Notice

Every effort was made to ensure that the information in this information product was complete and accurate at the time of publication. However, information is subject to change.

This information product describes certain hardware, software, features, and capabilities of Lucent Technologies products. This information product is for information purposes; therefore, caution is advised that this information product may differ from any configuration currently installed.

This 5ESS® switch document may contain references to the 5ESS® switch, the 5ESS®-2000 switch, and the 5ESS® AnyMedia® Switch. The official name of the product has been changed back to the 5ESS® switch. The documentation will not be totally reissued to change these references. Instead, the changes will be made over time, as technical changes to the document are required. In the interim, assume that any reference to the 5ESS®-2000 switch or the 5ESS® AnyMedia® Switch is also applicable to the 5ESS® switch. It should be noted that this name change may not have been carried forward into software-influenced items such as input and output messages, master control center screens, and recent change/verify screens.

Mandatory Customer Information

Interference Information: Part 15 of FCC Rules - Refer to the 5ESS® Switch Product Specification information product.

Trademarks

4ESS is a trademark of Lucent Technologies in the United States and other countries.
5ESS is a registered trademark of Lucent Technologies in the United States and other countries.
Air Extension is a servicemark of Lucent Technologies.
AnyMedia is a registered trademark of Lucent Technologies in the United States and other countries.
AUtopLEX is a registered trademark of Lucent Technologies in the United States and other countries.
ESS is a trademark of Lucent Technologies in the United States and other countries.
OneLink Manager is a trademark of Lucent Technologies in the United States and other countries.
SLC is a registered trademark of Lucent Technologies in the United States and other countries.
True Choice is a registered trademark in the United States and other countries, licensed exclusively through AT&T UNIX is a registered trademark in the United States and other countries, licensed exclusively through X-Open Company Ltd.

Limited Warranty
Warranty information applicable to the 5ESS® switch may be obtained from the Lucent Technologies Account Management organization. Customer-modified hardware and/or software is not covered by this warranty.

Ordering Information

This information product is distributed by Lucent Technologies in Indianapolis, Indiana.

The order number for this information product is 235-600-700. To order, call:

1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568 (from inside the continental United States)
1-317-322-6416 or fax to 1-317-322-6699 (from outside the continental United States).

Support Information

Information Product Support: To report errors or ask nontechnical questions about this or other information products produced by Lucent Technologies, contact Lucent Technologies by using one of the following methods:

Use the comment form at http://www.lucent-info.com/comments/
Send e-mail to comments@lucent.com

Please include with your comments the title, ordering number, issue number, and issue date of the information product, your complete mailing address, and your telephone number.

Technical Support Telephone Numbers: For technical assistance, call Technical Support Services (TSS) at:

1-866-LUCENT8 (1-866-582-3688) (from inside the continental United States)
1-630-224-4672 (from outside the continental United States).

Technical Support Services is staffed 24 hours a day, 7 days a week.

Acknowledgment

1. INTRODUCTION

1.1 PURPOSE

The 5ESS® Switch Input Messages document describes the input messages (IMs) available for use on the 5ESS®
switch input channels. This document is a reference guide for 5ESS® switch support personnel. This document is
available in electronic media only.

The messages in this document and its updates represent complete documentation for the 5E14 and later software
releases.

The 5ESS® switch IMs are used to control, maintain, and monitor the switching system, including the processors,
peripherals, and other software. For example, the messages can direct the system to:

- Execute diagnostic and exercise programs and report the results.
- Perform tests and report the results.
- Report the status of various subsystems.
- Report traffic information.
- Enter translation information into memory.
- Restore units to service or remove units from service.

Because of the many available options, some IMs are complex. Before using these particular messages, become
familiar with conventions used in this document to describe them (refer to the User Guidelines section).

Some messages may adversely affect service. These messages show a WARNING appearing opposite the key
block. Use these messages only during periods of light traffic. Before using one of these messages, read thoroughly
the manual page containing the message description.

1.1.1 UPDATE INFORMATION

This document is being updated to include documentation for the 5E17(1) software release of the 5ESS® switch. It
also includes numerous enhancements AND responses to customer requests for more information.

The following messages/appendixes have been updated:

ALM:FAC-C
CFR:SPRMEM-E
EXC:PM-D
INH:FAC-C
INIT:FAC-C
OP:FAC-C
OP:ST-GQPHLNK
OP:ST-GQPHPIPE
OP:ST-SERV
RMV:GQPHPIPE
RST:GQPHPIPE
ST:NIPMP-E
SW:SERV
TRC:UTIL-C
TRC:UTIL-D
TRC:UTIL-E
TST:PATH-C

1.1.1.1 SUPPORTED SOFTWARE RELEASES
In accordance with the 5ESS® Switch Software Support Plan, the 5E13 software release is rated Discontinued Availability (DA) as of August 30, 2002. The information supporting 5E13 and earlier is being removed over time, instead of concurrently, from all documentation.

If you are supporting offices that use a software release prior to 5E14 and you have a need for the information that is being removed, retain the associated pages as they are removed from the paper documents, or retain the earlier copy of the CD-ROM.

The purpose of this documentation is to facilitate early dissemination of information. Its contents are subject to change pursuant to the general non-disclosure agreements between Lucent Technologies and 5ESS® switch owners for the purpose of planning. To the best of Lucent Technologies’s knowledge, the information contained in this document is accurate and complete as of the date of publication. HOWEVER, LUCENT TECHNOLOGIES EXPRESSLY DISCLAIMS ANY WARRANTY AS TO ACCURACY OR COMPLETENESS NOR DOES LUCENT TECHNOLOGIES ASSUME ANY RESPONSIBILITY FOR THE USE OF THE INFORMATION BY OTHERS. Lucent Technologies reserves the right to change or delete any portions of the document or to add information in the future.

1.1.1.2 TERMINOLOGY

1.1.1.2.1 Communication Module Name Change

Global Messaging Server (GMS) is the official name of the communication module, model 3 (CM3) hardware. Where the term GMS may be expected in software-influenced items such as input and output messages, master control center screens, and recent change/verify screens, the term CM3 may be found until such time as the term is changed in the software code.

1.1.1.2.2 Bellcore/Telcordia Name Change

As of March 18, 1999, Bellcore officially changed its name to Telcordia Technologies. Not all pages of this document are being reissued to reflect this change; instead, the pages will be reissued over time, as technical and other changes are required. Customers on standing order for this document may see that, on previous-issue pages, the Bellcore name is still exclusively used.

Customers receiving new orders for this document will see the Telcordia Technologies name used as appropriate throughout the document, and the Bellcore name used only to identify items that were produced under the Bellcore name. Exceptions may exist in software-influenced elements such as input/output messages, master control center screens, and recent change/verify screens. These elements will not be changed in this document until such time as they are changed in the software code. Document updates will not be made specifically to remove historical references to Bellcore.

1.1.1.2.3 5ESS®-2000 Switch Name Change

This 5ESS® switch document may contain references to the 5ESS® switch, the 5ESS-2000 switch, and the 5ESS® AnyMedia® Switch. The official name of the product has been changed back to the 5ESS® switch. The documentation will not be totally reissued to change these references. Instead, the changes will be made over time, as technical changes to the document are required. In the interim, assume that any reference to the 5ESS-2000 switch or the 5ESS® AnyMedia® Switch is also applicable to the 5ESS® switch. It should be noted that this name change may not have been carried forward into software-influenced items such as input and output messages, master control center screens, and recent change/verify screens.

1.1.1.2.4 Document Specific Terminology

National ISDN is an evolving platform in which new features will continue to be introduced for new revenue opportunities, improved operational efficiencies, and for support of specific applications. NI 1, NI 2, and NI 3
represent specific features as documented in Bellcore SRs 1937, 2120, and 2457. The industry is migrating to an additional terminology to more specifically denote the availability of National ISDN features: NI 95, NI 96, etc. A feature is included in a specific version (such as, NI 96) if it is available by the switch vendors by the first quarter of the year.

As a result of the World Telecommunications Standardization Conference held March 1-12, 1993, the International Telegraph and Telephone Consultative Committee (CCITT), no longer exists as an organization under the International Telecommunication Union (ITU). According to the ITU, the CCITT is now referred to as the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS).

For new and revised Recommendations issued by the ITU-TS, the term "CCITT Recommendation X.xxx" will be replaced by the "ITU-T Recommendation X.xxx" designation. For a transition period from 1993 to 1997, if the Recommendation had a previous CCITT designation, the new name will include "(formerly CCITT Recommendation X.xxx)". Names of existing CCITT Recommendations will not change unless revised.

1.1.1.3 HANDLE DATE AND TIME TRANSITION TO YEAR 2000

For any time-stamp data that occurs in 5ESS® switch operations after the time is transitioned to the year 2000 and beyond, the year 00 shall be interpreted as 2000 after 12/31/1999. The data (billing, log files, and so forth) shall continue to work even right after transition to the year 2000 from midnight 12/31 1999.

1.1.2 ORGANIZATION

The IM manual includes the:

Introduction - explains the purpose of the document and the organization of the material presented.

User Guidelines - contains information about the conventions used in documenting IMs. The structure and layout of IMs, as well as their naming and usage conventions, are discussed. This section also explains the on-line help feature, the input message edit and history function, the format notation used in this document, and the organization and content of the message descriptions contained in this document.

Acronym List - defines acronyms and abbreviations used in the IM manual.

Indexes - contains helpful indexes. These indexes may be used as guides for locating and selecting specific message descriptions in the IM manual.

• The Functional Index summarizes the purpose of each IM, categorizing the IM according to unit or function.

• The Topical Index shows the relation of IMs divided into topics (categories).

Appendixes - contains information that is referred to by two or more IM descriptions, such as listings of audits and traffic (TRFC) sections.

The rest of the IM manual contains message descriptions presented in alphabetical order by message ID.

1.2 USER COMMENTS

We are constantly striving to improve the quality and usability of this information product. Please use one of the following options to provide us with your comments:

• You may use the on-line comment form at http://www.lucent-info.com/comments
You may email your comments to comments@lucent.com

Please include with your comments the title, ordering number, issue number, and issue date of the information product, your complete mailing address, and your telephone number.

If you have questions or comments about the distribution of our information products, see Section 1.3, Distribution.

1.3 DISTRIBUTION

For distribution comments or questions, contact your local Lucent Technologies Account Representative.

A documentation coordinator has authorization from Lucent Technologies to purchase our information products at discounted prices. To find out whether your company has this authorization through a documentation coordinator, call 1-888-LUCENT8 (1-888-582-3688).

Customers who are not represented by a documentation coordinator and employees of Lucent Technologies should order 5ESS® switch information products directly from Lucent Technologies.

To order, call the following telephone number:

- 1-888-LUCENT8 (1-888-582-3688) or fax to 1-800-566-9568; from inside the continental United States
- 1-317-322-6416 or fax to 1-317-322-6699; from outside the continental United States.

1.4 TECHNICAL ASSISTANCE

For technical assistance, call Technical Support Services (TSS) at:

- 1-866-LUCENT8 (1-866-582-3688); from inside the continental United States
- 1-630-224-4672; from outside the continental United States.

Technical Support Services is staffed 24 hours a day, 7 days a week.

1.5 SECURED/PROPRIETARY FEATURES

For all secured features, a right to use (RTU) fee must be paid before enabling information is provided. There may be additional proprietary documentation needed to interpret information regarding these features. Contact your Account Team Representative for additional information.

For a complete list of secured feature identifiers (SFID), refer to the Translation Guide (TG-5) manual, 235-080-100.

1.6 REFERENCES

This is a standard 5ESS® switch document that is also applicable to the Compact Digital Exchange (CDX) and Very Compact Digital Exchange (VCDX) switching systems. Information applicable to only CDX or VCDX may be found in the following documents:

235-120-010  Compact Digital Exchange (CDX) Reference Guide
235-120-020  Compact Digital Exchange (CDX) User’s Guide
Additional references are given as needed, within individual message descriptions. An "x" or "x"s in the last three positions of a release specific document number indicate the digits that change from release to release. Refer to 235-001-001, Documentation Description and Ordering Guide for the document number associated with each software release.
2. USER GUIDELINES

2.1 INTRODUCTION

This section explains the rules to which 5ESS® switch input messages (IMs) must conform, and the conventions that are used in this manual to show how messages are constructed.

The term messages refers to the commands that are used to control and monitor the 5ESS® switch system (IMs).

Each 5ESS® switch system is set to accept only one message language, human-machine language (MML). MML is the human interface language developed by the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT).

2.2 MESSAGE DESCRIPTIONS

The message descriptions form the bulk of the IM manual. Message descriptions are documented on manual pages.

The term "manual page" refers to the description of an IM without regard to how many physical sheets of paper or screens are used to complete the description.

Each IM manual page consists of several elements that form the message description.

2.3 MANUAL PAGE - GENERAL PARTS

This section gives a general description of each part of a manual page.

2.3.1 Page Headers (Paper Only)

The header consists of two lines across the top of each manual page. The header on the inside of the manual page identifies the document number and the issue date. The header on the outside of the manual page shows the name of the document (for example, 5ESS® Switch Input Messages), and the message name.

2.3.2 Message Name

The message name is made up of the command code and parameter names from the message format omitting any variables and optional values and has a maximum length of 20 characters. This is used like a dictionary heading to give a general idea of placement in the manual.

2.3.3 Page Footers (Paper Only)

The footer on the inside of the page contains the issue number. The outside footer shows the message ID and page number. The message ID is explained with the key block items.

2.3.4 The Key Block

The key block is the block of text in the upper right corner of the manual page. The key block includes:

- ID
- RELEASE
- COMMAND GROUP
- APPLICATION

2.3.4.1 ID
The ID is the unique identifier of the IM. Every message ID is composed of two parts separated by a colon. The part to the left of the colon is the command code of the message. One or more parameter names from the format usually make up the remaining portion of the ID. If there is more than one parameter name to the right of the colon, these parameter names are separated by a hyphen. For example: EXC:SODD-RED-OP.

2.3.4.2 RELEASE

This was formerly labeled GENERIC. The 5ESS® switch software release or range of releases to which the message description applies. Here are some examples of possible software release entries:

<table>
<thead>
<tr>
<th>Release Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5E14 only</td>
<td>The message description applies only to release 14.</td>
</tr>
<tr>
<td>5E14 and later</td>
<td>The message description applies to release 14 and to all later releases.</td>
</tr>
<tr>
<td>5E14 - 5E15</td>
<td>The message description applies to release 14 through release 15.</td>
</tr>
</tbody>
</table>

If changes from one release to another have affected a format, two or more separate manual pages are provided. Such a split is indicated by the last character of the message ID. If separate manual pages exist for the same message, the ID for the first manual page is followed by "-A", the second by "-B", and so forth.

Please note that this "dash-letter" suffix is dynamic depending on the number of software releases being supported and the number of versions of a message.

2.3.4.3 COMMAND GROUP

The command group identifies the message as a member of a group of input messages having a certain authority/priority level on the switch. This code can sometimes be changed by the service provider. What is documented on the manual page is the command group originally assigned by AT&T in the initial software release.

2.3.4.4 APPLICATION

This specifies the application to which the message pertains.

<table>
<thead>
<tr>
<th>Application Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>USA 5ESS® switch. May also apply to CDX, VCDX, or WNC. Refer to the help facility to verify applicability for these systems.</td>
</tr>
<tr>
<td>3B</td>
<td>administrative module (AM) software.</td>
</tr>
<tr>
<td>CNI</td>
<td>Common Network Interface.</td>
</tr>
<tr>
<td>CDX</td>
<td>Compact Digital Exchange only.</td>
</tr>
<tr>
<td>VCDX</td>
<td>Very Compact Digital Exchange. May also apply to the AEWNC. Refer to the help facility to verify applicability for this system.</td>
</tr>
<tr>
<td>AEWNC</td>
<td>Air ExtensionSM Wireless Network Controller only.</td>
</tr>
</tbody>
</table>

This implies that a listing such as "5,3B" means that this message applies to both USA 5ESS® switch and the administrative module software.

2.3.5 WARNING

Input messages that may adversely affect service are flagged with a warning message at the left side of the key block. An explanation of the warning is given in the PURPOSE section.

2.3.6 PURPOSE

This section of the manual page contains a brief explanation of the purpose of the message and includes the explanation of any associated warnings.
2.3.7 FORMAT

Message formats are a kind of notation that is used in this document to show the possible ways in which IMs can be constructed. Formats are described in greater detail in the MANUAL PAGE-SECTION DETAILS section of the User Guidelines.

2.3.8 EXPLANATION OF MESSAGE

This section of the manual page explains the meaning of the various parameter names, parameter values, and variables in the format.

2.3.9 SYSTEM RESPONSE

The system responds to IMs with an acknowledgment that appears one space after the terminating character of the IM on the TTY device. This will normally happen about five seconds after the message is entered.

These acknowledgments give information about the status of the message (for example, accepted, rejected, in progress, and so forth). Standard system responses are listed in the APP:RESPONSES appendix in the Appendixes section of the Input Messages manual. Standard craftshell responses are listed in Table 2-1 at the end of the User Guidelines. If a message has a response that is not standard, the response is explained in this section of the manual page.

2.3.10 REFERENCES

This section lists all related input and output messages, documentation references, Master Control Center (MCC) display pages and recent change views.

2.4 MANUAL PAGE - SECTION DETAILS

2.4.1 FORMAT Section

The format is the most important part of every manual page. The FORMAT shows the syntax of the message (that is, the way the message must be constructed so that the system will understand it correctly).

2.4.1.1 Example

Here is an example of how the FORMAT section of a typical manual page might look:

[1] OP:PMCR,TYPE=STAT[,HOURLY|,DAILY=a|,NOHOURLY|,NODAILY];

[2] OP:PMCR,TYPE=RET,INTVL=b,FORM=c;

[3] OP:PMCR,TYPE=DEM,FORM=c;

Many IMs can be input in more than one format. When appropriate, distinct formats are shown separately and given a number (in square brackets). In the example, there are three formats. (The OP:PMCR message requests various plant measurements detailing system performance statistics.)

Format 1 is a status report request. It reports hourly and/or daily data.

Format 2 is a retained report request. It reports hourly and/or daily data that was retained from a previous status report.

Format 3 is a demand report request. It reports up-to-the-hour data collected for the next daily report.
2.4.1.2 Format Notation

The message formats shown in this document may include one or more types of format notation that are not part of the message itself. The purpose of this notation is to show the choices the user has in entering the message.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>[ ]</td>
<td>Brackets enclose optional entries. Optional entries may be included in the message or may be omitted.</td>
<td></td>
</tr>
<tr>
<td>{ }</td>
<td>Braces enclose two or more entries where one entry, but only one, must be included in the message.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>OR bars separate a selection of entries enclosed by braces or brackets. One of the entries separated by OR bars, but only one, may be selected.</td>
<td></td>
</tr>
<tr>
<td>. . .</td>
<td>Vertical ellipsis marks (three vertical dots) following a format means that there may be more than one line when an OM is printed. These additional lines will conform to the same format, but may contain different data.</td>
<td></td>
</tr>
<tr>
<td>. . .</td>
<td>Three ellipsis marks with embedded spaces, either at the beginning of a line or at the end of a line, indicate that a format string is divided into multiple lines in the manual page. This is for documentation purposes only.</td>
<td></td>
</tr>
</tbody>
</table>

Remember that brackets, braces, OR bars, and ellipsis marks are never used when you are actually entering a message. They are only used in message formats to show you how a message must be constructed.

2.4.1.3 Notation Examples

The following examples illustrate the use of brackets, braces, OR bars, and ellipsis.

**ENTRY1 ENTRY2**
Both ENTRY1 and ENTRY2 must be used.

**ENTRY1** [ENTRY2]
Both entries are optional. Both, either, or neither may be used.

{ENTRY1|ENTRY2}
Either ENTRY1 or ENTRY2 must be used. Using both is not permitted.

[ENTRY1|ENTRY2]
Either ENTRY1 or ENTRY2, but not both, may be used. Both entries may be omitted.

[ENTRY1|ENTRY2|ENTRY3]
All three entries may be omitted; however, if any of these entries is used, your options are: ENTRY1 and ENTRY2 or ENTRY1 and ENTRY3. It is not permissible to use both ENTRY2 and ENTRY3.

[ENTRY1|ENTRY2|ENTRY3]
One of these three entries must be used, but it is not permissible to use more than one.

[ENTRY1]...[ENTRY1]
Signifies repetition of ENTRY1.

a b c
Signifies that there may be more than one line when an OM is printed.

2.4.1.4 Special Conventions

A special format convention governs cases where a colon is followed by a series of consecutive optional entries separated by commas. In these cases, the colon replaces the comma for the first optional entry that is actually used.

For example, DGN:MTC is documented with the following format:

DGN:MTC=a[:[RPT=b][,RAW][,UCL][,REX][,DEX]][,PH=c[&d]][,TLP][,CONT][,MT=e];

The following examples show the punctuation of this message when some (but not all) of the optional entries are chosen.

DGN:MTC=a;RPT=b,RAW,UCL,REX,PH=c,TLP;
DGN:MTC=a:RAW,UCL,REX,PH=c,TLP;
2.4.2 Message Syntax

The structure of messages consists of a series of fields that must be entered in a prescribed order. Fields and the entries that can be made in them are summarized in Table 2-2 of the User Guidelines.

This is the general syntax of a message:
\[ \text{command code:parameter block(s):...:[data parameters block(s)];} \]

IMs consist of two or more fields. The first field of an IM always contains a command code that identifies the action that the message is being used to accomplish. This command code is always followed by a colon.

The colon is followed by one or more parameter blocks. A parameter block consists of parameter names with associated parameter values. Parameter blocks are separated by colons. Parameter blocks identify units, functions, or data that the command code is acting upon.

A parameter name may appear by itself, or it may be followed by a single parameter value, a list of values, or a range of values. Parameter names are alphanumeric and must begin with a letter.

A parameter value is separated from a parameter name by an equal sign (=). Parameter values may be numeric or alphanumeric. When parameter values are shown in the FORMAT section of the manual page as lowercase letters, they represent variables that are replaced by specific data when the message is entered. If the value of the variable contains lowercase letters, the value must be enclosed in double quotes to retain the integrity of the lowercase letters.

Values in a list are separated by hyphens. Any two values that indicate the limits of a range are separated by two ampersands (&&), instead of a hyphen.

2.4.2.1 Syntax Examples

The following examples illustrate command codes and parameter blocks in various IMs.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLR:UMEM;</td>
<td>Two fields: the command code (CLR), and one parameter block (UMEM).</td>
</tr>
<tr>
<td>ABT:TASK:TLWS=a;</td>
<td>Three fields: the command code (ABT), and two parameter blocks (TASK and TLWS=a)</td>
</tr>
<tr>
<td>UPD:GEN:BACKOUT:UCL;</td>
<td>Four fields: the command code (UPD), and three parameter blocks (GEN, BACKOUT, and UCL).</td>
</tr>
<tr>
<td>OP:STATUS,PROCESS,ALL;</td>
<td>Three fields: the command code (OP) and two parameter blocks (STATUS and PROCESS,ALL).</td>
</tr>
</tbody>
</table>

**NOTE:** A comma is used here instead of the colon separating STATUS and PROCESS,ALL.

2.4.2.2 Parameter Name and Parameter Value Examples

The following examples show instances of parameter names and parameter values. OP:STATUS,DN=a;

The purpose of this message is to output the current status history for a specified line. The IM has the command code of OP (for "output"), and the parameter names STATUS and DN in the next field. The parameter name DN has the parameter value 'a'. This value stands for the directory number of the line for which the status history is to be printed. If you were to type in this message, you would substitute an actual directory number for the value 'a'.

SET:CLK,DATE=a-b-c,TIME=d-e-f;

This message sets the system clock to the date and time that you specify. There are three names in the second field (CLK, DATE, and TIME). If you were to type in the command, you would enter the month for 'a', the day of the
month for 'b', and the year for 'c'. Similarly, you would enter the hour, minute, and second for values 'd', 'e', and 'f'.

CLR:ISOL,SM=a[&&b];

This message takes one or more switching modules (SMs) out of isolation. The parameter name SM has one or two values ('a' and 'b'). You must enter at least one. If you choose to enter only 'a', then you will enter only one SM number. If you choose the option, then you will enter a range of SM numbers. In this case, 'a' will stand for the lower limit of the range, and 'b' stands for the upper limit of the range. (Note the two ampersands that precede the 'b'. These ampersands indicate that a range is being specified.)

2.4.2.3 Comparison of Format Syntax and Actual Input Messages

The following examples show message format syntax as they might appear in manual pages and some examples of actual IMs that correspond to these formats. The FORMAT section of a manual page uses uppercase to indicate command codes and parameter names. Lowercase letters are used to indicate variables. In actual use at the user input terminal, all command codes and parameter names may be typed in lowercase.

<table>
<thead>
<tr>
<th>Syntax:</th>
<th>OP:STATUS,DN=a;</th>
<th>OP:STATUS,DN=19;</th>
<th>OP:status,dn=19</th>
</tr>
</thead>
<tbody>
<tr>
<td>or</td>
<td>SET:CLK,DATE=5,TIME=15;</td>
<td>set:clk,DATE=5,TIME=15;</td>
<td></td>
</tr>
<tr>
<td>Syntax:</td>
<td>CLR:ISOL,SM=a[&amp;&amp;b];</td>
<td>CLR:ISOL,SM=9;</td>
<td>CLR:isol,SM=9;</td>
</tr>
<tr>
<td>Examples:</td>
<td>CLR:ISOL,SM=5&amp;&amp;12;</td>
<td>clr:isol,sm=5&amp;&amp;12;</td>
<td>clr:isol,sm=9;</td>
</tr>
<tr>
<td>or</td>
<td>CLR:ISOL,SM=5;</td>
<td>clr:isol,sm=5;</td>
<td></td>
</tr>
<tr>
<td>Syntax:</td>
<td>OP:STATUS,PROCESS,{ALLTERMS</td>
<td>ALLKERNS</td>
<td>ALL},OPL=a;</td>
</tr>
<tr>
<td>or</td>
<td>OP:STATUS,PROCESS,ALL,OPL=10;</td>
<td>op:status,process,all,OPL=10;</td>
<td></td>
</tr>
<tr>
<td>Syntax:</td>
<td>IN:REMOTE,START,BSDIR=&quot;a&quot;,BLOCKS=b;</td>
<td>IN:REMOTE,START,BSDIR=&quot;/etc/bwm&quot;,BLOCKS=100;</td>
<td>in:remote,start,bsdir=&quot;/etc/bwm&quot;,blocks=100;</td>
</tr>
<tr>
<td>or</td>
<td>IN:REMOTE,START,BLOCKS=100;</td>
<td>in:remote,start,blocks=100;</td>
<td></td>
</tr>
</tbody>
</table>

2.4.2.4 Entering an IM

The craftshell accepts simplified IM syntax. Commas rather than colons may be used to separate the parameter blocks after the command code and first colon. All options may be specified as a single, comma-separated parameter block.

Parameter names may be typed in any order within a parameter block, but the parameter blocks must appear in the order specified in the manual page.

2.4.2.5 Syntax Combination Example

This example may be entered in a variety of format syntax combinations:
DGN:IOP=1:RPT=1,RAW,UCL:DATA,CONT,TLP;
Valid examples:

<table>
<thead>
<tr>
<th>IM Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DGN:IOP=1,RPT=1,RAW,UCL:DATA,CONT,TLP;</td>
<td>(Colon between IOP and RPT has been changed to a comma.)</td>
</tr>
<tr>
<td>DGN:IOP=1,RAW,UCL,RPT=1:DATA,CONT,TLP;</td>
<td>(Order of keywords in the third block is rearranged.)</td>
</tr>
<tr>
<td>DGN:IOP=1,RAW,UCL,RPT=1:DATA,TLP,CONT;</td>
<td>(Order of keywords in the fourth block is rearranged.)</td>
</tr>
<tr>
<td>DGN:IOP=1,RAW,UCL,RPT=1,TLP,CONT;</td>
<td>(The &quot;:&quot; has been changed to a comma and the &quot;DATA,&quot; has been deleted.)</td>
</tr>
</tbody>
</table>

Invalid examples:

<table>
<thead>
<tr>
<th>IM Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DGN,IOP=1,RAW,UCL,RPT=1,CONT,TLP;</td>
<td>(First colon has been changed to a comma.)</td>
</tr>
<tr>
<td>DGN:IOP=1,CONT,TLP,RAW,UCL,RPT=1;</td>
<td>(Order of blocks 3 and 4 reversed.)</td>
</tr>
<tr>
<td>DGN:IOP=1,RAW,UCL,CONT,TLP,RPT=1;</td>
<td>(Parameters of blocks 3 and 4 are intermixed.)</td>
</tr>
</tbody>
</table>

Because of the way that IMs are translated internally by the system, the message that is echoed to an output device may look different from the message originally entered at the console.

For example, the actual message: DGN:IOP=1,RPT=1,RAW,UCL:DATA,CONT,TLP; may be echoed to an output device from any of the following IM formats:

DGN:IOP=1,RPT=1,RAW,UCL,CONT,TLP;
DGN:IOP=1,CONT,TLP,RAW,UCL,RPT=1;
DGN:IOP=1,RAW,UCL,CONT,TLP,RPT=1;
DGN:IOP=1,RAW,UCL,RPT=1,CONT,TLP;
DGN:IOP=1,UCI,RAW,RPT=1,TL,CONT;

2.4.2.6 A Summary of Syntax Rules

A summary of rules for constructing IMs follows:

1. Block separators (:) may be typed as commas (,) except for the colon immediately following the command code.

2. Parameter names may be unordered within a parameter block, but the blocks themselves must remain ordered.

3. All numbers in IMs are assumed to be decimal unless you indicate otherwise by entering the appropriate code before the number. Valid codes are:
   - B' (binary)
   - O' (octal)
   - H' or X' (hexadecimal)
   - D' (decimal)

4. An entered message may consist of up to 255 spaces and characters that may extend over several lines of input.

5. The last character in a format line must be either an exclamation point, a semicolon, or a question mark.
• The semicolon (provided automatically by the return key) causes the message to be executed immediately as entered.

• The exclamation point is a continuation character.

• The question mark requests craftshell help.

(6) Within a message, the equal sign (=) is used as a separator between the parameter name and the parameter value. Spaces are not allowed between parameters.

(7) Double quotation marks (" ") around a parameter value are required when specifying a pathname to a file or file name or to maintain the integrity of lowercase letters.

(8) Typing a non-printable character in a string results in ?(BEL) (a question mark and a bell sound). The non-printable character remains in the string.

2.5 ROUTING INPUT MESSAGE RESPONSES TO THE RECEIVE-ONLY PRINTER (ROP)

An output message response to an IM request is always printed on the originating TTY. The output message may also print on the receive-only printer (ROP) and/or other I/O devices, depending on the message class associated with the output message. There may be message classes that have an "RSP" or "_RSP" suffix (shown in the key block section of an output message description). These types of messages print at the originating TTY terminal only, in "response" to the input request.

Output messages with an "RSP" or "_RSP" message class can be forced to print at the ROP by appending ",PRTROP" to the end of the IM request. The ",PRTROP" option is valid on any IM and does not adversely affect the routing of the output message, except to route it to the ROP.

2.6 HELP FEATURE

The 5ESS® switch has an IM HELP feature. This feature:

• Improves the understanding of error messages in cases where syntax or semantic errors are found in entered messages.

• Helps with IM syntax, including parameter value type and range.

• Prompts for entering IMs.

**NOTE:** Do not use HELP while the emergency action interface (EAI) page is displayed. Instead, press the NORM/DISP key to display a non-EAI page, then use HELP. If HELP is used while the EAI page is displayed, only the bottom few lines of the HELP message are displayed. The EAI page may also be left partially blank, but can be restored manually by pressing the EA/DISP key.

2.6.1 The Different Kinds of Help

There are two different ways to get help. One way is to type a portion of an IM, followed by a question mark. Another way is to type a question mark after an error message. Either of these will get you help.

There are two different types of help. The first type of help provides information about the syntax of IMs. The second type of help assists you in composing IMs by prompting choices between the possible entries.

2.6.2 Getting Help If You Know One or More Parameter Name
If you know one or more of the parameter names in a message, you can find out how many messages share that parameter, and what the syntax of these messages is.

To get information about the parameter names in an IM, enter part of the message (one or more parameter names). Type a question mark after the last parameter name.

**EXAMPLE 1**

If you enter:  
```
  op:pmcr?
```

The system responds:
```
The input matches 3 messages.  
Further errors may be revealed after a single  
message has been selected.  

1) OP:PMCR:TYPE=a,FORM=b;
2) OP:PMCR:TYPE=a,INTVL=b,FORM=c;
3) OP:PMCR:TYPE=a,INTVL=b,FORM=c;
   b is HOURLY, DAILY[=d], NOHOURLY or NODAILY;  
   choose one or omit
   append text, hit ? for more info.,  
   hit <CR> to execute, or hit <DEL> to reject
```

op:pmcr_

These are the only messages that begin with "OP:PMCR". Up to 128 messages can be displayed. The underline character in the last line of the example represents the position of your cursor after the system has displayed its response on your terminal. The system will wait about forty seconds for your response. If you do not respond within that time, then you are exited from the help facility, and you get the system prompt.

You may do one of the following:

- Enter a carriage return to execute, "OP:PMCR" which results in a missing parameter name errors message.
- Type the rest of a message [for example, ":type=dem,form=1" (for format 1)] and a carriage return to execute the message.
- Type a question mark to go to the second help level. You are then taken through the message a step at a time, and you are prompted for each entry.
- Press the "Delete" key. You leave the help facility and the message is not sent.

**NOTE:** If you type a question mark immediately after a parameter name (as in the example), you get information only about the parameter names in the message. You do not get information about parameter values.

You may also get help for parameter values in a message. To get help for parameter values in a message, type an equal sign (=) followed by a question mark after the parameter name.

**EXAMPLE 2**

If you enter:  
```
  op:conv,len=?
```

The system responds:
```
LEN=a-b-c-d-e-f  
a is an SM number between 1 and 192  
b is a number between 0 and 7  
c is a number between 0 and 9  
d is 0 or 1
```
The system lists the possible entries for the values ('a' through 'f') of parameter LEN of this message. The underline character represents the position of the cursor on the screen.

2.6.3 Getting Help for an Error Message

If you make a mistake when you enter an IM, the system responds with an error message. You can invoke the help facility after receiving such a message and get more information about how the message should be composed.

Here is an example of getting help after the system sends an error message:

**EXAMPLE 3**

If you enter:

```
op:hdwchk,clink;
```

The system responds:

```
?D - unexpected keyword CLINK
enter a new command OR ? for more information
```

If you now type a question mark, you will obtain the following system response:

```
unexpected keyword CLINK
The input matches 3 messages.

(Further errors maybe revealed after
a single message has been selected.)
```

1)  **OP:HDWCHK,a;**
    
    a is MMP=b-c, CMP=b-d, FPC=b, PPC=b,
    ONTC=b, MSCU=b, or CLNK=e-f-g-h;
    must choose one

2)  **OP:HDWCHK,CM;**

3)  **OP:HDWCHK,NCREF,a;**
    
    a is PRIM=b, SEC=b, XC=b; REF1=b, REF2=b,
    REF3=b, REF4=b, REF5=b, REF6=b, REF7=b,
    REF8=b; must choose one

```
enter a new command OR ? for more information
```

Typing the question mark after an error message has the same effect as typing a message fragment followed by a question mark. The same kind of help is provided. In this case, three messages begin with **OP:HDWCHK**. The unexpected keyword error is ignored.

2.6.4 The Second Level of Help: Prompting

Once you have gotten help as described in the previous section, you can get an additional kind of help: prompting. If you type a question mark again after receiving the help described in Examples 1, 2, and 3, you are prompted for each entry in the message until it is complete.

If you type a question mark in response to Example 2, you are prompted for each parameter value (a through f) for parameter LEN. In Examples 1 and 3, you are asked to choose one message from the list that is displayed. Then
you are prompted to complete the chosen message.

2.6.5 Ending the Help Session

You may exit the help facility at any time by pressing the “Delete” key. If you are being prompted, then you must press the “Delete” key once to end the prompting, and press it a second time to end the help session.

2.7 INPUT MESSAGE EDIT AND HISTORY

The input message edit and history function is designed to assist the user in retrieving and editing input messages already entered on a given terminal. It provides the following capabilities to the user:

- A record of input messages entered during a session.
- Retrieval by history buffer line number, by string, or by last input message entered.
- Edit of retrieved input messages.

2.7.1 Availability

The input message edit and history function is provided on the following terminal types:

- Maintenance Control Center (MCC)
- Supplementary Trunk and Line Workstation (STLWS)
- Switching Control Center (SCC)
- Recent Change and Verify (RC/V)

2.7.2 Related Input/Output Messages

The input message edit and history function includes four input messages and an output message. The input messages apply only to the terminal upon which they are entered. See the appropriate manual pages for more information.

<table>
<thead>
<tr>
<th>IM Message ID</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALW:HIST</td>
<td>allow history recording</td>
</tr>
<tr>
<td>INH:HIST</td>
<td>inhibit history recording</td>
</tr>
<tr>
<td>CLR:HIST</td>
<td>clear history buffer</td>
</tr>
<tr>
<td>OP:HIST</td>
<td>displays entries from the history buffer</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>OM Message ID</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP:HIST</td>
<td>response to the OP:HIST input message</td>
</tr>
</tbody>
</table>

2.7.3 History

Each terminal keeps a separate history buffer containing only the input messages entered at that terminal. Input messages are saved only when history recording is allowed. By default, history recording is allowed when a terminal comes into service.

If history recording is allowed and the input message is not a help input message, then the submitted input message is saved in the history buffer.

Function associated input messages that access help information and retrieve or edit input messages are not stored, regardless of the status of history recording.
2.7.3.1 Service Affecting or Sensitive Input Messages

It is recommended that the user inhibit history recording before entering any input messages that are sensitive or may cause interruptions or degradations of service. This prevents the service affecting input message from being accidentally retrieved and re-executed. After the sensitive or service affecting input message is executed, history recording can be allowed.

2.7.3.2 History Buffer Line Numbers

The history buffer can have a maximum of 200 entries at any given time. The buffer line numbers, however, begin at 1 and have a maximum range of 999.

Numbering of the buffer lines continues to 1000 even though only the last 200 input messages are in the buffer at any given time. The input message assigned to buffer line number 1000 triggers the following sequence:

- It is reassigned to line number 200.
- The last 199 entries already in the buffer are renumbered 1 through 199.
- The incrementation of buffer line numbers resumes with 201.

2.7.3.3 Clearing the History Buffer

It is recommended that the user clear out the history buffer at the end of each terminal session. This helps keep users from accessing input messages and corrupting the switch database by accident or intent. The buffer is always empty when a terminal comes into service.

2.7.4 Special Characters

The characters '#' and '^' are used for line editing control. The '#' character indicates that a retrieval process is to commence. The '^' indicates that a string follows. The string may be null.

2.7.5 Input Message Retrieval Procedure

A input message can be retrieved by one of the following methods:

<table>
<thead>
<tr>
<th>Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>#n&gt;</td>
<td>Retrieve by history buffer line number. This retrieves line number 'n' from the history buffer.</td>
</tr>
<tr>
<td>##</td>
<td>Retrieve last input message. This is a shorthand method to retrieve the most recently stored input message from the history buffer.</td>
</tr>
<tr>
<td>#^a</td>
<td>Retrieve by string. This retrieves the most recently stored input message that contains the string 'a' from the history buffer.</td>
</tr>
</tbody>
</table>

2.7.6 Command Modes

The modes associated with the input message edit and history function are:

- command entry mode
- edit mode

2.7.6.1 Command Entry mode

Command entry mode is the default mode. Input messages entered in command entry mode are stored in the
From command entry mode, edit mode is accessed by entering one of the special character sequences that indicate history buffer retrieval is being requested.

If the indicated buffer line number or string is found in the history buffer, the retrieved input message becomes the "pending" input message and the craftshell switches to edit mode. If an available input message is not identified, a "Command Unavailable" error message is output and the craftshell remains in command entry mode.

The user stays in edit mode until he/she either submits the pending input message for execution or cancels the edit session. After each edit, the latest version of the pending input message is displayed, along with the edit mode prompt (<<). At the edit mode prompt, the user can perform any of the following actions:

- enter '?' to request input message edit help information.
- enter (cr) (carriage return) to execute the pending input message.
- enter (del) (delete) to return to command entry mode, without executing the pending input message.
- retrieve another saved input message by any of the available methods.
- continue editing the pending input message.
- enter an input message.

To stay in edit mode, a pending input message must always be available. If, after an edit cycle is complete, a pending input message is not available, the craftshell returns to command entry mode.

If a carriage return or semi-colon (;) is entered at the edit prompt (<<), the pending input message is submitted to the craftshell for execution and:

- the edit session is terminated
- the craftshell returns to command entry mode
- the command entry mode prompt (<) is displayed.

If the input message entered is incorrect, an appropriate error message is displayed by the craftshell.

**2.7.7 Help**

If a lone question mark (?) is entered at the edit prompt (<<), a brief input message edit help message is displayed, followed by the latest version of the pending input message and the edit mode prompt (<<).

If the user enters an edited input message with invalid syntax, the input message edit help information is displayed after the "Command Not Recognized" error message.

**2.7.8 Line Editing**

Input message editing provides the capability to retrieve saved input messages and re-execute them. Retrieved input messages may be edited using substitutions, appends, or a combination of both before re-execution.
2.7.8.1 Editing Definitions

Append = A string is added to the end of the pending message.

Substitute = A substitution is performed only at the right-most occurrence of the specified oldstring within the pending input message. This permits the user to easily update just the last characters(s) of an input string.

Nuances = A null oldstring causes the replacement string to be appended to the end of the pending input message. A null newstring causes the oldstring to be deleted from the pending input message.

2.7.8.2 Retrieval/Editing Options

<table>
<thead>
<tr>
<th>Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>^newstring</td>
<td>The newstring text is appended to the end of the pending input message or the last input message entered.</td>
</tr>
<tr>
<td>^oldstring^newstring</td>
<td>Substitute the new string for the old string to the pending input message or the last input message entered.</td>
</tr>
<tr>
<td>#n^newstring</td>
<td>Retrieve line number from the history buffer (#n) and append the newstring to it.</td>
</tr>
<tr>
<td>###^newstring</td>
<td>Retrieve the most recently stored input message from the history buffer (##) and append the newstring to it.</td>
</tr>
<tr>
<td>#^searchstring^newstring</td>
<td>Retrieve the most recently stored input message containing the searchstring from the history buffer (#^searchstring) and append the newstring to it.</td>
</tr>
<tr>
<td>#n^oldstring^newstring</td>
<td>Retrieve line number from the history buffer (#n) and substitutes the last occurrence of the oldstring with the newstring.</td>
</tr>
<tr>
<td>###^oldstring^newstring</td>
<td>Retrieve the most recently stored input message from the history buffer (##) and substitute the last occurrence of the oldstring with the newstring.</td>
</tr>
<tr>
<td>#^searchstring^oldstring^newstring</td>
<td>Retrieve the most recently stored input message containing the searchstring from the history buffer (#^searchstring) and substitute the last occurrence of the oldstring with newstring.</td>
</tr>
</tbody>
</table>

2.7.9 Error Cases

The input message edit and history function provides specific error messages to assist the user when problems are encountered when retrieving or editing an input message and when invalid conditions for an OP:HIST input message exist.

For error conditions that occur during the retrieve or edit procedures, the following results are possible:

<table>
<thead>
<tr>
<th>Result</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remain in command entry mode.</td>
<td>If an attempt to retrieve a input message (and go into edit mode) from command entry mode fails, there is no pending input message available. An error message is output, followed by the command entry mode prompt (&lt;).</td>
</tr>
<tr>
<td>Remain in edit mode.</td>
<td>If there is a pending input message available, subsequent error conditions generates an error message followed by the pending input message and the edit mode prompt (&lt;&lt;). The pending input message is the result of the last successful retrieve or edit.</td>
</tr>
<tr>
<td>Go to edit mode.</td>
<td>If a combined retrieve and edit input message is entered at the command entry mode prompt (&lt;), it may succeed for the retrieve and fail for the edit. An error message is output (for the failed edit), followed by the pending input message (the successful retrieve), and the edit mode prompt (&lt;&lt;).</td>
</tr>
<tr>
<td>Go to command entry mode.</td>
<td>If a successful edit results in a null pending input message, the command entry mode prompt (&lt;) is output. No error message is output, since the edit was successful.</td>
</tr>
</tbody>
</table>

2.8 MCC DISPLAY PAGES

Master Control Center (MCC) display pages are used to perform maintenance and administrative functions for the
A **5ESS® switch**.

See document 235-105-110 System Maintenance Requirements and Tools for a further explanation of MCC display pages.

### 2.9 **5ESS® SWITCH DIRECTORY STRUCTURE AND PATHNAMES**

A **5ESS® switch** file system is a set of directories, ordinary files, and special device files.

- A directory is a collection of names of files and other directories.

- An ordinary file (also called a `flat file`) is a collection of ASCII text. It may consist of ASCII characters, divided into lines demarcated by the new-line character, or it may consist of binary code that will be copied into main memory when a program is executed.

- A special device file supports input/output activity on a physical device, such as a terminal, magnetic tape, or disk partition. A request to read or write a special device file results in activation of the associated device. However, there is not necessarily a one-to-one correspondence between physical devices in the system and special device files. A single device may have more than one special device file. For example, four different special device files are used to read the same magnetic tape with high or low density and with or without rewind. Most special device files are located in a directory named `/dev`.

The set of directories and files that comprise a file system is organized into a hierarchical tree structure, illustrated in Figure 2-1. In this example:

- the database, dev, etc, lib, tmp, and cft directories all descend from the "root" directory

- the database directory contains a number of ordinary files, including the ecd and appecd databases

- the dev directory contains a number of special device files

- the cft directory contains various subdirectories, which in turn contain ordinary files and additional subdirectories
In the 5ESS® switch system, the database, etc, and tmp directories are themselves the "root" directories of separate file systems that are mounted on the root file system during a system bootstrap. These four file systems (root, database, etc, and tmp) constitute the minimum set of file systems that are required for the 5ESS® switch system to function. Backup copies of these file systems may also be provided, in case one of the primary file systems becomes damaged in a way that would prevent the system from operating successfully. If the system is bootstrapped on the backup file systems, the names of the directories where they are mounted remains the same. Other file systems may also be mounted automatically during a bootstrap, or they may be mounted manually by using ALW:FSYS-MOUNT.

Every file and directory in the system is identified by a unique pathname that indicates its location in the hierarchical file system structure. Many 5ESS® switch IMs require the specification of a pathname. There are two types of pathnames that may be specified:

- Full pathnames begin with a slash (/). This is the name of the "root" directory of the root file system, and is followed by the name of the directory that is immediately beneath the "root" directory, followed by another slash, then the next directory name, and so forth, until the name of the specified file or directory is reached.

For example: FN="/user/a*/smo/test"
• Relative pathnames begin with the name of a directory or file at an arbitrary point in the hierarchy, with no preceding slash. Their specification is relative to the immediately preceding directory. This is sometimes referred to as the base directory.

Because they contain lower-case alphabetic characters and slashes, pathnames must always be surrounded by quotation marks (""") when entered in an IM.

2.10 BINARY-DECIMAL-HEXADECIMAL CONVERSIONS

Both input and output messages use values in hexadecimal (base 16), decimal (base 10), octal (base 8), and binary (base 2). To convert binary numbers to hexadecimal, do the following:

• Separate the binary number into groups of four, starting with the rightmost number.
• Convert each group of four into its hexadecimal equivalent. (See Table 2-5 of the User Guidelines.)
• Example:

| 001000011110 | Binary number |
| 0010 0001 1110 | Binary number in groups of four |
| 2 1 E | Hexadecimal equivalent |

To convert hexadecimal numbers to binary, perform the above procedure in reverse order.

To convert numbers from hexadecimal to decimal or vice-versa, refer to Table 2-4 of the User Guidelines. The left column contains hexadecimal numbers without the units digits. The units digits are shown in the first row.

