For 5E8 and later, this field must be "N" if ACQSAQ ALT CDI is not entered.

2.15 ACQSVQ OVLP

Description: Will overlap outpulsing be allowed to the alternate ACQS voice quote.
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route ACQS voice quote traffic.

For 5E8 and later, this field must be "N" if ACQSVQ ALT CDI is not entered.

2.16 NC950 OVLP

Description: Will overlap outpulsing be allowed to the alternate noncoin 950 traffic.
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route noncoin 950 traffic.

For 5E8 and later, this field must be "N" if NC950 ALT CDI is not entered.

Copyright © 2003 Lucent Technologies

2.17 C950 1+ OVLP

Description: Will overlap outpulsing be allowed to the alternate coin 950 1+ traffic?
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route coin 950 1+ traffic.

For 5E8 and later, this field must be "N" if either C950 1+ ALT CDI is not entered, or C950 0+ ALT CDI is not entered.

2.18 C950 0+ OVLP

Description: Will overlap outpulsing be allowed to the alternate coin 950 0+ traffic?
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route coin 950 0+ traffic.

For 5E8 and later, this field must be "N" if either C950 1+ ALT CDI or C950 0+ ALT CDI is not entered.

2.19 TELECONF OVLP

Description: Will overlap outpulsing be allowed to the alternate teleconferencing traffic?
Default: N
Valid Entries: Y, N

Data Rules:

This field should be left blank if the primary OS will route teleconferencing traffic.

For 5E8 and later, this field must be "N" if TELECONF ALT CDI is not entered.

SEC. 4T: 5419 RECORD
OSPS LEC INTRACOMPANY NETWORK FORM - DNNTWK

1. GENERAL

The 5419 Record is available with the 5E4(2) Software Release.

This record provides LEC (Local Exchange Carrier) intracompany network information for the OSPS (Operator Services Position System) TA (Toll and Assistance) features. Carriers are furnished for operator-dialed directory numbers.

The carrier used for an operator-dialed third number or conference number will be the LEC if the LEC can handle it. If an interLATA carrier is needed, the one selected will be the global default conference carrier, defined in the CF CARR field of the OSPSOPT form (5424 Record).

For operator-dialed third or conference numbers to specific NPA-NXX combinations, a particular carrier can be indicated to be used. The carrier indicated on this form is always used to route to the specified NPA-NXX combination, overriding the carrier indicated on the 5424 Record. There can be as many as three carriers identified per NPA. Each carrier identified is for all NXXs that are marked with its designation (A, B or C). If a DNNTWK form is submitted, then there must be at least one OSPSOP form (5401 Record) defined for this office.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control group number and the office name on each record.

2.2 * NPA

Description: Enter a valid 3-digit NPA (Numbering Plan Area).

Required Field.
Valid Entries:
- For 5E4(2) - 5E8: 200 - 919, middle digit 0 or 1
- For 5E9(1) and later: 200 - 999

2.3 # CARRIER A

Description: Enter a valid interLATA carrier identification number.

Required Field.
Valid Entries:
- For 5E4(2) - 5E8: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

At least one of the NXX positions must be selected for CARRIER A. CARRIER A must not be the same as CARRIER B or CARRIER C.

Copyright © 2003 Lucent Technologies

Entries in this field must be defined as CARRIER ID on an ICF form (5305 Record). In addition, for 5E9(1) and later, FEAT GRP on the ICF form must be set to "D".

2.4 CARRIER B

Description: Enter a valid interLATA carrier identification number.
Valid Entries:
- For 5E4(2) - 5E8: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

Entries in this field must be defined as CARRIER ID on an ICF form. In addition, for 5E9(1) and later, FEAT GRP on the ICF form must be set to "D".

If one or more NXX positions are defined with "B", then CARRIER B must be specified. CARRIER B cannot be the same as CARRIER A or CARRIER C.

2.5 CARRIER C

Description: Enter a valid interLATA carrier identification number.
Valid Entries:
- For 5E4(2) - 5E8: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

Entries in this field must be defined as CARRIER ID on an ICF form. In addition, for 5E9(1) and later, FEAT GRP on the ICF form must be set to "D".

If one or more NXX positions are defined with "C", then CARRIER C must be specified. CARRIER C cannot be the same as CARRIER A or CARRIER B.

2.6 LIST OF NXXs (200 - 399)

Description: Enter the list of NXXs for the NPA/CARRIER combination. Each NXX that can be dialed must be assigned to either Carrier A, B, or C. An NXX should be left blank if it is not served by any carrier.
Valid Entries: A, B, C

Data Rules:

At least one of the NXX positions must be defined with CARRIER A. If either CARRIER B or CARRIER C are defined, then at least one of the NXX positions must be defined with them.

SEC. 4U: 5420 RECORD
CARRIER FOR OPERATOR SPECIAL DIALED CODES FORM - OCNTWK

1. GENERAL

The 5420 Record is available with 5E4(2) and later Software Releases.The carrier used for an operator special-dialed code will be the LEC (Local Exchange Carrier) if the LEC can handle it. If an interLATA carrier is needed, the one selected will be the global default route carrier (RT CARR field on the OSPSOPT form (5424 Record)). This form is used to specify exceptions to the above method of carrier selection. The carrier indicated on this form is always used to route to the given operator special-dialed code.

Given a specific NPA (Numbering Plan Area), TTC (Terminating Toll Center), and an operator special-dialed code, a particular carrier can be indicated to be used. If an OCNTWK form (5420 Record) is submitted, at least one OSPSOP form (5401 Record) must be submitted for this office.

If an operator-entered route number is floatable (i.e., the operator can drop off the call and leave the back and route numbers talking), then the carrier used must be the same as the one used for the forward number.

The carrier for an operator-entered non-floatable domestic route number is found by first consulting the 5420 Record to see if a specific carrier is desired. The carrier selected for a non-floatable route number does not have to have operator service supplied to it by OSPS.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control group number and the office name on each record.

2.2 * NPA

Description: Enter a valid NPA (Numbering Plan Area).

Required Field.
Valid Entries:
- For 5E4(2) - 5E8: 200 - 919, middle digit 0 or 1
- For 5E9(1) and later: 200 - 999

2.3 * TTC

Description: Enter a Terminating Toll Center.

Required Field.
Valid Entries: 0 - 99

2.4 * OSDC

Description: Enter an OSDC (Operator Special Dialed Code).

Required Field.
Valid Entries: 0 - 999, 1100 - 1199, or 11000 - 11999

Copyright © 2003 Lucent Technologies

2.5 # CARRIER ID

Description: Enter an interLATA carrier identification number.

Required Field.
Valid Entries:
- For 5E4(2) - 5E8: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

Entries in this field must be defined in the CARRIER ID field of an ICF form (5305 Record) with FEAT GRP equal to "D".

SEC. 4V: 5421 RECORD
OSPS RSM/CARRIER DATA FORM - RSMCAR

1. GENERAL

The 5421 Record is available with 5E4(2) and later Software Releases.

This record defines the routing indexes to a carrier from an RSM (Remote Switching Module). When an OSPS (Operator Services Position System) call is routed to a carrier, the routing information is normally on an ICF form (5305 Record). But, if the call came to the OSPS through an RSM, it is routed out of that same RSM to the desired carrier.

1.1 Recent Change View

The corresponding Recent Change View for this form is 26.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CARRIER ID

Description: Enter an interexchange carrier identification number.

Required Field.
Valid Entries:

For 5E4(2) - 5E7: 0 - 999

For 5E8:
- 0 - 999 for Feature Group D
- 0 - 9999 for Feature Group B

For 5E9(1) and later: 0 - 9999

Data Rules:

Entries in this field must be defined in the CARRIER ID field of an ICF form.

When CARRIER ID and RSM are defined on this form, and CARRIER ID is defined on the ICF form (5305 Record) with an ACCESS TYPE of "BOTH" or "TBOTH", DIG ROUTING equal to "N" and CARRIER TYPE equal to "CONSOL", the RSMCAR form must have DOMES CDI, DOMES RTI, TRANS CDI, TRANS RTI, INTL CDI, INTL RTI, SAC CDI, and SAC RTI entries.

For 5E8 only, if FEAT GRP is "D", then CARRIER ID cannot be four digits.

For 5E9(1) and later, CARRIER ID and FEAT GRP on the RSMCAR form must match CARRIER ID and FEAT GRP on the corresponding ICF form.

2.3 * FEAT GRP

Description: Enter the Feature Group type. (For more information on Feature Groups see Division 2, Section 3I.)

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later
Required Field.
Valid Entries:

Valid FEAT GRP Entries

Entry	Definition
B	Feature Group B
D	Feature Group D

Data Rules:

If FEAT GRP equals "B":

- FEATURE GROUP B ONLY fields must be entered.
- FEATURE GROUP D ONLY fields must not be entered.
- INTRA LATA must not be entered.

If FEAT GRP equals "D":

- For 5E8 only, CARRIER ID cannot be four digits,
- FEATURE GROUP B ONLY fields cannot be entered,
- INTRA LATA must be entered, and
- CARRIER ID must be defined on an ICF form:
  - if CARRIER TYPE on the ICF form is "CONSOL", ACCESS TYPE is "LTRM", "TLTM", "BOTH" or "TBOTH", and DIG ROUTING is "N", then the RSMCAR form must have an entry in the following fields:

    DOMES CDI

    DOMES RTI

    INTL CDI

    INTL RTI

    SAC CDI

    SAC RTI

  - if CARRIER TYPE on the ICF form is "IC", the RSMCAR form must not have any entry on the INTL CDI or INTL RTI fields.
  - if CARRIER TYPE is "IC" on the ICF form, and ACCESS TYPE is entered as "LTRM", "TLTM", "BOTH" or "TBOTH" and DIG ROUTING is entered as "N", then RSMCAR form must have have an entry on the following fields:

    DOMES CDI

Copyright © 2003 Lucent Technologies

DOMES RTI

SAC CDI

SAC RTI

- if CARRIER TYPE on the ICF form is "INC" and DIG ROUTING is entered as "N", then the RSMCAR form must have an entry in the following fields:

  INTL CDI

  INTL RTI

  SAC CDI

  SAC RTI

- if CARRIER TYPE on the ICF form is "INC", the RSMCAR form must have the following fields populated as follows:

  INTRA LATA equals N

  DOMES CDI is blank

  DOMES RTI is blank

- if CARRIER TYPE on the ICF form is "LEC" or "PSEUDO", the RSMCAR form must have the following fields populated as follows:

  INTRA LATA equals Y

  DOMES CDI is blank

  DOMES RTI is blank

  INTL CDI is blank

  INTL RTI is blank

  SAC CDI is blank

  SAC RTI is blank

Copyright © 2003 Lucent Technologies

2.4 * RSM

Description: Enter the Remote Switching Module number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For each entry in this field, the corresponding EQIM form (5700 Record) (where the EQIM IM field on the EQIM form matches the entry in this field) must have values of either "RSM", "ORM" or "TRM" in the SM USAGE field on the EQIM form.

2.5 OSPS SERVES

Description: Does this OSPS provide operator service to this carrier for calls originated on this RSM?.
Valid Entries: Y, N

FEATURE GROUP B ONLY

Fields Section 2.6 - Section 2.9 refer to Feature Group B only (see Division 2, Section 1AY for a description of Feature Groups B and D).

2.6 TRANS CDI

Description: The name of this field was changed to FGB CDI in 5E8. This field name applies to 5E7 and earlier. See FGB CDI for usage information.

2.7 FGB CDI

Description: Enter the code index for transitional calls. (This field was called TRANS CDI for 5E7 and earlier).

This code index overrides the value entered on an ICF form so that outgoing calls are routed out of the same RSM cluster that they arrived on.
Valid Entries: 1 - 4095

Data Rules:

Entries in this field must exist on an RAR form.

2.8 TRANS RTI

Description: The name of this field was changed to FGB RTI in 5E8. This field name applies to 5E7 and earlier. See FGB RTI for usage information.

2.9 FGB RTI

Description: Enter the regular route index for transitional calls. (This field was called TRANS RTI for 5E7 and earlier).

This route index overrides the value entered on an ICF form.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Copyright © 2003 Lucent Technologies

Data Rules:

Entries in this field must exist on an RTIDX form.

FEATURE GROUP D ONLY

Fields Section 2.10 - Section 2.20 refer to Feature Group D only (see Division 2, Section 1AY for a description of Feature Groups B and D).

2.10 INTRA LATA

Description: Does this carrier accept IntraLATA (Local Access and Transport Area) calls?
Valid Entries: Y, N

2.11 DOMES CDI

Description: Enter the code index for domestic calls.

This code index overrides the value entered on an ICF form so that outgoing calls are routed out of the same RSM cluster that they arrived on (for umbilical preservation).
Valid Entries: 1 - 4095

Data Rules:

Entries in this field must exist on an RAR form (5301 Record).

2.12 DOMES RTI

Description: Enter the regular route index for domestic calls.

This route index overrides the value entered on the ICF form.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

Entries in this field must exist on an RAR form.

2.13 TRANS CDI

Description: Enter the code index for transitional calls.

This code index overrides the value entered on an ICF form so that outgoing calls are routed out of the same RSM cluster that they arrived on (for umbilical preservation).
Valid Entries: 1 - 4095

Data Rules:

Entries in this field must exist on an RAR form.

2.14 TRANS RTI

Description: Enter the regular route index for transitional calls.

This route index overrides the value entered on an ICF form.

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

Entries in this field must exist on an RTIDX form.

2.15 INTL CDI

Description: Enter the code index for international calls.

This code index overrides the value entered on an ICF form so that outgoing calls are routed out of the same RSM cluster that they arrived on (for umbilical preservation).
Valid Entries: 1 - 4095

Data Rules:

Entries in this field must exist on an RAR form.

2.16 INTL RTI

Description: Enter the regular route index for international calls.

This route index overrides the value entered on an ICF form.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

Entries in this field must exist on an RTIDX form.

2.17 SAC CDI

Description: Enter the code index for Service Access Code calls.

This code index overrides the value entered on an ICF form so that outgoing calls are routed out of the same RSM cluster that they arrived on (for umbilical preservation).
Valid Entries: 1 - 4095

Data Rules:

Entries in the SAC CDI field must exist on an RAR form.

2.18 SAC RTI

Description: Enter the regular route index for Service Access Code calls.

This route index overrides the value entered on an ICF form.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Copyright © 2003 Lucent Technologies

Data Rules:

Entries in this field must exist on an RTIDX form.

2.19 NS CDI

Description: Enter the Number Services 800 calls destination index. This is a destination index which results in routing an SSP 800 call to carrier trunks. If this field is not entered, the default value for NS CDI will be the value entered in the NS CDI field on the ICF form (5305 Record).

Software Release: 5E9(1) and later.
Valid Entries: 1 - 4095

Data Rules:

NS CDI must not be entered if "B" is entered in the FEAT GRP field.

If NS CDI is entered, there must be a corresponding RAR form (5301 Record) where CDI matches NS CDI on the RSMCAR form.

2.20 NS RTI

Description: Enter the Number Services 800 calls route index. The route index entered in this field results in routing the SSP 800 call to carrier trunks. If this field is not entered, the default value for NS RTI will be the value entered in the NS RTI field on the ICF form (5305 Record).

Software Release: 5E9(1) and later.
Valid Entries:

- For 5E10 and earlier: 1 - 3617 or REGL for
- Local Exchange Call
- For 5E11 and 5E12: 1 - 4095 or REGL for
- Local Exchange Call
- For 5E13 and later: Blank, or 1 - 16382 or REGL for Local Exchange Call

Data Rules:

NS CDI must not be entered if "B" is entered in the FEAT GRP field.

If NS RTI is entered and it is not "REGL", then the entry in this field must match a ROUTE INDEX on an RTIDX form (5303 Record).

SEC. 4W: 5422 RECORD
OSPS CAMA TRANSFER TRUNKS FORM - TCITG

1. GENERAL

The 5422 Record is available with 5E4(2) and later Software Releases.

This record defines data associated with CAMA (Centralized Automatic Message Accounting) transfer trunks. System CAMA calls use outgoing transfer CAMA trunks to get the back number from TSPS (Traffic Services Position System) operators in case of ANIF (Automatic Number Identification Failure) during ONI (Operator Number Identification) calls.

Outgoing CAMA are E & M trunks, and incoming transfer CAMA trunks can be either E & M or loop trunks. The sent/received signals in the incoming transfer CAMA trunks are the received/sent signals in the outgoing transfer CAMA trunk.

When an incoming transfer CAMA call arrives, the OSPS (Operator Services Position System) returns an alerting tone to the calling party if ALERT TONE is specified as "Y" (in the 5422 Record) for the two trunk groups associated with the CAMA office.

For an incoming transfer CAMA call to reach an operator, there must be an entry for transfer CAMA in the ACDCTP form (5412 Record). The ACDCTP form entry must have an ORIGIN CALL of "XFER", a PREFIX of "NULLP", a CALL CLASS of "INT" and a CARRIER of "DC". Based on the desired call queue, a serving team to handle the call is selected.

If the OSPS operator enters a trouble number while handling an incoming transfer CAMA call, the OSPS will transmit a 7-digit NXX-YYYY to the CAMA office, where the NXX is specified in the below OTR OFC CODE field for the associated trunk groups, and YYYY is the associated trunk group member number.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control group number and the office name on each record.

2.2 * TGN

Description: Enter a valid trunk group number.

Transfer CAMA trunks from a CAMA office will be in two trunk groups. All the talking trunks from a CAMA office will be in one trunk group, and all the keying trunks from a CAMA office will be in another trunk group. The talking trunk and the associated keying trunk of a transfer CAMA trunk will have the same member number, and must be in the same SM.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Each trunk group number entered here must be defined on the TKGRP form (5202 Record) with a TRKCLS (trunk class) of either "TCITK" or "TCITT".

2.3 ALERT TONE

Copyright © 2003 Lucent Technologies

Description: Should an alert tone be supplied to the caller upon connection to the operator?
Default: N
Valid Entries: Y, N

2.4 SIGNAL TYPE

Description: Enter the signaling type.

There are two different types of signaling protocols between the CAMA office and the OSPS. If the trunks are analog loop trunks, the SIGNAL TYPE should be specified as 1. If the trunks are analog E & M trunks, the SIGNAL TYPE should be specified as 2. If the trunks are digital trunks, the SIGNAL TYPE can be either 1 or 2 depending on the CAMA office end. If the CAMA office is a 5ESS Switch, the SIGNAL TYPE should be 2.
Default: 2
Valid Entries: 1, 2

Data Rules:

If the SIGNAL TYPE is 1 and the TRKCLS on the TKGRP form is "TCIKT", the IDLE STATE on the TRUNK form (5204 Record) must be set to "OFF", and the SUPV must be "RB". If the SIGNAL TYPE is 1 and the TRKCLS on the TKGRP form is "TCITT", the IDLE STATE on the TRUNK form must be set to "ON" and the SUPV must be "RB". If the SIGNAL TYPE is 2, then SUPV on the TRUNK form must be "EM2" or "EM3"; for 5E7 and later when SIGNAL TYPE is 2, SUPV may also be "EM4" or "EM5".

2.5 OTR OFC CODE

Description: Enter the operator trouble report number.

This entry will be used to identify OTRs (Operator Trouble Reports) associated with this CAMA trunk group.

- **WARNING:** The trouble codes 998 and 999 should only be used for the purpose described in the OSPS Operator Trouble Report form (5410 Record) and should not be used here. The incorrect usage of these trouble codes could cause incorrect billing, asserts, etc.

Valid Entries: 200 - 999

SEC. 4X: 5423 RECORD
OSPS NXX LIST FOR BILLING NUMBER
ON ONI/ANIF CALLS FORM - VALOFFC

1. GENERAL

The 5423 Record is available with 5E4(2) and later Software Releases.

This record defines the valid NXXs (associated with ISP (Intermediate Switching Point) trunks) that may be entered as billing numbers (i.e., back numbers) by the OSPS (Operator Service Position System) operator. The information is needed for both CAMA (Centralized Automatic Message Accounting) ONI (Operator Number Identification) and ANIF (Automatic Number Identification Failure) calls.

All calls from both ONI- and ANI-type local offices require operator assistance in entering the calling (back) number.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * TGN

Description: Enter a valid TGN (Trunk Group Number).

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The entry in this field must be defined in the TGN field on a TKGRP form (5202 Record) with an entry in the corresponding TRKCLS field of "FIOPR" for 5E5 and earlier Software Releases, and "FIOPR" or "DIOR" for 5E6 and later Software Releases.

2.3 LIST OF NXXs (200 - 399)

Description: Indicate which NXXs may be used as a billing number. If the NXX may be used as a billing number, enter an "X"; otherwise, leave it blank.

At least one set of five NXXs must have each NXX with an "X" or space in each NXX.
Valid Entries: X

SEC. 4Y: 5424 RECORD
OSPS OPTIONS FORM - OSPSOPT

1. GENERAL

The 5424 Record is available with 5E4(2).

There can only be one OSPSOPT form entered for an office. When an OSPSOPT form is submitted, a CARRIER NAME entry is required on all submitted ICF forms (5305 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.9.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the Office Name on each record.

2.2 * OFFICE ID

Description: Enter the office identification number.

Required Field.
Valid Entries: 1 to 8 characters

Data Rules:

The entry in this field must match the entry in the OFFICE ID field on the OFCOPT form (5509 Record).

2.3 OSPS RAF

Description: Are the Digital Services Unit 2 units used for OSPS RAF (Recorded Announcement Functions)?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered (or no entry is made) in the OSPS RAF field, then an EQIM form (5700 Record) must be submitted with "LOADED" entered in the CONFIGURATION field for 5E9(1) and earlier. For 5E9(2) and later, see the EQIM form (Division 8, Section 2) for the figure showing the CONFIGURATIONs for Facilities and Applications.

DA OPTIONS

The following fields (Section 2.4 - Section 2.8) define OSPS DA (Directory Assistance) options.

2.4 OSPS DA

Description: Does this office serve directory assistance? Entering "N" in the OSPS DA field will disable the OSPS Directory Assistance feature.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If "Y" is entered in this field, at least one OPARM form (5400-1/2 Record) must exist for this office.

For 5E5 and later, if "Y" is entered in this field and OSPS TA is set to "N", then this is a Directory Assistance feature only, and every PSM (Position Switching Module) must be entered on every SMLDIT form (5315 Record) which is associated with a STINFO form (5402 Record). A PSM is an SM which has an LCEN defined on an OPARM form (5400 Record), or an LCEN or DEN defined on an OSPSOP form (5401 Record). The first three digits of the corresponding LCEN or DEN field contain the PSM number. An SMLDIT form is associated with a STINFO form if the LDIT on the SMLDIT form matches the LDIT assigned (via the LOCAL DIT field on a corresponding DAS form) to the DAS value entered in the DIG ANALYSIS SEL field or the SEC DIG ANALYSIS SEL field on the STINFO form.

2.5 DASC VENDOR

Description: Enter the DAS/C (Directory Assistance System/Computer) vendor supplying DA information for OSPS operators.
Default: NONE
Valid Entries:

Valid DASC VENDOR Entries

Entry	Definition
CCI	Computer Consoles Inc.
IBM	International Business Machines
NONE	No vendor

Data Rules:

If "NONE" is entered in this field, then the DAS/C AVAILABLE field must be "N" on every STINFO form (5402 Record).

If "CCI" is entered as the Vendor, the PSMs must be assigned an ID number in the range 1 - 127 (SM field on the EQIM form). This is a restriction imposed by CCI EIS software.

2.6 RCL LIMIT

Description: Enter the maximum number of operator recalls allowed a subscriber on an OSPS DA call.
Default: 0
Valid Entries: 0 - 255

Data Rules:

If "CCI" is entered in the DASC VENDOR field, then 0 must be entered in this field.

2.7 RCL TIME

Description: Enter the number of 50-millisecond recall timing intervals to be used for OSPS DA calls.
Default: 0
Valid Entries: 0 - 32767

Data Rules:

If "CCI" is entered in the DASC VENDOR field, then 0 must be entered in this field.

2.8 DABRAND

Description: Should a branding phrase be used?
Default: Y
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

T&A OPTIONS

The following fields (Section 2.9 - Section 2.16) define OSPS TA options.

2.9 OSPS TA

Description: Does this office service the OSPS TA (Toll and Assistance) feature? Entering "N" in the OSPS TA field will disable the OSPS Toll and Assistance feature.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in this field then:

- at least one OPARM form (5400-1/2 Record) must exist for this office.
- every PSM (Position Switching Module) must be assigned on every SMLDIT form. A PSM is an SM which has an LCEN defined on an OPARM form, or an LCEN or DEN defined on an OSPSOP form. The first three digits of the corresponding LCEN or DEN field contain the PSM number.
- and the INIT THANK YOU, and BRAND PHRASE fields, then an ANNHD form (5531 Record) must be submitted where 16 is entered in the HEADER ID field and "T" is entered in the APPLICATION field.

For 5E8 and later:

- RTRS SM must be entered.
- EMER INTER must be entered.

For 5E9(1) and later:

- Announcement Header OSPSTA 171 should have a disconnect warning time interval entered which is equal to the value in WARN TIME field on this form.
- APOS PROTOCOL must be "OFF", "1STAGE" or "2STAGE".

"Y" must be entered in the OSPS TA field if "Y" is entered in any of the following fields: ACTS
- BLV
- BRAND PHRASE,
- EXCEPT DETRM
- LATA MAP
- OPER EXT DB

If "N" is entered in the OSPS TA field, then:

- the entry in the OTR ID field of the OTRVLD form (5410 Record) must be a 3-digit number (1-999).
- or if OSPS TA is not entered, APOS PROTOCOL must be "OFF".

2.10 DSU2 Q TIME

Description: Enter the maximum queue time in the DSU2 - RAF (Digital Service Unit 2 - Recorded Announcement Function) DTA (Dial-Through Announcement) before timeout.

Copyright © 2003 Lucent Technologies

Default: 20
Valid Entries: 3 - 20

2.11 RTRS SM

Description: Enter the number of the SM containing the RTRS data links.
Valid Entries: 1 - 192

Data Rules:

If the RTRS SM field is entered, then an OSPSDSL form (5411 Record) must exist with a matching SM (first three digits of LCEN) and a SERVICE CLASS of "RTRS".

For 5E8 and later, if OSPS TA is "Y", then RTRS SM must be entered.

2.12 A1 ZONE

Description: Enter the difference between time zone one and the office time zone found on the OFCOPT form.

Required Field.
Default: 0
Valid Entries: N2, N1, 0, 1, and 2 (N stands for negative)

2.13 A2 ZONE

Description: Enter the difference between time zone two and the office time zone.

Required Field.
Default: 0
Valid Entries: N2, N1, 0, 1, and 2 (N stands for negative)

2.14 EX CONF DN

Description: This field furnishes a telephone number for operator external conference. This number is also used as a pseudo - ANI when an operator conference or route number is set up over an equal access trunk. The DN is in the format of NPA NXX XXXX.
Valid Entries: 10 digit numbers of the format

- For 5E9(1) and later: NPANXXXXXX,
- where N is 2 - 9, A / P / X are 0 - 9

Data Rules:

If no external conferencing is required, do not enter a DN.

2.15 APOS PROTOCOL

Description: This entry assigns the Automated Position status or protocol. The OSPS Automated Position automates the handling of 0+ dialed calls with collect, third number, and card billing. Two different protocols are provided for delivering calls to the APs: one stage and two stage. In a one stage office, APs provide automation of calling card, collect, and third number billing. The one stage protocol provides APOS handling for all 0+ dialed calls on incoming trunks marked for APOS handling.

In a two stage protocol, the caller is sent to an AP if the party fails to respond (timeout, flash, or dials 0) to the ACCS offering of calling card billing and the incoming trunk is marked for AP handling. In this situation, the AP provides the automation for collect, third number billing, and calling card.

Copyright © 2003 Lucent Technologies

The APOS PROTOCOL field is used by the AP (Automated Position) feature. (See Division 2, Section 4A for more information on the Automated Position Feature.)

Software Release: 5E7 and later
Default: OFF
Valid Entries:

Valid APOS PROTOCOL Entries

Entry	Definition
OFF or O	Status is off
1STAGE or 1	Provide automation of all 0+ calls
2STAGE or 2	

Data Rules:

If OSPS TA is "Y", APOS PROTOCOL must be "OFF", "1STAGE", or "2STAGE".

APOS PROTOCOL is a Secured Feature and must be purchased before "1STAGE" or "2STAGE" can be entered. The ACT field for SFID 65 on the SFSYS form must be set to"Y" before "1STAGE" or "2STAGE" is entered in this field. If SFID 65 is not activated, then "OFF" must be entered in APOS PROTOCOL.

OFF: If OSPS TA is "N", then APOS PROTOCOL must be "OFF".

2.16 ID COIN LINE

Description: Should the ANI digits be changed when a coin line is transferred out to an IC (Interexchange Carrier) when operator transfers calls to 0 over FGD using the operator key sequence "TRAN-0-SEND"?

The 0- Transfer over Feature Group D Trunks feature allows the LEC operator to use the TRAN-0-SEND OSPS capability to transfer calls to any IC supporting FGD (Feature Group D) signaling. If the operator enters a CIC (Carrier Identification Code) other than 288 and uses TRAN-0-SEND to transfer, the call is routed using FGD signaling to the carrier (i.e., (KP + II + ANI + ST)+(KP + 0 + ST)). The OSPS generates billing access records using structure code 00625 or 00627 and call type code 110 (InterLATA sent paid). This feature allows the LEC to signal special ANI INFO digits on coin line FGD TRAN-0-SEND transfers, thereby allowing the IC to identify the call as coin. This is a secured feature and must be activated on SFSYS form (5710-1 Record), Recent Change view 8.22; the secured feature ID is 102. For more information on 0- Transfer over Feature Group D feature see Division 2, Section 4A102.

If this field is "Y", the ANI INFO digits on coin lines are signaled to the IC as 27 when FGD TRAN-0-SEND is used.

Software Release: 5E8 and later
Default: N
Valid Entries: Y, N

OFFICE TRAFFIC MIX

The following fields (Section 2.17 - Section 2.18) support Office Traffic Mix. See Division 2, Section 3E for more information on OSPS Office Traffic Mix.

2.17 COIN MECH

Description: The COIN MECH field is used to specify the sum of the percentage of office traffic expected for ACTS (Automatic Coin Toll System) calls and the percentage of office traffic expected for MECH (More Efficient Call Handling) calls.

Software Release: 5E9(2) and later.
Required Field.

Copyright © 2003 Lucent Technologies

Default: 80
Valid Entries: 0 - 100 (%)

Data Rules:

If "Y" is entered in the ACT field and/or MECH FEATURE WORD, and the SM CONFIGURATION is "STANDARD", "LOADED", or "SM2000" on the EQIM form, then this field must not be 0. (See the figure for CONFIGURATIONs for Facilities and Applications on the EQIM form.)

2.18 LS QUANTUM

Description: The LS QUANTUM field is used to specify the sum of the percentage of office traffic expected for Listing Services calls and the percentage of office traffic expected for Easy Reach (QUANTUM) calls.

Software Release: 5E9(2) and later.
Required Field.
Default: 20
Valid Entries: 0 - 100 (%)

Data Rules:

LS QUANTUM on the OSPSOPT form must be entered if this office has an EQIM form where the value of CONFIGURATION supports OSPS, and one or more of the following conditions is true:

- OSPS DA is "Y" on the OSPSOPT form
- OSPS TA is "Y" on the OSPSOPT form
- PSM is "Y" on an OSPSSMINF form
- OSPS PSM is "Y" on an EQIM form

For the CONFIGURATION that supports OSPS see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

Conversely, if the CONFIGURATION value on the EQIM form does not support OSPS or if "Y" is not entered in either OSPS DA or OSPS TA,then LS QUANTUM must be zero on the OSPSOPT form.

ACCS BRANDING TIMERS

The following fields (Section 2.19 - Section 2.21) support the ACCS Thank You Branding Timer feature. For more information on this secured feature (SFID 390) see Division 2, Section 4A390.

2.19 DOM CALLED NUMBER

Description: Enter the duration, in tenths of a second, between the completion of an AT&T Thank You Branding announcement request, and the start of outpulsing a Domestic Format Called Number call.

Software Release: 5E9(1) and later.
Required Field.
Default: 80
Valid Entries: 0 - 80 tenths of a second

Data Rules:

- **WARNING:** When THANK YOU BRANDING is "Y", DOM and INTL CALLED NUMBERs are not usually set to 0. The normal default value for these fields is 80.

2.20 INTL CALLED NUMBER

Description: Enter the duration, in tenths of a second, between the completion of an AT&T Thank You

Copyright © 2003 Lucent Technologies

Branding announcement request, and the start of outpulsing an International Format Called Number call.

Software Release: 5E9(1) and later.
Required Field.
Default: 80
Valid Entries: 0 - 80 tenths of a second

Data Rules:

- **WARNING:** When THANK YOU BRANDING is "Y", DOM and INTL CALLED NUMBERs are not usually set to 0. The normal default value for these fields is 80.

2.21 THANK YOU BRANDING

Description: Is the Thank You Branding Timer feature active?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

- **WARNING:** When THANK YOU BRANDING is "Y", DOM and INTL CALLED NUMBERs, are not usually set to 0. The normal default value for these fields is 80.

If "Y" is entered, a SFSYS form (5713-1 Record) must exist with either SFID 288 ACT (AT&T) or SFID 390 (LECs) ACT set to "Y".

ACTS OPTIONS

The following fields (Section 2.22 - Section 2.29) define the available options for ACTS features.

2.22 ACTS

Description: Is the ACTS (Automatic Coin Toll Service) to be activated?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the ACTS field, then "Y" must be entered in the OSPS TA field. If "N" is entered in the OSPS TA field, then "N" must be entered in this field.

5E9(2) and later:

If either ACTS (Automated Coin Toll Service) is "Y" or FEATURE WORD is "Y" then, COIN MECH must be entered.

If an office has no EQIM form where the value of CONFIGURATION supports OSPS or if both the ACTS (Automated Coin Toll Service) and the FEATURE WORD fields are not set to "Y", then COIN MECH must be 0.

2.23 INI TIMER

Description: Enter the length (in half-seconds) of the coin timeout interval to be used during initial contact

Copyright © 2003 Lucent Technologies

with the customer. If a coin is not deposited by the customer within the interval, an initial contact timeout will occur and the customer will be given an announcement.
Default: 11
Valid Entries: 1 - 31

Valid INI TIMER Entries

Entry	Definition
INI TIMER 1	0.5 seconds
INI TIMER 2	1.0 seconds
INI TIMER 3	1.5 seconds
□	
□	
□	
INI TIMER 31	15.5 seconds

2.24 OVT TIMER

Description: Enter the length (in half-seconds) of the coin timeout interval to be used during interim overtime coin seizures. If a coin is not deposited by the customer within the interval, an overtime seizure timeout will occur and the customer will be given an announcement.
Default: 16
Valid Entries: 1 - 63

Valid OVT TIMER Entries

Entry	Definition
OVT TIMER 1	0.5 seconds
OVT TIMER 2	1.0 seconds
OVT TIMER 3	1.5 seconds
□	
□	
□	
OVT TIMER 63	31.5 seconds

2.25 INT C TIMER

Description: Enter the length (in half-seconds) of the intercoin timeout interval to be used between coin deposits. If a coin is not deposited by the customer within the interval, an intercoin timeout will occur and the customer will be given an announcement.
Default: 11
Valid Entries: 1 - 31

Valid INT C TIMER Entries

Entry	Definition
INT C TIMER 1	0.5 seconds
INT C TIMER 2	1.0 seconds
INT C TIMER 3	1.5 seconds
□	
□	
□	
INT C TIMER 31	15.5 seconds

2.26 INI RAT FL

Description: This field defines the routing of a CFR/RTRS (Centralized Flexible Rating/Real Time Rating System) rating failure during the initial contact period of an ACTS call.
Default: ANN
Valid Entries:

Valid INI RAT FL Entries

Entry	Definition
ANN	Route the call to an announcement.
OPR	Route the call to an operator.

2.27 EOC RAT FL

Copyright © 2003 Lucent Technologies

Description: This field defines the routing of a CFR/RTRS rating failure during the end-of-call period of an ACTS call.
Default: OPR
Valid Entries:

Valid EOC RAT FL Entries

Entry	Definition
FREE	No charge for the call
OPR	Route the call to an operator

2.28 LRG CHG THR

Description: Enter the threshold (in nickels) at which a coin call will be designated as a large charge call.
Default: 60
Valid Entries: 6 - 100

2.29 C TST CALL

Description: Enter the ACTS coin station test call number. A person at the coin station can initiate the testing of that station by dialing a 0+ call plus the digit string entered in this field.

If the test call number is to be automatically prefixed by an NPA, as indicated on a LDIT form (5300-3 Record), this feature will not function unless routing data is provided to route the call directly to a coin test trunk. The coin test trunk can be the same as used for a FIXED ROUTE TYPE of "ROCOIN", as indicated on a FIXRT form (5301-1 Record).
Default: 9591230
Valid Entries: 0 - 9999999 (telephone number)

MISC FEATURE ACTIVATION

The following fields (Section 2.30 - Section 2.49) define miscellaneous feature options.

2.30 OPER EXT DB

Description: Are OSPS TA operators able to access an external data base?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the OPER EXT DB field, then "Y" must be entered in the OSPS TA field. If "N" is entered in the OSPS TA field, then "N" must be entered in this field.

2.31 LATA MAP

Description: Does this OSPS or ISP (Intermediate Switching Point) office perform LATA (Local Access and Transport Area) mapping to determine whether a call is interLATA or intraLATA?

This field should be set to "N" when the office contains multiple digit trees (one per LATA served by the OSPS). This is the case for an OSPS integrated with an AT (Access Tandem) switch, or for one that resides in the local switching network.

A value of "Y" will be used when the office does not contain multiple digit trees and must perform LATA mapping to determine the type of carrier interconnect call. This is the case for an OSPS integrated with a toll switch that resides in the toll switching network, or when the office has trunks which serve more than one LATA.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If "Y" is entered in the LATA MAP field, then "Y" must be entered in the OSPS TA field.

2.32 EXCEPT DETRM

Description: Can this OSPS or ISP office perform exception area determination for interLATA calls?

Exception areas exist where the originating and terminating office codes (NPA-NXX) reside in different LATAs, but are owned by the same telephone company and are allowed to connect calls between these offices with their own LEC. Under normal situations, only IC (Interexchange Carriers) are allowed to make these interLATA connections. These are areas in which LECs are allowed to carry interLATA calls. This field should be set to "N" when the office does not have exception areas within its serving area. A value of "Y" will be used when the office does have exception areas within its serving area.

Exception areas are defined on an EXMAP form (5440 Record) and assigned to NPA-NXX combinations on an NPAMAP form (5414 Record).

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the EXCEPT DETRM field, then "Y" must be entered in the OSPS TA field.

2.33 ITNA

Description: Is ITNA (Improved Third Number Acceptance) feature processing activated?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.34 ITNA CHECKS

Description: Are Special Area Checks activated for ITNA (Improved Third Number Acceptance) treatment?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.35 INTRAFLOW ALW

Description: Is the the OSPS Intraflow feature activated?

This field turns OSPS Intraflow on or off for this office. Intraflow permits a Call Type to designate a principal Serving Team and up to 8 Supporting Teams, each with an associated delay outflow threshold.

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

Intraflow must be individually activated or deactivated for each Call Type and Serving Team via the INTRAFLOW ALW field on the OPSPSCT forms (5404 Record) and the STINFO forms (5402 Record), respectively.

2.36 FCA ON

Description: Are International Calls handled by FCA (Fully Coded Addressing)?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered here, then, on the OFCOPT form (5509 Record), "Y" must be entered in the OFFICE TYPE field and 288 0288 must be entered in the OFFICE CARRIER ID field.

2.37 AUTODACT MON

Description: Should the BST (Basic Services Terminal) or VDT (Video Display Terminal) monitoring port be automatically deactivated upon manager logoff?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

2.38 AUTO DIOR

Description: Are Automated Initial DIOR calls allowed?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

2.39 MQ900

Description: Does this OSPS handle 900 services? Also, for Recent Change only, this field allows the OSPS handled 900 feature to be tested before it is activated in an office. (See Division 2, Section 3I for more information on OSPS 900 Services.)

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries:

Valid MQ900 Entries

Entry	Definition
N	OSPS 900 processing is off.
Y	OSPS 900 processing is on.
T	This value is for Recent Change Only. Only OSPS 900 calls arriving on a designated test trunk receive treatment.

2.40 DIFF CARD ON

Description: Is the OSPS DIFF (Differentiation Of Card Service Charges) feature activated? (See Division 2, Section 3I for more information on the Differentiation of Card Service Charges feature.)

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When DIFF CARD ON is "Y", CCC ON must be "Y".

2.41 TCS PUB IND

Description: Should the "Public ??" indicator be displayed for collect calls requiring manual outpulsing for terminating code screening? (For more information on the TCS (Terminating Code Screening) Release 3 feature, see Division 2 Section 3I.)

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

2.42 CDBS SEQ

Description: Is CDBS (Customer Defined Bill Segmentation) for sequence calls activated? (For more information on CDBS, see Division 2, Section 3I.)

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDBS SEQ is "Y", then either CAS R3 ON must be "Y", or at least one of the following fields must NOT be "A":

- L CC ATT INTER
- L CC LEC INTER
- L CC ATT INTRA
- L CC LEC INTRA

2.43 BELLCORE ANI

Description: Does this OSPS conform to BELLCORE ANI signaling standards? "Y" indicates that a 0 or 1 cannot be accepted as the first number in a 7-digit ANI.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

2.44 OSPS INPA

Description: Is the OSPS Interchangeable Numbering Plan Area feature active? The Interchangeable Numbering Plan feature expands the range of the middle digit of the NPA from 0 - 1, to 0 - 9. This field should be "N" if the RAF has not been upgraded to support the announcements needed for this feature. For more information on the INPA feature see Division 2, Section 3E.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "Y" if ALLOW 7 DIGITS is "N" on the OPRTK form (5417 Record).

2.45 ALLOW 809 COMPL

Description: Is area code 809 eligible for CICADA service call completion?" The CICADA (Completion of InterLATA Calls Accessing Directory Assistance) feature provides the OSPS with the ability to offer call completion on calls to LEC DA (Directory Assistance) offices through AT&T owned OSPSs.

Callers dialing an 800 DA and who also receive ACCS (Automated Calling Card Services) treatment will hear a CICADA offer prompt after the "thank you". This announcement prompts the caller to enter 1 to accept the CICADA service and 2 to decline the CICADA service. If this field is set to "N", then the offer announcement is not provided.

For operator handled calls: the operator is given the "LSCC Eligible" indicator on 809 DA calls allowing the operator to offer the CICADA feature, if this field is set to "Y". No LSCC Eligible indicator displays if this field is set to "N".

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.46 INTRA TO INTER

Description: Is the Intraflow to Interflow feature active?

Intraflow to Interflow Call Handling with Interflow Call Queues is a secured feature that provides the ability for calls to be intraflowed to interflow call queues and for interflowed calls to be queued on the sending switch. For more information on the Intraflow to Interflow Call Handling see Division 2, Section 4A113.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.47 TOLL FREE 800

Description: Should the DIOR (Direct International Originations) Toll-Free 800 feature be activated? This feature allows 800 Service providers to specify how charging for the International Portion of the call will be handled from different countries. See Division 2, Section 3K, *Direct International Originations for more information on this feature.*

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.48 DIOR CPS R2

Description: Should the DIOR Country Pair Screening Release 2 feature be activated? See Division 2,

Copyright © 2003 Lucent Technologies

Section 3K, *Direct International Originations for more information on this feature.*

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.49 BRAND ON ROUTE

Description: Should carrier specific branding be done before routing? The BRAND ON ROUTE field supports the Carrier Specific Branding on Seizure for ACCS and ACTS feature. For more information on this secured feature, see Division 2, Section 4A378.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.50 ICS

Description: Is the ICS (Inmate Calling Services) feature activated? For more information on this feature, see Division 2, Section 4A385.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Inmate Calling Service is a secured feature that must be purchased by the office. Before this field can be set to "Y", the ACT field for SFID 385 or SFID 288 must be set to "Y" on the SFSYS form 5713-1 Record .

EXTERNAL DATA BASE QUERY OPTIONS

The following fields (Section 2.51 - Section 2.68) define external database query options.

RATE

The following fields (Section 2.51 - Section 2.54) define rating timing and query options.

2.51 TIME

Description: Enter the longest time (in seconds) that call processing will wait for a rating reply from the database.

- **WARNING:** A timeout will result in a rating failure. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value. If this time is increased beyond the default value, call load will be adversely affected.

Default: 4 (seconds)
Valid Entries: 1 - 8 (seconds)

2.52 MIN QRY

Description: Enter the minimum rate query attempts required in 15 minutes before alarm calculations are done.

Copyright © 2003 Lucent Technologies

Default: 40
Valid Entries: 1 - 64

2.53 ALARM THR

Description: Enter the rating alarm threshold for successful query percentage. An alarm is activated if the actual percentage of queries falls below this threshold.
Default: 95(%)
Valid Entries: 0 - 100(%)

2.54 OVLD TIME

Description: Enter the rating database overload timing for cutback controls. This indicates how long rating query cutback controls will be in affect for any non-zero overload level received from the rating database.
Default: 1 (minute)
Valid Entries: 0 - 8 (minutes)

NCD

The following fields (Section 2.55 - Section 2.58) define timing and query options for NCD (Network Call Denial).

2.55 TIME

Description: Enter the NCD timeout parameter. This is the longest time (in minutes) that call processing will wait for a reply from the database.

- **WARNING:** A timeout will result in the operator following local practices to obtain verification. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default values. If this time is increased beyond the default value, call load will be adversely affected.

Default: 2 (seconds)
Valid Entries: 1 - 8 (seconds)

2.56 MIN QRY

Description: Enter the minimum NCD query attempts required in 15 minutes before alarm calculations are done.
Default: 40
Valid Entries: 1 - 64

2.57 ALARM THR

Description: Enter the NCD alarm threshold for successful query percentage. An alarm is activated when the actual percentage falls below this value.
Default: 95(%)
Valid Entries: 0 - 100(%)

2.58 STAT

Description: Should NCD (Network Call Denial) queries be sent?
Default: N
Valid Entries: Y, N

CC

The following fields (Section 2.59 - Section 2.64) define CC (Calling Card) timing and query options.

Copyright © 2003 Lucent Technologies

2.59 CC ACC BNS SAMPLE SQD

Description: Enter the sampling rate for supplemental query data messages.
Default: 20
Valid Entries: 0 - 127

2.60 TIME

Description: Enter the calling card timeout parameter (in seconds). This is the longest time that call processing will wait for a calling card reply from the database.

- **WARNING:** A timeout will result in the operator following local practices to obtain verification. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value. If this time is increased beyond the default value, call load will be adversely affected.

Default: 2 (seconds)
Valid Entries: 1 - 8 (seconds)

2.61 MIN QRY

Description: Enter the minimum calling card query attempts required in 15 minutes before calling card software alarm calculations are done.
Default: 40
Valid Entries: 1 - 64

2.62 ALARM THR

Description: Enter the calling card alarm threshold for successful query percentage. An alarm is activated when the actual percentage falls below this threshold.
Default: 95(%)
Valid Entries: 0 -100(%)

2.63 OVLD TIME

Description: Enter the calling card database overload timing for cutback controls. This indicates how long calling card query cutback controls will be in affect for any non-zero overload level received from the database.
Default: 1 (minute)
Valid Entries: 0 - 8 (minutes)

2.64 BILL BLOCK

Description: Will a call be blocked for indeterminate query responses? An entry of "N" will allow the call to complete.
Default: N
Valid Entries: Y, N

BNS

The following fields (Section 2.65 - Section 2.68) define timing and query options for BNS (Billed Number Screening).

2.65 TIME

Description: Enter the BNS timeout parameter (in seconds). This is the longest interval that call processing will wait for a BNS reply from the database.

Copyright © 2003 Lucent Technologies

WARNING: A timeout will result in the operator following local practices to obtain verification. Since the level of query traffic that can be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value. If this time is increased beyond the default value, call load will be adversely affected.

Default: 2 (seconds)
Valid Entries: 1 - 8 (seconds)

2.66 MIN QRY

Description: Enter the minimum BNS query attempts required in 15 minutes before alarm calculations are done.
Default: 40
Valid Entries: 1 - 64

2.67 ALARM THR

Description: Enter the BNS alarm threshold for successful query percentage. An alarm is activated when the actual percentage falls below this threshold.
Default: 95(%)
Valid Entries: 0 - 100(%)

2.68 OVLD TIME

Description: Enter the BNS overload timing for cutback controls. This indicates the BNS database overload timing for cutback controls, and specifies how long BNS query cutback controls will be in affect for any non-zero overload level received from the database.
Default: 1 (minutes)
Valid Entries: 0 - 8 (minutes)

INTL BILL NBR SCREENING

The following field supports the IBNS (International Billed Number Screen Release 2) feature. For more information on this feature see Division 2, Section 4A386.

2.69 IBNS CTI

Description: Enter the treatment to be provided for IBNS "Deny Collect" calls.

Software Release: 5E9(1) and later.
Required Field.
Default: OPR
Valid Entries:

Valid IBNS CTI Entries

Entry	Definition
ANN	Tone Announcement
OPER	Operator

HOTEL/MOTEL OPTIONS

The following fields (Section 2.70 - Section 2.77) define hotel/motel billing options.

2.70 ACQS SM

Description: Enter the number of the SM containing the HOBIS/ (Hotel Billing Information System) HOBIC (Hotel Billing Information Center) and Auto Quote data links. This entry must be an ISDN SM.
Valid Entries: 1 - 192

Copyright © 2003 Lucent Technologies

Data Rules:

This field must be left blank if the HOBIS/C field is blank.

If this field is entered, an OSPSDSL form must exist with a matching SM (first three digits of LCEN) and a Service Class of "HOBICR", "HOBICV", "HOBIS", or "AQDSL".

2.71 HOBIS/C

Description: This field indicates whether the office is connected to a HOBIC (Hotel Billing Information Center) or a HOBIS (Hotel Billing Information System).
Valid Entries: HOBIC or HOBIS

Data Rules:

For 5E6 and later, if "HOBIS" is entered, then the only type of OSPS Hotel Billing Information entry that can be made in the SERVICE CLASS field on the OSPSDSL form is "HOBIS". If "HOBIC" is entered on this form, then only "HOBICV" or "HOBICR" can be entered in the SERVICE CLASS on the OSPSDSL form.

2.72 ACQS TAX

Description: Should applicable taxes be included in the charge computed for ACQS (Automatic Charge Quotation Service) calls?
Default: Y
Valid Entries: Y, N

2.73 DUP HOBIC

Description: Should the hotel billing information be sent over a duplicate set of printer lines to the HOBIC?
Default: N
Valid Entries: Y, N

2.74 HOBIS/C TIME

Description: Enter the number of minutes allowed for HOBIS/C messages before a credit record is made and attempts to send messages are not allowed.
Default: 10 (minutes)
Valid Entries: 1 - 10 (minutes)

2.75 HOBIS/C ALARM

Description: Enter the software alarm threshold for the number of HOBIS/C messages that will be buffered before an alarm is given.
Default: 100
Valid Entries: 1 - 100

2.76 ACQS FAIL

Description: After an ACQS rating failure, should the call be free? If "N" is entered, billing data will be sent to the HOBIS/C.
Default: N
Valid Entries: Y, N

2.77 Q CHK TIME

Description: Enter the number of minutes between checks of the ACQS message queue once a warning

Copyright © 2003 Lucent Technologies

condition has been reached.
Default: 3 (minutes)
Valid Entries: 1 - 60 (minutes)

ACCS OPTIONS

The following fields (Section 2.78 - Section 2.83) specify ACCS (Automatic Calling Card Service) options.

2.78 ACCS 1

Description: Enter the ACCS initial prompt treatment for coin and hotel/motel services.
Default: TANN
Valid Entries:

Valid ACCS 1 Entries

Entry	Definition
OP	OSPS position
TANN	Tone and Announcement
TONE	Tone treatment

Date Rules:
The HEADER ID field on an ANNHD form assigns the announcement for "TANN".

Either "TANN" or "TONE" (tone treatment) may be overridden by individual telephone number entries on an ACCST form (5428 Record).

2.79 ACCS 2

Description: Enter the ACCS initial prompt treatment for non-coin and non-hotel/motel (Service Class 2) services.
Default: TONE
Valid Entries:

Valid ACCS 2 Entries

Entry	Definition
OP	OSPS position.
TANN	Tone and announcement.
TONE	Tone.

Data Rules:

The HEADER ID field on an ANNHD form assigns the "TANN" announcement.

Either "TANN" or "TONE" treatment may be overridden by individual telephone number entries on an ACCST form (5428 Record).

2.80 BRAND PHRASE

Description: Is a branding phrase is to be used to indicate the carrier for a call?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the BRAND PHRASE field, then "Y" must be entered in the OSPS TA field. If "N" is entered in the OSPS TA field, then "N" must be entered in this field.

If "Y" is entered in the OSPS TA, INIT THANK YOU, and BRAND PHRASE fields, then an ANNHD form must be submitted where 16 is entered in the HEADER ID field and "T" is entered in the APPLICATION field.

Copyright © 2003 Lucent Technologies

"Y" must be entered in the OSPS TA field if "Y" is entered in any of the following fields:
- ACTS
- BLV
- BRAND PHRASE
- EXCEPT DETRM
- LATA MAP
- OPER EXT DB

2.81 INIT THANK YOU

Description: Should an ACCS "thank you" announcement for initial credit card validation be given?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the OSPS TA field and "Y" is entered in this field, then "5" must be entered in the HEADER ID field of an ANNHD form where "T" has been entered in the APPLICATION field.

If "Y" is entered in the OSPS TA, INIT THANK YOU and BRAND PHRASE fields, then an ANNHD form must be submitted where 16 is entered in the HEADER ID field and "T" is entered in the APPLICATION field.

2.82 SEQ THANK YOU

Description: Should an ACCS "thank you" announcement for sequential credit card validation be given?
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the OSPS TA field and "Y" is entered in this field, then 5 must be entered in the HEADER ID field of an ANNHD form where "T" has been entered in the APPLICATION field.

2.83 OPER SEQUENCE

Description: Is automated sequence dialing allowed following operator release?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If OPER SEQUENCE is "Y", OSPS TA must be "Y".

The Automated Sequence Dialing Following an Operator Release is a secured feature. This field can be activated only after Secured Feature ID 66 is set to "S" or "Y" on the SFSYS form.

AMA OPTIONS

The following fields (Section 2.84 - Section 2.90) specify AMA (Automatic Message Accounting) options.

2.84 BCCSC REC

Description: Should an AMA record be made when a call is blocked due to unsuccessful credit card

Copyright © 2003 Lucent Technologies

validation?
Default: N
Valid Entries: Y, N

2.85 ACCSQ REC

Description: Should an AMA record be made for every ACCS validation failure?
Default: N
Valid Entries: Y, N

2.86 ROUTE REC

Description: Should an AMA record be made when an inward call is made by an OSPS operator via the ROUTE# key? The number entered in the ROUTE or INTL Route field shall be recorded in the special service call AMA record. An inward call refers to the call from the OSPS to an external operator system.
Default: N
Valid Entries: Y, N

2.87 LSTG SVC REC

Description: Should an AMA record be written for a Listing Services call? An AMA record is only written when a valid ANI signal is received from the originating office. The record is written after the service is provided, so if multiple listings are accessed, multiple records are written.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.88 SAMPLE N

Description: Enter the sampling rate for AMA sampling. If the value entered indicates N, then the sampling rate equals 1/N. The default value 0 turns off sampling.
Default: 0
Valid Entries: 0 - 99

2.89 INW C REC

Description: Enter the inward call recording parameter. When this option is defined, a special service call AMA record is made for the inward call handled either automatically or by an OSPS operator. An inward call is a call to the OSPS from an external operator system.
Valid Entries: 0 - 999

2.90 WIRELESS REC

Description: Should wireless module be appended on AMA record for wireless calls? The AMA Recording of Calls from Wireless Service Providers feature allows the TCA to administer a new attribute in trunk group data, that identifies the trunk group as coming from a WSP (Wireless Service Provider). All calls that arrive at the OSPS from this trunk group, regardless of the forward number, will be treated as being WSP calls. To activate this feature, the Secured FEATURE ID for 104 must be active on the SFSYS form, view 8.22. See Division 2, Section 4A104 for more information on the secured feature AMA Recording of Calls from Wireless Service Providers and Division 2 Section 4A79 for more information on the secured feature ACCS for 0+800 Calls from Wireless Service Providers.

Software Release: 5E8 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If SFID 104 on the SFSYS form is not entered, WIRELESS REC must be "N".

NAI

The following fields (Section 2.91 - Section 2.99) support the NAI (Network Access Interrupt) feature. For more information on the NAI feature, see Division 2, Section 4A380.

2.91 TRANS TYPE

Description: Enter the index used by the 2STPE (Number 2 Signal Transfer Point Emulator) to look up a destination point code for queries destined for the 2LAC/NCP (Number 2 Line Application for Consumers / Network Control Point) for CCS7 TCAP (Common Channel Signaling 7 Transaction Capabilities Application Protocol) functions.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 255.

2.92 INDET RPLY

Description: Should deny treatment be given when the 2LAC/NAI CCS7 TCAP query reply is indeterminate?

Software Release: 5E9(1) and later.
Required Field.
Default: A
Valid Entries:

Valid INDET RPLY Entries

Entry	Definition
A	ALLOW treatment is to be given, and the call will successfully complete through normal handling.
D	DENY treatment is to be given, and the call will not be completed.

2.93 NAI MIN QRY

Description: Enter the number of 2LAC/NAI CCS7 TCAP query attempts required in a 15 minute period before software alarm calculations will be performed.

Software Release: 5E9(1) and later.
Required Field.
Default: 40
Valid Entries: 1 - 64

2.94 SUCC QRY

Description: Enter the percentage of successful 2LAC/NAI CCS7 TCAP queries, below which percentage an alarm will be activated, e.g. if the percentage of successful queries falls below the amount entered in this field, an alarm will be activated.

Software Release: 5E9(1) and later.
Required Field.
Default: 95
Valid Entries: 0 - 100 (%)

2.95 NAI CARRID

Copyright © 2003 Lucent Technologies

Description: Enter the carrier for NAI traffic.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 9999

2.96 NAI TIMEOUT

Description: Enter the time intervals call processing will wait for an NAI reply to a 2LAC/NAI CCS7 TCAP query. The intervals are in tenths of a second, e.g. 6 intervals would be 1 second.

Software Release: 5E9(1) and later.
Required Field.
Default: 20 (tenths of a second)

Enter 5 - 200 (1/10 of a second)

2.97 NAI

Description: Is the NAI (Network Access Interrupt) feature activated for this office?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then
- TRANS TYPE must be entered.
- NAI CARRID must be entered.

If "N" is entered, then
- CARD NAI must be N.
- BNS NAI must be N.

2.98 CARD NAI

Description: Is the NAI (Network Access Interrupt) card parameter activated? This parameter indicates whether 2LAC/NAI CCS7 TCAP signaling will be used instead of ANSI signaling for the 14-digit LEC card query.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.99 BNS NAI

Description: Should the 2LAC/NAI CCS7 TCAP signaling be used instead of ANSI signaling for BNS (Billed Number Screening) queries? This parameter indicates the type of signaling query that is to be sent. If the parameter is set to "Y", a 2LAC/NAI CCS7 TCAP is sent; otherwise an ANSI query is sent, depending on current processing.

Software Release: 5E9(1) and later.
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

CAMA OPTIONS

The following fields (Section 2.100 - Section 2.101) define define CAMA (Centralized Automatic Message Accounting) options.

2.100 ANIF TRBL RPT

Description: Should a trouble report be automatically generated each time a back number is entered due to an ANIF (Automatic Number Identification Failure)?
Default: N
Valid Entries: Y, N

2.101 TRANS OFC

Description: Should a 1+ system CAMA ONI (Operator Number Identification) ANIF calls be routed to a CAMA transfer office? If the call is not routed to the CAMA transfer office it will be handled by the OSPS operator.
Default: N
Valid Entries: Y, N

Data Rules:

If this office is in an initial or growth state, the OFC TYP field will be set to "Y".

COIN TROUBLE

The following fields (Section 2.102 - Section 2.103) define trouble numbers for coin trouble.

2.102 FRAUD NUM

Description: Enter the coin fraud trouble number.
Valid Entries: 0 - 999

2.103 CREDIT NUM

Description: Enter the coin credit trouble number.
Valid Entries: 0 - 999

BLV OPTIONS

The following fields (Section 2.105 - Section 2.106) define BLV (Busy Line Verification) options.

2.104 BLV

Description: Is BLV feature activated for the OSPS office?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in BLV, then "Y" must be entered in OSPS TA. Conversely, if "N" is entered in OSPS TA, the BLV must be "N".

2.105 BLV DAS

Copyright © 2003 Lucent Technologies

Description: Enter the BLV DAS (Digit Analysis Selector). An entry of 0 denotes "no data".

Software Release: 5E4(2) and later
Default: 0
Valid Entries:

For 5E14 and earlier: 0 - 99
For 5E15 and later: 0 - 254

2.106 SCREEN IDX

Description: Enter the Screening Index for BLV.
Valid Entries: 1 - 4095

CARRIER ID

The following fields (Section 2.107 - Section 2.111) define carrier identification numbers.

2.107 ROUTE

Description: Enter the route field carrier identification number. The route carrier is the default interLATA carrier used with the "ROUTE" key.
Valid Entries: 0 - 9999

Data Rules:

For 5E9(1) and later, if ROUTE is entered, then it must match a CARRIER ID on an ICF form which has "D" entered in the FEAT GRP field on that form.

2.108 CONF

Description: Enter the conference field carrier identification number (default interLATA carrier for an operator or third number conference).
Valid Entries: 0 - 9999

Data Rules:

For 5E9(1) and later, the entry in this field must match a CARRIER ID entry on an ICF form which has "D" entered in the FEAT GRP field on that form.

2.109 ICOS

Description: Enter the carrier identification number for blind transfer to an external IC operator system.
Valid Entries: 0 - 9999 or LEC

Data Rules:

For 5E9(1) and later, if 0 - 9999 is entered in this field, then the entry must match a CARRIER ID on an ICF form which has "D" entered in the FEAT GRP field on that form.

2.110 LSTG SVC

Description: LSTG SVC specifies the default carrier for calls that are outpulsed from Listing Services operator position and require an IC carrier on Listing Service non-ISP trunks.

Software Release: 5E6 and later
Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 9999

Data Rules:

The entry in this field must match an entry in the CARRIER ID field on the ICF form.

2.111 EMER INTER

Description: This field indicates the default carrier for emergency interLATA calls from a trunk group which is defined as intraLATA.

Software Release: 5E5 and later
Required Field.
Valid Entries: 0 - 9999

Data Rules:

For 5E6 and later, the value entered in this field must match a CARRIER ID on an ICF form. In addition, for 5E8 and later, "D" must be entered in the FEAT GRP field on the ICF form.

For 5E8 and later, if OSPS TA is "Y", then this field must be entered.

ACCS FOR CCC

The following fields (Section 2.112 - Section 2.115) support the ACCS for CCC (Automated Calling Screen Services for Commercial Credit Cards) feature. This is a secured feature, with SFID 388. For more information on this feature see Division 2, Section 4A388.

2.112 ACCS FOR CCC

Description: Is the ACCS for CCC feature active?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.113 DLY ANN INFTV

Description: Enter the maximum time (in tenths of a second) that a CCC (Commercial Credit Card) card validation query may take without the caller getting a delay announcement. The time represented by this field is compared to the time represented by the QUERY TIMEOUT field on the TCCID form (5454 Record) which is the OSPS TCR (TELEPHONE CREDIT CARD) ATTRIBUTES form. If this field is less, the CCC customer is given a delay announcement.

Software Release: 5E9(2) and later.
Required Field.
Default: 60
Valid Entries: 0 - 160 (tenths of a second)

2.114 VIRT CRD TXT

Description: Enter 6 alphanumeric characters of textual information displayed at the operator position for VC (Virtual Card) calls. A VC is a calling card issued by AT&T which can be used to charge calls in the AT&T Network. A VC is based on a customer selected card number which could represent a memorable personal combination of alphanumerics and digits. These unique combinations permit the issuing of "Vanity Cards". Examples of a VC number issued to a customer could be: "JOHNSMITH-1234" or "NEIMANMARCUS".

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and later.
Valid Entries: 6 characters

2.115 DFLT CRD TXT

Description: Enter 6 characters of textual information displayed at the operator position for card calls which do not use virtual cards nor cards defined on the TCCATTR form (5473 Record).

Software Release: 5E9(2) and later.
Valid Entries: 6 characters

INTERFLOW

The following fields (Section 2.116 - Section 2.119) define OSPS Interflow options.

2.116 Q DRN TIME

Description: Enter the Interflow Call Queue Drain time. This entry specifies the number of minutes allowed for draining the call queues of Operator Serving Teams undergoing scheduled Interflow activation. See OSPS feature section in Division 2, Section 3 for additional information.

Software Release: 5E5 and later
Required Field.
Default: 0 (minutes)
Valid Entries: 0 - 3 (minutes)

2.117 OSPS ID

Description: Enter the Interflow OSPS Office ID number. This is a number is unique among the switches in this interflowing switch complex. The default value of 0 should be used if this office is not interflowing calls.

This same entry will be used by switches receiving interflowed calls from this switch. The ACDCTP form (5412-A/F Records) of the receiving switch will use this value.

Software Release: 5E5 and later
Required Field.
Default: 0
Valid Entries: 0 - 9999

2.118 IFNAME

Description: Enter the Interflow OSPS Office Identifier Name. The IFNAME field indicates the name of an OSPS office used for Interflow and this name appears as part of the display on the operators' console of the receiving interflowed office.

Software Release: 5E5 and later
Default: 0
Valid Entries: 1 - 4 characters

Data Rules:

If entries are made on an INFLTADP form (5452 Record) and on INFLDEST forms (5448 Record), then the value entered here must be other than 0.

2.119 IFTRANSID

Copyright © 2003 Lucent Technologies

Description: A three-digit OSPS translation identifier is automatically entered in this field. The first two digits represent the Software Release and the third digit indicates the level within the Software Release. For example, the first issue of 5E8 would have an entry of 081.

The IFTRANSID field defines the translation identifier for this OSPS. The translation identifier is used to translate Interflow messages and affect decision points in the processing of a call when differing generics or point issues of software are used in an Interflowed complex.

Software Release: 5E5 and later
Default:

For 5E9(1) only: 91
- For 5E10: 101
- For 5E11: 111

Valid Entries:
- This field is automatically populated.

AUTO RECONFIGURATION

The following fields (Section 2.120 - Section 2.121) define Automatic Reconfiguration Options.

2.120 AUTO RECONFIG

Description: Is the OSPS call queue and the operator automatic reconfiguration active? If this field is set to "Y", then call queue and operator automatic reconfiguration pattern data is processed by the auto-reconfiguration terminal process, which is created every 15 minutes.

For 5E8 and later, this field is set to "N". This field is always set to "N" by ODA. Once the office has retrofitted onto the new Software Release, Recent Change can then be used to change this field to "Y". This field can also be automatically changed during the retrofit as follows:

1. During the BEGIN state, the retrofit software records the state of the AUTO RECONFIG field.
2. ODA ODD is expected to set this to "N".
3. When it is safe to turn this feature on, the retrofit process executes code to restore it to "Y", if it was originally "Y". This ensures that a "PAT ID" that was expected to fire, will only fire during a safe place in the retrofit process.

Software Release: 5E7 and later
Default: N
Valid Entries: N

2.121 SCHED IFLOW

Description: Is scheduled interflow activation and deactivation active? If this field is set to "Y", the scheduled interflow activation and deactivation pattern data is processed by the auto-reconfiguration terminal process, which is created every 15 minutes.

For 5E8 and later, this field is set to "N". This field is always set to "N" by ODA. Once the office has retrofitted onto the new Software Release, Recent Change can then be used to change this field to "Y". This field can also be automatically changed during the retrofit as follows:

1. During the BEGIN state, the retrofit software records the state of the SCHED IFLOW field.

Copyright © 2003 Lucent Technologies

2. ODA ODD is expected to set this to "N".

3. When it is safe to turn this feature on, the retrofit process executes code to restore it to "Y", if it was originally "Y". This ensures that a "PAT ID" that was expected to fire, will only fire during a safe place in the retrofit process.

Software Release: 5E7 and later
Default: N
Valid Entries: N

2.122 ICS EIS TIME

Description: Enter the length of time, in 10 second intervals, OSPS shall wait to receive a message from the EIS (External Information System). The value specified in this field is used when the OSPS recognizes that the EIS has gone off-hook on the ARU (Audio Response Unit) port. Prior to expiration of this timer, OSPS expects the EIS to request OSPS to perform forward number and billing restriction checks or to terminate the call. This field supports the Inmate Calling Services secured feature (SFID 385). For more information on this feature, see Division 2, Section 4A385.

Software Release: 5E9(2) and later.
Required Field.
Default: 60
Valid Entries: 10 - 160 (10 second intervals)

2.123 ICS BILL TIME

Description: Enter the length of time, in 15 second intervals, OSPS shall wait to receive a message from the EIS (External Information System). The value specified in this field is used when the OSPS has determined that billing is acceptable for the associated call and that, from an OSPS perspective, the call can be allowed to complete. Prior to expiration of this timer, OSPS expects the EIS to request OSPS to begin billable timing or to terminate the call. This field supports the Inmate Calling Services secured feature (SFID 385). For more information on this feature, see Division 2, Section 4A385.

Software Release: 5E9(2) and later.
Required Field.
Default: 240
Valid Entries: 15 - 480 (15 second intervals)

LINE INFORMATION DATA BASE QUERY OPTIONS

The following fields (Section 2.124 - Section 2.140) define LIDB (Line Information Data Base) options.

2.124 CC AND BNS TIME

Description: Enter the longest time that LIDB call processing will wait for a CC or BNS reply from the database.

WARNING: A timeout will result in the operator following local practices be handled decreases as the holding time increases, extreme care should be used when increasing the value above the default value. If this time is increased beyond the default value, call load will be adversely affected.

Software Release: 5E5 and later
Required Field.
Default: 2 (seconds)
Valid Entries: 1 - 8 (seconds)

Copyright © 2003 Lucent Technologies

L CC

The following fields define LIDB CC (Calling Card) options.

2.125 MIN QUERY

Description: Enter the minimum query attempts required in 15 minutes before LIDB CC alarm calculations will be performed.

Software Release: 5E5 and later
Required Field.
Default: 40
Valid Entries: 1 - 64

2.126 ALARM THR

Description: Enter the value for the LIDB CC software alarm threshold, which is a value for successful query percentage. If the percentage falls below this threshold, an alarm is activated.

Software Release: 5E5 and later
Required Field.
Default: 95(%)
Valid Entries: 0 - 100(%)

2.127 ATT INTER

Description: Enter one of the four following choices for an AT&T-carried interLATA call query.

Software Release: 5E5 and later
Required Field.
Default: A
Valid Entries:

Valid ATT INTER Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD.
D	Query handled by the designated DEFAULT field.

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.128 LEC INTER

Description: Enter one of the four following choices for a LEC-carried interLATA query.

Software Release: 5E5 and later
Default: A
Valid Entries:

Valid LEC INTER Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

Copyright © 2003 Lucent Technologies

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.129 ATT INTRA

Description: Enter one of the four following choices for an AT&T-carried intraLATA query.

Software Release: 5E5 and later
Required Field.
Default: A
Valid Entries:

Valid ATT INTRA Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.130 LEC INTRA

Description: Enter one of the four following choices for a LEC-carried intraLATA query.

Software Release: 5E5 and later
Required Field.
Default: A
Valid Entries:

Valid LEC INTRA Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.131 DEFAULT

Description: Is the Calling Card validation default database a LEC? Enter "N" if default database is an alternate destination or BVA.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When "C" is entered in any of the ATT/LEC INTER/INTRA fields, the LIDBLNQ form is accessed. If the LIDBLNQ form does not reveal the database, the L CC DEFAULT field is accessed. The entries in the L BNS DEFAULT and L CC DEFAULT fields must match.

Copyright © 2003 Lucent Technologies

2.132 CALLED NBR

Description: Is the called number in LIDB query protocol allowed on this switch? See Division 2, Section 4C3 for more information on the Inclusion Of The Called Number In The LIDB Protocol feature.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

L BNS

Description: The following fields define BNS (Billed Number Screening) LIDB options.

2.133 MIN QUERY

Description: Enter the value which indicates the minimum query attempts which are required in 15 minutes before LIDB BNS software alarm calculations will be performed.

Software Release: 5E5 and later
Required Field.
Default: 40
Valid Entries: 1 - 64

2.134 ALARM THR

Description: Enter the value for LIDB BNS software alarm threshold, which is a value for the successful query percentage. If the percentage falls below this threshold, an alarm is activated.

Software Release: 5E5 and later
Required Field.
Default: 95 (%)
Valid Entries: 0 - 100 (%)

2.135 ATT INTER

Description: Enter one of the four following choices for an AT&T-carried interLATA query.

Software Release: 5E5 and later
Default: A
Valid Entries:

Valid ATT INTER Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.136 LEC INTER

Description: Enter one of the four following choices for a LEC-carried interLATA query.

Software Release: 5E5 and later

Copyright © 2003 Lucent Technologies

Default: A
Valid Entries:

Valid LEC INTER Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.137 ATT INTRA

Description: Enter one of the four following choices for an AT&T-carried intraLATA query.

Software Release: 5E5 and later
Default: A
Valid Entries:

Valid ATT INTRA Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

2.138 LEC INTRA

Description: Enter one of the four following choices for a LEC-carried intraLATA query.

Software Release: 5E5 and later
Default: A
Valid Entries:

Valid LEC INTRA Entries

Entry	Definition
A	Query handled by AD (Alternate Destination) or BVA. For more information on the EABS Alternate Routing secured feature, see Division 2, Section 4A86.
B	Query handled by LEC.
C	Query handled by AD or BVA and LEC.
D	Query handled by the designated DEFAULT field.

Data Rules:

If "C" is entered, then data must be entered on the LIDBLNQ form (5449 Record).

2.139 DEFAULT

Description: Is the BNS validation default database a LEC? Enter "N" if it is an alternate destination or BVA.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

When "C" is entered in any of the ATT/LEC INTER/INTRA fields, the LIDBLNQ form is accessed. If the LIDBLNQ form does not reveal the database, then the L BNS DEFAULT field of this form is accessed.

The entries in the L BNS DEFAULT and L CC DEFAULT fields must match.

2.140 IIW INDET DNY

Description: Should automated international inward BNS (Billed Number Screening) indeterminate replies be denied?

The OSPS International Billed Number Screening is a secured feature that allows an international operator to access an OSPS for the purpose of performing a billed number screening check on a billing number.

This field indicates if indeterminate replies should be given "deny" treatment. The default value is "N", which means IBNS indeterminate query reply treatment results in "allowed" treatment.

The secured FEATURE ID 101 must be activated on the SFSYS form, Recent Change view 8.22. For more information on the OSPS International Billed Number Screening feature, see Division 2, Section 4A101.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.141 INDET AIBNS

Description: Should the treatment for an Automated AIBNS (Automated Inward Billed Number Screen) indeterminate query reply be allowed or denied? This field specifies whether deny treatment is to be given when the AIBNS reply is indeterminate.

The AIBNS (Automated Inward Billed Number Screening) feature provides Automated Inward access to the BNS (Billed Number Screening) capabilities of the OSPS. The BNS collect or third number check is performed automatically upon receiving a 10-digit number. Announcements are provided indicating whether the number to be used for billing is allowed, denied, or is a public station.

Software Release: 5E8 and later
Required Field.
Default: A
Valid Entries:

Valid INDET AIBNS Entries

Entry	Definition
A	Allow the call, indeterminate replies are given allow treatment.
D	Deny the call, indeterminate replies are given deny treatment.

2.142 INTRA AIBNS

Description: Should AIBNS intraLATA replies be given allow treatment? This field specifies whether allow treatment is to be given when the collect or third number acceptance indicator in the AIBNS reply indicates an intraLATA allow. "N" indicates the intraLATA allow reply will be given deny treatment.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

89/CCC (ANSI)

Copyright © 2003 Lucent Technologies

The following fields (Section 2.143 - Section 2.144) define the 89C (CCITT Telecommunication) card options.

2.143 MIN QUERY

Description: Enter minimum number 891/CCC ANSI Transaction query attempts in a 15 minute period before an SW (software) alarm is given.

Software Release: 5E7 and later
Default: 40
Valid Entries: 1 - 64

2.144 ALARM THR

Description: Enter 891/CCC ANSI TCAP (Transaction Capabilities Application Part) query software alarm threshold, which is the successful ANSI non-alarmed query percentage. This percent is number of ANSI TCAP queries attempted in a 15 minutes period, which Every fifteen minutes, counts of the number of ANSI TCAP queries attempted and the number of queries with reply valid are sent to the DS SP (Direct Signaling - System Process) are counted. The ANSI TCAP query success rate is calculated from these counts and is compared to the value in this field.

Software Release: 5E7 and later
Required Field.
Default: 95%
Valid Entries: 0 - 100 (%)

QUERY REPLIES

The following fields (Section 2.145 - Section 2.147) define the parameters for the LIDB Change Handling of Indeterminate Reply Codes Secured Feature. See Division 2, Section 4A81 for more information on this feature.
To activate this feature, 81 must be entered for the feature ID on the SFSYS form (5713-1 Record).

2.145 UNR AND NPG

Description: Specifies whether LIDB unavailable network resources and nonparticipating group query replies should be allowed, denied or given existing treatment. Existing treatment is specified by the field CC BILL BLOCK for card and indeterminate for BNS.

Software Release: 5E7 and later.
Required Field.
Default: E
Valid Entries:

Valid UNR AND NPG Entries

Entry	Definition
A	Allow; LIDB unavailable network resources and nonparticipating group query replies will be allowed.
D	Deny; LIDB unavailable network resources and nonparticipating group query replies will be denied.
E	Existing treatment; LIDB unavailable network resources and nonparticipating group query replies will be given existing treatment (field CC BILL BLOCK for card, indeterminate for BNS).

2.146 TIMEOUT

Description: Specifies whether a LIDB timeout query reply should be allowed, denied or given existing treatment. Existing treatment is specified by the field CC BILL BLOCK for card, and indeterminate for BNS.

Software Release: 5E7 and later.

Copyright © 2003 Lucent Technologies

Required Field.
Default: E
Valid Entries:

Valid TIMEOUT Entries

Entry	Definition
A	Allow; LIDB timeout query replies will be allowed.
D	Deny; LIDB timeout query replies will be denied.
E	Existing treatment; LIDB timeout query replies will be given existing treatment (field CC BILL BLOCK for card, and indeterminate for BNS).

2.147 OTHER INDET

Description: Specifies whether the other LIDB indeterminate query replies, Misroute, Missing Group, Reject Message, and Garbled message, should be allowed, denied or given existing treatment. This field does not apply to reply codes No Translation Address, Subsystem Congestion, Subsystem Failure, Unequipped User, Network Failure, or Network Congestion. Existing treatment is specified by the field CC BILL BLOCK for card, and indeterminate for BNS.

Software Release: 5E7 and later.
Required Field.
Default: E
Valid Entries:

Valid OTHER INDET Entries

Entry	Definition
A	Allow; all other LIDB indeterminate query replies will be allowed.
D	Deny; all other LIDB indeterminate query replies will be denied.
E	Existing treatment; all other LIDB indeterminate query replies will be given existing treatment (field CC BILL BLOCK for card, and indeterminate for BNS).

CAS

The following fields (Section 2.148 - Section 2.157) define CAS (Customer Account Services) options.

2.148 TIME

Description: This field specifies the amount of time to wait for a CAS query reply. Enter the longest time that CAS call processing will wait for a calling card reply. Entries are made in tenths of a second, for example, 10 represents one second, 11 represents 1.1 second, and 25 represents 2.5 seconds.

A timeout will result in call processing continuing the call (as indicated by the entry in the INDT BLK field). The level of query traffic that can be handled decreases as the holding time increases; extreme care should be used when increasing the value above the default value (20, or two seconds).

Software Release: 5E5 and later
Valid Entries: 10 - 80 (tenths of a second)

2.149 MIN QUERY

Description: Enter the minimum query attempts required in 15 minutes before CAS software alarm calculations will be performed.

Software Release: 5E5 and later
Default: 40
Valid Entries: 1 - 64

2.150 ALARM THR

Description: Enter CAS alarm threshold which is a value for the successful query percentage. If the

Copyright © 2003 Lucent Technologies

percentage falls below this threshold, an alarm is activated.

Software Release: 5E5 and later
Default: 95(%)
Valid Entries: 0 - 100(%)

2.151 CAS ON

Description: Is the CAS feature turned on? If "N" is entered in this field, then all 0- and 0+ calling card calls are treated as 10+4 card calls (LEC card).

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in this field, then a CASCON form (5455 Record) and a CASICON form (5456 Record) must be submitted (contract tables must exist).

If the entry in the NCD OFF field is "Y", then the entry in the CAS ON field must be "Y".

2.152 INDT BLK

Description: Should the call be blocked when CAS query response is indeterminate?

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

2.153 PIN ONLY

Description: Can the customer dial a 4-digit PIN (Personal Identification Number) only for calling card calls (pre-authorized collect feature)? The operator may enter a 4-digit PIN regardless of the entry in this field.

Software Release: 5E5 and later
Default: Y
Valid Entries: Y, N

2.154 NCD OFF

Description: Is NCD (Network Call Denial) query for calling cards turned off?

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

If the entry in the NCD OFF field is "Y", then the entry in the CAS ON field must be "Y".

2.155 CON TO OPR

Description: Is the caller to be routed to an operator when a contract table check violation is detected by call processing? A contract table check occurs when a caller uses an AT&T CAS calling card on an LEC-carried call.

Software Release: 5E5 and later

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.156 INCON TO OPR

Description: Enter "Y" is the caller to be routed to an operator when an inverse contract table check violation is detected by call processing? An inverse contract table check occurs when a caller uses an LEC calling card on an AT&T-carried call.

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

2.157 INW VAL ID

Description: Is the CAS IVI (Inward Validation Identification) feature activated? (See Division 2 Section 3I for more information on the CAS IVI feature.)

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If INW VAL ID is "Y", CAS R3 ON must be "Y".

If PL ON is "Y", INW VAL ID must be "Y".

COMMERCIAL CREDIT CARD

The following fields (Section 2.158 - Section 2.161) define CCC (Commercial Credit Card) options. They are available with CAS Release 2.

2.158 CCC ON

Description: Will the OSPS process CCC (Commercial Credit Cards) or other non-AT&T telecommunication cards (TEL)?

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the CCC ON field, then "Y" must entered in the OSPS TA field, and "Y" must be entered in the CAS ON field.

2.159 PROMPT TIME

Description: This field indicates the timing interval from the "bong" tone to initial digit reception for a customer-dialed 0+ ACCS call. A call that reaches the end of this timing interval will be routed to an operator position.

Entries are made in tenths of a second, for example, 20 represents two seconds, 21 represents 2.1 seconds, and 35 represents 3.5 seconds.

Software Release: 5E5 and later

Copyright © 2003 Lucent Technologies

Default: 50 (5 seconds)
Valid Entries: 20 - 90 (tenths of a second)

Data Rules:

This field will have no effect unless "Y" is entered in the CCC ON field.

2.160 ZERO TIME OUT

Description: This field is for customer-dialed 0+ ACCS calls; and indicates the timing interval of all card types (LEC, CAS, CCC and TEL) to route a call to an operator position when the initially-dialed card number is a "0" after the "bong" tone.

Entries are made in tenths of a second, for example, 10 represents one second, 11 represents 1.1 seconds, and 25 represents 2.5 seconds. The default value, 0, means that the call will be immediately routed to an operator position.

Software Release: 5E5 and later
Default: 0
Valid Entries: 0 - 90 (tenths of a second)

Data Rules:

This field will have no effect unless "Y" is entered in the CCC ON field.

2.161 DIGS TIME OUT

Description: This field is for customer-dialed ACCS calls, and indicates the inter-digit timing interval for all card types (LEC, CAS, CCC and TEL) from the first non-zero digit after the "bong" tone, until the last of a maximum of 32 digits is received. A timeout is the end of the calling card number entry process.

Call processing will give proper treatment to this call, depending on the received calling card number. If the account number has a variable number of digits, this field is used to determine the end of the calling card entry process.

Entries are made in tenths of a second, for example, 20 represents 2 seconds, 21 represents 2.1 seconds, and 35 represents 3.5 seconds.

Software Release: 5E5 and later
Default: 50 (5 seconds)
Valid Entries: 20 - 90 (tenths of a second)

Data Rules:

This field will have no effect unless "Y" is entered in the CCC ON field.

ENHANCED CUT-THROUGH

The following fields (Section 2.162 - Section 2.164) define options for Enhanced Operator Cut-through feature. (See Division 2, Section 3I for more information on this 5E8 Software Release feature.)

2.162 ECUT ON

Description: Is the Enhanced Operator Cut-through Feature activated?

Software Release: 5E8 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When ECUT ON is "Y", CAS ON must be "Y".

2.163 ECUT TIME

Description: Enter the interdigit timing after the fourteenth calling card digit is collected for the Enhanced Operator Cut-through feature. The timing entry is in tenths of a second, e.g., an entry of 20 is 2 seconds and an entry of 50 is 5 seconds.

Software Release: 5E8 and later
Required Field.
Default: 25
Valid Entries: 20 - 50 (tenths of a second)

2.164 ECUT ODO

Description: Is an operator request automatically generated? If "N" is entered, then the call is idled with a disconnect announcement when a caller's second attempt to enter a calling card number results in an ECUT (Enhanced Operator Cut-through) card recognition failure.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then "Y" must be entered in the ECUT ON field.

CAS RELEASE 3

The following fields (Section 2.165 - Section 2.171) define the CAS Release 3 options.

2.165 CAS R3 ON

Description: Is CAS R3 (Customer Account Services Release 3) feature activated?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CAS R3 ON is "Y", then CAS ON must be "Y" and CCC ON must be"Y".

If CAS R3 is "Y", at least one TCCID form must exist.

2.166 OFFICE ADMIN ID

Description: Enter a number to identify the originating administration to the foreign card databases for ICCV queries. The OFFICE ADMIN ID is sent as a field in a CAS CCS7 or CCITT TCAP (Transaction Capabilities Application Part) query.

Software Release: 5E7 and later

Copyright © 2003 Lucent Technologies

Default: 8900
Valid Entries: 0 - 9999999

2.167 CCS7 ALARM THR

Description: Enter the number of software alarm queries that is the threshold for CAS (Customer Account Services) TCAP (Transaction Capabilities Application Part). Every 15 minutes, counts of the number of CAS TCAP queries attempted and the number of queries with "reply valid" are sent to the DSSP (Direct Signal System Process). The CAS TCAP query success rate is calculated from these counts and is compared to the CCS7 ALARM THR percent. If the percentage rate falls below this threshold an alarm is activated. The CCS7 ALARM THR is specified by the TCA.

Software Release: 5E7 and later
Default: 95(%)
Valid Entries: 0 - 100(%)

2.168 ICCV ALARM THR

Description: Enter the number software alarm queries for the threshold for ICCV (International Credit Card Validation) TCAP. Every 15 minutes, counts of the number of ICCV CCITT TCAP queries attempted and the number of queries with "reply valid" are sent to the DSSP (Direct Signal System Process). The ICCV CCITT TCAP query success rate is calculated from these counts and is compared to ICCV ALARM THR. If the percentage rate falls below the threshold, an alarm is activated. The ICCV ALARM THR is specified by the TCA.

Software Release: 5E7 and later
Default: 95(%)
Valid Entries: 0 - 100(%)

2.169 CCS7 MIN QUERY

Description: Enter the the minimum number of CAS CCS7 TCAP queries to be attempted in a 15 minute period before alarm.

Software Release: 5E7 and later
Default: 40
Valid Entries: 1 - 64

2.170 ICCV MIN QUERY

Description: Enter the the minimum number of ICCV CCITT TCAP queries to be attempted in a 15 minute period before alarm.

Software Release: 5E7 and later
Default: 40
Valid Entries: 1 - 64

2.171 RECOGNIZE 10P4

Description: Recognize 10+4 cards in the CAS card recognition table?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If RECOGNIZE 10P4 is "Y", then CAS R3 ON must be "Y".

CARRIER SPECIFIC ROUTING

The following field defines the carrier specific routing.

2.172 CSR ON

Description: Is the CAS (Customer Account Services) CSR (Carrier Specific Routing) active? (For more information on this feature see Division 2, Section 3I.)

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CSR ON is "Y", CAS R3 ON must be "Y" and the Fully Coded Addressing feature must be activated, FCA ON must be "Y".

CAS CARD LIMITS

The following fields (Section 2.173 - Section 2.183) define CAS Purchase Limit attributes. For all Card Limit features, CAS R3 must be set to "Y". (For more information on CAS features see Division 2, Section 3I.)

2.173 PURCHASE LIMIT

Description: Is the CAS Purchase Limit Feature activated? For more information on CAS features see Division 2, Section 3I.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When PL ON is "Y", INW VAL ID must be "Y".

2.174 DURATION LIMIT

Description: Is the OSPS CAS Duration Limits feature active? This feature provides the ability to monitor the duration of a card call and possibly limit the call's duration to an amount specified in the card validation reply to a CAS CCS7 card validation query. See Division 2 Section 3I for more information on the CAS Duration Limits feature.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DURATION LIMIT is "Y", then CAS INW VAL ID must be "Y".

Copyright © 2003 Lucent Technologies

2.175 VOLUME LIMIT

Description: Is the OSPS CAS Volume Limits feature active? This feature provides the ability to limit the number of calls billed to an AT&T CAS card. For more information on CAS features see Division 2, Section 3I.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If VOLUME LIMIT is "Y", CAS INW VAL ID must be "Y".

2.176 ENHANCED LIMITS

Description: Is the OSPS CAS Enhanced Limits feature active? This feature provides the ability to explicitly restrict card calls to one call in progress at a time, or explicitly enable card calls to allow multiple calls in progress at a time. For more information on CAS features see Division 2, Section 3I.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ENHANCED LIMITS is "Y", then CAS INW VAL ID must be "Y".

2.177 CDM TIME

Description: Enter the Purchase Limit timing interval for calls in progress. This is the time in seconds, entered at 30-second intervals, between updates to the NCP while a call is in progress. For example, in 5E9(1) and later, if the entry is 600 (seconds) i.e., 10 minutes, then every 10 minutes while the call is in progress the OSPS sends a message to the database to update a CAS Limits card's status in the database while the call is in progress. For more information on CAS features see Division 2, Section 3I.

Software Release: 5E8 and later
Required Field.
Default: 600 (10 minutes)
Valid Entries: 30 - 1200 (seconds at 30-second intervals)

Data Rules:

For 5E9(1) and later, the value entered in CDM TIME must be equal to or greater than the value entered in the MIN REQUERY field plus 33 (CDM TIME = (or) MIN REQUERY + 33).

2.178 WARN TIME

Description: Enter the amount of time in seconds which is the amount of time after a Card Limits Disconnect Warning Announcement is played before the call is forcibly disconnected. For more information on CAS features see Division 2, Section 3I.

Software Release: 5E9(1) and later
Default: 30 (seconds)
Valid Entries: 10 - 90 (seconds, entered in increments of 5 seconds)

Copyright © 2003 Lucent Technologies

Data Rules:

If OSPS TA is set to "Y" on this form, then the announcement headers OSPSTA 171 and OSPSTA 174 on the ANNHD form have the same disconnect warning time interval (specified by PHRASES values) which is displayed as the entry in this field. Therefore, the PHRASES value which is third to the last (or third and fourth to the last) represents a time value equal to the entry in this field.

2.179 COURTESY INTERVAL

Description: This parameter is associated with the CAS Card Limits features. It provides a courtesy interval for the customer by specifying a desired (though not guaranteed) minimum amount of time a customer may talk before hearing a CL DWA (Card Limits Disconnect Warning Announcement). If the maximum allowed length of the call is so short that the caller would hear the CL DWA before having talked for the courtesy interval time, then the OSPS uses the minimum possible value of the Disconnect Warning Interval of 10 seconds instead of the value specified in this field. For more information on CAS features see Division 2, Section 3I.

Software Release: 5E9(1) and later.
Required Field.
Default: 12
Valid Entries: 8 - 99 (seconds)

2.180 MIN REQUERY

Description: Enter the CL MRT (Card Limit Minimum Re-query Time) in seconds, which is the minimum required time between requests to the card database for an additional balance. If a call does not have enough balance left to last through the duration of the MRT before it must request more balance again, then it is disconnected after consumption of the currently available balance without requesting more balance. This parameter is associated with the CAS Enhanced Limits feature of multiple calls in progress.

Software Release: 5E9(1) and later.
Required Field.
Default: 120 (seconds)
Valid Entries: 30 -360 (seconds)

2.181 PLBQ ON

Description: Is the Purchase Limit Balanced Quotation feature activated? The PLBQ (Purchase Limit Balance Quotation) feature provides special handling for disposable cards, which is a subset of PL (Purchase Limit) cards. Calls that are billed to disposable cards will receive a quotation of their remaining balance in dollars and cents prior to call completion. For more information on the PLBQ feature, see Division 2, Section 4A24.

Software Release: For RC/V: 5E8 and later
For ODA: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When PLBQ ON is "Y", PURCHASE LIMIT must be "Y".

2.182 PLBQ2 ON

Description: Should Release 2 of the PLBQ (Purchase Limit Balanced Quotation) feature be activated? See Division 2 Section 4A24 for more information on the PLBQ feature.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PLBQ2 ON is "Y", then PLBQ ON must be "Y".

2.183 AMA GENERIC DATA

Description: Is the AMA Generic Data Module feature activated? The OSPS provides the TCA with the ability to activate/deactivate the appending of the Generic Data AMA Module. The PLBQ Release 2 feature requires a new AMA module and tables to store the Card Rate, Product Type, and Tax Exemption indicator. The OSPS must append Module 343 - Generic Data Module to the AMA structure that is recorded for all "on-net" card calls if Release 2 is activated and the feature activation for AMA recording of card information is on.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If AMA GENERIC DATA is 'Y', PLBQ2 ON must be "Y".

NON-ENGLISH ANNC

The following fields (Section 2.184 - Section 2.185) define the attributes for the Non-English Announcements For Card Calls feature. For more information on NACC features see Division 2, Section 3I.

2.184 NACC

Description: Is the NACC (Non-English Announcements for Card Calls) feature active? The NACC feature provides the ability to play announcements for card calls in languages other than English.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If NACC is "Y", CAS ON must be "Y".

2.185 MAX LOP

Description: Enter the maximum LOP (Language Override Parameter) value that is considered valid in a CAS CCS7 TCAP query reply. The LANGUAGE entries on the LANGTBL form (5483-1 Record) may not exceed the MAX LOP value.

Software Release: 5E9(1) and later.
Default: 5
Valid Entries: 5 - 7

Data Rules:

Copyright © 2003 Lucent Technologies

If LANGUAGE is entered on the TCCID form, and a corresponding LANGTBL form exists (found by matching LANGUAGE on the TCCID form to DISPLAY ID on the LANGTBL form), then MAX LOP must be entered on the OSPSOPT form. No LANGUAGE entries on the LANGTBL form may exceed the MAX LOP value entered on the OSPSOPT form.

ICCV

The following fields (Section 2.186 - Section 2.190) define the parameters for ICCV (International Credit Card Validation). For more information on ICCV features, see Division 2, Section 3I.

2.186 CDBS

Description: Is CDBS (Customer Defined Bill Segmentation) for ICCV calls activated? (For more information on CDBS, see Division 2, Section 3I.)

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CDBS is "Y", CAS R3 ON must be "Y".

2.187 GEO RESTRICT

Description: Is the OSPS International Credit Card Validation - Called Number Geographic Restrictions feature activated? This feature allows restrictions to be placed on PTT (Post Telegraph and Telephone) card billed calls that originate on an AT&T OSPS.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then CAS R3 ON must be "Y".

2.188 CALL DUR CHRG

Description: Is the ICCV Call Duration and Charge feature active? The OSPS ICCV CDC (Request for Call Duration and Charge) feature provides a call disposition message containing call information to the card issuer. For more information on this feature, see Division 2, Section 3I

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", then CAS R3 ON must be "Y".

2.189 SDR CONV

Description: Enter the Standard Drawing Rights conversion factor. This parameter is used to convert US

Copyright © 2003 Lucent Technologies

monetary units to SDR (Standard Drawing Rights) and vice-versa for International Credit Card Validation call processing.

Software Release: 5E9(1) and later.
Required Field.
Default: 1.1000
Valid Entries: 0.0000 - 1.9999

2.190 CALL SCREENING

Description: Is the ICCV Call Screening feature activated? This feature allows restrictions on calls made to the "home" country for ICCV.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

CAS RESTRICTIONS

The following field indicates if the Called Number Restrictions feature is active.

2.191 CDNR CGNR

Description: Is the Called or Calling Number Restrictions feature active? This feature is an enhancement to the CAS (Customer Account Services) R3 feature, and allows identification of reply codes from a card database query that indicate restrictions on the called number or calling number.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then CAS R3 ON must equal "Y".

CARD SPEED DIALING (CSD)

The following fields (Section 2.192 - Section 2.195) define options for the Card Speed Dialing feature which allows holders of CAS/NCP CCS7 calling cards to use their own personal speed dial codes to make card billed calls, by using an abbreviated speed dial code instead of a full forward number. For more information on the Card Speed Dialing feature, see Division 2, Section 4A365.

2.192 ACCESS CODE *

Description: Enter the digit(s) for the service access code for the Card Speed Dialing feature. The access code will be a * and the one or two digits entered in this field.

Software Release: 5E8 and later.
Required Field.
Default: 7
Valid Entries: 1 - 99 (multiples of 10 are not allowed.)

2.193 CBSD ON

Description: Is the CBSD (Card Based Speed Dialing) feature active? For 5E9(2), both Phase 1 and

Copyright © 2003 Lucent Technologies

Phase 2 are included in the CBSD feature. Both ACCS and operator calls are now handled under this feature.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If CBSD ON is "Y", then:
- CAS R3 must be "Y"
- CSD ACCESS CODE must be entered

2.194 PHASE 1

Description: Is Phase 1 of the CSD (Card Speed Dialing) feature activated? Phase 1 of the CSD feature provides basic speed dialing for automated card billed calls. Provisioning of the SDC (Speed Dialing Codes) will be done manually by customer services representatives.

Software Release: 5E8 - 5E9(1)
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then CAS R3 must be "Y".

2.195 PHASE 2

Description: Is Phase 2 of the Card Speed Dialing feature activated? Phase 2 of the CSD feature allows the caller to make operator initiated calls.

Software Release: 5E9(1) only
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then CSD PHASE 1 must be also be "Y".

Phase 2 for CSD (Card Speed Dialing) feature is a secured feature that must be purchased by the office before the CSD PHASE 2 field on the OSPSOPT form can be set to "Y". SFID 365 ACT field must be set to "Y" on the SFSYS form (5713-1 Record).

AUTO PROVISIONING (SDAP)

The following fields (Section 2.196 - Section 2.198) support the Card Based Speed Dialing Auto Provisioning feature.

2.196 SDAP ON

Description: Is the Auto Provisioning phase of the CSD (Card Based Speed Dialing) feature active? This phase allows automated position treatment of Speed Dial calls. For more information on Speed Dial Auto Provisioning, see Division 2, Section 4A367. See also, Division 2, Section 4A365 for Card Based Speed

Copyright © 2003 Lucent Technologies

Dialing.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If SDAP ON is "Y", then:
- AS FEATURE WORD must be "Y"
- CAS R3 ON must be "Y"
- CBSD ON must be "Y"
- SDAP DEST IDX must be entered
- SDAP PCN must not be 0

2.197 DEST IDX

Description: This field specifies the serving teams that have automated positions capable of handling Card Based Speed Dialing Auto Provisioning calls. This parameter is initially set to 0, but it must be updated to a valid index, as determined by the service provider, before the Auto Provisioning feature can be activated. When set to a non-zero value, this routing index is used to determine the serving team for the call.

Software Release: 5E9(2) and later.
Valid Entries: 1 - 4095

Data Rules:

If SDAP ON is "Y", then SDAP DEST IDX must be entered. This must equal a destination index (CDI field) defined on an ACDPOL form (5412 Record).

If DEST IDX (for the SDAP feature) is entered, then the following conditions must be met:

1. NEXT CALL TYPE POOL LIST must be entered on an ACDPOL form where the TGN/CDI value on that forms equals the DEST IDX on this form.

2. This same ACDPOL form must have a PRE CALL ID which matches the PRE CALL ID on an ACDCTP form.

3. The matching ACDCTP form must have CALL ORIGIN set to "AP".

2.198 SDAP PCN

Description: This field is used as the "pseudo called number" on the AMA records of billable SDAP (Speed Dial Auto Provisioning) calls such as DIOR and Wireless. For more information on Speed Dial Auto Provisioning, see Division 2, Section 4A367. See also, Division 2, Section 4A365 for Card Based Speed Dialing.

Software Release: 5E9(2) and later.
Required Field.
Default: 0
Valid Entries: 0 or 10 digits

MECH

The following fields (Section 2.199 - Section 2.207) define options for MECH (More Efficient Call

Copyright © 2003 Lucent Technologies

Handling) feature.

2.199 FEATURE WORD

Description: Is MECH feature processing activated? ("T" for test trunk can be entered in the Recent Change View.)

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E9(2) and later:

COIN MECH on the OSPSOPT form must be entered, if this office has an EQIM form where the value of CONFIGURATION supports OSPS. Also, one or more of the following conditions is true:

- OSPS DA is "Y" on the OSPSOPT form
- OSPS TA is "Y" on the OSPSOPT form
- PSM is "Y" on an OSPSSMINF form
- OSPS PSM is "Y" on an EQIM form

For the CONFIGURATION that supports OSPS see the table Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.

Conversely, if an office does not have an EQIM form where the value of CONFIGURATION supports OSPS or when both the ACTS (Automated Coin Toll Service) and the FEATURE WORD fields are not set to "Y", then COIN MECH must be 0.

2.200 PERSON SWITCH

Description: Is MECH processing of person-to-person calls is activated?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If PERSON SWITCH is "Y", PERSON COLLECT must be "Y".

2.201 PERSON COLLECT

Description: Is MECH processing of person-to-person collect calls activated? The OSPS 5E6 MECH feature accommodated MECH eligibility on Station Collect calls only or on Station Collect calls plus all Person calls regardless of their class of charge (Person Paid, Person Card, etc). The PERSON COLLECT field, when coordinated with the PERSON SWITCH field value, allows both call handling enforcement and OAP 15 Minute and 24 Hour Report support of Station and Person Collect only MECH eligibility. The following table illustrates the allowed states of these fields and the resulting MECH eligibility for Person calls.

PERSON SWITCH	PERSON COLLECT	MECH ELIGIBILITY
N	Y	Only PERSON COLLECT is MECHable
Y	Y	ALL PERSON calls are MECHable. These are the active values at retrofit and they apply when, before retrofit, Station Collect PLUS ALL Person calls were technically MECHable. To change to the Station and Person Collect

		only MECH eligibility state, PERSON SWITCH must be changed from "Y" to "N".
N	N	NO PERSON calls are MECHable
Y	N	Invalid combination

Software Release: 5E9(1) and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.202 MUTE BK

Description: Should the back party be muted at operator seizure? If "Y" is entered, the back party is muted when a MECH processed call goes to an operator's position after the forward party answer.

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.203 MUTE FWD

Description: Should the forward party be muted at operator seizure? If "Y" is entered the forward party is muted when a MECH call goes to an operator's position after the forward party answer.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.204 MECH ANNC

Description: Should the holding announcement always be played for each call if an operator is not available to service the call at the forward party answer? If "N" is entered in the MECH ANNC field, then the holding announcement is only played when the expected delay exceeds the first delay threshold entered in the 1ST ANNC DELAY field on the OSPSCT form.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.205 MECH BRAND

Description: Should the branding feature be activated for holding announcement calls handled by MECH? Branding indicates the type of operator used. An entry of "N" indicates that the unbranded holding announcement (UNBRANDED ANNC) is played.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.206 REPEAT INTERVAL

Description: REPEAT INTERVAL is the number of seconds between MECH holding announcements.

Software Release: 5E6 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: 8 (seconds)
Valid Entries: 0 - 255 (seconds)

2.207 OFF HOOK WAIT

Description: OFF HOOK WAIT represents the length of time in minutes a MECH call is outpulsed while waiting for an off-hook message. If an off-hook message is not received within the number of minutes specified in this field, the call is torn down. A value of 0 turns off timing.

Software Release: 5E6 and later
Required Field.
Default: 4 (minutes)
Valid Entries: 0 - 15 (minutes)

LISTING SERVICES

The following fields (Section 2.208 - Section 2.211) define options for Listing Services. For more information on Listing Services features see Division 2 Section 3C.

2.208 LSCC FEATURE WORD

Description: Is the DACC (Directory Assistance Call Completion) feature activated?

Software Release: 5E6(2) and later
Required Field.
Valid Entries: Y, N

2.209 COIN PAID TRAF

Description: Should coin sent paid traffic be allowed for Listing Services call completion?

Software Release: 5E6(2) and later
Required Field.
Default: N
Valid Entries: Y, N

2.210 LS INTER CC

Description: Should interLATA call completion be allowed for Listing Services?

Software Release: 5E6(2) and later
Required Field.
Valid Entries: Y, N

2.211 LSCC R2

Description: Is the Listing Services Call Completion Release 2 feature activated? This feature includes entry of the back number and charging information by the Listing Services operator for LSCC (Listing Services Call Completion.) For more information on Listing Services Features, see Division 2, Section 3C.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If this field is "Y", then LSCC FEATURE WORD must be "Y".

2.212 MAX DUAL PORT CST

Description: Enter the maximum number of operator positions allowed to use the CST (Combined Service Terminals) software for the OSPS Recognition of Customer Provided Terminal feature. This field can only be entered in ODA, it cannot be entered or changed via Recent Change.
Valid Entries: 1 - 4095

Data Rules:

The total number of OSPSOP forms with CST INTERFACE entered must not be greater than the value of MAX DUAL PORT CST. If the total number of forms is greater, either some of the OSPSOP forms must be deleted, or the value of MAX DUAL PORT CST must be increased.

2.213 REC ON TRANS ANNC

Description: Should an enhanced AMA record be generated for Listing Services calls upon transfer to an announcement? The field supports the Enhanced AMA for Listing Services Secured Feature. For more information on this feature see Division 2, Section 4A369.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If LSTG SVC REC is "Y", REC ON TRANS ANNC must be "N".

This field is used by the "Enhanced AMA for Listing Services" secured feature. This feature must be purchased by the office before this field can be set to "Y". A SFSYS form must exist with SFID 369 ACT set to "Y".

2.214 REC ON CSAME/CDIFF

Description: Should an enhanced AMA record be generated for Listing Services calls for CSAME (Completion Same) and CDIF (Completion Different)? CSAME bills the call to the phone used to make the call. CDIF provides alternate billing, such as collect or credit card. The field supports the DACC (Directory Assistance Call Completion) AMA Record with Operator-Entered Forward Number secured feature (SFID 407 and OFID 640). For more information on this feature, see Division 2, Section 407. This field replaced the REC ON MANUAL COMP field .

Required Field.

Data Rules:
If LSTG SVC REC is "Y", REC ON CSAME/CDIFF must be "N".

2.215 REC ON VERBAL REPT

Description: Should an enhanced AMA record be generated for Listing Services calls upon verbal report? The field supports the Enhanced AMA for Listing Services Secured Feature. For more information on this feature see Division 2, Section 4A369.

Software Release: 5E9(1) and later.
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If LSTG SVC REC is "Y", REC ON VERBAL REPT must be "N".

This field is used by the "Enhanced AMA for Listing Services" secured feature. This feature must be purchased by the office before this field can be set to "Y". A SFSYS form must exist with SFID 369 ACT set to "Y".

2.216 REC ON POS RELEASE

Description: Should an enhanced AMA record be generated for Listing Services calls upon position release? The field supports the Enhanced AMA for Listing Services Secured Feature. For more information on this feature see Division 2, Section 4A369.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If LSTG SVC REC is "Y", REC ON POS RELEASE must be "N".

This field is used by the "Enhanced AMA for Listing Services" secured feature. This feature must be purchased by the office before this field can be set to "Y". A SFSYS form must exist with SFID 369 ACT set to "Y".

INTERCEPT

The following fields (Section 2.116 - Section 2.119) define the Intercept feature. Intercept is a feature for 5E6(2) and later.

2.217 INTER CC

Description: Should OSPS intercept interLATA call completion be allowed?

Software Release: 5E6(2) and later
Required Field.
Valid Entries: Y, N

2.218 DEST IDX

Description: Enter the Intercept Destination Index. This field indicates how OSPS should treat an incoming intercept call when a signaling irregularity is detected. If this field is left blank, then the call is sent to reorder, but if a non-zero value is entered, then this destination index is used to determine the OSPS call queue for the call.

Software Release: 5E6(2) and later
Valid Entries: 1 - 4095

2.219 AIS DAS

Description: Enter the DAS (Digit Analysis Selector) for incoming intercept signaling over MF trunks. The DAS is used as the starting point in digit analysis for digits signaled over incoming intercept trunks using MR signaling. Using this DAS, an INDIT/LDIT (Incoming Trunk Preliminary Digit Interpreter Table / Local Digit Interpreter Table) combination can be found which defines the valid signaling patterns for these

Copyright © 2003 Lucent Technologies

trunks. Valid patterns should have a CALL TYPE of "NORMAL", while invalid patterns should use "VACANT" on the LDIT form.

Software Release: 5E6(2) and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

The AIS DAS entered on an OSPSOPT form must be defined as DIGIT ANALYSIS SELECTOR on the DAS form.

AATOS/SDN NRA (AS)

The following fields (Section 2.220 - Section 2.222) define AATOS (Alternate Access to Operator Services) and SDN/NRA (Software Defined Network/ Network Remote Access) options.

2.220 AS FEATURE WORD

Description: Is the processing of AATOS/SDN NRA calls activated?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If AS FEATURE WORD is "Y", then:

- SDN CARRIER must be entered
- For 5E 14 and earlier: SDN DAS must be 1 - 99.

  For 5E15 and later: SDN DAS must be 1 - 254.
- OSPS TA must be entered as "Y".
- SDN CARRIER must be entered as the CARRIER ID on the ICF form.

2.221 SDN CARRIER

Description: Enter the default carrier ID for SDN/NRA calls.

Software Release: 5E7 and later
Valid Entries: 0 - 9999

Data Rules:

The SDN CARRIER must be entered as the CARRIER ID on the ICF form. In addition, for 5E9(1) and later, FEAT GRP on the ICF form must equal "D".

2.222 SDN DAS

Description: Enter the Digital Analysis Selector for SDN/NRA calls.

Copyright © 2003 Lucent Technologies

Software Release: 5E7 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

DIOR SPEED DIALING

The following field defines a parameter for the DSD (DIOR SPEED DIALING) feature. For more information on the DIOR Speed Dialing feature, see Division 2, Section 3K.

2.223 DSD SERVICE CODE

Description: Enter the access code for the DIOR Speed Dialing Service.

Software Release: 5E8 and later.
Default: 14
Valid Entries: 11 - 18 or 191 - 198

Data Rules:

For 5E9(1) and later the DSD SERVICE CODE entry must not equal the ACCESS CODE or SERVICE CODE entries on this form.

SUBACCOUNT BILLING

The following fields (Section 2.224 - Section 2.226) define Sub-account billing options.

2.224 SAB ON

Description: Is Subaccount Billing to be offered by this switch?

Software Release: 5E5 and later
Default: N
Valid Entries: Y, N

Data Rules:

This field must be "Y" if the entry in LEC ALW is "Y".

2.225 ACCESS CODE

Description: This field indicates the Subaccount Billing access code, which is the digit sequence keyed by the customer at the ACCS bong tone to indicate that the call should receive Subaccount Billing treatment.

Software Release: 5E5 and later
Default: 15
Valid Entries: 11 - 18

2.226 LEC ALW

Description: If the switch is owned by an interexchange carrer, is Subaccount Billing Service offered by the LEC serving this switch?

Software Release: 5E5 and later
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If "Y" is entered in the LEC ALW field, then "Y" must be entered in the SAB ON field.

CALL QUEUE SLOTS

The following fields (Section 2.227 - Section 2.229) define call queuing options for ACD. Software Release: 5E6 and later

2.227 ACTUAL CQDB

This is a Recent Change only field.

2.228 REQUIRED CQDB

This is a Recent Change only field.

2.229 CLAIM CQDB

Description: CLAIM CQDB specifies the maximum number of conference and transfer requests within the OSPS ACD to specific positions (i.e., requested by operator login id or position number) that can be queued because the "claimed" positions are busy.

Software Release: 5E6 and later
Required Field.
Default: 0
Valid Entries: 0 - 5000

Data Rules:

The sum of the entry in this field and all the entries of MAX CALLS on the OSPSCT form (5404 Record) must not exceed 5000.

DIOR SEQUENCE CALLING

The following fields (Section 2.230 - Section 2.236) define parameters for DIOR Sequence Call Handling. For more information on DIOR Sequence Call Handling, see Division 2, Section 3K on DIOR features.

2.230 DOM WAIT

Description: Enter the domestic waiting time period in seconds for the amount of time the DIOR Sequence Call Handling feature must wait before playing the announcement offering sequence dialing for an undefined or ring/no answer domestic call.

Software Release: 5E9(1) and later.
Default: 36
Valid Entries: 1 - 120 (seconds)

Data Rules:

If DIOR OTTO ACT is "Y", then DOM WAIT, INTL WAIT, and POST COMPL must all be entered.

2.231 INTL WAIT

Description: Enter the international waiting time period in seconds that is the amount of time the DIOR Sequence Call Handling feature must wait before playing the announcement offering to transfer the call to

Copyright © 2003 Lucent Technologies

an operator on undefined or ring/no answer international call.

Software Release: 5E9(1) and later.
Default: 60
Valid Entries: 1 - 120 (seconds)

Data Rules:

If DIOR OTTO ACT is "Y", then DOM WAIT, INTL WAIT, and POST COMPL, must all be entered.

2.232 POST COMPL

Description: Enter the post call completion time period in seconds that is the amount of time the DIOR Sequence Call Handling feature must wait before playing the announcement offering to transfer the call to an operator after a call has been completed. Entering 15 effectively turns this feature off for post call completion, since the switch disconnects after 10 seconds.

Software Release: 5E9(1) and later.
Default: 3
Valid Entries: 0 - 9, 15 (seconds)

Data Rules:

If DIOR OTTO ACT is "Y", then DOM WAIT, INTL WAIT, and POST COMPL must all be entered.

2.233 BUSY ANN ACT

Description: Should the DIOR Sequence Call Handling feature play an announcement to offer to transfer to the operator the CCS7 busy calls?

Software Release: 5E9(1) and later.
Default: N
Valid Entries: Y, N

2.234 RNA ANN ACT

Description: Should the DIOR Sequence Call Handling feature play an announcement to offer to transfer to the operator the CCS7 ring no answer calls?

Software Release: 5E9(1) and later.
Default: N
Valid Entries: Y, N

2.235 UNDEF ANN ACT

Description: Should the DIOR Sequence Call Handling feature play an announcement to offer to transfer to the operator the calls with a called number status of undefined?

Software Release: 5E9(1) and later.
Default: N
Valid Entries: Y, N

2.236 DIOR OTTO ACT

Description: Should the DIOR Sequence Call Handling feature be activated to OTTO (Offer Transfer To Operator)?

Software Release: 5E9(1) and later.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

If DIOR OTTO ACT is "Y", then DOM WAIT, INTL

WAIT, and POST COMPL must all be entered.

DIOR AUTOMATED CALLING

The following field supports DIOR AIC R3 (Direct International Originations Automated Initial Calls Release 3) feature. For more information on this feature, see Division 2, Section 3K on Direct International Originations.

2.237 DIOR AIC R3

Description: Is the DIOR Automated Initial Calls Release 3 feature active?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

VOICE MESSAGING SERVICE

The following fields (Section 2.238 - Section 2.241) define Voice Messaging service options.

2.238 VMS ON

Description: Is the OSPS VMSI feature activated?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ESP CREDIT CHECK is "Y", then CAS R3 ON must be "Y" and VMS ON must be "Y".

If PROMPT ON BUSY is "Y", then VMS ON must be "Y".

If PROMPT ON RING is "Y", then VMS ON must be "Y".

If OSPS TA is "N" then VMS ON must be "N".

If VMS ON is "Y" then SERVICE CODE must be entered.

2.239 VMS TIME OUT

Description: Enter the time out for ready to receive measured in seconds.

Software Release: 5E7 and later
Required Field.
Default: 20
Valid Entries: 1 - 20 seconds

2.240 OSPS OWNER

Copyright © 2003 Lucent Technologies

Description: Enter the the owner ID of the originating OSPS.

Software Release: 5E7 and later
Required Field.
Default: 0
Valid Entries: 0 - 9

2.241 SERVICE CODE

Description: Enter the VMSI Service Code.

Software Release: 5E7 and later
Default: 12
Valid Entries: 11 - 18, 191 - 198

Data Rules:

SERVICE CODE must not equal ACCESS CODE.

If SERVICE CODE is equal to 15, ACCESS CODE must be entered, but not as 15.

If VMS ON is "Y", then SERVICE CODE must be entered.

VMS ANNOUNCEMENT PROMPT

The following fields (Section 2.242 - Section 2.244) define VMS announcement prompt options. See Division 2, Section 3I for more information on this feature.

2.242 PROMPT ON BUSY

Description: Is the VMS prompt treatment on busy calls feature activated?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PROMPT ON BUSY is "Y", then VMS ON must be "Y".

2.243 PROMPT ON RING

Description: Is the VMS prompt treatment on Ring - No Answer activated?

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PROMPT ON RING is "Y", then VMS ON must be "Y".

2.244 RING TIME OUT

Description: Enter the RING TIME OUT in seconds before applying VMS Prompt On Ringing. This field is used by OSPS to indicate the amount of time it will wait before applying VMS prompting treatment on Ring

Copyright © 2003 Lucent Technologies

- No Answer calls.

Software Release: 5E7 and later
Default: 36
Valid Entries: 0 - 120 (seconds)

ESP (VMS) CREDIT CHECK

The following field defines the ESP (Enhanced Service Provider) VMS (Voice Messaging Service) credit check.

2.245 CREDIT CHECK

Description: Is the Enhanced Service Provider Credit Checking feature activated? For more information on this feature, see Division 2, Section 3I.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ESP CREDIT CHECK is "Y", then CAS R3 ON must be "Y" and VMS ON must be "Y".

TELEPHONE RELAY SERVICE (TRS)

The following fields (Section 2.246 - Section 2.248) define parameters for the TRS (Telephone Relay Service) feature. The OSPS TRS Call Handling special feature provides identification of TRS call billing restrictions based on received ANI Information Digits (II), screening calls originating in the area normally served by the receiving OSPS and identifying the calls as TRS calls in the AMA records for billing purposes. For more information on the TRS secured feature, see Division 2, Section 4A25.

2.246 TRS UNRESTRICTED

Description: Enter Telephone Relay Service unrestricted ANI II digits. Unrestricted indicates that all types of billing are allowed.

Software Release: 5E8 and later.
Required Field.
Default: 60
Valid Entries: 10 - 99

2.247 TRS RESTRICTED

Description: Enter the Telephone Relay Service restricted ANI II digits. Restricted indicates that sent-paid billing is not allowed.

Software Release: 5E8 and later.
Required Field.
Default: 67
Valid Entries: 10 - 99

2.248 TRS HOTEL

Description: Enter the Telephone Relay Service hotel ANI II digits. Hotel indicates that sent-paid billing not allowed on calls with an ANI outside the normally served area of the OSPS.

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later.
Required Field.
Default: 66
Valid Entries: 10 - 99

PRE-PAID OVERTIME COIN

The following fields (Section 2.249 - Section 2.250) define parameters for the Prepaid Overtime Coin feature. For more information on the Prepaid Overtime Coin feature see Division 2, Section 4A372.

2.249 COIN WARN

Description: This field is used to specify the time for the warning period for Pre-Paid Overtime for Coin Calls. This time period is for the amount of time prior to the end of the overtime period that a warning announcement should be given to the caller. If 0 is entered, no warning will be given.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 15

2.250 ERROR HNDLG

Description: This field is used to specify the type of call handling that should be used when too many rating failures occur on a Pre-Paid Overtime for Coin Call. The default treatment is to revert to standard post-paid coin service.

Software Release: 5E9(1) and later.
Valid Entries:

Valid ERROR HNDLG Entries

Entry	Definition
STD	Standard post-paid coin service
OPER	Transfer to an operator

AUTO INWRD LINE SCRN

The following fields (Section 2.251 - Section 2.255) support the AILS (Automated Inward Line Screening) feature. For more information on the AILS features, see Division 2, Section 4A370.

2.251 SOFTWARE VERSION

Description: Enter the AILS software version currently active in the OSPS.

Software Release: 5E9(1) and later.
Required Field.
Default: 1
Valid Entries: 1 - 99

2.252 ALLOW TCS

Description: are AILS CCS7 TCAP queries for TCS checks allowed when the OSPS is accessed via an 800 number?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.253 TIME

Copyright © 2003 Lucent Technologies

Description: Enter the TCAP query timeout parameter. It is expressed in tenths of seconds, e.g. enter 20 for 2 seconds.

Software Release: 5E9(1) and later.
Required Field.
Default: 20 (tenths of a second)
Valid Entries: 5 - 100 (tenths of a second)

2.254 ALARM THRESHOLD

Description: Enter the percentage to be compared with the ratio of AILS AT&T CCS7 TCAP query successes to total query attempts. In the event this ratio falls below the threshold, a software alarm will be activated. This field will not be active until 5E10 and later.

Software Release: 5E9(1) and later.
Required Field.
Default:

For 5E9(1) - 5E9(2): 0
- For 5E10 and later: 95

Valid Entries: 0 - 100

2.255 MINIMUM QUERY

Description: Enter the minimum number of query attempts required within a quarter hour for AILS AT&T CCS7 TCAP queries before a software alarm is activated by the OSPS. This field will not be active until 5E10 and later.

Software Release: 5E9(1) and later.
Required Field.
Default:

For 5E9(1) - 5E9(2): 1
- For 5E10 and later: 40

Valid Entries: 1 - 64

AUTO SERVICE ACCESS PROMPT

The following fields (Section 2.256 - Section 2.257) support the Auto Service Access Prompt for Language Specific Operator Services feature. For more information on this secured feature, see Division 2, Section 4A384.

2.256 ASAP AMA

Description: Should a new module be attached to the AMA billing stream that identifies calls that were given ASAP (Automated Service Access Prompting) FEM (Front End Menu) prompting?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ASAP (Auto Service Access Prompt) is a secured feature and must be purchased by the office before the

Copyright © 2003 Lucent Technologies

ASAP AMA or ASAP RTRS field on the OSPSOPT form can be set to "Y". The ACT field for SFID 384 must be set to "Y" on the SFSYS form (5713-1 Record) or the ACT field for SFID 288 for AT&T secured features must be "Y".

2.257 ASAP RTRS

Description: Should a new module be attached to the RTRS (Real Time Rating System) queries for ASAP calls and 0- operator calls to identify the level of automation and who entered the forward number?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ASAP (Auto Service Access Prompt) is a secured feature and must be purchased by the office before the ASAP AMA or ASAP RTRS field on the OSPSOPT form can be set to "Y". The ACT field for SFID 384 must be set to "Y" on the SFSYS form (5713-1 Record) or the ACT field for SFID 288 for AT&T secured features.

INCOMING SS7 SIGNALING

The following fields (Section 2.258 - Section 2.260) support the CCS7 Incoming Signaling for OSPS feature. For more information on this feature, see Division 2, Section 4A395.

2.258 SS7 SIGNALING

Description: Is the CCS7 Incoming Signaling for OSPS feature activated for this switch? This field specifies whether or not the OSPS is allowed to handle the incoming SS7 signaled calls from the 4ESS Switch.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This is a secured feature. If "Y" is entered, either the ACT field for SFID 395 must be "Y" on the SFSYS form (5713-1 Record) for this feature, or the ACT field for SFID 288 for AT&T secured features must be "Y".

2.259 ACM INTL TIMER

Description: For SS7 incoming international calls, enter the time delay (in 10 millisecond increments) between

- requesting that an ACM (Address Complete Message) be sent

and

- the initial request to connect an announcement circuit, automated position, or operator position.

Software Release: 5E10 and later.
Required Field.

Copyright © 2003 Lucent Technologies

Default: 1000
Valid Entries: 0 - 5000 (in 10 msec increments)

2.260 ACM DOMESTIC TIMER

Description: For SS7 domestic calls, enter the time delay (in 10 milisecond increments) between

- requesting that an ACM (Address Complete Message) be sent

and

- the initial request to connect an announcement circuit, automated position, or operator position.

Software Release: 5E10 and later.
Required Field.
Default: 100
Valid Entries: 0 - 5000 (in 10 msec increments)

2.261 PLBQ PROMO CARD

Description: Is the PLBQ Business/Residential Card feature activated? The PLBQ PROMO CARD and FULL CARD ENTRY fields were added to support the PLBQ Business/Residential Card feature. For more information on this feature, see Division 2, Section 4A400.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PLBQ PROMO CARD equals "Y", then PLBQ2 ON must equal "Y".

PLBQ Business/Residential Promo Card is a secured feature that must be purchased by the office before the PLBQ PROMO CARD field on the OSPSOPT form can be set to "Y". If "Y" is entered, then the ACT field for SFID 288 or SFID 400 must be set to "Y",

2.262 FULL CARD ENTRY

Description: Is the full card number required to be entered to receive CAS (Customer Accounts Services) rate quotes? The PLBQ PROMO CARD and FULL CARD ENTRY fields to support the PLBQ Business/Residential Card feature. For more information on this feature, see Division 2, Section 4A400.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If FULL CARD ENTRY equals "Y", then PLBQ2 ON must equal "Y".

QUIET HEAR

The following fields (Section 2.263 - Section 2.268) support the Quiet Hear feature. For more information on this feature, see Division 2, Section 4A402. This is a secured feature, therefore "Y" must be entered in

Copyright © 2003 Lucent Technologies

either the ACT field for SFID 402 or SFID 228.

2.263 LEC CARD ALW

Description: Are LEC (Local Exchange Carrier) cards eligible for QH (Quiet Hear) treatment?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.264 COLLECT COC ALW

Description: Are calls billed with a Collect COC (Class-of-Charge) eligible for QH treatment.

Software Release: 5E9(2) and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.265 THIRD NUMBER COC ALW

Description: Are calls billed with a Third Number COC (Class Of Charge) eligible for QH treatment.

Software Release: 5E9(2) and later.
Required Field.
Default: Y
Valid Entries: Y, N Enter Y for yes or N for no.

2.266 MISC COC ALW

Description: Are calls billed with
- Auto Collect
- Direct Distance Dialing (DDD)
- Hotel Room Number
- No Charge
- Paid
- COC (Class Of Charge)

designations are eligible for QH treatment? This field also defines QH treatment eligibility when external routing occurs without COC.

Software Release: 5E9(2) and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.267 DOM TIMER

Description: Enter the time interval for QH-T1 (Quiet Hear-Timer1). After a request is made to play the Quiet Hear Audio Logo annoucement (OSPSTA Header ID 148), which is a branding announcement, this timer determines the length of time (in tenths of seconds) OSPS waits before starting to outpulse a domestic forward number.

Software Release: 5E9(2) and later.
Required Field.
Default: 80

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 80 tenths of a second.

2.268 INTL TIMER

Description: Enter the time interval for QH-T2 (Quiet Hear-Timer2). After a request is made to play the Quiet Hear Audio Logo annoucement (OSPSTA Header ID 148), which is a branding announcement, this timer determines the length of time (in tenths of seconds) OSPS waits before starting to outpulse an international forward number.

Software Release: 5E9(2) and later.
Required Field.
Default: 80
Valid Entries: 0 - 80 tenths of a second

DIOR NRA

The following fields (Section 2.269 - Section 2.271) define parameters which support the DIOR (Direct International Originations) NRA (Network Remote Access) feature. For more information on this feature, see Division 2, Section 3K on Direct International Origination features.

2.269 NRA RTE IDX

Description: Enter the DIOR Network Remote Access routing index. The destination index (NRA DEST IDX) and route index fields should be populated with the destination and route indexes to be used when routing the DIOR NRA calls to the appropriate NRA toll office.

Software Release: 5E9(2) and later.
Valid Entries:
- For 5E13 and earlier: 1 - 3617
- For 5E14 and later: Blank, or 1 - 16382

2.270 NRA DEST IDX

Description: Enter the DIOR NRA (Network Remote Access) destination index to be used when routing DIOR NRA calls to the appropriate NRA toll office.

Software Release: 5E9(2) and later.
Valid Entries:
- For 5E12 and earlier: 1 - 4095
- For 5E13 and later: 1 - 16382

2.271 DIOR NRA ACT

Description: Is the DIOR (Direct International Originations) NRA (Network Remote Access) feature active?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DIOR NRA ACT is "Y", NRA RTE IDX and NRA DEST IDX must both be entered.

TOLL-FREE NPA EXPANSION

Copyright © 2003 Lucent Technologies

The following fields (Section 2.272 - Section 2.274) define the parameters for the 800 Toll Free Service NPA Expansion secured feature. For more information on this feature, see Division 2, Section 4A405.

2.272 DISP AUTO COLLECT

Description: Is AUTO COLLECT automatically displayed at a position for toll-free calls?

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.273 ENF AUTO COLLECT

Description: Is the auto collect portion of the 800 Toll-Free Services NPA Expansion feature enforced?

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then DISP AUTO COLLECT must equal "Y".

2.274 DIOR VMS FWD NBR

Description: Enter the 10-digit forward number to which VMS (Voice Messaging Service) transfers are sent for DIOR or wireless calls.

Software Release: 5E10 and later.
Required Field.
Default: 8005626275
Valid Entries: 10 digits

VMS ACCESS DIALING

The following fields (2.275 - 2.279) define the parameters for the VMS Access Dialing secured feature. For more information on this feature, see Division 2, Section 4A418.

2.275 VMS ACC DIAL

Description: Is the VMS Access Dialing feature activated? When this field is "Y", and the VMS ON field is "Y", then it is activated.

Software Release: 5E10 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When VMS ACC DIAL is Y, VMS ON must be Y.

2.276 VMS AD TIMER

Description: Specifies the interval, in tenths of a second, that OSPS waits for completion of entering an ESP (Enhanced Service Provider) access code.

Copyright © 2003 Lucent Technologies

Software Release: 5E10 and later.
Default: 20
Valid Entries: 10 - 90 tenths of a second

2.277 INTL RING TO

Description: Specifies the ring duration, in seconds, to wait before applying VMS prompt treatment for international non-answered calls.

Software Release: 5E10 and later.
Default: 36
Valid Entries: 0 - 120 seconds

2.278 IMPLCT TRANS

Description: Is the VMS Implicit Transfer feature activated? When this field is set to "Y", the VMS ACC DIAL field is set to "Y" and the IM TR ESP AC field has a valid value set, this feature is activated.

Software Release: 5E10 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When IMPLCT TRANS is "Y", VMS ACC DIAL must be "Y".

When IMPLCT TRANS is "Y", IM TR ESP AC must be entered.

2.279 IM TR ESP AC

Description: Specifies the ESP (Enhanced Service Provider) Access Code to which a call is transferred when the caller has implicitly requested a transfer to VMS.

Software Release: 5E10 and later.
Valid Entries: 0 - 999 or blank

Data Rules:

When the IM TR ESP AC field is entered on the OSPSOPT form, there must be an associated ESPINFO form where ACCESS CODE matches the IM TR ESP AC value.

SEC. 4Z: 5425 RECORD
AUTOMATIC CHARGE QUOTATION SERVICE FORM - ACQS

1. GENERAL

The 5425 Record is available with 5E4(2) and later Software Releases.

This record defines the characteristics of an ACQS (Automatic Charge Quotation Service) client. This record must not be entered unless the OSPSOPT form (5425 Record) is submitted and the OSPS TA field on that form is specified as "Y" (Yes).

An ACQS client can be a hotel, hospital, motel, law office, etc. The ACQS client will receive a time and charge quotation upon termination of a call originating from the ACQS client. The quotation will be sent, by the 5ESS Switch OSPS (Operator Services Position System) in one of three manners.

In the first manner, the quote will be electronically transmitted to a HOBIC or HOBIS (Hotel Billing Information Center or System), where an operator will then verbally transmit the information to the ACQS client. This is referred to as a voice quote.

In the second manner, a Network Auto Quote will be electronically transmitted to a HOBIC or HOBIS, where an operator will then verbally transmit the information to the ACQS client. This will appear as a voice quote to the client.

In the third manner, the quote is electronically transmitted directly to the ACQS client over a leased line to a printer or computer. This is referred to as an auto quote.

1.1 Hardware Requirements

The complete hardware requirements for an auto quote system (as opposed to a voice quote system), are explained in Division 3, Section 4L of this document.

The only component of the hardware that is defined on this input form is the analog TEN (Trunk Equipment Number), which defines the analog trunk port that connects to a leased line to a printer or computer at the ACQS client.

1.2 Recent Change View

The corresponding Recent Change view for this form is 26.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group number and the Office Name on each record.

2.2 * NPA

Description: Enter the NPA of the ACQS client line.

For 5E5 and later, this form contains three key fields and one optional key field. The four fields, NPA, NXX, BEG LINE and END LINE permit the entry of a range of telephone numbers. It is imperative that a single number or a number within a range of numbers is not duplicated as a single number or a number within a range of numbers on another instance of the ACQS input form.

Software Release: 5E5 and later.
Required Field.
Valid Entries:

Copyright © 2003 Lucent Technologies

- For 5E4(2) - 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

Data Rules:

For 5E9(1) and later, NPA/NXX assigned on the ACQS form must be defined on the NPAMAP form.

2.3 * NXX

Description: Enter the NXX of the ACQS client line.

Software Release: 5E5 and later.
Required Field.
Valid Entries: 3 digits

2.4 * BEG LINE

Description: Enter the last four digits of the ACQS client line. If a single line is being entered, then the END LINE field should not be entered. If a range of lines is being entered, then the entry in the BEG LINE field is the first member of the range.

Software Release: 5E5 and later.
Required Field.
Valid Entries: 0000 - 9999

2.5 (*) END LINE

Description: If a range of ACQS client lines is being entered, enter the last four digits of the last member of the range.

Software Release: 5E5 and later.
Valid Entries: 0000 - 9999

Data Rules:

If an entry is made in the END LINE field, it must be greater than the entry in the BEG LINE field.

2.6 # QUOTE TN

Description: Enter the 10-digit number used to deliver the time and charge quotation to the ACQS client. The valid entries for this required field are telephone numbers in NPA-NXX-XXXX format.

In the case of a voice quote, this is the number that a HOBIS/HOBIC operator would call to verbally relay time and charge information to the ACQS client.

In the case of auto quote, the QUOTE TN defines the telephone number associated with the analog trunk port defined in the AQEST TEN field.

The analog trunk port connects the leased line to the printer/computer of the ACQS client. the QUOTE TN is used internally by the 5ESS Switch software to access the analog trunk port and ensure that the path to the ACQS client is available.

Required Field.
Valid Entries: 10 digits
(See NPA field for NPA codes)

Data Rules:

Copyright © 2003 Lucent Technologies

The QUOTE TN, in both the voice quote and auto quote systems, must be duplicated on every instance of an ACQS input form where the entry in the ACQS NAME field is the same. The ACQS NAME field is an identifier of the ACQS client; every line within the same ACQS client must have the same QUOTE TN. Conversely, different ACQS clients (with different ACQS NAME entries) cannot share the same QUOTE TN.

The QUOTE TN is of special concern in the case of an auto quote system (as opposed to a voice quote system). The following condition applies only when the AUTO QUOTE field is set to "Y", which indicates an auto quote system. The last seven digits of the QUOTE TN must not be duplicated within the 5ESS Switch because the QUOTE TN is associated with a port in the 5ESS Switch. The only exception is the situation stated in the previous paragraph. The duplication of the last seven digits of the QUOTE TN, in the case of a voice quote system, where the AUTO QUOTE field is set to "N", is not of concern because the QUOTE TN is not associated with a port in the 5ESS Switch.

For 5E4(2), if the AUTO QUOTE field is set to "Y" (auto quote system), the last seven digits of the QUOTE TN must not appear in the following fields.

Field	Form	Record
PKT TN	AMLBDSL	5447-1
CKT TN	DSL	5900-1
CKT TN	DSMLHLN	5901-1
PKT TN	DSMLHLN	5901-1
TN	LINE	5109-1
LISTED TN to HIGHEST LISTED TN	MLHG	5110-1
SUBTN (1 to 8)	MLHG	5110-2
TN	MLHLN	5111-1
TN	MTNDR	5550
TN	MULTITN	5114
ACCESS TN	PSMTN	5925
TN (Note 1)	SHTN	5902-1

NOTE: 1:The TN is not the same as the TN in the first row of the SHARED LIST.

For 5E5 and later, the following fields are added to the list. The DSL (5900 Record) and DSMLHLN forms are no longer available.

Field	Form	Record
LOC TN	DFLTSRV	5974
TN (PPB1)	DSL	5907
TN (PPB2)	DSL	5907
CKT TN	DSLUSR	5908
PKT TN	DSLUSR	5908
ODB TN	DSLUSR	5908
MLHG TN (CKT)	DSLUSR	5908
MLHG TN (DPKT)	DSLUSR	5908

If the AUTO QUOTE field on this form is "Y", a NOC form (5501 Record) must exist whose OFFICE CODE matches the fourth through sixth digits of the QUOTE TN, and whose NPA CODE matches the first through third digits of the QUOTE TN.

Every ACQS input form which defines a line for the same ACQS client (the ACQS NAME fields are the same) and have AUTO QUOTE set to "Y" (an auto quote system) must have the same QUOTE TN and AQEST TEN combination. This combination of the QUOTE TN and the AQEST TEN is used by a single ACQS client. Therefore, the QUOTE TN or the AQEST TEN cannot appear on another ACQS input form with a different ACQS NAME.

Every ACQS input form which defines a line for the same ACQS client (the ACQS NAME fields are the same) and have AUTO QUOTE set to "N" (a voice quote system) must have the same QUOTE TN. Therefore, the QUOTE TN cannot appear on another ACQS input form with a different ACQS NAME.

2.7 # ACQS NAME

Description: Enter the identity of the ACQS client. No special characters are allowed.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 3 alphanumeric characters

Data Rules:

Every line within the same ACQS client will have the same ACQS NAME.

Two or more ACQS clients must not share the same ACQS NAME.

Every ACQS input form with the same ACQS NAME (same client) must have the identical entry in the following fields: QUOTE TN, TRUE HOTEL, AUTO QUOTE and AQ MSG FORMAT.

For 5E7 and later, less than 1000 telephone numbers may be assigned to an ACQS Auto Quote Client on ACQS forms. If AUTO QUOTE is "Y" on any ACQS form for 5E4(2) - 5E7 or "PRIVATE_LINE", for 5E8 and later (indicating an ACQS private line auto quote), then the number of 10-digit telephone numbers (indicating an ACQS Auto Quote Client), (NPA, NXX, BEG LINE through END LINE) on all ACQS forms with the same ACQS NAME must be less than 1000.

2.8 # TRUE HOTEL

Description: Is the ACQS client in the business of renting lodging on a nightly basis, such as a hotel or motel?

This information will appear in the AMA Record, Table 12 - Service Feature.

Required Field.
Valid Entries: Y, N

2.9 # AUTO QUOTE

Description: Does the ACQS client use an auto quote system? If "N" is entered, a voice quote system is used.

Software Release: 5E5 - 5E7
Required Field.
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the AUTO QUOTE field, then the AQEST TEN must be specified. If "N" is entered in the AUTO QUOTE field, then an entry is not allowed in the AQEST TEN field.

If "N" is entered in this field, then the AQ MSG FORMAT field must be set to "OSPS".

2.10 AQEST TEN

Description: Enter the TEN (Trunk Equipment Number) for the analog trunk port that connects to a leased line, which in turn connects to a printer or computer at the ACQS client.
Valid Entries: a 7-digit TEN in the following format.

TEN (TRUNK EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Trunk Unit	TU	X	0-7
Service Group	SVG	X	0-1
Pack	PACK	X	0-7
Circuit	CKT	X	0-3

Copyright © 2003 Lucent Technologies

Data Rules:

This field must be entered if the AUTO QUOTE field on this input form has been defined as "Y". This field must not be entered if the AUTO QUOTE field on this form has been defined as "N".

The AQEST TEN value must be defined on an EQTUP form (5720 Record), with the corresponding circuit (last digit of AQEST TEN) defined as "O" (operational) in the CKT X EQSTAT field (where X is the circuit number). ACQS TENs that are defined on the EQTUP form (with a CIRCUIT TYPE of "TRKTST") must have a circuit value (the seventh digit of the AQEST TEN) of 0 or 1 (and not 2 or 3).

The 5ESS Switch allows clients a system maximum of 1,000 auto quote clients (as opposed to voice quote).

The entry in this field must be a unique TEN within the 5ESS Switch. It cannot be duplicated in the following fields:

Field	Form	Record
TEN (Note 1)	TRUNK	5204
NUMBER (when OE TYPE = "T")	MLHLN	5111
NUMBER (when OE TYPE = "T")	LINE	5109

- ***NOTE:*** 1:If the QTY field is greater than 1, consecutive TENs are built for the next (QTY - 1) trunk members.

The AQEST TEN must not be duplicated on other ACQS input forms unless the forms have the same ACQS NAME entry, in which case the duplication is imperative.

2.11 MANUAL PBX

Description: Do either of the following conditions apply to the ACQS client line: a) the call originates through a manual PBX or b) the line is used for administrative calls in some instances and for "guest" calls in other instances? An administrative call does not require a time and charge quotation, whereas a "guest" call (e.g., a call from a hospital patient's room) does require a time and charge quotation.
Default: N
Valid Entries: Y, N

2.12 TRUE BILL TN

Description: Enter the telephone number to be used for billing purposes, if the client line telephone number is not to be used. The telephone number entered in this field will appear on the AMA record.
Valid Entries:

- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

For the 5E4(2) Software Release, the TRUE BILL TN entry cannot be the same as the last seven digits in the ACQS TN field.

For 5E5 and later, the TRUE BILL TN, if the first three digits match the entry in the NXX field, must be such that the last four digits do not match the entry in the BEG LINE or END LINE fields, nor any value between the two entries.

For 5E4(2), if a TRUE BILL TN is entered (and the same number will doubtlessly be entered on every ACQS input form with the same ACQS NAME), then another ACQS input form must be entered such that the key field, ACQS TN, is the TRUE BILL TN prefixed by the NPA of the ACQS TN on the ACQS input form where the TRUE BILL TN is entered. Additionally, the ACQS input form that has the TRUE BILL TN as the last seven digits of the key ACQS TN field should have the same QUOTE TN, ACQS NAME,

Copyright © 2003 Lucent Technologies

TRUE HOTEL, AUTO QUOTE, AQEST TEN and AQ MSG FORMAT entries (or no entries) as the original ACQS input form with the TRUE BILL TN. Finally, the TRUE BILL TN field should not be entered.

For 5E5 and later, if a TRUE BILL TN is entered (and the same number will doubtlessly be entered on every ACQS input form with the same ACQS NAME), than another ACQS input form must be entered such that: a) the NPA entry is the same as the NPA entry on the form with the TRUE BILL TN field, b) the NXX field is the first three digits of the TRUE BILL TN, c) the BEG LINE field is the last four digits of the TRUE BILL TN, and d) the END LINE field does not have an entry. Additionally, the "extra" ACQS input form that was built with keys from the TRUE BILL TN must have the same QUOTE TN, ACQS NAME, TRUE HOTEL, AUTO QUOTE, AQEST TEN and AQ MSG FORMAT entries (or no entries) as the original ACQS input form with the TRUE BILL TN. Finally, the TRUE BILL TN field should not be entered.

This additional ACQS input form that is submitted because of the presence of a TRUE BILL TN has no restrictions placed upon the entry in the MANUAL PBX field. It is possible that an ACQS client will have a mixture of ACQS input forms where some have an entry of "N" in the MANUAL PBX field and some have an entry of "Y". The choice of entry for the MANUAL PBX field in this additional ACQS input form requires some further explanation on the use of the MANUAL PBX field.

If "N" is entered in the MANUAL PBX field, then the call will be treated as a hotel seizure. If a number is entered in the TRUE BILL TN field on this input form, then that number will be displayed to the OSPS operator in the BACK NUMBER portion of the display.

If "Y" is entered in the MANUAL PBX field, then the call will be treated as a non-coin seizure and there will be no hotel identification associated with the call. The original ANI (Automatic Number Identification) will be displayed for the OSPS operator. If the call is announced by the ACQS client operator, the call will be treated as a hotel seizure via the OSPS operator depressing the HOTEL ROOM NUMBER key or depressing the BILLING CODE key and entering "GUEST" or "GST". If a number is entered in the TRUE BILL TN field, then that number will be displayed to the OSPS operator. All normal hotel practices will then apply.

If the ACQS client uses a true billing number and has a mixture of lines, where one subset has MANUAL PBX set to "Y" and the other subset has MANUAL PBX set to "N", then the following call processing conditions, in the event of an ANI failure or ONI (Operator Number Identification) failure, must be considered. If MANUAL PBX is set to "Y" in the form for the true billing number, calls will be treated as non-coin seizures; conversely, if MANUAL PBX is set to "N", calls will be treated as hotel seizures.

If the ACQS client does not use a true billing number, then in the event of an ANI or ONI failure, the aforementioned call processing conditions will be applied based on the MANUAL PBX entry associated with the individual line.

When the ACQS client does not have a mixture of MANUAL PBX entries for their lines, but does use a true billing number, the client should have the same value for MANUAL PBX as appears on the other ACQS input forms for that client.

For 5E12 and later, when a TRUE BILL TN is entered on an ACQS form, it must also be defined on another ACQS form where the:

- NPA equals the first three digits of the TRUE BILL TN
- NXX equals the next three digits of the TRUE BILL TN
- BEG LINE equals the last four digits of the TRUE BILL TN

The END LINE and TRUE BILL TN fields must not be entered on this ACQS form. The QUOTE TN, ACQS NAME, TRUE HOTEL, AUTO QUOTE, AQEST TEN, and AQ MSG FORMAT fields must have the same values or not have entries as on the previous form.

Copyright © 2003 Lucent Technologies

2.13 AQ MSG FORMAT

Description: If "Y" (Yes) is entered in the AUTO QUOTE field, then enter an autoquote message format for the ACQS client. The entry has significance only in the case of an auto quote system, which receives a printed time and charge quotation. A voice quote system receives the time and charge quotation verbally from the HOBIS/HOBIC.
Default: OSPS
Valid Entries:

Valid AQ MSG FORMAT Entries

Entry	Definition
OSPS	Operator Services Position System.
1BT2	Corresponds to the TSPS (Traffic Service Position System) generic 1BT2 format.
TSPS	Corresponds to the TSPS format used prior to generic 1BT2.

The OSPS ACQS interface avoids requiring replacement of existing auto quote TTY equipment. A comprehensive discussion of ACQS message formats is available in a document entitled "5ESS Switch Interface Specifications Required for the AUTO QUOTE Service for Hotel/Motel Feature," which is available from the Customer Information Center (using the ordering number 5D5-900-500).

The following tables present examples of each format type.

TSPS Format Example

123A ABC 06/30 12345 18:15 0028 $004.50 212-345-6789 X	
123A	The sequence number of the message for this ACQS; "A" identifies the TSPS buffer. The number portion will be replaced by "***" when the message cannot be sent to the ACQS directly (due to AQ TTY problems) and will be sent to a HOBIS/HOBIC.
ABC	The client account acronym.
06/30	The date of the call.
12345	The room number or client number.
18:15	The clock time (hours and minutes - 24-hour basis) at which chargeable conversation started.
0028	The elapsed, chargeable conversation time (minutes).
$004.50	The charge for the call.
212-345-6789	The called telephone number; always 10 digits.
X	The special call identifier; "D" is directory assistance; "V" is a verification call; "F" is an international call; "L" is a local call; "T" is a domestic toll call. An asterisk (*) will follow the letter when the message cannot be sent to the ACQS directly (due to AQ TTY paper change state) and will be sent to HOBIS/HOBIC.

1BT2 Format Example

C 123A ABC 06/30 12345 18:15:32 0028:36 $004.50 212-345-6789 X	
C	The carrier identifier. An "A" indicates AT&T-C, a "B" indicates a Bell Operating Company, (or an independent operating company), and a "U" indicates unknown.
123A	The sequence number of the message for this ACQS; "A" identifies the TSPS buffer. The number portion will be replaced by "***" when the message cannot be sent to the ACQS directly (due to AQ TTY problems) and will be sent to a HOBIS/HOBIC. The number portion will be replaced by "###" when an end-of-call rating failure occurs. The time and charge must be voice quoted.
ABC	The client account acronym.
06/30	The date of the call.
12345	The room number or client number.
18:15:32	The clock time (hours, minutes and seconds - 24-hour basis) at which chargeable conversation started.
0028:36	The elapsed, chargeable conversation time (minutes and seconds).
$004.50	The charge for the call. In the event of an end-of-call rating failure, the dollar amount will be "$SSS.SS" or "$PPP.PP" for station and person calls, respectively.
212-345-6789	The called telephone number; always 10 digits.
X	The special call identifier; "D" is directory assistance; "V" is a verification call; "F" is an international call; "L" is a local call; "T" is a domestic toll call. An asterisk (*) will follow the letter when the message cannot be sent to the ACQS directly (due to AQ TTY paper change state) and will be sent to HOBIS/HOBIC.

OSPS Format Example	5E9(1) and later
0288 123C ABC 06/30 1234567890 18:15:32 0028:36 $004.50 212-345-6789 X	
0288	The identification of the interLATA carrier, Bell Operating Company or independent operating company. "0288" indicates AT&T-C, "0000" indicates a Bell Operating Company, (or an independent operating company), while any other value indicates any other interLATA carrier.
123C	The sequence number of the message for this ACQS. If "C" is filled by the letter "A", this indicates that the voice quote number is known. If "C" is filled by the letter "X", this indicates that

Copyright © 2003 Lucent Technologies

	the voice quote number is unknown, and that the ACQS calling number will be substituted. The number portion will be replaced by "***" when the message cannot be sent to the ACQS directly (due to AQ TTY problems) and will be sent to a HOBIS/HOBIC. The number portion will be replaced by "###" when an end-of-call rating failure occurs. The time and charge must be voice quoted.
ABC	The client account acronym.
06/30	The date of the call.
1234567890	The room number or client number.
18:15:32	The clock time (hours, minutes and seconds - 24-hour basis) at which chargeable conversation started.
0028:36	The elapsed, chargeable conversation time (minutes and seconds).
$004.50	The charge for the call. In the event of an end-of-call rating failure, the dollar amount will be "$SSS.SS" or "$PPP.PP" for station and person calls, respectively.
212-345-6789	The called telephone number; always 10 digits.
X	The special call identifier; "D" is directory assistance; "V" is a verification call; "F" is an international call; "L" is a local call; "T" is a domestic toll call. An asterisk (*) will follow the letter when the message cannot be sent to the ACQS directly (due to AQ TTY paper change state) and will be sent to HOBIS/HOBIC.

OSPS Format Example	5E8 and later
288 123C ABC 06/30 1234567890 18:15:32 0028:36 $004.50 212-345-6789 X	
288	The identification of the interLATA carrier, Bell Operating Company or independent operating company. "288" indicates AT&T-C, "000" indicates a Bell Operating Company, (or an independent operating company), while any other value indicates any other interLATA carrier.
123C	The sequence number of the message for this ACQS. If "C" is filled by the letter "A", this indicates that the voice quote number is known. If "C" is filled by the letter "X", this indicates that the voice quote number is unknown, and that the ACQS calling number will be substituted. The number portion will be replaced by "***" when the message cannot be sent to the ACQS directly (due to AQ TTY problems) and will be sent to a HOBIS/HOBIC. The number portion will be replaced by "###" when an end-of-call rating failure occurs. The time and charge must be voice quoted.
ABC	The client account acronym.
06/30	The date of the call.
1234567890	The room number or client number.
18:15:32	The clock time (hours, minutes and seconds - 24-hour basis) at which chargeable conversation started.
0028:36	The elapsed, chargeable conversation time (minutes and seconds).
$004.50	The charge for the call. In the event of an end-of-call rating failure, the dollar amount will be "$SSS.SS" or "$PPP.PP" for station and person calls, respectively.
212-345-6789	The called telephone number; always 10 digits.
X	The special call identifier; "D" is directory assistance; "V" is a verification call; "F" is an international call; "L" is a local call; "T" is a domestic toll call. An asterisk (*) will follow the letter when the message cannot be sent to the ACQS directly (due to AQ TTY paper change state) and will be sent to HOBIS/HOBIC.

Data Rules:

For 5E5 - 5E7 if "N" is entered in the AUTO QUOTE field, or for 5E8 and later, "PRIVATE_LINE" is entered in the QUOTE TYPE field, the entry in the AQ MSG FORMAT field must be "OSPS".

2.14 QUOTE TYPE

Description: QUOTE TYPE describes how the ACQS (Automatic Charge Quotation Service) transmits the time and charge information for toll calls made by a party of the client.

Software Release: 5E8 and later.
Default: VOICE
Valid Entries:

Valid QUOTE TYPE Entries

Entry	Definition
NETWORK or N	Network Autoquote - the 5ESS Switch transmits the time and charge data to a HOBIS (Hotel Billing Information System). An individual at the HOBIS then dials up a connection

	to a printer in the ACQS establishment and prints the charge information on the printer. This field is provided by a secured feature.
PRIVATE_LINE or P	Private Line Autoquote - the 5ESS Switch transmits the time and charge data.
FAX or F	FAX quote - the HOBIS transmits the time and charge data via FAX. This field is provided by a secured feature.
VOICE or V	Voice quote - the 5ESS Switch transmits the time and charge data to the HOBIS/HOBIC and then verbally forwards the data to the client.

Data Rules:

If "PRIVATE_LINE" is entered in the QUOTE TYPE field, then the AQEST TEN must be specified. If "PRIVATE_LINE" is NOT entered in the QUOTE TYPE field, then an entry is not allowed in the AQEST TEN field.

If QUOTE TYPE is not "PRIVATE_LINE", then AQ MSG FORMAT must be "OSPS".

If TNs have assigned the NPA, NXX, BEG LINE and optionally END LINE field, and the QUOTE TYPE field is equal to "PRIVATE_LINE"; then the corresponding QUOTE TN requires that the NPA CODE and OFFICE CODE fields on a NOC form match the NPANXX of the QUOTE TN.

"FAX" and "NETWORK" enumerations are provided by a secured feature, therefore, SFID 82 must be set to "Y" on the SFSYS form (5713-1 Record) before these enumerations may be entered.

SEC. 4AA: 5426 RECORD
NPA TIME ZONES FORM - TMZN

1. GENERAL

The 5426 Record is available with 5E4(2) and later Software Releases.

This form should not be submitted unless the OSPS TA field on the OSPSOPT form (5424 Record) has been specified as "Y" (Yes).

This record defines the time zones in which the majority of NXXs within an NPA (Numbering Plan Area) reside. It is used in conjunction with any real time rated calls such as ACQS (Automatic Charge Quotation Service), and any RTRS (Real Time Rating System) or CFR (Centralized Flexible Rating) system. The time zone is expressed relative to the time zone in which the OSPS (Operator Services Position System) resides.

Advance planning is critical before completing the TMZN and NXXZN forms. An NPA which spans multiple time zones must be flagged. Each NXX within that NPA, which is not in the majority time zone, must be defined on the NXXZN form (5427 Record).

The correct choice for a MAJORITY ZONE will greatly reduce the number of NXXZN forms to be completed.

The OSPSOPT form A1 ZONE and A2 ZONE fields are used to specify a time difference between the 5ESS Switch OSPS time and A1 ZONE or A2 ZONE time. The difference can be a maximum of two hours.

These three different time zones should be carefully used to prevent numerous future NXXZN recent change exercises.

1.1 Four Planning Cases

There are four planning cases to consider, representing the possible combinations of the following variables:

- The NPA is entirely within a single time zone or the NPA spans two time zones.
- Every NXX in the NPA reacts to Daylight Savings Time in the same manner (all use Daylight Savings or all don't), or some NXXs in an NPA use Daylight Savings Time and some NXXs don't.

The first case is an NPA where every NXX is in the same time zone and every NXX uses Daylight Savings Time in a like manner. All the NXXs thus comprise a single set, with each NXX at the same time throughout the calendar year. The OSPSOPT form A1 ZONE or A2 ZONE would be referenced only if the NPA's time zone differed from the 5ESS Switch OSPS time zone. The NXXZN form would not be used because every NXX is in the MAJORITY ZONE.

The second case is an NPA that spans two time zones and every NXX uses Daylight Savings Time in a like manner. The NXXs thus comprise two distinct sets, each in a different time zone. The MAJORITY ZONE should represent the larger of the two sets. If one set of NXXs is in the same time zone as the 5ESS Switch OSPS, then the OSPSOPT form A1 ZONE field would be referenced to express the time difference relative to the 5ESS Switch OSPS time for the second set of NXXs. If both sets of NXXs are not in the same time zone as the 5ESS Switch OSPS, then the OSPSOPT form A1 ZONE and A2 ZONE fields would be referenced to express the time differences relative to the 5ESS Switch OSPS time. An NXXZN form would be used to indicate the time zone for each NXX that is not in the MAJORITY ZONE.

The third case is an NPA where every NXX is in the same time zone, but the NXXs do not use Daylight Savings Time in a like manner. The NXXs comprise two distinct sets, one which uses Daylight Savings

Copyright © 2003 Lucent Technologies

Time and one which does not. The MAJORITY ZONE should represent the larger of the two sets. The OSPSOPT form A1 ZONE and/or A2 ZONE fields could be used for either or both of the following purposes.

- To define a time zone if the NPA's MAJORITY ZONE differs from the 5ESS Switch OSPS time.
- To define a time zone for the smaller subset of NXXs which use Daylight Savings Time in a like manner.

An NXXZN form would be used to indicate the time zone for each NXX that is not in the MAJORITY ZONE. Thus, when the Daylight Savings Time change took place, the smaller set of NXXs would not have to be respecified through NXXZN Recent Change, but rather the A1 ZONE or A2 ZONE variables.

The fourth case is an NPA where the NXXs are in different time zones and the NXXs do not use Daylight Savings Time in a like manner. The MAJORITY ZONE should be the largest subset of NXXs that are in the same time zone all year (treating Daylight Savings Time in the same manner). The OSPSOPT form A1 ZONE and/or A2 ZONE fields could be used for the following purposes.

- To define a time zone if the NPA's MAJORITY ZONE differs from the 5ESS Switch OSPS time.
- To define a time zone for a subset of NXXs not in the MAJORITY ZONE and/or subset of NXXs which do not treat Daylight Savings Time in the same manner as the majority.

An NXXZN form would be used to indicate the time zone for each NXX that is not in the MAJORITY ZONE time zone. Thus, when the Daylight Savings Time change took place, the set of NXXs that are not in the majority time zone would not have to be re-entered, but rather, the A1 ZONE or A2 ZONE variable(s) could be changed.

1.2 Recent Change View

The corresponding Recent Change view for this form is 26.14.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control group number and the office name on each record.

2.2 * NPA

Description: Enter the NPA of the back number requesting time and charges (served by this OSPS).

Required Field.
Valid Entries:
- For 5E4(2) - 5E7: 200 - 919, middle digit 0 -1
- For 5E8: 100 - 919, middle digit 0 - 1
- For 5E9(1) and later: 100 - 999

Data Rules:

Entries in the NPA field must also be entered in the ORIG NPA field of the OPRTK form (5417 Record) or as TRUE NPA on the PRONXX form (5413 Record).

2.3 # MAJORITY ZONE

Copyright © 2003 Lucent Technologies

Description: Enter the time zone in which the majority (or all) of the NXXs in this NPA reside (defines the time difference compared to OSPS system time).

Required Field.

Valid MAJORITY ZONE Entries

Entry	Definition
PRI	Primary Time Zone. This is the same time as the 5ESS Switch (OSPS time).
ALT1	Alternate Time Zone 1. This indicates that the zone defined in the A1 ZONE field of the OSPSOPT form will be used.
ALT2	Alternate Time Zone 2. This indicates that the zone defined in the A2 ZONE field of the OSPSOPT form will be used.

2.4 # ADDL ZONES

Description: Does the NPA cover more than one time zone?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the ADDL ZONES field, time zone entries are required (for this NPA) on the NXXZN form on a per-NXX basis.

SEC. 4AB: 5427 RECORD
NXX OUTSIDE OF MAJORITY TIME ZONE FORM - NXXZN

1. GENERAL

The 5427 Record is available with 5E4(2) and later Software Releases.

This record should not be entered unless the OSPS TA field on the OSPSOPT form (5424 Record) has been specified as "Y" (Yes). This record defines the time zone for each NXX which does not reside in the majority time zone (that was specified for the NPA on the TMZN form (5426 Record)).

Please refer to the general section in the TMZN Form for useful information and strategy regarding defining time zones.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * NPA

Description: Enter the Numbering Plan Area of the back number requesting time and charges (NPA served by this OSPS).

Required Field.
Valid Entries: For 5E4(2) - 5E7: 200 - 919, middle digit 0 - 1

For 5E8: 100 - 919, middle digit 0 - 1

For 5E9(1) and later: 100 - 999

Data Rules:
The ADDL ZONES field must be marked "Y" on the TMZN form for each NPA entered in this field.

2.3 * NXX

Description: Enter the NXX that does not exist in the MAJORITY ZONE field of the TMZN form. If an NXX is not found here, the TMZN form time zone will be used.

Required Field.
Valid Entries: 000 - 999

2.4 # ZONE

Description: Enter the non-majority time zone.

Required Field.

Valid ZONE Entries

Entry	Definition
PRI	Primary Time Zone. This is the same time as the 5ESS Switch (OSPS time).
ALT1	Alternate Time Zone 1. This indicates that the zone defined in the A1 ZONE field of the OSPSOPT form will be used.
ALT2	Alternate Time Zone 2. This indicates that the zone defined in the A2 ZONE field of the OSPSOPT form

SEC. 4AC: 5428 RECORD
OSPS ACCS SPECIAL TREATMENT TABLE FORM - ACCST

1. GENERAL

The 5428 Record is available with 5E4(2) and later Software Releases.

This record defines 10-digit telephone numbers that require ACCS (Automated Calling Card Service) special treatment.

When a 0+ call is received at an OSPS (Operator Services Position System), if the call is not screened against calling card service, the ACCST form is checked, based on the calling (back) NPA-NXX entered, to determine the handling of the call. Possible values in the ACCST form include route the call to an operator, provide a tone to the caller or provide tone and announcement to the caller.

If the calling number is not found in the ACCST form, "default" treatment is applied to the call depending on the type of originating station.

Each ACCST form that is submitted must have a corresponding NPAMAP form (5414 Record). The two forms' NPA/NXX entries must match.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.40.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the office name on each record.

2.2 * TN

Description: Enter a valid 10-digit telephone number of the format NPANXXXXXX. For 5E4(2) - 5E8 NPA format is 200 - 919 where the middle digit can be only 0 - 1. For 5E9(1) and later, the NPA format is 200 - 999.

Required Field.
Valid Entries: 10 digits

2.3 # PROMPT TREATMENT

Description: Enter the initial prompt that a customer will encounter on an ACCS call.

Normally, the initial prompt that a customer will hear is controlled by an entry on the OSPSOPT form (5424 Record). The ACCS CL1 field is used for coin and hotel/motel lines, while the ACCS CL2 field is used for all other types of service.

The ACCST form is used to override the OSPSOPT form treatment on a per-telephone number basis.

Required Field.

Valid PROMPT TREATMENT Entries

Entry	Definition
OP	Routes the call to an OSPS position.
TANN	Routes the call to an announcement. (Digital ServicesUnit 2 - Recorded Announcement Function (DSU2-RAF) - DTA)treatment.
TONE	Routes the call to a tone.

SEC. 4AD: 5429 RECORD
OSPS ACCS RESTRICTED SEQUENCE TN FORM - SEQREST

1. GENERAL

The 5429 Record is available with 5E4(2) and later Software Releases.

This record is used to assign 3-, 7-, and 10-digit telephone numbers that cannot be accessed with ACCS (Automatic Calling Card Service) as an automated sequence call. For 5E5 and later Software Releases, the option is offered to disallow the number to be a forward number for an ACCS sequence call or for a Subaccount Billing sequence call.

ACCS (Automated Calling Card Service) customers can be restricted from calling certain numbers when dialing ACCS sequence calls. This applies to both LEC (Local Exchange Carrier) and CAS (Customer Account Services) cards.

Subaccount Billing is a new feature introduced in the 5E5 Software Release. This form allows for restriction of this feature for certain forward numbers when dialed as a sequence call.

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.41.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group number and the Office Name on each record.

2.2 * RESTRICTED TN

Description: Enter the 3-, 7-, or 10-digit restricted telephone number. For example, an entry of 500 restricts all 500-XXX-XXXX. NPA5551212 restricts all 5551212 numbers where an NPA was dialed.

