLING FORMS

Copyright © 2003 Lucent Technologies

SEC. 27A: 5627-1 RECORD
SPEED CALLING FEATURE DEFINITION FORM - SCFD

1. GENERAL

1.1 Speed Calling Assignments

The SCFD form (5627-1 Record) is used to define various combinations of Speed Call parameters for lines and trunks. For 5E6 and later Software Releases, it is used instead of the IDFD form (5601 Record) which is used in 5E2 and later Software Releases for defining Individualized Dialing Plan features and 5E5 and earlier Software Releases for defining Speed Calling features.

The need to use a separate form for defining Speed Calling parameters is due to the Disassociate Speed Calling from Individualized Dialing Plan feature. This feature is available in 5E6 and later and allows operating companies to make Speed Call assignments independently from IDP assignments.

For example, disassociating Speed Calling assignments from IDP assignments allows the operating company to assign a different Speed Calling feature, for example two-digit Speed Calling (SC2), to a line or trunk that already has been assigned a Speed Calling feature (SC1) without having to manually delete the existing feature and Speed Call list.

Subscribers can still select Speed Calling while being part of an IDP, however, the operating company no longer has to make the Speed Calling assignments as part of the IDP assignments. Therefore, this disassociation is transparent to the subscriber and does not affect the functionality of either feature.

1.2 Class of Service

For 5E6 and later, when a TN on a LINE form or a CKT TN on a DSLUSR form is assigned an SC feature on the LINEFA, BFG, or associated CLUSTR form, the TN must have an LCC/RAX defined on an LCC form with one of the following values: "4WINDIV", "INDIV", "PBX", "ATND", "TWOPTY", "HOTMOTL", "MODEM", "ISDN", "ISATND".

When an MLHG/TERM on an MLHLN form or a CKT MLHG / CKT TERM on a DSLUSR form is assigned an SC feature on the MLHLNFA, BFG, or associated CLUSTR form, the MLHG/TERM must have an LCC/RAX defined on an LCC form with one of the following values: "4WINDIV", "INDIV", "PBX", "ATND", "HOTMOTL", "MODEM", "ISDN", "ISATND".

1.3 Constructed/Preconstructed Features

Each combination of parameters serves as a constructed (switch owner defined) feature and it is given a feature name of one- to eight-characters. This defined feature name is used to assign the combination of parameters to a particular line or trunk on one of the following forms: the SCLPA form (5627-2 Record), SCMPA form (5627-3 Record) or SCTPA form (5627-4 Record). One of these forms is entered per line or trunk if the default parameters for this line or trunk on the SCFD form are undefined or inappropriate (see Figure 5). When referring to Figure 5, assume all necessary ODP or IDP data has been entered prior to the assignment of the Speed Calling feature.

For 5E6 and later, a line can be assigned up to two SC features (one 1-digit SC feature and/or one 2-digit SC feature). However, assigning two of the same features to one line is not allowed.

Also, if any member of an IDP Group has Speed Calling options, all Speed Calling codes must be defined on the IDPDCA form (5601 Record) for that IDP Group.

Certain SC features are preconstructed by ODA and automatically provided in the ODD (Office Dependent Database) at the time of office registration (see Figure 1). Preconstructed feature names begin with a slash (/); the slash may not be used as the first character of any other feature name except preconstructed feature names.

Copyright © 2003 Lucent Technologies

During a retrofit to the 5E6 Software Release, existing preconstructed and constructed IDP features that are assigned to any lines or trunks will be automatically converted to separate IDP and Speed Calling features. Preconstructed features in the 5E5 Software Release will be converted to two IDP preconstructed features (one for customer change, /IDP1 and one for no customer change, /IDP) and eleven Speed Calling preconstructed features (see Figure 2).

Constructed IDP features with Speed Calling options in the 5E5 Software Release will retain their IDP feature name along with their associated IDP feature data in 5E6 and later . However, any Speed Calling options defined as part of constructed IDP features will be moved automatically to corresponding preconstructed Speed Calling features (see Figure 2). This "evolution" of Speed Calling data includes any parameter data defined on IDPLPA, IDPMPA or IDPTPA forms.

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.51.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: This field is used to enter the Speed Call feature name. The first character of the feature name cannot be the slash (/) character. All BRCS feature names must be unique.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: This field is used for any pertinent descriptive remarks.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.5) define speed calling options.

2.4 SC

Description: Enter the Speed Call option.

Required Field.

Valid SC Entries

Entry	Definition
SC1	One-digit Speed Call
SC2	Two-digit Speed Call

2.5 SCC

Description: Is the Speed Call list changeable by the subscriber?

Required Field.
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

DN SCREENING OPTIONS

The following fields (Section 2.6 - Section 2.23) define Speed Call sequence screening with SC options DNSA through DNSQ for subscribers using one-digit or two-digit changeable Speed Call list codes.

2.6 DN SCREEN

Description: Will Speed Call sequences be screened with SC options DNSA through DNSQ for subscribers using one-digit or two-digit changeable Speed Call list codes?

Required Field.
Valid Entries: Y, N

Data Rules:

Since only customer changeable Speed Calling features are affected by the DN screening options, the value for this field is set by the value of the SCC field. For example, if SCC is set to "Y", DN SCREEN is then set to "Y" and the subscriber is allowed to change their Speed Call list. Conversely, if SCC is "N", then DN SCREEN is "N".

2.7 DNSA

Description: This no-change field is set to "Y" by ODA to allow the Directory Number of another member of the subscriber's terminal group to be stored in the Speed Call list.
Valid Entries: Y, N
Default Value: Y

2.8 DNSB

Description: This no-change field is set to "Y" by ODA to allow a 7- to 10-digit intraoffice number that is not screened by DNSA to be stored in the Speed Call list.
Valid Entries: Y, N
Default Value: Y

2.9 DNSC

Description: This no-change field is set to "Y" by ODA to allow an IntraLATA interoffice number to be stored in the SC list.
Valid Entries: Y, N
Default Value: Y

2.10 DNSD

Description: This no-change field is set to "Y" by ODA to allow an InterLATA number (not including international numbers) to be stored in the SC list.
Valid Entries: Y, N
Default Value: Y

2.11 DNSE

Description: To allow an international number to be stored in the SC list, this no-change field is set to "Y" by ODA.
Valid Entries: Y, N
Default Value: Y

2.12 DNSF

Copyright © 2003 Lucent Technologies

Description: To allow an X-1-1 number (411, 911, etc.) where N is any digit in the range 0-9, this no-change field is set to "Y" by ODA.
Valid Entries: Y, N
Default Value: Y

2.13 DNSG

Description: This no-change field is set to "Y" by ODA to allow a POTS operator number (0, 0 + 7/10 digits or 10XXX + 0 + 7/10 digits) to be stored in the SC list.
Valid Entries: Y, N
Default Value: Y

2.14 DNSH

Description: A POTS feature code with or without subsequent parameters is allowed in the SC list since this field is set to "Y" by ODA.
Valid Entries: Y, N
Default Value: Y

2.15 DNSI

Description: An IDP intercom number is allowed to be stored in the SC list since this field is set to "Y" by ODA. The number remaining after the deleting and prefixing done on the IDPICM form (5601-5 Record) will be subsequently screened by other DN options.
Valid Entries: Y, N
Default Value: Y

2.16 DNSJ

Description: When call processing recognizes an SC code as the dialed number, the stored number referenced by the code is retrieved and screened for other DN options. This retrieved number cannot be another SC code, therefore, this no-change field is set to "N" by ODA.
Valid Entries: Y, N
Default Value: N

2.17 DNSK

Description: Since a PFA (Private Facility Access) code that accesses a non-senderized facility is allowed to be stored in the SC list, this no-change field is set to "Y" by ODA. However, any subsequent digits received after the code has been received may not be stored in the list.
Valid Entries: Y, N
Default Value: Y

2.18 DNSL

Description: Since a PFA (Private Facility Access) code that accesses a senderized facility is allowed to be stored in the SC list, as well as the subsequent digits received after the code is received, this no-change field is set to "Y" by ODA. However, the number of subsequent digits to store is determined on the PFAGPA form (5609-5 Record).
Valid Entries: Y, N
Default Value: Y

2.19 DNSM

Description: An IDP escape to ODP access code is allowed to be stored in the SC list, therefore, this no-change field is set to "Y" by ODA. Subsequent digits received after the code are screened using other

Copyright © 2003 Lucent Technologies

DN options.
Valid Entries: Y, N
Default Value: Y

2.20 DNSN

Description: Since an IDP carrier specific code followed by an SC code is allowed to be stored in the SC list, this no-change field is set to "Y". Since the SC code is included, the DNSJ option must be used (no-change DNSJ = "Y") in conjunction with this option.
Valid Entries: Y, N
Default Value: Y

2.21 DNSO

Description: ARS (Automatic Route Selection) codes are allowed to be stored in the SC list, therefore, this no-change field is set to "Y". Digits received after the ARS code are screened with other DN options.
Valid Entries: Y, N
Default Value: Y

2.22 DNSP

Description: Is a PP (Precedence and Preemption) code allowed to be stored in the SC list?

Required Field.
Valid Entries: Y, N
Default Value: Y

2.23 DNSQ

Description: Must the number being forwarded to be connected to a terminal that can receive DSN (Defense Switched Network) calls?

Required Field.
Valid Entries: Y, N
Default Value: Y

DEFAULT PARAMETERS

The following fields (Section 2.24 - Section 2.25) define default parameters that are assigned to a terminal (line or trunk) along with the SC feature. However, if SCLPA, SCMPA and/or SCTPA forms are entered for a particular terminal, the entries made on those forms are used instead of the default parameters entered on this SCFD form.

2.24 SC LIST

Description: Optionally enter a default SC list. Do not enter a value in this field if SCC is "N" (unshared list). When the list is unshared, the SC LIST value is entered by ODA instead of the operating company and will be entered in the following format: the letter "A" followed by a seven-digit TN if the SC list is used by subscriber lines or the letter "A" and a four-digit TGN (for 5E10 and earlier, 0001 to 2000 or for 5E11 and later, 0001 to 4000) followed by a four-digit MEMB (0000 to 1951) if the list is used by trunks.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: up to 11 characters

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E12 and later, when SC SHARED is "Y", SC LIST may not be either "A" followed by a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

If the SC list is a shared list (SCC = "Y") the SC LIST field must be entered.

2.25 SC SHARED

Description: Is the SC list shared among two or more subscribers?
Valid Entries: Y, N

Data Rules:

An SC LIST name must be entered for shared lists (SC SHARED = "Y").

SEC. 27B: 5627-2 RECORD
SPEED CALLING LINE PARAMETER FORM - SCLPA

1. GENERAL

The 5627-2 Record, which is available with 5E6 and later Software Releases, is used to assign Speed Call parameters to non-Multi-Line Hunt lines when the default parameters on the corresponding SCFD form (5627-1 Record) are inappropriate or unspecified. When this record is entered, the line uses the SC (Speed Call) parameters entered on this form instead of the default parameters defined on the SCFD form, however, the line still uses the DN Screening options defined on the SCFD form.

For switch offices undergoing a retrofit from the 5E5 Software Release to the 5E6 Software Release, ODA will change existing constructed and preconstructed features to one of the eleven preconstructed features depending upon the DN screening options and whether or not the SC lists are changeable lists. For 5E6 and later, a line can be assigned up to two SC features (one 1-digit SC feature and/or one 2-digit SC feature). However, assigning two of the same features to one line is not allowed.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.51.

2. BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.1 * TN

Description: Enter the Telephone Number of the line.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated service class defined on the LCC form (5306 Record) must one of the following.

Class of Service	
ATND	50B nondata link console line or attendant line
HOTMOTL	Line termination at motel office equipment
INDIV	Individual line
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines
ISATND	ISDN Attendant Terminal
PBX	Line termination to a Private Branch Exchange
TWOPTY	Two-party line
MODEM	MODEM pool origination for analog line
4WINDIV	Four-wire individual line or four-wire manual PBX

For 5E12 and later, TN/FEATURE combinations on different SCLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the SCLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.2 * FEATURE

Copyright © 2003 Lucent Technologies

Description: Enter the SC (Speed Call) feature for which the SC parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This SC feature must be defined on an SCFD form (5627-1 Record).

2.3 SC LIST

Description: If the line subscribes to a shared list, enter an SC LIST name.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: up to 11 characters

Data Rules:

For 5E11 and earlier, the letter "A" cannot be the first character preceding the seven-digit TN or an eight-digit TN where the first four digits are in the range (for 5E10 and earlier, 0001 to 2000 or for 5E11 and later, 0001 to 4000) while the last four digits are in the range 0001-1951.

For 5E11 and earlier, if the line subscribes to an unshared list, leave this field blank and enter "N" in the SC SHARED field. If the list is unshared, ODA will automatically assign a list name in the following format: the letter "A" followed by the seven-digit TN.

For 5E12 and later:

- When SC LIST is specified, SC SHARED must be entered.
- When SC SHARED is "N" and SC LIST is not entered, SC LIST must be the letter "A" followed by the NPA plus TN.
- When SC SHARED is "N", SC LIST must be the letter "A" followed by the TN.
- When SC SHARED is "N", SC LIST must be the letter "A" followed by NPA plus TN.
- When SC SHARED is "Y" then SC LIST must be entered.
- When SC SHARED is "Y", SC LIST may not be either "A" plus by a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

For 5E12 and later, when the SCLPA forms have a 7-digit TN and SC SHARED is "N", the SC LIST TN must be "A" followed by the value of the 7-digit TN prefixed with the NPA from the corresponding NOC form.

2.4 SC SHARED

Description: Can the SC list be shared among two or more users?
Valid Entries: Y, N

Data Rules:

If the list is shared, then SC LIST must be entered.

2.5 NUMBER OF SC CODES

SEC. 27C: 5627-3 RECORD
SPEED CALLING
MLHG/TERM LINE PARAMETER FORM - SCMPA

1. GENERAL

The 5627-3 Record, which is available with 5E6 and later Software Releases, is used to assign Speed Call features to Multi-Line Hunt lines when the default parameters defined on the corresponding SCFD form (5627-1 Record) are inappropriate or unspecified. When this record is entered, the line uses the SC (Speed Call) parameters entered on this form instead of the default parameters defined on the SCFD form.

For switch offices undergoing a retrofit from the 5E5 Software Release to the 5E6 Software Release, ODA will change existing constructed or preconstructed features to one of the eleven preconstructed features depending upon DN screening options and whether or not the SC lists are changeable lists. For 5E6 and later, a line can be assigned up to two SC features (one 1-digit SC feature and/or one 2-digit SC feature). However, assigning two of the same features to one line is not allowed.

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.51.

2. BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.1 * MLHG

Description: Enter the Multi-Line Hunt Group number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.2 * TERM

Description: Enter the MLHG member number of the line.

Required Field.
Valid Entries: 1 - 2015 and 3001-3999

Data Rules:

The associated class of service defined on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B non-data link console line or attendant line
HOTMOTL	Line termination at motel office equipment
INDIV	Individual line
ISDN	Integrated Services Digital Network digital subscriber lines
ISATND	ISDN Attendant Terminal
PBX	Line termination to a Private Branch Exchange
TWOPTY	Two-party line
MODEM	MODEM pool origination for analog line
4WINDIV	Four-wire individual line or four-wire manual PBX

2.3 * FEATURE

Copyright © 2003 Lucent Technologies

Description: Enter the SC (Speed Call) feature for which the SC parameters are to be assigned.
Valid Entries: 1 - 8 characters

Data Rules:

This SC feature must be defined on an SCFD form (5627-1 Record).

2.4 SC LIST

Description: If the line subscribes to a shared list, enter an SC LIST name. The name is subject to the following restriction: the letter "A" cannot be the first character preceding the seven-digit TN or an eight-digit TN where the first four digits are in the range (for 5E10 and earlier, 0001 to 2000 or for 5E11 and later, 0001 to 4000) while the last four digits are in the range 0001-1951.

If the line subscribes to an unshared list, enter an SC LIST name with the letter "A" as the first digit followed by the seven-digit TN assigned to the Multi-Line Hunt line. Unshared lists may not be assigned to Multi-Line Hunt lines unless the lines have defined Member TNs.
Valid Entries:

- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: up to 11 characters

Data Rules:

When SC LIST is specified, SC SHARED must be entered.

When SC SHARED is "N", SC LIST must be the letter "A" followed by the user's 10-digit TN.

When SC SHARED is "Y", SC LIST may not be "A" followed by a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

2.5 SC SHARED

Description: Can the SC list be shared among two or more users?
Valid Entries: Y, N

Data Rules:

If the list is shared, then SC LIST must be entered.

2.6 NUMBER OF SC CODES

Description: This field is used by only RC/V (Recent Change/Verify).

SEC. 27D: 5627-4 RECORD
SPEED CALLING TRUNK PARAMETER FORM - SCTPA

1. GENERAL

The 5627-4 Record, which is available with 5E6 and later Software Releases, is used to assign Speed Call features to trunks when the default parameters on the SCFD form (5627-1 Record) are inappropriate or unspecified. When this record is entered, the trunk uses the SC (Speed Call) parameters entered on this form instead of the default parameters defined on the SCFD form.

For switch offices undergoing a retrofit from the 5E5 Software Release to the 5E6 Software Release, ODA will change existing features to one of the eleven preconstructed features depending upon DN screening options and whether or not the SC lists are changeable lists. For 5E6 and later Software Releases, a trunk can be assigned up to two SC features (one 1-digit SC feature and/or one 2-digit SC feature). However, assigning two of the same features to one trunk is not allowed.

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.51.

2. BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.1 * TGN

Description: Enter the Trunk Group number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated trunk class defined on the TKGRP form (5202 Record) must be one of the following.

TRKCLS	
Entry	**Definition**
LTOLLCON	Toll connecting
PDID	PBX direct inward dialing, 1-way outgoing
PF	Private Facility
PFITT	Private Facility Intertandem Trunk
PFLASH	Private Facility Feature Flash
PRINTOLL	Primary Intertoll
TTOLLCON	Toll completing
EDSL	Software Release: 5E8 and later. Extended Digital Subscriber Line trunk.
EDSLHM	Software Release: 5E8 and later. EDSL for Hotel/Motel TSPS service.

2.2 * MEMB

Description: Enter the Trunk Group Member number of the trunk.

Required Field.
Valid Entries: 0 - 1951

2.3 * FEATURE

Copyright © 2003 Lucent Technologies

Description: Enter the SC (Speed Call) feature for which the SC parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

This SC feature must be defined on an SCFD form (5627-1 Record).

2.4 SC LIST

Description: If the trunk subscribes to a shared list, enter an SC LIST name.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: up to 11 characters

Data Rules:

For 5E11 and earlier, the letter "A" cannot be the first character preceding the seven-digit TN or an eight-digit TN where the first four digits are in the range (for 5E10 and earlier, 0001 to 2000 or for 5E11 and later, 0001 to 4000) while the last four digits are in the range 0001-1951.

For 5E11 and earlier, if the line subscribes to an unshared list, leave this field blank and enter "N" in the SC SHARED field. If the list is unshared, ODA will automatically assign a list name in the following format: the letter "A" followed by the seven-digit TN.

For 5E12 and later:

- When SC LIST is specified, SC SHARED must be entered.
- When SC SHARED is "Y", SC LIST must be entered.
- Unshared SC LIST must be the trunk's TGN followed by its MEMB.
- When SC SHARED is "Y", SC LIST may not be "A" plus a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

2.5 SC SHARED

Description: Can the SC list be shared among two or more users?
Valid Entries: Y, N

Data Rules:

If the list is shared, then SC LIST must be entered.

SEC. 27E: 5627-5 RECORD
SPEED CALLING LIST FORM - SCLIST

1. GENERAL

The SCLIST form (5627-5 Record), which is available in 5E6 and later Software Releases, is used for assigning telephone numbers to Speed Calling codes and replaces the ADLIST form (5601-9 Record). The ADLIST form is still used for assigning TNs to Speed Calling codes in 5E5 and earlier Software Releases.

When the STORED SEQUENCE numbers (TNs) are not known at ODA time, and an IDP feature is also asigned to the line or trunk, and this form was *not* entered for any given SC List, memory will be reserved for the list entries for codes 2 through 7 (1-digit lists) or codes 20 through 49 (2-digit lists).

If an IDP feature is not assigned, and this form was *not* entered for any given SC List, then memory will be reserved for the list entries for codes 2 through 9 (1-digit lists) or codes 20 through 49 (2-digit lists).

When any forms are submitted for any given SC List, memory will only be reserved for the codes (1-digit) or ten-code blocks (2-digit) which are entered on the forms. Therefore, when any data is submitted for a 1-digit list, for example, extreme care must be taken to enter all eight codes (or more, if desired) even though the STORED SEQUENECE DNs may not be known for all of the codes. Customer originated changes to the SC Lists will be allowed only for those codes (or ten-code blocks) for which memory has been reserved.

1.1 Shared SC Lists

This form may be submitted for shared SC Lists which are unassigned. However, it may not be submitted for unshared SC Lists which are unassigned. That is, if the SC SHARED field is "N", one LINEFA or MLHLNFA form must also be submitted for a line with the Telephone Number indicated after the "A" in SC LIST. For trunks, either a TRUNKFA form must be submitted for the indicated Trunk Group and Member Number or a TKGRPFA form must be submitted for the indicated Trunk Group and the indicated Member Number defined on a TRUNK form.

1.2 Codes for Office Dialing Plan

The codes 2 through 9 and 20 through 49 are also provided in PDIT-1 defined on the PDIT form (5300-2 Record). If other codes are to be used by subscribers in the ODP (Office Dialing Plan), those codes must be added.

If any member of an IDP Group has Speed Calling options, all Speed Calling codes must be defined on the IDPDCA form (5601 Record) for that IDP Group.

1.3 Recent Change View

The corresponding Recent Change View for this form is 4.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SC LIST

Description: Enter the Speed Call List name.

SC LIST entries for 1-digit and 2-digit lists must be unique. However, the same name may be used for a

Copyright © 2003 Lucent Technologies

1-digit list as for a 2-digit list.

Required Field.
Valid Entries:
- For 5E11 and earlier: 1 - 8 characters
- For 5E12 and later: up to 11 characters

Data Rules:

For unshared lists assigned to lines, the SC LIST must be the letter "A" followed by the Telephone Number of the line. For this reason, unshared lists may not be assigned to Multi-Line Hunt lines unless the members have Telephone Numbers.

For unshared lists assigned to a trunk, the SC LIST must be the four-digit Trunk Group Number (for 5E10 and earlier, 0001 to 2000 or for 5E11 and later, 0001 to 4000) followed by the four-digit Member Number (0000 to 2015).

For 5E12 and later, when SC SHARED is "Y", SC LIST may not be either "A" followed by a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit member (0000-1951).

For 5E12 and later, when SC SHARED is "N", SC LIST must be "A" plus a 10-digit telephone number or a 4-digit TGN (0001-4000) followed by a 4-digit MEMB (0000-1951).

2.3 *SC CODE BLOCK

Description: Enter 1 or 2 digit SC CODE.

For 1-digit Speed Call lists, enter a "0".

For 2-digit lists, enter the tens digit of the codes which are entered in the SC CODE BLOCK fields, followed by a "0". For example, for the ten SC List codes 20 through 29, enter 20 in SC CODE BLOCK. For 2-digits lists, the valid values of the first digit are *, # and 0 to 9.
Valid Entries: 0 - 9, *, or #

2.4 SC SHARED

Description: Is the list shared? Enter "N" if the list is not shared.
Valid Entries: Y, N

2.5 NUMBER OF SC CODES

Description: This field is for Recent Change/Verify (RC/V) use only.

2.6 TGSR OV

Description: Should the Terminal Group Station Restrictions be overridden when a call is originated using this Speed Calling block? If ORIGINATING RESTRICTION is "FULL" or "SEMI" on the TGSRFD form (5607-1/2 Record), and a call is originated using this Speed Call block, the call is processed as if ORIGINATING RESTRICTION was set to "NONE". Calls originating outside of this SC block are still subject to the specified ORIGINATING RESTRICTION.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

This field may be set to "Y" only when SC SHARED is "Y".

SC LIST

The following fields (Section 2.7 - Section 2.8) define SC LIST entries.

2.7 SC CODE

Description: Enter the Speed Call code to be dialed. This code must be defined on an IDPDCA form (5601 Record). For 1-digit lists, up to twelve codes may be specified (*, # and 0 to 9). Since the characters # and * are cursor control codes for the ODA system, it is necessary to follow each of these characters by a blank (space bar) when entering it into the ODA system. For 2-digit lists, the first digit must be the same as the first digit of the SC CODE BLOCK and only ten codes may be specified with each code's last digit in the range 0 to 9. For 2-digit lists where the SC CODE BLOCK starts with a # or *, do not enter the blank, SC CODEs may not be duplicated in the list.

Caution should be used when defining the SC CODEs. If a line uses the ODP (Office Dialing Plan) and "0" is used as an SC CODE, then this subscriber will not be able to reach the operator on a zero minus call. If a terminal (line or trunk) uses an IDP (Individualized Dialing Plan), use discretion when defining codes in the IDPDCA. For instance, if "0" is used for attendant access, or "9" is used for escape to POTS, then those codes can not also be used for SC CODEs.
Valid Entries: 0 - 9, *, or #

Data Rules:

At least one SC CODE must be assigned in the SPEED CALL LIST. For 5E8 only, a minimum of six SC CODEs must be assigned.

For 5E9(1) and later, the entire block of SC CODEs (n0 - n9, where n is the first digit of the SC CODE BLOCK) must be entered for a 2-digit speed call list.

2.8 STORED SEQUENCE

Description: Leave this field blank if the STORED SEQUENCE (Directory Number) is unknown. If the DN is known, enter a string of up to 32 digits which the SC CODE is to access. 0, F, I and P which are applicable to terminals are assigned a Precedence and Preemption feature. See the PPFD form (5618-1 Record).
Valid Entries: 0 - 9, *, #, O, F, I, P

SEC. 28: HOME INTERCOM FORMS

Copyright © 2003 Lucent Technologies

SEC. 28A: 5628 RECORD
HOME INTERCOM FEATURE DEFINITION FORM - HIFD

1. GENERAL

HI/SVP (Home Intercom/Single Line Variety Package) is available with 5E6 and later Software Releases. The feature consists of two options: the Home Intercom Basic feature and the Single Line Variety Package.

The Home Intercom Basic feature allows users to establish a talking path between two or more extensions on a single-party analog line. To create a Home Intercom Basic call, the end-user goes off-hook, receives dial tone, dials their own telephone number and hangs up after receiving busy-tone. After the phone is put on-hook, the switch applies distinctive ringing pattern B (the default pattern) to all extensions on that line. When one or more extensions go off-hook, the ringing stops on all extensions and a voice path is established between all extensions that go off-hook. The voice path remains established until all extensions go on-hook or until the MAX TALK TIME value, defined on the OFCOPT form (5509 Record), is exceeded.

The Single Line Variety Package includes the following enhancements.

- Intercom Code Dialing: allows users to create a Home Intercom call via dial code rather than dialing their own phone number. This enhancement provides the default ringing pattern.
- Selective Intercom Dialing: allows subscribers to create a Home Intecom call by dialing an access code which will provide one of four distinctive ringing patterns.
- Selective Call Transfer: allows subscribers to transfer an outside call to another extension on the same line by flashing to place an outside call on hold, invoking one of the four ringing patterns via dial code and hanging up.
- Dialable Hold: allows subscribers to flash to place an outside call on hold, dial the Dialable Hold dial code, go on-hook and resume the call from any extension.

The Home Intercom feature may be assigned only to analog lines. On the associated LINE form (5109 Record) SHARED and MFRI must be "N", while SERHLN and ASSOC must be blank.

A CLASS OF SERVICE of "INDIV" and a TERMINATING TREATMENT of "AGING" or "INDIV" must be assigned on the associated LCC form (5306 Record).

The feature must be assigned to the line via the LINEFA form (5112 Record), CLUSTR form (5600 Record), or the BFG form (5625 Record). The AC field on the associated LINEFA or CLUSTR form must be set to "N".

The associated lines must not be assigned a Precedence and Preemption feature.

For more information on Home Intercom feature assignment, refer to Division 2, Section 1AT.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.53.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * FEATURE

Description: Enter the Home Intercom/Single Line Variety feature name. Feature names have no restrictions except feature names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

2.4 ICM CODE DIAL

Description: Is ICD (Intercom Code Dialing) allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.5 SEL ICM DIAL

Description: Is SID (Selective Intercom Dialing) allowed?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, ICM CODE DIAL must be "Y".

2.6 SEL CALL TRANS

Description: Is SCT (Selective Call Transfer) allowed?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, SEL ICM DIAL must be "Y" to allow dial code activation of the ringing patterns.

2.7 PRIV CONF

Description: Is private conference allowed during SCT (Selective Call Transfer)? Private conference allows subscribers on the same line to talk before reconnecting the outside call. If "N" is entered, the subscriber will be automatically connected to the held call without using any dial codes.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If "Y" is entered, SEL CALL TRANS must be "Y" to allow dial code activation of the ringing patterns.

2.8 DIAL HOLD

Description: Is DH (Dialable Hold) allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.9 CF ENABLE

Description: Can Home Intercom be activated when call forward variable is active on the line? If "Y" is entered and call forward variable is active, any attempt by the subscriber to dial his/her TN, the call will be forwarded. If "N" is entered, the call will not be forwarded.

Required Field.
Default: N
Valid Entries: Y, N

2.10 MDNL RING

Description: This field determines the ringing pattern that will be used during Home Intercom for lines that have multiple TNs with distinctive ringing (defined on the MTNDR form, 5550 Record).

If "Y" is entered, the master telephone number will receive the Home Intercom default ringing pattern and the dependent TNs will receive the patterns assigned on the MTNDR form.

If "N" is entered, the master telephone number will receive the default Multi-Distinctive Ringing pattern and the dependent TNs will receive the patterns assigned on the MTNDR form.

Required Field.
Default: N
Valid Entries: Y, N

SEC. 29: BULK CALLING LINE IDENTIFICATION FORMS

Copyright © 2003 Lucent Technologies

SEC. 29A: 5629-1 RECORD
BULK CALLING LINE IDENTIFICATION FEATURE DEFINITION FORM - BCLIDFD

1. GENERAL

The 5629-1 Record is available with 5E8 and later Software Releases, and defines various combinations of options available with the BCLID (Bulk Calling Line Identification) feature.

BCLID is a LASS (Local Area Signaling Service) feature providing call-related information on incoming calls for BRCS/Centrex, Multi-Line Hunt Group, and PBX customers. BCLID provides data only for calls from outside BRCS/Centrex Groups, MLHGs, or PBXs. PBX customers must either have DID (Direct Inward Dialing) capability or be part of an MLHG. This information includes the calling and called party directory number, the time the call was received, the calling line's multi-status indicator (indicating whether the true calling party DN is identified), and the called line's busy/idle status.

For interoffice calls, BCLID requires use of CCS (Common Channel Signaling) so that calling party information can be provided by the originating switch.

See Division 2, Section 1Y for more information on BCLID.

Each feature is given a feature name used to assign the constructed (defined) feature to lines. Certain BCLID features are pre-defined and automatically provided in the ODA database for initial offices, retrofit, or Large Terminal Growth. These are called preconstructed features. Preconstructed feature names all start with a slash (/); therefore, the slash may not be used as the first character of any feature other than preconstructed features. The preconstructed BCLID features are shown in Figure 1.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.62.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the BCLID feature name. Constructed feature names have no restrictions on characters, except the slash (/) cannot be the first character. Feature names starting with a slash are reserved for preconstructed features. All BRCS feature names must be unique.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Only one feature name is allowed to be assigned for a given LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), or associated CLUSTR form (5600 Record).

All BCLID feature names assigned to a BFG must be defined on a BCLIDFD form or be entered in the FEATURE field on an associated CLUSTR form.

All BCLID feature names defined on a BCLIDFD form:

- must not be defined as CLUSTER NAME on a CLUSTR form;

Copyright © 2003 Lucent Technologies

- may not be assigned to trunks via the CLUSTR, TKGRPFA (5206 Record) , or TRUNKFA forms (5205 Record).

Any BCLID feature assigned on a CLUSTR form must be defined on a BCLIDFD form.

Any BCLID feature assigned on a LINEFA or MLHLNFA form must be defined on a BCLIDFD form or as CLUSTER NAME on a CLUSTR form.

If a BCLID feature is assigned on a LINEFA, MLHLNFA, BFG, or associated CLUSTR form with:

- a TN on a LINE form (5109 Record),
- CKT TN on a DSLUSR form (5908 Record),
- MLHG on an MLHLN form (5111 Record), or
- CKT MLHG on a DSLUSR form,

then the LCC or RAX on the LINE, MLHLN, or DSLUSR form must correspond to one of the following as CLASS OF SERVICE on the LCC form (5306 Record): "4WINDIV",

- "ATND",
- "CALLBK" for 5E6 through 5E8 or
- "LTPCLBCK" for 5E9(1) and later,
- "CHGCALL",
- "HOTMOTL",
- "HOTPBX",
- "INDIV",
- "ISATND",
- "ISDN",
- "PBX", and
- "SATSTLN".

For 5E8 only, if an MLHG member is assigned a Bulk Calling Line Identification feature on an MLHLNFA form, the MLHG TERM must be 0001. For 5E9(1) and later, a BCLID feature may be assigned to an MLHG TERM greater than 0001, but in such cases a TN must be entered on the associated MLHLN form, or a CKT MLHG TN must be entered on the associated DSLUSR form; the NONHUNT field on the associated form must be "Y".

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

Fields Section 2.4 -Section 2.6 refer to feature options for BCLID.

2.4 AMA REC

Description: Is the billing "usage-sensitive" and not flat rate? A "Y" means "usage-sensitive", an "N" flat rate.

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.5 INTER GRP ONLY

Description: Are BCLID messages sent to the CPE only for inter-terminal group calls? If INTER GRP ONLY is "Y", the BCLID messages are sent for calls originated outside of the terminal group, and no messages are generated for calls originated inside the terminal group of the BCLID termination. If "N", BCLID generates a message for every incoming call (from inside or outside the terminal group) to this terminal group.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If INTER GRP ONLY equals "Y",

- FEATURE on the BFG form associated with this feature must also have FEATURE NAME on the TGSRFD form (5607-1/2 Record) assigned ,
- TN on the LINEFA, BFG, or associated CLUSTR form associated with this feature must also have FEATURE NAME on the TGSRFD form assigned , and
- MLHG on the MLHLNFA, BFG, or associated CLUSTR form associated with this feature must also have FEATURE NAME on the TGSRFD form assigned.

2.6 INCL DATE

Description: Is the date to be included in the BCLID message?

Required Field.
Default: N
Valid Entries: Y, N

DEFAULT PARAMETERS

Field Section 2.7 refers to default parameters.

2.7 BCLID GRP

Description: Enter the name of the BCLID group.
Valid Entries: 1 - 8 characters

Data Rules:

BCLID GRP must match a BCLID GRP on the BCLIDGP form.

If a TN defined on a LINEFA form has a BCLID feature assigned to it on a LINEFA, BFG (5625 Record), or associated CLUSTR form (5600 Record), and there is no TN assigned on a BCLIDLPA form, then BCLID GRP on the BCLIDFD form must be entered.

If an MLHG/MEMB defined on an MLHLNFA form has a BCLID feature assigned to it on an MLHLNFA, BFG (5625 Record), or associated CLUSTR form (5600 Record), and there is no MLHG/MEMB assigned on a BCLIDMPA form, then BCLID GRP on the BCLIDFD form must be entered.

SEC. 29B: 5629-2 RECORD
BULK LINE CALLING IDENTIFICATION GROUP PARAMETERS FORM - BCLIDGP

1. GENERAL

The 5629-2 Record is available with 5E8 and later Software Releases, and defines the group information associated with the BCLID (Bulk Calling Line Identification) feature.

See Division 2, Section 1Y for more information on BCLID.

Each terminal (line or trunk) that will use the BCLID capability must be assigned a BCLID feature identification (defined on the BCLIDFD form (5629-1 Record)) on a LINEFA (5112 Record), MLHLNFA (5113 Record), TKGRP (5202 Record), BFG (5625 Record) or CLUSTR form (5600 Record). In addition, each terminal must be assigned to a BCLID group which may be defined as the default parameter on the BCLIDFD form or on an individual terminal basis with the BCLIDLPA (5629-3 Record) or BCLIDMPA (5629-4 Record) forms. The preconstructed BCLID feature provided does not specify the BCLID group. Therefore, if the preconstructed feature is used, individual parameter forms must be entered for each terminal.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.62.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * BCLID GRP

Description: Enter the name of BCLID Group.

Required Field.
Valid Entries: 1 - 8 characters

2.3 # BCID

Description: Enter a BCID (Business Customer Identification).

Required Field.
Valid Entries: 1 - 65535

2.4 # AP SITE ID

Description: Enter the AP (Application Processor) Identification number associated with this BCLID Group.

Required Field.
Valid Entries: 1 - 255

Data Rules:

An AP SITE ID assigned on this form must not equal AP SITE ID on a DSLAP form (5963 Record) having E911 SITE equal to "Y".

2.5 ALT AP SITE ID

Copyright © 2003 Lucent Technologies

Description: Enter the alternate Application Processor Identification number associated with this BCLID Group. This ID specifies an alternate destination AP to send BCLID messages when the primary AP is unavailable to receive messages.
Valid Entries: 1 - 255

Data Rules:

ALT AP SITE ID cannot equal AP SITE ID.

An ALT AP SITE ID assigned on this form must not equal AP SITE ID on a DSLAP form having E911 SITE equal to "Y".

2.6 GRP ACTIVE

Description: Is BCLID GRP active?

If the group is active, all the incoming calls to all the terminals associated with this group are recorded normally by BCLID.

Required Field.
Default: Y
Valid Entries: Y, N

NPA - NXX GROWTH

2.7 BCLID TN 10

Description: This field indicates whether or not a 10 digit called party TN is to be sent over the AP link. Enter "Y" if a 10 digit called party TN is to be sent; otherwise, enter "N". This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later

SEC. 29C: 5629-3 RECORD
BULK CALLING LINE IDENTIFICATION LINE PARAMETER FORM - BCLIDLPA

1. GENERAL

The 5629-3 Record is available with 5E8 and later Software Releases, and defines BCLID (Bulk Calling Line ID) Line Parameters. The Line Parameter Form is used when a BCLID constructed feature is assigned to a "non-Multi-Line Hunt line and the desired parameters are different from the default parameters on the BCLIDFD form (5629-1 Record).

See Division 2, Section 1Y for more information on BCLID.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.62.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the BCLID customer.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

A TN assigned to a BCLID feature on this form must equal the TN defined on the LINEFA form where the BCLID feature is assigned to that feature via a LINEFA, BFG (5625 Record), or associated CLUSTR form (5600 Record).

For 5E9 and later, when TN(s) have a FEATURE assigned on the BCLIDLPA form, the FEATURE must be defined on the corresponding BCLIDFD form.

For 5E12 and later, TNs on different BCLIDLPA forms can not be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the BCLIDLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 # FEATURE

Description: Enter the BCLID feature name for which the BCLID group parameter is to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

This feature name must be defined on the BCLIDFD form.

2.4 # BCLID GRP

Description: Enter the name of the BCLID group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

BCLID GRP must equal BCLID GRP on a BCLIDGP form (5629-2 Record).

BULK CALLING LINE IDENTIFICATION MULTI-LINE HUNT GROUP PARAMETERS FORM - BCLIDMPA

1. GENERAL

The 5629-4 Record is available with 5E8 and later Software Releases, and defines BCLID (Bulk Calling Line Identification) Multi-Line Hunt line parameters. The Line (MLHG/TERM) Parameter Form is used when a BCLID constructed feature is assigned to a Multi-Line Hunt line, and the desired parameters are different from the default parameters on the BCLIDFD form (5629-1 Record).

See Division 2, Section 1Y for more information on BCLID.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.62.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

An MLHG assigned to a BCLID feature on this form must equal the combination of MLHG and MEMB defined on an MLHLNFA form, where the BCLID feature is assigned to that MLHG via an MLHLNFA, BFG (5625 Record), or associated CLUSTR form (5600 Record).

For 5E9 and later, when MLHG/TERMS have a FEATURE assigned on the BCLIDMPA form, the FEATURE must be defined on the corresponding BCLIDFD form.

2.3 MEMB

Description: This is a no change field and is defaulted to 0001. This is because the BCLID feature cannot be assigned to Multi-Line Hunt Group members other than 1.
Default: 1
Valid Entries: 1

2.4 # FEATURE

Description: Enter the BCLID feature name for which the BCLID group parameter is to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

This feature name must be defined on the BCLIDFD form.

2.5 # BCLID GRP

Description: Enter the name of the BCLID group.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

BCLID GRP must equal BCLID GRP on a BCLIDGP form (5629-2 Record).

SEC. 30A: 5630-1 RECORD
ADVANCED SERVICE INTERFACE FEATURE DEFINITION FORM - ASIFD

1. GENERAL

The 5630-1 Record is available with the 5E8 and later Software Releases, and contains information needed to describe the ASI (Advanced Service Interface) Proxy.

The ASI (Advanced Service Interface) Proxy is a secured feature providing a 5ESS Switch-based platform for connecting non-ISDN customers to an IP (Intelligent Peripheral). The IP provides automated call handling to subscribers. The ASI Proxy capability on the Switch does not provide the automated call handling by itself; rather, the IP acts as a subscriber "proxy" and provides the switch with the sequences of instructions for call handling, call extension and feature access.

The ASI Proxy capability, which is implemented as a BRCS terminal feature, provides two modes of operation:

- *Implicit Mode* allows the IP to be silently, directly connected onto the subscriber's phone upon origination or secondary dial tone. In this mode, the IP may:
  - Provide information to the subscriber upon origination of a call (through an announcement, dial tone, etc.);
  - Accept non-dialed (such as verbal) non-DTMF user requests and initiate dialing on the subscriber's behalf (dialing by the customer disconnects the IP);
  - Remain silent and wait for explicit invocation.

The subscriber can activate or deactivate the implicit mode feature by a CORC (Customer Originated Recent Change) toggle defined in the ODP. This toggle reverses the current status of the implicit mode feature. The subscriber must have the Implicit ASI Proxy feature assigned.

In this mode, the IP may also be used to provide auto dialing (call extension, feature activation) functions for the subscriber.

- *Explicit Mode* allows the subscriber to dial an ASI Proxy access code to communicate at length with the IP. In this mode, the Switch provides dial pulse to Touch-Tone conversion when necessary and passes along any customer dialed digits ending with "#" to the IP. The IP is also able to dial on behalf of the subscriber.

See Division 2, Section 4A93 for more information on ASI Proxy.

Each feature is given a feature name used to assign the constructed (defined) feature to lines. Certain ASI Proxy features are predefined and automatically provided in the ODA database for initial offices, retrofit, or Large Terminal Growth. These are called preconstructed features. Preconstructed feature names all start with a slash (/); therefore, the slash may not be used as the first character of any feature other than preconstructed features. The preconstructed ASI Proxy features are shown in Figure 1.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.61.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the name of the ASI Proxy feature being constructed. Constructed feature names have no restrictions on characters, except the slash (/) cannot be the first character. Feature names starting with a slash are reserved for preconstructed features. All BRCS feature names must be unique.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

ASI Proxy features must not be assigned to trunks, nor to a Secondary Only TN or Secondary Only MLHG/TERM NBR on an SHTN form (5902 Record).

All ASI Proxy feature names defined on an ASIFD form must not be defined as CLUSTER NAME on a CLUSTR form (5600 Record), and any ASI Proxy feature assigned on a CLUSTR form must be defined on an ASIFD form.

Any ASI Proxy feature assigned on a LINEFA (5112 Record) or MLHLNFA (5113 Record) form must be defined on an ASIFD form, or as CLUSTER NAME on a CLUSTR form.

All ASI Proxy feature names assigned to a BFG must be defined on an ASIFD form, or be entered in the FEATURE field on an associated CLUSTR form.

An ASIFD feature name:

- may not be assigned to an MLHG/TERM via the MLHLNFA, CLUSTR, or BFG form (5625 Record)
  - unless the MLHG/TERM has a TN entered on the associated MLHLN form (5111 Record);
  - unless the LCC and RAX entered on the associated MLHLN form is defined on an LCC form (5306 Record) with a CLASS OF SERVICE of "INDIV";
  - when SHARED equals "Y" on the associated MLHLN form;
  - when an HIFD Feature Name is assigned to the line.
- may not be assigned to a line via the LINEFA, CLUSTR, or BFG form
  - unless the LCC and RAX entered on the associated LINE form (5109 Record) is defined on an LCC form with a CLASS OF SERVICE of "INDIV";
  - when SHARED equals "Y" on the associated LINE form;
  - using LTSB (Line Time Slot Bridging).
- may not be assigned to a TN
  - via the LINEFA, CLUSTR, or BFG form when an HIFD Feature Name is assigned to the line;
  - (or CKT TN) defined on a DSLUSR form (5908 Record).
- may not be assigned to a CKT MLHG defined on a MLHLNFA, CLUSTER, or BFG form.

Copyright © 2003 Lucent Technologies

Only one ASIFD Feature Name:

- is allowed to be assigned to a line via the MLHLNFA,LINEFA, BFG, or CLUSTR form(s);
- is allowed for a given BFG or its associated CLUSTR form(s).

For 5E9(1) and later, FEATUREs assigned on a BFG form, CLUSTR form, LINEFA form or an MLHLNFA form and have R set to "Y" indicating that RAS (Remote Access Services) are desired, the FEATURE must be defined on a CFWFD form or on an ASIFD form.

For 5E9(1) and later, when BFG forms or associated CLUSTR form(s) have the field R set to "Y" for one or more FEATUREs defined on an ASIFD form one of the following conditions must be true:

- When ASI GRP is entered on the BFG form RMT SERV CODE and REC SERV CODE must be entered on the BFG form.
- When ASI GRP is not entered on the BFG form RMT SERV CODE and REC SERV CODE must be entered on the ASIFD form.

2.3 REMARKS

Description: Enter a descriptive comment about the feature.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

Fields Section 2.4 - Section 2.5 refer to feature options.

2.4 # IMP ACC

Description: Is implicit access to the IP desired?

Required Field.
Valid Entries: Y, N

Data Rules:

IMP ACC and EXP ACC cannot both be "N", but may both be "Y".

2.5 # EXP ACC

Description: Is explicit access to the IP desired?

Required Field.
Valid Entries: Y, N

Data Rules:

IMP ACC and EXP ACC cannot both be "N", but may both be "Y".

For a TN assigned an ASI Proxy feature on either the LINEFA, CLUSTR, or BFG form, or an MLHG/TERM assigned an ASI Proxy feature on either the MLHLNFA, CLUSTR, or BFG form, if EXP ACC equals "Y", then ACTION on the IDPDCA (5601-1/2 Record) or PDIT form (5300-2 Record) must equal "ASIUSE", and FEATURE on the IDPDCA or PDIT form must be the ASI Proxy feature assigned on this ASIFD form, or the ASI Proxy wild-card feature (/AS*).

Copyright © 2003 Lucent Technologies

DEFAULT PARAMETERS

Fields Section 2.6 - Section 2.10 refer to default parameters.

2.6 ASI GRP

Description: Enter the name of the ASI Proxy group to be used by the ASI Proxy feature.
Valid Entries: 1 - 8 characters

Data Rules:

ASI GRP must be defined on a corresponding ASIGP form (5630-4 Record).

2.7 SERV CODE

Description: Enter the service code defining the services allowed during implicit mode access to the IP.
Valid Entries: up to 5 digits, consisting of 0 - 9, * , or #

Data Rules:

If ASI GRP and SERV CODE are both entered, they must be defined on a corresponding ASIGP form.

If an ASI feature is assigned to a TN and defined on an ASIFD form with IMP ACC equals "Y", then SERV CODE must be entered, if not entered on an ASILPA,ASIMPA, or BFG form.

2.8 SID

Description: Enter the Subscriber ID used to identify the subscriber to the IP. If not specified, the SID is the TN of the line.
Valid Entries: up to 10 digits, consisting of 0 - 9, *, or #

2.9 IP DIAL BILL

Description: Does the subscriber want AMA (Automatic Message Accounting) billing records for an otherwise non-billable call dialed by the IP?
Default: N
Valid Entries: Y, N

2.10 EXP DIAL BILL

Description: Does the subscriber want AMA records for an explicit connection to the IP?
Default: N
Valid Entries: Y, N

Data Rules:

If EXP DIAL BILL is "Y", EXP ACC must be "Y".

REMOTE ACCESS

The RASI (Remote Access to ASI) feature is built upon the base ASI-Proxy (Advanced Service Interface) capability. The Remote Access to ASI will allow remote access to automated call handling, call extension and feature access.

Fields Section 2.11 - Section 2.13 refer to remote access capability.

2.11 RMT BILL

Copyright © 2003 Lucent Technologies

Description: Is billing for remote access to intelligent peripheral required?
Default: N
Valid Entries: Y, N

2.12 RMT SERV CODE

Description: Enter the Remote Service Code used to define the set of services allowed during remote access to the Intelligent Peripheral.
Valid Entries: Blank, or up to 5 characters of 0 - 9, *, or #

Data Rules:

When RMT SERV CODE is entered, REC SERV CODE must be entered.

For 5E9(1) and later, TN(s) that have the field R set to "Y" for one or more FEATUREs on the LINEFA form, CLUSTR form or an associated BFG form and the FEATURE is defined on an ASIFD form, the RMT SERV CODE and REC SERV CODE must be entered on an ASILPA form or on an ASIFD form (if an ASILPA form does not exist.).

For 5E9(1) and later, MLHG/TERM(s) that have the field R set to "Y" for one or more FEATUREs on the MLHLNFA form, CLUSTR form or an associated BFG form and the FEATURE is defined on an ASIFD form, the RMT SERV CODE and REC SERV CODE must be entered on an ASIMPA form or on an ASIFD form (if an ASIMPA form does not exist.).

CODE are entered, the R field for the associated feature must be set to "Y" on the MLHLNFA, or CLUSTR forms.

2.13 REC SERV CODE

Description: Enter the Remote Reconnect Service Code used to define the set of services allowed during a remote reconnect to the Intelligent Peripheral.
Valid Entries: Blank, or up to 5 characters of 0 - 9, *, or #

Data Rules:

When REC SERV CODE is entered, RMT SERV CODE must be entered.

SEC. 30B: 5630-2 RECORD
ADVANCED SERVICE INTERFACE LINE (TN) PARAMETER FORM - ASILPA

1. GENERAL

The 5630-2 Record is available with 5E8 and later Software Releases, and provides a means to create an ASI (Advanced Service Interface) Proxy Line form which overrides the Default Parameters on the corresponding ASIFD form (5630-1 Record).

See Division 2, Section 4A93 for more information on ASI Proxy.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.61.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TN

Description: Enter the TN of the line.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For 5E9(1) and later, TN(s) assigned an Advanced Service Interface Feature on the ASILPA form must have the TN assigned on a corresponding LINEFA form with the same FEATURE defined on either the LINEFA, BFG or associated CLUSTR form.

For 5E12 and later, TN/FEATURE combinations on different ASILPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit digit TNs on the ASILPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the name of the ASI Proxy feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

FEATURE must be defined on the corresponding ASIFD form.

2.4 # ASI GRP

Copyright © 2003 Lucent Technologies

Description: Enter the name of the ASI Proxy group to be used by the ASI Proxy feature.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

ASI GRP must be defined on a corresponding ASIGP form (5630-4 Record).

2.5 SERV CODE

Description: Enter the service code defining the services allowed during implicit mode access to the IP (Intelligent Peripheral).
Valid Entries: up to 5 digits, consisting of 0 - 9, *, or #

Data Rules:

If ASI GRP and SERV CODE are both entered, they must be defined on a corresponding ASIGP form.

If an ASI Proxy feature is assigned to a TN and defined on an ASIFD form with IMP ACC equals "Y", then SERV CODE must be entered, if not entered on that ASIFD form or a BFG form.

2.6 SID

Description: Enter the Subscriber ID used to identify the subscriber to the IP. If not specified, the SID is the TN of the line.
Valid Entries: up to 10 digits, consisting of 0 - 9, *, or #

2.7 IP DIAL BILL

Description: Does the subscriber want AMA (Automatic Message Accounting) billing records for an otherwise non-billable call dialed by the IP?

Required Field.
Default: N
Valid Entries: Y, N

2.8 EXP DIAL BILL

Description: Does the subscriber want AMA records for an explicit connection to the IP?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If EXP DIAL BILL equals "Y", EXP ACC on the corresponding ASIFD form must equal "Y".

REMOTE ACCESS

The RASI (Remote Access to ASI) feature is built upon the base ASI-Proxy (Advanced Service Interface) capability. The Remote Access to ASI will allow remote access to automated call handling, call extension and feature access.

Fields Section 2.9 - Section 2.11 refer to remote access capability.

2.9 RMT BILL

Copyright © 2003 Lucent Technologies

Description: Is billing for remote access to intelligent peripheral required?
Default: N
Valid Entries: Y, N

2.10 RMT SERV CODE

Description: Enter the Remote Service Code used to define the set of services allowed during remote access to the Intelligent Peripheral.
Valid Entries: Blank, or up to 5 characters of 0 - 9, *, or #

Data Rules:

When RMT SERV CODE is entered, REC SERV CODE must be entered.

For 5E9(1) and later, TN(s) that have the field R set to "Y" for one or more FEATUREs on the LINEFA form, CLUSTR form or an associated BFG form and the FEATURE is defined on an ASIFD form, the RMT SERV CODE and REC SERV CODE must be entered on an ASILPA form or on an ASIFD form (if an ASILPA form does not exist.).

2.11 REC SERV CODE

Description: Enter the Remote Reconnect Service Code used to define the set of services allowed during a remote reconnect to the Intelligent Peripheral.
Valid Entries: Blank, or up to 5 characters of 0 - 9, *, or #

Data Rules:

When REC SERV CODE is entered, RMT SERV CODE must be entered.

SEC. 30C: 5630-3 RECORD
ADVANCED SERVICE INTERFACE LINE (MLHG/TERM) PARAMETER FORM - ASIMPA

1. GENERAL

The 5630-3 Record is available with 5E8 and later Software Releases, and provides a means to create an ASI (Advanced Service Interface) Proxy Line form which overrides the Default Parameters on the corresponding ASIFD form (5630-1 Record).

See Division 2, Section 4A93 for more information on ASI Proxy.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.61.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

For 5E9(1) and later, MLHG/TERM(s) assigned an Advanced Service Interface FEATURE on the ASIMPA form must have the MLHG/TERM assigned on a corresponding MLHLNFA form with the same FEATURE defined on either the MLHLNFA, BFG or on their associated CLUSTR form(s).

2.3 * TERM

Description: Enter the Multi-Line Hunt Group member number of the line.

Required Field.
Valid Entries: 1 - 2000 or 3001 - 3999 (outdial terminals)

2.4 * FEATURE

Description: Enter the name of the ASI Proxy feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

FEATURE must be defined on the corresponding ASIFD form.

2.5 # ASI GRP

Copyright © 2003 Lucent Technologies

Description: Enter the name of the ASI Proxy group to be used by the ASI Proxy feature.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

ASI GRP must be defined on a corresponding ASIGP form (5630-4 Record).

2.6 SERV CODE

Description: Enter the service code defining the services allowed during implicit mode access to the IP (Intelligent Peripheral).
Valid Entries: up to 5 digits, consisting of 0 - 9, *, or #

Data Rules:

If ASI GRP and SERV CODE are both entered, they must be defined on a corresponding ASIGP form.

If an ASI Proxy feature is assigned to an MLHG/TERM and defined on an ASIFD form with IMP ACC equals "Y", then SERV CODE must be entered, if not entered on the ASIFD form, or a BFG form.

2.7 SID

Description: Enter the Subscriber ID used to identify the subscriber to the IP. If not specified, the SID is the TN of the line.
Valid Entries: up to 10 digits, consisting of 0 - 9, *, or #

2.8 IP DIAL BILL

Description: Does the subscriber want AMA (Automatic Message Accounting) billing records for an otherwise non-billable call dialed by the IP?

Required Field.
Default: N
Valid Entries: Y, N

2.9 EXP DIAL BILL

Description: Does the subscriber want AMA records for an explicit connection to the IP?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If EXP DIAL BILL equals "Y", EXP ACC on the corresponding ASIFD form must equal "Y".

REMOTE ACCESS

The RASI (Remote Access to ASI) feature is built upon the base ASI-Proxy (Advanced Service Interface) capability. The Remote Access to ASI will allow remote access to automated call handling, call extension and feature access.

Fields 2.10 - 2.12 refer to remote access capability.

2.10 REMOTE BILL

Copyright © 2003 Lucent Technologies

Description: Is billing for remote access to intelligent peripheral required?
Default: N
Valid Entries: Y, N

2.11 RMT SERV CODE

Description: Enter the Remote Service Code used to define the set of services allowed during remote access to the Intelligent Peripheral.
Valid Entries: Blank, or up to 5 characters of 0 - 9, *, or #

Data Rules:

When RMT SERV CODE is entered, REC SERV CODE must be entered.

For 5E9(1) and later, MLHG/TERM(s) that have the field R set to "Y" for one or more FEATUREs on the MLHLNFA form, CLUSTR form or an associated BFG form and the FEATURE is defined on an ASIFD form, the RMT SERV CODE and REC SERV CODE must be entered on an ASIMPA form or on an ASIFD form (if an ASIMPA form does not exist.).

2.12 REC SERV CODE

Description: Enter the Remote Reconnect Service Code used to define the set of services allowed during a remote reconnect to the Intelligent Peripheral.
Valid Entries: Blank, or up to 5 characters of 0 - 9, *, or #

Data Rules:

When REC SERV CODE is entered, RMT SERV CODE must be entered.

SEC. 30D: 5630-4 RECORD
ADVANCED SERVICE INTERFACE GROUP DEFINITION FORM - ASIGP

1. GENERAL

The 5630-4 Record is available with 5E8 and later Software Releases, and contains information needed to define the routing and signal conversion characteristics of an ASI (Advanced Service Interface) Proxy group.

See Division 2, Section 4A93 for more information on ASI Proxy.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.61.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ASI GRP

Description: Enter the name of the ASI Proxy group to be used by the ASI Proxy feature.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The ASI GRP and CODE defined on the ASIGP form must be entered on the ASILPA, ASIMPA, ASIFD and/or BFG forms as ASI GRP and RMT SERV CODE respectively.

The ASI GRP and CODE defined on the ASIGP form must be entered on the ASILPA, ASIMPA, ASIFD and/or BFG forms as ASI GRP and REC SERV CODE respectively.

2.3 * CODE

Description: Enter either the dialed access code digits to invoke explicit access to the IP (Intelligent Peripheral), or a service code defining the set of services allowed during implicit access to the IP.

Required Field.
Valid Entries: up to 5 digits, consisting of 0 - 9, *, or #

2.4 # RTI

Description: Enter the Route Index used to route to the IP.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

RTI must be defined on an RTIDX form (5303 Record) with ROUTE TYPE equal to "HUNT". Additionally,

Copyright © 2003 Lucent Technologies

the RTI must route to a trunk group with ASI PROXY equal to "Y" on the associated TKGRP form (5202 Record).

2.5 SIG CONV

Description: Is signal conversion needed for access to "cut-through facilities?
Default: N
Valid Entries: Y, N

2.6 SIG CNVT TIME

Description: Enter the time to wait after each dialed digit before deciding that dialing is complete and no more signal conversion is needed. A value of 0 may be used to indicate infinite timing.
Default: 0
Valid Entries: 4 - 900 (seconds)

2.7 MEA

Description: Is Modified Extended Access required?

If "Y", this ASI group provides Modified Extended Access which will provide DP to TT conversion for applicable subscribers. This allows DP subscribers to make ``extended calls'' through the IP.

This ASI enhancement is part of SFID 93 and is in addition to the original DP to TT conversion that was supported solely between an IP and a subscriber. This enhancement, controlled by the MEA field, allows DP to TT conversion past the IP for any call extensions.

If "N", this ASI group does not support MEA.
Default: N
Valid Entries: Y, N

SEC. 31A: 5632-1 RECORD
ADVANCED SERVICES PLATFORM FEATURE DEFINITION FORM - ASPFD

1. GENERAL

The ASPFD Record is available with 5E9(1) and later Software Releases, and defines various combinations of options available with the ASP (Advanced Services Platform) feature.

Lucent Technologies A-I-Net□ ASP provides true service-independent central office switch and interworking capabilities based on industry-standard AIN (Advanced Intelligent Network) requirements. ASP had been available since 5E6 as a secured feature, and enhancements were made in 5E8. For 5E9(1) and later, ASP is provisioned as a BRCS feature. In addition, several enhancements were made. These two changes created the need for a feature definition form.

See Division 2, Section 4A126 for more information on ASP.

1.1 Preconstructed Features

Each feature is given a feature name of from one to eight characters used to assign the constructed (defined) feature. Certain ASPFD features are pre-defined and automatically provided in the ODA database for initial offices, retrofit, or Large Terminal Growth. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. The preconstructed ASPFD features are shown in Figure 1.

1.2 Recent Change View

The corresponding Recent Change View for this form is 12.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the ASP feature Name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

An ASP feature assigned to a TRUNK GROUP on a TKGRPFA form (5206 Record), TN on a LINEFA form (5112 Record), an MLHG on an MLHLNFA form (5113 Record), or a TGN/MEMB on a TRUNKFA form (5205 Record), must be defined on this form or as CLUSTER NAME on the CLUSTR form (5600 Record).

An ASP feature assigned to a CLUSTR form must be defined on this form.

Only one ASPFD form may exist for a feature name.

For an ASP feature assigned to a TGN/MEMB on the TRUNKFA, TKGRPFA, or an associated CLUSTR form, IN START DIAL on the corresponding TRUNK form (5204 Record) must be other than "DIRC", "GRND", or "LOOP".

For 5E14 and earlier, an ASP feature assigned to a TN on the LINEFA form, an MLHG on the MLHLNFA

Copyright © 2003 Lucent Technologies

form, or a TGN on the TRUNKFA form must have at least one TRIG NBR (OHI, OHD, or TA) entered or one ALLOWED field (FCD or CDP) set to "Y" on the ASPFD, ASPLPA (5632-2 Record), ASPMPA (5632-3 Record), ASPTPA or ASPDP (5632-5 Record) (for 5E9(1)) forms (5632-4 Record).

An ASP feature assigned to a TGN/MEMB on either the TRUNKFA form or an associated CLUSTR form when an ASPFD, ASPTPA, or ASPDP (for 5E9(1)) form exists with OHD TRIG NBR entered must have TGN defined on a TKGRP form (5202 Record) with TRKCLS equal to "PF", "PFITT", or "PFLASH", "EDSL" or "EDSLHM".

ASP features may not be assigned to BRCS feature groups on the BFG form (5625 Record).

An ASP feature assigned to a TGN on the TRUNKFA or associated CLUSTR form, or TRUNK GROUP on the TKGRPFA form, must have an associated TKGRP form where TRK DIR equal to "INC" or "2W", since ASP features can be assigned only to incoming or two-way trunks.

ASP terminating features, where CONTROL is "TERM", may not be assigned to trunks via the TRUNKFA (5206 Record) or TKGRPFA (5205 Record) form or in a CLUSTER assigned via the TRUNKFA or TKGRPFA form)

2.3 REMARKS

Description: Enter a descriptive remark.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

Field Section 2.4 refers to feature options.

2.4 # CONTROL

Description: Enter the ASP feature type control.

Required Field.

Valid CONTROL Entries

Entry	Definition
ORIG	Feature is applied to the originator.
TERM	Feature is applied to the terminator.
NESS	Software Release: 5E9(2) and later. Network Element Services Signaling.

Data Rules:

If CONTROL is "TERM", only TERMINATING TRIGGERS can be entered. If CONTROL is "ORIG", only ORIGINATING TRIGGERS can be entered. For 5E9(2) and later, if CONTROL is "NESS", only NESS TRIGGERS can be entered.

If CONTROL equals "TERM", OHI TRIG NBR, OHD TRIG NBR, and, for 5E9(2) and later, NESS TRIG NBR must not be entered. Also FCD ALLOWED and CDP ALLOWED cannot be "Y" on the associated ASPLPA or ASPMPA forms.

If CONTROL equals "ORIG", no terminating and, for 5E9(2) and later, no NESS triggers can be assigned on an ASPLPA or ASPMPA form, i.e., TA TRIG NBR and, for 5E9(2) and later, NESS TRIG NBR must not be entered.

If multiple ASP features are assigned to a TN on a LINEFA form, a TGN/MEMB on the TRUNKFA form, or an MLHG on the MLHLNFA form or a CLUSTER containing multiple ASP features assigned, then only one ASP feature may have CONTROL set to "ORIG" on the associated ASPFD form. There can be only one originating ASP feature.

Copyright © 2003 Lucent Technologies

If multiple ASP features are assigned to a TN on a LINEFA form or an MLHG on the MLHLNFA form or a CLUSTER containing multiple ASP features assigned, then only one ASP feature may have CONTROL set to "TERM" on the associated ASPFD form. There can be only one terminating ASP feature.

If an ASP feature is assigned to an MLHG/TERM on the MLHLNFA or a corresponding CLUSTR form, and defined on an ASPFD from with CONTROL set to "TERM", then the MLHG/TERM must be defined on an MLHLN from with the TN entered or on a DSLUSR form as CKT MLHG/TERM with CKT MLHG TN entered.

For an ASP feature assigned to a TN or MLHG/TERM on the LINEFA or MLHLNFA or a corresponding CLUSTR form, and defined on an ASPFD from with CONTROL set to "TERM", then

- if the TN or MLHG/TERM is defined on a LINE or MLHLN form with LCC/RAX entered where LCC/RAX is defined on an LCC form, the LCC form associated with this line or Multi-Line Hunt Group line must have a CLASS OF SERVICE of "2PTY", "4WINDIV", "ATND", "CHGCALL", "COIN", "HOTMOTL", "HOTPBX", "INDIV", "MODEM", "PBX", or "TWOPTY", and TERMINATING TREATMENT on the LCC form must be "AGING", "INDIV", "INWATS", "MLHG", or "PARTY".

For the ASP Interworking with National ISDN and Custom ISDN Attendant secured feature (See Division 2, Section 4A139):

- if SFID 139 ACT is "Y" on the SFSYS form and the TN or MLHG/TERM is defined on a LINE, MLHLN, or DSLUSR form, then the LCC form associated with this line or Multi-Line Hunt Group can additionally have a CLASS OF SERVICE of "ISATND" or "ISDN" , and if CLASS OF SERVICE is "ISDN", then DSL CLS must be "STD" on the corresponding DSL form.
- if the TN or MLHG is defined on a DSLUSR form as CKT TN or CKT MLHG, then the ASP Interworking with National ISDN and Custom ISDN Attendants secured feature must be purchased and SFID ACT 139 must be "Y" on the SFSYS form.

NESS:
For 5E9(2) and later, if a TN is on the LINEFA (or an MLHG/TERM) form with an ASP feature

- assigned on either the LINEFA (or MLHLNFA) form or corresponding CLUSTR form
- and defined on the ASPFD form with CONTROL set to "NESS",

then

- the ASP NESS (Network Element Services Signaling) secured feature must be purchased and the ACT field for SFID 185 must be "Y" on the SFSYS form.
- the TN (or MLHG/TERM) must be defined on a DSLUSR form as CKT TN (or CKT MLHG/TERM) and LN TYPE must be "NONE" or not entered.

If CONTROL is set to "NESS", then on all associated ASPLPA and/or ASPLPA forms OHI TRIG NBR, OHD TRIG NBR, and TA TRIG NBR must not be entered; FCD ALLOWED and CDP ALLOWED must be "N".

If a TN (or MLHG/TERM) is defined on the LINEFA (or an MLHLNFA) form with multiple ASP features assigned on either the LINEFA (or MLHLNFA) form or corresponding CLUSTR form and the ASP features are defined on this form with CONTROL set to "NESS", then at most one ASP NESS feature can be assigned to a TN (or MLHG/TERM).

If a TN (or MLHG/TERM) is defined on the LINEFA (or an MLHLNFA) form with an ASP feature assigned

Copyright © 2003 Lucent Technologies

on either the LINEFA (or MLHLNFA) form or corresponding CLUSTR form, the TN (or MLHG/TERM)is defined on a DSLUSR form as CKT TN (or CKT MLHG/TERM) and this form has CONTROL set to "NESS", then the corresponding DSL form must have a DSL CLS of "STD".

DEFAULT PARAMETERS

Fields Section 2.5 - Section 2.31 refer to default parameters.

ORIGINATING TRIGGERS

Fields Section 2.5 - Section 2.18 refer to originating triggers. Originating triggers launch a query based on the calling number.

An ASP feature assigned to a TRUNK GROUP on the TKGRPFA form or associated CLUSTR form must have OHD TRIG NBR entered, or FCD ALLOWED or CDP ALLOWED equal to "Y" on an ASPFD, ASPTPA, or ASPDP (for 5E9(1)) form.

2.5 OHI TRIG NBR

Description: Enter the trigger number for Off-Hook Immediate triggers. The Off-Hook Immediate trigger is a subscribed trigger, that queries the SCP (Service Control Point) without referencing a dialing plan after the subscriber goes off-hook. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHI TRIG NBR is entered,

- OHD TRIG NBR must not be entered, and
- FCD ALLOWED and CDP ALLOWED must be "N".

For an ASP feature assigned to a TN on the LINEFA form or MLHG/TERM on the MLHLNFA form, if OHI TRIG NBR is entered on the ASPFD, ASPLPA, ASPMPA, or ASPDP (for 5E9(1)) forms,

- the only other BCRS feature that may be assigned is a terminating ASP feature.
- SERHLN on the corresponding LINE or DSLUSR must not be entered.

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if OHI TRIG NBR is entered on the ASPFD, ASPLPA, ASPMPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form (5306 Record) must have CLASS OF SERVICE of "INDIV".

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if the corresponding LCC form (5306 Record) has CLASS OF SERVICE of "ISDN", OHI TRIG NBR must not be entered on the associated ASPFD, ASPLPA, or ASPDP (for 5E9(1)) form. An OHI TRIG NBR is not allowed for lines with CLASS OF SERVICE of "ISDN".

For an ASP feature assigned to a TGN/MEMB on the TRUNKFA or TKGRPFA forms or an associated CLUSTR form, if OHI TRIG NBR or TA TRIG NBR is entered on an ASPFD or ASPDP (for 5E9(1)) form, an ASPTPA form must exist for this TGN/MEMB(s)/FEATURE combination, since an OHI TRIG NBR or a TA TRIG NBR cannot be assigned to a trunk.

For 5E9(2) and earlier, OHI TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form (5324 Record) where APPLICATION is "ASP", and when AIN REL is "R0" on the NSTRIG form, SERV KEY

Copyright © 2003 Lucent Technologies

must be "ANI".

For 5E10 and later, for every OHI TRIG NBR on the ASPFD form there must be a corresponding TRIG NBR entered on a NSTRIG form, APPLICATION must be "ASP" and SERVICE ALWD must not be "CSD". In addition, on the NSTRIG form when AIN REL equals "R0", SERV KEY must be "ANI".

For 5E9(2) and later, if

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")

and

- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a CLUSTR form containing an ASP feature assigned

and

- the associated ASPFD or ASPLPA (or ASPMPA) form has OHI TRIG NBR entered,

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

2.6 OHI TRIG ACT

Description: Is the Off-Hook Immediate trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHI TRIG ACT is "Y", OHI TRIG NBR must be entered.

2.7 OHD TRIG NBR

Description: Enter the Off-Hook Delay trigger number. The Off-Hook Delay trigger is a subscribed originating trigger that queries the SCP data base after all dialed/signaled digits have been collected and validated from the originating line/trunk. If the dialed/signaled digits have been defined as an escape code digit string, a query is not launched; rather, normal call processing treatment is applied. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHD TRIG NBR is entered, CDP ALLOWED must be "N".

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if OHD TRIG NBR is entered on the ASPFD, ASPLPA, ASPMPA, ASPDP (for 5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

For an ASP feature assigned to a TN on the LINEFA form, TGN/MEMB on the TRUNKFA form, TRUNK GROUP on the TKGRPFA form, or MLHG on the MLHLNFA form, if OHD TRIG NBR is entered on the ASPFD, ASPLPA, ASPMPA, ASPTPA ASPDP (for 5E9(1)) forms, then

Copyright © 2003 Lucent Technologies

- no other BRCS feature may be assigned to the line or Multi-Line Hunt Group except one terminating ASP feature with CONTROL set to "TERM", and no other features may be assigned to the trunk or trunk group.

For the ASP BRCS Off-Hook Delayed Interworking secured feature (See Division 2, Section 4A137):

- if SFID 137 ACT is "Y" on the SFSYS form and the TN or MLHG/TERM is either defined on a LINE, MLHLN form or on a DSLUSR form as CKT TN or CKT MLHG/TERM where DSL CLS on the corresponding DSL form is "STD", the only other BRCS features allowed to be assigned to the line or Multi-Line Hunt Group are those defined on the following forms:
  - ASPFD form with CONTROL set to "TERM"
  - CFWFD form with FWD COND set to "BUSY", "IDLE" or "BOTH"
  - CWTFD form with INVOKE set to "TERM"
  - MWFD form with CONTROL not set to "CODEALT".

NOTE: No other ASP originating features may be assigned to the line or Multi-Line Hunt Group.

- if BFGN is entered on the LINEFA or MLHLNFA form, the ASP (Advanced Service Platform) BRCS/OHD Interworking secured feature must be purchased and SFID ACT 137 must be "Y" on the SFSYS form.
- if SFID 137 ACT is "Y" on the SFSYS form and the TN or MLHG/TERM is either defined on a LINE, MLHLN form or on a DSLUSR form as CKT TN or CKT MLHG/TERM where DSL CLS on the corresponding DSL form is not set to "STD", no other BRCS features may be assigned except at most one ASP terminating feature with CONTROL set to "TERM".

OHD TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION is "ASP".

For an ASP feature assigned to a TGN/MEMB on the TKGRPFA or an associated CLUSTR form, if OHD TRIG NBR is entered on an ASPFD, ASPTPA, or ASPDP (for 5E9(1)) form, the TGN must be defined on the TKGRP form with TRKCLS of "PF", "PFITT", "PFLASH", "EDSL" or "EDSLHM".

When an ASP feature is assigned to a TN or MLHG/TERM on the LINEFA, MLHLNFA or a corresponding CLUSTR form, and an associated ASPFD, ASPLPA, ASPMPA, or ASPDP (for 5E9(1)) form has OHD TRIG NBR entered, and the TN or MLHG/TERM is defined on a DSLUSR form as CKT TN or CKT MLHG/TERM, then

- if CKT LCC/RAX on the DSLUSR form is defined on an LCC form with CLASS OF SERVICE of "ISDN" and the OHD TRIG NBR is defined on an NSTRIG form with APPLICATION set to "ASP", AIN REL on the NSTRIG form must be "R0D1" if a corresponding DSL form has DSL CLS of "STD", AIN REL must be "R0" if DSL CLS not set to "STD".

The only other BRCS features allowed to be assigned to a line are those defined on the ACCTFD, ASPFD (CONTROL is "TERM"), CPNBNFD or RNDFD when:

- ASP OHD Interactions with Account Code and CPN/BN secured feature is active (see Division 2, Section 4A150) and
- the TN(s) (or MLHG/TERM(s)) appear on the LINEFA (or MLHLNFA) form with an ASP feature

Copyright © 2003 Lucent Technologies

assigned or a CLUSTER containing an ASP feature assigned and

- OHD TRIG NBR is entered on the associated ASPFD or ASPLPA form and
- the TN (or MLHG/TERM) is either defined on a LINE (or MLHLN) form or on a DSLUSR form as CKT TN (or CKT MLHG/TERM) where DSL CLS on the corresponding DSL from is "STD".

For 5E9(2) and later, if

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")

and

- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a CLUSTR form containing an ASP feature assigned

and

- the associated ASPFD or ASPLPA (or ASPMPA) form has OHD TRIG NBR entered

and

- the TN (or MLHG/TERM) is either defined on the LINE (or MLHLN) or DSLUSR form as CKT TN (or CKT MLHG/TERM) where DSL CLS on the corresponding DSL form is "STD",

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

No other BRCS features may be assigned except at most one ASP terminating feature where CONTROL on the ASPFD form is "TERM" when the following conditions hold:

- ASP BRCS/OHD Interworking secured feature has been purchased with SFID ACT 137 field set to "Y" on the SFSYS form,

and/or

- ASP OHD Interactions with Account Code and CPN/BN secured feature has been purchased with SFID ACT 150 field set to "Y" on the SFSYS form,

and/or

- ASP NESS secured feature has been purchased with SFID ACT 185 field set to "Y" on the SFSYS form,

and/or

- ASP BRCS/OHD Interworking Extensions secured feature has been purchased with SFID ACT 226 field set to "Y" on the SFSYS form

and

- TN (or MLHG/TERM) appears on the LINEFA (or MLHLNFA) form with an ASP feature assigned on

Copyright © 2003 Lucent Technologies

the LINEFA (or MLHLNFA) or corresponding CLUSTR form

and

- the ASP feature is defined on the ASPFD, ASPLPA (or ASPMPA) with OHD TRIG NBR entered

and

- the TN (or MLHG/TERM) is defined on a DSLUSR form as CKT TN (or CKT MLHG/TERM) and DLS CLS on the corresponding DSL form is not "STD".

2.8 OHD TRIG ACT

Description: Is the Off-Hook Delay trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHD TRIG ACT is "Y", OHD TRIG NBR must be entered.

2.9 OHD DFLT ROUTE

Description: Is the Off-Hook Delay Default Route active? See Division 2, Section 4A516.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

If OHD DFLT ROUTE is "Y",
SFID 516 must be activated on the SFSYS form (5713 Record)

OHD TRIG NBR must be entered.

2.10 FCD ALLOWED

Description: Is the feature code dialing trigger allowed? Feature Code Dialing (formerly the ODP Prefix/Code trigger) is a subscribed trigger, querying the SCP when a subscriber goes off-hook and dials an ASP FCD access code. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if FCD ALLOWED or CDP ALLOWED is "Y" on the ASPFD, ASPMPA, or ASPDP (for 5E9(1)) forms, then

- the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

Copyright © 2003 Lucent Technologies

For the ASP Interworking with National ISDN and Custom ISDN Attendant secured feature (See Division 2, Section 4A139):

- if SFID 139 ACT is "Y" on the SFSYS form and the TN or MLHG/TERM is defined on a LINE form or a DSLUSR form with LCC/RAX entered and the LCC/RAX is defined on an LCC form, then the LCC form associated with this line can additionally have a CLASS OF SERVICE of "ISATND" and if CLASS OF SERVICE is "ISDN", DSL CLS can be "STD" on the corresponding DSL form.

If TGN/MEMB(s) are assigned an ASP feature on the TKGRPFA form or an associated CLUSTR form and

- FCD ALLOWED

  or

- CDP ALLOWED (for 5E14 and earlier)

is set to "Y" on the ASPFD or ASPTPA form, then the TGN must be defined on the TKGRP form with TRKCLS set to "PF", "PFITT" or "PFLASH".

2.11 FCD TRIG ACT

Description: Is the feature code dialing trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If FCD TRIG ACT is "Y", FCD ALLOWED must be "Y".

2.12 CDP ALLOWED

Description: Is the customized dialing plan trigger allowed? Customized Dialing Plan (formerly the IDP trigger) uses the IDP capabilities to access ASP. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

See Data Rules for FCD ALLOWED field.

For 5E15 and later, before TGN/MEMB(s) are assigned an ASP feature on either the TRUNKFA or TKGRPFA form or an associated CLUSTR form and an ASPFD or ASPTPA form exist with this feature where CDP ALLOWED is "Y" and the associated TGN defined on the TKGRP form with a TRKCLS value of "EDSL" or "EDSLHM", the following must be set to "Y" on the SFSYS form (Record 5713-1):

- ACT SFID 254 - Restrict Usage of ASP Trigger feature

  or

- ACT SFID 255 - ASP Originating Triggers feature

  and

Copyright © 2003 Lucent Technologies

- ACT SFID 557 - ASP CDP Trigger on PRI feature.

When TGN/MEMB(s) are assigned and ASP feature on either the TRUNKFA form or an associated CLUSTR form and an ASPFD or ASPTPA form exists with this feature where CDP ALLOWED is "Y", the TGN must be defined on the TKGRP form with a TRKCLS that corresponds to one of the following: "PF", "PFITT", "PFLASH", "EDSL", or "EDLSHM".

2.13 CDP TRIG ACT

Description: Is the customized dialing plan trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDP TRIG ACT is "Y", CDP ALLOWED must be "Y".

2.14 OBL TRIG NBR

Description: This field contains the originating busy line trigger number. The trigger number is a pointer to access the particular trigger. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Valid Entries: Blank or 1-255

Data Rules:

If OBL TRIG NBR is entered, the LCC form associated with this line must have a Class Of Service of "ATND", "CHGCALL", "COIN", "HOTMOTL", "INDIV", "ISATND", "MODEM", "PBX", "TWOPTY", "2PTY", "4WINDIV", "ISDN" or "HOTPBX".

OBL TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "R0D1".

2.15 OBL TRIG ACT

Description: This field contains the originating busy line trigger status. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OBL TRIG ACT is "Y", then OBL TRIG NBR must be entered.

2.16 ONA TRIG NBR

Description: This field contains the originating no answer trigger number. The trigger number is a pointer to access the particular trigger. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later
Valid Entries: Blank or 1-255

Data Rules:

If ONA TRIG NBR is entered, the LCC form associated with this line must have a Class Of Service of "ATND", "CHGCALL", "COIN", "HOTMOTL", "INDIV", "ISATND", "MODEM", "PBX", "TWOPTY", "2PTY", "4WINDIV", "ISDN" or "HOTPBX".

OBL TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "R0D1".

2.17 ONA TRIG ACT

Description: This field contains the originating no answer trigger status. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ONA TRIG ACT is "Y", then ONA TRIG NBR must be entered.

2.18 ONA TIMER

Description: This field contains the originating no answer trigger timer. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Valid Entries: Blank or 1-120 seconds

Data Rules:

If ONA TIMER is entered, then ONA TRIG NBR must be entered.

TERMINATING TRIGGERS

For 5E15 and later, the following fields (Section 2.19 - Section 2.21) refer to Terminating Trunk Group Triggers. The ASP Terminating Trunk Group Trigger allows the 5ESS to provide an ASP trigger for calls terminating to designated Private Facility and Primary Rate Interface trunk groups.

See Div. 2, Sec. 4A546 for more information on the Terminating Trunk Group Trigger feature.

The following fields (Section 2.22 - Section 2.24) refer to terminating triggers. Terminating triggers launch a query based on the number called.

2.19 TGT TRIG NBR

Description: Enter the terminating trunk group trigger number.

Software Release: 5E15 and later
Valid Entries: 1 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

When TGT TRIG ACT is Y, TGT TRIG NBR must be entered.

When TGT DFLT ROUTE is Y, TGT TRIG NBR must be entered.

When TGT TRIG NBR is entered, TAT TRIG NBR, TBL TRIG NBR, and TNA TRIG NBR must not be entered.

The secured feature Terminating Trunk Group Trigger must be purchased before TGT TRIG NBR can be set to a valid value, therefore the ACT field for SFID 546 on the SFSYS form must be "Y".

2.20 TGT TRIG ACT

Description: Is the terminating trunk group trigger active?

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TGT TRIG ACT is "Y", TGT TRIG NBR must be entered.

2.21 TGT DFLT ROUTE

Description: Is the terminating trunk group trigger default routing active?

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

If TGTDFLT ROUTE is "Y", TGT TRIG NBR must be entered.

2.22 TA TRIG NBR

Description: Enter the terminating attempt trigger number. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

For an ASP feature assigned to a TGN/MEMB on the TRUNKFA or TKGRPFA forms or an associated CLUSTR form, if OHI TRIG NBR or TA TRIG NBR is entered on an ASPFD or ASPDP (for 5E9(1)) form, an ASPTPA form must exist for this TGN/MEMB(s)/FEATURE combination. since an OHI TRIG NBR or a TA TRIG NBR cannot be assigned to a trunk.

TA TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "R0D1".

No more than one ASP feature with a TA TRIG NBR entry on an ASPFD, ASPLPA, ASPMPA, or ASPDP (for 5E9(1)) form may be assigned to a TN on a LINEFA, an MLHG/TERM on an MLHLNFA, or associated CLUSTR form.

2.23 TA TRIG ACT

Copyright © 2003 Lucent Technologies

Description: Is the terminating attempt trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA TRIG ACT is "Y", TA TRIG NBR must be entered.

2.24 TA DFLT ROUTE

Description: Is the terminating attempt trigger default routing active?

Required Field.
Default Value: N
Valid Entries: Y, N

Data Rules:
If TA DFLT ROUTE is "Y", TA TRIG NBR must be entered.

The TA DFLT ROUTE field is used by the ASP Default Routing for Terminating Attempt Triggers Special Feature. It is a secured feature and must be purchased by the office before this field can be set to "Y" on the ASPFD, ASPLPA, ASPMPA, or ASPDP (for 5E9(1)) If this field is set to "Y", a SFSYS form must exist with SFID 136 ACT field set to "Y".

2.25 TBL TRIG NBR

Description: This field is used to locate the unique network service for the ASP terminating busy line trigger.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 255

Data Rules:

When TBL TRIG NBR is entered, the SFSYS form (5713-1 Record) must have the ACT field for SFID 507 set to "Y".

If TBL TRIG NBR matches TRIG NBR on the NSTRIG form (5324 Record), then the fields listed must be defined on the NSTRIG form as follows:

- APPLICATION must be set to "ASP",
- AIN REL must be set to "R0D1",
- SERVICE must not be set to "CSD".

2.26 TBL TRIG ACT

Description: Is terminating busy line trigger active? This field is used to indicate whether the ASP terminating busy line trigger is active or inactive.

Required Field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When TBL TRIG ACT is "Y", TBL TRIG NBR must be entered.

2.27 TNA TRIG NBR

Description: This field is used to locate the unique network service for the ASP terminating no answer trigger.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 255

Data Rules:

When TNA TRIG NBR is entered, the SFSYS form (5713-1 Record) must have the ACT field for SFID 507 set to "Y".

If TNA TRIG NBR matches TRIG NBR on the NSTRIG form (5324 Record), then the fields listed must be defined on the NSTRIG form as follows:

- APPLICATION must be set to "ASP",
- AIN REL must be set to "R0D1",
- SERVICE must not be set to "CSD".

2.28 TNA TRIG ACT

Description: Is terminating no answer trigger active? This field is used to indicate whether the ASP terminating no answer trigger is active or inactive.

Required Field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TNA TRIG ACT is "Y", TNA TRIG NBR must be entered.

2.29 TNA TIMER

Description: This field is used to set up terminating no answer trigger timer.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 120 in seconds

Data Rules:

When TNA TIMER is entered, TNA TRIG NBR must be entered.

2.30 INTRA OFFICE FWD

Description: Enter the number of intra-office calls that can be forwarded.
Valid Entries: 1 - 99

Copyright © 2003 Lucent Technologies

2.31 INTER OFFICE FWD

Description: Enter the number of inter-office calls that can be forwarded.
Valid Entries: 1 - 99

NESS TRIGGERS

Fields Section 2.32 - Section 2.34 refer to NESS (Network Element Services Signaling) triggers. NESS triggers launch a query on an external database based on the calling number. These fields support the ASP NESS secured feature. For information on this feature, see Division 2, Section 4A185.

2.32 NESS TRIG NBR

Description: Enter the Network Element Services Number.

Software Release 5E9(2) and later.
Valid Entries: 1 - 255

Data Rules:

Only one type of TRIG NBR may be entered: "ORIG", "TERM", or "NESS".

When NESS TRIG NBR is entered, it must be defined on an NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "ROD1".

2.33 NESS TRIG ACT

Description: Is the Network Element Services Signaling active?

Software Release 5E9(2) and later.
Required Field.
Default Value: N
Valid Entries: Y, N

Data Rules:

When NESS TRIG ACT is "Y", NESS TRIG NBR must be entered.

When the ASP NESS secured feature is assigned to a line, the SFID ACT field must be set to "Y" on the SFSYS form (5713-1 Record).

2.34 NESS SCRN GRP

Description: Enter the Network Element Services Signaling screening group.

Software Release 5E9(2) and later.
Valid Entries: 1 - 255

Data Rules:

When NESS SCRN GRP is entered, it must be defined on an ASPGRP form (5634 Record)

SEC. 31B: 5632-2 RECORD
ADVANCED SERVICES PLATFORM (TN) PARAMETERS FORM - ASPLPA

1. GENERAL

The 5632-2 Record is available with 5E9(1) and later Software Releases, and defines ASP Line Parameters. The Line Parameter Form is used when an ASPFD constructed feature is assigned to a non-Multi-Line Hunt line and the desired parameters are different from the default parameters on the ASPFD form (5632-1 Record).

See Division 2, Section 1AP for more information on ASP.

It is recommended that the default parameter for the name of the ASP feature group be defined on the ASPFD form for the specific (constructed) ASP feature name. Then when the ASP feature name is assigned to a line on the LINEFA form (5112 Record) the default parameter will apply to that line without submitting an ASPLPA form.

For 5E14 and earlier, at least one of OHI TRIG NBR, OHD TRIG NBR, or TA TRIG NBR must be entered, or one of FCD ALLOWED or CDP ALLOWED must equal "Y".

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TN

Description: Enter the TN.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9
- and X is 0 - 9

Data Rules:

TNs assigned an ASP feature on this form must have a corresponding LINEFA or CLUSTR form with the same feature name.

For 5E12 and later, TN/FEATURE combinations on different ASPLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ASPLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the feature name.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E14 and earlier, an ASP feature assigned to a TN on the LINEFA form must have at least one TRIG NBR (OHI, OHD, or TA) entered or one ALLOWED field (FCD or CDP) set to "Y" on the ASPFD, ASPLPA, or ASPDP (for 5E9(1)) forms.

FEATURE must be defined on the corresponding ASPFD form.

ORIGINATING TRIGGERS

Fields Section 2.4 - Section 2.17 refer to originating triggers. Originating triggers launch a query based on the calling number.

If CONTROL on the ASPFD form equals "TERM", OHI TRIG NBR, OHD TRIG NBR, FCD ALLOWED, and CDP ALLOWED cannot be "Y".

2.4 OHI TRIG NBR

Description: Enter the Off-Hook Immediate trigger number. The Off-Hook Immediate trigger is a subscribed trigger, that queries the SCP without referencing a dialing plan after the subscriber goes off-hook.
Valid Entries: 1 - 255

Data Rules:

If OHI TRIG NBR is entered:

- OHD TRIG NBR must not be entered, and
- FCD ALLOWED and CDP ALLOWED must be "N".

For 5E9(2) and earlier, for every OHI TRIG NBR on this form there must be a corresponding TRIG NBR on the NSTRIG form (5324 Record), and APPLICATION must equal "ASP". If AIN REL is "R0" on the NSTRIG form, then SERV KEY must be "ANI".

For 5E10 and later, for every OHI TRIG NBR on the ASPLPA form there must be a corresponding TRIG NBR entered on a NSTRIG form, APPLICATION must be "ASP" and SERVICE ALWD must not be "CSD". In addition, on the NSTRIG form when AIN REL equals "R0", SERV KEY must be "ANI".

For an ASP feature assigned to a TN on the LINEFA form, if OHI TRIG NBR is entered on the ASPFD, or ASPLPA, or ASPDP (for 5E9(1)), the only other BCRS feature that may be assigned is a terminating ASP feature.

For an ASP feature assigned to a TN on the LINEFA form or an associated CLUSTR form (5600 Record), if OHI TRIG NBR is entered on the ASPFD, or ASPLPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form (5306 Record) must have CLASS OF SERVICE of "INDIV".

For 5E9(2) and later, if

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")

and

- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a CLUSTR form containing an ASP

Copyright © 2003 Lucent Technologies

feature assigned

and

- the associated ASPFD or ASPLPA (or ASPMPA) form has OHI TRIG NBR entered,

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

2.5 OHI TRIG ACT

Description: Is the Off-Hook Immediate trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHI TRIG ACT is "Y", OHI TRIG NBR must be entered.

2.6 OHD TRIG NBR

Description: Enter the Off-Hook Delay trigger number. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHD TRIG NBR is entered, CDP ALLOWED must be "N".

OHD TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION equals "ASP".

For an ASP feature assigned to a TN on the LINEFA form or an associated CLUSTR form, if OHD TRIG NBR is entered on the ASPFD, or ASPLPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

For an ASP feature assigned to a TN on the LINEFA form, if OHD TRIG NBR is entered on the ASPFD, or ASPLPA, or ASPDP (for 5E9(1)) forms, the only other BCRS feature that may be assigned is at most one terminating ASP feature.

For 5E9(2) and later, no other BRCS features may be assigned except at most one ASP terminating feature where CONTROL on the ASPFD form is "TERM" when the following conditions hold:

- ASP BRCS/OHD Interworking secured feature has been purchased with SFID ACT 137 field set to "Y" on the SFSYS form,

and/or

- ASP OHD Interactions with Account Code and CPN/BN secured feature has been purchased with SFID ACT 150 field set to "Y" on the SFSYS form,

and/or

Copyright © 2003 Lucent Technologies

- ASP NESS secured feature has been purchased with SFID ACT 185 field set to "Y" on the SFSYS form,

and/or

- ASP BRCS/OHD Interworking Extensions secured feature has been purchased with SFID ACT 226 field set to "Y" on the SFSYS form

and

- TN (or MLHG/TERM) appears on the LINEFA (or MLHLNFA) form with an ASP feature assigned on the LINEFA (or MLHLNFA) or corresponding CLUSTR form

and

- the ASP feature is defined on the ASPFD, ASPLPA (or ASPMPA) with OHD TRIG NBR entered

and

- the TN (or MLHG/TERM) is defined on a DSLUSR form as CKT TN (or CKT MLHG/TERM) and DLS CLS on the corresponding DSL form is not "STD".

If the following conditions exists:

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")

and

- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a CLUSTR form containing an ASP feature assigned

and

- the associated ASPFD or ASPLPA (or ASPMPA) form has OHD TRIG NBR entered

and

- the TN (or MLHG/TERM) is either defined on the LINE (or MLHLN) or DSLUSR form as CKT TN (or CKT MLHG/TERM) where DSL CLS on the corresponding DSL form is "STD",

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

2.7 OHD TRIG ACT

Description: Is the Off-Hook Delay trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If OHD TRIG ACT is "Y", OHD TRIG NBR must be entered.

2.8 OHD DFLT ROUTE

Description: Is the Off-Hook Delay Default Route active for the purpose? See Division 2, Section 4A516.

Software Release: 5E14 and later.
Default: N
Valid Entries: Y, N

Data Rules:

If OHD DFLT ROUTE is "Y", OHD TRIG NBR must be entered.

For 5E14 and later, if OHD DFLT ROUTE is "Y", SFID 516 must be activated on the SFSYS form (5713 Record).

2.9 FCD ALLOWED

Description: Is the feature code dialing trigger allowed? Feature Code Dialing (formerly the ODP Prefix/Code trigger) is a subscribed trigger, querying the SCP when a subscriber goes off-hook and dials an ASP FCD access code. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For an ASP feature assigned to a TN on the LINEFA form or an associated CLUSTR form, if FCD ALLOWED is "Y" on the ASPFD, or ASPLPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

2.10 FCD TRIG ACT

Description: Is the feature code dialing trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If FCD TRIG ACT is "Y", FCD ALLOWED must be "Y".

2.11 CDP ALLOWED

Description: Is the customized dialing plan trigger allowed? Customized Dialing Plan (formerly the IDP trigger) uses the IDP capabilities to access ASP. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

For an ASP feature assigned to a TN on the LINEFA form or an associated CLUSTR form, if CDP ALLOWED is "Y" on the ASPFD, or ASPLPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

2.12 CDP TRIG ACT

Description: Is the customized dialing plan trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDP TRIG ACT is "Y", CDP ALLOWED must be "Y".

2.13 OBL TRIG NBR

Description: Enter the originating busy line trigger number. This field indicates the unique location of the network service for the ASP originating busy line trigger. This field has been added to support the Advanced Service Platform Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later.
Valid Entries: Blank or 1 - 255

Data Rules:

If OBL TRIG NBR is entered, the LCC form associated with this line must have a Class Of Service of "ATND", "CHGCALL", "COIN", "HOTMOTL", "INDIV", "ISATND", "MODEM", "PBX", "TWOPTY", "2PTY", "4WINDIV", "ISDN" or "HOTPBX". Otherwise, the ASP BLNA feature is only allowed for lines with Class Of Service of "INDIV", "ISDN", "ATND" or "ISATND".

OBL TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "RODI".

2.14 OBL TRIG ACT

Description: Is the ASP originating busy line trigger active? This field has been added to support the Advanced Service Platform Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When OBL TRIG ACT is "Y", OBL TRIG NBR must be entered.

2.15 ONA TRIG NBR

Description: Enter the originating no answer trigger number. This field specifies the number used to locate the unique network service for the ASP originating no answer trigger. This field has been added to support the Advanced Service Platform Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later.
Valid Entries: Blank or 1 - 255

Copyright © 2003 Lucent Technologies

Data Rules:

If ONA TRIG NBR is entered, the LCC form associated with this line must have a Class Of Service of "ATND", "CHGCALL", "COIN", "HOTMOTL", "INDIV", "ISATND", "MODEM", "PBX", "TWOPTY", "2PTY", "4WINDIV", "ISDN" or "HOTPBX". Otherwise, the ASP BLNA feature is only allowed for lines with Class Of Service of "INDIV", "ISDN", "ATND" or "ISATND".

ONA TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "RODI".

2.16 ONA TRIG ACT

Description: Is the ASP originating no answer trigger active or inactive?

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ONA TRIG ACT is "Y", ONA TRIG NBR must be entered.

2.17 ONA TIMER

Description: Enter the no answer timeout value in seconds for ASP busy line no answer. The ONA TIMER field is used to set up originating no answer trigger timer.

Software Release: 5E12 and later.
Valid Entries: 1 - 120 in seconds

Data Rules:

When ONA TIMER is entered, ONA TRIG NBR must be entered.

TERMINATING TRIGGERS

Fields Section 2.18 - Section 2.20 refer to terminating triggers. Terminating triggers launch a query based on the number called.

If CONTROL on the ASPFD form equals "ORIG", no terminating triggers can be assigned.

2.18 TA TRIG NBR

Description: Enter the terminating attempt trigger number. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If TA TRIG NBR is entered:

- OHI TRIG NBR and OHD TRIG NBR must not be entered,
- OBL TRIG NBR, ONA TRIG NBR and NESS TRIG NBR, and
- FCD ALLOWED and CDP ALLOWED must be "N".

Copyright © 2003 Lucent Technologies

TA TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "R0D1".

No more than one ASP feature with a TA TRIG NBR entry on an ASPFD, or ASPLPA, or ASPDP (for 5E9(1)) form may be assigned to a TN on a LINEFA or associated CLUSTR form.

2.19 TA TRIG ACT

Description: Is the terminating attempt trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA TRIG ACT is "Y", TA TRIG NBR must be entered.

2.20 TA DFLT ROUTE

Description: Is the terminating attempt trigger default routing active?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA DFLT ROUTE is "Y", TA TRIG NBR must be entered.

The TA DFLT ROUTE field is used by the ASP Default Routing for Terminating Attempt Triggers Special Feature. It is a secured feature and must be purchased by the office before this field can be set to "Y". If this field is set to "Y", a SFSYS form must exist with SFID 136 ACT field set to "Y".

2.21 TBL TRIG NBR

Description: This field is used to locate the unique network service for the ASP terminating busy line trigger.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 255

Data Rules:

When TBL TRIG NBR is entered:

- OHI TRIG NBR, OHD TRIG NBR, OBL TRIG NBR, ONA TRIG NBR, and NESS TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".
- the SFSYS form (5713-1 Record) must have the ACT field for SFID 507 set to "Y".

If TBL TRIG NBR matches TRIG NBR on the NSTRIG form (5324 Record), then the fields listed must be defined on the NSTRIG form as follows:

- APPLICATION must be set to "ASP",
- AIN REL must be set to "R0D1",

Copyright © 2003 Lucent Technologies

- SERVICE must not be set to "CSD".

2.22 TBL TRIG ACT

Description: Is terminating busy line trigger active? This field is used to indicate whether the ASP terminating busy line trigger is active or inactive.

Required Field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TBL TRIG ACT is "Y", TBL TRIG NBR must be entered.

2.23 TNA TRIG NBR

Description: This field is used to locate the unique network service for the ASP terminating no answer trigger.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 255

Data Rules:

When TNA TRIG NBR is entered:

- OHI TRIG NBR, OHD TRIG NBR, OBL TRIG NBR, ONA TRIG NBR, and NESS TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".
- the ACT field for SFID 507 on the SFSYS form (5713-1 Record) must be set to "Y".

If TNA TRIG NBR matches TRIG NBR on the NSTRIG form (5324 Record), then the fields listed must be defined on the NSTRIG form as follows:

- APPLICATION must be set to "ASP",
- AIN REL must be set to "R0D1",
- SERVICE must not be set to "CSD".

2.24 TNA TRIG ACT

Description: Is terminating no answer trigger active? This field is used to indicate whether the ASP terminating no answer trigger is active or inactive.

Required Field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

When TNA TRIG ACT is "Y", TNA TRIG NBR must be entered.

2.25 TNA TIMER

Description: This field is used to set up terminating no answer trigger timer.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 120 in seconds

Data Rules:

When TNA TIMER is entered, TNA TRIG NBR must be entered.

2.26 INTRA OFFICE FWD

Description: Enter the number of intra-office calls that can be forwarded.
Valid Entries: 1 - 99

2.27 INTER OFFICE FWD

Description: Enter the number of inter-office calls that can be forwarded.
Valid Entries: 1 - 99

NESS TRIGGERS

Fields Section 2.28 - Section 2.30 refer to NESS (Network Element Services Signaling) triggers. NESS triggers launch a query on an external database based on the calling number. These fields support the NESS ASP secured feature. For information on this feature, see Division 2, Section 4A185.

2.28 NESS TRIG NBR

Description: Enter the Network Element Services Number.

Software Release: 5E9(2) and later.
Valid Entries: 1 - 255

Data Rules:

When NESS TRIG NBR is entered, NESS SCRN GRP must be entered.

Only one type of TRIG NBR may be entered: ORIGINATING, TERMINATING, or NESS.

When TN on a LINEFA form with an ASP feature assigned on the LINEFA or corresponding CLUSTR form has the NESS TRIG NBR entered on the associated ASPFD or ASPLPA form, then the NESS TRIG NBR must be defined on an NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "ROD1".

For 5E14 and later, when NESS TRIG NBR is entered, OHI TRIG NBR, OHD TRIG NBR, OBL TRIG NBR, ONA TRIG NBR, TAT TRIG NBR, TNA TRIG NBR, and TBL TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".

2.29 NESS TRIG ACT

Description: Is the Network Element Services Signaling active?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

When NESS TRIG ACT is "Y", NESS TRIG NBR must be entered.

When the ASP NESS secured feature is assigned to a line, the SFID ACT 185 field must be set to "Y" on the SFSYS form (5713-1 Record).

2.30 NESS SCRN GRP

Description: Enter the Network Element Services Signaling screening group.

Software Release: 5E9(2) and later.
Valid Entries: 1 - 255

Data Rules:

Data Rules:

When NESS SCRN GRP is entered, NESS TRIG NBR must be entered.

When NESS SCRN GRP is entered, it must be defined on an ASPGRP form (5634 Record).

SEC. 31C: 5632-3 RECORD
ADVANCED SERVICES PLATFROM (MLHG/TERM) PARAMETERS FORM - ASPMPA

1. GENERAL

The ASPMPA Record is available with 5E9(1) and later Software Releases, and defines ASP Multi-Line Hunt line parameters. The Line (MLHG/Term) Parameter Form is used when an ASP constructed feature is assigned to a Multi-Line Hunt line, and the desired parameters are different from the default parameters on the ASPFD form (5632-1 Record).

See Division 2, Section 1AP for more information on ASP.

It is recommended that the default parameter for the name of the ASP feature Group be defined on the ASPFD form for the specific (constructed) ASP feature name. Then when the ASP feature name is assigned to a Multi-Line Hunt line on the MLHLNFA form (5113 Record), the default parameter will apply without submitting an ASPMPA form.

For 5E14 and earlier, at least one of OHI TRIG NBR, OHD TRIG NBR, or TA TRIG NBR must be entered, or one of FCD ALLOWED or CDP ALLOWED to "Y".

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

MLHG/TERM(s) assigned an ASP feature on this form must have a corresponding MLHG/TERM on an MLHLNFA or an associated CLUSTR form with the same feature name.

2.3 * TERM

Description: Enter the Member Number of the MLHG.

Required Field.
Valid Entries: 1 - 2015
- 3001-3999 (outdial terminals)

Data Rules:

Copyright © 2003 Lucent Technologies

MLHG/TERM(s) assigned an ASP feature on this form must have a corresponding MLHG/TERM on an MLHLNFA or an associated CLUSTR form with the same feature name.

2.4 * FEATURE

Description: Enter the feature name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

FEATURE must equal FEATURE on the corresponding ASPFD form.

For 5E14 and earlier, an ASP feature assigned to an MLHG on the MLHLNFA form must have at least one TRIG NBR (OHI, OHD, or TA) entered or one ALLOWED field (FCD or CDP) set to "Y" on the ASPFD, or ASPMPA, or ASPDP (for 5E9(1)) forms.

ORIGINATING TRIGGERS

Fields Section 2.5 - Section 2.15 refer to originating triggers. Originating triggers launch a query based on the calling number.

If CONTROL on the ASPFD form equals "TERM", OHI TRIG NBR, OHD TRIG NBR, FCD ALLOWED, and CDP ALLOWED cannot be "Y".

2.5 OHI TRIG NBR

Description: Enter the Off-Hook Immediate trigger number. The Off-Hook Immediate trigger is a subscribed trigger, that queries the SCP without referencing a dialing plan after the subscriber goes off-hook. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHI TRIG NBR is entered:

- OHD TRIG NBR must not be entered, and
- FCD ALLOWED and CDP ALLOWED must be "N".

For 5E9(2) and earlier, for every OHI TRIG NBR there must be a corresponding TRIG NBR entered on the NSTRIG form (5324 Record), and APPLICATION equal "ASP". If AIN REL is "R0" on the NSTRIG form, then SERV KEY must be "ANI".

For 5E10 and later, for every OHI TRIG NBR on the ASPMPA form there must be a corresponding TRIG NBR entered on a NSTRIG form, APPLICATION must be "ASP" and SERVICE ALWD must not be "CSD". In addition, on the NSTRIG form when AIN REL equals "R0", SERV KEY must be "ANI".

For an ASP feature assigned to an MLHG/TERM on the MLHLNFA form, if OHI TRIG NBR is entered on the ASPFD, or ASPMPA, or ASPDP (for 5E9(1)) forms, the only other BCRS feature that may be assigned is a terminating ASP feature.

For an ASP feature assigned to an MLHG/TERM on the MLHLNFA form or an associated CLUSTR form (5600 Record), if OHI TRIG NBR is entered on the ASPFD, or ASPMPA, or ASPDP (for 5e9(1)) forms, the corresponding LCC form (5306 Record) must have CLASS OF SERVICE of "INDIV".

For 5E9(2) and later, if

Copyright © 2003 Lucent Technologies

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")
- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a corresponding CLUSTR form with an ASP feature assigned
- the associated ASPFD or ASPLPA (or ASPMPA) form has OHI TRIG NBR entered,

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

2.6 OHI TRIG ACT

Description: Is the Off-Hook Immediate trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHI TRIG ACT is "Y", OHI TRIG NBR must be entered.

2.7 OHD TRIG NBR

Description: Enter the Off-Hook Delay trigger number. The Off-Hook Delay trigger is a subscribed originating trigger that queries the SCP data base after all dialed/signaled digits have been collected and validated from the originating line/trunk. If the dialed/signaled digits have been defined as an escape code digit string, a query is not launched; rather, normal call processing treatment is applied. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHD TRIG NBR is entered, CDP ALLOWED must be "N".

OHD TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION equals "ASP".

For an ASP feature assigned to an MLHG/TERM on the MLHLNFA form or an associated CLUSTR form, if OHD TRIG NBR is entered on the ASPFD, or ASPMPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

For an ASP feature assigned to an MLHG on the MLHLNFA form, if OHD TRIG NBR is entered on the ASPFD, or ASPMPA, or ASPDP (for 5E9(1)) forms, the only other BCRS feature that may be assigned is at most one terminating ASP feature.

For 5E9(2) and later, if

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")
- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a corresponding CLUSTR form with an ASP feature assigned
- the associated ASPFD or ASPLPA (or ASPMPA) form has OHD TRIG NBR entered
- the TN (or MLHG/TERM) is either defined on the LINE (or MLHLN) or DSLUSR form as CKT TN (or CKT MLHG/TERM) where DSL CLS on the corresponding DSL form is "STD",

Copyright © 2003 Lucent Technologies

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

No other BRCS features may be assigned except at most one ASP terminating feature where CONTROL on the ASPFD form is "TERM" when the following conditions hold:

- one of the following secured features is active:
  - ASP BRCS/OHD Interworking secured feature has been purchased with SFID ACT 137 field set to "Y" on the SFSYS form,
  - ASP OHD Interactions with Account Code and CPN/BN secured feature has been purchased with SFID ACT 150 field set to "Y" on the SFSYS form,
  - ASP NESS secured feature has been purchased with SFID ACT 185 field set to "Y" on the SFSYS form,
  - ASP BRCS/OHD Interworking Extensions secured feature has been purchased with SFID ACT 226 field set to "Y" on the SFSYS form
- TN (or MLHG/TERM) appears on the LINEFA (or MLHLNFA) form with an ASP feature assigned on the LINEFA (or MLHLNFA) or corresponding CLUSTR form
- the ASP feature is defined on the ASPFD, ASPLPA (or ASPMPA) with OHD TRIG NBR entered
- the TN (or MLHG/TERM) is defined on a DSLUSR form as CKT TN (or CKT MLHG/TERM) and DLS CLS on the corresponding DSL form is nor "STD".

2.8 OHD TRIG ACT

Description: Is the Off-Hook Delay trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHD TRIG ACT is "Y", OHD TRIG NBR must be entered.

2.9 OHD TRIG NBR

Description: Enter the Off-Hook Delay trigger number. The Off-Hook Delay trigger is a subscribed originating trigger that queries the SCP data base after all dialed/signaled digits have been collected and validated from the originating line/trunk. If the dialed/signaled digits have been defined as an escape code digit string, a query is not launched; rather, normal call processing treatment is applied. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHD TRIG NBR is entered, CDP ALLOWED must be "N".

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if OHD TRIG NBR is entered on the ASPFD, ASPLPA, ASPMPA, ASPDP (for

Copyright © 2003 Lucent Technologies

5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

For an ASP feature assigned to a TN on the LINEFA form, TGN/MEMB on the TRUNKFA form, TRUNK GROUP on the TKGRPFA form, or MLHG on the MLHLNFA form, if OHD TRIG NBR is entered on the ASPFD, ASPLPA, ASPMPA, ASPTPA ASPDP (for 5E9(1)) forms, then

- no other BRCS feature may be assigned to the line or Multi-Line Hunt Group except one terminating ASP feature with CONTROL set to "TERM", and no other features may be assigned to the trunk or trunk group.

