GROWTH = Print all CM units and SMs in the GROW or SGRO equipage states.

a = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = MMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Synchronous data link controller (SDLC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Office network and timing complex (ONTC) side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = TMS link number, or lower limit of a range of TMS link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = QLPS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = CMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Time multiplexed switch fabric pair (TMSFP) number. For CM2 offices, this parameter is optional, and when entered, must always be TMS fabric pair 0. For CM3 offices, this parameter is required to identify a TMS link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Upper limit of a range of TMS link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Output Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the OP:EQSTAT-CM or OP:EQSTAT-RSMCL output message.

Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests the current status of the enhanced 911 service adjuncts (ESAs).

2. FORMAT

OP:ESA:STATUS;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG  = No good. May also include:
   - NOT AN ESA OFFICE = The request has been denied because the ESAs for the office have not been equipped (E911 OPTION field on RC/V View 8.1 is not ESA).
   - FAILED TO SEND MESSAGE = The request has been denied because the message cannot be sent to the communication module processor (CMP) to process the requested information.
   - FEATURE NOT AVAILABLE = The request has been denied because the dual ESA for E911 (SFID 108) and/or the dual ESA enhancements special feature (SFID 141) have not been purchased.

PF  = Printout follows. Followed by the OP:ESA output message.

RL  = Retry later. May also include:
   - CMP UNAVAILABLE = The message can not be sent. The communications module processor (CMP) is not available.
   - OTHER REQUEST IN PROGRESS = Another ESA request is currently in progress.

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
24.7 (DSL APPLICATION PROCESSOR COMMUNICATION DATA)
44. OP:F
1. PURPOSE

Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.

Format 1 is used to request an output report of performance monitoring counts for a specific DFI facility. This format is used to support early model DFIs such as ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as a DFI-1.)

Format 2 is used to request the current user input message requested ACS on a specified DFAC facility. The OP:FAC output message indicates the DFAC's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DFAC's.)

Format 3 is used to request the current user input message requested ACS on a specified DFI-2 facility. The OP:FAC output message indicates the DFI-2's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DFI-2's.)

Format 4 is used to request the current user input message requested ACS on a specified DLTU2 facility. The OP:FAC output message indicates the DLTU2's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DLTU2's.)

Format 5 is used to request an output report of performance monitoring counts for DFI-2 facilities (DFACs).

Format 6 is used to request an output report of performance monitoring counts for all DFI-2 facilities terminated on a given DFI-2.

Format 7 is used to request an output report of performance monitoring counts for all DFI-2 facilities terminated on a given digital line and trunk unit model 2 (DLTU2).

Format 8 is used to request an output report of performance monitoring counts for an IDCU facility (IFAC).

Format 9 is used to request an output report of performance monitoring counts for all in-service facilities on an IDCU.

Caution: Requesting counts for all facilities on the IDCU will generate four or more pages of ROP output if the IDCU is fully equipped.

Use the conditional option to report only those facilities that have generated an interval alert during the current 15-minute interval or daily alert during the current performance monitoring day.

Format 10 is used to request an output report of performance monitoring counts for all facilities on an IDCU-supported or a DNU-S supported TR303 remote terminal (RT).

Format 11 is used to request the current user input message requested alert control status (ACS) on the specified switching module (SM). (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the SM's current input message requested ACS. Recent changeable alert inhibits for the entire switch (RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]) or individual facilities (RC/V View 20.23 [IDCU FACILITY EQUIPMENT (IFAC)], 20.25 [DNU'S PERFORMANCE MONITORING - THRESHOLD GROUP]
(SM2000)), or 22.15 [PERFORMANCE MONITORING - THRESHOLD GROUP]) override the input message requested 'allows'. Also, input message requested inhibit for the SM overrides any input message requested allows on the DFAC, DFI-2, DLTU2, IDCU, TR303 RTs, IFACs, or DNU-S.

Format 12 is used to request the last user requested ACS on the specified IDCU. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the IDCU's last input message requested ACS. Even though interval and/or daily alerts may be reported as inhibited or allowed for the IDCU, subsequent requests to inhibit/allow reports for TR303 RTs or individual IFACs may have changed the input message alert control status for some of the IDCU's facilities. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.23 and 22.15) override any input message requested 'allows'.

Format 13 is used to request the last user input message requested ACS on the specified TR303 RT. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the RT's last input message requested ACS. Even though interval and/or daily alerts may be reported as inhibited or allowed for the RT, subsequent requests to inhibit/allow reports for the transport unit (such as, IDCU, DNU-S) or individual facilities may have changed the input message alert control status for some or all of the RT's facilities. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.23 and 22.15) override any input message requested 'allows'.

Format 14 is used to request the current user input message requested ACS on the specified IFAC. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the IFACs current input message requested ACS. The status reported for an IFAC represents a summary of all IDCU, TR303 RT and IFAC input message inhibit/allow requests. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.23 and 22.15) override any input message requested 'allows'.

Format 15 is used to request the current user input message requested ACS on the specified DNU-S. The OP:FAC output message indicates the DNU-S's current input message requested ACS.

Format 16 is used to request the current user input message requested ACS on a specified DNU-S SONET termination equipment (STE) facility number. The OP:FAC output message indicates the STE's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the STE's.)

Format 17 is used to request the current user input message requested ACS on a specified DNU-S virtual tributary 1.5 (VT1.5) facility. The OP:FAC output message indicates the VT1.5's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the VT1.5's.)

Format 18 is used to request the current user input message requested ACS on a specified DNU-S digital signal level-1 (DS1) facility. The OP:FAC output message indicates the DS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DS1's.)

Format 19 is used to request an output report of performance monitoring counts for all in-service STE facilities on a DNU-S.

Format 20 is used to request an output report of performance monitoring counts for a specified DNU-S STE facility.

Format 21 is used to request an output report of performance monitoring counts for all in-service VT1.5 facilities on a synchronous transport signal (STS-1) facility (with VT1 request) or all in-service DS1 facilities on an STS-1 facility (with DS1 request).

Caution: Requesting counts for all VT1.5 or DS1 facilities on an STS-1 facility will generate four or more pages of ROP output if all 28 facilities are in-service.
Format 22 is used to request an output report of performance monitoring counts for a specified DNU-S VT1.5 facility.

Format 23 is used to request an output report of performance monitoring counts for a specified DNU-S DS1 facility.

3. EXPLANATION OF MESSAGE
ACS = Report the requested unit's last requested or current alert report inhibit/allow status requested using the input message. Recent changeable alert inhibits may be in effect that override input message requested allows.

BOTH = Report counts from both ends of a facility. If the requested facility has only NE and the BOTH option used, then the request is processed for the NE.

COND = Conditional request. Report only those facilities that have reported a 15-minute threshold crossing during the current interval or a daily threshold crossing during the current day. Refer to the REPT:FAC output message.

CURR = Report all current 15-minute and day counts (default).

FE = Far end. Report counts from the far end of a facility only.

HIST = Report all 32 15-minute interval history counts. Requesting HIST counts will generate 3 or more pages of ROP output to report all 32 history intervals.

NE = Near end. Report counts from the switch end of the facility only.

PREV = Report all previous 15-minute and day counts. The previous 15-minute count is the same count as the first of the 32 history interval counts.

a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DFI-2 facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Integrated digital carrier unit (IDCU) facility (IFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = TR303 RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = STE facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

l = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The input contained an illegal specification.

PF = Printout follows. The request has been accepted and the OP:FAC output message follows.

RL = Retry later. The request has been denied, probably due to system load.

8.1 OFFICE PARAMETERS (MISCELLANEOUS)
20.23 IDCU FACILITY EQUIPMENT (IFAC)
20.25 DNUS PERFORMANCE MONITORING - THRESHOLD GROUP (SM2000)
22.15 PERFORMANCE MONITORING - THRESHOLD GROUP
1. PURPOSE

Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), optical interface unit (OIU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number.

Format 1 is used to request an output report of performance monitoring counts for a specific DFI facility. This format is used to support early model DFIs such as ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as a DFI-1.)

Format 2 is used to request the current user input message requested ACS on a specified DFAC facility. The OP:FAC output message indicates the DFAC's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DFAC's.)

Format 3 is used to request the current user input message requested ACS on a specified DFI-2 facility. The OP:FAC output message indicates the DFI-2's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DFI-2's.)

Format 4 is used to request the current user input message requested ACS on a specified DLTU2 facility. The OP:FAC output message indicates the DLTU2's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DLTU2's.)

Format 5 is used to request an output report of performance monitoring counts for DF1-2 facilities (DFACs).

Format 6 is used to request an output report of performance monitoring counts for all DF1-2 facilities terminated on a given DFI-2.

Format 7 is used to request an output report of performance monitoring counts for all DF1-2 facilities terminated on a given digital line and trunk unit model 2 (DLTU2).

Format 8 is used to request an output report of performance monitoring counts for an IDCU facility (IFAC).

Format 9 is used to request an output report of performance monitoring counts for all in-service facilities on an IDCU.

Caution: Requesting counts for all facilities on the IDCU will generate four or more pages of ROP output if the IDCU is fully equipped.

Use the conditional option to report only those facilities that have generated an interval alert during the current 15-minute interval or daily alert during the current performance monitoring day.

Format 10 is used to request an output report of performance monitoring counts for all facilities on an IDCU-supported or a DNU-S supported TR303 remote terminal (RT).

Format 11 is used to request the current user input message requested alert control status (ACS) on the specified switching module (SM). (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the SM's current input message requested ACS. Recent changeable alert inhibits for the entire switch (RC/V View 8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]) or individual facilities (RC/V View 20.23 [IDCU FACILITY EQUIPMENT (IFAC)], 20.25 [DNU S PERFORMANCE MONITORING - THRESHOLD GROUP])
(SM2000)], or 22.15 [PERFORMANCE MONITORING - THRESHOLD GROUP]) override the input message requested 'allows'. Also, input message requested inhibit for the SM overrides any input message requested allows on the DFAC, DFI-2, DLTU2, IDCU, TR303 RTs, IFACs, DNU-S, or OIU.