Required Field.
Valid Entries: 411

- 500
- 5551212
- 611
- 700
- 800,
- 811, 822, 833, 844 (5E10 and later)
- 855, 866, 877, 888, 899 (5E10 and later)
- 900
- 911
- NPA5551212 (for all NPAs)

Data Rules:

For 5E10 and later, if any number is not one of the following:

- 411
- 611
- 500
- 5551212
- 700
- 800

Copyright © 2003 Lucent Technologies

- 900
- 911
- NPA5551212 (where NPA is any NPA),

then INWATS NPA must be entered on a corresponding INWNPA form matching the RESTRICTED TN entry.

2.3 # ACCS

Description: Can this directory number be a forward number for an ACCS (Automated Calling Card Service) sequence call?

Software Release: 5E5 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.4 SUBACCT BILL

Description: Can this directory number be a forward number for a Subaccount Billing sequence call?

Software Release: 5E5 and later
Required Field.
Default: Y
Valid Entries: Y, N

SEC. 4AF: 5431 RECORD
DIOR EIGHT HUNDRED NUMBER PROVISIONING - DEHNP

1. GENERAL

The 5431 Record is available with the 5E9(1) and later Software Releases. The DIOR Eight Hundred Number Provisioning form specifies the countries from which DIOR (Direct International Originations) calls to 800 numbers have the international leg of the call billed to the caller, billed to the 800 number, or are denied completion. This form supports the DIOR Toll-Free 800 feature, for more information on this feature see Division 2, Section 3K.

Each OFFICE CODE must be pre-assigned to an SM on the DEHOCSM form.

Each entry in the CAC field of the CODELIST must be pre-defined as an IDDD CAC on the OSPS Country Number to Country Name Mapping form, CCNAME.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.85.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * INWATS NPA

Description: Enter the NPA of an INWATS (Inward Wide Area Telecommunications Service) number. This field was added to support the Toll-Free NPA Expansion feature. This feature allows new toll-free NPAs to be assigned as INWATS NPAs (with the current exhaustion of 800 numbers). For more information on provisioning the secured feature Toll-Free NPA Expansion, see Divison 2, Section 4A405.

Software Release: 5E10 and later
Required Field.
Default: 800
Valid Entries: 100 - 999.

Data Rules:

For each DEHNP form entered, there must be a corresponding DEHOCSM form where the following is found:

- INWATS NPA entries must match
- OFFICE CODE entries must match
- FEATURE on the DEHOCSM form must be "TF8"

2.3 * OFFICE CODE

Description: Enter the office code (NXX) of an 800 number.

Required Field.
Valid Entries: 200 - 999

Data Rules:

See Data Rule for INWATS NPA.

Copyright © 2003 Lucent Technologies

2.4 * LINE NUMBER

Description: Enter the line number of an 800 number.

Required Field.
Valid Entries: 0000 - 9999

2.5 ALL TRMT

Description: Enter the billing treatment to be used on the international leg of an 800 number call from any country code that is not entered in the CAC field of the CODELIST list below.

Required Field.
Default: CALLER
Valid Entries:

Valid ALL TRMT Entries

Entry	Definition
CALLER	Caller pays for the international leg of the call.
DENIED	800 number does not accept calls from any international origin
EHPAID	800 number pays for the international leg of the call.

Data Rules:

If "CALLER" is entered then:
- CODELIST TRMT cannot be "CALLER"
- CODELIST must have at least one entry

If "DENIED" is entered, then CODELIST TRMT cannot be "DENIED".

If "EHPAID" is entered, then CODELIST TRMT cannot be "EHPAID".

COUNTRY CODE TREATMENT LIST (CODELIST)

The following fields (Section 2.6 - Section 2.8) assigns the 800 number treatment for the IDDD (International Direct Distance Dialing) CAC (Country Access Codes).

2.6 CAC

Description: Enter the IDDD Country Access Code that is to have a billing treatment that is different from the treatment specified in the ALL TRMT field.
Valid Entries: 1 - 999

Data Rules:

CAC cannot be 0.

The combination of CAC and NXX entries must be unique.

If CAC is entered, then CODELIST TRMT and NXX must be entered. Conversely, if CAC is not entered then CODELIST TRMT and NXX cannot be entered.

When an CAC value is entered in the COUNTRY CODE TREATMENT LIST on this form, a corresponding CCNAME form must exist where the CAC and NXX combination entries match the combination of IDDD CAC and IS 809 NXX entries on the CCNAME form (5463 Record).

2.7 TRMT

Copyright © 2003 Lucent Technologies

Description: Enter the billing treatment to be used on the international leg of an 800 number call from the country code specified in the CAC field.

Valid CODELIST TRMT Entries	
Entry	**Definition**
CALLER	Caller pays for the international leg of the call.
DENIED	800 number does not accept calls from any international origin
EHPAID	800 number pays for the international leg of the call.

2.8 NXX

Description: Is the country code specified in the CAC field an NXX for the 809 country code?
Valid Entries: Y, N

Data Rules:

The CAC and NXX combination must be pre-defined using the IDDD CAC and IS 809 NXX fields on the OSPS Country Number to Country Name Mapping CCNAME form (5461 Record).

SEC. 4AG: 5432 RECORD
CREDIT CARD CALLING OPTIONS FORM - CCCOPT

1. GENERAL

The 5432 Record is available with 5E4(2) and later Software Releases.

This record is used to define credit card options.

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.99.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control group number and the office name on each record.

2.2 * KEY

Description: For this key field, 0 is the default and only valid entry.

Required Field.
Default: 0
Valid Entries: 0

2.3 # PIN FAIL TIME

Description: Enter the PIN (Personal Identification Number) failure time in minutes. This is the interval during which card validation PIN failure from a specific back number and with the same account number can occur before the LOCK OUT TIME interval is entered.

Required Field.
Default: 4
Valid Entries: 4 - 20 (minutes)

Data Rules:

The PIN FAIL TIME entry must be less than the LOCK OUT TIME entry.

2.4 # LOCK OUT TIME

Description: Enter the lock out time in minutes. This is the interval that a particular calling card customer will be blocked from ACCS service due to exceeding the FRAUD FAIL count with the PIN FAILURE TIME.

Required Field.
Default: 5
Valid Entries: 5 - 120 (minutes)

2.5 # FRAUD FAIL COUNT

Description: Enter the quantity of card validation PIN failures a customer will be allowed within the PIN FAIL TIME before the LOCK OUT TIME interval is entered.

Required Field.
Default: 30

Copyright © 2003 Lucent Technologies

Valid Entries: 4 - 30

2.6 SECURITY PRINTER

Description: For 5E8 and earlier, this field appears as text only on the input view and is changeable only by Recent Change. This field previously resided on the OFCOPT form (5509 Record) as OPERATOR SERVICE CENTER.

For 5E9(1) and later, this parameter specifies the OSC (Operator Service Center) and FMC (Force Management Center) location for the security printer. It is used to forward security messages to the right OSPS OAP (Administrative Processor). This field cannot be entered in ODA. On the Recent Change view 21.99, enter 1 - 32 for OSCs, or 101 - 108 for FMCs.

2.7 SECURITY TERMINAL

Description: This field appears as text only on the input view and is changeable only by Recent Change. This field previously resided on the OFCOPT form (5509 Record) as FORCE MANAGEMENT CENTER.

EMERGENCY INTERRUPT

The following fields (Section 2.8 - Section 2.9) define an emergency interrupt threshold.

2.8 EI LIMIT

Description: Enter the emergency interrupt limit in seconds. This field indicates the maximum number of seconds the operator can interrupt the forward party during Emergency Interrupt before a message will be generated on the security printer.
Default: 0
Valid Entries: 0 - 1023 (seconds)

2.9 EI THRESHOLD IND

Description: Will emergency interrupt thresholds be indicated? This field indicates whether a message should be printed when the Emergency Interrupt is exceeded.
Default: N
Valid Entries: Y, N

ALL CARDS FAIL (ACF)

The following fields (Section 2.10 - Section 2.13) define the global parameters for the ACF (All Cards Fail) feature which are only accessible from the OSPS OAP security terminal. They cannot be entered on an ODA view; they can only be entered on the Recent Change view 21.99 (OSPS Security Parameters). For more information on this feature see Division 2, Section 3I.

2.10 ACF ON

Description: This field activates the All Cards Fail feature.

Software Release: 5E9(1) and later.

2.11 PERMIT TIME

Description: This field indicates the ACF fraud candidate interval, 4 - 20 minutes. The ACF PERMIT TIME Interval is the specified time interval, in minutes, to allow repeated card validating failures from a specific back number and with the same PIN before the LOCK OUT TIME interval is entered.

Software Release: 5E9(1) and later.

Copyright © 2003 Lucent Technologies

2.12 LOCK OUT TIME

Description: ACF lockout interval is 5 - 120 minutes. The LOCK OUT TIME interval is the interval, in minutes, that a particular calling card customer will be blocked from ACCS service due to exceeding the FAIL THRESHOLD within the PERMIT TIME.

Software Release: 5E9(1) and later.

2.13 FAIL THRESHOLD

Description: Maximum ACF fraud attempts per PERMIT TIME, 4 - 30 attempts.

This parameter is the number of card validation replies matching the ACF fraud criteria. Enter the quantity of card validation failures that a customer will be allowed within the PERMIT TIME before the LOCK OUT TIME interval is entered, which qualifies for ACF.

Software Release: 5E9(1) and later.
Valid Entries:

SEC. 4AH: 5433 RECORD
DIOR COUNTRY PAIR SCREENING SPECIAL SCREENING - DCPSSS

1. GENERAL

The 5433 Record is available with the 5E9(1) Software Release. This form specifies additional screening which may be done on a country pair for DIOR (Direct International Originations) calls. For a Terminating Country Code (TERM CC field), calls may be required to use an AT&T card or be automatically routed to an operator based on the Originating Country Code (ORIG CC field) and/or carrier.

Screening may be specified in 3 different ways:

1. "ALL" in the ORIG CC field and no entry in the CARRIER field means that all originations receive the same treatment unless overridden by either of the following two ways.

2. A specific country code in the ORIG CC field and no carrier entered means all carriers from that country receive the same treatment unless overridden by the third way below. This can also override the treatment specified in (1) above for all carriers from this country.

3. Both a specific country code in the ORIG CC field and a carrier in the CARRIER field overrides the treatment specified in (1) or (2) above.

This form supports the CPS-SS (DIOR Country Pair Screening - Special Screening) feature. For more information on this feature see Division 2, Section 3K on DIOR features.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.86.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TERM CC

Description: Enter the DIOR terminating country code which is to have special screening done.

Required Field.
Valid Entries: 1 - 3 characters

Data Rules:

The entries in this field must be defined on the NONUSA form (5477 Record) using the HOME COUNTRY field with the DIOR MEMBER field set to "Y".

2.3 * ORIG CC

Description: Enter the DIOR originating country code to be paired with the TERM CC entry for special screening. "ALL" indicates that all originations receive the same screening when terminating to this TERM CC.

Required Field.
Valid Entries: 200 - 999 or ALL

Data Rules:

Copyright © 2003 Lucent Technologies

If "ALL" is entered, the CARRIER must not be entered.

Entries in this field must be defined on the CCNAME form (5463 Record) using the COUNTRY NUMBER field.

2.4 (*) CARRIER

Description: Enter the carrier of the originating country code to be paired with the terminating country code for special screening. If this field is not entered, it indicates all carriers.

Required Field.
Valid Entries: 0 - 9

2.5 # SCREEN CARD

Description: Should calls matching the originating country code and/or carrier terminating to this terminating country code be screened for an AT&T card?

Required Field.
Valid Entries: Y, N

Data Rules:

If both SCREEN CARD and OPERATOR are "N", then ORIG CC cannot be "ALL".

2.6 # OPERATOR

Description: Should calls matching the originating country code and/or carrier terminating to this terminating country code always be routed to an operator?

Required Field.
Valid Entries: Y, N

Data Rules:

If both SCREEN CARD and OPERATOR are "N", then ORIG CC cannot be "ALL".

SEC. 4AI: 5434 RECORD
OPERATOR DATA BASE PARAMETERS FORM - OPDBPARM

1. GENERAL

The 5434 Record is available with 5E4(2) and later Software Releases.

This record defines the data base and X.25 protocol parameters necessary to establish a session to an external data base (that is also accessible to the OSPS (Operator Services Position System) operator's VDT (Video Display Terminal)). The parameters (defined in this form) allow a call to be made to the database; a "virtual" event over a real "link".

The OPDBPARM form also defines the login and password strings being passed from the external data base, and the X.25 protocol parameters used to establish the link and define the message packet format.

When an OPDBPARM form is submitted, the OSPSOPT form (5424 Record) must have the OSPS TA field defined as "Y."

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Description: Enter the base and control group number and the office name on each record.

2.2 * DB NUMBER

Description: Enter the data base number that is accessible by an OSPS operator.

Required Field.
Valid Entries: 1 - 31

2.3 # DB NAME

Description: Enter a data base name. The entries must be unique.

Required Field for 5E6 and later.
Valid Entries: 1 - 5 characters

2.4 # DB PKT TN

Description: The name of this field was changed to FIRST DB PKT TN in 5E8. This field name applies to 5E7 and earlier. See FIRST DB PKT TN for usage information.

2.5 # FIRST DB PKT TN

Description: For 5E6 and later Software Releases, enter the ISDN telephone number of the external data base. This external data is used to provide MLB (Multileaf Bulletin) or EIS information to operators. Data base computers which belong to the same type are configured as a packet switching MLHG (Multiline Hunt Group). (This field was called DB PKT TN in 5E6 and 5E7.)

Required Field for 5E6 - 5E8.
Valid Entries: 7 or 11 digits

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E9(1) and later:
If FIRST DB PKT TN is entered, then CUGPX must be entered. If FIRST DB PKT TN is not entered, then CUGPX must not be entered.

If TERM TYPE is "TEMPLATE", both FIRST DB PKT TN and SECOND DB PKT TN must be entered.

If TERM TYPE is "BASIC" or "TRAINER", FIRST DB PKT TN must be entered.

2.6 SECOND DB PKT TN

Description: Enter the second ISDN Destination telephone number of the database. This is only used for databases which support "TEMPLATE" terminal emulation, i.e., "T" is entered in the TERM TYPE field.

Software Release: 5E8 and later
Valid Entries: 7 or 11 digits

Data Rules:

For 5E6 - 5E8, if TERM TYPE is "BASIC", then this field must not be entered. However, if TERM TYPE is NOT "BASIC", then this field must be entered.

For 5E9(1) and later, If TERM TYPE is "TEMPLATE", both FIRST DB PKT TN and SECOND DB PKT TN must be entered. If TERM TYPE is not "TEMPLATE", SECOND DB PKT TN must not be entered.

2.7 # CUGPX

Description: Enter the packet switching (preferential customer) Closed User Group index.

Required Field for 5E6 - 5E8.
Valid Entries: 0 - 99

Data Rules:

For 5E6 and later Software Releases, every CUGPX entry requires corresponding AMLBDSL and OSPSDSL forms to be entered, which meet the following criteria:

A. CUG LIST IDX field on the AMLBDSL form (5447 Record) must match the CUGPX entry on this form.

B. Every AMLBDSL form must have a corresponding OSPSDSL form (5411 Record) where entry in the SERVICE CLASS field is "TAOPER" and the entry in the LVL2 PROF field is "VDT". Corresponding forms have matching LCENs.

C. In addition, if the OPDBPARM form has a SEND WINDOW SIZE entry other than zero, the corresponding AMLBDSL form must have "Y" entered in the FLOW CNTL field.

For 5E9(1) and later, if FIRST DB PKT TN is entered, then CUGPX must be entered. If FIRST DB PKT TN is not entered, then CUGPX must not be entered.

2.8 FIRST SEARCH STRING

Description: Enter a first prompt string from the external data base e.g., login:
Valid Entries: 1 - 10 characters

2.9 SECOND SEARCH STRING

Copyright © 2003 Lucent Technologies

Description: Enter a second prompt string from the external data base, e.g., password: .
Valid Entries: 1 - 10 characters

2.10 SEND WINDOW SIZE

Description: Enter the sending size of the X.25 level 2 packet switch window.
Default: 0
Valid Entries: 0, 2, or 3

Data Rules:

When SEND WINDOW SIZE is 0, then SEND PACKET SIZE, RECEIVE WINDOW SIZE, and RECEIVE PACKET SIZE must all be 0.

2.11 SEND PACKET SIZE

Description: Enter the maximum size of information that can be sent as a block of data.
Default: 0
Valid Entries: 0 or 128

Data Rules:

When SEND PACKET SIZE is 0, then SEND WINDOW SIZE, RECEIVE WINDOW SIZE, and RECEIVE PACKET SIZE must all be 0.

2.12 RECEIVE WINDOW SIZE

Description: Enter the receiving size of the X.25 level 2 packet switch window.
Default: 0
Valid Entries: 0, 2, or 3

Data Rules:

When RECEIVE WINDOW SIZE is 0, then SEND WINDOW SIZE, SEND PACKET SIZE, and RECEIVE PACKET SIZE must all be 0.

2.13 RECEIVE PACKET SIZE

Description: Enter the maximum size of information that can be received as a block of data.
Default: 0
Valid Entries: 0 or 128

Data Rules:

When RECEIVE PACKET SIZE is 0, then SEND WINDOW SIZE, SEND PACKET SIZE, and RECEIVE WINDOW SIZE must all be 0.

2.14 RESTART TIMER

Description: Enter the restart request response timer. The X.25 level timer is used to time the response for sending the RESTART REQUEST packet from the VDT to the 5ESS Switch. The timer is started when a RESTART REQUEST packet is sent out and stopped when a RESTART CONFIRMATION or a RESTART REQUEST is received by the VDT. When the timer response time expires, the restart request counter is decremented and another RESTART REQUEST is sent out with RESTART TIMER being restarted.

Software Release: 5E6 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: 3 (seconds)
Valid Entries: 1 - 31 (seconds)

2.15 DATA TIMER

Description: The data packet acknowledgement timer. This is the X.25 level 3 timer used to time the acknowledgement of data packets. This timer is started whenever a DATA packet is sent from the VDT. It is also started whenever a DATA, Restart Request (RR) or Receiver Not Ready (RNR) packet is received with a P(R) that rotates the level 3 window. Upon timing out, the level 3 reset procedure is invoked with a RESTART REQUEST packet being sent out from the VDT.

Software Release: 5E6 and later
Required Field.
Default: 25 (seconds)
Valid Entries: 1 - 31 (seconds)

2.16 RESTART COUNT

Description: Restart request count. This is an X.25 level 3 counter associated with the restart request response timer. The restart request counter is decremented when the restart request response timer times out. When the restart request response timer times out the number of times equal to the restart request counter, level 3 communication is declared broken and the application is informed of this event.

Software Release: 5E6 and later
Required Field.
Default: 3
Valid Entries: 1 - 15

2.17 TERM TYPE

Description: This field defines the type of emulation used by the terminal when interfacing with the data base. For 5E6 and 5E7 this field is found on the OPEXTDB form (5435 Record).

Software Release: 5E8 and later
Required Field.
Default: BASIC
Valid Entries:

Valid TERM TYPE Entries

Entry	Definition
BASIC or B	The Basic terminal emulation (pre 5E6). This is the pre 5E6(2) terminal emulation
IBM or I	Software Release: 5E9(1) and later. Terminal emulation used for IBM.
TEMPLATE or TE	Specific terminal emulation specified by OA.
TRAINER or TR	
VDR or V	Software Release: 5E9(1) and later. Terminal emulation used for Volt Delta.

Data Rules:

When TERM TYPE is "BASIC", FIRST DB PKT TN must be entered.

For 5E9(1) and later, when TERM TYPE is "TEMPLATE", both FIRST DB PKT TN and SECOND DB PKT TN must be entered.

If "IBM" or "VDR" is entered, then the AUTO SESSION field on the corresponding OPEXTDB form must be "Y". The OPEXTDB and OPDBPARM forms correspond if the entry in DB NAME on the OPEXTDB form matches the the entry in DB NAME on this form.

SEC. 4AJ: 5435 RECORD
EXTERNAL DATA BASE ACCESS FORM - OPEXTDB

1. GENERAL

The 5435 Record is available with 5E4(2) and later Software Releases.

This record assigns each SERVING TEAM within an OSPS (Operator Services Position System) OSC (Operator Service Center) access to one or more external data bases. Each SERVING TEAM may have a primary data base session, a secondary data base session, and up to fifteen data base accesses.

The OPEXTDB form also defines login and password values, whether automatic login should be attempted and whether the data calls should be charged to the external data base DSL (Digital Subscriber Line) or to the operator VDT (Video Display Terminal) DSL.

When an OPEXTDB form is submitted, the OSPS TA field of the OSPSOPT form (5424-1/2/3/3/5 Record) must be set to Y.

1.1 Recent Change View

The corresponding Recent Change for this form is 27.31

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Description: Enter the base and control group number and the office name on each record.

2.2 * OSC NUMBER

Description: Enter the number of the operator service center.

Required Field.
Valid Entries: 1 - 32

Data Rules:

Every OSC NUMBER entry must appear in the OFFICE NUMBER field of an OPARM form (5400-1/2 Record).

2.3 * SERVING TEAM

Description: Enter the SERVING TEAM number that will service this OSPS call type.

A SERVING TEAM of 0 should be used when the operator is using the session for training purposes. When the operator logs into the switch for processing transactions, SERVING TEAM values 1 to 128 should be used.

Required Field.
Valid Entries: 0 - 128

Data Rules:

An entry in this field must be defined in the SERVING TEAM field on a STINFO form (5402 Record). If the SERVING TEAM is 0, no entry is required on the STINFO form.

For 5E6 and later, it is not necessary to submit an OPEXTDB form (5435 Record) for serving team 0. ODA will automatically assign terminal data base keys to a maximum of 15 external data bases for serving

Copyright © 2003 Lucent Technologies

team 0 in each OSC.

If SERVING TEAM is 0, then OSPS LOGIN must be "N".

2.4 * TERM DB KEY

Description: Enter the data base key number on the operator's terminal, TERM DB KEY, that is associated with a specific serving team and service identification number.

Required Field.

Valid TERM DB KEY Entries

Entry	Definition
MAINDB	Main data base key
DB1	Soft key 1 of the operator's terminal
DB2	Soft key 2 of the operator's terminal
DB3	Soft key 3 of the operator's terminal
DB4	Soft key 4 of the operator's terminal
DB5	Soft key 5 of the operator's terminal
DB6	Soft key 6 of the operator's terminal
DB7	Soft key 7 of the operator's terminal
DB8	Soft key 8 of the operator's terminal
DB9	Soft key 9 of the operator's terminal
DB10	Soft key 10 of the operator's terminal
DB11	Soft key 11 of the operator's terminal
DB12	Soft key 12 of the operator's terminal
DB13	Soft key 13 of the operator's terminal
DB14	Soft key 14 of the operator's terminal

Data Rules:

Each TERM DB KEY entry on an OPEISDB form (5462-2 Record) must correspond with one or more OPEXTDB forms, where SERVING TEAM and TERM DB KEY entries on OPEISDB and OPEXTB forms match. Also, DB NAME entries must be the same on all OPEXTDB forms associated with the same OPEISDB form.

2.5 # DB NAME

Description: Enter a 1 - 15 character the database name associated with the database number, DB NUMBER, on the OPDBPARM form (5434 Record).
Valid Entries: 1 - 15 characters

Data Rules:

For each DB NAME on this form, a corresponding DB NAME must be defined on the OPDBPARM form (5434 Record).

2.6 LOGIN ID

Description: Enter the OSPS user login identification.
Valid Entries: 1 - 6 characters

2.7 LOGIN DELIM

Description: Enter the login delimiter. This is the terminating character of the login string.

Valid LOGIN DELIM Entries

Entry	Definition
CR	Carriage return.
NL	New line.

2.8 PASSWORD

Copyright © 2003 Lucent Technologies

Description: Enter an OSPS password for access to the external data base.
Valid Entries: 1 - 8 character

Data Rules:

If AUTO LOGIN is "N", then neither PASSWORD nor LOGIN ID can be entered.

2.9 PASSWORD DELIM

Description: Enter the password delimiter. This is the terminating character of the password string.

Valid PASSWORD DELIM Entries

Entry	Definition
CR	Carriage return.
NL	New line.

2.10 AUTO LOGIN

Description: Will the operator position be automatically logged-in once an operator session is active? This feature is intended to reduce operator work time by performing redundant noncall-related steps that are required to access a remote (external) computer system.
Default: Y
Valid Entries: Y, N

Data Rules:

If "N" is entered in the AUTO LOGIN field, then an entry is not allowed in the LOGIN ID and PASSWORD fields.

2.11 AUTO SESSION

Description: Will the operator session be automatically established with the external data base? A session is the period of time during which a connection exists between the VDT and an external system (when information can be exchanged).
Default: Y
Valid Entries: Y, N

2.12 OSPS LOGIN

Description: Will the individual operator OSPS login identification be used as the LOGIN ID?

Required Field.
Valid Entries: Y, N

Data Rules:

If "Y" is entered in the OSPS LOGIN field, then an entry is not allowed in the LOGIN ID field.

2.13 REVERSE CHARGE

Description: Are data calls charged to the external data base DSL? Enter "N" if data calls are charged to the operator VDT DSL.

Required Field.
Valid Entries: Y, N

2.14 TERM TYPE

Description: For 5E6 and 5E7 Software Releases, this field defines the type of emulation used by the

Copyright © 2003 Lucent Technologies

terminal when interfacing with the data base. For 5E8 and later, this field was moved to the OPDBPARM form (5434 Record).

Software Release: 5E6 and 5E7
Required Field.
Default: BASIC
Valid Entries:

Valid TERM TYPE Entries

Entry	Definition
T	Specific terminal emulation specified by OA.
B	Basic terminal emulation prior to 5E6 Software Release.

SEC. 4AK: 5436 RECORD TERMINATING CODE SCREENING TEXT AND RESTRICTIONS FORM - TCSTEXT

1. GENERAL

The 5436 Record is available with 5E4(2) and later Software Releases. For automated and operator-assisted credit card calls, the screen code is used to find the corresponding entry in the 5436 Record. If no match is found, then the call is not TCS (Terminating Code Screening) restricted. If there is a match, the originating station class fields for TCS restrictions are checked.

This record contains the text and restrictions associated with TCS as it appears on the VDT (Video Display Terminal).

TCS restricts calling card and collect calls to designated domestic and international destinations. It also allows the display of user-defined text to an operator for designated destinations.

1.1 Office Options

If a TCSTEXT form is defined, then an OSPSOPT form (5424 Record) must exist with OSPS TA set to "Y".

1.2 Recent Change

The corresponding Recent Change View for this form is 27.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SCRN CODE

Description: Enter the terminating screen code from the TCSNPA form (5437 Record). An entry of 0 means not screened.
Valid Entries:
- 5E4(2) through 5E6: 0 - 31
- 5E7 and later: 0 - 127

Data Rules:

If 0 is entered in the SCRN CODE field, then:

- RESTRICT, DENY ALL, DENY STATION, PUBLIC, HOTEL, and OTHER fields under both the RESTRICT CLG CRD and DENY THIRD NBR heading must all be set to "N";
- the TEXT 1 field must be set to "NOT SCREENED"; and
- the TEXT 2 and TEXT 3 fields must not be entered.

DENY COLLECT

This heading was changed to COLLECT for 5E8 and later. See COLLECT for usage information.

COLLECT

Copyright © 2003 Lucent Technologies

The following fields (Section 2.3 - Section 2.7) determine screening when a collect call is made to a forward number. (This heading was called DENY COLLECT for 5E4(2) through 5E7.)

2.3 ALL

Description: The name of this field was changed to DENY ALL for 5E8 and later. See DENY ALL for usage information.

2.4 RESTRICT

Description: Should non-blocked collect calls be restricted to manual operator outpulsing?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

2.5 STATION ONLY

Description: The name of this field was changed to DENY STATION for 5E8 and later. See DENY STATION for usage information.

2.6 DENY STATION

Description: Should only station collect calls to a forward number be denied? (This field was called STATION ONLY for 5E4(2) through 5E7.)

Required Field.
Default: N
Valid Entries: Y, N

2.7 DENY ALL

Description: Should all collect calls (station and person) to a forward number be denied? (This field was called ALL for 5E4(2) through 5E7.)

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If DENY ALL is "Y", then STATION ONLY is a "don't care" situation.

For 5E8 and later, A SCRN CODE of 0 means not screened. All restriction must be set to "N".

RESTRICT CLG CRD

The following fields (Section 2.8 - Section 2.10) determine screening when a credit card call is made to a forward number.

2.8 PUBLIC

Description: Should calling card calls from public phones be restricted from manual outpulsing?

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.9 HOTEL

Description: Should calling card calls from hotels be restricted from manual outpulsing?

Required Field.
Default: N
Valid Entries: Y, N

2.10 OTHER

Description: Should calling card calls from any non-public/non-hotel phones be restricted from manual outpulsing?

Required Field.
Default: N
Valid Entries: Y, N

DENY THIRD NBR (TH)

The following fields (Section 2.11 - Section 2.13) determine screening for billing to a third number.

2.11 PUBLIC

Description: Should third number billing from public phones be denied?

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.12 HOTEL

Description: Should third number billing from hotels be denied?

Software Release 5E8 and later.
Required Field.
Default Value: N
Valid Entries: Y, N

2.13 OTHER

Description: Should third number billing from any non-public/non-hotel phones be denied?

Software Release 5E8 and later.
Required Field.
Default Value: N
Valid Entries: Y, N

2.14 TEXT

Description: Enter the message to be displayed at the VDT. Three lines of text may be added. Each line is an individual field, named TEXT 1, TEXT 2 and TEXT 3, respectively. Each line can have a maxi- mum of 49 characters. The only character which may not be entered is the double quote (").
Valid Entries: 0 - 49 characters

SEC. 4AL: 5437 RECORD
TERMINATING CODE SCREENING FOR NPA-NXX FORM - TCSNPA

1. GENERAL

The 5437 Record is available with 5E4(2) and later Software Releases.

This record contains the terminating screening codes for NPA-NXXs.

If a TCSNPA form is submitted where the NXX field is not entered and the SCRN CODE field is non-zero, then every NXX within the NPA will apply the indicated screening. If a TCSNPA form is submitted with the same NPA and an NXX is entered, that form will be ignored by ODA.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NPA

Description: Enter a 3-digit NPA (Numbering Plan Area) code.
Valid Entries:
- For 5E4(2) - 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

2.3 (*) NXX

Description: Enter a 3-digit Office Code. If this field is not entered, or 000 is entered, the entire NPA will receive the indicated screening.
Valid Entries: 000 - 999

Data Rules:

For 5E7 and later, if NXX is 000, there cannot be another TCSNPA form with the same NPA as entered on this form.

2.4 REORDER

Description: When restrictions apply, will the call be sent to reorder? If an "N" is entered then the call will be routed to an OSPS (Operator Services Position System) operator when restrictions apply.

Required Field.
Default: N
Valid Entries: Y, N

2.5 MECH

Description: Are the calls terminating at the NPA and NXX eligible for MECH (More Efficient Call Handling)?

Software Release: For 5E6 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: Y
Valid Entries: Y, N

ORIGINATING NPA LIST

The following fields (Section 2.6 - Section 2.7) assign the originating NPAs to a terminating screen code.

2.6 SCRN CODE

Description: Enter the terminating screen code. An entry of 0 means not screened.

Required Field.
Valid Entries:
- For 5E4(2) through 5E6: 0 - 31
- For 5E7 and later: 0 - 127

Data Rules:

For 5E7 and later, at least one SCRN CODE must be entered if N1 is entered, and a SCRN CODE may appear only once in this ORIGINATING NPA LIST.

The entry must be defined in the SCRN CODE field on the TCSTEXT form (5436 Record).

2.7 N1 - N16

Description: Enter the originating NPA of the back number. If "ALL" is entered for any originating NPA on this form, no other originating NPA entry is allowed. N1 through N16 must be entered left-to-right with no blanks between the entries. For example, if N3 is entered, then N1 and N2 must be entered.

Software Release: 5E7 and later
Valid Entries: Three-digit NPA, where the first digit must be 2-9 and the middle digit 0-1

Data Rules:

N1 must be entered for each SCRN CODE entered. N1 - N16 may appear only once in this ORIGINATING NPA LIST. The total number of N1 - N16 entries for this ORIGINATING NPA LIST may not exceed 16, i.e. all elements entered in the list must be unique.

SEC. 4AM: 5438 RECORD TERMINATING CODE SCREENING AND PCC FOR COUNTRY CODE FORM - TCSCC

1. GENERAL

The 5438 Record is available with 5E4(2) and later Software Releases.

This record contains the terminating screen codes for Country Codes, and is used for the International feature and the TCS (Terminating Code Screening) feature.

A PAIRED COUNTRY CODE is assigned for each COUNTRY CODE on this form. The remaining fields are related to TCS screening restrictions on the given international Customer Administration Centers.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * COUNTRY CODE

Description: Enter the Country Code portion of a forward number.
Valid Entries: 1 - 999

Data Rules:

The COUNTRY CODE field should be populated with a COUNTRY ACCESS CODE entered on the IDDD form (5307 Record).

2.3 # PAIRED COUNTRY CODE

Description: Enter the paired Country Code portion of the forward number. This is a padded 3-digit Country Code to be outpulsed on completed IDDD (International Direct Distance Dialing) calls. In order to complete the outpulsing of an international call, the COUNTRY CODE must be mapped to a PAIRED COUNTRY CODE.

Required Field.
Valid Entries: 1 - 999

2.4 REORDER

Description: When card restrictions apply, will the call be sent to reorder? If an "N" is entered then the call will be routed to an OSPS (Operator Services Position System) operator when restrictions apply.

Required Field.
Default: N
Valid Entries: Y, N

2.5 MECH

Description: Are the calls to this Country Code eligible for MECH (More Efficient Call Handling)?

Copyright © 2003 Lucent Technologies

Software Release: For 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

ORIGINATING NPA LIST

The following fields (Section 2.6 - Section 2.7) assign the orginating NPAs to a terminating screen code.

2.6 SCRN CODE

Description: Enter the terminating screen code. An entry of 0 means not screened.

Required Field.
Valid Entries:
- 5E4(2) through 5E6: 0 - 31
- 5E7 and later: 0 - 127

Data Rules:

For 5E7 and later, if one member of the ORIGINATING NPA LIST is entered, then SCRN CODE must be entered.

The entry must be defined in the SCRN CODE field on a TCSTEXT form (5436 Record).

2.7 N1 - N16

Description: Enter the originating NPA of the back number. If "ALL" is entered for any originating NPA on this form, no other originating NPA entry is allowed. When retrofitting from 5E6 to 5E7, the originating NPA, NP1 or row1 is set to "ALL". NP1 through NP16 must be entered left-to-right with no blanks between the entries. For example, if NP3 is entered, then NP1 and NP2 must be entered.

Software Release: 5E7 and later
Valid Entries: ALL, 100 - 999

Data Rules:

If SCRN CODE is entered, then one NPA or "ALL" must be entered.

SEC. 4AN: 5439 RECORD
OPERATOR SPECIAL DIALED CODES FORM - OSDC

1. GENERAL

The 5439 Record is available with 5E4(2) and later Software Releases.

This record contains the valid operator special-dialed codes used for residual calls. Residual calls are specialized operator calls handled by the SOST (Special Operator Service Traffic) operators.

When a customer places a residual call, the OSPS (Operator Services Position System) operator obtains the type of service information from the customer, enters an OSDC (Operator Special Dialed Code) to reach an SOST operator, informs the SOST of the call details, and then releases the call.

If an OSDC form is defined, then the OSPSOPT form (5424 Record) must be submitted with OSPS TA set to "Y".

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * OPER SPEC DIAL CODE

Description: Enter a 4- or 5-digit operator special-dialed code.
Valid Entries: 1100 - 1199, 11000 - 11999.

Data Rules:

There are a maximum of 10 codes permitted per 5ESS Switch. All the codes must be the same number of digits.

---

SEC. 4AO: 5440 RECORD
EXCEPTION AREAS FORM - EXMAP

1. GENERAL

The 5440 Record is available with 5E4(2) and later Software Releases.

This record defines the originating and terminating exception area indices for an exception call. The use of this form assumes that the 5ESS Switch has ISP (Intermediate Switching Point) trunks and, probably, OSPS (Operator Services Position System). This form should not be entered unless at least one TKGRP form (5202 Record) exists with a TRKCLS field entry of "FIOPR".

Exception calls are calls from a specific NPA-NXX served by the 5ESS Switch to a specific NPA-NXX in another LATA (Local Access and Transport Area). Although the call crosses a LATA boundary, the call is to be treated as an intraLATA call.

Exception area mapping is only done if an OSPSOPT form (5424 Record) has been submitted with the EXCEPT DETRM field set to "Y".

1.1 Recent Change View

The corresponding Recent Change view for this form is 26.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ORIG EAI

Description: Enter the originating exception area index.

Required Field.
Valid Entries: 1 - 250

Data Rules:

The ORIG EAI entry must not equal the TERM EAI entry.

Entries in this field must be defined in the EAI field of an NPAMAP form (5414 Record).

2.3 * TERM EAI

Description: Enter the terminating exception area index.

Required Field.
Valid Entries: 1 - 250

Data Rules:

The TERM EAI entry must not equal the ORIG EAI entry.

Entries in this field must be defined in the EAI field of an NPAMAP form (5414 Record).

SEC. 4AP: 5441-1/2/3 RECORD
BUSY LINE VERIFICATION NPA FORM - BLVNPA

1. GENERAL

The 5441 Record is available with 5E4(2) and later Software Releases.

This Record contains information regarding NPA-NXXs that can be verified using the BLV (Busy Line Verify) feature. BLV permits an operator to determine whether a telephone line is actually busy or not. The BLVNPA form contains the NPAs (Numbering Plan Areas) that are verifiable from the OSPS (Operator Services Position System) office, and a status for each NXX (Office Code) within the NPA (Numbering Plan Area). It also contains a routing code used when BLV is performed by the operator.

If a BLVNPA form is submitted, then an OSPSOPT form (5424 Record) must be submitted with the OSPS TA field set to "Y".

No more than 16 BLVNPA forms may be submitted for a 5ESS Switch.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NPA

Description: Enter an NPA (Numbering Plan Area).

Required Field.
Valid Entries:
- For 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

2.3 # ROUTE CODE

Description: Enter the routing code for Busy Line Verification. This code will replace the NPA of the called number when the operator attempts a BLV (for digit analysis). The code is used to properly route the call out of the OSPS office.

Required Field.
Valid Entries: 0 - 199

2.4 LIST OF NXXs (200-399)

Description: Enter the list of NXX lines; this field represents a BLV screen bit map.

Valid LIST OF NXXs Entries

Entry	Definition
0 (or blank)	Verifiable; theentire NXX can be verifiedby this OSPS.
1	Exclusions; there are linenumbers in the NXX that are excludedfrom verification.
2	Nonverifiable; the entire NXXcannot be verified by this OSPS.The operator can go to aninward operator to performthe verification.

Copyright © 2003 Lucent Technologies

Data Rules:

Entries of 1 in the LIST OF NXXs field require that a BLVEX form (5442 Record) be defined for this NPA/NXX combination.

SEC. 4AQ: 5442 RECORD
BUSY LINE VERIFICATION LINE EXCLUSIONS FORM - BLVEX

1. GENERAL

The 5442 Record is available with 5E4(2) and later Software Releases.

This record contains information regarding the lines excluded from verification for an NPA-NXX code.

A maximum of 96 BLVEX form entries are allowed for a specific combination of NPA and NXX.

If a BLVEX form is submitted, then the OSPSOPT form (5424 Record) must be submitted with OSPS TA set to "Y".

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NPA

Description: Enter an NPA (Numbering Plan Area).

Required Field.
Valid Entries:
- For 5E4(2) - 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

Data Rules:

For the NPA entered on this form, there must be a BLVNPA form (5441 Record) keyed by the NPA.

For 5E11 and later, ten-digit numbers which are defined by NPA, NXX, BEG LINE, and optionally, END LINE on the BLVEX form, must not be duplicated or overlapped by ten-digit numbers on another BLVEX form.

2.3 * NXX

Description: Enter an Office Code.

Required Field.
Valid Entries: 200 - 999

Data Rules:

For the NXX entered on this form, the BLVNPA form, keyed by the NPA on this form, must have a 1 entered for this NXX value in the LIST OF NXXs.

2.4 * BEG LINE

Description: Enter the station number to be excluded from verification. This field may be used to specify the first number for a range of numbers to be excluded. If this field is used to specify such a range, the

Copyright © 2003 Lucent Technologies

END LINE field will contain the last number in the range to be screened.

Required Field.
Valid Entries: 0000 - 9999

2.5 (*) END LINE

Description: Enter the last number in a range of numbers to be screened. This field is optional.
Valid Entries: 0001 - 9999

Data Rules:

If an entry is made in this field, it must be greater than the entry in the BEG LINE field.

SEC. 4AR: 5443 RECORD
TGN TO LEC INDEX FORM - TGNLEC

1. GENERAL

The 5443 Record is available with 5E4(2) and later Software Releases.

This record provides information for mapping a TGN (Trunk Group Number) to the appropriate text to be displayed to an operator when a call is routed to an OSPS (Operator Services Position System) position.

In other words, the record is used to provide VDT (Video Display Terminal) text specific to an incoming LEC (Local Exchange Carrier) trunk group. This text can be used to inform the OSPS operator that the call originated from an independent LEC company.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.21.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the base and control group number and the office name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

2.3 # LEC INDEX

Description: Enter the index into the LEC message table.

Required Field.
Valid Entries: 0 - 1999

Data Rules:

Entries in this field must exist as entries in the TEXT LINES field on the LECTEXT form (5444 Record).

```

SEC. 4AS: 5444 RECORD
LOCAL EXCHANGE CARRIER TEXT FORM - LECTEXT

1. GENERAL

The 5444 Record is available with 5E4(2) and later Software Releases.

This record provides LEC (Local Exchange Carrier) specific text to be displayed to an operator when a call comes to an OSPS (Operator Services Position System) operator position.

This text can be used to inform the OSPS operator that the call originated from an independent LEC company.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * LEC INDEX

Description: Enter the index into the LEC message table.

Required Field.
Valid Entries: 0 - 1999

2.3 TEXT LINES

Description: Enter the text to be displayed at the VDT (Video Display Terminal). There are 4 lines of data. Each line is an individual field, named TEXT 1, TEXT 2, TEXT 3 and TEXT 4, respectively. Each line can have a maximum of 29 characters. At least one character must be entered in one of the four lines; all characters are allowed, with the exception of a double quote (").
Valid Entries: 29 characters (per line)

SEC. 4AT: 5446 RECORD
NXX RESTRICTION FOR MEET-ME/ADD-ON
ALLIANCE TELECONFERENCING FORM - ATC

1. GENERAL

The 5446 Record is available with 5E4(2) and later Software Releases. It is used to list NPAs for which some or all NXXs can be restricted from using Meet-me or Add-on ATC (Alliance Teleconferencing). This record is used by OSPS (Operator Services Position System) for access restriction.

Detailed information concerning Alliance Teleconferencing capability is located in Division 2, Section 1O.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.40.

2. FORM ENTRIES

2.1 BASE AND CONTROL, UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NPA

Description: Enter the NPA (Numbering Plan Area) served by this OSPS containing NXXs that are restricted from originating Meet-me or Add-on calls.

Required Field.
Valid Entries:
- For 5E4(2) - 5E8: 200 - 919, middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

2.3 * TYPE

Description: Enter the ATC type.

Required Field.

Valid TYPE Entries

Entry	Definition
A	Add-on ATC
M	Meet-me ATC

2.4 # RESTRICT ALL

Description: Are all of the NXXs restricted? Enter "N" if only some of them are restricted.

Required Field.
Default: N
Valid Entries: Y, N

2.5 LIST OF NXXs

Description: Enter "X" (Yes) for each NXX that is to be restricted from originating Add-on or Meet-Me (depending upon the value in the TYPE field) ATC calls. Leave each NXX field blank (or spaces) that is not restricted.

Copyright © 2003 Lucent Technologies

If "Y" is entered in the RESTRICT ALL field, there is no need to make any entry in the LIST OF NXXs.
Valid Entries: X (blank or spaces)

SEC. 4AV: 5447-1/2/3 RECORD
OSPS DSL PACKET SWITCHING ASSIGNMENTS FORM - AMLBDSL

1. GENERAL

The 5447 Record is available with 5E4(2) and later Software Releases, and is used to collect data for OSPS/CACD (Centrex Automatic Call Distribution) packet switching DSL (Digital Subscriber Lines). The AMLB (Automated Multi-Leaf Bulletin) capability allows a VDT (Video Display Terminal) or CST (Combined Services Terminal) to make a packet-switched call to an external data base. In order to do this, the external data base is connected to a DSL (Digital Subscriber Line). The DSL needs to have its features and characteristics set appropriately to provide maximum efficiency for data transfer. This record is used to collect data for OSPS (Operator Services Position System) external data base DSLs.

AMLB is an on-line query system that contains frequently used information which may be used by an operator to complete a customer's call. OSPS uses the AMLB capability to access multi-leaf bulletin data. See Division 2, Section 3H for a more detailed discussion of the AMLB capability. See Division 2, Section 3G for additional information on MDBA (Multiple Data Base Access), which is an extension of AMLB.

1.1 B-channel Time Slots

The choice of a B-channel time slot must be unique within the 5ESS Switch. The combination of the LCEN (first four digits), PIDB, and TS fields are used to determine the uniqueness of a B-channel time slot. Figure 1 illustrates the forms and corresponding fields where the combination of the three fields may not be duplicated. Table references to the LCEN field refer only to the first four digits. The AMLBDSL form is included because the combination of the three fields may not be duplicated on different occurrences of an AMLBDSL form.

1.2 Recent Change View

The corresponding recent change view for this form is 21.34

2. FORM ENTRIES - 5447-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the office name on each record.

2.2 * LCEN

Description: The LCEN field lists the physical components that describe the AMLB DSL. Enter a valid 8-digit RISLU (Remote Integrated Service Line Unit) LCEN (Line Card Equipment Number).

Required Field.
Valid Entries: An 8-digit LCEN in the following format:

LINE CARD EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
(Remote) Integrated Services Line Unit	(R)ISLU	X	0-7
Line Group Card	LGC	XX	00-15
Line Card	LC	XX	00-31

Data Rules:

Duplicate LCENs must not be assigned.

LCENs defined in this field must be even (divisible by 2).

Copyright © 2003 Lucent Technologies

Within any given DSL group, DSLs of any LGC (Line Group Controller) must be assigned members from one and only one of the member number groupings 0-3, 6-9 or 12-15.

One EQISLU or EQRISLU form is required for all AMLBDSL forms with the same SM and ISLU entries in the LCEN field. All AMLBDSL forms require corresponding OSPSDSL forms with matching LCENs.

The SWITCHING MODULE field on the EQPSU form matches the SM portion of the LCEN field on the OSPSDSL and AMLBDSL forms. The ISCN field is located on the OSPSDSL form, and the ISCN field is located on an AMLBDSL form.

An SLG is a set of four ISLU LCs (Line Cards) assigned to the same LGC. The valid sets of LCs are as follows:

0, 2, 4, 6

8, 10, 12, 14

16, 18, 20, 22

24, 26, 28, 30

It is recommended that OSPS DSLs equipped in a given SLG (Sub-Line Group) belong to the same DSL group, when a Protocol Handler Type of PH3 is entered on the EQPSU form. (OSPS DSLs are assigned on an AMLBDSL and OSPSDSL forms.) A corresponding EQPSU form is one where the SM entry on the EQPSU form matches the SM portion of the LCEN entry on this form.

A LCEN which has a PKT RAX and a PKT LCC entered on a LCC form (5306 Record), which has an associated DIGIT ANALYSIS SELECTOR entered on a DAS form (5300-1 Record), which finally has the associated PREFIX/FEATURE DIT entered on PDIT form(s) (5300-2 Record[s]) and/or the associated LOCAL DIT entered on LDIT form(s) (5300-3/5 Record[s]) requires the following: When TYPE OF CI CALL is known on a PDIT and/or a LDIT form, it must be equal to "PSNCI" or "PSCAR".

A corresponding AMLBDSL form is required for each OSPSDSL form when LVL2 PROF on the OSPSDSL form is "ISDN" or "PKTSW". An AMLBDSL form must not be submitted unless LVL2 PROF on the corresponding OSPSDSL form is "ISDN" or "PKTSW". The AMLBDSL and OSPSDSL forms correspond if they have matching LCENs.

For 5E10 and later, the following data rule does not apply to an SM2000, provisioning of nailed-up time slots is not required on an SM2000.
On a PSU2, each Data Interface in an SM can have a maximum of 256 nailed-up time slots reserved for the following applications.

Timeslots Reserved for Applications

Application	Defined on Form(s)
EDSL	TRKCLS set to "EDSL" on the TKGRP form
IFOPER	TRKCLS set to "IFOPER" on the TKGRP form
IFTERM	TRKCLS set to "IFTERM" on the TKGRP form
IP	TRKCLS set to "PACKET" on the TKGRP form
ISM	PSISM
PKTPIPE	TRKCLS set to "PKTPIPE" on TKGRP form
RISLU B Channel	DSL and AMLBDSL
RISLU D Channel	DSL, DSLAP, MISLINK, and OSPSDSL
SPCHNDLR	TRKCLS set to "SPCHNDLR" on TKGRP form
X.25	XAT
X75	TRKCLS set to "X75" on the TKGRP form
X75P	TRKCLS set to "X75P" on the TKGRP form

These time slots can be reserved by setting rows RPTSS0 to RPTSS7 to 1 on the EQPSU form. The quantity of time slots reserved (i.e. the number set to 1) must be greater than or equal to the quantity of time slots assigned for the above applications. Note that a D-channel only takes a quarter of a time slot. A PSU SHELF may be assigned more than 1 DI: one for DI 0 and a second for DI 1. Since a given PSU SHELF may have as many as 128 time slots on a DI, it is not possible for each time slot to have a unique

Copyright © 2003 Lucent Technologies

vertical (column) position (i.e., unique time slot value of 0 - 31 on different PIDBs).

2.3 SERVICE CLASS

Description: Enter the OSPS Service Class.

Software Release: 5E6 and later
Required Field.
Valid Entries:

Valid SERVICE CLASS Entries

Entry	Definition
DAOPER	Directory Assistance Operator - BST
TAOPER	Toll and Assistance Operator - VDT
XDB	External Data Base

Data Rules:

DAOPER - If "DAOPER" is entered, then
- CUGOA must be "N"
- CUGIA must be "N"
- DPIDB must be blank
- ICB must be "N"
- ISCN must be blank
- N2 must be blank
- OCB must be "N"
- RATE must not be entered
- RCV TPC must be 9600
- SEND TPC must be 9600
- T1 must be blank
- TN must be entered
- TS must be blank
- TPCN must be "N"
- WNDSZ must be blank.

If "DAOPER" is entered and H PVC LCN is entered, then L 2W LCN and H 2W LCN must not be entered.

If "DAOPER" is entered and H PVC LCN is not entered, then L 2W LCN must be 1 and H 2W LCN must be 12.

TAOPER - If "TAOPER" is entered, then
- CUGOA must be "N"
- CUGIA must be "N"
- DPIDB must be blank
- FSA must be "N"
- IA must be "N"
- ICB must be "Y"
- ISCN must be blank
- H 2W LCN must be blank
- H OUT LCN must be 12
- H PVC LCN must be blank
- L 2W LCN must be blank
- L OUT LCN must be 1
- N2 must be blank
- OCB must be "N"
- RATE must not be entered
- RCV TPC must be 9600

Copyright © 2003 Lucent Technologies

- ☐ RCV PKT SIZE must be 128
- ☐ SEND TPC must be 9600
- ☐ SEND PKT SIZE must be 128
- ☐ T1 must be blank
- ☐ TN must be entered
- ☐ TPCN must be "N"
- ☐ TS must be blank
- ☐ WNDSZ must be blank.

For 5E9(1) and later, if "TAOPER" is entered and L IN LCN is not entered, then:

- ☐ CUGOA, CUGIA and IA must all be "N"
- ☐ ICB must be "Y"
- ☐ H IN LCN must not be entered
- ☐ L OUT LCN must be 1
- ☐ the corresponding OSPSDSL form (found by matching LCEN values) must not have any DATA LINK GRP or DATA LINK NBR entries.

For 5E9(1) and later, if "TAOPER" is entered and L IN LCN is entered, then:

- ☐ CUGOA, CUGIA, and IA must all be "Y"
- ☐ ICB must be "N"
- ☐ CUGOA, CUGIA, and IA must all be "Y"
- ☐ ICB must be "N"
- ☐ H IN LCN must be 1
- ☐ L IN LCN must be 1
- ☐ L OUT LCN must be 2
- ☐ the corresponding OSPSDSL form (found by matching LCEN values) must have entries for DATA LINK GRP and DATA LINK NBR.

XDB - If "XDB" is entered, then

- ☐ ISCN must be entered
- ☐ N2 must be entered
- ☐ RCV PKT SIZE must be 128
- ☐ RATE must be entered
- ☐ SEND PKT SIZE must be 128
- ☐ SUST must be "N"

Copyright © 2003 Lucent Technologies

- T1 must be entered
- WNDSZ must be entered.

If "XDB" is entered then either IN LCN or 2W LCN must have an entry.

2.4 TN

Description: Enter the TN (Packet Switching Telephone Number) that identifies this DSL.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

TNs must be unique for each entry.

A NOC form must exist for each entry in the TN field.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the AMLBDSL form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE or the NOC form does not exist, the 7-digit TN(s) must be entered as a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.5 # RAX

Description: Enter the Packet Switching Rate Center that performs digit analysis.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

The RAX on this form must match a RATE AREA on an LCC form. The LCC (LINE CLASS CODE) and RAX (RATE AREA) of an LCC form with a CLASS OF SERVICE of "TAOPER" must match the LCC and RAX on this form.

The LCC for a CLASS OF SERVICE of "TAOPER" is permitted only for packet switching.

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

2.6 # LCC

Description: Enter the Packet Switching Line Class Code that performs digit analysis. This entry represents an index to a terminating class and service class combination.

Required Field.
Valid Entries: 3-character alphanumeric strings

Data Rules:

The LCC on this form must match a LINE CLASS CODE on an LCC form. The LINE CLASS CODE and RATE AREA of an LCC form with a CLASS OF SERVICE of "TAOPER" must match the LCC and RAX on an AMLBDSL form. The LINE CLASS CODE for a CLASS OF SERVICE of "TAOPER" is permitted only

Copyright © 2003 Lucent Technologies

for packet switching.

2.7 ISCN

Description: Enter a valid 6-digit packet ISCN (Integrated Services Channel Number). The ISCN field defines the protocol handler that is used by this DSL for communications purposes.
Valid Entries: 6-digit packet ISCN with the following format:

INTEGRATED SERVICES CHANNEL NUMBER

Equipment		Format	Valid Entries
Shelf	SHELF	X	0-4
Channel Group	CHL GRP	XX	00-15
Channel	CHL	XXX	000-124

Data Rules:

The CHL entry must be zero or a multiple of four (e.g., 000, 004, 008, 012, ..., or 124).

Duplicate ISCNs may not be assigned.

If the PROTOCOL HANDLER TYPE on the corresponding EQPSU form is "PH16", then the last three digits of the ISCN entry must be 000.

When B1 PKT ISCNs are assigned on this form, a PIDB (Peripheral Interface Data Bus) with a PIDB TYPE of "PSU" is required on the same Packet Switching Unit shelf (on the EQISLU form) as the PSU shelf number specified by the first two digits of the ISCN entry.

One EQPSU form is required for all AMLBDSL forms assigning ISCNs in the same SM.

If ISCN has been entered, then the corresponding combination of SM, PSU, PSU SHELF and GRP must be entered on the PSUGP form.

ISCNs cannot be duplicated on one or more of the following forms:
- AMLBDSL
- CCLNK
- DSL
- DSLAP
- DSLUSR
- MDLNK
- MISLINK
- ODBRES
- OSPSDSL
- PSISM
- RTERM
- TRUNK and XAT.

Each ISCN entry must have the SHELF value (the first character of the ISCN) assigned on an EQPSUPH form on the same SWITCHING MODULE and having a matching PSU SHELF.

For 5E9(1) and later:

If SM / SHELF / CHL GRP combination corresponds with the combination of SM, PSU, PSU SHELF and GRP on the PSUGP form, then the PH TYPE on the PSUGP form must be set to "PH3". The SM is the first three digits of LCEN, SHELF/CHL GRP is the first three digits of ISCN on the AMLBDSL form (when it is entered) or the first three digits of ISCN on the corresponding OSPSDSL form when ISCN is not entered on the AMLBDSL form.

A maximum of 128 ALCBs (Access Link Control Blocks) can used per SM, Shelf and Channel Group.

Copyright © 2003 Lucent Technologies

The following applications use one ALCB:

- AMLBDSL - where SERVICE CLASS is "XDB" on a corresponding OSPSDSL form
- DSL - where SHELF/CHL GRP is the first three digits of PPB1 ISCN or PPB2 ISCN
- DSLUSR
  - where SHELF/CHL GRP is the first three digits of D ISCN on a corresponding DSL form
  - where SHELF/CHL GRP is the first three digits of ODB ISCN1 or ODB ISCN2
- MISLINK - where SHELF and CHL GRP are the SHELF and CHL GRP fields (respectively) on the form
- OSPSDSL - where SHELF/CHL GRP is the first three digits of ISCN and SERVICE CLASS is "TAOPER" or "DAOPER"
- XAT - where SHELF/CHL GRP is the first three digits of ISCN.

For 5E10 and later:

Each SM (Switching Module) can have up to 5 PSU SHELFs (defined by the first digit in the ISCN field). If the UNIT TYPE on the EQIM form (5700 Record) is not "SM2000", each PSU SHELF can be assigned up to (32 times X) time slots for the following applications: (Note: X represents the number of PIDBs, 0 to 4, provisioned per shelf.)

32 Time Slots For Applications
5E10 and Later

Application	Form
RISLU B Channel	defined on the DSL/AMLBDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
RISLU D Channel	defined on the DSL/DSLAP/OSPSDSL forms where the first 3-digit of LCEN matches SM on an EQRISLU form.
X.25	defined on the XAT form.
ISM	defined on the PSISM form.
IP	defined by setting TRKCLS equal to "PACKET" on the TKGRP form and defining members on TRUNK forms.
X75P	defined by setting TRKCLS equal to "X75P" on the TKGRP form and defining members on TRUNK forms.
X75	defined by setting TRKCLS equal to "X75" on the TKGRP form and defining members on TRUNK forms.
EDSL	defined by setting TRKCLS equal to "EDSL" on the TKGRP form and defining members on TRUNK forms.
IFOPER	defined by setting TRKCLS equal to "IFOPER" on the TKGRP form and defining members on TRUNK forms.
IFTERM	defined by setting TRKCLS equal to "IFTERM" on the TKGRP form and defining members on TRUNK forms.
RPA	defined by setting BRI RDTA PIDB TS to a non-zero value on the EQPSUPH form.
PKTPIPE	defined by setting TRKCLS equal to "PKTPIPE" on the TKGRP form and defining members on TRUNK forms.
SPCHNDLR	defined by setting TRKCLS equal to "SPCHNDLR" on the TKGRP form and defining members on TRUNK forms.

For 5E10 and later, the SM entered in the ISCN field on this form can not have an ISCN SHELF and CHL GRP which are mixed with ISCNs from PSISM forms, PSULNK forms, or TRUNK forms which have a TRKCLS of

- "PACKET"
- "PKTPIPE"
- "SPCHNDLR"

Copyright © 2003 Lucent Technologies

- "X75"
- "X75P"

defined on the TKGRP form. However, the

- AMLBDSL
- DSL
- DSLAP
- DSLUSR
- ODBRES
- OSPSDSL
- RTERM
- XAT

forms along with all TRUNK forms which have a TRKCLS of

- "EDSL"
- "IFTERM"
- "IFOPER"

defined on the TKGRP form can share an ISCN SHELF and CHL GRP (the first three characters of the ISCN) with ISCNs from other forms from this set in the same SM.

2.8 N2

Description: The N2 field defines the maximum number of LAPB level 2 frame retransmissions for packet switching on a B-channel that will take place before any type of testing action is taken.
Valid Entries: 2 - 15

Data Rules:

An entry in the N2 field is required when "ADMIN" is entered in the D SERV field.

2.9 T1

Description: Enter the timeout value for LAPB level 2 frame retransmission. The value may range from 0.2 to 2.0 seconds in increments of 0.02 seconds.
Valid Entries: even numbers from 20 - 200 (tenths of a second)

Data Rules:

An entry in the T1 field is required when "ADMIN" is entered in the D SERV field.

2.10 WNDSZ

Description: Enter the maximum number of LAPB level 2 I-frames. This entry indicates how many frames containing data may be transmitted before an acknowledgement is required.
Valid Entries: 1 - 7

Data Rules:

An entry in the WNDSZ field is required when "ADMIN" is entered in the D SERV field.

2.11 DPIDB

Description: Enter the PIDB number for the ISLU-based AMLB DSL.
Valid Entries: 2 - 11

Data Rules:

Copyright © 2003 Lucent Technologies

An entry in this field is required when "ADMIN" is entered in the D SERV field.

An entry is not allowed in this field for DSLs assigned to a RISLU.

2.12 TS

Description: Enter the time slot that the B-channel is assigned to on the D PIDB.
Valid Entries: 0 - 31

Data Rules:

An entry in the TS field is required when "ADMIN" is entered in the D SERV field. Digital subscriber lines must not be assigned to duplicate B-channel time slots.

B-channel time slots cannot be assigned by ODA. Hardware assignments (on the EQISLU form) must be sufficient for the number of time slots required. An entry is not allowed in the TS field for DSLs assigned to a RISLU.

The TS entry must not be equal to the LGC portion of the entry in the LCEN field, and must not equal the sum of the LGC plus 16.

The LCEN's assigned on the AMLBDSL, DSLAP or OSPSDSL forms, or DSL OE's on the DSL form or OE's on the MISLINK form can not have their D and/or B Channels assigned to conflicting DPIDB time slots or quarter time slots due to manual (vs ODA) time slot assignments. Each SM/ISLU or SM/IDCU DPIDB time slot may be assigned only once. (Note, D channels are allocated to quarter time slots; therefore up to four unique assignments can be made before a time slot is considered full.

When making manual assignments, care must be taken to use assignments as shown in Figure 2, TS Entry vs LGC and DPIDB entries. For example, if manual assignments are being made and the DPIDB selected is 11 and the LGC from the OE is 0, then the TS assignment must be 1, 9, 17, or 25. B and/or D channel assignments made manually cannot conflict with the ODA assignment algorithm. The ODA algorithm allocates 4 time slots for each DPIDB per SM/ISLU/LGC. The LGCs 0 - 7 are allocated time slots on the odd numbered DPIDBs while LGCs 8 - 15 are allocated time slots on the even numbered DPIDBs. Manual time slot assignments do not have to follow this algorithm. However, if manual assignments are made, they will use one or more time slots. These manual assignments diminish (and may conflict with) the time slots available for the ODA assignment algorithm. For example, TS 1, 9, 17 and 25 are the 4 time slots that are allocated to ODA for LGC 0 in any ISLU which has a DPIDB 11 assigned. If a manual assignment is made to TS 9 on DPIDB 11 from any LGC in this ISLU there will only be 3 TS left on PIDB 11 for ODA assignments. Of course other odd numbered DPIDBs will have 4 TS for ODA assignments to LGC 0.

2.13 # SUST

Description: Can packet switching termination be denied on this DSL. Enter "Y" to deny termination; enter "N" to allow termination.

Required Field for 5E6 and later
Default: Y
Valid Entries: Y, N

2.14 BILL TN

Description: Enter a valid 7 or 10 digit packet switching telephone number to which charges should be billed for this DSL. No entry is required if the billing number is the same number that was entered in the TN field.
Valid Entries: 7 or 10 digit TN

Copyright © 2003 Lucent Technologies

2.15 RMK

Description: Enter a remarks or brief information.
Valid Entries: 0 - 16 alphanumeric characters

3. FORM ENTRIES - 5447-2 RECORD

3.1 H PVC LCN

Description: Enter the highest assignable PVC (Permanent Virtual Circuit) LCN (Logical Channel Number) to be used by this DSL.
Valid Entries: 1 - 127

Data Rules:

If an entry is made in the H PVC LCN field of the AMLBDSL form, a corresponding PSPVC formmust exist. This requires that either a TN exist on an AMLBDSL form, or that a PKT MLHG/TERM combination exists (that matches a DSL NAME ID/DSL NAME RL combination on the OSPSDSL form with SERVICE CLASS of "XDB"). PSPVC forms are required for assigning PSPVCs (Packet Switching Permanent Virtual Circuits).

Logical Channel Numbers

The following fields (Section 3.2 - Section 3.9) refer to LCNs.

- The IN LCN (Incoming Logical Channel Number) fields control the calls that are to be terminated on the AMLB DSL.
- The 2W LCN The 2W LCN fields control the calls that are to be both originated and terminated on the AMLB DSL.
- The OUT LCN fields control the calls that are to be originated by the AMLB DSL.

Data Rules:
An entry is required in either the IN LCN or 2W LCN fields when "ADMIN" is entered in the D SERV field.

3.2 L IN LCN

Description: The L IN LCN entry is the starting channel number of incoming calls for this DSL. This value and the H IN LCN value limit the number of logical channels that will be handled by the DSL.
Valid Entries: 1 - 127

Data Rules:

If L IN LCN is entered, then H IN LCN must be entered, and vice versa.

If the H PVC LCN field is blank, then L IN LCN must be 1. The value entered in the L IN LCN field must be at least one greater than the entry in the H PVC LCN field.

3.3 H IN LCN

Description: The H IN LCN entry is the upper starting channel number. The L IN LCN value and this value limit the number of logical channels that will be handled by the DSL.
Valid Entries: 1 - 127

Data Rules:

Copyright © 2003 Lucent Technologies

If L IN LCN is entered, then H IN LCN must be entered, and vice versa. The value entered in the H IN LCN field must be greater than or equal to the entry in the L IN LCN field.

3.4 ICB

Description: Are incoming calls barred?

Required Field.

Default Value: N
Valid Entries: Y, N

Data Rules:

For 5E9(1) and earlier, if ICB is "Y", then L/H 2W LCN must be blank.

3.5 L 2W LCN

Description: Enter the starting channel number of two-way calls for this DSL. This value and the value for H 2W LCN limit the number of logical channels that will be handled by the DSL for two-way calls.
Valid Entries: 1 - 127

Data Rules:

If H 2W LCN is entered, then L 2W LCN must be entered, and vice versa. Also, H 2W LCN must be greater than or equal to L 2W LCN.

The entry in the L 2W LCN field must be greater than the entry in the H PVC LCN field

3.6 H 2W LCN

Description: Enter the upper channel number. This value and the value for L 2W LCN limit the number of logical channels that will be handled by the DSL for two-way calls.
Valid Entries: 1 - 127

Data Rules:

If H 2W LCN is entered, then L 2W LCN must be entered, and vice versa. The entry in the H 2W LCN field must be greater than or equal to the entry in the L 2W LCN field.

3.7 L OUT LCN

Description: Enter the starting channel number of outgoing calls on this DSL The L OUT LCN and H OUT LCN fields limit the number of out-going logical channels that will be handled by the DSL.
Valid Entries: 1 - 127

Data Rules:

If H OUT LCN is entered, then L OUT LCN must be entered, and H OUT LCN must be greater than or equal to L OUT LCN.

The entry in the L OUT LCN field must be greater than the entry in the H PVC LCN field.

If H 2W LCN is entered, then L OUT LCN must be greater than H 2W LCN

3.8 H OUT LCN

Description: Enter the upper channel number for outgoing calls on this DSL. The L OUT LCN and H OUT

Copyright © 2003 Lucent Technologies

LCN fields limit the number of outgoing logical channels that will be handled by the DSL.
Valid Entries: 1 - 127

Data Rules:

If L OUT LCN is entered, then H OUT LCN must be entered. The entry in the H OUT LCN field must be greater than the entry in the L OUT LCN field.

The entry in the L OUT LCN field must be greater than the entry in the H 2W LCN field.

3.9 OCB

Description: Are outgoing calls barred, i.e. not permitted? If "Y" is entered in the OCB field, only entries within the closed user group to which the VDT subscribes will be allowed.

Required Field.
Default: N
Valid Entries: Y, N

3.10 X25VER

Description: Enter the X.25 CCITT Standard Version supported for this DTE (Data Terminating Equipment).

Software Release: 5E6 and later
Required Field.
Default: 1984
Valid Entries: 1980, 1984

Data Rules:

If X25VER is 1980 and CUGOA or CUGIA is "Y", then CUGPX must be entered.

3.11 LPS PORT

Description: Is this port used by the adjunct processor of the LPS (Lesson Presentation System) feature? If so, this port cannot be used as an operator port on the switch. This field supports the Lesson Presentation System feature. For more information on this feature, see Division 2, Section 3L.

Software Release: 5E9(1) and later.
Default: N
Valid Entries: Y, N

Data Rules:

If LPS PORT is ""Y"", then:
- CUGIA must be "Y"
- CUGOA must be "Y"
- H IN LCN must be 1
- IA must be "Y"
- ICB must be "N"
- L IN LCN must be 1
- L OUT LCN must be 2
- SERVICE CLASS must be "TAOPER"

If LPSPORT is ""N"" and OSPSSRVCL is "TAOPER", then:
- CUGOA must be "N"

Copyright © 2003 Lucent Technologies

- CUGIA must be "N"
- H IN LCN must not be entered
- IA must be "N"
- ICB must be "Y"
- L OUT LCN must be 1

3.12 MLHG

Description: This field can only be entered on the Recent Change View 21.34. It specifies the D-channel packet multiline hunt group number. This field supports the Lesson Presentation System feature. For more information on this feature, see Division 2, Section 3L.

Software Release: 5E9(1) and later.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

This must equal an HML from view 3.5. View 3.5 must have a LISTED TN and LAST LISTED TN entered and an MLH FEATURE entered which has been defined on view 12.18 with a HUNT TYPE of "PSUCD".

3.13 TERM

Description: This field can only be entered on the Recent Change View 21.34. This field specifies the D-channel packet multiline hunt terminal number. This is used to uniquely identify a member in an MLHG that represents a packet end-point. This field supports the Lesson Presentation System feature. For more information on this feature, see Division 2, Section 3L.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 2015.

3.14 SEND TPC

Description: Enter the send throughput class. This field and the RCV TPC field define the upper limits of the needed throughput for the AMLB DSL. A value higher than the expected maximum should be chosen. For AMLB uses, this value should be 19200.

Required Field.
Default:

5E9(1) and later: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600 or 19200.

3.15 RCV TPC

Description: Enter the send and receive throughput classes. These fields define the upper limits of the needed throughput for the AMLB DSL. A value higher than the expected maximum should be chosen. For AMLB uses, this value should be 19200.

Required Field.
Default:

5E9(1) and later: 9600
Valid Entries: 75, 150, 300, 600, 1200, 2400, 4800, 9600 or 19200.

Copyright © 2003 Lucent Technologies

3.16 SEND PKT SIZE

Description: Enter the Send Packet Sizes (in bytes).

Required Field.
Default: 128
Valid Entries: 128 or 256 (bytes)

3.17 RCV PKT SIZE

Description: Enter the Receive Packet Sizes (in bytes).

Required Field.
Default: 128
Valid Entries: 128 or 256 (bytes)

3.18 SEND PKTWD

Description: Enter the number of data packets that the CPE device can have unacknowledged, on a sending basis, at any time. If no entry is made in this field, it is set to 2.

Required Field.
Default: 2
Valid Entries:

5E9(1) and later: 1 - 7

Data Rules:

For 5E9(1) and later, if SEND PKTWD is not 2, FCPN must be "Y".

3.19 RCV PKTWD

Description: Enter the number of data packets that the CPE device can have unacknowledged, on a receiving basis, at any time. If no entry is made in the PKT SIZE RCV field, it is set to 2.

Required Field.
Default: 2
Valid Entries:

5E9(1) and later: 1 - 7

Data Rules:

For 5E9(1) and later, if RCV PKTWD is not 2, FCPN must be "Y".

3.20 REV CHARGE

Description: Is reverse charged allowed for the call?

Required Field.
Default: N
Valid Entries: Y, N

3.21 FCPN

Copyright © 2003 Lucent Technologies

Description: Should flow control parameter negotiation indication between the calling and called parties be enabled? When a call is made, a number of parameters are requested by the calling party. These parameters are referred to as negotiated parameters. The negotiated parameters that are allowed will have to be determined based on the needs of the parameters that are supported by the external data base computer"s X.25 "front end".

3.22 TPCN

Description: Is Throughput class negotiation for a virtual circuit indicated?

Required Field.
Default: N
Valid Entries: Y, N

3.23 FSA

Description: Does Fast Select acceptance permit the transfer of data in an incoming call packet. Enter "Y" to indicate fast select acceptance.

Required Field.
Default: N
Valid Entries: Y, N

3.24 IA

Description: Is an abbreviated packet telephone number allowed to be used in calls?

Required Field.
Default: N
Valid Entries: Y, N

3.25 IECP DNIC

Description: Enter the IECP (Inter-Exchange Carrier Preselect) DNIC (Data Network Identification Code) used when calls go beyond the 5ESS Switch to which the data base is connected.
Valid Entries: 1111 - 1114 and 2000 - 9000.

Data Rules:

Corresponding PSDNICRI forms are required where the entry in the DNIC field (on the PSDNICRI form) matches the IECP DNIC entry on an AMLBDSL form.

3.26 RATE

Description: Enter the X.25 B1 channel data rate. This field supports the CSIDP (Call Serving Information Delivery Platform). For more information on this special feature, see Division 2, Section 4C13. For the CSIDP feature, this field must be either "56KB" or "64KB" and must match the DIP switch settings of the corresponding T-BR1TE card in the ADTRAN channel bank. The recommended value is "64KB" if the XDB (External Database) is on an ISLU. For the RISLU, the value should be "56KB".

Software Release: 5E8 and later.
Default: 64IK
Valid Entries:

Valid RATE Entries

Entry	Definition
56K	56 KB data calls
64K	64 KB data calls
64IK	Inverted 64 KB data calls

Copyright © 2003 Lucent Technologies

Data Rules:

If SERVICE CLASS is "XDB", RATE must be entered.

4. FORM ENTRIES - 5447-3 RECORD

CLOSED USER GROUP

The following fields (Section 4.1 - Section 4.4) define information for a CUG (Closed User Group). The VDT/CST may belong to one or more CUGs.

4.1 CUGPX

Description: Enter the Preferential Customer CUG Index.
Valid Entries: 0 - 99

Data Rules:

If no entry is made in the CUGHX field, then no entry is allowed in the CUGPX field. Each entry in the PREFER CUST IDX field must equal one of the entries in the IDX field.

4.2 CUGOA

Description: Are outgoing calls permitted to be made to CUGs other than those specified in the CUG.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If no entry is made in the CUGHX field, then this field must be "N".

For 5E6 and later, if CUGOA or CUGIA is "Y" and X25VER is "1980", then CUGPX must be specified.

4.3 CUGIA

Description: Are incoming calls permitted to be accepted from CUGs other than those specified in the CUG.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If no entry is made in the CUGHX field, then this field must be "N".

If CUGHX is blank, then CUGIA and CUGOA must be "N" and CUGPX must be blank.

For 5E6 and later, if CUGIA is "Y" and X25VER is 1980, then CUGPX must be entered.

4.4 CUGHX

Description: Enter the Highest Customer CUG Index.
Valid Entries: 0 - 99

Data Rules:

Copyright © 2003 Lucent Technologies

If CUGHX is blank, then CUGIA and CUGOA must be "N" and CUGPX must be blank.

If CUGHX is entered, and CUGOA and CUGIA are "N", then CUGPX must be less than or equal to CUGHX.

CUG LIST

The following fields (Section 4.5 - Section 4.7) define information for the Closed User Group List.

4.5 DNIC

Description: Enter the packet switching DNIC (Data Network Identification Code). If all of the members of a closed user group are within the same network, the DNIC is that of the home network. Otherwise, one of the other networks involved should be designated as the coordinating administration.
Valid Entries: 1111 - 1114 and 2000 - 9999

Data Rules:

If either DNIC, ICN or IDX are entered, then all three must be entered.

4.6 ICN

Description: Enter the International Closed user group code. This entry indicates the international CUGs that this DSL is allowed to communicate with. This value is unique for each CUG belonging to the same network.
Valid Entries: 1 - 32767

Data Rules:

If either DNIC, ICN or IDX are entered, then all three must be entered.

4.7 IDX

Description: Enter the customer CUG Index. This is a local CUG that this DSL is allowed to communicate with.
Valid Entries: 0 - 99

Data Rules:

If either DNIC, ICN or IDX are entered, then all three must be entered.

Duplicate IDX entries are not allowed.

The entry in the IDX field must be less than or equal to the entry in the CUGHX field. The highest entry in the IDX field must equal the entry the CUGHX.

FORMS AND FIELDS WHERE LCEN, B RELPIDB AND B TIMESLOT MAY NOT BE DUPLICATED

SEC. 4AW: 5448 RECORD
OSPS LISTING SERVICES/CACD INTERFLOW DESTINATION RECORD - INFLDEST

1. GENERAL

The 5448 Record is available with 5E5 and later Software Releases. The INFLDEST form (5448 Record) is is used for selecting a new destination index for Listing Services and CACD (Commercial Automatic Call Distribution) calls that are to be interflowed. An outgoing destination index is assigned based on an incoming destination index, the trunk group number, and a destination office ID.

For each unique combination of the INC CDI and DEST ID fields specified on one or more INFLDEST forms, there must be a corresponding INFLDEST form defined with the wild card TGN value of "9999".

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL ESS UNIT

Enter the Base and Control number and Office Name on each record.

2.2 * INC CDI

Description: Enter the Incoming Code Index.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

The entries in the INC CDI and OUTGO CDI fields must not be the same.

For every INC CDI entered on this form, there must be a CDI entered on one of the following forms:

- The CODE INDEX field or the CDI field on the CONFLICT RESOLUTION ENTRIES list, on the LDIT form (5300-3/5 Record);
- For 5E8 and later, the CODE INDEX field or the CDI field on the CONFLICT RESOLUTION ENTRIES list, on the RDIT form (5300-7/8 Record);
- The CODE INDEX field on the MLDIT form (5300-3/5 Record);
- The CODE INDEX field on the PDIT form (5300-2 Record);
- The CODE INDEX field on the INDIT form (5309 Record); or
- For 5E7 and later, the WITH ANI or WITHOUT ANI fields on the AISCLS form (5469 Record).

2.3 * TGN

Description: Enter the Incoming TGN (Trunk Group Number).

Required Field.
Valid Entries:
- For 5E10 and earlier 1 - 2000, or 9999

Copyright © 2003 Lucent Technologies

- For 5E11 and later: 1 - 4000, or 9999

Data Rules:

For every TGN entered on this form that is not equal to "9999", there must be a corresponding entry in the TGN field of a TKGRP form (5202 Record).

2.4 * DEST ID

Description: This field indicates the new OSPS listing services and C-ACD interflow destination office ID.

Required Field.
Valid Entries: 1 - 9999

Data Rules:

A maximum of 16 unique values are allowed.

2.5 # OUTGO CDI

Description: This required field indicates the Outgoing CDI. The valid range entries range from 1 through 4095.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

The entries in the OUTGO CDI and INC CDI fields must not be the same.

Each OUTGO CDI entry on an INFLDEST form must be defined in the CDI field of at least one RAR form (5301 Record).

The OUTGO CDI field on an INFLDEST form and the OUTGO CDI on another INFLDEST form cannot be the same when the following conditions are met:

- The TGN on one of the INFLDEST forms is between 1 and 2000 and the TGN on the other INFLDEST form is 9999.
- The combination of the INC CDI and DEST ID fields is the same on both INFLDEST forms.

2.6 # DEST NAME

Description: This required field indicates the destination office name. Entries must be unique.

Required Field.
Valid Entries: 4-character alphanumeric
- office identifiers

Data Rules:

If DEST ID on this form equals one of the OSPS IDs on the INFLTADP form (5452 Record), then DEST NAME must be identical to the corresponding OFC on the INFLTADP form. (All OSPS IDs must be unique).

SEC. 4AX: 5449 RECORD
OSPS LINE INFORMATION DATABASE (LIDB) QUERY FORM - LIDBLNQ

1. GENERAL

The 5449 Record is available with 5E5 and later Software Releases, and is used for designating a query destination on a per NPA-NXX or RAO-(0/1)XX basis.

1.1 Line Information Data Base Exchange/ Alternate Billing Service

The LIDB/EABS (Line Information Data Base Exchange Alternate Billing Service) capability provides a LEC (Local Exchange Carrier) OSPS (Operator Services Position System) the ability to obtain billing authorization information from the LIDB via the LEC's SS7 (Signaling System 7) network for interLATA traffic or from the BVA (Billing Validation Application) via AT&T's CCIS6 or DCIS6 network. These capabilities are needed to permit LECs to process Calling Card, Collect, and Bill-To-Third number calls, in an environment where the billing authorization data base is distributed between the LECs and AT&T. A LEC can now either query the AT&T BVA database or the LIDB database.

The 5449 Record defines where a query should be sent to each NXX/(0/1)XX of a given NPA or RAO (Revenue Accounting Office) subgroup. (An NPA or RAO subgroup is a group of calling or BNS (Billed Number Screening) numbers. Refer to Division 2, Section 3I for more detailed information regarding the definition and population of the LIDB feature. Also, for enchancements to this feature, see Division 2, Section 4A81, Division 2, Section 4C1 and Section 4C3.

1.2 EABS Alternate Routing Secured Feature

For 5E8 and later, with the introduction of the EABS Alternate Routing Secured feature, this record may be used to select between two databases capable of processing LIDB format queries for billing validations. When the LIDB field has a value of "N", the database that is queried is an AD (Alternate Destination) if the EABS Alternate Routing secured feature has been activated. If this feature is off, the Alternate Destination is the BVA. If this feature is on, the Alternate Destination is a database capable of processing LIDB queries. For more information on the EABS Alternate Routing Secured feature, see Division 2, Section 4A86.

1.3 5449 Record Fields

The columns in the 5449 Record reflect the following:

NPA/RAO column reflects the NPA/RAO field on this form.

HUND DIGIT column reflects the hundred digit of the START XXX field.

NXX / (0/1)XX columns reflects the entry in the LIDB field ("Y" or "N") for each NXX or (0/1)XX from 000 through 999.

1.4 Cross Check with OSPSOPT Form

A LIDBLNQ form may not be submitted unless at least one of the following fields on the OSPSOPT form (5424 Record) is set to "C".

L CC ATT INER
- □ CC LEC INTER
- □ CC ATT INTRA
- □ CC LEC INTRA
- □ BNS ATT INTER
- □ BNS LEC INTER
- □ BNS ATT INTRA

Copyright © 2003 Lucent Technologies

- BNS LEC INTRA

1.5 Recent Change View

The corresponding Recent Change views are 27.32 and 27.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and Office Name on each record.

2.2 *NPA OR RAO

Description: This key field refers to the NPA or RAO of the CC (Calling Card) or BNS numbers.
Valid Entries: 200 - 999

2.3 *START XXX

Description: This second key field indicates the starting office code [NXX or (0/1)XX] for a range of values whose query destination will be entered. The START XXX and END XXX fields enable the definition of query destinations of ranges of NXXs/(0/1)XXs within an NPA/RAO.

The START XXX value and the END XXX value define the office code range of numbers for which the query destination of LIDB or BVA is specified in the RANGE LIDB. Or, if exceptions occur within this range, they are entered in the NXX(0/1)XX field lists, and the LIDB field is entered for each of the exceptions. The remaining numbers in the range receive the default value entered in the L CC DEFAULT and L BNS DEFAULT fields on the OSPSOPT form (Record 5424).
Valid Entries: x00, where x is an integer, for example 000, 200, 600 or 900.

2.4 END XXX

Description: The END XXX field is automatically populated after the START XXX value is entered. The value will be x99, where x is the integer entered as the first number in the START XXX field. For example, if 600 is entered for START XXX, then 699 will be automatically entered for END XXX. Individual exceptions to the range specified by START XXX and END XXX fields are entered in the NXX (0/1)XX LIST.

2.5 RANGE LIDB

Description: Is the LIDB database populated with billing information for the range of values indicated on this form? This field is used only if the entire range of values of START XXX to END XXX have the query destination set to the same database. For example, 600 through 699 range of values should be set to query the AD BVA database. If "Y" is entered, then LEC's LIDB is populated with billing data for the entire range of values. If "N" is entered, then the AD database is populated with billing data for the entire range of values. If the EABS Alternate Routing Special Feature is off, the Alternate Destination is the BVA. If it is on, the Alternate Destination is a database capable of processing LIDB queries.
Valid Entries: Y, N

Data Rules:

If an entry is made in RANGE LIDB, then no further entries should be made on this form.

NXX (0/1)XX LIST

The following fields (Section 2.6 - Section 2.7) define numbers in the range which are exceptions. If the

Copyright © 2003 Lucent Technologies

query destinations for the numbers in the range, as specified by START XXX and END XXX, are not the same, those exceptions should be listed in this field and the database destination query entered in the LIDB field. The numbers that are not entered in the list below receive the default value entered in the L CC DEFAULT and L BNS DEFAULT fields on the OSPSOPT form. Therefore, if the L CC DEFAULT/L BNS DEFAULT is "Y" (the query database destination is the LIDB database), list only the three digit office codes that query the BVA database and enter "N" as the LIDB field for each of those office codes.

2.6 XXX

Description: Enter the number which should NOT receive the default value entered in the L CC DEFAULT and L BNS DEFAULT fields on the OSPSOPT form.
Valid Entries: The three digit office code value within the range defined by START XXX and END XXX.

2.7 LIDB

Description: Should the LEC LIDB be the destination database? If "Y" is entered, then the LEC's LIDB is the destination database that is populated with the billing data for this office code. If "N" is entered, then the AD database is the destination database that is populated with the billing data for this office code. If the EABS Alternating Routing secured feature is not activated, the Alternate Destination is the BVA. If it is activated, the Alternate Destination is a database capable of processing LIDB queries.
Valid Entries: Y, N

SEC. 4AZ: 5451 RECORD
OSPS (INCOMING) INTERFLOW TOLL & ASSISTANCE IDENTIFIERS FORM - INFLTAP

1. GENERAL

The INFLTAP form (5451 Record) is an ODA (Office Data Administration) input form that is used for Interflow (incoming) Serving Team information for OSPS. This form is available with 5E5 and later Software Releases.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.51.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL

Enter the Base and Control number and Office Name on each record.

2.2 * KEY

Description: This field is used to activate the form; the only valid entry is 1.

Required Field.
Valid Entries: 1

OSPS LIST

The following information (fields Section 2.3 - Section 2.6) is required for each OSPS Switch that is sending interflow data to this switch.

This list consists of four fields. If an entry is made in one field, then entries are required in the remaining three associated fields.

The OSPS LIST was increased to allow a maximum of 100 entries to support the Interflow: Expanding the Number of Incoming Trunk Groups feature (SFID 394). For more information on this feature, see Division 2, Section 4A394.

2.3 OSPS ID

Description: This field indicates the unique ID number of the originating OSPS Switch. This identifier represents the switch from which the interflow data is coming.
Valid Entries: 1 - 9999

2.4 OFC

Description: This field indicates the unique name of the originating OSPS Switch.
Valid Entries: 1 - 4 alphanumeric characters

2.5 BCHTGN

Description: Enter the TGN (Trunk Group Number) for B-channels for incoming Interflow traffic.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

The entry in the BCHTGN field cannot equal the entry in the DCHTGN field for this or any other OSPS ID. Each entry in this field must be unique.

For every TGN identified here, a corresponding entry should exist on the TKGRP form (5202 Record), with the corresponding TRK DIR field set to "INC" and the TRKCLS field set to "IFTERM."

2.6 DCHTGN

Description: Enter the TGN (Trunk Group Number) for D-channels for incoming interflow traffic.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Entries must be unique. The entry in the DCHTGN field cannot equal the entry in the BCHTGN field for this or any other OSPS ID.

For every TGN identified here, a corresponding entry should exist on the TKGRP form, with the corresponding TRK DIR set to "SGNL" and the TRKCLS set to "IFTERM."

SEC. 4BA: 5452 RECORD
OSPS (OUTGOING) INTERFLOW TOLL & ASSISTANCE IDENTIFIERS FORM - INFLTADP

1. GENERAL

The INFLTADP form (5452 Record) is an ODA (Office Data Administration) input form that is used for Destination (outgoing) Interflow Serving Team information for OSPS (Operator Services Position System). This form is available with 5E5 and later Software Releases. This form defines the interflow destinations and associates them with B- and D-channels.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.52.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL

Enter the Base and Control Number and Office Name on each record.

2.2 * KEY

Description: This field activates the form; the only valid entry is 1.

Required Field.
Valid Entries: 1

OSPS LIST

The following information (fields Section 2.3 - Section 2.7) is required for each OSPS Switch that will be receiving interflow traffic from this switch.

This is a list consisting of four fields. If an entry is made in one field, then entries are required in the remaining three associated fields.

2.3 OSPS ID

Description: This field is an identifier of the OSPS Switch that will receive Interflow calls. This field must be unique for each entry.
Valid Entries: 1 - 9999

2.4 OFC

Description: This field indicates the name of the receiving OSPS Switch. Entries in the OFC field must be unique.
Valid Entries: 1 - 4 alphanumeric characters

2.5 BCHTGN

Description: Enter the Trunk Group Number for B-channels for outgoing interflow traffic.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

Entries in the BCHTGN field must be unique and cannot be equal to the entry in the DCHTGN field for this or any other OSPS ID.

For every TGN identified here, a corresponding entry must exist on the TKGRP form (5202 Record) with the corresponding TRK DIR field set to "OUT" and the TRKCLS field set to "IFOPER."

2.6 DCHTGN

Description: Enter the Trunk Group Number for D-channels for outgoing interflow traffic. Entries in the DCHTGN field must be unique.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

Entries in the DCHTGN field must be unique and cannot be the same as the entry in the BCHTGN field for this or any other OSPS ID.

For every TGN entered here, a corresponding entry should exist on the TKGRP form (5202 Record) with the corresponding TRKCLS field set to "IFOPER" and the TRK DIR field set to "SGNL."

2.7 ISERVTM

Description: This field displays the interflow serving team number associated with the OSPS ID of the OSPS used for interflow call traffic on the RC View 27.52. This is a Recent Change/Verify field, it cannot be entered in ODA.

Software Release: 5E9(1) and later.
Valid Entries: 129 - 144

SEC. 4BB: 5453 RECORD
OSPS INTERFLOW TRANSLATION IDENTIFIERS - INFLTRID

1. GENERAL

The INFLTRID form (5453 Record) is available with 5E5 and later Software Releases. The 5453 Record defines the valid translation identifiers for cooperating Interflow OSPS Switches.

When any cooperating OSPS has a generic retrofit or update requiring translations at this OSPS switch, an update with the new translation identifier is needed. These identifiers are used to insure upward and downward compatibility of the different software levels in an interflow complex.

After an interflow call is interflowed between two switches, the call is processed cooperatively by the two switches. In the process, messages and data are interflowed back and forth between the two switches via OSPS EDSLs (Primary Rate Interfaces). If the two switches are operated under different Software Releases (or BWM levels within a Software Release), a translation of the message and/or data may be necessary.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.50.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Number on each record.

2.2 * KEY

Description: This field is used to activate the form; the only valid entry is 1.

Required Field.
Valid Entries: 1

VALID TRANSLATION IDENTIFIERS

The Valid Translation Identifiers (fields Section 2.4 - Section 2.5) indicates the generic or the associated software, and is used by the cooperating switch to determine if and what type of message translation is needed. The 5453 Record contains the translation ID of this switch and a list of other translation IDs which may be recognized by this switch, and provides application compatibility between this and other switches. If the translation ID in an interflowed message does not match the IDs in the list, the message cannot be translated.

There must be at least one entry in this list.

2.3 THIS TRANS ID

Description: The field is used for Recent Change purposes only.

2.4 TRANS ID

Description: The TRANS ID field defines a translation identifier of the compatible Software Releases. The first two digits represent the software release and the third digit indicates the level within the software release. For example, the first issue of 5E5 will be 051.
Valid Entries: 51 - 255

Copyright © 2003 Lucent Technologies

2.5 REMARK

Description: This field may be used to enter a remark, such as the Software Release name or point issue.
Valid Entries: 1 - 12 alphanumeric characters

SEC. 4BC: 5454 RECORD
OSPS TELEPHONE CREDIT CARD ISSUER IDENTIFICATION - TCCID

1. GENERAL

The TCCID form is an ODA (Office Data Administration) input form that provides for identification of telephone calling cards other than the 14 digit LEC (Local Exchange Carrier) card. This identification will be used in the CAS (Customer Account Service) feature. With the use of CAS Release 2, other TEL (non-AT&T Telecommunication cards) in the CCITT standard format, will also be recognized. Additionally, with CAS 2, certain CCC (Commercial Credit Cards) - such as Mastercard, VISA, American Express, etc, will be accepted if they are in the ISO/ANSI standard format. This form is available with 5E5 and later Software Releases.

1.1 Recent Change View

The corresponding Recent Change View to this form is 27.55.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control GROUP Number and Office Name on each record.

2.2 *ISSUER ID DIGITS

Description: This key field is used for the Issuer ID digits of the TCR (Telephone Credit card). Enter the digits of the issuer ID.

Required Field.
Valid Entries: 00 - 9999999

Data Rules:

Entries which are substrings of other digit entries are not allowed. A substring is defined as a value of ISSUER ID DIGS on one TCCID form, which equals the leftmost digits of the ISSUER ID DIGS entered on another TCCID form. For example: if "5971234" had already been entered as a ISSUER ID DIGS value, then entries of "597" and "59712" would be substrings and would be invalid entries.

The number of digits in ISSUER ID DIGITS plus the sum of ACCT NBR LENGTH + CHECK NBR LENGTH must be less than 20.

For 5E7 and later, if the number of digits entered in the ISSUER ID DIGITS field added to the values of ACCT NBR, CHECK NBR, and PIN is equal to 14, then the corresponding TCCATTR form should not have SIGNALING TYPE of "CCS6" and PREPEND 891 set to "N". TCCATTR form corresponds to this form if the CARD ATTR ID on the TCCATTR form matches the CARD ATTR ID on this form.

For 5E9(2) and later, if the number of ISSUER ID DIGITS is greater than 4, then the corresponding TCCATTR form must have PREPEND 891 set to "N". The corresponding TCCATTR form is found by matching CARD ATTR ID with CARD ATTR ID on the TCCATTR form.

2.3 #CARD ATTR ID

Description: Enter the card attribute identification number. The attributes entered on this form are assigned to this ID.

Software Release: 5E7 and later
Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 63

Data Rules:

Every CARD ATTR ID entered on the TCCID form must have a matching CARD ATTR ID on the TCCATTR form.

2.4 #TRANS TYPE

Description: Enter the number to indicate the translation type to be used when a query is sent from the 5ESS Switch to a 2STP (Signal Transfer Point). The 2STP uses this entry and the internal tables to select the proper database to which the query is routed. The TRANS TYPE should match a TRANS TYPE on a DSAPP form (5537 Record).

Software Release: 5E7 and later
Required Field.
Valid Entries: 0 - 255

2.5 CSR ATTR ID

Description: Enter the Carrier Specific Routing Attribute ID. The CSR ATTR ID is the key into the CSRATTR form which identifies the card vendor country code, the administration ID number which indicates the foreign carrier for that card, and indicates if another carrier for call overflow is allowed.

Software Release: 5E7 and later
Valid Entries: 1 - 200

Data Rules:

If CSR ATTR ID is entered, there must be a corresponding CSRATTR form where the CSR ATTR ID on the CSRATTR form matches the CSR ATTR ID on this form.

For 5E9(1) and later, if CSR ATTR ID is entered, but SIGNALING TYPE is not set to "ICCV" on the TCCATTR form, then one or more corresponding NONUSA forms must be entered. (The corresponding TCCID form is found by matching CARD ATTR ID on the TCCATTR form with CARD ATTR ID on the TCCID form. The corresponding NONUSA form is found by matching COUNTRY on the TCCID form to HOME COUNTRY on the NONUSA form.)

QUANTITY OF DIGITS

The following fields (Section 2.6 - Section 2.10) define the options for the quantity of digits. This label applies only to 5E5 - 5E8.

2.6 ACCT NBR

Description: The name of this field was changed to ACCT NBR LENGTH in 5E9(1). This field name applies to 5E5 - 5E8. See ACCT NBR LENGTH for usage information.

2.7 # ACCT NBR LENGTH

Description: This field represents the quantity of digits in the TCR account field. If CARD TYPE is "CCC", and if the account number has more than one acceptable length (i.e some Visa cards with 13-digit account numbers and some VISA cards with 10-digit account numbers), this field must be 0. If CARD TYPE is "TEL" or "CAS", this field must have an entry. (This field was called ACCT NBR for 5E5 - 5E8.)
Valid Entries: 0 - 14

Data Rules:

Copyright © 2003 Lucent Technologies

This value plus the number of digits entered in ISSUER ID DIGS plus the CHECK NBR value must not exceed a total of 19.

If ACCT NBR on the TCCID form is 0, CARD TYPE on the TCCATTR form must be "CCC".

2.8 #CHECK NBR

Description: The name of this field was changed to CHECK NBR LENGTH in 5E9(1). This field name applies to 5E5 - 5E8. See CHECK NBR LENGTH for usage information.

2.9 # CHECK NBR LENGTH

Description: This required field refers to the digits in the TCR check number field. If the Luhn Check Digit is separate from the account number, enter a 1, else enter 0. (This field was called CHECK NBR for 5E5 - 5E8.)

Required Field.
Valid Entries: 0, 1

Data Rules:

This value plus the number of digits entered in ISSUER ID DIGS plus the ACCT NBR value must not exceed a total of 19.

2.10 #PIN

Description: The name of this field was changed to PIN LENGTH in 5E9(1). This field name applies to 5E5 - 5E8. See PIN LENGTH for usage information.

2.11 # PIN LENGTH

Description: Enter the quantity of digits in the TCR PIN (Personal Identification Number). (This field was called PIN for 5E5 - 5E8.)

Required Field.
Valid Entries: 0 - 13

Data Rules:

If PIN LENGTH is 0, then EXP DATE TRMT must be "N".

2.12 DB LABEL

Description: DB LABEL is used as a heading label on the software alarm and measurements report to identify an individual or group of ICCV (International Credit Card Validation) card issuers. The entry "DFALT" is reserved for use as a "default" group of ICCV card issuers.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 5 alphanumeric characters

Data Rules:

If the SIGNALING TYPE of the corresponding TCCATTR form (found by matching the CARD ATTR ID on both forms) is "ICCV", then this field must match a DB LABEL value on the ICCVDB form (5478 Record).

2.13 COUNTRY

Description: Enter the identifier for the country of the ICCV card issuer.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(1) and later.
Valid Entries: 1 - 3 alphanumeric characters

Data Rules:

For 5E9(1) and later, if the SIGNALING TYPE on the corresponding TCCATTR form (found by matching the CARD ATTR ID values on both forms) is "ICCV", then the TCCID's COUNTRY field must be entered and the value entered must match either an ACCESS CODE on an IDDD form (5307 Record) or a HOME COUNTRY value on a NONUSA form (5477-1 Record).

If SIGNALING TYPE is not set to "ICCV" on the TCCATTR form and CSR ATTR ID is not entered on the corresponding TCCID form, then COUNTRY must not be entered and DB LABEL must be 0 or must not be entered on that TCCID form. (The corresponding TCCID form is found by matching CARD ATTR ID on the TCCATTR form with CARD ATTR ID on the TCCID form.)

2.14 LANGUAGE

Description: Enter the identifier for the language to be used for credit card announcements. If this field is not entered, English is the language that is used.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 3 characters

Data Rules:

If this field is entered, then a a matching DISPLAY ID value must be entered on the LANGTBL form.

2.15 ALLOW HOME CALL

Description: Is call completion allowed for a "home" call? If this is an ICCV card, this field indicates whether home country calls are allowed by this card issuer.

Software Release: 5E9(1) and later.
Default: Y
Valid Entries: Y, N

Data Rules:

If "N" is entered, COUNTRY DIRECT NUM must be entered.

If "Y" is entered, COUNTRY DIRECT NUM cannot be entered.

2.16 COUNTRY DIRECT NUM

Description: Enter the card issuer's country direct number. The TCA must enter an 800 number each time ALLOW HOME CALL is set to "N".

Software Release: 5E9(1) and later.
Valid Entries: 10 digits

Data Rules:

If ALLOW HOME CALL is "N", then this field must be entered with the card issuers country direct 800 number.

If ALLOW HOME CALL is "Y", this field cannot be entered.

2.17 DISPOSABLE CARD

Copyright © 2003 Lucent Technologies

Description: Is this a disposable card? A disposable card is a prepaid card which can be used as a gift, a promotional card, or for foreigners traveling in the United States. For more information on Disposable Cards see the Purchase Limits Balance Quotation secured feature in Division 2, Section 4A24.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, the corresponding TCCATTR form must have a SIGNALING TYPE of "CCS7". (The TCCATTR form corresponds if the CARD ATTR ID on the TCCID form matches the CARD ATTR ID on the TCCATTR form.)

For 5E9(1) and later, if "Y" is entered, LANGUAGE must not be entered.

2.18 CARR GRP

Description: Enter a Carrier Group ID for which all carriers within the group will accept this card for billing purposes. If this field is not entered it indicates that all carriers accept this card. The CARR GRP field was added to support the Calling Card Screening by Carrier secured feature (SFID 374). For more information on this feature see Division 2, Section 4A374.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 200

Data Rules:

If CARR GRP is entered, then there must be a matching CARRGRP form (5492 Record) with the same CARR GRP values.

2.19 ISSUER ID TEXT

Description: Enter the issuer ID information displayed at the operator position for calling card calls. The ISSUER ID TEXT and EXP DATE TRMT fields were added to support the ACCS (Automated Calling Card Services) for CCC (Commercial Credit Cards) secured feature (SFID 388).

Software Release: 5E9(2) and later.
Valid Entries: 1 - 6 characters

2.20 EXP DATE TRMT

Description: Should CCC cards be given expiration date treatment instead of the normal PIN treatment?

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If PIN LENGTH is 0, then EXP DATE TRMT must be "N".

2.21 QUIET HEAR TRMT

Description: Should Quiet Hear treatment be applied based on the entry for a non-LEC card's Issuer

Copyright © 2003 Lucent Technologies

Identifier as defined in the OSPS Card Recognition table? The QUIET HEAR TRMT field was added to support the Quiet Hear secured feature (SFID 402). For more information on the Quiet Hear feature, see Division 2, Section 4A402.

Software Release: 5E9(2) and later.
Required Field.
Default: Y
Valid Entries: Y, N

2.22 VMS ELIGIBLE

Description: Is this card's issuer identifier eligible for Voice Message System (VMS) treatment? For more information, see Division 2, Section 4A418.

Software Release: 5E10(1) and later.
Required Field.
Default: Y
Valid Entries: Y, N

SEC. 4BD: 5455-A/B RECORD
OSPS CAS CONTRACT STATUS RECORD - CASCON

1. GENERAL

The 5455-A Record is available with 5E5 and later Software Releases. It is used for creating a CAS (Customer Account Services) contract table. The contract table is used to verify that a contract exists between AT&T and the LEC (Local Exchange Carrier) such that an AT&T calling card can be used as a billing method for LEC carried calls. For CAS Release 2, this table also defines the contractual status for CCC (Commercial Credit Cards) and other TEL (telecommunication) cards. The contractual status of a complete NPA associated with a billing number can be indicated or if necessary, the individual NXXs status can be defined.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.53.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NPA

Description: Enter the NPA (Numbering Plan Area code).

Required Field.
Valid Entries: 200 - 999

2.3 # NPA STATUS

Description: This is the indicator of the CAS NPA contract status.

Required Field.
Default: A
Valid Entries:

Valid NPA STATUS Entries

Entry	Definition
A	Allow all NXXs (contract exists).
D	Deny all NXXs (no contract exists).
P	Partial Allow (only some NXXs have contract).

Data Rules:

If the value "P" (Partial Allow) is entered, at least one entry must be made in the LIST OF NXXs. If "A" or "D" is entered, then no entries can be made in the LIST OF NXXs.

2.4 LIST OF NXXs

The LIST OF NXXs indicates whether an NXX has a contract for LEC calls to be charged to an AT&T, CCC, or TEL calling card. Entries are made in the LIST OF NXXs only if the NPA STATUS has a value of "P" (Partial Allow).

Enter "N" (No) in the appropriate space for those NXXs not contracted. Leave blank if a contract exists. The NXXs are arranged in 5-position fields; a change to any 5-position field requires the reentry of all 5 positions.

Copyright © 2003 Lucent Technologies

Data Rules:
At least one entry of "N" must be made on this field if NPA STATUS is "P".

SEC. 4BE: 5456-A/B RECORD
OSPS CAS INVERSE CONTRACT STATUS RECORD - CASICON

1. GENERAL

The 5456-A Record is available with 5E5 and later Software Releases. It provides for creating a CAS (Customer Account Services) inverse contract table. This table is used to indicate whether a contract exists between the switch owner and the LEC (Local Exchange Carrier) such that a LEC calling card can be used as a billing method for calls carried by the switch owner. Entries are based on the NPA-NXX or RAO of the LEC calling card number. The contractual status of a complete NPA or RAO (Revenue Accounting Office) number is indicated. In the case of NPA, the individual NXX status can be defined if desired.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.54.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * NUMBER

Description: Enter the NPA (Numbering Plan Area) code or the RAO (Revenue Accounting Office) code.

Required Field.
Valid Entries: 200 - 999

2.3 * TYPE

Description: This field indicates the type of number (NPA or RAO) which has been entered above.

Required Field.

Valid TYPE Entries

Entry	Definition
N	Numbering Plan Area.
R	Revenue Accounting Office.

2.4 # STATUS

Description: This field is the indicator of the CAS inverse contract status. It indicates whether an NXX has a contract for calls carried by the switch owner to be billed to a LEC calling card.

Required Field.
Default: A
Valid Entries:

Valid STATUS Entries

Entry	Definition
A	Allow all NXXs or XXXs (contract exists).
D	Deny all NXXs or XXXs (no contract exists).
P	Partial Allow (only some NXXs have contract).

Data Rules:

If "RAO" has been entered as TYPE, then only "A" or "D" are valid entries. Partial Allow ("P") is used only for "NPA" entries.

Copyright © 2003 Lucent Technologies

If "A" or "D" is entered, there must not be any entries in the NXX LIST. If the value "P" (Partial Allow) is entered, then entries must be made in the NXX LIST.

2.5 NXX LIST

Description: This field indicates whether an NXX has a contract for calls carried by the switch owner to be billed to a LEC calling card. Entries are made here only if STATUS has a value of "P" (Partial Allow) and TYPE is "NPA."

Enter "N" (No) in the corresponding space for those NXXs not contracted. Leave blank if a contract exists. The NXXs are arranged in 5-position fields; a change to any 5-position field requires the re-entry of all 5 positions.
Valid Entries: N

Data Rules:

At least one entry of "N" must be made in this field if STATUS is "P".

SEC. 4BF: 5458 RECORD
OSPS COMMERCIAL ACD PARAMETERS - CACDPARM

1. GENERAL

The 5458 Record is available with 5E6 and later Software Releases.

This form is used to define OSPS (Operator Services Position System) CACD (Commercial Automatic Call Distributor) and Call Vectoring global parameters residing in the SMs (Switching Modules). Also, the call vectoring limits that can be set by the TCA (Telephone Company Administration) are defined in the 5458 Record. Only one CACDPARM form is entered for an office.

1.1 Commercial ACD

For the 5E4(2) and 5E5 Software Releases, Commercial ACD is activated on the OSPSOPT form (5424 Record). For 5E6 and later, CACD is activated on the CACDPARM form. For 5E9(1) and later, ACD/BRCS global parameters have been added to this form.

Division 2, Section 3D, OSPS Commercial Automatic Call Distributor Services Feature Section gives information on how to provision OSPS CACD features and Call Vectoring.

See Division 2, Section 4A121 for information on how to provision the ACD/BRCS secured feature.

1.2 Call Vectoring

The CVECT form (5460 Record) defines the Call Vectoring Steps. The maximum limits for Call Vectoring steps and delays are defined on this form. The TCA (Telephone Company Administration) can limit the number of vector steps for a call. These limits prevent any infinite loops that may be defined in call vectoring by the CACD customer from consuming unlimited real-time resources. When a given limit is reached, vector processing stops, reorder tone is given to a caller if the call has not yet been queued; or if the call has been queued, it remains in queue. If no limit is specified, no limit is enforced.

Call vectoring steps are divided into a set of categories reflecting their use and real-time load. The vector step categories are:

- Queuing or transferring the call between queues
- Conditional GOTOs based on call queue or serving team state, age of the call at head of the queue or expected delay
- GOTO based on time-of-day or day-of-week
- Announcement or delay with music
- Conditional or unconditional GOTO to another vector

Any vector step that does not fall into one of these categories does not have a limit associated with it other than the limit on total vector steps. Each category has a resettable limit such that if, during vector processing, the limit for the allowable number of steps in that category is reached and vector processing is paused. The pause lasts an amount of time identified for all Call Vectoring pauses established by the TCA. If no pause limit is specified, the pause period shall be five seconds. Each forced pause resets the limits for all categories. In addition, the limits are reset each time a delay step is successfully executed or the call is successfully routed to an announcement.

In addition to the resettable limits, each category has an absolute limit on the number of steps that each call can sequence. This limit is not reset by the successful execution of a delay step or successful route to an announcement. If a step is encountered during vector processing that exceeds the limit on that step's

Copyright © 2003 Lucent Technologies

category, vector processing is stopped for the call. If no limit is specified for steps in a given category, no limit is enforced for steps in that category.

In addition to the above limits, there is a global limit on the length of time that a call can be vectored without being placed in queue. The intent of this limit is to prevent calls from receiving endless vector treatment.

1.3 Recent Change View

The corresponding Recent Change view for this form is 8.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and office name on each record.

2.2 * KEY

Description: This field is the Processor ID and is always 0.

Required Field.
Valid Entries: 0

FEATURE ACTIVATION

The following fields (Section 2.3 - Section 2.4) activate the Commercial ACD features.

2.3 COMMERCIAL ACD

Description: Should CACD be activated? Enter "Y" if CACD should be activated and "N" if it should not be activated.

For 5E4(2) and 5E5, this field is on the OSPSOPT form (5424 Records).

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, the OSPS DA field on the OSPSOPT form (5424 Record) must be "Y".

2.4 CALL VECTORING

Description: Should the Call Vectoring feature be activated? Enter "Y" if Call Vectoring should be activated and "N" if it should not be activated.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E11 and later, if "Y" is entered, COMMERCIAL ACD must be "Y".

ACD/BRCS

Copyright © 2003 Lucent Technologies

For 5E9(1) - 5E10, fields Section 2.5 - Section 2.7 define the office parameters for the ACD/BRCS feature. For 5E11 and later, these fields were moved to the ACDBPARM form, see Division 4, Section 32K.

2.5 SIMINTRA

Description: Enter the maximum number of simultaneous intraoffice forwarded calls allowed as an action of ACD re-routing for ACD/BRCS. For more information on ACD/BRCS feature see Division 2, Section 4A121. For 5E11 and later, this field was moved to the ACDBPARM form, see Division 4, Section 32K.

Software Release: 5E9(1) - 5E10
Required Field.
Default: 99
Valid Entries: 1 - 99

2.6 SIMINTER

Description: Enter the maximum number of simultaneous interoffice forwarded calls allowed as an action of ACD re-routing for ACD/BRCS. For more information on ACD/BRCS feature see Divison 2, Section 4A121. For 5E11 and later, this field was moved to the ACDBPARM form, see Division 4, Section 32K.

Software Release: 5E9(1) - 5E10
Required Field.
Default: 99
Valid Entries: 1 - 99

2.7 CFMAX

Description: Enter the maximum number of call forwardings as an action of ACD re-routing for ACD/BRCS. For more information on ACD/BRCS feature see Division 2, Section 4A121. For 5E11 and later, this field was moved to the ACDBPARM form, see Division 4, Section 32K.

Software Release: 5E9(1) - 5E10
Required Field.
Default: 5
Valid Entries: 1 - 32

CALL VECTORING FIELDS

The following fields (Section 2.8 - Section 2.21) specify the maximum limits for Call Vectoring commands (steps) and delays.

ABSOLUTE MAXIMUM LIMITS (A)

The following fields (Section 2.8 - Section 2.14) preceded by an "A" specify the maximum limits for call vectoring steps.

2.8 A VECTOR XFERS

Description: This field specifies the maximum number of intervector GOTOs that can be processed for a given call. An intervector GOTO is any conditional or unconditional GOTO to a step in another vector. Vector processing is stopped when this limit is reached. If the call has not been previously queued, the caller is provided with reorder. If the call has been previously queued, the caller continues to receive any active delay treatment and remains in the queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If you enter 0 in this field no limit is enforced.
Default: 20

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 255

2.9 A ACD STAT QRYS

Description: This field specifies the maximum number of "GOTOAGE", "GOTOQUE", "GOTOSTA", "GOTOAVL" and "GOTODLY" steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call has not been place in a queue, the caller is given reorder. If the call has been queued, the caller continues to receive any active delay treatment, such as music, ring or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

When the field is 0, no limit is enforced.
Default: 4
Valid Entries: 0 - 255

2.10 A TOD DOW STPS

Description: This field specifies the maximum number of "GOTOTOD" and "GOTODOW" steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is given reorder. If the call is in a queue, the caller receives any active delay treatment and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If 0 is entered no limit is enforced.
Default: 10
Valid Entries: 0 - 255

2.11 A MUS ANNC STPS

Description: This field specifies the maximum number of "MUSIC", "ANNOUNC" or "PROMPT" steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is provided with reorder. If the call is in a queue, the caller receives any active delay treatment, such as music, ringing, or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If 0 is entered, no limit is enforced.
Default: 10
Valid Entries: 0 - 255

2.12 A QUEUE STPS

Description: This field specifies the maximum number of QUEUE steps that can be processed for a given call. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller provided with reorder. If the call is in a queue, the caller receives any active delay treatment, such as music, ringing, or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If 0 is entered, no limit is enforced.
Default: 4
Valid Entries: 0 - 255

2.13 A VECTOR STPS

Description: This field specifies the total number of vector steps a call can go through while waiting for an available agent. The purpose of this field is to detect and terminate endless loops in a CACD customer's vector program. Vector processing is stopped when this limit is reached. If the call is not in a queue, the caller is provided with reorder. If the call is in a queue, the caller receives any active delay treatment, such

Copyright © 2003 Lucent Technologies

as music, ringing, or quiet, and remains in queue. The call remains in this state until the caller abandons or the call is connected to an agent.

If 0 is entered, no limit is enforced.
Default: 100
Valid Entries: 0 - 255

2.14 A NOT QUEUED SEC

Description: This field specifies the maximum number of seconds a call can be vectored without being placed in a queue. When this limit is reached, call vector processing is stopped and the caller is provided with reorder.

If 0 is entered, no limit is enforced.
Default: 120
Valid Entries: 0 - 255 (seconds)

2.15 A ANNC SEC

Description: This field specifies the maximum number of seconds an announcement can last, if the call was routed to that announcement and had not been placed in a queue. An announcement is stopped when this limit is reached.

If 0 is entered, no limit is enforced.
Default: 120
Valid Entries: 0 - 255 (seconds)

BETWEEN DELAYS MAXIMUM LIMITS (B)

The following fields (Section 2.16 - Section 2.20) preceded by an "B" specify the maximum limits for steps that can be processed without pausing.

2.16 B VECTOR XFERS

Description: This field specifies the maximum number of intervector GOTOs that can be processed without pausing. An intervector GOTO step is vector processing a conditional or unconditional GOTO another step in another vector. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step, defined on the CVECT form (5460 Record) is successfully processed. If the counter reaches the specified limit, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early, if an agent becomes available during the pause. Any currently active delay treatment continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If 0 is entered, no limit is enforced.
Default: 2
Valid Entries: 0 - 255

2.17 B ACD STAT QRYS

Description: This field specifies the maximum number of "GOTOAGE", "GOTOQUE", "GOTOAVL", "GOTOSTA" and "GOTODLY" steps that can be processed without pausing. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment, such as music, ringing or quiet, continues during the pause. If no delay treatment is

Copyright © 2003 Lucent Technologies

active, the caller hears silence during the pause.

If 0 is entered in this field, no limit is enforced.
Default: 2
Valid Entries: 0 - 255

2.18 B TOD DOW QRYS

Description: This field specifies the maximum number of "GOTOTOD" and "GOTODOW" steps that can be processed without pausing. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step defined on the CVECT form (5460 Record) is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment,such as music, ringing or silence, continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If 0 is entered, no limit is enforced.
Default: 6
Valid Entries: 0 - 255

2.19 B MUS ANNC STPS

Description: This field specifies the maximum number of "MUSIC", "ANNOUNC" or "PROMPT" steps that can be processed without pausing. The counter used to count the steps is reset whenever an "ANNOUNC", "MUSIC", "RING" or "QUIET" step, defined on the CVECT form (5460 Record) is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment, such as music, ringing or silence, continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If 0 is entered, no limit is enforced.
Default: 1
Valid Entries: 0 - 255

2.20 B QUEUE STPS

Description: This field specifies the maximum number of "QUEUE" steps that can be processed without pausing. The counter used to count the steps is reset whenever an ANNOUNC, MUSIC, RING or QUIET step, defined on the CVECT form, is successfully processed. If the counter reaches the limit specified, vector processing is paused for the number of seconds defined in the PAUSE SEC field on this form and all resettable limit counters are cleared. If the call has been placed into a queue, the pause ends early if an agent becomes available during the pause. Any currently active delay treatment continues during the pause. If no delay treatment is active, the caller hears silence during the pause.

If 0 is entered, no limit is enforced.
Default: 1
Valid Entries: 0 - 255

FORCE PAUSE DELAY

The Call Vectoring Global Pause Period is defined in the following field (Section 2.8).

2.21 PAUSE SEC

Description: This field specifies the length of time (in seconds) that a call can be paused if any of the

Copyright © 2003 Lucent Technologies

resettable limits are reached. The value entered in this field must be greater than or equal to 5.
Default: 5
Valid Entries: 5 - 255 (seconds)

VECTOR PROMPT TIMING

The following fields (Section 2.22 - Section 2.23) define the timing for vector prompts.

2.22 FIRST DIGIT

Description: Enter the number of seconds the Call Vector Prompt feature will wait for the first digit in any prompt step.

Software Release: 5E8 and later
Valid Entries: 0 - 64 (seconds)

2.23 OTHER DIGITS

Description: Enter the seconds the Call Vector Prompt feature will wait for all other digits in a multidigit prompt step.

Software Release: 5E8 and later
Valid Entries: 0 - 64 (seconds)

SEC. 4BG: 5459 RECORD
OSPS COMMERCIAL ACD CALL VECTORING DESTINATION TN - CVDSTTN

1. GENERAL

The 5459 Record is available with 5E6 and later Software Releases.

This form defines call routing for the Call Vectoring command step ROUTE, which reroutes the caller to another telephone number. The Call Vectoring ROUTE step is defined on the CVECT form (5460 Record). ARG1, an argument in the "ROUTE" step must be populated with DEST NBR, the destination ID defined on this form. The DEST NBR provides the key to this form which gives either the Route Index (RI field) or the destination Telephone Number (TN field) for the rerouted call. The destination telephone number is billed for the forward leg of the call.

1.1 Recent Change View

The corresponding Recent Change View for CVDSTTN is 21.42. For more information on Recent Change Views that correspond to ODA forms, please see Division 0, Section 2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * DEST NBR

Description: Enter the destination number ID.

Required Field.
Valid Entries: 1 - 256

Data Rules:

A DEST NBR entered in the ARG1 field of the "ROUTE" step on the CVECT form (5460 Record) requires an entry in this field equal to ARG1.

2.3 TN

Description: Enter a 7- or 10-digit telephone number.
Valid Entries: 7 or 10 digits

Data Rules:

Either a telephone number is entered in this field or a route index is entered in the RI field, but both cannot be entered on a form.

A TN entered on this form requires that the same value is defined on one of the following forms
- ACQS,
- DSLUSR
- LINE
- MLHLN
- MLHG
- MLTITIN
- MTNDR
- PSMTN
- SHTN

Copyright © 2003 Lucent Technologies

2.4 RI

Description: Enter a route index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules:

Either this field or the TN field must have an entry, but not both. An entry in this field requires an equivalent entry in the ROUTE INDEX field on the RTIDX form (5303 Record). The field is restricted to Private Facility trunks, i.e., the trunks have a TKCLS of "PFITT" or "PFLASH" on the TKGRP form.

SEC. 4BH: 5460 RECORD
OSPS COMMERCIAL ACD CALL VECTORS FORM - CVECT

1. GENERAL

The 5460 record is available with 5E6 and later Software Releases. This form is used to define Call Vectoring steps that determine how an incoming call is to be treated while waiting for a CACD (Commercial Automatic Call Distributor) agent.

This record is used to identify the vector steps to be applied to a call that has been routed for call vectoring. Included among the steps that can be applied to a call are: placing the call in queue, playing an announcement or music, rerouting the caller to an alternate destination or branching to another step within the current vector or to a step in a different vector.

To apply Call Vectoring treatment to a call, the ACTIVATE field must be set to "Y". If the initial vector is not activated, all calls associated with that vector receive standard call processing treatment.

The REDIR VECTOR field diverts calls to another VECTOR ID to receive alternate Call Vectoring treatment. If the vector specified in the redirection parameter does not exist, the call is placed in its call queue and receives standard call processing treatment. Only one level of redirection is permitted. If the second vector also has a VECTOR ID populated in its REDIR VECTOR field, the second redirection is ignored and the call is provided with Call Vectoring treatment as defined by the second vector.

The initial vector, which redirects to another vector, must be activated. Any vector steps that are associated with a vector referenced during branching to a second vector are performed regardless of the activation state of the second vector.

On a single CVECT form, up to 15 steps or commands can be identified in each vector. However, longer step sequences can be created by chaining vectors together using GOTO commands. The table in Figure 1 , Call Vectoring Commands and Associated Arguments, displays the vector commands and their corresponding arguments to allow for the proper handling of the vector command.

The office maximum limits for the vector steps are set on the CACDPARM form (5458 Record). Only one CACDPARM form is entered per office.

Examples of Call Vectoring are given in Figures Figure 2 and Figure 3 at the end of this section.

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.41.

2. BASE AND CONTROL, ESS UNIT

Enter the Base and Control number and office name on each record.

2.1 * VECTOR ID

Description: Enter the call vector number.

Required Field.
Valid Entries:
- 5E9(2) and earlier: 1 - 256
- 5E10 and later: 1 - 1024

2.2 ACTIVATE

Copyright © 2003 Lucent Technologies

Description: Should this vector be activated? Enter "Y" to activate this vector; enter "N" to deactivate it. When this attribute is "N", all calls assigned to this vector receive standard treatment.

Required Field.
Default: N
Valid Entries: Y, N

2.3 REDIR VECTOR

Description: Enter the alternate Vector ID for redirection. Calls that would ordinarily receive call vectoring treatment on this form are redirected to the alternate vector number.
Valid Entries:

- 5E9(2) and earlier: 1 - 256
- 5E10 and later: 1 - 1024

Data Rules:

If the REDIR VECTOR is entered, then another CVECT form must exist which has a VECTOR ID equal to the REDIR VECTOR value on this CVECT form. This field entry cannot equal the VECTOR ID on this CVECT form.

CALL VECTOR STEPS

The following fields (Section 2.4 - Section 2.10) define the call vectoring steps for this VECTOR ID.

2.4 CMD CD

Description: Enter the call vector command code for steps 1 -15. This field defines the function to be performed by this vector step.

Valid CMD CD Entries

Entry	Definition
ANNOUNC	Connect call to announcement.
ANSWER	Return answer supervision.
BUSY	Forced busy.
DISC	Forced disconnect.
GOTO	Unconditional GOTO.
GOTOAGE	Conditional GOTO based on the age of the call at the head of a queue.
GOTOAVL	Conditional GOTO based on available agents.
GOTODLY	Conditional GOTO based on expected delay.
GOTODOW	Conditional GOTO based on the day of the week.
GOTONUM	Conditional GOTO based on TOUCH-TONE number(s) entered by caller.
GOTOQUE	Conditional GOTO based on the number of calls in a queue.
GOTOSTA	Conditional GOTO based on staffed agents.
GOTOTOD	Conditional GOTO based on the time of day.
MUSIC	Delay caller with music.
NOOP	No operation.
PROMPT	Prompt caller for a number via TOUCH-TONE digit entry.
QUEUE	Queue or transfer call.
QUIET	Delay caller with silence.
REQRTE	Software Release: 5E10 only Request Route call vectoring command for the Third Party Call Control feature. For 5E11 and later, this value was moved to the CMD CD field on the ACDVCT form (5643 Record) to support the ACD/BRCS Interworking II feature.
RING	Delay caller with audible ring.
ROUTE	Route call to remote destination.
STOP	Stop operation.

ANNOUNC - Connect call to announcement

This command is used to route a caller to an announcement identified by the RTI (Route Index). An optional error step may be defined to provide alternate treatment to the caller when an announcement

Copyright © 2003 Lucent Technologies

channel cannot be obtained. If no error step is specified, vector processing will continue on to the next step.

- ARG1 - Valid entries are the route index to the announcement:

  For 5E10 and earlier: 1 - 3617

  For 5E11 and 5E12: 1 - 4000

  For 5E13 and later: 1 - 16382

  The ROUTE INDEX on an RTIDX form must equal ARG1. In addition, CI ROUTE TYPE on the RTIDX form must equal "GENANN". In addition A TKGRP form must be entered where TGN equals the TRUNK GROUP NUMBER on the above RTIDX form, TRK DIR is "ANN", and the CYCLES field on the TKGRP form cannot equal 0. Also, a TRUNK form (5204 Record) must be entered where the TGN field equals the TRUNK GROUP NUMBER on the above RTIDX form, and the first member on the TRUNK form must have MEMB equal 0.

- ARG2 - must be blank
- ERR - blank or 1 - 15 If ERR is 1 - 15
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

ANSWER - Return answer supervision

- ARG1 - must be blank
- ARG2 - must be blank
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

This command is used to return answer supervision if it has not yet been returned.

BUSY - Forced busy

- ARG1 - must be blank
- ARG2 - must be blank
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

This command is used to disconnect a caller from any active delay treatment, remove the caller from queue and return busy tone to the caller prior to disconnecting the call. This command causes the call to be removed from vector processing.

DISC - Forced disconnect

This command is used to disconnect a caller from any active delay treatment, remove the caller from queue and optionally route the caller to an announcement prior to disconnecting the call. This command

Copyright © 2003 Lucent Technologies

causes the call to be removed from vector processing. See ANNOUNC command for routing to an announcement.

ARG1 - Valid entries are a blank or the route index to the announcement:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4000
- For 5E13 and later: 0 - 16382
- ARG2 - must be blank
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

DISC routes the call to the announcement indicated by the route index if given. When specified, the route index must be valid and correspond to a terminating port. The route index is also owned by the CACD customer. The route index in ARG1 must be entered in the ROUTE INDEX field on the RTIDX form (5303 Record) and the CI ROUTE TYPE field on that RTIDX form must equal "GENANN". In addition, A TKGRP form must be entered where TGN equals the TRUNK GROUP NUMBER on the above RTIDX form, the TRK DIR is "ANN", and the CYCLES field on the TKGRP form cannot equal 0. Also, a TRUNK form (5204 Record) must be entered where TGN field equals the TRUNK GROUP NUMBER on the above RTIDX form, and the first member on the TRUNK form must have MEMB equal 0.

GOTO - Unconditional GOTO

This command is used to unconditionally branch to a step in the current vector or to a step in another vector.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank,, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15, vector step number. ARG2 must be entered.

- ERR - must be blank

- COND - must be blank

- CARG1 - must be blank

- CARG2 - must be blank

GOTOAGE - Conditional GOTO based on the age of the call at the head of a queue

This command is a conditional GOTO step used to branch to a step in the current vector or to a step in another vector when the specified condition is met. The decision to branch is based on the age of the first call in the specified Call Queue (length of time the first call has been in that queue). An optional error step can be executed if the AM/CMP is in overload or the query for the queue status fails. If the query for the queue status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the age of the first call in queue is greater than 8191 seconds.

- ARG1 - Valid entries are blank or a VECTOR ID number:

Copyright © 2003 Lucent Technologies

5E9(2) and earlier: 1 - 256

5E10 and later: 1 - 1024

If ARG1 is not blank, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15, vector step number; the argument must be entered.
- ERR - Valid entries are blank or 1 - 15, vector step number
- COND - Valid entries are GT or LE
- CARG1 - Valid entries are 1 - 128, number of the queue, which must equal the OSPS CALL TYPE field on the OSPSCT form (5404 Record). This number must be entered.
- CARG2 - Valid entries are 1 - 8191, threshold in seconds for the age of the first call on the specified queue. This number must be entered.

GOTOAVL - Conditional GOTO based on available agents

This conditional GOTO command is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on the current number of agents who are not busy with a call or made busy in the specified Serving Team. An optional error step can be executed if the AM/CMP is in overload or the query for the serving team status fails. If the query for the serving team status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the number of available agents is zero.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15, vector step number. This argument must be entered.
- ERR - Valid entries are blank or 1 - 15, vector step number
- COND - Valid entries are "GT" or "LE". This argument must be entered.
- CARG1 - Valid entries are 1 - 128, serving team ID, which must equal an entry in the SERVING TEAM field on the STINFO form (5402 Record). This argument must be entered.
- CARG2 - Valid entries are 0 - 4000, threshold for number of serving team. This argument must be entered.

GOTODLY - Conditional GOTO based on expected delay

This command is a conditional GOTO step used to branch to a step in this VECTOR ID or to a step in another VECTOR ID when the specified condition is met. The decision to branch is based on the expected delay for attaching a caller to an agent for calls in the specified Call Queue. An optional error step can be executed if the AM/CMP is in overload or the query for the queue status fails. If the query for the queue status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the expected delay for calls in the queue to be serviced is greater than

Copyright © 2003 Lucent Technologies

8191 seconds.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15, vector step number. This argument must be entered.

- ERR - Valid entries are blank or 1 - 15, vector step number

- COND - Valid entries are "GT" or "LE"; this argument must be entered.

- CARG1 - Valid entries are 1 - 128, number of the queue, which must equal the OSPS CALL TYPE field on the OSPSCT form (5404 Record). This number must be entered.

- CARG2 - Valid entries are 1 - 8191, threshold in seconds for the expected delay for connecting a call to an agent. This argument must be entered.

GOTODOW - Conditional GOTO based on the day of the week

This conditional GOTO command is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on the current Day-of-Week. One of two conditions can be identified: the current day is Less than or Equal to,"LE", Greater Than, "GT" or Equal to, "EQ", the specified day or the current day is Included in, IN" or Excluded from, "EX", the specified day range. If the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank,, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15 vector step number; must be entered.

- ERR - must be blank

- COND - Valid entries are "GT", "LE", "IN", "EQ" or "EX"; must be entered.

- CARG1 - Enter day of the week, 1 - 7, where 1 is Monday; must be entered.

- CARG2 - must be blank if COND is "GT", "LE" or "EQ"; if COND is "IN" or "EX" then day of the week, 1 - 7, where 1 is Monday; must be entered.

GOTONUM - Conditional GOTO based on TOUCH-TONE number(s) entered by caller

This command is used in conjunction with the PROMPT command to provide branching on caller-entered digits. It is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on evaluation of the digits entered by the caller.

- ARG1 - Valid entries are blank or a VECTOR ID number:

Copyright © 2003 Lucent Technologies

5E9(2) and earlier: 1 - 256

5E10 and later: 1 - 1024

If ARG1 is not blank, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15, vector step number. ARG2 must be entered.
- ERR - blank or 1 - 15
- COND - Valid entries are "EQ", "GT" or "LE"; must be entered
- CARG1 - Valid entries are caller entered digit, 0 - 32. The digit to be examined for the condition. If no digit is specified, the first digit entered by the customer is examined. This argument is optional.
- CARG2 - Enter digit value used to evaluate the condition. This value is compared with the digit indicated by CARG1. Valid entries are, 0 - 9, 11 based on the "#" key or 16 based on the empty digit.

If an entry is made in the CARG1 field, the entry specifies the caller-entered digit to be examined as part of the conditional evaluation. If no entry is made in this field, the first digit is examined. Vector Processing branches to the step specified by the optional error step of a GOTONUM command when the number of caller-entered digits is less than the value populated in the CARG1 field. When this occurs, the branch occurs immediately and evaluation of the condition is bypassed. If no error step is identified, the condition is evaluated even if the specified number of digits are not entered by the customer (the digits not entered by the caller are padded with 'empty' digits and used in the evaluation).

The entry in the CARG2 field identifies a digit value which is used in the evaluation of the condition. This value is compared against the specified caller-entered digit (or the first digit if no entry exists in the CARG1 field) to determine if the condition evaluates to TRUE or FALSE.

GOTOQUE - Conditional GOTO based on the number of calls in a queue.

This command is a conditional GOTO based on the number of calls in a queue. This command may branch to a step in the current vector or to a step in another vector if the number of calls that currently reside in the specified Call Queue is greater than "GT" less than "LE" or equal to "EQ", the specified amount in CARG2. An optional error step can be executed if the AM/CMP is in overload or the query for the queue status fails. If the query for the queue status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this vector ID is executed. If an error step is not specified, the condition is evaluated assuming that number of calls in queue is greater than 5000.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank,, then ARG1 must equal the VECTOR ID number on a CVECT form.
- ARG2 - Valid entries are 1 - 15, vector step number; this argument must be entered.
- ERR - Valid entries are a blank or 1 - 15, vector step number.
- COND - Valid entries are "GT", "LE" or "EQ"; this argument must be entered.
- CARG1 - Valid entries are 1 - 128, number of the queue, which must equal the OSPS CALL TYPE field on the OSPSCT form (5404 Record). This number must be entered.

Copyright © 2003 Lucent Technologies

- CARG2 - Valid entries are 0 - 5000, threshold for calls in a queue; this argument must be entered.

GOTOSTA - Conditional GOTO based on staffed agents

This command is a conditional GOTO step used to branch to a step in the current vector or to a step in another vector when the specified condition is met. The decision to branch is based on the current number of agents logged-in to the specified Serving Team. An optional error step can be executed if the AM/CMP is in overload or the query for the serving team status fails. If the query for the serving team status is successful and the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed. If an error step is not specified, the condition is evaluated assuming the number of agents logged-in is zero.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank,, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15, vector step number; this argument must be entered.

- ERR - Valid entries are blank or 1 - 15, vector step number

- COND - Valid entries are "GT" or "LE"; this argument must be entered.

- CARG1 - Valid entries are 1 - 128, serving team ID, which must equal an entry in the SERVING TEAM field on the STINFO form (5402 Record). This argument must be entered.

- CARG2 - Valid entries are 0 - 4000, threshold for number of agents who are not busy with a call or made busy on the specified serving team members logged-in. This argument must be entered.

GOTOTOD - Conditional GOTO based on the time of day

This conditional GOTO command is used to branch to a step in this VECTOR ID or to a step in another vector when the specified condition is met. The decision to branch is based on the current Time-of-Day. One of four conditions can be identified: the current time is Less than or Equal to, "LE" or Greater Than "GT", the specified time or the current time is Included in "IN" or Excluded from, "EX" the specified time range. If the condition is met, vector processing branches to the specified step. If the condition is not met, the next step in this VECTOR ID is executed.

- ARG1 - Valid entries are blank or a VECTOR ID number:

  5E9(2) and earlier: 1 - 256

  5E10 and later: 1 - 1024

  If ARG1 is not blank, then ARG1 must equal the VECTOR ID number on a CVECT form.

- ARG2 - Valid entries are 1 - 15 vector step number. This argument must be entered.

- ERR - must be blank

- COND - Valid entries are "GT", "LE", "IN" or "EX". One of these conditions must be entered.

- CARG1 - Valid entries are hours and minutes of the day. This argument must be entered. 0 - 23, first two digits are the hours of the day, 00 - 59, second two digits are the minutes of the hour

Copyright © 2003 Lucent Technologies

- CARG2 - Valid entries are blank if COND is "GT" or "LE". If COND is "IN" or "EX" then valid entries are: 0000 - 2359: 00 - 23, first two digits are the hours of the day; 00 - 59, second two digits are the minutes of the hour.

MUSIC - Delay caller with music

This command provides delay treatment to a caller by routing the call to a music source identified by the Route Index. The route index must be valid and correspond to a terminating port. This route index is also owned by the CACD customer. An optional error step may be defined to provide alternate treatment to the caller if a music channel cannot be obtained. If the route attempt to the music source is unsuccessful and no error step is specified, the caller is provided with audible ring. The length of time that music is to be provided to the caller may be defined.

- If no time limit is specified and the call has been previously queued, vector processing is stopped and the caller continues to hear music until an agent is available or until the caller abandons.
- If no time limit is specified and the caller is not in a queue, the caller will get reorder.
- If no time limit is specified, and the caller is not in a queue and the A NOT QUEUED SEC set to 0 on the CACDPARM form, the caller will get reorder.

- ARG1 - Valid entries are the route index:

  For 5E10 and earlier: 1 - 3617

  For 5E11 and 5E12: 1 - 4000

  For 5E13 and later: 1 - 16382

  ARG1 must be entered. The ROUTE INDEX on an RTIDX form must equal ARG1. In addition, CI ROUTE TYPE on the RTIDX form must equal "GENANN". In addition, A TKGRP form must be entered where TGN equals the TRUNK GROUP NUMBER on the above RTIDX form, and TRK DIR is "ANN". In addition, on the above TKGRP form, CYCLES must equal 0 and BARGE IN must equal "Y". Also, a TRUNK form (5204 Record) must be entered where TGN field equals the TRUNK GROUP NUMBER on the above RTIDX form and the first member on the TRUNK form must have MEMB equal 0.

- ARG2 - Valid entries are blank or 15 - 1023, the duration of the music in seconds.
- ERR - blank or 1 - 15
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

NOOP - No operation

ARG1 - any value
- ARG2 - any value
- ERR - any value
- COND - any value
- CARG1 - any value
- CARG2 - any value

Copyright © 2003 Lucent Technologies

This is the initial state for vectoring commands. This command can be used to temporarily disable steps rather than deleting them. The given step(s) remains intact but they are passed over during vector processing rather than executed.

PROMPT - Prompt caller for a number via TOUCH-TONE dialing

The PROMPT command is a secured feature. See Division 2, Section 4A for information on how to activate a secured feature.

The PROMPT command routes the caller to an announcement which prompts the called for TOUCH-TONE digit entry.

- ARG1 - Valid entries are the route index to the announcement:

  For 5E10 and earlier: 1 - 3617

  For 5E11 and 5E12: 1 - 4000

  For 5E13 and later: 1 - 16382

  This field must be entered. The ROUTE INDEX on an RTIDX form must equal ARG1. In addition, CI ROUTE TYPE on the RTIDX form must equal "GENANN". In addition, A TKGRP form must be entered where TRK DIR is "ANN" and the TGN equals the TRUNK GROUP NUMBER on the above RTIDX form. CYCLES must be equal to 1 on the TKGRP form. Also, a TRUNK form (5204 Record) must be entered where TGN field equals the TRUNK GROUP NUMBER on the above RTIDX form, and first member on the TRUNK form must have MEMB equal 0.

- ARG2 - Valid entries are 1 - 32, the number of digits expected after prompt announcement. This field must be entered.

- ERR - blank or 1 - 15

- COND - must be blank

- CARG2 - must be blank

This feature provides CACD customers with the ability to route callers to an announcement prior to delivery to an agent. The announcement is used to prompt callers for Touch-Tone input. The digits are collected and then used to provide the following functions:

- To determine the appropriate call queue (and ultimately serving team) to handle the call. This allows a caller to be connected to an agent trained specifically to handle the caller's needs.

- To provide front-end digit collection (such as a credit card number, social security number or zip code). This allows faster call handling as data is available to the agent upon position seizure.

The announcement is provided to a caller through a 13A or similar unit. Digit collection is accomplished through the use of UTDs (Universal Tone Decoders) equipped in the OSM (Originating Switching Module). When a PROMPT command is encountered in a vector, the caller is routed to the announcement unit as specified by the route index given in ARG1. ARG2 specifies the maximum number of digits to collect. Digits entered after the maximum value has been reached are not collected in this PROMPT step. An optional error step may be specified to identify call treatment if an announcement unit cannot be accessed or a UTD is not available.

The UTD is connected to the call prior to routing to the announcement. This allows callers to begin digit entry prior to the completion of the announcement. The path to the announcement is dropped once the

Copyright © 2003 Lucent Technologies

first digit is entered. On variable length multi-digit entries, the "#" key may be used to signal early input termination before the specified maximum number of digits has been entered. The "*" key may be used to delete all previously entered digits. This key may be depressed at any time until the caller has entered the maximum number of digits as specified in the PROMPT command. The caller can then begin reentry of the number.

Upon termination of the prompting announcement, the caller has 8 seconds to begin digit entry. Failure to begin digit entry within 8 seconds causes Touch-Tone entry to be terminated and Vector Processing to proceed to the next step. Once digit entry has begun, the caller has 5 seconds between each digit to continue digit entry. Touch-Tone entry is terminated and Vector processing proceeds to the next step if the caller pauses for more than 5 seconds between digits. Failure to obtain an 8 second timer prior to entry of the first digit is treated as an immediate timeout and entry is terminated. Failure to obtain a timer for subsequent digits is ignored and the PROMPT command waits indefinitely for the next digit. Early input termination may also occur:

- When an agent is attached to the call prior to entry of all digits (this may only occur when the call has been queued prior to the PROMPT step)
- When the prompting announcement exceeds the length of time that an announcement can last for a call that has not been previously placed in a queue (this may only occur when the call has not been queued prior to the PROMPT step).

On multi-digit entries, the caller-entered digits are sent to the MIS as part of the vector PROMPT message. The determination of whether an entry is multi-digit or not is based on the value populated in the ARG2 field. The MIS receives a vector PROMPT message for all PROMPT steps in which the value of the ARG2 field is greater than one even if the caller enters only one digit. Single digit entries are not sent to the MIS as they are typically associated with the selection of a call queue and would not be useful to the CACD customer. A partial multi-digit entry is sent to the MIS for any of the early input termination cases discussed above.

Once the caller-entered digits have been collected, the GOTONUM command maybe used. The GOTONUM command contains a conditional argument used to determine the proper handling of a call. If the condition evaluates to TRUE, Call Vectoring treatment branches to the specified step in this VECTOR ID or to a step in another vector. If the condition evaluates to FALSE, the next step in the current vector is processed.

See Figure 2 and Figure 3 for examples of PROMPT command.

For 5E9(2) and later, if CMD CD is "PROMPT",the number of times an announcement may be repeated per call is 1, therefore the CYCLES field on the TKGRP form must be 1.

QUEUE - Queue or transfer call

This command causes a call to be placed in queue if it is not in a queue or transferred to the identified queue if the call has been queued. An error step is executed if the queue attempt fails either because the AM/CMP is in overload or the call could not be queued (e.g. the queue is full).

- ARG1 - Valid entries are 1 - 128, number of the queue, which must equal an OSPS CALL TYPE field on the OSPSCT form (5404 Record). This number must be entered.
- ARG2 - Valid entries are blank or 1 - 276, the BST display index associated with the call, which must equal the BST DISPLAY INDEX on a corresponding OBSTS form (5408 Record).
- ERR - Valid entries are vector step numbers; this parameter cannot be blank.
- COND - must be blank

Copyright © 2003 Lucent Technologies

- CARG1 - must be blank
- CARG2 - must be blank

QUIET - Delay caller with silence.

This command provides delay treatment to a caller in the form of silence. The length of time that silence is provided to the caller must be specified.

- ARG1 - must be blank
- ARG2 - Valid entries are 5 - 1023, duration of quiet in seconds. ARG2 must be entered.
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

REQRTE - Software Release: 5E10 only
Request route call vectoring command for Third Party Call Control.

The REQRTE command is a secured feature (SFID 222) used to route calls to another destination based on the routing information sent by the customer's host computer to the switch. Routing choices allow the system administrator of the host computer to specify a 1 - 10 digit TN, an ACD/BRCS call type queue ID, an ACD/BRCS vector ID, or an ACD/BRCS agent ID. See Division 2, Section 4A222 for more information.

- ARG1 - Valid entries are blank or a host computer ID of 1 - 1000
- ARG2 - must be blank
- ERR - Valid entries are 1 - 15 (required vector step number to execute for error conditions)
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

RING - Delay caller with audible ring

This command provides delay treatment to a caller in the form of audible ring. The length of time that audible ring is to be provided to the caller may be defined.

- If no time limit is specified and the call has been previously queued, vector processing is stopped and the caller continues to hear audible ring until an agent is available or until the caller abandons.
- If no time limit is specified and the caller is not in a queue, the caller will get reorder.
- If no time limit is specified, and the caller is not in a queue and the A NOT QUEUED SEC set to 0 on the CACDPARM form, the caller will get reorder.

- ARG1 - must be blank

Copyright © 2003 Lucent Technologies

- ARG2 - Valid entries are blank or 5 - 1023 duration of ring in seconds
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

ROUTE - Route call to remote destination

When this command is executed, the call is removed from queue and vector processing is terminated. ARG1 for the ROUTE step is the Destination Number Index and must be defined in the CVDSTTN form (5459 Record). The CVDSTTN form assigns either a 7- or 10-digit telephone number or a route index for routing the caller. The intended use of this command is to reroute calls to another destination when the queue is either closed or full and cannot handle the call.

- ARG1 - Valid entries are 1 - 256, destination ID number. This entry must equal a DEST NBR on the CVDSTTN form (5459 Record) which assigns the forwarding telephone number (TN field) or route index (RTI field).
- ARG2 - must be blank
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

STOP - Stop operation

- ARG1 - must be blank
- ARG2 - must be blank
- ERR - must be blank
- COND - must be blank
- CARG1 - must be blank
- CARG2 - must be blank

This command is used to halt further vector processing. If the call has not been queued, the caller is provided with reorder. If the call has been queued, any active delay treatment continues and the call remains in queue. The call remains in this state until the caller abandons or the caller is attached to an agent.

2.5 ARG1

Description: Enter the first argument for the vector step. See Figure 1 for types of ARG1 arguments associated with a specific Vector Command.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Copyright © 2003 Lucent Technologies

Data Rules:

If one of the GOTO steps is entered in the CMD CD field and the corresponding ARG1 is greater than 0, then a CVECT form must be entered where VECTOR ID equals that ARG1.

If "MUSIC", "DISC", "PROMPT" or "ANNOUNC" is entered in the CMD CD field, then an RTIDX form (5303 Record) must be entered with a ROUTE INDEX equal to the corresponding ARG1 and a CI ROUTE TYPE on the RTIDX form must equal "GENANN". In addition, a TKGRP form (5202 Record) must be entered where TGN equals the TRUNK GROUP NUMBER on the RTIDX form and TRK DIR on TKGRP form equals "ANN". For an entry of "ANNOUNC" or "DISC", CYCLES on the above corresponding TKGRP form cannot equal 0. For an entry of "MUSIC", the CYCLES field must equal 0 and BARGE IN must equal "Y" on that corresponding TKGRP form. For an entry of "PROMPT", the CYCLES field on the TKGRP form must be 1.

If "MUSIC", "DISC", "PROMPT" or "ANNOUNC" is entered in this field, then a TRUNK form (5204 Record) must be entered where the TGN equals the TRUNK GROUP NUMBER entry on the RTIDX form and the first member on that TRUNK form must have MEMB equal 0.

2.6 ARG2

Description: Enter the second argument for the vector step. See Figure Figure 1 for types of ARG2 arguments associated with a specific Vector Command. ARG2 of the GOTO steps cannot branch back to the same step.
Valid Entries: 1 - 1023

2.7 ERR

Description: Enter the error treatment vector step number. For example, "MUSIC" can fail to route to a music port if is is already connected to the maximum number of calls it can support. When such a failure occurs, vector processing can be diverted to another vector step by specifying that step in the ERR field.
Valid Entries: 1 - 15

2.8 COND

Description: Enter the conditional specification for a conditional GOTO statement. For example, if "LE" is entered, the branch step occurs if the condition being tested is less than or equal to the entry in CARG1 / CARG2.

Valid COND Entries

Entry	Definition
LE	Less than or equal to a value
GT	Greater than a value
IN	Included in a range of values
EX	Excluded from a range of values
EQ	Equal to a value

2.9 CARG1

Description: Enter the first conditional GOTO argument of the vector step. See Figure 1 for types of CARG1 arguments associated with a specific Vector Command.
Valid Entries: 0 - 2359

Data Rules:

If "GOTOQUE", "GOTOAGE" or "GOTODLY" is entered in the CMD CD field, then an OSPSCT form must be entered where the OSPS CALL TYPE equals the corresponding CARG1.

2.10 CARG2

Copyright © 2003 Lucent Technologies

Description: Enter the second conditional GOTO argument of the vector step. See Figure 1 for types of CARG2 arguments associated with a specific Vector Command.
Valid Entries: 0 - 8191

[] - Arguments or error steps enclosed in [] are optional.
DISPX - Display index
HHMM - Hours and Minutes
Host ID - ACD/BRCS customer's host computer identification number
Queue - Queue number of call type ID
RTI - Route Index
Serv Team - Serving Team

Figure 1 CALL VECTORING COMMANDS AND ASSOCIATED ARGUMENTS

EXAMPLE 1: CALL VECTOR SCENARIO

Step	CMD CD	ARG1	ARG2	ERR Step	COND	CARG1	CARG2
1	PROMPT	304	2	6			
2	GOTONUM		4		LE		5
3	BUSY						
4	QUEUE	75		6			
5	MUSIC	2015					
6	STOP						

1. When the above vector is processed, the caller is routed to the announcement associated with ROUTE INDEX 304.
2. The announcement prompts the caller for input. A maximum of 2 digits are accepted, as specified by the value in the ARG2 field.
3. After the caller-entered digits have been collected, the "GOTONUM" command is evaluated. Because CARG1 is blank, the first digit entered is compared against the digit 5, the value identified in the CARG2 field.
4. If the first digit entered is less than or equal to 5, then the condition is evaluated as TRUE and Vector Processing branches to Step 4 in the current VECTOR ID, as specified by the value in the ARG2 field. Step 4 places the caller in call queue 75 and then provides the caller with the music source associated with ROUTE INDEX 2015 and vector processing stops because a time limit has not been specified in ARG2 of the MUSIC step (step 5). The caller is connected to the music until an agent becomes available for the call or the calling party abandons.

Figure 2 EXAMPLE 1: CALL VECTOR SCENARIO

Copyright © 2003 Lucent Technologies

EXAMPLE 2: CALL VECTOR SCENARIO

Step	CMD CD	ARG1	ARG2	ERR Step	COND	CARG1	CARG2
1	PROMPT	305	32				
2	GOTONUM		5		EQ		11
3	GOTONUM		5		EQ	32	2
4	BUSY						
5	QUEUE	75		7			
6	MUSIC	2015					
7	STOP						

1. When the above vector is processed, the caller is routed to the announcement associated with ROUTE INDEX 305.
2. The announcement prompts the caller for input. A maximum of 32 digits will be accepted, as specified by the value in the ARG2 field.
3. After the caller-entered digits have been collected, the GOTONUM command identified in Step 2 is evaluated. The first digit entered, (CARG1 is blank) is compared against the "#" key, the value identified in the CARG2 field.
4. If the first digit entered is equal to "#", then the condition is evaluated as TRUE and Vector Processing branches to Step 5 in the current VECTOR ID, as specified by the value in the ARG2 field. Step 5 indicates that the caller is to be placed in call queue 75 and then Step 6 provided with the music source associated with ROUTE INDEX 2015 and vector processing stops.
5. When Step 3 is processed, the 32nd caller-entered digit, as specified by the value in the CARG1 field, is compared against the digit 2, the value identified in the CARG2 field. If the 32nd digit is equal to 2, then the condition is evaluated as TRUE and Vector Processing branches to Step 5 in the current VECTOR ID, as specified by the value in the ARG2 field. If the 32nd digit entered is not equal to 2, the condition is evaluated as FALSE and the next step, Step 4 is processed. Step 4 causes Vector Processing to stop and busy tone to be returned to the caller.

Copyright © 2003 Lucent Technologies

SEC. 4BI: 5461-1 RECORD
OSPS IMPROVED THIRD NUMBER ACCEPTANCE LINE EXCEPTION - EXCPT

1. GENERAL

The 5461-1 Record is available with 5E6 and later Software Releases. This record is the ITNA (Improved Third Number Acceptance) Line exception table, and indicates the TIME SET ID for a single line number or for a range of line numbers based on the calling number. See Division 2, Section 3I for more translation information for ITNA.

1.1 TIME SET ID

A TIME SET ID field is first checked on the TREAT form. If the time of day does not fall between the start and stop time specified by that TIME SET ID field or "NEVER" is entered in the TIME SET ID field, then the exception table is referenced to determine if the calling number contains a different TIME SET ID. If a different TIME SET ID is found in the exception table, then it can be determined if the time of day falls between the start and stop times for this TIME SET ID.

The TIME SET ID on this form indicates whether auto outpulsing should always be performed for the calling number or if automatic outpulsing to the third number for acceptance of the charges depends on the time of day.

1.2 Directory Numbers

Directory numbers should never overlap on EXCPT forms. An EXCPT form may not include the same directory number(s) in a range that is also entered on another EXCPT form.

1.3 NPAMAP Form

For every EXCPT form entered, a corresponding NPAMAP form (5414 Record) must be entered where the NPA and NXX are equivalent on both forms.

1.4 Recent Change View

The corresponding Recent Change View for this form is 26.32.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * NPA

Description: Enter the numbering plan area code.

Required Field.
Valid Entries: 200 - 999

Data Rules:

The NPA and NXX combination on this form must equal the same combination on an NPAMAP form.

2.3 * NXX

Description: Enter the exchange office code.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 200 - 999

2.4 * BEGIN LN

Description: Enter an individual line number or the first line number in a range of consecutive line numbers. The range of directory numbers (NPA-NXX-BEGIN LN through NPA-NXX-END LN) should never overlap between EXCPT forms. A minimum of 5 lines must be entered in a range.

Required Field.
Valid Entries: 0 - 9999

2.5 (*) END LN

Description: Enter the last number in a range of line numbers. This is an optional key field.
Valid Entries: 0 - 9999

Data Rules:

If an entry is made in this field, then an entry must be made in BEGIN LN and the entry in END LN must be greater than the BEGIN LN entry.

2.6 # TIME SET ID

Description: Enter the TIME SET ID. The "TSx" entries are defined by the TCA. This allows for the third party number not to be disturbed during late night hours for verification. An entry of "ALWAYS" specifies auto outpulsing to the third party number should always be performed for the calling number.

Required Field.
Valid Entries: TS1, TS2, TS3, TS4, TS5, TS6, TS7, TS8 or ALWAYS.

Data Rules:

If "TS1", "TS2", "TS3", "TS4", "TS5", "TS6", "TS7" or "TS8" is entered in the TIME SET ID field, a SETID form must be defined with that TIME SET ID.

Copyright © 2003 Lucent Technologies

SEC. 4BJ: 5461-2 RECORD
OSPS IMPROVED THIRD NUMBER ACCEPTANCE TIME SET FORM - SETID

1. GENERAL

The 5461-2 Record is available with 5E6 and later Software Releases. This record defines the associated starting time and stopping time of the TIME SET ID for the ITNA (Improved Third Number Acceptance) feature. The combination of the START HOUR plus the START MINUTE cannot equal the STOP HOUR plus the STOP MINUTE.

1.1 TIME SET ID

The TIME SET IDs are assigned on the EXCPT form (5461-1 Record) and TREAT form (5461-4 Record). TIME SET ID has an associated start and stop time that corresponds to a time range which ITNA feature uses to determine whether it is acceptable to call the third party to obtain verbal acceptance for calling charges. For example, if it is late at night, it may not be acceptable to wake the third party for verbal acceptance.

If the time that the call is attempted takes place between the START HOUR and the STOP HOUR, automatic outpulsing occurs. Otherwise, a message is displayed to the operator indicating that verbal acceptance is required, but the time is inappropriate. See Division 2, Section 3I for translation information for ITNA.

1.2 Recent Change View

The corresponding Recent Change View for this form is 26.30.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * TIME SET ID

Description: Enter the TIME SET ID to be defined. These TIME SET IDs are assigned on the EXCPT form and the TREAT form.

Required Field.
Valid Entries: TS1, TS2, TS3, TS4, TS5, TS6, TS7, TS8.

2.3 # START HOUR

Description: Enter the start hour for the TIME SET ID.

Required Field.
Valid Entries: 00 - 23

2.4 # START MINUTE

Description: Enter the start minute for the TIME SET ID.

Required Field.
Valid Entries: 00 - 59

2.5 # STOP HOUR

Copyright © 2003 Lucent Technologies

Description: Enter the stop hour for the TIME SET ID.

Required Field.
Valid Entries: 00 - 23

2.6 # STOP MINUTE

Description: Enter the stop minutes for the TIME SET ID.

Required Field.
Valid Entries: 00 - 59

SEC. 4BK: 5461-3 RECORD
OSPS IMPROVED THIRD NUMBER ACCEPTANCE SPECIAL AREA CODE FORM - SPECL

1. GENERAL

The 5461-3 Record is available with 5E6 and later Software Releases. This record identifies the back third number NPAs which are being designated as special areas and should receive ITNA treatment. If an entry is found for the billing number NPA requested by the back calling party, ITNA treatment will be provided to the call. Otherwise, standard operator practices should be followed. For example, a TCA handles traffic for locations near the Canadian border and uses the Billing Validation Application for Billed Number Screening which returns an indeterminate reply. That TCA may allow the benefits of the ITNA automation by including those NPAs in this form.

See Division 2, Section 3I for translation information for ITNA.

1.1 Recent Change View

The corresponding Recent Change View for this form is 26.31.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * KEY

Description: Do not enter this field. This should be not be entered, because only one form is required.

2.3 NPA

Description: Enter the Numbering Plan Area Code(s) for the special area(s).

Required Field.
Valid Entries: 200 - 999

SEC. 4BL: 5461-4 RECORD
OSPS IMPROVED THIRD NUMBER ACCEPTANCE CALL TREATMENT FORM - TREAT

1. GENERAL

The 5461-4 Record is available with 5E6 and later Software Releases. This record assigns the special and normal SET TIME IDs when the ITNA (Improved Third Number Acceptance) feature is applied to the call. The TIME SET IDs are defined in the SETID form (5461-2 Record) and give the corresponding time range when the third party number is automatically outpulsed for verbal acceptance of the charges. For example, the number is not automatically outpulsed in late evening hours.

See Division 2, Section 3I for translation information for ITNA.

1.1 Recent Change View

The corresponding Recent Change View for this form is 26.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * ORIG STAT TYPE

Description: Enter the Originating Station Types.

The data fields entered on the TREAT form must be consistent for the same ORIG STAT TYPE.

EXAMPLE: There are three ORIG STAT TYPEs of "PREPCOIN". One form entry has a CARRIER and a TGN entered. The other two only have TGNs entered. This is an error since all the "PREPCOIN" entries must have the same fields entered consistently (they do not have to match). However, it is permissible to have a TGN entered on one and a TGN range entered on another.

Valid ORIG STAT TYPE Entries

Entry	Definition
0 or OTHER	All others
1 or POSTPCOIN	Postpaid coin
2 or PREPCOIN	Prepaid coin
3 or TRUEHOTL	True hotel ACQS (Automatic Charge Quotation Service) calls
4 or ACQSOTHER	Other types of ACQS calls
5 or UNKNOWN	Type unknown
6 or NCNPUB	Non coin public
7 or NACQSHOTL	Hotel, non-ACQS

Data Rules:

If the TCA does not care what the originating station type is and would like to treat all station types the same, the "UNKNOWN" entry should be used.

2.3 (*) CARRIER

Description: Enter the CARRIER ID. LEC indicates the Local Exchange Carrier.
Valid Entries:

- For 5E6 - 5E8: 0 - 999 or LEC
- For 5E9(1) and later: 0 - 9999 or LEC

Copyright © 2003 Lucent Technologies

Data Rules:

If CARRIER is entered, BEGIN TGN must be entered.

An entry in this field, other than "LEC", requires an ICF form (5305 Record) to be entered with the CARRIER ID equal to this entry. If no carrier is specified, all carriers are treated the same.

For 5E8 and later, if CARRIER is not "LEC", and BEGIN TGN and END TGN are entered, CARRIER must equal a CARRIER ID on an ICF form, with the ICF form's FEAT GRP equal to "D".

For 5E6 and 5E7 , if a CARRIER is entered on any TREAT form, then a CARRIER must be entered on all TREAT forms with that same ORIG STAT TYPE. In addition, there must be at least one TREAT form with the same ORIG STAT TYPE for each ICF form where CARRIER on the TREAT form matches CARRIER ID on the ICF form.

For 5E8 and later , separate all TREAT forms with CARRIER entered into groups which have the same ORIG STAT TYPE. For every ICF form entered in which FEAT GRP is "D", then there must be at least one TREAT form in each group (of the same ORIG STAT TYPE) where the CARRIER on the TREAT form matches the CARRIER ID on the ICF form.

2.4 (*) BEGIN TGN

Description: Enter an individual Trunk Group Number or the first number in a range of Trunk Group Numbers.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If no beginning Trunk Group Number is specified, all incoming operator trunks receive the same treatment.

A minimum of 5 Trunk Group Numbers must be entered in a range. Trunk Group Numbers in a range on one TREAT form should never overlap on the Trunk Group Numbers in a range on another TREAT form.

2.5 (*) END TGN

Description: Enter the last number in a range of Trunk Group Numbers.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If END TGN is entered, BEGIN TGN must also be entered. The END TGN entry must be greater than the BEGIN TGN entry.

2.6 # TIME SET ID

Description: Enter the TIME SET ID.

"ALWAYS" indicates the third party number will always be automatically outpulsed for verbal acceptance of the calling charges.

"NEVER" indicates that acceptance by the third party is not required. However, the EXCPT form (5461-1 Record) will be checked to see if exceptions exist to this case.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: TSx (x=1-8), ALWAYS, or NEVER

Data Rules:

The "TSx" entries are defined on the SETID form, therefore, if "TS1", "TS2", "TS3", "TS4", "TS5", "TS6", "TS7" or "TS8" are entered in this field, there must be a SETID form defining that entry.

When the TREAT form is entered with a TIME SET ID equal to an entry other than "NEVER" or "ALWAYS", a SETID form must be entered with TIME SET ID equal to TIME SET ID on the TREAT form.

SEC. 4BM: 5462-1 RECORD
OSPS EXTERNAL INFORMATION SYSTEM (EIS) DATA - EISDATA

1. GENERAL

The 5462-1 Record is available with 5E6 and later Software Releases. This record defines the operational parameters for a particular OSPS EIS (External Information System).

Division 2, Section 3C gives the translations for provisioning an EIS and External ARU (Audio Response Unit).

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.51.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * EIS NBR

Description: Enter the External Information System Identification Number that is assigned to the EIS. The EIS NBR is assigned to a particular EIS by the 5ESS Switch owner.
Valid Entries: 1 - 16

Data Rules:

The EIS NBR must match the DATA LINK GRP number on the corresponding OSPSDSL form (5411 Record) for all Call Processing Data Links associated with the EIS.

2.3 # EIS NAME

Description: The External Information System's Name is used to identify the EIS on other input forms. The 1 to 15 character name must be unique.

Required Field.
Valid Entries: 1 - 15 characters

Data Rules:

The entry in this field must match the following:

- EIS NAME is entered on an OPEISDB form (5462-2 Record)
- EIS NAME on the SERVDEST form (5467 Record)
- NAME field on the EISSM form (5462-3 Record)

2.4 # VENDOR

Description: Enter the name of the EIS vendor supplying the EIS.

Required Field.

Valid VENDOR Entries

Copyright © 2003 Lucent Technologies

Entry	Definition
C or CCI	Software Release: 5E6 and later Computer Consoles Incorporated
CGI	Software Release: 5E7 and later. Computer Generation Incorporated
I or IBM	Software Release: 5E6 and later International Business Machines
NRP	Software Release: 5E10 and later Network Resource Platform.This value supports the AATLSOS AAP AATLSOS - AAP (Alternate Access to Language SpecificOperator Services - Automatic Access Prompting) Using CPDL (Call Processing Data Link) Interface feature.For more information on this feature, see Division 2,
TMC	Software Release: 5E9(2) and later. Tele-Matic. This value supports the ICS (Inmate CallingServices) secured feature (SFID 385 or 288). For moreinformation on this feature, see Division 2, Section4A385.
VDR	Software Release: 5E7 and later. Volt Delta Resource

Data Rules:

CCI:
If "CCI" is entered, "SET1" is automatically entered in MSG SET.

CGI:
If "CGI" is entered:

- "SET3" is automatically entered in MSG SET.
- When PRE OPER EIS is entered on the SERVDATA form, and the corresponding EISDATA form (found by matching PRE OPER EIS on the SERVDATA form with EIS NAME on the EISDATA form) has "CGI" entered as the VENDOR, then OSPS SVC CODE on the SERVDATA form must be "SPCL700". If VENDOR is not "CGI" on the EISDATA form, OSPS SVC CODE must not be "SPCL700" on the SERVDATA form. (For more information on Specialized Handling for 700 Services secured features, see Division 2, Section 4A69 and Section 4A89.)

IBM:
If "IBM" is entered:

- "SET2" is automatically entered in the MSG SET field.
- The IBMRNGS form must be submitted.
- The SERVICE CLASS on the OSPSDSL form is "EIS"
- EIS NBR on the EISDATA form matches DATA LINK GRP on the OSPSDSL form), and the DATA LINK NBR on the OSPSDSL form must be less than 255.
- PRE OPER EIS on the SERVDATA form matches EIS NAME on this form and OSPS SVC CODE on the SERVDATA form must be either "IBMLS" or "IBMINCPT".

NRP:
If VENDOR is "NRP", then MSG SET is set to "SET6".

TMC:
If "TMC" is entered, "SET5" is automatically entered in MSG SET.

If PRE OPER EIS is entered on the SERVDATA form, and the corresponding EISDATA form (found by

Copyright © 2003 Lucent Technologies

matching PRE OPER EIS on the SERVDATA form with EIS NAME on the EISDATA form) has "TMC" entered as the VENDOR, then OSPS SVC CODE on the SERVDATA form must be "INMATE".

When PRE OPER EIS is entered on the SERVDATA form, and the corresponding OSPS SVC CODE on the SERVDATA form is "INMATE", the associated EISDATA form (found by matching PRE OPER EIS on the SERVDATA form with EIS NAME on the EISDATA form) must have "TMC" entered as the VENDOR.

VDR:
If "VDR" is entered, then "SET4" is automatically entered in MSG SET.

2.5 MSG SET

Description: The MSG SET field identifies the message sets supported by the EIS software interface. This field cannot be entered. It is set automatically when the VENDOR field is entered.

Valid MSG SET Entries

Entry	Definition
SET1	Software Release: 5E6 and later. CCI message set.
SET2	Software Release: 5E6 and later. IBM message set.
SET3	Software Release: 5E7 and later. CGI message set.
SET4	Software Release: 5E7 and later. VDR message set.
SET5	Software Release: 5E9(2) and later. TMC message set. This value supports the Inmate CallingServices feature (SFID 385). For more information on thisfeature, see Division 2, Section 4A385.
SET6	Software Release: 5E10 and later This value supports the AATLSOS AAP AATLSOS - AAP (Alternate Access to Language SpecificOperator Services - Automatec Access Prompting) Using CPDL (Call Processing Data Link) Interface feature.For more information on this feature, see Division 2,

2.6 SWITCH ID

Description: The Switch Identification number is a number assigned by the EIS to this 5ESS Switch.

Required Field.
Default: 0
Valid Entries: 0 - 255

2.7 MSG DELAY

Description: Message Delay is the number of 50 millisecond intervals that OSPS waits for an expected message response from the specified EIS. The default of 100 milliseconds should result in a delay of 5 seconds.

Required Field.
Default: 100
Valid Entries: 1 - 1023

2.8 MAX CALLS

Description: The Maximum Calls per link indicates the maximum number of calls to be assigned to the CPDL. This value is based on the expected number of messages required for calls that can be assigned to the CPDLs on a given EIS and the holding time of those calls. It is assumed that all CPDLs to a vendor have the same call handling capacity. If more calls occur than the MAX CALL entry for all CPDLs associated with the EIS on a single SM, these calls will be routed to an operator and must be handled manually.

Copyright © 2003 Lucent Technologies

Required Field.
Default: 60
Valid Entries: 1 - 255

2.9 MAX MSGS

Description: This is the maximum number of application messages per second that can be received and sent over a CPDL operating during normal conditions.

Required Field.
Default: 10
Valid Entries: 1 - 255

2.10 NEW EIS NAME

Description: This is a Recent Change field used to assign a new name to an existing EIS.

SEC. 4BN: 5462-2 RECORD
OSPS OPERATOR TO EIS AND DATA BASE MAPPING - OPEISDB

1. GENERAL

The 5462-2 Record is available with 5E6 and later Software Releases.

The 5462-2 Record assigns the EIS (External Information System) name and database key from the operator terminal to a particular serving team and service ID. This allows the proper database display and EIS interface to be provided to an operator when a call is routed to the operator's position. This is based on the operator's serving team and the service ID of the call.

The following forms may be required for OPEISDB form entires.

- STINFO form (5402 Record) is required to define the serving team number.
- SERVDATA form (5466 Record) is required to define a SVC ID (Service Identification) number.
- EISDATA form (5462-1 Record) is required if the EIS NAME is entered on this form.
- OPEXTDB form (5435 Record) is required if the TERM DB KEY is entered on this form.

Division 2, Section 3C discusses the translations required for Listing Services.

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.55.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * SERVING TEAM

Description: Serving Team number is the identification number of the the group of operators to provide a specific service.

Required Field.
Valid Entries: 1 - 128.

Data Rules:

This Serving Team number must be defined on an STINFO form (5402 Record).

2.3 * SVC ID

Description: The SVC ID (Service Identification) number defines a particular type of service.

Required Field.
Valid Entries: 1 - 1023

Data Rules:

SVC ID must be defined on a SERVDATA form (5466 Record). Each EIS NAME and SVC ID on an OPEISDB form (5462-2 Record) must have exactly one OSPS CALL TYPE on an OSPSCT form (5404

Copyright © 2003 Lucent Technologies

Record), which is used as the Listing Services Recall Call Type. If LIST SVC RECALL is "Y" on an OSPSCT form, OSPS CALL TYPE is used as the Listing Services Recall Call Type for the EIS NAME on the OPEISDB form pointed to by the SERVING TEAM and SVC ID on this OSPSCT form.

2.4 EIS NAME

Description: The External Information System name is given by the 5ESS Switch to identify a particular EIS.
Valid Entries: 1 - 15 characters

Data Rules:

The EIS NAME is defined on an EISDATA form (5462-1 Record).

2.5 TERM DB KEY

Description: The TERM DB KEY (Database Key) number on the operator's VDT terminal (for 5E6 and later Software Releases) is assigned to a particular serving team and EIS identification number. The BST-LS may not utilize this field, even though it is populated for a given serving team.

Valid TERM DB KEY Entries

Entry	Definition
MAINDB	Main data base key
DB1	Soft key 1 of the operator's terminal
DB2	Soft key 2 of the operator's terminal
DB3	Soft key 3 of the operator's terminal
DB4	Soft key 4 of the operator's terminal
DB5	Soft key 5 of the operator's terminal
DB6	Soft key 6 of the operator's terminal
DB7	Soft key 7 of the operator's terminal
DB8	Soft key 8 of the operator's terminal
DB9	Soft key 9 of the operator's terminal
DB10	Soft key 10 of the operator's terminal
DB11	Soft key 11 of the operator's terminal
DB12	Soft key 12 of the operator's terminal
DB13	Soft key 13 of the operator's terminal
DB14	Soft key 14 of the operator's terminal

Data Rules:

If a TERM DB KEY is entered, the key must be defined on one or more OPEXTDB forms (5435 Record), and the SERVING TEAM and TERM DB KEY fields on both forms must match. Also, DB NAME must be the same on all OPEXTDB forms associated with the same OPEISDB form (5462-2 Record). If a TERM DB KEY is not entered, NO data base key will be activated.

SEC. 4BO: 5462-3 RECORD
OSPS SM SPECIFIC DATA FOR EIS - EISSM

1. GENERAL

The 5462-3 Record is available with 5E6 and later Software Releases.

The 5462-3 Record defines the EIS (External Information System) data specific to a particular SM. This form indicates the EIS has been assigned CPDLs (Call Processing Data Links) on this SM and specifies the minimum number of CPDLs needed to support the SM during the busy hour. It also indicates if this SM supports 5ESS Switch and EIS message interaction prior to an operator being attached to the call, i.e., pre-operator services directed by the EIS. Note that the number of CPDLs for each SM attached to an EIS can be different than the minimum number required to handle busy hour traffic. The MIN LINKS field is used by maintenance to permit a conditional removal of a CPDL from service if more CPDLs are in service then the MIN LINKS number.

The following forms are required with this form:

- EQIM form (5700-1/2 Record), where the SM number on EQIM matches the SM number on the EISSM form. The CONFIGURATION entry on the EQIM form must be "LOADED".
- OSPSDSL form (5411 Record) with a SERVICE CLASS entry of "EIS". The SM on the EISSM form must match the SM portion of the LCEN on the OSPSDSL form.
- EISDATA form (5462-1 Record) must have an entry in the EIS NAME field that matches the NAME field in the EISSM form.
- SERVDATA form (5466 Record): if the PRE OPER EIS field has an entry, then a corresponding EISSM form must exist with PRE OPER equal "Y", and NAME on the EISSM form must match the PRE OPER EIS field on the SERVDATA form.

Division 2, Section 3C contains information on the translations for an External ARU (Audio Response Unit).

1.1 Recent Change View

The corresponding Recent Change view for this form is 21.52. For more information on Recent Change views that correspond to ODA forms, please see Division 0, Section 2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * SM

Description: Enter the SM number that has CPDLs assigned to the EIS for this SM.

Required Field.
Valid Entries: 1 - 192

Data Rules:

An EQIM form (5700-1/2 Record) must be submitted for this SM and the CONFIGURATION field on the EQIM form must be "LOADED". If the SERVICE CLASS is "EIS" on the OSPSDSL form (5411 Record)

Copyright © 2003 Lucent Technologies

and on a corresponding EISDATA form (5462-1 Record) the EIS NBR field on the EISDATA form matches the DATA LINK GRP on the OSPSDSL form, then the SM on the EISSM form must match the SM portion of the LCEN on the OSPSDSL form.

EIS DATA

Enter the data for the CPDLs in the next three fields (Section 2.3 - Section 2.5). At least one entry is required in each of the fields under EIS DATA.

2.3 NAME

Description: Enter the same EIS NAME specified on the corresponding EISDATA form (5462-1 Record).
Valid Entries: 1 - 15 characters

Data Rules:

If SERVICE CLASS is "EIS" on an OSPSDSL form (5411 Record), and on the corresponding EISDATA form the EIS NBR field matches the DATA LINK GRP on the OSPSDSL form, then the NAME on EISSM form must match the EIS NAME on the EISDATA form.

2.4 MIN LINKS

Description: Enter the minimum number of links assigned for each EIS. This is the minimum number of links required during the busy hour. The minimum number of links cannot be greater than the number of links assigned on the OSPSDSL form (5411 Record) for this SM and EIS.

A major alarm is sounded if the number of CPDLs in service falls below the number specified in this field. The determination of the minimum number of links required is based on the number of EIS calls that are handled by a particular EIS SM, the average work time for such calls and the average number of EIS messages associated with each of those calls. Initially this number must be an approximation until actual usage statistics are monitored to determine if greater or fewer CPDLs are required.
Valid Entries: 0 - 16

2.5 PRE OPER

Description: Are the CPDLs on this SM to be used to communicate with the EIS prior to an operator being attached to the call? The pre-operator services are controlled by the EIS, therefore, this feature must be supported by the associated EIS vendor. Enter "N" if this SM does not communicate with the EIS prior to an operator seizure.
Valid Entries: Y, N

SEC. 4BP: 5463 RECORD
OSPS COUNTRY CODE TO COUNTRY NAME MAPPING FORM - CCNAME

1. GENERAL

The 5463 Record is available with 5E6and later Software Releases. The form is used to map Country Number to a 15-character country name. This information is used for DIOR (Direct International Origination) calls. It also specifies whether automated calling card initial and sequence calls are allowed from this country. If the DIOR Sequence Call Enhancements feature is active, then it can specify automated initial and sequence calls by carrier within a country number.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.81. The view number was changed from 27.7 to 27.81 enabling all new views to be grouped together which were added to support the various DIOR features.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * COUNTRY NUMBER

Description: Enter the DIOR (Direct International Originations) country number.

Required Field.
Valid Entries: 200 - 999

2.3 COUNTRY NAME

Description: Enter the Country Name associated with the Country Number.
Valid Entries: 1 to 15 characters

2.4 AUTO HNDLG ALLOW

Description: Are DIOR initial and sequence calls eligible for automated handling?
Default: N
Valid Entries: Y, N

2.5 IDDD CAC

Description: Enter the IDDD (International Direct Distance Dialing) CAC (Country Access Code) that corresponds to the country number specified in the COUNTRY NUMBER field, with the exception of 809. If the IDDD CAC is 809, enter the NXX (see the IS 809 NXX field below.) The fields IDDD CAC and IS 809 NXX were added for the DIOR (Direct International Originations) Toll Free 800 feature. For more information on this feature, see Division 2, Section 3K on DIOR features.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 808, 810 - 999

Data Rules:

IDDD CAC cannot be 0.

If IDDD CAC is entered, IS 809 NXX must be entered, and conversely if this field is not entered, IS 809

Copyright © 2003 Lucent Technologies

NXX must not be entered.

2.6 IS 809 NXX

Description: Is the code entered in the IDDD CAC field the NXX for a Caribbean country code?

Software Release: 5E9(1) and later.
Required Field.
Default: N (5E9(2) and later)

Valid Entries: Y, N

Data Rules:

If "Y" is entered, then IDDD CAC must be entered.

2.7 AP QUEUE

Description: Should the Automated Position queue be used when an automated call needs to be sent to a position from this country? The AP QUEUE field supports the DIOR Automated Initial Calls Release 3 feature. For more information on this feature, see Division 2, Section 3K on DIOR features.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.8 NRA CC

Description: Enter a country code other than the IDDD CAC (International Direct Distance Dialing Country Access Code) for DIOR NRA (Network Remote Access) calls originating from the country specified in the COUNTRY NUMBER field. This country code is used to determine call completion permissions. This field should not be entered (i.e., blank) if the IDDD CAC is used for NRA calls. The NRA CC field was added to support the DIOR (International Originations) Network Remote Access feature. For more information on this feature, see Division 2, Section 3K on provisioning DIOR features.

Software Release: 5E9(2) and later.
Valid Entries: 1 - 999

CARRIER HANDLING PERMISSIONS (CARRHNDLG)

The following fields (Section 2.9 - Section 2.12) define the carrier handling permissions for each possible carrier for a country number. This is a positional list where each element corresponds to a particular possible carrier. If a carrier does not exist for a country, these list element entries must be left blank.

The list of carrier permissions supports the DIOR Sequence Call Enhancements special feature. For more information on this feature, see Division 2, Section 3K.

Data Rules:
For each carrier, AUTO INIT, AUTO SEQ, DIOR OTTO, and APQ must all be entered or all be blank.

2.9 AUTO INIT

Description: Are automated initial calls allowed from this carrier? This field indicates if DIOR initial calls are eligible for automated handling by this carrier.

Software Release: 5E9(1)
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

For each carrier, AUTO INIT, AUTO SEQ, DIOR OTTO, and APQ must all be entered or all be blank.

2.10 AUTO SEQ

Description: Are automated sequence calls allowed from this carrier? This field indicates if DIOR sequence calls are eligible for automated handling by this carrier.

Software Release: 5E9(1)
Valid Entries: Y, N

Data Rules:

For each carrier, AUTO INIT, AUTO SEQ, DIOR OTTO and APQ must all be entered or all be blank.

2.11 DIOR OTTO

Description: Is the DIOR OTTO (Offer Transfer To Operator) feature available to this carrier?

Software Release: 5E9(1)
Valid Entries: Y, N

Data Rules:

For each carrier, AUTO INIT, AUTO SEQ, DIOR OTTO, and APQ must all be entered or all be blank.

2.12 APQ

Description: Should the Automated Position queue be used when an automated call from this carrier needs to be sent to a position? The APQ field supports the DIOR Automated Initial Calls Release 3 feature. For more information on this feature see Division 2, Section 3K on DIOR features.

Software Release: 5E9(2) and later.
Valid Entries: Y, N

Data Rules:

For each carrier, AUTO INIT, AUTO SEQ, DIOR OTTO, and APQ must all be entered or all be blank.

SEC. 4BQ: 5464 RECORD
OSPS INTERNATIONAL TERMINATING RESTRICTIONS - TPRINTL

1. GENERAL

The 5464 Record is available with 5E6 and later Software Releases. For 5E6 - 5E9(1), this form was the TPRCC form for OSPS Terminating Country Permission. For 5E9(2) and later, this form is the OSPS International Terminating Restrictions form, TPRINTL. This form defines the countries that DIOR (Direct International Originations) can terminate to. For those DIOR calls allowed to terminate to certain foreign countries, the DIOR service provider (the carrier for the call) and each allowable terminating Country Code must be specified in this form.

The OSPS International Terminating Restrictions provides TERM CC and ADDITIONAL DIGITS information to screen/restrict calls to specific international forward numbers or groups of numbers. It also specifies the treatment to be given to DIOR, AATOS, AATLSOS, and wireless call types to the entered international forward numbers or groups of numbers.

The terminating end of a DIOR call is not permitted to route to a foreign country unless that carrier and Country Code have been entered in this form.

For a listing of country names and associated Country Codes refer to the CCNAME form (5463 Record).

1.1 Terminating Point Restrictions for International Numbers

For 5E9(2) and later, ITPR (Terminating Point Restrictions for International Numbers) is a feature that must be purchased by the office before the TPRINTL forms can be used. Therefore, the ACT field for SFID 387 on the SFSYS form (5713-1 Record) must be "Y", before any entries are made on this form.

1.2 Recent Change View

The corresponding Recent Change View for this form is 27.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CARRIER ID

Description: Enter the ID number of the carrier that will provide DIOR service to the country specified in the COUNTRY CODE field.
Valid Entries: 0 - 9999

Data Rules:

For 5E9(1) and earlier, Each entry in this field requires a duplicate entry in the CARRIER ID field on an ICF form (5305 Record), and for 5E8 - 5E9(1)and later, the ICF form's FEAT GRP must equal "D".

For 5E9(1) only, if the value in this field matches the value of the CARRIER ID on the ICF with "D" entered in the FEAT GRP field, then the CARRIER TYPE on the ICF form must be either "INC" or "CONSOL".

For 5E9(2) and later, the only value entered is 0288.

2.3 * COUNTRY CODE

Description: The name of this field was changed to TERM CC in 5E9(2). This field name applies to 5E9(1)

Copyright © 2003 Lucent Technologies

and earlier. See TERM CC for usage information.

2.4 * TERM CC

Description: Terminating Country Code of the international forward number which is used to screen the call for restrictions. This field was called COUNTRY CODE for 5E9(1) and earlier.

Required Field.
Valid Entries: 1 - 999

Data Rules:

For 5E10 and later, TERM CC cannot be 0.

2.5 (*) ADDITIONAL DIGITS

Description: The ADDITIONAL DIGITS field more precisely identifies any screening to be done beyond the TERM CC. Leave blank to specify the TERM CC only, or enter enough digits such that the number of digits in the TERM CC field added to the number of digits in this field add up to a total of 4 to 6 digits, or enter an entire international forward number except for the country code.

If any digits are entered in this field, the total number of digits calculated by adding the length of the TERM CC field and this field must be at least 4.

If a total of 4 to 6 digits are entered between the two fields, all calls of the types below to any international forward number that consists of the same first 4- to 6-digits receive the treatment indicated for that call type.

If no digits are entered in this field, treatment specified below for any given call type is given on all calls to the country code entered in the TERM CC field.

If 7 or more digits are entered, they are assumed to be an entire international forward number, and matching is only attempted on the entire digit string for screening purposes.

Software Release: 5E9(2) and later.
Valid Entries: 0 - 14 digits

2.6 EXPLANATION

Description: The EXPLANATION field is a no-change field that displays a reminder of how the data entered in the ADDITIONAL DIGITS field will be used. This field cannot be entered.

If a total of 7 or more digits is entered in a combination of the TERM CC and ADDITIONAL DIGITS fields the phrase "Full Number Match Only" is displayed; otherwise, the phrase "Any Partial Number Match" is displayed.

Software Release: 5E9(2) and later.

2.7 DIOR TRMT

SEC. 4BR: 5465 RECORD
OSPS TERMINATING NPA NXX RESTRICTIONS FORM - TPRNPA

1. GENERAL

The 5465 Record is available with 5E6 and later Software Releases. This form defines the terminating point restrictions data for a DIOR (Direct International Origination) call with a domestic forward number.

An entry in this record indicates that a DIOR call is not allowed to terminate to the identified NPA or NPA NXX.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CARRIER

Description: Enter the carrier ID number of the carrier providing DIOR service for the call.
Valid Entries: 0 - 9999

Data Rules:

For every CARRIER entry on this form, a corresponding ICF form must have "D" entered in the FEAT GRP field. Forms correspond if the entry in this field is equal to the entry in the CARRIER ID field on the ICF form.

2.3 * NPA

Description: Enter the Numbering Plan Area code.
Valid Entries: 200 - 999

2.4 (*)NXX

Description: Enter the Office Code.
Valid Entries: 0 - 999

Data Rules:

If LINE is entered, NXX must be entered.

2.5 (*) LINE

Enter the forward line number (the local DN minus the office code). If this field is blank, the entire NPA or entire NPA and NXX is specified. The LINE, DIOR TRMT, AATOS TRMT, AATLSOS TRMT, and WIRELESS TRMT fields support the TPR (Terminating Point Restrictions) Expansion feature. For more information on this feature, see Division 2, Section 4A371.

Data Rules:
If LINE is entered, then NXX must be entered.

2.6 DIOR TRMT

Copyright © 2003 Lucent Technologies

Description: Enter the type of Terminating Point Restriction Expansion treatment to be given to DIOR calls. The LINE, DIOR TRMT, AATOS TRMT, AATLSOS TRMT, and WIRELESS TRMT fields support the TPR (Terminating Point Restrictions) Expansion feature. For more information on this feature, see Division 2, Section 4A371

Software Release: 5E9(1) and later.
Required Field.
Default: ALLOW
Valid Entries:

Valid DIOR TRMT Entries

Entry	Definition
ALLOW	Call Allowed.
ANN	Blocked. Send to Announcement
OPER	Blocked. Send to Operator.
RESTR	Restricted. Send to operator (operator override allowed).

2.7 AATOS TRMT

Description: Enter the type of Terminating Point Restriction Expansion treatment to be given to AATOS calls.

Software Release: 5E9(1) and later.
Required Field.
Default: ALLOW
Valid Entries:

Valid AATOS TRMT Entries

Entry	Definition
ALLOW	Call Allowed.
ANN	Blocked. Send to Announcement
OPER	Blocked. Send to Operator.
RESTR	Restricted. Send to operator (operator override allowed).

2.8 AATLSOS TRMT

Description: Enter the type of Terminating Point Restriction Expansion treatment to be given to AATLSOS calls.

Software Release: 5E9(1) and later.
Required Field.
Default: ALLOW
Valid Entries:

Valid AATLSOS TRMT Entries

Entry	Definition
ALLOW	Call Allowed.
ANN	Blocked. Send to Announcement
OPER	Blocked. Send to Operator.
RESTR	Restricted. Send to operator (operator override allowed).

2.9 WIRELESS TRMT

Description: Enter the type of Terminating Point Restriction Expansion treatment given to wireless calls.

Software Release: 5E9(1) and later.
Required Field.
Default: ALLOW
Valid Entries:

Valid WIRELESS TRMT Entries

SEC. 4BS: 5466 RECORD
OSPS SERVICE DATA FOR LISTING SERVICES CALLS - SERVDATA

1. GENERAL

The 5466 Record is available with 5E6 and later Software Releases. This record defines, for the 5ESS Switch owner, the EIS service parameters. A Service ID is assigned to each call queue to determine the treatment each call is to receive. The SVC ID is assigned to serving teams on the OSPSCT form (5404 Record). Division 2, Section 3C discusses the translations required for an EIS and an External ARU (Audio Response Unit).

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.54.

2. FORM AND RECORD ENTRIES - 5466 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * SVC ID

Description: The Service Identification number is assigned by the switch owner to identify the specific service parameters.
Valid Entries: 1 - 1023

Data Rules:

For 5E9(1) and later, if an entry is made on this form, then the LSTG SVC field on the OSPSOPT form must have an entry.

2.3 INITIAL ACTION

Description: This field is for call processing use at call origination to determine the initial treatment to be given to the call.

Required Field.
Default: TOOPR
Valid Entries:

Valid INITIAL ACTION Entries

Entry	Definition
ASKEIS or A	Request action from EIS.
REORDER or R	Route to reorder.
TODEST or TOD	Route directly to service destination.
TOOPER or TOO	Route directly to operator.

Data Rules:

If "ASKEIS" is entered:

- PRE OPER EIS must be entered
- OSPS SVC CODE cannot be "IBMLS"
- SVC DEST must not be entered
- for 5E9(2) only, INT ANNC TYPE must not be entered unless OSPS SVC CODE is "SRVC7", then it

Copyright © 2003 Lucent Technologies

must be entered.

- for 5E10 and later,
  - and OSPS SVC CODE is "INMATE", then INT ANNC TYPE must be 150.
  - and OSPS SVC CODE is "AAP"
  - and OSPS SVC CODE is "SRVC8" INT ANNC TYPE must be 317.
- for 5E11 and later,
  - and OSPS SVC CODE is "AAP", then INT ANNC TYPE must be 317.

When PRE OPER EIS is entered on the SERVDATA form, and when the associated INITIAL ACTION field is "ASKEIS", a corresponding EISSM form (5462-3 Record) must exist where PRE OPER is "Y" and NAME on the EISSM form matches PRE OPER EIS on the SERVDATA form.

If "REORDER" or "TOOPER" are entered, INT ANNC TYPE, PRE OPER EIS, and SVC DEST must not be entered.

If "TOOPER" is entered, OSPS SVC CODE cannot be:
- "AAP"
- "IBMINCPT"
- "INMATE"
- "SPCL700"
- "SRVC7" (5E9(2) - 5E10)

If "TODEST" is entered, SVC DEST must be entered.

2.4 PRE OPER EIS

Description: The pre-operator EIS name is used when the call is to establish an interface with an EIS to obtain initial routing instructions, i.e., before being routed to an operator position. This can be used to provide an EIS directed announcement based on call related data, such as, the time of day, the day of the week, etc. Enter the name that is defined on the EISDATA form (5462-1 Record).
Valid Entries: 1 - 15 characters

Data Rules:

PRE OPER EIS and SVC DEST fields are the keys to the SERVDEST form (5467 Record).

If PRE OPER EIS is entered, then a corresponding EISSM form (5462-3 Record) must exist where PRE OPER is "Y" and NAME on the EISSM form matches PRE OPER EIS on the SERVDATA form.

A second OPEISDB form (5462-2 Record) and a second OSPSCT form (5404 Record) are required for the first OSPSCT form if LIST SVC RECALL on the first OSPSCT form is "Y" and PRE OPER EIS entry on the corresponding SERVDATA form is different than the EIS NAME on the first OPEISDB form.

- A corresponding SERVDATA form is found by matching the SVC ID field on the SERVDATA form with the SVC ID field on the first OSPSCT form.
- The first OPEISDB form is found by matching the SERVING TEAM and SVC ID fields on the OPEISDB form with the SERVING TEAM and SVC ID fields on the first OSPSCT form, respectively.

Copyright © 2003 Lucent Technologies

- The second OPEISDB form is found by matching the SVC ID and EIS NAME fields on the second OPEISDB form with the SVC ID and PRE OPER EIS fields on the SERVDATA form.

If PRE OPER EIS is entered and the corresponding EISDATA form (found by matching PRE OPER EIS on the SERVDATA form with EIS NAME on the EISDATA form) has

- "VDR" entered as the VENDOR,

  then OSPS SVC CODE on the SERVDATA form must be "VDRLS" or "INCPT".

- "TMC" entered as the VENDOR,

  then OSPS SVC CODE on the SERVDATA form must be "SRVC7".

2.5 SVC DEST

Description: Enter the Service Destination Number, which defines the type of destination, such as, an External ARU, an operator or an Internal ARU. The Service Destination ID is a flexible way of assigning the destination ID provided by the vendor.

The PRE OPER EIS and SVC DEST entries are the keys into the SERVDEST form (5467 Record), which provides the initial routing destination for the initial action of an EIS. The SVC DEST field is an identifier used to obtain the route type and route code when the INITIAL ACTION is "TODEST".
Valid Entries: 1 - 65535

Data Rules:

If SVC DEST is entered on the SERVDATA form (5466 Record), then a corresponding SERVDEST form (5467 Record) must exist where SVC DEST and EIS NAME on the SERVDEST form match SVC DEST and PRE OPER EIS on the SERVDATA form, respectively.

If SVC DEST and INT ANNC TYPE are both entered on a SERVDATA form, then RTE TYPE on the corresponding SERVDEST form must be "FIIA" or "RIIA". A corresponding SERVDEST form is where the SVC DEST and EIS NAME fields on the SERVDEST form match the SVC DEST and PRE OPER EIS fields on the SERVDATA form, respectively.

If SVC DEST is entered, but INT ANNC TYPE is NOT entered on the SERVDATA form, then RTE TYPE on the corresponding SERVDEST form must NOT be "FIIA" or "RIIA". A corresponding SERVDEST form is where the SVC DEST and EIS NAME fields on the SERVDEST form match the SVC DEST and PRE OPER EIS fields on the SERVDATA form, respectively.

2.6 INT ANNC TYPE

Description: Enter the Internal Announcement Type, which specifies the internal pre-announcement to be supplied by the 5ESS Switch DSU2-RAF. The internal RAF unit may play a specified pre-announcement if this source is selected as the initial SVC DEST. The entries are defined by the HEADER ID on the ANNHD form (5531 Record). The larger range of values for 5E9(2) and later supports SAS (Service Announcement System).
Valid Entries:

- For 5E6 - 5E9(1): 1 - 255
- For 5E9(2) and later: 1 - 131,071

Data Rules:

5E9(1) and earlier, INT ANNC TYPE must not be entered if INITIAL ACTION is "ASKEIS".

Copyright © 2003 Lucent Technologies

5E9(2) and later:

If INT ANNC TYPE is entered:

- then "SRVC7" must be entered in OSPS SVC CODE. If "SRVC7" is not entered, INT ANNC TYPE may not be entered.
- and INITIAL ACTION is "ASKEIS", then OSPS SVC CODE must "SRVC7". If OSPS SVC CODE is not "SRCV7", and INITIAL ACTION is "ASKEIS", then INT ANNC TYPE cannot be entered.
- and "SRVC7" is entered in OSPS SVC CODE, then an ANNAPL form must exist where APPLICATION is "OSPSTA"
- and "SRVC7" is not entered in OSPS SVC CODE, then a corresponding ANNHD form is required and the APPLICATION field on ANNHD form must be "OSPSDA".
- and "SRVC7" is entered in OSPS SVC CODE, then a corresponding ANNHD form is required where APPLICATION is "OSPSTA" and HEADER ID matches INT ANNC TYPE on the SERVDATA form.
- and OSPS SVC CODE is not "SRVC7" an ANNAPL form must exist where APPLICATION is "OSPSDA". If OSPS SVC CODE is "SRVC7", INT ANNC TYPE must be 150.

2.7 OSPS SVC CODE

Description: Enter the OSPS Service Code, which is the code of an OSPS supported service.

Required Field.
Default: LS
Valid Entries:

Valid OSPS SVC CODE Entries

Entry	Definition
AAP	Software Release: 5E11 and later. (For 5E9(2) - 5E10 see "SRVC8".) AATLSOS AAP using CPDL Interface Services using NRP (Network Resource Platform) as the EIS vendor. This value supports the AATLSOS AAP CPDL (Alternate Access to Language Specific Operator Services Automated Access Prompting Call Processing Data Link) Interface feature. For more information on this feature, see Division 2, Section 4A412,
IBMINCPT or IBMI	Software Release: 5E6(2) and later. IBM Intercept Services
IBMLS or IBML	Software Release: 5E6(2) and later. IBM Listing Services
INCPT or IN	Software Release: 5E6(2) and later. CCI and general Intercept Services
INMATE	Software Release: 5E11 and later. Inmate Calling Services using TMC (Tele-Matic Corporation) as the EIS vendor. This value supports the Inmate Calling Service feature. For more information on this feature, see Division 2, Section 4A385. For 5E9(2) - 5E10 later, see "SRVC7".
LS or L	Software Release: 5E6 and later. CCI and general Listing Services
SPCL700 or SP	Software Release: 5E7 and later. Specialized Handling for 700 calls. For more information on Specialized Handling for 700 Services secured features, see Division 2, Section 4A69 and Section 4A89. For information on Specialized Handling for 700 Calls Test Calls, see Division 2, Section 4C17.

AATLSOS AAP using CPDL Interface Services using NRP (Network Resource Platform) as the EIS vendor This value supports the AATLSOS AAP CPDL (Alternate Access to Language Specific Operator Services Automated Access Prompting Call Processing Data Link) Interface feature. For more information on this feature, see Divison 2, Section 4A412.
VDRLS or V	Software Release: 5E9(1) and later. VDR (Volt Delta Resource) Listing Services

Data Rules:

"INCPT" or "IBMINCPT" must be entered, when CALL ORIGIN on a corresponding ACDCTP form is "AIS". The corresponding form is found when SVC ID of this form matches SVC ID of OSPSCT form and OSPS CALL TYPE of OSPSCT form matches CALL TYPE of ACDCTP form. Conversely, if CALL ORIGIN on the ACDCTP form is not "AIS", OSPS SVC CODE field cannot be "INCPT", "IBMINCPT" or "SPCL700".

If "IBMLS" or "IBMINCPT" is entered, a corresponding EISDATA form (found by matching PRE OPER EIS on the SERVDATA form with EIS NAME on the EISDATA form) must have "IBM" entered as the VENDOR.

AAP
If "AAP" is entered and INITIAL ACTION is "ASKEIS", then INT ANNC TYPE must be 317.

INMATE
If "INMATE" is entered,

- BILLING NUMBER must be entered.
- and INITIAL ACTION is "ASKEIS", then INT ANNC TYPE must be 150.

SPCL700

- "SPCL700" is used by the Specialized Handling of 700 Calls secured feature, therefore, SFID 69 on the SFSYS form (5713-1 Record) must be set to "S" or "Y".
- If "SPCL700" is entered, CALL COMPL must be "Y"
- "SPCL700" cannot be entered if SVC ID on this form matches a SVC ID entry on the OPEISDB form.
- If "CGI" is entered as the VENDOR on the corresponding EISDATA form, then OSPS SVC CODE must be "SPCL700". If "CGI" is not entered as the VENDOR on the corresponding EISDATA form, then OSPS SVC CODE cannot be "SPCL700". Corresponding forms are found by matching the value in the PRE OPER EIS field on this form with the EIS NAME field on the EISDATA form.

SRVC7
If "SRVC7" is entered:
- BILLING NUMBER must be entered
- INITIAL ACTION cannot be "TOOPER"
- INT ANNC TYPE must be 150

If "SRVC7" is entered and PRE OPER EIS is entered, then the associated EISDATA form (found by

Copyright © 2003 Lucent Technologies

matching PRE OPER EIS on the SERVDATA form with EIS NAME on the EISDATA form) must have "TMC" entered as the VENDOR.

If "SRVC7" is not entered, BILLING NUMBER must not be entered.

SRVC8
See "AAP".

2.8 EIS APPL CODE

Description: Enter the EIS Application Code, which is supplied by the EIS vendor and informs the vendor's application which service is required by this call.
Valid Entries: 1 - 1023

2.9 NBR RECALLS

Description: Enter the Number of Recalls, which is the default value used by OSPS as the number of recalls permitted for this service. The EIS vendor system may override this parameter. This field is used when a value is not provided by an EIS vendor or when a service is provided without EIS support.

Required Field.
Default: 0
Valid Entries: 1 - 255

2.10 RECALL DELAY

Description: The RECALL DELAY is the interval in 50 millisecond intervals the call is to be delayed after a particular service, such as the end of an announcement, before an operator is requested for the call. For example, "100" gives a 5-second delay between the end of the automated portion of the service and the beginning operator recall. An entry in this field is needed only when a value is not provided by an EIS or when a service is provided without EIS support. This is an optional field.
Default: 0
Valid Entries: 0 - 1023

2.11 CALL COMPL

Description: Is Call Completion allowed?

Software Release: 5E6(2) and later
Default: N
Valid Entries: Y, N

Data Rules:

If CALL COMPL is "N", DIGIT TIMING, CALL PROG RI, and TURN BACK RI cannot be entered.

2.12 DIGIT TIMING

Description: This field is not currently being used, because internal ARUs do not support Call Completion prompting at this time.

2.13 TURN BACK RI

Description: Enter the route index for the announcement to be played, when the call cannot be completed.

Software Release: 5E6(2) and later

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

This field can only be entered if CALL COMPL is "Y".

A corresponding RTIDX form is required, where the ROUTE INDEX value on the RTIDX form must match the TURN BACK RI value on the SERVDATA form. In addition, this matching RTIDX form must have ROUTE TYPE set to "HUNT" and CI ROUTE TYPE set to "GENANN". A corresponding TKGRP form is also required. The TGN on the TKGRP form must match the TRUNK GROUP NUMBER on the corresponding RTIDX form . Additionally, on the TKGRP Form, the TRK DIR must be "ANN".

2.14 CALL PROG RI

Description: Enter the route index for the call in progress announcement.

Software Release: 5E6(2) and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If this field is entered, then CALL COMP must be "Y".

A corresponding RTIDX form is required, where the ROUTE INDEX value on the RTIDX form must match the CALL PROG RI value. In addition, this matching RTIDX form must have ROUTE TYPE set to "HUNT" and CI ROUTE TYPE set to "GENANN". A corresponding TKGRP form is also required. The TGN on the TKGRP form must match the TRUNK GROUP NUMBER on the corresponding RTIDX form. Additionally, on the TKGRP Form, the TRK DIR must be "ANN".

2.15 BILLING NUMBER

Description: Enter the 10-digit number (NPANXXXXXX) that will be billed for a pre-paid ICS call. This field supports the OSPS Inmate Calling Service secured feature (SFID 385). For more information on this feature, see Division 2, Section 4A385.

Software Release: 5E9(2) and later.
Valid Entries: 10-digit number

Data Rules:

BILLING NUMBER must be entered if OSPS SVC CODE is "SRVC7". It must not be entered if OSPS SVC CODE is not "SRVC7".

SEC. 4BT: 5467 RECORD
OSPS DESTINATION DATA FOR LISTING SERVICES CALLS - SERVDEST

1. GENERAL

The 5467 Record is available with 5E6 and later Software Releases.

The 5467 Record is used to translate an EIS (External Information Service) vendor's service destination to a 5ESS Switch routing type and associated routing code, such as a route index. Note that if the EIS NAME is null, this Record can still be accessed for routing information for services that do not initially have an EIS assigned to the call.

The route type can specify route to an internal announcement, route to an external announcement or route to an operator.

1.1 Listing Services Translations

Division 2, Section 3C discusses the translations required for Listing Services, and the form flow figures for the cross checks for RTE TYPEs of "RIXA", "RIIA" and "FIIA".

1.2 Recent Change View

The corresponding Recent Change View for this form is 21.53.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * SVC DEST

Description: Enter the EIS (External Information System) service destination identification number. This number is supplied by the vendor.
Valid Entries: 1 - 65535

Data Rules:

When SVC DEST is entered on the SERVDATA form (5466 Record), a corresponding SERVDEST form (5467 Record) must exist where SVC DEST and EIS NAME on the SERVDEST form match SERV DEST and PRE OPER EIS on the SERVDATA form respectively.

2.3 (*) EIS NAME

Description: External Information System Name. This field allows the same destination IDs to be used by EISs from different vendors. This is an optional key field. Leave blank or enter a name that is 1-15 characters and is defined on the EISDATA form (5462-1 Record).
Valid Entries: 1 - 15 characters

Data Rules:

A corresponding EISDATA form must exist where EIS NAME matches EIS NAME on the SERVDEST form (5467 Record).

2.4 # RTE TYPE

Description: The Route Type is used to indicate the 5ESS Switch route type.

Copyright © 2003 Lucent Technologies

Required Field.

Valid RTE TYPE Entries

Entry	Definition
CC	Software Release: 5E7 and later. Complete call
FIIA	Route to an internal announcement that has a fixed route index
OPER	Route to an operator
R13A	Software Release: 5E7 and later. Route to 13A recorded announcement unit
REORDER	Software Release: 5E7 and later. Route to reorder
RICCXA	Software Release: 5E7 and later. Route to external announcement with CC checks that has a route index.
RIIA	Route to an internal announcement that has a route index
RIXA	Route to an external announcement that has a route index
TERM	Software Release: 5E7 and later. Terminate the call

Data Rules:

Figures 1, 2 and 3 show the form flow for cross reference forms for RTE TYPEs.

RTE CODE must not be entered for the following RTE TYPEs:
- "CC",
- "FIIA",
- "OPER",
- "REORDER", or
- "TERM"

RTE CODE must be entered for the following RTE TYPEs:
- "RICCXA",
- "RIIA",
- "RIXA", or
- "R13A".

FIIA - For every SERVDEST form with "FIIA" entered for RTE TYPE, there must exist a FIXRT form (5301 Record) with "OSPSEIS" entered for FIXED ROUTE TYPE. In addition, the RTIDX (5303 Record) and TKGRP (5202-1/2 Record) forms are also required when a fixed route is defined.

RIIA, RIXA, RICCXA, R13A - If "RIIA", "RIXA", "RICCA" or "R13A" is entered for RTE TYPE, then an RTIDX form is required where ROUTE INDEX on the RTIDX form matches RTE CODE on the SERVDEST form (5467 Record) and ROUTE TYPE on the RTIDX form is "HUNT".

In addition, for 5E7 and later, if the RTE TYPE is "RIIA" or "R13A", CI ROUTE TYPE on the corresponding RTIDX form must be "GENANN".

RIIA - A second RTIDX form may be required for each SERVDEST form with a RTE TYPE of "RIIA" or "RIXA" to handle overflow conditions. The ROUTE INDEX on the second RTIDX form must match the NEXT ROUTE on the first RTIDX form. The ROUTE INDEX on the first RTIDX form must match the RTE CODE on the SERVDEST form. Also, the ROUTE TYPE on the second RTIDX form must be "HUNT" or "REORDER".

If "RIIA" is entered:

- SVC GRP must be "DA" on the corresponding TKGRP form.

- TRKCLS must be "RAFANNC" on TKGRP form.

Copyright © 2003 Lucent Technologies

A TKGRP form is associated with a SERVDEST form through a RTIDX form as follows: the ROUTE INDEX on the RTIDX form matches RTE CODE on the SERVDEST form and TGN on the TKGRP form matches TGN on the RTIDX form.

- and the RTE TYPE on the second RTIDX is "HUNT", then a corresponding TKGRP form is required where TGN on the TKGRP form matches TRUNK GROUP NUMBER on the second RTIDX form and TRK DIR on the TRKGRP form is "RAF".

RIXA - If the RTE TYPE on the SERVDEST form is "RIXA" and RTE TYPE on the second RTIDX is "HUNT", then a corresponding TKGRP form is required where TGN on the TRKGRP form matches TRUNK GROUP NUMBER on the second RTIDX form and TRKCLS on the TRKGRP form is "EISTRK".

If SVC DEST and EIS NAME on the SERVDEST form match SVC DEST and PRE OPER EIS on the SERVDATA form respectively, and SVC DEST and INT ANNC TYPE are both entered on a SERVDATA form, then the RTE TYPE on the corresponding SERVDEST form must be "FIIA" or "RIIA". Conversely, if SVC DEST is entered and INT ANNC TYPE is NOT entered on a SERVDATA form, the RTE TYPE on the corresponding SERVDEST form must NOT be "FIIA" or "RIIA".

2.5 RTE CODE

Description: The Routing Code is used to designate the route index.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

RTE CODE must not be entered if RTE TYPE is "OPER" or "FIIA". An entry is required if the RTE TYPE is "RIIA" or "RIXA".

SEC. 4BV: 5469 RECORD
OSPS INTERCEPT DESTINATION INDICES - AISCLS

1. GENERAL

The 5469 Record is available with 5E6(2) and later Software Releases. This form defines the intercept class, which determines the destination index (to be used for call type determination) on the basis of the intercept class and the called number information. Each class has two destination indexes, one is used if ANI (Automatic Number Identification) is available, the other is used if ANI is not available. All intercept calls receive treatment based on the data entered on this form and the data entered on the ACDCTP form. If this form does not contain data for the call, or if the destination index is blank, then the intercept data on the ACDCTP form is used.

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.57.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * INCPT CLASS

Description: Enter the intercept class. In the following entries, only the first few letters which make the entry unique need to be entered. The abbreviated entries are within brackets in the following list.

Valid INCPT CLASS Entries

Entry	Definition
[ANIB]LNK	
[ANIF]AIL	ANI Equipment Failure to Identify Line Number
[ANIR]EG	ANI Regular
[ANIT]RBL	ANI Special (Trouble) Number
[C]ONC	Concentrator Spinoff
[ONIR]EG	ONI (Operator Number Identification) Regular
[ONIB]LNK	ONI Blank or Unassigned Number
[ONIT]RBL	ONI Special (Trouble) Number

Data Rules:

An entry in this field requires an entry either in the WITH ANI field or in the WITHOUT ANI field.

If "ANIFAIL", "CONC", "ONIREG", "ONIBLNK", or "ONITRBL" are entered, the WITH ANI field must be left blank, but the WITHOUT ANI field must have an entry.

DESTINATION INDEX

The following fields (Section 2.3 - Section 2.4) assign the destination index for expanded call type determination.

2.3 WITH ANI

Description: Enter the destination index for expanded call type determination that is used if ANI is available.
Valid Entries: 1 - 4095

Data Rules:

Copyright © 2003 Lucent Technologies

If the destination index is blank, then the call will receive treatment according to the call origination data on the ACDCTP form (5412 Record) when SECOND LEVEL is "DEST", or on call origination data and incoming trunk group when SECOND LEVEL is "TGRP". This cannot be blank if WITHOUT ANI is blank.

If the DESTINATION INDEX WITH ANI field is entered, an ACDPOL form (5412 - B/C/E/F Record) must exist where TGRP/DEST is "DEST" and TGN/CDI field matches the DESTINATION INDEX WITH ANI on the AISCLS form.

The WITH ANI entry may be an INC CDI (Code Index) on the INFLDEST form (5448 Record).

2.4 WITHOUT ANI

Description: Enter the destination index for expanded call type determination that is used if ANI is not available. If the destination index is blank, then the call will receive treatment according to the expanded call type determination data populated for intercept.
Valid Entries: 1 - 4095

Data Rules:

If the destination index is blank, then the call will receive treatment according to the call origination data on the ACDCTP form (5412 Record) when SECOND LEVEL is "DEST", or on call origination data and incoming trunk group when SECOND LEVEL is "TGRP".

If the DESTINATION INDEX WITHOUT ANI field is entered, an ACDPOL form (5412 - B/C/E/F Record) must exist where TGRP/DEST is "DEST" and TGN/CDI field matches the DESTINATION INDEX WITHOUT ANI on the AISCLS form.

The WITHOUT ANI entry may be an INC CDI (Code Index) on the INFLDEST form.

SEC. 4BW: 5471-1/2 RECORD
OSPS PORT RANGES FOR IBM DA SYSTEM - IBMRNGS

1. GENERAL

This form is available with 5E6(2) and later Software Releases and is used to define the parameters for the IBM interface. Only one form is entered for each 5ESS Switch. It allows the OSPS owner to obtain an IBM position ID for each of the ARU (Audio Response Unit) trunk group members (ports) associated with the IBM DAS (Directory Assistance System). The MIN POSITION, MAX POSITION, and TGN LIST fields allow the OSPS owner to obtain an IBM Position ID for each of the OSPS operator positions associated with the IBM DAS working in conjunction with an OSPS.

1.1 Position ID Range

The MIN POSITION and MAX POSITION assign the range of sequential positions, from the minimum position to the maximum number of positions, that may interface with the IBM DAS. For example, when OSPS position numbers in the range of 500 to 1499 are planned to interface with an IBM DAS, MIN POSITION is set to 500 and MAX POSITION is set to 1000. Not all the positions within this range are required to interface with the IBM DAS. Only OSPS operator position IDs where "VDT" is entered in the POS TYPE field on the OSPSOP form (5401 Record) are converted to IBM Position ID. However, all current and future positions which provide services via the IBM DAS must fall within these bounds. If the MIN POSITION entry or MAX POSITION entry is changed later, all IBM Position IDs associated with ARU ports will need to be reassigned in the IBM DAS; therefore, growth for operator position should be considered when assigning these values.

1.2 IBM Position ID

The IBM Position ID equals the POS NUM entry on the OSPSOP form. If the OSPS owner wishes to start the sequence at OSPS position number 1, the POS NUM can be set to zero to make the OSPS position number and IBM Position ID equal; this only wastes the first IBM Position ID (ID = 0), as OSPS has no position number zero. Alternately, this parameter can be set to one, which makes the IBM Position ID one less than the corresponding OSPS position number.

1.3 ARU Trunks

The sum of the MAX POSITION entry, plus the trunk groups may not exceed 9000. (See TOTAL PORTS field for how this is calculated.) This is an IBM system limit. The 9000 range must be potentially shared with other switching systems that use a given IBM DAS.

- **WARNING:** When the sum of all ranges exceeds 4500, indicating that over half the available array in the IBM DAS has been allocated for this office alone, a reassessment may be required if other offices share an IBM DAS.

1.4 5471-2 Output Record

The 5471-2 Record is an output record which shows the operator position and trunk group member assiociated with an IBM position ID.

1.5 Recent Change View

The corresponding Recent Change View for this form is 21.58.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: This is the key into this form. It will always be 1.
Default: 1
Valid Entries: 1

Data Rules:

The IBMRNGS form must be submitted when SERVICE CLASS on the OSPSDSL form is "EIS" and VENDOR on the EISDATA form is "IBM" (EIS NBR on the EISDATA form matches DATA LINK GRP on the OSPSDSL form).

2.3 # MIN POSITION

Description: Enter the lowest operator position number. MIN POSITION assigns the the lowest (minimum) operator position number served by the IBM DAS.

Required Field.
Valid Entries: 0 - 4095

Data Rules:

The MIN POSITION entry plus MAX POSITION entry must be less than 4097.

2.4 # MAX POSITION

Description: Enter the maximum number of operator positions that can serve an IBM DAS. The MAX POSITION is the highest number of operator position numbers set aside to serve the IBM DAS. MIN POSITION plus MAX POSITION assigns the range of sequential positions that may interface with the IBM DAS.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

MAX POSITION cannot be less than MIN POSITION.

Leave the MAX POSITION entry blank if no data is to be entered for this field; 0 is not allowed. If MAX POSITION is blank (no value entered by the customer), then MIN POSITION must be 0.

TGN LIST

The following fields (Section 2.5 - Section 2.9) define options for the ARU trunk groups that interface with an IBM DAS.

These fields assign the range for ARU trunk groups and indicate the maximum member range (MAX MEMB) for each of up to eight ARU trunk groups which may interface with a Directory Assistance System(s).

Each of the 8 rows for the ARU trunk groups apply to both internal OSPS DSU2-RAF trunk groups as well as external ARU trunk groups which connect to IBM DAS ARU's. The remainder from the division of the trunk group number divided by eight is referred to as the "IBM trunk group index." Each ARU trunk group associated with a particular IBM DAS must have a unique IBM trunk group index. The MAX MEMB specifies the range of the largest trunk group with a TGN (Trunk Group Number) that is a multiple of eight (IBM Trunk Group Index of zero) and interfaces with an IBM DAS. The DAS1(2,3,4) TGN field applies to

Copyright © 2003 Lucent Technologies

any IBM DAS-associated trunk group with an IBM trunk group index of 1, etc.

Assume an office requires two DAS Systems, DAS1 and DAS2; a trunk group to DAS1 (TGN 256) needs 200 members and a trunk group to DAS2 (TGN 504) requires 350 members. The MAX MEMB is set to 350. The ranges specified must include room for growth. If any range is later modified, it will affect all the Position IDs of ARU members in groups with a larger IBM trunk group index, and will require reassignment in the IBM DAS.

If MAX POSITION is not 0, then the sum of RANGES in the TGN LIST must be greater then 0, i.e. one of the fields must have an entry.

If MAX POSITION is blank, then MAX MEM row 1 must be blank. The sum of all the ranges for positions and trunk groups may not exceed 9000. This is an IBM system limit. Note that the 9000 range must be potentially shared with other switching systems that use a given IBM DAS. Therefore, ODA gives a warning when the sum of all ranges exceeds 4500, indicating that over half the available array in the IBM DAS has been allocated for this office alone, and reassessment may be required if other offices share an IBM DAS.

The TOTAL (number of) PORTS equals the sum of the operator positions (MAX POSITION entry minus the MIN POSITION entry) plus 1, plus the sum of the entries for MAX POSITION plus the sum of the number of MAX POSITION entries must be less than 9001. For example, if MIN POSITION is 100, MAX POSITION is 200 and MAX MEMB has entries 300 and 400, then TOTAL PORTS = (200 - 100) +1 +(300 + 400) + 2 (number of entries for MAX MEMB), which equals 803. It SHOULD be less than 4501, otherwise an ODA warning is given.

2.5 MAX MEMB

Description: Enter the maximum member range for ARU trunk groups interfaced with an IBM DAS. At least one MAX MEMB must be entered.
Valid Entries: 1 - 4095

Data Rules:

If MAX MEM is entered, at least one DAS TGN must also be entered.

2.6 DAS1 TGN

Description: Enter the TGN (trunk group number) connected to IBM DAS system 1.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The first row entry for IBM DAS1 must be divisible by 8, (i.e., must have a remainder of 0). The second row entry must have a remainder of 1 when divided by 8. The third row entry must have a remainder of 2 when divided by 8, the forth row a remainder of 3, the fifth row a remainder of 4, the sixth row a remainder of 5, the seventh row a remainder of 6, and the eighth row must have a remainder of 7 when divided by 8.

Each DAS1 (DAS2, DAS3, DAS4) TGN, entered on the IBMRNGS form, must have a matching TGN on a TKGRP form. The TRKCLS on the corresponding TKGRP form must be either "EISTRK" or "RAFANNC". If TRKCLS is set to "RAFANNC" the SVC GRP on the TKGRP form must be set to "DA". If TRKCLS is set to "EISTRK", no other DAS TGN values entered on the same row on the IBMRNGS form can have the same TGN. For example, DAS2, DAS3, or DAS4 cannot have the same TGN value as DAS1.

2.7 DAS2 TGN

Copyright © 2003 Lucent Technologies

Description: Enter the TGN (trunk group number) connected to IBM DAS system 2.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The first row entry for IBM DAS2 must be divisible by 8, (i.e., must have a remainder of 0). The second row entry must have a remainder of 1 when divided by 8. The third row entry must have a remainder of 2 when divided by 8, the forth row a remainder of 3, the fifth row a remainder of 4, the sixth row a remainder of 5, the seventh row a remainder of 6, and the eighth row must have a remainder of 7 when divided by 8.

Each DAS1 (DAS2, DAS3, DAS4) TGN, entered on the IBMRNGS form, must have a matching TGN on a TKGRP form. The TRKCLS on the corresponding TKGRP form must be either "EISTRK" or "RAFANNC". If TRKCLS is set to "RAFANNC" the SVC GRP on the TKGRP form must be set to "DA". If TRKCLS is set to "EISTRK", no other DAS TGN values entered on the same row on the IBMRNGS form can have the same TGN. For example, DAS2, DAS3, or DAS4 cannot have the same TGN value as DAS1.

2.8 DAS3 TGN

Description: Enter the TGN (trunk group number) connected to IBM DAS system 3.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The first row entry for IBM DAS3 must be divisible by 8, (i.e., must have a remainder of 0). The second row entry must have a remainder of 1 when divided by 8. The third row entry must have a remainder of 2 when divided by 8, the forth row a remainder of 3, the fifth row a remainder of 4, the sixth row a remainder of 5, the seventh row a remainder of 6, and the eighth row must have a remainder of 7 when divided by 8.

Each DAS1 (DAS2, DAS3, DAS4) TGN, entered on the IBMRNGS form, must have a matching TGN on a TKGRP form. The TRKCLS on the corresponding TKGRP form must be either "EISTRK" or "RAFANNC". If TRKCLS is set to "RAFANNC" the SVC GRP on the TKGRP form must be set to "DA". If TRKCLS is set to "EISTRK", no other DAS TGN values entered on the same row on the IBMRNGS form can have the same TGN. For example, DAS2, DAS3, or DAS4 cannot have the same TGN value as DAS1.

2.9 DAS4 TGN

Description: Enter the TGN (trunk group number) connected to IBM DAS system 4.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The first row entry for IBM DAS4 must be divisible by 8, (i.e., must have a remainder of 0). The second row entry must have a remainder of 1 when divided by 8. The third row entry must have a remainder of 2 when divided by 8, the forth row a remainder of 3, the fifth row a remainder of 4, the sixth row a remainder of 5, the seventh row a remainder of 6, and the eighth row must have a remainder of 7 when divided by 8.

Each DAS1 (DAS2, DAS3, DAS4) TGN, entered on the IBMRNGS form, must have a matching TGN on a TKGRP form. The TRKCLS on the corresponding TKGRP form must be either "EISTRK" or "RAFANNC". If TRKCLS is set to "RAFANNC" the SVC GRP on the TKGRP form must be set to "DA". If TRKCLS is set

Copyright © 2003 Lucent Technologies

to "EISTRK", no other DAS TGN values entered on the same row on the IBMRNGS form can have the same TGN. For example, DAS2, DAS3, or DAS4 cannot have the same TGN value as DAS1.

2.10 TOTAL PORTS

Description: This field cannot be entered. The total number of ports is calculated and entered when the form is validated. The TOTAL (number of) PORTS equals the sum of the operator positions (MAX POSITION entry minus the MIN POSITION entry) plus 1, plus the sum of the entries for MAX POSITION, plus the sum of the number of MAX POSITION entries must be less than 9001.

SEC. 4BX: 5472 RECORD
VOICE MESSAGING SERVICE INTERFACE - ESPINFO

1. GENERAL

This record is available with 5E7 and later Software Releases. This form defines information about the ESP (Enhanced Service Provider) for VMS (Voice Messaging Service). The ESP is external to the 5ESS Switch. For more information on VMS features, see Division 2, Section 3I.

1.1 CCS7 Signaling Call Processing Data Needs

For 5E8 and later, CCS7 signaling can be used to transfer data to a particular ESC (Enhanced Services Complex). If the VMS Signaling Parameter specifies CCS7 signaling, then, as applicable, the OSPS encodes the Calling Number, Billing Number, Called Number, CCC Authorization Code, and Subaccount Billing Number into the parameters of an IAM message. The CCS7 SIGNALING field specifies whether or not CCS7 signaling is being used. The CC DIGIT TYPE attribute is used to indicate that the Billing Number sent in a Generic Digits Parameter is a card number.

The PIN DIGIT TYPE, CAC DIGIT TYPE, SAB DIGIT TYPE, and the THIRD NBR TYPE fields allow the TCA to initialize or modify the Type of Digits value of the Generic Digits Parameter used to send the PIN information, CCC Authorization Code, SAB Number information, and the Third Number Billing information to any specific ESC.

The default values for these fields are the expected values to be used by the AT&T ESC.

1.2 Recent Change View

The corresponding Recent Change View for this form is 27.65.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *ACCESS CODE

Description: Enter the ESP Access Code. Enter a 1, 2, or 3 digit number.
Valid Entries: 0 - 9, 00 - 99, 000 - 99

2.3 #ACCESS TN

Description: Enter the ESP access ten-digit telephone number (NPANXXXXXX). For 5E7 - 5E8, the NPA format is 200 - 919, where the middle digit can be only 0 - 1. For 5E9(1) and later, NPA is 200 - 999.

Required Field.
Valid Entries: 10 digits

2.4 SEND CARD NBR

Description: Should the Calling Card Number be sent to ESP?

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.5 SEND SAB NBR

Description: Should the Subaccount Billing Number be sent to ESP?

Required Field.
Default: N
Valid Entries: Y, N

2.6 BACK THIRD XFER

Description: Should the Bill be transferred to a Back Third Number?

Required Field.
Default: N
Valid Entries: Y, N

2.7 CCS7 SIGNALING

Description: Is CCS7 signaling used for the transfer of information to the ESPs?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

2.8 CC DIGIT TYPE

Description: Enter the type of digits for credit card billing number. This field is the decimal form of the binary value to be placed into an IAM (Initial Address Message). It represents the billing number credit card type of digits used in the IAM. The value must be a number recognized by the receiving switch network.

Software Release: 5E8 and later
Required Field.
Default: 27
Valid Entries: 0 - 31

Data Rules:

CC DIGIT TYPE, PIN DIGIT TYPE, CAC DIGIT TYPE and SAB DIGIT TYPE must be unique.

2.9 PIN DIGIT TYPE

Description: Enter the billing number PIN type of digits used in an IAM (Initial Address Message). This field is used to indicate that the message being sent contains a credit card PIN (personal identification number). This value must be a number recognized by the receiving switches in the network.

Software Release: 5E8 and later
Required Field.
Default: 21
Valid Entries: 0 - 31

Data Rules:

CC DIGIT TYPE, PIN DIGIT TYPE, CAC DIGIT TYPE and SAB DIGIT TYPE must be unique.

2.10 CAC DIGIT TYPE

Copyright © 2003 Lucent Technologies

Description: Enter the CCC (Commercial Credit Card) Authorization Code type of digits used in the Initial Address Message. This field is used to indicate that the message being sent contains a credit card authorization code. This value must be a number recognized by the receiving switches in the network.

Software Release: 5E8 and later
Default: 29
Valid Entries: 0 - 31

Data Rules:

CC DIGIT TYPE, PIN DIGIT TYPE, CAC DIGIT TYPE and SAB DIGIT TYPE must be unique.

2.11 SAB DIGIT TYPE

Description: Enter the SAB (Subaccount Billing) number type of digits used in an IAM. This field is used to indicate that the message being sent contains a subaccount billing number. This value must be a number recognized by the receiving switches in the network.

Software Release: 5E8 and later
Default: 28
Valid Entries: 0 - 31

Data Rules:

CC DIGIT TYPE, PIN DIGIT TYPE, CAC DIGIT TYPE and SAB DIGIT TYPE must be unique.

2.12 THIRD NBR TYPE

Description: Enter the third number type used in an IAM. This field is used to indicate that the message being sent contains a third number billing number. This value must be a number recognized by the receiving switches in the network.

Software Release: 5E8 and later
Default: 128
Valid Entries: 0 - 255

2.13 VMS DOM BLG

Description: Is the VMS (Voice Messaging Service) Access Dialing feature used for billing purposes when forwarded numbers are domestic? For more information, see Div. 2, Sec. 4A418.

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

2.14 VMS INTL BLG

Description: Is the Voice Messaging Service (VMS) Access Dialing feature used for billing purposes when forwarded numbers are international? For more information, see Div. 2, Sec. 4A418.

Software Release: 5E10 and later
Default: N
Valid Entries: Y, N

SEC. 4BY: 5473 RECORD
OSPS TELEPHONE CREDIT CARD (TCR) ATTRIBUTES - TCCATTR

1. GENERAL

The 5473 record is available with 5E7 and later Software Releases. This form defines the attributes for a card type. It is used to group a set of card attributes together so that particular group of attributes can be associated with a particular card or cards that are identified via the Card Identification Tables.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.56.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CARD ATTR ID

Description: Enter the card attribute identification number. The attributes entered on this form are assigned to this ID.
Valid Entries: 0 - 63

Data Rules:

Every CARD ATTR ID entered on the TCCID form must have a matching CARD ATTR ID on the TCCATTR form.

CARD ATTRIBUTES

This heading is found only on the 5E7 form. The following fields (Section 2.3 - Section 2.8) define the card attributes for this card attribute ID.

2.3 # CARD TYPE

Description: Enter the TCR calling card type. For 5E5 and 5E6 this field was on the TCCID form, (5454 Record).

Required Field.

Valid CARD TYPE Entries

Entry	Definition
CAS	AT&T Customer Account Services card only
CCC	Commercial Credit Card
TEL	Non-AT&T Telecommunications card

Data Rules:

The following table gives the CARD TYPE enumerations that must be entered for the SIGNALING TYPE.

SIGNALING TYPE	CARD TYPE
MAN	TEL or CCC
CCS7	CAS
ICCV	TEL

CARD TYPE on TCCATTR form must be "CCC" when ACCT NBR on the TCCID form is 0. (CARD ATTR ID on TCCATTR form matches the CARD ATTR ID on the TCCID form.)

Copyright © 2003 Lucent Technologies

2.4 # SIGNALING TYPE

Description: Enter the query signaling type used to validate a calling card.

Required Field.

Valid SIGNALING TYPE Entries

Entry	Definition
CCS7 or 7	CAS Common Channel Signaling 7
ERV	External Routing Verfication
ICCV or I	International Credit Card Validation
MAN or M	Manual
AT1 or A	ANSI type 1 signaling
LIDB or L	Software Release: 5E8 and earlier. LIDB signaling

Data Rules:

When SIGNALING TYPE is "CCS7", "ICCV", or "AT1" ,

- QUERY TIMEOUT must be entered.
- The PIN field on the associated TCCID form must be 4. (The CARD ATTR ID on the associated TCCID form matches the CARD ATTR ID on this form.)

When SIGNALING TYPE is "ICCV":

- CARD TYPE must be "TEL".
- QUERY TIMEOUT must be entered.
- For 5E9(1) and later, if the CARD ATTR ID value on this form matches the CARD ATTR ID value on the TCCID form, then:
  - the COUNTRY field on the TCCID form must be entered and the value entered must match either an ACCESS CODE on an IDDD form (5307 Record) or a HOME COUNTRY value on a NONUSA form (5477-1 Record).
  - the value in the DB LABEL field on the TCCID form must match the DB LABEL value on the ICCVDB form (5478 Record).

When SIGNALING TYPE is "CCS7", QUERY TIMEOUT must be entered.

When SIGNALING TYPE is "MAN":

- CARD TYPE must be "TEL" or "CCC".
- QUERY TIMEOUT must not be entered.

WARNING: For 5E14 and later, when SIGNALING TYPE is "MAN":

- TIME AND CHARGES will automatically be set to blank.
- PREPEND 891 will automatically be set to blank.
- INDETERMINATE will automatically be set to blank.

Copyright © 2003 Lucent Technologies

For 5E14 and later, when SIGNALING TYPE is "ERV", the VER ROUTING NBR field on the FTPARM form cannot be blank.

For 5E15 and later, when SIGNALING TYPE is "ERV", the VER ROUTING NBR field on the FTPARM form (6424 Record) or the TCCATTR form (5473 Record) cannot be blank.

2.5 TIME AND CHARGES

Description: Are time and charge requests allowed for this call?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

When SIGNALING TYPE is "MAN", TIME AND CHARGES must be "N".

2.6 INDETERMINATE

Description: Is the call allowed when the query response in not definite?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

INDETERMINATE must be "N" if SIGNALING TYPE is "MAN".

2.7 PREPEND 891

Description: Should 891 be prepended to this card number?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

PREPEND 891 must be "N"

- if SIGNALING TYPE is "MAN".
- if the sum of the number of digits entered in the ISSUER ID DIGITS field on the TCCID form, added to the values of ACCT NBR, CHECK NBR, and PIN equal 14.

2.8 QUERY TIMEOUT

Description: Enter the length of time in tenths of a second allowed to wait for a query reply.
Valid Entries: 10 - 160 (tenths of a second)

Data Rules:

QUERY TIMEOUT must be entered if SIGNALING TYPE is "AT1", "ICCV", or "CCS7". If QUERY TIMEOUT is not entered for these SIGNALING TYPEs, it defaults to 20.

QUERY TIMEOUT must not be entered if SIGNALING TYPE is "MAN".

Copyright © 2003 Lucent Technologies

2.9 ALLOW 900 CALLS

Description: Are OSPS 900 services allowed for this CARD ATTR ID?

Software Release: 5E8 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.10 VER ROUTING NBR

Description: This field specifies a 10-digit external routing number to be used by the OSPS (Operator Services Position System) when a caller has selected a commercial credit card as the method of call billing.

Software Release: 5E15 and later
Valid Entries: 10-digit number (8XXXXXXXXX where X = 0 - 9)

The first digit for this field must be 8.

SEC. 4BZ: 5474 RECORD
OSPS SERVICE DESIGNATION FOR 1+800 AATOS/SDN NRA OR AATLSOS CALLS - SRVDESIG

1. GENERAL

The 5474 Record is available with 5E7 and later Software Releases. The AATOS (Alternate Access To Operator Services) and SDN/NRA (Software Defined Network/Network Remote Access) and AATLSOS (Alternate Access to Language Specific Operators) features handle 1+8XX dialed calls which arrive at an OSPS via a dedicated trunk with an SSC-WXY number signaled in the forward number field. This form is used to determine the expected Service type for 1 + 8XX calls arriving on AATOS and SDN/NRA MF trunks.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.70

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 (*) SSC WXY

Description: Enter the SSC-WXY number as signaled in the forward number field of a 1+8XX dialed AATOS or SDN/NRA call. SSC-WXY can be any combination of digits 0 through 9.
Valid Entries: 0 - 999999

Data Rules:

For 5E8 and later, if SSC WXY is entered, ACCESS NUMBER 800 cannot be entered.

2.3 (*) Z

Description: Enter the Z digit signaled in the forward number of the call. The Z digit is either the 10th digit of the 1+8XX Access with FGD Signaling telephone number, or it is associated with the SSCWXY number.

Software Release: 5E8 and later.
Valid Entries: 0 - 9

Data Rules:

If ACCESS NUMBER 800 is entered, Z cannot be entered.

5E9(2) and later:
"Z" must be entered if:
- SERVICE TYPE is "IBNS"
- SERVICE TYPE is "SVC01" - "SVC41"

2.4 (*) ACCESS NUMBER 800

Description: Enter the 1+8XX Access Call number using Feature Group D Signaling. These the digits are signaled by the OSO (Originating Screening Office) in the forward number field of a 1+8XX Access call using the Feature Group D signaling. These digits are used to differentiate calls routed to the OSPS

Copyright © 2003 Lucent Technologies

directly from a LEC end office or access tandem office from AATOS calls and SDN calls to private networks. This field supports the Toll-Free Access Using FGD Signaling secured feature (SFID 377). For more information on this feature, see Division 2 Section 4A377.

Software Release: 5E9(1) and later.
Valid Entries: 0000000 - 9999999

Data Rules:

If ACCESS NUMBER 800 is entered,
- SSC WXY cannot be entered
- Z cannot be entered

2.5 (*) INWATS NPA

Description: Enter the NPA of the INWATS (INward Wide Area Telecommunications Service) access call using Feature Group D Signaling. This field supports the Toll-Free Services NPA secured feature (SFID 405), which, with the exhaustion of 800 numbers, allows other NPAs to be assigned as INWATS. For more information on this feature, see Division 2, Section 4A405. Also, for direct-dialed calls, the LEC Toll-free Treatment for NPA 888 Phase 1 feature must be active. This is a secured feature with SFID 158. For more information on this feature, see Division 2, Section 4A158.

Software Release: 5E10 and later.
Valid Entries: 100 - 999

Data Rules:

If SSC WXY is entered, ACCESS NUMBER 800 and INWATS NPA cannot be entered.

If ACCESS NUMBER 800 is entered, then INWATS NPA must be entered.

If INWATS NPA is entered, a corresponding INWNPA form (6404 Record) must be entered with a matching INWATS NPA value.

2.6 # SERVICE TYPE

Description: Is this call an AATOS call or an SDN/NRA call?

Valid SERVICE TYPE Entries

Entry	Definition
AATOS or A	An Alternate Access to Operator Services call For more information on the AATOS feature, see Division 2, Section 3I.
IBNS	Software Release: 5E9(2) only. See "IBNS".
IBNS	Software Release: 5E10 and later. International Billed Number Screening Release 2. "IBNS" supports the International Billed Number Screening Release 2 secured feature (SFID 386). For more information on this feature see Division 2, Section 4A386.
SDAP	Software Release: 5E9(2) and later. 1+8XX SDAP (Speed Dialing Auto-Provisioning) calls. For more information on Card Based SDAP feature, see Division 2, Section 4A365.
SDNNRA or S	A Software Defined Network/Network Remote Access call For more information on the SDN NRA feature, see Division 2, Section 4A85.
SVC01 - 41	

Data Rules:

If "AATOS", "SDAP" or "SDNNRA" is entered, DESTINATION INDEX cannot be entered.

Copyright © 2003 Lucent Technologies

For 5E9(2) and later, if SERVICE TYPE is not
- "AATOS"
- "SDAP" (5E10 and later.)
- "SDNNRA", or
- "IBNS",

then LABEL must be entered.

IBNS:
If "IBNS" is entered, then
- ACCESS NUMBER 800 must not be entered.
- ACQS must be "N"R
- DESTINATION INDEX must be entered.
- FTS must be "N".
- LABEL must not be entered.
- PAID must be "N".
- Z must be entered.

WARNING: TCS ONPA is automatically set to 0 if SERVICE TYPE is "IBNS".

SDNNRA:
If "SDNNRA" is entered:
- ACQS must be "N"
- PAID must be "N"

SVC01 - SCV41:
If "SVC01" - "SVC41" is entered, then Z must be entered.

2.7 DESTINATION INDEX

Description: Enter the destination index used to route the call to a language-specific operator serving team.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 4095

2.8 FTS

Description: Is this a FTS NRA (Federal Telecommunications System Network Remote Access) call?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then:
- ACQS must be "N"
- PAID must be "N"
- SERVICE TYPE must be "SDNNRA"

2.9 LABEL

Description: Enter the label displayed at the operator position to indicate the service requested by the

Copyright © 2003 Lucent Technologies

caller.

Software Release: 5E9(1) and later.
Valid Entries: 1 - 7 characters

Data Rules:

LABEL must be entered for all SERVICE TYPEs that are not
- "AATOS"
- IBNS (5E9(2) and later.)
- SDAP(5E10 and later.)
- "SDNNRA"

If SERVICE TYPE is "IBNS", then LABEL must not be entered.

2.10 ACQS

Description: Is the hotel room number's Class of Charge billing allowed for this AATLSOS call.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.11 PAID

Description: Is PAID and DDD (Direct Distance Dialing) Class of Charge billing allowed for this AATLSOS call?

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

2.12 MEASUREMENT INDEX

Description: Enter the measurement index for Toll-Free Access calls which have an associated label displayed along with measurements on the 30-minute traffic report. This field supports the Toll-Free Access Using FGD Signaling (Phase 2) secured feature (SFID 377). For more information on this feature, see Division 2 Section 4A377.

Software Release: 5E9(2) and later.
Valid Entries: 1 - 100

Data Rules:

If MEASUREMENT INDEX is entered, then a matching MEASDSIG form with a corresponding MEASUREMENT INDEX value must be entered.

2.13 TCS ONPA

Description: Enter the originating NPA to be used during TCS (Terminating Code Screening) checks. If this field is not entered, then the signaled originating NPA is used as the originating NPA during TCS checks. If 0 is entered then no TCS checks apply. The TCS ONPA is specified on a per service basis. This field supports the AATOS (Alternate Access To Operator Services) Fraud Control feature. For more information on this feature, see Division 2, Section 4A401.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and later.
Default: 800
Valid Entries: 0 - 999

Data Rules:

- **WARNING:** TCS ONPA is automatically set to 0 if SERVICE TYPE is "IBNS".

2.14 QUIET HEAR TRMT

Description: Is Quiet Hear treatment allowed? The application of the Quiet Hear feature is based on either the Toll-free Access Call Routing Number or Toll-free Access Number as defined in the OSPS Service Designation table. The QUIET HEAR TRMT and AUDIO LOGO BRAND fields support the Quiet Hear secured feature (SFID 402). For more information on this feature, see Division 2, Section 4A402.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "N" is entered, then AUDIO LOGO BRAND must be "N".

2.15 AUDIO LOGO BRAND

Description: Is Quiet Hear Audio Logo branding allowed? The application of Quiet Hear Audio Logo Branding is based on either the Toll-free Access Call Routing Number or Toll-free Access Number as defined in the OSPS Service Designation table. The QUIET HEAR TRMT and AUDIO LOGO BRAND fields support the Quiet Hear secured feature (SFID 402). For more information on this feature, see Division 2, Section 4A402.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then QUIET HEAR TRMT must be "Y".

2.16 AUTO TRMT

Description: Should a 1-800-CALLATT call be provided with OSPS/APS (Automated Position System) handling? The AUTO TRMT field has been added to support the AATLSOS (Alternate Access To Language Specific Operator Services) - AAP (Automated Access Prompting) feature. For more information on this feature, see Division 2, Section 4A619.

Software Release: 5E9(2) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If AUTO TRMT equals "Y", then SERVICE TYPE must be "SVC01" - "SVC41".

Copyright © 2003 Lucent Technologies

2.17 ASAP TREATMENT

Description: Should ASAP (Automated Service Access Prompting) treatment apply to calls on this trunk group? The ASAP TREATMENT field was added to support the ASAP for LSOS (Language Specific Operator Services) Rating Changes secured feature (SFID 414). For more information on this feature, see Division 2, Section 4A414.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.18 CPDL TREATMENT

Description: Enter the CPDL (Call Processing Data Links) Treatment. The CPDL Treatment specifies whether the 1-800-CALLATT call can be supported by the CPDL Interface interacting with the NRP (Network Routing Processor) platform.

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If AUTO TRMT is "Y", CPDL TREATMENT must be "N".

If CPDL TREATMENT is "Y", ASAP TREATMENT must be "N".

SEC. 4CA: 5475 RECORD
OSPS CARRIER SPECIFIC ROUTING (CSR) INTL CREDIT CARD ATTRIBUTES - CSRATTR

1. GENERAL

The 5475 Record is available with the 5E7 Software Release. This record is used to provide information about international credit cards. The information provided on this record is the card vendor's country code as defined by the CCITT, the international administration ID, which is the carrier to be used for international call in the destination country, and CSR preference indicator.

The card vendor country code, CARD VENDOR CC, is used by the OSPS office to determine if a CSR call is also an international calling card call destined for the home country of the card issuer.

The international administration ID, INTL ADMIN ID, and and CSR preference indicator, PREFERENCE ID, are signaled by the OSPS office (via TOLL), to the GATEWAY office. The GATEWAY office depending on the condition of the network, the value of INTL ADMIN ID, and the value of the PREFERENCE ID gives the CSR calls the following treatment:

- if the card issuer's network, CSR ATTR ID, is available, the CSR call is routed to that INTL ADMIN ID, the carrier's network in the destination country.
- if card issuer's network is not available and if PREFERENCE ID, the preference indicator is set to "PREFERRED", the CSR call is overflowed to another carrier's network in the destination country.
- if the card issuer's network is not available and INTL ADMIN ID is set to "MANDATORY", the CSR call is denied. (See Division 2 Section 3I for more information on CSR feature.)

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.58.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CSR ATTR ID

Description: Enter the Carrier Specific Routing Attribute ID. It is used as an index to determine information for a particular card number when an international call is made. The CSR ATTR ID value is assigned to the TCR (Telephone Credit Card) number on the TCCID form.

Required Field.
Valid Entries: 1 - 200

2.3 # CARD VENDOR CC

Description: Enter the Card Vendor country code. This field provides the country code of the card issuer as defined by the CCITT.

Required Field.
Valid Entries: 1 - 999

2.4 # INTL ADMIN ID

Copyright © 2003 Lucent Technologies

Description: Enter the International Administration ID. The Administration ID represents the international carrier that should be used for routing a credit card call in the home country of the card issuer. This parameter is signaled by the OSPS office (via TOLL), to the GATEWAY office, and the GATEWAY office uses it to route the CSR call to an appropriate carrier's network in the destination country.

Required Field.
Valid Entries: 1 - 7

2.5 # PREFERENCE ID

Description: Enter the CSR Preference Indicator. This attribute indicates whether the carrier to be used for the CSR international credit card, once the call reaches the home country of the card issuer, has to be the carrier identified in the INTL ADMIN ID, "MANDATORY", or if the INTL ADMIN ID carrier is not available, the call may be overflowed to another carrier in that country, "PREFERRED". This parameter is signaled by the OSPS office (via TOLL), to the GATEWAY office. The GATEWAY office uses it when routing the CSR call.

Required Field.

Valid PREFERENCE ID Entries

Entry	Definition
MANDATORY	Carrier identified in the INTL ADMIN ID
PREFERRED	Overflow to another carrier in that country, if the INTL ADMIN ID carrier is not available.

SEC. 4CB: 5476 RECORD
OSPS SM INFORMATION - OSPSSMINF

1. GENERAL

The 5476 Record is available for the 5E6 - 5E9(2) Software Releases.The OSPS Switching Module Information form defines present or future OSPS equipment on an SM for distribution requirements of group types of GPD OSPS (OSPS Group Partitioned Data) and GPD OPRT (SM's with operator traffic trunks Group Partitioned data)

1.1 Recent Change View

This form does not have a corresponding Recent Change View.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SM

Description: Enter the Switching Module number.

Required Field.
Valid Entries: 1 - 192

2.3 # CONFIG

Description: Enter the SM Configuration.

Required Field.

Valid CONFIGURATION Entries

Entry	Definition
BASIC	Includes software installed in every SM.
STANDARD	Includes all of the "Basic" programs, plus special programs supporting toll service (e.g., CSG, OSPS trunking, and Federal Systems).
LOADED	Includes all of the "Basic" and "Standard" programs, plus programs supporting ISDN services and OSPS.
SM2000	Software Release: 5E9(2) and later. Includes SM-2000 software.

Data Rules:

For 5E9(1) and earlier, a "BASIC" SM can not be a PSM or be equipped with DTA RAFs, operator traffic trunks, or OSPS operator trunks.

The entry in this form should match the CONFIGURATION field on the corresponding EQIM form where SM on the EQIM form matches the SM on the OSPSSMINF form.

2.4 PSM

Description: Are regular or interflow operator positions assigned to this SM? If an SM is a PSM (Position Switching Module) then either "DAOPER" is entered in the OSPS SRVCL on the OSPS DSL form, or "IFOPER" is entered as the TRKCLS on the TKGRP form.

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If PSM is "Y", CONFIG should be LOADED.

If PSM is "N", DTA RAF should be entered.

If both PSM and OPR TR TRK are "N", OSPS OPR TRK should be entered.

A "BASIC" SM can not be a PSM or be equipped with DTA RAFs, operator traffic trunks, or OSPS operator trunks.

If "Y" is entered, then regular operator positions or interflow operator positions should be assigned to an equipment number in the SM. Regular operator positions and interflow operator positions are assigned equipment numbers in the LCEN or DEN fields on OSPSOP forms. The first three digits in the LCEN or DEN is the SM number.

For 5E8 and later, the entry in this field should match OSPS PSM on the corresponding EQIM for where SM on the EQIM form matches the SM on the OSPSSMINF form.

2.5 DTA RAF

Description: Is a DTA RAF on this SM? If a DTA RAF is on this SM, then "DTA" or "CTR" will be entered in the RAF TYPE field on the EQRA form.

Required Field.
Default: N(5E9(1) and earlier)
Valid Entries: Y, N

Data Rules:

If PSM is "N", DTA RAF should be entered.

A "BASIC" SM can not be a PSM or be equipped with DTA RAFs, operator traffic trunks, or OSPS operator trunks.

If "Y" is entered, thenat least one DTA RAF should be equipped in the SM. An SM on the EQRA form should match the SM on this form and SERVICE TYPE on the EQRA form should be "DTA" or "CTR".

2.6 OPR TR TRK

Description: Are operator traffic trunks in this SM? If Operator traffic trunks are on this SM, then "DIOR", "FIOPR", "FIOPRI" or "INAISTRK" is entered in the TRKCLS field on the TKGRP form.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If both PSM and OPR TR TRK are "N", then OSPS OPR TRK should be entered.

A "BASIC" SM can not be a PSM or be equipped with DTA RAFs, operator traffic trunks, or OSPS operator trunks.

If "Y" is entered, thenoperator traffic trunks should be assigned in the SM specified on the form. Operator traffic trunks are in a trunk group with a trunk class of

- "DIOR"

Copyright © 2003 Lucent Technologies

- "FIOPR"
- "FOPRI"
- "INAISTRK" The TKGRP form should point to at least one TRUNK form (matching TGN) where the first three digits of the TEN, DEN, or NEN match the SM on the OSPSSMINF form.

2.7 OSPS OPR TRK

Description: Are OSPS operator trunks in this SM? OSPS operator trunks on this SM are also entered on the OPRTK form.

Required Field.
Default: N(5E9(1) and earlier)
Valid Entries: Y, N

Data Rules:

If both PSM and OPR TR TRK are N, then OSPS OPR TRK should be entered.

A "BASIC" SM can not be a PSM or be equipped with DTA RAFs, operator traffic trunks, or OSPS operator trunks. If "Y" is entered, then OSPS operator trunks should be assigned in the SM specified on the form. OSPS operator trunk groups are specified on the OPRTK form. An OPRTK form should point to at least one trunk form (matching TGN) where the first three digits of the TEN, DEN, or NEN match the SM on the OSPSSMINF form.

SEC. 4CC: 5477-1 RECORD
NPA NXXS OUTSIDE THE UNITED STATES - NONUSA

1. GENERAL

The 5477-1 Record is available with the 5E8 Software Release. This record is used to construct a table of NPA NXXs that are located within the NANP (North American Numbering Plan), but are outside the United States.

The table indicates if the NPA NXX is an acceptable terminating number for a DIOR country-to-country call. This table is used by the DIOR CPS (Direct International Originations Country Pair Screening) feature to screen DIOR country-to-country calls. For more information on the special feature, DIOR CPS, see Division 2, Section 4C4. For more information on the DIOR feature, see Division 2, Section 3I.

For 5E9(1) and later, this form is also applicable to the ICCV Request for Call Duration and Charge feature, see Division 2, Section 3I.

1.1 Recent Change View

The corresponding Recent Change View for this form is 26.6

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * NPA

Description: Enter the NPA of the forward number which is within the NANP, but not within the United States, and which is being identified by the DIOR Country Pair Screening feature.

Required Field.
Valid Entries: 3 digits for the NPA
- For 5E8: N is (2 - 9), P is (0 - 1), A is (0 - 9)
- For 5E9(1) and later: 200 - 999

2.3 (*) NXX

Description: Enter the office code, NXX, of the forward number, which is being identified by the Country Pair Screening Feature. If this field is not entered, it indicates that all NXXs are applicable for the NPA entered on this form.
Valid Entries: 200 - 999

Data Rules:

If this field is blank (indicating all NXXs for this NPA), then no other NONUSA forms may exist with the same NPA value.

2.4 # HOME COUNTRY

Description: Enter 3 alphanumeric characters to identify the home country of this NPA-NXX for the ICCV Request for Call Duration and Charge feature.

Software Release: 5E9(1) and later.
Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 3 alphanumeric characters

2.5 MEMBER

Description: The name of this field was changed to DIOR MEMBER in 5E9(1). This field name applies to 5E8. See DIOR MEMBER for usage information.

2.6 DIOR MEMBER

Description: Are DIOR country-to-country calls permitted to terminate to this NPA NXX? This field specifies whether the NPA NXX(s) entered on this form identifies a country which is a member of a group of countries that allow DIOR calls to terminate to other group members. (This field was called MEMBER for 5E8.)

Required Field.
Default: N
Valid Entries: Y, N

SEC. 4CD: 5478 RECORD
INTERNATIONAL CREDIT CARD VALIDATION DATABASE FORM - ICCVDB

1. GENERAL

The 5478 Record is available with 5E9(1) and later Software Releases. This table is used to provide a ratio percentage of successful queries on a card issuer basis and the minimum number of query attempts required before the query success ratio is applied. It includes a label which is printed on the measurement and software alarm reports. Each entry is linked to the card issuer by the ICCV DB LABEL field on the TCCID form.

Each entry in this table contains information about an ICCV card issuer.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.60

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * DB NUMBER

Description: The entry in this field is used to link this view with ICCV (International Credit Card Validation) card issuers on the TCCID form (5454 Record). A DB NUMBER of 0 represents all data bases not specified on the TCCID form.

Required Field.
Valid Entries: 0 - 16

Data Rules:

If DB NUMBER is 0, then DB LABEL is set to "DFALT".

2.3 # DB LABEL

Description: DB LABEL is used as a header on software alarm and measurements reports to identify an individual or group of ICCV (International Credit Card Validation) card issuers. The entry "DFALT" is reserved for use as a "default" group of ICCV card issuers.

Required Field.
Valid Entries: 1 - 5 alpha-numeric characters or DFALT

Data Rules:

DB LABEL must be unique.

If DB NUMBER is 0, DB LABEL must be "DFALT".

If a TCCATTR form (5473 Record) corresponds with a TCCID form (5454 Record), i.e. the CARD ATTR ID on both forms match, and the SIGNALING TYPE on the TCCATTR form is "ICCV", then the DB LABEL on the TCCID form must match the DB LABEL entry on this form.

2.4 ALARM THR

Copyright © 2003 Lucent Technologies

Description: Enter the CAS ICCV TCAP query alarm threshold in terms of the percentage of the number of successful queries. If the percentage falls below this threshold, an alarm is activated.

Required Field.
Default: 95 (%)
Valid Entries: 0 - 100 (%)

2.5 MIN QUERY

Description: Minimum number of CAS ICCV TCAP query attempts required in a 15 minute period before query success ratio is applied and a software alarm calculation is performed.

Required Field.
Default: 40
Valid Entries: 1 - 64

FOR UPDATE ONLY

The following field is for Recent Change Update purposes only.

2.6 NEW DB LABEL

Description: This is a Recent Change only field. Enter the new database label to be used as a header on software alarm and measurements reports. This field can only be entered in an update operation. The entry "DFALT" is reserved for use as a "default" group of ICCV card issuers.
Valid Entries: 1 - 5 alpha-numeric characters or DFALT

Data Rules:

If NEW DB LABEL equals "DFALT", then DB NUMBER must equal 0.

NEW DB LABEL must not equal DB LABEL.

SEC. 4CF: 5480 RECORD
OSPS DIFFERENTIATION OF CARD SERVICE CHARGES FORM - CMPCRD

1. GENERAL

The 5480 Record is available with the 5E8 Software Release. This form assigns the comparison calling card defined by the TCA (Telephone Company Administration) for the Differentiation of Card Service Charges feature, and assigns a label which defines the Issuer of the comparison card. This comparison card can be used as a marketing technique to compare calling card prices between the calling customer's card and a TCA defined comparison card.

Only one CMPCRD form can be entered for an office.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.45

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * COMPARISON CARD

Description: Enter the first 2 - 7 digits of the comparison card. This is the comparison Card Vendor/Issuer ID number. It will be used in rate quote queries.

For 2 - 5 or 7-digit card numbers:

- If the 2 - 5 or 7-digit card number is found in the card recognition tables, the entry is accepted.
- If the card number is not found in the card recognition tables and the TCA entered 2-5 digits or 7 digits, the entry must be rejected.

For a 6-digit number:

- If a 6-digit number is found in the card recognition tables, and the TCA did not indicate the card is a 10+4 card, then OSPS must accept the entry.
- If a 6-digit number is found in the card recognition tables, and the TCA indicated the number is a 10+4 card, then OSPS must reject the entry.
- If a 6-digit number is not found in the card recognition tables, and the TCA did not indicate the card is a 10+4 card, the OSPS must reject the entry.
- If a 6-digit number is not found in the card recognition tables, and the TCA indicated the number is a 10+4 card, the OSPS must accept the entry.

Required Field.
Default: N
Valid Entries: 00 - 9999999

Data Rules:

If COMPARISON CARD is not a six-digit number, CARD IS 10P4 must be "N".

Copyright © 2003 Lucent Technologies

2.3 CARD IS 10P4

Description: Is this comparison card a 10+4 card?

Required Field.
Valid Entries: Y, N

Data Rules:

If COMPARISON CARD is not a six-digit number, then this field must be "N".

If CARD IS 10P4 is "N", then the entry in the COMPARISON CARD on this form must match ISSUER ID DIGITS on the TCCID form (5454 Record).

If CARD IS 10P4 is "Y", then COMPARISON CARD entry can not match any ISSUE ID DIGITS entry on the TCCID form.

2.4 # CARD LABEL

Description: Enter 1 - 5 characters that is a meaningful label for the comparison card. This label will display the name of the card issuer on the RATE page of the OSPS VDT/CST when a comparison card is used during processing of OSPS calling card Rate Quote queries.

Required Field.
Valid Entries: 1 - 5 characters

SEC. 4CG: 5481 RECORD
OSPS BACK NUMBER ALTERNATE ROUTING - SCROAR

1. GENERAL

The 5481 Record is available for 5E7 and later Software Releases.

The OSPS Back Number Alternate Routing form is used to populate the OSPS Back Number Alternate Routing Table. This table provides alternate routing based on the alternate screening index that is directly associated with the screening code for the back line number of the call. A maximum of 64 different SCREEN CODEs can be defined.

1.1 OLS Alternate Routing

This form was added for the OAR (Originating Line Screening Alternate Routing) secured feature. (For more information on the OAR feature, see Division 2, Section 4A76.) The OLS (Originating Line Screening) Alternate Routing feature allows an OSPS to populate alternate routing translation data for a particular call and apply it just before routing the call from the OSPS to the final routing destination. The final routing destination is based on the alternate screening index, SCRN IDX, that is directly associated with the screening code, SCRN CODE, applicable to the back line number of the call. Possible destinations can be anything that can be accomplished through routing translations: including announcement facility (e.g. 13A announcement), reorder, or an alternate trunking arrangement.

This feature uses the screening code applied to the back number of the call to determine the alternate screening index to be used. OAR works in conjunction with the existing OLS feature which allows the OSPS to assign OLS code(s) to the back line number(s). The OSPS could choose to assign all the back line number(s) to one OLS code or assign certain back line number(s) to separate OLS codes which can provide a finer control in handling the call for this feature.

This is a secured feature. It is activated on the SFSYS form (5713-1 Record) by setting SFID 76 to "Y". Also, the entry in the SCRN IDX field must also be entered in the SCR field on the RAR form.

1.2 Recent Change View

The corresponding Recent Change View for this form is 26.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SCRN CODE

Description: Enter the OSPS Back Number Screen Code associated with the back number screening.

Required Field.
Valid Entries: 1 - 999

2.3 # SCRN IDX

Description: Enter the alternate screening index.

Required Field.
Valid Entries: 1 - 4095

Data Rules:

Copyright © 2003 Lucent Technologies

If SCRN IDX is entered on this form, then that screen index must be entered in the SCR field on an RAR form.

SEC. 4CH: 5482A/B RECORD
OSPS BLOCKING 900 CALLS FOR LEC CARDS FORM - BLK900

1. GENERAL

The 5482 Record is available with 5E7 and later Software Releases. It is used by the OSPS Blocking 900 Calls for LEC Cards feature to determine if a LEC calling card can be used to bill a 900 number call. (For more information on OSPS Blocking 900 Calls for LEC Card features see Division 2, Section 4A77.) For 5E7, identification is based on the first three card digits, either the NPA (Numbering Plan Area) or RAO (Revenue Accounting Office) code for 5E7. For 5E8 and later, in addition to identification based on NPA or RAO, identification may be based on the first six digits of the card for specific NXXs within an NPA.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.59.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * NUMBER

Description: Enter the NPA or RAO code associated with the LEC calling card.

Required Field.
Valid Entries: 200 - 999

2.3 * TYPE

Description: This entry indicates whether an NPA or an RAO is entered in the NUMBER field.

Required Field.

Valid TYPE Entries

Entry	Definition
N or NPA	An NPA NUMBER is entered.
R or RAO	An RAO NUMBER is entered.

Data Rules:

If "R" is entered, then the LIST OF NXXs cannot be entered, and "A" or "B" must be entered in the STATUS field.

2.4 # STATUS

Description: This entry indicates if 900 calls should be blocked or allowed for the LEC card corresponding to the RAO or NPA.

WARNING: If TYPE is "NPA" and "A" or "B" is entered for STATUS, **all** entries in the LIST OF NXXs will be changed to match the entry in this field.

Required Field.

Valid STATUS Entries

Entry	Definition
A	Allow the RAO or all NXXs for the NPA to charge 900 calls to the corresponding LEC calling card.
B	Block the RAO or all NXXs for the NPA from charging 900 calls to the corresponding LEC calling card.

Copyright © 2003 Lucent Technologies

P	Software Release: 5E8 and later. Partial block. Block only the NXXs with "B" entered in the LIST OF NXXs (200-999) from charging 900 calls to the corresponding LEC calling card for the NPA.

Data Rules:

For 5E8 and later, if STATUS is "P", there must be at least one entry in the LIST OF NXXs.

2.5 LIST OF NXXs (200-999)

Description: Enter if an NXX for 900 calls should be blocked to the LEC card corresponding to the NPA NXX. If 900 calls should be blocked for the NPA NXX, enter a "B" in the table for the NXX number. If 900 calls are allowed, leave the entry blank.

Software Release: 5E8 and later.
Valid Entries:

Valid LIST OF NXXs Entries

Entry	Definition
blank	a space or blank indicates the NPA-NXX is allowed to charge 900 calls.
B	Block 900 calls for this NXX.

SEC. 4CI: 5483-1 RECORD
NON-ENGLISH LANGUAGE ANNOUNCEMENT APPLICATION TYPES - LANGTBL

1. GENERAL

The 5483-1 Record is available with the 5E9(1) Software Release. An entry in this table maps the language value for a calling card to the announcement application type so that card announcements may be played in the appropriate language for a customer. It also maps the language to the operator position display. The LANGUAGE field is equivalent to the LOP (Language Override Parameter) that may be returned in a calling card query reply from the CAS (Customer Account Services) NCP (Network Control Point) database.

Each non-English language that is to be used must have an entry (and only one) entry in this table. This form allows each language to activated or deactivated independently.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.66.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * LANGUAGE

Description: Enter the non-English language identifier. The language value is retrieved from the card issuer database (TCCID form, 5454 Record) or is returned in a CAS card validation query as a language of preference. This table maps the language value to the proper set of announcements to play so that the announcements are in the language that the card issuer or customer has selected.

Required Field.
Valid Entries: 2 - 7

Data Rules:

The entry in this field may not exceed the MAX LOP value entered on the OSPSOPT form (5424 Record).

2.3 ACTIVATE

Description: Is this language activated for use on card call announcements? This field may be set to "N" if the phrase set for this language has not been populated on the specified RAF announcement board. A value of "N" will result in English announcements being used instead of the language specified on this form.

Required Field.
Default: N
Valid Entries: Y, N

2.4 # ANNC APPL

Description: Enter the announcement application type. Special announcement applications are defined to allow using the same announcement header IDs for non-English language announcements as are used for English OSPS card announcements.

Required Field.
Valid Entries: L[2 - 7]

Copyright © 2003 Lucent Technologies

Data Rules:

Each entry in this field must be unique.

2.5 # DISPLAY ID

Description: Enter the language identifier to be displayed at the operator position indicating which non-English language is associated with this call.

NOTE: Upper case letters are not translated into lower case letters.

Required Field.
Valid Entries: 1 - 3 alphanumeric characters

Data Rules:

Each entry in this field must be unique.

If LANGUAGE is entered on the TCCID form (5454 Record), a matching value must be entered in this field, and the MAX LOP field on the OSPSOPT form (5424 Record) must be entered.

SEC. 4CJ: 5483-2 RECORD
ENGLISH PHRASE ID TO NON-ENGLISH PHRASE ID MAPPING - PHRLANG

1. GENERAL

The 5483-2 Record is available with the 5E9(1) Software Release. An entry in this form maps an English language phrase ID to a corresponding non-English language phrase ID. This is necessary only for those phrase IDs that are not associated with an announcement header ID. For example, the entries in this form map English phrases, such as those used for for CMA (Customized Market Announcements) to corresponding non-English language phrases specified in the OLS (Originating Line Screening) record.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.67.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ENGLISH PHRASE ID

Description: Enter the English phrase ID to be mapped to a non-English language phrase ID.

Required Field.
Valid Entries:
- For 5E9(1): 1 - 16,000
- For 5E9(2) and later: 1 - 16,383 or 16,600 - 65,530

Data Rules:

For each ENGLISH PHRASE ID entered on this form, there must be a matching PHRASE ID on the PHRASE form (5534 Record) where APPLICATION is "OSPSTA".

2.3 * NON ENGLISH ANNC APPL

Description: Enter the announcement application type of the non-English language used to map the English phrase ID to the non-English phrase ID>

Required Field.
Valid Entries: L[2 - 7]

Data Rules:

For each PHRLANG form, there must be a corresponding PHRASE form where NON ENGLISH PHRASE ID and NON ENGLISH ANNC APPL on the PHRLANG form match PHRASE ID and APPLICATION on the PHRASE form.

2.4 # NON ENGLISH PHRASE ID

Description: Enter the non-English phrase ID which corresponds to the English phrase ID entered in ENGLISH PHRASE ID.

Required Field.
Valid Entries:

Copyright © 2003 Lucent Technologies

- For 5E9(1): 1 - 16,000
- For 5E9(2) and later: 1 - 16,383 or 16,600 - 65,530

Data Rules:

For each PHRLANG form, there must be a corresponding PHRASE form where NON ENGLISH PHRASE ID and NON ENGLISH ANNC APPL on the PHRLANG form match PHRASE ID and APPLICATION on the PHRASE form.

SEC. 4CK: 5477-2 RECORD
DIOR COUNTRY PAIR SCREENING PERMISSIONS - DCPSP

1. GENERAL

The 5477-2 Record is available with the 5E8 Software Release. It is used to construct a table of Originating and Terminating Country Codes for the DIOR CPS (Country Pair Screening) feature. CPS uses this table to screen DIOR Country-to-Country calls to allow completion of calls to countries if the originating country does not restrict country-to-country DIOR calls. For more information on the special feature DIOR CPS see Division 2, Section 3K on DIOR features.

For 5E8, the COUNTRY CODE field contains either an originating or a terminating country code depending upon the value in ORIG CARR. If 0 - 9 is entered for ORIG CARR, then the value entered in COUNTRY CODE is an originating country code. A terminating country code does not have a carrier associated with it.

For 5E9(1) and later, the COUNTRY CODE field contains the DIOR Originating Country Code.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.82. This view was re-numbered from 27.8 to 27.82 in order to keep all the DIOR views together.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * COUNTRY CODE

Description: **For 5E8 only,** enter the originating or terminating country code. If 0 - 9 is entered for ORIG CARRIER, then the value entered in this field is an originating country code. A terminating country code does not have an entry in ORIG CARR. Country codes are defined on the CCNAME form (5463 Record).

For 5E9(1) and later,enter the DIOR originating country code for an international call. The value specified should match the number found in the country code portion of the international forward number.

This field is named ORIG CC on RC view 27.82.

Required Field.
Valid Entries: 200 - 999

Data Rules:

For 5E8 only, if COUNTRY CODE is greater than 199, the COUNTRY CODE value on this form must match a COUNTRY NUMBER on a corresponding CCNAME form.

For 5E9(1) and later, every COUNTRY CODE entered on this form must have a matching COUNTRY NUMBER entered on a CCNAME form.

2.3 (*)ORIG CARR

Description: The name of this field was changed to ORIG CARRIER in 5E9(1). This field name applies to 5E8 only. See ORIG CARRIER for usage information.

2.4 (*) ORIG CARRIER

Copyright © 2003 Lucent Technologies

Description: Enter the Originating Carrier Code providing the DIOR service from the country specified in Country Code. The carrier code identifies the carrier from which the DIOR call originates. The originating carrier is a one-digit code that is the seventh digit from the left of the 10-digit DIOR back number. (For more information on DIOR back numbers see the DIOR feature section in Division 2, Section 3I.) (This field was called ORIG CARR for 5E8.)
Valid Entries: 0 - 9

Data Rules:

When COUNTRY CODE is less than 200, ORIG CARR cannot be entered.

If ORIG CARR is not entered, CALL ANYWHERE must be "N".

2.5 CALL ANYWHERE

Description: Does the originating carrier providing DIOR service permit calls to all countries? If "N" is entered, then the originating country has terminating restrictions.

Software Release: 5E8 only.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ORIG CARR is not entered, CALL ANYWHERE must be "N".

2.6 # TERM CC

Description: Enter the dialable country code that applies to the DIOR Originating Country Code when a DIOR caller is placing a call to that country.

Software Release: 5E9(1) and later.
Required Field.
Valid Entries: 2 - 999

2.7 # COMPLETION TYPE

Description: Enter the call completion type identified for the ORIG CARRIER providing DIOR service for the COUNTRY CODE entry.

Software Release: 5E9(1) and later.
Required Field.
Valid Entries:

Valid COMPLETION TYPE Entries

Entry	Definition
R or MEMBER	Permit completion to member countries only.
R+ or MEMBER+	Permit completion to all member countries plus certain non-member countries listed here.
R- or MEMBER-	Permit completion to all member countries except certain members listed on this form in the TERMINATING COUNTRY IDENTIFIER LIST.
W or WORLD	Permit completion to any country
W- or WORLD-	Permit completion to any country except those listed on this form in the TERMINATING COUNTRY IDENTIFIER LIST.

Data Rules:

If "MEMBER" or "WORLD" is entered, no entries are allowed in the TERMINATING COUNTRY IDENTIFIER LIST.

Copyright © 2003 Lucent Technologies

If "MEMBER+", "MEMBER-", or "WORLD-" is entered then there must be at least one entry in the TERMINATING COUNTRY IDENTIFIER LIST.

TERMINATING COUNTRY IDENTIFIER LIST (CTRYLIST)

The following ROW ID fields specify the country code for adding or subtracting from the normal list of allowed calls. The entries in this list must be unique.

2.8 ROW ID

Description: Enter the dialable country code (digits) or country name abbreviation (characters) for adding or subtracting from the normal list of allowed calls.

Software Release: 5E9(1) and later.
Required Field.
Valid Entries: 1 - 3 digits or characters

Data Rules:

This field must have at least one entry if the COMPLETION TYPE field is set to "MEMBER-", "MEMBER+", or "WORLD-". This field cannot have any entries if the COMPLETION TYPE field is set to "MEMBER", or "WORLD".

For each 1 - 3 digit TERMINATING COUNTRY IDENTIFIER LIST ID entered where COMPLETION TYPE is "MEMBER-", a matching TERM CC must be entered on this or on another DCPSP form.

If 1 - 3 digits are entered and the COMPLETION TYPE is "MEMBER+", then the TERM CC entry on this form or TERM CC entry any other DCPSP form cannot match this entry.

Each three character country code with a COMPLETION TYPE of "MEMBER+", "MEMBER-", or "WORLD-" must be defined on a corresponding NONUSA form (5477-1 Record). A corresponding NONUSA form is found by matching the TERMINATING COUNTRY IDENTIFIER LIST ID with HOME COUNTRY on the NONUSA form. If the COMPLETION TYPE is "MEMBER-", DIOR MEMBER on the corresponding NONUSA form must be "Y". When the COMPLETION TYPE is "MEMBER+", DIOR MEMBER must be "N".

SEC. 4CL: 5484 RECORD
OSPS DIOR SPEED DIALING - DIORSD

1. GENERAL

The 5484 Record is available with the 5E8 and later Software Releases. The OSPS DIOR (Direct International Originations) Speed Dialing form assigns a speed-dialing code to a telephone number. DIOR speed dialing provides USA Direct customers with the ability to use abbreviated or speed-dialing codes to access a number of information services. The numbers of these services are maintained in this form and are accessible to all DIOR customers through a 1- to 3-digit speed-dialing code. When prompted for a forward number, a DIOR caller may dial the DIOR speed-dialing service code and the corresponding 1- to 3-digit speed-dialing code to complete the call to the desired service provider. This capability allows both the automated DIOR customer and an operator assisted DIOR customer to complete calls with an abbreviated digit string. For more information on DIOR Speed Dialing see Division 2, Section 4B26.

SEC. 4CM: 5485 RECORD
OSPS FTS NRA COUNTRY CODE EXCEPTIONS - FTSCC

1. GENERAL

The 5485 Record is available with 5E8 and later Software Releases. The OSPS FTS NRA Country Code Exceptions form assigns the forward number country code that identifies those FTS NRA (Federal Telecommunications System Network Remote Access) calls that must be routed over the FTS NRA PNI (Private Network Interface).

This form supports the OSPS FTS-2000 NRA feature. For more information on the FTS-2000 NRA feature, see Division 2, Sections 4A85.

SEC. 4CN: 5486 RECORD
OSPS FTS NRA DOMESTIC EXCEPTIONS - FTSNANP

1. GENERAL

The 5486 Record is available with 5E8 and later Software Releases. The OSPS FTS NRA NPA-NXX Exceptions form assigns the forward number NPAs or NPA-NXXs that identify those FTS NRA (Federal Telecommunications System Network Remote Access) calls that must be routed over the public network. This form supports the OSPS FTS-2000 NRA feature. For more information on this secured feature see Division 2, Section 4A85.

The range of the field NPA was expanded in 5E9(1) and later to support the Interchangeable NPAs feature. For more information on this feature see Division 2, Section 3E, *OSPS 5ESS Switch Enhancements.*

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.77.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 NPA

Description: Enter a forward NPA code that identifies FTS NRA calls that must be routed over the public network.
Valid Entries: 3-digits
- For 5E8: 200 - 919 middle digit 0 - 1
- For 5E9(1) and later: 200 - 999

2.3 NXX

Description: Enter a forward NXX office code that identifies FTS NRA calls that must be routed over the public network.
Valid Entries: 200 to 999

SEC. 4CP: 5488 RECORD
OSPS FTS NRA ROUTING NUMBERS - FTSRN

1. GENERAL

The 5488 Record is available with 5E8 and later Software Releases. The OSPS FTS NRA Routing Numbers form assigns the 10-digit routing numbers used to route FTS NRA (Federal Telecommunications System Network Remote Access) calls to the FTS NRA PNI (Private Network Interface). It also assigns the 10-digit FTS NRA attendant forward number.

This form supports the OSPS FTS-2000 NRA feature. For more information on this feature see Division 2, Section 4A85.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.76.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ROUTING NUMBER

Description: Enter the routing number that is used to route FTS NRA calls to the FTS NRA PNI. This field is also used to specify the FTS NRA attendant forward number.

Required Field.
Valid Entries: 10-digit routing number.

2.3 ATTENDANT

Description: Is this number is used to complete an FTS NRA call to an FTS NRA attendant?

Required Field.
Default: N
Valid Entries: Y, N

SEC. 4CW: 5496 RECORD
DIOR EIGHT HUNDRED OFFICE CODE TO SM MAPPING - DEHOCSM

1. GENERAL

The 5496 Record is available with the 5E9(1) and later Software Releases. The DIOR Eight-Hundred Office Code-to-SM form specifies the SM (Switching Module) on which the billing treatment data is stored for DIOR (Direct International ORiginations) Toll Free International 800 Services. For more information on this feature, see Division 2, Section 3K, *Direct International Originating Features.*

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.84

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * INWATS NPA

Description: Enter the NPA of an INWATS (Inward Wide Area Telecommunications Service) number. The INWATS NPA key field was added to support the exhaustion of 800 numbers, to allow other NPAs to be assigned as INWATS (Inward Wide Area Telecommunications Service) NPAs. This field supports the 800 Toll Free Services NPA Expansion feature. This feature is a secured feature with an SFID of 405. For more information on provisitioning this feature, see Division 2, Section 4A405.

Software Release: 5E10 and later.
Required Field.
Valid Entries: 100 - 999

Data Rules:

For each DEHOCSM form entered, there must be a corresponding INWNPA form with a matching INWATS NPA entry.

2.3 * OFFICE CODE

Description: Enter the office code (NXX) of the INWATS number.

Required Field.
Valid Entries: 200 - 999

2.4 * FEATURE

Description: Enter the DIOR feature that is using this particular OFFICE CODE-to-SM mapping to store its data. The FEATURE field was added to support the DIOR Network Remote Access feature. For more information on this feature, see Division 2, Section 3K on provisioning DIOR features.

Software Release: 5E9(2) and later.
Required Field.
Valid Entries:

Valid FEATURE Entries

Entry	Definition
TF8	DIOR Toll-free 800 feature.
NRA	DIOR Network Remote Access feature.

SEC. 4CX: 5498 RECORD - CICPHR

1. GENERAL

The 5498 Record is available for 5E9(1) and later. This form maps the Carrier Identification Code to an Announcement Phrase Identification Code for the carrier. Refer to the PHRASE form (5534 Record) for a description of Phrase IDs.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.66.

2. FORM AND RECORD ENTRIES

2.1 * CARRIER ID

Description: Enter the Carrier Identification Code.

Required Field.
Valid Entries: 0 - 9999

2.2 # PHRASE ID

Description: Enter the Phrase Identification Code.

Required Field.

Valid PHRASE ID Entries	
1 - 16383, 16385 - 16389, or 16500 - 32767	5E9(2) and earlier. See Division 3, Sec. 5AH for a description of PHRASE IDs.
1 - 16383 or 16600 - 65530	5E10 and later. See Division 3, Sec. 5AH for a description of PHRASE IDs.

Data Rules:

When a PHRASE ID is entered, there must be an associated PHRASE form where APPLICATION is "OSPSTA" and the PHRASE ID on the PHRASE form matches the PHRASE ID on the CICPHR form.

SEC. 4CY: 5499 RECORD
OSPS MEASUREMENTS DESIGNATION FOR 800 ACCESS CALLS - MEASDSIG

1. GENERAL

The 5499 Record is available for 5E9(2) and later. This form specifies information for measurement indexes and their corresponding labels.

This form was added to support phase 2 of the 800 Access Using FGD Signaling feature. Phase 2 of this feature replaces the existing 800 Access Using FGD Signaling feature measurements (i.e., attempts and messages for AATOS (Alternate Access to Operator System) and AATLSOS (Alternate Access to Language Specific Operator System) calls) with a measurement array.

The measurement array is defined by the Measurement Label Data. Each entry in the Measurement Label Data contains the following:

- a label assigned to an index,
- the number of call Attempts for 800 access calls assigned to that index in the 1+800 Service designation Table, and
- the number of messages (billable calls) for 800 access calls assigned to that index in the 1+800 Service Designation Table.

This form allows the operating company personnel to populate indexes and labels for the Measurement Array Data. Indexes must be assigned in sequential order from 1 to 100. The labels shall be alphanumeric and shall be able to range from 1 - 7 characters including blanks.

1.1 Recent Change View

The corresponding Recent Change view for this form is 27.71

For Recent Change, deletes can only performed on the last (highest) index populated in the view. This feature modifies OSPS RC/V view 27.70 by adding a new field called MEASUREMENT INDEX. After OSPS RC/V view 27.71 has been populated, Indexes can be assigned to existing 800 access numbers already defined in this view and new 800 access numbers can be added as required. For existing 800 access numbers in this view, the MEASUREMENT INDEX is "blank" and measurement peg counts are not performed until a valid index is assigned.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MEASUREMENT INDEX

Description: Enter the measurement index used to specify 800 Access calls which have an associated label displayed along with measurements on the 30-minute traffic report.

Required Field.
Valid Entries: 1 - 100

2.3 # LABEL

Description: Enter the label associated with the measurement index. Enter up to 7 alphanumeric

SEC. 4CZ: 6400 RECORD
DIOR NETWORK REMOTE ACCESS PROVISIONING - DNRA

1. GENERAL

The 6400 Record is available for 5E9(2) and later Software Releases. This form specifies the countries to which DIOR (Direct International Originations) calls to NRA INWATS (Network Remote Access Inward Wide Area Telecommunications Service) numbers are allowed or are denied completion. This view was added to support the DIOR Network Remote Access feature. For more information on this feature, see Division 2, Section 3K on provisioning DIOR features.

Each OFFICE CODE must be assigned to an SM on the DEHOCSM (DIOR Eight Hundred Office Code to SM Mapping) form (5496 Record). Each entry in the CAC field of the Exception List must be defined as an NRA CC or as an IDDD CAC on the CCNAME (OSPS Country Number to Country Name Mapping) form (5463 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.87.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * INWATS NPA

Description: Enter the NPA of the INWATS (toll-free) number that subscribes to the NRA feature. For 5E9(2) only, the only entry allowed for this field was 800.

Required Field.
Default: 800
Valid Entries: 100 - 999

2.3 * OFFICE CODE

Description: Enter the office code of an INWATS (toll-free) number that subscribes to the NRA feature.

Required Field.
Valid Entries: 200 - 999

Data Rules:

For each DNRA form entered, there must be a corresponding DEHOCSM form where OFFICE CODE and INWATS NPA on the DNRA form matches the OFFICE CODE and INWATS NPA on the DEHOCSM form and FEATURE on the DEHOCSM form is set to "NRA".

The same OFFICE CODE/LINE NUMBER combination cannot be entered on both the DEHNP form and the DNRA form, e.g. the same toll-fee number cannot be used for the DIOR Toll-Free 800 feature and the DIOR NRA feature. (See Division 2, Section 3K for more information on the DIOR Toll-Free feature.)

2.4 * LINE NUMBER

Description: Enter the line number of the INWATS number that subscribes to the NRA feature.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 0000 - 9999

Data Rules:

See the data rule for OFFICE CODE.

2.5 # ROUTING NUMBER

Description: Enter the 7-digit routing number for routing calls to the Network that subscribes to the NRA feature.

Required Field.
Valid Entries: 7 digits (0 - 9)

2.6 #5 DEFAULT TRMT

Description: Are calls allowed or denied for this NRA number from any country code that is not specified in the CAC field of the NRA EXCEPTION LIST below?

Required Field.

Valid DEFAULT TRMT Entries

Entry	Definition
A	Allowed
D	Denied

NRA EXCEPTION LIST (EXCEPTIONLIST)

The following field in the Country Code Exception List consists of the IDDD CAC (International Direct Distance Dialing Country Access Codes) or NRA CC (Network Remote Access Country Codes) that do not receive the default Network Remote Access number treatment.

2.7 CAC

Description: Enter the IDDD CAC or NRA CC that should be treated differently from the treatment specified in the DEFAULT TRMT field.
Valid Entries: 1 - 999

Data Rules:

CAC entries must be unique.

CAC cannot be 0.

This country access code must be defined using the IDDD CAC field or the NRA CC field on the CCNAME (5463 Record, View 27.81).

SEC. 4DE: 6406 RECORD
CUSTOMIZED HANDLING BY CARD PRODUCT TYPE - CHBCPT

1. GENERAL

The 6406 Record is available with the 5E9(2) Software Release. It is used to define parameters for specific card product types in the Card Product Type table. This form supports the PLBQ (Purchase Limits Balance Quotation) Business/Residential Card feature. For more information on this feature, see Division 2, Section 4A400.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.61.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CARD PRODUCT TYPE

Description: Enter the card product type which will be used to define the parameters in the Card Product Type table.

Required Field.
Valid Entries: 0 - 255

BALANCE QUOTATION CONTENT

The following fields (Section 2.3 - Section 2.5) define the balance quotation content.

2.3 ANNC MONETARY BAL

Description: Should the monetary amount of the remaining balance be included in the balance quotation?

Required Field.
Default: N
Valid Entries: Y, N

2.4 ANNC TIME BAL

Description: Should the allowed time that the specific call can last for the given monetary balance be included in the balance quotation?

Required Field.
Default: N
Valid Entries: Y, N

2.5 CUSTOM ANNC HDR

Description: Description: Enter the Announcement HEADER ID for the customized announcement to be given with the balance quotation. The CUSTOM ANNC HDR field is used to indicate that this announcement may be given as part of, or instead of, the balance quotation.

Data Rules:

Copyright © 2003 Lucent Technologies

If CUSTOM ANNC HDR is entered, there must be a corresponding ANNHD form with HEADER ID equal to the CUSTOM ANNC HDR entry, and with APPLICATION set to "OSPSTA".

2.6 RECORD BILLING

Description: Should AMA Module 917 be appended for the recording of credit that has been used?

Required Field.
Default: N
Valid Entries: Y, N

2.7 WARNING ANNC HDR

Description: Enter the HEADER ID for the announcement to be given instead of the standard disconnect warning announcement. The WARNING ANNC HDR field is used to indicate which customized announcement should be given instead of the standard disconnect warning announcement.
Valid Entries: 271 - 300

Data Rules:

If WARNING ANNC HDR is entered, there must be a corresponding ANNHD form with HEADER ID equal to the WARNING ANNC HDR entry, and with APPLICATION set to "OSPSTA".

2.8 CARD RSTRCT HNDLG

Description: Enter the type of card restriction that should be used on a specific card product type. The CARD RSTRCT HNDLG field was added to support the ATCO (Automated TCS/CPS Override) feature. For more information on this feature, see Division 2, Section 4A409.

Software Release: 5E10 and later.
Required Field.
Default: VERIFY
Valid Entries:

Valid CARD RSTRCT HNDLG Entries

Entry	Definition
ALLOW	Verificaiton is not needed. Restriction can beautomatically overridden.
OTHBLG	Verification is not needed. Restriction cannot beoverridden - use other billing.
VERIFY	Verification with the ICVC (International Card Verification Center) should proceed.

SEC. 4DF: 6407 RECORD
INTERFLOW DATA FOR AUTO-RECONFIGURATION PATTERN - IDIFLOW

1. GENERAL

The 6407 Record is available with the 5E10 and later Software Releases. It is used by the the OSPS auto-reconfiguration process to set up serving team data for a scheduled interflow activation/ deactivation. An auto-reconfiguration pattern ID (which is recent changeable only on View 21.16) and interflow activation/ deactivation pattern data. A pattern has data that will be acted upon at some time in the future as specified by the time (data) in the pattern. Patterns contain data on a serving team basis. The data consists of the next scheduled interflow status (on or off) of a serving team and the destination where calls for the serving team will be interflowed. This form can only be entered for retrofits.

1.1 Recent Change View

There is no corresponding Recent Change View for this form. However, the PATTERN ID and automatic reconfiguation time and day are entered on the 21.16. There is no ODA input form equivalent for view 21.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PATTERN ID

Description: Enter the pattern ID that is entered on RC View 21.16. The Pattern ID identifies specific OSPS automatic reconfiguration time data in the OSPS database.

Required Field.
Valid Entries: 1 - 84

Data Rules:

A corresponding PATTERN ID must be entered on the RC View 21.16 prior to retrofit, or this PATTERN ID cannot be entered.

DESTINATION

The following fields (Section 2.3 - Section 2.7) list the interflow data for a serving team.

2.3 SERVING TEAM

Description: Enter the serving team that has been assigned the PATTERN ID.
Valid Entries: 1 - 128

Data Rules:

SERVING TEAM numbers for which INTERFLOW or REROUTE are entered must also be entered on the STINFO form (5402 Record).

2.4 INTERFLOW

Description: Enter the interflow destination.
Valid Entries: 129 - 144

Copyright © 2003 Lucent Technologies

Data Rules:

If INTEFLOW or REROUTE is entered, either ACTIVATE or DEACTIVATE must be "Y".

If INTERFLOW and REROUTE are not entered:
- ACTIVATE must not be entered
- DEACTIVATE must not be entered

If INTERFLOW is entered, then on the corresponding STINFO form (SERVING TEAM entries match):
- NON ISP ONLY must be "N"
- OPER TYPE must be "TA"

If INTERFLOW is entered a corresponding entry is required in the ISERVTM field in the OSPS LIST on the INFLTADP form (5452 Record).

2.5 REROUTE

Description: Enter the Reroute destination.
Valid Entries: 1 - 16

Data Rules:

If INTEFLOW or REROUTE is entered, either ACTIVATE or DEACTIVATE must be "Y".

If INTERFLOW and REROUTE are not entered:
- ACTIVATE must not be entered
- DEACTIVATE must not be entered

If REROUTE is entered and OPER TYPE is "TA" on the corresponding STINFO form, then NON ISP AND TA and NON ISP ONLY must have different entries on the STINFO form, i.e., they cannot both be "Y" nor can they both be "N").

If REROUTE is entered, and OPER TYPE is "DA" on the corresponding STINFO form, then NON ISP ONLY and NON ISP AND TA must be "N" on the STINFO form.

2.6 ACTIVATE

Description: Enter the activation status.
Valid Entries: Y or blank

2.7 DEACTIVATE

Description: Enter the deactivation status.
Valid Entries: Y or blank

SEC. 4DI: 6410 RECORD
OSPS VMS TERMINATING NPA NXX RESTRICTIONS - VMSTPR

1. GENERAL

The VMSTPR form (6410 Record) is available with 5E10 and later Software Releases. It provides NPA, NXX and LINE number information to block call termination for VMS (Voice Messaging Service) calls. For more information, see Div. 2, Sec. 4A418.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.64.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *NPA

Description: The NPA field is used to specify the terminating numbering plan area code that is being blocked.

Required Field.
Valid Entries: 1 - 999

2.3 (*)NXX

Description: The NXX field is used to specify the terminating office code that is being blocked.

Required Field.
Valid Entries: 0 - 999

Data Rules:

When NXX has not been entered, LINE cannot be entered.

2.4 (*)LINE

Description: The LINE field is used to specify the terminating line number that is being blocked.

Required Field.
Valid Entries: 0 - 9999

SEC. 4DJ: 6411 RECORD
OSPS LOCAL NUMBER PORTABILITY DATABASE QUERY - OLNPU

1. GENERAL

The OLNPU form (6411 Record) is available with 5E11 and later Software Releases. It is used to maintain the billing validation for a specified set of NXXs in an NPA. The LNPD (Local Number Portability Database) or an alternate destination may be selected. All operations: insert, update, review and delete, may be performed using this form. For more information, see Division 2, Section 4A417 for the LEC offering or Section 4A419 for the AT&T offering.

1.1 Recent Change View

For this form there are two corresponding Recent Change Views. RC/V view 27.34 is for inserting and deleting LNPD data while RC/V view 27.35 is used for reviewing and updating LNPD data.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *NPA

Description: The NPA field is used to specify the numbering plan area code.

Required Field.
Valid Entries: 200 - 999

2.3 *START XXX

Description: The START XXX field is used to specify the first NXX for which local number portability information is to be viewed or changed.

Required Field.
Valid Entries: 000,100,200,300,400,500,600,700,800,900

2.4 END XXX

Description: The END XXX field is a no change field which specifies the last NXX in a range when the local number portability status of an entire range of NXX values is to be changed.

2.5 RANGE LNPD

Description: Is the query destination for the START XXX to END XXX range the LNPD?
Valid Entries: Y, N

Data Rules:

If RANGE LNPD is entered, there should be no XXX LIST entries.

Either RANGE LNPD must be entered or an entry must be made in the XXX LIST.

NXX LIST

The following fields (Section 2.6 - Section 2.7) make up the NXX LIST. The NXX LIST displays the portability status for the listed XXX values.

Copyright © 2003 Lucent Technologies

2.6 XXX

Description: An individual XXX value from within the START XXX to END XXX range for which the portability status is displayed.
Valid Entries: An XXX value within the range of START XXX to END XXX.

Data Rules:

XXX entries must be unique.

If XXX is entered, then LNPD must be entered.

2.7 LNPD

Description: Should a query be sent to the LNPD for number portability?
Valid Entries: Y, N

Data Rules:

If LNPD is entered, then XXX must be entered.

SEC. 4DK: 6412 RECORD
OSPS DACC TREATMENT TABLE

1. GENERAL

The 6412 Record is available with 5E10 and later Software Releases. The OSPS DACC Treatment Table defines enhanced treatment for CICADA call completion

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.88.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *DEST NBR

Description: Destination Number. This field is used to specify a 3, 7, or 10-digit destination number for DA call completion. Enter a 3-digit number of the form N11 (where N is 2 - 9), or enter a 7 or 10 digit number.

Required Field.

2.3 DA TYPE

Description: Directory Assistance Type. This field specifies an indicator to be associated with the destination number. This value is mapped to a value included in the AMA record made for a DA call completion call.
Valid Entries: 1 - 20, or blank

2.4 DACC ALLOW

Description: Is DA call completion allowed? This field specifies whether or not the calls to DEST NBR are eligible for CICADA call completion.

Required Field.
Default: Y
Valid Entries: Y,N

For 5E12 and later, when DACC ALLOW is "N", DA TYPE must not be entered.

2.5 HEADER ID

Description: Announcement Header ID. This field specifies the announcement HEADER ID for the CICADA announcement for DEST NBR.
Valid Entries: 1 - 131071

2.6 LSCC REDIRECT

Description: Is LSCC with SS7 Redirect feature treatment activated for the associated DA destination number? This field specifies whether or not LSCC (Listing Services Call Completion) with SS7 Redirect feature treatment is active for the associated DA (Directory Assistance) destination number.

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.7 LIST LIMIT ENF

Description: Should an error message be displayed to the OSPS-LS operator on calls to the associated DA destination number? Listing Services Limit Display Indicator. This field specifies whether or not to display an error message to the OSPS-LS operator on calls to the associated DA destination number. This parameter is exampled by the OSPS-LS only on a 4ESS originated call.

Required Field.
Default: N
Valid Entries: Y, N

2.8 DIOR DACC ALLOW

Description: Is DA Call Completion allowed for DIOR originated calls? This field specifies whether or not the DA Call Completion feature is allowed for DIOR originated calls. The DIOR DACC ALLOW field was added to support the Listing Services - International DA (Directory Assistance) feature. For more information on this feature, see Division 2, Section 4A324.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

For 5E12 and later, when DIOR DACC ALLOW is "Y", DACC ALLOW must be "Y".

2.9 PL CARD ALLOW

Description: Is DA Call Completion allowed for a valid Purchase Limits card? This field specifies whether or not a DA call should be allowed for a valid Purchase Limits card. The PL CARD ALLOW field was added to support the Listing Services - International DA feature. For more information on this feature, see Division 2, Section 4A324.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

2.10 RTRS INTL IND

Description: Should the RTRS international call indicator be set? This field determines how RTRS should handle the rate quotation query. The RTRS INTL IND field was added to support the Listing Services - International DA feature. For more information on this feature, see Division 2, Section 4A324.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

2.11 APS 00- DA

Description: Activate the Automated Position System 00- DA Measurement parameter. This field is used to determine whether or not the OSPS-TA should peg the new measurements for AP-handled calls.

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.12 LS MEASUREMENT

Description: Activate the Listing Services Measurement parameter? This field is used to determine whether or not OSPS-LS should peg the new measurements.

Required Field.
Default: N
Valid Entries: Y, N

SEC. 4DY: 6424 RECORD
OSPS FEATURE PARAMETERS - FTPARM

1. GENERAL

The 6424 Record is available with 5E10 and later Software Releases. The OSPS Feature Parameters provides the capability for specifying, updating, and/or verifying OSPS feature options.

This view is an extension of the OSPSOPT form (5424 Record, RC View 8.9). New feature parameters will be added to this form, unless a specific parameter needs to added to an already existing feature group on the OSPSOPT form. The OFFICE ID must be defined for the OSPSOPT form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.41. The RC View 8.41 has one restriction on the use of the view. No more than 40 parameters should be changed in a single update activity. Single updates of more than 40 parameters may not be completed successfully. However, the integrity of the office data in the database is maintained in all situations.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * OFFICE ID

Description: Enter the office identification. This may be the common language office name.
Valid Entries: 1 - 8 characters

Data Rules:

When the FTPARM form is entered, the OSPSOPT form must also be entered and the OFFICE ID values must match.

AUTOMATED TCS/CPS OVERRIDE (ATCO)

The following fields (Section 2.3 - Section 2.12) define the parameters for ATCO (Automation of TCS/CPS Override) feature. For more information on this secured feature, see Division 2, Section 4A409.

2.3 DIOR TO INTL DEST

Description: Is the ATCO feature activated for DIOR originations that terminate to international destinations?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the following must be entered:
- CALL SETUP TIMER
- CALLER SPLIT TIMER
- FINAL DISP TIMER
- ICVC TOLL-FREE NBR and must not be 0
- INTERACTION TIMER
- POST WARNING TIMER

Copyright © 2003 Lucent Technologies

2.4 DIOR TO DOM DEST

Description: Is the ATCO feature activated for DIOR originations that terminate to domestic destinations?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the following must be entered:
- CALL SETUP TIMER
- CALLER SPLIT TIMER
- FINAL DISP TIMER
- ICVC TOLL-FREE NBR must not be 0
- INTERACTION TIMER
- POST WARNING TIMER

2.5 NO DIOR TO INTL DEST

Description: Is the ATCO feature activated for non-DIOR originations that terminate to international destinations?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the following must be entered:
- CALL SETUP TIMER
- CALLER SPLIT TIMER
- FINAL DISP TIMER
- ICVC TOLL-FREE NBR and must not be 0
- INTERACTION TIMER
- POST WARNING TIMER

2.6 NO DIOR TO DOM DEST

Description: Is ATCO feature activated for non-DIOR originations that terminate to domestic destinations?
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the following must be entered:
- CALL SETUP TIMER
- CALLER SPLIT TIMER
- FINAL DISP TIMER
- ICVC TOLL-FREE NBR and must not be 0
- INTERACTION TIMER
- POST WARNING TIMER

2.7 CALL SETUP TIMER

Description: Enter the timer threshold, in seconds, from the time the OSPS routes the call to the ICVC (International Card Verification Center) until the ICVC returns answer supervision (or network "busy" or "block" is received). A timeout (timer threshold is exceeded) indicates a problem with the routing and

Copyright © 2003 Lucent Technologies

results in the call being sent to an OSPS operator queue.
Valid Entries: 1 - 60 (seconds)

2.8 CALLER SPLIT TIMER

Description: Enter the maximum time, in seconds, from the time the caller is "split" (unable to hear conversation), until the caller is "unsplit" so that they hear an announcement or interact with the ICVC attendant or an OSPS operator. A timeout (maximum time is exceeded) indicates the caller has been "split" for too long during ATCO processing, which results in a warning announcement/tone being played to the ICVC attendant.
Valid Entries: 2 - 180 (seconds)

Data Rules:

CALLER SPLIT TIMER must be greater than CALL SETUP TIMER.

2.9 INTERACTION TIMER

Description: Enter the sanity timer for monitoring the the length of the verification conversation. This field specifies the duration threshold, in seconds, for which the ICVC attendant must provide a final call disposition after the verification conversation has begun (i.e., the caller was "unsplit"). A timeout (sanity timer is expired) results in a warning announcement/tone being played.
Valid Entries: 1 - 1800 (seconds)

2.10 POST WARNING TIMER

Description: Enter the timer specifying the amount of time the ICVC attendant has to signal a call status to the OSPS after a warning announcement has been given (either due to a Caller Split or Caller Interact timing). A timeout results in the call being sent to an OSPS operator queue.
Valid Entries: 1 - 30 (seconds)

2.11 FINAL DISP TIMER

Description: Enter the timer specifying the amount of time the ICVC attendant has to signal a call status to the OSPS after the caller has been "split" via the # key. A timeout results in a the call being sent to an OSPS operator queue.
Valid Entries: 1 - 10 (seconds)

2.12 ICVC TOLL-FREE NUMBER

Description: Enter the 10-digit Toll-Free routing number from the office to the ICVC. If 0 is entered, it indicates no data.
Default: 0
Valid Entries: 10-digit number

2.13 WIRELESS AP HANDLING

Description: Can CCS7 Signaled Wireless calls be routed to an AP (Automated Position)? This field supports the CCS7 Incoming Signaling From 4ESS for Wireless Service Providers feature.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

INTERCEPT SCREENING

Copyright © 2003 Lucent Technologies

The following fields (Section 2.14 - Section 2.16) define parameters for the CAS International Intercept feature. For more information on this feature see Division 2, Section 4A420.

2.14 INTRCPT DIOR

Description: Is CAS intercept screening for DIOR originations offered by this switch?

Software Release: 5E10 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.15 INTRCPT NDIOR

Description: Is CAS intercept screening for non-DIOR originations offered by this switch?

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

2.16 CRD RESTR TYP

Description: Is the quotation of the card restriction type in ATCO announcements and operator displays offered by this switch?

Software Release: 5E10 and later
Required Field.
Default: N
Valid Entries: Y, N

CARD VERIFICATION

2.17 VER ROUTING NBR

Description: This field specifies a 10-digit external routing number to be used by the OSPS (Operator Services Position System) when a caller has selected a commercial credit card as the method of call billing.

Software Release: 5E14 and later
Valid Entries: 10-digit number (8XXXXXXXXX where X = 0 - 9)

The first digit for this field must be 8.

AATLSOS - AAP

The following fields (Section 2.18 - Section 2.22) define the parameters that support the AATLSOS - AAP (Alternate Access to Language Specific Operator Services - Automatic Access Prompting) using CPDL (Call Processing Data Link) Interface feature. See Division 2 Section 4A412 for more information on this feature.

2.18 COMP CALL TIMER

Description: Enter the AATLSOS Automated Access Prompting ACCS completion call timer value in seconds in 10 second increments. This is the timeout value after which, the OSPS recognizes that the NRP (Network Resource Platform) has gone off hook on the external ARU (Audio Response Unit) trunk.

Software Release: 5E10 and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: 900 (seconds)
Valid Entries: 10 - 1800 (increments of 10 seconds)

2.19 ACCS FWD NBR TIMER

Description: Enter the AATLSOS AAP ACCS (Automated Calling Card Service) forward number timer in tenths of a second. The ACCS FWD NBR TIMER field specifies the interdigit timeout value (time waiting for another entered digit), after the 10th digit if an NANP (North American Number Plan) number is dialed, or after the 11th digit, if a 0 or 1 is dialed prior to the NANP number until normal call processing continues.

Software Release: 5E10 and later
Required Field.
Default: 50 (5 seconds)
Valid Entries: 0 - 80 (0 - 8 seconds)

2.20 ACCS CARD NBR TIMER

Description: Enter the time in tenths of a second before a time occurs after the "#" is entered after the forward number.

Software Release: 5E10 and later
Required Field.
Default: 20
Valid Entries: 0 - 80 (0 - 8 seconds)

2.21 AATOS TREATMENT

Description: Enter the type of treatment the AATOS call will receive.

Software Release: 5E10 and later
Required Field.
Default: OPR
Valid Entries:

Valid AATOS TREATMENT Entries

Entry	Definition
ANN	The AATOS call will receive a played announcement
OPR	The AATOS call will be sent to the operator.

2.22 FOCUS LOAD SM

Description: Enter the SM number for the AATLSOS Automated Access Prompting SM for 1-800-CALLATT calls using CPDL interface. This SM has a CPDL link and a vendor of NRP.

Software Release: 5E10 and later.
Required Field.
Default: 0
Valid Entries: 0 - 192

LOCAL NUMBER PORTABILITY (LNP)

The following fields (Section 2.23 - Section 2.34) define parameters for the Local Number Portability for OSPS feature. For more information on this feature, see Division 2, Section 4A417.

2.23 ATT FEAT ACT

Description: Is the LNP (Local Number Portability) feature active?

Copyright © 2003 Lucent Technologies

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ATT FEAT ACT and LEC FEAT ACT cannot both be set to "Y".

In order to set the ATT FEAT ACT field to "Y", the Local Number Portability feature must first be purchased by the office by setting the ACT field for either SFID 288 or SFID 419 to "Y" on the SFSYS form.

2.24 LEC FEAT ACT

Description: Is the LEC (Local Exchange Carrier) LPN feature activated?

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ATT FEAT ACT and LEC FEAT ACT cannot both be set to "Y".

In order to set the LEC FEAT ACT field to "Y", the Local Number Portability feature must first be purchased by the office by setting the ACT field for SFID 417 to "Y" on the SFSYS form.

2.25 ATT QRY TRANS

Description: Enter the unique Query Translation Type for LNP TCAP queries.

Software Release: 5E11 and later.
Required Field.
Default: 0
Valid Entries: 0 - 255

2.26 AIN TRIGGER NBR

Description: Enter the AIN trigger number used for OSPS AIN (Advanced Intelligent Network) LNP queries.

Software Release: 5E11 and later.
Required Field.
Default: 0
Valid Entries: 0 - 255

2.27 ATT QRY TIMEOUT

Description: Enter the LNP Query Timeout Parameter in seconds for LNP queries.

Software Release: 5E11 and later.
Required Field.
Default: 2
Valid Entries: 1 - 8 (seconds)

2.28 ATT QRY ALM THR

Copyright © 2003 Lucent Technologies

Description: Enter the LNP Query Alarm Threshold, which is the percent of LNP query successes in 1/4 hour below which LNP failure alarm will be activated.

Software Release: 5E11 and later.
Required Field.
Default: 15 (%)
Valid Entries: 0 - 100 (%)

2.29 ATT MIN THR

Description: Enter Minimum Threshold for LNP queries, which is the minimum threshold for LNP Software Alarm Calculations.

Software Release: 5E11 and later.
Required Field.
Default: 1
Valid Entries: 1 - 64

2.30 TLN CARD NBR

Description: Are the LNP Queries sent on TLN (Telephone Line Number) based 10+4 card numbers?

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.31 THRD NBR CALLS

Description: Enter whether LNP queries sent on all third number calls at billing validation time or at routing time.

Software Release: 5E11 and later.
Required Field.
Default: BILL
Valid Entries:

Valid THRD NBR CALLS Entries

Entry	Definition
BILL	Billing validation time
ROUT	Routing time

2.32 LRN IN OTRS

Description: Is the LRN (Location Routing Number) included in the OTR (Operator Trouble Reports)?

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.33 LRN ASSERTS

Description: Is the LRN included in Asserts?

Software Release: 5E11 and later.
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.34 DIGITS LIDB QRY

Description: Enter the number of digits to be included in the address of a LIDB query.

Software Release: 5E11 and later.
Required Field.
Default: 6
Valid Entries: 6 or 10

2.35 FLEX ACD FEAT ACT

Description: This field specifies whether the OSPS Flexible ACD Call Type Determination feature is active.

Software Release: 5E13 and later.
Required Field.
Default: N
Valid Entries: Y,N

2.36 MAX CTD LEVELS

Description: This field specifies the maximum number of call type determination levels allowed on a call that receives OSPS Flexible Call Type Determination feature treatment.

Software Release: 5E13 and later.
Required Field.
Default: 4
Valid Entries: 4 - 7

LISTING SERVICES

2.37 INTL DA TA ACT

Description: Activate the TA portion of the International Directory Assistance TA feature? This field specifies whether or not the TA portion of International DACC (Directory Assistance Call Completion) is active. The INTL DA TA ACT field was added to support the Listing Services - International DA (Directory Assistance) feature. For more information on this feature, see Division 2, Section 4A324.

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, when INTL DA TA ACT is "Y":

- TA NATL DA must be "Y"
- the ACT field on the SFSYS form (5713-1 Record) for SFID 324 must be set to "Y"

2.38 INTL DA LS ACT

Description: Activate the LS portion of the International Directory Assistance TA feature? This field specifies whether or not the LS portion of International DACC is active. The INTL DA LS ACT field was

Copyright © 2003 Lucent Technologies

added to support the Listing Services - International DA feature. For more information on this feature, see Division 2, Section 4A324.

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, when INTL DA LS ACT is "Y":

- LS NATL DA must be "Y"
- the ACT field on the SFSYS form (5713-1 Record) for SFID 324 must be set to "Y"

SEC. 4EG: 6434 RECORD
OSPS FLEXIBLE ACD CALL TYPE DETERMINATION - FLEXACD

1. GENERAL

The 6434 Record is available with the 5E13 and later Software Releases. It provides the ability to specify OSPS call queues based upon various call characteristic parameters. This form supports the Flexible ACD (Automatic Call Distributor) Call Type Determination feature. For more information on this feature, see Division 2, Section 4a450.

1.1 Recent Change View

The corresponding Recent Change View for this form is 26.8.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PRE CALL ID

Description: This field specifies the Pre Call ID value that serves as a key to the flexible ACD call type determination process.

Required Field.
Valid Entries: 1 - 127

Data Rules:

Each PRE CALL ID value defined on this form must be entered on at least one ACDCTP form.

2.3 * CALL PROPERTY

Description: These fields identify the call property type and value used in flexible ACD call type determination.

The CALL PROPERTY field actually consists of 2 fields - Call Property Type (CPTYPE) and Call Property Value (CPVALUE).

Required Field.
Valid Entries: 1 - 10 alpha-numeric characters

Valid CALL PROPERTY (CPTYPE) Entries

Entry	Definition
AN	Access Number
AO	Account Owner
CIC	Carrier Identification Code
DCIC	DIOR Carrier
DEST	Destination Index
II	ANI II Digits
LC	Language Code
LRN	Originating Location Routing Number
NPA	Originating NPA-NXX
OLS	Originating Line Screening Code
TGRP	Incoming Trunk Group Number

Data Rules:

For 5E13 and later:

Copyright © 2003 Lucent Technologies

- When CALL PROPERTY is "AN", CALL PROPERTY.CPVALUE must be either a 7-digit number, where each digit is 0 - 9, or a 10-digit number of the form 8XXNXXXXXX where N=2 - 9 and X=0 - 9.
- When CALL PROPERTY.CPTYPE is greater than 128, then DISPLAYINDEX must be unknown.
- When CALL PROPERTY.CPTYPE is "AO", CALL PROPERTY.CPVALUE must be 4 alpha-numeric characters.
- When CALL PROPERTY.CPTYPE is "CIC", CALL PROPERTY.CPVALUE must be 0 - 9999 or LEC.
- When CALL PROPERTY.CPTYPE is "DCIC", CALL PROPERTY.CPVALUE must be of the form XXXX, where X=0 - 9.
- When CALL PROPERTY.CPTYPE is "DEST", CALL PROPERTY.CPVALUE must be 1 - 4095.
- When CALL PROPERTY.CPTYPE is "II", CALL PROPERTY.CPVALUE must be 00 - 99.
- When CALL PROPERTY.CPTYPE is "LC", CALL PROPERTY.CPVALUE must be 0 - 1000.
- When CALL PROPERTY.CPTYPE is "LRN", CALL PROPERTY.CPVALUE must be of the form NXXXXX, where N=1 - 9 and X=0 - 9.
- When CALL PROPERTY.CPTYPE is "NPA", CALL PROPERTY.CPVALUE must be of the form NXXXXX, where N=1 - 9 and X=0 - 9.
- When CALL PROPERTY.CPTYPE is "OLS", CALL PROPERTY.CPVALUE must be 0 - 999.
- When CALL PROPERTY.CPTYPE is "TGRP", CALL PROPERTY.CPVALUE must be 1 - 4000.

2.4 # CALL TYPE

Description: This field identifies the OSPS Call Type or Service ID selected during the flexible ACD call type determination.

Required Field.
Valid Entries: 1 - 1023

2.5 DISPLAY INDEX

Description: This field specifies the operator position display index.
Valid Entries: 1 - 276

Data Rules:

When DISPLAY INDEX is entered, an associated OBSTS form must be found with matching DISPLAY INDEX.

2.6 APOS CALL TYPE

Description: This field specifies the call type used to direct calls to automated positions.
Valid Entries: 1 - 128

Data Rules:

When APOS CALL TYPE is entered, the FLEXACD form must have a corresponding OSPSCT form with APOS CALL TYPE equal to OSPS CALL TYPE. Additionally, the matching OSPSCT form must have OPR TYPE set to "TA".

Copyright © 2003 Lucent Technologies

2.7 ACD EXPRESSION

Description: This field defines the overriding call property expression to be used for flexible ACD call type determination.
Valid Entries: A, C, D, G, I, L, N, O, Q, S, T, |, &, or blank

Valid ACD EXPRESSION Entries

Entry	Definition
A	ACCT Owner
C	Carr ID
D	Dest Index
G	Lang Code
I	ANI II
L	LRN
N	NPA-NXX
O	OLS Code
Q	Quit
R	DIOR Carrier
S	Access Number
T	Trk Grp
| or &	Special Cases (e.g., T|D|O&I)
blank	

Data Rules:

For 5E13 and later:

- Unless the CALL ORIGIN is "CDSU", "SPCL700", or "ICS", each FLEXACD form must have a corresponding OSPSCT form with OSPS CALL TYPE equal to CALL TYPE. Additionally, the matching OSPSCT form must have OPER TYPE set to "TA".

- When APOS CALL TYPE is entered on a FLEXACD form, the FLEXACD form must have a corresponding ACDCTP form where the CALL ORIGIN of the corresponding ACDCTP form is not "AIS", "CDSU", "SPCL700" or "ICS".

- When APOS CALL TYPE is entered on a FLEXACD form, and the FLEXACD form has a corresponding ACDCTP form where the CALL ORIGIN of the corresponding ACDCTP form is not "AIS", "CDSU", "LSTA", "SPCL700" or "ICS", there must be an OSPSCT form where APOS CALL TYPE on the FLEXACD form matches the OSPS CALL TYPE on the OSPSCT form. In addition, the SVC ID on the OSPSCT form must not be entered.

- When APOS CALL TYPE is entered on a FLEXACD form and the matching ACDCTP form has a CALL ORIGIN of "LSTA", the AP call queue can be a Listing Services call, but only if SFID 415 ACT is set to "Y". This is a secured feature which must be purchased.

- There must be a corresponding OSPSCT form such that OSPS CALL TYPE on the OSPSCT form matches CALL TYPE on the FLEXACD form, and this OSPSCT form must have SVC ID entered.

- There must be a corresponding OSPSCT form such that OSPS CALL TYPE on the OSPSCT form matches CALL TYPE on the FLEXACD form, and this OSPSCT form must not have SVC ID entered.

- A SERVDATA form must be found where CALL TYPE on the FLEXACD form matches the SVC ID on the SERVDATA form. The OSPS SVC CODE on this SERVDATA form must be "AAP".

- A SERVDATA form must be found where CALL TYPE on the FLEXACD form matches the SVC ID on the SERVDATA form. The OSPS SVC CODE on this SERVDATA form must be "INMATE".

- There must be an OSPSCT form where CALL TYPE on the FLEXACD form matches OSPS CALL TYPE on the OSPSCT form. Then SVC ID on the ODPSCT form must match the SVC ID on a SERVDATA form. Additionally, OSPS SVC CODE on the SERVDATA form must not be "INCPT", "IBMINCPT", "SPCL700" or "INMATE".

Copyright © 2003 Lucent Technologies

- When CALL ORIGIN on the associated ACDCTP form is "LSTA" and APOS CALL TYPE on the FLEXACD form is entered, there must also be a corresponding OSPSCT form such that OSPS CALL TYPE on the OSPSCT form matches APOS CALL TYPE on the FLEXACD form. This OSPSCT form must have SVC ID entered.

- ACD EXPRESSION cannot contain a call property type matching the call property type in CALL PROPERTY.

SEC. 4EH: 6435 RECORD
OSPS NPA CODE EXPANSION FOR BLV - ENHBLV

1. GENERAL

The 6435 Record is available as a 5E11 Software Update. It provides the capability for specifying the LRN (Location Routing Numbers) or NPA (Numbering Plan Area), the route code, and NXX (Office Code), or range of NXXs. This form supports the OSPS NPA Code Expansion feature. For more information on this feature, see Division 2, Section 4A449.

1.1 Recent Change View

The corresponding Recent Change View for this form is 27.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *LRN/NPA

Description: This field is used to specify the numbering plan area code.

Software Release: 5E11 and later
Required Field.
Valid Entries: 200 - 999

Data Rules:

Ten-digit numbers which are defined by NPA, NXX, BEG LINE, and optionally, END LINE on the ENHBLV form, must not be duplicated or overlapped by ten-digit numbers on another ENHBLV form.

2.3 (*) BEG NXX

Description: This field is used to specify the NXX or the first number in a range of NXXs.

Software Release: 5E11 and later
Valid Entries:

000 - 999 (for first NXX in a range)
blank (for all NXXs)

Data Rules:

When an ENHBLV form is entered, the BEG NXX field is blank, and the LRN/NPA is entered, there can be no other ENHBLV forms entered with the same LRN/NPA value. Leaving the BEG NXX blank means that all NXXs are excluded for that LRN/NPA. Therefore no other forms can be entered for that LRN/NPA.

2.4 (*) END NXX

Description: This field is used to specify the last NXX in a range of NXXs.

Software Release: 5E11 and later
Valid Entries:

Copyright © 2003 Lucent Technologies

001 - 999 or
blank

When END NXX is known, BEG NXX must not be greater than END NXX.

2.5 # ROUTE CODE

Description: This field specifies the routing code for the LRN or NPA.

Software Release: 5E11 and later
Required Field.
Valid Entries: 1 - 999

Data Rules:

The ROUTE CODE must be the same for all ENHBLV forms having the same LRN/NPA value.

---

SEC. 4ES: 6446 RECORD
OSPS DA CUSTOM BRANDING BY ACCOUNT OWNER - AOWNER

1. GENERAL

The 6446 Record is available as a 5E13 Software Update. It provides DA custom branding by account owner information. This form supports the DA Custom Branding by Account Owner feature. For more information on this feature, see Division 2, Section 4A543.

1.1 Recent Change View

The corresponding Recent Change View for this form is 21.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *ACCOUNT OWNER

Description: This field is used to specify the account owner.

Software Release: 5E13 and later
Required Field.
Valid Entries: Four alpha-numeric characters

2.3 # HEADER ID

Description: This field specifies the Announcement Header ID number.

Software Release: 5E13 and later
Required Field.
Valid Entries: 1 - 131071

Data Rules:

When the HEADER ID is entered on any AOWNER form, there must be a corresponding ANNHD form with matching HEADER ID and the APPLICATION field set to "OSPSDA".

---

SEC. 5A: 5501 RECORD
NORMALIZED OFFICE CODE ASSIGNMENT FORM - NOC

1. GENERAL

The 5501 Record is used to associate a NOC (Normalized Office Code) with each OFFICE CODE and NPA (Numbering Plan Area) code. The OFFICE CODE is commonly referred to as the "NXX" which are the 3-digits after the NPA (commonly referred to as the "area code"). In addition, this form is used to assign Routing and Charging Intercept Treatment. Each type of Intercept (Regular, Blank Number, Out-of-Service and Deny Termination) is assigned a Route Index and Charge Index per NXX.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *NPA

Description: The NPA field is used to specify the numbering plan area code. With 5E12, this field has been changed to a key field. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Required Field.

Software Release: 5E12 and later
Valid Entries: 200 - 999

2.3 * OFFICE CODE

Description: Enter the NXX of the office. Traditionally, office codes are of the form NXX. However, 0XX and 1XX are provided for special uses to preserve standard office code ranges. These are typically used for INWATS lines. Since 0XX and 1XX are being excluded from the LDIT, these lines can only be terminated to from an incoming trunk.

Required Field.
Valid Entries: 3 digits (of the form XXX where
- X = 0 - 9)

Data Rules:

For 5E12 and later, one NOC form is required for every OFFICE CODE or NPA/OFFICE CODE combination in the office.

For 5E12 and later, if the NOC form has an OFFICE CODE value equal to that of another NOC form, the Number Portability NPA-NXX Growth feature is required. It is a secured feature which must be purchased by the office. An SFSYS form must exist with SFID 198 set to "Y".

2.4 # BASE NPA

Description: The BASE NPA field is used to display the base numbering plan area status. BASE NPA

Copyright © 2003 Lucent Technologies

must equal "Y" for each NXX in the office. The first occurrence of an NXX in the office must have BASE NPA equal to "Y" and all others with the same NXX value must have BASE NPA equal to "N". When assigning an NXX to more than one NPA (NON-UNIQUE NXX), one of the NPAs must be designated as the BASE NPA. This would usually correspond to the NPA associated with the NXX if the NXX was previously assigned as a unique NXX.This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Required Field.
Valid Entries: Y, N

Data Rules:

For 5E12 and later, only one NOC form per OFFICE CODE value may have BASE NPA set to "Y".

2.5 UNIQUE OFFCODE