For the ASP BRCS Off-Hook Delayed Interworking secured feature (See Division 2, Section 4A137):

- if SFID 137 ACT is "Y" on the SFSYS form and the TN or MLHG/TERM is either defined on a LINE, MLHLN form or on a DSLUSR form as CKT TN or CKT MLHG/TERM where DSL CLS on the corresponding DSL form is "STD", the only other BRCS features allowed to be assigned to the line or Multi-Line Hunt Group are those defined on the following forms:
  - ASPFD form with CONTROL set to "TERM"
  - CFWFD form with FWD COND set to "BUSY", "IDLE" or "BOTH"
  - CWTFD form with INVOKE set to "TERM"
  - MWFD form with CONTROL not set to "CODEALT".

NOTE: No other ASP originating features may be assigned to the line or Multi-Line Hunt Group.

- if BFGN is entered on the LINEFA or MLHLNFA form, the ASP (Advanced Service Platform) BRCS/OHD Interworking secured feature must be purchased and SFID ACT 137 must be "Y" on the SFSYS form.
- if SFID 137 ACT is "Y" on the SFSYS form and the TN or MLHG/TERM is either defined on a LINE, MLHLN form or on a DSLUSR form as CKT TN or CKT MLHG/TERM where DSL CLS on the corresponding DSL form is not set to "STD", no other BRCS features may be assigned except at most one ASP terminating feature with CONTROL set to "TERM".

OHD TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION is "ASP".

For an ASP feature assigned to a TGN/MEMB on the TKGRPFA or an associated CLUSTR form, if OHD TRIG NBR is entered on an ASPFD, ASPTPA, or ASPDP (for 5E9(1)) form, the TGN must be defined on the TKGRP form with TRKCLS of "PF", "PFITT", "PFLASH", "EDSL" or "EDSLHM".

When an ASP feature is assigned to a TN or MLHG/TERM on the LINEFA, MLHLNFA or a corresponding CLUSTR form, and an associated ASPFD, ASPLPA, ASPMPA, or ASPDP (for 5E9(1)) form has OHD TRIG NBR entered, and the TN or MLHG/TERM is defined on a DSLUSR form as CKT TN or CKT MLHG/TERM, then

- if CKT LCC/RAX on the DSLUSR form is defined on an LCC form with CLASS OF SERVICE of "ISDN" and the OHD TRIG NBR is defined on an NSTRIG form with APPLICATION set to "ASP", AIN REL on the NSTRIG form must be "R0D1" if a corresponding DSL form has DSL CLS of "STD", AIN REL must be "R0" if DSL CLS not set to "STD".

Copyright © 2003 Lucent Technologies

The only other BRCS features allowed to be assigned to a line are those defined on the ACCTFD, ASPFD (CONTROL is "TERM"), CPNBNFD or RNDFD when:

- ASP OHD Interactions with Account Code and CPN/BN secured feature is active (see Division 2, Section 4A150) and
- the TN(s) (or MLHG/TERM(s)) appear on the LINEFA (or MLHLNFA) form with an ASP feature assigned or a CLUSTER containing an ASP feature assigned and
- OHD TRIG NBR is entered on the associated ASPFD or ASPLPA form and
- the TN (or MLHG/TERM) is either defined on a LINE (or MLHLN) form or on a DSLUSR form as CKT TN (or CKT MLHG/TERM) where DSL CLS on the corresponding DSL from is "STD".

For 5E9(2) and later, if

- the ASP NESS secured feature has been purchased (SFID ACT 185 on the SFSYS form is set to "Y")

and

- a TN (or MLHG/TERM) on the LINEFA (or MLHLNFA) form with a CLUSTR form containing an ASP feature assigned

and

- the associated ASPFD or ASPLPA (or ASPMPA) form has OHD TRIG NBR entered

and

- the TN (or MLHG/TERM) is either defined on the LINE (or MLHLN) or DSLUSR form as CKT TN (or CKT MLHG/TERM) where DSL CLS on the corresponding DSL form is "STD",

then the only BRCS features allowed to be assigned to the line (or MLHG/TERM) are those defined on the ASPFD form with CONTROL set to "TERM" or "NESS".

No other BRCS features may be assigned except at most one ASP terminating feature where CONTROL on the ASPFD form is "TERM" when the following conditions hold:

- ASP BRCS/OHD Interworking secured feature has been purchased with SFID ACT 137 field set to "Y" on the SFSYS form,

and/or

- ASP OHD Interactions with Account Code and CPN/BN secured feature has been purchased with SFID ACT 150 field set to "Y" on the SFSYS form,

and/or

- ASP NESS secured feature has been purchased with SFID ACT 185 field set to "Y" on the SFSYS form,

and/or

Copyright © 2003 Lucent Technologies

- ASP BRCS/OHD Interworking Extensions secured feature has been purchased with SFID ACT 226 field set to "Y" on the SFSYS form

and

- TN (or MLHG/TERM) appears on the LINEFA (or MLHLNFA) form with an ASP feature assigned on the LINEFA (or MLHLNFA) or corresponding CLUSTR form

and

- the ASP feature is defined on the ASPFD, ASPLPA (or ASPMPA) with OHD TRIG NBR entered

and

- the TN (or MLHG/TERM) is defined on a DSLUSR form as CKT TN (or CKT MLHG/TERM) and DLS CLS on the corresponding DSL form is not "STD".

2.10 OHD TRIG ACT

Description: Is the Off-Hook Delay trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHD TRIG ACT is "Y", OHD TRIG NBR must be entered.

2.11 OHD DFLT ROUTE

Description: Is the Off-Hook Delay Default Route active? See Division 2, Section 4A516.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

If OHD DFLT ROUTE is "Y", OHD TRIG NBR must be entered.

For 5E14 and later, if OHD DFLT ROUTE is "Y", SFID 516 must be activated on the SFSYS form (5713 Record).

2.12 FCD ALLOWED

Description: Is the feature code dialing trigger allowed? Feature Code Dialing (formerly the ODP Prefix/Code trigger) is a subscribed trigger, querying the SCP when a subscriber goes off-hook and dials an ASP FCD access code. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

For an ASP feature assigned to an MLHG/TERM on the MLHLNFA form or an associated CLUSTR form, if FCD ALLOWED is "Y" on the ASPFD, or ASPMPA, or ASPDP (for 5E9(1)) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

2.13 FCD TRIG ACT

Description: Is the feature code dialing trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If FCD TRIG ACT is "Y", FCD ALLOWED must be "Y".

2.14 CDP ALLOWED

Description: Is the customized dialing plan trigger allowed? Customized Dialing Plan (formerly the IDP trigger) uses the IDP capabilities to access ASP. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For an ASP feature assigned to an MLHG/TERM on the MLHLNFA form or an associated CLUSTR form, if CDP ALLOWED is "Y" on the ASPFD, or ASPMPA, or ASPDP (for 5E9(1) forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

2.15 CDP TRIG ACT

Description: Is the customized dialing plan trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDP TRIG ACT is "Y", CDP ALLOWED must be "Y".

2.16 OBL TRIG NBR

Description: This field contains the originating busy line trigger number. The trigger number is a pointer to access the particular trigger. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Valid Entries: Blank or 1-255

Data Rules:

If OBL TRIG NBR is entered, the LCC form associated with this line must have a Class Of Service of "ATND", "CHGCALL", "COIN", "HOTMOTL", "INDIV", "ISATND", "MODEM", "PBX", "TWOPTY", "2PTY", "4WINDIV", "ISDN" or "HOTPBX".

Copyright © 2003 Lucent Technologies

OBL TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "RODI".

2.17 OBL TRIG ACT

Description: This field contains the originating busy line trigger status. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OBL TRIG ACT is "Y", then OBL TRIG NBR must be entered.

2.18 ONA TRIG NBR

Description: This field contains the originating no answer trigger number. The trigger number is a pointer to access the particular trigger. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Valid Entries: Blank or 1-255

Data Rules:

If ONA TRIG NBR is entered, the LCC form associated with this line must have a Class Of Service of "ATND", "CHGCALL", "COIN", "HOTMOTL", "INDIV", "ISATND", "MODEM", "PBX", "TWOPTY", "2PTY", "4WINDIV", "ISDN" or "HOTPBX".

OBL TRIG NBR must equal TRIG NBR on a corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "RODI".

2.19 ONA TRIG ACT

Description: This field contains the originating no answer trigger status. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ONA TRIG ACT is "Y", then ONA TRIG NBR must be entered.

2.20 ONA TIMER

Description: This field contains the originating no answer trigger timer. It was added to support the ASP Provisioning of Busy/No Answer Triggers feature.

Software Release: 5E12 and later
Valid Entries: Blank or 1-120 seconds

Data Rules:

Copyright © 2003 Lucent Technologies

If ONA TIMER is entered, then ONA TRIG NBR must be entered.

TERMINATING TRIGGERS

Fields Section 2.21 - Section 2.23 refer to terminating triggers. Terminating triggers launch a query based on the number called.

If CONTROL on the ASPFD form equals "ORIG", no terminating triggers can be assigned.

2.21 TA TRIG NBR

Description: Enter the terminating attempt trigger number. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If TA TRIG NBR is entered:

- OHI TRIG NBR and OHD TRIG NBR must not be entered, and
- FCD ALLOWED and CDP ALLOWED must be "N".

TA TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "R0D1".

No more than one ASP feature with a TA TRIG NBR entry on an ASPFD, or ASPMPA, or ASPDP (for 5E9(1)) form may be assigned to an MLHG/TERM on an MLHLNFA or associated CLUSTR form.

2.22 TA TRIG ACT

Description: Is the terminating attempt trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA TRIG ACT is "Y", TA TRIG NBR must be entered.

2.23 TA DFLT ROUTE

Description: Is the terminating attempt trigger default routing active?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA DFLT ROUTE is "Y", TA TRIG NBR must be entered.

The TA DFLT ROUTE field is used by the ASP Default Routing for Terminating Attempt Triggers Special Feature. It is a secured feature and must be purchased by the office before this field can be set to "Y". If this field is set to "Y", a SFSYS form must exist with SFID 136 ACT field set to "Y".

Copyright © 2003 Lucent Technologies

2.24 TBL TRIG NBR

Description: This field is used to locate the unique network service for the ASP terminating busy line trigger.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 255

Data Rules:

When TBL TRIG NBR is entered:

- OHI TRIG NBR, OHD TRIG NBR, OBL TRIG NBR, ONA TRIG NBR, and NESS TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".
- the SFSYS form (5713-1 Record) must have the ACT field for SFID 507 set to "Y".

If TBL TRIG NBR matches TRIG NBR on the NSTRIG form (5324 Record), then the fields listed must be defined on the NSTRIG form as follows:

- APPLICATION must be set to "ASP",
- AIN REL must be set to "R0D1",
- SERVICE must not be set to "CSD".

2.25 TBL TRIG ACT

Description: Is terminating busy line trigger active? This field is used to indicate whether the ASP terminating busy line trigger is active or inactive.

Required Field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TBL TRIG ACT is "Y", TBL TRIG NBR must be entered.

2.26 TNA TRIG NBR

Description: This field is used to locate the unique network service for the ASP terminating no answer trigger.

Software Release: 5E14 and later
Valid Entries: Blank, or 1 - 255

Data Rules:

When TNA TRIG NBR is entered:

- OHI TRIG NBR, OHD TRIG NBR, OBL TRIG NBR, ONA TRIG NBR, and NESS TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".
- the SFSYS form (5713-1 Record) must have the ACT field for SFID 507 set to "Y".

Copyright © 2003 Lucent Technologies

If TNA TRIG NBR matches TRIG NBR on the NSTRIG form (5324 Record), then the fields listed must be defined on the NSTRIG form as follows:

- APPLICATION must be set to "ASP",
- AIN REL must be set to "R0D1",
- SERVICE must not be set to "CSD".

2.27 TNA TRIG ACT

Description: Is terminating no answer trigger active? This field is used to indicate whether the ASP terminating no answer trigger is active or inactive.

Required Field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TNA TRIG ACT is "Y", TNA TRIG NBR must be entered.

2.28 TNA TIMER

Description: This field is used to set up terminating no answer trigger timer.

Software Release: 5E14 and later.
Valid Entries: Blank, or 1 - 120 in seconds

Data Rules:

When TNA TIMER is entered, TNA TRIG NBR must be entered.

2.29 INTRA OFFICE FWD

Description: Enter the number of intra-office calls that can be forwarded.
Valid Entries: 1 - 99

2.30 INTER OFFICE FWD

Description: Enter the number of inter-office calls that can be forwarded.
Valid Entries: 1 - 99

NESS TRIGGERS

Fields Section 2.31 - Section 2.33 refer to NESS (Network Element Services Signaling) triggers. NESS triggers launch a query on an external database based on the calling number. These fields support the ASP NESS secured feature. For information on this feature, see Division 2, Section 4A185.

2.31 NESS TRIG NBR

Description: Enter the Network Element Services Number.

Software Release: 5E9(2) and later.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 255

Data Rules:

When NESS TRIG NBR is entered, NESS SCRN GRP must be entered.

Only one type of TRIG NBR may be entered: ORIGINATING, TERMINATING, or NESS.

When an MLHG/TERM on a MLHLNFA form with an ASP feature assigned on the MLHLNFA or corresponding CLUSTR form has the NESS TRIG NBR entered on the associated ASPFD or ASPMPA form, then the NESS TRIG NBR must be defined on an NSTRIG form with APPLICATION set to "ASP" and AIN REL set to "ROD1".

For 5E14 and later, when NESS TRIG NBR is entered, OHI TRIG NBR, OHD TRIG NBR, OBL TRIG NBR, ONA TRIG NBR, TAT TRIG NBR, TNA TRIG NBR, and TBL TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".

2.32 NESS TRIG ACT

Description: Is the Network Element Services Signaling active?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When NESS TRIG ACT is "Y", NESS TRIG NBR must be entered.

When the ASP NESS secured feature is assigned to a line, the SFID ACT 185 field must be set to "Y" on the SFSYS form (5713-1 Record).

2.33 NESS SCRN GRP

Description: Enter the Network Element Services Signaling screening group.

Software Release: 5E9(2) and later.
Valid Entries: 1 - 255

Data Rules:

When NESS SCRN GRP is entered, NESS TRIG NBR must be entered.

When NESS SCRN GRP is entered, it must be defined on an ASPGRP form (5634 Record)

SEC. 31D: 5632-4 RECORD
ADVANCED SERVICES PLATFORM (TGN/MEMB) PARAMETERS FORM - ASPTPA

1. GENERAL

The 5632-4 Record is available with 5E9(1) and later Software Releases, and assigns ASP feature parameters to trunks if the default parameters of the ASPFD form (5632-1 Record) are inappropriate or unspecified.

See Division 2, Section 1AP for more information on ASP.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

TGN must equal TRUNK GROUP on the corresponding TKGRPFA form (5206 Record).

TGN and MEMB must equal TGN and MEMB on the corresponding TRUNK (5204 Record) or TRUNKFA form (5205 Record).

2.3 * MEMB

Description: Enter the Trunk Group Member Number.

Required Field.
Valid Entries: 0 - 1951

Data Rules:

TGN and MEMB must equal TGN and MEMB on the corresponding TRUNK or TRUNKFA form.

2.4 * FEATURE

Description: Enter the feature name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

Copyright © 2003 Lucent Technologies

FEATURE must equal FEATURE on the corresponding ASPFD form, and CONTROL on that ASPFD form cannot equal "TERM".

For 5E14 and earlier, an ASP feature assigned to a TGN on the TRUNKFA form must have at least one TRIG NBR (OHI, OHD, or TA) entered or one ALLOWED field (FCD or CDP) set to "Y" on the ASPFD, ASPDP (5632-5 Record), or ASPTPA forms.

ORIGINATING TRIGGERS

Fields Section 2.5 - Section 2.11 refer to originating triggers. Originating triggers launch a query based on the calling number.

OHD TRIG NBR must be entered, or FCD ALLOWED or CDP ALLOWED must equal "Y".

An ASP feature assigned to a TRUNK GROUP on the TKGRPFA form or associated CLUSTR form (5600 Record) must have OHD TRIG NBR entered, or FCD ALLOWED or CDP ALLOWED equal "Y" on an ASPFD, ASPDP, or ASPTPA form.

2.5 OHD TRIG NBR

Description: Enter the Off-Hook Delay trigger number. The Off-Hook Delay trigger is a subscribed originating trigger that queries the SCP data base after all dialed/signaled digits have been collected and validated from the originating line/trunk. If the dialed/signaled digits have been defined as an escape code digit string, a query is not launched; rather, normal call processing treatment is applied. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHD TRIG NBR is entered, CDP ALLOWED must be "N".

For an ASP feature assigned to a TGN/MEMB on the TRUNKFA form, if OHD TRIG NBR is entered on the ASPFD, ASPDP, or ASPTPA forms, the only other BCRS feature that may be assigned is a terminating ASP feature.

OHD TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form (5324 Record), where APPLICATION equals "ASP".

2.6 OHD TRIG ACT

Description: Is the Off-Hook Delay trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHD TRIG ACT is "Y", OHD TRIG NBR must be entered.

2.7 OHD DFLT ROUTE

Description: Is the Off-Hook Delay Default Route active? See Division 2, Section 4A516.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If OHD DFLT ROUTE is "Y", OHD TRIG NBR must be entered.

For 5E14 and later, if OHD DFLT ROUTE is "Y", SFID 516 must be activated on the SFSYS form (5713 Record).

2.8 FCD ALLOWED

Description: Is the feature code dialing trigger allowed? Feature Code Dialing (formerly the ODP Prefix/Code trigger) is a subscribed trigger, querying the SCP when a subscriber goes off-hook and dials an ASP FCD access code. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

2.9 FCD TRIG ACT

Description: Is the feature code dialing trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If FCD TRIG ACT is "Y", FCD ALLOWED must be "Y".

2.10 CDP ALLOWED

Description: Is the customized dialing plan trigger allowed? Customized Dialing Plan (formerly the IDP trigger) uses the IDP capabilities to access ASP. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E15 and later, before TGN/MEMB(s) are assigned an ASP feature on either the TRUNKFA or TKGRPFA form or an associated CLUSTR form and an ASPFD or ASPTPA form exist with this feature where CDP ALLOWED is "Y" and the associated TGN defined on the TKGRP form with a TRKCLS value of "EDSL" or "EDSLHM", the following must be set to "Y" on the SFSYS form (Record 5713-1):

- ACT SFID 254 - Restrict Usage of ASP Trigger feature

  or

- ACT SFID 255 - ASP Originating Triggers feature

  and

- ACT SFID 557 - ASP CDP Trigger on PRI feature.

2.11 CDP TRIG ACT

Copyright © 2003 Lucent Technologies

Description: Is the customized dialing plan trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDP TRIG ACT is "Y", CDP ALLOWED must be "Y".

TERMINATING TRIGGERS

For 5E15 and later, the following fields (Section 2.12 - Section 2.14) refer to Terminating Trunk Group Triggers. The ASP Terminating Trunk Group Trigger allows the 5ESS to provide an ASP trigger for calls terminating to designated Private Facility and Primary Rate Interface trunk groups.

See Div. 2, Sec. 4A546 for more information on the Terminating Trunk Group Trigger feature.

2.12 TGT TRIG NBR

Description: Enter the terminating trunk group trigger number.

Software Release: 5E15 and later
Valid Entries: 1 - 255

Data Rules:

When TGT TRIG ACT is "Y", TGT TRIG NBR must be entered.

When TGT DFLT ROUTE is "Y", TGT TRIG NBR must be entered.

When TGT TRIG NBR is entered, OHD TRIG NBR must not be entered and FCD ALLOWED and CDP ALLOWED must be "N".

For every TGT TRIG NBR on the ASPTPA form there must be a corresponding TRIG NBR entered on a NSTRIG form where APPLICATION equals "ASP" and AIN REL equals "R0D1".

The secured feature Terminating Trunk Group Trigger must be purchased before TGT TRIG NBR can be set to a valid value, therefore the ACT field for SFID 546 on the SFSYS form must be "Y".

2.13 TGT TRIG ACT

Description: Is the terminating trunk group trigger active?

Required Field.

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

When TGT TRIG ACT is "Y", TGT TRIG NBR must be entered.

2.14 TGT DFLT ROUTE

Description: Is the terminating trunk group trigger default routing active?

Software Release: 5E15 and later

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

If TGTDFLT ROUTE is "Y", TGT TRIG NBR must be entered.

SEC. 31E: 5632-5 RECORD
ADVANCED SERVICES PLATFORM FEATURE DEFAULT PARAMETERS FORM - ASPDP

1. GENERAL

The 5632-5 Record is available with the 5E9(1) Software Release only, and defines ASP (Advanced Services Platform) parameter data on a feature basis. It recovers existing (5E8) default parameter ASP data into the new BRCS format. This form can change default parameter data, but the data cannot be changed for preconstructed ASP features on the ASPFD form (5632-1 Record).

See Division 2, Section 1AP for more information on ASP.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the ASP feature Name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

FEATURE must equal FEATURE on the corresponding ASPFD form.

An ASP feature assigned to a TN on the LINEFA form (5112 Record), an MLHG on the MLHLNFA form (5113 Record), or a TGN on the TRUNKFA form (5205 Record) must have at least one TRIG NBR (OHI, OHD, or TA) entered or one ALLOWED field (FCD or CDP) set to "Y" on the ASPFD, ASPDP, ASPLPA (5632-2 Record), ASPMPA (5632-3 Record), or ASPTPA forms (5632-4 Record).

ORIGINATING TRIGGERS

Fields Section 2.3 - Section 2.10 refer to originating triggers. Originating triggers launch a query based on the calling number.

An ASP feature assigned to a TRUNK GROUP on the TKGRPFA form (5206 Record) or associated CLUSTR form (5600 Record) must have OHD TRIG NBR entered, or FCD ALLOWED or CDP ALLOWED equal "Y" on an ASPFD, ASPDP, or ASPTPA form.

2.3 OHI TRIG NBR

Description: Enter the trigger number for Off-Hook Immediate triggers. The Off-Hook Immediate trigger is a subscribed trigger, that queries the SCP without referencing a dialing plan after the subscriber goes off-hook. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

Copyright © 2003 Lucent Technologies

If OHI TRIG NBR is entered,

- OHD TRIG NBR must not be entered, and
- FCD ALLOWED and CDP ALLOWED must be "N".

OHI TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form (5324 Record), where APPLICATION equals "ASP", and when AIN REL is "R0" on the NSTRIG form, SERV KEY must be "ANI".

For an ASP feature assigned to a TN on the LINEFA form or MLHG/TERM on the MLHLNFA form, if OHI TRIG NBR is entered on the ASPFD, ASPDP, ASPLPA, or ASPMPA forms, the only other BCRS feature that may be assigned is a terminating ASP feature.

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if OHI TRIG NBR is entered on the ASPFD, ASPDP, ASPLPA, or ASPMPA forms, the corresponding LCC form (5306 Record) must have CLASS OF SERVICE of "INDIV".

2.4 OHI TRIG ACT

Description: Is the Off-Hook Immediate trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHI TRIG ACT is "Y", OHI TRIG NBR must be entered.

2.5 OHD TRIG NBR

Description: Enter the Off-Hook Delay trigger number. The Off-Hook Delay trigger is a subscribed originating trigger that queries the SCP data base after all dialed/signaled digits have been collected and validated from the originating line/trunk. If the dialed/signaled digits have been defined as an escape code digit string, a query is not launched; rather, normal call processing treatment is applied. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If OHD TRIG NBR is entered, CDP ALLOWED must be "N".

OHD TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION equals "ASP".

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if OHD TRIG NBR is entered on the ASPFD, ASPDP, ASPLPA, or ASPMPA forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

For an ASP feature assigned to a TN on the LINEFA form, TGN/MEMB on the TRUNKFA form, TRUNK GROUP on the TKGRPFA form, or MLHG on the MLHLNFA form, if OHD TRIG NBR is entered on the ASPFD, ASPDP, ASPLPA, ASPMPA, or ASPTPA forms, the only other BCRS feature that may be assigned is a terminating ASP feature.

For an ASP feature assigned to a TGN/MEMB on the TRUNKFA or TKGRPFA forms or an associated CLUSTR form, if OHI TRIG NBR or TA TRIG NBR is entered on an ASPFD or ASPDP form, an ASPTPA form must exist for this TGN/MEMB(s)/FEATURE combination. since an OHI TRIG NBR or a TA TRIG

Copyright © 2003 Lucent Technologies

NBR cannot be assigned to a trunk.

2.6 OHD TRIG ACT

Description: Is the Off-Hook Delay trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OHD TRIG ACT is "Y", OHD TRIG NBR must be entered.

2.7 FCD ALLOWED

Description: Is the feature code dialing trigger allowed? Feature Code Dialing (formerly the ODP Prefix/Code trigger) is a subscribed trigger, querying the SCP when a subscriber goes off-hook and dials an ASP FCD access code. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if FCD ALLOWED is "Y" on the ASPFD, ASPDP, ASPLPA, or ASPMPA forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

2.8 FCD TRIG ACT

Description: Is the feature code dialing trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If FCD TRIG ACT is "Y", FCD ALLOWED must be "Y".

2.9 CDP ALLOWED

Description: Is the customized dialing plan trigger allowed? Customized Dialing Plan (formerly the IDP trigger) uses the IDP capabilities to access ASP. The query method depends on which digit collection method is provisioned.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For an ASP feature assigned to a TN on the LINEFA form, MLHG/TERM on the MLHLNFA form, or an associated CLUSTR form, if CDP ALLOWED is "Y" on the ASPFD, ASPDP, ASPLPA, or ASPMPA forms, the corresponding LCC form must have CLASS OF SERVICE of "INDIV", "ATND" or "ISDN".

Copyright © 2003 Lucent Technologies

2.10 CDP TRIG ACT

Description: Is the customized dialing plan trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDP TRIG ACT is "Y", CDP ALLOWED must be "Y".

TERMINATING TRIGGERS

Fields Section 2.11 - Section 2.13 refer to terminating triggers. Terminating triggers launch a query based on the number called.

2.11 TA TRIG NBR

Description: Enter the terminating attempt trigger number. The trigger number is a pointer to access the particular trigger.
Valid Entries: 1 - 255

Data Rules:

If TA TRIG NBR is entered,

- OHI TRIG NBR and OHD TRIG NBR must not be entered, and
- FCD ALLOWED and CDP ALLOWED must be "N".

TA TRIG NBR must equal TRIG NBR on the corresponding NSTRIG form, where APPLICATION equals "ASP" and AIN REL equals "R0D1".

For an ASP feature assigned to a TGN/MEMB on the TRUNKFA or TKGRPFA forms or an associated CLUSTR form, if OHI TRIG NBR or TA TRIG NBR is entered on an ASPFD or ASPDP form, an ASPTPA form must exist for this TGN/MEMB(s)/FEATURE combination. since an OHI TRIG NBR or a TA TRIG NBR cannot be assigned to a trunk.

No more than one ASP feature with a TA TRIG NBR entry on an ASPFD, ASPDP, ASPLPA, or ASPMPA form may be assigned to a TN on a LINEFA, an MLHG/TERM on an MLHLNFA, or associated CLUSTR form.

2.12 TA TRIG ACT

Description: Is the terminating attempt trigger active for the purpose of launching an SCP query?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA TRIG ACT is "Y", TA TRIG NBR must be entered.

2.13 TA DFLT ROUTE

Description: Is the terminating attempt trigger default routing active?

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If TA DFLT ROUTE is "Y", TA TRIG NBR must be entered.

The TA DFLT ROUTE field is used by the ASP Default Routing for Terminating Attempt Triggers Special Feature. It is a secured feature and must be purchased by the office before this field can be set to "Y". If this field is set to "Y", a SFSYS form must exist with SFID 136 ACT field set to "Y".

2.14 INTRA OFFICE FWD

Description: Enter the number of intra-office calls that can be forwarded.
Valid Entries: 1 - 99

2.15 INTER OFFICE FWD

Description: Number of inter-office calls that can be forwarded.
Valid Entries: 1 - 99

SEC. 31F: 5634 RECORD
ADVANCED SERVICES PLATFORM NESS GROUP SCREENING LIST FORM - ASPGRP

1. GENERAL

The 5634 Record is available with 5E9(2) and later Software Releases, and defines a list of TN values that are allowed to be called for a given screening list group. This screening list group is used by terminals that have the ASP (Advanced Services Platform) NESS (Network Element Services Signaling) secured feature assigned to them.

See Division 2, Section 4A185 for more information on concerning this feature.

1.1 Recent Change View

The corresponding Recent Change View for this form is 4.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * SCRN GRP

Description: Enter the ASP NESS screening group number.

Required Field.
Valid Entries: 1 - 255

2.3 TN

Description: Enter the a 10-digit telephone number.

Required Field.
Valid Entries: 10-digit number

Data Rules:

TN entries must be unique.

There must be at least one TN entry in the TN LIST.

SEC. 31G: 5670 RECORD
ADVANCED SERVICES PLATFORM OPTIONS - ASPOPT

1. GENERAL

The 5670 Record is available with 5E12 and later Software Releases, and is used to set the ASP office parameters for the office.

See Division 2, Section 4A126 for more information on ASP.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.49.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 *KEY

Description: Enter the key value which is always 0.

Software Release: 5E12 and later
Required Field.

2.3 MAX TRIG

Description: Enter the number of times an ASP protocol call can serially trigger.

Software Release: 5E12 and later
Valid Entries: 1 - 6

Data Rules:

When MAX TRIG is entered, then ASP OFC must be "SSP".

2.4 ACG FNL TRMT

Description: Enter the ACG (Automatic Call Gap) final treatment for calls blocked due to ACG controls.

Software Release: 5E12 and later
Required Field.
Default: RT
Valid Entries:

Valid ACG FNL TRMT Entries

Entry	Definition
RT	Reorder tone.
VA	Voice announcement. Routed to the "NCA" (National Congestion Announcement (no circuits available) Fixed Route Type.

2.5 RDRCT THRES

Description: Enter the Forward Call Redirection Threshold, the number of times an ASP call can be forwarded.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later
Valid Entries: 1 - 9

Data Rules:

When RDRCT THRES is entered, then ASP OFC must be "SSP".

Since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, RDRCT THRES must not be entered until SFID 126 ACT on the SFSYS form has been set to "Y".

2.6 ESC CD CNTL

Description: Is the escape code shared with interoffice trunk triggers? The ESC CD CNTL field is used to specify on a per SSP (Service Switching Point) basis if an escape code applies to both an OHD (Off-Hook Delay) trigger and a shared interoffice trunk trigger.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ESC CD CNTL is entered, then ASP OFC must be "SSP".

Since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, ESC CD CNTL must be "N" until SFID 126 ACT on the SFSYS form has been set to "Y".

2.7 SCP DAS

Description: Enter the single DAS value for SCP return route trunk ASP calls. The SCP DAS field is used as the DAS (Digit Analysis Selector) for retranslating ASP (Advanced Services Platform) calls after querying the external SCP (Service Control Point) database. At an ASP office, a query is made to an external SCP database to obtain routing information necessary to complete the call. The SCP DAS indicates where translations should begin in digit analysis for routing numbers which are returned from the SCP database.

Software Release: 5E12 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When SCP DAS is entered, then ASP OFC must be "SSP".

When an SCP DAS is entered, it must be defined on an associated DAS form.

2.8 ASP OFC

Description: Enter the type of ASP (Advanced Services Platform) support to be provided by this office.

Software Release: 5E12 and later
Required Field.
Default: NONE
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid ASP OFC Entries	
Entry	**Definition**
NONE or N	This office does not support ASP.
SSP or S	This office is an ASP SSP (Service Switching Point).

Data Rules:

Since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, ASP OFC must be "NONE" until SFID 58 on the SFSYS form has been set to "S" or "Y".

When ASP OFC is "NONE",

- MAX CONV must be 5.
- NSTRIG forms must have APPLICATION equal to "E911" or 800.
- No ICF forms may exist with ASP CDI or ASP RTI entered.
- No MCRTIDX forms (5304 Record) may exist with MC ROUTE TYPE equal to "ASP".
- No IDPDCA forms may exist with ACTION or CONFLICT ACTION equal to "IDPASP" (For 5E9(1) and later, "ASPDNC", "ASPNORM", "ASPVAR").
- No PDIT forms may exist with ACTION equals "ASPDNC", "ASPNORM", or "ASPVAR".
- There is no office support for ASP. The ICF forms can have neither ASP TF CDI nor ASP TF RTI entered.

When ASP OFC is "SSP",

- SCP DAS must be entered
- PSEUDO CARR must be entered
- ASP ANI must be entered
- INT OFC TRIG must be entered
- MAX TRIG must be entered
- and APPLICATION equals "ASP" (and for 5E9(1) and later, AIN REL equals "R0") on an NSTRIG form (5324 Record), SERV KEY on that NSTRIG form must equal "CDPN" or "ANI".
- Any MCRTIDX forms where MC ROUTE TYPE equals "ASP" must not have TRUNK GROUP NUMBER, DIGITS TO BE DELETED, PREFIX DIGITS, NEXT ROUTE, or NEXT MC ROUTE INDEX entered.
- A DSAPP form must exist with APPLIC set to "ASP" or "AINR0D1".
- since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, MAX TRIG must equal 3 unless SFID 126 ACT on the SFSYS form has been set to "Y".

When ASP OFC is not "SSP",

- NATURE OF NBR on all LDIT, MLDIT (5300-3 Record), PDIT (5300-2 form), or RDIT forms (5300-7/8 Record), and NON for CONFLICT RESOLUTION ENTRY on all LDIT or RDIT forms must not be entered.
- there must be no SCFAM forms where STRUCT CODE FAMILY equals "ASP".

Copyright © 2003 Lucent Technologies

- NATURE OF NBR on all LDIT, MLDIT (5300-3 Record), or RDIT forms (5300-7/8 Record), and NON on all LDIT or RDIT forms must not be entered.
- there must be no SSPANN forms where CUST HDRID or CUST TRLID is entered.

2.9 PSEUDO CARR

Description: Enter the carrier ID that is to be outpulsed in the EA (Equal Access) signaling stream to the SSP. This carrier must also be defined in the Access Tandem as a pseudo carrier.

Software Release: 5E12 and later
Valid Entries: 0 - 9999

Data Rules:

PSEUDO CARR must equal CARRIER ID on an ICF form, with the ICF form's FEAT GRP equal to "D".

2.10 ASP ANI

Description: Enter the digits to be used as the ASP (Advanced Services Platform) ANI (Automatic Number Identifier). This ANI is used to distinguish an incoming EAMF/CCS7 trunk call as ASP. It is also used as the ANI II digits on an outgoing EAMF/CCS7 trunk when the SCP does not provide an OST (Originating Station Type) parameter to be outpulsed as the ANI II.

Software Release: 5E12 and later
Valid Entries: 00 - 99, but value 100 may be input to represent a "null" ASP ANI.

2.11 MAX CONV

Description: Enter the maximum number of conversations an ASP call is allowed to have, per transaction, with the SCP. (See Division 2, Section 4A on Secured Features for more information.)

Software Release: 5E12 and later
Required Field.
Default: 5
Valid Entries: 1 - 30

Data Rules:

When ASP OFC is "NONE", MAX CONV must be 5.

This parameter is used by the Advanced Services Platform feature, which is a Secured Feature. Before this field may be set to a value other than the default, SFID 51 on the SFSYS form (5713 Record) must be set to "Y".

2.12 ASP RESP

Description: Enter the ASP (Advanced Services Platform) SCP response timer. This is the number of seconds an ASP call will suspend, waiting for the SCP to respond to the ASP query. When the SCP fails to respond in this specified time interval, the call is routed to reorder.

Software Release: 5E12 and later
Required Field.
Default: 3
Valid Entries: 1 - 5

Copyright © 2003 Lucent Technologies

2.13 IGN OHD 0+PQSCR

Description: Should pre-query screening be ignored for 0+ prefix calls on a line with an Off-Hook Delay trigger? This field supports the ASP Pre-Query Screening for OHD Triggers secured feature. For more information on this feature, see Division 2, Section 4A178.

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries:

Valid PRE QUERY SCR Entries

Entry	Definition
Y	0+ calls will not be part of the pre-query screening.
N	0+ calls will be subject to screening.

Data Rules:

This field supports the ASP Pre-Query Screening for OHD Triggers secured feature. Before this field can be changed, the ACT field for SFID 178 on the SFSYS form (5713-1 Record) must be set to "Y".

2.14 INT OFC TRIG

Description: Enter the shared interoffice trigger number.

Software Release: 5E12 and later
Valid Entries: 1 - 255

Data Rules:

When INT OFC TRIG is entered, then ASP OFC must be "SSP".

When INT OFC TRIG is entered, it must equal TRIG NBR on an NSTRIG form, where APPLICATION equals "ASP".

2.15 ORIG BL TRIG

Description: Enter the originating busy line trigger number. The ORIG BL TRIG field is used to specify the trigger number used to locate the unique network service when a busy line condition is encountered. Population of this field indicates that a query will be launched to an external database. This field supports the ASP Originating Busy/No Answer Triggers with Extended Ringing secured feature. For more information concerning this feature, see Division 2, Section 4A189.

Software Release: 5E12 and later
Valid Entries: 1 - 255

Data Rules:

This field supports the ASP Originating Busy/No Answer Triggers with Extended Ringing secured feature. The SFID 189 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before the ORIG BL TRIG or ORIG NA TRIG field may be entered.

When this field is entered, the ORIG BL TRIG must be defined on the NSTRIG form (5324 form) as TRIG NBR. On the NSTRIG form, APPLICATION must be "ASP" and AIN REL must be "R0D1".

2.16 ORIG NA TRIG

Description: Enter the originating no answer trigger number. The ORIG NA TRIG field is used to specify the trigger number used to locate the unique network service when a no answer condition is encountered.

Copyright © 2003 Lucent Technologies

Population of this field indicates that a query will be launched to an external database. This field supports the ASP Originating Busy/No Answer Triggers with Extended Ringing secured feature. For more information concerning this feature, see Division 2, Section 4A189.

Software Release: 5E12 and later
Valid Entries: 1 - 255

Data Rules:

This field supports the ASP Originating Busy/No Answer Triggers with Extended Ringing secured feature. The SFID 189 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before the ORIG BL TRIG or ORIG NA TRIG field may be entered.

When this field is entered, the ORIG NA TRIG must be defined on the NSTRIG form (5324 form) as TRIG NBR. On the NSTRIG form, APPLICATION must be "ASP" and AIN REL must be "R0D1"

2.17 ORIG NO ANS TIME

Description: Enter the timeout value in seconds for the ASP Originating No Answer timer. The timer may be superceded by SCP provided "No Answer Timer" parameter if received by the SSP. This field supports the ASP BLNA (Busy Line No Answer) secured feature. For more information on this feature see Division 2, Section 4A147. This field also supports the Originating Busy Line/No Answer Office Triggers with Extended Ringing feature. For more information on this feature see Division 2, Section 4A189.

Software Release: 5E12 and later.
Valid Entries: 1 - 120 (seconds)

Data Rules:

This field is used by the ASP BLNA and ASP Originating Busy/No Answer Triggers with Extended Ringing secured features. Therefore, before this field can be entered, the ACT field for either SFID 147 or SFID 189 on the SFSYS form (5713-1 Record) must be set to "Y".

2.18 INH OFC OBL OOL

Description: Is the ASP office busy line trigger out of LATA inhibited? The INH OFC OBL OOL field was added to support ASP Call Screening of Busy/No Answer (BLNA) Office Triggers. The feature was first made available in a 5E11 Software Update. This field was moved to this form for the 5E12 Software Release.

Required Field.

2.19 INH OFC ONA OOL

Description: Is the ASP office no answer trigger out of LATA inhibited? The INH OFC ONA OOL field was added to support ASP Call Screening of Busy/No Answer (BLNA) Office Triggers. The feature was first made available in a 5E11 Software Update. This field was moved to this form for the 5E12 Software Release.

Required Field.

2.20 TERM NO ANS TIME

Description: This field is used to indicate the no answer timeout value in seconds for the ASP Terminating Busy Line/No Answer feature.

Copyright © 2003 Lucent Technologies

Software Release: 5E14 and later
Required Field.
Default: 18
Valid Entries: 1 - 120 in seconds

2.21 AMA AIN BUSY NA

Description: Is the AMA Recording - AIN Busy and Don't Answer feature active? The AMA AIN BUSY NA field supports the AMA Recording - AIN Busy and Don't Answer secured feature. For more information concerning this feature, see Division 2, Section 4A166.

Required Field.

Data Rules:
The AMA AIN BUSY NA field supports the AMA Recording - AIN Busy and Don't Answer secured feature. The SFID 166 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field may be set to "Y".

ORIG DAS FOR ASP TRIGGERS

The following fields (Section 2.22 - Section 2.24) define the parameters which support the ASP Multiple Rate Center Support feature. This is a secured feature with SFID 162. For more information on this feature, see Division 2, Section 4A162.

For 5E15 and later the TGT (Trunk Group Trigger) was added to Section 2.24 to extend the ASP Triggers to include support of the Terminating Trunk Group Triggers feature, see Division 2, Section 4A546.

2.22 ARS FCD CDP

Description: Is the DAS (Digit Analysis Selector) assigned to the originator used after ARS (Automatic Route Selection) FCD (Feature Code Dialing), and CDP (Customized Dialing Plan) triggers? If "Y" is entered, the DAS assigned to the originator is used to interpret digits after an ASP query for ARS, FCD, and CDP triggers. If "N" is entered, the SCP DAS is used to interpret digits after an ASP query for ARS, FCD, and CDP triggers.

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

SFID 162 on the SFSYS form (5713-1 Record) must have the ACT field set to "Y" before the ARS FCD CDP or OHI OHD TAT field can be set to "Y".

2.23 OHI OHD TAT

Description: Is the DAS (Digit Analysis Selector) assigned to the originator used after OHI (Off-Hook Immediate), OHD (Off-Hook Demand), and TAT (Termination Attempt Triggers) triggers? If "Y" is entered, the DAS assigned to the originator is used to interpret digits after an ASP query for OHI, OHD, and TAT triggers. If "N" is entered, the SCP DAS is used to interpret digits after an ASP query for OHI, OHD, and TAT triggers.

Software Release: 5E12 through 5E14.
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

SFID 162 on the SFSYS form (5713-1 Record) must have the ACT field set to "Y" before the ARS FCD CDP or OHI OHD TAT field can be set to "Y".

2.24 OHI OHD TAT TGT

Description: Is the DAS (Digit Analysis Selector) assigned to the originator used after OHI (Off-Hook Immediate), OHD (Off-Hook Demand), TAT (Termination Attempt Triggers), and TGT (Trunk Group Triggers) triggers? If "Y" is entered, the DAS assigned to the originator is used to interpret digits after an ASP query for OHI, OHD, TAT, and TGT triggers. If "N" is entered, the SCP DAS is used to interpret digits after an ASP query for OHI, OHD, TAT and TGT triggers.

Software Release: 5E15 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

SFID 162 on the SFSYS form (5713-1 Record) must have the ACT field set to "Y" before the ARS FCD CDP or OHI OHD TAT TGT field can be set to "Y".

ASP IP TIMERS

The following fields (Section 2.25 - Section 2.26) are used to set the maximum duration of a STOR (Send To Outside Resource) connection and the maximum amount of time the switch will wait for the IP (Intelligent Peripheral) to send the Disconnect message. These fields support the AIN SSP Send To Outside Resource (Local) feature. For more information on this feature, see Division 2, Section 4A229.

2.25 TSTRC

Description: Enter the STOR (Sent To Outside Resource (Local)) connection time. This field indicates the maximum duration of a STOR connection, as measured from the Connect message received from the IP. 0 indicates no timing.

Software Release: 5E12 and later
Required Field.
Default: 06
Valid Entries:
- For 5E12 thru 5E14: 0 - 60 minutes
- For 5E15 and later: 0 - 300 minutes

Data Rules:

STOR (Send To Outside Resource (Local) is a secured feature. Before STOR data can be assigned, TSTRC must be 06 until SFID 126 ACT and SFID 229 ACT on the SFSYS form have been set to "Y".

For 5E15 and later, when TSTRC is set to a value greater than 60, then the ACT field for SFID 560 on the SFSYS form has to be set to "Y".

2.26 TDISC

Description: Enter the STOR (Sent To Outside Resource (Local) disconnection time. This field indicates the maximum amount of time the switch will wait for the IP to send the Disconnect message after a facility

Copyright © 2003 Lucent Technologies

message with a Cancel IP Resource operation is sent from the SSP (Service Switching Point) to the IP.

Software Release: 5E12 and later
Required Field.
Default: 4.0
Valid Entries: 1.0 - 4.0 (in increments of 0.5)

Data Rules:

STOR (Send To Outside Resource (Local)) is a secured feature. Before STOR data can be assigned, TDISC must be 4.0 until SFID 126 ACT and SFID 229 ACT on the SFSYS form have been set to "Y".

EON DAS ASP TRIGGERS

The following fields (Section 2.27 - Section 2.29) are proprietary.

2.27 EON APN DAS

Description: Proprietary field.

Software Release: 5E14 and later

2.28 EON LOCAL DAS

Description: Proprietary field.

Software Release: 5E14 and later

2.29 EON TOLL DAS

Description: Proprietary field.

Software Release: 5E14 and later

ASP TIMEOUT ALARM

The following fields (Section 2.30 - Section 2.31) are used to specify the interval of time within which ASP queries are counted and to indicate the percentage of ASP timeout queries within a specified interval. These fields support the ASP (Advanced Services Platform) Timeout Alarm feature. For more information on this feature, see Division 2, Section 2Y.

2.30 TIME INTERVAL

Description: The TIME INTERVAL field indicates the interval of time within which ASP queries are counted.

Software Release: 5E15 and later
Default: 60
Valid Entries: Blank, or enter 5 - 60 in five-minute increments.

2.31 ALARM THRESHOLD

Description: The ALARM THRESHOLD indicates the percentage of ASP timeout queries within a specified interval.

Software Release: 5E15 and later

Copyright © 2003 Lucent Technologies

Default: 100
Valid Entries: Blank, or enter 1 - 100 percent.

ASP MID CALL EVENT

The following fields (Section 2.32 - Section 2.33) are used to specify the timing interval (for 5E13 and later) and indicate the activity of the Mid Call Events (for 5E15 and later). These fields support the ASP (Advanced Services Platform) Mid Call Event Detection feature. For more information on this feature, see Division 2, Section 4A343.

2.32 ODTMF INTERDIG TIM

Description: The ODTMF INTERDIG TIM (Originating Dual Tone Multi-Frequency Interdigit Timing) field is used to specify the originating dual tone multi-frequency interdigit timing interval for Mid Call Event digits.

Software Release: 5E13 and later
Required Field.
Default: 4
Valid Entries: 2 - 10 seconds

Data Rules:

For 5E13 and later, when the ODTMF INTERDIG TIM field is set to a valid value other than 4, the ACT field for SFID 345 on the SFSYS form (5713-1 Record) must be set to "Y".

2.33 MID CALL EVENT ON

Description: The MID CALL EVENT ON field indicates whether one or both Mid Call Events (O_Disconnect_Called and O_DTMF_Entered) are active and to increase the SRE (Software Resource Engineering).

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the MID CALL EVENT ON field is set to "Y", either the ACT field for SFID 343 or the ACT field for SFID 345 must also be set to "Y".

CRITICAL INDICATORS

The following fields (Section 2.34 - Section 2.43) support the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY.

For 5E15 and later the TGT (Trunk Group Trigger) was added to Section 2.43 to extend the CRITICAL INDICATORS to include support of the Terminating Trunk Group Triggers feature, see Division 2, Section 4A546.

2.34 CRIT MAX TRIG

Description: The CRIT MAX TRIG field is used to indicate whether the MAX TRIG field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.35 CRIT RDRCT THRES

Description: The CRIT RDRCT THRES field is used to indicate whether the RDRCT THRES field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.36 CRIT SCP DAS

Description: The CRIT SCP DAS field is used to indicate whether the SCP DAS field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.37 CRIT ASP OFC

Description: The CRIT ASP OFC field is used to indicate whether the ASP OFC field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.38 CRIT MAX CONV

Description: The CRIT MAX CONV field is used to indicate whether the MAX CONV field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.39 CRIT ORIG BL TRIG

Description: The CRIT ORIG BL TRIG field is used to indicate whether the ORIG BL TRIG field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.40 CRIT ORIG NA TRIG

Description: The CRIT ORIG NA TRIG field is used to indicate whether the ORIG NA TRIG field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.41 CRIT ARS FCD CDP

Copyright © 2003 Lucent Technologies

Description: The CRIT ARS FCD CDP field is used to indicate whether the ARS FCD CDP field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.42 CRIT OHI OHD TAT

Description: The CRIT OHI OHD TAT field is used to indicate whether the OHI OHD TAT field is critical.

Software Release: 5E13 through 5E14
Required Field.
Default: N
Valid Entries: Y, N

2.43 CRIT OHI OHD TAT TGT

SEC. 31H: 5649 RECORD
BLOCKED LINE ASP FCD CODES - LNBLKCOD

1. GENERAL

The 5649 Record is available with 5E15 and later Software Releases, and provides analog and ISDN circuit TNs the capability of blocking selected (unrestricted FCD) triggers by those users who show no interest in using specific services and do not want to access them by inadvertently dialing the trigger code. This form was added to support the ASP Unrestricted FCD Trigger feature. See Division 2, Section 4A572 for more information.

The secured feature ASP Unrestricted FCD Trigger must be purchased before the LNBLKCOD form can be entered, the ACT field for SFID 572 on the SFSYS form must be set to "Y".

1.1 Recent Change View

The corresponding Recent Change Views for this form is 4.40.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number for which certain ASP FCD codes will be blocked.
Valid Entries: Enter XXXXXXX or NXXXXXXXXX where N equals 2 - 9 and X equals 0 - 9.

Data Rules:

When a TN is entered at least one FCD CODE must be entered.

A LNBLKCOD form cannot be entered if the corresponding LINE form URT FCD BLK field is set to "Y". LNBLKCOD corresponds with the LINE form when the TNs match.

When a TN is entered on the LNBLKCOD form, it must be entered as a TN on the LINE form, MLHLN form, or a CKT TN/CKT MLHG TN on the DSLUSR form.

When a TN is entered on the LNBLKCOD FORM it also must be entered as a TN on the LINE form or MLHLN form with a CLASS OF SERVICE of "INDIV" or "ATND" on the correponding LCC form, or as a CKTN or CKT MLHG TN on the DSLUSR form with a CLASS OF SERVICE of "ISDN" or "ISATND" on the corresponding LCC form. Forms correspond when the LCC and RAX fields match.

BLOCKED CODES LIST

The following field refers to the BLOCKED CODES LIST, consisting of up to 32 FCD triggers.

2.3 FCD CODE

Description: Enter the ASP unrestricted FCD code to be blocked.
Valid Entries: Enter Blank, or 1 to 7 dialable digits (0 - 9,* or #). If # or * are entered as single characters, they must be preceded by a space.

Data Rules:

At least one FCD CODE must be entered.

Copyright © 2003 Lucent Technologies

FCD CODE must be unique in BLOCKED CODES LIST.

The FCD CODE entered on the LNBLKCOD form must be entered as DIGITS TO INTERPRET on a PDIT form, where FEATURE is set to "/*" and ACTION is "ASPDNC", "ASPNORM", or "ASPVAR".

SEC. 31I: 5650 RECORD
SIMULTANEOUS RINGING FEATURE DEFINITION - SRFD

1. GENERAL

The 5650 Record is available with 5E16 and later Software Releases, and provides the ability to define Simultaneous Ringing features. This form was added to support the Simultaneous Ringing feature. See Division 2, Section 4A587 for more information.

The Simultaneous Ringing feature is a secured feature and must be purchased before the SRFD form can be entered. ACT must be set to "Y" for SFID 587 on the SFSYS form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.65.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE NAME

Description: This field identifies a particular Simultaneous Ringing feature by name.

Software Release: 5E16 and later
Valid Entries: Enter up to 8 alphanumeric characters. Feature name entries must be unique. Preconstructed features always begin with a slash (/).

2.3 REMARKS

Description: An optional field used to provide any additional information regarding this feature.

Software Release: 5E16 and later
Valid Entries: Enter up to 32 alphanumeric characters.

FEATURE OPTIONS

Fields Section 2.4 - Section 2.5 refer to the feature activation and deactivation options.

2.4 ACT TYPE

Description: This is a display only field which indicates the feature activation type.

Software Release: 5E16 and later
Default: CODE
Valid Entries: The only valid value is "CODE".

2.5 DACT TYPE

Description: This is a display only field which indicates the feature deactivation type.

Software Release: 5E16 and later
Default: CODE
Valid Entries: The only valid value is "CODE".

SEC. 31J: 5651 RECORD
SIMULTANEOUS RINGING MDN (MEMBER DIRECTORY NUMBER) LIST- SRDN

1. GENERAL

The 5651 Record is available with 5E16 and later Software Releases. It provides the ability to edit a list of MDNs (Member Directory Numbers) that are associated with a specific TN. A list of up to four MDNs is allowed. This form was added to support the Simultaneous Ringing feature. See Division 2, Section 4A587 for more information.

The Simultaneous Ringing feature is a secured feature and must be purchased before the SRDN form can be entered. ACT must be "Y" for SFID 587 on the SFSYS form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.65.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 *TN

Description: Telephone number.

Software Release: 5E16 and later
Valid Entries: Enter a 7 or 10 digit telephone number of the form XXXXXXX or NXXXXXXXXX, where N is a number from 2 to 9 and X is a number from 0 to 9.

Data Rules:

The TN must exist on a LINE form and must not be any of the following:

- MLHG (Multiline Hunt Group) Member
- Multi-party Line
- Coin Phone
- PSAP (Public Safety Answering Point)
- Analog Attendant
- Shared analog
- Secondary only
- ACD (Automatic Call Distributor) Agent
- Series Completion Member
- ISDN (Integrated Services Digital Network)

ACT must be "Y" for SFID 587 on the SFSYS form (Record 5713-1).

Copyright © 2003 Lucent Technologies

TN must equal TN on a LINEFA form (Records 5121, 5122, 5112, 5113, 5123, and 5124).

FEATURE must be defined in the FEATURE LIST on the LINEFA form.

2.3 * FEATURE

Description: This field identifies a particular Simultaneous Ringing feature by name.

Software Release: 5E16 and later
Valid Entries: Enter up to 8 alphanumeric characters. Feature name entries must be unique. Preconstructed features always begin with a slash (/).

Data Rules:

FEATURE must equal FEATURE NAME on an SRFD form (Record 5650).

MDN LIST

The MDN LIST allows up to four member directory numbers to be assigned to the specified TN.

2.4 MDN

Description: Member directory number.

Software Release: 5E16 and later
Valid Entries: Enter from up to 32 digits of 0 - 9, plus special characters "*" or "#".

SEC. 32: ACD BRCS

Copyright © 2003 Lucent Technologies

SEC. 32A: 5631-1 RECORD
ACD/BRCS AND DAA TN ASSIGNMENT FORM - ACDTN

1. GENERAL

The 5631 Record is available with the 5E9(1) Software Release. It is used by the ACD/BRCS (Automatic Call Distributor/Business and Residential Custom Services) feature to define the ACD directory number or the DAA (Direct Agent Access) directory number. For more information on the secured feature ACD/BRCS and ACD/BRCS Interworking II see Division 2, Section 4A121.

ACD TN is a telephone number that gets standard queuing and delay treatment or vectoring treatment. This TN is dialed by a customer to be routed through an ACD to any agent. In addition the ACD TN calls can be interflowed. Interflow allows for immediate or permanent close down of one, some or all agent serving teams at a specific position. Call traffic requiring agent assistance that is otherwise handled by the closed serving teams is subsequently interflowed to another destination.

DAA TN is the telephone number that is associated with a specific agent ID. The calls are routed to that agent.

1.1 Provisioning ACD TN and DAA TN for 5E11 and Later

For 5E11 and later, the forms for provisioning an ACD TN or DAA TN are listed below. Before using the corresponding RC View to provision an ACD or DAA TN, it is necessary to set up required information for these TNs on other RC views. The order in which the ODA forms and Recent Change views are listed below must be the order that Recent Change follows for entering the necessary information prior to using the 6.10 view.

Provision ACD TN or DAA TN

Form	Record	RC View	Data
DAS	5300-1	9.1	Define a valid DAS (Digit Analysis Selector) with the Packet Switch indicator set to "N".
SMLDIT	5315	9.25	Distribute the LDIT associated with the DAS to all operational SMs in the office.
ICF	5305	10.3	Define a valid carrier ID specified in the PIC field.
RAR	5301	10.10	Define a valid screening index specified in the SCR field.
STPARM	5638	6.1	Define a valid ACD serving team.
AGNTID	5639	6.3	Define a valid ACD agent identifier specified in the AGENT ID field.
CQPARM	5640	6.4	Define a valid ACD call queue specified in the CALL QUEUE field.
SZDISP	5641	6.5	Define a valid display index specified in the DISPX field.
ACDVCT	5643	6.7	Define a valid vector identifier specified in the VECTOR ID field.

1.2 Recent Change View

The corresponding Recent Change View for this form is 6.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TN

Description: Enter the ACD (Automatic Call Distributor) or DAA (Direct Agent Access) Telephone Number.

Required Field.
Valid Entries: For 5E11 and earlier: 7 digits

Copyright © 2003 Lucent Technologies

For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

ACD and DAA TNs are used for the secured feature ACD/BRCS. "Y" must be entered in the SFIDs 16 and 121 on the SFSYS form (5713-1 Record) for DAA TNs, and SFID 121 on the SFSYS form for ACD TNs.

For 5E12 and later, TNs on different ACDTN forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the ACDTN form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

ACD and DAA TNs may not appear as the series completed to TN on any form. Therefore, they may not be entered in the SERHLN field on the LINE (5109 Record), MLHLN (5111 Record), DSLUSR (5908 Record), or SHTN forms (5902 Record).

ACD TN must not be entered as the TN on the PIDEF form.

A NOC form (5501 Record) is required for the NXX of each TN on this form.

TN cannot be duplicated on any of the following forms:
- ACQS (5425 Record)
- AMLBDSL (5447 Record)
- DSL (5907 Record)
- DSLUSR (5908 Record)
- LINE (5109 Record)
- MLHG (5110 Record)
- MLHLN (5111 Record)
- MTNDR (5550 Record)
- MULTITN (5114 Record)
- NPOOL (5177 Record)
- PSMTN (5925/5925A Record)
- RDTAPORT (5911A/B Record)
- SHTN (5902 Record)
- XAT (5909-1/2 Record)

2.3 #CALL TYPE

Description: Enter a valid Call Type (queue number). This field identifies the call queue that handles calls for this ACD TN or DAA TN. DAA TNs are given queue treatment if the DAA agent is not logged in and FWD TO DN or VECTOR ID is not assigned. A CALL TYPE is always required since the TGID (Terminal Group) for this TN is obtained from the primary serving team of this call type queue. See CALL QUEUE field for 5E11 and later.

Software Release: 5E9(1) - 5E10
Required Field.
Valid Entries: 1 - 128

Data Rules:

This CALL TYPE must be defined on the OSPSCT form (5404 Record) with a matching OSPS CALL TYPE value and AUTO CALL DIST field must be "Y". Also, the SERVING TEAM value on the OSPSCT form must have TGID defined for the associated Serving Team on the STINFO form.

Copyright © 2003 Lucent Technologies

2.4 CALL QUEUE

Description: Enter the ACD (Automatic Call Distributor) call queue number. This field identifies the call queue that handles calls for this ACD TN or DAA TN. DAA TNs are given queue treatment if the DAA agent is not logged in and FWD TO DN or VECTOR ID is not assigned. An incoming ACD call is placed in a queue specified by this number if no agents are available to handle this type of call. The CQPARM form is used to define a valid ACD call queue to be entered in this field.

Software Release: 5E11 and later.
Valid Entries: 1 - 999

Data Rules:

If CALL QUEUE is not entered, then:
- E911 PSAP must be "N"
- Q DIALING TN must be "N"

The CALL QUEUE value must be defined on a corresponding CQPARM form with a matching SERVING TEAM entered. In addition, the SERVING TEAM value on the CQPARM form must be defined on a corresponding STPARM form with TGID entered.

2.5 #PIC

Description: Enter a valid Presubscribed inter-LATA carrier. This field is used for ACD TN and DAA TN call redirection.

Required Field.
Valid Entries: 0 - 9999

Data Rules:

This PIC must be defined on the ICF form with "D" entered in the FEAT GRP field on that form.

2.6 PTC

Description: Enter the presubscribed intra-LATA toll carrier. This field supports the ICLATA secured feature for ACD/BRCS. For more information on the ICLATA feature, see Division 2, Section 4A149. For more information on the ACD/BRCS features, see Division 2, Section 4A141.

Software Release: 5E11 and later.
Valid Entries: 0 - 9999

Data Rules:

The PTC field is used by the ICLATA secured feature, which must be purchased by the office before the field can be entered. The ACT field for SFID 149 on the SFSYS form must be set to "Y" before PTC can be entered.

The PTC value must be defined on an ICF form as CARRIER ID and the FEAT GRP field on that ICF form must be set to "D".

2.7 PLC

Description: Enter the PLC (Presubscribed Local Carrier) code. The PLC field supports the Alternate Local Service Provider Routing feature. For more information on the Alternate Local Service Provider Routing feature, see Division 2, Section 4A269.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later.
Valid Entries: Blank, or 0 - 9999.

Data Rules:

The PLC value must be defined on an ICF form as CARRIER ID with FEAT GRP equal to "D" .

2.8 UNBUNDLED

Description: Has this line been unbundled from the LEC?

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

If UNBUNDLED is "Y", then PLC must be entered.

2.9 #SCR

Description: Enter a valid Screening Index for busy line verification. This field is used for routing and charging redirected ACD or DAA calls.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

There must be an RAR form entry with this screen index and code index combination. The code index is obtained from the LDIT form and the DAS value below.

2.10 #DAS

Description: Enter a valid Digit Analysis Selector. This field is used for digit analysis of redirected ACD and DAA calls.

Required Field.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

The DAS assigned on this form must be defined on the DAS form (5300 Record).

Also , the LDIT value associated with this DAS (either LINE DAS LOCAL DIT or TRUNK DAS LOCAL DIT) must be distributed to all operational SMs. This is accomplished by entering an SMLDIT form with this LDIT value as the key and by entering each operational SM (as defined on EQIM forms where EQSTATUS is "O") into the LIST OF SWITCHING MODULES.

The DAS values entered on the ACDTN form cannot be associated with an LDIT used for packet routing. Therefore, "PSNCI" or "PSCAR" cannot be entered in the TYPE OF CI CALL field on an LDIT form or an MLDIT form if the LDIT value is associated with this DAS (either LINE DAS LOCAL DIT or TRUNK DAS LOCAL DIT); also, the the CI TYPE entries in the CONFLICT RESOLUTION ENTRIES cannot be equal a "PSNCI" or "PSCAR" on the corresponding LDIT form.

Copyright © 2003 Lucent Technologies

Entries in the DAS and SCR fields on this form require that a DAS form must exist with a DATREE that matches the DAS value, and a corresponding RAR form which requires the combinations of CODE INDEX from one or more LDIT, RDIT, PDIT, IDDD, INDIT, or MLDIT forms, and SCR on this form.

2.11 #DISPX

Description: Enter a valid Display Index. This field identifies the display index for calls to this ACD/DAA TN.

Required Field.
Valid Entries:
- For 5E9(1) - 5E10: 1 - 276
- For 5E11 and later: 1 - 2047

Data Rules:

For 5E9(1) - 5E10, the DISPX value must match a DISPLAY INDEX value on the OBSTS form (5408 Record).

For 5E11 and later, DISPX value(s) must match the DISPX value on the SZDISP form (5641 Record).

2.12 LINE SCREEN

Description: Is Toll diversion, code restriction, or WATS band screening activated? This field is used for ACD/DAA call redirection. See the C BLK attribute on the RAR form (5301 Record), Division 3, Section 3F, and the LINE SCREENING attribute on the LCC form (5306 Record) in Division 3, Section 3S for additional information.

Required Field.
Default: N
Valid Entries: Y, N

2.13 VECTOR ID

Description: Enter a valid Vector ID. This field identifies the vector which provides call handling while waiting for an ACD/DAA agent.
Valid Entries:
- For 5E9(2) and earlier: 1 - 256
- For 5E10: 1 - 1024
- For 5E11 and later: 1 - 2048

Data Rules:

For 5E9(1) - 5E10, the VECTOR ID entered here must be defined on a CVECT form (5460 Record).

For 5E11 and later, if VECTOR ID is entered, it must be defined on the ACDVCT form (5643 Record).

2.14 Q DIALING TN

Description: Is the ACD TN associated with the CALL QUEUE used for Queue Dialing? A value of "N" means that the ACD TN or DAA TN will not be used for Queue Dialing. When Q DIALING TN is "Y", the ACD TN or DAA TN may be accessed by the queue number indicated in the CALL TYPE field.

For 5E11 and later, if this field is set to "Y" on the Recent Change View, then the TN is displayed on the

Copyright © 2003 Lucent Technologies

Call Queue RC View 6.4 as the queue TN for the CALL QUEUE. When a TN with Q DIALING TN is set to "Y" is deleted, then the verify only field ACD TN on RC View 6.4 will be blank for that queue.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(1) - 5E10, only one TN per unique CALL TYPE may have Q DIALING TN set to "Y".

For 5E11 and later, only one TN per unique CALL QUEUE may have Q DIALING TN set to "Y".

2.15 INWATS

Description: Is INWATS (Inward Wide Area Telecommunications Service) is allowed?

Required Field.
Default: N
Valid Entries: Y, N

2.16 FLS

Description: Are calls to this ACD TN or DAA TN free? A value of "Y" entered in FLS (Free Line Service) indicates that calls to this ACD TN or DAA TN are not billed. A value of "N" means that calls to this ACD TN or DAA TN get standard billing treatment.

Required Field.
Default: N
Valid Entries: Y, N

2.17 CALL TRACE

Description: Will Call Tracing be activated? When CALL TRACE is "Y", all incoming calls to the ACD TN or DAA TN are traced and a record is typed on the Maintenance TTY.

Required Field.
Default: N
Valid Entries: Y, N

2.18 CALL CLASS

Description: This field is used by the MIS (Management Information System) to track ACD/DAA calls. Enter a valid CALL CLASS.
Valid Entries:

- For 5E9(1) - 5E10: 1 - 511
- For 5E11 and later: 1 - 2048

Data Rules:

For 5E11 and later, if CALL CLASS is entered, CALL QUEUE and DISPX must be entered.

2.19 CPND TO MIS

Description: Are calling numbers for calls to this ACD/DAA TN sent to the MIS?

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

2.20 CPND TO AGENT

Description: Are calling numbers displayed on the agent's terminal?

Required Field.
Default: N
Valid Entries: Y, N

2.21 CHNG TN

Description: This is a recent change only field that allows the user to update or insert a value for TN, which is the key field for this view. The update and insert operations are not allowed for key fields; however, the TN field can be changed through this field. This is a Text Only field for ODA. For 5E9(1) - 5E10 see Recent Change view 4.15. For 5E11 and later, see Recent Change View 6.10.

2.22 E911 PSAP

Description: Is this an ACD E911 Public Safety Answering Point? This field is used by the Pinnacle ACD E911 Special Feature.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

To activate this secured feature, the ACT field for SFID 143 on the SFSYS form (5713-1 Record) must be "Y".

For 5E9(1) - 5E10, the value entered for E911 PSAP must equal the value entered for E911 PSAP on the STINFO form.

For 5E11 and later:
If CALL QUEUE is defined as a CALL QUEUE on the CQPARM form with SERVING TEAM entered and this SERVING TEAM is defined on the STPARM form as SERVING TEAM, then the value entered for E911 PSAP on this form must equal the value entered for E911 PSAP on the STPARM form.

If CALL QUEUE is entered and E911 PSAP is set to "Y", then the CALL QUEUE must be defined on the CQPARM form with an entry in the SERVING TEAM field.

DIRECT AGENT ACCESS

The following fields (Section 2.23 - Section 2.24) define attributes for a DAA TN.

2.23 AGENT ID

Description: This field identifies the agent associated with this Direct Agent Access TN. An entry in the AGENT ID field identifies this TN as a DAA DN. Enter one to four digits.

For 5E9(1) - 5E10, leading zeros have significance, i.e., 01 is different from 1.
Valid Entries:
- For 5E9(1) - 5E10: 1 - 8999
- For 5E11 and later: 1 - 32768

Copyright © 2003 Lucent Technologies

Data Rules:

An entry in the AGENT ID field identifies this TN as a DAA DN, therefore, SFIDs 16 and 121 must be "Y" on the SFSYS form.

When AGENT ID is blank, FWD TO DN must be blank.

For 5E9(1) - 5E10, the AGENT ID entered here must be defined as an OPERATOR ID on an OSPSOA form with an OPER TYPE of "DA".

For 5E11 and later, an AGENT ID must be defined on a corresponding AGNTID form (5639 Record).

2.24 FWD TO DN

Description: When the corresponding agent is not logged in, calls terminating to DAA TN will be forwarded to the telephone number entered in this field.
Valid Entries:
- For 5E9(1) - 5E10: 7 or 10 digits
- For 5E11 and later: 1 - 15 digits

Data Rules:

FWD TO DN must not be entered unless there is an entry in AGENT ID.

For 5E9(1) - 5E10, FWD TO DN must not equal the entry in the TN field; digits 4-10 cannot be equal to the TN.

For 5E9(1) and later, the first three digits of the FWD TO DN must not equal an NPA CODE on the corresponding NOC form.

INTERFLOW

The following field assigns the destination directory number for interflowed calls.

2.25 DEST DN

Description: Enter the destination telephone number for ACD Interflowed calls. Interflow allows for immediate or permanent close down of one, some, or all agent serving teams at a specific location. Call traffic requiring agent assistance that is otherwise handled by the closed serving teams is subsequently interflowed to another call center.
Valid Entries:
- For 5E9(1) - 5E10: 7 or 10 digits
- For 5E11 and later: 1 - 15 digits

Data Rules:

DEST DN cannot equal the entry in the TN field; digits 4-10 cannot be equal to the TN.

For 5E9(1) and later, the first three digits of the DEST DN must not equal the NPA CODE on the corresponding NOC form.

When DEST DN is entered, AGENT ID and FWD TO DN must not be entered.

SEC. 32B: 5637 RECORD
ACD MANAGEMENT INFORMATION SYSTEM LINK - MISLINK

1. GENERAL

The 5637 Record is available with 5E9(1) and later Software Releases. It is used to make MIS LINK assignments, providing the capability to provision an MIS (Management Information System) SM Event Link for ACD/BRCS on all valid DSLs. For more information on ACD/BRCS see Division 2, Section 4A121. Note that as additional OE (Office Equipment) types are supported, additional time slot and related data rules are implemented. See the specific OE type for additional rules.

1.1 Time Slots

The following discussion of time slots is intended to illustrate the general rules for time slot assignment. In this discussion, ISLU and IDCU equipment are referenced. For rules pertaining to subsequent OE types, see the OE field.

ODA assigns time slot values to the MISLINK forms that have unassigned time slots. The ODA assignment requires that LKCENs ("K" type Equipment Numbers) assigned to LGs 0 - 7 (the sixth and seventh digit of the Equipment Number) are assigned time slots on odd numbered EQISLU PIDBs and that LCKENs assigned to LGs 8 - 15 are assigned time slots on even numbered EQISLU PIDBs, each with a PIDB TYPE of "PSU".

D and/or B Channel time slots cannot be assigned by ODA unless a sufficient number of DPIDBs are assigned on the EQISLU form (5731 Record) with a PIDB TYPE of "PSU" time slots. If the number of time slots available is 0, there are no DPIDB assignments on the EQISLU form for the combination of SM/ISLU2. Or, for example, if the number of time slots available is 4 and the number of time slots assigned is 5 then the data must be examined to determine why more than the available number of time slots have been assigned. Error correction may require regrouping ISCN assignments more efficiently or possibly the DPIDB assignments on the EQISLU form may need modification. B and/or D channel assignments made manually may conflict with the ODA assignment algorithm.

The ODA algorithm is allocated 4 time slots per DPIDB per SM/ISLU2/LG. The LGs 00 - 07 are allocated time slots on the odd numbered DPIDBs while LGs 08 - 15 are allocated time slots on the even numbered DPIDBs. Manual time slot assignments do not have to follow this algorithm. However, if manual assignments are made, they use one or more time slots. These manual assignments diminish (and may conflict with) the time slots available for the ODA assignment algorithm.

The LCEN's assigned on the AMLBDSL, DSLAP or OSPSDSL forms, or DSL OE's on the DSL form or OE's on the MISLINK form can not have their D and/or B Channels assigned to conflicting DPIDB time slots or quarter timeslots due to manual (vs ODA) time slot assignments. Each SM/ISLU or SM/IDCU DPIDB time slot may be assigned only once. (Note, D channels are allocated to quarter time slots; therefore up to four unique assignments can be made before a time slot is considered full.

Time slots for DPIDBs, which are assigned and reserved on an ISLU(2), cannot exceed the maximum number of 32 time slots available for the DPIDB. Time slots are allocated for DSL D and/or B channels on the following forms:

- AMLBDSL
- DSL (where DSL OE type equals "I" or "K")
- DSLAP
- MISLINK (where OE type equals "I" or "K")
- OSPSDSL forms

Time slots are allocated either on the form or by the ODA automatic time slot assignment algorithm. Time slots may also be reserved for On Demand B channel usage on the ODBTS form. If more than 32 time slots are assigned or reserved, time slots on the ODBTS form will need to be re-assigned to correct the DPIDBs in error.

Copyright © 2003 Lucent Technologies

The IDCU DPIDBs connect the IDCU to the PSU. They carry IDCU control information (EOC and TMC channels); the DSL D channel control and packet data; and the DSL B channel packet switching and voice data. Each DPIDB has 32 time slots. The EOC, TMC and B channels each occupy a full TS. The D channels each occupy one-quarter TS but should be packed (up to) four to a TS if they

- originate on the same TR303 RT,
- are assigned to the same DPIDB and
- belong to the same DSL group (ISCN 1,3).

They must also occupy a unique IDCU DS1 TS and have the same positioning in that TS. In other words, D channel quarter TS can not be switched. The required number of DPIDB time slots must be available for the following forms:

- DSL
- MISLINK
- ODBTS
- RTERM

The following data rule is not executed on an SM-2000, provisioning of nailed-up time slots is not required on an SM-2000. On a PSU1, each Data Interface in a SM can have a maximum of 128 nailed-up time slots reserved for the following applications:

Data Interface for Nailed-up Time Slots

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms (CMDA application).
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3 digits of LCEN match SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3 digits of LCEN (on the DSLAP or OSPSDSL form) or OE (on the DSL or MISLINK form) match SM on an EQRISLU form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms (CMDA application).
X.25	Defined on the XAT forms.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

These time slots can be reserved by entering the rows RPTSS0 to RPTSS7 on the EQPSU form. The quantity of time slots reserved (i.e. the number entered) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D channel only takes a quarter of a time slot.

Also, the reserved time slots must be entered such that for any given SHELF, (defined by the first digit of ISCN field or by the SHELF field on the MISLINK form), the time slots assigned to that SHELF must not be duplicated in the same vertical (column) position if they appear in more than one row (RPTSS0 through RPTSS7).

1.2 Recent Change View

For 5E9(1) - 5E10, the corresponding Recent Change View for this form is 23.19. For 5E11 and later, the corresponding Recent Change View for this form is 6.11.

Copyright © 2003 Lucent Technologies

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *OE

Description: Enter the OE (DSL) equipment number (a composite of the equipment type and number).

Required Field.

Valid OE Type Entries

Entry	Definition
A	Software Release: 5E12 and later. INEN - TR-303 on DNU-S.
E	Software Release: 5E12 and later. AIUEN - AIU (Access Interface Unit) ISDN U-Interface).
G	Software Release: 5E9(1) and later. GEN - GAMA IDCU (Integrated Digital Carrier Unit).
I	Software Release: 5E9(1) and later. ISDN Digital (U & T Card) - ISLU (Integrated Services Line Unit).
K	Software Release: 5E10 and later. LCKEN - ISDN ISLU2.
M	Software Release: 5E9(1) - 5E9(2). MEN - IDCU (Integrated Digital Carrier Unit).

If OE is "A", the INEN Equipment Number consists of the following:

TR-303 on DNU-S, Type A

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Line	LINE	XXXX	0001-2048

If OE is "E", the AIUEN Equipment Number consists of the following:

AIU ISDN U-Interface, Type E

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	AIU	XXX	000-127
Pack	PACK	XX	00-19
Circuit	CKT	XX	00-15

If OE is "G", the GEN Equipment Number consists of the following:

IDCU, Type G

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Integrated Digital Carrier Unit	IDCU	XX	00-42
Remote Terminal	RT	XX	01-31
Remote Line	LINE	XXXX	0001-2048

If OE is "I", the LCEN Equipment Number consists of the following:

ISLU, Type I

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
(Remote) Integrated Services Line Unit	(R)ISLU	X	0-7
Line Group Controller	LGC	XX	00-15
Line Card	LC	XX	00-31

If OE is "K", the LCKEN Equipment Number consists of the following:

ISLU2 , Type K

Copyright © 2003 Lucent Technologies

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Integrated Services Line Unit	ISLU2	XX	00 - 42
Line Group	LG	XX	00 - 15
Line Board	LBD	X	0 - 7
Line Circuit	LCKT	XX	00 - 07

Data Rules:
OE TYPE:

A:
If OE is type "A",

- DNU-S DSLs defined on the DSL or MISLINK form which have the same identical entries for the first four digits of the OE (SM,DNUS) and which also have the same DS1 and DS1 TS entries, must also have the same RT (OE[5,6]) and SHELF/CHL GRP (also defined as the first through third digits of the D ISCN) entries.

- D and/or B Channels cannot be assigned to conflicting DS1 time slots or quarter time slots due to manual (vs system) time slot assignments among the DSL, MISLINK, or NAILUP forms.

E:
If OE is type "E",

- DPIDB must be 1 - 5.

- the AIU must be defined on the EQAIUP form with an equipage status of "O" and a type of "AIULP" or "AIURPLP".

- an EQAIU form must be defined with a matching TSGRP NO whose PSU SHLF matches the first digit of the SHELF on the MISLINK form.

G:
If OE is type "G", DPIDB must be 12 - 22.

For the following forms:
- DSL
- LINE
- MISLINK
- MLHLN
- TRUNK

- Originating Equipment Numbers cannot be duplicated on thefor the IDCU (Integrated Digital Carrier Unit) equipment.

- OE ports which have SM/IDCU/RT values (the OE NUMBER[1,7]), then they must correspond to the SM/UNIT NUMBER/RT EX values assigned on an RTERM form (5174 Record). In addition, the DSL, DSLUSR, and MISLINK OE ports must be located on equipment identified on an RTERM form where RT INTERFACE is "TR303".

  - For all TR303 remote terminals, OEs can be assigned to the RT only if the TR303 is equipped (i.e, RT EQSTAT must equal "O" or "G"). In addition, OEs assigned to any TR303 cannot have the assigned line value exceed the RT LINE SIZE on the related RTERM form. (The line value is OE NUMBER[8,11] for an OE TYPE of "G".)

  - All IDCU MISLINKs that have "TR303" remote terminals assigned are prohibited from using the "303ZCS" suppression method, i.e., the SUP MTHD on the RTERM form can not be "303ZC".

Copyright © 2003 Lucent Technologies

If OE type is "G":

- each ISCN or SHELF/CHL GRP/CHL combination must have a proper Packet Switching Unit shelf assigned on the EQIDCU form (5846 Record). The PSU shelf specified by the entry in the SHELF field must be defined on the EQIDCU form with a PIDB TYPE of "PSU".
- on IDCU equipment, when packing QTR TS on an MISLINK form (up to 4 QTR TSs to a TS) on an SM/IDCU/RT (OE NUMBER[1,7])
  - the set of DPIDB, TIMESLOT, DS1 and DS1 TS must each be identical, i.e., DS1 = DS1, etc.).
  - the fields SHELF and CHL GRP (concatenated) must also be the same on all the MISLINK forms in the group. If the DPIDB/TIMESLOT combination is the same on any forms, the DS1/DS1 TS combinations must also be the same across those MISLINK forms.
  - (with known D channel assignments) the assigned QTR TS andthe CHL must be unique across the identical set of forms.

I:
If OE is type "I",
- DPIDB must be 2 - 11
- DS1 and DS1 TS cannot be entered

An OE type of "I" must be defined as an equipped and operational U or T card on the ISLULC form (5942 Record).

For OEs with an OE TYPE of "I" which are assigned a Protocol Handler on the EQPSU form, it is recommended that those equipped in a given SLG (Sub Line Group), belong to the same DSL group (first three digits of ISCN which is a combination of SHELF, CHLGRP, and CHL). An SLG is a set of 4 (R)ISLU LCs (Line Cards) assigned to the same LGC (Line Group Controller). The LCs are (0,2,4,6) or (8,10,12,14) or (16,18,20,22) or (24,26,28,30).

K:
If OE type is "K",

- the assigned TIMESLOT may not be equal to the LG part of the OE or the LG part plus 16.
- DS1 and DS1 TS cannot be entered.
- DPIDB must be 2 - 11.
- Equipment Numbers with OE type of "K" must be defined as an equipped and operational U or T Board on the ISLULB form (5952 Record).

OE NUMBER:

For 5E9(2) and earlier, the value assigned in TERMLIM defines the maximum number of ISDN Terminals that are allowed to be simultaneously active per SM. TERMLIM is a no display field on the EQIM form with a default of 2047. In most cases TERMLIM should be set to this value. The ISDN Terminals are defined as follows:

ISDN Terminal Assignments

Form	SM	Number of Assignments
DSL	OE[1,3]	MTERM defines the quantity of ISDN Terminals per DSL form.

Copyright © 2003 Lucent Technologies

DSLAP	LCEN[1,3]	number of ISDN Terminals is incremented by 1 for each LCEN list element defined.
MISLINK	OE[1,3]	1
OSPSDSL	LCEN[1,3]	1 where SERVICE CLASS is not "XDB"

ACD data links assigned to the same SM must be assigned to different line group controllers.

The OE must be defined on the ISLULC (5942 Record) with an equipage state of Operational and a card type of "PULC", "ULC", or "TLC".

The following form(s) cannot have duplicate Line Card or Line Board assignments:

- DSL - OE
- DSLAP - LCEN
- MISLINK - OE
- OSPSDSL - LCEN/MATE LCEN
- RDTAPORT - OE

The following combination of fields

- OE
- DATA LINK GRP
- DATA LINK NBR

must be unique on MISLINK input forms.

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks). The following applications define the possible LLCB assignments:

		LLCB	
Form	**SM**	**SHELF CHL GRP**	**Increment**
AMLBDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	OE[1,3]	PPB1 ISCN[1,3]	by 1 for each PPB1 ISCN defined.
		PPB2 ISCN[1,3]	by 1 for each PPB2 ISCN defined.
		D ISCN[1,3]	by 1 if a matching DSLUSR form is not found
DSLUSR	OE[1,3]	D ISCN[1,3] on the correspond-ing DSL form	by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered.
			by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
		ODB ISCN1[1,3] ODB ISCN2	by 1 if only ODB ISCN1 is entered.
			by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
DSLAP	LCEN[1,3]	ISCN[1,3]	by 1 for each unique LCEN/ISCN combination.
MISLINK	OE[1,3]	SHELF and CHL GRP	by 1 for each MISLINK form.
OSPSDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined.
			by 1 for each unique OSPSDSL form.
RTERM where RT INTERFACE is "TR303"	SM	ISCN[1,3]	by 2 for each TMC PRI ISCN and each TMC NPRI ISCN entry.
			by 3 for each EOC PRI ISCN and each EOC NPRI ISCN entry.
TRUNK Where TRKCLS is "IFOPER", "IFTERM" or "EDSL"	DEN[1,3]	ISCN[1,3]	1 for each unique TRUNK form.
XAT	DEN[1,3]	ISCN[1,3]	by 1 for each unique XAT form.

The ODA automatic time slot assignment algorithm allocates four TS to each SM/ISLU2/LG configuration for each PIDB from the ISLU2 to the PSU as follows:

- for LGs entered between 0 - 7, the time slots are assigned to odd numbered PSU PIDBs and

Copyright © 2003 Lucent Technologies

- for LGs entered between 8 - 15, the time slots are assigned to even numbered PSU PIDBs (PIDBs are assigned on the EQISLU form).

A SLG (Sub Line Group) is a group of no more than 4 LC (Line Cards) per LGC (Line Group Controller). It is recommended that for every (R)ISLU, SLGs be installed in the following order as growth occurs:

Growth Order Of SLGs

SLG	LGC 5th And 6th Digit Of LCEN	Line Cards Last 2 Digits Of LCEN
0-15	0-15	16, 18, 10, 22
16-31	0-15	08, 10, 12, 14
32-47	0-15	24, 26, 28, 30
48-63	0-15	00, 02, 04, 06

No more than three MISLINK forms can be assigned to a single SM.

For each set of MISLINK forms having equipment numbers with the same SM (first 3 digits of the OE), the set of DATA LINK NBR values must be consecutive starting from 0.

All of the DSLs -
- IDCU DSLs defined on
- DSL
- MISLINK
- and ISLU/ISLU2 DSLs as defined on
- DSL
- DSLAP
- MISLINK
- OSPSDSL

on an SM which have identical entries for the first five digits of the OE for ISLU2 or IDCU or first four digits for ISLU; and which also have the same D REL PIDB and D TIMESLOT entries; must, additionally, have the same
- RT for IDCU
- OE[5,6] for ISLU
- LGC for ISLU2

and SHELF/CHL GRP (also defined as the first through third digits of the [D] ISDN) entries.

For the following applications:

Time Slots Reserved for Applications

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on

Copyright © 2003 Lucent Technologies

	TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

The following data rule is not executed on an SM-2000, because provisioning of nailed-up time slots is not required on an SM-2000.

- For the above applications (except the RPA application), each Data Interface in an SM can have a maximum for 256 nailed-up time slots for a PSU2 or a maximum of 128 nailed-up time slots for a PSU1.

  These time slots can be reserved by setting rows RPTSS0 - RPTSS7 to 1 on the EQPSU form (5741 Record). The quantity of time slots reserved (i.e. the number of entries set to 1) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D channel only takes a quarter of a time slot.

  Also, the reserved time slots must be entered such that for any given SHELF the time slots assigned for a SHELF may be duplicated in the same vertical (column) position only as many times as the SHELF has PIDBs assigned. For example, if SHELF 1 has 2 DI0 PIDBs assigned in the PIDB field, then a given vertical position (0-31) in the DI0 PSU TSIU TIMESLOTs field (RPTSS0 - RPTSS7) may not be used more than twice for that shelf.

- Each Switching Module can have up to 5 PSU SHELFs. On the EQIM form, when UNIT TYPE is not "SM2000" each PSU SHELF can be assigned up to (32 times X) time slots for the above table of applications. (Note: X represents the number of PIDBs, 0 to 4, provisioned per shelf.)

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

2.3 # SERVCLASS

Description: Enter the service class applied to the digital subscriber line specified in the OE (OE for LCENs) field. For this form the only service class supported is "MISLNK" for the Management Information System Link.

Required Field.
Default: MISLNK
Valid Entries: MISLNK

Data Rules:

If "MISLNK" is entered, then CONFIGURATION on the corresponding EQIM form must have a value which supports this SERVICE CLASS value shown in the table for Configurations for Facilities and Applications. (SM on the EQIM form matches the first 3 digits of the OE on the MISLINK form).

2.4 # SHELF

Description: Enter the PSU shelf number where the protocol handler that services the line is located.

Required Field.
Valid Entries: 0 - 4

Data Rules:

Copyright © 2003 Lucent Technologies

Each SM can have up to 5 PSU Shelfs.
Each Shelf can have up to 16 PH (Protocol Handlers).
Each PH can be assigned up to 32 time slots.
On Demand B Channel, Packet B Channel, Packet D Channel, EDSL, IFOPER, and IFTERM on PHs can be assigned on the following forms:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- OSPSDSL
- RTERM
- TRUNK
- XAT

The combination of SM (OE NUMBER[1,3]), SHELF, and CHL GRP must be entered on the PSUGP form (5949 Record).

An ISCN (Integrated Services Channel Number) is the combination of SHELF, CHL GRP, and CHL. ISCNs require a PIDB with a PIDB TYPE of "PSU" assigned on the same Packet Switching Unit shelf on the EQISLU form as the PSU shelf specified by the entry in the SHELF field.

Each ISCN entry must have the SHELF value assigned on an EQPSUPH form (5742 Record) on the same SWITCHING MODULE and having a matching PSU SHELF.

The ISCN must be a unique value within an SM. ISCNs cannot be duplicated on one or more of the following forms:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

- AMLBDSL
- DSL
- DSLAP
- MISLINK
- DSLUSR
- ODBRES
- OSPSDSL
- RTERM
- XAT

with all TRUNK forms which have a TRKCLS of:

Copyright © 2003 Lucent Technologies

- "EDSL"
- "IFTERM"
- "IFOPER"

However, they can not have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of

- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form
- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form.
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2,
- MISLINK - where , SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form.
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is "TAOPER" or "DAOPER".
- XAT - where SHELF/CHL GRP is the first three digits of ISCN.

For 5E11 and later, the following data rules apply for the Automatic ISDN Line Assignment feature (For more information on this feature, see Division 2, Section 1BO).

SHELF, CHL GRP and CHL must all be entered for the existing form tuple in Large Terminal Growth. Former data rules still apply to the existing form tuples in Large Terminal growth.

When SHELF, CHL GRP or CHL is entered, all must be entered.

When SHELF is not entered, DPIDB, TIMESLOT, QTR TS, DS1 and DS1 TS must not be entered.

For a given SM, the SHELF, CHL GRP and CHL fields on a MISLINK form must not be entered when ACT on FOSYS form (5713-2 Record), where FID is 695, is set to "Y".

For a given SM, the SHELF, CHL GRP and CHL fields on a MISLINK form must be entered when ACT on FOSYS form, where FID is 695, is set to "N".

2.5 # CHL GRP

Description: Enter the PSU channel group number of the protocol handler on the PSU shelf.

Required Field.
Valid Entries: 0 - 15

Copyright © 2003 Lucent Technologies

Data Rules:

The ISCN (Integrated Services Channel Number), which consists of the SHELF, CHL GRP and CHL, must exist in the same loaded SM as specified by the OE NUMBER[1,3] on this form.

For 5E11 and later, the following data rules apply for the Automatic ISDN Line Assignment feature (For more information on this feature, see Division 2, Section 1BO).

SHELF, CHL GRP and CHL must all be entered for the existing form tuple in Large Terminal Growth. Former data rules still apply to the existing form tuples in Large Terminal growth.

When SHELF, CHL GRP or CHL is entered, all must be entered.

For a given SM, the SHELF, CHL GRP and CHL fields on a MISLINK form must not be entered when ACT on FOSYS form (5713-2 Record), where FID is 695, is set to "Y".

For a given SM, the SHELF, CHL GRP and CHL fields on a MISLINK form must be entered when ACT on FOSYS form, where FID is 695, is set to "N".

2.6 # CHL

Description: Enter the PSU channel member number of the PH (Protocol Handler) on the PSU shelf.

Required Field.
Valid Entries: 0 - 127

Valid CHL Entries per PH

Entry	PH
0 - 3	PH16
6 - 9	PH16
12 - 15	PH16
0 - 127	PH128

Data Rules:

For 5E11 and later, the following data rules apply for the Automatic ISDN Line Assignment feature (For more information on this feature, see Division 2, Section 1BO).

SHELF, CHL GRP and CHL must all be entered for the existing form tuple in Large Terminal Growth. Former data rules still apply to the existing form tuples in Large Terminal growth.

When SHELF, CHL GRP or CHL is entered, all must be entered.

For a given SM, the SHELF, CHL GRP and CHL fields on a MISLINK form must not be entered when ACT on FOSYS form (5713-2 Record), where FID is 695, is set to "Y".

For a given SM, the SHELF, CHL GRP and CHL fields on a MISLINK form must be entered when ACT on FOSYS form, where FID is 695, is set to "N".

2.7 FWCLI

Description: Enter the FW CLI (Firmware Change Level Indicator) of the digital line being serviced.
Default: 0
Valid Entries: 0

2.8 DPIDB

Description: Enter the DPIB (Directly Connected Peripheral Interface Data Bus) number for ISLU(2) or IDCU SG 0. This data bus is the vehicle that links the D-channel of the DSL, resident on an ISLU(2) or

Copyright © 2003 Lucent Technologies

IDCU in an SM, to the SM's peripheral PSU (Packet Switching Unit).

- ***NOTE:*** The field must be non-zero for DSLs on an ISLU(2) or IDCU but must be zero for DSLs on a RISLU. If the field is left blank the DPIDB value will be chosen by the system.

Valid DPIDB Entries

Entry	Definition
1 - 5	AIU ISDN U-Interface.
2 - 11	ISLU(2); "I" or "K".
12 - 22	IDCU; "G".

Data Rules:

Manually assigned DPIDBs require an EQISLU form with a matching PIDB whose PSU SHELF matches the SHELF entry on this form.

The DPIDB must be previously grown in as a DPIDB before it can be used. For ISLU, the DPIDB is grown using the EQISLU form (5731 Record, RC view 22.5); for IDCU, the DPIDB is grown using the EQIDCU form (5846 Record, RC view 19.12).

DPIDBs must have a corresponding PIDB with a PIDB TYPE of "PSU" assigned on the EQISLU form (5731 Record).

A RISLU does not have a DPIDB. Therefore, DPIDB cannot be entered for an OE which is resident on a RISLU (as opposed to an EQISLU defined ISLU), and which is defined on an EQRISLU input form.

Manually assigned DPIDBs with an OE type of "G", must have the proper PSU Shelf assigned with a matching PIDB NO. on an EQIDCU form (5846 Record). The PSU Shelf number, specified by the SHELF entry, must be defined as DI/PSU SHELF on the matching EQIDCU form and the PIDB TYPE on the EQIDCU form must be "PSU".

2.9 TIMESLOT

Description: Enter a time slot on the DPIDB (Directly Connected Peripheral Interface Data Bus) to carry signals for the D-channel between the ISLU(2) (Integrated Service Line Unit(2) or the IDCU (Integrated Digital Carrier Unit) and a PSU (Packet Switch Unit). If this field is not entered, an available time slot will be automatically assigned. (See also time slot information under the "Time Slot" heading in the "GENERAL" section.)
Valid Entries: Blank (computed automatically), or 0 - 31

Data Rules:

The assigned TIMESLOT is either equal to the LGC part of the DSL OE or the LGC plus 16.

If DS1, DS1 TS or TIMESLOT is entered, all must be entered.

If the DSL is resident on a RISLU, this field must not be entered.

Time slots for a given combination of SM, ISLU(2) or IDCU, and PIDB, may not be duplicated for other DSLs.

DSL lines cannot be assigned duplicate time slots on the following forms:
- DSL
- MISLINK
- RTERM

If the OE defined on a MISLINK form is associated with an EQRISLU form, the TIMESLOT information must not be assigned.

Copyright © 2003 Lucent Technologies

2.10 QTR TS

Description: Enter the D-channel Quarter Time Slot number. All quarter time slots in a time slot must be assigned (if possible) to a time slot before another time slot is used. If this field is not entered, an available QTR TS will be automatically assigned.
Valid Entries: 0 - 3

Data Rules:

Digital subscriber lines cannot be assigned duplicate D-channel quarter time slots.

The quarter time slot may not be duplicated for the same combination of SM, ISLU or IDCU, DPIDB, and TS for another DSL.

The digital subscriber lines must be assigned on local ISLU(2)s, if QTR TS have been assigned.

2.11 # LVL2 PROF

Description: Enter the Level 2 profile. However, for an MIS (Management Information System), this field is used to indicate packet switching. Since packet switching is not yet supported for MIS Links, the only valid value is "DASC" to indicate "no packet switching".

Required Field.
Default: DASC
Valid Entries: DASC

2.12 DS1

Description: Enter the data facility which connects an RT (Remote Terminal) to an IDCU (Integrated Digital Carrier Unit). This field is not used for ISLU(2)s.
Valid Entries: 1 - 28

Data Rules:

If DS1, DS1 TS, or TIMESLOT are entered, all must be entered.

If DS1 or DS1 TS are entered, the following must be entered:
- DPIDB
- DS1
- DS1 TS
- QTR TS
- TIMESLOT

If 1 is entered, DS1 TS cannot be 11 or 23.

The DS1 for a given IDCU RT is assigned by the RTERM form (5174 Record RC view 18.15). On the RTERM form the RT DS1 is connected to an FAC (IDCU Facility) where IFAC is a DS1 number viewed from the IDCU point of view (0 - 39), instead of a DS1 number viewed from the remote terminal point of view (1 - 28). On the RTERM form, the RT DS1 number is called RT Terminal number (RT TERM). If the DS1 is not assigned to an IFAC, no time slot on this DS1 can be assigned to a DSL.

If the OE is defined on a TR303 remote terminal and the DS1 entered on this form corresponds with the IFAC entered in the RT IFAC TERMINATION list on the RTERM form with ROW RT TERM equal to the DS1, then this IFAC can not equal PROT LINE on the same RTERM form.

2.13 DS1 TS

Copyright © 2003 Lucent Technologies

Description: Enter the D channel DS1 time slot number on the DS1 data channel which connects an RT (Remote Terminal) and an IDCU (Integrated Digital Carrier Unit). 24 time slots are available. This field is used to assign one time slot to the D channel for circuit switching or D channel packet switch user. This field is not used for ISLU(2)s.

NOTE: Time Slot 11 and 23 on the number 1 DS1 of a remote terminal is reserved for the IDCU EOC (Embedded Operation Channel) and TMC (Time-slot Management Channel).

Valid Entries: 0 - 23

Data Rules:

If DS1, DS1 TS, or TIMESLOT is entered, all must be entered.

IDCU remote terminal ports cannot be assigned duplicate IFAC (DS1) time slots on the following forms:

- DSL
- MISLINK
- NAILUP
- RTERM

ISDN applications (DSL and MISLINK form) are not allowed when ZCS signaling is used.

EXTERNAL DATA LINK

The following fields (Section 2.14 - Section 2.15) define the external data links.

2.14 # DATA LINK GRP

Description: Enter the data link identification number.
Valid Entries: 1 - 999

Data Rules:

For 5E9(1) - 5E9(2), for each set of MISLINK forms having the same DATA LINK GRP, the set of DATA LINK NBR values must be consecutive starting from 0.