Format 12 is used to request the last user requested ACS on the specified IDCU. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the IDCU's last input message requested ACS. Even though interval and/or daily alerts may be reported as inhibited or allowed for the IDCU, subsequent requests to inhibit/allow reports for TR303 RTs or individual IFACs may have changed the input message alert control status for some of the IDCU's facilities. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.23 and 22.15) override any input message requested 'allows'.

Format 13 is used to request the last user input message requested ACS on the specified TR303 RT. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the RT's last input message requested ACS. Even though interval and/or daily alerts may be reported as inhibited or allowed for the RT, subsequent requests to inhibit/allow reports for the transport unit (such as, IDCU, DNU-S) or individual facilities may have changed the input message alert control status for some or all of the RT's facilities. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.23 and 22.15) override any input message requested 'allows'.

Format 14 is used to request the current user input message requested ACS on the specified IFAC. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the IFACs current input message requested ACS. The status reported for an IFAC represents a summary of all IDCU, TR303 RT and IFAC input message inhibit/allow requests. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.23 and 22.15) override any input message requested 'allows'.

Format 15 is used to request the current user input message requested ACS on the specified DNU-S. The OP:FAC output message indicates the DNU-S's current input message requested ACS.

Format 16 is used to request the current user input message requested ACS on a specified DNU-S SONET termination equipment (STE) facility number. The OP:FAC output message indicates the STE's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the STE's.)

Format 17 is used to request the current user input message requested ACS on a specified DNU-S virtual tributary 1.5 (VT1.5) facility. The OP:FAC output message indicates the VT1.5's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the VT1.5's.)

Format 18 is used to request the current user input message requested ACS on a specified DNU-S digital signal level-1 (DS1) facility. The OP:FAC output message indicates the DS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DS1's.)

Format 19 is used to request an output report of performance monitoring counts for all in-service STE facilities on a DNU-S.

Format 20 is used to request an output report of performance monitoring counts for a specified DNU-S STE facility.

Format 21 is used to request an output report of performance monitoring counts for all in-service VT1.5 facilities on a synchronous transport signal (STS-1) facility (with ALLVT1 request) or all in-service DS1 facilities on an STS-1 facility (with ALLDS1 request).

Caution: Requesting counts for all VT1.5 or DS1 facilities on an STS-1 facility will generate four or more pages of ROP output if all 28 facilities are in-service.
Format 22 is used to request an output report of performance monitoring counts for a specified DNU-S VT1.5 facility.

Format 23 is used to request an output report of performance monitoring counts for a specified DNU-S DS1 facility.

Format 24 is used to request the current user input message requested ACS on the specified OIU. The OP:FAC output message indicates the OIU's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the OIU's.)

Format 25 is used to request the current user input message requested ACS on a specified OIU optical carrier level 3 (OC3) facility number. The OP:FAC output message indicates the OC3's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the OC3's.)

Format 26 is used to request the current user input message requested ACS on a specified OIU synchronous transport signal level 1 (STS1) facility. The OP:FAC output message indicates the STS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the STS1's.)

Format 27 is used to request the current user input message requested ACS on a specified OIU virtual tributary 1.5 (VT1.5) facility. The OP:FAC output message indicates the VT1.5's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the VT1.5's.)

Format 28 is used to request the current user input message requested ACS on a specified OIU digital signal level 1 (DS1) facility. The OP:FAC output message indicates the DS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DS1's.)

Format 29 is used to request an output report of performance monitoring counts for the selected side, in-service OC3 facilities for each protection group on an OIU.

Format 30 is used to request an output report of performance monitoring counts for all in-service VT1.5 facilities on an STS-1 facility (with ALLVT1 request) or all in-service DS1 facilities on an STS-1 facility (with ALLDS1 request).

Caution: Requesting counts for all VT1.5 or DS1 facilities on an STS-1 facility will generate four or more pages of ROP output if all 28 facilities are in-service.

3. EXPLANATION OF MESSAGE

**ACS**
= Report the requested unit’s last requested or current alert report inhibit/allow status requested using the input message. Recent changeable alert inhibits may be in effect that override input message requested allows.

**BOTH**
= Report counts from both ends of a facility. If the requested facility has only NE and the BOTH option used, then the request is processed for the NE.

**COND**
= Conditional request. Report only those facilities that have reported a 15-minute threshold crossing during the current interval or a daily threshold crossing during the current day. Refer to the REPT:FAC output message.

**CURR**
= Report all current 15-minute and day counts (default).

**FE**
= Far end. Report counts from the far end of a facility only.

**HIST**
= Report all 32 15-minute interval history counts. For OIU facilities, report all 31 15-minute history counts (the previous 15-minute count is not included in the history interval counts for OIU facilities).

Requesting HIST counts will generate 3 or more pages of ROP output to report all of the history intervals.

**NE**
= Near end. Report counts from the switch end of the facility only.

**PREV**
= Report all previous 15-minute and day counts. The previous 15-minute count is the same count as the first of the 32 history interval counts for non-OIU facilities. For OIU facilities, the previous 15-minute count is not included with the history interval counts.

a  = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = DFI-2 facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Integrated digital carrier unit (IDCU) facility (IFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = TR303 RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = STE facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = OC3 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = STS1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The input contained an illegal specification.

PF = Printout follows. The request has been accepted and the OP:FAC output message follows.

RL = Retry later. The request has been denied, probably due to system load.

5. REFERENCES

Input Message(s):

ALW:FAC
INH:FAC
INIT:FAC
OP:FAC-C

Software Release: 5E16(2) and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests output of the contents of the performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), integrated digital carrier unit (IDCU), optical interface unit (OIU), or a digital networking unit - synchronous optical network (SONET) (DNU-S) number. Also requests output of the PM measurement data for packet protocol layers associated with a session initiation protocol (SIP) protocol handler (PH).

The command is also used to request output of the vacant DS1 trunking facilities terminated on a digital line and trunk unit (DLTU), peripheral control and timing (PCT) line and trunk unit (PLTU), DNU-S, or OIU.

Format 1 is used to request an output report of performance monitoring counts for a specific DFI facility. This format is used to support early model DFIs such as ANN1, ANN3(B), and so forth. (Such a DFI is sometimes known as a DFI-1.)

Format 2 is used to request the current user input message requested ACS on a specified DFAC facility. The OP:FAC output message indicates the DFAC's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DFAC's.)

Format 3 is used to request the current user input message requested ACS on a specified DFI-2 facility. The OP:FAC output message indicates the DFI-2's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DFI-2's.)

Format 4 is used to request the current user input message requested ACS on a specified DLTU2 facility. The OP:FAC output message indicates the DLTU2's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DLTU2's.)

Format 5 is used to request an output report of performance monitoring counts for DFI-2 facilities (DFACs).

Format 6 is used to request an output report of performance monitoring counts for all DFI-2 facilities terminated on a given DFI-2.

Format 7 is used to request an output report of performance monitoring counts for all DFI-2 facilities terminated on a given digital line and trunk unit model 2 (DLTU2).

Format 8 is used to request an output report of performance monitoring counts for an IDCU facility (IFAC).

Format 9 is used to request an output report of performance monitoring counts for all in-service facilities on an IDCU.

CAUTION: Requesting counts for all facilities on the IDCU will generate four or more pages of ROP output if the IDCU is fully equipped.

Use the conditional option to report only those facilities that have generated an interval alert during the current 15-minute interval or daily alert during the current performance monitoring day.

Format 10 is used to request an output report of performance monitoring counts for all facilities on an IDCU-supported or a DNU-S supported TR303 remote terminal (RT).

Format 11 is used to request the current user input message requested alert control status (ACS) on the specified
switching module (SM). (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the SM's current input message requested ACS. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V View 20.23, 20.25, 20.32 or 22.15) override the input message requested 'allows'. Also, input message requested inhibit for the SM overrides any input message requested allows on the DFAC, DFI-2, DLTU2, IDCU, TR303 RTs, IFACs, DNU-S, OIU or SIP-T PHs.

Format 12 is used to request the last user requested ACS on the specified IDCU. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the IDCU's last input message requested ACS. Even though interval and/or daily alerts may be reported as inhibited or allowed for the IDCU, subsequent requests to inhibit/allow reports for TR303 RTs or individual IFACs may have changed the input message alert control status for some of the IDCU's facilities. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.15 and 20.23) override any input message requested 'allows'.

Format 13 is used to request the last user input message requested ACS on the specified TR303 RT. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the RT's last input message requested ACS. Even though interval and/or daily alerts may be reported as inhibited or allowed for the RT, subsequent requests to inhibit/allow reports for the transport unit (such as, IDCU, DNU-S) or individual facilities may have changed the input message alert control status for some or all of the RT's facilities. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.15 and 20.23) override any input message requested 'allows'.

Format 14 is used to request the current user input message requested ACS on the specified IFAC. (The REPT:FAC output message describes the alert report.) The OP:FAC output message indicates the IFACs current input message requested ACS. The status reported for an IFAC represents a summary of all IDCU, TR303 RT and IFAC input message inhibit/allow requests. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V Views 20.15 and 20.23) override any input message requested 'allows'.

Format 15 is used to request the current user input message requested ACS on the specified DNU-S. The OP:FAC output message indicates the DNU-S's current input message requested ACS.

Format 16 is used to request the current user input message requested ACS on a specified DNU-S SONET termination equipment (STE) facility number. The OP:FAC output message indicates the STE's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the STE's.)

Format 17 is used to request the current user input message requested ACS on a specified DNU-S virtual tributary 1.5 (VT1.5) facility. The OP:FAC output message indicates the VT1.5's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the VT1.5's.)

Format 18 is used to request the current user input message requested ACS on a specified DNU-S digital signal level-1 (DS1) facility. The OP:FAC output message indicates the DS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DS1's.)

Format 19 is used to request an output report of performance monitoring counts for all in-service STE facilities on a DNU-S.

Format 20 is used to request an output report of performance monitoring counts for a specified DNU-S STE facility.

Format 21 is used to request an output report of performance monitoring counts for all in-service VT1.5 facilities on a synchronous transport signal (STS-1) facility (with ALLVT1 request) or all in-service DS1 facilities on an STS-1 facility (with ALALLDS1 request).