<table>
<thead>
<tr>
<th><strong>Table 2-1</strong></th>

</tbody>
</table>
| ?E CFTSHL TERMINAL READING ERROR, ERRNO=c | The craftshell encountered an error while reading input from a terminal.  
   c = System error code (refer to the System Error Codes Appendix, APP:SYSERR, in the Output Messages manual). |
| ?E CFTSHL UNABLE TO FORK PROCESS d | The craftshell can not fork a new process to execute a command.  
   d = Full pathname of the process that was not executed because of the fork failure. |
| ?E COMMAND NOT RECOGNIZED | This Line Edit and History error can occur when a string (recall, append or substitute string) was not prepended with a caret (^), a recall command was entered that did not properly specify which stored command was being recalled or there were too many 'caret' characters in an edit command. |
| ?E - input matches multiple messages | The typed input request matches more than one input message in the IM catalog and the craftshell can not determine which message to execute. To obtain further information enter the help facility by terminating the input request with a question mark ('?'). If the desired input request can not be satisfied after accessing the help facility, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Output Messages manual. |
| ?E NO COMMANDS ARE STORED | A Line Edit and History recall command was entered when there are no commands in the history buffer to recall. The No Commands Are Stored error takes precedence over the other Line Edit error messages. |
| ?E STRING NOT FOUND | This Line Edit and History error can occur for two reasons:  
   A substitute command was entered where the 'OLD' string is not present in the pending command.  
   A recall by string command was entered where the recall string is not present in any of the commands stored in the command history buffer. |
| ?E STRING TOO LONG | This Line Edit and History error occurs when an append or substitute command is entered that would result in a command longer than the legal limit of 256 characters. The append or substitute is rejected. |
| ?E - syntax error; invalid e | The craftshell encountered an IM syntax error.  
   e = The part of the IM that the craftshell identified as invalid. |
| ?E - syntax error; unexpected 'f' after g | The craftshell encountered an IM syntax error.  
   f = First invalid part of the IM.  
   g = Last valid part of the IM. |
| ?E - terminator must be 'q' | The craftshell encountered an improper IM terminator.  
   q = Proper IM terminator character. |
<p>| ?E UNABLE TO INITIATE COMMAND h | The craftshell is unable to execute an input request because it encountered a zero-length file. |</p>
<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>±E UNABLE TO MATCH COMMAND i</td>
<td>An input command was entered that does not exist in the craftshell search directories. i = Full pathname of the non-existent command code</td>
</tr>
<tr>
<td>±E UNAVAILABLE COMMAND, CMD = j TO k</td>
<td>A Line Edit and History recall command was entered that identified a command that is out of the available range. To assist the user, the available range is printed as part of the error message. j = Lowest command number of available range k = Highest command number of available range</td>
</tr>
<tr>
<td>±E INVALID COMMAND</td>
<td>The craftshell is unable to execute an input request because it encountered a non-executable file or because it located a command directory but no executable file.</td>
</tr>
<tr>
<td>±V - invalid command code l</td>
<td>The craftshell encountered an IM with an invalid command code. l = The command code that the craftshell identified as invalid.</td>
</tr>
<tr>
<td>±G - FEATURE NOT AVAILABLE</td>
<td>The requested action failed because the feature required to process the request is not present in the switch or the given module.</td>
</tr>
<tr>
<td>±G - FILE OPEN FAILURE</td>
<td>An OP:HIST input command was entered but the output file could not be opened to print the information.</td>
</tr>
<tr>
<td>±G - NO COMMANDS ARE STORED</td>
<td>An OP:HIST input command was entered when there are no commands in the history buffer to output.</td>
</tr>
<tr>
<td>±G - RANGE UNAVAILABLE, CMD = m TO n</td>
<td>An OP:HIST input command was entered that specified a range (either explicitly or implicitly) that does not match any available stored command. To assist the user, the available range is printed as part of the error message. m = Lowest command number of available range n = Highest command number of available range</td>
</tr>
<tr>
<td>±G - SM o is isolated</td>
<td>The craftshell encountered an input request targeted for a switching module (SM) that is in the isolated state. o = Processor number of the isolated SM.</td>
</tr>
<tr>
<td>±G - SM p is not equipped</td>
<td>The craftshell encountered an input request targeted for an SM that is not equipped. p = Processor number of the unequipped SM.</td>
</tr>
<tr>
<td>±G - SYNTAX ERROR IN PREVIOUS MESSAGE</td>
<td>The EXC:PREV command was entered to execute a command that has a syntax error.</td>
</tr>
<tr>
<td>±L - UNABLE TO EXECUTE COMMAND</td>
<td>The craftshell is unable to communicate with another process to execute an input request. Retry request later.</td>
</tr>
<tr>
<td>±L - UNABLE TO SERVICE REQUEST</td>
<td>The craftshell is unable to execute an input request due to unavailable system resources such as system overload, excessive queue lengths, or a busy process. Retry request later.</td>
</tr>
</tbody>
</table>
### Table 2-2  Summary of Parts of a Message Format

<table>
<thead>
<tr>
<th>Term or Item</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block of Parameters</td>
<td>Any field but first field of message. Contains parameter names and parameter values.</td>
</tr>
<tr>
<td>Braces { }</td>
<td>Enclose two or more entries, separated by OR bars, of which the user must input one, but only one. Not input as part of the message.</td>
</tr>
<tr>
<td>Brackets [ ]</td>
<td>Enclose optional entries. Not input as part of the message.</td>
</tr>
<tr>
<td>Command Code</td>
<td>First field of message. Contains command code.</td>
</tr>
<tr>
<td>Data Field</td>
<td>Optional blocks of parameters in messages.</td>
</tr>
<tr>
<td>Equal Sign =</td>
<td>Separates parameter name and parameter value.</td>
</tr>
<tr>
<td>Exclamation Point !</td>
<td>Message terminating character that does one of the following:</td>
</tr>
<tr>
<td></td>
<td>• In certain messages, causes the command to be executed at an appropriate break point.</td>
</tr>
<tr>
<td></td>
<td>• Causes the system to expect more data field parameters to follow on the next line of input.</td>
</tr>
<tr>
<td></td>
<td>• Causes the entered portion of the command to be executed as an immediate action (any ordinary message).</td>
</tr>
<tr>
<td></td>
<td>Also causes a special colon (:) prompt to be issued. The terminal will not print output messages until the normal semicolon (;) terminating character is entered.</td>
</tr>
<tr>
<td>Field</td>
<td>Basic structural unit of message. Variable length. Separated by colons.</td>
</tr>
<tr>
<td></td>
<td>There are at least two fields per message: command code and parameter block(s), in that order.</td>
</tr>
<tr>
<td>Keyword</td>
<td>The term keyword is often used in error messages to refer to a parameter name.</td>
</tr>
<tr>
<td>Message Length</td>
<td>Number of characters including spaces within the message (up to 255 characters). This may exceed one line.</td>
</tr>
<tr>
<td>Number Base</td>
<td>Default is decimal. Otherwise, numbers input must be preceded by B' (binary), O' (octal), or H' (hexadecimal).</td>
</tr>
<tr>
<td>OR bar</td>
<td>Separates entries within braces or brackets. One entry, but only one, must be selected. If selections are enclosed by braces, one entry must be input; if enclosed by brackets, the entry is optional. Not input as part of the message.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Parameter name and its associated parameter values, if any. Two or more parameters within a block of parameters are separated by commas.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Mnemonic identifier of a unit, function, or condition. May have parameter values associated with it. Error messages often refer to parameter names as keywords. Input as shown.</td>
</tr>
<tr>
<td>Parameter Value</td>
<td>Separated from parameter name by equal sign (=). Often represented by a variable in message format. Can be input as a single entry, as multiple entries in the form a-b-c, or as a range in the form x&amp;&amp;y.</td>
</tr>
<tr>
<td>Pathname</td>
<td>Starts with a slash (/), with every file and directory name separated by a slash. When entered, must be immediately preceded and followed by quotation marks (&quot;),.</td>
</tr>
<tr>
<td>Question Mark ?</td>
<td>Help request character. A question mark may follow a partial message or previously entered message that was erroneous. Typing ? after a help guidance message will cause it to enter prompting mode.</td>
</tr>
<tr>
<td>Quotation Marks &quot;&quot;</td>
<td>Enclose pathname of file, directory, or device. Also enclose any text strings entered. Input as shown.</td>
</tr>
<tr>
<td>Semicolon ;</td>
<td>Message terminating character that causes the command to be executed as an immediate action.</td>
</tr>
<tr>
<td>&amp;&amp;</td>
<td>Indicates a range in messages.</td>
</tr>
<tr>
<td>Variable</td>
<td>Shown as a lowercase letter in manual pages. Replace with user-supplied information.</td>
</tr>
<tr>
<td>Verb</td>
<td>Known as the command code. Shows what type of action is to be taken. May be an abbreviation of the command code.</td>
</tr>
</tbody>
</table>

### Table 2-3  Summary of Pathnames

<table>
<thead>
<tr>
<th>Pathname</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>/</td>
<td>Full pathname of the “root” directory of the root file system.</td>
</tr>
<tr>
<td>/data base</td>
<td>Full pathname of the data base directory which is located directly under <code>/</code>.</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>/cft/shlcmds</td>
<td>Full pathname of the cmds directory, which is located under the shl directory, which is located under the cft directory, which is located directly under <code>/</code>.</td>
</tr>
<tr>
<td>/cft/shlcmds/INH/AUD</td>
<td>Full pathname of the AUD program which is executed by the INH/AUD message.</td>
</tr>
<tr>
<td>INH/AUD</td>
<td>Relative pathname of the same AUD program, relative to the /cft/shlcmds base directory.</td>
</tr>
<tr>
<td>OP/AUD</td>
<td>Relative pathname of the AUD program which is executed by the OP/AUD message, relative to the /cft/shlcmds base directory.</td>
</tr>
<tr>
<td>/dev/root</td>
<td>Full pathname of the special device file for the disk partition that contains the root file system (mounted as <code>/</code>).</td>
</tr>
<tr>
<td>/dev/broot</td>
<td>Full pathname of the special device file for the disk partition that contains the backup copy of the root file system (also mounted as <code>/</code>).</td>
</tr>
<tr>
<td>/dev/db</td>
<td>Full pathname of the special device file for the disk partition that contains the db file system (mounted as <code>/data base</code>).</td>
</tr>
<tr>
<td>/dev/bdb</td>
<td>Full pathname of the special device file for the disk partition that contains the backup copy of the db file system (also mounted as <code>/data base</code>).</td>
</tr>
<tr>
<td>/dev/mt00</td>
<td>Full pathname of the high density magnetic tape device that is attached to input/output processor (IOP) number 0 with an option 0 (rewinds a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt04</td>
<td>Full pathname of the high density magnetic tape device that is attached to IOP number 0 with an option 4 (does not rewind a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt08</td>
<td>Full pathname of the low density magnetic tape device that is attached to IOP number 0 with an option 8 (rewinds a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt0c</td>
<td>Full pathname of the low density magnetic tape device that is attached to IOP number 0 with an option c (does not rewind a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt10</td>
<td>Full pathname of the high density magnetic tape device that is attached to IOP number 1 with an option 0 (rewinds a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt14</td>
<td>Full pathname of the high density magnetic tape device that is attached to IOP number 1 with an option 4 (does not rewind a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt18</td>
<td>Full pathname of the low density magnetic tape device that is attached to IOP number 1 with an option 9 (rewinds a tape after reading from it or writing to it).</td>
</tr>
<tr>
<td>/dev/mt1c</td>
<td>Full pathname of the low density magnetic tape device that is attached to IOP number 1 with an option c (does not rewind a tape after reading from it or writing to it).</td>
</tr>
</tbody>

</tr>
</tbody>
</table>
previously-executed full, incremental or entity static office-dependent data (SODD) audit, a
detailed summary report of errors detected by one of the forementioned audits, or just a
summary of the number of errors found by one of the forementioned audits.

Requests that one of the following be printed: the execution status of the static
office-dependent data (SODD) audits; the full SODD audit's schedule; the status of the active
SODD audit(s).

Reports the error counts of one or more audits controlled by the system integrity monitor
(SIM).

Provides the ability to obtain status of a CNI Ring 1 Audit.

Requests a report of the status of a specified audit, all audits, or all inhibited audits for a
particular communication module processor (CMP) or range of CMPs.

Requests a report of the status of a specified audit, all audits, or all inhibited audits for a
particular communication module processor (CMP) or range of CMPs.

Requests the status of a specific audit, all audits or all inhibited audits for a particular kernel
process environment.

Requests the status of a specific audit, all audits or all inhibited audits for a particular kernel
process environment.

Requests a report of the status of a specific audit, all audits, or all inhibited audits for a
particular switching module (SM) or range of SMs.

Requests a report of the status of a specific audit, all audits, or all inhibited audits for a
particular switching module (SM) or range of SMs.

Requests the status of the full or incremental static office-dependent data (SODD) audit.

Requests a list of environments supporting the requested audit.

Schedules the day, time, and duration for the full static office-dependent data (SODD) audit.

Requests to set SODD Audit to run full, incremental or sub audit(s) during execution.

Requests that a currently active audit that is controlled by the administrative module (AM)
system integrity monitor (SIM) stops.

Requests that a currently active audit that is controlled by the administrative module (AM)
system integrity monitor (SIM) stops.

Requests the termination of an executing static office-dependent data (SODD) audit as
indicated with the parameter list.

</table>
Indicate which disk blocks correspond to a given block sequence number, and the automatic message accounting (AMA) partitions on which they are located.

OP:AMA-SEQ
5E12 and later

Requests a report of the current or most recent automatic message accounting (AMA) tape or teleprocessing session.

OP:AMA-SESSION
5E12 and later

Requests the printing of the automatic message accounting (AMA) record status in the administrative module (AM) buffer.

OP:AMA-STATUS
5E12 and later

Requests automatic message accounting (AMA) teleprocessing and tape summary data.

OP:AMA-SUMMARY
5E12 and later

Requests automatic message accounting (AMA) teleprocessing summary data that has been accumulated today.

OP:AMA-TELE
5E12 and later

Requests the current status of the automatic message accounting irregularity (AMAIRR) record reporting feature.

OP:AMAIRR
5E12 and later

Requests the current status of the automatic message accounting lost (AMALOST) record reporting feature.

OP:AMALOST
5E12 and later

Requests the current status of the automatic message accounting (AMA) record reporting feature AMATRC.

OP:AMATRC
5E12 and later

Requests that an automatic message accounting (AMA) partition be equipped or unequipped for either the ST1 or ST2 data stream.

SET:AMA-CONFIG
5E12 and later

Requests that one or two of the automatic message accounting (AMA) control file parameters be set.

SET:AMA-CONTROL
5E12 and later

Requests that the automatic message accounting (AMA) office stream configuration be set.

SET:AMA-STREAM
5E12 and later

Requests that the tape writing process be stopped.

STP:AMATAPE
5E12 and later

Requests that a particular tape drive be set to the automatic message accounting (AMA) function and that the tape on that tape drive be verified.

VFY:AMATAPE
5E12 and later

Requests that billing data be collected from the switching modules (SMs) and the billing data in the administrative module be written to disk prior to generic retrofit.

WRT:AMADATA
5E12 and later

### 18.1 Centralized Automatic Message Accounting Operator Number Identification

</table>
### bearer independent call control (BICC) call instance code (CIC) query

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP:BICC</td>
<td>5E15 and later</td>
</tr>
</tbody>
</table>

Requests the output of bearer independent call control (BICC) data matching specific characteristics.

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP:BICCBLK</td>
<td>5E16(1) and later</td>
</tr>
</tbody>
</table>

Requests the output of bearer-independent call control (BICC) call instance code (CIC) block for specific information.

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP:BICCBMOVE</td>
<td>5E16(1) and later</td>
</tr>
</tbody>
</table>

Requests the status of a Static Call Instance Code Allocation process.

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP:BICCCQ</td>
<td>5E15 and later</td>
</tr>
</tbody>
</table>

Determines whether the common channel signaling (CCS) automatic bearer independent call control (BICC) call instance code (CIC) query for CCS System 7 (CCS7) trunks is inhibited or allowed for the entire office, and the BICC CIC query start time.

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMV:BICCCADN</td>
<td>5E16(1) and later</td>
</tr>
</tbody>
</table>

Requests the removal of a single bearer-independent call control (BICC) block from service and the placing of all the call instance codes (CICs) of the specified block into the circuit administration (CADN) out-of-service (OOS) status.

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>RST:BICCCADN</td>

### 32.3 Reorder

**Message ID/ Software Release Range**

| Requests that additional information on calls that are routed to reorder be collected for a switching module (SM) or a range of SMs, and the information be reported on the ROP after 15 minutes have elapsed or information for the first 30 reorder events has been collected, whichever occurs first. | ALW:REORD-SM 5E12 and later |

### 32.4 Switch Cutoff

**Message ID/ Software Release Range**

| Requests that information related to switch cutoff calls be allowed, either with or without an accompanying hardware call trace. | ALW:SCORPT 5E12 and later |
| Requests that the reporting of information related to switch cutoff calls be inhibited. | INH:SCORPT 5E12 and later |

### 32.5 Transient Calls Lost

**Message ID/ Software Release Range**

| Requests that the reporting of information be allowed related to transient calls lost either with or without an accompanying hardware call trace. | ALW:TCLRPT 5E12 and later |
| Inhibits the reporting of information related to transient calls lost. | INH:TCLRPT 5E12 and later |

### 33. CAMPED-ON UNITS

**Message ID/ Software Release Range**

| Requests a list of the trunks, lines, data links, and Operator Services Position System Ports | OP:CAMPON-A |
### 34. CARRIER GROUP ALARM

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requests clearance of a network management (NM) call gapping (CGAP) code control restricting traffic by issuing a destination code, an access prefix, or both.</td>
<td>CLR:CGAP 5E12 and later</td>
</tr>
<tr>
<td>Requests that the active carrier group alarms from integrated carrier facilities terminating on digital facility interfaces (DFIs), integrated digital carrier units (IDCUs), remote integrated services line units (RISLUs), non-integrated carrier facilities monitored by metallic service unit (MSU) scan points, and digital network unit-synchronous optical network (SONET)/(DNU-S) be printed.</td>
<td>OP:CGA-A 5E12 only</td>
</tr>
<tr>
<td>Requests that the active carrier group alarms from integrated carrier facilities terminating on digital facility interfaces (DFIs), integrated digital carrier units (IDCUs), remote integrated services line units (RISLUs), non-integrated carrier facilities monitored by metallic service unit (MSU) scan points, and digital networking unit-synchronous optical network (SONET)/(DNU-S) be printed.</td>
<td>OP:CGA-B 5E13 - 5E15</td>
</tr>
<tr>
<td>Requests that the active carrier group alarms be printed for integrated carrier facilities terminating on digital facility interfaces (DFIs), digital networking unit-synchronous optical network (SONET)/(DNU-S), integrated digital carrier units (IDCUs), optical interface unit (OIU), remote integrated services line units (RISLUs), SLC® 96 DFI facility interfaces (SDFIs), and non-integrated carrier facilities monitored by metallic service unit (MSU) scan points.</td>
<td>OP:CGA-C 5E16(1) and later</td>
</tr>
<tr>
<td>Requests that all call gapping (CGAP) code controls in the office be listed.</td>
<td>OP:CGAP 5E12 and later</td>
</tr>
<tr>
<td>Requests that a call gapping (CGAP) code control be set to restrict traffic.</td>
<td>SET:CGAP-A 5E12 - 5E14</td>
</tr>
<tr>
<td>Requests that a call gapping (CGAP) code control be set to restrict traffic.</td>
<td>SET:CGAP-B 5E15 and later</td>
</tr>
</tbody>
</table>

### 35. CENTRALIZED TRUNK TESTING UNIT

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requests that the position busy (PB) indicator be cleared at certain trunk line work stations.</td>
<td>CLR:PB</td>
</tr>
</tbody>
</table>
Requests the display of the position busy (PB) and not position busy (NBP) status of each of the trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test calls.

Requests that the position busy (PB) indicator of certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test line calls be set.

### 36. CHECKSUM

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requests a 16-bit checksum for a specified file, and prints the number of blocks in the file.</td>
<td>OP:ST-SUM 5E12 and later</td>
</tr>
</tbody>
</table>

### 37. CLOCKS

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reports the current date and time.</td>
<td>OP:CLK 5E12 and later</td>
</tr>
<tr>
<td>Requests that the system clock be set to the specified date and time, or that the system time be adjusted by a small amount.</td>
<td>SET:CLK-5 5E12 and later</td>
</tr>
<tr>
<td>Sets the system clock to the specified data and time.</td>
<td>SET:CLK-A 5E12 - 5E13</td>
</tr>
<tr>
<td>Sets the system clock to the specified data and time.</td>
<td>SET:CLK-B 5E14 and later</td>
</tr>
</tbody>
</table>

### 38. COMMAND HISTORY

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allows history recording for the terminal upon which it is entered.</td>
<td>ALW:HIST 5E12 and later</td>
</tr>
<tr>
<td>Clears out the command history buffer.</td>
<td>CLR:HIST 5E12 and later</td>
</tr>
<tr>
<td>Requests that the previous input message entered at this terminal be re-executed.</td>
<td>EXC:PREV 5E12 and later</td>
</tr>
<tr>
<td>Inhibits history recording for the terminal upon which it is entered.</td>

<td>OP:RING</td>
</tr>
</tbody>
</table>
node, a group of nodes, or all nodes on a particular group.

Requests an output of the status of all the break points in the specified node.

5E12 and later

OP:RUTIL

Requests an output of the status of the specified break point in the specified common network interface (CNI) ring node.

5E12 and later

OP:RUTILFLAG

Requests that the common network interface database consolidator (CNIDBOC) be run.

RCV:M-CNIDBOC

5E12 and later

Requests that the common network interface (CNI) growth script be executed.

RCV:M-CNIGROWTH

5E12 and later

Requests that the specified link node (LN) be removed from service.

RMV:LN

5E12 and later

Requests that the specified link node (LN) be restored to service either conditionally or unconditionally.

RST:LN

5E12 and later

Terminates or interrupts the updating of the software of all SS7 nodes before the update procedure has been completed.

STOP:LNUPD

5E12 and later

Requests the Operating System for Distributed Switching (OSDS) resource monitoring utility to stop collecting and reporting usage of OSDS message, process, stack, and timer control blocks.

STP:PERF

5E12 and later

Requests that the mate network clock node be switched to the master network clock node.

SW:CLOCK

5E12 and later

Requests a set of the given break point at the specified common network interface (CNI) ring node with the action-list provided.

WHEN:RUTIL

5E12 and later

41.1 Ring Peripheral Controller Node

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/Software Release Range</th>

<tr>
<td>Requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) message handler (CMPMSGH) be executed.</td>
<td>EXC:UT-CMPMSG-B 5E15 and later</td>
</tr>
</tbody>
</table>
Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory.

IF:UT-CMP-A
5E12 - 5E14

Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory.

IF:UT-CMP-B
5E15 and later

Signifies the end of an IF-ELSE statement in the communication module processor (CMP) and must be used in combination with the IF:UT-CMP input message.

IF:UT-CMP-ENDIF
5E12 and later

Requests that the automatic execution of an audit or the routine execution of the audit cycle be inhibited in one communication module processor (CMP).

INH:AUD-CMP
5E12 and later

Requests that the hardware checks on the specified communication module processor (CMP) be inhibited.

INH:HDW-CMP
5E12 and later

Requests that a specific generic utility WHEN clause in the communications module processor (CMP), or all such active clauses, be inhibited.

INH:UT-CMP
5E12 and later

Requests that the selected communication module processors (CMPs) be initialized at the specified level.

INIT:COMP
5E12 and later

Requests that a single process purge (SPP) of a named process in a selected communication module processor (CMP).

INIT:COMP-SPP
5E12 and later

Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP).

LOAD:UT-CMP
5E12 and later

Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP) message handler (CMPMSG).

LOAD:UT-CMPMSG-A
5E12 - 5E14

Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP) message handler (CMPMSG).

LOAD:UT-CMPMSG-B
5E15 and later

Requests a copy of the postmortem for the communication module processor (CMP).

OP:POSTMORT-CMP
5E12 and later

Requests a report of the status of a specified audit, all audits, or all inhibited audits for a particular communication module processor (CMP) or range of CMPs.

OP:ST-AUD-CMP-A
5E12 - 5E15

Requests a report of the status of a specified audit, all audits, or all inhibited audits for a particular communication module processor (CMP) or range of CMPs.

OP:ST-AUD-CMP-B
5E16(1) and later

Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the communications module processor (CMP).

OP:UT-CMP
5E12 and later

Requests removal of a communication module processor (CMP) from service.

RMV:COMP
5E12 and later

Requests a conditional or unconditional restore of a communication module processor (CMP) to the active or standby state.

RST:COMP
5E9(1) and later

Requests a download of the off-line communication module processor (CMP) memory for the specified CMP from the off-line administrative module (AM) disk followed by an off-line verification.

ST:OPUMP-CMP
5E9(1) and later

Stops the currently executing audit in a communication module processor (CMP).

STP:AUD-CMP
5E12 and later

Requests that specific actions on a communication module processor (CMP) be stopped (Format 1).

STP:COMP
5E12 and later

Requests that the current switch on the unit specified be stopped.

STP:SW
5E12 and later

Requests activation of the standby of the communication module processor (CMP).

SW:CMP
5E12 and later

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).

WHEN:UT-CMP-A
5E12 - 5E14

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).

WHEN:UT-CMP-B
5E15 and later

45. COMMUNICATIONS LINK

</tbody>
</table>
Requests that interrupts in an integrated digital carrier unit (IDCU) service group circuit be inhibited.

INH:HDW-IDCU
5E12 and later

Requests that interrupts in an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be inhibited.

INH:HDW-IDCUEL
5E12 and later

Requests that the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC) be inhibited.

INH:RT-REPT
5E12 and later

Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU).

LOAD:UT-IDCU
5E12 and later

Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU) loop side interface (LSI).

LOAD:UT-IDCULSI
5E12 and later

Requests a status message of the provisionable elements of a remote terminal (RT) terminating on an IDCU or DNUS.

OP:RT-PROV
5E12 and later

Requests the current status of the printing of remote terminal (RT) report messages at the Master Control Center (MCC) and the Switching Control Center (SCC).

OP:RT-REPT
5E12 and later

Requests that an integrated digital carrier unit (IDCU) service group circuit be removed from service.

RMV:IDCU
5E12 and later

Requests that an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be removed from service unconditionally, by preempting the current user.

RMV:IDCUEL
5E12 and later

Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.

RMV:IDCUEOC
5E12 and later

Requests that an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be removed from service.

RMV:IDCUPIDB
5E12 and later

Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.

RMV:IDCUTMC
5E12 and later

Requests that an integrated digital carrier unit (IDCU) service group circuit be restored to service either conditionally or unconditionally.

RST:IDCU
5E12 and later

Requests that an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be restored to service.

RST:IDCUEL
5E12 and later

Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be restored to service.

RST:IDCUEOC
5E12 and later

Requests that an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be restored to service.

RST:IDCUPIDB
5E12 and later

Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be restored to service.

RST:IDCUTMC
5E12 and later

Requests that actions on an integrated digital carrier unit (IDCU) service group circuit be stopped.

STP:IDCU
5E12 and later

Requests that actions on an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be stopped.

STP:IDCUEL
5E12 and later

Requests that actions on a remote terminal (RT) embedded operations channel (EOC) circuit be stopped.

STP:IDCUEOC
5E12 and later

Requests that actions on an integrated digital carrier unit (IDCU) peripheral interface data bus (PIDB) or direct PIDB (DPIDB) pair (both IDCU service groups) be stopped.

STP:IDCUPIDB
5E12 and later

Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped.

STP:IDCUTMC
5E12 and later

Requests that the actions on a remote terminal (RT) for the specified unit circuit be stopped.

STP:RMV-RT
5E12 and later

Requests that the actions on a remote terminal (RT) for the specified unit circuit be stopped.

STP:RST-RT
5E12 and later

Requests that the active and standby integrated digital carrier unit (IDCU) service group circuits be switched (interchanged).

SW:IDCU
5E12 and later

Requests that the active and standby states of remote terminal (RT) embedded operations channel (EOC) circuits be switched (interchanged).

SW:IDCUEOC
5E12 and later

Requests that the active and standby states of remote terminal (RT) timeslot management channel (TMC) circuits be switched (interchanged).

</tr>
<tr>
<td>Requests an update of a switching module’s (SM) office-dependent data (ODD) to support stand-alone operation.</td>
<td>CNVT:STANDALONE</td>
</tr>
</tbody>
</table>
Requests that the office dependent data (ODD) recent change (RC) log file be copied from disk to magnetic tape.  
**COPY:LOG-TAPE**  
5E12 and later

Outputs all the ODD backup scheduled requests set by the previous BKUP:ODD messages.  
**OP: BKUPSTAT**  
5E12 and later

Requests a report of the office-dependent data (ODD) availability in the administrative module (AM), switching module(s) (SMs), and communication module processor CMP(s).  
**OP: ODD-AM-SM**  
5E12 and later

Requests a report of office dependent-data (ODD) warning information in the specified processors.  
**OP: ODDWARN**  
5E12 and later

Requests that uncommitted application recent changes be backed out.  
**SET: BACKOUT-A**  
5E12 - 5E13

Requests that uncommitted application recent changes be backed out.  
**SET: BACKOUT-B**  
5E14 and later

Perform maintenance actions on the static office-dependent data (ODD) proxy database.  
**ST: DBPROXY**  
5E15 and later

Requests that the relations RT_DNTRAN, RT_SPECRI, RTDN_MHG, and RTDNMPG be populated for new remote switching modules (RSMs).  
**ST: MODGRW-RSM**  
5E12 and later

Increases the size of physical memory allocated to the protected non-redundant database.  
**ST: NRODDGRW-A**  
5E12 - 5E16(1)

Increases the size of physical memory allocated to the protected non-redundant database.  
**ST: NRODDGRW-B**  
5E16(2) and later

Performs the blockid conversion for the redundant office-dependent data (RODD).  
**ST: ODDBST**  
5E12 and later

Requests that a new copy of office-dependent data (ODD) be created for a switching module (SM) that is being added to the switch.  
**ST: ODDCREAT-SM**  
5E12 and later

Requests that office-dependent data (ODD) files be removed from an switching module (SM) that is being removed from the office.  
**ST: ODDRSM-SM**  
5E12 and later

Requests initiative of an update of all multi-module remote switching module (MMRSM) site common office dependent data (ODD) in all RSMs which are members of the MMRSM site.  
**ST: ODDUPD**  
5E12 and later

Allocates physical memory to the redundant portion of office dependent data (RODD) for the purpose of growth, provided that there is physical memory available.  
**ST: RODDGRW**  
5E12 and later

Requests an increase in the size of physical memory allocated to the unprotected (dynamic) office-dependent data (ODD).  
**ST: UODDGRW-SM**  
5E12 - 5E16(1)

Requests a graceful stop of the currently printing port list.  
**STP: LIST**  
5E12 and later

Requests that the office dependent data (ODD) evolution or double logging process be stopped.  
**STP: ODDDEVOL**  
5E12 and later

Requests that the current switch on the unit specified be stopped.  
**STP: SW**  
5E12 and later

## 147. OFFICE NETWORK

## 201.1 Common Channel Signaling System 7

### CLR:CCS-SRST
Clears the status of a route making it available, and stops the signaling route set test (SRST) for the route.

### INIT:SCCP
Requests an initialization of named table(s) in the selected common channel signaling (CCS) global switching module (GSM).

### OP:CCS-ACDPC
Requests the linkset or combined linkset servicing each accessible destination point code (DPC) for the common channel signaling (CCS) global switching module (GSM).

### OP:CCS-ACTLK
Requests the number of currently active (in service) member(s) in each signaling linkset on a common channel signaling (CCS) global switching module (GSM).

### OP:CCS-CLS
Requests status information of all members of one or more combined link sets (CLoSs) on a given common channel signaling (CCS) global switching module (GSM).

### OP:CCS-DPC
Requests status information for one or more destination point codes (DPCs) associated with a given common channel signaling (CCS) global switching module (GSM).

### OP:CCS-DPCLS
Requests a report of the destination point codes (DPCs) currently served by a specified SS7 linkset or combined linkset on a common channel signaling (CCS) global switching module (GSM).

### OP:CCS-GSM-A
Outputs for each global switching modules (GSM) the common channel signaling (CCS) protocol type and status of the signaling links.

### OP:CCS-GSM-B
Requests common channel signaling link (CCSLK) and internal CCS message transport (CMT) summary status on one/more global switching modules (GSMs).

### OP:CCS-LSCLS
Generates the report of the combined link set of which a given link set is a member.

### OP:CCS-MON
Requests the monitoring action to be turned on, turned off, or the status of links and/or members and/or flow control management (FCM) and/or traffic flow management (TFM) for specified monitoring masks (or a combination thereof).

### OP:CCS-OCP
Requests information about specific originating point codes that are provisioned.

### OP:CCS-ROUTE
Requests specific routing status.

### OP:CCS-SMG
Requests status information for one or more signaling connection control part (SCCP) subsystem(s) at one or more destination point codes (DPCs).

### OP:CCS-SLS
Requests a display of the normal and current signaling link selection (SLS) distributions for all links currently carrying traffic to the specified destination point code (DPC) or a display of the normal and current SLS distribution of a link for a specific linkset (LS) or combined linkset (CLS) specified.

### OP:CCS-TPC
Requests the translation point code (TPC) for a single or range of translation types to be displayed.

### OP:ST-CCSLK
Requests the status of one or more common channel signaling (CCS) links.

### OP:ST-MD
Requests status of the common channel signaling (CCS) message delivery (MD) network.

### OP:TPC
Requests that translation point codes (TPCs) for the specified translation type (TT) be displayed.

### RMV:CCSLK
Removes a common channel signaling (CCS) link(s) from service by deactivating, inhibiting, or blocking the link(s).

### RMV:MD
Removes a common channel signaling (CCS) intra-global switching module (GSM) message delivery (MD) path internal to the GSM.

### RST:CCSLK
Restores service to a common channel signaling (CCS) link(s) by removing the deactivating, inhibiting, or blocking status on that link(s).
201.2 Common Channel Signaling Protocol Monitoring

Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), optical interface unit (OIU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.

**5E13 - 5E15**

Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), optical interface unit (OIU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.

**5E16(1) only**

Requests output containing the busy/idle status of umbilical T1 facility channels between a host switching module (HSM) and remote switching module (RSM).

**5E12 and later**

Requests the value of the switching module (SM) status indicator.

**5E12 and later**

Requests removal of a remote switching module (RSM) facility (FAC) or a trunk FAC from service.

**5E12 and later**

Requests that an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.

**5E12 and later**

Requests restoration of a remote switching module (RSM) facility (FAC) or a trunk FAC to service.

**5E12 and later**

Requests that an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be restored to service.

**5E12 and later**

Requests that a far end loop process (FELP) or a protection configuration request (PROT) be set for a particular digital signal level one (DS1) facility (FAC).

**5E12 and later**

Requests enabling of the option to update the switching module (SM) status indicator to off-normal when a remote terminal (RT) T1 is in an off-normal state.

**5E12 and later**

Requests that maintenance actions be stopped on a remote switching module (RSM) facility (FAC) or a trunk FAC.

**5E12 and later**

Requests that action on an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be stopped.

**5E12 and later**

Requests a test (connectivity exercise) of the connection of a remote switching module (RSM) facility (FAC).

**5E12 and later**

handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU link.

Convert from a given packet switch unit (PSU) link (PSLNK) to the associated protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU link.

Requests consolidated routing information based on requested digit analysis selector (DAS).

Requests output of a complete routing pattern based on input information.

### 231. TRANSMISSION CONTROL PROTOCOL/INTERNET PROTOCOL

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>

</tr>
</tbody>
</table>

This request is used to "force" active a particular function pack pair of a transmission rate conversion unit - model III (TRCU3) circuit.

### 233. TRANSMISSION TEST FACILITY COMMON BOARD

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requests that actions on the test transmission facility common (TTFCOM) circuit be aborted at the specified location.</td>
<td>ABT:TTFCOM 5E12 and later</td>
</tr>
</tbody>
</table>

Allows hardware error checks to be performed on the specified transmission test facility common (TTFCOM) circuit pack.

Requests that a transmission test facility common (TTFCOM) circuit be diagnosed to determine whether it is in satisfactory working order.

Interactively diagnoses (exercises) the transmission test facility common (TTFCOM) circuit.

Inhibits the hardware error checks performed on the specified transmission test facility common (TTFCOM) circuit pack.

Requests that a transmission test facility common (TTFCOM) circuit pack be removed from service.

Conditionally or unconditionally restores a transmission test facility common (TTFCOM) board in a global digital service unit (GDSU) to service.

Requests that actions on the transmission test facility common (TTFCOM) board at the specified location be stopped.

### 234. TRUNK AND LINE WORK STATION

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>

<tbody>
<tr>
<td>Requests that an active trunk and line work station (TLWS) maintenance task or an AUTOPLEX® automatic task administrator (AATA) maintenance task be aborted.</td>
<td>ABT:ASK 5E12 and later</td>
</tr>
</tbody>
</table>

Requests that an active trunk and line work station (TLWS) maintenance task be aborted.

Requests that the position busy (PB) indicator be cleared at certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) assigned to receive incoming 101 test line calls.

Clears the status of a route making it available, and stops the signaling route set test (SRST). | CLR:SRST-DPC 5E12 and later |
for the route.

Requests that the trunk and line work station (TLWS) test position (TP) digital testing defaults
be reset to the system defaults.

Requests that the frequency and level be cleared at a particular trunk and line work station
(TLWS) test position (TP).

Requests that the digits that are used for automatic outpulsing on the trunk associated with
the indicated trunk and line work station (TLWS) test position (TP) be cleared.

Requests seizure of an incoming 101TL (test-line) call at a trunk and line work station (TLWS)
test position (TP).

Requests connection of the specified line or trunk at the trunk and line work station (TLWS)
test position (TP) to a test access unit (TAU) jack.

Requests seizure of (connection to) a line for interactive trunk and line work station (TLWS)
testing.

Requests to connect the trunk and line work station (TLWS) talk-and-monitor (T&M) phone
with the current line or trunk associated with the test position (TP).

Requests that the port (line or trunk) that is associated with the specified trunk and line work
station (TLWS) test position (TP) be re-seized.

Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS)
testing.

Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS)
testing.

Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS)
testing.

Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS)
testing.

Requests that the line that is associated with the specified trunk and line work station (TLWS)
test position (TP) be disconnected.

Requests that the trunk and line work station (TLWS) talk-and-monitor (T&M) phone be
disconnected from the indicated test position (TP).

Requests that the port (line or trunk) that is associated with the specified trunk and line work
station (TLWS) test position (TP) be disconnected.

Requests that the trunk that was associated with the specified trunk and line work station
(TLWS) test position (TP) using an earlier CONN:WSTRK or CONN:WSIC input message be
released.

Requests the display of the position busy (PB) and not position busy (NPB) status of each of
the trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned
to receive incoming 101 test calls.

Requests the immediate or automatic printing of test results from the specified trunk and line
work station (TLWS) test position (TP).

Requests the testing status of one or all trunk and line work station (TLWS) test positions
(TP).

Releases a trunk and line work station (TLWS) test position (TP).

Stops the test in progress and releases the associated testing hardware [such as, global
digital services function (GDSF), transmission test facility (TTF) or directly connected test unit
(DCTU)] at the indicated trunk and line work station (TLWS) test position (TP).

Requests that the position busy (PB) indicator of certain trunk line work stations (TLWSs) or
centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test line calls
be set.

Requests setting the trunk and line work station (TLWS) test position (TP) digital testing
defaults.

Requests setting the trunk and line work station (TLWS) test position (TP) digital testing
frequency and/or level.

Requests to set the digits that are to be used for automatic outpulsing on a trunk associated
with the indicated trunk and line work station (TLWS) test position (TP).

Requests that the mode of the trunk and line work station (TLWS) talk-and-monitor (T&M)
phone connected to the indicated test position (TP) be set.

Requests a trunk and line work station (TLWS) test position (TP) and testing resources (ID) to
associate with the terminal issuing this input message.

Requests to stop the action of a test at the trunk and line work station (TLWS) test position
(TP) started by a digital, metallic, supervision, or transmission test request.

</tbody>
</table>
Requests that all dynamic overload controls (DOCs) specified for the office be listed, or lists
the control for a single trunk group.

Report the status of inhibited or allowed for the periodic signaling link test (PSLT).

Requests print-out of the threshold counts, operational all tests passed count, and purge
count of a trunk circuit (Formats 1, 2, 3 and 4) or universal tone decoder (UTD) (Format 5),
universal tone generator (UTG) (Format 6), or retractive pulsing trunk (Format 7) on the trunk
error analysis lists.

Requests print-out of the threshold counts, operational all tests passed count, and purge
count of a trunk circuit, universal tone decoder (UTD), universal tone generator (UTG), or
retractive pulsing trunk on he trunk error analysis lists.

Requests print-out of the threshold counts, operational all tests passed count, and purge
count of a trunk circuit, universal tone decoder (UTD), universal tone generator (UTG), or
retractive pulsing trunk on he trunk error analysis lists.

Requests report of trunks being held off-hook and ouf-of-service.

Establishes or releases a connection between a network digital loop and a specific digital
tunk.

Establishes or releases a connection between a network digital loop and a specific digital
tunk.

Establishes or releases a connection between a network digital loop and a specific digital
tunk.

Establishes or releases a connection between a network 1004 Hz tone and a specific digital
tunk.

Establishes or releases a connection between a network 1004 Hz tone and a specific digital
tunk.

Establishes or releases a connection between a network 1004 Hz tone and a specific digital
tunk.

Requests the removal of a trunk from service and places it in the specified out-of-service
(OOS) status.

Requests the removal of a trunk from service and places it in the specified out-of-service
(OOS) status.

Requests the removal of a trunk from service and places it in the specified out-of-service
(OOS) status.

Requests the removal of a trunk from service and places it in the specified out-of-service
(OOS) status.

Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate
interface (PRI) group, all trunks on a digital facility interface (DFI), or all trunks on a digital
network unit - synchronous optical network (SONET) (DNU-S) virtual tributary 1.5 facility
(VT1.5) be returned to service by deleting the specified out-of-service (OOS) condition.

Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate
interface (PRI) group, all trunks on a digital facility interface (DFI), or all trunks on a digital
networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility
be returned to service by deleting the specified out-of-service (OOS) condition.

Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate
interface (PRI) group, all trunks on a digital facility interface (DFI), all trunks on a digital
networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility,
or all trunks on a peripheral control and timing line and trunk unit (PLTU) be returned
to service by deleting the specified out-of-service (OOS) condition.

Requests that a RST:TRK request be stopped and the trunk(s) be put back into an
appropriate out-of-service status.

Requests that a RST:TRK request be stopped and the trunk(s) be put back into an
appropriate out-of-service status.
Requests a report to verify all the members of a multi-line hunt group (MLHG).

VFY:MLHG

</tr>
<tr>
<td>UPD:APPLY-FILER-B 5E16(1) and later</td>
<td>Requests application of a file replacement update associated with a software update.</td>
</tr>
</tbody>
</table>
Requests application of a function replacement update associated with a software update.  
UPD:APPLY-FUNC R-A  
5E12 - 5E15

Requests update to the software update database after the successful execution of the first input message preceding the first UPD:APPLY message in the APPLY section of the MSGS file in a software update (SU).  
UPD:APPLY-UNIX  
5E12 and later

Requests that the status of software update (SU) process automation be determined and/or changed.  
UPD:AUTO  
5E12 and later

Requests that an office health check be performed (UPD:AUTOCHK) or requests that the results of the last office healthcheck be displayed (UPD:AUTOCHK:STATUS).  
UPD:AUTOCHK  
5E12 and later

Requests that the software update (SU) process automation office profile be changed according to the arguments and values specified in the input message.  
UPD:AUTOPROFILE  
5E12 and later

Requests that the named software update (SU) be scheduled for automatic installation (UPNM option) or requests the status of the currently scheduled SU (STATUS option).  
UPD:AUTOSCHED  
5E12 and later

Requests that software updates be backed out.  
UPD:BACKOUT  
5E12 and later

Requests that the administrative module (AM) minimum-configuration or full-configuration boot image be updated.  
UPD:BLDBOOT  
5E12 and later

Requests that an official software update be blocked or inhibited from being backed out.  
UPD:BLOCk  
5E12 and later

Requests that the last official software update be backed out.  
UPD:BOLO  
5E12 and later

Used during the common network interface (CNI) to host global switching module (GSM) conversion procedure to copy and initialize integrated services user part (ISUP) trunk member data in the host GSM processor.  
UPD:CCS-CUTOVER  
5E15 and later

Used during the common network interface (CNI) platform to host global switching module (GSM) platform conversion procedure to update internal integrated services user part (ISUP) trunk group/member and transaction capability application part (TCAP) application relational data for the  "psu_mod" attribute.  
UPD:CCS-PSUMOD  
5E15 and later

Request to change the name of the apply software update for the easybwm process.  
UPD:CHG-APPLY  
5E12 - 5E13

Request to change the name of the backout software update for the easybwm process.  
UPD:CHG-BKOUT  
5E12 - 5E13

Request to change the name of the install software update for the easybwm process.  
UPD:CHG-INST  
5E12 - 5E13

Request to change the soak timer interval for the install SU in the easybwm process (MCC Page 1940).  
UPD:CHG-SKTM  
5E12 - 5E13

Requests that one or more software updates be cleared from the administrative module (AM) field update directory.  
UPD:CLR  
5E12 and later

Requests that information about administrative module (AM) software updates be displayed.  
UPD:DISPLAY  
5E12 and later

Requests a display of the first portion of the specified section of the software update (SU) MSGS file on the Master Control Center (MCC) 1960 page for the SU that is currently loaded on that same page (using the UPD:UPNAME input message).  
UPD:DISPLAYUPD  
5E12 - 5E13

To enable switching module (SM) or communication module processor (CMP) incore memory to be dumped to a file.  
UPD:DUMPCORE-A  
5E12 - 5E15

To enable switching module (SM) or communication module processor (CMP) incore memory to be dumped to a file.  
UPD:DUMPCORE-B  
5E16(1) and later

Requests execution of all messages in the specified section (APPLY, SOAK, OFC, or BKOUT) of the software update (SU) MSGS file for the SU that is currently loaded on the Master Control Center (MCC) 1960 page.  
UPD:EXALL  
5E12 - 5E13

Requests execution of the next message(s) in the specified section(s) of the software update (SU) MSGS file for the SU that is currently loaded on the Master Control Center (MCC) 1960 page.  
UPD:EXNXT  
5E12 - 5E13

Requests that the software update expansion process that takes place automatically during the download of a compressed software update (SU) be manually stopped (STOP), or requests that any compressed files in the software update specified (UPNM=a) be expanded to their original size so that software update application may begin immediately.  
UPD:EXPAND  
5E12 and later

Requests that function information from a process file's symbol table be displayed for one to

Requests that a value(s) be loaded into the memory of the specified time multiplex switch
(TMS). LOAD:UT-TMS-A
5E12 - 5E14
Requests that a value(s) be loaded into the memory of the specified time multiplex switch (TMS).

**LOAD:**UT-TMS-B  
5E15 and later

Requests that a value be loaded into the memory of the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).

**LOAD:**UT-TMUX  
5E12 and later

Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the communications module processor (CMP).

**OP:**UT-CMP  
5E12 and later

Requests a report on the status of one or all of the generic utilities WHEN clauses in the specified packet interface unit (PI).

**OP:**UT-MCTSI-PI  
5E12 and later

Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the specified packet switch unit protocol handler (PSUPH).

**OP:**UT-PSUPH-A  
5E12 - 5E15

Requests a report on the status of one or all of the generic utilities WHEN clauses in the specified packet switch unit protocol handler (PSUPH).

**OP:**UT-PSUPH-B  
5E16(1) and later

Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the switching module (SM).

**OP:**UT-SM  
5E12 and later

Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.

**TRC:**UTIL-A  
5E12 only

Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.

**TRC:**UTIL-B  
5E13 - 5E14

Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.

**TRC:**UTIL-C  
5E15 - 5E16(1)

Requests a utility call trace snapshot of the resources used by an in-progress call, and to update the hardware call trace Master Control Center (MCC) page with new trace data.

**TRC:**UTIL-D  
5E16(2) and later

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).

**WHEN:**UT-CMP-A  
5E12 - 5E14

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).

**WHEN:**UT-CMP-B  
5E15 and later

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet interface unit (PI).

**WHEN:**UT-MCTSI-PI  
5E12 and later

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).

**WHEN:**UT-PSUPH-A  
5E12 - 5E14

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).

**WHEN:**UT-PSUPH-B  
5E15 only

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).

**WHEN:**UT-PSUPH-C  
5E16(1) and later

Requests a temporary generic utility breakpoint be defined using and address of an application program in the specified switching module (SM/SM-2000).

**WHEN:**UT-SM-A  
5E12 - 5E16(1)

Requests a temporary generic utility breakpoint be defined using and address of an application program in the specified switching module (SM/SM-2000).

**WHEN:**UT-SM-B  
5E16(2) and later

### 246. UTILITY CALL TRACE

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
</table>
| Request output containing the busy/idle status of T1 facility channels, and how they are populated with circuit switched voice (CSV) and circuit switched data (CSD) (DS0 and/or wideband) calls. | **OP:**CHANMAP-A  
5E12 only |
| Request output containing the busy/idle status of T1 facility channels, and how they are populated with circuit switched voice (CSV) and circuit switched data (CSD) (DS0 and/or wideband) calls. | **OP:**CHANMAP-B  
5E13 and later |

### 247. UTILITY VARIABLE

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
</table>
| Requests that data be copied from an administrative module (AM) generic access package (GRASP) in utility variable to virtual addresses in main memory and in registers as an action associated with a breakpoint. | **COPY:**UVAR  
5E12 and later |
Dumps the contents of one or more administrative module (AM) generic access package (GRASP) utility variables either as an immediate message or as an action associated with a breakpoint.

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dumps the contents of one or more administrative module (AM) generic access package (GRASP) utility variables either as an immediate message or as an action associated with a breakpoint.</td>
<td>DUMP:UVAR 5E12 and later</td>
</tr>
</tbody>
</table>

Loads administrative module (AM) generic access package (GRASP) utility variable with specified data as an immediate operation or as an action associated with a breakpoint.

<table>
<thead>
<tr>
<th>Topic/Purpose</th>
<th>Message ID/ Software Release Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loads administrative module (AM) generic access package (GRASP) utility variable with specified data as an immediate operation or as an action associated with a breakpoint.</td>

The requested audit is already running. (They may have been initiated manually, or by a system process.) This number is controlled by a parameter in the system integrity monitor control (SIMCNTL) record in the equipment configuration database (ECD).

The OP:AUD input message may be used to obtain further information about currently running audits that may be preventing the initiation of the requested audit.

A kernel process audit is already running. Only one kernel process audit may run at any one time. (It may have been initiated manually or by a system process.)

The OP:AUD input message may be used to obtain further information about currently running audits which may be preventing the initiation of the requested audit.

The maximum number of supervisor process audits is already running. (They may have been initiated manually or by a system process.) This number is controlled by a parameter in the SIMCNTL record in the ECD.

The OP:AUD input message may be used to obtain further information about currently running audits which may be preventing the initiation of the requested audit.

Another audit with the same name is already running. Only uniquely named audits are permitted to run at the same time.

The OP:AUD input message may be used to obtain further information about currently running audits which may be preventing the initiation of the requested audit.

Audit system initialization is in progress.

Audit system initialization failed.

SIM was unable to access an equipment configuration database record using a record identifier (RID) passed to it by the input message program.

SIM failed to start the audit.

System integrity output formatter is dead.

An invalid record identifier (RID) was passed to SIM by the input message program.

An invalid instance record identifier (RID) was passed to SIM by the input message program.

Cannot stop a non-segmented audit.
1. APPENDIX

EXPLANATION OF NG RESPONSES APPENDIX

The following is a list of no good (NG) system responses that are used with many of the 5ESS® switch input messages for communication module (CM) units. NG acknowledgements are used when the syntax of a message is valid, but the message has been denied. Additional information is printed out to explain why the message was denied. Not all responses apply to all messages.

NG - ALL NOT VALID WITH A SINGLE UNIT = The ALL option was entered along with a single unit request, which is invalid.

NG - ATTEMPT TO ABORT OR STOP FAILED = A failure was encountered when trying to send an abort or stop request to another process. Try again later.

NG - ATTEMPT TO QUEUE OR SEND REQUEST FAILED = The request could not be put on the deferred maintenance queue, or a failure was encountered when trying to send the request.

NG - CM IS NOT ISOLATED FROM AM = The request has been denied because the CM was not isolated from the administrative module (AM) at the time of the request.

NG - CM ISOLATED FROM AM = The requested action cannot be performed because the CM has been manually isolated from the AM.

NG - COMMUNICATION MODULE VINTAGE MUST BE CM2 = The requested action has been denied because the communication module was an incorrect CM vintage.

NG - DEGROW OPTION NOT VALID FOR CM3 = The DEGROW option is no longer valid for the CM3 removal of a QGP or QLPS.

NG - DLI DOES NOT EXIST IN RSM = A message for a dual link interface (DLI) was entered, but the switching module (SM) type was found to be a remote switching module (RSM). No DLIs exist in an RSM.

NG - EX ALREADY QUEUED = An exercise (EX) START message was entered for unit on which an exercise is already running.

NG - EX INVALID FOR UNIT = An exercise (EX) was requested for a unit that an exercise cannot be run on. [Exercises can only be run on subunits; such as, they can be run on a module message processor (MMP), but not the entire message switch (MSGS).]

NG - EX NOT STARTED = An EX message (other than the START message) was entered for a unit on which there was no exercise previously running.

NG - FRC OPTION INVALID = The FORCE option no longer exists for the restore (RST) message.

NG - GROWTH BOARD IN GROWTH STATE = A request was made for a module message processor (MMP), but because the MMP growth board is in the GROWTH state, the request could not be honored.
NG - HELPER OPTION INVALID FOR UNIT = The HELPER option was entered for an invalid unit.

NG - INHIBIT OR ALLOW REQUEST NOT VALID FOR THIS UNIT = An inhibit or allow request was made for a unit for which hardware checks cannot be inhibited or allowed.

NG - INVALID COMMAND OR MISSING OPTION = Either the message entered is invalid or no option was entered for a message where one of several options is required.

NG - INVALID DLI SIDE SPECIFIED = The dual link interface (DLI) side entered in the input message was not 0 or 1.

NG - INVALID HELPER SIDE SPECIFIED = The HELPER side entered in the input message was not 0 or 1.

NG - INVALID MESSAGE OPTION = An invalid option was entered in the message. An example would be entering an unconditional (UCL) option on a RMV:MMP message.

NG - INVALID OPTION COMBINATION = Two options were entered together that don't make sense; for example, both MAJOR AND MINOR for an ONTC request.

NG - INVALID OR MISSING OPTION = No option was entered for a message that requires at least one of several options to be entered.

NG - INVALID RANGE = A request was entered with an invalid range, for example a range in decreasing order rather than increasing order.

NG - MAJOR OPTION INVALID FOR UNIT = The MAJOR option was entered for a unit other than the office network and timing complex (ONTC) or office network and timing complex common unit (ONTCCOM).

NG - MATE HELPER NOT IN SERVICE = A HELPER option was entered but the mate HELPER is not in service, therefore the request must be denied.

NG - NEED GROW OPTION FOR UNIT IN GROWTH STATE = The unit is in a growth or special growth state, and the GROW option was not used on the request.

NG - NEED GROW OPTION WHEN SM IS IN GROWTH STATE = All equipped SMs in the specified range are in the SGRO state, but no GROW option was used on the request.

NG - NO DLIs REQUESTED ARE EQUIPPED = No dual link interfaces (DLIs) in the range requested are equipped.

NG - NO HARDWARE CHECKS FOR CM1 MSCU = Messages to inhibit and allow hardware checks are not valid for a communication module model 1 (CM1) message switch control unit (MSCU).

NG - NO SMs REQUESTED ARE EQUIPPED = No switching modules (SMs) in the range requested are equipped.

NG - NO UNITs REQUESTED ARE EQUIPPED = No units in the range requested are equipped.

NG - NOT IN REQUESTED STATE = No units were found in the requested state.

NG - OFFLINE PARTITIONS NOT MOUNTED = The request requires access to files on the offline disk but no offline disk partitions are mounted.

NG - REMOVE REQUEST INVALID FOR TMSLNK = A remove is not a valid request for a TMSLNK.

NG - REQUEST ALREADY ACTIVE = A message was entered to stop or abort an action that is in an active state.
that cannot be stopped or aborted. An example of this is a remove request. Once it has been
scheduled from the deferred maintenance queue (DMQ), it cannot be stopped.

NG - REQUEST CANNOT BE ABORTED OR STOPPED = A message was entered to stop or abort an action that is
in a state where it cannot be stopped or aborted. An example of this is a remove request. Once it
has been scheduled from the deferred maintenance queue (DMQ), it cannot be stopped.

NG - REQUEST INVALID FOR UNIT = An invalid request was made for the unit.

NG - REQUEST NOT FOUND ON CM DMQ = A stop or abort was entered, and the unit and action could not be
found on the communication module deferred maintenance queue (DMQ). Use the
OP:DMQ-CM-SM input message to check what is currently on the queue.

NG - REQUEST NOT VALID FOR CM3 = A command was entered which is not supported by offices having CM3
vintage communications modules. Commands to diagnose or exercise individual message switch
subunits are not valid for CM3.

NG - RSMCL OPTION NOT VALID FOR CM3 = The RSMCL option is no longer valid for CM3. This option was
previously used to select an MMP/SDLC for RSMs. For CM3, this option will now be handled
automatically by Recent Change.

NG - STBY OPTION INVALID = The standby (STBY) option was entered for a unit that does not run
active/standby.

NG - SWITCH INVALID ON UNIT TYPE = A request was made to switch a unit for which a switch request is not
valid.

NG - TOO LATE TO ABORT OR STOP REQUEST = A request was made to stop or abort a diagnostic request
after the diagnostic was completed but before it was removed from the deferred maintenance
queue (DMQ).

NG - UCL OPTION INVALID = The unconditional (UCL) option is not valid on this type of request.

NG - UNIT HAS NO HDWCHK STATUS = An OP:HDWCHK request was made for a unit that hardware checks
cannot be inhibited or allowed on.

NG - UNIT IN GROWTH STATE = The unit is in a growth or special growth state, and the GROWTH option was
not used on the request.

NG - UNIT TYPE INCOMPATIBLE WITH NC TYPE = A request was made for a network clock subunit which is
inconsistent with the type of clock equipped.

NG - UNIT UNEQUIPPED = The unit the message was entered for is not in an operational state.