2.15 # DATA LINK NBR

Description: Enter the relative data link number.
Valid Entries: 0 - 2

Data Rules:

For a given SM, the following SHELF, CHL GRP and CHL fields on a MISLINK form must not be entered when ACT on FOSYS form, where FID is 695, is set to "Y" (AILA feature active).

```
mislink                    5ESS SWITCH

SEC. 32C: 5638 RECORD
ACD SERVING TEAM PARAMETERS - STPARM

1. GENERAL

The 5638 Record is available with 5E11 and later Software Releases. It is to provide information about a serving team. A serving team is a group of agent positions that services one or more call queues. This form supports the ACD/BRCS Interworking II feature. For more information on the ACD/BRCS feature see Division 2, Section 4A121.

1.1 Recent Change View

The corresponding Recent Change View for this form is 6.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SERVING TEAM

Description: Enter the number of the serving team that will service this call queues.

Required Field.
Valid Entries: 1 - 999

2.3 SA Q

Description: Enter the service assistance call queue number. This number allows the serving team to conference with a service assistant associated with the call queue. If this field is not entered, it indicates that no service assistance is available.
Valid Entries: 1 - 999

Data Rules:

If SA Q entered, the value must be defined as a CALL QUEUE on a CQPARM form (5640 Record).

2.4 EMRG CF

Description: Does this team have a conference capability on an emergency call queue? If "Y" is entered in this field, this team has conference queue capability during an emergency call. When the EMRG button is pressed at an agent position, a conference call is set up with an emergecy assistant associated with an emergency call queue.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, EMRG CF Q must be entered.

If "N" is entered, EMRG CF Q must not be entered.

2.5 EMRG CF Q

Copyright © 2003 Lucent Technologies

Description: Enter the emergency conference call queue number, if emergency call conference capability is available.
Valid Entries: 1 - 999

Data Rules:

IF EMRG CF Q entered, the value must be defined as a CALL QUEUE on a CQPARM form.

2.6 INTRAFLOW ALW

Description: Is this serving team allowed to receive intraflowed calls?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered:

- PCT INTRAFLOW must be entered.
- INTRAFLOW ALW on the ACDBPARM form is set to "Y".

2.7 PCT INTRAFLOW

Description: This field indicates the maximum percentage of currently logged-in agents of this serving team that is allowed to handle calls from supporting calls queues.
Valid Entries: 1 - 100 (%)

2.8 AFTER CALL WK

Description: Should the after-call work-state (auto make busy) be allowed? If "Y" is entered, then the ACD/BRCS position enters the "Make Busy with ACD call" state whenever the agent answers a hunted call. For more information on the ACD/BRCS feature see Division 2, Section 4A121.

Required Field.
Default: N
Valid Entries: Y, N

2.9 LIVE MIKE

Description: Should a live mike be allowed during service observing? If "Y" is entered then the ACD/BRCS service observer is by default given a 2-way connection when service observing. If "N" is entered, then the ACD/BRCS service observer is by default given a 1-way connection when service observing.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the Live Mike secured feature must be purchased, therefore, the ACT field for SFID 4 must be set to "Y".

2.10 WARN TONE

Copyright © 2003 Lucent Technologies

Description: This field specifies whether, during an ACD/BRCS service observe session, a warning tone is provided to the observed agent, or it is provided to the observed agent and far party, or it is not provided to either the agent or the far party. No entry in this field indicates a warning tone is not provided.

Valid WARN TONE Entries

Entry	Definition
1ALL	A warning tone is provided once to the agent and the far end.
AGENT	Only the agent being observed hears a warning tone.
ALL	The agent being observed and far end hear a warning tone.

2.11 # TGID

Description: Enter the Terminal Group Identification used to assign the serving team to an ACD/BRCS customer.

Required Field.
Valid Entries: 1 - 65535

Data Rules:

The TGID entered on this form must be defined as a GROUP ID on either the TGSRFD, TGSRLPA, TGSRMPA, TGSRTPA or BFG form.

2.12 ACD GROUP

Description: Enter the sub-terminal group which allows customers (or end-users) to divide their call centers into smaller groups. This allows different groups to exist within the same ACD customer with the same level of security that exists between different ACD customers. Security, in this case, refers to the agents' inability to log-in to ACD groups other than the one to which they are assigned.

Required Field.
Default: 001
Valid Entries: 1 - 999

2.13 E911 PSAP

Description: Is this an ACD E911 Public Safety Answering Point serving team?

Required Field.
Default: N
Valid Entries: Y, N

SEC. 32D: 5639 RECORD
ACD AGENT ID ASSIGNMENT - AGNTID

1. GENERAL

The 5639 Record is available with 5E11 and later Software Releases. It is used to associate an Agent ID with a serving team. Multiple agents are typically assigned to a given serving team. In addition, this form specifies if the agent has monitoring capabilities and, if so, the password required to enable the monitoring (service observing) capabilities. This form supports the ACD/BRCS Interworking II feature. For more information on this feature, see Division 2, Section 4A121.

The value specified in the SERVING TEAM field must be defined on the STPARM form (5638 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 6.3

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * AGENT ID

Description: Enter the agent login identification.

Required Field.
Valid Entries: 1 - 32768

2.3 # SERVING TEAM

Description: Enter the serving team number to which this agent is assigned.

Required Field.
Valid Entries: 1 - 999

Data Rules:

The SERVING TEAM must be defined on an STPARM form (5638 Record).

2.4 MON PERMISSION

Description: Does this agent have permission to monitor (service observer) other agents?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then PASSWORD must be entered.

2.5 PASSWORD

Description: Enter the 6-digit password required by the agent to perform monitoring.
Valid Entries: 6 digits from 0 - 9

SEC. 32E: 5640 RECORD
ACD CALL QUEUE PARAMETERS FORM - CQPARM

1. GENERAL

The 5640 Record is available with the 5E11 and later Software Releases. It is used to assign administrative data to be applied to call queues. All serving teams specified on the SERVING TEAM field must be defined on the STPARM form (5638 Record, RC View 6.1).

This form supports the ACD/BRCS Interworking II feature. For more information on this feature, see Division 2, Section 4A121.

1.1 Intraflow Background Information

The supporting teams are searched in order until either

- the queue delay of the call does not exceed a delay outflow threshold of a supporting serving team,
- the call checks all its supporting teams without success,
- or the call is assigned to a serving team.

For example:

Assume the following for a call arriving for call queue 1:

- Call queue one has serving team 2 as the principal serving team and supporting serving teams 3 and 4, with delay outflow thresholds of 5 and 15, respectively.
- Call queue one has two calls on queue and there are no available servers on principle team 2.
- The call at the head of call queue one has waited 17 seconds.
- Serving team 3's threshold is 50% for maximum percentage of currently logged-in operators allowed to handle calls from supporting call queues (PCT INTRAFLOW on STPARM form). It has four agents logged-in and two are busy with calls from supporting serving teams.
- Serving team 4's team threshold is 75%. It has ten agents logged-in. One is busy with a call from a supporting queue. The new call is queued because other calls are already queued.

The ACD (Automatic Call Distributor) checks the call at the head of the queue and finds that it has waited longer than the delay outflow threshold for the first supporting serving team 3. The call cannot be intraflowed to team 3, because doing so would cause more than 50% of the agents on the serving team to be handling calls from supporting queues simultaneously. So, the ACD checks the next supporting team. The call has also waited longer than the delay outflow threshold for its second supporting team team 4. The call is intraflowed to team 4 because team 4 will have only 20% of its agents handling calls from its supporting queues, which is much less than its team threshold of 75%.

1.2 Recent Change View

The corresponding Recent Change View for this form is 6.4

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and the Office Name on each record.

2.2 * CALL QUEUE

Description: Enter the ACD (Automatic Call Distributor) call queue number.

Required Field.
Valid Entries: 1 - 999

Data Rules:

CALL QUEUE(s) that are defined on this form and have a SERVING TEAM entered and one or more SUP TEAM(s) entered, then each SERVING TEAM and SUP TEAM must be defined on the STPARM form with the same E911 PSAP value.

2.3 SERVING TEAM

Description: Enter the principal serving team number for the call queue.
Valid Entries: 1 - 999

Data Rules:

If a value is entered for SERVING TEAM, then it must be defined as a SERVING TEAM on the STPARM form (5638 Record).

2.4 # CD RTI

Description: Enter the route index for the close-down announcement.

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

An entry for CD RTI must be defined as a ROUTE INDEX on the RTIDX form. In addition, the RTIDX form must have an entry for TRUNK GROUP NUMBER. The TRUNK GROUP NUMBER must be defined as TGN on a TKGRP form with TRK DIR set to "ANN" or "OUT", and LOCAL SM must be unknown.

2.5 # ANN1 RTI

Description: Enter the first delay announcement route index.

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

An entry for ANN1 RTI must be defined as a ROUTE INDEX on the RTIDX form. In addition, the RTIDX form must have an entry for TRUNK GROUP NUMBER. The TRUNK GROUP NUMBER must be defined as TGN on a TKGRP form with TRK DIR set to "ANN" and LOCAL SM must be unknown.

2.6 # ANN2 RTI

Copyright © 2003 Lucent Technologies

Description: Enter the second delay announcement route index.

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

An entry for ANN2 RTI must be defined as a ROUTE INDEX on the RTIDX form. In addition, the RTIDX form must have an entry for TRUNK GROUP NUMBER. The TRUNK GROUP NUMBER must be defined as TGN on a TKGRP form with TRK DIR set to "ANN" and LOCAL SM must be unknown.

2.7 # ANN3 RTI

Description: Enter the third delay announcement route index.

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

An entry for ANN3 RTI must be defined as a ROUTE INDEX on the RTIDX form. In addition, the RTIDX form must have an entry for TRUNK GROUP NUMBER. The TRUNK GROUP NUMBER must be defined as TGN on a TKGRP form with TRK DIR set to "ANN" and LOCAL SM must be unknown.

2.8 CQ NAME

Description: Enter up to ten characters for the Call Queue name. This name must be unique for all call queues on the switch.
Valid Entries: 1 - 10 aphanumeric characters

Data Rules:

The CQ NAME entries on the CQPARM form must be unique.

2.9 SERV OBJ

Description: Enter the average delay in tenths of a second that calls of this type should expect before reaching a server.
Default: 100 (tenths of a second)
Valid Entries: 1 - 600 (tenths of a second)

2.10 MAX CALLS

Description: Enter the maximum number of calls allowed in the call queue. The sum of MAX CALLS for all call queues on the switch cannot exceed 40,000.
Valid Entries: 0 - 40000

Data Rules:

The sum of MAX CALLS on all CQPARM forms cannot exceed the maximum value of 40,000.

2.11 CWON SEC

Copyright © 2003 Lucent Technologies

Description: Enter the elapsed time in seconds, during a queue delay, after which the call waiting indicator will be displayed at the serving team positions for this call queue.
Default: 11 (seconds)
Valid Entries: 1 - 1800 (seconds)

Data Rules:

CWON SEC must be greater than CWOFF SEC.

2.12 WCOFF SEC

Description: Enter the elapsed time in seconds, during a queue delay, after which the call waiting indicator will not be displayed at the serving team positions for this call queue.
Default: 9 (seconds)
Valid Entries: 1 - 1800 (seconds)

2.13 CQ STATE

Description: Enter the availability of the call queue.

Required Field.
Default: CLOSED
Valid Entries:

Valid CQ STATE Entries

Entry	Definition
CLOSED	Call queue is not available
OPEN	Call queue is available
TOD	Call queue availability depends on the Time of Day.

Data Rules:

If CQ STATE is not "CLOSED", SERVING TEAM must be entered.

If "TOD" is entered, STATE in the CALL QUEUE TOD LIST must have an entry for every day of the week.

2.14 DEL1 THR

Description: Enter the threshold of the number of seconds of delay before the first announcement is played. 0 is used to force the first announcement.

Required Field.
Default: 15
Valid Entries: 1 - 1800 or 0 seconds

Data Rules:

DEL1 THR must be less than DEL2 THR.

2.15 DEL2 THR

Description: Enter the threshold of the number of seconds of delay before the second announcement is played.

Required Field.
Default: 40 (seconds)
Valid Entries: 1 - 1800 (seconds)

Data Rules:

Copyright © 2003 Lucent Technologies

DEL2 THR must be less than DEL3 THR.

2.16 DEL3 THR

Description: Enter the threshold of the number of seconds of delay before the third announcement is played.

Required Field.
Default: 60 (seconds)
Valid Entries: 1 - 1800 (seconds)

2.17 INTRAFLOW ALW

Description: Is intraflow allowed for this call queue? This field indicates whether the call queue may intraflow calls to other serving teams. Intraflow allows an ACD administrator to designate for each call queue a single principal serving team and up to 8 supporting serving teams with associated delay outflow thresholds.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered:

- at least one SUP TEAM must have a value of 1 - 999.
- SUP TEAMs in SUPPORT TEAM LIST which are defined on an STPARM form must have INTRAFLOW ALW set to "Y" on the STPARM form.

2.18 QUEUE BUSY

Description: Should a busy tone be given when call queue is full? This field indicates if busy tone should be given, instead of announcement or re-order, when a call is routed to the specified call queue and there are no queue slots available for that queue.

Required Field.
Default: N
Valid Entries: Y, N

2.19 DELAY BUSY

Description: Should a busy tone be given when delay threshold is exceeded? This field indicates if busy tone should be given, instead of announcement or re-order, when the "DEL3 THR" threshold for the specified call queue has been exceeded.

Required Field.
Default: N
Valid Entries: Y, N

2.20 TGID

Description: The TGID field displays the TGID (Terminal Group Identifier) (if it is assigned) to an ACD/BRCS serving team on the RC View 6.4. (It is not displayed on this ODA form.) When a TGID is assinged on the STPARM form (RC View 6.1), and that serving team is associated with a CALL QUEUE

Copyright © 2003 Lucent Technologies

on this form, then any subsequent updates of the TGID value on View 6.1 will cause the terminal group to be updated for all the CALL QUEUEs that are associated with the SERVING TEAM having this TGID.
Valid Entries: 1 - 65535

2.21 ACD GROUP

Description: This is a Recent Change only field to display the ACD group identification. This field uniquely identifies a sub-terminal group to allow call centers to be divided into smaller groups. This allows different groups to exist within the same ACD customer with the same level of security that exists between different ACD customers.
Default: 1
Valid Entries: 1 - 999

Q DIALING

The following field (Section 2.22) applies to queue-dialed calls.

2.22 ACD OR DAA TN

Description: This is a Recent Change display-only field. The automatic call distribution or direct agent access telephone number to the call queue is displayed on the 6.4 RC View, if it has been assigned. This field is assigned by setting the Q DIALING TN field on RC View 6.10 (ACDTN form 5631-1 Record). When the Q DIALING TN field on View 6.10 is set to "N", then no value will be displayed in this field on the RC View 6.4. The ACD OR DAA TN is not displayed on this ODA form.

SUPPORT TEAM LIST (SUPTEAMLIST)

The following fields (Section 2.23 - Section 2.24) list supporting serving team numbers and dealy thresholds for supporting teams. A call queue may have 0 - 8 supporting serving teams.

2.23 SUP TEAM

Description: Enter the supporting serving team number for the intraflow supporting team.
Valid Entries: 1 - 999

Data Rules:

The supporting serving team entered in SUP TEAM, must not equal the value entered in SERVING TEAM.

SUP TEAM entries must be unique. Supporting serving team numbers must be unique.

When SUP TEAM in SUPTEAMLIST is entered, SERVING TEAM must be entered.

Each SUP TEAM in SUPPORT TEAM LIST assigned on a CQPARM form must be defined on an STPARM form.

Each SERVING TEAM and SUP TEAM assigned on this form must be defined on the STPARM form with the same E911 PSAP value.

2.24 DELAY THRSH

Description: Enter the delay outflow threshold in seconds for intraflow to the supporting serving team. See Intraflow Background Information under the GENERAL section.
Valid Entries: 0 - 1800 (seconds)

Data Rules:

If DELAY THRSH is greater than 0, the corresponding SUP TEAM must contain a value of 1 - 999.

Copyright © 2003 Lucent Technologies

DELAY THRSH 8 must be greater than or equal to DELAY THRSH 7, DELAY THRSH 7 must be greater than or equal to DELAY THRSH 6, DELAY THRSH 6 must be greater than or equal to DELAY THRSH 5, DELAY THRSH 5 must be greater than or equal to DELAY THRSH 4, etc.

CALL QUEUE TOD LIST (CQTODLIST)

The following fields (Section 2.25 - Section 2.28) list the call queue availability states, begin times and end times for call queues that are available depending on the TOD (Time Of Day).

2.25 DAY

Description: The day of the week is given at the beginning of the Call Queue TOD list.
Valid Entries: SUN, MON, TUE, WED, THR, FRI, SAT

2.26 STATE

Description: Enter the call queue time of day availability state of the call queue.

Valid TOD STATE Entries

Entry	Definition
CLSD	Closed state
OEXC	Open exclusive state - closed between begin time and end time
OINC	Open inclusive state - open between begin time and end time, closed otherwise.

Data Rules:

If STATE is not entered, BEGIN TIME and END TIME must not be entered.

If "CLSD" is entered and BEGIN TIME or END TIME is entered, both must be entered and BEGIN TIME must be less than END TIME.

If "OINC" or "OEXC" is entered, then BEGIN TIME and END TIME must both be entered and BEGIN TIME must be less than END TIME.

2.27 BEGIN TIME

Description: Enter the beginning time for the call queue time of day availability for this call queue. The time is specified in military time, which is a 24 hour HHMM format, where HH:00 - 23 MM:00 - 59. For example, 2315 hours is 11:15 P.M. and 0000 is 12:00 A.M..
Valid Entries: 0000 - 2359

2.28 END TIME

Description: Enter the ending time for the call queue time of day availability for this call queue. The time is specified in military time, which is a 24 hour HHMM format, where HH:00 - 23 MM:00 - 59. For example, 2315 hours is 11:15 P.M. and 0000 is 12:00 A.M..
Valid Entries: 0000 - 2359

SEC. 32F: 5641 RECORD
ACD SEIZURE DISPLAY - SZDISP

1. GENERAL

The 5641 Record is available with the 5E11 Software Release. This form defines the display parameters provided when the operator position is seized for an incoming ACD/BRCS call. This form supports the ACD/BRCS Interworking II feature. For more information on this feature, see Division 2, Section 4A121.

1.1 Recent Change View

The corresponding Recent Change View for this form is 6.5

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * DISPX

Description: Enter the display index.
Valid Entries: 1 - 2047

TEXTUAL DISPLAY

The following field defines the text display.

2.3 DISPLAY

Description: Enter text of up to ten characters that are displayed at the agent position when the position is seized. Only alphanumeric, -, / characters or blank may be entered.
Valid Entries: 1 - 10 alphanumeric characters, -, /, or blank

CALLING/CALLED NUMBER DISPLAY

The following fields (Section 2.4 - Section 2.5) define the display for the calling or called number.

2.4 DN START

Description: Enter the calling or called number display start. The first digit of the incoming dialed digits that is displayed on the agent terminal must be specified.
Valid Entries: 1 - 10

Data Rules:

If DN START is entered, DN LENGTH must be entered.

If DN START is not entered, DN LENGTH must not be entered.

The sum of DN START and DN LENGTH must be less than or equal to 11. A maximum of 10 characters are allowed for display.

2.5 DN LENGTH

Description: Enter the calling or called number display length. This specifies the number of digits to be displayed on the agent terminal. The sum of DN START and DN LENGTH cannot be greater than the

Copyright © 2003 Lucent Technologies

number of digits remaining after digit analysis, plus one.
Valid Entries: 1 - 10

DISPLAY CALLING/CALLED DN

The following fields (Section 2.6 - Section 2.7) define parameters for the display of the calling or called directory number.

2.6 CALLING DN

Description: Is the calling number directory number displayed?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered,
- CALLED DN must be "N".
- DN START must be entered.

2.7 CALLED DN

Description: Is the called number directory number displayed?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, DN START must be entered.

SEC. 32H: 5643 RECORD
ACD CALL VECTORS FORM - ACDVCT

1. GENERAL

The 5643 record is available with 5E11 and later Software Releases. This form is used to define the Call Vectoring steps that determine how an incoming call is to be treated while waiting for a ACD (Automatic Call Distributor) agent. This form supports the ACD/BRCS Interworking II feature. For more information on this feature, see Division 2, Section 4A121.

This record is used to identify the vector steps to be applied to a call that has been routed for call vectoring. Included among the steps that can be applied to a call are:

- placing the call in queue,
- playing an announcement or music,
- rerouting the caller to an alternate destination or
- branching to another step within the current vector or to a step in a different vector.

1.1 Activate the Feature

To apply Call Vectoring treatment to a call, the ACTIVATE field must be set to "Y". If the initial vector is not activated, all calls associated with that vector receive standard queueing and delay treatment.

1.2 Redirecting the Vector

The REDIR VECTOR field diverts calls to another VECTOR ID to receive alternate Call Vectoring treatment. If the vector specified in the redirection parameter does not exist, the call is placed in its call queue and receives standard queueing and delay treatment. Only one level of redirection is permitted. If the second vector also has a VECTOR ID populated in its REDIR VECTOR field, the second redirection is ignored and the call is provided with Call Vectoring treatment as defined by the second vector.

The initial vector, which redirects to another vector, must be activated. Any vector steps that are associated with a vector referenced during branching to a second vector are performed regardless of the activation state of the second vector.

1.3 Chaining Vectors

On a single ACDVCT form, up to 15 steps or commands can be identified in each vector. However, longer step sequences can be created by chaining vectors together using GOTO commands. The table in Figure 1 Call Vectoring Commands and Associated Arguments, displays the vector commands and their corresponding arguments to allow for the proper handling of the vector command.

The office maximum limits for the vector steps are set on the ACDBPARM form (5645 Record). Only one ACDBPARM form is entered per office.

Examples of Call Vectoring are given in Figures 2 and 3 at the end of this section.

1.4 Recent Change View

The corresponding Recent Change view for this form is 6.7.

2. BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control number and office name on each record.

2.1 * VECTOR ID

Description: Enter the call vector number.

Required Field.
Valid Entries: 1 - 2048

2.2 ACTIVATE

Description: Should this vector be activated? Enter "Y" to activate this vector; enter "N" to deactivate it. When this attribute is "N", all calls assigned to this vector receive standard queueing and delay treatment.

Required Field.
Default: N
Valid Entries: Y, N

2.3 REDIR VECTOR

Description: Enter the alternate Vector ID for redirection. Calls that would ordinarily receive call vectoring treatment on this form are redirected to the alternate vector number, defined on another ACDVCT form.
Valid Entries: 1 - 2048

Data Rules:

If the REDIR VECTOR is entered, then another ACDVCT form must exist which has a VECTOR ID equal to the REDIR VECTOR value on this form.This field entry cannot equal the VECTOR ID on this form.

CALL VECTOR STEPS

The following fields (Section 2.4 - Section 2.10) define the call vectoring steps for this VECTOR ID.

2.4 CMD CD

Description: Enter the call vector command code for steps 1 -15. This field defines the function to be performed by this vector step.

Valid CMD CD Entries

Entry	Definition
ANNOUNC	Connect call to announcement. This command is used to route a caller to an announcement identified by the RTI (Route Index). An optional error step may be defined to provide alternate treatment to the caller when an announcement channel cannot be obtained. If no error step is specified, vector processing will continue on to the next step.
ANSWER	Return answer supervision. This command is used to return answer supervision if it has not yet been returned.
BUSY	Forced busy. This command is used to disconnect a caller from any active delay treatment, remove the caller from queue and return busy tone to the caller prior to disconnecting the call. This command causes the call to be removed from vector processing.
DISC	Forced disconnect. This command is used to disconnect a caller from any active delay treatment, remove the caller from queue and optionally route the caller to an announcement prior to disconnecting the call. This command causes the call to be removed from vector processing. See ANNOUNC command for routing to an announcement.
GOTO	Unconditional GOTO. This command is used to unconditionally branch to a step in the current vector or to a step in another vector.

Copyright © 2003 Lucent Technologies

GOTOAGE	Conditional GOTO based on the age of the call at the head of a queue. This command is a conditional GOTO step used to branch to a step in the current vector or to a step in another vector when the specified condition is met. The decision to branch is based on the age of the first call in the specified Call Queue (length of time the first call has been in that queue). An optional error step can be executed if the AM/CMP is in overload or the query for the queue status fails. If the query for the queue status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the age of the first call in queue is greater than 8191 seconds.
GOTOAVL	Conditional GOTO based on available agents. This conditional GOTO command is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on the current number of agents who are not busy with a call or made busy in the specified Serving Team. An optional error step can be executed if the AM/CMP is in overload or the query for the serving team status fails. If the query for the serving team status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the number of available agents is zero.
GOTODLY	Conditional GOTO based on expected delay. This command is a conditional GOTO step used to branch to a step in this VECTOR ID or to a step in another VECTOR ID when the specified condition is met. The decision to branch is based on the expected delay for attaching a caller to an agent for calls in the specified Call Queue. An optional error step can be executed if the AM/CMP is in overload or the query for the queue status fails. If the query for the queue status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the expected delay for calls in the queue to be serviced is greater than 8191 seconds.
GOTODOW	Conditional GOTO based on the day of the week. This conditional GOTO command is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on the current Day-of-Week. One of five conditions can be identified: the current day is Less than or Equal to, "LE", Greater Than, "GT" or Equal to, "EQ", the specified day or the current day is Included in, "IN" or Excluded from, "EX", the specified day range. If the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed.
GOTONUM	Conditional GOTO based on TOUCH-TONE number(s) entered by caller. This command is used in conjunction with the PROMPT command to provide branching on caller-entered digits. It is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on evaluation of the digits entered by the caller.
GOTOQUE	Conditional GOTO based on the number of calls in a queue. This command may branch to a step in the current vector or to a step in another vector if the number of calls that currently reside in the specified Call Queue is greater than "GT", less than "LE" or equal to "EQ", the specified amount in CARG2. An optional error step can be executed if the AM/CMP is in overload or the query for the queue status fails. If the query for the queue status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this vector ID is executed. If an error step is not specified, the condition is evaluated assuming that number of calls in queue is greater than 40,000.
GOTOSTA	Conditional GOTO based on staffed agents. This command is a conditional GOTO step used to branch to a step in the current vector or to a step in another vector when the specified condition is met. The decision to branch is based on the current number of agents logged-in to the specified Serving Team. An optional error step can be executed if the AM/CMP is in overload or the query for the serving team status fails. If the query for the serving team status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the number of agents logged-in is zero.

Copyright © 2003 Lucent Technologies

GOTOTOD	Conditional GOTO based on the time of day. This conditional GOTO command is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on the current Time-of-Day. One of four conditions can be identified: the current time is Less than or Equal to, "LE" or Greater Than "GT", the specified time or the current time is Included in "IN" or Excluded from, "EX" the specified time range. If the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed.
MUSIC	Delay caller with music. This command provides delay treatment to a caller by routing the call to a music source identified by the Route Index. The route index must be valid and correspond to a terminating port. This route index is also owned by the ACD/BRCS customer. An optional error step may be defined to provide alternate treatment to the caller if a music channel cannot be obtained. If the route attempt to the music source is unsuccessful and no error step is specified, the caller is provided with audible ring. The length of time that music is to be provided to the caller may be defined.
NOOP	No operation. This is the initial state for vectoring commands. This command can be used to temporarily disable steps rather than deleting them. The given step(s) remains intact but they are passed over during vector processing rather than executed.
PROMPT	Prompt caller for a number via TOUCH-TONE digit entry. This feature provides ACD customers with the ability to route callers to an announcement prior to delivery to an agent. The announcement is used to prompt callers for Touch-Tone input. The PROMPT command is a secured feature. The PROMPT command will not be activated until the ACT field for SFID 41 must be set to "Y" on the SFSYS form. See Division 2, Section 4A41 for more information on this feature. See also, Vector Prompt Enhancements (SFID 138) in Division 2, Section 4A138.
QUEUE	Queue or transfer call. This command causes a call to be placed in queue if it is not in a queue or transferred to the identified queue if the call has been queued. An error step is executed if the queue attempt fails either because the AM/CMP is in overload or the call could not be queued (e.g. the queue is full).
QUIET	Delay caller with silence. This command provides delay treatment to a caller in the form of silence. The length of time that silence is provided to the caller must be specified.
REQRTE	Request route call vectoring command for Third Party Call Control. The REQRTE command is a secured feature (SFID 222) used to route calls to another destination based on the routing information sent by the customer's host computer to the switch. Routing choices allow the system administrator of the host computer to specify a 1 - 10 digit TN, an ACD/BRCS call queue ID, an ACD/BRCS vector ID, or an ACD/BRCS agent ID. See Division 2, Section 4A222 for more information.
RING	Delay caller with audible ring. This command provides delay treatment to a caller in the form of audible ring.
ROUTE	Route call to remote destination. When this command is executed, the call is removed from queue and vector processing is terminated. ARG1 for the ROUTE step is the Destination Number Index and must be defined in the ACDVCTN form (5644 Record). The ACDVCTN form assigns either a 1 - 15 digit telephone number for routing the call. The intended use of this command is to reroute calls to another destination when the queue is either closed or full and cannot handle the call.
STOP	Stop vector processing. This command is used to halt further vector processing. If the call has not been queued, the caller is provided with reorder. If the call has been queued, any active delay treatment continues and the call remains in queue. The call remains in this state until the caller abandons or the caller is attached to an agent.

Data Rules:

ANNOUNC:

Copyright © 2003 Lucent Technologies

If "ANNOUNC" is entered:
- ARG1 must be a valid route index:
  - For 5E12 and earlier: 1 - 4095
  - For 5E13 and later: 1 - 16382
- The following must not be entered:
  - ARG2
  - CARG1
  - CARG2, or
    for 5E12 and later, CARG2 must be 1 - 165 (for the Immediate Start Announcement feature) or not entered
  - COND

If "ANNOUNC" or "DISC" is entered on the ACDVCT form, ARG1 of the same CALL VECTOR STEP on this form must match ROUTE INDEX on a RTIDX form where CI ROUTE TYPE is "GENANN" and TRUNK GROUP NUMBER is entered.
The TRUNK GROUP NUMBER on the RTIDX form must be defined as TGN on a TKGRP form with
- TRK DIR set to "ANN", and
- CYCLES must be greater than 0.

In addition, there must be a TRUNK form defined for this TKGRP where TGN on the TKGRP form matches TGN on the TRUNK form and MEMB is 0.

For 5E12 SU and later, if "ANNOUNCE", "DISC", or PROMPT is entered, and CARG2 is entered with a value from 1 - 165, ARG1 must be defined as ROUTE INDEX on the RTIDX form and each of the RTIDX forms must have a TRUNK GROUP NUMBER that corresponds to a TGN on the TKGRP form where IMM START ANN is "Y".

ANSWER:
If "ANSWER" is entered, the following cannot be entered:
- ARG1
- ARG2
- CARG1
- CARG2
- COND
- ERR

BUSY:
If "BUSY" is entered, the following cannot be entered:
- ARG1
- ARG2
- CARG1
- CARG2
- COND
- ERR

DISC:
If "DISC" is entered:

Copyright © 2003 Lucent Technologies

- ARG1 must be a valid route index:
  - For 5E12 and earlier: 1 - 4095
  - For 5E13 and later: 1 - 16382
- The following must not be entered:
- ARG2
- CARG1
- CARG2, or
  for 5E12 and later, CARG2 must be 1 - 165 (for the Immediate Start Announcement feature) or not entered
- COND
- ERR

If "DISC" or "ANNOUNC" is entered on the ACDVCT form, ARG1 of the same CALL VECTOR STEP on this ACDVCT form must match ROUTE INDEX on a RTIDX form where CI ROUTE TYPE is "GENANN" and TRUNK GROUP NUMBER is entered.
The TRUNK GROUP NUMBER on the RTIDX form must be defined as TGN on a TKGRP form with
- TRK DIR set to "ANN", and
- CYCLES must be greater than 0

In addition, there must be a TRUNK form defined for this TKGRP where TGN on the TKGRP form matches TGN on the TRUNK form and MEMB is 0.

For 5E12 SU and later, if "DISC", "ANNOUNCE", or PROMPT is entered, and CARG2 is entered with a value from 1-165, ARG1 must be defined as ROUTE INDEX on the RTIDX form and each of the RTIDX forms must have a TRUNK GROUP NUMBER that corresponds to a TGN on the TKGRP form where IMM START ANN is "Y".

GOTO:
If "GOTO" is entered,
- either ARG1 must not be entered, or
- it must be a valid vector number: 1 - 2048.
- ARG2 must be a valid step number: 1 - 15.
- The following must not be entered:
  - CARG1
  - CARG2
  - COND
  - ERR

GOTOAGE If "GOTOAGE" is entered:
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048.
- ARG2 must be a valid step number: 1 - 15.
- CARG1 must be a valid queue number: 1 - 999
- CARG2 must be a valid queued-call-age
- threshold: 1 - 8191
- COND must be a valid condition: "GT" or "LE"

Copyright © 2003 Lucent Technologies

If "GOTOQUE", "GOTOAGE" or "GOTODLY" is entered, one CQPARM form must be entered where CALL QUEUE equals CARG1 of that same CALL VECTOR STEP on this form.

GOTOAVL:
If "GOTOAVL" is entered:
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048.
- ARG2 must be a valid step number: 1 - 15
- CARG1 must be a serving team: 1 - 999
- CARG2 must be a valid serving team
- threshold: 0 - 9999
- COND must be a valid condition: "GT" or "LE"

If "GOTOSTA" or "GOTOAVL" are entered, then one STPARM form must be entered where SERVING TEAM equals CARG1 of that same CALL VECTOR STEP on this form.

GOTODLY:
If "GOTODLY" is entered:
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048.
- ARG2 must be a valid step number: 1 - 15.
- CARG1 must be a valid queue number: 1 - 999
- CARG2 must be a valid queued-call-age
- threshold: 1 - 8191
- COND must be a valid condition: "GT" or "LE"

If "GOTOQUE", "GOTOAGE" or "GOTODLY" is entered, one CQPARM form must be entered where CALL QUEUE equals CARG1 of that same CALL VECTOR STEP on this form.

GOTODOW:
If "GOTODOW" is entered:
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048
- ARG2 must be a valid step number: 1 - 15
- CARG1 must be a valid day of week: 1 - 7
- ERR must not be entered.
- COND must be a valid condition:
-
    - "EQ", "EX", "GT", "IN", or "LE"
    - if COND is "IN" or "EX" then:

      CARG2 must be a valid day of week1 - 7
    - if COND is "EQ", "GT", "LE" then:

      CARG2 must not be entered.

GOTONUM:
If "GOTONUM" is entered
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048
- ARG2 must be a valid step number: 1 - 15

Copyright © 2003 Lucent Technologies

- CARG1 must be a valid number of digits: 0 - 32.
- CARG2 must be a valid number of
- digits value: 0 - 16
- COND must be a valid condition: "EQ", "GT",
- or "LE"

If an entry is made in the CARG1 field, the entry specifies the caller-entered digit to be examined as part of the conditional evaluation. If no entry is made in this field, the first digit is examined.

Vector Processing branches to the step specified by the optional error step of a GOTONUM command when the number of caller-entered digits is less than the value populated in the CARG1 field. When this occurs, the branch occurs immediately and evaluation of the condition is bypassed. If no error step is identified, the condition is evaluated even if the specified number of digits are not entered by the customer (the digits not entered by the caller are padded with 'empty' digits and used in the evaluation).

The entry in the CARG2 field identifies a digit value which is used in the evaluation of the condition. This value is compared against the specified caller-entered digit (or the first digit if no entry exists in the CARG1 field) to determine if the condition evaluates to TRUE or FALSE.

GOTOQUE:
If "GOTOQUE" is entered,
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048
- ARG2 must be a valid step number: 1 - 15
- CARG1 must be a valid queue number: 1 - 999
- CARG2 must be a valid calls-in-queue
- threshold: 0 - 40000
- COND must be a valid condition: "GT" or "LE"

If "GOTOQUE", "GOTOAGE" or "GOTODLY" is entered, one CQPARM form must be entered where CALL QUEUE equals CARG1 of that same CALL VECTOR STEP on this form.

GOTOSTA:
If "GOTOSTA" is entered:
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048.
- ARG2 must be a valid step number: 1 - 15
- CARG1 must be a serving team: 1 - 999
- CARG2 must be a valid serving team
- threshold: 0 - 9999
- COND must be a valid condition: "GT" or "LE"

If "GOTOSTA" or "GOTOAVL" are entered, then one STPARM form must be entered where SERVING TEAM equals CARG1 of that same CALL VECTOR STEP on this form.

GOTOTOD:
If "GOTOTOD" is entered:
- ARG1 must not be entered, or
- must be a valid vector number: 1 - 2048
- ARG2 must be a valid step number: 1 - 15
- ERR must not be entered
- CARG1 must be a valid time of day in
- HHMM: 0000 - 2359
- COND must be a valid condition:

Copyright © 2003 Lucent Technologies

- "EX", "GT", "IN", or "LE"
- If COND is "EX" or "IN", CARG2 must be a valid time of day in HHMM: 0000 - 2359
- If COND is "GT" or "LE" CARG2 must not be entered.

MUSIC:
The length of time that music is to be provided to the caller may be defined.

- If no time limit is specified and the call has been previously queued, vector processing is stopped and the caller continues to hear music until an agent is available or until the caller abandons.
- If no time limit is specified and the caller is not in a queue, the caller will get reorder.
- If no time limit is specified, and the caller is not in a queue and the A NOT QUEUED SEC set to 0 on the ACDBPARM form, the caller will get reorder.

If "MUSIC" is entered:
- ARG1 must be a valid route index:
  - For 5E12 and earlier: 1 - 4095
  - For 5E13 and later: 1 - 16382
- ARG2 must not be entered, or
- be a valid duration in seconds: 15 - 1023
- The following must not be entered:
  - CARG1
  - CARG2
  - COND

If "MUSIC" is entered, then ARG1 of the same CALL VECTOR STEP on this ACDVCT form must match ROUTE INDEX on a RTIDX form where CI ROUTE TYPE is "GENANN" and TRUNK GROUP NUMBER is entered.
The TRUNK GROUP NUMBER on the RTIDX form must be defined as TGN on a TKGRP form with
- TRK DIR set to "ANN",
- BARGE IN set to "Y", and
- CYCLES must be 0 or unknown.

In addition, there must be a TRUNK form defined for this TKGRP where TGN on the TKGRP form matches TGN on the TRUNK form and MEMB is 0.

- **WARNING:** For 5E11 and later, if "MUSIC" is entered, the selected music (on hold) source (defined on the TGATTD form (5611 Record) via the TGN and MEMB fields) must not be shared by any other music source. Therefore, the TGN from the TGATTD form should not match the TRUNK GROUP MEMBER from the RTIDX form (5643 Record).

PROMPT:
The PROMPT command routes the caller to an announcement which prompts the called for TOUCH-TONE digit entry. The digits are collected and then used to provide the following functions:

Copyright © 2003 Lucent Technologies

- to determine the appropriate call queue (and ultimately serving team) to handle the call. This allows a caller to be connected to an agent trained specifically to handle the caller's needs.

- to provide front-end digit collection (such as a credit card number, social security number or zip code). This allows faster call handling as data is available to the agent upon position seizure.

The announcement is provided to a caller through a 13A or similar unit. Digit collection is accomplished through the use of UTDs (Universal Tone Decoders) equipped in the OSM (Originating Switching Module). When a PROMPT command is encountered in a vector, the caller is routed to the announcement unit as specified by the route index given in ARG1. ARG2 specifies the maximum number of digits to collect. Digits entered after the maximum value has been reached are not collected in this PROMPT step. An optional error step may be specified to identify call treatment if an announcement unit cannot be accessed or a UTD is not available.

The UTD is connected to the call prior to routing to the announcement. This allows callers to begin digit entry prior to the completion of the announcement. The path to the announcement is dropped once the first digit is entered. On variable length multi-digit entries, the "#" key may be used to signal early input termination before the specified maximum number of digits has been entered. The "*" key may be used to delete all previously entered digits. This key may be depressed at any time until the caller has entered the maximum number of digits as specified in the PROMPT command. The caller can then begin reentry of the number.

Upon termination of the prompting announcement, the caller has the number of seconds entered in the FIRST DIGIT field on on the ACDBPARM form (5645 Record) to begin digit entry. (See also the OTHER DIGITS field on the ACDBPARM form.) Failure to begin digit entry within 8 seconds causes Touch-Tone entry to be terminated and Vector Processing to proceed to the next step. Once digit entry has begun, the caller has 5 seconds between each digit to continue digit entry. Touch-Tone entry is terminated and Vector processing proceeds to the next step if the caller pauses for more than 5 seconds between digits. Failure to obtain an 8 second timer prior to entry of the first digit is treated as an immediate timeout and entry is terminated. Failure to obtain a timer for subsequent digits is ignored and the PROMPT command waits indefinitely for the next digit. Early input termination may also occur:

- when an agent is attached to the call prior to entry of all digits (this may only occur when the call has been queued prior to the PROMPT step)

- when the prompting announcement exceeds the length of time that an announcement can last for a call that has not been previously placed in a queue (this may only occur when the call has not been queued prior to the PROMPT step).

On multi-digit entries, the caller-entered digits are sent to the MIS as part of the vector PROMPT message. The determination of whether an entry is multi-digit or not is based on the value populated in the ARG2 field. The MIS receives a vector PROMPT message for all PROMPT steps in which the value of the ARG2 field is greater than one even if the caller enters only one digit. Single digit entries are not sent to the MIS as they are typically associated with the selection of a call queue and would not be useful to the ACD customer. A partial multi-digit entry is sent to the MIS for any of the early input termination cases discussed above.

Once the caller-entered digits have been collected, the GOTONUM command maybe used. The GOTONUM command contains a conditional argument used to determine the proper handling of a call. If the condition evaluates to TRUE, Call Vectoring treatment branches to the specified step in this VECTOR ID or to a step in another vector. If the condition evaluates to FALSE, the next step in the current vector is processed.

See Figure 2 and Figure 3 for examples of PROMPT command.

If "PROMPT" is entered:

Copyright © 2003 Lucent Technologies

- ARG1 must be a valid route index:
  - For 5E12 and earlier: 1 - 4095
  - For 5E13 and later: 1 - 16382
- ARG2 must be a valid number of digits: 1 - 32
- CARG2 must not be entered, or for 5E12 and later, CARG2 must be 1 - 165 (for the Immediate Start Announcement feature) or not entered
- COND must not be entered

NOTE: A 1 entered in CARG1 will be used for the Vector Prompt Enhancement secured feature. For more information on this feature, see Division 2, Section 4A138.

If "PROMPT" is entered, ARG1 of the same CALL VECTOR STEP on this ACDVCT form must match ROUTE INDEX on a RTIDX form where CI ROUTE TYPE is "GENANN" and TRUNK GROUP NUMBER is entered. The TRUNK GROUP NUMBER on the RTIDX form must be defined as TGN on a TKGRP form with

- TRK DIR set to "ANN", and
- CYCLES must be 1.

In addition, there must be a TRUNK form defined for this TKGRP where TGN on the TKGRP form matches TGN on the TRUNK form and MEMB is 0.

For 5E12 SU and later, if "PROMPT", "DISC", or "ANNOUNC" is entered, and CARG2 is entered with a value from 1 - 165, ARG1 must be defined as ROUTE INDEX on the RTIDX form and each of the RTIDX forms must have a TRUNK GROUP NUMBER that corresponds to a TGN on the TKGRP form where IMM START ANN is "Y".

QUEUE:
If "QUEUE" is entered:

- ARG1 must be a valid queue number: 1 - 999
- ARG2 must not be entered, or
- must be a valid display index: 1 - 2047
- ERR must be a valid error step number: 1 - 15
- CARG1 must not be entered
- CARG2 must not be entered
- COND must not be entered

If "QUEUE" is entered:

- ARG1 of the same CALL VECTOR STEP on this ACDVCT form must match CALL QUEUE on a CQPARM form.
- and if the corresponding ARG2 element has an entry, a SZDISP form must be defined where ARG2 on this ACDVCT form matches DISPX on the SZDISP form.

QUIET:
If "QUIET" is entered:

- ARG2 must be a valid duration in seconds: 5 -1023
- The following must not be entered:
  - ARG1
  - CARG1

Copyright © 2003 Lucent Technologies

- CARG2
- COND
- ERR

REQRTE:
If "REQRTE" is entered:
- ARG1 must not be entered, or
- must be 1 - 1000.
- ARG2 must not be entered
- CARG1 must not be entered
- CARG2 must not be entered
- COND must not be entered
- ERR must be a valid step number: 1 - 15

RING:
The length of time that audible ring is to be provided to the caller may be defined.

- If no time limit is specified and the call has been previously queued, vector processing is stopped and the caller continues to hear audible ring until an agent is available or until the caller abandons.
- If no time limit is specified and the caller is not in a queue, the caller will get reorder.
- If no time limit is specified, and the caller is not in a queue and the A NOT QUEUED SEC is set to 0 on the ACDBPARM form, the caller will get reorder.

If "RING" is entered:
- ARG2 must not be entered, or
- must be a valid duration in seconds: 5 - 1023
- The following must not be entered:
  - ARG1
  - CARG1
  - CARG2
  - COND
  - ERR

ROUTE:
If "ROUTE" is entered:
ARG1 must be a valid destination number: 1 - 2048
- The following must not be entered:
  - ARG2
  - CARG1
  - CARG2

Copyright © 2003 Lucent Technologies

- COND
- ERR

If "ROUTE" is entered, and the corresponding ARG1 element has an entry, an ACDVCTN form must be defined where ARG1 on the ACDVCT form matches DEST NBR on the ACDVCTN form.

STOP:
If "STOP" is entered, the following cannot be entered:
- ARG1
- ARG2
- CARG1
- CARG2
- COND
- ERR

2.5 ARG1

Description: Enter the first argument for the vector step. See Figure 1 for types of ARG1 arguments associated with a specific vector command.
Valid Entries:
- For 5E12 and earlier: 0 - 4095
- For 5E13 and later: Blank, or 1 - 16382

2.6 ARG2

Description: Enter the second argument for the vector step. See Figure 1 for types of ARG2 arguments associated with a specific vector command. ARG2 of the GOTO steps cannot branch back to the same step.
Valid Entries: 1 - 2047

Data Rules:

ARG2 of a GOTO-type step should not branch back to the same step.

2.7 ERR

Description: Enter the error treatment vector step number. For example, "MUSIC" can fail to route to a music port if is is already connected to the maximum number of calls it can support. When such a failure occurs, vector processing can be diverted to another vector step by specifying that step in the ERR field.
Valid Entries: 1 - 15

2.8 COND

Description: Enter the conditional specification for a conditional GOTO statement. For example, if "LE" is entered, the branch step occurs if the condition being tested is less than or equal to the entry in CARG1 / CARG2.

Valid COND Entries

Entry	Definition
EX	Excluded from a range of values
EQ	Equal to a value
GT	Greater than a value
IN	Included in a range of values
LE	Less than or equal to a value

Copyright © 2003 Lucent Technologies

2.9 CARG1

Description: Enter the first conditional GOTO argument of the vector step. See Figure 1 for types of CARG1 arguments associated with a specific Vector Command.
Valid Entries: 0 - 2359

2.10 CARG2

Description: Enter the second conditional GOTO argument of the vector step. See Figure 1 for types of CARG2 arguments associated with a specific Vector Command.

For 5E12 SU and later, CARG2 also supports the Immediate Start Announcement feature (see Division 2, Section 1BX).
Valid Entries:

0 - 40000
1 - 165 (Immediate Start Announcement)

CALL VECTORING COMMANDS AND ASSOCIATED ARGUMENTS

CMD CD	ARG1	ARG2	ERR	COND	CARG1	CARG2

Figure 1 CALL VECTORING COMMANDS AND ASSOCIATED ARGUMENTS

EXAMPLE 1: CALL VECTOR SCENARIO							
Step	**CMD CD**	**ARG1**	**ARG2**	**ERR Step**	**COND**	**CARG1**	**CARG2**
1	PROMPT	304	2	6			
2	GOTONUM		4		LE		5
3	BUSY						
4	QUEUE	75		6			
5	MUSIC	2015					
6	STOP						

1. When the above vector is processed, the caller is routed to the announcement associated with ROUTE INDEX 304.
2. The announcement prompts the caller for input. A maximum of 2 digits are accepted, as specified by the value in the ARG2 field.
3. After the caller-entered digits have been collected, the "GOTONUM" command is evaluated. Because CARG1 is blank, the first digit entered is compared against the digit 5, the value identified in the CARG2 field.
4. If the first digit entered is less than or equal to 5, then the condition is evaluated as TRUE and Vector Processing branches to Step 4 in the current VECTOR ID, as specified by the value in the ARG2 field. Step 4 places the caller in call queue 75 and then provides the caller with the music source associated with ROUTE INDEX 2015 and vector processing stops because a time limit has not been specified in ARG2 of the MUSIC step (step 5). The caller is connected to the music until an agent becomes available for the call or the calling party abandons.

   If the first digit entered is not less than or equal to 5, the condition is evaluated as FALSE and the next step, Step 3 is processed. Step 3 causes Vector Processing to stop and busy tone to be returned to the caller.

Figure 2 CALL VECTOR SCENARIO 1

EXAMPLE 2: CALL VECTOR SCENARIO							
Step	**CMD CD**	**ARG1**	**ARG2**	**ERR Step**	**COND**	**CARG1**	**CARG2**
1	PROMPT	305	32				
2	GOTONUM		5		EQ		11
3	GOTONUM		5		EQ	32	2
4	BUSY						
5	QUEUE	75		7			
6	MUSIC	2015					
7	STOP						

1. When the above vector is processed, the caller is routed to the announcement associated with ROUTE INDEX 305.
2. The announcement prompts the caller for input. A maximum of 32 digits will be accepted, as specified by the value in the ARG2 field.
3. After the caller-entered digits have been collected, the GOTONUM command identified in Step 2 is evaluated. The first digit entered, (CARG1 is blank) is compared against the "#" key, the value identified in the CARG2 field.
4. If the first digit entered is equal to "#", then the condition is evaluated as TRUE and Vector Processing branches to Step 5 in the current VECTOR ID, as specified by the value in the ARG2 field. Step 5 indicates that the caller is to be placed in call queue 75 and then Step 6 provided with the music source associated with ROUTE INDEX 2015 and vector processing stops.

   If the first digit entered is not equal to "#", then the condition is evaluated as FALSE and the next step, Step 3 is processed. Step 3 specifies that another "GOTONUM" command is to be evaluated.
5. When Step 3 is processed, the 32nd caller-entered digit, as specified by the value in the CARG1 field, is compared against the digit 2, the value identified in the CARG2 field. If the 32nd digit is equal to 2, then the condition is evaluated as TRUE and Vector Processing branches to Step 5 in the current VECTOR ID, as specified by the value in the ARG2 field. If the 32nd digit entered is not equal to 2, the condition is evaluated as FALSE and the next step, Step 4 is processed. Step 4 causes Vector Processing to stop and busy tone to be returned to the caller.

SEC. 32I: 5644 RECORD
ACD CALL VECTORING DESTINATION TN FORM - ACDVCTN

1. GENERAL

The 5644 Record is available with 5E11 and later Software Releases. It is used to define and administer remote telephone numbers. In call vector processing, a ROUTE step is used to send a call to another ACD site. The ROUTE step contains a specified destination number which is mapped to a TN. (See the ACDVCT form, 5643 Record).

This form supports the ACD BRCS Interworking II feature. For more information on this feature, see Division 2, Section 4A121.

1.1 Recent Change View

The corresponding Recent Change View for this form is 6.8.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * DEST NBR

Description: Enter the destination index (ROUTE step Destination Number). When the CMD CD element of CALL VECTOR STEPS is "ROUTE" on the ACDVCT form, and the corresponding ARG1 element has an entry, ARG1 on the ACDVCT form matches DEST NBR on this form.

Required Field.
Valid Entries: 1 - 2048

2.3 # TN

Description: Enter the telephone directory number the ACD site. The ROUTE step on the ACDVCT form is used to send a call to this remote ACD site.

Required Field.
Valid Entries: 1 - 15 digit

SEC. 32K: 5645 RECORD
ACD/BRCS OFFICE PARAMETERS - ACDBPARM

1. GENERAL

The 5645 Record is available with 5E11 and later Software Releases. It is used to define the office parameters for ACD/BRCS (Automatic Call Distribution / Business and Residential Custom Services) features, ACD users, and define limits for call vectoring. Only one ACDBPARM form is entered for an office. This view supports the ACD/BRCS Interworking II features For more information on these features see Division 2, Section 4A121.

1.1 Call Vectoring

The ACDVCT form (5643 Record) defines the Call Vectoring Steps. The maximum limits for Call Vectoring steps and delays are defined on this form. The TCA (Telephone Company Administration) can limit the number of vector steps for a call. These limits prevent any infinite loops that may be defined in call vectoring by the ACD/BRCS customer from consuming unlimited real-time resources. When a given limit is reached, vector processing stops, reorder tone is given to a caller if the call has not yet been queued; or if the call has been queued, it remains in queue. If no limit is specified, no limit is enforced.

Call vectoring steps are divided into a set of categories reflecting their use and real-time load. The vector step categories are:

- Queuing or transferring the call between queues
- Conditional GOTOs based on call queue or serving team state, age of the call at head of the queue or expected delay
- GOTO based on time-of-day or day-of-week
- Announcement or delay with music
- Conditional or unconditional GOTO to another vector

Any vector step that does not fall into one of these categories does not have a limit associated with it other than the limit on total vector steps. Each category has a resettable limit such that if, during vector processing, the limit for the allowable number of steps in that category is reached and vector processing is paused. The pause lasts an amount of time identified for all Call Vectoring pauses established by the TCA. If no pause limit is specified, the pause period shall be five seconds. Each forced pause resets the limits for all categories. In addition, the limits are reset each time a delay step is successfully executed or the call is successfully routed to an announcement.

In addition to the resettable limits, each category has an absolute limit on the number of steps that each call can sequence. This limit is not reset by the successful execution of a delay step or successful route to an announcement. If a step is encountered during vector processing that exceeds the limit on that step's category, vector processing is stopped for the call. If no limit is specified for steps in a given category, no limit is enforced for steps in that category.

In addition to the above limits, there is a global limit on the length of time that a call can be vectored without being placed in queue. The intent of this limit is to prevent calls from receiving endless vector treatment.

1.2 Recent Change View

The corresponding Recent Change View for this form is 6.9

Copyright © 2003 Lucent Technologies

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: This field is the Processor ID and is always 1. Enter 1 or just press the return key.

Required Field.
Valid Entries: 1

2.3 CALL VECTORING

Description: Should the Call Vectoring feature be activated? Enter "Y" if Call Vectoring should be activated and "N" if it should not be activated.

Required Field.
Default: N
Valid Entries: Y, N

2.4 SIMINTRA

Description: Enter the maximum number of simultaneous intraoffice forwarded calls allowed as an action of ACD re-routing for ACD/BRCS. For more information on ACD/BRCS feature see Division 2, Section 4A121.

Required Field.
Default: 99
Valid Entries: 1 - 99

2.5 SIMINTER

Description: Enter the maximum number of simultaneous interoffice forwarded calls allowed as an action of ACD re-routing for ACD/BRCS. For more information on ACD/BRCS feature see Division 2, Section 4A121.

Required Field.
Default: 99
Valid Entries: 1 - 99

2.6 CFMAX

Description: Enter the maximum number of call forwardings as an action of ACD re-routing for ACD/BRCS. For more information on ACD/BRCS feature see Division 2, Section 4A121.

Required Field.
Default: 5
Valid Entries: 1 - 32

2.7 INTRAFLOW ALW

Description: Should intraflow be turned on? Intraflow allows an ACD (Automatic Call Distributor) administrator to designate a single principal serving team and up to eight supporting serving teams with associated delay outflow thresholds for each call queue.

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

CALL QUEUE SLOTS

The following fields (Section 2.8 - Section 2.9) define call queue data blocks.

2.8 ACTUAL CQDB

Description: This field is a "display only" field for both Recent Change and ODA. This global parameter contains a count of the total number of initialized ACD/BRCS Call Queue Data Blocks. If the initialization succeeds, then this parameter is set to the value of the REQUIRED CQDB parameter. In case of an initialization failure, this parameter reflects the actual number of data blocks that were successfully initialized. This parameter is supported by ODA, but the value does NOT appear on the ODA form. It is initialized by ODA to equal the value of the REQUIRED CQDB parameter. This parameter is a Recent Change verify only field.
Valid Entries: 0 - 40000

2.9 REQUIRED CQDB

Description: This field is a "display only" field for both Recent Change and ODA. This global parameter (Call Queue Maximum Calls Sum) contains the sum of the ACD/BRCS Call Queue's maximum number of data blocks. This is a Recent Change only field. This parameter is supported by ODA but the value does NOT appear on any ODA form.
Valid Entries: 0 - 40000

CALL VECTORING FIELDS

The following fields (Section 2.10 - Section 2.23) specify the maximum limits for Call Vectoring commands (steps) and delays.

ABSOLUTE MAXIMUM LIMITS (A)

The following fields (Section 2.10 - Section 2.22) preceded by an "A" specify the maximum limits for call vectoring steps.

2.10 A VECTOR XFERS

Description: This field specifies the maximum number of intervector GOTOs that can be processed for a given call. An intervector GOTO is any conditional or unconditional GOTO to a step in another vector. Vector processing is stopped when this limit is reached. If the call has not been previously queued, the caller is provided with reorder. If the call has been previously queued, the caller continues to receive any active delay treatment and remains in the queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If this field has no entry no limit is enforced.
Default: 20
Valid Entries: 1 - 255

2.11 A ACD STAT QRYS

Description: This field specifies the maximum number of GOTO status queries based on are or queue/team state, i.e., "GOTOAGE", "GOTOQUE", "GOTOSTA", "GOTOAVL" and "GOTODLY" steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call has not been place in a queue, the caller is given reorder. If the call has been queued, the caller continues to receive any active delay treatment, such as music, ring or quiet, and remains in queue. The call remains

Copyright © 2003 Lucent Technologies

in this state until the caller abandons or the call is connected to an agent.

If this field has no entry, no limit is enforced.
Default: 4
Valid Entries: 1 - 255

2.12 A TOD DOW STPS

Description: This field specifies the maximum number of "GOTOTOD" and "GOTODOW" steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is given reorder. If the call is in a queue, the caller receives any active delay treatment and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If this field has no entry, no limit is enforced.
Default: 10
Valid Entries: 1 - 255

2.13 A MUS ANNC STPS

Description: This field specifies the maximum number of "MUSIC", "ANNOUNC" or "PROMPT" steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is provided with reorder. If the call is in a queue, the caller receives any active delay treatment, such as music, ringing, or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If this field is not entered, no limit is enforced.
Default: 10
Valid Entries: 1 - 255

2.14 A QUEUE STPS

Description: This field specifies the maximum number of QUEUE steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is provided with reorder. If the call is in a queue, the caller receives any active delay treatment, such as music, ringing, or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If this field is not entered, no limit is enforced.
Default: 4
Valid Entries: 1 - 255

2.15 A VECTOR STPS

Description: This field specifies the total number of vector steps a call can go through while waiting for an available agent. The purpose of this field is to detect and terminate endless loops in an ACD/BRCS customer's vector program. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is provided with reorder. If the call is in a queue, the caller receives any active delay treatment, such as music, ringing, or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If this field is not entered, no limit is enforced.
Default: 100
Valid Entries: 1 - 255

2.16 A NOT QUEUED SEC

Copyright © 2003 Lucent Technologies

Description: This field specifies the maximum number of seconds a call can be vectored without being placed in a queue. When this limit is reached, call vector processing is stopped and the caller is provided with reorder.

If this field is not entered, no limit is enforced.
Default: 120
Valid Entries: 1 - 255 (seconds)

2.17 A ANNC SEC

Description: This field specifies the maximum number of seconds an announcement can last, if the call was routed to that announcement and had not been placed in a queue. An announcement is stopped when this limit is reached.

If this field is not entered, no limit is enforced.
Default: 120
Valid Entries: 1 - 255 (seconds)

BETWEEN DELAYS MAXIMUM LIMITS (B)

The following fields (Section 2.18 - Section 2.22) preceded by an "B" specify the maximum limits for steps that can be processed without pausing.

2.18 B VECTOR XFERS

Description: This field specifies the maximum number of intervector GOTOs that can be processed without pausing. An intervector GOTO step is vector processing a conditional or unconditional GOTO another step in another vector. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step, defined on the ACDVCT form (5643 Record) is successfully processed. If the counter reaches the specified limit, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early, if an agent becomes available during the pause. Any currently active delay treatment continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If this field is note entered, no limit is enforced.
Default: 2
Valid Entries: 1 - 255

2.19 B ACD STAT QRYS

Description: This field specifies the maximum number of "GOTOAGE", "GOTOQUE", "GOTOAVL", "GOTOSTA" and "GOTODLY" steps that can be processed without pausing. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment, such as music, ringing or quiet, continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If this field is not entered, no limit is enforced.
Default: 2
Valid Entries: 1 - 255

2.20 B TOD DOW QRYS

Description: This field specifies the maximum number of "GOTOTOD" and "GOTODOW" steps that can

Copyright © 2003 Lucent Technologies

be processed without pausing. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step defined on the ACDVCT form (5643 Record) is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment, such as music, ringing or silence, continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If this field is not entered, no limit is enforced.
Default: 6
Valid Entries: 1 - 255

2.21 B MUS ANNC STPS

Description: This field specifies the maximum number of "MUSIC", "ANNOUNC" or "PROMPT" steps that can be processed without pausing. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step, defined on the ACDVCT form (5643 Record) is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment, such as music, ringing or silence, continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If this field is not entered, no limit is enforced.
Default: 1
Valid Entries: 1 - 255

2.22 B QUEUE STPS

Description: This field specifies the maximum number of "QUEUE" steps that can be processed without pausing. The counter used to count the steps is reset whenever an ANNOUNC, MUSIC, RING or QUIET step, defined on the ACDVCT form, is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If this field is not entered, no limit is enforced.
Default: 1
Valid Entries: 1 - 255

FORCE PAUSE DELAY

The Call Vectoring Global Pause Period is defined in the following field (Section 2.23).

2.23 PAUSE SEC

Description: This field specifies the length of time (in seconds) that a call can be paused if any of the resettable limits are reached. The value entered in this field must be greater than or equal to 5.

Required Field.
Default: 5
Valid Entries: 5 - 255 (seconds)

VECTOR PROMPT TIMING

The following fields (Section 2.24 - Section 2.25) define timing limits for prompting. These fields support

Copyright © 2003 Lucent Technologies

the Vector Prompt features. For more information on these features, see Division 2, Section 4A41 and Section4A138.

2.24 FIRST DIGIT

Description: Enter the number of seconds the Vector Prompt waits for the first digit in any prompt step.

Required Field.
Default: 8
Valid Entries: 1 - 64 (seconds)

2.25 OTHER DIGITS

Description: Enter the number of seconds the Vector Prompt will wait for all other digits in a multi-digit prompt step.

Required Field.
Default: 5
Valid Entries: 1 - 64 (seconds)

SEC. 1: ISDN LINE FORMS

Copyright © 2003 Lucent Technologies

SEC. 1C: 5902-1/2 RECORD
PRIMARY OR SECONDARY ONLY KEY SYSTEM FORM - SHTN

1. GENERAL

The 5902 Record is available with 5E4(2) and later Software Releases. A telephone number which appears on more than one terminal is called a Shared TN or MLHG/TERM. Shared TNs or MLHG/TERMs are divided into Primary and Secondary TN or MLHG/TERM. This form is used to assign a Primary or Secondary TN or MLHG/TERM to ISDN Terminals.

Each ISDN terminal where the telephone appears will be provided with an indication of the status of each shared Call Appearance. Manual Exclusion, Automatic Call Exclusion, Abbreviated/Delayed Ringing, and Bridging features are also provided.

Bridging allows two terminals to talk on the same call.

Manual Exclusion allows the user to restrict members of the group from bridging on to an existing call, or from retrieving a call on hold.

Automatic Call Exclusion prevents members of the SHDN (Shared DN) group from bridging onto an active call or from remotely retrieving a call on hold.

The Abbreviated/Delayed Ringing feature provides various options for audible and visual alerting at each terminal that shares a TN.

A telephone number can only be a primary TN on one station set but it can be a call appearance on other station sets. A secondary only TN has no assigned physical equipment but can be a call appearance on other station sets.

Secondary Only TNs and MLHG/TERMs cannot be assigned any of the following features on the LINEFA, MLHLNFA, BFG or associated CLUSTR forms: ACB, ACCT, ACSR, ACVT, ARS, ASI (5E8 and later), ASP (5E9(1) and later), ATH, CWT, DISP, HI (5E6 and later), ICM, IDP, LSAC, LSAR, LSCOT, MDR, MWY, PFA, PUO, SC (5E6 and later), or TOD.

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.20.

2. FORM ENTRIES - 5902-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 (*) TN

Description: Enter the Primary or Secondary Telephone Number of the customer. If the TN entered in this field is defined on a LINE form or DSLUSR form (5E5 and later), then this TN is a Primary TN. If the TN is not defined on one of these forms, this is a Secondary Only TN.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E8 and later, if this TN is a Secondary Only TN, and the Shared List contains a TN or MLHG/TERM that is defined on a DSLUSR form assigned to a Standard BRI (DSL CLS is "STD" on the associated DSL form), then on this SHTN form SAR NUM must not be entered; and SAR ORIG, SAR TERM, INCOMING, INTERCOM, ORIG CALL WAIT, and PP must be "N"; for 5E8 only, SERHLN must not be entered, and ASP ALW must be "N".

For 5E8 only, if this TN is a Primary analog TN defined on a LINE form, and any of the Shared List TNs or MLHG/TERMs are defined on a DSLUSR form assigned to a Standard BRI (DSL CLS is "STD" on the associated DSL form), then on the LINE form, SERHLN must not be entered and ASP ALW must be "N".

When the SHTN form has one or more lines terminating to an RSM, all lines on the SHTN form must terminate to the same RSM cluster (the REMOTE SITE entry on the EQIM forms must be the same).

For 5E12 and later, if the first 3 digits of the 7-digit Key TNs on the SHTN form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the TN must be a 10-digit TN.

For 5E12 and later, when the Key TN(s) on the SHTN form have an NXX and/or NPA/NXX combination assigned, an OFFICE CODE and/or NPA/OFFICE CODE combination must be assigned on a NOC form.

For 5E12 and later, Key TNs, Key MLHG, Key TERM NBR combinations on different SHTN forms cannot be duplicated.

For 5E12 and later, if the KEY TNs on the SHTN form have SERHLN entered, the equivalent 10-digit SERHLN cannot equal the equivalent 10-digit Key TN.

For 5E12 and later, the Key TNs on the SHTN form cannot match a TN in the SHARED LIST in a position other than row 1.

For 5E12 and later, the SHTN forms, where Key TN matches SHARED LIST TN in row 1 and Key MLHG is not entered, the following requirements must be met:

- At least two SHARED LIST TN or MLHG/TERM NBR combinations must be entered.
- CALL APP in row 1 of the SHARED LIST must not be entered.
- NBR in row 1 of the SHARED LIST must not be entered.
- SP DNA in row 1 of the SHARED LIST must not be entered.
- AU DNA in row 1 of the SHARED LIST must not be entered.
- BRCS must not be entered.
- E911 PSAP must not be entered.
- BILL TN must not be entered.
- DNYBV must not be entered.
- SUST must not be entered.
- INWATS must be "N".
- TRC must be "N".
- ICP must not be entered.
- BUSY MONITOR must be "N".

Copyright © 2003 Lucent Technologies

- ATT MLHG must not be entered.
- RBV TGN must not be entered.
- RMK must not be entered.
- SAR NUM must not be entered.
- SAR ORIG must be "N".
- SAR TERM must be "N".
- INCOMING must be "N".
- INTERCOM must be "N".
- ORIG CALL WAIT must be "N".
- PP must be "N".
- NON-HUNT TN must not be entered.
- MMB SUBGP must not be entered.
- RND SUBGP must not be entered.
- NI SAR LIST entries must not be entered.
- CONTEXT ID must be "N" for 5E12 and 5E13 and "NATIVE" for 5E14.

For 5E12 and later, when two (or more) Key TN and/or Key MLHG/TERM NBR combinations on two (or more) SHTN forms have the same last 7 digits of the TN for Key TNs or the same last 7 digits of CKT MLHG TN found on the corresponding DSLUSR forms for Key MLHG/TERM NBRs, then the SHARED LIST elements TN or MLHG/TERM NBR (2 - 32 for a primary MLHLN, or 1 - 32 for a secondary only terminal) cannot be duplicated between SHTN lists of those SHTN forms if EKTS is "BASIC" on DSLUSR forms which correspond to the SHARED LIST TN or MLHG/TERM NBR.

The corresponding DSLUSR form for the SHTN form Key MLHG/TERM NBR is found by matching the DSLUSR CKT MLHG/CKT TERM entries with the SHTN Key MLHG/TERM NBR entries. The corresponding DSLUSR form for SHTN Key TN is found by matching the DSLUSR CKT TN entries with the SHTN Key TN entries.

The corresponding DSLUSR form for the SHTN SHARED LIST elements is found by matching the SHARED LIST TN with the CKT TN on the DSLUSR form, or the SHARED LIST MLHG/TERM NBR on the SHTN form with the CKT MLHG/CKT TERM on the DSLUSR form.

These same rules apply to Primary MLHG/TERM NBR SHTN forms and Secondary MLHG/TERM NBR SHTN forms. A Primary SHTN form exists when the Key MLHG/TERM NBR are known and match the MLHG/TERM NBR which are entered in the first row of the SHARED LIST or the Key TN is known, the Key MLHG/TERM NBR is unknown and Shared LIST 1 TN equals the Key TN. The known SHARED LIST elements from 2 - 32 are examined to determine the conflict. A Secondary SHTN form exists when the Key MLHG/TERM NBR are entered and TN is entered in the first row in the SHARED LIST or the Key TN is entered and the TN entered in the first row is different for the Key TN. The known SHARED LIST elements from 1 - 32 are examined to determine the conflict.

2.3 (*) MLHG

Copyright © 2003 Lucent Technologies

Description: Enter the Multi-Line Hunt Group Number. If the MLHG and TERM NBR entered on this form is defined on an MLHLN form or a DSLUSR form (5E5 and later) , then this MLHG/TERM is a Primary shared terminal. If the MLHG and TERM NBR is not defined on one of these forms, this is a Secondary-Only terminal.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

All three optional key fields may be entered for Secondary terminals only. This allows a TN to be associated with a Secondary Only terminal.

For a Secondary Only MLHG terminal, a corresponding MLHG form must be defined.

For 5E5 and later, if both this field and the ATT MLHG field are entered, then the MLHG must be defined in the MLHG field of an MLHG form such that the MLHG FEATURE is defined on an MLHGFD form (5604 Record) with a HUNT TYPE that is neither "ISAT" nor "MUPH".

For 5E8 only, if this MLHG/TERM is a Primary analog MLHG/TERM defined on a MLHLN form, and any of the Shared List TNs or MLHG/TERMs are defined on a DSLUSR form assigned to a Standard BRI (DSL CLS is "STD" on the associated DSL form), then on the MLHLN form, SERHLN must not be entered and ASP ALW must be "N".

For 5E8 and later, if this is a Secondary Only MLHG/TERM, and the Shared List contains a TN or MLHG/TERM that is defined on a DSLUSR form assigned to a Standard BRI (DSL CLS is "STD" on the associated DSL form), then on this SHTN form SAR NUM must not be entered; SAR ORIG, SAR TERM, INCOMING, INTERCOM, ORIG CALL WAIT, and PP must be "N"; for 5E8 only SERHLN must not be entered, and ASP ALW must be "N".

For 5E8 and later, MLHGs that include Secondary Only terminals shared to Standard BRI terminals may not have a Precedence Hunt Type. That is, if this form defines a Secondary Only MLHG/TERM, and any member of the Shared List is defined on a DSLUSR form that is associated with a DSL form where DSL CLS is "STD", then the MLHG, as defined on the MLHG form, may not be assigned an MLHG FEATURE with HUNT TYPE set to "PMHG" on the MLHGFD form.

If a member of the Shared List is defined as a CKT TN or CKT MLHG/TERM on a DSLUSR form where EKTS is "BASIC", then the key MLHG and TERM NBR on this SHTN form must be defined as CKT MLHG and TERM on a DSLUSR form where a value is entered in CKT SWITCHING MLHG TN.

For a Secondary Only terminal where the key MLHG/TERM fields are entered, and a member of the Shared List is defined as CKT TN or CKT MLHG/TERM on a DSLUSR form where EKTS is "BASIC", then the key TN must be entered on this SHTN form.

2.4 (*) TERM NBR

Description: Enter the Multi-Line Hunt Terminal Number.
Valid Entries: 1 - 2015

2.5 ADR TIME

Description: Enter the Abbreviated/Delayed Ringing Time in seconds. Abbreviated Ringing time indicates the length of time before audible ringing stops. Delayed Ringing indicates the length of time before ringing begins.
Valid Entries: 0 - 255 (seconds)

Data Rules:

Copyright © 2003 Lucent Technologies

When ADR PAT is "DEL", "ABR", or "DRI", ADR TIME must be greater than 0; when ADR PAT is any other value, ADR TIME must be 0 or blank.

SHARED LIST

For 5E7 and earlier, a maximum of 8 entries may be defined in the SHARED LIST (fields Section 2.6 - Section 2.15). For 5E8 and later, the list has been expanded to accept 32 entries.

For 5E8 and later, the list entries will be sorted before being loaded into the 5ESS Switch. The first row will be left in place, to be followed by 1) entries that reside on the same SM and connect to the same PH (Protocol Handler) as the first entry; 2) entries that reside on the same SM but do not connect to the same PH, sorted by PH; and 3) all other entries, sorted by SM and PH.

- ***NOTE:*** The PH identifier is composed of the Shelf and Channel Group numbers from the D ISCN field on the associated DSL form.

For 5E5 and later, each TN assigned in the list must be defined in the TN field of the LINE form or in the CKT TN field of the DSLUSR form. Each MLHG and TERM assigned in the list must be defined in the MLHG and TERM fields of the MLHLN form or in the CKT MLHG and TERM fields of the DSLUSR form (TERM TYPE and OE fields must be entered).

If a TN defined on the LINE form (or an MLHG/TERM defined on the MLHLN form) is entered in the SHARED LIST, it must be a primary TN (MLHG/TERM).

For 5E8 and later, Standard and Custom DSL terminals may not appear in the same Shared List. All terminals that are in the Shared List and are defined on DSLUSR forms must be associated with DSL forms where DSL CLS is "STD", or all must be associated with DSL forms where DSL CLS is "PP" or "MP".

For 5E8 only, analog and Custom ISDN terminals may not series complete to Standard IDSN terminals. If members of the Shared List on this SHTN form are associated with Standard DSLs, the key TN may not be assigned as a series completion number in the SERHLN field on a LINE, MLHLN, DSLUSR, or another SHTN form.

PRIMARY: A primary TN or MLHG/TERM is designated by duplicating the key TN or MLHG/TERM in row 1 of the SHARED LIST. The CALL APP, NBR, SP DNA (5E9(1) and later), and AU DNA (5E9(1) and later) fields must be blank. For ISDN terminals, values from the FIRST CA and NUM CA fields on the DSL or DSMLHLN form will be used for the CALL APP and NBR fields on this form. For analog lines, a 1 will be used for the CALL APP and NBR fields.

The TN or MLHG/TERM listed in rows 2 through 32 are the primary TNs or MLHG/TERMs associated with the station sets that the primary TN or MLHG/TERM listed in row 1 is to appear on.

At least two row entries must be entered in the SHARED LIST. Only the default values assigned on Screen 2 are allowed.

SECONDARY/SECONDARY ONLY: A secondary only TN or MLHG/TERM is defined by entering the Secondary TN in the key TN or MLHG/TERM. The Secondary TN or MLHG/TERM entered in the key field must not be entered in the first row of the SHARED LIST. The TNs or MLHG/TERMs entered in the SHARED LIST are the primary TNs or MLHG/TERMs associated with the station sets that the Secondary TN or MLHG/TERM is to appear on.

Secondary only TNs or MLHG/TERMs must not be assigned to any physical equipment, therefore they should not be assigned on a LINE, MLHLN, DSL or DSMLHLN form. At least one row entry must be entered in the SHARED LIST.

2.6 TN

Copyright © 2003 Lucent Technologies

Description: Enter the SHARED LIST Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

At least one SHARED LIST TN or MLHG/TERM NBR combination must be specified. The TNs specified within the SHARED LIST must be unique.

For 5E8 only, if the SHARED LIST TN is defined on a DSLUSR form (5908 Record) as a CKT TN, then if EKTS on the DSLUSR form is "BASIC", CALL APP must not be entered in this shared list item, and NBR must be 1.

For 5E8 and later, if the SHARED LIST TN is defined on a DSLUSR form (5908 Record) as a CKT TN, then:

- If EKTS is "CACH", and the user is assigned to a Standard DSL (DSL CLS is "STD" on the associated DSL Form), CALL APP must be entered;

- If EKTS is not entered and DSL CLS is not "STD", CALL APP must be entered for this shared list item.

For 5E9(1) and later, if SHARED LIST TN is defined on a DSLUSR form as a CKT TN, with EKTS on DSLUSR as "BASIC", both CALL APP and NBR must be blank; if EKTS is other than "BASIC", both CALL APP and NBR must be entered.

For 5E12 and later, if the first 3 digits of the 7-digit SHARED LIST TNs on the SHTN form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE or the NOC form does not exist, the SHARED LIST TN must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, the SHARED LIST TNs on the SHTN form can not match another SHARED LIST TN in the SHARED LIST.

For 5E12 and later, when the SHTN forms have Key TN, MLHG and TERM NBR entered, the SHARED LIST TN in row 1 cannot match the Key TN on the same SHTN form.

2.7 MLHG

Description: Enter the SHARED LIST Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

At least one SHARED LIST TN or MLHG/TERM NBR combination must be specified. The MLHG/TERM NBR combination specified in the SHARED LIST must be unique.

For 5E8 only, if the SHARED LIST MLHG and TERM are defined on a DSLUSR form (5908 Record) as a CKT MLHG/TERM, and EKTS on the DSLUSR form is "BASIC", CALL APP must not be entered in this shared list item, and NBR must be 1.

Copyright © 2003 Lucent Technologies

For 5E8 and later, if the SHARED LIST MLHG and TERM are defined on a DSLUSR form (5908 Record) as a CKT MLHG/TERM, then:

- If EKTS is "CACH", and the user is assigned to a Standard DSL (DSL CLS is "STD" on the associated DSL Form), CALL APP must be entered;
- If EKTS is not entered and DSL CLS is not "STD", CALL APP must be entered.

For 5E9(1) and later, if SHARED LIST MLHG is defined on a DSLUSR form as a CKT MLHG, with EKTS on DSLUSR as "BASIC", both CALL APP and NBR must be blank; if EKTS is other than "BASIC", both CALL APP and NBR must be entered.

2.8 TERM NBR

Description: Enter the SHARED LIST Multi-Line Hunt Terminal Number.
Valid Entries: 1 - 2015

2.9 CALL APP

Description: Enter the button number where the first Call Appearance will appear.
Valid Entries: 1 - 254

Data Rules:

The sum of the CALL APP and NBR fields must not exceed 255. If the SHARED LIST TN or MLHG/TERM NBR entered is not primary, a CALL APP must be specified.

For 5E8 and later, a CALL APP must be entered for EKTS CACH or custom TNs or MLHG/TERM NBRs.

For 5E9(1) and later, if CALL APP is entered, SP DNA and AU DNA must not be entered.

2.10 NBR

Description: Enter the Number of Call Appearances.
Valid Entries: 1 - 16

Data Rules:

The sum of the CALL APP and NBR fields must not exceed 255. If the SHARED LIST TN or MLHG/TERM NBR entered is not primary, a NBR must be specified.

For Secondary TNs, the first row entry of NBR must be the maximum NBR value or share the maximum NBR value entered on the form.

For 5E8 and later, NBR must be entered for EKTS CACH or custom TNs or MLHG/TERM NBRs.

For 5E9(1) and later, if NBR is entered, SP DNA and AU DNA must not be entered.

2.11 MAN EXCL

Description: Is Manual Exclusion allowed? Manual Exclusion can be activated by an access code or button.

Software Release: 5E6 and earlier
Valid Entries: Y, N

2.12 SP DNA

Copyright © 2003 Lucent Technologies

Description: Enter the DN (Directory Number) CA for speech. This is a field for ATS (Automatic Terminal Setup). See Division 2, Section 1AM for more information on ATS. ISDN routing and digit analysis require speech and audio (voiceband data, e.g., facsimile and modems) calls to be routed differently. Speech treatments should not be applied to an audio call to maintain the integrity of the bit stream. See Division 2, Section 1W for more information on audio and speech calls.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If SP DNA and AU DNA are both entered, they must not be equal.

SP DNAs may be entered for Basic EKTS terminals.

2.13 AU DNA

Description: Enter the DN CA for audio. This is a field for ATS (Automatic Terminal Setup). See Division 2, Section 1AM for more information on ATS.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If SP DNA and AU DNA are both entered, they must not be equal.

AU DNAs may be entered for Basic EKTS terminals.

2.14 CALL EXCL

Description: Is Call Exclusion allowed?

Software Release: 5E7 and later
Valid Entries:

Valid CALL EXCL Entries

Entry	Definition
N	Indicates that Call exclusion is not allowed.
M	Indicates that Call Exclusion is allowed, however, this option must be activated manually by pressing a feature button or dialing a code.
A	This option automatically activates Call Exclusion upon origination and termination on this Secondary only/Primary TN or MLHG/TERM NBR.

Data Rules:

For 5E8 and later, when members of the same Shared List are Standard DSL users, they may not have a mixture of manual and automatic call exclusion options. All members must have CALL EXCL set to "M", "N", or blank; or all must have it set to "A", "N", or blank.

2.15 ADR PAT

Description: Abbreviated and Delayed Ringing Pattern. Indicate the Ringing pattern assigned to this terminal which shares a TN.

Valid ADR PAT Entries

Entry	Definition
NOR	Normal Ringing indicates that both visual and audible ringing are assigned.
NON	No Ringing indicates visual ringing is provided with no audible ringing.
DEL	Delayed Ringing indicates that both audible and visual ringing will be delayed for a given amount of time. The length of the delay must be defined in the ADR TIME field.

Copyright © 2003 Lucent Technologies

ABR	Abbreviated Ringing indicates that audible ringing will stop after a given amount of time. Although the audible ringing stops, visual ringing continues. The length of time that audible ringing is provided must be defined in the ADR TIME field.
DRI	Software Release: 5E7 and later. Delayed Ringing with Immediate Display indicates that visual ringing will begin immediately, but audible ringing will be delayed for the length of time defined in the ADR TIME field.
NRN	Software Release: 5E7 and later. No Ring, No Display, indicates that neither audible nor visual ringing will be provided.

2.16 EPO ON

Description: Should call and event information be tracked on calls to or from the call appearances of the TN or MLHG and TERM NBR specified as the key on the terminal on which the TN or MLHG and TERM NBR in the SHARED LIST is primary.

When EPO ON is set to "Y" and at least one of the terminals in the SHARED LIST is designated as an EPO position (EPO POS NUM on DSLUSR is entered), event information for calls and events to and from the call appearances of the TN or MLHG and TERM NBR (specified as key) on the terminal on which the TN or MLHG and TERM NBR in the SHARED LIST is primary is sent to the MIS (Management Information Systems). The information includes reports on terminal usage, status, event codes, and call-related events associated with the tracked TN or MLHG and TERM NBR. The MIS compiles the call data and provides user reports and displays to the customer.

When EPO ON is set to "Y" in the SHARED LIST and the TN or MLHG and TERM NBR are specified as the key and is shared on at least one terminal in the SHARED LIST which is an EPO position terminal (has EPO POS NUM entered on DSLUSR), then the TN or MLHG and TERM NBR specified as the key has the capability of being tracked on any terminal on which it has call appearances. Complete information for calls originating from or terminating to these call appearances on the terminal specified in the SHARED LIST is sent to the MIS only when the terminal in the SHARED LIST is defined as an EPO position terminal (EPO POS NUM is entered on DSLUSR). If the terminal in the SHARED LIST is not defined as an EPO position terminal (EPO POS NUM is not entered on DSLUSR):

- Calls from the call appearances of the TN or MLHG and TERM NBR specified as the key on the terminal in the SHARED LIST are not tracked.
- Calls to the call appearances of the TN or MLHG and TERM NBR specified as the key on the terminal in the SHARED LIST are tracked for shared call information.

When EPO ON in the SHARED LIST is set to "N", calls to or from the call appearances of the TN or MLHG and TERM NBR on the terminal in the SHARED LIST are not tracked.

Software Release: 5E11 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When the SHTN form primary TNs match a DSLUSR form CKT TN, the entry in the DSLUSR form EPO ON field must be the same as the entry in the SHTN form SHARED LIST row 1 EPO ON field.

When the SHTN form primary MLHG/TERM NBRs matches the DSLUSR form CKT MLHG/TERMs, the entry in the DSLUSR form EPO ON field must be the same as the entry in the SHTN form SHARED LIST row 1 EPO ON field.

When the SHARED LIST Row TN on the SHTN form is associated with a CKT TN on a DSLUSR form that has an ACD POS NUM entry, the EPO ON field for that SHARED LIST Row must be "N".

When the SHTN forms have one or more SHARED LIST TNs defined on a DSLUSR form where the

Copyright © 2003 Lucent Technologies

corresponding DSL form (DSL form DSL OE matches DSLUSR form OE) has DSL CLS set to "STD", the EPO ON entry in the SHARED LIST row involved in the match to DSLUSR must be "N".

When the SHTN forms have one or more SHARED LIST MLHG/TERM NBR combinations defined on a DSLUSR form where the corresponding DSL form (DSL form DSL OE matches DSLUSR form OE) has DSL CLS set to "STD", the EPO ON entry in the SHARED LIST row involved in the match to DSLUSR must be "N".

When the SHTN form Key MLHG/TERM NBR combination matches the MLHG/TERM NBR entry in Row 1 of the same SHTN form SHARED LIST and also matches an MLHLN form MLHG/TERM combination, this scenario is defined as a shared analog MLHG. In such a case, the entry in the SHTN SHARED LIST Row 1 EPO ON field must be "N".

3. FORM ENTRIES - 5902-2 RECORD

SECONDARY ONLY

Secondary Only fields (Section 3.1 - Section 3.30) should be defined for Secondary Only TNs and MLHG/TERMs.

Data Rules:
For 5E12 and later, the Secondary Only TNs on the SHTN form (where Key TN does not match SHARED LIST TN from row 1 or SHARED LIST MLHG from row 1 is entered), must meet all of the following requirements:

- If BUSY MONITOR is "Y", ATT MLHG must be entered.
- The first row entry must have the maximum value or share the maximum value of NBR.
- INWATS must be "N".
- NON-HUNT TN cannot be entered.
- ATT MLHG and RBV TGN cannot be entered at the same time.
- When RBV TGN is entered, BUSY MONITOR must be "N".
- MMB SUBGP cannot be entered.
- RND SUBGP cannot be entered.

3.1 BRCS

Description: Can BRCS features be assigned to this line? This field applies to secondary only TNs and MLHG/TERMs.
Valid Entries: Y, N

Data Rules:

If "Y" is entered, the Primary TN or Primary MLHG/TERM must be assigned on the LINEFA or MLHLNFA forms, respectively.

For 5E8, if the lead TN or MLHG/TERM NBR has been assigned an LCC/RAX on a LINE, MLHLN or DSLUSR form where the corresponding LCC form has DIGIT ANALYSIS SELECTOR equal to the ASP DAS on the OFCOPT form, then BRCS must be "N".

3.2 E911 PSAP

Copyright © 2003 Lucent Technologies

Description: Is this an E911 Public Safety Answering Point? This field applies to the secured feature, ISDN PSAP Support. For information on the feature, see Division 2, Section 4A114.

Software Release: 5E8 and later
Valid Entries: Y, N

Data Rules:

This field can be "Y" only if the ISDN PSAP Support secured feature has been purchased; SFID 114 ACT must be set to "Y" on the SFSYS form (5713-1 Record).

When the first TN (or MLHG/TERM NBR) entry in the SHARED LIST is the same as the key TN (MLHG/TERM NBR), E911 PSAP cannot be entered.

If a primary E911 PSAP TN (or MLHG/TERM NBR) is assigned in the key TN (or MLHG/TERM NBR) field (i.e., the key TN (MLHG/TERM NBR) matches the SHARED LIST ROW 1 TN (MLHG/TERM NBR) and is defined as a CKT TN (CKT MLHG/TERM) on a DSLUSR form where E911 PSAP is "Y"), then all TN or MLHG/TERM NBR entries in the SHARED LIST must also be defined as CKT TNs or CKT MLHG/TERMs on DSLUSR forms where E911 PSAP is "Y".

When values are entered in the MLHG/TERM NBR and E911 PSAP fields, the value entered for E911 PSAP must match the E911 PSAP entry on the corresponding MLHG form.

When E911 PSAP for Secondary Only is "Y", the following rules apply.

- SUST must be "N", and SERHLN cannot be entered.
- All entries in the SHARED LIST must be defined on DSLUSR forms (SHARED LIST TN or MLHG/TERM NBR matches CKT TN or CKT MLHG/TERM on the DSLUSR form) where E911 PSAP is "Y".
- The OE of the SHARED LIST ROW 1 TN or MLHG/TERM NBR (entered on the corresponding DSLUSR form) must be defined on a DSL form where DSL CLS is "MP" or "PP"; that is, it must be a custom DSL. If DSL CLS is "PP", ACSR GRP must be blank.
- The CKT SWITCHING LCC and RAX of the SHARED LIST ROW 1 TN or MLHG/TERM NBR (entered on the corresponding DSLUSR form) must be defined on an LCC form where CLASS OF SERVICE is "ISDN".
- The TN may not be a series completion DN on another form; that is, it may not appear in the SERHLN field on a LINE, MLHLN, DSLUSR, or SHTN form.
- The TN may not be assigned the following types of BRCS features on the LINEFA, CLUSTR, or BFG form: ACCT, ACSR, ARS, ATH, CFW (where CFPF ALW is "Y"), ICM, MDR, MS, PFA, PP, PUO, PUT, TGSR, or TOD.
- The MLHG/TERM NBR may not be assigned the following types of BRCS features on the MLHLNFA, CLUSTR, or BFG form: ACCT, ACSR, ARS, ATH, CFW (where CFPF ALW is "Y"), ICM, MDR, MS, PFA, PP, PUO, PUT, TGSR, or TOD.

3.3 BAUTO

Description: This is a Recent Change only field.

3.4 SAR NUM

Description: The next three fields provide the option of reserving call appearances for originating or

Copyright © 2003 Lucent Technologies

terminating calls.

Reservations can be one of three types:

- Origination only: SAR ORIG field equal to "Y"
- Termination only: SAR TERM field equal to "Y"
- Origination and priority terminations: SAR ORIG and SAR TERM fields equal to "Y". Priority terminations are defined in the INCOMING, INTERCOM, ORIG CALL WAIT and PP fields. One or more priority terminations must be defined.

The SAR NUM field is the number of subaddresses reserved. It applies to secondary only TNs and defines the number of call appearances to be reserved for originating or terminating calls. The number of subaddress reservations is less than or equal to the largest value in the NBR field. The highest numbered subaddresses are reserved. For example, if CALL APP is 1, NBR is 3 and SAR NUM is 2, then call appearances 2 and 3 are reserved.
Valid Entries: 1 - 16

Data Rules:

If SAR NUM is blank, then SAR ORG and SAR TERM must be "N".

3.5 # SAR ORIG

Description: Will call appearances be reserved for originating calls? Any attempt to terminate to the subaddress reserved for originating calls will result in a busy signal. Originations will be handled normally.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

3.6 # SAR TERM

Description: Will call appearances be reserved for terminating calls? Any attempt to originate on a subaddress reserved for terminating calls will be denied. Calls will terminate normally.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

3.7 # INCOMING

Description: Are incoming calls to a terminal group a priority? This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If INCOMING is "Y", then SAR ORIG and SAR TERM must be "Y".

3.8 # INTERCOM

Description: Are ISDN Intercom calls a priority? This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If INTERCOM is "Y", then SAR ORIG and SAR TERM must be "Y".

3.9 # ORIG CALL WAIT

Description: Are originating calls a priority? This is the ISDN equivalent of call waiting origination. This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ORIG CALL WAIT is "Y", then SAR ORIG and SAR TERM must be "Y".

3.10 # PP

Description: Are Priority and Preemption calls a priority? This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PP is "Y", then SAR ORIG and SAR TERM must be "Y".

3.11 BILL TN

Description: Enter a 7 or 10-digit telephone number if billing is to be charged to a number other than the key TN. This field applies to secondary only TNs and MLHG/TERMs.
Valid Entries: 7 digits (0 - 9); or ten digits (first digit 2 - 9, second digit 0 - 1, remaining digits 0 - 9)

3.12 IBV

Description: Is Busy Verification allowed for this secondary only TN or MLHG/TERM? If this field is set to "N", Busy Verification will be denied. IBV applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.
Valid Entries: Y, N

3.13 SUST

Copyright © 2003 Lucent Technologies

Description: Is terminating service allowed for this secondary only TN or MLHG/TERM? If this field is set to "N", terminating service will be suspended; the TN or MLHG/TERM will not be allowed to receive calls. SUST applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.
Valid Entries: Y, N

3.14 # INWATS

Description: Is the MLHG Inwats? Only Secondary MLHG/TERMs with an associated TN can have a "Y" in this field.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then ICP must be "N".

3.15 ICP

Description: Should terminating calls be routed to regular intercept? This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.
Valid Entries: Y, N

3.16 # TRC

Description: Is Call Tracing on calls allowed? This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

Required Field.
Default: N
Valid Entries: Y, N

3.17 # BUSY MONITOR

Description: Can the key TN be monitored by the Busy Lamps of an ISDN Attendant MLHG?

Required Field.
Default: N

Data Rules:

An ISDN Attendant Multi-Line Hunt Group can busy monitor a Hundreds Group (Telephone Numbers that share the same first five digits) only if those Telephone Numbers that can be busy monitored do not physically terminate to more than 12 processors (SMs and/or AM). Entering a LISTED TN on an MLHG form causes the AM to be counted as one of the processors.

The following Telephone Numbers can be included in the Hundreds Group, if the BUSY MONITOR field on the form is set to "Y":

- A TN from a LINE form;
- A TN from a MLHLN form;
- A CKT TN from a DSL form;
- A CKT TN from a DSMLHLN form;

Copyright © 2003 Lucent Technologies

- A LISTED TN from an MLHG form.

The following physical terminations can be included in the Processor count, if the BUSY MONITOR field on the form is set to "Y":

- The first three digits (SM) of the OE NUMBER from a LINE form;
- The first three digits (SM) of the OE NUMBER from a MLHLN form;
- The first three digits (SM) of the LCEN or ILEN from a DSL form;
- A LISTED TN from an MLHG form will cause the AM to be counted;
- The first TN in the SHARED LIST on a SHTN form has three possible cases:
  - If the TN matches the CKT TN on a DSL form, then the corresponding first three digits (SM) of the LCEN or ILEN on that DSL form will be counted;
  - If the TN matches the CKT TN on a DSMLHLN form, then the corresponding first three digits (SM) of the LCEN or ILEN on that DSMLHLN form will be counted;
  - If the MLHG and TERM NBR match the CKT MLHG and CKT TERM on a DSMLHLN form, then the corresponding first three digits (SM) of the LCEN or ILEN on that DSMLHLN form will be counted.

This field must be "N" if 1 is entered in the key TERM field. For 5E4(2), if this field is "Y", an ISAT GRP must be entered. This field applies to secondary only TNs and secondary only MLHG/TERMs with an associated TN.

For 5E5 and later, if this field is "Y", the ATT MLHG field must be entered.

3.18 ATT MLHG

Description: Enter the Attendant MLHG that can control the TN that is shared on this form.

Software Release: 5E5 and later
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

The ATT MLHG must have a service class of "ISATND" or "ATND" defined on the LCC form (5306 Record).

If this field is entered, it must be defined in the MLHG field on an MLHG form (5110-1 Record) with an MLHG FEATURE associated with a HUNT TYPE of "ISAT" or "MUPH" on an MLHGFD form (5604 Record). If the HUNT TYPE is not "ISAT", BUSY MONITOR must be "N".

If this field is entered and TERM NBR is "001", then the MLHG must be defined on an MLHG form with ATT MLHG equal to the ATT MLHG on this form.

For 5E8 and later, if ATT MLHG is entered, RBV TGN must not be entered.

3.19 RBV TGN

Copyright © 2003 Lucent Technologies

Description: Enter the number of the incoming trunk group used to Remote Busy Verify the Secondary Only TN (DN) or the TN associated with a Secondary Only terminal on this form. Remote Busy Verify cannot be assigned to Primary TNs or Primary Terminals on this form. This TGN allows an ISAT (ISDN Attendant) on another 5ESS switch to Busy Verify this DN if the TGN is associated with a Secondary Only TN (DN).

Software Release: 5E8 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If RBV TGN is entered, ATT MLHG must not be entered, BUSY MONITOR must be "N", and TN must be entered.

If TN(key) matches SHARED LIST row 1 TN, RBV TGN must not be entered. If MLHG/TERM NBR(key) matches SHARED LIST row 1 MLHG/TERM NBR, RBV TGN must not be entered. If RBV TGN is entered and a Secondary Only MLHG/TERM is entered, the TN key field must be entered.

If RBV TGN is entered, there must be a corresponding TKGRP form (5202 Record) with that TGN defined, and that TKGRP form must have TRKCLS set to "ATNDVFY", and TRK DIR must be "INC". Also, for the TGN on the TKGRP form, there must be at least one corresponding TRUNK form (5204 Record) with QTY entered.

If RBV TGN is entered, MLHG must equal MLHG on a corresponding MLHG form. That MLHG form must have MLHG FEATURE equal to FEATURE NAME on a corresponding MLHGFD form, which in turn must not have HUNT TYPE set to "MUPH", "ISAT", or "PSUCD".

If RBV TGN is entered, the corresponding DSLUSR form must have CSV entered and greater than zero.

3.20 PORTED

Description: The PORTED field is used to indicate whether the TN has been ported into this office via the NP (Number Portability) feature. The indicator is used by call processing to determine whether or not to generate an BAF (NP Bellcore AMA Format) module for originating and terminating IXC (Inter-Exchange Carrier) access records.

Software Release: 5E11 and later
Valid Entries: Y, N

3.21 NON COND TRIG

Description: The NON COND TRIG field is used to indicate whether or not a call to this DN requires a non-conditional query of the SCP (Service Control Point) prior to routing the call.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When SERHLN exists, NON COND TRIG must be "N".

When ICP is "Y", NON COND TRIG must be "N".

Copyright © 2003 Lucent Technologies

When NON COND TRIG is set to "Y", the ACT field for SFID 216 on the SFSYS form must be set to "Y". And if SFID 216 is set to "Y", SFID 174 must also be set to "Y".

NON COND TRIG must be "N" for Primary TNs, Primary MLHG members, Secondary only MLHG members, and Secondary only MLHG members with a DN.

NON COND TRIG can only be "Y" for Secondary only TNs.

3.22 PVN ALW

Description: The name of this field was changed to ASP ALW in 5E8. This field name applies to 5E6 - 5E7. See ASP ALW for usage information.

3.23 ASP ALW

Description: Is this Secondary Only TN allowed to originate ASP (Advanced Services Platform; previously PVN (Private Virtual Network)) calls via an ODP Feature/Prefix Code trigger? (This field was called PVN ALW for 5E6 - 5E7).

Software Release: 5E6 - 5E8
Required Field.
Default: N

Data Rules:

If PVN OFC on the OFCOPT form (5509 Record) is set to "NONE", then this office does not support ASP and PVN ALW must be "N".

A line dedicated to ASP services should not be entered as part of a Series Completion Group. When PVN ALW is set to "Y" and SERHLN is entered, then the DIGIT ANALYSIS SELECTOR on the corresponding LCC form (5306 Record) cannot be equal to PVN DAS on the OFCOPT form (5509); note that the LCC form will be found by using the LCC and RAX from the DSLUSR form (5908 Record) defining this line's lead TN or MLHG Member (as assigned by TN or MLHG and TERM NBR in the first element of the SHARED LIST). Likewise, DIGIT ANALYSIS SELECTOR should not be equal to a DAS equivalent in functionality to the PVN DAS (i.e., a virtual ASP DAS).

3.24 SERHLN

Description: SERHLN defines a Series Completing to Telephone Number. Series Completion supports BRI (Basic Rate Interface) lines for CSV (Circuit-Switched Voice) calls. The feature hunts a linked-list DN until an idle line is found or until 16 Series Completion attempts are made. A maximum of 50 TNs can Series Complete to a single TN defined on this form or on the DSLUSR, LINE or MLHLN forms.

Software Release: 5E6 and later
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

When this field is entered, the following conditions must be true: ICP must be "N", the TN field must be entered, SERHLN cannot equal the TN field, PVN ALW must be "N" (5E6 - 5E8). SERHLN cannot be entered when either CKT ICP or PVN ALW (5E6 -5E8) is "Y".

When SERHLN, MLHG and TERM NBR are entered, NON-HUNT TN must be "Y".

Copyright © 2003 Lucent Technologies

For 5E8 only, the SERHLN cannot be a Standard BRI line, an analog line shared to a Standard BRI, or a Secondary Only TN associated with a Standard BRI. That is, the SERHLN may not be defined as a CKT TN or CKT SWITCHING MLHG TN on a DSLUSR form when DSL CLS is "STD" on the corresponding DSL form. It may not be defined as a TN on a LINE or MLHLN form if the TN or MLHG is a key on an SHTN form, and a shared list entry on that form is defined on a DSLUSR form with DSL CLS "STD" on the corresponding DSL form. It may not be defined as a Secondary Only key TN on another SHTN form where any shared list entry is defined on a DSLUSR form with DSL CLS "STD" on the corresponding DSL form.

For 5E9(1) and later, TN(s) on the SHTN form that have Series Completion allowed (SERHLN is known). One of the following conditions must be satisfied:

- The SERHLN matches an STN on the SHTN form with SMLHG/SMEMB unknown, STN does not match TN in row 1 of the SHARED LIST, and ICP is "N".
- The SERHLN matches an STN on the SHTN form with SMLHG/SMEMB known, SMLHG/SMEMB does not match MLHG/MEMB in row 1 of the SHARED LIST, and ICP is "N".
- The SERHLN matches a CKTTN on the DSLUSR form with ICP equal to "N".
- The SERHLN matches a CKT MLHG TN on the DSLUSR with ICP equal to "N".
- The SERHLN assigned on the SHTN form must be defined on the MLHLN form with ICP (intercept) equal to "N". The LCC/RAX must match LCC/RAX on the LCC form with a TERMINATING TREATMENT equal to "INWATS" or "MLHG".
- The SERHLN must be defined on a LINE form (as TN) with ICP equal to "N". The LCC/RAX must match LCC/RAX on an LCC form with a TERMINATING TREATMENT equal to "INWATS", "PARTY", "RI", or "INDIV".
- The SERHLN assigned on the SHTN form must be defined on a LINE, MLHLN, DSLUSR, or SHTN form, or as a LISTED TN on an MLHG form.

For 5E12 and later, if the 3 digits of the 7-digit SERHLNs on the SHTN form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE or the NOC form does not exist, the SERHLN must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

3.25 MONITORED TN

Description: The MONITORED TN field is used to indicate whether or not this line is monitored by one or more ISDN terminals. This field supports the Telephone Status Monitor and Select Feature. For more information, see Div. 2 Sec. 4A264. The field is used by Recent Change only and cannot be accessed by ODA.

3.26 CONTEXT ID

Description: This field is used to indicate whether or not a shared directory number is "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E12 and 5E13: N
- For 5E14: NATIVE

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid CONTEXT ID Entries		
Entry for 5E12, 5E13	**Entry for 5E14 and later**	**Description**
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

For 5E12 and later:

When the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" on the SHTN form, the ACT field for SFID (Secured Feature ID) 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

When the first TN entry from the SHARED LIST is equal to the key TN, CONTEXT ID must be set to "N" or "NATIVE".

When the first MLHG/TERM entry from the SHARED LIST is equal to the key MLHG/TERM, CONTEXT ID must be set to "N" or "NATIVE".

3.27 RMK

Description: Enter a descriptive comment. This field applies to secondary only TNs.
Valid Entries: up to 16 characters.

MLHG TERM

The following fields (Section 3.28 - Section 3.30) apply to Secondary Only MLHG terminals.

3.28 NON-HUNT TN

Description: Is this Terminal a Non-Hunt Terminal? Non-hunt allows a line in an MLHG to receive direct calls that do not hunt if the called line is busy. This field applies to secondary only MLHG/TERMs with an associated TN.
Valid Entries: Y, N

3.29 MMB SUBGP

Description: Enter the Member Make Busy Subgroup number for the Secondary MLHG Terminal. The number here designates a subgroup. All members in the same subgroup have the same Make Busy Subgroup number. Subgroups exist within an MLHG; MMB SUBGP values can appear in multiple MLHGs, but each combination of MLHG and MMB SUBGP defines a unique subgroup.
Valid Entries: 1 - 255

3.30 RND SUBGP

Description: Enter the Random Make Busy Subgroup number for the Secondary MLHG Terminal. The number here designates a subgroup. All members in the same subgroup have the same Random Make Busy Subgroup number. Subgroups exist within an MLHG; RND SUBGP values can appear in multiple MLHGs, but each combination of MLHG and RND SUBGP defines a unique subgroup.
Valid Entries: 1 - 255

NI SAR LIST (SARLIST)

The following fields (Section 3.31 - Section 3.32) describe the NI SAR LIST. These fields support the

Copyright © 2003 Lucent Technologies

ISDN Call Appearance Reservation Feature. See Division 2, Section 1BM for more information.

Subaddress reservation list contains up to 3 entries which consist of type of subaddresses to reserve, the order in which the type of reservation specified should appear with respect to the other types of subaddresses reserved, if any, and the number of subaddresses to reserve for that type of subaddress reservation.

3.31 TYPE AND ORDER

Description: The TYPE AND ORDER field is used to specify the type and order of subaddresses to reserve for call appearance reservation. The subaddress types can be reserved in any order with respect to one another; however, all subaddresses within one category must be reserved contiguously (i.e. each reservation type may appear only once in NI SAR LIST(SARLIST) field). The location of the list entry determines the ordering of the reservation type with respect to the other types of subaddresses reserved, if any. The reserved subaddresses are assigned to the highest numbered subaddresses associated with the circuit telephone number specified in the CKT TN field.

Example 1:
The following is an example of the assignment of call appearance reservation to a non-shared secondary-only TN.

A secondary-only TN is inserted on the SHTN form (the key is the secondary-only TN), and is assigned to appear on a terminal where a Standard ISDN circuit TN is primary and the EKTS field is set to "CACH" on the DSLUSR form. This is accomplished by putting the circuit TN in the SHARED LIST and assigning a value in the CA and CA QTY fields. The secondary-only TN is assigned to appear on the circuit TN's terminal starting at CA 10 for a CA QTY of 4. Therefore, four appearances of the secondary-only TN will appear on the terminal where the circuit TN is primary.

The NI SAR LIST for the secondary-only TN is set up as follows:

NI SAR LIST		
ROW	TYPE AND ORDER	QTY
1	ORIG	1
2	TERM	1

In this example, the secondary-only TN is a non-shared secondary-only, since the TN only appears on one terminal, the circuit TN's primary terminal. The secondary-only TN has four subaddresses, since it appears for four call appearances on the terminal. Therefore, the secondary-only may have up to four subaddresses reserved for call appearance reservation. In this example, only two of the secondary-only TN's subaddresses are to be reserved (sum of QTYcolumn). Since the reserved subaddresses are the highest numbered subaddresses of the TN, it is the last two of the four subaddresses (subaddresses 3 and 4 of the TN) which will have subaddress reservation. The order of the types of reservation follows the order specified in the NI SAR LIST field. Therefore, subaddress 3 of the TN will be reserved for originations ("ORIG") since a QTY of 1 subaddress is specified to be reserved for "ORIG" and it is the first TYPE in the NI SAR LIST. Subaddress 4 will be reserved for terminations ("TERM"), since a QTY of 1 subaddress is specified to be reserved for TERM and it is the second TYPE in the NI SAR LIST. Any non-reserved subaddresses are the lowest numbered subaddresses of the TN (in this example, subaddresses 1 and 2 are not reserved).

On the Standard "CACH" terminal (where the circuit TN is primary), the subaddresses correspond to call appearances as follows:

- CA 10 is subaddress 1 of secondary-only TN (not reserved)
- CA 11 is subaddress 2 of secondary-only TN (not reserved)
- CA 12 is subaddress 3 of secondary-only TN (reserved for originations)
- CA 13 is subaddress 4 of secondary-only TN (reserved for terminations)

Copyright © 2003 Lucent Technologies

Example 2:
Assigning call appearance reservation to a shared TN (secondary-only or primary).

When a TN (secondary-only or primary) is shared, its subaddresses and corresponding subaddress reservation is also shared. The following example will demonstrate the shared scenario when call appearance reservation is assigned.

A circuit TN has been defined on the DSLUSR form to have 5 call appearances (CA QTY is 5) starting at call appearance 3 (CA is 3) on the terminal on which the circuit TN is primary, and NI SAR LIST is set up as follows.

NI SAR LIST		
ROW	TYPE AND ORDER	QTY
1	PRIO	1
2	TERM	2
3	ORIG	1

In this example, the circuit TN has five subaddresses (CA QTY is 5). Four of the circuit TN's five subaddresses are to be reserved (sum of the QTY column). Since the reserved subaddresses are the highest numbered subaddresses of the circuit TN, it is the last four of the five subaddresses (subaddresses 2, 3, 4, and 5 of the circuit TN) which will have subaddress reservation. The order of the types of reservation follows the order specified in the NI SAR LIST field. Therefore, subaddress 2 of the circuit TN will be reserved for originations and priority incoming terminations ("PRIO") since a QTY of 1 subaddress is specified to be reserved for "PRIO" and it is the first TYPE in the NI SAR LIST. Subaddresses 3 and 4 will be reserved for terminations ("TERM"), since a QTY of 2 subaddresses is specified to be reserved for TERM and it is the second TYPE in the NI SAR LIST. Finally, subaddress 5 will be reserved for originations ("ORIG"), since a QTY of 1 subaddress is specified to be reserved for ORIG and it is the third type in the NI SAR LIST. Any non-reserved subaddresses are the lowest numbered subaddresses of the circuit TN (in this example, subaddress 1 is not reserved).

On this terminal (the circuit TN's terminal), the subaddresses correspond to call appearances as follows:

- CA 3 is subaddress 1 (not reserved)
- CA 4 is subaddress 2 (reserved for "ORIG" and "PRIO" terminations)
- CA 5 is subaddress 3 (reserved for terminations only)
- CA 6 is subaddress 4 (reserved for terminations only)
- CA 7 is subaddress 5 (reserved for originations only)

Next, the circuit TN (circuit TN A) is shared onto another terminal where circuit TN B is primary. This is accomplished through this form and circuit TN A is assigned to appear on the terminal where circuit TN B is primary starting at call appearance 20 (CA is 20) for three call appearances (CA QTY is 3). Therefore, only three of circuit TN A's subaddresses are to be shared, and they will be the lowest numbered subaddresses of circuit TN A, in this case subaddresses 1, 2, and 3. The subaddresses will also carry any subaddress reservation they have assigned to the terminal(s) on which they are shared. So in this example, subaddress 1 of circuit TN A will appear on circuit TN B's terminal and will be non-reserved (because subaddress 1 of circuit TN A is non-reserved). Subaddress 2 of circuit TN A on circuit TN B's terminal will be reserved for originations and priority terminations (because subaddress 2 of circuit TN A is reserved for this type of reservation). Similarly, subaddress 3 of circuit TN A on circuit TN B's terminal will be reserved for terminations. If subaddresses 4 and 5 were also shared, the reservation type for those subaddresses would be carried, but in this case those subaddresses do not appear on circuit TN B's terminal, so circuit TN A has no subaddresses reserved for originations- only on circuit TN B's terminal.

Copyright © 2003 Lucent Technologies

On circuit TN B's terminal, the subaddresses correspond to call appearances as follows:

- CA 20 is subaddress 1 of circuit TN A (non-reserved)
- CA 21 is subaddress 2 of circuit TN A (reserved for originations and priority terminations)
- CA 22 is subaddress 3 of circuit TN A (reserved for terminations only)

Software Release: 5E11 and later.
Valid Entries:

Valid TYPE AND ORDER Entries

Entry	Definition
ORIG	Subaddress(es) reserved for originations only.
PRIO	Subaddress(es) reserved for originations and priority incoming terminations.
TERM	Subaddress(es) reserved for terminations only.
blank	No subaddress reservation.

Data Rules:

When TYPE AND ORDER is "ORIG" and QTY is equal to the highest value of SHARED LIST NBR, BUSY MONITOR must not be "Y".

When the first row TN entry from SHARED LIST is equal to the key TN (ie. Primary TN), the NI SAR LIST entries cannot be made.

When the first TN or MLHG/TERM entry from SHARED LIST is equal to the key TN or MLHG/TERM on this form, the NI SAR LIST entries must not be specified.

Secondary MLHG/TERMs cannot make entries to the NI SAR LIST.

If TYPE AND ORDER or QTY is entered, both must be entered.

All known values of TYPE AND ORDER must be unique.

Entry on the NI SAR LIST must not be made when TN, MLHG and TERM NBR are entered.

When a TN is assigned via the SHARED LIST on a SHTN form that has one or more NI SAR LIST entries, the TN must be defined (as CKT TN) on a DSLUSR form. In addition, the DSLUSR form EKTS field must have an entry, and the following must be true:

- When the EKTS entry is "BASIC", if an NI SAR LIST entry is made, only one entry is permitted and that one entry must have an NI SAR LIST QTY equal to 1.
- When the EKTS entry is "CACH", the sum of the values entered in the NI SAR LIST QTY fields must not exceed the entry in the NBR field in row 1 of the SHTN form SHARED LIST.

3.32 QTY

Description: The QTY field is used to specify the quantity of subaddresses to be reserved for the type of subaddress designated for the secondary-only TN. Secondary-only TN's do not have a terminal on which the TN is primary, so the number of subaddresses allowed to be reserved is determined by the terminal on which the secondary-only TN appears the most times (i.e. for the most call appearances). Therefore, the total number of subaddresses reserved for the secondary-only TN must not exceed the highest value specified in the CA QTY field on the DSLUSR form.

Software Release: 5E11 and later.
Valid Entries: 1 - 16

SEC. 1D: 5903 RECORD
INCOMING CALL IDENTIFICATION PARAMETER FORM - ICIPF

1. GENERAL

The 5903 Record is available with 5E4(2) and later Software Releases. This record is used to assign ICI (Incoming Call Identification) parameters to ISDN Attendant Multi-Line Hunt Groups and Terminal Groups.

1.1 ISDN Attendant Hunt Groups

ISAT (ISDN Attendant) hunt groups use ICIs to determine the types of calls served by each attendant. The ICIs assigned on this form define which ICIs the Multi-Line Hunt Group serves and the ICIs assigned on the DSLUSR form define which ICIs the individual member (Multi-Line Hunt Group terminal number) serves.

1.2 Queuing

If queuing is provided for the ISAT Multi-Line Hunt Group, the ICIs and priorities assigned to them are used to determine how calls will be removed from the queue. For more information on ISDN Attendant Hunting and Queuing, please refer to the feature sections in Division 2.

1.3 TGID

This form is also used to assign ICIs to a TGID (Terminal Group Identification) number. ICIs assigned to a TGID are used with the display feature to identify the type of incoming call to an ISDN terminal. For example, if the ICI "TIE1" is assigned to a particular trunk group that belongs to TGID 10, it will be displayed to ISDN terminals in this group that have an appropriate display feature whenever they receive a call over this trunk group.

The total combination of all ICIs assigned (HUNTING, PREC, FX, TIE and CNET) to any given group in the following fields must not exceed sixteen.

A maximum of 16 ICI's may be assigned on the ICIPF form, i.e., the total combination of all ICIs assigned (HUNTING, PREC, FX, TIE and CNET) to any given group in the following fields must not exceed 16.

1.4 Recent Change View

The corresponding Recent Change view for this form is 3.43.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * GRP TYP

Description: Enter the Group Type.

Required Field.

Valid GRP TYP Entries

Entry	Definition
HUNT	Multi-Line Hunt Group
TGSR	Terminal Group ID

Data Rules:

Copyright © 2003 Lucent Technologies

HUNT - For 5E9(2) and later , if GRP TYP is "HUNT":

- and FTS PRIO is entered then FTS TGN must also be entered.
- and one or more of the HUNTING ICI PRIO, PREC ICI PRIO, FX TRK GRPS PRIO, TIE TRK GRPS PRIO, CNET TRK CRP PRIO, or FTS TRK GRP PRIO fields have been entered, then the corresponding MLHG form (5110 Record) must have an entry for QFEATURE.
- and the values entered for FX TRK GRPS, TIE TRK GRPS, CNET TRK, or FTS TRK GRP are not assigned to a CKT MLHG or CKT TERM field on the corresponding DSLUSR forms, then each must be assigned to the ICI's on at least one DSLUSR form where ICIPF GRP NBR matches DSLUSR CKT MLHG.

TGSR - If GRP TYP is "TGSR", then PRIO must not be entered for the following TRK GRPs:
- FX
- TIE
- CNET
- FTS

2.3 * GRP NBR

Description: Enter the Multi-Line Hunt Group Number or Terminal Group ID.

Required Field.
Valid Entries:
- For MLHGs:
  - 5E14 and earlier: 1 - 2000
  - 5E15 and later: 1 - 8191
- For Terminal Groups: 1 - 65535

Data Rules:

If GRP TYP is "HUNT", GRP NUM must be less than 2001 and the group number must be defined on the MLHG form with a hunting feature (from the MLHGFD form) which has a hunt type of "ISAT".

If the group type is TGSR, the valid range is 1-65535 and the group number must be defined on the TGSRMPA or TGSRLPA form.

HUNTING ICI

The following fields (Section 2.4 - Section 2.5) define the Hunting ICIs. Up to sixteen Hunting ICIs may be assigned on an ICIPF form. A priority must be assigned along with each ICI defined. The group type must be "HUNT" to allow Hunting ICI entries.

2.4 ICI

Description: Enter the Hunting ICI.

Valid ICI Entries

Entry	Definition
CFBL	calls that have been call forwarded via a call forward busy line feature.