**CAUTION:** Requesting counts for all VT1.5 or DS1 facilities on an STS-1 facility will generate four or more pages of
ROP output if all 28 facilities are in-service.

Format 22 is used to request an output report of performance monitoring counts for a specified DNU-S VT1.5 facility.

Format 23 is used to request an output report of performance monitoring counts for a specified DNU-S DS1 facility.

Format 24 is used to request the current user input message requested ACS on the specified OIU. The OP:FAC output message indicates the OIU's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the OIU's.)

Format 25 is used to request the current user input message requested ACS on a specified OIU optical carrier level 3 (OC3) facility number. The OP:FAC output message indicates the OC3's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the OC3's.)

Format 26 is used to request the current user input message requested ACS on a specified OIU synchronous transport signal level 1 (STS1) facility. The OP:FAC output message indicates the STS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the STS1's.)

Format 27 is used to request the current user input message requested ACS on a specified OIU virtual tributary 1.5 (VT1.5) facility. The OP:FAC output message indicates the VT1.5's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the VT1.5's.)

Format 28 is used to request the current user input message requested ACS on a specified OIU digital signal level 1 (DS1) facility. The OP:FAC output message indicates the DS1's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the DS1's.)

Format 29 is used to request an output report of performance monitoring counts for the selected side, in-service OC3 facilities for each protection group on an OIU.

Format 30 is used to request an output report of performance monitoring counts for a specified OC3 facility on an OIU.

Format 31 is used to request an output report of performance monitoring counts for a specified STS1 facility on an OIU.

Format 32 is used to request an output report of performance monitoring counts for a specified VT1.5 facility on an OIU.

Format 33 is used to request an output report of performance monitoring counts for a specified DS1 facility on an OIU.

Format 34 is used to request an output report of performance monitoring counts for all in-service VT1.5 facilities on a synchronous transport signal (STS-1) facility (with ALLVT1 request) or all in-service DS1 facilities on an STS-1 facility (with ALLDS1 request).

**CAUTION:** Requesting counts for all VT1.5 or DS1 facilities on an STS-1 facility will generate four or more pages of ROP output if all 28 facilities are in-service.

Format 35 is used to request the current user input message requested ACS on a specified OIU optical carrier level 3 concatenated (OC3C) facility number. The OP:FAC output message indicates the OC3C's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the OC3C's.)
Format 36 is used to request the current user input message requested ACS on a specified OIU synchronous transport signal level 3 concatenated (STS3C) facility. The OP:FAC output message indicates the STS3C's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the STS3C's.)

Format 37 is used to request an output report of performance monitoring counts for a specified OC3C facility on an OIU.

Format 38 is used to request an output report of performance monitoring counts for a specified STS3C facility on an OIU.

Format 39 is used to request an output report of the vacant DS1 trunking facilities on DLTU, PLTU, DNU and OIU.

Format 40 is used to request the current user input message requested ACS on a specified OIU PPP link (PPPLK). The OP:FAC output message indicates the PPPLK's current input message requested ACS. (If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the PPPLK's.)

Format 41 is used to request an output report of performance monitoring counts for a protocol layer or protocol layers associated with the specified OIU PPP link. If no protocol layer is specified, performance monitoring counts for all protocol layers associated with the PPP link will be output. A request for history performance monitoring counts will only be allowed if counts for a specific protocol layer are to be output. A request for performance monitoring counts for all protocol layers will not allow the history count option.

Format 42 is used to request an output report of performance monitoring counts for the extended access interface unit (EAIU) timeslot group (TSGRP).

Format 43 is used to request the current ACS on the specified PSU. If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the PSU's. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V View 20.32) override any input message requested 'allows'.

Format 44 is used to request the current ACS on a specified SIP PH (other PHs are not allowed). If the ACS is inhibited for the entire SM, the OP:FAC output message will indicate the SM's current ACS rather than the SIP PH's. Recent changeable alert inhibits for the entire switch (RC/V View 8.1) or individual facilities (RC/V View 20.32) override any input message requested 'allows'.

Format 45 is used to request the performance monitoring counts for a protocol layer associated with the specified SIP PH. If no protocol layer is specified, performance monitoring counts for all protocol layers associated with the SIP PH will be output. A request for history performance monitoring counts will only be allowed if counts for a specific protocol layer are to be output. A request for performance monitoring counts for all protocol layers will not allow the history count option.

3. EXPLANATION OF MESSAGE

ACS = Report the requested unit’s last requested or current alert report inhibit/allow status requested using the input message. Recent changeable alert inhibits may be in effect that override input message requested allows.

COND = Conditional request. Report only those facilities that have reported a 15-minute threshold crossing during the current interval or a daily threshold crossing during the current day. Refer to the REPT:FAC output message.

CURR = Report all current 15-minute and day counts (default).

HIST = Report all 32 15-minute interval history counts. For OIU facilities, report all 31 15-minute history counts (the previous 15-minute count is not included in the history interval counts for OIU facilities). Requesting HIST counts will generate 3 or more pages of ROP output to report all of the history intervals.

PREV = Report all previous 15-minute and day counts. The previous 15-minute count is the same count as the first of the 32 history interval counts for non-OIU facilities. For OIU facilities, the previous 15-minute count is not included with the history interval counts.

VAC = Report vacant DS1 trunking facilities.

a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DFI-2 facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Integrated digital carrier unit (IDCU) facility (IFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = TR303 RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = STE facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = OC3 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = STS1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = OC3C number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = STS3C number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Type of report counts. Valid value(s):
   BOTH = Report counts from both ends of a facility. If the requested facility has only NE or only FE and the BOTH option is used, then the request is processed for only the available option.
   FE = Far end. Report counts from the far end of a facility only.
   NE = Near end. Report counts from the switch end of the facility only.

v = Protocol layer. Valid value(s):
   ICMP = Internet control message protocol layer.
   IP = Internet protocol layer.
   PPP = Point-to-point protocol layer.
   RTP = Real-time transport protocol layer.
   UDP = User datagram protocol layer.
Switching module (SM) number or lower limit of a range of SM numbers.

Upper limit of a range of SM numbers.

EAIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Common data and control controller (COMDAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

TSGRP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

SIP protocol layer. Valid value(s):

- ETH = Ethernet link layer.
- ICMP = Internet control message protocol layer.
- IP = Internet protocol layer.
- SCTP = Stream control transmission protocol layer.
- SIP = Session initiation protocol layer.

4. SYSTEM RESPONSE

NG = No good. The input contained an illegal specification.

PF = Printout follows. The request has been accepted and the OP:FAC output message follows.

RL = Retry later. The request has been denied, probably due to system load.

1. PURPOSE

Request output containing the busy/idle status of umbilical T1 facility channels between a host switching module (HSM) and remote switching module (RSM). This message does not support intercluster link (ICL) facilities.

2. FORMAT

OP:FACMAP,FAC=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Facility (FAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - DATABASE READ FAILURE = Failure in reading database for this facility.
   - FACILITY IS NOT AN UMBILICAL FACILITY = Facility is not an HSM to/from an RSM umbilical facility.
   - UNIT DOES NOT EXIST = Bad DLTU number.

PF = Printout follows. The request has been accepted and is being processed. The OP:FACMAP output message will follow.

RL = Retry later.

OP:FNAME

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Reports the full pathname of a file in a mounted file system. This input message, used to analyze data produced by the FSBLK and FSLINK file system audits, provides pathnames based on the entry of inode or block numbers.

2. FORMAT

OP:FNAME,FN="a", {INODE|BLOCK}=b[&c];

3. EXPLANATION OF MESSAGE

a = The full pathname of the file system. Note that quotation marks are required.

b = Inode or block number; or the lower limit of a range (0-546048) of inode or block numbers.

Note: If an INODE number is specified, the minimum value of 'b' is two.

c = The upper limit of a range of inode or block number of a range (0-546048).

4. SYSTEM RESPONSE

Entry of this message may produce one or more of the following system responses. RL responses will only appear if the input message catalog is not active.

RL = Retry later. May also include:

- CANNOT CHANGE DIRECTORY TO /dev = Unable to change working directory to /dev.
- CANNOT FIND FILE SYSTEM = Unable to find the first directory of the mounted file system.
- CANNOT OPEN FILE SYSTEM = Cannot open the file system at its mount point.
- CANNOT READ SUPERBLOCK = Unable to read the superblock for the file system.
- CANNOT SEEK TO SUPERBLOCK = Unable to seek to the file system’s superblock.
- MOUNT TABLE ERROR = Unable to obtain the mount table from the file manager.

?D =

- INCONSISTENT DATA1 = The greater value must be equal to or larger than the lower value in the range.
- INVALID CHARACTER1 = The first or only range value is not an integer.
- INVALID CHARACTER2 = The last range value is not an integer.
- INVALID KEYWORD 1 = FN must be the first keyword.
- INVALID KEYWORD 2 = INODE or BLOCK must be the second keyword.
- MISSING DATA1 = No file system name given.
- MISSING DATA2 = No inode or block # given.
- MISSING KEYWORD 1 = FN must appear after FNAME.
- MISSING KEYWORD 2 = Either INODE or BLOCK must be entered.
- RANGE ERROR 1, 'a' = File system requested does not exist. 'a' is the value entered.
- RANGE ERROR 4 = Reason for error:
- The lower or only INODE value is less than two.
- The greater or only INODE value is larger than the maximum allowed in the file system.

- RANGE ERROR 5 = The greater or only BLOCK value is larger than the maximum allowed in the file system.
- RANGE ERROR 6 = The lower or only BLOCK value is less than the minimum allowed in the file system.

OP:G-READHDR

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5
Type: Input

1. PURPOSE

Requests that tape header information and, if present, a volume table of contents (VTOC) be read from a load-disk-from-tape (LDFT) formatted tape and output to the receive-only printer (ROP). The data is also written to a file in the /etc/log directory. The data file is used during a software release transition for tape loading.