* These represent the limits imposed by input messages. The actual member numbers of units in a administrative module (AM) computer system are defined in the equipment configuration data base for that system.
1. MESSAGE TYPE PARAMETER APPENDIX

If a particular parameter is not associated with a message type, an NA will be displayed in the first field for the parameter.

Some of the following message types have a limited set of parameters sent for event detection point request (EDP-R) messages as opposed to the full set for trigger detection point request (TDP-R) messages. In the following message types, the parameters that apply to the EDP-R are marked with an * to the right of the parameter. The rest of the parameters associated with the message type will not be included in the EDP-R messages whether populated or not. Also, note that for those message types that distinguish between EDP-R and TDP-R, the notification indicator parameter will only be part of the EDP-R and not the TDP-R.

**APP:POINT-CODE**

**Software Release:** 5E14 and later  
**Message Class:** N/A  
**Application:** 5  
**Type:** Input

## 1. APPENDIX

The following describes the destination point code (entered as DPC or DPCID in input messages) and origination point code (entered as OPC) input parameters are entered as 9-digit numbers of the form:

```
aaabbbddd
```

These parameters can be parsed into four possible formats.

The last format is used for CNI inter-module trunks (IMTs) and only applies to DPCs.

### Format 1: ANSI® format

<table>
<thead>
<tr>
<th>variable</th>
<th>value(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa</td>
<td>network (001-235, 237-253, 255)</td>
</tr>
<tr>
<td>bbc</td>
<td>cluster (000-255)</td>
</tr>
<tr>
<td>ddd</td>
<td>cluster member (000-255)</td>
</tr>
</tbody>
</table>

### Format 2: AT&T format

<table>
<thead>
<tr>
<th>variable</th>
<th>value(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa</td>
<td>network (254)</td>
</tr>
<tr>
<td>bb</td>
<td>cluster region (00-31)</td>
</tr>
<tr>
<td>c</td>
<td>cluster type (0-7)</td>
</tr>
<tr>
<td>ddd</td>
<td>cluster member (000-255)</td>
</tr>
</tbody>
</table>

### Format 3: UNITEL format

<table>
<thead>
<tr>
<th>variable</th>
<th>value(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa</td>
<td>network (236)</td>
</tr>
<tr>
<td>bb</td>
<td>cluster region (00-31)</td>
</tr>
<tr>
<td>c</td>
<td>cluster type (0-7)</td>
</tr>
<tr>
<td>ddd</td>
<td>cluster member (000-255)</td>
</tr>
</tbody>
</table>

### Format 4: IMT format

<table>
<thead>
<tr>
<th>variable</th>
<th>value(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa</td>
<td>network (000)</td>
</tr>
<tr>
<td>bbc</td>
<td>near SM number (1-192)</td>
</tr>
<tr>
<td>ddd</td>
<td>far SM number (1-192)</td>
</tr>
</tbody>
</table>

An OPC is entered based upon the value of its network. DPCs are entered based upon their own network and the network of their corresponding OPCs, as delineated in the table below:

<table>
<thead>
<tr>
<th>DPC network</th>
<th>OPC uses Format 1</th>
<th>OPC uses Format 2</th>
<th>OPC uses Format 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>network = 254</td>
<td>use Format 1</td>
<td>use Format 1</td>
<td>use Format 1</td>
</tr>
<tr>
<td>network = 236</td>
<td>use Format 1</td>
<td>use Format 1</td>
<td>use Format 1</td>
</tr>
<tr>
<td>network = 0</td>
<td>use Format 4</td>
<td>use Format 4</td>
<td>use Format 4</td>
</tr>
</tbody>
</table>
APP: RANGES

Software Release: 5E14 and later
Message Class: N/A
Application: 5
Type: Input

1. APPENDIX: UNIT/EQUIPMENT RANGES FOR INPUT MESSAGES

This appendix is a list of units/equipment and the valid maximum range for use in input messages. This maximum may not coincide with the way that an individual switch is configured.

Access Interface Unit (AIU)

<table>
<thead>
<tr>
<th>Unit/Equipment</th>

### APPENDIX: SYSTEM RESPONSES

<table>
<thead>
<tr>
<th>Acknowledgement</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP</td>
<td>In progress. Request received and initiated. Further output will follow.</td>
</tr>
<tr>
<td>NA</td>
<td>No acknowledgment. Normally, the system acknowledges an input request within 5 to 10 seconds. If control of the message processing has been lost, NA is output to indicate an acknowledgment failure. Input message execution may or may not complete. Normal results will occur if the execution completes successfully. The NA response should only occur during abnormal circumstances such as overload conditions.</td>
</tr>
<tr>
<td>NG</td>
<td>No good. The message was received, but the request conflicts with the current system or equipment status; for example, an attempt was made to restore a unit that is being diagnosed.</td>
</tr>
<tr>
<td>NO</td>
<td>Feature not available. The requested action failed because the feature required to process the request is not present in the switch or the given module.</td>
</tr>
<tr>
<td>OK</td>
<td>Good. The message was received, the appropriate process was initiated, and work was completed.</td>
</tr>
<tr>
<td>PF</td>
<td>Printout follows. The request was received and will be acted upon. A printout will follow sometime later to explain in detail the results of the work initiated by the IM. This printout may be a termination report that may include the result of the work initiated by the IM.</td>
</tr>
<tr>
<td>RL</td>
<td>Retry later. Request cannot be executed now because resources are unavailable or the requested process is busy. The message may be entered again later.</td>
</tr>
<tr>
<td>?A</td>
<td>Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted.</td>
</tr>
<tr>
<td>?D</td>
<td>Data field or a block of parameters following the DATA parameter contains an error. It may mean that an item was incorrectly typed or improper data was entered, or that a keyword or execute symbol was omitted. The message should be checked in the Input Messages document.</td>
</tr>
<tr>
<td>?E</td>
<td>Error exists in the message but cannot be resolved to the proper field.</td>
</tr>
<tr>
<td>?T</td>
<td>Time-out has occurred on the channel. Input has not been received within the allotted time, and processing of the message has been aborted.</td>
</tr>
<tr>
<td>?V</td>
<td>Verb field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted.</td>
</tr>
<tr>
<td>?X</td>
<td>A request has been made to abort the current message or to interrupt the current output process.</td>
</tr>
</tbody>

Notes:

a. The standard 105 test includes: 105L, 105RN, 105N, and 105NT.

b. The 105RL (return loss) test includes: 105ERL, 105SRL, and 105SHI.

d. The 105ALL test includes the following 105 test line tests: 105L, 105RN, 105N, 105L4, 105L10, 105L28, and 105NT.

e. 102LB test executes 1004 Hz at 0dB transmission and C-message noise filter used in measurement for noise. This test was designed for APX BSSAPS2 and IVT trunks.
APP:TRFC-SECTION

Software Release: 5E14 and later
Command Group: N/A
Application: 5
Type: Input

1. APPENDIX: TRAFFIC SECTIONS

This appendix identifies the sections of the 30-minute traffic report (TRFC30) by section number and section name.

Some section names are followed by an 'x' which denotes that an identifier is required for requests to allow (ALW) or inhibit (INH) that section for TRFC30 for collection (CLCT) and/or for output to the receive-only printer (ROP). The descriptions (contents) for those sections include "For CLCT" and/or "For ROP/OP" with information as to what identifiers are required for CLCT and/or ROP/OP.

For the sections that are limited for collection the section description includes "For CLCT"; the input message format is for example:

\{ALW|INH\}:TRFC30,CLCT,PSPORT=sm-shelf-dslg

The description also indicates the maximum number of units that can be collected.

Some of those sections have limited ROP output and when "for ROP/OP" specifies "x" equals one of the following and lists the possible keywords (UNIT, HIGH, LOW, HILO); the input message format is for example:

\{ALW|INH\}:TRFC30,ROP,PSPORT,HIGH=1

For other sections that have limited ROP "for ROP/OP" specifies "x = some identifier; the input message format is for example:

\{ALW|INH\}:TRFC30,ROP,TG="trunk group identifier(s)"

The sections whose section names are followed by 'x' can also be requested for output (OP) (of the most recent report) using identifiers for example:

OP:TRFC30,PSORT,HIGH=2

in which case the requested records are output (if available). However, if no identifiers are provided for example:

OP:TRFC30,PSORT

the previously allowed records are output (if any were allowed).

Other section names are followed by '[o]' which denotes that an identifier is optional for ALW, INH, or OP input messages. For these sections there are no "For CLCT" cases since everything generated will be collected; the option applies only to output. If no identifiers are specified the default is that all records collected will be output for example:

OP:TRFC30,CORC

However, specific records can be output using keywords for example:

OP:TRFC30,CORC,UNIT=sm

To allow (ALW) or inhibit (INH) specific records using keywords for example:

\{ALW|INH\}:TRFC30,ROP,CORC,UNIT=sm
For sections where there is no ‘x’ or ‘[o]’ (that is, cannot accept an identifier)

**ALW:TRFC30,ROP,"section name"**

will cause all collected records to print every time the report is generated until inhibited for output by

**INH:TRFC30,ROP,"section name"**.

While:

**OP:TRFC30,"section name"**

will print every record collected for the most recent report.

Unless specifics are provided “for CLCT”, ALW/INH for CLCT requires only the section name: ALW/INH for TRFCH requires only the section name.

**NOTE:** When entering variables, separate the field and its variable with an equal sign. For lists, elements are hyphen (-) separated.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>ACDBRCS</td>
<td>182</td>
<td>Automatic call distributor (ACD)/business and residential customer services (BRCS) measures.</td>
</tr>
</tbody>
</table>
| ACSR x       | 108            | Automatic customer station rearrangement (ACSR) measures.  
Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection.  
For ROP/OP, where 'x' = ACSR group ID, a maximum of six IDs can be entered. |
| ADPIDB x     | 229            | AIU directly-connected peripheral interface data bus counts.  
For CLCT/ROP, first allow this section for collection or printing (‘x’ is not used), then enable at least one SHELF and AIU using RC/V Views 13.7 (MEASUREMENT COLLECTION SELECTIVITY) and 13.8 (MEASUREMENT RANGE SELECTIVITY).  
For OP, ‘x’ is a SM-SHELF-AIU set and is identified completely by SM#-SHELF#-AIU#. A maximum of six (6) sets can be entered. |
| AIU          | 216            | Access interface unit (AIU) counts.  
Allow this section for collection and then select AIU(s) using RC/V Views 13.7 and 13.8.  
For ROP printing, all AIUs selected for collection are printed when the ALW input message is used.  
For ROP printing, allow this section first and then select AIUs using RC/V Views 13.7 and 13.8. If no AIUs are selected, the default set of AIUs selected for collection will be printed. |
| AIULC x      | 218            | AIU line counts for a specific AIU.  
For CLCT, allow this section for collection and then select one single AIU using RC/V Views 13.7 and 13.8. An AIU is defined as a SM#-AIU# and a maximum of one AIU can be requested through RC/V.  
For ROP/OP, ‘x’ is a line component and is identified completely by SM#-AIU#-AP#-LC#. A maximum of six (6) line component patterns can be entered where SM#-AIU# is consistent.  
For ROP printing, allow this section first (without specifying ‘x’) and then select individual lines using RC/V Views 13.7 and 13.8. |
Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

</tbody>
</table>

| APDL | 59 | Application processor data link (APDL) measures. |
| ANNC | 46 | Announcement services measures. |

| APSODB x | 228 | AIU Packet Switching On-Demand B-channel counts. |
|         |     | For CLCT/ROP, first allow this section for collection or printing ('x' is not used), then enable at least one AIU using RC/V Views 13.7 and 13.8. |
|         |     | For OP, 'x' is a SM-AIU set and is identified completely by SM#-AIU#. A maximum of six (6) AIUs can be entered. |

| ARS x | 35 | Automatic route selection (ARS) measures. |
|       |     | For ROP/OP, where 'x' = the lead (MCRTPIDX) of an ARS pattern group, a maximum of five patterns can be entered. |

| ASP | 231 | Advanced service platform non toll free. |
|     |     | **NOTE:** The output depends on OFID 1006. If OFID 1006 is switched off then the section 231 (ASP) with single precision counters can be used. For OFID 1006 switched on the section 85 (ASPN) with double precision counters can be used (5E16(2)+). |

| ASPLG | 117 | Advanced service platform large. |

| ASPN | 85 | Advanced service platform non toll free (5E16(2)+) |
|      |     | **NOTE:** The output depends on OFID 1006. If OFID 1006 is switched off then the section 231 (ASP) with single precision counters can be used. For OFID 1006 switched on the section 85 (ASPN) with double precision counters can be used. |

| ASPTF | 232 | Advanced service platform toll free. |
|       |     | **NOTE:** The output depends on OFID 1006. If OFID 1006 is switched off then the section 232 (ASPTF) with single precision counters can be used. For OFID 1006 switched on the section 86 (ASPTFN) with double precision counters can be used (5E16(2)+). |

| ASPTFN | 86 | Advanced service platform toll free (5E16(2)+) |
|        |     | **NOTE:** The output depends on OFID 1006. If OFID 1006 is switched off then the section 232 (ASPTF) with single precision counters can be used. For OFID 1006 switched on the section 86 (ASPTFN) with double precision counters can be used. |

| ATMLNK | 167 | ATM link measurements (5E17(1)+) |
|        |     | For OP request, x equals SM-PSU-LINK-LINKTYPE. |
|        |     | Where: |
|        |     | **SM** = Switching module. |
**PSU** = Packet switch unit (0-1).
**LINK** = Link number (1-10).
**LINKTYPE** = Link type. Valid value(s):
  - B = ATM backhaul.
  - P = ATM PSU link using PHA2.

**ATMQOSPS x** 239 ATM quality of service for PSU to PSU connection (5E17(1)+). For OP request, x equals NCA-LINK-FSID-FCA-CP-DIR.

Where:
- **NCA** = Near PSU community address (1-254).
- **LINK** = Link number (1 - 10).
- **FSID** = Far PSU subnet ID. When PSU CA expansion feature is active, the range of far subnet ID is 0 to 3. When DLCI expansion feature is active, the range of far subnet ID is 0 to 15.
- **FCA** = Far PSU community address (1-254).
- **CP** = Connection priority. Valid value(s):
  - H = High.
  - L = Low.
- **DIR** = ATM PSU-PSU connection PM direction. Valid value(s):
  - I = Incoming.
  - O = Outgoing.

**ATTG x** 33 Attendant group (ATTG) measures.

Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection.

For ROP/OP, where ’x’ = attendant group ID, a maximum of five IDs can be entered.

**BCHNEG 80** B-channel negotiation (BCHNEG) (5E14+).

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection. A BCHNEG is defined as a BTG# and a maximum of 640 components can be requested.

For OP request, where ’x’ equal BTG#, a maximum of six units can be entered.

**BCLID x** 147 Bulk calling line identification (BCLID).

For CLCT, [ALW| INH] : TRFC30, CLCT, BCLID=x-x-x-x-x-x-x-x-x where ’x’ equals business customer identifier (BCID), a maximum of 25 can be studied in an office; nine can be entered with a single input request.

ALL (with INH only) inhibits all BCIDs that are allowed for collection; the list of BCIDs is saved.

PREV (with ALW only) reactivates the previously allowed list of BCIDs if PREV is the first ALW request after the list was inhibited.

For ROP/OP, where ’x’ equals one of the following:
- UNIT=Business customer identifier#
- HIGH=count#
- LOW=count#
- HILO=count#
### BEARERLNK

<table>
<thead>
<tr>
<th>BEARERLNK</th>
<th>208</th>
</tr>
</thead>
</table>

Bearer link measurements (5E16(2)+)

For CLCT and ROP printing, enable components using RC/V View 13.7 and 13.8 before allowing this section for collection and ROP.

To allow/inhibit for collection:

```
ALW| INH:TRFC30, CLCT, BEARERLNK
```

For CLCT, you can use `'o'` equals ALL, with INH, inhibits all SM-BNID from collection and reporting, with ALW, allows all existing SM-BNID.

To allow/inhibit for ROP output:

```
ALW| INH:TRFC30, ROP, BEARERLNK
```

To allow/inhibit for TRFCH output:

```
ALW| INH:TRFC30, TRFCH, BEARERLNK
```

Request for immediate output:

```
OP:TRFC30, BEARERLNK=x-x-x-x-x-x
```

(max of 6 units), where `x`=SM-BNID.

Or, `OP:TRFC30, BEARERLNK` will print whatever is allowed on RC/V view.

### BICCG [o]

<table>
<thead>
<tr>
<th>BICCG</th>
<th>205</th>
</tr>
</thead>
</table>

BICC group measurements (BICCG) (5E15+).

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection. A BICCG is defined as a BICCG#.

For OP request, `'o'` is a BICCG and is identified completely by a: BICCG#

Refer to the APP:RANGES appendix in the Appendixes section of the Input Message manual.

A maximum of thirteen line patterns can be entered.

### BICCSM [o]

<table>
<thead>
<tr>
<th>BICCSM</th>
<th>207</th>
</tr>
</thead>
</table>

BICC group/SM measurements (BICCSM) (5E16(1)+).

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection. A component is defined as a BICCG#-SM#.

For OP request, `'o'` is a BICCG-SM set and is identified completely by a: BICCG#-SM#

Refer to the APP:RANGES appendix in the Appendixes section of the Input Message manual.

A maximum of seven (7) sets can be entered.

### BRCF x

<table>
<thead>
<tr>
<th>BRCF</th>
<th>29</th>
</tr>
</thead>
</table>

Business and residential customer service feature (BRCF) measures.

Enable groups using RC/V View 13.3 (BRCS MEASUREMENTS) before allowing this section (or ALL) for collection.

For ROP/OP, where `x` = BRCS feature (feature ID), a maximum of five features is allowed.

### BRCS

<table>
<thead>
<tr>
<th>BRCS</th>
<th>26</th>
</tr>
</thead>
</table>

Business and residential customer services (BRCS) office totals.

### CDN x

<table>
<thead>
<tr>
<th>CDN</th>
<th>128</th>
</tr>
</thead>
</table>

Customer directory number (CDN) counts reported on a directory number (DN) basis (analog lines only).
For CLCT, ‘x’ equals one of the following:

- **DN=DN(7 digits)** = A maximum of six hyphen separated DNs can be entered with a single input request. (This applies for {ALW|INH} ROP also).
- **DN=ALL** = (with INH only) Inhibits all DNs that are currently allowed for collection; the list of DNs is saved.
- **DN=PREV** = (with ALW only) Reactivates the previously inhibited list of DNs if PREV is the first ALW request after the list was inhibited.
- **RANGE=DN1&&DN2** = This section has introduced the allowing/inhibiting of a DN range to ease data entry. This range is limited to 25 DNs. DN1 and DN2 are the lower and upper bounds of the range of DNs respectively.

A maximum of 250 DNs can be studied in an office, where all DNs studied can reside on any one SM. Up to 20 DNs under study may be allowed for ROP output.

### APP:RANGES Appendix

<table>
<thead>
<tr>
<th>CMIX</th>
<th>253</th>
<th>Call Mix (CMIX) measurements [SET(1)+].</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMP</td>
<td>126</td>
<td>Communication module processor (CMP).</td>
</tr>
<tr>
<td>CORC</td>
<td>27</td>
<td>Customer-originated RC/V (CORC) traffic measures.</td>
</tr>
</tbody>
</table>

For ROP/OP, where ‘o’ equals one of the following:

- **UNIT=SM#**
- **HIGH=count#**
- **LOW=count#**
- **HILO=count#**

A maximum of six switching modules (SMs) or one count can be entered.

### CT

- **5** Call type (CT) information.

### CTS x

- **125** Control time slot (CTS) link occupancy measurements.

For ROP/OP, where ‘x’ equals one of the following:

- **UNIT=SM#**
- **HIGH=count#**
- **LOW=count#**
- **HILO=count#**

A maximum of six SMs or one count can be entered.

### DCLU

- **21** Digital carrier line unit (DCLU).

### DLINE x

- **222** Digital network unit synchronous optical network (SONET) (DNU-S) - lines counts.

For CLCT and ROP printing, enable one or more lines using RC/V Views 13.7 and 13.8 before allowing this section for collection. A line is defined as a SM#-DNUS#-RDT#-LINE# and a maximum of 512 lines can be requested through RC/V.

For OP request, ‘x’ is a line and is identified completely by an IDLC network equipment number (INEN): SM#-DNUS#-RDT#-LINE#.

Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

A maximum of six line patterns can be entered.

### DLN

- **66** Direct link node (DLN).

### DLTU

- **16** Digital line/trunk unit (DLTU).

### DMLHG

- **65** Defense switched network/automatic voice network (DSN/AUTOVON) multi-line hunt group (MLHG) (DMLHG). The same MLHGs allowed for section 34 (MLHG) will print for DMLHG.

### DNUS

- **189** Digital networking unit-SONET (DNU-S).

### DODB x

- **223** DNU-S - ODB counts.

For CLCT and ROP printing, enable a maximum of one DNU-S using RC/V Views 13.7 and 13.8 before allowing this section for collection. A individual DNU-S is defined as a SM#-DNUS#.
For OP request, where ‘x’ equals SM#-DNUS#-PSU#-PSU_SHELF#, a maximum of six units can be entered.

For CLCT, where ‘x’ equals one of the following (only one of the study sets can be active):
LCEN=SM#-ISLU# |
or
LCKEN=SM#-ISLU#
for allowing all (up to maximum of 1024) DSLs on one ISLU. A maximum of one ISLU can be entered.

For allowing individually selected DSLs served by an ISLU (LCEN) or an ISLU2 (LCKEN). A maximum of 1024 can be selected, four per request.
LCEN=SM#-ISLU#-LG#-LC#
LCKEN=SM#-ISLU#-LG#-LB#-LCKT#
PREV (with ALW only) reactivates the previously allowed individually selected DSLs if PREV is the first request after an INH-ALL.

ALL (with INH only) inhibits whichever study set is allowed for collection. If an individual study set is allowed for collection then the list of DSLs will be saved when the section is inhibited for collection. If an ISLU study set is allowed for collection, nothing is saved when it is inhibited.

For ROP/OP, where ‘x’ equals one of the following:
LCEN=SM#-ISLU#-LG#-LC#
LCKEN=SM#-ISLU#-LG#-LB#-LCKT#
HIGH=count# |
HILO=count# |
LOW=count#
 a maximum of four DSLs or one count can be entered.

For ECDN, where ‘x’ equals one of the following:

To allow/inhibit for collection

ALW|INH:TRFC30,CLCT,IPIDB

To allow/inhibit for output

ALW|INH:TRFC30,ROP,IPIDB=x

where 'x' equals SM#-IDCU#. It is possible to allow at most 10 IDCUs for ROP at the moment (5 per request).

Request for immediate output

OP:TRFC30,IPIDB

IRT x | 143  IDCU remote digital terminal (RT) counts.

For CLCT, where 'x' equals one of the following (only one of the study sets can be active at one time):

GROUP=SM#-IDCU# for allowing all RTs on an IDCU. A maximum of 25 SM-IDCU pairs can be entered, eight per request.

PREV (with ALW only) reactivates the previously allowed study set if PREV is the first request after an INH.

ALL:
with INH : inhibits whichever study set is allowed for collection.
The study set is saved.

with ALW : allows all existing (but not more than 800) RTs for collection.

UNIT=SM#-IDCU#-RT# for allowing individual RTs. A maximum of 800 RTs can be entered, eight per request.

For ROP/OP, where 'x' equals one of the following:
UNIT=SM#-IDCU#-RT#
HIGH=count#
LOW=count#
HILO=count#

a maximum of six units or one count can be entered.

IPOIU o | 259  IP OIU measurements (5E16(2)+)

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection and ROP.

To allow/inhibit for collection:

ALW|INH:TRFC30,CLCT,IPOIU,PART={a|all}

where "a" is an individual part number.

For CLCT, you can use 'o' equals ALL, with INH, inhibits all SM-OIU-PG from collection and reporting with ALW, allows all existing SM-OIU-PG.

To allow/inhibit for ROP output:
ALW|INH:TRFC30,ROP,IPOIU,PART={a|all}

where "a" is an individual part number.

To allow/inhibit for TRFCH output:

ALW|INH:TRFC30,TRFCH,IPOIU,PART={a|all}

where "a" is an individual part number.

Request for immediate output:

OP:TRFC30,IPOIU=x-x-x-x-x-x,PART={a|all}

where "x" = SM-OIU-PG and "a" is an individual part number.

or

OP:TRFC30,IPOIU,PART={a|all}

where "a" is an individual part number. will print whatever is allowed on RC/V view.

ISLU 49 Integrated services line unit (ISLU).

ISM [o] 53 ISDN switching module (ISM).

For ROP/OP, where ‘o’ equals one of the following:

UNIT=SM#
HIGH=count#
LOW=count#
HILO=count#

a maximum of six SMs or one count can be entered.

ISOFC 50 ISDN office totals (ISOFC).

ISPI [o] 51 Packet interface (PI) measurements.

For ROP/OP, where ‘o’ equals one of the following:

UNIT=SM#
HIGH=count#
LOW=count#
HILO=count#

a maximum of six SMs or one count can be entered.

ISUP 120 ISDN user part (ISUP) office totals.

IPT 198 Intelligent peripheral trunks (IPT).

For ROP/OP, execute:

ALW:TRFC30,rop,IPT

OP:TRFC30,IPT

For CLCT, a maximum of 25 can be studied in an office using RC/V. If none is allowed for
collection then inhibit collection will be set.

For ROP/OP, execute:

ALW:TRFC30,rop,IPT

OP:TRFC30,IPT

LAG x 251 Line Access Gateway (LAG) measurements [5E16(1)+].

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before
allowing this section for collection and ROP.

To allow/inhibit for collection:

ALW|INH:TRFC30,CLCT,LAG
To allow/inhibit for ROP output:

ALW|INH:TRFC30,ROP,LAG

To allow/inhibit for TRFCH output:

ALW|INH:TRFC30,TRFCH,LAG

Request for immediate output

OP:TRFC30,LAG=x-x-x-x-x-x (max of 6 units), where x=SM#-LAG#.

or OP:TRFC30,LAG will print whatever is allowed on RC/V view.

LASS 76 Local area signaling services (LASS) office totals.

LGC x 145 Line group controller (LGC) measurements. For CLCT, where 'x' equals a study group (1-5). The members of an LGC study group consist of unique SM/ISLU(RISLU) pairs; however, the same SM/ISLU(RISLU) pairs may appear in multiple study groups. These SM/ISLU(RISLU) pairs are assigned to a study group using RC view 13.6 (up to 100 unique pairs per study group can be assigned). A maximum of five study groups can be allowed for collection.

NOTE: If an LGC(s) becomes operational on any ISLU that is a member of a study group previously allowed for collection, the counts will not be generated on those additional LGC(s) until the study group is reallowed for CLCT.

For ROP/OP, where 'x' equals one of the following:
UNIT=SM#-ISLU#-LGC#
HIGH=count#
HILO=count#
LOW=count#
a maximum of six LGCs or one count can be entered.

LINE x 90 Per LINE measurements on a concentrator basis. Only lines with non-zero counts will be printed on the ROP.

For CLCT: ([ALW|INH]:TRFC30,CLCT,),
LINE=SM#-line unit#-concentrator#
ILA=SM#-line unit#-concentrator#-line#

LINE=ALL or ILA=ALL (with INH only) inhibits all lines and individual line assignments that were allowed for collection.

A maximum of 20 concentrators and/or 128 individual line assignments (ILA) can be under study simultaneously. A maximum of eight concentrators or six ILAs can be entered with a single input message.

This data can alternatively be entered using RC/V Views 13.4 and 13.5.

**LN 121** Leased network (LN) office totals.

**LU 11** Line unit (LU) measures.

**MAP 181** Mobile application part (MAP) office total measurements.

**MBG x 192** Multiswitch business group (MBG).

For CLCT, `[ALW|INH]:TRFC30,CLCT,MBG=x-x-x-x-x-x-x-x` where 'x' equals multiswitch business group (MBG), a maximum of 20 can be studied in an office; nine can be entered with a single input request.

For ROP/OP, execute:

```
ALW:TRFC30,rop,MBG
```

**MGSC 74** ISDN BRCS message service customer counts. Enable groups using RC/V View 24.11 before allowing this section (or ALL) for collection.

**MGSG 75** ISDN BRCS message service multi-line hunt group counts.

Enable groups using RC/V View 24.10 before allowing this section (or ALL) for collection.

**MH 185** Message Handler (MH) measurements taken on a per MH basis only on SM2000 SMs. Measurements on all active MHs on the switch will be collected and reported.

**MHPipe 177** MH-QLPS pipe occupancy.

**MLHG x 34** Multi-line hunt group (MLHG) measures.

Enable groups using RC/V View 13.3 before allowing this section (or ALL) for collection.

For ROP/OP, where ‘x’ = MLHG ID, a maximum of five IDs can be entered.

**MMP 18** Module message processor (MMP).

**MMSUJMTB 78** Junctors and MTBS activities of MMSU (MMSUJMTB) counts.

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection.

For OP request, where ‘x’ equals SM#-MMSU#-SG#-SHELF#, a maximum of six units can be entered with a single input request.

**MMSUGMTIB 79** GDX-ES and MTIBS activities of MMSU (MMSUGMTIB) counts.

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection.

For OP request, where ‘x’ equals SM#-MMSU#, a maximum of six units can be entered with a single input request.

**MOD1 x 122** Miscellaneous per SM measurements (MOD1).

For ROP/OP, where ‘x’ equals one of the following:

- `UNIT=SM#`
- `HIGH=count#`
- `LOW=count#`
- `HILO=count#`
a maximum of six SMs or one count can be entered.

</thead>
</table>

In an FTS2000 office this section will always be allowed for CLCT (that is, cannot be inhibited). This section will be sent to the network servicing system (ANSER) using EADAS link.

However, in a non-FTS2000 office this section will always be inhibited for CLCT (that is, cannot be allowed).

This section is inhibited for ROP (that is, cannot be allowed) in every office.

</tr>
</thead>
<tbody>
<tr>
<td>ODBPSU x</td>
<td>221</td>
<td>On-demand B-channel - PSU shelf counts.</td>
</tr>
</tbody>
</table>

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection. A individual PSU shelf is defined as a SM#-PSU#-PSU_SHELF# and a maximum of 115 components can be requested.

For OP request, where ‘x’ equals SM#-DNUS#-PSU#-PSU_SHELF#, a maximum of six units can be entered.

| OEIS x | 124| OSPS external information system (OEIS) data links measures. One measurement per EIS link with a maximum of 320 links. |
For ROP/OP, where 'x' equals one of the following:
UNIT=EIS_ID#-LINKNO#
HIGH=count#
LOW=count#
HILO=count#
a maximum of six units or one count can be entered.

OFA 61 OSPS facility administration (OFA) measures.
OFC 3 Office (OFC) totals.
OFF 127 OSPS fast features (OFF) measures.
OINTA 97 OSPS interflow listing services/commercial-automatic call distributor (C-ACD) measures (OINTA).
This was formerly titled OSPS interflow non-toll and assistance (T&A) calls sent measures (OINTA).
OIRCV 96 OSPS interflow T&A calls received (OIRCV) measures.
OISNT 95 OSPS interflow T&A calls sent (OISNT) measures.
OIU x 81 Optical interface unit (OIU) counts [5E16(2)+].

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection and printing to the ROP.

To allow/inhibit for collection:
ALW|INH:TRFC30,CLCT,OIU{,all}
For CLCT, if you use the ALL option, with INH, it will inhibit all SM-OIU from collection and reporting. If you use ALL with ALW, it will allow all existing SM-OIU for collection.

To allow/inhibit for ROP output:
ALW|INH:TRFC30,ROP,OIU
To allow/inhibit for TRFCH output:
ALW|INH:TRFC30,TRFCH,OIU
Request for immediate output:
OP:TRFC30,OIU=x-x-x-x-x-x
where "x" = SM-OIU

OLAC 195 OSPS line applications for consumers (OLAC) signaling measures.
OMISC 123 OSPS miscellaneous calls measures.
ORTR 63 OSPS real-time rating (ORTR) query measures.
OSPS 44 Operator services position system measurements.
OSPSDL [o] 45 Operator Services Position System data links (OSPS-DL) directory assistance system/computer (DAS/C) and/or management information system/computer (MIS/C) measurements.
For ROP/OP, where 'o' equals one of the following:
UNIT=SM#
HIGH=count#
LOW=count#
HILO=count#
a maximum of five SMs or one count can be entered.

OTA 64 OSPS miscellaneous calls.
OTAP 102 OSPS performance.
OVMS 168 OSPS voice messaging service (OVMS) measures.
OVOEQ 101 OSPS call volume and equipment usage.
### PAG Measurements

<table>
<thead>
<tr>
<th>PAG</th>
<th>254</th>
<th>SM PAG measurements [5E16(1)+].</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBG x</td>
<td>119</td>
<td>Packet business group (PBG) counts.</td>
</tr>
</tbody>
</table>

For ROP/OP, where 'x' equals one of the following:
- UNIT=PBG#
- HIGH=count#
- LOW=count#
- HILO=count#

A maximum of five PBGs or one count can be entered.

### PBOCC Measurements

<table>
<thead>
<tr>
<th>PBOCC x</th>
<th>165</th>
<th>PSU2 Packet bus occupancy (PBOCC) measurements [5E17(1)+].</th>
</tr>
</thead>
</table>

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection and ROP. A component is a SM#-PSU# and a maximum of 46 components can be requested through RC/V.

To allow/inhibit for collection:
- ALW|INH:TRFC30,CLCT,PBOCC

To allow/inhibit for ROP output:
- ALW|INH:TRFC30,ROP,PBOCC

To allow/inhibit for TRFCH output:
- ALW|INH:TRFC30,TRFCH,PBOCC

Request for immediate output:
- OP:TRFC30,PBOCC=x-x-x-x-x-x (max of 6 units), where x=SM#-PSU#. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual for the range of values for SM# and PSU#.

or OP:TRFC30,PBOCC will print all of the components enabled for ROP output on RC/V Views 13.7 and 13.8.

### PC Measurements

<table>
<thead>
<tr>
<th>PC x</th>
<th>234</th>
<th>Message transfer part point code (PC) measurements.</th>
</tr>
</thead>
</table>

For CLCT and ROP printing, enable one or more PC using RC/V Views 13.7 and 13.8 before allowing this section for collection. A PC is defined as a GSM#-NETWORK#-CLUSTER#-MEMBER# and a maximum of 640 PC can be requested through RC/V.

For OP request, 'x' is a PC and is identified completely by a:
- GSM#-NETWORK#-CLUSTER#-MEMBER#

Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

A maximum of six line patterns can be entered.

### PCF Measurements

<table>
<thead>
<tr>
<th>PCF x</th>
<th>245</th>
<th>Protocol handler packet control function (PCF) [5E17(1)+].</th>
</tr>
</thead>
</table>

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before allowing this section for collection and ROP. A component is a SM#-PSU#-SHELF#-CHGRP# and a maximum of 230 components can be requested through RC/V.

To allow/inhibit for collection:
ALW|INH:TRFC30,CLCT,PCF

To allow/inhibit for ROP output:
ALW|INH:TRFC30,ROP,PCF

To allow/inhibit for TRFCH output:
ALW|INH:TRFC30,TRFCH,PCF

Request for immediate output:

OP:TRFC30,PCF=x-x-x-x-x-x (max of 6 units), where
x=SM#-PSU#-SHELF#-CHGRP#.

Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual for the range of values for SM#, PSU#, SHELF# and
CHGRP#.

OP:TRFC30,PCF will print all of the components enabled for ROP output on RC/V Views
13.7 and 13.8.

PCSDN x

199 Personal communications services directory number (PCSDN) special study counts reported
on a directory number (DN) basis (PCS lines only).

For CLCT, 'x' equals the following:
-DN(7 digits) = A maximum of six hyphen separated DNs can be entered with a single
input request.

A maximum of 48 PCS DNs can be studied in an office, where all DNs studied can reside
on any one SM.

PCSOFC 200 Personal communications services office (PCSOFC) total measurements.

PHE x 2 Protocol handler ethernet (PHE) (5E17(1)+).

For CLCT and ROP printing, enable components using RC/V Views 13.7 and 13.8 before
allowing this section for collection and ROP. A component is a
SM#-PSU#-SHELF#-CHGRP# and a maximum of 230 components can be requested
through RC/V.

To allow/inhibit for collection:
ALW|INH:TRFC30,CLCT,PHE

To allow/inhibit for ROP output:
ALW|INH:TRFC30,ROP,PHE

To allow/inhibit for TRFCH output:
ALW|INH:TRFC30,TRFCH,PHE

Request for immediate output:

OP:TRFC30,PHE=x-x-x-x-x-x (max of 6 units), where
x=SM#-PSU#-SHELF#-CHGRP#.

Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual for the range of values for SM#, PSU#, SHELF# and
CHGRP#.

OP:TRFC30,PHE will print all of the components enabled for ROP output on RC/V Views
13.7 and 13.8.

1. APPENDIX: TST:DSL INPUT MESSAGE

1.1 ABSTRACT

This appendix is intended to provide detailed information to support the TST:DSL input message. This appendix provides information which will be helpful for the experienced, as well as the new user.

NOTE: ISLU is supported only on SM whereas ISLU2 is supported on both SM-2000 and the SM. It also should be noted that ISLU2 is supported in 5E10 and later releases. The term LCKEN and ISLU2 in this section is associated with 5E10 and later releases.

1.2 TEST PROCEDURE LIMITATIONS

A test procedure independent of the TST:DSL input message can test any digital subscriber line (DSL) or, more accurately, any basic rate interface (BRI). Presently, testing of DSLs is supported in all configurations of the integrated services line unit (ISLU) and integrated digital carrier unit (IDCU). In addition, testing DSLs of both custom and standard (layer 3) interface types is supported.

The types of DSL (layer 1) interfaces supported are the T-interface (T) and the U-interface (U). The U-interface DSLs (U-DSLs), are supported by alternate mark inversion (AMI) and 2 binary 1 quaternary (2B1Q) technologies. The 2B1Q version supports the standard defined by the ANSI®. For the remainder of this document and the TST:DSL output message manual, the term ANSI® will refer to the 2B1Q version.

For IDCU the equivalent of the ISLU line card (LC) is called a channel unit (CU). Throughout this message, the LC and IDCU CU will be collectively referred to as the line termination (LT). For ISLU2, 8 of these line terminations are integrated on a single pack called line board. Since there is no unique physical hardware associated with these for ISLU2, we associate ISLU2 with the term "line circuit". The term LC is allowed on input as a value for the TERM parameter; however, LT is preferred and will always be used in output messages and associated documentation.

Any TST:DSL request may be terminated using the STP:TST:DSL input message. The only exception is the IDCU CRC test, which as per specification, must execute until completion.

The following message formats indicate the parameters that apply to specific test types as used for ISLU and IDCU applications. If a parameter not shown within a specific format is used, the parameter will be optionally ignored (if the parameter is unneeded) or the request will be rejected (either partially or completely). The TST:DSL

1.3 ENTRY CRITERIA

Before a TST:DSL test request can be executed, specific conditions must be satisfied, most importantly, the DSL port to be tested must be adequately identified. For TST:DSL, the SM and internal port name are not currently accepted on input; therefore, other external identifiers must be used.

NOTE: The ports that are not assigned the accepted external identifiers cannot be tested using TST:DSL (such as, inter-SM ports).

A complete TST:DSL request can be generated by providing a DN or an OE number on an input. The following requests fully specify LPBK testing on all populated DSL channels (that is, using default parameters).
If an OE number is entered and a CPE LPBK is intended or a USER mode test has been specified, a valid TEI must be entered. The following sections clarify the use of the accepted external identifiers.

1.3.1 Directory Number (DN)

The DN is the most complete external identifier that can be submitted. From the DN, the OE number and assigned TEI can be determined.

On a single-point/point-to-point DSL there can only be one active (CSV|CSD) user; therefore, the service order profile (USOP) can immediately be associated with an attached CPE. On a multi-point DSL there can be eight (CSV|CSD) users. Each user is associated with an attached CPE when a valid service profile identifier (SPID) is programmed into the CPE. The SPID contains the DN of the user; therefore, the appropriate service order profile (USOP) can be associated with the CPE.

1.4 Equipment Numbers (ILEN|LCEN|LCKEN)

The line termination equipment numbers (LCEN), the line circuit equipment number (LCKEN), or the IDCU line equipment number (ILEN) may be used to identify a particular DSL. This identifier is sufficient for single mode LPBK testing of particular DSL channels using any available termination (excluding the CPE) or to perform a mismatch or CRC test. These external identifiers are NOT sufficient when a particular DSL user must be identified.

In such cases, a valid TEI may be submitted (in addition), to complete the user/equipment identification.

1.4.1 Terminal Endpoint Identifier (TEI)

The TEI is used to identify a specific CPE that is attached to a DSL. Up to eight CPE may be simultaneously connected to a multipoint DSL. When a CPE is plugged in, the switch assigns a unique number to that CPE. The number, which can range from 0 to 126, is called a TEI. Each time a CPE is disconnected and then reconnected to the switch, a different TEI will be assigned.

The presence of a CPE on the T-interface is acknowledged when the switch assigns that CPE a TEI. If the CPE is plugged in and a TEI is not assigned, the CPE will be inoperative. The assigned TEIs can be obtained using the OP:CPE input message.

For TST:DSL, the primary purpose for using a TEI on input, is to identify a specific CPE for LPBK testing; however, the TEI can also be used to identify a particular user of the DSL, if the associated CPE is bound. If the CPE is cut off from the switch for a period of time, the CPE will request a new TEI. This can occur when long duration D-channel LPBK or metallic tests are performed.

1.4.2 CPE binding

Binding is the process of formally associating a particular USOP with individual CPE. When CPE is "bound", the customer is allowed to access a predefined set of subscribed services with that CPE. Specifically, the communication services for which the customer/user is periodically billed.

Binding on a single-point/point-to-point DSL occurs automatically, after the CPE is connected and assigned a TEI. This is possible because there can only be one active (CSV|CSD) user on this type of DSL.

On a multi-point DSL there can be eight (CSV|CSD) users. When CPE are connected, TEIs are assigned; however, the DSL users cannot be associated with specific CPE. Each user is "bound" to specific CPE when a valid SPID is programmed into the CPE. The SPID contains the DN of the user; therefore, the appropriate USOP can be
associated with the CPE and on input, a OE number with a bound TEI can be used to derive the user DN. A CPE can be "bound" to set of "default services" (that is, if defined for the DSL). In this case, a specific DSL user has not been bound to the CPE.

1.5 CONCURRENT DSL ACTIVITIES

A TST:DSL procedure can coexist with other DSL maintenance procedures or customer calls. A TST:DSL procedure will only seize control (that is, take ownership) of DSL resources that are required to complete the specified test. For example, if TST:DSL is to evaluate the B1-channel, the D-channel and B2-channel may be free to process customer calls or perform other maintenance activities. Examples of other maintenance activities are RMV:LINE, RMV:CPE or another TST:DSL request.

When customer service must be blocked The customer impact associated with testing can be reduced or eliminated through the use of

1.5.1 DSL Resource Ownership

For TST:DSL, the scope of DSL ownership required is determined by the DSL channels to be tested, as well as the hardware that must be used. For digital LPBK testing, the hardware unit providing the LPBK termination may not be capable of looping back individual DSL channels. In such a case, all DSL channels must always be placed in LPBK; therefore, all DSL channels must be owned by the test procedure. Such a limitation would be evident when an individual channel is tested, as all DSL channels would be blocked for testing.

To determine the DSL ownership required for a test request, the capabilities of the unit providing the LPBK termination must be understood. This information is provided in the TST:DSL input manual for each unit, under the TERM parameter. Consider the port ownership required on an ANSI® DSL given the following test:

\[
\text{TST:DSL, DN=X, CH=D, TERM=NT1;}\]

The input manual indicates that the ANSI® NT1 is capable of providing a LPBK on one or both B-channels or on all DSL channels. If the D-channel must be tested, all DSL channels must be looped back at the NT1; therefore, all DSL channels must be owned by the test procedure (albeit, only the D-channel is tested).

Testing on the D-channel will always require the test procedure to take ownership of all circuit switched (CS) B-channels. Call setup procedures are performed in-band on the D-channel; therefore, when the D-channel is tested, the CS B-channels cannot be used for customer calls. This is event given the following test:

\[
\text{TST:DSL, DN=X, CH=D, TERM=LT;}\]

The input manual indicates that the LT is capable of providing a LPBK on any DSL channel or all DSL channels. In addition, a LPBK terminations may be selectively removed. The LT hardware attributes do not require that CS B-channels be owned by the test procedure; however, the “testing begins” message will indicate that CS B-channels are owned.

**NOTE:** If a PPB-channel is populated, it is not owned by the test procedure. The PPB service does not require use of the D-channel for call setup (signaling is in-band).

For ANSI® DSLs, the hardware units that provide LPBK terminations are resources that can be owned by a test procedure. If a test procedure owns the ANSI® NT1, subsequent procedures requiring control of the NT1 will camp-on (that is, wait in line) for ownership of that resource. Consider the following test sequence on an ANSI® DSL:
The input manual indicates that for ANSI® NT1 requests to remove a LPBK condition, all DSL channels (looped back) will be affected. Given this hardware restriction, if both requests where allowed to proceed, the first request to complete would unloop the NT1 on all channels. To eliminate potential conflict, the second request will camp-on for ownership of the NT1.

On ANSI® DSLs, orders to provide LPBKs within specific units on the loop are transmitted on the embedded operations channel (EOC). This channel can only be used by one procedure at a time; therefore, to allow other procedures access, the EOC resource is released after use. For LPBK testing the EOC is owned only while a request to establish or remove a LPBK is in progress. Consider the following sequence of maintenance requests that will run concurrently:

```
TST:DSL,DN=X,TEST=CRC;
TST:DSL,DN=X,CH=B1,TERM=CU3;
TST:DSL,DN=X,CH=B2,TERM=LT;
TST:DSL,DN=X,TEST=CRC,DUR=0,V;
```

In the above test sequence, a CRC test, a B1 CU3 LPBK test, a B2 LT LPBK test, and the PM counts at the CUs and LT are being read concurrently. In this case, to avoid EOC camp-on, reading the PM counts at the CUs would have to be done last, as the use of the EOC is required for the duration of the PM read. The other tests only need the EOC for a short period of time.

In general, if required DSL resources are unavailable (such as, B-channel, NT1, EOC, and so forth), the associated maintenance procedure will camp-on for ownership.

### 1.5.2 AMI N-Channel

The N-Channel is used to communicate with transmission equipment on the AMI DSL loop. Specifically, TST:DSL uses the N-channel to communicate with the NT1 and populated CUs. The implementation of the N-channel is similar to other AMI DSL channels; however, the N-channel is used solely for maintenance purposes.

The N-Channel supports setting up and removing LPBKs and to administer the layer 1 protocol.

### 1.5.3 ANSI® Embedded Operations Channel (EOC)

The EOC is used to communicate with ANSI® NT1s and CUs. The implementation of the EOC is similar to other ANSI® DSL channels; however, the EOC is used solely for maintenance purposes.

The EOC is used to set up LPBKs, reset PM counts, read PM counts, request bad CRC from the NT1, remove LPBKs, turn off the request for bad CRC, and perform a CU PM interval freeze operation (that is, shift the "current" PM counters to the "previous" PM counters in the CU and then reset the "current" PM counters in the CU).

Concurrent testing at the NT1 and CUs for ANSI® U-DSLs is possible because the EOC operations are held active by the NT1 or CU. Once the operation is active, the EOC is available for other operations. For AMI U-DSLs, N-channel operations at the NT1 and CUs can only be held active by the LT. This ties up the N-Channel for the duration of the operation. Thus, concurrent operations at the NT1 or CU for AMI U-DSLs are not possible.

### 1.5.4 EOC Camp-on
The EOC channel is generally used for very brief periods to set up or tear down an operation. The EOC is a system resource. As such, each test must wait its turn to gain access to it. Most operations only require use of the EOC for a few seconds. Reading CU PM counts, however, nominally takes about 25 seconds (the time to read current and previous PM counts for 6 CUs). This means other tests may camp on for use of the EOC. If the camp-on is required to set up a test, a camp-on message will be printed. If the camp-on is required to end a test, a camp-on message is not printed. However, if the camp-on fails in this later case, a failing test status “CANNOT RE-GAIN EOC RSC” is printed. In critical cases (like LPBKs), the test will preempt for the EOC so that the LPBK can be removed. An INTERRUPT string is printed on the TST:DSL output message to indicate that a test could not terminate normally. The TST:DSL output message manual specifies procedures for handling these situations.

Even if the EOC channel is idle, some tests cannot be run at the same time because they require the same system resources for the duration of the test. For example, a B1 LPBK at the NT1 and the LT is not possible as they require the same B-channel resource. In these cases, the tests will camp-on for the specified CAMP time.

1.6 LOOP-BACK TESTING

Depending on the options selected, this message will perform a digital loop-back (LPBK) test on all the assigned D- and B-channels or only a single assigned channel.

1.6.1 LPBK Terminations (TERM)

A LPBK test is performed by first establishing a LPBK at the specified termination. The termination is entered with the TERM option. Then test data is transmitted over the channel(s) to be tested. The returned data from the LPBK is verified and the test results are printed.

A LPBK termination may be placed at the assigned protocol handler (PH), the DSL LT, channel units (CU1 to CU6), the network termination 1 (NT1), or the customer premises equipment (CPE). Testing to externally applied LPBK terminations at the customer premises is also supported.

1.6.2 Acceptable Bit Error Rate (ABER)

The pass/fail criteria of any CS digital test may be modified using the acceptable bit error rate (ABER) input parameter. This parameter is particularly useful when using the sectionalization (SECT) option to do fault isolation (refer to the FAULT ISOLATION TESTING section below for details).

The ABER is not used to specify the pass/fail criteria for PS digital tests. For PS tests, the pass/fail criterion is fixed. If fewer than 98% of the transmitted packets are received without error, then the test is considered failed.

1.6.3 Protocol Error Record (PER) Interactions

When performing any form of loopback testing, the generation of PERs will be inhibited for the duration of the test. After the test has been completed, PER generation will remain inhibited for a period of three to six minutes. Use the ALW:ALE input message to allow PER generation prior to the expiration of this period.

1.7 FAULT ISOLATION TESTING

Three distinct testing modes are possible. These modes determine how many terminations are to be used during testing:

- Default (single termination used)
- Sectionalization (SECT - all terminations may be used)
- Sequential (SEQ - all terminations may be used)
The default mode tests the single termination (that is, CPE, NT1, CUs, LT, or PH) specified. The remaining two modes test multiple terminations.

1.7.1 Elapsed Testing Time

The maximum duration for each termination of a SECT or SEQ test is one hour. Therefore, the maximum elapsed time for a SECT or SEQ test is ten hours. This is the time to test all possible terminations (CPE, NT1, CU6, ..., CU1, LT, and PH).

1.8 MISMATCH TEST

The mismatch test (TEST=MSMTCH) will detect a mismatch of an LT and the first metallic termination beyond the LT on U-DSLs. This test is used to ensure compatibility between the LT and the first unit (CU or NT1) connected to the LT. This message cannot be used to detect NT1 mismatches when CUs are present.

The mismatch test also tests for loop resistance that is too high or too low between the tip and ring of the LT connected to the first metallic termination (NT1 or CU), and the mismatch test tests for loop resistance that is too low between tip and ground or ring and ground.

For AMI U-DSLs, the mismatch test will also detect a tip and ring reversal at the NT1 (when no CUs are present). Tip and ring reversals at CUs do not matter.

Mismatch detection is possible even if the first termination (NT1 or CU) is powered down (but still connected to the loop).

1.8.1 Mismatch Testing Performed After Certain Loop-backs.

There are many conditions that can cause layer 1 (U-interface) to be down. These include certain metallic loop faults, NT1 "quiet mode", faulty equipment (NT1, CUs, LT), "mismatch", etc. Since some of these conditions are checked by the mismatch test, the mismatch test is automatically run whenever layer 1 is found down at the U-interface and a LPBK of all channels has been requested at an NT1 or CU. Any problems found by the mismatch test will be printed on the ROP.

As a positive indication that the mismatch test was run as part of a LPBK test, a "test qualifier" of the form (MMT xxxx) is printed. Refer to the TST:DSL output message for details.

1.8.2 Mismatch Test Results

For cases when the mismatch test detects high or low loop resistance, it is recommended that voltage, resistance, and capacitance metallic tests be run on the loop to determine the specific characteristics of any metallic loop fault that may be present. Metallic loop tests are available using mechanized loop testing (MLT) systems, or they are available from the trunk and line work station (TLWS) metallic testing menu 5600/5700 (5E10+).

1.8.3 Mismatch Condition - Exists

If the mismatch test determines that an LT or NT1/CU mismatch exists, then the out-of-service port status will be changed to reflect the mismatch condition.

1.8.4 Mismatch Condition - Does Not Exist

If the mismatch test determines that a mismatch does not exist but layer 1 at the"U-interface is down", then the out-of-service port status may be changed to indicate that the "NT1 power is lost" or the "U-interface is down". The choice depends on two things:

- What the port status was prior to running the mismatch test and
- Whether the mismatch test found that the loop between the LT and the first metallic termination (NT1 or CU1) was open or connected.