CFDA	Calls that have been call forwarded via a call forward don't answer feature.
CFOH	Calls that have been forwarded via a call forward don't answer feature.
CFV	Calls that have been call forwarded via a call forward variable feature.
DCL	Identifies a call originating from manual (no-dial) line.
EMER	Identifies a call where the user dialed the attendant using a prespecified IDP (Individualized Dialing Plan)

Copyright © 2003 Lucent Technologies

	code which was defined as an emergency code (has an ACTION of "EMER"). When the EMER ICI is assigned, it must also be assigned to all terminals of the Multi-Line Hunt Group on the DSLUSR form.
FTSICN	Software Release: 5E9(2) and later. FTS-2000 trunk to CENTREX Network. An incoming call is terminating in a CENTREX Network from a trunk group marked as an FTS trunk group.
FXICN	Software Release: 5E9(2) and later. FX trunk to CENTREX Network. An incoming call is terminating in a CENTREX Network from a trunk group marked as an FX trunk group.
ICPT	Call is intercepted and redirected to the attendant. This may ICPT
LDNx	Call arrived on (LDN1 - LDN8) one of the eight sub-groups (x = 1 to 8). These ICIs are used for calls arriving at a Multi-Line Hunt Group which have no other ICI. LDN (Listed Directory Number) ISAT (ISDN Attendant) Multi-Line Hunt Groups may have up to eight sub-group TNs (defined on the MLHG form). LDN ICIs have a one-to-one relationship to SUBTN fields one through eight on the MLHG form; therefore, for each LDN ICI defined here, there must be a corresponding SUBTN entry on the MLHG form. If LDN ICIs are assigned, WAT ICIs cannot also be assigned (you cannot mix LDN and WAT ICIs).
QUE	Software Release: 5E6 and later. Calls queued to individual hunted TNs.
RBQ	Calls that have terminated after the ring back queuing feature was used to camp on to a busy trunk group.
RLT	Release Link Services associated with Centralized Attendant Services.
TIEICN	Software Release 5E9(2) and later. TIE trunk to CENTREX Network. An incoming call is terminating in a CENTREX Network from a trunk group marked as a TIE trunk group.
WATx	(WAT1 - WAT5) are used for calls arriving at the ISAT group as INWATS calls. The WATS ICIs have a one-to-one relationship with SUBTN fields one through five on the MLHG form; therefore, for each WAT ICI defined here, there must be a corresponding SUBTN entry on the MLHG form. ISAT INWATS Multi-Line Hunt Groups can have no more than five subgroup TNs.

Data Rules:

If a Precedence and Preemption ICI is entered in the PREC ICI list, then only "EMER", "QUE" and either "LDN" or "WAT" can be entered as HUNTING ICIs.

If one or more "QUE" ICIs are entered, then GRP NBR must be defined on an MLHG form (5110 Record) with Q INDI HNT TNS set to "Y".

2.5 PRIO

Description: Enter a priority for the Hunting ICI, where 1 is the highest priority and 8 is the lowest. Calls to an ISDN Attendant group that cannot be terminated to an available attendant who serves the ICI may be placed on a queue. Calls that are queued in this manner are served based on their priority, length of time in the queue and availability of an attendant serving the particular ICI.
Valid Entries: 1 - 8

PREC ICI

The following fields (Section 2.6 - Section 2.7) define the Precedence and Preemption ICIs. Up to six Precedence and Preemption ICIs may be assigned per group. The GRP TYP must be "TGSR" to allow PREC ICI entries.

2.6 ICI

Description: Enter the Precedence and Preemption ICI.

Valid ICI Entries

Entry	Definition
PPEXEC	The precedence "Executive" is used on this call.
PPFLSH	The precedence "Flash" is used on this call.
PPFOVR	The precedence "Flash Override" is used on this call.
PPIMMD	The precedence "Immediate" is used on this call.
PPPRIO	The precedence "Priority" is used on this call.
PPROUT	The precedence "Routine" is used on this call.

Copyright © 2003 Lucent Technologies

2.7 PRIO

Description: Enter a priority for the Precedence ICI, where 1 the highest priority and 8 the lowest. Calls to an ISDN Attendant group that cannot be terminated to an available attendant who serves the ICI may be placed on a queue. Calls that are queued in this manner are served based on their priority, length of time in the queue and availability of an attendant serving the particular ICI.
Valid Entries: 1 - 8

FX TRK GRPS

The following fields (Section 2.8 - Section 2.9) define the Foreign Exchange Trunk Group ICIs. Up to eight Foreign Exchange Trunk Group ICIs (FX1 - FX8) may be assigned per group. These ICIs are used for calls that have arrived from a trunk group which is recognized as an FX trunk group.

If a TGN is entered for FX TRK GRPS, TIE TRK GRPS, or CNET TRK GRPS, then it must be assigned to a CKT MLHG/CKT TERM on the corresponding DSLUSR form. Each of the FX TRK GRPS , TIE TRK GRPS or CNET TRK GRPS with GRP TYP of "HUNT" on an ICIPF form must be assigned to the ICIs on at least one DSLUSR form where ICIPF GRP NBR matches DSLUSR CKT MLHG.

2.8 TGN

Description: Enter the Trunk Group Number of the foreign exchange trunk group.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

If TGN is entered, it must be defined on a TKGRP form (5202 Record).

2.9 PRIO

Description: Enter a priority for the Foreign Exchange Trunk Group ICI, where 1 is the highest priority and 8 the lowest. Calls to an ISDN Attendant group that cannot be terminated to an available attendant who serves the ICI may be placed on a queue. Calls that are queued in this manner are served based on their priority, length of time in the queue and availability of an attendant serving the particular ICI.
Valid Entries: 1 - 8

TIE TRK GRPS

The following fields (Section 2.10 - Section 2.11) define the Tie Trunk Group ICIs. Up to eight Tie Trunk Group ICIs (TIE1 - TIE8) may be assigned per group. These ICIs are used for calls that have arrived from a trunk group recognized as a TIE trunk group.

If a TGN is entered for FX TRK GRPS, TIE TRK GRPS, or CNET TRK GRPS, then it must be assigned to a CKT MLHG/CKT TERM on the corresponding DSLUSR form. Each of the FX TRK GRPS , TIE TRK GRPS or CNET TRK GRPS with GRP TYP of "HUNT" on an ICIPF form must be assigned to the ICIs on at least one DSLUSR form where ICIPF GRP NBR matches DSLUSR CKT MLHG.

2.10 TGN

Description: Enter the Trunk Group Number of the TIE Trunk Group.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Copyright © 2003 Lucent Technologies

The trunk group entered here must be defined on the TKGRP form (5202 Record).

2.11 PRIO

Description: Enter a priority for the TIE Trunk Group ICI, where 1 is the highest priority and 8 the lowest. Calls to an ISDN Attendant group that cannot be terminated to an available attendant who serves the ICI may be placed on a queue. Calls that are queued in this manner are served based on their priority, length of time in the queue and availability of an attendant serving the particular ICI.
Valid Entries: 1 - 8

CNET TRK GRP

The following fields (Section 2.12 - Section 2.13) define the CNET Trunk Group ICI. A single CNET Trunk Group ICI can be assigned per group. These ICIs are used for calls that have arrived from a trunk group designated as a CENTREX Network Trunk Group.

If a TGN is entered for FX TRK GRPS, TIE TRK GRPS, or CNET TRK GRPS, then it must be assigned to a CKT MLHG/CKT TERM on the corresponding DSLUSR form. Each of the FX TRK GRPS , TIE TRK GRPS or CNET TRK GRPS with GRP TYP of "HUNT" on an ICIPF form must be assigned to the ICIs on at least one DSLUSR form where ICIPF GRP NBR matches DSLUSR CKT MLHG.

2.12 TGN

Description: Enter the Trunk Group Number of the CNET Trunk Group.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The trunk group entered here must be defined on the TKGRP form (5202 Record).

2.13 PRIO

Description: Enter a priority for the CNET Trunk Group ICI, where 1 is the highest priority and 8 the lowest. Calls to an ISDN Attendant group that cannot be terminated to an available attendant who serves the ICI may be placed on a queue. Calls that are queued in this manner are served based on their priority, length of time in the queue and availability of an attendant serving the particular ICI.
Valid Entries: 1 - 8

FTS TRK GRP

The following fields (Section 2.14 - Section 2.15) define a Federal Telecommunications System 2000 Trunk Group composite structure consisting of TGN and PRIO. These ICIs are used for calls that have arrived from a trunk group designated as an FTS-2000 trunk group. These fields are used by the CENTREX Network secured features. For more information on the CENTREX Network features, see Division 2, Sections 4A181, 4A182, and 4A183.

2.14 TGN

Description: Enter the single FTS-2000 trunk group ICI to the specified trunk group.

Software Release: 5E9(2) and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

The trunk group entered here must be defined on the TKGRP form (5202 Record).

2.15 PRIO

Description: Enter the priority of the FTS-2000 Trunk Group ICI. Calls to an ISDN Attendant group that cannot be terminated to an available attendant who serves the ICI may be placed on a queue. Calls that are queued in this manner will be served based on their priority, length of time in the queue and availability of an attendant serving the particular ICI. A priority of 1 represents the highest priority.

Software Release: 5E9(2) and later
Valid Entries: 1 - 8

SEC. 1E: 5904 RECORD
DSL QUEUE MONITOR FORM - DSLQMON

1. GENERAL

The 5904 Record lists the MLHGs (Multi-Line Hunt Groups) that are to be monitored by a DSL monitor for queue status. A DSL queue monitor is any ISDN terminal that can request or display MLHG queue status. This form was added with the Circuit-Switched Data Queuing feature available with 5E6 and later Software Releases. (Refer to the feature description for CSD Queuing in Division 2, Section 1BB for further information.)

MLHG queues are monitored via a QSFB (Queue Status Feature Button) and the terminal display on a queue monitor console. Lamps on the console are turned on and off automatically to show the number of calls queued. The queue monitor console may or may not be an ISAT (ISDN Attendant) console. Also, the queue monitor console does not have to be a member of an MLHG.

The queue display status is intended for use on an ISDN terminal with a 40 character or more display. If the terminal display is less than 40 characters, the queue status information may be truncated. This feature can also be assigned to a terminal without display capabilities.

The queue monitor console contains a separate QSFB (Queue Status Feature Button) for each MLHG that it monitors. The QSFB is used to request the display for a particular MLHG queue. The monitor has from one to eight QSFBs. Each QSFB is always associated with a QTWL (Queue Threshold Warning Lamp). The value for QTWL is defined in the QMON THRESHOLD field on either the QUFD (5617-1/2 Record) or the QUGPA (5617-3/4 Record) form. When the number of calls in the queue is greater than the threshold warning value, the QTWLs on all consoles monitoring this particular MLHG are turned on. Each QSFB is also associated with an action defined on the CFGGRP form (5964 Record). These actions are LQxDISP (where x is from 1 to 8) and are associated with QSFBx respectively.

Up to eight MLHGs (MLHG1 through MLHG8) to be monitored can be entered on this form. Monitored MLHGs can be analog or ISDN, voice or CSD. ISAT MLHGs cannot be monitored. Each MLHG can be monitored by three separate queue monitor consoles.

Either the TN field or the MLHG/TERM NBR fields must be entered. Both TN and MLHG/TERM NBR cannot be entered. For each DSLQMON form with TN or MLHG/TERM NBR entered, there must be a corresponding DSLUSR form (5908 Record) with known values for CONFIG GRP and TERM TYPE.

The queue monitor consoles defined on this form must not exceed the number of consoles allowed per office (indicated by the MAX MON field on the ISDN OPT form (5941 Record)).

1.1 Recent Change View

The corresponding Recent Change view for this form is 23.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 (*) TN

Description: Enter the telephone number of the DSLQMON (if it has one).
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Copyright © 2003 Lucent Technologies

Data Rules:

The first three digits of the TN must be defined on the NOC form.

When this field is entered, there must be a corresponding CKT TN defined on the DSLUSR form (5908 Record).

For 5E12 and later, TNs on different DSLQMON forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the DSLQMON form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 (*) MLHG

Description: Enter the Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

This field must be defined on the MLHG form (5110 Record). When this field is entered, there must be a corresponding CKT MLHG defined on the DSLUSR form (5908 Record).

2.4 (*) TERM NBR

Description: Enter the MLHG Terminal Number.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals only)

Data Rules:

When this field is entered, there must be a corresponding CKT TERM defined on the DSLUSR form (5908 Record).

2.5 MONITORED MLHGS

Description: Enter from 1 to 8 unique MLHGs that can be monitored by the console defined on this form.
Valid Entries: For 5E14 and earlier: 1 - 2000

For 5E15 and later: Blank or 1 - 8191

Data Rules:

The MLHGs entered in this list cannot be monitored by more than three consoles.

Each MLHG entered in the list must be defined on the MLHG form (5110-1 Record) with QFEATURE entered. Also, the associated MLHGFD form (5604 Record) must not have "ISAT" entered in the HUNT TYPE field.

SEC. 1F: 5905 RECORD
ODB ISLU(2) IDCU TS ALLOCATION - ODBTS

1. GENERAL

The 5905 Record is applicable with 5E5 and later Software Releases. This form is used to reserve DPIDB (Directly connected Peripheral Interface Data Bus) time slots for DSL (Digital Subscriber Line) users with the ODB (On-demand B-channel Packet Switching) feature. The time slot allocation is provided on a per SM (Switching Module) and unit type basis.

A DSL user is assigned the ODB feature when an ODB TN is entered on the DSLUSR form (5908 Record). However, the reserved time slots are not initially allocated to the user. Instead, the time slots become part of a DPIDB time slot "pool" to be accessed later by a DSL user with the ODB feature on the same SM and unit.

Note that unit types defined on this form must be defined on the respective unit form. See the UNIT TYPE field for appropriate assignments.

1.1 Recent Change View

The Recent Change View for this form is 23.13.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

If an ODB ISCN is entered on the DSLUSR form, the SM entered on this form must equal the first three digits of the OE (Office Equipment) number entered on the DSLUSR form.

The SM number entered on this form must be defined on the EQIM form (5700 Record) with EQSTATUS set to "O" (operational).

2.3 * UNIT TYPE

Description: Enter the unit type. For 5E5 - 5E7, this field was called ISLU.

Required Field.

Valid UNIT TYPE Entries

Entry	Description
AIU or A	Software Release: 5E12 and later. Access Interface Unit ISDN U-Interface.
IDCU or ID	Software Release: 5E8 and later Integrated Digital Carrier Unit.
ISLU or IS	Software Release: 5E5 and later Integrated Services Line Unit.
ISLU2 or ISL	Software Release: 5E10 and later Integrated Services Line Unit 2.

Copyright © 2003 Lucent Technologies

Data Rules:

AIU ISDN:
For 5E12 and later, when UNIT TYPE is "AIU", SM, UNIT, DPIDB and PSU SHELF must be defined on an EQAIU form (5745-1/2 Record) as SM, AIU, TSGRP NO, and PIDB/PSU SHLF, respectively, with a PIDB TYPE of "PSU" and an AIU TYPE of "AIU" .

IDCU:
For 5E8 and later, when UNIT TYPE is "IDCU" then SM, UNIT, DPIDB and PSU SHELF must be defined on an EQIDCU form as SM, IDCU, PIDB NO. and DI/PSU SHLF, respectively, with a PIDB TYPE of "PSU".

ISLU:
For 5E10 and later, when SM, UNIT TYPE, UNIT, DPIDB and PSU SHELF(s) are assigned on an ODBTS form and the UNIT TYPE is "ISLU" or "ISLU2" then SM, UNIT, DPIDB and PSU SHELF must be defined on an EQISLU form as SWITCHING MODULE, ISLU NUMBER, PIDB NO. and PSU SHELF, respectively, with a PIDB TYPE of "PSU".

2.4 * UNIT

Description: Enter the unit number.

Required Field.
Valid Entries:
- For 5E9(2) and earlier: 0 - 7 for ISLU/2 or IDCU
- For 5E10 - 5E11: 0 - 42 for ISLU/2 or IDCU
- For 5E12 and later:
- 0 - 7 for ISLU/2
- 0 - 42 for IDCU
- 0 - 104 for AIU

ODB TS LIST

The ODB TS LIST consists of three entries: the MIN TS/DPIDB, DPIDB, PSU SHELF. The MIN TS/DPIDB, DPIDB and PSU SHELF fields must all have an entry or must all be left blank.

Values for the MAX TS/SHELF and USRS/SHELF fields are used only for verification purposes by Recent Change. The MAX TS/SHELF field shows the maximum number of time slots assigned to a PSU Shelf for ODB use, and the USRS/SHELF field shows the number of ODB users per PSU Shelf.

2.5 MIN TS/DPIDB

Description: Enter the minimum number of timeslots to be assigned to a DPIDB for ODB use.

There must be at least one MIN TS/DPIDB value entered in order to reserve time slots for the PSU SHELF defined on this form if an ODB ISCN number is entered on the DSLUSR form.

A value of 0 means that all available time slots for the corresponding DPIDB can be allocated for DSL B and/or D channels on the AMLBDSL (5447 Record), DSL (5907 Record), DSLAP (5963 Record) and/or OSPSDSL (5411 Record) forms. A non-zero value reserves time slots for ODB use only. Also, the total number of allocated time slots (including those reserved for ODB) cannot exceed the total amount of available time slots (32) per DPIDB.
Valid Entries: 0 - 32

2.6 DPIDB

Copyright © 2003 Lucent Technologies

Description: Enter the DPIDB number.

All DPIDB entries must be unique. The DPIDB connects the ISLU/IDCU/AIU to the PSU.
Valid Entries:
- 0 - 11, or blank (for ISLU)
- 5E8 - 5E11: 12 - 22, or blank (for IDCU)
- 5E12 and later: 1 - 5 for AIU, 0 - 11 for ISLU,
- or 12 - 22 for IDCU

Data Rules:

For UNIT TYPE of "AIU", the total number of timeslots, per DPIDB, cannot be greater than 32.ODA error message "ISDN(287a/b/c)" is generated whenever more than 32 timeslots have been assigned/reserved. ISDN(287a) details the overloaded DPIDBs and ISDN(287b) lists all the nailed up timeslots that have been manually or automatically assigned. ISDN(287c) provides all the timeslots reserved on the ODBTS form. Timeslots reserved on the ODBTS form will need to be re-assigned to correct the DPIDBs in error. ISDN(287a/b/c) is a companion error message to "ISDN(288a/b/c)" which is generated when D and/or B Channel TIMESLOTSs cannot be assigned by ODA because of a lack of DPIDB timeslots (DPIDBs are assigned on the EQAIU form with a PIDB TYPE of "PSU").

2.7 PSU SHELF

Description: Enter the Packet Switch Unit Shelf number.
Valid Entries: 0 - 4

Data Rules:

If an ODB ISCN number is entered on the DSLUSR form, the PSU SHELF number defined on this form must equal the first digit of the ODB ISCN number.

SEC. 1G: 5906 RECORD
ODB ISCN RESERVATION - ODBRES

1. GENERAL

The 5906 ODB ISCN Reservation Record is available with 5E5 and later Software Releases. The ODBRES form is used to reserve ISCNs (Integrated Services Channel Numbers) for DSL (Digital Subscriber Line) users of the ODB (On Demand B-Channel Packet Switching) feature. A DSL user is assigned the ODB feature when an ODB TN is entered on a DSLUSR form (5908 Record) where an ISCN is initially allocated to the ODB user. The ISCNs reserved by this form become part of an ISCN "pool" to be accessed later by RC/V for ODB assignment on the RC view 23.2 and by ACSR (Automatic Customer Station Rearrangement) to assign an ISCN to the ODB user. (See ACSR feature Section Division 2, Section 1AD).

When an ODB user is defined in RC view 23.2 and an ISCN is not entered, this ISCN "pool" will be accessed automatically and an ISCN will be assigned to the user. If the BAND field on the RC view 23.2 is entered, an ISCN with the same BAND on this form will be assigned. Otherwise, an ISCN with a BAND of 0 will be assigned.

The ISCN must be assigned on RC view 23.14 (ODBRES form) before an ISCN can be manually assigned to an ODB user on RC view 23.2.

- ***NOTE:*** The ISCNs allocated in this pool or assigned to an ODB user must have time-slots reserved between the ISLU (Integrated Services Line Unit), or the IDCU (Integrated Digital Carrier Unit), and PSU shelves (same shelves as the ISCNs assigned on this form) on the ODBTS form (RC view 23.13).

ISCNs do not represent the exact physical location of the hardware in the PSU (Packet Switching Unit); the numbers only define that the hardware exists in the unit. Every defined ISCN must be unique per SM, (ISCNs defined on this form cannot be used on any other form). Also, the first digit of the ISCN defined on this form, which represents the PSU shelf number, and its corresponding SM number must be assigned on an EQPSUPH form (5742 Record) as PSU SHELF and SM respectively. ISCNs are defined on this form as XYYZZZ according to the following format.

ISCN (INTEGRATED SERVICES CHANNEL NUMBER)

Equipment		Format
Shelf	SHELF	X
Channel Group	CHL GRP	YY
Channel	CHL	ZZZ

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.14.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: Enter the Switching Module number; each SM contains an ISLU, or an IDCU.

Required Field.
Valid Entries: 1 - 192

Data Rules:

Copyright © 2003 Lucent Technologies

This SM number must be defined on an EQIM form (5700 Record), and the EQSTATUS field on the EQIM form must equal "O" (Operational).

For 5E9(1) and later, the SM, SHELF, and CHL GRP must be defined in the SM, PSU SHELF, and GRP fields on a PSUGP form (5949 Record) where PH TYPE is set to "PH3".

2.3 * SHELF

Description: Enter the Packet Switching Unit shelf number.

Required Field.
Valid Entries: 0 - 4

Data Rules:

ISCNs cannot be duplicated on one or more of the following forms:
- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:
- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- RTERM
- XAT

with all TRUNK forms which have a TRKCLS of:
- "EDSL"
- "IFTERM"
- "IFOPER"

However, they can not have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from
- PSISM forms,
- PSULNK forms, or
- TRUNK forms which have a TRKCLS of
- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"

Copyright © 2003 Lucent Technologies

- "X75"
- "X75P"

Each ISCN entry (defined as the combination SHELF, CHL GRP, and CHL fields) must have the SHELF value assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

If an SM/ISCNs combination has been assigned, then the corresponding combination of SM, PSU, PSU SHELF and GRP must be entered on the PSUGP form.

2.4 * CHL GRP

Description: Enter the Channel Group number.

Required Field.
Valid Entries: 0 - 15

CHL BAND LIST

Both of the fields (Section 2.5 - Section 2.6) under CHL BAND LIST (CHL and BAND) must have a value entered or they both must be left blank.

2.5 CHL

Description: Enter the PH channel number assigned to the user of the ODB feature.
Valid Entries: 0 - 124, in increments of 4 (0,4,8,...)

Data Rules:

All CHL entries must be unique.

2.6 BAND

Description: Enter the band number. This number indicates the amount of PH (Protocol Handler) usage each user will need. The number is used as a load balancing mechanism to segregate lighter users from heavier users.
Valid Entries: 0 - 15

SEC. 1H: 5907 RECORD
DIGITAL SUBSCRIBER LINE - DSL

1. GENERAL

The 5907-1/2/3/4/5/6/7 DSL Records are available with 5E5 and later Software Releases.

It is imperative to refer to the Multipoint DSL (Digital Subscriber Line) Feature Description (Division 2, Section 1AA in this document) before entering these Records.

1.1 PURPOSE

The 5907 Record series has two major purposes.

First, it is used to define the attributes of a DSL. A DSL is also referred to as a BRI (Basic Rate Interface). Second, it is used to define the attributes of the B1 and/or B2 channel of the DSL, if either or both of those channels are to be used on a Permanent Packet basis (dedicated to X.25 Packet Switching).

The DSL OE field on the DSL form is the field which associates a DSL with the users of the DSL. The users are defined on DSLUSR forms (5908 Records). The OE field on the DSLUSR form indicates which DSL the user employs. The aforementioned two fields are the only link between a DSL form and a DSLUSR form.

If the ODB TN, ODB MLHG/TERM, CKT TN, or CKT MLHG TN fields on a DSLUSR form are entered, this indicates that one or both B-channels are to be used on a Demand basis. Therefore, a DSL form must be submitted, for the DSL, with the D SERV field set to "SX". If ODB on the DSLUSR form is 1, the B1 SERV or B2 SERV field must be set to "DMD" (Demand); if ODB is 2, B1 SERV and B2 SERV must be "DMD".

Duplicate values are not allowed among the DPKT MLHG field on a DSLUSR form, the ODB MLHG field on a DSLUSR form, the CKT MLHG field on a DSLUSR form, the PPB1 MLHG field on a DSL form, the PPB2 MLHG field on a DSL form, and the MLHG field on an MLHLN form (5111 Record), with the following exceptions:

- a CKT MLHG on a DSLUSR form may duplicate an MLHG on an MLHLN form if the CKT TERM on the DSLUSR form is different from the TERM on the MLHLN form, thus allowing a mixture of digital and analog users in the same MLHG;
- a DPKT MLHG on a DSLUSR form may duplicate an MLHG on an MLHLN form if the DPKT TERM on the DSLUSR form is the same as the TERM on the MLHLN form (as used for a Modem Pool group member);
- PPB1 MLHG and PPB2 MLHG on the DSL form and DPKT MLHG (Non-Modem Pooling) and ODB MLHG on the DSLUSR form and PKT MLHG on the XAT form may be the same. The corresponding TERM entries must be different if their CHL SEL fields are "N". If the corresponding CHL SEL fields are "Y" and the channels are defined for the same user, then the TERM entries must be the same. (CHL SEL is not valid with XAT.)

1.2 CCITT TERMINOLOGY

Fields Section 3.11 - Section 3.14 relate to CCITT terminology.

A brief description of the CCITT recommendation for the X.25 protocol is required before proceeding. Data Terminating Equipment, in CCITT parlance, is equivalent to the CPE (Customer Premises Equipment) device connected to the DSL. Data Circuit Equipment is equivalent to a PH (Protocol Handler) on a PSU (Packet Switch Unit) within the 5ESS Switch.

Copyright © 2003 Lucent Technologies

Level 2 of the X.25 protocol is used to describe the linkage between a CPE device and the PH on the 5ESS Switch.

Level 3 of the X.25 protocol is used to describe the linkage between two CPE devices.

1.3 LOGICAL CHANNEL NUMBER

Fields Section 4.1 - Section 4.7 refer to LCNs (Logical Channel Numbers).

Each B-channel can define 127 possible LCNs for the purpose of establishing simultaneously active SVCs (Switched Virtual Circuits) and/or PVCs (Permanent Virtual Call/Circuits). The circuits are used to connect CPE devices with each other in order to transmit Packet-Switched Data.

SVCs exist only for the period of the call. The CPE device and the PH must interact, through CCITT specified packet communication, to set up each call, and clear the SVC after each call.

A PVC exists between CPE devices until the customer deems otherwise. There is no need to set up each call or to clear the PVC after each call.

There is a system limitation of 128 simultaneously active SVCs and/or PVCs for each PH. Congestion on the network, due to contention for available SVCs or PVCs, is handled through CCITT specified procedures, which will be explained later.

There are four categories of LCNs (PVCs and SVCs). A PVC is a permanent, two-way connection between CPE devices. An incoming SVC can only receive incoming data. A two-way SVC can transmit outgoing data or receive incoming data. An outgoing SVC can only transmit outgoing data. The terms incoming and outgoing are used from the perspective of the PH.

The CCITT has specified a required order of assigning the four categories of LCNs.

The lowest numbers (1 to x) can be used for the PVCs, if the customer wishes to have PVCs. The H PVC LCN field (Highest PVC LCN) indicates the highest numbered LCN that is a PVC. For example, if the H PVC LCN field is 7, that means that LCNs 1 through 7 are PVCs.

The next highest range of numbers for LCNs belongs to the incoming only SVCs. This range is indicated in the L IN LCN field (Lowest Incoming LCN) and the H IN LCN field (Highest Incoming LCN).

The next highest range of numbers for LCNs belongs to the two-way SVCs. This range is indicated in the L 2W LCN field (Lowest Two-Way LCN) and the H 2W LCN field (Highest Two-Way LCN).

The highest range of numbers for LCNs belongs to the outgoing only SVCs. This range is indicated in the L OUT LCN field (Lowest Outgoing LCN) and the H OUT LCN field (Highest Outgoing LCN).

As an example, an ISCN (Integrated Services Channel Number) could define its 127 associated LCNs as follows:

H PVC LCN = 7

(LCNs 1 to 7 are PVCs)

L IN LCN = 8
H IN LCN = 15

(LCNs 8 to 15 are incoming SVCs)

L 2W LCN = 16
H 2W LCN = 100

Copyright © 2003 Lucent Technologies

(LCNs 16 to 100 are two-way SVCs)

L OUT LCN = 101
H OUT LCN = 127

(LCNs 101 to 127 are outgoing SVCs)

If PVCs are not desired, LCN 1 is available for an incoming SVC.

If PVCs and incoming SVCs are not desired, LCN 1 is available for a two-way LCN.

If PVCs, incoming SVCs, and two-way SVCs are not desired, LCN 1 is available for outgoing LCNs.

The CCITT, to minimize "call collisions", has specified that a CPE device should start its search algorithm for an available LCN (SVCs only) with a two-way SVC or outgoing SVC. The PH should start its search algorithm with the highest numbered SVC that is in a ready state.

Either the H PVC LCN field or the L IN LCN and H IN LCN field combination or the L 2W LCN and H 2W LCN field combination, or the L OUT LCN and H OUT LCN field combination must be entered. If this is not done, there will not be any LCNs to carry packets.

1.4 CLOSED USER GROUPS

A CUG is a sub-network of CPE devices which can communicate with each other. A CPE device can belong to multiple CUGs. The primary purpose of a CUG is to provide security to its members, since a CUG member cannot communicate with a CPE device which is not in the same CUG. A CPE device which belongs to multiple CUGs may indicate the CUG of choice, in the call request packet or the incoming call packet, for transmitting and receiving packets, respectively. If a CUG is not specified, the Preferential CUG will be selected. Refer to the description of the CUGPX (Closed User Group Preferential Index) field.

A CUG with Outgoing Access allows its member CPE devices to originate virtual calls to CPE devices that do not belong to any CUG (e.g., public network), or to CPE devices that belong to a CUG with Incoming Access.

A CUG with Incoming Access allows its member CPE devices to receive virtual calls from a CPE device that does not belong to any CUG (e.g., public network), or from CPE devices that belong to a CUG with Outgoing Access.

1.5 PROVISIONING DIFFERENCES BETWEEN ODA AND RECENT CHANGE

ODA will support the provisioning of DSLs without any users or services (PPBs or default service); for example, in the case of Large Terminal Growth. Recent Change will not support such provisioning, but will support the addition of users/services on DSLs grown by ODA without any services.

Recent Change will also support the following in regard to DSLs grown without users/services:

- the DSLs may be deleted;
- if brought up in a Recent Change View but not changed, the DSLs will be saved; and
- nothing in the DSL can be changed if users/services are not added.

Recent Change will not allow deletion of all users and services from a DSL already having services.

Copyright © 2003 Lucent Technologies

1.6 LOGICAL LINK CONTROL BLOCKS

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks). The following applications define the possible LLCB assignments. These applications cannot use more than 384 LLCBs.

LLCB Assignments

Form	SM SHELF CHL GRP	LLCB Count
AMLBDSL	SM is the first three digits of LCEN SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of PPB1 ISCN.	The count is incremented by 1 for each PPB1 ISCN defined.
DSL	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of PPB2 ISCN.	The count is incremented by 1 for each PPB2 ISCN defined.
DSL	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of D ISCN.	If a matching DSLUSR form is not found the count is incremented by 1.
DSLAP	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 1 for each unique OE/ISCN combination.
DSLUSR	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of D ISCN on the corresponding DSL form.	The count is incremented by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered. The count is incremented by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
DSLUSR	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of ODB ISCN1 and/or ODB ISCN2.	The count is incremented by 1 if only ODB ISCN1 is entered. The count is incremented by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
MISLINK	SM is the first three digits of OE SHELF and CHL GRP are the SHELF and CHL GRP fields, respectively.	The count is incremented by 1 for each MISLINK form.
OSPSDSL	SM is the first three digits of LCEN SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined. Else the count is incremented by 1 for each unique OSPSDSL form.
RTERM	Where RT INTERFACE is "TR303" SM is SM SHELF/CHL GRP is the first three digits of TMC PRI ISCN, TMC NPRI ISCN, EOC PRI ISCN or EOC NPRI ISCN.	The count is incremented by 2 for each TMC PRI ISCN and for each TMC NPRI ISCN entry. The count is incremented by 3 for each EOC PRI ISCN and for each EOC NPRI ISCN entry.
TRUNK	TRKCLS equals to "IFOPER", "IFTERM" or "EDSL" on the TKGRP form. SM is the first three digits of DEN or NEN SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 1 for each unique TRUNK form.
XAT	SM is the first three digits of OE SHELF/CHL GRP is the first three digits of ISCN.	The count is incremented by 1 for each unique XAT form.

1.7 RECENT CHANGE VIEW

The corresponding Recent Change View for this form is 23.2.

2. FORM ENTRIES - 5907-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * DSL OE

Description: This field is comprised of an equipment Type and Number. For the ISLU (Integrated Services Line Unit) or the RISLU (Remote Integrated Services Line Unit), the DSL equipment number is referred to an "LCEN" (Line Card Equipment Number). Available with 5E8 and later, the IDCU (Integrated Digital Carrier Unit) capability is introduced for interface with RT (Remote Terminals). The IDCU equipment number is referred to as an ILEN (IDCU Line Equipment Number) which may be either 8 digits (referred to as a "MEN") or 10 digits (referred to as a "GEN" (see Valid DSL OE Types table below).

IDCU DSLs have the same capabilities as the ISLU DSLs. The functionality defined on the DSL form is the same as the functionality for ISLU, except that IDCU does not support OSPS. For IDCU, the DSL form will only be used by TR303 RTs (Remote Terminal). The RT INTERFACE on the RTERM form (5714 Record) must be "TR303". Other IDCU applications do not support ISDN. The SM and IDCU must be defined on an EQIDCU form (5846 Record) with this SM and IDCU. The RT must be defined on an RTERM form with this SM, a UNIT TYPE of IDCU, a UNIT NUMBER corresponding to the IDCU number and the RT EX (Remote External) number corresponding to the RT number.

Required Field.

Valid DSL OE Type Entries

Entry	Definition
A	Software Release: 5E12 and later. The DSL OE is associated with a 10-digit TR-303 on DNU-S (INEN).
E	Software Release: 5E12 and later. The DSL OE is associated with the AIU-ISDN equipment number (AIUEN).
G	Software Release: 5E8 and later. The DSL OE is associated with a 10-digit ILEN (GEN) for an IDCU RT. This designation accommodates up to 2048 lines.
I	The DSL OE is associated with an 8-digit ISLU or RISLU (LCEN).
K	Software Release: 5E10 and later. The DSL is associated with the ISDN ISLU2 line card equipment number (LCKEN).
X	Software Release: 5E16 and later. The DSL OE (Digital Subscriber Line card Equipment Number (composite line card equipment number consisting of LCENTYPE and LCEN)).

The OE SIZE is defined on the OFCOPT form (5509 Record). All OE types "M" or "G" in an office must correspond with the OFCOPT form OE SIZE field and only one OE type is allowed in an office.

If DSL OE is set to "A", the 10-digit INEN consists of the following components:

For 5E16 and later, when DSL OE is "X", SERV TYPE must be "CFS" on the ENETLINK form (5827 Record) for SM of OE.

TR-303 On DNU-S, Type A

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Line	CKT	XXXX	0001-2048

If DSL OE is set to "E", the 10-digit AIUEN consists of the following components:

ACCESS INTERFACE UNIT, Type E

Copyright © 2003 Lucent Technologies

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Access Interface Unit	AIU	XXX	000-127
Pack	PACK	XX	00-19
Circuit	CKT	XX	00-15

If DSL OE is set to "I", the 8-digit LCEN consists of the following components:

LINE CARD EQUIPMENT NUMBER, Type I

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
(Remote) Integrated Services Line Unit	(R)ISLU	X	0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

If DSL OE is set to "G", the IDCU Equipment Number consists of:

IDCU Remote Terminal Number, Type G

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	IDCU	X	0-42
Remote Terminal	RT	XX	01-31
Line	LINE	XXXX	0001-2048

If DSL OE is set to "M", the IDCU Equipment Number consists of:

IDCU Remote Terminal Number, Type M

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	IDCU	X	0-42
Remote Terminal	RT	XX	01-31
Line	LINE	XX	01-99

If DSL OE is set to "K", the ISLU2 Equipment Number consists of:

ISLU2, Type K

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	LU	XX	00 - 42
Line Group	LG	XX	00 - 15
Line Board	LBD	X	0 - 7
Line Circuit	LCKT	XX	00 - 07

Data Rules:

The SM entered must appear in the SWITCHING MODULE field on an EQPSU form (5741 Record). An EQPSU form defines the PSU peripheral to the SM.

The LCEN must be unique and must not appear on another DSL form, an OSPSDSL form (5411 Record), a DSLAP form (5963 Record), or RDTAPORT form. These forms cannot have duplicate Line Cards or Line Boards assigned.

For 5E8 and later:
IDCU (ILEN) DSL OE numbers cannot be duplicated on the LINE, MLHLN, or TRUNK forms.

DSL OE numbers and TRK OE numbers must be mutually exclusive for IDCU equipment on the DSL, LINE, MLHLN, RDTAPORT, and TRUNK forms.

All of the digital subscriber lines on an SM :
IDCU DSLs OE TYPE "G"
ISLU DSLs OE TYPE "I"
ISLU2 DSLs OE TYPE "K"

1. which have identical entries for the first five digits of the OE for OE TYPEs "G" and "K" or first four digits for OE TYPE "I"

Copyright © 2003 Lucent Technologies

2. and which also have the same D RELPIDB and D TIMESLOT entries

3. must additionally have the same

   RT for OE TYPE "G"

   LG for OE TYPE "I"

   LGC for OE TYPE "K"

4. and the same SHELF/CHL GRP defined as the 1-3 digits of the D ISCN entries.

5E9(1) and later:

A SLG (Sub Line Group) is a group of no more than 4 LC (Line Cards)

Growth Order Of SLGs

SLG	LGC 5th And 6th Digit Of LCEN	Line Cards Last 2 Digits Of LCEN
0-15	0-15	16, 18, 10, 22
16-31	0-15	08, 10, 12, 14
32-47	0-15	24, 26, 28, 30
48-63	0-15	00, 02, 04, 06

Each SM (Switching Module) can have up to 5 PSU SHELFs (defined by the first digit in the ISCN field). On the EQIM form, when UNIT TYPE is not "SM2000" each PSU SHELF can be assigned up to (32 times X) time slots for the following applications: (Note: X represents the number of PIDBs, 0 to 4, provisioned per shelf)

Applications Assigned Timeslots

Form	Definition
EDSL	defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	defined on the PSISM form.
PKTPIPE	Software Release: 5E10 and later. Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Software Release: 5E10 and later. Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	defined on the XAT form.
X75	defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

For 5E10 and later, on a PSU2, each Data Interface in a SM can have a maximum of 256 nailed-up time slots.

- The following data rule is not applicable on an SM-2000 processors, since provisioning of PSU

Copyright © 2003 Lucent Technologies

nailed-up timeslots is not required on an SM-2000. Each Data Interface in a SM can have a maximum of 256 nailed-up timeslots reserved for the applications listed in the table below. These timeslots can be reserved by entering rows RPTSS0 to RPTSS7 on the EQPSU form. The quantity of timeslots reserved (i.e. the number of entries) must be greater than or equal to the quantity of timeslots assigned for the above applications. Note that a D channel only takes a quarter of a timeslot.

Timeslots Reserved for Applications

Application	Defined on Form(s)
RISLU B Channel	DSL and AMLBDSL
RISLU D Channel	DSL, DSLAP, MISLINK, and OSPSDSL
X.25	XAT
ISM	PSISM
IP	TRKCLS set to "PACKET" on the TKGRP form
X75	TRKCLS set to "X75" on the TKGRP form
X75P	TRKCLS set to "X75P" on the TKGRP form
EDSL	TRKCLS set to "EDSL" on the TKGRP form
IFOPER	TRKCLS set to "IFOPER" on the TKGRP form
IFTERM	TRKCLS set to "IFTERM" on the TKGRP form
PKTPIPE	TRKCLS set to "PKTPIPE" on TKGRP form
SPCHNDLR	TRKCLS set to "SPCHNDLR" on TKGRP form

- A PSU SHELF may be assigned more than 1 DI; one for DI 0 and a second for DI 1. Since a given PSU SHELF may have as many as 128 time slots on a DI, it is not possible for each timeslot to have a unique vertical (column) position (i.e., unique time slot value of 0 - 31 on different PIDBs).

Type is "G" or "M":
The "M" and "G" DSL OEs are associated with the OE SIZE on the OFCOPT form. If OE SIZE is 8, DSL OE will be "M"; if OE SIZE is 10, DSL OE will be "G". All IDCU equipment in an office must use the same DSL OE type, either "G" or "M".

OEs for all TR303 RTs, can only be assigned if the TR303 is equipped (RT EQSTAT must be set to "O" or "G") on the RTERM form.

Type is "G":
For 5E9(1) and later, if "G" is entered:

- Originating Equipment Numbers cannot be duplicated on DSL, LINE, MLHLN, TRUNK or MISLINK forms for IDCU (Integrated Digital Carrier Unit) equipment. DSL OE(s), NUMBER(s), TRK OE(s) and OE(s) must be mutually exclusive for IDCU equipment on the DSL, LINE, MLHLN, TRUNK and MISLINK forms. The IDCU Originating Equipment Numbers are located:
  - in the DSL OE field on the DSL forms (where DSL OE type is equal to "G");
  - in the NUMBER field on the LINE/MLHLN forms (where OE TYPE is equal to "G");
  - in the TRK OE field on the TRUNK forms (where TRK OE type is equal to "G");
  - in the OE field on the MISLINK forms (where OE type is equal to "G").

- the SM/IDCU/RT values assigned to OE NUMBER[1,7] must correspond to the SM/UNIT NUMBER/RT EX values assigned on an RTERM form. OE ports must be located on equipment identified on an RTERM form where the RT INTERFACE is "TR303".

- have SM/IDCU/RT values assigned to OE NUMBER[1,7] which correspond to the SM/UNIT NUMBER/RT EX values assigned on an RTERM form where RT INTERFACE is "TR303". For all TR303 remote terminals, OEs can be assigned to the RT only if the TR303 is equipped (i.e, RT EQSTAT must equal "O" or "G"). In addition, OEs assigned to any TR303 cannot have the assigned line value exceed the RT LINE SIZE on the related RTERM form. (The line value is OE NUMBER[8,11] for an OE TYPE of "G".)

Copyright © 2003 Lucent Technologies

- and the OE is defined on a TR303 remote terminal on the RTERM form, the DS1 entered on the DSL form must correspond with the IFAC entered on the RTERM form in the RT IFAC TERMINATION list with ROW RT TERM equal to the DS1. Also, this IFAC can not equal PROT LINE on this same RTERM form.

- and the corresponding RTERM form has an RT INTERFACE of "TR303" all IDCU DSLs and MISLINKs that have "TR303" remote terminals assigned are prohibited from using "303ZCS" suppression method. Therefore, the SUP MTHD on the RTERM form can not be "303ZC".

If "G" is entered for IDCU equipment on this form with D channel assignments, when packing QTR TS on these forms (up to 4 to a TS) for an SM/IDCU/RT (the first seven digits of the OE),

- the assigned QTR TS and the Channel must be unique across the identical set of forms. Channel is the last three digits of D ISCN.

- the set of D RELPIDB, D TIMESLOT DS1 and DS1 TS must each be identical (i.e., DS1 = DS1, etc.).

  In addition, the first three digits of the ISCN must also be the same on all the DSL forms in the group. If the DSL form D RELPIDB/D TIMESLOT combination is the same on any forms, the DS1/DS1 TS combinations must also be the same across those DSL forms.

For 5E10 and later:
If OE is type "G":

- then D RELPIDB must be 12 - 22.

- and PPB1 DS1 or PPB1 DS1 TS is entered, both must be entered.

- PPB1 DPIDB must be 12 - 22.

- and PPB2 DS1 or PPB2 DS1 TS is entered, both must be entered.

- PPB2 DPIDB must be 12 - 22.

For manually assigned D RELPIDBs and/or PPB1/PPB2 DPIDBs, with DSL OE originating equipment type of "G":

- each PIDB must have proper Packet Switching Unit shelf assigned with matched PIDB NO. on the EQIDCU form. The PSU shelf, which is specified by the first digit of the D ISCN and/or PPB1/PPB2 ISCN on the DSL forms, must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

- must have a corresponding PIDB NO. with a PIDB TYPE of "PSU" assigned on the EQIDCU form.

Type is "I":
For the "I" type, the LCEN must be defined on an ISLULC form (5942 Record) with an "O" in the EQST field, and a TYPE of "PULC", "ULC", or "TLC". "PULC" and "ULC" are U-cards, and "TLC" is a T-card.

For 5E9(1) and later, an OE type of "I"

- must be defined as an equipped and operational U or T card on the ISLULC input form.

- the ODA automatic time slot assignment algorithm allocates four TS to each SM/ISLU/LGC configuration for each PIDB from the ISLU to the PSU as follows:

Copyright © 2003 Lucent Technologies

- for LGCs (digits 5 & 6 of the Equipment Number) numbered between 0 and 7 the time slots are assigned to odd numbered PSU PIDBs and for
- LGCs numbered between 8 and 15 the time slots are assigned to even numbered PSU PIDBs (PIDBs are assigned on the EQISLU form).
- time slots for DPIDBs, which are assigned and reserved on an ISLU(2), cannot exceed the maximum number of 32 time slots available for the DPIDB. Timeslots (TS) are allocated for DSL D and/or B channels on the following forms:

  AMLBDSL

  DSL (where DSL OE type equals "I" or "K")

  DSLAP

  MISLINK (where OE type equals "I" or "K")

  OSPSDSL forms

  Timeslots are allocated either on the form or by the ODA automatic time slot assignment algorithm. Timeslots may also be reserved for On Demand B channel usage on the ODBTS form.

Type is "K":
For 5E9(1) and later, for an OE type of "K"

- must be defined as an equipped and operational U or T Board on the ISLULB input form.
- time slots for DPIDBs, which are assigned and reserved on an ISLU(2), cannot exceed the maximum number of 32 time slots available for the DPIDB. Timeslots (TS) are allocated for DSL D and/or B channels on the following forms:

  AMLBDSL

  DSL (where DSL OE type equals "I" or "K")

  DSLAP

  MISLINK (where OE type equals "I" or "K")

  OSPSDSL forms

  Timeslots are allocated either on the form or by the ODA automatic time slot assignment algorithm. Timeslots may also be reserved for On Demand B channel usage on the ODBTS form.

The ODA automatic time slot assignment algorithm allocates four TS to each SM/ISLU2/LG configuration for each PIDB from the ISLU2 to the PSU as follows:

- for LGs (digits 6 & 7 of the Equipment Number) numbered between 0 and 7 the time slots are

Copyright © 2003 Lucent Technologies

assigned to odd numbered PSU PIDBs

- for LGs numbered between 8 and 15 the time slots are assigned to even numbered PSU PIDBs (PIDBs are assigned on the EQISLU form).

For 5E10 and later:
When OE type is "K":

- the assigned D TIMESLOT may not be equal to the LG part of the DSL OE or the LG plus 16.
- DS1 and DS1 TS cannot be entered.
- D RELPIDB must be 2 - 11.

For 5E12 and later:

When OE type is "A":

When DSL OE is "A", and QTR TS, DS1 or DS1 TS is entered, all must be entered.

When DSL OE is "A", D RELPIDB and D TIMESLOT must not be entered.

When DSL OE is "A", and PPB1 DS1 or PPB1 DS1 TS is entered, both must not be entered.

When DSL OE is "A", and PPB2 DS1 or PPB2 DS1 TS is entered, both must not be entered.

When DSL OE is "A", both PPB1 DPIDB and PPB1 TS must not be entered.

When DSL OE is "A", both PPB2 DPIDB and PPB2 TS must not be entered.

When DSL OE is not "A", and DS1 or DS1 TS is entered, then D RELPIDB, D TIMESLOT, QTR TS, DS1 and DS1 TS must be entered.

When DSL OE is not "A", and D RELPIDB, D TIMESLOT or QTR TS is entered, all must be entered.

When DSL OE is not "A", and PPB1 DPIDB or PPB1 TS is entered, both must be entered.

When DSL OE is not "A", and PPB2 DPIDB or PPB2 TS is entered, both must be entered.

When DSL OE is not "A", and PPB1 DS1 or PPB1 DS1 TS is entered, then PPB1 DPIDB, PPB1 TS, PPB1 DS1 and PPB1 DS1 TS must be entered.

When DSL OE is not "A", and PPB2 DS1 or PPB2 DS1 TS is entered, then PPB21 DPIDB, PPB2 TS, PPB21 DS1 and PPB2 DS1 TS must be entered.

When OE type is "E":

Each SM/AIU DPIDB time slot may be assigned only once (i.e., D and/or B Channels cannot be assigned to conflicting DPIDB time slots or quarter time slots due to manual (vs ODA) time slot assignments). Note that D channels are allocated to quarter time slots, therefore, up to four unique assignments can be made before a time slot is considered full. (Time slot conflicts are generated by system message "ISDN288a/b/c" which will assist in resolving conflicts.)

- DS1 and DS1 TS cannot be entered.
- PPB1 DS1 and PPB1 DS1 TS cannot be entered.
- PPB2 DS1 and PPB2 DS1 TS cannot be entered.

Copyright © 2003 Lucent Technologies

- D RELPIDB must be 1 - 5.
- PPB1 DPIDB must be 1 - 5.
- PPB2 DPIDB must be 1 - 5.
- AIU OEs must be defined as operational on the EQAIUP form as SM/AIU/APPL PACK NUM with TYPE set to "AIULP" or "AIURPLP".

2.3 # D ISCN

Description: Enter the D-channel ISCN, on the PSU, which is conjoined to the DSL.

The DSL is connected, via a PIDB (Peripheral Interface Data Bus) to a PSU.

Required Field.
Valid Entries: The 6-digit ISCN consists of the following components:

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		Format	Valid Entries
Shelf		X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127

Data Rules:

For the shelf, enter the PSU PH shelf number. The SHELF must correspond to a PSU SHELF field on an EQPSU form, where the value in the SWITCHING MODULE field is the SM portion (first three digits) of the DSL OE, which has a SHLF SIDE 0/1 with EQST set to "O".

For CHL GRP, enter the PSU PH number on the PSU shelf. PHs are assigned as a component of an ISCN on AMLBDSL forms (5447 Record), DSL forms (5907 Record), DSLAP forms (5963 Record), DSLUSR forms (5908 Record), OSPSDSL forms (5411 Record), PSISM forms (5920 Record), and TRUNK forms (5204 Record). PHs are also assigned in the CHL GRP field on ODBRES forms (5906 Record). The total quantity of PHs assigned on these forms must not exceed the quantity of PHs defined for the given SWITCHING MODULE and PSU SHELF on an EQPSUPH form (5742 Record) with EQST set to "O". The CHL GRP is a "logical" value. The number that is assigned in this field will not always be the number of the PH that is used. The quantity of PHs defined on the EQPSUPH form relative to the quantity of PHs assigned on the aforementioned forms is critical; the actual values are not of importance.

Each ISCN entry (D/PPB1/PPB2 ISCN on the DSL form) must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

For CHL, enter the PSU PH member number.

The ISCN must be a unique value within an SM. ISCNs cannot be duplicated on one or more of the following forms:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM

Copyright © 2003 Lucent Technologies

- RTERM
- TRUNK
- XAT.

This field cannot have the same SHELF and CHL GRP, within the same SM, as an ISCN from a PSISM form (5920 Record), or a TRUNK form (5204 Record) with an associated TRKCLS of "PACKET" or "X75P" defined on a TKGRP form (5202 Record).

Each SM can have up to 5 PSU shelves. Each Shelf can have up to 16 protocol handlers. Shelves and protocol handlers are defined by the first 3 digits of the ISCN field. Each protocol handler can be assigned up to 32 time slots (or 128 quarter time slots).

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

AMLBDSL, DSL, DSLAP, DSLUSR, ODBRES, OSPSDSL, RTERM, and XAT forms along with all TRUNK forms which have a TRKCLS of "EDSL", "IFTERM", or "IFOPER" defined on the TKGRP form can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM. However, they cannot have an ISCN SHELF and CHL GRP which are mixed with ISCNs from PSISM forms or TRUNK forms that have a TRKCLS of "PACKET" or "X75" or "X75P" defined on the TKGRP form.

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form
- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2
- MISLINK - where , SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is "TAOPER" or "DAOPER"
- XAT - where SHELF/CHL GRP is the first three digits of ISCN.

For 5E9(1) and later, if the OE is defined on a DSLUSR form with DPKT TN or DPKT MLHG and TERM entered, then the first three digits of the OE, the first digit of D ISCN, and the second two digits of D ISCN must be defined in the SM, PSU SHELF, and GRP fields on a PSUGP form (5949 Record) where PH TYPE is set to "PH3".

For 5E9(1) and later, if D ISCN and/or PPB1/PPB2 ISCN are assigned with an originating equipment type of "G", each ISCN or SHELF/CHL GRP/CHL combination must have a proper Packet Switching Unit shelf assigned on the EQIDCU form. The PSU shelf specified by the first digit of the ISCN on either the DSL form ..sx mlh sep 95> must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

Copyright © 2003 Lucent Technologies

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- RTERM
- XAT

with all TRUNK forms which have a TRKCLS of:

- "EDSL"
- "IFTERM"
- "IFOPER"

However, they can not have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of

- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

For 5E11 and later, D ISCN must be entered for the existing form tuple in Large Terminal Growth. (AILA (Automatic ISDN Line Assignment) existing form tuples in Large Terminal Growth should still keep the old checks whether AILA feature active or not). For more information on this feature, see Division 2, Section 1BO.

When D ISCN is not entered, D RELPIDB, D TIMESLOT, QTR TS, DS1 and DS1 TS must not be entered.

For 5E12 and later, for OE TYPE of "E", ISCNs assigned on the DSL, DSLUSR, DSLAP, or MISLINK forms, must have a PIDB with a PIDB TYPE of "PSU" assigned on the same Packet Switching Unit shelf on the EQAIU form as the PSU shelf specified by the first digit of the ISCN.

For 5E13 and later, ISCNs assigned on the DSL, DSLUSR, DSLAP, IPDSL or MISLINK forms must have a PIDB with a PIDB TYPE of "PSU" assigned on the same Packet Switching Unit shelf on the EQAIU form as the PSU shelf specified by the first digit of the ISCN (on the MISLINK form, ISCN is the combination of SHELF, CHL GRP, and CHL; on the IPDSL form, ISCN is the combination of PSIU SHELF, DSL GRP and PH CHAN or B PH CHAN).

2.4 # D SERV

Description: Enter the service on the D-channel.

Required Field.

Valid D SERV Entries

Entry	Definition
ADMIN	No Q.931 control signaling or X.25 signaling; therefore, no D-channel service.
SONLY	Q.931 control signaling only; used for an ISDN Attendant (applicable for Point-to-Point only).
SX	Q.931 signaling and X.25 packet signaling.
XMP	D-channel Packet Switching for Modem Pooling.

Data Rules:

ADMIN:
If this field is set to "ADMIN", then the B1 SERV and/or B2 SERV fields must either not be entered, or be set to "X25". The MDPKT field must be set to 0, which indicates that D-channel service is not allowed for

Copyright © 2003 Lucent Technologies

any user of this DSL.

SONLY:
If this field is set to "SONLY" (ISDN Attendant use), then the B1 SERV field must be "DMD", and the B2 SERV field must not be entered. The ACSR GRP field must not be entered; the ACSR (Automatic Customer Station Rearrangement) feature does not support ISDN attendants. All the DSLUSR forms, for this DSL, must have TERM TYPE set to "ATND".

For 5E12 and later, when a DSL form has DSERV set to "SONLY", all of the DSLUSR forms with an OE that matches the DSL OE must have TERM TYPE set to "ATND" or "TYPED".

SX:
If this field is set to "SX", then the B1 SERV and B2 SERV fields must both be entered.

XMP:
If this field is set to "XMP" (Modem Pool member):

- then the B1 SERV and B2 SERV fields must not be entered, the MDPKT field must be set to 1, and the DSL CLS field must be set to "PP". The digital portion of a Modem Pool member (a Terminal Adaptor) is a single user that only applies the D-channel service.

- then only one DSLUSR form, for this DSL, must exist with only the DPKT MLHG and DPKT TERM optional keys entered. Only the D-channel is applied. On the sole DSLUSR form, DPKT HUNT NOTIF must be blank, DPKT HUNT DEACT must be "N", DPKT NOTIF must not equal "COND", and DPKT CHL SEL must equal "N". The DSLUSR form must not have the DPKT H PVC LCN, DPKT L IN LCN, DPKT H IN LCN, DPKT L OUT LCN, and DPKT H OUT LCN fields entered, and must have the DPKT L 2W LCN and DPKT H 2W LCN fields set to 1. A Modem Pool group member is allowed a single two-way LCN, which is an SVC. (Refer to the paragraphs, in Division 5, Section 1I of this document which describe LCNs used with D-channels.) The DPKT CUGPX field must be entered. (Refer to the paragraphs, in Division 5, Section 1I of this document which describe CUGs.) For 5E9(1) and later, DPKT MLHG TN must be blank. Division 5, Section 1I of this document describes the DSLUSR form.

- for 5E9(1) and later, DPKT MLHG(s) assigned on a corresponding DSLUSR input form must have all corresponding DPKT TERM(s) defined on a PSCUG form as PKT MLHG/TERM. The DNIC/ICN entries on the PSCUG form must be identical for all DPKT TERM(s) within a DPKT MLHG. (The corresponding forms are found by matching OE from the DSLUSR form to DSL OE on a DSL form.)

- ***NOTE:*** For Modem Pool Terminal Adapters (D SERV = XMP), there must be only one DNIC/ICN combination defined per DPKT MLHG and only one PSCUG form defined per DPKT MLHG/TERM. The CUG IDX on the PSCUG form must match the DPKT CUGPX on the corresponding DSLUSR form.

2.5 B1 SERV

Description: Enter the service on the B1-channel.
Default: DMD
Valid Entries:

Valid B1 SERV Entries

Entry	Definition
DMD	Demand access to CSD (Circuit-Switched Data), CSV (Circuit-Switched Voice), or X.25 Packet-Switched Data.
X25	Permanent Packet (dedicated to X.25 Packet-Switched Data).

Data Rules:

This field must be set to "DMD" if a DSLUSR form has been submitted, for this DSL, with the CSV CHL and/or the CSD CHL fields set to "B1". The "B1" choice indicates that a user of this DSL wants Demand

Copyright © 2003 Lucent Technologies

service on the B1-channel.

This field must be set to "DMD" if a DSLUSR form has been submitted, for this DSL, with the CSV and/or the CSD fields set to 2. The choice of 2 indicates that a user of this DSL wants Demand service on both B-channels.

This field must be set to "X25" if a DSLUSR form has been submitted, for this DSL, with the PPB1 USR field set to "Y". The "Y" in the PPB1 USR field indicates that a user of this DSL wants to use the B1-channel on a Permanent Packet Basis (dedicated to X.25 Packet-Switched Data).

When B1 SERV is "X25", PPB1 LCC/RAX/RATE/N2/T1/T3/WNDSZ must be entered.

2.6 B2 SERV

Description: Enter the service on the B2-channel.
Default: DMD
Valid Entries:

Valid B2 SERV Entries

Entry	Definition
DMD	Demand access to Circuit-Switched Data, Circuit-Switched Voice, or X.25 Packet-Switched Data.
X25	Permanent Packet (dedicated to X.25 Packet-Switched Data).

Data Rules:

This field must be set to "DMD" if a DSLUSR form has been submitted, for this DSL, with the CSV CHL and/or the CSD CHL fields set to "B2". The "B2" choice indicates that a user of this DSL wants Demand service on the B2-channel.

This field must be set to "DMD" if a DSLUSR form has been submitted, for this DSL, with the CSV and/or the CSD fields set to 2. The choice of 2 indicates that a user of this DSL wants Demand service on both B-channels.

This field must be set to "X25" if a DSLUSR form has been submitted, for this DSL, with the PPB2 USR field set to "Y". The "Y" in the PPB2 USR field indicates that a user of this DSL wants to use the B2-channel on a Permanent Packet Basis (dedicated to X.25 Packet-Switched Data).

For 5E11 and later, when B2 SERV is "X25", PPB2 LCC/RAX/RATE/N2/T1/T3/WNDSZ must be entered.

2.7 BRI TYPE

Description: This field is used only by Recent Change to display the type of line card used by this BRI. For 5E8 and later, this field is left blank for IDCU DSLs.

Software Release: 5E6 and later

2.8 PM GRP

Description: This field is used to define a PM (Performance Measurement) GRP (Group) name.
Valid Entries: 1 - 8 characters

Data Rules:

When PM GRP is entered, a corresponding PMTHRESH form (5948 Record) must be entered with PM TYPE of "DSL".

2.9 ACSR GRP

Description: Enter the name of the Automatic Customer Station Rearrangement group.

Copyright © 2003 Lucent Technologies

The assignment of an ACSR group allows the users to move from DSL to DSL or change the User Service Order Profile associated with a DSL.
Valid Entries: 1 - 8 characters

Data Rules:

If an entry is made in this field, then the entry must be defined in the ACSR GRP field on an ACSRGP form (5959-2 Record).

A CKT TN that has an ACSR feature assigned to it and is defined on a DSLUSR form, associated with this DSL, must have the same ACSR group assigned to it on an individual basis as the ACSR group entered in this field. An ACSR feature (with a group) is defined on an ACSRFD form (5959-1 Record), or an ACSRLPA form (5959-3 Record) and then assigned to the CKT TN on a LINEFA form (5112 Record), BFG form (5625 Record), or associated CLUSTR form (5600 Record).

2.10 DFLT SRV

Description: Default Service allows unknown CPE (Customer Premise Equipment) on a DSL (Digital Subscriber Line) which has subscribed to Default Service to originate ACSR, BRI Test Line, 108 Test Line, BRI Verification, Repair (611), Business Office (811), and Emergency (911) calls. Terminations to the user are denied with Default Service. For more information on the NI-3 Default Service Feature, see Division 2, Section 1AM. Also for 5E10 and later, see Division 2, Section 4A238 for information on the Automatic Association of Default Service feature.

Enter the name of the Default Service that is available to this DSL.
Valid Entries: 1 - 7 characters. The first character must not be a slash (/).

Data Rules:

The entry must be defined in the DFLT SRV field on a DFLTSRV form (5974 Record).

If the ACSR GRP field has an entry, this field must have an entry.

If an entry is made in this field, then the B1 SERV and/or B2 SERV fields must be set to "DMD". The ACSR feature does not support Permanent Packet B-channels.

If an entry is made in this field, the entry may not be "ACTBFG", "NONTGID", "CLEANUP", "TEMP", "SETUP" or "ABORT". The 5ESS Switch software treats Default Service as a BFG (BRCS Feature Group) and gives it an internal BFG identifier. This is transparent to the ODA user. The ODA user will define the group on a DFLTSRV form and then assign the group to a DSL on the DSL form. A BFG form (5625 Record) will never be applied. However, the six prohibited group names are reserved BFG names.

2.11 DSL CLS

Description: This field specifies the DSL class as a single user, multiple users under the Lucent Technologies custom protocol, or multiple users under the Bellcore standard protocol.

The Bellcore standard protocol does not support PODs (Plain Old Data) service.

Required Field.
Default: STD
Valid Entries:

Valid DSL CLS Entries

Entry	Definition
MP	Multipoint BRI. The DSL supports multiple active users (maximum of 8). A Lucent Technologies proprietary (custom) protocol is used.
PP	Point-to-Point BRI. The DSL supports a single active user.
STD	Software Release: 5E8 and later.

Copyright © 2003 Lucent Technologies

	Standard BRI. The DSL supports multiple active users (maximum of 8). The Standard (Bellcore compliant) protocol is used.

Data Rules:

The MTERM field on this form indicates the maximum number of provisioned users, regardless of the quantity of active users indicated in the ACT USR fields on the DSLUSR forms associated with this DSL.

MP:
If this field is set to "MP", and the MTERM field has no entry, then the MTERM field will be assigned a value of 2.

If this field is set to "MP", then the D SERV field must be set to "SX". For 5E6 and later, if this field is "MP" and RSTR MP is "N" or blank, then ACT USR must be "Y" on all corresponding DSLUSR forms (DSL OE on this form matches the OE on the DSLUSR forms).

PP:
If this field is set to "PP", and the D SERV field is not set to "ADMIN" (there are no users associated with the "ADMIN" case, only Permanent Packet B-channels), and the MTERM field is not entered, then the MTERM field will be assigned a value of 1, since a Point-to-Point DSL can only have one active user.

If this field is set to "PP", and the D SERV field is set to "ADMIN", and the MTERM field is not entered, then the MTERM field will be assigned a value of 0, since there are no users associated with the "ADMIN" case.

This field must be set to "PP" if a DSLUSR form has been submitted, for this DSL, with the CSV CHL and/or the CSD CHL fields set to "B1" or "B2".

STD:
For 5E8 and later, when DSL CLS is "STD":
- ACSR GRP must not be entered.
- CUT DGTS must be entered,
- D SERV must be "SX",
- MTERM must be 1 - 8
- RSTR MP must be "N" or not entered
- DFLT SRV must not be entered.(5E8 - 5E9(2))

- For (R)ISLU, the associated Line Card defined on the ISLULC form must have TYPE set to

  "AULC"

  "SAULC"

  "TLC"

- For IDCU, the associated RT defined on the RTERM form must be set to "TR303".

All DSLUSR forms assigned to this DSL (where OE field values match) must observe the following rules:

- The DSL users must be assigned an "ISDN" CLASS OF SERVICE on the associated LCC form;
- If CKT TN or CKT MLHG/TERM are entered,

  ACT USR must be "Y"

Copyright © 2003 Lucent Technologies

BRITL ALW must be "N"

or not entered

LN TYPE must be "NONE"

or not entered

SAR NUM must not be entered

SERHLN must not be entered

and the following fields must be "N"

ASP ALW

INCOMING

INTERCOM

LONG DST DR ORIG CW

PP

SAR ORIG

SAR TERM

- If CONFIG GRP is entered on the DSLUSR form, it must be defined on a CFGGRP form where CPE COMPONENT is not greater than 0, and GRP TYPE is "STD";
- If CKT MLHG is entered on the DSLUSR form, it must be defined on an MLHG form where AP SITE ID and BCID1 - BCID6 are not entered, and where the MLHG FEATURE does not have HUNT TYPE "ISAT" or "PMHG" defined on an MLHGFD form;
- If the EKTS field is entered on the DSLUSR form, TERM TYPE must be "TYPEC"; if EKTS is not entered, TERM TYPE must be "TYPEA", CA and CA QTY must be 0;

Standard Only BRI Features:
The following features may be assigned only to Standard BRI users (None of these features may be assigned to non-standard BRI users.):

- LASS Automatic Recall for Data features defined on an LSARFD form (5971-1 Record) where CSD ALW is "Y"
- For 5E9(1) and later, Multiway features defined on MWFD forms (5602-1/2 Record) with MULTIWAY

Copyright © 2003 Lucent Technologies

TRANSFER set to "ET" may be assigned only to Standard BRI users.

Standard BRI and Shared Analog Features:
The following features can only be assigned to a DSLUSR from to Standard BRI or a primary analog line shared to a Standard BRI via the SHTN form.

- BRCS RND (Redirecting Number Delivery) features defined on an RNDFD form (5983 Record) may be assigned only to Standard BRI users and to analog lines shared to those users on the SHTN form.

Blocked Standard BRI and Shared Analog Features:
The following BRCS feature types may not be assigned to Standard BRI users or to analog lines shared on the SHTN form to Standard BRI users:

The following are totally blocked:

- TERM feature - Automatic Call-Back features defined on the ACBFD form (5616-1 Record);
- TERM feature - ISDN ACSR features defined on the ACSRFD form (5959-1 Record),
- Precedence and Preemption features defined on the PPFD form (5618-1 Record);

The following are conditionally blocked.

- For 5E9(1) and later when the SFID 139 ACT field is not "Y" on the SFSYS form (5713-1 Record), Advanced Services Platform features defined on the ASPFD form (5632-1 Record).
- Intercom features defined on the ICMFD form (5960-1 Record) may not be assigned unless EKTS is "CACH" on the DSLUSR form ;
- For 5E9(2) and earlier, Call Forwarding features defined on a CFWFD form (5614-1/2 Record) where CFPF ALW is "Y".

  However, for 5E10 and later, if the ACT field for SFID 225 is "Y" indicating National ISDN-3 BRI features are activated, then this feature is not blocked.
- For 5E9(1) and later, Call Forwarding features defined on a CFWFD form with FWD CONDITION set to "ACDI";
- Display and Privacy features defined on a DISPFD form (5965 Record) where either TIME DATE or INSPECT is "Y"
- Line Identification features defined on an LIDFD form (5966 Record) where CALL NBR DELIV PRIM is "Y"
- Message Service System features defined on an MSFD form (5962-1 Record) where

  LW CALLING is "INOUT" or "OUT"

  MSG RTRVL DISP is "Y"

  PRNT ON DEMAND is "Y" or AUTO CALL is "Y";
- Calling Party Number / Billing Number features defined on a CPNBNFD form (5982 Record) where CPN BN is not "CPNONLY" or "CPNPREF";

Copyright © 2003 Lucent Technologies

- For 5E9(1) and later, Call Pickup Originating features defined on a PUOFD form (5605-1 Record) where INITIATE is one of the following:

  "ANSBACK"

  "BPARK"

  "DPARK"

  "RTRV"

- For 5E10 and later, if the ACT field for SFID 225 on the SFSYS form (5713-1 Record) is "Y", then:

  CND SHAR DN must be "N"

  or CDN PRIM DN must be "Y"

  or DQD must be "Y"

  or AUTO CALL must be "Y".

  Electronic Delivery Services features may only be assigned on the EDSFD form if SFID 225 ACT field is "Y".

Blocked Standard BRI Only:
The following BRCS features may not be assigned with the indicated option to Standard BRI users:

Totally blocked features:

- For 5E9(1) and later, Call Waiting features defined on the CWTFD form

Conditionally blocked features:

- Multiway calling features defined on an MWFD form (5602-1/2 Record) where DIAL CODE OR BUTTON is "Y";

EKTS Features:
ISDN Intercom Features that can only be assigned to a DSLUSR form if the EKTS field on DSLUSR is "CACH".

- ISDN Intercom features defined on the ICMFD form (5960-1 Record) cannot be assigned to DSL users when EKTS is blank on the DSLUSR form.

If the DSL user is a member of an EKTS group listed on an SHTN form, SHARED must be "Y", and EKTS must be "BASIC" or "CACH";

NOTE: Features that can be assigned only to Standard BRI users or to analog lines shared to those users may not appear on the same CLUSTR or BFG forms as features that cannot be

Copyright © 2003 Lucent Technologies

assigned to standard BRI users. Mixing these features will cause assignment errors on the LINEFA or MLHLNFA forms.

For 5E8 and later, when DSL CLS is not "STD", all DSLUSR forms assigned to this DSL (OE field values match) must observe the following rules:

- The following DSLUSR fields must not be entered;

  AGI

  CSV ACO

  CSV LIMIT

  CSD ACO

  CSD LIMIT

  EKTS

- if TERM TYPE is other than "TYPEE", CA QTY must be entered; CA must be entered if TERM TYPE is:

  "ATND"

  "TYPEB"

  "TYPEC"

  "TYPED"

SERHLN on the DSLUSR form may not be defined on another DSLUSR form that is assigned to a DSL with DSL CLS of "STD";

2.12 RSTR MP

Description: Is this Multipoint DSL restricted to a single active user?
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the DSL CLS field must be set to "MP". This field has no meaning for a Point-to-Point DSL since it can have only one active user.

If "Y" is entered, then only one DSLUSR form, for this DSL, can exist with the ACT USR field set to "Y".

2.13 ACSR INH

Description: Should use of the Automatic Customer Station Rearrangement feature be inhibited on this DSL?

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.14 MDPKT

Description: This field indicates the maximum number of users of this DSL that are allowed X.25 Packet Switching services on the D-channel.
Valid Entries: 0 - 8

Data Rules:

If this field has no entry, and the D SERV field is "ADMIN", then this field will be assigned a value of 0. There are no users associated with a D SERV value of "ADMIN". For 5E6 and later, if D SERV is "ADMIN" or "SONLY", MDPKT must be 0.

For 5E6 and later, if D SERV is "XMP" and DSL CLS is "PP", then MDPKT must be 8.

The MDPKT entries on DSL form(s) are used to indicate the maximum number of DSLUSR forms that can be defined with an entry for DPKT TN or DPKT MLHG/TERM and an OE that matches the DSL OE entered on the DSL form. The number of DSLUSR forms, meeting the above conditions, cannot be greater than the value of MDPKT field.

2.15 MTERM

Description: Indicate the maximum number of active users, on this DSL, regardless of the quantity of active users indicated in the ACT USR fields on the DSLUSR forms associated with this DSL, that will simultaneously receive services. The users are handled on a "first plugged in", "first serviced" basis.
Valid Entries: 0 - 8

Data Rules:

If this field is not entered, and the DSL CLS field is set to "PP", and the D SERV field is not set to "ADMIN" (which is not associated with users) this field must equal 1.

If the D SERV field is set to "ADMIN", this field must equal 0. The "ADMIN" case is not associated with users.

If the DSL CLS field is equal to "MP", and this field is not entered, then this field will be assigned a value of 2.

If the DSL CLS field is equal to "MP", then this field must have a value between 2 and 8.

For 5E9(2) and earlier, the value assigned in TERMLIM defines the maximum number of ISDN Terminals that are allowed to be simultaneously active per SM. TERMLIM is a no display field on the EQIM form with a default of 2047. In most cases TERMLIM should be set to this value. The ISDN Terminals are defined as follows:

ISDN Terminal Assignments

Form	SM	Number of Assignments
DSL	OE[1,3]	MTERM defines the quantity of ISDN Terminals per DSL form.
DSLAP	LCEN[1,3]	number of ISDN Terminals is incremented by 1 for each LCEN list element defined.
MISLINK	OE[1,3]	1
OSPSDSL	LCEN[1,3]	1 where SERVICE CLASS is not "XDB"

2.16 D RELPIDB

Description: The Peripheral Interface Data Bus is the vehicle that links the D-channel of the DSL, resident on an ISLU or IDCU in an SM, to the SM's peripheral PSU.

NOTE: For (R)ISLU and IDCU, the manual entry of the D RELPIDB, D TIMESLOT, QRT TS,

Copyright © 2003 Lucent Technologies

DS1, and DS1 TS fields is optional. ODA will mechanically enter this data if not entered by the customer. However, if entered by the customer, when one of these time slot fields is entered, all of the appropriate fields for the equipment type (i.e., ISLU or IDCU) must be entered. For example, for ISLU, the D RELPIDB, D TIMESLOT, and QRT TS fields must be entered. For IDCU, the D RELPIDB, D TIMESLOT, QTR TS, DS1, and DS1 TS fields must be entered. Additionally, if populated by the customer, the D RELPIDB must be connected to the PSU shelf assigned to a D ISCN. Also, if the D RELPIDB/D TIMESLOT is the same on any form, the DS1/DS1 TS must also be the same across the DSL forms and vice versa. When D channel assignments are made, the set of D RELPIDB, D TIMESLOT, DS1 AND DS1 TS must also be the same across the DSL forms.

For IDCU, it is also important to note that IDCU remote terminal ports must not have duplicate IFAC (IDCU Facility), that is, DS1 time slot assignments. This may occur on any of the following forms: DSL, DSLUSR (5908 Record), ODBTS (5905 Record), NAILUP (5207), RTERM (5174).
Valid Entries: 12 - 22, or blank (for IDCU)

Data Rules:

For ISLU, the PIDB number entered must be assigned on an EQISLU form (5731 Record) with the PIDB TYPE field equal to "PSU", and the SHELF field equal to the first digit of the D ISCN field on this DSL form. For IDCU, the identical condition must exist on the EQIDCU form (5846 Record).

If D RELPIDBs and/or B RELPIDBs are assigned, then a corresponding PIDB with a PIDB TYPE of "PSU" must be assigned on the EQISLU form.

For 5E9(1) and later, for manually assigned D RELPIDBs, there must be an EQISLU form with a matching PIDB whose PSU SHELF matches the first digit of D ISCN and/or PPB1/PPB2 ISCN.

If the DSL is resident on a RISLU, this field must not be entered.

For 5E10 and later:

For manually assigned D RELPIDBs and/or PPB1/PPB2 DPIDBs, with DSL OE originating equipment type of "G":

- each PIDB must have proper Packet Switching Unit shelf assigned with matched PIDB NO. on the EQIDCU form. The PSU shelf, which is specified by the first digit of the D ISCN and/or PPB1/PPB2 ISCN on the DSL forms, must be defined on the EQIDCU form with a PIDB TYPE of "PSU".
- must have a corresponding PIDB NO. with a PIDB TYPE of "PSU" assigned on the EQIDCU form.

For 5E12 and later:

When the following forms have D RELPIDBs and/or B RELPIDBs assigned , there must be a TSGRP NO with a PIDB TYPE of "PSU" assigned on the EQAIU form (5745-1/2 Record): DSL, DSLAP, or MISLINK.

For manually assigned D RELPIDBs and/or PPB1/PPB2 DPIDBs, with DSL OE originating equipment type of "E":

- there must be a EQAIU form assigned with a matching TSGRP NO whose PSU SHLF matches the first digit of D ISCN and/or PPB1/PPB2 ISCN (on the DSL form), and/or the LINK DATA ISCN (on the DSLAP form), and/or SHELF (on the MISLINK form), and/or the PSIU SHELF (on the IPDSL form; 5E13 and later).
- assigned AIU DSLs which have identical entries for the first six digits of the OE, and also have the same D REL PIDB and D TIMESLOT entries, must also have the same PACK (OE[7,8]), and SHELF/CHL GRP (also defined as the first through third digits of the [D] ISDN).

Copyright © 2003 Lucent Technologies

For 5E13 and later:

When the following forms have D RELPIDBs and/or B RELPIDBs assigned , there must be a TSGRP NO with a PIDB TYPE of "PSU" assigned on the EQAIU form: DSL, DSLAP, IPDSL or MISLINK.

2.17 D TIMESLOT

Description: Enter the D-channel Time Slot.

Manual entry of this field is optional; ODA will select the data if not entered by the customer. However, if entered by the customer, the appropriate assignment rules for the equipment type must be followed

- ***NOTE:*** See "Note:" in the D RELPIDB field above.

When making manual assignments, care must be taken to use assignments as shown in Figure 1, *D TIMESLOT Assignment vs LCG and D REL PIDB Entries.* For example, if manual assignments are being made on the DSL form and the D REL PIDB selected is 11 and the LGC from the OE is 0, then the D TIMESLOT assignment must be 1, 9, 17, or 25. B and/or D channel assignments made manually cannot conflict with the ODA assignment algorithm. The ODA algorithm is allocated 4 time slots per DPIDB per SM/ISLU/LGC. The LGCs 00 thru 07 are allocated time slots on the odd numbered DPIDBs while LGCs 08 thru 15 are allocated time slots on the even numbered DPIDBs Manual time slot assignments do not have to follow this algorithm. However, if manual assignments are made, they will use one or more time slots. These manual assignments diminish and may conflict with, the time slots available for the ODA assignment algorithm. For example, TS 1, 9, 17 and 25 are the 4 time slots that are allocated to ODA for LGC 0 in any ISLU which has a DPIDB 11 assigned. If a manual assignment is made to TS 9 on DPIDB 11 from any LGC in this ISLU there will only be 3 TS left on PIDB 11 for ODA assignments. Of course other odd numbered DPIDBs will have 4 TS for ODA assignments to LGC 0.
Valid Entries: 0 - 31

Data Rules:

For ISLU, if this field is entered, the value must not equal the value expressed by the fifth and sixth digits of the DSL OE field (the LGC), nor that value plus 16.

For ISLU, if the DSL is resident on a RISLU, this field must not be entered.

For ISLU, time slots, for a given combination of SM, ISLU, and PIDB, may not be be duplicated more than three times (D-channels utilize up to four Quarter Time Slots) on other DSL forms, DSLAP forms, or OSPSDSL forms.

For ISLU and IDCU, all the DSLs on an SM that have the same values of D RELPIDB and D TIMESLOT must have the same SHELF and CHL GRP number (the first three digits of the D ISCN).

The LCEN's assigned on the AMLBDSL, DSLAP or OSPSDSL forms, or DSL OE's on the DSL form or OE's on the MISLINK form can not have their D and/or B Channels assigned to conflicting DPIDB time slots or quarter time slots due to manual (vs ODA) time slot assignments. Each time slot may be assigned only once. (Note, D channels are allocated to quarter time slots; therefore up to four unique assignments can be made before a time slot is considered full.

For 5E9(1) and later, the combination of SM, IDCU, DPIDB and TIMESLOT must be unique. DSLs cannot be assigned duplicate time slots on the following forms:

- DSL form - D-channel and B-channel time slots
- MISLINK form - D-channel time slots
- RTERM form - EOC and TMC PRI/NPRI time slots

All of the digital subscriber lines on an SM, i.e.,

Copyright © 2003 Lucent Technologies

- IDCU DSLs defined on the DSL or
- MISLINK forms
- ISLU/ISLU2 DSLs as defined on the DSL,
- DSLAP, MISLINK or OSPSDSL forms

which have identical entries for the first five digits of the OE
- (LCEN[1,5] for ISLU2, or
- (DSL) OE[1,5] for IDCU) or
- OE[1,4] for ISLU

and which also have the same D REL PIDB and D TIMESLOT entries, must also have the same LGC, i.e.,
- (LCEN[6,7] for ISLU2) or
- RT (OE NUMBER[6,7] for IDCU or
- OE[5,6] for ISLU), and
- SHELF/CHL GRP (also defined as the first
- through third digits of the [D] ISDN) entries.

For 5E9(1) and later, unassigned D TIMESLOTs and/or B TIMESLOTS require that ODA assign these values. The ODA assignment requires that LKCENs ("K" type Equipment Number) assigned to LGs 0 - 7 (Note: the sixth and seventh digit of the Equipment Number is the LG) get time slots on odd numbered EQISLU PIDBs and that LCKENs assigned to LGs 8 - 15 get time slots on even numbered EQISLU PIDBs, each with a PIDB TYPE of "PSU".

For 5E10 and later, when the DSL or DSLAP forms have unassigned D TIMESLOTs and/or B TIMESLOTS, ODA assigns these values. The ODA assignment requires that LKCENs (DSL OE on the DSL for "K" TYPE) assigned to LGs 0 - 7 (Note: the sixth and seventh digit of the LCKEN/DSL OE is the LG) get time slots on odd numbered EQISLU PIDBs and that LCKENs assigned to LGs 8 - 15 get time slots on even numbered EQISLU PIDBs, each with a PIDB TYPE of "PSU". If there are either no odd numbered PIDBs for LG 0 - 7 or even numbered PIDBs for LG 8 - 15 on this ISLU2, a cross check error will occur.

2.18 QTR TS

Description: Enter the D-channel Quarter Time Slot.

Manual entry of this field is optional; ODA will populate the data if not entered by the customer. However, if entered by the customer, the appropriate assignment rules for the equipment type must be followed (see Note: in the D RELPIDB field above).

The QTR TS, in the case of IDCU, requires a quarter time slot on the D RELPIDB and a quarter channel on the DS1.

A time slot is assignable in four quarters and can be assigned to either of the following fields: D RELPIDB, D TIMESLOT, DS1, and DS1 TS. For efficiency, quarter time slots should be packed four to a time slot. When doing this the D RELPIDB, D TIMESLOT, DS1, and DS1 TS must be the same across all of the four quarter time slots being packed.
Valid Entries: 0 - 3

Data Rules:

If any of the D RELPIDB, D TIMESLOT, or QTR TS fields are entered, then all three must be entered.

If the DSL is resident on a RISLU, this field must not be entered.

For 5E9(1) and later, QTR TS may only be assigned ISLU(2) DSLs.

The QTR TS may not be duplicated for the same combination of SM, ISLU/ IDCU, D RELPIDB and D

Copyright © 2003 Lucent Technologies

TIMESLOT on another DSL form, or a DSLAP form, or an OSPSDSL form.

In order to conserve resources, the assignment of quarter time slots must be "packed". That is, all quarter time slots in a time slot must be assigned (if possible) to a time slot before another time slot is used. To pack the time slot, all D-channels on an LGC are candidates for assignments to the same time slot. No D-channels can be assigned to a time slot to which a D-channel from another LGC has been assigned. The D-channels which are assigned to a time slot must all be in the same CHL GRP. The only restriction on the D ISCN is that all members assigned to a given time slot must be in the same CHL GRP and have the same SHELF assignment (first three digits of the D ISCN).

5E10 and later:
QTR TS may only be assigned ISLU(2) DSLs.

Digital subscriber lines cannot be assigned duplicate D-channel quarter time slots.

For the Originating Equipment Types of "G", when packing QTR TS on DSL forms (up to 4 to a TS) on an SM/IDCU/RT (the first seven digits of the DSL OE):

- the assigned QTR TS and the D ISCN (last three digits) must be unique across the identical set of the DSL form (SM/IDCU/RT) in question.
- the set of D RELPIDB D TIMESLOT, DS1, DS1 TS must each be identical (ie: DS1 = DS1, etc.) and the first three digits of the D ISCN must also be the same on these DSL forms. If the D RELPIDB/D TIMESLOT is the same on any forms the DS1/DS1 TS must also be the same across those DSL forms. The converse is also true. The first three digits of the D ISCN must be consistent also.

2.19 DS1

Description: Enter the RT DS1 which carries the D-channel time slot. Refer to the RT IFAC TERMINATION field on the RTERM form (5174 Record) to correlate an RT DS1 to its associated IFAC, and vice versa.

Manual entry of this field is optional; ODA will populate the data if not entered by the customer. However, if entered by the customer, the appropriate assignment rules for the equipment type must be followed (see Note: in the D RELPIDB field above).

For IDCU (DSL OE "M" or "G"), the IDCU DS1 selection is optional, if not populated by the customer, ODA will select a DS1. If populated by the customer the D RELPIDB, D TIMESLOT, QTR TS and DS1 TS must be populated.
Valid Entries: 1 - 28

2.20 DS1 TS

Description: Enter the IDCU DS1 IFAC time slot.

Manual entry of this field is optional; ODA will populate the data if not entered by the customer. However, if entered by the customer, the appropriate assignment rules for the equipment type must be followed (see Note: in the D RELPIDB field above).

- ***NOTE:*** To pack QTR TS, the D TIMESLOT, D RELPIDB, DS1 and DS1 TS must be identical. The first three characters of the ISCN must also be identical. The first character of the ISCN must correspond to the DPIDB shelf assignment on the EQIDCU form for D RELPIDB. Also, the SM, IDCU and RT from the DSL OE must be identical.

For IDCU (DSL OE is set to "M" or "G"), the IDCU DS1 TS selection is optional. If not populated by the customer, ODA will populate it. If populated by the customer, the D RELPIDB, D TIMESLOT, QTR TS and DS1 must be populated. This DS1 TS should be one of the time slots on the selected DS1. For an ISLU

Copyright © 2003 Lucent Technologies

(DSL OE is set to "I"), the DS1 TS field must be blank.
Valid Entries: 0 - 23

Data Rules:

The combination of SM, IDCU, IFAC and TIMESLOT must be unique. The following IDCU remote terminal ports cannot be assigned duplicate IFAC (DS1) time slots:

IFAC TIMESLOTS

Form	Timeslots
DSL	D-channel (DS1 and DS1 TS) and B-channel (PPB1/2 DS1 and DS1 TS) time slots
MISLINK	D-channel time slots (DS1 and DS1 TS)
NAILUP	nailup/hairpin time slots: C PATH DS1 and NC PATH DS1 for the IFACs. C PATH1 DS0, C PATH2 DS0, NC PATH1 DS0, NC PATH2 DS0 for the time slots.
RTERM	Fixed time slots for the primary and secondary TMC and EOC are assigned by ODA on the primary IFAC (the 1st IFAC in the RT TERM/IFAC list) and backup IFAC (EOC/TMC BKUP TERM) for the RT.

The fixed time slots are TS 11 for EOC and TS 23 for TMC. If ZCS (SUP METHOD is "303ZC" on the RTERM form) signaling is used by the IFAC, additional guard channels (TS) are required; they are TS 10 for EOC and TS 0 and 22 for TMC. ISDN applications (DSL and MISLINK form) are not allowed when ZCS signaling is used.

2.21 CUT NPA

Description: The CUT NPA field is used to specify the NPA (Numbering Plan Area) code to be used during cutover activities. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: Enter 3 digits of the form (2-9)(0-9)(0-9).

Data Rules:

For 5E12 and later, CUT NPA and/or the first three digits of CUT DGTS(s) entered on the DSL form must match an NPA and/or OFFICE CODE defined on the NOC form.

2.22 CUT DGTS

Description: Enter the four digits to be used during cutover activities to determine the line state of this DSL (active or inactive). It is suggested that the digits entered be the first four digits from one of the telephone numbers associated with the DSL.
Valid Entries: Each of the four digits may range from 0 to 9.

Data Rules:

The first three digits must be defined in the OFFICE CODE field on an NOC form (5501 Record). The fourth digit is the companion thousands digit.

If this field is entered, one of the following four conditions must be true:

- The DSL CLS field on this form is set to "MP";
- The DSL CLS field on this form is set to "PP" and there is no Circuit Switching done by this DSL (the CKT TN field or the combination of the CKT MLHG and CKT TERM fields are not entered);
- The DFLT SRV field on this form is entered;
- The D SERV field on this form is set to "ADMIN", and the B1 SERV or B2 SERV fields on this form

Copyright © 2003 Lucent Technologies

are set to "X25".

For 5E12 and later, if the first 3 digits of CUT DGTS on the DSL form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, CUT NPA must also be entered on the DSL form.

2.23 TSTLINE

Description: Is this DSL put into service while the 5ESS Switch is in the Pre-Cutover mode?

A value of "Y" would be an exception to a group of lines in a Switching Module that have been set to a Pre-Cutover status equal to "INACTIVE". This is normally done for test lines, not "live" customers. It is recommended that all lines submitted at the time of Selected Line And Trunk Translations be set to "Y".

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When this field has a value of "N", refer to the IMINFO form (5510 Record) and the COTH form (5513 Record) for the Pre-Cutover and Post-Cutover status of all telephone numbers in the office.

2.24 EL

Description: Is this an ESP (Essential Service Protection) DSL?

A value of "Y" marks the DSL as "essential". The DSL is covered by ESP, a priority service which guarantees ESP lines a greater probability of origination than non-ESP lines during extreme system overload. When EL is "Y" in extreme system overload, ESP will give a 5 to 1 call origination priority to ESP lines over non-ESP lines.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

2.25 PREX

Description: Should REX be prohibited for this BRI? This field supports the Prohibit Routine Exercise secured feature (SFID 267). Note that this field interacts with the PREX ON BRI field on the ISDNOPT form which supports the Prohibit REX on BRI Lines Per Office feature (SFID 266).

See Division 2, Sections 4A266/267.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E11, when PREX is "Y", DSL OE TYPE cannot be "G".

For 5E12 and later, when PREX is "Y", DSL OE TYPE cannot be "A" or "G".

If this field is entered, SFID 267 ACT on the SFSYS form (5713 Record) must be "Y".

Copyright © 2003 Lucent Technologies

3. FORM ENTRIES - 5907-2, 5 RECORDS

PERMANENT PACKET B-CHANNEL ASSIGNMENTS

Fields Section 3.1 - Section 5.15 refer to fields for the Permanent Packet B-channel assignments.

Permanent Packet B-channels are dedicated to X.25 Packet Switching and to usage by a single user. They do not handle CSV or CSD services. They cannot be shared by multiple users in a Pure Multipoint environment.

If the B1 SERV field is not set to "X25", then the B1-channel is not used for Permanent Packet service. Thus, the customer should not visit any field under the PPB1 (PERMANENT PACKET B1) heading. Non-defaulted fields must not be entered and defaulted fields must be left as defaulted. The SUST field, which is used to deny termination, will be assigned a value of "Y".

If the B1 SERV field is "X25", then the B1-channel is used for Permanent Packet service. Thus, the customer must visit many of the fields under the PPB1 heading. The TN field and/or the MLHG and TERM field combination must be entered. The LCC, RAX, ISCN, RATE, N2, T1, T3, and WNDSZ fields must be entered. The D SERV field must be "SX" or "ADMIN".

If the B2 SERV field is not set to "X25", then the B2-channel is not used for Permanent Packet service. Thus, the customer should not visit any field under the PPB2 (PERMANENT PACKET B2) heading. Non-defaulted fields must not be entered and defaulted fields must be left as defaulted. The SUST field, which is used to deny termination, will be assigned a value of "Y".

If the B2 SERV field is "X25", then the B2-channel is used for Permanent Packet service. Thus, the customer must visit many of the fields under the PPB2 heading. The TN field and/or the MLHG and TERM field combination must be entered. The LCC, RAX, ISCN, RATE, N2, T1, T3, and WNDSZ fields must be entered. The D SERV field must be "SX" or "ADMIN".

The LCC and RAX combination assigned to a Permanent Packet B-channel must have an associated DIGIT ANALYSIS SELECTOR entered on a DAS form (5300-1 Record), which in turn has associated PREFIX / FEATURE DIT(s) entered on PDIT form(s) (5300-2 Record), or LOCAL DIT(s) entered on LDIT form(s) (5300-3 Record). If the TYPE OF CI CALL is entered on the PDIT/LDIT form(s), it must be set to either "PSNCI" (Packet Switching Non-Carrier), or "PSCAR" (Packet Switching Carrier).

The fields related to the PERMANENT PACKET B1 and PERMANENT PACKET B2 sections are identical. Thus, the instructions for the two sections are merged into a common set. The instructions assume that the requisite to be in either section (B1 SERV/B2 SERV is "X25) has been met.

3.1 TN

Description: Enter the Packet TN of the DSL (if it has one).
Valid Entries:

- For 5E11 and earlier: 7 digits: the first digit
- cannot be a 0 or 1 (the remaining 6 digits may
- range from 0 - 9)
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

The first three digits of the TN must be defined in the OFFICE CODE field on an NOC form. If the MLHG, TERM, and H PVC LCN fields are entered, then this field must have an entry.

For 5E8 and later, when MLHG and TERM are entered, and CHL SEL is "Y" or HUNT NOTIF is "YES",

Copyright © 2003 Lucent Technologies

then a TN must be entered in this field.

When CHL SEL is "N", this TN must be unique within the 5ESS Switch with the following exception:

- It can duplicate the CKT TN or the MLHG TN (under the CKT SWITCHING header) on a DSLUSR form for the DSL if the PPB1/PPB2 USR field is set to "Y".

When CHL SEL is "Y", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can duplicate the CKT TN or CKT MLHG TN (under the CKT SWITCHING header) on a DSLUSR form for the DSL if the PPB1/PPB2 USR field is set to "Y".
- It must equal DPKT TN or DPKT MLHG TN on a DSLUSR form for the DSL if the DPKT CHL SEL is set to "Y" and PPB1/PPB2 USR is set to "Y".
- It must equal ODB TN or ODB MLHG TN on a DSLUSR form for the DSL if the ODB CHL SEL is set to "Y" and PPB1/PPB2 USR is set to "Y".
- It must equal PPB1/PPB2 TN (on the same DSL form) if the corresponding PPB1/PPB2 CHL SEL equals "Y" and if PPB1 and PPB2 are defined for the same user or are not assigned on a DSLUSR.

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN, or member TN. Multiple TNs are defined in the TN field on a MULTITN form (5114 Record). For 5E5 and later, the TN entered in this field on the DSLUSR form may not duplicate a TN entered in the TN field on a MULTITN form.

Multiple TNs that are defined on the MULTITN form may not be assigned to modem pools, PPB1 MLHG/TERMS, or PPB2 MLHG/TERMS.

For 5E5 and later, if a value is entered in this field, the LCC and RAX combination on this form must be defined on an LCC form (5306 Record) with a CLASS OF SERVICE of "ISDN", and a TERMINATING TREATMENT of "INDIV".

If a value is not entered in this field, then the LCC and RAX combination on this form must be defined on an LCC form (5306 Record) with a CLASS OF SERVICE of "ISDN".

For 5E12 and later, when the DSL forms have PPB1 TN and PPB2 TN entered, and PPB1 CHL SEL or PPB2 CHL SEL equal "N", PPB1 TN must not be equal to PPB2 TN.

For 5E12 and later, if the first 3 digits of the 7-digit PPB1 TNs on the DSL form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit PPB1 TN(s) must be entered as a 10-digit PPB1 TN(s).

For 5E12 and later, if the first 3 digits of the 7-digit PPB2 TNs on the DSL form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit PPB2 TN(s) must be entered as a 10-digit PPB2 TN(s).

For 5E12 and later, the Permanent Packet TN(s) on the DSL form must have an NXX or NPA/NXX combination that is an OFFICE CODE or NPA/OFFICE CODE combination defined on a NOC form.

3.2 MLHG

Description: Enter the MLHG Number.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Copyright © 2003 Lucent Technologies

Data Rules:

The entry must be defined in the MLHG field on an MLHG form. The associated MLHGFD form must have the HUNT TYPE field set to "PSUCD".

If the MLHG field is entered, then the TERM field must be entered, and if the TERM field is entered, the MLHG field must be entered.

For 5E5 and later, if the LOCAL SM field on the defining MLHG form is entered, then the SM portion (first three digits) of the DSL OE on this form must equal the value in the LOCAL SM field.

For 5E7 and later, if PPB1 MLHG is entered then PPB1 L IN LCN or PPB1 L 2W LCN must be entered. Also, if PPB2 MLHG is entered then PPB2 L IN LCN or PPB2 L 2W LCN must be entered.

For 5E8 and later, if MLHG/TERM are not entered, then HUNT NOTIF, BUSY LIMIT, and LNR HNT TN must not be entered, and HUNT DEACT must be "N".

PPB1 MLHG and PPB2 MLHG on the DSL form and DPKT MLHG (Non-Modem Pooling) and ODB MLHG on the DSLUSR form and PKT MLHG on the XAT form may be the same. The corresponding TERM entries must be different if their CHL SEL fields are "N". If the corresponding CHL SEL fields are "Y", and the channels are defined for the same user, then the TERM entries must be the same. (CHL SEL is not valid with XAT.)

3.3 TERM

Description: Enter the MLHG Terminal Number.
Valid Entries: 1 - 2015

Data Rules:

If the MLHG and TERM fields are entered, then the ICB (Incoming Calls Barred) field must be set to "N".

For 5E8 and later, if the PPB1 MLHG equals the PPB2 MLHG and either PPB1 CHL SEL or PPB2 CHL SEL equals "N", then the PPB1 TERM must not equal the PPB2 TERM. If the PPB1 MLHG equals the PPB2 MLHG, both CHL SEL fields equal "Y", and both channels are defined for the same user, then PPB1 TERM must equal PPB2 TERM.

For 5E6 and later, if an MLHG and TERM combination is entered, then the LCC and RAX combination on this form must be defined on an LCC form with a CLASS OF SERVICE of "ISDN".

If an MLHG and TERM combination is entered, then the TN field must be entered on this form, or the LISTED TN field on the associated MLHG form must be entered.

3.4 LCC

Description: Enter a 3-character Packet Line Class Code.
Valid Entries: Each of the three characters may be a number or letter.

Data Rules:

The entry must be defined in the LINE CLASS CODE field of an LCC form.

3.5 RAX

Description: Enter a Packet Rate Area.

The RAX and LCC are used to determine the Digit Analysis Selector and Screening Index used for packet calls originating from this device and the terminating treatment of packet calls to this device.

Copyright © 2003 Lucent Technologies

Valid Entries: For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 999

Data Rules:

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

3.6 LNR HNT TN

Description: Enter the Linear Hunt TN of a Multi-Line Hunt Group member. This LNR HNT TN serves as a linear entry point to the MLHG. Hunting always begins at the member associated with the called TN; it hunts sequentially through the members of the hunt group until either it reaches a non-busy member, or it reaches the last member and all hunted members were hunt-busy.

If the member TN is on intercept, the LNR HNT TN will not be on intercept.

Software Release: 5E8 and later
Valid Entries:

- For 5E11 and earlier: 7 digits: the first digit
- cannot be a 0 or 1 (the remaining 6 digits may
- range from 0 - 9)
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

If LNR HNT TN is entered, the following must be true:

- MLHG and TERM must be entered.
- The first three digits of LNR HNT TN must be defined in the OFFICE CODE field on the NOC form.
- For any "PSUCD" MLHGs, if LNR HNT TN for member 1 is not entered, then no other members can have LNR HNT TN entered.
- LNR HNT TN must be unique within the 5ESS Switch with the following exceptions:
  - If PPB1/PPB2 CHL SEL equals "Y", then it must equal DPKT LNR HNT TN on a DSLUSR form for the DSL if the DPKT CHL SEL is set to "Y" and PPB1/PPB2 USR is set to "Y".
  - If PPB1/PPB2 CHL SEL equals "Y", then it must equal ODB LNR HNT TN on a DSLUSR form for the DSL if the ODB CHL SEL is set to "Y" and PPB1/PPB2 USR is set to "Y".
  - If PPB1/PPB2 CHL SEL equals "Y", then it must equal PPB1/PPB2 LNR HNT TN (on the same DSL form) if PPB1 and PPB2 are defined for the same user, or if neither is assigned to any user.

For 5E12 and later, when the DSL forms have B1 SERV set to "X25", PPB1 LNR HNT TN entered, and PPB1 TN and/or PPB2 TN entered, PPB1 LNR HNT TN must not be equal to PPB1 TN or PPB2 TN.

For 5E12 and later, when the DSL forms have B2 SERV set to "X25", PPB2 LNR HNT TN entered, and PPB1 TN and/or PPB2 TN entered, PPB2 LNR HNT TN must not be equal to PPB1 TN or PPB2 TN.

For 5E12 and later, when the DSL forms have PPB1 LNR HNT TN and PPB2 LNR HNT TN entered, and PPB1 CHL SEL or PPB2 CHL SEL equal "N", PPB1 LNR HNT TN must not be equal to PPB2 LNR HNT TN.

Copyright © 2003 Lucent Technologies

For 5E12 and later, if the first 3 digits of the 7-digit PPB1 LNR HNT TNs on the DSL form are equivalent to an OFFICE CODE on the NOC form, but there is more than one NOC form with the same value for OFFICE CODE, the following 7-digit PPB1 LNR HNT TN(s) must be entered as a 10-digit PPB1 LNR HNT TN(s).

For 5E12 and later, if the first 3 digits of the 7-digit PPB2 LNR HNT TNs on the DSL form are equivalent to an OFFICE CODE on the NOC form, but there is more than one NOC form with the same value for OFFICE CODE, the 7-digit PPB2 LNR HNT TN(s) must be entered as a 10-digit PPB2 LNR HNT TN(s).

For 5E12 and later, when the PPB1/PPB2 LNR HNT TN(s) on the DSL form have an NXX and/or NPA/NXX combination assigned, there must be a matching OFFICE CODE or NPA/OFFICE CODE defined on a NOC form.

3.7 HUNT DEACT

Description: Should the MLHG member be deactivated (marked busy) for hunted calls? A value of "N" indicates the Multi-Line Hunt Group member is active (available) for hunting.

The deactive/active status has no effect on call originations or on non-hunted calls made to the MLHG member using its individual TN.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If MLHG and TERM are not entered, HUNT DEACT must be "N".

3.8 CHL SEL

Description: Is the TN a Common TN that is shared by at least two channels on the DSL? When a call terminates to a Common TN, an Active Channel Selection algorithm is performed to determine the channel on which the call will be offered.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PPB1 CHL SEL and PPB2 CHL SEL are both "Y" and PPB1 and PPB2 are defined for the same user, then the following PPB1 and PPB2 fields must be set the same: TN, MLHG, TERM, LCC, RAX, first three digits of ISCN, LNR HNT TN, HUNT DEACT, BILL TN, BUSY LIMIT, ICB, OCB, PMDR GRP, PMDR ACT, SEND PKTSZ, SEND PKTWD, RCV PKTSZ, RCV PKTWD, FCPN, TPCN, REV CHARGE, LCP, IECPDNIC, FSA, IA, PB GRP, X25VER, CALL TN, CALL ID, DIS SCR, ICP, HUNT NOTIF, SUST, CUGPX, CUGOA, and CUGIA.

If CHL SEL is "Y", H PVC LCN must not be entered.

At least two channels (PPB1 CHL SEL, PPB2 CHL SEL, ODB CHL SEL, or DPKT CHL SEL) of the DSL for a user must have Channel Selection set to "Y", or none of the channels may be set.

If DPKT CHL SEL (DSLUSR form), ODB CHL SEL (DSLUSR form), PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) are set to "Y" for a user of the DSL, then the following must be true for that user:

Copyright © 2003 Lucent Technologies

- The following parameters associated with CHL SEL equal to "Y" must be the same: MLHG, TERM, LNR HNT TN, LCC, RAX, HUNT DEACT, first three digits of ISCN, BILL TN, BUSY LIMIT, ICB, OCB, PMDR GRP, PMDR ACT, FCPN, TPCN, REV CHARGE, LCP, IECPDNIC, FSA, IA, PB GRP, X25VER, ICP, HUNT NOTIF, SUST, CUGPX, CUGOA, and CUGIA.

- If MLHG and TERM are entered, all the associated Channel Types with CHL SEL set to "Y" must have the same DPKT MLHG TN, ODB MLHG TN, PPB1 TN and/or PPB2 TN.

- If MLHG and TERM are not entered, all the associated Channel Types with CHL SEL set to "Y" must have the same DPKT TN, ODB TN, PPB1 TN and/or PPB2 TN.

- All the associated B-Channel Types with CHL SEL set to "Y" must have the same SEND PKTSZ, SEND PKTWD, RCV PKTSZ, and RCV PKTWD.

- If PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) equals "Y", and there exists a DSLUSR form for the DSL where DPKT NOTIF and/or ODB NOTIF is set to "COND" and PPB1 USR and/or PPB2 USR equals "Y", then of all the associated Channel Types with CHL SEL set to "Y" at least one Channel must have 2W LCN or IN LCN entered.

- If PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) equals "Y" and there exists a DSLUSR form for the DSL where DPKT CHL SEL or ODB CHL SEL equals "Y", and PPB1 USR and/or PPB2 USR equals "Y", then the appropriate PPB1 and/or PPB2 fields CALL TN, CALL ID, and DIS SCR (DSL form) must equal "N".

- If MLHG and TERM are entered then of all the associated packet services (PPB1, PPB2, DPKT, ODB) with CHL SEL set to "Y" for this user, at least one packet service must have 2W LCN or IN LCN entered.

3.9 ISCN

Description: Enter the B-channel Integrated Services Channel Number, on the PSU, which is conjoined to the DSL.

The DSL is connected, via a PIDB to a PSU.

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		Format	Valid Entries
Shelf		X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	0-127

Data Rules:

For the shelf, enter the PSU PH shelf number. The SHELF must correspond to a PSU SHELF field on an EQPSU form, where the value in the SWITCHING MODULE field is the SM portion (first three digits) of the DSL OE, which has a SHLF SIDE 0/1 with EQST set to "O".

For CHL, enter the PSU PH number on the PSU shelf. PHs are assigned, as a component of an ISCN, on AMLBDSL forms (5447 Record), DSL forms (5907 Record), DSLAP forms (5963 Record), DSLUSR forms (5908 Record), OSPSDSL forms (5411 Record), PSISM forms (5920 Record), and TRUNK forms (5204 Record). PHs are also assigned in the CHL GRP field on ODBRES forms (5906 Record). The total quantity of PHs assigned on these forms must not exceed the quantity of PHs defined for the given SWITCHING MODULE and PSU SHELF on an EQPSUPH form (5742 Record) with EQST set to "O". The CHL GRP is a "logical" value. The number that is assigned in this field will not always be the number of the PH that is used. The quantity of PHs defined on the EQPSUPH form relative to the quantity of PHs assigned on the aforementioned forms is critical; the actual values are not of importance.

Each ISCN entry (D/PPB1/PPB2 ISCN on the DSL form) must have the SHELF value (the first character

Copyright © 2003 Lucent Technologies

of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

For CHL, enter the PSU PH member number. A B-channel requires four (4) PH channels for service.

The ISCN must be a unique value within an SM.

Any combination of the SHELF and CHL GRP entries must be defined on an EQPSUPH form.

This field cannot have the same SHELF and CHL GRP, within the same SM, as an ISCN from a PSISM form, or a TRUNK form with an associated TRKCLS of "PACKET", or "X75P", defined on a TKGRP form.

Each SM can have up to 5 PSU Shelfs. Each Shelf can have up to 16 Protocol Handlers (PH). Shelfs and PHs are defined by the first 3 digits of the ISCN field. Each PH can be assigned up to 32 time slots. up to 16 Protocol Handlers (PH).

For 5E9(1) and later:
The first three digits of OE, the first digit of ISCN, and the second two digits of ISCN must be defined in the SM, PSU SHELF, and GRP fields on a PSUGP form where PH TYPE is set to "PH3".

The following D ISCN and/or PPB1/PPB2 ISCN are assigned on with an originating equipment type of "G". Each ISCN or SHELF/CHL GRP/CHL combination must have a proper Packet Switching Unit shelf assigned on the EQIDCU form. The PSU shelf specified by the first digit of the ISCN on either the DSL form must be defined on the EQIDCU form with a PIDB TYPE of "PSU".

If ISCNs are assigned, then a PIDB with a PIDB TYPE of "PSU" must be assigned on the same Packet Switching Unit shelf on the EQISLU form as the PSU shelf specified by the first digit of the ISCN.

For 5E10 and later, the following forms
- AMLBDSL
- DSL
- MISLINK
- DSLAP
- DSLUSR
- ODBRES
- OSPSDSL
- RTERM
- XAT

and TRUNK forms which have a TRKCLS of "EDSL", "IFTERM" or "IFOPER" defined on the TKGRP form can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM. However, they can not have an ISCN SHELF and CHL GRP which are mixed with ISCNs from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of
- "PACKET",
- "X75",
- "X75P",
- "PKTPIPE",
- "SPCHNDLR" defined on the TKGRP form.

For 5E11 and later, PPB1 ISCN must be entered for the existing form tuple in Large Terminal Growth. (AILA (Automatic ISDN Line Assignment) feature existing form tuples in Large Terminal Growth should still keep the old checks whether the AILA feature is active or not). For more information on this feature, see Division 2, Section 1BO.

When PPB1 ISCN is not entered, PPB1 DPIDB, PPB1 TS, PPB1 DS1 and PPB1 DS1 TS must not be entered.

Copyright © 2003 Lucent Technologies

For 5E11 and later, PPB2 ISCN must be entered for the existing form tuple in Large Terminal Growth. (Automatic ISDN Line Assignment feature existing form tuples in Large Terminal Growth should still keep the old checks whether the AILA feature is active or not.

When PPB2 ISCN is not entered, PPB2 DPIDB, PPB2 TS, PPB2 DS1 and PPB2 DS1 TS must not be entered.

When ACT on FOSYS form (5713-2 Record), where FID is 695, is set to "Y" (i.e., the AILA feature is active) and ODB TN, ODB MLHG and ODB TERM are not entered on the corresponding DSLUSR form, the D ISCN field on the matching DSL form must not be entered.

When ACT on FOSYS form (5713-2 Record), where FID is 695, is set to "N" (i.e., the AILA feature is not active) and ODB TN, ODB MLHG and ODB TERM are not entered on the corresponding DSLUSR form, the D ISCN field on the matching DSL form must be entered.

3.10 RATE

Description: Enter the DSL baud rate.
Valid Entries: 56KB, 64KB

3.11 N2

Description: Enter the N2 value.

The N2 value, per CCITT specifications, is the maximum number of attempts made by the CPE device or the PH to successfully transmit a frame at the LAPB (Link Access Procedure B) Level 2. Following N2 failures, the PH attempts to restore the link, which is either an SVC or a PVC. If the PH cannot restore the link, the PH will clear the SVCs and reset the PVCs.

Refer to Section 1.2 for background information.
Valid Entries: 2 - 15

3.12 T1

Description: Enter the T1 timer.

The T1 timer, per CCITT specifications, is the period of time before retransmission of a frame may be initiated at the LAPB Level 2.

Refer to Section 1.2 for background information.
Valid Entries: 2 - 200, even only, in units of a tenth of a second.

3.13 T3

Description: Enter the T3 timer.

The T3 timer, per CCITT specifications, is the period of time at which an idle channel is considered to have been in the idle state excessively long. The indication of this situation is passed to the PH to assure that the channel is idle and ready to be set for operation once again. The duration of the T3 timer must be greater than one tenth of the duration of the T1 timer to ensure that retransmission efforts are not aborted.

Refer to Section 1.2 for background information.
Valid Entries: 3 - 30, in units of a full second.

3.14 WNDSZ

Description: Enter the WNDSZ value.

Copyright © 2003 Lucent Technologies

This value, named "I frames k" in CCITT terminology, is the maximum quantity of sequentially numbered LAPB Level 2 I-frames (Information) which the CPE device or PH can have unacknowledged at any time. I-frames, which are data packets, are number sequentially applying modulo 8 arithmetic. Modulo 8 arithmetic is strictly concerned with remainders when dividing by 8. For example, 27 modulo 8 equals 3 because three is the remainder when 27 is divided by eight. The possible remainders when dividing by 8 are 0 through 7. Hence, every I-frame has a number between 0 and 7.

Refer to Section 1.2 for background information.
Valid Entries: 0 - 7

3.15 DPIDB

Description: Enter the number of the PIDB which links the B-channel of the DSL resident on the unit (ISLU, IDCU, AIU) to the SM's PSU.

- ***NOTE:*** See "Note:" in the D RELPIDB field above.

Valid DPIDB Entries

Entry	Definition
1 - 5	Software Rlease: 5E12 and later: For OE type "E".
2 - 11	Software Release: 5E8 - 5E9(2) For OE type "I" Software Release: 5E10 and later. For OE type "I" or "K".
12 - 22	Software Release: 5E8 - 5E9(2) For OE type "G" or "M". Software Release: 5E10 and later. For OE type "G".

Data Rules:

If this field is entered, then the TS field must be entered.

This field must not be entered if the DSL is resident on a RISLU.

For ISLU, if this field is entered, the value must not equal the value expressed by the fifth and sixth digits of the DSL OE, or that value plus 16.

If this field is entered, then the DPIDB field must be entered.

B-channel Time Slots, for a given combination of SM, ISLU, and PIDB, may not be duplicated on other DSL forms or AMLBDSL forms.

If the DSL is resident on a RISLU, this field must not be entered.

For 5E9(1) and later, the combination of SM, IDCU, DPIDB and TIMESLOT must be unique. DSLs cannot be assigned duplicate time slots on the following forms:

- DSL form - D-channel and B-channel time slots
- MISLINK form - D-channel time slots
- RTERM form - EOC and TMC PRI/NPRI
- time slots

For 5E10 and later:

For manually assigned D RELPIDBs and/or PPB1/PPB2 DPIDBs, with DSL OE originating equipment type of "G":

Copyright © 2003 Lucent Technologies

- PIDB must have proper Packet Switching Unit shelf assigned with matched PIDB NO. on the EQIDCU form. The PSU shelf, which is specified by the first digit of the D ISCN and/or PPB1/PPB2 ISCN on the DSL forms, must be defined on the EQIDCU form with a PIDB TYPE of "PSU".
- must have a corresponding PIDB NO. with a PIDB TYPE of "PSU" assigned on the EQIDCU form.

3.16 TS

Description: Enter the B-channel Time Slot.

NOTE: See "Note:" in the D RELPIDB field above.
Valid Entries: 0 - 31

3.17 DS1

Description: Enter the IDCU DS1 which carries the D-channel time slot.

For IDCU (DSL OE "M" or "G"), the IDCU DS1 selection is optional, if not populated by the customer, ODA will select a DS1. If populated by the customer the D RELPIDB, D TIMESLOT, QTR TS and DS1 TS must be populated.
Valid Entries: 1 - 28

Data Rules:

If entered, this DS1 must be assigned as an IFAC row in the RT IFAC TERMINATION list on the RTERM form with SM, UNIT NUMBER and RTEX matching the corresponding values in the DSL OE.

For ISLU (DSL OE is set to "I", the DS1 field must be blank.

3.18 DS1 TS

Description: Enter the IDCU DS1 time slot.

For IDCU (DSL OE "M" or "G"), the IDCU DS1 TS selection is optional. If not populated by the customer, ODA will populated it. If populated by the customer, the D RELPIDB, D TIMESLOT, QTR TS and DS1 must be populated. This DS1 TS should be one of the time slots on the selected DS1. For ISLU (DSL OE is set to "I"), the DS1 TS field must be blank.
Valid Entries: 0 - 23, or blank

Data Rules:

The combination of SM, IDCU, IFAC and TIMESLOT must be unique. The following IDCU remote terminal ports cannot be assigned duplicate IFAC (DS1) time slots:

IFAC TIMESLOTS

Form	Timeslots
DSL	D-channel (DS1 and DS1 TS) and B-channel (PPB1/2 DS1 and DS1 TS) time slots
MISLINK	D-channel time slots (DS1 and DS1 TS)
NAILUP	nailup/hairpin time slots: C PATH DS1 and NC PATH DS1 for the IFACs. C PATH1 DS0
RTERM	Fixed time slots for the primary and secondary TMC and EOC are assigned by ODA on the primary IFAC (the 1st IFAC in the RT TERM/IFAC list) and backup IFAC (EOC/TMC BKUP TERM) for the RT.

The fixed time slots are TS 11 for EOC and TS 23 for TMC. If ZCS (SUP METHOD is "303ZC" on the RTERM form) signaling is used by the IFAC, additional guard channels (TS) are required; they are TS 10 for EOC and TS 0 and 22 for TMC. ISDN applications (DSL and MISLINK form) are not allowed when ZCS

Copyright © 2003 Lucent Technologies

signaling is used.

3.19 NEW TN

This is a Recent Change field added in 5E7.

3.20 BILL TN

Description: Enter a 7 or 10-digit TN to be billed if the TN to be billed is different from the TN on this form.

Enter a valid 7-digit TN if calls are to be billed to a TN within the local office.

Enter a valid 10-digit number if calls are to be billed to a TN outside the local office.

Valid BILL TN Entries

Entry	Definition
NXXXXXX	NXX is a valid office code defined in the OFFICE CODE field on an NOC form.
NPANXXXXXX	Any 10-digit number is acceptable; however, normal expected values are valid NPA and NXX codes.
ZXXXXXX	Z is 0 or 1. This is normally used for OUTWATS billing purposes. The first three digits must be defined in the OFFICE CODE field on an NOC form.

Data Rules:

For 5E12 and later, if the BILL TN(s) on the DSL form have an NXX or NPA/NXX combination without a matching OFFICE CODE and/or NPA/OFFICE CODE combination defined on the NOC form of this office, then this condition is valid only if you allow billing to NXX codes served by other offices or if the first digit of the NXX code is 0 or 1 showing OUTWATS billing.

3.21 RMK

Description: This field may be used for any descriptive comment.
Valid Entries: A maximum of sixteen characters may be entered.

4. FORM ENTRIES - 5907-3, 6 RECORDS

4.1 H PVC LCN

Description: Enter the Highest Logical Channel Number that can be assigned to a Permanent Virtual Circuit.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If the H PVC LCN field is entered, then a corresponding PSPVC form (5923 Record) must be entered with a value entered in the LCN field which is less than or equal to the value entered in this field.

4.2 L IN LCN

Description: Enter the Lowest Incoming Logical Channel Number.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If the H PVC LCN field is entered, and this field is entered, then the value in this field must be one greater

Copyright © 2003 Lucent Technologies

than the value in the H PVC LCN field.

If this field is entered, then the H IN LCN field must be entered in order to indicate the range of incoming LCNs.

If the H PVC LCN field is not entered, and this field is entered, then the value in this field must equal 1.

If MLHG and TERM are entered and CHL SEL equals "N", L IN LCN or L 2W LCN must be entered.

4.3 H IN LCN

Description: Enter the Highest Incoming Logical Channel Number.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If this field is entered, then the L IN LCN field must be entered in order to indicate the range of incoming LCNs.

If the L IN LCN field is entered, then the value in the H IN LCN field must be greater than or equal to the value in the L IN LCN field.

4.4 L 2W LCN

Description: Enter the Lowest Two-Way Logical Channel Number.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If the H IN LCN field is entered, and this field is entered, then the value in this field must be greater than the value in the H IN LCN field. Thus, there may be a gap between the Incoming LCN range and the Two-way LCN range.

If the H IN LCN field is not entered, and the H PVC LCN field is entered and this field is entered, then the this field must have a value greater than the H PVC LCN value.

If this field is entered, then the H 2W LCN field must be entered in order to indicate the range of two-way LCNs.

If MLHG and TERM are entered and CHL SEL equals "N", L IN LCN or L 2W LCN must be entered.

4.5 H 2W LCN

Description: Enter the Highest Two-Way Logical Channel Number.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If this field is entered, then the L 2W LCN field must be entered in order to indicate the range of two-way LCNs.

If the L 2W LCN field is entered, then the value in this field must be greater than or equal to the value in the L 2W LCN field.

Copyright © 2003 Lucent Technologies

4.6 L OUT LCN

Description: Enter the Lowest Outgoing Logical Channel Number.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If this field is entered, then the H OUT LCN field must be entered in order to indicate the range of outgoing LCNs.

If the H 2W LCN field is entered, and this field is entered, then the value entered in this field must be greater than the value entered in the H 2W LCN field. Thus, there may be a gap between the incoming Two-way LCN range and the Outgoing LCN range.

If this field and the H PVC LCN field are entered, and the H IN LCN and the H 2W LCN fields are not entered, then the value entered in this field must be greater than the value entered in the H PVC LCN field.

4.7 H OUT LCN

Description: Enter the Highest Outgoing Logical Channel Number.

Refer to Section 1.3 for background information.
Valid Entries: 1 - 127

Data Rules:

If this field is entered, then the L OUT LCN field must be entered in order to indicate the range of outgoing LCNs.

If the L OUT LCN field is entered, then the value entered in this field must be greater than or equal to the value entered in the L OUT LCN field.

4.8 BUSY LIMIT

Description: Enter the busy limit for this MLHG terminal. The busy limit represents the maximum number of concurrent incoming virtual calls an MLHG member may receive before the member is marked busy for hunting purposes. Calls to non-hunt DNs are included in the incoming call count but are not restricted by the busy limit.

Software Release: 5E8 and later
Valid Entries:
- If CHL SEL is "Y": 1 - 269
- If CHL SEL is "N": 1 - 127

Data Rules:

This parameter is applicable to MLHG members only. If MLHG and TERM are not entered, BUSY LIMIT must not be entered.

If MLHG and TERM are entered, BUSY LIMIT should be set according to the rules that follow. When BUSY LIMIT is not entered, the maximum value for the applicable rule will be assigned.

- If the DSL is on a PH3 and CHL SEL equals "N", BUSY LIMIT must be less than or equal to the sum of IN LCNs plus 2W LCNs.

Copyright © 2003 Lucent Technologies

- If CHL SEL equals "Y", BUSY LIMIT must be less than or equal to the sum of IN LCNs and 2W LCNs of all associated packet services (PPB1, PPB2, DPKT, and ODB) with CHL SEL set to "Y" for this user.

4.9 ICB

Description: Is the ICB feature desired?

The ICB feature prevents the user from receiving incoming virtual calls. The user may still originate outgoing virtual calls.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(1) and earlier, if this field is "Y", then the L IN LCN and H IN LCN fields must not be entered.

4.10 OCB

Description: Is the OCB (Outgoing Calls Barred) feature desired?

The OCB feature prevents the user from originating outgoing virtual calls. The user may still receive incoming virtual calls.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(1) and earlier, if this field is "Y", then the L OUT LCN and H OUT LCN fields must not be entered.

If the ICB field is "N", and the OCB field is "Y", then the L IN LCN and H IN LCN fields must be entered to provide the incoming data transmission.

If the ICB field is "Y", and the OCB field is "N", then the L OUT LCN and H OUT LCN fields must be entered to provide the outgoing data transmission.

4.11 PMDR GRP

Description: Enter the Packet MDR (Message Detail Recording) group name associated with the TN for PPB1 or PPB2.

Software Release: 5E7 and later
Valid Entries: 1 - 8 characters

Data Rules:

When PMDR GRP is entered, PMDR ACT must be entered. When PMDR GRP is not entered, PMDR ACT must not be entered.

If B1 SERV/B2 SERV is not entered or is not "X25", PMDR GRP and PMDR ACT must not be entered.

4.12 PMDR ACT

Copyright © 2003 Lucent Technologies

Description: Is the Packet MDR Group associated with the PPB1 or PPB2 TN activated? This field does not have a default value.

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

When PMDR GRP is entered, PMDR ACT must be entered. When PMDR GRP is not entered, PMDR ACT must not be entered.

If B1 SERV/B2 SERV is not entered or is not "X25", PMDR GRP and PMDR ACT must not be entered.

4.13 SEND TPC

Description: The Send Throughput Class is the bits per second that a virtual call sends data.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200,
- 2400, 4800, 9600, or 19200

4.14 SEND PKTSZ

Description: The Send Packet Size is the maximum number of bytes of data in a packet (excluding control type information) that can be sent.
Default: 128
Valid Entries: 128, 256

Data Rules:

If the FCPN (Flow Control Parameter Negotiation) field is "N", then this field must be 128. Refer to the description of the FCPN field.

4.15 SEND PKTWD

Description: Enter the number of data packets that the CPE device can have unacknowledged, on a sending basis, at any time.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if PPB1/PPB2 SEND PKTWD is not 2, PPB1/PPB2 FCPN must be "Y".

4.16 SEND MCT

Description: Enter the maximum combined throughput in kilobits per second for the sending direction. When the sum of the sending throughput of virtual calls exceeds the SEND MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 64 - 128 (kbps), in increments of 8

4.17 RCV TPC

Description: The Receive Throughput Class is the bits per second that a virtual call receives data.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200,

Copyright © 2003 Lucent Technologies

- 2400, 4800, 9600, or 19200

4.18 RCV PKTSZ

Description: The Receive Packet Size is the maximum number of bytes of data in a packet (excluding control type information) that can be received.
Default: 128
Valid Entries: 128, 256

Data Rules:

If the FCPN is "N", then this field must be 128. Refer to the description of the FCPN field.

4.19 RCV PKTWD

Description: Enter the number of data packets that the CPE device can have unacknowledged, on a receiving basis, at any time.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if PPB1/PPB2 RCV PKTWD is not 2, PPB1/PPB2 FCPN must be "Y".

4.20 RCV MCT

Description: Enter the maximum combined throughput in kilobits per second for the receiving direction. When the sum of the receiving throughput of virtual calls exceeds the RCV MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 64 - 128 (kbps), in increments of 8

4.21 FCPN

Description: Is Flow Control Parameter Negotiation desired?