2. FORMAT

OP:GEN:READHDR[,MT0|MT1|,RESET];

3. EXPLANATION OF MESSAGE

MT0 = Select tape drive zero (default).
MT1 = Select tape drive one.
RESET = Remove the data file written by a previous OP:G-READHDR request from the /etc/log directory.

4. SYSTEM RESPONSE

NG = No good. The request was denied because of an illegal option, or illegal combination of options.
PF = Printout follows.

   OP:GROW
46. OP:H
OP:HDWCHK-A

Software Release: 5E14 only
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a printout of the hardware check status of the specified unit or set of units.

2. FORMAT

\[ \text{OP:HDWCHK, \{CM|MPCU=a|MMP=a-b|CMP=a-b|QGP=a-b|FPC=a|PPC=a|ONTC=c\} NCREF,\{XC=c|PRIM=c|SEC=c|REFf=c\}|CLNK=d-c-e-a}; \]

3. EXPLANATION OF MESSAGE

- **CM** = Provide the hardware check status for all of the above communication module (CM) units that are in service but have hardware checks inhibited.
- **a** = (MSCU) Message switch number for message switch control unit, (MMP) module message processor, (CMP) communication module processor, (QGP) quad-link packet switch gateway processor, (FPC) foundation peripheral controller, (PPC) pump peripheral controller, or (CLNK) communication link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Unit number.
- **c** = Office network and timing complex (ONTC) number for ONTC, cross-couple reference (XC), primary reference (PRIM), secondary reference (SEC), or CLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Switching module (SM) number for CLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = Type of module message processor for CLNK. Valid value(s):
  - 0 = MMP handling the even control time slot associated with the SM.
  - 1 = MMP handling the odd control time slot associated with the SM.
- **f** = Network clock reference number.

4. SYSTEM RESPONSE

- **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
- **PF** = Printout follows. Followed by the OP:HDWCHK output message.

235-105-250  System Recovery Procedures
OP:HIST

Software Release: 5E14 and later
Command Group: NOCHK
Application: 5
Type: Input

1. PURPOSE

The OP:HIST input request prints a range of the stored requests from the history buffer to the terminal. OP:HIST gives the user the ability to review a section of the stored requests available in the command history buffer, and identify their associated numbers. The user may then recall a stored request using the associated number.

OP:HIST will be honored if any portion of the applicable range is available in the command history buffer. This permits the user to hunt for a stored request without having to be completely within the available range of associated numbers.

Format 1 outputs the last 15 of the available stored requests.

Format 2 outputs the available stored requests from the specified range of 'a' to 'b'. The 'b' parameter is optional. If only the 'a' parameter is given, the range will be 'a' to 'a'+15.

Format 3 outputs the last 'c' of the available stored requests. If fewer than 'c' requests are available, the request is applied to the available ones.

Format 4 outputs all of the available stored requests. This can be up to 200 requests, so discretion is advised. For additional information about the use of the history function, refer to the "Input Message Edit and History" portion of the USER GUIDELINES section of the Input Messages manual.

2. FORMAT

[1] OP:HIST;
[2] OP:HIST, CMD=a[&&b];

3. EXPLANATION OF MESSAGE

a = Lowest associated number for requested range.
b = Highest associated number for requested range (optional).
c = Number of most recently stored requests to output.
d = Lowest number of the available range.
e = Highest number of available range.

4. SYSTEM RESPONSE

NG = No good. The requests could not be output, the request is rejected. Rejection reasons are:
- FILE OPEN FAILURE = The output file could not be opened.
- NO COMMANDS ARE STORED = There are no stored input requests.
- RANGE UNAVAILABLE, CMD d TO e = The range requested does not have any intersection with the available associated number range. The available range is given to aid the user for another attempt.

PF = Printout follows. The request was accepted and is followed by the OP:HIST output message.

5. REFERENCES

Input Message(s):

ALW:HIST
CLR:HIST
INH:HIST

Output Message(s):

OP:HIST
OP:HISTORY-A

Software Release: 5E14 only
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests the printing of the most recently retained (logged) output reports and/or the event history from the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or from the specified packet switching unit protocol handler (PSUPH). The desired PSUPH may also be referenced by its currently associated channel group (CHNG). If RCVY is specified, then the recovery output report history will be printed. If EVENT is specified, then the event history will be printed. If neither RCVY nor EVENT are specifically requested, then by default both will be printed. However, event history dumps are not supported on PIs of hardware type PI1 or on PSUPHs of hardware type PH2.

The print mode of the PSUPH or PI may be changed through this message as well. Once the print mode of a PSUPH or PI is set to "ON", the unit’s output reports will be printed on the receive-only printer (ROP) until manually changed or until 48 hours have elapsed without a PI or PSUPH’s print mode change of "ON".

For PH hardware types other than PH2, this will also generate the PH event history report. For PI2 hardware type of packet interface (PI), this will also generate the PI event history report.

2. FORMAT

OP:HISTORY, {PSUPH=a-b-c-d | CHNG=a-b-c-e | MCTSI=a-f, PI} [,RCVY] [,EVENT] [,PRNTMODE={ON|OFF}];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Switching module (SM) number.
b = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = PSUPH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = CHNG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = MCTSI side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress. The input message was accepted and the printing of the requested history is in
progress.

NG = No good. The input message was not accepted because the SM is isolated or the equipment does not exist.

NO = Feature not available. The requested action failed because the feature required to process the request is not present in the module.

REPT: PP-EM

Input Appendix(es):

APP: RANGES
OP: HISTORY-C

Software Release: 5E18(1) and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Format 1 requests the printing of the most recently retained (logged) output reports and/or the event history from the specified packet interface (PI) of the module controller time slot interchanger (MCTSI), or from the specified packet switching unit protocol handler (PSUPH).

The desired PSUPH may also be referenced by its currently associated channel group (CHNG). If RCVY is specified, then the recovery output report history will be printed. If EVENT is specified, then the event history will be printed. If neither RCVY nor EVENT are specifically requested, then by default both will be printed. However, event history dumps are not supported on PIs of hardware type PI1 or on PSUPHs of hardware type PH2.

The print mode of the PSUPH or PI may be changed through this message as well. Once the print mode of a PSUPH or PI is set to "ON", the unit’s output reports will be printed on the ROP until manually changed.

For PH hardware types other than PH2, this will also generate the PH event history report. For PI2 hardware type of packet interface (PI), this will also generate the PI event history report.

Format 2 is applicable only for the enhanced packet switching unit (PSU2E), and requests the printing of the most recently retained event history from either the specified control fanout (CF) or the packet fanout (PF) unit on the PSU2E common board (PSUCOM). One can specify the number of desired events to print using the EVCNT field. If EVCNT is not specified, 21 events (3 message blocks) will be printed.

2. FORMAT

[1] OP:HISTORY,{PSUPH=a-b-c-d|CHNG=a-b-c-e|MCTSI=a-f ,PI}. . .[,]RCVY[,]EVENT[,]PRNTMODE={ON|OFF}];

[2] OP:HISTORY,PSUCOM=a-b-g, {CF|PF=h},[EVCNT=i];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switching unit (PSU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c = PSU shelf number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

d = PSUPH number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
e  = CHNG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = MCTSI side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = PSUCOM side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = PF shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i  = Number of PF3/CF3 events to be printed. Default value = 21. Range is from 1 to 255.

4. SYSTEM RESPONSE

 IP  = In progress. The input message was accepted and the printing of the requested history is in progress.

 NG = No good. The input message was not accepted because the SM is isolated or the equipment does not exist.

 NO = Feature not available. The requested action failed because the feature required to process the request is not present in the module.

1. PURPOSE

Requests inventory data be printed for circuit packs residing on an optical interface unit (OIU) or access interface unit (AIU).

Format 1 requests inventory data for all optical facility interface (OFI) circuit packs on a given OIU or switching module (SM).

Format 2 requests inventory data for all circuit packs on a given AIU.

2. FORMAT

[1] OP:INVEN,SM=a,OIU={b|ALL};

[2] OP:INVEN,SM=a, AIU=b;

3. EXPLANATION OF MESSAGE

ALL = print data for all OIUs on a given SM.

a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and an OP:INVEN output message will follow.

NG = No good. May also include:

- NO SUCH SM = The message syntax is valid, but the requested SM does not exist.
- SM UNEQ = The message syntax is valid, but the requested SM is unequipped.
- INVALID SM = The message syntax is valid, but the requested SM is a classic SM.
- UNIT UNEQ = The message syntax is valid, but the requested unit is unequipped.

RL = Retry later. The request cannot be executed now due to a loss of communication to the requested SM.

235-105-220  Corrective Maintenance
OP:IODRV

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Reports the current options set for the administrative module (AM) input/output processor (IOP) driver messages.

Note: If none of the options is specified, this message will report all of the severity level option settings, the handler identification option setting, and the class option settings that are turned on, and whether MSGSAVE is ON or OFF.

2. FORMAT

OP:IODRV[:[LVL][,ID][,CLASS][,MSGSAVE]];

3. EXPLANATION OF MESSAGE

CLASS  = Report the class option setting.
ID  = Report the handler identification option setting.
LVL  = Report the severity level option setting.
MSGSAVE  = Report whether or not IOP error messages are being saved in the IODRVLOG logfile.

4. SYSTEM RESPONSE

NG  = No good. Process not initiated.
PF  = Printout follows. Followed by the OP:IODRV output message.

5. REFERENCES

Output Message(s):

OP:IODRV

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE
Requests specific information about an IOP member number.

2. FORMAT

OP:IOP a;INFO!

3. EXPLANATION OF MESSAGE

a  IOP member number.

4. SYSTEM RESPONSE

PF  Printout follows. Followed by the OP:IOP output message.

5. REFERENCES

Output Message(s):

OP:IOP
OP:IPCFG

Software Release: 5E16(2) and later
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the output of IP address and subnet mask configuration information matching the following specified characteristics. These include:

- The entire office.
- A specific SM.
- A specific IP address.
- A specific network identifier.