Description: This is a Recent Change display-only field. The UNIQUE OFFCODE field is used to display the office code unique status.

2.6 NPA CODE

Description: Enter the Numbering Plan Area Code. NPAs are normally in the following range: N is 2-9; P is 0-1; A is 0-9.

Required Field.

Software Release: 5E11 and earlier
Valid Entries: 3 digits
- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 through 5E11: 200 - 999

2.7 NOC

Description: Enter a unique Normalized Office Code Number, one per Office Code.

Required Field.
Valid Entries:
- For 5E12 and later: 1 - 8190

Data Rules:

For 5E12 and later, when the NOC forms have a NOC value greater than 250, the Number Portability NPA-NXX Growth feature must be provided. It is a secured feature which must be purchased by the office. An SFSYS form must exist with SFID 198 set to "Y".

For 5E12 and later, NOCs cannot be duplicated on the NOC input form. All NOCs associated with NPA and OFFICE CODE (NXX) combinations must be unique values for the given office.

2.8 RAX

Description: Enter the Rate Area Exchange center number. This field is used to identify "rate centers" that are established by tariffs for routing and charging. It is used in association with the SCREENING INDEX and DAS (Digit Analysis Selector) fields on the LCC form (5306 Record). Note that this field is the same (functionally) as the RATE AREA field on the LCC form.

Copyright © 2003 Lucent Technologies

Software Release: 5E8 and later.
Default: 00 (indicates no RAX number)
Valid Entries:
- For 5E14 and earlier: 1 - 99
- For 5E15 and later: 1 - 999

Data Rules:

For 5E15 and later, if RAX is greater than 99, SFID 561 ACT on the SFSYS form (5713-1 Record) must be "Y" (see Division 2, Section 4A561).

ROUTE INDEX DATA

The following fields (Section 2.9 - Section 2.12) are used to define Route Index Data.

2.9 REG ICPT RI

Description: Enter the Route Index Number that is to be used for Regular intercept. Route Indexes 1 - 100 should be assigned to Fixed Route Types.

If the specified Route Index points to an AIS Trunk Group, the AIS normally expects to receive a prefix digit of 3 for this type of Intercept. If this is desired, 3 must be entered in PREFIX DIGITS on the RTIDX form (5303 Record).

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

2.10 BLANK NBR RI

Description: Enter the Route Index number that is to be used for Blank Number Intercept. Route Indexes 1 - 100 should be assigned to Fixed Route Types.

If the specified Route Index points to an AIS Trunk Group, the AIS normally expects to receive a prefix digit of 0 for this type of Intercept. If this is desired, 0 must be entered in PREFIX DIGITS on the RTIDX form (5303 Record).

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

2.11 OOS RI

Description: Enter the Route Index number that is to be used for Out-of-Service (trouble) Intercept. Route Indexes 1 - 100 should be assigned to Fixed Route Types.

If the specified Route Index points to an AIS Trunk Group, the AIS normally expects to receive a prefix digit of 1 for this type of Intercept. If this is desired, 1 must be entered in PREFIX DIGITS on the RTIDX form (5303 Record).

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095

Copyright © 2003 Lucent Technologies

- For 5E13 and later: 1 - 16382

2.12 DENIED TERM RI

Description: Enter the Route Index number that is to be used for Deny Termination Intercept. Route Indexes 1 - 100 should be assigned to Fixed Route Types.

Required Field.
Valid Entries:
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

For 5E12 and later, the denied term intercept route index(s) defined on the NOC form, must be defined on the RTIDX form.

For 5E12 and later, the denied term intercept route index(s) defined on the NOC form, must be defined on the CGIDX form.

CHARGE INDEX DATA

The following fields (Section 2.13 - Section 2.16) are used to define Charge Index Data.

2.13 REG ICPT CI

Description: Enter the Charge Index number that is to be used for Regular Intercept.

Required Field.
Valid Entries: 1 - 2047

Data Rules:

For 5E12 and later, the regular intercept charge index(s) defined on the NOC form, must be defined on the CGIDX form.

2.14 BLANK NBR CI

Description: Enter the Charge Index number that is used for Blank Number Intercept.
Valid Entries: 1 - 4095

2.15 OOS CI

Description: Enter the Charge Index number that is to be used for Out-of-Service (trouble) Intercept.
Valid Entries: 1-2047

Data Rules:

For 5E12 and later, the out-of-service intercept charge index defined on the NOC form, must be defined on a CGIDX form.

2.16 DENIED TERM CI

Description: Enter the Charge Index number that is to be used for Deny Termination Intercept.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 2047

Data Rules:

For 5E12 and later, the deny term intercept charge index defined on the NOC form, must be defined on the CGIDX form.

2.17 REMARKS

Description: This field may contain any entries deemed locally necessary.
Valid Entries: 16 characters

2.18 NOT CODE HOLDER

Description: Is this switch not the code holder?

Required field.

Software Release: 5E14 and later
Default: N
Valid Entries: Y, N

Data Rules:

When NOT CODE HOLDER is "Y", ACT must be "Y" for SFID 530 on the SFSYS form.

THOUSANDS GROUP STATUS

In order to use the following fields, ACT must be "Y" for SFID 530 on the SFSYS form.Refer to Section 2.19 through Section 2.28 for individual field information.

2.19 PORTED OUT 0

Description: Is the 0000 to 0999 block of telephone numbers ported out?
Default: N
Valid Entries: Y, N

2.20 PORTED OUT 1

Description: Is the 1000 to 1999 block of telephone numbers ported out?
Default: N
Valid Entries: Y, N

2.21 PORTED OUT 2

Description: Is the 2000 to 2999 block of telephone numbers ported out?
Default: N
Valid Entries: Y, N

2.22 PORTED OUT 3

Description: Is the 3000 to 3999 block of telephone numbers ported out?
Default: N
Valid Entries: Y, N

2.23 PORTED OUT 4

Copyright © 2003 Lucent Technologies

Description: Is the 4000 to 4999 block of telephone numbers ported out?
Default: N
Valid Entries: Y, N

2.24 PORTED OUT 5

Description: Is the 5000 to 5999 block of telephone numbers ported out?
Default: N
Valid Entries: Y, N

2.25 PORTED OUT 6

Description: Is the 6000 to 6999 block of telephone numbers ported out?

SEC. 5B: 5502 RECORD
MAIN DISTRIBUTING FRAME
TEST TRUNK ASSIGNMENT FORM - MDFTA

1. GENERAL

The 5502 Record is applicable to 5E2 and later Software Releases. It is used for IMLT-2 (Integrated Mechanized Loop Testing) with a DFTAC (Distributing Frame Test Access Circuit). The MDFTA is used to define the connection between the DFTAC (Distributing Frame Test Access Circuit) and the MDF (Main Distributing Frame) TTC (Test Trunk Circuit) as well as the DFTAC LTP (Logical Test Port) and the LEN of the dedicated line from the DFTAC to an LU (Line Unit). Refer to the feature division for IMLT-2.

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TEST TRUNK CIRCUIT TGN

Description: Enter the Trunk Group Number of the Test Trunk Circuit connecting the DFTAC and the MDF.

Required Field.
Valid Entries: 1 - 255

Data Rules:

The TTC TGN must also be defined on the TKGRP form (5202 Record).

2.3 * TTC MEMBER NUMBER

Description: Enter the Test Trunk Circuit member number.

Required Field.
Valid Entries: 0 - 999

Data Rules:

The TTC Member Number must also be defined on the TRUNK form (5204 Record).

2.4 DFTAC IDENTIFICATION

Description: Enter the DFTAC Identification which is the DFTAC appearance on the MSU/MMSU. The DFTAC identification number must be a 7-digit number in the following format.

DFTAC IDENTIFICATION

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-48 (CM1)
			1-192 (CM2)
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15

Copyright © 2003 Lucent Technologies

			(Regular MSU) 00-31 (Modular MSU)

Data Rules:

DFTAC IDENTIFICATIONs must match an EQMMSP or EQMSP form with PACK EQUIPMENT LIST TYPE equal to "DFTC" and PACK EQUIPMENT LIST EQST set to "O".

2.5 LOGICAL TEST PORT

Description: Enter the Logical Test Port associated with the MDF. This is the LTP with a TRKCLS of "LTPDFTAC". One LTP is required per DFTAC circuit and it must be located in the same SM as the DFTAC.

LTP (LOGICAL TEST PORT) NUMBER

Equipment	Valid Entries
Switching Module	1 - 48 (CM1)
	1 - 192 (CM2)
Logical Test Port	000-255

Valid Entries: 6 digits

Data Rules:

The LTP must also be defined on the TRUNK form (5204 Record).

2.6 OE TYPE

Description: Enter the type of line.

Valid OE TYPE Entries

Entry	Definition
C	Telephone Number is associated with an ISLU Line Card Equipment Number and NUMBER field must contain an 8-digit equipment number.
D	Telephone Number is associated with a 4-wire Digital Equipment Number and NUMBER field must contain an 8-digit DEN.
G	Software Release: 5E8 and later. Telephone Number is associated with an IDCU (Integrated Digital Carier Unit) Equipment Number and NUMBER field must contain a 10-digit equipment number (GEN) for a remote terminal or a PUB43801. For 5E10 and later a 11 digit equipment number is required.
L	Telephone Number is associated with an analog-type Line Equipment Number and NUMBER field must contain an 8- or 10-digit LEN.
M	Software Release: 5E8 through 5E9(2). Telephone Number is associated with an IDCU (Integrated Digital Carier Unit) Equipment Number and NUMBER field must contain an 8-digit equipment number (MEN) for a remote terminal or a PUB43801.
S	Telephone Number is associated with a SLC-96 Equipment Number and NUMBER field must contain a 7-digit SLEN.
T	Telephone Number is associated with a 4-wire analog Trunk Equipment Number and NUMBER field must contain a 7-digit TEN.

Data Rules:

For OE TYPE and NUMBER there must be a corresponding TN with matching OE TYPE and NUMBER on the LINE form (5109 Record).

The LINE form(s) associated with OE TYPE and NUMBER on MDFTA form must have the indicated fields populated on the LINE form as follows:

- BRCS must be "N"
- COIN must be "N"

Copyright © 2003 Lucent Technologies

- COMPL must be "N"
- DNY BV must be "N"
- DNY ROH must be "N"
- DTLBILL must be "N"
- FGA must be "N"
- FLS must be "N"
- GST must be "N"
- NO DIAL must be "N"
- PALIT must be "Y"
- PTY must be "I"
- SERHLN must not be entered
- SLUS must be "N"
- SUSO must be "Y"
- TRAFFIC must be "N"
- TSTLINE must be "N"
- TTC must be "Y"
- ICP must be "N"

The LCC form(s) that corresponds to a LINE form(s) associated with OE TYPE and NUMBER on the MDFTA form, must have the CLASS OF SERVICE of "INDIV".

DFTAC (Distributing Frame Test Access Circuit) dedicated lines can not be associated with multi-line hunt groups, they can only be assigned on the LINE form. Therefore MLHLN forms cannot have an OE TYPE and MUMBER which corresponds to an OE TYPE and NUMBER on an MDFTA form.

2.7 NUMBER

Description: Enter the equipment number. The content of this field is dependent upon the entry in the OE TYPE field as described above.

If OE TYPE is "G" for an IDCU Remote Terminal, the Equipment Number consists of:

GEN (IDCU Remote Terminal 5E9(2) and earlier)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	X	0-7
Remote Terminal	RT	XX	01-31
Line	LINE	XXXX	0001-2048

GEN (IDCU Remote Terminal 5E10 and later)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	XX	00-42
Remote Terminal	RT	XX	01-31
Line	LINE	XXXX	0001-2048

If OE TYPE is "G" for an IDCU PUB, the Equipment Number consists of:

GEN (IDCU PUB43801 5E9(2) and earlier)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	X	0-7
DS1	DS1	XX	51-90
Line	LINE	XXXX	0001-0024

GEN (IDCU PUB43801 5E10 and later)

Equipment		Format	Valid Entries

Copyright © 2003 Lucent Technologies

Switching Module	SM	XXX	001-192
Unit Number	IDCU	XX	00-42
DS1	DS1	XX	51-90
Line	LINE	XXXX	0001-0024

If OE TYPE is "L", this is a Line Equipment Number, an 8-digit number in the following format.

LEN (LINE EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Line Unit	LU	X	0-7
		XXX	000 - 042 (5E9(2) and later)
Concentrator	CONC	X	0-9
Switch Group	SWG	X	0-1
Switch	SW	X	0-7
Level	LEV	X	0-3

If OE TYPE is "M" for an IDCU Remote Terminal, this is a 8-digit number in the following format.

MEN (IDCU Remote Terminal)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	X	0-7
Remote Terminal	RT	XX	01-31
Line	LINE	XX	01-99

If OE TYPE is "M" for an IDCU PUB, this is an 8-digit number in the following format.

MEN (IDCU PUB43801)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Unit Number	IDCU	X	0-7
DS1	DS1	XX	51-90
Line	LINE	XX	01-24

If OE TYPE is "S", this is a SLC-96 Equipment Number, an 8-digit number in the following format.

SLC-96 EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Digital Carrier Line Unit	DCLU		0-7
Remote Terminal	RT	XX	01-32
Line	LINE	XX	01-96

If OE TYPE is "D", this is a 4-wire Digital Equipment Number, an 8-digit number in the following format.

DEN (DIGITAL EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Digital Line Trunk Unit	DLTU	X	0-5
Digital Facility Interface	DFI	XX	01-10
Digital Channel	DCHAN	XX	01-48

If OE TYPE is "T", this is a 4-wire analog Trunk Equipment Number, a 7-digit number in the following format.

TEN (TRUNK EQUIPMENT NUMBER)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Trunk Unit	TU	X	0-7
Service Group	SVG	X	0-1
Pack	PACK	X	0-7
Circuit	CKT	X	0-3

Copyright © 2003 Lucent Technologies

If OE TYPE is "C", this is an ISLU Line Card Equipment Number, 8 digits in the following format.

LINE CARD EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	001-192
Line Unit	LU		0-7
Line Group Controller	LGC	XX	00-15
Line Card	LC	XX	00-31

SEC. 5C: 5503 RECORD
PAIR GAIN TEST CONTROLLER FORM - PGTC

1. GENERAL

The 5503 Record is applicable to 5E2 and later Software Releases. It is used in offices equipped with IMLT-2 (Integrated Mechanized Loop Testing System Two) if those offices have the optional PGTC (Pair Gain Test Controller). The PGTC is the interface between the IMLT-2 and a USLC-96 (Universal SLC-96) and is only required if IMLT-2 will be used to test USLC-96. The 5503 Record will define the connections between the PGTC and the 5ESS Switch.

The IMLT-2 obtains access to the PGTC via the MTB (Metallic Test Bus). Only one PGTC test port can terminate on an MMSU (Modular Metallic Service Unit). Also, a PGTC test port must terminate on an MMSU where a DCTU (Directly Connected Test Unit) port, used for testing USLC-96 remote terminals, terminates.

The PGTC is controlled by Distribute Points in the 5ESS Switch. There are two Distribute Points and two Metallic Bus connections required for PGTC. The two Distribute Points must be assigned sequentially to the same MMSU and the same DIST (Distribute Point) circuit pack. Likewise, the two MTBs must be assigned sequentially to the same MMSU and MACC (Metallic Access Circuit) pack.

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.7.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PGTC FRAME NUMBER

Description: Enter the Pair Gain Test Controller Frame Number. Only one PGTC Frame will exist at a host office and it will always be numbered one (1). Each RSM or cluster of RSMs will only have one PGTC which will be numbered as the RSM or lowest numbered RSM in the cluster.

In an office equipped with CM1 (Communications Module 1), the valid entries for SM are 1 - 48. In an office equipped with CM2, the valid entries are 1 - 192.

Required Field.
Valid Entries: 1 - 192

2.3 * PGTC TRUNK NUMBER

Description: Enter the Pair Gain Test Controller Trunk Number.

Required Field.
Valid Entries: 1 - 255

Data Rules:

Only one PGTC Test Trunk is allowed per MSU shelf in a Service Group.

2.4 # METALLIC TEST BUS

Description: Enter the low numbered MTB which is the bus wired to the input of the PGTC. MTBs for

Copyright © 2003 Lucent Technologies

PGTC are assigned in contiguous pairs and must be on the same MACC pack; two MTBs per PGTC are required. The second MTB (wired to the PGTC output) will be assigned automatically as the next sequential MTB. The maximum value of the low numbered MTB that can be assigned is a 13 because MTB 15 is reserved for testing. Also, a minimum of one MTB assigned to the DCTU must terminate on the same MMSU service group shelf as the two MTBs assigned to the PGTC. Furthermore, for higher testing throughputs (PST), PGTC test ports must be assigned to each MMSU service group shelf where a DCTU port used for testing USLC-96 remote terminals terminates.

In an office equipped with CM1 (Communications Module 1), the valid entries for SM are 1 - 48. In an office equipped with CM2, the valid entries are 1 - 192.

Metallic Test Bus Point 15 of every MACC pack is reserved for general internal MSU and MMSU diagnostics. Protocol test or diode resistor tests are included in general internal diagnostics.

The Metallic Test Bus is assigned a 9-digit number in the following format.

MTB (METALLIC TEST BUS)

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Bus	BUS	XX	00 - 14

Data Rules:

If this MTB number resides on an ORM, RSM, or TRM, the PGTC and the MTB must share the same SITE ID (assigned on the EQIM form). In addition, if this is a remote SITE ID, the MTBs must reside on the Common Resource Module (denoted by MASTER MODULE on a corresponding EQSITE form (5722 Record)). This rule does not apply to co-located ORMs/TRMs sharing resources.

2.5 # LO DISTRIBUTE POINT

Description: Enter the low PGTC Distribute Point number. This is the value of the MSU Distribute Point wired to the high valued resistor for the PGTC. The second Distribute Point will be assigned to the next sequential Distribute Point on the same Distribute pack. These Distribute Points must be in the same MSU as the MACC packs that terminate the low and high MTBs.

In an office equipped with CM1 (Communications Module 1), the valid entries for SM are 1 - 48. In an office equipped with CM2, the valid entries are 1 - 192.

The PGTC Distribute Point is a 9-digit number in the following format.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Distribute Point Number	DPN	XX	00 - 30

SEC. 5D: 5504 RECORD
TONE TIME FORM - TNTYP

1. GENERAL

The TNTYP form is used to define "ROH", "REORDER", "HIGHTONE", and "BUSY" tones.

Offices must also define the DSN (Defense Switched Network) Preemption Tone, "PRMPTON", if any line or Multi-Line Hunt Line is assigned a Precedence and Preemption BRCS feature.

With 5E3 and later Software Releases, DSN (Defense Switched Network) offices must also define the DSN (Defense Switched Network) Permanent Tone, "DSNROH".

1.1 Standard Input Data

A standard set of input data is provided by the ODA system as each office is registered. If, however, it is required that the timing intervals vary from the standard, the TNTYP form may be used to specify them.

1.2 Recent Change View

The corresponding Recent Change View for this form is 8.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 *TONE TYPE

Description: Enter the Type of Tone being defined.

Valid TONE TYPE Entries

Entry	Definition
AUDIBLE	Software Release: 5E7 and later. Audible tone.
ROH	Receiver Off Hook
REORDER	120 IPM
BUSY	60 IPM
PRMPTON	DSN (Defense Switched Network) Preemption Tone. Required in all DSN (Defense Switched Network) offices and all offices in which any PP (Precedence and Preemption) feature is assigned to any line or trunk.
DSNROH	Software Release: 5E3 and later. DSN (Defense Switched Network) permanent tone. Required in all DSN offices. Only DSN offices may select this entry.
HIGHTONE	Software Release: 5E4(2) and later. Steady High Tone.
HIGH120	Software Release: 5E7 and later. 120 ipm cadenced high tone. Required in all E911 offices. If a CAMA PSAP attempts a Selective Transfer for which no TN is assigned in the caller's ESN form (5540 Record), this tone is returned to the PSAP.

Data Rules:

If a TN on a LINEFA form (5112 Record) or a MLHG/TERM combination on a MLHLNFA form (5113 Record) are assigned a FEATURE defined on a PUOFD form (5605-1A Record) where INITIATE is set to "BSYVFY", then a TNTYP form must be submitted with TONE TYPE set to "HIGHTONE" and TIMED? set to "N".

Copyright © 2003 Lucent Technologies

When TONE TYPE is "HIGH120", TIMED? must be "N".

2.3 TIMED?

Description: Is the Tone timed?

Required Field.
Valid Entries: Y, N

Data Rules:

If a "Y" is entered in this field, the duration in seconds must be entered in the HOW MANY SECONDS? field. If an "N" is entered in this field, then an entry must not be made in the HOW MANY SECONDS? field.

2.4 HOW MANY SECONDS?

Description: If a Tone is Timed, this field must contain the duration in seconds.
Valid Entries: 0 - 255

Standard Input Data for 5E2 and 5E3

TONE TYPE	TIMED?	HOW MANY SECONDS?
BUSY	N	
REORDER	N	
ROH	Y	045

Standard Input Data for 5E4(2) and Later

TONE TYPE	TIMED?	HOW MANY SECONDS?
BUSY	N	
HIGHTONE	N	
REORDER	N	
ROH	Y	045

SEC. 5E: 5505-1/2 RECORD
AUTOMATIC TRUNK TEST TABLE FORM - AUTO

1. GENERAL

The 5505-1/2 Records are used to define the ATTTN (Automatic Trunk Test Table Numbers) and their associated test lines. It is used by both the Trunk Automatic Progression Testing program and manual testing initiated at the 5ESS Switch as a record of the outpulsing information necessary to reach certain test lines in the terminating office.

1.1 Number of Outpulsed Digits

All test numbers require the same number of digits to be outpulsed to process a normal outgoing call to each terminating office. If a terminating office is expecting five digits to be outpulsed to that office from the 5ESS Switch Outgoing Trunk Group, then five digits should be entered on the ATTTN (Automatic Trunk Test Table Number) for that Outgoing Trunk Group.

1.2 Trunk Groups Requiring ATTTN

Most two-way and outgoing Trunk Groups require an ATTTN. Refer to the Trunk Group Record in Division 3 Section 2A for Trunk Groups requiring an ATTTN. If a Trunk Group is required by ODA to have an ATTTN, but the far end office does not have test circuits, any defined ATTTN may be assigned to the Trunk Group. However, it is recommended that a "dummy" ATTTN be used and defined on this 5505 Record. The dummy ATTTN may contain any combination of data which satisfies the ODA input requirements and user standards.

If the trunk group has a TRKCLS of "TSPS" which terminates on an OSPS trunk with a TRKCLS of "FIOPR", then the test numbers entered on this form must conform to the format of 10x, 958-10x, or 959-10x, where x is an integer 1 - 9.

1.3 Test Assignments

The 5505-1/2 Records contain sixteen types of test assignments. (For more complete descriptions see AT&T Practice 781-030-100, Section 8.)

SYNCHRONOUS TEST - This test provides an automatic series of on hook/off hook flashes for each pulsing rate. After all of the series of flashes are complete, the trunk will be left in the quiet termination state.

NONSYNCHRONOUS TEST - The Nonsynchronous type is the only type required for those offices where marginal type tests cannot be applied directly to the incoming trunk circuit, as is frequently the case with Step-by-Step systems.

PERMANENT BUSY - The Number associated with this test provides a permanent busy tone when accessed.

100 TEST - This test provides far to near end loss measurements and near end noise measurements. The 100 Test Line supplies milliwatt tone for approximately 5 seconds and then applies a quiet termination to the caller until the caller hangs up.

102 TEST - This test provides far to near end loss measurements. The 102 Test Line supplies milliwatt tone for 9 seconds and then applies a quiet termination for 1 second. This 10 second sequence is repeated indefinitely until the caller hangs up.

103 TEST - This test provides for overall testing of the supervisory and signaling capabilities of intertoll trunks equipped with rering features. The 103 Test Line is required for 5ESS Switch local/toll applications.

Copyright © 2003 Lucent Technologies

104 TEST - This test provides two-way loss and noise measurements on any type of trunk. The 104 Test Line seizes a trunk, outpulses digits, sends tones to the far end office, and evaluates the tones received from the far end office.

105 TEST - This test provides two-way loss and noise measurements. The 105 Test Line is used by the CAROT (Centralized Automatic Reporting on Trunks) system.

106 TEST - This test is used in conjunction with the 102 test line for loop-around or two-way transmission testing. This test will provide 10 seconds of 1004 Hz tone followed by loop-around of the T&R leads to the T1 and R1 leads until disconnect is detected on the E lead. This test is used for DSN (Defense Switched Network) offices.

INV TEST - This test provides access to the ISTF (Integrated Services Test Function) Unit to do inverted (bits are inverted on channel) Transmission Tests over a digital trunk. Available with 5E4(2) and later Software Releases.

NINV TEST - This test is similar to the INV TEST except that the bit pattern is not inverted on the channel. Available with 5E4(2) and later Software Releases.

SXS TEST - Used by an office with trunks terminating at a step-by-step office. The testing is similar to synchronous testing, consisting of on-hook/off-hook signals. Available with 5E4(2) and later Software Releases.

CTX2 TEST - A synchronous test type used by an office with trunks terminating to a Number 5 Crossbar office that is equipped with Phase II Centrex features. The test exercises the supervisory and transfer features of the trunk. Available with 5E4(2) and later Software Releases.

CTX3 TEST - A synchronous test type used by an office with trunks terminating to a Number 5 Crossbar office that is equipped with Phase III Centrex features. The test exercises the supervisory and transfer features of the trunk. Available with 5E4(2) and later Software Releases.

109 TEST - A test of the performance of an echo controller at a terminating toll office. The test is only used when there is an office, on the far end of any trunk, that is a 5ESS Switch with an RMS-D3 test device. Available with 5E4(2) and later Software Releases.

606 TEST - A digital loop-back test for digital continuity and fidelity. The test is only used when there is an office, on the far end of any trunk, that is a 5ESS Switch with an RMS-D3 test device. Available with 5E4(2) and later Software Releases.

1.4 Continuity Checks

The AUTOMATIC PROGRESSION TEST TYPE of "CONT" is available with 5E3 and later Software Releases. The continuity checks are run on a time basis over CCS trunks until continuity is restored or until they are stopped by maintenance personnel.

1.5 Recent Change View

The corresponding recent change view for this form is 14.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * AUTOMATIC TRUNK TEST TABLE NUMBER

Description: Enter the Automatic Trunk Test Table Number.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 999

2.3 AUTOMATIC PROGRESSION TEST TYPE

Description: Enter the APTT (Automatic Progression Test Type).

Valid AUTOMATIC PROGRESSION TEST TYPE Entries

Entry	Definition
102LB	Software Release: 5E9(1) and later. 102 Loopback Test
103	103 Type Test
105	Software Release: 5E9(1) and later. 105 type test
CONT	Software Release: 5E3 and later. Continuity Test
CTX2	Software Release: 5E4(2) and later. Centrex Phase II Test
CTX3	Software Release: 5E4(2) and later. Centrex Phase III Test.
INV	ISTF Inverted Loopback Test
NINV	ISTF Non-Inverted Loopback Test
NSYN	Non-Synchronous Test
PB	Permanent Busy Test
SHCT	Software Release: 5E10 and later. Speech Handler trunk PCM loop back test.This enumeration supports the CDMA (Code Division MultipleAccess) feature. For more information on this feature, seeDivision 2, Section 8B.
SYN	Synchronous Test
SXS	Software Release: 5E4(2) and later. Step-by-Step Test.

Data Rules:

An entry is required if any trunk group has an "N" entered in the IAPT (Inhibit Automatic Progression Table) field on the TKGRP form.

With 5E3 and later, CCS Trunks (INPULSING/OUTPULSING CCIS6 or ISUP7) must use an Automatic Progression Test Type of "CONT" or "PB" or blank.

"102LB" may be entered in this field only for DCS (Digital Cellular Switch) trunks where TRKCLS on the corresponding TKGRP form (5202 Record) is "CST2" or "IVTRK".

For 5E14 and earlier, when TGNs are defined on the TKGRP form (5202 Record) with TRKCLS equal to "SPCHNDLR" and the ATTTN field on this form is entered, the AUTO form must be entered and this field must be equal to "SHCT".

For 5E15 and later, when the AUTO form is entered and this field is "SHCT", any TKGRP forms which use a value of the ATTTN field on this form must have a TRKCLS field equal to "SPCHNDLR".

DIGITS TO BE OUTPULSED

The following fields (Section 2.4 - Section 2.19) define the digits to be outpulsed.

2.4 SYNCHRONOUS TEST

Description: Enter the number to be outpulsed to access the Synchronous Test Line at the far end office.
Valid Entries: 1 - 11 digits

2.5 NONSYNCHRONOUS TEST

Description: Enter the number to be outpulsed to access the Nonsynchronous Test Line at the far end office.

Copyright © 2003 Lucent Technologies

If SYNCHRONOUS TEST contains an entry and NONSYNCHRONOUS TEST is blank, ODA specifies the same number entered in SYNCHRONOUS TEST for NONSYNCHRONOUS TEST.
Valid Entries: 1 - 11 digits

2.6 PERMANENT BUSY TEST

Description: Enter the number to be outpulsed to access the Permanent Busy Test Line at the far end office.
Valid Entries: 1 - 11 digits

2.7 100 TYPE TEST

Description: Enter the number to be outpulsed to access the 100 Test Line at the far end office.
Valid Entries: 1 - 11 digits

2.8 102 TYPE TEST

Enter the number to be outpulsed to access the 102 Test Line at the far end office.

2.9 103 TYPE TEST

Description: Enter the number to be outpulsed to access the 103 Test Line at the far end office.
Valid Entries: 1 - 11 digits

2.10 104 TYPE TEST

Description: Enter the number to be outpulsed to access the 104 Test Line at the far end office.
Valid Entries: 1 - 11 digits

2.11 105 TYPE TEST

Description: Enter the number to be outpulsed to access the 105 Test Line at the far end office.
Valid Entries: 1 - 11 digits

2.12 106 TYPE TEST

Description: Enter the number to be outpulsed to access the 106 test line.
Valid Entries: 1 - 11 digits

Data Rules:

This field may be entered only for DSN (Defense Switched Network) offices, therefore, the DSN OPT field must be set to "Y" on the OFCOPT form.

2.13 INV TYPE TEST

Description: Enter the number to be outpulsed to access an INV Test line at the far-end office where the bits in the bit stream will be inverted. Only digital trunks will be tested.

Software Release: 5E4(2) and later
Valid Entries: 1 - 11 digits

2.14 NINV TYPE TEST

Description: Enter the number to be outpulsed to access an NINV Test line at the far-end office where the bits in the bit stream are not inverted. Only digital trunks will be tested.

Copyright © 2003 Lucent Technologies

Software Release: 5E4(2) and later.
Valid Entries: 1 - 11 digits

2.15 SXS TYPE TEST

Description: Enter the number to be outpulsed to access the SXS Test Line.

Software Release: 5E4(2) and later
Valid Entries: 1 - 10 digits

Data Rules:

If the AUTOMATIC PROGRESSION TEST TYPE field is "SXS", then a value must be entered in the SXS TYPE TEST field.

2.16 CTX2 TYPE TEST

Description: Enter the number to be outpulsed to access the CTX2 Test Line.

Software Release: 5E4(2) and later.
Valid Entries: 1 - 10 digits

Data Rules:

If the AUTOMATIC PROGRESSION TEST TYPE field is "CTX2", then a value must be entered in the CTX2 TYPE TEST field.

2.17 CTX3 TYPE TEST

Description: Enter the number to be outpulsed to access the CTX3 Test Line.

Software Release: 5E4(2) and later.
Valid Entries: 1 - 10 digits

Data Rules:

If the AUTOMATIC PROGRESSION TEST TYPE field is "CTX3", then a value must be entered in the CTX3 TYPE TEST field.

2.18 109 TYPE TEST

Description: Enter the number to be outpulsed to access the 109 Test Line.

Software Release: 5E4(2) and later.
Valid Entries: 1 - 10

2.19 606 TYPE TEST

Description: Enter the number to be outpulsed to access the 606 Test Line.

Software Release: 5E4(2) and later.
Valid Entries: 1 - 10

SEC. 5F: 5506 RECORD
AMA CALL TYPE FORM - AMACT

1. GENERAL

The 5506 Record is used to define AMA (Automatic Message Accounting) Call Types. A subset of the AMA Call Types are assigned on the CGIDX form (5302-1 Record). For an initial office, ODA builds the AMACT forms. Figures 2 - 6 describe the entries built by ODA.

The figures are a composite of all Call Types for the various Software Releases. Software Release restrictions are included under AMA CALL TYPE descriptions.

Since the AMACT entries assigned by ODA are in compliance with Standard telecommunications accounting procedures, extreme caution should be used by the switch owner if changes are considered. However, it may be necessary to change the "Special Study" and "Include Customer ID"? field since ODA defaults all Call Types to a "NO". Any other field changes on the AMACT form should be discussed with the AMA personnel.

With 5E4(2) and later, new AMA CALL TYPES have been added for the OSPS (Operator Services Position System) toll and assistance feature.

OSPS AMA records are generated at the end of a call. The determination of making an AMA record, the call type and the structure code is based on the information in the call record, i.e., it is based on what the operator and customers did during the call.

When an AMA record is to be made, a call type, which is specified in the 5506 Record, is determined for the call based on various information.

For definitions of call codes not associated with call types on this form, refer to 235-100-125 (System Descriptions).

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and office name on each record.

2.2 * AMA CALL TYPE

Description: This field is used to enter the AMA Call Type being defined. Refer to Figure 1 for valid AMA CALL TYPE entries.

2.3 DETAIL BILL

Description: Is the number dialed to be included on the AMA record?

Required Field.
Valid Entries: Y, N

2.4 TRACER TYPE

Description: This field is used for revenue purposes to describe the data sent to AMA.

Copyright © 2003 Lucent Technologies

The AMA personnel receive measurements from the 5ESS Switch on the number of calls per Tracer Type that were transmitted over the data link. If the AMA calls do not agree with the 5ESS Switch calls, the AMA personnel can then estimate the amount of revenue lost by using an average charge per Tracer Type (e.g., if 200 local calls were lost at an average charge of 20 cents, the estimated loss of revenue is $40.00).

Required Field.

Valid TRACER TYPE Entries

Entry	Definition
LOCAL	Local call, pegs records output local answered or not recorded local answered.
TOLL	Toll call, pegs records output toll answered or not recorded toll answered.
SPCL	Software Release: 5E4(2) and later. Special services, pegs records output special answered or not recorded special.
SPECIAL	Software Release: 5E3 and earlier. Special services, pegs records output special answered or not recorded special.
OPER	Operator Assisted Calls, pegs records output operator answered or not recorded operator answered.
OTHER	Not toll or local, pegs records output other answered or not recorded other answered.
INTERLATA	Software Release: 5E4(2) and later. InterLATA call, pegs records output interLATA for answered or unanswered calls or not recorded interLATA for answered and unanswered interLATA calls.
ILATA	Software Release: 5E3 and earlier. InterLATA call, pegs records output interLATA for answered or unanswered calls or not recorded interLATA for answered and unanswered interLATA calls.

AMA personnel should be consulted before changing the entries built by ODA in this field since these are Accounting Classifications not Network Facility Classifications.

2.5 INCLUDE MBI/WATS BAND ?

Description: Is the MBI (Message Billing Index) to be included on the AMA record?

Required Field.
Valid Entries: Y, N

2.6 STUDY TYPE

This field is used by the Maintenance Center. The Maintenance Center may optionally request an AMA study on abandoned calls. The criteria for an abandoned call is as follows:

- The call has been processed.
- A network connection is up.
- The terminating end is ringing.
- The originator hangs up before answer.

Normally abandoned call details are not recorded at AMA facilities. However, call details will be recorded by classification of call when a study is initiated by the Maintenance Center. The Maintenance Center may request a study on LOCAL, TOLL, ALL or SPECIAL CALL Types. When SPECIAL CALL Types are requested, only those Call Types that have a Y in the Special Study field will be studied. AMA personnel should be consulted before changing the entries built by ODA in this field since these are Accounting Classifications not Network Facility Classifications.

These entries are totally independent of the classifications entered in the Tracer Type field.

Required Field.

Copyright © 2003 Lucent Technologies

Valid STUDY TYPE Entries

Entry	Definition
LOCL	Software Release: 5E4(2) and later. Local data.
LOCAL	Software Release: 5E3 and earlier. Local data.
TOLL	Toll data.
OTHER	Other data (not local or toll).
ILATA	Software Release: 5E3 and earlier. InterLATA data.
INTERLATA	Software Release: 5E4(2) and later. InterLATA data.
OPER	Software Release: 5E4(2) and later. Operator Assisted Calls.

2.7 SPECIAL STUDY?

The Maintenance Center may optionally request an AMA study on abandoned calls. Abandoned call details are recorded at AMA facilities based on the call classification requested at the Maintenance Center. The Maintenance Center may select LOCAL, TOLL, ALL or SPECIAL Call Types. When SPECIAL is selected, only those Call Types that have a "Y" entered in this field will be studied.

Required Field.

2.8 INCLUDE CUSTOMER ID?

Description: Will the customer's identification number (a terminal group number) be included in the AMA record?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This entry may be equal to "Y" only for the following AMA Call Types: "ACCT", "CCSAS", "CFPFNA" "ETCCSA", "ETMDR", "FGDWBL" "FX", "TANTTK", "WATISB", "WATSB" or "WATSBL". For 5E6 and later, it may also be "Y" when AMA CALL TYPE is "DMRTM", "FGBOL", "FGDOL", "ISDATA", "ISDNOL", or "SP".

Valid AMA CALL TYPE Entries

VALID ENTRY	REMARKS	SOFTWARE RELEASE	CALL CODE
ACCT	Account Code calls not normally recorded.	5E3 and later	124
ACCTX	Account Code dialed calls extended by an attendant to a CENTREX station not normally recorded.	5E3 and later	83
ACCTIE	Account code dialed calls extended by an attendant to a tie trunk.	5E3 and later	84
ATTCMC	AT&T Cellular Mobile Carrier. Used for billing when an incoming call originates on a Trunk Group with CMC equal to "Y" with 5E2 and 5E3. With 5E4(2) and later , this value is "CMC"	5E2 and 5E3	306
ATTSP	AT&T Station Paid. Used by an Interexchange Carrier switch on calls from an Equal Access End Office or Access Tandem using Equal Access Signaling or from directly connected lines.		60
AUTO	Automatic collect T&A OSPS call.		019
BLVOSPS	Busy Line Verify T&A OSPS calls.		043
CCSAS	Common Control Switching Arrangement Sampling.	5E3 and later	21
CFPFNA	Call Forwarding over Private Facilities No Answer. Used for tandem tie trunk. Same as Call Type "TANTTK" except call processing does not generate a simulated answer.		32
CMC	AT&T Cellular Mobile Carrier. Used for billing when an incoming call originates on a Trunk Group with CMC equal to Yes.	5E4(2) and later	306
CMBOT	Cellular Mobile Carrier originating calls to access tandem for Type 2B	5E11 and later.	63

Copyright © 2003 Lucent Technologies

	access.		
CMCBTT	Cellular Mobile Carrier originating calls to access tandem for Type 2B access.	5E11 and later.	65
CMCOT	Cellular Mobile Carrier originating calls to access tandem for Type 2A access.	5E9(1) and 5E10.	64
CMCTT	Cellular Mobile Carrier terminating calls from access tandem for Type 2A access.	5E9(1) and 5E10.	66
CNA	Connecting Network Access.	5E11 and later	720
CRED	Subscriber credit entry AMA record.	5E4(2) and later	107
DIDSTUDY	Direct Inward Dialing Study. It is used to track PBX DID trunk calls which have not returned answer supervision after a specified time. This time limit is determined on the OFCOFT form (5509 Record). The 5ESS Switch determines that the call is connected upon receiving an "answer back" from the PBX, however, some PBX's turn off the answer back which allows incoming calls to connect without being billed. Tracking these calls via AMA study records helps prevent this occurrence.	5E6 and later	381
DA411	Local Directory Assistance calls.		9
DA555	Toll Directory Assistance calls.		33
DDD0	Direct Distance Dialing Operator-assisted OSPS T&A calls.		024
DMRT	Detail billed, message rate, timed.		5
DMRTM	Detail billed, message rate, timed. Also includes an MBI.		1
DMRUM	Detail billed, message rate, untimed. Includes an MBI.		
EIOSPS	Emergency Interrupt T&A OSPS calls.		044
ETCCSA	Electronic Tandem Common Control Switching Arrangement.		
ETMDR	Electronic Tandem Message Detail Recording (via Revenue Accounting Office-RAO).	5E3 and later	
FGAOL	Feature Group A Originating LATA.		
FGATL	Feature Group A Terminating LATA.		
FGBOL	Feature Group B Originating LATA.		
FGBTL	Feature Group B Terminating LATA.		
FGDOL	Feature Group D Originating LATA.		
FGDTL	Feature Group D Terminating LATA.		
FGDWBL	Feature Group D WATS Originating LATA. Used for InterLATA calls with a Group Billing Number.		114
FR	Flat rate calls. This AMA Call Type should be used for local calls from telephone subscribers having flat rate service. AMA Call Type "FREE" should be used for free calls from a flat-rate line.		
FREE	Free calls. This AMA Call Type should be used for all free calls from non-coin lines. Free calls from coin lines should be assigned AMA Call Type "LOCN". Calls to TSPS, tones, announcements, business office and free terminating line service are normally designated as free.		
FX	Foreign Exchange.		11
ICVPN	Originating Access to Interexchange Carrier Virtual Private Network.		263
INWAT	Terminating INWATS.		8
INWTS	Terminating INWATS.	5E4(2) and later	8
ISDATA	ISDN data intraLATA calls.	5E3 and later	
ISDNOL	ISDN data originating interLATA calls.	5E3 and later	117
ISDNTL	ISDN data terminating interLATA calls.	5E3 and later	121
LNPDFR	Local Number Portability	5E13 and later	721
LOCN	Local coin calls should be used for all calls from coin lines except calls to local or toll Directory Assistance. For those calls, AMA Call Types DA411 and DA555 should be used. AMA Call Type LOCN must contain an MBI assigned on the 5302-4 Record. AMA Call Types DA411 and DA555, when used for coin, must also contain an MBI assigned on the 5302-4 Record.		41
MRTM	Message rate, timed, includes an MBI.		
MRUM	Message rate, untimed, includes an MBI.		4
NONR	Nonrevenue OSPS T&A calls.	5E4(2) and later	35
NRBLV	Busy Line Verify, Nonrevenue OSPS T&A calls.	5E4(2) and later	057
NREIOSPS	Nonrevenue emergency interrupt OSPS T&A call.	5E4(2) and later	058
NS	Number services call, use call code from SCP data base stored in call code.	5E4(2) and later	
OSOINW	Originating Screening Office INWATS.	5E5 and later	360
PECO	Person collect OSPS T&A call.	5E4(2) and later	017
PEPD	Person paid OSPS T&A call.	5E4(2) and later	016.
PPCZTA	Person coin zone OSPS T&A call.	5E4(2) and later	029
PSCD	Person special called OSPS T&A call.	5E4(2) and later	023

Copyright © 2003 Lucent Technologies

PSCG	Person special calling OSPS T&A call.	5E4(2) and later	018
SCBLV	Special calling busy line verify OSPS T&A call.	5E4(2) and later	054
SCEI	Special calling emergency interrupt OSPS T&A call.	5E4(2) and later	055
SCOL	Station collect OSPS T&A call.	5E4(2) and later	014
SCOSPS	Station coin zone OSPS T&A call.		
SP	Station paid. Provides details for a direct dialed, station paid 7 or 10 digit call.		
SPAMEG	MEGACOM service.		309
SPAWAT	Special Access Wide Area Telecommunications Service.		
SPOH	Station paid operator-handled OSPS T&A call.	5E4(2) and later	
SPOSPS	Station paid OSPS T&A call.	5E4(2) and later	
SSCD	Station special called OSPS T&A call.		
SSCG	Station special calling OSPS T&A call.		015
SSVC	Special service OSPS T&A call.	5E4(2) and later	108
TANTTK	Tandem Tie Trunk calls.		32
TCNT	OSPS Traffic Counts AMA record.	5E4(2) and later	056
UTT	Utility Telemetry Trunk	5E9(2) and later	550
WATISB	WATS individual station paid. Used for IntraLATA calls with a Station Billing Number.		7
WATSB	WATS using special billing. It is for IntraLATA calls with a Group Billing Number		68
WATSBL	WATS station billed InterLATA. Used for InterLATA calls with a Station Billing Number.		111

SEC. 5G: 5507 RECORD
IOP APPLICATION PROCESSOR COMMUNICATION FORM - APCOMM

1. GENERAL

The 5507 Record is available with 5E3 and later Software Releases and is used to define the communication path between an application process running in the 5ESS Switch, and an application running in an AP (Application Processor). The Application Processor Communications Package formats, sends and receives messages to an AP from the Input/Output Processor through a Synchronous Data Link Controller. APPLICATION PROCESSOR on the OFCOPT form must be "AM" or "AMSM".

For 5E4(2) and later, a maximum of 10 AP SITE IDs may be defined for the office.

1.1 Recent Change View

The corresponding Recent Change View for this form is 24.1.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * AP SITE ID

Description: Enter the Site Identification Number of the Application Processor. This number identifies the AP to the 5ESS Switch.

Required Field.
Valid Entries: 1 - 255

2.3 AP INDEX

Description: Enter the Application Processor Index; this number must be unique to each AP SITE ID entered. A maximum of three AP SITE ID and associated AP INDEX values are currently supported.

Required Field.
Valid Entries: 1 - 3

2.4 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 8 characters

2.5 LINK (1-6)

Description: These entries represent the external data links that connect the AP to the 5ESS Switch. At least one of the six LINKs must be assigned for each APCOMM input form submitted. Once a link is assigned on a given APCOMM input form, it cannot be used again on any other APCOMM input form submitted. A given AP can be assigned any number of the available links, but since the maximum number of APs is currently three, the suggested number of links assigned to each AP is two. Although the range for this field is 1 - 32, currently the only valid entries are 1 - 6.
Valid Entries: 1 - 6

SEC. 5I: 5509 RECORD
OFFICE OPTIONS FORM - OFCOPT

1. GENERAL

The OFCOPT form is available with 5E2 and later Software Releases. This form must be completed for a 5ESS Switch and is used to supply various miscellaneous office options and parameters. This form is required at the time of initial translations for all offices.

The 5509 Record is provided as a reproducible form that may optionally be used. However, if this record is requested in the ODA data base using "records" command, the screen image of the input form will be printed instead of the tabularized record.

1.1 Recent Change View

The corresponding Recent Change Views for this form are 8.1 and 8.15.

2. FORM AND RECORD ENTRIES

2.1 *KEY

Description: Enter the key value which is always 0.

2.2 OFFICE ID

Description: This field is used to identify the office to the Recent Change System. Any entry which will sufficiently identify the office is acceptable.
Valid Entries: 1 - 8 alphanumeric characters

2.3 COMPANY ID

Description: This field is used to identify the Company. This field may be used for Secured Feature Activation using a common company-wide password rather than an individual switch-specific password. For more information, please see the Feature Description Section in Division 2, Section 1BX.
Valid Entries: 1 - 8 alphanumeric characters

2.4 TIME ZONE

Description: Enter the time zone in which the 5ESS Switch is located. This entry reflects the hour difference between the office and GMT (Greenwich Mean Time).

Valid TIME ZONE Entries

Entry	Definition
-12 through +12	Hour difference between office and GMT
EST or -5	Eastern Standard Time
CST or -6	Central Standard Time
MST or -7	Mountain Standard Time
PST or -8	Pacific Standard Time
-5S	Software Release: 5E5 and later. Eastern Standard Time Special (no Daylight Savings Time)
-6S	Software Release: 5E5 and later. Central Standard Time Special (no Daylight Savings Time)
-7S	Software Release: 5E5 and later. Mountain Standard Time Special (no Daylight Savings Time)
-8S	Software Release: 5E5 and later. Pacific Standard Time Special (no Daylight Savings Time)

2.5 DAYLIGHT SAVINGS TIME

Copyright © 2003 Lucent Technologies

Description: Is Daylight Savings Time observed in this office?
Valid Entries: Y, N

2.6 COIN RETURN POTENTIAL

Description: Enter the potential used by the office for coin return.
Valid Entries: "PLUS" or "MINUS"

2.7 EXPANDED INBAND SGNLING

Description: Is Expanded Inband Signaling provided in the office? Expanded Inband Signaling provides the 5ESS Switch with the ability to recognize a lengthened on-hook wink from the TSPS.
Valid Entries: Y, N

2.8 STUCK COIN REPORT

Description: This field identifies the frequency, in minutes, with which the Stuck Coin Report is printed.
Valid Entries: 15, 30, 45 or 60 minutes

2.9 LTP SCR

Description: Enter the Screening Index to be used for Logical Test Port calls. An entry must be made in this field if any of the following are supported by the office: ROTL, Remote TLWS or CTTU.

This Screening Index is accessed during digit analysis of ROTL (Remote Office Test Line) Security Callback and Connection Appraisal calls or termination to the Remote Talk and Monitor Telephone Numbers of either the Remote TLWS (Trunk and Line Work Station) or CTTU (Central Trunk Test Unit).

The Screening Index used should have the characteristics of a simple POTS line Screening Index, such as single party flat rate or equivalent.
Valid Entries: 1 - 4095

2.10 LTP DAS

Description: Enter the DAS (Digit Analysis Selector) to be used for Logical Test Port calls. An entry must be made in this field if any of the following are supported by the office: ROTL, Remote TLWS or CTTU.

This DAS is accessed during digit analysis of ROTL (Remote Office Test Line) Security Callback and Connection Appraisal calls or termination to the Remote Talk and Monitor Telephone Numbers of either the Remote TLWS (Trunk and Line Work Station) or CTTU (Central Trunk Test Unit).

The Digit Analysis Selector used should have the characteristics of a simple POTS line Digit Analysis Selector, such as single party flat rate or equivalent.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

2.11 AM ODD MEMORY SIZE

Description: This field is used to indicate the amount of memory in kilobytes to be reserved for the ODD (Office Dependent Data).

The basis for populating this field is the number of EOP (End-Of-Period) lines as it appears in 5DOPS (5ESS Switch Digital Ordering and Planning System).
Default:

Copyright © 2003 Lucent Technologies

5E15 and earlier: 10240

5E16 and later: 16384

Valid Entries: (see table)

Valid AM ODD MEMORY SIZE Entries

Software Release	VCDX	3B21	DRM
5E9(2) - 5E11	6144	3584	-
5E12	9216	10240	-
5E13	10240	10240	-
5E14 - 5E15	10240	10240	10240
5E16 and later	10240	16384	10240

2.12 ODD DISK SIZE

Description: This field indicates in kilobytes the amount of disk space available for disk resident ODD (Office Dependent Data).

The appropriate disk configuration for an office is based on formulas in 5DOPS (5ESS Digital Ordering and Planning System) which relate to the total SM ODD size and the AMA requirements of the office. DISK CONFIGURATION information is entered on the ECDOPT form.
Default:

5E8 and later: 8992
Valid Entries:

Valid ODD DISK SIZE Entries

Software Release	Values	DISK CONFIGURATION on ECDOPT form
5E8 and later	8992	63, 66

For 5E13 and earlier, the ODD DISK SIZE on the OFCOPT form must correspond to the DISK CONFIGURATION on the ECDOPT form. The ODD DISK SIZE on the OFCOPT form must correspond to the DISK CONFIGURATION on the RETINFO form.

2.13 EOP LINES

Description: Enter the EOP (End-Of-Period) lines.
Valid Entries: 0 - 99, 999

2.14 EOP TRUNKS

Description: Enter the EOP (End-Of-Period) trunks.
Valid Entries: 0 - 99, 999

2.15 EOP SCR

Description: Enter the EOP (End-Of-Period) Screening Indexes.
Valid Entries: 1 - 4095

2.16 EOP CDI

Description: Enter the EOP (End-Of-Period) Code Indexes.
Valid Entries: 1 - 4095

2.17 RCOSL

Description: This is a Recent Change only field used for Operations System.

Copyright © 2003 Lucent Technologies

NDC NTMOS/RCVERBOSE OPTS

The following fields are used to indicate whether or not the office has a link to NDC OS. Refer to Section 2.18 - Section 2.23 for individual field information.

2.18 EADAS LINK

Description: The EADAS LINK field is changed to TRFM LINK for 5E15 and later. See TRFM LINK below for usage information.

2.19 TRFM LINK

Description: Prior to 5E15, this field was called EADAS LINK. Is there a link to the Network Data Collections Operations System?
Valid Entries: Y, N

Data Rules:

For Flexible IOP Selection (5E4(2) and later), if "Y" is entered in this field, DEVICE TYPE on the ECDOPT form must be "SDL3".

2.20 RCVERBOSE

Description: This is a Recent Change only field which indicates whether a one line summary of Recent Change inserts, updates, deletes and failures is printed on the ROP (Receive Only Printer) after a Recent Change transaction has completed. If this option is set to "Y", all recent changes are logged to the ROP unless the user specifically sets the verbose option to "N".

2.21 RNM LINK

Description: Does this office have a direct link to the RNMC (Remote Network Management Center) system data link?

Software Release: 5E7 and later
Valid Entries: Y, N

Data Rules:

If RNM LINK is set to "Y", DEVICE TYPE on the ECDOPT form must be "SDL5". Conversely, if "N" is entered, DEVICE TYPE on ECDOPT form cannot be " SDL5".

2.22 TRFM RNM OPT

Description: The value of this field indicates which type of link (TRFM or RNM) is used for the TCP/IP link.

Software Release: 5E15 and later
Default: NONE
Valid Entries:

Valid TRFM RNM OPT Entries - 5E15 and later

Entry	Definition
BOTH	TRFM and RNM links are the TCP/IP links.
NONE	No TCP/IP links.
RNM	Remote Network Management Link is the TCP/IP link.
TRFM	Traffic Measurement Link is the TCP/IP link.

Data Rules:

When TRFM RNM OPT is "NONE", RNM LINK must be "N".

Copyright © 2003 Lucent Technologies

When TRFM RNM OPT is "RNM", RNM LINK must be "Y".

When TRFM RNM OPT is "TRFM", TRFM LINK must be "Y".

When TRFM RNM OPT is "BOTH", TRFM LINK must be "Y" and RNM LINK must be "Y".

When TRFM RNM OPT is "BOTH", "RNM" or "TRFM", LOC IDENT CODE must be entered.

TRFM RNM OPT can be set to "BOTH", "RNM" or "TRFM", when the ACT field for SFID 532 is set to "Y" on the SFSYS form (5713-1 Record).

2.23 LOC IDENT CODE

Description: The value of this field is the Common Language Location Identifier Code that is unique to the SPCS (Stored Program Control System).

Software Release: 5E15 and later.
Valid Entries: Blank, or 11 Alphanumeric Characters

LOC IDENT CODE must be entered when TRFM RNM OPT is "BOTH", "RNM" or TRFM".

2.24 ACTIVATE DIV OF REV

Description: Is the Division of Revenue feature to be activated?
Valid Entries: Y, N

2.25 DIV OF REV HOURLY RPTS

Description: Are the hourly Division of Revenue reports to be generated?
Valid Entries: Y, N

2.26 DIV OF REV COUNT TYPES

Description: Enter the type of Division of Revenue reports which are to be sent to EADAS.
Valid Entries: PEG, USAGE, or BOTH.

2.27 5 MIN PERM SIG THRESHOLD

Description: This field establishes a threshold for the number of permanent signal conditions appearing on lines within a 5 minute interval. When this threshold is exceeded, an alarmed message will be produced at the RSB (Remote Service Bureau), if equipped, or at the SCC (Switching Control Center).

The threshold value is dependent upon the number of lines in an office. A suggested value can be derived using the formula ((Number of Lines * 1/600) + 7). Employing this formula, a 5,000-line office would have a 5-Minute Permanent Signal Threshold value of 15.
Valid Entries: 4 - 90

2.28 VAR TIME PERM SIG THRESHOLD

Description: This field establishes a threshold for the number of permanent signal conditions appearing on lines within a variably set interval. When this threshold is exceeded, an alarmed message will be produced at the RSB (Remote Service Bureau), if equipped, or at the SCC (Switching Control Center).

The threshold value is dependent upon the number of lines in an office. A suggested value can be derived using the formula ((Number of Lines * 3/800) + 13). Employing this formula, a 5,000-line office would have a Variable Time Permanent Signal Threshold value of 31.

Copyright © 2003 Lucent Technologies

Valid Entries: 4 - 400

2.29 VAR TIME PERM SIG INTERVAL

Description: This field defines the interval, in minutes, for the Variable Timed Permanent Signal Threshold.
Valid Entries: 15, 30, 45 or 60 minutes

2.30 ALLOW TOUCH TONE FRAUD

Description: Can all customers in the database marked as DP (Dial-Pulse) only originate calls with DTMF (Dual Tone Multifrequency) station sets? This is also called Touch Tone fraud.
Default: N
Valid Entries: Y, N

2.31 PRINT TOUCH TONE FRAUD

Description: Should the TTY print a message whenever Touch Tone fraud occurs? This allows the maintenance personnel to change the database and either correct their records or have the Business Office contact the customer about paying for DTMF service.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, ALLOW TOUCH TONE FRAUD? must be "Y".

2.32 #DSN OPTION

Description: Is this a Defense Switched Network office?

Software Release: 5E3 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "N" is entered in the DSN OPTION? field, an entry in the BILLING DN field of the TKGRP form (5202 Record) is allowed for TRKCLS values of "LATA", "PF", "PFLASH", "PFITT", "LTPCLBCK", "LTPDFTAC", "LTPROTL", "EDSL", "EDSLHM", "IFOPER" and "IFTERM".

In a DSN office (DSN OPT is "Y"), if the AMA LENGTH field on the ACCTFD form (5623-1 Record) is set to 8, then the ACCT LENGTH field on the ACCTGP form (5623-2 Record) must be less than or equal to 7. If the AMA LENGTH field on the ACCTFD form is set to 15, then the ACCT LENGTH field on the ACTGP form must be less than or equal to 14.

For 5E9(1) and later, if the DSN OPT field is set to "Y", then:

- TIMING forms with a SERVICE CLASS of "PF" must conform to one of the two following rules:
  - if SIGNAL TYPE is "NONE", START SIGNAL must be "DIRC"
  - if SIGNAL TYPE is not "NONE", then it must be "DP", "TT" or "MF" and START SIGNAL must be "DLAY", "DLTN", "IMED", "WINK", "GRND", "LOOP" or "ANSDTONE".

- TIMING forms with a SERVICE CLASS of "LTOLLCON" must conform to one of the three following

Copyright © 2003 Lucent Technologies

rules:

- if SIGNAL TYPE is either "RPEO" or "RPTO", START SIGNAL must be "IMED";
- if SIGNAL TYPE is "NONE", START SIGNAL must be "DIRC";
- if SIGNAL TYPE is not "RPEO", "RPTO" or "NONE", it must be "DP" or "MF" and START SIGNAL must be "DLAY", "IMED", "WINK" or "DLTN"

- TIMING forms with a SERVICE CLASS of "PFLASH" must conform to one of the two following rules:
  - if SIGNAL TYPE is "NONE", START SIGNAL must be "DIRC";
  - if SIGNAL TYPE is not "NONE", it must be "DP", "TT" or "MF" and START SIGNAL must be "DLAY", "DLTN", "IMED", "WINK", "GRND" or "LOOP".

2.33 #CPE OPTION

Description: Is the 5ESS Switch configured as CPE (Customer Premises Equipment)?

This field is set to "Y" when the 5ESS Switch is configured as a privately-owned PBX.

When this field is "Y", the power level of dial tone generated by the switch is lowered and the loss plan for talking connections is altered.

When this field is "N", no digital loss is inserted on line-to-line connections, and no digital loss is inserted in the plan from the line to the trunk on line-to-trunk connections.

Software Release: 5E3 and later
Required Field for 5E4(2) and later.
Default: N
Valid Entries: Y, N

2.34 SES

Description: Enter the SES trunk group number. This entry is used to declare which trunk group is the Service Evaluation System trunk group for the office.

More than one TKGRP form can have a TRKCLS of "SES", but only one value can be entered for SES on the OFCOPT form. This means that the other trunks with TRKCLS "SES" will not have full [if any] SES functionality.

Software Release: 5E7 and later.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If SES is entered, then it must be defined as a TGN on the TKGRP form and TRKCLS must be set to "SES".

BATCH RC/V

Copyright © 2003 Lucent Technologies

The following fields (Section 2.35 - Section 2.40) are used for Batch Recent Change/Verify.

2.35 BATCH RC/V INTERVAL

Description: Enter the number of hours between scheduled Batch RC/V (Recent Change/Verify) releases.
Default: 1
Valid Entries: 0 - 24

- ***NOTE:*** Although zero is a legal value, it should not be entered because it means the Batch RC/V process would run continuously.

2.36 BATCH RC/V RELEASE TIME

Description: Enter the number of minutes past the hour that Batch RC/V changes should be released.
Default: 0
Valid Entries: 0 - 59

2.37 BATCH RC/V CLEANUP AGE

Description: Enter the number of days a Batch RC/V file may age before being cleaned up.
Default: 14
Valid Entries: 0 - 30

- ***NOTE:*** Although zero is a legal value, it should not be entered because it means the Batch RC/V file would be cleaned up in less than 24 hours, when the next Batch RC/V process begins.

2.38 BATCH RC/V CLEANUP TIME

Description: This field indicates what time to start the Batch RC/V cleanup process.
Default: 00:00
Valid Entries: 00:00 - 23:59 (hrs:min) where 00:00 is midnight.

2.39 BATCH RC/V INHIBIT

Description: Should the Batch RC/V process be inhibited?
Default: Y
Valid Entries: Y, N

2.40 BATCH CLEANUP INHIBIT

Description: Should the Batch RC/V cleanup process be inhibited?
Default: Y
Valid Entries: Y, N

TRUNK ERROR ANALYSIS

The following fields (Section 2.41 - Section 2.42) are used to analyze trunks.

2.41 ROUTE TO TERA?

Description: Should the MDIIs (Machine Detected Interoffice Irregularities) be sent to TERA (Trunk Error Analysis)?
Default: Y
Valid Entries: Y, N

2.42 ERROR THRESHOLD

Copyright © 2003 Lucent Technologies

Description: Enter the consecutive error count analysis threshold to be used in reporting Trunk port or UTD (Universal Tone Decoder) failures which are sent to TERA.
Default: 3
Valid Entries: 1 - 15

2.43 MFR REVERTIVE MANUAL?

Description: Are revertive calls originated by MFR (Multi-Frequency Ringing) customers to be completed manually via an operator?

Revertive calls are calls originated by one party of a multi-party line (i.e., they share common line equipment).

NOTE: Offices which do not have MFR customers should use the default value.
Default: N
Valid Entries: Y, N

2.44 2 PARTY ANI?

Description: Do calls originated by two party lines require ANI (Automatic Number Identification) or ONI (Operator Number Identification) for billing?

NOTE: For 5E5 and later, this field was moved to the IMINFO form (5510 Record).

Required Field.
Valid Entries: Y, N

2.45 LOCAL TRAF MEAS CHANNEL?

Description: For 5ESS Switch owners who do not utilize an EADAS (Engineering and Administrative Data Acquisition System), is a local traffic channel of the IOP (Input/Output Processor) equipped to print traffic reports locally or remotely or to collect the traffic reports for further processing by some other system?
Default: SUMMARY
Valid Entries:

Valid LOCAL TRAF MEAS CHANNEL Entries

Entry	Definition
BOTH	Both traffic measurement reports are printed.
SECTION	Traffic measurement section reports are printed.
SUMMARY	Traffic measurement summary reports are printed.

Data Rules:

If "SECTION" is entered, then TRAFFIC CHNL (TTY7) on the ECDOPT form must not be equipped.

If "SUMMARY" is entered, TRAFFIC CHNL (TTY7) on the ECDOPT form must be equipped.

2.46 IMLT-2?

Description: Does the office have the IMLT-2 (Integrated Mechanized Loop Testing) System?
Valid Entries: Y, N

Data Rules:

For Flexible IOP Selection (5E4(2) and later), if "Y" is entered in this field, then " SDL2" must be entered as a valid DEVICE TYPE on the EDCOPT form.

2.47 IMLT RETRY

Copyright © 2003 Lucent Technologies

Description: The IMLT (Integrated Mechanized Loop Testing) RETRY field indicates whether or not the IMLT retry timer should be activated.
Required field.

Software Release: 5E16(2) FR 1 and later
Default: N
Valid Entries: Y, N

Data Rules:

When IMLT RETRY is "Y", the ACT field for SFID 685 on the SFSYS form (5713-1 Record) must also be set to "Y".

2.48 IMLT RDELAY

Description: The IMLT RETRY time delay field indicates the amount of time in seconds that is designated for IMLT retry.
Required field.

Software Release: 5E16(2) FR 1 and later
Default: 25
Valid Entries: 1 - 60 seconds

2.49 #APPLICATION PROCESSOR

Description: Does the office have the Application Processor Option?

Software Release: 5E3 and later
Required Field.
Default: NO
Valid Entries:

Valid AP Entries - 5E4(2) and later

Entry	Definition
NO	No APs on this switch
AM	Only AM IOP APs on the switch
SM	Only ISDN SM APs on this switch
AMSM	Both AM IOP and ISDN SM APs on this switch.

Data Rules:

If the APCOMM form (5507 Record) is submitted, then APPLICATION PROCESSOR must be set to "Y".

2.50 CARRIER ID

Description: The Carrier Identification Code specifies the OSPS number associated with certain operator service features. It is used to route Carrier Interconnect calls when the line subscriber (or trunk) originates a CI call and does not explicitly dial an FGD CAC (Carrier Access Code) and has neither a PIC nor a Group PIC. The PIC (Presubscribed InterLATA Carrier) is assigned on the LINE or MLHLN forms. Group PICs may be assigned on IDPGP forms for terminals belonging to an Individualized Dialing Plan.

Software Release: 5E5 and later
Valid Entries:

For 5E9(1) and later: 0 - 9999

Data Rules:

If a Carrier Identification Code is entered, it must be defined on the ICF form (5305 Record), and for 5E8

Copyright © 2003 Lucent Technologies

and later, FEAT GRP on the ICF form must equal "D".

If CARRIER ID is not entered, then an FIXRT form must exist for each of the following FIXED ROUTE TYPE values:

- ANSTO
- DCOFHK
- IECFAIL
- INVPIC
- NO10XX
- NOACK
- NOSSD
- NOSTART
- OSANITO
- REQ10XX
- SSDOFHK

For 5E8 and later, if "OFFICE" CARRIER is 288 (0288 for 5E9(1) and later)and OFFICE TYPE is "Y" on this form, and "Y" is entered in OSPS TA on the OSPSOPT form (5424 Record), then at least one FIXRT form (5301-1 Record) must have a FIXED ROUTE TYPE of "OEASERR".

2.51 TOLL CARRIER

Description: Enter the presubscribed intraLATA toll carrier designation. This field supports the Intra-LATA PIC secured feature. For more information on this feature, see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 9999 or blank

Data Rules:

For 5E14 and later, the TOLL CARRIER entered requires a CARRIER ID on the ICF form with FEAT GRP equal to "D".

For 5E14 and earlier, if this field is entered, the TOLL CARRIER must be entered as the CARRIER ID on the ICF form (5305 Record).

This field is used by the Intra-LATA PIC feature. It is a secured feature that must be purchased by the office before the field can be entered. The ACT field for SFID 149 on the SFSYS (5713-1 Record) must be set to "Y", before this field can be entered.

2.52 ICLATA SCD IND

Description: Should Intra-LATA PIC Selective Carrier Denied 0- calls be routed to an announcement? Enter "Y" for routing to an announcement or "N" to route to LEC. This field supports the Intra-LATA PIC secured feature. For more information on this feature, see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

This field is used by the InterLATA Carrier's IntraLATA Capability Special Feature. It is a secured feature that must be purchased by the office before the field can be set to "Y", i.e., the ACT field for SFID 149 on

Copyright © 2003 Lucent Technologies

the SFSYS (5713-1 Record) must be set to "Y".

This field also requires the Selective Carrier Denial secured feature. Before this field can be set to "Y", the ACT field for SFID 13 on the SFSYS (5713-1 Record) must be set to "Y".

This field is used by the Alternate Local Service Provider Routing feature. It is a secured feature that must be purchased by the office before the field can be set to "Y". The ACT field for SFID 269 on the SFSYS (5713-1 Record) must be set to "Y".

2.53 RINGING TIMEOUT

Description: This field indicates in minutes how long ringing will continue if the following conditions do not occur: answer, abandon or overload. If the conditions are not met the call will unconditionally timeout. If this field is left blank, no timeout will occur.
Valid Entries: 2 - 32767 minutes

2.54 INTEROFFICE TRACE NUMBERS

Description: Enter a maximum of four 7- or 10-digit Interoffice Trace Numbers. All interoffice calls made to these designated Telephone Numbers will be traced.
Valid Entries: 7- or 10-digit TN (0 - 9)

2.55 CAMA - ONI TRUNK TROUBLE CODE NUMBERS

Description: If one or more Trunk Groups with a trunk class of CAMOPKEY are equipped in the office, a maximum of four 7-digit CAMA Trunk Trouble Code Numbers may be specified in these fields. These Telephone Numbers are used by the CAMA Operator when trouble is encountered on a particular call. The operator is able to key in one of these trouble code numbers and report the trouble.
Valid Entries:

- For 5E11 and earlier: 7-digit TN (0 - 9)
- For 5E12 and later: XXXXXXX where X is 0 - 9

Data Rules:

If these fields are left blank, all ONI calls will be redirected to the "CAMAONI" fixed route defined on the FIXRT form (5301-1 Record).

2.56 NM DEFAULT NPA

Description: This is the implied NPA for the office. The Area Code entered will be used for Network Management code control and for Carrier Interconnect calls when the Area Code is not analyzed in digit analysis forms of LDIT and INDIT as part of the Incoming Digits string. The Area Code to be entered is usually considered the Home NPA of the office and is most frequently implied for 7-digit calls by the originator. For cases where the Area Code entered here is not to be used, NPAs entered on the LDIT and INDIT will override the DEFAULT NPA.

If this office is equipped with the SSP 800 feature (SERV SWITCH PT set to "Y"), this field is used to determine if intraLATA routed numbers returned from the SCP database are to be routed as 7-digit calls. Refer to Division 2, Section 1X for more information on the SSP 800 feature.
Valid Entries: 200 - 999

2.57 NM SILC LEVEL 1

Description: This field is used by NM (Network Management) SILC (Selective Incoming Load Control). Enter a percentage of calls that will be blocked during machine congestion level 1.

Copyright © 2003 Lucent Technologies

Default: 0.0
Valid Entries: 0.0 - 100.0 in increments of 12.5

2.58 NM SILC LEVEL 2

Description: This field is used by NM (Network Management) SILC (Selective Incoming Load Control). Enter a percentage of calls that will be blocked during machine congestion level 2.
Default: 0.0
Valid Entries: 0.0 - 100.0 in increments of 12.5

2.59 COMMON CHAN SIG

Description: Does the office use CCS (Common Channel Signaling)?

For 5E11 and later, enter the CCS platform being used in this office.

Required Field for 5E11 and later.
Default: NO for 5E11 and later.
Valid Entries:
- For 5E10 and earlier: Y, N
- For 5E11 and later: See table below.

Valid COMMON CHAN SIG Entries

Entry	Definition
CNI	SS7 on CNI (Common Network Interface) platform is used in this office.
NO	No SS7 platform is used in this office.
PSU	SS7 on PSU (Packet Switch Unit) platform is used in this office.
ALL	Software Release: 5E12 and later CNI and SS7 are equipped in this office. This allows use of the CNI or a given GSM to signal for a specific ISUP trunk group. For reliability considerations, an ISUP trunk group can be added on a given GSM and use the GSM's PSU for signaling instead of the CNI ring. When using the PSU, all members of the given ISUP trunk group must physically reside on the given GSM. Only 16 GSMs are allowed in a given office; not all SMs can equip PSU signaled ISUP trunk groups. For TCAP applications (NS800, ASP, ISVM, CNAM, LASS), PSU signaling can be the application used when on a GSM. When on a non-GSM, the application must use the CNI for signaling.

Data Rules:

For 5E10 and earlier:

If "Y" is entered, at least one Link Node should be specified as "Y" on the ECDOPT form (5706 Record).

For 5E9(1) through 5E10:

- If "N" is entered, then SERV SWITCH PT? must be "N".

For 5E9(1) and later:

- If COMMON CHAN SIG is entered for a non-ATT office, only one Origination Point Code is allowed for CCS7 Trunk Groups. Thus, if the ORIG PT CODE on the TKGRP form (5202 Record) is entered, it must be the same on all TKGRP forms where it has been entered and it must match the OPC on the OFCOPT form.

For 5E11 and later:

Copyright © 2003 Lucent Technologies

If COMM CHAN SIG is set to "CNI" but does not agree with the data found in the office database, the discrepancy can cause serious problems during booting. Contact the Lucent Technologies Project Consultant at once.

The entry in this field must be consistent with the entry for the PRODUCT field on this form.

Only when COMMON CHAN SIG is "CNI" or "PSU" on this form, may ACT PT SDN be "Y".

If COMMON CHAN SIG is "NO" or "PSU" then:

- ORIG SCREEN OFF must be "N"
- ACTION POINT must be "N"
- ACT PT SDN must be "N"
- HOMENPA must not be entered.

CNI:
If COMMON CHAN SIG is "CNI" on this form with INPULSING/OUTPULSING set to "ISUP7" on the TKGRP form (5202 Record) or WB RATE is entered and INPULSING/OUTPULSING is set to "DCHN" on the TKGRP form, then LOCAL SM must be entered on the TKGRP form.

NO:
When COMM CHAN SIG is set to "NO", SERV SWITCH PT? must be "N".

COMM CHAN SIG must not be set to "NO" when INPULSING or OUTPULSING is "CCIS6" or "ISUP7" on the TKGRP form (5202 Record).

If COMMON CHAN SIG is "NO", the CCSRTI form(s) (5313 Record) should be defined.

When a DSAPP form (5537 Record) is entered, COMMON CHAN SIG can not be "NO".

PSU:
If COMMON CHAN SIG is "PSU" on this form with INPULSING/OUTPULSING set to "ISUP7" on the TKGRP form (5202 Record) or WB RATE is entered and INPULSING/OUTPULSING is set to "DCHN" on the TKGRP form, then LOCAL SM must be entered on the TKGRP form and LOCAL SM must match GSM on the CCGSM form (6008 Record).

If COMMON CHAN SIG is "PSU" on this form, then a CCGSM form must be defined.

If COMMON CHAN SIG is "PSU" on this form, then APPLIC on the DSAPP form (5537 Record) must be "ACND", "ASP", "ISVM", "LASS", "NS800", "AINR0D1", "LNACP", or "TNAI".

For 5E15 and later:

- when COMMON CHAN SIG is set to "PSU" or "ALL" on this form, the first three digits of DEST POINT CODE are not equal to "000", INPULSING/ OUTPULSING is set to "ISUP7" and LOCAL SM is known on the TKGRP form (5202 Record):
  - the LOCAL SM on the TKGRP form must match either the SM on the MDLNK form (6009 Record) or the NON GLOBAL SM on the CMTMH form (6021 Record); and
  - the GSM on the CCGSM form (6008 Record) must match either the SM on the MDLNK form or the GLOBAL SM on the CMTMH form.

- when COMMON CHAN SIG is set to "PSU" or "ALL" on this form, INPULSING/OUTPULSING is set to

Copyright © 2003 Lucent Technologies

"ISUP7", the first three digits of the DEST POINT CODE are not equal to "000" and LOCAL SM is unknown on the TKGRP form (5202 Record):

- the first three digits of TEN, DEN, or NEN for all members of that trunk group entered on the TRUNK form (5204 Record) must match either SM on the MDLNK form (6009 Record) or NON GLOBAL SM on the CMTMH form (6021 Record); and
- GSM on the CCGSM form must match either SM on the MDLNK form or GLOBAL SM on the CMTMH form.

ALL:
For 5E14 and later, when COMMON CHAN SIG is "ALL" on this form, the value of each ALIAS PC on the CCGSM form must not match either the value of OPC on the OFCOPT form or the value of ALIAS POINT CODE on the ALIASPC form.

2.60 DIRECT LINK NODE

Description: Does a DLN (Direct Link Node) exist in the CCS office?

Software Release: 5E4(2) and later
Valid Entries: Y, N

Data Rules:

For 5E10 and earlier:

If DIRECT LINK NODE is "Y", then COMMON CHAN SIG must be "Y".

For 5E11 and later:

If DIRECT LINK NODE is "Y", then COMMON CHAN SIG must be "ALL" or "CNI".

2.61 ORIG SCREEN OFF

Description: Is the office an Originating Screening Office for INWATS (800) calls?

For LEC switches, this field should be left blank or set to "N".
Valid Entries: Y, N

Data Rules:

If "Y" is entered, COMMON CHAN SIG must equal "Y" and HOME NPA must be entered.

With 5E4(2) and later, if ORIG SCREEN OFF is "Y" the SERV SWITCH PT must not be "Y".

If ORIG SCREEN OFF or SERV SWITCH PT is "Y", then if TRK DIR is "INC" and TRKCLS is not "DIOR", "TOPAS", "RMSD3", or "INAISTRK", and for 5E9(1) and later is also not "ACJCK", "BUSYVFY", or "LTOLLCON", then FAR END NPA must be entered on the TKGRP form.

For 5E9(1) and later, if "Y" is entered then SERV SWITCH PT? must not be "Y".

2.62 HOME NPA

Description: This field applies to any toll network switch that does 800 screening and is defined as an 800 originating screening office (ORIG SCREEN OFF set to "Y"). The HOME NPA represents the home NPA of the toll office doing the screening. It is used to determine whether or not the translated 800 number (POTS number) returned from the NCP/STP is within the Home NPA.

Copyright © 2003 Lucent Technologies

For LEC switches, this field should be blank.
Valid Entries: 200 - 999

Data Rules:

If ORIG SCREEN OFF is "Y", the Home NPA of the office must be entered otherwise it should be left blank.

2.63 ACT PT SDN

Description: Does the office serve as an ACP (Action Control Point) for the SDN (Software Defined Network)?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

An office serving as an ACP must provide CCS (Common Channel Signaling), therefore, if this field is "Y", then the COMMON CHAN SIG field must by "Y".

An office cannot serve as an ACP and an SSP (Service Switching Point), therefore, if this field is "Y", then the SERV SWITCH PT field must be "N".

For 5E7 and later, if SERV SWITCH PT or ACT PT SDN equals "Y", at least one SCFAM form (5536 Record) must exist.

For 5E9(1) and later, if "Y" is entered, then SERV SWITCH PT? may not be "Y".

2.64 #SERV SWITCH PT?

Description: Can this SSP (Service Switching Point) office process Number Services calls?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "Y", the LATA NUMBER field must be entered.

For 5E6 and later, if SERV SWITCH PT? is "Y", then incoming and two-way trunk groups (TRK DIR is "INC" or "2W" on the TKGRP form) must be assigned a FAR END NPA on the TKGRP form (5202 Record).

If ORIG SCREEN OFF or SERV SWITCH PT is "Y", then if TRK DIR is "INC" and TRKCLS is not "DIOR", "TOPAS", "RMSD3", or "INAISTRK", and for 5E9(1) and later is also not "ACJCK", "BUSYVFY", or "LTOLLCON", then FAR END NPA must be entered on the TKGRP form.

For 5E7 and later, if SERV SWITCH PT or ACT PT SDN equals "Y", at least one SCFAM form (5536 Record) must exist.

For 5E8 and later, if SERV SWITCH PT? is "N", on each ICF form where FEAT GRP equals "D" and CARRIER TYPE equals "LEC" or "PSEUDO", NS CDI and NS RTI must not be entered.

Copyright © 2003 Lucent Technologies

For 5E9(1) and later:

- If COMMON CHAN SIG is "N", then SERV SWITCH PT? must be "N".
- If "Y" is entered, then LATA NUMBER must be known.
- If ORIG SCREEN OFF is "Y", then SERV SWITCH PT? must not be "Y".
- If ACT PT SDN is "Y", then SERV SWITCH PT? may not be "Y".

For 5E11 and later:

When this field is "Y", ACT PT SDN must be "N".

2.65 LATA NUMBER

Description: Enter the LATA (Local Access and Transport Area) number for this office. For 5E11 and later, LATA fields were added to the DSAPP (5537 Record) and LCC (5306 Record) forms to support the TCAP Improvements for Switches Spanning Multiple LATAs feature which extends the operation of the current LASS features to support lines (or groups of lines) in LATAs other than the LATA specified on this OFCOPT form. For more information on this feature, see Division 2, Section 4A171.

Software Release: 5E4(2) and later
Valid Entries: 100 - 999

Data Rules:

For 5E9(1) - 5E10, this field must be entered if SERV SWITCH PT? is "Y".

For 5E11 and later, if this field is not entered, SERV SWITCH PT? must be "N".

2.66 EXTRA START WINK

Description: Does an Equal Access End Office expect to receive an extra start wink from an International Carrier over the shared Trunk Group to the access tandem?
Default: N
Valid Entries: Y, N

2.67 OPC

Description: OPC preserves the 9-character origination point code for an office having a CNI frame to support CCS7 trunking over retrofit. This is the same value as OPC on the TKGRP form. A value cannot be entered in this field.

For 5E9(1) and later, OPC indicates the office is using the AT&T format and therefore all the DEST PT CODE values on the TKGRP form must be in the correct format based on the first 3 digits. If the first 3 digits of the DEST PT CODE are 236 or 254 and match the first 3 digits of the OPC field, then the DEST PT CODE must be in the AT&T format, else the T1 CCS format will be used.

Software Release: 5E8 and later

Data Rules:

For 5E15 and later, if the first three digits of the OPC on this form are 236 or 254, then ISUP7 trunks in an AT&T-C office or a UNITEL office must be signaled via the CNI platform and one of the following conditions must exist:

- The Pseudo-Point Code Capability feature must be activated. (For a more detailed discussion of the

Copyright © 2003 Lucent Technologies

Pseudo-Point Code Capability feature, see Sections 6.5.52 and 6.5.57 of the 235-190-120 document.)

- The TCAP (Transaction Capabilities Application Part) Message Tandem feature must be activated. This is a secured feature that is activated by setting the ACT field for SFID (Secured Feature ID) 195 to "Y" on the SFSYS form (5713-1 Record). For more information on the TCAP Message Tandem feature, see Division 2, Section 4A195.

EQUAL ACCESS

The following fields (Section 2.68 - Section 2.71) are used only when this office serves as InterLATA Carrier switch (i.e. when the associated trunk groups have a TRKCLS of "LATA".

When overlap outpulsing is used by an EAEO (Equal Access End Office) for EA (Equal Access) Three-Stage Signaling, the overlap outpulsing timers will prevent abnormal holding of 5ESS Toll Switch resources.

2.68 TIME

Description: Enter the maximum time in milliseconds to wait between the Equal Access Signaling digit sequences (i.e., the ANI and address sequences). When EA (Equal Access) Three-Stage Signaling is used, the value entered in this field represents the maximum time allowed from the receipt of the last digit of the second stage to the receipt of the first digit of the third stage.
Default: 300000
Valid Entries: 2000 - 300000.

2.69 OVERLOAD TIME

Description: Enter the maximum time in milliseconds to use (instead of the value entered in TIME) when the switch is in overload condition.
Default: 15000
Valid Entries: 2000 - 15000

2.70 OFFICE TYPE

Description: Is this a switch owner toll office? "N" indicates this is a LEC (Local Exchange Carrier) office.

This field is used to allow software features which are to be used only in the switch owner network. It controls certain OSPS features and the Fully Coded Addressing feature that attaches specific digits to international calls processed in the switch owner network.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is "N", then the OFFICE CARRIER field will automatically be assigned a value of "000".

If this field is "Y" and the OFFICE CARRIER field has the value of 288 (0288 for 5E9(1) and later), indicating that this is a switch owner toll office, then each SMLDIT form (5315 Record) that is associated with a special Toll DAS value (81, 82, 89, 90, 91, 92, 97, 98) must include every SM in the office (i.e., all of the SMs defined on an EQIM form (5700-1 Record)). The SMLDIT form is associated with a DAS value via the LOCAL DIT field on a DAS form (5300-1 Record).

If the OFFICE TYPE has a value of "Y", the OFFICE CARRIER field has a value of "288" (0288 in 5E9(1)

Copyright © 2003 Lucent Technologies

and later)indicating that this is a switch owner toll office; and in addition, the ACT PT SDN field on the OFCOPT form is "Y", indicating that this office serves as an ACP (Action Point) for the SDN (Software Defined Network); then, the SMLDIT form which is associated with the Toll DAS value of 88 must include every SM that has any trunks which are defined on the TKGRP form with INPULSING set to "ISUP7" or ACP SDN set to "Y". (The associated SM(s) can be found in the first three digits of the DEN, TEN, or (for 5E9(2) and later) NEN field on all related TRUNK forms.)

For 5E8 and later, if OFFICE TYPE is "Y", then RCD 3PT1 ITC on the TKGRP form (5202 Record) must not be entered and, RCD 3PT1 ITC on this form must be "3PT1KHZ".

For 5E14 and later, when DRM is "Y" on the EQCORE form, OFFICE TYPE must be "N".

2.71 OFFICE CARRIER

Description: For a 5ESS Toll Switch, the international carrier identification of the office should be entered in this field.

The Carrier Identification Code entered in this field is also the OSPS backup carrier for operator services dialing and operator conferencing when the designated carrier cannot handle the call. The carrier identification entered in this field is the primary OSPS carrier used for back party recalls and operator delayed (booked) calls.

For AT&T switches, enter 288 (0288 for 5E9(1) and later). For LEC (Local Exchange Carrier) owned switches, 0 should be entered even though such a switch may have toll functionality.

Software Release: 5E5 and later
Default: 000
Valid Entries:

For 5E9(1) and later: 0 - 9999 or LEC

Data Rules:

For 5E8 and later, if OFFICE CARRIER is 288 (0288 for 5E9(1) and later)and OFFICE TYPE is "Y" on this form, and "Y" is entered in OSPS TA on the OSPSOPT form (5424 Record), at least one FIXRT form (5301-1 Record) must have a FIXED ROUTE TYPE of "OEASERR".

For 5E9(1) through 5E13, the OFFICE CARRIER field must be entered as CARRIER ID on the ICF form if OFFICE CARRIER has a value other than "LEC".

For 5E14 and later, the OFFICE CARRIER field on the OFCOPT form is required to be entered as CARRIER ID with FEAT GRP equal to "D" on the ICF form, if OFFICE CARRIER has a value other than "LEC".

AMA RECORDING OPTIONS

The following fields (Section 2.72 - Section 2.103) are used for AMA billing. All the AMA RECORDING OPTIONS must be entered.

2.72 AMA METHOD

Description: Enter the method to be used for AMA billing.

- ***NOTE:*** For 5E5 and later, if "NONE" is entered a warning message will be displayed to alert the office that all billing WITHIN the office has ceased. (Billing could be handled externally through CAMA facilities.)

Default: AMATPS

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid AMA METHOD Entries

Entry	Definition
AMATPS	Allows a small office to use teleprocessing. Enter this value if the office uses LAMA (Local AMA).
AMATPS1	Makes the billing system act like AMATPS, but should only be used when the office is normally a Dual Stream office that is operating in a "degraded" single stream mode defaulting to Stream 1.
AMATPS2	Should only be used when the office is operating in a "degraded" single stream mode defaulting to Stream 2.
AMADUAL	Allows the office to operate as a full Dual Stream office, with billing traffic going to two separate streams. This allows large offices to process and send two separate billing streams simultaneously.
NONE	Turns off all billing options in an office except for CAMA billing.

2.73 AMADNS ACTIVE

Description: Use the Automatic Message Accounting Data Networking System billing interface?

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered:

- SFID 328 on the SFSYS form must be set to "Y".
- AMA METHOD field must be set to "AMATPS" or "AMATPS1".

2.74 MIN AMA ALRM

Description: Enter AMA Disk Writer Minor Alarm setting as a percentage of the total AMA disk storage. (See Division 2, Section 1AX, *Allow Craft To Set AMA Alarm Levels* for more information.)

Software Release: 5E8 and later
Required Field.
Default: 70 (%)
Valid Entries: 0 - 96 (%)

Data Rules:

If MIN AMA ALRM must be at least 2 less than the value of MAJ AMA ALRM (given that MAJ AMA ALRM is populated with a valid value 2 - 98), and at least 4 less than the value of CRIT AMA ALRM, (given that CRIT AMA ALRM is populated with a valid value 4 - 100).

2.75 MAJ AMA ALRM

Description: Enter AMA Disk Writer Major Alarm setting as a percentage of the total AMA disk storage. (See Division 2, Section 1AX, *Allow Craft To Set AMA Alarm Levels* for more information.)

Software Release: 5E8 and later
Required Field.
Default: 90 (%)
Valid Entries: 2 - 98 (%)

Data Rules:

Copyright © 2003 Lucent Technologies

If the value of MAJ AMA ALRM must be at least 2 greater than the value of MIN AMA ALRM (given that MIN AMA ALRM is populated with a valid value 0 - 96), and at least 2 less than the value of CRIT ALRM (given that CRIT AMA ALRM is populated with a valid value 4 - 100).

2.76 CRIT AMA ALRM

Description: Enter AMA Disk Writer Critical Alarm alarm setting as a percentage of the total AMA disk storage. (See Division 2, Section 1AX, *Allow Craft To Set AMA Alarm Levels* for more information).

Software Release: 5E8 and later
Required Field.
Default: 100 (%)
Valid Entries: 4 - 100 (%)

Data Rules:

If the value of CRIT AMA ALRM must be at least 4 greater than the value of MIN AMA ALRM (given that MIN AMA ALRM is populated with a valid value 0 - 96), and at least 2 greater than the value of MAJ AMA ALRM (given that MAJ AMA ALRM is populated with a valid value 2 - 98).

2.77 ISDAMAOPT

Description: This field is used to select the type of AMA records generated as a result of CSD (Circuit-Switched Data) calls. Should voice ("Y") or data ("N") structure and call codes be used in the AMA record for CSD calls?

When "N" is entered, the existing 5E3 and later implementation of AMA call codes and structure codes for CSD calls are used.

When "Y" is entered, the existing voice call codes and structure codes are used for CSD calls.

When either "N" or "Y" is entered, an EBAF (Extended Bellcore AMA Format) record is appended to the AMA record. This appended record contains information about the type of service invoked by the CSD call. A 070 Module is appended when a signaling/supplementary service is invoked, otherwise, Module 071 is appended.

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.78 ISVAMAOPT

Description: This field is used to select the type of AMA records generated as a result of CSV (Circuit-Switched Voice) calls.

When "Y" is entered, either module AAA or BBB is always appended to an existing voice structure code, depending upon whether a signaling/supplementary service is used in the call.

When "N" is entered, a data module is not appended unless a signaling/supplementary service is used, in which case module AAA is used.

In addition, an EBAF (Extended Bellcore AMA Format) record is appended to the AMA record. This appended record contains information about the type of service invoked by the CSD call.

When "Y" is entered, either the 070 Module or 071 Module will always be appended to the record. Module 070 is appended when a signaling/supplementary service is invoked, otherwise, Module 071 is appended. When "N" is entered, no EBAF record is appended unless a signaling/ supplementary service is used.

Copyright © 2003 Lucent Technologies

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.79 SHORT SUPERVISORY TRANSITIONS

Description: Are Short Supervisory Transitions (also referred to as Signaling Irregularities) recorded for all billable calls?

When set to "Y", up to 16 Short Supervisory Transitions can be recorded per call.
Default: N
Valid Entries: Y, N

2.80 LOCAL ANSWERED CALLS?

Description: Should local answered calls generate AMA data?

An entry of "N" indicates that calls will not be recorded on AMA for Tracer Types defined as local on the 5506 Record (AMACT form). This is intended to be used in case of trouble to enable higher revenue calls to continue to be recorded.
Default: Y
Valid Entries: Y, N

2.81 LOCAL ABANDONS?

Description: Should AMA data be recorded for abandoned local calls?
Default: N
Valid Entries: Y, N

Data Rules:

If the entry is "Y", calls recorded will be those defined as LOCAL in the STUDY TYPE field of the AMACT form (5506 Record).

2.82 TOLL ABANDONS?

Description: Should AMA data be recorded for abandoned toll calls?
Default: Y
Valid Entries: Y, N

Data Rules:

If the entry is "Y", calls recorded will be those defined as TOLL in the STUDY TYPE field of the AMACT form (5506 Record).

2.83 SPECIAL ABANDONS?

Description: Should AMA data be recorded for abandoned calls which are associated with particular AMA Call Types that are being used for special studies?
Default: N
Valid Entries: Y, N

Data Rules:

The special study AMA Call Types must be defined on the AMACT form.

Copyright © 2003 Lucent Technologies

2.84 ALL ABANDONS?

Description: Should AMA data be recorded for all abandoned calls?
Default: N
Valid Entries: Y, N

Data Rules:

If the entry is "Y", calls recorded will be those defined as "LOCAL", "TOLL" and "OTHER" in the STUDY TYPE field of the AMACT form (5506 Record).

2.85 SSU ON LOCAL CALLS?

Description: Should the Switch Supervisory Unit (also referred to as the Trunk Network Number) be recorded for local calls?
Default: N
Valid Entries: Y, N

2.86 SSU ON TOLL CALLS?

Description: Should the Switch Supervisory Unit (also referred to as the Trunk Network Number) be recorded for toll calls?
Default: N
Valid Entries: Y, N

2.87 LOCAL COIN

Description: Should AMA records be generated for local-coin sent-paid calls? When LOCAL COIN is set to "Y", an AMA record will be generated for each local sent-paid coin phone call not involving an operator. This field is used by the Coin Line AMA Secured Feature; for more information, see Division 2, Section 4A70.

Software Release: 5E7 and later
Default: N
Valid Entries: Y, N

Data Rules:

This field is used by the Coin Line AMA, a secured feature, and must be purchased by the office; therefore, the SFID 70 on the SFSYF form (5713-1 Record) must be set to "S" or "Y", before "Y" can be entered in this field.

2.88 SSU ON ALL CALLS?

Description: Should the Switch Supervisory Unit (also referred to as the Trunk Network Number) be recorded for all calls?
Default: N
Valid Entries: Y, N

2.89 TERMINATING INTERLATA?

Description: Should terminating call recording be done on calls received from InterLATA Carriers associated with CI (Carrier Interconnect)?

This is considered the master switch for CI terminating billing.

If this entry equals "N", the Charge Index options for Feature Group B and D Terminating LATA billing will

Copyright © 2003 Lucent Technologies

be ignored.
Default: Y
Valid Entries: Y, N

2.90 SSU ON INTERLATA?

Description: Should the Switch Supervisory Unit (also referred to as the Trunk Network Number) be recorded on answered InterLATA calls?
Default: N
Valid Entries: Y, N

2.91 HR INWATS OVERFLOW RECORD?

Description: Should the hourly AMA records be produced for the cumulative count of overflows due to busy INWATS terminating Multiline Hunt Groups?
Default: N
Valid Entries: Y, N

2.92 DID TIMEOUT

Description: Enter the amount of time in minutes that a DID facility will be terminated without receiving answer supervision from the PBX before a DID study is generated by AMA. If 0 is entered, DID study records will not be generated.

Software Release: 5E6 and later
Required Field.
Default: 5
Valid Entries: 0 - 60 (minutes)

2.93 CMC WINK CONNECT

Description: Should the initial wink received from the FGD carrier be used as the CMC (Cellular Mobile Carrier) connect time? This parameter is used to determine the begin time for AMA Billing for calls from a CMC to an FGD (Feature Group D) Carrier. A "Y" indicates the connect time begins when the initial wink is received from the FGD carrier. The default value "N" indicates that the connect time begins when seizure is detected on an incoming trunk.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

2.94 AMA ERROR MIN ALARM

Description: Should a minor alarm be generated when AMALOST and AMAIRR records are sent to the ROP? This parameter is being added as part of the AMA ERROR LOG FILE feature. This parameter will NOT be coupled with the AMALOST and AMAERROR records that will be written to the new log file.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

2.95 LDC GEN TIME

Description: Enter the time of day to generate AMA Long Duration Call records. The entry must be in the format of HH:MM where HH is the hour and MM is the minute. Enter midnight as 00:00. All five

Copyright © 2003 Lucent Technologies

characters, including the colon, must be entered. This field supports the AMA Long Duration Recording Duration Enhancements feature. For more information on this feature, see Division 2, Section 1AP.

Software Release: 5E10 and later
Required Field.
Default: 00:00
Valid Entries: HH:MM, where
- HH is 00 - 23
- MM is 00 - 59

2.96 TRUNK

Description: Should the trunk module be appended to AMA Records? This field was added for the Local Trunk Billing Enhancements secured feature. For more information concerning this feature, see Division 2, Section 4A278.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The Local Trunk Billing Enhancements secured feature that must be purchased by the office, and the ACT field for SFID 278 on the SFSYS form must be set to "Y" before the TRUNK field on the OFCOPT form can be set to "Y".

2.97 OPER

Description: Should an AMA Record be generated for operator services? This field was added for the AMA Recording Capabilities for Unbundled Local Switching secured feature. For more information concerning this feature, see Division 2, Section 4A281.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The AMA Recording Capabilities for Unbundled Local Switching is a secured feature that must be purchased by the office, and the ACT field for SFID 281 on the SFSYS form must be set to "Y" before the OPER field on the OFCOPT form can be set to "Y".

2.98 ORIG UNBUNDLED

Description: This field is used to control AMA (Automatic Message Accounting) recording for originating unbundled lines.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the ORIG UNBUNDLED , ORIG RESOLD, TERM UNBUNDLED or TERM RESOLD fields are set to

Copyright © 2003 Lucent Technologies

"Y", or the UNBLD/RESLD SC field is set to "001", the ACT field for SFID 321 on the SFSYS form (5713-1 Record) must be set to "Y".

2.99 ORIG RESOLD

Description: This field is used to control AMA (Automatic Message Accounting) recording for originating resold lines.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

2.100 TERM UNBUNDLED

Description: This field is used to control AMA (Automatic Message Accounting) recording for terminating unbundled lines.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

2.101 TERM RESOLD

Description: This field is used to control AMA (Automatic Message Accounting) recording for terminating resold lines.

Software Release: 5E12 and later
Required Field.
Default: N
Valid Entries: Y, N

2.102 UNBLD/RESLD SC

Description: This field is used to select the structure code to be used when a Call Type Record CC126 or CC128 is generated through theAMA (Automatic Message Accounting) Recording for Resale and Unbundled. For further information on this feature, see Division 2, Section 4A321.

Software Release: 5E12 and later
Required Field.
Default: 500
Valid Entries: 001 or 500

2.103 AMA AIN BUSY NA

Description: Is the AMA Recording for AIN Busy and Don't Answer Calls feature active? This field supports the AMA Recording for AIN Busy and Don't Answer Calls secured feature. For more information on this feature, see Division 2, Section 4A166. When this field is set to "Y", busy or abandoned ASP calls with a pending AMA record will generate an XX220 or XX221 record. When this field is set to "N", busy ASP calls with a pending AMA record will not generate a record. Existing AMA functionality will determine whether abandoned or unanswered ASP calls with a pending AMA record will generate a record.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E10 and 5E11
Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

Data Rules:

The SFID 166 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set to "Y".

When this field is set to "Y" and the AMA Recording - IN Busy Don't Answer secured feature has been purchased with SFID 166 ACT field set to "Y" on the SFSYS form, then SFID 126 ACT field on the SFSYS form must also be set to "Y".

TESTING OPTIONS

The following fields (Section 2.104 - Section 2.107) are used for Automatic Line Insulation Testing.

2.104 ALIT START TIME

Description: Enter the scheduled start time for ALIT (Automatic Line Insulation Testing).
Valid Entries: 00:00 - 23:59 (hrs:min) where 00:00 is midnight.

Data Rules:

If any ALIT option is entered, all ALIT fields must have an entry.

2.105 ALIT DURATION

Description: Enter the duration, in hours, of ALIT (Automatic Line Insulation Testing).
Valid Entries: 0 - 8

Data Rules:

If any ALIT option is entered, all ALIT fields must have an entry.

2.106 ALIT RANGE

Description: Enter the resistance range to be used during ALIT testing. A higher resistance range gives a greater test sensitivity.

Valid ALIT RANGE Entries

Resistance Range	ALIT Pack Equipped		
	TN 330	**TN 329**	**TN 328**
A	320 K ohms	80 K ohms	80 K ohms
B	1.25 M ohms	320 K ohms	160 K ohms
C	2.5 M ohms	1.25 M ohms	640 K ohms
D	5.0 M ohms	5.0 M ohms	2.5 M ohms

Data Rules:

If any ALIT option is entered, all ALIT fields must have an entry.

2.107 ALIT TYPE

Description: Enter the ALIT test type desired for the office.

Valid ALIT TYPE Entries

Entry	Definition
FEMF	Foreign potential on-line test, with retest on failure.
SRG	Short circuit and Ring to Ground test, with retest on failure.
TRG	Tip or Ring to Ground test, with retest on failure.
GEN	General test, which incorporates FEMF plus SRG plus TRG tests, with no retest on failure.

Copyright © 2003 Lucent Technologies

Data Rules:

If any ALIT option is entered, ALIT Type must have an entry.

APT TESTING

The following fields are used to designate the start time, duration and the algorithm, number of processes, day on which APT Testing should be done. Refer to Section 2.108 - Section 2.112 for individual field information.

2.108 ALGORITHM

Description: This field indicates the algorithm used for offices in APT (Automatic Progression Testing) for trunks on DS1s (Digital Signal Level 1). Analog trunks are tested sequentially during APT testing independently. This field supports the APT Enhancements feature. For information on this feature see, Division 2, Section 2AD.

Required Field.

Software Release: 5E16 FR2 and later
Default: SEQN
Valid Entries:

Valid ALGORITHM Entries

Entry	Definition
1ONLY	Test One Only (test one trunk only on the DS1, independently on this field value whether test passes or fails and then move to a trunk on another DS1).
FULL	Full (test all trunks on the DS1, independently on this field value whether test passes or fails, and then move to a trunk on another DS1).
SEQN	Sequential (APT should test all trunks sequentially in the office, independently on APT testing algorithm settings for individual DS1s).
SUCC	Stop on Success (test one trunk on the DS1 and then move to a trunk on another DS1 if test passes, or test next trunk on the same DS1 if test fails).

Data Rules:

When ALGORITHM is "'SEQN", PROCS NBR must be 2.

2.109 PROCS NBR

Description: This field indicates the maximum number of concurrent APT (Automatic Progression Testing) processes that can be running. This field supports the APT Enhancements feature. For information on this feature see, Division 2, Section 2AD.

Required Field.

Software Release: 5E16 FR2 and later
Default: 2
Valid Entries: 1 - 8

2.110 APT START TIME

Description: Enter the scheduled start time for APT (Automatic Progression Testing) on trunks.
Valid Entries: 00:00 - 23:59 (hrs:min) where 00:00 is midnight.

Data Rules:

If any APT option is entered, all APT fields must have an entry.

Copyright © 2003 Lucent Technologies

2.111 APT DURATION

Description: Enter the duration, in hours, of APT (Automatic Progression Testing).
Valid Entries: 0 - 8

Data Rules:

If any APT option is entered, all APT fields must have an entry.

2.112 DAYS ON WHICH APT TESTING IS TO BE CONDUCTED:

This field contains an entry for every day of the week. Enter a "Y" opposite the appropriate day if APT testing is to be conducted on that day. Otherwise, enter "N".

Data Rules:
If any APT option is entered, all APT fields must have an entry.

2.113 OCTL TONE DURATION

Description: Enter the duration in tenths of a second for the Open Circuit Test Tone.
Default: 50 (5 seconds)
Valid Entries: 0 - 127

2.114 OCTL OPEN DURATION

Description: Enter the duration in seconds of the open circuit to be used during open circuit testing.
Default: 30
Valid Entries: 0 - 127 seconds.

TWS FOR 101TL:

The following fields (2.89 - 2.91) are used to specify the order of priority for terminating incoming 101 Test Line calls. Duplicated designations are not allowed.

2.115 FIRST

Description: Enter the priority order of the TWS (Trunk Work Stations) to be used for terminating incoming 101 Test Line calls.
Default: "LOCAL"
Valid Entries:

Valid TWS FOR 101TL Entries

Entry	Definition
LOCAL	Local TLWS (Trunk and Line Work Stations).
REMOTE	Remote TLWS (Trunk and Line Work Stations).
CTTU	Central Trunk Test Unit.

2.116 SECOND

Description: Enter the priority order of the TWS (Trunk Work Stations) to be used for terminating incoming 101 Test Line calls.

Valid TWS FOR 101TL Entries

Entry	Definition
LOCAL	Local TLWS (Trunk and Line Work Stations).
REMOTE	Remote TLWS (Trunk and Line Work Stations).
CTTU	Central Trunk Test Unit.

2.117 THIRD

Copyright © 2003 Lucent Technologies

Description: Enter the priority order of the TWS (Trunk Work Stations) to be used for terminating incoming 101 Test Line calls.

Valid TWS FOR 101TL Entries

Entry	Definition
LOCAL	Local TLWS (Trunk and Line Work Stations).
REMOTE	Remote TLWS (Trunk and Line Work Stations).
CTTU	Central Trunk Test Unit.

MSU/MMSU ALARMS CONTROLS/REPORTS

The following fields (Section 2.118 - Section 2.122) are used for MSU/MMSU Alarms.

2.118 MISCELLANEOUS ALM OPT

Description: Is the office equipped with the MSU/MMSU Miscellaneous Alarms option?
Default: N
Valid Entries: Y, N

2.119 #OVERLAP SIZE

Description: Enter the number of digits in the message that it sends from originating treatment to terminating treatment to outpulse to the external operator system when overlap outpulsing is in effect.

Software Release: 5E4(2) and later
Required Field.
Default: 1
Valid Entries: 1 - 15

2.120 #DN PRIVACY?

Description: Is DN (Directory Number) privacy on for the office?

This field should not be used when the office does not have all-call DN privacy assigned properly to the terminals in the office. In this way, the calling DNs will not be displayed until the data in the office has been set up correctly.

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If this field is set to "N", DN Privacy is not turned on for the office, but is turned on individually for each terminal (analog or ISDN) if DN Privacy is assigned to the terminal. Calling DNs can be displayed at those ISDN terminals that have the Calling Number Delivery feature. If this field is set to "Y", then the calling DN will not be displayed even if the terminal has the Calling Number Delivery feature.

2.121 ISP DIGITS

Description: This field indicates the number of digits that must be collected before outpulsing can occur when an operator calls through the ISP (Intermediate Switch Point).

Software Release: 5E4(2) and later
Required Field.
Default: 2
Valid Entries: 2 - 31

Copyright © 2003 Lucent Technologies

2.122 FAIL ID

Description: This field indicates the destination index of the operator system announcement to route operator calls when the carrier cannot be determined because of a failure in digit reception from the local office.

Software Release: 5E4(2) and later
Valid Entries: 0 - 9999 or LEC

LEASED NETWORK

The following fields (Section 2.123 - Section 2.129) are parameters used for Leased Networks.

The fields (8 HR SCAN, 8 HR START, and 8 HR FREQ) are parameters used for the 8-hour passed MDR (Message Detail Recording) feature. The 8-hour passed MDR feature generates an additional MDR record for calls that have been in progress for 8-hours or more. The 8-hour passed MDR feature is assigned to a MDR Group by entering "Y" in the 8 HR PASSED field on the MDRGP form (5624-2 Record).

2.123 8 HR SCAN

Description: Should the 8-hour passed scanning software be activated?

The scanning software looks for calls that have been in progress for at least 8 hours. When the 8-hour passed scanning software is activated, the frequency of scanning will be determined by the values entered in the 8 HR START and 8 HR FREQ fields.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the 8-hour passed scanning is activated, then an 8-hour passed MDR record will be generated when a call has been in progress for 8-hours or more and the 8-hour passed MDR feature has been assigned on the MDRGP form.

If this field is "N", the scanning software will not be activated, therefore, an 8-hour passed MDR record will not be generated even if a "Y" is entered in the 8 HR PASSED field on the MDRGP form.

2.124 8 HR START

Description: Indicate the starting time of the scanning software in hours past midnight. The scanning software looks for calls that are assigned the 8-hour passed MDR feature and have been in progress for a least 8-hours. The scanning will be done periodically based on the value entered in the 8 HR FREQ field. a required field.

Software Release: 5E5 and later
Required Field.
Default: 1 (1 a.m.)
Valid Entries: 0 - 23 (hours past midnight)

2.125 8 HR FREQ

Description: Indicate the scanning frequency of the software in hours. The scanning frequency is how often the scanning software looks for calls that are assigned the 8-hour passed MDR feature and have been in progress for at least 8-hours.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Required Field.
Default: 8
Valid Entries: 2, 4, 6, or 8

For example, if 7 is entered in the 8 HR START field and 6 is entered in this field, scanning will occur at 7 a.m, 1 p.m, 7 p.m and 1 a.m.

2.126 TIME OUT

Description: This field specifies the number of seconds a Leased Network Action Control Point will wait for a response from the NCP (Network Control Point) before routing a call to reorder.

Software Release: 5E6 and later
Required Field.
Default: 4
Valid Entries: 2 - 6

2.127 GLBL TITLE

Description: This field is used by a Leased Network ACP (Action Control Point) when it queries the Network Control Point for routing and charging information. The field specifies a 6 digit global title, inserted by the ACP into the CCS7 SCCP header and translated by the STP (Signaling Transfer Point) into a Destination Point Code, to route a message to the NCP.

Software Release: 5E6 and later
Required Field.
Default: 0
Valid Entries: 0 - 999999

2.128 DAS

Description: This field specifies the DAS (Digit Analysis Selector) to be used for vacant code screening for Leased Network Action Control Point calls.

Software Release: 5E6 and later
Valid Entries:

Data Rules:

If entered, the Digital Analysis Selector must be defined on the DAS form (5300-1 Record). If the ACTION POINT field is "Y", this DAS may not appear on any TKGRP form.

2.129 ACTION POINT

Description: Is this office an Action Point for a Leased Network?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

All LN ACP offices must be equipped with a CCS7 CNI (Common Network Interface). Therefore, when ACTION POINT is "Y", COMMON CHAN SIG must also be "Y".

Copyright © 2003 Lucent Technologies

PPM PULSE WIDTH

The following fields (Section 2.130 - Section 2.132) are used to set the Battery reversal, Tone, and Third-wire PPM (Periodic Pulse Metering) pulse width for ISLUs.

2.130 #ISLU BATTERY

Description: This field indicates the ISLU Battery reversal PPM pulse width.

Software Release: 5E3 and later
Required Field.
Default: 0 ms
Valid Entries: 0, 100 - 800; in 50 ms increments.

2.131 #ISLU TONE

Description: This field indicates the ISLU tone PPM pulse width.

Software Release: 5E3 and later
Required Field.
Default: 0 ms
Valid Entries: 0, 100 - 800; in 50 ms increments.

2.132 #ISLU THIRD WIRE

Description: This field specifies the ISLU third-wire applique PPM pulse width.

Software Release: 5E3 and later
Required Field.
Default: 0 ms
Valid Entries: 0, 100 - 800; in 50 ms increments.

SPECIAL ACCESS

The following field is used for Special Features.

2.133 SP ACCESS

Description: Is the Special Access feature to be activated at this office?

The Special Access feature allows a customer to have a PBX (digital or analog) directly connected to the DLTU of a 5ESS Toll Switch.

This field must be "Y" if at least one Special Access customer is or will be connected to this switch.

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

CCS FEATURES

Available with 5E11 and later Software Releases, the following fields (Section 2.134 - Section 2.136) are used by the CCS (Common Channel Signaling) feature. These features are available for both the CNI-based SS7 signaling platform and the PSU-based SS7 (Signaling System 7) signaling platform.

2.134 EXPANDED SLS

Copyright © 2003 Lucent Technologies

Description: Is the Expanded Signaling Link Selection feature to be activated at this office? The SLS feature determines the specific links and STP (Signal Transfer Points) used to route a message. This field is used to indicate whether expansion on the SLS is allowed. Such expansion allows the maximum size of a "B" or "D" link set to be 16 links compared to the previous value of 8. The expansion also allows a more even traffic distribution on links in a (combined) link set, especially after link failures. This field on this form defines the feature only for the CNI-based SS7 signaling platform. For the PSU-based SS7 signaling platform, see Division 9, Section 10H.

This feature is a secured feature with SFID 175 which must be set to "Y" on the SFSYS form before it can be activated.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered,

- SFID 175 ACT on the SFSYS form must be "Y".
- COMMON CHAN SIG must be "ALL" or "CNI".
- CNI EQUIP must be "Y".

If SFID 175 is not set to "Y" on the SFSYS form, EXPANDED SLS must be "N".

2.135 IMPROVED SLT

Description: Is the Improved Signaling Test feature to be activated at this office? This feature adds two additional capabilities to the existing SLT procedure. The first improvement provides that the test pattern sent in the second signaling link test message is the same as that sent in the first signaling link test message. This allows the response to the first test message to be accepted as a response to the second test message, in effect, allowing twice the time for a response to the first signaling link test message. The second improvement provides that when the "test available (i.e., in-service) links periodically" option is on, the test should be performed even on links which are experiencing transmit or receive congestion. This field defines the feature for both CNI and PSU-based SS7 signaling platforms.

This feature is a secured feature with SFID 176 which must be set to "Y" on the SFSYS form before it can be activated.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered,

- SFID 176 ACT on the SFSYS form must be "Y".

If SFID 176 is not set to "Y" on the SFSYS form, IMPROVED SLT must be "N".

2.136 MTP NODE RESTART

Copyright © 2003 Lucent Technologies

Description: Is the Message Transport Protocol feature to be activated at this office? This feature enables the MTP to bring sufficient signaling links into the available state to handle the expected traffic and to stabilize its routing before user traffic is restarted at a signaling point that has just become available. This procedure uses the TRA (Traffic Restart Allowed) and the TRW (Traffic Restart Waiting) messages. This field defines the feature for both CNI and PSU-based SS7 signaling platforms.

This feature is a secured feature with SFID 177 which must be set to "Y" on the SFSYS form before it can be activated.

Software Release: 5E11 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered,

- SFID 177 ACT on the SFSYS form must be "Y".

If SFID 177 is not set to "Y" on the SFSYS form, MTP NODE RESTART must be "N".

2.137 FALSE LINK CONG

Description: This field is used to display the false link congestion level.

Software Release: 5E13 and later
Required Field.
Default: LVL2
Valid Entries: None, LVL1, or LVL2

ADV SVC PLATFORM

Available with 5E6 and through 5E11 Software Releases, the following fields (Section 2.138 - Section 2.149) are used by ASP (Advanced Services Platform). For 5E12 and later, the following fields have been moved to the ASPOPT form (5670 Record). See Division 4, Section 31G.

2.138 MAX TRIG

Description: Enter the number of times an ASP call can serially trigger.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Valid Entries: 1 - 6

Data Rules:

When MAX TRIG is entered, then ASP OFC must be "SSP".

2.139 ACG FNL TRMT

Description: Enter the ACG (Automatic Call Gap) final treatment for calls blocked due to ACG controls.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11

Copyright © 2003 Lucent Technologies

Required Field.
Default: RT
Valid Entries:

Valid ACG FNL TRMT Entries	
Entry	**Definition**
RT	Reorder tone.
VA	Voice announcement. Routed to the "NCA" (National Congestion Announcement (no circuits available) Fixed Route Type.

2.140 RDRCT THRES

Description: Enter the Forward Call Redirection Threshold, the number of times an ASP call can be forwarded.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Valid Entries: 1 - 10

Data Rules:

When RDRCT THRES is entered, then ASP OFC must be "SSP".

Since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, RDRCT THRES must not be entered until SFID 126 ACT on the SFSYS form has been set to "Y".

2.141 ESC CD CNTL

Description: Can escape codes be used on dialed digits following the detection of an 0ZZ shared interoffice trigger on the INDIT form?

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When ESC CD CNTL is entered, then ASP OFC must be "SSP".

Since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, ESC CD CNTL must be "N" until SFID 6 ACT and SFID 126 ACT on the SFSYS form have been set to "Y".

2.142 INT OFC TRIG

Description: Enter the shared interoffice trigger number.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Valid Entries: 1 - 255

Data Rules:

When INT OFC TRIG is entered, then ASP OFC must be "SSP".

Copyright © 2003 Lucent Technologies

When INT OFC TRIG is entered, it must equal TRIG NBR on an NSTRIG form, where APPLICATION equals "ASP".

2.143 SCP DAS

Description: Enter the single DAS value for SCP return route trunk ASP calls.

NOTE: For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When SCP DAS is entered, then ASP OFC must be "SSP".

When an SCP DAS is entered, it must be defined on an associated DAS form.

2.144 ASP OFC

Description: Enter the type of ASP (Advanced Services Platform) support to be provided by this office.

NOTE: For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E6 through 5E11
Required Field.
Default: NONE
Valid Entries:

Valid ASP OFC Entries

Entry	Definition
NONE or N	This office does not support ASP.
SSP or S	This office is an ASP SSP (Service Switching Point).

Data Rules:

For 5E6 and later, since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, ASP OFC must be "NONE" until SFID 58 on the SFSYS form has been set to "S" or "Y".

For 5E8 and later, if ASP OFC is not "SSP", NATURE OF NBR on all LDIT, MLDIT (5300-3 Record), or RDIT forms (5300-7/8 Record), and NON on all LDIT or RDIT forms must not be entered.

NONE For 5E8 and later, if "NONE" is entered,

- MAX CONV must be 5.
- NSTRIG forms must have APPLICATION equal to "E911" or 800.
- No CFGGRP forms (5964 Record) may exist with BUTTON LIST ACTION(s) of "ASPUSE".
- No ICF forms may exist with ASP CDI or ASP RTI entered.
- No MCRTIDX forms (5304 Record) may exist with MC ROUTE TYPE equals "ASP".
- No IDPDCA forms may exist with ACTION or CONFLICT ACTION equal to "IDPASP" (For 5E9(1) and later, "ASPDNC", "ASPNORM", "ASPVAR").

Copyright © 2003 Lucent Technologies

For 5E9(1) and later, if ASP OFC equals "NONE", no PDIT forms may exist with ACTION equals "ASPDNC", "ASPNORM", or "ASPVAR".

For 5E10 and later, when the OFCOPT form has ASP OFC defined as "NONE", there is no office support for ASP. The ICF forms can have neither ASP TF CDI nor ASP TF RTI entered.

SSP - For 5E8 and later, if ASP OFC equals "SSP"

- and APPLICATION equals "ASP" (and for 5E9(1) and later, AIN REL equals "R0") on an NSTRIG form (5324 Record), SERV KEY on that NSTRIG form must equal "CDPN" or "ANI".
- for 5E9(2) and earlier, there must be a FIXRT form where FIXED ROUTE TYPE equals "NSANNC", and where CHARGE INDEX is not entered.
- Any MCRTIDX forms where MC ROUTE TYPE equals "ASP" must not have TRUNK GROUP NUMBER, DIGITS TO BE DELETED, PREFIX DIGITS, NEXT ROUTE, or NEXT MC ROUTE INDEX entered.
- A DSAPP form (5537 Record) must exist with APPLIC set to "ASP". For 5E9(1) and later, a DSAPP form must exist with APPLIC set to "ASP" or "AINR0D1".

For 5E9(1) and later, if ASP OFC is "SSP", then:

- ASP ANI and PSEUDO CARR must be entered;
- MAX TRIG must be entered;
- INT OFC TRIG must be entered.
- since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, MAX TRIG must equal 3 unless SFID 126 ACT on the SFSYS form has been set to "Y".
- for 5E9(1) only, if APPLIC is "ASP" on the DSAPP form (5537 Record) and the field HAVE THE DIALING PLANS FOR ASP USERS BEEN REVIEWED? is "N" on the ODAOPT form (5523 Record), data changes may be required for the continued seamless operation of the ASP capabilities after the office has retrofitted to 5E9(1). Reference material is available in the *GUIDE TO ASP DATA CHANGES* to assist in these changes.

If ASP OFC is not "SSP",

- there must be no SCFAM forms where STRUCT CODE FAMILY equals "ASP".
- NATURE OF NBR on all LDIT, MLDIT (5300-3 Record), or RDIT forms (5300-7/8 Record), and NON on all LDIT or RDIT forms must not be entered.
- there must be no SSPANN forms where CUST HDRID or CUST TRLID is entered.

2.145 PSEUDO CARR

Description: Enter the carrier ID that is to be outpulsed in the EA (Equal Access) signaling stream to the SSP. This carrier must also be defined in the Access Tandem as a pseudo carrier.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E6 through 5E11

Copyright © 2003 Lucent Technologies

Valid Entries:

For 5E9(1) and later: 0 - 9999

Data Rules:

If PSEUDO CARR is entered on this form, then it must be defined on the IFC form.

When ASP OFC is "SSP", then a PSEUDO CARRIER must be entered.

For 5E8 and later, PSEUDO CARR must equal CARRIER ID on an ICF form, with the ICF form's FEAT GRP equal to "D".

2.146 ASP ANI

Description: Enter the digits to be used as the ASP (Advanced Services Platform) ANI (Automatic Number Identifier). This ANI is used to distinguish an incoming EAMF/CCS7 trunk call as ASP. It is also used as the ANI II digits on an outgoing EAMF/CCS7 trunk when the SCP does not provide an OST (Originating Station Type) parameter to be outpulsed as the ANI II.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E6 through 5E11
Required Field.
Default: 100
Valid Entries: 00 - 99, but value 100 may be input to represent a "null" ASP ANI.

2.147 MAX CONV

Description: Enter the maximum number of conversations an ASP call is allowed to have, per transaction, with the SCP. (See Division 2, Section 4A on Secured Features for more information.)

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E8 through 5E11
Required Field.
Default: 5
Valid Entries: 1 - 30

Data Rules:

When ASP OFC is "NONE", MAX CONV must be 5.

This parameter is used by the Advanced Services Platform feature, which is a 5E6 and later Secured Feature that must be purchased by the office before the data may be set to a value other than the default. SFID 51 on the SFSYS form (5713 Record) is reserved for Advanced Services Platform and must be set to "S".

2.148 ASP RESP

Description: Enter the ASP (Advanced Services Platform) SCP response timer. This is the number of seconds an ASP call will suspend, waiting for the SCP to respond to the ASP query. When the SCP fails to respond in this specified time interval, the call is routed to reorder.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E6 through 5E11
Required Field.

Copyright © 2003 Lucent Technologies

Default: 3
Valid Entries: 1 - 5

2.149 ORIG NO ANS TIME

Description: Enter the timeout value in seconds for the ASP Originating No Answer Timer. This field supports the ASP BLNA (Busy Line No Answer) secured feature. For more information on this feature see Division 2, Section 4A147.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Valid Entries: 1 - 120 (seconds)

Data Rules:

This field is used by the ASP BLNA and ASP Originating Busy/No Answer Triggers with Extended Ringing secured features. Therefore, before this field can be entered, the ACT field for either SFID 147 or SFID 189 on the SFSYS form (5713-1 Record) must be set to "Y".

2.150 PRE QUERY SCR

Description: Should pre-query screening be ignored for 0+ prefix calls on a line with an Off-Hook Delay trigger? This field supports the ASP Pre-Query Screening for OHD Triggers secured feature. For more information on this feature, see Division 2, Section 4A178.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E10 and 5E11
Default: N
Valid Entries:

Valid PRE QUERY SCR Entries

Entry	Definition
Y	0+ calls will not be part of the pre-query screening.
N	0+ calls will be subject to screening.

Data Rules:

This field supports the ASP Pre-Query Screening for OHD Triggers secured feature and must be purchased before this field can be changed. Therefore, the ACT field for SFID 178 on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be changed.

2.151 ORIG BUSY TRG

Description: Enter the originating busy line trigger number. The trigger number is used to locate the unique network service when the busy line condition is encountered. Population of this field indicates that a query will be launched to an external database. This field supports the ASP Originating Busy/No Answer Triggers with Extended Ringing secured feature. For more information on this feature, see Division 2, Section 4A189.

- ***NOTE:*** For 5E11, the Recent Change View 8.1 field is ASP BL TRIG NBR.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E11
Default: 1 - 255

Copyright © 2003 Lucent Technologies

Data Rules:

ASP Originating Busy/No Answer Triggers with Extended Ringing is a secured feature. Before ORIG BUSY TRG or ORIG NO ANS TRG can be entered, SFID 189 ACT field on the SFYS form (5713-1 Record) must be set to "Y".

When ORIG BUSY TRG is entered, ORIG BUSY TRG must be defined on an NSTRIG form (5324 Record) as TRIG NBR. On the NSTRIG form, APPLICATION must be "ASP" and AIN REL must equal "R0D1".

2.152 ORIG NO ANS TRG

Description: Enter the originating no answer trigger number. The trigger number is used to locate the unique network service when a no answer condition is encountered. Population of this field indicates that a query will be launched to an external database. This field supports the ASP Originating Busy/No Answer Triggers with Extended Ringing secured feature. For more information on this feature, see Division 2, Section 4A189.

- ***NOTE:*** For 5E11, the Recent Change View 8.1 field is ASP NA TRIG NBR.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E11.
Default: 1 - 255

Data Rules:

ASP Originating Busy/No Answer Triggers with Extended Ringing is a secured feature. Before ORIG BUSY TRG or ORIG NO ANS TRG can be entered, SFID 189 ACT field on the SFYS form (5713-1 Record) must be set to "Y".

When ORIG NO ANS TRG is entered, ORIG NO ANS TRG must be defined on an NSTRIG form (5324 Record) as TRIG NBR. On the NSTRIG form, APPLICATION must be "ASP" and AIN REL must equal "R0D1".

2.153 INH OFC OBL OOL

Description: Is the ASP office busy line trigger out of LATA inhibited? This field supports the ASP Call Screening for Busy/No Answer Office Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A212.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E11
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The ASP Call Screening for Busy/No Answer Office Triggers is a secured feature. The SFID 212 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set to "Y".

2.154 INH OFC ONA OOL

Description: Is the ASP office no answer trigger out of LATA inhibited? This field supports the ASP Call Screening for Busy/No Answer Office Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A212.

Copyright © 2003 Lucent Technologies

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E11
Required Field.
Default: N
Valid Entries: Y,

Data Rules:

The ASP Call Screening for Busy/No Answer Office Triggers is a secured feature. The SFID 212 ACT field on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be set to "Y".

ORIG DAS FOR ASP TRIGGERS

The following fields (Section 2.155 - Section 2.156) define the parameters which support the ASP Multiple Rate Center Support feature. This is a secured feature with SFID 162 and is available for 5E9(1) through 5E11. For more information on this feature, see Division 2, Section 4A162. For 5E12 and later, these fields have been moved to the ASPOPT form (5670 Record). See Division 4, Section 31G.

2.155 ARS FCD CDP

Description: Is the DAS (Digit Analysis Selector) assigned to the originator used after ARS (Automatic Route Selection) FCD (Feature Code Dialing), and CDP (Customized Dialing Plan) triggers? If "Y" is entered the DAS assigned to the originator is used to interpret digits after an ASP query for ARS, FCD, and CDP triggers. If "N" is entered, the SCP DAS is used to interpret digits after an ASP query for ARS, FCD, and CDP triggers.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

SFID 162 on the SFSYS form (5713-1 Record) must have the ACT field set to "Y" before the ARS FCD CDP or OHI OHD TAT field can be set to "Y".

2.156 OHI OHD TAT

Description: Is the DAS (Digit Analysis Selector) assigned to the originator used after OHI (Off-Hook Immediate), OHD (Off-Hook Demand), and TAT (Termination Attempt Triggers) triggers? If "Y" is entered, the DAS assigned to the originator is used to interpret digits after an ASP query for OHI, OHD, and TAT triggers. If "N" is entered the SCP DAS is used to interpret digits after an ASP query for OHI, OHD, and TAT triggers.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E9(1) through 5E11
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

SFID 162 on the SFSYS form (5713-1 Record) must have the ACT field set to "Y" before the ARS FCD CDP or OHI OHD TAT field can be set to "Y".

Copyright © 2003 Lucent Technologies

ASP IP TIMERS

Available with 5E10 and 5E11 Software Releases, the following fields (Section 2.157 - Section 2.158) are used to set the maximum duration of an STOR connection and the maximum amount of time the switch will wait for the IP (Intelligent Peripheral) to send the Disconnect message. These fields support the AIN SSP Send To Outside Resource (Local) feature. For more information on this feature, see Division 2, Section 4A229. For 5E12 and later, these fields have been moved to the ASPOPT form (5670 Record). See Division 4, Section 31G.

2.157 TSTRC

Description: Enter the STOR (Sent To Outside Resource (Local)) connection time. This field indicates the maximum duration of an STOR connection, as measured from the Connect message received from the IP. 0 indicates no timing.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E10 and 5E11
Required Field.
Default: 06
Valid Entries: 0 - 60 minutes

Data Rules:

Since STOR (Send To Outside Resource (Local) is a secured feature and must be purchased by the office before STOR data can be assigned, TSTRC must be 06 until SFID 126 ACT and SFID 229 ACT on the SFSYS form have been set to "Y".

2.158 TDISC

Description: Enter the STOR (Sent To Outside Resource (Local) disconnection time. This field indicates the maximum amount of time the switch will wait for the IP to send the Disconnect message after a facility message with a Cancel IP Resource operation is sent from the SSP (Service Switching Point) to the IP.

- ***NOTE:*** For 5E12 and later, this field was moved to the ASPOPT form (5670 Record).

Software Release: 5E10 and 5E11
Required Field.
Default: 4.0
Valid Entries: 1.0 - 4.0 (in increments of 0.5)

Data Rules:

Since STOR (Send To Outside Resource (Local)) is a secured feature and must be purchased by the office before STOR data can be assigned, TDISC must be 4.0 until SFID 126 ACT and SFID 229 ACT on the SFSYS form have been set to "Y".

INTERNATIONAL OUTBOUND CALL

Available with 5E5 and later Software Releases, traditional 2-stage signaling uses these fields (Section 2.159 - Section 2.160) for international outbound calls. The digits received in the first stage are 011 + PCC or 18X where PCC is the Pseudo Country Code and 18X indicates an international call. Digits received in the second stage are KP + CC + NN + ST or KP + PCC + NN + ST. KP is the MF Start Digit. CC is the Country Code. PCC is the Pseudo Country Code. NN is the National Number. ST is the MF end digit.

2.159 TRAD 2-STAGE PST

Copyright © 2003 Lucent Technologies

Description: This field indicates the maximum time in milliseconds for permanent signal timing during the second stage of a traditional 2-stage international outbound call. At expiration of the timer, the call is torn down.

Software Release: 5E5 and later
Default: 10000 ms
Valid Entries: 5000 - 25000 ms

2.160 TRAD 2-STAGE PDT

Description: This field indicates the maximum time in milliseconds for partial dial timing during the second stage of a traditional 2-stage international outbound call. At expiration of the timer, the call is torn down.

Software Release: 5E5 and later
Default: 20000 ms
Valid Entries: 5000 - 25000 ms

2.161 PROHIBIT DT

Description: Should Prohibit Disconnect Timing idle the MLHG member immediately upon disconnect, rather than applying the normal 10-second disconnect timing? If "Y" is entered, the MLHG will become idle immediately after disconnect. If "N" is entered, the 10-second disconnect timing will be provided for the MLHG member.

NOTE: For 5E5 and later, this field was moved to the IMINFO form (5510 Record).

Required Field.
Default Value: N
Valid Entries: Y, N

Data Rules:

This field pertains to Multi-line Hunt Group members whose LCC is defined on an LCC form with a CLASS OF SERVICE entry of "ATND".

2.162 # RM RTG RSTRCT

Description: The value entered in this field serves as the cornerstone for the 5ODA algorithms that assign hundreds groups to routing modules.

Before selecting a value, refer to Division 3, Section 1O in order to understand the 5ODA algorithms.

If "Y" is entered in this field, then a remote module (ORM, RSM, TRM) can be a routing module for a hundreds group if and only if all the terminations within the hundreds group physically reside within the remote cluster.

If "N" is entered in this field, then a remote module (ORM, RSM, TRM) can be routing module for a hundreds group regardless of where the terminations within the hundreds group physically reside.

Software Release: 5E5 and later
Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then this office has Restricted Routing Module Assignment. A Hundreds Group can

Copyright © 2003 Lucent Technologies

contain packet switching TNs which have ports on a Remote SM ("RSM", "TRM", or "ORM" is entered in SM USAGE field on the EQIM form). Normally, for a packet routing module in a RESTRICTED office, all of the TNs in the HG (Hundreds Group) must terminate on an SM in the same Remote Cluster (the CLIDs on the EQIM form must match). It is also required that the routing module for packet HGs be an SM with a value in the CONFIGURATION field on the EQIM form which supports packet switching (see the table for Configurations for Facilities and Applications for the EQIM form in Division 8, Section 2.) However, if the only SMs in this office which support packet switching are Remote SMs, routing will be provided in the Remote SM which supports Packet Switching. This is equivalent to assigning UNRESTRICTED status to the office (RM RTG RSTRCT = "N") for packet TNs.

- ***NOTE:*** The default value of "Y" is normally used in order to prevent Remote Modules from containing Routing Data for Local Modules. When a Remote Module is isolated and contains Routing Data for a Local Module, Digit Analysis cannot be completed for any call needing the Routing Data in the Remote Module.

- ***NOTE:*** Values for the PKT SM are taken from the HGRPAS input form. If HGRPAS form does not have a value in the PKT SM field, a routing assignment is then made algorithmically.

Q931 PROTOCOL OPTIONS

The following field is used to assign Q931 protocol options.

2.163 CAUSE LOC

Description: This field is used internally by the switch for Q.931 error analysis.

Software Release: 5E6 and later
Required Field.
Default: PUB
Valid Entries:

Valid CAUSE LOC Entries

Entry	Definition
PUB	A public network serves the local user.
PRIV	A private network serves the local user.

DEFAULT BRI TYPE

The following field is available with 5E6 and later Software Releases. It is used as a default on the RC Views 23.2 and 23.8, when assigning DSL Line Cards.

2.164 # BRI TYPE

Description: This office parameter specifies the default type of DSL line card circuit to be assigned in the office. If a BRI TYPE is not specified on the assignment forms, this field is used as the default on the RC Views 23.2 and 23.8 to indicate the subscriber's NT1 (Network Termination) type. This office parameter is provided to help reduce the number of BRI TYPE entries that need to be specified on assigning a DSL. If the switch has more than one type of BRI line card type, choose the type of BRI line card that is the most prevalent on the switch as the default type to eliminate the greatest number of BRI TYPE entries that need to be made on RC Views 23.2 and 23.8. It is important to assign a subscriber to a line card (equipment number) with the same type as the subscriber's NT1. If the wrong type is assigned, the DSL will not go in service and the subscriber will not get dial tone.

Software Release: 5E6 and later
Required Field.
Valid Entries:

Valid BRI TYPE Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

TLC	5E4(2) T-card
PULC	5E4(2)Phase 1 U-card
ULC	5E4(2)Phase 2 U-card
AULC	5E6 ANSI Standard U-card
I2TCKT	Software Release: 5E10 and later. ISLU2 TLBD (T-Circuit)
I2UCKT	Software Release: 5E10 and later. ISLU2 ULBD (U-Circuit)

CDMA DTMF

The following fields provide CDMA (Code Division Multiple Access) DTMF (Dual Tone Multi-Frequency) Tone Programmability and are available with 5E13 and later Software Releases. See Division 2, Section 8b for more information.

- ***NOTE:*** For 5E15 and later, these fields have been moved to the CDMAOPT form (5599 Record).

2.165 OVERRIDE

Description: Do you want to override the CDMA mobile on/off duration?

When this field is "Y", the mobile on/off duration values can be overriden with the provisioned values in the LENGTH ON and LENGTH OFF fields.

When this field is "N", the mobile on/off duration is not overriden.

Software Release: 5E13 and later
Default: N
Valid Entries: Y, N

Data Rules:

When OVERRIDE is "N", LENGTH ON must not be entered.

When OVERRIDE is "N", LENGTH OFF must not be entered.

When OVERRIDE is "Y", LENGTH ON must be entered.

2.166 LENGTH ON

Description: The LENGTH ON field is used to indicate the Dual Tone Multi-Frequency on duration, in milliseconds, for CDMA.

Software Release: 5E13 and later
Valid Entries: 100, 150, 200, 250, 300, 350 or blank

2.167 LENTGH OFF

Description: The LENGTH OFF field is used to indicate the Dual Tone Multi-Frequency off duration, in milliseconds, for CDMA

Software Release: 5E13 and later
Valid Entries: 50, 100, 150, 200 or blank

PERFORMANCE MONITORING

The following fields (Section 2.168 - Section 2.172) apply to the PM alerting function. Performance monitoring alerting, which is available with 5E6 and later Software Releases, is the ability to collect and

Copyright © 2003 Lucent Technologies

report performance data for TIDI U-BRIs (U-interface BRIs). The operating company has the ability to inhibit and allow the setting and reporting of performance monitoring alerting thresholds. The U-BRI provides two, 64 Kbps (kilo-bits per second) B-channels for circuit-switched voice, circuit-switched data or packet switched data calls; and one 16 Kbps D-channel for signaling or packet-switched data over a single, non-loaded pair of wires. (For more information concerning PM alerting and the U-interface BRI, see the PMTHRESH form (5948 Record)).Three of the following fields, PM TIME, MAX NO THR GRPS,

and FAC PM ENABLE, are also used for performance monitoring on a DFI (Digital Facility Interface), an IDCU (Integrated Digital Carrier Unit), and a DNU-S (Digital Networking Unit - SONET). See Division 5, Section 5L for performance monitoring for the DNU-S.

2.168 DSL PM ENABLE

Description: Should performance monitoring alerting be enabled for office DSLs? This office parameter is used to indicate if layer 1 performance monitoring alerting is turned on or off on the entire switch. (See the PMTHRESH form (5948 Record) for more information on performance monitoring alerting).

Software Release: 5E6 and later. Required Field.
Default: Y
Valid Entries: Y, N

2.169 REPORT INT

Description: Specify the interval at which PM interval reports are generated for the switch office.

Software Release: 5E6 and later
Required Field.
Default: 1
Valid Entries: 1, 2, 3, 4, 6, 8, 12 and 24 hour(s).

2.170 CRC SES RATE

Description: Specify the number of Cyclic Redundancy Code errors allowed before a SES (Severely Errored Second) is incremented in an ANSI U-Card.

Software Release: 5E6 and later
Required Field.
Default: 3
Valid Entries: 1 - 10

2.171 MAX NO THR GRPS

Description: Enter the maximum number of Performance Monitoring groups allowed for this office.

Software Release: 5E6 and later
Required Field.
Default: 256
Valid Entries: 0 - 65535

Data Rules:

For 5E7 and later, the total number of PM forms, which is the sum of the number of PMTHRESH forms and the number of DNUPM forms, must not exceed the entry in this field.

2.172 PM TIME

Description: The PM TIME field specifies the hour at which ALE and performance monitoring reports will

Copyright © 2003 Lucent Technologies

be generated daily.For DFI, IDCU, and DNU-S, this field specifies the start hour for the 24-hour collection interval.

Software Release: 5E6 and later
Required Field.
Default: 0
Valid Entries: 0 - 23; where 0 is 12 midnight.

2.173 BPV SES RATE

Description: Enter the number of BPVs (Bipolar Violations) that can occur before a DS1 SES (Severely Errored Second) is declared. (See the PMTHRESH form (5948 Record) for more information on performance monitoring alerting.)

Software Release: 5E8 and later
Default: 307 (SES)
Valid Entries: 1 - 334 (SES)

2.174 FAC PM ENABLE

Description: Should PM (Performance Monitoring) alerting be enabled for switch facilities for DFI, IDCU, and DNU-S. See the PMTHRESH form (5948 Record) for more information on performance monitoring alerting.See also Division 5, Section 5L for DNU-S performance monitoring data.

Software Release: 5E8 and later
Default: Y
Valid Entries: Y, N

MISMATCH DETECTION

The following fields (Section 2.175 - Section 2.176) are used to support the ANSI U-interface BRI (Basic Rate Interface) available with 5E6 and later Software Releases.

2.175 ENABLE

Description: Is U-BRI NT (Network Termination) automatic mismatch detection activated for the switch?

Software Release: 5E6 and later
Required Field.
Default: Y
Valid Entries: Y, N

2.176 REPORT

Description: Should an output message be generated when a mismatch is detected between the NT and the U-BRI in the ISLU?

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

ISUP

The following fields (Section 2.177 - Section 2.178) are available with 5E6 and later Software Releases. They support timing control functions in CCS7 network interconnect between Local Exchange and InterLATA Carriers.

Copyright © 2003 Lucent Technologies

2.177 CRA TIMER

Description: This field is the Circuit Reservation Acknowledgement Timer. It indicates the elapsed time (seconds) an originating toll office will wait for an IAM (Initial Address Message) after sending a Circuit Reservation Acknowledgement message to the Originating Access Tandem.

Software Release: 5E6 and later
Required Field.
Default: 25
Valid Entries: 20 - 25 seconds

2.178 EXM D TIMER

Description: This field is the ISUP exit message delay timer. It provides a delay to ensure that glare or blocking is not encountered on the outgoing trunk to an Originating Toll Office. When the timer expires, the Originating Access Tandem sends an Exit Message to the End Office.

Software Release: 5E6 and later
Required Field.
Default: 300 ms
Valid Entries: 100 - 1200; in 100 ms intervals.

2.179 BUSY ANNC

Description: Should the terminating exchange send busy tone to the originating exchange when the called party is busy?

A terminating exchange determines whether the called party interface is busy prior to performing circuit allocation. If the called party interface is busy, the office must either (1) return a Release Message (REL) with a cause of user busy (17), or (2) provide busy tone.

The ISUP Busy Play Announcement (BUSY ANNC) is checked by the operational software during call failures in which the called party is busy and the call route consists of ISUP protocol trunks interworked to other signal protocol trunks.

If "Y" is entered a busy tone should be provided to the originating exchange. If "N" is entered a Release Message should be sent to the originating exchange.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

2.180 LEC ANNC

Description: If the call cannot be routed for failure conditions, other than those associated with called party screening, should the terminating exchange send a busy tone to the originating exchange?

If "N" is entered, a CCS7 Release Message will be sent to the originating switch instead of busy tone.

These options are for treatment of Vacant Code, No Circuit Announcement, and Reorder.

The options in this field do not apply to called party screening failures, which include the following CCS7 Release Messages: destination out of order (27), number changed (22), unallocated number (1), user busy (17), no user responding (18), call rejected (21), or bearer capability not implemented (65).

If a failure event other than what is listed above occurs, the switch software must determine whether to

Copyright © 2003 Lucent Technologies

send a Release Message or provide an appropriate tone or announcement.

The value entered in this field will be checked at Local Exchanges by the operational software for call failures that consist of the following:

- the call originates from a non-ISDN interface.
- the call is of type, 3.1kHz audio or speech.
- the call route consists of only ISUP trunks.

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

2.181 LEC IW REL

Description: Is an ISUP Local Exchange Carrier Interworking Release message provided to the previous exchange when a failure occurs on an ISUP trunk in the LEC network? This only applies to non-ISDN access calls which have not used ISUP trunks exclusively over the full call completion path.

"Y" indicates that a Release message will be sent. "N" indicates that a tone/announcement will be provided to the preceding exchange.

These options are for treatment of Vacant Code, No Circuit Announcement, and Reorder.

The options in this field do not apply to called party screening failures, which include the following CCS7 Release Messages: destination out of order (27), number changed (22), unallocated number (1), user busy (17), no user responding (18), call rejected (21), or bearer capability not implemented (65).

The value entered in this field will be checked at Local Exchanges by the operational software for call failures that consist of the following:

- the call originates from a non-ISDN interface.
- the call is of type, 3.1kHz audio or speech.
- the call route consists of a combination of ISUP trunks interworked to other protocol trunks (e.g., MF).

Software Release: 5E7 and later
Required Field.
Default: N
Valid Entries: Y, N

2.182 BLANK NBR REL

Description: Is the Release with Cause Code Value 1 for Vacant Numbers feature active for this office? For more information on this feature, see Division 2, Section 1BU.

- ***NOTE:*** This feature is intended for use in Canada only. There is no expectation at this time that this feature will be used in the U.S., and it is not recommended that this feature be turned on in U.S. switches.

Software Release: 5E13 and later
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

2.183 RCD 3PT1 ITC

Description: Recode 3PT1kHz Information Transfer. Enter the bearer capability (speech or 3.1kHz) , which is the information transfer capability when referring to the specific rate of communication, or the user service information when referring to user-specified information. See Division(2 Section 1W for more information on Recode 3.1kHz Audio feature.)

This field is used to determine the bearer capability under the following conditions:

- the call has a bearer capability of 3.1kHz audio;
- the call is about to be routed out over an ISUP trunk;
- the office processing the call is either a local tandem which received the call via an incoming inband signaling speech trunk or an originating end office serving a non-ISDN origination;
- the per trunk group indicator, RCD 3PT1 ITC on the TRKGRP form (5202 Record), is blank.

(See Division 2, Section 1W, *CCS7 ISDN-UP Enhancements* for more information.)

Software Release: 5E8 and later
Required Field.
Default: SPEECH
Valid Entries:

Valid RCD 3PT1 ITC Entries

Entry	Definition
SPEECH	Recode the bearer capability to "speech".
3PT1KHZ	Send out bearer capability as "3.1kHz audio" without modification.

Data Rules:

This field should not be set to "3PT1KHZ" until the following conditions are met:

1. all far switches have implemented the rule that the value of the USI parameter is either controlled by the trunk group parameter (if not set to "null"), or the switch parameter;
2. the transmission facilities to all far switches are capable of handling calls with a bearer capability of 3.1kHz audio; and
3. the software at all far switches is capable of handling calls with a bearer capability of 3.1kHz audio.

These checks are not made by the software; therefore, the craft personnel should make these checks before changing this global office parameter to "3PT1KHZ".

If this is a switch owner toll office, then RCD 3PT1 ITC must be "3PT1KHZ".

2.184 CICP BLOCK

Description: Should the ISUP Carrier Identification Code Parameter be blocked? This field is used by the Carrier Identification Code Parameter secured feature, which must be purchased by the office before this field can be set to "Y". For more information on this feature, see Division 2, Section 4A9.

Software Release: 5E8 and later.
Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If "Y" is entered, then the SFID 009 ACT field on the SFSYS form (5713-1 Record) must be set to "Y".

2.185 ISUP APN DAS

Description: Proprietary field.

2.186 IAM CRM PRIOR

The IAM CRM PRIOR (Initial Address Message and Circuit Reservation Message Priority) field is used as an indicator for SS7 ISUP to mark the priority for IAMs and CRMs. When set to 1, all outgoing IAMs and CRMs (regardless of type) are set to the standard priority of 1. If set to 0, all GETS (Government Emergency Telecommunications Service) and MLPP (Multi-Level Precedence and Preemption) non-routine IAMs and CRMs have outgoing priority equal to 1; all other types of calls (including routine MLPP calls) have their priority lowered to 0. For more information, see Division 2, Section 4A279.

Required Field.

2.187 OFC OLI

Description: Proprietary field.

ON-LINE OFFICE RECORDS

The ON-LINE OFFICE RECORDS entries are associated with office records which are changed via the RC/V (Recent Change/Verify) system. The information that is printed is that found on the Records 5100-1/2/3, 5105-1/2, 5109-1/2, 5110-1/2, 5111-1/2 and 5171-1/2. This information will be automatically printed on-line at the office based on the options assigned in fields (Section 2.188 - Section 2.191).

2.188 ENABLED?

Description: Should office records which are changed via the RC/V (Recent Change/Verify) system be automatically printed on-line at the office?
Default: N
Valid Entries: Y, N

2.189 START HOUR

Description: Enter the hour of the day when the office records should begin printing on-line at the office.
Default: 23
Valid Entries: 0 - 23; where 0 is midnight.

2.190 DURATION

Description: Enter the duration in hours that will be allowed for the printing of the on-line office records.
Default: 4
Valid Entries: 0 - 24 hours

2.191 SUN THROUGH SAT

Description: For each day of the week, Sunday through Saturday, should the on-line office records be printed automatically?
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

HOME INTERCOM

Available with 5E6 and later Software Releases, the following fields (Section 2.192 - Section 2.194) are parameters used by the Home Intercom feature.

2.192 MAX RING TIME

Description: This field indicates the maximum amount of time a phone may ring before it must be picked up during Home Intercom activation.

Software Release: 5E6 and later
Required Field.
Default: 180 seconds
Valid Entries: 30 - 300 seconds

2.193 MAX HOLD TIME

Description: This field indicates the maximum amount of time an outside call may be put on hold during the Home Intercom Dialable Hold feature.

Software Release: 5E6 and later
Required Field.
Default: 180 seconds
Valid Entries: 30 - 32767 seconds

2.194 MAX TALK TIME

Description: This field indicates the maximum amount of time extensions on the same line may talk during Home Intercom Basic, Intercom Code Dialing, Selective Intercom Dialing, Selective Call Transfer (only during private conference when outside party disconnects).

Software Release: 5E6 and later
Required Field.
Default: 10
Valid Entries: 1 - 1440 minutes

SERIES COMPLETION

The following field is Recent Change only. It is used to remove back links for Series Completion.

2.195 DEL BCK LNK

Description: This is a Recent Change only field. This field indicates if error messages will occur when attempting to delete a directory number that is a member of a series completion linked list, i.e. when BCK LNK is "Y".

If "Y" is entered, no error message will occur and the series completion back links will be removed automatically when the DN is deleted. This will also remove the DN from the series completion field on all other TNs (multiple lines series complete to the same line.)

If "N" is entered, an error message will occur when attempting to delete a DN that is a member of a series completion linked list. The craft will need to enter the update mode in Recent Change and set the BCK LNK field on the associated Recent Change View (e.g. view 1.1, 23.2, 23.8) to "N" (removes back links) before the TN can be removed.

Software Release: 5E6 and later

Copyright © 2003 Lucent Technologies

PER CALL TEST FAILURE

The following field is a Recent Change only. It is used for PCTF (Per Call Test Failure) Reports.

2.196 PCTF INT

Description: This is a Recent Change only field. This field is used to indicate the time interval between PCTF summary reports. The report will be generated automatically based on the value stored in this field.

Software Release: 5E6 and later

SLC96 T1 FACILITIES

The following field is available with 5E6 and later Software Releases. It is used to optionally monitor the status of SLC96 T1 Facilities.

2.197 # OFF NORMAL

Description: Should the SM status indicator be updated when SLC-96 T1 facilities are off normal?

If "Y" is entered and the SLC96 T1 facility is on protection, the SM status indicator will be updated to "RT PLS". If the facility is out of service, the SM status indicator will be set to "CKT OOS".

If "N" is entered, the SM status indicator will not be affected.

Software Release: 5E6 and later
Required Field.
Valid Entries: Y, N

ISVM OPTION

The ISVM TCAP TIMER field was added with the Inter-Switch Voice Messaging feature. This feature is described in Division 2 Section 5 of the TG.

2.198 ISVM TCAP TIMER

Description: Inter-Switch Voice Messaging TCAP (Transaction Capabilities Application Part) timer. An entry in this field represents the timeout value for ISVM TCAP Message.

Software Release: 5E7 and later.
Default: 3
Valid Entries: 1 - 10 seconds.

REMOTE DIGITAL TEST ACCESS

The following fields (Section 2.199 - Section 2.202) are used to set up an RDTA (Remote Digital Test Access) connection on an ISDN line or trunk. With this feature (also referred to as RPA [Remote Protocol Access]), a craft at a Customer Service Center can access customer BRIs, PRIs, packet trunks, or CCS7 ISUP trunks and troubleshoot problems. Refer to the RPA feature description in Division 2, Section 5F for more information on this feature.

2.199 RDTA SCRN IDX

Description: Enter the Screening Index (used by RDTA during digit analysis) to translate a TN for a 56Kbps or 64Kbps data call.

Software Release: 5E7 and later

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 4095

Data Rules:

If at least one RDTAPORT (5909 Record) or RDTATN (5910 Record) is entered for this office, then RDTA SCRN IDX must be entered.

If RDTA SCRN IDX is entered then RDTA DAS must be entered. For 5E8 and later, all combinations of CODE INDEX from one or more RDIT forms, and RDTA SCRN IDX must have corresponding RAR form (5301 Record) entries for CDI and SCR.

2.200 RDTA DAS

Description: Enter the Digit Analysis Selector (to be used in digit analysis) that translates a DN from an input TTY message for RDTA.

Software Release: 5E7 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

RDTA DAS must be entered if a RDTAPORT form (5909 Record) or RDTATN form (5910 Record) is entered for this office.

If RDTA DAS is entered, RDTA SCRN IDX must be entered.

The RDTA DAS entered must be defined on a DAS form (5300 Record) with the LINE DAS information entered. The LDIT defined on the DAS form should be entered on a SMLDIT form (5315 Record) and assigned to all the LOADED SMs as well as standard SMs in the office. A loaded SM is defined on a EQIM form with CONFIGURATION equal to "LOADED".

The LDIT defined on the DAS form must be defined on an LDIT form with CODE INDEX or CDI entered. All combinations of RDTA SCRN IDX (entered on this form) and CODE INDEXs or CDIs (entered on the corresponding LDIT forms) must be entered on the RAR form.

2.201 BRI MAX SESSION

Description: Enter the maximum number of simultaneous RPA BRI sessions allowed for any SM in this office.

Software Release: 5E7 and later
Valid Entries: 1 - 15

Data Rules:

If BRI MAX SESSION is entered, RDTA SCRN IDX and RDTA DAS must be entered.

2.202 RDTA PIC

Description: Enter the Remote Digital Terminal Access PIC (Primary Inter-Exchange Carrier).

Software Release: 5E9(1) and later.
Valid Entries: 0 - 9999

Data Rules:

Copyright © 2003 Lucent Technologies

RDTA DAS must be entered when RDTA PIC is entered.

For 5E14 and later, when the RDTA PIC is entered on the OFCOPT form, a corresponding ICF form must be entered where the RDTA PIC from the OFCOPT form is equal to a CARRIER ID from the ICF form with FEAT GRP equal to "D".

911

The following field (Section 2.203) is used for B911 and E911 service.

2.203 TIMING DELAY

Description: This field defines the digit analysis timing delay for a 911 call. After a caller dials 911, or any other digits designated to receive 911 treatment, the switch waits the specified number of seconds before it considers the dialing complete. If the caller enters additional digits during the delay period, the switch will report a dialing error.

The TIMING DELAY field is used for both B911 and E911 calls. If left blank, no timing delay will be applied.

Software Release: 5E7 and later
Default: 0
Valid Entries: 0 - 3 (seconds)

ENHANCED 911

The following fields (Section 2.204 - Section 2.212) apply to the E911 feature available with 5E7 and later Software Releases. For information about E911, see Division 2, Section 1BD.

2.204 E911 OPTION

Description: The E911 OPTION field specifies what type of E911 processing the switch supports.

Software Release: 5E7 and later
Default: INACTIVE
Valid Entries:

Valid E911 OPTION Entries

Entry	Definition
INACTIVE	The switch does not have E911 processing capabilities.
ESA	The switch can process E911 calls and has the ability to query the ESA (E911 Service Adjunct) for selective routing information.
NONESA	The switch can process E911 calls but does not have the ability to query the ESA for selective routing information.

Data Rules:

If E911 OPTION is "ESA", one and only one DSLAP form (5963 Record) must be entered with E911 SITE set to "Y".

If "ESA" or "NONESA" is entered, then the following fields must be entered:
- E911 DAS
- E911 LN SFG
- E911 SCR
- E911 TRK SFG

If E911 OPTION is "ESA" or "NONESA", there must be an ESN form (5540 Record) with SM entered and

DAS blank for each SM on the EQIM form where EQSTATUS is operational, "O". Also, a TNTYP form (5504 Record) must be defined with TONE TYPE set to "HIGH120".

2.205 E911 DAS

Description: The E911 DAS specifies the Digit Analysis Selector that will be used to translate telephone numbers stored in E911 data. Telephone numbers translated by this DAS include primary and alternate PSAP (Public Safety Answering Point) TNs, selective transfer TNs, and PSAP reroute TNs. PSAP and selective transfer TNs are specified in ESN forms (5540 Record); PSAP reroute TNs are specified in TKGRP forms.

Software Release: 5E7 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When E911 OPTION is "ESA" or "NONESA", the E911 DAS must be entered and must be defined on a DAS form (5300-1 Record).

If E911 DAS is entered, the LDIT associated with the DAS must be distributed to all SMs in the office. Either the LINE DAS LOCAL DIT or TRUNK DAS LOCAL DIT on the DAS form must be specified on an SMLDIT form (5315 Record) where every operational SM, defined on EQIM forms (5700-1/2 Record) with EQSTATUS set to "O", is specified in the LIST OF SWITCHING MODULES.

If E911 DAS is entered, the LDIT associated with the DAS must not have a packet routing CI TYPE of "PSNCI" or "PSCAR".

2.206 E911 SCR

Description: The E911 SCR field specifies the screening index used to route to telephone numbers stored in the E911 data. It is used in conjunction with the E911 DAS to route to primary and alternate PSAP (Public Safety Answering Point) TNs, selective transfer TNs, and to PSAP reroute TNs. PSAP and selective transfer TNs are specified in ESN forms (5540 Record); PSAP reroute TNs are specified in TKGRP forms.

Software Release: 5E7 and later
Valid Entries: 1 - 4095

Data Rules:

A value must be entered in this field if E911 OPTION is "ESA" or "NONESA".

2.207 E911 LN SFG

Description: This field specifies the E911 Line SFG (Simulated Facilities Group) which will restrict the number of 911 calls allowed to simultaneously terminate at E911 PSAPs. The Line SFG restricts only those calls that originate from lines or from PBX trunks (E911 TYPE set to "PBXNONDED" on the TKGRP form). 911 calls will receive reorder treatment when they originate from these sources and the SFG limit (defined on the corresponding PFASFG form) has been reached.

Software Release: 5E7 and later
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Copyright © 2003 Lucent Technologies

Data Rules:

If E911 OPTION is "ESA" or "NONESA", E911 LN SFG must be entered and must be defined on a PFASFG form (5609-3 Record) with an associated SFG TYPE of "E911LNE".

2.208 E911 TRK SFG

Description: This field specifies the E911 TRK SFG (Trunk Simulated Facilities Group) which will restrict the number of 911 calls routed to E911 PSAPs when the calls originate from trunk groups with E911 TYPE set to "NONDED".

Software Release: 5E7 and later
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If E911 OPTION is "ESA" or "NONESA", E911 TRK SFG must be entered and must be defined on a PFASFG form with an associated SFG TYPE of "E911TRK".

2.209 PRIM E911 APID

Description: This field displays the primary APID (Application Processor ID) used as a link to the ESA. It is a Recent Change Verify only field. This field is populated from the 24.7 view. This parameter is used to identify the primary E911 ESA. There can be only one instance of PRIM E911 SITE being set to "Y".

Software Release: 5E7 and later

2.210 SEC E911 APID

Description: This field is a Recent Change Verify only field. This global parameter is used by the Dual ESA for E911 secured feature to identify the backup E911 AP (Applications Processor), which is also known as an ESA (Emergency Services Adjunct). This field is populated from the 24.7 view. If the SEC E911 SITE field is set to "Y", then this parameter should be set to the "APID" on that view. There can only be one instance of SEC E911 SITE being set to "Y".

Software Release: 5E8 and later

2.211 ESA SW TIME

Description: Enter the hour of the day (military time) to automatically switch the active and inactive ESAs (Emergency Services Adjuncts). This field is used by the Dual ESA for E911 Enhancements secured feature. It is a secured feature and must be purchased by the office before this field can be changed from the default value. For more information on this feature, see Division 2, Section 4A141.

If 0 is entered, then no switch occurs. An entry of 24 indicates midnight.

Software Release: 5E9(1) and later.
Required Field.
Default: 0
Valid Entries: 0 - 24 (military time)

Data Rules:

For any entry other than 0, the SFID 141 ACT field must be set to "Y" on the SFSYS form (5713-1

Copyright © 2003 Lucent Technologies

Record).

2.212 E911 CESID

Description: Enter the E911 Customer Emergency Service Identification. This field is associated with the CPN Delivery on E911 Calls secured feature; it specifies on a per office basis whether the BN (Billing Directory Number) or the CPN (Calling Party Number) will be used for ESA (E911 Service Adjunct) queries, PSAP (Public Safety Answering Point) displays, and ALI/DMS (Automatic Location Information / Data Management System) look-ups. For more information about this field, see Division 2, Section 4A116, which describes the secured feature.

Software Release: 5E8 and later.
Required Field.
Default: BN
Valid Entries:

Valid E911 CESID Entries

Entry	Definition
BN or B	Billing number
CPN or C	Calling party number

Data Rules:

E911 CESID can be set to "CPN" only if the secured feature is purchased (SFID 116 ACT is "Y" on the SFSYS form (5713-1 Record)); otherwise, it must be set to "BN".

OUTBOUND SERVICES

The following field defines the parameter for Alternate Signal Switching Modules.

2.213 ALT SIG SM

Description: Alternate Signal Switching Module.

NOTE: This field is not enterable pending future development.

OFFICE EQUIPMENT

The following field defines a parameter for the OE (Office Equipment).

2.214 OE SIZE

Description: This field is used to specify whether an office supports either an 8- or 10-digit OE number for IDCU port assignments. If the RTs (Remote Terminals) to be provisioned are to have a capacity of more than 99 lines, a 10-digit OE number is required.
The OE SIZE field dictates the OE TYPE field for all IDCU equipment.

For 5E9(2) and earlier, if an IDCU remote terminal or PUB43801 is to be provisioned, the same OE TYPE of either "G" (10-digit) or "M" (8-digit) must be assigned on all assignment forms:

- DSL (5907 Record)
- DSLUSR (5908 Record)
- LINE (5109 Record)
- MISLINK
- MLHLN (5111 Record)
- NAILUP (5207 Record)
- TRUNK (5204 Record)

Copyright © 2003 Lucent Technologies

- ***NOTE:*** All OE Types of "M" or "G" in an office must correspond with the OFCOPT form OE SIZE field and only one OE Type is allowed in an office (either "G" or "M").

Software Release: 5E8 and later
Required Field.
Default: 8
Valid Entries: 8 or 10

- ***NOTE:*** When an existing 5ESS Switch office is converted from an 8-digit OE ("M") to a 10-digit OE ("G"), all future IDCU OEs (TR303, TR08, or PUBs) entered must be in the new 10-digit OE format. Any attempt to enter an 8-digit ("M") format will be rejected.

The OE format is:

- 8-digit "M":

  XXXYZZLL, where

  XXX = SM

  Y = Unit Number

  ZZ = Remote Terminal

  LL = Line

- 10-digit "G":

  XXXYZZLLLL, where

  XXX = SM

  Y = Unit Number

  ZZ = Remote Terminal

  LLLL = Line

Conversion from an 8- to 10-digit OE is performed on Recent Change View 8.1. In order to avoid error conditions as a result of OE conversions, care must be taken to ensure that OE conversions are coordinated to assure that affected personnel are apprised of the impact of an 8-digit to 10-digit OE conversion.

Data Rules:

All IDCU equipment in an office must use the same OE TYPE.

If RT LINE SIZE on the RTERM form (5174-1/2/3/4 Record) is greater than 99, OE SIZE must be set to 10.

INDIV DIALING PLAN

The following field defines an IDP (Individualized Dialing Plan) parameter.

2.215 IDP DESEP

Description: Enter the IDP (Individualized Dialing Plan) Destination Separation Class for IDP dial codes. When IDP digit analysis identifies that an IDP dial code has been dialed, the value of this field is assigned

to the route request message. All IDP dial codes are given this value, regardless of which IDP group the dial codes are defined in.

Software Release: 5E8 and later
Valid Entries: 1 - 255

Data Rules:

If a DESEP is entered, it must be defined on the Traffic Separation Cell Grouping TRFSEP form (5308 Record).

DESEP 0 is used whenever DESEP is not provided by digit analysis, line, or trunk translations. DESEP 63 is used by the Switch for calls that are not applicable to DOR (Division of Revenue). The values of 0 and 63 should not be assigned. See Division 2, Section 1B.

ASI PROXY

Field Section 2.216 refers to the ASI (Advanced Service Interface) Proxy feature.

2.216 ASI ON

Description: Is the ASI Proxy traffic enabled?

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

ASI Proxy is a secured feature and must be purchased by the office before the default value for this field can be changed. An SFSYS form must exist with SFID 93 set to "S" for ASI ON to equal "Y".

ESSENTIAL SERVICE PROTECT

The following field defines the office parameter for ESP (Essential Service Protection).

2.217 ESP NORM ALW

Description: Is Essential Service Protection normally allowed? This office parameter is used by the ESP Back-lighting feature. This field defines how the off-normal condition for ESP (Essential Service Protection) is be displayed on the MCC. A value of "N" indicates that the off-normal condition for ESP is allowed and the normal condition is inhibited. A value of "Y" indicates that the off-normal condition for ESP is inhibited and the normal condition is allowed. When ESP is allowed, an indicator on the MCC page 109 (OVERLOAD) is back-lighted with yellow and the OVERLOAD indicator in the SSA (Summary Status Area) is back-lighted with blue indicating an OFF-NORMAL condition.

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

SSP 800

The following fields (Section 2.218 - Section 2.219) define the office parameters for Advanced Service Platform and Service Switching Point 800 calls.

Copyright © 2003 Lucent Technologies

2.218 INH SCP NPA DEL

Description: Should deleting the NPA code from the routing DN returned from the SCP be inhibited? This office parameter is used for ASP (Advanced Services Platform) and SSP (Service Switching Point) 800 calls to indicate if the deleting of the NPA should be inhibited for the routing DN returned from the SCP (Service Control Point) database. At an SSP office a query is made to an external SCP database to obtain routing information necessary to complete the call. The NPA deletion is done before invoking digit analysis on the returned routing DN.

Software Release: 5E6 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.219 SCP 800 DAS

Description: Enter the DAS for retranslating the routing DN returned from the SCP. If the originator's DAS is not desired, this office parameter is used as the DAS (Digit Analysis Selector) for retranslating SSP (Service Switching Point) 800 calls after querying the external SCP (Service Control Point) database. At an SSP office, a query is made to an external SCP database to obtain routing information necessary to complete the call. This parameter is used to indicate where translations should begin in digit analysis for routing numbers that are returned from the SCP database. If this field is not entered, SCP 800 DAS will not be used for retranslating returned routing numbers; the originator's DAS will be used, except for the case where 800 calls are made via ASP. Then,

For 5E9(1) and later, the line DAS will be used as the originator's DAS since the ASP DAS no longer exists.

Software Release: 5E6 and later.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

For 5E9(1) and later, the SCP 800 DAS must be defined in the DIGIT ANALYSIS SELECTOR field on a DAS form (5300-1 Record).

MDII

The following fields (Section 2.220 - Section 2.222) define the office parameters for the Excessive MDII Alarm feature. For more information on this feature, see Division 2, Section 4C6.

2.220 MDII INTERVAL

Description: Enter the time interval, in minutes, to be used for counting the number of MDII (Machine Detected Interoffice Irregularities) which must be reached to generate an alarm. A value of 0 indicates that an alarm will not be generated.

Software Release: 5E6 and later.
Default: 0
Valid Entries: 0 - 127 (minutes)

2.221 MDII THRESHOLD

Description: Enter theMDII count threshold that must be exceeded to generate an alarm.

Copyright © 2003 Lucent Technologies

Software Release: 5E6 and later.
Default: 20
Valid Entries: 1 - 255

2.222 MDII MJR ALARM

Description: Should an MDII major alarm be generated? This field indicates whether a major or minor alarm is generated when the MDII threshold is exceeded within the specified time interval. "N" indicates a minor alarm should be generated.

Software Release: 5E6 and later.
Default: N
Valid Entries: Y, N

FEATURE GROUP D

Fields Section 2.223 - Section 2.224 refer to Feature Group D.

2.223 FGD PHASE

Description: Enter the Feature Group D phase for the office.

WARNING: This field controls the ODP translation of CAC codes. Use of "POSTPHASE" will turn off 5-digit CACs. See Division 2, Section 1BI for more information on FGD CACs.

Software Release: 5E9(1) and later
Required Field.
Default: PREPHASE
Valid Entries:

Valid FGD PHASE Entries

Entry	Definition
PREPHASE or PR	Ordinary subscribers are allowed to dial the 10XXX CAC. Test lines will have the capability to dial the expanded CAC and be routed to the proper carrier. This phase does not impact dialing of 950 calls or any other features.
PERMPHASE or PE	Ordinary subscribers are allowed to dial either the 10XXX or the 101XXXX CAC on a call by call basis. This phase does not impact dialing of 950 calls or any other features.
POSTPHASE or PO	Ordinary subscribers are allowed to dial only the 101XXXX CAC. This phase does not impact dialing of 950 calls or any other features.

Data Rules:

If FGD PHASE equals "POSTPHASE", exactly one FIXRT form must exist with FIXED ROUTE TYPE set to "INVCAC"

2.224 TCAP CIC

Description: Will this office accept an expanded TCAP CIC (Carrier Identification Code)? The value of this field indicates to the SCP whether or not the SSP is capable of handling a four-digit CIC. A value of "Y" means that a 4-digit CIC is used; "N" means that the 3-digit CIC is still being used. For ASP queries, this field only applies to ASP Release 0.0. The ASP 0.1 (5E9(1)) protocol does not support this parameter.

Software Release: 5E9(1) and later
Required Field.
Default: N
Valid Entries: Y, N

SPEECH ROUTING

Copyright © 2003 Lucent Technologies

Field Section 2.225 refers to trunks with speech treatments.

2.225 SPEECH TRK GRPS

Description: This is a Recent Change / Verify only field on the 8.1 view which displays the number of trunk groups in the office which have speech treatments applied to them. Trunk groups which have speech treatments have the SPEECH TRMTS field set to "Y" on the TKGRP form, view 5.1 For more information on the Routing Based on Bearer feature, see Division 2, Section 1W on CCS7 IDSN UP (User Part) Enhancements.

Software Release: 5E9(1) and later

NETWORK RELEASE

The following field (Section 2.226) defines Software Releases for switches networked with the switch in this office.

2.226 OLDEST RELEASE

Description: The entry in this field indicates the oldest Software Release which is currently being run on any switch which is networked with the switch in this office. Some features require that every switch that communicates with the switch in this office be on the same or later Software Release. These features look at this parameter to determine when the feature can be active on the network and therefore active on this switch. These features cannot be active on this switch until this parameter indicates that all switches on the network are operating at the minimum Software Release needed to support the feature. This minimum Software Release level is referred to as the "Activation Level". As long as the entry in this field is greater than or equal to the feature's "Activation Level", the feature can safely be active on the network. Some optional features may also have a feature activation field which will not apply until after the "Activation Level" has been satisfied. If coordination is necessary, all switches on the network may update this field at the same time during periods of low call traffic.

The first one (or two) digits indicate the Software Release. The last two digits indicate the Software Update level within the current Software Release. This is an arbitrary designation and does not necessarily correspond to the actual number of Software Updates distributed to the field.

For example:
901 is entered for the first Software Release for 5E9(1). Later Software Updates in 5E9(1) which require network coordination would be represented by 902, 903, etc.

This field does not need to be updated unless it is required by a certain feature within that release.

- ***NOTE:*** Decreasing the value of this field could deactivate some features on the switch which are currently active. Increasing the value of this field by more than one will activate features for this value and features for the values that were skipped.

The following table lists features which use this field to determine when they are allowed to be active in the network. The activation level is the minimum software release level the network must be on before the feature can be active.

NETWORK	FEATURE	ACTIVATION LEVEL
FTS2000	INPA	901

Software Release: 5E9(1) and later.
Valid Entries: 1 - 9999

CKT SWITCHED TRUNK

Copyright © 2003 Lucent Technologies

The following field describes an office parameter for Circuit Switched Trunks.

2.227 CST DAS

Description: Enter the circuit switched trunk digit analysis selector.

Software Release: 5E8 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

USTWC

The following fields (Section 2.228 - Section 2.231) define the parameters for the Usage-Sensitive 3-Way Calling feature. The fields also define parameters for the Spontaneous Usage-Sensitive 3-Way Calling feature.

2.228 USTWC FEAT

Description: Enter the Usage-Sensitive 3-Way Calling feature name. This parameter is being used to store the feature identifier for Usage Sensitive Three Way Calling. It will only be stored if the feature SFID (Secured Feature ID) 106 has been activated on the SFSYS form (5713-1 Record). If this parameter is stored, it will indicate that the feature is available in the office. This field also is used for the Spontaneous Usage-Sensitive 3-Way Calling feature. For more information on this feature, see Division 2, Section 4A156.

Software Release: 5E8 and later.
Valid Entries: 1 - 8 characters

Data Rules:

The Usage Sensitive Three-Way Calling feature is a Secured Feature that must be purchased by the office before data can be entered and/or changed for the USTWC fields on the OFCOPT form. If an SFSYS form does not have SFID 106 ACT set to "Y", then the field USTWC FEAT must not be entered and the fields USTWC ACT and USTWC CHRG must be set to "N".

For 5E9(1) and later:

- if USTWC FEAT is not entered, then SPONT AVAIL must be "UNAVAIL".
- if USTWC FEAT is entered and the SPONT AVAIL is "GENAVAIL" or "SUBSCR", then the USTWC FEAT field is used by the Spontaneous Usage Sensitive Three-Way Calling Special Feature and the feature name entered in this field must be defined on the MWFD form with the following:

  ACT/INACT OPTION is "ALWACT"

  AMAC is "USAGE"

  MULTIWAY CONTROL is "3WAY"

  FLASH ENTRY POINT is "Y"

  OFF HOOK ENTRY POINT is "N"

Copyright © 2003 Lucent Technologies

- if SPONT AVAIL is "UNAVAIL", then USTWC FEAT field is used by the Usage Sensitive Three-Way Calling Special Feature. Therefore, the feature name entered in this field must be defined on the MWFD form with:

  ACT/INACT OPTION is "ACT1CA"

  AMAC is "USAGE"

  FLASH ENTRY POINT is "N"

  MULTIWAY CONTROL is "3WAY"

  OFF HOOK ENTRY POINT is "Y"

2.229 USTWC ACT

Description: Should Usage-Sensitive 3-Way Calling activation records be made? See Division 2, Section 4A106 for more information on Usage Sensitive Three-Way Calling Secured feature. This field also is used for the Spontaneous Usage-Sensitive 3-Way Calling feature. For more information on this feature, see Division 2, Section 4A156.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If SFID 106 is not set to "Y" on the SFSYS form, USTWC ACT must be "N".

2.230 USTWC CHRG

Description: Should Usage-Sensitive 3-Way Calling charge records be made? This field also is used for the Spontaneous Usage-Sensitive 3-Way Calling feature. For more information on this feature, see Division 2, Section 4A156.

Software Release: 5E8 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If SFID 106 is not set to "Y" on the SFSYS form, USTWC CHRG must be "N".

2.231 SPONT AVAIL

Description: The SPONT AVAIL field is used to determine the type of availability for the Spontaneous Usage-Sensitive Three-Way Calling Feature. The SPONT AVAIL field was added to support the Spontaneous Usage-Sensitive Three-Way Calling Special Feature. This feature will be made available in

Copyright © 2003 Lucent Technologies

a 5e9(1) Software Update (SU). For more information on this feature, see Division 2, Section 4A156.

Software Release: 5E9(1) and later.
Required Field.
Default: UNAVAIL
Valid Entries:

Valid SPONT AVAIL Entries

Entry	Definition
GENAVAIL	The Spontaneous USTWC feature is to be generally available to all users, with the exception of disabled lines.
SUBSCR	Feature is available only to those users who subscribe to use it (RC view 1.6, ODA LINE form).
UNAVAIL	Feature is not available in this office.

Data Rules:

"UNAVAIL" must be entered in this field if USTWC FEAT field is not entered.

This field supports the Spontaneous Usage Sensitive Three-Way Calling feature, which is a Secured Feature that must be purchased by the office before this field can be changed from the default value of "UNAVAIL". Therefore, the ACT field for SFID 156 on the SFSYS form (5713-1 Record) must be set to "Y" before this field can be entered.

NETWORK ACCESS INTERRUPT (NAI)

The following fields (Section 2.232 - Section 2.233) defines office parameters for the Toll NAI (Network Access Interrupt) secured feature.

2.232 TOLL

Description: Is the Network Access Interrupt feature for Toll active? This field supports the Toll NAI secured feature (SFID 380). For more information on the Toll NAI feature, see Division 2, Section 4A380.

Software Release: 5E9(1) and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If "Y" is entered, then NAI SUBSYS NBR must be entered.

2.233 SUBSYS NBR

Description: Enter the subsystem number used in direct signaling application for Toll NAI.

Software Release: 5E9(1) and later.
Valid Entries: 232 - 255

DNUS

The following field defines the office parameter for DNU-S

2.234 FI SWITCH INT

Description: Enter the minimum interval in days that the REX (Routine Exercise) is permitted to run without switching the SFIs (STSX-1 Facility Interfaces). A value of "OFF" means never switch. This parameter supports the DNU-S. For more information on DNU-S, see Division 2, Section 9C.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and later.
Required Field.
Default: 28
Valid Entries: OFF or 1 - 360 (days)

OIU

The following field defines the office parameter for OIU.

2.235 OFI SWITCH INT

Description: The OFI SWITCH INT field is used to specify the minimum interval in days that REX (Routine EXercise) is permitted to run without switching the OFI (Optical Facility Interfaces). This field supports the OIU (Optical Interface Unit) feature. For more information on this feature, see Division 2, Section 7BQ.

Software Release: 5E16(2) and later.
Required Field.
Default: 28
Valid Entries: OFF or 1 - 360 (days)

2.236 OIU TDM CHBLK CNT

Description: The OIU TDM CHBLK CNT (Optical Interface Unit Time Division Multiplexing Channel Block Count) field is used to display the number of 672 channel blocks assigned to TDM OIUs in the office. This is a no change field. This field supports the OIU - IP (Optical Interface Unit - Internet Protoco) feature. This feature is made available in 5E16 Feature Release 3. (For more information on this feature, See Division 2, Section 7BX.)

Software Release: 5E16(2) and later
Required Field.
Default: 0
Valid Entries: 0 - 1152

2.237 OIU TDM CHBLK LMT

Description: The OIU TDM CHBLK LMT (Optical Interface Unit Time Division Multiplexing Channel Block Limit) field is used to display the maximum number of 672 channel blocks assigned to TDM OIUs in the office. This is a no change field. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature. This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

Software Release: 5E16(2) and later
Required Field.
Default: 0
Valid Entries: 0 - 1152

2.238 OIU IP CHBLK CNT

Description: The OIU IP CHBLK CNT (Optical Interface Unit Internet Protocol Channel Block Count) field is used to display the number of 672 channel blocks assigned to IP OIUs in the office. This is a no change field. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature. This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

Software Release: 5E16(2) and later
Required Field.
Default: 0

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 1152

2.239 OIU IP CHBLK LMT

Description: The OIU IP CHBLK LMT (Optical Interface Unit Internet Protocol Channel Block Limit) field is used to display the maximum number of 672 channel blocks assigned to IP OIUs in the office. This is a no change field. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature. This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

Software Release: 5E16(2) and later.
Required Field.
Default: 0
Valid Entries: 0 - 1152

PHA

The following fields (Section 2.240 - Section 2.242) define the parameters for the Protocol Handler for PHA (Protocol Handler for Asynchronous Transfer) feature. For more information on this feature, see Divison 2, Section 4A224.

2.240 CONG1 QCAP

Description: Enter the percentage when the Congestion Level 1 Queue Capacity Threshold is exceeded for Protocol Handlers for ATM (Asynchronous Transfer Mode). Measurements are pegged when this threshold is exceeded.

Software Release: 5E10 and later.
Required Field.
Default: 50(%)
Valid Entries: 0 - 100 (%)

Data Rules:

CONG1 QCAP cannot be greater than CONG2 QCAP.

2.241 CONG2 QCAP

Description: Enter the percentage when the Congestion Level 2 Queue Capacity Threshold for Protocol Handlers for ATM (PHA) is exceeded. Measurements are pegged when this threshold is exceeded.

Software Release: 5E10 and later.
Required Field.
Default: 80 (%)
Valid Entries: 0 - 100 (%)

2.242 ATM LAYER

Description: Enter the Asynchronous transfer mode layer used to specify the physical layer used between PHAs (Protocol Handlers for Asynchronous Transfer Mode).

Software Release: 5E10 and later.
Required Field.
Default: SONET
Valid Entries:

Valid ATM LAYER Entries	
Entry	**Definition**

SONET	Synchronous Optical Network
SDH	Synchronous Digital Hierarchy

PHV

The following fields (Section 2.243 - Section 2.244) define the parameters for PHV (Protocol Handlers for Voice.) These fields support the CDMA (Code Division Multiple Access) feature. For more information on this feature see Division 2, Section 8B.

2.243 VOC TYPE

Description: Enter the rate of the vocoders on the PHV (protocol handlers for voice).

Software Release: 5E10 and later.
Required Field.
Default: 8 or 13 KBPS
Valid Entries:

Valid VOC TYPE Entries

Entry	Definition
8KBPS	8 kilobit per second vocoder
13KBPS	13 kilobit per second vocoder

2.244 REV QLTY THRESH

Description: Enter the CDMA reverse voice quality threshold. This threshold is used to determine when to peg the SH (Speech Handler) measurements associated with Low Quality Reverse Voice Call Intervals. Specifically, when the voice quality value of the reverse voice frame fed to the vocoder for the call interval is below this threshold, the appropriate measurement is pegged. This threshold is NOT used for SH reverse voice frame selection.

Software Release: 5E10 and later.
Required Field.
Default: 0
Valid Entries: 0 - 127

CNIS INTRAGROUP DELIVERY ONLY

The following field defines the office parameter for CNIGI (Calling Number Identification Services Intragroup Delivery Only) feature. For more information on this National ISDN 3 feature, see Division 2, Section 1AM.

2.245 CNIGI

Description: The CNIGI (Calling Number Identification Services Intragroup Delivery Only) field indicates whether members of the terminal group have restrictions on delivery of CPN (Calling Party Number), RN (Redirecting Number), CPS (Calling Party Subaddress), and ICLID (Incoming Call Line Identification). Based on the CNIGI field, these may be restricted to intragroup calls only.

Software Release: 5E10 and later
Default: NULL
Valid Entries:

Valid CNIGI Entries - 5E10 and later

Entry	Definition
INTRAONLY	The above items are delivered only on intra-group calls.
NORSTRCT	No restrictions apply.
NULL	Consult the CNIGI field value on the Terminal Group Attendant and Data form, TGATTD (5611 Record, Recent Change view 4.4).

Copyright © 2003 Lucent Technologies

COMMUNICATION MODULE

The following field supports the CM3 NxTMS feature (99-5E-4104). For more information on this feature see Division 2, Section 7BO.

2.246 TMS HUNT

Description: This field indicates the Time Multiplex Switch algorithm number.

Software Release: 5E16.2 and later
Default: 0
Valid Entries:

Valid TMS HUNT Entries - 5E16.2 and later

Mode	Name	Definition	Usage
1	Round Robin	Call paths are hunted in a rotation among all equipped TMSFP (including TMSFP 0).	Offices with all SM-2000s
2	Zero-last	Call paths are hunted in a rotation among all equipped TMSFP. TMSFP 0 is always hunted last.	Offices with SMs
0	Default	If the office has all SM-2000s then use mode 1. If the office has a mixture of SM 2000s and SMs then use mode 2.	Default for all offices.

The TMS Hunt value will be set to default (0) for new starts on or retrofits to 5E16.2. The option can be changed to lock in a mode (1 or 2)

CALL WAITING DELUXE

The following fields defines the office parameter for Call Waiting Deluxe. These fields support the Call Waiting Deluxe Phase II Feature. This is a secured feature with SFID 145. For more information on this feature, see Division 2, Section 4A145.

2.247 ALERT TYPE

Description: The Call Waiting Deluxe Alerting Type. The user and/or the CPE is alerted of an incoming call by way of a tone.

Software Release: 5E10 and later.
Default: CWD2
Valid Entries:

Valid ALERT TYPE Entries - 5E10 and later

Entry	Definition
OFCALERT	Office value
CWD	SAS only with non-ADSI per-call options allowed
CWD1	SAS & CAS with non-ADSI per-call options restricted
CWD2	SAS & CAS with non-ADSI allowed

2.248 DFLT OPT

Description: Default Service Option is a treatment applied to incoming calls when the user does not select a per-call option.

Software Release: 5E10 and later.
Default: CALLFWD
Valid Entries:

Valid DFLT OPT Entries - 5E10 and later

Entry	Definition
OFCDFLTOPT	Office value
	Continue providing waiting party audible ringing

Copyright © 2003 Lucent Technologies

CALLFWD	Forward waiting call to CFDA destination
DEFANNC	Connect waiting call to default announcement

2.249 USG SENS CONF

Description: Usage Sensitive Conference is used to track the usage of conferencing.

Software Release: 5E10 and later.
Default: N
Valid Entries:

Valid USG SENS CONF Entries - 5E10 and later

Entry	Definition
OFCCONF	Office value
N	Do not provide usage sensitive AMA for conferencing on this line
Y	Provide usage sensitive AMA for conferencing on this line

2.250 SUPV ANNC

Description: Answer Supervision on Per-call Announcement will charge for each time announcement is used.

Software Release: 5E10 and later.
Valid Entries: Y, N
Default Value: Y

2.251 DFLT ANNC

Description: Determines if answer supervision shall be provided for the default announcement.

Software Release: 5E10 and later.
Default: Y
Valid Entries: Y, N

2.252 HOLD ANNC

Description: Determines if answer supervision shall be provided at the beginning or ending of Hold Announcement.

Software Release: 5E10 and later.
Default: BEGOFANNC
Valid Entries:

Valid HOLD ANNC Entries - 5E10 and later

Entry	Definition
BEGOFANNC	Provide answer supervision at the beginning of the hold annc.
ENDOFANNC	Provide answer supervision at the end of hold annc.

2.253 FLASH TIMER

Description: Maximum amount of time the switch mutes the voice-path after it detects a flash signal from a non-ADSI compatible CPE while a call is on hold. If the flash timer expires before a DTMF tone is detected, the switch performs the RETURN treatment. The flash timer is stopped when the system detects a valid DTMF tone.

Software Release: 5E10 and later.
Default: 1.5 seconds
Valid Entries: Enter a value from 1 to 8 seconds (increments of 0.5 seconds)

2.254 DFLT TIMER

Copyright © 2003 Lucent Technologies

Description: Amount of time the switch waits before providing CWD default treatment, if the CWD customer has not selected a CWD per-call option or the waited party has not disconnected. The default timer is started after the switch sends the re-alerting tone. The default timer is stopped when the system detects a flash or the waiting party disconnects.

Software Release: 5E10 and later.
Default: 15 seconds
Valid Entries: Enter a value from 0 to 110 seconds (increments of 1 seconds)

2.255 HOLD TIMER

Description: The interval from when a held party is connected to a silent termination until it is connected, or re-connected, to a reminder announcement.

Software Release: 5E10 and later.
Default: 60 seconds
Valid Entries: 0 - 120 seconds (increments of 1 second)

2.256 PRODUCT

Description: Enter Product Architecture Type.

Software Release: 5E10 and later.
Default: 5ESS
Valid Entries:

Valid PRODUCT Entries - 5E10 and later

Entry	Definition
5ESS	Standard 5ESS office.
VCDX	Very Compact Digital Exchange.
WNC	Wireless NetworkCentrex.
DRM	Distinctive Remote Module. For more information see Division 2, Section 4A525.

Data Rules:

If PRODUCT is "VCDX", all trunk groups with DCS TRK on the TKGRP form equal to "Y" must also have LOCAL MOD specified. If PRODUCT is other than "VCDX", all trunk groups with DCS TRK equal to "Y" must leave LOCAL MOD blank.

For 5E11 and later, when VCDX OFFICE is set to "Y" on the EQCORE form and TRKCLS on the TKGRP form (5202-1/2 Record) is not in the table below, then LOCAL SM on the TKGRP form must be known.

For 5E14 and later, when the REMOTE MODULE has RALM forms for various Alarm Scan Points (0-54) defined and the PRODUCT field on the OFCOPT form is set to "DRM", ALARM INPUT OPT must be "Y" on the OFCOPT form.

For 5E14 and later, when the REMOTE MODULE has RALM forms for Alarm Scan Points 100 through 113 defined and the PRODUCT field on the OFCOPT form is set to "DRM", ALARM OUTPUT OPT must be "Y" on the OFCOPT form.

For 5E14 and later, if the value of PRODUCT on the OFCOPT form is either "VCDX" or "DRM", then all TKGRP forms with DCS TRK equal to "Y" must have LOCAL SM specified. If the value of PRODUCT on the OFCOPT form is not "VCDX" or "DRM", then all TKGRP forms with DCS TRK equal to "Y" must have LOCAL SM null.

LOCAL SM Entries
Software Release: 5E11 and later

Data Condition	Trunk Group Definition
TRKCLS[1,3] = "LTP"	Local Test Port Trunk
TRKCLS = "EDS" and RDTA GRP = "Y"	Extended Digital Subscriber RDTA Trunk TRKCLS = "INAISTRK"

Copyright © 2003 Lucent Technologies

TRKCLS = "RMSD3"	TAT connected to RSM-D3 Trunk
TRKCLS = "TOPAS"	Test Access Trunk - TOPAS Interface

For 5E10 and later, when WNC is entered, a WCTXOPT form must be entered with a SITE ID of 0.

When "WCN" is entered, an action of "FLASH" must be entered on the SRVCDESC form (5985 Record) to indicate the WCTX Wireless Flash feature.

For 5E13 and later, when PRODUCT is "WNC", then TANDEM CUT on the ICF form must be "N".

LONG DISTANCE PLATFORM

Prior to 5E12, this was the TOLL DIGITAL EXCHANGE field group, the field group name was changed to LONG DISTANCE PLATFORM.

The following fields define Long Distance Platform parameters used in a LDP (Long Distance Platform) office. This is a secured feature with SFID 165. For more information on this feature, see Division 2, Section 4A165.

2.257 TDX CARRID

Description: With 5E12 and later, this field name is changed to LDP CARRID. Enter the Toll Exchange Carrier Identification number. This field supports the Toll Digital Exchange Basic Call Processing Feature used in a LDP office.

Software Release: 5E10 through 5E11.
Valid Entries: 0 - 9999

Data Rules:

When TDX CARRID is entered, the CARRIER ID must be defined on the ICF form, and FEAT GRP on the ICF form must equal "D".

The TDX CARRID field can not be set to "0" when any trunk group defined in the office has TDX set to "Y" on the TKGRP form.

2.258 LDP CARRID

Description: Prior to 5E12, this was the TDX CARRID field. With 5E12 and later, this field name was changed to LDP CARRID. Enter the Long Distance Platform Identification number. This field supports the Long Distance Platform Basic Call Processing Feature used in a LDP office.

Software Release: 5E12 and later.
Valid Entries: 0 - 9999

Data Rules:

When LDP CARRID is entered, the CARRIER ID must be defined on the ICF form, and FEAT GRP on the ICF form must equal "D".

The LDP CARRID field cannot be set to "0" when any trunk group defined in the office has LDP set to "Y" on the TKGRP form.

2.259 LDP OFFICE ID

Description: The LDP OFFICE ID is used to populate the office ID in the NST (Network Specific Termination) parameter. For more information, see Division 2, Section 4A287.

Software Release: 5E13 and later.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 255, or leave blank.

2.260 NST ALL

Description: Send the NST (SS7 Network Specification Termination) parameter on all (ACM, CPG, and REL) messages, should the other conditions for sending the parameter be met? For more information, see Division 2, Section 4A287.

Software Release: 5E13 and later.
Valid Entries: Y, N
Default Value: N

2.261 ACCT PROMPT

Description: The ACCT PROMPT field specifies the toll account prompt. The ACCT ANNC field was removed. The ACCT PROMPT and CARRIER TONE fields were added to support the 400Hz Carrier Tone feature. For more information on this feature see Division 2, Section 4A165.

Software Release: 5E13 and later
Default: BEEP2
Valid Entries:

Valid ACCT PROMPT Entries

Entry	Definition
ANNC	SAS (Service Announcement System announcement)
BEEP2	Prompt of two audible beeps
CARRIER	400Hz carrier tone.

Data Rules:

When ACCT PROMPT is "CARRIER", CARRIER TONE must be "Y".

For 5E13 later, when the OFCOPT form has ACCT PROMPT set to "ANNC", exactly one FIXRT form must exist with FIXED ROUTE TYPE set to "TACCT".

2.262 CARRIER TONE

Description: The CARRIER TONE field specifies whether the 400Hz Carrier Tone should be provided as a system tone. Should 400Hz Carrier Tone be provided as a system tone?
Default: N
Valid Entries: Y, N

2.263 ACCT ANNC

Description: Should Account Code Announcement Indicator be provided by the Service Announcement System?

For 5E13 and later, this field is changed to ACCT PROMPT.

Software Release: 5E11 through 5E12
Valid Entries: Y, N
Default Value: N

Data Rules:

When the OFCOPT form has ACCT ANNC set to "Y", exactly one FIXRT form must exist with FIXED ROUTE TYPE set to "TACCT".

2.264 NSC WC ID

Copyright © 2003 Lucent Technologies

Description: The NSC WC ID field is used to specify the LDP (Long Distance Platform) network selection code context ID. If the Context ID, the first three digits of the AMA Digits Dialed WC parameter, returned from the SCP is the same as the NSC WC ID, the remaining digits in the AMA Digits Dialed WC parameter will be treated as a T-NSC (Terminating Network Selection Code). If the two values being compared do not match, the remaining digits will be treated as AMA digits. For more information, see Div. 2, Sec. 4A217.

Software Release: 5E12 and later.
Valid Entries: 0 - 999, or leave blank.

2.265 ORIG NSC

Description: The ORIG NSC field is used to specify the LDP originating network selection code and must be entered for the MINT-ALPHA feature.For more information see, Div. 2, Sec. 4A217.

Software Release: 5E12 and later.
Valid Entries: 0 - 999, or leave blank.

2.266 TERM NSC

Description: The TERM NSC field is used to specify the LDP terminating network selection code. For more information, see Div. 2, Sec. 4A217.

Software Release: 5E12 and later.
Valid Entries: 0 - 999, or leave blank.

Data Rules:

When the MINT-ALPHA feature is purchased by the office with SFID 217 ACT set to "Y" on the SFSYS form, TERM NSC on the OFCOPT form and the corresponding LDPTNSC form must be entered.

2.267 TEST CALL TNSC

Description: The TEST CALL TNSC field is used to specify the LDP test call terminating network selection code. For more information, see Div. 2, Sec. 4A217.

Software Release: 5E12 and later.
Valid Entries: 0 - 999, or leave blank.

Data Rules:

When the MINT-ALPHA feature is purchased by the office with SFID 217 ACT set to "Y" on the SFSYS form, TEST CALL TNSC on the OFCOPT form and the corresponding LDPTNSC form must be entered.

2.268 LDP ANI

Description: The LDP ANI field is used to indicate which ANI table is used. If "Y" the ANITABLE form is used, if "N" the ANITBL form is used.

For more information see Division 2, section 4A165.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E13, when TRKCLS on the TKGRP form is "IC", "LATA" or "TTOLLCON", and LDP on the TKGRP form is "Y" and LDP ANI on the OFCOPT form is "N", then there must exist an ANITBL form with NPA equal to 000, NXX equal to 000 and LINE equal to 0000.

Copyright © 2003 Lucent Technologies

INCREASED TGN

The following fields define the Increase Number of Trunk Groups to 4000 feature. This is a secured feature with SFID 172. For more information on this feature, see Division 2, Section 4A172.

2.269 MAX TGN

Description: The MAX TGN field is used to specify the maximum number of trunk groups in this office.

Software Release: 5E11 and later.
Valid Entries: 2000, 4000
Default Value: 2000

Data Rules:

The Increase Number of Trunk Groups to 4000 is a secured feature that must be purchased by the office before MAX TGN can be set to 4000 on the OFCOPT form. A SFSYS form must exist with SFID 172 ACT set to "Y".

The TGN entered on the TKGRP form must be less or equal to the value of MAX TGN on the OFCOPT form.

2.270 MAX RTIDX

Description: The MAX RTIDX field is used to specify the maximum number of route indices in this office.

Software Release: 5E11 and later.
Default: 3617
Valid Entries:

For 5E13 and later: 3617, 4095 , 16382

Data Rules:

This field supports the Increase Number of Trunk Groups to 4000 secured feature that must be purchased by the office before MAX RTIDX can be set to 4095 on the OFCOPT form. A SFSYS form must exist with SFID 172 ACT set to "Y".

The MC ROUTE INDEX on the MCRTIDX form and the ROUTE INDEX on the RTIDX form must be less or equal to the value of MAX RTIDX on the OFCOPT form.

When MAX RTIDX is set to 16382, the ACT field for SFID 289 must be set to "Y" on the SFSYS form.

LOCAL NUMBER PORTABILITY

The following field defines a parameter for the Local Number Portability feature. This is a secured feature with SFID 174. For more information on this feature, see Division 2, Section 4A174.

2.271 JIP

Description: Enter 6 digits NPA-NXX of the form (0-9) (0-9) (0-9) (0-9) (0-9) (0-9). This field defines the Jurisdiction Information Parameter. The JIP field is used to specify the ISUP parameter included in the IAM (Initial Address Message). It contains the NPA-NXX of a designated LRN (Location Routing Number) on the originating switch. The JIP is needed to allow carriers to determine the switch of the originating service provider so the bill can be sent to the correct company.

Copyright © 2003 Lucent Technologies

Software Release: 5E11 and later.
Valid Entries: A 6-digit number

Data Rules:

If JIP is entered, SFID 174 ACT on the SFSYS form must be "Y".

2.272 DFLT FLAT RATE

Description: The DFLT FLAT RATE field is used to indicate whether or not flat rate AMA records should be generated.

Software Release: 5E11 and later.
Valid Entries:

Valid DFLT FLAT RATE Entries

Entry	Definition
C for COND	Conditional generation of flat rate record when a LRN is received in the NP response message.
N for NONE	Never generate a flat rate record.
U for UNCOND	Unconditional generation of flat rate records whenever an LNP query is performed without failure or errors.

2.273 DFR STRCT CODE

Description: The DFR STRCT CODE field is used to specify which structure code is to be used for the generation of a flat rate AMA record.

SoftwareRelease: 5E11 and later.
Valid Entries: 001 or 500

REORDER THRESHOLDS

The following fields (Section 2.274 - Section 2.276) provide an alarm on a per SM basis when the "re-order" count (the number of incompleted calls routed for retry (re-order) reaches the defined threshold. Calls may be re-ordered due to a busy trunk, lack of proper engineering or overload situation, software/hardware resource limitations, and/or database inconsistencies.

2.274 RCR MINOR

Description: The RCR MINOR field is used to specify the minor Reorder Count Ratio alarm threshold in this office.

Software Release: 5E11 and later.
Default: 0
Valid Entries: 0 - 253 (0 to deactivate)

Data Rules:

RCR MINOR must be less than RCR MAJOR.

RCR MINOR, RCR MAJOR, and RCR CRITICAL must be all 0 or all greater than 0.

2.275 RCR MAJOR

Description: The RCR MAJOR field is used to specify the major Reorder Count Ratio alarm threshold in this office.

Software Release: 5E11 and later.
Default: 0

Copyright © 2003 Lucent Technologies

Valid Entries: 0, or 2 - 254 (0 to deactivate)

Data Rules:

RCR MAJOR must be less than RCR CRITICAL.

RCR MINOR, RCR MAJOR, and RCR CRITICAL must be all 0 or all greater than 0.

2.276 RCR CRITICAL

Description: The RCR CRITICAL field is used to specify the critical Reorder Count Ratio alarm threshold in this office.

Software Release: 5E11 and later.
Default: 0
Valid Entries: 0, or 3 - 255 (0 to deactivate)

RCR MINOR, RCR MAJOR, and RCR CRITICAL must be all 0 or all greater than 0.

LDCW TREATMENT

The following field defines the office papameter for the Long Distance Call Waiting feature.

2.277 LDCW TRMT

Description: Are SS7 calls without Calling Party Number information to be treated as local calls for the Long Distance Call Waiting Feature? Enter "N" for Long Distance Calls or "Y" for Local Calls. This field supports the Enhanced Long Distance Call Waiting Feature. For more information on this feature see Division 2, Section 4A91.

Software Release: 5E10 and later.
Default: N
Valid Entries: Y, N

2.278 SIGIOPT

Description: Investigate abnormal signaling? This field is a no change field and defaults to "Y".

Software Release: 5E11 and later
Required Field.
Default Value: Y
Valid Entries: Y, N

ISUP/BICC QRY OPTIONS

The following fields define the office parameters for the Circuit Query Options for the CCS7-PSU for EXM/SM-2000 feature. Refer to Division 2, Section 9L for more information on this feature.

2.279 CQM RSND

Description: This parameter specifies the circuit query timer value (in seconds) used when waiting for a reply to a Circuit Query Message.

Software Release: 5E12 and later.
Default: 10
Valid Entries: 10 - 15 in seconds

2.280 CQ START TIME

Copyright © 2003 Lucent Technologies

Description: This field has been replaced by CQ/BQ START TIME.

2.281 CQ/BQ START TIME

Description: This parameter specifies the circuit query (5E12 and later)/BICC CIC Query (5E15 and later) start time value. It is used to define the hours that the daily automatic office wide circuit query and the BICC CIC query will begin. The BICC group query was added to support Feature 99-5E-7555.D. See Division 2, Section 4A567 for more information.

Software Release: 5E12 and later
Default: 3
Valid Entries: 0 - 23 (blank means query is off)

NPA-NXX GROWTH

2.282 ASI SID 10

Description: The ASI SID 10 field is used to indicate whether the default directory number associated with the ASI (Advanced Services Interface) subscriber to the IP (Intelligent Peripheral) on this switch should be displayed as 10 digits or 7 digits. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E12 and later, the ASI SID 10 field on the OFCOPT form is used by the Number Portability - NPA-NXX Growth feature. This is a secured feature that must be purchased by the office before data can be changed from the default value. An SFSYS form must exist with SFID 198 set to "Y".

2.283 ROP DISP DN 10

Description: The ROP DISP DN 10 is used to indicate whether the switch is displaying the full 10 digits of a DN (Directory Number) whenever DNs are printed on the ROP. This field supports the Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

RTCD OPTIONS

2.284 BILL SM

Description: The BILL SM is used to display the global billing SM (Switching Module) for the RTCD (Real Time Call Detail) platform. For more information, see Division 2, Section 4A245.

Software Release: 5E12 and later.
Default: Null
Valid Entries: 0 - 192 (0 indicates there is no global billing SM)

2.285 RTCD OFC

Description: The RTCD OFC field is used to indicate on a per office basis, whether or not RTCD billing

Copyright © 2003 Lucent Technologies

records are generated. For more information, see Division 2, Section 4A245.

Software Release: 5E12 and later.
Required Field.
Default: N
Valid Entries: Y,N

Data Rules:

For 5E12 and later, when RTCD OFC on the OFCOPT form is set to "Y", SFID 245 must be set to "Y" on the SFSYS form.

2.286 RTCD ALM

Description: The RTCD ALM field is used to indicate on a per office basis, whether or not alarms are activated during stand-alone billing. These alarms will sound when the RTCD records that have been written to the stand-alone billing memory have filled the available RTCD memory space to the defined thresholds. For more information, see Division 2, Section 4A245.

Software Release: 5E12 and later.
Required Field.
Default: Y
Valid Entries: Y,N

2.287 SCP TREC

Description: The SCP TREC field is used to determine how billing information should be recorded for SCP transactions. For more information, see Division 2, Section4A245.

Software Release: 5E13 and later.
Valid Entries:

Valid SCP TREC Entries

Entry	Definition
AMAONLY	Use the AMAslpID for AMA records only.
RTCDAMA	Use the AMAslpID for AMA and RTCD records.
RTCDONLY	Use the AMAslpID for RTCD records only.

PSU TRUNKS

2.288 PP IDLE

Description: Enter the time in seconds indicating the time without flags before Packet Pipes go idle.

This office parameter indicates the time without flags before packet pipe trunk members will go to the state of idle channel. When the PH being used by a packet pipe trunk member detects that a previously active packet pipe has gone idle at layer 1 (i.e. no 0/1 transitions), an "idle" timer of duration PP IDLE is started. If the "idle" timer expires before any activity is detected on the packet pipe, the "idle" condition of the packet pipe is reported to TM (Terminal Maintenance). TM reports the status of the packet pipe as "OOS BLKD IDLE".

This field was added to support the CDMA Data Services - Circuit Mode feature for 5E12 and later. For more information on this feature, see Division 2, Section 8F.

Software Release: 5E12 and later.
Required Field.
Default: 4
Valid Entries: 1 - 30 seconds

Copyright © 2003 Lucent Technologies

2.289 PER RATE

Description: Enter the Protocol Error Record leak rate for speech handler trunks.

This office parameter indicates the PER (Protocol Error Record) leak rate for the speech handler channel trunks. The parameter applies to all trunks on a switch. The leak rate represents the number of PERs to be leaked in a period of time. Example: If the value of this global parameter is set to 5 and the time interval is 3 minutes, then every 3 minutes 5 PERs will be leaked.

This field was added to support the CDMA Data Services - Circuit Mode feature for 5E12 and later. For more information on this feature, see Division 2, Section 8F.

Software Release: 5E12 and later.
Required Field.
Default: 5
Valid Entries: 0 - 255

2.290 PER THRESH

Description: Enter the Protocol Error Record threshold for speech handler trunks.

This office parameter indicates the PER (Protocol Error Record) error threshold for speech handler channel trunks. The parameter applies to all the trunks on a switch. A report is generated when the defined PER threshold value is met. Example: If this global parameter is set to 15, then when the PER count for a trunk reaches 15 a report is generated. An internal counter is reset so that the next report is only generated when a new PER count of 15 is reached.

This field was added to support the CDMA Data Services - Circuit Mode feature for 5E12 and later. For more information on this feature, see Division 2, Section 8F.

Software Release: 5E12 and later.
Required Field.
Default: 15
Valid Entries: 0 - 255

2.291 PER 3G RATE

Description: Enter the PER (Protocol Error Record) CDMA Third Generation leak rate.

This office parameter indicates the PER leak rate for CDMA Third Generation 1X High Speed Data trunks. The parameter applies to all trunks on a switch. The leak rate represents the number of PERs to be leaked in a period of time. For example, if the value of this global parameter is set to "5" and the time interval is 3 minutes, then every 3 minutes, 5 PERS are leaked.

This field was added to support the CDMA 3G1X High Speed Data feature for 5E15 and later. For more information on this feature, see Division 2, Section 8Z.

Software Release: 5E15 and later.
Required Field.
Default: 5
Valid Entries: 0 - 255

2.292 PER 3G THRESH

Description: Enter the Protocol Error Record CDMA Third Generation threshold.

This office parameter indicates the PER error threshold for CDMA Third Generation 1X High Speed Data trunks. The parameter applies to all the trunks on a switch. A report is generated when the defined PER

Copyright © 2003 Lucent Technologies

threshold value is met. For example, if this global parameter is set to "15", then when the PER count for a trunk reaches 15, a report is generated. An internal counter is reset so that the next report is only generated when a new PER count of 15 is reached.

This field was added to support the CDMA 3G1X High Speed Data feature for 5E15 and later. For more information on this feature, see Division 2, Section 8Z.

Software Release: 5E15 and later.
Required Field.
Default: 15
Valid Entries: 0 - 255

2.293 PRIM VOC ALG

Description: Enter the Primary Voice Decoder Algorithm.

The PRIM VOC ALG field is used to specify the primary (default) voice 1 decoder (vocoder) algorithm. This algorithm is only used for voice decoder channel groups (defined by PH TYPE on the PSUGP form (5949 Record)) that can be associated with more than one GRP TYPE on the PSUGP form. It is used to set the GRP TYPE when an ADT (AUTOPLEX Data Trunk) is assigned to the channel group before a CVT (CDMA Voice Trunk) is assigned to the channel group. Example: Suppose that PH TYPE "PHV3" is able to handle the 8K, 13K, and EVRC algorithms, which means that GRP TYPE could get set to "CQ8CG", "CQ13CG", or "EVRCCG". Also suppose that this PH has been assigned on the PSUGP form, but has not been used yet by any trunk group member (so GRP TYPE is currently NULL). If the first trunk group member assignment to this PHV3 is an ADT and PRIM VOC ALG is set to "8K", the GRP TYPE will get set to "CQ8CG" for that channel group. (This means that CVT trunks subsequently assigned to this channel group must also have SERV TYPE "8K" on the TKGRP form (5202 Record))

This field was added to support the CDMA Data Services - Circuit Mode feature for 5E12 and later. For more information on this feature, see Division 2, Section 8F.

Software Release: 5E12 and later.
Required Field.
Default: EVRC
Valid Entries:

Valid PRIM VOC ALG Entries - 5E12 and later

Entry	Definition
8K	8 KB channel group.
13K	13 KB channel group.
EVRC	EVRC algorithm channel group.

2.294 SEC VOC ALG

Description: Secondary Voice Decoder Algorithm.

This field is used to specify the default voice decoder (vocoder) algorithm for the first data (ADT) trunk group member on a PHV5 where no voice trunk has been assigned on the same channel group.

This field was added to support the Dynamic Allocation of Vocoders on PHV5 feature for 5E16 and later. (For more information on this feature, see Division 2, Section 8Y.)

Software Release: 5E16 and later.
Required Field.
Default: CEV13
Valid Entries:

Valid SEC VOC ALG Entries - 5E16 and later

Entry	Definition
13K	13K voice service for SPCHNDLR trunk groups.

Copyright © 2003 Lucent Technologies

ACELP	Algebraic Code Excited Linear Predictive Algorithm Vocoder
CEV13	Service type for CDMA EVRC and 13K Vocoder.
EVRC	Enhanced Variable Rate Coding for SPCHNDLR trunk groups.
TACVS	Service type for TDMA ACELP and VSELP Vocoder.
VSELP	Vector Sum Excited Linear Predictive Algorithm Vocoder.

Data Rules:

- ***NOTE:*** A SEC VOC ALG of "TACVS" is not currently supported. The valid entry "TACVS" for this field may potentially be supported for future use.

FRBC LEV 3 PER

The following fields define the Frame Relay Bearer Channel Level 3 Protocol Error Record Minimum and Maximum Thresholds.

These fields were added to support the CDMA Data Services - Circuit Mode feature for 5E12 and later. For more information on this feature, see Division 2, Section 8F.

2.295 MIN THRESH

Description: Enter the Frame Relay Bearer Channel Level 3 Protocol Error Record Minimum Threshold.

This office parameter indicates the minimum (troubled) threshold for service-affecting level 3 errors on FRBC (Frame Relay Bearer Channel) trunks for the entire switch. When this threshold is reached, an entry for this FRBC trunk will be placed in a table that tracks FRBCs experiencing errors and the entry is timestamped. If the maximum threshold is reached, the current time and the timestamp of the table entry are compared. If the difference is less than a pre-defined time, the FRBC is taken out-of-service. If the time difference is greater than the pre-defined time, then the error count is decremented by a pre-defined amount.

Software Release: 5E12 and later.
Required Field.
Default: 500
Valid Entries: 1 - 2047

Data Rules:

MIN THRESH must be less than MAX THRESH

2.296 MAX THRESH

Description: Enter the Frame Relay Bearer Channel Level 3 Protocol Error Record Maximum Threshold.

This office parameter indicates the maximum (remove) threshold for service-affecting level 3 errors on FRBC (Frame Relay Bearer Channel) trunks for the entire switch. When the minimum (troubled) threshold is reached, an entry for this FRBC trunk will be placed in a table that tracks FRBCs experiencing errors and the entry is timestamped. If the maximum threshold is reached, the current time and the timestamp of the table entry are compared. If the difference is less than a pre-defined time, the FRBC is taken out-of-service. If the time difference is greater than the pre-defined time, then the error count is decremented by a pre-defined amount.

Software Release: 5E12 and later.
Required Field.
Default: 900
Valid Entries: 1 - 2047

TALKING CALL WAITING

The following fields (Section 2.297 - Section 2.307) were added to support the Talking Call Waiting feature

Copyright © 2003 Lucent Technologies

for 5E12 and later. For more information on this feature, see Division 2, Section 4A331.

2.297 ANS TIMER

Description: This field is used to indicate the maximum amount of time in seconds that the switch waits for the IP (Intelligent Peripheral) to answer.

Software Release: 5E12 and later
Default: 2
Valid Entries: 0.1 - 10.0

Data Rules:

When ANS TIMER is not equal to 2.0, DN1 or DN2 must be entered.

For 5E14 and earlier, when ANS TIMER is set to a value other than 2, the ACT field for SFID 331 on the SFSYS form (5713-1 Record) must be set to "Y".

2.298 DISC TIMER

Description: This field is used to indicate the maximum amount of time in seconds that the switch waits for the IP (Intelligent Peripheral) to disconnect.

Software Release: 5E12 and later
Default: 3
Valid Entries: 0.1 - 10.0

Data Rules:

When DISC TIMER is not equal to 3.0, DN1 or DN2 must be entered.

For 5E14 and earlier, when DISC TIMER is set to a value other than 3, the ACT field for SFID 331 on the SFSYS form must be set to "Y".

2.299 DN1

Description: The DN1 (Directory Number 1) field indicates the DN of the Intelligent Peripheral which provides the call waiting tone and spoken name of the calling party to the TCW subscriber. The DN must be translated correctly on the LDIT/RDIT forms (5300-3, 5300-7 Records) so that a call to this DN terminates to the IP.

Software Release: 5E12 and later
Valid Entries: 0 - 9 (up to 18 digits)

Data Rules:

When DN1 is entered, TCW DAS and TCW SCR must both be entered.

When DN1, DN2, TCW DAS, or TCW SCR is entered, the ACT field for SFID 331 on the SFSYS form (5713-1 Record) must be set to "Y".

2.300 DN2

Description: The DN2 (Directory Number 2) field indicates the DN of the Intelligent Peripheral which provides the spoken name only of the calling party to the TCW subscriber. The DN must be translated accurately on the LDIT/RDIT forms (5300-3/5300-7 Records) so that a call to the DN terminates to the IP. The subscriber subscribes to CWT (Call Waiting Terminating), TCW, and CIDCW (Caller ID on Call Waiting). If CIDCW overrides Caller ID, TCW is not invoked.

Copyright © 2003 Lucent Technologies

Software Release: 5E12 and later
Valid Entries: 0 - 9 (up to 18 digits)

Data Rules:

When DN is entered, TCW DAS and TCW SCR must both be entered.

NOTE: DN1/DN2 should not be any special number (e.g., 800/888) that results in a query to an external system (e.g., STP/SCP (Signal Transfer Point/Service Control Point). No AIN (Automatic Identification Number) triggers should be assigned to the DN1/DN2. In both of these cases normal CW (Call Waiting) tone (instead of talking) will be provided to the subscriber.

DN1/DN2 should be translated correctly on PDIT/LDIT/RDIT (5300-2, 5300-3, 5300-7 Records) and on the RAR (5301 Record) forms so that a call to these DNs terminates to the IP (Intelligent Peripheral) using LEC(Local Exchange Carrier) facility and the call becomes a free call (if the TELCO (Telephone Company) wants no AMA (Automatic Message Accounting)).

2.301 DNB

Description: This field is used by the Talking Call Waiting - Distinctive Call Waiting Tones feature to indicate the DN (Directory Number) of the Intelligent Peripheral which provides the call waiting tone pattern "B". The DNB field on this form supports the Talking Call Waiting - Distinctive Call Waiting Tones feature. This is a secured feature, therefore the ACT field for SFID 590 must be set to "Y" on the SFSYS form (5713-1 Record) before this field can be entered. (For more detailed information on the Talking Call Waiting - Distinctive Call Waiting Tones feature, see Division 2, Section 4A590.)

Software Release: 5E16 and later.
Valid Entries: Blank, or enter 1 - 18 digits of 0 - 9

Data Rules:

When DNB, DNC, or DNG is entered, DN1, TCW DAS and TCW SCR must be entered.

2.302 DNC

Description: This field is used by the Talking Call Waiting - Distinctive Call Waiting Tones feature to indicate the DN of the Intelligent Peripheral which provides the call waiting tone pattern "C". The DNC field on this form supports the Talking Call Waiting - Distinctive Call Waiting Tones feature. This is a secured feature, therefore the ACT field for SFID 590 must be set to "Y" on the SFSYS form (5713-1 Record) before this field can be entered. (For more detailed information on the Talking Call Waiting - Distinctive Call Waiting Tones feature, see Division 2, Section 4A590.)

Software Release: 5E16 and later.
Valid Entries: Blank, or enter 1 - 18 digits of 0 - 9

Data Rules:

When DNB, DNC, or DNG is entered, DN1, TCW DAS and TCW SCR must be entered.

2.303 DNG

Description: This field is used by the Talking Call Waiting - Distinctive Call Waiting Tones feature to indicate the DN of the Intelligent Peripheral which provides the call waiting tone pattern "G". The DNG field on this form supports the Talking Call Waiting - Distinctive Call Waiting Tones feature. This is a secured feature, therefore the ACT field for SFID 590 must be set to "Y" on the SFSYS form (5713-1 Record) before this field can be entered. (For more detailed information on the Talking Call Waiting - Distinctive Call

Copyright © 2003 Lucent Technologies

Waiting Tones feature, see Division 2, Section 4A590.)

Software Release: 5E16 and later.
Valid Entries: Blank, or enter 1 - 18 digits of 0 - 9

Data Rules:

When DNB, DNC, or DNG is entered, DN1, TCW DAS and TCW SCR must be entered.

2.304 TCW DAS

Description: The TCW DAS (Talking Call Waiting Digit Analysis Selector) is a number that indicates which digit interpreter tables to use for analyzing the incoming digit stream for a call used to make a connection to the IP. TCW DAS is used to determine which PDIT/LDIT/RDIT is to be used by digit analysis to route the call to IP (DN1/DN2) overriding the TCW subscriber's line DAS. The PDIT/LDIT/RDIT provides Code Index, TYPE OF CI CALL, and Route Index (or Office Code) for the call to DN1/DN2. TCW DAS could be an existing DAS (preferred) or a new DAS. The DAS must be defined on the DAS form (5300-1 Record).

Software Release: 5E12 and later
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When TCW DAS is entered, then DN1 or DN2, and TCW SCR must be entered.

When TCW DAS is entered, that TCW DAS must be defined on the DAS form (5300 Record).

2.305 TCW SCR

Description: The TCW SCR (Talking Call Waiting Screening Index) field is used for digit analysis when making a connection to the IP. This value is also used to access information for routing and charging. TCW SCR is used to point to the RAR form where a Charge Index is assigned to the Code Index (from PDIT/LDIT/RDIT) associated with the DN1/DN2 for billing the call to DN1/DN2. TCW SCR overrides the subscriber's line SCR.

The Charge Index is then expanded on CGIDX form (5302-1 Record) where the AMA CALL TYPE is set to "FREE" resulting in no AMA record generation for the call to DN1/DN2.

TCW SCR could be an existing SCR (preferred) or a new SCR.

The SCR must be defined on the RAR form.

The "FREE" Charge Index could be an existing one or a new one.

Software Release: 5E12 and later
Valid Entries: 1 - 4095

Data Rules:

When TCW SCR is entered, then DN1 or DN2, and TCW DAS must be entered.

When TCW SCR is entered, then TCW SCR must be defined on at least one RAR form (5301 Record) as SCR.

NOTE: The DN1/DN2 must be translated first on the PDIT/LDIT forms and then on the RDIT

Copyright © 2003 Lucent Technologies

form with a unique Code Index and a TYPE OF CI CALL equal "NORMAL" on the RDIT form. This unique Code Index can then be entered on the RAR form (corresponding to TCW SCR) for the correct prefix of DN1/DN2, to provide a "FREE" Charge Index.

2.306 TCW SUPPRESS AMA

Description: This field is used to indicate whether AMA (Automatic Message Accounting) billing should be suppressed for TCW (Talking Call Waiting) calls.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E14 and later:

When TCW SUPPRESS AMA is entered, this value must be defined on the ICF form (5305 Record).

When TCW SUPPRESS AMA is "Y", the ACT fields for SFID 331 and SFID 558 must also be set to "Y".

2.307 TCW CARRID

Description: This field defines the carrier that will be used to route Inter-LATA (Local Access and Transport Area) calls to an external IP (Intelligent Peripheral).

Software Release: 5E14 and later
Valid Entries: Blank, or 0 - 9999

Data Rules:

For 5E14 and later:

When TCW CARRID is entered, this value must be defined on the ICF form (5305 Record).

When TCW CARRID is entered, and TCW SUPPRESS AMA is "Y", the ACT fields for SFID 331 and SFID 558 must also be set to "Y".

2.308 VIRTUAL SWITCH

Description: VIRTUAL SWITCH field indicates whether or not this CP (Call Processing) node is a part of a virtual switch. (i.e. the switch is a host for DRM or a DRM itself). Is this call processing node part of a virtual switch? For more information, see Division 2, Section 4A525.

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When PRODUCT is "DRM", VIRTUAL SWITCH must be "Y".

The Distinctive Remote Module feature is a Secured Feature which must be purchased by the office before VIRTUAL SWITCH on the OFCOPT form may be set to "Y". An SFSYS form must exist with SFID 525 ACT set to "Y".

Copyright © 2003 Lucent Technologies

CALEA

The following fields (Section 2.309 - Section 2.311) define the fields used for the CALEA feature. For more information on this feature see Division 2, Section 4A509.

The CALEA (The Communication Assistance for Law Enforcement Act) feature is a Secured Feature, that must be purchased by the office before the following CALEA fields can be changed. An SFSYS form must exist with SFID 509 ACT set to "Y".

2.309 CALEA SM

Description: The CALEA SM field is used to indicate the delivery SM for the call content channels. For more information, see Division 2, Section 4A509.

Software Release: 5E14 and later
Valid Entries: 1 - 192

Data Rules:

When CALEA SM is greater than 0, a SFSYS form must exist with SFID 509 ACT set to "Y".

2.310 ADMIN ACCESS

Description: Should access to non - CALEA views be allowed? The ADMIN ACCESS field gives 5E personnel an option to restrict the CALEA personnel from access to the 5E data. For more information, see Division 2, Section 4A509.

Software Release: 5E15 and later
Required field.
Default: N
Valid Entries: Y, N

2.311 TD LIMIT

Description: The TD LIMIT field, supports the CALEA Punch List Dialed Digit Extraction message solution. This field provides a threshold for tone decoders. Therefore, when a particular SM gets close to use all of its tone decoders on regular phone calls and surveillance, CALEA Punch List code will detect the situation (based on the threshold and number of tone decoders of that particular SM) and free up the tone decoder used by the surveillance to the regular phone calls. For more information, see Division 2, Section 4A509.

Software Release: 5E15 and later
Required field.
Default: 50
Valid Entries: 0 - 90 percent

CALL SCREENING

The following fields (Section 2.312 - Section 2.313) define the interval duration for the screening and monitoring phases of a forwarded call for the Forwarded Call - Call Screening feature. The screening phase is the period of time when a forwarded call is made available for screening. The monitoring phase is the period of time when a subscriber is allowed to monitor a forwarded call. For more information on this feature see Division 2, Section 4A526.

2.312 T SCREEN

Description: This field is used to define the duration of the screening phase.

Copyright © 2003 Lucent Technologies

Software Release: 5E14 and later
Required field.
Default: 20
Valid Entries: 6 - 60 seconds

2.313 CS MONITOR

Description: This field is used to define the duration of the monitoring phase.

Software Release: 5E14 and later
Required field.
Default: 60
Valid Entries: 0 - 180 seconds where 0 indicates no time limit

USAGE SENSITIVE CALL FORWARDING

The following fields (Section 2.314 - Section 2.315) were added to support the Usage Sensitive Call Forwarding feature. For more details on this feature, refer to Division 2, Section 4A544.

2.314 USCF FEAT

Description: Usage Sensitive Call Forwarding feature name. This field indicates which call forwarding feature is activated when USCF ALW and USCF ACT on the LINE form (Record 5109) are "Y".

Software Release: 5E15 and later.
Valid Entries: Up to eight alphanumeric characters.

Data Rules:

When USCF FEAT is entered, the following must be true:

- ACT must be "Y" on the SFSYS form for SFID 544
- The feature name in the USCF FEAT field must be defined on a CFWFD form with FWD CONDITION set to "BOTH" and ACT TYPE set to "CDCA1A" or "CDDNCA".

2.315 USCF CFV ALERT

Description: Should alerting be provided when a call is forwarded by USCF FEAT?

Software Release: 5E15 and later.
Required Field.
Default: N
Valid Entries: Y or N

Data Rules:

When USCF CFV ALERT is "Y", USCF FEAT must be entered.

SESSION INITIATION PROTOCOL

The field under this heading was added to support the SIP (Session Initiation Protocol) for Packet Trunking feature. For more information see Division 2, Section 4A684.

2.316 COUNTRY CODE

Description: This field represents the Home Country Code.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) FR 3 and later
Valid Entries:

Valid COUNTRY CODE Entries	
Entry	**Definition**
0	SIP-T processing is not available in the office.
1-999	Country Code

Data Rules:

When the ACT field for SFID 684 is "N" on the SFSYS form (5713-1 Record), COUNTRY CODE must be 0.

When GSM is not defined on the SIPGSM form (5880 Record), COUNTRY CODE must be 0.

When GSM is defined on the SIPGSM form, COUNTRY CODE must not be 0.

USAGE SENSITIVE SIX -WAY CALLING

The following fields (Section 2.317 - Section 2.319) were added to support the Usage Sensitive Six-Way Calling feature. For more information on this feature, see Division 2, Section 4A553.

2.317 USSWC FEAT

Description: Usage Sensitive Six-Way Calling Multiway feature name. This field is optional. It is used to store the Usage Sensitive Six-Way Calling Multiway feature name if the feature is enabled in the office. If left blank, the feature is not active in the office. To activate the feature, a Usage Sensitive Six-Way Calling feature or the preconstructed feature "/MWUSSWC" (Multi-Way Usage Sensitive Six-Way Calling) can be entered in this field

Software Release: 5E15 and later
Valid Entries: Blank, or enter 1 - 8 characters to activate.

For 5E15 and later:

- USSWC (Usage Sensitive Six-Way Calling) is a secured feature and must be purchased by the office before the USSWC FEAT, USSWC ACT, and USSWC CHRG fields can be entered and/or changed for the USSWC feature. Consequently, the ACT field for SFID 553 must be set to "Y" on the SFSYS form (5713-1 Record) before this field and the USSWC ACT and USSWC CHRG fields can be entered and /or changed. (For more information about the USSWC feature, see Division 2, Section 4A553.)
- When the USSWC FEAT field is entered on this form, the USSWC FEAT name must be defined on the MWFD form (5602 Record) where the appropriate fields on the MWFD form are set as follows:
  - FEATURE OPTIONS fields: ACT/INACT OPTION must be set to "ACT1CA", MULTIWAY CONTROL must be set to "NWAY", and AMAC must be set to "USAGE",
  - ENTRY POINT fields: FLASH must be set to "Y", IN MIDDLE must be set to "Y", and OFF HOOK must be set to "Y", and
  - DEFAULT PARAMETER field: N-WAY MAXIMUM must be set to "6".

2.318 USSWC ACT

Description: Should a Usage Sensitive Six-Way Calling AMA activation record be created? This field is used to determine if Usage Sensitive Six-Way Calling AMA activation records should be made in the office when USSWC calls are made. This field supports the Usage Sensitive Six-Way Calling feature. For more information on this feature, see Division 2, Section 4A553.

Copyright © 2003 Lucent Technologies

Software Release: 5E15 and later
Required field.
Default: N
Valid Entries: Y, N

Data Rules:

When USSWC ACT is "Y", USSWC FEAT must be entered.

For 5E15 and later, when the ACT field on the SFSYS form (5713-1 Record) for SFID (Secured Feature ID) 553 is set to "Y" , the USSWC ACT field can be changed to "Y". (For more detailed information on the Usage Sensitive Six-Way Calling, see Division 2, Section 4A553.)

2.319 USSWC CHRG

Description: Should a Usage Sensitive Six-Way Calling AMA charge record be created? This field is used to determine if Usage Sensitive Six-Way Calling AMA charge records should be made in the office when USSWC calls are made. This field supports the Usage Sensitive Six-Way Calling feature. For more information on this feature, see Division 2, Section 4A553.

Software Release: 5E15 and later
Required field.
Default: N
Valid Entries: Y, N

Data Rules:

When USSWC CHRG is "Y", USSWC FEAT must be entered.

For 5E15 and later, when the ACT field on the SFSYS form (5713-1 Record) for SFID (Secured Feature ID) 553 is set to "Y", the USSWC CHRG field can be changed to "Y". (For more detailed information on the Usage Sensitive Six-Way Calling, see Division 2, Section 4A553.)

CGA OPTIONS

2.320 CGA BUNDLE

Description: Bundled carrier group alarm report? This field was added to support the PCT Line/Trunk (PLTU) feature. For more information on this feature, see Division 2, Section 7AP.

Software Release: 5E15 and later
Default: Y
Valid Entries: Y, N

2.321 INH VACANT FAC

Description: The Inhibit Vacant Facility field is used to activate/deactivate the Inhibit CGA (Carrier Group Alarm) feature. For more information on this feature, see Division 2, Section 4A661.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

Data Rules:

When INH VACANT FAC is "Y", the ACT field for SFID 661 on the SFSYS form (5713-1 Record) must also be set to "Y".

Copyright © 2003 Lucent Technologies

2.322 VACANT FAC REPT TIME

Description: The Vacant Facility Report Time field is used to specify the hour of the day in which the daily automatic vacancy report will be generated. This field supports the Inhibit CGA feature.

Software Release: 5E16(2) and later
Default: 0
Valid Entries: 0 - 23

Data Rules:

When VACANT FAC REPT TIME is a non-zero value, the ACT field for SFID 661 on the SFSYS form (5713-1 Record) must be set to "Y".

DRM

The following fields (Section 2.323 - Section 2.325) provide alarm control for the DRM (Distinctive Remote Module) feature. For more information on this feature, see Division 2, Section 4A525.

2.323 ALARM OUTPUT OPT

Description: Should the alarm output option be turned on for this site?

Software Release: 5E14 and later
Required field.
Default: N
Valid Entries: Y, N

Data Rules:

When PRODUCT is not "DRM", ALARM OUTPUT OPT must be "N".

When ALARM OUTPUT OPT is "Y", ALARM DURATION must be entered.

When ALARM OUTPUT OPT is "N", ALARM DURATION must not be entered.

When the ALARM OUTPUT OPT field is set to "Y" on the OFCOPT form, the ALARM POINTs (50 - 54 & 100 - 113) should be assigned on the RALM forms for the SM defined on the EQIM form.

When the ALARM OUTPUT OPT field is set to "Y" on the OFCOPT form, there must be an EQRAU form for the SM defined on the EQIM form.

2.324 ALARM INPUT OPT

Description: Should the alarm input option be turned on for this site?

Software Release: 5E14 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When PRODUCT is not "DRM", ALARM INPUT OPT must be "N".

When the ALARM INPUT OPT field is set to "Y" on the OFCOPT form, the ALARM POINTs should be

Copyright © 2003 Lucent Technologies

assigned on the RALM forms for the SM defined on the EQIM form.

2.325 ALARM DURATION

Description: Alarm duration for output alarms.
Valid Entries: Blank, or enter 5 - 300 seconds.

Data Rules:

When PRODUCT is not "DRM", ALARM DURATION must not be entered.

PLATFORM CUTOVER

The following fields (Section 2.326 - Section 2.328) are added to support the SS7 (Signaling System 7) PSU (Packet Switching Unit) feature. For more information on this feature, see Division 2, Section 7BA.

2.326 CUTOVER MODE

Description: This field indicates whether or not the office is in signaling cutover mode. This is a display only field for ODA.

Software Release: 5E15 and later
Default: NONE

2.327 HOST PLAT 1

Description: This field indicates the signaling platform acting as the primary interface to the SS7 network when CUTOVER MODE is set to "PRECUT". This is a display only field for ODA.

Software Release: 5E15 and later

2.328 HOST PLAT 2

Description: This field indicates the signaling platform acting as the primary interface to the SS7 network when CUTOVER MODE is set to "POSTCUT". This is a display only field for ODA.

Software Release: 5E15 and later

SS7 CONNECTION HOLD TIMERS

This field supports the SS7 Using Operator Services feature. For more information see, Division 2, Section 4A603.

2.329 END OFFICE

Description: This field indicates the time in seconds to wait for a Connection Hold Release from operator services switch used at the originating end office.

Software Release: 5E16 and later.
Default: 120
Valid Entries: 60 - 240 seconds

CRITICAL INDICATORS

The following fields (Section 2.330 - Section 2.346) support the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY.

Copyright © 2003 Lucent Technologies

2.330 CRIT EXPANDED INBAND SGNLING

Description: The CRIT EXPANDED INBAND SGNLING field is used to indicate whether the EXPANDED INBAND SGNLING field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.331 CRIT NM DEFAULT NPA

Description: The CRIT NM DEFAULT NPA field is used to indicate whether the NM DEFAULT NPA field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.332 CRIT HOME NPA

Description: The CRIT HOME NPA field is used to indicate whether the HOME NPA field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.333 CRIT EXTRA START WINK

Description: The CRIT EXTRA START WINK field is used to indicate whether the EXTRA START WINK field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.334 CRIT CPE OPTION

Description: The CRIT CPE OPTION field is used to indicate whether the CPE OPTION field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.335 CRIT OFFICE TYPE

Description: The CRIT OFFICE TYPE field is used to indicate whether the OFFICE TYPE field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

2.336 CRIT E911 OPTION

Description: The CRIT E911 OPTION field is used to indicate whether the E911 OPTION field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.337 CRIT E911 DAS

Description: The CRIT E911 DAS field is used to indicate whether the E911 DAS field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.338 CRIT E911 SCR

Description: The CRIT E911 SCR field is used to indicate whether the E911 SCR field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.339 CRIT IHN SCP NPA DEL

Description: The CRIT IHN SCP NPA DEL field is used to indicate whether the IHN SCP NPA DEL field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.340 CRIT SCP 800 DAS

Description: The CRIT SCP 800 DAS field is used to indicate whether the SCP 800 DAS field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.341 CRIT FGD PHASE

Description: The CRIT FGD PHASE field is used to indicate whether the FGD PHASE field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.342 CRIT TCAP CIC

Copyright © 2003 Lucent Technologies

Description: The CRIT TCAP CIC field is used to indicate whether the TCAP CIC field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.343 CRIT USTWC FEAT

Description: The CRIT USTWC FEAT field is used to indicate whether the USTWC FEAT field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.344 CRIT USTWC ACT

Description: The CRIT USTWC ACT field is used to indicate whether the USTWC ACT field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.345 CRIT SPONT AVAIL

Description: The CRIT SPONT AVAIL field is used to indicate whether the SPONT AVAIL field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.346 CRIT CICP BLOCK

Description: The CRIT CICP BLOCK field is used to indicate whether the CICP BLOCK field is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

CIC ALLOCATION

The following fields (Section 2.347 - Section 2.350) supports the BICC (Bearer Independent Call Control) Static CIC Allocation feature. For more information on this feature, see Division 2, Section 7BF.

2.347 CAMPON TIMER

Description: This field indicates the number of minutes to be used for camp-on when the "Automatic Start CIC (Call Instance Code) Growth Process" parameter is set to "Y" or the CAMPON parameter is not specified in the MML (Man Machine Language) command.

Software Release: 5E16 and later
Default: 20
Valid Entries: 1 - 60

Copyright © 2003 Lucent Technologies

2.348 KILL CALLS

Description: This field specifies whether or not BICC Calls on selected CIC block will be killed when the camp-on timer expires. It also is used when the UNCONTIONAL parameter is not specified in the MML command.

Software Release: 5E16 and later
Default: Y
Valid Entries: Y, N

2.349 GROWTH VIA RCV

Description: This field specified whether or not adding an SM2000 to the CIC Distribution (RC/V (Recent Change and Verify) 5.70) will trigger the CIC SM (Switching Module) Growth process.

Software Release: 5E16 and later
Default: N
Valid Entries: Y, N

Data Rules:

For 5E16(2) FR 3 and later, when GROWTH VIA RCV is "Y", then a BICC Packet group must be defined on the PKTGRP form (5219 Record), and the CICDIST form (5217 Record) must exist.

2.350 PRINT ASSERT NAME

Description: This field is used to indicate whether or not an assert name should be printed.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

On-Hook Data Transmission

2.351 OFC FSK OSI

Description: This field is used to indicate the per-office parameter provided to control the sending of the OSI (Open Signaling Interval).

Software Release: 5E15 and later
Default: N
Valid Entries: Y, N

Data Rules:

For 5E15 and later, when OFC FSK OSI is set to "Y", the ACT field for SFID 613 on the SFSYS form (5713-1 Record) must also be set to "Y".

BICC TIMERS/RANGES

The following fields (Section 2.352 - Section 2.370) are fields that support the PSAX Separate BICC (Bearer Independent Call Control) Timers feature. For more information on this feature, see Division 2, Section 10D.

2.352 BICC ADDR COMP

Description: This field is used to indicate the time to wait (in seconds) for the CCS (Common Channel

Copyright © 2003 Lucent Technologies

Signaling) address complete message using the BICC protocol.

Software Release: 5E16 and later
Required Field.
Default: 25

2.353 BICC COT

Description: This field is used to indicate the time to wait (in seconds) for the CCS continuity message using the BICC protocol.

Software Release: 5E16 and later
Required Field.
Default: 12

2.354 BICC CQ START TIME

Description: This field is used to specify the hours past midnight that the daily automatic office-wide BICC circuit query starts.

Software Release: 5E16 and later
Required Field.
Default: 4

2.355 BICC GBLO RSND

Description: This field indicates the global BICC group block resend (in seconds).

Software Release: 5E16 and later
Required Field.
Default: 10

2.356 BICC GRS RSND

Description: This field indicates the BICC group reset resend timer (in seconds).

Software Release: 5E16 and later
Required Field.
Default: 10

2.357 BICC GUBL RSND

Description: This field indicates the BICC group unblocking resend timer (in seconds).

Software Release: 5E16 and later
Required Field.
Default: 10

2.358 BICC CQM RSND

Description: This field indicates the BICC circuit query timer value (in seconds) that is used when waiting for a reply to a circuit query message.

Software Release: 5E16 and later
Required Field.
Default: 10

Copyright © 2003 Lucent Technologies

2.359 BICC RLC SHORT

Description: This field indicates the time to wait in seconds for the CCS release complete message using BICC protocol.

Software Release: 5E16 and later
Required Field.
Default: 10

2.360 BICC RLC LONG

Description: This field indicates the time to wait (in seconds) for the CCS release complete message using BICC protocol.

Software Release: 5E16 and later
Required Field.
Default: 60

2.361 BICC RS RSND

Description: This field indicates the global BICC reset resend (in seconds).

Software Release: 5E16 and later
Required Field.
Default: 10

2.362 BICC SUS

Description: This field indicates the time to wait (in seconds) for the CCS SUS message using the BICC protocol.

Software Release: 5E16 and later
Required Field.
Default: 15

2.363 MAX RNG BGB BGU

Description: This field indicates the maximum value for range in BIC GB/GU messages.

Software Release: 5E16 and later
Required Field.
Default: 127

2.364 MAX RNG BGRS

Description: This field indicates the maximum value for range in BICC GRS messages.

Software Release: 5E16 and later
Required Field.
Default: 127

2.365 UNI SETUP IND

Description: This field indicates the time to wait (in seconds) for the UNI_SETUP_IND message (Sapphire UNI Setup Indicating Message) at the Originating Packet Switch.

Software Release: 5E16 and later
Required Field.

Copyright © 2003 Lucent Technologies

Default: 15

2.366 UNI CONN CFM

Description: This field indicates the time to wait (in seconds) for UNI_CONNECT_CFM message (Sapphire UNI Connect Confirmation Message) at the Originating Packet Switch.

Software Release: 5E16 and later
Required Field.
Default: 15

2.367 UNI CONN IND

Description: This field indicates the time to wait (in seconds) for UNI_CONNECT_IND message (Sapphire UNI Connect Indicating Message) at the TPS (Terminating Packet Switch).

Software Release: 5E16 and later
Required Field.
Default: 10

2.368 UNI REL CFM

Description: This field indicates the time to wait (in seconds) for UNI_RELEASE_CFM message (Sapphire UNI Release Confirmation Message.)

Software Release: 5E16 and later
Required Field.
Default: 5

2.369 UNI REL IND

Description: This field indicates the time to wait (in seconds) for UNI_RELEASE_IND message (Sapphire UNI Release Indicating Message).

Software Release: 5E16 and later
Required Field.
Default: 5

2.370 UNI IWG REL

Description: This field indicates the time (in seconds) to wait for the BICC release prior to passing an IWG (InterWorking Gateway) release event to BICC.

Software Release: 5E16 and later
Required Field.
Default: 2
Valid Entries: 1 - 4

2.371 COMFORT NOISE GEN

Description: This field contains the type of comfort noise generations. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). For more information on this feature, see Division 2, Section 7BX.
Default: IDLE
Valid Entries: Blank, IDLE or HOTH

Copyright © 2003 Lucent Technologies

2.372 OPS APM TIMER

Description: This field is used to specify in seconds how long the OPS (Originating Packet Switch) waits for an APM (Application Transport Message) from the TPS (Terminating Packet Switch). This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308) This feature is made available in 5E16 Feature Release 3. For more information on this feature, see Division 2, Section 7BX.
Default: 10
Valid Entries: 1 - 30

2.373 TPS APM TIMER

Description: This field is used to specify in seconds how long the TPS (Terminating Packet Switch) waits for an APM (Application Transport Message) from the OPS (Originating Packet Switch). This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. For more information on this feature, see Division 2, Section 7BX.
Default: 10
Valid Entries: 1 - 30

2.374 INTG IDENTIFIER

Description: This field is used to specify the global default Inter-Nodal traffic group identifier. This field supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. For more information on this feature, see Division 2, Section 7BX.
Default: 0
Valid Entries: 1 - 65535

2.375 GSM ESCALATION

Description: This global parameter field is used for the enhancements to CCS (Common Channel Signaling) operation on a PSU (Packet Switching Unit) signaling platform in a wireless environment. It supports the GSM Escalation Strategy Enhancements feature. For information on this feature see, Division 2, Section 7CD.

Software Release: 5E16(1) FR 4 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When GSM ESCALATION is "Y", CUTOVER MODE must not be "PRECUT" or "POSTCUT".

When SM on the EQPSU form (5741 Record) is defined as a GSM on the CCGSM form (6008 Record), and the GSM ESCALATION field on this form is set to "Y", the CRIT PSU on the EQPSU form must not be set to "Y" on any GSM with dual PSUs set to 1.

When GSM ESCALATION is "Y", AMPS DCS GSM must be entered and must be a value greater than zero on the APXPARM form (5050 Record).

2.376 SPOP

Description: The SPOP (Signaling PH Outage Prevention) field is an officewide parameter used to indicate whether Signaling PH Outage Prevention function is turned on or off for this office.

Software Release: 5E17 and later
Required Field.
Default: OFF

Copyright © 2003 Lucent Technologies

Valid Entries: ON, OFF

SEC. 5J: 5510 RECORD
SWITCHING MODULE INFORMATION FORM - IMINFO

1. GENERAL

The Switching Module Information Record is available with 5E2 and later Software Releases, and gathers and builds miscellaneous customer data related to a given SM (Switching Module). It must be completed for each SM in a multi-module 5ESS Switch.

1.1 Directly Connected Test Unit

The DCTU (Directly Connected Test Unit) measures voltage, resistance and capacitance on analog circuits for trunks and lines. It replaces manual testing previously done from the TLWS (Trunk and Line Work Station). The Route Index establishes the metallic path between a given line or trunk in an SM to be tested and the DCTU test circuits defined by the LTPs (Logical Test Ports) in a Trunk Group. DCTUs are assigned on the EQDCTU form (5751 Record).

Ordinarily, only one DCTU is required in a 5ESS Switch. If one or more DCTUs is equipped in a multi-module office, the DCTU Route Index must be defined for every SM in the office. This Route Index must be defined on the RTIDX form (5303 Record) and associated with a Trunk Group containing LTPs. Refer to Division 2, Section 2J.

1.2 Remote Switch Modules

RSM (Remote Switch Module) types ORM (Optically Remote Switching Module) and TRM (Two-Mile optically Remote Switching Module) are available with 5E3 and later. ORMs and TRMs are assigned on the EQIM form (5700-1/2 Record).

1.3 Cutover of Switch Modules

The *CUTOVER BY SM DATA* fields are related to the cutover capability. The initialization of the pre- and post- cutover status and Cutover Route Index allow the customer the choice of either a flash cutover or a gradual cut by SM. A flash cut means all customers are put into service at once on the new 5ESS Switch. A gradual cut means selected customers (based on the SM value) are cut into service on the new 5ESS Switch in a phased approach via MCC maintenance messages.

The Status refers to the state of the line in the 5ESS Switch. The normal Precut Status would be "INACTIVE", as the customer personnel does testing. After cutover procedures have been activated, the Postcut Status would be "ACTIVE"; the customer line is now being actively served by the 5ESS Switch.

If the customer prefers to cut by SM in the gradual method,

- for the SM being cut over, the Precut Status is "INACTIVE" and the Postcut Status is "ACTIVE"; and
- for the SM to be cut over later, the Precut Status and Postcut Status are both "INACTIVE". The Postcut Status would be set later to "ACTIVE" and the customer personnel would use MCC Maintenance messages and screens to individually activate each SM.

Table 1 summarizes cutover data requirements for both this form and the COTH form (5513 Record).

1.4 Recent Change View

The corresponding Recent Change Views for this form are 8.27, 10.2, 11.1 and 18.1.

2. FORM AND RECORD ENTRIES

Copyright © 2003 Lucent Technologies

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * SWITCHING MODULE

Description: Enter the number of the Switching Module being defined.

Required Field.
Valid Entries: 1 - 192

Data Rules:

For 5E2 and later, in offices equipped with CM1 (Communications Module 1), the valid entries are 1-48. In offices equipped with CM2 (Communications Module 2), the valid entries are 1-192.

EQUIP RELATED RTIs

Fields Section 2.3 - Section 2.8 refer to related Route Indexes. All have Note 1 applying to the valid entries.

2.3 DCTU ROUTE INDEX

Description: Enter the DCTU Route Index if a DCTU is provided in the office or at the Remote Site.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

A DCTU Route Index must be assigned to an RSM, an ORM, or a TRM if a DCTU is provided at the RSM, ORM, or TRM.

All RSMs in the same remote site, if served by only one DCTU physically connected to an RSM within the remote site, can have the same DCTU Route Index.

For 5E5 and later, co-located ORMs (or TRMs) can have the same DCTU Route Index provided that a DCTU is physically connected to an ORM (or TRM) at the same location.

The values for DCTU ROUTE INDEX, SLIM ROUTE INDEX, ALIT ROUTE INDEX, MAJ ROUTE INDEX, CSTL ROUTE INDEX, LTD ROUTE INDEX and ALT CUTOVER RTI must be unique.

DCTU ROUTE INDEX may not be duplicated on a LINE (5109-1/2/3 Record),NOC (5501 Record), RAR (5301 Record), or FIXRT form (5301-1 Record).

The value of the DCTU Route Index must be defined on an RTIDX form (5303 Record) with an associated TGN defined on a TKGRP form (5202 Record). This Trunk Group must have LTPs assigned dedicated to the DCTU circuits (TRKCLS "LTPDCTU").

Any DCTU ROUTE INDEX entered must be assigned on an RTIDX form with ROUTE TYPE of "HUNT".

For 5E3 and later, if no DCTU is in the office, then this field must be left blank or be assigned on an RTIDX form with a ROUTE TYPE of "REORDER".

2.4 SLIM ROUTE INDEX

Copyright © 2003 Lucent Technologies

Description: Enter the Subscriber Line and Instrument Measurement Route Index.

This field supports the TLWS Metallic Test Capability. See Division 2, Section 4A230.

Software Release: 5E10 and later
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If a SLIM ROUTE INDEX is entered, there must be a corresponding entry on the RTIDX form with the same ROUTE INDEX and a TRUNK GROUP NUMBER entered. The TRUNK forms entered with the same TGN value must have an LTP equipment number on an SM which has a corresponding EQMMSP form with a PACK EQUIPMENT LIST TYPE of "SLIM".

If SLIM ROUTE INDEX is entered, ROUTE INDEX on the RTIDX form must be entered with a indicated TRUNK GROUP number.

If SLIM ROUTE INDEX is entered, the associated TRUNK GROUP NUMBER must have a TRUNK CLASS of "LTPSLIM" on the TRKGRP form.

SLIM ROUTE INDEX may not be duplicated on a RAR, FIXRT, or NOC form.

2.5 ALIT ROUTE INDEX

Description: Enter the Route Index Number assigned for Automatic Line Insulation Tests. An entry is required only if the SM has one or two MSUs (Metallic Service Units) or MMSUs (Modular Metallic Service Units), with at least one ALIT type pack assigned.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If a Route Index is entered, it must be defined on the RTIDX form and associated with an LTP Trunk Group (TRKCLS "LTPALIT"). For further information, refer to the section describing Automatic Line Insulation Tests within Division 2, Section 2 of this guide.

If this field is entered, this Switching Module must be equipped on the EQMSP or EQMMSP forms (5750 Record) with an MSU/MMSU Pack Type equal to "ALIT".

If ALIT ROUTE INDEX is specified, then MAJ ROUTE INDEX is required. ALIT ROUTE INDEX and MAJ ROUTE INDEX must be unique values

ALIT ROUTE INDEX may not be duplicated on a LINE, NOC,RAR,or FIXRT form.

2.6 MAJ ROUTE INDEX

Description: Enter the Route Index Number assigned for Metallic Access Junctors. An entry is required only if the SM has one or two MSUs or MMSUs with at least one MACC (Metallic Access Circuit) type pack assigned.
Valid Entries:
- For 5E10 and earlier: 1 - 3617

Copyright © 2003 Lucent Technologies

- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

If a Route Index is entered, it must be defined on the RTIDX form and associated with an LTP Trunk Group (TRKCLS "LTPMSU").For further information refer to the section describing Metallic Access for Line and Trunk Testing within Division 2, Section 2 of this guide.

If this field is entered, this Switching Module must be equipped on the EQMSP or EQMMSP forms with an MSU/MMSU MSU Pack Type equal to "MACC".

MAJ ROUTE INDEX may be assigned without ALIT ROUTE INDEX being assigned (that is, an SM may be equipped with an MSU which has an MACC pack but no ALIT pack).

MAJ ROUTE INDEX may not be duplicated on a LINE, NOC,RAR,or FIXRT form.

2.7 CSTL ROUTE INDEX

Description: Enter the Coin Station Test Line (CSTL) Route Index. This Route Index is only used in the routing of outgoing CSTL calls from RSMs, ORMs or TRMs. The CSTL Route Index points to a Trunk Group containing outgoing CSTL trunks (from the SM).
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The value of CSTL ROUTE INDEX may not be entered for any of the other Route Indexes on this form; that is, DCTU ROUTE INDEX, ALIT ROUTE INDEX, MAJ ROUTE INDEX, LTD ROUTE INDEX or ALT CUTOVER RTI. This value also cannot be duplicated on other IMINFO forms, unless the RSM is part of an RSM cluster or if the RSM is one in a group of co-located ORMs (or TRMs). If a Route Index is entered, it must be defined on an RTIDX form.

CSTL ROUTE INDEX may not be duplicated on a NOC, RAR,or FIXRT form.

If the RSM is part of a cluster, then this field can have the same value entered on the IMINFO forms for all RSMs in the cluster. For example, if CSTL ROUTE INDEX on the IMINFO form for SM3 and the IMINFO form for SM90 are both 101, then SM3 and SM90 are part of a cluster and the corresponding EQIM forms for SM3 and SM90 should have the same RSM SITE or REMOTE SITE value.

Each RSM equipped with an outgoing CSTL trunk(s) must have its own outgoing CSTL Trunk Group as well as its own unique Route Index which points to it unless the RSM is a member of a cluster.

This field must be used only for RSMs equipped with an outgoing CSTL trunk; that is, CSTL ROUTE INDEX must equal ROUTE INDEX on an RTIDX form, where the Trunk Group assigned to the Route Index is defined on a TKGRP form with TRKCLS equal to "TSTK".

For 5E5 and later, ORMs (or TRMs) can have the same CSTL ROUTE INDEX if they are co-located.

2.8 LTD ROUTE INDEX

Description: Enter the LTD (Local Test Desk) Route Index. This Route Index is only used in the routing of outgoing LTD calls from RSMs or with ORMs or TRMs available with 5E3 and later. The LTD Route Index points to a Trunk Group containing outgoing LTD trunks from the SM. This field is used only for Remote

Copyright © 2003 Lucent Technologies

Switching Modules (RSMs, ORMs or TRMs).
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

The value of LTD Route Index may not be entered for any of the other Route Indexes on this form; that is, DCTU ROUTE INDEX, ALIT ROUTE INDEX, MAJ ROUTE INDEX, CSTL ROUTE INDEX or ALT CUTOVER RTI. This value also cannot be duplicated on other IMINFO forms, unless the RSM Module is part of an RSM cluster, or if the RSM is one in a group of co-located ORMs (or TRMs). If a Route Index is entered, it must be defined on an RTIDX form.

LTD ROUTE INDEX may not be duplicated on a NOC, RAR,or FIXRT form.

For 5E5 and later, ORMs (or TRMs) can have the same LTD ROUTE INDEX if they are co-located.

This field must be used only for RSMs, ORMs or TRMs equipped with an outgoing LTD trunk; that is, LTD ROUTE INDEX must equal ROUTE INDEX on an RTIDX form, where the Trunk Group assigned to the Route Index is defined on a TKGRP form with TRKCLS equal to "TSTK".

CUTOVER BY SM DATA

Fields Section 2.9 - Section 2.11 refer to cutover of SMs.

2.9 PRECUT STATUS

Description: Enter the precut mode status of the SM.

Valid PRECUT STATUS Entries

Entry	Definition
ACTIVE	The SM is active.
INACTIVE	The SM is inactive.

Data Rules:

If the SMs are going to be cut over in a flash cut or gradually (see Section 1.3), this field should be set to "INACTIVE".

For 5E4(2) and later, for LTG (Large Terminal Growth), if PRECUT STATUS is "INACTIVE" and the OFCOPT form (5509 Record) has CUTOVER equal to "N", the ODA Project Consultants should be called to change CUTOVER to "Y".

For 5E4(2) and later, if the office is undergoing LTG, IMINFO forms with both PRECUT STATUS and POSTCUT STATUS set to "ACTIVE" should be investigated. PRECUT STATUS and POSTCUT STATUS may need to be blank. If no new lines are added to this SM, then PRECUT STATUS and POSTCUT STATUS should be blank. Refer to the official LTG documentation for formal procedures.

Existing TNs cannot be defined for an SM with an "INACTIVE" PRECUT STATUS.

2.10 POSTCUT STATUS

Description: Enter the postcut mode status of the SM.

Valid POSTCUT STATUS Entries

Entry	Definition
ACTIVE	The SM is active.
INACTIVE	The SM is inactive.

Copyright © 2003 Lucent Technologies

Data Rules:

For a flash cutover, this field should be set to "ACTIVE". For an SM to be cut over at a later time, set this field to "INACTIVE". When using the gradual cut, MLHG members are cut into service based on the SM value of the LEN associated with the main directory number (Member 1) of the MLHG regardless of the LEN values of each member.

For 5E4(2) and later, if the office is undergoing LTG (Large Terminal Growth), IMINFO forms with both PRECUT STATUS and POSTCUT STATUS set to "ACTIVE" should be investigated. PRECUT STATUS and POSTCUT STATUS may need to be blank. If no new lines are added to this SM, then PRECUT STATUS and POSTCUT STATUS should be blank. Refer to the official LTG documentation for formal procedures.

2.11 ALT CUTOVER RTI

Description: Enter the Alternate Cutover Route Index, which is required for every SM. This Route Index routes calls terminating to a pre-cutover line in the "INACTIVE" state. The Route Index may be associated with reorder tone, a recorded announcement, or an outgoing Trunk Group to the existing office in which the Telephone Number is active.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

This field must be entered for initial and growth offices.

The ALT CUTOVER RTI must not be duplicated on the FIXRT, LINE, NOC, or RAR forms.

2.12 MFR FREQUENCY CLASS

Description: Enter the valid Frequency Class for this SM.

Required Field.
Default: NON
Valid Entries:

Valid MFR FREQUENCY CLASS Entries

Entry	Definition
NON	SM does not support MFR customer lines
HAR	Harmonic Frequency Series
SYN	Synchromonic Frequency Series
DEC	Decimonic Frequency Series

Data Rules:

All SMs that have any MFR (Multi-Frequency Ringing) customers assigned must have the appropriate MFR Frequency Class specified. See Division 3, Sections 1I and 1K for the table giving the correspondence of MFR Frequency Class to Party value assigned to customer MFR lines on the LINE and MLHLN forms (5111-1/2/3 Record).

If an SM does not support MFR, a value of "NON" is required in this field.

For SMs with an entry other than "NON", all line units defined on EQLUP forms (5711 Record) must have LINE UNIT TYPE not equal to "4AB1".

2.13 2 PARTY ANI

Copyright © 2003 Lucent Technologies

Description: Is there ANI (Automatic Number Identification) for two-party lines? If this field is set to "Y", ANI is used; if set to "N", ONI (Operator Number Identification) is used. This field should be specified at ODA time. There is no Recent Change support for this field.

Software Release: 5E5 and later
Required Field.
Valid Entries: Y, N

Data Rules:

If this field is "Y", then each of the LINE forms which have the same OE NUMBER defined for this SM must have PTY entered, with only 1 tip party assignment when PTY is "T", 0, or 6 - 9 and/or 1 ring party assignment where PTY is "R" or 1 - 5.

2.14 PROHIBIT DT

Description: Is disconnect timing prohibited?

Software Release: 5E5 and later
Required Field.
Default: N
Valid Entries: Y, N

MSU/MMSU ALARMS CONTROLS

Fields Section 2.15 - Section 2.16 refer to parameters used to measure chatter.

2.15 CHATTER SAMPLING

Description: Enter the sampling time in seconds used for chattering controls.

Software Release: 5E5 and later
Default: 1
Valid Entries: 1 - 10 (seconds)

2.16 CHATTER TRANSITION

Description: Enter the number of MMSU scan point transitions for chattering.

Software Release: 5E5 and later
Default: 4
Valid Entries: 0 - 60

2.17 UTD LIMIT

Description: Enter the percentage of UTDs (Universal Tone Decoders) on the SM that may be used for ASI (Advanced Service Interface) Proxy.

Software Release: 5E8 and later
Required Field.
Default: 10
Valid Entries: 0 - 100 (%)

2.18 LOCAL LOSS

Description: Enter the time slot interchanger local loss. See the Far Access Remote secured feature in Division 2, Section 4A184.

Copyright © 2003 Lucent Technologies

Software Release: 5E9(2) and later
Required Field.
Default: 0.0
Valid Entries: 0.0 - 15.0 (dB in 0.5 increments)

Data Rules:

The LOCAL LOSS and REMOTE LOSS fields on the IMINFO form are used by the Far Access Remote secured feature. The feature must be purchased by the office, and an SFSYS form must exist with the ACT field for SFID 184 set to "Y" before data can be changed from the default value 0.0.

2.19 REMOTE LOSS

Description: Enter the time slot interchanger remote loss. See the Far Access Remote secured feature in Division 2, Section 4A184.

Software Release: 5E9(2) and later
Required Field.
Default: 0.0
Valid Entries: 0.0 - 15.0 (dB in 0.5 increments)

Data Rules:

See data rules for LOCAL LOSS.

2.20 STOR UTD LIMIT

Description: Enter the maximum percentage of UTDs (Universal Tone Decoders) on the SM available for STOR. This field specifies the maximum percentage of UTDs (Universal Tone Decoders) that may be used by the AIN SSP STOR (Send to Outside Resource) (Local) secured feature (SFID 229). For more information on the AIN SSP STOR (Local) feature, see Division 2, Section 4A229.

Software Release: 5E10 and later
Required Field.
Default: 10
Valid Entries: 0 - 100

Data Rules:

Since AIN SSP STOR (Send To Outside Resource) (Local) is a secured feature and must be purchased by the office before STOR data can be assigned, STOR UTD LIMIT must be 10 until SFID 126 ACT and SFID 229 ACT on the SFSYS form have been set to "Y".

2.21 ODTMF UTD LIMIT

Description: The ODTMF UTD LIMIT (Originating Dual Tone Multi-Frequency Universal Tone Decoders Limit) field is used to specify the maximum percentage of UTD (Universal Tone Decoders) that may be used by the O_DTMF event for the ASP (Advanced Services Platform) Mid Call Event Detection feature. This is expressed as a percentage of the total available UTDs on the Switching Module. For more information on the ASP Mid Call Event Detection feature, see Division 2, Section 4A343.

Software Release: 5E13, 5E15 and later
Required Field.
Default: 10
Valid Entries:
- For 5E13 and 5E14: 1 - 100
- For 5E15: 0 - 100

Copyright © 2003 Lucent Technologies

Data Rules:

When the ODTMF UTD LIMIT field is set to a valid value other than 10, the ACT field for SFID 345 on the SFSYS form (5713-1 Record) must be set to "Y".

WARNING: When ODTMF UTD LIMIT is greater than 49% of the available UTDs assigned for Mid Call Event, call originations using UTD may be impacted.

CORC LOG BUFFER

Fields Section 2.22 - Section 2.23 refer to parameters used to set thresholds for controlling the Customer Originated Recent Change Log Buffer. CORCs are customer activated changes, such as call-forwarding, which affect switch data. The CORC log buffer maintains CORC changes which are periodically "flushed" to disk. The following fields define the frequency of CORE flushes.

2.22 CORC FLUSH

Description: This field specifies how full the CORC log buffer must be before a CORC "flush" will take place. This threshold is expressed as the percent of the total available CORC log buffer.

Software Release: 5E9(2) and later
Default: 50
Valid Entries: 20 - 80 percent

2.23 TOD CORCS

Description: This field specifies the number of Time of Day CORCs allowed in the log buffer before a CORC flush may take place.

Software Release: 5E9(2) and later
Valid Entries: 1 - 20

NUMBER PORTABILITY

This field group was added to accommodate local number portability. This is a secured feature with SFID 199. For more information on Number Portability, see Division 2, Section 4A174.

2.24 JIP

Description: This field specifies the JIP (Jurisdiction Information Parameter) and is used with number portability. It specifies the ISUP parameter used, on a per-SM basis, when generating the IAM (Initial Address Message). This parameter contains the NPA/NXX combination of the designated LRN (Location Routing Number) representing this SM.

When this SM serves as a community dial office replacement with a wire-center different than the host office, the JIP overrides the office parameter defined on the OFCOPT form (5509 Record). The per-SM parameter is used in IXC (Inter-eXchange Carrier) AMA Access recording for IXC handled calls originating or terminating to or from ported DNs on the SM.

This feature was added for the AMA Billing feature. For more information on AMA Billing, see Division 2, Section 4A199.

Software Release: 5E11 and later
Valid Entries: Blank or 6 digits (0 - 9)

SMs SERVING:	OFFICE	TYPE	IMINFO form		COTH form

SEC. 5K: 5511 RECORD
TRUNK AND LINE WORK STATION FORM - TLWS

1. GENERAL

The 5511 Record is available in 5E2 and later Software Releases and defines each TLWS (Trunk and Line Work Station) associated with a 5ESS Switch. An MCC (Master Control Center) TLWS is required in every 5ESS Switch and must be defined on the 5511 Record.

If the TLWS is equipped with a TAU (Test Access Unit), this record defines the LTP (Logical Test Port), Metallic Test Bus, and the Cut-Thru and Diode Distribute Points assigned to each DC Jack and the AC Jack TENs (Trunk Equipment Numbers).

1.1 Logical Test Port Assignments

LTP assignments are made by machine owner. The Metallic Test Bus and Distribute Point assignments are also made by machine owner, but are taken from a list of available assignments provided by Lucent Technologies. All DC Jack assignments for each TLWS must be in the same SM (Switching Module).

The 5511 Record is formatted in such a way that two lines of data may be required for each TLWS. The first line of data contains the WSN (Work Station Number), the T&M (Talk and Monitor) Telephone Numbers (if applicable), an indication of a possible TAU, DC Jack 1 and AC Jack Trunk Data assignments. The second line of data contains the DC Jack 2 assignments. If the TLWS is not equipped with a TAU, only one line of data is required.

1.2 Device Identification

For 5E6 and earlier, when each TLWS form is entered into ODA, a DEVID (Device Identification) value is computed by the ODA program based on the WSN. The DEVID is also output if the 5511 Record is requested. The following table shows the correspondence of WSN to DEVID:

WSN	DEVID	DESCRIPTION
1	a	TLWS in the MCC.
2	z	TLWS in an SCC (Switching Control Center).
3	l	First Supplemental TLWS.
4	m	Second Supplemental TLWS.
5	n	Third Supplemental TLWS.
6	o	Fourth Supplemental TLWS.
7	j	Fifth Supplemental TLWS.
8	k	Sixth Supplemental TLWS.

For 5E7 and 5E8, the DEVID value must be entered; it is not automatically computed. For 5E9(1) and later, DEVID is optional.

1.3 Talk and Monitor Telephone Number

Each TLWS may be assigned a T&M Telephone Number, which is Local or Remote. A TLWS may not have assignments for both. A local Telephone Number is used if the TLWS may be served by the local 5ESS Switch line equipment (either an LEN or SLEN) and the NXX is defined in the OFFICE CODE field on a NOC form (5501 Record). Otherwise, the T&M Monitor is a remote Telephone Number.

1.4 Recent Change View

The corresponding Recent Change View for this form is 14.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Copyright © 2003 Lucent Technologies

Enter the Base and Control Group Number and Office Name on each record.

2.2 * WORK STATION NUMBER

Description: Enter the WSN.

Required Field.

Valid WORK STATION NUMBER Entries

Entry	Definition
1	MCC (Master Control Center).
2	SCC (Switching Control Center).
3-8	
3 - 32	Software Release: 5E9(1) and later. Supplemental TLWS.

Data Rules:

Work Station Number 1 is required for every 5ESS Switch. The only valid entries for single module offices are 1 and 2.

For 5E6 and earlier, a value between 3 and 8, entered in this field is directly related to entries on the ECDOPT form (5706 Record) for new or growth offices.

For 5E4(2) through 5E6, the introduction of Flexible IOP (Input/Output Processor) selection altered the ECDOPT form. A given WORK STATION NUMBER is directly related to an entry in the DVT (Device Type) element of a member of IOP LIST on the ECDOPT form. The table below shows what DVT value to use for a particular WORK STATION NUMBER. If the WORK STATION NUMBER is not defined on a TLWS form, that value should not be used in the IOP LIST.

5E4(2) - 5E6 Software Releases

WORK STATION NUMBER	IOP List DVT Value
3	TTY11
4	TTY12
5	TTY13
6	TTY14
7	TTY09
8	TTY10

For 5E7 and later, there is no automatic assignment of a DVT value on the ECDOPT form by WORK STATION NUMBER.

For 5E9(1) and later, if WORK STATION NUMBER is set to 1, it is recommended that DEVID be "a".

2.3 DEVID

Description: For 5E6 and earlier, this was a Recent Change field, with the Device Identification automatically computed based on the WORK STATION NUMBER entered.

Software Release: 5E7 and later
Required Field for 5E8 and earlier.
Valid Entries:

Valid DEVID Entries

Entry	Description
a	
z	
j - o	Supplemental TLWS.
C - I	Supplemental TLWS.
Y	Supplemental TLWS.

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E7 - 5E8, the following table shows the DEVICE TYPE which must be entered on the ECDOPT form for a DEVID entry. For 5E9(1) and later, adherence to the corresponding values in this table is not required but is recommended.

5E7 - 5E8 Software Releases

DEVID	DEVICE TYPE	NAME
l	TTY11	STLWS1
m	TTY12	STLWS2
n	TTY13	STLWS3
o	TTY14	STLWS4
j	TTY9	STLWS5
k	TTY10	STLWS6
C	TTY28	STLWS7
D	TTY29	STLWS8
E	TTY30	STLWS9
F	TTY31	STLWS10
G	TTY32	STLWS11
H	TTY33	STLWS12
I	TTY34	STLWS13
Y	TTY50	STLWS14

If DEVID is "a", it is recommended that WORK STATION NUMBER be 1.

2.4 REMARKS

Description: Enter any comments deemed locally necessary.
Valid Entries: up to 16 characters (alphanumeric or
- blank)

2.5 LOCAL TALK & MONITOR TN

Description: Enter the Local T&M Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

An entry is required for Work Station 1, and is optional for Work Stations 2-8. A Telephone Number entered must be a Telephone Number served by the 5ESS Switch, i.e., the NXX is defined in the OFFICE CODE field on a NOC form.

It is recommended that:

- all Local T&M phones on the TLWS forms be members of the same MLHG and defined on an MLHLN form (5111-1 Record).

- all Local T&M phones have an individual DN (Directory Number).

- if only Work Station 1 is equipped, the local T&M phone be an MLHG member. A T&M TN that is an individual line must be defined on the LINE form (5109 Record). Whether the Telephone Number is an individual line or an MLHG member, the Telephone Number must have a "Y" in the SUSO field on the LINE or MLHLN form and a CLASS OF SERVICE of "CALLBK" on an LCC form (5306 Record).

For 5E8, the Local T&M must also be assigned on either the LINE form or the MLHLN form with OE TYPE and NUMBER entered, with ICPT set to "N". The LCC/RAX combination on the LINE form or MLHLN form must also appear on the LCC form with a SERVICE CLASS of "CALLBK".

Copyright © 2003 Lucent Technologies

For 5E9 and later, the Local T&M must also be assigned on either the LINE form or the MLHLN form with OE TYPE and NUMBER entered, with ICPT set to "N". The LCC/RAX combination on the LINE form or MLHLN form must also appear on the LCC form with a SERVICE CLASS of "LTPCLBCK".

Either the LOCAL TALK & MONITOR TN field or the REMOTE TALK & MONITOR TN field may be entered, but not both.

If 1 is entered in the WORK STATION NUMBER field, either the LOCAL TALK & MONITOR TN or the REMOTE TALK & MONITOR TN field must be entered.

For 5E12 and later, if the first 3 digits of the 7-digit LOCAL TALK & MONITOR TNs on the TLWS form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the following 7-digit LOCAL TALK & MONITOR TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.6 REMOTE TALK & MONITOR TN

Description: Enter a Remote Talk and Monitor Telephone Number.

The Telephone Number is used for terminating TLWS T&M requests and 101 Test Line calls to the remote TLWS, and may be served by any other office. A 0+ number is not recommended.
Valid Entries: 7 or 10 digits plus an optional 0 or 1 prefix

- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

Data Rules:

An entry is made in this field only if the TLWS is remote from the 5ESS Switch.

If a Local T&M TN has been entered for this TLWS, this field must be left blank.

When a T&M or 101 Test Line call must be terminated to this TN, the TN is screened and routed as if dialed by a line with the LTP SCR and LTP DAS fields of the OFCOPT form entered.

If 1 is entered in the WORK STATION NUMBER field, then either this field or the LOCAL TALK & MONITOR TN field must be entered.

2.7 REMOTE TALK & MONITOR LTP

Description: Enter the LTP for the Remote T&M TN.

Valid Entries: A six-digit number of the following format:

REMOTE T&M LTP

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Logical Test Port	LTP	XXX	000-255

Data Rules:

If a Remote T & M TN is specified, an LTP must be entered.

The LTP may be assigned in any equipped SM, and must be assigned to a member of an outgoing LTP Trunk Group on the TKGRP form (5202-1) Record, with HUNT TYPE set to "FIFO" and TRKCLS set to "LTPCLBCK".

The value entered in this field must not be duplicated in the TALK & MONITOR LTP field on a CTTU form (5518 Record).

Copyright © 2003 Lucent Technologies

2.8 TEST ACCESS UNIT EQUIPPED

Description: Is the TLWS1 equipped with a TAU?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

TAU must equal "N" if the WSN is 2. The Supplemental TLWSs (WSN is 3 through 8) may be optionally equipped with a TAU.

If TAU equals "Y", all of the fields for AC JACKs and DC JACKs must be entered. If TAU equals "N", all the fields for AC JACKs and DC JACKs must not be entered.

2.9 CARRIER ID

Description: Enter an InterLATA Carrier ID, if required, for the Remote T&M TN. If the digit interpreter tables referenced by the LTP DAS on the OFCOPT form (5509 Record), define the Remote T&M TN as an InterLATA call, a Carrier ID is required to route the call back to the Remote Talk and Monitor TN.
Valid Entries:

- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

Any Carrier ID entered must be defined on an ICF form (5305 Record), and for 5E8 and later, FEAT GRP on the ICF form must equal "D".

DC-JACK Assignments

Fields Section 2.10 -Section 2.17 refer to DC-JACK assignments. Entries are required in these fields when the TLWS is equipped with a TAU. If the TLWS is not equipped with a TAU, these fields must be blank. For 5E8 and earlier, all DC Jack assignments for each TLWS must be in the same SM.

2.10 DC-JACK 1 LOGICAL TEST PORT

Description: Enter the LTP assigned to DC Jack #1.
Valid Entries: A 6-digit number of the following format:

LOGICAL TEST PORT

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Logical Test Port	LTP	XXX	000-255

2.11 DC-JACK 1 METALLIC TEST BUS

Description: Enter the MTB (Metallic Test Bus) assignment for DC Jack #1.
Valid Entries: A nine-digit number of the following format:

METALLIC TEST BUS

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Regular MSU)
			00-31

Copyright © 2003 Lucent Technologies

			(Modular MSU)
Bus	BUS	XX	00-14

Data Rules:

The METALLIC TEST BUS entry must be unique within the 5ESS Switch.

The MTB assigned to DC Jack #1 must be associated with the same MSU Unit as the MTB assigned to DC Jack #2 and must be in SVG 0.

MTB Point 15 of every MACC (Metallic Access Circuit) pack is reserved for general internal MSU and MMSU (Modular Metallic Service/Switch Unit) diagnostics. Protocol tests or diode resistor tests are included in general internal diagnostics.

For 5E9(1) and later, LTPs, MTBs, and DPs assigned on this form must reside in the local office and may not terminate to an ORM, RSM or TRM (the first three characters of the MTB represent the SM).

2.12 DC-JACK 1 CUT-THRU DIST. PT.

Description: Enter the Cut-Thru Distribute Point assigned to DC Jack #1.
Valid Entries: A nine-digit number of the following format:

CUT-THRU DIST. PT.

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

The Cut-Thru Distribute Point associated with DC Jack #1 must be assigned to Service Group 0. Refer to Division 8, Section 1 for procedures to obtain the DPN assignments.

The DIST. PT. entry must be unique within the 5ESS Switch. The entry must also appear on an EQMSP form (5750 Record) or EQMMSP form (5750 Record) with the TYPE element in the PACK EQUIPMENT LIST set to "DIST".

For 5E9(1) and later, LTPs, MTBs, and DPs assigned on this form must reside in the local office and may not terminate to an ORM, RSM or TRM (the first three characters of the MTB represent the SM).

2.13 DC-JACK 1 DIODE DIST. POINT

Description: Enter the Diode Distribute Point assigned to DC Jack #1.
Valid Entries: A nine-digit number of the following format:

DIODE DIST. PT.

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

Copyright © 2003 Lucent Technologies

The Diode Distribute Point associated with DC Jack #1 must be assigned to SVG 0. Refer to Division 8, Section 1 for procedures to obtain the DPN assignments.

The DIST. PT. entry must be unique within the 5ESS Switch. The entry must also appear on an EQMSP form (5750 Record) or EQMMSP form (5750 Record) with the TYPE element in the PACK EQUIPMENT LIST set to "DIST".

2.14 DC-JACK 2 LOGICAL TEST PORT

Description: Enter the LTP assigned to DC Jack #2.
Valid Entries: A six-digit number of the following format:

LOGICAL TEST PORT

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-127
Logical Test Port	LTP	XXX	000-255

Data Rules:

The value must not be the same as the value used for DC-JACK 1. Refer to Division 8, Section 1 for procedures to obtain these assignments.

For 5E9(1) and later, LTPs, MTBs, and DPs assigned on this form must reside in the local office and may not terminate to an ORM, RSM or TRM (the first three characters of the MTB represent the SM).

2.15 DC-JACK 2 METALLIC TEST BUS

Description: Enter the MTB assignment for DC Jack #2.
Valid Entries: A nine-digit number of the following format:

METALLIC TEST BU

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Bus	BUS	XX	00-14

Data Rules:

The METALLIC TEST BUS entry must be unique within the 5ESS Switch.

The MTB assigned to DC Jack #2 must be associated with the same MSU as the MTB assigned to DC Jack #1 and must be in SVG 1.

MTB Point 15 of every MACC pack is reserved for general internal MSU and MMSU diagnostics. Protocol tests or diode resistor tests are included in general internal diagnostics.

2.16 DC-JACK 2 CUT-THRU DIST. POINT

Description: Enter the Cut-Thru Distribute Point assigned to DC Jack #2.
Valid Entries: A nine-digit number of the following format:

CUT-THRU DIST. PT.

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	1
Board	BRD	XX	00-15

Copyright © 2003 Lucent Technologies

			(Regular MSU) 00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-30

Data Rules:

The Cut-Thru Distribute Point associated with DC Jack #2 must be assigned to SVG 1.

The DIST. PT. entry must be unique within the 5ESS Switch. The entry must also appear on an EQMSP form (5750 Record) or EQMMSP form (5750 Record) with the TYPE element in the PACK EQUIPMENT LIST set to "DIST".

2.17 DC-JACK 2 DIODE DIST. POINT

Description: Enter the Diode Distribute Point assigned to DC Jack #2.
Valid Entries: A nine-digit number of the following format:

DIODE DIST. PT.

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	1
Board	BRD	XX	00-15 (Regular MSU) 00-31 (Modular MSU)
Distribute Point Number	DPN	XX	00-31

Data Rules:

The Diode Distribute Point associated with DC Jack #2 must be assigned to SVG 1.

The DIST. PT. entry must be unique within the 5ESS Switch. The entry must also appear on an EQMSP form (5750 Record) or EQMMSP form (5750 Record) with the TYPE element in the PACK EQUIPMENT LIST set to "DIST".

AC JACK TRUNK DATA

Fields Section 2.18 -Section 2.19 refer to AC Jack Trunks. Entries are required in these fields only when the TLWS is equipped with a TAU. Otherwise, leave these fields blank.

The TENs (Trunk Equipment Numbers) entered in the AC-JACK 1 TEN and AC-JACK 2 TEN fields must be assigned on a TRUNK form (5204-1 Record). In 5E2, the entry appears in the TEN field. In 5E3 and later, the entry may appear in the TEN field or be "implied" by the value in the QTY field. The QTY field defines a maximum of 24 Trunk Members with one form. The requisite hardware is assigned sequentially.

The TENs entered in the AC-JACK 1 TEN and AC-JACK 2 TEN fields must be associated with a Trunk Group whose TRKCLS on the TKGRP form is set to "ACJCK".

For 5E15 FR 5 (Feature Release 5) and later, the names have been changed for AC-JACK 1 TEN and AC-JACK 2 TEN to AC-JACK 1 OE and AC-JACK 2 OE. Prior to 5E15 FR 5 and later, the TEN is restricted to SVG 1 of a Trunk Unit.

2.18 AC-JACK 1 OE

Description: This field is used if the TRUNK and LINE Workstation is equipped with a TAU (Test Access Unit. These fields supports the Digital Trunk Interface for TAU feature. For more information on this feature see Division 2, Section 4A632.
Valid Entries: Prior to 5E15 FR1 a seven-digit number of the following format:

Copyright © 2003 Lucent Technologies

TRUNK EQUIPMENT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1-192
Trunk Unit	TU		0-7
Service Group	SVG	X	0
Pack	PK	X	0-7
Circuit	CKT	X	0-3

For 5E15 FR1 and later:

DEN (Digital Line and Trunk Unit) Equipment Number			
Equipment		**Format**	**Valid Entries**
SM	Switching Module	XXX	001-192
DLTU	Digital Line Trunk Unit	XXX	000-011
DFI	Digital Facility Unit	XX	01-10
DCHAN	Digital Channel	XX	01-48

NEN (Digital Networking Unit - SONET) Equipment Number			
Equipment		**Format**	**Valid Entries**
SM	Switching Module	XXX	001-192
DNUS-S	Digital Networking Unit - SONET	X	0-7
DG	Data Group	X	0-1
STE	Synchronous Transport Signal	X	1-6
STS	SONET Termination Equipment	X	1
VTG	Virtual Tributary Group	X	1-7
VTM	Virtual Tributary Member	X	1-4
DS0	Digital Signal Level 0	XX	01-24

TEN (Analog TU (Trunk Unit)) Equipment Number			
Equipment		**Format**	**Valid Entries**
SM	Switching Module	XXX	001-192
TU	Trunk Unit	X	0-7
SWG	Switch Group	X	0-1
GR	Group	X	0-7
CKT	Circuit	X	0-3

Data Rules:

For offices equipped with CM1 Communications Module, valid SM entries are 1-48. For offices equipped with CM2, valid entries are 1-192.

For 5E15 FR1 and later,

- AC-JACK 1 OE must be assigned to Service Group 0 for TEN type trunks defined on the TRUNK form (5204 Record)..
- When AC-JACK 1 OE and AC-JACK 2 OE are entered on the TLWS form with types equal to "D" or "N", the ACT field for SFID 632 on the SFSYS form (5713-1 Record) must be set to "Y".

When equipments are associated with the AC-JACK 1 OE or AC-JACK 2 OE fields, the TKGRP form must be defined with TRKCLS equal to "ACJCK".

When AC-JACK 1 OE or AC-JACK 2 OE is assigned, a corresponding TRUNK form must exist.

2.19 AC-JACK 2 OE

Description: This field is used if the TRUNK and LINE Workstation is equipped with a TAU (Test Access Unit. These fields supports the Digital Trunk Interface for TAU feature. For more information on this feature see Division 2, Section 4A632. Prior to 5E15 FR 5 and later, the TEN is restricted to SVG 1 of a Trunk

Copyright © 2003 Lucent Technologies

Unit.
Valid Entries: Prior to 5E15 FR 5 a seven-digit number of the following format:

TRUNK EQUIPMENT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Trunk Unit	TU		0-7
Service Group	SVG	X	1
Pack	PK	X	0-7
Circuit	CKT	X	0-3

For 5E15 FR1 and later:

DEN (Digital Line and Trunk Unit) Equipment Number

Equipment		Format	Valid Entries
SM	Switching Module	XXX	001-192
DLTU	Digital Line Trunk Unit	XXX	000-011
DFI	Digital Facility Unit	XX	01-10
DCHAN	Digital Channel	XX	01-48

NEN (Digital Networking Unit - SONET) Equipment Number

Equipment		Format	Valid Entries
SM	Switching Module	XXX	001-192
DNUS-S	Digital Networking Unit - SONET	X	0-7
DG	Data Group	X	0-1
STE	Synchronous Transport Signal	X	1-6
STS	SONET Termination Equipment	X	1
VTG	Virtual Tributary Group	X	1-7
VTM	Virtual Tributary Member	X	1-4
DS0	Digital Signal Level 0	XX	01-24

TEN (Analog TU (Trunk Unit)) Equipment Number

Equipment		Format	Valid Entries
SM	Switching Module	XXX	001-192
TU	Trunk Unit	X	0-7
SWG	Switch Group	X	0-1
GR	Group	X	0-7
CKT	Circuit	X	0-3

Data Rules:

For offices equipped with CM1, valid SM entries are 1-48. For offices equipped with CM2, valid entries are 1-192.

AC-JACK 2 OE must be assigned to Service Group for TEN type trunks defined on the TRUNK form..

SEC. 5L: 5512 RECORD
REMOTE OFFICE TEST LINE FORM - ROTL

1. GENERAL

The 5512 Record is available with 5E2 and later Software Releases. The ROTL (Remote Office Test Line) interfaces with existing CAROT (Centralized Automatic Reporting On Trunks) systems through the DDD Network. This form is used to store the security call-back telephone numbers of all CAROTS that can access the 5ESS Switch trunks (outgoing and 2-way) in this office, and also defines the maintenance mode of the CAROT.

The ROTL feature allows interoffice trunk testing to be performed automatically from a CAROT System, a computerized system that automatically accesses and tests trunks. The ROTL answers calls from the CAROT, receiving information in the form of Multi-Frequency digits, and causes trunks to be accessed and attached to the responder for transmission measurement.

Access to ROTL is made via a number defined on the LINE form (5109 -1/2/3 Record) with TEST CODE equal to "ROTL", and the RTI field defined. Refer to Division 2, Section 2 for the full description of the ROTL Logical Test Ports.

The key field is the CAROT Identification code.

The other entries □ security call-back telephone number and maintenance test mode □ define the actual security call-back number and associated maintenance test mode.

1.1 Recent Change View

The corresponding Recent Change View for this form is 14.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CAROT ID CODE

Description: Enter the CAROT identification code sent to the 5ESS Switch ROTL software, which will be used for security callback.
Valid Entries: 0 - 9

2.3 SECURITY CALL-BACK TN

Description: Enter the telephone number used by the ROTL to call back the CAROT.
Valid Entries: Any 7 or 10 digit Telephone Number,

- □ plus an optional 1 prefix digit
- □ For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- □ For 5E8 and later: 200 - 999

Data Rules:

If MAINTENANCE TEST MODE is "MAN" or "AUTO", this field is required.

2.4 MAINTENANCE TEST MODE

Description: Enter the mode of maintenance authority for ROTL testing.

Copyright © 2003 Lucent Technologies

Required Field.

Valid MAINTENANCE TEST MODE Entries

Entry	Definition
AUTO	Automatic. Any CAROT center can automatically remove trunksfrom service if they fail specific tests. The AML (AutomaticMaintenance Limit) cannot be exceeded. The AML is established by theowner of the 5ESS Switch and states the number of trunks that can beremoved from service.
MAN	Manual. A manual control location gives the customer authorityto remove some or all trunks from service, allowing the AML to beexceeded. Exceeding the AML is not allowed with the AUTO mode.
NONE	Inhibits any and all callers from a given CAROT ID from changingthe trunk status of any tested trunks.

2.5 CARRIER ID

Description: Enter a Carrier Identification Code, if required, for the Security Call-Back Telephone Number.

If the digit interpreter tables referenced by the LTP DAS entry on the OFCOPT form (5509 Record) define that Telephone Number as an InterLATA call, then a Carrier ID is required to route the call back to the Security Call-Back TN.
Valid Entries:

- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

Any CARRIER ID entered must be defined on an ICF form (5305 Record), and for 5E8 and later, FEAT GRP on the ICF form must equal "D".