The transmission of data between a CPE device and a PH is controlled separately for each direction and is controlled by the receiver of the data. This is, in CCITT nomenclature, referred to as flow control. An additional aspect of flow control is the ability of the PH to limit the rate at which it accepts packets, when it recognizes network congestion. FCPN allows the PH and the CPE device to negotiate the Window Size and the Packet Size (128 or 256 bytes) on a per-call basis.

Required Field.
Default: N
Valid Entries: Y, N

4.22 TPCN

Description: Is TPCN (Throughput Class Negotiation) desired?

TPCN allows the sending and receiving entities to negotiate the bits per second to be transmitted in either direction, on a per-call basis. Both the sending and receiving party must subscribe to this service for the negotiation to transpire.

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

4.23 REV CHARGE

Description: Will the called CPE device accept the charge for a call from a Protocol Handler?

Required Field.
Default: N
Valid Entries: Y, N

5. FORM ENTRIES - 5907-4, 7 RECORDS

5.1 LCP

Description: Will Local Charge Prevention be activated? When LCP is "Y", all the X.25 outgoing calls from this user will be Reverse Charged and any X.25 incoming calls that contain Reverse Charge will be cleared.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

LCP is not allowed with Reverse Charge. If LCP is "Y", then REV CHARGE must be "N".

5.2 IECPDNIC

Description: Enter a 4-digit Data Network ID Code for Interexchange Carrier Pre-select.
Valid Entries: 0001 - 9999

Data Rules:

This entry must be defined in the DNIC field on a PSDNICRI form (5921 Record).

5.3 FSA

Description: Is FSA (Fast Select Acceptance) desired?

The Fast Select feature allows a CPE (customer premise equipment) device to receive up to 128 bytes of user data with call setup and clearing packets.

Required Field.
Default: N
Valid Entries: Y, N

5.4 IA

Description: Is IA (Intercom Addressing) desired?

ISDN Intercom Addressing permits the ISDN user to access other users on the 5ESS Switch with a 4-digit or 7-digit number.

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

5.5 PB GRP

Description: Enter the PBG (Packet Business Group). Do not enter a value if this channel is not a member of a PBG.

The Packet Switching Data Business Group Service feature enables the customer to set up and administer intra-switch PBGs by assigning a PBG number to each X.25 termination to distinguish between intra-PBG and other calls on the AMA record.

An MLHG will be assigned to a PBG by associating the PBG with an MLHG on an MLHG form. The DSL form should only be used to assign a PBG if the TN or MLHG member has an associated TN.
Valid Entries: 1 - 100

Data Rules:

If this field is entered, then the TN field must be entered.

5.6 X25VER

Description: Enter the X.25 CCITT version supported for this DTE (Data Terminating Equipment).

Software Release: 5E6 and later
Required Field.
Default: 1984
Valid Entries: 1980, 1984

5.7 CALL TN

Description: For this DTE, will the Calling TN be used as the Billing TN in the AMA record? The Calling TN is received in the Call Request Packet. For more information see Division 2, Section 5B, "Enhancements To X.25 Packet Switching For Trusted DTE".

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

CALL TN must be "N" if B1 SERV/B2 SERV is unknown or if B1 SERV/B2 SERV is not "X25".

5.8 CALL ID

Description: Should the Calling ID be allowed to be received from the DTE as a Lucent Technologies Defined Facility Marker? If "Y" is entered , the Call ID received in the call request packet will be used as the Call ID for the call. If "N" is entered, the 5ESS Switch generates a Call ID for the call.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

CALL ID must be "N" if B1 SERV/B2 SERV is unknown or if B1 SERV/B2 SERV is not "X25".

5.9 DIS SCR

Copyright © 2003 Lucent Technologies

Description: Will the Directory Number Screening Indicator be disabled? The DN Screening Indicator checks the Calling TN received in the Call Request Packet for the correct 11-digit format. With the Trusted DTE feature enabled, it is assumed that the calling DTE has already screened the Calling TN.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

DIS SCR must be "N" if B1 SERV/B2 SERV is unknown or if B1 SERV/B2 SERV is not "X25".

5.10 ICP

Description: Are originating or terminating packet calls denied? Intercept, in the packet-switched world, is a packet message denying service.

Required Field.
Default: N
Valid Entries: Y, N

5.11 HUNT NOTIF

Description: Indicate the Hunting Notification procedure to be used for processing an X.25 CLAMN (Called Line Address Modified Notification) facility and a modified address for this Multi-Line Hunt Group member.

The X.25 CLAMN feature allows the terminating CPE or switch to return the X.25 CLAMN facility, along with a modified Called Address field containing the non-hunt DN for the end-point, to the calling party. When a call is offered to a packet-mode hunt terminal as part of hunting, CLAMN signaling is returned to the calling party to indicate that a hunt was performed.

If HUNT NOTIF is blank, the CLAMN feature is not applicable.

Software Release: 5E8 and later
Valid Entries:

Valid HUNT NOTIF Entries

Entry	Definition
YES	The switch initiates CLAMN procedures when the terminating DTE does not. If neither the CLAMN nor the modified address is present, the switch will insert the CLAMN and non-hunt telephone number into the X.25 call request packet and allow the X.25 call to proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
NO	The switch does not initiate CLAMN procedures. If neither the CLAMN facility nor the modified address is present, or if both are present, the X.25 call will proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
OLD	The X.25 CLAMN procedure that existed prior to the 5E8 Software Release is used.

Data Rules:

This parameter is applicable to MLHG members only. If MLHG and TERM are not entered, HUNT NOTIF must not be entered.

If MLHG and TERM are entered, HUNT NOTIF must be entered.

If HUNT NOTIF is "YES", TN must be entered.

5.12 SUST

Copyright © 2003 Lucent Technologies

Description: Is packet termination denied?

Required Field.
Default: N
Valid Entries: Y, N

5.13 CUGPX

Description: Enter the Preferential Customer CUG Index.

Refer to Closed User Groups description in Section 1 of this form for background information.
Valid Entries: 0 - 99

Data Rules:

If a CUGPX is entered, then it must be defined in the CUG IDX field on a PSCUG form (5924 Record).

If a TN and CUGPX are entered, then a PSCUG form must exist such that the PKT TN and CUG IDX fields equal, respectively, the TN and CUGPX on this form.

If an MLHG, TERM, and CUGPX are entered, then a PSCUG form must exist such that the PKT MLHG, PKT TERM, and CUG IDX fields equal, respectively, the MLHG, TERM, and CUGPX on this form.

5.14 CUGOA

Description: Is CUGOA (Closed User Group Outgoing Access) desired?

The CUGOA indicator permits CUG members to access CPE devices that do not belong to a CUG (e.g., public network), or CPE devices that belong to a CUG with Incoming Access.

Refer to Closed User Groups description in Section 1 of this form for background information.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CUGOA is "Y", the corresponding PSCUG form (5924A Record) must be defined with the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services, respectively.

5.15 CUGIA

Description: Is CUGIA (Closed User Group Incoming Access) desired?

The CUGIA indicator permits CUG members to access CPE devices that do not belong to a CUG (e.g., public network), or CPE devices that belong to a CUG with Outgoing Access.

Refer to Closed User Groups description in Section 1 of this form for background information.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CUGIA is "Y", the corresponding PSCUG form (5924A Record) must be defined with the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services, respectively.

Figure 2 SAMPLE DSL FORM 5E12 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

SEC. 1I: 5908-1/2/3/4/5/6/7/8/9/10/11/12/13 RECORD DIGITAL SUBSCRIBER LINE USER - DSLUSR

1. GENERAL

The 5908 Digital Subscriber Line User Records are available with 5E5 and later Software Releases. Refer to the Multipoint Digital Subscriber Line Feature Description (Division 2, Section 1AA) before entering these records. Note: A DSL (Digital Subscriber Line) can also be referred to as a BRI (Basic Rate Interface).

5908 Records need not be entered when a DSL is used solely for B-channel Permanent Packet services or when a DSL is provisioned for users that will be added later.

1.1 Major Purposes of DSLUSR

The 5908 Records are used for four major purposes:

1. DSLUSR defines the associated TN(s) and status of a DSL user. The OE field on this form is the field that associates a user with a particular DSL. This DSL is defined on a DSL form (5907-1 Record) in the DSL OE field. These two fields are the only link between a DSL form and a DSLUSR form.
2. DSLUSR defines the circuit switching (voice and data) attributes of a DSL user.
3. DSLUSR defines the D-channel packet switching attributes of a DSL user.
4. DSLUSR defines the On Demand B-channel packet switching attributes of a DSL user.

1.2 Optional Keys

The DSLUSR form has nine optional keys that are grouped into six "functions" (explained below). The optional keys are:

1. CKT TN (Circuit Telephone Number)
2. DPKT TN (D-channel Packet Telephone Number)
3. ODB TN (On Demand B-channel Telephone Number)
4. CKT MLHG (Circuit Multi-Line Hunt Group Number)
5. CKT TERM (Circuit Multi-Line Hunt Group Terminal Number)
6. DPKT MLHG (D-channel Packet Multi-Line Hunt Group Number)
7. DPKT TERM (D-channel Packet Multi-Line Hunt Group Terminal Number)
8. ODB MLHG (On Demand B-channel Multi-Line Hunt Group Number). This key is available for 5E8 and later Software Releases.
9. ODB TERM (On Demand B-channel Multi-Line Hunt Group Terminal Number). This key is available for 5E8 and later Software Releases.

The combination of CKT MLHG/CKT TERM is considered one function. DPKT MLHG/DPKT TERM is considered one function. ODB MLHG/ODB TERM is considered one function. CKT TN, DPKT TN, and ODB TN are each considered separate functions.

At least one function must be entered for each DSL user (i.e., a CKT TN entry, a DPKT TN entry, an ODB

Copyright © 2003 Lucent Technologies

TN entry, a CKT MLHG and a CKT TERM entry, a DPKT MLHG and a DPKT TERM entry, or an ODB MLHG and an ODB TERM entry).

Any combination of keys or functions that does not violate the following conditions is valid:

- An entry cannot be made in both the CKT TN field and the CKT MLHG and CKT TERM fields.
- An entry cannot be made in both the DPKT TN field and the DPKT MLHG and DPKT TERM fields.
- An entry cannot be made in both the ODB TN field and the ODB MLHG and ODB TERM fields.

For a given DSL, the number of DSLUSR forms with either a DPKT TN entry or a combined DPKT MLHG/DPKT TERM entry must not exceed the value entered in the MDPKT field on the DSL form. The MDPKT field indicates how many users are allowed D-channel X.25 Packet Switching service on a DSL.

1.3 Maximum Users

The (R)ISLU's ((Remote)Integrated Services Line Unit) LCEN (Line Card Equipment Number) or IDCU's (Integrated Digital Carrier Unit) ILEN (Line Equipment Number) entered in the OE field of this form directly affects the quantity of users permitted on a DSL. If the LCEN is defined on an ISLULC form with the TYPE field set to "PULC" or "ULC" (U-card), a maximum of eight active users may use the DSL. The IDCU is also restricted to a maximum of eight users to a DSL.

1.4 Modem Pool Restrictions

If a DSL form has an entry of "XMP" in the D SERV field, indicating that the DSL will be used for the Terminal Adaptor component in a Modem Pool group, then the following must be true.

- There must a DSLUSR form associated with the DSL (the OE on this form must match the DSL OE on a DSL form).
- The Pool is a Hunt Group (the only key fields defined on this form are DPKT MLHG / DPKT TERM).
- The H PVC LCN, L IN LCN, H IN LCN, L OUT LCN and H OUT LCN fields (under the D-CHANNEL PACKET SWITCHING header) must not be entered.
- The DPKT L 2W LCN and DPKT H 2W LCN fields must equal 1; this item, in conjunction with the previous item, limits the DSL to the use of a single Two-way SVC (Switched Virtual Circuit).
- The DPKT CUGPX field must be entered since access to Modem Pools, either Public or Private, must be carefully restricted; a Preferential CUG (Closed User Group) provides a secure sub-network.
- DPKT HUNT NOTIF must be blank, DPKT HUNT DEACT must be "N", DPKT NOTIF must not equal "COND", and DPKT CHL SEL must equal "N".
- For 5E9(1) and later, DPKT MLHG TN must be blank.

1.5 Shared TNs

Shared TNs are TNs that can be assigned to multiple ISDN terminals. If a TN from the SHARED LIST on an SHTN form (5902 Record) appears in the CKT TN field of this form, then the TERM TYPE and OE fields on this form must be entered.

1.6 Duplicate Values

Duplicate values are not allowed among the DPKT MLHG field on a DSLUSR form, the ODB MLHG field

Copyright © 2003 Lucent Technologies

on a DSLUSR form, the CKT MLHG field on a DSLUSR form, the PPB1 MLHG field on a DSL form, the PPB2 MLHG field on a DSL form, and the MLHG field on an MLHLN form (5111 Record), with the following exceptions:

- A CKT MLHG on a DSLUSR form may duplicate an MLHG on an MLHLN form, CKT TERM on the DSLUSR form and TERM on the MLHLN form are different values;
- A DPKT MLHG on a DSLUSR form may duplicate an MLHG on an MLHLN form, if DPKT TERM on a DSLUSR form and TERM on an MLHLN form are the same, as used for Modem Pooling;
- For 5E8 and later, PPB1 MLHG and PPB2 MLHG on the DSL form and DPKT MLHG (Non-Modem Pooling) and ODB MLHG on the DSLUSR form and PKT MLHG on the XAT form may be the same. The corresponding TERM entries must be different if their CHL SEL fields are "N". If the corresponding CHL SEL fields are "Y", the TERM entries must be the same. (CHL SEL is not valid with XAT.)

1.7 Closed User Groups

A CUG (Closed User Group) is a sub-network of CPE devices that can communicate with each other. A CPE device can belong to multiple CUGs. The primary purpose of a CUG is to provide security to its members, since a CUG member cannot communicate with a CPE device which is not in the same CUG. A CPE device that belongs to multiple CUGs can indicate the CUG of choice, in the call request packet or the incoming call packet, for transmitting and receiving packets, respectively. If a CUG is not specified, the Preferential CUG will be selected. Refer to the description of the CUGPX field (4.32).

A CUG with Outgoing Access allows its member CPE devices to originate virtual calls to CPE devices that do not belong to any CUG (e.g., public network) or to CPE devices that belong to a CUG with Incoming Access.

A CUG with Incoming Access allows any CUG or from CPE devices that belong to a CUG with Outgoing Access.

The CUGPX, CUGOA, and CUGIA fields in this form implement CUG access features.

1.8 CCITT Terminology

This section briefly describes the CCITT (International Telegraph and Telephone Consultative Committee) recommendation for the X.25 protocol. DTE (Data Terminal Equipment), in CCITT parlance, is equivalent to the CPE (Customer Premises Equipment) attached to the DSL. DCE (Data Circuit Equipment) is equivalent to a PH (Protocol Handler) on a PSU (Packet Switching Unit) within the 5ESS Switch.

Level 2 of the X.25 protocol is used to describe the linkage between a CPE device and the PH on the 5ESS Switch.

Level 3 of the X.25 protocol is used to describe the linkage between two CPE devices.

1.9 Figure 1 References

The conditions that affect the LCC and RAX combinations entered on this form are contained in Figure 1.

Figure 1 also lists the CLASS OF SERVICE required on an LCC form (5306 Record) for BRCS features assigned to optional key fields on this DSLUSR form and the CLASS OF SERVICE required for assignments other than BRCS features.

1.10 Duplication of Call Appearance Assignments

CA (Call Appearance) button assignments previous to 5E9(1) could be made with the DSLUSR (using the

Copyright © 2003 Lucent Technologies

CA and CA QTY fields) and SHTN forms (using the CA and NUM fields).

For 5E9(1) and later, several CA fields defining DNAs (Directory Number Appearances) which formerly had been manually programmed at the terminal were added to the DSLUSR, SHTN, and CAICOM forms. Button assignments now can be made with the AU DNA and AU DNA QTY, DNA and DNA QTY for DPKT, K56 DNA and K56 DNA QTY, K64 DNA and K64 DNA QTY, DNA and DNA QTY for ODB, SP DNA and SP DNA QTY fields on DSLUSR, the SP DNA and AU DNA fields on the SHTN form, as well as the CA and CA QTY fields on the CAICOM form (5984 Record).

Each CA must be unique. See Division 2, Section 1AM for more information on how to determine if call appearances are duplicated.

Duplicate button assignments are not allowed when:

- CKT TN on DSLUSR equals SHARED LIST TN on SHTN; or
- CKT MLHG and TERM on DSLUSR equals MLHG and TERM NBR (both SHARED LIST) on SHTN.

For 5E9(1) and later, duplicate button assignments are not allowed when:

- at least two of the fields CKT TN on DSLUSR, SHARED LIST TN on SHTN, or TN on CAICOM are equal;
- CKT MLHG and TERM on DSLUSR equals MLHG and TERM NBR (both SHARED LIST) on SHTN; or
- CKT MLHG TN on DSLUSR equals TN on CAICOM.

1.11 Recent Change View

The corresponding Recent Change View for this form is 23.2.

2. FORM ENTRIES, 5908-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 (*) CKT TN

Description: The Circuit Telephone Number of the DSL (if it has one).
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits must be defined in the OFFICE CODE field on a NOC form (5501 Record).

This field or the MLHG TN field must have an entry if the BUSY MONITOR field is "Y". BUSY MONITOR indicates that this terminal can be monitored via the Busy Lamps of an ISDN Attendant MLHG.

This field must not be entered if the B1 SERV and B2 SERV fields on the DSL form for this DSL are set to "X25". This combination indicates that both B-channels are Permanent Packet, solely used for X.25

Copyright © 2003 Lucent Technologies

Packet Switched Data. Thus, there can be no circuit-switched (Voice or Data) services on either B-channel.

If CKT TN has an associated CLASS OF SERVICE that is not "ISDN", all MWFD forms assigned on the LINEFA, BFG or an associated CLUSTR form must have FEATURE BUTTON, DIAL CODE OR BUTTON, and ISDN CALL PICKUP set to "N".

For 5E8 and later, the entry in the CKT TN field must be unique within the 5ESS Switch, with the exception that it may match only one of the following:

- The DPKT TN or DPKT MLHG TN entry on the same DSLUSR form, where DPKT CHL SEL is "N".
- The ODB TN or ODB MLHG TN entry on the same DSLUSR form, where ODB CHL SEL is "N".
- The PPB1 TN on the DSL form, for this DSL, where PPB1 CHL SEL is "N", if the PPB1 USR entry on this DSLUSR form is "Y".
- The PPB2 TN on the DSL form, for this DSL, where PPB2 CHL SEL is "N", if the PPB2 USR entry on this DSLUSR form is "Y".

For 5E8 and later, if no matches are made above, the entry in the CKT TN field must be unique within the 5ESS Switch, with the exception that it may match only one, two, or three of the following:

- The DPKT TN or DPKT MLHG TN entry on the same DSLUSR form, where DPKT CHL SEL is "Y".
- The ODB TN or ODB MLHG TN entry on the same DSLUSR form, where ODB CHL SEL is "Y".
- The PPB1 TN on the DSL form, for this DSL, where PPB1 CHL SEL is "Y", if the PPB1 USR entry on this DSLUSR form is "Y".
- The PPB2 TN on the DSL form, for this DSL, where PPB2 CHL SEL is "Y", if the PPB2 USR entry on this DSLUSR form is "Y".

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN or member TN. Multiple TNs are defined in the TN field on a MULTITN form (5114 Record). The TN entered in this field on the DSLUSR form may not duplicate a TN entered in the TN field on a MULTITN form.

The CKT TN must not have an ACSR (Automatic Customer Station Rearrangement) feature assigned to it if the PPB1 USR and/or PPB2 USR fields on this form are "Y". The ACSR feature does not support Permanent Packet B-channels.

If this field and the CKT MLHG and CKT TERM fields are not entered, then circuit switching services are not required. Therefore, under the CKT SWITCHING header, the SUST (deny termination) field will be assigned a value of "Y" and all the other fields must either not be entered or they must be left with their default values.

If this field or the combination of the CKT MLHG and CKT TERM fields are entered, then under the CKT SWITCHING header, the LCC, RAX, CSV CHL and CSD CHL fields must be entered. The LCC and RAX combination must be defined on a LCC form with a CLASS OF SERVICE of "ISDN" and a TERMINATING TREATMENT of "INDIV".

If the CKT TN has been assigned a Precedence and Preemption feature on a LINEFA form (5112 Record), a BFG form (5625 Record) or an associated CLUSTR form (5600 Record), then the Switching Module (first three digits of the OE field) must be defined on an EQIM form (5700 Record) with an entry in the CONFIGURATION field other than "BASIC". The "BASIC" SM configuration is available in 5E5 and later Software Releases. Refer to Division 8, Section 2 of this guide for a complete explanation of SM configurations. Note that SMs used for ISDN have a configuration of "LOADED".

Copyright © 2003 Lucent Technologies

For 5E8 and later, if the CKT TN has been assigned a Call Pickup Terminating feature on a LINEFA form (5112 Record), a BFG form (5625 Record), or an associated CLUSTR form (5600 Record), and if the feature was defined on the PUTFD form (5605-2a/b Record) with FEATURE FUNCTION set to "HDIRPUBRG", then:

- if the DSL CLS is "STD" on the corresponding DSL form, and on this DSLUSR form EKTS is blank, then CSV LIMIT must be 1;
- for all other cases, CA QTY must be 1 or not entered.

If the CKT TN is entered, neither CSV LIMIT nor EKTS is entered, and DSL CLS is "STD" on the corresponding DSL form, then this CKT TN cannot be assigned a Call Pickup Terminating feature (defined on the PUTFD form) on the LINEFA form or on an associated BFG or CLUSTR form.

For 5E10 and later:
If CKT TN is entered and has either the DFLT TN USER field set to "Y" or the DPKT FIXED TEI field entered, then the corresponding LINEFA form (DSLUSR form CKT TN matches LINEFA form TN) cannot have BRCS features assigned on the LINEFA, BFG, or CLUSTR forms which are not allowed with NIT (Non-Initializing Terminal) features. NIT BRCS features, defined on the following forms:

- ASPFD form with CONTROL set to "NESS"
- EDSFD form
- MSFD form

are not allowed. They require the use of Initializing Terminals.

For 5E12 and later, if the first 3 digits of the 7-digit CKT TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, CKT TN must be 10 digits.

For 5E12 and later, when the TN(s) on the DSLUSR form have an NXX and/or NPA/NXX combination entered, the OFFICE CODE and/or NPA/OFFICE CODE combination must be defined on a NOC form.

For 5E12 and later, if the CKT TN(s) or CKT MLHG/CKT TERM(s) are assigned to an EPO POS NUM, the CKT LC/CKT RAX values on the DSLUSR form:

- Must have a CLASS OF SERVICE of "ISDN" on the associated LCC form.

or

- May have a CLASS OF SERVICE of "ISATND" with a TERM TYPE of "TYPED" on the DSLUSR form.

For 5E16 and later, when the CKT TN has been assigned a Direct Call Transfer to Voice Mail feature on a LINEFA form (5112 Record), a BFG form (5625 Record) or an associated CLUSTR form (5600 Record), then the CKT TN must also be defined on the DSLUSR form with a LCC/RAX value that corresponds to the "ISDN" CLASS OF SERVICE on the LCC form.

2.3 (*) DPKT TN

Description: The D-channel Packet Telephone Number of the DSL (if it has one).
Valid Entries:

- For 5E11 and earlier: NXXXXXX,
- where N is 2 - 9 and X is 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and

Copyright © 2003 Lucent Technologies

- X is 0 - 9

Data Rules:

The first three digits must be defined in the OFFICE CODE field on a NOC form.

If this field is entered, then the DPKT MLHG and DPKT TERM fields must not be entered.

If this field and the DPKT MLHG and DPKT TERM fields are not entered, then D-channel services are not required. Therefore, under the DPKT (D-CHANNEL PACKET SWITCHING) header, the SUST field (deny termination) will be assigned a value of "Y" and the other fields must either not be entered or they must be left with their default values.

If this field is entered, then the following conditions apply to fields under the DPKT (D-CHANNEL PACKET SWITCHING) header:

- The LCC and RAX fields must be entered;
- The H PVC LCN field or the combination of the L IN LCN and H IN LCN fields or the combination of the L 2W LCN and H 2W LCN fields or the combination of the L OUT LCN and H OUT LCN fields must have an entry and if they are entered, their value must be from 1 to 15. LCN (Logical Channel Number) assignment for a D-channel is explained immediately preceding the LCN fields under the DPKT (D-CHANNEL PACKET SWITCHING) header.

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN or member TN. Multiple TNs are defined in the TN field on a MULTITN form. The TN entered in this field on the DSLUSR form may not duplicate a TN entered in the TN field on a MULTITN form.

For 5E8 and later, If DPKT TN is entered and OE is entered, DPKT NOTIF must be entered.

For 5E8 and later, when DPKT CHL SEL is "N", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form.
- It can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.

For 5E8 and later, when DPKT CHL SEL is "Y", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form.
- It can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.
- It must equal ODB TN if the corresponding ODB CHL SEL is set to "Y" on the same instance of the DSLUSR form.
- It must equal PPB1 TN (on the DSL form) if the corresponding PPB1 CHL SEL is set to "Y" and PPB1 USR on the DSLUSR form equals "Y".
- It must equal PPB2 TN (on the DSL form) if the corresponding PPB2 CHL SEL is set to "Y" and PPB2 USR on the DSLUSR form equals "Y".

Copyright © 2003 Lucent Technologies

For 5E12 and later, when the DSLUSR forms have DFLT TN USER set to "N" and either DPKT CHL SEL or ODB CHL SEL set to "N", DPKT TN, ODB TN, DPKT MLHG TN, ODB MLHG TN, DPKT LNR HNT TN, and ODB LNR HNT TN must be unique.

For 5E12 and later, when the DSLUSR forms have DFLT TN USER set to "Y" and both DPKT TN and ODB TN are entered, DPKT TN must equal ODB TN.

For 5E12 and later, when the DSLUSR forms have DPKT CHL SEL and ODB CHL SEL set to "Y", and DPKT TN and/or ODB TN are entered, DPKT TN and ODB TN must both be entered and DPKT TN must equal ODB TN.

For 5E12 and later, if the first 3 digits of the 7-digit DPKT TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, DPKT TN must be 10 digits.

For 5E12 and later, when the DPKT and/or ODB LNR HNT TNs on the DSLUSR form have an NXX and/or NPA/NXX combination assigned, the NXX and/or NPA/NXX combination must be defined on the NOC form.

2.4 (*) ODB TN

Description: The On Demand B-channel Telephone Number of the DSL (if it has one).
Valid Entries:

- For 5E11 and earlier: NXXXXXX,
- where N is 2 - 9 and X is 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits must be defined in the OFFICE CODE field on a NOC form.

This telephone number must be unique within the 5ESS Switch with the following two exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form;
- it can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN or member TN. Multiple TNs are defined on in the TN field on a MULTITN form. The TN entered in this field on the DSLUSR form may not duplicate a TN entered in the TN field on a MULTITN form.

This field must not be entered if the PPB1 USR and PPB2 USR fields are "Y". This would indicate that both B-channels are dedicated to Permanent Packet, thus precluding the use of either B-channel in an On Demand mode. Another indication of the same case would be the B1 SERV and B2 SERV fields on the DSL form, for this DSL, both "X25".

If the MAXB CHL field is not entered, then this field must not be entered. The MAXB CHL indicates the number of B-channels to be used in a Demand basis; if none are to be used, there is no ODB (On Demand B-channel) service available.

If this field is not entered, then X.25 Packet Switching on the B-channel (On Demand) is not desired. Therefore, under the ODB (ON DEMAND B-CHANNEL) header, the SUST (deny termination) field will be assigned a value of "Y" and the other fields must either not be entered or they must be left with their

Copyright © 2003 Lucent Technologies

default values.

If this field is entered, then the combination of the L IN LCN and H IN LCN fields or the combination of the L 2W LCN and H 2W LCN fields or the combination of the L OUT LCN and H OUT LCN fields must have entries. LCN (Logical Channel Number) assignment for an On Demand B-channel is explained immediately preceding the LCN fields in the ODB (ON DEMAND B-CHANNEL) portion of this TG-5 section.

If the field is entered, the LCC and RAX fields, under the ON DEMAND B-CHANNEL heading, must have entries which are defined on a LCC form where the corresponding CLASS OF SERVICE field is "ISDN" and the TERMINATING TREATMENT field is "INDIV".

If this field is entered, then the DSL form, for this DSL, must have the D SERV field "SX" and the B1 SERV and/or B2 SERV fields "DMD". The B1/B2 SERV field value of "DMD" indicates that the B-channel is to be used on a Demand basis.

For 5E7 and later, if this field is entered, ODB LCC and RAX must be entered. If this field and the OE field are entered, then the following fields under the ODB (ON DEMAND B-CHANNEL) header must also be entered:

- BAND
- ISCN1 (5E8 and later)
- N2,
- NOTIF (5E8 and later)
- ODB (5E8 and later)
- RATE
- T1,
- T3,
- WNDSZ

For 5E8 and later, when ODB CHL SEL is "N", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form.
- It can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.

For 5E8 and later, when ODB CHL SEL is "Y", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form.
- It can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.
- It must equal DPKT TN if the corresponding DPKT CHL SEL is set to "Y".
- It must equal PPB1 TN (on the DSL form) if the corresponding PPB1 CHL SEL is set to "Y" and PPB1 USR on the DSLUSR form equals "Y".
- It must equal PPB2 TN (on the DSL form) if the corresponding PPB2 CHL SEL is set to "Y" and PPB2 USR on the DSLUSR form equals "Y".

For 5E12 and later, if the first 3 digits of the 7-digit ODB TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE

Copyright © 2003 Lucent Technologies

CODE, ODB TN must be 10 digits.

For 5E11 and later, when ACT on FOSYS form (5713-2 Record) where FID is 695 is set to "Y" (i.e., the AILA (Automatic ISDN Line Assignment) feature active) and ODB TN is entered or ODB MLHG and ODB TERM are entered, and ODB CHL SEL is "Y" on the corresponding DSLUSR form, the ODB ISCN fields on the DSLUSR form must be entered. For more information on this feature, see Division 2, Section 1BO.

2.5 (*) CKT MLHG

Description: The Multi-Line Hunt Group number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

This field must be defined in the MLHG field on the MLHG form (5110-1 Record).

If the CKT TERM is entered, then this field must be entered.

The entry in the CKT MLHG field must not be the same as the entry in the DPKT MLHG field.

This field must not be entered if the PPB1 USR and PPB2 USR fields are "Y". That would indicate that both B-channels are used for Permanent Packet and therefore circuit-switched services would not be available.

This field must be entered if the RMB (Remote Make Busy) field or the STH (Stop Hunt) field or the MMB SUBGROUP (Make Busy Subgroup) fields are entered, since these fields are only applicable to circuit-switched service for hunt groups and require a TN for identification.

If the LOCAL SM field on the defining MLHG form is entered, then the SM portion (first three digits) of the OE on this form must equal the value in the LOCAL SM field.

If this field and the CKT TERM and CKT TN fields are not entered, then circuit-switched services are not desired. Therefore, under the CKT SWITCHING header, the SUST field (deny termination) will be assigned a value of "Y" and all the other fields either must not be entered or they must be left with their default values.

If this field is entered, then under the CKT SWITCHING header, the LCC and RAX fields must be entered.

If this field is entered and the LCC and RAX (under the CKT SWITCHING header) are defined on a LCC form with a CLASS OF SERVICE "ISATND", then the CKT MLHG must be defined in the MLHG field of an MLHG form such that the MLHG FEATURE is defined on an MLHGFD form (5604 Record) with a HUNT TYPE of "ISAT". This is used for ISDN Attendants.

If both this field and the ATT MLHG field are entered, then the CKT MLHG must be defined in the MLHG field of an MLHG form such that the MLHG FEATURE is defined on an MLHGFD form (5604 Record) with a HUNT TYPE that is neither "ISAT" nor "MUPH".

For 5E8 and later, if the CKT MLHG/TERM has been assigned a Call Pickup Terminating feature on an MLHLNFA form (5113 Record), a BFG form (5625 Record), or an associated CLUSTR form (5600 Record), and if the feature was defined on the PUTFD form (5605-2a/b Record) with FEATURE FUNCTION set to "HDIRPUBRG", then:

- if the DSL CLS is "STD" on the corresponding DSL form, and on this DSLUSR form EKTS is blank, then CSV LIMIT must be 1;

- for all other cases, CA QTY must be 1 or not entered.

Copyright © 2003 Lucent Technologies

If the CKT MLHG/TERM is entered, neither CSV LIMIT nor EKTS is entered, and DSL CLS is "STD" on the corresponding DSL form, then this CKT MLHG/TERM cannot be assigned a Call Pickup Terminating feature (defined on the PUTFD form) on the MLHLNFA form or on an associated BFG or CLUSTR form.

For 5E9(1) and later, if CKT MLHG is entered, ACD POS NUM cannot be entered.

For 5E11 and later, if CKT MLHG is entered, NI SAR LIST entries are not permitted.

2.6 (*) CKT TERM

Description: The MLHG terminal number.
Valid Entries: 1 - 2015 or 3001 - 3999 (for outdial terminals only)

Data Rules:

Outdial terminals must not belong to an MLHG (defined on an MLHG form) whose MLHG FEATURE is defined on an MLHGFD form with a HUNT TYPE of "MUPH".

If the CKT MLHG is entered, then this field must be entered.

This field must not be entered if the PPB1 USR and PPB2 USR fields are "Y". This combination would indicate that both B-channels are Permanent Packet, solely used for X.25 Packet Switched Data. Thus, there cannot be any circuit-switched (Voice or Data) services on either B-channel.

For 5E9(1) and earlier, ISAT (ISDN Attendant) MLHGs are limited to 40 terminals; CKT TERM in an ISAT MLHG may not exceed 40. For 5E9(2) and later, ISAT groups may have a maximum of 63 terminals; CKT TERM may not exceed 63. ISAT MLHGs are identified by a HUNT TYPE of "ISAT" on the associated MLHGFD form.

If the CKT MLHG and CKT TERM combination have been assigned a Precedence and Preemption feature on an MLHLNFA form (5113 Record), a BFG form or an associated CLUSTR form, then the Switching Module (first three digits of the OE field) must be defined on an EQIM form (5700 Record) with an entry in the CONFIGURATION field other than "BASIC".

2.7 (*) DPKT MLHG

Description: The Multiline Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

If the DPKT TERM field is entered, then this field must be entered.

The entry in the DPKT MLHG field must not be the same as the entry in the CKT MLHG field.

If the MLHG TN field, under the DPKT (D-CHANNEL PACKET SWITCHING) header, is entered, then this field must be entered.

If this field is entered, then under the DPKT (D-CHANNEL PACKET SWITCHING) header, the LCC and RAX fields must be entered.

If this field is entered, then DPKT L IN LCN or DPKT L 2W LCN must be entered.

If this field and the DPKT TERM and DPKT TN fields are not entered, then D-channel Packet Switching

Copyright © 2003 Lucent Technologies

services are not desired. Therefore, under the DPKT (D-CHANNEL PACKET SWITCHING) header, the SUST field (deny termination) is assigned a value of "Y" and the other fields either must not be entered or must contain default values.

The DPKT MLHG and DPKT TERM fields must not be duplicated in the DSL NAME ID and (5411 Record) when the SERVICE CLASS entry on the OSPSDSL form is "XDB".

If the LOCAL SM field on the defining MLHG form is entered, then the SM portion (first three digits) of the OE on this form must equal the value in the LOCAL SM field.

If the DPKT MLHG and DPKT TERM fields are entered, then the MLHG TN field must be entered or the LISTED TN field on the associated MLHG form must be entered.

If the DPKT MLHG/TERM(s) are entered and the DPKT MLHG TN is not entered, and D SERV is not equal to "XMP" on a corresponding DSL form; then the Line Class Code and Rate Center combination (DPKT LCC/DPKT RAX) must be defined on the LCC form with a corresponding CLASS OF SERVICE of "ISDN". (The DSL form is found by matching OE from the DSLUSR form to DSL OE on a DSL form.)

For 5E8 and later, when DPKT CHL SEL or ODB CHL SEL is "N", DPKT MLHG/TERM must not equal ODB MLHG/TERM. If DPKT MLHG/TERM are not entered, the following must not be entered:

- DPKT HUNT NOTIF
- DPKT BUSY LIMIT
- DPKT LNR HNT TN

and DPKT HUNT DEACT must be "N".

2.8 (*) DPKT TERM

Description: The MLHG terminal number.
Valid Entries: 1 - 2015

Data Rules:

If the DPKT MLHG field is entered, then this field must be entered.

If the DPKT MLHG and DPKT TERM fields are entered and the corresponding OE is defined on a DSL form with the D SERV field a value other than "XMP", then the value entered in the DPKT MLHG field must be defined on a MLHG form with an MLHG FEATURE that is defined on a MLHGFD form with HUNT TYPE "PSUCD".

If the DPKT MLHG and DPKT TERM fields are entered and the associated OE is with the D SERV field set to "XMP" (indicating a Modem Pool terminal adaptor), then:

- The combination of the DPKT MLHG and DPKT TERM fields must appear, respectively, in the PKT MLHG and PKT TERM fields of a PSCUG form (5924 Record).

- The DNIC (Data Network ID Code) and ICN (International CUG Number) fields, on PSCUG forms, must be the same combination for every DPKT TERM within a DPKT MLHG.

- An MLHLN form (5111 Record) must exist such that the combination of the MLHG and TERM fields match, respectively, the DPKT MLHG and DPKT TERM fields on this DSLUSR form. A Modem Pool member has an analog and a digital component, defined on an MLHLN form and a DSLUSR form, respectively.

- The MLHG form, where the MLHG entry matches the DPKT MLHG entry on this DSLUSR form, must have an entry in the corresponding MPTYPE field. The MPTYPE field is used exclusively by Modem Pool Hunt Groups.

Copyright © 2003 Lucent Technologies

- The corresponding DPKT MLHG must be defined on an MLHG form whose corresponding MLHG FEATURE is defined on an MLHGFD form with a HUNT TYPE of "UCD".

2.9 (*) ODB MLHG

Description: On Demand B-channel Multi-Line Hunt Group.

Software Release: 5E8 and later
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

If ODB MLHG is entered, OE and ODB TERM must be entered; ODB TN must not be entered.

When DPKT CHL SEL or ODB CHL SEL is "N", DPKT MLHG/TERM must not be the same as ODB MLHG/TERM.

The entry in the ODB MLHG field must not be the same as the entry in the CKT MLHG field.

If this field is entered, then ODB L IN LCN or ODB L 2W LCN must be entered.

If this field and ODB TERM and ODB TN are not entered, On Demand B-channel services are not desired. Therefore, under the ODB header, the fields either must not be entered or must contain default values.

If this field is entered, the following fields under the ODB (On Demand B-channel) header, must be entered: ISCN1, ODB, LCC, RAX, RATE, N2, T1, T3, WNDSZ, and BAND.

This field must not be entered if the PPB1 USR and PPB2 USR fields are "Y".

If the MAXB CHL field is not entered, this field must not be entered. The MAXB CHL indicates the number of B-channels to be used on a demand basis. If none are to be used, there is no ODB service available.

If ODB MLHG and TERM are not entered, ODB HUNT NOTIF, ODB BUSY LIMIT, and ODB LNR HNT TN must not be entered; ODB HUNT DEACT must be "N".

If the LOCAL SM field on the defining MLHG form is entered, the SM portion (first three digits) of the OE on this form must equal the value in the LOCAL SM field.

If ODB MLHG is entered, the MLHG must be defined on an MLHG form with an MLHG FEATURE that is defined on an MLHGFD form with HUNT TYPE set to "PSUCD".

For 5E8 and later, if the ODB MLHG/TERM(s) are entered and ODB MLHG TN is not entered; then the Line Class Code and Rate Center combination (ODB LCC/ODB RAX) must be defined on the LCC form with a corresponding CLASS OF SERVICE of "ISDN".

For 5E11 and later, when ACT on FOSYS form (5713-2 Record) where FID is 695 is set to "Y" (i.e., the AILA (Automatic ISDN Line Assignment) feature active) and ODB TN is entered or ODB MLHG and ODB TERM are entered, and ODB CHL SEL is "Y" on the corresponding DSLUSR form, the ODB ISCN fields on the DSLUSR form must be entered. For more information on this feature, see Division 2, Section 1BO.

For 5E12 and later, when the ODB MLHG TNs on the DSLUSR form have an NXX and/or NPA/NXX combination assigned, the NXX or NPA/NXX must be defined as an OFFICE CODE and/or NPA/OFFICE CODE on a NOC form.

2.10 (*) ODB TERM

Copyright © 2003 Lucent Technologies

Description: On Demand B-channel Multi-Line Hunt Group member.

Software Release: 5E8 and later
Valid Entries: 1 - 2015

Data Rules:

If ODB TERM is entered, ODB MLHG must be entered.

For 5E8 and later, if the ODB MLHG/TERM(s) are entered and ODB MLHG TN is not entered; then the Line Class Code and Rate Center combination (ODB LCC/ODB RAX) must be defined on the LCC form with a corresponding CLASS OF SERVICE of "ISDN".

For 5E11 and later, when ACT on FOSYS form (5713-2 Record) where FID is 695 is set to "Y" (i.e., the AILA (Automatic ISDN Line Assignment) feature active) and ODB TN is entered or ODB MLHG and ODB TERM are entered, and ODB CHL SEL is "Y" on the corresponding DSLUSR form, the ODB ISCN fields on the DSLUSR form must be entered. For more information on this feature, see Division 2, Section 1BO.

2.11 OE

Description: Equipment type and number.
Valid Entries: This is a two segment field comprised of an equipment type and number for the (R)ISLU LCEN of the DSL. For 5E8 and later, the ILEN equipment type and number was added for IDCU.

Valid OE Type Entries

Entry	Definition
A	Software Release: 5E12 and later. TR-303 on DNU-S (i.e., INEN).
E	Software Release: 5E12 and later. Access Interface Unit (i.e., AIUEN).
G	Software Release: 5E8 and later. The OE type is associated with a 10-digit ILEN for an IDCU RT (Remote Terminal). This IDCU designation (GEN) accommodates up to 2048 lines.
I	The OE is associated with an 8-digit (R)ISLU LCEN.
K	Software Release: 5E10 and later. ISDN ISLU2 line card equipment number (LCKEN).
X	Software Release: 5E16 and later. The DSL OE (Digital Subscriber Line card Equipment Number (composite line card equipment number consisting of LCENTYPE and LCEN)).

If "A" is entered, the OE consists of:

TR-303 on DNU-S, Type A

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Line	LINE	XXXX	0001-2048

If "E" is entered, the OE consists of:

For 5E16 and later, when OE is "X", SERV TYPE must be "CFS" on the ENETLINK form (5827 Record) for SM of OE.

AIU-ISDN, Type E

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Access Interface Unit	AIU	XXX	00-127
Pack	PACK	XX	00-19
Circuit	CKT	XX	00-15

If "G" is entered, the OE consist of:

Copyright © 2003 Lucent Technologies

IDCU Remote Terminal Number, Type G			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Unit Number	IDCU	X	0-42
Remote Terminal	RT	XX	01-31
Line	LINE	XXXX	0001-2048

If "I" is entered, the OE consist of:

(R)ISLU Equipment Number	Type I		
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
(Remote) Integrated Service Line Unit	(R) ISLU	X	0-7
Line Group Controller	LGC	XX	00-15
Line Card	LC	XX	00-31

If OE is set to "K", this OE Equipment number consists of:

ISLU2 Remote Terminal Number, Type K			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Unit Number	LU	XX	00 - 42
Line Group	LG	XX	00 - 15
Line Board	LBD	X	0 - 7
Line Circuit	LCKT	X	0 - 7

If an "M" is entered, the OE consist of:

IDCU Remote Terminal Number, Type M			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Unit Number	IDCU	X	0-7
Remote Terminal	RT	XX	01-31
Line	LINE	XX	01-99

The length of the equipment number is defined in the OE SIZE field on the OFCOPT form (5509 Record). Only one OE type is allowed in an office.

Data Rules:

This field must be entered if the CKT ICP (Intercept), DPKT ICP or ODB ICP fields are "N".

The SM entered must appear in the SWITCHING MODULE field on an EQPSU form (5741 Record). An EQPSU form defines the PSU (Packet Switching Unit) peripheral to the SM. The PSU is an integral part of ISDN (Integrated Services Digital Network) hardware.

The OE must appear in the DSL OE field on a DSL form. A DSL user cannot be indicated without the DSL itself defined.

For 5E8 and later, when the CKT TN or CKT MLHG/TERM fields are entered, and DSL CLS is "STD" on the associated DSL form, the following rules apply:

- TERM TYPE cannot be "TYPEB", "TYPED", "TYPEE", or "ATND";
- ACT USR must be "Y";
- BRITL ALW must be "N" or not entered;
- SAR NUM must not be entered.
- LN TYPE must be "NONE or not entered;
- The following fields must be "N": SAR ORIG, SAR TERM, INCOMING, INTERCOM, ORIG CW, PP, and LONG DST DR.

Copyright © 2003 Lucent Technologies

For 5E8 and later, when DSL CLS is "PP" or "MP", the following rules apply:

- if the CKT TN or CKT MLHG/TERM fields are entered, and if TERM TYPE is "TYPEA", "TYPEB", "TYPEC", "TYPED", or "ATND", then CA QTY must be entered;
- if TERM TYPE is "TYPEB", "TYPEC", "TYPED", or "ATND" CA must be entered. (DSL CLS is not "STD").

For a Modem Pool member, the modem and terminal adaptor must be on the same SM. Therefore, the SM entered in this field, which is for the DSL for the terminal adaptor, must be the same as the SM entered in the OE NUMBER field with an OE TYPE of "C", "L" or "S" on the MLHLN form, which is the analog of interest must match the DPKT MLHG and DPKT TERM fields on this form.

All LCENs and ILENs that appear on a DSLUSR form must be defined on a DSL form.

Type is "G":
If "G" is entered,

- the SM/IDCU/RT values assigned to OE NUMBER[1,7] must correspond to the SM/UNIT NUMBER/RT EX values assigned on an RTERM form (5174 Record).
- the first three digits and the fourth and fifth digits of OE NUMBER must be defined on an EQIDCU form as SM and IDCU.
- and if the DSL has manually assigned D RELPIDBs and/or PPB1/PPB2 DPIDBs, there must be a corresponding PIDB NO. With PIDB TYPE of PSU on the EQIDCU form.

NOTE: The IDCU DPIDBs connect the IDCU to the PSU. They carry IDCU control information (EOC and TMC channels), the DSL D channel control and packet data, and the DSL B-channel packet switching and voice data. Each DPIDB has 32 TS (time slots). The EOC, TMC and B-channels each occupy a full TS. The D-channels each occupy one-quarter TS but should be packed (up to) four to a TS if they originate on the same TR303 RT, if they are assigned to the same DPIDB and they belong to the same DSL group (ISCN 1,3). They must also occupy a unique IDCU DS1 TS and have the same positioning in that TS. In other words, D-channel quarter TS cannot be switched.

OE is "I":
If OE TYPE is "I" then the first three digits and the fourth digit of OE NUMBER must be defined on an EQISLU form as SWITCHING MODULE and ISLU NUMBER.

OE is "K" :
If OE TYPE is "K" then the first three digits and the fourth and fifth digits of OE NUMBER must be defined on an EQISLU form as SWITCHING MODULE and ISLU NUMBER.

For 5E10 and later, the ODA automatic time slot assignment algorithm allocates four TS to each SM/ISLU2/LG configuration for each PIDB from the ISLU2 to the PSU as follows: For LGs (OE[6,7] or DSL OE[6,7]) numbered between 0 and 7 the time slots are assigned to odd numbered PSU PIDBs and for LGs (OE[6,7] or DSL OE[6,7]) numbered between 8 and 15 the time slots are assigned to even numbered PSU PIDBs (PIDBs are assigned on the EQISLU form). If there are too many time slots assigned for the number of PIDBs on either the ODD or EVEN numbered PIDBs a cross check error will occur.

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form

Copyright © 2003 Lucent Technologies

- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2
- MISLINK - where SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is "TAOPER" or "DAOPER"
- XAT - where SHELF/CHL GRP is the first three digits of ISCN.

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks). The following applications define the possible LLCB assignments:

LLCB			
Form	**SM**	**SHELF CHL GRP**	**Increment**
AMLBDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	OE[1,3]	PPB1 ISCN[1,3]	by 1 for each PPB1 ISCN defined.
		D ISCN[1,3]	by 1 if a matching DSLUSR form is not found
DSLUSR	OE[1,3]	D ISCN[1,3] on the cor- responding DSL form	by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered.
			by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
		ODB ISCN1[1,3]	by 1 if only ODB ISCN1 is entered.
		ODB ISCN2	by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
DSLAP	LCEN[1,3]	ISCN[1,3]	by 1 for each unique LCEN/ISCN combination.
MISLINK	OE[1,3]	SHELF and CHL GRP	by 1 for each MISLINK form.
OSPSDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined.
			by 1 for each unique OSPSDSL form.
RTERM RT INTERFACE is "TR303"	SM	ISCN[1,3]	by 2 for each TMC PRI ISCN and each TMC NPRI ISCN entry.
			by 3 for each EOC PRI ISCN and each EOC NPRI ISCN entry.
TRUNK Where TRKCLS is "IFOPER", "IFTERM" or "EDSL"	DEN[1,3]	ISCN[1,3]	by 1 for each unique TRUNK form.
XAT	DEN[1,3]	ISCN[1,3]	by 1 for each unique XAT form.

USER INFO

Fields Section 2.12 - Section 2.18 refer to user information.

For 5E12 and later, when more than one DSLUSR form with the same value of OE have CKT LCC and CKT RAX values defined on an associated LCC form, all DSLUSR forms must have the same CLASS OF SERVICE assigned.

2.12 USPID

Copyright © 2003 Lucent Technologies

Description: Enter the User Service Profile Identifier. The USPID is the provisioned part of the SPID, which identifies a terminal to the switch during initialization. It is a unique identifier for each DSL user in the office.

For custom DSLs (where DSL CLS is not "STD" on the DSL form), the USPID may be no longer than 10 digits. For Standard DSLs the USPID may be 1 - 18 digits in length. Leading zeros are significant. For example, 10 and 0010 are not identical, but are two different identifiers. Likewise, 0 and 0000000000 are different.

For 5E9(1) and later, the Telephone Company is responsible for determining and entering a value for this field. Besides appearing on this DSLUSR form (5908 Record), the USPID values also appear on output-only records (5908A and 5908B) described in Division 5, Section 1K.

For more information about the 5E9(1) USPID field, see Division 2, Section 1AA.

For 5E10 and later, the value 010101010101 cannot be entered. It is reserved to support the Automatic SPID Download feature. For more information on this feature, see Division 2, Section 4A200.

Software Release: 5E9(1) and later
Valid Entries: 1 - 18 digits

Data Rules:

If USPID is entered, OE TYPE and NUMBER must be entered; likewise, if the OE fields are entered, USPID must be entered.

The USPID must be unique for each DSLUSR form in the office.

When DSL CLS on the corresponding DSL form is other than "STD", the USPID is limited to a maximum length of ten digits.

2.13 MAXB CHL

Description: The maximum number of B-channels to be used on a Demand basis for circuit-switched services.
Valid Entries: 1 or 2

Data Rules:

If the ODB TN field is entered, then this field must be entered.

If this field is not entered, then the CSV CHL and CSD CHL fields must not be entered or must be "NO", because that indicates that circuit-switched services on the B-channel are not desired.

If a value is entered in this field, the value must equal or exceed the value entered in the CSV or CSD fields. circuit-switched services cannot use more B-channels than have been appropriated.

2.14 ACT USR

Description: Is this user an active user on a DSL?
Valid Entries: Y, N

Data Rules:

A Point-to-Point DSL or Restricted MP-DSL (Multipoint DSL) must only have a single active user. Pure DSL Multipoint has every user as an active user.

2.15 DFLT TN USER

Copyright © 2003 Lucent Technologies

Description: Is this user a default telephone number user? This field supports the Non-Initializing Terminals secured feature on a Standard ISDN interface. For more information on this feature, see Division 2, Section 1AM.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Default DN Service for Non-Initializing Terminals is a feature that must be purchased by the office before the DFLT TN USER field can be set to "Y". The ACT field for SFID 225 on the SFSYS form (5713-1 Record) must be set to "Y", before "Y" can be entered in this field.

DFLT TN USER must be "N", if DPKT FIXED TEI is entered.

If DFLT TN USER is "Y" :

- and CKT services are entered, then

  CKT TN must be entered.

- and DPKT services are entered, then

  DPKT TN must be entered.

- and ODB services are entered, then

  ODB TN must be entered.

- and both DPKT TN and ODB TN are entered, then

  DPKT CHL SEL must be "Y"

  ODB CHL SEL must be "Y"

  DPKT TN must equal ODB TN.

- the following must not be entered:

  CKT MLHG

  CONFIG GRP

  DPKT H PVC LCN

  EKTS

  PASC

Copyright © 2003 Lucent Technologies

- the following must be "N":

  SHARED

  SCP ALW

  NIT does not allow the user to have a terminal key system.

- and a CKT TN, or a DPKT TN or ODB TN is entered, only one packet DSLUSR form is allowed per BRI at a time. Only one DSLUSR form on a DSL with DFLT TN USER set to "Y", can have a CKT TN and only one DSLUSR form can have a DPKT and/or an ODB TN, i.e., one packet DFLT TN and one circuit DFLT TN. The TNs can be for separate users or the same user.

- and a CKT TN is entered , then on the corresponding DSL form (DSL OE matches DSLUSR form OE) the DFLT SRV field must not have an entry. A BRI cannot have Default Service (DFLT SRV) and a Circuit Default DN (DFLT TN USER) at the same time. Note, this data rules is for 5E10 only. It will be deleted for 5E10 Software Updates.

- then on the corresponding DSL form (DSL form DSL OE matches DSLUSR form OE) the DSL CLS field must be set to "STD". A BRI cannot have a Default DN (DFLT TN USER) unless its Class of Service is "STD".

CAICOM form can only be entered when "CACH" is entered for EKTS. Therefore, if CKT TN is entered with either the DFLT TN USER field set to "Y" or the DPKT FIXED TEI field entered, a corresponding CAICOM form (where DSLUSR form CKT TN matches CAICOM form TN) can not be entered. ISDN Call Appearance Intercom is not allowed with either a Circuit Default DN (DFLT TN USER) or a Fixed Terminal Endpoint Identifier (DPKT FIXED TEI).

If either the DFLT TN USER field is set to "Y" or the DPKT FIXED TEI field entered, the CKT TN cannot have BRCS features assigned on the LINEFA, BFG, or CLUSTR forms which are not allowed with NIT (Non-Initializing Terminal) features. In addition, BRCS features defined on the following forms:

- ASPFD with CONTROL set to "NESS"
- EDSFD
- MSFD

are not allowed for NIT, because they require the use of Fully Initializing Terminals.

2.16 PPB1 USR

Description: Is Permanent Packet B1 associated with this user?
Valid Entries: Y, N

Data Rules:

One and only one DSLUSR form, per unique DSL, may have this field "Y".

If Permanent Packet B1 is associated with this user, then the DSL, defined on a DSL form, must have an entry of "X25" in the B1 SERV field. The "X25" entry indicates a Permanent Packet B-channel.

2.17 PPB2 USR

Description: Is Permanent Packet B2 associated with this user?
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

One and only one DSLUSR form, per unique DSL, may have this field "Y".

If Permanent Packet B2 is associated with this user, then the DSL, defined on a DSL form, must have an entry of "X25" in the B2 SERV field. The "X25" entry indicates a Permanent Packet B-channel.

Both PPB1 USR and PPB2 USR can be "Y" on the same instance of this form.

If both PPB1 USR and PPB2 USR are "Y", then the CKT TN, CKT MLHG, CKT TERM, ODB TN, and ODB MLHG/TERM, fields must not be entered. A user that indicates that both B-channels are to be used for Packet Switching has precluded the use of any circuit-switched services or On Demand B-channel Packet Switched services.

2.18 AGI

Description: The AGI (Associated Group Indicator) designates the group to which a Demand B-channel user is assigned. When users of the same BRI are assigned to the same AGI group, they will be treated as one logical Demand B-channel user.

AGI applies only to Demand B-channel users on Standard BRIs: the user subscribes to CSV, CSD, or ODB services; and DSL CLS is set to "STD" on the associated DSL form.

Software Release: 5E8 and later
Valid Entries: 1 or 2

Data Rules:

If a value is entered in AGI, DSL CLS must be "STD" on the corresponding DSL form.

When DSLUSR forms share a common OE, and the OE is assigned on a Standard DSL form where

- neither B1 SERV nor B2 SERV is "X25", then all AGI fields on the DSLUSR forms must have a value or all must be blank
- either B1 SERV or B2 SERV is "X25", then all AGI fields on the DSLUSR forms must have the same value (either 1 or 2) or all must be blank
- both B1 SERV and B2 SERV are "X25", then no AGI field on the DSLUSR forms may have an entry.

When a value is entered in AGI, MAXB CHL must be 1; and CSV, CSD, or ODB must be 1.

If both PPB1USR and PPB2USR are "Y", AGI must be blank.

2.19 INHIBIT DEL

Description: This field is used to indicate whether or not deletion is inhibited for this DSL.

Software Release: 5E13 and later
Valid Entries: Y, N

- ***NOTE:*** INHIBIT DEL must be set to "N" before deletion is allowed.

CKT SWITCHING

The following fields (Section 2.20 - Section 8.9) contain entries used in circuit-switched calls.

2.20 MLHG TN

Copyright © 2003 Lucent Technologies

Description: The Hunt Telephone Number of the DSL (if it has one).
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits must be defined in the OFFICE CODE field on a NOC form.

If this field is entered, then the CKT MLHG and CKT TERM fields must be entered.

This field or the CKT TN field must have an entry if the BUSY MONITOR field is "Y", which indicates that the terminal can be monitored via the Busy Lamps of an ISDN Attendant MLHG.

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN or member TN. Multiple TNs are defined in the TN field on a MULTITN form. The TN entered in this field on the DSLUSR form may not duplicate a TN entered in the TN field on a MULTITN form.

For 5E8 and later, the CKT MLHG TN must duplicate the LISTED TN on the associated MLHG form if this is member 1 of the MLHG, and the associated MLHG FEATURE has a HUNT TYPE of "REG", "HTC", or "PMHG" indicated on the MLHGFD form (5604 Record); otherwise, the entry in the CKT MLHG TN field must be unique within the 5ESS Switch, with the exception that it may match only one of the following:

- The DPKT TN or DPKT MLHG TN entry on the same DSLUSR form, where DPKT CHL SEL is "N".
- The ODB TN or ODB MLHG TN entry on the same DSLUSR form, where ODB CHL SEL is "N".
- The PERMANENT PACKET B1 TN on the DSL form, for this DSL, where PPB1 CHL SEL is "N", if the PPB1 USR entry on this DSLUSR form is "Y".
- The PERMANENT PACKET B2 TN on the DSL form, for this DSL, where PPB2 CHL SEL is "N", if the PPB2 USR entry on this DSLUSR form is "Y".

If no matches are made above, the entry in the CKT MLHG TN field must be unique within the 5ESS Switch, with the exception that it may match only one, two, or three of the following:

- The DPKT TN or DPKT MLHG TN entry on the same DSLUSR form, where DPKT CHL SEL is "Y".
- The ODB TN or ODB MLHG TN entry on the same DSLUSR form, where ODB CHL SEL is "Y".
- The PERMANENT PACKET B1 TN on the DSL form, for this DSL, where PPB1 CHL SEL is "Y", if the PPB1 USR entry on this DSLUSR form is "Y".
- The PERMANENT PACKET B2 TN on the DSL form, for this DSL, where PPB2 CHL SEL is "Y", if the PPB2 USR entry on this DSLUSR form is "Y".

For 5E12 and later, if the first 3 digits of the 7-digit CKT MLHG TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE or the NOC form does not exist, CKT MLHG TN must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.21 LCC

Description: The Line Class Code. Line Class Codes are defined on the LCC form (5306 Record).

Copyright © 2003 Lucent Technologies

Valid Entries: 3 alphanumeric characters.

Data Rules:

If the CKT MLHG and CKT TERM fields are entered, then the LCC and RAX combination must be defined on a LCC form with a CLASS OF SERVICE "ISDN" or "ISATND" and a TERMINATING TREATMENT "MLHG" or "INWATS".

If the CKT MLHG and CKT TERM fields are entered and the CKT MLHG is defined on an MLHG form whose MLHG FEATURE is defined on an MLHGFD form whose BEARER field is "CSD" (Circuit-Switched Data), then the LCC associated with the CKT MLHG must be defined on an LCC form whose TERMINATING TREATMENT is "MLHG".

If the CKT MLHG and CKT TERM fields are entered and the CKT MLHG is defined on an MLHG form whose MLHG FEATURE is defined on an MLHGFD form whose BEARER field is "CSD", then the TERM TYPE field on the DSLUSR field must be "TYPEA", "TYPEB", "TYPEC", "TYPED" or "TYPEE".

For 5E8 and later, if the CKT TN or CKT MLHG/TERM fields are entered, and DSL CLS is "STD" on the associated DSL form, then the LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "ISDN".

For 5E8 and later, TNs (Telephone Numbers) on a LINE form or CKT TNs (Circuit Telephone Numbers) on a DSLUSR form that are assigned to a Terminal Group & Station Restriction Feature on either the LINEFA, BFG form or an associated CLUSTR form(s), the TN must also be defined on the LINE form or DSLUSR form with a LCC/RAX value that corresponds to one of the following Service Classes on the LCC form:

- "4WINDIV"
- "ATND"
- "INDIV"
- "HOTPBX"
- "HOTMOTL"
- "ISATND"
- "MODEM"
- "ISDN"
- "PBX"
- "SATSTLN"

2.22 RAX

Description: The Rate Area. The LCC and RAX determine the Digit Analysis Selector and Screening Index used for calls originating from this line and the terminating treatment of calls to this line.
Valid Entries:

- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

If the LCC and RAX combination, under the CKT SWITCHING header, are defined on an LCC form with a CLASS OF SERVICE of "ISATND", then "ATND" must be entered in the TERM TYPE field on this DSLUSR form.

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.23 BILL TN

Copyright © 2003 Lucent Technologies

Description: A TN to be billed if the Circuit TN to be billed is different from the CKT TN of this DSL.
Valid Entries: A 7-digit Circuit TN for calls billed to a Circuit TN within the local office; a 10-digit Circuit TN for calls billed to a Circuit TN outside the local office. Valid TNs must be in one of the following formats:

Valid BILL TN Entries

Entry	Definition
NXXXXXX	Where the first three digits are a valid office code defined in the OFFICE CODE field on a NOC form.
ZXXXXXX	Z is 0 or 1. This is normally used for OUTWATS billing purposes. The first three digits must be defined in the OFFICE CODE field on a NOC form.
NPAXXXXXXX	A 10-digit number with valid NPA and NXX codes.

2.24 CPN SCRN

Description: Will user-provided Calling Party Numbers (CPNs) be screened?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CPN SCRN is "Y", the user-provided CPN is screened against the primary DN for the terminal. If the CPN does not match the primary DN, it is replaced with a switch-provided CPN.

If CPN SCRN is "N", the switch always provides the CPN, even if the terminal sends a CPN.

CPN SCRN should be "Y" only for those ISDN terminals that supply a user-provided CPN.

For terminals connected to a PBX, this attribute should always be "N", since screening should not be done in a PBX.

2.25 RMK

Description: Remarks entered for administrative purposes.
Valid Entries: Up to 16 alphanumeric characters.

3. FORM ENTRIES, 5908-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

CIRCUIT VOICE (CSV)

The following fields (Section 3.2 -Section 3.10) apply to Circuit Switched Voice service.

3.2 CSV

Description: The number of Circuit-Switched Voice channels allowed.
Valid Entries: 1 or 2

Data Rules:

If the CSV CHL field is "B1", "B2" or "ANY", then this field must be entered.

The value entered in this field must not exceed the value entered in the MAXB CHL field.

Copyright © 2003 Lucent Technologies

If a Multi-Line Hunt Group is defined on an MLHG form where BEARER on the corresponding MLHGFD form for the MLHG FEATURE is "VOICE", and the MLHG is assigned as CKT MLHG on this DSLUSR form, or as the key MLHG on an SHTN form where TN from the first row matches the CKT TN on this DSLUSR form, then a value must be entered in this CSV field.

For 5E8 and later, when either the CKT TN or CKT MLHG/TERM is entered, if the CSV field is entered, the EKTS field is not entered, and the DSL CLS is "STD" on the associated DSL form, then CSV LIMIT on this DSLUSR form must be entered.

For 5E11 and later:

When CSV is set to "2" and TERM TYPE is "TYPEA" or "TYPEC", DSL CLS is set to "STD" on the corresponding DSL form, then the ACT field for SFID 268 must be set to "Y".

When CSV is set to "2" and TERM TYPE is set to "TYPEA" or "TYPEC", then DSL CLS must be set to "STD" on a corresponding DSL form.

3.3 CSV CHL

Description: The channel(s) allowed for Circuit-Switched Voice.
Valid Entries: B1, B2, ANY (B1 and B2) or NO (neither B1 or B2).

Data Rules:

If the CSV field is entered, then this field must be "B1", "B2", or "ANY".

If the CSV field is equal to 2, then this field must be "ANY".

If the B1 SERV field on the DSL form for this DSL is "X25", this field must not be "B1". The B1 SERV entry of "X25" indicates the channel is to be used on a Permanent Packet basis, thus precluding the use of circuit-switched services.

If the B2 SERV field on the DSL form for this DSL is "X25", this field must not be "B2", The B2 SERV entry of "X25" indicates the channel is to be used on a Permanent Packet basis, thus precluding the use of circuit-switched services.

3.4 CSV ACO

Description: The CSV ACO (Circuit Switched Voice Additional Call Offering) indicates the type of CSV ACO service provided. ACO is an optional feature for type A BASIC CALL CPE's. Not all BASIC CALL CPE's will operate correctly with ACO. If the CPE is not compatible with ACO this field may be left blank.

CSV ACO applies only to Standard BRI users.

Software Release: 5E8 and later
Valid Entries:

Valid CSV ACO Entries

Entry	Definition
U	Unrestricted version of ACO.
INTRA	Software Release: 5E9(1) and later. Unrestricted Intra-Basic Business Group.
INCOM	Software Release: 5E9(1) and later. Unrestricted Incoming to Basic Business Group Only.

Data Rules:

If a value is entered in this field, DSL CLS must be "STD" on the associated DSL form. On this DSLUSR form, TERM TYPE must be "TYPEA"; CSV LIMIT must be entered; EKTS and CKT MLHG/TERM cannot be entered.

Copyright © 2003 Lucent Technologies

For 5E9(1) and later if CSV ACO is entered, CSV LIMIT must be greater than CSV NBLIMIT; if CSV LIMIT is greater than 1, CSV NBLIMIT must be greater than 0. When CSV NBLIMIT is not entered and CSV LIMIT is 1, the software will automatically set CSV NBLIMIT to 0; when CSV LIMIT is greater than 1, the software will set CSV NBLIMIT to 1.

If CSV ACO is not entered, CSV NBLIMIT must not be entered.

If CSV ACO is "INTRA" or "INCOM", BRCS must be "Y"; and the CKT TN must be assigned a Terminal Group Station Restriction feature, defined on a TGSRFD form (5607-1/2 Record) and assigned to the TN on a LINEFA, CLUSTR, or BFG form.

3.5 CSV LIMIT

Description: This field specifies the CSV Call Reference Busy Limit.

Software Release: 5E8 and later
Valid Entries: 1 - 16

Data Rules:

If a value is entered in this field, DSL CLS must be "STD" on the associated DSL form. On this DSLUSR form TERM TYPE must be "TYPEA" and CSV must be entered.

3.6 CSV NBLIMIT

Description: Enter the maximum number of simultaneous waiting voice calls. (See data rules under the CSV ACO field.)

Software Release: 5E9(1) and later
Valid Entries: 0 - 15

3.7 SP DNA

Description: Enter the first DN (Directory Number) CA for speech. This field, along with SP DNA QTY, is used to set the range of speech DNAs. Each DNA must be unique. See Division 2, Section 1AM for more information on how to determine if CAs are duplicated.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If SP DNA is entered, SP DNA QTY must be entered. When SP DNA and SP DNA QTY are both entered, CSV must be 1.

The range of SP DNAs and the range of any of the following cannot overlap: AU DNAs, DPKT DNAs, K56 DNAs, K64 DNAs, or ODB DNAs.

If SP DNA or SP DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

3.8 SP DNA QTY

Description: Enter the number of DN CAs for speech.

Software Release: 5E9(1) and later
Valid Entries: 1 - 16

Copyright © 2003 Lucent Technologies

Data Rules:

If SP DNA QTY is entered, SP DNA must be entered. If SP DNA and SP DNA QTY are both entered, CSV must be 1.

SP DNA QTY cannot exceed CSV LIMIT.

The sum of SP DNA and SP DNA QTY cannot exceed 255.

When EKTS is "BASIC" and SP DNA QTY is entered, SP DNA QTY must be 1.

If SP DNA or SP DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

3.9 AU DNA

Description: Enter the first DN CA for audio. This field, along with AU DNA QTY, is used to set the range of audio DNAs. Each DNA must be unique. See Division 2, Section 1AM for more information on how to determine if CAs are duplicated.

Software Release: 5E9(1) and later
Valid Entries: 1 - 255

Data Rules:

If AU DNA is entered, AU DNA QTY must be entered.

The range of AU DNAs cannot overlap with the range of any of the following: DPKT DNAs, K56 DNAs, K64 DNAs, ODB DNAs, or AU DNAs.

If AU DNA or AU DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

3.10 AU DNA QTY

Description: Enter the number of DN CAs for audio.

Software Release: 5E9(1) and later
Valid Entries: 1 - 16

Data Rules:

If AU DNA QTY is entered, AU DNA must be entered. If AU DNA and AU DNA QTY are both entered, CSV must be 1. If EKTS is "BASIC" and AU DNA QTY is entered, AU DNA QTY must be 1.

AU DNA QTY cannot exceed CSV LIMIT.

The sum of AU DNA and AU DNA QTY cannot exceed 255.

If AU DNA or AU DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

CIRCUIT DATA (CSD)

The following fields (Section 3.11 -Section 3.19) apply to Circuit Switched Data service.

3.11 CSD

Description: The number of Circuit-Switched Data channels allowed.
Valid Entries: 1 or 2

Data Rules:

Copyright © 2003 Lucent Technologies

If the CSD CHL field is "B1", "B2", or "ANY", then this field must be entered.

The value entered in this field must not exceed the value entered in the MAXB CHL field.

If a Multi-Line Hunt Group is defined on an MLHG form where BEARER on the corresponding MLHGFD form for the MLHG FEATURE is "CSD", and the MLHG is assigned as CKT MLHG on this DSLUSR form, or as the key MLHG on an SHTN form where TN from the first row matches the CKT TN on this DSLUSR form, then a value must be entered in this CSD field.

For 5E8 and later, when either the CKT TN or CKT MLHG/TERM is entered, if the CSD field is entered, and DSL CLS is "STD" on the associated DSL form, then CSD LIMIT on this DSLUSR form must be entered.

3.12 CSD CHL

Description: The channel(s) allowed for Circuit-Switched Data.
Valid Entries: B1, B2, ANY (B1 and B2) or NO (neither B1 or B2).

Data Rules:

If the CSD field is entered, then this field must be "B1", "B2", or "ANY".

If the CSD field is equal to 2, then this field must be "ANY".

If the B1 SERV field on the DSL form for this DSL is "X25", this field must not be "B1", The B1 SERV entry of "X25" indicates the channel is to be used on a Permanent Packet basis, thus precluding the use of circuit-switched services.

If the B2 SERV field on the DSL form for this DSL is "X25", this field must not be "B2". The B2 SERV entry of "X25", indicates the channel is to be used on a Permanent Packet basis, thus precluding the use of circuit-switched services.

3.13 CSD ACO

Description: The CSD ACO (Circuit Switched Data Additional Call Offering) indicates the type of CSD ACO service provided. ACO is an optional feature for type A BASIC CALL CPE's. Not all BASIC CALL CPE's will operate correctly with ACO. If the CPE is not compatible with ACO this field may be left blank.

CSD ACO applies only to Standard BRI users.

Software Release: 5E8 and later
Valid Entries:

Valid CSD ACO Entries

Entry	Definition
U	Unrestricted version of ACO.
INTRA	Software Release: 5E9(1) and later. Unrestricted Intra-Basic Business Group.
INCOM	Software Release: 5E9(1) and later. Unrestricted Incoming to Basic Business Group Only.

Data Rules:

If a value is entered in this field, DSL CLS must be "STD" on the associated DSL form. On this DSLUSR form, TERM TYPE must be "TYPEA"; CSD LIMIT must be entered; EKTS and CKT MLHG/TERM cannot be entered.

For 5E9(1) and later if CSD ACO is entered, CSD LIMIT must be greater than CSD NBLIMIT; if CSD LIMIT is greater than 1, CSD NBLIMIT must be greater than 0. When CSD NBLIMIT is not entered and CSD

Copyright © 2003 Lucent Technologies

LIMIT is 1, the software will automatically set CSD NBLIMIT to 0; when CSD LIMIT is greater than 1, the software will set CSD NBLIMIT to 1.

If CSD ACO is not entered, CSD NBLIMIT must not be entered.

If CSD ACO is "INTRA" or "INCOM", BRCS must be "Y"; and the CKT TN must be assigned a Terminal Group Station Restriction feature, defined on a TGSRFD form (5607-1/2 Record) and assigned to the TN on a LINEFA, CLUSTR, or BFG form.

3.14 CSD LIMIT

Description: This field specifies the CSD Call Reference Busy Limit. An entry in this field is necessary to originate or terminate CSD calls on all types of Standard lines: Basic, ACO, EKTS Basic, and EKTS CACH.

Software Release: 5E8 and later
Valid Entries: 1 - 16

Data Rules:

If a value is entered in this field, DSL CLS must be "STD" on the associated DSL form. On this DSLUSR form CSD must be entered; if CSD LIMIT is greater than 1, EKTS must be blank.

3.15 CSD NBLIMIT

Description: Enter the maximum number of simultaneous waiting data calls. (See data rules under the CSD ACO field.)

Software Release: 5E9(1) and later
Valid Entries: 0 - 15

3.16 K56 DNA

Description: Enter the first DN CA for K56 CSD. This field, along with K56 DNA QTY, is used to set the range of K56 CSD DNAs. Each DNA must be unique. See Division 2, Section 1AM for more information on how to determine if CAs are duplicated.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If K56 DNA is entered, K56 DNA QTY must be entered. If K56 DNA and K56 DNA QTY are both entered, CSD must be 1 or 2.

The range of K56 DNAs cannot overlap with the range of any of the following: AU DNAs, CAs, DPKT DNAs, K64 DNAs, ODB DNAs, or SP DNAs.

If K56 DNA or K56 DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

3.17 K56 DNA QTY

Description: Enter the number of DN CAs for 56K CSD.

Software Release: 5E9(1) and later
Valid Entries: 1 - 16

Data Rules:

Copyright © 2003 Lucent Technologies

If K56 DNA QTY is entered, K56 DNA must be entered. If K56 DNA and K56 DNA QTY are both entered, CSD must be 1 or 2.

K56 DNA QTY cannot exceed CSD LIMIT.

The sum of K56 DNA and K56 DNA QTY cannot exceed 255.

If EKTS is "BASIC" and K56 DNA QTY is entered, K56 DNA QTY must be 1. If EKTS is "CACH" and K56 DNA QTY is entered, K56 DNA QTY must be 1.

If K56 DNA or K56 DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

3.18 K64 DNA

Description: Enter the first DN CA for K64 CSD. This field, along with K64 DNA QTY, is used to set the range of K64 CSD DNAs. Each DNA must be unique. See Division 2, Section 1AM for more information on how to determine if CAs are duplicated.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If K64 DNA and K64 DNA QTY are both entered, CSD must be 1 or 2. If K64 DNA is entered, K64 DNA QTY must be entered.

The range of K64 DNAs cannot overlap with the range of any of the following: AU DNAs, CAs, K56 DNAs, DPKT DNAs, ODB DNAs, or SP DNAs.

If K64 DNA or K64 DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

3.19 K64 DNA QTY

Description: Enter the number of DN CAs for 64K CSD.

Software Release: 5E9(1) and later
Valid Entries: 1 - 16

Data Rules:

If K64 DNA QTY is entered, K64 DNA must be entered. If K64 DNA and K64 DNA QTY are both entered, CSD must be 1 or 2.

K64 DNA QTY cannot exceed CSD LIMIT. The sum of K64 DNA and K64 DNA QTY cannot exceed 255.

When EKTS is "BASIC" and K64 DNA QTY is entered, K64 DNA QTY must be 1. When EKTS is "CACH" and K64 DNA QTY is entered, K64 DNA QTY must be 1.

If K64 DNA or K64 DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

4. FORM ENTRIES, 5908-3 RECORD

4.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

4.2 SUST

Copyright © 2003 Lucent Technologies

Description: Is termination denied for circuit-switched services?

Required Field.
Default: N
Valid Entries: Y, N

4.3 ICP

Description: Are terminating calls to be routed to regular intercept?

Required Field.
Default: N
Valid Entries: Y, N

4.4 CA

Description: The button number associated with the first Call Appearance for a CKT TN or CKT MLHG/TERM. A single TN in a voice application can have several appearances at an ISDN set and can be associated with a primary TN or an MLHG member. The CA field and the CA QTY field define the buttons on the ISDN set where multiple call appearances are located.
Valid Entries: 1 - 254

Data Rules:

For 5E9(1) and later, the range of CAs (see description of CA QTY) cannot overlap with the range of any of the following: DPKT DNAs, K56 DNAs, K64 DNAs, or ODB DNAs.

4.5 CA QTY

Description: Call Appearance Quantity. The consecutive number of buttons that this CKT TN or CKT MLHG/CKT TERM combination appears at on the CPE. These consecutive buttons start with the entry assigned in the CA field. For example, if CA is 12 and CA QTY is 6, then buttons 12 through 17 would represent call appearances for the given CKT TN or CKT MLHG and TERM.
Valid Entries: 1 - 16

Data Rules:

Because a CPE terminal has a maximum of 254 buttons, the sum of the values entered in the CA and CA QTY field cannot exceed 255. For example, if CA is 240 and CA QTY is 15, then buttons 240 through 254 would represent call appearances for the given CKT TN or CKT MLHG and TERM. The sum of the CA and CA QTY fields is 255 and the last available ISDN set button has been appropriated.

If the CSV field is "2", then this field must not be entered.

If a SHTN form (5902 Record) has an entry in the TN field and no entry in either the MLHG or TERM fields, and this TN appears in the CKT TN field of a DSLUSR form, then the CA QTY must be greater than or equal to any NBR entered in the SHARED LIST on the SHTN form. Thus, when a primary TN on a given ISDN set with a particular quantity of call appearances is also a secondary TN on another ISDN set, the secondary TN must have an equal or greater quantity of call appearances entered.

If the CKT TN has been assigned an Electronic Directory Service feature that is defined on a EDSFD form (5961-1 Record) with at least one of the four FEATURE OPTIONS "Y", then the CA and CA QTY fields on this DSLUSR form must both be entered.

If the CKT TN has been assigned an ISDN Intercom feature, then the CA and the CA QTY field must be entered.

If the CKT TN or the CKT MLHG/TERM has been assigned a Multiway Feature that will be invoked by

Copyright © 2003 Lucent Technologies

dialing a code or optionally pressing a feature button, then the ISDN terminal must have at least two call appearances. That is, if the Multiway Feature is defined on the MWFD form (5602 Record) with the DIAL CODE or BUTTON field "Y", then one of the following must be true. Either CA QTY on the DSLUSR form must be greater than 1 or the CKT TN (or MLHG/TERM) must appear in the SHARED LIST of an SHTN form (5902 Record) where the CKT TN (MLHG/TERM) is not the key TN (MLHG/TERM).

If a directory number or a multiline hunt group member is assigned a directed call pickup feature that can barge-in on held calls, then that number or member must have only one call appearance. That is, if a CKT TN or CKT MLHG/CKT TERM is assigned a Call Pickup Terminating feature on the LINEFA, MLHLNFA, BFG or CLUSTR form and the feature was defined on a PUTFD form with a FEATURE FUNCTION of "HDIRPUBRG", then the CA QTY field must be either blank or "1".

4.6 BRCS

Description: Are BRCS features assigned to this line?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then either the CKT TN on this form must appear in the TN field on a LINEFA form or the CKT MLHG and CKT TERM must appear in the MLHG and TERM fields, respectively, on an MLHLNFA (5113 Record). Enter "N" if either of the above cases does not apply.

Note: More than two Circuit-Switched Voice users with BRCS features on the same DSL will affect MP-DSL performance.

4.7 TERM TYPE

Description: The ISDN Customer Premises Equipment terminal type.

Valid TERM TYPE Entries

Entry	Definition
ATND	ISDN Attendant Terminal.
TYPEA	Terminal with a single Telephone Number or MLHG member where the subscriber can control multiple concurrent calls.
TYPEB	Terminal with a single Telephone Number or MLHG member and TMF (Terminal Management Function). TMF provides management capabilities of call appearance buttons on the terminal.
TYPEC	Terminal with TMF and button management within the terminal itself. The terminal translates call appearance numbers to specific buttons on the terminal.
TYPED	Terminal C with TMF performed by the 5ESS Switch. This terminal may have multiple DNs and must have TMF capabilities on the 5ESS Switch.
TYPEE	Circuit-Switch Data Terminal. If the RMB or STH field are entered, then "TYPEE" must be entered in this field.

Data Rules:

If the DSL form (for this DSL) has D SERV "SONLY", indicating an ISDN Attendant, then this field must be "ATND". Conversely, if TERM TYPE on this form is "ATND", then the DSL form, for this DSL, must have the D SERV field "SONLY".

Numerous dependencies exist between the TERM TYPE field and other fields on this form. Refer to Figure 2, which illustrates these dependencies.

PODs service requires that this field be left blank.

For 5E8 and later, since entry to any of the National ISDN fields AGI, CSV ACO, CSV LIMIT, CSD ACO, CSD LIMIT, or EKTS requires a TERM TYPE of "TYPEA" or "TYPEC", National ISDN does not directly

Copyright © 2003 Lucent Technologies

support PODs service. The equivalent of PODs service may be achieved by not assigning BRCS features and by not entering any of the "STD" specific fields on the DSLUSR form when DSL CLS is "STD" on the associated DSL form.

For 5E8 and later, when either CKT TN or CKT MLHG/TERM is entered:

- if EKTS is entered, TERM TYPE must be "TYPEC";
- if CSV ACO, CSD ACO, or CSV LIMIT is entered, or if CSD LIMIT is entered and EKTS is not entered, then TERM TYPE must be "TYPEA";
- if DSL CLS is "STD" on the associated DSL form, then on this DSLUSR form TERM TYPE must be "TYPEA" or "TYPEC";if EKTS is not entered, TERM TYPE must be "TYPEA";
- if TERM TYPE is "TYPEB", "TYPEC", "TYPED", or "ATND", and DSL CLS is not "STD" on the associated DSL form, then CA must be entered on this DSLUSR form ;
- if DSL CLS is not "STD" on the associated DSL form, and TERM TYPE on this form is not "TYPEE", then CA QTY must be entered.

For 5E11 and later:
When TERM TYPE is "ATND", "TYPEB", or "TYPED", CSV must not equal "2".

For 5E12 and later:
If TERM TYPE is "ATND", and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", and the value of DSL OE on the DSLUSR form matches the DSL OE field on the DSL form, then the DSL CLS field on the DSL form must be set to "PP".

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND" and the value of DSL OE on the DSLUSR form matches the DSL OE field on the DSL form, then the DSL CLS field on the DSL form must be set to "PP" or "MP".

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", the following fields must be set to "N" on the DSLUSR form.

- INCOMING
- INTERCOM
- ORIG CW
- PP

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", the ERCO ASGN and SHARED fields must be set to "N" on the DSLUSR form.

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", the CKT MLHG must be entered.

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", the SAR NUM must not be entered.

Copyright © 2003 Lucent Technologies

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", the ATT MLHG and RBV TGN fields must not be entered, and the SAR ORIG and SAR TERM fields must be set to "N".

If TERM TYPE is "TYPED" and CKT LCC and CKT RAX values match the LINE CLASS CODE and RATE AREA values on the associated LCC form having the CLASS OF SERVICE of "ISATND", the CKT MLHG and CKT TERM fields from the DSLUSR form must not be SHARED LIST MLHG and SHARED LIST TERM NBR on the SHTN form.

When the DSLUSR form has TERM TYPE set to "TYPED", and entries for CKT LCC and CKT RAX values are defined on the LCC form with the CLASS OF SERVICE set to "ISATND", Secured Feature SFID 292 ACT field must be set to "Y" on the SFSYS form. If this Secured Feature is not purchased, the DSLUSR forms must have TERM TYPE set to "ATND".

When the DSLUSR form has TERM TYPE set to "TYPED", and D SERV on the associated DSL form is "SONLY", CLASS OF SERVICE on the corresponding LCC form must be "ISATND".

When a DSLUSR form has a value of CKT MLHG, and has CKT LCC and CKT RAX values that match the LINE CLASS CODE and RATE AREA values of an associated LCC form, and the LCC form has a CLASS OF SERVICE of " ISATND", the TERM TYPE must be "ATND" or "TYPED" on the DSLUSR form.

When the LINE CLASS CODE and RATE AREA are assigned on the LCC form with a CLASS OF SERVICE of "ISATND", the corresponding TERM TYPE on the DSLUSR form must be set to "ATND" or "TYPED".

When the MLHG form has an MLHG FEATURE value that matches FEATURE NAME on the associated MLHGFD form, and MLHG on the MLHG form matches the value of one or more DSLUSR forms, and the HUNT TYPE on the MLHGFD form is ISAT, then the TERM TYPE on the corresponding DLSUSR form must be "ATND" or "TYPED".

4.8 CONFIG GRP

Description: The Configuration Group name that describes feature actions assigned to CPE terminal buttons.
Valid Entries: 1 - 8 characters.

Data Rules:

The Configuration Group entered must be defined in the CONFIG GRP field on a CFGGRP form (5964 Record).

If the Configuration Group has an ACTION of "BYGP" (Group Make Busy) specified where the MLHG FEATURE is defined on an MLHGFD form with a HUNT TYPE not equal to "ISAT". Only the first member of an MLHG can activate must not be entered.

If the CKT MLHG is defined on an MLHG form with an MLHG FEATURE defined on an MLHGFD form with a HUNT TYPE of "ISAT" (ISDN Attendant), this field must be entered.

For 5E8 and later, when CONFIG GRP is entered, and DSL CLS is "STD" on the associated DSL form, the CONFIG GRP must be defined on a CFGGRP form where GRP TYPE is set to "STD"; if DSL CLS is not "STD", GRP TYPE must be "CUSTOM".

5. FORM ENTRIES, 5908-4 RECORD

5.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

5.2 DISPLAY

Description: Is there a display module on the station set?

For 5E9(1) and later, the meaning of the DISPLAY field is changed for Standard DSL users. If DISPLAY is "Y", the user will receive all Standard Displays (incoming, outgoing, and feature displays). Assigning an ICLID feature merely provides the user the calling DN in the Standard Display.

For Custom DSL users to receive call-related displays, Line Identification features (ICLID/OCLID) must be assigned to the user, and DISPLAY must be set to "Y".

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "Y" if the CKT TN or the CKT MLHG/CKT TERM combination are assigned a Display feature on a DISPFD form (5965 Record) where the INSPECT field and/or the TIME DATE field are "Y".

This field must be "Y" if the CONFIG GRP field has an entry which is defined on a CFGGRP form with a LASS Customer Originated Trace feature assigned to a button. The LASS Customer Originated Trace feature is defined in the FEATURE field on a LSCOTFD form (5972 Record). The feature displays a number to call to report harassing phone calls.

If the CKT TN or the CKT MLHG/CKT TERM are assigned a Message Service System feature and the feature is defined on a MSFD form (5962-1 Record) with the MSG RTRVL DISP field "Y", then this field must be "Y".

If the TIME MODE field is "Y", indicating the use of a 24-hour clock, then this field must be "Y".

5.3 EKTS

Description: This field specifies the type of EKTS (Electronic Key Telephone Service) provided for Standard DSL users.

Software Release: 5E8 and later
Valid Entries:

Valid EKTS Entries

Entry	Definition
BASIC	Restricts the user to one call appearance.
CACH	Permits access to more than one call appearance for each telephone number.

Data Rules:

If either CKT TN or CKT MLHG/TERM is entered:

- if EKTS is entered, DSL CLS must be "STD" on the associated DSL form; on this DSLUSR form, TERM TYPE must be "TYPEC"; CSV LIMIT cannot be entered; CPN SCRN must be "Y"; furthermore,
  - if EKTS is "BASIC, and CKT MLHG is entered, CKT SWITCHING MLHG TN must be entered;
  - if EKTS is "CACH", both CA and CA QTY must be entered;
  - if the EKTS user is assigned CSD service, CSD LIMIT must be 1 for service to be available;

Copyright © 2003 Lucent Technologies

- if EKTS is not "BASIC" and TERM TYPE is "TYPEC", CA must be entered;
- if EKTS is not entered:
  - if CSD LIMIT is entered, TERM TYPE must be "TYPEA";
  - if DSL CLS is "STD" on the DSL form, neither CA nor CA QTY can be entered;
- if DSL CLS is "STD" on the associated DSL form, and the CKT TN or CKT MLHG/TERM from this DSLUSR form appears in the SHARED LIST on an SHTN form, then a value must be entered in EKTS.

For 5E9(1) and later, if EKTS is "BASIC", CA and CA QTY must not be entered. If EKTS is "CACH", SP DNA, SP DNA QTY, AU DNA, and AU DNA QTY must not be entered.

5.4 SHARED

Description: Is this CKT TN or this CKT MLHG/CKT TERM combination shared (i.e., appear on more than one terminal)?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the CKT TN or the CKT MLHG/CKT TERM combination must be defined in the optional key TN field or in the optional key MLHG and TERM NBR combination on an SHTN form.

If "N" is entered, then the CKT TN or the CKT MLHG and CKT TERM combination must not be defined in the optional key TN field or in the optional key MLHG and TERM NBR combination on an SHTN form.

If the CKT MLHG and CKT TERM combination appear in the MLHG and TERM fields of a MULTITN form (5114 Record), and the associated LCC is defined on a LCC form with a CLASS OF SERVICE of "ISATND" or "ISAT", this field must be "N".

MLHGs which are used as Message Service Centers, in conjunction with the Application Processor, must have all their members with this field set to "N". The MLHG which is used for this purpose is defined on an MLHG form with the AP SITE ID field or one of the BCID fields entered.

5.5 PRIVACY

Description: Is all-call privacy allowed? PRIVACY prevents TN information from being displayed to the called party for all calls.

For 5E6 and later, this field is optional. If this field is set to "Y", the presentation status of the calling number will be private. When this field is set to "N", the presentation status of the calling number is public. If the CPNP (Calling Party Number Presentation) feature has not been purchased (FID 50 on the SFSYS form (5713-1 Record) is not set to "S"), a blank PRIVACY field will default to "N". When the CPNP feature has been purchased (FID 50 on the SFSYS form (5713-1 Record) is set to "S"), a blank PRIVACY field will remain blank allowing the presentation status to be determined by either the PRIVACY field on the SCRIDXPA form (5543 Record) or the DN PRIVACY field on the OFCOPT form (5509 Record).

For 5E6 and later, the precedence for determination of call privacy is dependent on the purchase of the CPNP special feature. When the CPNP special feature has not been purchased, the precedence hierarchy is:

Copyright © 2003 Lucent Technologies

1. If DN PRIVACY on the OFCOPT form is "Y", the calling party number presentation status is private.

2. If DN PRIVACY on the OFCOPT form is "N", the calling party number presentation status is determined by the PRIVACY field on this form.

When the CPNP special feature has been purchased, the precedence hierarchy is:

1. If PRIVACY on this form has been entered, it is used to determine the calling party number presentation status.

2. If PRIVACY on this form has not been entered, but an SCRIDXPA form has been entered for the SCREENING INDEX assigned to the LCC form whose LCC and RAX are assigned to this form, then that SCRIDXPA form may be used. If PRIVACY on the SCRIDXPA form has been entered, then that value is used to determine the calling party number presentation status.

3. If PRIVACY on the SCRIDXPA form has not been entered, or no corresponding SCRIDXPA form was found, then DN PRIVACY on the OFCOPT form will be used to determine the calling party number presentation status.

Default: N (5E9(1) and later)
Valid Entries: Y, N

Data Rules:

All-call privacy can be deactivated on a per-call basis by the per-call privacy feature. See the PCP ALW field.

5.6 TIME MODE

Description: Should the time displayed on ISDN Terminals be in a 12-hour format? If so, enter "Y". If not, the default ("N"), is a 24-hour format. All features that display the time use the format entered in this field.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the TERM TYPE field is not entered, then the TIME MODE field must be "N".

To display the time on an ISDN Terminal, the DISPLAY field must be "Y".

5.7 AC ALW

Description: Does the customer want access to the LASS (Local Area Signaling Services) Automatic Callback indicator feature?
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN" or "ISATND", then ODA assigns a "Y" in this field.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form permitted access to the feature are "ISDN" or "ISATND".

If the TERM TYPE field is not entered, this field is assigned a "N" by ODA.

Copyright © 2003 Lucent Technologies

For 5E6 and later, if the CKT TN (or CKT MLHG/TERM) is assigned a LASS Automatic Callback feature on the LINEFA (or MLHLNFA), BFG, or associated CLUSTR form, AC ALW may not be "N".

5.8 AR ALW

Description: Does the customer want access to the LASS Automatic Recall indicator feature?
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN" or "ISATND", then ODA will assign a Y in this field.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN" or "ISATND".

If the TERM TYPE field is not entered, this field is assigned a "N" by ODA.

For 5E6 and later, if the CKT TN (or CKT MLHG/TERM) is assigned a LASS Automatic Recall feature on the LINEFA (or MLHLNFA), BFG, or associated CLUSTR form, AR ALW may not be "N".

5.9 COT ALW

Description: Does the customer want access to the LASS Customer Originated Trace?
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN" or "ISATND", ODA assigns a "Y" in this field.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN" or "ISATND".

If the TERM TYPE field is not entered, this field will be assigned a "N" by ODA.

For 5E6 and later, if the CKT TN (or CKT MLHG/TERM) is assigned a LASS Customer Originated Trace feature on the LINEFA (or MLHLNFA), BFG, or associated CLUSTR form, COT ALW may not be "N".

5.10 PCP ALW

Description: Does the customer want access to the LASS Per-Call Privacy?
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN" or "ISATND", then ODA will assign a Y in this field.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN" or "ISATND".

If the TERM TYPE field is not entered, this field is assigned a "N" by ODA.

For 5E6 and later:
"Y" may be entered for the additional classes of service: "TWOPTY", "HOTMOTL", "COIN", or "2PTY".

When left blank, this field will be treated as having a value of "Y" for the following additional classes of service: "TWOPTY", "HOTMOTL", "COIN", or "2PTY".

Copyright © 2003 Lucent Technologies

PCP general availability may be allowed or denied via the LASSFA form (5973 Record) and the SCRIDXPA form (5543 Record).

If CKT TN or CKT MLHG/TERM(s) have a PCP ALW value of "Y", the CKT TN or CKT MLHG/TERM must also be entered on this form with an LCC/RAX value that corresponds to one of the following CLASS OF SERVICEs on the LCC form (5306 Record):

- "2PTY"
- "4WINDIV"
- "ATND"
- "B911"
- "CHGCALL"
- "COIN"
- "HOTMOTL"
- "HOTPBX"
- "INDIV"
- "ISATND"
- "ISDN"
- "LTPCLBK"
- "PBX
- "SATSTLN"
- "TWOPTY"

In addition, the CLASS OF SERVICESs

- "2PTY",
- "CHGCALL",
- "COIN",
- "HOTMOTL",
- "HOTPBX", and
- "TWOPTY"

are valid only when the SFSYS form (5713-1 Record) has SFID 50 ACT field set to "Y".

5.11 SCA GA ALW

Description: Does the customer want access to the LASS Selective Call Acceptance feature?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "4WINDIV" or "PBX", then ODA assigns a "Y" in this field. Otherwise, "N" is assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", "4WINDIV" or "PBX".

If the TERM TYPE field is not entered, this field will be assigned a "N" by ODA.

5.12 SCF GA ALW

Description: Does the customer want access to the Generally Available LASS Selective Call Forwarding feature?

Software Release: 5E6 and later
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "4WINDIV" or "PBX", ODA assigns a "Y" in this field. Otherwise, "N" is assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", "4WINDIV" or "PBX".

If the TERM TYPE field is not entered, this field is assigned a "N" by ODA.

5.13 SCR GA ALW

Description: Does the customer want access to the Generally Available LASS Selective Call Rejection feature?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", "4WINDIV" or "PBX", then ODA assigns a "Y" in this field. Otherwise, "N" is assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV", "4WINDIV" or "PBX".

If the TERM TYPE field is not entered, this field is assigned a "N" by ODA.

5.14 SDA GA ALW

Description: Does the customer want access to the Generally Available LASS Selective Distinctive Alert feature?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

If this field is left blank and the associated CLASS OF SERVICE on the LCC form is "ISDN", "INDIV", or "PBX", ODA assigns a "Y" in this field. Otherwise, "N" is assigned.

The only service classes, indicated in the CLASS OF SERVICE field on an associated LCC form, permitted access to the feature are "ISDN", "INDIV" or "PBX".

If the TERM TYPE field is not entered, this field is assigned a "N" by ODA.

5.15 ALT LANG

Description: Should the alternate language DSU2-RAF LASS announcements be used? This field supports the Alternate Language LASS Announcement feature, for more information on this feature see Division 2, Section 4A119.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If ALT LANG is set to "Y", then two FIXRT forms must be defined: one with "ALSLE" entered in FIXED ROUTE TYPE and one with "AL2LVL" entered in FIXED ROUTE TYPE.

DSLUSR forms with an ALT LANG field set to "Y" indicate that the Alternate Language LASS Announcement Special Feature is to be used. It is a secured feature and must be purchased by the office before this field can be set to "Y". An SFSYS form must exist with SFID 119 ACT set to "Y".

5.16 FLS

Description: Will free terminating service be activated? With FLS, all calls terminating to this TN are not billed.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The "Y" option usually applies only to direct connect and manual lines.

5.17 SUSO

Description: Should originating service be denied or suspended?

Required Field.
Default: N
Valid Entries: Y, N

Data Rule:
This field must be "N" if 2 PARTY ANI is "N" on the associated IMINFO form and the CLASS OF SERVICE is either "2PTY" or "TWOPTY" on the associated LCC form. This form corresponds with the IMINFO form if the first 3 digits of the OE field match the SWITCHING MODULE field on the IMINFO form. This form corresponds with the LCC form if LCC/RAX fields match.

5.18 CONTEXT ID

Description: This field is used to indicate whether or not a DSL (Digital Subscriber Line) is set to "NATIVE", "RESOLD", or "UNBUNDLED" for the AMA Recording for Resale and Unbundling feature. For more information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default:
- For 5E12 and 5E13: N
- For 5E14: NATIVE

Valid Entries:

Valid CONTEXT ID Entries

Entry for 5E12, 5E13	Entry for 5E14 and later	Description
N	NATIVE	Line owned by ILEC/Switch Owner with no additional recording.
R	RESOLD	Unbundled Line with Service Provider and Timing Module
U	UNBUNDLED	Resale Line with Service Provider and NO Timing Module

Data Rules:

Copyright © 2003 Lucent Technologies

For CKT TNs or CKT MLHG/CKT TERMs on the DSLUSR form, when the CONTEXT ID field is set to "R" or "RESOLD" or, "U" or "UNBUNDLED" , the ACT field for SFID (Secured Feature ID) 321 on the SFSYS form (5713-1 Record) must also be set to "Y".

For CKT TNs or CKT MLHG/CKT TERMs on the DSLUSR form, when the CONTEXT ID field is set to "R" or RESOLD" or, "U" or "UNBUNDLED", there must be an LCC form (5306 Record) where the RAX and LCC has a CLASS OF SERVICE of "ISATND" or "ISDN".

5.19 COMPL

Description: Complaint observing is used for customers who question their message rate bills. Does the customer want a detailed AMA record generated on all originating calls from this line, either answered or unanswered, except when the call encounters a Charge Index defined with a Call Type of "FREE"?

Required Field.
Default: N
Valid Entries: Y, N

5.20 SLUS

Description: Subscriber Line Usage is used for customers who question their message rate bills. Does the customer want a detailed AMA record generated on all originating calls from this line, either answered or unanswered, except when the call encounters a Charge Index defined with a Call Type of "FREE"?

Required Field.
Default: N
Valid Entries: Y, N

5.21 BRITL ALW

Description: Should the user be allowed to call a billed BRITL (BRI Dial Up Test Line)? If BRITL ALW is "Y", the circuit-switched voice user may test the operation of the DSL by placing a call to a preassigned DN. The bill for accessing the test line will be based on the duration of the call.

This field does not affect access to nonbilled BRITLs.

For more information about the BRITL feature, see Division 2, Section 2U.

Software Release: 5E6 and later
Valid Entries: Y, N

5.22 DTLBILL

Description: Detailed Billing is used for customers who question their message rate bills. Does the customer want a detailed AMA record generated on all originating calls from this line, either answered or unanswered, except when the call encounters a Charge Index defined with a Call Type of "FREE"?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The only difference between COMPL, SLUS and DTLBILL is the designation set in the AMA record.

5.23 TRAFFIC

Description: Should a Traffic Sampling Study be activated?

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

5.24 SAR NUM

Description: This field defines the number of call appearances to be reserved (subaddresses) for originating or terminating calls.
Valid Entries: 1 - 16

Data Rules:

The value entered in this field must not be greater than the value entered in the CA QTY field. If the number of subaddress reservations is less than the value in the CA QTY field, the subaddresses reserved are the last call appearances. For example, if CA is 1, CA QTY is 6 and SAR NUM is 2, then call appearances 5 and 6 are reserved.

If the SAR NUM field is not entered, then the SAR ORIG and SAR TERM fields must be "N".

If the SAR ORIG and SAR TERM are both "N", then this field must not be entered.

5.25 SAR ORIG

Description: The subaddress origination reservation. Any attempt to terminate to the subaddress results in a busy signal. Originations are handled normally.

Required Field.
Default: N
Valid Entries: Y, N

5.26 SAR TERM

Description: The subaddress termination reservation. Any attempt to originate on this subaddress will be denied. Calls terminate normally.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If one of the INCOMING, INTERCOM, ORIG CW or PP fields is "Y", then the SAR ORIG and SAR TERM fields must be "Y". Conversely, if the SAR ORIG and SAR TERM fields are both "Y", then at least one of the INCOMING, INTERCOM, ORIG CW or PP fields must be "Y".

5.27 NONHUNT

Description: Is this terminal a non-hunt terminal? NONHUNT allows a line in a CKT MLHG to receive direct calls that do not hunt if the called line is busy.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Non-hunt TNs may be assigned to terminals within a MLHG. Any terminal may be assigned a non-hunting

Copyright © 2003 Lucent Technologies

TN.

Non-hunt TNs interact with the group features in the following way:

- The group CFV (Call Forwarding Variable) has no effect on the non-hunt TN. If CFV is active for the group, calls to the non-hunt TN will not be forwarded as a result of the group CFV.
- The group and member make-busy keys have no effect on the non-hunt TN. If the make-busy keys are operated, calls can still complete to the non-hunt TN.

All non-outdial terminals (CKT TERM is 1 to 2015) with this field "Y" must have a CKT MLHG TN entered.

All outdial terminals (CKT TERM is 3001-3999) must have this field "Y".

If NONHUNT is "Y", then the associated TERMINATING TREATMENT on a LCC form must be "MLHG" or "INWATS".

If NONHUNT is "Y", then the CKT MLHG, defined on the MLHG form, must have an MLHG FEATURE that is defined on an MLHGFD form with a HUNT TYPE of "HTC", "REG", "UCD", "ISAT" or "PMHG".

NONHUNT must be "Y" when the fields MLHG and TERM NBR are defined on the SHTN form (5902 Record).

5.28 CA PREF

Description: The ISDN Terminal Call Appearance Preference. This field indicates the call appearance to select when a user goes off-hook.

Required Field.
Default: I
Valid Entries:

Valid CA PREF Entries

Entry	Definition
I	Idle call appearance preference. When a user goes off-hook, the call appearance which is currently idle is automatically selected and the user receives dial tone. If no call appearances are idle, then no call appearance is selected.
R	Ringing call appearance preference. When a user goes off-hook, the call appearance which was alerting first is automatically selected and the user is connected to the calling party. If no call appearances are alerting, then an idle call appearance is selected.

5.29 DNY BV

Description: Should the Deny Busy Verification feature be activated?

Required Field.
Default: N
Valid Entries: Y, N

5.30 TRC

Description: Should call tracing on calls to this line be activated?

Required Field.
Default: N
Valid Entries: Y, N

5.31 DNY ROH

Copyright © 2003 Lucent Technologies

Description: Should Deny Receiver Off-Hook tone be activated?

Required Field.
Default: Y
Valid Entries: Y, N

6. FORM ENTRIES, 5908-5 RECORD

6.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

6.2 BUSY MONITOR

Description: Can the CKT TN entered for this DSL Multiline terminal be monitored by the Busy Lamps of an ISDN Attendant MLHG?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the CKT TERM or DPKT TERM fields are "1", then this field must be "N".

If this field is "Y", then either a CKT TN and OE or an MLHG TN and OE must be entered.

If the SAR NUM and CA QTY fields have equal entries, this field must be "N".

If this field is "Y", then the LCC and RAX (under the CKT SWITCHING header) must be defined on a LCC form with a CLASS OF SERVICE of "ISDN".

If BUSY MONITOR is "Y", ATT MLHG must be entered.

6.3 ATT MLHG

Description: The ISDN Attendant MLHG that can busy monitor this TN.

Software Release: 5E7 and later.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

The value entered in this field can also appear in the ATT MLHG field on a LINE form, an MLHLN form, an MLHG form or an SHTN form. When it appears on any of the previously mentioned forms or this form, and also appears in the CKT MLHG field on this form, the LCC and RAX for the ATT MLHG must be defined on an LCC form with a CLASS OF SERVICE of "ISATND" or "ATND".

If this field is entered and CKT TERM is "001", then the CKT MLHG must be defined on an MLHG form with ATT MLHG equal to the ATT MLHG on this form.

An ISDN Attendant cannot busy monitor a Hundreds Group if the Hundreds Group has physical terminations on more than 13 Switching Modules.

For 5E8 and later, if ATT MLHG is entered, RBV TGN must not be entered.

Copyright © 2003 Lucent Technologies

6.4 RBV TGN

Description: Enter the RBV TGN of the incoming trunk group used to Remote Busy Verify the CKT TN (DN) or the CKT SWITCHING MLHG TN of this form. This TGN allows an ISAT (ISDN Attendant) on another 5ESS switch to Busy Verify this DN if the TGN is associated with a CKT TN (DN) or CKT SWITCHING MLHG TN.

Software Release: 5E8 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If RBV TGN is entered, either a CKT TN or a CKT SWITCHING MLHG TN must be entered, BUSY MONITOR must be "N", and CSV must be entered and greater than zero.

If RBV TGN is entered, there must be a corresponding TKGRP form (5202 Record) with that TGN defined, and that TKGRP form must have TRKCLS set to "ATNDVFY", and TRK DIR must be "INC". Also, for the TGN on the TKGRP form, there must be at least one corresponding TRUNK form (5204 Record) with QTY entered.

If RBV TGN is entered, and CKT MLHG and CKT TERM are entered, CKT MLHG must equal MLHG on a corresponding MLHG form. That MLHG form must have MLHG FEATURE equal FEATURE NAME on a corresponding MLHGFD form, which must not have HUNT TYPE set to "MUPH", "ISAT", or "PSUCD".

6.5 SERHLN

Description: A Series Completing to Telephone Number. Series Completion supports BRI (Basic Rate Interface) lines for CSV (Circuit-Switched Voice) calls. SERHLN hunts a linked-list DN until an idle line is found or until 16 Series Completion attempts are made. A maximum of 50 TNs can Series Complete to a single TN defined on this form or on the LINE, MLHLN or SHTN forms.

Software Release: 5E6 and later
Valid Entries:
- For 5E11 and earlier: 7-digit number, 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

SERHLN cannot be entered when CKT ICP is "Y".

A maximum of 512 TN(s) are allowed to Series Complete to a single TN which is entered in the SERHLN field on the the LINE, MLHLN, DSLUSR or SHTN forms.

When SERHLN is entered, the CKT TN field or the CKT MLHG TN must be entered; however, SERHLN cannot have the same entry as CKT TN or CKT MLHG TN. When each of these three fields are entered, NONHUNT must be "Y".

When SERHLN is entered the following must be true:

- TERM TYPE and LCEN (or ILEN) must be entered,

- The LCC must be defined on an LCC form where:

Copyright © 2003 Lucent Technologies

- for a CKT TN, TERMINATING TREATMENT must be "INDIV";
- for a CKT MLHG/TERM, TERMINATING TREATMENT must be "MLHG" or "INWATS".

For 5E7 and later, if Series Completion is allowed (SERHLN is entered), one of the following conditions must be satisfied:

1. the SERHLN assigned on this form matches a CKT MLHG TN on a DSLUSR with ICP (intercept) of "N".
2. the SERHLN must be defined on a LINE form (as TN) with ICP (intercept) of "N". The LCC/RAX must match LCC/RAX on LCC form with a TERMINATING TREATMENT of "INWATS", "PARTY", "RI", or "INDIV".
3. the SERHLN matches a CKT TN on a DSLUSR form with ICP of "N".
4. the SERHLN must be defined on an MLHLN form (as TN) with ICP of "N". The LCC/RAX must match LCC/RAX on an LCC form with a TERMINATING TREATMENT of "INWATS" or "MLHG".
5. the SERHLN matches an STN on an SHTN form where SMLHG/SMEMB is not entered, STN does not match TN in row 1 of the SHARED LIST, and ICP is "N".
6. the SERHLN matches an STN on an SHTN form where SMLHG/SMEMB is entered, SMLHG/SMEMB does not match MLHG/MEMB in row 1 of the SHARED LIST, and ICP is "N".
7. the SERHLN assigned on a DSLUSR form must be defined on the LINE form, MLHLN form, DSLUSR form, SHTN form or as LISTED TN on an MLHG form.

For 5E12 and later, if the SERHLNs on the DSLUSR form have SERHLN entered, the equivalent 10-digit SERHLN cannot equal the equivalent 10-digit CKT TN on the same DSLUSR form.

For 5E12 and later, if the SERHLNs on the DSLUSR form have SERHLN entered, the equivalent 10-digit SERHLN cannot equal the equivalent 10-digit CKT MLHG TN on the same DSLUSR form.

For 5E12 and later, if the first 3 digits of the 7-digit SERHLNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE or the NOC form does not exist, SERHLN must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

6.6 BCK LNK

Description: Does any other TN series complete to this CKT TN? This is a Recent Change only field on the 23.2 view. It cannot be entered on the ODA form.

Software Release: 5E6 and later.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then ICP must be "N" and TERM TYPE must be entered.

6.7 QUEUE MONITOR

Description: Does the ISDN terminal monitor MLHG queuing data? This is a Recent Change only field on

Copyright © 2003 Lucent Technologies

view 23.2. It cannot be entered on the ODA form.

Software Release: 5E6 and later.
Valid Entries: Y, N

Data Rules:

If QUEUE MONITOR is "Y", then CONFIG GRP and TERM TYPE must be entered.

6.8 EPO POS NUM

Description: Enter the EPO (Enhanced Professional Office) position number. This number is used to associate an EPO position number with a Custom ISDN terminal and uniquely identifies each EPO terminal. When a terminal is designated as an EPO position, circuit telephone numbers and circuit MLHG (Multi-line Hunt Group) members, which have call appearances on the terminal, can be tracked for call and event information. This information is sent to the MIS (Management Information System). Assigning an EPO POS NUM to a terminal provides the ability to track circuit telephone numbers or circuit MLHG members. Whether or not each individual telephone number or MLHG member is tracked depends on how the EPO ON field is set. Tracking can be assigned for the primary CKT TN of the terminal by setting EPO ON to "Y" on this form. For circuit telephone numbers or circuit MLHG member which share call appearances on this terminal, tracking is determined by the EPO ON fields on SHTN form (23.20 or 23.21 views). This field supports the Enhanced Professional Office secured feature (SFID 179). For more information on this feature, see Division 2, Section 4A179.

Software Release: 5E11 and later.
Valid Entries: 1 - 15000

Data Rules:

The EPO POS NUM field on the DSLUSR form is used by the Enhanced Professional Office Feature. It is a Secured Feature that must be purchased by the office before EPO POS NUM can be entered. An SFSYS form must exist with SFID 179 ACT set to "Y".

EPO POS NUM(s) must be unique, they cannot be duplicated on another DSLUSR form.

EPO POS NUM and ACD POS NUM cannot both be entered.

If EPO POS NUM is entered:
- CSV must be entered
- TERM TYPE must be "TYPEB" or "TYPED"

If a CKT TN, CKT MLHG, or CKT MLHG/CKT TERM field is entered and also has an entry in EPO POS NUM, then:

- the corresponding DSL form (where DSLUSR OE matches DSL form DSL OE) must not have a DSL CLS of "STD".

- the CKT LCC/CKT RAX values on the DSLUSR form must have a CLASS OF SERVICE of "ISDN" on the associated LCC form.

6.9 EPO ON

Description: Should the CKT TN or the CKT MLHG and CKT TERM be tracked? When "Y" is entered and the terminal has been designated as an EPO position, event information for calls and events to this CKT TN or CKT MLHG and CKT TERM is sent to the MIS (Management Information System). The information

Copyright © 2003 Lucent Technologies

includes reports on terminal usage, status, event codes, and call-related events associated with the tracked CKT TN or CKT MLHG and CKT TERM. The MIS compiles the call data and provides user reports and display to each customer.

The information is sent to the MIS only when EPO ON is "Y" and EPO POS NUM is entered on this form. If "N" is entered or the terminal is not defined as an EPO position, no tracking will be performed for calls to or from this terminal.

The value of EPO ON can be modified for the CKT TN on the SHTN form (5902 Record) (23.20 or 23.21 views). For CKT TN or CKT MLHG members other than the primary CKT TN, which share call appearances on this terminal, tracking is always determined by the EPO ON fields on the SHTN form.

Software Release: 5E11 and later.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, ACD POS NUM cannot be entered.

When DSLUSR forms have the CKT TN or CKT MLHG field entered and also have the EPO ON field set to "Y", the corresponding DSL form (where DSLUSR OE matches DSL form DSL OE) must not have a DSL CLS of "STD".

6.10 ACD POS NUM

Description: This attribute uniquely identifies an ACD/BRCS position. When this attribute has a value other than 0, this terminal is an ACD/BRCS position.

ACD/BRCS positions are required to have the following characteristics:
- circuit switch voice service
- service class of "ISDN"
- position DN which is primary

ACD/BRCS positions are not allowed to have the following characteristics or features:
- assigned to a Bellcore Standard BRI
- a shared primary (position) DN
- assigned series completion DNs
- a primary or secondary DN that is a MLHG member
- a circuit switched MLHG member

For more information on the ACD/BRCS secured feature, see Division 2, Section 4A121.

Software Release: 5E9(1) and later
Valid Entries:
- For 5E9(1) - 5E10: 1 - 4095
- For 5E11 and later: 1 - 9999

Data Rules:

ACD POS NUM on the DSLUSR form must be a unique entry and cannot be entered on another DSLUSR form.

For 5E9(1) - 5E10, it cannot be entered as POS NUM on the OSPSOP form.

No more than 512 ACD POS NUM values may be assigned to the same SM on the DSLUSR form.

Copyright © 2003 Lucent Technologies

If ACD POS NUM is entered
- BRCS must be "Y"
- CSV must be entered.
- CKT MLHG cannot be entered
- CKT TN must be entered.
- SERHLN cannot be entered
- SHARED must be "N"
- TERM TYPE must be "TYPEB" or "TYPED"

For 5E11 and later:
- ACD GROUP must be entered
- EPO POS NUM cannot be entered

If ACD POS NUM and CKT TN fields are entered, then:

- the corresponding DSL form (where DSLUSR OE matches DSL form DSL OE) must not have a DSL CLS of "STD".

- The telephone number must have the required IDP and/or TGSR features must be assigned on the LINEFA form, CLUSTR form or associated BFG form.

- For the IDP feature, A (ACTIVE) should be "Y". For the TGSR feature, if A (ACTIVE) is "Y", then the nondefault TGSR attributes remain active when an agent is logged in or logged off. However, if A (ACTIVE) is "N", then the default TGSR attributes are active when the agent is logged off and the nondefault TGSR attributes are active when the agent is is logged on.

- this CKT TN must have one and only one CFW feature with FWD CONDITION of "ACDI" on the associated CFWFD form, which is assigned on the LINEFA form, CLUSTR form or associated BFG form with "Y" entered in the A (ACTIVE) field.

- the CKT TN must not be assigned to a PP feature, an ACVT feature, or an ACSR feature on the LINEFA form, CLUSTR form or associated BFG form.

- the CKT TN must have exactly one MW feature with MULTIWAY CONTROL of "3WAY" and FEATURE BUTTON set to "Y" on the associated MWFD form, which is assigned on the LINEFA form, CLUSTR form or associated BFG form.

- the CKT TN may not be the PRIMARY TN (in SHARED LIST position 1) for any Key MLHG/TERM NBR on the SHTN form.

- the associated LCC/RAX value on the DSLUSR form must have the SERVICE CLASS of "ISDN" on the LCC form.

ACD POS NUM may not be entered on the DSLUSR form unless "Y" is entered in SFIDs 121 and 122 on the SFSYS form (5713-1 Record). ACD POS NUM assignment is for the secured feature ACD/BRCS and must therefore be purchased by the Office before they may be assigned on the DSLUSR form.

5E11 and later.
If EPO ON is "Y", ACD POS NUM cannot be entered.

6.11 ACD GROUP

Description: Enter the Automatic call distributor group. This field uniquely identifies a sub-terminal group to allow customers to divide their call centers into smaller groups. This allows different groups to exist within the same ACD customer with the same level of security that exists between different ACD

Copyright © 2003 Lucent Technologies

customers. This field supports the ACD/BRCS Position Provisioning secured feature (SFID 122). For more information on this secured feature, see Division 2, Section 4A122.

Over a retrofit from 5E10 to 5E11, if ACD POS NUM is entered, this field is set to 1. If ACD POS NUM is not entered, this field is also not entered.

Software Release: 5E11 and later.
Valid Entries: 1 - 999

Data Rules:

If ACD POS NUM or ACD GROUP is entered, both must be entered.

7. FORM ENTRIES, 5908-6 RECORD

7.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

7.2 CIDIAL

Description: Carrier Interconnect Dialing Permissions.

Required Field.
Default: ALLOW
Valid Entries:

Valid CIDIAL Entries

Entry	Definition
ALLOW	The customer can dial an FGD CAC (Carrier Access Code) or use a PIC (Pre-subscribed InterLATA Carrier) identification number if one is assigned when making a carrier interconnect call.
DENY	The customer cannot dial an FGD CAC.
REQ	The customer is required to dial an FGD CAC when making a carrier interconnect call. A PIC may not be assigned to lines with this CIDIAL type.
TALLOW	Same as ALLOW, but used for a CI test line only.
TDENY	Same as DENY, but used for a CI test line only.
TREQ	Same as REQ, but used for a CI test line only.

Data Rules:

For 5E9(2) and later, PIC is not allowed for lines that require carrier access code dialing, therefore, if "TREQ" or "REQ" is entered, PIC cannot be entered..

If "REQ" or "TREQ" is entered, PTC must not be entered.

7.3 PIC

Description: A PIC (Pre-subscribed InterLATA Carrier identification number) assigned to a DSL.
Valid Entries: 0 - 9999

Data Rules:

This entry is not valid when CIDIAL is "REQ" or "TREQ".

For 5E8 and later, if PIC is entered, then on the ICF form (5305 Record) the CARRIER ID must match the PIC entry and FEAT GRP must be "D".

For 5E9(1) and later, PIC is not allowed for lines that require carrier access code dialing.

Copyright © 2003 Lucent Technologies

7.4 PTC

Description: Enter the PTC (Presubscribed IntraLATA Toll Carrier). This field supports the ICLATA (InterLATA Carrier's IntraLATA Capability) secured feature. For more information on the ICLATA feature, see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 9999

Data Rules:

The PTC field is used by the ICLATA Secured Feature. This feature must be purchased by the office before the field can be entered. The SFID 149 ACT field must be set to "Y" on the SFSYS form (5713-1 Record), before PTC can be entered.

If the PTC field is entered, then the PTC must be entered as a CARRIER ID on the ICF form (5305 Record).

7.5 PLC

Description: Enter the PLC (Presubscribed Local Carrier) code. The PLC field supports the Alternate Local Service Provider Routing feature. For more information on the Alternate Local Service Provider Routing feature, see Division 2, Section 4A269.

Software Release: 5E12 and later.
Valid Entries: Blank, or 0 - 9999.

Data Rules:

The PLC field on the DSLUSR form must be defined as CARRIER ID on the ICF form with FEAT GRP equal to "D".

7.6 UNBUNDLED

Description: Has this line been unbundled from the LEC?

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

If UNBUNDLED is "Y", then PLC must be entered.

7.7 INCOMING

Description: Are incoming calls to a terminal group a priority?

Required Field.
Default: N
Valid Entries: Y, N

7.8 INTERCOM

Description: Are ISDN Intercom calls a priority?

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If this field is "Y", the SAR ORIG and SAR TERM fields must be "Y".

7.9 ORIG CW

Description: Are originating call waiting calls a priority? This is the ISDN equivalent of call waiting origination.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", the SAR ORIG and SAR TERM fields must be "Y".

7.10 PP

Description: Are Precedence and Preemption calls a priority?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", the SAR ORIG and SAR TERM fields must be "Y".

7.11 AUTO HOLD

Description: Does auto hold apply? Auto hold allows an existing call to be placed on hold. If "N" is entered, auto drop applies. Auto drop allows an existing call to be disconnected and a new call appearance to be connected.

Required Field.
Default: N
Valid Entries: Y, N

7.12 ONE TOUCH

Description: Will ONE TOUCH be activated? If "Y", a switch is associated with this feature that will automatically turn on the terminal's speaker phone to answer or originate a call.

Required Field.
Default: N
Valid Entries: Y, N

7.13 LN TYPE

Description: Depending on the line type entered, does the line belong to a Leased Network and does it query the NCP (Network Control Point) data base for routing and charging information?

Software Release: 5E6 and later
Default: NONE
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid LN TYPE Entries

Entry	Definition
IMT	Software Release: 5E9(1) and later. An Inter-Machine Trunk.
NONE	Not a Leased Network line.
NOQRY	A Leased Network line that does not query the NCP data base.
QRY	A Leased Network line that queries the NCP data base.

Data Rules:

If a CKT TN (or MLHG/TERM) is defined with LN TYPE of "QRY", the CKT TN (MLHG/TERM) must not be assigned a BRCS Authorization Code Feature on the BFG, LINEFA (MLHLNFA) or an associated CLUSTR form.

For a Leased Network line, LN TYPE "QRY" or "NOQRY", the following restrictions apply:

- If a CKT TN is defined and is entered on both an ATHLPA form (5619-5 Record) and a MDRLPA form (5624-4 Record), the corresponding ATH FOR MDR on the ATHLPA form must be "N".
- If a CKT TN is defined, it must also be on at least one ARSLPA form or be assigned an ARS (Automatic Route Selection) Feature on the BFG, LINEFA or an associated CLUSTR form.
- If an MLHG/TERM is defined and is assigned both ATH and MDR Features on MLHLNFA, CLUSTR or BFG (except MDR may not be on BFG), then the ATH FOR MDR on the associated ATHFD or ATHMPA or BFG form must be equal to "N".
- If a CKT MLHG/TERM is defined, it must be assigned an ARS feature on a BFG, MLHLNFA or associated CLUSTR form.
- If a CKT TN (or MLHG/TERM) is defined, the LCC and RAX must be defined on a LCC form with CLASS OF SERVICE equal to "ISDN".
- If a CKT TN is defined and is assigned both ATH and MDR Features on a LINEFA or associated CLUSTR form (excluding the BFG form), then the ATH FOR MDR on the associated ATHFD or ATHLPA form must be equal to "N".

If a CKT TN defined on this form is entered on an ATHLPA form with ATH FOR MDR equal to "Y" and is also entered on a MDRLPA form, then the LN TYPE field on this form must be "NONE" or blank.

The LN TYPE must be "NONE" or blank if: a CKT TN defined on this form is assigned both ATH and MDR Features on BFG, LINEFA or associated CLUSTR forms and the ATH feature is defined on the ATHFD form with ATH FOR MDR equal "Y".