If the out-of-service port status was "dying gasp under study" and the loop was "connected", then the dying gasp is assumed to have been received from the NT1 due to a loss of power to the NT1. For this case, the port status will be changed to "NT1 power is lost". If the loop is faulty (that is, one that is not properly connected or one that is opened), it is assumed that any information (dying gasp or otherwise) cannot be received from the NT1. For this case, the "dying gasp under study" indication will be replaced with "U-interface is down", as the dying gasp is assumed to have been erroneously generated from the faulty loop.

The technique used by the mismatch test to evaluate the out-of-service "dying gasp under study" port status works even when BRITE CUs are equipped on the U-DSL. This is because the BRITE CU will ignore any dying gasp indication at the instant that it detects a faulty loop (for example, the loss of the U-interface between the NT1 and the last CU). This means that if a proper connection exists between the LT and CU1, then any dying gasp indication received by the LT from CU1 must have originated from the NT1 prior to the loss of the U-interface.

If the port status was "Mismatch", then the port status would be changed to "U-interface is down". If the port status was anything else, then the port status would be unchanged.

The key is that the out-of-service port statuses (that is, dying gasp under study, NT1 power is lost, mismatch, and U-interface is down) indicate that the U-interface is down. The "NT1 power is lost" signifies that the loss of the U-interface is likely due to customer premises equipment (that is, NT1) problems rather than network (that is, 2-wire loop, CU or LT) problems. Other statuses may indicate customer premises equipment (that is, CPE or NT1) or network equipment problems.

**NOTE:** "U-interface is down" includes the out-of-service port statuses of UINTF, LINKx, TESTx, NTPWR, and so forth. Refer to the APP:PORT-STATUS appendix in Appendixes section of the Output Message manual for more information.

### 1.9 CORRUPT CRC TESTING

The PM freeze interval boundary refers to the PM report interval defined on the RC/V View 8.1 (OFFICE PARAMETERS). The LT current hour PM counts are flagged as corrupt. There is no way to indicate when the CU PM counts are corrupt.

The PM counts are left with the values at the end of the test. This is to allow the PM counters to be read again if desired. The user can clear these PM counts if it is not desirable for performance monitoring to continue based on the values of the counters at the end of the test. The EXC:ALE-RESET input message can be used to clear the PM counts.

The CRC testing procedure includes the following operations:

- Clears the CU interval PM counts (current and previous),
- Clears the LT hour PM counts (current only),
- Marks the current hour LT PM counts as corrupt,
- Sends bad (corrupted) CRC downstream,
- requests the NT1 to send bad CRC upstream (the NT1 must be functional for the CRC test to work),
- Prevents the hourly and interval PM freeze from occurring on this DSL should the CRC test cross a
PM freeze (hour or interval) boundary while the test is running,
- Runs the test for the duration (DUR) specified then stops the test (that is, stop sending bad CRC to the NT1 and requests that the NT1 stop sending bad CRC to the switch), and
- Reads the PM counts and prints the results,
- The PM counts are left with the values at the end of the test.

1.9.1 Interpreting CRC Test Results

The corrupt CRC test results are output in tabular format detailing both the previous and current hour PM counts for the LT. If the V (verbose) parameter is selected, counts will be printed for each equipped channel unit. The PM counts for the upstream direction (that is, NT1 to the LT) and the downstream direction (that is, LT to the NT1) of transmission include numerical results for block errors (BE), severe errored seconds (SES) and errored seconds (ES).

The LT previous hour PM counts, which are displayed on output, will not be modified by the CRC test. In addition, the CU previous interval PM counts should remain at zero. The current PM counts at the LT and CUs will vary based on the duration (DUR) of CRC testing.

The CRC test generates one BE for every ANSI® superframe (12 milliseconds) transmitted upstream and downstream. This means that the BE counter will accumulate at a rate of 83.3 block errors per second. The ES counter will increment once for every second the test runs. The BE count should be approximately 83.3 times the ES count. The ES and SES should be very nearly equal (refer to the WARNING below).

A severely errored second (SES) occurs when a given number of bit errors (BE)s occur in one second. For CUs, the allowable number of BEs is fixed at 3/sec. For LTs, the number of allowable BEs/sec is recent changeable [refer to RC/V View 8.1 (OFFICE PARAMETERS)]. The CU SES counts and the LT SES counts can only be correlated, if the allowable BEs/sec is the same in each case.

1.9.2 Reading PM counts

If a CRC test duration is specified to be zero seconds, no CRC test will take place; however, a the PM counts will be read and output. This is useful for obtaining the current PM counts prior to testing or obtaining the counts associated with a CRC test that has just previously been run. The success/failure STATUS associated with reading of the PM counts is output, in addition to the equipped channel units and the elapsed time (ET) taken to read the CU PM counts. The presence of a satellite link may be deduced using the ET output parameter, as the ET will be greater when a satellite transmission link is present.

The PM counts at the CU or LT are not altered by this request. The EXC:ALE input message may also be used to read the PM counts.

1.9.3 CRC Testing and PM Alerts

The purpose of CRC testing is to verify that the performance monitoring (PM) counters at the LT and the CUs can detect and maintain a record of BEs. In addition, if the reporting of PM alerts has been turned on, a PM alert (REPT ALE LEVEL 1 output message) should be triggered if the CRC test duration (DUR) is long enough to cause an LT PM count threshold to be reached.

There are several reasons why it may not be possible to trigger a PM alert. In general, alerts will not be fired if PM has been turned off or an alert has already been triggered. Only one PM alert can be triggered per hour (for hourly alerts) and only one PM alert can be triggered per day (for daily alerts). A CRC test cannot be used to trigger an alert, if the alert has already been triggered for the associated day or hour. Once PM has been turned off, PM counts
will not be incremented; therefore, PM will not be triggered. The PM can be turned off on a specific LT for the following reasons:

- U-interface is down at the LT (port status states: UINTF, MSMTCH, etc.).
- The LT is out-of-service (OOS).
- U-DSL D-channel has been manually removed OOS.
- The DSL is unassigned.
- PM has been turned off for the PM group [RC/V View 22.15 (PM THRESHOLD GROUP)].
- PM has been turned off for the SM with the INH:ALE input message using the LEVEL1, SM=a options.
- PM has been turned off for the Office [RC/V View 8.1 (RC OFFICE PARAMETERS)].

The PM threshold information is available in the following recent change (RC) views:

- RC/V View 22.15 (PM - THRESHOLD GROUP) shows the PM threshold values for a specific PM group.
- RC/V View 23.2 (DIGITAL SUBSCRIBER LINE - NON BRC S), RC/V View 23.8 (DSL/BRCs ASSIGNMENT) shows the PM group assigned to a specific U-DSL.
- RC/V View 22.7 (ISLU LINE CARD) shows the PM group assigned to a specific U-DSL.

1.10 EQUIPPED CHANNEL UNITS

It is not possible to determine the presence of AMI CUs, as there is no internal record of CUs and the switch interface does not support responses to CU requests; however, the ANSI® U-DSL interface standard allows all requests to be acknowledged.

For ANSI® U-DSLs, the presence of CUs is detected by polling for each possible CU. In general, the number equipped CUs (EQCU) is provided in the output for all test types.

If the EQCUs cannot be determined, the EQCU output will indicate the faulty portion of the transmission link. For example, if the U-interface beyond CU2 is down, then the equipped CUs cannot be determined; however, information will be output to identify link two as faulty (that is, EQCU=LINK2). This information is similar to the port status information provided by the OP:ST-PORT output message. Refer to the TST:DSL output message for details.
1. APPENDIX: EXPLANATION OF RESPONSES

The following is a list of system responses that are used with many of the 5ESS® switch generic utilities (UT) input requests. The acknowledgements are used when the syntax of a request is valid, but the request has been denied. Additional information is printed out to explain why the request was denied. Not all responses apply to all requests.

**IP**
- = In progress. The request was received at the destination and initiated.

**NA**
- = No acknowledgment. A symbolic look-up is in progress for a unit serviced by the generic utilities input requests. The request is being held in the buffer and will be acted upon when the symbolic look-up has been completed.

**NG**
- = No good. The request syntax is valid but the request conflicts with current system or equipment status.

**NG - CM ISOLATED FROM AM**
- The input request can not be sent at this time because the AM is isolated from the CM. This situation affects all of the UT manually entered input requests. The request must be run again after communications are re-established.

**NG - COMMAND MUST BE PART OF A CLAUSE**
- The input request must be part of a clause. The request can not stand alone.

**NG - COMMAND NOT ALLOWED FOR UNIT TYPE**
- The request can not be used for this type of unit.

**NG - COULD NOT RECOGNIZE MESSAGE**
- This request was passed to the UT controlling process but the structure is not recognized by the UT code.

**NG - INTERNAL ERROR**
- Requests to this processor must be immediate requests and not part of a clause.

**NG - ILLEGAL FPC NUMBER**
- The requested FPC number does not exist.

**NG - ILLEGAL MMP NUMBER**
- The requested MMP number does not exist.

**NG - ILLEGAL PCR NUMBER**
- The requested processor does not exist or is not in a valid state for operation.

**NG - ILLEGAL PPC NUMBER**
- The requested PPC number does not exist.

**NG - ILLEGAL SM NUMBER**
- The requested SM does not exist or is not in a valid state for operation.

**NG - NO OPERATIONAL PCR IN SPECIFIED RANGE**
- The requested range of processors does not contain any units which have an operational or special grow state.

**NG - NO OPERATIONAL SM IN SPECIFIED RANGE**
- The requested range of SMs does not contain any operational or special grow SMs.

**NG - PCR DOES NOT MATCH PCR IN THE PREVIOUS COMMAND**
- This request, being part of a clause, must be sent to the same processor as the request that preceded it.
NG - SM DOES NOT MATCH SM IN PREVIOUS COMMAND = The syntax for the request is correct but a series of requests is being entered at this terminal for a different SM. The clause is still active and waiting to be finished and this request has not been included in the clause.

NG - SM NOT SPECIFIED = This request is part of a clause but is not being allowed because the SM number is not indicated. The request needs to be re-entered with the desired SM number.

OK = The request syntax is correct, the processor is available, and the request has been accepted and will be processed.

PF = Printout follows. A corresponding output message will follow in response to the request.

RL = Retry later. System resources could not be allocated to process the request.

RL - ANOTHER TERMINAL IN MIDDLE OF CLAUSE = The requested processor is being set-up with a clause from another terminal.

RL - PCR IS ISOLATED = The requested processor is valid but communications were not established at the time of the request.

RL - SM IS ISOLATED = The requested SM is a valid processor but communications were not established at the time of the request.

ERROR = The request syntax was correct but UT does not recognize the request.
6. ABT
ABT:AIUCOM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions be aborted on an access interface unit common data and control controller (COMDAC).

NOTE: Execution of this message may require further action to put the unit into a valid state. Refer to the REFERENCES section of this manual page.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT:[a,]AIUCOM=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action to be aborted. Valid value(s):
  DGN = Diagnose.
  RMV = Remove.
  RST = Restore.
  SW = Switch.

NOTE: The default is the action currently executing.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = AIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = COMDAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. Followed by the ABT:AIUCOM output message.

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the directly connected test unit port circuit (DCTUPORT) at the specified location be aborted.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT:[a,]DCTUPORT=b-c-d;

3. EXPLANATION OF MESSAGE

a  = Action being aborted (the default is the action currently executing on the DCTUPORT). Valid value(s):
   DGN  = Diagnose.
   EX   = Exercise.
   RMV  = Remove.
   RST  = Restore.

b  = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Directly connected test unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

   NG  = No good. The request has been denied because of a conflict with current status.
   PF  = Printout follows. Followed by the ABT:DCTUPORT output message.

5. REFERENCES

Input Message(s):

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts maintenance actions on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH).

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT: [a,]DFIH=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action to be aborted. Valid value(s):
  DGN = Diagnose.
  EX  = Exercise.
  RMV = Remove.
  RST = Restore.

NOTE: The default is the action currently executing on the DFIH.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RISLU digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:

  CONFLICT WITH UNIT STATE
  SM DOES NOT EXIST
  SM UNEQUIPPED
  UNIT DOES NOT EXIST

PF = Printout follows. An ABT:DFIH output message follows in response to the request.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that currently running actions be aborted without cleaning up on the distributing frame test access circuit (DFTAC).

This input message should be used only if STP:DFTAC has been attempted and has failed to terminate the previous action. Since both hardware and data may be left in an invalid state as a consequence of the ABT:DFTAC message, a number of other outputs, such as audits and asserts, may follow.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT: [e,] DFTAC = a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module number.
b = MSU number.
c = Service group.
d = Circuit number.
e = The action to be aborted. Valid value(s):
   DGN
   EX
   RMV
   RST

4. SYSTEM RESPONSE

NG = No good. Invalid SM number, MSU number, or service group number.
PF = Printout follows. Followed by ABT:DFTAC output message.
RL = Retry later. The request cannot be executed now (that is, SM is not linked).

ABT:DLI

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Aborts an action on a specific dual link interface (DLI) or range of DLIs in the specified office network and timing complex (ONTC).

'Abort' is differentiated from 'stop' by the action of the request. An abort action is immediate and without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.

**NOTE:** An 'ABT' should only be used if an 'STP' input message fails.

2. **FORMAT**

ABT: {a,}DLI={b|b&&c}-d;

3. **EXPLANATION OF MESSAGE**

- **a** = Action being aborted (default is any action currently waiting or executing on the DLI). Valid value(s):
  - DGN = Diagnose.
  - EX = Exercise.
  - RST = Restore.

- **b** = Number of the switching module (SM) that the DLI is on. Also specifies the lower limit for the range of DLIs that is to be aborted, where the DLI number is equivalent to the SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c** = Upper limit of a range of DLIs to be aborted.

- **d** = ONTC side that the DLI is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

- **IP** = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

- **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC).

**NOTE:** Execution of this message may require further action to put the unit into a sane state. Refer to the References section of this message.

**WARNING:** This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of other asserts and audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

```
ABT: [a,]DNUSCC=b-c-d;
```

3. EXPLANATION OF MESSAGE

- **a** = Action to be aborted (default is the action currently executing on the DNUSCC). Valid value(s):
  - DGN = Diagnose.
  - RMV = Remove.
  - RST = Restore.

- **b** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c** = Digital networking unit - synchronous optical network (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **d** = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG** = No good. The message form is valid, but the request conflicts with the current status.
- **PF** = Printout follows. An ABT:DNUSCC output message will follow.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

1510 (DNUS STATUS)
1. PURPOSE

Requests abort of maintenance actions on a remote switching module (RSM) facility (FAC) or a trunk FAC.

A remote switching module (RSM) FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is an inter-office trunk.

WARNING: This message causes the intended process to be purged. It also causes an SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT:[a,a,FAC=b-c-d-e;]

3. EXPLANATION OF MESSAGE

- **a**: Action being aborted (default is the action currently executing on the FAC). Valid value(s):
  - **RMV**: Remove.
  - **RST**: Restore.
  - **TST**: Test.

- **b**: Switching module (SM) number.

- **c**: Digital line and trunk unit (DLTU) number.

- **d**: RSM digital facilities interface (RDFI) number, inter-RSM communication link digital facilities interface (CDFI) number, or inter-office trunk DFI number.

- **e**: Facility number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG**: No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
  - **NOT STARTED UNIT IN GROWTH STATE**
  - **SM DOES NOT EXIST**
  - **SM UNEQUIPPED**
  - **UNIT DOES NOT EXIST**
PF = Printout follows. An ABT:FAC output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP: RANGES
ABT:GKCCR

**Software Release:** 5E14 and later
**Command Group:** ODD
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests that any currently running generated key collection and compression routine (GKCCR) processes be aborted in specified processors. Either specific processors can be specified or no processors can be specified. If no processors are specified, then the GKCCR will be aborted on every processor.

ABT:GKCCR aborts GKCCR whether the GKCCR was invoked automatically or manually. Automatic GKCCR runs periodically unless GKCCR is inhibited using the INH:GKCCR input request. Manual GKCCR runs as a result of the EXC:GKCCR input request.

No data corruption will occur as a result of the abort. The GKCCR processes are purged immediately and the user should not expect to see any subsequent EXC:GKCCR or REPT:GKCCR output messages from the purged GKCCR processes.

Any queued manual GKCCR requests are de-queued for the specified processors.

2. **FORMAT**

   ABT:GKCCR[,SM=a[&b]][,CMP=c[-{PRIM|MATE}]][,AM];

3. **EXPLANATION OF MESSAGE**

   **MATE** = Mate CMP.
   **PRIM** = Primary CMP.
   a = Switching module (SM) number or the lower limit of a range of SM numbers.
   b = The upper limit of a range of SM numbers.
   c = Communications module processor (CMP) number.

4. **SYSTEM RESPONSE**

   **NG** = No good. The input request is invalid. May also include:
   - **NO VALID PROCESSOR SPECIFIED** = Specific processor(s) were specified in the input request line but no requested processor was operational. If specific processors are to be requested, at least one requested processor must be operational.

   **PF** = Printout follows. The request was accepted. An ABT:GKCCR output message will report the status of the request.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions on the host switching module (HSM) digital facilities interface (HDFI) circuit be aborted. This message results in a process purge in the HSM.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT:[a,]HDFI=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action being aborted. If the action being aborted is a conditional removal of an HDFI, there is a corresponding conditional removal of the T1 facility (T1FAC) in the remote switching module (RSM) being processed. The T1FAC action in the RSM may be manually aborted if desired. Default is the action currently executing on the HDFI. Valid value(s):
   DGN = Diagnose.
   EX = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = Digital line and trunk unit (DLTU) number.

d = HDFI number.

4. SYSTEM RESPONSE

Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or exercise on the link interface (LI) subunit of the specified office network and timing complex (ONTC).

"Abort" is differentiated from "stop" by the action of the request. An abort action is immediate and without regard to the state of the hardware, while "stop" will wait for a "clean" point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE 1: This message is only valid for offices with communication module model 1; (CM1) hardware.

NOTE 2: An 'ABT' should only be used if an 'STP' input message fails.

2. FORMAT

ABT:[a,L]I=b;

3. EXPLANATION OF MESSAGE

a = Action being aborted (default is any action currently waiting or executing on the LI). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.

b = Side of the ONTC that the LI is on.

4. SYSTEM RESPONSE

IP = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts the library program in the administrative module (AM) and/or switching modules (SMs) as specified, and the scratch area used in the SM for the library program is released.

WARNING: This input message can leave the resources used by the library program in an unknown state. It should only be used when a normal STP:LIB input message fails.

2. FORMAT

ABT:LIB:TEAM=a[,AM][,SM=b|,SM=c&&d];

3. EXPLANATION OF MESSAGE

a = Team number (1-15) to which this input message applies. This number is specified in the LOAD:LIB input message, and is used so that more than one person may test at the same time, using different team numbers.

b = SMs that this message should be directed to. The team specified must have a library program running in the SM(s) listed. There can be up to five SM numbers listed. A range could be used instead, as indicated.

c = The optional first SM in the range 'c' to 'd'.

d = The optional last SM in the range 'c' to 'd'.

NOTE: If neither the AM or any SMs are specified, the ABT:LIB message is sent to the AM and all SMs with clients loaded under the same team as those specified.

4. SYSTEM RESPONSE

NG = No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages.

PF = Printout follows. Message has been sent to the SMs/AM or team specified.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE
Requests that actions on the line unit high level service circuit (LUHLSC) be aborted at the specified location.

WARNING: This message causes a specified action to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT
ABT:[a,]LUHLSC=b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action being aborted (the default is the action currently executing on the LUHLSC). Valid value(s):
  DGN = Diagnose.
  EX  = Exercise.
  RMV = Remove.
  RST = Restore.

b = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = High-level service circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because of a conflict with current status.

PF  = Printout follows. Followed by the ABT:LUHLSC output message.

5. REFERENCES
Input Message(s):
1. PURPOSE

Requests that actions on the metallic access (MA) circuit be aborted at the specified location.

WARNING: This message causes the specified action to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT:[a,]MA=b-c-d-e;

3. EXPLANATION OF MESSAGE

- **a**: Action being aborted (the default is the action currently executing on the MA circuit). Valid value(s):
  - DGN = Diagnose.
  - EX = Exercise.
  - RMV = Remove.
  - RST = Restore.

- **b**: Switching module number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

- **c**: Metallic service unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

- **d**: Service group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

- **e**: Metallic access board number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG**: No good. The request has been denied because of a conflict with current status.

- **PF**: Printout follows. Followed by the ABT:MA output message.

ABT:MI

- **Software Release**: 5E14 and later
- **Command Group**: CM
- **Application**: 5
- **Type**: Input

1. **PURPOSE**

Aborts a diagnostic or exercise on the message interface (MI) on the specified office network and timing complex (ONTC).

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a " sane" state.

**NOTE**: Abort should only be used if an 'STP' input message fails.

2. **FORMAT**

\[ \text{ABT:} [a,] \text{MI=b;} \]

3. **EXPLANATION OF MESSAGE**

- **a** = Action being aborted (default is any action currently waiting or executing on the MI). Valid value(s):
  - **DGN** = Diagnose.
  - **EX** = Exercise.

- **b** = Side of ONTC that the MI is on.

4. **SYSTEM RESPONSE**

- **IP** = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

- **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

235-105-210   Routine Operations and Maintenance.
ABT:OFI

Software Release: 5E16(1) and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the currently executing maintenance action on an optical facility interface (OFI) be aborted.

WARNING: The ABT command causes the intended process to be purged. It can also cause a variable number of other purges, asserts and audit reports. Under normal circumstances, use the STP verb; use ABT only if the STP command fails. Service-affecting aborts tear down any calls on the specified OFI circuit.

2. FORMAT

ABT: [a,] OFI=b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action being aborted (default is the currently executing action). Valid value(s):
   DGN = Diagnose.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. Followed by the ABT:OFI output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

OP:OFR-STATUS

Output Message(s):

ABT:OFR
STOP:OFR
ABT:ONTC

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or conditional restore request on the specified office network and timing complex (ONTC).

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (such as, the end of a phase) and will attempt to leave the hardware in a "sane" state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT

ABT: [a,] ONTC=b;

3. EXPLANATION OF MESSAGE

a = Action being aborted (default is any action currently waiting or executing on the ONTC). Valid value(s):
   DGN = Diagnose.
   RST = Conditional restore.

   NOTE: A removal, unconditional restoration, or switch cannot be aborted once it is accepted.

b = Side of the ONTC.

4. SYSTEM RESPONSE

   IP = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

   NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

5. REFERENCES

Input Message(s):

   SW:ONTC

Output Message(s):
ABT:ONTCCOM
Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE
Aborts an action on the specified office network and timing common units (ONTCCOM). The ONTCCOM is made up of the following entities:

- Message interface (MI).
- Network clock (NC).
- Time multiplexed switch (TMS) excluding the network control and timing links (NCTLNKs).
- Link interface (LI), which exists only in the communication module model 1 (CM1) hardware.

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware, while 'stop' will wait for a 'clean' point of termination, (that is, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT
ABT:[a,]ONTCCOM=b;

3. EXPLANATION OF MESSAGE
a = Action being aborted (default is any action currently waiting or executing on the ONTC). Valid value(s):
   DGN = Diagnose.
   RST = Restore.

   NOTE: A removal, unconditional restoration, or switch cannot be aborted once it is accepted.

b = ONTC common side.

4. SYSTEM RESPONSE
IP = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

Input Appendix(es):

APP: CM–IM–REASON
ABT:OTO

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Aborts the specified office-to-office (OTO) task. If directory number (DN), SLC® line equipment number (SLEN), integrated digital carrier unit (IDCU) line equipment number (ILEN), digital network equipment number(INEN), and OTO request number are omitted, all currently active OTO tasks will be aborted.

2. FORMAT

ABT:OTO[,NPA=1][,h];

3. EXPLANATION OF MESSAGE

a = Three-digit office code.
b = Local digits.
c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Digital carrier line unit (DCLU) number.
e = Remote terminal (RT) number.
f = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If a DN, SLEN, ILEN, INEN or request number are not specified, then all active office-to-office tasks are aborted.

g = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Valid value(s):

<table>
<thead>
<tr>
<th>DN=a-b</th>
<th>ILEN=c-g-e-f</th>
<th>INEN=c-j-k-f</th>
<th>REQ=i</th>
<th>SLEN=c-d-e-f</th>
</tr>
</thead>
</table>

i = OTO request number of task to be aborted. The request number can be found on the printout follows (PF) acknowledgement message of the EX:OTO input message that is to be aborted. In addition, it is displayed on all EX:OTO output messages associated with that task.

j = Digital network unit (DNU) number.

k = Remote terminal (RT) number.

l = Numbering Plan Area or Area Code of the DN.
4. SYSTEM RESPONSE

NG = No good. No office-to-office tasks are currently active, or specified task not found to be currently active. Valid value(s):
- OTO NOT ACTIVE
- REQ NOT ACTIVE
- STARTING DN NOT ACTIVE
- STARTING SLEN NOT ACTIVE
- STARTING ILEN NOT ACTIVE
- STARTING NPA & DN NOT ACTIVE

PF = Printout follows. The request is accepted and the specified task(s) will be aborted. An EX:OTO output message will follow.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT: [a,] PSUPIDB=b-c-d-e;

3. EXPLANATION OF MESSAGE

- **a**
  = Action to be aborted (the default action is the action currently executing on the PSU PIDB). Valid value(s):
    - RMV = Remove.
    - RST = Restore.

- **b**
  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c**
  = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **d**
  = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **e**
  = PIDB number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG**
  = No good. The request has been denied. The message is valid but the request conflicts with current status.

- **PF**
  = Printout follows. The ABT:PSUPIDB output message will follow.

- **RL**
  = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on a quad-link packet switch (QLPS) gateway processor (QGP) be aborted (ABT).

WARNING: This message causes the QGP action to be killed. It is recommended that the stop (STP) verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT: [a,]QGP=b-c;

3. EXPLANATION OF MESSAGE

a = Action to be aborted. This input message will abort all requests with the specified action either waiting or executing for the QGP; if no action is given, all requests for the QGP are aborted. Valid value(s):
   DGN = Diagnose. (Not valid for CM3)
   EX = Exercise. (Not valid for CM3)
   RST = Restore.
   (blank) = Any action on the QGP.

b = Message switch (MSGS) side number. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual.

c = QGP number. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendices section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. A QGP abort output message follows.

**Command Group:** SM
**Application:** 5
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that maintenance actions be aborted on a digital networking unit - synchronous optical network (DNU-S) synchronous transport signal electrical interface (STSX-1) facility interface (SFI).

**NOTE:** Execution of this message may require further action to put the unit into a sane state. Refer to the REFERENCES section of this message.

**WARNING:** This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of other asserts and audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT

ABT:\[a,]SFI=b-c-d-e;

3. EXPLANATION OF MESSAGE

**a**

= Action to be aborted (default is the action currently executing on the SFI). Valid value(s):

- **DGN** = Diagnose.
- **RMV** = Remove.
- **RST** = Restore.

**b**

= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**c**

= DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**d**

= Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**e**

= STSX-1 facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

**NG**

= No good. The message form is valid, but the request conflicts with the current status.

**PF**

= Printout follows. An ABT:SFI output message will follow.

**RL**

= Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE
SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that actions on the subscriber line instrument measurement (SLIM) board be aborted.

WARNING: This message causes the intended process to be purged. It also causes a variable number of audit reports due to the purge. It is recommended that the STP (STOP) verb be used under normal circumstances. The ABT input message should only be used if the STP message fails.

2. FORMAT

ABT:[a,]SLIM=b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action being aborted. The default is the action currently executing on the SLIM board. Valid values are:
  DGN = Diagnose.
  EX  = Exercise.
  RMV = Remove.
  RST = Restore.

b = Switching module number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c = Metallic service unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

d = Service group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

e = SLIM board number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because of a conflict with current status.

PF = Printout follows. Followed by the ABT: SLIM output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the currently executing maintenance action on a synchronous transport signal - level 1 (STS1) be aborted.

WARNING: The ABT command causes the intended process to be purged. It can also cause a variable number of other purges, asserts and audit reports. Under normal circumstances, use the STP verb; use ABT only if the STP command fails. Service-affecting aborts tear down any calls on the specified STS1.

2. FORMAT

ABT: [a,]STS1=b-c-d-e-f;

3. EXPLANATION OF MESSAGE

a = Action being aborted (default is the currently executing action). Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Optical carrier - level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = STS1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the ABT:STS1 output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

ABT : TEN

Input Appendix(es):

APP : RANGES
ABT:TMS

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Aborts a diagnostic or exercise on the time multiplexed switch (TMS) on the specified office network and timing complex (ONTC).

Abort is differentiated from stop by the action of the request. An abort action is immediate, without regard for the state of the hardware. 'Stop' will wait for a 'clean' point of termination, (such as, the end of a phase) and will attempt to leave the hardware in a sane state.

NOTE: Abort should only be used if an 'STP' input message fails.

2. FORMAT

ABT: [a,] TMS=b;

3. EXPLANATION OF MESSAGE

a = Action being aborted (default is any action currently waiting or executing on the TMS). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.

b = Side of ONTC.

4. SYSTEM RESPONSE

IP = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

OP: DMQ-CM

Input Appendix(es):

APP: CM-IM-REASON
ABT:TMSFP

Software Release: 5E16(2) and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Aborts a diagnostic, remove, or restore, on the time multiplexed switch (TMS) fabric pair (TMSFP) for the specified office network and timing complex (ONTC). This command also has the option of aborting any running or pending child requests of the parent TMSFP.

ABT is differentiated from STP by the action of the request. An abort action is immediate, without regard for the state of the hardware, while STP will wait for a graceful point of termination, (for example, the end of a phase) and will attempt to leave the hardware in a valid state.

WARNING: This message causes the TMSFP action to be killed. It is recommended that the stop (STP) verb be used under normal circumstances. ABT should only be used if the STP message fails.

2. FORMAT

ABT: [a,]TMSFP=b-c[,ALL];

3. EXPLANATION OF MESSAGE

ALL = Abort the TSMFP request and/or any child (for example, QLPS, NLI, DLI) requests that may exist on the deferred maintenance queues (DMQ).

a = Action to be aborted. The default is any action currently waiting or executing on the TMSFP. Valid value(s):
   DGN = Diagnose.
   RMV = Remove.
   RST = Restore.

b = ONTC side that the TMSFP is on.

c = TMS fabric pair number.

4. SYSTEM RESPONSE

IP = In progress. The abort has been initiated. A completion message will be printed for the original request when the abort has completed.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Local digital service unit (DSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because of a conflict with current status.

PF = Printout follows. Followed by the ABT:UTD output message.

5. REFERENCES

Input Message(s):
ABT:UTG
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE
Requests that actions be aborted on the universal tone generator (UTG) at the specified location.

WARNING: This message causes the intended process to be purged. It also causes a SMABTREQ assert and a variable number of audit reports due to the purge. It is recommended that the STP verb be used under normal circumstances; ABT should only be used if the STP message fails.

2. FORMAT
ABT: [a,]UTG=b-c-d-e;

3. EXPLANATION OF MESSAGE

- **a** = Action being aborted (default is the action currently executing on the UTG). Valid value(s):
  - DGN = Diagnose.
  - EX = Exercise.
  - RMV = Remove.
  - RST = Restore.

- **b** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c** = Local digital service unit (DSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **d** = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **e** = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG** = No good. The request has been denied because of a conflict with current status.

- **PF** = Printout follows. Followed by the ABT:UTG output message.

Software Release: 5E16(1) and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE
SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the currently executing maintenance action on a virtual tributary - level 1.5 (VT15) be aborted.

WARNING: The ABT command causes the intended process to be purged. It can also cause a variable number of
other purges, asserts and audit reports. Under normal circumstances, use the STP verb; use ABT only if
the STP command fails. Service-affecting aborts tear down any calls on the specified VT15 facility.

2. FORMAT

ABT:[a,b-c-d-e-f-g-h];

3. EXPLANATION OF MESSAGE

a = Action being aborted (default is the currently executing action). Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section
   of the Input Messages manual.

c = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes
   section of the Input Messages manual.

d = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section
   of the Input Messages manual.

e = Optical carrier - level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes
   section of the Input Messages manual.

f = Synchronous transport signal - level 1 (STS1) number. Refer to the APP:RANGES appendix in
   the Appendixes section of the Input Messages manual.

g = VT15 group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
   Messages manual.

h = VT15 member number. Refer to the APP:RANGES appendix in the Appendixes section of the
   Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.
PF = Printout follows. Followed by the ABT:VT15 output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

8. ADD
ADD:PAUTH

Software Release: 5E14 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Adds a new person identity (IDENT) with its related password (PSSWD) to the person authority (PAUTH) database.

This input message is not printed (echoed) on the read-only printer (ROP) in order to keep passwords private.

This input message is used in administering security of the maintenance interface. Refer to the Authority Management section of the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

ADD:PAUTH,IDENT="a",PSSWD="b";

3. EXPLANATION OF MESSAGE

a = Identity of the person that uses the password, in one to eight letters and/or digits. To avoid collisions with terminal identities, person identities may not begin with "tty" and equal four characters in length.

b = Password in six to thirteen characters.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- PASSWORD ILLEGAL LENGTH = The given password is less than six characters or greater than 13 characters in length.
- PERSON IDENTITY NOT UNIQUE = The given person identity already exists in the person authority database or the person identity is four characters in length and begins with "tty".
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The person authority database is inaccessible.

OK = Good. The identity and password are added to the person authority database.

RL = Retry later. Valid value(s):
- AUTHORITY ADMINISTRATION UNDER UPDATE = The person authority database is currently being updated.

235-105-210  Routine Operations and Maintenance
ADD:PCGRP

Software Release: 5E14 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

This input message adds a command group or profile to the person-command group (PCGRP) relation for the given person identity (IDENT).

Format 1 associates a command group (COMGR) with a person identity (IDENT), allowing a user to access the messages in the command group. Format 2 associates a profile (PROFL) with an IDENT, allowing a user to access all the messages associated with a set of command groups. These input messages are used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

[1] ADD:PCGRP:IDENT=a,COMGR=b;
[2] ADD:PCGRP:IDENT=a,PROFL=c;

3. EXPLANATION OF MESSAGE

a = Identity of the person in one to eight letters and/or digits.

b = Command group. Valid value(s):
ADMIN = System administrator only activities.
ALARM = Alarm manipulation.
AM = Administrative module maintenance.
AMA = Automatic message accounting.
AUDIT = Audits.
AUTH = Command and authority administration.
CCS = Common channel signaling.
CM = Communications module maintenance.
FHADM = File handling and administration.
MAINT = Routine maintenance activities.
MEAS = Measurements.
NMOC = Network management and overload control.
ODD = Office dependent data activities.
PASS = Personal password modification.
RCV = Recent change and verify activities.
SM = Switching module maintenance.
SPECRCV = Special RC/V input messages.
SFTMG'T = Software management (update, software release retrofit).
SFTUTIL = Software utilities.
SUPERUSR = Super user authority (bypass terminal authority).
SYSRCVY = System recovery activities.
TRACE = Call trace.
TRKLN = Trunk and line maintenance.
Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

c = A profile name which has been previously created using ADD:PROFL. The name is one to eight letters and/or digits.

4. SYSTEM RESPONSE

NG = No good. May also include:
- COMMAND GROUP ALREADY ASSIGNED TO THIS PERSON = The given command group has already been assigned to this person identity.
- NON-EXISTENT PERSON IDENTITY = The given person identity does not exist in the person authority database.
- PROFILE ALREADY ASSIGNED = The given command profile (PROFL) has already been assigned to this person identity.
- PROFILE IDENTITY DOES NOT EXIST = The given profile does not exist in the profile authority database.
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The person authority database is inaccessible.

OK = Good. The command group or profile is associated with the person identity.

RL = Retry later. May also include:
- AUTHORITY ADMINISTRATION UNDER UPDATE = The person authority database is currently being updated.

235-105-210   Routine Operations and Maintenance
ADD:PROFL

**Software Release:** 5E14 and later

**Command Group:** AUTH

**Application:** 5,3B

**Type:** Input

1. **PURPOSE**

Adds a new profile identity (IDENT) to the profile authority database (PROFL). A profile is a set of command groups, which are detailed in the APP:COMMAND-GRP appendix of the Input Messages manual. A maximum of 64 profiles are allowed.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. **FORMAT**

ADD:PROFL,IDENT=a;

3. **EXPLANATION OF MESSAGE**

a

= Identity of the profile to be added to the profile authority database. A maximum of eight characters may be used.

4. **SYSTEM RESPONSE**

NG

= No good. May also include:

- **MAXIMUM NUMBER OF PROFILES EXCEEDED** = The maximum of 64 profiles are already defined.

- **PROFILE IDENTITY NOT UNIQUE** = The given profile identity is already in the profile authority database.

- **UNABLE TO ACCESS PROFILE ADMINISTRATION** = The profile authority database is inaccessible.

OK

= Good. The profile name is successfully added to the profile authority database.

RL

= Retry later. May also include:

- **PROFILE ADMINISTRATION UNDER UPDATE** = The profile authority database is currently being updated.

Other Manual(s):
235-105-210  Routine Operations and Maintenance
ADD:TAUTH

Software Release: 5E14 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

Adds a terminal identity (TERM) to the terminal authority (TAUTH) database.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

ADD:TAUTH:TERM=a;

3. EXPLANATION OF MESSAGE

a  = Terminal identity in four characters, starting with "tty".

4. SYSTEM RESPONSE

NG  No good. May also include:
   - INVALID TERMINAL IDENTITY = The given terminal identity is either not four characters in length or does not start with "tty".
   - TERMINAL IDENTITY ALREADY EXISTS = The given terminal identity already exists in the terminal authority database.
   - UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The terminal authority database is inaccessible.

OK  = Good. The terminal identity is added to the terminal authority database.

RL  = Retry later. May also include:
   - AUTHORITY ADMINISTRATION UNDER UPDATE = The terminal authority database is currently being updated.

9. ALW
ALW:ACSR
Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE
Requests that automatic customer station rearrangement (ACSR) requests be added or deleted from the ACSR queue. Machine-generated inhibitions of ACSR cannot be overridden with this input message.

2. FORMAT
ALW:ACSR, {ENQ|DEQ|ALL};

3. EXPLANATION OF MESSAGE
ALL = Allow adding and deleting of ACSR requests.
DEQ = Allow deleting (dequeueing) of ACSR requests.
ENQ = Allow adding (enqueueing) of ACSR requests.

4. SYSTEM RESPONSE
OK = Good. ACSR enqueueing or dequeueing request was received.

5. REFERENCES
Input Message(s):
INH:ACSR
OP:STAT

Output Message(s):
OP:STAT
ALW:ALE-A

Software Release: 5E14 - 5E15
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option.

The parameters are grouped into three classes.

Automatic ALE session output controls: The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

Switching module (SM) controls: The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

Automatically generated reports as well as the actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not resume for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

Line/trunk controls: Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 is used to allow the automatic session controls.

Format 2 is used to allow the SM control parameters.

Format 3 is used to allow the PER generation for a ISDN protocol channel.

The level 1 control parameters for U-interface DSLs are manipulated using the RC/V view 8.1 and 22.15 for performance monitoring group definitions.

Example 1: .ce ALW:ALE, LEVEL2, PER=REPT, PRINT
will allow the LEVEL2, PER=REPT, and PRINT controls allowing the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message indicates that the results from the automatic session will be printed on the ROP.

Example 2: .ce ALW:ALE, PER=GEN, SM=7

will allow the PER generation control that enables the collection of PERs on SM 7.

Example 3:

ALW:ALE, PER=GEN, DN=2204000

will allow the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000. In this case, the SM inhibit supersedes the channel inhibit; therefore, if the SM is inhibited, then PERs will not be collected for the channel regardless of the state of the channel inhibit.

2. FORMAT

[1] ALW:ALE{[,LEVEL2][,PRINT][,PER=REPT]};
[2] ALW:ALE, SM=a{&&b}{[,LEVEL1][,PER=GEN]};
[3] ALW:ALE,c[,CH=a^1],PER=GEN;

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

LEVEL1 = Allow level 1 performance monitoring for the indicated SM. The default is level 1 allowed.

LEVEL2 = Process level 2 error counts. These counters exist in the protocol handler (PH). Allowing level 2 automatic ALE will report packet error counts and automatically reset the counters. The default is level 2 allowed.

PER=GEN = Allow PER generation for the indicated SM or channel. The default is that PER generation is allowed for the indicated SM or channel.

PER=REPT = Allow PER reporting for the automatically requested ALE sessions. The default is that PER reporting is allowed. Set the specified protocol error record (PER) parameters.

PRINT = Send output to the receive-only printer (ROP). The default is ROP output allowed.

a = SM number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{d} = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{e} = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{f} = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{g} = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{h} = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{i} = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{j} = The directory number associated with the port. This parameter can only be used to identify channels associated with DSLs.

\textbf{k} = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{l} = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{m} = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{n} = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Primary/protection identifier. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

p = RT line number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

q = Integrated services line unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

r = Line group controller number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

s = Line card number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

t = Multi-line hunt group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

u = Multi-line hunt group member number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

v = Logical port number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

w = Data link (group) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

x = Relative link (member) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

y = Trunk group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk group member number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

a¹ = Channel type to be allowed (valid only for LCEN line identification). Valid value(s):
    B¹ = Channel B1.
    B² = Channel B2.
    D = D-channel (default).

b¹ = Packet switching unit (PSU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = PSU shelf number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = PSU channel group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = Integrated service line unit 2 (ISLU2) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

f¹ = Line board number. Refer to the APP: RANGES appendix in the Appendixes section of the Input
Messages manual.

g\(^1\) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^1\) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^1\) = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^1\) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^1\) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^1\) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^1\) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^1\) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^1\) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\(^1\) = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\(^1\) = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s\(^1\) = Peripheral control and timing (PCT) line and trunk unit number (PLTU). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t\(^1\) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u\(^1\) = Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v\(^1\) = Channel number (CHAN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w\(^1\) = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x\(^1\) = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
y^1 = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. This message was not recognized or was not acceptable. May also include:
- ALE FEATURE NOT LOADED = The ALE feature is not loaded in the switch software configuration.
- COMMUNICATION FAILURE = A system error has occurred.
- INVALID INPUT = Parameter to allow does not match entity to allow.
- PROCESS CREATION FAILURE = A system error has occurred.

OK = Good. Requested parameter has been allowed.

PF = Printout follows. Requested parameter allow has been initiated. Followed by the ALW:ALE output message.

RL = Retry later. May also include:
- AM IN MIN MODE = The AM is in minimum operation mode.
- REQUEST ALREADY IN PROGRESS = An ALE allow request is already running. Only one allow request is permitted at a time.

RC/V View(s):
8.1 OFFICE PARAMETERS (MISCELLANEOUS)
22.15 PERFORMANCE MONITORING - THRESHOLD GROUP
1. PURPOSE

Requests that the operation of automatic line evaluation (ALE) be allowed for the specified option.

The parameters are grouped into three classes.

Automatic ALE session output controls: The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

Switching module (SM) controls: The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any of the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

NOTE: Automatically generated reports as well as the actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not resume for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

Line/trunk controls: Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

After the introduction of PCF on PHE2 feature, ALE doesn't provide performance monitoring error count information on A10/A11/ETHERNET protocols, but PER is able to provide the protocol error histories on A10/A11/ETHERNET protocols on PCF PH. There are two kinds of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol error histories stored in the PH. Level 7 retrieves A10/A11 error histories stored in PH.

If the PER generation inhibit is active, then no PERs will be recorded for either the ISDN protocol channel or PCF PH.

Format 1 is used to allow the automatic session controls, only applies to ISDN ALE session.

Format 2 is used to allow the SM control parameters, applies to both ISDN channel and PCF PH. But for PCF PH,
PER is a required key and LEVEL1 is not applicable.

Format 3 is used to allow the PER generation for a ISDN protocol channel.

Format 4 is used to allow the PER generation for PCF PH.

The level 1 control parameters for U-interface DSLs are manipulated using the RC/V view 8.1 and 22.15 for performance monitoring group definitions.

Example 1:

ALW:ALE, LEVEL2, PER=REPT, PRINT

will allow the LEVEL2, PER=REPT, and PRINT controls allowing the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message indicates that the results from the automatic session will be printed on the ROP.

Example 2:

ALW:ALE, PER=GEN, SM=7

will allow the PER generation control that enables the collection of PERs on SM 7, not only for the ISDN channels, but also for the PCF PH, if the PCF on PHE2 feature is activated.

Example 3:

ALW:ALE, PER=GEN, DN=2204000

will allow the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000. In this example, the SM inhibit supersedes the channel inhibit; if the SM is inhibited, then PERs will not be collected for the channel regardless of the state of the channel inhibit.

Example 4:

ALW:ALE, PER=GEN, PCFIP=193.193.193.193

will allow the PER generation control that enables the collection of PERs associated with the PCF PH for PCF IP address 193.193.193.193. In this example, the SM inhibit supersedes the channel inhibit; therefore, if the SM is inhibited, then PERs will not be collected for the PCF PH regardless of the state of the PCF PH inhibit.

2. FORMAT

[1] ALW:ALE([,LEVEL2][,PRINT][,PER=REPT]);

[2] ALW:ALE, SM=a[&b]([,LEVEL1][,PER=GEN]);

[3] ALW:ALE, c[,CH=a1],PER=GEN;

[4] ALW:ALE, PCFIP=z1-z1-z1-z1,PER=GEN;

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the
format.

**LEVEL1**
- Allow level 1 performance monitoring for the indicated SM. The default is level 1 allowed.

**LEVEL2**
- Process level 2 error counts. These counters exist in the protocol handler (PH). Allowing level 2 automatic ALE will report packet error counts and automatically reset the counters. The default is level 2 allowed.

**PER=GEN**
- Allow PER generation for the indicated SM or channel. The default is that PER generation is allowed for the indicated SM or channel.

**PER=REPT**
- Allow PER reporting for the automatically requested ALE sessions. The default is that PER reporting is allowed. Set the specified PER parameters.

**PRINT**
- Send output to the receive-only printer (ROP). The default is ROP output allowed.

*a* = SM number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

*b* = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

*c* = Line identification. Valid value(s):

- AIUEN=f-n^1-o^1-p^1
- BST=d-e
- DEN=f-g-h-i
- DN=j
- DNUSEOC=f-h^1-n-o

*d* = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = The directory number associated with the port. This parameter can only be used to identify channels associated with DSLs.
k = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
q = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
r = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
s = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
t = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
u = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
v = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
w = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Relative link (member) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Trunk group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Trunk group member number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Channel type to be allowed (valid only for LCEN line identification). Valid value(s):
- B1 = Channel B1.
- D = D-channel (default).

Packet switching unit (PSU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

PSU shelf number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

PSU channel group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Integrated service line unit 2 (ISLU2) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Line board number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Line circuit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Data group (DG) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Synchronous transport signal (STS) facility number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Virtual tributary group (VTG) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Digital signal level 0 (DS0) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Line group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Access interface unit (AIU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

AIU pack number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

\( p^1 \)
- AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( q^1 \)
- SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( r^1 \)
- Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( s^1 \)
- Peripheral control and timing (PCT) line and trunk unit number (PLTU). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( t^1 \)
- PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( u^1 \)
- Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( v^1 \)
- Channel number (CHAN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w^1 \)
- Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x^1 \)
- Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y^1 \)
- Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z^1 \)
- IP address field. Valid value is 0-255.

\( a^2 \)
- Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^2 \)
- Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^2 \)
- Optical carrier level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^2 \)
- Synchronous transport signal level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

**NG**
- No good. This message was not recognized or was not acceptable. May also include:
  - **ALE FEATURE NOT LOADED** = The ALE feature is not loaded in the switch software configuration.
  - **COMMUNICATION FAILURE** = A system error has occurred.
  - **INVALID INPUT** = Parameter to allow does not match entity to allow.
  - **PROCESS CREATION FAILURE** = A system error has occurred.
= Good. Requested parameter has been allowed.

PF = Printout follows. Requested parameter allow has been initiated. Followed by the ALW:ALE output message.

RL = Retry later. May also include:
- AM IN MIN MODE = The AM is in minimum operation mode.
- REQUEST ALREADY IN PROGRESS = An ALE allow request is already running. Only one allow request is permitted at a time.

22.15 PERFORMANCE MONITORING - THRESHOLD GROUP
ALW:ALM-A

Software Release: 5E14 - 5E16(1)
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that alarm reporting on a scan point be allowed, according to type. Formats 1 through 4 are for alarms assigned to input/output processor (IOP) scan points. Format 5 is for alarms assigned to remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) metallic service unit (MSU) scan points and is available only in a multimodule RSM, ORM or TRM that has the alarm input option. Format 6 is for alarms assigned to remote alarm section (RAS) scan points. Format 7 is for alarms assigned to expansion access interface unit (EAIU) scan points.

2. FORMAT

[1] ALW:ALM,(BPSC=a|MFFUSE=b|MFFAN|MISC=c);
[2] ALW:ALM,ESM[,PWR];
[3] ALW:ALM,CNI,(FANALM|FRMFUSE|PWR);

[6] ALW:ALM,RAS,SCPT=f,SITE=g;
[7] ALW:ALM,EAIU=e-h,SCPT=f;

3. EXPLANATION OF MESSAGE

CNI = Common network interface.
ESM = External sanity monitor.
FANALM = Fan alarm.
FRMFUSE = Frame fuse alarm.
MFFAN = Miscellaneous frame fan.
MFFUSE = Miscellaneous frame fuse.
MSGS = Message switch.
ONTC = Office network timing complex.
PWR = Power.
SCPT = Scan point.
TMS = Time multiplexed switch.
a = Building/power scan point (BPSC) number.
b = Unit number. MSGS and TMS are for CM1 offices only. ONTC is for CM2 offices only.
c = Miscellaneous (MISC) IOP scan point number.
d = Remote building/power scan point (RBPSC) number.
e = Switching module (SM) number.
f = Scan point number.
g = Remote peripheral site number.
h = EAIU unit number.

4. SYSTEM RESPONSE

NG = No good. Invalid scan point, SM number or site number.
PF = Printout follows. The ALW:ALM output message follows.
RL = Retry later. Unable to process request or unable to communicate with SM.

ALW:AMA-AUTOST

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that automatic message accounting (AMA) automatic tape writing be allowed. This input message is required following offline AMA automatic tape-writing sessions during software transitions since AMA sessions are inhibited when these sessions are ended.

2. FORMAT

ALW:AMA:AUTOST[,ST1|,ST2];

3. EXPLANATION OF MESSAGE

ST1 = Used if AMA data goes to the ST1 data stream.
ST2 = Used if AMA data goes to the ST2 data stream.

NOTE: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

IP = In progress. Request accepted. The AMA monitor process has been called to cancel manual blocking of AMA automatic tape writing sessions previously blocked using the INH:AMA-AUTOST message. When the request is complete, the contents of the AMA control file will be output. Refer to the REPT:AMA-CONT output message.

NG = No good. Data stream checks failed.

RL = Retry later. A message could not be sent to the AMA monitor process. May also include:
- EVEN OFFLINE MHDS COULD NOT BE ACCESSED = Disk file controller (DFC) 0 could not be accessed in the equipment configuration database (ECD) or is not active (ACT) and/or DFC 2 can be accessed in the ECD but is not ACT or unequipped (UNEQIP). When this is the case, wait until all controllers for the even offline moving head disks (MHDs) are restored, or restore the appropriate controller using the RST:DFC input message with the UCL option. This message could occur prior to an offline AMA session during software transitions.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that automatic message accounting (AMA) teleprocessing sessions or tape writing sessions be allowed. This input message is required following offline AMA sessions during software transitions since AMA sessions are inhibited when these sessions end.

WARNING: It is important to note that since sessions following an offline tape or AMATPS session are being inhibited, that the user invoke the OP:AMA-DISK input message prior to the next session. If this is not done prior to the next ALW:AMA-SESSION and/or ALW:AMA-AUTOST and the amount of data on the offline disks is 0% and 0 block (no more data) as indicated by the termination message from the last session, it will be necessary to manually remove the retrofit site file (/updtmp/site/access.oflama).

2. FORMAT

ALW:AMA:SESSION[,ST1|,ST2];

3. EXPLANATION OF MESSAGE

ST1 = Used if AMA data goes to the ST1 data stream.
ST2 = Used if AMA data goes to the ST2 data stream.

NOTE: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

IP = In progress. Request accepted. The AMA monitor process has been called to allow AMA teleprocessing or tape writing sessions that were inhibited with the INH:AMA-SESSION message. When the request is complete, the contents of the AMA control file will be output. Refer to the REPT:AMA-CONT output message.

NG = No good. Data stream checks failed.

RL = Retry later. A message could not be sent to the AMA monitor process. May also include:

- EVEN OFFLINE MHDS COULD NOT BE ACCESSED = Disk file controller (DFC) 0 could not be accessed in the equipment configuration database (ECD) or is not active (ACT) and/or DFC 2 can be accessed in the ECD but is not ACT or unequipped (UNEQIP). When this is the case, wait until all controllers for the even offline moving head disks (MHDs) are restored, or restore the appropriate controller using the RST:DFC input message with the UCL option. This message could occur prior to an offline AMA session during software transitions.

REPT:AMATRC

Other Manual(s):
235-190-101 Business and Residence Modular Features
235-190-300 Billing Features
ALW:AMATRC

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Format 1 requests that the printing of an automatic message accounting (AMA) record be allowed on the receive-only printer (ROP) for a specific originating and/or terminating directory number (DN). When an AMA record is generated whose originating or terminating DN matches any of the up to 5 DN(s) selected (that is, DN and PS flag are equal) the AMA record will be printed on the ROP.