Output will include the SM, IP address, subnet mask, network ID, equipment and interface type. The equipment information displayed depends on the equipment type. It includes the unit type, unit number and protection group for OIU-IP facilities. For PHs, the output includes the PSU number, PSU shelf, channel group (PH number) and processor group (for SIP PHs). The interface type indicates if the IP address is used internally (for example, SM/PH processor IP assignments on the 5ESS® switch) or if the address is associated with external interfaces (OC-3c, ethernet, X.25).

Only one OP:IPCFG request may be processed by the system at any moment. Additional requests will be denied.

WARNING: Requesting this message may cause an enormous amount of data to be printed on the ROP. The use of any format could cause a degradation in switch service.

The input message, STP:IPCFG, can be used to halt the printing of this input message should system operation be impacted by this message.

2. FORMAT

[1] OP:IPCFG,OFFICE;

3. EXPLANATION OF MESSAGE

a = SM number. Search for IP configuration information is restricted to specified SM. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = IP address. Consisting of a hyphen separated decimal number with a maximum of 15 characters.
This is the internet protocol address. Its format is \( xxx-xxx-xxx-xxx \) where \( xxx \) ranges from 0 to 255.

c = Network ID. Refer to APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and an OP:IPCFG output message will follow.

RL = Retry later. May also include:
- FAILED TO CREATE PROCESS = The process that would service the request could not be created, or did not receive the request, probably due to system load.
- REQUEST ALREADY IN PROGRESS = An OP:IPCFG request is already running. Only one request is allowed to run at a time.
- TOO MANY PROCESSES ACTIVE = A process to service the request cannot be created because the maximum number of active maintenance processes has been reached.

48. OP:J
OP:JOBSTATUS-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a report of the status of all terminal maintenance jobs initiated through the trunk and line work station (TLWS) maintenance automatic task administrator or the Autoplex® automatic task administrator (AATA) currently active in the system. If the job type (JOB) is omitted, the default job type is TLWS.

2. FORMAT

OP:JOBSTATUS[,JOB=a];

3. EXPLANATION OF MESSAGE

a = Job type. Valid value(s):
   AATA = AATA maintenance task.
   TLWS = TLWS maintenance task.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by the OP:JOBSTATUS output message.
RL = Retry later. The request has been denied, probably due to system load.

Output Message(s):

OP:JOBSTATUS
49. OP:L
OP:LASSRQST-A
Software Release: 5E14 only
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests local area signaling services (LASS) screen list editing (SLE) validation of a ten-digit directory number (DN). A LASS user can add a DN to a list after the DN passes certain validation checks. A caller whose number appears in the list is then given special treatment based on the LASS selective features (LSF) the user has activated.

This input message performs the validation checks to assist in diagnosing validation failures.

2. FORMAT

OP:LASSRQST,DN=a[,LATA=b][,OPC=c];

3. EXPLANATION OF MESSAGE

a = The ten-digit DN to be validated.

b = An optional three digit absolute local access transport area (LATA) number (100-999). The TCAP improvements feature for a switch spanning multiple LATAs must be purchased for this option to work.

c = Origination point code consisting of nine digit character string. Refer to the APP:POINT-CODE appendixes in the Appendixes section of the Input Messages manual.

Note: This option is mandatory in a multi-platform office.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
- DN MUST BE 10 DIGITS = DN entered must have ten digits. Each digit must be a numeric character from 0 to 9.
- GSM/PROTOCOL MISMATCH = The GSM and the protocol do not match, missing or incorrect data.
- LATA MUST BE 3 DIGITS [100 - 999] = LATA entered must have three digits.
- MUST ENTER OPC = The origination point code must be specified as part of the input message because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
- NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
- NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
- OPC IS INVALID = The entered digits are either invalid, the number of digits entered is incorrect, or the point code was not provisioned in the office.
- OPC IS NOT AVAILABLE = Could not get the point code. There was missing or incorrect data in the input message.
= The request is not allowed. Valid value(s):
- FEATURE NOT AVAILABLE = The TCAP improvements feature for a switch spanning multiple 
  LATAs must be purchased for the "LATA" option to work.

PF = Printout follows. The DN validation request was accepted. Followed by the OP:LASSRQST output 
  message.

RL = Retry later. Valid value(s):
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are 
  congested.

.LI The message was not accepted because of a temporary lack of available 
  resources.

1. PURPOSE

Requests local area signaling services (LASS) screen list editing (SLE) validation of a ten-digit directory number (DN). A LASS user can add a DN to a list after the DN passes certain validation checks. A caller whose number appears in the list is then given special treatment based on the LASS selective features (LSF) the user has activated.

This input message performs the validation checks to assist in diagnosing validation failures.

2. FORMAT

OP:LASSRQST,DN=a[,LATA=b][,OPC=c][,PLATFORM=d];

3. EXPLANATION OF MESSAGE

a  = The ten-digit DN to be validated.

b  = An optional three digit absolute local access transport area (LATA) number (100-999). The TCAP improvements feature for a switch spanning multiple LATAs must be purchased for this option to work.

c  = Origination point code consisting of nine digit character string. Refer to the APP:POINT-CODE appendixes in the Appendixes section of the Input Messages manual.

Note: This option is mandatory in a multi-platform office.

d  = Signaling Platform. Valid value(s):
   0  = Common Network Interface (CNI) Platform
   1 - 192 = Global Switching Module (GSM) Number

Note: This option is mandatory in a multi-platform office.

4. SYSTEM RESPONSE

NG  = No good. Valid value(s):
   - CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
   - DN MUST BE 10 DIGITS = DN entered must have ten digits. Each digit must be a numeric character from 0 to 9.
   - GSM/PROTOCOL MISMATCH = The GSM and the protocol do not match, missing or incorrect data.
   - LATA MUST BE 3 DIGITS [100 - 999] = LATA entered must have three digits.
   - MUST ENTER OPC = The origination point code must be specified as part of the input message because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit
(PSU) platforms.
- MUST ENTER PLATFORM = The signaling platform must be specified as part of the input message because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and switch unit (PSU) platforms.
- NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
- NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
- OPC IS INVALID = The entered digits are either invalid, the number of digits entered is incorrect, or the point code was not provisioned in the office.
- OPC IS NOT AVAILABLE = Could not get the point code. There was missing or incorrect data in the input message.
- OPC NOT ON PLATFORM = Could not find the point code on the platform entered.
- PLATFORM IS INVALID = The entered signaling platform is either invalid or the platform entered is not provisioned in the office.

NO = The request is not allowed. Valid value(s):
- FEATURE NOT AVAILABLE = The TCAP improvements feature for a switch spanning multiple LATAs must be purchased for the "LATA" option to work.

PF = Printout follows. The DN validation request was accepted. Followed by the OP:LASSRQST output message.

RL = Retry later. Valid value(s):
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.

.LI The message was not accepted because of a temporary lack of available resources.

OP:LIB-DISK
Software Release: 5E14 and later
Command Group: ADMIN
Application: 5
Type: Input

1. PURPOSE
Requests information about the library programs that exist on the administrative module (AM) disk. With the filename specified, it will only report on that filename. With no name mentioned, it will report on all library programs in the library program directory.

2. FORMAT
OP:LIB:DISK[, FN="a"];

3. EXPLANATION OF MESSAGE

   a = The name of the program to be reported on. If this option is omitted, all library programs will be listed.

4. SYSTEM RESPONSE

   NG = No good. The library program directory cannot be read. Check permissions on directory "/noSext/lib".

   PF = Printout follows. A report will follow.

5. REFERENCES
None.
**OP:LIB-STATUS**

**Software Release:** 5E14 and later  
**Command Group:** ADMIN  
**Application:** 5  
**Type:** Input

1. PURPOSE

Requests information about the current status of library programs currently loaded or running on the system.

2. FORMAT

```
OP:LIB:STATUS[,TEAM=a][,AM][,SM=b|,SM=c&&d);
```

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**AM** = The input message should be sent to the library program running in the administrative module (AM) under this team.

**a** = The team number (1-15) to which this input message applies. This number is specified in the LOAD:LIB input message, and is used so that more than one person may test at the same time, using different team numbers.

**b** = The SM to which this message should be directed. The team specified must have a library program running in the SM(s) listed.

**c** = The first SM in the range 'c' to 'd'.

**d** = The last SM in the range 'c' to 'd'. There can be up to 5 SM numbers listed.

4. SYSTEM RESPONSE

**NG** = No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages.

**PF** = Printout follows. Message has been sent to the SMs/AM or TEAM specified.

5. REFERENCES

Other Manual(s):

None.
OP:LIST-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a list of trunks, lines, data links, or operator services position system ports (OSPSPORTs) that currently match the status specified in the request. Any port type that uses the digital facility interface (DFI) can be listed by specifying the DFI. Any port type that uses the digital network unit - synchronous optical network (SONET) (DNU-S) can be listed by specifying the virtual tributary level 1 facility (VT1FAC). Ports that use the radio port controller units (RPCU) can be listed by specifying the RPCU. All switched virtual circuit (SVC) ports on a frame relay bearer channel (FRBC) can be listed by specifying the FRBC group and member. Not all in-service trunks, lines, data links, or OSPSPORTs in either the entire office or a specified switching module (SM) can be listed. A subset can be listed (refer to the EXPLANATION OF MESSAGE for details). Only one OP:LIST request can be active in the system at any moment; any additional requests will be denied.

2. FORMAT

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

FULL  = Use the primary and pending statuses for match and print in the output list. When FULL is not specified (default), only the primary status is used to match and only the primary status is printed on the output list. FULL and SUM may not be specified together. SUM only allows for a summary on one status.

PRIGRP  = Primary rate interface (PRI) group. If this specifier is entered by itself, all OOS PRIGRP D-channels are printed that match the status given. This does not include OSPS PRI D-channels, since they are not assigned a PRI group number.

SUM  = Print a summary report. This report gives only the number of ports that matched the status. (Incompatible with [,FULL]).

a  = Valid value(s):

b  = SM number. Restrict the output to one switching module. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
Note: Variables 'c' through 'g' are subfields giving the port status [default is out-of-service (OOS)] to match against the subset of trunks, lines, data links, or OSPSPORTs. If a subfield is omitted, any value for that subfield will match. Fields are always separated by a single comma, even if in-between fields are omitted (as in OOS, MAN). If a group number or group and range of members were specified and all status subfields were omitted, then all the statuses will be listed including in-service for that group or range of members.