The LN TYPE must be "NONE" or blank if: an MLHG/TERM defined on this form is assigned both ATH and MDR Features on BFG, MLHLNFA or associated CLUSTR forms and it has the parameter ATH FOR MDR "Y" on an ATHMPA, BFG or ATHFD form.

7.14 BLK 1PLUS

Description: Enter the type of blocking on a line if the office has the 1+ blocking/1+ split blocking feature.

Software Release: 5E7 and later
Required Field.
Default: NONE
Valid Entries:

Valid BLK 1PLUS Entries

Entry	Definition
FULL	Block all 1+ dialing.

Copyright © 2003 Lucent Technologies

SPLIT	Block 10xxx-1+ if the carrier dialed is not the pre-subscribed carrier.
NONE	No blocking for 1+ on the line.

Data Rules:

BLK 1PLUS must be "NONE", if the OE TYPE and NUMBER are not entered.

If CKT TN, CKT MLHG, and CKT TERM are not entered, then BLK 1PLUS must be "NONE".

If BLK 1PLUS is set to either "FULL" or "SPLIT", then LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "INDIV", "4WINDIV", "PBX", "HOTPBX", "HOTMOTL", "COIN", "ATND", "ISDN", "ISATND", or "SATSTLN".

7.15 RMB

Description: The Scan Point Number for CKT MLHG/CKT TERM combinations requiring a Member Make Busy Key assignment (previously called Remote Make Busy).
Valid Entries:

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	XX	0-1
Board	BRD	XX	00-31
Scan Point Number	SPN	XX	00-31

Data Rules:

A CKT MLHG can have up to 32 terminals sharing one Scan Point Number for Member Make Busy Keys (previously called Remote Make Busy). Available assignments can be found on the 5840 Record.

For 5E6 and later, RMB can be entered only when CKT MLHG is entered and TERM TYPE is "TYPEE".

7.16 RND MKB

Description: Specify the Random Make Busy scan point.
Valid Entries: A scan point number consisting of:

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-31
Scan Point Number	SPN	XX	00-31

Data Rules:

RND MKB can be entered only when CKT MLHG and CKT TERM are entered and CKT TERM is 1 - 2015 (not an Outdial terminal).

RND MKB can only be entered when TERM TYPE is "TYPEE".

This field cannot be entered when the MLHG form has HUNT TYPE equal "ISAT".

RND MKB and RND SUBGP cannot be both entered simultaneously.

7.17 STH

Description: The Scan Point Number for CKT MLHG/CKT TERM combinations requiring a Stop Hunt Key assignment (which stops hunting at the member).

Copyright © 2003 Lucent Technologies

Valid Entries:

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU	X	0-1
Service Group	SVG	XX	0-1
Board	BRD	XX	00-31
Scan Point Number	SPN	XX	00-31

Data Rules:

The Scan Point Number for Stop Hunt Keys must be unique. Available assignments can be found on the 5840 Record.

8. FORM ENTRIES, 5908-7 RECORD

8.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

8.2 MMB SUBGROUP

Description: For 5E6 and later this field has been renamed as MMB SUBGP.

8.3 MMB SUBGP

Description: The Member Make Busy Subgroup number for the MLHG Terminal.
Valid Entries: 1 - 255

Data Rules:

The number entered here designates a subgroup. All members in the same subgroup must have the same MMB SUBGP number.

This field cannot be entered when the MLHG form has HUNT TYPE equal "ISAT".

CKT TERM must be entered when MMB SUBGP is entered.

The CONFIG GRP entered must be defined on a CFGGRP form with a feature button assigned an ACTION of "BYMB" (Member Make Busy).

It is recommended that if one of the subgroup members resides on a RSM (Remote Switching Module), then all members of the subgroup should reside on the same RSM.

8.4 RND SUBGP

Description: Enter the Make Busy Subgroup Number for the Make Busy ISDN Buttons.

Software Release: 5E7 and later
Valid Entries: 1 - 255

Data Rules:

When TERM TYPE is "ATND", a RND SUBGP cannot be entered.

RND MKB and RND SUBGP cannot both be entered.

If MMB SUBGP or RND SUBGP is entered, then CKT MLHG/TERM must be specified.

Copyright © 2003 Lucent Technologies

8.5 ERCO ASGN

Description: Assign Executive Ringer Cutoff to a shared DN BRCS line. ERCO allows an ISDN keyset user to press a feature button to turn audible ringing on or off for all incoming voice calls except for ICOM, 911 and Auto Call Back. When ringing is turned off by ERCO, visual alerting at the principal's terminal and the ability to pick up the call still occurs.

The operation of the Executive Ringer Cutoff feature button does not alter call treatment at any of the coverage terminals. In addition, while ERCO is in effect, all other functions on the ISDN keyset are unaffected. Incoming Calls are lighted normally and given standard displays.

ERCO, which is a Secured System Optional feature, and its translation requirements are described in Division 2, Section 4A.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ERCO ASGN is "Y", then TERM TYPE must not be "ATND" and SHARED must be "Y".

A feature button with its ACTION field "ERCO" is assigned on a CFGGRP form (5964 Record). should be entered in the CONFIG GRP field on this form, if a feature button on the CFGGRP form will be assigned "ERCO".

ERCO can only be assigned if the SFSYS form (5713 Record) indicates that the feature has been purchased and enabled.

8.6 ERCO ACT

Description: This is a Recent Change only field. It is used to activate and deactivate ERCO.

8.7 LONG DST DR

Description: Is distinctive ringing supplied for long distance calls?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If LONG DST DR is set to "Y", then LCC and RAX must be defined on an LCC form with a CLASS OF SERVICE of "ATND", "INDIV", "ISATND", "ISDN", or "PBX".

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before the LONG DST DR field can be changed from its default value on either the LINE, MLHLN, or DSLUSR forms. The SFID 91 ACT field on the SFSYS form (5713-1 Record) must be set to "Y", before the LONG DST DR field can be set to "Y".

8.8 E911 PSAP

Description: Is this an E911 Public Safety Answering Point? This field applies to the secured feature, ISDN PSAP Support. For information on the feature, see Division 2, Section 4A114.

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later.
Valid Entries: Y, N

Data Rules:

This field can be "Y" only if the ISDN PSAP Support secured feature has been purchased; SFID 114 ACT must be set to "Y" on the SFSYS form (5713-1 Record).

If "Y" is entered, then
- ACD POS NUM must not be entered.
- CKT TERM must not be greater than 2015.
- CSV must be entered.
- TERM TYPE must be "TYPEB" or "TYPED".
- SERHLN must not be entered.
- SUSO must not be "Y".
- SUST must not be "Y".

In addition, if "Y" is entered, the following restrictions apply.

- The CKT SWITCHING LCC and RAX must be defined on the LCC form with CLASS OF SERVICE set to "ISDN".
- OE must be defined on the DSL form with DSL CLS set to "MP" or "PP". If DSL CLS is "PP", ACSR GRP on the DSL form must be blank.
- For 5E9(1) and later, if a CKT TN is entered and
  - ACD POS NUM is not entered, then the following types of BRCS features cannot be assigned to the CKT TN (via the LINEFA, CLUSTR, or BFG form):

    ACCT

    ACSR

    ARS

    ATH

    CFW (CFPF ALW is "Y")

    ICM

    MDR

    MS

    PFA

    PP

Copyright © 2003 Lucent Technologies

PUO

PUT

TGSR

TOD

- ACD POS NUM is entered, the following types of BRCS features cannot be assigned to the CKT TN (via the LINEFA, CLUSTR, or BFG form):

  ACCTFD

  ACSRFD

  ARSFD

  ATHFD

  CFPF (CFPF ALW is "Y")

  ICMFD

  MDRFD

  MSFD

  PFAFD

  PPFD

  PUOFD

  PUTFD

  TODFD

- If CKT MLHG / CKT TERM are entered, then:

  - the value entered for E911 PSAP must match the E911 PSAP entry on the corresponding MLHG form;

  - the MLHG member may not be assigned the following types of BRCS features on the MLHLNFA, CLUSTR, or BFG form: ACCT, ACSR, ARS, ATH, CFW (where CFPF ALW is "Y"), ICM, MDR,

Copyright © 2003 Lucent Technologies

MS, PFA, PP, PUO, PUT, TGSR, or TOD.

- The CKT TN and CKT MLHG TN may not be series completion DNs on other forms; that is, they may not appear in the SERHLN field on a LINE, MLHLN, DSLUSR, or SHTN form.

For 5E9(1) and later, if "Y" is entered and ACD POS NUM is entered, then the SFID 143 ACT field must be set to "Y" on the SFSYS form (5713-1 Record). This data combination is used by the Pinnacle ACD E911 secured feature that must be purchased by the office before this data combination can be entered.

If "Y" is entered and ACD POS NUM is entered for a CKT TN, then the CKT TN must have a fully unrestricted TGSR (Terminal Group Station Restriction) feature assigned via the LINEFA, CLUSTR, or BFG form. The TGSR feature must be defined on the TGSRFD form with ORIGINATING RESTRICTION field, the ORIGINATING DEFAULT field, the TERMINATING RESTRICTION field, and the TERMINATING DEFAULT field set to "NONE".

8.9 SCP ALW

Description: Is the DSL allowed to receive messages from the SCP (Service Control Point)? This field supports the Network Element Services Signaling secured feature. For more information on this feature, see Division 2, Section 4A185.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Before "Y" can be entered in this field, the ASP (Advanced Service Platform) NESS (Network Element Services Signaling) secured feature must be purchased and the SFID 185 ACT field must be "Y" on the SFSYS form (5713-1 Record).

If "Y" is entered:

- CKT TN or CKT MLHG TN must be entered.
- and CKT MLHG is entered, then NONHUNT must be "Y".
- the corresponding DSL form (DSLUSR OE matches DSL OE) must have a DSL CLS of "STD".

8.10 PASC

Description: Is Personal Communications Access Service - C Interface available? This field is used to indicate if the PCS (Personal Communications Services)/ISDN feature is available on the DSL. Note that effective with the implementation of the PCS/ISDN Interworking feature, the IHN DSL MAINT field was added to the RTERM form to allow several types of DSL testing to be inhibited (see the RTERM form (5174 Record), Division 3, Section 1S). For more information on PCS and INH DSL MAINT, see NI-3 (National ISDN 3) in Division 2, Section 1AM.

The PCS/ISDN Interworking feature is a secured feature and SFID 228 on the SFSYS form must be "Y".

Software Release: 5E10 and later.
Valid Entries: PCSI

Data Rules:

Copyright © 2003 Lucent Technologies

If "PCSI" is entered, CKT TN must be entered.

If "PCSI" is entered, the following fields must not be entered:

AGI
- SPDNA
- AUDNA
- K56DNA
- K64DNA
- ATTMLHG
- RBVTGN
- SERHLN
- ODB TN
- EKTS
- ODB MLHG/ODB TERM

If "PCSI" is entered, the following fields must be as indicated:

BRCS must be "Y"
- SHARED must be "N"
- CSV must be 1
- CSV CHL must be "ANY"
- E911PSAP must be "N"
- TERM TYPE must be "TYPEA"
- AC ALW must be "N"
- AR ALW must be "N"
- COT ALW must be "N"
- SCA GA ALW must be "N"
- SCF GA ALW must be "N"
- SCR GA ALW must be "N"
- SDA GA ALW must be "N"

If "PCSI" is entered for a CKT TN, the CKT TN may not be entered as SERHLN on a LINE, SHTN, or MLHLN form or as a SERHLN on another DSLUSR form.

If "PCSI" is entered, each DSLUSR form must have a corresponding DSL form where the following conditions are met:

DSL CLS is set to "STD"
- B1 SERV must not be "X25"
- B2 SERV must not be "X25"

If "PCSI" is entered, the assignment of BRCS features to a TN (LINEFA form) are prohibited EXCEPT for:
- RNDFD features
- ASPFD features
- DISPFD features
- CPNBNFD features

Multiway Calling features are also prohibited except Three-Way Calling with MULTIWAY CONTROL set to "3WAY" and MULTIWAY TRANSFER is set to "N".

If "PCSI" is entered, a CKT TN must appear as TN on a LINEFA form which has an ASP feature or a CLUSTER containing an ASP feature assigned. Additionally, the associated ASPFD form must have CONTROL set to "ORIG" and the OHD TRIG NBR field on the ASPFD or ASPLPA forms must be

Copyright © 2003 Lucent Technologies

entered.

8.11 ALT

Description: Is Automatic Link Transfer available?

This field supports the PCS/ISDN Interworking feature. It is used to indicate whether this user on the DSL is allowed to comply with a request for an Automatic Link Transfer. The purpose of the ALT is to move a PCS call from one RPCU (Radio Port Control Unit) to another RPCU. For more information, see Division 2, Section 1AM.

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ALT is "Y", PASC must be "PCSI".

8.12 LRN INDEX

Description: Enter an index into the LRNINDEX form (5328 Record) to obtain the LRN associated with this DN. LRNs are used to route DNs that have been ported into the office from other switches. An LRN uniquely identifies an office and rate center. This field supports the Local Number Portability secured feature (SFID 174). For more information on this feature, see Division 2, Section 4A174.

Software Release: 5E11 and later.
Valid Entries: 1 - 127

Data Rules:

When this field is entered, LRN INDEX must also be entered on the LRNINDEX form (5328 Record).

8.13 PORTED

Description: The PORTED field is used to indicate whether the TN has been ported into this office via the NP (Number Portability) feature. The indicator is used by call processing to determine whether or not to generate an NP BAF (Bellcore AMA Format) module for originating and terminating IXC (Inter-Exchange Carrier) access records.

Software Release: 5E11 and later
Default: N
Valid Entries: Y, N

8.14 NON COND TRIG

Description: The NON COND TRIG field is used to indicate whether or not a call to this DN requires a non-conditional query of the SCP (Service Control Point) prior to routing the call.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

NON COND TRIG must be "N" when:

Copyright © 2003 Lucent Technologies

- ICP is "Y"
- E911 PSAP is "Y"

When NON COND TRIG is "Y", then:

- CKT TN and DPKT/ODB/PPB1/PPB2 TN must not be the same.
- CKT TN must be entered but CKT MLHG and CKT TERM must be blank.
- the ACT field for SFID 216 must be set to "Y" on the SFSYS form, and if SFID 216 is set to "Y", SFID 174 must also be set to "Y".
- the CLASS OF SERVICE and TERMINATING TREATMENT on the LCC form should be as follows:
  - Valid CLASS OF SERVICE
    - "10PTY", "2PTY", "4PFS", "4PSS", "5PTY", "8PSS", "ATND", "CHGCALL", "COIN", "HOTMOTL", "HOTPBX", "INDIV", "ISATND", "ISDN", "PBX", "SATSTLN", "TWOPTY", "4WINDIV"
  - Valid TERMINATING TREATMENT
    - "INDIV", "INWATS", "MLHG", "PARTY"

NI SAR LIST (SARLIST)

The following fields (Section 8.15 - Section 8.16) describe the NI SAR LIST. These fields support the ISDN Call Appearance Reservation feature. See Division. 2, Section 1BM for more information.

The subaddress reservation list contains up to 3 entries which consist of the type of subaddresses to reserve, the order in which the type of reservation specified should appear with respect to the other types of subaddresses reserved, if any, and the number of subaddresses to reserve for that type of subaddress reservation.

8.15 TYPE AND ORDER

Description: The TYPE AND ORDER field is used to specify the type and order of subaddresses to reserve for call appearance reservation. The subaddress types can be reserved in any order with respect to one another; however, all subaddresses within one category must be reserved contiguously (i.e. each reservation type may appear only once in NI SAR LIST(SARLIST) field). The location of the list entry determines the ordering of the reservation type with respect to the other types of subaddresses reserved, if any. The reserved subaddresses are assigned to the highest numbered subaddresses associated with the circuit telephone number specified in the CKT TN field. Following is an example of the assignment of call appearance reservation on a terminal on which the circuit TN specified is primary.

The circuit TN has 5 call appearances (CA QTY is 5) starting at call appearance 3 (CA is 3) and the NI SAR LIST field is set up as follows:

NI SAR LIST		
ROW	TYPE AND ORDER	QTY
1	PRIO	1
2	TERM	2
3	ORIG	1

Copyright © 2003 Lucent Technologies

In this example, the circuit TN has five subaddresses (CA QTY is 5). Four of the circuit TN's five subaddresses are to be reserved (sum of QTY column). Since the reserved subaddresses are the highest numbered subaddresses of the circuit TN, it is the last four of the five subaddresses (subaddresses 2, 3, 4, and 5 of the circuit TN) which will have subaddress reservation. The order of the types of reservation follows the order specified in the NI SAR LIST field. Therefore, subaddress 2 of the circuit TN will be reserved for originations and priority incoming terminations ("PRIO") since a QTY of 1 subaddress is specified to be reserved for "PRIO" and it is the first type in the NI SAR LIST. Subaddresses 3 and 4 will be reserved for terminations ("TERM"), since a QTY of 2 subaddresses are specified to be reserved for TERM and it is the second type in the NI SAR LIST. Finally, subaddress 5 will be reserved for originations ("ORIG"), since a QTY of 1 subaddress is specified to be reserved for "ORIG" and it is the third type in the NI SAR LIST. Any non-reserved subaddresses are the lowest numbered subaddresses of the circuit TN (in this example, subaddress 1 is non-reserved).

On this terminal, the subaddresses correspond to CA (Call Appearances) as follows:

- CA 3 is subaddress 1 (non-reserved)
- CA 4 is subaddress 2 (reserved for "ORIG" and "PRIO" terminations)
- CA 5 is subaddress 3 (reserved for terminations)
- CA 6 is subaddress 4 (reserved for terminations)
- CA 7 is subaddress 5 (reserved for originations)

NOTE: See SHTN form (Division 5 Section 1C) for a description of call appearance reservation when the circuit TN is shared.

Software Release: 5E11 and later.
Valid Entries:

Valid TYPE AND ORDER Entries

Entry	Definition
ORIG	Subaddress(es) reserved for originations only.
PRIO	Subaddress(es) reserved for originations and priority incoming terminations.
TERM	Subaddress(es) reserved for terminations only.
blank	No subaddress reservation.

Data Rules:

TYPE AND ORDER and QTY must be entered together, e.g. if TYPE AND ORDER is entered, QTY must be entered for that TYPE AND ORDER.

When EKTS is "BASIC" and TYPE AND ORDER is "ORIG", BUSY MONITOR must not be "Y".

TYPE AND ORDER must be unique in the NI SAR LIST.

NI SAR LIST entries are not permitted when a CKT MLHG is entered.

When an NI SAR LIST entry is made, CKT TN must be entered.

When a CKT MLHG is entered, NI SAR LIST entries are not permitted.

When an NI SAR LIST entry is made, EKTS must be "BASIC" or "CACH".

- When EKTS is "BASIC"
  - no more than one NI SAR LIST row entry is permitted.
  - if one NI SAR LIST entry is made, the QTY field entry must be 1.

Copyright © 2003 Lucent Technologies

- When EKTS is "CACH", and SARLIST has only one row entry, and that entry has both a TYPE AND ORDER of "ORIG" and a QTY entry equal to the CA QTY entry, then BUSY MONITOR must not be "Y".

8.16 QTY

Description: The Quantity of subaddresses to be reserved for Call Appearance Reservation field is used to specify the quantity of subaddresses to be reserved for the type of subaddress designated in the TYPE AND ORDER field. The number of subaddresses reserved may not exceed the total number of subaddresses specified in the CA QTY field for the circuit TN. The reserved subaddresses will be assigned to the highest numbered subaddresses of the circuit TN.

Software Release: 5E11 and later.
Valid Entries: 1 - 16, or leave blank.

Data Rules:

When EKTS is "CACH", the sum of the NI SAR LIST QTY fields must not exceed the entry in the CA QTY field.

ADVANCED SERVICES PLATFORM

The following fields (Section 8.17 - Section 8.20) were added to accommodate the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. This is a secured feature with SFID 210. For more information on this feature, see Division 2, Section 4A210.

8.17 OFC OBL INH

Description: The OFC OBL INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by individual lines. It indicates whether the ASP Office Originating Busy Line Office Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating Busy Line Office Trigger is inhibited.

This field was added for the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, Section 4A210.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC OBL INH must be "N".

8.18 OFC ONA INH

Description: The OFC ONA INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by individual lines. It indicates whether the ASP Office Originating No Answer Office Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating No Answer Office Trigger is inhibited.

This field was added for the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature. For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division

Copyright © 2003 Lucent Technologies

2, Section 4A210.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC ONA INH must be "N".

8.19 URT FCD BLK

Description: Should all Unrestricted FCD Codes be blocked from this CKT TN or CKT MLHG TN?

- ***NOTE:*** On the LINE, MLHLN, and DSLUSR forms this URT FCD BLK field is intended for use on individual or line attendant lines only.

This field was added for the ASP Unrestricted FCD Trigger feature. For more information, see Division 2, Section 4A572.

Software Release: 5E15 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When URT FCD BLK is "Y", either CKT TN or CKT MLHG must be entered.

When URT FCD BLK is "Y" and CKT MLHG is entered, CKT MLHG TN must be entered.

When the CKT TN or CKT MLHG/TERM is entered on a DSLUSR form where URT FCD BLK is set to "Y", the ACT field for SFID 572 on the SFSYS form must be "Y". This field is used by the ASP Unrestricted FCD Codes secured feature, which must be purchased before URT FCD BLK can be set to "Y".

When "Y" is entered in the URT FCD BLK field on the DSLUSR form, the CKT TN or the CKT MLHG TN on the DSLUSR form cannot be entered as a TN on the LNBLKCOD form.

When "Y" is entered in the URT FCD BLK field on the DSLUSR form, the CLASS OF SERVICE on the corresponding LCC form must be "ISDN" or "ISATND".

When a DSLUSR form is entered, indicating this is an ISDN office, and secured feature ASP Unrestricted FCD Trigger has been purchased, the ACT field for SFID572, is "Y", then the ACT field for SFID 139, Advanced Service Platform Interworking with Nation ISDN and Custom ISDN, must also be "Y" on the SFSYS form.

8.20 BLK LN CODE

Description: This is a text only field that indicates if a LNBLKCOD form exists for this TN.

This field was added for the ASP Unrestricted FCD Trigger feature. For more information on, see Division 2, Section 4A572.

Software Release: 5E15 and later

9. FORM ENTRIES, 5908-8 RECORD

Copyright © 2003 Lucent Technologies

9.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

DPKT

The following fields (Section 9.2 - Section 11.16)

contain entries used in DPKT (D-Channel packet-switched) calls.

9.2 MLHG TN

Description: The packet telephone number of the DSL (if it has one).
Valid Entries:

- For 5E11 and earlier: NXXXXXX,
- where N is 2 - 9 and X is 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9
- and X is 0 - 9

Data Rules:

The first three digits must be defined in the OFFICE CODE field on a NOC form.

When this field is entered, DPKT MLHG/TERM, LCC, and RAX must be entered. When DPKT MLHG/TERM and DPKT H PVC LCN are entered, MLHG TN must be entered.

The Telephone Number entered here cannot duplicate the Telephone Number entered in the ODB TN field.

This Telephone Number must be unique within the 5ESS Switch with the following two exceptions:

- It can match the CKT TN or the MLHG TN (under the CKT SWITCHING header) on the same instance of a DSLUSR form;

- it can match the LISTED TN on the associated MLHG form if this is member 1 of the MLHG.

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN or member TN. Multiple TNs are defined in the TN field on a MULTITN form. The TN entered in this field on the DSLUSR form may not duplicate a TN entered in the TN field on a MULTITN form.

Multiple TNs that are defined on the MULTITN form may not be assigned to modem pools, PPB1 MLHG/TERMs or PPB2 MLHG/TERMs.

For 5E8 and later, this field must be entered when DPKT MLHG and TERM are entered and DPKT CHL SEL equals "Y" or DPKT HUNT NOTIF is "YES".

For 5E8 and later, when DPKT CHL SEL is "N", this TN must be unique within the 5ESS Switch with the exception that it can equal the CKT TN or MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.

When DPKT CHL SEL is "Y", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form.

- It can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the

Copyright © 2003 Lucent Technologies

DSLUSR form.

- It must equal ODB MLHG TN if the corresponding ODB CHL SEL is set to "Y".
- It must equal PPB1 TN (on the DSL form) if the corresponding PPB1 CHL SEL is set to "Y" and PPB1 USR on the DSLUSR form equals "Y".
- It must equal PPB2 TN (on the DSL form) if the corresponding PPB2 CHL SEL is set to "Y" and PPB2 USR on the DSLUSR form equals "Y".

For 5E12 and later, when the DSLUSR forms have DPKT CHL SEL and ODB CHL SEL set to "Y" ,and DPKT MLHG TN and/or ODB MLHG TN are entered, DPKT MLHG TN and ODB MLHG TN must both be entered and DPKT MLHG TN must equal ODB MLHG TN.

For 5E12 and later, if the first 3 digits of the 7-digit DPKT MLHG TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE or the NOC form does not exist, DPKT MLHG TN must be a 10-digit TN with the NPA/OFFICE CODE defined in the NOC form.

9.3 LCC

Description: The Line Class Code. LCCs are defined on the LCC form (5306 Record).
Valid Entries: 3 alphanumeric characters.

Data Rules:

This field must be entered if the DPKT TN or DPKT MLHG/DPKT TERM fields are entered.

9.4 RAX

Description: The rate area. The LCC and RAX determine the Digit Analysis Selector and Screening Index used for calls originating from this line and the terminating treatment of calls to this line.
Valid Entries:

- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

This field must be entered if the DPKT TN or DPKT MLHG/DPKT TERM fields are entered.

If an MLHG TN (under the D-CHANNEL PACKET SWITCHING header) is not entered and the D SERV field on the DSL form for this DSL, is not "XMP" (indicating no Modem Pooling), then the LCC and RAX combination must be defined on a LCC form with an associated CLASS OF SERVICE of "ISDN" and a TERMINATING TREATMENT of "MLHG".

If an MLHG TN (under the D-CHANNEL PACKET SWITCHING header) is entered and the D SERV field on the associated DSL form is not "XMP", then the LCC and RAX must be defined on a LCC form with a CLASS OF SERVICE of "ISDN" and a TERMINATING TREATMENT of "INDIV".

If the D SERV field, on the DSL form for this DSL is "XMP" (indicating Modem Pooling), then the LCC and RAX combination entered under the DPKT (D-CHANNEL PACKET SWITCHING) with an associated CLASS OF SERVICE of "ISDN" and a TERMINATING TREATMENT of "AGING".

9.5 LNR HNT TN

Description: The Linear Hunt TN of a Multi-Line Hunt Group member. This LNR HNT TN serves as a

Copyright © 2003 Lucent Technologies

linear entry point to the MLHG. Hunting always begins at the member associated with the called TN; it hunts sequentially through the members of the hunt group until either it reaches a non-busy member, or it reaches the last member and all hunted members were hunt-busy.

If the member TN is on intercept, the LNR HNT TN will not be on intercept.

Software Release: 5E8 and later
Valid Entries:
- For 5E11 and earlier: NXXXXXX,
- where N is 2 - 9
- and X is 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

If DPKT LNR HNT TN is entered, the following must be true:

- OE must be entered.
- DPKT MLHG and TERM must be entered.
- The first three digits of the LNR HNT TN must be defined in the OFFICE CODE field on the NOC form.
- For a "PSUCD" MLHG, if LNR HNT TN for member 1 is not entered, no other members can have LNR HNT TN entered.
- LNR HNT TN must be unique within the 5ESS Switch with the following exceptions:
  - If DPKT CHL SEL is "Y", it must match ODB LNR HNT TN on the same DSLUSR form, where the corresponding ODB CHL SEL is "Y".
  - If DPKT CHL SEL is "Y" and PPB1 USR on this DSLUSR form is "Y", it must match the PPB1 LNR HNT TN on the DSL form, for this DSL, where PPB1 CHL SEL is "Y".
  - If DPKT CHL SEL is "Y" and PPB2 USR on this DSLUSR form is "Y", it must match the PPB2 LNR HNT TN on the DSL form, for this DSL, where PPB2 CHL SEL is "Y".

For 5E12 and later, when the DSLUSR forms have DPKT CHL SEL and ODB CHL SEL set to "Y" ,and DPKT LNR HNT TN and/or ODB LNR HNT TN are entered, DPKT LNR HNT TN and ODB LNR HNT TN must both be entered and DPKT LNR HNT TN must equal ODB LNR HNT TN.

For 5E12 and later, when the DSLUSR forms have DPKT TN or DPKT MLHG and DPKT TERM entered, and also have an entry for DPKT LNR HNT TN, DPKT LNR HNT TN must not equal CKT TN, DPKT TN, ODB TN, CKT MLHG TN, DPKT MLHG TN, or ODB MLHG TN.

For 5E12 and later, if the first 3 digits of the 7-digit DPKT LNR HNT TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, DPKT LNR HNT TN must be 10 digits.

9.6 HUNT DEACT

Description: Should the MLHG member be deactivated (marked busy) for hunted calls? A value of "N" indicates the Multi-Line Hunt Group member is active (available) for hunting.

Copyright © 2003 Lucent Technologies

The deactive/active status has no effect on non-hunted calls, calls made to the MLHG member using its individual TN.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DPKT MLHG and TERM are not entered, DPKT HUNT DEACT must be "N".

If DPKT MLHG and TERM are defined for Modem Pooling, DPKT HUNT DEACT must be "N".

9.7 CHL SEL

Description: Is the TN a Common TN that is shared by at least two channels on the DSL? When a call terminates to a Common TN, an Active Channel Selection algorithm is performed to determine the channel on which the call will be offered.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DPKT CHL SEL and ODB CHL SEL are both "Y", the following DPKT and ODB fields must be set the same:

- (DPKT/ODB) TN
- (DPKT/ODB) MLHG
- (DPKT/ODB) TERM
- BILL TN
- BUSY LIMIT
- CHARGE
- CUGPX
- CUGOA
- CUGIA
- FCPN
- FSA
- HUNT DEACT
- HUNT NOTIF
- IA
- ICB
- ICP
- IECPDNIC
- LCC
- LCP
- LNR HNT TN
- MLHG TN
- NOTIF
- OCB
- PB GRP
- PMDR GRP
- PMDR ACT
- RAX

Copyright © 2003 Lucent Technologies

- REV
- SUST
- TPCN
- X25VER

If CHL SEL is "Y", OE must be entered.

If DPKT CHL SEL is "Y", DPKT H PVC LCN must not be entered.

DPKT CHL SEL must equal "N" when the DPKT MLHG and TERM is defined for Modem Pooling.

At least two channels of the DSL for a user must have Channel Selection (PPB1 CHL SEL, PPB2 CHL SEL, ODB CHL SEL, or DPKT CHL SEL) set to "Y", or none of the channels should be set.

If DPKT CHL SEL is "Y", service must be on a PH3. The first three digits of OE, the first digit of D ISCN, and the second two digits of D ISCN must match SM, PSU SHELF, and GRP, respectively, on a PSUGP form. PH TYPE on the PSUGP form must be set to "PH3".

If DPKT CHL SEL (DSLUSR form), ODB CHL SEL (DSLUSR form), PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) are set to "Y" for a user of the DSL, the following must be true for that user:

- The following parameters associated with CHL SEL equal to "Y" must be the same: MLHG, TERM, LNR HNT TN, LCC, RAX, HUNT DEACT, first three digits of ISCN, BILL TN, BUSY LIMIT, ICB, OCB, PMDR GRP, PMDR ACT, FCPN, TPCN, REV CHARGE, LCP, IECPDNIC, FSA, IA, PB GRP, X25VER, ICP, HUNT NOTIF, SUST, CUGPX, CUGOA, and CUGIA.
- If MLHG and TERM are entered, all the associated Channel Types with CHL SEL set to "Y" must have the same: DPKT MLHG TN, ODB MLHG TN, PPB1 TN, and/or PPB2 TN.
- If MLHG and TERM are not entered, all the associated Channel Types with CHL SEL set to "Y" must have the same: DPKT TN, ODB TN, PPB1 TN and/or PPB2 TN.
- All the associated B-Channel Types with CHL SEL set to "Y" must have the same SEND PKTSZ, SEND PKTWD, RCV PKTSZ, and RCV PKTWD.
- If DPKT NOTIF (DSLUSR form) and/or ODB NOTIF (DSLUSR form) is set to "COND", then of all the associated Channel Types with CHL SEL set to "Y", at least one Channel must have 2W LCN or IN LCN entered.
- If PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) equals "Y" and DPKT CHL SEL (DSLUSR form) or ODB CHL SEL (DSLUSR form) equals "Y", the appropriate PPB1 and/or PPB2 fields CALL TN, CALL ID, and DIS SCR (DSL form) must equal "N".
- If MLHG/TERM are entered, then of all the associated packet (PPB1, PPB2, DPKT, ODB) services with CHL SEL set to "Y" for this user, at least one packet service must have 2W LCN or IN LCN entered.

9.8 NEW TN

This field is a Recent Change field added in 5E7.

9.9 BILL TN

Description: A TN to be billed if the PKT TN to be billed is different from the PKT TN of this DSL.
Valid Entries: A 7-digit PKT TN if calls are to be billed to a PKT TN within the local office; a valid 10-digit number if calls are to be billed to a PKT TN outside the local office. Entries must be in one of the

Copyright © 2003 Lucent Technologies

following formats:

Valid BILL TN Entries

Entry	Definition
NXXXXXX	Where NXX is a valid office code defined in the OFFICE CODE field on a NOC input form.
NPANXXXXXX	Any 10-digit number is acceptable; however, normal expected values are valid NPA and NXX codes.
ZXXXXXX	Where Z is 0 or 1. This is normally used for OUTWATS billing purposes. The first three digits must be defined in the OFFICE CODE field on a NOC input form.

9.10 FIXED TEI

Description: Enter the Fixed terminal endpoint identifier. If this field is not entered it indicates there is no support for NIT access to a PVC (Permanent Virtual Circuit). This field supports the Non-Initializing Terminals secured feature on a Standard ISDN interface. For more information on this feature, see Division 2, Section 1AM.

Software Release: 5E10 and later.
Valid Entries: 0 - 63

Data Rules:

Fixed Terminal Endpoint Identifier for use with Permanent Virtual Circuits and Non-Initializing Terminals is a feature that must be purchased by the office before the DPKT FIXED TEI field on the DSLUSR form can have an entry. The SFID 225 ACT field on the SFSYS form (5713-1 Record) must be set to "Y", before this field can be entered.

If FIXED TEI is entered then the following must be entered:
- DPKT TN
- DPKT H PVC LCN

and the following must not be entered:
- CONFIG GRP
- CKT MLHG
- EKTS
- PASC

and the following must be "N":
- DFLT TN USER
- SCP ALW
- SHARED.

If DPKT FIXED TEI is entered and ODB services are also entered, then ODB TN must be entered.

If the DPKT FIXED TEI field is entered, then on the corresponding DSL form (DSL form DSL OE matches DSLUSR form OE) the DSL CLS field must be set to "STD". A BRI cannot have a Fixed Terminal Endpoint Identifier (DPKT FIXED TEI) unless its Class of Service is "STD".

The DPKT FIXED TEI field value cannot be duplicated for DSLUSR forms with the same OE value. The same Fixed Terminal Endpoint Identifier value cannot be assigned to more than one terminal on a BRI.

CAICOM form can only be entered when "CACH" is entered for EKTS. Therefore, if CKT TN is entered with either the DFLT TN USER field set to "Y" or the DPKT FIXED TEI field entered, corresponding CAICOM form (where DSLUSR form CKT TN matches CAICOM form TN) can not be entered. ISDN Call Appearance Intercom is not allowed with either a Circuit Default DN (DFLT TN USER) or a Fixed Terminal Endpoint Identifier (DPKT FIXED TEI).

If either the DFLT TN USER field is set to "Y" or the DPKT FIXED TEI field entered, then the CKT TN

Copyright © 2003 Lucent Technologies

cannot have BRCS features (assigned on the LINEFA, BFG or CLUSTR forms) which are not allowed with Non-Initializing Terminal features. In addition, BRCS features defined on the following forms:

- ASPFD with CONTROL set to "NESS"
- EDSFD
- MSFD

are not allowed for NIT, because they require the use of Fully Initializing Terminals.

9.11 RMK

Description: Remarks entered for administrative purposes.
Valid Entries: Up to 16 alphanumeric characters.

Logical Channel Numbers

Fields Section 9.12 -Section 9.18 refer to D-Channel LCNs. Each D-channel can define 15 possible LCNs to establish simultaneously active SVCs (Switched Virtual Circuits) or PVCs (Permanent Virtual Circuits). The circuits connect CPEs together for packet switched data transmission.

SVCs exist only during the call. The CPE and the PH must interact through CCITT (International Telegraph and Telephone Consultative Committee) specified packet communication to set up each call and clear the SVC for each call.

A PVC exists between CPE devices until the customer deems otherwise. There is no need to set up each call or to clear the PVC for each call.

There is a system limitation of 128 simultaneously active SVCs or PVCs for each PH. Congestion on the network, due to contention for available SVCs or PVCs, is handled through CCITT specified procedures.

There are four categories of LCNs (PVCs and SVCs). A PVC is a permanent, two-way connection between CPE devices. An incoming SVC can only receive incoming data. A two-way SVC can transmit outgoing data or receive incoming data. An outgoing SVC can only the perspective of the PH.

The CCITT has specified a required order of assigning the four categories of LCNs.

The lowest numbers (1 to x) can be used for the PVCs, if the customer wishes to have PVCs. The H PVC LCN field (highest PVC LCN) indicates the highest numbered LCN that is a PVC. For example, if the H PVC LCN field is 7, that means that LCNs 1 through 7 are PVCs.

The next highest range of numbers for LCNs belongs to the incoming only SVCs. This range is indicated in the L IN LCN field (Lowest Incoming LCN) and the H IN LCN field (Highest Incoming LCN).

The next highest range of numbers for LCNs belongs to the two-way SVCs. This range is indicated in the L 2W LCN field (Lowest Two-way LCN) and the H 2W LCN field (Highest Two-way LCN).

The highest range of numbers for LCNs belongs to the outgoing only SVCs. This range is indicated in the L OUT LCN field (Lowest Outgoing LCN) and the H OUT LCN field (Highest Outgoing LCN).

As an example, an ISCN could define its 15 associated LCNs as follows:

H PVC LCN = 2 (LCNs 1 and 2 are PVCs)

L IN LCN = 3

H IN LCN = 4 (LCNs 3 and 4 are incoming SVCs)

L 2W LCN = 8

H 2W LCN = 9 (LCNs 8 and 9 are two-way SVCs)

Copyright © 2003 Lucent Technologies

L OUT LCN = 10

H OUT LCN = 12 (LCNs 10 to 12 are outgoing SVCs)

If PVCs are not desired, LCN 1 is available for an incoming SVC.

If PVCs and incoming SVCs are not desired, LCN 1 is available for a two-way SVC.

If PVCs, incoming SVCs and two-way SVCs are not desired, LCN 1 is available for outgoing SVCs.

The CCITT, to minimize "call collisions", has specified that a CPE device should start its search algorithm for an available LCN (SVCs only) with the highest numbered SVC that is in a ready state.

The H PVC LCN field or the L IN LCN and H IN LCN field combination or the L 2W LCN and H 2W LCN field combination or the L OUT LCN and H OUT LCN field combination must be entered.

9.12 H PVC LCN

Description: The Highest Logical Channel Number that can be assigned to a Permanent Virtual Circuit.
Valid Entries: 1 - 15

Data Rules:

When the DPKT TN or DPKT MLHG/TERM is assigned on a PSPVC form where the LCN is entered, the LCN must be less than or equal to the H PVC LCN entered here.

9.13 L IN LCN

Description: The Lowest Incoming Logical Channel Number.
Valid Entries: 1 - 15

Data Rules:

If the L IN LCN field is entered, then the H IN LCN field must be entered in order to specify the range of incoming LCNs.

If the H PVC LCN field is not entered and L IN LCN is entered, then L IN LCN field must be "1".

If the H PVC LCN field is entered and L IN LCN is entered, then L IN LCN must be 1 greater than the H PVC LCN field.

9.14 H IN LCN

Description: The Highest Incoming Logical Channel Number.
Valid Entries: 1 - 15

Data Rules:

The value entered in this field must be greater than or equal to the value entered in the L IN LCN field in order to specify a single Incoming LCN or a range of Incoming LCNs.

9.15 L 2W LCN

Description: The Lowest Two-Way Logical Channel Number.
Valid Entries: 1 - 15

Data Rules:

Copyright © 2003 Lucent Technologies

If the L 2W LCN field is then the H 2W LCN field must be entered in order to specify the range of Two-Way LCNs.

If this field and the H IN LCN field are entered, the value entered in L 2W LCN must be greater than the value entered in the H IN LCN field.

If this field and the H PVC LCN fields are entered, but the H IN LCN field is not entered, the value entered in L 2W LCN must be greater the value entered in the H PVC LCN field.

9.16 H 2W LCN

Description: The Highest Two-Way Logical Channel Number.
Valid Entries: 1 - 15

Data Rules:

The value entered in this field must be greater than or equal to the value entered in the L 2W LCN field in order to specify a single Two-Way LCN or a range of Two-Way LCNs.

9.17 L OUT LCN

Description: The Lowest Outgoing Logical Channel Number.
Valid Entries: 1 - 15

Data Rules:

If the L OUT LCN field is entered, then the H OUT LCN field must be entered in order to specify a range of Outgoing LCNs.

If this field and the H 2W LCN fields are entered, the value entered in L OUT LCN must be greater than the value entered in the H 2W LCN field.

If this field and the H PVC LCN fields are entered and the H IN LCN and H 2W LCN fields are not entered, then the value entered in this field must be greater than the value entered in the H PVC LCN field.

9.18 H OUT LCN

Description: The Highest Outgoing Logical Channel Number.
Valid Entries: 1 - 15

Data Rules:

The value entered in this field must be greater than or equal to the value entered in the L OUT LCN field in order to specify a single Outgoing LCN or a range of Outgoing LCNs.

9.19 BUSY LIMIT

Description: Enter the busy limit for this MLHG terminal. The busy limit represents the maximum number of concurrent incoming virtual calls an MLHG member may receive before the member is marked busy for hunting purposes. Calls to non-hunt DNs are included in the incoming call count but are not restricted by the busy limit.

Software Release: 5E8 and later
Valid Entries:
- If CHL SEL is "Y": 1 - 269
- If CHL SEL is "N": 1 - 15

Copyright © 2003 Lucent Technologies

Data Rules:

This field is applicable to MLHG members only. If DPKT MLHG and TERM are not entered, DPKT BUSY LIMIT must not be entered.

If DPKT MLHG and TERM are entered, BUSY LIMIT should be set according to the rules that follow. When BUSY LIMIT is not entered, the maximum value for the applicable rule will be assigned (but not for Modem Pooling):

- If the DSL is on a PH3 and DPKT CHL SEL is set to "N", DPKT BUSY LIMIT must be less than or equal to the sum of DPKT IN LCNs plus DPKT 2W LCNs.
- If DPKT CHL SEL is set to "Y", DPKT BUSY LIMIT must be less than or equal to the sum of IN LCNs and 2W LCNs of all associated packet (PPB1, PPB2, DPKT, and ODB) services with CHL SEL set to "Y" for this user. If two ODBs are provisioned, add twice the value of the first ODB's IN LCNs plus 2W LCNs to the count.

9.20 ICB

Description: Will the Incoming Calls Barred feature be activated? ICB prevents the user from receiving incoming virtual calls. The user can still originate outgoing virtual calls.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the DPKT MLHG and DPKT TERM fields are entered, then this field must be "N".

For 5E9(1) and earlier, if this field is "Y", then the L IN LCN, H IN LCN, L 2W LCN and H 2W LCN fields must not be entered.

9.21 OCB

Description: Will the Outgoing Calls Barred feature be activated? OCB prevents the user from originating outgoing virtual calls. The user can still receive incoming virtual calls.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

for 5E9(1) and earlier, if this field is "Y", the L OUT LCN, H OUT LCN, L 2W LCN and H 2W LCN fields must not be entered.

If the OCB field is "Y" and the ICB field is "N", the L IN LCN and H IN LCN fields must be entered.

If the OCB field is "N" and the ICB field is "Y", the L OUT LCN and H OUT LCN fields must be entered.

10. FORM ENTRIES, 5908-9 RECORD

10.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

10.2 PMDR GRP

Description: Enter the MDR (Message Detail Recording) group name associated with the D-Channel Packet TN. This field was added with the Packet MDR feature.

Software Release: 5E7 and later
Valid Entries: 1 - 8 characters

Data Rules:

If DPKTTN, DPKTMLHG or DPKTTERM are not entered, PMDR GRP should not be entered.

If ODBTN is not entered, PMDR GRP should not be entered.

If PMDR GRP is entered, PMDR ACT must be entered, and it must be defined on the MDRGP form as the MDR GROUP NAME where PACKET MDR is "Y". If PMDR GRP is not entered, then PMDR ACT must not be entered.

If PMDR GRP(s) are entered for DPKT (Packet Switch D-Channel) on the DSLUSR input form, then the corresponding DSL form must not have D SERV set to "XMP".

10.3 PMDR ACT

Description: Is the Packet MDR Group active for the D-Channel TN?

Software Release: 5E7 and later.
Valid Entries: Y, N

Data Rules:

If PMDR GRP is not entered, PMDR ACT should not be entered.

10.4 SEND TPC

Description: The Throughput Class of a virtual call from the terminal to the switch.

Required Field.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800 or 9600

10.5 SEND PKTSZ

Description: The maximum number of bytes of data in a packet (excluding control type information) that can be sent.

Required Field.
Default: 128
Valid Entries: 128 or 256 bytes

Data Rules:

If the FCPN field is "N", this field must equal 128.

10.6 SEND PKTWD

Description: The number of data packets that the CPE device can have unacknowledged, on a sending basis, at any time.

Required Field.

Copyright © 2003 Lucent Technologies

Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if DPKT SEND PKTWD or DPKT RCV PKTWD is not 2, DPKT FCPN must be "Y".

10.7 SEND MCT

Description: Enter the maximum combined throughput in kilobits per second for the sending direction. When the sum of the sending throughput of virtual calls exceeds the SEND MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 16 - 32 (kbps), in increments of 2

10.8 RCV TPC

Description: The Throughput Class of a virtual call to the terminal from the switch.

Required Field.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800 or 9600

10.9 RCV PKTSZ

Description: The maximum number of bytes of data in a packet (excluding control type information) that can be received.

Required Field.
Default: 128
Valid Entries: 128 or 256 bytes

Data Rules:

If the FCPN field is "N", this field must equal 128.

10.10 RCV PKTWD

Description: The number of data packets that the CPE device can have unacknowledged, on a receiving basis, at any time.

Required Field.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if DPKT SEND PKTWD or DPKT RCV PKTWD is not 2, DPKT FCPN must be "Y".

10.11 RCV MCT

Description: Enter the maximum combined throughput in kilobits per second for the receiving direction. When the sum of the receiving throughput of virtual calls exceeds the RCV MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 16 - 32 (kbps), in increments of 2

Copyright © 2003 Lucent Technologies

10.12 FCPN

Description: Will the Flow Control Parameter Negotiation feature be activated? FCPN allows the PH and the CPE device to negotiate the Window Size (2 or 3) and the Packet Size (128 or 256 bytes) on a per-call basis. Data transmission between a CPE and a PH is controlled separately for each direction and is controlled by the receiver of the data. This is, in CCITT nomenclature, referred to as flow control. An additional aspect of flow control is the ability of the PH to limit the rate at which it accepts packets when it recognizes network congestion.

Required Field.
Default: N
Valid Entries: Y, N

10.13 TPCN

Description: Will the Throughput Class Negotiation feature be activated? TPCN allows sending and receiving entities to negotiate the bits/second that are transmitted in either direction on a per-call basis. Both the sending and receiving party must subscribe to this service.

Required Field.
Default: N
Valid Entries: Y, N

10.14 REV CHARGE

Description: Will the called CPE device accept the charge for a call from a PH?

Required Field.
Default: N
Valid Entries: Y, N

10.15 LCP

Description: Will Local Charge Prevention be activated? When LCP is "Y", all the X.25 outgoing calls from this user will be Reverse Charged, and any X.25 incoming calls that contain Reverse Charge will be cleared.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

LCP is not allowed with Reverse Charge. If LCP is "Y", then REV CHARGE must be "N".

D SERV on the DSL form associated with this form must not equal "XMP" when LCP is "Y".

11. FORM ENTRIES, 5908-10 RECORD

11.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

11.2 IECPDNIC

Description: A 4-digit DNIC (Data Network ID Code) for Inter-Exchange Carrier Pre-select.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 9999

Data Rules:

This entry must be defined in the DNIC field on the PSDNICRI form (5921 Record).

11.3 FSA

Description: Will the Fast Select Acceptance feature be activated? FSA allows a CPE device to receive up to 128 bytes of user data with call setup and clearing packets. The feature cannot be applied if the target CPE Device does not have Fast Select Acceptance.

Required Field.
Default: N
Valid Entries: Y, N

11.4 IA

Description: Will the ISDN Intercom Addressing feature be activated? IA permits the ISDN user to access other users on the 5ESS Switch with a 4- or 7-digit number.

Required Field.
Default: N
Valid Entries: Y, N

11.5 PB GRP

Description: The Packet Switching Data Business Group Service feature enables the customer to set up and administer intra-switch PBG (Packet Business Groups) by assigning a PBG number to each X.25 termination to distinguish between intra-PBG and other calls on the AMA record.
Valid Entries: 1 - 100

Data Rules:

An MLHG is assigned to a PBG by associating the PBG with an MLHG on an MLHG form. The DSLUSR form should only be used to assign a PBG if the MLHG member has a known MLHG TN.

Do not enter a value if this user is not a member of a PBG.

For 5E8 and later when DPKT PB GRP is entered, OE must be entered, and the PB GRP must be defined on a PBGRP form (5931 Record).

If DPKT PB GRP and DPKT MLHG are both entered, DPKT MLHG TN must be entered.

11.6 X25VER

Description: The Packet Switch D-Channel X.25 CCITT Version Supported for this DTE.

Software Release: 5E6 and later
Required Field.
Default: 1984
Valid Entries: 1980, 1984

Data Rules:

If DPKTTN is known, and DPKT MLHG and DPKTTERM is unknown, DPKT X25VER must be 1984.

11.7 NOTIF

Copyright © 2003 Lucent Technologies

Description: Enter the Notification Class.

If a call is routed to a channel with Conditional Notification when Layer 1 is up on the channel, but Layer 2 is down for the channel, the channel will be notified of the incoming call. The channel is notified by sending a Q.931 message on the D-channel. If the user accepts the call by responding to the Q.931 message, the switch will initiate Layer 2 setup procedures on the channel and offer the call.

If DPKT service is not subscribed to, this field must not be entered.

Software Release: 5E8 and later
Valid Entries:

Valid NOTIF Entries

Entry	Definition
COND	Conditional notification
NO	No notification

Data Rules:

This field is required when DPKT TN and OE are entered.

If NOTIF is "COND", the following must be true:

- DPKT MLHG and TERM must not be entered.
- DPKT H PVC LCN must not be entered.
- DPKT ICB must be "N".
- If DPKT CHL SEL is "N", DPKT L IN LCN or DPKT L 2W LCN must be entered.

11.8 ICP

Description: Are originating or terminating calls to be denied? Intercept, in the packet switched world, is a packet message denying service.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DPKT ICP is "Y" and DPKT MLHG is entered, then OE must be entered.

11.9 HUNT NOTIF

Description: Indicate the Hunting Notification procedure to be used for processing an X.25 CLAMN (Called Line Address Modified Notification) facility and a modified address for this Multi-Line Hunt Group member.

The X.25 CLAMN feature allows the terminating CPE or switch to return the X.25 CLAMN facility, along with a modified Called Address field containing the non-hunt DN for the end-point, to the calling party. When a call is offered to a packet-mode hunt terminal as part of hunting, CLAMN signaling is returned to the calling party to indicate that a hunt was performed.

If HUNT NOTIF is blank, the CLAMN feature is not applicable.

Software Release: 5E8 and later
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid HUNT NOTIF Entries

Entry	Definition
YES	The switch initiates CLAMN procedures when the terminating DTE does not. If neither the CLAMN nor the modified address is present, the switch will insert the CLAMN and non-hunt telephone number into the X.25 call request packet and allow the X.25 call to proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
NO	The switch does not initiate CLAMN procedures. If neither the CLAMN facility nor the modified address is present, or if both are present, the X.25 call will proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
OLD	The X.25 CLAMN procedure that existed prior to the 5E8 Software Release is used.

Data Rules:

This field is applicable to MLHG members only. If DPKT MLHG and TERM are not entered, DPKT HUNT NOTIF must not be entered.

If DPKT MLHG and TERM (Non-Modem Pooling) are entered, DPKT HUNT NOTIF must be entered. If DPKT MLHG and TERM are defined for Modem Pooling, DPKT HUNT NOTIF must not be entered.

If DPKT HUNT NOTIF is "YES", DPKT MLHG TN must be entered.

11.10 TCID

Description: Enter the TCID (Throughput Class Indicator) for the D-channel. All incoming calls to the Common DN with a throughput class less than or equal to the TCID are routed to the D-channel. If 0 is entered, the TCID is not subscribed to.

Software Release: 5E8 and later
Valid Entries: 0, 75, 150, 300, 600, 1200, 2400, 4800, or 9600 (kbps)

Data Rules:

DPKT CHL SEL must be "Y" when DPKT TCID is entered. If DPKT CHL SEL is "Y", and TCID is left blank, a value of 9600 kbps will be assigned.

11.11 SUST

Description: Is termination denied or suspended for packet switched services?

Required Field.
Default:
Valid Entries: Y, N

Data Rules:

This field must be "N" if the DPKT TN or the DPKT MLHG/DPKT TERM fields are entered.

11.12 DNA

Description: Enter the first DN CA for DPKT. This field, along with DNA QTY, is used to set the range of DPKT DNAs. Each DNA must be unique. See Division 2, Section 1AM for more information on how to determine if CAs are duplicated.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If DPKT DNA is entered, DPKT DNA QTY must be entered.

Copyright © 2003 Lucent Technologies

The range of DPKT DNAs cannot overlap the range of any of the following: AU DNAs, CAs, ODB DNAs, K56 DNAs, K64 DNAs, and SP DNAs.

If DPKT DNA or DPKT DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

11.13 DNA QTY

Description: Enter the number of DN CAs for DPKT.

Software Release: 5E9(1) and later
Valid Entries: 1 - 4

Data Rules:

If DPKT DNA QTY is entered, DPKT DNA must be entered. The sum of DPKT DNA and DPKT DNA QTY cannot exceed 255.

If DPKT DNA QTY and ODB DNA QTY are both entered, and either DPKT MLHG equals ODB MLHG or DPKT TN equals ODB TN, the sum of DPKT DNA QTY and ODB DNA QTY cannot exceed 4.

If DPKT DNA or DPKT DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

11.14 CUGPX

Description: The Preferential Customer CUG Index. Refer to the Closed User Group explanation in the General section of this form for more information on CUGs.
Valid Entries: 0 - 99

Data Rules:

The entry must be defined in the CUG IDX field on a PSCUG form (5924 Record).

11.15 CUGOA

Description: Will the CUG Outgoing Access indicator be activated? CUGOA permits CUG members to access CPE devices that do not belong to a CUG, or CPE devices that belong to a CUG with Incoming Access.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CUGOA is "Y", the corresponding PSCUG form (5924A Record) must be defined with the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services, respectively.

11.16 CUGIA

Description: Will the CUG Incoming Access indicator be activated? CUGIA permits CUG members to access CPE devices that do not belong to a CUG, or CPE devices that belong to a CUG with Outgoing Access.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If CUGIA is "Y", the corresponding PSCUG form (5924A Record) must be defined with the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services, respectively.

12. FORM ENTRIES, 5908-11 RECORD

12.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

ODB (On Demand B-Channel)

The following fields (Section 12.2 - Section 14.28) contain entries for calls using ODB.

12.2 MLHG TN

Description: Enter the On Demand B-channel Multi-Line Hunt Group member Telephone Number.

Software Release: 5E8 and later
Valid Entries:
- For 5E11 and earlier: NXXXXXX,
- where N is 2 - 9 and X is 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits must be defined in the OFFICE CODE field on the NOC form.

If this field is entered, ODB MLHG and ODB TERM must be entered.

This field must be entered when ODB MLHG and TERM are entered, and ODB CHL SEL equals "Y" or ODB HUNT NOTIF is "YES".

When ODB CHL SEL is "N", this TN must be unique within the 5ESS Switch with the exception that it can equal the CKT TN or MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.

When ODB CHL SEL is "Y", this TN must be unique within the 5ESS Switch with the following exceptions:

- It can equal the CKT TN on the same instance of the DSLUSR form.
- It can equal the MLHG TN (under the CKT SWITCHING header) on the same instance of the DSLUSR form.
- It must equal DPKT MLHG TN if the corresponding DPKT CHL SEL is set to "Y".
- It must equal PPB1 TN (on the DSL form) if the corresponding PPB1 CHL SEL is set to "Y" and PPB1 USR on the DSLUSR form equals "Y".
- It must equal PPB2 TN (on the DSL form) if the corresponding PPB2 CHL SEL is set to "Y" and PPB2 USR on the DSLUSR form equals "Y".

Multiple TNs allow the assignment of additional TNs to an MLHG's main TN, subgroup TN, or member TN. Multiple TNs are defined in the TN field on a MULTITN form. The TN entered in this field on the DSLUSR form must not duplicate a TN entered in the TN field on a MULTITN form.

Copyright © 2003 Lucent Technologies

Multiple TNs that are defined on the MULTITN form may not be assigned to modem pools, PPB1 MLHG/TERMs or PPB2 MLHG/TERMs.

For 5E12 and later, if the first 3 digits of the 7-digit ODB MLHG TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, ODB MLHG TN must be 10 digits.

12.3 LCC

Description: The Line Class Code. LCCs are defined on the LCC form (5306 Record).
Valid Entries: 3 alphanumeric characters.

Data Rules:

The LCC and RAX combination associated with the ODB TN or ODB MLHG/TERM must be defined on an LCC form with CLASS OF SERVICE of "ISDN" and TERMINATING TREATMENT of "INDIV".

12.4 RAX

Description: The Packet Rate Area. The LCC and RAX are used to determine the Digit Analysis Selector and Screening Index used for calls originating from this line and the terminating treatment of calls to this line.
Valid Entries:
- For 5E14 and earlier: 1 -99
- For 5E15 and later: 1 -999

12.5 LNR HNT TN

Description: The Linear Hunt TN of a Multi-Line Hunt Group member. This LNR HNT TN serves as a linear entry point to the MLHG. Hunting always begins at the member associated with the called TN; it hunts sequentially through the members of the hunt group until either it reaches a non-busy member, or it reaches the last member and all hunted members were hunt-busy.

If the member TN is on intercept, the LNR HNT TN will not be on intercept.

Software Release: 5E8 and later
Valid Entries:
- For 5E11 and earlier: NXXXXXX,
- where N is 2 - 9 and X is 0 - 9
- For 5E12 and later: XXXXXXX or
- NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

If ODB LNR HNT TN is entered, the following must be true:

- OE must be entered.
- ODB MLHG and TERM must be entered.
- The first three digits of the LNR HNT TN must be defined in the OFFICE CODE field on the NOC form.
- For a "PSUCD" MLHG, if LNR HNT TN for member 1 is not entered, no other members can have LNR HNT TN entered.

Copyright © 2003 Lucent Technologies

- LNR HNT TN must be unique within the 5ESS Switch with the following exceptions:
  - If ODB CHL SEL is "Y", ODB LNR HNT TN must match DPKT LNR HNT TN on the same DSLUSR form when the corresponding DPKT CHL SEL is "Y".
  - If ODB CHL SEL is "Y" and PPB1 USR on this DSLUSR form is "Y", it must match the PPB1 LNR HNT TN on the DSL form, for this DSL, where PPB1 CHL SEL is "Y".
  - If ODB CHL SEL is "Y" and PPB2 USR on this DSLUSR form is "Y", it must match the PPB2 LNR HNT TN on the DSL form, for this DSL, where PPB2 CHL SEL is "Y".

For 5E12 and later, when the DSLUSR forms have ODB TN or ODB MLHG and ODB TERM entered, and also have an entry for ODB LNR HNT TN, ODB LNR HNT TN must not equal CKT TN, DPKT TN, ODB TN, CKT MLHG TN, DPKT MLHG TN, or ODB MLHG TN.

For 5E12 and later, if the first 3 digits of the 7-digit ODB LNR HNT TNs on the DSLUSR form are equal to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value of OFFICE CODE, ODB LNR HNT TN must be 10 digits.

12.6 HUNT DEACT

Description: Should the MLHG member be deactivated (marked busy) for hunted calls? A value of "N" indicates the Multi-Line Hunt Group member is active (available) for hunting.

The deactive/active status has no effect on non-hunted calls, calls made to the MLHG member using its individual TN.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ODB MLHG and TERM are not entered, ODB HUNT DEACT must be "N".

12.7 CHL SEL

Description: Is the TN a Common TN that is shared by at least two channels on the DSL? When a call terminates to a Common TN, an Active Channel Selection algorithm is performed to determine the channel on which the call will be offered.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DPKT CHL SEL and ODB CHL SEL are both "Y", the following DPKT and ODB fields must be set the same: (DPKT/ODB) TN, (DPKT/ODB) MLHG, (DPKT/ODB) TERM, LCC, RAX, MLHG TN, LNR HNT TN, HUNT DEACT, BILL TN, BUSY LIMIT, ICB, OCB, PMDR GRP, PMDR ACT, FCPN, TPCN, REV CHARGE, LCP, IECPDNIC, FSA, IA, PB GRP, X25VER, NOTIF, ICP, HUNT NOTIF, SUST, CUGPX, CUGOA, and CUGIA.

If CHL SEL is "Y", OE must be entered.

Copyright © 2003 Lucent Technologies

At least two channels of the DSL for a user must have Channel Selection (PPB1 CHL SEL, PPB2 CHL SEL, ODB CHL SEL, or DPKT CHL SEL) set to "Y", or none of the channels should be set.

If DPKT CHL SEL (DSLUSR form), ODB CHL SEL (DSLUSR form), PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) are set to "Y" for a user of the DSL, the following must be true for that user:

- The following parameters associated with CHL SEL equal to "Y" must be the same: MLHG, TERM, LNR HNT TN, LCC, RAX, HUNT DEACT, first three digits of ISCN, BILL TN, BUSY LIMIT, ICB, OCB, PMDR GRP, PMDR ACT, FCPN, TPCN, REV CHARGE, LCP, IECPDNIC, FSA, IA, PB GRP, X25VER, ICP, HUNT NOTIF, SUST, CUGPX, CUGOA, and CUGIA.
- If MLHG and TERM are entered, all the associated Channel Types with CHL SEL set to "Y" must have the same: DPKT MLHG TN, ODB MLHG TN, PPB1 TN, and/or PPB2 TN.
- If MLHG and TERM are not entered, all the associated Channel Types with CHL SEL set to "Y" must have the same: DPKT TN, ODB TN, PPB1 TN and/or PPB2 TN.
- All the associated B-Channel Types with CHL SEL set to "Y" must have the same SEND PKTSZ, SEND PKTWD, RCV PKTSZ, and RCV PKTWD.
- If DPKT NOTIF (DSLUSR form) and/or ODB NOTIF (DSLUSR form) is set to "COND", then of all the associated Channel Types with CHL SEL set to "Y", at least one Channel must have 2W LCN or IN LCN entered.
- If PPB1 CHL SEL (DSL form) and/or PPB2 CHL SEL (DSL form) equals "Y" and DPKT CHL SEL (DSLUSR form) or ODB CHL SEL (DSLUSR form) equals "Y", the appropriate PPB1 and/or PPB2 fields CALL TN, CALL ID, and DIS SCR (DSL form) must equal "N".
- If MLHG/TERM are entered, then of all the associated packet (PPB1, PPB2, DPKT, ODB) services with CHL SEL set to "Y" for this user, at least one packet service must have 2W LCN or IN LCN entered.

12.8 ISCN1

Description: The number of the first B-channel ISCN (Integrated Services Channel Number) on the PSU conjoined to the DSL. The DSL is connected, via a PIDB (Peripheral Interface Data Bus), to the PSU (Packet Switching Unit).
Valid Entries: A 6-digit number in the following format

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		Format	Valid Entries
Shelf	SHELF	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127, in multiples of 4

Data Rules:

ISCNs cannot be duplicated on one or more of the following forms:
- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL

Copyright © 2003 Lucent Technologies

- PSISM
- RTERM
- TRUNK and XAT.

The SHELF is the PSU PH shelf number. It must correspond to a PSU SHELF field on an EQPSU form.

The CHL GRP is the number of the PH (Protocol Handler) on the PSU shelf. The CHL GRP is a "logical" value that will not always correspond to the physical number of a PH. PHs are assigned, as a component of an ISCN, on AMLBDSL forms (5447 Record), DSL forms (5907 Record), DSLAP forms (5963 Record), DSLUSR forms (5908 Record), OSPSDSL forms (5411 Record), PSISM forms (5920 Record), and TRUNK forms (5204 Record). PHs are also assigned in the CHL GRP field on ODBRES forms (5906 Record). The total quantity of PHs assigned on these forms must not exceed the quantity of PHs defined for the given SWITCHING MODULE and PSU SHELF on an EQPSUPH form (5742 Record) with EQST "O".

The CHL is the PH channel number.

- D/PPB1/PPB2 ISCN on the DSL form - ISCN on the AMLBDSL, DSLAP, OSPSDSL, XAT, TRUNK form - ISCN and MATE ISCN on the PSISM form - ISCN on the ODBRES form defined as the combination SHELF||CHL GRP||CHL - ISCN on the MISLINK form defined as the combination SHELF||CHL GRP||CHL - TMC PRI, TMC NPRI, EOC PRI or EOC NPRI ISCN(s) on the RTERM form

Each ISCN entry (the first character of the (ODB ISCN1 on the DSLUSR form) must have the SHELF value assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

PSU SHELF and GRP have not been entered on the PSUGP form. The ISCN must be unique within an SM.

This field cannot have the same SHELF and CHL GRP, within the same SM, as an ISCN from a PSISM form (5920 Record) or a TRUNK form (5204 Record) with an associated TRKCLS of "PACKET" or "X75P" defined on the TKGRP form (5202 Record).

If this field is entered, the SM (first three digits of the OE) and the ISLU LCEN, or IDCU ILEN, (fourth digit of the OE) and the PSU SHELF (first digit of the ISCN) must appear, respectively, in the SM, ISLU/IDCU, and PSU SHELF fields of an ODBTS form (5905 Record). The corresponding MIN TS/PIDB field must be greater than zero.

For 5E8 and later, if both ODB ISCN1 and ODB ISCN2 are entered, the first three digits of ISCN1 and ISCN2 must be equal, and the last three digits of ISCN1 and ISCN2 must not be equal.

For 5E9(1) and later, the first digit of the OE, the second two digits of the OE, and the first three digits of the ISCN1 must be defined in the SM, PSU SHELF, and GRP fields on a PSUGP form where PH TYPE is set to "PH3".

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL

Copyright © 2003 Lucent Technologies

- RTERM
- XAT

with all TRUNK forms which have a TRKCLS of:
- "EDSL"
- "IFTERM"
- "IFOPER"

However, they cannot have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of
- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form
- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2
- MISLINK - where SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is "TAOPER" or "DAOPER"
- XAT - where SHELF/CHL GRP is the first three digits of ISCN

12.9 ISCN2

Description: The number of the second On Demand B-channel ISCN (Integrated Services Channel Number) on the PSU conjoined to the DSL. The DSL is connected, via a PIDB (Peripheral Interface Data Bus), to the PSU (Packet Switching Unit).
Valid Entries: A 6-digit number in the following format

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		Format	Valid Entries
Shelf	SHELF	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127, in multiples of 4.

Data Rules:

The SHELF is the PSU PH shelf number. It must correspond to a PSU SHELF field on an EQPSU form.

The CHL GRP is the number of the PSU PH on the PSU shelf. PHs are assigned, as a component of an ISCN, on AMLBDSL forms (5447 Record), DSL forms (5907 Record), DSLAP forms (5963 Record),

Copyright © 2003 Lucent Technologies

DSLUSR forms (5908 Record), OSPSDSL forms (5411 Record), PSISM forms (5920 Record) and TRUNK forms (5204 Record). PHs are also assigned in the CHL GRP field on ODBRES forms (5906 Record). The CHL is the PSU PH channel number.

If ODB ISCN2 is entered, ODB must be 2.

If both ODB ISCN1 and ODB ISCN2 are entered, the first three digits of ISCN1 and ISCN2 must be equal; the last three digits must not be equal.

The SM, PSU, SHELF, and CHLGRP must be defined on a PH3 on a PSUGP form (5949 Record).

The ISCN must be unique within an SM.

This field cannot have the same SHELF and CHL GRP, within the same SM, as an ISCN from a PSISM form (5920 Record) or a TRUNK form (5204 Record) with an associated TRKCLS of "PACKET", "X75", or "X75P" defined on the TKGRP form (5202 Record).

If this field is entered, the SM (first three digits of the OE) and the ISLU , or IDCU, (fourth digit of the OE), and the PSU SHELF (first digit of the ISCN) must appear, respectively, in the SM, ISLU/IDCU), and PSU SHELF fields of an ODBTS form (5905 Record). The corresponding MIN TS/PIDB field must be greater than zero.

For 5E9(1) and later, the first three digits of the OE and the first three digits of ISCN2 must be defined on a PSUGP form with PH TYPE set to "PH3".

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- RTERM
- XAT

with all TRUNK forms which have a TRKCLS of:

- "EDSL"
- "IFTERM"
- "IFOPER"

However, they cannot have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of

- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form

- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN

Copyright © 2003 Lucent Technologies

- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2
- MISLINK - where SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is "TAOPER" or "DAOPER"
- XAT - where SHELF/CHL GRP is the first three digits of ISCN

12.10 BAND

Description: The On Demand B-Channel Band number. Entries represent the PSU PH number. This field is used for load balancing and determines the volume of use that clients need. 5ESS Switch owners can assign the bands according to their definitions of "light" through "heavy" users.
Default: 0
Valid Entries: 0 - 15

12.11 ODB

Description: Enter the number of On Demand B-channels this user subscribes to.

Software Release: 5E8 and later
Valid Entries: 1, 2

Data Rules:

If ODB is not entered, no ODB channels are subscribed to; neither ODB ISCN1 nor ODB ISCN2 may be entered.

If ODB is 1, one ODB channel is subscribed to, and the following must be true:

- ODB TN or ODB MLHG and TERM must be entered.
- ODB ISCN1 must be entered, and ODB ISCN2 must not be entered.
- D SERV on the corresponding DSL form must be "SX", and B1 SERV or B2 SERV must be "DMD".

If ODB is 2, two ODB channels are subscribed to, and the following must be true:

- ODB TN or ODB MLHG and TERM must be entered.
- ODB ISCN1 and ODB ISCN2 must be entered.
- PPB1 USR and PPB2 USR must be "N" or not entered.
- ODB CHL SEL must be "Y".
- D SERV, on the corresponding DSL form, must be "SX", and B1 SERV and B2 SERV must be "DMD".

ODB must be less than or equal to MAXB CHL.

Copyright © 2003 Lucent Technologies

For 5E10 and later, when DSLUSR form(s) have ODB ISCN1 entered; an ODBTS form must be defined where SM, UNIT and PSU SHELF matches the first three digits of OE, the fourth digit of OE (for DSL OE type equal to "I"), the fourth and fifth digits of OE (for DSL OE type equal to "G", "K"), and the first digit of ODB ISCN1 respectively from the DSLUSR form. The OE type on DSLUSR must correspond to UNIT TYPE on the ODBTS form (OE type "I" equal to ISLU; OE type "K" equal to ISLU2; OE type "G" equal to IDCU; OE type "E" equal to AIU). There must also be at least one MIN TS/DPIDB reserved on the ODBTS for this PSU SHELF. An ODBTS form, meeting the above conditions, must exit.

12.12 RATE

Description: The DSL baud rate.
Valid Entries: 56KB or 64KB

12.13 N2

Description: The maximum number of attempts made by the CPE device or the PH to successfully transmit a frame at the LAPB (Link Access Procedure B) Level 2. Following N2 failures, the PH attempts to restore the link, which is either a SVC (Switched Virtual Circuit) or a PVC (Permanent Virtual Circuit). SVCs and PVCs are explained later in this section, immediately before those fields which involve LCN (Logical Channel Numbers). If the PH cannot restore the link, the PH will clear the SVCs and reset the PVCs. The N2 value is per CCITT specifications.
Valid Entries: 2 - 15

12.14 T1

Description: The period of time before retransmission of a frame can be initiated at the LAPB (Link Access Procedure B) Level 2. The T1 timer is per CCITT specifications.
Valid Entries: 20 - 200; even numbers only, in units of a tenth of a second.

12.15 T3

Description: The amount of time when a channel is considered idle for too long. This indication is passed to the PH to assure that the channel is idle and ready to be set for operation once again. The T3 timer is per CCITT specifications.
Valid Entries: 3 - 30 (in full seconds)

Data Rules:

The duration of the T3 timer must be greater than the duration of the T1 timer to ensure that retransmission efforts are not aborted.

12.16 WNDSZ

Description: The maximum quantity of sequentially numbered LAPB Level 2 I-frames (Information), or "I frames k" in CCITT terminology, which the CPE device or PH can have unacknowledged at any time. I-frames, which are data packets, are number sequentially applying modulo 8 arithmetic. Modulo 8 arithmetic is strictly concerned with remainders when dividing by 8. For example, 27 modulo 8 equals 3 because three is the remainder when 27 is divided by eight. The possible remainders when dividing by 8 are 0 through 7. Hence, every I-frame has a number between 0 and 7, inclusive.
Valid Entries: 1 - 7

13. FORM ENTRIES, 5908-12 RECORD

13.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

13.2 NEW TN

This field is a recent change field added in 5E7.

13.3 BILL TN

Description: A TN to be billed if the ODB TN or ODB MLHG TN to be billed is different from the ODB TN or ODB MLHG TN of this DSL.
Valid Entries: A 7-digit TN for calls billed to a TN within the local office; a 10-digit TN for calls billed to a TN outside the local office. Valid TNs must be in one of the following formats:

Valid BILL TN Entries

Entry	Definition
NXXXXXX	Where NXX is a valid office code defined in the OFFICE CODE field on a NOC form.
NPANXXXXXX	Any 10-digit number is acceptable; however, normal expected values are valid NPA and NXX codes.
ZXXXXXX	Where Z is 0 or 1. This is normally used for OUTWATS billing purposes. The first three digits must be defined in the OFFICE CODE field on a NOC form.

13.4 RMK

Description: Remarks entered for administrative purposes.
Valid Entries: Up to 16 alphanumeric characters.

Logical Channel Numbers

Fields Section 13.5 -Section 13.10 refer to On Demand B-Channel LCNs. Each On Demand B-channel can define 127 possible LCNs to establish simultaneously active SVCs (Switched Virtual Circuits). The circuits connect CPEs together for packet switched data transmission. PVCs (Permanent Virtual Circuits) are not defined for On Demand B-channels. Since On Demand B-channels are not dedicated to packet switching full-time, PVCs for this type of service are contradictory.

SVCs exist only during the call. The CPE and the PH must interact through CCITT specified packet communication to set up each call and clear the SVC for each call.

The system limits each PH to 128 simultaneously active SVCs and/or PVCs. Congestion on the network, due to contention for available SVCs or PVCs, is handled through CCITT procedures.

There are three categories of LCNs that can be associated with an On Demand B-channel. An incoming SVC can only receive incoming data. A two-way SVC can transmit outgoing data or receive incoming data. An outgoing SVC can only the perspective of the PH.

CCITT has a required order of assigning the categories of LCNs. In the case of the On Demand B-channel, if Incoming LCNs are used, the L IN LCN (Lowest Incoming LCN) must be LCN 1. The H IN LCN (Highest Incoming LCN) is used to define the range of Incoming LCNs.

The next highest range of numbers for LCNs belongs to the two-way SVCs. This range is indicated in the L 2W LCN field (Lowest Two-way LCN) and the H 2W LCN field (Highest Two-way LCN).

The highest range of numbers for LCNs belongs to the outgoing only SVCs. This range is indicated in the L OUT LCN field (Lowest Outgoing LCN) and the H OUT LCN field (Highest Outgoing LCN).

As an example, an ISCN could define its 127 associated LCNs as follows:

L IN LCN = 1

H IN LCN = 4 (LCNs 1-4 are incoming SVCs)

L 2W LCN = 8

Copyright © 2003 Lucent Technologies

H 2W LCN = 50 (LCNs 8-50 are two-way SVCs)

L OUT LCN = 62

H OUT LCN = 72 (LCNs 62-72 are outgoing SVCs)

The CCITT, to minimize "call collisions", has specified that a CPE device should start its search algorithm for an available LCN (SVCs only) with the highest numbered SVC that is in a ready state.

The L IN LCN and the H IN LCN field combination or the L 2W LCN and the H 2W LCN field combination or the L OUT LCN and the H OUT LCN field combination must be entered.

13.5 L IN LCN

Description: The Lowest Incoming LCN (Logical Channel Number).
Valid Entries: If an entry is made in this field, the entry must be 1.

Data Rules:

For 5E8 and later, if ODB MLHG and TERM are entered and ODB CHL SEL equals "N", ODB L IN LCN or L 2W LCN must be entered.

13.6 H IN LCN

Description: The Highest Incoming Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

The L IN LCN and H IN LCN fields must both be entered in order to define a range of incoming LCNs.

The value entered in this field must be greater than or equal to the value entered in the L IN LCN field.

13.7 L 2W LCN

Description: The Lowest Two-Way Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If this field and the H IN LCN fields are entered, then the value entered in this field must be greater than the value entered in the H IN LCN field.

For 5E8 and later, if ODB MLHG and TERM are entered and ODB CHL SEL equals "N", ODB L IN LCN or L 2W LCN must be entered.

13.8 H 2W LCN

Description: The Highest Two-way Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If the L 2W LCN field is entered, then the H 2W LCN field must be entered in order to define a range of Two-way LCNs.

The value entered in this field must be greater than or equal to the value entered in the L 2W LCN field.

Copyright © 2003 Lucent Technologies

13.9 L OUT LCN

Description: The Lowest Outgoing Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If this field and the H 2W LCN fields are entered, than the value entered in this field must be greater than the value entered in the H 2W LCN field.

13.10 H OUT LCN

Description: The Highest Outgoing Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If the L OUT LCN field is entered, then the H OUT LCN field must be entered in order to define a range of Outgoing LCNs.

The value entered in this field must be greater than or equal to the value entered in the L OUT LCN field.

13.11 BUSY LIMIT

Description: Enter the busy limit for this MLHG terminal. The busy limit represents the maximum number of concurrent incoming virtual calls an MLHG member may receive before the member is marked busy for hunting purposes. Calls to non-hunt DNs are included in the incoming call count but are not restricted by the busy limit.

Software Release: 5E8 and later
Valid Entries:
- If CHL SEL is "Y": 1 - 269
- If CHL SEL is "N": 1 - 127

Data Rules:

This field is applicable to MLHG members only. If ODB MLHG and TERM are not entered, ODB BUSY LIMIT must not be entered.

If ODB MLHG and TERM are entered, BUSY LIMIT should be set according to the rules that follow. When BUSY LIMIT is not entered, the maximum value for the applicable rule will be assigned.

- If the DSL is on a PH3 and ODB CHL SEL is set to "N", ODB BUSY LIMIT must be less than or equal to the sum of ODB IN LCNs plus ODB 2W LCNs.

- If ODB CHL SEL is set to "Y", ODB BUSY LIMIT must be less than or equal to the sum of IN LCNs and 2W LCNs of all associated packet (PPB1, PPB2, DPKT, and ODB) services with CHL SEL set to "Y" for this user. If two ODBs are provisioned, add twice the value of the first ODB's IN LCNs plus 2W LCNs to the count.

13.12 ICB

Description: Will the Incoming Calls Barred feature be activated? ICB prevents the user from receiving incoming virtual calls. The user can still originate outgoing virtual calls.

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then the L IN LCN, H IN LCN, L 2W LCN and H 2W LCN fields must not be entered.

13.13 OCB

Description: Will the Outgoing Calls Barred feature be activated? OCB prevents the user from originating outgoing virtual calls. The user can still receive incoming virtual calls.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then the L OUT LCN, H OUT LCN, L 2W LCN and H 2W LCN fields must not be entered.

If the OCB field is "Y" and the ICB field is "N", then the L IN LCN and H IN LCN fields must be entered.

If the OCB field is "Y" and the ICB field is "N", then the L IN LCN and H IN LCN must be entered.

13.14 PMDR GRP

Description: Enter the MDR group name associated with the On Demand B-Channel Packet TN.

Software Release: 5E7 and later
Valid Entries: 1 - 8 characters

Data Rules:

If ODBTN is not entered, PMDR GRP should not be entered.

If PMDR GRP is entered, PMDR ACT must be entered, and it must be defined on the MDRGP form as MDR GROUP NAME where PACKET MDR is "Y". If PMDR GRP is not entered, PMDR ACT must not be entered.

13.15 PMDR ACT

Description: Is the Packet MDR Group active for the On Demand B-Channel TN?

Software Release: 5E7 and later.
Valid Entries: Y, N

Data Rules:

If PMDR GRP is not entered, PMDR ACT must not be entered.

14. FORM ENTRIES, 5908-13 RECORD

14.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

14.2 SEND TPC

Copyright © 2003 Lucent Technologies

Description: The Throughput Class of a virtual call from the terminal to the switch.

Required Field.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800,
 9600 or 19200

14.3 SEND PKTSZ

Description: Send Packet Size is the maximum number of bytes of data in a packet (excluding control type information) that can be sent.

Required Field.
Default: 128
Valid Entries: 128 or 256 bytes

Data Rules:

If the FCPN field is "N", than this field must equal 128.

14.4 SEND PKTWD

Description: The number of data packets that the CPE device can have unacknowledged, on a sending basis, at any time.

Required Field.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if ODB SEND PKTWD or ODB RCV PKTWD is not 2, ODB FCPN must be "Y".

14.5 SEND MCT

Description: Enter the maximum combined throughput in kilobits per second for the sending direction. When the sum of the sending throughput of virtual calls exceeds the SEND MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 64 - 128 (kbps), in increments of 8

14.6 RCV TPC

Description: The Throughput Class of a virtual call to the terminal from the switch.

Required Field.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800,
 9600 or 19200

14.7 RCV PKTSZ

Description: The Receive Packet Size is the maximum number of bytes of data in a packet (excluding control type information) that can be received.

Copyright © 2003 Lucent Technologies

Required Field.
Default: 128
Valid Entries: 128 or 256 bytes

Data Rules:

If the FCPN field is "N", than this field must equal 128.

14.8 RCV PKTWD

Description: The number of data packets that the CPE device can have unacknowledged, on a receiving basis, at any time.

Required Field.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if ODB SEND PKTWD or ODB RCV PKTWD is not 2, ODB FCPN must be "Y".

14.9 RCV MCT

Description: Enter the maximum combined throughput in kilobits per second for the receiving direction. When the sum of the receiving throughput of virtual calls exceeds the RCV MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 64 - 128 (kbps), in increments of 8

14.10 FCPN

Description: Will the Flow Control Parameter Negotiation feature be activated? FCPN allows the PH and the CPE device to negotiate the Window Size (2 or 3) and the Packet Size (128 or 256 bytes) on a per-call basis. Data transmission between a CPE and a PH is controlled separately for each direction and is controlled by the receiver of the data. This is, in CCITT nomenclature, referred to as flow control. An additional aspect of flow control is the ability of the PH to limit the rate at which it accepts packets when it recognizes network congestion.

Required Field.
Default: N
Valid Entries: Y, N

14.11 TPCN

Description: Will the Throughput Class Negotiation feature be activated? TPCN allows sending and receiving entities to negotiate the bits/second that are transmitted in either direction on a per-call basis. Both the sending and receiving party must subscribe to this service.

Required Field.
Default: N
Valid Entries: Y, N

14.12 REV CHARGE

Description: Will the called CPE device accept the charge for a call from a PH?

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

14.13 LCP

Description: Will Local Charge Prevention be activated? When LCP is "Y", all the X.25 outgoing calls from this user will be Reverse Charged, and any X.25 incoming calls that contain Reverse Charge will be cleared.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

LCP is not allowed with Reverse Charge. If LCP is "Y", then REV CHARGE must be "N".

D SERV on the DSL form associated with this form must not equal "XMP" when LCP is "Y".

14.14 IECPDNIC

Description: The DNIC (Data Network ID Code) for Inter-Exchange Carrier Pre-select.
Valid Entries: 1 - 9999

Data Rules:

This entry must be defined in the DNIC field on a PSDNICRI form.

14.15 FSA

Description: Will the Fast Select Acceptance feature be activated? FSA allows a CPE device to receive up to 128 bytes of user data with call setup and clearing packets.

Required Field.
Default: N
Valid Entries: Y, N

14.16 IA

Description: Will the ISDN Intercom Addressing feature be activated? IA permits the ISDN user to access other users on the 5ESS Switch with a 4- or 7-digit number.

Required Field.
Default: N
Valid Entries: Y, N

14.17 PB GRP

Description: The Packet Switching Data Business Group Service feature. PB GRP enables the customer to set up and administer intra-switch PBG (Packet Business Groups) by assigning a PBG number to each X.25 termination to distinguish between intra-PBG and other calls on the AMA record.
Valid Entries: 1 - 100

Data Rules:

An MLHG is assigned to a PBG by associating the PBG with an MLHG on an MLHG form. The DSLUSR form should only be used to assign a PBG if the MLHG member has a known MLHG TN.

Copyright © 2003 Lucent Technologies

Do not enter a value if this user is not a member of a PBG.

For 5E8 and later when ODB PB GRP is entered, OE must be entered, and the PB GRP must be defined on a PBGRP form (5931 Record).

If ODB PB GRP and ODB MLHG are entered, ODB MLHG TN must also be entered.

14.18 X25VER

Description: The Packet Switch D-Channel X.25 CCITT Version Supported for this DTE.

Software Release: 5E6 and later
Required Field.
Default: 1984
Valid Entries: 1980, 1984

14.19 NOTIF

Description: Enter the Notification Class.

If a call is routed to a channel with Conditional Notification when the Layer 1 is up on the channel, but Layer 2 is down for the channel, the channel will be notified of the incoming call. The channel is notified by sending a Q.931 message on the D-channel. If the user accepts the call by responding to the Q.931 message, the switch will initiate Layer 2 setup procedures on the channel and offer the call.

If ODB service is not subscribed to, this field must not be entered.

Software Release: 5E8 and later
Valid Entries:

Valid NOTIF Entries

Entry	Definition
COND	Conditional notification
NO	No notification

Data Rules:

This field is required when ODB TN and OE are entered.

If NOTIF is "COND", the following must be true:

- ODB MLHG and TERM must not be entered.
- ODB T3XX must be 0.
- ODB ICB must be "N".
- If ODB CHL SEL is "N", ODB L IN LCN or ODB L 2W LCN must be entered.

14.20 T3XX

Description: This timer is invoked when an On Demand B-channel connection exists between the CPE and the PH, but no virtual calls are taking place. The timer is started when the ODB connection is first established, stopped any time the number of active X.25 virtual calls on that ODB connection changes from zero to one, and restarted any time the number of active X.25 virtual calls on that ODB connection changes from one to zero.

If the timeout value is reached, the connection between the CPE and the PH is torn down. This allows

Copyright © 2003 Lucent Technologies

other users in a Multipoint scenario to use the B-channel and saves the end customer from unnecessary connection tariffs.

A value of 0 indicates that the ODB user does not subscribe to the T3XX timer; in this case, the timer is not used.

Required Field for 5E9(1) and later.
Default:

For 5E9(1) and later: 0
Valid Entries: 0, or 10 - 60 (minutes)

14.21 ICP

Description: Are originating or terminating packet calls to be denied? Intercept, in the packet switched world, is a packet message denying service.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ICP must be "N" when a TN is defined on the LINE (5109 Record) or MLHG (5110 Record) form.

If ODB ICP is "Y" and ODB MLHG is entered, then OE must be entered.

14.22 HUNT NOTIF

Description: Indicate the Hunting Notification procedure to be used for processing an X.25 CLAMN (Called Line Address Modified Notification) facility and a modified address for this Multi-Line Hunt Group member.

The X.25 CLAMN feature allows the terminating CPE or switch to return the X.25 CLAMN facility, along with a modified Called Address field containing the non-hunt DN for the end-point, to the calling party. When a call is offered to a packet-mode hunt terminal as part of hunting, CLAMN signaling is returned to the calling party to indicate that a hunt was performed.

If HUNT NOTIF is blank, the CLAMN feature is not applicable.

Software Release: 5E8 and later
Valid Entries:

Valid HUNT NOTIF Entries

Entry	Definition
YES	The switch initiates CLAMN procedures when the terminating DTE does not. If neither the CLAMN nor the modified address is present, the switch will insert the CLAMN and non-hunt telephone number into the X.25 call request packet and allow the X.25 call to proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
NO	The switch does not initiate CLAMN procedures. If neither the CLAMN facility nor the modified address is present, or if both are present, the X.25 call will proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
OLD	The X.25 CLAMN procedure that existed prior to the 5E8 Software Release is used.

Data Rules:

This field is applicable to MLHG members only. If ODB MLHG and TERM are not entered, ODB HUNT NOTIF must not be entered.

If ODB MLHG and TERM are entered, ODB HUNT NOTIF must be entered.

Copyright © 2003 Lucent Technologies

If ODB HUNT NOTIF is "YES", ODB MLHG TN must be entered.

14.23 SUST

Description: Is termination denied for packet switched services?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the ODB TN field is entered, this field must be "N".

14.24 DNA

Description: Enter the first DN CA for ODB. This field, along with DNA QTY, is used to set the range of ODB DNAs. Each DNA must be unique. See Division 2, Section 1AM for more information on how to determine if CAs are duplicated.

Software Release: 5E9(1) and later
Valid Entries: 1 - 254

Data Rules:

If ODB DNA is entered, ODB DNA QTY must be entered.

The range of ODB DNAs cannot overlap with the range of any of the following: AU DNAs, CAs, DPKT DNAs, K56 DNAs, K64 DNAs, or SP DNAs.

If ODB DNA or ODB DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

14.25 DNA QTY

Description: Enter the number of DN CAs for ODB.

Software Release: 5E9(1) and later
Valid Entries: 1 - 4

Data Rules:

If ODB DNA QTY is entered, ODB DNA must be entered. The sum of ODB DNA and ODB DNA QTY cannot exceed 255.

If DPKT DNA QTY and ODB DNA QTY are both entered, and either DPKT MLHG equals ODB MLHG or DPKT TN equals ODB TN, then the sum of DPKT DNA QTY and ODB DNA QTY cannot exceed 4.

If ODB DNA or ODB DNA QTY is entered, DSL CLS must be "STD" on the corresponding DSL form.

14.26 CUGPX

Description: The Preferential Customer CUG (Closed User Group) Index.
Valid Entries: 0 - 99

Data Rules:

This entry must appear in the CUG IDX field on a PSCUG form.

14.27 CUGOA

Copyright © 2003 Lucent Technologies

Description: The Closed User Group Outgoing Access indicator. CUGOA permits CUG members to access CPE devices that do not belong to a CUG or CPE devices that belong to a CUG with Incoming Access.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the Packet Service types DPKT and ODB have CUGOA or CUGIA set to "Y". then a corresponding PSCUG form must have entries in the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services.

14.28 CUGIA

Description: Will the Closed User Group Incoming Access indicator be activated? CUGIA permits CUG members to access CPE devices that do not belong to a CUG or CPE devices that belong to a CUG with Outgoing Access.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the Packet Service types DPKT and ODB have CUGOA or CUGIA set to "Y". then a corresponding PSCUG form must have entries in the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services.

15. FORM ENTRIES, 5908-14, 15 RECORD

15.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

ICI

The ICI LIST field (Section 15.2) is used in connection with the ICI (Incoming Call Identification) feature. ICIs assigned here determine the types of calls an ISDN attendant serves. For more detail on these fields, refer to ISDN Attendant Hunting and Queuing (Division 2, Section 1T). The ICI List is continued on the 5908-11 Record.

15.2 ICI LIST

Description: ICI 1 through ICI 16 list ICI values assigned to an ISDN Attendant Terminal.

Valid ICI LIST Entries

Entry	Definition
CFBL	For calls that have been call forwarded via a call forward busy line feature.
CFDA	For calls that have been call forwarded via a call forward don't answer feature.
CFOH	For calls that have been forwarded via a call forward don't answer feature; in this case, the terminal the call was forwarded from was "off hook" (on another call appearance).
CFV	For calls that have been call forwarded via a call forward variable feature.
CNET	CNET Trunk Group ICI. Identifies calls originating from a trunk group designated as a Corporate Network trunk group.
DCL	Identifies a call originating from a manual (no-dial) line.
EMER	Identifies a call where the user dialed the attendant using a prespecified IDP code defined for emergencies (ACTION = "EMER"). When assigned, EMER ICI must be assigned to all terminals on an

Copyright © 2003 Lucent Technologies

	MLHG.
FTS	Software Release: 5E9(2) and later. Federal Telecommunications System. Used for calls that have arrived from a trunk group recognized as an FTS trunk group.
FTSICN	Software Release: 5E9(2) and later. Identifies calls on an FTS incoming trunk to a CENTREX Network. For more information on the CENTREX Network features see Division 2, Sections 4A181, 4A182, and 4A183.
FXICN	Software Release: 5E9(2) and later. Identifies calls on an FX incoming trunk to a CENTREX Network. For more information on the CENTREX Network features see Division 2, Sections 4A181, 4A182, and 4A183.
FX1-8	Foreign Exchange Trunk Group ICIs (FX1 through FX8). Used for calls that have arrived from a trunk group recognized as FX.
ICPT	Used for calls intercepted and redirected to the attendant because of the IDP
LDNx	The subgroup (LDN1 through LDN8x) that the call arrived on. LDN is the Listed Directory Number. LDNx is used for calls arriving at MLHGs with no other ICI. ISAT MLHGs may have up to 8 subgroup TNs defined on the MLHG form. LDN ICIs have a one-to-one relationship to SUBTN fields. For each LDN ICI defined here, there must be a corresponding SUBTN entry on the MLHG form. If LDN ICIs are assigned, WAT ICIs cannot be assigned (i.e., they cannot be mixed).
PPEXEC	Indicates that the precedence "Executive" was used on this call.
PPFLSH	Indicates that the precedence "Flash" was used on this call.
PPFOVR	Indicates that the precedence "Flash Override" was used on this call.
PPIMMD	Indicates that the precedence "Immediate" was used on this call.
PPPRIO	Indicates that the precedence "Priority" was used on this call.
PPROUT	Indicates that the precedence "Routine" was used on this call.
PRIO	Identifies an MCA (Multiple Call Appearance) Priority Call.
QUE	Software Releases: 5E6 and later. Queues calls to individual hunted TNs.
RBQ	Calls that have terminated after the ring back queuing feature was used to camp on to a busy trunk group.
RLT	RLT (Release Link Trunk) service for ISDN attendants.
TIE1-8	Tie Trunk Group ICIs (TIE1 through TIE8). Used for calls that have arrived from a trunk group recognized as a TIE trunk group.
TIEICN	Software Release: 5E9(2) and later. Identifies calls on a TIE incoming trunk to a CENTREX Network. For more information on the CENTREX Network features see Division 2, Sections 4A181, 4A182, and 4A183.
WATx	(WAT1 through WAT5) Used for calls arriving at the ISAT group as INWATS calls. The WATs ICIs have a one-to-one relationship with SUBTN fields one through five on the MLHG form; therefore, for each WAT ICI defined, there must be a corresponding SUBTN entry on the MLHG form. ISAT INWATS MLHGs can have no more than five subgroup TNs.

Data Rules:

If an ICI is entered in the ICI LIST, then the CKT MLHG and CKT TERM fields must be entered.

ICIs are used by ISDN Attendants. Therefore, if any ICIs are entered on this form, the CKT MLHG must be defined on an MLHG form where the MLHG FEATURE is defined on an MLHGFD form with a HUNT TYPE of "ISAT".

If precedence ICIs (PPxxxx) are entered, then one or more WATs ICIs or LDN ICIs must be entered; but not both types. EMER and QUE ICIs can also be entered with precedence ICIs (PPxxxx). For 5E9(1) and later, only "EMER", "QUE", "WAT" or "LDN" ICIs are valid with precedence (PPxxxx) ICIs on the ICI LIST.

At least one EMER ICI must be entered in the list if there is an ICIPF form (5903 Record) where the GRP TYP field is "HUNT", the GRP NBR field is the same value as the CKT MLHG on this DSLUSR form and at least one "EMER" has been entered in the HUNTING ICI list.

For 5E6 and later, at least one QUE ICI must be entered in the list if there is an ICIPF form (5903 Record) where the GRP TYP field is "HUNT", the GRP NBR is the same value as the CKT MLHG on this DSLUSR form and at least one "QUE" has been entered in the HUNTING ICI list.

An ICI assigned here must be assigned to a MLHG on a corresponding ICIPF form where the GRP TYP field is "HUNT". Forms correspond if the GRP NBR field on the ICIPF form is the same value as the CKT

Copyright © 2003 Lucent Technologies

MLHG on this DSLUSR form.

SEC. 1J: 5909-1/2/3 RECORD
X.25 PACKET SWITCHING CHANNEL ASSIGNMENT FORM - XAT

1. GENERAL

The 5909-1/2 Record is available with 5E6 and later Software Releases. It is used to provision T1 facilities (digital lines and trunks) with X.25 Packet Switching services on a subscription basis using Q.931 signaling. When this form is entered, ports are defined for each channel of the T1 facility selected for packet switching. For 5E6 and later Software Releases, T1 facility channels can be provisioned and supported like BRI (Basic Rate Interface) Permanent Packet B-channels, which includes membership in MLHGs (Multi-line Hunt Groups).

The term and form name XAT refer to X.25 access to T1 facility DS0 channels. The term "DS0" refers to a single data channel or single digitally transmitted voice channel.

A T1 facility contains up to twenty-four separate DS0 channels. Each channel can be provisioned for packet switching. Any DS0 channels not being used for packet switching can still be used for other digital services (anywhere an individual Digital Equipment Number is assigned) on the 5ESS switch. The number of channels chosen to carry packet switched data also can be changed on a subscription basis, however, On-demand B-channel packet switching services are not available on XAT channels.

Circuit switching and packet switching services (XAT channels) can coexist on the same T1 facility. If circuit-switched services are not desired, signaling via the D-channel is not needed and channel 24 becomes available for packet switching. However, if any channels of the T1 facility are provisioned for PRI use, no packet switching services are allowed on the PRI D-channel (channel 24). No circuit switching services are allowed on DS0 channels selected for B-channel packet switching and, likewise, no packet services are allowed on DS0 channels selected for circuit switching.

1.1 LCN (Logical Channel Numbers)

LCNs represent SVCs and/or PVCs. These circuits connect CPE devices with each other to transmit packet switched data.

SVCs exist only for the period of the call. The CPE device and the PH interact through CCITT (International Telegraph and Telephone Consultative Committee) specified packet communication to connect and clear the SVC for each call. A PVC is a permanent, two-way connection between CPE devices. There is a system limitation of 128 simultaneously active LCNs (SVCs and/or PVCs) for each PH.

The CCITT has specified an order of assigning the four categories of LCNs. The lowest numbers (1 to x) can be used for the PVCs, if PVCs are desired. The H PVC LCN field (highest PVC LCN) indicates the highest numbered LCN that is a PVC. For example, if the H PVC LCN field is 7, LCNs 1 through 7 are PVCs.

The next highest range of numbers for LCNs belongs to the incoming only SVCs. This range is indicated in the Lowest Incoming LCN (L IN LCN) field and the Highest Incoming LCN (H IN LCN) field.

The next highest range of numbers for LCNs belongs to the two-way SVCs. This range is indicated in the Lowest Two-way LCN (L 2W LCN) field and the Highest Two-way LCN (H 2W LCN) field.

The highest range of numbers for LCNs belongs to the outgoing only SVCs. This range is indicated in the Lowest Outgoing LCN (L OUT LCN) field and the Highest Outgoing LCN (H OUT LCN) field.

For example, LCNs could be defined as follows:

- H PVC LCN = 2 (LCN 1 & 2 are PVC)

Copyright © 2003 Lucent Technologies

- IN LCN = 3
- IN LCN = 4 (LCN 3 & 4 are incoming SVC)
- L 2W LCN = 8
- H 2W LCN = 9 (LCNs 8 & 9 are 2-way SVC)
- L OUT LCN = 10
- H OUT LCN = 12 (LCNs 10-12 are outgoing SVC)

If PVCs are not desired, LCN 1 is available for an incoming SVC.

If PVCs and incoming SVCs are not desired, LCN 1 is available for a two-way SVC.

If PVCs, incoming SVCs and two-way SVCs are not desired, LCN 1 is available for outgoing SVCs.

1.2 Recent Change View

The corresponding Recent Change view for this form is 23.40.

2. FORM ENTRIES - 5901-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 (*) PKT TN

Description: Enter the packet telephone number if this individual port is to be configured for X.25 service.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9
- and X is 0 - 9

Data Rules:

A PKT TN must be entered if a PKT MLHG/TERM NBR and a H PVC LCN are entered. A PKT TN and a PKT MLHG/TERM NBR both can be entered if an individual PKT TN is defined for the MLHG member.

The first three digits of this TN must be defined on the NOC form (5501 Record). The packet TN defined on this XAT form must be unique, that is, it cannot be defined on any other XAT, DSL, DSLUSR, LINE, MLHLN, PSMTN, ACQS, AMLBDSL, MLHG, SHTN, MULTITN or MTNDR form.

If PKT TN is defined on this form and PKT MLHG and TERM NBR are not entered, then the LCC and RAX must be defined on the LCC form with a corresponding CLASS OF SERVICE of "XAT", a TERMINATING TREATMENT of "INDIV", and LINE SCREENING set to "N".

For 5E10 and later, when PKT TN(s) on the PSPVC form match PKT TN(s) on XAT form(s), the OE must be specified.

For 5E12 and later, PKT TN or PKT TN and PKT MLHG/TERM NBR combinations on different XAT forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit PKT TNs on the XAT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE,

Copyright © 2003 Lucent Technologies

the 7-digit PKT TN(s) must be entered as a 10-digit PKT TN(s).

For 5E12 and later, PKT TN and LNR HNT TN on the XAT form must be unique within the same XAT form.

For 5E12 and later, when the PKT TN(s) on the XAT form have an NXX (the first 3 digits of a 7-digit PKT TN) or an NPA/NXX combination (first 6-digits of a 10-digit PKT TN) entered, the OFFICE CODE or an NPA/OFFICE CODE combination must be defined on a NOC form.

2.3 (*) PKT MLHG

Description: Enter the packet MLHG number. A combination of XAT channels (possibly from more than one T1 facility) and BRI packet switching B-channels can coexist in the same MLHG.

Required Field (if a PKT TN is not entered).
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

The PKT MLHG number entered on this XAT form must be defined on a corresponding MLHG form (5110 Record). This corresponding MLHG form must have a LISTED TN entered. This matching MLHG form also must have an MLHG FEATURE entered which has been defined on the MLHGFD form (5604 Record) with a HUNT TYPE of "PSUCD".

For 5E8 and later, PKT MLHG may be the same as PPB1 MLHG and PPB2 MLHG on the DSL form and DPKT MLHG (Non-Modem Pooling) and ODB MLHG on the DSLUSR form. The corresponding PKT TERM must be different.

If PKT MLHG and TERM NBR are not entered, HUNT DEACT must be "N", and the following fields must not be entered: HUNT NOTIF, BUSY LIMIT, and LNR HNT TN.

If PKT MLHG/TERM NBR(s) are entered, then the Line Class Code and Rate Center combination (LCC/RAX) must be defined on the LCC form with a corresponding CLASS OF SERVICE of "XAT", a TERMINATING TREATMENT of "INDIV" or "MLHG", and LINE SCREENING of "N".

For 5E10 and later, when PKT MLHG is entered, OE must be entered.

2.4 (*) TERM NBR

Description: Enter the packet MLHG member number. A TERM NBR must be specified if a PKT MLHG has been defined.

Required Field (if a PKT TN has not been entered).
Valid Entries: 1 - 2015

Data Rules:

If a PKT MLHG and TERM NBR are entered, a DEN must be entered.

2.5 DEN

Description: Enter the Digital Equipment Number representing the SM, DLTU (Digital Line and Trunk Unit), DFI (Digital Facilities Interface) and channel number. Each DEN must be unique.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and earlier
Valid Entries: The DEN is an 8-digit number consisting of:

DIGITAL EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Line and Trunk Unit	DLTU	X	0-5
		XX	0 - 11 (5E15 and later)
Digital Facility Interface	DFI	XX	01-10
Channel Number	CH	XX	01-48

Data Rules:

If the channel number is greater than 24, a DLTU TYPE of "DLTU48" must be defined on the EQDU form. There can be a maximum of 160 XATs per SM.

Each SM / SHELF / CHL GRP can use a maximum of 384 LLCBs (Logical Link Control Blocks). The following applications define the possible LLCB assignments:

LLCB

Form	SM	SHELF CHL GRP	Increment
AMLBDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique AMLBDSL form where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form.
DSL	OE[1,3]	PPB1 ISCN[1,3]	by 1 for each PPB1 ISCN defined.
		PPB2 ISCN[1,3]	by 1 for each PPB2 ISCN defined.
		D ISCN[1,3]	by 1 if a matching DSLUSR form is not found
DSLUSR	OE[1,3]	D ISCN[1,3] on the cor-responding DSL form	by 2 for each DSLUSR form where DPKT TN or DPKT MLHG/TERM is entered.
			by 1 for each DSLUSR form where DPKT TN and DPKT MLHG/TERM are blank.
		ODB ISCN1[1,3] ODB ISCN2	by 1 if only ODB ISCN1 is entered.
			by 2 if both ODB ISCN1 and ODB ISCN2 are entered.
DSLAP	LCEN[1,3]	ISCN[1,3]	by 1 for each unique LCEN/ISCN combination.
MISLINK	OE[1,3]	SHELF and CHL GRP	by 1 for each MISLINK form.
OSPSDSL	LCEN[1,3]	ISCN[1,3]	by 2 for each unique OSPSDSL form where SERVICE CLASS is "TAOPER" or "DAOPER" and a corresponding AMLBDSL form is defined.
			by 1 for each unique OSPSDSL form.
RTERM RT INTERFACE is "TR303"	SM	ISCN[1,3]	by 2 for each TMC PRI ISCN and each TMC NPRI ISCN entry.
			by 3 for each EOC PRI ISCN and each EOC NPRI ISCN entry.
TRUNK Where TRKCLS is "IFOPER", "IFTERM" or "EDSL"	DEN[1,3]	ISCN[1,3]	by 1 for each unique TRUNK form.
XAT	DEN[1,3]	ISCN[1,3]	by 1 for each unique XAT form.

2.6 OE

Description: Enter the Orignating Equipment Number. The OE field is used to specify the originating equipment number (composite equipment number consisting of OETYPE and OEN). Enter one alphabetic character (OETYPE) followed by up to 10 digits (OEN) of the following format:

Software Release: 5E10 and later
Valid Entries:

Valid OE Type Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

D	Digital Trunk Equipment Number for PRI (DEN)
N	Networking Equipment Number (NEN).
U	Software Release 5E16(20 and later. XAT PH Channel Group Member.

If OE is set to "D", this OE Number consists of:

OE Number, Type D

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Line Trunk Unit	DLTU	X	0 - 5
Digital Facility Interface	DFI	XX	01 - 10
Digital Channel	DCHAN	XX	01 - 48

If OE is set to "N", this OE Number consists of:

OE Number, Type N - 5E12 and earlier

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNUS	X	0 - 5
Data Group	DG	X	0 - 1
Synchronous Transport Signal number	STS	X	0 - 5
Virtual Tributary	VT	XX	01 - 28
Digital Signal Level 0 channel	DS0	XX	01 - 24

OE Number, Type N - 5E13 and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNUS	X	0 - 7
Data Group	DG	X	0 - 1
SONET Termination Equipment number	STE	X	1 - 6
Synchronous Transport Signal number	STS	X	1
Virtual Tributary Group	VTG	X	1 - 7
Virtual Tributary Member	VTM	X	1 - 4
Digital Signal Level 0 channel	DS0	XX	01 - 24

For 5E16(2) and later, if OE is set to "U", this OE Number consists of:

OE Number, Type U (5E16(2) and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Packet Switching Unit	PSU	X	0 - 1
Shelf	SH	X	0 - 4
Channel Group	CHGRP	XX	01 - 15
Channel	CHAN	XXX	001 - 127

Data Rules:

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group. The following applications use one ALCB:

- AMLBDSL - first three digits of ISCN where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form
- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2
- MISLINK - where, SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN where SERVICE CLASS is

Copyright © 2003 Lucent Technologies

"TAOPER" or "DAOPER"

- XAT - where SHELF/CHL GRP is the first three digits of ISCN

For 5E10 and later:

A maximum of 160 XAT forms can be assigned to a given Switching Module. The Switching module is determined from the first three characters of the OE field on the XAT form.

Type D

When the XAT form(s) has an OE TYPE of "D" and a DEN specified, the DFI(s) that exist on the EQDUP form must have a FAC 0 or FAC 1 EQUIPMENT STATUS of "O" on the EQDUP form.

When the XAT forms have an OE TYPE of "D" and an OE entered, indicating a DEN assignment, the corresponding EQDUP form for this DEN must be defined. The EQDUP key fields: SWITCHING MODULE, DLTU and DFI PACK NUMBER correspond to OE[1,3], OE[4,4] and OE [5,6] respectively, when OE TYPE is "D".

Type N

When XAT form(s) have an OE TYPE of "N" and a NEN specified, there must be a corresponding EQVT form with VT EQSTAT and DS1S EQSTAT both set to "O".

- ***NOTE:*** For 5E13 and later, the associated EQVT form may be found by matching OE[1,3] with EQVT SM, OE[4] with EQVT DNUS, OE[5] with EQVT DATA GROUP, OE[6] with EQVT STE, OE[7] with EQVT STS, OE[8] with EQVT VT GROUP, and OE[9] with EQVT VT MEMBER.

Type U

When OE is "U":

- PKT MLHG, OCU and CSU LOOPBACK, CUGOA, FSA, REV CHARGE "N".
- L OUT LCN and H OUT LCN must be entered.
- L IN LCN, H IN LCN, H PVC LCN, L 2W LCN, H 2W LCN, and PBGRP must not be entered.

For 5E16(2) and later, when OE is "U" and a UEN is specified a PSU must exist on the EQPSU form (5741 Record).

When OE is "U", there must be a matching IPINTF fom where PKT TN equals the PKT TN on this form, and the LCN on the IPINTF form must be greater than or equal to the L OUT LCN on the XAT form, and must be less than or equal to the H OUT LCN on the XAT form.

When OE is "U", there must exist a matching IPINTF form where PKT TN equals PKT TN on this form, and SEND PKT SIZE on the XAT form must be greater than or equal to the MTU SIZE on the IPINTF form.

2.7 CHNG PKT TN

Description: This field is used by Recent Change only. No ODA input is required.

2.8 CHNG PKT MLHG

Description: This field is used by Recent Change only. No ODA input is required.

2.9 CHNG TERM NBR

Copyright © 2003 Lucent Technologies

Description: This field is used by Recent Change only. No ODA input is required.

2.10 CHNG DEN

Description: This field is used by Recent Change only. No ODA input is required.

Software Release: 5E9(2) and earlier

2.11 CHNG OE

Description: This field is used by Recent Change only. No ODA input is required.

Software Release: 5E10 and later

MLHG ONLY

The next two fields (Section 2.12 - Section 2.13) apply only to Multi-Line Group members.

2.12 LNR HNT TN

Description: Enter the Linear Hunt TN of a Multi-Line Hunt Group member. This LNR HNT TN serves as a linear entry point to the MLHG. Hunting always begins at the member associated with the called TN; it hunts sequentially through the list of members of the hunt group until either it reaches a non-busy hunt group member, or it reaches the last member and all members were hunt-busy.

If the member TN is on intercept the LNR HNT TN will not be on intercept.

Software Release: 5E8 and later
Valid Entries: 7 digits

Data Rules:

If LNR HNT TN is entered, the following must be true:

- DEN, PKT MLHG, and TERM NBR must be entered.
- The first three digits must be defined in the OFFICE CODE field on the NOC form.
- For any "PSUCD" MLHG, if LNR HNT TN for member 1 is not entered, no other members can have LNR HNT TN entered.
- LNR HNT TN must be unique within the 5ESS Switch.

For 5E12 and later, if the first 3-digits of the 7- digit LNR HNT TNs on the XAT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit LNR HNT TN(s) must be entered as a 10-digit LNR HNT TN(s).

For 5E12 and later, when the LNR HNT TNs on the XAT form have an NXX (the first 3 digits of a 7-digit LNR HNT TN) or NPA/NXX combination (the first 6 digits of a 10-digit LNR HNT TN) assigned, the NXX or NPA/NXX must be defined on a NOC form.

2.13 HUNT DEACT

Description: Should the MLHG member be deactivated (marked busy) for hunted calls? A value of "N" indicates the Multi-Line Hunt Group member is active (available) for hunting.

The deactive/active status has no effect on non-hunted calls, calls made to the MLHG member using its

Copyright © 2003 Lucent Technologies

individual TN.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PKT MLHG and TERM NBR are not entered, HUNT DEACT must be "N".

2.14 ISCN

Description: Enter the ISCN (Integrated Services Channel Number) representing a shelf, CHL GRP (channel group) and CHL (channel, in multiples of 4 [e.g. 0, 4, 8...]) in the PSU (Packet Switching Unit). This entry represents one of the five shelves in the PSU.

The ISCN Assignment Record (5844 Record) lists all assigned ISCNs.
Valid Entries: The ISCN is a six-digit number consisting of:

ISCN NUMBER			
Equipment		**Format**	**Valid Entries**
Shelf	SHELF	X	0 - 4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127 (0, 4, 8, ...)

Data Rules:

The SHELF number must be defined on the EQPSU form (5741 Record) where a SHELF SIDE 0/1 EQST has been set to "O" operational) for the same SM (first three digits of DEN on XAT form equals SM on EQPSU form).

The CHL GRP entry represents one of sixteen PH (Protocol Handler) circuit packs on one of the PSU shelves.

The CHL entry represents the PSU PH member number within the PH. The entry must be in multiples of 4.

The DLTU, DFI and ISCN must exist in the same loaded SM as specified by the DEN for this PKT TN or PKT MLHG member.

For 5E9(2) and earlier, an ISCN must be assigned on this form if a DEN has been assigned on this form.

For 5E9(1) - 5E9(2), the first three digits of DEN, the first digit of ISCN, and the second two digits of ISCN must match the SM, PSU SHELF, and GRP, respectively, on a PSUGP form (5949 Record) where PH TYPE is "PH3".

The following forms can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- MISLINK
- ODBRES
- OSPSDSL
- RTERM
- XAT

Copyright © 2003 Lucent Technologies

with all TRUNK forms which have a TRKCLS of:
- "EDSL"
- "IFTERM"
- "IFOPER"

However, they can not have an ISCN SHELF and CHL GRP which are mixed with Protocol Handler assignments from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of
- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"
- "X75"
- "X75P"

For 5E10 and later, when OE is entered, ISCN must be entered.

For 5E10 and later, when OE is not entered, ISCN cannot be entered.

A PIDB (Peripheral Interface Data Bus) must be defined for the hardware represented by the ISCN. For an (R)ISLU, the PIDB is defined on the EQISLU form (5731 Record) with a PIDB TYPE of "PSU" and a PSU SHELF number equal to the SHELF number assigned on this XAT form. For 5E8 and later, the IDCU PIDB is defined on the EQIDCU form (5846 Record) with a PIDB TYPE of "PSU" and a PSU SHELF number equal to the SHELF number assigned on this XAT form.

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

The ISCN must be a unique value within an SM. ISCNs cannot be duplicated on one or more of the following forms:
- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

For 5E10 and later, the following data rule is not executed on an SM-2000, because provisioning of nailed-up time slots is not required on an SM-2000. Each Data Interface in a SM can have a maximum of 256 nailed-up time slots reserved for the application in the following table. These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the following applications. Note that a D channel only takes a quarter of a time slot.

The time slots are reserved for the applications in the table that follows.

In addition, on a PSU1 , each Data Interface in a SM can have a maximum of 128 nailed-up time slots reserved for the following applications:

Timeslots Reserved for Applications

Application	Definition

Copyright © 2003 Lucent Technologies

EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM form.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RPA	Defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.
X.25	Defined on the XAT form.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

These time slots can be reserved by entering the rows RPTSS0 to RPTSS7 on the EQPSU form. The quantity of time slots reserved (i.e. the number entered) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D channel only takes a quarter of a time slot.

Also, the reserved time slots must be entered such that for any given SHELF, (defined by the first digit of ISCN field or by the SHELF field on the MISLINK form), the time slots assigned to that SHELF must not be duplicated in the same vertical (column) position if they appear in more than one row (RPTSS0 through RPTSS7).

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

2.15 # LCC

Description: Enter a packet Line Class Code. (See the LCC form (5306 Record) for LCC definitions.)
Valid Entries: 1 - 3 characters

Data Rules:

The LCC and RAX assigned on this XAT form must be defined on the LCC form (5306 Record) with a CLASS OF SERVICE of "XAT", a TERMINATING TREATMENT of "INDIV", and LINE SCREENING set to "N".

2.16 # RAX

Description: Enter a packet Rate Area. The Rate Area and LCC determine the DAS (Digit Analysis Selector) and Screening Index used for calls originating from this line and terminating treatment of calls to this line.

Required Field.
Valid Entries:

- For 5E14 and earlier: 1-99
- For 5E15 and later: 1 - 999

Copyright © 2003 Lucent Technologies

Data Rules:

Since the DAS points to packet switching digit interpreter tables, the LDIT, MLDIT and PDIT tables used by this PKT TN or PKT MLHG member must be packet switching tables (TYPE OF CI CALL is "PSNCI" or "PSCAR").

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.17 RATE

Description: Enter the XAT Channel Data Rate.

Required Field.
Valid Entries:

5E13 and earlier: 56K, 64K or 64IK
5E14 and later: 56KB, 64KB or 64IK

- ***NOTE:*** For 5E14 and later, the Data Rate names were updated to be consistent with Recent Change.

Data Rules:

For 5E9(2) and earlier, a RATE must be entered if a DEN has been assigned on this form.

For 5E10 and later, when OE is entered, RATE must be entered.

For 5E10 and later, when OE is not entered, RATE cannot be entered.

For 5E9(2) and earlier the DENs assigned on this XAT form and defined on the EQDUP form, only the following combinations of DFI MODEs on the EQDUP form and RATEs from the XAT form are allowed:

- When the XAT RATE is "56K", the EQDUP DFI MODE must be "D4", "FEB7", "D464", "FE64", "64K" or "FE8Z";
- when the XAT RATE is "64IK", the EQDUP DFI MODE must be "D464", "FE64", "64K" or "FE8Z";
- when the XAT RATE is "64K", the EQDUP DFI MODE must be "64K" or "FE8Z".

RATE must be "56K" when OCU LOOPBACK or CSU LOOPBACK is "Y".

For 5E10 and later, when the XAT forms have DEN(s) assigned on the corresponding EQDUP form, only the following XAT RATE/EQDUP DFI MODE combinations are valid: When the XAT RATE is "56K", the EQDUP DFI MODE must be "D4", "FEB7", "D464", "FE64 70, "64K" or "FE8Z". When the XAT RATE is "64IK", the EQDUP DFI MODE must be "D464", "FE64", "64K" or "FE8Z". When the XAT RA TE is "64K", the EQDUP DFI MODE must be "64K" or "FE8Z".Note:

- ***NOTE:*** The EQDUP key fields SWITCHING MODULE, DLTU and DFI PACK NUMBER correspond to OE[1,3], OE[4,4] and OE [5,6] respectively, when OE TYPE is "D".

For 5E10 and later, when XAT form(s) have an OE TYPE of "N" and a NEN assigned, and XAT RATE is "64K", the ZCS on the associated EQVT form must be "N".

2.18 N2

Copyright © 2003 Lucent Technologies

Description: The N2 value, per CCITT specifications, is the maximum number of attempts made by the CPE device or the PH to successfully transmit a frame at the LAPB (Link Access Procedure B) Level 2. Following N2 failures, the PH attempts to restore the link, which is either a SVC or a PVC. If the PH cannot restore the link, the PH will clear the SVCs and reset the PVCs.
Valid Entries: 2 - 15

Data Rules:

For 5E9(2) and earlier, N2 must be entered if a DEN has been assigned on this form.

For 5E10 and later, when OE is entered, N2 must be entered.

For 5E10 and later, when OE is not entered, N2 cannot be entered.

2.19 T1

Description: The T1 timer, per CCITT specifications, is the period of time before retransmission of a frame may be initiated at the LAPB Level 2.
Valid Entries: 20 - 200, even numbers only, in tenths of a second.

Data Rules:

For 5E9(2) and earlier, T1 must be entered if a DEN has been assigned on this form.

For 5E10 and later, when OE is entered, T1 must be entered.

For 5E10 and later, when OE is not entered, T1 cannot be entered.

2.20 T3

Description: The T3 timer, per CCITT specifications, is the period of time at which an idle channel is considered to have been in the idle state excessively long. The indication of this situation is passed to the PH to assure that the channel is idle and ready to be set for operation once again. The duration of the T3 timer must be greater than the duration of the T1 timer to ensure that retransmission efforts are not aborted.
Valid Entries: 3 - 30 in full seconds

Data Rules:

For 5E9(2) and earlier, T3 must be entered if a DEN has been assigned on this form.

For 5E10 and later, when OE is entered, T3 must be entered.

For 5E10 and later, when OE is not entered, T3 cannot be entered.

The duration entered in the T3 field must be greater than one-tenth the duration entered in the T1 field.

2.21 WNDSZ

Description: The maximum quantity of sequentially numbered LAPB Level 2 I-frames (Information) that the CPE device or PH can have unacknowledged at any time. This field is "I frames k" in CCITT terminology.
Valid Entries: 1 - 7

Data Rules:

For 5E9(2) and earlier, WNDSZ must be entered if a DEN has been assigned on this form.

For 5E10 and later, when OE is entered, WNDZ must be entered.

Copyright © 2003 Lucent Technologies

For 5E10 and later, when OE is not entered, WNDZ cannot be entered.

2.22 SUST

Description: Will all packet terminations to this line be denied?
Default: N
Valid Entries: Y, N

Data Rules:

When a PKT MLHG and TERM NBR are entered, SUST must be "N".

2.23 OCU LOOPBACK

Description: Is Loopback testing allowed at the OCU (Office Channel Unit)?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered, RATE must be "56K".

For 5E10 and later, when OE is not entered, OCU LOOPBACK must be "Y".

2.24 CSU LOOPBACK

Description: Is Loopback testing allowed at the CSU (Channel Service Unit)?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered, RATE must be "56K".

For 5E10 and later, when OE is not entered, CSU LOOPBACK must be "Y".

2.25 X25VER

Description: Enter the X.25 CCITT version supported for this CPE.
Default: 1984
Valid Entries: 1980, 1984

Data Rules:

For 5E9(2) and earlier, leave this field blank if DEN has not been entered.

For 5E10 and later, when OE is not entered, X25VER must be "1984".

2.26 ICB

Description: Will the ICB (Incoming Calls Barred) option be activated? ICB prevents users from receiving incoming virtual calls. The user may still originate outgoing virtual calls.
Default: N
Valid Entries: Y, N

Data Rules:

Enter "N" if PKT MLHG and TERM NBR have been entered.

Copyright © 2003 Lucent Technologies

For 5E10 and later, when OE is not entered, ICB must be "N".

2.27 OCB

Description: Will the OCB (Outgoing Calls Barred) feature be activated? OCB prevents the user from originating outgoing virtual calls. The user may still receive incoming virtual calls.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when OE is not entered, OCB must be "N".

2.28 BILL TN

Description: Enter a TN to be billed if the TN is is different from the PKT TN associated with this port.
Valid Entries: A 7-digit TN (if calls are to be billed to a TN within the local office); a 10-digit TN (if calls are to be billed to a TN outside the local office)

Valid 7 and 10-digit numbers can be the following formats:

- NXXXXXX - Where NXX is a valid office code defined in the OFFICE CODE field on a NOC form.
- NPANXXXXXX - Any 10-digit number; however, expected values are NPA and NXX codes.
- ZXXXXXX - Where Z is 0 or 1 (normally used for OUTWATS billing purposes). The first three digits must be defined in the OFFICE CODE field on a NOC form.

Data Rules:

If the BILL TN field is left blank and a DEN is assigned, the PKT TN will be used as the BILL TN.

For 5E10 and later, when OE is not entered, BILL TN cannot be entered.

For 5E12 and later, when the BILL TN(s) on the XAT form have an NXX value (the first 3 digits of a 7-digit BILL TN) or an NPA/NXX combination (the first 6-digits of a 10-digit BILL TN) without a matching OFFICE CODE or NPA/OFFICE CODE defined on the NOC form of this office, is valid only if you allow billing to NXX codes served by other offices or if the first digit of the NXX code is 0 or 1 designating OUTWATS billing.