NOTE: When placing a call to an INWATS or feature group A (FGA) facility the DN associated with the INWATS or FGA facility will be placed in the originating DN field of the AMA record.

With multiple DN tracing allowed, a maximum of five DNs can be entered for tracing. Without multiple DN tracing, a maximum of one DN can be entered for tracing. When a DN entered for tracing matches an existing DN, the trace option will be overwritten by the trace option of the DN entered. Refer to the Billing Features and Specifications manual for additional information about this feature.

NOTE: If several simultaneous (on average 7 or more) AMA records are generated matching the selected DN, there is a possibility that the ROP will get flooded and some AMA records may not get printed. The number that can be printed is dependent on the length of the individual records, as well as the size of the shared memory buffer available between the operational kernel process (OKP) and AM system processes.

Format 2 requests that each AMA record that is sent to the ROP using AMATRC be placed in the AMTRCLOG log file. When the FILE parameter is specified, each time a AMA record whose originating or terminating number matches any of the existing DN(s) is generated, the record will be printed on the ROP. In addition to being sent to the ROP the AMA record will be placed in the AMTRCLOG log file.

2. FORMAT

[1] ALW:AMATRC:DN=a[,PS][,b];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

FILE = Requests that AMATRC output be placed in the AMATRC Log File in addition to the ROP.

a = The seven- or ten-digit directory number.

b = The option for tracing ORIG, TERM, or BOTH. The default will be ORIG if option for tracing is omitted.

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID DIGIT ENTERED = Only digits, no alpha or special characters are accepted.
- SEVEN OR TEN DIGITS REQUIRED = Either seven or ten digits are required to perform the
trace if the Number Portability - NPA/NXX Growth feature is not ACTIVE

- 10 DIGIT DN REQUIRED = Ten digits are required to perform the trace if the Number Portability - NPA/NXX Growth feature is ACTIVE
- EXCEEDED 5 DN LIMIT = One or more DNs must be inhibited before another DN can be allowed for tracing.

OK

= Good. The request has been received. All subsequent AMA entries generated with the given originating or terminating directory number will be printed on the ROP. Refer to the REPT:AMATRC output message.

ALW:AUD-CMP
Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE
Requests that a communication module processor (CMP) audit be allowed to execute automatically or an audit cycle
to execute routinely on one CMP.

2. FORMAT
ALW:AUD[a],CMP=0;

3. EXPLANATION OF MESSAGE

   a = Audit ID. Valid value(s):
      CYCLE = Allow the routine execution of the audit cycle (default).

4. SYSTEM RESPONSE

   NG = No good. May also include:
       - AUDIT NOT AVAILABLE IN CMP = The request has been denied because the audit specified
         in the 'a' variable does not exist in the CMP specified.
       - INVALID CMP = The specified CMP does not exist.
   OK = Good. The request has been received and completed. Audit or cycle has been allowed.

   Other Manual(s):
   235-600-400 Audits
ALW:AUD-ENV

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Allows a kernel process environment (OKP or SMKP) audit to execute automatically or allows an audit cycle in the administrative module (AM) to execute routinely.

2. FORMAT

ALW:AUD[a],ENV=b;

3. EXPLANATION OF MESSAGE

a = Audit(s) to be allowed. Valid value(s):
Audit ID
CYCLE = Routine audit cycle.

b = Type of process. Valid value(s):
OKP = Operational kernel process.
SMKP = Switch maintenance kernel process.

4. SYSTEM RESPONSE

NG = No good. May also include:
- ARGUMENT FOR ENV MISSING = The request has been denied because neither OKP nor SMKP were specified for variable 'b'.
- AUDIT NOT AVAILABLE IN SPECIFIED ENV = The request has been denied because the specified audit is not available in the requested kernel process.
- SM TYPE NOT VALID FOR THIS REQUEST = The request has been denied because an SM type (RSM, LSM, or HSM) was specified for a kernel process environment.

OK = Good. The request has been received and completed. Audit or audit cycle has been allowed.

Input Message(s):

INH:AUD

Other Manual(s):
235-600-400 Audits
ALW:AUD-SM

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Allows a switching module (SM) audit to execute automatically or an audit cycle to execute routinely on one SM or a range of SMs.

2. FORMAT

ALW:AUD[=a],SM=b[&c][,RSM][,LSM][,HSM][,ORM][,TRM];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Audit(s) to be allowed. The default is CYCLE. Valid value(s):
   Audit ID
   CYCLE = Allow the routine execution of the audit cycle.

b = SM number, or lower limit of a range of SM number. The default is any type of SM.

c = Upper limit of a range of SM number.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - AUDIT NOT AVAILABLE IN SM TYPE = The request has been denied because the audit specified in the 'a' variable does not exist in the SM type specified or does not exist in any SM type.
   - INVALID SM RANGE/TYP E COMBINATION = The request has been denied because either the range is not in ascending order, or there is not at least one SM of the specified type (or any type) within the range.

OK = Good. The request has been received and completed. Audit or cycle has been allowed.

RL = Retry later. May also include:
   - MESSAGE BROADCAST INTERNAL ERROR = The message cannot be sent to the specified SM(s) at the present time due to problems scheduling a job to broadcast the message.

235-600-400  Audits
ALW:AUD-SODD
   Software Release: 5E14 and later
   Command Group: AUDIT
   Application: 5
   Type: Input

1. PURPOSE

Requests that either the full or incremental static office-dependent data (SODD) audit, which is to execute automatically, be allowed. The full audit will restart provided there are at least 15 minutes remaining in the audit schedule (refer to the SCHED:AUD-SODD input message.) The incremental audit will restart provided there are unaudited log files from the last ODD backup.

2. FORMAT

   ALW:AUD=SODD, {FULL | INCR};

3. EXPLANATION OF MESSAGE

   FULL = Allow the full SODD audit to be executed.

   INCR = Allow the incremental SODD audit to be executed.

4. SYSTEM RESPONSE

   OK = Good. The request has been received and completed; the SODD audit has been allowed.

Other Manual(s):

235-105-210  Routine Operations and Maintenance
ALW:AUD

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the routine execution of one or more audits controlled by the system integrity monitor (SIM) that were previously inhibited be allowed. Entering the ALW:AUD input message clears one or more audit inhibits previously set to the manually inhibited or automatically inhibited state.

Separate inhibit states are provided for:

- All audits. When the inhibit state for ALL audits is set, routine audit scheduling is completely turned off. Entering the ALW:AUD input message with the ALL option reinitializes the audit control subsystem and turns on routine audit scheduling, but it has no effect on the inhibit states of individual audits.

- Each audit, identified by audit name and member number. When an audit is inhibited, either manually or automatically, it is not scheduled to run routinely or in response to a software request.

- Each instance of an audit. One instance of an audit may be inhibited while other instances are allowed to run routinely.

Audit inhibit states may be displayed by entering the OP:AUD input message.

2. FORMAT

ALW:AUD,{ALL|a [=b]|a=c,INS=d};

3. EXPLANATION OF MESSAGE

ALL = Specifies all audits controlled by SIM:

Clears a master inhibit state which is independent of the inhibit states for individual audits. Causes SIM to attempt to initialize the audit control system if it has not been successfully initialized.

If the control record in the equipment configuration data base for SIM has been modified, ALL causes SIM to reinitialize its internal control parameters according to the new content of the control record.

a = Audit name. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual for administrative module (AM) audit names.

NOTE: If 'a' is specified without 'b', all members of the audit will be allowed.

b = Member number. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual. May be specified as a single number or a list of numbers.

c = Single member number. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual.

d = Instance name.
4. SYSTEM RESPONSE
Refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Allows originating (ORIG) or terminating (TERM) blocked call indication (BCI) reporting when a path is not available through both the A- and B-links of a line unit concentrator. Use this message to identify the lines in an office that experience A- and B-link blockages, and to indicate the severity of this problem on a line unit basis.

WARNING: The use of system resources to report A- and B-link blockages will negatively affect call processing capacity when frequent blockages occur. It is recommended that originating and terminating blockage studies not be done at the same time, and that the selected value for maximum messages (MAX) be kept small to avoid excessive message processing.

2. FORMAT

ALW:BCI, {ORIG|TERM}, SM=a[&b][,MAX=c];

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number, or the lower limit in a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Upper limit SM number in a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Maximum number of blocked-call messages to be reported by an included SM before reporting is automatically halted for that SM.

4. SYSTEM RESPONSE

PF = Printout follows. The request was received and the REPT:BCI output message follows as blockages occur.

ALW:BREVC

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the effect of the INH:BREVC input message be canceled, and allows automatic brevity control to be reapplied.

Brevity control (BREVC) restricts and prints application terminal (TTY) output messages by message class and priority to reduce the quantity of messages printed at the receive-only printer (ROP). Brevity control does not affect manual or alarmed messages. The brevity status for each MSGCLS can be printed out using the OP:BREVC input message. The status for each system can be printed using the OP:SYSSTAT input message.

2. FORMAT

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Allow all message classes.

a = Message class mnemonic. The MSGCLS for a particular message can be found on the corresponding output message manual page. The valid MSGCLS codes can be listed using the OP:LPS input message.

b = CMP number.

c = SM number or lower limit of a range of SM numbers.

d = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. An illegal SM number or range was specified or, an illegal CMP number was specified.

OK = Good. The message was accepted and the action completed.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the reporting of information related to calls pegging the default cell group (DCG) be allowed. The default cell group is the zero cell group. Cell groups are used for division of revenue traffic separation. Calls pegging the zero cell group are due to division of revenue translation errors. Allowing this report under those conditions will provide reports of originating and terminating information for the calls pegging the zero cell group. The report will be terminated automatically after printing 32 reports.

WARNING: This message should not be used during periods of heavy receive-only printer (ROP) usage. The output from this message, REPT DCGRPT, can be throttled during periods of heavy ROP output. The impact of throttling is that anywhere from one to all of the reports, including the “Auto Termination” message, may not be printed.

2. FORMAT

ALW:DCGRPT;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - ALREADY ALLOWED = The request has been denied because the report has already been allowed.
   - NOT ALLOWED – DIV OF REV OPTION OFF = The request has been denied because division of revenue option must be on.

OK = Good. The request has been accepted. All subsequent occurrences of calls pegging the default cell group will print an information report. Refer to the REPT:DCGRPT output message.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that debugging messages be allowed to be printed for a given feature. Allowing debugging messages on a switching module (SM) causes additional ASSERT, PTRACE, and debugging output messages to be printed during error handling.

NOTE: The PTRACE message class must be allowed in order to print PTRACE messages. Refer to the CHG:LPS-MSGCLS input message.

WARNING: Before using this input message, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual. The user is responsible for any effects on system operation that result from the use of this input message.

Using the METSUCESS option will result in the output message REPT:METALLIC being printed for every successful metallic path setup completion. This could result in a large number of output messages being sent to the ROP printer if automated metallic testing is being done with this option allowed.

Do not leave the debugger allowed for an indefinite period of time.

Format 1 is for ALE, CCS7MTCE, DIGITAL, METALLIC, METPTRACE, METALLMSG, METRESBLK, MESTSWBLK, METHWFAIL, METSUCESS, and MLT SM only cases.

Format 2 is for CCS7MTCE and MLT AM only cases.

Format 3 is for MLT AM and SM cases.

2. FORMAT

[1] ALW:DEBUG,a,SM[=b[&c]];

[2] ALW:DEBUG,a,AM;

[3] ALW:DEBUG,a;

3. EXPLANATION OF MESSAGE

a = Feature with additional debugging messages. Valid value(s):
   ALE = Automatic line evaluation.
   CCS7MTCE = Common channel signal maintenance activity.
   DIGITAL = Digital testing of lines (TST:DSL) and trunks (TST:TRK).
   METALLIC = Metallic path setup ASSERT and PTRACE messages with low-level unformatted information, not intended for general customer use.
   METALLMSG = Metallic path setup blockage and failure (REPT:METALLIC).
NOTE: Using METALLMSG will also allow METRESBLK, METSWBLK, and METHWFAIL.

METHWFAIL = Metallic path setup hardware failure (REPT:METALLIC).
METPTRACE = Metallic related PTRACE messages.
METRESBLK = Metallic path setup resource blockage (REPT:METALLIC).
METSUCCESS = Metallic path setup completed successfully (REPT:METALLIC).
METSWBLK = Metallic path setup software blockage (REPT:METALLIC).
MLT = Mechanized loop test.
TSTPATH = Test path application (TST:PATH).

b = SM number or the lower limit of a range of SM numbers (defaults to all equipped SMs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.
PF = Printout follows. Followed by the ALW:DEBUG output message.

ALW:DLNHB

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the common network interface (CNI) automatic direct link node (DLN) heartbeat test be allowed. The ALW:DLNHB and INH:DLNHB input messages form the basic on/off mechanism for DLN heartbeat. When the ALW:DLNHB is issued, the "DLN heartbeat test" checks each switching module (SM) for its ability to communicate with the DLN. It cycles through all the SMs checking one every 30 seconds. This input message will allow the automatic testing to continue until and INH:DLNHB is issued.

2. FORMAT

ALW:DLNHB;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. May also include:
- DLNs ARE NOT EQUIPPED = DLN heartbeat is neither necessary nor enabled when the CNI ring is not equipped with DLNs.

OK = Good. Automatic testing allowed.

Software Release: 5E14 and later
Command Group: MAINT
Application: 5,3B
Type: Input

1. PURPOSE

Allows previously inhibited or suspended sources to send automatic maintenance requests to the administrative module (AM) maintenance input request administrator (MIRA).

Format 1 reverses the effect of an inhibit source message (INH:DMQ) for a specified source of automatic maintenance requests. Format 2 is valid only while execution of deferred maintenance requests is suspended during system recovery. It allows execution of deferred maintenance requests during system recovery.

2. FORMAT

[1] ALW:DMQ:SRC=a;

3. EXPLANATION OF MESSAGE

a = Three-character source name. Valid value(s):
   ADP = Automatic diagnostic process.
   ALL = Allows all automatic maintenance requests by clearing the inhibited sources.
   ARR = Automatic ring recovery.
   REX = Routine exerciser.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the ALW:DMQ output message.

Software Release: 5E17(1) and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Allows the initiation of external performance monitoring (PM) sessions over one or more packet switch unit (PSU) asynchronous transfer mode (ATM) links (PSALNK).

A PSALNK provides the ability to interconnect the local PSU with multiple other PSUs in the ATM network, as designated by their community address and subnetwork identifiers. Each of these PSU-to-PSU connections can be monitored internally for performance-impacting metrics in accordance to the GR-1248 ATM standard and included in the relevant switch measurement reports for output. Similarly, the far endpoint of each PSU-to-PSU connection can request that the identical virtual circuit be monitored.

The purpose of this input message is to allow these external requests for PM activity by far endpoints to be fulfilled by the host switch. Each PM session (either internally or externally initiated) consumes a set amount of finite resources on each end of the target virtual circuit. Once these resources have been exhausted, additional PM requests will be denied. The corresponding INH:EXTPM input message provides a means of disabling external PM activity.

If the PSALNK option is included, only the specified PSALNK will be affected by the input message. Otherwise, all PSALNKs in the office will be affected by the input message.

PM is only supported over a virtual circuit terminated locally by a PSALNK hosted on a Protocol Handler for ATM Version 2 (PHA2).

2. FORMAT

ALW:EXTPM[,PSALNK=a-b-c];

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number of the target PSALNK.
b = PSU number of the target PSALNK.
c = Link number of the target PSALNK.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by one or more ALW:EXTPM output messages.

NG = No good. May also include:
- NO PHA2 PSALNK EQUIPPED = The request has been denied. The message is valid but no PSALNKs within the scope of the input message were detected in the current equipage.
- PSALNK UNEQUIPPED = The request has been denied. The message is valid but the specified PSALNK was not detected in the current equipage.
- MUST BE A PHA2 PSALNK = The request has been denied. The message is valid but the specified PSALNK is not hosted by a PHA2.
- DATABASE ERROR = The request has been denied. The message is valid but an internal
database error has prevented any action from being taken.

- **INTERNAL CORRUPTION** = The request has been denied. The message is valid but an internal data corruption error has prevented any action from being taken.

**RL** = Retry later. May also include:

- **PREVIOUS REQUEST IN PROGRESS** = The request has been denied. The message is valid but the previous request must complete before a new request can be made.

j = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Optical carrier - level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Synchronous transport signal - level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = VT15 group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = VT15 member number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

v = Optical carrier - level 3 concatenated (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Synchronous transport signal - level 3 concatenated (STS3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = PSU shelf (PSUSHLF) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = PSU relative protocol handler (PSURELPH). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the ALW:FAC output message.

NG = No good. The input contained an illegal specification.

RL = Retry later. The request has been denied, probably due to system load.

Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the access permissions of a specific file be changed. Permissions allow the owner, group, and others to read, write, and execute a file.

WARNING: Incorrect permission values can prevent the system from accessing needed files or executing input messages and processes.

2. FORMAT

ALW:FILESYS,ACCESS=a,FN="b";

3. EXPLANATION OF MESSAGE

a = A 3-digit number giving access permissions for owner, group and others, in that order. Valid value(s):
  1 = Execute (search in directory) only.
  2 = Write only.
  3 = Write and execute (search).
  4 = Read only.
  5 = Read and execute (search).
  6 = Read and write.
  7 = Read, write, and execute (search).

b = Full pathname of the file or directory.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the ALW:FSYS-ACCESS output message.

CRAFT FM 01)
ALW:GKCCR
Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE
Requests that automatic periodic execution of the generated key collection and compression routine (GKCCR) be allowed in specified processors. Either specific processors can be specified or no processors can be specified. If no processors are specified, then the GKCCR will be allowed in every processor.

2. FORMAT

ALW:GKCCR[,SM=a[&b]][,CMP=c][,AM];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Switching module (SM) number or the lower limit of a range of SM numbers.

b = The upper limit of a range of SM numbers.

c = Communications module processor (CMP) number.

4. SYSTEM RESPONSE

NG = No good. The input request is invalid. May also include:
- NO VALID PROCESSOR SPECIFIED = Specific processor(s) were specified in the input request line, but no requested processor was operational. If specific processors are to be requested, at least one requested processor must be operational.

OK = Good. Request was accepted.

APP:RANGES
ALW:HDW-CLNK

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Allows level 2 and level 3 hardware checks errors to be performed on one or all communication links (CLNKs).
(Refer to the Corrective Maintenance Manual for an explanation of level 2 and level 3 errors.)

2. FORMAT

ALW:HDWCHK,CLNK{=a-b-c-d|,ALL};

3. EXPLANATION OF MESSAGE

ALL = Allow errors on all communication links.
a = Switching module (SM) number.
b = Office network and timing complex (ONTC) side.
c = Module message processor (MMP) type. Valid value(s):
   0 = Alpha.
   1 = Beta.
d = Message switch (MSGS) side.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - ALL NOT VALID WITH A SINGLE UNIT = A single CLNK and ALL may not be specified together.
   - UNIT UNEQUIPPED = The specified single CLNK is unequipped.

PF = Printout follows. A printout will follow when the requested action is completed.

ALW:HDW-CM

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Allows hardware error checks to be performed on all communication module (CM) units. This includes the message switch control unit (MSCU) (for communication module model 2; hardware only), foundation peripheral controller (FPC), pump peripheral controller (PPC), module message processor (MMP), office network and timing complex (ONTC), and communication links (CLNKs).

2. FORMAT

ALW: HDWCHK, CM;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

IP = In progress. May also include:
- PENDING EXIT FROM MANUAL CM ISOLATION = The request cannot be executed now because the communication module (CM) is isolated from the administrative module (AM) by a manual request. The request will be acted upon once AM communication with the CM is re-established.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. The request has been accepted and the ALW: HDW-CM output message follows.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full; try again later.

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Requests that hardware error checks be allowed to be performed on the specified integrated digital carrier unit (IDCU) facility (IFAC) circuit. This input message will only work on IFACs associated with the A and P facilities for the TR008 remote terminal (RT) and on the protection line for the TR303 RT.

2. FORMAT

ALW:HDWCHK,IFAC=a-b-c;

3. EXPLANATION OF MESSAGE

a  
= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  
= IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  
= IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

**PF**  
= Printout follows. The ALW:HDW-IFAC output message follows.

**NG**  
= No good. The request has been denied. The message is valid but the request conflicts with current status.

**RL**  
= Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Input Appendix(es):

APP:RANGES
1. PURPOSE

Requests that a hardware check (HDWCHK) be allowed in a module controller/time-slot interchange unit (MCTSI). The system enables the indicated HDWCHK if internal checks allow the transition.

2. FORMAT

ALW:HDWCHK,MCTSI=a-b,c;

3. EXPLANATION OF MESSAGE

a = Switching module (SM)/SM-2000 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Module controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Keyword that specifies inhibit bit name. Valid value(s):

NOTE: If the keyword is invalid for the specified SM/SM-2000, the request will be denied with the message STOPPED REQUEST NOT ALLOWED.

ALL = All valid module controller maintenance errors.
AFFCI = Active flip-flop cleared interrupt. Valid for SMs with the MCTU3 (module controller/time slot interchange unit 3) and for SM-2000s.
ARPV = Arbitration protocol violation error. Valid for SM-2000 only.
CACHE = Cache errors. Allowing CACHE on SM-2000s with cache allows the interrupts source while on non-SM-2000s with caches it enables the cache area (the normal mode of operation) as well, which speeds up the operation of the processor. This option is only valid for SMs with the MCTU2 (module controller/time slot interchange unit 2), the extended memory addressing (EMA) 20 or SM-2000s equipped with a CORE60 processor pack. If this error has been inhibited, allowing it will improve processor performance.
CADPR = Memory address mismatch error. Valid for SM-2000 only.
CBERR = Correctable bit error. If this error has been inhibited, allowing it will improve processor performance. Inhibiting this has no performance impact on SM-2000 or MCTU3.
CI0IN = Control interface 0 interrupt.
CI1IN = Control interface 1 interrupt.
CPINT = Enhanced central processor intervention interrupt.
DCODE = Decode error. Valid for SM-2000 only.
DL0PE = Dual link interface (DLI) 0 parity error. Not valid for SM-2000.
DLI0I = Data link 0 interrupt. Not valid for SM-2000.
DLI1I = Data link 1 interrupt. Not valid for SM-2000.
IAC0 = DLI0 illegal access error. Not valid for SM-2000.
IAC1 = DLI1 illegal access error. Not valid for SM-2000.
LPVER = Bus lock violation. Valid for SM-2000 only.
MADPE = Address parity error.
MCINT = Resets in the mate controller.
MH0IN = Message handler 0 interrupt. Valid for SM-2000 only.
MH1IN = Message handler 1 interrupt. Valid for SM-2000 only.
MH2IN = Message handler 2 interrupt. Valid for SM-2000 only.
MIOIO = I/O invalid operation error.
MH1IN = Message handler 0 interrupt. Valid for SM-2000 only.
MH0IN = Message handler 0 interrupt. Valid for SM-2000 only.
MIOT = I/O timer time out error.
MIOUE = I/O unlock error.
MPRIN = Maintenance interrupts in the mate MCTSI.
MRDYT = Ready time out.
MRSPERR = Multiple response error. Valid for MCTU2 and SM-2000 only.
MRWPE = Read or write parity error.
MWPER = Write protect error.
NCBERR = Non-correctable bit error. Valid for SM-2000 only.
PIINT = Packet interface (PI) interrupt.
PUMPHW = Pump hardware errors. Valid for MCTU2, MCTU3, and SM-2000 only.
REFE = Dynamic RAM refresh fail error. Valid for SM-2000 only.
SSYNC = Scanned I/O sync error. Valid for SM-2000 only.
TSIIN = Time-slot interchange (TSI) interrupt. For SM-2000, this will allow interrupts from network link interfaces (NLIs) if the NLIs are not inhibited by an INH:HDWCHK-ONTC request.
TSI4IN = TSI model four interrupt. Allowing this bit will not affect the inhibits for NLIs. Use this if you want to inhibit only TSI interrupts. Valid for SM-2000 only.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the ALW:HDW-MCTSI output message.
RL = Retry later. The message cannot be processed, so try the message again later. This response will be output if the AM cannot communicate with the requested SM/SM-2000.

TSIIN = Time-slot interchange (TSI) interrupt. For SM-2000, this will allow interrupts from network link interfaces (NLIs) if the NLIs are not inhibited by an INH:HDWCHK-ONTC request.
TSI4IN = TSI model four interrupt. Allowing this bit will not affect the inhibits for NLIs. Use this if you want to inhibit only TSI interrupts. Valid for SM-2000 only.
XCDUXIN = XCDU interrupt where x is the XCDU number. Allowing this interrupt will result in allowing all interrupts for the requested XCDU including the interrupts from the CIs in that XCDU. Valid for SM-2000 only.
XLCKM = XCDCLs (electrical control and data control link) or OCDCLs (optical control and data control link) loss of clock interrupt. Valid for SM-2000 only.
PF = Printout follows. Followed by the ALW:HDW-MCTSI output message.

RL = Retry later. The message cannot be processed, so try the message again later. This response will be output if the AM cannot communicate with the requested SM/SM-2000.

Output Message(s):

ALW : HDW-MCTSI
OP : OFFNORM-SM

Input Appendix(es):

APP : RANGES

Other Manual(s):

235-105-250  System Recovery Procedures
1. PURPOSE

Requests that a hardware check be allowed in a module controller/time-slot interchange unit (MCTSI). The system enables the indicated HDWCHK if internal checks allow the transition.

2. FORMAT

ALW:HDWCHK,MCTSI=a-b,c;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Module controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Keyword that specifies inhibit bit name. If the keyword is invalid for the specified SM/SM-2000, the request will be denied with the message STOPPED REQUEST NOT ALLOWED.

Valid value(s):
AFFCI = Active flip-flop cleared interrupt. Valid for SMs with the module controller/time slot interchange unit 3 (MCTU3) and for SM-2000s.
ALL = All valid module controller maintenance errors.
ARPV = Arbitration protocol violation error. Valid for SM-2000 only.
CACHE = Cache errors. Allowing CACHE on SM-2000s with cache allows the interrupts source while on non-SM-2000s with caches it enables the cache area (the normal mode of operation) as well, which speeds up the operation of the processor. This option is only valid for SMs with the module controller/time slot interchange unit 2 (MCTU2), the extended memory addressing (EMA) 20 or SM-2000s equipped with a CORE60 or CORE700 processor pack. If this error has been inhibited, allowing it will improve processor performance on non-SM-2000s.
CADPR = Memory address mismatch error. Valid for SM-2000 only.
CBERR = Correctable bit error. If this error has been inhibited, allowing it will improve processor performance. Inhibiting this has no performance impact on SM-2000 or MCTU3.
CI0IN and CI00IN = Control interface (CI) 0 interrupt.
CI1IN and CI01IN = CI 1 interrupt.
CI2IN and CI02IN = CI 2 interrupt. Valid for SM-2000 only.
CI3IN and CI03IN = CI 3 interrupt. Valid for SM-2000 only.
CIdeIN = CI interrupt in an electrical extended control and data unit (XCDU) or optical extended control and data unit (OXU) shelf. Valid for SM-2000 only.
CPINT = Enhanced central processor intervention interrupt.
DCODE = Decode error. Valid for SM-2000 with CORE60 only.
DL0PE = Dual link interface (DLI) 0 parity error. Not valid for SM-2000.
DLI0I  = Data link 0 interrupt. Not valid for SM-2000.
DLI1I  = Data link 1 interrupt. Not valid for SM-2000.
IAC0   = DLI0 illegal access error. Not valid for SM-2000.
IAC1   = DLI 1 illegal access error. Not valid for SM-2000.
LOSUI  = Update interface loss of synchronization. Valid for SM-2000 with CORE700 only.
LPVER  = Bus interface loss of synchronization. Valid for SM-2000 with CORE60 only.
MADPE  = Address parity error.
MCINT  = Resets in the mate controller.
MH0IN  = Message handler 0 interrupt. Valid for SM-2000 only.
MH1IN  = Message handler 1 interrupt. Valid for SM-2000 only.
MH2IN  = Message handler 2 interrupt. Valid for SM-2000 only.
MIOIO  = I/O invalid operation error.
MIOLE  = I/O timer lock error.
MIOTO  = I/O timer time out error.
MIQUE  = I/O unlock error.
MPRIN  = Maintenance interrupts in the mate MCTSI.
MRDYT  = Ready time out.
MRSPERR = Multiple response error. Valid for MCTU2 and SM-2000 only.
MRWPE  = Read or write parity error.
MWPER  = Write protect error.
NCBERR = Non-correctable bit error. Valid for SM-2000 only.
OXUFIN = OXU interrupts. Valid for SM-2000 only.
PIINT  = Packet interface (PI) interrupt.
PUMPHW = Pump hardware errors. Valid for MCTU2, MCTU3, and SM-2000 only.
REFE   = Dynamic RAM refresh fail error. Valid for SM-2000 only.
SSYNC  = Scanned I/O sync error. Valid for SM-2000 with CORE60 only.
TSIIN  = Time-slot interchange (TSI) interrupt. For SM-2000, this will allow interrupts from network link interfaces (NLIs) if the NLIs are not inhibited by an INH:HDWCHK-ONTC request.
TSI4IN = TSI model four interrupt. Allowing this bit will not affect the inhibits for NLIs. Use this if you want to inhibit only TSI interrupts. Valid for SM-2000 only.
XCDUgIN = XCDU interrupt. Allowing this interrupt will result in allowing all interrupts for the requested XCDU including the interrupts from the CIs and DIs in that XCDU. Valid for SM-2000 only.
XLCKM  = Electrical control and data control link (XCDCDL) or optical control and data control link (OCDCL) loss of clock interrupt. Valid for SM-2000 only.

* = Shelf. Valid value(s):
0  = Local CI's.
1 - 8  = XCDU/OXU number.
e = CI number. Valid value(s):
   0 - 3 = Local. Valid for SM-2000 only.
   0 - 2 = XCDU/OXU. Valid for SM-2000 only.

f = OXU number (1 - 8).

g = XCDU number.

4. SYSTEM RESPONSE

   PF = Printout follows. Followed by the ALW:HDW-MCTSI output message.

   RL = Retry later. The message cannot be processed, so try the message again later. This response will be output if the AM cannot communicate with the requested SM/SM-2000.

ALW:HDW-RRCLK

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Allows hardware checks to occur on a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK). The system enables the hardware checks if internal status allows the transition.

2. FORMAT

ALW:HDWCHK,RRCLK=a-b-c;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RRCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:

CONFLICT WITH UNIT STATE
SM DOES NOT EXISTSM UNEQUIPPED
UNIT DOES NOT EXIST

PF = Printout follows. The ALW:HDW-RRCLK output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP:PORT-STATUS
1. PURPOSE

Requests that a specific machine-detected interoffice irregularity (MDII) that has reporting suppressed be allowed to be printed again.

2. FORMAT

ALW:MDII=a,TG=b;

3. EXPLANATION OF MESSAGE

a = The MDII suppressed on a trunk group. Valid value(s):
2SPDT = Partial dial timeout in the second stage of a traditional 2-stage international outbound call.
2SPST = Permanent signal timeout in the second stage of a traditional 2-stage international outbound call.
2SVCA = Vacant code in the second stage of a traditional 2-stage international outbound call.
ABF = Abandon failure.
ACK = No acknowledgment wink.
ANF = Failure to receive automatic number identification (ANI) digits on incoming LATA trunk.
ANF2 = ANI collected by an operator following a failure to receive ANI digits on an incoming centralized automatic message accounting (CAMA) trunk.
ANI = Time-out waiting for far off-hook from Traffic Service Position System (TSPS) before sending ANI digits.
AST = Position acknowledge seizure signal time-out.
ATO = Time-out waiting for address complete signal.
BAF = Blocking acknowledgment failure.
BLFCA = Blocking a fully coded addressed international outbound call routed to a non-CCS trunk.
CAF = Circuit reset acknowledgment failure.
CAI = Address incomplete received.
CII = Initial address message (IAM) irregularity (incoming).
CKF = Continuity check failure (incoming).
COF = Confusion received (outgoing).
CRA = Circuit reservation message (CRM) timer timed out while waiting for a circuit reservation acknowledgment (CRA) message.
CQR = Circuit query message (CQM) timed out while waiting for a circuit query reply (CQR) message.
CRR = Reset received (incoming).
CTO = Continuity timeout (incoming).
CVN = Vacant national number received (outgoing).
DDF = Delay dial, steady off-hook.
DSN = Delay dial, steady on-hook.
EXD = Extra digit.
EXP = Extra pulse.
FCA = Final closure abandon.
FKP = False key pulse.
FSA = False start abandon.
HGBAF = Hardware group blocking acknowledgment failure.
HGUAF = Hardware group unblocking acknowledgment failure.
IAD = Incomplete address detected (incoming).
IAM = CRA timer timed out while waiting for an IAM.
ICA = Incoming advance.
IDIG = Invalid digit.
KPST = Received call on equal access trunk which contains a KP + ST ANI sequence.
MCA = Misrouted CAMA.
MGBAF = Maintenance group blocking acknowledgment failure.
MGUAF = Maintenance group unblocking acknowledgment failure.
MPS = Misplaced start pulse.
MRF = Message refusal received (outgoing).
MTD = Mutilated digit.
NACK = No ground acknowledgment received on a ground start private facility (FX) trunk.
NKP = No key pulse.
NOANI = Received call on an equal access trunk which contains no ANI information. This call will not be blocked.
ONOA = OSPS nature of address.
OSI = Operator services information.
PAT = Position attached signal time-out.
PDA = Partial dial abandon.
PDT = Partial dial time-out.
PFR = Polarity failure.
PST = Permanent signal time-out.
RLG = Release guard on unstable call (outgoing).
RST = Reset received (outgoing).
SGD = Failure to receive station group designator (SGD).
SSD = No second start dial wink.
TRR = Tip-ring reversal.
TTR = Operator trunk trouble reports.
UAF = Unblocking acknowledgment failure.
UCA = Unauthorized CAMA.
UQL = Unequipped label received (outgoing).
UXS = Unexpected stop.
VCA = Vacant code.
VPA = Voice path assurance timeout (outgoing).
WBF = Incoming wideband call spans facilities or trunk groups.
WSN = Wink start, steady on-hook.
WSR = Wink start, steady off-hook.
XST = Expected stop time-out.

b = Trunk group number.

4. SYSTEM RESPONSE

NA = No acknowledgment. Request has not been acknowledged. It is probable that the request has
been lost.

PF = Printout follows. Request has been accepted. The ALW:MDII output message will follow identifying the results of the request.

**Application:** 5  
**Type:** Input

1. PURPOSE

Requests that line card/network termination (NT) mismatch detection be allowed on integrated services digital network (ISDN) lines equipped with U-cards. To be certain of the results of this message, the following three conditions should be noted.

First, ALW:MISMATCH without the report (REPT) option will only enable mismatch detection. No output will be provided on the receive-only printer (ROP), but the port status of out-of-service (OOS) blocked (BLKD) lines will be updated to OOS BLKD mismatch (MSMTCH) for those lines having mismatches. Second, ALW:MISMATCH,REPT will provide a printout on the ROP of the lines that have mismatches only if the ALW:MISMATCH message is also entered on a separate message line. ALW:MISMATCH,REPT does not turn on mismatch detection. Third, to allow the NT mismatch detection and the NT mismatch report on a switching module (SM), the office parameters for NT mismatch detection and NT mismatch report must also be set to Y, using Recent Change/Verify (RC/V) OFFICE PARAMETERS view 8.1 (refer to MISMATCH DETECTION ENABLE and REPORT on RC/V view 8.1).

2. FORMAT

```
ALW:MISMATCH[,REPT][,SM=a[&b]];
```

3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **REPT** = Allow the reporting on the ROP of the lines found to have mismatches, provided that mismatch detection has been allowed.
- **a** = SM number or the lower limit of a range of SM numbers. If no SM number or range is specified, all equipped and operational SMs will be allowed.
- **b** = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

- **NG** = No good. The message was not recognized or acceptable.
- **PF** = Printout follows. Followed by ALW:MISMATCH output message.

*Command Group:* SFTUTIL  
*Application:* 5  
*Type:* Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that the operating system for distributed switching (OSDS) monitor actions be allowed.

The ALW:MON messages activates the OSDS monitor by setting the monitor control word a non-zero value. This is the first word of the OShisarray monitor buffer in the administrative module (AM) or the Slihistory monitor buffer in the switching module (SM) or the communications module processor (CMP).

**WARNING:** The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it. This message should be used under the guidance of high-level technical support.

**NOTE:** An increase in the processor occupancy is directly related to the number of options specified for the SET:MON-WTD, SET:MON-DATA, SET:MON-FCN, SET:MON-SPEC input messages.

2. **FORMAT**

```
ALW:MON, {AM|SM=a | CMP=b-c};
```

3. **EXPLANATION OF MESSAGE**

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- \(a\) = Switching module (SM) number.
- \(b\) = Message switch side.
- \(c\) = Communications module processor (CMP) number.

4. **SYSTEM RESPONSE**

- **NG** = No good. Error in format.
- **PF** = Printout follows. Followed by ALW:MON output message.
- **RL** = Retry later. System resource shortage.

Software Release: 5E14 - 5E16(1)
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE
Requests that the printing of output messages stimulated by the remote network management center (RNMC) be allowed.

2. FORMAT
ALW:NMOUT[,TYPE=a];

3. EXPLANATION OF MESSAGE
   a = Message type. The default is to allow all output messages resulting from RNMC actions. Valid value(s):
      CGAP = Call gapping code controls messages.
      DOC = Dynamic overload controls messages.
      SILC = Selective incoming load controls messages.
      SSTR = Service selective trunk reservation controls messages.
      TGC = Manual trunk group controls messages.
      TR = Trunk reservation controls messages.

4. SYSTEM RESPONSE
   NG = No good. The request has been denied. May also include:
       - INVALID REQUEST = This office is not equipped to process the request entered.
       - INVALID TYPE = An invalid message type was entered.
   OK = Good. The input message executed successfully.

**1. PURPOSE**

Requests that the printing of output messages stimulated by the remote network management center (RNMC) be allowed.

**2. FORMAT**

```
ALW:NMOUT[,TYPE=a];
```

**3. EXPLANATION OF MESSAGE**

- `a` = Message type. The default is to allow all output messages resulting from RNMC actions. Valid value(s):
  - 
  - `CGAP` = Call gapping code controls messages.
  - `DOC` = Dynamic overload controls messages.
  - `SILC` = Selective incoming load controls messages.
  - `SSTR` = Service selective trunk reservation controls messages.
  - `TGC` = Manual trunk group controls messages.
  - `TR` = Trunk reservation controls messages.
  - `HTR` = Hard-to-reach (HTR) controls messages.

**4. SYSTEM RESPONSE**

- `NG` = No good. The request has been denied. May also include:
  - `INVALID REQUEST` = This office is not equipped to process the request entered.
  - `INVALID TYPE` = An invalid message type was entered.
  - `FEATURE NOT AVAILABLE` = The HTR feature is not available.

- `OK` = Good. The input message executed successfully.

ALW:PCTF

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the per-call test failure (PCTF) verbose mode be allowed. Allowing the PCTF verbose mode on a switching module (SM) causes individual REPT:PCTF reports to be generated for every PCTF that occurs on the SM. When the PCTF verbose mode is not allowed (inhibited), only the first and tenth occurrences of a PCTF type on a line is reported.

2. FORMAT

ALW:PCTF,VERBOSE[,SM=a[&&b]];

3. EXPLANATION OF MESSAGE

a = SM number or the lower limit of a range of SM numbers. The default is all equipped SMs.
b = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.
PF = Printout follows. Followed by ALW:PCTF output message.

1. PURPOSE

Requests that the printing of the regularly scheduled 24-hour plant report to the ROP be allowed. The specified part(s) will continue to be automatically printed until inhibited by the INH:PLNT24 input message.

By default, PART24 is inhibited for the ROP and ALW:PLNT24 and "ALL" will not cause PART24 to be allowed for the ROP. PART24 can only be allowed for the ROP by entering ALW:PLNT24;PART24.

2. FORMAT

ALW:PLNT24:{a|ALL};

3. EXPLANATION OF MESSAGE

ALL = Allow all parts of the 24-hour plant report (except PART24).

a = Name of report part to be allowed. Valid value(s):
PART1 = Service measurements.
PART2 = Equipment performance.
PART3 = Performance measurements.
PART4 = Remote switching module (RSM) maintenance service and performance.
PART5 = Trunk error analysis.
PART6 = Interlata carrier measurements.
PART7 = Network call denial.
PART8 = RSM cluster measurements.
PART9 = Integrated services digital network (ISDN) packet switching office totals.
PART10 = Operator Services Position System (OSPS) processors counts.
PART11 = ISDN Office totals.
PART13 = OSPS real-time rating query measures.
PART14 = OSPS facility administration measures.
PART15 = OSPS measurements.
PART16 = OSPS interflow measures.
PART17 = OSPS line information data base (LIDB) measures.
PART18 = OSPS customer account services (CAS).
PART19 = Action control point (ACP) for software defined networks.
PART21 = Leased network action point.
PART22 = OSPS intercept measures.
PART23 = OSPS customer account services release 3 signaling measures.
PART24 = Machine detected inter-office irregularity (MDII) trunk group measurements.
PART25 = ISDN user part (ISUP) office totals.
PART26 = DS1 measurements.
PART27 = Static proportionate bidding (PB) measurements.
PART28 = OSPS international credit card validation (ICCV) measures by foreign database.
PART29 = OSPS line applications for consumers (LAC) signaling measures.
PART30 = OSPS originating line number screening (OLNS) measures.
PART36 = Signaling link performance.
4. SYSTEM RESPONSE

NG = No good. The request was made during the automatic preparation of the report. The OP:PLNT24-NOT output message will follow. May also include:
- DATA NOT AVAILABLE AT THIS TIME = Report is being generated and, therefore, manual requests are locked out, or the report has not generated since an initialization.

OK = Good. The part(s) was/were allowed.

ALW:REX-CM-SM

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Allows either one or all valid test types of routine exercise (REX) of the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs.

2. FORMAT

ALW:REX [,CM] [,SM=a[&b]] [,c];

3. EXPLANATION OF MESSAGE

a = SM number, or lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = REX test type to be allowed (default is to allow all three test types). Valid value(s):

DGN = Allow diagnostic exercise.
ELS = Allow electronic loop segregation tests. This is not a valid test type for the CM.
FAB = Allow fabric exerciser tests of grids. This is not a valid test type for the CM.

NOTE: If neither CM nor SM is specified, the default is to exercise hardware in the CM and all SMs.

4. SYSTEM RESPONSE

NG = No good. The request was not a valid entry.
OK = Good. Request is valid and accepted.
RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

ALW:REX-UNIT-A

Software Release: 5E14 only
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the scheduling of a unit for routine exercise (REX) be allowed in the communication module (CM) or in a switching module (SM). This applies only to diagnostic (DGN) tests.

2. FORMAT

ALW:REX{,CM[a],SM=a,b[=c]};

3. EXPLANATION OF MESSAGE

a    = SM number.
b    = The SM unit type to be allowed. DGN tests are the only test types that may be inhibited on a unit basis. Valid value(s):
   ASC    = Alarm service circuit.
   BTSR   = Bootstrapper circuit.
   DCLU   = Digital carrier line unit.
   DCTU   = Directly connected test unit.
   DLTU   = Digital line and trunk unit.
   DNUS   = Digital networking unit - synchronous optical network (SONET) (DNU-S).
   GDSF   = Global digital services function.
   GDSU   = Global digital service unit.
   IDCU   = Integrated digital carrier unit.
   ISLU   = Integrated services line unit.
   ISTF   = Integrated services test facility.
   LDSU   = Local digital service unit.
   LU     = Line unit.
   MCTSI  = Module controller/time slot interchanger.
   MSU    = Metallic service unit.
   MTIB   = Metallic test interface bus.
   PSU    = Packet switching unit.
   RAF    = Recorded announcement frame.
   RAU    = Remote answering unit.
   RCLK   = Remote clock.
   RLI    = Remote line interface.
   SAS    = Service announcement system.
   TU     = Trunk unit.

   c    = Unit number.

d    = The CM unit type to be inhibited. Valid value(s):
   MSGS    = Message switch.
   ONTC    = Office network timing complex.
4. SYSTEM RESPONSE

NG = No good. The request was not a valid entry.
OK = Good. Request is valid and accepted.
RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

1280 [REX STATUS (SM)]
1290 [REX STATUS (CM)]
ALW:REX-UNIT-B

Software Release: 5E15 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE
Requests that the scheduling of a unit for routine exercise (REX) be allowed in the communication module (CM) or in a switching module (SM). This applies only to diagnostic (DGN) tests.

2. FORMAT

ALW:REX{,CM[,{d=c}]},SM=a,b[{c}];

3. EXPLANATION OF MESSAGE

a = SM number.

b = The SM unit type to be allowed. DGN tests are the only test types that may be inhibited on a unit basis. Valid value(s):
- AIU = Access Interface Unit.
- ASC = Alarm service circuit.
- BTSR = Bootstrapper circuit.
- DCLU = Digital carrier line unit.
- DCTU = Directly connected test unit.
- DLTU = Digital line and trunk unit.
- DNUS = Digital networking unit - synchronous optical network (DNU-S).
- GDSF = Global digital services function.
- GDSU = Global digital service unit.
- IDCU = Integrated digital carrier unit.
- ISLU = Integrated services line unit.
- ISTF = Integrated services test facility.
- LDSU = Local digital service unit.
- LU = Line unit.
- MCTSI = Module controller/time slot interchanger.
- MSU = Metallic service unit.
- MTIB = Metallic test interface bus.
- PSU = Packet switching unit.
- RAF = Recorded announcement frame.
- RAU = Remote answering unit.
- RCLK = Remote clock.
- RLI = Remote line interface.
- SAS = Service announcement system.
- TU = Trunk unit.
- PLTU = Peripheral Line and Trunk Unit.
- IWG = Inter-Working Gateway.

c = Unit number.

d = The CM unit type to be inhibited. Valid value(s):
- MSGS = Message switch.
ONTC  = Office network timing complex.

4. SYSTEM RESPONSE

NG  = No good. The request was not a valid entry.
OK  = Good. Request is valid and accepted.
RL  = Retry later. SM is in an abnormal state. The request cannot be executed now.

ALW:REX

Software Release: 5E14 and later
Command Group: MAINT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that routine exercises (REX) be allowed by clearing individual routine exercise inhibits for one or more hardware communities by clearing the REX temporary inhibit(s). A hardware community consists of a major device controller and its associated subdevices. If a hardware community has REX permanently inhibited, its REX temporary inhibit is not available.

WARNING: It may be desirable to keep REX inhibited on some units. Unless units are specified with this message, all administrative module (AM) controllers including the ring peripheral controller nodes (RPCNs) will be allowed for REX. Because of the configuration of the common network interface (CNI) ring, RPCNs should never be allowed for REX. Allowing REX on RPCNs may lead to service degradation or interruption.

2. FORMAT

ALW:REX[,a [=b]];

3. EXPLANATION OF MESSAGE

ALL = Clear the temporary REX inhibits for all major community controllers that are not permanently inhibited from REX.

a = Unit name of a major community controller. Applications may add additional major controllers which may be allowed by this input message. Valid value(s):
    CU = Control unit.
    DCI = Dual serial channel/computer interconnect.
    IOP = Input/output processor.

NOTE: If not specified, then routine exercises will be allowed for all AM controllers.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual. If not specified, then all controllers with the specified unit name are allowed.

4. SYSTEM RESPONSE

NG = No good. Routing exercises are permanently inhibited for the unit specified or for all the units specified.

OK = Good. Routine exercises are allowed for the units specified or for at least one of the units specified.

PF = Printout follows. Followed by an ALW:REX output message.
= Retry later. The database manager or a database record could not be opened. Try again at a later time. If this persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

ALW:RPC

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

The purpose of this input message is to allow routine port conditioning. Port conditioning is the process of
determining the status of a port, and depending on the port type, setting the hardware and scanning registers to
reflect that status.

2. FORMAT

ALW:RPC[,SM=a[&b]]; 

3. EXPLANATION OF MESSAGE

a = SM number or the lower limit of a range of SMs. Refer to the APP:RANGES appendix in the
Appendixes section of the Input Messages manual.

b = Upper limit of a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

NOTE: If no SM number or range is specified, all equipped and operational SMs will be allowed.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and the ALW:RPC output message will follow.

NG = No good. The input message was not recognized or acceptable.

Input Appendix(es):

APP:RANGES
ALW:RT-FAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that protection (PROT) line switch requests be allowed to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) or requests that a DS1 be allowed to be released from protection. This message is applicable for RTs terminating on an integrated digital carrier unit (IDCU) or a digital carrier line unit (DCLU).

2. FORMAT

ALW:RT,FAC=a-b,{PROT|RELEASE};

3. EXPLANATION OF MESSAGE

PROT = Allow switching from the specified DS1 FAC to the protection line (for use with the DCLU or the IDCU).

RELEASE = Allow a DS1 to be released from protection (for use with the IDCU only).

a = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RT DS1 FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. An ALW:RT-FAC output message will follow.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

**ALW:RTMTBOVR**

*Software Release:* 5E14 and later  
*Command Group:* TRKLN  
*Application:* 5  
*Type:* Input

### 1. PURPOSE

Requests that metallic setup failure override be allowed when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT). If the MTB is really open and override is allowed, metallic setup will succeed. The system default is to allow metallic setup failure override.

This message will set an override flag in a switching module (SM) to the allow state. The flag can be set in one SM or in all SMs. If individual SMs are set differently, be aware that if the modular metallic service unit (MMSU) and RT are in different SMs a remote read of the flag stored in the RT SM is done from the MMSU SM. If the remote read fails, the default of the override flag will be that stored in the MMSU SM.

### 2. FORMAT

```
ALW:RTMTBOVR [,SM=a[&b]];
```

### 3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **a** = SM number, or the lower limit of a range of SM numbers. If no SM number or range is specified, all equipped and operational SMs will be allowed.
- **b** = The upper limit of a range of SM numbers.

### 4. SYSTEM RESPONSE

- **NG** = No good. The message was not recognized or acceptable.
- **PF** = Printout follows. The request has been accepted and a ALW:RTMTBOVR message will follow.

ALW:RTMTBPRT

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of the REPRTRMTBSID message be allowed when the metallic test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).

The system default is to allow the printing of this message. This can be inhibited with the input message INH:RTMTBPRT. By inhibiting the printing of this message, the ability to see the cause of metallic setup failure will be lost. If, however, metallic setup override is allowed with the message ALW:RTMTBOVR, then it might be desirable not to have the message print. Consider carefully what configuration is desired in the office.

This message will set a print flag in a switching module (SM) to the allow state. The flag can be set in one or in all SMs. If individual SMs are set differently, be aware that if the modular metallic service unit (MMSU) and RT are in different SMs a remote read of the flag stored in the RT SM is done from the MMSU SM. If the remote read fails, the default of the print flag will be that stored in the MMSU SM.

2. FORMAT

ALW:RTMTBPRT[, SM=a[&&b]]; 

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number, or the lower limit of a range of SM numbers. If no SM number or range is specified, all equipped and operational SMs will be allowed.

b = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

PF = Printout follows. The request has been accepted and an ALW:RTMTBPRT message will follow.

ALW:S7RPT

**Software Release:** 5E15 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

This command allows viewing of CCS MTCE messages.

It allows observing the reception and sending of any reset, blocking, unblocking, or related acknowledgement message; and any continuity, circuit query and circuit validation message.

It should be used with SET:S7RPT and EXC:S7RPT to start viewing CCSMTCE messages. S7RPT observations will only be active for an hour after the initial ALW:S7RPT command was entered. By entering additional ALW:S7RPT commands, the current observation interval can be extended, thus preserving the current settings. A warning output report will be given 10 minutes before an observation expires. If S7RPT observations are still active one hour after the last ALW:S7RPT command was entered, then:
- All S7RPT observation scopes and types will be cleared.
- All S7RPT observation sessions will be terminated.

Should system operation be impacted by this message:
- The input message STP:S7RPT, can be used to halt observation on a specific scope.
- The input message SET:S7RPT, can be used to halt observation on a specific type.
- The input message INH:S7RPT, can be used to halt observation on all scopes and turn off the ALW command.

Requesting this message may cause large amounts of data to be printed on the receive-only-printer (ROP).

All observation output reports are logged into a daily log file by request.

2. **FORMAT**

ALW:S7RPT;

3. **EXPLANATION OF MESSAGE**

No variables.

4. **SYSTEM RESPONSE**

**OK** = The message has been accepted. May also include:
- OBSERVATION INTERVAL EXTENDED 1 HOUR = The input message has been issued before.

**PF** = Printout follows. Refer to the ALW:S7RPT output message.

**NG** = No good. May also include:
- FEATURE NOT AVAILABLE = The command cannot be used in this office. The office should be upgraded.
- HARDWARE NOT OPERATIONAL = CCS is not available in the office.

ALW:SCORPT

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that information related to switch cutoff calls be allowed, either with or without an accompanying hardware call trace.

A switch cutoff (SCO) occurs when an established connection is broken for some reason other than an onhook by one of the talking parties (that is, hardware or software failures, procedural errors or exhausted resources).

2. FORMAT

ALW:SCORPT[,a];

3. EXPLANATION OF MESSAGE

a

= Option selected. Valid value(s):
DEBUG

= If this option is selected, a more detailed SCO report from a software viewpoint is generated.

NOTE 1: Because of the large amount of information that will print with this option, support personnel should implement this ONLY if a large number of SCOs still occur after all hardware and resource problems have been resolved.