- **c** = Port status - basic state. Valid value(s):
  - **IS** = In service. Valid only with FRCD qualifier in specific OP:LIST subcategories. Valid value(s):
    - OP:LIST, AP
    - OP:LIST, DATALINKS
    - OP:LIST, HOBICR
    - OP:LIST, HOBIS
    - OP:LIST, LINES

    - OP:LIST, OAPO
    - OP:LIST, PRIGRP
    - OP:LIST, RAS
    - OP:LIST, TRUNKS
    - OP:LIST, TG
  - **OOS** = Out-of-service. Default case in specified OP:LIST subcategories. Valid value(s):
    - OP:LIST, AP
    - OP:LIST, AQEST
    - OP:LIST, BST
    - OP:LIST, DATALINKS
    - OP:LIST, HOBICR
    - OP:LIST, HOBIS
    - OP:LIST, LINES
    - OP:LIST, MISLNK
    - OP:LIST, OAPF
    - OP:LIST, OAPO
    - OP:LIST, OPT
    - OP:LIST, OSPSPORTS
    - OP:LIST, PRIGRP
    - OP:LIST, RAS
    - OP:LIST, TG
    - OP:LIST, TRUNKS
    - OP:LIST, XDPF
    - OP:LIST, XDPO

- **d** = Port status - qualifier. Valid value(s):
  - **BLKD** = Blocked.
  - **CADN** = Circuit administration.
  - **CUTOVER** = Cutover (pre-cut) inactive state.
  - **DSLINIT** = Digital subscriber line (DSL) initialization.
  - **FRCD** = Forced.
  - **MKBUSY** = Make busy.
MTCE = Maintenance.
PPSRV = Pre/post service.
STBY = Standby.
TMT = Traffic management.
WAIT = Waiting for acknowledgement.

Port status - operational restrictions. Valid value(s):
- BCOOS = Bearer channel is out-of-service.
- BCMOOS = Bearer channel member is out-of-service.
- BUSY = Forced busy by switch.
- CCSINIT = Common channel signaling (CCS) initialization.
- CONT = Continuity test failure (CCS only).
- DCHOOS = D-channel is out-of-service.
- DS0_OOS = ISLP member trunk is out-of-service.
- DSBLD = Disabled.
- FAF = Facility failure.
- FE = Family of equipment.
- HW = High and wet.
- LKDO = Locked out.
- LVL1ERR = Level 1 error.
- LVL2ERR = Level 2 error.
- LVL3ERR = Level 3 error.
- PLGUP = Plug-up.
- PPMOOS = Packet pipe member trunk is out-of-service.
- PX = Power cross.
- RAP = Recorded announcement port.

Port status - supplementary information. Valid value(s):
- AFAF = Associate facility failure.
- AML = Automatic maintenance limit.
- AQ = Autoquote problem.
- AUDIT = Audit detected problem.
- CAMA = Centralized automatic message accounting.
- CAROT = Centralized automatic reporting on trunks.
- CDI = Control and data interface.
- CKT = General circuit.
- CTTU = Central trunk testing unit.
- DLRNORS = INITIAL response not received over DSL data link.
- DM_RECD = Received a level 2 disconnect message frame from far end.
- DS1OOS = Digital signal level 1 is out-of-service.
- DYGSPUS = Dying gasp under study.
- ERATC = Trunk error analysis test call failure.
- ERATP = Trunk error analysis all tests passed.
- FORPOT = Foreign potential.
- GRD = Ground fault.
- GRID = Line unit grid bad.
- IAA = Ineffective attempt analysis.
- INC = Incoming end. When used with the continuity status [OOS, maintenance (MTCE), CONT], it means that this CCS trunk is involved in automatic continuity retesting that is being controlled by the far end office.

\[e\] = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f
- PRI group number. If a number is specified, all the D- and B-channels in the PRI group are output that match the status given. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k
- EIS identifier (ID) on which the CPDL terminates. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l
- Digital networking unit - SONET number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m
- Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n
- Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o
- Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p
- RPCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q
- Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r
- SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s
- Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF
- Printout follows. The request has been accepted and is followed by OP:LIST-DATA, OP:LIST-DATALIN, OP:LIST-LINES, OP:LIST-OSPSPOR, OP:LIST-REPORT, OP:LIST-SUM or the OP:LIST-TRUNK output message. When the request is entered from the master control center (MCC), the output will also be directed to the ROP.

RL
- Retry later. The request has been denied, most probably due to system load.

Application: 5
Type: Input

1. PURPOSE

Requests a list of trunks, lines, data links, or operator services position system ports (OSPSPORTs) that currently match the status specified in the request. Any port type that uses the digital facility interface (DFI) can be listed by specifying the DFI. Any port type that uses the digital network unit - synchronous optical network (SONET) (DNU-S) can be listed by specifying the virtual tributary level 1 facility (VT1FAC). Ports that use the radio port controller units (RPCU) can be listed by specifying the RPCU. All switched virtual circuit (SVC) ports on a frame relay bearer channel (FRBC) can be listed by specifying the FRBC group and member. Any port type on a peripheral control and timing line and trunk unit (PLTU) facility can be listed by specifying the PLTU facility number. Any port type on an optical interface unit (OIU) facility can be listed by specifying the OIU facility number. Not all in-service trunks, lines, data links, or OSPSPORTs in either the entire office or a specified switching module (SM) can be listed. A subset can be listed (refer to the EXPLANATION OF MESSAGE for details). Only one OP:LIST request can be active in the system at any moment; any additional requests will be denied.

2. FORMAT

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

FULL

Use the primary and pending statuses for match and print in the output list. When FULL is not specified (default), only the primary status is used to match and only the primary status is printed on the output list. FULL and SUM may not be specified together. SUM only allows for a summary on one status.

PRIGRP

Primary rate interface (PRI) group. If this specifier is entered by itself, all OOS PRIGRP D-channels are printed that match the status given. This does not include OSPS PRI D-channels, since they are not assigned a PRI group number.

SUM

Print a summary report. This report gives only the number of ports that matched the status. (Incompatible with [,FULL]).

a

Unit. Valid value(s):

AP [=h]
AQEST
AQM [=h]
AQ [=h]
BST [=k]
DASC [=h]
DATALINKS
DFI=m-d^1-e^1
DSLG=m-n
EIS [=k^1]
FRBC=x-q^1
b = SM number. Restrict the output to one switching module. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

**NOTE:** Variables 'c' through 'g' are subfields giving the port status [default is out-of-service (OOS)] to match against the subset of trunks, lines, data links, or OSPSPORTs. If a subfield is omitted, any value for that subfield will match. Fields are always separated by a single comma, even if in-between fields are omitted (as in OOS,MAN). If a group number or group and range of members were specified and all status subfields were omitted, then all the statuses will be listed including in-service for that group or range of members.

c = Port status - basic state. Valid value(s):

d = Port status - qualifier. Valid value(s):

BLKD = Blocked.
CADN = Circuit administration.
CUTOVER = Cutover (pre-cut) inactive state.
DSLINIT = Digital subscriber line (DSL) initialization.
FRCD = Forced.
MKBUSY = Make busy.
MTCE = Maintenance.
PPSRV = Pre/post service.
STBY = Standby.
TMT = Traffic management.
WAIT = Waiting for acknowledgement.

e = Port status - operational restrictions. Valid value(s):

BCOOS = Bearer channel is out-of-service.
BCMOOS = Bearer channel member is out-of-service.
BUSY = Forced busy by switch.
CCSINIT = Common channel signaling (CCS) initialization.
CONT = Continuity test failure (CCS only).
DCHOOS = D-channel is out-of-service.
DS0_OOS = ISLP member trunk is out-of-service.
DSBLD = Disabled.
FAF = Facility failure.
FE = Family of equipment.
HW = High and wet.
LKDO = Locked out.
LVL1ERR = Level 1 error.
LVL2ERR = Level 2 error.
LVL3ERR = Level 3 error.
PLGUP = Plug-up.
PPMOOS = Packet pipe member trunk is out-of-service.
PX = Power cross.
RAP = Recorded announcement port.

f = Port status - supplementary information. Valid value(s):
APAF = Associate facility failure.
AML = Automatic maintenance limit.
AQ = Autoquote problem.
AUDIT = Audit detected problem.
CAM = Centralized automatic message accounting.
CAROT = Centralized automatic reporting on trunks.
CDI = Control and data interface.
CKT = General circuit.
CTTU = Central trunk testing unit.
D IN = INITIAL response not received over DSL data link.
DM_RECD = Received a level 2 disconnect message frame from far end.
DS1OOS = Digital signal level 1 is out-of-service.
DYGSPUS = Dying gasp under study.
ERATC = Trunk error analysis test call failure.
ERATP = Trunk error analysis all tests passed.
FORPOT = Foreign potential.
GRD = Ground fault.
GRID = Line unit grid bad.
IAA = Ineffective attempt analysis.
INC = Incoming end. When used with the continuity status [OOS, maintenance (MTCE), CONT], it means that this CCS trunk is involved in automatic continuity retesting that is being controlled by the far end office.
ISLU = Integrated services line unit.
INIT = Initialization.
L2DOWN = For a packet-switched line, level 2 protocol in not established.
L2QLTY = Poor level 2 transmission quality. The line/trunk had too many level 2 protocol errors.
LINK1 = The basic rate interface transmission extension (BRITE) link one is down.
LINK2 = The BRITE link two is down.
LINK3 = The BRITE link three is down.
LINK4 = The BRITE link four is down.
LINK5 = The BRITE link five is down.
LINK6 = The BRITE link six is down.
MPP = Modem pool problem.
MSMTCH = Mismatch.
MTCECH = Maintenance channel.
NO_RESP = No response from far end during an attempted level 2 communication establishment.
NR = No response.
NRT = No response while in test mode.
NTDACT = Network termination (NT) is deactivated.
NTOFN = NT off normal.
NTPPWR = NT primary power is lost.
NTPWR = NT lost power.
NTSPWR = NT secondary power is lost.
ODD = Office dependent data.
OTG = Outgoing end. When used with the continuity status (OOS, MTCE, CONT), it means that this CCS trunk is the end controlling the automatic continuity retesting.