2.29 RMK

Description: Remarks consisting of alphanumeric, blank or special characters except double quotes.
Valid Entries: 1 - 16 characters

3. FORM ENTRIES - 5902-2 RECORD

3.1 H PVC LCN

Description: Enter the highest LCN that can be assigned to a PVC. For 5E9(2) and earlier, at least one LCN field must be entered if a DEN is assigned. For 5E10 and later, when OE is entered, H PVC LCN, or L IN LCN, or H IN LCN, or L 2W LCN, or H 2W LCN, or L OUT LCN, or H OUT LCN must be entered.
Valid Entries: 1 - 127

Data Rules:

Copyright © 2003 Lucent Technologies

If H PVC LCN is entered, there must be a corresponding PSPVC form (5923 Record) with an LCN value less than or equal to this H PVC LCN value. If a PSPVC form is not entered, ODA will default the corresponding attribute values for the data.

For 5E10 and later, when OE is not entered, H PVC LCN cannot be entered.

3.2 L IN LCN

Description: Enter the Lowest Incoming LCN.
Valid Entries: 1 - 127

Data Rules:

If H PVC LCN is entered and this field is entered, the L IN LCN value must be one greater than the H PVC LCN value. If an entry is made in this field and H PVC LCN is not entered, the entry must be 1.

For 5E8 and later, if PKT MLHG and TERM NBR are entered, L IN LCN or L 2W LCN must be entered.

For 5E10 and later, when OE is not entered, L IN LCN cannot be entered.

3.3 H IN LCN

Description: Enter the Highest Incoming Logical Channel Number. The L IN LCN and H IN LCN fields must both be entered in order to define a range of incoming LCNs. If one is left blank, they must both be left blank.
Valid Entries: 1 - 127

Data Rules:

The value entered in this field must be greater than or equal to the value entered in the L IN LCN field.

For 5E10 and later, when OE is not entered, H IN LCN cannot be entered.

3.4 L 2W LCN

Description: Enter the Lowest Two-Way Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If this field and the H IN LCN fields are entered, then the value entered in this field must be greater than the value entered in the H IN LCN field.

If this field is entered, H IN LCN is blank and H PVC LCN is entered. The entry in this field must be greater than the H PVC LCN. Also, if this field is blank, H 2W LCN must be blank. However, if either field is entered, both must be entered.

For 5E8 and later, if PKT MLHG and TERM NBR are entered, L IN LCN or L 2W LCN must be entered.

For 5E10 and later, when OE is not entered, L 2W LCN cannot be entered.

3.5 H 2W LCN

Description: Enter the Highest Two-way Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If the L 2W LCN field is entered, then the H 2W LCN field must be entered in order to define a range of

Copyright © 2003 Lucent Technologies

Two-way LCNs. The value entered in this field must be greater than or equal to the value entered in the L 2W LCN field.

For 5E10 and later, when OE is not entered, H 2W LCN cannot be entered.

3.6 L OUT LCN

Description: Enter the Lowest Outgoing Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If either L OUT LCN or H OUT LC is not entered, they both must not be entered. If one is entered, then both must be entered.

If this field and the H 2W LCN fields are entered, then the value entered in this field must be greater than the value entered in the H 2W LCN field.

The value in this field must be greater than the previously entered H PVC LCN value if L IN LCN and L 2W LCN are blank. Also, L OUT LCN must be greater than H IN LCN if H IN LCN is entered.

For 5E10 and later, when OE is not entered, L OUT LCN cannot be entered.

3.7 H OUT LCN

Description: Enter the Highest Outgoing Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

If the L OUT LCN field is entered, then the H OUT LCN field must be entered in order to define a range of Outgoing LCNs. If this field is not entered, L OUT LCN must not be entered.

The value entered in this field must be greater than or equal to the value entered in the L OUT LCN field.

For 5E10 and later, when OE is not entered, H OUT LCN cannot be entered.

3.8 BUSY LIMIT

Description: Enter the busy limit for this MLHG terminal. The busy limit represents the maximum number of concurrent incoming virtual calls an MLHG member may receive before the member is marked busy for hunting purposes. Calls to non-hunt DNs are included in the incoming call count but are not restricted by the busy limit.

Software Release: 5E8 and later
Valid Entries: 1 - 127

Data Rules:

This parameter is applicable to MLHG members only. If PKT MLHG and TERM NBR are not entered, BUSY LIMIT must not be entered.

If PKT MLHG and TERM NBR are entered, BUSY LIMIT should be set according to the rules that follow. When BUSY LIMIT is not entered, the maximum value for the applicable rule will be assigned.

- If the XAT is on a PH3, BUSY LIMIT must be less than or equal to the sum of IN LCNs plus 2W LCNs.

3.9 HUNT NOTIF

Copyright © 2003 Lucent Technologies

Description: Indicate the Hunting Notification procedure to be used for processing an X.25 CLAMN (Called Line Address Modified Notification) facility and a modified address for this Multi-Line Hunt Group member.

The X.25 CLAMN feature allows the terminating CPE or switch to return the X.25 CLAMN facility, along with a modified Called Address field containing the non-hunt DN for the end-point, to the calling party. When a call is offered to a packet-mode hunt terminal as part of hunting, CLAMN signaling is returned to the calling party to indicate that a hunt was performed.

If HUNT NOTIF is blank, the CLAMN feature is not applicable.

Software Release: 5E8 and later
Valid Entries:

Valid HUNT NOTIF Entries

Entry	Definition
YES	The switch initiates CLAMN procedures when the terminating DTE does not. If neither the CLAMN nor the modified address is present, the switch will insert the CLAMN and non-hunt telephone number into the X.25 call request packet and allow the X.25 call to proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
NO	The switch does not initiate CLAMN procedures. If neither the CLAMN facility nor the modified address is present, or if both are present, the X.25 call will proceed. When the terminating DTE uses CLAMN procedures, the switch screens the CLAMN usage according to BELLCORE defined rules.
OLD	The X.25 CLAMN procedure that existed prior to the 5E8 Software Release is used.

Data Rules:

HUNT NOTIF is applicable to MLHG members only. If PKT MLHG and TERM NBR are not entered, HUNT NOTIF must not be entered.

If PKT MLHG and TERM NBR are entered, HUNT NOTIF must be entered.

If HUNT NOTIF is "YES", TN must be entered.

3.10 PMDR GRP

Description: Enter a Packet MDR Group name for associated with a XAT. The PMDR is used to generate Message Detail Recording records for packet data calls.

Software Release: 5E7 and later
Valid Entries: 1 - 8 characters

Data Rules:

For 5E9(2) and earlier, if DEN is not entered, PMDR GRP must not be entered. PMDR GRP and PMDR ACT must both be entered or neither can be entered.

For 5E10 and later, when OE is not entered, PMDR GRP cannot be entered.

3.11 PMDR ACT

Description: Is the Packet MDR Group associated with the XAT activated?

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

IF PMDR GRP is not entered or if DEN is not entered, PMDR ACT must not be entered. PMDR ACT must be entered when PMDR GRP is entered.

Copyright © 2003 Lucent Technologies

For 5E10 and later, when OE is not entered, PMDR ACT cannot be entered.

3.12 SEND TPC

Description: Enter the Throughput Class of a virtual call from the terminal to the switch.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600, or 19200.

Data Rules:

For 5E10 and later, when OE is not entered, SEND TPC must be 9600.

3.13 SEND PKTSZ

Description: Enter the maximum number of bytes of data that can be sent in a packet (excluding control type information).
Default: 128
Valid Entries: 128 or 256 bytes

Data Rules:

If the FCPN field is "N", this field must be 128.

For 5E10 and later, when OE is not entered, SEND PKTSZ must be 128.

3.14 SEND PKTWD

Description: Enter the number of data packets that the CPE device can have unconfirmed on a sending basis at any time.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if SEND PKTWD is not 2, FCPN must be "Y".

For 5E10 and later, when OE is not entered, SEND PKTWD must be 2.

3.15 SEND MCT

Description: Enter the maximum combined throughput in kilobits per second for the sending direction. When the sum of the sending throughput of virtual calls exceeds the SEND MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 64 - 128 (kbps), in increments of 8

Data Rules:

For 5E10 and later, when OE is not entered, SEND MCT can not be entered.

3.16 RCV TPC

Description: Enter the Throughput Class of a virtual call to the terminal from the switch.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600, or 19200.

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E10 and later, when OE is not entered, RCV TPC must be 9600.

3.17 RCV PKTSZ

Description: Enter the maximum number of bytes of data that can be received in a packet (excluding control type information).
Default: 128
Valid Entries: 128 or 256 bytes

Data Rules:

Enter 128 when FCPN is "N". If the FCPN field is "N", this field must be 128.

For 5E10 and later, when OE is not entered, RCV PKTSZ must be 128.

3.18 RCV PKTWD

Description: Enter the number of data packets that the CPE device can have unconfirmed on a receiving basis at any time.
Default: 2
Valid Entries: 1 - 7

Data Rules:

For 5E9(1) and later, if RCV PKTWD is not 2, FCPN must be "Y".

For 5E10 and later, when OE is not entered, RCV PKTWD must be 2.

3.19 RCV MCT

Description: Enter the maximum combined throughput in kilobits per second for the receiving direction. When the sum of the receiving throughput of virtual calls exceeds the RCV MCT (Maximum Combined Throughput), the user is considered busy.

Software Release: 5E8 and later
Valid Entries: 64 - 128 (kbps), in increments of 8

Data Rules:

For 5E10 and later, when OE is not entered, RCV MCT cannot be entered.

3.20 ICP

Description: Will terminating calls be routed to regular intercept?
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(2) and earlier, if "N" is entered, a DEN must be entered. If "Y" is entered, a PKT TN or PKT MLHG/TERM must be entered. However, when PKT MLHG/TERM is entered when ICP is "Y", a DEN also must be entered.

For 5E9(2) and earlier, DEN does not have to be entered if ICP is "Y" and PKT TN is entered. If the DEN is unassigned in this case (ICP is "Y" and PKT TN assigned), all fields on this form should be left blank or entered with their corresponding default values.

For 5E10 and later, when ICP is "N", OE must be entered.

Copyright © 2003 Lucent Technologies

For 5E10 and later, when ICP is "Y", PKT TN or PKT MLHG/TERM NBR and OE must be entered.

3.21 PB GRP

Description: Enter the number associated with the Packet Switching Data Business Group Service. This feature enables the customer to set up and administer intra-switch PBGs (Packet Business Groups) by assigning a PBG number to each X.25 termination to distinguish between intra-PBG and other calls on the AMA record. Do not enter a value if this user is not a member of a PBG.
Valid Entries: 1 - 100

Data Rules:

If a PB GRP is entered, a PKT TN must be entered.

For 5E10 and later, when OE is not entered, PB GRP cannot be entered.

An MLHG will be assigned to a PBG by associating the PBG with an MLHG on an MLHG form (5110 Record). The DSLUSR form (5908 Record) or XAT form should only be used to assign a PBG if the MLHG member has a known member TN.

3.22 REV CHARGE

Description: Will the called CPE accept the charge for a call from a PH?
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when OE is not entered, REV CHARGE MUST be "N".

3.23 LCP

Description: Will Local Charge Prevention be activated? When LCP is "Y" all the X.25 outgoing calls from this user will be Reverse Charged and any X.25 incoming calls that contain Reverse Charge will be cleared.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

LCP must be "N" when DEN is blank.

LCP is not allowed with Reverse Charge. If LCP is "Y" then REV CHARGE must be "N".

For 5E10 and later, when OE is not entered, LCP must be "N".

3.24 FCPN

Description: Will FCPN (Flow Control Parameter Negotiation) be activated? The transmission of data between a CPE device and a PH is controlled separately for each direction and is controlled by the receiver of the data. This is, in CCITT nomenclature, referred to as flow control. An additional aspect of flow control is the ability of the PH to limit the rate at which it accepts packets when it recognizes network congestion. FCPN allows the PH and the CPE device to negotiate the Window Size (2 or 3) and the Packet Size (128 or 256 bytes) on a per-call basis.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when OE is not entered, FCPN must be "N".

3.25 TPCN

Description: Will TPCN (Throughput Class Negotiation) be activated? TCPN allows the sending and receiving entities to negotiate the bits per second to be transmitted in either direction on a per-call basis. Both the sending and receiving party must subscribe to this service for the negotiation to transpire.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when OE is not entered, FCPN must be "N".

3.26 FSA

Description: Will the FSA (Fast Select Acceptance) feature be activated? FSA allows a CPE device to receive up to 128 bytes of user data with call setup and clearing packets.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when OE is not entered, FSA must be "N".

3.27 IA

Description: Will the ISDN IA (Intercom Addressing) be activated? IA permits the ISDN user to access other users on the 5ESS Switch with a 4-digit or 7-digit number.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E10 and later, when OE is not entered, IA must be "N".

3.28 IECP DNIC

Description: Enter a 4-digit DNIC (Data Network ID Code) for Inter-Exchange Carrier Pre-select.
Valid Entries: 1 - 9999

Data Rules:

This entry must be defined in the DNIC field on a PSDNICRI form (5921 Record).

For 5E10 and later, when OE is not entered, IECP DNIC cannot be entered.

4. FORM ENTRIES - 5902-3 RECORD

4.1 CUGPX

Description: Enter the Preferential Customer CUG (Closed User Group) Index.
Valid Entries: 0 - 99

Copyright © 2003 Lucent Technologies

Data Rules:

CUGPX must be entered if CUGOA is "Y" or CUGIA is "Y" and X25VER is "1980".

This CUGPX entry must equal the CUG IDX field on a PSCUG form (5924 Record) where the PKT MLHG and PKT TERM entries on PSCUG form equal the the PKT MLHG and TERM NBR (if entered) on this XAT form.

Also, this CUGPX entry must equal the CUG IDX field on a PSCUG form where the PKT TN entry on the PSCUG form equals the PKT TN (if entered) on this XAT form.

If the PKT TN or PKT MLHG/TERM NBR assigned on this XAT form equals the PKT TN or PKT MLHG/PKT TERM on the PSCUG form, this CUGPX field should be entered and CUGOA and CUGIA have to be set to "Y".

For 5E10 and later, when OE is not entered, CUGPX cannot be entered.

4.2 CUGOA

Description: Will the CUG Outgoing Access indicator be activated? CUGOA permits CUG members to access CPE devices that do not belong to a CUG or CPE devices that belong to a CUG with Incoming Access.
Default: N
Valid Entries: Y, N

Data Rules:

If CUGOA is "Y", the corresponding PSCUG form (5924A Record) must be defined with the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services, respectively.

For 5E10 and later, when OE is not entered, CUGOA must be "N".

4.3 CUGIA

Description: Will the CUG Incoming Access indicator be activated? CUGIA permits CUG members to access CPE devices that do not belong to a CUG or CPE devices that belong to a CUG with Outgoing Access.
Default: N
Valid Entries: Y, N

Data Rules:

If CUGIA is "Y", the corresponding PSCUG form (5924A Record) must be defined with the PKT TN or PKT MLHG/PKT TERMs equal to the TNs or MLHG/TERMs of these Packet Services, respectively.

For 5E10 and later, when OE is not entered, CUGIA must be "N".

4.4 CUGHX

Description: This field is used by only Recent Change to display the highest used CUG index. It is a display only field. No ODA input is required. For more information concerning Closed User Groups see Division 2, Section 1AL.

Copyright © 2003 Lucent Technologies

SEC. 1K: 5908A-1/2 RECORD
PPB/USER RECORD
5908B RECORD
DSL USER RECORD

1. GENERAL

The 5908A and 5908B Records are output-only records that list all DSL users in the office.

The 5908A Record, available in the 5E5 through 5E8 Software Releases, was replaced by the 5908A-1 and 5908A-2 Records for 5E9(1) and later. The data on these records is sorted by Office Equipment number.

The 5908B Record is available with 5E9(1) and later Software Releases and is sorted by USPID (User Service Profile Identifier).

2. RECORD ENTRIES - 5908A-1

2.1 OE

Description: This field is comprised of an equipment type and number for the ISLU, RISLU, or IDCU LCEN (Line Card Equipment Number) of the DSL. For a detailed description of this field, see the DSL OE field on the DSL form (5907 Record).

2.2 DSL CLS

Description: This field specifies the DSL class as a single user, multiple users under the AT&T custom protocol, or multiple users under the Bellcore Standard protocol. Its values are "PP" for custom Point-to-Point, "MP" for custom Multipoint, and "STD" for the Bellcore compliant Standard multipoint.

2.3 RSTR MP

Description: Is the Multipoint DSL restricted to a single active user ("Y" or "N")?

2.4 MTERM

Description: This field reports the maximum number of active users on the DSL, regardless of the quantity of active users indicated in the ACT USR fields on the DSLUSR forms associated with the DSL, that will simultaneously receive services. Users are handled on a "first plugged in", "first serviced" basis.

2.5 CKT TN or MLHG/TERM

Description: If the DSL user has a Circuit Telephone Number or is a member of a Circuit Multi-Line Hunt Group, the Circuit TN or the MLHG and terminal number are reported here.

2.6 DPKT TN or MLHG/TERM

Description: If the DSL user has a Packet Telephone Number or is a member of a Packet Multi-Line Hunt Group, the Packet TN or the MLHG and terminal number are reported here.

2.7 ODB TN or MLHG/TERM

Description: If the DSL user has an ODB (On Demand B-channel) Telephone Number or is a member of an ODB Multi-Line Hunt Group, the ODB TN or the MLHG and terminal number are reported here.

2.8 CKT MLHG TN

Copyright © 2003 Lucent Technologies

Description: If the DSL user has a Circuit Multi-Line Hunt Group Telephone Number, it is reported here.

2.9 DPKT MLHG TN

Description: If the DSL user has a Packet Multi-Line Hunt Group Telephone Number, it is reported here.

2.10 ODB MLHG TN

Description: If the DSL user has an ODB Multi-Line Hunt Group Telephone Number, it is reported here.

2.11 ACT USR

Description: Is the user an active user on the DSL ("Y" or "N")?

2.12 PPB1 USR

Description: Is Permanent Packet B1 associated with this user ("Y" or "N")?

2.13 PPB2 USR

Description: Is Permanent Packet B2 associated with this user ("Y" or "N")?

2.14 AGI

Description: The AGI (Associated Group Indicator) designates the group to which a Demand B-channel user is assigned. When users of the same BRI are assigned the same AGI, they are treated as one logical Demand B-channel user. AGI applies only to Standard BRIs.

2.15 USPID

Description: The USPID (User Service Profile Identifier) is the provisioned part of the SPID, which identifies a terminal to the switch during initialization. It uniquely identifies the DSL user in the office.

2.16 SUPPL

Description: This field indicates whether or not supplemental information for this OE appears on the 5908A-2 Record. If SUPPL is blank, no data exists for the OE on the second record.

3. RECORD ENTRIES - 5908A-2

3.1 OE

Description: This field duplicates an OE number that appears on the 5908A-1 Record.

3.2 PPB1 TN

Description: If the DSL has a PPB1 (Permanent Packet B1) Telephone Number, the PPB1 TN is reported here.

3.3 PPB1 MLHG

Description: If the DSL is assigned a PPB1 Multi-Line Hunt Group, the MLHG number appears here and the member number appears in the PPB1 TERM column.

3.4 PPB1 TERM

Copyright © 2003 Lucent Technologies

Description: If the DSL is assigned a PPB1 Multi-Line Hunt Group, the terminal number appears here and the MLHG appears in the PPB1 MLHG column.

3.5 PPB2 TN

Description: If the DSL has a PPB2 (Permanent Packet B2) Telephone Number, the PPB2 TN is reported here.

3.6 PPB2 MLHG

Description: If the DSL is assigned a PPB2 Multi-Line Hunt Group, the MLHG number appears here and the member number appears in the PPB2 TERM column.

3.7 PPB2 TERM

Description: If the DSL is assigned a PPB2 Multi-Line Hunt Group, the terminal number appears here and the MLHG appears in the PPB2 MLHG column.

4. RECORD ENTRIES - 5908B

4.1 USPID

Description: The USPID (User Service Profile Identifier) is the provisioned part of the SPID, which identifies a terminal to the switch during initialization. It uniquely identifies the DSL user in the office.

4.2 OE

Description: This field is comprised of an equipment type and number for the ISLU, RISLU, or IDCU LCEN (Line Card Equipment Number) of the DSL. For a detailed description of this field, see the DSL OE field on the DSL form (5907 Record).

4.3 DSL CLS

Description: This field specifies the DSL class as a single user, multiple users under the AT&T custom protocol, or multiple users under the Bellcore Standard protocol. Its values are "PP" for custom Point-to-Point, "MP" for custom Multipoint, and "STD" for the Bellcore compliant Standard multipoint.

4.4 RSTR MP

Description: Is the Multipoint DSL restricted to a single active user ("Y" or "N")?

4.5 MTERM

Description: This field reports the maximum number of active users on the DSL, regardless of the quantity of active users indicated in the ACT USR fields on the DSLUSR forms associated with the DSL, that will simultaneously receive services. Users are handled on a "first plugged in", "first serviced" basis.

4.6 CKT TN or MLHG/TERM

Description: If the DSL user has a Circuit Telephone Number or is a member of a Circuit Multi-Line Hunt Group, the Circuit TN or the MLHG and terminal number are reported here.

4.7 DPKT TN or MLHG/TERM

Description: If the DSL user has a Packet Telephone Number or is a member of a Packet Multi-Line Hunt Group, the Packet TN or the MLHG and terminal number are reported here.

Copyright © 2003 Lucent Technologies

4.8 ODB TN or MLHG/TERM

Description: If the DSL user has an ODB (On Demand B-channel) Telephone Number or is a member of an ODB Multi-Line Hunt Group, the ODB TN or the MLHG and terminal number are reported here.

4.9 CKT MLHG TN

Description: If the DSL user has a Circuit Multi-Line Hunt Group Telephone Number, it is reported here.

4.10 DPKT MLHG TN

Description: If the DSL user has a Packet Multi-Line Hunt Group Telephone Number, it is reported here.

4.11 ODB MLHG TN

Description: If the DSL user has an ODB Multi-Line Hunt Group Telephone Number, it is reported here.

4.12 ACT USR

Description: Is the user an active user on the DSL ("Y" or "N")?

4.13 PPB1 USR

Description: Is Permanent Packet B1 associated with this user ("Y" or "N")?

4.14 PPB2 USR

Description: Is Permanent Packet B2 associated with this user ("Y" or "N")?

4.15 AGI

Description: The AGI (Associated Group Indicator) designates the group to which a Demand B-channel user is assigned. When users of the same BRI are assigned the same AGI, they are treated as one logical Demand B-channel user. AGI applies only to Standard BRIs.

Copyright © 2003 Lucent Technologies

SEC. 1L: 5911A/B Record
REMOTE DIGITAL TEST ACCESS PORT/TN ASSIGNMENT RECORD - RDTAPORT

1. GENERAL

The 5911A and 5911B Records are available with 5E7 and later Software Releases. They are used to set up the data for the RPA (Remote Protocol Access) feature at the Access Switch. The Access Switch is defined as a switch that is maintained by a CSC (Customer Service Center). The CSC is a work center where protocol analysis is done.

RPA allows a craft at a CSC to troubleshoot a customer problem by setting up an RDTA (Remote Digital Test Access) connection on the customer's ISDN BRI (Basic Rate Interface) lines or PRI (Primary Rate Interface) lines, trunks, and packet trunks.

Note that RPA and RDTA can be used interchangeably. Division 2, Section 5F contains a full feature description for the RPA feature.

For each instance of the RDTAPORT form, two records are generated: the 5911A and the 5911B Record. Each record contains the same information; however, the 5911A Record is sorted by the RDTA OE field, and the 5911B is sorted by the CSC ID field.

If an RDTAPORT form is defined for an office, the fields RDTA DAS and RDTA SCRN IDX must be entered on the OFCOPT form (5509 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 22.17.

2. FORM AND RECORD ENTRIES

2.1 * RDTA OE

Description: This is a two segment field comprised of an equipment type and number.

Required Field.

Valid RDTA OE Entries

Entry	Definition
D	Software Release 5E9(2) and later: The RDTA OE is associated with a Digital Trunk Number (DEN) for PRI (Private Rate Interface).
E	Software Release 5E12 and later: The RDTA OE is associated with an AIU ISDN U-Interface (Access Interface Unit).
I	Software Release 5E9(2) and later: The RDTA OE is for a Pseudo BRI associated with (R)ISLU Line Card Equipment Number.
K	Software Release 5E10 and later: The RDTA OE is for a Pseudo BRI associated with ISLU2 Line Card Equipment Number and the number must be an 11-digit equipment number.
N	Software Release 5E10 and later: The RDTA OE is associated with a Networking Equipment Number (NEN).

If RDTA OE is set to "D", the equipment number must consist of:

OE Number, TYPE "D"

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Digital Line & Trunk Unit	DLTU	X	0 - 5
Digital Facility Interface	DFI	XX	01 - 10
D Channel	DCHAN	XX	01 - 24
			25 - 48

If RDTA OE is "E", this AIU Equipment Number must consists of:

Copyright © 2003 Lucent Technologies

OE Number, TYPE "E"			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Access Interface Unit	AIU	XXX	000 - 127
Pack	PACK	XX	00 - 19
Circuit	CKT	XX	00 - 35

Data Rules:

If RDTA OE is set to "I", the equipment number must consist of:

OE Number, TYPE "I"			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Integrated Services Line Unit	ISLU	X	0 - 7
Line Group Controller	LGC	XX	00 - 15
Line Card	LC	XX	00 - 31

If RDTA OE is set to "K", the equipment number must consist of:

OE Number, TYPE "K" - 5E10 and later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Integrated Services Line Unit	ISLU	XX	00 - 42
Line Group Controller	LGC	XX	00 - 15
Line Board	LBD	X	0 - 7
Line Circuit	LCKT	XX	00 - 07

IF RDTA OE is set to "N", the equipment number must consist of:

OE Number, TYPE "N" - 5E10 - 5E12			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Digital Networking Unit - SONET	DNUS	X	0 - 7
Data Group	DG	X	0 - 1
Synchronous Transport Signal number	STS	X	0 - 5
Virtual Tributary	VT	XX	01 - 28
Digital Signal Level 0 Channel	DS0	XX	01 - 24

OE Number, TYPE "N" - 5E13 and later			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Digital Networking Unit - SONET	DNU-S	X	0-7
Data Group	DG	X	0-1
SONET Termination Equipment	STE	X	1-6
Synchronous Transport Signal	STS	X	1
Virtual Tributary Group	VTG	X	1-7
Virtual Tributary Member	VTM	X	1-4
Digital Signal Level 0 channel	DS0	XX	01-24

The Pseudo BRI OE must be defined on an ISLULC form (5942 Record) with an "O" in the EQST field and a TYPE of "TLC" "ULC", "PULC" or "AULC".

The Pseudo BRI OE must be unique and must not appear on another RDTAPORT form, a DSL form (5907 Record), an OSPSDSL form (5411 Record) or a DSLAP form (5962 Record).

For 5E9(2) and earlier, if RDTA OE TYPE is "D" then PRI TN must be entered. Also, D CHAN TN, B1 CHAN TN and B2 CHAN TN must not be entered.

If RDTA OE TYPE is "I", "K", or "E", then D CHAN TN, B1 CHAN TN and B2 CHAN TN must all be entered and PRI TN must be blank.

The PRI OE number must be defined on a TRUNK form (5204 Record) with the field BRCS set to "N". The corresponding TKGRP form (5202 Record) must have the field RDTA GRP set to "Y".

Copyright © 2003 Lucent Technologies

For 5E10 and later, when RDTA OE TYPE is "D", the last two digits of RDTA OE cannot be 24 or 48.

For 5E10 and later, when RDTA OE TYPE is "N", the last two digits of RDTA OE cannot be 24.

For 5E10 and later, when RDTA OE TYPE is "D" or "N", D CHAN TN, B1 CHAN TN and B2 CHAN TN cannot be entered.

For 5E10 and later, when RDTA OE TYPE is "D" or "N", PRI TN must be entered.

For 5E10 and later, when RDTAPORT forms are defined with RDTA OE TYPE set to "D" or "N", the RDTA OE NUMBER must be defined on a TRUNK form as either DEN or NEN respectively. The corresponding TKGRP form must have RDTA GRP set to "Y".

For 5E12 and later, when RDTA OE TYPE is "E", an EQAIUP form must be defined as SM/AIU/APPL PACK NUM with TYPE set to "AIULP" or "AIURPLP.

2.2 # CSC ID

Description: The Customer Service Center ID where the RPA test equipment is located.

Required Field.
Valid Entries: 1 - 8 characters

2.3 PAIR

Description: Enter the paired number for an RPA facility. Pairing allows the craft to add distinct paired numbers to sets of BRIs or PRIs for easy identification on printed office records. From 1 to 24 pairs may be defined. No entry means that the output facility does not have a paired number assigned.
Valid Entries: 1 - 24

PSEUDO BRI

2.4 D CHAN TN

Description: Enter the TN associated with the D channel of the Pseudo BRI port. The TN must be unique within the 5ESS Switch.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits of the D CHAN TN must be defined in the OFFICE CODE field on the NOC form (5501 Record).

For 5E12 and later, if the first 3 digits of the 7-digit D CHAN TNs on the RDTAPORT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit D CHAN TN(s) must be entered as a 10-digit TN(s).

For 5E12 and later, the D CHAN TN, B1 CHAN TN, B2 CHAN TN, and PRI TN on the RDTAPORT form must be unique.

For 5E12 and later, 10-digit D CHAN TNs, B1 CHAN TNs, B2 CHAN TNs and/or PRI TNs defined on a RDTAPORT form must have an NPA/NXX (the first six digits of the TN) that is defined as an NPA/OFFICE CODE on a NOC form.

Copyright © 2003 Lucent Technologies

For 5E12 and later, the 7-digit D CHAN TNs, B1 CHAN TNs, B2 CHAN TNs and/or PRI TNs defined on a RDTAPORT form must have an NXX (the first three digits of the TN) that is an OFFICE CODE defined on a NOC form.

2.5 B1 CHAN TN

Description: The TN associated with the B1 channel of the Pseudo BRI port. The TN must be unique within the 5ESS Switch.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits of the B1 CHAN TN must be defined in the OFFICE CODE field on a NOC form.

For 5E12 and later, if the first 3 digits of the 7-digit B1 CHAN TNs on the RDTAPORT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit B1 CHAN TN(s) must be entered as a 10-digit TN(s).

2.6 B2 CHAN TN

Description: The TN associated with the B2 channel of the Pseudo BRI port. The TN must be unique within the 5ESS Switch.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits of the B2 CHAN TN must be defined in the OFFICE CODE field on a NOC form.

For 5E12 and later, if the first 3 digits of the 7-digit B2 CHAN TNs on the RDTAPORT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit B2 CHAN TN(s) must be entered as a 10-digit TN(s).

PRI

2.7 PRI TN

Description: The TN associated with the Primary Rate Interface B channel port. The TN must be unique within the 5ESS Switch.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The first three digits of the PRI TN must be defined in the OFFICE CODE field on a NOC form.

For 5E12 and later, if the first 3 digits of the 7-digit PRI TNs on the RDTAPORT form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE

Copyright © 2003 Lucent Technologies

CODE, the 7-digit PRI TN(s) must be entered as a 10-digit TN(s).

SEC. 1M: 5910A and 5910B RECORD
REMOTE DIGITAL TEST ACCESS TELEPHONE NUMBER - RDTATN

1. GENERAL

The 5910A and the 5910B records are available with the 5E7 and later Software Releases. They are used as part of the RPA (Remote Protocol Access) feature to allow an operating company at a Remote Switch to document the TN (Telephone Number) of a Protocol Analyzer at an Access Switch. The Access Switch is defined as a switch that maintains the connections to the protocol analyzer equipment is the CSC (Customer Service Center). The Remote Switch is a switch that does not maintain physical RPA connections to the CSC. The CSC is a work center where protocol analysis is done.

The RPA feature, also referred to as RDTA (Remote Digital Test Access), provides a craft at a CSC with the ability to troubleshoot a customer problem by a setting up an RDTA connection on the customer's ISDN facilities. For more information, refer to the RPA Feature Description in Division 2, Section 5F.

For each RDTATN form instance, two office records are generated: 5910A and 5910B. The 5910A Record contains the TN, CSC ID, CHANNEL, and PAIR fields. The record is sorted by TN. The 5910B Record contains the same information but is sorted by the CSC ID.

1.1 Recent Change View

The corresponding Recent Change view for this form is 22.18.

2. FORM AND RECORD ENTRIES

2.1 * TN

Description: Enter the TN associated with a particular Pseudo-BRI or PRI B-channel port that has been defined for the RDTA capability.
Valid Entries: A 7-, 10- or 15-digit TN

Data Rules:

If the value entered is a 10-digit TN, it must not match any combinations of NPA and 7-digit TNs entered on the RDTAPORT form (5911-A/B Record).

2.2 # CSC ID

Description: Enter the Customer Service Center ID where protocol analysis is done.

Required Field.
Valid Entries: 1 - 8 characters

2.3 # CHANNEL

Description: Enter the channel associated with the TN. If the TN is associated with a Pseudo-BRI D channel, the value must be 0. If the TN is associated with a Pseudo-BRI B1 the value must be 1. If it is associated with a Pseudo-BRI B2 channel, the value must be 2.

If the TN is associated with a PRI B channel then the value is 1 to 23 depending on the PRI B channel.

Required Field.
Valid Entries: 0 - 23

2.4 PAIR

Copyright © 2003 Lucent Technologies

Description: Enter the paired number for an RPA output facility. Pairing allows the craft to add distinct paired numbers to sets of Pseudo-BRI or PRI pairs for easy identification on printed office records. No entry indicates that the craft has chosen not to assign a paired number to the facility.
Valid Entries: 1 - 24

SEC. 1N: 5915 RECORD
ODB CUT THROUGH TS ALLOCATION - ODBCTUR

1. GENERAL

The On-Demand B-Channel Cut Through Time Slot Allocation form is available with the 5E12 and later Software Releases. It supports the TR-303 RDT (Remote Digital Terminal) on the DNU-S (Digital Networking Unit - Synchronous Optical Network) feature. It is used to reserve cut through time slots for DSL (Digital Subscriber Line) users with the On-Demand B-Channel Packet Switching feature.

Reserved time slots are not initially allocated to the user. Instead, the time slots become part of a cut through time slot "pool" to be accessed later by a DSL user with the ODB feature on the same SM and DNU-S. Prior to reserving cut through time slots, the PSU must be defined on the EQPSU form (5741 Record).

1.1 Recent Change View

The Recent Change/Verify view for this form is 23.19.

1.2 * SM

Description: Enter the SM (Switching Module) number on which the On-demand B-Channel service resides.

Required Field.
Valid Entries: 1 - 192

Data Rules:

If an ODB ISCN is entered on the DSL, the SM entered on this view must equal the first three digits of the Office Equipment number entered on the DSL form. The SM number entered on this view must be defined on the EQIM form (5700 Record) with EQSTAT set to "O".

1.3 * PSU

Description: Enter the Packet Switch Unit number.

Required Field.
Valid Entries: 0

For 5E16 and later, PSU must be "0".

ODB TS LIST

The following fields (Section 1.5 - Section 1.7) provide information for defining the time slot list.

1.4 PSU SHELF

Description: Enter the Packet Switch Shelf number.
Valid Entries: 0 - 4

Data Rules:

PSU SHELF entries must be unique.

If an ODB ISCN number is entered on the DSL form, the PSU SHELF number on this form should equal the first digit of the ODB ISCN number.

Copyright © 2003 Lucent Technologies

If PSU SHELF is entered, RESERVED TS must be entered.

1.5 RESERVED TS

Description: Enter the number of time slots which have been assigned to the associated cut through peripheral.
Valid Entries: 0 - 768

Data Rules:

If RESERVED TS is entered, SHELF must be entered.

At least one RESERVED TS and PSU SHELF value must be entered.

1.6 AVAILABLE TS

Description: This field defines the maximum number of remaining time slots which may be assigned out of the cut through time slot "pool".
Valid Entries: 0 - 768

1.7 ODB USER

Description: This is a Recent Change only field. It specifies the number of On-Demand B time slots being used on a per shelf basis.

SEC. 3: PACKET SWITCHING FORMS

Copyright © 2003 Lucent Technologies

SEC. 3A: 5920 RECORD
PACKET SWITCHING INTER SM
NAIL-UP FORM - PSISM

1. GENERAL

The 5920 Record is applicable for 5E3 and later Software Releases.The PSISM form is used to define a dedicated path from an ISCN (Integrated Services Channel Number) in one SM (Switching Module) to an ISCN in another SM.

The two ISCNs have a master and mate (slave) relationship. The master controls the state of the path and initiates the vast majority of the work. The mate can detect problems, but can only report the problems to the master.

It is strongly suggested that every effort be made to balance the quantity of masters on each ISDN SM. Though not as critical, it is advisable to balance the quantity of mates on each ISDN SM.

An individual ISDN SM can support a maximum of 160 nail-up endpoints (master or mate). There cannot be more than 32 links between a pair of ISDN SMs.

The combination of SM and DLT or the combination of MATE SM and MATE DLT must be unique within the 5ESS Switch.

1.1 Recent Change View

The corresponding Recent Change view for this form is 22.13.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * SM

Description: Enter a valid Switching Module number. This field refers to the MASTER.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM and the MATE SM cannot be equal.

For 5E9(2) and later, each value of SM and MATE SM entered on the PSISM form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports Packet Switching. For the CONFIGURATION that supports Packet Switching, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

The value entered in this field must appear in the SWITCHING MODULE field on an EQPSU form (5741 Record).

The following data rules are not executed on an SM-2000, because provisioning of nailed-up time slots is not required on an SM-2000. Each DI (Data Interface) in a SM can have a maximum of 256 nailed-up timeslots reserved for the application in the following table. These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the following applications.

Copyright © 2003 Lucent Technologies

Note that a D channel only takes a quarter of a time slot.

In addition, onn a PSU1 , each Data Interface in a SM can have a maximum of 128 nailed-up time slots reserved for the following applications:

Data Interface for Nailed-up Timeslots

Application	Definition
EDSL	Defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	Defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	Defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
ISM	Defined on the PSISM forms.
IP	Defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
PKTPIPE	Defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms (CMDA application).
RISLU B Channel	Defined on the DSL/AMLBDSL forms where the first 3 digits of LCEN match SM on an EQRISLU form.
RISLU D Channel	Defined on the DSL/DSLAP/MISLINK/OSPSDSL forms where the first 3 digits of LCEN (on the DSLAP or OSPSDSL form) or OE (on the DSL or MISLINK form) match SM on an EQRISLU form.
SPCHNDLR	Defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms (CMDA application).
X.25	Defined on the XAT forms.
X75	Defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
X75P	Defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.

These time slots can be reserved by entering the rows RPTSS0 to RPTSS7 on the EQPSU form. The quantity of time slots reserved (i.e. the number entered) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D channel only takes a quarter of a time slot.

Also, the reserved time slots must be entered such that for any given SHELF, (defined by the first digit of ISCN field or by the SHELF field on the MISLINK form), the time slots assigned to that SHELF must not be duplicated in the same vertical (column) position if they appear in more than one row (RPTSS0 through RPTSS7).

2.3 * DLT

Description: Enter a valid Data Link Terminal number. The DLT (Data Link Terminal) is a logical port that has no relationship to a physical port. An ISDN SM can support 160 nail-up endpoints, and the DLT is used as an identifier for each logical port. This field refers to the MASTER.

Required Field.
Valid Entries: 1 - 160

2.4 ISCN

Description: Enter a valid Integrated Services Channel Number.

Required Field.
Valid Entries: a 6-digit number in the ISCN format

ISCN (INTEGRATED SERVICES CHANNEL NUMBER)

Equipment		Format	Valid Entries
Shelf	-	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127 (See note below.)

Copyright © 2003 Lucent Technologies

NOTE: For 5E9(1) and later, the valid Channel entries for a PH2 are 000 - 012.

Data Rules:

The SHELF, PSU protocol handler shelf number, must correspond to a shelf on an EQPSU form which has a SHLF SIDE 0/1 EQST of 0.

The CHL is the PSU protocol handler number on the shelf. Each DSL GROUP corresponds to a PROTOCOL HANDLER assigned to the PSU SHELF on an EQPSUPH form (5742 Record) with the SWITCHING MODULE equal to this SM and the PSU SHELF equal to the PSU protocol handler shelf number.

The CHL is the PSU protocol handler member number within the protocol handler. For 5E4(2) and later, the CHL must be a multiple of 4.

The combination of SM and the last three digits of the ISCN (the CHL) or the combination of MATE SM and the last three digits of MATE ISCN must be unique within the 5ESS Switch. The combination may not be duplicated on any

- AMLBDSL form (5447 Record),
- DSL form (5900 Record),
- DSLAP form (5963 Record),
- OSPSDSL form (5411 Record),
- another PSISM form (5920 Record)
- QPHPIPE form (5828 Record) or,
- TRUNK form (5204 Record).

The combination of SM and ISCN or the combination of MATE SM and MATE ISCN may not be duplicated on any of the forms listed above.

PSISM forms cannot have combinations of ISCN (or MATE ISCN) SHELF and CHL GRP entries that duplicate those for the same SM on AMLBDSL, DSL, DSLAP, DSLUSR, ODBRES, OSPSDSL, QPHPIPE, RTERM, or XAT forms, or on TRUNK forms where TRKCLS is "EDSL", "IFTERM", or "IFOPER".

The Protocol Handlers specified on the PSISM forms (combination of SM, with first 3 digits of the ISCN and MATE SM with the first 3 digits of the MATE ISCN) cannot be mixed with Protocol Handlers assigned on other forms. PSISM forms cannot have common SHELF and CHL GRP with the following forms :

- CCLNK
- DSLUSR
- MDLNK
- MISLINK
- PSULNK
- TRUNK
- XAT

The ISCN must be a unique value within an SM. ISCNs cannot be duplicated on one or more of the following forms:

- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES

Copyright © 2003 Lucent Technologies

- OSPSDSL
- PSISM
- RTERM
- TRUNK
- XAT.

If the SM and three left-most digits of ISCN assigned on this form have been defined on a PSUGP form as SM and PSU SHELF and GRP respectively, then the corresponding value of PH TYPE must not be:

"PHV1" or "PHV2" for 5E10

"PHV1", "PHV2", or "PHV3" for 5E11

"PHV1", "PHV2", "PHV3", "PHV4", "PHV5", "PHV6", or "VIRT" for 5E18

on the PSUGP form.

SM/ISCNs assigned on this form must have a corresponding combination of SM, PSU, PSU SHELF and GRP entered on the PSUGP form.

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

2.5 MASTER

Description: Is the SM controller of the path? This field defaults to "Y" and cannot be changed.
Default: Y
Valid Entries: Y

2.6 MATE SM

Description: Enter a valid Mate Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM and MATE SM cannot be equal.

For 5E9(2) and later, each value of SM and MATE SM entered on the PSISM form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports Packet Switching. For the CONFIGURATION that supports Packet Switching, see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

The value entered in this field must appear in the SWITCHING MODULE field on an EQPSU form (5741 Record).

2.7 MATE DLT

Description: Enter a valid Mate Data Link Terminal number. The DLT (Data Link Terminal) is a logical port that has no relationship to a physical port. An ISDN SM can support 160 nail-up endpoints, and the DLT is used as an identifier for each logical port.

Required Field.
Valid Entries: 1 - 160

Copyright © 2003 Lucent Technologies

2.8 MATE ISCN

Description: Enter a valid Mate Integrated Services Channel Number.

Required Field.
Valid Entries: a 6-digit number in the ISCN format

ISCN (INTEGRATED SERVICES CHANNEL NUMBER)			
Equipment		**Format**	**Valid Entries**
Shelf	-	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-127 (See note below.)

NOTE: For 5E9(1) and later, the valid Channel entries for a PH2 are 000 - 012.

Data Rules:

Refer to the Data Rules for the ISCN field.

SEC. 3B: 5921 RECORD
PACKET SWITCHING DNIC TO RI ASSIGNMENT FORM - PSDNICRI

1. GENERAL

The 5921 Record is applicable to 5E3 and later Software Releases. The PSDNICRI form is used to assign a Route Index that routes to a Packet Switching trunk, and then outside the 5ESS Switch to another Packet Network and its associated Data Network Identification Code.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.35.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * DNIC

Description: Enter a valid Packet Switching Data Network ID Code.
Valid Entries:
- For 5E3 and 5E4(2): 0 - 9999
- For 5E5: 1111 - 1114 and 2000 - 9999
- For 5E6 and later: 0001-9999

2.3 ROUTE INDEX

Description: Enter a valid Route Index.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

The Route Index must be defined on the RTIDX form (5303 Record) and that Route Index must point to a Trunk Group with a HUNT TYPE of "PSUCD".

SEC. 3C: 5922 RECORD
PACKET SWITCHING
BILLING RATE PERIODS FORM - PSRATE

1. GENERAL

The 5922 Record is available with 5E3 and later Software Releases. It is used to define the billing rates for Packet Switching. The input form provides billing rate data for each day of the week and for holidays. The billing rate data is specified in one-hour increments.

For 5E3 and 5E4(2), an SM with Packet Switching capabilities is specified on the EQPSU form (5741-1/2 Record). For 5E5 and later, the EQPSUPH form (5742 Record) defines the Packet Switching Protocol Handlers equipped in a 5ESS Switch. If the EQST field does not have at least one entry of "O" (Operational) on the EQPSUPH form, then the PSRATE form must not be entered.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * DAY

Description: Enter holiday or the day of the week. If this office applies the Packet Switching feature, this form must be completed for all eight days.

Required Field.

Valid DAY Entries

Entry	Definition
MON	Monday
TUE	Tuesday
WED	Wednesday
THU	Thursday
FRI	Friday
SAT	Saturday
SUN	Sunday
HOL	Holiday

2.3 TIME OF DAY

Description: The 24 hours of the day, in one-hour increments, are preprinted on the PSRATE input form. The Billing Rate must be entered for each hour.

Required Field.
Default: 1
Valid Entries:

Valid TIME OF DAY Entries

Entry	Definition
1	Billing rate 1
2	Billing rate 2
3	Billing rate 3
4	Billing rate 4

SEC. 3D: 5923 RECORD
PACKET SWITCHING
PERMANENT VIRTUAL CIRCUIT ASSIGNMENT FORM - PSPVC

1. GENERAL

The 5923 Record is applicable to 5E3 and later Software Releases. The PSPVC form is used to assign PVC (Permanent Virtual Circuit) Logical Channel Numbers to DSLs (Digital Subscriber Lines) that have Packet Switching. The sending and receiving parties must be set up in an identical manner.

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 (*) PKT TN

Description: Enter a valid Packet Switching Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

Either a PKT TN or a PKT MLHG/TERM must be entered.

For 5E5 and later Software Releases, this Packet Switching TN must be defined on a DSLUSR form (5908 Record) in the DPKT TN field or defined on a DSL form (5907 Record) in the PPB1 TN or PPB2 TN field. The value entered in the LCN field must not be greater than the value entered in the H PVC LCN field on the DSL or DSLUSR form.

For 5E12 and later, PKT TN/LCN combinations on different PSPVC forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit PKT TNs on the PSPVC form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit PKT TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 (*) PKT MLHG

Description: Enter a valid Packet Switching Multi-Line Hunt Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

Either a PKT TN or a PKT MLHG/TERM must be entered.

Copyright © 2003 Lucent Technologies

For 5E5 and later Software Releases, this PKT MLHG/TERM must be defined on one of the following forms:

- DSLUSR form in the DPKT MLHG/TERM field. The value entered in the LCN field must not be greater than the value entered in the H PVC LCN field on the DSLUSR form.
- DSL form in the PPB1 MLHG/TERM or PPB2 MLHG/TERM field. The value entered in the LCN field must not be greater than the value entered in the H PVC LCN field on the DSL form.
- OSPSDSL form (5411 Record) in the DSL NAME ID/DSL NAME RL field with a SERVICE CLASS of "XDB". The value entered in the LCN field must not be greater than the value entered in the HIGH PVC LCN field on the associated AMLBDSL form (5447 Record).

2.4 (*) PKT TERM

Description: Enter a valid Packet Switching Multi-Line Hunt Group Terminal (Member) number.
Valid Entries: 1 - 2015

Data Rules:

If this field is entered, the associated PKT MLHG field must be entered.

2.5 * LCN

Description: Enter a valid packet switching Logical Channel Number.

Required Field.
Valid Entries: 1 - 127

2.6 SEND PKT SIZE

Description: Enter the Send Packet Size which is the maximum number of bytes of data in a packet that can be sent.

Required Field.
Default: 128
Valid Entries: 128 or 256 (bytes)

2.7 RCV PKT SIZE

Description: Enter the Receive Packet Size which is the maximum number of bytes of data in a packet that can be received.

Required Field.
Default: 128
Valid Entries: 128 or 256 (bytes)

2.8 SEND WINDOW SIZE

Description: Enter the number of data packets that the CPE device can have unacknowledged, on a sending basis, at any time.

Required Field.
Default: 2
Valid Entries:
- 5E8 and earlier: 2 - 3
- 5E9(1) and later: 1 - 7

Copyright © 2003 Lucent Technologies

2.9 RCV WINDOW SIZE

Description: Enter the number of data packets that the CPE device can have unacknowledged, on a receiving basis, at any time.

Required Field.
Default: 2
Valid Entries:
- 5E8 and earlier: 2 or 3
- 5E9(1) and later: 1 - 7

2.10 # CALL IND

Description: Enter a valid PVC Logical Channel Number call indicator.

Required Field.

Valid CALL IND Entries

Entry	Definition
CALLING	Calling indicator.
CALLED	Called indicator.

Data Rules:

For 5E13 and earlier, when CALL IND is "CALLING", then REMOTE TN must be entered.

2.11 BILLABLE

Description: Is the logical channel number billable?

Required Field.
Default: Y
Valid Entries: Y, N

2.12 # FCL TYPE

Description: Enter a valid destination facility type. The FCL TYPE (Facility Type) indicates what the interface is on the far end of a PVC (Permanent Virtual Circuit). The PVC is supported for Packet Switching with the layer 3 protocol being either X.25, X.75 or X.75P, the later two enumerations being for packet trunks.

Required Field.

Valid FCL TYPE Entries

Entry	Definition
X25	defines the interface on the far end of the PVC to be an X.25 line
X75	defines the interface on the far end of the PVC to be an X.75 trunk
X75P	defines the interface on the far end of the PVC to be an X.75P trunk
INET	For 5E14 and later. INET stands for Internet Protocol which is the TCP/IP protocol stack. INET - defines the interface on the far end of the PVC to be an interface to TCP/IP. This interface is internal to the switch and is not associated with a physical external interface.

Data Rules:

When FCL TYPE is "INET" or "X25", REMOTE DNIC and LINK ID must not be entered.

When FCL TYPE is not "INET" or "X25", REMOTE DNIC and LINK ID must be entered.

Copyright © 2003 Lucent Technologies

When FCL TYPE is "INET" or "X75", REMOTE TN must not be entered.

When FCL TYPE is not "INET", REMOTE LCN must be entered.

When FCL TYPE is "INET":

- CALL IND must be "CALLING".
- SEND PKT SIZE must be 256.
- RCV PKT SIZE must be 256.
- SEND WINDOW SIZE must be 7.
- RCV WINDOW SIZE must be 7.

For 5E14 and later, when the FCL TYPE on the PSPVC form is set to "INET", there must exist a matching IPINTF form (case 1) where PKT TN equals PKT TN and LCN equals LCN, or a matching IPINTF form (case 2) where PKT MLHG/PKT TERM equals PKT MLHG/PKT MEMB and LCN equals LCN. In either case 1 or case 2 above, the SEND PKT SIZE on the PSPVC form must be greater than or equal to the MTU SIZE on the corresponding IPINTF form.

2.13 LINK ID

Description: Enter the gateway Link ID. When the FCL TYPE is X75 or X75P, the LINK ID points to the Remote Trunk Gateway.
Valid Entries: 1 - 255

2.14 REMOTE LCN

Description: Enter a valid Remote packet switching Logical Channel Number.
Valid Entries: 1 - 4095

2.15 REMOTE TN

Description: Enter a valid Remote Directory Number in NPANXXXXXX format.
Valid Entries: 10 digits

2.16 REMOTE DNIC

Description: Enter a valid Packet Switching Data Network ID Code.

The DESTINATION PSN will be used for routing. The REMOTE DNIC may be used at the far end of the PVC for billing purposes.
Valid Entries: 1111 - 1114 and 2000 - 9999

2.17 DESTINATION PSN

Description: Enter the Destination Packet Switch Number. The PSN entered must be a Packet Switch Number of a 5ESS Switch that resides in the same IP (Internal Protocol) subnetwork as this switch. The PSN entered will be the switch that provides the gateway trunk group which is either:

- the PSN of the 5ESS Switch which connects the IP subnetwork to the PPSN via an X.75' trunk group, or
- the PSN of a 5ESS Switch that is connected to a 1PSS which connects to the PPSN.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Valid Entries: 1 - 255

Data Rules:

The PSN entered must be defined on the RTIDX form in the DESTINATION PSN field.

2.18 INTRA GROUP

Description: The INTRA GROUP field applies to the Packet Switching Data Business Group Service feature. This feature enables a customer to set up and administer intra-switch PBGs (Packet Business Groups) by assigning a PBG number to each X.25 termination to distinguish between intra-group calls and other calls on the AMA billing record. An MLHG (Multi-Line Hunt Group) will be assigned to a PBG by associating a PBG number with the MLHG TN.

An entry in this field indicates whether or not the PVC is considered intra-group for billing purposes.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 3E: 5924/5924A RECORDS
PACKET SWITCHING CLOSED USER GROUP
ASSIGNMENT FORM - PSCUG

1. GENERAL

The 5924/5924A Record is applicable to 5E3 and later Software Releases. The PSCUG form is used to assign DSLs (Digital Subscriber Lines), that have Packet Switching, to a Closed User Group.

There are two records associated with this form. The 5924 Record is arranged in the format of the ODA input form. The 5924A Record is arranged by DNIC/ICN and is an output record only.

1.1 Recent Change View

The corresponding Recent Change view for this form is 23.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PKT TN

Description: Enter a valid Packet Switching Telephone Number. Either a PKT TN or a PKT MLHG/TERM must be entered.

Required Field
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

For 5E5 and later Software Releases, this Packet Switching TN must be defined on a DSLUSR form in the DPKT TN or ODB TN field or defined on a DSL form in the PPB1 TN or PPB2 TN field.

For 5E7 and later, this Packet Switching TN must be defined on a DSLUSR form in the DPKT TN or ODB TN field, or, defined on a DSL form in the PPB1 TN or PPB2 TN field, or, defined on the XAT form (5924 Record) in the PKT TN field.

For 5E10 and later, when PKT TN(s) on the PSCUG form match PKT TN(s) on the XAT form(s) the OE must be specified.

For 5E12 and later, PKT TN/CUG IDX combinations on different PSCUG forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit PKT TNs on the PSCUG form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit PKT TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * PKT MLHG

Description: Enter a valid Packet Switching Multi-Line Hunt Group Number. Either a PKT TN or a PKT MLHG/TERM must be entered.

Copyright © 2003 Lucent Technologies

Required Field
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

Data Rules:

For 5E5 and later Software Releases, this PKT MLHG/TERM must be defined on a DSLUSR form in the DPKT MLHG/TERM field or on a DSL form in the PPB1 MLHG/TERM or PPB2 MLHG/TERM field.

2.4 * PKT TERM

Description: Enter a valid Packet Switching Multi-Line Hunt Terminal Number.

Required Field
Valid Entries: 1 - 2015

Data Rules:

If a Packet Switching TERM is entered, the associated Packet Switching MLHG field must be entered.

2.5 * CUG IDX

Description: Enter a valid Preferential Customer Closed User Group Index.

Required Field.
Valid Entries: 0 - 99

Data Rules:

For each unique PKT TN, as the CUG IDX varies from 0 to 99, the combination of DNIC and ICN values should be unique.

CLOSED USER GROUP

2.6 DNIC

Description: Enter a valid Packet Switching Data Network ID Code.

Required Field.
Valid Entries: 1111 - 1114 and 2000 - 9999

2.7 ICN

Description: Enter a valid International Closed User Group Number.

Required Field.
Valid Entries: 0 - 65535

SEC. 3F: 5925/5925A RECORD PACKET SWITCHING ISDN MODEM TN TO DSL ASSIGNMENT FORM - PSMTN

1. GENERAL

The 5925 and 5925A Records are applicable to 5E4(2) and later Software Releases. The PSMTN form is used to assign Modem Pool access TNs to DSLs (Digital Subscriber Lines) that have Packet Switching.

Two records are associated with this form. The 5925 Record is arranged in the format of the ODA input form. The 5925A Record is arranged by ACCESS TN and is an output record only.

For more information on ISDN Modem Pools see Division 2, Section 1AL, "ISDN Closed User Groups and Modem Pooling."

1.1 Recent Change View

The corresponding Recent Change view for this form is 23.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 (*) PKT TN

Description: Enter a valid Packet Switching Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

Either a PKT TN or a PKT MLHG/TERM must be entered.

For 5E4(2), this Packet Switching TN must be defined as a PKT TN on a DSL form (5900 Record) or DSMLHLN form (5901 Record).

For 5E5 and later,

- this Packet Switching TN must be defined on either a DSLUSR form (5908 Record) in the DPKT TN or ODBTN field or on a DSL form (5907 Record) in the PPB1 TN or PPB2 TN field.

- the PKT TN must be defined on the DSL form (5907 Record) as PPB1 TN or PPB2 TN, or on the DSLUSR form (5908 Record) as DPKT TN, DPKT MLHG TN, or ODB TN, or on the MLHG form (5110 Record) within the range of TNs specified by LISTED TN to HIGHEST LISTED TN where HUNT TYPE is "PSUCD" on the corresponding MLHGFD form (5604 Record). For 5E6 and later, PKT TN can also be defined on the XAT form. For 5E8 and later, it can also be defined on the DSL form as PPB1 LNR HNT TN or PPB2 LNR HNT TN, or on the DSLUSR form as DPKT LNR HNT TN, ODB MLHG TN, or ODB LNR HNT TN, or on the XAT form as LNR HNT TN.

For 5E12 and later,

Copyright © 2003 Lucent Technologies

- PKT TNs on different PSMTN forms cannot be duplicated.

- if the first 3 digits of the 7-digit PKT TNs on the PSMTN form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit PKT TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 ACCESS TN

Description: Enter a valid Modem Pooling Access Telephone Number without prefix.

ACCESS TN must contain at least one Modem Pooling Access TN, and each ACCESS TN must be a unique number. There can be a total of 11 ACCESS TNs.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

For 5E12 and later,

- the ACCESS TN(s) on the PSMTN form cannot match another ACCESS TN on the same PSMTN form.

- the first three digits of a 7-digit TN or the first six digits of a 10-digit TN must be assigned on the NOC form as the OFFICE CODE or the NPA/OFFICE CODE, respectively.

For 5E12 and later,

- if the first 3 digits of the 7-digit ACCESS TNs on the PSMTN form are equivalent to an OFFICE CODE on the NOC form, but there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7- digit ACCESS TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.4 MODEM POOL GROUP

Description: Enter a valid Packet Switching Modem Pool Group Number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

MODEM POOL GROUP is a required entry when ACCESS TN is defined.

The MODEM POOL GROUP must be defined as an MLHG (5110 Record) with a value in the MPTYPE field. It must also appear on a PSCUG form (5924 Record) in the PKT MLHG field.

SEC. 3G: 5926 RECORD
TRUNK PACKET SWITCHING PVC LCN ASSIGNMENT FORM - X75PVC

1. GENERAL

The 5926 Record is available with 5E5 and later Software Releases. The X75PVC form is used to assign PVC (Permanent Virtual Circuit) Logical Channel Numbers to X.75P and X.75 packet switching trunks.

Trunks defined on this form must be X.75P or X.75 trunks (TRKCLS must be "X75P" or "X75" on the TKGRP form).

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.13.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number of the trunk to be assigned to a PVC.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The TGN entered in this field must be defined on the TKGRP form with a TRKCLS of "X75P" or "X75".

2.3 * MEMB

Description: Enter the Trunk Group Member Number.
Valid Entries: 0 - 23

Data Rules:

The TGN/MEMB must be defined on a TRUNK form.

2.4 * LCN

Description: Enter a packet switching Logical Channel Number.
Valid Entries: 1 - 127

Data Rules:

The value entered in this field must be less than or equal to the value entered in the HIGH PVC LCN field on the TRUNK form.

2.5 # CALL IND

Description: Enter a PVC Call Indicator to determine which end of the PVC is calling or being called.

Required Field.

Copyright © 2003 Lucent Technologies

Valid CALL IND Entries	
Entry	**Definition**
CALLING	PVC calling end
CALLED	PVC called end

2.6 FCL TYPE

Description: Enter the Tandem Trunk Remote Facility Type. The FCL TYPE (Facility Type) indicates what the interface is on the far end of a PVC (Permanent Virtual Circuit). The PVC is supported for Packet Switching with the layer 3 protocol being either X.25, or X.75P, the later enumeration being for packet trunks.

Software Release: 5E8 and later
Required Field.
Valid Entries:

Valid FCL TYPE Entries	
Entry	**Definition**
X75P	defines the interface on the far end of the PVC to be an X.75P trunk
X25	defines the interface on the far end of the PVC to be an X.25 line
INET	For 5E14 and later. INET stands for Internet Protocol which is the TCP/IP protocol stack. INET - defines the interface on the far end of the PVC to be an interface to TCP/IP. This interface is internal to the switch and is not associated with a physical external interface.

Data Rules:

If FCL TYPE is "X75P", then LINK ID and PSN must be entered, and PVC ID NUMBER and BILLABLE must not be entered. Also, TRKCLS on the corresponding TKGRP must be set to "X75P".

If FCL TYPE is "X25", REMOTE TN must be entered.

When FCL TYPE is "INET", REMOTE LCN must not be entered.

When FCL TYPE is "INET":

- CALL IND must be "CALLING".
- SEND PKT SIZE must be 256.
- RCV PKT SIZE must be 256.
- SEND WINDOW SIZE must be 7.
- RCV WINDOW SIZE must be 7.

For 5E14 and later, when the FCL TYPE on the X75PVC form is set to "INET", there must exist a matching IPINTF form where TGN equals TGN, MEMB equals TGN MEMB and LCN equals LCN. The SEND PKT SIZE on the X75PVC form must be greater than or equal to the MTU SIZE on the corresponding IPINTF form.

For 5E14 and later, when the FCL TYPE on the X75PVC form is set to "INET", there must exist a matching TRUNK form where TGN/MEMB equals TGN/MEMB. The TRUNK form must have a matching PSUGP form where the first three digits of DEN or NEN, and the first digit of ISCN and the second two digits of ISCN equal SM, PSU SHELF and GRP respectively. The PH TYPE on the corresponding PSUGP form must be set to "PH3" or "PH4".

2.7 # ACCESS TN

Description: The name of this field was changed to REMOTE TN in 5E8. This field name applies to 5E5 - 5E7. See REMOTE TN for usage information.

Copyright © 2003 Lucent Technologies

2.8 # ACCESS LCN

Description: The name of this field was changed to REMOTE LCN for 5E8. This field name applies to 5E5 - 5E7. See REMOTE LCN for usage information.

2.9 REMOTE LCN

Description: Enter a Remote (Access) LCN (Logical Channel Number). The Remote LCN is the LCN associated with the far end of the PVC. (This field was called ACCESS LCN for 5E5 - 5E7.)
Valid Entries: 1 - 4095

X25 FCL TYPE

The following field must only be defined when the FCL TYPE is set to X25.

2.10 REMOTE TN

Description: Enter a valid Remote (Access) Telephone Number. The Remote TN is the telephone number at the remote end of the PVC. The format of the 10-digit TN is NPANXXXXXX where the digits are as follows:

- N is (2 - 9)
- P is (0 - 1)
- A and X are (0-9).

(This field was called ACCESS TN for 5E5 - 5E7).

Required Field.
Valid Entries: ten digit number

X75P FCL TYPE

The following fields (Section 2.11 - Section 2.12) must only be defined when the FCL TYPE is set to X75P.

2.11 LINK ID

Description: Enter the Tandem Trunk Remote Gateway Link ID. This field is used to designate the destination (remote) gateway link ID of a tandem X.75P to X.75P trunk group PVC.
Valid Entries: 1 - 255

Data Rules:

If FCL TYPE is "X75P", LINK ID and PSN must be entered.

2.12 PSN

Description: Enter the Packet Switch Number of the far end X75P PVC. This field identifies the destination packet switch that provides the IP interface with another packet switching network. The destination packet switch is a switch that resides in the same IP subnetwork as this switch.
Valid Entries: 1 - 255

Data Rules:

If FCL TYPE is "X75P", LINK ID and PSN must be entered.

The PSN assigned on this form must be defined on an RTIDX form.

Copyright © 2003 Lucent Technologies

2.13 SEND THRUPUT CLASS

Description: Enter the Sending Throughput Class which is the bits per second at which a virtual call will send data.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600 or 19200.

2.14 RCV THRUPUT CLASS

Description: Enter the Receive Throughput Class which is the bits per second at which a virtual call will receive data.
Default: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600 or 19200.

2.15 SEND PKT SIZE

Description: Enter the Send Packet Size which is the maximum number of bytes of data in a packet that can be sent.
Default: 128
Valid Entries: 128 or 256 bytes.

2.16 RCV PKT SIZE

Description: Enter the Receive Packet Size which is the maximum number of bytes of data in a packet that can be received. Default Value: 128
Valid Entries: 128 or 256 bytes

2.17 SEND PKT WINDOW SIZE

Description: Enter the number of data packets that the STE can have unacknowledged, on a sending basis, at any time.
Default: 2
Valid Entries:
- 5E8 and earlier: 2 - 3
- 5E9(1) and later: 1 - 7

2.18 RCV PKT WINDOW SIZE

Description: Enter the number of data packets that the STE can have unacknowledged, on a receiving basis, at any time.
Default: 2
Valid Entries:
- 5E8 and earlier: 2 - 3
- 5E9(1) and later: 1 - 7

X.75 ONLY

The name of this heading was changed to X.75 TGN for 5E8 and later. This heading name is for 5E6 and 5E7 only. See X.75 TGN for usage information.

X75 TGN

The following fields (Section 2.19 - Section 2.20) must only be defined when TRKCLS on the TKGRP form is "X75" for the same TGN. (This heading was called X.75 ONLY for 5E6 and 5E7.)

Copyright © 2003 Lucent Technologies

2.19 PVC ID NUMBER

Description: Enter a Permanent Virtual Circuit ID number. This ID is assigned to an X.75 PVC to be used for AMA inter-network billing records.

Software Release: 5E6 and later
Valid Entries: 1 - 9999

Data Rules:

Trunks with a TRKCLS other than "X75" should leave this field blank.

2.20 BILLABLE

Description: Is this X.75 PVC the billable user?

Software Release: 5E6 and later
Valid Entries: Y, N

Data Rules:

Trunks with a TRKCLS other than "X75" should leave this field blank.

SEC. 3I: 5928 RECORD
TRANSIT NETWORK IDENTIFICATION CODE FORM - TNICLIST

1. GENERAL

The 5928 Record is available with the 5E8 Software Release and it is used to provision a list of up to 20 shared INICs/DNICs (ISDN Network Identification Codes / Data Network Identification Codes) for the entire switch.The list of shared INICs/DNICs are referred to as TNIs (Transit Network Identifiers). The number of entries may vary from 0 to 20. The list can be empty, i.e., 0, or the list may contain up to 20 TNI entries. The entries in the list must be unique.

This form can only be entered for ISDN offices, and only one form is entered for an office.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.15.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: This field is the designated key to the form. It must always be 0.

Valid Entry: 0

2.3 INIC/DNIC

Description: Enter the INIC (ISDN Network Identification Code) or DNIC (Data Network Identification Code). Each entry must be unique; duplicate entries cannot be made.
Valid Entries: 1 - 9999

Data Rules:

For 5E9(1) and earlier, the TNICLIST form can only be entered for offices that contain ISDN SMs; therefore, at least one SM on the EQIM form (5700 Record) must have a CONFIGURATION of "LOADED".

For 5E9(2) and later, the TNICLIST form can only be entered for offices that support Transit Network Identification; therefore, at least one SM on the EQIM form must have a CONFIGURATION that supports Transit Network Identification.

SEC. 3J: 5949 RECORD
PACKET SWITCHING UNIT LOGICAL GROUP FORM - PSUGP

1. GENERAL

The 5949 Record is available with 5E6 and later Software Releases. It is used to specify the PH (Protocol Handler) type for a defined logical channel group on a PSU (Packet Switching Unit) shelf. Any ISCNs assigned on the following forms must be represented on this form: the AMLBDSL form (5447 Record), the CCLNK form (6004 Record), the DSL form (5907 Record), the DSLAP form (5963 Record), the DSLUSR form (5908 Record), the IPDSL form (6430 Record), the MDLNK (5637 Record), the MISLNK (5637), the ODBRES form (5906 Record), the OSPSDSL form (5411 Record), the PSISM form (5920 Record), the PSULNK form (5057 Record), the PSUPIPE form (5990 Record), the QPHPIPE (5828 Record), the RTERM (5174 Record), the TRUNK form (5204 Record), and the XAT form (5909 Record). Also, a combination of SM, PSU, PSU SHELF, and GRP must be entered with VIRTUAL set to "N".

PH types can be mixed on the PSU shelf making it necessary to specify the PH TYPE per logical channel group. The logical channel group does not represent the exact physical location of the PH circuit pack; it represents the existence of the pack on a PSU shelf in the PSU.

1.1 Recent Change View

The corresponding Recent Change view for this form is 22.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: Enter the Switching Module where this PSU resides.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E18 and later, when SM, PSU, PSU SHELF, GRP TYPE, and PH TYPE are entered on the PSUGP form, and SG 0 TYPE and SG 1 TYPE are set to "PSU2E" on the EQPSU form (5741 Record), the following forms must be set accordingly:

- CCLNK (6004 Record)
  - GSM, SHELF, and CHANNEL GROUP must be entered.
- MDLNK (6009 Record)
  - SM, SHELF, and CHANNEL GROUP must be entered.
- ATMLNK (5592 Record)
  - SM, PSU, SHELF, and CHL GRP must be entered and CON TYPE is set to "ATMNET" or "ATMPP".

Copyright © 2003 Lucent Technologies

- PSULNK (5057 Record)
  - NEAR SM, NEAR PSU, NEAR SHELF, and NEAR CHL GRP must be entered and CON TYPE is set to "ATMNET" or "POINT".
  - FAR SM, FAR PSU, FAR SHELF, and FAR CHL GRP must be entered and CON TYPE is set to "POINT".

- TRUNK (5204 Record)
  - The first seven digits of TRKOE must be entered on the TRUNK form where TRKOE type is "U" and TRKCLS is "FRBC" or "PKTPIPE" on the TKGRP form (5202 Record).
  - The first seven digits of TRKOE must be entered on the TRUNK form where TRKOE type is "U" and TRKCLS is "SPCHNDLR" and SERV TYPE is "8K", "13K", or "EVRC"on the TKGRP form.
  - The first seven digits of TRKOE must be entered on the TRUNK form where TRKOE type is "U" and TRKCLS is "SPCHNDLR" and SERV TYPE is "13K" or "EVRC"on the TKGRP form.
  - The first seven digits of TRKOE must be entered on the TRUNK form where TRKOE type is "U" and TRKCLS is "SPCHNDLR" and SERV TYPE is "13K", "EVRC", or "CEV13" on the TKGRP form.
  - The first seven digits of TRKOE must be entered on the TRUNK form where TRKOE type is "U" and TRKCLS is "A5", "IS41", or "3GPD" on the TKGRP form.
  - the first seven digits of TRKOE have been assigned on the TRUNK form where TRKOE type is "U"' and TRKCLS is "SPCHNDLR" and SERV TYPE is not "13", "EVRC", "CEV13", or "SME13" (on the TKGRP form).

- ETHIP (5995 Record)
  - SM, PSU, SHELF, and CHANNEL GROUP must be entered.

2.3 * PSU

Description: Enter the Packet Switching Unit number.

Required Field.
Default: 0
Valid Entries:

5E15 and earlier: 0
5E16 and later: 0 - 1

2.4 * PSU SHELF

Description: Enter the PSU Shelf number.

Required Field.
Valid Entries: 0 - 4

2.5 AVAILABLE PH2

Copyright © 2003 Lucent Technologies

Description: This is a Recent Change only field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available PH2s in the PSU. This number is determined by subtracting the number of spare and assigned PH2s from the total number of operational PH2s.
Valid Entries: 0 - 16

2.6 AVAILABLE PH3

Description: This is a Recent Change only field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available PH3s in the PSU. This number is determined by subtracting the number of spare and assigned PH3s from the total number of operational PH3s.
Valid Entries: 0 - 16

2.7 AVAILABLE PH4

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available channel groups for protocol handler 4.

Software Release: 5E10 and later
Valid Entries: 0 - 16

2.8 AVAILABLE PH22

Description: This is a Recent Change only field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available PH22s in the PSU. This number is determined by subtracting the number of spare and assigned PH22s from the total number of operational PH22s. This field supports the Protocol Handler 22 Base System feature. For more information on this feature, see Division 2, Section 5L.

Software Release: 5E14 and later
Valid Entries: 0 - 16

2.9 AVAILABLE PH31

Description: This is a Recent Change only field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available PH31s in the PSU. This number is determined by subtracting the number of spare and assigned PH31s from the total number of operational PH31s. This field supports the SAAL (Signaling Link ATM (Asynchronous Transfer Mode) Adaptation Layer) SS7 (Signaling System 7) High Speed Signaling Links feature. For more information on this feature, see Division 2, Section 4A670.

Software Release: 5E16 and later
Valid Entries: 0 - 16

2.10 AVAILABLE PH33

Description: This is a Recent Change only field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available PH33s in the PSU. This number is determined by subtracting the number of spare and assigned PH33s from the total number of operational PH33s. This field supports the SIP (Session Initiation Protocol) for Packet Trunking feature. For more information see Division 2, Section 4A684.

Software Release: 5E16(2) FR 3 and later
Valid Entries: 0 - 16

2.11 AVAILABLE PHV1

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA

Copyright © 2003 Lucent Technologies

input is required. It displays the number of available channel groups for protocol handlers for voice 1. The verify fields AVAILABLE PHV1 and AVAILABLE PHV2 were added to support the new PH types for the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B. PHV1 protocol handler supports the 8 KB/S vocoder.

Software Release: 5E10 and later
Valid Entries: 0 - 16

2.12 AVAILABLE PHV2

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available channel groups for protocol handlers for voice. This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B. The PHV2 protocol handler supports the 13KB/S vocoder.

Software Release: 5E10 and later
Valid Entries: 0 - 16

2.13 AVAILABLE PHV3

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available channel groups for protocol handlers for voice. This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B. The PHV3 protocol handler supports the 13KB/S vocoder.

Software Release: 5E11 and later
Valid Entries: 0 - 16

2.14 AVAILABLE PHV4

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of available channel groups for protocol handlers for voice. This field supports the CDMA (Code Division Multiple Access) feature. For more information on this feature, see Division 2, Section 8B. The PHV4 protocol handler supports the 13KB/S vocoder.

Software Release: 5E12 and later
Valid Entries: 0 - 16

2.15 AVAILABLE PHV5

Description: This is a Recent Change Verify field. It is a display-only field in ODA. Therefore, no ODA input is required. It displays the number of available protocol handlers for voice 5. This field supports the PHV5 (Downloadable Protocol Handler for Voice 5) feature. For more information on this feature, see Division 2, Section 8AB.

Software Release: 5E16.1 and later
Valid Entries: 0 - 16

2.16 AVAILABLE PHV6

Description: This is a Recent Change Verify field. It is a display-only field in ODA. Therefore, no ODA input is required. It displays the number of available protocol handlers for voice 5. This field supports the PHV6 (Protocol Handler for Voice 6) feature. For more information on this feature see, Division 2, Section 7CD.

Software Release: 5E18(1) and later
Valid Entries: 0 - 16.

Copyright © 2003 Lucent Technologies

2.17 AVAILABLE PHA1

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of protocol handlers for asynchronous transfer mode (type 1) which are available to be assigned to channel groups. This field supports the PHA (Protocol Handler Asynchronous Transfer) feature. For more information on this feature, see Division 2, Section 4A224.

Software Release: 5E10 and later
Valid Entries: 0 - 16.

2.18 AVAILABLE PHA2

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of channel groups for PH (Protocol Handler) A2 (ATM (Asynchronous Transfer Mode) - version 2. This field supports the PHA2/PHE2 on PH30 feature. For more information on this feature, see Division 2, Section 5BM.

Software Release: 5E16 and later
Valid Entries: 0 - 16

2.19 AVAILABLE PHE2

Description: This is a Recent Change Verify field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the number of channel groups for PH (Protocol Handler) E2 (Ethernet - version 2). This field supports the PHA2/PHE2 on PH30 feature. For more information on this feature, see Division 2, Section 5BM.

Software Release: 5E16 and later
Valid Entries: 0 - 16

2.20 VIRTUAL

Description: The Virtual packet switch interface unit shelf that specifies whether or not the PSU shelf number is virtual.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

Data Rules:

When VIRTUAL is "Y", an ENETLINK form (5827 Record) must exist on the same SM with a SERV TYPE value of "CFS".

CHANNEL GROUPS (GP)

Each PSU Shelf can contain up to sixteen logical channel groups, numbered 0 - 15. A PH TYPE must be entered for at least one channel group on this PSUGP form. At least one PROTOCOL HANDLER GROUP entry must be specified.

2.21 PH TYPE

Description: Enter the type of PH circuit pack.

PH3 provides the equivalent functionality of PH2 and can be equipped on the same PSU shelf with PH2.

Valid PH TYPE Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

PH2	Protocol Handler 2 which is a 80186-based PH with 128 channels.
PH3	Software Release: 5E6 and later. Protocol Handler 3 which is a 68030-based PH with 128 channels.
PH4	Software Release: 5E10 and later. Protocol Handler version 4, which is a 68030-based PH with 128 channels.
PH22	Software Release: 5E14 and later. Protocol Handler version 22, which is a 68060-based PH.
PH31	Software Release: 5E16(2) and later. Protocol Handler with 31 channels.
PH33	Software Release: 5E16(2)FR 3 and later. Protocol Handler with 33 channels. This field supports the OIU (Optical Interface Unit) SIP-T (Session Initiation Protocol for Telephones) feature. For more information see Division 2, Section 4A684.
PHV1	Software Release: 5E10 and later. Protocol handler for Voice 1 (8 kilobit vocoder). This enumeration supports the CDMA (Code Division Multiple Access) feature. For more informaton on this feature, see Division 2, Section 8B.
PHV2	Software Release: 5E10 and later. Protocol handler for Voice 2 (13 kilobit vocoder). This enumeration supports the CDMA feature. For more information on CDMA see Division 2, Section 8B.
PHV3	Software Release: 5E11 and later. The PHV3 feature increases the number of voice channels provided per PHV circuit pack from the 12 voice channels on the PHV1 and PHV2 to 16. For more information on this feature see Division 2, Section 8F.
PHV4	Software Release: 5E14 and later. Protocol Handler for Voice 4 provides 32 speech vocoders per circuit board. For more information on this feature see Division 2, Section 8J.
PHV5	Software Release: 5E16 and later. Protocol Handler for Voice 5. Provides 64 vocoders for voice and supports simultaneous voice and data. Refer to Division 2, Section 8AB for more information.
PHV6	Software Release: 5E18(1) and later. Protocol Handler for Voice 6. Provides 128 vocoder and supports the PHV6 feature. Refer to Division 2, Section 7CD.
PHA1	Software Release: 5E10 and later. Protocol handler for ATM (Asynchronous Transfer Mode) 1. This enumeration supports the PHA (Protocol Handler for Asynchronous Transfer) feature. For more information on this feature see Division 2, Section 4A224.

Data Rules:

Speech Handler Trunk group members must have a corresponding PSUGP form or the corresponding PSUGP form must have a PH TYPE (on PSUGP) which is appropriate for the value of SERV TYPE (on TKGRP). The following table defines the PH TYPEs (on PSUGP) which are valid for each value of SERV TYPE (on TKGRP).

For 5E18(1) andd later:

When PH TYPE is "PHV5" or "PHV6" on this form, SERV TYPE on the TKGRP form (5502 Record) must be "CEV13", or "PHV6", respectively.

When PH TYPE is "PHV5" on this form, SERV TYPE on the TKGRP form must not be "ACELP" or "VSELP".

Valid PH TYPE Entries

SERV TYPE	PH TYPE
8K	PHV1, PHV3, PHV4
13K	PHV2, PHV3, PHV4, PHV5
ACELP	PHV4
CEV13	PHV5
EVRC	PHV3, PHV4, PHV5
SME13	PHV6
TACVS	PHV5
VSELP	PHV4

When at least one Multi-Line Hunt Member has a PH TYPE of "PH2", the corresponding PBGRP form

Copyright © 2003 Lucent Technologies

LCN AGGREGATE and TPC AGGREGATE must be blank and OVERFLOW TREAT must be "NONE".

When TGNs are defined with a TRKCLS of
- "PACKET",
- "X75P", or
- "X75"

on a TKGRP form and the corresponding Trunk Members defined on TRUNK forms have the first three digits of the DEN or the NEN, the first digit of ISCN, and the second two digits of ISCN matching SM, PSU SHELF and GRP, respectively, on a PSUGP form, if the PH TYPE on the PSUGP form is "PH2", the last three digits of the ISCN field on the TRUNK forms must be 000.

PH3:
The number of operational PH3s assigned for a given PSU Shelf minus the number of PH3 Logical groups assigned to that PSU Shelf must be greater than or equal to the entry in the PH3 MIN SPARE fields specified for that PSU Shelf.

Operational PH3s - PH3 Logical Groups = PH3 MIN SPARE

- The number of operational PH3s is obtained from the EQPSUPH form, where PH CLI is 00000200 and EQST is "O".

- The number of PH3 logical groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH3".

- The PH3 MIN SPARE field is specified on the EQPSUPH form.

When TGNs are defined with a TRKCLS of
- "PACKET",
- "X75P", or
- "X75"

on a TKGRP form and the corresponding Trunk Members defined on TRUNK forms have the first three digits of the DEN or the NEN, the first digit of ISCN, and the second two digits of ISCN matching SM, PSU SHELF and GRP, respectively, on a PSUGP form, and if the PH TYPE on the PSUGP form is set to "PH3" or "PH4", the last three digits of the ISCN field on the TRUNK forms must be
- 000
- 004
- 008
- 012
- 016 or
- 020.

PH4:
The number of operational PH4s assigned for a given PSU Shelf minus the number of PH4 Logical groups assigned to that PSU Shelf, must be greater than or equal to the PH4 MIN SPARE specified for that PSU Shelf. For a given PSU Shelf:

Operational PH4s - PH4 Logical Groups = PH4 MIN SPARE

- The number of operational PH4s is obtained from the EQPSUPH form where PH CLI is 00001800 and EQST is "O".

- The number of PH4 logical groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH4".

Copyright © 2003 Lucent Technologies

- The PH4 MIN SPARE is specified on the EQPSUPH form.

When TGNs are defined with a TRKCLS of
- "PACKET",
- "X75P", or
- "X75"

on a TKGRP form and the corresponding Trunk Members defined on TRUNK forms have the first three digits of DEN or NEN, the first digit of ISCN, and the second two digits of ISCN matching SM, PSU SHELF and GRP, respectively, on a PSUGP form, and if the PH TYPE on the PSUGP form is set to "PH3" or "PH4", the last three digits of the ISCN field on the TRUNK forms must be
- 000
- 004
- 008
- 012
- 016 or
- 020.

When TRKCLS is "FRBC" on the TKGRP form (5202-1/2/3/4/5/6/7/8/9 Record) and PH TYPE is "PH4", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 015 for all corresponding trunk members of this trunk group.

When TRKCLS is "PKTPIPE" on the TKGRP form and PH TYPE is "PH4", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 031 for all corresponding trunk members of this trunk group.

For PSUGP forms representing PH4s which have exceeded their capacity for CDMA trunk routing, the count of Packet Pipe Member trunks assigned to all Packet Pipe trunks which use this PH4 may not exceed 32. The number of CDMA calls the PH4 can handle may not exceed 64. The number of possible CDMA calls is dependent upon the presence of Trunk Group SERV TYPEs of:

"13K" or "8K", for 5E10 and 5E11

"13K", "8K", "ACELP170, "DATA", "EVRC", or "VSELP" for 5E12

in the switch, the DATA RATE of the Packet Pipe Member Trunks and the number of Packet Pipe Member trunks which point to this PH4.

PH22:
The number of operational PH22s assigned for a given PSU Shelf minus the number of PH22 Logical groups assigned to that PSU Shelf must be greater than or equal to the entry in the PH22 MIN SPARE fields specified for that PSU Shelf.

Operational PH22s - PH22 Logical Groups = PH22 MIN SPARE

- The number of operational PH22s is obtained from the EQPSUPH form, where PH CLI is 00002800 and EQST is "O".

- The number of PH22 logical groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PH22".

- The PH22 MIN SPARE field is specified on the EQPSUPH form.

When TRKCLS is "PKTPIPE" on the TKGRP form and PH TYPE is "PH22", the channel component (the last three digits) of TRKOE NUMBER on the TRUNK form must be in the range of 000 to 063 for all

Copyright © 2003 Lucent Technologies

corresponding trunk members of this trunk group.

PHVs
ISCNs entered on the TRUNK form, which are associated with a PH TYPE of "PHV1", "PHV2", "PHV3", "PHV4", or "PHV5" on the associated PSUGP form, are exclusively used for Speech Handler trunks via UEN assignment on the TRUNK form (TRKOE where OE TYPE is equal to "U");

The following table indicates which PH TYPEs are valid for a given SERV TYPE:

SERV TYPE	PH TYPE
8K	PHV1, PHV3, PHV4
13K	PHV2, PHV3, PHV4,PHV5
ACELP	PHV3, PHV4
EVRC	PHV3, PHV4,PHV5
VSELP	PHV3, PHV4

The following TGNs (on TKGRP form) are defined with a TRKCLS of "SPCHNDLR". All corresponding trunk members of this trunk group (on TRUNK form), must have a TRKOE entered with an OE TYPE of 'U'. In addition the last three digits of the OE must be in a specific range, dependent upon the type of Protocol Handler for which the specific trunk resides.

PH TYPE	OE
PHV1	000 - 011
PHV2	000 - 011
PHV3	000 - 015
PHV4	000 - 031
PHV5	000 - 63

All members of a trunk group where TRKCLS is "ADT" on the TKGRP form must have TRKOE TYPE equal to "U" on the TRUNK form and TRKOE NUMBER, on the TRUNK form, must correspond to a Protocol Handler Logical Channel Group where PH TYPE equals "PHV1", "PHV2", "PHV3", "PHV4" or "PHV5".

All members of a trunk group where TRKCLS is "A5" or "IS41" on the TKGRP form must have TRKOE TYPE equal to "U" on the TRUNK form and TRKOE NUMBER, on the TRUNK form, must correspond to a Protocol Handler Logical Channel Group with a PH TYPE of "PHV4" or "PHV5".

PHV1
The number of operational PHV1s assigned for a given PSU Shelf minus the number of PHV1 Logical groups assigned to that PSU Shelf, must be greater than or equal to the PHV1 MIN SPARE specified for that PSU Shelf.

In other words, for a given PSU Shelf:
Operational PHV1s - PHV1 Logical Groups >= PHV1 MIN SPARE

- The number of operational PHV1s is obtained from the EQPSUPH form where PH CLI is 00000001 and EQST is "O".
- The number of PHV1 logical groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PHV1".
- The PHV1 MIN SPARE is specified on the EQPSUPH form.

PHV2
The number of operational PHV2s assigned for a given PSU Shelf minus the number of PHV2 Logical groups assigned to that PSU Shelf, must be greater than or equal to the PHV2 MIN SPARE specified for that PSU Shelf.

In other words, for a given PSU Shelf:
Operational PHV2s -- PHV2 Logical Groups >= PHV2 MIN SPARE

Copyright © 2003 Lucent Technologies

- The number of operational PHV2s is obtained from the EQPSUPH form where PH CLI is:

00000002 or 00000004 and EQST is "O", for 5E10

00000002 and EQST is "O", for 5E11 and later.

- The number of PHV2 logical groups assigned is obtained from the corresponding PSUGP form where PH TYPE is "PHV2".
- The PHV2 MIN SPARE is specified on the EQPSUPH form.

When the ISCNs entered on the TRUNK form are associated with a PH TYPE of "PHV1", "PHV2", or "PHV3" on the associated PSUGP form, the PHV1s, PHV2s, and PHV3s are exclusively used for Speech Handler trunks via the UEN assignment on the TRUNK form (TRKOE where OE TYPE is equal to "U").

PHV3:
For all Speech Handler trunk group members assigned to channels of a given PHV3 (PHV3 PH TYPE), the corresponding value of SERV TYPE must be consistent (i.e., if one channel of a PHV3 is assigned to a Speech Handler trunk group member where the corresponding TKGRP entry SERV TYPE is "EVRC", all other Speech Handler trunk group members assigned to channels of this same PH must reside in a Speech Handler trunk group where the corresponding TKGRP entry SERV TYPE is "EVRC" as well).

The number of operational PHV3s assigned for a given PSU Shelf minus the number of PHV3 Logical groups assigned to that PSU Shelf, must be greater than or equal to the PHV3 MIN SPARE specified for that PSU Shelf.

In other words, for a given PSU Shelf:
Operational PHV3s - PHV3 Logical Groups >= PHV3 MIN SPARE

PHV4:
For all Speech Handler trunk group members assigned to channels of a given PHV4 (PH TYPE is "PHV4"), the corresponding value of SERV TYPE on the TKGRP form must be consistent. For example, when one channel of a PHV4 is assigned to a Speech Handler trunk group member where the corresponding SERV TYPE entry on the TKGRP form is "ACELP", all other Speech Handler trunk group members assigned to channels of this same PHV must reside in a Speech Handler trunk group where the corresponding SERV TYPE entry on the TKGRP form is "ACELP" also.

PHV5:

When PH TYPE is "PHV5", SM must not be defined on a PSISM form (5920 Record) with ISCN. SHELF and ISCN.CHL GRP equal to PSU SHELF and GRP respectively.

For all Speech Handler trunk group members assigned to channels of a given PHV5 (PH TYPE is "PHV5"), the corresponding value of SERV TYPE must be the same.

The channel component of TRKOE NUMBER (the last three digits) on the TRUNK form must be 064 - 095 for all members of a trunk group with TRKCLS equal to "ADT" on the TKGRP form when the value in TRKOE NUMBER on the TRUNK form corresponds to a Protocol Handler Logical Channel Group where PH TYPE is "PHV5".

2.22 GRP TYPE

Description: This is a Recent Change only field. It is a display-only field in ODA, therefore, no ODA input is required. It displays the type of digital service (any service requiring a Digital Equipment Number) supported by this channel group.

Copyright © 2003 Lucent Technologies

2.23 AUTO ASSIGN

Description: Allow automatic assignments of ISCNs on MISLINK, DSL and DSLAP? The AUTO ASSIGN field is used to indicate whether automatic ISCN assignment is to be used to assign ISCNs from this channel group. This assignment will only apply to channel groups of type DSLG or NULL. If the assignment is allowed for this channel group, then the channels on this channel group will be potential candidates for automatic ISCN assignment from the following views: ACD Management Information System Link (RC/V 6.11), DSL Assignment (RC/V 23.2), DSL/BRCS Assignment (RC/V 23.8), DSL/USER Copy (RC/V 23.30), and DSLAP (DSL Application Processor Communication Data) (RC/V 24.7).

This field was added for the Automatic ISDN Line Assignment feature. For more information on this feature, see Division 2, Section 1BO.

Software Release: 5E11 and later
Valid Entries: Y, N

Data Rules:

When PH TYPE is not "PH2", "PH3", or "PH4", AUTO ASSIGN must be "N".

SEC. 3K: 5930 RECORD
X75 CLOSED USER GROUP FORM - X75CUG

1. GENERAL

The 5930 Record is available with the 5E8 Software Release. This form assigns the X.75 trunk group CUG (Closed User Group) IIC (International Interlock Code) lists. The lists are identified by a unique CUG List ID number. Each list ID number may have up to 100 unique IICs provisioned. The entire switch can have a maximum of 1600 IICs defined. These can be spread across all provisioned X.75 trunk groups.

This form is only used for X.75 trunk groups.

1.1 Recent Change View

The corresponding Recent Change View for this form is 5.14

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *CUG LIST ID

Description: Enter the CUG LIST ID number associated with a list of CUG IICs (International Interlock Codes). The CUG LIST ID is assigned to X.75 trunk groups and may have up to 100 list entries.
Valid Entries: 1 - 1600

Data Rules:

At least one entry is required in the CUG LIST.

If CUG LIST ID is entered, then an SM must be defined on the EQIM form (5700 Record) with "LOADED" entered in the CONFIGURATION field. X75CUG forms can only be entered for offices that contain an ISDN SM.

CUG LIST

The following fields (Section 2.3 - Section 2.4) define the entries in the CUG LIST. Up to 100 CUGs may be entered in the list. The entries consist of the DNIC (Data Network Identification Code) and the ICN (International Closed User Group Number). These pairs are used in establishing a virtual call by the CPE (Customer Premise Equipment) that are members of a CUG. At least one DNIC/ICN combination must be entered.

2.3 DNIC

Description: Enter the CUG (Closed User Group) DNIC (Data Network Identification Code) of the network of the coordinating administration or RPOA (Recognized Private Operating Agency). The DNIC must be unique.

If all the members of a CUG are within the same network, the DNIC is that of the home network. Otherwise, one of the networks involved is designated as the coordinating administration.
Valid Entries: 1 - 9999

Data Rules:

If this list element is entered, then the corresponding ICN list element must be entered. Each combination

Copyright © 2003 Lucent Technologies

of DNIC and ICN must be unique in the CUG LIST.

2.4 ICN

Description: Enter International CUG number. This number is assigned by the CUG coordinating administration or RPOA. The number must be unique for each CUG belonging to the same network.

No more than 1600 DNIC/ICN combinations can be entered on all to the X75CUG forms in an office.
Valid Entries: 0 - 65535

Data Rules:

If this list element is entered, then the corresponding DNIC list element must be entered. Each combination of DNIC and ICN must be unique in the CUG LIST.

No more than 1600 DNIC/ICN combinations can be entered on all to the X75CUG forms in an office.

SEC. 3L: 5931 RECORD
PACKET BUSINESS GROUP FORM - PBGRP

1. GENERAL

The 5931 Record is available with 5E8 and later Software Releases. It is used to construct PBGs (Packet Business Groups) that may be assigned to packet Multi-Line Hunt Groups or to packet switching services (D-Channel, On Demand B-Channel, Permanent Packet B-Channel, and X.25 Access on a T1 facility). Any PBG assigned on an MLHG (5110 Record), DSL (5907 Record), DSLUSR (5908 Record), or XAT form (5909 Record) must be defined on this PBGRP form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * PB GRP

Description: Enter a PB GRP number to identify the Packet Business Group. This number is assigned to packet Multi-Line Hunt Groups or packet switching services, indicating membership in the Packet Business Group.

Required Field.
Valid Entries: 1 - 100

Data Rules:

A PB GRP must be defined here if it is entered in any of the following fields: PB GRP on the MLHG form, PPB1 PB GRP or PPB2 PB GRP on the DSL form, DPKT PB GRP or ODB PB GRP on the DSLUSR form, or PB GRP on the XAT form.

2.3 ABBR DIAL LENGTH

Description: Enter the number of digits to be used for abbreviated dialing within the group. This feature allows members of the PB GRP to originate calls to other members by using the last n digits of the called DN (Directory Number). The length (n) of the abbreviated code is determined by the ABBR DIAL LENGTH field.

When a call is originated using an abbreviated code, the switch will expand the code to a full packet DN by prefixing the abbreviated digits with the corresponding digits of the calling user's address. All members of the PB GRP must have the same initial digits. If the number expands to 11 digits, the first (11 - n) digits must be the same for all members of the PB GRP.

If the ABBR DIAL LENGTH field is left blank, abbreviated dialing cannot be used by members of the PB GRP.
Valid Entries: 1 - 6

Data Rules:

If a value is entered in this field, all members of the PBG must be assigned to PH3s on the PSUGP form (5949 Record).

Copyright © 2003 Lucent Technologies

2.4 ABBR NBR DELIVERY

Description: Should an abbreviated calling number be delivered to the called party when one group member calls another member? If abbreviated number delivery is provisioned ("Y"), and both the calling and called DNs have the same leading digits, then only the trailing digits of the originator's DN are placed in the Calling Address field of the Incoming Call Packet. The number of trailing digits is determined by the ABBR DIAL LENGTH field; therefore, a PB GRP that subscribes to Abbreviated Number Delivery must also subscribe to Abbreviated Dialing.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this entry is "Y", a value must be entered in ABBR DIAL LENGTH.

2.5 PBG AMA

Description: Should AMA records be generated for intra-PBG calls?

Required Field.
Default: Y
Valid Entries: Y, N

2.6 BILL TN

Description: Enter a 7- or 10-digit DN (Directory Number) to be used for billing record purposes. If the PBG AMA MODULE is set to "Y" on the ISDNOPT form (5509 Record), the BILL TN will be appended to the AMA records of calls for the PB GRP.
Valid Entries: 7 or 10 digits

Data Rules:

If 10 digits are entered, the first three digits must be an NPA where N is 2 - 9, P is 0 - 1, and A is 0 - 9.

BILL TN must be entered when PBG AMA MODULE is "Y" on the ISDNOPT form.

SIMULATED FACILITY GROUP DATA

The following fields (Section 2.7 - Section 2.9) determine if the LCN (Logical Channel Number) and TPC (Throughput Class) usage will be limited for the PBG.

2.7 LCN AGGREGATE

Description: Enter the aggregate logical channel number limit. This field is used to limit the number of LCNs simultaneously utilized by the members of the PB GRP.
Default: 1024
Valid Entries: 1 - 65536

Data Rules:

If a value is entered in this field, all members of the PBG must be assigned to PH3s on the PSUGP form.

2.8 TPC AGGREGATE

Description: Enter the aggregate throughput class limit in kilobits. This field limits the TPC simultaneously utilized by the members of the PB GRP.

Copyright © 2003 Lucent Technologies

Default: 8192
Valid Entries: 1 - 524288 (kilobits)

Data Rules:

If a value is entered for this field, all members of the PBG must be assigned to PH3s on the PSUGP form.

2.9 OVERFLOW TREAT

Description: Enter the overflow treatment. This entry specifies the treatment that will apply to calls originated or terminated by the PB GRP when one or both of the above aggregate limits is exceeded.

Only as many characters as make the entry unique need to be entered in this field, e.g. enter "N" for "NONE".
Default: BLOCK
Valid Entries:

Valid OVERFLOW TREAT Entries

Entry	Definition
BLOCK	The call will be denied.
NONE	The aggregates are not monitored, so no special call treatment is required.
PREMIUM	If the billable party is a member of the PBG, the AMA record will indicate a premium charge. If the billable party is not a member of the PBG, the call will be denied.

Data Rules:

When OVERFLOW TREAT is "PREMIUM" or "BLOCK", TPC AGGREGATE or LCN AGGREGATE must be entered.

If this entry is other than "NONE", all members of the PBG must be assigned to PH3s on the PSUGP form.

SEC. 3M: 5932 RECORD
TSM MONITORING TO MONITORED FORM - TELMON

1. GENERAL

The 5932 Record is available with 5E12 and later Software Releases. It is used to specify the telephone numbers which are being monitored by this ISDN line.

This form supports the Telephone Status Monitor and Select Feature. For more information, see Div. 2 Sec. 4A264.

1.1 Recent Change View

The corresponding Recent Change View for this form is 23.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and office name on each record.

2.2 * MONITORING TN

Description: Enter the telephone number of the monitoring terminal.
Valid Entries: XXXXXXX or NXXXXXXXXX where N = 2 - 9 and X = 0 - 9

Data Rules:

If the first 3 digits of the 7-digit MONITORING TN(s) on the TELMON form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit MONITORING TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 CONFIG GRP

Description: This field is used to indicate the configuration group to which the terminal belongs. This is a no change field.
Valid Entries: 1 - 8 characters

MONITORED LIST

The following fields (Section 2.4) - (Section 2.8) comprise the MONITORED LIST.

2.4 CPE

Description: This field indicates the terminal component. The Component number identifies a unit which is comprised of a maximum of 254 buttons on a Customer Premises Equipment terminal. Up to eight components on a terminal are allowed. This is a no change field.
Valid Entries: 0 - 7

2.5 BUTTON

Description: This field indicates the button number to which telephone monitor status is assigned. This is a no change field.
Valid Entries: 1 - 254

Copyright © 2003 Lucent Technologies

2.6 TN

Description: Enter the telephone number which is to be monitored by the monitoring ISDN terminal.
Valid Entries: XXXXXXX or NXXXXXXXXX where N = 2 - 9 and X = 0 - 9

Data Rules:

At least one TN must be specified in the MONITORED LIST.

When TN is not entered, DSS and RING must not be entered.

If the first 3 digits of the 7-digit MONITORED TN(s) on the TELMON form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit MONITORED TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.7 DSS

Description: Is this terminal allowed to use this TSM button for Direct Station Select?
Valid Entries: Y, N

2.8 RING

Description: Is a ping ring to be heard at the monitoring terminal?

Valid Values: Y, N

SEC. 3N: 5987 RECORD
INTERNET PROTOCOL (IP) PROCESSOR ASSIGNMENT - IPPROC

1. GENERAL

1.1 IP (Internet Protocol) Processor Assignment

The IP (Internet Protocol) Processor Assignment form provides the capability to provision up to five IP addresses and subnet masks, and associated IP, TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) parameters to a processor (SM or PH). This form was created to support the CALEA TCP/IP Core feature. For more information on this feature see Division 2, Section 4A509. This feature was first made available in the 5E14 Software Release.

1.2 Recent Change View

The corresponding Recent Change View for IPPROC is 33.1.

2. FORM ENTRIES - 5987 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *PROCESSOR ID

Description: This field specifies the ID of the processor. For SM, the SM number. For PH, the number of the SM on which the PH resides.
Valid Entries: 1 - 192

Data Rules:

The PROCESSOR ID(s) assigned on the IPPROC form, must be defined on a EQIM form with EQSTATUS of "O".

2.3 *PROCESSOR TYPE

Description: This field specifies the type of processor.
Valid Entries:

Enter SM or PH
For 5E16(2) and later, enter OIU, PH, or SM (Future MH, OKP)

WARNING: For 5E16(2) and later, set REASSEM TIMER, ICMP ERR CNT, MTU ENABLE, MTU DISC, TCP MSS, TCP START PORT, TCP DEF TTL, UDPCHKSUM EN, UDP DEF TTL, REFRESH INTRVL, and CLEANUP INTRVL to blank for PROCESSOR TYPE "OIU".

Data Rules:

When PROCESSOR TYPE is "SM", QUALIFIER 2 must not be entered.

When PROCESSOR TYPE is "SM", QUALIFIER 3 must not be entered.

When PROCESSOR TYPE is "PH", QUALIFIER 2 must be entered.

When PROCESSOR TYPE is "PH", QUALIFIER 3 must be entered.

Copyright © 2003 Lucent Technologies

When the IPPROC form has PROCESSOR TYPE set to "PH", the PROCESSOR ID must be defined on a EQPSU form as SWITCHING MODULE. Also, the corresponding QUALIFIER 2 entry must be assigned on the same EQPSU form as SWITCHING MODULE and COM ADDR.

When the IPPROC form has PROCESSOR TYPE set to "PH", the combination of PROCESSOR ID (SM) and QUALIFIER 3 (SHELF/CHL GRP) must be defined on at least one of the following forms:

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- ETHIP
- MISLINK
- OSPSDSL
- PCRGRP
- PSISM
- RTERM
- XAT
- TRUNK

where TRKCLS is "EDSL", "IFTERM", "IFOPER", "PACKET", "PCF", "X75", or "X75P". The PROCESSOR ID must also match the SM or the three left-most digits of OE. QUALIFIER 3 must match the three left-most digits of ISCN or SHELF/CHL GRP entered on the same form. In the case of the Trunk form where TRKCLS is "PCF", QUALIFIER 3 must match digits 5-7 of the TRKOE.

When the IPPROC forms have PROCESSOR TYPE set to "PH", and PROCESSOR ID (SM) and QUALIFIER 3 (SHELF/CHL GRP) are defined on a PSUGP form as SM and PSU SHELF/GRP respectively, the corresponding PH TYPE on the PSUGP form must be "PH3", "PH4", or "PHE2".

For 5E16(2) and later:

- when PROCESSOR TYPE is "PH",
  - QUALIFIER 2 must be entered.
  - QUALIFER 3 must be entered.
- when PROCESSOR TYPE is "OIU",
  - QUALIFIER 2 must be 0 - 7.
  - QUALIFIER 3 must be 0 - 9.
  - ROW 2 - 5 of IP ADDRESS must be blank.
  - MTU ENABLE and UPD CHKSUM must be blank.
  - OVLD TRIG must be 80 - 95.

Copyright © 2003 Lucent Technologies

- UDP START PORT must be 1024 - 61503.

- when PROCESSOR TYPE is "PH" or "SM":
  - OVLD TRIG must be blank.
  - PM GROUP must be blank.
  - UDP START PORT must be 32768 - 65535.

2.4 QUALIFIER 2

Description: This field specifies the second qualifier of the processor address. For a PH, this field is the COM ADDR (PSU community address) found on the EQPSU form, Packet Switch Unit. For an SM, leave blank.
Valid Entries: For a PH enter a number from 0 - 254.

Data Rules:

The corresponding QUALIFIER 2 entry must be assigned on the same EQPSU form as COM ADDR.

2.5 QUALIFIER 3

Description: This field specifies the third qualifier of the processor's address. For an SM, leave blank.
Valid Entries:

For a PH, enter PSU shelf 0-4 and channel group 00-15.
For 5E16(2) and later, blank, or enter 000 - 009 for an OIU protection group or PSU shelf (0 - 4) and channel group (00 - 1) for PH.

IP ADDRESS

IP (Internet Protocol) addresses consisting of a Local IP address and subnet mask. At least one IP address must be specified. Refer to Section 2.6 - Section 2.7 for individual field information.

2.6 LOCAL IP ADDR

Description: Enter the Local IP Address which is to be assigned to the processor.
Valid Entries: For LOCAL IP ADDR set 1, for Class A, enter 001 - 126, for Class B, enter 128 - 191, or for Class C, enter 192 - 223. For LOCAL IP ADDR set 2, 3, and 4, enter 0 - 254; 000.000.000.000 or 255.255.255.255 is not allowed. If one set is blank they all must be blank.

Data Rules:

When LOCAL IP ADDR is entered, IP SUBNET MASK must be entered.

LOCAL IP ADDR must be 001.000.000.001 - 126.255.255.254, 128.001.000.001 - 191.254.255.254 or 192.000.001.001 - 223.255.254.254.

When LOCAL IP ADDR set 1 is 001 - 126, IP SUBNET MASK must be 255.000.000.000 or 255.192.000.000 - 255.255.255 .000.

When LOCAL IP ADDR set 1 is 128 - 191, IP SUBNET MASK must be 255.255.000.000 or

Copyright © 2003 Lucent Technologies

255.255.192.000 - 255.255.255 .000.

When LOCAL IP ADDR set 1 is 192 - 223, IP SUBNET MASK must be 255.255.255.000 or 255.255.255.192 - 255.255.255 .240.

At least one LOCAL IP ADDR must be entered in the IP ADDRESS list.

LOCAL IP ADDRs in the IP ADDRESS list must be unique.

2.7 IP SUBNET MASK

Description: Enter the IP Subnet Mask to be assigned to the processor.
Valid Entries: Blank, or enter 255 for IP subnet mask set 1. Blank, or enter 0 - 255 for IP subnet mask set 2, 3, and 4.

Data Rules:

When IP SUBNET MASK is entered, LOCAL IP ADDR must be entered.

IP PARAMETER ASSIGNMENT

IP (Internet Protocol) Parameter Assignment. Refer to Section 2.8 - Section 2.11 for individual field information.

2.8 REASSEM TIMER

Description: Enter the time in seconds that the processor waits to process a packet.
Default: 60
Valid Entries: 1 - 255 seconds

2.9 ICMP ERR CNT

Description: Enter the number of bytes returned in ICMP (Internet Control Message Protocol) error reporting message for this processor.

Software Release: 5E16(2) and later
Default: 64
Valid Entries: 20 - 255 bytes.

2.10 MTU ENABLE

Description: Is the flag to indicate the maximum transmission unit discovery algorithm enabled?
Default: N
Valid Entries: Y, N

2.11 MTU DISC

Description: Enter the interval in seconds at which the path MTU (Maximum Transmission Unit) discovery algorithm tries to increase the MTU.
Default: 30
Valid Entries: 10 - 10000 seconds

2.12 OVLD TRIG

Description: This field is used to indicate the IP overload control occupancy trigger. The OVLD TRIG field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). See Division 2, Section 7BX.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Default: 95
Valid Entries: Blank, or enter 80 - 95

TCP PARAMETER ASSIGNMENT

TCP (Transmission Control Protocol) Parameter Assignment. Refer to Section 2.13 - Section 2.15 for individual field information.

2.13 TCP MSS

Description: Enter the maximum segment size for the transmission control protocol in bytes.
Default: 536
Valid Entries: 108 - 8000 bytes

2.14 TCP START PORT

Description: Enter the lowest automatically allocated port number for a transmission control protocol connection. Modifying the TCP START PORT field may result in the tear down of any/all currently existing sockets.
Default: 49152
Valid Entries: Enter a number from 32768 - 65535.

2.15 TCP DEF TTL

Description: Enter the number of intermediate hops a packet can make before being discarded (one hop is assumed to take one second).
Default: 255
Valid Entries: Enter 1 to 255.

UDP PARAMETER ASSIGNMENT

UPD (User Datagram Protocol) Parameter Assignment. Refer to Section 2.16 - Section 2.18 for individual field information.

2.16 UDP CHK SUM EN

Description: Is the datagram protocol checksum option enabled?
Default: Y
Valid Entries: Y, N

2.17 UDP START PORT

Description: Enter the lowest automatically allocated port number for a datagram protocol connection. Modifying the UDP START PORT field may result in the tear down of any/all currently existing sockets.
Default: 49152
Valid Entries:

Enter a number from 32768 to 65535.
For 5E16(2) and later, enter a number from 0 to 65535.

2.18 UDP DEF TTL

Description: Enter the number of intermediate hops a packet can make before being discarded (one hop is assumed to take one second).
Default: 255

Copyright © 2003 Lucent Technologies

Valid Entries: Enter 1 to 255.

ARP PARAMETER ASSIGNMENT

The following fields, Section 2.19 - Section 2.20 supports the PCF on PHE2 feature. For more information, see Division 2, Section 8AC.

2.19 REFRESH INTRVL

Description: This field identifies the interval (in minutes) for ARP (Address Resolution Protocol) information to be unconditionally refreshed from cache.

Software Release: 5E16(2) and later
Required Field.
Default: 20
Valid Entries: 0 - 60

2.20 CLEANUP INTRVL

Description: This field indicates the interval (in minutes) for ARP information to be discarded from the cache.
Required field.

Software Release: 5E16(2) and later
Valid Entries: 0 - 60

2.21 PM GROUP

Description: This field is used to assign a performance monitoring group to the PPPLK associated with this OIU PG.

Software Release: 5E16(2) and later
Valid Entries: Enter up to 8 alphanumeric characters.

Data Rules:

For 5E16(2) and later, PM GROUP must not equal:

- "PPPLNKG", "OSTEGDF", "OSTS1GD", "OVT1DEF", "OVT1GDF", "ODS1EDF", "ODS1SDF", "ODS1EGD", "ODS1SGD", "OSTS1DEF", "OSTS3CDF", "OC3CSTDF", "OSTS3CG", "OC3CSTDF", or "OC3CSTG".

2.22 ICMP ERR GEN

Description: This field indicates whether or not error generation is enabled or disabled. This field supports the SIP (Session Initiation Protocol) for Packet Trunking feature. For more information see Division 2, Section 4A684.
Required field.

Software Release: 5E16(2) FR 3 and later
Default: Y
Valid Entries: Y, N

2.23 IP FRAGMENT

Description: This field indicates whether or not the IP (Internet Protocol) fragmentation is enabled or disabled. This field supports the SIP (Session Initiation Protocol) for Packet Trunking feature.

Copyright © 2003 Lucent Technologies

Required field.

Software Release: 5E16(2) FR 3 and later
Default: Y
Valid Entries: Y, N

2.24 MTU INTVL AFT FAIL

Description: This field indicates the interval between attemped MTU(Maximum Transmission Unit) increases, when the previous attempt to increase the PMTU {Previous MTU) has failed. This field supports the SIP (Session Initiation Protocol) for Packet Trunking feature.
Required field.

SEC. 3O: 5988 RECORD
INTERNET PROTOCOL (IP) INTERFACE ASSIGNMENT - IPINTF

1. GENERAL

1.1 Internet Protocol (IP) Interface Assignment

The Internet Protocol (IP) Interface Assignment form provides the capability to provision up to five IP addresses and subnet masks, and associated IP parameters to an internet interface. This form was created to support the CALEA TCP/IP Core feature. For more information on this feature see Division 2, Section 4A509. This feature was first made available in the 5E14 Software Release.

1.2 Recent Change View

The corresponding Recent Change View for IPINTF is 33.2.

2. FORM ENTRIES - 5988 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 PKT TN

Description: Enter the packet switching telephone number. that can either be an individual packet TN on a DSL (PPB1 or PPB2) or an XAT TN.
Valid Entries: Enter a 7 or 10 digit telephone number of the form NXXXXXX or NXXNXXXXXX, where N is a number from 2 to 9 and X is a number from 0 to 9.

Data Rules:

When PKT TN(s) are assigned on the IPINTF form, the PKT TN(s) must be defined on a DSL form (as PPB1 TN where PPB1 MLHG/TERM are left blank or as PPB2 TN where PPB2 MLHG/TERM are left blank), or on a XAT form (as PKT TN where PKT MLHG and TERM NBR are left blank).

When the PKT TN and LCN(s) are assigned on the IPINTF form, the PKT TN and LCN(s) must be defined on a PSPVC form with FCL TYPE equal to "INET".

2.3 PKT MLHG

Description: This field specifies the group number for a packet switching multiline hunt group.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

When the PKT MLHG/TERM(s) are assigned on the IPINTF form, they must be defined on a DSL form (as PPB1 MLHG/TERM or PPB2 MLHG/TERM), or on a XAT form (as PKT MLHG/TERM NBR).

When the PKT MLHG/PKT MEMB and LCN(s) are assigned on the IPINTF form, the PKT MLHG/PKT MEMB and LCN(s) must be defined on a PSPVC form with FCL TYPE equal to "INET".

2.4 PKT MEMB

Description: This field specifies the number of a particular member within the specified packet switching

Copyright © 2003 Lucent Technologies

multiline hunt group. The PKT MLHG and PKT MEMB combination can either be an individual packet service on a DSL (PPB1 or PPB2) or an XAT.
Valid Entries: 1 - 2015

2.5 TGN

Description: This field specifies the group number for the trunk associated with the IP interface.
Valid Entries: 1 - 4000

Data Rules:

When the TGN, TGN MEMB and LCN(s) are assigned on the IPINTF form, the TGN, TGN MEMB and LCN(s) must be defined on a X75PVC form with FCL TYPE equal to "INET".

2.6 TGN MEMB

Description: This field specifies the number of a particular trunk member within the specified trunk group. Enter a number from 0 to 23.
Valid Entries: 0 - 23

2.7 OE

Description: This is a no change field that contains one alphabetic character followed by an equipment number of the following format:

Valid OE Type Entries

Entry	Definition
A	INEN [IDLC (Integrated Digital Loop Carrier) Network Equipment Number]
E	AIUEN [Digital (U Circuit) AIU (Access Interface Unit) Equipment Number]
G	GEN [GAMA-IDCU (Integrated Digital Carrier Unit) Equipment Number]
I	ISDN [Digital (U & T Card) ISLU (Integrated Services Line Unit) Equipment Number]
K	LCKEN [Digital (T & U Circuit) ISLU2 Integrated Services Line Unit 2 Equipment Number]
U	Software Release 5E16(2) and later. XAT PH Channel Group Member.

For type A, INEN [Integrated Digital Loop Carrier (IDLC) Network Equipment Number], enter (1-192) (0-7) (01-99) (0001-2048) where:

Type A, INEN [IDLC (Integrated Digital Loop Carrier) Network Equipment Number]

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Network Unit-Synchronous Optical Network	DNUS	X	0-7
Remote terminal	RT	XX	01-99
Remote Terminal	LINE	XXXX	0001-2048

For type E, AIUEN [Digital (U Circuit) AIU (Access Interface Unit) Equipment Number], enter (1-192) (000-104) (00-19) (00-15) where:

Type E, AIUEN [Digital (U Circuit) AIU (Access Interface Unit) Equipment Number]

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Access Interface Unit Two	AIU	XXX	000-104
Pack Number	PACK	XX	00-19
Circuit number	CKT	XX	00-15

For RT GEN [GAMA-Integrated Digital Carrier Unit (IDCU) Equipment Number], enter (1-192) (00-42) (01-31) (0001-2048) where:

Type G, GEN [GAMA-IDCU (Integrated Digital Carrier Unit) Equipment Number]

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Integrated Digital Carrier Unit	IDCU	XX	00-42
Remote Terminal	RT	XX	01-31

Copyright © 2003 Lucent Technologies

Remote Line	LINE	XXXX	0001-2048

For ISDN [Digital (U & T Card) Integrated Services Line Unit (ISLU) Equipment Number], enter (1-192) (0-7) (00-15) (00-31) where:

Type I, ISDN [Digital (U & T Card) ISLU (Integrated Services Line Unit) Equipment Number]

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Integrated Services Line Unit	ISLU	X	0-7
Line Group Card	LGC	XX	00-15
Line card	LC	XX	00-31

For LCKEN [Digital (T & U Circuit) Integrated Services Line Unit 2 (ISLU2) Equipment Number], enter (1-192) (00-42) (00-15) (0-7) (00-07) where:

Type K, LCKEN [Digital (T & U Circuit) ISLU2 Integrated Services Line Unit 2 Equipment Number]

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Integrated Services Line Unit Two	ISLU2	XX	00-42
line group card	LGC	X	00-15
line board	L Board	X	0-7
Line Circuit	L Circuit	XX	00-07

For 5E16(2) and later, if OE is set to "UEN", this OE Number consists of:

OE Number, Type U (5E16(2) and later

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Packet Switching Unit	PSU	X	0 - 1
Shelf	SH	X	0 - 4
Channel Group	CHGRP	XX	01 - 15
Channel	CHAN	XXX	001 - 127

2.8 ISCN

Description: This is a no change field. This field specifies the ISCN to which the address is to be assigned.
Valid Entries: SU shelf [0-4] CHL group [00-15] PH chan [000-127]

2.9 LCN

Description: This field defines the Logical Channel Number for the packet switching interface.
Valid Entries: 1 - 27

2.10 INTERFACE NAME

Description: This field specifies the name of the interface.
Valid Entries: Enter name starting with an alphanumeric character followed by 4 to 18 characters including ".", "_" or "-".

Data Rules:

The INTERFACE NAMEs entered on the IPINTF form cannot be duplicated on one or more IPINTF forms.

IP ADDRESS

Enter the gateway or interface addresses consisting of an IP address and subnet mask. At least one IP address must be specified. Refer to Section 2.11 - Section 2.12 for individual field information.

2.11 GATEWAY IP ADDR

Description: IP address to be assigned to the interface.
Valid Entries: For Gateway IP address set 1, for Class A enter 001 - 126, for Class B 128 - 191, or for

Copyright © 2003 Lucent Technologies

Class C 192 - 223. For Gateway IP address set 2, 3, and 4, enter 0 - 255; 000.000.000.000 or 255.255.255.255 is not allowed.

Data Rules:

When GATEWAY IP ADDR is entered, IP SUBNET MASK must be entered.

GATEWAY IP ADDR must be 001.000.000.001 - 126.255.255.254, 128.001.000.001 - 191.254.255.254 or 192.000.001.001 - 223.255.254.254.

When GATEWAY IP ADDR set 1 is 001 - 126, IP SUBNET MASK must be 255.000.000.000 or 255.192.000.000 - 255.255.255 .000.

When GATEWAY IP ADDR set 1 is 128 - 191, IP SUBNET MASK must be 255.255.000.000 or 255.255.192.000 - 255.255.255 .000.

When GATEWAY IP ADDR set 1 is 192 - 223, IP SUBNET MASK must be 255.255.255.000 or 255.255.255.192 - 255.255.255 .240.

At least one GATEWAY IP ADDR must be entered in the IP ADDRESS list.

GATEWAY IP ADDRs in the IP ADDRESS list must be unique.

The GATEWAY IP ADDR(s) entered on the ETHIP and IPINTF forms cannot equal the LOCAL IP ADDR(s) entered on the IPPROC form, all GATEWAY IP ADDR(s) and LOCAL IP ADDR(s) must be unique in the office.

2.12 IP SUBNET MASK

Description: IP subnet mask to be assigned to the interface.
Valid Entries: Enter 255 for IP subnet mask set 1. Enter 0 - 255 for IP subnet mask set 2, 3, and 4.

Data Rules:

When IP SUBNET MASK is entered, GATEWAY IP ADDR must be entered.

2.13 MCAST ADDR

Description: This field defines the multicast address for the interface.
Valid Entries: Blank, or enter 224 - 239 for Multicast IP address set 1. Blank, or enter 0 - 255 for Multicast IP address set 2, 3, and 4.

2.14 MTU SIZE

Description: This field defines the maximum number of bytes per transfer from this interface.

Required field.
Default: 256
Valid Entries: 128 - 1600

2.15 CALEA IN USE

Description: Is this interface in use by the CALEA Application?

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

The Communication Assistance for Law Enforcement Act is a secured feature that must be purchased by the office before the CALEA IN USE field on the IPINTF form can be set to "Y".

SEC. 3P: 5989 RECORD
INTERNET PROTOCOL (IP) ROUTING TO INTERFACE - IPROUT

1. GENERAL

1.1 Internet Protocol (IP) Interface Routing to Interface

The Internet Protocol (IP) Interface Routing form provides the capability to provision an IP gateway between an external IP destination and a local IP interface. This form was created to support the CALEA TCP/IP Core feature. For more information on this feature see Division 2, Section 4A509. This feature was first made available in the 5E14 Software Release.

1.2 Recent Change View

The corresponding Recent Change View for IPROUT is 33.3 .

2. FORM ENTRIES - 5989 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 DEST IP ADDR

Description: This field specifies one of the network or host IP addresses that can be reached via this route.
Valid Entries: For Destination IP address set 1, enter 001 - 126 for Class A, 128 - 191 for Class B, or 192 - 223 for Class C, or 000. For Destination IP address set 2, 3, and 4, enter 0 - 255. All four sets must be entered; 000.000.000 or 255.255.255.255 is not allowed.

2.3 INTERFACE NAME

Description: This field specifies the name of an interface.
Valid Entries: Enter name starting with an alphanumeric character followed by 4 to 18 characters including ".", "_" or "-".

Data Rules:

The INTERFACE NAMEs entered on the IPROUT form must be defined on a ETHIP or IPINTF form with the same GATEWAY IP ADDR(s) on the IPINTF only. If a ETHIP form,was found, then the GATEWAY IP ADDR on the IPROUT form must be defined on the same ETHIP form (where INTERFACE NAMEs match) as GATEWAY IP ADDRESS.

If a IPINTF form was found, then the GATEWAY IP ADDR on the IPROUT form must be defined on the same IPINTF form (where INTERFACE NAMEs match) as one of the GATEWAY IP ADDR(s) from the list.

The KEY FIELDS lists the keys for the ETHIP or IPINTF form. If neither form was found with the same INTERFACE NAME value then KEY FIELDS will be blank."

2.4 NET OR HOST

Description: This field indicates if the destination IP address given is a network or host IP address.
Default: NET
Valid Entries: Enter NET or HOST.

Data Rules:

Copyright © 2003 Lucent Technologies

When NET OR HOST is "NET", DEST IP ADDR must be [001 - 126].000.000.000, [128.001 - 191.254].000.000 or [192.000.001 - 223.255.254].000.

When NET OR HOST is "HOST", DEST IP ADDR must be 001.000.000.001 - 126.25 5.255.254, 128.001.000.001 - 191.254.255.254 or 192.000.001.001 - 223.255.254.254.

When NET OR HOST is "NET" and DEST IP ADDR set 1 is 001 - 126, IP SUBNET MASK must be 255.000.000.000 or 255.192.000.000 - 255.255.255 .000.

When NET OR HOST is "NET" and DEST IP ADDR set 1 is 128 - 191, IP SUBNET MASK must be 255.255.000.000 or 255.255.192.000 - 255.255.255 .000.

When NET OR HOST is "NET" and DEST IP ADDR set 1 is 192 - 223, IP SUBNET MASK must be 255.255.255.000 or 255.255.255.192 - 255.255.255 .240.

When NET OR HOST is "NET", IP SUBNET MASK must be entered.

2.5 IP SUBNET MASK

Description: This field specifies the subnetwork mask associated with the destination IP address.
Default: set 1 is 255 for "NET", blank for "HOST"
Valid Entries: Blank, or enter 255 for IP subnet mask set 1. Blank, or enter 0 - 255 for IP subnet mask set 2, 3, and 4.

Data Rules:

If set 1 is blank, all must be blank.

If set 1 is known, all must be known.

2.6 GATEWAY IP ADDR

Description: This field specifies the IP address of the gateway through which data is sent to the destination.
Valid Entries: For Gateway IP address set 1, enter 001 - 126 for Class A, 128 - 191 for Class B, or 192 - 223 for Class C. For Gateway IP address set 2, 3, and 4, enter 0 - 255.

2.7 ROUTE METRIC

Description: This field specifies the route metric associated with the routing path. This is used for load balancing in multi-routing.
Default: 1
Valid Entries: Enter 1 - 255