```

SEC. 5M: 5513 RECORD
CUTOVER BY THOUSANDS GROUP - COTH

1. GENERAL

The 5513 Record is available with 5E2 and later Software Releases and is used to define the Cutover By Thousands Group. It is part of the gradual cutover capability associated with the IMINFO form (5510 Record).

Data presented on this record will enable the customer personnel to cut over telephone lines from an existing office to a 5ESS Switch office based on the Office Code and Thousands Group of the Telephone Numbers.

Since the 5513 Record is for support of the 5510 Record, the 5513 Record use is optional. In the absence of the 5513 Record, the default condition will be the Flash Cut or Interface Module Cut as indicated by the 5510 Record. Thus, any Telephone Numbers not specifically covered by the 5513 Record will take on the pre-cutover or post-cutover status as defined on the 5510 Record. From that viewpoint, the 5513 Record can be looked upon as an exception list.

For 5E12 and later, COTH forms cannot be entered for lines in existing thousands groups in the office.

1.1 Multi-party Groups

Two, four, and eight party lines share the same Line Equipment Number. Cutover By Thousands Group works from the Telephone Number. Therefore, when any member of a multi-party group is cut over into active service in the 5ESS Switch office, all members of the multi-party group will be cutover. This will be true even if one or more of the Telephone Numbers of the multi-party group is in a Thousands Group which is not marked for cutover at that time.

1.2 Multi-Line Hunt Groups

When any member of a Multi-Line Hunt Group is cutover to a 5ESS Switch office, all members of the Multi-Line Hunt Group without individual TNs are cutover at the same time. The group is cutover according to the thousands group of the MLHG TN. Members of the group that have individual TNs are cutover according to the thousands group of their individual TN.

1.3 DSL Lines

For 5E5 and later, DSLs are cutover as follows. Multipoint DSLs are cutover as a single entity according to the thousands group specified by the "cut digits" of the DSL form (5907 Record). Point-to-Point DSLs are cutover according to the "cut digits" of the DSL form.

The AP (Application Processor) Data Links DSL lines are always cutover in an "in-service" state.

1.4 Recent Change View

The corresponding Recent Change view for this form is 11.2.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each Record.

2.2 *NPA

Description: The NPA field is used to specify the numbering plan area code. This field supports the

Copyright © 2003 Lucent Technologies

Number Portability - NPA-NXX Growth secured feature, see Division 2, Section 4A198.

Software Release: 5E12 and later
Valid Entries: 200 - 999

Data Rules:

For 5E12 and later, when the OFFICE CODES and/or NPA/OFFICE CODE combinations are assigned on COTH forms, they must be defined on the NOC form.

2.3 * OFFICE CODE

Description: Enter the three-digit NXX of the office for which the Thousands Group is to be cutover to the 5ESS Switch.

Required Field.
Valid Entries: 3 digits

Data Rules:

For 5E12 and later, if the COTH forms have an OFFICE CODE defined and there are multiple NOC forms with the same value of OFFICE CODE, NPA will also have to be defined on the COTH form.

2.4 * THOUS DIGIT

Description: Enter the Thousands Digit of the Telephone Numbers in the Office Code that is to be cut over to the 5ESS Switch.

Required Field.
Valid Entries: 0 - 9

2.5 PRECUT STATUS

Description: The recommended entry for Pre-Cut-Over Status is "INACTIVE".

Valid PRECUT STATUS Entries

Entry	Definition
ACTIVE	Lines are active when the office is in a precut state.
INACTIVE	Lines are inactive when the office is in a precut state.

Data Rules:

Existing TNs cannot be defined for an SM with an "INACTIVE" PRECUT STATUS.

For 5E12 and later, COTH forms that have a PRECUT STATUS of "INACTIVE", must have the CUTOVER field on the OFCOPT form set to "Y".

2.6 POSTCUT STATUS

Description: The recommended entry for POSTCUT STATUS is "INACTIVE". Other uses are to be made of this field in the future.

Valid POSTCUT STATUS Entries

Entry	Definition
ACTIVE	Lines are active when the office is in a postcut state.
INACTIVE	Lines are inactive when the office is in a postcut state.

2.7 ALT CUTOVER RTI

Description: Enter a Route Index when the PRECUT STATUS is "INACTIVE". The route index is used to

Copyright © 2003 Lucent Technologies

route calls attempting to terminate to an inactive line. It may be associated with reorder tone, a recorded announcement, or an outgoing Trunk Group to the existing office in which the Telephone Number is active.
Valid Entries:

- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

SEC. 5N: 5514 RECORD
CARRIER GROUP ALARM
SCAN POINT DEFINITION FORM - CGASP

1. GENERAL

The 5514 Record is available with 5E2 and later Software Releases and is used to define Scan Points assigned to Carrier Group Alarms.

The 5514 Record is used to associate the Scan Point Number with the type of carrier facility and the action to be taken on its associated trunks or lines if that system fails.

If the carrier system terminates directly on the 5ESS Switch, do not assign a Carrier Group Alarm Scan Point. Digital Trunks, specified as DENs (Digital Equipment Numbers) and Subscriber Loop Carrier lines, specified as Integrated SLENs (Subscriber Loop Carrier-96 Equipment Numbers) on these systems will be cared for by the 5ESS Switch software.

A Scan Point defined on the 5514 Record is then assigned to the carrier's trunks or lines. For trunks, enter the Carrier Group Alarm Scan Point Number on a TRUNK form (5204 Record). For lines, enter the Carrier Group Alarm Scan Point Number on a LINE form (5109 Record) for individual lines or on an MLHLN form (5111 Record) for Multi-Line Hunt Group lines.

A scan point must be unique within the 5ESS Switch. Scan points appearing in any of the following fields must be assigned on a CGASP form.

FIELD	FORM	RECORD
CARRIER GRP ALM	LINE	5109
CARRIER GRP ALM	MLHLN	5111
CGASPN	TRUNK	5204

The scan point values may be duplicated among the three aforementioned forms.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * CGA SCAN POINT

Description: Enter the scan point number assigned to the CGA. The scan point is a 9-digit number that must be in the following format.

Refer to Division 8, Section 1 for procedures to obtain the SPN assignments.

Required Field.

SCAN POINT NUMBER			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 48 (CM1)
			1 - 192 (CM2)
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0 - 1
Board	BRD	XX	00 - 15

Copyright © 2003 Lucent Technologies

			(Regular MSU) 00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00-30

Data Rules:

The first four components (SM, MSU, SVG and BRD) must be defined on an EQMSP form (5750 Record) with the TYPE set to "SCAN".

The first four components (SM, MSU, SVG and BRD) must be defined on an EQMMSP form (5750 Record) with the TYPE set to "SCAN".

2.3 ACTION

Description: This field defines the Action to be taken by the 5ESS Switch during a failure on a Carrier Group.

Required Field.
Default: REP
Valid Entries:

Valid ACTION Entries

Entry	Definition
IGN	Ignore. No action of any type is to be taken if the carrier fails.
REP	Report when the Carrier fails. A message will be printed at the Master Control Center when the Carrier fails. This treatment would be the most satisfactory for lines.
CON	Condition when the Carrier fails. When "CON" is entered, the associated line or trunk will be taken out of service when the Carrier fails. Normally this option would be selected for trunks only.

2.4 FACILITY TYPE

Description: Enter the Type of Facility assigned to the CGA.

Valid FACILITY TYPE Entries

Entry	Definition
ANCB	Analog Channel Bank
DTCB	Digital Channel Bank
PG	Pair Gain
SLC	Subscriber Loop Carrier - nonintegrated

cgasp 5ESS Switch
(5514) OFFICE DATA ADMINISTRATION
CGA SCAN POINT DEFINITION

*1. CGA SCAN POINT 008112024
2. ACTION REP
3. FACILITY TYPE ANCB

SEC. 5O: 5515 RECORD
ROUTINE EXERCISE SCHEDULE FORM - RXSCHD

1. GENERAL

The 5515 Record is available with 5E2 and later Software Releases. It is used to supply the time for the Routine Exercise Schedule for the Administrative Module and Switching Module tests. The recommended schedules are provided in the following documents: 235-105-210 and 235-105-110.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.3.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 ENTITY

Description: Entity identifies the type of unit for which the schedule is being established. The AM (Administrative Module) and each operational Switching Module requires an entry in this field.

An entry of a zero indicates that the schedule being established will be applicable for the Administrative Module. When the schedule being established is applicable to a Switching Module, the Switching Module Number (1 - 192) must be entered here. For offices equipped with CM1 (Communications Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2, valid entries are 1 - 192.
Valid Entries: 0 - 192

Data Rules:

If ENTITY is 1 - 192, then START TIME and DURATION must be entered for all three types of testing.

Each entry for a Switching Module (1 - 192) must be defined in the SM field of an EQIM form (5700-1 Record) with the corresponding EQSTATUS set to "O" (Operational).

DIAGNOSTICS

Entries made in the Diagnostics column will provide for the DGN (Diagnostic) tests. Diagnostic test schedule data must be provided for the Administrative Module. There are two test types available for scheduling in the Administrative Module, full ("F") and partial ("P") diagnostic tests. For reliability reasons, full diagnostics for the Administrative Module should be scheduled only about once a week and partial diagnostics should be scheduled for the remaining six days of the week.

Only the full diagnostics test is available for Switching Modules; it should be scheduled once per week.

Testing should be scheduled for light traffic hours, i.e. during early morning hours, and should be limited to a maximum of six hours.

ELS

Entries made in the ELS (Electronic Loop Segregation) column will provide for the Electronic Loop Segregation tests which analyze customer lines for their electrical characteristics. Electronic Loop Segregation tests periodically test the loaded/non-loaded characteristics of lines, and update the database accordingly. The ELS tests take approximately one hour for each Line Unit. The point at which the test stops will be the point at which it will start testing at its next scheduled time. Electronic Loop Segregation

Copyright © 2003 Lucent Technologies

test schedule data cannot be provided for the Administrative Module.

Each SM (Switching Module) executing ELS tests requires the use of a TTF (Transmission Test Facility) responder so the total number of SMs executing ELS at any one time should not exceed the number of TTF responders equipped in the office. For example, if an office with 5 SMs has 3 TTF responders, only 3 SMs should perform ELS tests at the same time.

FABRIC

Description: Entries made in the Fabric column will provide for the Fabric tests. Fabric tests Line Unit Grid Circuits. The Fabric tests take approximately two hours for each Line Unit. The point at which the test stops will be the point at which it will start testing at its next scheduled time. Fabric test schedule data cannot be provided for the Administrative Module.

2.3 START TIME

Description: Enter the Start Time for the test being scheduled. The entry must be in the format of HH:MM where HH is the hour, and MM is the minute. All five characters, including the colon, must be entered.
Valid Entries: HH:MM, where

- HH is 00 - 23
- MM is 00 - 59

2.4 DURATION

Description: Enter the number of hours for which the tests may continue. Although zero is a valid entry, if it is entered, the test will never begin because, although the test is scheduled, no time is allocated for it.
Valid Entries: 0 - 12

Data Rules:

If an entry is made in one of the DURATION fields, then the corresponding START TIME field must have an entry. If a DURATION field is not entered, then all other corresponding fields must not be entered.

2.5 VERBOSE

Description: Should completion messages be printed at the end of Diagnostics, ELS, and Fabric Tests?
Default: N
Valid Entries: Y, N

2.6 SUNDAY THROUGH SATURDAY

Description: Enter the extent to which the test is to be run.

Valid SUNDAY THROUGH SATURDAY Entries

Entry	Definition
F	Full set of tests
N	(Or if the field is left blank) no tests are to be performed.
P	Partial Diagnostic test on the Administrative Module.

Data Rules:

When ENTITY is 0, indicating an Administrative Module schedule, a "P" may be entered in the Diagnostic column.

An entry of "P" is not allowed in the ELS (Electronic Loop Segregation) or Fabric columns under any circumstances, or the Diagnostic column when ENTITY is 1 - 192, indicating Switching Module.

SEC. 5P: 5516 RECORD
REMOTE ALARM ASSIGNMENT RECORD - RALM

1. GENERAL

The 5516 Record is used to define Remote Alarm Scan and Distribute Point Number Assignments.

This record is intended to be used as an Office Record for those 5ESS Switches that do not utilize the default assignments for Remote Alarms. See Figure 1 for the default assignments.

The Remote Alarm Process applies to an RSM (Remote Switching Module), ORM (Optically Remote Module), or TRM (Two-Mile Optically Remote Module).

Remote Alarm Scan and Distribute Point Assignments are "mirror image"; for each Scan or Distribute Point entered in Service Group 0, a corresponding point will be automatically assigned in Service Group 1 with the same SM, MSU, BRD and SPN. The Remote Alarm Scan and Distribute Points for both Service Groups 0 and 1 will appear on the following records (other than the 5516 Record):

- 5840 and 5840A for Scan Points
- 5841 and 5841A for Distribute Points

The Remote Alarm Process has two Scan Boards, and one Distribute board duplicated on each of the two Service Groups of a Metallic Service Unit in each Remote Module. The boards are identified on an EQMSU form (5750 Record).

The Remote Alarm Process consists of two options, the Alarm Input Option and the Alarm Output Option. Any existing RSM is equipped with the hardware necessary for both options. Only the designated MASTER MODULE of a REMOTE SITE can be assigned these options on an EQSITE form.

The Input Option provides for building and power alarm sources to be wired as alarm inputs to this capability. Hardware for the Input Option consists of eighteen power alarm sources and two standard building alarms. Also included are thirty scan points that may be assigned on an office basis to additional building alarm sources. The Input Option utilizes unused scan points that may exist on MSU Scan circuit packs. If existing unused scan points are unavailable, additional circuit packs must be purchased.

The Output Option provides the audibles for all alarms and for the Alarm and Status Panel at the remote site. The Output Option utilizes unused points that may exist on TN220B MMSU Scan and TN221 MMSU Distribute circuit packs. If existing unused scan or distribute points are unavailable, additional packs must be purchased. Hardware for the Output Option consists of the following:

- Alarm and Status Circuit Pack or RAU Circuit Pack.
- Alarm and Status Display Panel.
- Audible Alarm Unit.
- Five MMSU Scan Points per service group.
- Fifteen MMSU Distribute Points per service group.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number, and the Office Number on each record.

2.2 * REMOTE MODULE

Description: Enter the Switching Module number of the Remote Module being served.

For offices equipped with CM1 (Communications Module 1), valid entries for SM are 1 - 48. For offices equipped with CM2, valid entries are 1 - 192.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM entered must be defined as the MASTER MODULE on an EQSITE form.

For 5E10 and later, if the SM entered is a WCTX (Wireless Centrex) application (as defined by PRODUCT on the OFCOPT form (5509 Record) set to "WNC"), the SM entered must have a matching SM value on the EQIM form (5700 Record).

2.3 * ALARM POINT

Description: Enter the Remote Alarm Scan Point. The Alarm Point number is the number used to identify the point in messages to maintenance personnel and to the Recent Change process.

The Alarm Input Option corresponds to Alarm Points 0 - 54. The Alarm Output Option corresponds to Alarm Points and 100 - 108 for 5A RSMs and Alarm Points and 100 - 113 for Multi-Module RSMs, ORMs or TRMs. See Figure 1 for Remote Alarm Point Default values.

Required Field.
Valid Entries:
- For 5E9(1) and earlier: 0 - 54 and 100 - 113
- For 5E9(2) and later:
- VCDX office: 0, 1, 4 - 54 and 100 - 113
- Non-VCDX office: 0 - 54 and 100 - 113

Data Rules:

For WCTX applications (i.e., PRODUCT on the OFCOPT form set to "WNC"):

- if a Remote Alarm Point 0 - 54 is assigned, the WCTXOPT form must have the INPUT OPTION entry set to "Y".

- if any Remote Alarm Point 100 - 113 is assigned, the WCTXOPT form must have the INPUT OPTION entry set to "Y" and the ALARM DURATION entered.

2.4 SCAN POINT NO

Description: Enter the Scan Point Number assigned to this Remote Alarm Point. This entry is required for Alarm Points 0 - 54 only; leave blank for all others.

The Scan Point is a 9-digit number in the following format.

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0
Board	BRD	XX	00 - 15

Copyright © 2003 Lucent Technologies

			(Regular MSU) 00 - 31 (Modular MSU)
Scan Point Number	SPN	XX	00 - 30

- ***NOTE:*** Only Service Group 0 should be entered. A corresponding Scan Point will be automatically assigned for Service Group 1 with the same SM, MSU, BRD and SPN.

Data Rules:

Scan Point Number 31 is used for a current sensing point and cannot be assigned in this field.

The SM entered in this field must be the same as the SM entered in the REMOTE MODULE field. The Scan Point must be defined on an EQMSP (5750 Record) or EQMMSP (5750 Record) form with "SCAN" entered in the TYPE field.

2.5 DIST POINT NO

Description: Enter the Distribute Point Number assigned to this Remote Alarm Point. This entry is required for Alarm Points 100 - 113 only; leave blank for all others.

The Distribute Point is a 9-digit number in the following format.

DISTRIBUTE POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU		0 - 1
Service Group	SVG	X	0
Board	BRD	XX	00 - 15 (Regular MSU)
			00 - 31 (Modular MSU)
Distribute Point Number	DPN	XX	00 - 31

- ***NOTE:*** Only Service Group 0 should be entered. A corresponding Distribute Point will be automatically assigned for Service Group 1 with the same SM, MSU, BRD and DPN.

Data Rules:

The SM entered in this field must be the same as the SM entered in the REMOTE MODULE field. The Distribute Point must be defined on the EQMSP or EQMMSP form with "DIST" entered in the TYPE field.

2.6 IN USE?

Description: Is this Scan Point operational? Enter an "N" if this Scan Point is not operational.

Required Field.
Valid Entries: Y, N

2.7 MCC NAME

Description: Enter the name of the alarm as it should appear on the MCC (Master Control Center).

Leave this field blank if the Alarm Point is 0, 1 or greater than 31.
Valid Entries: 9 characters

2.8 TTY NAME

Description: Enter the name of the alarm as it should appear on the TTY. This is the name that will be presented to the maintenance personnel on their teletype unit.

Copyright © 2003 Lucent Technologies

Valid Entries: 20 characters

2.9 NORMAL STATE

Description: Enter the Normal (unalarmed) State for this Scan Point.

Required Field.
Valid Entries: OPEN and CLOSED

2.10 ALARM LEVEL

Description: Enter the Alarm Level to be indicated to the maintenance personnel when the Scan Point state is different than that shown for the Normal State.

Valid ALARM LEVEL Entries

Entry	Definition
CRIT	Critical.
MAJ	Major.
MIN	Minor.
ACT	Action.
INFO	Information.

SEC. 5Q: 5517 RECORD
RSM LINK ASSIGNMENT FORM - RSMLNK

1. GENERAL

The 5517 Record is used to define the assignment of the Umbilical Links between the Host Switching Module (i.e., the HOST field) and the Remote Switching Module (i.e., the RSM field).

The DFI-R (RSM Digital Facility Interface) is used in the DLTU (Digital Line Trunk Unit) to provide the interface between the Host Switching Module and the Remote Switching Module.

Effective with 5E10 and later, a single Host SM-2000 can host between 1 and 30 RSMs as opposed to the previous limit of 5 RSMs per Host SM. This enhancement pertains to the operation of an SM-2000 as a host to RSMs, not to operating an SM-2000 as an RSM itself.

Effective as a 5E13 and later Software Update, this feature provides the capability to support a non-SM-2000 RSM via a DNU-S on a Host SM-2000. The following updates were made to implement this feature:

1. a UNIT TYPE field was added to define either a DLTU or a DNU-S,
2. three new fields were added: STS, VTG, and VTM (consistent with the 5E13 DNU-S VT Group Number feature (99-5E-4424) which introduced a new VT facility DS1 numbering scheme for DNU-S provisioning (see Division 2, Section 9Q)),
3. three fields were modified: DNUS, DG, and STE were appended to the FAR END fields.

For more information on the RSM feature, see the RSM on DNU-S feature (99-5E-4209), Division 2, Section 9S.

1.1 Intra-Cluster Links

The RSMLNK form is also used to define the ICLs (Intra-Cluster Links) between the RSMs within an RSM site. RSMLNK forms are required for both Single Module and Multi-Module RSMs. For more information on RSM sites, see the EQSITE form, Division 8, Section 15..

1.2 Recent Change View

The corresponding Recent Change Views for this form are 18.5 and 18.9.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * RSM

Description: Enter the Switching Module number of the RSM (Remote Switching Module).

Required Field.
Valid Entries: 1 - 192

Data Rules:

This SM must have an SM USAGE of "RSM" on the EQIM form (5700 Record).

Copyright © 2003 Lucent Technologies

2.3 # RSM SITE

Description: Enter the RSM SITE number. All Switching Modules in the same RSM SITE must have the same RSM SITE value.

Required Field.
Valid Entries: 1 - 174

Data Rules:

The RSM SITE value assigned here must be defined on an EQSITE form (5722 Record).

2.4 # HOST

Description: Enter the Switching Module number of the HIM (Host Switching Module).

Required Field.
Valid Entries: 1 -192

Data Rules:

For offices equiped with a CM1 (Communications Module 1) only 1 - 48 can be entered for the SM. For offices equipped with a CM2, 1 - 192 can be entered for the SM.

This SM must have an SM USAGE of "HIM" on the EQIM form.

This value must not equal the value in the RSM field or any FAR END SM.

In a Multi-Module RSM, it is not required that all Switching Modules at the RSM SITE have the same HOST.

For 5E10 and later, if this HOST SM is defined as an SM2000 (UNIT TYPE is "SM2000" on the EQIM form), the FAR END DFIs on this RSMLNK form that carry the first two CTS to the same FAR END DLTU2 must not be on the same DLTU2 fuse group on HOST SM. The first two CTS are on the NEAR END DLTU2 0, NEAR END DFI 1, FAC 0 and NEAR END DFI 2, FAC 0. Note that Far END DFIs on the RSMLNK forms are assigned to fuse groups on the DLTU2 as follows:

Fuse Groups	FAR END DFI Number
A	1, 5, 9
B	2, 6, 10
C	4, 8
D	3, 7

LINKS:

This section is used to define up to 20 umbilical links between the RSM and the HIM. The RSM can be remoted from the host office using 2 to 20 umbilical links. A minimum of two T1 umbilical links are required to the Host Switching Module.

The LINKS section is used to define RSM Umbilical Links and ICLs (Intra-Cluster Links) for Multi-Module RSMs.

The following fields (Section 2.5 - Section 2.16) define the LINKS.

For each link the remote DLTU (Digital Line Trunk Unit), DFI (Digital Facility Interface), and the Host DLTU and DFI must be assigned.

In 5E5 and later Software Releases, the Remote and Host facility must also be assigned.

Data Rules:

Copyright © 2003 Lucent Technologies

The matching NEAR END and FAR END LINKS must have the same DFI TRANSMISSION MODES specified on EQDUP forms (5730 Record).

The NEAR END assignments must be unique. The FAR END assignments must be unique.

If the LINK SM is not "H", then the matching NEAR END and FAR END LINKS must have their FIU PORTS, on EQDUP forms, in the same range, either 0 - 1 or 2 - 9.

Remote DFIs must have the DFI USAGE field, on the EQDUP form, set to "RDFI" or "CDFI".

Every item associated with a LINK must have an entry.

2.5 NEAR END DLTU

Description: Enter the DLTU on the "near end" of the link, whether or not it is an umbilical to the Host or an ICL to another RSM within the RSM SITE. This is the DLTU on the RSM.
Valid Entries: 0 - 5

Data Rules:

DLTU 0 with DFIs of 1 - 2 cannot be used for ICL links.

2.6 NEAR END DFI

Description: Enter the DFI on the "near end" of the link, whether or not it is an umbilical to the Host or an ICL to another RSM within the RSM SITE. This is the DFI on the RSM.
Valid Entries: 5E12 and earlier: 1 - 16
5E13 and later: 1 - 10

2.7 NEAR END FAC

Description: Indicate the "near end" facility.

Software Release: 5E5 and later
Valid Entries:

Valid NEAR END FAC Entries

Entry	Definition
0	For a DFI, the DFI can terminate one T1 facility (24 channels) per circuit pack.
	For a DFI-2, the DFI-2 can terminate two T1 facilities (48 channels) per circuit pack. A value of 0 entered in this field indicates that channels 1 - 24 are utilized.
1	For DFI-2, the DFI-2 can terminate two T1 facilities (48 channels) per circuit pack. A value of 1 entered in this field indicates that channels 25 - 48 are utilized.

Data Rules:

If 0 is entered for a DFI, the FAC IND on the EQDUP form must be 0.

If 0 is entered for a DFI-2, the FAC IND on the EQDUP form must be 1 or 3.

If 1 is entered for a DFI-2, the FAC IND on the EQDUP form must be 3.

2.8 UNIT TYPE

Description: Enter the Unit Type.

Software Release: 5E13 and later
Valid Entries: DLTU or DNUS

Data Rules:

Copyright © 2003 Lucent Technologies

When UNIT TYPE is "**DLTU**",

- DFI/DG must be 1 - 10
- FAC/STE must be 0 - 1
- STS must not be entered
- VTG and VTM must not be entered

When UNIT TYPE is "DNUS",

- DFI/DG must be 0 - 1
- FAC/STE must be 1 - 6
- STS must be 1
- VTG must be 1 - 7
- VTM must be 1 - 4

When UNIT TYPE is "DNUS" and FAR SM is "H", the required host CTS (Control Time Slot) links ROW pairs [1-2 and 3-4] must not have the same DNUS, DG, and STE. Also, the corresponding CTS ROW mates [1-3 and 2-4] must not have the same DNUS, DG, and STE.

2.9 FAR END SM

Description: Enter the "far end" SM number or "H" for host.

Valid FAR END SM Entries

Entry	Definition
H	The "far end" of the link is the HOST.
1 - 192	The RSM number of the "far end" that is an RSM within the RSM SITE.

Data Rules:

If FAR END SM is "H", CLK REF must be "N".

2.10 FAR END DLTU/DNUS

Description: Enter the DLTU or DNUS used at the "far end" of the umbilical or ICL link. For 5E13 and later, this field name was changed from FAR END DLTU to FAR END DLTU/DNUS to support the RSM on DNU-S feature (99-5E-4209). For more information, see Division 2, Section 9S.

Valid DLTU/DNUS Entries

Entry	Definition
5E14 and earlier: 0 - 5	DLTU.
5E15 and later: 0 - 11	
0 - 7	DNU-S.

Data Rules:

For 5E13 and later, for DNU-S, the NEAR END LINKS and matching FAR END DNU-S VT LINKS must have a NEAR END DFI (TRANSMISSION) MODE OF "B8ZS" on the corresponding EQDUP form.

2.11 FAR END DFI/DG

Description: Enter the DFI or DG used at the "far end" of the umbilical or ICL link. For 5E13 and later, this

Copyright © 2003 Lucent Technologies

field name was changed from FAR END DFI to FAR END DFI/DG to support the RSM on DNU-S feature (99-5E-4209). For more information, see Division 2, Section 9S.
Valid Entries: 5E12 and earlier: 1 - 16 (DLTU/DFI)
5E13 and later: 0 - 1 (DNUS/DG)

2.12 FAR END FAC/STE

Description: Indicate the "far end" facility or STE (Signaling Terminal Equipment). For 5E13 and later, this field name was changed from FAR END FAC to FAR END FAC/STE to support the RSM on DNU-S feature (99-5E-4209). For more information, see Division 2, Section 9S.

Software Release: 5E5 and later: 0 - 1 (FAC)
5E13 and later: 1 - 6 (STE)
Valid Entries:

Valid FAR END FACSTE Entries

Entry	Definition
0	For a DFI, the DFI can terminate one T1 facility (24 channels) per circuit pack.
1	For a DFI-2, the DFI-2 can terminate two T1 facilities (48 channels) per circuit pack. A value of 1 entered in this field indicates that channels 25 - 48 are utilized.

Data Rules:

If 0 is entered for a DFI, then the FAC IND on the EQDUP form must be 0.

If 0 is entered for a DFI-2 then the FAC IND on the EQDUP form must be 1 or 3.

If 1 is entered for a DFI-2, then FAC IND on the EQDUP form must be 3.

2.13 STS

Description: Enter the STS (Synchronous Transport Signal) for the DNU-S. For 5E13 and later, this field was added to support the RSM on DNU-S feature (99-5E-4209). For more information, see Division 2, Section 9S.

Software Release: 5E13 and later
Valid Entries: 1

2.14 VTG

Description: Enter the VTG (Virtual Tributary Group) for the DNU-S. For 5E13 and later, this field was added to support the RSM on DNU-S feature (99-5E-4209). For more information, see Division 2, Section 9S.

Software Release: 5E13 and later
Valid Entries: 1 - 7

2.15 VTM

Description: Enter the VTG (Virtual Tributary Member) for the DNU-S. For 5E13 and later, this field was added to support the RSM on DNU-S feature (99-5E-4209). For more information, see Division 2, Section 9S.

Software Release: 5E13 and later
Valid Entries: 1 - 4

2.16 CLK REF

Description: Is this link used to provide a timing link between RSMs within the RSM SITE? "N" must be

Copyright © 2003 Lucent Technologies

entered for an umbilical link (i.e., "H" is entered for FAR END SM.)
Valid Entries: Y, N

Data Rules:
When CLK REF is "Y", the links must be assigned in pairs on a given RSMLNK form. The pair of timing links must not specify the same value of FIU SUBGROUP on the EQDUP forms which define these RSM Cluster DFIs. (Cluster DFI links with a FAC = 0 are associated with the FAC 0 FIU SUBGROUP on the EQDUP form. Cluster DFI links with a FAC = 1 are associated with the FAC 1 FIU SUB GROUP on the EQDUP form.

SEC. 5R: 5518 RECORD
CENTRAL TRUNK TEST UNIT FORM - CTTU

1. GENERAL

The 5518 Record is used to define the CTTUs (Central Trunk Test Units). CTTU is available with 5E2 and later Software Releases.

The Central Trunk Test Unit is used to test trunks and lines from a remote location, and is similar in function to a Trunk and Line Work Station. However, the CTTU is a common work station designed for use with any ESS. The user of the CTTU runs tests at the remote Central Offices by making selections from menus without having knowledge of the specifics of the different test positions of the various ESS's. In other ESS switches, the CTTU interfaces to an RTTU (Remote Trunk Test Unit) which resides outside the switch at the Central Office. In the 5ESS Switch, the CTTU interfaces directly to the switch, the RTTU function being implemented in software residing in the switch. The 5ESS Switch software interprets requests originated from a CTTU, performs the appropriate line or trunk tests locally and returns the results to the CTTU.

The Central Trunk Test Unit communicates with the 5ESS Switch over a synchronous dial up Data Link operating at 1200 bits per second. The dial up line must be defined as denied origination on the LINE form (5100-1 Record) and is connected to an auto answer 212 dataset. The dataset is connected to an appropriate slot of the 3B IOP (Input/Output Processor).

1.1 CTTU User Classes

Four classes of CTTU users exist. Class A users have unrestricted control over trunk maintenance state and the ability to monitor traffic busy circuits. This work center has PCO (Plant Control Office) responsibility for the circuits involved (i.e., in-service/out-of-service control over them). Class B users can make trunks temporarily unavailable for call processing and monitor the trunk under test during manual access. Class C users have the ability to remove a limited number of trunks from service (up to the automatic maintenance limit). Class C users are mechanized systems operating in an automatic mode to routinely test trunks. Class D users are only allowed to test traffic idle circuits and cannot invoke the talk and monitor feature. Class D users are not allowed to remove trunks from service.

Since Class A, B, and C users can adversely affect system performance, a security protocol is required. This security is provided by entries made with the 5518 Record. The CTTU sends a message to the 5ESS Switch containing a user ID number. The switch then calls back the CTTU on the Security Callback Telephone Number. The switch also establishes a Talk and Monitor circuit, if specified, for Class A and B users. No entries are required or allowed for Class D users.

User number 2 must be defined as a Class A user. All other valid user numbers (2 through 9 and 20 through 49) may be assigned to any security classification A, B, or C. However, it is recommended users 3 and 4 (in addition to user 2) be assigned as Class A, user 5 be assigned as Class C, and all other user numbers be assigned as Class B. If these recommendations are not followed, an appropriate warning message will be issued by ODA. An absolute limit of three Class A users, thirty-four Class B users, and one Class C user exists. If any CTTU user is defined, user number 2 must be defined.

1.2 Recent Change View

The corresponding Recent Change View for this form is 14.4.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * USER NUMBER

Description: Enter the CTTU user identification number.
Valid Entries: 2 - 9 and 20 - 49

Data Rules:

If USER NUMBER is 2, SECURITY CLASSIFICATION must be "A", and TALK AND MONITOR PHONE TN must exist. For 5E2 through 5E6, if USER NUMBER is 2, 101 ACCESS? must be known.

2.3 SECURITY CLASSIFICATION

Description: Enter the security classification. User number 2 must be Class A. It is recommended users 3 and 4 also be assigned Class A, user 5 be assigned Class C and all other user numbers be assigned Class B.

Required Field.
Valid Entries: A, B, or C

2.4 SECURITY CALLBACK TN

Description: Enter the Security Callback Telephone Number. Any CTTU user defined on this form must have a Security Callback Number.

Required Field.
Valid Entries: Any 7 or 10 digit Telephone Number, plus an optional 1 prefix digit
- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

2.5 TALK & MONITOR PHONE TN

Description: Enter the T&M (Talk and Monitor) Phone Telephone Number. A T&M Phone TN is required for user number 2 and is optional for other Class A and B users. It may be activated by the user at the CTTU through menu commands or by a distant office terminating to the CTTU User Number 2 as a 101 Test Line call. (See Division 2, Section 2 of this guide for translations on Terminating Test Lines.)
Valid Entries: Any 7 or 10 digit Telephone Number, plus an optional 1 prefix digit
- For 5E7 and earlier: 200 - 919 middle digit 0 - 1
- For 5E8 and later: 200 - 999

2.6 TALK & MONITOR LTP

Description: Enter the Talk and Monitor LTP (Logical Test Port).

The Talk and Monitor LTP is used by the 5ESS Switch software to originate Talk and Monitor phone calls for the CTTU user. These calls are screened and routed as if they had been dialed by a line with the Screening Index and Digit Analysis Selector specified in the LTP SCR (Logical Test Port Screening Index) and LTP DAS (Logical Test Port Digital Analysis Selector) fields of the OFCOPT form (5509 Record).
Valid Entries: A six-digit number consisting of the following:

TALK AND MONITOR LOGICAL TEST POINT

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Logical Test Port	LTP	XXX	000-255

Data Rules:

Each user assigned a Talk and Monitor Phone Telephone Number requires a unique LTP. The LTP may

Copyright © 2003 Lucent Technologies

be assigned in any equipped Switching Module, and must be assigned to a member of an outgoing LTP Trunk Group with no HUNT TYPE and a TRKCLS of "LTPCLBCK". The Trunk Group must have IAPT of "Y". These LTP trunks may be members of the same Trunk Group containing the Trunk and Line Work Station's Remote Talk and Monitor LTP. If the user is not assigned a Talk and Monitor phone, this field must be left blank.

2.7 CARRIER ID

Description: Enter a Carrier Identification Code, if required, for the Security Callback Telephone Number or Talk and Monitor Phone TN. If either or both of these numbers are defined as InterLATA calls on the digit interpreter tables, then a Carrier ID is required to route these calls.
Valid Entries:

- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

Any Carrier ID entered must be defined on an ICF form (5305 Record), and for 5E8 and later, FEAT GRP on the ICF form must equal "D".

2.8 101 ACCESS?

Description: Will the Talk and Monitor phone be used to terminate incoming 101 Test Line calls? This field is for User Number 2 only, other user numbers must leave it blank.

Software Release: 5E2 through 5E6
Valid Entries: Y, N

SEC. 5S: 5519 RECORD
REMOTE CLOCK REFERENCE FORM - RCLKREF

1. GENERAL

The 5519 Record is available with 5E2 and later Software Releases and is used to describe the exterior references for the Remote Clock equipped in an RSM Site.

1.1 Recent Change View

The corresponding Recent Change View for this form is 20.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * REM SW MODULE

For 5E5 and later, this field is replaced by RSM.

2.3 * RSM

Description: Enter the value of the Remote Switching Module.

Software Release: 5E5 and later
Valid Entries: 1 - 192

Data Rules:

This RSM must be identified as the Master RSM on the appropriate EQSITE form (5722 Record).

2.4 * REFERENCE

Description: Enter the external reference number.
Valid Entries: 1 - 8

2.5 # PRIORITY

Description: Enter the priority of the external reference. The highest stability or most preferred reference should have a priority of one, the next most preferred a priority of two, and so on for all equipped references. These values must be unique for each reference associated with the clock.

Required Field.
Valid Entries: 1 - 8

2.6 EQUIPMENT STATUS

Description: Enter the equipment status.

Required Field.
Default: O
Valid Entries:

Valid EQUIPMENT STATUS Entries

Entry	Definition
O	Operational

Copyright © 2003 Lucent Technologies

G	Growth
U	Unequipped

Data Rules:

For new offices and units destined for factory testing, the status must be operational ("O"). During offline ODA database retrofits, it may be set to the other values.

2.7 INTERRUPT STATUS

Description: Enter the Interrupt Status.

Required Field.
Default: ALLOW
Valid Entries: ALLOW, INHIBIT

Data Rules:

If EQUIPMENT STATUS is "O", INTERRUPT STATUS must be "ALLOW". If EQUIPMENT STATUS is "U", INTERRUPT STATUS must be "INHIBIT".

2.8 # REFERENCE TYPE

Description: Enter the type of reference used.

Required Field.

Valid REFERENCE TYPE Entries

Entry	Definition
24CHAN	24 channel T1 trunk
ANALOG	Analog reference

REFERENCE TYPE must be "24CHAN" for remote clock references.

2.9 REFERENCE FORMAT

Description: Enter the reference format used.

For 5E5 through 5E7, if the RCLK references come from a BITS (Building Integrated Timing Supply) clock, REFERENCE FORMAT must be set to "D4WZC".

WARNING: RSM synchronization should be obtained from the HSM-RSM umbilicals. Synchronization from other sources is not recommended. (If synchronization is from another source, the synchronization clock must be traceable to the clock source used by the host switch; and it must meet the LSSGR requirements for stability, reliability, and availability.)

Required Field.
Default: FEWZC
Valid Entries:

Valid REFERENCE FORMAT Entries

Entry	Definition
D4WOZ	D4 without Zero Code Suppression.
D4B8	D4 with Bipolar 8 Zeros Suppression.
D4WZC	D4 with Zero Code Suppression.
FEWOZ	Extended Framing Format without Zero Code Suppression.
FEB8	Extended Framing Format with Bipolar 8 Zeros Suppression.
FEWZC	Extended Framing Format with Zero Code Suppression.

Copyright © 2003 Lucent Technologies

2.10 EXT REF

Description: Will the RCLK references come from an external source? If this field is "Y", the RCLK references are NOT coming from RSM umbilicals through BRs (Bridging Repeaters), but from another source such as a BITS (Building Integrated Timing Supply) clock. This case is demonstrated in Figure 1 .

If this field is "N", the RCLK references ARE coming from RSM umbilicals through BRs (as implemented prior to the 5E8 Software Release). This case is demonstrated in Figure 2 .

During a retrofit to the 5E8 Software Release, if the REFERENCE FORMAT field is "FEB8" or "FEWZC", the EXT REF field will be set to "N"; otherwise, it will be set to "Y".

Software Release: 5E8 and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If EXT REF is "N", all fields under REFERENCE SOURCE and ALTERNATE SOURCE must be entered. If EXT REF is "Y", these fields are optional; but if any of them is entered, all must be entered.

REFERENCE SOURCE

At least two Reference Sources (fields Section 2.11 - Section 2.14) must be defined for each RSM specified, therefore two RCLKREF forms are required. The suggested method of assigning the sources is to use the first Reference Source as the Alternate Source for the second and the second Reference Source as the Alternate Source for the first.

2.11 SM

Description: Enter the number of the Switching Module that has the DLTU (Digital Line and Trunk Unit) that contains the reference.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM entered must be the same as the value entered in the RSM field.

2.12 DLTU

Description: Enter the number of the Digital Line and Trunk Unit containing the pack with the reference.

Required Field.
Valid Entries: 0 - 5

2.13 DFI

Description: Enter the number of the DFI (Digital Facility Interface) pack that contains the reference.

Required Field.
Valid Entries: 1 - 16

2.14 FAC

Description: Indicate the facility used.

Copyright © 2003 Lucent Technologies

Software Release: 5E5 and later
Required Field.
Valid Entries: 0, 1

Data Rules:

For a DFI the entry must be 0; the DFI can terminate one T1 facility (24 channels) per circuit pack.

For a DFI-2 the entry may be 0 or 1. The DFI-2 can terminate two T1 facilities (48 channels) per circuit pack. A value of 0 entered in this field indicates that channels 1 - 24 are utilized. A value of 1 entered in this field indicates that channels 25 - 48 are utilized.

ALTERNATE SOURCE

The fields (Section 2.15 - Section 2.18) define the Alternate Source.

2.15 ALTERNATE SM

Description: Enter the number of the Switching Module that has the DLTU that contains the Alternate Source for this reference.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM entered must be the same as the value entered in the RSM field.

2.16 ALTERNATE DLTU

Description: Enter the number of the Digital Line and Trunk Unit containing the pack with the alternate reference.

Required Field.
Valid Entries: 0 - 5

2.17 ALTERNATE DFIPK

Description: Enter the number of the DFI pack that contains the alternate reference.

Required Field.
Valid Entries: 1 - 16

2.18 ALTERNATE FAC

Description: Indicate the facility used for the alternate reference.

Software Release: 5E5 and later
Required Field.
Valid Entries: 0, 1

Data Rules:

For a DFI the entry must be 0; the DFI can terminate one T1 facility (24 channels) per circuit pack.

For a DFI-2 the entry may be 0 or 1. The DFI-2 can terminate two T1 facilities (48 channels) per circuit pack. A value of 0 entered in this field indicates that channels 1 - 24 are utilized. A value of 1 entered in this field indicates that channels 25 - 48 are utilized.

SEC. 5T: 5520 RECORD
DIGIT ANALYSIS TIMING FORM - TIMING

1. GENERAL

The 5520 Record is used to define intervals for Permanent Signal, Partial Dial and Critical Timing in a 5ESS Switch.

1.1 Default Data

A standard set of input data is provided by the ODA system as each office is registered and normally no data need be entered by the ODA system users. If, however, it is required that timing intervals vary from the standard, the TIMING form may be used to specify them (see Figure 1).

With 5E3 and later, a standard set of input data is provided by the 5ODA system for DSN (Defense Switch Network) offices (see Figure 2).

1.2 Line Class of Service

A TIMING form entry must be defined for each combination of Line CLASS OF SERVICE (specified on the LCC form (5306 Record)) and SIGNAL TYPE (TT or DP) for which any Line form (5109-1/2 Record) or MLHLN form (5111-1/2 Record) entry exists.

With 5E3 and later, a TIMING form entry must be defined for the Line CLASS OF SERVICE "ISDN" specified on the LCC form (5306 Record) and SIGNAL TYPE of "DCHN", for which any DSL form (5900 Record) or DSMLHLN form (5901 Record) exists.

1.3 Trunk Class of Service

A TIMING form must be defined for each combination of Trunk Class, (with the exception of "ACJCK", "FXROTL", "EDSL", "EDSLHM", "IFOPER", "IFTERM", "OTOTK", "PACKET", "TCIKT" and "TCITT") and INPULSING field, defined on the TKGRP form, and IN START DIAL, specified for any incoming or two-way trunk on the TRUNK form.

1.4 Recent Change

The corresponding Recent Change View for this form is 8.5.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SERVICE CLASS

Description: Enter the Service Class. Service Classes are categorized as either Line or Trunk classes.

Required Field.

Valid LINE CLASS Entries

Entry	Definition
ATND	Attendant DN.
B911	Basic 911 Emergency Service Bureau.
CALLBK	Trunk and Line Work Station Call Back Line.
CHGCALL	Charge-a-Call Line.
COIN	Coin Line.
HOTMOTL	Line with Hotel/Motel features.
HOTPBX	Line with Hotel/Motel and PBX features.

Copyright © 2003 Lucent Technologies

INDIV	Individual Line.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Line .
ISDN	Software Release: 5E3 and later. Digital Subscriber Line.
LTPCLBCK	Recent Change only. See CALLBK for definition.
MODEM	Software Release: 5E3 and later. Packet Switching Modem Pooling.
PBX	Line with PBX features.
RCDM	Software Release: 5E7 and later. Recent Change Delayed Message.
SATSTLN	Stand-alone test line for RSM and Local SM use.
TEST	Test Line.
TWOPTY	Two Party Line.
2PTY	2 Party Multi-Frequency Ringing.
4PFS	4 Party Full-Selective.
4PSS	4 Party Semi-Selective.
4WINDIV	Software Releaser: 5E3 and later. 4-Wire Individual.
5PTY	5 Party Multi-Frequency Ringing.
8PSS	8 Party Semi-Selective.
10PTY	10 Party Multi-Frequency Ringing.

Valid TRUNK CLASS Entries

Entry	Definition
ACJCK	Incoming From TLWS (Trunk and Line Work Station) for AC Testing.
ATNDVFY	Software Release: 5E8 and later. Remote Busy Verify. Allows the ISDN Attendant the ability to verify lines on remote 5ESS Switches by way of BVTs (Busy Verify Trunks). The lines on the remote Switch may be busy verified only if they are associated to an incoming ISAT BVT. For information on how various TNs are associated, see Division 2, Section 1T.
BUSYVFY	Incoming From Switchboard or TSPS.
CAMAANI	Incoming CAMA ANI Trunks.
CAMAONI	Incoming CAMA ONI Trunks.
DIOR	Software Release: 5E6 and later. Direct International Origination.
EDSL	Extended Digital Subscriber Line trunks.
EDSLHM	Extended Digital Subscriber Line hotel/motel service to TSPS.
FIOPR	Software Release: 5E4(2) and later. Intermediate Switch Point for incoming operator trunk.
IC	Interexchange Carrier.
IDCS	Software Release: 5E9(1) and later. Inter-DCS (Digital Cellular Switch) trunk.
INAISTRK	Software Release: 5E6(2) and later. Incoming Intercept Trunk using an EIS (External Information System) database.
LATA	Intertoll Trunks from a LATA.
LTOLLCON	Toll Connecting Trunk - Local Office End.
PF	Private Facility Trunk.
PFITT	Software Release: 5E3 and later. Private Facility Intertandem Trunk.
PFLASH	Private Facility Trunk with FLASH.
PRINTOLL	Primary Intertoll.
RMSD3	Software Release: 5E4(2) and later. TAT connected to a RMSD3.
SCINTOLL	Secondary Intertoll.
SPAB800	Software Release: 5E5 and later. Special Access Basic 800 Service.
SPAM800	Software Release: 5E5 and later. MEGACOM 800 Service.
SPAMEG	Software Release: 5E5 and later. MEGACOM service.
SPAWATS	Software Release: 5E5 and later. Special Access WATS service.
TOLLOPER	Incoming From Toll Switchboard.
TOPAS	Software Release: 5E4(2) and later. TAT connected to TOPAS.
TSTK	LTD, Incoming or Outgoing.
TTOLLCO	Toll Connecting - Toll Office End.

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E6(2) and later, when a TIMING form is submitted with a SERVICE CLASS of "INAISTRK", at least one TKGRP form must be submitted with a TRKCLS of "INAISTRK".

For 5E7 and later, if SERVICE CLASS is "RCDM", then
- SIGNAL TYPE must be "DP" or "TT"
- START SIGNAL must be "NONE"

and the following fields default to recommended values that may be changed if desired:

CRITICAL TIMING defaults to "4"
- PARTIAL DIAL TIMING defaults to "20"
- PERMANENT SIGNAL TIMING defaults to "20"
- OVERLOAD PARTIAL DIAL defaults to "10"
- OVERLOAD PERM. SIGNAL defaults to "10"

For 5E8 and later, if SERVICE CLASS is equal to "ATNDVFY", START SIGNAL must equal "WINK", and SIGNAL TYPE must equal "MF".

For 5E9(1) and later, if SFID ACT 130 is "N" on the SFSYS form (5713-1 Record), SERVICE CLASS may not be "IDCS". If SERVICE CLASS is "IDCS", SIGNAL TYPE must be "MF" or "TT". Additionally, the following fields must be set within the valid ranges. When a field is left blank, the system will set it to the specified default value.

Service Class "IDCS"

Field	Range	Default
CRITICAL TIMING	2 - 5	4
PARTIAL DIAL TIMING	4 - 12	4
PERMANENT SIGNAL TIMING	4 - 12	5
OVERLOAD PARTIAL DIAL	4 - 12	4
OVERLOAD PERM SIGNAL	4 - 12	5

2.3 * START SIGNAL

Description: Enter the Start Signal Type.

Required Field.

Valid LINE CLASS START SIGNAL Entries

Entry	Definition
NONE	No start signal for lines, revertive pulse trunks, and CCS trunks.
WINK	Wink Start.
WNKDT	Software Release: 5E3 and later. Wink Start and Dial Tone. Used in the Defense Switched Network.
DLTN	Dial Tone.

Data Rules:

For any LINE Service Class, with the exception of "4WINDIV", the only valid entry is "NONE".

For a LINE Service Class of "4WINDIV", the valid entries are "WINK", "WNKDT", and "DLTN".

Valid TRUNK CLASS START SIGNAL Entries

Entry	Definition
ANSDTONE	Software Release: 5E4(2) and later. Answer Supervision/Dial Tone. Provide answer supervision along with dial tone start signal on incoming trunks when the 5ESS Switch is configured as a PBX.
DLAY	Delay Dial.
DLTN	Dial Tone.
IMED	Immediate Start.

Copyright © 2003 Lucent Technologies

NONE	No start signal for lines, revertive pulse trunks and CCS trunks.
WINK	Wink Start.
DIRC	Incoming Direct Connect Trunk.
GRND	Ground start supervision FX trunk.
LOOP	Loop start supervision FX trunk.
WNKDT	Software Release: 5E3 and later. Wink start and dial tone. Used in the Defense Switched Network.

ANSDTONE:

- "ANSDTONE" is only valid with a SERVICE CLASS of "PF".
- SIGNAL TYPE must be "DP", "MF" or "TT".

DIRC:"DIRC" is valid with SERVICE CLASS of "PF", "PFLASH", "PFITT", "LTOLLCON", or "INAISTRK". When START SIGNAL is "DIRC", then SIGNAL TYPE must be "NONE"; for 5E9(1) and later, SIGNAL TYPE must be "DP", "MF", "TT" or "NONE".

GRND and **LOOP**: "GRND" and "LOOP" START SIGNALS are valid only if SERVICE CLASS is a trunk class value of "PF" or "PFLASH".

NONE: When SERVICE CLASS is "LATA": if Signal Type is "MF", START SIGNAL must be "WINK"; if Signal Type is "ISUP7", START SIGNAL must be "NONE".

A SERVICE CLASS of "EDSL" or "EDSLHM" must have a START SIGNAL of "NONE".

WINK: A Service Class of "IC", "RMSD3" or "TOPAS" must have a Start Signal of "WINK". For Software Release 5E5 and earlier, a Service Class of "LATA" must also have a Start Signal of "WINK".

A SERVICE CLASS of "SPAWATS" or "SPAMEG" must have a START SIGNAL of "WINK", "DLTN" or "IMED".

A SERVICE CLASS of "SPAB800" or "SPAM800" must have a START SIGNAL of "WINK", "DLAY" or "IMED".

For 5E6(2) and later, START SIGNAL must be "WINK", "DLAY", "IMED", or "DIRC", if SERVICE CLASS IS "INAISTRK".

2.4 * SIGNAL TYPE

Description: Enter the Signal Type.

Required Field.

Valid LINE SERVICE CLASS SIGNAL TYPE Entries

Entry	Definition
DP	Dial Pulse.
TT	Touch-Tone.
DCHN	Software Release: 5E3 and later. D-Channel signaling for Digital Subscriber Lines

Data Rules:

The only valid entry for a LINE SERVICE CLASS code of "4WINDIV" is "TT".

DCHN: For 5E3 - 5E5, "DCHN" is valid only with SERVICE CLASS "ISDN" and "ISATND".

For 5E6 and later, it is also valid for SERVICE CLASS "EDSL" and "EDSLHM". START SIGNAL must be "NONE". All LINE SERVICE CLASSES, with the exception of "4WINDIV", the valid entries are "DP", "TT", and "DCHN".

Copyright © 2003 Lucent Technologies

Valid TRUNK CLASS SIGNAL TYPE Entries	
Entry	**Definition**
DP	Dial Pulse.
MF	Multifrequency.
NONE	No Inpulsing for direct connect trunks.
RPEO	Revertive Pulsing to End Office.
RPTO	Revertive Pulsing to Tandem Office.
TT	Touch-Tone.

Signal types "RPEO" and "RPTO" are valid only with SERVICE CLASS "LTOLLCON" and START SIGNAL must be "IMED".

When SIGNAL TYPE is "NONE", then START SIGNAL must be "DIRC".

A SERVICE CLASS of "IC", "LATA", "RMSD3" or "TOPAS" must have a SIGNAL TYPE of "MF".

A SERVICE CLASS of "SPAWATS", "SPAMEG", "SPAB800" or "SPAM800" must have a SIGNAL TYPE of "MF", "DP" or "TT".

A SERVICE CLASS of "PF" or "PFLASH" must have a SIGNAL TYPE of "DP", "MF", "TT" or "NONE".

A SERVICE CLASS of "PFITT" must have a SIGNAL TYPE of "DP", "ISUP7", "MF", "TT" or "NONE".

A SERVICE CLASS of "LATA" must have a SIGNAL TYPE of "ISUP7" or "MF".

A SERVICE CLASS of "EDSL" or "EDSLHM" must have a SIGNAL TYPE of "DCHN" or "NONE".

For 5E6(2) and later, the SIGNAL TYPE must be "MF", "DP", or "NONE", if the SERVICE CLASS is "INAISTRK"

2.5 CRITICAL TIMING

Description: Enter the Critical Timing interval in seconds. Critical timing is used between dialed or in-pulsed digits where a timeout would cause digit analysis to provide a Specified Feature Treatment (PDIT form) or Code Conflict Treatment (LDIT form).
Valid Entries: 2 - 5 (seconds)

Data Rules:

For 5E8 and earlier, the CRITICAL TIMING value must be at least two seconds less than the PARTIAL DIAL TIMING.

2.6 PARTIAL DIAL TIMING

Description: Enter the partial dial timing interval in seconds. PARTIAL DIAL TIMING is used under normal conditions. OVERLOAD PARTIAL DIAL is used when an office is in an overload condition. Either PARTIAL DIAL TIMING or OVERLOAD PARTIAL DIAL will be in effect at one time. An office would not have both in use at the same time.