NOTE 2: Additional possible call cutoffs that were not pegged on the measurements report may be shown in this report with this option. This is the only way to see these "possible" call cutoffs.

TRC

= Print a hardware call trace (TRC:UTIL-LINE) with each SCO report that occurs.

4. SYSTEM RESPONSE

OK

= Good. The request has been received. All subsequent occurrences of switch cutoff calls will print an information report (REPT:SWITCH-CC).

ALW:TCLRPT

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the reporting of information be allowed related to transient calls lost either with or without an accompanying hardware call trace.

When TRC is specified, a hardware call trace (TRC:UTIL input message) is invoked for each transient call lost occurring.

2. FORMAT

ALW:TCLRPT[,TRC];

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

OK = Good. The request has been received. All subsequent occurrences of transient calls lost will print an information report (REPT:TRANSIENT-CL).

5. REFERENCES

Input Message(s):

130 (NM EXCEPTION)
ALW:TRACE

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that tracing be allowed to take place according to the previously input trace parameter settings. The ALW:TRACE and the INH:TRACE input messages form the basic on/off mechanism for trace. The parameter settings may be changed at any time through use of the SET:TRACE (whether tracing is allowed or inhibited). Until the ALW:TRACE request is issued, no trace report will be attempted (although it will consume a certain amount of fixed overhead).

NOTE: The interprocessor message switch (IMS) driver process must be running before trace updates can be sent to the node processors (NP).

2. FORMAT

ALW:TRACE;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. The ALW:TRACE output message will be printed.

SET:TRACE
**ALW:TRAP**

**Software Release:** 5E14 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that a pending trap that was entered by the SET:TRAP input message be activated. In addition, this input message will allow a trap that was temporarily suspended/inhibited or that has completed due to duration or message count criterion being satisfied to be resumed.

Traps that have been aborted before completing can be restarted by entering the ALW:TRAP input message. Traps that have been stopped by a STOP:TRAP input message can not be reactivated with an ALW:TRAP input message. These traps can only be activated by entering a new SET:TRAP input message. Traps will be activated for the specified identification numbers.

2. **FORMAT**

```
ALW:TRAP:ID={a[-a][-a][-a][-a]}|ALL);
```

3. **EXPLANATION OF MESSAGE**

- **ALL** = Activate all pending traps.
- **a** = Trap identification number.

4. **SYSTEM RESPONSE**

```
PF = Printout follows. Followed by an ALW:TRAP output message.
```

ALW:TRFC15

Software Release: 5E14 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that the 15-minute traffic report be allowed to be output to the receive-only printer (ROP). The report will continue to be output until turned off by the INH:TRFC15 message.

2. FORMAT

ALW:TRFC15;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. May also include:
- PRINT ALLOCATION EXCEEDED = The message allocation for this office has reached its limit. The requested report has not been allowed.

OK = Good. The requested report has been allowed. May also include:
- LPS SET TO DISCARD = The report has been allowed, but output may not be seen because the log/print status is set to discard messages of this class.

ALW:TRFC30

Software Release: 5E14 and later
Command Group: MEAS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the specified section of the 30-minute traffic report be allowed to be collected (CLCT) or output to the traffic channel (TRFCH) or receive-only printer (ROP) every 30 minutes. The specified section will continue to be collected in the administrative module (AM) or output every 30 minutes until it is inhibited using the INH:TRFC30 input message. If no section is specified, an attempt will be made to allow all sections starting with Section 1. Those sections which do not fit in the buffer will remain inhibited. Sections which require identifiers in addition to the section name are not included in ALL or the default case.

NOTE: Some recent changes may need to be done first before allowing some sections. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual.

WARNING: If no sections are specified, all sections that do not require arguments will be allowed.

2. FORMAT

ALW:TRFC30,{CLCT|TRFCH|ROP}[::a::ALL];

3. EXPLANATION OF MESSAGE

NOTE: Collection must be allowed before directions to print or prior to being allowed for the traffic channel.

ALL = Allow all sections that do not require identifiers default.

a = Section name that is to be allowed. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CONFIGURATION NOT SUPPORTED = The section requested represents a configuration not present in this office.
- DATABASE ERROR = A database error prevented the request from being successfully completed.
- INCOMPLETE UNIT ID = The identifiers entered incompletely specified a unit.
- INVALID UNIT IDENTIFIERS = The identifier entered did not specify a unit for which data can be collected, or too many identifiers were entered for the ALW:TRFC30-ROP when a section with multiple study sets was requested.
- MEMORY ALLOCATION EXCEEDED = The TRFC30 buffer (memory) allocation would be exceeded if the section were allowed.
- MUST INHIBIT CURRENTLY ALLOWED STUDY SET = This section is a special study section that can not have study sets allowed for collection concurrently. The study set that is currently allowed must be inhibited before any other study set from this section will be allowed for collection.
- NOT ALLOWED FOR COLLECTION = The section cannot be allowed for output because it is not allowed for collection.
- PREVIOUS SAVED STUDY SET DOES NOT EXIST = This section is a special study section that did not save the arbitrary study set or the arbitrary study set does not exist.
- PRINT ALLOCATION EXCEEDED = The printing time allocation would be exceeded if the section were allowed for output to the ROP and/or TRFCH.
- SECTION NOT ALLOWABLE FOR PRINT = The section cannot be allowed for the ROP and/or TRFCH.
- SOME NOT ALLOWED- MEMORY ALLOCATION EXCEEDED = The TRFC30 buffer (memory) allocation would be exceeded if ALL sections were allowed; some section(s) remain inhibited.
- SOME NOT ALLOWED - PRINT ALLOCATION EXCEEDED = The printing time allocation would be exceeded if ALL sections were allowed; some section(s) remain inhibited.
- SOME SECTIONS NOT ALLOWED FOR ROP|TRFCH = ALL sections were requested, one or more sections are not allowed for output because they are not allowed for collection. Use the OP:STATUS,TRFC30 input message to determine which sections are inhibited for ROP/TRFCH. OP:MEASTAT,CLCT input message can be used to determine which sections are inhibited for collection.
- NO GROUPS ENABLED = Enable group by using the recent change/verify (RC/V) view before allowing specific sections. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual for information on which RC/V views are appropriate for specific sections.

NO = The requested action failed. May also include:
- FEATURE NOT AVAILABLE = The feature required to process the request is not present in the switch.

OK = Good. The section(s) were allowed that could be allowed; however, section(s) that could not be allowed for ROP and/or TRFCH will remain inhibited when ALW:TRFC30,ROP,ALL is requested. May also include:
- LPS SET TO DISCARD = The section(s) were allowed, but output may not be seen because the log print status (LPS) is set to discard messages of this class.

PF = Printout follows. The ALW:TRFC30 output message will be printed.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that generic utility WHEN breakpoint clauses in the communication module processors (CMP) be allowed or enabled.

This message may be used together with any of the other CMP generic utility input messages. Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

ALW:UT:CMP=a,{MATE|PRIM},{UTIL|UTILFLAG=b}{!|;}

3. EXPLANATION OF MESSAGE

MATE = Execute this input message on the standby CMP.
PRIM = Execute this input message on the active CMP.
UTIL = Execute this input message on all of the WHEN clauses in the specified CMP.

a = CMP number.

b = The identification number of a specific WHEN clause, which is to be enabled to an active state. Must be a number from 0 to 127.

NOTE: When requesting the enabling of WHEN clauses which have the TIME parameter specified, a maximum of 20 WHEN clauses may be enabled in one allow input message.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

235-105-250   Craft Terminal Lockout Job Aid
11. ASGN
1. PURPOSE

Requests that a dynamic overload control (DOC) response category and action be assigned for a specified common channel signaling (CCS) trunk group.

2. FORMAT

ASGN:DOC,TG=a,RESP=b[,CNTL=c];

3. EXPLANATION OF MESSAGE

a = CCS trunk group number. Must be a one-way outgoing or a two-way trunk group.

b = Response category. These categories designated 'A' through 'F' along with traffic type and level of DOC received determine the percentage of calls on which to apply DOC.

Table 1  DOC Response Category

<table>
<thead>
<tr>
<th>DOC LEVEL RECEIVED</th>
<th>TRAFFIC</th>
<th>RESPONSE CATEGORY TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>A</td>
<td>B</td>
</tr>
<tr>
<td>DOC1</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DOC2</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DOC3</td>
<td>100%</td>
<td>100%</td>
</tr>
</tbody>
</table>

For example, the office receives a DOC2 level. If the user assigns DOC and the response category chosen is E, DOC will be applied to 100% of the alternate route traffic and 75% of the direct route traffic.

c = Control action. Valid value(s):
CANT = DOC CANT control.
SKIP = DOC SKIP control.

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

PF = Printout follows. Followed by the ASGN:DOC output message.

RL = Retry later. May also include:
- RESOURCE SHORTAGE = The necessary resources are not available.

ASGN:DOC,TG=a,RESP=b[,CNTL=c];

3. EXPLANATION OF MESSAGE

a = CCS trunk group number. Must be a one-way outgoing or a two-way trunk group.

b = Response category. These categories designated 'A' through 'F' along with traffic type and level of DOC received determine the percentage of calls on which to apply DOC. Traffic type can be either hard-to-reach (HTR) or non-HTR.

<table>
<thead>
<tr>
<th>DOC LEVEL RECEIVED</th>
<th>TRAFFIC TYPE</th>
<th>RESPONSE CATEGORY</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>DOC1</td>
<td>A</td>
</tr>
<tr>
<td>Alternate route to non-HTR</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>Direct route to non-HTR</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>Alternate route to HTR</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>Direct route to HTR</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>DOC2</td>
<td>Alternate route to non-HTR</td>
<td>0%</td>
</tr>
<tr>
<td>Direct route to non-HTR</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>Alternate route to HTR</td>
<td>100%</td>
<td>100%</td>
</tr>
<tr>
<td>Direct route to HTR</td>
<td>0%</td>
<td>100%</td>
</tr>
<tr>
<td>DOC3</td>
<td>All traffic</td>
<td>100%</td>
</tr>
</tbody>
</table>

For example, the office receives a DOC2 level. If the user assigns DOC and the response category chosen is E, DOC will be applied to 100% of the alternate route non-HTR traffic, 75% of the direct route non-HTR traffic, 100% of the alternate route HTR traffic and 100% of the direct route HTR traffic.

c = Control action. Valid value(s):
CANT = DOC CANT control.
SKIP = DOC SKIP control.
4. SYSTEM RESPONSE

NG  = No good. May also include:
    - INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

PF  = Printout follows. Followed by the ASGN:DOC output message.

RL  = Retry later. May also include:
    - RESOURCE SHORTAGE = The necessary resources are not available.

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Assigns trunk groups to the network management (NM) schedule (SCH). This teletypewriter (TTY) message is only valid for defense switched network (DSN) switches. This message also has options to permit the display of trunk groups in the TRUNK block of the DSN exception page. Each trunk group displayed in the TRUNK block has three indicators associated with it, the level of maintenance usage of the trunk group, the number of attempts per circuit per hour (ACH) of the trunk group, and the level of connections per circuit per hour (CCH).

2. FORMAT

ASGN:DPSCH,TG=a[-a][-a][-a][-a][-a][-a][-a][,ROW=b][,COL=c];

3. EXPLANATION OF MESSAGE

a = Trunk group number.

b = Row number of the TRUNK block in the DSN exception page. Zero is the default.

c = Column number of the TRUNK block in the DSN exception page. Zero is the default.

There are 24 display boxes in the TRUNK block with six boxes per row and four boxes per column. A particular display is identified by its row number and column number.

If neither row number nor column number is entered, one to eight trunk groups may be specified. These trunk groups will be added only to the schedule list. These trunk groups are not displayed in the TRUNK block. If only column number is entered, up to four trunk groups may be specified. These trunk groups are displayed on the designated column from top to bottom. The row defaults to 1 in the TRUNK block.

If only row number is entered, up to six trunk groups may be specified. The specified trunk groups are displayed on the designated row from left to right. The column defaults to 1 in the TRUNK block.

If both row and column numbers are entered, only one trunk group may be specified and it will be displayed in the designated box. If row=0 and col=0 is specified, the trunk group is only added to the schedule list. This trunk group is not displayed in the TRUNK block.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the ASGN:DPSCH output message.

NG = No good. May also include:
   - INVALID PARAMETER = Column/row number not in valid range.
   - TOO MANY TGS = Too many trunk groups are specified for the give column/row number. (Refer to variable 'c' for maximum number of trunk groups allowed for a column/row).

RL = Retry later. May also include:
   - RESOURCE SHORTAGE = The necessary resources are not available.

Software Release: 5E16(2) and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE
Requests that a destination specified by code and/or carrier be assigned to the manual hard-to-reach (MHTR) list.

NOTE: For the AUTOPLEX® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT
ASGN:MHTR,{CODE=a[CARR=b]|CARR=b};

3. EXPLANATION OF MESSAGE
a  = Destination code (1 to 10 digits). (Valid character set 0-9); The string is typically of the form NPANXXX where NPA is the area code, NXX is the office code and X is the first of the last four digits of the number. Any of the leftmost subsets, however, can be entered (such as, the area code, the area code followed by one digit of the office code NPAN, and so forth.).

NOTE: The code could be a full destination code or any left-most subset thereof.

b  = The feature group D carrier (0 - 9999).

4. SYSTEM RESPONSE
NG  = Not good. Valid value(s):
   FEATURE NOT AVAILABLE = The hard-to-reach feature is not available.

PF  = Printout follows. Followed by the ASGN:MHTR output message.

RL  = Retry later. Valid value(s):
   RESOURCE SHORTAGE = The necessary resources are not available.

1. PURPOSE

Requests that a trunk reservation (TR) control be assigned to a specified trunk group.

Note: For the Autoplex® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

ASGN:TR,TG=a,{RL1=b[,RL2=c]|RL2=c},RESP=d[,CNTL=e][,ARA=f][,INH=g];

3. EXPLANATION OF MESSAGE

a = Trunk group (TG) number. Must be a one-way outgoing or a two-way trunk group.

b = Reservation level 1 (RL1). Number of idle circuits per trunk group to be reserved - (0 - 15, default 0).

c = Reservation level 2 (RL2). Number of idle circuits per trunk group to be reserved - (0 - 15, default 0).

Note: At least one reservation level (RL1 or RL2) must be non-zero. If both are non-zero, then RL1 must be greater than RL2. If an SSTR control has been assigned for TG 'a' by an ASGN:SSTR input message, RL1 and RL2 must be assigned with a value 1 <= RL < RL2 < RL1 <= 15. RL is the reservation level possibly assigned by any ASGN:SSTR input message for this trunk group.

d = Response category (RESP). These categories, designated 'A' through 'E', along with the reservation level triggered determine the percentage of calls to control as shown in Exhibit A.

Table 1 Exhibit A: TR Response Category

<table>
<thead>
<tr>
<th>RESERVATION LEVEL</th>
<th>TRAFFIC</th>
<th>RESPONSE CATEGORY TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RL1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Alternate route</td>
<td>A: 0%  B: 0%  C: 0%  D: 100%  E: 0%</td>

- INVALID REQUEST FOR INTERPROCESSOR AUDIT = The requested audit is not valid on the
specified processor.
- UNAVAILABLE OR INVALID CMP = The specified CMP is unavailable or does not exist.

PF = Printout follows. The request has been received. One or more of the following audit output
messages are printed: AUD:CMP-ABORTED, AUD:CMP-COMPL, AUD:CMP-DUMP,
AUD:CMP-ERROR, and AUD:CMP-FAILURE.

AUD:CMP-ERROR
AUD:CMP-FAILURE

Other Manual(s):
235-600-400 Audits
AUD:CNC

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that the central node control (CNC) audit be initiated. Internal ring node maintenance records are audited for inconsistencies which could prevent jobs (such as RST:LN) from progressing or cause jobs to be aborted unnecessarily. (This audit is also executed automatically.)

2. FORMAT

AUD:CNC=1[:{a|b|a,b}];

3. EXPLANATION OF MESSAGE

Routine execution of this audit may be inhibited by UNIX® RTR Operating System Administration Module (AM) during outages of the interprocess message switch (IMS) subsystem. This can be checked by using the OP:AUD input message and routine execution can be resumed by using the ALW:AUD input message.

a = Specifies whether the audit should correct errors. Valid value(s):
   CORR = Correction should occur (default).
   NCG  = Inhibit error correction.

b = Specifies the level of detail of error reporting. Valid value(s):
   DETL = Generate a raw data report for each error found (default).
   SUM  = Generate only an audit completion message when the audit terminates.

4. SYSTEM RESPONSE

Refer to the System Responses Table in the Input Messages User Guidelines.

Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the standby control unit memory (CUMEM) audit be run in the standby control unit (CU), comparing the contents of the online and off-line main stores when in the ACT/ACT or ACT/STBY modes.

WARNING: This audit can take more than 180 minutes to run and can degrade the performance of other UNIX® RTR system audits. Excessive audit errors may result in a hardware reconfiguration with one CU being left out-of-service.

2. FORMAT

AUD:CUMEM=1 [::a|:b|:a,b];

3. EXPLANATION OF MESSAGE

a = Indicates whether audit should correct errors. Valid value(s):
   CORR = Audit should correct errors (default).
   NCG = Audit does not correct errors.

b = Indicates what type of report or message to generate. Valid value(s):
   DETL = Generate a raw data report for each error found followed by an audit completion message. (Default). (A limited number of reports is generated.)
   SUM = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

4. SYSTEM RESPONSE

Refer to the APP:AUD appendix in the Appendixes section of the Output Messages manual.

Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the equipment configuration database (ECD) be audited.

Format 1 audits the incore ECD. Format 2 runs a structural audit of the minimum configuration ECD. Format 3 runs a structural audit of the full configuration ECD.

WARNING: Running ECD audit 1 or 3; while diagnostics are running can result in mutilation of database records.

2. FORMAT

[1] AUD:ECD=a[:b|:c]:b,c;
[2] AUD:ECD=2,INS="ecd"[:b|:c]:b,c;
[3] AUD:ECD=2,INS="appecd"[:b|:c]:b,c;

3. EXPLANATION OF MESSAGE

a

= Specifies the type of incore ECD audit. Valid value(s):
1 = Structural audit.
3 = Raw data audit.

b

= Indicates whether audit should correct errors. Valid value(s):
CORR = Audit should correct errors (default).
NCG = Audit does not correct errors.

c

= Indicates what type of report or message to generate. Valid value(s):
DETL = Generate a raw data report for each error found followed by an audit completion message (default). (A limited number of reports is generated.)
SUM = Generate only an audit completion message when the audit terminates. Raw data reports are not created for any errors that are found.

AUD:LKBDST

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5,CNI
Type: Input

1. PURPOSE

To initiate the link status and band status audit. This audit compares link status data and band-related status data in
the link node and in the administrative module (AM) with associated reference data in the AM. When requested
without specifying a particular node or the ALL option, the system will select a single node to be audited. The node
selected will be the next node in the routine audit sequence.

NOTE: Routine execution of this audit may be inhibited by the UNIX® RTR system during outages of the common
network interface (CNI) subsystem. This may be verified using the OP:AUD input message. Routine
execution may be resumed by using the ALW:AUD input message.

2. FORMAT

AUD:LKBDST=1[:a][:PARAM="NODE{ ALL|(b,c)}"];

3. EXPLANATION OF MESSAGE

ALL = Audit all nodes. If a particular node is desired, use the group-member number designation.

a = Level of detail of error reporting. Valid value(s):
DETL = Generate a raw data report for each error found. This is the default value.
SUM = Generate only an audit completion message when the audit terminates.

b = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

c = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the AUD:ENV-LKBDST output message.

235-600-400  Audits
AUD:NIDATA

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that the internal data audits be run on the recent changeable tables. These audits compare data table copies stored on disk with copies of the same tables residing in memory in the administrative module (AM) and report any mismatches. Tables are also checked for invalid data within tables and for inconsistencies across tables. Errors that cannot be corrected using recent change will be corrected by the audit mechanism.

2. FORMAT

AUD:NIDATA=a[:DETL|:SUM];

3. EXPLANATION OF MESSAGE

DETL = Generate a raw data report for each error found. (Only a limited number of such reports can be generated.)

SUM = Generate an audit completion message when the audit terminates. Do not create raw data reports for any errors that are found.

a = The type of data table to be audited. Valid value(s):
1 = Office identification data.
2 = Link configuration data.
3 = Logical-physical translation data.
4 = Common channel signaling system 7 (CCS7) routing data.
5 = Subsystem information data.
8 = Global title translator data.

NOTE: NIDATA8 has a special trigger mechanism. This audit does not run until after a common network interface (CNI) recent change/verify (RC/V) of screen 15.11 in any mode (I,U,D,R). Any message received before a RC/V transaction is invalid.

10 = Protocol timers/parameters data

4. SYSTEM RESPONSE

235-190-120 Common Channel Signaling Service Features
235-600-400 Audits Manual
1. PURPOSE

NMDATA is the audit family name for the group of audits concerned with the integrity of network management dynamic data.

NMDATA 1 audits the routing tables. The routing tables consist of the network table, cluster table, page access table, the member table, the link set translation table, the routing priority index (RPI) status table, and the director index to network table. One aspect of the routing tables structure is the dynamic allocation and deallocation of slots in the page access table and the member table (those tables are also referred to as the paging tables) as different network events (such as remote link failures or congestion) occur. Common network interface (CNI) processes and maintains status information for the point code affected by those events. Those paging tables that are used in the allocation/deallocation of slots are audited to ensure that pointers connecting the tables are valid. The free entries for the paging tables are audited as well as the used entries. The fields in the routing tables that are used when routing or updating status information about a point code are also audited by NMDATA 1. The audit looks at inconsistencies between the different fields and among the different routing tables. A copy of the data being audited is also found in the direct link node (DLN). When changes are made to the administrative module (AM) master copy as a result of error correction, the remote node copy is updated by using REMACS.

NOTE: The application is not notified of the change to the data as a result of error correction. For this reason, it is recommended that NMDATA 1 always runs in error detection mode only.

NMDATA 2 audits the loadshare tables in the AM. The loadshare tables are used for message routing in the direct link node (DLN), the D-channel node (DCHN) and the AM. The copy of the loadshare tables in the AM is the master copy and the remote nodes are updated using REMACS if error correction results in any changes to the master copy.

NOTE: NMDATA 2 is different than NMDATA 1 in that a loadshare table update report will be sent to the application if error correction results in any changes to the master copy of the tables.

WARNING: CNI does not recommend running this audit in error correction mode. Error correction mode should only be used under the guidance of CNI customer support because of the critical nature of the data being audited. CNI customer support should always be notified in the event of an error.

2. FORMAT

AUD:NMDATA={a[:b|:c|:b,c];}

3. EXPLANATION OF MESSAGE

a  = Specifies the audit member to be run. Valid value(s):
    1  = Routing tables linked list and consistency check audit.
    2  = Loadshare tables audit.

b  = Audit action. Valid value(s):
CORR = Indicates error-correction mode.
NCG = Indicates error-detection mode.

The default value is contained within the equipment configuration database (ECD) record for this audit (audrec).

c = Type of report. Valid value(s):
DETL = Indicates a raw data report for each error found should be generated (default). The raw data report(s) are followed by an audit completion message. A limited number of reports is generated.
SUM = Indicates only an audit completion message is generated when the audit terminates and in that case raw data reports are not created for any errors that are found.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the AUD:NMDATA output message.

235-600-400 Audits
AUD:NODEST

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5,CNI
Type: Input

1. PURPOSE

Requests that ring node (RN) state audits be initiated.

The node availability map audit compares the two principal records within the Interface Module System (IMS) driver process of the states of ring nodes. It does not check the major state in the equipment configuration database (ECD). This map contains a flag for each ring node indicating whether the node is an IMS user node (IUN) in the active (ACT) state. It is used primarily by the neighboring "audit" and to send state updates after changes in ring configuration and after initializations. The audit compares the map to the major states of the nodes recorded in the IMS driver process. When errors are detected the map is corrected to agree with the major states. Routine execution of these audits may be inhibited by UNIX® RTR during outages of the IMS subsystem. This can be checked by using the OP:AUD input message and routine execution can be resumed by using the ALW:AUD input message.

2. FORMAT

AUD:NODEST=1[:{a|b|a,b}];

3. EXPLANATION OF MESSAGE

1 = Audit the node availability map. (This audit is also automatically scheduled.)

a = Specifies whether the audit should correct errors. Valid value(s):
   CORR = Indicates correction should occur (default).
   NCG  = Inhibits error correction.

b = Specifies the level of detail of error reporting. Valid value(s):
   DETL = Generate a raw data report for each error found (default).
   SUM  = Generate only an audit completion message when the audit terminates.

4. SYSTEM RESPONSE

PF = Printout follows.

AUD:SM

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests a switching module (SM) audit to be run in one SM or a range of SMs.

2. FORMAT

AUD:a,SM=b[&&c][,RSM][,LSM][,HSM][,ORM][,TRM];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Audit ID for an application audit.
b = SM number, or lower limit of a range of SM numbers.
c = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - AUDIT NOT AVAILABLE IN SM TYPE = The request has been denied because the specified audit does not exist in the specified processor type.
   - INVALID SM RANGE/TYPe COMBINATION = The request has been denied because of incorrect order of specified range or no equipped SMs in range.

PF = Printout follows. The request has been received. One or more of the following audit output message(s) are printed: AUD:SM-ABORTED, AUD:SM-COMPLETED, AUD:SM-DUMP, AUD:SM-ERROR, and AUD:SM-FAILURE.

5. REFERENCES

13. BKUP
BKUP:ODD

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests a backup of the office-dependent data (ODD) to disk.

Format 1 requests a backup of the administrative module (AM) ODD, the communications module processor (CMP) ODD, non-redundant ODD (NRODD), redundant ODD (RODD), or the entire system. Format 2 requests to schedule the ODD backup to run periodically at specific intervals.

NOTE: During heavy recent change activity, an ODD backup has a slight chance of aborting because of a lack of resources for the backup to execute. Requesting ODD backup during heavy recent change activity is not recommended because this will affect the ODD backup and recent change performance and response time. If a backup aborts, re-request the ODD backup during a period of light recent change activity.

Failure of ODD backup will cause a minor alarm.

Format 3 requests the ODD backup in preparation for ODD evolution. This message should be entered immediately prior to the final ODD dump and should be used only once during a retrofit or a large terminal growth. This message removes recent change evolution files if they exist, and starts double-logging of recent changes (RCs) and customer originated recent changes (CORCs). Consult the Retrofit Procedures manual or the Large Terminal Growth Procedures manual before using this message.

2. FORMAT

[1] BKUP:ODD[,FULL][,AM][,CMP=0][,NRODD=a[&b]][,RODD=a][,COUNT];
[2] BKUP:ODD[,FULL][,AM][,CMP=0][,NRODD=a[&b]][,RODD=a][,EVERY=c,AT=d;
[3] BKUP:ODD[,FULL],ODDEVOL,TOGENERIC=e;

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

COUNT = Report the number of kilobytes of ODD backed up.

FULL = Back up the entire ODD unconditionally. If FULL is not specified, only those ODD blocks that have been altered since the last ODD backup will be backed up (a differential backup). The AM ODD backup is always a full backup (that is, a differential backup of the AM ODD is not available).

NOTE: The default is the entire system (the AM, the CMP, NRODDs of all SMs and RODD) if none is specified.

a = SM number or the lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = Interval in days (0-90) between successive ODD backup runs.
d = Time of day in hours and minutes when ODD is to be backed up.

e = Number of the software release to which the ODD is being evolved (for example, 6 for 5E6(1) software release).

4. SYSTEM RESPONSE

NG = No good. May also include:
   - INVALID SM RANGE = The input request is not valid.
   - INVALID CMP RANGE = The input request is not valid.

PF = Printout follows. Request accepted and the BKUP: ODD output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

14. CFR
1. PURPOSE

Configure MHD0 and MHD1 to be the duplex boot disks.

This is only supported on a 3B21D Hardware Platform that is configured to support the recovery from the alternate boot disk feature. For this to complete successfully, the 3B21D must be booted with an alternate boot disk selected as one of the duplex boot disks and the UCB states of the system and alternate boot disks must meet the following criteria:

- If MHD0 is one of the current duplexed boot disks, its state must be ACT. MHD1 and the alternate boot disk must not be in the ACT, STBY, or INIT states.
- If MHD1 is one of the current duplexed boot disks, its state must be ACT. MHD0 and the alternate boot disk must not be in the ACT, STBY, or INIT states.

2. FORMAT

CFR:DUPLEXDISKS!

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF  Printout follows. Followed by the CFR:DUPLEXDISKS output message.

5. REFERENCES

Output Message(s):

CFR:DUPLEXDISKS
CFR:PMEM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

This message configures the switching modules (SMs) physical memory after memory board growth to incorporate the memory added into the spare memory hole. The spare memory hole is located after standalone billing memory and before any peripheral images that may be loaded. After growing in physical memory, this input message is used to move the peripheral images into the new memory board and to merge the extra amount of memory into the spare memory hole. The SM will not be able to use the extra memory grown in until this input message is executed.

2. FORMAT

CFR:PMEM,SM=a[,REQST={GROW}];

3. EXPLANATION OF MESSAGE

a = SM number.

4. SYSTEM RESPONSE

PF = Printout follows. Request accepted and the CFR:PMEM output message follows.
RL = Retry later. Memory growth terminal process could not be created.

Output Message(s):

CFR:PMEM
DUMP:SMMAP
CFR:RING

**Software Release:** 5E14 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests that the common network interface (CNI) ring be configured to include or exclude ring node(s) from the active ring segment, or if the ring is down, to initialize it.

**NOTE:** Ring reconfigurations abort diagnostics of ring nodes.

Ring configurations established by this request have no special permanence -- they are not remembered as having been requested manually and they do not change the ring interface hardware maintenance states of the nodes. For example, a ring segment isolated by this request and not containing a ring fault may be included back into the active ring segment by any subsequent ring configuration change, such as by a fault recovery, diagnostic, restore or subsequent CFR:RING request. An exception is that nodes in the GROW major state will always be kept isolated to prevent installation from causing ring recoveries.

The ring can not be reconfigured using the INCLUDE or EXCLUDE options if either the current BISO and/or EISO ring node is not active. A ring with an inactive BISO and/or EISO node is in a transient state. Restoration of this node(s) will be given top priority. The MOVFLT option may be used subject to limitations described above.

### 2. FORMAT

```
CFR:RING[[{[,RPCNa=b[,RPCNc=d]]|[,LNa=b[,LNC=d]]}],[,RPCNa=b[,RPCNc=d]|LNa=b[,LNC=d]]:EXCLUDE]|{[,RPCNa=b[,RPCNc=d]|LNa=b[,LNC=d]]:INCLUDE}|
[,RPCNa=b|LNa=b]:MOVFLT]);
```

### 3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**EXCLUDE**

= Isolate specified node(s) from the active ring segment. This may cause inclusion or isolation of other nodes to form a workable ring.

Active ring nodes can not be isolated.

A section of the ring can not be isolated such that the remaining active ring segment is too short. That is, the active ring segment must contain a minimum combination of ring nodes and interframe buffers to allow simultaneous propagation of long messages plus the token message. Note that when the system attempts to choose active BISO and EISO ring nodes to isolate a given requested range of node(s), this threshold could be crossed.

As with INCLUDE requests, if an isolated segment currently exists, the node or nodes requested must either include the BISO and/or EISO node(s) or, must already be excluded from the active ring segment.

**INCLUDE**

= Make ring nodes part of the active ring segment (default).

If node(s) are specified then only those nodes will be added to the active ring segment in response to this request.
If no nodes are specified then the new configuration will include as many nodes as possible. If the ring is down, it will be initialized.

If an isolated ring segment currently exists, the requested node or nodes must include the nearest isolated neighbor node or segment of the beginning of isolation (BISO) and/or end of isolation (EISO) nodes so as not to fragment the existing isolated segment.

**LN** = Link node.

**MOVFLT** = Move an indication of a faulty ring interface from the currently isolated ring node to the adjacent ring node, ‘a’, and reconfigure the ring so that ‘a’ becomes the isolated node.

Automatic ring error analysis cannot always determine which of two adjacent nodes is at fault. When manual maintenance indicates that the wrong ring node has been isolated, this request is used to correct the ring configuration. Such correction may not be possible using other methods because it may be essential to have an isolated node adjacent to the fault and the ring may be too small to allow both nodes to be isolated, even temporarily.

This form of the request is accepted only when a single node is currently isolated and the specified node, ‘a’, is adjacent (that is, ‘a’ is the BISO or EISO ring node) and is not undergoing restoration.

**NOTE:** The ring can not be reconfigured if either the current BISO or EISO ring node is not active. A ring with an inactive BISO or EISO node is in a transient state, its restoration is given top priority. The MOVFLT option may be used subject to limitations described above.

When the ring is down, the CFR:RING request (without options) will attempt to initialize the ring. This requires at least one RPCN node in the standby (STBY) state. (A successful RST:RPCN input request will leave the RPCN node in the STBY state when the ring is down). The ring initialization will not, in itself, restore any interprocess message switch (IMS) user node (IUN)s to service.

Ring initializations are much slower than ring reconfigurations. Allow several minutes per one hundred nodes equipped in the office.

**NOTE:** If the ring initialization is successful, any subsequent problems that cause it to go down will probably abort IMS unless manual ring mode is in effect. Refer to the REPT:MANUAL-RING output message for details.

The ring is reconfigured or initialized as per the INCLUDE or EXCLUDE keyword explanation above.

a = A ring node (RN) group number or lower limit of a range of RN group numbers (in the direction of flow of ring 0).

b = The RN member number or lower limit of a range of RN member numbers.

c = Upper limit of a range of RN's group numbers.

d = Upper limit of a range of RN's member numbers.

### 4. SYSTEM RESPONSE

allocated in conjunction with this request if not already allocated.

**LDSF2**  
The local digital service function 2 (LDSF2) resident operational software image and hashsum are allocated. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

**LDSU**  
The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

**PH2**  
The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

**PH22S**  
The set of two protocol handler model 22 (PH22) common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH22S and IP22S images and hashsums.

**PH3C**  
The set of two PH3 ISDN resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.

**PH3S**  
The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH3S and IP3S images and hashsums.

**PH4ACC**  
The set of two protocol handler model 4 (PH4) resident access software images and hashsums are allocated. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

**PH4GWY**  
The set of two PH4 resident gateway software images and hashsums are allocated. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

**PH4IFR**  
The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well.

**PH4PP**  
The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

**PHA1**  
The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

**PHE1**  
The set of two protocol handler (PHE1) with SCSI/ethernet resident software images and hashsums are allocated.

**PHV1**  
The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

**PHV3C**  
The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

**PHV4C**  
The set of two speech handler (PHV4) resident software images and hashsums are allocated. This includes the PHV4C and V4DSP8K images and hashsums.

**PI**  
The packet interface (PI) resident software image and hashsum are allocated.

**PI2**  
The packet interface model 2 (PI2) resident software image and hashsum are allocated.

**RAF**  
The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

**SAS**  
The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

**V4DSPEVRC**  
The EVRC DSP software images and hashsums are allocated, for use with the PHV4 speech handlers.
V4DSP13K = The 13K DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSPACELP = The ACELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSPISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSPVSELP = The VSELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

3. EXPLANATION OF MESSAGE

UCL = Unconditionally process the image(s) for the specified unit, ignoring checks for hardware equipage.

a = SM peripheral hardware unit. Valid value(s):
DNUS = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are allocated. This includes the DNUSCC and DNUSTMX images and hashsums.
DSP13K = The 13K DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
DSPACELP = The ACELP DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
DSPEVRC = The EVRC DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
DSPVSELP = The VSELP DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
GDSF = The global digital services function (GDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
IDCU = The set of three integrated digital carrier unit (IDCU) resident software images and hashsums are allocated. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
ISLU = The integrated services line unit (ISLU) resident software image and hashsum are allocated.
ISLU2 = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are allocated.
ISTF = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
LDSF = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
LDSF2 = The local digital service function 2 (LDSF2) resident operational software image and hashsum are allocated. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

LDSU = The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

PH2 = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH22S = The set of two protocol handler model 22 (PH22) common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH22S and IP22S images and hashsums.

PH22W = The set of two protocol handler model 22 (PH22) wireless resident software images and hashsums are allocated. This includes the PH22W and IP22W images and hashsums.

PH3 = The set of two PH3 ISDN resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.

PH3S = The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH3S and IP3S images and hashsums.

PH4ACC = The set of two protocol handler model 4 (PH4) resident access software images and hashsums are allocated. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

PH4GWY = The set of two PH4 resident gateway software images and hashsums are allocated. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

PH4IFR = The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well.

PH4PP = The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

PHE1 = The set of two protocol handler (PHE1) with SCSI/Ethernet resident software images and hashsums are allocated.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are allocated. This includes the PHV4C and V4DSP8K images and hashsums.

PHV5C = The set of two speech handler (PHV5) resident software images and hashsums are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.

PI = The packet interface (PI) resident software image and hashsum are allocated.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident
software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

**V4DSPEVRC1** = The set of three EVRC DSP software images and hashsums are allocated, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF +TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

**V4DSP13K** = The 13K DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

**V4DSPACELP** = The ACELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

**V4DSPISLP** = The ISLP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

**V4DSPVSELP** = The VSELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

**V5DSPCDMA** = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are allocated, for use with the PHV5 speech handlers.

**V5DSPISLP** = The ISLP DSP software image and hashsum are allocated, for use with the PHV5 speech handlers.

**V5DSPTDMA** = The consolidated TDMA QCELP (which include ACELP and VSELP) image and hashsums are allocated, for use with the PHV5 speech handlers.

b = SM number.

c = Request type. Valid value(s):
   DEGROW
   GROW = Default.

4. SYSTEM RESPONSE

**PF** = Printout follows. Request accepted. Followed by the CFR:SPRMEM output message.

**RL** = Retry later. Memory growth terminal process could not be created.

1. PURPOSE

Requests that a section or sections of switching module (SM) memory be allocated/deallocated from the spare memory hole for the peripheral image or images that resides in the peripheral unit specified on the input message line. The SM memory layout need no longer contain images for peripherals that are not equipped. This input message must be executed with a request type of GROW during the growth procedures for the first peripheral unit of each type grown on an SM. It should also be executed with a request type of DEGROW after the last peripheral unit of each type is degrown on an SM to reclaim memory and consolidate spare memory.

2. FORMAT

CFR:SPRMEM,ODRID=a,SM=b[,REQST={c}][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally process the image(s) for the specified unit, ignoring checks for hardware equipage.

a = SM peripheral hardware unit. Valid value(s):

CFCBUF = The configuration control buffer area and hashsums are allocated.
DNUS = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are allocated. This includes the DNUSSCC and DNUSTMX images and hashsums.
DSP13K = The 13K DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
DSPACELP = The ACELP DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
DSPEVRC = The EVRC DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
DSPVSELP = The VSELP DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
GDSF = The global digital services function (GDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
IDCU = The set of three integrated digital carrier unit (IDCU) resident software images and hashsums are allocated. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
ISLU = The integrated services line unit (ISLU) resident software image and hashsum are allocated.
ISLU2 = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are allocated.
ISTF = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
LDSF = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are
allocated in conjunction with this request if not already allocated.

**LDSF2**
- The local digital service function 2 (LDSF2) resident operational software image and hashsum are allocated. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

**LDSU**
- The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

**OIU24**
- The 24-channel optical interface unit (OIU) resident software image and hashsum are allocated.

**PH2**
- The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

**PH22I**
- The protocol handler model 22 (PH22) ISDN-wireless resident software image (PH22I) and hashsums are allocated. If not already allocated, the PH22 IOP (IP22) image and hashsums will also be allocated.

**PH22S**
- The set of two PH22 common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH22S and IP22S images and hashsums.

**PH31S**
- The protocol handler 31 for high speed signaling links image and hashsums are allocated.

**PH3C**
- The set of two PH3 ISDN resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.

**PH3S**
- The set of two protocol handler model 3 (PH3) CCS resident software images and hashsums are allocated. This includes the PH3S and IP3S images and hashsums.

**PH4ACC**
- The set of two protocol handler model 4 (PH4) resident access software images and hashsums are allocated. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

**PH4GWY**
- The set of PH4 resident gateway software images and hashsums are allocated. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

**PH4IFR**
- The PH4 resident ISDN frame relay software image (PH4IFRIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well.

**PH4PP**
- The PH4 resident package pipe software IOP image (PH4PPPIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

**PHA1**
- The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

**PHA2A**
- The protocol handler for ATM (PHA2) version 2 resident software image and hashsum are allocated.

**PHE1**
- The set of two protocol handler with SCSI/Ethernet version 1 (PHE1) resident software images and hashsums are allocated.

**PHE2E**
- The protocol handler with SCSI/Ethernet version 2 (PHE2) resident software images and hashsums are allocated.

**PHV1**
- The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

**PHV3C**
- The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

**PHV4C**
- The set of two speech handler (PHV4) resident software images and hashsums are allocated. This includes the PHV4C and V4DSP8K images and hashsums.

**PHV5C**
- The set of two speech handler (PHV5) resident software images and hashsums

are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.

PI = The packet interface (PI) resident software image and hashsum are allocated.
PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.
RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.
V4DSPEVRC1 = The set of three EVRC DSP software images and hashsums are allocated, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF+TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

V4DSP13K = The 13K DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.
V4DSPACELP = The ACELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.
V4DSPISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.
V4DSPVSELP = The VSELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V5DSPCDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are allocated, for use with the PHV5 speech handlers.
V5DSPISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV5 speech handlers.

   ISTF = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not...
already allocated.

LDSF = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

LDSF2 = The local digital service function 2 (LDSF2) resident operational software image and hashsum are allocated. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

LDSU = The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

OIU24 = The 24-channel optical interface unit (OIU) resident software image and hashsum are allocated.

OIUATM = The asynchronous transfer mode (ATM) OIU resident software image and hashsum are allocated.

OIUIP = The internet protocol (IP) OIU resident software image and hashsum are allocated.

PH2 = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH22I = The protocol handler model 22 (PH22) ISDN-wireless resident software image (PH22I) and hashsums are allocated. If not already allocated, the PH22 IOP (IP22) image and hashsums will also be allocated.

PH22S = The set of two PH22 common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH22S and IP22S images and hashsums.

PH31S = The protocol handler model 31 (PH31) high speed common channel signaling resident software image (PH31S) and hashsums are allocated.

PH3C = The set of two PH3 ISDN resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.

PH3S = The set of two protocol handler model 3 (PH3) CCS resident software images and hashsums are allocated. This includes the PH3S and IP3S images and hashsums.

PH4ACC = The set of two protocol handler model 4 (PH4) resident access software images and hashsums are allocated. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

PH4GWY = The set of two PH4 resident gateway software images and hashsums are allocated. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

PH4IFR = The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well.

PH4PP = The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

PHA2A = The protocol handler for ATM (PHA2) version 2 resident software image and hashsum are allocated.

PHE1 = The set of two protocol handler (PHE1) with SCSI/ethernet resident software images and hashsums are allocated.

PHE2E = The protocol handler (PHE2) with SCSI/ethernet version 2 resident software
images and hashsums are allocated.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are allocated. This includes the PHV4C and V4DSP8K images and hashsums.

PHV5C = The set of two speech handler (PHV5) resident software images and hashsums are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.

PI = The packet interface (PI) resident software image and hashsum are allocated.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

V4DSPEVRC1 = The set of three EVRC DSP software images and hashsums are allocated, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF+TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

V4DSP13K = The 13K DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSPACELP = The ACELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSPISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSPVSELP = The VSELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V5DSPCDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are allocated, for use with the PHV5 speech handlers.

V5DSPISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV5 speech handlers.

V5DSPSME13 = The consolidated SMV, EVRC and 13K DSP software image and hashsum are allocated, for use with the PHV5 speech handlers.

**3. EXPLANATION OF MESSAGE**

- **UCL**: Unconditionally process the image(s) for the specified unit, ignoring checks for hardware equipage.
- **a**: SM peripheral hardware unit. Valid value(s):
  - **CFCBUF**: The configuration control buffer area and hashsums are allocated.
  - **CSCPSAS**: The operational and diagnostic common service circuit platform (CSCP) service announcement system (SAS) resident software images and hashsums are allocated. This includes the CSCPSAS and CSCPDG images and hashsums.
  - **DNUS**: The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are allocated. This includes the DNUSCC and DNUSTMX images and hashsums.
  - **DSP13K**: The 13K DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
  - **DSPACELP**: The ACELP DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
  - **DSPEVRC**: The EVRC DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
  - **DSPVSELP**: The VSELP DSP software image and hashsum are allocated, for use with the PHV3 speech handlers.
  - **GDSF**: The global digital services function (GDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
  - **GDSF2**: The global digital services function 2 (GDSF2) resident operational software image and hashsum are allocated. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.
  - **IDCU**: The set of three integrated digital carrier unit (IDCU) resident software images and hashsums are allocated. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
  - **ISLU**: The integrated services line unit (ISLU) resident software image and hashsum are allocated.
  - **ISLU2**: The integrated services line unit model 2 (ISLU2) resident software image and hashsum are allocated.
ISTF = The integrated services test function (ISTF) resident operational software image and hashsum are allocated. The hardware digital service unit (HDSU) diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

LDSF = The local digital service function (LDSF) resident operational software image and hashsum are allocated. The DSC3 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

LDSF2 = The local digital service function 2 (LDSF2) resident operational software image and hashsum are allocated. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

LDSU = The local digital service unit (LDSU) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

OIU24 = The 24-channel optical interface unit (OIU) resident software image and hashsum are allocated.

OIUATM = The asynchronous transfer mode (ATM) OIU resident software image and hashsum are allocated.

OIUIP = The internet protocol (IP) OIU resident software image and hashsum are allocated.

PH2 = The set of four protocol handler model 2 (PH2) resident software images and hashsums are allocated. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH22I = The protocol handler model 22 (PH22) ISDN-wireless resident software image (PH22I) and hashsums are allocated. If not already allocated, the PH22 IOP (IP22) image and hashsums will also be allocated.

PH22S = The set of two PH22 common channel signaling (CCS) resident software images and hashsums are allocated. This includes the PH22S and IP22S images and hashsums.

PH31S = The protocol handler model 31 (PH31) high speed common channel signaling resident software image (PH31S) and hashsums are allocated.

PH3C = The set of two PH3 ISDN resident software images and hashsums are allocated. This includes the PH3C and OIOP images and hashsums.

PH3S = The set of two protocol handler model 3 (PH3) CCS resident software images and hashsums are allocated. This includes the PH3S and IP3S images and hashsums.

PH4ACC = The set of two protocol handler model 4 (PH4) resident access software images and hashsums are allocated. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

PH4GWY = The set of two PH4 resident gateway software images and hashsums are allocated. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

PH4IFR = The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well.

PH4PP = The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are allocated. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be allocated as well. These images are used for CDMA and TDMA packet pipe applications.

PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are allocated.

PHA2A = The protocol handler for ATM (PHA2) version 2 resident software image and hashsum are allocated.
PHE1 = The set of two protocol handler (PHE1) with SCSI/ethernet resident software images and hashsums are allocated.

PHE2E = The protocol handler (PHE2) with SCSI/ethernet version 2 resident software images and hashsums are allocated.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are allocated.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are allocated. This includes the PHV3C and DSP8K images and hashsums.

PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are allocated. This includes the PHV4C and V4DSP8K images and hashsums.

PHV5C = The set of two speech handler (PHV5) resident software images and hashsums are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.

PHV6C = The set of two speech handler (PHV6) resident software images and hashsums are allocated. This includes the PHV6C and V6DSPCDMA images and hashsums.

PI = The packet interface (PI) resident software image and hashsum are allocated.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are allocated.

PSU2E = The set of CF3/PF3 resident firmware and hardware images and their corresponding hashsums that are pumped from the AM disk. This set is composed of 2 PF3 and 2 CF3 images as shown:

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are allocated. The HDSU diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are allocated. This includes the SAS and HSAS images and hashsums.

V4DSP EVRC1 = The set of three EVRC DSP software images and hashsums are allocated, for use with the PHV4 speech handlers. This includes the V4DSP EVRC(FDTMF +TTY/TDD), V4DSP EVRC2(EC+TTY/TDD) and V4DSP EVRC3(EC+FDTMF) images and hashsums.

V4DSP13K = The 13K DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSP ACELP = The ACELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSP ISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V4DSP VSELP = The VSELP DSP software image and hashsum are allocated, for use with the PHV4 speech handlers.

V5DSP CDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are allocated, for use with the PHV5 speech handlers.

V5DSP ISLP = The ISLP DSP software image and hashsum are allocated, for use with the PHV5 speech handlers.

V5DSP SMV = The consolidated SMV, EVRC and 13K DSP software image and hashsum are allocated, for use with the PHV5 speech handlers.

V6DSP CDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are allocated, for use with the PHV6 speech handlers.

V6DSP SMV = The consolidated SMV, EVRC and 13K DSP software image and hashsum are allocated, for use with the PHV6 speech handlers.

\[ b \] = SM number.
c  = Request type. Valid value(s):
      DEGROW
      GROW = Default.

4. SYSTEM RESPONSE

PF  = Printout follows. Request accepted. Followed by the CFR:SPRMEM output message.
RL  = Retry later. Memory growth terminal process could not be created.

5. REFERENCES

Input Message(s):

   DUMP : SMMAP

Output Message(s):

   CFR : SPRMEM
   DUMP : SMMAP
15. CHG
**CHG:ALM**

**Software Release:** 5E14 and later  
**Command Group:** ALARM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests a change to or adds alarm labels, levels, and repeatability status for office assignable building/power or miscellaneous alarms. Any combination of one or more of the keywords TAG, LVL, and REPEAT can be specified.

2. **FORMAT**

```
CHG:ALM, a=b[, TAG="c"][, LVL=d[, REPEAT=e]];
```

3. **EXPLANATION OF MESSAGE**

**a**

Type of alarm. Valid value(s):
- BPSC = Building/power scan point.
- MISC = Miscellaneous.

**b**

Scan point number. Valid value(s):

<table>
<thead>
<tr>
<th>If 'a' =</th>
<th>'b' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPSC</td>
<td>2-27</td>
</tr>
<tr>
<td>MISC</td>
<td>0-47</td>
</tr>
</tbody>
</table>

**c**

Alarm label (maximum of 9 characters, plus and minus signs, numbers, or spaces). To remove (not replace) an alarm label, the TAG field 'c' may be entered as a null string (for example, TAG=""), or TAG may be entered without the 'c' argument. If the TAG keyword is not entered or an asterisk (*) is used in field 'c', the alarm label will default to the previous label.

**d**

Alarm level. If the LVL keyword is not entered, the alarm level will default to the previous level (original default level is MJ). Valid value(s):
- CR = Critical.
- IF = Informational.
- MJ = Major.
- MN = Minor.

**e**

Alarm repeatability status. If an office assignable alarm is assigned as repeating, when that alarm is activated, it will generate a new alarm every 15 minutes until the stimulus for the alarm is cleared or the alarm is inhibited. If the REPEAT keyword is not entered, the alarm repeatability status will default to the previous value (original default is N). Valid value(s):
- N = No (non-repeating).
- Y = Yes (15-minute repeating).

4. **SYSTEM RESPONSE**

**PF**

Printout follows. A CHG:ALM output message will follow in response to the request.

**NG**

No good. The request has been denied. The office is not equipped to process the request entered.

Output Message(s): 

CHG : ALM

Other Manual(s):
235-105-210  Routine Operations and Maintenance
1. PURPOSE

Requests a change in the common network interface (CNI) incore view of the CNI generic identification (ID). It causes the CNI to read the equipment configuration data (ECD) and common network interface release (CNIREL) files in order to change the generic ID of the CNI. This input message is executed automatically with every software update containing the CNIREL product and is not intended to be run manually.

2. FORMAT

CHG:GEN;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by an CHG:GEN output message.

5. REFERENCES

Output Message(s):

CHG:GEN
CHG:LPS-MSGCLS

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the log/print status (LPS) of one or all output message class(es) be changed. A record of the log/print status of each output message class is kept in the current status table and in the backup status table. If the status of the current table is changed without writing to the backup table, the Master Control Center (MCC) system inhibit lamp will be lit.

This message will only change 5ESS® switch message classes. Message classes are listed in the APP:MSGCLS appendix in the Appendixes section of the Output Messages manual.

NOTE: This message will NOT affect critical, major, and minor alarm level output messages and output messages produced as a result of manual inputs. This message will NOT change common network interface (CNI) message classes either.

Format 1 changes the current log and/or print status to ON or OFF, as specified. If TOBKUP is entered, the same change will be applied to the backup status as well.

Format 2 copies the backup status to the current status, or vice-versa.

2. FORMAT

[1] CHG:LPS,MSGCLS={a|ALL},{PRINT=b|LOG=c|PRINT=b,LOG=c}[,TOBKUP];

[2] CHG:LPS,MSGCLS={a|ALL},{FROMBKUP|TOBKUP};

3. EXPLANATION OF MESSAGE

ALL = Change all message classes.
FROMBKUP = Copy the backup status to the current table.
TOBKUP = Copy the current status to the backup table. Discard status cannot be copied to backup table.
a = Valid message class.
b = Equipment configuration database (ECD) routing status (ON or OFF).
c = Daylog routing status (ON or OFF).

NOTE: Discard status can be obtained by specifying PRINT=OFF, LOG=OFF. Messages with this status will be discarded unless alarmed or manually generated.