```
iprout                    5ESS Switch                _

SEC. 3Q: 5991 RECORD - PACKET SWITCH UNIT GATEWAY PSUGW

1. GENERAL

Available for 5E15 FR4 and later, this form supports the PSU (Packet Switching Unit) CA (Community Address) Expansion (99-5E-8012) feature. It is used to assign a gateway community address to a PSU in a wireless network. See Division 2, Section 7BH.

1.1 Recent Change View

The corresponding Recent Change View for this view is 22.26.

2. FORM ENTRIES - 5991 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *SM

Description: Enter the SM number.
Valid Entries: 0 - 192

2.3 *PSU 0

Description: Enter the PSU (Packet Switch Unit) number.
Default: 0
Valid Entries:

5E15 and earlier: 0
5E16 and later: 0 - 1

GATEWAY ADDRESSES

The following fields (Section 2.4 - Section 2.7) allow assignment of gateway community addresses to a PSU. Note also that NETWORK 0 - 3 must not be equal to the COM ADDR on the associated EQPSU form.

2.4 NETWORK 0

Description: Enter the Gateway Address of Network 0.
Valid Entries: Blank, or 1 - 254

Data Rules:

NETWORK 0 and 1 cannot be identical.

NETWORK 0 and 2 cannot be identical.

NETWORK 0 and 3 cannot be identical.

For 5E17(1) FR1 and later, twice the value of every GATEWAY ADDRESS on this form cannot equal to VPI on the INTERPSU form (5993 Record).

For 5E17(1) FR1 and later, twice the value of every GATEWAY ADDRESS on this form cannot equal to

Copyright © 2003 Lucent Technologies

HIGH PRIORITY VPI on the INTRAPSU form (5992 Record).

2.5 NETWORK 1

Description: Enter the Gateway Address of Network 1.
Valid Entries: Blank, or 1 - 254

Data Rules:

NETWORK 1 and 2 cannot be identical.

NETWORK 1 and 3 cannot be identical.

2.6 NETWORK 2

Description: Enter the Gateway Address of Network 2.
Valid Entries: Blank, or 1 - 254

Data Rules:

NETWORK 2 and 3 cannot be identical.

2.7 NETWORK 3

Description: Enter the Gateway Address of Network 3.
Valid Entries: Blank, or 1 - 254

2.8 FEATURE ACTIVE

Description: Is the PSU Community Expansion feature active?
Default: N
Valid Entries: Y, N

Data Rules:

When Y is entered,

- there must be a matching PSULNK form for each GATEWAY PHA where CON TYPE is "ATMGW".
- all of the PSUGW forms in the 5ESS office must have the same SUBNETWORK ID.
- one of the gateway addresses must be entered.

For 5E17(1) FR1 and later, for every PSUGW form where FEATURE ACTIVE is "Y", there must be a matching ATMLNK (5592 Record) or PSULNK (5057 Record) form with CHANNELS CON TYPE set to "ATMNET".

For 5E17(1) FR1 and later, every PSUGW form where FEATURE ACTIVE is "Y" with a matching ATMLNK form, and if this ATMLNK form has a CHANNELS list with CON TYPE equal to "ATMNET"., then the ATMLNK must have a corresponding INTERPSU form with FAR SUBNET ID different from SUBNET ID on the CDMAOPT form.

2.9 SUBNETWORK ID

Description: Enter the Subnetwork ID number.
Default: 0
Valid Entries: 0 - 3

Copyright © 2003 Lucent Technologies

Data Rules:

When SUBNETWORK is 0, NETWORK 0 must not be entered.

When SUBNETWORK is 1, NETWORK 1 must not be entered.

When SUBNETWORK is 2, NETWORK 2 must not be entered.

When SUBNETWORK is 3, NETWORK 3 must not be entered.

SEC. 3R: PACKET SWITCH COMPONENT - PSCOMP

1. GENERAL

This form is available with the 5E16 and later Software Releases. It is used to define hardware assignments within packet components.

1.1 Recent Change View

This form has no corresponding Recent Change View.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM NUMBER

Description: This field is used to indicate the Switching Module number associated with the component.

Software Release: 5E16 and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

The combination of SM NUMBER, COMPONENT TYPE, and COMPONENT ID on this form, must be defined on the MGPCOMP form (6921 Record).

2.3 * COMPONENT TYPE

Description: This field identifies the type of component.

Software Release: 5E16 and later
Required Field.
Valid Entries:

Valid TMS COMPONENT TYPE Entries

Entry	Description
LAG	Line Access Gateway
TAG	Trunk Access Gateway

Data Rules:

When COMPONENT TYPE is "LAG":

- only slots 1 - 14 may be entered.
- CARD TYPE must not be "STS-1".

When COMPONENT TYPE is "TAG":

- only slots 11 - 14 may be entered.
- CARD TYPE must be blank or "STS-1".

Copyright © 2003 Lucent Technologies

2.4 * COMPONENT ID

Description: This field identifies the ID of the component assigned to the packet line/trunk.

Software Release: 5E16 and later
Required Field.
Valid Entries: 1 - 105

2.5 # COMPONENT NAME

Description: This field identifies the name of the component.

Software Release: 5E16 and later
Required Field.
Valid Entries: 1 - 20 characters

Data Rules:

COMPONENT NAME can not be duplicated on another PSCOMP form.

2.6 EMS NAME

Description: This field is the element manager name assigned to the LAG/TAG.

Software Release: 5E16 and later
Valid Entries: 1 - 11 characters

2.7 NEXT LAG

Description: This field indicated the next lag in the daisy chain.

Software Release: 5E16 and later
Valid Entries: 1 - 20 characters

2.8 PREVIOUS LAG

Description: This field indicated the previous lag in the daisy chain.

Software Release: 5E16 and later
Valid Entries: 1 - 20 characters

2.9 CLEI

Description: The Common Language Equipment Identifier field is a 10 character alphanumeric code assigned to telecommunication equipment.

Software Release: 5E16 and later
Valid Entries: blank or 1 - 10 characters

2.10 CARD TYPE

Description: This field indicates the type of card provisioned in a particular slot of the component. This is a Display Only field.

Software Release: 5E16 and later
Valid Entries: COIN, ISDN BRI, POTS, POTS+ADSL, or STS-1

SEC. 3S: 5995 RECORD
INTERNET PROTOCOL (IP) INTERFACE ASSIGNMENT - ETHIP

1. GENERAL

This form provides the ethernet capability to provision IP addresses, subnet masks, and associated IP parameters to an internet interface. This form was created to support the PCF (Packet Control Function) on PHE2 (PH30 with Ethernet Link) feature. For more information on this feature see Division 2, Section 8AC. This feature was first made available in the 5E16(1) FR1 (Feature Release 1) Software Release.

1.1 Recent Change View

The corresponding Recent Change View for ETHIP is 33.4.

2. FORM ENTRIES - 5995 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: This field identifies the Switching Module number.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

SM, PSU, SHELF and CHANNEL GROUP must correspond to a Protocol Handler Logical Channel Group with a PH TYPE of "PHE2" on the PSUGP form (5949 Record).

When SM, PSU, SHELF, and CHANNEL GROUP matches the first seven digits of the TRKOE on the TRUNK form (5204 Record), and the TRKGRP form (5202 Record) has TRKCLS equal to "PCF", RATE must be 100, MODE must be "F", and MTU SIZE must be 1500 on the ETHIP form.

2.3 * PSU

Description: This field identifies the Packet Switching Unit associated with the SM.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 or 1

2.4 * SHELF

Description: This field specifies the Shelf number where the PSU is located.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 - 4

2.5 * CHANNEL GROUP

Description: This field specifies the Channel Group number.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 - 15

2.6 # INTERFACE NAME

Description: This field specifies the name of the interface.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 1 - 19 alphanumeric characters

Data Rules:

The INTERFACE NAMEs entered on the IPINTF form must be unique in a given office.

2.7 # PHE LINK

Description: This field specifies the Protocol Handler Ethernet link number.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 1 - 48

Data Rules:

PHE LINK cannot be duplicated for a given combination of SM/PSUon this and the PCRGRP form (5883 Record)..

The total number of ETHIP forms cannot exceed 48 per SM.

For 5E16(2) FR 3 and later, when PHE LINK is greater than 10, the ACT field for SFID 684 on the SFSYS form (5713-1 Record) must be "Y".

2.8 # GATEWAY IP ADDR

Description: This field specifies the IP Address to be assigned to the interface. For 5E16(2) FR 3 and later, this field is being replaced with 2 new fields and renamed GATEWAY IP ADDRESS 1 and GATEWAY IP ADDRESS 2. This change supports the SIP (Session Initiation Protocol) for Packet Trunking feature. For more information see Division 2, Section 4A684.

2.9 # GATEWAY IP ADDR 1

Description: This field specifies the IP Address 1 to be assigned to the interface.

Software Release: 5E16(1) and later
Required Field.
Valid Entries:

Set 1 (001 - 126 for Class A; 128 - 191 for Class B; or 192 - 223 for Class C)
Set 2,3, and 4 (0 - 255)

Data Rules:

For 5E16(2) FR 3 and later, GATEWAY IP ADDRESSes on the ETHIP and IPINTF forms (5988 Record), and the LOCAL IP ADDRs on the IPPROC form (5987 Record) must be unique in a given office.

Copyright © 2003 Lucent Technologies

GATEWAY IP ADDRESS 1 cannot be equal to GATEWAY IP ADDRESS 2.

2.10 # IP SUBNET MASK

Description: This field specifies the IP Subnet Mask to be assigned to the interface. For 5E16(2) FR 3 and later, this field is being replaced with 2 new fields and renamed IP SUBNET MASK 1 and IP SUBNET MASK 2. This changes support the SIP (Session Initiation Protocol) for Packet Trunking feature.

2.11 # IP SUBNET MASK 1

Description: This field specifies the IP Subnet Mask 1 to be assigned to GATEWAY IP ADDRESS 1 of the interface.

Software Release: 5E16(2) and later
Required Field.
Valid Entries:

Set 1 (255)
Set 2, 3, and 4 (0 -255)

2.12 # GATEWAY IP ADDR 2

Description: This field specifies the IP Address 2 to be assigned to the interface.

Software Release: 5E16(2) and later
Valid Entries:

Set 1 (001 - 126 for Class A; 128 - 191 for Class B; or 192 - 223 for Class C)
Set 2,3, and 4 (0 - 255)

Data Rules:

For 5E16(2) FR 3 and later, GATEWAY IP ADDRs must not match LOCAL IP ADDRs and all GATEWAY IP ADDRs and LOCAL IP ADDRs must be unique in a given office.

When GATEWAY IP ADDR 2 is 001 - 126, IP SUBNET MASK 2 must be 255.000.000.000 - 255.255.255.252.

A Class A GATEWAY IP ADDR 2 cannot be XXX.000.000.000 or XXX.255.255.

When GATEWAY IP ADDR 2 is 128 - 191, IP SUBNET MASK 2 must be 255.255.000.000 - 255.255.255.252.

A Class B GATEWAY IP ADDR 2 cannot be XXX.XXX.000.000 or XXX.XXX.255.

When GATEWAY IP ADDR 2 is 192 - 223, IP SUBNET MASK 2 must be 255.255.255.000 - 255.255.255.252.

A Class C GATEWAY IP ADDR 2 cannot be XXX.XXX.XXX.000 or XXX.XXX.XXX.255.

When GATEWAY IP ADDRESS 2 is blank, IP SUBNET MASK 2 must be blank.

2.13 # IP SUBNET MASK 2

Description: This field specifies the IP Subnet Mask 2 to be assigned GATEWAY IP ADDRESS 1 of the interface.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Valid Entries:

Set 1 (255)
Set 2, 3, and 4 (0 -255)

2.14 MCAST ADDR

Description: This field defines the Multicast Address for the interface.
Valid Entries: Blank, or enter 224 - 239 for Multicast IP ddress set 1. Blank, or enter 0 - 255 for Multicast IP address set 2, 3, and 4.

2.15 MTU SIZE

Description: This field defines the maximum number of bytes per transfer from this interface.

Software Release: 5E16(1) and later
Required Field.
Default: 1500
Valid Entries: 256 - 1600

Data Rules:

MTU SIZE must be 1500 for any SM+PSU+SHELF+CHANNEL GROUP combination entered on the PCRGRP form (5883 Record).

ETHERNET DATA

The following fields, Section 2.16 - Section 2.17 , are used to indicate the rate and mode of the data flow for individual field information.

2.16 # RATE

Description: This field is used to indicate the rate associated with the speed of the ethernet link.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 10 - 100

Data Rules:

When RATE is "A" then MODE must also be "A".

2.17 # MODE

Description: This field identifies the mode used for the data flow of the ethernet connection.
Valid Entries:

Valid MODE Entries

Entry	Definition
A	Auto
F	Full
H	Half
N	Null

Data Rules:

When MODE is "A" then RATE must also be "A".

SEC. 3T: 5996 RECORD
PCF OFFICE PARAMETERS - PCFOPT

1. GENERAL

The PCF (Packet Control Function) Office Parameters form is used to assign office-wide PCF parameters. This form was created to support the PCF on PHE2 (PH30 with Ethernet Link) feature. For more information on this feature see Division 2, Section 8AC. This feature was first made available in the 5E16(1) FR1 (Feature Release 1) Software Release.

1.1 Recent Change View

The corresponding Recent Change View for PCFOPT is 34.1.

2. FORM ENTRIES - 5996 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * KEY

Description: The KEY field is the key for accessing the appropriate relation. In this case it is always 0.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0

2.3 UDP PORT

Description: This field specifies the User Datagram Protocol port number. It is used for both source and destination.

Software Release: 5E16(1) and later
Valid Entries: 0 - 65535

2.4 MS FWD DORM BUF

Description: This field specifies the MS (Mobile Station) Forward Dormancy Buffer number.

Software Release: 5E16(1) and later
Valid Entries: 0 - 32

2.5 BUSY REACT TIMER

Description: This field specifies the Busy Reactivation Timer number.

Software Release: 5E16(1) and later
Valid Entries: 0 - 255

2.6 PDSN RETRY

Description: This PDSN (Packet Data Serving Node) Retry field specifies the number of attempts to resend.

Software Release: 5E16(1) and later
Valid Entries: 1 - 10

Copyright © 2003 Lucent Technologies

2.7 PDSN OOS INTRVL

Description: This field specifies the PCF PDSN out-of-service (OOS) periodic interval used to retry new connections to a failed PDSN.

Software Release: 5E16(1) and later
Valid Entries: 5 - 65535

2.8 PDSN LIFETIME

Description: This field specifies the PDSN life time in seconds.

Software Release: 5E16(1) and later
Valid Entries: 600 - 65535

2.9 PDSN TIME TOL

Description: This field specifies the PDSN time tolerance in seconds.

Software Release: 5E16(1) and later
Valid Entries: 1 - 255

2.10 ACCOUNT WAIT TMR

Description: The PCF Accounting Wait Timer field specifies the delay from the actual time the mobile begins using the airlink.

Software Release: 5E16(1) and later
Valid Entries: 1 - 10

2.11 TREGREQ TIMEOUT

Description: This field is the maximum time the PCF waits for a PDSN reply message from another PDSN.

Software Release: 5E16(1) and later
Valid Entries: 1000 - 5000

2.12 TREGREQ DELAY TMR

Description: The Tregreq Delay Timer field represents the delay timer for the ECP (Executive Cellular Processor) dormant link layer connection closure.

Software Release: 5E16(1) and later
Valid Entries: 0 - 30

2.13 BS/MSC ID

Description: This field specifies the BS/MSC (Base Station/Mobile Switching Center) identification to be sent to the PDSN in registration request messages.

Software Release: 5E16(1) and later
Valid Entries: 0 - 12 characters

2.14 MAX DORM SESSIONS

Description: This field specifies the total number of dormant sessions for each PCF in an office.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(1) and later
Valid Entries: 1 - 100000

2.15 PER MIN THRESHOLD

Description: This field specifies the PCF A11/A10 PER (Protocol Error Record) minimum threshold.

Software Release: 5E16(1) and later
Valid Entries: 1 - 4094

2.16 PER MAX THRESHOLD

Description: This field specifies the PCF A11/A10 PER (Protocol Error Record) maximum threshold.

Software Release: 5E16(1) and later
Valid Entries: 2 - 4095

2.17 PER LEAK COUNT

Description: This field specifies the PER Leaky Bucket leak count.

Software Release: 5E16(1) and later
Valid Entries: 0 - 511

GRE PARAMETERS

The following fields, Section 2.18 Section 2.20 , are used to indicate the information about the Generic Routing Encapsulation fields.

2.18 GRE MAX BUFFER

Description: This field specifies the max PER (Protocol Errror Record) flow sequence buffer for the GRE protocol. This is a no change field.

Software Release: 5E16(1) and later

2.19 GRE OUT OF ORDER

Description: This field specify the out of timeout for the GRE protocol. This is a no change field.

Software Release: 5E16(1) and later

2.20 GRE PKT DISC LIMIT

Description: This field specifies the consecutive packet discard limit for GRE protocol.

Software Release: 5E16(1) and later
Valid Entries: N/A

2.21 CELL ID ENABLE

Description: This field indicates whether or not the Cell ID is enabled.

Software Release: 5E16(1) and later
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.22 CELL FACE ENABLE

Description: This field indicates whether or not the Cell Face is enabled.

Software Release: 5E16(1) and later
Default: N
Valid Entries: Y, N

When CELL FACE ENABLE is "Y", CELL ID ENABLE must also be "Y".

2.23 CELL INFO ORDER

Description: This field informs the PCF how to structure the BSID Cell Identifier Type 2 Octets when CELL ID ENABLE is set to "Y".

Software Release: 5E17(1) and later
Default: N
Valid Entries: Y, N

Y (to switch order)
N (to not switch order)

2.24 ACT TIME PARM

Description: This field determines if the Active Timer Parameter in the Active Stop Airlink record is sent using the IS-835 or IS-835-B standard.

Software Release: 5E17(1) and later
Default: N
Valid Entries: Y, N

Y (IS-835-B)
N (IS-835))

2.25 HDLC FRAMING

Description: This field indicated whether or not the HDLC (High Data Levell Link Control) is on or off.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

PCF SECURITY

These fields (Section 2.26 - Section 2.28) support the PCF (Packet Control Function) Security on PHE2 (Protocol Handler Ethernet 2) feature. For more information on this feature see, Division 2, Section 8AI. All of these fields are no_change fields.

2.26 PCF PHE2 LIMIT

Description: This field specifies the number of allowed PCF PHEs in the office.

Software Release: 5E17(1) FR 2 and later
Valid Entries: No Change

2.27 PCF PHE2 PROV

Copyright © 2003 Lucent Technologies

Description: This field specifies the number of provisioned PCF PHEs in the office.

Software Release: 5E17(1) FR 2 and later
Valid Entries: No Change

2.28 PCF PHE2 PSWD

Description: This field provides the password for changing PCF PHE LIMIT.

Software Release: 5E17(1) FR 2 and later
Valid Entries: No Change

APIT PARAMATERS

These fields (Section 2.29 - Section 2.34) support the 3G-1X HSPD (High Speed Packet Data) Performance for Chatty Applications feature. For more information on this feature see, Division 2, Section 8AL.

2.29 INIT TIMER

Description: This field is used to specify the initial timer value of APIT (Adaptive Packet Inactivity Timer) when it is recalculated by PCF.

Software Release: 5E17(1) FR 3
Default: 15,000
Valid Entries: 5000 - 60000 milliseconds

2.30 INACT TIME

Description: This field is used to specify the inactivity time for APIT after it is initialized.

Software Release: 5E17(1) FR 3
Default: 10,000
Valid Entries: 0 - 60000 milliseconds

2.31 REACT COST

Description: This field is used to specify the cost of call release and reactivation when PCF recalculates the APIT.

Software Release: 5E17(1) FR 3
Default: 7500
Valid Entries: 1000 - 30000 milliseconds

2.32 LOCAL MARGIN

Description: This field is used to specify the margin of a locality when PCF recalculates the APIT.

Software Release: 5E17(1) FR 3
Default: 2000
Valid Entries: 0 - 10000 milliseconds

2.33 INTER ARRIVAL

Description: This field is used to specify the average chatty inter-arrival time when PCF recalculates the APIT.

Copyright © 2003 Lucent Technologies

Software Release: 5E17(1) FR 3
Default: 5000
Valid Entries: 0 - 25000 milliseconds

2.34 STEP DOWN SIZE

Description: This field is used to specify the step size for timer reduction when PCF recalculates the APIT.

Software Release: 5E17(1) FR 3
Default: 10
Valid Entries: 1 - 50 percent

SEC. 3U: 5996-2 RECORD
PCF PDSN IP ASSIGNMENT - PCFPDSN

1. GENERAL

The PCF (Packet Control Function) IP Assignment form provides the capability to provision a PDSN (Packet DataServing Node) IP address to PCF. This form was created to support the PCF on PHE2 (PH30 with Ethernet Link) feature. For more information on this feature see Division 2, Section 8AC. This feature was first made available in the 5E16(1) FR1 (Feature Release 1) Software Release.

1.1 Recent Change View

The corresponding Recent Change View for PCFOPT is 34.2.

2. FORM ENTRIES - 5996 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: The field represents the Switching Module number.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

When SM, PSU, SHELF, and CHANNEL GROUP is entered, these fields must be defined on the ETHIP form (5995 Record).

When this form is entered, the PCFOPT form (5996-1 Record) must also be entered.

There can only be a maximum of 1024 PCFPDSN forms.

SM, PSU, SHELF, and CHANNEL GROUP must match the first seven digits of TRKOE on at least one TRUNK form (5204 Record), where the TKGRP form has TRKCLS equal to "PCF".

2.3 * PSU

Description: This field specifies the Packet Switching Unit number.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 or 1

2.4 * SHELF

Description: This field specifies the Packet Switching Unit shelf number.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 - 4

2.5 * CHANNEL GROUP

Copyright © 2003 Lucent Technologies

Description: This field specifies the Channel Group position.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 - 15

2.6 * IP ADDRESS

Description: This field specifies the Channel Group position.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 0 - 255 for each set

Data Rules:

When IP ADDRESS is entered, it must be defined on the PDSNCNFG form (5997 Record).

SEC. 3V: 5997 RECORD
PDSN CONFIGURATION - PDSNCNFG

1. GENERAL

The PDSN (Packet Data Serving Node) Configuration form is used to assign PDSN configuration parameters. This form was created to support the PCF (Packet Control Function) on PHE2 (PH30 with Ethernet Link) feature. For more information on this feature see Division 2, Section 8AC. This feature was first made available in the 5E16(1) FR1 (Feature Release 1) Software Release.

1.1 Recent Change View

The corresponding Recent Change View for PDSNCNFG is 34.3.

2. FORM ENTRIES - 5997 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * IP ADDRESS

Description: IP (Internet Protocol) Address to be assigned to the PDSN interface.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: For IP address set 1, for Class A enter 001 - 126, for Class B 128 - 191, or for Class C 192 - 223.

2.3 IP SUBNET MASK

Description: This field specifies the IP Subnet Mask assigned to the PDSN.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 255 for set 1 and 0 - 255 for all other sets

2.4 SHARED SECRET

Description: This field is used for authentication.

Software Release: 5E16(1) and later
Required Field.
Valid Entries: 255 for set 1 and 0 - 255 for all other sets

2.5 MOB HOME AUTH EXT

Description: This field indicates whether or not the PCF (Packet Control Function) should authenticate all registration reply messages.

Software Release: 5E16(1) and later
Required Field.
Default: Y
Valid Entries: Y, N

2.6 REG UPD AUTH EXT

Copyright © 2003 Lucent Technologies

Description: This field indicates whether or not the PCF (Packet Control Function) should authenticate all registration update messages.

Software Release: 5E16(1) and later
Required Field.
Default: Y
Valid Entries: Y, N

2.7 SPI AUTHENT PROTECT

Description: This field indicates whether or not the SPI (Security Parameter Index) is protected during authentication.

Software Release: 5E16(1) and later
Required Field.
Default: Y
Valid Entries: Y, N

2.8 SPI

Description: This field indicates the Security Parameter Index.

Software Release: 5E16(1) and later
Required Field.
Default: 3
Valid Entries: 1 - ffffffff hex

Data Rules:

SPI must be a value greater than 0.

2.9 VEND/ORG SPEC EXT

Description: This field indicates whether or not a vendor/organization specific extension is allowed to be sent with multiple attributes.

Software Release: 5E16(1) and later
Required Field.
Default: N
Valid Entries: Y, N

2.10 ESN ACCT ENABLE

Description: This field indicates whether or not the ESN (Equipment Serial Number) accounting is enabled.

Software Release: 5E16(1) and later
Required Field.
Default: N
Valid Entries: Y, N

2.11 IS-835 VERSION 0

Description: This field indicates whether or not the IS-835 (Interim Standard-835) version 0 standard is applicable.

Software Release: 5E16(1) and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.12 GRE CHKSUM ENABLE

Description: This field indicates whether or not the GRE (Generic Routing Encapsulation) checksum is enabled.

Software Release: 5E16(1) and later
Required Field.
Default: N
Valid Entries: Y, N

SEC. 3W: 5918 RECORD
VOICE AND DATA CHANNELS

1. GENERAL

The Voice and Data Channel Counts form provides records of the RC (Recent Change) 22.32 transactions and it supports the Voice and Data Channel Counts feature.. For more information on this feature, see Division 2, Section 4A635.

1.1 Recent Change View

The corresponding Recent Change View is 22.32.

2. FORM ENTRIES - 5988 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Inserts, updates, and deletes will ONLY be allowed for RC. This form can only be reviewed by ODA.

2.2 * KEY

Description: This field is used to review and insert a voice and data channel licensed record.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: 0 - 2047

2.3 * PURCHASE ORDER

Description: This field is used to specify the purchase order number of new voice or data channels purchased.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: 0 - 20 alphanumeric characters

2.4 * NEW VOICE LICENSED

Description: This field is used to specify new voice channels for a particular purchase order.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: -32768 - 32767

2.5 * NEW DATA LICENSED

Description: This field is used to specify new licensed data channels for a particular purchase order.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: -32768 - 32767

2.6 FEATURE ACTIVE

Description: This field is used to specify whether or not to enable the Voice and Data Channel Counts feature. This is a no_change field.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later

2.7 DATE

Description: This field is used to specify the date of particular transaction. This is a no_change field.

Software Release: 5E16(2) and later

2.8 REMARKS

Description: This field is used to add any remarks for a particular purchase order. This is a no_change field.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: 0 - 32 characters

VOICE

The following fields (Section 2.9 - Section 2.10) are no_change fields that indicate the voice provision and the total license channels.

2.9 PROVISIONED

Description: This field is used to specify total voice channels in an office.

2.10 TOTAL LICENSED

Description: This field is used to specify total licensed channels in an office.

DATA

The following fields (Section 2.11 - Section 2.12) are no_change fields that indicate the data provision and the total license channels.

2.11 PROVISIONED

Description: This field is used to specify total provisioned data channels in an office.

2.12 TOTAL LICENSED

Description: This field is used to specify total licensed data channels in an office.

2.13 CONFIRM NEW VOICE

Description: This field is used to confirm new licensed voice channels of a particular purchase order.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: -32768 - 32767

2.14 CONFIRM NEW DATA

Description: This field is used to confirm new licensed data channels of a particular purchase order.

Software Release: 5E16(2) and later
Required Field.

SEC. 3X: 5992 RECORD
INTRA NETWORK PSU CONNECTIVITY - INTRAPSU

1. GENERAL

This form is made available with the 5E17(1) FR1 (Feature Release 1) and later Software Releases. It allows a user to define and specify parameters needed for intra network PSU (Packet Switching Unit) connectivity. This form supports the PHA2 (Protocol Handler for ATM (Asynchronous Transfer Mode) 2) PSU to PSU Connectivity feature. For more information on this feature, see Division 2, Section 7BY.

1.1 Recent Change View

The corresponding Recent Change View is 22.29.

2. FORM ENTRIES - 5992 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: This field represents the Switching Module number.

Software Release: 5E17(1) and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

Every INTRAPSU form must have a matching ATMLNK form (5592 Record) where CHANNELS CON TYPE is "ATMNET".

When INTRAPSU forms exist, CDMAOPT forms must also exist.

2.3 * PSU

Description: This field represents the Packet Switching Unit.

Software Release: 5E17(1) and later
Required Field.
Valid Entries: 0 - 1

2.4 * LINK

Description: This field specifies the Packet Switch Unit link number.

Software Release: 5E17(1) and later
Required Field.
Valid Entries: 1 - 10

2.5 # NETWORK CON TYPE

Description: This field is used to indicate how the PSUs in the same subnet are connected.

Software Release: 5E17(1) and later
Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid NETWORK CON TYPE Entries	
Entry	**Definition**
VCC	Virtual Channel Connection
VPC	Virtual Path Connection

Data Rules:

NETWORK CON TYPE must be "VCC" or "VPC".

When NETWORK CON TYPE is "VCC" or one of the CON TYPE of COMMUNITY ADDRESS CONNECTION OVERRIDES is "VCC", HIGH and LOW PRIORITY VPI must be entered.

2.6 HIGH PRIORITY VPI

Description: This field is used to specify the high priority Virtual Path Identifier.

Software Release: 5E17(1) and later
Valid Entries: 0 - 528

Data Rules:

The values for HIGH PRIORITY VPI and LOW PRIORITY VPI must be different.

2.7 LOW PRIORITY VPI

Description: This field is used to specify the low priority Virtual Path Identifier.

Software Release: 5E17(1) and later
Valid Entries: 0 - 528

COMMUNITY ADDRESS CONNECTION OVERRIDES

This list is used to override the default values of the connection type for each PSU Community Address.

2.8 CON TYPE

Description: This field is used to specify the connection type of each PSU community address.

Software Release: 5E17(1) and later
Valid Entries:

Valid CON TYPE Entries	
Entry	**Definition**
VCC	Virtual Channel Connection
VPC	Virtual Path Connection

SEC. 3Y: 5993 RECORD
INTER NETWORK PSU CONNECTIVITY - INTERPSU

1. GENERAL

This form is made available with the 5E17(1) FR1 (Feature Release 1) and later Software Releases. It allows a user to define and specify parameters needed for inter network PSU (Packet Switching Unit) connectivity. This form supports the PHA2 (Protocol Handler for ATM (Asynchronous Transfer Mode) 2) PSU to PSU Connectivity feature. For more information on this feature, see Division 2, Section 7BY.

1.1 Recent Change View

The corresponding Recent Change View is 22.30.

2. FORM ENTRIES - 5993 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SM

Description: This field represents the Switching Module number.

Software Release: 5E17(1) and later
Required Field.
Valid Entries: 1 - 192

Data Rules:

Every INTERPSU form must have a matching ATMLNK form (5592 Record) where CHANNELS CON TYPE is "ATMNET".

When INTERPSU, INTRAPSU, PSUGW, or PSUPM forms exist, the CDMAOPT form (5599 Record) must also exist.

2.3 * PSU

Description: This field represents the Packet Switching Unit.

Software Release: 5E17(1) and later
Required Field.
Valid Entries: 0 - 1

2.4 * LINK

Description: This field specifies the Packet Switch Unit link number.

Software Release: 5E17(1) and later
Required Field.
Valid Entries: 1 - 10

2.5 * FAR SUBNET ID

Description: This field is used to indicate the far subnet identifier.

Software Release: 5E17(1) and later

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 0 - 3

Data Rules:

When FAR SUBNET ID on this form is not equal to SUBNET ID on the CDMAOPT form (5599 Record), and NETWORK CON TYPE or COMMUNITY ADDRESS CONNECTION OVERRIDES CON TYPE on the INTERPSU form is "GW", then the PSUPM form (5998 Record) must not be entered.

FAR SUBNET ID on this form must not equal to SUBNET ID on the CDMAOPT form.

2.6 # NETWORK CON TYPE

Description: This field is used to indicate how the PSUs are connected to the far network.

Software Release: 5E17(1) and later
Required Field.
Valid Entries:

Valid NETWORK CON TYPE Entries

Entry	Definition
GW	Gateway connection
VCC	Virtual Channel Connection

- **WARNING:** Inhibit all the active PM sessions of this SM/PSU/LINK/FAR SUBNET ID before updating NETWORK CON TYPE from "VCC" to "GW".

Data Rules:

When NETWORK CON TYPE or COMMUNITY ADDRESS CONNECTION OVERRIDES CON TYPE on the INTERPSU form is "GW", and FEATURE ACTIVE on the PSUGW form (5991 Record) is "Y", then GATEWAY ADDRESSES associated with the FAR SUBNET ID on the INTERPSU form must be entered.

When NETWORK CON TYPE or COMMUNITY ADDRESS CONNECTION OVERRIDES CON TYPE on the INTERPSU form is "GW", or NEWWORK CON TYPE or COMMUNITY ADDRESS CONNECTION OVERRIDES CON TYPE on the INTRAPSU form is "VPC", there must be an ATMLNK form (5592 Record) with matching SM, PSU, and LINK, and also with VPC SUPPORT set to "Y".

When NETWORK CON TYPE is "VCC" or one of CON TYPE of COMMUNITY ADDRESS CONNECTION OVERRIDES is "VCC", VPI must be entered.

2.7 VPI

Description: This field is used to specify the Virtual Path Identifier.

Software Release: 5E17(1) and later
Valid Entries: 0 - 528

Data Rules:

VPI on this form and HIGH PRIORITY VPI and LOW PRIORITY VPI on the INTRAPSU form (5992 Record) must be unique per PSU.

COMMUNITY ADDRESS CONNECTION OVERRIDES

This list is used to override the default values of the connection type for each PSU Community Address.

2.8 CON TYPE

Copyright © 2003 Lucent Technologies

Description: This field is used to specify the connection type of each PSU community address.

Software Release: 5E17(1) and later
Valid Entries:

Valid CON TYPE Entries	
Entry	**Definition**
GW	Gateway Connection
VCC	Virtual Channel Connection

SEC. 3Z: 5219 RECORD
PACKET GROUP DEFINITION - PKTGRP

1. GENERAL

This form supports ATM (Assynchronous Transfer Mode) Packet groups for BICC (Bearer Independent Call Control) signaling and IP (Internet Protocol) Packet Group for SIP-T (Session Initiation Protocol for Telephones) signaling. It is used to insert, update, review, and delete ATM or IP (Internet Protocol) packet groups. This form is made available with the 5E16(2) and later Software Releases.

1.1 Recent Change View

The corresponding Recent Change View for PKTGRP is 5.71.

2. FORM ENTRIES - 5219 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PKT GRP

Description: This field is used to specify the Packet Group.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: 7000 - 7999

Data Rules:

When DEST PT CODE and ORIG PT CODE are entered, and ASSOC SET NAME, SIP-T GSM, and SIP-T PARM SET NAME fields are not entered on this form (signifying BICC Packet Group):

- a CICDIST form (5217 Record) must be defined.
- at least one SM2K MODULE must be entered on the CIC DISTRIBUTION list on the CICDIST form.
- the ACT field for SFID 567 on the SFSYS form (5713-1 Record) must be set to "Y".

When ASSOC SET NAME, SIP-T GSM, and SIP-T PARM SET NAME fields are entered, and DEST PT CODE and ORIG PT CODE are not entered on this form (signifying SIP-T Packet Group):

- the ACT field for SFID 684 on the SFSYS form (5713-1 Record) must be set to "Y".

2.3 RMK

Description: This field is used to specify an optional remark up to 16 characters.

Software Release: 5E16(2) and later
Valid Entries: 1 - 16 alphanumeric characters

2.4 # BEARER NET ID

Description: This field is used to specify the Bearer Network ID.

Software Release: 5E16(2) and later

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 512

2.5 # FAR CLLI

Description: This field is used to specify an 11-character Far End Common Language Location Identifier.
Required field.

Software Release: 5E16(2) and later
Valid Entries: 11 characters

2.6 # NEAR CLLI

Description: This field is used to specify an 11-character Near End Common Language Location Identifier.
Required field.

Software Release: 5E16(2) and later
Valid Entries: 11 characters

2.7 # HUNT TYPE

Description: This field is used to specify the type of hunting.
Required field.

Software Release: 5E16(2) and later
Required Field.
Default: 2WF
Valid Entries:

Valid TMS COMPONENT TYPE Entries

Entry	Description
2WB	Two-Way Backward hunt.
2WF	Two-Way Forward hunt.

Data Rules:

HUNT TYPE must be"'2WF" for SIP-T Group.

HUNT TYPE must be "2WB" or "2WF" for BICC Group.

2.8 # CONTROL TYPE

Description: This field is used to specify the Control Type.

Software Release: 5E16(2) and later
Required Field.
Valid Entries: [C]ANCEL or [S]KIP

BICC FIELDS

The following fields (Section 2.9 - Section 2.13) are used to indicate that a BICC Packet Group has been defined.

2.9 DEST PT CODE

Description: This field is used to specify the Destination Point Code value.

Software Release: 5E16(2) and later

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E16(2) and later:

- DEST PT CODE must not equal ORIG PT CODE.
- If DEST PT CODE is known and in the IMT (Inter-Module Trunking) format, then seventh, eighth, and nineth digits of the DEST PT CODE must not be equal to fourth, fifth and sixth digits of DEST PT CODE.
- Either all BICC fields must be entered, or all SIP-T fields must be entered.
- DEST PT CODE and ORIG PT CODE pair must be unique between all BICC Packet Groups.

  When the TGN is defined with PKT GRP entered on the TKGRP form (5202 Record), and the PKT GRP is associated with a SIP-T Packet Group (defined on the PKTGRP form (5219 Record), DEST PT CODE and ORIG PT CODE must not be entered

2.10 ORIG PT CODE

Description: This field is used to specify the Originating Point Code value.

Software Release: 5E16(2) and later

Data Rules:

For 5E16(2) and later, the ORIG PT CODE and DEST PT CODE specify different networks in the first three digits of the point code, thus the DEST PT CODE must be in ANSI format and the fourth, fifth and sixth digits of the DEST PT CODE must be between 0 and 255.

When a BICC Packet Group is defined (DEST PT CODE and ORIG PT CODE entered), all groups must use the same CCS platform, either "CNI" or "PSU" (identified by ORIG PT CODE).

When a BICC Packet Group is defined (DEST PT CODE and ORIG PT CODE entered) that uses a PSU platform, then GSM derived from the ORIG PT CODE must be entered either as GLOBAL SM on the CMTMH form (6021 Record) or SM on the MDLNK form (6009 Record), and all SM2K MODULEs on the CICDIST form must be entered either as NON GLOBAL SMs on the CMTMH form, or SM on the MDLNK form.

In a non-VCDX office, when a BICC Packet Group is defined that uses the PSU platform, then GSM derived from ORIG PT CODE must be entered on the CCGSM form (6008 Record) as a Host GSM (Global Switching Module).

When a BICC Packet Group is defined and it uses the CNI platform, DLN on the OFCOPT form (5509 Record) must be set to "Y".

2.11 PLATFORM

Description: This field is used to indicate CNI (Common Network Interface) or PSU (Packet Switching Unit) for BICC/CCS7 (Signaling System 7) Signaling Platform. This is a no_change field that only applies to BICC packet groups.

Software Release: 5E16(2) and later

2.12 BASE CIC

Copyright © 2003 Lucent Technologies

Description: This field is used to specify the Base Call Instance Code.

Software Release: 5E16(2) and later
Valid Entries: 0 - 4294966912

Data Rules:

For 5E16(2) and later:

- BASE CIC cannot exceed 4294966912.
- BASE CIC must be divisible by 128.

2.13 TOTAL CICS

Description: This field is used to specify the Total Call Instance Codes.

Software Release: 5E16(2) and later
Valid Entries: 0, or 256 - 65536, in multiples of 128

SIP-T FIELDS

The following fields (Section 2.14 - Section 2.16) are used to support the SIP (Session Initiation Protocol) for Packet Trunking feature. For more information see Division 2, Section 4A684.

2.14 ASSOC SET NAME

Description: This field is used to indicate the association set name.

Software Release: 5E16(2) and later
Valid Entries: 1 - 20 characters

Data Rules:

When ASSOC SET NAME and SIP-T GSM is entered, they must be defined on the ASSOCSET form (5890 Record) with GSM equal to SIP-T GSM.

ASSOC SET NAME ans SIP-T GSM pair must be unique between all SIP-T Packet Groups defined on this form.

2.15 SIP-T GSM

Description: This field is used to indicate the SIP-T (Session Initiation Protocol for Telephones) Global Switching Module.

Software Release: 5E16(2) and later
Valid Entries: 1 - 192

Data Rules:

When SIP-T GSM is entered, it must be defined on the SIPGSM and SIPTSMS forms (5880/5881 Records).

2.16 SIP-T PARM SET NAME

Description: This field is used to indicate the global SIP-T parameters set name.

Software Release: 5E16(2) and later

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 20 characters

Data Rules:

SIP-T PARM SET NAME must be defined on the SIPTPARM form (5882 Record).

2.17 TGN

Description: This field indicates the Service Group associated with the Packet Group. This is a no_change field.

Software Release: 5E16(2) and later
Valid Entries:

SEC. 3AA: 5998 RECORD
PSU TO PSU PERFORMANCE MONITORING SESSION - PSUPM

1. GENERAL

Available for 5E17(1) FR1 and later, this form supports the PHA2 (Protocol Handler for ATM (Asynchronous Transfer Mode) 2) PSU (Packet Switching Unit) to PSU Connectivity feature (99-5E-8048). This form is used to define the parameters used in a session to monitor the performance of the ATM connection for this feature.. For more information, see Division 2, Section 7BY.

1.1 Recent Change View

The corresponding Recent Change View for this view is 22.31.

2. FORM ENTRIES - 5998 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PMS NUMBER

Description: The PMS NUMBER field represents the number used to identify a performance monitoring session.

Software Release: 5E17(1) FR1 and later
Required field.
Valid Entries: 1 - 1024

Data Rules:

Each PSUPM form must have a corresponding EQIM form (5700 Record) where the EQSTATUS is "O".

2.3 # NEAR COM ADDR

Description: This field is used to specify the community address of the near PSU.

Software Release: 5E17(1) FR1 and later
Required field.
Valid Entries: 1 - 254

Data Rules:

The combination of NEAR COM ADDR, LINK, FAR SUBNET ID, and FAR COM ADDR must be unique between the PSUPM forms.

The combination of NEAR COM ADDR, FAR SUBNET ID, FAR COM ADDR, and CONN PRIORITY must be unique between the PSUPM forms.

Every NEAR COM ADDR, LINK, FAR SUBNET ID, FAR COM ADDR, and CONN PRIORITY combination on the PSUPM form where AUTO REPORT and ENABLED are "Y", these fields must be associated with START1COMP, START3COMP, (Far Subnet ID, Far PSU Community Address), and Connection Priority of START2COMP on the MEASSUM form (5563 Record) where SECTION NAME is "ATMQOSPS".

When NEAR COM ADDR is entered, it must be defined with the same value as COM ADDR on the EQPSU form (5741 Record).

Copyright © 2003 Lucent Technologies

2.4 # LINK

Description: This field identifies the PSU link number.

Software Release: 5E17(1) FR1 and later
Required field.
Valid Entries: 1 - 10

2.5 FAR SUBNET ID

Description: The CDMA (Code Division Multiple Access) sub-network ID assigned to the far end.

Software Release: 5E17(1) FR1 and later
Valid Entries: 0 - 3

Data Rules:

When FAR SUBNET ID is not entered, NEAR COM ADDR must not equal FAR COM ADDR.

Every PSUPM form where FAR SUBNET ID is entered and not equal to SUBNET ID on the CDMAOPT form must have a corresponding PSUGW form (5991 Record) with FEATURE ACTIVE set to "Y".

Every PSUPM form where FAR SUBNET ID is entered must have a corresponding INTRAPSU form.

2.6 # FAR COM ADDR

Description: This field is used to specify the community address of the far PSU.

Software Release: 5E17(1) FR1 and later
Required field.
Valid Entries: 1 - 254

2.7 # CONN PRIORITY

Description: This field specifies the connection priority.

Software Release: 5E17(1) FR1 and later
Required field.
Valid Entries: H (High), L (Low)

2.8 # TYPE

Description: This field specifies the type of monitoring to apply.

Software Release: 5E17(1) FR1 and later
Required field.
Valid Entries:

Valid TYPE Entries

Entry	Definition
B	Both incoming and outgoing
I	Incoming only.
O	Outgoing only.

2.9 BLOCK SIZE

Description: This field indicates how many ATM cells are transmitted before a performance monitoring cell is transmitted.

Copyright © 2003 Lucent Technologies

Software Release: 5E17(1) FR1 and later
Required field.
Default: 1024
Valid Entries: 128, 256, 512, 1024, 2048, 4096, 8192, 16384, or 32768.

2.10 SECB

Description: The SECB (Severly Errored Cell Blocks Threshold) field indicates the number of SECBs that can be encountered before firing an alarm in the office.

Software Release: 5E17(1) FR1 and later
Required field.
Default: OFF
Valid Entries:

Valid TYPE Entries

Entry	Definition
OFF	Threshold is off.
1	Minimum threshold level.
4294967295	Maximum threshold level.

2.11 IMPBLCK

Description: The Impaired Block Thrreshold field indicates the number of impaired blocks that can be encountered before firing an alarm in the office.

Software Release: 5E17(1) FR1 and later
Required field.
Default: OFF
Valid Entries:

Valid TYPE Entries

Entry	Definition
OFF	Threshold is off.
1	Minimum threshold level.
4294967295	Maximum threshold level.

2.12 AUTO REPORT

Description: This field indicates whether a performance monitoring session is reported automatically.

Software Release: 5E17(1) FR1 and later
Required field.
Default: N
Valid Entries: Y, N

2.13 ENABLED

Description: This field indicates whether a performance monitoring session is enabled. This is a display only field.

Software Release: 5E17(1) FR1 and later.
Default: N
Valid Entries: Y, N

SEC. 3AB: 5880 RECORD
SIP-T GLOBAL SM - SIPGSM

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking SIP-T (Session Initiation Protocol for Telephones) feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to insert, review, update, or delete the SIP GSM (Global Switching Module).

1.1 Recent Change View

The corresponding Recent Change View for this view is 5.80.

2. FORM ENTRIES - 5880 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * GSM

Description: The GSM field is used to specify the global switching module used to support SIP signaling.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

Data Rules:

GSM must be an SM with UNITTYPE set to "SM2000" or "SM2005" and have EQSTATUS set to "O" on the EQIM form (5700 Record).

Every defined (SIPT) GSM must have PI SG 0 EQSTATUS and PI SG 1 EQSTATUS set to "O" on the EQIM form.

When GSM is associated with a SIP-T Packet Group on the PKTGRP form (5219 Record), it must be defined on this form with the no_display field APPLSIPT set to "Y".

SIP-T modules cannot exist for a GSM when SIP-T application is not active on the GSM (i.e.,no_display field APPLSIPT on the SIPGSM form is "N").

2.3 # DEMO

Description: The DEMO field is used to specify whether or not the demonstration mode should be on.

Software Release: 5E16(2) FR3 and later
Required field.
Default: N
Valid Entries: Y, N

Data Rules:

When DEMO is "N", SM USAGE on the EQIM form must be "HIM" or "IM" for this SM.

SEC. 3AC: 5881 RECORD
SIP-T CALL PROCESSING SMS - SIPTSMS

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to specify SM-2000 modules in an office for SIP-T call processing.

1.1 Recent Change View

The corresponding Recent Change View for this view is 5.81.

2. FORM ENTRIES - 5881 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * GSM

Description: The GSM field is used to specify the global switching module used to support SIP signaling.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

Data Rules:

GSM must be an SM with UNITTYPE set to "SM2000" or "SM2005" and have EQSTATUS set to "O" on the EQIM form (5700 Record).

SIP-T modules cannot exist for a GSM which has DEMO on the SIPGSM form (5880 Record) set to "Y".

When GSM is entered it must be defined as SIP-T GSM on the SIPGSM form (5880 record).

SIP-T SMS (SIPTSMS)

The following fields (Section 2.3 - Section 2.4) provide information in an office for SIP-T call processing. For more information on this feature, see Division 2, Section 4A684.

2.3 SM2K MODULE

Description: The SM2K MODULE field specifies the SM-2000 call processing SM.

Software Release: 5E16(2) FR3 and later
Valid Entries: 1 - 192

Data Rules:

- **WARNING:** SM2K MODULE in SIP-T SMS list must not equal GSM.

At least one SM2K MODULE in SIP-T SMS list must be entered.

SM2K MODULE in SIP-T SMS list must be unique.

All SIP-T SM2K MODULEs entered on this form must be defined on the NON-GSM LIST list on the QGCON form (5829 Record).

Copyright © 2003 Lucent Technologies

SM2K MODULE must be an SM with UNITTYPE set to "SM2000" or "SM2005" , and have EQSTATUS set to "O" on the EQIM form (5700 Record).

2.4 ROUTE

Description: The ROUTE field specifies if message routing is allowed.

Software Release: 5E16(2) FR3 and later
Valid Entries: Y, N

Data Rules:

When ROUTE is known the SM2K MODULE must be entered.

SEC. 3AD: 5882 RECORD
SIP-T PARAMETERS DEFINITION - SIPTPARM

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to insert, review, update, or delete the SIP-T parameters.

1.1 Recent Change View

The corresponding Recent Change View for this view is 5.82.

2. FORM ENTRIES - 5882 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PARM SET NAME

Description: The PARM SET NAME field specifies the global SIP-T parameter set name.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 20 alphanumeric characters

TIMERS

The following fields (Section 2.3 - Section 2.6) provide information on the transaction times related to the SIP-T feature. For more information on this feature, see Division 2, Section 4A684.

2.3 INVITE TMR

Description: The INVITE TMR field specifies the SIP-T invite transaction timer in seconds.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 32
Valid Entries: 5 - 45

2.4 NON INVITE TMR

Description: The NON INVITE TMR field specifies the SIP-T non invite transaction timer in seconds.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 32
Valid Entries: 5 - 45

2.5 WAIT FOR ACK

Description: The WAIT FOR ACK field specifies the SIP-T acknowledgement wait timer in seconds.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 32

Copyright © 2003 Lucent Technologies

Valid Entries: 5 - 45

2.6 WAIT FOR UPDATE

Description: The WAIT FOR UPDATE field specifies the length of time in seconds that SIP-T waits for updates.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 32
Valid Entries: 5 - 45

PARAMETERS

The following fields (Section 2.7 - Section 2.10) provide information on the parameters related to the SIP-T feature. For more information on this feature, see Division 2, Section 4A684.

2.7 SIG SERVICE

Description: The SIG SERVICE field specifies the type of signaling service being used..

Software Release: 5E16(2) FR3 and later
Required field.
Default: TOS
Valid Entries:

Valid SIG SERVICE Entries	
Entry	**Definition**
[D]IFFSERV	Differential Service
[T]OS	Type of Service

Data Rules:

When SIG SERVICE is "DIFFSERV", SERVICE CDPT must be between 0 and 63.

2.8 SERVICE CDPT

Description: The SERVICE CDPT field indicates TOS (Type of Service) or DIFFSERV (Differential Service) code point.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 0
Valid Entries: 0 - 127

2.9 # TRUST ISUP

Description: The TRUST ISUP field indicates whether or not the value in ISUP MIME should be used for call processing when a value is also present in the SIP-T header.

Software Release: 5E16(2) FR3 and later
Required field.
Default: Y
Valid Entries: Y, N

2.10 # MSG BUNDLE DELAY

Description: The BUNDLE field indicates if outgoing messages should be delayed or sent immediately.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) FR3 and later
Required field.
Default: N
Valid Entries: Y, N

SEC. 3AE: 5883 RECORD
PROCESSOR GROUP - PCRGRP

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to insert, review, update, and delete the Processor Group corresponding to either one or two SIP PHs (Protocol Handlers) that function as a serving/non-serving pair.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.16.

2. FORM ENTRIES - 5883 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PCR GRP

Description: The PCR GRP field specifies the Processor Group number.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 24

2.3 * SM

Description: The SM field specifies from which SM (Switching Module) data will be read.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 1 - 192

2.4 APPL TYPE

Description: The APPL TYPE field specifies the application type.

Software Release: 5E16(2) FR3 and later
Required field.
Default: SIPT
Valid Entries: SIPT

Data Rules:

For each PROTOCOL HANDLER field entered on this form with APPL TYPE set t o "SIPT", SM, PSU, SHELF, and POSITION must match SWITCHING MODULE, PSU, PSU SHELF, and PH on the EQPSUPH form (5742 Record), and the corresponding PROTOCOL HANDLER entry on the EQPSUPH form must have EQST set to "O" (Operational) and PH CLI set to 00020000 (PHE2).

2.5 PSU

Description: The PSU field specifies the Packet Switch Unit number.

Software Release: 5E16(2) FR3 and later

Copyright © 2003 Lucent Technologies

Required field.
Default: 0
Valid Entries: 0

PROTOCOL HANDLERS

The following fields (Section 2.6 - Section 2.8) provide the shelf number, channel group, and the associated position of the PH (Protocol Handler) as it relates to the SIP-T feature. For more information on this feature, see Division 2, Section 4A684.

2.6 SHELF

Description: The SHELF field specifies the Protocol Handler shelf number.

Software Release: 5E16(2) FR3 and later
Valid Entries: 0 - 4

Data Rules:

At least one SHELF/CHGRP/POSITION must be entered.

SHELF/CHGRP/POSITION in PROTOCOL HANDLERS list must be unique.

When SHELF/CHGRP is entered on this form, it must be used on the IPPROC form (5987 Record) as QUALIFIER 3.

Each SHELF/CHGRP combination and each SHELF/CHGRP/POSITION combination on the same SM entered on the PCRGRP form, must be unique.

PHs (SHELF/CHGRP) with the same PCR GRP ans SM entered on this form, must have the same values for parameters on the ETHIP form (5995 Record).

2.7 CHGRP

Description: The CHGRP field specifies the Protocol Handler channel group.

Software Release: 5E16(2) FR3 and later
Valid Entries: 0 - 15

2.8 POSITION

Description: The POSITION field specifies the associated position for Protocol Handler channel groups.

Software Release: 5E16(2) FR3 and later
Valid Entries: 0 - 15

SEC. 3AF: 5884 RECORD
INTERNET PROTOCOL (IP) PING PARAMETERS - IPPING

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form is used to manage the IP Ping Parameters.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.17.

2. FORM ENTRIES - 5884 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * INTERFACE NAME

Description: This field identifies the name associated with an IP (Internet Protocol).

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: an alphanumeric character followed by 4 to 18 characters including a comma, a underscore, or a dash.

Data Rules:

When INTERFACE NAME is entered, it must be defined on the ETHIP or IPROUT forms (5995/5884 Records).

2.3 * IP ADDRESS

Description: This field represents the IP address of the IP node to be pinged.IP Address used to ping some other IP node through the interface specified.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries:

001 - 126 for Class A,
128 - 191 for Class B,
or 192 - 223 for Class C

Data Rules:

ROUTE METRIC on the IPROUT form (5989 Record) must be defined for each IP address specified in the IP ADDRESS field on this form.

IP ADDRESS must be 001.000.000.001- 126.255.255.254, 128.001.000.001 - 191.254.255.254, or 192.000.001.001 - 223.255.254.254.

A Class A IP ADDRESS cannot be XXX.000.000.000 or XXX.255.255.255

A Class B IP ADDRESS cannot be XXX.XXX.000.000 or XXX.XXX.255.255

Copyright © 2003 Lucent Technologies

A Class C IP ADDRESS cannot be XXX.XXX.XXX.000 or XXX.XXX.XXX.255

2.4 # PING

Description: This field gives the user the ability to periodically enable/disable the pinging to the gateway routers.

Software Release: 5E16(2) FR3 and later
Required field.
Default: N
Valid Entries: Y, N

2.5 PING INTVL

Description: This field indicates the interval between pings to the gateway routers.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 5
Valid Entries: 2 - 20

2.6 MAX FAIL PINGS

Description: This field represents the maximum number of consecutive failed pings before determining that the router has failed.

Software Release: 5E16(2) FR3 and later
Required field.
Default: 3
Valid Entries: 2 - 5

SEC. 3AG: 5885 RECORD
SCTP ENDPOINT PARAMETERS - SCTPPARM

1. GENERAL

Available for 5E16(2) FR3 and later, this form supports the SIP (Session Initiation Protocol) for Packet Trunking feature (99-5E-8382). For more information, see Division 2, Section 4A684. This form supports the definition of SCTP (Stream Control Transport Protocol) endpoint parameters.

1.1 Recent Change View

The corresponding Recent Change View for this view is 33.18.

2. FORM ENTRIES - 5885 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * PARM SET NAME

Description: The PARM SET NAME field specifies the SCTP endpoint parameters set name.

Software Release: 5E16(2) FR3 and later
Required field.
Valid Entries: 20 alphanumeric characters

2.3 RTO INI

Description: The RTO INI field specifies the initial value of retransmission timer (each stored unit is 100 milliseconds).

Software Release: 5E16(2) FR3 and later
Required field.