Required Field.
Valid Entries: 2 - 120 (seconds)

2.7 PERMANENT SIGNAL TIMING

Description: Enter the permanent signal timing interval in seconds. PERMANENT SIGNAL TIMING is used under normal conditions. OVERLOAD PERM. SIGNAL is used when an office is in an overload condition. Either PERMANENT SIGNAL TIMING or OVERLOAD PERM. SIGNAl will be in effect at one time. An office would not have both in use at the same time.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 2 - 120 (seconds)

2.8 OVERLOAD PARTIAL DIAL

Description: Enter the partial dial timing interval under office overload conditions. Partial dial timing is used under normal conditions. OVERLOAD PARTIAL DIAL is used when an office is in an overload condition. Either PARTIAL DIAL TIMING or OVERLOAD PARTIAL DIAL will be in effect at one time. An office would not have both in use at the same time.

Required Field.
Valid Entries: 2 - 120 (seconds)

2.9 OVERLOAD PERM. SIGNAL

Description: Enter the permanent signal timing interval when the office is in an overload condition. PERMANENT SIGNAL TIMING is used under normal conditions. OVERLOAD PERM. SIGNAL is used when an office is in an overload condition. Either PERMANENT SIGNAL TIMING or OVERLOAD PERM. SIGNAL will be in effect at one time. An office would not have both in use at the same time.

Required Field.
Valid Entries: 2 - 120 (seconds)

SEC. 5U: 5521 RECORD
TOPAS CLLI CODE IDENTIFICATION FORM - CLLI

1. GENERAL

The 5521 Record is available with 5E4(2) and later Software Releases. The TOPAS CCLI Code Identification form is used by toll offices that employ the TOPAS (Testing, Operations, Provisioning and Administration System) Operations System. The TOPAS Operations System provides circuit order and testing administration for circuits terminating on a 5ESS Switch in the AT&T Network.

A single 5521 Record is required to define the 5ESS Office CLLI (Common Language Location Identification) Code; and an additional 5ESS Switch 5521 Record is required for each Remote Switch Module, that has a unique CLLI Code, linked to the host at the local 5ESS Switch Office.

1.1 Recent Change View

There is no corresponding Recent Change View for this form.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * SM TYPE

Description: Enter the type of Switching Module site that is being identified.

Required Field.

Valid SM TYPE Entries

Entry	Definition
LSM	An identifier for all the Switching Modules located within the local 5ESS Switch Office. There must be only one CLLI form with "LSM" entered in the SM TYPE field.
RSM	An identifier for each Remote Switch Module, that has a unique CLLI code, linked to the host at the local 5ESS Switch Office.

2.3 (*) RSM NBR

Description: Remote Switching Module number.
Valid Entries: 1 - 174

Data Rules:

If "LSM" was entered in the SM TYPE field on this input form, the RSM NBR field must not be entered. If "RSM" was entered in the SM TYPE, then a value must be entered in the RSM NBR field.

The value entered must be defined in the RSM SITE field on the EQIM Form (5700-1 Record).

2.4 # CLLI CODE

Description: Enter the local CLLI Code if the SM TYPE field on this form was set to "LSM". Enter the CLLI Code assigned at the Remote Switching Module if the SM TYPE field on this form was set to "RSM". The entry must be six alphabetic characters followed by five alphanumeric characters. The following example illustrates a valid entry for the CLLI CODE field.

CLLI CODE Example

Definition	Entry	Description
ENTITY	"CG8"	Control Group 8

Copyright © 2003 Lucent Technologies

BUILDING	"PT"	Peach Tree
STATE	GA	Georgia
PLACE	"ATLA"	Atlanta

Required Field.
Valid Entries: 11 characters

SEC. 5W: 5523 RECORD
ODA OPTIONS - ODAOPT

1. GENERAL

The 5523 Record is available with 5E2 and later Software Releases. The ODA options form must be completed for a 5ESS Switch. It is used to supply miscellaneous ODA options and parameters for Retrofits or Large Terminal Growth.

The 5523 Record is provided as a reproducible record that may optionally be used. However, if this record is requested in the ODA database using the "records" command, the screen image of the input form will be printed instead of a tabularized record.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * KEY

Description: Enter the key value.

Required Field.
Default: For 5E7 and later: 0
Valid Entries: 0

2.3 TRANSITIONAL LINE PIC

Description: Enter the Carrier Identification Number to be assigned during ODA to each line in the office as its PIC (Presubscribed InterLATA Carrier) if the line does not have a PIC assigned in the PIC field on the defining form and the CIDIAL field on the defining form is not set to "REQ", or "TREQ".

For 5E2, the defining form can be a LINE form (5109-1 Record), or a MLHLN form (5111-1 Record).

For 5E3 and 5E4(2), the defining form can be a LINE form, a MLHLN form, a DSL form (5900-2 Record), or a DSMLHLN form (5901-2 Record).

For 5E5, the defining form can be a LINE form, a MLHLN form or a DSLUSR form (5908-2 Record).

Software Release: 5E5 and earlier
Valid Entries: 0 - 999

Data Rules:

If this field is entered, the value must be defined in the CARRIER ID field on an ICF form (5305 Record).

2.4 # PBX DID CONVERSION

Description: Should PBX DID hundreds groups currently defined in blocks of one hundred consecutive TNs on LINE forms with a common RTI be reassigned to a HGRPAS form (5115 Record)?

This field is applicable to retrofit offices converting to 5E2 through 5E6 and all large terminal growth offices.

The PBX DID conversion has been developed to reassign PBX DID hundreds groups that were assigned on LINE forms prior to the introduction of the HGRPAS form. Conversions requested will be automatically

Copyright © 2003 Lucent Technologies

executed at the time of the first crosscheck run. A report listing all the hundred groups converted will be generated by the conversion process. This DID converted report can be accessed using the "list" command.

Software Release: 5E6 and earlier
Required Field.
Valid Entries: Y, N

2.5 HUNDREDS GROUP SM ROUTING ASSIGNMENT

Description: Enter the option for preserving Routing Module assignments indicated on HGRPAS forms.

This field is directly related to the SAVE field on the HGRPAS form. The HGRPAS form allows the assignment of a Circuit Routing Module and/or a Packet Routing Module to a specific Hundreds Group. If none of the Hundreds Groups, or only a subset of the Hundreds Groups within the 5ESS Switch (as opposed to all the Hundreds Groups), are assigned a Circuit Routing Module and/or a Packet Routing Module, the 5ODA software will apply a series of algorithms to assign a Circuit Routing Module and/or a Packet Routing Module to those Hundreds Groups without assignment.

The series of algorithms assign a Routing Module based on the physical terminations of Telephone Numbers within the Hundreds Group. The first choice for a Routing Module would be the SM in which the most TNs, within the Hundreds Group, physically terminate. This would optimize call processing performance and reduce memory usage.

If all the Telephone Numbers within a Hundreds Group physically terminated on RSMs, ORMs, or TRMs within the same Remote Site, one of the RSMs, ORMs, or TRMs would be the choice for the Routing Module.

The SAVE field on the HGRPAS form is used to indicate if the Circuit Routing Module, or Packet Routing Module, or both, assigned to a particular Hundreds Group, are to be saved for an office undergoing a Retrofit or a Large Terminal Growth.

Software Release: 5E5 and later
Valid Entries:

Valid HUNDREDS GROUP SM ROUTING ASSIGNMENT Entries

Entry	Definition
REALLOCATE or R	5ODA will apply the series of algorithms to every Hundreds Group in the 5ESS Switch. 5ODA will completely ignore the existing Routing Module assignments.
PARTIAL or P	ODA will apply the series of algorithms only to those Hundreds Groups associated with either no entry, or an entry of "NONE" in the SAVE field on HGRPAS forms. If the SAVE field has an entry of "CKT", "PKT", or "BOTH", that existing assignment will be preserved.
PRESERVE or S	5ODA will not apply the series of algorithms to any Hundreds Groups in the 5ESS Switch regardless of the SAVE entries on HGRPAS forms. Every existing assignment will be preserved.

Data Rules:

This field must be entered for an office undergoing a Retrofit or a Large Terminal Growth, but must not be entered for a new office.

If "PARTIAL" is entered in this field, at least one HGRPAS form must be submitted where at least one SAVE field has a value of "CKT", "PKT", or "BOTH".

2.6 MULTIWAY 3WAY CONSTRUCTED FEATURE

Description: Enter the name of a constructed feature with MULTIWAY CONTROL equal to "3WAY" that the office plans to replace with the standardized /MWCTIA4 feature (MULTIWAY CONTROL equals "3WAY" on the MWFD form (5602-1/2 Record)). Since this is a required field, if a feature name does not

Copyright © 2003 Lucent Technologies

need to be entered, enter the word "NONE".

The /MWCTIA4 preconstructed feature on the MWFD form has existed in two ways, with MULTIWAY CONTROL equal to "3WAY" or "AUTO3WAY". For retrofits, if an office has previously come in with /MWCTIA4 MULTIWAY CONTROL equal to "3WAY", was forced to change to "AUTO3WAY" and built a new constructed feature with "3WAY" to maintain functionality, this field will help the office to convert that new constructed feature back to the standardized /MWCTIA4. A new preconstructed feature /MWCTIA5 is identical to /MWCTIA4, except that MULTIWAY CONTROL is equal to "AUTO3WAY".

Two crosschecks will be run using this new field. The first crosscheck will compare the constructed feature to /MWCTIA4 and specify any discrepancies so that office is assured of maintaining functionality following the change. The second crosscheck will identify all assignments of the constructed feature in the database. Using the output from this crosscheck, the office (or the ODA Project Consultants, at the office's request) can manually change some or all of the assignments of the constructed feature to /MWCTIA4.

Software Release: 5E7 and later
Required Field.
Valid Entries: Any valid constructed feature name (not beginning with a /) or NONE

2.7 ASP DEFAULT ROUTE INDEX

Description: Enter the default ASP route index for 3/6/10-N11 trigger definitions in digit analysis transalations. When an ASP trigger is assigned on an IDDD, LDIT, MLDIT or RDIT form and no OFFICE CODE or ROUTE INDEX is entered, the entry for this ASP DEFAULT ROUTE INDEX field is used as the ROUTE INDEX.

This ROUTE INDEX will then be used when an attempt is made to route to the DN specified as the 3/6/10-N11 trigger, either if the ASP trigger is deactivated or if the SCP routes the call back to the DN after the query.

Software Release: 5E8 and later
Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

2.8 HAVE THE DIALING PLANS FOR ASP USERS BEEN REVIEWED?

Description: Have you reviewed your dialing plans for ASP users?

Software Release: 5E9(1)
Required Field.
Default: N
Valid Entries: Y, N

SEC. 5Y: 5525 RECORD
NETWORK CLOCK 2 REFERENCE FORM - NCLKREF

1. GENERAL

The 5525 Record is available with 5E2 and later Software Releases and is used to define the exterior references for the NCLK2 (Network Clock Model 2). This form is required for 24-channel exterior references for NCLK2 (clock type of "24CHAN2"on the EQCORE input form).

1.1 Recent Change View

The corresponding Recent Change view for this form is 17.16.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * REFERENCE

Description: Enter the external reference number.

- ***NOTE:*** REFERENCE number in a CM2 (Communication Module Model 2) office can not be reused. Each value must be unique. Also, at most, 8 of these forms can be entered for CM3 (Communication Module Model 3).

Required Field.
Valid Entries: 1 - 8

Data Rules:

If a 24-channel NCLK2 is used (CLOCK TYPE of "24CHAN2" on the EQCORE input form), then only reference values 1 - 4 can be used with the following restrictions:

For 5E14 and earlier:

- A REFERENCE TYPE of "ANALOG" can be used for references 1 and 3.
- A REFERENCE TYPE of "24CHAN" can be used on any reference 1 - 4.

For 5E15 and later:

The EQCORE form (5701 Record) must be inserted before this form can be inserted/updated.

When this form exists with a REFERENCE value of 1 or 0, and a REFERENCE TYPE of "ANALOG", and CLOCK TYPE on the EQCORE form is "NCLK3", then this same REFERENCE value with REFERENCE TYPE of "ANALOG10" must not exist. Either one or the other of these NCLKREF forms with the same REFERENCE value can exist, but not both.

2.3 *REFERENCE TYPE

Description: Enter the reference type used.

Valid REFERENCE TYPE Entries

Entry	Definition
30CHAN	30-channel reference

Copyright © 2003 Lucent Technologies

64K	64 Kilobytes reference
24CHAN	24-channel reference
ANALOG	Analog reference (2.048mHz)
ANALOG10	Analog reference (10mHz)

Data Rules:

For 5E15 and later:

When REFERENCE TYPE is "ANALOG" or "ANALOG10" , REFERENCE FORMAT must not be entered.

When REFERENCE TYPE is "24CHAN", the REFERENCE FORMAT must be "D4B8", "DAWOZ", "D4WZC", "FEB8", "FEWOZ", or "FEWZC".

When REFERENCE TYPE is "64K", REFERENCE FORMAT must be "AMI64K".

When REFERENCE TYPE is "30CHAN", REFERENCE FORMAT must be "AMI" or "HDB3".

When REFERENCE TYPE is "ANALOG", "ANALOG10", or "64K" and CLOCK TYPE is "NCLK3", then REFERENCE must be 1 or 2.

2.4 #CLOCK TYPE

Description: This field is used to indicate the type of Network Clock being used.
Valid Entries:

Valid CLOCK TYPE Entries

Entry	Definition
24CHAN2	24-channel DS1 format T1 trunk
NCLK3	NCLK3 NetworkClock
SANC3	NCLK3 Stand-alone
STDALNE2	NCLK2 Stand-alone

Data Rules:

For 5E15 and later:

When an office is equipped with CM3, CLOCK TYPE must be "NCLK3" or "SANC3".

When an office is equipped with CM2, CLOCK TYPE must be "24CHAN2" or "STDALNE2".

When CLOCK TYPE is "24CHAN2", REFERENCE TYPE must be "ANALOG" or "24CHAN".

When CLOCK TYPE is "24CHAN2", and REFERENCE TYPE is "24CHAN", REFERENCE can only be 1 through 3.

When CLOCK TYPE is "24CHAN2", only REFERENCE 1 can have a REFERENCE TYPE of "24CHAN".

When CLOCK TYPE is "STDALNE2", REFERENCE TYPE must be "ANALOG" or "24CHAN".

When CLOCK TYPE is "STDALNE2", EQUIPMENT STATUS must not be "O".

When CLOCK TYPE is "NCLK3", only REFERENCE 1 or 2 can have a REFERENCE TYPE of "ANALOG", "ANALOG10", or "64K".

When CLOCK TYPE is "SANC3", EQUIPMENT STATUS must not be "O".

2.5 #PRIORITY

Description: Enter the priority of the external reference. The primary reference has a value of 1, the

Copyright © 2003 Lucent Technologies

second priority reference has a value of 2, and so forth until all references have been assigned.
Valid Entries: 1 - 8

2.6 EQUIPMENT STATUS

Description: Enter the equipment status. For new offices and units destined for factory testing, operational is the only allowed value. During off-line ODA database retrofits, the other values are valid.

Valid EQUIPMENT STATUS Entries

Entry	Definition
O	Operational
G	Growth
U	Unequipped

Data Rules:

For 5E15 and later:.

When EQUIPMENT STATUS is "O", INTERRUPT STATUS must be allowed.

When EQUIPMENT STATUS is "U", INTERRUPT STATUS must be inhibited.

2.7 INTERRUPT STATUS

Description: Enter the Interrupt Status.

Required Field.
Default: ALLOW
Valid Entries:

Valid INTERRUPT STATUS Entries

Entry	Definition
ALLOW	Allow interrupts
INHIBIT	Inhibit interrupts

Data Rules:

If EQUIPMENT STATUS is "O", INTERRUPT STATUS must be "ALLOW". If EQUIPMENT STATUS IS "U", INTERRUPT STATUS must be "INHIBIT".

2.8 REFERENCE FORMAT

Description: Enter the format of the reference.
Default: D4WOZ
Valid Entries:

Valid REFERENCE FORMAT Entries

Entry	Definition
AMI64K	64K-composite signal AMI.
D4WOZ	D4 without Zero Code Suppression
D4B8	D4 with Bipolar 8 Zeros Suppression
D4WZC	D4 with Zero Code Suppression
FEWOZ	Extended Framing Format without Zero Code Suppression
FEB8	Extended Framing Format with Bipolar 8 Zeros Suppression
FEWZC	Extended Framing Format with Zero Code Suppression
AMI	30-channel Alternate Mark Inversion
HDB3	30-channel High Density Bipolar with 3 Zeros Substitution

Data Rules:

If REFERENCE TYPE is "24CHAN", valid entries are "D4WOZ", "D4B8", "D4WZC", "FEWOZ", "FEB8", and "FEWZC".

SEC. 5AC: 5529 RECORD
ANNOUNCEMENT APPLICATION SM LIST FORM - ANNAPL

1. GENERAL

The 5529 Record is available with 5E4(2) and later Software Releases.

This record is used to enter the SMs (Switching Modules) where the DSU2-RAFs (Digital Service Unit Model 2 - Recorded Announcement Function) reside as well as the type of application announcements supported by that DSU2-RAF.

NOTE: The specific APPLICATION must be entered before Standard Input Data is provided by ODA for the associated ANNHD form (5531 Record), ANNTR form (5533 Record), and/or ANNDG form (5532 Record).

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.64.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control group Number and the Office Name on each record.

2.2 * APPLICATION

Description: Enter the type of application which corresponds to an SM.

An entry of "LASS" is necessary to use the Limited 2-Level COT/AC (Customer Originating Trace/Automatic Callback) Secured Feature Announcements. Refer to Division 2, Section 4A for details.

Required Field.

Valid APPLICATION Entries

Entry	Definition
2LEVEL or 2	Software Release: 5E7 and later. 2-Level COT and AC (Customer Originated Trace and Automatic Callback).
ACSR or A	Software Release: 5E5 and later. Automatic Customer Station Rearrangement.
ASP or AS	Software Release: 5E8 and later. ASP (Advanced Services Platform)
L[2 - 7]	Software Release: 5E9(1) and later. The OSPS Non-English Application type used to map the English phrase ID to the non-English phrase ID. L2 - L7 are defined on the LANGTBL (5483-2 Record) and correspond to the non-English language designated by the DISPLAY ID field.
LASS or L	Software Release: 5E6 and later. LASS (Local Area Signaling Services) Selective Features Screen List Editing.
NPA_SP	Software Release: 5E13 and later. Numbering Plan Area Split Announcement.
OSPSDA or D	Software Release: 5E4(2) and later. OSPS Directory Assistance.
OSPSTA or T	Software Release: 5E4(2) and later. OSPS Toll and Assistance.
RAS or R	Software Release: 5E5 and later. Remote Access Service.
VARRAF	Software Release: 5E13 and later. Variant Recorded Announcements Function

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E8 and later, if at least one ANNAPL form has an APPLICATION that is not
- "OSPSDA"
- "OSPSTA"
- "L2 - 6"

then at least one EQIM form must have OSPS PM set to "N".

For 5E11 and later, when APPLICATION does not equal "2LEVEL", "ASP", "LASS", "TACCT", (for 5E13 and later) "NPA_SP", or "VARRAF", then at least one ANNHD form (5531 Record), ANNDG form (5532 Record), and the ANNTR form (5533 Record) must be submitted for the same announcement application.

For 5E13 and later, when APPLICATION is "2LEVEL", "LASS", or "NPA_SP, at least one ANNHD form (5531 Record) and ANNDG form (5532 Record) must be submitted for that APPLICATION.

WARNING: For 5E13 and later, when APPLICATION is "OSPSDA", "OSPSTA", "RAS", "ACSR", "LASS", "2LEVEL", "ASP", or "NPA_SP", there must be one TKGRP form (5202 Record) with a corresponding SVC GRP value listed in the following table.

APPLICATION ENTRY	TKGRP FORM SVC GRP ENTRY
OSPSDA	DA
OSPSTA	ACCS or COIN
RAS	RAS
ACSR	ACSR or RAS
LASS	RAS
2LEVEL	RAS
ASP	ASP
NPA_SP	RAS

2LEVEL - For 5E7 and later, if the APPLICATION is "2LEVEL", then at least one associated ANNHD form and one ANNDG form must exist.

ACSR / RAS - For 5E5 and later, if the APPLICATION is "ACSR" or "RAS", then at least one associated ANNHD form (5531 Record), ANNTR form (5533 Record), and ANNDG form (5532 Record) must be entered.

ASP
For 5E6 and later, if the APPLICATION is "ASP", then at least one associated ANNHD form (5531 Record) must exist. Associated ANNTR forms (5533 Record) may exist. No associated ANNDG forms (5532 Record) will exist.

LASS
For 5E6 and later, if the APPLICATION is "LASS", then at least one associated ANNHD form and one ANNDG form must exist.

OSPSDA / OSPSTA
For 5E7 and later, if APPLICATION is "OSPSDA" or "OSPSTA", then OSPS PSM must be "Y" on at least one EQIM form.

VARRAF
For 5E13 and later, when APPLICATION is "VARRAF" at least one ANNHD form (5531 Record) must be submitted for the same announcement application.

2.3 LOG UPDATE

Description: This field is used only by Recent Change.

Software Release: 5E6 and later

Copyright © 2003 Lucent Technologies

2.4 SWITCHING MODULES

Description: Enter the 3-digit SMs.
Valid Entries: 1 - 192

Data Rules:

The list of SMs must contain at least one entry. Each SM in the list must be unique. Up to 25 SMs may be used per application.

For 5E8 and later, if a RAF on an SM is defined on the EQRA form, it must be assigned to an application on an ANNAPL form. Also, an entry in this field must have a RAF on that SM defined on an EQRA form.

SEC. 5AD: 5530 RECORD
MSU/MMSU SCAN POINT ASSIGNMENT FORM - MSUSP

1. GENERAL

The 5530 Record is applicable to 5E2 and later Software Releases, and is used to define the MSU/MMSU (Metallic Service Unit/Modular Metallic Service Unit) Scan Points.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MSU/MMSU SCAN POINT

Description: Enter the MSU/MMSU Scan Point Number. Refer to Division 8, Section 1 for procedures to obtain these assignments.

This is a 9-digit number in the following format.

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-48 (CM1)
			1-192 (CM2)
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Scan Point Number	SPN	XX	00-31

Required Field.
Valid Entries: 9 digits

Data Rules:

The value must be unique within the 5ESS Switch.

The pack must be defined on an EQMSP or an EQMMSP form (5750 Record) with TYPE set to "SCAN".

2.3 SCAN POINT TYPE

Description: Enter the Scan Point Type.

Required Field.

Valid SCAN POINT TYPE Entries

Entry	Definition
BDOCPWR	Broadcast Dynamic Overload Control Power
MISC	Miscellaneous Alarm
MSUPWR	MSU Power
NMFPWR	Network Management Frame Power
R13A	13A Recorded Announcement and 14A Recorded Announcement

Copyright © 2003 Lucent Technologies

Data Rules:

For 5E3 and later, if this field is "R13A", then "MJOP" or "MNOP" are the only valid entries for NORMAL STATE.

2.4 ACTION

Description: Enter the Action to be taken by the 5ESS Switch during a failure.

Required Field.

Valid ACTION Entries

Entry	Definition
IGN	Ignore; no action of any type is to be taken.
REP	Report a failure. A message will be printed at the Master Control Center.
CON	Condition. When "CON" is entered, the associated line or trunk will be taken out of service. Under normal conditions, only R13A scan points may require a value of "CON" to allow conditioning of 13A and 14A announcement unit ports.

2.5 NORMAL STATE

Description: Enter the type of facility assigned to this alarm.

Required Field.

Valid NORMAL STATE Entries

Entry	Definition
MJOP	Major Alarm. Scan Point normally open (unsaturated).
MJCL	Major Alarm. Scan Point normally closed (saturated).
MNOP	Minor Alarm. Scan Point normally open (unsaturated).
MNCL	Minor Alarm. Scan Point normally closed (saturated).
MAJGA	Major Group Alerting circuit. This feature provides a means of alerting a group or several groups of subscribers for the purpose of disseminating an alert message.
MINGA	Minor Group Alerting circuit.
ANCB	Analog channel bank.
DTCB	Digital channel bank.
PG	Pair gain.
SLC	Subscriber line concentrator.

2.6 IN USE

Description: Is this Scan Point operational?
Valid Entries: Y, N

Data Rules:

For 5E8 and later, this field can be entered only for SCAN POINT TYPEs "MISC" and "R13A"; for all other types it must be blank.

2.7 DUPLEX SCAN POINT

Description: Scan Points may be duplicated for certain Circuit Types. If this is a Duplex Scan Point, enter the MSU/MMSU Duplex Scan Point Number. If it is a Simplex Scan Point, leave this field blank.

Refer to Division 8, Section 1 for procedures to obtain these assignments.

The field consists of a 9-digit number in the following format.

SCAN POINT NUMBER

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-48
			(CM1)
			1-192

Copyright © 2003 Lucent Technologies

			(CM2)
Metallic Service Unit	MSU		0-1
Service Group	SVG	X	0-1
Board	BRD	XX	00-15 (Regular MSU)
			00-31 (Modular MSU)
Scan Point Number	SPN	XX	00-31

Valid Entries: 9 digits

Data Rules:

If a value is entered, the Service Group (fifth digit) must not be the same as the Service Group (fifth digit) in the MSU/MMSU SCAN POINT value.

If a value is entered, the SM (first three digits) must be the same as the SM (first three digits) in the MSU/MMSU SCAN POINT value.

2.8 SIDE

Description: Enter the Scan Point side.
Valid Entries: 0 or 1

Data Rules:

If the SCAN POINT TYPE is "BDOCPWR", "MSUPWR" OR "NMFPWR", a value must be entered in this field; otherwise leave this field blank.

2.9 LABEL

Description: Enter the name of the alarm as it should appear on the MCC (Master Control Center).
Valid Entries: 5E9(2) and earlier: 11 characters
- 5E10 and later: 25 characters

Data Rules:

A value must be entered if the SCAN POINT TYPE is "R13A" or "MISC"; otherwise leave this field blank.

PORT CONDITIONING

The following fields (Section 2.10 - Section 2.14) are used to describe the port which the scan point conditions. These fields are used only when ACTION is equal to "CON".

2.10 TN

Description: Enter the Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The TN entered here must be defined on a LINE form (5109 Record). If a value is entered in this field, then MLHG/TERM and TGN/MEMB must be blank.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the MSUSP form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or

Copyright © 2003 Lucent Technologies

the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.11 MLHG

Description: Enter the Multi-Line Hunt Group Number.
Valid Entries: For 5E14 and earlier: 1 - 2000

For 5E15 and later: Blank or 1 - 8191

Data Rules:

The MLHG/TERM entered must be defined on an MLHLN form (5111 Record). If a value is entered in this field, then the TERM field must also be entered and TN, TGN and MEMB must be blank.

2.12 TERM

Description: Enter the MLHG Terminal Number.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

2.13 TGN

Description: Enter the Trunk Group Number.
Valid Entries:

- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

A value is allowed for TGN to describe the port, which the scan point conditions, only if ACTION is equal to "CON". If a value is entered in this field, then the MEMB field must also be entered and the TN, MLHG and TERM must be blank. The TGN/MEMB entered must be defined on a TRUNK form (5204 Record).

2.14 MEMB

Description: Enter each Member Number in the Trunk Group.
Valid Entries: 0 - 1951

SEC. 5AE: 5531 RECORD
ANNOUNCEMENT HEADER PHRASE LIST FORM - ANNHD

1. GENERAL

The 5531 Record is available with 5E3 and later Software Releases. This record lists the phrases, in the required order, to be associated with an announcement header. An announcement header enables a group of phrases (comprising an announcement) to be accessed with a "header identification number."

The header identification is mapped to a set of phrase identification commands which specify either to concatenate a phrase identification or to insert a digit string at that point in the announcement. For example, a typical announcement header is "The number is . . . ," followed by a directory number given twice in succession. The "language" portion is a phrase or phrases, which are ordered in the PHRASE list on this form. Each PHRASE is defined on a PHRASE form (5534 Record). The pattern for the Directory Number is defined in an ANNDG form (5532 Record).

NOTE: The specific APPLICATION must be entered on the associated ANNAPL form (5529 Record) before the default input data will be provided for this form.

1.1 Default Data

For 5E5 and later Software Releases, a standard set of default data is provided by the ODA system. Normally, no data need be entered, with the exception that customers using customized packs may need to enter data manually. They should consult customer support.

1.2 Limited 2-Level COT/AC Secured Feature

To use the Limited 2-Level COT/AC (Customer Originating Trace/Automatic Callback) Secured Feature Announcements, an ANNHD form with APPLICATION equal to "LASS" must exist or be entered. In addition, new HEADER ID values of 249 through 255 must be entered by the office through RC or ODA, or via an SU/BWM script (See Figure 2). Refer to Division 2, Section 4A for details.

1.3 Recent Change View

The corresponding Recent Change view for this form is 8.61.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * HEADER ID

Description: Enter a Header Identification number.
Valid Entries:
- For 5E3 - 5E9(1): 1 - 255
- For 5E9(2) and later: 1 - 137,071

Data Rules:

For 5E5 and later, Header IDs for the application "OSPSTA" that are not included in the standard input data provided for OSPS TA offices should be manually entered. Customers using customized packets should consult customer support.

For RAF services, if the HEADER ID is for an OSPS Customized Announcement Circuit Pack, the MICRO

Copyright © 2003 Lucent Technologies

CODE field for the Customized pack should be entered on the EQRAP form (5822 Record) with an entry of "5D155xyy" (where x is alphabetic and yy is numeric), and the corresponding APPLICATION entry on the EQRAP form should be equal to "OSPS-TA". Also, the BRAND PHRASE field on the OSPSOPT Form (5424 Record) must be set to "Y".

2.3 * APPLICATION

Description: Enter the type of application which corresponds to the header announcement.

Valid APPLICATION Entries

Entry	Definition
2LEVEL or 2	Software Release: 5E7 and later. 2-Level COT and AC (Customer Originated Trace and Automatic Callback).
ACSR or AC	Software Release: 5E6 and later. Automatic Customer Station Rearrangement.
ASP or AS	Software Release: 5E8 and later. ASP (Advanced Services Platform)
L[2 - 7]	Software Release: 5E9(1) and later. The OSPS Non-English Application type used to map the English phrase ID to the non-English phrase ID. L2 - L7 are defined on the LANGTBL form (5483-2 Record) and correspond to the non-English language designated by the DISPLAY ID field.
LASS or LA	Software Release: 5E6 and later. LASS Selective Features Screen List Editing. Also used by Limited 2-Level COT/AC.
NPA_SP	Software Release: 5E13 and later. Numbering Plan Area Split Announcement.
OSPSDA or D	Software Release: 5E3 and later. OSPS Directory Assistance.
OSPSTA or T	Software Release: 5E4(2) and later. OSPS Toll and Assistance.
RAS or R	Software Release: 5E5 and later. Remote Access Service.
TACCT	Software Release: 5E11 and later. TDX (Toll Digital Exchange) account code.
VARRAF	Software Release: 5E13 and later. Variant Recorded Announcements Function

Data Rules:

2LEVEL:
For 5E7 and later, if the APPLICATION is "2LEVEL", then at least one associated ANNAPL form and one ANNDG form must exist.

ACSR or RAS:
For 5E5 and later, if the APPLICATION is "ACSR" or "RAS", an associated ANNAPL form (5529 Record), ANNTR form, and ANNDG form must be entered.

ASP:
For 5E6 and later, if the APPLICATION is "ASP", then an associated ANNAPL form must exist and an associated ANNTR forms may exist. No associated ANNDG forms will exist. If the APPLICATION is "LASS", then an associated ANNAPL form, and an ANNDG form must exist.

NPA_SP:
For 5E13 and later, when APPLICATION is "NPA_SP", the HEADER ID must be "1".

OSPSTA - If an announcement HEADER ID of 39 or 40 is entered with APPLICATION equal to "OSPSTA", then the BRAND PHRASE field on the OSPSOPT form (5424 Record) must be set to "Y". In addition, for 5E9(1) and later, SFID 15 on the SFSYS form (5713-1 Record) is set to "Y".

For 5E4(2) and later, if the APPLICATION is "OSPSDA" or "OSPSTA", then an associated ANNDG form (5532 Record), ANNTR form (5533 Record) and an ANNAPL form (5529 Record) must exist.

Copyright © 2003 Lucent Technologies

For 5E9(1) and later, if APPLICATION is "OSPSTA" and a phrase value in the PHRASE LIST is in the range

- 14000 - 14999, the following must be true:
  - All SMs listed on the ANNAPL form with an APPLICATION of "OSPSTA" must have at least one associated EQRAP form (the SM values match).
  - This associated EQRAP form must have an APPLICATION of "OSPS-TA" and must have

    for 5E9(1) only, a MICROCODE with the first 7 characters equal to 5D155A1 entered on PACK 2 or PACK 3.

    or

    for 5E9(2) and later, a MICROCODE of 5D155A10 entered on PACK 2 or PACK 3.

    For 5E10 and later, this does not apply to SAS.

- 290 through 312, the following must be true:
  - All SMs listed on the ANNAPL form with an APPLICATION of "OSPSTA" must have at least one associated EQRAP form (the SM values match).
  - This associated EQRAP form must have an APPLICATION of "OSPS-TA" and must have

    for 5E9(1) only, a MICROCODE with the first 7 characters equal to 5D172A2 or 5D172A3 entered on PACK 2 or PACK 3

    or

    for 5E9(2) and later, a MICROCODE of 5D172A20 or 5D172A30 entered on PACK 2 or PACK 3.

    For 5E10 and later, this does not apply to SAS.

- 256 through 289, the following must be true:
  - All SMs listed on the ANNAPL form with an APPLICATION of "OSPSTA" must have at least one associated EQRAP form (the SM values match).
  - This associated EQRAP form must have an APPLICATION of "OSPS-TA" and for 5E9(1) only, must have a MICROCODE with the first 7 characters equal to 5D172A1, 5E172A2, or 5D172A3 entered on PACK 2 or PACK 3.

    or

    for 5E9(2) and later must have a MICROCODE of 5D172A10, 5D172A20 or 5D172A30 entered on PACK 2 or PACK 3.

    For 5E10 and later, this does not apply to SAS.

- 313 through 324, the following must be true:
  - All SMs listed on the ANNAPL form with an APPLICATION of "OSPSTA" must have at least one associated EQRAP form (the SM values match).
  - This associated EQRAP form must have an APPLICATION of "OSPS-TA" and must have

Copyright © 2003 Lucent Technologies

for 5E9(1) only a MICROCODE with the first seven characters equal to 5D172A3 entered on PACK 2 or PACK 3.

or

for 5E9(2) and later, a MICROCODE of 5D172A30 entered on PACK 2 or PACK 3.

For 5E10 and later, this does not apply to SAS.

For 5E9(1) and later, if APPLICATION is "OSPSTA" and HEADER ID is 171, then:

- the PHRASE ID list must contain PHRASE ID 94 only once.
- the PHRASE ID preceding PHRASE ID 94 must be 6, 29, 34, or 39 - 46.
- if the PHRASE ID preceding PHRASE ID 94 is 6, then the phrase preceding PHRASE ID 6 must be in the range 39 - 45.
- if OSPS TA is set to "Y" on the OSPSOPT form, then "OSPSTA" announcement header 171 should have a disconnect warning time interval (specified by the PHRASE ID value) which is equal to the (CAS CARD LIMIT) WARN TIME on the OSPSOPT form. This means that the PHRASE ID value which precedes PHRASE ID 94 (or the first and second PHRASE ID values preceding PHRASE ID 94) must be a number which represents a time value equal to that of WARN TIME.

The actual time value in seconds can be found using the PHRASE ID in the table below.

PHRASE ID Values

FIRST PRECEDING PHRASE ID	SECOND PRECEDING PHRASE ID	TIME VALUE
29		ten
34		fifteen
39		twenty
40		thirty
41		forty
42		fifty
43		sixty
44		seventy
45		eighty
46		ninety
6	39	twenty-five
6	40	thirty-five
6	41	forty-five
6	42	fifty-five
6	43	sixty-five
6	44	seventy-five
6	45	eighty-five

VARRAF:
For 5E13 or later:

- when APPLICATION is "VARRAF", PHRASE_LIST.PHR must be 32768 - 33407.
- when APPLICATION is "VARRAF", PHRASE_LIST for PHRASE ID must be defined on the PHRASE form (5534 Record) with APPLICATION set to "VARRAF".

2.4 DURATION

Description: The DURATION field specifies the duration of the announcement in seconds. This is a read

Copyright © 2003 Lucent Technologies

only, verify field on Recent Change view 8.61. It cannot be entered on the ODA form or the Recent Change view. The values in this field are in the range of 0 - 7200 seconds.

The calculated duration of the commands/phrases on the ANNHD input form cannot exceed 7200 seconds. The duration is calculated from the PHRASE input form records.

2.5 PHRASES

Enter the phrase numbers for each phrase header.

Valid PHRASE Entries

Entry	Description
0	Software Release: 5E3 - 5E9(1). Defines end-of-phrase list.
1 - 46	Digit string-related phrase IDs (refer to the PHRASE form).
47 - 16383	Application-defined phrase IDs.
16385	Command - insert a digit string.
16386	Command - repeat the previous digit string.
16387	Software Release: 5E7 and later. Command - date of last incoming call.
16388	Software Release: 5E7 and later. Command - time of last incoming call.
16389	Software Release: 5E7 and later. Command - number of dollars and cents.
16500	Software Release: 5E4(2) and later. Command - insert a Credit digit string.
16501	Software Release: 5E4(2) and later. Command - insert a Charge Due digit string.
16502	Software Release: 5E4(2) and later. Command - insert a Call Duration digit string.
16600 - 65530	Software Release: 5E9(2) and later. Application-defined phrase IDs.

Data Rules:
For 5E3 - 5E9(1), at least two entries in this list are required. The last (and only the last) phrase number must be 0. For 5E9(1) and earlier a maximum of 50 phrases may be used. For 5E9(2) a maximum of 67 phrases may be used, and at least one phrase is required.

Each command/phrase defined on this form for a HEADER ID must be defined in the PHRASE ID field on a PHRASE form.

SEC. 5AF: 5532 RECORD
ANNOUNCEMENT DIGIT INFLECTION SCHEME FORM - ANNDG

1. GENERAL

The 5532 Record is available with 5E3 and later Software Releases. This record contains a list of inflection commands and phrases used to convert a digit string into a set of phrase identifications.

The Digit Inflection Scheme is a "template" for the digit string; the Digit Inflection Scheme details how to pronounce digits. Digit string expansion occurs whenever a digit string is to be inserted into an announcement. Digit information is extracted from a digits array used by application software. For each digit string in this array, the associated Inflection ID is used to determine what inflection scheme is to be applied to the digit string. The phrases are interpreted as commands or Phrase IDs. The Phrase IDs correspond to digit-related phrases such as digits, pauses, area codes, etc.

- ***NOTE:*** The specific APPLICATION on the associated ANNAPL form (5529 Record) must be entered before Standard Input Data will be provided by ODA for this form.

1.1 Limited 2-Level COT/AC Secured Feature

To use the Limited 2-Level COT/AC (Customer Originating Trace/Automatic Callback) Secured Feature Announcements, forms with APPLICATION equal to "LASS" and INFLECTION ID equal to 1 through 7 and 10 must be entered. These 8 forms are shared by the LASS features and the COT/AC application.

1.2 Recent Change View

The corresponding Recent Change View for this form is 8.60.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * APPLICATION

Description: Enter the type of application which corresponds to the header announcement.

Valid APPLICATION Entries

Entry	Definition
2 or 2LEVEL	Software Release: 5E7 and later. 2-Level COT and AC (Customer Originated Trace and AutomaticCallback).
A or ACSR	Software Release: 5E5 and later. Automatic Customer Station Rearrangement.
L[2 - 7]	Software Release: 5E9(1) and later. The Non-English Application type used to map the Englishphrase ID to the non-English phrase ID. L2 - L7 are definedon the LANGTBL (5483-2 Record) and correspond to thenon-English language designated by the DISPLAY ID field.
L or LASS	Software Release: 5E6 and later. Local Area SignalingServices Selective Features Screen List Editing.
NPA_SP	Software Release: 5E13 and later. Numbering Plan Area Split Announcement.
D or OSPSDA	OSPS Directory Assistance.
T or OSPSTA	Software Release: 5E4(2) and later. OSPS Toll and Assistance.
R or RAS	Software Release: 5E5 and later. Remote Access Service.

Data Rules:

Copyright © 2003 Lucent Technologies

For 5E4(2) and later, if the APPLICATION is "OSPSDA" or "OSPSTA", then an associated ANNHD form (5531 Record), ANNTR form (5533 Record), and an ANNAPL form (5529 Record) must exist.

For 5E5 and later, if the APPLICATION is "RAS" or "ACSR", then an associated ANNHD form (5531 Record), ANNTR form (5533 Record), ANNDG form, and an ANNAPL form (5529 Record) must exist.

For 5E6 and later, if the APPLICATION is "LASS", then an associated ANNHD form (5531 Record), ANNDG form, and an ANNAPL form (5529 Record) must exist.

For 5E7 and later, if the APPLICATION is "2LEVEL", then at least one associated ANNHD form and an ANNAPL form must exist.

2.3 * INFLECTION ID

Description: Enter an Inflection Identification number. Each application may have from 1 to 255 different inflection schemes.

2.4 INFLECTION COMMANDS/PHRASES

Description: Enter the Inflection Command/Phrase number for each string. At least two INFLECTION COMMANDS/PHRASES are required; "END" must be entered at the end of each string.
Valid Entries: See Figures 1 and 2

Data Rules:

"TWODIG" must be entered if a digit string is to be entered twice.

Any entries in this field must have a corresponding PHRASE ID on a PHRASE form (5534 Record).

INFLECTION COMMAND/PHRASE	DESCRIPTION	SOFTWARE RELEASE
END	End of Inflection Command/Phrase Array	5E3 and later

SEC. 5AG: 5533 RECORD
ANNOUNCEMENT TRAILER PHRASE LIST FORM - ANNTR

1. GENERAL

The 5533 Record is available with 5E3 and later Software Releases. This record lists phrases that identify announcement trailer. An announcement trailer enables a group of phrases (comprising an announcement) to be accessed with a "trailer identification number."

The trailer identification is mapped to a set of phrase identifications/ commands which specify whether to concatenate a phrase identification or to expand a digit string at that point in the announcement. For example, a typical announcement trailer is, "If you have further questions, a directory assistance operator will return". The type of trailer announcement depends on whether subscriber recall will be allowed. If recall is not allowed, the typical trailer is, "If you have further questions, please hang up and try again".

The phrase or phrases are ordered in the PHRASE list on this form, and each PHRASE is defined on a PHRASE form (5534 Record).

With 5E4(2) and later Software Releases, the SM and DURATION fields have been removed.

1.1 Default Data

With 5E5 and later Software Releases, a set of Default Input Data is provided by ODA (See Figure 1).

NOTE: The specific APPLICATION must be entered on the associated ANNAPL form (5529 Record) before Default Input Data will be provided by ODA for this form.

1.2 Recent Change View

The corresponding Recent Change View for this form is 8.62.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TRAILER ID

Description: Enter a trailer identification number.
Valid Entries: For 5E11 and earlier: 1 - 255
For 5E12 and later: 1 - 65535

2.3 * APPLICATION

Description: Enter the type of application which corresponds to the trailer announcement.

Valid APPLICATION Entries

Entry	Definition
ACSR or A	Software Release: 5E5 and later. Automatic Customer Station Rearrangement.
ASP or AS	Software Release: 5E8 and later. ASP (Advanced Services Platform) (previously PVN (Private Virtual Network)).
L[2 - 7]	Software Release: 5E9(1) and later. The Non-English Application type used to map the English phrase ID to the non-English phrase ID. L2 - L7 are defined on the LANGTBL (5483-2 Record) and correspond to the non-English language designated by the DISPLAY ID field.

Copyright © 2003 Lucent Technologies

OSPSDA or D	OSPS Directory Assistance.
OSPSTA or T	Software Release: 5E4(2) and later. OSPS Toll and Assistance.
PVN or P	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASP". See the description under "ASP".
RAS or R	Software Release: 5E5 and later. Remote Access Service.

Data Rules:

For 5E5 and later, if the APPLICATION is "ACSR" or "RAS" at least one ANNAPL form, ANNHD form, ANNDG form, and ANNTR form must be entered.

For 5E6 and 5E7, if the APPLICATION is "PVN", then an associated ANNAPL form (5529 Record) must exist. An associated ANNHD form (5531 Record) may exist. No associated ANNDG forms (5532 Record) will exist.

2.4 DURATION

Description: This field is a Recent Change only field. The DURATION field specifies the duration of the announcement in seconds.
Valid Entries: 0 - 7200

Data Rules:

The calculated duration of the commands/phrases string on the ANNTR input form cannot exceed
- 255 seconds for 5E9(1) and earlier or
- 7200 seconds for 5E9(2) and later.

The duration is calculated from the PHRASE input form records.

2.5 PHRASES

Description: Enter the phrase numbers for each phrase trailer.
Valid Entries:
- For 5E7 - 5E9(1): 0 - 16383, 16385 - 16389
- or 16500 - 32767
- For 5E9(2) and later: 1 - 16383, 16385 - 16389,
- or 16500 - 65530

Data Rules:

For 5E3 - 5E9(1), at least two entries in this list must be entered. The last, and only the last phrase number, must be 0. For 5E9(1) and earlier, the maximum number of phrases is 50.

For 5E9(2) and later, at least one phrase is required. The maximum number of phrases is 49.

SEC. 5AH: 5534 RECORD
ANNOUNCEMENT PHRASE LIST FORM - PHRASE

1. GENERAL

The 5534 Record is available with 5E3 and later Software Releases. This record defines and describes phrase IDs which are provided on the DSU2-RAF (Digital Services Unit 2-Recorded Announcement Function) Announcement Storage circuit packs for each application (see Division 8, Section 36 for required pack assignments).

As phrase IDs are changed in the RAFs (5531, 5532, and 5533 Records), they must be changed on this record so that the two are synchronized. (This is not necessarily true during a growth scenario.) The 5534 Record allows the phrases to be stored in the AM (Administrative Module) to provide verification and information while populating the announcement data base.

1.1 Default Data

Available with 5E5 and later Software Releases, a standard set of input data is provided for the APPLICATIONs, such as "ACSR" and "RAS", by the ODA system as each office is registered and normally no data need be entered by the ODA system users for those particular applications. If, however, it is required that the data vary from the standard, this form may be used to specify the necessary data.

- ***NOTE:*** With 5E7 only, FEATURE ID 536 must be activated on the SFSYS form (8.22 Record) (RC View 8.31) to access LASS phrases 411 through 443. The MC5D143A30, L23 pack must be equipped on the DSU2-RAF (see Division 8, Section 36 for required pack assignments). Refer to Division 3, Section 5AE for further explanation.

- ***NOTE:*** Since the PHRASE field only accommodates 65 characters, some standard input phrases may have words omitted or abbreviated from the actual announcement supplied by the DSU2-RAF firmware.

1.2 Limited 2-Level COT/AC Secured Feature

To use the Limited 2-Level COT/AC (Customer Originating Trace/Automatic Callback) Secured Feature Announcements, forms with APPLICATION equal to "LASS" and PHRASE ID equal to 1 through 46, 65, 98, 104 through 177, or any customized phrase number used by the ANNHD forms must be entered.

Form instances with PHRASE IDs equal to 1 through 46 are used by other LASS announcements and are provided as part of the standard data set. Form instances with PHRASE ID equal to 65, 98, and 104 through 177 are specific to the Limited 2-Level COT/AC Secured Feature and are not provided with standard data; rather, they must be entered by the office through RC or ODA or via an SU/BWM script.

In order to use the phrases provided on the standard BRCS-SLE announcement board (see the EQRAP form (5822 Record), Division 8, Section 36) forms using phrases in Figure 2 must be built.

1.3 Recent Change View

The corresponding Recent Change View for this form is 8.63.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PHRASE ID

Copyright © 2003 Lucent Technologies

Description: Enter a phrase identification number.
Valid Entries:

- For 5E7 - 5E9(1): 1 - 6383,
- 16,385 - 16,389, and
- 16,500 - 32,767
- For 5E9(2) and later: 1 - 16,383, and
- 16,600 - 65,530

Valid PHRASE ID Entries

PHRASE ID	Definition
1 - 46	Digit String-related Phrase IDs.
47 - 16383	Application-defined Phrase IDs.
14000 - 14999	Software Release: 5E5 and later. Customized audible logos provided for BRCS Customized Announcement Circuit Pack.
16385	Software Release: 5E4(2) and later. Command. Insert a digit string.
16386	Software Release: 5E4(2) and later. Command. Repeat the previous digit string.
16387	Software Release: 5E7 and later. Command - date of last incoming call.
16388	Software Release: 5E7 and later. Command - time of last incoming call.
16389	Software Release: 5E7 and later. Command - number of dollars and cents.
16500 - 32767	Software Release: 5E4(2) and later. Application-specific commands that are defined by applications to have certain meanings.
32768 - 65530	Software Release: 5E9(2) and later. Application-defined phrase IDs.

For OSPS ACTS (Automated Coin Announcements), the following application-specific commands are recognized:

Valid OSPS ACTS PHASE ID Entries

PHRASE ID	Definition
16500	Command. Insert a CREDIT digit string.
16501	Command. Insert a CHARGE DUE digit string.
16502	Command. Insert a CALL DURATION digit string.

Data Rules:

A PHRASE form must be submitted for each PHRASE ID value from 1 - 46 for 5E4(2) and later.

2.3 * APPLICATION

Description: Enter the type of application which corresponds to a Switching Module.
Default: OSPSDA
Valid Entries:

Valid APPLICATION Entries

Entry	Definition
2LEVEL or 2	Software Release: 5E7 and later. 2-Level COT and AC (Customer Originated Trace and Automatic Callback).
ACSR or A	Software Release: 5E5 and later Automatic Customer Station Rearrangement.
ASP or AS	Software Release: 5E8 and later. ASP (Advanced Services Platform) (previously PVN (Private Virtual Network)).
LASS or L	Software Release: 5E6 and later Local Area Signaling Services Selective Features Screen List Editing. Also used by Limited 2-Level COT/AC.

Copyright © 2003 Lucent Technologies

NPA_SP	Software Release: 5E13 and later. Numbering Plan Area Split Announcement.
OSPSDA or D	Software Release: 5E3 and later OSPS Directory Assistance.
OSPSTA or T	Software Release: 5E4(2) and later OSPS Toll and Assistance.
PVN or P	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASP". See the description under "ASP".
RAS or R	Software Release: 5E5 and later Remote Access Service.
TACCT	Software Release: 5E11 and later TDX (Toll Digital Exchange) account code.
VARRAF	Software Release: 5E13 and later. Variant Recorded Announcements Function.

Data Rules:

When APPLICATION is "VARRAF", LANGUAGE CODE must be entered.
When APPLICATION is not "VARRAF", LANGUAGE CODE must not be entered.

2.4 # DURATION

Description: Enter the expected duration of the phrase.

Required Field.
Valid Entries:
- For 5E3 - 5E9(1): 1 - 255
- For 5E9(2) and later: 1 - 7200 (seconds)

2.5 # PHRASE

Description: Enter the text equivalent of the phrase.

Required Field.
Valid Entries: 1 - 65 characters.

The following table shows the DURATION value and the PHRASE text that will be ODA assigned after certain PHRASE IDs are entered. The user may enter values to overwrite the ODA assignments.

Valid PHRASE Entries

PHRASE ID	DURATION	Entries
1	1	zero (flat)
2	1	one (flat)
3	1	two (flat)

SEC. 5AI: 5535 RECORD
NETWORK ANNOUNCEMENTS FORM - SSPANN

1. GENERAL

The 5535 Record is available with 5E4(2) and later Software Releases. It is used to specify a failure announcement code and either the route index to an announcement trunk group to be used to supply the appropriate message or pointers to customized header and trailer announcements.

The customized header and trailer announcements, specified by CUST HDRID and CUST TRLID, are for use by ASP (Advanced Services Platform) announcement codes. With 5E9(2) and earlier, the ANNC RTI is not used by ASP announcement codes. The route index for the ASP DSU2/RAF is derived from the FIXRT form (5301-1 Record) where FIXED ROUTE TYPE is "NSANNC". With 5E10 and later, ASP announcement codes may specify an ANNC RTI. Specifying an ANNC RTI allows routing to 13A announcements.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * ANNC CODE

Description: Enter the integer value of the Network Announcement Code that provides the appropriate failure message.

The announcement code will be determined by the SCP (Service Control Point) location and returned to the office where the call was routed from. Each announcement code, that can be returned by the SCP, must have either an associated route index or an associated customized header ID specified.

Required Field.
Valid Entries:
- For 5E11 and earlier: 0 - 255
- For 5E12 and later: 0 - 65535

2.3 SM

Description: This field is used only by Recent Change.

2.4 ANNC RTI

Description: Enter the route index number of the trunk group that will route the caller to the appropriate announcement.

Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and later: 1 - 4095

Data Rules

Copyright © 2003 Lucent Technologies

The route index must appear on an RTIDX form (5303 Record) and the associated trunk group must be defined on a TKGRP form (5202 Record).

If a CUST HDRID is not entered, then an ANNC RTI must be entered.

2.5 CUST HDRID

Description: Enter the customized announcement header ID associated with this ANNC CODE. The specified announcement header will be played when this ANNC CODE is received back from the SCP.
Valid Entries:
- For 5E11 and earlier: 1 - 255
- For 5E12 and later: 1 - 65535

Data Rules:

Since a CUST HDRID is only used by ASP (Advanced Services Platform, previously Private Virtual Network, PVN) located on an SSP (Service Switching Point), a CUST HDRID cannot be entered unless PVN OFC on the OFCOPT form (5509 Record) is set to "SSP".

Every CUST HDRID must be defined as the HEADER ID on an ANNHD form (5531 Record) where APPLICATION is set to "ASP". If an ANNC RTI is not entered, then a CUST HDRID must be entered.

2.6 CUST TRLID

Description: Enter the customized announcement trailer ID associated with this ANNC CODE. The specified announcement trailer will be played when this ANNC CODE is received back from the SCP.
Valid Entries:
- For 5E11 and earlier: 1 - 255
- For 5E12 and later: 1 - 65535

Data Rules:

Since a CUST TRLID is only used by ASP (Advanced Services Platform; previously Private Virtual Network, PVN) located on a SSP (Service Switching Point), a CUST TRLID cannot be entered unless PVN OFC on the OFCOPT form (5509 Record) is set to "SSP".

Every CUST TRLID must be defined as the TRAILER ID on an ANNTR form (5533 Record) where APPLICATION is set to "ASP". A CUST TRLID cannot be entered unless a CUST HDRID has also been entered.

2.7 TONE TYPE

Description: The TONE TYPE field provides the 400Hz carrier tone as the network tone. This field was added to support 400Hz Carrier Tone feature. The 400Hz Carrier Tone feature provides a basic enhancement to the Long Distance Platform, it relies on the condition that SFID 165 is unlocked. For more information on this feature see Division 2, Section 4A165.

Software Release: 5E13 and later
Valid Entries: Blank or CARRIER

Data Rules:

One and only one of ANNC RTI, CUST HDRID or TONE TYPE must be entered and must not be zero.

When the SSPANN forms have TONE TYPE entered, the ASP OFC field on the ASPOPT form must be set to "SSP".

Copyright © 2003 Lucent Technologies

When the SSPANN form has TONE TYPE set to "CARRIER", the CARRIER TONE on the OFCOPT form must be set to "Y".

SEC. 5AJ: 5536 RECORD
STRUCTURE CODE FAMILY FORM - SCFAM

1. GENERAL

The 5536 Record is available with 5E4(2) and later Software Releases.

This form is used to specify Call Code to structure code family. This is saved in a call record from the TCAP (Transaction Capability Application Part) message sent from a remote data base.

In 5E4(2), this form was used for an SSP (Service Switching Point) office to process Number Services calls.

In 5E5 and later, this form can be used for an SSP office or an office serving as an ACP (Action Control Point) for an SDN (Software Defined Network). In 5E6 and later, it can also be used for a Leased Network ACP.

In 5E6 and later, this form can also be used for an SSP office which supports ASP (Advanced Services Platform) calls.

To determine if the office is an SSP office (with or without ASP support) or an ACP office, please refer to the OFCOPT form. An SSP office without ASP support will have "Y" entered in the SERV SWITCH PT field and "NONE" entered in the ASP OFC (5E8 and later) PVN OFC (5E6 - 5E7) field on the OFCOPT form. An SSP office with ASP support will have "SSP" entered in the ASP (PVN) OFC field on the OFCOPT form (the value entered in SERV SWITCH PT does not matter in this case). An ACP office will have a "Y" entered in the ACT PT SDN field on the OFCOPT form.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.18.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * CALL CODE

Description: Enter the integer representation of the digits contained in the TCAP message sent from the SCP for Number Services calls. The values entered must be coordinated with the data base administrator for the SCP installation.
Valid Entries: 0 - 999

2.3 # STRUCT CODE FAMILY

Description: Enter the structure code family. This indicates the structure code to be used to bill the call.

Required Field.

Valid STRUCT CODE FAMILY Entries

Entry	Definition
APSDN	Software Release: 5E5 and later. Software Defined Network structure code family. This entry is used if the call code returned from the data base is to be billed as a SDN call at an ACP, and can only be used for an ACP office.
ASP	Software Release: 5E8 and later. ASP (AdvancedServices Platform, previously PVN (Private Virtual Network))structure code family. This entry is used if the call code returnedfrom the SCP is to be billed as an ASP call at an SSP, and can

Copyright © 2003 Lucent Technologies

	onlybe used for an SSP office with ASP support; that is, ASP OFC (PVN OFCfor 5E6 - 5E7) on the OFCOPT form (5509 Record) is set to"SSP").
IC	Interexchange Carrier structure code family. This entry is used if the call code returned from the SCP is to be billed for an IC(Interexchange Carrier), and can only be used for a SSP office.
LNACP	Software Release: 5E6 and later. LN (Leased Network)structure code family. This entry is used if the call code returnedfrom the Network Control Point data base is to be billed as a LN callat the ACP. This structure code family is only valid for LNACP. If anSCFAM form is entered with STRUCT CODE FAMILY equal to"LNACP", there must be an OFCOPT form with ACTION POINT setto "Y".
PVN	Software Release: 5E6 - 5E7. For 5E8 and later, thisis changed to "ASP". See the description under "ASP".
TELCO	Local Telephone Company structure code family. This entry is used if the call code returned from the SCP is to be billed for a Local Telephone Company, and can only be used for a SSP office.

SEC. 5AK: 5537 RECORD
DIRECT SIGNALING APPLICATION FORM - DSAPP

1. GENERAL

The 5537 Record is available with the 5E4(2) and later Software Releases. It is used to specify the Direct Signaling Application Type, Transaction Type and the Subsystem Number used by the direct signaling trunks which use the CCS7 (Common Channel Signaling System 7) signaling protocols.

1.1 CNI Database Caution

The signaling application view 8.17 (DSAPP form (5537 Record)) must be entered for each CCS7 based feature. The 15.10 and 15.11 Recent Change views must be inserted prior to the 8.17 view.

The CNI database is not a relational database, therefore it does not directly interface with the 5ESS-2000 Switch relational database. Due to the differences between the two databases, if the 8.17 view is populated prior to the 15.10 and 15.11 views, the application is marked as prohibited and no call processing will occur for those application type calls. If 8.17 is entered first, the views must be deleted and then reinserted in the proper sequence. For more information on provisioning CNI, see Division 9.

1.2 Recent Change

The corresponding Recent Change View for this form is 8.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 *APPLIC

Description: Enter the Direct Signaling Application type.

Valid APPLIC Entries

Entry	Definition
ACND or AC	Software Release: 5E6 and later. CNAM (Analog Calling Name Delivery).
AINR0D1 or AI	Software Release: 5E9(1) and later. AIN (Advanced Intelligent Network) Release 0.1B.
APSDN or AP	Software Release: 5E5 and later. 5ESS-2000 Switch ACP (Action Control Point) for a SDN (Software Defined Network).
ASP or AS	Software Release: 5E8 and later. ASP (Advanced Services Platform) (previously PVN (Private Virtual Network)).
AT1 or AT	Software Release: 5E5 and later. ANSI (American National Standards Institute) TCAP (Transaction Capabilities Application Part) Type 1 signaling to a database. For 5E5 and 5E6, this signaling queries the LIDB (Line Information Database). For 5E7 and later, queries are sent to the BVD (Billing Validation Database).
CCS7 or C	Software Release: 5E7 and later. CCS7 signaling to a CAS/NCP database.
DCIS or D	Software Release: 5E5 and later. Destination-routed CCIS6.
ICCV or IC	Software Release: 5E7 and later. ICCV signaling to a foreign database.
ISVM or IS	Software Release: 5E7 and later. Inter-Switch Voice Messaging.
LALT	Software Release: 5E8 and later. LIDB Alternate Destination. This is the direct signaling application type for the EABS

Copyright © 2003 Lucent Technologies

	Alternate Routing secured feature. For more information on this feature, see Division 2, Section 4A86.
LASS or LAS	Software Release: 5E5 and later. Local Area Signaling Services.
LIDB or L	Software Release: 5E5 and later. Line Interface Data Base usage.
LNACP or N	Software Release: 5E6 and later. Leased Network Action Control Point.
NCD	Software Release: 5E9(1) and later. Network Call Denial. (Currently not used)
NS800 or NS	Number Service 800 usage.
PVN or P	Software Release: 5E6 - 5E7. For 5E8 and later, this is changed to "ASP". See the description under "ASP".
OLNP or OL	Software Release: 5E12 and later. OSPS Local Number Portability
ONAI	Software Release: 5E9(1) and later. OSPS Network Access Interrupt
TNAI	Toll Network Access Interrupt Application.

Data Rules:

For 5E8 and earlier, if "NS800" or "PSDN" is entered for APPLIC, the OFCOPT form (5509 Record) must have either SERV SWTCH PT or ACT PT SDN set to "Y".

If "PVN" is entered for APPLIC, the OFCOPT form (5509 Record) must have ASP OFC (5E8 and later) (PVN OFC for 5E6 - 5E7) set to "SSP".

For 5E9(1) and later, if APPLIC equals "ASP" or "AINR0D1", ASP OFC on the OFCOPT form must equal "SSP".

The APPLIC field on this form may be set to "ACND" only when the CNAM (Analog Calling Name Delivery) secured feature has been purchased and the secured feature ID 40 has been set to "S"(for 5E9(1) and later, SFID 40 must have ACT equal to "Y") on the SFSYS form (5713-1 Record).

For 5E9(1) and later, since ASP is a secured feature and must be purchased by the office before ASP data can be assigned, APPLIC must not equal "AINR0D1" until SFID 126 ACT on the SFSYS form has been set to "Y".

2.3 *LATA

Description: Enter the Local Access and Transport Area number. The maximum number of LATAs that can be entered is 28. This field, and DPC 1 and DPC 2 fields, are used to support the TCAP Improvements for Switches Spanning Multiple LATAs feature to extend the operation of the current LASS features to support lines (or groups of lines) in LATAs other than the LATA number specified on the OFCOPT form (5509 Record). See Division 2, Section 4A171.

Software Release: 5E11 and later
Valid Entries: 0 - 255

Data Rules:
If LATA is entered,

- there must exist another DSAPP form with the same APPLIC entry and the LATA field is not entered.
- APPLIC must be "ACND" or "LASS".
- DPC 1 and DPC 2 must be entered.
- SUB SYS NBR must not be entered.

Copyright © 2003 Lucent Technologies

- the ACT field for SFID 171 must be activated on the SFSYS form.

If LATA is not entered,

- DPC 1 and DPC 2 must not be entered.
- SUB SYS NBR must be entered.

2.4 #TRANS TYPE

Description: Enter the Transaction Type to be used with Direct Signaling Applications. The STP TT NBR field on the NSTRIG form applies only to ASP Release 0.1B and later for 5E9(1) and later triggers. If STP TT NBR is blank, the Translation Type entered for the field TRANS TYPE on the DSAPP form is used.

Required Field.
Valid Entries: 0 - 255

Data Rules:

If APPLIC is "ICCV" or "CCS7", then TRANS TYPE must be 0.

2.5 SUB SYS NBR

Description: Enter the Subsystem Number used by the Direct Signaling Application.

Data Rule:
For 5E5 and later, the Subsystem Number must be unique for each Application type defined on the DSAPP form.

Required Field.
Valid Entries: 232 - 254

2.6 DPC 1

Description: Enter the Destination Point Code 1. This field is used to specify the first signaling point for the STP (Signaling Transfer Point).

Software Release: 5E11 and later
Valid Entries: 9 digits in the following format.

2.7 DPC 2

Description: Enter the Destination Point Code 2. This field is used to specify the second signaling point for the STP.

Software Release: 5E11 and later
Valid Entries: 9 digits in the following format.

SEC. 5AL: 5538 RECORD
REMOTE ACCESS SERVICE RTI DEFINITION FORM - RASRTI

1. GENERAL

The 5538 Record is available with 5E5 and later Software Releases. This form is used to define the routing used by RAS (Remote Access Service) from an RADN (Remote Access DN) to the DSU2-RAF-DTA that corresponds with a specified home switch.

For 5E8 and later, a corresponding ANNAPL form must be submitted with an APPLICATION of "RAS".

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.19.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ANNC RTI

Description: Enter the the route index that routes the RAS customer to the DSU2-RAF-DTA.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 3617
- For 5E11 and 5E12: 1 - 4095
- For 5E13 and later: 1 - 16382

Data Rules:

The ROUTE INDEX must be defined on the RTIDX form (5303 Record) with CI ROUTE TYPE set to "GENANN"; the associated TKGRP form must have SVC GRP set to "RAS".

2.3 IDPNAME

Description: Enter the IDP group name. IDP names have no restrictions on the valid characters. If the field is left blank, the Office Dialing Plan will be used.
Valid Entries: 1 - 8 characters

Data Rules:

Either this field or the DAS field must be entered.

The IDPNAME must be defined on the IDPGP form (5601-4 Record).

2.4 IDP RESTRICT

Description: Must the calling TN be in the same IDP group as the RADN IDP group assigned on this form?
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

This field can only be "Y" when the IDPNAME field is entered. If "Y" is entered the calling TN must be in the same IDP group as the RADN.

2.5 DAS

Description: Enter the DAS (Digit Analysis Selector) number used to screen digits.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

Either this field or the IDPNAME field must be entered. The DAS must be defined on the DAS form (5300-1 Record).

SEC. 5AM: 5539 RECORD
LU/(R)ISLU MEASUREMENTS FORM - MEASLU

1. GENERAL

The 5539 Record is available with 5E7 and later Software Releases. It supports the LU/ISLU Load Administration Measurements feature, which is explained in the Switch Administration and Engineering Guidelines document, 235-070-100.

NOTE: References to "ISLUs" in this section also apply to RISLUs (Remote ISLUs).

The LU/ISLU Load Administration Measurements feature will assist network administrators in monitoring call loads on the switch for the following units:

- LUs (Line Units) and ISLUs
- ISLUs (Integrated Service Line Units)

An administrator can study the traffic load on selected units by: 1) defining study groups on the MEASLU form (5539 Record), and 2) enabling measurement generation and collection through appropriate Input Messages to the switch. Usage data for operational Switch Groups and Line Group Controllers on the selected units will be reported on half hour intervals in Sections 144 and 145 of the TRFC30 report.

1.1 Defining a Study Group

LUs and ISLUs (or Remote ISLUs) are targeted for study by including them in a study group defined on an MEASLU form. Each study group definition requires a line unit type ("LU" or "ISLU"), a study group identifier, and a list of SMs/LUs or SMs/ISLUs. A maximum of 19 study groups, each containing up to 100 unique units, may be specified. A unit can be included in multiple study groups.

NOTE: Although 500 ISLUs and 500 LUs can be included in study groups, only a maximum of 250 fully equipped ISLUs and 4000 Switch Groups can be studied simultaneously (the number of fully equipped Line Units is dependent on the LU concentration level).

1.2 Recent Change View

The corresponding Recent Change View for this form is 13.6.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * UNIT TYPE

Description: Enter the type of units being studied. A study group may include either LUs or ISLUs but not both a combination of the three.

Required Field.

Valid UNIT TYPE Entries

Entry	Definition
LU	This is a Line Unit study group.
ISLU	This is an Integrated Services Line Unit study group.

NOTE: For the AIU (Access Interface Unit) measurements, introduced in 5E11, see Division 2,

Copyright © 2003 Lucent Technologies

Section 7K.

Data Rules:

When "LU" is entered, each pair of SM and UNIT NO fields must be defined on an EQLU form (5710 Record) as SM and LINE UNIT. When "ISLU" is entered each SM and UNIT NO must be defined either on an EQISLU form (5731 Record) as SM and ISLU NUMBER or on an EQRISLU form (5732 Record) as SM and RISLU NUMBER.

For 5E10 and later, when a UNIT TYPE of "ISLU" is defined on the MEASLU form, all SM/UNIT NO combinations listed on the MEASLU form must be defined as either SWITCHING MODULE/ISLU NUMBER on an EQISLU form or SWITCHING MODULE/RISLU NUMBER on an EQRISLU form.

2.3 * STUDY GROUP

Description: Enter a number that uniquely identifies the LU or ISLU study group. An office can have a total of 19 LU or 19 ISLU study groups that may be created. Each study group is numbered uniquely from 1 to 19 (not necessarily in numerical order).

Required Field.
Valid Entries:
- 5E13 and earlier: 1 - 5
- 5E14 and later: 1 - 19

UNITS FOR DATA COLLECTION

A study group may contain up to 100 line units (LUs or ISLUs), each identified by a pair of fields, SM and UNIT NO.

2.4 SM

Description: Enter the number of the Switching Module on which the line unit (LU or ISLU) resides.

Value Entries: 1 - 192

2.5 UNIT NO

Description: Enter the number of the line unit (LU or ISLU) to be studied.

NOTE: For 5E9(2) and later, 0 - 7 is used for SMs; 0 - 42 is used for SM-2000.
Valid Entries:
- 5E9(1) and earlier: 0 - 7
- 5E9(2) and later: 0 - 42

Data Rules:

If an SM is entered, the corresponding UNIT NO must also be entered; if the UNIT NO is entered, the SM must be entered.

Each SM/UNIT NO combination must be unique within the study group; however, any particular SM/UNIT NO can be included in more than one study group.

For a Study Group defined with a Unit Type of "LU", each pair of SM and UNIT NO fields must be defined on an EQLU form (5710 Record) as SM and LINE UNIT. When "ISLU" is entered, the SM and UNIT NO must be defined either on an EQISLU form (5731 Record) as SM and ISLU NUMBER or on an EQRISLU form (5732 Record) as SM and RISLU NUMBER.

Copyright © 2003 Lucent Technologies

If the SMs and UNIT NOs are defined on the EQLU form, measurements will be performed on all operational Line Unit Grids associated with the Line Units as defined on the EQLUP form (5711 Record). If the SMs and UNIT NOs are defined on the EQISLU or EQRISLU form, all the operational Line Group Controllers associated with the Integrated Service Line Units as defined on EQLGC form (5733 Record) will be measured.

SEC. 5AN: 5540 RECORD SELECTIVE ROUTING AND TRANSFER DATA FOR ESN (SM/DAS) - ESN

1. GENERAL

For 5E7 and later Software Releases, the 5540 Record is available with the E911 feature (see Division 2, Section 1BD).

The ESN form serves two purposes. First, it is used to define an ESN (Emergency Service Number), a set of telephone numbers for the emergency services a 911 caller may require. Second, it is used to define SM standalone data, a set of emergency numbers for a 911 call that arrives at an SM unable to communicate with the CMP (Communication Module Processor).

1.1 ESN Data

An ESN represents a municipal or county area served by a specific set of emergency services. Each 911 call that enters the switch is associated with an ESN, either by a query to the ESA (Emergency Service Adjunct) or from data on an ESCO form (5541 Record).

The ESN determines the primary PSAP (Public Service Answering Point) to which the call will be routed. It also provides an alternate PSAP(s), to be used when the primary PSAP is unavailable.

The E911 attendant at a CAMA PSAP can selectively transfer a 911 call to a specific agency in the caller's area. The ESN stores the telephone numbers for up to six selective transfer keys on the PSAP console.

Additionally, an ESN may specify that the caller's NPD (Numbering Plan Digit) and ANI (Automatic Number Identification) will be flashed at the E911 attendant's console at a CAMA PSAP. The flashing indicates to the attendant that the call may require special attention, for example, calls from a chemical plant.

1.2 SM Standalone Data

In addition to defining E911 ESNs, the ESN form is used to define standalone data for individual Switching Modules on the E911-serving switch.

ESN processing is performed on the 5ESS Switch CMP. When an SM is unable to communicate with the CMP, the ESN, with its accompanying routing and selective transfer information, is inaccessible. Standalone data establishes a set of routing and selective transfer numbers the SM will use when the CMP does not respond.

One standalone ESN form must be defined for each SM. These required forms must have only the SM number as a key; the DAS field must be blank.

If more than one set of emergency standalone numbers is required for 911 calls arriving at an SM, distinctions can be made through the DAS associated with the caller. Additional ESN forms can be defined with SM and DAS as keys. In this way, multiple 911 calling areas can be routed to different emergency numbers.

When a 911 call requires standalone routing on an SM, the operational software will look first for an ESN form with the SM and DAS. If the form does not exist, it will use the form for the SM (blank DAS).

When a 911 call is routed using SM standalone data, the caller's NPD and ANI are always flashed on the E911 attendant console at a CAMA PSAP. The flash indicates to the attendant that the call may require special attention -- in this case because it was routed with standalone data.

1.3 E911 Feature Lock

Copyright © 2003 Lucent Technologies

The E911 secured feature must be unlocked on the SFSYS form (5713 Record) before ODA software will accept ESN forms.

1.4 Recent Change View

The corresponding Recent Change View for this form is 9.40.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 (*) ESN

Description: The ESN (Emergency Service Number) is an optional key field that cannot be used in conjunction with the SM or DAS key fields. It represents the proper emergency services a specific address should receive. It is used to obtain routing and selective call transfer telephone numbers.
Valid Entries: 1 - 1023

Data Rules:

Either ESN or SM, but not both, must be entered on this form.

When ESN is entered, DAS must be blank.

2.3 (*) SM

Description: The SM (Switching Module) is an optional key field on this form. It cannot be used in conjunction with the ESN field; however, it can be used with the DAS field.
Valid Entries: 1 - 192

Data Rules:

Either ESN or SM, but not both, must be entered.

Either SM or ESN, but not both, must be entered.

When SM is entered, FLASH must be "N" or blank; the SM must be defined on an EQIM form (5700-1/2 Record) where EQSTATUS is operational ("O").

2.4 (*) DAS

Description: The DAS (Digital Analysis Selector) field is an optional key. It cannot be used with the ESN field but can be used with the SM.

DAS is used to expand the extra selective routing cability when an SM goes into stand-alone mode or when the CMP does not respond to an SM request for an ESN translation. Emergency calls originating on this SM can, in these cases, use the call originator's DAS and SM as keys to retrieve default routing and selective transfer telephone numbers.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

Copyright © 2003 Lucent Technologies

When DAS is entered, SM must be entered and ESN must be blank. The DAS must be defined on a DAS form (5300-1 Record).

2.5 FLASH

Description: Should the caller's NPD and ANI be flashed on the E911 attendant's console at the CAMA PSAP? Flashing indicates to the attendant that the call may require special attention.

Since 911 calls routed with SM standalone data are automatically flashed, this FLASH field applies only to ESN data.
Default: N
Valid Entries: Y, N

Data Rules:

FLASH may be "Y" only when ESN is entered.

2.6 # PRIM PSAP

Description: This field is the Primary PSAP (Public Safety Answering Point) TN, a 7- or 10-digit telephone number first used to route an E911 call.

Required Field.
Valid Entries: 7 or 10 digits

Data Rules:

The PRIM PSAP telephone number must be different than the ALT1 PSAP and ALT2 PSAP telephone numbers described below.

2.7 # ALT1 PSAP

Description: The ALT1 PSAP is the First Alternate PSAP TN, a 7- or 10-digit telephone number used to route the E911 call when routing to the PRIM PSAP telephone number fails.

Required Field.
Valid Entries: 7 or 10 digits

Data Rules:

The ALT1 PSAP telephone number must be different than the PRIM PSAP and ALT2 PSAP telephone numbers.

2.8 ALT2 PSAP

Description: The ALT2 PSAP is the Second Alternate PSAP TN, a 7- or 10-digit telephone number used to route the E911 call when routing to the PRIM PSAP and ALT1 PSAP telephone numbers fail.
Valid Entries: 7 or 10 digits

Data Rules:

The ALT2 PSAP telephone number must be different than the PRIM PSAP and ALT1 PSAP telephone numbers.

- ***NOTE:*** Care should be taken in choosing the PSAP TNs. If the routing for the TN chosen is in a Remote Module, this could impact the ability to complete the E911 call, if the Remote Module is isolated. Verify the routing by reviewing the 5115 HGRPS form (4.14 RC/V) to see what Module (Local or Remote) contains the routing data for the NPA NXX YY?? chosen for the PSAP TN.

Copyright © 2003 Lucent Technologies

CRITICAL DATA INDICATOR

The following (fields Section 2.9 - Section 2.10) support the RC Translations Protection For Highly Critical Elements feature, see Division 2, Section 1BY for more information.

2.9 CRIT IND

Description: This field supports the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT IND field is used to indicate whether the ESN data is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.10 CRIT RMK

Description: This field enhances the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT RMK field is used to enter a remark to explain why this ESN form instance is critical.

Software Release: 5E15 and later
Valid Entries: Enter up to 32 characters

Data Rules:

When the ESN form has the CRIT RMK field entered, the SFSYS form SFID 566 ACT field must be set to "Y".

SELECTIVE TRANSFER TNS

The E911 feature includes a capability called "Selective Transfer". This option allows an E911 attendant to transfer a call by depressing a key for a specific emergency service, for example, "FIRE". The operational software on the switch will associate that key with the telephone number for the fire department in the caller's area.

Up to six Selective Transfer TNs (fields Section 2.11 - Section 2.16) can be specified.

Other translations required for the Selective Transfer option are discussed in Division 2, Section 1BD, "Enhanced 911 Emergency Service".

2.11 TN1

Description: TN1 is the first Selective Transfer Telephone Number, a 7- or 10-digit telephone number used by CAMA PSAP attendants to do selective call transfers.
Valid Entries: 7 or 10 digits

2.12 TN2

Description: TN2 is the second Selective Transfer Telephone Number, a 7- or 10-digit telephone number used by CAMA PSAP attendants to do selective call transfers.
Valid Entries: 7 or 10 digits

2.13 TN3

Description: TN3 is the third Selective Transfer Telephone Number, a 7- or 10-digit telephone number

Copyright © 2003 Lucent Technologies

used by CAMA PSAP attendants to do selective call transfers.
Valid Entries: 7 or 10 digits

2.14 TN4

Description: TN4 is the fourth Selective Transfer Telephone Number, a 7- or 10-digit telephone number used by CAMA PSAP attendants to do selective call transfers.
Valid Entries: 7 or 10 digits

2.15 TN5

Description: TN5 is the fifth Selective Transfer Telephone Number, a 7- or 10-digit telephone number used by CAMA PSAP attendants to do selective call transfers.
Valid Entries: 7 or 10 digits

2.16 TN6

Description: TN6 is the sixth Selective Transfer Telephone Number, a 7- or 10-digit telephone number used by CAMA PSAP attendants to do selective call transfers.
Valid Entries: 7 or 10 digits

SEC. 5AO: 5541 RECORD
EMERGENCY SERVICE CENTRAL OFFICE FORM - ESCO

1. GENERAL

For 5E7 and later software releases, the 5541 Record is available with the E911 feature. When a 911 call arrives at an E911-serving office, the ESCO form is used to retrieve an ESN (Emergency Service Number), NPD (Numbering Plan Digit), and selective routing indicator, based on the originating calling area.

An ESCO is associated with a 911 call through the dialing plan or trunk group. When the call originates in the E911-serving office, the ESCO is determined from the DAS form (5300-1 Record). When the call arrives on a trunk, the ESCO is taken from the TKGRP form (5202 Record) unless an ESCO is not assigned; then, it is taken from the DAS form.

- **WARNING:** For E911-serving offices (E911 OPTION set to "ESA" or "NONESA" on the OFCOPT form), it is recommended that an ESCO be assigned to every DAS form used for voice calls. If a 911 call cannot be associated with an ESCO through the trunk group or dialing plan, the call will be routed using the SM standalone data defined in the ESN form (5540 Record).

See Division 2, Section 1BD, for more information on the E911 feature.

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.41.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * ESCO

Description: For E911 calls, the ESCO (Emergency Service Central Office) is used to retrieve an Emergency Service Number, Numbering Plan Digit, and Selective Routing Indicator. Each ESCO is associated with 911 calls from specific offices or calling areas.

ESCO values are assigned to calling areas through originating trunk groups (on the TKGRP form) or dialing plans (on the DAS form).
Valid Entries: 1-999

2.3 # ESN

Description: An ESN represents a set of Emergency Service Numbers assigned to a specific address. The ESN assigned to the ESCO is used by the operational software when selective routing is not required (SEL RT is "N"), and when a selective routing query to the ESA (E911 Service Adjunct) fails. The ESN determines PSAP (Public Safety Answering Point) and selective call transfer telephone numbers from the ESN form.

Required Field.
Valid Entries: 1 - 1023

Data Rules:

The ESN must be defined on an ESN form (5540 Record).

2.4 # NPD

Copyright © 2003 Lucent Technologies

Description: The NPD (Numbering Plan Digit) represents the NPA of the E911 call originator. The one-digit NPD and the caller's ANI (Automatic Number Identification) are displayed on the attendant's console at an E911 CAMA PSAP.

Required Field.
Valid Entries: 0 - 3

2.5 # SEL RT

Description: Should Selective Routing be performed? When SEL RT is "Y", a query will be sent to the ESA to retrieve an ESN determined by the caller's ANI. When selective routing is not required (SEL RT = "N"), the ESN on this form will be used to route the E911 call.

Required Field.
Valid Entries: Y, N

CRITICAL DATA INDICATOR

The following (fields Section 2.6 - Section 2.7) support the RC Translations Protection For Highly Critical Elements feature, see Division 2, Section 1BY for more information.

2.6 CRIT IND

Description: This field supports the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT IND field is used to indicate whether the emergency service central office data is critical.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.7 CRIT RMK

Description: This field enhances the RC Translations Protection for Highly Critical Elements feature. For more information on this feature, see Division 2, Section 1BY. The CRIT RMK field is used to enter a remark to explain why this ESCO is critical.

Software Release: 5E15 and later
Valid Entries: Enter up to 32 characters

Data Rules:

When the ESCO form has the CRIT RMK field entered, the SFSYS form SFID 566 ACT field must be set to "Y".

LEASED NETWORK NODE MAPPING - LNNODEM

1. GENERAL

The 5542 Record is available with 5E7 and later Software Releases. This capability provides a new automatic Network Management control that provides the ability for the network manager to reserve up to 15 trunks in a trunk group for critical users.

1.1 Recent Change View

The corresponding Recent Change view for this form is 10.28.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *DEST CLLI

Description: This field is used to identify a destination switch for reporting node-to-node measurements by inputting the Far End Common Language Location Identifier.

Software Release: 5E3 and later
Valid Entries: 1 - 11 characters

The format for Far End Common Language Location Identifier is as follows:

Example: CHCGILMOCG0.

DEST CLLI Format

Character Positions	Location	Example
1 - 4	Place	CHCG (Chicago)
5, 6	State	IL (Illinois)
7, 8	Building	MO (Monroe)
9 - 11	Entity	CG0 (Control Group 0)

2.3 #LN ARS IDX

Description: This field is the ARS Index used to route to the Destination switch for collection of the Leased Network node-to-node data.
Valid Entries: 1 - 1000

Data Rules:

Any single value of LN ARS IDX may not be entered on more than one LNNODEM form.

SEC. 5AQ: 5543 RECORD
SCREENING INDEX PARAMETER ASSIGNMENT - SCRIDXPA

1. GENERAL

The 5543 Record is available with the 5E6 and later Software Releases and is used to assign parameters to a line or trunk on a per screening index basis.

The key screening index (SCRN IDX) is assigned to specific LCC (Line Class Code) and RAX (Rate Area) combinations. When an SCRIDXPA form has been entered, the information will apply to all lines defined on the LINE form (5109 Record), MLHLN form (5111 Record), and DSLUSR form (5908 Record) whose LCC and RAX have been assigned this SCRN IDX. In some cases, the attributes may be overridden by attributes on the LINE, MLHLN or DSLUSR forms. See specific field descriptions to determine when attributes may be overridden on a per-line basis. For more information, see D2S4A.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * SCRN IDX

Description: Enter a screening index. This is a screening index associated with a line or trunk that originates a call.

Required Field.
Valid Entries: 1 - 4095.

Data Rules:

SCRN IDXs assigned on SCRIDXPA forms must be defined as SCREENING INDEX on an RAR form.

CPN PRESENTATION

The following fields (Section 2.3 - Section 2.4) are applicable only to the CPNP special feature in determining the presentation status of the calling party.

2.3 PCP ALW

Description: Is per-call privacy general availability allowed with this screening index? This field is applicable only to the CPNP (Calling Party Number Presentation) feature.

In some cases, this field can be used to override the status of PCP general availability as set on the LASSFA form:

1. If LASSFA has PCP set to "SUBSCR", then setting this PCP ALW to "Y" will make PCP generally available for lines assigned this screening index, provided the appropriate LINE, MLHLN or DSLUSR form also has PCP ALW set to "Y" and does not have a subscribed DISP feature.

2. If LASSFA has PCP set to "GENAVAIL", then setting this PCP ALW to "N" will prohibit PCP from being generally available for lines assigned this screening index without a subscribed DISP feature.

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Per-call Privacy is applicable to only certain classes of service. If LCC forms have a SCREENING INDEX defined on an SCRIDXPA form where PCP ALW is set to "Y", CLASS OF SERVICE on the LCC form must be set to one of the following values: ATND, INDIV, 4WINDIV, CHGCALL, ISDN, ISATND, B911, SATSTLN, CALLBK, PBX, TWOPTY, HOTMOTL, COIN, 2PTY.

CPN Presentation is a Secured Feature, and must be purchased before data can be assigned. FEATURE ID 50 on the SFSYS form must be set to "S" before PCP ALW can be set to "Y" and PRIVACY can be entered on a SCRIDXPA form. When FID 50 is not "S", this field will not be used and must be set to "N".

For 5E11 and later, if PCP ALW is "Y", the SCRN IDX field on each SCRIDXPA form must have at least one matching SCREENING INDEX value on the LCC form.

2.4 PRIVACY

Description: Is all-call privacy active? When set to "Y", all calls will be marked with a presentation status of private. When set to "N", all calls will be marked with a presentation status of public. When left blank, presentation status cannot be determined from this attribute on this form (see the information below in this description for interactions with the OFCOPT form).

The PRIVACY field also appears on the LINE, MLHLN and DSLUSR forms, and when entered on one of those forms, it will overrride the value on this SCRIDXPA form for that particular line. When PRIVACY has not been entered on the LINE, MLHLN or DSLUSR forms, the value of PRIVACY on this form will be used.

When PRIVACY has been left blank on both this form and the LINE, MLHLN and DSLUSR forms, the value of DN PRIVACY on the OFCOPT form (5509 Record) will be used to determine the presentation status.
Default: N
Valid Entries: Y, N

Data Rules:

CPN Presentation is a Secured Feature, and must be purchased before data can be assigned. FEATURE ID 50 on the SFSYS form must be set to "S" before PCP ALW can be set to "Y" and PRIVACY can be set on an SCRIDXPA form. When FID 50 is not "S", this field will not be used and cannot be set.

2.5 ANI II DIGITS

Description: This ANI pair will be associated with the screen index for the Flexible ANI Enhancement secured feature. For more information about the feature, see Division 2, Section 4A142.

Software Release: 5E9(1) and later
Valid Entries: 00 - 99

Data Rules:

A value can be entered in this field only if the Flexible ANI Enhancement secured feature has been purchased, and SFID 142 is set to "Y" on the SFSYS form (5713-1 Record).

ASP

The following fields (Section 2.6 - Section 2.8) support the ASP (Advanced Services Platform) Inhibiting of

Copyright © 2003 Lucent Technologies

Originating Busy/No Answer Office Triggers secured feature. For more information concerning this feature, see Division 2, Section 4A210.

2.6 OFC OBL INH

Description: The OFC OBL INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by screen index. It indicates whether the ASP Office Originating Busy Line Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating Busy Line Trigger is inhibited.

For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, S4A210.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC OBL INH must be "N".

2.7 OFC ONA INH

Description: The OFC ONA INH field is used to enhance the functionality provided by the ASP Originating Busy/No Answer Triggers with Extended Ringing feature. This field allows inhibiting by screen index. It indicates whether the ASP Office Originating No Answer Trigger should be inhibited. If this field is set to YES, it means that the ASP Office Originating No Answer Trigger is inhibited.

For more information on the ASP Inhibiting of Originating Busy/No Answer Office Triggers feature, see Division 2, S4A210.

Software Release: 5E11 and later.
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

When the inhibiting feature has not been purchased, OFC ONA INH must be "N".

2.8 OS TRIG INH

Description: This field indicates if the AIN Operator Services trigger is inhibited or not. This field was added to support the AIN Operator Services Trigger feature. See Division 2, Section 4A584.

Software Release: 5E16 and later.
Required Field.
Default: N
Valid Entries: Y, N

2.9 RESTRICT LINE

Description: This field indicates if the origination should be processed as a restricted/special line.

Software Release: 5E16 and later
Valid Entries:

Copyright © 2003 Lucent Technologies

Entry	Defition
blank	Use value from subsequent screening index, or previous if subsequent also has blank value in this field.
Y	Calls are processed as originating from restricted/special line. Also subsequent screening induces will use this value.
N	Calls are processed as originating from non restricted/special line. Also subsequent screening induces will use this value.

SEC. 5AR: 5713-1 RECORD
SECURED FEATURE SYSTEM ASSIGNMENT FORM - SFSYS

1. GENERAL

This form is used to enable secured features. Secured features are the optional service features that can be purchased in addition to the features included in the current Software Release. The secured features need to be enabled by a Lucent Technologies SEE (System Equipment Engineer). Once the SEE determines through the TEO (Telephone Equipment Order) that secured features have been purchased by the customer, the SEE enables those features either through 5ODA or through Recent Change View 8.22. For 5E13 and later, the SFID (Secured Feature ID) number fields increased from 500 to 996 (see Division 2, Section 4A0).

For a new 5ESS Switch office, retrofit or large terminal growth, the SEE populates the SFSYS form, which enables access to the secured features that the office has purchased. Figure 1 gives the SFID number that corresponds to a specific secured feature.

NOTE: For information on a specific secured feature, see Division 2, Section 4A*XX*, where *XX* is the SFID. For example, for information on the secured feature having SFID 34, see Division 2, Section 4A34.

1.1 On-line Informational Software Updates

Informational Software Updates, which are available on SCANS (Software Change Administration and Notification System), provide information on features which are released during a Software Update. In addition to being transmitted to users via SCANS, these Informational Software Updates can also be accessed in the 5ESS Switch electronic media documentation. The Informational Software Updates are located on the menu for 5ESS Switch documentation on-line or on CD-ROM.

1.2 Recent Change View

The corresponding Recent Change View for SFSYS is 8.22.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and the Office Name on each record.

2.2 * MODULE

Description: Enter "OFC", the only entry allowed for this field. This form applies to each SM in the office.

Software Release: 5E5 and later
Required Field.
Valid Entries: OFC

2.3 SFID

Description: The secured feature identification number to be activated. This field is not changeable by the user. It is simply a list of available SFIDs.

2.4 ACT

Description: This field is used to enable or disable access to a secured feature.

To enable a feature, select the SFID number corresponding to the secured feature and enter "Y" in the

Copyright © 2003 Lucent Technologies

ACT field. To disable a feature, select the SFID number corresponding to the secured feature and enter "N" or a "tic" (a single quote) to blank the ACT field.

Figure 1 shows the corresponding SFID number for each secured feature.
Valid Entries: Y, N, or blank

Secured Feature Module Growth Update Automation	NA	5E5 5E6	SU 900085 GA	- GA

NONE = No Informational Software Update issued.

- = Software Release Feature. No Informational Software Update issued.

GA = Feature available in the General Availability Software Release.

NA = Feature no longer uses SFID or is not available for this Software Release.

* = When multiple software updates are listed for a single software release, all of the software updates for that software release must be installed for the feature to function.

FR = Feature is available with a feature release; e.g., FR2 indicates Feature Release 2.

SEC. 5AS: 5713-2 RECORD SPECIAL AND TRANSPARENCY FEATURE OPTIONING SYSTEM FORM - FOSYS

1. GENERAL

For 5E5 through 5E8 Software Releases, the FOSYS (Feature Optioning SYStem) form is used to administer TFOS (Transparency Feature Optioning System) bits for Special and Transparency Features. For 5E9(1) and later, these TFOS IDs (Transparency Feature IDs) are called OFS IDs (Optioned Feature System IDs). Transparency Features have been developed to replicate features that exist on the 1A ESS Switch.

NOTE: The use of OFS IDs is not limited to Transparency Features, and not all Transparency Features use OFS IDs.

OFS IDs can be administered on a per-SM basis. If an FOSYS form exists with MODULE set to an SM number, then that form sets the OFS IDs on that SM. If there is no FOSYS form for a particular SM and an FOSYS form with MODULE set to "OFC" exists, then those settings are used. Therefore, the FOSYS form with MODULE set to "OFC" acts as a default for all SMs without an SM-specific form.

1.1 Initializing OFS Parameters In Newly Grown SMs

For 5E6 and later, this capability provides for the initialization of OFS parameters to either be activated or deactivated during SM growth. Prior to this capability, when a new SM was added to an office, all OFS feature activation status was set by default to be deactivated. This capability allows OFS feature activation status in the new SM to be activated at growth time.

OFS feature parameters are dependent on the state of existing OFS parameters, and features will be activated in the new SM based on the following rules:

Feature Activation During SM Growth

Existing State	Newly Grown SM State
On in all SMs.	On
On in some SMs.	Off
Off in all SMs.	Off

This capability keeps a record in the CMP of the status (either active or inactive) of each SM's optioned features. These settings, called "normal" or "growth" settings, reflect how OFS IDs are set across the office and will be used to initialize OFS IDs in newly grown SMs. For 5E6 and later, when MODULE is "CMP", then the FID (Feature ID) settings have the following meaning:

Valid FEATURE ID Entries For MODULE set to "CMP"

Entry	Definition
Y	Software Release: 5E9(1) and later. Yes. The OFS ID is active in all SMs.
P	Software Release: 5E6 and later. Partially set/active. The OFS ID is set/active in some but not all SMs.
N or Blank	Software Release: 5E9(1) and later. Not active. The OFS ID is not active in any SMs.

These settings are used to initialize OFS IDs in newly grown SMs. When the FID is "P", "N", or blank, the FID on the new SM will be "N" or blank. When a CMP form exists, it must be consistent with other FOSYS form data. When a CMP form does not exist, it will be automatically created during mapping and during the printing of office records.

2. ON-LINE INFORMATIONAL SOFTWARE UPDATES

Informational Software Updates, which are available on SCANS (Software Change Administration And Notification System), provide information on features which are released during a Software Update. In

Copyright © 2003 Lucent Technologies

addition to being transmitted to users via SCANS, these Informational Software Updates can also be accessed in the 5ESS Switch electronic media documentation. The Informational Software Updates are located on the menu for 5ESS Switch documentation on-line or on CD-ROM.

2.1 Recent Change View

For 5E9(1) and later, the corresponding Recent Change View for FOSYS is 8.31.

3. FORM AND RECORD ENTRIES

3.1 BASE AND CONTROL, ESS UNIT

This field is used to enter the Base and Control Number and the Office Name on each record.

3.2 * MODULE

Description: Enter the SM number which will receive its own OFS ID settings. Enter "OFC" to set OFS IDs in all SMs that do not have their own FOSYS form (i.e., all SMs not having their own OFS ID settings will receive the same OFS ID settings). The value of "OFC" is not available after a retrofit because "OFC" will be represented by each SM value. After a retrofit, only the values of 1 - 192 and "CMP" can be referenced directly.

Required Field.

Valid MODULE Entries

Entry	Definition
1 - 192	Set OFS IDs for this SM.
CMP	Use these OFS IDs to initialize OFS IDs in newly grown SMs.
OFC	Set OFS IDs in all SMs that do not have their own FOSYS form.

TRANSPARENCY FEATURE ID LIST

This list of OFS IDs is generally used to enable or option Special and Transparency Features. To enable or option a feature, select the FID that corresponds to the desired OFS ID and enter "Y" in the ACT field. To disable an OFS ID, enter "N" or blank. Figure 1 shows the corresponding number for each Special or Transparency Feature.

3.3 ACT

Description: This is the OFS ID number.

For 5E9(1) and later, FID refers to the OFS ID number only, and ACT is the input field. This indicates that the feature corresponding to that OFS ID is enabled. When MODULE is "CMP", enter "P" to indicate that the feature corresponding to that OFS ID is enabled in some but not all SMs. To disable a OFS ID, enter "N" or blank.
Valid Entries:

Valid ACT Entries

Entry	Definition
Y	Software Release: 5E9(1) and later. Enable feature for this OFS ID.
Blank	Software Release: 5E5 and later. Disable feature for this OFS ID.
N	Software Release: 5E9(1) and later. Disable feature for this OFS ID.
P	The feature is enabled for this OFS ID in some but not all SMs.

Data Rules:

While FIDs can normally be altered on a per SM basis, there are certain FIDs that must be consistent on

Copyright © 2003 Lucent Technologies

an office basis. The FIDs which must be consistent on all FOSYS forms are:

For 5E5: None
- For 5E6: 539, 541, 546, 547, 548, 550, 553, 557
- For 5E7: 541, 546, 547, 548, 550, 553, 557
- For 5E8: 541, 550, 553, 557
- For 5E9(1): 541, 550, 553, 557 692 - 755

When FID is "P", then MODULE must be "CMP".

For 5E6 and later, if all the SMs have a particular FID set to "Y", then on the "CMP" FOSYS form the FID should also be set to "Y". If all the SMs have a particular FID set to blank or "N", then on the "CMP" FOSYS form that FID should also be blank or "N". If the SMs have mixed values of "Y, blank or "N" for a particular FID, then on the "CMP" FOSYS form that FID should be set to "P".

Notes:

SU - Feature available in a Software Update (Formerly called BWM).

GA - Feature available in the General Availability Software Release.

- = No Informational Software Update available.
NA - Not applicable. An optioning bit is no longer needed to option the feature. An alternative mechanism (e.g., a dedicated parameter or an option name on the options views) is now used to option the feature.

Copyright © 2003 Lucent Technologies

(SFxx) - Secured Feature. Optional feature that can be purchased. For more information refer to Division 2, Section 4Axx.

(SpF) - Special Feature. For more information refer to Division 2, Section 4C.
(TF) - Transparency Feature. For more information refer to Division 2, Section 4B0, Page 1.

SEC. 5AT: 5544 RECORD
MH PIPE ASSIGNMENT FORM - EQPIPE

1. GENERAL

The 5544 Record is available with the 5E9(2) and later Software Releases. It is used to assign QLPS (Quad-Link Packet Switch) MH (Message Handler) pipes in an SM-2000 office.

An SM-2000 Message Handler pipe is a high bandwidth path for message transport between a QLPS QTMSLNK (a port connection on the QLPS board of the TMS (Time Multiplex Switch)) and a given QLPS endpoint, that is, an MH (Message Handler) in an SM-2000. It is a physical path that sustains HDLC (High Level Data Link Control) traffic from the QLPS to the MH. When an SM-2000 Message Handler pipe is assigned, the operational software determines what resources are available for the pipe: QTMSLNKs and HDLC channels and timeslots on the QTMSLNKs.

New pipes cannot be assigned during a retrofit.

1.1 Recent Change View

The corresponding Recent Change View for this form is 17.20.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * QLPS NETWORK

Description: Enter the QLPS Board to which the pipe is assigned.

Required Field.
Valid Entries: 0, 1

Data Rules:

Two EQQLPS forms (5854 Record) must exist for the QLPS NETWORK entered here, one each for ONTC SIDE 0 and ONTC SIDE 1. On both forms EQSTAT must be "O".

2.3 * SM2000 SM

Description: Enter the SM-2000 on which the pipe is being defined.

Required Field.
Valid Entries: 1 - 192

Data Rules:

The SM-2000 must be defined on an EQIM form (5700-1/2 Record) where UNIT TYPE is "SM2000" and EQSTATUS is "O".

Each SM-2000 entered defines a MH Pipe from an SM-2000 class processor Switching Module to a QLPS NETWORK. Similarly, each GLOBAL SM, PSU SHELF, and CHANNEL GROUP combination entered on the QPHPIPE form defines a QPH Pipe from a GSM (Global Switching Module) to a QLPS NETWORK. There is a limit to the number of pipes that can be defined on each QLPS NETWORK. There are 30 available pipes for each TMSLINK (QTMSLINK). There are 4 TMSLINKSs defined on each QLPS NETWORK for a total of 120 pipes for each QLPS NETWORK. Each TMSLINK has a total of 224 timeslots

Copyright © 2003 Lucent Technologies

that can be utilized between the 30 pipes defined on that TMSLINK.

SEC. 5AU: 5545 RECORD
LOCAL OFFICE SCREENING - LOCSCRN

1. GENERAL

The 5545 Record is available with the 5E8 Software Release. It is used to screen the NPA (Numbering Plan Area) and Office Codes (NXX) for long distance calls.

This form contains all of the NPA and NPA NXX entries which should be treated as local calls for the CWT (Call Waiting Terminating) with DT (Distinctive Tones) and DR (Distinctive Ringing) for Long Distance Calls.

This form must be populated with all NPA and NPA NXX entries that are considered local to the office. SS7 trunks with a TRKCLS of "LTOLLCON" will check this table for an entry. If an entry is found, the call is considered a local call. If the NPA or NPA NXX is not found on this table, the call is considered long distance and may require distinctive tones for call waiting, or distinctive ringing for long distance calls. For more information on the Call Waiting with Distinctive Tones and Distinctive Ringing for Long Distance Calls feature, see Division 2, Section 4A91.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.26.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *DAS

Description: The DAS field is used to to allow a screening NPA+NXX table for each DAS in the switch. These screening tables are used to determine the call treatment for intra-switch and inter-switch calls. This field supports the Enhanced Long Distance Call Waiting Feature. For more information on this feature see Division 2, Section 4A91.

Software Release: 5E10 and later.
Required Field.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When the DAS field is entered there must be a corresponding DAS value defined on a DAS form.

2.3 * LOCAL NPA

Description: Enter the three digit local NPA that should be considered as local for CWT DT/DR (Call Waiting Distinctive Tones and Distinctive Ringing).

Software Release: 5E8 and later.
Required Field.
Valid Entries: 200 - 999

Copyright © 2003 Lucent Technologies

Data Rules:

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before data can be entered on the LOCSCRN form. Therefore, the ACT field for SFID 91 must be set to "Y" on the SFSYS form (5713-1 Record).

Once a LOCSCRN form is entered without specifying a LOCAL OFC CODE, no other LOCSCRN forms may be entered for the same LOCAL NPA.

2.4 (*) LOCAL OFC CODE

Description: Enter the Local Office Code that is considered as local to this office for CWT DT/DR. A LOCAL OFC CODE that is left blank implies that this is an NPA only case.

Software Release: 5E8 and later.
Valid Entries: 000 - 110, 112 - 999

Data Rules:

LOCAL OFC CODE cannot be equal to 111.

If the LOCAL NPA is entered and the LOCAL OFC CODE is unknown, then LOCAL OFC CODE cannot be entered for the same LOCAL NPA on any other LOCSCRN forms. Once a LOCSCRN form is entered without specifying a LOCAL OFC CODE, no other LOCSCRN forms may be entered for the same LOCAL NPA to specify NPA-NXX combinations.

SEC. 5AV: 5546 RECORD
LASS NPA SPLIT RESOLUTION FORM - NPASPLIT

1. GENERAL

The 5546 Record is available with the 5E6 and later Software Releases and is used to allow the customer to build data for a single NPA split.

The LASS NPA Split Resolution feature is a secured feature that must be purchased by the office and SFID 36 set to "S" on the SFSYS form (Record 5713-1 Record) before data can be entered on the NPASPLIT form.

For 5E6 and 5E7 , there is a one-to-one correspondence between an old NPA and a new NPA. A given old NPA can be split into only one new NPA. A given new NPA can be split from only one old NPA.

In 5E8 and later, there can be a one-to-many and/or a many-to-one relationship between OLD NPA and NEW NPA. A given OLD NPA can be split into more than one NEW NPA.

For example, 312 could be split into both 708 and 815. Two NPASPLIT forms are built with the key sets:

- OLD NPA = 312
- NEW NPA = 708
- OLD NPA = 312
- NEW NPA = 815

A given NEW NPA can be split from more than one OLD NPA

For example, 816 could be split from 217, 319 and 808. Three NPASPLIT forms are built with the key sets:

- OLD NPA = 217
- NEW NPA = 816
- OLD NPA = 319
- NEW NPA = 816
- OLD NPA = 808
- NEW NPA = 816

For 5E8 and later, an NPASPLIT form is entered for every combination of OLD NPA and NEW NPA.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.25.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * OLD NPA

Description: Enter the old NPA (Numbering Plan Area) that is going to be split.

Required Field.
Valid Entries: 200 - 999

2.3 * NEW NPA

Description: Enter the new NPA into which the old NPA is being split.

Required Field.
Valid Entries: 200 - 999

2.4 TCAP VALID (OPTION 1)

Description: Should TCAP (Transaction Capabilities Application Part) validation be used? This option is used when validating the DN in a TCAP query for AC (Automatic Callback), AR (Automatic Recall) and SLE (Screen List Editing). If the TCAP NPA is in the NPA Split Table and TCAP VALID (OPTION 1) is "Y", the TCAP DN will be considered valid if the TCAP DN is valid with either NPA from the NPA Split Table.

For 5E6 and 5E7, this field exists for informational purposes only and is controlled by setting/resetting TFOS ID 546 on the FOSYS form (5713-2 Record). TFOS ID 546 controls the TCAP mismatch option. This option is used for TCAP queries to validate a DN in a TCAP query for AC (Automatic Callback), AR (Automatic Recall) or SLE (Screen List Editing). If TFOS ID 546 is "S" and the NPA in the TCAP query matches an NPA in the NPA split table, the DN in the TCAP query is considered valid.

Required Field.
Default: N
Valid Entries: Y, N

2.5 DIG SCRN (OPTION 2)

Description: Should digit screening be used? This option is used when performing screening. If the calling NPA is in the NPA Split Table and DIG SCRN (OPTION 2) is "Y", screening will use only the last seven digits of the calling DN when searching a screening list. If these seven digits match a DN on the screening list and the calling NPA and the screening list NPA are associated with the same NPA split, a match has been found and actions appropriate to the screening feature are taken. If the calling NPA and the list NPA do not match, the call will fail screening.

For 5E6 and 5E7, this field exists for informational purposes only and is controlled by setting/resetting TFOS ID 547 on the FOSYS form (5713-2 Record). TFOS ID 547 is the screening office option. This option is used when performing screening on an incoming call. If TFOS ID 547 is "S", screening is done on the seven digits, NXX-XXXX, of the calling DN. If the seven digits match a DN on the screening list, and if the calling NPA and the screening list NPA are associated with the same NPA split, a match has been found. If the screening list NPA is not associated with the same NPA split as the calling NPA, screening continues.

Required Field.
Default: N
Valid Entries: Y, N

2.6 SLE DEL (OPTION 3)

Description: Should SLE (Screen List Editing) deletion screening be used? When using SLE to delete a number from a screening list, if the NPA of the number to delete is in the NPA Split Table and SLE DEL

Copyright © 2003 Lucent Technologies

(OPTION 3) is "Y", SLE list delete will use both the old and the new NPA to check if the DN exists on the list.

For 5E6 and 5E7, this field exists for informational purposes only and is controlled by setting/resetting TFOS ID 548 on the FOSYS form (5713-2 Record). TFOS ID 548 is the SLE add/delete option. If TFOS ID 548 is "S" and the NPA of the DN being added/deleted from the screening list is in the NPA split table, SLE uses both old and new NPAs to check if the DN is on the screening list.

Required Field.
Default: N
Valid Entries: Y, N

2.7 SLE CHNG (OPTION 4)

Description: Should SLE (Screen List Editing) change screening be used? When using SLE to add a number to a screening list, if the NPA of the number to add is in the NPA Split Table and SLE CHNG (OPTION 4) is "Y", SLE list add will use both the old and the new NPA to check if the DN already exists on the list. If the DN is on the list with the old NPA, and the user has attempted to add it with the new NPA, SLE list add will update the screening list entry and replace the old NPA with the new NPA.

For 5E6 and 5E7, this field exists for informational purposes only and is controlled by setting/resetting TFOS ID 548 on the FOSYS form (5713-2 Record). TFOS ID 548 is the SLE add/delete option. If TFOS ID 548 is "S" and the NPA of the DN being added/deleted from the screening list is in the NPA split table, SLE uses both old and new NPAs to check if the DN is on the screening list.

Required Field.
Default: N
Valid Entries: Y, N

SEC. 5AW: 5547 RECORD
SRE INCREMENTAL GLOBAL PARAMETERS - SREINCR

1. GENERAL

- **WARNING: This view should not be used to make changes to dynamic memory without first contacting your local support and/or Lucent Technologies support. Once the software resource is increased, it cannot be decreased without a switch initialization.** For more detailed information, refer to Lucent Technologies 235-070-100, Administration and Engineering Guidelines, Sec. 10: SM Resource Utilization; SM Resource Overload Control; Software Engineerable Resources.

The 5547 Record is available with the 5E9(2) and later Software Releases. It is used to increase engineering software resource (memory) parameters per SM (Switching Module) for new start and/or retrofit offices. The SREINCR form is implemented to facilitate efficient utilization of memory per SM. A software resource is defined as a dynamic ODD (Office Dependent Data) data structure, or data block, required to provide the necessary memory to support various service requirements.

1.1 Software Resource Calculation

Effective with 5E9(2) and later, automatic algorithms calculate dynamic software resources per SM based upon factors such as the number of lines, trunks, feature usage, etc. This process is adequate to handle most engineerable software resources and therefore use of ODA to define quantities of software resources should not be necessary.

In some instances, however, this form may be required in order to initially define an allocation of software resources. For example, in the case of the SRVOT software resource, the automatic algorithm's SRVOT calculation may over/under engineer memory per SM in sites that have LS (Listing Services) trunking on a subset of SMs. In this case, this form is used by the administrator to allocate SRVOT software resources in the SMs that serve LS calls. This could also apply to COINOT. SRVOT and COINOT calculations are dependent upon the global values set on the OSPSOPT form (5424 Record) using the LS QUANTUM and COIN MECH fields, respectively (see Division 3, Section 4Y).

The SREINCR INCREMENTAL VALUE field is used to initially define the quantity of a particular software resource, when necessary. The increment range is 0 - 65535; however, there is a maximum quantity of data blocks that can be assigned to a particular software resource, by type of switching module (i.e., SM, SM-2000, or Administrative Module), as indicated in the Maximum Incremental Values table in this section.

1.2 Recent Change View

The Recent Change View for this form is 8.40.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *MODULE

Description: Enter the number to distinguish the SM from the AM (Administrative Module). The 1 - 192 range is used to designate an SM; 193 is used to designate an AM for purposes of updating Software Resources.

Required Field.
Valid Entries: 1 - 193

Data Rules:

Copyright © 2003 Lucent Technologies

If MODULE is 1 - 192 (i.e., SM), there must be a least one EQIM form where the SM field on the EQIM form matches the MODULE field on this form.

If MODULE 1- 192, and SOFTWARE RESOURCE is "CINDX7" or "ENTRY7" and INCREMENTAL VALUE is a non-zero value, there must be at least one TRUNK form specified with a DEN, TEN, or NEN whose first 3 digits are equal to the MODULE value on this form, and the corresponding TKGRP form must have INPULSING and/or OUTPULSING set to "ISUP7".

If MODULE is 193 (i.e., AM), and SOFTWARE RESOURCE is "CINDX7" or "ENTRY7", and INCREMENTAL VALUE is a non-zero value, there must be at least one TRUNK form specified with a DEN, TEN, or NEN, and the corresponding TKGRP form must have INPULSING and/or OUTPULSING set to "ISUP7".

2.3 *SOFTWARE RESOURCE

Description: Enter the Software Resource.

Required Field.

Valid SOFTWARE RESOURCES Entries

Entry	Description
ACRD	Auxiliary Call Record. Used in conjunction with the 5ESS Call Record and the OSPS Call Record to maintain call-related information for the life of an OSPS call.
ADB	Analog Data Block. This dynamic relation contains data used to keep track of an ISDN originated call for the Shared Analog member.
APB	Associated Process Block.
APBUF	Software Release: 5E10 and later. Applications Processors Memory Buffer.
APDU	Software Release: 5E10 and later. An SM loaded with the IDCU or ATS (Automatic Terminal Setup) packages, which is nominally based on the number of TR303 RTs present in the SM and the ATS software (which is a fixed number 60) and this incremental global parameter. This global parameter should be administered by ODA and TM triggers. It is not administered by RC. This count is recalculated during a retrofit. (See also, "MALLOC", "RTLB", and "RTMSGBUF".)
ASPBASE	A global parameter that tracks the current tuple count for the following data relations: Relation Owner for ASP (NS_IDX); Network Services Data Block for ASP (NSDB); Network Services Data Block for ASP Call Legs (NS_BILL).
ASPTP	Software Release: 5E13 and later. A global parameter that contains an SM's current tuple count for relation ASP_TP. It is verified during full initializations and updated as tuples are inserted via trigger functions. For more information, see Division 2, Section 4A301.
ATCALL	Software Release: 5E10 and later. Automatic Call Data for Message Services and Electronic Directory Service.
BRCSDB	BRCS Data Block linked to the DALB for BRCS specific data.
CBDB	Call Buildup Data Block.
CCSSTPDB	CCSSeTuP Data Block.
CFLNT	Call Forwarding Line Termination Data Block.
CFSCOP	Call Forwarding System Process Data Block.
CINDX7	CCS7 Message Consolidation and Acknowledgement Handler CIC List Index Data Block.
CLDB	Call Leg Data Block.
COINOT	OSPS COIN Originating Treatment dynamic data.
CPLR	Coupler Data Block.
CQB	Circuit Queuing Block.
CRD	Call Record Data Block.
CVSTATE	Call Vectoring State.
DALB	D-Channel Application Linkage Block. This dynamic relation contains data to provide a means to route messages from a D-channel to the proper Terminal Process.
DBCND	CLID Calling Number Delivery temporary storage block. This relation is used as a temporary storage structure to store the last incoming calling DN (LICDN). By storing the LICDN, the terminal that has ICLID CND and performs a pickup will be able to display the number.
DISPDB	Display Data Block.
E911DB	E911 Data Block.
ENTRY7	CCS7 MCAH Table Entry Data Block.

Copyright © 2003 Lucent Technologies

FACMSG	Proprietary.
FRNAMA	Software Release: 5E14 and later. AIN Furnish AMA (Automatic Message Accounting) Information. SFID 517.
GPFTIME	Software Release: 5E12 and later. General purpose functional timer data blocks.
LSCMDB	Large Shared Call Model Data Block. This dynamic relation contains data used by the SCM (Shared Call Model). The SCM Data Block is linked to the APB of the terminal process which contains the controlling SCM.
MALLOC	Software Release: 5E10 and later. An SM loaded with the IDCU or ATS (Automatic Terminal Setup) packages, which is nominally based on the number of TR303 RTs present in the SM and the ATS software (which is a fixed number 80) and this incremental global parameter. This global parameter should be administered by ODA and TM triggers. It is not administered by RC. (See also, "APDU", "RTLB", and "RTMSGBUF".)
MDB	Model Data Block.
MSMWIDA	Software Release: 5E10 and later. Message Waiting Indicator Data.
OAOTDB	Software Release: 5E10 and later. Actions Originating Treatment Data Block. Used for incoming calls to OSPS.
ORIGINFO	Software Release: 5E16(2) and later. Supports the Call Transfer Custom Display Enhancement feature. See Division 2, Section 4A588 for information on this feature.
OSPCB	OSDS (Operating System for Distributed Switching) Process Control Block.
OSTCB	OSDS Timer Control Block.
PHDB	Path Data Block.
PHISTORY	Port status history. An IM relation that stores a port's history of out-of-service statuses whenever a port is out-of service for more than one reason. These statuses are called pending statuses.
PTRDB	Pointers to Data Blocks.
PUENTRY	Stores information about the Call Pickup queued call.
QRYDB	Contains data saved across transition strings for the QUERY model.
QVSTATE	Software Release: 5E11 and later. Per SM count of initialized ACD/BRCS queuing and vectoring state tuples. This entry supports the ACD/BRCS Interworking 11 feature. For more information on this feature, see Division 2, Section 4A121.
RTLB	Software Release: 5E10 and later. An SM loaded with the IDCU or ATS (Automatic Terminal Setup) packages
RTMSGBUF	Software Release: 5E10 and later. An SM loaded with the IDCU or ATS (Automatic Terminal Setup) packages
SCMDB	Shared Call Model Data Block. Contains data used by the SCM. The SCM Data Block is linked to the APB of the terminal process which contains the controlling SCM.
SDAP	Speed Dialing Auto-Provisioning Data Block.
SIPTBLK	Software Release: 5E16(2) FR 3 and later. Session Initiation Protocol for Telephony is blank.
SIPTMAP	Software Release: 5E16(2) FR 3 and later. Session Initiation Protocol for Telephony Mapping.
SRVOT	Listing Services and Quantum Call Data for OT and EIS Interface.
STPDB	Proprietary.
TATDB	Terminating Attempt Trigger Data Block.
TNINFO	Notification Information Data Block.

Data Rules:

APBUF:
For 5E10 and later, if "APBUF" is entered, and a non-zero INCREMENTAL VALUE, at least one DSLAP form must exist for each of the SREINCR forms where MODULE on the SREINCR form matches SM on the DSLAP form. In addition, MODULE on the SREINCR form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports Application Processors.

APDU:
If "APDU", "MALLOC", "RTLB" or "RTMSGBUF" (ISDN and TR303 IDCU applications) are entered and have a non-zero INCREMENTAL VALUE, MODULE on the SREINCR form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports ISDN and/or

Copyright © 2003 Lucent Technologies

TR303 IDCU applications.

ASPBASE:
If "ASPBASE" or "TNINFO" is entered, and a non-zero INCREMENTAL VALUE is entered, "ASP OFC" must equal "SSP" or SERV SWITCH PT must equal "Y" on the OFCOPT form (5509 Record) and a DSAPP form (5537 Record) must exist with APPLIC set to "ASP" or "AINR0D1" .

ASPTP:
For 5E13 and later, if "ASPTP" is entered and INCREMENTAL VALUE is not 0, then there must be one and only one DSAPP form with APPLIC equal "AINR0D1".

For 5E13 and later, on the SREINCR form, if SOFTWARE RESOURCE is "ASPTP" and INCREMENTAL VALUE is not 0 , then ASP OFC must be "SSP" on the ASPOPT form.

For 5E13 and later, when the SREINCR form has SOFTWARE RESOURCE set to "ASPTP", and a non-zero INCREMENTAL VALUE, an SFSYS form must exist with SFID 126 ACT set to "Y".

ATCALL:
For 5E10 and later, when SREINCR forms have SOFTWARE RESOURCE set to "ATCALL", and a non-zero INCREMENTAL VALUE, at least one DSLUSR form must have an associated MLHLNFA or LINEFA form with either an EDS feature assigned, whose associated EDSFD form has AUTO CALL set to "Y", or an MSS feature assigned, whose associated MSFD form has AUTO CALL set to "Y" for each of the SREINCR forms where MODULE on the SREINCR form matches OE[1,3] on the DSLUSR form.

In addition, MODULE on the SREINCR form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports ISDN BRCS.

BRCSDB:
For 5E10 and later, if SOFTWARE RESOURCE is set to "BRCSDB", and a non-zero INCREMENTAL VALUE, the MODULE entry must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports ISDN BRCS.

CCSSTPDB:
For 5E11 and later, if MODULE is less than 193 on an SM and SOFTWARE RESOURCE is set to "CCSSTPDB", and a non-zero INCREMENTAL VALUE, there must be at least one TRUNK form specified with a DEN, TEN, or NEN whose first 3 digits are equal to the MODULE on the SREINCR form, and the corresponding TKGRP form must have INPULSING set to "ISUP7".

DISPDB:
For 5E10 and later, if SOFTWARE RESOURCE is set to "DISPDB", and a non-zero INCREMENTAL VALUE, the MODULE entry must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports ISDN BRCS.

FRNAMA:
If "FRNAMA" is entered and INCREMENTAL VALUE is not 0, ASP OFC on the ASPOPT form must be "SSP".

MALLOC:
"APDU", "MALLOC", "RTLB" or "RTMSGBUF" are used for ISDN and TR303 IDCU applications. If "APDU", "MALLOC", "RTLB" or "RTMSGBUF" are entered and have a non-zero INCREMENTAL VALUE, MODULE on the SREINCR form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports ISDN and/or TR303 IDCU applications.

MSMWIDA:
For 5E10 and later, when SREINCR forms have SOFTWARE RESOURCE set to "MSMWIDA", and a non-zero INCREMENTAL VALUE, at least one DSLAP form with ISVM set to "Y", must exist for each of the SREINCR forms where MODULE on the SREINCR form matches SM on the DSLAP form. In addition, MODULE on the SREINCR form must have a corresponding EQIM form with the same SM

Copyright © 2003 Lucent Technologies

value where the value entered for CONFIGURATION supports Application Processors.

QVSTATE:
If "QVSTATE" is entered and has a non-zero INCREMENTAL VALUE, an SFSYS form must exist with SFID 121 ACT set to "Y".

RTLB and RTMSGBUF:
"APDU", "MALLOC", "RTLB" or "RTMSGBUF" are used for ISDN and TR303 IDCU applications. If "APDU", "MALLOC", "RTLB" or "RTMSGBUF" are entered and have a non-zero INCREMENTAL VALUE, MODULE on the SREINCR form must have a corresponding EQIM form with the same SM value where the value entered for CONFIGURATION supports ISDN and/or TR303 IDCU applications.

TATDB:
If SOFTWARE RESOURCE is set to "TATDB" and a non-zero INCREMENTAL VALUE, then an OFCOPT form must exist with ASP OFC is set to "SSP" or SERV SWITCH PT is set to "Y", and a DSAPP form must also exist with APPLIC set to "AINR0D1".

TNINFO:
If "TNINFO" (or "ASPBASE") in entered, and a non-zero INCREMENTAL VALUE is entered, "ASP OFC" must equal "SSP" or SERV SWITCH PT must equal "Y" on the OFCOPT form (5509 Record) and a DSAPP form (5537 Record) must exist with APPLIC set to "ASP" or "AINR0D1".

2.4 #INCREMENTAL VALUE

Description: This field is used to define the available data blocks for the software resource and module entered. Enter the resource quantity desired.

Required Field.
Valid Entries: 0 - 65535 (increments of 50)

Data Rules:

For 5E10 and later, a list of all the possible values for SOFTWARE RESOURCE field on SREINCR form where MODULE is not equal to 193 (on an SM), and the corresponding maximum allowed on the INCREMENTAL VALUE is shown below. The maximum may vary depending on the types of SWITCHING MODULE.

SM denotes those SREINCR forms where the associated EQIM form, found by matching SM to MODULE, have UNIT TYPE set to a value other than "SM2000". SM2000 denotes those SREINCR forms where the associated EQIM form have UNIT TYPE set to "SM2000".

SEC. 5AX: 5548 RECORD
SLIM OE LIST - SLLEN

1. GENERAL

The SLLEN form (5548 Record) is available with the 5E10 and later Software Releases. It is used to define the range of subscriber office equipment numbers that are to be tested by the SLIM2 (Subscriber Line and Instrument Measurements-2) feature, executed in the "Routine Mode".

The "Routine Mode" of the SLIM2 feature is a secured feature and therefore SFID ACT 230 must be "Y" on the SFSYS form (5713-1 Record).

For more information on SLIM2, see Divison 2, Section 4A230.

1.1 Recent Change View

The corresponding Recent Change View for this form is 14.13.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *OE LIST ID

Description: Enter the OE LIST ID.

Required Field.
Valid Entries: 1 - 8

2.3 *ENTRY NUMBER

Description: Enter the entry number.

Required Field.
Valid Entries: 1 - 60

2.4 #START OE

Description: Enter the originating equipment type.

Required Field.

Valid START OE Entries

Entry	Definition
A	Software Release: 5E12 and later. TR-303 on DNU-S (i.e., INEN).
C	The TN is associated with ISLU Line Card Equipment Number and Number field must contain an 8-digit equipment number.
E	Software Release: 5E11 and later. The TN is associated with an AIU (Access Interface Unit).
G	The TN is associated with an analog IDCU Equipment Number and Number field must contain an 11-digit equipment number (GEN) for a remote terminal or a PUB43801.
L	The TN is associated with an analog-type Line Equipment Number and Number field must contain a 10-digit LEN.
S	The TN is associated with SLC-96 Equipment Number and Number field must contain an 8-digit SLEN.

Copyright © 2003 Lucent Technologies

2.5 END OE

Description: Enter the ending originating equipment type.

Required Field.
Valid Entries: (see table above)

Data Rules:

When END OE is specified, the START OE must be specified.

The END OE value must equal the START OE value.

SEC. 5AY: 5549 RECORD
SLIM TEST SET - SLTSET

1. GENERAL

The SLTSET form (5549 Record) is available with the 5E10 and later Software Releases. It is used to define the types of SLIM (Subscriber Line and Instrument Measurements) tests that are to be performed during a SLIM2 test session, executed in the "Routine Mode". Several sets can be defined with each set having different tests associated with it.

The "Routine Mode" of the SLIM2 feature is a secured feature and therefore SFID ACT 230 must be "Y" on the SFSYS form (5713-1 Record).

For more information on SLIM2, see Divison 2, Section 4A230.

1.1 Recent Change View

The corresponding Recent Change View for this form is 14.14.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TEST SET ID

Description: Enter the identification number for the test set.

Required Field.
Valid Entries: 1 - 8

FOREIGN VOLTAGE

The following fields (Section 2.3 - Section 2.8) define what foreign voltage tests are performed.

2.3 T01ONV

Description: The AC tip to ground is a non-entry field which is defaulted to "Y".

2.4 T02ONV

Description: The AC ring to ground is a non-entry field which is defaulted to "Y".

2.5 T03ONV

Description: The AC tip to ring is a non-entry field which is defaulted to "Y".

2.6 T04ONV

Description: The DC tip to ground is a non-entry field which is defaulted to "Y".

2.7 T05ONV

Description: The DC ring to ground is a non-entry field which is defaulted to "Y".

2.8 T06ONV

Copyright © 2003 Lucent Technologies

Description: The DC tip to ring is a non-entry field which is defaulted to "Y".

INSULATION RESISTANCE

The following fields (Section 2.9 - Section 2.11) define what insulation resistance tests are performed.

2.9 T01ONR

Description: Execute insulation resistance on hook tip to ground test?

Required Field.
Default: N
Valid Entries: Y, N

2.10 T02ONR

Description: Execute insulation resistance on hook ring to ground test?

Required Field.
Default: N
Valid Entries: Y, N

2.11 T03ONR

Description: Execute insulation resistance on hook tip to ring test?

Required Field.
Default: N
Valid Entries: Y, N

CAPACITANCE

The following fields (Section 2.12 - Section 2.14) define what capacitance tests are performed.

2.12 T01ONC

Description: Execute capacitance on hook tip to ground test?

Required Field.
Default: N
Valid Entries: Y, N

2.13 T02ONC

Description: Execute capacitance on hook ring to ground test?

Required Field.
Default: N
Valid Entries: Y, N

2.14 T03ONC

Description: Execute capacitance on hook tip to ring test?

Required Field.
Default: N
Valid Entries: Y, N

SEC. 5AZ: 5554-1/2 RECORD
SLIM THRESHOLD LIST - SLTHRS

1. GENERAL

The SLTHRS form (5554-1/2 Record) is available with the 5E10 and later Software Releases. It supports the SLIM2 (Subscriber Line and Instrument Measurement-2) feature. It is used to define threshold values for the various tests performed during SLIM2 testing to determine the tolerance for pass/fail indications.

1.1 Routine and Operator Modes

The threshold values which are available to an SM (Switching Module) are determined by whether testing is executed in "Routine Mode" or "Operator Mode". The "Routine Mode" of SLIM2 is a secured feature which allows threshold values to be set in a range of values, outside of the initial default values. In order to execute testing using the Routine Mode, SFID ACT 230 on the SFSYS form (5713-1 Record) must be set to "Y".

The "Operator Mode" of SLIM2 is not a secured feature and allows only the default values to be used during SLIM2 testing. To execute SLIM2 in the Operator Mode, this is the only SLIM2-related view which can be entered; all others are blocked.

For more information on SLIM2, see Division 2, Section 4A230.

1.2 Recent Change View

The corresponding Recent Change View for this form is 14.15.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *THRESHOLD LIST ID

Description: Enter the identification number for the Threshold List.

Required Field.
Default: 0
Valid Entries: 0 - 8

Data Rules:

A SLTHRS form with a THRESHOLD LIST ID of 0 must always exist for SLIM2 OPERATOR mode, that is, a THRESHOLD ID of 0 is required with all threshold values set to their defaults.

FOREIGN VOLTAGE TESTS

The following fields (Section 2.3 - Section 2.14) define the low and high thresholds for foreign voltage tests.

2.3 LOW T01ONVL

Description: Enter the desired threshold value for the AC tip to ground in volts.

Required Field.
Default: 0

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 500

Data Rules:

T01ONVL must be less than or equal to T01ONVH.

2.4 HIGH T01ONVH

Description: Enter the desired threshold value for the AC tip to ground in volts.

Required Field.
Default: 7
Valid Entries: 0 - 500

2.5 LOW T02ONVL

Description: Enter the desired threshold value for the AC ring to ground in volts.

Required Field.
Default: 0
Valid Entries: 0 - 500

Data Rules:

T02ONVL must be less than or equal to T02ONVH.

2.6 HIGH T02ONVH

Description: Enter the desired threshold value for the AC ring to ground in volts.

Required Field.
Default: 7
Valid Entries: 0 - 500

2.7 LOW T03ONVL

Description: Enter the desired threshold value for the AC tip to ring in volts.

Required Field.
Default: 0
Valid Entries: 0 - 500

Data Rules:

T03ONVL must be less than or equal to T03ONVH.

2.8 HIGH T03ONVH

Description: Enter the desired threshold value for the AC tip to ring in volts.

Required Field.
Default: 7
Valid Entries: 0 - 500

2.9 LOW T04ONVL

Description: Enter the desired threshold value for the DC tip to ground in volts.

Copyright © 2003 Lucent Technologies

Required Field.
Default: -50
Valid Entries: -999 - 999

Data Rules:

T04ONVL must be less than or equal to T04ONVH.

2.10 HIGH T04ONVH

Description: Enter the desired threshold value for the DC tip to ground in volts.

Required Field.
Default: 100
Valid Entries: -999 - 999

2.11 LOW T05ONVL

Description: Enter the desired threshold value for the DC ring to ground in volts.

Required Field.
Default: -50
Valid Entries: -999 - 999

Data Rules:

T05ONVL must be less than or equal to T05ONVH.

2.12 HIGH T05ONVH

Description: Enter the desired threshold value for the DC ring to ground in volts.

Required Field.
Default: 100
Valid Entries: -999 - 999

2.13 LOW T06ONVL Required Field.

Description: Enter the desired threshold value for the DC tip to ring in volts.

Data Rules:

T06ONVL must be less than or equal to T06ONVH.

2.14 HIGH T06ONVH Required Field.

Description: Enter the desired threshold value for the DC tip to ring in volts.

INSULATION RESISTANCE TESTS

The following fields (Section 2.15 - Section 2.22) define the low and high thresholds for the Insulation Resistance Tests.

2.15 LOW T01ONRL

Description: Enter the desired threshold value for the tip to ground in kilohms.

Required Field.

Copyright © 2003 Lucent Technologies

Default: 30
Valid Entries: 1 - 16000

Data Rules:

T01ONRL must be less than or equal to T01ONRH.

2.16 HIGH T01ONRH

Description: Enter the desired threshold value for the tip to ground in kilohms.

Required Field.
Default: 50
Valid Entries: 1 - 16000

2.17 LOW T02ONRL

Description: Enter the desired threshold value for the ring to ground in kilohms.

Required Field.
Default: 30
Valid Entries: 1 - 16000

Data Rules:

T02ONRL must be less than or equal to T02ONRH.

2.18 HIGH T02ONRH

Description: Enter the desired threshold value for the ring to ground in kilohms.

Required Field.
Default: 50
Valid Entries: 1 - 16000

2.19 LOW T03ONRL

Description: Enter the desired threshold value for the tip to ring in kilohms.

Required Field.
Default: 30
Valid Entries: 1 - 16000

Data Rules:

T03ONRL must be less than or equal to T03ONRH.

2.20 HIGH T03ONRH

Description: Enter the desired threshold value for the tip to ring in kilohms.

Required Field.
Default: 50
Valid Entries: 1 - 16000

2.21 LOW T04ONRL

Description: Enter the desired threshold value for the monitor for short in kilohms.

Copyright © 2003 Lucent Technologies

Required Field.
Default: 35
Valid Entries: 35 - 65

Data Rules:

T04ONRL must be less than or equal to T04ONRH.

2.22 HIGH T04ONRH

Description: Enter the desired threshold value for the monitor for short in kilohms.

Required Field.
Default: 65
Valid Entries: 35 - 65

CAPACITANCE TESTS

The following fields (Section 2.23 - Section 2.28) define the low and high threshold values for Capacitance Tests.

2.23 LOW T01ONCL

Description: Enter the desired threshold value for the tip to ground in nanofarads in increments of 10.

Required Field.
Default: 0
Valid Entries: 0 - 6000 (increments of 10)

Data Rules:

T01ONCL must be less than or equal to T01ONCH.

2.24 HIGH T01ONCH

Description: Enter the desired threshold value for the tip to ground in nanofarads in increments of 10.

Required Field.
Default: 500
Valid Entries: 0 - 6000 (increments of 10)

2.25 LOW T02ONCL

Description: Enter the desired threshold value for the ring to ground in nanofarads in increments of 10.

Required Field.
Default: 0
Valid Entries: 0 - 6000 (increments of 10)

Data Rules:

T02ONCL must be less than or equal to T02ONCH.

2.26 HIGH T02ONCH

Description: Enter the desired threshold value for the ring to ground in nanofarads in increments of 10.

Required Field.

Copyright © 2003 Lucent Technologies

Default: 500
Valid Entries: 0 - 6000 (increments of 10)

2.27 LOW T03ONCL

Description: Enter the desired threshold value for the tip to ring in nanofarads in increments of 10.

Required Field.
Default: 0
Valid Entries: 0 - 6000 (increments of 10)

Data Rules:

T03ONCL must be less than or equal to T03ONCH.

2.28 HIGH T03ONCH

Description: Enter the desired threshold value for the tip to ring in nanofarads in increments of 10.

Required Field.
Default: 3000
Valid Entries: 0 - 6000 (increments of 10)

OFF-HOOK TESTS

The following fields (Section 2.29 - Section 2.42) define the low and high threshold values for the Off-Hook Tests.

2.29 LOW T01OFL

Description: Enter the desired threshold value for the loop resistance in ohms.

Required Field.
Default: 150
Valid Entries: 0 - 3000

Data Rules:

T01ONFL must be less than or equal to T01ONFH.

2.30 HIGH T01OFH

Description: Enter the desired threshold value for the loop resistance in ohms.

Required Field.
Default: 2000
Valid Entries: 0 - 3000

2.31 LOW T02OFL

Description: Enter the desired threshold value for the dial speed in tenths of a hertz.

Required Field.
Default: 80
Valid Entries: 50 - 250 (in tenths of a hertz)

Data Rules:

Copyright © 2003 Lucent Technologies

T02ONFL must be less than or equal to T02ONFH.

2.32 HIGH T02OFH

Description: Enter the desired threshold value for the dial speed in tenths of a hertz.

Required Field.
Default: 120
Valid Entries: 50 - 250 (in tenths of a hertz)

2.33 LOW T03OFL

Description: Enter the desired threshold value for the dial pulse ratio percentage.

Required Field.
Default: 50
Valid Entries: 5 - 95

Data Rules:

T03ONFL must be less than or equal to T03ONFH.

2.34 HIGH T03OFH

Description: Enter the desired threshold value for the dial pulse ratio percentage.

Required Field.
Default: 70
Valid Entries: 5 - 95

2.35 LOW T04OFL

Description: Enter the desired threshold value for the key tone level in dBm.

Required Field.
Default: -20
Valid Entries: -26 - 3

Data Rules:

T04ONFL must be less than or equal to T03ONFH.

2.36 HIGH T04OFH

Description: Enter the desired threshold value for the key tone level in dBm.

Required Field.
Default: 0
Valid Entries: -26 - 3

2.37 LOW T05OFL

Description: Enter the desired threshold value for the key tone difference in dBm.

Required Field.
Default: -11
Valid Entries: -26 - 26

Copyright © 2003 Lucent Technologies

Data Rules:

T05ONFL must be less than or equal to T05ONFH.

2.38 HIGH T05OFH

Description: Enter the desired threshold value for the key tone difference in dBm.

Required Field.
Default: 11
Valid Entries: -26 - 26

2.39 LOW T06OFL

Description: Enter the desired threshold value for the key tone frequency in tenths of a percent.

Required Field.
Default: 982
Valid Entries: 900 - 1100 (in tenths of a percent)

Data Rules:

T06ONFL must be less than or equal to T06ONFH.

2.40 HIGH T06OFH

Description: Enter the desired threshold value for the key tone frequency in tenths of a percent.

Required Field.
Default: 1018
Valid Entries: 900 - 1100 (in tenths of a percent)

2.41 LOW T07OFL

Description: Enter the desired threshold value for the flash hook in milliseconds.

Required Field.
Default: 200
Valid Entries: 40 - 1500

Data Rules:

T07ONFL must be less than or equal to T03ONFH.

2.42 HIGH T07OFH

Description: Enter the desired threshold value for the flash hook in milliseconds.

Required Field.
Default: 1100
Valid Entries: 40 - 1500

SEC. 5BA: 5555 RECORD
SLIM TEST JOB - SLJOB

1. GENERAL

The SLJOB form (5555 Record) is available with the 5E10 and later Software Releases. It is used to specify test jobs for scheduled SLIM2 (Subscriber Line and Instrument Measurements-2) test sessions, executed in the "Routine Mode". This form relates test sets, threshold lists, equipment numbers, etc., to be tested and the types of lines to be allowed to be tested. Up to 240 jobs can be defined to test subscriber line and trunks.

The "Routine Mode" of the SLIM2 feature is a secured feature and therefore SFID ACT 230 must be "Y" on the SFSYS form (5713-1 Record).

For more information on SLIM2, see Division 2, Section 4A230.

1.1 Recent Change View

The corresponding Recent Change View for this form is 14.16.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *JOB ID

Description: Enter the JOB ID.

Required Field.
Valid Entries: 1 - 240

2.3 #TEST SET ID

Description: Enter the Test Set ID number.

Required Field.
Valid Entries: 1 - 8

2.4 THRESHOLD LIST ID

Description: Enter the Threshold List ID.

Required Field.
Default: 0
Valid Entries: 0 - 8

2.5 #START OE

Description: Enter the originating equipment type and number.

Required Field.

Valid START OE Entries

Entry	Definition
A	Software Release: 5E12 and later. TR-303 on DNU-S (i.e., INEN).

Copyright © 2003 Lucent Technologies

C	The TN is associated with ISLU Line Card Equipment Number and Number field must contain an 8-digit equipment number.
E	Software Release: 5E11 and later: The TN is associated with an AIU (Access Interface Unit).
G	The TN is associated with an analog IDCU Equipment Number and Number field must contain an 11-digit equipment number (GEN) for a remote terminal or a PUB43801.
L	The TN is associated with an analog-type Line Equipment Number and Number field must contain a 10-digit LEN.
S	The TN is associated with SLC-96 Equipment Number and Number field must contain an 8-digit SLEN.

Data Rules:

If START OE is entered, OE LIST ID must be blank.

2.6 NUMBER

Description: The Office Equipment Number.
Valid Entries: An 8-, 10- or 11-digit number in one of the following formats.

If DSL OE is set to "A", the INEN Equipment Number consists of:

TR-303 on DNU-S, Type A

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1-192
Unit Number	DNUS	X	0-7
Remote Terminal	RT	XX	01-99
Line	LINE	XXXX	0001-2048

If OE TYPE is "C", this ISLU Line Card Equipment Number consists of:

OE NUMBER, TYPE C

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Line Unit	LU	X	0 - 7
Line Group Controller	LGC	XX	00 - 15
Line Card	LC	XX	00 - 31

Data Rules:

The ISLU Line Card must be defined on an ISLULC form (5942 Record) with EQST set to "O" and TYPE set to "ZLC".

If OE TYPE is "E", this AIU Equipment Number consists of:

OE NUMBER, TYPE E

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	AIU	XXX	000 - 042
Pack	PACK	XX	00 - 19
Circuit	CKT	XX	00 - 31
			Coin 00 - 15

If OE TYPE is "G", this IDCU Equipment Number residing on a PUB43801 consists of:

OE NUMBER, TYPE G - PUB43801

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	X	0 - 7 (5E9(1)and earlier)
		XXX	000 - 042 (5E9(2) and later)
DS1	DS1	XX	51 - 90
Line	LINE	XXXX	0001 - 0024

Copyright © 2003 Lucent Technologies

OE NUMBER, TYPE G - Remote Terminal			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Unit Number	IDCU	X	0 - 7 (5E9(1)and earlier)
		XXX	000 - 042 (5E9(2) and later)
DS1	DS1	XX	51 - 90
Line	LINE	XXXX	0001 - 0024

If OE TYPE is "L", this Line Unit Equipment Number consists of:

OE NUMBER, TYPE L			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Line Unit	LU	X	0 - 7 (5E9(1)and earlier)
		XXX	000 - 042 (5E9(2) and later)
Concentrator	CONC	X	0 - 9
Switch Group	SWG	X	0 - 1
Switch	SW	X	0 - 7
Level	LEV	X	0 - 3

If OE TYPE is "S", this SLC Equipment Number consists of:

OE NUMBER, TYPE S			
Equipment		**Format**	**Valid Entries**
Switching Module	SM	XXX	1 - 192
Digital Carrier Line Unit	DCLU	X	
Remote Terminal	RT	XX	01 - 06
Line	LINE	XX	01 - 96

2.7 END OE

Description: Enter the ending originating equipment type and number.

Required Field.
Valid Entries: (see tables above)

Data Rules:

The END OE type must be the same as the START OE type.

The END OE SM value must equal the START OE SM value.

When END OE is specified, the START OE must be specified.

2.8 OE LIST ID

Description: Enter the Test Set ID number.

Required Field.
Valid Entries: 1 - 8

Data Rules:

If OE LIST ID is entered, START OE must be blank.

2.9 OOS ALLOWED

Description: Do you want to test out of service lines within a given OE range?

Required Field.

Copyright © 2003 Lucent Technologies

Default: N
Valid Entries: Y, N

2.10 PBX ALLOWED

Description: Do you want to test private branch exchange lines within a given OE range?

Required Field.
Default: Y
Valid Entries: Y, N

SEC. 5BB: 5556 RECORD
SLIM TEST SESSION - SLSESS

1. GENERAL

The SLSESS form (5556 Record) is available with the 5E10 and later Software Releases. It supports the SLIM2 (Subscriber Line and Instrument Measurements-2) feature, executed in the "Routine Mode". The SLESS form is used to define the schedule that test jobs will be executed. Up to six different jobs can be scheduled, but the actual number of jobs that can be executed is dependent upon the number of SLIM devices that exist and the quantity of OEs and tests assigned to each job.

The "Routine Mode" of the SLIM2 feature is a secured feature and therefore SFID ACT 230 must be "Y" on the SFSYS form (5713-1 Record).

For more information on the SLIM2 feature, see Divison 2, Section 4A230.

1.1 Recent Change View

The corresponding Recent Change View for this form is 14.17.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TEST SESSION ID

Description: Enter the identification number of the test session.

Required Field.
Valid Entries: 1 - 40

2.3 #TEST JOB 1

Description: Enter the number for test job 1.

Required Field.
Valid Entries: 1 - 240

2.4 TEST JOB 2

Description: Enter the number for test job 2.
Valid Entries: 1 - 240

2.5 TEST JOB 3

Description: Enter the number for test job 3.
Valid Entries: 1 - 240

2.6 TEST JOB 4

Description: Enter the number for test job 4.
Valid Entries: 1 - 240

2.7 TEST JOB 5

Copyright © 2003 Lucent Technologies

Description: Enter the number for test job 5.
Valid Entries: 1 - 240

2.8 TEST JOB 6

Description: Enter the number for test job 6.
Valid Entries: 1 - 240

2.9 START DATE

Description: Enter the date to start the test session.
Valid Entries: MMDDYY

Data Rules:

If START DATE is known, START TIME and STOP TIME must also be known.

If START DATE is unknown, START TIME and STOP TIME must also be unknown.

2.10 START TIME

Description: Enter the time to start the test session, in military time.
Valid Entries: HH:00-23; MM:00-59

2.11 STOP TIME

Description: Enter the time to stop the test session, in military (24 hour) time.
Valid Entries: HH:00-23; MM:00-59

2.12 PERIODICITY

Description: Enter the test session periodicity.

Required Field.
Default: ONCE
Valid Entries:

Valid PERIODICITY Entries

Entry	Definition
O	Once.
D	Daily.
W	Weekly.
M	Monthly.

SEC. 5BC: 5557 RECORD
METALLIC COMPENSATION VALUES - MTBCOMP

1. GENERAL

The MTBCOMP form (5557 Record) is available with the 5E10 and later Software Releases. It is used to define the SLIM2 (Subscriber Line and Instrument Measurements-2) metallic testing compensation values. The SLIM2 feature operates in either the "Routine Mode" or "Operator Mode". The Routine Mode is a secured feature and therefore SFID ACT 230 must be "Y" on the SFSYS form (5713-1 Record) to activate Routine Mode. When this form is defined, there must be a corresponding entry where MTBCOMP SM, UNIT TYPE, and UNIT NO have a match on one of the following equipment forms:

Form Name	Record Number	SM	UNIT TYPE	UNIT NO
EQRISLU	5732	IM	RISLU	0 - 104
EQISLU	5731	IM	(multiple unit types)	0 - 104
EQLU	5710	IM	(multiple unit types)	0 - 104
EQAIU	5745	SM	(multiple unit types)	0 - 104
EQDNUS	5855	SM	DNUS	0 - 104
EQDLCU	5809	IM	DCLU	0 - 104
EQTU	5720	IM	SN100	0 - 104
EQIDCU	5846	SM	IDCU	0 - 104

For more information on SLIM2, see Division 2, Section 4A230.

1.1 Recent Change View

There is no corresponding Recent Change View for this form as once initially defined these values can only be changed via ODA (Office Data Administration).

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *SM

Description: Enter the Switching Module number.

Required Field.

2.3 *UNIT TYPE

Description: Enter the type of unit.

Required Field.

Valid LINE UNIT TYPE Entries

Entry	Definition
4AB1	2-shelf Model 1 Line Unit.
4AC1	2-shelf Model 2 Line Unit.
4AD1	2-Shelf Model 3 Line Unit. Provides a 10:1 concentration ratio.
ISLU	Integrated Services Line Unit.
ISLU2	Integrated Services Line Unit 2.
RISLU	Remote Integrated Services Line Unit.
IDCU	Integrated Digital Carrier Unit.
DCLU	Digital Carrier Line Unit.
SN100	Trunk Unit.
AIU	Access Interface Unit

2.4 *UNIT NUMBER

Copyright © 2003 Lucent Technologies

Description: Enter the Unit Number.

Software Release: 5E12 and later
Required Field.
Valid Entries: 0 - 104

2.5 LOOPRES

Description: This field was edited for spacing (readability) in 5E12. See LOOP RES below.

2.6 LOOP RES

Description: Enter the loop resistance value in ohms.
Valid Entries: 0 - 8000
Default Value:
- 5E12 and later: 0

Data Rules:
LOOPRES must be 0 for UNIT TYPEs of "4AD1", "4AN1", "4AC1", "4AB1", "ISLU", "SN100", or "AIU".

2.7 AB2ECAP

Description: This field was edited for spacing (readability) in 5E12. See AB2E CAP below.

2.8 AB2E CAP

Description: Enter the tip to ring leg to ground in nanofarads.
Valid Entries: 0 - 6000 (in increments of 10)

Data Rules:
AB2ECAP must be 110 for UNIT TYPEs of "4AD1", "4AN1", "4AC1", "4AB1", "ISLU", "SN100", or "AIU".

2.9 A2BCAP

Description: This field was edited for spacing (readability) in 5E12. See A2B CAP below.

2.10 A2B CAP

Description: Enter the tip to ring capacitance in nanofarads.
Valid Entries: 0 - 6000 (in increments of 10)
Default Value:
- 5E12 and later: 0

Data Rules:
AB2ECAP must be 0 for UNIT TYPEs of "4AD1", "4AN1", "4AC1", "4AB1", "ISLU", "SN100", or "AIU".

2.11 LEAKT2G

Description: For 5E12 and later, this field was renamed to LEAK T2G. See LEAK A2E for usage information.

2.12 LEAK A2E

Description: Enter the tip leg to ground leakage resistance in kilo-ohms.
Valid Entries: -1 - 50000000

Copyright © 2003 Lucent Technologies

Default value:
- 5E12 and later: 50000000

2.13 LEAKR2G

Description: For 5E12 and later, this field was renamed to LEAKB 2E. See LEAKB 2E for usage information.

2.14 LEAKB 2E

Description: Enter the ring leg to ground leakage resistance in kilo-ohms.
Valid Entries: -1 - 50000000
Default value:
- 5E12 and later: 50000000

2.15 LEAKT2R

Description: For 5E12 and later, this field was renamed to LEAKA 2B. See LEAKA 2B for usage information.

2.16 LEAKA 2B

Description: Enter the tip leg to ring leakage resistance in kilo-ohms.
Valid Entries: -1 - 50000000
Default value:
- 5E12 and later: 50000000

2.17 FREQLOSS

Description: This field name was edited for spacing (readability) in 5E12. See FREQ LOSS below.

2.18 FREQ LOSS

Description: Enter the frequency loss in kHz.
Valid Entries: 0 - 1000000

SEC. 5BD: 5560 RECORD
AUTOMATIC NUMBER IDENTIFICATION SWITCHING MODULE FORM - ANIMOD

1. GENERAL

The 5560 Record is applicable to 5E10 and later Software Releases and is used to define the SM (Switch Module) which contains Outbound Services data for the given ANI (Automatic Number Identification). This form supports the TDX (Toll Digital Exchange) Special Feature in a LDP (Long Distance Platform) office.

The TDX ANI (Automatic Number Identification) Table Processing feature is part of the Long Distance Platform Feature set. See Div. 2 Sec 4A165 (Toll Digital Exchange Basic Call Processing For Toll 5ESS Switch) for details.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.50

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * NPA

Description: The NPA field is used to specify the Numbering Plan Area code.

Required Field.
Valid Entries: 200 - 999.

2.3 * NXX

Description: The NXX field is used to specify the Office code associated with this NPA. Enter the NPA portion of the ANI.

Required Field.
Valid Entries: 000 - 999.

2.4 # SM

Description: The SM field is used to specify the switching module where the ANI Table resides for this NPA and NXX. If the SM field is left blank, an SM is automatically selected. Subsequent Recent Change inserts with SM set to blank will cause RC to select the next operational SM in the office, in order to distribute the ANI Table equally across all SMs.
Valid Entries: 1 - 192

Data Rules:

Each value of SM entered on the ANIMOD form must be defined on an EQIM form with EQSTATUS equal to "O".

SEC. 5BE: 5561 RECORD
AUTOMATIC NUMBER IDENTIFICATION TABLE - ANITBL

1. GENERAL

The 5561 Record is applicable to 5E12 and earlier Software Releases. For 5E13 and later this form is split into the ANITABLE and LDPINDEX forms. For 5E13 the 5561 Record will remain for retrofit purposes. See Div. 2, Sec. 4A165 for details.

The Automatic Number Identification Table form contains the switch - based ANI (Automatic Number Identification) table. The ANI table contains ANI's designating special treatment when a match occurs with an ANI associated with an incoming TDX (Toll Digital Exchange) Call based on the option set, which is defined on this form.

This form supports the TDX (Toll Digital Exchange) ANI Table Processing Feature. This is a secured feature with SFID 235.

The TDX ANI (Automatic Number Identification) Table Processing feature is part of the LDP (Long Distance Platform) Feature set. See Div. 2 Sec. 4A165 (Toll Digital Exchange Basic Call Processing For Toll 5ESS Switch) for details.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.51

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *NPA

Description: The NPA field is used to specify the Numbering Plan Area code.

Required Field.
Valid Entries: 200 - 999, or 000 for default ANI table entry.

Data Rules:

When NPA equals 000, NXX must be 000 and LINE must be 0000.

When NPA equals 000, NXX equals 000 and LINE equals 0000, then DAS must be greater than 0.

When the NPA, NXX, LINE and DAS fields are entered on the ANITBL form a DAS form must be defined as a DIGIT ANALYSIS SELECTOR value with a PREFIX/FEATURE DIT value entered (e.g., Line DAS).

When the NPA, NXX, LINE and DAS fields are entered on the ANITBL form, and the DAS field is defined as the DIGIT ANALYSIS SELECTOR on a DAS form, the value of LOCAL DIT for LINE DAS on the corresponding DAS form must be entered. Also LOCAL DIT must be defined as LDIT on the corresponding SMLDIT form for every operational SM in the office. This must be accomplished by entering an SMLDIT form with this LDIT value as the key and by entering each operational SM (as defined on EQIM forms where EQSTATUS is "O") into the LIST OF SWITCHING MODULES.

When the NPA and NXX have been assigned on the ANITBL form, they must also be defined on an ANIMOD form.

Copyright © 2003 Lucent Technologies

When the NPA, NXX, LINE and TRIG NBR fields are entered on the ANITBL form, the TRIG NBR must be defined on a corresponding NSTRIG form with APPLICATION equal to "ASP" and AIN REL equal to "R0D1".

For 5E11 and later, when the NPA, NXX, LINE and FIXED CARRIER fields are entered on the ANITBL form, a CARRIER ID must be defined on a corresponding ICF form with FEAT GRP equal to "D".

For 5E11 and later, when the NPA, NXX, LINE and LDP CARRIER fields are entered on the ANITBL form, the LDP CARRIER must defined on a corresponding LDPCTBL form.

For 5E11, when the NPA, NXX, LINE and LDP CARRIER fields are entered on the ANITBL form, the LDP CARRIER must not be entered as TDX CARRID on the OFCOPT form.

For 5E12 and later, there must not be more than 8 ANITBL forms where NPA, NXX and LINE fields are the same.

For 5E12 and later, when there is more than one ANITBL form with the same NPA, NXX and LINE fields, a SFSYS form must exist with SFID 207 ACT set to "Y".

2.3 *NXX

Description: The NXX field is used to specify the Office Code associated with this NPA. Enter the NPA portion of the ANI.

Required Field.
Valid Entries: 000 - 999, or 000 for default ANI table entry.

2.4 *LINE

Description: The LINE field is used to specify the Local DN minus the office code.

Required Field.
Valid Entries:

- For 5E11 and earlier: 0000 - 9999
- For 5E12 and later: 0000 - 9999 or ANY for the wild card. For more information, see Division 2, Section 4A165, Feature 99-5E- 4221.

2.5 *LDP CARRIER

Description: The Long Distance Platform Carrier field is used to specify a carrier for the call. This field supports the Mulitple CIC (Carrier Identification Code) Support for LDP (Long Distance Platform) Feature. For more information see Div. 2, Sec. 4A165.

Software Release: 5E11 and later
Valid Entries:

- For 5E11: Blank or 0 - 9999
- For 5E12: Enter 0 - 9999, 10000 for default LDP CARRIER, or 10004 for the wild card LDP CARRIER. For more information, see Division 2, Section 4A165, Feature 99-5E- 4221.
- For 5E13 and later: Enter 0 - 9999, 10000 for default LDP CARRIER, or ANY for the wild card LDP CARRIER.

Data Rules:

Copyright © 2003 Lucent Technologies

When NPA is "000", NXX must be "000", LINE must be "0000" and LDP CARRIER must not be entered.

When LDP CARRIER is "10000", NPA must be "000" and LINE must be "0000".

2.6 DAS

Description: Enter the digit analysis selector or tree number for interpreting incoming digits to enable routing and charging calls. A value of 0 indicates no data for this field.
Default: 00
Valid Entries: 00 - 99.

2.7 SCR

Description: The SCR field is used to specify the screening index which allows for different billing rates and routing. This field supports the ANI Table Line Class Code feature. For more information see Div. 2, Sec. 4A165.
Valid Entries: Blank, or 1 - 4095.

2.8 NET CALL DENIAL

Description: Should the TDX call origination be denied?
Default: N
Valid Entries: Y, N

2.9 ACCT CODE LENGTH

Description: The ACCT CODE LENGTH field is used to specify the number of account code digits expected. A value of "0" indicates that an account code is not expected.
Default: 0
Valid Entries: 0 - 15.

2.10 FIXED CARRIER

Description: The FIXED CARRIER field is used to specify the Carrier used for inter-LATA calls.

Valid Entries: 0 - 9999, or blank.

Data Rules:

When FIXED CARRIER is entered, TRIG NBR must not be entered.

2.11 TRIG NBR

Description: The TRIG NBR field is used to specify the ASP (Advanced Services Platform) trigger number used to locate unique network service for dialed digits. Population of this field indicates that a query will be launched to an external database.
Valid Entries: 1 - 255, or blank.

Data Rules:

When TRIG NBR is entered, FIXED CARRIER must not be entered.

The TRIG NBR field on the ANITBL form is used by the Toll Digital Exchange Special Feature in a LDP (Long Distance Platform) office. It is a secured feature that must be purchased by the office before the field can be entered. A SFSYS form must exist with SFID 126 ACT set to "Y".

Copyright © 2003 Lucent Technologies

2.12 II SCREEN

Description: The II SCREEN field is used to indicate whether or not the ANI data should be taken from the II Digits Table.

Software Release: 5E13 and later
Required Field.
Default: N
Valid Entries: Y, N

2.13 TERM NSC

Description: The TERM NSC field is used to specify the terminating network selection code. It translates to a DAS (Digit Analysis Selector) and screening index for routing the call. It is applicable in LDP (Long Distance Platform) networks that employ MINT (Multi-vendor Intra-Network Trunk) processing. For more information, see Div. 2, Sec. 4A217.

Software Release: 5E12 and later
Valid Entries: 0 - 999, or leave blank.

SEC. 5BF: 5562 RECORD
LONG DISTANCE PLATFORM CARRIER TABLE - LDPCTBL

1. GENERAL

The 5562 Record is applicable to 5E11 and later Software Releases. The 5562 Record provides an LDP Carrier Table and Default Carrier Table. The LDP Carrier Table applies to callers who used a carrier not shown in the ANI table or did not require ANI table processing and used a carrier that was not the home carrier ID. The default LDP Carrier Table applies to callers who used a carrier to which they have not subscribed or did not require ANI table processing and used a carrier that was not entered in the LDP carrier table.

The LDP Carrier Table supports part of the LDP (Long Distance Platform) Feature set. See Div. 2, Sec. 4A165 (Toll Digital Exchange Basic Call Processing For Toll 5ESS - 2000 Switch) for details.

1.1 Recent Change View

The corresponding Recent Change view for this form is 8.52

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *LDP CARRIER

Description: Enter the Long Distance Platform Carrier ID.

Required Field.
Valid Entries: 0 - 9999 or 10000 for default LDP carrier.

Data Rules:

The LDP CARRIER field on the LDPCTBL form is used by the Long Distance Platform Carrier Special Feature. It is a secured feature that must be purchased by the office before the field can be entered. A SFSYS form must exist with SFID 202 ACT set to "Y".

When the LDP CARRIER field is entered on the LDPCTBL form, the LDP CARRIER must be defined as CARRIER ID on a corresponding ICF form with FEAT GRP equal to "D".

2.3 *CARRIER PRESUBSCD

Description: Is carrier presubscribed?

Software Release: 5E12 and later
Required Field.
Valid Entries: Y, N

2.4 #DAS

Description: Enter the digit analysis selector or tree number for interpreting incoming digits to enable routing and charging calls.

Required Field.
Valid Entries:

Copyright © 2003 Lucent Technologies

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When the DAS field is entered on the LDPCTBL form, the DAS must be defined on a DAS form as a DIGIT ANALYSIS SELECTOR value with a PREFIX/FEATURE DIT value entered.

When the DAS field is entered on the LDPCTBL form, the DAS field is defined as DIGIT ANALYSIS SELECTOR on a DAS form. Therefore, the value of LOCAL DIT for LINE DAS on the corresponding DAS form must be entered. Also LOCAL DIT must be defined as LDIT on the corresponding SMLDIT for every operational SM in the office. This must be accomplished by entering an SMLDIT form with this LDIT value as the key and by entering each operational SM (as defined on EQIM forms where EQSTATUS is "O") into the LIST OF SWITCHING MODULES.

2.5 SCR

Description: The SCR field is used to specify the screening index which allows for different billing rates and routing.

Software Release: 5E12 and later
Valid Entries: 1 - 4095

2.6 NET CALL DENIAL

Description: Is Network Call Denial Active?
Valid Entries: Y, N

2.7 ACCT CODE LENGTH

Description: The ACCT CODE LENGTH field is used to specify the number of account code digits expected. A value of 0 indicates that an account code is not expected.
Valid Entries: 0 - 15.

2.8 FIXED CARRIER

Description: The FIXED CARRIER field is used to specify the Carrier used for inter-LATA calls.
Valid Entries: 0 - 9999

Data Rules:

When the FIXED CARRIER field is entered on the LDPCTBL form, the FIXED CARRIER must be defined as CARRIER ID on a corresponding ICF form with FEAT GRP equal to "D".

2.9 TRIG NBR

Description: The TRIG NBR field is used to specify the ASP (Advanced Services Platform) trigger number used to locate unique network service for dialed digits. Population of this field indicates that a query will be launched to an external database.
Valid Entries: 1 - 255

Data Rules:

When TRIG NBR is entered, FIXED CARRIER must not be entered.

The TRIG NBR field on the LDPCTBL form is used by the Long Distance Platform Carrier Special Feature. It is a secured feature that must be purchased by the office before the field can be entered. A SFSYS form

Copyright © 2003 Lucent Technologies

must exist with SFID 126 ACT set to "Y".

When the TRIG NBR field is entered on the LDPCTBL form, the TRIG NBR must be defined on a corresponding NSTRIG form with APPLICATION equal to "ASP" and AIN REL equal to "R0D1".

2.10 II SCREEN

The II SCREEN field is used to indicate whether or not the ANI data should be taken from the II Digits Table.

Required Field.

2.11 TERM NSC

Description: The TERM NSC field is used to specify the terminating network selection code. It translates to a DAS (Digit Analysis Selector) and screening index for routing the call. It is applicable in LDP (Long Distance Platform) networks that employ MINT (Multi-vendor Intra-Network Trunk) processing. For more information, see Div. 2, Sec. 4A217.

Software Release: 5E12 and later
Valid Entries: 0 - 999, or leave blank.

Data Rules:

For 5E12 and later, the TERM NSC entered on the LDPCTBL form must be defined on the corresponding LDPTNSC form.

SEC. 5BG: 5563 RECORD
MEASUREMENT COLLECTION SUMMARY - MEASSUM

1. GENERAL

The MEASSUM (Measurement Collection Summary) form (5563 Record) is available with 5E11 and later Software Releases. It is used to identify "components" selected for traffic measurements reported on the "30-minute" measurement report. Components are defined as the entity to be measured; components can be at the end product level (AIU, DNU-S, SS7 PSU, etc.) or subassemblies (i.e., packs, lines, DPIDB, etc.).

This form was introduced concurrently with the 5E11 and later AIU (Access Interface Unit) feature. The introduction of this form implements a new traffic measurement architecture for the collection of traffic data. Effective with 5E12 and later, additional measurement capabilities were added to support new features (see the Valid SECTION NAME Entries table).

The SECTION NAME field is used to select the components for measurement. The value of the SECTION NAME field gives meaning to the other fields on this form. For example, when field SECTION NAME is set to "AIULN", field START2COMP represents a pack number on an AIU. However, when SECTION NAME is set to "AIU", START2COMP has no meaning because the end product AIU is the highest level in the product structure, and therefore START2COMP should be left blank. For more details, see the description for the three START1COMP through START3COMP fields.

For ODA, the SECTION NAME field is used at the time of office initialization to select components to be measured. After office initialization, the components selected can be viewed on the corresponding RC (Recent Change) View 13.9. Note that RC's corresponding 13.9 View is actually a RC verify-only view.