4. SYSTEM RESPONSE

OK = Good. The request to change current and/or backup statuses was accepted. May also include:
- EXCEPT CNI MSGCLS'S NOT CHANGED = The request to change current status of all message classes except CNI message classes was accepted.
NG  = No good. May also include:
- DISCARD NOT WRITABLE TO BKUP = The message class is set to discard and therefore cannot be copied to backup.
- INTERNAL ERROR = Failed from lseek, read, or write operations to the disk file that contains the tables.
- PLEASE REROUTE CNI MESSAGES VIA ECD/RCV = CNI message classes can only be rerouted using ECD/RCV classdef form on MCC page 199.

RL  = Retry later. May also include:
- LPS DISK TABLE (HMlpstable) NOT FOUND = The disk file that contains the tables cannot be found. A new file will be created and OP:LPS output message will be generated automatically. Retry then.

235-600-30x  ECD/SG
CHG:MRVT

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the message transfer part (MTP) route verification test (MRVT) delay parameter (D), which is used in the calculation of the T1 timer, be changed or displayed. If a request is made to change the delay parameter, and it is within range, the requested value is written onto disk and the delay parameter is updated to the new value.

2. FORMAT

CHG:MRVT=[a];

3. EXPLANATION OF MESSAGE

a = The new value of the delay parameter in seconds (default 8).

NOTE: If this argument is not present on the input message line, the current value of the delay parameter is displayed.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by CHG:MRVT output message.

Output Message(s):

CHG:MRVT
EXC:MRVT-PC-STPS
REPT:MRVR

Other Manual(s):

235-190-120 Common Channel Signaling Service Features
1. PURPOSE

Requests that brevity control be activated on messages with CRITICAL, MAJOR, MANUAL and/or MINOR handling priorities. Messages originated with any of these four handling priorities are considered alarmed. Brevity control restricts the number of application terminal (TTY) output messages that are sent to the administrative module (AM) to reduce the quantity of messages. Brevity control is applied for a specific message class and for a specific handling priority.

The brevity control status for each message class can be printed out using the OP:BREVC[,MSGCLS=a] input message. The status for the entire system can be printed out using OP:SYSSTAT input message.

The AM, communications module processor (CMP) and all the switching modules (SMs) normally restrict the generation of output messages through automatic brevity controls on messages with handling priorities lower than the four alarmed levels. Under unusual circumstances, it may be desirable to restrict alarmed messages originating from an SM or CMP which may increase communication link traffic and degrade AM performance and capacity.

Format 1 allows the user to enable/disable brevity control on one or more alarmed message types.

Format 2 allows the user to enable/disable brevity control on one or more alarmed message types and flush the SM or CMP buffers of all messages that are currently covered under brevity control.

Format 3 allows the user to flush the SM or CMP buffers of all messages that are currently covered under brevity control.

This message control is automatically cleared during high-level AM initializations.

WARNING: The indiscriminate use of the CHG:MSGCNTL message may cause alarmed messages to be discarded and delay notification of alarms.

2. FORMAT

   
   
   [,FLUSH];

3. EXPLANATION OF MESSAGE

CMP = Change the state of brevity for the CMP.

DISCARD = Enable brevity control. (Used with ALL, CRITICAL, MAJOR, MINOR, and MANUAL input messages.)

FLUSH = Allow SM or CMP message buffers to be flushed of all messages that are currently covered under brevity control.

HSM = Change the state of brevity control for host switching modules in range.

LSM = Change the state of brevity control for local switching modules in range.

NORM = Disable brevity control. (Used with ALL, CRITICAL, MAJOR, MINOR, and MANUAL input messages.)

ORM = Change the state of brevity control for optical remote switching modules in range.

RSM = Change the state of brevity control for remote switching modules in range.

SM = Change the state of brevity for one or more SMs.

TRM = Change the state of brevity control for two-mile optical remote switching modules in range.

DRM = Change the state of brevity control for distinctive remote switching modules in range.

a = CMP number.

b = SM number or lower limit of a range of SM numbers.

c = Upper limit of a range of SM numbers.

d = The type of alarmed message for which the state of brevity control should be changed. Valid value(s):

ALL = Change the state of brevity control for all four alarmed messages.

CRITICAL = Change the state of brevity control for critical messages.

MAJOR = Change the state of brevity control for major messages.

MANUAL = Change the state of brevity control for manual messages.

MINOR = Change the state of brevity control for minor messages.

4. SYSTEM RESPONSE

NG = No good. An illegal SM number or range was specified or illegal CMP number was specified.

OK = Good. The message was accepted and the action completed.

Software Release: 5E14 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE
Changes the password for a given person identity (IDENT) in the person authority database (PAUTH). The user will be forced to choose a new password upon his or her next login.

This input message is not printed (echoed) on the read-only printer (ROP) in order to keep passwords private. This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT
CHG:PAUTH:IDENT="a",PSSWD="b";

3. EXPLANATION OF MESSAGE
a  = Identity of the person that uses the password, in one to eight characters.
b  = Password in six to thirteen characters.

4. SYSTEM RESPONSE
NG  = No good. Valid value(s):
- NON-EXISTENT PERSON IDENTITY = The given person identity does not exist in the person authority database.
- PASSWORD INVALID length = The given password is greater than 13 characters in length.
- PASSWORD MUST BE AT LEAST 6 CHARACTERS = The given password is less than six characters in length.
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The person authority database is inaccessible.

OK  = Good. The identity and password have been changed in the person authority database.

RL  = Retry later. Valid value(s):
- AUTHORITY ADMINISTRATION UNDER UPDATE = The person authority database is currently being updated.

CHG:PRNTMODE-A

Software Release: 5E14 only
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests a change to the print mode of the specified packet interface (PI) and/or packet switching unit protocol handler (PSUPH).

Format 1 changes the print mode of the specified PI of the module controller time slot interchanger (MCTSI) or PSUPH. The desired PSUPH may also be referenced by its currently associated channel group (CHNG). This input message will also print the PSUPH's or PI's logged recovery output reports if RCVYHST is specified. This input message will also print the PSUPH's or PI's event history if EVENTHST is specified. However, even history dumps are not supported on PIs of hardware type PI1 or on PSUPHs of hardware type PH2. Format 2 changes the print mode of all PSUPHs and/or all PIs of the specified switching module (SM). Once the print mode of a PSUPH(s) or(AND) PI(s) is set to "ON", the unit's output reports will be printed on the ROP (receive-only printer) until manually changed or until 48 hours have elapsed without a PI's or PSUPH's print mode change of "ON".

2. FORMAT

[1] CHG:PRNTMODE={ON|OFF},{PSUPH=a-b-c-d|CHNG=a-b-c-e|MCTSI=a-f,PI}[,RCVYHST][,EVENTHST];

3. EXPLANATION OF MESSAGE

CHNG = Channel group (logical PH).
RCVYHST = Print all logged output reports from the specified PI or PSUPH.
EVENTHST = Print event history from the specified PI or PSUPH.
MCTSI = Module controller time slot interchanger.
OFF = Set the printing mechanism to OFF for printing the specified PSUPH's or PI's messages. If an SM is specified, the printing mechanism for all PHs and/or all PI's in the SM will be changed to OFF.
ON = Set the printing mechanism to ON for printing the specified PSUPH's or PI's messages. If an SM is specified, the printing mechanism for all PHs and/or all PI's in the SM will be changed to ON.
PI = Packet interface.
PP = Port processor (refers to PSUPH or PI, collectively).
PSUPH = Packet switching unit protocol handler (physical PH).
a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PSUPH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = CHNG number.

f = MCTSI side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the print mode is changed as requested. The printing of the requested history is in progress. (This response is given when a history dump is requested.)

NG = No good. The message was not accepted because the SM is isolated or the equipment does not exist.

NO = Feature not available. The requested action failed because the feature required to process the request is not present in the module.

OK = Good. The message was accepted and the print mode is changed as requested.

1. PURPOSE

Requests a change to the print mode of the specified packet interface (PI) and/or packet switching unit protocol handler (PSUPH).

The specified PI's or PSUPH's stack frame and register dump may be printed out on the ROP if PPFRMREG is set to ON.

Format 1 changes the print mode of the specified PI of the module controller time slot interchanger (MCTSI) or PSUPH. The desired PSUPH may also be referenced by its currently associated channel group (CHNG). This input message will also print the PSUPH's or PI's logged recovery output reports if RCVYHST is specified.

This input message will also print the PSUPH's or PI's event history if EVENTHST is specified. However, even history dumps are not supported on PIs of hardware type PI1 or on PSUPHs of hardware type PH2.

Format 2 changes the print mode of all PSUPHs and/or all PIs of the specified switching module (SM). Once the print mode of a PSUPH(s) or(P/and) PI(s) is set to "ON", the unit's output reports will be printed on the ROP until manually changed.

2. FORMAT

[1] CHG:PRNTMODE=g,h[,RCVYHST][,EVENTHST][,PPFRMREG=j];

[2] CHG:PRNTMODE=g,SM=a,i[,PPFRMREG=j];

3. EXPLANATION OF MESSAGE

RCVYHST = Print all logged output reports from the specified PI or PSUPH.
EVENTHST = Print event history from the specified PI or PSUPH.
PPFRMREG = Print stack frame and register dump from specified PI or PSUPH when an assert fires.

a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Adds or removes a command group (COMGR) from a profile identity (IDENT) in the profile authority database (PROFL). The IDENT must already be defined by the ADD:PROFL input message.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

CHG:PROFL:IDENT=a,ACTION=b,COMGR=c[-d][-e][-f][-g][-h][-i][-j];

3. EXPLANATION OF MESSAGE

a = Identity of the profile in one to eight letters and/or digits.

b = The action to perform on the profile. Valid value(s):
   EXCLUDE = Remove the given command group(s) from the profile.
   INCLUDE = Add the given command group(s) to the profile.

   ADMIN = System administrator only activities.
   ALARM = Alarm manipulation.
   AM = Administrative module maintenance.
   AMA = Automatic Message Accounting.
   AUDIT = Audits.
   AUTH = Command and authority administration.
   CCS = Common channel signaling.
   CM = Communications module maintenance.
   FHADM = File handling and administration.
   MAINT = Routine maintenance activities.
   MEAS = Measurements.
   NMOC = Network management and overload control.
   ODD = Office Dependent Data activities.
   PASS = Personal password modification.
   RCV = Recent Change and Verify activities.
   SM = Switching module maintenance.
   SPECRCV = Special RCV input messages.
   SFTMGMT = Software management (update, software release retrofit).
   SFTUTIL = Software utilities.
   SUPERUSR = Super user authority (bypass terminal authority).
   SYSRCVY = System recovery activities.
   TRACE = Call trace.
   TRKLN = Trunk and line maintenance.
Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

4. SYSTEM RESPONSE

NG = No good. May also include:
- PROFILE IDENTITY DOES NOT EXIST = The given profile identity does not exist in the profile authority database.
- UNABLE TO ACCESS PROFILE ADMINISTRATION = The profile authority database is inaccessible.

OK = Good. Command group(s) successfully added to or removed from the given profile.

RL = Retry later. May also include:
- PROFILE ADMINISTRATION UNDER UPDATE = The profile authority database is currently being updated.

1. PURPOSE

Changes a user's password (PSSWD) from its current value (OLD) to a new value (NEW). A user may change only his or her own password.

This input message is not printed (echoed) on the Receive Only Printer (ROP) in order to keep passwords private. This input message is associated with maintenance interface security. Refer to the Routine Operations and Maintenance manual for further information.

2. FORMAT

   CHG:PSSWD:OLD=a,NEW=b;

3. EXPLANATION OF MESSAGE

   a = Old password in six to thirteen characters.
   b = New password in six to thirteen characters.

4. SYSTEM RESPONSE

   NG = No good. May also include:
   - CURRENT USER IS NOT OWNER OF THE PASSWORD = A user can change only his or her own password.
   - LESS THAN 'a' WEEK(S) SINCE LAST PASSWORD CHANGE = A minimum of 'a' weeks must elapse between password changes, where 'a' is the minimum password change time defined in the ECD Emergency Action Interface Option (eaiopt) record.
   - OLD PASSWORD INCORRECT = The given old password does not match the user's current password in the person authority database.
   - PASSWORD CAN NOT BE SIMILAR TO LOGIN ID = A password must differ from the login (person) identity by at least two character positions. It also must not be the reverse or circular shift of the login identity.
   - PASSWORD CAN NOT BE SIMILAR TO PREVIOUS PASSWORD = A password must differ from the previous password by at least two character positions. It also must not be the reverse or circular shift of the previous password.
   - PASSWORD MUST BE AT LEAST 6 CHARACTERS = A password must contain at least six characters.
   - PASSWORD MUST BE DIFFERENT THAN PREVIOUS 3 PASSWORDS = The last three passwords can not be used as a new password.
   - PASSWORD MUST CONTAIN AT LEAST 2 ALPHA AND 1 DIGIT OR SPECIAL CHAR = A password must contain at least two alphabetic characters and one digit or special character.
   - UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The person authority database is inaccessible.

   OK = Change to password is made in the person authority database.
= Retry later. May also include:
- AUTHORITY ADMINISTRATION UNDER UPDATE = The person authority database is currently being updated.

235-105-210 Routine Operations and Maintenance
235-600-30x ECD/SG Data Base Manual
CHG:SLK

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a change in the minor state of a signaling link (SLK).

2. FORMAT

CHG:SLK=a-b:c;

3. EXPLANATION OF MESSAGE

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Requested minor state. Valid value(s):

FIS = This option may be used to force manual out-of-service restrictions from a Common Channel Signaling System 7 (CCS7) link.

GROW = Place the link in the growth state. This state is used during link installation or removal.

IS = Place the link in-service. Make signaling link available to traffic.

MOOS = Place the link manually out-of-service. Signaling link cannot handle traffic. Typically used when performing maintenance on a link.

TEST = Place the link in test state. This state is used during link installation or removal.

A request is made to change the minor state of the particular SLK to the specified state. It should be noted that entering this request does not guarantee the specified action. Successful SLK prove-in is required to accomplish the requested action. For example, when a link is in the MOOS state and is being returned to the IS state, it is actually moved from MOOS to OOS, which allows automatic link prove-in to begin. It is not until successful prove-in has been reached that the link is moved to the IS state.

4. SYSTEM RESPONSE

PF = Printout follows. The CHG:SLK output message will be printed.

1520 (RING NODE STATUS PAGE)
1521 (SIGNALING LINK SUMMARY PAGE)
1522 (SIGNALING LINK PAGE)
1. PURPOSE

Requests that the SCCP routing verification test (SRVT) delay parameter, which is used in the calculation of the T2 timer, be changed or displayed. The expiration of the T2 timer signifies the end of the waiting period for the reception and processing of all expected SCCP routing verification acknowledgement (SRVA) messages.

If a request is made to change the delay parameter, and the requested value is within range, it is written onto disk and the delay parameter is updated to the new value. This new value becomes the new “default”, that will be read in on initializations. The initial default is 12.

2. FORMAT

CHG:SRVT[=a];

3. EXPLANATION OF MESSAGE

a = The new value of the delay parameter. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

NOTE: If this argument is not present on the input message line, the current value of the Delay parameter is displayed to the maintenance output class.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the CHG:SRVT output message.

16. CLR
CLR:ACKDB

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the segment name of acknowledgement database (ACKDB) be invalidated so that the next invocation of either the shell or display administration process (DAP) reinitializes the segment name using the ACKDB installed in /cft/she/ackdb. Current running processes will continue to use the old copy of the ACKDB until they are terminated. New processes will typically generate NA BAD ACKDB acknowledgements until the shells and display administration process are restarted using the 805 and 808 pokes on the C/D UPDATE MCC page.

WARNING: This message is intended for field update purposes only.

2. FORMAT

CLR:ACKDB;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

IP = In progress. Request received and initiated. Further output will follow.

CLR:ALARMS

Software Release: 5E14 and later
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that the alarm indicators on the display terminals be cleared (retired), the exit pilot light alarm units and the audible alarms. This message has the same effect as pressing the alarm release key (PF4) on a display terminal.

2. FORMAT

CLR:ALARMS;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

OK = Good. The alarms have been cleared.

NG = No good. The system is unable to clear the alarms.

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE
Clears one or all alternate route cancellation (ARC) controls of a given control type. This TTY message is valid only for defense switched network (DSN) switches.

2. FORMAT

CLR:ARC[,OFFICE=a[,],TYPE=b;]

3. EXPLANATION OF MESSAGE

a = Switching office name. The default is for the total office.

b = Type of control to be cleared. Valid value(s):

CANT = Clear the cancel to (CANT) control. Refer to the SET:ARC input message for the description of CANT.
CANF = Clear the cancel from (CANF) control. Refer to the SET:ARC input message for the description of CANF.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the CLR:ARC output message.

RL = Retry later. May also include:
- RESOURCE SHORTAGE = The necessary resources are not available.

**Software Release:** 5E14 only
**Command Group:** CCS
**Application:** 5
**Type:** Input

1. PURPOSE

Clears an advanced services platform (ASP) 0.1 test query parameter (or set of parameters) that has been set. All of the fields for a parameter are cleared. By specifying a parameter name, a single parameter may be cleared. By specifying a message type, all of the test query parameters associated with that message are cleared. Since a parameter may be used for more than one message type, clearing such a parameter causes the parameter to be cleared for all message types. Caution should be exercised when choosing the message type option. All of the parameters may be cleared by specifying the ALL message type.

2. FORMAT

CLR:ASPTQ, {MSGPARM=a | MSGTYPE=b};

3. EXPLANATION OF MESSAGE

`a` = The test query parameter name to be cleared. Valid value(s):

- **ACCCD** = Access code.
- **AMAMSMEMENT** = AMA measurement.
- **AMP** = Advanced intelligence network maintenance parameter.
- **BEARCAP** = Bearer capability.
- **BUSYCAUSE** = Busy cause.
- **BUSYTYPE** = Busy type.
- **CHGNBR** = Charge number.
- **CHGTYPE** = Charge party station type.
- **CLDPTY** = Called party ID.
- **CLDTYPE** = Called party station type.
- **CLEARCS** = Clear cause.
- **CLGBGID** = Calling party business group ID.
- **CLGPTY** = Calling party ID.
- **CLOSECAUSE** = Close cause.
- **COLLADR** = Collected address information.
- **COLLDIGS** = Collected digits.
- **DISCCAUSE** = Disconnect cause.
- **DTMFDGTDDET** = Dial tone multi-frequency (DTMF) digits detected.
- **FAILCAUSE** = Failure cause.
- **GENLIST** = Generic address list.
- **GENNAME** = Generic name.
- **GLOBTITLE** = Global title address.
- **LATA** = Local access and transport area.
- **NOTIFYIND** = Notification indicator.
- **OPC** = Origination point code.
- **ORIGCLDPTY** = Original called party ID.
- **PRMCAR** = Primary carrier.
- **RDIRINFO** = Redirection information.
- **RDIRPTY** = Redirecting party ID.
- **TCMARK** = Traveling class mark.
The message type. For convenience, the test query parameters associated with each message type are listed below. Even though the timer parameter is displayed with each message type (refer to the OP:ASPTQ input message), the timer parameter is not cleared when clearing parameters based upon a message type (except for the ALL message type).

Note: The message type of NPINFOANAL is not allowed for the CLR:ASPTQ message. To clear the parameters associated with the number portability (NP) test query message type (TST:ASPTQ, MSGTYPE=NPINFOANAL), use the message type of INFOANAL.

Valid value(s):

**CLOSE** = Close.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Close cause.
- User ID.

**INFOANAL** = Information analyzed.
- Access code.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Calling party business group ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Collected address information.
- Collected digits.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.
- Global title address.

**INFOCOLL** = Information collected.
- Access code.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Collected address information.
- Collected digits.
- Generic address list.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Vertical service code.
- Global title address.

**NTWKBSY** = Network Busy.
- Bearer capability.
- Called party ID.
- Calling party ID.
- Charge number.
- Charging party station type.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Traveling class mark.
- Trigger criteria type.
- User ID.

**OANSWER** = Originating answer.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

**OCLDPTYBSY** = Originating called party busy.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Busy cause.
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Trigger criteria type.
- User ID.

ODISCONNECT = Originating disconnect.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Disconnect cause.
- Notification indicator.
- User ID.

ODTMFENTRD = Originating dial tone multi-frequency (DTMF) entered.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- DTMF digits detected.
- Notification indicator.
- User ID.

ONOANSWER = Originating no answer.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Primary carrier.
- Redirecting party ID.
- Redirection information.
- Trigger criteria type.
- User ID.

ORIGAT = Origination attempt.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Calling party ID.
- Charge number.
- Charge party station type.
- Local access and transport area.
- Origination point code.
- Primary carrier.
- Translation type.
- Trigger criteria type.
- User ID.
- Global title address.

OTERMSZD = Originating termination seized.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.
TANSWER = Terminating answer.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

TBUSY = Terminating busy.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Busy cause.
- Busy type.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Trigger criteria type.
- User ID.

TERMAT = Termination attempt.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Translation type.
- Traveling class mark.
- Trigger criteria type.
- User ID.
- Global title address.

TNOANSWER = Terminating no answer.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Called party ID.
- Called party station type.
- Calling party ID.
- Charge number.
- Charge party station type.
- Generic name.
- Local access and transport area.
- Notification indicator.
- Original called party ID.
- Origination point code.
- Redirecting party ID.
- Redirection information.
- Trigger criteria type.
- User ID.

TRMRSRCAVL = Terminating resource available.
- Advanced intelligence network maintenance parameter.
- Bearer capability.
- Notification indicator.
- User ID.

RESCLR = Resource clear.
- Advanced intelligence network maintenance parameter.
- AMA measurement.
- Clear cause.
- Collected address information.
- Collected digits.
- Failure cause.
- Primary carrier.

ALL = All of the ASP 0.1 test query parameters.

4. SYSTEM RESPONSE

NO = The request is not allowed. Valid value(s):
- FEATURE NOT AVAILABLE = The ASP 0.1 feature must be purchased before attempting to
clear an ASP 0.1 test query parameter.

OK = Good. The request was accepted.

RL = Retry later. Valid value(s):
- INTERNAL ERROR = An internal error was encountered and processing could not continue.

SET: ASPTQ
TST: ASPTQ

Other Manual(s):
235-190-126 Advanced Services Platform
CLR:AUD

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Format 1 requests the clearing of the full static office-dependent data (SODD) audit's schedule. Either part or all of the schedule may be cleared.

Format 2 requests the removal of existing full and incremental SODD audit error logs generated from their previous cycles of execution. All /rclog/SODD/errlog/*.prev files are removed. This input message should be used when the file system space for /rclog is low.

Format 3 requests the removal of single or all current audits from the SODDCNTL file.

Format 4 requests the removal of restart files generated by PRC, MFT=ALL and FULL audits.

2. FORMAT

[1] CLR:AUD=SODD,SCHED,DAY=a;
[3] CLR:AUD=SODD,AUDIT=b;
[4] CLR:AUD=SODD,c;

3. EXPLANATION OF MESSAGE

a

= Day from the full audit schedule to be cleared. Valid value(s):
MON = Monday.
TUE = Tuesday.
WED = Wednesday.
THU = Thursday.
FRI = Friday.
SAT = Saturday.
SUN = Sunday.
ALL = All days. All entries in the schedule are cleared.

b

= Audit to be cleared from the SODDCNTL file. Valid value(s):
BOOT = Boot Critical sub audit.
BRC5 = BRCS sub audit.
CCS = CCS sub audit.
DIGIT = Digit Analysis sub audit.
EQUIP = Equipment sub audit.
FULL = Full audit.
GLOBAL = Global Parameters sub audit.
INCR = Incremental audit.
ISDN = ISDN sub audit.
LINE = Line sub audit.
MISC = Miscellaneous sub audit.
MLHG = MLHG sub audit.
PSMLHG = Packet Switching MLHG sub audit.
OSPS = OESP sub audit.
TRUNK = Trunk sub audit.
PSTRUNK = Packet Switching Trunk sub audit.
ALL = All audits. All audits from the SODDCNTL file are removed.

c = Restart file to be removed. Valid value(s):
PRC = Processor Entity audit.
MFTALL = All BRCS MFT audits.
FULL = Full audit.

4. SYSTEM RESPONSE

PF = Printout follows. Valid value(s):
- OP AUD=SODD SCHED MESSAGE FOLLOWS = Followed by an OP:AUD-SODD-SCH output message.
- OP AUD=SODD MESSAGE FOLLOWS = Followed by an OP:AUD-STATUS or OP:AUD-ERROR output message.
- OP AUD=SODD STATUS MESSAGE FOLLOWS = Followed by an OP:AUD-STATUS or OP:AUD-ERROR output message.

5. REFERENCES

Other Manual(s):
235-105-210  Routine Operations and Maintenance Manual
CLR:BACKOUT

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that non-backed-up application recent changes be cleared from the administrative module (AM) and/or one or more switching modules (SMs) or a communication module processor (CMP) on a bootstrap (pump) of that processor. This message cancels the effect of the SET:BACKOUT input message.

Normally, when a processor undergoes a high-level initialization (selective initialization or full initialization), recently applied recent changes are replaced in the text and/or office dependent data (ODD).

WARNING: Recent changes that have been applied since the last backout will not be included on one or more processors. Permitting backouts of selected processors may introduce inconsistencies between processors which can have adverse effects.

2. FORMAT

CLR:BACKOUT,RC,{CMP=a,{PRIM|MATE}|AM|SM=b[&&c],AM|SM=b[&&c]},{LSM},{HSM},{RSM},{ORM},{TRM};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

MATE = Mate CMP.
PRIM = Primary CMP.
RC = Mark the named processor(s) to include all recent changes that have not been backed up on subsequent AM bootstraps and/or SM pumps.

a = CMP number.
b = SM number, or the lower limit of a range of SM numbers.
c = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because:
- An illegal SM number or invalid range/type combination was specified.
- An illegal CMP number/type combination was specified.
- The processor type was invalid or missing (AM, SM or CMP).
OK = Good. The message was accepted and the action completed.

1850/1851 (CMP INH & RCVRY CNTL)
CLR:BICCBMOVE

Software Release: 5E16(1) and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

The purpose of this command is to reset environment variables because of an abnormal termination of the EXC:BICCBMOVE input message. This command only resets the environment and will not stop a running EXC:BICCBMOVE process.

To stop an EXC:BICCBMOVE process, use STP:BICCBMOVE.

2. FORMAT

CLR:BICCBMOVE;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No Good. May also include:
- CIC ALLOCATION PROCESS IS RUNNING = An EXC:BICCBMOVE process is currently running normally.

OK = Good. The request was accepted and completed. The abnormally terminated EXC:BICCBMOVE process will be cleared from the system.

Software Release: 5E15 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests an automated system backup to be unscheduled. This message removes the specified backup entry from the system cron table file.

2. FORMAT

CLR: BKUP: a:DATA, DAY=b, TIME=c;

3. EXPLANATION OF MESSAGE

a = Interval. Valid value(s):
   MONTH = Monthly backup is to be unscheduled.
   WEEK = Weekly backup is to be unscheduled.

b = Day. If 'a' is equal to "WEEK", then this variable is the day of the week. Valid value(s):
   0 = Sunday.
   1 = Monday.
   2 = Tuesday.
   3 = Wednesday.
   4 = Thursday.
   5 = Friday.
   6 = Saturday.

   If 'a' is equal to "MONTH", then this variable is the day of the month (1-31).

c = Time of day the backup is to begin in hours and minutes (hhmm) between 0000 and 2359.
   Example, 2200 is 10:00 PM.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the CLR: BKUP output message.

CLR:CCS-SRST

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Clears the status of a route making it available, and stops the signaling route set test (SRST) for the route.

WARNING: Use of this message may be service affecting.

2. FORMAT

CLR:CCS,SRST,SM=a, {DPC=b|CLUSTER=c} [ ,LS=d ];

3. EXPLANATION OF MESSAGE

a  = Common channel signaling (CCS) global switching module (GSM) number.
   Note: It is required that the GSM number is provided by the craft for this command.

b  = Destination point code (DPC) identifier. This format is network-cluster-member. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

c  = Cluster identifier. This format is network-cluster only. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Link set. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   Note: If LS is not specified, the change/removal shall be applied to all applicable linksets within the GSM. If parallel link sets are provisioned to the same DPC they will also be cleared.

4. SYSTEM RESPONSE

NG  = No good. The syntax of a message is valid, but the message has been denied. The request can be repeated. May also include:
   − INVALID GSM SPECIFIED = Invalid GSM number specified by the craft.
   − EITHER DPC OR CLUSTER MUST BE PROVIDED = Either DPC or cluster must be provided by the craft.
   − OFFICE NOT EQUIPPED WITH CCS = Office not equipped with CCS signaling.

PF  = Printout follows. The request was received and will be acted on. The CLR:SRST output message follows.

RL  = Retry later. System resources are unavailable to execute this input message now.

Input Appendix(es):

APP: RANGES
APP: POINT-CODE
CLR:CGAP

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests clearance of a network management (NM) call gapping (CGAP) code control restricting traffic by issuing a destination code, an access prefix, or both. This message also has an option to clear all CGAP code controls in the office.

Format 1 clears all the CGAP code controls in the office. Format 2 clears the CGAP code control for a specified destination code regardless of the access prefix. Format 3 clears the CGAP code control for a specified prefix regardless of the destination code. Format 4 clears the CGAP code control for a specified destination code and a specified prefix.

2. FORMAT

[1] CLR:CGAP;
[2] CLR:CGAP,CODE=a,DOM={ALL|c};
[3] CLR:CGAP,PREFIX=b,DOM={ALL|c};
[4] CLR:CGAP,CODE=a,PREFIX=b,DOM={ALL|c};

3. EXPLANATION OF MESSAGE

ALL = Clear code control to all domains. The default is to clear all CGAP code controls in the office.

NOTE: If the control is set on code, prefix, and domain, all three are required in the message to clear the control.

a = Destination code (up to 18 characters; valid character set 0-9,”*”,#).

b = The access prefix. The access prefix only applies to feature group D carriers.

c = Switching domain list.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the CLR:CGAP output message.

RL = Retry later. May also include:
   - RESOURCE SHORTAGE = The necessary resources are not available.

130 (NM EXCEPTION)
CLR:DSE

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the trapping and printing of direct signaling events (DSE) be turned off. These events will be reported in the REPT:ACP-APP-SM, REPT:ASP, REPT:DSE, REPT:MS-TRAPPED, REPT:NS and REPT:OSPS-DSE output messages.

2. FORMAT

CLR:DSE=a;

3. EXPLANATION OF MESSAGE

a = Event trap to be turned off. Valid value(s):
   ALL = All events.
   AILSGMG = Automated inward line screening (AILS) message received with invalid format reply.
   AILSMRQ = AILS error - misrouted query.
   AILSTOT = AILS query timed out before a reply was received.
   AILSTRF = AILS error - task refused.
   AILSUDV = AILS error - message received with unexpected input data value.
   ASPACGCOMP = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.
   ASPBADRESP = ASP SCP response message received with invalid data.
   ASPNORTEMSG = ASP reject message, return error and a play announcement received at the switch from the SCP.
   ASPQRYFAIL = ASP query blocked by network management (NM) ACG, a returned query or conversation received at the switch or a time out received in call processing.
   ASPSNCOMP = ASP SCP response message with a send notification component received at the switch.
   ASPTNMSG = ASP termination notification message sent from the switch to the SCP.
   CASDBOV = Customer account services (CAS) message received indicating database overload.
   CASDBUN = CAS message returned - database unable to process.
   CASGMSG = CAS message received garbled.
   CASNBLK = CAS message returned because of network blockage.
   CASNCON = CAS message returned because of network congestion.
   CASNRTE = CAS message returned because of no routing data.
   CASTOUT = CAS message returned because of timeout.
   CASUNEQ = CAS message returned because of unequipped destination.
   CASURPY = CAS message received with an unexpected reply.
   CAS7ABM = CAS common channel signaling 7 (CCS7) abort message received.
   CAS7ACG = CAS CCS7 ACG invoke component received.
   CAS7GMG = CAS CCS7 received with invalid format reply.
   CAS7GWE = CAS CCS7 error - gateway error.
   CAS7MPR = CAS CCS7 error - message received with missing parameter.

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Deletes a package (PKG) from the five-minute (M5) surveillance data set of packages. This TTY message is valid only for defense switched network (DSN) switches.

2. FORMAT

CLR:DSNM5,PKG=a;

3. EXPLANATION OF MESSAGE

a = Package. Valid value(s):
   ARC = Alternate route cancellation control.
   CLCT = Network management control counts.
   CLDIR = Call direction.
   DCC = Destination code cancellation control.
   DLYR = Delayed readiness.
   IMA = Additional ineffective machine attempts.
   OVRLD = Overload or congestion control.
   RRC = Manual reroute trunk group controls.
   SVC = Critical service circuits.
   TGFLAG = Trunk group flags.
   TGMEAS = Basic trunk group measurements.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
   - PACKAGE UNASSIGNED = Package not assigned for data collection.

PF = Printout follows. Followed by the CLR:DSNM5 output message.

RL = Retry later. Valid value(s):