OPNOXL3 = Switch could not activate level 3 protocol.
PCTF = Per call test failure.
POSNOB = OSPS position no B-channel. Could not activate B-channel (voice) port of DSL.
POSNRESP = OSPS position failed to send initial response.
PPM = Periodic pulse metering unit.
PROV = Lines that have not yet been provisioned.
PSU = Packet switch unit.
RDATA = Remote digital test access.
RESTART = Q.931 restart message.
REX = Routine exercise.
RO = Routine/other.
ROTF = Routine operational test failure (such as, scanner stuck off-hook).
RSMMSA = Remote switching module (RSM) in module stand-alone mode (MSA) of operation.
RT = OOS in the RT.
RTTF = Routine transmission test failure.
SCC = Removed by Switching Control Center.
SERVICE = Q.931 service message.
SPARED = Line is involved in an ISLU sparing configuration.
STKSCN = Suspected stuck scan (STKSCN) lead on the line group controller (LGC) or the line card (LC).
SWEQF = Switch equipment failure.
TEST = In test mode.
TEST1 = Testing in progress at the NT or BRITE channel unit (CU) and the BRITE link one is down.
TEST2 = Testing in progress at the NT or BRITE CU and the BRITE link two is down.
TEST3 = Testing in progress at the NT or BRITE CU and the BRITE link three is down.

- **MSMTCH** = Mismatch.
- **MTCECH** = Maintenance channel.
- **NO_RESP** = No response from far end during an attempted level 2 communication establishment.
- **NR** = No response.
- **NRT** = No response while in test mode.
- **NTDACT** = Network termination (NT) is deactivated.
- **NTOF** = NT off normal.
- **NTPPWR** = NT primary power is lost.
- **NTL** = NT lost power.
- **NTSPWR** = NT secondary power is lost.
- **ODD** = Office dependent data.
- **OTG** = Outgoing end. When used with the continuity status (OOS, MTCE, CONT), it means that this CCS trunk is the end controlling the automatic continuity retesting.
- **OPNOXL3** = Switch could not activate level 3 protocol.

**g** = Port status- mode. Valid value(s):
- Automatic.

**h** = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**k** = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**m** = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Packet switch unit (PSU) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = The lower limit of range of multi-line hunt group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = The upper limit of range of multi-line hunt group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Trunk group or bearer independent call control (BICC) group number against which to generate the list. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = The lower limit of a range of trunk group member numbers or normalized call instance codes (CICs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = The upper limit of a range of trunk group member numbers or normalized CICs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = PRI group number. If a number is specified, all the D- and B-channels in the PRI group are output that match the status given. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = EIS identifier (ID) on which the CPDL terminates. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital networking unit - SONET number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = RPCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
s^1 = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t^1 = PLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u^1 = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v^1 = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w^1 = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x^1 = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y^1 = Virtual network announcement resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z^1 = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a^2 = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b^2 = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c^2 = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d^2 = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e^2 = STS level 1 (STS-1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h^2 = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by OP:LIST-DATA, OP:LIST-DATALIN, OP:LIST-LINES, OP:LIST-OSPSPOR, OP:LIST-REPORT, OP:LIST-SUM or the OP:LIST-TRUNK output message. When the request is entered from the master control center (MCC), the output will also be directed to the ROP.

RL = Retry later. The request has been denied, most probably due to system load.

OP:LIST-FLOWACT

Software Release: 5E17(1) and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests a list of all active performance monitoring (PM) sessions established internally or externally. Internal PM sessions are PM sessions established by the host switch. External PM sessions are PM sessions established either by another switch, by the same switch using an intra-switching module (SM) and inter-packet switch unit (PSU) connection (when dual PSUs exist), or by the same switch using an inter-SM connection.

A PSU asynchronous transfer mode (ATM) link (PSALNK) provides the ability to interconnect the local PSU with multiple other PSUs in the ATM network, as designated by their community address and subnetwork identifiers. Each of these PSU-to-PSU connections can be monitored internally for performance-impacting metrics in accordance to the GR-1248 ATM standards and included in the relevant switch measurement reports for output. Similarly, the far endpoint of each PSU-to-PSU connection can request that the identical virtual circuit be monitored for data collection.

The purpose of this input message is to request a list of active PM activity initiated by near or far endpoints. The input message ALW:PM allows internal PM sessions and the input message ALW:EXTPM allows external PM sessions. The corresponding INH:PM and INH:EXTPM input messages provide a means of disabling internal and external PM activity respectively.

Any single ATM virtual circuit may be tracked for performance activity by both the host 5ESS® switch and a remote endpoint simultaneously. Such a PM session has both internal and external properties. When both endpoints have identical connection types [for example, both are virtual path connections (VPC) or both are virtual channel connections (VCC)], this PM session is referred to as a shared flow.

If the PSALNK option is included, only PM sessions on the specified PSALNK will be affected by the input message. If the ALL option is included, all PSALNKs in the office will be affected by the input message.

PM is only supported over a virtual circuit terminated locally by a PSALNK hosted on a protocol handler for ATM version 2 (PHA2).

2. FORMAT

OP:LIST-FLOWACT,{ALL|PSALNK=a-b-c};

3. EXPLANATION OF MESSAGE

a = SM number of the target PSALNK.
b = PSU number of the target PSALNK.
c = Link number of the target PSALNK.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by one or more OP:LIST-FLOWACT output messages.
NG = No good. May also include:
- NO PHA2 PSALNK EQUIPPED = The request has been denied. The message is valid but no
PSALNKs within the scope of the input message were detected in the current equipage.

- **PSALNK UNEQUIPPED** = The request has been denied. The message is valid but the specified PSALNK was not detected in the current equipage.
- **MUST BE A PHA2 PSALNK** = The request has been denied. The message is valid but the specified PSALNK is not hosted by a PHA2.
- **DATABASE ERROR** = The request has been denied. The message is valid but an internal database error has prevented any action from being taken.
- **INTERNAL CORRUPTION** = The request has been denied. The message is valid but an internal data corruption error has prevented any action from being taken.
- **AM TIMER NOT STARTED** = The request has been denied. The message is valid but a shortage of system resources has prevented any action from being taken.

**RL**

- **PREVIOUS REQUEST IN PROGRESS** The request has been denied. The message is valid but the previous request must complete before a new request can be made.

OP:LIST-ISMNAIL-A

Software Release: 5E14 - 5E15
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Outputs a status list of all inter-SM (switching module) nailups (ISMNAIL) used for packet transport between two SMs. Variants are permitted to obtain the primary status of all nailups emanating from a specific SM or channel group (Format 1), or the primary/history states of all nailups between a designated pair of SMs (Format 2). Also available are "state filtering options" to output only selected classes of output status.

2. FORMAT

[1] OP:LIST,ISMNAIL,SM=a[,CHNG=b][,ALL|IS|OOS];
[2] OP:LIST,ISMNAIL,SM=c,MATESM=d[,ALL|IS|OOS];

3. EXPLANATION OF MESSAGE

ALL = This option allows output for all ISMNAILs to be produced, regardless of status.
IS = This option allows only output for operational in-service (IS) or automatic time slot switching (IS-AUTISS) ISMNAILs to be reported.
OOS = This option allows only output for out-of-service (OOS) ISMNAILs to be reported. This is the default, if no option is specified.
a = SM number from which status of ISMNAILs are desired.
b = Channel group (CHNG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Note: If this option is included, only the primary status of ISMNAILs associated with the specified CHNG are provided. Without this option, all ISMNAILs on the specified source SM will be considered.
c = SM number from which primary and history status of ISMNAILs between a pair of SMs is desired.
d = Mate SM number is the other SM of interest.

4. SYSTEM RESPONSE

NG = No good. May also include:
- SM ## NOT IN THE ISM NETWORK = The request has been denied. Either the source or the destination SM or both have no ISMNAILs associated with it.
PF = Printout follows. The request has been accepted and is followed by the OP:LIST-ISMNAIL output message.
= Retry later. The request cannot be executed immediately because the automatic task administrator (ATA) cannot currently schedule a new task, or another OP:LIST-ISMNAIL or OP:OFFNORM-IS request is in progress (no more than one task of this type may be executed at any given time); retry later, when system load is reduced.

Input Appendix(es):

APP:RANGES
OP:LISTOTO

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a listing of the unassigned (UNA) lines, the integrated SLC® (ISLC) lines, and/or the integrated digital carrier unit (IDCU) lines within a specified range of directory numbers, SLC® line equipment numbers (SLENs), or IDCU line equipment numbers (ILENs). This message is used to obtain a listing of these lines before an office-to-office test program (EX:OTO) is exercised.

If the UNA, ISLC, and IDCU options are all omitted from the input message, a line report will be printed for every line within the range to allow verification of the 5ESS® switch translations with office records.

Note: To reduce the possibility of loss of results due to message throttling, the OP:LISTOTO input message should be run at periods of low activity. In addition, refer to the INH:BREVC input message.

2. FORMAT

OP:LISTOTO[,UNA][,ISLC][,IDCU][,NPA=r],i;

3. EXPLANATION OF MESSAGE

a = Three-digit office code.
b = Local digits of the first or only line of the range.
c = Local digits of the last line of the range.
d = Switching module (SM) number.
e = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = First or only RT line number of the range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Last RT line number of the range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Equipment number. Valid value(s):

\[DN=a-b[&&c]\]
\[ILEN=d-j-k-l[&&m]\]
\[INEN=d-n-o-p-q[&&h]\]
\[SLEN=d-e-f-g[&&h]\]
j = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RT number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = First or only RT line number or PUB43801 channel of the range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Last RT line number or PUB43801 channel of the range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Digital network unit (DNU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = First or only RT line number of the range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Last RT line number of the range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Numbering Plan Area or Area Code of the DN.

4. SYSTEM RESPONSE

PF = Printout follows. The message has been accepted and is followed by the OP:LISTOTO output message.