RC Views 13.7 and 13.8 are used to further delineate selected components or to select a range of components to be measured. RC View 13.7 allows updating of individual components within a range to be selected/unselected for measurement. RC View 13.8 allows all components within a range to be selected/unselected for measurement. If multiple RC updates of either or both views are performed for a particular range of components, the data will reflect only the final state. For example, if RC View 13.7 is used to activate a certain component and subsequently RC View 13.8 is used to activate a range of components including that same component, the net result will be that all components within that range will be activated, including the component that was first activated using 13.7. No error/warning is generated by RC when selecting a component that is already selected. Similarly, if a range of components is activated using 13.8, RC View 13.7 could be used to deactivate one or more of those components, leaving the remainder active.

If reviewing the selected components (using either Recent Change Views 13.7, 13.9 (or 5563 Record)), only the selected component(s) and status can be determined, not the manner in which RC was used to select the components.

For 5E12 and later, RC View 13.10 is introduced and has some differences with Recent Change Views 13.7 and 13.8. For example, Recent Change View 13.10 is limited to data keyed by DN (Directory Number) for SECTION NAMES "ECDN" and "EPCS". RC Views 13.7 and 13.8 can also be used to update these same sections. RC View 13.10 can also operate in a special insert mode, where only unselected data is operated upon. Unlike update mode, previously selected components will be silently ignored, and the collection values for that component (e.g., ROP (Read/Receive Only Printer)) will not be changed. If reviewing SECTION NAMES "ECDN" or "EPCS", only the selected components can be determined, not the RC View (13.7, 13.8, or 13.10) used to select them.

1.1 Recent Change View

The corresponding Recent Change View for this form is 13.9 - a read only view. Supporting Recent Change Views for updating the data entered on this ODA form are 13.7, 13.8, and 13.10.

Copyright © 2003 Lucent Technologies

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

COMPONENTS

These fields are used to designate the entity level (i.e., unit, component, etc.) for measurement. The SECTION NAME field is used along with the START1COMP - START3COMP fields to designate the measurable entity.

2.2 *SECTION NAME

Description: Enter the value for the desired traffic measurement report(s).

Required Field.

Valid SECTION NAME Entries

Entry	TRFC30 Section Number	Description
ADPIDB	229	Software Release: 5E12 and later: Measurements for On-Demand B-Channel on DPIDB (Directly Connected Peripheral Interface Data Bus) for the AIU, AIU ISDN U-Interface, and Remote AIU ("EAIU") features.
AIU	216	Software Release: 5E11 and later: Measurements for the AIU feature and, for 5E12 and later, the Remote AIU ("EAIU") feature. See Division 2, Section 7K.
AIULC	218	Software Release: 5E11 and later: Measurements for all line circuits within a specific AIU type that has at least 1 operational application pack. See Division 2, Section 7K.
AIULN	217	Software Release: 5E11 and later: Measurements for specified AIU type line circuits.
APSODB	228	Software Release: 5E12 and later: Measurements for On-Demand B-Channel per AIU.
ATMLNK	167	Software Release: 5E17(1) FR1 and later: ATM Link measurements.
ATMQOSPS	239	Software Release: 5E17(1) FR1 and later: ATM Quality Of Service measurements for PSU to PSU connectivity on PHA2.
BCHNEG	80	Software Release: 5E14 and later: Measurements for B-Channel Negotiation. See Division 2, Section 6K.
BEARERLNK		Software Realease: 5E16(2) and later: BEARERLNK (Bearer Link Measurements). This entry supports the OIU - IP feature. See Division 2, Section 7BX.
[BI]CCG	205	Software Release: 5E15 and later: BICC Group Measurements. This entry supports the PDS - BICC Call Processing feature. See Division 2, Section 4A567.
[BIC]CSM	207	Software Realease: 5E16(2) and later: BICC CIC (Call Instance Code) SM-2000. This entry supports the BICC Static CIC Allocation feature. See Division 2, Section 1CB.
[DL]INE	222	Software Release: 5E12 and later: Measurements for specified TR303 on DNU-S lines. This entry supports the TR303 DNU-S feature. See Division 2, Section 9J.
[DO]DB	223	Software Release: 5E12 and later: On-Demand B-Channel for DNU-S. This entry supports the TR303 DNU-S feature. See Division 2, Section 9J.
[EC]DN	235	Software Release: 5E12 and later:

HSPD	244	Software Release: 5E15 and later: Measurements for High Speed Data Trunk Group.
IPOIU		Software Realease: 5E16(2) and later: IPOIU Measurements. This entry supports the OIU - IP feature. See Division 2, Section 7BX.
LAG	251	Software Release: 5E16(2) and later. Measurement for Line Access Gateway.
[MMSUG]MTIB	79	Software Release: 5E12 SU and later: Measurements for the MMSU Modular Metallic Test Interface Bus. See Division 2, Section 1BS.
[MMSUJ]MTB	78	Software Release: 5E12 SU and later: Measurements for the MMSU Modular Metallic Test Bus. See Division 2, Section 1BS.
MTSM	149	Software Release: 5E16(2) and later. Matrix Time Slot Measurements. See Division 2, Section 7BO.
[O]DBPSU	221	Software Release: 5E12 and later: On-Demand B-Channel measurements for specified PSU shelves. This entry supports the TR303 DNU-S feature. See Division 2, Section 9J.
OIU	81	Software Release: 5E16(2) and later. Measurements for Optical Interface Unit. This entry supports the OIU feature. See Division 2, Section 7BQ.
PBOCC	165	Software Release: 5E17.1 FR 1 and later. This entry supports the PSU PB Occupancy Measurements feature. See Division 2, Section 1CS.
[P]C	234	Software Release: 5E12 and later: Point Code. This entry supports the SS7 PSU on SM/EXM-2000 feature. See Division 2, Section 9L.
PCF	245	Software Release: 5E17(1) FR 2 and later: Packet Control Function. This value supports the Measurements for PCF on PHE2 feature. See Division 2, Section AH.
PHE	2	Software Release: 5E17(1) FR 2 and later: Protocol Handler Ethernet This value supports the Measurements for PCF on PHE2 feature. See Division 2, Section AH.
PKTGRP	211	Software Release: 5E16(2) FR 3 and later: Packet Group. This field supports the SIP-T (Session Initiation Protocol) for Packet Trunkingfeature. For more information see Division 2, Section 4A684.
PKTZ		Software Realease: 5E16(2) and later: PKTZ (Different Packetization Time Measurements). This entry supports the OIU - IP feature. See Division 2, Section 7BX.
PRIGRP	243	Software Release: 5E14 and later: This entry was previously called "TBCT" for 5E13 and earlier. The name was changed to more accurately describe the measurement. See Division 2, Section 4A214.
PSUCHAN	193	Software Release: 5E14 and later: Packet Switch Unit Channel Measurements
RDT	224	Software Release: 5E12 and later: Measurements for specified DNU-S and RDT(s) (Remote Digital Terminals). This entry supports the TR303 DNU-S feature. See Division 2, Section 9J.

Copyright © 2003 Lucent Technologies

[RDTDN]U	225	Software Release: 5E12 and later: RDT measurements for specified DNU-S. This entry supports the TR303 DNU-S feature. See Division 2, Section 9J.
[SC]CP	233	Software Release: 5E12 and later: Signaling Connection Control Part. This entry supports the SS7 PSU on SM/EXM-2000 feature. See Division 2, Section 9L.
SCTP	210	Software Release: 5E16(2) FR 3 and later. Stream Control Transmission Protocol. This field supports the OIU (Optical Interface Unit) SIP-T (Session Initiation Protocol for Telephones) feature. For more information see Division 2, Section 4A684.
SL	230	Software Release: 5E12 and later: Signaling Link. This entry supports the SS7 PSU on SM/EXM-2000 feature. See Division 2, Section 9L.
SLS	203	Software Release: 5E15 and later: Provides data for the Signaling Link Set performance. See Division 2, Section 7AX.
[SM]IWGPCT	206	Software Release: 5E15 and later: PCT Link Measurements. This entry supports the PDS - BICC Call Processing feature. See Division 2, Section 4A567.
SNP	204	Software Release: 5E15 and later: Provides data for the performance of CCS7 links for the GSM (Global Switching Modules). See Division 2, Section 7AX.
TAG	252	Software Release: 5E16(2) and later. Measurement for Trunk Access Gateway.
[T]BCT	243	Software Release: 5E13 and later: Measurements for the PRI Two B-channel Transfer feature. See Division 2, Section 4A214. NOTE: The name of this entry was changed to "PRIGRP" in 5E14.
TGN	212	Software Release: 5E15 and later: Measurements for trunk groups. Introduced by the Trunk Group Register Expansion feature. See Division 2, Section 4A596.
TSM	150	Software Release: 5E16(2) and later: Measurements for time slots. This entry supports the Additional Time Slot Measurements feature. See Division 2, Section 7BR.

Data Rules:

When "ADPIDB" is entered:

- DEST SM, START3COMP and START2COMP must be defined as SM, AIU and LOCAL TIME SLOT GROUP (PIDB) PSU SHLF, with EQSTAT is set to "O", respectively on the EQAIU form.
- DEST SM must be entered,
- START1COMP must be 0,
- START2COMP must be 0 - 4,
- START3COMP must be 0 - 42.

When "AIU" is entered:

- DEST SM and START1COMP must be defined as the SM and the AIU, respectively, on the EQAIU form (5745 Record) with its EQSTATUS set to "O".

DEST SM and START1COMP must be defined as SM and AIU on the EQAIU form where LOCAL TIME SLOT GROUP (PIDB), ROW 1, EQSTAT is set to "O", or where REMOTE COMDAC 0 TIME SLOT

Copyright © 2003 Lucent Technologies

GROUP (TSPFAC0) row 1 EQSTAT is set to "O", or where TIME SLOT GROUP (XAIUTSGRP) row 1 EQSTAT is set to "O".

When "AIU" or "AIULC" is entered:

- DEST SM must be entered
- Refer to the START1COMP Valid Entry Table for software-release-specific entries.
- START2COMP and START3COMP must not be entered.

When "AIULC" is entered:

- At least one EQAIUP form must be defined with EQSTAT set to "O", and DEST SM and START1COMP defined as SM and AIU, respectively.
- Only one MEASSUM form is allowed per office.

When "AIULN" is entered:

- DEST SM must be entered,
- Refer to the START1COMP - START3COMP fields for software-release-specific entries.
- DEST SM, START1COMP and START2COMP must be defined as SM, AIU and APPL PACK NUM on the EQAIUP form where TYPE is not set to "AIRG" and EQSTAT is set to "O".
- and TYPE is "AIURPLP" on the corresponding EQAIUP form, START3COMP must be in the range of 00 - 11.
- and TYPE is "AICLP" or "AIULP" on the corresponding EQAIUP form, START3COMP must be in the range of 00 - 15.

When "APSODB" is entered:

- DEST SM and START1COMP must be defined as SM and AIU on the EQAIU form where LOCAL TIME SLOT GROUP (PIDB), ROW 1, EQSTAT is set to "O".

When "BCHNEG" is entered:

- START1COMP must be 1 - 4000, or leave blank

  1 - 4000 = (PRI) B-Channel trunk group number

  blank = uses the highest numbered (PRI) B-Channel trunk group number.
- START2COMP, START3COMP, and DEST SM must not be entered.
- START1COMP must have a matching TGN on the TKGRP form with a TRKCLASS of "EDSL" or "EDSLHM" and a TRK DIR of "INC", "OUT", or "2W".

When "DLINE" is entered:

- DEST SM must be entered,

Copyright © 2003 Lucent Technologies

- START1COMP must be 0 - 7 (DNU-S),
- START2COMP must be 1 - 99 (RDT),
- START3COMP must be 1 - 2048 (RT Line),
- the maximum lines per office is 512.

When "DLINE", "DODB" , "ODBPSU", "RDT", or "RDTDNU" is entered:

- the DEST SM must be a valid SM defined on the EQIM form and UNIT TYPE must be "SM2000".

When "DODB" or "RDTDNU" is entered:

- START1COMP must be 0 - 7 (DNU-S),
- START2COMP must not be entered,
- START3COMP must not be entered,
- only one MEASSUM form is allowed per office for "DODB".
- only two MEASSUM forms are allowed per office for "RDTDNU".

When "ODBPSU"is entered:

- DEST SM must be entered,
- START1COMP must be 0,
- START2COMP must be 0 - 4 (PSU shelf),
- START3COMP must not be entered.
- the maximum lines per office is 115.

When "RDT" is entered:

- DEST SM must be entered,
- START1COMP must be 0 - 7 (DNU-S),
- START2COMP must be 1 - 99 (RDT),
- START3COMP must not be entered,
- the maximum lines allowed per office is 256.

When "ECDN" or "EPCS" is entered:

- START1COMP must be a 7 or 10-digit TN (NXXXXXX or NXXXXXXXXX).
- START2COMP, START3COMP, or DEST SM must not be entered,

For 5E12 and later,

Copyright © 2003 Lucent Technologies

- a maximum of 250 MEASSUM forms are allowed per office with SECTION NAME of "ECDN" and a maximum of 250 MEASSUM forms are allowed per office with SECTION NAME of "EPCS".
- if START1COMP is either a 7-digit or 10-digit TN, when the 7-digit TN is equal to the last seven digits of a 10-digit TN with the same value of SECTION NAME, and the NPA for the seven digit TN is the same as the first three digits of the 10-digit TN, the forms are duplicated; one of the two forms must be deleted.
- 7-digit and 10-digit TNs cannot have duplicate OFFICE CODE entries on the NOC form.
- the first three digits of a 7-digit TN and the first six digits of a 10-digit TN must be assigned on the NOC form as the OFFICE CODE or the NPA/OFFICE CODE, respectively.

When "PC" is entered:

- START1COMP must be 9 digits:

[000-225] [000-255] [000-255] or
[000-255] [00-31] [0-7] [000-255]

When "PRIGRP" is entered:

- START1COMP on the same MEASSUM form must be defined as PRI GROUP on the PRIGRP form (5211 Record).
- a maximum of 640 MEASSUM forms are allowed per office with SECTION NAME of "PRIGRP".

When "PSUCHAN" is entered:

- START1COMP, must be a number from 0 to 1 or blank, where (0-1) is the PSU number or where blank uses the lowest PSU number.
- START2COMP, must be a number from 0 to 4 or blank, where (0-4) is the PSU SHELF number and where blank uses the lowest PSU SHELF number
- START3COMP, must be a number from 0 to 15 or blank, where (0-15) is the channel group for the PSU shelf.

When "SCCP" is entered:

- START1COMP must be 0 - 192 (GSM)
- START2COMP, START3COMP, and DEST SM must not be entered.

When "SL" is entered:

- DEST SM must be entered, START1COMP must be 0 - 255 (link set), START2COMP must be 0 - 7 (member) and START3COMP must not be entered.

For 5E12 SU and later:

When SECTION NAME is "MMSUJMTB":

Copyright © 2003 Lucent Technologies

- START3COMP must be 0 - 3.

When SECTION NAME is "MMSUGMTIB":

START1COMP must be 0 - 1, and START2COMP and START3COMP must not be entered.

For 5E13 and later:

When SECTION NAME is "TBCT"/"PRIGRP":

- START1COMP must be 1 - 4095, and START2COMP, START3COMP, and DEST SM must not be entered.
- and START1COMP is entered, START1COMP must match PRI GROUP on the PRIGRP form.
- a maximum of 640 MEASSUM forms are allowed per office.

For 5E15 and later:

When SECTION NAME is "SLS":

- DEST SM must be entered, START1COMP and END1COMP must be 1- 255 (Link Set Number) or not entered, START2COMP, END2COMP, START3COMP, and END3COMP must not be entered.

When SECTION NAME is "SNP":

- DEST SM must not be entered, START1COMP and END1COMP must be 1- 192 (GSM) or not entered, START2COMP, END2COMP, START3COMP, and END3COMP must not be entered.

When SECTION NAME is "BICCG":

- START1COMP must be entered and should be between 7000 and 7999.
- DEST SM, START2COMP, START3COMP, and START4COMP must not be entered.

When SECTION NAME is "HSPD":

- START1COMP must have a matching TGN on the TKGRP form with a TRKCLASS of "3GPD".

When SECTION NAME is "SMIWGPCT":

- DEST SM must be known and, START1COMP, START2COMP, START3COMP, and START4COMP must not be entered.
- DEST SM should have a matching IM on the EQIWG form (5874 Record).

When SECTION NAME is "SMIWGPCT" or "FRBC":

- DEST SM should have a matching IM on the EQIM form (5700 Record) with EQSTATUS set to "O".

When SECTION NAME is "TGN":

- START1COMP must be 1 - 4000.

Copyright © 2003 Lucent Technologies

- START2COMP, START3COMP and DEST SM must not be entered.
- START1COMP must have a matching TGN on the TKGRP form (5202 Record) where TRKCLS does not equal "FRBC", "PPMEM", "PKTPIPE", or "SVC".
- START1COMP must have a trunk group number less than or equal to MAX TGN in the OFCOPT form (5509 Record).
- ACT must be "Y" for SFID 596 on the SFSYS form (5713-1 Record).

For 5E16(2) and later:

When SECTION NAME is "BICCSM":

- DESTSM must have a matching SM2K MODULE value entered in the CIC DISTRIBUTION list on the CICDIST form (5217 Record).
- START1COMP must have a matching TGN on the TKGRP form (5202 Record).

When SECTION NAME is "LAG", DEST SM must be entered, START1COMP must be 1 - 105 (LAG), and START2COMP and START3COMP must not be entered.

When SECTION NAME is "TAG", DEST SM must be entered, START1COMP must be 1 - 9 (TAG), and START2COMP and START3COMP must not be entered.

When SECTION NAME is "PSUCHAN":

- START1COMP [1, 1] (PS UNIT) must be 0 - 1
- START1COMP [2, 14] (PSU SHELF) must be 0 - 4
- START2COMP (CHANNEL GROUP) must be 0 - 15
- START3COMP (CHANNEL) must be 0 - 127
- DEST SM must be entered.

When SECTION NAME is not "PC", "ECPSRVT", "PSUCHAN", or "FRBC", START1COMP must not have leading zeroes.

When SECTION NAME is "ECPSRVT", START1COMP [2, 10] must match the SERV TYPE on the TKGRP form (5202 Record).

When SECTION NAME is "ECPSRVT" for START1COMP [2, 10], SERV TYPE on the TKGRP form (5202 Record) must be "3G1XPD".

When SECTION NAME is "PSUCHAN" , and DEST SM matches SWITCHING MODULE on the EQPSU or EQPSUP forms:

- START1COMP [1, 1] (PS UNIT) must match PSU on the EQPSU or EQPSUPH forms
- START1COMP [2, 14] (PSU SHELF) must match PSU on the EQPSU or EQPSUPH forms

When SECTION NAME is "MTSM":

- START1COMP and START2COMP must be different and must be a value between 1-192,

Copyright © 2003 Lucent Technologies

START3COMP and DESTSM must not be entered.

When SECTION NAME:

- is "BEARERLNK", then START1COMP must be between 1 and 192, START2COMP must be between 1 and 512, START3COMP and DEST SM must not be entered.
- is "PKTZ", then START1COMP must be between 1 and 512, START2COMP, START3COMP and DESTSM must not be entered.
- is "IPOIU", then START1COMP must be between 1and 192, START2COMP must be between 0 and 7, START3COMP must be between 0 and 9, DEST SM must not be entered.
- is "BEARERLNK", START1COMP must match OIU SM on the EQOIUP form and START2COMP must match BNID on the EQOIUP form.
- is "IPOIU", START1COMP, START2COMP, and START3COMP must match OIU SM, OIU, and PROTECTION GROUP on the EQOIUP form and BNID on the EQOIUP form must be entered.
- is "PKTZ", START1COMP should have a matching BNID on the BEARERNET form.

For each START1COMP entered for "IPOIU" SECTION NAME on the MEASSUM form, there must be a corresponding tuple on the EQIM form, where SM is equal to START1COMP, with UNIT TYPE set to "SM2000"' or "SM2005" and EQSTATUS is equal to "O" (Operational).

When "PKTGRP" is entered, START1COMP should have a matching PKT GRP defined on the PKTGRP form (5219 Record) where ASSOC SET NAME is entered.

When "SCTP" is entered, START1COMP should have a matching ASSOC NUMBER on the SCTPASSC form (5889 Record), and DEST SM must be entered.

For 5E17 and later:

When SECTION NAME is "SNP" and/or "PBOCC":

- START1COMP must have a matching SM on the EQIM form (5700 Record) with EQSTATUS equal "O".

When SECTION NAME is "PBOCC":

- START1COMP must match SWITCHING MODULE, and START2COMP must match PSU on the EQPSU form (5741 Record).
- the ATMLNK form (5592 Record) must have at least one tuple where its CHANNELS CON TYPE equals "ATMNET", and the SM matches START1COMP and PSU matches START2COMP on the MEASSUM form.

When SECTION NAME is "ATMLNK" and START3COMP is "P", then the DEST SM, START1COMP, and START2COMP must have the corresponding SM, PSU, and LINK values entered on the ATMLNK form (5592 Record) and CHANNELS CON TYPE is "ATMNET".

When SECTION NAME is "PCF" :

- there must be a corresponding PCFPDSN form (Record) where DEST SM, START1COMP, START2COMP, and START3COMP equals SM, PSU, SHELF and CHANNEL GROUP respectively.

Copyright © 2003 Lucent Technologies

When SECTION NAME is "PCF" or PHE:

- there must be a corresponding ETHIP form (Record) where DEST SM, START1COMP, START2COMP, and START3COMP equals SM, PSU, SHELF, and CHANNEL GROUP respectively.

2.3 (*)START1COMP

Description: The START1COMP field specifies the component pattern of the initial starting point for a range of components. This value will be used in conjunction with the START2COMP and START3COMP fields to determine the starting point for displaying, in ascending order, the collection identifier in the COMPONENT COLLECTION LIST field on Recent Change View 13.7.
Valid Entries: The following table summarizes valid entries for this field:

Valid START1COMP Entries

Entry	Description
0 - 104	"ADPIDB", "AIU", "AIULC", "AIULN", "APSODB"
0 - 1	"ATMLNK", MMSUGMTIB", "MMSUJMTB", "PCF", and "PHE".
1 - 512	"BEARERLNK", IPOIU", "PKTZ"
1 - 4000	"BCHNEG", "HSPD" For 5E15 FR3 and later: "BCHNEG", "HSPD" and "TGN"
7 or 10-digit telephone number	"ECDN" or "EPCS".
0 - 1 + Service Type	"ECPSRVT"
00100000 - 19241531	"FRBC"
7000 - 7999	"BICCG", "BICCSM"
1 - 105	"LAG"
1 - 9	"TAG"
0 - 1	"MMSUGMTIB" or "MMSUJMTB"
0 - 7	"OIU"
1 - 192	"BEARERLNK", "IPOIU", "TSM" , MTSM", "PBOCC",
1 - 4095	"PRIGRP"
0 - 1 (PS UNIT), 0 - 4 (PSU SHELF)	"PSUCHAN"
10 - 255	"HSL" or "HSLS"

2.4 (*)START2COMP

Description: This field is used to specify the component pattern of the initial starting point for a range of components. This value is used in conjunction with the START1COMP and START3COMP fields to determine the starting point for displaying in ascending order, the collection identifier in the COMPONENT COLLECTION LIST field on the 13.7 View.
Valid Entries:

Valid START2COMP Entries

Entry	Description
1 - 10	"ATMLNK", "ATMQOSPS"
1 - 512	"BEARERLNK"
H orL (ATMQOSPS)	CP
0 - 7	"IPOIU"
0 - 15	"HSL" , "PCF", "PHE"
0 - 1	"MMSUJMTB"' or "PBOCC"
1 - 192	"MTSM"
0 - 4	"PCF", "PHE"

Data Rules:

When SECTION NAME is "AIULN", enter a number from 0 - 19, for the AIU pack number, or leave blank (uses lowest operational APPL PACK NUM in the AIU).

When SECTION NAME is "AIU" or "AIULC", leave blank (not used).

2.5 (*)START3COMP

Copyright © 2003 Lucent Technologies

Description: This field is used to specify the component pattern of the initial starting point for a range of components. This value is used in conjunction with the START1COMP and START2COMP fields to determine the starting point for displaying, in ascending order, the collection identifier in the COMPONENT COLLECTION LIST field on 13.7 View.
Valid Entries:

Valid START3COMP Entries

Entry	Description
"B" or "P"	"ATMLNK"
[0-3]-[1-254]-[L,H] 0-3 represents the far subnet ID 1-254 is the far community address, and H, L is either High or Low connect priority	"ATMQOSPS"
1 - 10	"ATMQOSPS"
0 - 9	"IPOIU"
0 - 3	"MMSUJMTB"
Blank	"MTSM"
0 - 15	"PCF", "PHE"

Data Rules:

If SECTION NAME is "AIULN", enter a number from 0 - 31, where:
- 0 - 15: circuits on an AIU coin pack
- 0 - 31: circuits on an AIU non-coin application pack.

Blank: uses lowest circuit number in the AIU pack.

If SECTION NAME is "AIU" or "AIULC", leave blank (not used).

2.6 (*)DEST SM

Description: The field is used to specify the SM associated with components from which the data will be collected.
Valid Entries: Blank, or 1 - 192

2.7 ROP

Description: Generate the components measurements report on the ROP (Receive Only Printer)?

Software Release: 5E12 and later
Valid Entries: Y, N

SEC. 5BH: 5567 RECORD
CCS TCAP APPLICATION - CCSTCAP

1. GENERAL

The CCSTCAP (Common Channel Signaling Transaction Capabilities Application Part) form (5567 Record) is available with 5E12 and later Software Releases.

It is used to support the CCS7-PSU on SM/EXM-2000 feature (see Division 2, Section 9L).

The 5567 Record defines, on an SM/SM-2000 basis:

- the CCS signaling platform: CNI (Common Network Interface) or a particular GSM (Global Switching Module)
- the type of CCS signaling application.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.42.

1.2 * SM

Description: Enter the SM (Switching Module) Number.

Required Field.
Valid Entries: 1 - 192

Data Rules:

SM on the CCSTCAP form must match SM on the EQIM form.

1.3 * APPLICATION

Description: Enter the signaling application type.

Required Field.

Valid APPLICATION Entries	
ACND	Analog Calling Name Delivery.
AILS	Automated Inward Line Screening.
AINROD1	Advanced Services Platform Release 0.1.
APSDN	Software Defined Network at an Action Point.
ASP	Advanced Services Platform.
AT1	ANSI TCAP Type I.
CCS7	Common Channel Signaling System 7 TCAP.
DCIS	Destination Routed CCIS6.
E911	Emergency 911 call.
ICCV	International Credit Card Validation.
ISVM	Inter-Switch Voice Messaging.
LALT	LIDB Alternate Destination.
LASS	Local Area Signaling Services.
LIDB	Line Information Database.
LNACP	Leased Network Action Control Point.
NCD	Network Call Denial.
NS800	Number Services 800 Application.
OLNP	OSPS Local Number Portability.
ONAI	OSPS Network Access Interrupt Application.
PVN	Private Virtual Network.
TNAI	Toll Network Access Interrupt Application.

Data Rules:

Copyright © 2003 Lucent Technologies

When APPLICATION is not "NS800", "LASS", "AINRODI", "ASP", "ISVM", "ACND", "LNACP", or "TNAI", PLATFORM must be 0.

For each APPLICATION entered, there must be a matching DSAPP entered on the DSAPP form (5537 Record).

When APPLICATION matches the APPLIC on the DSAPP form and the PLATFORM is not set to 0 and is not equal to SM on the CCSTCAP form, the PLATFORM must match a GSM on the corresponding CCTT form where the TRANS TYPE on the DSAPP form matches the TRANS TYPE on the CCTT form.

1.4 # PLATFORM

Description: Enter the CCS signaling platform.

Required Field.

Valid PLATFORM Entries	
0	Common Network Interface.
1 - 192	Global Switching Module.

Data Rules:

When PLATFORM is 0, the COMMON CHAN SIG field on the OFCOPT form (5509 Record) must be "CNI" or "ALL".

For each non-zero PLATFORM entered,

- there must be a matching GSM entered on the CCGSM form.
- TRANS TYPE on the DSAPP form (5537 Record) must match a TRANS TYPE on the CCTT form.

For 5E14 and earlier, when PLATFORM is not 0, PLATFORM must be equal to SM.

When PLATFORM is not 0 and the SM entered has an SM-2000 class processor, the APPLICATION field must not be set to "LNACP".

For 5E15 and later, when PLATFORM is not 0 and is not equal to SM on the CCSTCAP form, the PLATFORM and the SM on the CCSTCAP form must match the GLOBAL SM and NON GLOBAL SM on the CMTMH form, respectively.

SEC. 5BI: 5568 RECORD
LDP TERMINATING NSC - LDPTNSC

1. GENERAL

The LDPTNSC form (5568 Record) is available with 5E12 and later Software Releases. It provides the capability for specifying or verifying a TNSC (Terminating Network Selection Code), and its associated DAS (Digit Analysis Selector) and screening index information. This view will be populated on a LDP switch, and will be used to provide the DAS and screening index to route ingressing traffic from a MINT (Multi-Vendor Intra-Network Trunk). It will also be used when a TNSC is returned from the SCP. This new form was added to support the MINT feature. For more information, see Div. 2, Sec. 4A217.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.53.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TERM NSC

Description: The TERM NSC field is used to specify the terminating network selection code. It translates to a DAS (Digit Analysis Selector) and screening index for routing the call. It is applicable in LDP networks that employ MINT processing.

Required Field.
Valid Entries: 0 - 999

Data Rules:

When TERM NSC is entered on the ANITBL form, the TERM NSC must be defined on the LDPTNSC form.

2.3 #DAS

Description: The DAS field is used to specify the digit analysis selector used when interpreting incoming digits for routing and charging purposes.

Required Field.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

The DAS entered on the LDPTNSC form must be defined on the DAS form where DIGIT ANALYSIS SELECTOR matches DAS on the LDPTNSC form. In addition, the TYPE OF CI CALL and CI TYPE of CONFLICT RESOLUTION ENTRIES on the corresponding LDIT form and the TYPE OF CI CALL on the corresponding MLDIT form must not be "PSNCI" and "PSCAR".

2.4 #SCR

Copyright © 2003 Lucent Technologies

Description: The SCR field is used to specify the screening index. It is used to determine how calls will be charged.

Required Field.
Valid Entries: 1 - 4095

2.5 LRN DAS

Description: Location routing number digit analysis selector.

Software Release: 5E13 and later.
Valid Entries:

For 5E14 and earlier: 1 - 99
For 5E15 and later: 1 - 254

Data Rules:

When LRN DAS is entered on this form, the ACT field for SFID 303 must be set to "Y" on the SFSYS form (5713-1 Record).

When LRN DAS is entered on the LDPTNSC form, it must be defined as DIGIT ANALYSIS SELECTOR on the DAS form.

SEC. 5BJ: 5569 RECORD
LDP TRUNK TERMINATING NSC - TGNTNSC

1. GENERAL

The TGNTNSC form (5569 Record) is available with 5E12 and later Software Releases. It provides the capability for specifying or verifying a TNSC (Terminating Network Selection Code) based on an incoming TNSC over a trunk group. This new form was added to support the MINT feature. For more information, see Div. 2, Sec. 4A217.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.54.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *TGN

Description: The TGN field is used to specify the trunk group number.

Required Field.
Valid Entries: 0 - 999

2.3 *INCOMING TERM NSC

Description: The INCOMING TERM NSC field is used to specify the terminating network selection code. It is applicable in LDP networks that employ MINT processing.

Required Field.
Valid Entries: 0 - 999, or the number 1022.

Data Rules:

INCOMING TERM NSC cannot be the same as TERM NSC.

2.4 #TERM NSC

Description: The TERM NSC field is used to specify the terminating network selection code. It is applicable in LDP (Long Distance Platform) networks that employ MINT processing.

Required Field.
Valid Entries: 0 - 999

Data Rules:

The TERM NSC entered on the TGNTNSC form must be defined on the LDPTNSC form.

SEC. 5BK: 5570 RECORD
REROUTE ON RELEASE CAUSE LIST - RORLST

1. GENERAL

The RORLST form (5570 Record) is available with 5E12 and later Software Releases. It is used to arm (i.e. enable) various cause values associated with a resource unavailable event. If a reroute on release message is received at this switch, and the cause value associated with the message is armed, the switch shall continue searching for an outgoing route. The search will commence with the next route index in the chain after the one which returned the reroute on release message, and will continue until another route is found available, a route search limit is reached, or the chain is exhausted. If a reroute on release message is received at this switch, and the cause value associated with the message is not armed, or the Reroute on Release feature is not purchased, reroute on release processing as previously described will not occur. This form was added to support the Multi-Vendor Intra-Network Trunk (MINT) feature. This feature was first made available in a 5E12(1) software update. For more information, see Div. 2, Sec 4a217.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.55.

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *KEY

Description: The KEY field is used to access this form.

Required Field.
Valid Entries: 1

2.3 CAUSE 32 - 47

Description: The CAUSE 32 - 47 fields are used to indicate whether or not this ISUP protocol cause value is activated for the office. Is this ISUP protocol activated for the office?

Required Field.

SEC. 5BL: 5571 RECORD
TIME DEPENDENT ROUTING - TDR

1. GENERAL

The TDR form (5571 Record) is available with 5E12 and later Software Releases. It is used to specify and verify time intervals and their associated substitute route indices. The new route index overrides the original route index for the specified time interval. If two or more time intervals include the present time, and are marked as active, the new route index will be chosen from the highest numbered row entry in the list of time intervals. This form was added to support the MINT (Multi-Vendor Intra Network Trunk) feature. This feature was first made available in a 5E12 Software Update. For more information, see Div. 2, Sec. 4A217.

1.1 Recent Change View

The corresponding Recent Change View for this form is 10.39

2. FORM ENTRIES AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *ROUTE INDEX

Description: The ROUTE INDEX field is used to specify the route index number. The route index determines a network path, typically used to complete a call or route to error treatment when the call is unable to complete.

Required Field.
Valid Entries: 1 - 16382

Data Rules:

When a ROUTE INDEX is entered, at least one time interval must be entered.

The ROUTE INDEX entered on the TDR form cannot be used as NEW ROUTE IDX on any other TDR forms. In addition, the NEW ROUTE IDX entered on the TDR form also cannot be used as ROUTE INDEX on any other TDR forms.

The following ROUTE INDEX and/or NEW ROUTE IDX entered on the TDR forms must be defined on the RTIDX forms.

TIME INTERVALS

The following list of time intervals (up to 16 entries) consisting of START DAY, START TIME, END DAY, END TIME, NEW ROUTE INDEX, and ACTIVATION status, for a given ROUTE INDEX. When a time interval field is entered, all other fields for that interval must be entered.

2.3 START DAY

Description: The START DAY field is used to specify the starting day for a particular time interval.

Valid Entries: MON, TUE, WED, THU, FRI, SAT, SUN, or leave blank.

2.4 START TIME

Copyright © 2003 Lucent Technologies

Description: The START TIME field is used to specify the starting time for a particular time interval.
Valid Entries: 0 - 23, or leave blank.

Data Rules:

When START DAY equals END DAY, START TIME must be different than the END TIME for that time interval.

2.5 END DAY

Description: The END DAY field is used to specify the end day for a particular time interval.
Valid Entries: MON, TUE, WED, THU, FRI, SAT, SUN, or leave blank.

2.6 END TIME

Description: The END TIME field is used to specify the end time for a particular time interval.
Valid Entries: 0 - 23, or leave blank.

2.7 NEW ROUTE IDX

Description: The NEW ROUTE IDX field is used to specify the route index which replaces the ROUTE INDEX for a particular time interval.
Valid Entries:

- For 5E12 and earlier: 1 - 4095, or leave blank.
- For 5E13 and later: Blank, or 1 - 16382

Data Rules:

When a NEW ROUTE IDX is entered, it must not be equal to ROUTE INDEX.

2.8 ACTIVE

Description: The ACTIVE field is used to indicate whether a particular time interval entry will be evaluated when selection of a NEW ROUTE IDX occurs.
Valid Entries: Y, N or blank

SEC. 5BM: 5572 RECORD
TDMA OFFICE OPTIONS - TDMAOPT

1. GENERAL

The 5572 Record is available with the 5E12 Software Update and BMI (Beginning Managed Introduction) of the 5E13 Software Release. It provides the capability for specifying or verifying the global parameters for TDMA (Time Division Multiple Access).

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.56.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: This field is used to access this form.

Required Field.
Default: 0
Valid Entries: 0

2.3 ECHO BP

Description: The Echo Canceller Bypass field indicates whether or not echo canceller is turned on for Switched Based TDMA Vocoders feature.
Default: N
Valid Entries: Y, N

2.4 PARAM 1

Description: This field is used to define tuning parameter 1 for TDMA vocoders.
Default: 0
Valid Entries: 0 - 32767

2.5 PARAM 2

Description: This field is used to define tuning parameter 2 for TDMA vocoders.
Default: 0
Valid Entries: 0 - 32767

2.6 PARAM 3

Description: This field is used to define tuning parameter 3 for TDMA vocoders.

SEC. 5BN: 5573 RECORD
II DIGITS TABLE FORM - IIDIGTBL

1. GENERAL

The 5573 Record is available with 5E13 and later Software Releases and contains the information to route the call. A II Digits Screen bit is added to each entry of the ANI (Automatic Number Identification) Table and the LDP (Long Distance Platform) Carrier Table.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.57.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * II DIGITS

Description: This field is used to specify the II digits value associated with an LDP call.

Required Field.
Valid Entries: 0 - 99, or ANY for the wild card

2.3 * TGN

Description: This field used to specify the trunk group number.

Required Field.
Valid Entries: 1 - 4000, or ANY for the wild card

Data Rules:

When TGN exceeds 2000, the ACT field for Secured Feature ID (SFID) 172 must be set to "Y" on the SFSYS form (5713-1 Record).

2.4 DAS

Description: This field is used to specify the digit analysis selector or tree number used when interpreting incoming digits for routing and charging purposes.

Required Field.
Default: 000
Valid Entries:

For 5E14 and earlier: 0 - 99
For 5E15 and later: 0 - 254

Data Rules:

When IIDIGTBL forms have a known value for the DAS field which matches a DAS value on the DAS form, the LDIT value associated with the DAS must be distributed to all operational SMs (Switching Modules). This is accomplished by entering the LDIT value as the key on the SMLDIT form and by entering each operational SM (as defined on EQIM forms where EQSTATUS is "O") into the list of SMs on the SMLDIT

Copyright © 2003 Lucent Technologies

form.

When DAS is entered, DAS must be defined as DIGIT ANALYSIS SELECTOR on the DAS form where PREFIX/FEATURE DIT is entered.

2.5 SCR

Description: This field is used to specify the screening index which allows for different billing rates and routing.
Valid Entries: 1 - 4095, or blank

Data Rules:

When SCR is entered, SCR must be defined on the RAR form as SCR.

2.6 NET CALL DENIAL

Description: This field is used to specify whether or not an LDP call will be denied origination.

Required Field.
Default: N
Valid Entries: Y, N

2.7 ACCT CODE LENGTH

Description: This field is used to specify the number of account code digits that are expected. A value of 0 indicates that an account code is not expected.

Required Field.
Default: 0
Valid Entries: 0 - 15

2.8 FIXED CARRIER

Description: This field is used to specify the carrier used to route Inter-LATA calls.
Valid Entries: 0 - 9999, or blank

Data Rules:

When FIXED CARRIER is entered:

- TRIG NBR must not be entered.
- FIXED CARRIER must be defined as CARRIER ID on the ICF form where FEAT GROUP equals "D".

2.9 TRIG NBR

Description: This field is used to specify the trigger number to locate unique network service for dialed digits.
Valid Entries: 1 - 255, or blank

Data Rules:

When TRIG NBR is entered:

- FIXED CARRIER must not be entered.

Copyright © 2003 Lucent Technologies

- TRIG NBR on the NSTRIG form must be defined where APPLICATION equals "ASP" and AIN REL equals "R0D1".

2.10 TERM NSC

Description: This field is used to specify the terminating network selection code. It translates to a DAS and screening index for routing the call. It is applicable in LDP networks that employ MINT (Multifarious Intra-Network Trunk) processing.
Valid Entries: 0 - 999, or blank

Data Rules:

When TERM NSC is entered, TERM NSC on the LDPTNSC form must be defined.

SEC. 5BO: 5574 RECORD
ROUTE INDEX LIST FORM - RTLIST

1. GENERAL

1.1 Route Index List Definition

This form allows for a list of route indicies to be linked or chained together for the purposes of searching for a non-busy route. A route index is used to determine a network path for call completion. If the call is unable to complete it is routed to an error treatment source as determined by the route index. The position of the route indicies in the list indicates the sequence in which they are searched. When a LDP (Long Distance Platform) call is originated, it proceeds routing to the trunk group associated with the first route index in the list. Upon finding no available members in the trunk group, the call routes to the trunk group associated with the next route index in the list. This process continues until an available path is found or until the route index list is exhausted. If the call routes through the list without finding an idle trunk group, attempts to queue or apply Final Route Trigger are made, if assigned and active, before sending the call to final treatment. When a route index list exists, the NEXT ROUTE field on the RTIDX form is not used.

1.2 Recent Change View

The corresponding Recent Change View for RTLIST is 10.40.

2. FORM ENTRIES - 5574 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * RTIDX

Description: RTIDX is the first route index in the list and acts as the key field for this form. It uniquely identifies a list of route indices. The value in this field must be unique in that a route index can only be used as a key for a list once.

Software Release: 5E13 and later.
Valid Entries: 1 - 16382

ROUTE INDEX LIST

For 5E13 and later, this is a list of route indices with associated route type, trunk group number, digits deleted, prefix digit, signaling protocol and final route trigger. Also, a remarks field is included for each route index in the list. The order of the route indices in the list determines the sequence in which they are searched to find an available route path. Refer to Section 2.3 - Section 2.10 for individual field information.

2.3 RTI

Description: This field specifies a route index. The routing sequence is determined by the position of the route index in the list.

Software Release: 5E13 and later.
Valid Entries: 1 - 16382

Data Rules:

The RTI in row 1 of the ROUTE INDEX LIST (RTILIST) must match the RTIDX key.

Each RTI in the ROUTE INDEX LIST (RTILIST) must be unique.

Copyright © 2003 Lucent Technologies

Each RTI in the ROUTE INDEX LIST (RTILIST) must be defined on the RTIDX form.

Only the last RTI in the ROUTE INDEX LIST (RTILIST) may have:

- ROUTE TYPE equal to "DNTRAN" or "REORDER"
- an entry in the FNL RT TRIG NBR field

on the corresponding RTIDX form.

2.4 ETYP

Description: This field is a no change field and displays the type of routing associated with this route index.

Software Release: 5E13 and later.
Valid Entries: HUNT, DNTRAN, REORDER, BUSY, or MAIN

- ***NOTE:*** Refer to Division 3 Section 3p, Route Index Form - RTIDX, for details on specific route types.

2.5 TGN

Description: This field is a no change field. It displays the group number of the trunk group to be routed to based on the associated RTI in the list.

Software Release: 5E13 and later.
Valid Entries:

- For 5E13 and 5E14: 0 - 4000
- For 5E15:1 - 4000 for circuit trunk groups or 7000 - 7999 for BICC groups
- For 5E16(2) and later: 1 - 4000

2.6 DIG DLT

Description: This field is a no change field which displays the number of digits to be deleted.

Software Release: 5E13 and later.
Valid Entries: 00 - 15

2.7 PRF DIG

Description: This is a no change field that displays the digits to be prefixed for outpulsing.

Software Release: 5E13 and later.
Valid Entries: 1 - 10 or blank

2.8 SIG PRO

Description: This is a no change fild that displays the type of signaling protocol for the

Software Release: 5E13 and later.
Valid Entries: EA, FGB, INC, INCM, MEA, PNANI or TRAD

- ***NOTE:*** Refer to Division 3 Section 3p, Route Index Form - RTIDX, for details on these valid entries..

Copyright © 2003 Lucent Technologies

2.9 FNL TRIG

Description: This is a no change field which displays the final route trigger that is used when the route index list has been exhausted.

Software Release: 5E13 and later.
Valid Entries: 1 - 255 or blank

2.10 RMK

Description: This field is a no change field which displays optional remarks or comments pertinent to the associated RTI.

Software Release: 5E13 and later.
Valid Entries: Up to 16 alphanumeric characters (including special characters and/or blanks)

SEC. 5BP: 5575 RECORD
AUTOMATIC NUMBER IDENTIFICATION INDEX TABLE - ANITABLE

1. GENERAL

The 5575 Record is available with 5E13 and later Software Releases and contains the ANI's designating special treatment when a match occurs with an incoming LDP (Long Distance Platform) call based on an index-defined option set, which is on the LDPINDEX form.

This form supports the ANI Table Index feature which is an evolution of the TDX (Toll Digital Exchange) ANI Table Processing Feature SFID 235.

See Div. 2, Sec. 4A165 (Toll Digital Exchange Basic Call Processing For Toll 5ESS Switch) for details.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.58

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *NPA

Description: The NPA field is used to specify the Numbering Plan Area code.

Required Field.
Valid Entries: 200 - 999, or 000 for default ANI table entry.

Data Rules:

When NPA is 000, NXX must be 000, LINE must be 0000, LDP CARRIER must be 10000, and INDEX must be 0.

When NPA and NXX have been assigned on the ANITABLE form, NPA and NXX must be defined on an ANIMOD form.

When TRKCLS on the TKGRP form is "IC", "LATA" or "TTOLLCON", and LDP on the TKGRP form is "Y", then there must be an ANITABLE form with NPA equal to 000, NXX equal to 000 and LINE equal to 0000.

2.3 *NXX

Description: The NXX field is used to specify the Office Code associated with this NPA. Enter the NPA portion of the ANI.

Required Field.
Valid Entries: Enter a number from 000 to 999. For default ANI table entry enter 000 with an NPA of 000. For a 3-digit ANI, enter 000 with a valid NPA and LINE equal to 0000.

2.4 *LINE

Description: The LINE field is used to specify the Local DN minus the office code.

Required Field.
Valid Entries: Enter a four-digit number from 0000 to 9999, or ANY for the wild card digits. For the default

Copyright © 2003 Lucent Technologies

ANI, enter 0000 with an NPA and NXX of 000. For a 3-digit ANI, enter 0000 with an NXX of 000 and a valid NPA.

2.5 *LDP CARRIER

Description: The Long Distance Platform Carrier field is used to specify a carrier for the call. This field supports the Mulitple CIC (Carrier Identification Code) Support for LDP (Long Distance Platform) Feature. For more information see Div. 2, Sec. 4A165.
Valid Entries: Enter 0-9999, or 10000 for the default carrier, or ANY for the wild card carrier.

Data Rules:

When LDP CARRIER is 10000, NPA must be 000, NXX must be 000, and LINE must be 0000.

When the LDP CARRIER field is entered on the ANITABLE form, LDP CARRIER must be defined on a corresponding LDPCTBL form with CARRIER PRESUBSCD equal to "Y".

2.6 INDEX

Description: Long Distance Platform index.
Valid Entries: 0, 10 - 131071

Data Rules:

When INDEX is 0, NPA must be 000, NXX must be 000, LINE must be 0000, and LDP CARRIER must be 10000.

The INDEX field on the ANITABLE form must be defined on the LDPINDEX form.

SEC. 5BQ: 5576 RECORD
LONG DISTANCE PLATFORM (LDP) INDEX FORM - LDPINDEX

1. GENERAL

The 5576 Record is available with 5E13 and later Software Releases and contains the option set for the ANITABLE form.

For more information see Division 2, Section 4A165.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.59.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * INDEX

Description: Long distance platform index.

Required Field.
Valid Entries: Enter 10 - 131071 or 0 for the default ANI table entry.

Data Rules:

When INDEX is 0 (default ANI table entry) DAS must be entered and not 00.

For 5E14 and later, a LDPINDEX form must exist with INDEX equal to 0.

LDP BASIC CALL PROCESSING

The following fields (Section 2.3 - Section 2.5) supports the LDP (Long Distance Platform) Basic Call Processing capabilities.

2.3 DAS

Description: This field is used to specify the digit analysis selector or tree number used when interpreting incoming digits for routing and charging purposes.

Required Field.
Default: 00
Valid Entries:

For 5E14 and earlier: 0 - 99
For 5E15 and later: 0 - 254

Data Rules:

When INDEX is 0 (default ANI table entry), DAS must be entered and not 00.

When the DAS field is entered on the LDPINDEX form, it must be defined on a DAS form as the DIGIT ANALYSIS SELECTOR value with a PREFIX/FEATURE DIT value entered.

Copyright © 2003 Lucent Technologies

When the DAS field is entered on the LDPINDEX form and the DAS field is defined as a DIGIT ANALYSIS SELECTOR on a DAS form, the value of the LOCAL DIT for the LINE DAS on the corresponding DAS form must be entered. Also, the LOCAL DIT must be defined as a LDIT on the corresponding SMLDIT for every operational SM in the office.

This must be accomplished by entering a SMLDIT form with this LDIT value as the key and by entering each operational SM (as defined on EQIM forms where EQSTATUS is "O") into the LIST OF SWITCHING MODULES.

2.4 SCR

Description: This field is used to specify the screening index which allows for different billing rates and routing.
Valid Entries: 1 - 4095, or blank

Data Rules:

When the SCR field is entered on the LDPINDEX form,this SCR must be defined on a corresponding RAR form.

2.5 TERM NSC

Description: This field is used to specify the terminating network selection code. It translates to a DAS and screening index for routing the call. It is applicable in LDP networks that employ MINT (Multifarious Intra-Network Trunk) processing.
Valid Entries: 0 - 999, or blank

Data Rules:

When the TERM NSC is entered on the LDPINDEX form, the TERM NSC must be defined on the LDPTNSC form.

LDP ENHANCED CALL PROCESSING

The following fields (Section 2.6 - Section 2.10) supports the LDP (Long Distance Platform) Enhanced Call Processing capabilities.

2.6 NET CALL DENIAL

Description: This field is used to specify whether or not an LDP call will be denied origination.

Required Field.
Default: N
Valid Entries: Y, N

2.7 ACCT CODE LENGTH

Description: This field is used to specify the number of account code digits that are expected. A value of 0 indicates that an account code is not expected.

Required Field.
Default: 0
Valid Entries: 0 - 15

2.8 FIXED CARRIER

Description: This field is used to specify the carrier used to route Inter-LATA calls.

Copyright © 2003 Lucent Technologies

Valid Entries: 0 - 9999, or blank

Data Rules:

When FIXED CARRIER is entered TRIG NBR must not be entered.

When the FIXED CARRIER field is entered on the LDPINDEX form, FIXED CARRIER must be defined on a corresponding ICF form with FEAT GRP equal to "D".

2.9 TRIG NBR

Description: This field is used to specify the trigger number to locate unique network service for dialed digits. If this field is entered, a query will be launched to an external database.
Valid Entries: 1 - 255, or blank

Data Rules:

When TRIG NBR is entered, FIXED CARRIER must not be entered.

When the TRIG NBR field is entered on the LDPINDEX form,TRIG NBR must be defined on a corresponding NSTRIG form with APPLICATION equal to "ASP" and AIN REL equal to "R0D1".

2.10 II SCREEN

Description: The II SCREEN field is used to indicate if call processing should use the ANI data from the IIDIGTBL form to route the call.
Default: N
Valid Entries: Y, N

2.11 REMARKS

Description: The REMARKS field is used to enter remarks for the index used by ANIs.
Valid Entries: Enter up to 12 alphanumeric characters.

2.12 USED BY COUNT

Description: The USED BY COUNT field is used to hold the number of ANIs which use this index.
Valid Entries: 0 - 9999999

SEC. 5BR: SETTINGS OF TRAFFIC MEASUREMENTS REPORTS FORM - MEASRET

1. GENERAL

The form is used to retrofit the TRFMSET Relation, and is made available with the 5E16(1) FR 2 Software Release.This form is used only for Retrofit. It supports the Reserve the Settings of Traffic Meassurements Reports feature. For more information on this feature, see Division 2, Section 2AC.

1.1 Recent Change View

There is no corresponding Recent Change View for this form.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * INDEX

Description: This field indicates the key that is used to access a particular tuple in the TRFMSET Relation.

Required Field.

Software Release: 5E16(1) FR 2 and later
Valid Entries: 0 - 511

2.3 COMP LIST

Description: The Component List field contains information about the settings of Traffic Measurements reports needed to define them.

Software Release: 5E16(1) FR 2 and later
Valid Entries: 8 alphanumeric characters

SEC. 5BS: 5578 RECORD
TOLLFREE/DEFAULT ANI II - TFANI

1. GENERAL

The 5578 Record is available with 5E11 and later Software Releases. The Tollfree/Default ANI (Automatic Number Identification) II form is used to map Original II digits to Default II digits and Tollfree II digits.

The Pay Phone Compensation for Tollfree Calls and Tollfree Calling Enhancement for Flexible ANI features are secured features (both under SFID 332) that must be set to "Y" before the TFANI form can be populated.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.74.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * ORIGINAL II

Description: This field is used to specify the Original ANI II digits as determined by call processing. For Access Tandems, these are the II digits received in the signaling message from the end office. For translation numbers, the original II digits are the SCP returned II digits. These ANI II digits identify the originating line class-of-service.

Required Field.
Valid Entries: 00 - 99

2.3 TOLLFREE II

Description: This field is used to specify the mapped ANI II digits that will be sent if the carrier does not accept original II digits for translated tollfree calls. If blank, no new modification to the ANI II digits will be made.
Valid Entries: 00 - 99 or blank

2.4 DEFAULT II

Description: This field is used to specify the mapped ANI II digits that will be sent if the carrier does not accept Original II digits for non-translated tollfree calls. If blank, no new modification to the ANI II digits will be made.
Valid Entries: 00 - 99 or blank

2.5 REMARKS

Description: This field is for optional remarks or for a descriptive comment.
Valid Entries: Enter up to 16 characters (includes alphanumeric, special characters, or blank).

SEC. 5BU: 5580 RECORD
OLD NPANXX MAPPING TO NEW NPA - NPANXX

1. GENERAL

The NPANXX form (5580 Record) is available with 5E13 and later Software Releases, and is used to map an old NPA (Numbering Plan Area) NXX (Office Code (Part of Dialed Number)) to a new NPA. Specifiying the OLD NXX is optional. The new NPA is used in an announcement stating the transition to the new NPA. The office code is commonly referred to as the "NXX" which are the three digits (e.g., telephone exchange) after the NPA (commonly referred to as the "area code").

The NPANXX form was added to support the Announcement on Detection of NPA Split feature. This is a secured feature with an SFID of 347 that must be activated before using this form. For more detailed information on activating this feature, see Division 2, Section 4A347.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *OLD NPA

Description: Enter the 3-digit old NPA that is being split. NPAs are normally in the following range: N is 2-9; P is 0-9; A is 0-9.

Required Field.

Software Release: 5E13 and later
Valid Entries: 200 - 999

Data Rules:

When two or more NPANXX forms have the same value of OLD NPA, the OLD NXX must be entered on all of the NPANXX forms.

2.3 (*)OLD NXX

Description: Enter the 3-digit old Office Code. NXXs are normally in the following range: N is 0-9; X is 0-9; X is 0-9. This field is optional.

Software Release: 5E13 and later
Valid Entries: 000 - 999

2.4 #NEW NPA

Description: Enter the 3-digit new NPA created. NPAs are normally in the following range: N is 2-9; P is 0-9; A is 0-9.

Required Field.

Software Release: 5E13 and later
Valid Entries: 200 - 999

SEC. 5BW: 5590 RECORD
NO TEST TRUNK (NTT) UNIT - NTTU

1. GENERAL

The 5590 Record is available with the 5E15 and later Software Releases. The No Test Trunk (NTT) Unit form is used to define an NTT unit and MTB (Metallic Test Bus) pairs reserved for each testing trunk connected to NTT unit. It also contains information about equipment locations for MSU (Metallic Service Unit) of the first MTB 0 associated with the NTT unit and the related digital trunk unit which is used for NTT trunk assignments.

1.1 Recent Change View

The corresponding Recent Change view for this form is 14.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * NTT UNIT ID

Description: The NTT UNIT ID field indicates the NTT unit identifier being unique in the office.

Software Release: 5E15 and later
Required Field.
Valid Entries: 1 - 99

2.3 SM

Description: The SM field indicates the switching module where the MSU of the first MTB 0 associated to NTT unit is located. This is a display only field.

Software Release: 5E15 and later
Valid Entries: 1 - 192

2.4 EQL BAY

Description: The EQL BAY field indicates the equipment location bay number for the MSU of the first MTB 0 associated with the NTT unit.

Software Release: 5E15 and later
Valid Entries:

00 to 84
0 - 14, 100 - 104, or 200 - 208 for an SM2000.

2.5 EQL UNVER

Description: The EQL UNVER field indicates the equipment location vertical position number for the MSU of the first MTB 0 associated with the NTT unit.

Software Release: 5E15 and later
Valid Entries: 00 - 84

Copyright © 2003 Lucent Technologies

2.6 EQL AISLE

Description: The EQL AISLE field indicates the equipment location (floor and aisle) number for the MSU of the first MTB 0 associated with the NTT unit.

Software Release: 5E15 and later
Valid Entries:

00 - 99 for floor number
00 - 99 for aisle number

2.7 DIGITAL TRUNK UNIT

Description: The DIGITAL TRUNK UNIT field indicates the equipment number (composite equipment number consisting of DTUTYP and DTUNBR) of the digital trunk unit used for assignment of NTT trunk sthat are connected to the NTT unit.

Software Release: 5E15 and later
Valid Entries:

Digital Trunk Unit Type Valid Entries

Entry	Definition
D	DEN [Digital Line and Trunk Unit (DLTU) Equipment NumbeR.
N	NEN [Digital Networking Unit - SONET (DNU-S) Equipment Number.

Digital Trunk Unit Equipment Number for DEN

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
DLTU (digital line trunk unit)	DLTU	XXX	000 - 011
DFI (digital facility interface)	DFI	XX	01 - 10
FACIND (facility indicator	FAC IND	X	1 - 2

Digital Trunk Unit Equipment Number for NEN

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
DNU-S (digital networking unit - SONET)	DNU-S	X	0 - 7
DG (data group)	DG	X	0 - 1
STE (SONET termination equipment)	STE	X	1 - 6
STS (synchronous transport signal)	STS	X	1
VTG (virtual tributary group)	VTG	X	1 - 7
VTM (virtual tributary member)	VTM	X	1 - 4

MTB ASSIGNMENT LIST (MTBLIST)

The MTB assignment list contains MTB pairs associated to DS0's of NTT Unit related to testing trunks connected to this unit and assigned to respective channels of digital trunk unit. The channel 1 is used for Signaling Converter Control Trunk (SCCT), and testing trunks are assigned to channels 2 thru 13 of digital trunk unit.

2.8 MTB0

Description: The MTB0 field indicates the Metallic Test Bus 0 associated with a NTT testing trunk. It is used for configuration and verification of a trunk.

Software Release: 5E15 and later
Valid Entries:

MTB0 Valid Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 -1
Service Group	SG	X	0 -1
Board	BD	XX	00 - 31

Copyright © 2003 Lucent Technologies

Bus	BUS	XX	00 - 14

Data Rules:

MTB0 for CHNL 2 must be entered.

2.9 MTB1

Description: The MTB1 field indicates the Metallic Test Bus 1associated with a NTT testing trunk. It is used for configuration and verification of a trunk.

Software Release: 5E15 and later
Valid Entries:

MTB1 Valid Entries

Equipment		Format	Valid Entries
Switching Module	SM	XXX	1 - 192
Metallic Service Unit	MSU	X	0 -1
Service Group	SG	X	0 -1
Board	BD	XX	00 - 31
Bus	BUS	XX	00 - 14

Data Rules:

All entered.MTB0 and MTB1 must be unique.

SEC. 5CB: 5766 Record
OIU CARRIER GROUP ALARM INTEGRATION
TIMESGROUP FORM - CGATIME

1. GENERAL

The 5766 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete CGA (Carrier Group Alarm) groups which define alarm ON/OFF integration times of Alarm Indication Signals, Local Alarms, and Remote Alarms on all OIU facilities. This form supports the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 20.33.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * CGA GROUP

Description: This field is used to specify the name for a Carrier Group Alarm group.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric charaters

2.3 SONET TYPE

Description: This field is used to indicate whether or not the associated CGA Group is for SONET (Synchronous Optical Networking) type STE, HVC, and LVC facilities.

Software Release: 5E16(2) and later
Valid Entries: Y, N

Data Rules:

When SONET TYPE is "Y":

- ST AIS must be 1.0 - 10.0 by 0.5
- ST LOCAL must be 1.0 - 10.0 by 0.5
- ST REMOTE must be 1.0 - 10.0 by 0.5
- CL AIS must be 1.0 - 200.0 by 0.5
- CL LOCAL must be 1.0 - 200.0 by 0.5

Copyright © 2003 Lucent Technologies

- CL REMOTE must be 1.0 - 200.0 by 0.5
- The ratio of timers CL AIS to ST AIS cannot exceed 20:1.
- The ratio of timers CL LOCAL to ST LOCAL cannot exceed 20:1.
- The ratio of timers CL REMOTE to ST REMOTE cannot exceed 20:1.

When SONET TYPE is "N":

- ST AIS must be 0.1 - 60.0 by 0.1
- ST LOCAL must be 0.1 - 60.0 by 0.1
- ST REMOTE must be 0.1 - 60.0 by 0.1
- CL AIS must be 0.1 - 1200.0 by 0.1
- CL LOCAL must be 0.1 - 1200.0 by 0.1
- CL REMOTE must be 0.1 - 1200.0 by 0.1
- The ratio of timers ST AIS to CL AIS cannot exceed 20:1.
- The ratio of timers CL AIS to ST AIS cannot exceed 20:1.
- For the timers CL AIS and ST AIS, the smaller must divide evenly into the larger.
- The ratio of timers ST LOCAL to CL LOCAL cannot exceed 20:1.
- The ratio of timers CL LOCAL to ST LOCAL cannot exceed 20:1.
- For the timers CL LOCAL and ST LOCAL, the smaller must divide evenly into the larger.
- The ratio of timers ST REMOTE to CL REMOTE cannot exceed 20:1.
- The ratio of timers CL REMOTE to ST REMOTE cannot exceed 20:1.
- For the timers ST REMOTE and CL REMOTE, the smaller must divide evenly into the larger.

2.4 REMARKS

Description: This field is used to save any remarks associated with this CGA group.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 32 alphanumeric characters

2.5 STAIS

Description: The SONET Set Alarm Indication Signal field sets the amount of time (in seconds) an AIS (Alarm Indication Signal) should integrate before declaring a CGA SET on any facility subscribing to this provisioning group.

Software Release: 5E16(2) and later
Default: 2.5
Valid Entries:

1.0 - 10.0 seconds in 0.5 second increments, or

Copyright © 2003 Lucent Technologies

0.1 - 60.0 seconds in 0.1 second increments (dependent upon the value of SONET TYPE)

2.6 STLCL

Description: The SONET Set Local field sets the amount of time (in seconds) an local alarm should integrate before declaring a CGA SET on any facility subscribing to this provisioning group.

Software Release: 5E16(2) and later
Default: 2.5
Valid Entries:

1.0 - 10.0 seconds in 0.5 second increments, or
0.1 - 60.0 seconds in 0.1 second increments (dependent upon the value of SONET TYPE)

2.7 STRMT

Description: The SONET SET Remote field sets the amount of time (in seconds) a remote alarm should integrate before declaring a CGA SET on any facility subscribing to this provisioning group.

Software Release: 5E16(2) and later
Default: 0.5
Valid Entries:

1.0 - 10.0 seconds in 0.5 second increments, or
0.1 - 60.0 seconds in 0.1 second increments (dependent upon the value of SONET TYPE)

2.8 CLAIS

Description: The SONET Clear Alarm Indication Signal field sets the amount of time (in seconds) an AIS alarm should de-integrate before declaring a CGA CLEAR on any facility subscribing to this provisioning group.

Software Release: 5E16(2) and later
Default: 10
Valid Entries:

1.0 - 200.0 seconds in 0.5 second increments, or
0.1 - 1200.0 seconds in 0.1 second increments (dependent upon the value of SONET TYPE)

2.9 CLLCL

Description: The SONET Clear Local field sets the amount of time (in seconds) a local alarm should deintegrate before declaring a CGA CLEAR on any facility subscribing to this provisioning group.

Software Release: 5E16(2) and later
Default: 10
Valid Entries:

1.0 - 200.0 seconds in 0.5 second increments, or
0.1 - 1200.0 seconds in 0.1 second increments (dependent upon the value of SONET TYPE)

2.10 CLRMT

Copyright © 2003 Lucent Technologies

Description: The SONET Clear Remote field sets the amount of time (in seconds) a remote alarm should deintegrate before declaring a CGA CLEAR on any facility subscribing to this provisioning group.

Software Release: 5E16(2) and later
Default: 0 .1
Valid Entries:

1.0 - 200.0 seconds in 0.5 second increments, or
0.1 - 1200.0 seconds in 0.1 second increments (dependent upon the value of SONET TYPE)

SEC. 5CC: 5767 Record
OIU PERFORMANCE MONITORING - THRESHOLD GROUP FORM - OIUPM

1. GENERAL

The 5767 Record is available with 5E16(2) and later Software Releases. It is used to insert, review, update, and delete PM (Performance Monitoring) thresholds for OIU transport facilities. This form supports the following features:

- OIU (Optical Interface Unit) OC-3 (Optical Carrier Level 3) NAR (North American Region) feature (99-5E-7140). For more information, see Division 2, Section 7BQ.
- OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. (For more information on this feature, see Division 2, Section 7BX.)

1.1 Recent Change View

The Recent Change View for this form is 20.32.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * PM GROUP

Description: The PM (Performance Monitoring) Group field is used to specify a name for a PM group.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 8 alphanumeric charaters

2.3 REMARKS

Description: This field is used to save any remarks associated with this PM group.

Software Release: 5E16(2) and later
Valid Entries: Blank, or 1 - 32 alphanumeric characters

2.4 # CKT TYPE

Description: This field is used to specify what types of OIU facilities this PM group can be assigned to. Required field.

Software Release: 5E16(2) and later
Valid Entries:

Valid CKT TYPE Entries

Entry	Definition
DS1	OIU Digital Signal - Level 1 Facility .
OC3	OIU - SONET Terminating Equipment facility.
OC3C	Optical Carrier level 3 Concatenated signal .
PPPLNK	Point-to-Point Link facility.
STS1FAC	OIU - Synchronous Transport Signal Facility.
STS3C	OIU Synchronous Transport Signal Facility.
VT15	OIU - Virtual Tributary 1.5 Facility

Copyright © 2003 Lucent Technologies

Data Rules:

When CKT TYPE is "OC3" or "OC3C":

- LESDAT must be blank or 1 - 65535.
- LSESDAT must be blank or 1 - 65535.
- LES15MAT must be blank or 1 - 900.
- LSES15MAT must be blank or 1- 900.
- PFLSDAT must be blank or 1 - 65535.
- PFLS15MAT must be blank or 1- 900.

When CKT TYPE is "STS1FAC", "VT15", or "DS1":

- PESDAT must be blank or 1 - 65535.
- PSESDAT must be blank or 1 - 65535.
- PUASDAT must be blank or 1 - 65535.
- PES15MAT must be blank or 1 - 900.
- PSES15MAT must be blank or 1 - 900.
- PUAS15MAT must be blank or 1 - 900.

When CKT TYPE is "DS1":

- PFLSDAT must be blank or 1 - 65535.
- PSSDAT must be blank or 1 - 65535.
- PFLS15MAT must be blank or 1 - 900.
- PSS15MAT must be blank or 1 - 900.
- PUAS15MAT must be blank or 1 - 900.
- PSESDAT must be blank or 1 - 65535.
- PUASDAT must be blank or 1 - 65535.
- PES15MAT must be blank or 1 - 900.
- PSES15MAT must be blank or 1 - 900.

When CKT TYPE is "STS3C":

- PESDAT must be blank or 1 - 65535.
- PSESDAT must be blank or 1 - 65535.
- PUASDAT must be blank or 1 - 65535.

Copyright © 2003 Lucent Technologies

- CV15MAT must be blank or 1 - 16383
- PES15MAT must be blank or 1 - 900.
- PSES15MAT must be blank or 1 - 900.
- PUAS15MAT must be blank or 1 - 900.

When CKT TYPE is "PPPLNK":

- CVDAT, LESDAT, LSESDAT, PESDAT, PSESDAT, PUASDAT, PFLSDAT, PSSDAT, CV15MAT, LES15MAT, LSES15MAT, PES15MAT, PSES15MAT, PUAS15MAT, PFLS15MAT, and PSS15MAS must all be blank.

When CKT TYPE is not "PPPLNK":

- IPHDAT, IPCDAT, USPDAT, IIHDAT, IIQDAT, IIFDAT, ICRDAT, IDCDAT, ICPDAT, ICEDAT, ICTDAT, UURDAT, EURDAT, RDLDAT, ERRDAT, URVDAT, URIDAT, IPH15MAT, IPC15MAT, USP15MAT, IIH15MAT, IIQ15MAT, IIF15MAT, ICR15MAT, ICD15MAT, ICP15MAT, ICE15MAT, ICT15MAT, UUR15MAT, EUR15MAT, RDL15MAT, ERR15MAT, URV15MAT, and URI15MAT must all be blank.
- IPHDAT must be blank or 1 - 65535.
- IPCDAT must be blank or 1 - 65535.
- USPDAT must be blank or 1 - 65535.
- IIHDAT must be blank or 1 - 65535.
- IIQDAT must be blank or 1 - 65535.
- IIFDAT must be blank or 1 - 65535.
- ICRDAT must be blank or 1 - 65535.
- ICDDAT must be blank or 1 - 65535.
- ICPDAT must be blank or 1 - 65535.
- ICEDAT must be blank or 1 - 65535.
- ICTDAT must be blank or 1 - 65535.
- UURDAT must be blank or 1 - 65535.
- EURDAT must be blank or 1 - 65535.
- RDLDAT must be blank or 1 - 65535.
- ERRDAT must be blank or 1 - 65535.
- URVDAT must be blank or 1 - 65535.
- URIDAT must be blank or 1 - 65535.
- IPHMAT must be blank or 1 - 900.
- IPCMAT must be blank or 1 - 900.

Copyright © 2003 Lucent Technologies

- USPMAT must be blank or 1 - 900.
- IIHMAT must be blank or 1 - 900.
- IIQMAT must be blank or 1 - 900.
- IIFMAT must be blank or 1 - 900.
- ICRMAT must be blank or 1 - 900.
- ICDMAT must be blank or 1 - 900.
- ICEMAT must be blank or 1 - 900.
- ICTMAT must be blank or 1 - 900.
- UURMAT must be blank or 1 - 900.
- EURMAT must be blank or 1 - 900.
- RDLMAT must be blank or 1 - 900.
- ERRMAT must be blank or 1 - 900.
- URVMAT must be blank or 1 - 900.
- URIMAT must be blank or 1 - 900.

DAILY ALERTING THRESHOLDS

2.5 INHDAY

Description: This field is used to indicate whether or not to inhibit all daily alerting thresholds. Required field.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

2.6 CVDAT

Description: This field is used to specify the Coding Violation Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 1048575

2.7 LESDAT

Description: This field is used to specify Line Errored Seconds Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.8 LSESDAT

Description: This field is used to specify Line Severely Errored Seconds Daily Alerting Threshold.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.9 PESDAT

Description: This field is used to specify Path Errored Seconds Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.10 PFLSDAT

Description: This field is used to specify Path Frame Loss Seconds Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.11 PSESDAT

Description: This field is used to specify Path Severely Errored Seconds Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.12 PSSDAT

Description: This field is used to specify Path Slip Seconds Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.13 PUASDAT

Description: This field is used to specify Path Unavailable Seconds Daily Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

IP THRESHOLDS

These fields (Section 2.14 - Section 2.30) support the OIU-IP feature. For more information on these features, see Division 2, Section 7BQ and Division 2, Section 7BX, respectively.

2.14 IPHDAT

Description: The IPHDAT (Invalid PPP Header Received) field is used to specify the alerting threshold for the number of invalid PPP (Point-to-Point) headers received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.15 IPCDAT

Description: The IPCDAT (Invalid PPP Checksum Received) field is used to specify the alerting threshold for the number of invalid PPP checksums received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

Copyright © 2003 Lucent Technologies

2.16 USPDAT

Description: The USPDAT (Unavailable Seconds At PPP Layer) field is used to specify the alerting threshold for the number of unavailable seconds at PPP layer time.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.17 IIHDAT

Description: The IIHDAT (Invalid IP Header) field is used to specify the alerting threshold for the number of invalid IP (Internet Protocol) headers.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.18 IIQDAT

Description: The IIQDAT (Incoming IP Queue Congestion) field is used to specify the alerting threshold for the number of incoming IP queue congestions.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.19 IIFDAT

Description: The IIHDAT (Incoming Fragmented IP Datagrams) field is used to specify the alerting threshold for the number of invalid IP headers.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.20 ICRDAT

Description: The ICRDAT (Incoming ICMP Datagrams Received) field is used to specify the alerting threshold for the number of incoming ICMP (Internet Control Message Protocol) datagrams received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.21 ICDDAT

Description: The ICDDAT (Incoming Destination Unreachable Message Received) field is used to specify the alerting threshold for the number of incoming destination unreachable message received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.22 ICPDAT

Description: The ICPDAT (ICMP Parameter Problem Message Received) field is used to specify the alerting threshold for the number of ICMP parameter problem messages received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.23 ICEDAT

Copyright © 2003 Lucent Technologies

Description: The ICEDAT (ICMP Echo Request Message Received) field is used to specify the alerting threshold for the number of ICMP echo request messages received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.24 ICTDAT

Description: The ICTDAT (ICMP TTL Exceeded Message Received) field is used to specify the alerting threshold for the number of ICMP exceeded messages received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.25 UURDAT

Description: The UURDAT(Unexpected UDP Datagrams Received) field is used to specify the alerting threshold for the number of unexpected UDP (User Datagram Protocol) datagrams.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.26 EURDAT

Description: The EURDAT (Errored UDP Datagrams Received) field is used to specify the alerting threshold for the number of errored UDP datagrams received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.27 RDLDAT

Description: The RDLDAT (RTP Datagrams Lost) field is used to specify the alerting threshold for the number of RTP (Real Time Transport Protocol) datagrams lost.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.28 ERRDAT

Description: The ERRDAT (Errored RTP Datagrams Received) field is used to specify the alerting threshold for the number of errored RTP datagrams received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.29 URVDAT

Description: The URVDAT (Unexpected RTCP Datagrams Received Valid Port) field is used to specify the alerting threshold for the number of unexpected RTCP (Real Time Control Protocol) datagrams receiving invalid ports.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.30 URIDAT

Copyright © 2003 Lucent Technologies

Description: The URIDAT (Unexpected RTCP Datagrams Received Invalid Port) field is used to specify the alerting threshold for the number of unexpected RTCP datagrams receiving invalid ports.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

FIFTEEN MINUTE ALERTING THRESHOLDS

2.31 INH15

Description: This field is used to inhibit all 15 minute alerting thresholds.
Required field.

Software Release: 5E16(2) and later
Default: N
Valid Entries: Y, N

2.32 CV15MAT

Description: This field is used to specify the alerting threshold for the Coding Violation 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 65535

2.33 LES15MAT

Description: This field is used to specify the alerting threshold for the Line Errored Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.34 LSES15MAT

Description: This field is used to specify the alerting threshold for the Line Severely Errored Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.35 PES15MAT

Description: This field is used to specify the alerting threshold for the Path Errored Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.36 PFLS15MAT

Description: This field is used to specify the alerting threshold for the Path Frame Loss Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

Copyright © 2003 Lucent Technologies

2.37 PSES15MAT

Description: This field is used to specify the alerting threshold for the Path Severely Errored Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.38 PSS15MAT

Description: This field is used to specify the alerting threshold for the Path Slip Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.39 PUAS15MAT

Description: This field is used to specify the alerting threshold for the Path Unavailable Seconds 15 Minute Alerting Threshold.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

IP THRESHOLDS

These fields (Section 2.40 - Section 2.56) support the OIU-NAR and the OIU-IP features. For more information on these features, see Division 2, Section 7BQ and Division 2, Section 7BX, respectively.

2.40 IPH15MAT

Description: The IPH15MAT field is used to specify the alerting threshold for the number of invalid PPP headers received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.41 IPC15MAT

Description: The IPC15MAT field is used to specify the alerting threshold for the number of invalid PPP checksums received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.42 USP15MAT

Description: The USP15MAT field is used to specify the alerting threshold for the number of unavailable seconds for the PPP layer.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.43 IIH15MAT

Description: The IIH15MAT field is used to specify the alerting threshold for the number of invalid IP headers.

Copyright © 2003 Lucent Technologies

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.44 IIQ15MAT

Description: The IIQ15MAT field is used to specify the alerting threshold for the number of incoming IP queue congestion.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.45 IIF15MAT

Description: The IIF15MAT field is used to specify the alerting threshold for the number of incoming fragmented IP datagrams.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.46 ICR15MAT

Description: The ICR15MAT field is used to specify the alerting threshold for the number of incoming ICMP datagrams received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.47 ICD15MAT

Description: The ICD15MAT field is used to specify the alerting threshold for the number of incoming destination unreachable messages received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.48 ICP15MAT

Description: The ICP15MAT field is used to specify the alerting threshold for the number of ICMP parameter problem message received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.49 ICE15MAT

Description: The ICE15MAT field is used to specify the alerting threshold for the number of ICMP echo request messages received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.50 ICT15MAT

Description: The ICT15MAT field is used to specify the alerting threshold for the number of ICMP exceeded messages received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

Copyright © 2003 Lucent Technologies

2.51 UUR15MAT

Description: The UUR15MAT field is used to specify the alerting threshold for the number of unexpected UDP datagrams.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.52 EUR15MAT

Description: The EUR15MAT field is used to specify the alerting threshold for the number of errored UDP datagrams received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.53 RDL15MAT

Description: The RDL15MAT field is used to specify the alerting threshold for the number of RTP datagrams lost.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.54 ERR15MAT

Description: The ERR15MAT field is used to specify the alerting threshold for the number of errored RTP datagrams received.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.55 URV15MAT

Description: The URV15MAT field is used to specify the alerting threshold for the number of unexpected RTCP datagrams received valid port.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

2.56 URI15MAT

Description: The URI15MAT field is used to specify the alerting threshold for the number of unexpected RTCP datagrams receiving invalid ports.

Software Release: 5E16(2) and later
Valid Entries: 1 - 900

SEC. 5CD: 5769 Record
THRESHOLD ALARM LEVELS - ALRMLVLS

1. GENERAL

The 5769 Record is available with 5E16(2) and later Software Releases. It is used to review and update threshold alarm levels. This form supports the OIU - IP (Optical Interface Unit - Internet Protocol) feature (99-5E-8308). This feature is made available in 5E16 Feature Release 3. For more information on this feature, see Division 2, Section 7BX.

1.1 Recent Change View

The Recent Change View for this form is 8.29.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * KEY

Description: The KEY field is used to access the form.

Software Release: 5E16(2) and later
Default: 0

2.3 ICMP ECHO REQ

Description: This field is used to define the alarm level for the ICMP (Internet Control Message Protocol) echo request thresholds, ICE15MAT and ICEDAT, on the OIUPM form.

Software Release: 5E16(2) and later
Valid Entries: Blank, or enter MINOR

2.4 IP FRAG DATAGRM

Description: This field is used to define the alarm level for the IP (Internet Protocol) fragmented datagrams thresholds, IIF15MAT and IIFDAT, on the OIUPM form.

Software Release: 5E16(2) and later
Valid Entries: Blank, or enter MINOR

2.5 UDP UNEXP DATAGRM

Description: This field is used to define the alarm level for the UDP (User Datagram Protocol) unexpected datagram thresholds, UUR15MAT and UURDAT, on the OIUPM form.

Software Release: 5E16(2) and later
Valid Entries: Blank, or enter MINOR

2.6 RTCP INV PORT

Description: This field is used to define the alarm level for the RTCP (Real-time Control Protocol) unexpected invalid port use thresholds, URI15MAT and URIDAT, on the OIUPM form.

Software Release: 5E16(2) and later

Copyright © 2003 Lucent Technologies

Valid Entries: Blank, or enter MINOR

2.7 RTCP VAL PORT

Description: This field is used to define the alarm level for the RTCP unexpected valid port use thresholds, URV15MAT and URVDAT, the OIUPM form.

Software Release: 5E16(2) and later
Valid Entries: Blank, or enter MINOR

BICC RELEASE CAUSE VALUE - UNI2BCAU

1. GENERAL

The UNI2BCAU form (5589 Record) is available with 5E15 Feature Release 3 Software Update, and is used to provide customers with the ability to enter the desired BICC (Bearer Independent Connection Control) causes from the UNI (User to Network Interface) release cause categories.

This form is being added to support the Cause Value Mapping feature. This is a secured feature with an SFID of 567 that must be activated before using this form. For more detailed information on activating this feature, see Division 2, Section 4A567.

1.1 Recent Change View

The corresponding Recent Change View for this form is 8.43.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 *UNI KEY

Description: This field is used as the UNI cause value or BICC category. When a bearer connection is being released, a UNI RELEASE message will be sent. One of the fields in the RELEASE message is "cause", which specifies the reason why the bearer connection is released.

Required Field.

Software Release: 5E15 and later
Valid Entries:

Valid OUTPULSING Entries

Entry	Definition
CV0	Unknown
CV1	Unallocated number
CV2	No route to specified transit network
CV3	No route to destination
CV16	Normal Call Clearing
CV22	Number changed
CV25	Exchange Routing Errors
CV27	Destination out of order
CV28	Invalid Number Format (Address incomplete)
CV31	Normal - unspecified
CV34	No circuit available
CV35	Requested VPCI/VCI Not Available
CV36	VPCI/VCI Assignment Failure
CV37	User Cell Rate Not Available
CV38	Network out of order
CV41	Temporary failure
CV42	Switching equipment congestion
CV44	Requested Channel not available
CV45	No VPI/VCI Available
CV46	Precedence Call Blocked
CV47	Resource Unavailable
CV49	Quality of Service Not Available
CV57	Bearer Capability not authorized
CV58	Bearer Capability presently not available
CV63	Service or option not available, unspecified
CV65	Bearer capability not implemented, unspecified
CV66	Channel type not implemented
CV69	Requested facility not implemented

Copyright © 2003 Lucent Technologies

CV70	Only restricted digital information bearer capability is available
CV73	Unsupported combination of traffic parameters
CV79	Service or option not implemented, unspecified
CV91	Invalid transit network selection
BRF	BICC Cause Category "A": Bearer routing failure
NCC	BICC Cause Category "B": Normal Call Clearing
RUU	BICC Cause Category "C": Resource unavailable, unspecified
SNU	BICC Cause Category "D": Service or option not implemented, unspecified.
IU	BICC Cause Category "E": Interworking, unspecified
NU	BICC Cause Category"F": Normal, unspecified

Data Rules:

2.3 #BICC CAUSE

Description: This field is the BICC cause value. When a BICC call is being released, a BICC RELEASE message will be sent. One of the fields in the RELEASE message is "cause", which specifies the reason why the call is released.

Required Field.

Software Release: 5E15 and later
Valid Entries: 1 - 127

SEC. 6A: 5550 RECORD
MULTIPLE TN'S WITH DISTINCTIVE RINGING - MTNDR

1. GENERAL

The 5550 Record is available with 5E4(2) and later Software Releases. This is a Secured Feature and is available only to 5ESS Switch offices that have made special arrangements to purchase the feature.

1.1 Line Assignment

The MDNL (Multiple Telephone Numbers Per Line with Distinctive Ringing) feature allows multiple telephone numbers, with distinctive ringing, to be assigned to a single line (Master TN), without an additional line termination or additional station equipment.

An unlimited number of telephone numbers (Dependent TNs) may be assigned to the Master TN, but only four distinctive ringing patterns are available to be assigned to Dependent TNs.

This feature may only be assigned to analog lines with a CLASS OF SERVICE of "INDIV" or "INWATS" on the associated LCC form (5306 Record).

1.2 BRCS Feature Assignment

BRCS features are assigned to the Master TN and these features except Distinctive Ringing will be applied to all Dependent TNs.

The Master TN will receive ringing pattern "A" unless the BRCS Distinctive Ringing feature (defined on the DRFD form (5606-1 Record)) is assigned to the Master TN with a ringing pattern other than "A" The Dependent TNs are assigned individual distinctive ringing patterns on this form.

The BRCS Call Waiting and Call Forwarding features are enhanced with the MDNL feature. Distinctive Call Waiting tones, which correspond to the distinctive ringing patterns assigned to the Dependent TN on this form, allow the user to distinguish which number is being called.

If Call Forwarding is assigned to the Master TN, the forwarding of calls to Dependent TNs can be applied two different ways:

A. All calls that terminate to the Master or Dependent TNs can be forwarded using the Call Forwarding Variable feature assigned to the Master TN. This is accomplished by assigning a Call Forwarding Variable feature with the FORWARD MULTIPLE TN'S? field set to "Y" on the CFWLPA form (5614-3 Record).

B. All calls that terminate to the Master TN can be forwarded. All calls to Dependent TNs cannot be forwarded. This is accomplished by assigning a Call Forwarding Variable feature with the FORWARD MULTIPLE TN'S? field set to "N" on the CFWLPA form (5614-3 Record).

1.3 Line Time Slot Bridging

The MDNL feature is compatible with the 1-TN LTSB (Line Time Slot Bridging) feature (refer to Division 2, Section 1ac). 1-TN LTSB has two ports with the same telephone number. The ports are bridged through software emulation, as opposed to the traditional metallic bridging.

1.4 Recent Change View

The corresponding Recent Change View for this form is 1.9.

2. FORM AND RECORD ENTRIES

Copyright © 2003 Lucent Technologies

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and office name on each record.

2.2 * TN

Description: Enter the Telephone Number of the Dependent TN.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

This TN must be unique within the 5ESS Switch and must not be set to the TN entered in the MASTER TN field.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the MTNDR form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, the TN(s) defined on the MTNDR form must have the first three digits of a 7-digit TN or the first six digits of a 10-digit TN assigned on the NOC form as the OFFICE CODE or the NPA/OFFICE CODE, respectively.

2.3 # MASTER TN

Description: Enter the seven-digit Telephone Number of the Master TN. The Master TN is the telephone number that the Dependent TN is associated with. This is a required field.

Required Field.
Valid Entries: 7 digits, 0 - 9

Data Rules:

The value entered here must be defined on a LINE form with an OE NUMBER specified and either PTY must be set to "I" and MFRI must be set to "N" or PTY must be left blank.

MTNDR form(s) cannot have a MASTER TN assigned which matches a TN on a LINE form having 2-TN LTSB (Line Time Slot Bridging) assigned (the ASSOC OE TYPE and NUMBER match a second LINE form with matching OE TYPE and NUMBER). These types of lines cannot have Multiple TNs with Distinctive Ringing assigned.

For 5E12 and later, if the first 3 digits of the 7-digit MASTER TNs on the MTNDR form are equivalent to an OFFICE CODE on the NOC form, but there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7- digit MASTER TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

For 5E12 and later, the TNs on the MTNDR form cannot have the MASTER TN equal to the TN on the same MTNDR form.

2.4 # RINGING PATTERN TYPE

Description: Enter the Distinctive Ringing Pattern that is assigned to the Dependent TN entered in the TN field.

Required Field.

Copyright © 2003 Lucent Technologies

Default: A
Valid Entries:

Valid RINGING PATTERN TYPE Entries

Entry	Definition
A	Ringing - repeated pattern of 2 seconds on and 4 seconds off (normal ringing pattern). Call Waiting Tone - pattern of 0.3 seconds on.
B	Ringing - repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on followed by 4 seconds off. Call Waiting Tone - pattern of 0.1 seconds on, 0.1 seconds off, 0.1 seconds on.
C	Ringing - repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on and 4 seconds off. Call Waiting Tone - pattern of 0.1 seconds on, 0.1 seconds off, 0.1 seconds on, 0.1 seconds off, 0.1 seconds on.
E	Ringing - repeated pattern of 0.3 seconds on, 0.2 seconds off, 1 second on, 0.2 seconds off, 0.3 seconds on, and 4 seconds off. Call Waiting Tone - pattern of 0.1 seconds on, 0.1 seconds off, 0.3 seconds on, 0.1 seconds off, 0.1 seconds on.

2.5 # TRC

Description: Will Call Tracing be allowed? When Call Trace is in effect, it is used to trace all incoming calls to the customer's Telephone Number and a record is printed on the Maintenance TTY.

Required Field.
Default: N
Valid Entries: Y, N

2.6 # ICP

Description: Will routing of terminating calls be allowed to go to regular intercept? If ICP is "Y" then all calls terminating to the Dependent TN, defined in the TN field, are rerouted to Regular Intercept.

Required Field.

Default value is N
Valid Entries: Y, N

2.7 DNY BV

Description: This field is used in Recent Change as a verify only field to indicate if Deny Busy Verification is allowed.

2.8 # INWATS

Description: Will Inwats be allowed? If a "Y" is entered, then the Dependent TN, defined in the TN field, will have Inwats.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If this field is "Y" then ICP must be "N"

2.9 NEXT KEY TN

Description: This field is used in Recent Change as a verify only field to determine all the Dependent TNs associated with the Master TN.

SEC. 6B: 5551 RECORD
CARRIER LINE SCREENING FORM - CARSCR

1. GENERAL

The 5551 record is available with 5E5 and later Software Releases, and is used by the operating company to assign carrier line screening information to an individual TN (Telephone Number) or to an MLHG (Multi-Line Hunt Group) and MLHG member for a particular carrier as part of the SCD (Selective Carrier Denial) feature. The SCD feature is also available with 5E5 and later Software Releases and allows carriers to selectively inhibit certain calls from lines the carriers themselves have designated as non-paying subscribers.

The 5551 Record consists of all carriers assigned to each individual TN or MLHG group and member. Each unique CARRIER ID, however, generates a second record (5551A). This record consists of each individual carrier and the corresponding TN or MLHG group and member the listed carrier is screening.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.60.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 (*) TN

Description: Enter a local Telephone Number.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

If a TN is entered, then the MLHG and TERM fields on this form must be left blank. However, if MLHG and TERM values are going to be entered on this form, this TN field must be left blank.

The TN entered on this form must be defined on a LINE form (5109 Record) where OE TYPE/NUMBER must be defined and "N" must be entered in the SHARED field. Also, the CLASS OF SERVICE field on the LCC form (5306 Record), where the LCC/RAX value equals the LCC/RAX entered on the LINE form, must have one of the following values entered: "INDIV", "PBX", "HOTMOTL", or "HOTPBX".

For 5E12 and later, TNs on different CARSCR forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the CARSCR form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 SCD OE

Description: This field identifies the Selective Carrier Denial Office Equipment number. This is a Recent Change only field.

2.4 (*) MLHG

Copyright © 2003 Lucent Technologies

Description: Enter the MLHG number.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: Blank or 1 - 8191

Data Rules:

When assigning MLHG numbers, entries exceeding 999 are not allowed until the range of 1 - 999 is completely exhausted. If a value is entered in this field, the TERM field on this form must also have an entry and the TN must be left blank. If a TN value was entered, leave this MLHG field blank.

The MLHG value entered must be defined on an MLHLN form (5111-1/2/3 Record) where OE TYPE/NUMBER must be defined and "N" must be entered in the SHARED field. Also, the CLASS OF SERVICE field on the LCC form, where LCC/RAX matches the LCC/RAX on the MLHLN form, must have one of the following values: "INDIV", "PBX", "HOTMOTL", or "HOTPBX".

2.5 (*) TERM

Description: Enter the MLHG terminal number.
Valid Entries: 1 - 2015 and 3001 - 3999
- (outdial terminals only)

Data Rules:

The TERM value must be defined on the MLHLN form where OE TYPE/NUMBER must be defined and "N" must be entered in the SHARED field. Also, the CLASS OF SERVICE field on the LCC form, where the LCC/RAX matches the LCC/RAX on the MLHLN form, must have one of the following values: "INDIV", "PBX", "HOTMOTL", or "HOTPBX".

If a value is entered in this field, an MLHG value must be entered and the TN field must be blank; however, the TERM field is left blank if a TN value was entered.

2.6 * CARRIER ID

Description: Enter the Carrier Identification Code.

Required Field.
Valid Entries:
- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

The CARRIER ID value entered on this form must be defined on the ICF form (5305 Record) with SCD SCRNING set to "Y", and for 5E8 and later, FEAT GRP on the ICF form must equal "D".

SEC. 6C: 5552 RECORD
SCD SCREENED SERVICE ACCESS CODES FORM - SACSCR

1. GENERAL

This form is available with 5E5 and later Software Releases. It is used to assign Service Access Codes that will be screened by the operating company via the SCD (Selective Carrier Denial) feature. The SCD feature allows a carrier to selectively inhibit certain carrier handled calls from lines designated as non-paying subscribers by the particular carrier.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.8.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * SAC

Description: Enter a three-digit Service Access Code in the NPA format where N is any digit in the range 2 - 9, P is in the range 0 - 1, and A equals 0 - 9.

Required Field.
Valid Entries: 3 digits

Data Rules:

If a SAC is entered on this form, it must be defined as the first three digits of INCOMING DIGITS on at least one LDIT form with TYPE OF CI CALL set to "SAC".

Copyright © 2003 Lucent Technologies

SEC. 1: CLUSTER FORMS

Copyright © 2003 Lucent Technologies

SEC. 1A: 5600 RECORD
CLUSTER DEFINITION FORM - CLUSTR

1. GENERAL

The 5600 Record is available with 5E2 and later Software Releases and defines a cluster of BRCS (Business and Residence Custom Services) Feature names.

With 5E6 and later Software Releases, Speed Calling (Abbreviated Dialing) features are assigned separately from IDP (Individualized Dialing Plan) features. Prior to this disassociation, a 5600 Record can be assigned an IDP feature with a Speed Call feature which counts as one feature for that line. However, after a retrofit from the 5E5 Software Release to the 5E6 Software Release, any CLUSTR form with an IDP feature will retain IDP features but will not retain any Speed Call features. Constructed and preconstructed Speed Calling features in the 5E5 Software Release are automatically assigned to corresponding Speed Calling preconstructed features in the 5E6 Software Release.

The CLUSTER NAME is an arbitrary eight character name that must be unique and cannot be equivalent to any other BRCS Feature names.

The CLUSTR form is normally used to create a CLUSTER NAME that represents a group of BRCS feature names. The CLUSTER NAME is then assigned on various feature assignment forms such as LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), TRUNKFA (5205 Record), and TKGRPFA (5206 Record). This method saves data entry effort by allowing a group of features to be represented by a single CLUSTER NAME which is then used in the actual customer assignment.

Note that a CLUSTER NAME can be defined with no BRCS Features. The empty CLUSTER value is assigned on appropriate feature definition forms to initialize the customer assignment base relation data in ODA, and then the actual features are added to the CLUSTR form (5600 Record) after turnover using Recent Change update.

Wildcard feature names of the format /AA* (AA equal to alphabetic) are not allowed to be assigned to a feature on the CLUSTR form.

The following restrictions apply:

- A maximum of 1023 clusters may be defined in an office.
- Clusters may not be assigned to any party lines.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.2.

2. FORM AND RECORD ENTRIES - 5600 RECORD

2.1 BASE AND CONTROL ESS UNIT

Enter the Base and Control Group Number and the Office Name on each record.

2.2 * CLUSTER NAME

Description: Enter a unique BRCS Feature Cluster Name. The Cluster Name cannot be equivalent to any other BRCS Feature names assigned on the CLUSTR form.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

Copyright © 2003 Lucent Technologies

The total quantity of unique CLUSTER NAMEs may not exceed 1023.

2.3 REMARKS

Description: Enter a description of the CLUSTER NAME.
Valid Entries: 1 - 32 characters

FEATURE LIST

Fields Section 2.4 -Section 2.8 refer to a list of up to sixteen feature names (16 rows, each containing a unique BRCS Feature name), with the associated Activity Status, automatic forms Presentation status, Authorization Code feature status, and Remote Access Services feature status.

2.4 FEATURE

Description: Enter the unique BRCS Feature Name.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

For 5E9(1) and later, the BRCS Feature Names assigned on the input CLUSTR form must be defined on any of the associated Feature Definition forms:

ACBFD, ACCTFD, ACSRFD, ACVTFD, ARSFD, ASIFD, ASPFD, ATHFD, BCLIDFD, CFWFD, CPNBNFD, CWTFD, DISPFD, DRFD, EDSFD, HIFD, ICMFD, IDFD, MSFD, LIDFD, LSACFD, LSARFD, LSCOTFD, LSCAFD, LSCFFD, LSCRFD, LSDAFD, LSCARFD, MWFD, MDRFD, PFAFD, PPFD, PUOFD, PUTFD, RNDFD, SCFD, TGSRFD, TODFD

The /LIRDAMU, /LIRDNMU, and /LIRMDU preconstructed features which were created to support the Calling Name Delivery feature were not available for the 5E7 Software Release.

For 5E15 and later, when FEATURE is entered on this form, it must not be defined on the MWFD form (5602 Record) where the appropriate fields on the MWFD form are set as follows:

- FEATURE OPTIONS fields: ACT/INACT OPTION must be set to "ACT1CA", MULTIWAY CONTROL must be set to "NWAY", and AMAC must be set to "USAGE",
- ENTRY POINT fields: FLASH must be set to "Y", IN MIDDLE must be set to "Y", and OFF HOOK must be set to "Y", and
- DEFAULT PARAMETER field: N-WAY MAXIMUM must be set to "6".

The feature options on the MWFD form define a USSWC (Usage Sensitive Six-Way Calling) feature which cannot be assigned on this form. USSWC must be assigned on the OFCOPT form (5509 Record). For more information on the USSWC feature, see Division 2, Section 4A553.

2.5 A

Description: Is the BRCS feature initially active? This is the Activity Status.
Valid Entries: Y, N

Data Rules:

The value of the Activity Status for each Feature Name in the FEATURE LIST is based on the following conditions:

If the Feature Name is defined on the ACBFD (5616-1 Record) or ARSFD form (5608-1A/1B Record), then

Copyright © 2003 Lucent Technologies

the Activity Status must equal "Y".

If the Feature Name is defined on the CFWFD (5614-1/2 Record), CWTFD (5603-1 Record), DRFD (5606-1 Record), PUOFD (5605-1 Record), PUTFD (5605-2 Record) (5E6 and earlier) , or TGSRFD form (5607-1/2 Record) with the ACT TYPE equal to "AUTO", then the Activity Status must equal "Y".

For 5E7 and later, if the Feature Name is defined on the PUTFD form, with ACT TYPE equal to "AUTO", it is recommended that the Activity Status equal "Y".

If the Feature Name is defined on the TODFD form (5610-1 Record) with the CUSTOMER ACTIVATION equal to "N", then the Activity Status must equal "Y".

If the Feature Name is defined on the IDFD form (5601 Record) with CUST ACT/DEACT IDP equal to "N", then the Activity Status must equal "Y".

If the Feature Name is defined on the MWFD form (5602-1/2 Record) with the ACT/INACT OPTION equal to "ALWACT" or "INACT1CA", then the Activity Status must equal "Y".

If the Feature Name is defined on the CFWFD form with the ACT TYPE equal to "CODE", "CDDN", "CDDNC", or "CDDNCA", then the Activity Status must equal "N".

If the Feature Name is defined on the MWFD form with the ACT/INACT OPTION equal to "ACT1CA", then the Activity Status must equal "N".

If the Feature Name is defined on the CWTFD, DRFD or TGSRFD form with the ACT TYPE equal to "CODE" and the DACT TYPE equal to "AUTO", then the Activity Status must equal "N".

2.6 P

Description: Enter the value for automatic forms presentation. The value to be entered is that which will be used in RC/V after the ODD (Office Dependent Data) is loaded on the switch.

Valid P Entries

Entry	Definition
N	No automatic forms presentation
R	Automatic forms presentation on RC/V review case
U	Automatic forms presentation on RC/V update case

Data Rules:

If one or more Feature Names are submitted, the corresponding A and P fields must also have an entry.

If the FEATURE assigned on this form is defined on the DISPFD form (5965 Record) or LIDFD form (5966 Record), then this field must be entered with "N".

2.7 AC

Description: Is the Authorization Code feature required?

Software Release: 5E3 and later
Valid Entries: Y, N

Data Rules:

If AC is "Y", then this CLUSTR form or an associated LINEFA, MLHLNFA, TKGRPFA or TRUNKFA form must have one and only one ATH Feature associated with it, defined on the ATHFD form (5619-1 Record).

If AC is "Y", and the corresponding feature is not an ATH feature defined on an ATHFD form, then the feature must be entered on ATHFCOS forms (5619-4 Record) for the CSV ATH Groups associated with lines, MLHG/TERMs, trunk groups, or trunks to which this cluster is assigned. For 5E6 and later, the

Copyright © 2003 Lucent Technologies

feature must also be entered on ATHFCOS forms for the CSD ATH Group.

If the AC field is set to "Y", then an Authorization Code Feature must also exist on either a LINEFA form, a BFG form, or an associated CLUSTR form. The Authorization Code Feature must be defined on the ATHFD form, and entered on a LINEFA form, BFG form, or an associated CLUSTR form.

AC must be "N" when FEATURE is:

- a DISP feature, and the cluster is assigned on a LINEFA, MLHLNFA, TKGRPFA, or TRUNKFA form;
- an ACVT, BCLID, CPNBN, EDS, LID, MS, or RND feature, and the cluster is assigned on a LINEFA or MLHLNFA form;
- an ACSR, HI, or Feature Button ICM feature, and the cluster is assigned on a LINEFA form.

2.8 R

Description: Are RAS (Remote Access Services) requested on the feature?

Software Release: 5E5 and later
Valid Entries: Y, N

Data Rules:

The only feature supported by RAS in 5E5 is RACF (Remote Access Call Forwarding). If "Y" is entered, the associated CFWFD form (5614-1/2 Record) must have ACT TYPE set to "CDDN", "CDDNC", "CDDNCA", "CDCA1A", or "CODE", and the DACT TYPE set to "CODE".

SEC. 2: INDIVIDUALIZED DIALING FORMS

Copyright © 2003 Lucent Technologies

SEC. 2A: 5601 RECORD
INDIVIDUALIZED DIALING FEATURE DEFINITION FORM - IDFD

1. GENERAL

The 5601 Record is available with 5E2 and later Software Releases. The IDFD form is used to define IDPs (Individualized Dialing Plans) for assignment to lines and/or trunks.

A terminal (line or trunk) may be assigned only one ID feature on the feature assignment forms LINEFA, MLHLNFA, BFG, TKGRPFA or TRUNKFA. Each such combination is given a feature name of from one- to eight-characters which is used to assign the constructed (switch owner defined) feature to lines or trunks. ID constructed features do not count toward the office's Constructed Feature Limit; see the CFL form (5712 Record) in Division 8, Section 11.

Certain ID features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/) and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed ID features is contained in Figure 2 .

1.1 Recent Change View

The corresponding Recent Change view for this form is 12.17.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * FEATURE

Description: Enter the Individualized Dialing feature name. Feature names may be from one- to eight-characters long, with no restrictions on the valid characters, except that feature names starting with a slash (/) are reserved for preconstructed features.

Preconstructed features may be reviewed in the ODA database but may not be deleted, changed or inserted.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

The following fields (Section 2.4 - Section 2.7) define the options assigned with the feature.

2.4 INHIBIT CHARGING

Description: Enter the type of calls that will not be charged.
Default: ICOMOFFC
Valid Entries:

Valid INHIBIT CHARGING Entries

Copyright © 2003 Lucent Technologies

Entry	Definition
ICOMGRP	Inhibit charging of intercom calls within the originator's Terminal Group.
ICOMOFFC	Inhibit charging of line-to-line intercom calls withinthe originator's switching office.
NO	Bill all calls normally.

2.5 CUST ACT/DEACT IDP

Description: Is the customer allowed to activate or deactivate the IDP?
Default: N
Valid Entries: Y, N

Data Rules:

If customer deactivation is allowed, the particular IDP must contain an IDP deactivation code (see the IDPDCA form). A terminal must be authorized with an appropriate DPAT (Dialing Plan Access Treatment) code to deactivate its IDP and it must be assigned to an IDP Group for deactivation to be successful.

If customer activation of an IDP is allowed, the ODP (Office Dialing Plan) must contain an IDP activation code (see the PDIT Form). A terminal must be authorized to activate its IDP, and it must be assigned to an IDP Group for activation to be successful. A terminal is authorized by being assigned an IDFD feature name which allows activation of the IDP. If it is desired that not all of the terminals which use the IDP Group information should be allowed to activate the IDP, then two IDFD features would be required. One of the IDFD forms would be defined with CUST ACT/DEACT IDP equal to "Y", and the other equal to "N". They must have unique feature names so they can be assigned appropriately to the terminals on the feature assignment forms. All the terminals can still be assigned to (and share) the same IDP Group Name and information.

2.6 CUST ACT/DEACT ACT

Description: Is the customer allowed to activate or deactivate the Alternate Code Treatment for any of its defined sets (see the IDPACT form)? Enter "N" if customer activation/deactivation is not allowed.
Default: N
Valid Entries: Y, N

Data Rules:

If customer activation/deactivation is allowed, either the named IDP must contain codes with "ACTOFF" and "ACTON" actions (see the IDPDCA form) or an appropriate key must be provided (see the FTRKEY form).

To activate or deactivate the ACT with a dialed code, a terminal must be authorized (with an appropriate DPAT code), and it must be assigned an IDP for the change to be successful.

2.7 GPIC CUST CHANGEABLE

Description: Is the customer allowed to change the IDP group primary interexchange carrier?
Default: N
Valid Entries: Y, N

Data Rules:

If customer change is allowed, the named IDP must contain a group carrier change code (see the IDPDCA form). To change the carrier, a terminal must be authorized (with an appropriate DPAT code) to change the carrier and it must be assigned an IDP for the change to be successful.

DEFAULT PARAMETERS

The following fields (Section 2.8 - Section 2.10) define the default parameters assigned with the feature to

Copyright © 2003 Lucent Technologies

terminals (lines or trunks). These parameters will be assigned to the terminal unless they are overridden by entries on the IDPLPA, IDPMPA or IDPTPA forms.

If an IDPLPA, IDPMPA, or IDPTPA parameter assignment form is entered for any given terminal, all entries on that form will be used for the terminal. None of the default parameters entered here on the IDFD form will be used.

2.8 IDP GROUP NAME

Description: Enter the name of the default Individualized Dialing Plan Group Name. The name may be from one to eight characters, with no restrictions on the valid characters.
Valid Entries: 1 - 8 characters

Data Rules:

When a trunk is assigned an IDP feature on the TKGRPFA, TRUNKFA, or associated CLUSTR form, the IDP GROUP NAME must be entered here or on the IDPTPA form if one exists for the trunk group.

If a default IDP GROUP NAME entered is defined on an IDPGP form (5601-4 Record) with DPAT ALLOWED set to "Y", DPAT CATEGORY must be entered on this IDFD form.

If a default IDP GROUP NAME is not entered, DPAT CATEGORY must not be specified.

2.9 DPAT CATEGORY

Description: Enter the default Dialing Plan Access Treatment category.
Valid Entries: 1 - 32

Data Rules:

If this field is entered, IDP GROUP NAME must be entered on this form, and for 5E8 and later, DPAT ALLOWED must be "Y" on the corresponding IDPGP form (5601-4 Record).

2.10 ICR SFG

Description: Enter an Intercom Calling Restriction Simulated Facility Group number.
Valid Entries: 1 - 2000

Data Rules:

If an ICR SFG is entered, then an IDP GROUP NAME must be entered. The ICR SFG must also be defined on the PFASFG form with "ICR" entered in the SFG TYPE field.

SEC. 2B: 5601-1/2 RECORDS
INDIVIDUALIZED DIALING PLAN DIALED CODE ASSIGNMENT FORM - IDPDCA

1. GENERAL

The 5601-1/2 Record is used to define the dialed codes associated with IDPs (Individualized Dialing Plans).

The IDPDCA form is associated with an Individualized Dialing Feature Definition form, IDFD form (5601-a/b Record).

1.1 Dialed Code Ambiguities

Ambiguities are allowed in defining an IDP's dialed codes. This is similar to ambiguities which occur in the ODP (Office Dialing Plan), particularly as defined in LDIT. Ambiguities occur whenever the treatment of a call depends, at some point in the inpulsing, upon whether or not any additional digits are received. As an example, if two entries are provided on the IDPDCA, one for 2 (an Abbreviated Dial code) and one for 2000 (an Intercom code), an ambiguity occurs after the digit 2 is received. The ambiguity is resolved by critical timing, usually four seconds (see the TIMING form, (5520 Record)). If no more digits are received within this specified interval, the call times out and is given the treatment specified on the IDPDCA entry for 2. Otherwise, digit analysis continues as more digits are received.

For any two IDPDCA entries in which ambiguity occurs, the entry with the shorter of the codes must have a STATE of "NORMAL", i.e., all the digits expected must be specified in Incoming Digits.

1.2 Abbreviated Dialing

A terminal which belongs to an IDP Group, and also has Abbreviated Dialing, must use the IDPDCA to interpret the AD (Abbreviated Dialing) codes. Dialing AD codes while the Office Dialing Plan is doing digit analysis will not be allowed for this terminal.

It is possible to enter in Incoming Digits more than one digit for AD1USE and more than two digits for AD2USE. However, call processing will use the last digit or digits dialed to enter the Abbreviated Dialing Lists. For instance, if *20 is defined in the IDPDCA as AD2USE, the 20 should be defined in the ADLIST. When the customer dials *20, the Stored DN associated with 20 will be used.

1.3 Recent Change View

The corresponding Recent Change View for this form is 9.13.

2. FORM ENTRIES - 5601-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * IDP GRP

Description: Enter the IDP Group Name.

Required Field.
Valid Entries: 1 - 8 characters

2.3 * INC DIGITS

Description: Enter the dialed, or inpulsed, code to be interpreted.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 10 digits, 0 - 9 inclusive. The first digit may also be # or *. The first or second digit, but not both, may be O, F, I, or P.

Data Rules:

If the O, F, I or P characters are entered, the corresponding ACTION and FEATURE must be associated with DSN/PP (Defense Switched Network / Precedence and Preemption). The DSN/PP interface is defined with the BRCS feature PP (Precedence and Preemption). For additional information concerning digit analysis for DSN/PP refer to the PPFD form (5618-1 Record).

If it is necessary to enter a single character * or #, the character must be preceded or followed by a space (space bar).

2.4 STATE

Description: This field defines the state of digit interpretation after the last digit in the INC DIGITS field has been dialed.

Required Field.
Default: NORMAL
Valid Entries:

Valid STATE Entries

Entry	Definition
CONFLCT	If the destination or treatment of the call cannot be determined after receipt of the last digit in the INC DIGITS field but depends upon the number (rather than value) of additional dialed digits, then enter "CONFLCT" in this field. Also enter "CONFLCT" when the treatment can be determined by the INC DIGITS, but a variable number of digits remain to be collected.
REMAIN	If the specified INC DIGITS are sufficient to determine the call treatment, but additional digits are to be collected for outpulsing or for intercom calling, then enter "REMAIN". If "REMAIN" is specified, an entry is required in the NBR REM DIGITS field. If "REMAIN" is specified, an entry is required in both ACTION and FEATURE.
NORMAL	If the specified digits are sufficient to determine the call treatment, and no additional digits are to be collected, enter "NORMAL". If "NORMAL" is specified, an entry is required in both ACTION and FEATURE.
PAUSE	This state is applicable to the DSN (Defense Switched Network) capability. If the specified INC DIGITS are sufficient to determine an action but subsequent digits must also be analyzed in the IDPDCA, enter "PAUSE". If "PAUSE" is specified, an entry is required in both ACTION and FEATURE.

Data Rules:

When STATE is "CONFLCT", at least two conflict resolution entries must be entered on this form.

If STATE is "CONFLCT" then only the conflict entries may be specified.

When STATE is "PAUSE", REM DIGITS must be blank.

2.5 ACTION

Description: Enter the action to be taken when the INC DIGITS are dialed.

This field does not apply when STATE is "CNFLCT" or "CONFLCT".

Valid ACTION Entries

Entry	Definition
AAOFF	Auto Answer Off via dial code. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.
AAON	Auto Answer On via dial code. For more information on the ACD/BRCS secured feature see

Copyright © 2003 Lucent Technologies

	Division 2, Section 4A121.
ACBCANC	Cancel auto-call back camp-on.
ACBUSE	Use auto-call back to camp-on to busy line.
ACCANC	LASS Automatic Callback deactivation. This dialed code allows the user to deactivate the AC (Automatic Callback) feature. The user goes off-hook, enters the dialed code, and receives a cancellation announcement.
ACCTACT	Activate account code feature.
ACCTDCT	Deactivate account code feature.
ACCTUSE	Account code use code.
ACDXFER	Transfer to ACD from ARU followed by ACD DN for the Transfer to ACD from ARU Special Feature.
ACSRCAN	Cancel ACSR move. This action is currently not available.
ACSROFF	Allows a member of an ACSR group with GRP CNTL set to "Y" on the ACSRFD form to deactivate ACSR for the entire group.
ACSRON	Allows a member of an ACSR group with GRP CNTL set to "Y" on the ACSRFD form (5959-1 Record) to activate ACSR for the entire group.
ACSRUSE	Allows an ACSR user to invoke an ACSR move.
ACSRVFY	Allows an ACSR user to verify the status of the ACSR move on the queue.
ACTCPNBN	Activate the CPN/BN feature via dialed code.
ACTGMB	Software Release: 5E15 and later. Activate Group Make Busy
ACTMMB	Software Release: 5E15 and later. Activate Member Make Busy
ACTOFF	Set ACT in IDP off.
ACTON	Set ACT in IDP on.
ACTSTH	Software Release: 5E15 and later. Activate Stop Hunt
ACUSE	Callback activation. This dialed code allows the user to activate the AC (Automatic Callback) feature. The user goes off-hook, enters the dialed code, and receives an appropriate response. (See page of this section for possible responses.)
AD1CH	Change 1 digit Abbreviated Dial list.
AD1USE	Use 1 digit Abbreviated Dial.
AD2CH	Change 2 digit Abbreviated Dial list.
AD2USE	Use 2 digit Abbreviated Dial.
AIUSE	Agent Intercom via dial code. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.
ALTACT	Activate alternate parameter set.
ANSBACK	Call Park Answer Back. This action allows the user to answer back a parked call from any DN within the same terminal group. For more information on Call Park see Division 2, Section 4A124.
AQCUSE	ACD Queue Calling via dial code. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.
ARCANC	LASS Automatic Recall deactivation. This dialed code allows the user to deactivate the AR (Automatic Recall) feature. The user goes off-hook, enters the dialed code and a cancellation announcement is returned.
ARSCP	Change ARS pattern group number.
ARSDCT	Deactivate ARS feature for one call.
ARS1USE	Use Automatic Route Selection with Private Network Dialing Plan 1.
ARS2USE	Use Automatic Route Selection with Private Network Dialing Plan 2.
ARSUSE	Use Automatic Route Selection with the Office Dialing Plan.
ARUSE	LASS Automatic Recall activation. This dialed code allows the user to activate the AR (Automatic Recall) feature. The user goes off-hook, enters the dialed code, and receives an appropriate response. (See page of this section for possible responses.)
ASITOG	ASI (Advanced Service Interface) Proxy implicit mode toggle. A dialed code defined in the office as a CORC (Customer Originated Recent Change) allows the user to activate or deactivate the ASI Proxy implicit mode feature. The system response is a stutter dial tone. See Division 2, Section 4A93 for more information about ASI.
ASIUSE	ASI Proxy explicit mode activation. This dialed code allows the user to activate the ASI Proxy feature in the explicit mode. The user goes off-hook, enters the dialed code, and receives an immediate connection to an ASI trunk (no dial or confirmation tone).
ASPDNC	No further digits are collected and an immediate query is sent to the SCP. A response is received and the call is routed.
ASPNORM	Digit collection and digit analysis on the collected digits are performed. A query is then launched to the SCP. A response is received and the call is routed.
ASPVAR	Digits are collected until interdigit timing expires. A query is launched and a response is received from the SCP. The call is routed.
ATACTMWI	Activate Message Waiting Indicator by attendant. This dialed code is used by a MSC (Message

Copyright © 2003 Lucent Technologies

	Service Center) attendant to activate the MWI (Message Waiting Indicator) at the user's station set. The attendant enters the dialed code, receives stutter dial tone and then dials the number of the telephone the MWI is to be activated on.
ATDCTMWI	Deactivate Message Waiting Indicator by attendant. This dialed code works similarly to the "ATACTMWI" action. The attendant can enter the dialed code, receive stutter dial tone and then dial the number of the telephone the MWI is to be deactivated on.
ATFACT	DN activates ISDN Attendant Control of Voice Terminal feature.
ATFDCT	DN deactivates ISDN Attendant Control of Voice Terminals feature.
ATGACT	A DN activates ISDN ACVT (Attendant Control of Voice Terminal) feature for a group of DNs.
ATGDCT	A DN deactivates ISDN ACVT (Attendant Control of Voice Terminal) feature for a group of DNs.
ATHACT	This feature is used to activate the Authorization Code feature. This ACTION will automatically set the A field to "Y" on the associated line or trunk assignment form, e.g., LINEFA, TRUNKFA, or TKGRPFA forms.
ATHDCT	This feature is used to deactivate the Authorization Code feature. This ACTION will automatically set the A field to "N" on the associated line or trunk assignment form, e.g., LINEFA, TRUNKFA, or TKGRPFA forms.
ATHINS	This ACTION is used to put a line or trunk "In Service" by automatically setting the ATH FIRST field to "N" on the associated ATHLPA, ATHMPA or ATHTPA form. When the ATH FIRST field is set to "N", an Authorization Use Code and the Authorization Code is not needed before the TN is entered.
ATHNREQ	This ACTION is used to automatically set the AC field to "N" on the associated line or trunk assignment form, e.g., LINEFA, TKGRPFA, or TRUNKFA forms. When the AC field has a value of "N", an Authorization Use Code and an Authorization Code is not needed before a feature, e.g., call forwarding, can be used. The features must be specified on the ATHFCOS form and they must be dial code activated.
ATHOOS	This ACTION is used to put a line or trunk "Out of Service" by automatically setting the ATH FIRST field to "Y" on the associated ATHLPA, ATHMPA or ATHTPA form. When the ATH FIRST field is set to "Y", an Authorization Use Code and the Authorization Code is needed before the TN is entered.
ATHREQ	This ACTION is used to automatically set the AC field to "Y" on the associated line or trunk assignment form. When the AC field has a value of "Y", an Authorization Use Code and an Authorization Code is needed before a feature (e.g., call forwarding) can be used. The features must be specified on the ATHFCOS form and they must be access code activated.
ATHUSE	This ACTION is used as the Authorization Use Code for the Authorization Code Feature defined on the ATHFD form (5619-1 Record).
AUCUSE	Auto Call Set Up used with Message Service and Electronic Directory Service features.
BPARK	Basic Call Park. This action allows a user active on a call to park the call against the user's DN. Dial codes can be used for ISAT (ISDN Attendant) consoles but cannot be used with ISDN terminals. For more information on Call Park see Division 2, Section 4A124.
BBTLUSE	This action is used for billed BRITL (Basic Rate Interface Dial Up Test Line).
BSYACT	Software Release: 5E16(2) and later. Activates all Call Forwarding Busy feature's prestored DNs.
BSYDCT	Software Release: 5E16(2) and later. Deactivates all Call Forwarding Busy feature's prestored DNs.
BTLUSE	This action is used for non-billed BRITL access.
CCL	Code calling for call pickup.
CFDATCH	Change Call Forward Don't Answer timing.
CFDCT	Deactivate all Call Forwarding features with prestored DNs.
CFDNCH	Change Forward-to DN.
CFVACT	Activate all Call Forwarding Variable features. Associated with Call Forwarding Busy/Idle feature.
CFVDCT	Deactivate all Call Forwarding Variable features. Associated with Call Forwarding Busy/Idle feature.
CLOFF	Closed Off via dial code. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.
CLON	Closed On via dial code. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.
CLWCUSE	Cancel Leave Word Calling. Used with the Message Service feature.
CNDACT	ICLID (Individual Calling Line Identification) Calling Number Delivery activation. This dialed code allows the user to activate the Calling Number Delivery feature which allows the called party to receive data on an incoming call. The user goes off-hook, enters the dialed code, and receives a confirmation tone.
CNDDCT	ICLID (Individual Calling Line Identification) Calling Number Delivery deactivation. This dialed code allows the user to deactivate the Calling Number Delivery feature which allows the called

Copyright © 2003 Lucent Technologies

	party to receive data on an incoming call. The user goes off-hook, enters the dialed code, and receives a confirmation tone.
CNPUSE	Toggle for NAME privacy per-call. This action is used in the Analog Calling Name Delivery Feature. See Division 2 Section 4A40 for more information.
COTUSE	Customer Originated Trace activation. This dialed code allows the user to activate the Customer Originated Trace feature. The user goes off-hook, enters the dialed code, and receives an appropriate response. (See page of this section for possible responses.)
CPQ1	Use call pickup feature with queue 1.
CPQ2	Use call pickup feature with queue 2.
CPQ3	Use call pickup feature with queue 3.
CPQ4	Use call pickup feature with queue 4.
CSACT	Software Release: 5E14 and later. Activate call screening.
CSDCT	Software Release: 5E14 and later. Deactivate call screening.
CSTOG	Software Release: 5E16(2) and later. Used to toggle between activating and deactivating the FCCS (Forwarded Call - Call Screening) Enhancement feature. For more infomation, see Division 2, Section 4A592.
CTT	Analog Attendant Call Though Test Action. Allows the attendant to make a test call from an Analog line that has been assigned an attendant class of service. The test call will verify the operation of the selected trunk member and the switch translations.
CWDLU	Use a dial Call Waiting feature. For ISDN Attendant Consoles, this action is used to assign the camp-on dialed code.
CWOACT	Activate all Call Waiting Originating features.
CWODCT	Deactivate all Call Waiting Originating features.
CWTACT	Activate all Call Waiting Terminating features.
CWTDCT	Deactivate all Call Waiting Terminating features.
CWXCH	Change Call Waiting tone repetition interval.
DAACT	Software Release: 5E16(2) and later. Activates all Call Forwarding Don't Answer feature's prestored DNs.
DADCT	Software Release: 5E16(2) and later. Deactivates all Call Forwarding Don't Answer feature's prestored DNs.
DALTACT	Activate alternate parameter set for CSD.
DARSCP	Change the active ARS pattern group number for CSD.
DBDACT	Deactivate all busy/idle data call forwarding features.
DBDDCT	Deactivate all busy/idle data call forwarding features.
DCDTVM	Software Release: 5E16(2) and later. DTVM Direct Connect.
DCTCPNBN	Deactivate the CPN/BN feature via dialed code.
DCTGMB	Software Release: 5E15 and later. Deactivate Group Make Busy
DCTMMB	Software Release: 5E15 and later. Deactivate Member Make Busy
DCTMWI	Deactivate Message Waiting Indicator. Used with the Message Service feature. The MWI (Message Waiting Indicator) can be deactivated by entering this dialed code. If an MWI lamp is provided with the station set, this action may be associated with the lamp and can be used to deactivate the lamp.
DCTSTH	Software Release: 5E15 and later. Deactivate Stop Hunt
DFRLALT	Activate the CSD alternate FRL.
DGPACT	Activate the ARS CSD group.
DGPDCT	Deactivate the ARS CSD group.
DMAINACT	Activate main parameter set for CSD.
DNPUSE	DNPUSE
DPARK	Directed Call Park. This action allows a user active on a call to park the call against the user's DN, or direct the call to be parked against another directory number within the same terminal group. Dial codes can be used for ISAT (ISDN Attendant) consoles but cannot be used with ISDN terminals. For more information on Call Park see Division 2, Section 4A124.
DPN	Use directed call pickup without barge-in.
DPU	Use directed call pickup with barge-in.
DRPCH	Change ringing pattern.
DTONE	Provide second dial tone.
DTPOTSA	Escape to POTS and give dial tone: Do not retranslate the access code (INC DIGITS) in the Office Dialing Plan.
DTVMCF	Software Release: 5E16(2) and later. DTVM Call Forward.
EMER	Emergency call to DSN operator.
EMUSE	Emergency via dial code or feature button. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.

Copyright © 2003 Lucent Technologies

FRLALT	Activate the Alternate FRL table.
FRLDMAIN	Activate the CSD main FRL.
FRLMAIN	Activate the Main FRL table.
FTACT	Activate BRCS feature.
FTDCT	Deactivate BRCS feature.
GPACT	Activate ARS group.
GPDCT	Deactivate IDP or ARS group.
GRPCARCH	Change group carrier in IDP.
HIDHOLD	This action allows a customer to activate the Dialable Hold feature which is a subset of the Home Intercom feature.
HIRINGA	This action is used to apply Ringing Pattern A for the Selective Intercom Dialing feature which is a subset of the Home Intercom feature. Provides repeated pattern of 2 seconds on and 4 seconds off.
HIRINGB	This action is used to apply Ringing Pattern B for the Selective Intercom Dialing and Intercom Code Dialing features. Provides repeated pattern of 0.8 seconds on, 0.4 seconds off, 0.8 seconds on, followed by 4 seconds off.
HIRINGC	This action is used to apply Ringing Pattern C for the Selective Intercom Dialing feature which is a subset of the Home Intercom feature. Provides repeated pattern of 0.4 seconds on, 0.2 seconds off, 0.4 seconds on, 0.2 seconds off, 0.8 seconds on, followed by 4 seconds off.
HIRINGG	This action is used to apply Ringing Pattern G for the Selective Intercom Dialing feature which is a subset of the Home Intercom feature. Provides repeated pattern of 0.3 seconds on, 0.2 seconds off, 1 second on, 0.2 seconds off, 0.3 seconds on, followed by 4 seconds off.
IBSYVFY	ISDN Busy Verify action. This action is used with the ISDN Attendant Console Busy Verification of Directory Numbers and Trunks. The FEATURE associated with this attendant action must be a call pickup originating feature (/CPUVO or an equivalent constructed feature). To implement the barge-in feature, the terminating line/trunk must have a call pickup terminating feature (/CPUIVT for digital, /CPUVT for analog, or an equivalent constructed feature).
ICMUSE	Use intercom range.
IDNACT	Activate/deactivate ISDN ACVT (Attendant Control of Voice Terminals) restrictions for an individual terminal (line).
IDPASP	Access the ASP (Advanced Service Platform; previously PVN (Private Virtual Network)) "default" dialing plan via this IDP. The ASP "default" dialing plan is specified via the ASP DAS field on the OFCOPT form (5509 Record). This action will result in an ASP origination regardless of whether or not the line or trunk is allowed to originate ASP calls. In other words, the action "IDPASP" overrides the ASP ALW field on the LINE (5109 Record), MLHLN (5111 Record), DSLUSR (5908 Record), SHTN (5902 Record) and TKGRP (5202 Record) forms.
IEMEROVR	ISDN Attendant Emergency Override action. The FEATURE associated with this attendant action must be a call pickup originating feature (/CPUEO or an equivalent constructed feature). The lines to be overridden must have a call pickup terminating feature (/CPUIEOT for digital, /CPUEOT for analog, or an equivalent constructed feature). The attendant will be able to use the dialed code to override terminating restrictions such as Call Forwarding, Series Completion or members of a multiline hunt group.
IGACT	Activate/deactivate ISDN ACVT (Attendant Control of Voice Terminals) restrictions for a group of lines.
INSUSE	Inspect Use Action. This action allows the display of call-related information about any call appearance in a hold, alerting, or active state.
LDNDCT	Deactivation of all LDNs in a MUPH or ISAT group for a CF variable feature at once.
LSFNOSYM	This action is used by the LSF (LASS Selective Features) to access the SLE (Screen List Editing) session. This ACTION will prompt the user via announcements for digits rather than an asterisk or a pound sign during an SLE session.
LSFSYM	This action is used by the LSF (LASS Selective Features) to access the SLE (Screen List Editing) session. This ACTION will prompt the user via announcements for an asterisk or a pound sign rather than digits during an SLE session.
LSP	Loudspeaker paging for call pickup. The paged party may enter a dialed code and be connected to the calling party.
LWCUSE	Leave Word Calling. The dialed code associated with this action allows the calling party to leave a message for the called party.
MAINACT	Activate main parameter set.
MDRACT	MDR Feature activation code.
MDRDCT	MDR Feature deactivation code.
MDROFF	MDR Group Status - off.
MDRON	MDR Group Status - on.
MEOFF	Dialed Code Request - Manual Exclusion off.
MEON	Dialed Code Request - Manual Exclusion on.

Copyright © 2003 Lucent Technologies

MWITD	ISDN Terminal Dialed Code.
MWSOH	Start multiway feature off hook.
MWSPL	Split last added party from multiway call.
NNPRV	Force per-call NAME and TN private.
NNPUB	Force per-call NAME and TN public.
NTPOTSA	Escape to POTS without dial tone; retranslate the access code (INC DIGITS) in the Office Dialing Plan.
PAI	Immediate DSN/PP access code with second dial tone.
PDTEO	Executive override DSN/PP access code with second dial tone.
PDTF	Flash DSN/PP access code with second dial tone.
PDTFO	Flash override DSN/PP access code with second dial tone.
PDTI	Immediate DSN/PP access code with second dial tone.
PDTP	Priority DSN/PP access code with second dial tone.
PDTR	Routine DSN/PP access code with second dial tone.
PDTRC	DSN/PP Route Code with second dial tone.
PFUSE	Use private facilities.
PNTEO	Executive override DSN/PP access code without second dial tone.
PNTF	Flash DSN/PP access code without second dial tone.
PNTFO	Flash override DSN/PP access code without second dial tone.
PNTI	Immediate DSN/PP access code without second dial tone.
PNTP	Priority DSN/PP access code without second dial tone.
PNTR	Routine DSN/PP access code without second dial tone.
PNTRC	DSN/PP route code without dial tone.
PO	Routine DSN/PP call to DSN/PP operator.
PODUSE	Print on Demand. Used with the Message Service feature.
POF	Flash DSN/PP call to DSN/PP operator.
POFO	Flash override DSN/PP call to DSN/PP operator.
POI	Immediate DSN/PP call to DSN/PP operator.
POP	Priority DSN/PP call to DSN/PP operator.
PP1AREA	PP area code, each area code corresponds to an DSN geographic area. (See Note 1.)
PP2AREA	PP area code, each area code corresponds to an DSN geographic area. (See Note 1.)
PP3AREA	PP area code, each area code corresponds to an DSN geographic area. (See Note 1.)
PP4AREA	PP area code, each area code corresponds to an DSN geographic area. (See Note 1.)
PP5AREA	PP area code, each area code corresponds to an DSN geographic area. (See Note 1.)
PRCD	DSN/PP Route Control Digit.
RBQCAN	Ringback queuing cancel.
RBQVFY	Ringback queuing verify.
RTRV	Call Park Retrieve. This action allows a user to answer a call that is parked against the user's DN. For more information on Call Park see Division 2, Section 4A124.
SAUSE	Service Assist via dial code or feature button. For more information on the ACD/BRCS secured feature see Division 2, Section 4A121.
SDNUSE	Invoke a Software Defined Network call.
SEL1XFER	Transfer to Selective Transfer TN 1 from E911 PSAP (Public Safety Answering Point).
SEL2XFER	Transfer to Selective Transfer TN 2 from E911 PSAP.
SEL3XFER	Transfer to Selective Transfer TN 3 from E911 PSAP.
SEL4XFER	Transfer to Selective Transfer TN 4 from E911 PSAP.
SEL5XFER	Transfer to Selective Transfer TN 5 from E911 PSAP.
SEL6XFER	Transfer to Selective Transfer TN 6 from E911 PSAP.
SPCAR	Use the FGD CAC (Carrier Access Code) with the Intercom or Abbreviated Dial digits that follow.
SP4CAR	Use the FGD CAC with the Intercom or Abbreviated Dial digits that follow.
SRGACT	Software Release: 5E16(2) and later. Activate Simultaneous Ringing
SRGDCT	Software Release: 5E16(2) and later. Deactivate Simultaneous Ringing
SRGNOSYM	Software Release: 5E16(2) and later. Simultaneous Ringing SLE No Symbols
SRGSYM	Software Release: 5E16(2) and later. Simultaneous Ringing SLE Symbols
TD1PAD	Add 1 parameter code.
TDACT	Activate a Time-Of-Day feature.
TDADZP	Add zero parameter code.
TDATCH	Change Time-Of-Day Action Time.
TDDALL	Delete all code lists.
TDDCT	Deactivate a Time-Of-Day feature.
TDDEL1P	Delete 1 parameter code list.
TDOWCH	Change One Week Time-Of-Day Schedule.
TDZPDEL	Delete zero parameter code list.
TGACT	Activate a terminal group feature.
TGDCT	Deactivate a terminal group feature.
UCRACT	Activate UCR (Unidentified Call Rejection).
UCRDCT	Deactivate UCR (Unidentified Call Rejection).

Copyright © 2003 Lucent Technologies

- ***NOTE:*** 1: Actions marked with "Note 1" in the above table are associated with the BRCS feature, Precedence and Preemption, used for the DSN Network.

For 5E16(2) and later, when this form contains an ACTION or CONFLICT RESOLUTION ACTION entry which is inconsistent with the corresponding FEATURE entry. Either the FEATURE is not found on the appropriate Feature Definition FORM or the FORM level restrictions are not met.

- For 5E16(2) and later, when this form has the wildcard feature or CONFLICT RESOLUTION LIST wildcard feature (/CF*), ACTION can only be "BSYACT", "BSYDCT", "CFDATCH", "CSTOG", "DAACT", or "DADCT" when the ACT field for SFID 592 on the SFSYS form (5713-1 Record) has been set to "Y".

- ***NOTE:*** The following actions can only be assigned to dial codes on the IDPDCA form (RC/V 9.13) when the ACT field for SFID 592 is set to "Y": "BSYACT", "BSYDCT", "CFDATCH", "CSTOG", "DAACT", or "DADCT" (when being assigned to dial codes, all five actions can only be associated with the /CF* feature). Also, the existing action "CFDATCH" can now be associated with the /CF* feature on the PDIT form (RC/V 9.13) when the ACT field for SFID 592 is set to "Y" (originally, "CFDATCH" could only be associated with non-wildcard CF features. When the ACT field for SFID 592 is set to "Y", the action can be associated with both the /CF* feature and the non-wildcard CF features.)

ACUSE, ARUSE: After subscribers dial an "ACUSE" (or "ARUSE") code, they may receive the following responses:

- Audible alerting. The called party is alerted immediately because the called station is found to be idle.
- Short-term denial. Reorder tone is given to the user to indicate that network resources are temporarily exhausted or the called party has a feature active that causes the Automatic Callback (or Automatic Recall) attempt to be denied, e.g., Call Forwarding Variable. A subsequent attempt by the user to activate the feature may succeed.
- Long-term denial. An announcement is returned indicating that the Automatic Callback (or Automatic Recall) feature is not allowed to the user.
- Confirmation. An announcement is returned indicating that the Automatic Callback (or Automatic Recall) feature has been activated. Change the 1 digit Abbreviated Dial list.

COTUSE: After subscribers dial a "COTUSE" code, they may receive the following responses:

- Successful activation. An announcement is returned indicating a successful activation of the COT request and provides information on any further action the user should take.
- Trace not available. An announcement is returned indicating that the call has already been traced or invalid data about the call is stored in the history block, e.g., originating and terminating switches are not connected by CCS7 trunks.
- Buffer full. An announcement is returned indicating that the COT message buffer is full and the user should attempt the trace again later.
- Short-term denial. Reorder tone is given to the user to indicate that network resources are exhausted. A subsequent attempt by the user to activate the feature may succeed.
- Feature denial. Reorder tone is given to the user to indicate that the Customer Originated Trace feature is not available to the user.

DNPUSE: The "DNPUSE" action is used for per-call TN privacy; the dialed code can be used in two ways.

- The calling party subscribes to all-call privacy which allows the calling party to prevent delivery of their

Copyright © 2003 Lucent Technologies

TN to the called party for all calls (PRIVACY field on the LINE, MLHLN, or DSLUSR form is "Y"). The calling party can deactivate all-call privacy on a per-call basis (TN PRIVACY field on the DISPFD form is "Y"), allowing the calling TN to be displayed to the called party. To deactivate all-call privacy on a per-call basis, the user goes off-hook, enters the dialed code, receives a confirmation tone, receives dial tone, and then dials the TN.

- The terminal may not subscribe to all-call privacy which allows the TN of the calling party to be delivered to the called party for all calls (PRIVACY field on the LINE, MLHLN, or DSLUSR form is "N"). The calling party can activate per-call privacy on a per-call basis (TN PRIVACY field on the DISPFD form is "Y"), not allowing the calling TN to be displayed to the called party. To activate per-call privacy on a per-call basis, the user goes off-hook, enters a dialed code, receives a confirmation tone, receives dial tone, and then dials the telephone number.

Data Rules:

When STATE is "PAUSE", "REMAIN", or "NORMAL", a value must be entered in this field.

When ACTION is "ASPDNC", "ASPNORM", or "ASPVAR",

- TRIG NBR must be entered; and
- ASP OFC on the OFCOPT form must be "SSP".

ACDXFER: This action is for the Special Feature Transfer to ACD from an ARU. For more information see Division 2, Section 4A71. This action can only be used with the NULL feature (/*).

ACTCPNBN: When ACTION is "ACTCPNBN", then the corresponding FEATURE entry must be defined on a CPNBNFD form (5982 Record) with ACT set to "CODE". In addition, the corresponding FEATURE entry must be defined on the ACVTFD form (5967 record) .

ATFACT: When ACTION is "ATFACT" then the corresponding FEATURE entry must be defined on the ACVTFD form (5967 record).

ATFDCT: When ACTION is "ATFDCT" then the corresponding FEATURE entry must be defined on the ACVTFD form (5967 record).

ATGACT: When ACTION is "ATGACT", then the ACVT feature assigned must have an associated restriction group defined. A DN can only activate an ACVT feature for the group in which the DN belongs. In addition, the corresponding FEATURE entry must be defined on the ACVTFD form (5967 record).

ATGDCT: When ACTION is "ATGDCT", then the ACVT feature assigned must have an associated restriction group defined. A DN can only deactivate an ACVT feature for the group in which the DN belongs. In addition, the corresponding FEATURE entry must be defined on the ACVTFD form (5967 record).

BBTLUSE: When ACTION is "BBTLUSE", the DSL that will be tested must have BRITL ALW set to "Y" on the corresponding DSLUSR form. In addition, INC DIGITS on this form must contain only the digits 0 - 9.

BTLUSE: When ACTION is "BTLUSE", then INC DIGITS on this form must contain only the digits 0 - 9.

CNPUSE: The ACTION "CNPUSE" must be used with the feature defined on the DISPFD form and have TN PRIVACY set to "Y" on the DISPFD form for the feature being used. The wildcard feature /DI* may also be used with TN PRIVACY set to "N" on the DISPFD form.

CSACT, CSDCT: When ACTION is "CSACT" or "CSDCT", FEATURE must be "/CF*".

DCTCPNBN: When ACTION is "DCTCPNBN", the corresponding FEATURE entry must appear on a

Copyright © 2003 Lucent Technologies

CPNBNFD form (5982 Record) with DEACT set to "CODE".

DTONE: When ACTION is "DTONE", STATE must equal PAUSE.

HIDHOLD: When ACTION is "HIDHOLD", the DIAL HOLD field must be "Y" on the associated HIFD form (5628 Record).

HIRINGA, HIRINGC, HIRINGG: When ACTION is "HIRINGA", "HIRINGC", or "HIRINGG", the SEL ICM DIAL field must be "Y" on the associated HIFD form (5628 Record).

HIRINGB: When ACTION is "HIRINGB", the ICM CODE DIAL field or the SEL ICM DIAL field must be "Y" on the associated HIFD form.

IBSYVFY: When ACTION is "IBSYVFY", the associated call pickup originating feature must be defined on a PUOFD form (5605-1 Record). If the terminating line or trunk is assigned a call pickup terminating feature, that feature must be defined on a PUTFD form (5605-2 Record).

IDPPVN: The "IDPPVN" ACTION cannot be entered when PVN OFC on the OFCOPT form is set to "NONE" since that would indicate the office does not support ASP.

IEMEROVR: When ACTION is "IEMEROVR", the associated call pickup originating feature must be defined on a PUOFD form. The call pickup terminating feature assigned to the lines to be overridden must be defined on a PUTFD form.

NNPRV, NNPUB: ACTIONs "NNPRV" and "NNPUB", must be used with the feature defined on the DISPFD form and have TN PRIVACY set to "Y" on the DISPFD form for the feature being used. The wildcard feature /DI* may also be used with TN PRIVACY set to "N" on the DISPFD form.

SELnXFER: When ACTION is "SELnXFER", where n is 1 - 6, FEATURE must be "/*".

UCRACT: When the ACTION is "UCRACT", the feature must be the /*.

The following ACTIONs require the NULL FEATURE (/*):

- "AAOFF",
- "AAON",
- "ACDXFER",
- "AIUSE",
- "AQCUSE",
- "ATACTMWI",
- "ATDCTMWI",
- "AUCUSE",
- "BBTLUSE",
- "BTLUSE",
- "CLOFF",
- "CLON",
- "EMUSE",
- "MEOFF",
- "MEON",
- "SAUSE",
- "SDNUSE"

2.6 FEATURE

Description: Enter the name of a feature to be accessed or affected by this dialed code. The feature must be defined on one of the BRCS feature definition forms. It may be a constructed or preconstructed feature.

Copyright © 2003 Lucent Technologies

The set of preconstructed features includes wild-card features which may be entered in Individualized or Office Dialing Plans but may not be assigned to lines or trunks. These wild-card features should be included in dialing plans whenever a dialed code affects a feature associated with the calling terminal (line or trunk) rather than a feature specified in the dialing plan itself. For example, if a dialed code's ACTION is "AD1CH" (change the 1-digit Abbreviated Dial List), and the customer dialing the code is to be allowed to change his AD List regardless of the specific ID feature containing the AD list, then the ID wild-card feature name "/ID*" should be entered as the FEATURE. If the customer should be allowed to change only a specific AD list, then the specific ID feature name should be entered as the FEATURE.

The specific feature definition form on which the feature is defined depends upon the value of the ACTION field entry as shown in Figure Figure 1 .

Those ACTIONs where the FEATURE TYPE is indicated as "any non-wild-card feature name" require a specific FEATURE name and the wild-card feature may not be entered here.

For those actions for which the FEATURE TYPE is "any feature name", either the wild-card feature name or a specific feature name may be entered. It is recommended that the wild-card feature always be used; no cases are presently envisioned in which a non-wild-card feature would be appropriate.

For the cases where FEATURE TYPE is "any wild-card feature name", only a wild-card feature name may be entered.
Valid Entries: 1 - 8 characters

Data Rules:

When STATE is "CNFLCT" or "CONFLCT", this field must be blank.

When STATE is "PAUSE", "REMAIN", or "NORMAL", a value must be entered in this field.

2.7 REM DIGS

Description: Enter the number of remaining digits to collect.
Valid Entries: 1 - 14

If the STATE is not "REMAIN", this field must be blank.

2.8 ACT SET

Description: Enter the alternate code treatment set number.
Valid Entries: 1 - 32

Data Rules:

Any value entered here must have been defined on the IDPACT form (5601-3 Record) with the IDP GRP entered on this form.

2.9 ICM RANGE

Description: Enter the intercom range identification number.
Valid Entries: 1 - 512

Data Rules:

Any value entered here must be defined on the IDPICM form (5601-5 Record) with the same IDP GRP entered on this form. This field must be entered if ACTION is ICMUSE, PO, POP, POI, POF, POFO or EMER.

When STATE is "PAUSE", "REMAIN", or "NORMAL", a value must be entered in this field.

Copyright © 2003 Lucent Technologies

2.10 TRIG NBR

Description: Enter the Network services trigger number.

Software Release: 5E9(1) and later
Valid Entries: 1 - 255

Data Rules:

When TRIG NBR is entered, ACTION must be "ASPNORM", "ASPVAR" or "ASPDNC".

2.11 DPAT CATEGORIES

Description: Enter a "Y" or "N" in each position of each dialing plan access treatment categories. A "Y" indicates that a line (or trunk) with the corresponding DPAT code will be allowed access to the feature specified for this dialed code. An "N" indicates no access is allowed. For each of the seven groupings, either leave all five categories blank, indicating that access is not permitted for any of the five categories, or enter "Y" or "N" in each of the five categories, as appropriate. In each case, the leftmost position of the grouping represents the lowest numbered category of the group and the rightmost represents the highest.

A DPAT code is assigned to each terminal (line or trunk) via the default parameter of DPAT CATEGORY on the IDFD form or on a parameter assignment form, IDPLPA, IDPMPA or IDPTPA. If both are used, the value on the parameter assignment form takes precedence, overriding the default value.

Whenever the IDPDCA form is used to analyze digits, either dialed or reconstructed, the DPAT CATEGORY will be checked. Abbreviated Dial and Intercom codes are examples of reconstructed numbers. If the Abbreviated Dial code is allowed for the originator (via DPAT), but the reconstructed number is not (and is being analyzed in IDP), the call will be given the DPAT error treatment.

When STATE is "PAUSE", "REMAIN", or "NORMAL", a value must be entered in this field.

3. FORM ENTRIES - 5601-2 RECORD

CONFLICT RESOLUTION LIST

The following fields (Section 3.1 - Section 3.7) are arranged into eight conflict resolution entries. At least two conflict resolution entries must be entered when the value entered in the STATE field is "CONFLCT".

- ***NOTE:*** The input screen format was consolidated to streamline the data entry function. The number of screens was reduced from five to two. Also, the field group title was changed from CONFLICT RESOLUTION ENTRIES to CONFLICT RESOLUTION LIST.

3.1 REM DIGS

Description: Enter the number of remaining digits to be dialed before the call treatment can be determined.
Valid Entries: 0 - 14

3.2 ACTION

Description: Enter the action to be taken when the INC DIGITS plus NBR DIGITS have been dialed.
Valid Entries: Refer to the ACTION field description at the beginning of this section.

Data Rules:

When CONFLICT RESOLUTION ACTION is "ASPDNC", "ASPNORM" or "ASPVAR",

Copyright © 2003 Lucent Technologies

- TRIG NBR must be entered; and
- ASP OFC on the OFCOPT form must be "SSP".

3.3 FEATURE

Description: Enter the name on a feature, IDP or Abbreviated Dial List which is to be accessed or affected by this dialed code. The name entered here must be defined on one of the BRCS feature definition forms. For a more complete description, see the description of the FEATURE field earlier in this section.
Valid Entries: 1 - 8 characters

3.4 ACT SET

Description: Enter the Alternate Code Treatment set number.
Valid Entries: 1 - 32

Data Rules:

Any value entered here must have been defined on the IDPACT form with the IDP GRP entered on this form.

3.5 ICM RANGE

Description: Enter the intercom range identification number.
Valid Entries: 1 - 512

Data Rules:

Any value entered here must be defined on the IDPICM form with the IDP GRP entered on this form.

3.6 TRIG NBR

Description: Enter the Network Services trigger number.

Software Release: 5E9(1) and later
Valid Entries: 1 - 255

Data Rules:

When TRIG NBR is entered in the CONFLICT RESOLUTION LIST, ACTION in the list must be "ASPNORM", "ASPVAR"or "ASPDNC".

3.7 DPAT CATEGORIES

Description: Enter a "Y" or "N" in each position of each of the Dialing Plan Access Treatment categories. A Y indicates that a line (or trunk) with the corresponding DPAT code will be allowed access to the feature specified for this dialed code. An "N" indicates no access is allowed. For each of the seven groupings, either leave all five categories blank, indicating that access is not permitted for any of the five categories, or enter "Y" or "N" in each of the five categories, as appropriate. In each case, the leftmost position of the grouping represents the lowest numbered category of the group and the rightmost represents the highest.

SEC. 2C: 5601-3 RECORD
INDIVIDUALIZED DIALING PLAN
ALTERNATE CODE TREATMENT FORM - IDPACT

1. GENERAL

The 5601-3 Record is available with the 5E2 and later Software Releases. It is used to define A.C.T.s (Alternate Code Treatments) associated with IDPs (Individualized Dialing Plans). An Alternate Code Treatment allows customers to provide different treatments to specified IDP codes at certain times. This is accomplished by associating a valid IDP dialed code with an A.C.T. set. Each A.C.T. set is associated with an on/off indicator. When the indicator is off, normal treatment is given when a line (or trunk) dials a code assigned to that A.C.T. set. If a line or trunk dials a code in a set with the indicator on, the Alternate Code Treatment is given.

The on/off indicator is set (or unset) either by customer dial access to an appropriate code in the IDP or by a key. See the FTRKEY form (5613 Record).

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.11.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * IDP GROUP NAME

Description: Enter the IDP Group Name.

Required Field.
Valid Entries: 1 - 8 characters

2.3 * A.C.T. SET

Description: Enter the Alternate Code Treatment set number.

Required Field.
Valid Entries: 1 - 32

2.4 ACTIVE?

Description: Will Alternate Code Treatment be active when the database is initially installed in the 5ESS Switch?

Required Field.
Default: N
Valid Entries: Y, N

2.5 TREATMENT

Description: Specify the treatment to be given when A.C.T. is active.

Required Field.
Default: TONE
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid TREATMENT Entries	
Entry	**Definition**
ANNC	When A.C.T. is active, the call will be sent to anannouncement as specified by the Fixed Route Type of "ACT"on the FIXRT Form (5301-1 Record).
RERTE	When A.C.T. is active, the call will be sent to aDirectory Number as specified in the REROUTE TO DN field below.
TONE	When A.C.T. is active, the call will be given reorder tone.

2.6 REROUTE TO DN

Description: If the TREATMENT is "RERTE", enter the Directory Number the call is to be re-routed to. If the TREATMENT is other than "RERTE", leave this field blank. The digits entered will be interpreted by the IDPDCA Form (5601-1/2 Record).
Valid Entries: Up to 32 digits (0 - 9, * and #)

SEC. 2D: 5601-4 RECORD
INDIVIDUALIZED DIALING PLAN GROUP DEFINITION FORM - IDPGP

1. GENERAL

The 5601-4 Record is available with the 5E2 and later Software Releases, and defines the options associated with IDPs (Individualized Dialing Plans).

1.1 Recent Change View

The corresponding Recent Change View for this form is 9.10.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * IDP GROUP NAME

Description: Enter the IDP group name.
Valid Entries: 1 - 8 characters

2.3 REMARK

Description: Enter an optional descriptive comment.
Valid Entries: up to 32 characters

2.4 IDP ACTIVE?

Description: Is the IDP initially active?

Required Field.
Default: Y
Valid Entries: Y, N

2.5 A.C.T. ALLOWED?

Description: Is Alternate Code Treatment allowed?

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

If A.C.T. is allowed, an IDPACT form (5601-3 Record) must be completed for the IDP and two codes must be defined on the IDPDCA form (5601 -1/2 Record), or a key must be defined on the FTRKEY form (5613 Record), to allow for A.C.T. activation and deactivation.

2.6 DPAT ALLOWED?

Description: Is Dialing Plan Access Treatment allowed?

Required Field.
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If the value for DPAT ALLOWED? is "Y", the DPAT CATEGORY must be entered on the IDFD forms (5601 Record) and IDPTPA forms (5601-8 Record) assigned this IDP GROUP NAME.

2.7 GPIC

Description: Enter the Group Pre-subscribed InterLATA Carrier for the IDP group. The GPIC is used as the InterLATA Carrier whenever a line (or trunk) assigned to this IDP originates and the line does not have a Line Primary Carrier and does not dial the carrier number.
Valid Entries:
- For 5E8 and earlier: 0 - 999
- For 5E9(1) and later: 0 - 9999

Data Rules:

If GPIC is known, it must equal CARRIER ID on an ICF form (5305 Record), and for 5E8 and later, FEAT GRP on the ICF form must equal "D".

2.8 GROUP PTC

Description: The GROUP PTC field is used to specify the group presubscribed intra-LATA toll carrier identification number. This field supports the Intra-LATA PIC Capability Special Feature, for more information on this feature see Division 2, Section 4A149.

Software Release: 5E9(1) and later.
Valid Entries: 0 - 9999 or leave blank

For 5E12 and later, when the GROUP PTC field on the IDPGP form has been entered, the GROUP PTC must be entered as a CARRIER ID on the ICF form with FEAT GRP equal to "D".

2.9 GROUP PLC

Description: The GROUP PLC field is used to specify the group PLC (Presubscribed Local Carrier) code.

Software Release: 5E12 and later
Valid Entries: Blank or 0-9999

Data Rules:

When GROUP UNBUNDLED is "Y", GROUP PLC must be entered.

GROUP PLC on the following IDPGP forms must be defined as CARRIER ID on the ICF form with FEAT GRP equal to "D".

2.10 GROUP UNBUNDLED

Description: Has this group been unbundled from the LEC?

Software Release: 5E12 and later
Default: N
Valid Entries: Y, N

Data Rules:

When GROUP UNBUNDLED is "Y", GROUP PLC must be entered.

Copyright © 2003 Lucent Technologies

2.11 STANDARD ERROR TREATMENT

Description: Enter the treatment to be given an origination dialing an invalid IDP code.

Required Field.
Default: TONE
Valid Entries:

Valid STANDARD ERROR TREATMENT Entries

Entry	Definition
ANNC	The call is sent to an announcement as specified by the FIXED ROUTE TYPE of "IDPERR" on the FIXRT form (5301-1 Record).
RERTE	The call is sent to a Directory Number as specified in the ERROR REROUTE TO DN field below.
TONE	The call is given reorder tone.
USEOFFC	The digits dialed are reinterrupted using the ODP (Office Dialing Plan) and the call is treated accordingly. If the call is originated by a line assigned to this IDP Group, the ODP consists of PDIT and LDIT. If the call is originating from a trunk assigned to this IDP Group, the DAS specification on the Trunk Group determines an INDIT or PDIT and an LDIT.

2.12 ERROR REROUTE TO DN

Description: Enter a Telephone Number. The digits entered are interpreted by the IDPDCA form.
Valid Entries: up to 32 digits, 0 - 9, * and #

Data Rules:

An entry in this field is allowed only if the STANDARD ERROR TREATMENT is "RERTE".

2.13 DPAT TREATMENT

Description: Enter the treatment to be given an origination with a disallowed DPAT code.

Valid DPAT TREATMENT Entries

Entry	Definition
ANNC	The call is sent to an announcement as specified by the FIXED ROUTE TYPE of "DPAT" on the FIXRT form.
RERTE	The call is sent to a Directory Number as specified in the DPAT REROUTE TO DN field below.
TONE	The call is given reorder tone.

Data Rules:

An entry in this field is allowed only if DPAT ALLOWED is "Y".

2.14 DPAT REROUTE TO DN

Description: Enter a Telephone Number. The digits entered are interpreted by the IDPDCA form.
Valid Entries: up to 32 digits, 0 - 9, *, and #

Data Rules:

An entry in this field is allowed only if the DPAT TREATMENT is "RERTE".

2.15 SLE SYMBOL

Description: Enter the symbols allowed as part of an extension during a LASS Screen List Editing session or Forward to DN.

Software Release: 5E6 and later
Required Field.
Default: NONE
Valid Entries:

Copyright © 2003 Lucent Technologies

Valid SLE SYMBOL Entries	
Entry	**Definition**
"*"(space)	Only an "*" may be used as part of an extension or Forward to DN.
"#"(space)	Only a "#" may be used as part of an extension or Forward To DN.
"*#"	Both an "*" and a "#" may be used as part of an extension or Forward To DN.
NONE	Neither "*" or "#" may be used as part of an extension or Forward To DN.

2.16 CF DT POTS

Description: Should a dial tone be returned following entry of an "escape to POTS" dial code during an entry of the Forward to DN on a Call Forward activation?

The escape to POTS dial code is defined by entering an ACTION of "DTPOTSA" on the IDPDCA form.

Software Release: 5E6 and later
Required Field.
Default: N
Valid Entries: Y, N

2.17 ESC TO POTS

Description: Enter the dial code used to escape to POTS. When an ISDN Standard CPE (Customer Premises Equipment) terminal originates a POTS call via functional addressing, the switch software will prefix this ESC TO POTS code to the (called) address digits. The code must be the same as the escape to POTS code defined in the IDP (data rule below). ESC TO POTS applies only to Standard BRI users (DSL CLS is "STD" on the DSL form).

Software Release: 5E8 and later
Valid Entries: 3 digits; first digit may be "*" or "#"

Data Rules:

The entry must be defined as INC DIGITS for the IDP GRP on an IDPDCA form with a STATE of "NORMAL" and ACTION of "DTPOTSA"; or if the STATE is "CONFLCT" then there must be one entry in the CONFLICT RESOLUTION LIST where REM DIGS is 0 and ACTION is "DTPOTSA". The FEATURE field or the CONFLICT RESOLUTION LIST FEATURE field must have an IDP feature defined on the IDPFD form.

SEC. 2E: 5601-5 RECORD
INDIVIDUALIZED DIALING PLAN
INTERCOM RANGE FORM - IDPICM

1. GENERAL

The 5601-5 Record is available with the 5E2 and later Software Releases. It is used to define the intercom ranges associated with IDPs (Individualized Dialing Plans). Intercom dialing allows a customer to have a shortened dialing sequence, typically to reach a group of destination Telephone Numbers with common leading digits.

When a customer dials a code within an intercom range, the switch determines the intercom range and the appropriate number of digits are deleted, and then the appropriate digits are prefixed (as defined on this form). The transformed number is then interpreted by either the IDP or the Office Dialing Plan as if it had actually been dialed.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.12.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * IDP GROUP NAME

Description: Enter the IDP Group Name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The IDP group whose name is entered here must be defined on the IDPGP form (5601-4 Record) and one or more IDPDCA forms (5601-1/2 Records).

2.3 * INTERCOM RANGE ID

Description: Enter a number to identify the intercom range. The intercom range defined on this form may be entered on the IDPDCA form for the appropriate dialed codes.

Required Field.
Valid Entries: 1 - 512

2.4 USE OFFICE DIALING PLAN?

Description: Is the reconstructed code to be interpreted by the ODP (Office Dialing Plan)? if "N" is entered, the IDP will be used.

Required Field.
Default: Y
Valid Entries: Y, N

2.5 NUMBER OF DIGITS TO DELETE

Copyright © 2003 Lucent Technologies

Description: Enter the number of digits to delete from the dialed digits. No entry is equivalent to 0.
Valid Entries: 0 - 7.

2.6 PREFIXED DIGITS

Description: Enter the digits to be prefixed to the digits remaining after the NUMBER OF DIGITS TO DELETE have been deleted. The resulting reconstructed code will be re-interpreted by either the IDP or the office dialing plan, as appropriate.
Valid Entries: Up to 32 digits (0 - 9, *, #, F, O, I, P), where

- F - Flash
- O - Override flash
- I - Immediate
- P - Priority

SEC. 2F: 5601-6 RECORD
IDP LINE (TN) PARAMETER FORM - IDPLPA

1. GENERAL

The 5601-6 Record is available with the 5E2 and later Software Releases. It is used when assigning ID features to non-Multi-Line Hunt lines to assign ID feature parameters to the lines if the default parameters associated with the ID feature are inappropriate or unspecified.

NOTE: For 5E6 and later Software Releases, Speed Call parameters are assigned to non-Multi-Line Hunt lines by entering the SCLPA (Speed Call Line Parameter Assignment) form (5627-2 Record) instead of the IDPLPA form (5601-6 Record). To use the SCLPA form instead of the IDPLPA form, see Division 4, Section 27B.

If an IDPLPA form is entered for any given line, then all entries on that form will be used for the line instead of the default parameters entered on the corresponding IDFD form (5601-a/b Record).

For 5E5 and earlier Software Releases, when an ID feature associated exclusively with Abbreviated Dialing (i.e., an ID feature without an Individualized Dialing Plan) is assigned to a line with unshared Abbreviated Dialing only, this form need not be entered. The unshared AD List name will be the letter "A" followed by the 7-digit Telephone Number of the line.

For 5E5 and earlier Software Releases, when assigning Individualized Dialing features (defined with an IDP Group) to lines, the options AD1 and AD2 must be considered. For example, if a line is assigned an ID feature which has been defined with AD1 equal to "Y", then that line will be assigned a 1-digit Abbreviated Dialing list either through explicit translations or by default. If the default parameter entries for the 1-digit list are not entered on the IDFD form (5601-a/b Record) nor on this IDPLPA form, the list will be assumed to be unshared.

Therefore, the specific Abbreviated Dialing requirements for the line must be defined on the IDFD form. If a line is not to have 1-digit Abbreviated Dialing, then the Individualized Dialing feature assigned to the line must be defined with AD1 equal to "N".

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.26.

2. FORM ENTRIES, 5E5 AND EARLIER SOFTWARE RELEASES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TN

Description: Enter the Telephone Number of the line.

Required Field.
Valid Entries:

For 5E5 and earlier: 7 digits

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following:

Class of Service

Copyright © 2003 Lucent Technologies

Entry	Definition
ATND	50B Non-data Link Console Line or Attendant Line.
INDIV	Individual Line.
HOTMOTL	Line with hotel/motel feature.
ISDN	Software Release: 5E4(2) and later. ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
PBX	Line to a PBX.
TWOPTY	Two-Party Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.

2.3 * ID FEATURE

Description: Enter the name of the ID feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ID feature defined on the IDFD form.

2.4 IDP GROUP NAME

Description: Enter the name of an Individualized Dialing Plan group which this line will use, if any.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an IDP GROUP defined on the IDPGP form and one or more IDPDCA forms.

2.5 DPAT CATEGORY

Description: If an IDP GROUP NAME is specified, and DPAT is allowed on the IDP GROUP (as specified on the IDPGP form), then enter the Dialing Plan Access Treatment category.
Valid Entries: 1 - 32

Data Rules:

If this field is entered and the line is to access a feature via the IDP, then the appropriate character of the DPAT CATEGORIES on the IDPDCA form must be set to "Y".

An entry is prohibited in this field if the IDP GROUP is unspecified or an IDP GROUP is specified but DPAT is not allowed on the IDP GROUP.

ABBREVIATED DIAL LIST 1

The following fields (Section 2.6 - Section 2.7) define a 1-digit Abbreviated Dialing list.

2.6 LIST NAME

Description: If the line subscribes to unshared 1-digit Abbreviated Dialing (Speed Calling), leave this field blank and enter N in the SHARED field. The name assigned to the list will automatically be set to the letter "A" followed by the seven-digit Telephone Number of the line. If the line subscribes to a shared list, enter a 1-digit Abbreviated Dialing List name. A shared list name may be any one- to eight-character name except the letter "A" followed by seven digits or an eight-digit name where the first four digits are in the range 0001 to 2000 and the second four digits are in the range 0000 to 2047.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 8 characters

2.7 SHARED?

Description: Is the 1-digit Abbreviated Dialing List to be shared among two or more terminals (lines and/or trunks)?
Valid Entries: Y, N

Data Rules:

A "Y" is required if the LIST NAME was entered.

ABBREVIATED DIAL LIST 2

The following fields (Section 2.8 - Section 2.9) define a 2-digit Abbreviated Dialing list.

2.8 LIST NAME

Description: If the line subscribes to unshared 2-digit Abbreviated Dialing (Speed Calling), leave this field blank and enter "N" in the SHARED field. The name assigned to the list will automatically be set to the letter "A" followed by the seven-digit Telephone Number of the line. If the line subscribes to a shared list, enter a 2-digit Abbreviated Dialing List name. A shared list name may be any one- to eight-character name except the letter "A" followed by seven digits or an eight-digit name where the first four digits are in the range 0001 to 2000 and the second four digits are in the range 0000 to 2047.
Valid Entries: 1 - 8 characters

2.9 SHARED?

Description: Is the 2-digit Abbreviated Dialing List to be shared among two or more terminals (lines and/or trunks)?
Valid Entries: Y, N

Data Rules:

A "Y" is required if the LIST NAME was entered.

2.10 ICR SFG

Description: Enter an Intercom Calling Restriction Simulated Facility Group number.
Valid Entries: 1 - 2000

Data Rules:

If an ICR SFG is entered, then an IDP GROUP NAME must be entered. The ICR SFG must also be defined on the PFASFG form.

3. FORM ENTRIES, 5E6 AND LATER SOFTWARE RELEASES

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 * TN

Description: Enter the seven-digit Telephone Number of the line.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following:

Class of Service	
Entry	**Definition**
ATND	50B Non-data Link Console Line or Attendant Line.
HOTMOTL	Software Release: 5E6 and earlier. Line with hotel/motel feature.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
MODEM	Software Release: 5E7 and later. Packet Switching Modem Pooling.
PBX	Line to a PBX.
TWOPTY	Two-Party Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.

For 5E12 and later, TN/FEATURE combinations on different IDPLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the IDPLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

3.3 * FEATURE

Description: Enter the name of the ID feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ID feature defined on the IDFD form.

3.4 # IDP GROUP NAME

Description: Enter the name of an Individualized Dialing Plan group which this line will use, if any.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an IDP GROUP defined on the IDPGP form and one or more IDPDCA forms.

3.5 DPAT CATEGORY

Description: If DPAT is allowed on the IDP GROUP (as specified on the IDPGP form), then enter the Dialing Plan Access Treatment category.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 32

Data Rules:

An entry is prohibited in this field if DPAT is not allowed on the IDP GROUP.

If this field is entered and the line is to access a feature via the IDP, then the appropriate character of the DPAT CATEGORIES on the IDPDCA form must be set to "Y".