APP:CM-IM-REASON
```
CLR:FRC-TRCU3

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE
This request is used to clear the "force" on a particular function pack pair of a TRCU3 circuit. There is no force state of a function pair, so this request is accomplished by clearing hardware register on the mate function pack which was set by the force command to make it faulty. This command is needed to facilitate TRCU3 function pack replacement.

2. FORMAT
CLR:FRC,TRCU3=a-b-c,{HOST|REMOTE};

3. EXPLANATION OF MESSAGE
a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = TRCU Path (TRCUPATH). This is the TRCUPATH connecting a host and remote TRCU3 circuits.
c = Side. This is the side of the CM which the function pack is connected that is desired to clear the force active.

HOST
"HOST" refers to the TRCU3 at the host location next which connects to the CM.

REMOTE
"REMOTE" refers to the TRCU3 at the remote location which is connected to the optically remoted (switching) module. (ORM).

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request. Refer to the CLR FRC TRCU3 output message.

PF = Printout follows.

Application: 5,3B
Type: Input

1. PURPOSE

Release a file from the input/output drivers cache memory. This is used during the installation of a new version of a file that could have been cached in the memory of the IODRV. Upon successful completion, the next time the file is needed by the IODRV, the file will be read from the disk.

2. FORMAT

CLR:IOMEM:FN "a"!

3. EXPLANATION OF MESSAGE

a full pathname that specifies the file to be released from the IODRV's cached memory.

4. SYSTEM RESPONSE

PF Printout follows. Followed by a CLR:IOMEM output message.

5. REFERENCES

Output Message(s):

CLR:IOMEM
CLR:ISOL-CM

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that the communication module (CM) be re-synchronized with (unisolated from) the administrative module (AM). This request configures the message switch control unit (MSCU) so that it no longer operates independent of the AM and refreshes CM status maintained in the AM with the actual hardware status obtained from the CM. The re-synchronization is performed conditionally and major errors will cause the AM to attempt to re-isolate the CM.

A complete AM/CM initialization is required to recover from most duplex hardware failures.

This input message is only applicable to offices having CM2-vintage communication modules.

2. FORMAT

CLR:ISOL,CM;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid, but could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the CLR:ISOL-CM output message.

109 (OVERLOAD)
CLR:M5-B

Software Release: 5E15 - 5E16(1)
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a package be deleted from the set of five-minute (M5) surveillance data packages for the on-site network management channel.

2. FORMAT

CLR:M5,PKG=a;

3. EXPLANATION OF MESSAGE

a = Package. Valid value(s):
ASPTF = Advanced services platform toll free counts.
BICCMEAS = Bearer independent call control measurements.
BNP = Basic number portability measurements.
CCS = Common channel signaling (CCS) general service measurements.
CCSP = CCS special service measurements.
CGAP = Code control.
CLCT = Network management control counts.
CLDIR = Call direction.
DLYR = Delayed readiness.
EON5 = End office nodal phase 5.
GETSHPC = Government emergency telecommunications service high probability of call completion.
HPCBICC = High probability of call completion BICC group.
HPCTG = High probability of call completion trunk group.
IECSST = Inter-exchange carrier start signal timeout counts.
IECSTG = Inter-exchange carrier shared trunk group counts.
IMA = Additional ineffective machine attempts.
LN = Leased network action point.
LNCU = Leased network office-wide measurements for critical users.
LNNODE = Leased network node-to-node measurements.
MLNC = Failure to match and no circuit.
NS = Number services.
OVRLD = Overload or congestion.
RRC = Manual reroute trunk group controls.
SDN = Action control point for software defined networks.
SVC = Critical service circuits.
TGFLAG = Trunk group flags.
TGMEAS = Basic trunk group.
WBTGMEAS = Wideband trunk group.

4. SYSTEM RESPONSE
NG = No good. May also include:
- **INVALID REQUEST** = The request has been denied. This office is not equipped to process the request entered.

PF = Printout follows. Followed by the CLR:M5 output message.

RL = Retry later. May also include:
- **RESOURCE SHORTAGE** = The necessary resources are not available.

- (MCTSI/DLI)
- (MCTSI/RLI)
1. PURPOSE

Requests to clear all brevity control message discard (MGDSC) counts and throttling message discard counts for administrative module (AM) operational kernel process, a communication module processor (CMP), or a switching module (SM). The brevity control message discard count contains total number of messages being discarded due to brevity control for the day or since the last CLR:MGDSC input message has been entered. The message throttling discard count contains total number of messages being discarded due to queue overflow for the day or since the last CLR:MGDSC input message has been entered. The discard count for each message class is also automatically reset to zero daily at 23:58:00, two minutes before midnight.

2. FORMAT

CLR:MGDSC, {AM|CMP=a|SM=b};

3. EXPLANATION OF MESSAGE

a = CMP number.

b = SM number.

4. SYSTEM RESPONSE

NG = No good. May also include:
  - CMP IS NOT AVAILABLE = The request cannot be executed now due to the requested CMP is either unavailable or not equipped.
  - SM IS NOT AVAILABLE = The request cannot be executed now due to the requested SM is either unavailable or not equipped.

OK = Good. Request was accepted. All message discard counts have been reset to zero.

Output Message(s):

   OP : MGDSC
CLR:MHD-MAEC

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

To clear a given moving head disk's (MHD's) media access error counter (MAEC). The MAEC for a given MHD is set to zero.

A MAEC counts all errors which could be classified as bad disk blocks (media defects). If upon investigation, some or all of these errors are attributed to specific bad disk blocks, the bad disk blocks should be mapped out using the LOAD:MHD input message, followed by the INIT:MHD input message. This procedure will reset the specified MHD's MAEC back to zero.

If upon investigation, none of these errors are attributed to media defects, then mapping bad blocks and formatting the disk is not necessary. In this case, the CLR:MHD-MAEC input message is used to reset the specified MHD's MAEC back to zero.

2. FORMAT

CLR:MHD=a:MAEC;

3. EXPLANATION OF MESSAGE

a = MHD member number.

4. SYSTEM RESPONSE

PF = Followed by the CLR:MHD-MAEC output message.

130 NM EXCEPTION
CLR:MINMODE-CNI

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Removes (clears) the common network interface (CNI) system from min-mode. This message cancels the effect of the SET:MINMODE-CNI input message. When the CNI system is taken out of minmode, a CNI full initialization (FI) (level 4) will be performed.

NOTE: The CNI system can be taken out of min mode only if the administrative module (AM) is not in min mode.

2. FORMAT

CLR:MINMODE,CNI,LVL4;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The request was unsuccessful because:
   - The office is not equipped with CNI.
   - The AM is in min mode.
   - Software level 5 (S5) initialization of CCSINIT failed.
   - Some internal error occurred.

PF = Printout follows. The message has been accepted and an output message will follow.

MCC Display Page(s):

   (CNI FRAME AND CCS LINK STATUS DISPLAY PAGE)
CLR:MINMODE-SM

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Clears the selected switching modules (SMs) from minimum mode (minmode) by resetting the appropriate SM inhibits and performing a full initialization. The SM inhibits which are reset as a result of this message are minmode, software error checks, hardware error checks, application routine exercises, and application routine audits. This message cancels the effect of the SET:MINMODE-SM input message.

WARNING: This message will cause all selected modules to initialize even if the modules were not in minmode prior to the initialization.

2. FORMAT

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

BPUMP = Request a full SM pump using the backup pump function (SI or FI). This pump uses the control time slots (no special hardware) and may succeed when a normal pump fails; however, it is at least 16 times slower than the normal pump. This option should be used on a pump peripheral controller (PPC) duplex failure of the administrative module (AM) peripheral hardware or failure of the bootstrapper hardware in the SM.

FI = Full initialization (clear all stable calls).

NPUMP = Request a full SM pump using the normal pump function (SI or FI).

PUMP = Request a full SM pump at the requested level (SI or FI). A normal pump (NPUMP) will be used unless a failure occurs, in which case a backup pump (BPUMP) will be selected automatically. This is the recommended option to request a full pump.

a = SM number, or lower limit of a range of SM number.

b = Upper limit of the range of SM number.

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the request is in progress.

NG = No good. The message was not accepted because:
- An illegal SM number or range combination was specified.
- An illegal initialization level was specified.
- An illegal option was specified; only PUMP, NPUMP, or BPUMP are allowed, and only with an FI.

Input Message(s):

SET:MINMODE–SM
CLR:MON

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5
Type: Input

1. PURPOSE

Requests that the specified operating system for distributed switching (OSDS) monitor data collection areas be set to zero.

2. FORMAT

CLR:MON, {AM|SM=a | CMP=b-c }, {CTL|PTA|DPA|ALL};

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Set the entire monitor buffer area to zero.
CTL = Set the control data area of the monitor buffer to zero.
DSP = Set the dispatch area of the monitor buffer to zero.
PTA = Set the count and time data area of the monitor buffer to zero.
a = Switching module (SM) number.
b = Message switch side.
c = Communications module processor (CMP) number.

4. SYSTEM RESPONSE

NG = No good. Error in format.
PF = Printout follows.
RL = Retry later. System resource shortage.

5. REFERENCES

None.
CLR:MWI

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that a Message Service System (MSS) message waiting indicator (MWI) be deactivated for a given seven-digit directory number (DN).

2. FORMAT

CLR:MWI,DN=a[,FNAME=b];

3. EXPLANATION OF MESSAGE

a = The seven-digit DN to be validated.

b = The MSS feature on the seven-digit DN. If multiple MSS features are assigned to this DN, the feature must be specified to avoid incorrect feature deactivation.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - MUST ENTER A 7 DIGIT DN = The DN field has more or less than seven digits in it. The DN field must contain digits only.

RL = Retry later. The message was not accepted because of a temporary lack of available resources.

PF = Printout follows. The DN validation request was accepted and the CLR:MWI output message follows.

---

Copyright ©2003 Lucent Technologies
MCC Display Page(s):
1187, y,x       PSU/ATM LINKS STATUS (where y=PSU number and x=SM number)
1. PURPOSE

Requests that the manually set automatic protection switch (APS) state of the packet switch unit (PSU) link (PSLNK) be cleared.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA cannot be specified by the PSU equipment number and must always be entered as PSU CA.

NOTE: For gateway protocol handlers (PH) the only valid input message format is #4. Other formats will not yield the expected results.

2. FORMAT

[1] CLR:PSLNK=a-b;
[2] CLR:PSLNK,PSUCA=a,FARCA=b;
[3] CLR:PSLNK,PSU=c-0,FARCA=b;
[4] CLR:PSLNK,PSUCA=a;

3. EXPLANATION OF MESSAGE

a = Near PSU community address of the PSU link.
b = Far PSU community address of the PSU link.

The far end CA must be zero if the PSU link is connected to an asynchronous transfer mode (ATM) switch in a point-to-multipoint configuration network.
c = Switching module (SM) number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.
P = Printout follows. Followed by the CLR:PSLNK output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

CLR:PSLNK

MCC Display Page(s):
PSU LINKS STATUS
CLR:PSLNK-B

Software Release: 5E16(1) and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the manually set automatic protection switch (APS) state of the packet switch unit (PSU) link (PSLNK) be cleared.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA.

2. FORMAT

[1] CLR:PSLNK=a-b;

[2] CLR:PSLNK,PSUCA=a,FARCA=b;

[3] CLR:PSLNK,PSU=c-d,FARCA=b;

3. EXPLANATION OF MESSAGE

a = Near PSU community address of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Far PSU community address of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

NOTE: The far end CA must be zero if the PSU link is connected to an asynchronous transfer mode (ATM) switch in a point-to-multipoint configuration network.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PSU number Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status. Refer to the APP:SYS-RESPONSE appendix in the Appendixes section of this Input Messages manual.

PF = Printout follows. Followed by the CLR:PSLNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

CLR:PTN

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that partitions on a specified disk be cleared (initialized with zeroes). The partitions to be cleared are determined from a specfile (default /etc/clearspec). Both the disk specified and its mate should be active before this message is entered.

This input message will be used by the applications that have AMA partitions (on removable media disk packs) which need to be cleared whenever a disk copy is generated.

2. FORMAT

CLR:PTN:MHD=a[:SPECF="b"];

3. EXPLANATION OF MESSAGE

a = Identifies of disk unit to be initialized with zeroes.

b = Pathname of specification file containing list of partition names that will be initialized with zeroes. Default will be /etc/clearspec.

4. SYSTEM RESPONSE

NG = No good. Process not initiated.

PF = Printout follows.

   1960 (BWM INSTALLATION)
CLR:RT-FAC
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that a far end loop process (FELP) or a protection (PROT) configuration request be cleared for a particular digital signal level one (DS1) facility (FAC).

If the request to be cleared has not been set for the specified facility, this request will have no effect.

2. FORMAT
CLR:RT,FAC=a-b,{FELP|PROT[,UCL]};

3. EXPLANATION OF MESSAGE
FELP = Configure a DS1 FAC to the looped state at the RT (for example, a “virtual pinjack”).
PROT = Switch from the specified DS1 FAC to the protection line.
UCL = Unconditionally take FAC off PROT (only valid for TR303 RTs).
a = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = RT DS1 FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
PF = Printout follows. The request was accepted. The CLR:RT-FAC output message follows.
NG = No good. The request has been denied. The message is valid but the request conflicts with current status.
RL = Retry later. The request cannot be executed now because the SM is isolated from the administrative module (AM).

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet interface (PI) unit be removed.

NOTE: This input message is only supported on PIs of the PI2 hardware type.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

CLR:UT:MCTSI=a-b,PI,{UTIL|UTILFLAG=c}{!|;}

3. EXPLANATION OF MESSAGE

UTIL = Execute this input message on all of the WHEN clauses in the specified PI.

a = Switching module (SM) number.

b = Side of the module controller/time-slot interchange (MCTSI).

c = The identification number of a specific WHEN clause, which is to be removed from the PI.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

5. REFERENCES

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet switch unit protocol handler (PSUPH) be removed.

NOTE: This input message is only supported on PSUPHs of the PH3/PH4 hardware type (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

CLR:UT:PSUPH=a-b-c-d,{UTIL|UTILFLAG=b}{!|;}

3. EXPLANATION OF MESSAGE

UTIL = Execute this input message on all of the WHEN clauses in the specified PSUPH.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The identification number of a specific WHEN clause, which is to be removed from the PSUPH.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE
Requests that one specific WHEN clause or all WHEN clauses from both the application program and the memory of the packet switch unit protocol handler (PSUPH) be removed.

This input message is not supported on PSUPHs of the PH2 hardware type and is supported on all others. This message may be used together with any of the other PSUPH generic utility input messages. Refer to the REFERENCES section of this message description. If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT
CLR:UT:PSUPH=a-b-c-d,{UTIL|UTILFLAG=e};

3. EXPLANATION OF MESSAGE

UTIL = Execute this input message on all of the WHEN clauses in the specified PSUPH.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = The identification number of a specific WHEN clause, which is to be removed from the PSUPH.

4. SYSTEM RESPONSE

CLR:UTIL

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Removes all currently defined administrative module (AM) generic access package (GRASP) breakpoints; clears definitions.

2. FORMAT

CLR:UTIL[,RESET];

3. EXPLANATION OF MESSAGE

RESET = The RESET option causes the breakpoint number to be re-initialized; the next breakpoint defined will be given the number 1.

4. SYSTEM RESPONSE

NG = No good. No GRASP breakpoints are currently defined.
PF = Printout follows. Followed by the CLR:UTIL output message.
RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

CLR:UTIL
OP:UTIL
CLR:UTILFLAG

**Software Release:** 5E14 and later  
**Command Group:** SFTUTIL  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**

Removes the specified administrative module (AM) generic access package (GRASP) breakpoint and clears the definition.

2. **FORMAT**

CLR:UTILFLAG=a[,RESET];

3. **EXPLANATION OF MESSAGE**

- **RESET** = If ‘a’ is the last remaining defined breakpoint, then the RESET option causes breakpoint numbering to be reinitialized; the next defined breakpoint will be given the number 1.

  If ‘a’ is not the last defined breakpoint, then the RESET keyword is ignored.

- **a** = Numeric identifier (one or more decimal digits) for the breakpoint to be cleared.

4. **SYSTEM RESPONSE**

- **NG** = No good. Identifier does not correspond to a currently defined breakpoint.

- **PF** = Printout follows. Followed by the CLR:UTILFLAG output message.

- **RL** = Retry later. The system is in an overload condition or completing the previous OP:UMEM message.

CLR:WSDGTL
Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE
Requests that the trunk and line work station (TLWS) test position (TP) digital testing defaults be reset to the system defaults. The stored defaults are then used when a TST:WSDGTL test is requested and the values are not explicitly set.

There are four system defaults for digital testing. Valid value(s):
BLKSZ = 56000.
CHAN = ALL channels.
TERM = Line termination (LT).
TESTEQ = D-channel.

2. FORMAT
CLR:WSDGTL,TP=a;

3. EXPLANATION OF MESSAGE
a = TLWS TP number.

4. SYSTEM RESPONSE
NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.
OK = Good. Digital testing defaults were reset.

160 (TRUNK & LINE MAINT)
CLR:WSFREQ

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the frequency and level be cleared at a particular trunk and line work station (TLWS) test position (TP). Frequency and level returns to the default values of 1004 Hz at 0 db.

2. FORMAT

CLR:WSFREQ,TP=a;

3. EXPLANATION OF MESSAGE

a = TLWS TP number.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

OK = Good. Default frequency and level reset to 1004 Hz at 0 dBm.

14.5 (VERIFY 101 TEST LINE)
17. CMPR
CMPR:DISK-CORE

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Compares the text portions of the disk and core images of a non-killable process. Equipment configuration database (ECD) and public library (PLIB) can also be compared.

2. FORMAT

CMPR:DISK,CORE,FN="a"; [, OPTNM="b",MPT="c",MHDNUM="d"];

3. EXPLANATION OF MESSAGE

a = Pathname of the file. The pathname is a list of the names of each directory leading to the file, and ends with the name of the specific file. Each name begins with a slash, and the entire pathname is enclosed in quotation marks. For example, "/usr/a1/ssw/test" means that /usr/a1/ssw is the list of directory names and /test is the file name.

b = Special device file name on offline partition (that is, /dev/root).

c = Pathname of mount point.

d = MHD number.

4. SYSTEM RESPONSE

PF = Printout follows. The CMPR:DISK-CORE output message follows.

**Command Group:** FHADM  
**Application:** 5,3B  
**Type:** Input  

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Compares the contents of two disks or two disk partitions. A disk partition may reside on the disk of its duplex mate, or on an arbitrary disk. Also, both disk partitions may reside on the same disk.

Only one CMPR:MHD or COPY:DIFF-SRC-MHD input message is allowed to run at one time. If more than one is attempted, the disk file controller (DFC) will deny the request and output an error code to that effect.

**WARNING:** Incorrect use of this input message can degrade system performance. This input message should not be used without expert technical assistance. This message should not be executed during AM or CM REX. Ignoring this warning could lead to call processing problems.

2. FORMAT

\[
\text{CMPR:MHD=}a[,\text{PTN=}(b|c\&d)][:\text{MATE|MHD=}e[,\text{PTN=}(b|c\&d)][:\text{DATA}[,\text{BLOCKS=}f[,\text{RO}]]]}
\]

3. EXPLANATION OF MESSAGE

- **RO** = All blocks on specified moving head disks (MHDs) or partitions will be read into memory, but no comparison will be performed. If MHD 'e' or MATE is not specified, the reads will only be performed on MHD 'a'.
- **a** = First member number.
- **b** = Partition numbers, or list of partitions (r1, r2, r3, ..., rn) where the list may include 64 entries. Default will be all but the FREE, UNASGN, DIAG, SWAP, and PDUMP partitions.
- **c-d** = A range of partition numbers where a list of up to 32 ranges (p0-p1, p2-p3, p4-p5, ..., pm-pn) may be specified. A range has the format 'c-d' where 'd' must be greater than 'c'.
- **e** = Second member number. If MHD 'a' or MATE is not specified, MATE is the default.
- **f** = An integer value indicating the size of the input/output (I/O) buffers as a multiple of disk blocks. If 'BLOCKS' is not specified, the default is 256. However, if 'BLOCKS' is not specified, and the 'RO' option is used, then the default is 128.

4. SYSTEM RESPONSE

- **PF** = Printout follows. Followed by the CMPR:MHD output message.

235-105-24x Software Release Retrofit
CNVT:CORCLOG

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that customer-originated recent change (CORC) logfiles be evolved (converted) and reapplied. This message the binary plus CORC logfiles for reapplication on the target software release.

WARNING: This message is only applicable during retrofit and should only be used when following procedures detailed in the Software Release Retrofit document.

2. FORMAT

CNVT:CORCLOG[,EVOL,LOAD];

3. EXPLANATION OF MESSAGE

NOTE: If none of the options is specified, EVOL will be performed and CORCs will be inhibited.

EVOL = Evolves CORC logfiles from binary format of the current software release to binary plus format of the target software release.

LOAD = Reapplies binary plus CORC logfiles to target software release.

4. SYSTEM RESPONSE

NG = No good. The input request is not valid.
PF = Printout follows. Request accepted and the CNVT:CORCLOG output message follows.

235-105-24x  Software Release Retrofit
1. PURPOSE

Requests that equipment numbers relating to remote terminals (RT) that interface to an integrated digital carrier unit (IDCU) or a digital networking unit - synchronous optical network (DNU-S) be converted. Given any of the three following identifiers, this message will provide the other two:

A  SID = Site identification number

B  For the IDCU:
   BIDCURT = Local number for an RT terminating on an IDCU.

   For the DCLU:
   DCLURT = Local number for an RT terminating on an DCLU.

   For the DNU-S:
   DNUSRT = Local number for an RT terminating on a DNU-S.R

C  For the IDCU:
   IFAC = Digital signal level one (DS1) facility (IFAC) number

   For the DCLU:
   SDFI = SLC® 96 digital facility interface (SDFI) number

   For the DNU-S:
   DS1SFAC = DNU-S digital signal level 1 facility (DS1SFAC) number R

2. FORMAT

CNVT:RT,a;

3. EXPLANATION OF MESSAGE

a  = Valid value(s):

| IFAC=c-e-h | DCLURT=c-d-b | IDCURT=c-e-b | DNUSRT=c-f-b | SDFI=c-d-g | DS1SFAC=c-f-i | SID=j |

b  = RT local number for IDCU or for DCLU. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = DNUS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = SDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = DS1SFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The CNVT:RT-SID-LRT output message follows.

NG = No good. Unit does not exist. The specified RT equipment number could not be found in the database.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1660,xxxx (TR303 REMOTE TERMINAL)
1. PURPOSE

Requests an update of a switching module’s (SM) office-dependent data (ODD) to support stand-alone operation. This message populates the directory number (DN) translation data for all lines physically terminating on the given SM, such that the SM is capable of processing intramodule calls even when it becomes isolated from the rest of the switch.

NOTE: This input message is to be used only in conjunction with the SM stand-alone installation procedure. The conversion routine can take several minutes to complete.

2. FORMAT

CNVT:STANDALONE, SM=a[, UNDO];

3. EXPLANATION OF MESSAGE

UNDO = Restore the ODD to the state before conversion in the event that the first attempt to convert the SM aborted.

a = SM number of the module to be converted to stand-alone.

4. SYSTEM RESPONSE

NG = No good. The input request is not valid.

PF = Printout follows. One or more CNVT:STANDALONE output messages follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

CPE = Obtain the customer premises equipment (CPE) information for this line and display on the TLWS screen. Valid only for digital subscriber lines (DSLs). Note: this request is not allowed through MML input.

USPID = Obtain the user service profile identifier (USPID) information for this line and display on the TLWS
screen. Valid only for DSLs. Note: this request is not allowed through MML input.

a  = TLWS TP number.

b  = Directory number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be seized. For LTSB a member number of 1 will seize the lead line and a member number of 2 will seize the associate line. If no member number is specified, for 1-DN LTSB, the lead line will be seized. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be seized.

d  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

 g  = Switch board number (LU1, LU2, or LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i  = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j  = MLHG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k  = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l  = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m  = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n  = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o  = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p  = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q  = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
r = Data link (group) number of the AP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Relative link (member) number of the AP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Integrated service line unit 2 (ISLU2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a1 = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b1 = AIU line pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d1 = DNU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress.

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

Application: 5
Type: Input

1. PURPOSE

Requests to connect the trunk and line work station (TLWS) talk-and-monitor (T&M) phone with the current line or trunk associated with the test position (TP).

The T&M phone will be connected in the MONITOR mode of operation (refer to the SET:WSPHONE input message for changing the T&M mode) when it is initially connected.

2. FORMAT

CONN:WSPHONE,TP=a;

3. EXPLANATION OF MESSAGE

a          = TLWS TP number.

4. SYSTEM RESPONSE

OK          = The phone has been added.
NG          = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

14.3 (TRUNK AND LINE WORK STATION)
CONN:WSPORT

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the port (line or trunk) that is associated with the specified trunk and line work station (TLWS) test position (TP) be re-seized. The association was accomplished earlier using a CONN:WSLINE, CONN:WSTRK or CONN:WSIC input message.

2. FORMAT

CONN:WSPORT,TP=a;

3. EXPLANATION OF MESSAGE

a = TLWS TP number.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

OK = Good. Port seized.

160 (TRUNK & LINE MAINT)
1. PURPOSE

Requests seizure of (connection to) a trunk for interactive trunk and line work station (TLWS) testing. A test position (TP) must be assigned before seizing the trunk (refer to the SET:WSPOS input message).

Format 1 will cause the port most recently requested for seizure on the TP to be reseized. In Format 2, a trunk is identified by a digital equipment number (DEN). In Format 3, a trunk is identified by a trunk (analog) equipment number (TEN). In Format 4, a trunk is identified by a trunk group (TG) (first member). In Format 5, a trunk is identified by a specific member of a trunk group (TKGMN). In Format 6, the trunk is identified by a next member (NEXTMEM) of the trunk group currently being tested. In Format 9, a trunk is identified by a SLC® line equipment number (SLEN). In Format 10, the trunk is identified by an integrated digital carrier unit (IDCU) line equipment number (ILEN). In Format 11, the trunk is identified by a networking equipment number (NEN). In Format 12, a trunk is identified by a packet switching unit (PSU) equipment number (PSUEN). In Format 13, a trunk is identified by a Digital Networking Unit-Synchronous Optical Network (DNU-S) number (INEN). The digital service unit 2 recorded announcement function (DSU2-RAF) announcement port is seized by using Format 7. The service announcement system (SAS) digital service circuit port is seized by using Format 8.

Note: Announcement test function (ATF) will either be a RAF or SAS.

3. EXPLANATION OF MESSAGE
a = TLWS TP number.
b = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = ATF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Remote terminal number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = Remote terminal line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
q = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
r = Remote terminal (RT) number in the IDCU or the digital signaling 1 (DS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
s = RT line number or the digital signaling 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

OK  = Port has been seized.

NG  = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

RL  = Retry later. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

5. REFERENCES

Input Message(s):
COPY:ACTDISK

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a file from an active disk to an offline (OFL) or out-of-service (OOS) disk. The file can be a regular file, a contiguous file (type "C" or "x"), or a block device (type "b", partition or file system). For a regular or contiguous file, the destination file will be created with type, owner, and permission flags similar to those of the source file.

2. FORMAT

COPY:ACTDISK,MHD=a,SRC="b",PTN="c"[,DEST="d"];

3. EXPLANATION OF MESSAGE

a  = Specifies destination disk unit. This disk should not be active.
b  = Full pathname of the file to be copied. This file should exist on an active disk.
c  = Special device filename or number of the destination partition on the non-active disk. If a name is specified, then this partition should exist on the active disk.
d  = A pathname where the file is to be written, on the non-active file system. If this name is not specified, the path name of the source file will be used. If the name starts with a "/", then the mount point will be excluded. This name should not be specified if the source is a partition or file system.

4. SYSTEM RESPONSE

PF  = Printout follows. Followed by the COPY:ACTDISK output message.

5. REFERENCES

Output Message(s):

COPY:ACTDISK
COPY:ADDR

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from virtual addresses in main memory to other virtual addresses, registers, or administrative module (AM) generic access package (GRASP) utility variables as a response to a breakpoint.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

2. FORMAT

COPY:ADDR=a[,OFF=b] [,L=c|,NL=d] {:ADDR=e|:UVAR=f|:REG=g} [:WORD];

3. EXPLANATION OF MESSAGE

WORD = All addresses, offsets, and lengths are interpreted in terms of words (including addresses derived in address chains). If this option is omitted, values given are in bytes.

a = The starting virtual address for the source data in decimal, octal, or hexadecimal notation.

b = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified.

c = The length of the copy in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default is 1 word or byte.

d = The operation will use the locations beginning 'd' lower than the calculated address and ending at the address. The locations are used in ascending order.

e = The virtual address of the destination for the data in decimal, octal, or hexadecimal notation.

f = A GRASP utility variable, in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session.

g = The name of the register to be written as the destination copy. Valid register names are:

4. SYSTEM RESPONSE

?I = General syntax error. Valid value(s):
   - INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
   - INVALID KEYWORD = ADDR is invalid in an immediate action.
   - RANGE ERROR (UVAR) = Invalid utility variable number was specified.
   - RANGE ERROR (L or NL) = Length specified is too long.
   - INPUT ERROR (OFF COUNT) = Too many offsets listed.

IP = In progress. The message has been added to the WHEN action list.

NG = No good. Valid value(s):
   - BAD REG NAME = A named register is not a valid destination.

PF = Printout follows. Followed by the COPY:ADDR output message.

RL = Retry later. The system is in an overload condition.

COPY: BKDISK

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies selected on-line disk partitions to tape in the load disk from tape (LDFT) format. The partitions must be
specified in a specification file. The default for the specification file name is "/etc/pdtspec". The full pathname must
be given for each partition, and only one partition can appear on each line.

If the system is booted on the primary root file system, for those partitions having backup partitions, the backup
partitions are written to tape. If the system is booted on the backup root file system, the primary disk partitions are
written to tape. Partitions without backup partitions are written from the primary partitions in both cases. Collectively
the partitions make up one logical volume. Format 1 copies the partitions to magnetic tape in single volume format.
Format 2 acknowledges the mounting of a new tape by the user and is only used in conjunction with Format 1.
Format 3 copies partitions to a digital audio tape (DAT) in multi-volume format. On a 3B21D with a DAT drive,
Format 3 is used to format the DAT with multiple logical volumes, provided the tape already contains the TOP file at
the beginning of the tape. (The TOP file is considered to be Session 1 Volume 0 and is written by the
COPY:TAPE-TOP input request.) One or more of these logical volumes form a backup session. A DAT may be
formatted with no more than nine backup sessions in sequential order. A backup session may contain any
combination of logical volumes meeting the following criterion: the logical volumes within a session must be ordered
such that any given volume identified by its logical volume number has a greater number than the previous volume
in the session. Refer to variable ‘f’ for the mapping of logical volume numbers to the volume names they represent.
By default, Format 3 will try to append logical volumes to the current end of data mark. There are optional
parameters for session and volume position to request that a logical volume be appended to the end of a specific
logical volume on the DAT for the purpose of overwriting the DAT from that point forward. This option is only valid
for overwriting logical volumes within the most recent backup session or for appending a logical volume for the next
session to the last logical volume of the specified positioning session.

2. FORMAT

PSESSE=g, PVOL=h [, FN="d"] [, MRG] [, EXT] [, SKP] [, NODMTMSG] [, COM];>

3. EXPLANATION OF MESSAGE

COM = This option must be used when creating a UNIX® RTR disk image that contains a common
volume table of contents (VTOC) (a VTOC containing both the 3B20D very large main memory
(VLMM) and 3B21D lboot partitions) or when creating other generic text tapes that is shared among
3B20D VLMM and 3B21D processors.

EXT = LDFT extended format tapes where the data blocks can be up to 6K bytes. This option cannot be
used on a Kennedy tape drive controlled by an UN134 PC.

MRG = Writes generic and database partitions as one generic sequence. With this option, the
specification file should contain both database and generic partitions. As the default, if the
specification file contains generic and database partitions, then two sequences will be created.

Copyright ©2003 Lucent Technologies
**NOTE:** The default action is not supported for a multi-volume LDFT tape. The user must specify this option when the specification file contains both data base and generic partitions and input request Format 3 is being used.

**NODMTMSG** = Upon completion, the DISMOUNT TAPE AND LABEL message will not be printed.

**SKP** = Skip block usage bitmap and unused data blocks when writing file systems to tape. Use of this option is generally recommended, as it will conserve tape, if possible, and save time. Note, however, that tape reading and writing time may approximately double when this option is used with streaming tape drives (tape drives without mechanical tensioners or vacuum columns) in a worst-case data scattering scenario.

**a** = Pathname that specifies the boot disk.

**b** = Special device file name of the tape drive to be used. Refer to the ECD/SG manual.

**c** = Specifies the size of the tape, mounted in feet for 9-track devices, or meters for digital audio tapes (DATs). The acceptable range for a 9-track tape size is 600 to 2400 and the acceptable range for a DAT tape size is 30 to 90. The format requires entry of the tape size separated from the keyword by a space.

**d** = Specification file name that contains a set of partitions to be written to tape. The full pathname of the file is required.

**e** = Backup session number which is used to group one or more logical volumes together. The first backup session on tape must be numbered backup session 1 and increased sequentially thereafter with a maximum value of 9.

**f** = Logical volume number which identifies the group of partitions being written to tape. Valid value(s):

- 1 = AMTEXT.
- 2 = AMODD.
- 3 = SMTEXT.
- 4 = SMODD1.
- 5 = SMODD2.
- 6 = SMODD3.
- 7 = SMODD4.
- 8 = SMODD5.
- 9 = SMODD6.

**g** = Positioning backup session number which identifies a backup session on tape. The range of positioning backup session numbers is 1 to 9. This number is used along with the positioning logical volume number to locate a specific logical volume on tape to which to append the new logical volume. The absence of the positioning fields will result in the logical volume being appended to the current end of data mark on tape.

**h** = Positioning logical volume number. The range of positioning logical volume numbers is 0 to 9. Note that 0 is included in this range to allow for appending to the TOP file. Refer to the explanation of field ‘g’ for more information.

---

**4. SYSTEM RESPONSE**
NG = No good. A fatal error was encountered because the actual disk writer or the user
acknowledgement program (Format 2) could not be initiated. Try to initiate the request again. If the
process still fails, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of
the Input Messages manual.

PF = Printout follows. Followed by the COPY:BKDISK output message.

?D = Error in the data field.

COPY:BKTAPE

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies the contents of a multi-volume formatted digital audio tape (DAT) from a source DAT drive to a destination DAT drive. The default action is to make a complete copy of the source DAT. If the optional session number is specified, then the multi-volume formatted data is copied from the beginning of the specified session on the source DAT and appended to the end of the previous session on the destination DAT.

2. FORMAT

COPY:BKTAPE:SRC="a", DEST="b" [,SESS=c];

3. EXPLANATION OF MESSAGE

a = Device filename of the source DAT drive. Refer to the User Guidelines for definitions and examples of tape device names.

b = Device filename of the destination DAT drive. Refer to the User Guidelines for definitions and examples of tape device names.

c = Session number on the source DAT. This session is the starting point for the copy from the source DAT. Valid session numbers are 1 through 9.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by a COPY:BKTAPE output message.

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Compares disk partitions in order to detect differences. When a difference is found, data is copied from the source partition to the destination partition. The input arguments can specify disks or specific partitions. A disk partition may reside on the disk of its duplex mate, or on an arbitrary disk. Also, both partitions may reside on the same disk.

A difference generates a message which identifies the location of the difference. A copy will then be performed to correct the difference. The source argument is considered to contain the correct disk data. The mismatch messages provide an audit trail of corrected disk blocks. Only one COPY:DIFF-SRC-MHD or CMPR:MHD input message is allowed to run at one time. If more than one is attempted, the disk file controller (DFC) driver will deny the request and output an error code to that effect.

WARNING: Incorrect use of this input message can degrade system performance and result in disk data mutilation. This input message should not be used without expert technical assistance.

2. FORMAT

COPY:DIFF:SRC,MHD=a[,PTN={b|c&&d}]:DEST,{MATE|MHD=e}[,PTN={b|c&&d}] [,BLOCKS=i];

3. EXPLANATION OF MESSAGE

a = Source member number.
b = Partition number within a range of (0 to 63), or list of partitions (r1, r2, r3, ..., rn) where the list may include 64 entries. Default will be all but the FREE, UNASGN, DIAG, SWAP, and PDUMP partitions.
c = Lower limit in a range of partition numbers where a list of up to 32 ranges (p0-p1, p2-p3, p4-p5, ..., pm-pn) may be specified.
d = Upper limit in a range of partition numbers.
e = Destination member number.
i = An integer value indicating the size of the input/output (I/O) buffers as a multiple of disk blocks. The legal values are 1-256. If BLOCKS is not specified, the default number of 128 will be used.

4. SYSTEM RESPONSE

COPY:ECD-TAPE

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the equipment configuration database (ECD) and system generation (SG) database files be copied from the primary partition on disk to a magnetic tape. The database files are first converted to a readable format, and then written to tape.

This message is primarily used for preliminary and final office data administration (ODA) database preparation for ECD evolution as a part of retrofit procedure. Files copied to tape are ASCII (dumped) version of “root” ECD and SG in /database (/dev/db) file system.

2. FORMAT

COPY:ECD:TAPE[:TU=a][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Start a new process even when one is already running. The running process will be terminated before the new one is started.

a = Tape drive unit (TU). 0, 1, L0 or L1. When 0 or 1 is specified, data will be written in high density if the tape drive is of high density type. Otherwise, data will be written in low density. When L0 (low density unit 0) or L1 is specified, data will be written in low density regardless of the tape drive type (high density tape drive can be used in either density mode). High density write will use much less tape. When TU is not specified, unit 0 is assumed.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:ECD-TAPE output message.

5. REFERENCES

Output Message(s):

235-105-210   Routine Operations and Maintenance

MCC Display Page(s):
(CRAFT FM 01)
COPY:FSYS-FILE

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE
Requests that a specific file be copied to another file or directory.

WARNING: All existing data in the destination file will be destroyed.

2. FORMAT
COPY:FILESYS,FILE,SRC="a",DEST="b"[,{ERASE|NOERASE}];

3. EXPLANATION OF MESSAGE

ERASE = Sourcefile will be renamed (moved) to the destination indicated in variable 'b'. As a result, one file will exist.

NOERASE = Sourcefile will be copied to the destination indicated in variable 'b'. As a result, two files will exist.
NOERASE is the default value.

NOTE: If ERASE is specified, the source file will be renamed (moved) to the DEST indicated, that is, one file will exist. However, if NOERASE is used the SRC file will be copied to the DEST indicated and two files will exist. Failure to indicate either will default to NOERASE.

a = Pathname of the file to be copied. The pathname is a list of the names of each directory leading to the file, and ends with the name of the specific file. Each name begins with a slash, and the entire pathname is enclosed in quotation marks. For example, "/usr/a1/ssw/test" means that /usr/a1/ssw represents the list of directory names and /test represents the file name.

b = Pathname of the destination directory or file. 'b' cannot be identical to 'a'.

NOTE: If only a filename is given for DEST, the default directory is /cft/shl. Example:
COPY:FILESYS{:[DATA,]|,}FILE,SRC="/tmp/tst",DEST="tmtst";

4. SYSTEM RESPONSE

COPY:LOG-TAPE

Software Release: 5E14 and later
Command Group: FHADM
Application: 5
Type: Input

1. PURPOSE

Requests that the office dependent data (ODD) recent change (RC) log file be copied from disk to magnetic tape.

Format 1 invokes a process that copies the named RC log file to tape. Format 2 restarts the process unconditionally. This format can be used to override the retry later - in progress (RL - IP) system response.

2. FORMAT

[1] COPY:LOG:TAPE,FN="a";

3. EXPLANATION OF MESSAGE

UCL = Indicates that the request is to be performed unconditionally, possibly interrupting a COPY:LOG-TAPE input message that is in progress.

a = Indicates the file name. The full pathnam, surrounded by double quotation marks, of the log file to be written to tape.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by one or more COPY:LOG-TAPE output messages.

RL = Retry later. May also include:
    - IP = In progress. Process already running; needs UCL to proceed (refer to Format 2).

5. REFERENCES

Output Message(s):

COPY:LOG-TAPE

Other Manual(s):

Where (x) is the release-specific version of the specified manual.
235-105-24x Software Release Retrofit
COPY:ODD-TAPE

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the system office dependent data (ODD) files be copied from disk to magnetic tape.

This message is primarily used for preliminary and final office data administration (ODA) database preparation for ODD evolution as a part of retrofit procedure. Files and partitions copied to tape are: disk ODD (/dev/no5dodd1 or /dev/no5dodd2); all the "*odd*.out" (* = any ASCII string) files in /no5odd/cpdata (/dev/no5aodd1 or 2), /no5odd/cidata (/dev/no5codd1 or 2) and /no5odd/imdataN (/dev/no5soddN--N represents a number in newer software release). The sides 1 and 2 are alternated for each ODD backup operation and whichever happens to be the official backup side will be copied to tape. Format 1 starts a process that copies the system ODD files to tape. TU option may be used to specify the tape drive unit and density. If TU option is not specified, unit 0 (side 0) is assumed and write density is determined by the type of the equipment. Format 2 restarts the process (after mounting a new tape) to write the second (and subsequent) tape. The tape must be mounted on the same unit as the first tape. Format 3 restarts the process at a mid-numbered tape. Format 4 kills the currently running process and starts a new process on the tape specified.

2. FORMAT

[1] COPY:ODD,TAPE[,ALL][,PRELIM][,TU=b][,UCL];
[2] COPY:ODD,TAPE,CONTINUE[,ALL];
[3] COPY:ODD,TAPE=a[,ALL][,TU=b],CONTINUE;
[4] COPY:ODD,TAPE=a[,ALL][,TU=b],CONTINUE,UCL;

3. EXPLANATION OF MESSAGE

ALL = Copy equipment configuration database (ECD) and system generation (SG) database on the same tape as the ODDs mentioned above. The ECD and SG copied here will be "undumped" (non-ASCII) format. If you have a high-density tape drive, using this keyword will reduce the number of tapes needed.

NOTE: Once the "ALL" option is used, you must continue using it in all subsequent COPY:ODD-TAPE input messages until you are finished.

PRELIM = Preliminary dump. This option is used when making the preliminary ODD/ECD dump for a software release retrofit. When the final dump tapes are made for the software release retrofit, this parameter should be omitted.

CONTINUE = Restart the process (after a new tape is mounted) to write the second (and subsequent) tape(s). The tape must be mounted on the same unit as the first tape. When the process is in waiting state, tape number 'a' is not needed and will be ignored if present. The waiting process produces tapes in sequential order and knows what tape number to produce.

When there is no waiting process (no other COPY:ODD-TAPE process is running), and the CONTINUE keyword is used, tape number 'a' is required to signal that you wish to start from a mid-numbered tape rather than starting from the first tape.
UCL  = Start a new process even when one is already running. The running process will be terminated before the new one is started. Tape drive unit 0 will be used.

a  = Tape number. The tape number should be specified only when you wish to start from a mid-numbered tape (such as, tape number 2) instead of sequentially starting from tape 1. Refer to the explanation for CONTINUE.

b  = Tape drive unit (TU). 0, 1, L0 or L1. When 0 or 1 is specified, data will be written in high density if the tape drive is of high density type. Otherwise, data will be written in low density. When L0 (low density unit 0) or L1 is specified, data will be written in low density regardless of the tape drive type (high density tape drive can be used in either density mode). High density write will use much less tape. When TU is not specified, unit 0 is assumed.

4. SYSTEM RESPONSE

PF  = Printout follows. Followed by the COPY:ODD-TAPE output message.

RL  = Retry later. Process is already running. Use Format 4 to proceed.

5. REFERENCES

Output Message(s):

COPY:ODD-TAPE

Where (x) is the release-specific version of the specified manual.

235-105-24x   Software Release Retrofit
1. PURPOSE

Copies a specific file from an out-of-service (OOS) disk to an active system disk. This message is typically used for retrieving a file from a software backup maintained on a spare disk.

2. FORMAT

COPY:OOSDISK:MHD=a, SRC="b", DEST="c"[, PTN=d];

3. EXPLANATION OF MESSAGE

a = Specifies a non-active disk containing the source file (0-255).

b = Full pathname that specifies the file to be copied.

c = Pathname of the destination file.

d = Specifies partition number, where the source file resides in the OOS disk. If not specified, the partition corresponding to the file on the active disk will be used.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:OOSDISK output message.

5. REFERENCES

Output Message(s):

COPY:OOSDISK
COPY:PID

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from virtual addresses in main memory to the administrative module (AM) generic access package (GRASP) utility variables.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

2. FORMAT

COPY:PID=a,ADDR=b[,OFF=c][,L=d|,NL=e]:UVAR=f[:WORD];

3. EXPLANATION OF MESSAGE

WORD

= All addresses, offsets, and lengths are to be interpreted in words, including addresses derived in address chains. If this option is omitted, values given are assumed to be in bytes.

a

= Process ID (PID) of the target process.

b

= The starting virtual address for the source data in decimal, octal, or hexadecimal notation.

c

= A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified.

d

= The length of file to be copied in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default is 1 byte or 1 word.

e

= The operation will use the locations beginning 'e' lower than the calculated address and ending at the address. The locations are used in ascending order.

f

= A GRASP utility variable (1-50), in decimal, to be written as the address of the destination of the copy. Utility variable values are reset to zero at the end of a debugging session.

4. SYSTEM RESPONSE

?I

= General syntax error. May also include:
- EXTRA KEYWORD (PID) = PID is invalid in a breakpoint.
- INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
- INPUT ERROR (OFF COUNT) = Too many offsets listed.
- INVALID KEYWORD = Destination of ADDR or REG not valid outside of a WHEN action list.
- RANGE ERROR (L or NL) = Length specified is too long.
- RANGE ERROR (PID) = Process ID is out of range.
- RANGE ERROR (UVAR) = Invalid utility variable number was specified.
NG = No good. May also include:
BAD PID = The PID specified is for a process for which copies are not allowed.

PF = Printout follows. Followed by COPY:PID output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that one set of disk partitions be copied into a corresponding set of partitions.

A duplex disk configuration is a prerequisite for the input message to work properly. To ensure data consistency, one of the moving head disks (MHDs) of the duplex pair will be removed from service and the data from its copy of the source partition will be copied to the destination partition on the disk which is left active. After the copy is complete, the MHD which was removed from service will be restored.

WARNING: All existing data in the destination partitions will be destroyed.

2. FORMAT

COPY:PTN:DATA,ALL,SRC="a",DEST="b",[ACT];

3. EXPLANATION OF MESSAGE

ACT = Leaves the system in a duplex disk configuration as it copies the partitions.

a = Full pathname of a file that specifies a list of partitions, or a special device filename of a partition to be copied. Refer to the ECD/SG manual.

b = Full pathname of a file that contains the corresponding list of destination partitions, or the special device filename for a destination partition.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:PTN-ALL output message.

5. REFERENCES

Input Message(s):

Other Manual(s):

Where 'x' is the release-specific version of the specified document.
COPY:REG

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from the administrative module (AM) registers to virtual addresses in main memory and in registers as an action associated with a breakpoint.

Copies data from registers to the AM generic access package (GRASP) utility variables as either an immediate action or as an action associated with a breakpoint.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

Format 1 is executed as an action associated with a breakpoint.

Format 2 is executed as either an immediate action or as an action associated with a breakpoint.

2. FORMAT

[1] COPY:REG=a[,OFF=b][,L=c]{:ADDR=e|:REG=g|:UVAR=f}[:WORD]!
[2] COPY:REG=a[,L=c]:UVAR=f[:WORD]{}|;}

3. EXPLANATION OF MESSAGE

WORD = All addresses and lengths are in terms of words. If this option is omitted, values given are assumed to be in bytes.

a = Specifies a register to be read as the source for the copy. Valid value(s):
   AP = Argument pointer AP.
   ATBBGR = Register used by the ATB miss routine to temporarily store the bi-directional gating register (BGR).
   ATBPSW = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.
   ATBQ = Register used by the ATB miss routine to temporarily store the 'q' register.
   ATBSAR = Register used by the address translation buffer (ATB) miss routine to temporarily store the store address register (SAR) contents.
   ATBSAR = Register used by the ATB miss routine to temporarily store the store control register (SCR) contents.
   ATBSAR = Register used by the ATB miss routine to temporarily store the store data register (SDR) content.
   BGR = Bi-directional gating register.
   CAR = Channel address register.
   CDR = Channel data register.
   ERC = Error register (ER) clear.
   FP = Frame pointer FP.
   HG = Reserved register HG.

UINTER = Shadow error register (uint_er) loaded during an error microinterrupt.

b = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified. (Used as an action associated with a breakpoint.)

c = The length of the copy assumed to be in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default for an omitted or zero length is 1.

e = Specifies the destination virtual address for the data in decimal, octal, or hexadecimal notation. (Used as an action associated with a breakpoint.)

f = Specifies a GRASP utility variable (1-50), in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session. (Can be used as an immediate action or associated with a breakpoint.)

g = Specifies the register to be written as the destination copy. (Used as an action associated with a breakpoint.) Valid value(s):

4. SYSTEM RESPONSE

?I = General syntax error. Valid value(s):
   - EXTRA KEYWORD (OFF) = Indirection not allowed except as action of a WHEN.
   - INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
   - INVALID KEYWORD = Destination of ADDR or REG not valid outside of a WHEN action list.
   - RANGE ERROR (UVAR) = Invalid utility variable number was specified.
   - RANGE ERROR = Length specified is too long.

IP = In progress. The message has been added to the WHEN action list.

NG = No good. Valid value(s):
   - BAD REG NAME = A named register is not a valid source or destination.

PF = Printout follows. Followed by the COPY:REG output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

WHEN:UID

Output Message(s):

COPY:ADDR
COPY:PID
COPY:REG
COPY:UID
COPY:UVAR
COPY:SPDISK

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a specific partition, or a list of partitions, from one of the system disks to an active spare disk. This input message is typically used for generating a backup copy of the software on a system disk. The system disk pair must be duplexed to use this input message.

2. FORMAT

COPY:SPDISK:SRC="a",DEST="b";

3. EXPLANATION OF MESSAGE

a = Full pathname of a file that contains a list of partitions, or a special device file name of a partition, to be copied. Refer to the ECD/SG manual.

b = Filename for the corresponding list of destination partitions, or the special device filename for a destination partition.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:SPDISK output message.

5. REFERENCES

Output Message(s):

COPY:SPDISK

Other Manual(s):

Where 'x' is the release-specific version of the specified document.

235-600-30x ECD/SG
COPY:TAPE-DATA

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies a task oriented practice (TOP) file(s) from disk to tape. A TOP file contains writable microcode and the load disk from tape (LDFT) program used for a "deadstart." If the COM option is specified, the very large main memory (VLMM) TOP file and 3B21D TOP file are copied from disk to tape, strictly in that order. Otherwise, a hardware-platform-specific TOP file is copied. For example, if the current hardware platform is VLMM, /etc/topfile64 or /etc/topfile is copied to tape.

2. FORMAT

COPY:TAPE:DATA,TOP,TD="a",[COM];

3. EXPLANATION OF MESSAGE

COM = Option used to create a common TOP tape which consists of both the VLMM TOP file and the 3B21D TOP file.

NOTE: The input message with the COM option does not copy the standard main memory (SMM) or extended main memory (EMM) TOP file. If this option is not specified, the TOP file copied to tape will be the one for the current hardware platform. Refer to the example in the PURPOSE section.

a = Tape special device file name. Refer to the User Guidelines, for definition and examples of tape device names.

4. SYSTEM RESPONSE

PF Printout follows.

5. REFERENCES
COPY:TAPE-EMERDMP

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Copies data from the emergency dump partition on a disk to a magnetic tape.

NOTE: If the resulting tape is to be read on a UNIX® system, it must be read using the 'dd' input message.

2. FORMAT

COPY:TAPE,EMERDMP,TD="a";

3. EXPLANATION OF MESSAGE

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:TAPE-EMERDMP output message.

(CRAFT FM 01)
COPY:TAPE-IN

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Copies files from a magnetic tape containing full or relative pathnames and header information, and places them in their respective directories. This input message can also print a table of contents of the tape.

WARNING: If the full path was specified in the COPY:TAPE-OUT input message, directory information is retained and the file will be placed in the same directory it was copied from, overwriting any existing version.

NOTE: If the tape to be read was written on a UNIX® system, it must have been written using the cpio message with the -c option.

2. FORMAT

COPY:TAPE,IN,TD="a"[,TOC] | [,BSDIR="b"];

3. EXPLANATION OF MESSAGE

TOC = Table of contents. Prints a list of the files on the tape with their status information. No files are created.

a = Tape special device file name. Refer to Table 3 in the User Guidelines of the Input Messages manual.

b = Pathname of the base directory into which the files on the tape will be copied. Refer to the User Guidelines of the Input Messages manual for definitions of pathname and directory.

NOTE: If the relative path was specified in the COPY:TAPE-OUT input message, the default base directory is /cft/shl/cmds. Use the BSDIR option to specify an alternate base directory.

Remember, the BSDIR option does not apply if the full pathname was specified in the COPY:TAPE-OUT input message. Use the TOC option of COPY:TAPE-IN to determine how a file or list of files, were copied to tape, whether by relative pathnames or by full pathnames.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:TAPE-IN output message.

5. REFERENCES

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Copies one or more files to a magnetic tape, along with full or relative pathnames and header (status) information.

Format 1 is used to copy one or more files with full pathnames. Refer to the User Guidelines of the Input Messages manual for a definition of full pathnames.

WARNING: Use extreme caution when invoking this input message with full pathnames. Reading a tape which contains full pathnames may destroy existing data.

Format 2 is used to copy one or more files with relative pathnames. Refer to the User Guidelines of the Input Messages manual for a definition of relative pathnames.

NOTE: If the resulting tape is to be read on a UNIX® system, it must be read using the 'cpio' input message with the -c options.

2. FORMAT

[1] COPY:TAPE,OUT,TD="a"{,FN="b"|,FLIST="c"};
[2] COPY:TAPE,OUT,TD="a"{,FN="d"|,FLIST="e"},BSDIR="f";

3. EXPLANATION OF MESSAGE

a = Tape special device file name. Refer to Table 3 in the User Guidelines of the Input Messages manual for examples of tape device names.

b = Full pathname of the single file to be written to the tape.

c = Pathname of a file that contains a list of full pathnames of the files to be written to the tape. Used if two or more files are to be written.

d = Relative pathname of the single file to be written to the tape. Specify the base directory with the BSDIR option.

e = Pathname of a relative file that contains a list of pathnames of the files to be written to the tape. Used if two or more files are to be written. Specify the base directory with the BSDIR option.

f = Pathname of the base directory where the file to be copied to tape is located. Relative pathnames are relative to this directory.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:TAPE-OUT output message.

MCC Display Page(s):

(CRAFT FM 01)
COPY:TAPE-TEST

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Writes the diagnostic test tape header block onto a magnetic tape. A demand diagnostic phase for the tape unit verifies the tape has this header block (in low density) before using the tape for testing.

2. FORMAT

COPY:TAPE,TEST,TD="a";

3. EXPLANATION OF MESSAGE

a = Tape special device file name. Select low density and rewind. The diagnostic phase will not accept the tape if the header block is written in high density. Refer to the Summary of Pathnames table in the User Guidelines of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the COPY:TAPE-TEST output message.

5. REFERENCES

Output Message(s):

COPY:TAPE-TEST

Other Manual(s):
235-105-210 Routine Operations and Maintenance

MCC Display Page(s):
(CRAFT FM 01)
COPY:TAPE-TOP

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE
Copies a tape-only program (TOP) file from disk to tape. A TOP file contains writable microcode and the load disk from tape (LDFT) program used for a "deadstart."

2. FORMAT
COPY:TAPE:TOP,TD "a",[COM]!

3. EXPLANATION OF MESSAGE
COM = Option used to create a common TOP tape consisting of both the VLMM TOP file and the 3B21D TOP file.

This option does not copy the standard main memory (SMM) or extended main memory (EMM) TOP file.

If the COM option is specified, the very large main memory (VLMM) TOP file and the 3B21D TOP file are copied from disk to tape, strictly in that order.

If this option is not specified, the TOP file copied to tape will be the one for the current hardware platform. For example, if the current hardware platform is VLMM, /etc/topfile64 or /etc/topfile is copied to tape.

a = Tape special device file name.

4. SYSTEM RESPONSE
PP = Printout follows. Followed by the COPY:TAPE-TOP output message.

5. REFERENCES
Output Message(s):
COPY:TAPE-TOP
1. PURPOSE

Requests that data be copied from virtual addresses in main memory to administrative module (AM) generic access package (GRASP) utility variables as an immediate action.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied.

2. FORMAT

COPY:UID=a,ADDR=b[,OFF=c][,L=d|,NL=e]:UVAR=f[:WORD];

3. EXPLANATION OF MESSAGE

WORD = All addresses, offsets, and lengths are to be interpreted in words, including addresses derived in address chains. If this option is omitted, values given are assumed to be in bytes.

a = The utility ID (UID) of the process from which the source data will be copied.

b = The starting virtual address for the data in decimal, octal, or hexadecimal notation.

c = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified.

d = The length of the copy in bytes unless the WORD option is specified. The maximum is 128 bytes or 32 words. The default is 1 byte or 1 word.

e = The operation will use the locations beginning 'e' lower than the calculated address and ending at the address. The locations are used in ascending order.

f = A GRASP utility variable (1-50), in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session.

4. SYSTEM RESPONSE

?I = General syntax error. May also include:
- EXTRA KEYWORD (UID) = UID is not valid in a WHEN action list.
- EXTRA KEYWORD (UID) = UID is invalid in a breakpoint.
- INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
- INVALID KEYWORD = Destination of ADDR or REG not valid outside of a WHEN action list.
- RANGE ERROR (UID) = Utility ID is out of range.
- RANGE ERROR (UVAR) = Invalid utility variable number was specified.
- RANGE ERROR (L or NL) = Length specified is too long.
- INPUT ERROR (OFF COUNT) = Too many offsets listed.
NG = No good. May also include:
- BAD UID = The UID specified is for a process for which copies are not allowed.

PF = Printout follows. Followed by the COPY:UID output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the communications module processor (CMP), and optionally perform any of the following operations:

<table>
<thead>
<tr>
<th>To perform:</th>
<th>Use:</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment operation</td>
<td>target(1) = value(2) oper=plus value(3)</td>
</tr>
<tr>
<td>decrement operation</td>
<td>target(1) = value(2) oper=minus value(3)</td>
</tr>
<tr>
<td>multiply operation</td>
<td>target(1) = value(2) oper=mult value(3)</td>
</tr>
<tr>
<td>divide operation</td>
<td>target(1) = value(2) oper=div value(3)</td>
</tr>
<tr>
<td>logical AND operation</td>
<td>target(1) = value(2) oper=and value(3)</td>
</tr>
<tr>
<td>logical OR operation</td>
<td>target(1) = value(2) oper=or value(3)</td>
</tr>
<tr>
<td>logical XOR operation</td>
<td>target(1) = value(2) oper=xor value(3)</td>
</tr>
<tr>
<td>logical shift left operation</td>
<td>target(1) = value(2) oper=shl value(3)</td>
</tr>
<tr>
<td>logical shift right operation</td>
<td>target(1) = value(2) oper=shr value(3)</td>
</tr>
<tr>
<td>invert operation</td>
<td>target(1) = value(2) oper=invert</td>
</tr>
</tbody>
</table>

This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

COPY:UT-CMP=a,(MATE|PRIM),{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"|SYMIDX1=f} [,L1=g] [,INDIR1=h] [,OFF1=i[-1[-1[-1]]]],EQ[,EA2], {ADDR2=j|REG2=k|UVAR2=l|GVAR2="m"|SYMIDX2=n|VAL2=o} [,L2=p] [,INDIR2=q] [,OFF2=r[-1[-1]]] [,oper=s] [,EA3] [,ADDR3=t|REG3=u|UVAR3=v|GVAR3="w"|SYMIDX3=x|VAL3=y] [,L3=z] [,INDIR3=a1] [,OFF3=b1[-b1[-b1[-b1]]]]!|;}

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'i' are field one of the copy input message, this field is also described as the target field.

Note: Variables 'j' through 'r' are field two of the copy input message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 's' through 'b1' are field three of the copy input message, this field is also described as the
value(3) field. This field is used together with the arithmetic operator to modify field two of the copy input message.

EA2 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE = Execute this input message on the standby CMP.

PRIM = Execute this input message on the active CMP.

a = CMP number.

b = Address that the value is copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

d = Utility variable (0-14) that the value is copied into.

e = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'r' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

k = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.
1 = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

m = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number ‘n’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

n = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

o = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

p = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

q = Level of indirection (0-3) for the second part of the message. Default is 0.

r = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

s = Legal operator. Valid value(s):
- `and` = Performs logical “and” of the value in field 2 with the value of field 3.
- `div` = Divides the value of field 2 by the value of field 3.
- `invert` = Performs a logical binary inversion of the value in field 2.
- `minus` = Subtracts the value of field 3 from the value of field 2.
- `mult` = Multiplies the value of field 3 with the value of field 2.
- `or` = Performs logical “or” of the value in field 2 with the value of field 3.
- `plus` = Adds the value of field 3 to the value of field 2.
- `shl` = Shifts left the value in field 2 by the value of field 3.
- `shr` = Shifts right the value in field 2 by the value of field 3.
- `xor` = Performs logical “exclusive or” of the value in field 2 with the value of field 3.

t = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

u = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

v = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify
the addressing mode (or value) in the second field of the copy input message.

\( w \) = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘\( x \)’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

\( x \) = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

\( y \) = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

\( z \) = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

\( a^1 \) = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

\( b^1 \) = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

1. PURPOSE

Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the communications module processor (CMP), and optionally perform any of the following operations:

<table>
<thead>
<tr>
<th>To perform:</th>
<th>Use:</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment operation</td>
<td>target(1) = value(2) oper=plus value(3)</td>
</tr>
<tr>
<td>decrement operation</td>
<td>target(1) = value(2) oper=minus value(3)</td>
</tr>
<tr>
<td>multiply operation</td>
<td>target(1) = value(2) oper=mult value(3)</td>
</tr>
<tr>
<td>divide operation</td>
<td>target(1) = value(2) oper=div value(3)</td>
</tr>
<tr>
<td>logical AND operation</td>
<td>target(1) = value(2) oper=and value(3)</td>
</tr>
<tr>
<td>logical OR operation</td>
<td>target(1) = value(2) oper=or value(3)</td>
</tr>
<tr>
<td>logical XOR operation</td>
<td>target(1) = value(2) oper=xor value(3)</td>
</tr>
<tr>
<td>logical shift left operation</td>
<td>target(1) = value(2) oper=shl value(3)</td>
</tr>
<tr>
<td>logical shift right operation</td>
<td>target(1) = value(2) oper=shr value(3)</td>
</tr>
<tr>
<td>invert operation</td>
<td>target(1) = value(2) oper=invert</td>
</tr>
</tbody>
</table>

This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

COPY: UT-CMP=a,(MATE|PRIM),{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"|SYMIDX1=f}[,...,L1=q][,INDIR1=h][,OFF1=i[-i[-i]]],EQ[,EA2],{ADDR2=j|REG2=k|UVAR2=l|GVAR2="m"|SYMIDX2=n|VAL2=o}[,...,L2=p][,...,INDIR2=q][,...,OFF2=r[-r[-r]]][,...,oper=s][,...,EA3][,...,ADDR3=t|REG3=u|UVAR3=v|GVAR3="w"|SYMIDX3=x|VAL3=y][,...,L3=z][,...,INDIR3=a1][,...,OFF3=b1[-b1[-b1]]]();

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'i' are field one of the copy input message, this field is also described as the target field.

Note: Variables 'j' through 'z' are field two of the copy input message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 's' through 'b' are field three of the copy input message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of the copy
input message.

EA2 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE = Execute this input message on the standby CMP.

PRIM = Execute this input message on the active CMP.

a = CMP number.

b = Address that the value is copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into. Name of a specific register whose data is to be dumped. The following registers can be used:

1. If switch CM complex is a Model 3, the registers are general purpose registers GPR0, GPR2-GPR31, SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, integer exception XER, external interrupt mask register EIMR (from module processor), and the system management interrupt mask register SMIMR (from module processor).

2. If switch CM complex is Model 2 or earlier, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, or status register SR.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

d = Utility variable (0-14) that the value is copied into.

e = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘<‘ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the
copy input message.

\( k \) = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. Name of a specific register that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

\( l \) = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

\( m \) = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'n' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

\( n \) = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

\( o \) = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

\( p \) = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

\( q \) = Level of indirection (0-3) for the second part of the message. Default is 0.

\( r \) = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

\( s \) = Legal operator. Valid value(s):

- **and** = Performs logical "and" of the value in field 2 with the value of field 3.
- **div** = Divides the value of field 2 by the value of field 3.
- **invert** = Performs a logical binary inversion of the value in field 2.
- **minus** = Subtracts the value of field 3 from the value of field 2.
- **mult** = Multiplies the value of field 3 with the value of field 2.
- **or** = Performs logical "or" of the value in field 2 with the value of field 3.
- **plus** = Adds the value of field 3 to the value of field 2.
- **shl** = Shifts left the value in field 2 by the value of field 3.
- **shr** = Shifts right the value in field 2 by the value of field 3.
- **xor** = Performs logical "exclusive or" of the value in field 2 with the value of field 3.
t = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

u = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message. Name of register whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy command. The following registers can be used:
1 If switch CM complex is a Model 3, the registers are (general purpose registers GPR0, GPR2-GPR31, SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, XER, external interrupt mask register EIMR, and the system management interrupt mask register SMIMR).
2 If switch CM complex is Model 2 or earlier, the registers are (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR).

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

v = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

w = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'x' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

x = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

y = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

z = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes - 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

a^1 = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

b^1 = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

</tbody>
</table>

Note: This input message is only supported on PIs of the PI2 hardware type.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

COPY:UT:MCTSI=a-b,PI, {ADDR1=c|REG1=d|UVAR1=e|GVAR1="f"|SYMIDX1=g} [,L1=h] [,INDIR1=i] [,OFF1=j[-j][-j][[-j]]],EQ [,EA2], {ADDR2=k|REG2=l|UVAR2=m|GVAR2="n"|SYMIDX2=o|VAL2=p} [,L2=q] [,INDIR2=r] [,OFF2=s[-s][-s][-s]] [,oper=t] [,EA3], {ADDR3=u|REG3=v|UVAR3=w|GVAR3="x"|SYMIDX3=y|VAL3=z} [,L3=a1] [,INDIR3=b1] [,OFF3=c1[-c1][-c1][-c1]]|!|;}

3. EXPLANATION OF MESSAGE

Note: Variables 'c' through 'j' are field one of this input message, this field is also described as the target field.

Note: Variables 'k' through 's' are field two. This field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field.

Note: Variables 't' through 'c1' are field three. This field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two.

EA2 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the second part of this input message.
EA3 = The value that is to be copied is the determined effective address of the message instead of the contents of the address for the third part of this input message.

a = Switching module (SM) number.

b = Side of the module controller/time-slot interchange (MCTSI).

c = Address that the value is copied into.

d = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.

Note: This option of this input message can only be used as part of a generic utilities WHEN input clause.

e = Utility variable (UVAR) (0-14) that the value is copied into.

f = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

i = Level of indirection (0-3) for the first part of the message. Default is 0.

j = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

k = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

l = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

Note: This option of this input message can only be used as part of a generic utilities WHEN input clause.

m = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

n = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'o' must be used to enter this input message using symbolic access.
The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

- Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

- Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field.

- Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

- Level of indirection (0-3) for the second part of the message. Default is 0.

- The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

- The arithmetic operators that can be used. Valid value(s):
  - **and**: Performs logical "and" of the value in field 2 with the value of field 3.
  - **div**: Divides the value of field 2 by the value of field 3.
  - **invert**: Performs a logical binary inversion of the value in field 2.
  - **minus**: Subtracts the value of field 3 from the value of field 2.
  - **mult**: Multiplies the value of field 3 with the value of field 2.
  - **or**: Performs logical "or" of the value in field 2 with the value of field 3.
  - **plus**: Adds the value of field 3 to the value of field 2.
  - **shl**: Shifts left the value in field 2 by the value of field 3.
  - **shr**: Shifts right the value in field 2 by the value of field 3.
  - **xor**: Performs logical "exclusive or" of the value in field 2 with the value of field 3.

- An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

- Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

  **Note:** This option of this input message can only be used as part of a generic utilities WHEN input clause.

- Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

- Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘y’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

- Symbol index number of global variable. The symbol index can be determined for this processor.
by using the DUMP:UT-SYMID input message.

z = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field.

a\(^1\) = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

b\(^1\) = Level of the indirection (0-3) for the third field. Default is 0.

c\(^1\) = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

3. EXPLANATION OF MESSAGE

Note: Variables 'e' through 'l' are field one of the copy input message. This field is also described as the target field.

Note: Variables 'm' through 'u' are field two of the copy input message, this field is also described as the
value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 'v' through 'e' are field three of the copy input message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of the copy input message.

EA2 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Address that the value is copied into.

f = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied into.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

g = Utility variable (UVAR) (0-14) that the value is copied into.

h = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'i' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

i = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

j = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

k = Level of indirection (0-3) for the first part of the message. Default is 0.

l = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

m = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.
n = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

o = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

p = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'q' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

q = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

r = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

s = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2, SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

t = Level of indirection (0-3) for the second part of the message. Default is 0.

u = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

v = Legal operator. Valid value(s):
and = Performs logical "and" of the value in field 2 with the value of field 3.
div = Divides the value of field 2 by the value of field 3.
invert = Performs a logical binary inversion of the value in field 2.
minus = Subtracts the value of field 3 from the value of field 2.
mult = Multiplies the value of field 3 with the value of field 2.
or = Performs logical "or" of the value in field 2 with the value of field 3.
plus = Adds the value of field 3 to the value of field 2.
shl = Shifts left the value in field 2 by the value of field 3.
shr = Shifts right the value in field 2 by the value of field 3.
xor = Performs logical "exclusive or" of the value in field 2 with the value of field 3.

w = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.
**x**
= Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message. 
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

**y**
= Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

**z**
= Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'a' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

**a**
= Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

**b**
= Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

**c**
= Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

**d**
= Level of the indirection (0-3) for the third field of copy input message. Default is 0.

**e**
= The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

### 4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be copied into an address, register, global variable (specified for name or symbol index), or utility variable of the packet switch unit protocol handler (PSUPH), and optionally perform any of the following operations:

<table>
<thead>
<tr>
<th>To perform:</th>
<th>Use:</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment operation</td>
<td>target(1) = value(2) oper=plus value(3)</td>
</tr>
<tr>
<td>decrement operation</td>
<td>target(1) = value(2) oper=minus value(3)</td>
</tr>
<tr>
<td>multiply operation</td>
<td>target(1) = value(2) oper=mult value(3)</td>
</tr>
<tr>
<td>divide operation</td>
<td>target(1) = value(2) oper=div value(3)</td>
</tr>
<tr>
<td>logical AND operation</td>
<td>target(1) = value(2) oper=and value(3)</td>
</tr>
<tr>
<td>logical OR operation</td>
<td>target(1) = value(2) oper=or value(3)</td>
</tr>
<tr>
<td>logical XOR operation</td>
<td>target(1) = value(2) oper=xor value(3)</td>
</tr>
<tr>
<td>logical shift left operation</td>
<td>target(1) = value(2) oper=shl value(3)</td>
</tr>
<tr>
<td>logical shift right operation</td>
<td>target(1) = value(2) oper=shr value(3)</td>
</tr>
<tr>
<td>invert operation</td>
<td>target(1) = value(2) oper=invert</td>
</tr>
</tbody>
</table>

Note: This input message is only supported on PSUPHs of the PH3/PH4 and later hardware types (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

COPY:UT-PSUPH=a-b-c-d, {ADDR1=e | REG1=f | UVAR1=g | GVAR1="h"} ...

3. EXPLANATION OF MESSAGE

Note: Variables 'e' through 'l' are field one of the copy input message. This field is also described as the target field.

Note: Variables 'm' through 'u' are field two of the copy input message, this field is also described as the
value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 'v' through 'e1' are field three of the copy input message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of the copy input message and is optional.

EA2 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Address that the value is copied into.

f = Name of a specific register whose data is to be dumped. The following registers can be used:
- If PSUPH is a PHV5 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.
- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

g = Utility variable (UVAR) (0-14) that the value is copied into.

h = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'i' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

i = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

j = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

k = Level of indirection (0-3) for the first part of the message. Default is 0.
The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

Name of a specific register that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message. The following registers can be used:

- If PSUPH is a PHV5 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.
- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number ‘q’ must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2, SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

Level of indirection (0-3) for the second part of the message. Default is 0.

The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

Legal operator. Valid value(s):

and = Performs logical “and” of the value in field 2 with the value of field 3.
div = Divides the value of field 2 by the value of field 3.
invert = Performs a logical binary inversion of the value in field 2.
minus = Subtracts the value of field 3 from the value of field 2.
mult = Multiplies the value of field 3 with the value of field 2.
or = Performs logical "or" of the value in field 2 with the value of field 3.
plus = Adds the value of field 3 to the value of field 2.
shr = Shifts right the value in field 2 by the value of field 3.
xor = Performs logical "exclusive or" of the value in field 2 with the value of field 3.

w = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

x = Name of register whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy command. The following registers can be used:
   - If PSUPH is a PHV5 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.
   - If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

y = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

z = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'a1' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

a1 = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

b1 = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

c1 = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

d1 = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

e1 = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.
4. SYSTEM RESPONSE