3.6 ICR SFG

Description: Enter an Intercom Calling Restriction Simulated Facility Group number.
Valid Entries: 1 - 2000

Data Rules:

If an ICR SFG is entered, then an IDP GROUP NAME must be entered. The ICR SFG must also be defined on the PFASFG form.

SEC. 2G: 5601-7 RECORD
IDP LINE (MLHG/TERM) PARAMETER FORM - IDPMPA

1. GENERAL

The 5601-7 Record is used to assign feature ID parameters to Multi-Line Hunt lines when the default parameters associated with the ID feature are inappropriate.

NOTE: Speed Call parameters are assigned to Multi-Line Hunt lines by entering the SCMPA (Speed Call MLHG/TERM Line Parameter Assignment) form (5627-3 Record) instead of the IDPMPA form (5601-7 Record). Therefore, ignore all references to Abbreviated Dialing (Speed Call) attributes on the IDPMPA form for 5E6 and later Software Releases. To use the SCMPA form instead of the IDPMPA form, see Division 4, Section 27C.

If an IDPMPA form is entered for any given terminal, then all entries on that form will be used for the terminal instead of the default parameters entered on the corresponding IDFD form (5601-a/b Record).

For 5E5 and earlier Software Releases, when an ID feature associated exclusively with Abbreviated Dialing (i.e., an ID feature without an Individualized Dialing Plan) is assigned to a Multi-Line Hunt line with unshared Abbreviated Dialing only, this form need not be entered. The unshared AD List name will be the letter "A" followed by the 7-digit Telephone Number of the Multi-Line Hunt line. (Multi-Line Hunt lines may subscribe to unshared AD Lists only if they have a Telephone Number.)

For 5E5 and earlier Software Releases, the options AD1 and AD2 must be considered when assigning Individualized Dialing features (defined with an IDP Group) to Multi-Line Hunt lines. For example, if a Multi-Line Hunt line is assigned an ID feature which has been defined with AD1 equal to "Y", then that line will be assigned a 1-digit Abbreviated Dialing list either through explicit translations or by default. If the default parameter entries for the 1-digit list are not entered on the IDFD form (5601-a/b Record), nor on this IDPMPA form, the list will be assumed to be unshared.

Therefore, the specific Abbreviated Dialing requirements for the Multi-Line Hunt line must be defined on the IDFD Form. If a Multi-Line Hunt line is not to have 1-digit Abbreviated Dialing, then the Individualized Dialing feature assigned to the Multi-Line Hunt line must be defined with AD1 equal to "N".

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.26.

2. FORM ENTRIES, 5E5 AND EARLIER SOFTWARE RELEASES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Member number of the line.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service

Entry	Definition
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
HOTMOTL	Line with hotel/notel feature.
PBX	Line to a PBX.
TWOPTY	Two-Party Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.

2.4 * ID FEATURE

Description: Enter the name of the ID feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ID feature defined on the IDFD form.

2.5 IDP GROUP NAME

Description: Enter the name of the Individualized Dialing Plan Group which this line will use, if any.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an IDP group defined on the IDPGP form and one or more IDPDCA forms.

2.6 DPAT CATEGORY

Description: If an IDP GROUP NAME is specified, and DPAT is allowed on the IDP GROUP (as specified on the IDPGP form) then enter the Dialing Plan Access Treatment category.
Valid Entries: 1 - 32

Data Rules:

If this field is entered and the line is to access a feature via the IDP, then the appropriate character of the DPAT CATEGORIES on the IDPDCA form must be set to Y.

An entry is prohibited in this field if the IDP GROUP is unspecified, or an IDP GROUP is specified but DPAT is not allowed on the IDP GROUP.

ABBREVIATED DIAL LIST 1

The following fields (Section 2.7 - Section 2.8) define a 1-digit Abbreviated Dialing list.

Copyright © 2003 Lucent Technologies

2.7 LIST NAME

Description: Multi-Line Hunt lines may subscribe to unshared AD lists only if they have a Telephone Number. If this line has a TN and subscribes to unshared 1-digit Abbreviated Dialing (Speed Calling), enter a 1-digit AD List name consisting of the letter "A" followed by the seven-digit Telephone Number assigned to the Multi-Line Hunt line. If the line subscribes to a shared list, enter a 1-digit Abbreviated Dialing List name. A shared list name may be any one- to eight-character name except the letter "A" followed by seven digits or an eight-digit name where the first four digits are in the range 1 to 2000 and the second four digits are in the range 0 to 2047.
Valid Entries: 1 - 8 characters

2.8 SHARED?

Description: Is the 1-digit Abbreviated Dialing List to be shared among two or more terminals (lines and/or trunks)?
Valid Entries: Y, N

Data Rules:

A "Y" is required if the LIST NAME was entered.

ABBREVIATED DIAL LIST 2

The following fields (Section 2.9 - Section 2.10) define a 2-digit Abbreviated Dialing list.

2.9 LIST NAME

Description: Multi-Line Hunt lines may subscribe to unshared AD Lists only if they have a Telephone Number. If this line has a TN and subscribes to unshared 2-digit Abbreviated Dialing (Speed Calling), enter a 2-digit AD List name consisting of the letter "A" followed by the seven-digit Telephone Number assigned to the Multi-Line Hunt line. If the line subscribes to a shared list, enter a 2-digit Abbreviated Dialing List name. A shared list name may be any one- to eight-character name except the letter "A" followed by seven digits or an eight-digit name where the first four digits are in the range 1 to 2000 and the second four digits are in the range 0 to 2047.
Valid Entries: 1 - 8 characters

2.10 SHARED?

Description: Is the 2-digit Abbreviated Dialing List to be shared among two or more terminals (lines and/or trunks)?
Valid Entries: Y, N

Data Rules:

A "Y" is required if the LIST NAME was entered.

2.11 ICR SFG

Description: Enter an Intercom Calling Restriction Simulated Facility Group number.
Valid Entries: 1 - 2000

Data Rules:

If an ICR SFG is entered then an IDP GROUP NAME must be entered. The ICR SFG must also be defined on the PFASFG form.

3. FORM ENTRIES, 5E6 AND LATER SOFTWARE RELEASES

Copyright © 2003 Lucent Technologies

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 * MLHG

Description: Enter the Multi-Line Hunt Group number of the line.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

3.3 * TERM

Description: Enter the Multi-Line Hunt Group Member number of the line.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
Entry	**Definition**
ATND	50B Nondata Link Console Line or Attendant Line.
HOTMOTL	Software Release: 5E6 and earlier. Linewith hotel/motel feature.
INDIV	Individual Line.
ISDN	Software Release: 5E4(2) and later. ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	Software Release: 5E4(2) and later. ISDN Attendant Terminal.
MODEM	Software Release: 5E7 and later. Packet Switching Modem Pooling.
PBX	Line to a PBX.
TWOPTY	Two-Party Line.
4WINDIV	Software Release: 5E3 and later. 4-Wire Individual Line or 4-Wire Manual PBX.

3.4 * FEATURE

Description: Enter the name of the ID feature for which the parameters are to be assigned.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ID feature defined on the IDFD form.

3.5 IDP GROUP NAME

Description: Enter the name of the Individualized Dialing Plan Group which this line will use, if any.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an IDP group defined on the IDPGP form and one or more IDPDCA forms.

Copyright © 2003 Lucent Technologies

3.6 DPAT CATEGORY

Description: If DPAT is allowed on the IDP GROUP (as specified on the IDPGP Form), then enter the Dialing Plan Access Treatment category.
Valid Entries: 1 - 32

Data Rules:

An entry is prohibited in this field if DPAT is not allowed on the IDP GROUP.

If this field is entered and the line is to access a feature via the IDP, then the appropriate character of the DPAT CATEGORIES on the IDPDCA form must be set to "Y".

3.7 ICR SFG

Description: Enter an Intercom Calling Restriction Simulated Facility Group number.
Valid Entries: 1 - 2000

Data Rules:

If an ICR SFG is entered then an IDP GROUP NAME must be entered. The ICR SFG must also be defined on the PFASFG form.

SEC. 2H: 5601-8 RECORD
IDP TRUNK PARAMETER FORM - IDPTPA

1. GENERAL

The 5601-8 Record is available with 5E2 and later Software Releases. It is used when assigning ID features to trunks when the default parameters associated with the ID feature are inappropriate.

- ***NOTE:*** For 5E6 and later Software Releases, Speed Call parameters are assigned to trunks by entering an SCTPA (Speed Call Trunk Parameter Assignment) form (5627-4 Record) instead of the IDPTPA form (5601-8 Record). To use the SCTPA form instead of the IDPTPA form, see Division 4, Section 27D.

If an IDPTPA form is entered for any given trunk, all entries on that form will be used for the trunk instead of the default parameters on the corresponding IDFD form (5601-a/b Record).

For 5E5 and earlier Software Releases, when an ID feature associated exclusively with Abbreviated Dialing (i.e., an ID feature without an Individualized Dialing Plan) is assigned to a trunk with unshared Abbreviated Dialing only, this form need not be entered. The unshared AD List name will be the 4-digit Trunk Group Number followed by the 4-digit Member Number.

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.26.

2. FORM ENTRIES, 5E5 AND EARLIER SOFTWARE RELEASES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * TRUNK GROUP

Description: Enter the Trunk Group Number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202 Record) must be one of the following.

TRKCLS	
Entry	**Definition**
LTOLLCON	Toll Connecting.
PF	Private Facility.
PFITT	Software Release: 5E3 and later. Private Facility Intertandem Trunk.
PFLASH	Private Facility Feature Flash.
PRINTOLL	Primary Intertoll.
TTOLLCON	Toll Completing.
EDSL	Software Release: 5E8 and later. Extended Digital Subscriber Line trunk.
EDSLHM	Software Release: 5E8 and later. EDSL for Hotel/Motel TSPS service.

Copyright © 2003 Lucent Technologies

2.3 * MEMBER

Description: Enter the Trunk Group Member Number of the trunk.

Required Field.
Valid Entries: 0 - 1951.

2.4 * ID FEATURE

Description: Enter the name of the ID feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ID feature defined on the IDFD form (5601-a/b Record).

2.5 IDP GROUP NAME

Description: Enter the name of the Individualized Dialing Plan which this trunk will use, if any.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an IDP defined on the IDPGP form and one or more IDPDCA forms.

2.6 DPAT CATEGORY

Description: If an IDP GROUP NAME is specified, and DPAT is allowed on the IDP GROUP (as specified on the IDPGP form), then enter the Dialing Plan Access Treatment category.
Valid Entries: 1 - 32

Data Rules:

If this field is entered and the trunk is to access a feature via the IDP, then the appropriate character of the DPAT CATEGORIES on the IDPDCA form must be set to "Y".

An entry is prohibited in this field if the IDP GROUP is unspecified, or an IDP GROUP is specified but DPAT is not allowed on the IDP GROUP.

ABBREVIATED DIAL LIST 1

The following fields (Section 2.7 - Section 2.8) define a 1-digit Abbreviated Dialing list.

2.7 LIST NAME

Description: If the trunk subscribes to unshared 1-digit Abbreviated Dialing (Speed Calling), leave this field blank and enter "N" in the SHARED field. The name assigned to the list will automatically be set to an eight-digit list name consisting of the four-digit Trunk Group Number followed by the four-digit Member Number. If the trunk subscribes to a shared list, enter a 1-digit Abbreviated Dialing List name. A shared list name may be any one- to eight-character name except the letter "A" followed by seven digits or an eight-digit name where the first four digits are in the range 1 to 2000 and the second four digits are in the range of 0 to 1951.
Valid Entries: 1 - 8 characters

2.8 SHARED?

Copyright © 2003 Lucent Technologies

Description: Is the 1-digit Abbreviated Dialing List to be shared among two or more terminals (lines and/or trunks)?
Valid Entries: Y, N

Data Rules:

A "Y" is required if the LIST NAME was entered.

ABBREVIATED DIAL LIST 2

The following fields (Section 2.9 - Section 2.10) define a 2-digit Abbreviated Dialing list.

2.9 LIST NAME

Description: If the trunk subscribes to unshared 2-digit Abbreviated Dialing (Speed Calling), leave this field blank and enter "N" in the SHARED field. The name assigned to the list will automatically be set to an eight-digit list name consisting of the four-digit Trunk Group Number followed by the four-digit Member Number. If the trunk subscribes to a shared list, enter a 2-digit Abbreviated Dialing List name. A shared list name may be any one- to eight-character name, except the letter "A" followed by seven digits or an eight-digit name where the first four digits are in the range 1 to 2000 and the second four digits are in the range of 0 to 1951.
Valid Entries: 1 - 8 characters

2.10 SHARED?

Description: Is the 2-digit Abbreviated Dialing List to be shared among two or more terminals (lines and/or trunks)?
Valid Entries: Y, N

Data Rules:

A "Y" is required if the LIST NAME was entered.

3. FORM ENTRIES, 5E6 AND LATER SOFTWARE RELEASES

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 * TGN

Description: Enter the Trunk Group Number of the trunk.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202 Record) must be one of the following.

TRKCLS	
Entry	**Definition**
LTOLLCON	Toll Connecting.
PF	Private Facility.
PFITT	Software Release: 5E3 and later. Private Facility Intertandem Trunk.

Copyright © 2003 Lucent Technologies

PFLASH	Private Facility Feature Flash.
PRINTOLL	Primary Intertoll.
TTOLLCON	Toll Completing.

3.3 * MEMB

Description: Enter the Trunk Group Member Number of the trunk.

Required Field.
Valid Entries: 0 - 1951

3.4 * FEATURE

Description: Enter the name of the ID feature for which the parameters are to be assigned.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of an ID feature defined on the IDFD form (5601-a/b Record).

3.5 # IDP GROUP NAME

Description: Enter the name of the Individualized Dialing Plan which this trunk will use, if any.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered must be that of an IDP defined on the IDPGP form and one or more IDPDCA forms.

3.6 DPAT CATEGORY

Description: If DPAT is allowed on the IDP GROUP (as specified on the IDPGP form), then enter the Dialing Plan Access Treatment category.
Valid Entries: 1 - 32

Data Rules:

An entry is prohibited in this field if DPAT is not allowed on the IDP GROUP.

If this field is entered and the line is to access a feature via the IDP, then the appropriate character of the DPAT CATEGORIES on the IDPDCA form must be set to "Y".

Copyright © 2003 Lucent Technologies

SEC. 2I: 5601-9 RECORD
ABBREVIATED DIALING LIST FORM - ADLIST

1. GENERAL

The 5601-9 Record is available with the 5E5 and earlier Software Releases. It is used to reserve memory for Abbreviated Dialing Lists and for assigning stored DNs (Directory Numbers) to Abbreviated Dialing codes.

For 5E6 and later Software Releases, the 5601-9 Record is not available; therefore, use the SCLIST form (5627-5 Record) to assign DNs to Speed Call codes.

When the stored DNs are not known at ODA time, an ID feature has been defined, and this form was not entered for any given AD List, memory will be reserved for the list entries for codes 2 through 7 (1-digit lists) or codes 20 through 49 (2-digit lists).

When the stored DNs are not known at ODA time, no ID feature has been defined, and this form was not entered for any given AD List, memory will be reserved for the list entries for codes 2 through 9 (1-digit lists) or codes 20 through 49 (2-digit lists).

When any forms are submitted for any given AD List, memory will only be reserved for the codes (1-digit) or ten-code blocks (2-digit) which are entered on the forms. Therefore, when any data is submitted for a 1-digit list, for example, extreme care must be taken to enter all eight codes (or more, if desired) even though the stored DNs may not be known for all of the codes. Customer originated changes to the AD Lists will be allowed only for those codes (or ten-code blocks) for which memory has been reserved.

This form may be submitted for shared AD Lists which are not yet assigned to any terminal. However, it may not be submitted for unshared AD Lists which are unassigned. That is, if the SHARED field is "N", one LINEFA or MLHLNFA form must also be submitted for a line with the Telephone Number indicated after the "A" in AD LIST NAME. For trunks, either a TRUNKFA form must be submitted for the indicated Trunk Group and Member Number or a TKGRPFA form must be submitted for the indicated Trunk Group and the indicated Member Number defined on a TRUNK form.

The codes 2 through 9 and 20 through 49 are also provided in PDIT. If other codes are to be used by subscribers in the ODP (Office Dialing Plan), those codes must be added.

If any member of an IDP Group has Abbreviated Dialing options, all codes must be defined in the IDPDCA for that IDP Group.

1.1 Recent Change View

The corresponding Recent Change view for this form is 4.2.

2. FORM ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

2.2 * AD LIST NAME

Description: Enter the Abbreviated Dialing List name. For unshared lists assigned to lines, the AD LIST NAME must be the letter "A" followed by the Telephone Number of the line. For this reason, unshared lists may not be assigned to Multi-Line Hunt lines unless the lines have Telephone Numbers. For unshared lists assigned to a trunk, the AD LIST NAME must be the four-digit Trunk Group Number (0001 to 2000) followed by the four-digit Member Number (0000 to 2047). Shared list names may be any one- to eight-character names except for those allowed for unshared lists.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

AD LIST NAMEs for 1-digit lists must be unique and list names for 2-digit lists must be unique. However, the same name may be used for a 1-digit list as for a 2-digit list.

2.3 * AD CODE BLOCK

Description: For 1-digit AD lists, enter a 0. For 2-digit lists, enter the tens digit of the codes which are entered in the AD CODE fields, followed by a 0. For example, for the ten AD List codes 20 through 29, enter 20 in AD CODE BLOCK. For 2-digits lists, the valid values of the first digit are *, # and 0 to 9.

Required Field.
Valid Entries: 2 digits (See Description.)

2.4 SHARED

Description: Is the list shared?

Required Field.
Valid Entries: Y, N

AD LIST

The Abbreviated Dialing list consists of the followings fields (Section 2.5 - Section 2.6).

2.5 AD CODE

Description: Enter the Abbreviated Dialing code to be dialed. For 1-digit lists, up to twelve codes may be specified (*,# and 0 to 9). Since the characters # and * are cursor control codes for the ODA system, it is necessary to follow each of these characters by a blank (space bar) when entering it into the ODA system. For 2-digit lists, the first digit must be the same as the first digit of the AD CODE BLOCK and only ten codes may be specified with each code's last digit in the range 0 to 9. For 2-digit lists where the AD CODE BLOCK starts with a # or *, do not enter the blank. AD CODEs may not be duplicated in the list.

Caution should be used when defining the AD codes. If a line uses the ODP (Office Dialing Plan) and 0 is used as an AD code, then this subscriber will not be able to reach the operator on a zero-minus call. If a terminal (line or trunk) uses an IDP (Individualized Dialing Plan), care should be taken with codes defined in the IDPDCA. For instance, if 0 is used for attendant access, or 9 is used for escape to POTS, then those codes can not also be used for AD codes.
Valid Entries: 2 digits (See Description.)

2.6 STORED DN

Description: Leave this field blank if the stored DN (Directory Number) is unknown. If the DN is known, enter a string of up to 32 digits which the AD CODE is to access. The digits may be *, # or 0 to 9, or O, F, I and P which are applicable to terminals which are also assigned a Precedence and Preemption feature. See the PPFD form (5618-1 Record).
Valid Entries: up to 32 digits (0 - 9, *, #, O, F, I, P)

ABBREVIATED DIALING GROUP DATA FORM - ADDATA

This section has been removed from the TG-5.

Copyright © 2003 Lucent Technologies

SEC. 2K: 5601-11 RECORD IDP REVERSE CODE ASSIGNMENT (INDIVIDUAL DIALING) - IDPRDCA

1. GENERAL

The 5601-11 Record is available with the 5E5 and later Software Releases. It is used to define the reverse codes associated with IDPs (Individualized Dialing Plans).

The IDPRDCA is associated with an IDFD (Individualized Dialing Feature Definition) which has IDP GROUP equal to "Y".

This form is used to assign a reverse intercom range to a public TN in an IDP group. Reverse intercom code assignment allows a customer to convert a 10-digit public TN back to an intercom extension for intra-switch AC invocations.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * IDP GRP

Description: Enter the IDP GRP name. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The value entered here must be defined on the IDPGP form (5601-4 Record) as IDP GROUP NAME.

2.3 * DIGITS

Description: Enter the dialed digits to be interpreted. Up to ten digits may be entered in the format of NPA-NXX-XXXX.

Required Field.
Valid Entries: up to 10 digits (0 - 9)

Data Rules:

The digits entered in this field cannot be the beginning substring of another DIGITS field with the same IDP GRP defined on this form.

2.4 # REV ICM RANGE

Description: This field indicates the reverse intercom range.

Required Field.
Valid Entries: 1 - 512

Copyright © 2003 Lucent Technologies

Data Rules:

Any value entered here must be defined on the IDPRICM form (5601-12 Record) with the same IDP GRP defined on this form.

SEC. 2L: 5601-12 RECORD IDP REVERSE INTERCOM RANGE (INDIVIDUAL DIALING) - IDPRICM

1. GENERAL

The 5601-12 Record is available with the 5E5 and later Software Releases. It is used to define the reverse intercom ranges associated with IDPs (Individualized Dialing Plans). Reverse intercom dialing allows a 10-digit public TN to be converted back to an intercom extension after a LASS (Local Area Signaling Serviced) AC (Automatic Callback) invocation.

When the AC feature is invoked, the switch determines the reverse intercom range, the appropriate number of digits are deleted, and then the appropriate digits are prefixed to reconstruct the extension. The extension is then interpreted by the IDP or ODP (Office Dialing Plan) as if it had actually been dialed.

1.1 Recent Change View

The corresponding Recent Change view for this form is 9.26.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * IDP GRP

Description: Enter the IDP Group Name. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The IDP group whose name is entered here must be defined on the IDPGP form and one or more IDPRDCA forms.

2.3 * REV ICM RANGE

Description: This field indicates the reverse intercom range.

Required Field.
Valid Entries: 1 - 512

Data Rules:

The reverse intercom range defined on this form must be entered on the IDPRDCA form (5601-11 Record) for the appropriate codes.

2.4 # NBR DEL DIG

Description: Enter the number of digits to delete.

Required Field.
Default: 0
Valid Entries: 0 - 10

Copyright © 2003 Lucent Technologies

Data Rules:

If NBR DEL DIG is 0, then PRFX DIG must be entered.

2.5 PRFX DIG

Description: Enter the digits to be prefixed to the remaining digits. The resulting reconstructed extension will be re-interpreted by either the IDP or the office dialing plan, as appropriate.
Valid Entries: up to 7 digits (0 - 9, *, and #)

SEC. 3: MULTIWAY CALLING FORMS

Copyright © 2003 Lucent Technologies

SEC. 3A: 5602-1/2 RECORD
MULTI-WAY FEATURE DEFINITION FORM - MWFD

1. GENERAL

The 5602-1/2 Record is available with the 5E2 and later Software Releases. The record is used to define many of the Add-On and conferencing features used in other switching systems (e.g., Call Hold, Three-Way Calling, Six-Port Conferencing, and Call Transfer) and replaces the Three-Way Calling feature in earlier 5ESS Software Releases. The 5602-1/2 Record is also used to define how call processing will be affected by customer attempts to flash or disconnect while holding, adding, or transferring calls.

Multi-Way Calling is also used in conjunction with other BRCS features to provide services similar to those existing systems.

There are two basic types of multi-way features - Hold features and Conference features. The Hold features are those constructed with the multi-way control options Hold, Hold and Alternate, and Code and Alternate ("HOLD", "HOLDAT" and "CODEALT", respectively in the MULTIWAY CONTROL field). These features allow a customer to hold an existing call and make another call, and to reconnect to the originally held call.

Each defined feature is given a feature name of from one to eight characters which is used to assign the constructed (defined) feature to lines or trunks. Certain multi-way features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/) and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed multi-way features is contained in Figures 1, 2, 3, and 4.

A terminal (line or trunk) must be assigned a multi-way feature on the appropriate feature assignment form, BFG (5625-1/7 Record), CLUSTR (5600 Record), LINEFA (5112 Record), MLHNFA (5113 Record), TKGRPFA (5206 Record) or TRUNKFA (5205 Record).

1.1 Class of Service

For 5E6 and later, lines assigned a Multiway Calling feature must have an associated Class of Service of "4WINDIV", "INDIV", "ATND", "PBX", "SATSTLN", "ISDN", or "ISATND". That is, when a TN defined on a LINE form or a CKT TN defined on a DSLUSR form is assigned a Multiway Calling feature on a LINEFA, BFG, or associated CLUSTR form, the TN must be assigned an LCC and RAX defined on the LCC form with one of the above classes of service. The same restriction holds for a Multi-Line Hunt Group terminal defined on an MLHLNFA form or a CKT MLHG/TERM defined on a DSLUSR form.

1.2 Feature Assignment Rules

Multi-way features assigned to CKT TNs defined on DSLUSR forms with an associated Class of Service of "ISDN" must have the following fields set to "N": FLASH, IN MIDDLE, OFF HOOK, CALL WAITING, and CALL PICKUP.

Multi-way features assigned to CKT TNs with an associated Class of Service other than "ISDN" must have the following fields set to "N": FEATURE BUTTON, DIAL CODE OR BUTTON, and ISDN CALL PICKUP.

Multi-way features assigned to CKT TNs with an associated Class of Service of "ISATND" must have the following fields set to "N": FLASH, IN MIDDLE, OFF HOOK, CALL WAITING, CALL PICKUP, FEATURE BUTTON, DIAL CODE OR BUTTON, and ISDN CALL PICKUP.

Multi-way features assigned to CKT TNs with an associated Class of Service other than "ISATND" must have the ISDN ATTENDANT field set to "N".

Copyright © 2003 Lucent Technologies

1.3 Preconstructed Feature Changes

A new preconstructed feature, /MWCTIA5, was added for 5E3 and later Software Releases. This was done because the /MWCTIA4 preconstructed feature on the MWFD form has existed in two ways, with MULTIWAY CONTROL equal to "3WAY" or "AUTO3WAY". In 5E7 and later Software Releases, /MWCTIA4 will be standardized to have MULTIWAY CONTROL equal to "3WAY" in all offices. The new preconstructed feature /MWCTIA5 is identical to /MWCTIA4, except that MULTIWAY CONTROL is equal to "AUTO3WAY".

The following outlines the revised retrofit process:

1. During retrofits to 5E4, 5E5 or 5E6, the /MWCTIA4 feature will retain its current MULTIWAY CONTROL value. MULTIWAY CONTROL values of "AUTO3WAY" will remain "AUTO3WAY". MULTIWAY CONTROL values of "3WAY" will remain "3WAY".

2. In 5E3 and later, the /MWCTIA4 feature will have MULTIWAY CONTROL equal to "3WAY" for all new-start offices or for retrofitting offices that have deleted or renamed their original /MWCTIA4 feature.

3. Existing offices can get the /MWCTIA5 feature via application of a BWM. The customer is being asked in 5E3 - 5E6 to use /MWCTIA5 for features that wish to have MULTIWAY CONTROL equal to "AUTO3WAY" so as to minimize impact in 5E7 and 5E8 retrofits.

4. During a retrofit to 5E7 or 5E8, the /MWCTIA4 feature will be standardized. The /MWCTIA4 feature will have MULTIWAY CONTROL set to "3WAY" in all offices. If the /MWCTIA4 feature came in with MULTIWAY CONTROL equal to "AUTO3WAY", then all assignments of the /MWCTIA4 feature will be automatically changed by ODA to /MWCTIA5 to preserve functionality. If /MWCTIA4 came in with MULTIWAY CONTROL equal to "3WAY", then nothing will be changed.

5. An office which previously started with /MWCTIA4 MULTIWAY CONTROL equal to "3WAY", was forced to change MULTIWAY CONTROL to "AUTO3WAY" and had to replace /MWCTIA4 assignments with a new constructed feature with MULTIWAY CONTROL equal to "3WAY" to maintain functionality, may use the ODAOPT form (5523 Record) to "back out" the constructed feature assignments and replace them with the standardized /MWCTIA4 feature.

   The new field MULTIWAY 3WAY CONSTRUCTED FEATURE has been added to the ODAOPT form. This field can be used to specify the name of a constructed feature with MULTIWAY CONTROL equal to "3WAY" that the customer plans to replace with the standardized /MWCTIA4 feature (MULTIWAY CONTROL equal to "3WAY").

   This conversion will not take place automatically. The actual changes must be done manually.

   Two crosschecks will be run using this new field. The first crosscheck will compare the constructed feature to /MWCTIA4 and specify any discrepancies so that the office is assured of maintaining functionality following the change. The second crosscheck will identify all assignments of the constructed feature in the database. Using the output from this crosscheck, the office (or the ODA Project Consultants, at the office's request) can manually change some or all of the assignments of the constructed feature to /MWCTIA4.

   Note that this replacement process is manual, not automated. As such, the use of the new MULTIWAY 3WAY CONSTRUCTED FEATURE field and the crosscheck data is optional in all offices. The purpose of the field and crosscheck is to assist offices in "undoing" changes forced on offices during earlier retrofits.

Copyright © 2003 Lucent Technologies

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.19.

2. FORM ENTRIES - 5602-1 RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

2.2 * FEATURE NAME

Description: Enter the multi-way calling Feature Name.

There are no restrictions on the valid characters, except that Feature Names starting with a slash (/) are reserved for preconstructed features. Preconstructed features may be reviewed in the ODA database but may not be deleted, changed, or inserted.

Required Field.
Valid Entries: 1- 8 characters

Data Rules:

For 5E15 and later, the feature options on the MWFD form define a USSWC (Usage Sensitive Six-Way Calling) feature which cannot be assigned on this form or any of the associated CLUSTR forms (5600 Record). USSWC must be assigned on the OFCOPT form (5509 Record). For more information on the USSWC feature, see Division 2, Section 4A553.

For 5E15 and later, when FEATURE NAME is entered for USSWC (Usage Sensitive Six-Way Calling) features defined on this form where the fields listed are set as follows:

- FEATURE OPTIONS fields: ACT/INACT OPTION is set to "ACT1CA", MULTIWAY CONTROL is set to "NWAY", and AMAC is set to "USAGE",
  - ***NOTE:*** The MULTIWAY CONTROL and AMAC fields are locked and cannot be changed.
- ENTRY POINT fields: FLASH is set to "Y", IN MIDDLE is set to "Y", and OFF HOOK is set to "Y", and
  - ***NOTE:*** The FLASH, IN MIDDLE, and OFF HOOK fields are locked and cannot be changed.
- DEFAULT PARAMETER field: N-WAY MAXIMUM is set to "6",

then:

- the MLHLNFA, CLUSTR, and/or BFG forms (5113, 5600, 5625 Records respectively) cannot have a USSWC feature name entered as these features are not assignable to multiline hunt lines. The USSWC feature must be assigned on the OFCOPT form (5509 Record). (For more information on the USSWC feature, see Division 2, Section 4A553.)
- the LINEFA, CLUSTR, and/or BFG forms (5112, 5600, 5625 Records respectively) cannot have a USSWC feature name entered as these features are not assignable to lines. The USSWC feature must be assigned on the OFCOPT form. (For more information on the USSWC feature, see Division 2, Section 4A553.)

2.3 REMARKS

Copyright © 2003 Lucent Technologies

Description: Enter (optionally) a descriptive comment.
Valid Entries: up to 32 characters

FEATURE OPTIONS

Fields Section 2.4 -Section 2.11 refer to feature options.

2.4 ACT/INACT OPTION

Description: Enter the activation/deactivation type for the feature.

Required Field.
Default: ALWACT
Valid Entries:

Valid ACT/INACT OPTION Entries

Entry	Definition
ACT1CA	When this option is selected, the feature is inactive when assigned to a line. In order to use the feature, the customer dials an activation code for the feature. As soon as the call ends, the feature is automatically deactivated. The activation code is required in either the Office Dialing Plan defined on a PDIT form (5300-2 Record), or the line's Individualized Dialing Plan defined on an IDPDCA form (5601-1/2 Record), with an ACTION of "FTACT" and a FEATURE equal to the FEATURE NAME entered on this form.
ALWACT	When this option is selected, the feature is completely activated when assigned to the line. The only way to deactivate the feature is through a service order request.
CUSTSEL	When this option is selected, the feature is inactive when assigned to a line. A customer can activate and deactivate it by dialing an appropriate activation or deactivation code. The state of activation or deactivation is determined by the last dialed activation or deactivation code (i.e., an active feature remains active until the customer dials the deactivation code, or until the Time-Of-Day feature triggers the deactivation code. The activation code is required in either the Office Dialing Plan (defined on a PDIT form), or the line's Individualized Dialing Plan (defined on an IDPDCA form), with an ACTION of "FTACT", and a FEATURE equal to the FEATURE NAME entered on this form. The deactivation code is similarly required in either the office dialing plan or the line's Individualized Dialing Plan with an ACTION of "FTDCT", and a FEATURE equal to the FEATURE NAME entered on this form.
INACT1CA	When this option is selected, the feature is active when assigned to a line. In order to deactivate the feature, the customer dials a deactivation code for the feature. As soon as the call ends, the feature is automatically reactivated. The deactivation code is required in either the Office Dialing Plan (defined on a PDIT form), or the line's Individualized Dialing Plan (defined on an IDPDCA form), with an ACTION of "FTDCT", and a FEATURE equal to the FEATURE NAME entered on the form.

2.5 MULTIWAY CONTROL

Description: Enter the type of Multi-Way calling feature.

"3WAY" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.

- ***NOTE:*** See Section 1.3 for details on the correct value of this field for certain preconstructed features.

Default: 3WAY
Valid Entries:

Valid MULTIWAY CONTROL Entries

Entry	Definition
3WAY	Allows the customer to hold and add terminals to a call and to form three-way calls. The controlling terminal of a two-way call (i.e., the terminal with the multi-way feature) uses the same procedure as used in the "HOLD" type call to put the non-controlling terminal on hold and dial a

Copyright © 2003 Lucent Technologies

	third party. At any time after the controlling terminal receives (audible), it may flash to reconnect the non-controlling terminal of the original call to form a three-way call. If the non-controlling terminal of the original call disconnects after the third party answers but before the three-way call is established, the controlling terminal receives an optional party departure tone. If the controlling terminal disconnects from the three-way call, the other two terminals are also disconnected unless the MULTIWAY TRANSFER is specified as "ALW". NOTE: The third party can be bridged on even if busy tone or reorder was reached by subscribing to the secured feature, Three-Way Reconnect. For 5E5 and later, this feature must be activated by an AT&T System Equipment Engineer on RC View 10.19 in the 5E4(2) Software Release, or on the SFSYS form (5713 Record, RC View 8.22) in 5E5 and later.
AUTO3WAY	Similar to the 3WAY option except the non-controlling terminal of the original call is automatically reconnected when the controlling terminal receives calling terminal treatment (audible, busy tone, etc). Features of this type are normally assigned to 50B CPS and other attendant consoles, but may be assigned to any line.
CODEALT	This option allows the controlling terminal to put the non-controlling terminal of a two-way establishing a connection with the third terminal to flash (getting recall dial tone) and dial a code to reestablish a connection with the original non-controlling terminal. Subsequent flashes by the controlling terminal return recall dial tone and the controlling terminal can dial the code to alternate between the held terminals. The dialed code is required in either the Office Dialing Plan (defined on the PDIT form), or the line's Individualized dialing Plan (defined on the IDPDCA form), with an ACTION of "MWSOH", and a FEATURE equal to the FEATURE NAME entered on this form.
DIRCON	Allows the controlling terminal of a two-way call to flash and automatically form a three-way call with a predesignated third terminal. The predesignated third terminal is changeable only by a service order.
FLSHRPT	Flash repeat.
HOLD	This option allows the controlling terminal of a two-way call to hold the non-controlling terminal by flashing (thereby receiving recall dial tone). After receiving recall dial tone, the controlling terminal can dial the number of a third terminal. If the controlling terminal flashes again after receiving recall dial tone and before dialing of the third party is complete, the call is reconnected to the non-controlling terminal of the original two-way call. If a connection is established between the controlling terminal and the third terminal, the call must be completed and the controlling terminal must disconnect. After disconnect, the system rings the controlling terminal back and on answer, the original two-way call is reestablished. If the non-controlling terminal of the original two-way call disconnects while the controlling terminal and third terminal are connected, the controlling terminal receives an optional party departure tone.
HOLDALT	This option allows the controlling terminal to put the non-controlling terminal of a two-way call on hold, hold a third terminal and while speaking with or awaiting answer from the third terminal to flash to alternate between the original non-controlling terminal and the third terminal. Subsequent flashes by the controlling terminal alternate between the two non-controlling terminals.
HLDALT3W	Software Release: 5E10 and later. Call Waiting Deluxe - Hold call and alternate 3 way. For more information on the Call Waiting Deluxe Secured Feature, see Division 2, Section 4A145
NWAY	Similar to 3WAY except that up to six parties may be included in the call, depending on the value of N-WAY MAXIMUM assigned to the controlling terminal. This option requires 6-port conference circuits be equipped in the office as specified on the EQDSP form (5740 Record).
CODE3WAY	Software Release: 5E4(2) and later. Dial SOCS for 3-Way Calling.
HA3WAY	Software Release: 5E4(2) and later. Hold call and alternate 3-way.

Data Rules:

3WAY - For 5E15 and later:

Copyright © 2003 Lucent Technologies

- When MULTIWAY CONTROL is "3WAY" and AMAC is "USAGE" and FLASH is "N":
  - ACT/INACT OPTION must be "ACT1CA"
  - IN MIDDLE must be "N" and OFF HOOK must be "Y"
- When MULTIWAY CONTROL is "3WAY" and AMAC is "USAGE" and FLASH is "Y":

- XFER PTYS PRES Call Types must not be entered
- NWAY PTYS PRES Call Types must be "N"

CODE3WAY - For 5E4(2) and later, if MULTIWAY CONTROL is "CODE3WAY", MULTIWAY TRANSFER, SPLIT LAST PTY, HOLD XFER, 3WAY XFER, and the IN MIDDLE, OFF HOOK and CALL PICKUP ENTRY POINTS must be "N".

2.6 MULTIWAY TRANSFER

Description: Enter the Multi-Way Transfer option.

Copyright © 2003 Lucent Technologies

"NO" is the only value allowed except for multi-way features derived from the preconstructed features using ODA change-insert mode of the review operation.
Default: NO
Valid Entries:

Valid MULTIWAY TRANSFER Entries

Entry	Definition
ALW	Allow transfer occurs when the controlling terminal disconnects from a configuration in which one or more terminals are on hold and the controlling terminal is talking to another terminal, or a configuration in which the controlling terminal is talking with two or more other terminals. The transfer connects the non-controlling terminals into a talking configuration.
ET	Software Release: 5E9(1) and later. Explicit Transfer Request. A feature with MULTIWAY TRANSFER set to "ET" may be assigned only to Standard BRI users: DSL CLS is "STD" on the DSLUSR form (5908 Record).
NO	No transfer is allowed. When the controlling terminal disconnects, all terminals on the call are idled unless there is a terminal on hold, in which case the controlling terminal is rung back by the held terminal(s).
TONE	Allows transfer on dial tone. Provides the ability to receive a call, flash to hold the call and then after dialing an access code to the public network or a private facility that returns dial tone, disconnect and transfer the dial tone to the held terminal. That terminal can then complete dialing the call. The held terminal must be a member of the controlling terminal's terminal group.

Data Rules:

For 5E4(2) and later, if MULTIWAY TRANSFER is "NO", ISDN ATTENDANT must be "N".

For 5E4(2) and later, if MULTIWAY TRANSFER is "TONE", ISDN FEATURE BUTTON, ISDN DIALED CODE OR BUTTON, ISDN CALL PICKUP, ISDN ATTENDANT, CALL WAITING, and CALL PICKUP ENTRY POINTS must be "N", and MULTIWAY CONTROL cannot be "DIRCON", "NWAY", or "CODE3WAY".

2.7 PS/PD TREATMENT

Description: Enter the Multi-Way Calling Permanent Signal/Partial Dial Treatment. This is used to specify what types of treatment are given when a customer using a multi-way feature and receiving a dial tone to dial a code or telephone number times out due to normal permanent signal or partial dial timing.

"AUTOREST" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: AUTOREST
Valid Entries:

Valid PS/PD TREATMENT Entries

Entry	Definition
AUTOREST	The state which existed prior to the dial tone that resulted in PS/PD timeout is restored.
NORMAL	Normal office PS/PD treatment. The treatment is given even if there are held terminals. The customer may flash to exit this treatment and be reconnected to dial tone or may disconnect. If the customer has one or more terminals on hold, the caller is rung back upon disconnect.
SILENCE	The customer hears nothing when PS/PD treatment is begun. The customer may flash to exit this treatment in the same way as with "NORMAL".

Data Rules:

For 5E4(2) and later, if PS/PD TREATMENT is "AUTOREST", ISDN FEATURE BUTTON, ISDN DIALED CODE OR BUTTON, ISDN CALL PICK-UP, and ISDN ATTENDANT must be "N".

For 5E4(2) and later, if PS/PD TREATMENT is "SILENCE", ISDN FEATURE BUTTON, ISDN DIALED CODE OR BUTTON, ISDN CALL PICKUP and ISDN ATTENDANT must be "N".

Copyright © 2003 Lucent Technologies

2.8 DEPARTURE TONE

Description: Enter the departure tone given to the controlling terminal in a multi-way call when either a held terminal or a non-controlling terminal in a three-way or n-way call disconnects.

"NONE" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: NONE
Valid Entries:

Valid DEPARTURE TONE Entries

Entry	Definition
BEEP1	One beep of from 200 to 4000 milliseconds of 440 Hz tone. The duration of the tone is specified in the TONE DURATION field of this form or the MWLPA (5602-3 Record), MWMPA (5602-3 Record) or MWTPA (5602-4 Record) form.
BEEP2	Two beeps of 100 milliseconds of 440 Hz tone separated by 100 milliseconds.
BEEP3	Three beeps of 100 milliseconds of 440 Hz tone separated by 100 milliseconds.
LEAVE	Party leaving tone of 150 milliseconds of 1510 Hz tone followed by 300 milliseconds of 1510 Hz + 1103 Hz tone.
NONE	No tone.

2.9 FLASH BEFORE ANS

Description: Is Flash Before Answer allowed? Flash Before Answer allows the switch owner to select when a customer flash is recognized by the switch while the controlling terminal is establishing the first leg of a multi-way call.

If "Y", The controlling terminal is allowed to flash after calling party treatment (e.g., audible ring) is returned but before the called party answers.

If "N", The controlling terminal is allowed to flash only after the called party answers.

"Y" is the default value and the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: Y
Valid Entries: Y, N

Data Rules:

For 5E4(2) and later, if FLASH BEFORE ANS is "Y", CALL WAITING and CALL PICK-UP ENTRY POINTS must be "N".

For 5E4(2) and later, if FLASH BEFORE ANS is "N", ISDN FEATURE BUTTON, ISDN DIALED CODE OR BUTTON, ISDN CALL PICK-UP and ISDN ATTENDANT must be "N".

2.10 SPLIT LAST PTY

Description: Is Split Last Party allowed? Split Last Party allows the controlling terminal in an n-way call to flash (after the n-way call is established) and dial a code to remove the last party added to the n-way call. Once a terminal is split from the call, the code may not be used again until another party has been added to the call.

The split last party code is required in either the office dialing plan (defined on the PDIT form), or the line's IDP (defined on the IDPDCA form) with an ACTION of "MWSPL" and a FEATURE equal to the FEATURE NAME entered on this form.

"N" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

"Y" may be entered only if the MULTIWAY CONTROL is "NWAY".

2.11 AMAC

Description: This field indicates whether flat rate or usage sensitive billing is used.

Software Release: 5E8 and later.
Default: FLAT
Valid Entries:

Valid AMAC Entries

Entry	Definition
FLAT	Flat rate AMA charging.
USE	Software Release 5E8 only. Usage sensitive AMA charging.
USEAGE	Software Release 5E9 and later. Usage sensitive AMA charging.

Data Rules:

When AMAC is "FLAT", all other billing options must be "N".

If AMAC is "USAGE" or "USE"

- 3WAY must be "ALL"
- 3WAY ADDED PTY CALL TYPES must be "Y"
- 3WAY ORIG PTY CALL TYPES must be "Y"
- 3WAY XFER and HOLD XFER must be "N".
- ACT/INACT OPTION must be "ACT1CA"
- CALL WAITING and CALL PICKUP must be "N".
- DEPARTURE TONE must be "NONE"
- DIAL CODE OR BUTTON must be "N".
- DIRECT CONNECT DN must not be entered.
- FEATURE BUTTON must be "N".
- FLASH must be "N".
- FLASH BEFORE ANS must be "N".
- HOLD must be "ALL"
- HOLD ADDED PTY CALL TYPES must be "Y"
- HOLD ORIG PTY CALL TYPES must be "Y"
- IN MIDDLE must be N and OFF HOOK must be "Y"
- ISDN CALL PICKUP and ISDN ATTENDANT must be "N".

Copyright © 2003 Lucent Technologies

- MULTIWAY CONTROL must be "3WAY"
- MULTIWAY TRANSFER must be "NO"
- N-WAY MAXIMUM must not be entered.
- NWAY PTYS PRES CALL TYPES must not be entered.
- PS/PD TREATMENT must be "AUTOREST"
- SPLIT LAST PTY must be "N".
- TONE DURATION must not be entered.
- TRANSFER must be "ALL"
- XFER ORIG PTY CALL TYPES must not be entered.
- XFER ADDED PTY CALL TYPES must not be entered.
- XFER PTYS PRES CALL TYPES must not be entered.

If Usage Sensitive Three-Way Calling features are defined on an MWFD form where MULTIWAY CONTROL is "3WAY" and AMAC is "USAGE", these features cannot be assigned to lines, therefore the LINEFA, CLUSTR, and/or BFG forms cannot have a Usage Sensitive Three-Way Calling feature name entered.

The field USTWC FEAT on the OFCOPT form is used by the Usage Sensitive Three-Way Calling Special Feature, therefore the feature name specified in that field must be defined on an MWFD form where MULTIWAY CONTROL is "3WAY" and AMAC is "USAGE".

If Usage Sensitive Three-Way Calling features are defined on an MWFD form where MULTIWAY CONTROL is "3WAY" and AMAC is "USAGE", these features cannot be assigned to multi-line hunt lines; therefore MLHLNFA, CLUSTR and/or BFG forms cannot have a Usage Sensitive Three-Way Calling feature name entered.

For 5E9(1) and later with Usage Sensitive 3-Way Calling, when AMAC is "USAGE" and FLASH is "N",

- ACT/INACT OPTION must be "ACT1CA"
- IN MIDDLE must be "N"
- OFF HOOK must be "Y".

For 5E9(1) and later with Spontaneous Usage Sensitive 3-Way Calling, when AMAC is "USAGE" and FLASH is "Y",

- ACT/INACT OPTION must be "ALWACT"
- OFF HOOK must be "N".

ENTRY POINT

Fields Section 2.12 -Section 2.16 specify when the multi-way feature is invoked during normal call processing. The two dialed code entry points, IN MIDDLE and OFF HOOK are not mutually exclusive with each other. However, the remaining entry points, FLASH, CALL WAITING and CALL PICKUP are

Copyright © 2003 Lucent Technologies

mutually exclusive with each other and with the IN MIDDLE and OFF HOOK entry points, one of the ENTRY POINTS must be "Y".

2.12 FLASH

Description: Will the controlling terminal in a call involving two parties or involving the controlling terminal and some treatment (audible ringing, reorder, announcement, etc.) flash to receive dial tone and invoke the multi-way feature?

"Y" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: Y
Valid Entries: Y, N

Data Rules:

If FLASH is "Y", IN MIDDLE, OFF HOOK, CALL WAITING and CALL PICKUP ENTRY POINTS must be "N".

2.13 IN MIDDLE

Description: Is the multi-way feature accessed by dialing a code? In order for the customer to dial the code, dial tone must be provided with one or two terminals already being held. Therefore, a terminal assigned a multi-way feature with an IN MIDDLE entry point must either also be assigned a multi-way feature with one of the FLASH, entry points or a multi-way feature with the OFF HOOK entry point. The OFF HOOK entry point may be specified on either the same multi-way feature as the IN MIDDLE entry point, or on another multi-way feature.

If on another multi-way feature, both features must be assigned to the terminal. The code to invoke the feature is required in either the Office Dialing Plan (defined on the PDIT form), or the line's IDP (defined on the IDPDCA form) with an ACTION of "MWSOH" and a FEATURE equal to the FEATURE NAME entered on this form.

"N" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E4(2) and later, if IN MIDDLE is "Y", MULTIWAY CONTROL cannot be "DIRCON" or "CODE3WAY".

2.14 OFF HOOK

Description: Is a multi-way feature invoked while receiving dial tone with no terminals held by dialing a code? The code to invoke the feature is required in either the Office Dialing Plan (defined on the PDIT form), or the line's IDP (defined on the IDPDCA form) with an ACTION of "MWSOH" and a FEATURE equal to the FEATURE NAME entered on this form.

"N" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E4(2) and later, if OFF HOOK is "Y", CALL WAITING and CALL PICKUP ENTRY POINTS must be "N". In addition, MULTIWAY CONTROL cannot be "DIRCON" or "CODE3WAY".

Copyright © 2003 Lucent Technologies

2.15 CALL WAITING

Description: Is the multi-way feature to be invoked from the call waiting feature? In order for a call waiting feature to exit to this multi-way feature, the call waiting feature (defined on the CWTFD form (5603-1 Record)) must have this multi-way feature specified as its MULTI-WAY BRIDGE TO FEATURE.

If the call waiting customer flashes (the first flash), the talked to terminal is put on hold, control of the call is transferred to this multi-way feature and the controlling terminal is connected with the waiting terminal.

"N" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E4(2) and later, if CALL WAITING is "Y", CALL PICKUP must be "N", ACT/INACT must be "ALWACT", MULTI-WAY XFER must not be "TONE", FLASH BEFORE ANS must be "N", 3WAY XFER must be "N" and HOLD XFER must be "N".

2.16 CALL PICKUP

Description: Is the multi-way feature invoked from the call pickup terminating feature? In order for a call pickup terminating feature to exit to this multi-way feature, the call pickup terminating feature (defined on the PUTFD form (5605-2 Record)) must have this multi-way feature specified as its MULTI-WAY field.

"N" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N
Valid Entries: Y, N

Data Rules:

If CALL PICKUP is "Y", ACT/INACT must be "ALWACT", MULTIWAY CONTROL must be "3WAY", MULTIWAY TRANSFER cannot be "TONE", FLASH BEFORE ANS must be "N", and HOLD XFER must be "N".

ISDN ENTRY POINT

Fields Section 2.17 -Section 2.20 refer to when the multi-way feature is invoked during normal call processing for ISDN terminals. The entry points, FEATURE BUTTON, DIALED CODE OR BUTTON and ISDN CALL PICKUP are mutually exclusive. Features constructed with these entry points can be assigned only to ISDN terminals.

2.17 FEATURE BUTTON

Description: Will entry to multi-way features be allowed for ISDN functional buttons, Conference or Transfer, from an ISDN terminal on a two-way call? These are functional buttons and depression of these buttons causes specific messages (Conference or Transfer message) to be sent by the terminal.

When an ISDN terminal voice is active on a CA (Call Appearance) and is in a talking state as the result of either originating or receiving a call, or is connected to some treatment (audible ringing or announcement) after having completed dialing, the user may press the conference or transfer button on the ISDN terminal and may or may not press the CA of the other call to conference with or transfer to depending upon the terminal interface.

Software Release: 5E4(2) and later

Copyright © 2003 Lucent Technologies

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ISDN FEATURE BUTTON is "Y" then the following must be true:

- ISDN DIALED CODE OR BUTTON and ISDN CALL PICKUP must be "N".
- 3WAY XFER SIGNAL CONTROL and HOLD XFER SIGNAL CONTROL must be "N".
- FLASH BEFORE ANSWER must be "Y".
- CALL TRANSFER CONSTRAINTS must not be "TONE" and MULTIWAY CONTROL must not be "AUTO3WAY", "HOLDALT", "CODEALT", or "DIRCON".
- PS/PD TREATMENT must be "NORMAL" and HOLD FILTERING must be "ALL".

For 5E8 and later, if a Multi-Way feature with FEATURE BUTTON set to "Y" is assigned to a CKT TN on a non-Standard BRI (CKT TN is defined on a DSLUSR form where the associated DSL form has a DSL CLS other than "STD"), the CKT TN's CPE must have more than one call appearance. Either the CA QTY on the DSLUSR form must be greater than one, or the CKT TN must appear in the SHARED LIST of an SHTN form (5902 Record) where the CKT TN is not the key TN. Similarly, if the feature is assigned to a CKT MLHG/TERM, the CKT MLHG/TERM's CPE must have more than one call appearance. Either the CA QTY on the DSLUSR form must be greater than one, or the CKT MLHG/TERM must appear in the SHARED LIST of an SHTN form where the CKT MLHG/TERM is not the key MLHG/TERM.

For 5E10 and later, if the ISDN FEATURE BUTTON ENTRY POINT is "Y", MULTIWAY CONTROL cannot be "AUTO3WAY", "CODEALT", "DIRCON", "HLDALT3W" or "HOLDALT".

2.18 DIAL CODE OR BUTTON

Description: Can the ISDN terminal voice user invoke an active ISDN multi-way feature by dialing a code? Optionally, the user can press a feature button instead of dialing the code. In order to dial this type of code or press a feature button to indicate the feature, the user must be receiving dial tone.

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ISDN DIALED CODE OR BUTTON is "Y" then the following must be true:

- ISDN FEATURE BUTTON, ISDN CALL PICKUP, 3WAY XFER SIGNAL CONTROL must be "N".
- FLASH BEFORE ANSWER must be "Y".
- CALL TRANSFER CONSTRAINTS must not be "TONE" and MULTIWAY CONTROL must not be "AUTO3WAY", "HOLDALT", "CODEALT", or "DIRCON".
- PS/PD TREATMENT must be "NORMAL" and HOLD FILTERING must be "ALL".

If a Multi-Way feature with DIAL CODE OR BUTTON set to "Y" is assigned to a CKT TN on a non-Standard BRI (CKT TN is defined on a DSLUSR form where the associated DSL form has a DSL CLS

Copyright © 2003 Lucent Technologies

other than "STD"), the CKT TN's CPE must have more than one call appearance. Either the CA QTY on the DSLUSR form must be greater than one, or the CKT TN must appear in the SHARED LIST of an SHTN form (5902 Record) where the CKT TN is not the key TN.Similarly, if the Multi-Way Feature is assigned to the CKT MLHG/TERM on a non-Standard BRI, the CKT MLHG/TERM's CPE must have more than one call appearance. Either the CA QTY on the DSLUSR form must be greater than one, or the CKT MLHG/TERM must appear in the SHARED LIST of an SHTN form where the CKT MLHG/TERM is not the key MLHG/TERM.

For 5E10 and later, if DIAL CODE OR BUTTON ENTRY POINT is "Y", MULTIWAY CONTROL cannot be "AUTO3WAY", "CODEALT", "DIRCON", "HLDALT3W" or "HOLDALT".

2.19 ISDN CALL PICKUP

Description: May a multi-way feature for ISDN be entered from Call Pickup?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ISDN CALL PICKUP is "Y" then the following must be true:

- ISDN FEATURE BUTTON, DIALED CODE OR BUTTON, 3WAY XFER SIGNAL CONTROL and HOLD XFER SIGNAL CONTROL must be "N".
- ACT/INACT OPTION must be "ALWACT", MULTIWAY CONTROL must be "3WAY", FLASH BEFORE ANSWER must be "Y", PS/PD TREATMENT must be "NORMAL" and HOLD FILTERING must be "ALL".
- CALL TRANSFER CONSTRAINTS must not be "TONE".

2.20 ISDN ATTENDANT

Description: May a multi-way feature for ISDN ATTENDANT be accessed by dialed code or feature button?

Software Release: 5E4(2) and later
Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If ISDN CALL PICKUP is "Y" then the following must be true:

- ISDN FEATURE BUTTON, ISDN CALL PICKUP, 3WAY XFER SIGNAL CONTROL and HOLD XFER SIGNAL CONTROL must be "N".
- FLASH BEFORE ANSWER must be "Y", PARTIAL SIGNAL/PARTIAL DIAL treatment must be "NORMAL" and HOLD FILTERING must be "ALL".
- MULTIWAY CONTROL must not be "FLSHRPT", "HOLDALT", "CODEALT", "DIRCON" or "HOLD".
- CALL TRANSFER CONSTRAINTS must not be "N". HOLD XFER must be "N" and HOLD FILTERING must be "ALL".

Copyright © 2003 Lucent Technologies

For 5E10 and later, if ISDN ATTENDANT ENTRY POINT is "Y", MULTIWAY CONTROL cannot be "CODEALT", "DIRCON", "FLSHRPT", "HLDALT3W", "HOLD" or "HOLDALT".

SIGNAL CONTROL

Fields Section 2.21 -Section 2.22 refer to allowing a signal to be sent to a controlling terminal on 3-Way and transfer and hold and transfer. When a 50A or 50B console is used by an attendant to transfer calls, the attendant usually sets up a three-way call with the last terminal still unanswered. The attendant puts this call on hold.

If the last terminal answers, or the original non-controlling terminal disconnects, the switch sends an open interval (nominally 150 milliseconds) toward the console. The console senses this open interval and disconnects.

- ***NOTE:*** This open interval under worst case extreme switch load conditions could be of a duration up to 330 milliseconds.

If the open interval was sent as a result of a disconnect from the original non-controlling terminal, the switch idles all the terminals involved in the three-way call.

If the open interval had been sent as a result of an answer from the last terminal, the switch connects the remaining two (non-attendant) terminals.

If the controlling terminal's hardware is not equipped to detect the open interval, it has no affect on call processing.

If both of the SIGNAL CONTROL options are specified as "N", no open interval is sent.

2.21 3WAY XFER

Description: Will a signal be sent to the controlling terminal on 3-way and transfer?

"N"is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N
Valid Entries: Y, N

Data Rules:

For MULTIWAY CONTROL options of "3WAY", "AUTO3WAY", "DIRCON", or "NWAY" with MULTIWAY TRANSFER of either "ALW" or "TONE", 3WAY XFER may be specified as "Y". For other MULTIWAY CONTROL options and for MULTIWAY TRANSFER of "NO", 3WAY XFER must be "N". If "Y" is specified and a three-way or n-way call has been established with no terminals on hold and the third (or nth) terminal has been called and answers, or the non-controlling terminal of a three-way call disconnects, the open interval is sent to the controlling terminal.

For 5E4(2) and later, if 3WAY XFER is "Y", ISDN FEATURE BUTTON, ISDN DIALED CODE or BUTTON, ISDN CALL PICKUP and ISDN ATTENDANT must be "N", MULTIWAY CONTROL cannot be "HOLD", "HOLDALT", or "CODEALT", MULTIWAY TRANSFER must be "Y" and the CALL WAITING and CALL PICKUP ENTRY POINTS must be "N".

For 5E7 and later, if 3WAY XFER is "Y", then the MW feature cannot be assigned on either the TRUNKFA form (5205 Record) or TKGRPFA form (5206 Record).

For 5E10 and later, when 3WAY XFER is "Y", MULTIWAY CONTROL cannot be "CODE3WAY", "CODEALT", "HLDALT3W", "HOLD" or "HOLDALT".

Copyright © 2003 Lucent Technologies

2.22 HOLD XFER

Description: Will a signal be sent to the controlling terminal on hold and transfer?

"N" is the only value allowed except for multi-way features derived from the preconstructed features using the ODA change-insert mode of the review operation.
Default: N
Valid Entries: Y, N

Data Rules:

If the MULTIWAY CONTROL option equals "NWAY" or "CODE3WAY", HOLD XFER must equal "N". For all other MULTIWAY CONTROL values, HOLD XFER can be equal to "Y" or "N".

If MULTIWAY TRANSFER equals "NO", HOLD XFER must be "N".

If "Y" is specified and one terminal is on hold and the controlling terminal has dialed a third terminal, when the third terminal answers, or if the held terminal disconnects, an open interval is sent to the controlling terminal.

For 5E4(2) and later, if HOLD XFER is "Y", ISDN FEATURE BUTTON, ISDN DIALED CODE or BUTTON, ISDN CALL PICKUP, ISDN ATTENDANT and CALL WAITING and CALL PICKUP ENTRY POINTS must be "N".

For 5E7 and later, if HOLD XFER is "Y", then the MW feature cannot be assigned on either the TRUNKFA form (5205 Record) or TRGRPFA form (5206 Record).

FILTERING FEATURE OPTIONS

Fields Section 2.23 -Section 3.9 refer to Filtering Feature Options. The Filtering Feature Options specified on screen 2 of the MWFD form are used to limit and control the actions of the multi-way feature based on the relationship of the controlling terminal (i.e., the terminal to which the multi-way feature is assigned) to both its status as a call originator and its relationship to the terminal it is attempting to affect. Two classes of filtering must be specified:

A. Originating/Terminating Filtering, which determines whether the call was originated by, or terminated to, the controlling terminal (i.e., the terminal to which the multi-way feature is assigned); and

B. Call Filtering, which determines the relationship of the controlling to a non-controlling terminal in a multi-way call.

In each of the filtering classes, if the conditions specified by the selected filtering option are not met, the action being attempted by the controlling terminal is not allowed.

ORIGINATING/TERMINATING

Fields Section 2.23 -Section 2.25 refer to Originating/Terminating Options. Each of the Originating/Terminating options is used to specify whether the multi-way action is allowed based on whether the original call was originated by, or terminated to, the controlling terminal (i.e., the terminal to which the multi-way feature is assigned).

Valid ORIGINATING/TERMINATING Entries

Entry	Definition
ALL	Allows the action regardless of whether the original call was originated by or terminated to the controlling terminal.
ORIG	Limits the action to cases in which the original call was originated by the controlling terminal.
TERM	Limits the action to cases in which the original call was terminated to the controlling terminal.

Copyright © 2003 Lucent Technologies

For 5E4(2) and later, if any of the ORIGINATING/TERMINATING options is "ORIG" or "TERM", ISDN FEATURE BUTTON, ISDN DIALED CODE OR BUTTON, ISDN CALL PICKUP and ISDN ATTENDANT must be "N".

2.23 HOLD

Description: Enter the Originating/Terminating Option for HOLD filtering.

If this multi-way feature has a FLASH entry point, the HOLD filtering is done on the original call at the time the controlling terminal flashes to put another terminal on hold.

If the requirements of the specified option are not met, the flash is ignored and the controlling terminal remains in a talking state with the original non-controlling terminal.

If the entry point is IN MIDDLE and the controlling terminal dials a code to invoke the multi-way feature and the requirements of the specified option are not met, the feature is not allowed, reorder is given to the controlling terminal and the controlling terminal must use the original feature's control functions to remove the reorder.

Required Field.
Default: ALL
Valid Entries: ALL, ORIG, TERM

Data Rules:

For 5E4(2) and later, if HOLD is not "ALL", ISDN ENTRY POINTS BUTTON, DIALED CODE OR BUTTON, CALL PICKUP and ATTENDANT must be "N".

2.24 3WAY

Description: Enter the Originating/Terminating Option for 3WAY filtering.

If this multi-way feature has a FLASH entry point, the 3WAY filtering is done on the original call at the time the controlling terminal flashes to create a three-way call.

If the requirements of the specified option are not met, the flash is ignored, the controlling terminal is not allowed to create the three-way call and the call configuration that existed prior to the flash remains.

If the entry point is IN MIDDLE and the controlling terminal dials a code to create a three-way call and the requirements of the specified option are not met, the feature is not allowed, reorder is given to the controlling terminal and the controlling terminal must use the original feature's control functions to remove the reorder.

An entry is required in this field if MULTIWAY CONTROL is "3WAY", "AUTO3WAY", or "DIRCON". Otherwise, 3-way filtering is not done and no entry is allowed in this field.
Valid Entries: ALL, ORIG, TERM

2.25 TRANSFER

Description: Enter the Originating/Terminating Option for TRANSFER filtering.

If this multi-way feature has a MULTIWAY TRANSFER option of "ALW" or "TONE", this filtering is done on a call in which the controlling terminal has either set up a three-way call, or has put the non-controlling terminal of a two-way call on hold and has dialed a third terminal and then disconnects.

If the requirements of the specified option are not met, all terminals involved in the call are idled.

An entry is required in this field if the MULTIWAY TRANSFER option is either "ALW" or "TONE".

Copyright © 2003 Lucent Technologies

Otherwise no entry is allowed in this field.
Valid Entries: ALL, ORIG, TERM

3. FORM ENTRIES - 5602-2 RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

CALL FILTERING

Fields Section 3.2 -Section 3.9 refer to Call Filtering.

This type of filtering examines the relationship among the non-controlling terminals involved in the call and the controlling terminal.

Within each of the eight call classes below, a "Y" or "N" indication must be specified (depending on the selected MULTIWAY CONTROL and MULTIWAY TRANSFER options) for each of five categories of calls. If more than one of the categories are "Y", a call in any of the specified categories is allowed to complete (assuming that originating/terminating filtering also passed). The five categories are as follows:

Valid CALL TYPES

Entry	Definition
ATTENDANT	A "Y" specifies that if the non-controlling terminal involved in the call is classed as an attendant (i.e., its Line Class Code must have a Class Of Service of "ATND") and is in the same terminal group as the controlling terminal, the action is allowed.
INTRAGRP	A "Y" specifies that the non-controlling terminal involved in the call must be in the same terminal group as the controlling terminal but may not be either a private facility or an attendant.
INTRAOFC	A "Y" specifies that the non-controlling terminal involved in the call must be in the same office as the controlling terminal but may not be in the same terminal group or be either a private facility or an attendant.
INTEROFC	A "Y" specifies that the non-controlling terminal involved in the call must be in a different office from the controlling terminal and may not be either a private facility or an attendant.
PVTFAC	A "Y" specifies that the non-controlling terminal involved in the call must be a private facility and may not be classed as an attendant.

For 5E4(2) and later Software Releases, one of the above five categories must be "Y".

CALL CLASSES

Fields Section 3.2 -Section 3.9 refer to Call Classes.

3.2 HOLD ORIG PTY

Description: Can the controlling terminal put the originating party on hold?

This filtering is done on the relationship between the controlling terminal and the non-controlling terminal of the original call at one of the following times:

A. If this multi-way feature has a FLASH entry point, when the controlling terminal flashes in an attempt to hold the original non-controlling terminal.

   If the original non-controlling terminal is not in one of the allowed categories, the flash is ignored and the controlling terminal remains in a talking state with the non-controlling terminal.

B. If the entry point is IN MIDDLE and the controlling terminal dials a code to invoke the multi-way hold feature and the original non-controlling terminal is not in one of the allowed categories, the feature is not allowed, reorder is given to the controlling terminal and the controlling terminal must use the

Copyright © 2003 Lucent Technologies

original feature's control functions to remove the reorder.

"Y" or "N" entries are always required in all five categories.

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the HOLD ORIG PTY Call Type, then one of the options must be "Y".

3.3 HOLD ADDED PTY

Description: Can the controlling terminal put the added party on hold?

This filtering is done on the relationship between the controlling terminal and a new terminal after the controlling terminal successfully holds any other terminals involved in the call and finishes dialing either a party to be added or an access code to another multi-way feature in an attempt to alternate to or add another party.

If the party being added is not in one of the allowed categories, the controlling terminal is given reorder and must use the original feature's control functions to remove it. "Y" or "N" entries are always required in all five categories.

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the HOLD ADDED PTY Call Type, then one of the options must be "Y".

3.4 3WAY ORIG PTY

Description: Can the controlling terminal add a third party to an existing call?

This filtering is done on the relationship between the controlling terminal and the original non-controlling terminal of a two-way call after the controlling terminal flashes to create a three-way call or dials an access code to another multi-way feature in an attempt to add a new terminal to the call.

If the original party is not in one of the allowed categories, the controlling terminal is given reorder and must use the original feature's control functions to remove it.

"Y" or "N" entries must be specified in all five categories for multi-way features with MULTIWAY CONTROL of "3WAY", "AUTO3WAY", or "DIRCON". Entries are prohibited for all other multi-way features.
Default: Y
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the 3WAY ORIG PTY Call Type, then one of the options must be "Y".

Copyright © 2003 Lucent Technologies

3.5 3WAY ADDED PTY

Description: Can the controlling terminal add another line to an existing call?

This filtering is done on the relationship between the controlling terminal and a new terminal after the controlling terminal flashes to create a three-way call or dials an access code to another multi-way feature in an attempt to add a new terminal to the call (e.g., a direct connect feature).

If the party being added is not in one of the allowed categories, the controlling terminal is given reorder and must use the original feature's control functions to remove it.

"Y" or "N" entries must be specified in all five categories for multi-way features with MULTIWAY CONTROL of "3WAY", "AUTO3WAY", or "DIRCON". Entries are prohibited for all other multi-way features.
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the 3WAY ADDED PTY Call Type, then one of the options must be "Y".

3.6 XFER ORIG PTY

Description: Can the controlling terminal transfer the originating party?

This filtering is done on the relationship between the controlling terminal and the original non-controlling terminal of a two-way call after the controlling terminal disconnects from the call.

If the original party is not in one of the allowed categories, all remaining terminals in the call are idled.

"Y" or "N" entries must be specified in all five categories for multi-way features with MULTIWAY TRANSFER of "ALW" or "TONE". Entries are prohibited for all other multi-way features.
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the XFER ORIG PTY Call Type, then one of the options must be "Y".

3.7 XFER ADDED PTY

Description: Does the added party stay connected after the controlling terminal disconnects?

This filtering is done on the relationship between the controlling terminal and the added terminal after the controlling terminal disconnects from the call.

If the added party is not in one of the allowed categories, all remaining terminals on the call are idled.

"Y" or "N" entries must be specified in all five categories for multi-way features with MULTIWAY TRANSFER of "ALW" or "TONE". Entries are prohibited for all other multi-way features.
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the XFER ADDED PTY Call Type, then one of the options must be "Y".

3.8 XFER PTYS PRES

Copyright © 2003 Lucent Technologies

Description: Does the other party or third party stay present after the controlling terminal disconnects?

This filtering is done on the relationship between the controlling terminal and both the original and the added terminals after the controlling terminal disconnects from the call.

If either of the non-controlling terminals are in any of the allowed categories, the transfer is effected.

If neither of the two non-controlling terminals is in one of the allowed categories, all terminals on the call are idled.

"Y" or "N" entries must be specified in all five categories for multi-way features with MULTIWAY TRANSFER of "ALW" or "TONE". Entries are prohibited for all other multi-way features.
Valid Entries: Y, N

Data Rules:

When one of the FILTERING FEATURE OPTIONS is entered for the XFER PTYS PRES Call Type, then one of the options must be "Y".

3.9 NWAY PTYS PRES

Description: Do the parties remain present after the controlling terminal disconnects?

This filtering is done on the relationship between the controlling terminal and all non-controlling terminals in an n-way call when the controlling terminal disconnects with none of the non-controlling terminals on hold (if any terminals are on hold, the controlling terminal is rung back).

If any of the non-controlling terminals are in any of the allowed categories, the remaining terminals are connected in an (n-1)-way call. Each subsequent disconnect by the remaining terminals repeats the filtering using the relationship between the original controlling terminal and the remaining non-controlling terminals. On any of the disconnects, if none of the remaining terminals is in one of the allowed categories, all terminals on the call are idled.

"Y" or "N" entries must be specified in all five categories for multi-way features with MULTIWAY CONTROL of "NWAY". Entries are prohibited for all other multi-way features.
Valid Entries: Y, N

Data Rules:

For 5E15 and later, when MULTIWAY CONTROL is "NWAY" and AMAC is "USAGE" for NWAY PTYS PRES Call Type, then all of the FILTERING FEATURE OPTIONS must be "N".

For 5E15 and later, when MULTIWAY CONTROL is not "NWAY" or AMAC is not "USAGE" for NWAY PTYS PRES Call Type, then one of the FILTERING FEATURE OPTIONS must be "Y".

DEFAULT PARAMETERS

Fields Section 3.10 -Section 3.12 refer to Default Parameters. Default Parameters on a MWFD form are automatically assigned to a terminal when the multi-way feature is assigned to the terminal unless they are overridden by parameters specified on the individual terminal parameter (MWLPA, MWMPA, or MWTPA) form.

If the terminal parameter form is entered for a given terminal, all of the parameters specified override the default parameters.

3.10 N-WAY MAXIMUM

Description: Enter the maximum number of terminals which may be connected on a n-way call.

Copyright © 2003 Lucent Technologies

This parameter is allowed only for a MULTIWAY CONTROL of "NWAY".
Valid Entries:

For 5E4(2) and later: 0, 3 - 6

3.11 TONE DURATION

Description: Enter the duration (in milliseconds) of the BEEP1 DEPARTURE TONE.

This entry is allowed only when DEPARTURE TONE is "BEEP1".
Valid Entries: 200, 300, 600, 900, 1200, 1500, 1800, 2100, 2400, 2700, 3000, 3300, 3600, 3900, and 4000.

3.12 DIRECT CONNECT DN

Description: Enter the predesignated TN of the Terminal for the Direct Connect three-way connections.

This entry is required and only allowed when MULTIWAY CONTROL is "DIRCON".
Valid Entries: 1 - 15 digits (0 - 9, # or *)

SEC. 3B: 5602-3 RECORD
MULTIWAY CALLING
LINE (TN) PARAMETER FORM - MWLPA

1. GENERAL

The 5602-3 Record is available with 5E2 and later Software Releases, and is used to define Multiway Calling Line Parameters.

The Line Parameter Form is used when a Multiway constructed feature is assigned to a terminal (line or trunk) and the desired parameters are different from the default parameters on the MWFD Form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TELEPHONE NUMBER

Description: Enter a valid customer Telephone Number.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The TN must be assigned on the LINE Form (5109 Record).

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
B911	Line to an Emergency Bureau.
INDIV	Individual Line.
PBX	Line to a PBX.
SATSTLN	Stand-Alone Test Line.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
ISDN	Digital Subscriber Line associated ISDN (Integrated Service Digital Network) service.
ISATND	ISDN attendant.

For 5E12 and later, TELEPHONE NUMBER and FEATURE combinations on different MWLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TELEPHONE NUMBERs on the MWLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Copyright © 2003 Lucent Technologies

Description: Enter the Feature Name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a multiway feature defined on the MWFD form, except it must not be a wild card feature.

2.4 N-WAYS

Description: Enter the number of terminals allowed in an N-Way call.
Valid Entries: 0, 3, 4, 5 or 6

2.5 TONE DURATION

Description: Enter the duration of party departure tone (single beep only) in milliseconds. The normal duration is 300 milliseconds.
Valid Entries: 0, 200, 300, 600, 900, 1200, 1500, 1800, 2100, 2400, 2700, 3000, 3300, 3600, 3900 or 4000 (milliseconds)

2.6 DIRECT CONN DN

Description: Enter a Direct Connect Directory Number. Entries are typically 1, 3, 7, 8, 10 or 11 digits or an IDDD number.
Valid Entries: 1 - 15 digits

SEC. 3C: 5602-4
MULTIWAY CALLING
LINE (MLHG/TERM) PARAMETER FORM - MWMPA

1. GENERAL

The 5602-4 Record is available with 5E2 and later Software Releases, and is used to define Multiway Calling Multi-Line Hunt Group Parameters.

The parameter form for Multiway Calling will be used when a Multiway constructed feature is assigned to a terminal (line or trunk), and the desired parameters are different from the default parameters on the MWFD Form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * MLHG

Description: Enter the Multi-Line Hunt Group Number.

Required Field.
Valid Entries:
- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter the Multi-Line Hunt Group Terminal (member) Number.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
B911	Line to an Emergency Bureau.
INDIV	Individual Line.
PBX	Line to a PBX.
SATSTLN	Stand-Alone Test Line.
4WINDIV	4-Wire Individual Line or 4-Wire manual PBX.
ISDN	Digital Subscriber Line associated ISDN (Integrated Service Digital Network) Service.
ISATND	ISDN attendant.

2.4 * FEATURE

Description: Enter the Feature Name.

Required Field.

Copyright © 2003 Lucent Technologies

Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a Multiway feature defined on the MWFD form, except it may not be a wild card feature.

2.5 N-WAYS

Description: Enter the number of terminals allowed in a N-way call.
Valid Entries: 0, 3, 4, 5 or 6

2.6 TONE DURATION

Description: Enter the duration of party departure tone (single beep only) in milliseconds. The normal duration is 300 milliseconds.
Valid Entries: 0, 200, 300, 900, 1200, 1500, 1800, 2100, 2400, 2700, 3000, 3600, 3900 or 4000 (milliseconds)

2.7 DIRECT CONN DN

Description: Enter a Direct Connect Directory Number. Entries are typically 1, 3, 7, 8, 10 or 11 digits or an IDDD number.

SEC. 3D: 5602-5
MULTIWAY CALLING
TRUNK PARAMETER FORM - MWTPA

1. GENERAL

The 5602-5 Record is available with 5E2 and later Software Releases, and is used to define Multiway Calling Trunk Parameters.

The Trunk Parameter Form is used when a multiway constructed feature is assigned to a terminal (line or trunk) and the desired parameters are different from the default parameters on the MWFD form.

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.27.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TGN

Description: Enter the TGN (Trunk Group Number).

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202 Record) must be one of the following.

TRKCLS	
PF	Private Facility
PFLASH	Private Facility Feature Flash
PFITT	Private Facility Intertandem trunk

2.3 * MEMB

Description: Enter the Trunk Group Member number.

Required Field.
Valid Entries: 0 - 1951

2.4 * FEATURE

Description: Enter the feature name.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

The name entered here must be that of a multiway feature defined on the MWFD form, except it may not

Copyright © 2003 Lucent Technologies

be a wild card feature.

2.5 N-WAYS

Description: Enter the number of terminals allowed in an N-way call.
Valid Entries: 0, 3, 4, 5 or 6

2.6 TONE DURATION

Description: Enter the duration of party departure tone (single beep only) in milliseconds. The normal duration is 300 milliseconds.
Valid Entries: 0, 200, 300, 900, 1200, 1500, 1800, 2100, 2400, 2700, 3000, 3300, 3600, 3900 or 4000 (milliseconds)

2.7 DIRECT CONN DN

Description: Enter a Direct Connect Directory Number. Entries are typically 1, 3, 7, 8, 10 or 11 digits or an IDDD number.
Valid Entries: 1 - 15 digits

Copyright © 2003 Lucent Technologies

SEC. 4A: 5603-1 RECORD
CALL WAITING FEATURE DEFINITION FORM - CWTFD

1. GENERAL

The 5603-1 Record is available with 5E2(2) and later Software Releases. It is used to define a number of separate features by selecting various feature options for Call waiting. The provided features are Call Waiting Terminating, distinctive tones for Call Waiting Terminating, Call Waiting Originating Dial Call Waiting, Call Waiting - Incoming only and Attendant Camp-On.

Each feature is given a feature name of from one to eight characters which is used to assign the constructed (defined) feature to lines.

1.1 Pre-defined Call Waiting Features

Certain Call Waiting features are pre-defined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed Call Waiting features is contained in Figure 1.

1.2 Recent Change View

The corresponding Recent Change View for this form is 12.15.

2. FORM AND RECORD ENTRIES - ESS
5603-1 RECORD

2.1 BASE AND CONTROL NUMBER, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * FEATURE NAME

Description: Enter the Feature Name.

Feature names may be from one to eight characters long, with no restrictions on the valid characters, except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment of up to 32 characters.
Valid Entries: 1 - 32 characters

ACTIVATION

Fields (Section 2.4 - Section 2.7) specify the Call Waiting activation options.

2.4 ACT TYPE

Description: Enter the method of feature Activation.

Required Field.
Default: AUTO

Copyright © 2003 Lucent Technologies

Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
CODE	Used to indicate that activation allowed for this feature is by dialing a code.
AUTO	Used to indicate no customer activation. Upon assignment the feature is made active and is ready to be used.

Data Rules:

If ACT TYPE equals "AUTO", then DACT TYPE must be "NONE" or "CODE".

If ACT TYPE is CODE and this feature is assigned to a line, then the line should normally be assigned an IDP (Individualized Dialing Plan), and at least one dialed code of the IDP (on the IDPDCA Form) ESS 5601-1/2 Record should have ACTION equal to FTACT and a FEATURE associated with the dialed code on the IDPDCA Form equal to this Call Waiting feature, or CWOACT if INVOCATION is ORIG or CODE, and the FEATURE associated with the dialed code on the IDPDCA Form must be that of the Call Waiting "wild-card" feature (/CW*) or CWTACT if INVOCATION is TERM and the FEATURE associated with the dialed code on the IDPDCA Form must be that of the Call Waiting "wild-card" feature (/CW*).

Alternately, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to FTACT and a FEATURE associated with the dialed code on the PDIT Form equal to this Call Waiting feature, or CWOACT if INVOCATION is ORIG or CODE and the FEATURE associated with the dialed code on the PDIT Form must be that of the Call Waiting "wild-card" feature (/CW*), or CWTACT if INVOCATION is TERM and the FEATURE associated with the dialed code on the PDIT Form must be that of the Call Waiting "wild-card" feature (/CW*).

If Telephone Numbers on the LINEFA form or Multi-Line Hunt Group Terminal Numbers on the MLHLNFA form are assigned a Call Waiting Feature with the Activation Type entry set to "AUTO" on the CWTFD form, the corresponding Initial Activation Status entry on the LINEFA form or MLHLNFA form, the BFG form or an associated CLUSTR form must be "Y".

2.5 DACT TYPE

Description: Enter the method of feature Deactivation.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
CODE	Used to indicate that deactivation allowed for this feature is by dialing a code.
NONE	Used to indicate no customer deactivation is allowed. The feature can never be deactivated from the customer's station, except by a Service Order request through the switch owner.
AUTO	Used to indicate no customer deactivation. The feature is inactive upon assignment and stays inactive until a valid activation code is dialed.

Data Rules:

If ACT TYPE is set to "AUTO", the DACT TYPE must be equal to "NONE" or "CODE".

If ACT TYPE is set to "CODE", the DACT TYPE must be equal to "AUTO" or "CODE".

If DACT TYPE is "CODE" and this feature is assigned to a line, then the line should normally be assigned an IDP (Individualized Dialing Plan), and at least one dialed code of the IDP (on the IDPDCA Form) should have ACTION equal "FTDCT" and a FEATURE associated with the dialed code on the IDPDCA Form equal to this Call Waiting feature.

Alternately, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one

Copyright © 2003 Lucent Technologies

dialed code ACTION equal to "FTDCT", and a FEATURE associated with the dialed code on the PDIT Form equal to this Call Waiting feature. If the ACTION is equal to "CWTDCT", the FEATURE associated with the dialed code on the PDIT Form must be that of the Call Waiting "wild-card" feature (/CW*).

2.6 INVOCATION

Description: Enter the type of Invocation. Required Field.
Default Value: TERM

Valid INVOCATION Entries

Entry	Definition
CODE	Used if the line with this feature is to invoke Call Waiting by dialing a code. When this option is selected, the customer may then dial the code followed by the terminating line's Telephone Number, if the terminating line is busy it will receive Call Waiting tone.
ORIG	Used if all calls originated from a line with this feature to a busy line within the originator's terminal group will send Call Waiting tone to the terminating line.
PTRM	Similar in use to RTRM except that the tone will indicate to this line when the call waiting has a higher precedence level than the existing call. (This assumes that the line does not have the parameter IMMED PREEMPTION equal to Yes. If it did, this feature would not be invoked.)
RTRM	Used only for lines which have also been assigned a Precedence and Preemption BRCS feature, see the PPFD Form, ESS 5618-1 Record. This is a special type of Call Waiting Terminating feature and combined with a unique CDPTY TONE INDICATOR will indicate to this line when a call is waiting that is either of routine precedence or a lower precedence than the existing call. Any line which is assigned a Call Waiting feature with this INVOCATION type, must also be assigned a Call Waiting feature with the INVOCATION equal to TERM.
TERM	Used if the line with this feature is to receive Call Waiting tone whenever any call meeting the specified CALL SELECTION criteria attempts to terminate to it and the line is busy.

Any line which is assigned a Call Waiting feature with this INVOCATION type, must also be assigned a Call Waiting feature with the INVOCATION equal to TERM.

Data Rules:

CODE:
If dial Call Waiting (INVOCATION is "CODE"), Call Waiting Originating (INVOCATION is "ORIG") and Call Waiting Terminating (INVOCATION is "TERM") are assigned to a line, then dial Call Waiting takes precedence over Call Waiting Terminating, and Call Waiting Terminating takes precedence over Call Waiting Originating.

If "CODE" is entered, then the line with this feature should normally be assigned an IDP and at least one dialed code of the IDP (on the IDPDCA Form) should have ACTION equal to "CWDLU", and the FEATURE associated with the dialed code on the IDPDCA Form must be that of the Call Waiting "wild-card" feature (/CW*), or equal to this Call Waiting feature.

Alternately, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "CWDLU" and the FEATURE associated with the dialed code on the PDIT Form must be that of the Call Waiting "wild-card" feature (/CW*), or equal to this Call Waiting feature.

For 5E6 and later, if "CODE" is entered, then CALLED PTY TONE INTERVAL must be 10.

PTRM and RTRM:
For 5E8 and later, if "PTRM" or "RTRM" is entered, then LONG DST DT must be "NORMAL".

ORIG:
For 5E6 and later, if "ORIG" is entered, CALLED PTY TONE INTERVAL must be 10.

2.7 FLASH ON FORWARD?

Copyright © 2003 Lucent Technologies

Description: Is a called party allowed to be connected to a Call Waiting party and place the original party in a hold state?

If a flash is not allowed for the specific Call Waiting feature, it will be ignored. The Call Waited party may disconnect the current call and be rungback by the Call Waiting party.

Required Field.
Default: Y, N

NOTE: The default and only value is "Y", except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

BRIDGE TO FEATURE

Field Section 2.8 specifies the bridge to Multiway feature.

2.8 MULTIWAY

Description: Enter a Multiway feature name if FLASH ON FORWARD is "Y".

Multiway feature name may be from one to eight characters long, with no restrictions on the valid characters. However wild-card feature (/MW*) is not allowed.

If flashing is allowed for the specific Call Waiting feature, the feature will place the original party in a hold state and connect to the Call Waiting party. At this time, call processing control is passed to the Multiway feature where it has an entry point from Call Waiting.
Valid Entries: 1 - 8 characters

Data Rules:

If FLASH ON FORWARD is "Y", the assigned MW feature must have the following characteristics equal to "Y" on the MWFD Form (5602-1/2 Record):

ENTRY POINT for CALL WAITING

HOLD ORIG PTY for ATTENDANT

HOLD ORIG PTY for INTRAGRP

HOLD ORIG PTY for INTRAOFC

HOLD ORIG PTY for INTEROFC

HOLD ORIG PTY for PVTFAC

HOLD ADDED PTY for ATTENDANT must equal ATTENDANT on the CWTFD Form

HOLD ADDED PTY for INTRAGRP must equal INTRA TERMINAL GROUP on the CWTFD Form

HOLD ADDED PTY for INTRAOFC must equal INTRA OFFICE on the CWTFD Form

HOLD ADDED PTY for INTEROFC must equal INTER OFFICE on the CWTFD Form

HOLD ADDED PTY for PVTFAC must equal PRIVATE FACILITY ACCESS on the CWTFD Form.

INDICATORS

Fields (Section 2.9 - Section 2.11) specify the various indications for the calling and called parties.

Copyright © 2003 Lucent Technologies

2.9 CDPTY TONE INDICATOR

Description: Enter the Called Party Indicator Tone.

CDPTY Tone alerts a talking party of an incoming call. The indicator is in the form of tone patterns.

Required Field.
Default: BEEP1
Valid Entries:

Valid CDPTY TONE INDICATOR Entries

Entry	Definition
BEEP1	Called party receives one beep
BEEP2	Called party receives two beeps
BEEP3	Called party receives three beeps

2.10 CGPTY TONE INDICATOR

Description: Enter Calling Party Tone Indicator.

This field specifies the various indications that a calling party should receive.

Required Field.
Default: RING
Valid Entries:

Valid CGPTY TONE INDICATOR Entries

Entry	Definition
BEEP1	Calling party receives one beep followed by audible ring.
BEEP2	Calling party receives two beeps followed by audible ring.
BEEP3	Calling party receives three beeps followed by audible ring.
BUSY	Calling party receives a busy tone. When this field is busy, the calling party receives a "beep" followed by "silence" because of the Attendant Camp-On with Silence Field Feature.
RING	Calling party receives an audible ring
SILENCE	Software Release: 5E4(2) and later. Calling party receives one beep followed by silence.
MUSIC	Software Release: 5E7 and later. Music is given to the calling party.

Data Rules:

Secured Feature ID 64 must be set to "S" ("Y" for 5E9(1) and later) on the SFSYS form (Record 5713-1) in order for CGPTY TONE INDICATOR to be set to "MUSIC" for constructed features.

When CGPTY TONE INDICATOR is "MUSIC", INVOCATION must be either "ORIG" or "CODE".

If CGPTY TONE INDICATOR is "MUSIC" on this form for a Call Waiting feature assigned to a TN or MLHG/MEMB on a LINEFA, MLHLNFA, CLUSTR, or BFG form, then the TN or MLHG/MEMB must also have a TGSR feature assigned with MOH ALW set to "Y" on either the TGSRFD, TGSRLPA, TGSRMPA, or BFG form.

2.11 DEPTY TONE INDICATOR

Description: Enter the Party Departure Tone Indicator. DEPTY Tone Indicator is of the review operation. This field has the default and only value of "NONE".

Required Field.
Default: NONE
Valid Entries:

Valid DEPTY TONE INDICATOR Entries

Entry	Definition

Copyright © 2003 Lucent Technologies

BEEP1	One beep.
BEEP2	Two beeps.
BEEP3	Three beeps.
LEAVE	Party leaving tone.
NONE	No tone.

BILLING

Field Section 2.12 specifies the type of calling party billing to be used.

2.12 CALLING PARTY BILL

Description: Enter whether the calling party will be billed normally, not at all, or in some special manner.

Required Field.
Default: NORMAL
Valid Entries:

Valid CALLING PARTY BILL Entries

Entry	Definition
NORMAL	Indicates billing the calling party when there is a connection between the calling party and the called party.
NEVER	Indicates never billing the calling party.
AFTER	Indicates billing the calling party x seconds after any kind of calling party treatment beings (a tone or an announcement but not audible ring or busy tone). If an answer occurs before the time interval x.

The default and only value is NORMAL, except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

CHANGE PARAMETER

Field Section 2.13 - Section 2.14 specifies whether the customer is allowed to change parameters.

2.13 CHANGE CDPTY TONE INTERVAL

Description: Is the customer is allowed to change the called party tone interval by dialing a code.

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

CHANGE CDPTY TONE INTERVAL must equal "N" if INVOCATION is set to "ORIG" or "CODE".

IF CHANGE CDPTY TONE INTERVAL is "Y", and this feature is assigned to a line, then the line should normally be assigned an IDP (Individualized Dialing Plan), and at least one dialed code of the IDP (on the IDPDCA) Form should have ACTION equal to "CWXCH" and have FEATURE associated with the dialed code on the IDPDCA Form equal to this Call Waiting feature.

Alternately, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION equal to "CWXCH", and FEATURE associated with the dialed code on the PDIT Form equal to this Call-Waiting feature.

2.14 CW DELUXE

Description: Activate Call Waiting Deluxe for this feature? For more information on the secured feature Call Waiting Deluxe, see Division 2, Section 4A145.

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

When CW DELUXE is "Y" then MULTIWAY must be entered and must be "/MWCWAC", "/MWCWGO" , "/MWCWIO", or "/MWCWNG".

When CW DELUXE is "Y", INVOCATION must be "TERM".

When Call Waiting Deluxe features are defined on this form with CW DELUXE set to "Y", then

- ACT for SFID 145 on the SFSYS form must be "Y" before LINE forms can have a Call Waiting Deluxe feature assigned on the LINEFA, CLUSTR, and/or BFG form.
- if LINE forms have Call Waiting Deluxe features assigned on the LINEFA, CLUSTR, and/or BFG form, the LCC and RAX of the line must be defined on the LCC form with CLASS OF SERVICE set to "INDIV" or "PBX".
- if LINE forms have Call Waiting Deluxe features assigned on the LINEFA, CLUSTR, and/or BFG form, on the LINE form, then SUSO, SUST, SHARED must be "N" and ASSOC OE TYPE and NUMBER must not be entered.
- if Remote Call Forwarding features are defined on the CFWFD form where FORWARD is "BOTH", ACT TYPE is "AUTO", and DACT TYPE is "NONE", then LINE forms cannot have both a Call Waiting Deluxe and Remote Call Forwarding feature assigned on the LINEFA, CLUSTR and/or BFG form.
- these features are not assignable to ISDN lines defined on the DLUSR form. Therefore, LINEFA, MLHLNFA, CLUSTR and/or BFG forms associated with an ISDN line cannot have a Call Waiting Deluxe feature name entered.
- these features are not assignable to multi-line hunt lines defined on the MLHLN form. Therefore, MLHLNFA, CLUSTR and/or BFG forms associated with a multi-line hunt line cannot have a Call Waiting Deluxe feature name entered.

CALL SELECTION

Fields (Section 2.15 - Section 2.19) specify the conditions under which a called line should be call waited. For a call to be call waited, the following five options are used as criteria. Any of the following five options may be specified.

2.15 ATTENDANT

Description: Enter "Y" if ATTENDANT calls are call-waited, or "N" if not.

Required Field.
Default: Y
Valid Entries: Y, N

- ***NOTE:*** The default and only value is "Y", except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

2.16 INTRA OFFICE

Description: The incoming call is an intraoffice, non-private facility call, and the incoming call and the called line are not members of the same Terminal Group and the incoming call is not from the attendant. Enter "Y" (Yes) if intraoffice calls are call-waited, or "N" (No) if not.

Copyright © 2003 Lucent Technologies

The default and only value is Y, except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Required Field.
Default: Y
Valid Entries: Y, N

2.17 INTER OFFICE

Description: The incoming call is an interoffice, non-private facility and the incoming call and the called line are not in the same Terminal Group and the incoming call is not from the attendant. Enter "Y" if interoffice calls are call-waited, or "N" if not.

The default and only value is Y, except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Required Field.
Default: Y
Valid Entries: Y, N

Data Rules:

For 5E8 and later, if "N" is entered, LONG DST DT must be "NORMAL".

2.18 INTRA TERMINAL GROUP

Description: The incoming call belongs to the same Terminal Group as the called line and the incoming call is not from the attendant. Enter "Y" if intra Terminal Group calls are call waited, or "N" if not.

The default and only value is "Y", except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Required Field.
Default: Y
Valid Entries: Y, N

2.19 ATTENDANT PRIVATE FACILITY ACCESS

The incoming call is from a private facility and not from an attendant. Enter "Y" if private facility access calls are call-waited, or "N" if not.

The default and only value is Y, except for Call Waiting features derived from the preconstructed features using the ODA change-insert mode of the review operation.

DEFAULT PARAMETERS

The following fields (Section 2.20 - Section 2.21) define the default parameters assigned with the feature to lines. These parameters are assigned to the line unless they are over-ridden by entries on the CWTLPA or CWTMPA forms.

2.20 CALLED PTY TONE INTERVAL

Description: Enter the interval at which the called party receives beeps.
Default: 10 (seconds) Valid Entries: 0 - 60 (seconds)

Data Rules:

For 5E6 and later , when INVOCATION is "ORIG" or "CODE", CALLED PTY TONE INTERVAL must be

Copyright © 2003 Lucent Technologies

"10".

2.21 LONG DST DT

Description: Long Distance Distinctive Tone specifies whether a distinctive call waiting tone is given when the called party receives a long distance incoming call. The NPA/NXX entries on the LOCSCRN form (5545 Record) determines when this would apply. This field supports the Call Waiting Distinctive Tone and Distinctive Ringing for Long Distance Calls feature. For more information on this feature, see Division 2, Section 4A91.

Software Release: 5E8 and later.
Required Field.
Default: NORMAL
Valid Entries:

Valid LONG DST DT Entries

Entry	Definition
DTONE	Provide normal call waiting treatment for non-long distance calls and call waiting distinctive tone pattern E for long distance calls.
NORMAL	Both local and long distance calls receive the "normal" call waiting tones.
ONLY	Provide call waiting distinctive tone pattern E only for long distance calls.

Data Rules:

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before the LONG DST DT field can be changed from its default value on either the BFG, CWTFD, CWTLPA or CWTMPA forms. If the SFID 91 ACT field is not set to "Y" on the SFSYS form (5713-1 Record), then the LONG DST DT field must be "NORMAL".

CALL WAITING DELUXE

The following fields define the office parameters for Call Waiting Deluxe. These fields support the Call Waiting Deluxe Phase II Feature. This is a secured feature with SFID 145. For more information on this feature, see Division 2, Section 4A145.

2.22 ALERT TYPE

Description: Enter the Call Waiting Deluxe Alerting Type. The user and/or the CPE is alerted of an incoming call by way of a tone.

Software Release: 5E10 and later.
Default: OFCALERT
Valid Entries:

Valid ALERT TYPE Entries - 5E10 and later

Entry	Definition
OFCALERT	Office value
CWD	SAS only with non-ADSI per-call options allowed
CWD1	SAS & CAS with non-ADSI per-call options restricted
CWD2	SAS & CAS with non-ADSI allowed

Data Rules:

When ALERT TYPE is not "OFCALERT", CW DELUXE must be "Y".

2.23 DFLT OPT

Description: Default Service Option is a treatment applied to incoming calls when the user does not select a per-call option.

Copyright © 2003 Lucent Technologies

Software Release: 5E10 and later.
Default: OFCDFLTOPT
Valid Entries:

Valid DFLT OPT Entries - 5E10 and later

Entry	Definition
OFCDFLTOPT	Office value
CONTRING	Continue providing waiting party audible ringing
CALLFWD	Forward waiting call to CFDA destination
DEFANNC	Connect waiting call to default announcement

Data Rules:

When DFLT OPT is not "OFCDFLTOPT", CW DELUXE must be "Y".

2.24 USG SENS CONF

Description: Usage Sensitive Conference is used to track the usage of conferencing.

Software Release: 5E10 and later.
Default: OFCCONF
Valid Entries:

Valid USG SENS CONF Entries - 5E10 and later

Entry	Definition
OFCCONF	Office value
NO	Do not provide usage sensitive AMA for conferencing on this line
YES	Provide usage sensitive AMA for conferencing on this line

Data Rules:

When USG SENS CONF is not "CWDELUXE", CW DELUXE must be "Y".

TALKING CALL WAITING

2.25 TCW

Description: This field is used in determining whether or not Talking Call Waiting is assigned to the Call Waiting feature.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

Data Rules:

When TCW is "Y", INVOCATION must be "TERM".

MDNL CALL WAITING

The following fields (Section 2.26 - Section 2.28) support the MDR/CW/CF Interaction Enhancement (FAX Ring) Feature. This is a secured feature using SFID 535. For more information on this feature, see Division 2, Section 4A535.

2.26 INH CW MASTER

Description: Is Call Waiting inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Copyright © 2003 Lucent Technologies

Data Rules:

If INVOCATION is not in "TERM" then INH CW MASTER must be "N".

If INH CW MASTER is "Y", then INH CW DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.27 INH CW DEPEND

Description: Is Call Waiting inhibited for the dependent TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CW DEPEND must be "N".

If INH CW DEPEND is "Y", then INH CW MASTER must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.28 INHIBIT MDNL CW

Description: This field is used in determining whether or not Call Waiting is inhibited for the master telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CW must be "NONE".

SEC. 4B: 5603-2 RECORD
CALL WAITING LINE (TN) PARAMETER FORM - CWTLPA

1. GENERAL

The 5603-2 Record is available with 5E2 and later Software Releases. It is used to define specific parameters assigned to every non-Multi-Line Hunt line assigned with a specific constructed Call Waiting feature. It is required only if the default parameters assigned on the CWTFD form (5603-1 Record) are inappropriate.

1.1 Recent Change View

The corresponding Recent Change View for this form is 1.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL , ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * TN

Description: Enter a Telephone Number.

Required Field.
Valid Entries:
- For 5E11 and earlier: 7 digits
- For 5E12 and later: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and
- X is 0 - 9

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Non-data Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Line to a PBX.

For 5E12 and later, TN/FEATURE combinations on different CWTLPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the CWTLPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TN(s) must be a 10-digit TN with the NPA/OFFICE CODE defined on the NOC form.

2.3 * FEATURE

Description: Enter the Feature Name. There are no restrictions on valid characters.

Required Field.
Valid Entries: 1 - 8 characters

2.4 CDPTY TONE INTERVAL

Copyright © 2003 Lucent Technologies

Description: Enter the interval at which the called party receives beeps. Zero indicates no repetition.
Valid Entries: 0 - 60 (seconds)

Data Rules:

CDPTY TONE INTERVAL must equal 10 if INVOCATION on the CWTFD form equals ORIG or CODE.

2.5 LONG DST DT

Description: Long Distance Distinctive Tone specifies whether a distinctive call waiting tone is given when the called party receives a long distance incoming call. The NPA/NXX entries on the LOCSCRN (5545 Record) determine when this would apply.

Software Release: 5E8 and later.
Valid Entries:

Valid LONG DST DT Entries

Entry	Definition
DTONE	Provide normal call waiting treatment for non-long distance calls and call waiting distinctive tone pattern E for long distance calls. (See Division 2)
NORMAL	Both local and long distance calls receive the "normal" call waiting tones as specified in the CDPTY TONE INDICATOR field on the CWTFD form.
ONLY	Provide call waiting distinctive tone pattern E only for long distance calls. (See Division 2)

Data Rules:

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before the LONG DST DT field can have values other than "NORMAL" or unknown on either the BFG, CWTFD, CWTLPA, or CWTMPA forms. If the SFID 91 ACT field is not set to "Y" on the SFSYS form (5713-1 Record), then the LONG DST DT field must be "NORMAL".

If a TN on the LINEFA form has a CWT Feature assigned on either the LINEFA, CLUSTR, or BFG form, and the feature has either INVOCATION set to "PTRM" or "RTRM" or INTER OFFICE is set to "N" on the CWTFD form (5603-1 Record), then LONG DST DT must be "NORMAL" or unknown on either the BFG or corresponding CWTLPA form. If a CWT feature is assigned through a BFG that has any of the CWT parameters entered, then all CWT parameters on the BFG form are used.

CALL WAITING DELUXE

The following fields define the office parameters for Call Waiting Deluxe. These fields support the Call Waiting Deluxe Phase II Feature. This is a secured feature with SFID 145. For more information on this feature, see Division 2, Section 4A145.

For 5E10 and later, when CWTLPA forms, keyed by TN, have input fields ALERT TYPE not equal to "OFCALERT" or DFLT OPT not equal to "OFCDFLTOPT" or USG SENS CONF not equal to "OFCCONF", FEATURE must be defined on a CWTFD form with CW DELUXE equal to "Y".

2.6 ALERT TYPE

Description: Enter the Call Waiting Deluxe Alerting Type. The user and/or the CPE is alerted of an incoming call by way of a tone.

Software Release: 5E10 and later.
Default: OFCALERT
Valid Entries:

Valid ALERT TYPE Entries - 5E10 and later

Entry	Definition
OFCALERT	Office value

Copyright © 2003 Lucent Technologies

CWD	SAS only with non-ADSI per-call options allowed
CWD1	SAS & CAS with non-ADSI per-call options restricted
CWD2	SAS & CAS with non-ADSI allowed

2.7 DFLT OPT

Description: Default Service Option is a treatment applied to incoming calls when the user does not select a per-call option.

Software Release: 5E10 and later.
Default: OFCDFLTOPT
Valid Entries:

Valid DFLT OPT Entries - 5E10 and later

Entry	Definition
OFCDFLTOPT	Office value
CONTRING	Continue providing waiting party audible ringing
CALLFWD	Forward waiting call to CFDA destination
DEFANNC	Connect waiting call to default announcement

2.8 USG SENS CONF

Description: Usage Sensitive Conference is used to track the usage of conferencing.

Software Release: 5E10 and later.
Default: OFCCONF
Valid Entries:

Valid USG SENS CONF Entries - 5E10 and later

Entry	Definition
OFCCONF	Office value
NO	Do not provide usage sensitive AMA for conferencing on this line
YES	Provide usage sensitive AMA for conferencing on this line

TALKING CALL WAITING

2.9 TCW

Description: This field is used in determining whether or not Talking Call Waiting is assigned to the Call Waiting feature for this line only.

Software Release: 5E12 and later.
Default: N
Valid Entries: Y, N

MDNL CALL WAITING

The following fields (Section 2.10 - Section 2.12) support the MDR/CW/CF Interaction Enhancement (FAX Ring) Feature. This is a secured feature using SFID 535. For more information on this feature, see Division 2, Section 4A535.

2.10 INH CW MASTER

Description: Is Call Waiting inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

Copyright © 2003 Lucent Technologies

If INVOCATION is not in "TERM" then INH CW MASTER must be "N".

If INH CW MASTER is "Y", then INH CW DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.11 INH CW DEPEND

Description: Is Call Waiting inhibited for the dependent TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CW DEPEND must be "N".

If INH CW DEPEND is "Y", then INH CW MASTER must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.12 INHIBIT MDNL CW

Description: This field is used in determining whether or not Call Forwarding is inhibited for the master telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CW must be "NONE".

SEC. 4C: 5603-3 RECORD
CALL WAITING LINE (MLHG/MEMB) PARAMETER FORM - CWTMPA

1. GENERAL

The 5603-3 Record is available with 5E2 and later Software Releases. It is used to define specific parameters assigned to every Multi-Line Hunt line associated with a specific constructed Call Waiting feature. It is required only if the default parameters assigned on the CWTFD form (5603-1 Record) are inappropriate.

Only Call Waiting originating and Dial Call Waiting can be assigned to MLHG/TERMs. Call Waiting Terminating cannot be assigned to MLHG/TERMs. Those Call Waiting features that are allowed have INVOCATION equal to "CODE" or "TERM" on the CWTFD form. Disallowed features have INVOCATION equal to "TERM", "RTRM" or "PTRM".

1.1 Recent Change View

The corresponding Recent Change view for this form is 3.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the office name on each record.

2.2 * MLHG

Description: Enter a Multi-Line Hunt Group Number.

Required Field.
Valid Entries:

- For 5E14 and earlier: 1 - 2000
- For 5E15 and later: 1 - 8191

2.3 * TERM

Description: Enter a Multi-Line Hunt Member Number.

Required Field.
Valid Entries: 1 - 2015 and 3001 - 3999 (Outdial Terminals Only)

Data Rules:

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
ATND	50B Nondata Link Console Line or Attendant Line.
INDIV	Individual Line.
ISDN	ISDN (Integrated Services Digital Network) digital subscriber lines.
ISATND	ISDN Attendant Terminal.
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
PBX	Line to a PBX.

2.4 * FEATURE

Description: Enter the feature name. There are no restrictions on the valid characters.

Copyright © 2003 Lucent Technologies

Required Field.
Valid Entries: 1 - 8 characters

2.5 CDPTY TONE INTERVAL

Description: Enter the interval at which the called party receives beeps. Zero indicates no repetition.
Valid Entries: 0 - 60 (seconds)

Data Rules:

CDPTY TONE INTERVAL must equal 10 if INVOCATION on the CWTFD form equals "ORIG" or "CODE".

2.6 LONG DST DT

Description: Long Distance Distinctive Tone specifies whether a distinctive call waiting tone is given when the called party receives a long distance incoming call. The NPA/NXX entries on the LOCSCRN (5545 Record) determine when this would apply.

Software Release: 5E8 and later.
Valid Entries:

Valid LONG DST DT Entries

Entry	Definition
DTONE	Provide normal call waiting treatment for non-long distance calls and call waiting distinctive tone pattern E for long distance calls.
NORMAL	Both local and long distance calls receive the "normal" call waiting tones as specified in the CALLED PTY TONE INTERVAL field on the CWTFD form (5603-1 Record).
ONLY	Provide call waiting distinctive tone pattern E only for long distance calls.

Data Rules:

The Call Waiting Distinctive Tones and Distinctive Ringing for Long Distance Calls feature is a Secured Feature that must be purchased by the office before the LONG DST DT field can have values other than "NORMAL" or unknown on either the BFG, CWTFD, CWTLPA, or CWTMPA forms. If the SFID 91 ACT field is not set to "Y" on the SFSYS form (5713-1 Record), then the LONG DST DT field must be "NORMAL".

If a CWT Feature assigned on either the MLHLNFA, CLUSTR, or BFG form and the feature has either the INVOCATION field set to "PTRM" or "RTRM" or the INTER OFFICE field set to "N" on the CWTFD form (5603-1 Record), then LONG DST DT must be "NORMAL" or unknown on either the BFG or corresponding CWTMPA form. If a CWT feature is assigned through a BFG that has any of the CWT parameters entered, then all CWT parameters on the BFG form are used.

CALL WAITING DELUXE

The following fields define the office parameters for Call Waiting Deluxe. They are Recent Change only fields and can not be entered. These fields support the Call Waiting Deluxe Phase II Feature. This is a secured feature with SFID 145. For more information on this feature, see Division 2, Section 4A145.

2.7 ALERT TYPE

Description: The Call Waiting Deluxe Alerting Type. The user and/or the CPE is alerted of an incoming call by way of a tone. This is a Recent Change field only and can not be entered.

Software Release: 5E10 and later.
Valid Entries:

Valid ALERT TYPE Entries - 5E10 and later

Entry	Definition

Copyright © 2003 Lucent Technologies

OFCALERT	Office value
CWD	SAS only with non-ADSI per-call options allowed
CWD1	SAS & CAS with non-ADSI per-call options restricted
CWD2	SAS & CAS with non-ADSI allowed

2.8 DFLT OPT

Description: Default Service Option is a treatment applied to incoming calls when the user does not select a per-call option. This is a Recent Change field only and can not be entered.

Software Release: 5E10 and later.
Valid Entries:

Valid DFLT OPT Entries - 5E10 and later

Entry	Definition
OFCDFLTOPT	Office value
CONTRING	Continue providing waiting party audible ringing
CALLFWD	Forward waiting call to CFDA destination
DEFANNC	Connect waiting call to default announcement

2.9 USG SENS CONF

Description: Usage Sensitive Conference is used to track the usage of conferencing. This is a Recent Change field only and can not be entered.

Software Release: 5E10 and later.
Valid Entries:

Valid USG SENS CONF Entries - 5E10 and later

Entry	Definition
OFCCONF	Office value
NO	Do not provide usage sensitive AMA for conferencing on this line
YES	Provide usage sensitive AMA for conferencing on this line

MDNL CALL WAITING

The following fields (Section 2.10 - Section 2.12) support the MDR/CW/CF Interaction Enhancement (FAX Ring) Feature. This is a secured feature using SFID 535. For more information on this feature, see Division 2, Section 4A535.

2.10 INH CW MASTER

Description: Is Call Waiting inhibited for the master TN of a line using MDR?

Software Release: 5E14
Default: N
Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CW MASTER must be "N".

If INH CW MASTER is "Y", then INH CW DEPEND must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.11 INH CW DEPEND

Description: Is Call Waiting inhibited for the dependent TN of a line using MDR?

Software Release: 5E14
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

If INVOCATION is not in "TERM" then INH CW DEPEND must be "N".

If INH CW DEPEND is "Y", then INH CW MASTER must be "N".

To enable this feature, the ACT field for SFID 535 must be set to "Y" on the SFSYS form (5713-1 Record).

2.12 INHIBIT MDNL CW

Description: This field is used in determining whether or not Call Forwarding is inhibited for the master telephone number, the dependent telephone number, or either.

Software Release: 5E15 and later.
Default: NONE
Valid Entries: D, M, or N

Data Rules:

If INVOCATION is not in "TERM", then INHIBIT MDNL CW must be "NONE".

SEC. 4D: 5603-4 RECORD
CALL WAITING TRUNK (TGN/MEMB) PARAMETERS - CWTTPA

1. GENERAL

The 5603-4 Record is available with 5E5 and later Software Releases. It is used to define specific parameters assigned to every trunk member associated with a specific constructed Call Waiting feature. It is required only if the default parameters assigned on the CWTFD form (5603-1 Record) are inappropriate.

Call Waiting can only be assigned to trunks with a TRKCLS of "PFLASH" and RLT TYPE of "PERM" or "TEMP" on the TKGRP form (Record 5202).

1.1 Recent Change View

The corresponding Recent Change view for this form is 5.24.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TGN

Description: Enter the Trunk Group Number.

Required Field.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

The associated TRKCLS entry on the TKGRP form (5202 Record) must be "PFLASH", Private Facility Feature Flash.

2.3 * MEMB

Description: Enter the trunk group member number.

Required Field.
Valid Entries: 0 - 1951

2.4 * FEATURE

Description: Enter the feature name. There are no restrictions on the valid characters.

Required Field.
Valid Entries: 1 - 8 characters

2.5 CLD PTY TONE INTERVAL

Description: Enter the interval at which the called party receives beeps. Zero indicates no repetition.
Valid Entries: 0 - 60 (seconds)

Copyright © 2003 Lucent Technologies

Data Rules:

CLD PTY TONE INTERVAL must equal 10 if INVOCATION on the CWTFD form is "ORIG" or "CODE".

2.6 BILLAFTX

Description: This field indicates how many seconds will lapse before billing the calling party. This is a no change field which is defaulted to 0.
Default: 0
Valid Entries: 0

```

SEC. 5: MULTILINE HUNT GROUP FORMS

Copyright © 2003 Lucent Technologies

SEC. 5A: 5604 RECORD
MULTI-LINE HUNT GROUP
FEATURE DEFINITION FORM - MLHGFD

1. GENERAL

The 5604 Record is available with 5E2 and later Software Releases; it is used to describe the Multi-Line Hunt Group feature definition.

The Multi-Line Hunting capability provides hunting for multiple non-data link consoles, Uniform Call Distribution, queuing for lines and non-data link consoles, call waiting lamp control, delay treatment for queuing, and key control.

Certain MLHG features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features.

1.1 Recent Change View

The corresponding Recent Change View for this form is 12.18.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * FEATURE NAME

Description: Enter a unique feature name to define the particular BRCS (Business and Residence Customer Services) feature. The first character cannot be a slash (/). Feature names starting with a slash are reserved for preconstructed features. See Figure 1 for the preconstructed MLHG feature names.

Required Field.
Valid Entries: 1 - 8 alphanumeric characters

Data Rules:

Each FEATURE NAME which is defined on the MLHGFD form must also be assigned on the MLHG form (5110 Record).

2.3 REMARKS

Description: Enter a descriptive comment to describe the meaning of the BRCS feature.
Valid Entries: 1 - 32 characters

2.4 # HUNT TYPE

Description: Enter the type of hunting for the MLHG.

Required Field.
Default: REG
Valid Entries:

Valid HUNT TYPE Entries

Entry	Definition
HTC	Circular Hunt is an arrangement in which hunting begins with the Terminal Number associated with the called number and continues sequentially through the last Terminal Number in the Multi-Line Hunt Group. Hunting resumes with Terminal Number 1 and continues through the Terminal Number preceding the Start

Copyright © 2003 Lucent Technologies

	Hunt Terminal Number.
ISAT	Software Release: 5E4(2) and later. ISDN Attendant Terminal Hunt. ISDN Attendant Terminals must be configured into hunt groups known as ISAT Multi-Line Hunt Groups. This HUNT TYPE is used to hunt these Multi-Line Hunt Groups.
MUPH	MUPH (Multiple Position Hunt) is a line hunting arrangement used by a business customer that has multiple non-data link attendant console positions. The services MUPH provides to multiple console positions are as follows: □ Call regulation that allows only one call to ring at a console at any one time and prevents any new incoming calls from completing to a console position that is busy. □Even call distribution to Multiple Console positions in the MUPH group. □Access for up to six Call Types. □ Hunting for up to thirty-two lines per console. □ Hunting for up to sixteen consoles in the hunt group. □ Optional queuing for calls when busy conditions are encountered.
PMHG	Software Release: 5E3 and later. Precedence Hunt. This entry is associated with an DSN(Defense Switched Network). This HUNT TYPE should be used, if the MLHG is preemptable. After hunting for an idle terminal, and one is not found, a preemptable hunt will be made by precedence level of existing calls, starting with the first preemptable member. Precedence levels are used to search by priority each succeeding level that is lower than the precedence call terminating.
PRRG	Precedence Regular Hunt. This entry is associated with an DSN(Defense Switched Network). This HUNT TYPE should be used if the MLHG is preemptable. After hunting for an idle terminal, and if one is not found, a preemptable hunt will be made by precedence level of existing calls, starting with the first preemptable member. Precedence levels are used to search by priority each succeeding level that is lower than the precedence call terminating.
PSUCD	Software Release: 5E3 and later. Packet Switching Uniform Call Distribution is a HUNT TYPE used with DSL groups that are designated for packet switching. For 5E8 and later, any packet MLHG with a hunt type of "PSUCD" can also subscribe to a Linear hunt option. The Linear hunt algorithm for packet MLHGs is similar to the Regular hunt type for circuit MLHGs. The linear hunt begins with the start hunt terminal number (entry point) and continues sequentially through the last terminal number of the MLHG. The Linear hunt type is provisioned on packet MLHGs by defining LNR HNT TNs (Linear entry points) on members of the MLHG. These MLHG members and their linear hunt TNs can be defined on the DSL form (as PPB1 TERM and PPB1 LNR HNT TN or PPB2 TERM and PPB2 LNR HNT TN), the DSLUSR form (as DPKT TERM and DPKT LNR HNT TN or ODB TERM and ODB LNR HNT TN), and the XAT form (as TERM NBR and LNR HNT TN). The Linear Hunt TN defined on member 1 of the MLHG serves as the Group Linear entry point. Therefore, the Linear Hunt TN for member 1 must be defined if the MLHG subscribes to Linear hunting. If the Linear Hunt TN for member 1 is not defined, no other member can have a Linear Hunt TN.
REG	Regular Hunt is an arrangement in which hunting begins with the Start Hunt Terminal Number and continues sequentially through the last terminal number in the Multi-Line Hunt Group.
UCD	Software Release: 5E3 and later. UCD (Uniform Call Distribution) is a hunting arrangement that provides uniform termination call assignment (distribution) to members of a Multi-Line Hunt Group. This HUNT TYPE should be used with a Multi-Line Hunt Group of Modem Pool. A Modem Pool Group is comprised of modems and terminal adaptors which allow data calls between analog and digital customers.

Data Rules:

With HUNT TYPE "HTC" or "REG", the listed Telephone Number must be associated with Terminal 1 on the MLHLN form (5111 Record).

Copyright © 2003 Lucent Technologies

If HUNT TYPE "PMHG" or "PRRG" is used for an MLHG, the FIRST PREEMPT MEMB must also be specified on the MLHG form, and each terminal in the MLHG must have a Precedence and Preemption Feature assigned.

For 5E5 and later, when HUNT TYPE is "PSUCD", at least one EQPSUPH form (5742 Record) must have an entry of "O" in the EQST field.

For 5E6 and later, if HUNT TYPE is "PSUCD", INWATS must be "N".

2.5 # OVERFLOW REG

Description: Will an Overflow Message Register be used?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

If the Overflow Peg Count Reg is assigned a Distribute Point Number on the MLHG form (5110 Record), this field must have an entry of "Y".

2.6 # INWATS

Description: Is this MLHG an INWATS group?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

The INWATS feature is applicable on a group basis only. When this field is "Y", all members of the MLHG must have an LCC with a TERMINATING TREATMENT of "INWATS" and a CLASS OF SERVICE of "INDIV", "HOTPBX", "PBX", "HOTMOTL", or "ATND".

2.7 # CF BUSY

Description: Can the Multi-Line Hunt Group be assigned Call Forwarding Busy Line?

Required Field.
Default: N
Valid Entries: Y, N

Data Rules:

For 5E3 and later, if a Modem Pool Group is being defined, which is indicated by an entry in the MPTYPE field on the MLHG form, this field must be "N".

If a Packet Switching Group (DSL members) is being defined, which is indicated by a HUNT TYPE of "PSUCD" on this form, this field must be "N".

2.8 # CF VARIABLE

Description: Can the Multi-Line Hunt Group be assigned Call Forwarding Variable?

Required Field.
Default: N

Copyright © 2003 Lucent Technologies

Valid Entries: Y, N

Data Rules:

For 5E5 and later, when CF VARIABLE is "Y", the first member of the MLHG must for 5E5 and 5E6 (and should for 5E7 and later) be assigned a Call Forwarding Variable feature. For 5E5 only, the FWD CONDITION for the feature must be "BOTH" or "PRCV" on the MLHGFD form. For 5E6 and later, FWD CONDITION must be "BOTH" or "DBTH".

For 5E3 and later, if a Modem Pool Group is being defined, which is indicated by an entry in the MPTYPE field on the MLHG form, this field must be "N".

If a Packet Switching Group (DSL members) is being defined, which is indicated by a HUNT TYPE of "PSUCD" on this form, this field must be "N".

2.9 # BEARER

Description: BEARER is used to indicate the type of calls that can be routed to this Multi-Line Hunt Group.

Software Release: 5E4(2) and later
Required Field.
Default: VOICE
Valid Entries:

Valid BEARER Entries

Entry	Definition
CSD	Circuit Switched Data.
PACKET	Packet data.
VOICE	Voice.

Data Rules:

If BEARER is "CSD", HUNT TYPE must be "UCD", "HTC", or "REG".

For 5E5 and later, If HUNT TYPE is "HTC", "REG", or "UCD", BEARER must be "CSD" or "VOICE".

If HUNT TYPE is "ISAT", BEARER must be "VOICE". For 5E5 and later, if HUNT TYPE is "ISAT", "MUPH", or "PMHG", BEARER must be "VOICE". If HUNT TYPE is "PSUCD", BEARER must be "PACKET".

If CSD is entered and a CKT MLHG/TERM is defined on the DSMLHLN form (5901 Record), the associated LCC form (5306 Record) must have a TERMINATING TREATMENT of "MLHG".

Copyright © 2003 Lucent Technologies

SEC. 6A: 5605-1a/b RECORD
CALL PICKUP ORIGINATING FEATURE DEFINITION FORM - PUOFD

1. GENERAL

The 5605-1a/b Record is available with 5E2 and later Software Releases. It is used to define a number of separate but related features by selecting various feature options for CPUO (Call Pickup Originating). The provided features are CPUO, DCP (Directed Call Pickup) Originating, DCP Originating with Barge In, Loud Speaker Paging, and Code Calling.

Each feature is given a feature name of from one to eight characters which is used to assign the constructed (defined) feature to lines.

1.1 Predefined Call Pickup Originating Features

Certain CPUO features are predefined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed CPUO features is contained in Figure 1. A list of the preconstructed CPUT (Call Pickup Terminating) features is contained in Division 4, Section 6B, Figures 1, 2, and 3.

1.2 Terminal Assignments

A terminal (line or trunk) must be assigned a CPUO feature on the appropriate feature assignment form, LINEFA, MLHLNFA, BFG, TKGRPFA or TRUNKFA.

1.3 Line Assignments

For 5E4(2) and later Software Releases, each terminal (line) which is assigned the PUO (Pickup Originating) feature on the appropriate LINEFA, MLHLNFA, BFG or CLUSTR form with the feature also defined on the PUOFD form with the INITIATE field equal to "BSYVFY" or "EMEROVR" must have a CKT MLHG/TERM or CKT TN defined on the DSMLHLN or DSL forms with an associated CLASS OF SERVICE on the LCC form of "ISATND".

1.4 Recent Change View

The corresponding Recent Change View for this form is 12.13.

2. FORM ENTRIES - 5605-1a RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 *FEATURE NAME

Description: Enter the Feature Name. Feature Names may be from one to eight characters long, with no restrictions on the valid characters, except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Copyright © 2003 Lucent Technologies

Description: Enter a descriptive comment.
Valid Entries: 1 - 32 characters

FEATURE OPTIONS

Fields Section 2.4 - Section 2.9 define the feature options.

2.4 ACT TYPE

Description: Enter the method of feature Activation.

Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
CODE	Activation by dialing a code.
AUTO	No customer activation. The feature is considered active as soon as the switch owner assigns it to a line. The feature will remain active until the switch owner deactivates it.

Data Rules:

If ACT TYPE is "CODE", DACT TYPE must be "CODE"; if ACT TYPE is "AUTO", then DACT TYPE must be "NONE".

If ACT TYPE is "CODE", and this feature is assigned to a line, then the line should normally be assigned an IDP, and at least one dialed code of the IDP on the IDPDCA Form (5601-1/2 Record) should have ACTION equal to "FTACT", and a FEATURE associated with the dialed code on the IDPDCA Form equal to this CPUO feature.

Alternately, if the line is not assigned an IDP, then the PDIT (Primary Digit Interpreter Table) used by the line should contain at least one dialed code with ACTION equal to "FTACT", and a FEATURE associated with the dialed code on the PDIT Form equal to this CPUO feature.

For 5E6 and later, a Call Pickup Originating feature with activation and deactivation type "CODE" cannot be assigned on a BFG form (5625 Record).

For 5E7 and later, when Telephone Numbers on the LINEFA form or Multiline Hunt Terminal Numbers on the MLHLNFA form are assigned a Call Pickup Originating Feature with the Activation Type entry set to "AUTO" on the PUOFD form, the corresponding Initial Activation Status entry on the LINEFA or MLHLNFA form, an associated CLUSTR form or on a BFG form must be equal to "Y".

2.5 DACT TYPE

Description: Enter the method of feature Deactivation.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
CODE	Deactivation by dialing a code.
NONE	No customer deactivation is allowed.

Data Rules:

If DACT TYPE is "CODE", then ACT TYPE must be "CODE".

Copyright © 2003 Lucent Technologies

If DACT TYPE is "NONE", then ACT TYPE must be "AUTO".

If DACT TYPE is "CODE", and this feature is assigned to a line, then the line should normally be assigned an IDP, and at least one dialed code of the IDP on the IDPDCA Form (5601-1/2 Record) should have ACTION equal to "FTDACT", and a feature associated with the dialed code on the IDPDCA Form equal to this CPUO feature.

2.6 INITIATE

Description: Indicate which option of the PUO feature is being selected, and in which manner it will actually be used.
Default: IPRDQ
Valid Entries:

Valid INITIATE Entries

Entry	Definition
ANSBACK	Software Release: 5E9(1) and later. For Answer Back of a parked call. For more information on Call Park, see Division 2, Section 4A124, or for National ISDN Call Park (5E12 and later), see Division 2, Section 4A258.
BPARK	Software Release: 5E9(1) and later. For Basic Call Park. For more information on Call Park, see Division 2, Section 4A124.
BSYVFY	Software Release: 5E4(2) and later. For Busy Verify.
CDCAL	For Code Calling.
DPARK	Software Release: 5E9(1) and later. For Directed Call Park. For more information on Call Park, see Division 2, Section 4A124, or for National ISDN Call Park (5E12 and later), see Division 2, Section 4A258.
EMEROVR	Software Release: 5E4(2) and later. For Emergency Override.
IDPUDL	Initiation by Directed Call Pickup.
IPRDQ	Initiation by Predesignated Pickup group.
IPREDN	Initiation by Predesignated Directory Number (Telephone Number).
LDSPKPG	For Loud Speaker Paging.
RTRV	Software Release: 5E9(1) and later. For Retrieving a parked call. For more information on Call Park see Division 2, Section 4A124.

- ***NOTE:*** "IPRDQ" is the default value, and the only value allowed except for CPUO features derived from the preconstructed features using the ODA change-insert mode of the review operation.For 5E9(1) and later, if INITIATE equals "ANSBACK", "BPARK", "DPARK", or "RTRV", then the following must be true:

- BARGE IN must be "N".
- NUMBER OF PICKUP GROUPS must be 0.
- CHANGE PICKUP TN ALLOWED must be "N".

Only one each of the INITIATE values "ANSBACK", "BPARK", "DPARK", and "RTRV" is allowed to be assigned to a given port (i.e., assigned to a given LINEFA/MLHLNFA form, BFG form or an associated CLUSTR form(s)).

If a Call Pickup Originating feature with INITIATE set to any of the values "ANSBACK", "BPARK", "DPARK" or "RTRV" is assigned to the line or BFG, then a Home Intercom feature cannot be assigned to the line or BFG.

A Pickup Originating feature with INITIATE set to "BPARK" or"RTRV" cannot be assigned to MLHG MUPH members.

Data Rules:

BPARK: BPARK is not allowed for STD digital subscriber lines (i.e., National ISDN lines).

Copyright © 2003 Lucent Technologies

BSYVFY: For 5E4(2) and later, if INITIATE equals "BSYVFY", then

- BARGE IN must be "Y",
- NUMBER OF PICKUP GROUPS must be 0,
- CHANGE PICKUP TN ALLOWED must be "N", and
- TONE TYPE field on TNTYP form (5504 Record) must be "HIGHTONE".

CDCAL, LDSPKPG: These options are mutually exclusive. However, multiple features can be assigned to one line. If this feature is assigned to a line, then the line should normally be assigned an IDP, and at least one dialed code of the IDP on the IDPDCA Form (5601-1/2 Record) should have ACTION of

- "CCL" if INITIATE is "CDCAL",
- "LSP" if INITIATE is "LDSPKPG",
- "DPU" if INITIATE is "IPREDN" or "IDPUDL", and BARGE IN is "Y",
- "DPN" if INITIATE is "IPREDN" or "IDPUDL", and BARGE IN is "N",

and a FEATURE associated with the dialed code on the IDPDCA Form is equal to this CPUO feature.

Code Calling and Loud Speaker Paging allow customer premises equipment to be accessed by attendants and TG (Trunk Group) station users as well as non-TG station users by dialing an Access Code.

If INITIATE is "CDCAL" or "LDSPKPG", then NUMBER OF PICKUP GROUPS must be 0, BARGE IN must be "N", and CHANGE PICKUP TN ALLOWED must be "N".

For 5E4(2) and later, if INITIATE is "CDCAL" or "LDSPKPG", then TGN and MEMB must be entered as default parameters on this form, and/or on the associated PULPA (5605-3 Record) or PUMPA form (5605-4 Record), and the corresponding TKGRP form must have a TRKCLS of "PFCPE".

EMEROVR: Emergency override allows the attendant to complete incoming calls to TNs with terminating restrictions, call forwarding activated, busy from the make busy key, or part of a series completion or MLHG. It cannot preempt a call, but can override call forwarding, stations with series completion, multi-line hunting, group make busy, Terminal Group & Station Restriction or Attendant-Controlled Voice Terminals. The line need not be a DSL to be overridden. The attendant can activate Emergency Override with a feature button or a dialed access code.

If INITIATE equals "EMEROVR", then BARGE IN must be "Y", NUMBER OF PICKUP GROUPS must be 0, and CHANGE PICKUP TN ALLOWED must be "N".

For 5E5 and later, if /CPUEO, or any feature with INITIATE equal to "EMEROVR" is assigned on a LINEFA or MLHLNFA form, or assigned BFG or CLUSTER form, the corresponding LINE, MLHG, MLHLN, DSLUSR, or SHTN form must have an entry in the ATT MLHG field.

IDPUDL: DCP without Barge In allows the customer to attempt a call pickup on either predesignated or not predesignated TN. DCP with Barge In works the same as DCP without Barge In unless the ringing station is answered before DCP with Barge In is initiated. If the line on which the Barge In is being attempted, is in the talking state, Barge In will be performed.

If INITIATE equals "IDPUDL", then NUMBER OF PICKUP GROUPS must be 0 and CHANGE PICKUP TN ALLOWED must be "N".

Copyright © 2003 Lucent Technologies

IPRDQ: Call Pickup is used to allow a customer to pickup any ringing station set in a specified pickup group. A customer can pickup from up to four pickup groups per constructed feature. Calls in the pickup group are arranged by longest ringing period. The call which has been ringing the longest will be removed from the pickup group first.

If INITIATE equals "IPRDQ", then BARGE IN must be "N", CHANGE PICKUP TN ALLOWED must be "N", and NUMBER OF PICKUP GROUPS must be 1 to 4.

For 5E3 and later, If INITIATE equals "IPRDQ", then only one PUOFD FEATURE NAME may exist per TN on a LINEFA or its associated BFG or CLUSTR form(s), or per MLHG/TERM on a given MLHLNFA or its associated BFG or CLUSTR form(s).

IPREDN: If INITIATE equals "IPREDN", then NUMBER OF PICKUP GROUPS must be 0.

RTRV: RTRV is not allowed for STD digital subscriber lines (i.e., National ISDN lines).

2.7 BARGE IN?

Description: Is Barge In into an existing call allowed?

Barge In is used with Directed Call Pickup.
Default: N
Valid Entries: Y, N

- ***NOTE:*** For 5E2 and later, "N" is the default value and the only value allowed except for CPUO features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Data Rules:

With 5E4(2) and later, if BARGE IN is "Y", then INITIATE must be "IDPUDL", "IPREDN", "EMEROVR", or "BSYVFY".

2.8 CHANGE PICKUP TN ALLOWED?

Description: Is change DCP number allowed?
Default: N
Valid Entries: Y, N

The note in Section 2.7 also applies here.

Data Rules:

If CHANGE PICKUP TN ALLOWED is set to "Y", then INITIATE must be "IPREDN".

2.9 NUMBER OF PICKUP GROUPS

Description: Enter the number of pickup queues (groups) a customer is able to pick up from.

Up to four groups may be specified. This applies to call pickup only. A different dialed code is associated with each of the groups, although there is only one assigned feature.

Required Field.
Valid Entries: 0 - 4

Data Rules:

If INITIATE is "IPRDQ", then NUMBER OF PICKUP GROUPS must be 1 to 4.

Copyright © 2003 Lucent Technologies

If NUMBER OF PICKUP GROUPS is 1 to 4, and this feature is assigned to a line, then the line should normally be assigned an IDP. At least one dialed code of the IDP on the IDPDCA Form should then have ACTION of

- "CPQ1" if NUMBER OF PICKUP GROUPS is 1 to 4,
- "CPQ2" if NUMBER OF PICKUP GROUPS is 2 to 4,
- "CPQ3" if NUMBER OF PICKUP GROUPS is 3 or 4,
- "CPQ4" if NUMBER OF PICKUP GROUPS is 4,

and a FEATURE associated with the dialed code on the IDPDCA Form (5601-1/2 Record) must be that of the CPUO "wild-card" feature (/PO*) or equal to this CPUO feature.

Alternately, if the line is not assigned an IDP, then the PDIT used by the line should contain at least one dialed code with ACTION of

- "CPQ1" if NUMBER OF PICKUP GROUPS is 1 to 4,
- "CPQ2" if NUMBER OF PICKUP GROUPS is 2 to 4,
- "CPQ3" if NUMBER OF PICKUP GROUPS IS 3 or 4,
- "CPQ4" if NUMBER OF PICKUP GROUPS is 4,

and a FEATURE associated with the dialed code on the PDIT Form (5300-2 Record) must be that of the CPUO "wild-card" feature (/PO*) or to this CPUO feature.

CALL SELECTION

At least one of the following options (Section 2.10 - Section 2.14) must be set to "Y". Call selection indicates the type of calls the party can pickup by means of Call Pickup, DCP, DCP with Barge In, or with 5E4 and later Software Releases, Busy Verify. For call pickup, this would indicate the type of calls that this party can remove from the pickup group. There will be no queues for Directed Pickup and Directed Pickup with Barge In, but through CALL SELECTION, the type of call will be entered. For Code Calling and Loud Speaker Paging, CALL SELECTION determines the party attempting to initiate a code call is eligible to do so.

2.10 ATTENDANT?

Description: Are attendant calls allowed?
Default: Y
Valid Entries: Y, N

NOTE: For 5E2 and later, "Y" is the default value and the only value allowed except for CPUT features derived from the preconstructed features using the ODA change-insert mode of the review operation.

2.11 INTRA TERMINAL GROUP?

Description: Are Intraterminal Group calls allowed?
Default: Y
Valid Entries: Y, N

The note in Section 2.10 also applies here.

Copyright © 2003 Lucent Technologies

2.12 INTRAOFFICE?

Description: Are Intraoffice calls allowed?
Default: Y
Valid Entries: Y, N

The note in Section 2.10 also applies here.

2.13 INTER OFFICE?

Description: Are Interoffice calls allowed?
Default: Y
Valid Entries: Y, N

The note in Section 2.10 also applies here.

2.14 PRIVATE FACILITY ACCESS?

Description: Are Private Facilities Access calls allowed?
Default: Y
Valid Entries: Y, N

The note in Section 2.10 also applies here.

3. FORM ENTRIES - 5605-1b RECORD

3.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and Office Name on each record.

3.2 *FEATURE NAME

Description: Enter the Feature Name. Refer to Section 2.2 . Feature Names maybe from one to eight characters long, with no restrictions on the valid characters except that the first character may not be a slash (/). Feature Names starting with a slash are reserved for preconstructed features.

DEFAULT PARAMETERS

The following fields (Section 3.3 - Section 3.10) define the default parameters assigned with the feature to lines. These parameters will be assigned to the line unless they are overridden by entries on the PULPA (5605-3 Record) or PUMPA (5605-4 Record) Forms.

3.3 DIRECT PICKUP TN

Description: The name of this field was changed to DPU TN in 5E12. This field name applies to 5E11 and earlier. See DPU TN for usage information.

3.4 DPU TN

Description: Enter the Telephone Number served by this office. This field was called DIRECT PICKUP TN for 5E11 and earlier.

Software Release: 5E12 and later
Valid Entries: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

Copyright © 2003 Lucent Technologies

If DPU TN is entered, then INITIATE must be "IPREDN".

NXX(s) (the first 3 digits of a 7-digit TN) and/or NPA/NXX combinations (the first 6 digits of a 10-digit TN) from the DPU TN on the PUOFD form must be defined as OFFICE CODE and/or NPA/OFFICE CODE on the NOC form.

If the first 3 digits of the 7-digit DPU TNs on the PUOFD form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the 7-digit DPU TN(s) must be entered as a 10-digit DPU TN(s).

3.5 ORIG PICKUP GROUP 1

Description: Enter the queue (group) that the customer can originate to pickup.
Valid Entries: 2 - 65534

Data Rules:

If this field has an entry, the NUMBER OF PICKUP GROUPS must be 1, 2, 3, or 4.

3.6 ORIG PICKUP GROUP 2

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

If this field has an entry, the NUMBER OF PICKUP GROUPS must be 2, 3, or 4.

3.7 ORIG PICKUP GROUP 3

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

If this field has an entry, the NUMBER OF PICKUP GROUPS must be 3 or 4.

3.8 ORIG PICKUP GROUP 4

Description: Enter the queue (group) that the customer can originate to pick up.
Valid Entries: 2 - 65534

Data Rules:

If this field has an entry, the NUMBER OF PICKUP GROUPS must be 4.

3.9 TGN

Description: Enter the Trunk Group Number for Code Calling or Loud Speaker Paging.
Valid Entries:
- For 5E10 and earlier: 1 - 2000
- For 5E11 and later: 1 - 4000

Data Rules:

If this field has an entry, then MEMB must be specified.

If TGN and MEMB have an entry, then INITIATE must be "CDCAL" or "LDSPKPG", and SLVLDSPN on

Copyright © 2003 Lucent Technologies

the TRUNK Form (5204 Record) must be specified.

3.10 MEMB

Description: Enter the Trunk Group Member Number for Code Calling or Loud Speaker Paging.
Valid Entries:

For 5E3 and later: 0 - 1951

SEC. 6B: 5605-2a/b RECORD
CALL PICK-UP TERMINATING FEATURE DEFINITION RECORD - PUTFD

1. GENERAL

The 5605-2a/b Record is available with 5E2 and later Software Releases. It is used to define a number of separate but related features by selecting various feature options for Call Pick-Up Termination. The Call Pick-Up Terminating feature determines what one allows to be done to his telephone by others who have the originating feature.

Each feature is given a feature name of from one to eight characters which is used to assign the constructed (defined) feature to lines. Certain Call Pick-Up Termination features are pre-defined and automatically provided in the ODA database at the time of office registration. These are called preconstructed features. Preconstructed feature names all start with a slash (/), and the slash may not be used as the first character of any feature other than preconstructed features. A list of the preconstructed Call Pick-Up Terminating features is contained in Figures 1, 2, and 3. A list of the preconstructed Call Pick-Up Originating features is contained in Division 4, Section 6A, Figures 1 and 2.

The 5605-2a/b Record is not used as a record for output. It is provided to give the customer more space to enter valid entries used for ODA input.

A terminal (line or trunk) must be assigned a Call Pick-Up Terminating feature on the appropriate feature assignment form: LINEFA (5112 Record), MLHLNFA (5113 Record), BFG (5625 Record), TKGRPFA (5206 Record), or TRUNKFA (5205 Record).

1.1 Directed Pick-Up Nonbarge-In Feature

The DPN (Directed Pick-Up Nonbarge-In feature) has been changed for 5E5 and later Software Releases. For 5E4(2) and earlier Software Releases, it is necessary to assign the terminating DPN feature (/CPDNT) to a line so other terminal group members with the originating DPN feature (/CPDNO) can pick up that particular line.

NOTE: For 5E7 and later, /CPDNT is no longer available as a preconstructed feature.

For 5E5 and later Software Releases, all terminal group members that are assigned the /CPDNO feature will be allowed to pick up another group member's calls without the need of a terminating feature being assigned to the called users. However, group members who do not wish to have their lines picked up by other group members can block these terminal group members by using a new feature (/CPBDNT). Therefore, instead of using a feature to allow call pick-up (/CPDNT), terminal group members can use a feature (/CPBDNT) to deny call pick-up to particular group members since all members of the same group can be picked up by default.

During a retrofit from 5E4(2) to 5E5, /CPDNT features are removed from all LINEFA, MLHLNFA, BFG, and CLUSTR input forms if the terminal group to which it belonged had a Call Pick-Up Originating feature and the /CPDNT terminating feature; lines that were not assigned the /CPDNT feature now are assigned the /CPBDNT feature. These changes do not alter the functionality of the DPN feature; i.e., the 5E4(2) and earlier version and the 5E5 version perform the same function.

1.2 Recent Change View

The corresponding Recent Change View for this form is 12.14.

2. FORM ENTRIES - 5605-2a/b RECORD

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Group Number and Office Name on each record.

Copyright © 2003 Lucent Technologies

2.2 * FEATURE NAME

Description: Enter the feature name. Feature names have no restrictions on the valid characters, except that the first character may not be a slash (/). Feature names starting with a slash are reserved for preconstructed features.
Valid Entries: 1 - 8 characters

2.3 REMARKS

Description: Enter a descriptive comment if desired.
Valid Entries: up to 32 characters

FEATURE OPTIONS

Fields Section 2.4 -Section 2.9 refer to feature options.

2.4 ACT TYPE

Description: Enter the method of feature activation.

Required Field.
Default: AUTO
Valid Entries:

Valid ACT TYPE Entries

Entry	Definition
CODE	Dialing a code activates this feature.
AUTO	No customer activation. The feature is considered active as soon as the switch owner assigns it to a line. The feature remains active until the switch owner deactivates it.

Data Rules:

If ACT TYPE is "CODE", then DEACT TYPE must be "CODE". If ACT TYPE is "AUTO", then DEACT TYPE must be "NONE".

For 5E6 and later, a Call Pickup Terminating feature with activation and deactivation type "CODE" cannot be assigned on a BFG form (5625 Record).

For 5E6 and earlier, if ACT TYPE is "AUTO", the corresponding Initial Activation Status entry on the MLHLNFA, BFG, or associated CLUSTR form (5600 Record) must be "Y".

For 5E7 and later, if ACT TYPE is "AUTO", it is recommended that the corresponding Initial Activation Status entry on the MLHLNFA, BFG, or associated CLUSTR form be "Y".

For 5E7 and later, when Telephone Numbers on the LINEFA form are assigned a Call Pickup Terminating feature and ACT TYPE is "AUTO" on the PUTFD form, the corresponding Initial Activation Status on the LINEFA, BFG, or associated CLUSTR form must be "Y".

If ACT TYPE is "CODE", and this feature is assigned to a line, then the line should normally be assigned an Individualized Dialing Plan, and at least one dialed code of the IDP (on the IDPDCA form (5601-1/2 Record)) must have ACTION equal to "FTACT", and a FEATURE associated with the dialed code on the IDPDCA form equal to this Call Pick-Up Terminating feature. Alternately, if the line is not assigned an IDP, then the PDIT used by the line must contain at least one dialed code with ACTION equal to "FTACT", and a FEATURE associated with the dialed code on the PDIT form (5300-2 Record) equal to this Call Pick-Up Terminating feature.

For 5E6 and later, if ACT TYPE is "CODE" and the feature is assigned to an MLHG/TERM on the MLHLNFA form (5113 Record), the Multi-Line Hunt Group terminal must have access to an IDP

Copyright © 2003 Lucent Technologies

(Individualized Dialing Plan) or ODP (Office Dialing Plan) where the action code associated with the feature is "FTACT". An IDP is defined on the IDPDCA form (5601-1/2 Record); an ODP is defined on the PDIT form (5300-2 Record). If the MLHG/TERM is Secondary Only, the dialing plans associated with the Primary terminal are considered for the check.

2.5 DACT TYPE

Description: Enter the method of feature deactivation.

Required Field.
Default: NONE
Valid Entries:

Valid DACT TYPE Entries

Entry	Definition
CODE	Dialing a code deactivates this feature.
NONE	No customer deactivation is allowed.

Data Rules:

If DACT TYPE is "CODE", then ACT TYPE must be "CODE".

If DACT TYPE is "NONE", then ACT TYPE must be "AUTO".

If DACT TYPE is "CODE", and this feature is assigned to a line, then the line should normally be assigned an Individualized Dialing Plan, and at least one dialed code of the IDP (on the IDPDCA form (5601-1/2 Record)) should have ACTION equal to "FTDACT", and a FEATURE associated with the dialed code on the IDPDCA form equal to this Call Pick-Up Terminating feature.

For 5E6 and later, if DACT TYPE is "CODE" and the feature is assigned to an MLHG/TERM on the MLHLNFA form (5113 Record), the Multi-Line Hunt Group terminal must have access to an IDP (Individualized Dialing Plan) or ODP (Office Dialing Plan) where the action code associated with the feature is "FTDCT". An IDP is defined on the IDPDCA form (5601-1/2 Record); an ODP is defined on the PDIT form (5300-2 Record). If the MLHG/TERM is Secondary Only, the dialing plans associated with the Primary terminal are considered for the check.

2.6 FEATURE FUNCTION

Description: Select the pickup terminating option. Selection of an option indicates that the customer will permit others to perform this function on this line.

Required Field for 5E4(2) and later.
Default: CALPU
Valid Entries:

Valid FEATURE FUNCTION Entries

Entry	Definition
CALPU	For Call Pick-Up, a ringing station can only go into one terminating pickup group. The terminating pickup group number is assigned at the time the feature is assigned.
DIRPU	Directed pickup is used to determine whether a particular line will be able to have the directed pickup function performed on it. (This option indicates that the customer who has this line would like for other eligible parties to be able to pick this phone up when it is ringing.)
DIRPUBRG	Directed pickup with barge-in is similar to directed pickup with the exception that barge-in is performed along with the directed pickup. (This option would be selected for those who wish to allow direct pickup with barge-in to be performed on their line.)
HDIRPUBRG	Software Release: 5E4(2) and later. Directed pickup with barge-in on held calls is similar to directed pickup with barge-in with the addition that barge-in may be performed on a call that has been placed on hold.
TBSYVFY	Software Release: 5E4(2) and later. This option allows an ISDN Attendant to perform busy verification on lines to determine if a

Copyright © 2003 Lucent Technologies

	particular line is actually in use or possibly out of service.
TEMEROVR	Software Release: 5E4(2) and later. This option allows an ISDN Attendant to complete incoming calls on an emergency override basis to directory numbers that cannot receive calls directly due to one or more of the following features being invoked on the line: □Call forwarding □Series completion □Multi-Line Hunting □Make busy keys □TGSR (Terminal Group Station Restriction) □ACVT (Attendant Control of Voice Terminal). The line to be overridden can be digital or analog. This feature does not provide preemption of a call, it merely allows for completion of calls to lines with the features described below.

NOTE: For 5E2 and 5E3, "CALPU" is the default value and the only value allowed except for Call Pick-Up Terminating features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Data Rules:

No more than one Call Pick-Up Terminating feature with FEATURE FUNCTION equal to "CALPU", "DIRPU", "DIRPUBRG", "HDIRPUBRG", "TBSYVFY", and "TEMEROVR" may be assigned to a directory number via feature assignment forms.

If FEATURE FUNCTION is "CALPU", then BARGE IN TONE INDICATOR must be "NONE", ORIG/TERM CALL must be "NONE".

If FEATURE FUNCTION is "DIRPU", then BARGE IN TONE INDICATOR must be "NONE", ORIG/TERM CALL must be "NONE", and MULTIWAY FEATURE must be blank; for 5E7 and later, ATTENDANT?, INTRA OFFICE?, INTRA TERMINAL GROUP?, INTER OFFICE?, and PRIVATE FACILITY ACCESS? cannot all be "Y".

If FEATURE FUNCTION is "DIRPUBRG", then BARGE IN TONE INDICATOR must be "BEEP1" or "NONE" (with 5E9(1) and later), ORIG/TERM CALL must be "ORGCAL", "TERMCAL", or "ACALNFLT", and MULTIWAY FEATURE must be specified.

For 5E5 and later, if FEATURE FUNCTION is "DIRPUBRG", then BARGE IN TONE INDICATOR must be "BEEP1" or "NONE", ORIG/TERM CALL must be "ORGCAL", "TERMCAL", or "ACALNFLT", and MULTIWAY FEATURE must be specified.

For 5E4(2) and later, if Feature Function is "TBSYVFY", then ORIG/TERM CALL must be "ACALNFLT", BARGE IN TONE indicator must be "BEEP1", and MULTIWAY FEATURE must be known.

If /CPUVT, /CPUIVT, or any feature with FEATURE FUNCTION equal to "TBSYVFY" is assigned on a LINEFA or MLHLNFA form, or assigned BFG or CLUSTER form, the corresponding LINE, MLHLN, DSLUSR, or SHTN form must for 5E7 and earlier have an entry in the ATT MLHG field. For 5E8 and later, the form must have an entry in either the ATT MLHG or the RBV TGN field, unless MLHG TERM is 1. If the feature is assigned to member 1 of an MLHG, then if the HUNT TYPE on the associated MLHGFD form is "HTC", "REG", or "PMHG", ATT MLHG or RBV TGN must be entered on the MLHG form; if HUNT TYPE is "UCD", ATT MLHG or RBV TGN must be entered on the MLHG, DSLUSR, MLHLN, or SHTN form.

For 5E4(2) and later, if Feature Function is "TEMEROVR", then ORIG/TERM CALL must be "ACALNFLT", and BARGE IN TONE indicator must be "BEEP1".

For 5E5 - 5E7, if /CPUEOT, /CPUIEOT, or any feature with FEATURE FUNCTION equal to "TEMEROVR" is assigned on a LINEFA or MLHLNFA form, or assigned BFG or CLUSTER form, the corresponding LINE, MLHLN, DSLUSR, or SHTN form must have an entry in the ATT MLHG field.

Copyright © 2003 Lucent Technologies

For 5E9(2) and later, when the MLHG/TERM(s) on the MLHLN form or CKT MLHG/CKT TERM(s) on the DSLUSR form or MLHG/TERM NBR(s) on the SHTN form where TERM is not equal to 1 are assigned a Call Pickup Terminating Feature on the MLHLNFA, BFG or associated CLUSTR form, the Call Pickup Terminating Feature must be defined on a PUTFD form where FEATURE FUNCTION is set to "TEMEROVR". Therefore, the ATT MLHG on the DSLUSR, MLHLN or SHTN form must be entered. In addition, the ATT MLHG must be defined on a corresponding MLHG form with a MLHG FEATURE defined on a MLHGFD form that has HUNT TYPE set to "ISAT".

For 5E9(2) and later, when TN(s) on the LINE form or CKT TN(s) on the DSLUSR form or TN(s) on the SHTN form are assigned a Call Pickup Terminating Feature on the LINEFA, BFG or associated CLUSTR form, and this Call Pickup Terminating Feature is defined on a PUTFD form where FEATURE FUNCTION is "TEMEROVR", then:

- the ATT MLHG on the LINE, DSLUSR or SHTN form must be entered
- the ATT MLHG must be defined on a corresponding MLHG form with an MLHG FEATURE defined on a MLHGFD form that has HUNT TYPE set to "ISAT"
- either the ATT MLHG field is blank, or the ATT MLHG field is entered but not associated with a HUNT TYPE of "ISAT".

For 5E9(2) and later, when TN(s) on the LINE form or CKT TN(s) on the DSLUSR form or TN(s) on the SHTN form are assigned a Call Pickup Terminating Feature on the LINEFA, BFG or associated CLUSTR form, and this Call Pickup Terminating Feature is defined on a PUTFD form where FEATURE FUNCTION is "TBSYVFY", then:

- the ATT MLHG or RVB TGN on the LINE, DSLUSR or SHTN form must be entered
- when the ATT MLHG is entered, it must be defined on a corresponding MLHG form with an MLHG FEATURE defined on a MLHGFD form that has HUNT TYPE set to "ISAT"
- either the ATT MLHG and RBV TGN fields are both blank, or the ATT MLHG field is entered but not associated with a HUNT TYPE of "ISAT".

2.7 BARGE IN TONE INDICATOR

Description: This field informs the "barged-in upon party of an existing call in the talking state that another party is barging-in on the call. The tone is given to the party being barged-in upon and will be given regardless of whether or not this party originated the existing call.

Required Field for 5E4(2) and later.
Default: NONE
Valid Entries:

Valid BARGE IN TONE INDICATOR Entries

Entry	Definition
NONE	No Tone
BEEP1	One Beep

- ***NOTE:*** For 5E2 and 5E3, "NONE" is the default value and the only value allowed except for Call Pick-Up Terminating features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Data Rules:

For 5E4(2) and later, if BARGE IN TONE INDICATOR is "BEEP1", then FEATURE FUNCTION must be "DIRPUBRG", "HDIRPUBRG", "TBSYVFY", or "TEMEROVR".

Copyright © 2003 Lucent Technologies

2.8 ORIG/TERM CALL

Description: This field is used for Directed Pick-Up with Barge-in. Filtering is based on the call on which barge-in is being attempted.

Required Field for 5E4(2) and later.
Default: NONE
Valid Entries:

Valid ORIG/TERM CALL Entries

Entry	Definition
ORCAL	Originating calls
TERMCAL	Terminating calls
ACALNFLT	Any calls - indicates no filtering.
NONE	Not applied

- ***NOTE:*** For 5E2 and 5E3, "NONE" is the default value and the only value allowed except for Call Pick-Up Terminating features derived from the preconstructed features using the ODA change-insert mode of the review operation.

Data Rules:

For 5E4(2) and later, if ORIG/TERMCALL is "ACALNFLT", then FEATURE FUNCTION must be "DIRPUBRG", "HDIRPUBRG", "TBSYVFY", or "TEMEROVR".

For 5E9(1) and later, if ORIG/TERMCALL is "NONE", then FEATURE FUNCTION must be "CALPU" or "DIRPU".

For 5E9(1) and later, if ORIG/TERMCALL is "ORGCAL", then FEATURE FUNCTION must be "DIRPUBRG" or "HDIRPUBRG".

For 5E9(1) and later, if ORIG/TERMCALL is "TERMCAL", then FEATURE FUNCTION must be "DIRPUBRG" or "HDIRPUBRG".

2.9 MULTIWAY FEATURE

Description: When a party having direct pickup with barge-in terminating feature is in the talking state, and another party having direct pickup with barge-in originating feature attempts to barge in, call processing control is passed to the multiway feature where it has an entry point from Call Pick-Up. Enter a MULTIWAY FEATURE name if FEATURE FUNCTION is "DIRPUBRG" or "HDIRPUBRG". MULTIWAY FEATURE name has no restrictions on the valid characters. Wild-card feature (/MW*) is not allowed.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E4(2) and later, the assigned MULTIWAY FEATURE must have the following characteristics: On the MWFD form (5602 Record), 3 WAY ORIG PTY for ATTENDANT, INTRAGRP, INTRAOFC, INTEROFC, and PVTFAC must be "Y"; 3WAY ADDED PTY for ATTENDANT, INTRAGRP, INTRAOFC, INTEROFC, and PVTFAC must equal the values for ATTENDANT?, INTRA TERMINAL GROUP?, INTRA OFFICE?, INTER OFFICE?, and PRIVATE FACILITY ACCESS? respectively on the PUTFD form.

When a terminal (line) defined on the DSLUSR form (5908 Record) has an associated CLASS OF SERVICE of "ISDN" on the LCC form (5306 Record), and the line has been assigned a Call Pick-Up Terminating feature on the MLHLNFA, CLUSTR (5600 Record), BFG, or LINEFA form with the feature also defined on this form and a value entered in this field, then on the MWFD form, the ENTRY POINT for CALL PICK-UP field must be "N", and ISDN ENTRY POINT for ISDN CALL PICK-UP field must be "Y".

When a CKT TN defined on a DSLUSR form has an associated Class of Service of "ISDN", and the TN is assigned a Call Pick-Up Terminating feature on the LINEFA form, or on an associated BFG or CLUSTR

Copyright © 2003 Lucent Technologies

form, with the feature defined on this form with a value entered in the MULTIWAY FEATURE field and FEATURE FUNCTION set to "TEMEROVR", then on the MWFD form ISDN CALL PICKUP must be set to "Y".

If the Call Pick-Up Terminating feature has FEATURE FUNCTION equal to "HDIRPUBRG", then on the MWFD form, the MULTIWAY TRANSFER must be "ALW".

CALL SELECTION

Call Selection specifies the condition under which a called line should be added to the pickup group for a particular line. The type of call must be known at the time the pickup is attempted.

2.10 ATTENDANT?

Description: Are attendant calls allowed?

Required Field for 5E5 and later.
Default: Y
Valid Entries: Y, N

2.11 INTRA OFFICE?

Description: Are Intraoffice calls allowed?

Required Field for 5E5 and later.
Default: Y
Valid Entries: Y, N

Data Rules:

The note in Section 2.10 also applies here.

2.12 INTRA TERMINAL GROUP?

Description: Are Intraterminal Group calls allowed?

Required Field for 5E5 and later.
Default: Y
Valid Entries: Y, N

Data Rules:

The note in Section 2.10 also applies here.

2.13 INTER OFFICE?

Description: Are Interoffice calls allowed?

Required Field for 5E5 and later.
Default: Y
Valid Entries: Y, N

Data Rules:

The note in Section 2.10 also applies here.

2.14 PRIVATE FACILITY ACCESS?

Copyright © 2003 Lucent Technologies

Description: Are Private Facility Access calls allowed?

Required Field for 5E5 and later.
Default: Y
Valid Entries: Y, N

Data Rules:

The note in Section 2.10 also applies here.

DEFAULT PARAMETERS

Fields Section 2.15 -Section 2.17 define the default parameters assigned with the feature to lines. These parameters will be assigned to the line unless they are over-ridden by entries on the PULPA (5605-3 Record) or PUMPA (5605-4 Record) forms.

2.15 TERM PICK-UP GROUP

Description: Enter the Terminating Pick-Up Group.
Valid Entries: 2 - 65535

Data Rules:

If this field has an entry, then FEATURE FUNCTION must be "CALPU".

2.16 TONE INTERVAL

Description: Enter the Barge-in Tone Interval in seconds. An entry of 0 indicates no repetition.

Software Release: 5E5 and earlier
Valid Entries: 0, blank

2.17 TONE DURATION

Description: Enter the Barge-in Tone Duration in milliseconds.

Software Release: 5E5 and earlier
Valid Entries: 900, blank

Data Rules:

For 5E4(2) and 5E5, if Tone Duration is 900, then FEATURE FUNCTION must be "DIRPUBRG", "HDIRPUBRG", "TBSYVFY", or "TEMEROVR".

SEC. 6C: 5605-3 RECORD
CALL PICKUP LINE (TN) PARAMETER FORM - PULPA

1. GENERAL

The 5605-3 Record is available with 5E2 and later Software Releases. It is used to define specific parameters assigned to every non-Multi-Line Hunt Group line associated with a specific constructed call pickup feature. It is required only if the default parameters assigned on the PUOFD or PUTFD forms are inappropriate.

1.1 Recent Change View

The corresponding Recent Change view for this form is 1.23.

2. FORM AND RECORD ENTRIES

2.1 BASE AND CONTROL, ESS UNIT

Enter the Base and Control Number and the Office Name on each record.

2.2 * TN

Enter a Telephone Number.

Required Field.

The associated Class of Service on the LCC form (5306 Record) must be one of the following.

Class of Service	
INDIV	Individual Line
4WINDIV	4-Wire Individual Line or 4-Wire Manual PBX.
ISDN	Digital Subscriber Line associated ISDN (Integrated Services Digital Network) service.
PBX	Line to a PBX.

2.3 * FEATURE

Description: Enter the feature name. There are no restrictions on the valid characters except that the first character may not be a slash (/). Feature Names starting with a slash are reserved for preconstructed features.

Required Field.
Valid Entries: 1 - 8 characters

Data Rules:

For 5E12 and later, TN/FEATURE combinations on different PULPA forms cannot be duplicated.

For 5E12 and later, if the first 3 digits of the 7-digit TNs on the PULPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, or the NOC form does not exist, the 7-digit TNs must be 10-digit TNs with the NPA/OFFICE CODE defined on the NOC form.

2.4 # TERM PICKUP GROUP

Description: Enter the Terminating Pickup Group.

Required Field.
Valid Entries: 1 - 65534.

Copyright © 2003 Lucent Technologies

Data Rules:

This field must have a value of 1 if the FEATURE field on this form appears in the FEATURE NAME field of a PUOFD form (5605-1 Record). This field must have a value in the range of 2 to 65534 if the FEATURE field on this form appears in the FEATURE NAME field of a PUTFD form with a FEATURE FUNCTION of "CALPU".

If this field has a value of 2 to 65534, then DIRECT PICKUP TN, ORIG PICKUP GROUPs 1-4, TGN and MEMB must not be entered.

2.5 TONE INTERVAL

Description: Enter the Barge-in Tone repetition Interval in seconds.
Valid Entries: 0 (seconds)

Data Rules:

For 5E4(2) and later, TONE INTERVAL is entered only if the associated FEATURE FUNCTION on the PUTFD form is "DIRPUBRG", "TBSYVFY" or "TEMEROVR".

2.6 TONE DURATION

Description: Enter the Barge-in Tone Duration in milliseconds.
Valid Entries: 900 (milliseconds)

Data Rules:

TONE DURATION is entered only when FEATURE FUNCTION on the PUTFD form equals "DIRPUBRG".

2.7 DIRECT PICKUP TN

Description: The name of this field was changed to DPU TN in 5E12. This field name applies to 5E11 and earlier. See DPU TN for usage information.
When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

2.8 DPU TN

Description: Enter the Telephone Number served by this office. This field was called DIRECT PICKUP TN for 5E11 and earlier.

Software Release: 5E12 and later
Valid Entries: XXXXXXX or NXXXXXXXXX where N is 2 - 9 and X is 0 - 9

Data Rules:

If DPU TN is entered, ORIG PICKUP GROUP 1 and TGN must not be specified.

If this field has an entry, then INITIATE on the PUOFD form must be "IPREDN". The corresponding PUOFD form is found by matching FEATURE on this form with FEATURE NAME on the PUOFD form.

If the first 3 digits of the 7-digit DPU TNs on the PULPA form are equivalent to an OFFICE CODE on the NOC form, and there is more than one NOC form with the same value for OFFICE CODE, the DPU TN must be a 10-digit TN.

NXX(s) (the first 3 digits of a 7-digit TN) and/or NPA/NXX combinations (the first 6 digits of a 10-digit TN) from the DPU TN on the PULPA form must be defined as OFFICE CODE and/or NPA OFFICE CODE on the NOC form.

Copyright © 2003 Lucent Technologies

If the PULPA forms have a DPU TN entry, the corresponding PUOFD forms must have an INITIATE entry of "IPREDN".

If the TN(s) is missing the DPU TN assignment on the PULPA form or in the PUOFD form's default parameters but the Call Pickup Originating Feature with INITIATE equal to "IPREDN" on the PUOFD form, the Direct Pickup TN has to be specified if Call Pickup Originating is initiated by a predesignated TN.

2.9 ORIG PICKUP GROUP 1

Description: Enter the queue (Group) that the customer can Originate to Pickup.
Valid Entries: 2 - 65534

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

If ORIG PICKUP GROUP 1 is entered, DIRECT PICKUP TN and TGN must not be specified.

If ORIG PICKUP GROUP 1 is entered, then the NUMBER OF PICKUP GROUPS on the associated PUOFD form must be 1, 2, 3 or 4.

2.10 ORIG PICKUP GROUP 2

Description: Enter the queue (Group) that the customer can Originate to Pickup.
Valid Entries: 2 - 65534

Data Rules:

When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

If TERM PICKUP GROUP is 1 and ORIG PICKUP GROUP 2 is entered, ORIG PICKUP GROUP 1 must be specified.

If ORIG PICKUP GROUP 2 is entered, then the NUMBER OF PICKUP GROUPS on the associated PUOFD form must be 2, 3 or 4.

2.11 ORIG PICKUP GROUP 3

Description: Enter the queue (Group) that the customer can Originate to Pickup.
Valid Entries: 2 - 65534

Data Rules:

If TERM PICKUP GROUP is 1 and ORIG PICKUP GROUP 3 is entered, ORIG PICKUP GROUP 1 and 2 must be specified.

When TERM PICKUP GROUP is 2 to 65534, this field must not be specified.

If ORIG PICKUP GROUP 3 is entered, then the NUMBER OF PICKUP GROUPS on the associated PUOFD form must be 3 or 4.