RL = Retry later. The request has been denied due to unavailable system resources.

Output Message(s):

OP:LIT
OP:LNSTAT

Software Release: 5E12 and later
Command Group: N/A
Application: 5,CNI
Type: Input

1. PURPOSE

Requests that a snapshot of certain key link node (link interface and node processor) status and data information be output. The requested data to be output is described in the OP:LNSTAT output manual page. The requested data is intended to aid in troubleshooting and analyzing link node problems. This input message is valid only for Signaling System 7 (SS7) links.

2. FORMAT

OP:LNSTAT=a-b[:DEST=c];

3. EXPLANATION OF MESSAGE

a = Link group number.

b = Link member number.

c = Destination class. The destination number to output device cross reference can be found by using the OP:OUTCLS input message.

4. SYSTEM RESPONSE

NG = No good. The request was not accepted, reason to follow.

PF = Printout follows. Followed by the OP:LNSTAT output message.

RL = Retry later. The OP:LNSTAT cannot execute at this time, reason to follow.

   REPT:LNUPD LN
   STOP:LNUPD
OP:LOG

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that selected contents of a logfile be printed (output). If the logfile is the only criterion entered, the first 200 entries of the logfile are printed. Otherwise, only the entries in the logfile that meet all of the selection criteria are printed. Unless the LIMIT option is specified as one of the criteria, the first 200 entries that match all the selection criteria are printed.

The entire output report is always routed to the read-only printer (ROP). The amount of data output routed to the terminal is determined by the input message line options selected and the size of the data output. When the "CLASS" option is set to "T," the entire output report is routed to the terminal as well as the ROP. When the "CLASS" option is set to "R," the entire output report is routed to the ROP, and only the COMPLETED message is routed to the terminal.

Note: The COMPLETED message also contains the last non-full segment, if it exists, of the output report. If the data output fills 'n' complete segments (where 'n' is an integer greater than or equal to 1) then the COMPLETED message (and no output data) is printed at the terminal.

When the "DEVICE" option is set to a valid device, the entire output report is routed to the specified device as well as the ROP with nothing being output to the terminal.

There are two formats, depending on the way the starting and ending dates and times are specified.

The DATE, TIME, ID, MSGCLS and TYPE options are matched with information contained in the user control string which the spooler adds as a prefix to each message before storing it in the logfile. The user control string is not part of the OP:LOG output. The keyword (KW) option matches on the text of each message.

2. FORMAT

[1] OP:LOG:LG="a"[:,DATE=b[&c]][,TIME=d[&e]][,KW="f"][,ID=g]
[,MSGCLS=l][,TYPE=h][,LIMIT=i][,CLASS=j],DEVICE="k")

[2] OP:LOG:LG="a"[:,DATE=m[&n]][,KW="f"][,ID=g]
[,MSGCLS=l],TYPE=h][,LIMIT=i][,CLASS=j],DEVICE="k")

3. EXPLANATION OF MESSAGE

a = Name of the logfile. Any valid administrative module (AM) logfile name. The current logfile names are:
AMAERLOG
AUDLOG
AMTRCLOG
CMDLOG
CMONLOG
CNCELOG
CONFLOG
DAYLOG
DKDRVLOG
Most logfile names can be found in the APP:MSGCLS appendix in the Appendixes section of the Output Messages manual.

- **b**: Start date, given as a 6-digit number in the form mmddyy.
- **c**: End date, given as a 6-digit number in the form mmddyy. Default is start date.
- **d**: Start time, given as a 4-digit number in the form hhmm.
- **e**: End time, given as a 4-digit number in the form hhmm. Default = start time.
- **f**: A keyword that appears in all entries that are to be reported.
- **g**: Four-digit decimal number which is used to link an item in a logfile with an entry in another file. The ID is filled in by the process that made the logfile entry: for example, 1234, 0017, 0003.
- **h**: Four-digit decimal number that specifies the type of entry in a logfile. The TYPE is filled in by the process which made the logfile entry; for example, 1234, 0945, 0005.
- **i**: The maximum number of output entries requested. Default = 200. OP:LOG will report output complete if this limit is reached.
- **j**: Location to which output should be routed. Valid value(s):
  - **R**: Receive-only printer (default).
  - **T**: Terminal and read-only printer.
- **k**: A specific device to which output should be routed. This device should not be a logfile device. For example, "ttyc" will direct the output to /dev/ttyc.
- **l**: A message class name (1-9 characters). This name is encoded in the user control string as a four-digit decimal number.
- **m**: Start date and time, given as a 10-digit number in the form mmddyyhhmm. For example, October 2 1987 at 10:00 PM is given as 1002872200.
4. SYSTEM RESPONSE

IP = In progress.

RL = Retry later. Valid value(s):
   - CANNOT ATTACH TO ECD = Could not attach to the equipment configuration database (ECD).

1. PURPOSE

Requests the current and backup log/print status (LPS).

Format 1 requests the status of one or all message classes. Format 2 requests all message classes for which the current status matches the entered status.

2. FORMAT

[1] OP:LPS,MSGCLS={a|ALL};
[2] OP:LPS[,LOG=b][,PRINT=c];

3. EXPLANATION OF MESSAGE

ALL = Print statuses of all message classes.

a = Valid message class.

Note: The default for variables 'b' and 'c' is to print all statuses of all message classes.

b = Daylog routing status (ON or OFF).

c = Equipment configuration data base (ECD) routing status (ON or OFF).

4. SYSTEM RESPONSE

NG = No good. There was no message class with current status matching the entered status.

PF = Printout follows.

RL = Retry later. The disk file which contains the tables cannot be found. A new file will be created, and the OP:LPS output message will be generated automatically. Retry after the new file is created.

235-100-125  System Description
235-600-30x  ECD/SG Data Base
50. OP:M
1. PURPOSE

Requests a specified package from the five-minute (M5) surveillance data.

Note: For offices that have a direct link to the remote network management center, the network management (NM) trunk group schedule can be as large as 2000. Requesting the TGMEAS package may cause a large amount of data to be printed on the read-only printer (ROP).

WARNING: To accommodate up to 2000 trunk groups, more than 100 messages will be printed on the ROP.

For the TGMEAS and TGFLAG packages, the printing of the reports can be stopped with the use of the STP:NMOP input message. Specifying the "TG=" parameter in the input message will print the report for a specific trunk group.

2. FORMAT

\[ \text{OP:M5,PKG=a[,TG=b][,NODES=c-d];} \]

3. EXPLANATION OF MESSAGE

\[ a \quad \text{= Package. Valid value(s):} \]

- ASPTF = Advanced services platform toll free counts.
- BNP = Basic number portability measurements.
- CCS = Common channel signaling general service measurements.
- CCSP = Common channel signaling special service measurements.
- CGAP = Code control.
- CLCT = Network management control counts.
- CLDIR = Call direction.
- DLYR = Delayed readiness.
- EON5 = End office nodal phase 5.
- GETSHPC = Government emergency telecommunications service high probability of call completion.
- HPCTG = High probability of call completion trunk group.
- IECSSST = Inter-exchange carrier start signal timeout counts.
- IECSTG = Inter-exchange carrier shared trunk group counts.
- IMA = Additional ineffective machine attempts.
- LN = Leased network action point.
- LNCU = Leased network office-wide measurements for critical users.
- LNNODE = Leased network node-to-node measurements.
- MLNC = Failure to match and no circuit.
- NS = Number services.
- OVRLD = Overload or congestion.
- RRC = Manual reroute trunk group controls.
SDN = Software-defined network.
SVC = Critical service circuits.
TGFLAG = Trunk group flags.
TGMEAS = Basic trunk group.
WBTGMEAS = Wideband trunk group.

b = Trunk group number. This parameter is only specified with the TGMEAS or TGFLAG packages. For the TGMEAS package, this trunk group must be on the NM trunk group schedule. The default is all trunk groups on the NM trunk group schedule. If the trunk group is not on the NM trunk group schedule, use the ASGN:NMSCH input message to assign it. For the TGFLAG package, this trunk group does not have to be on the NM trunk group schedule.

c = CLLI code.

d = Voice/data indicator. Valid value(s):
    D = Data indicator.
    V = Voice indicator.

Note: The parameters ‘c’ and ‘d’ indicate a node and are only specified with the LNNODE package. The default is all nodes on the NM node schedule. If the node requested is not on the NM node schedule, use the ASGN:NMNODES input message to assign it.

4. SYSTEM RESPONSE

NG = No good. May also include:
    - DATA NOT COLLECTED = The request has been denied. The trunk group or node requested has been scheduled, but the data has not yet been collected.
    - FEATURE NOT AVAILABLE = The request has been denied. The requested feature is not available.
    - INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.
    - NODE UNASSIGNED = The request has been denied. The node requested is not on the NM node schedule, and is not included in the measurement collection. Use the ASGN:NMNODES input message to add the node to the NM node schedule. Wait for the next five-minute collection period and re-enter the request.
    - PACKAGE UNASSIGNED = The request has been denied. The data for the package requested is not currently being collected. Use the SET:M5 input message to add the package to the package list so data will be collected. Wait for the next five minute collection period and re-enter the request.
    - TG UNASSIGNED = The request has been denied. The trunk group requested is not on the NM schedule, and is not included in the measurement collection. Use the ASGN:NMSCH input message to add the trunk group to the NM schedule. Wait for the next five minute collection period and re-enter the request.

PF = Printout follows. Followed by the OP:M5 output message. May also include:
    - DATA SUSPECT = Measurement data may not be accurate or complete.

RL = Retry later. May also include:
CONFLICTING REQUEST = A similar request is being processed utilizing necessary resources.
LOCKED OUT = Measurement data is in the process of being collected.
RESOURCE SHORTAGE = The necessary resources are not available.

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

WTD = "What to do" or "What to dump" keyword.

a = Switching module (SM) number.

b = Message switch side (0 or 1).

c = Communications module processor (CMP) number.

d = Pathname of UNIX® RTR operating system file name (FN). Quotation marks are required.

4. SYSTEM RESPONSE

NG = No good. Error in format.

PF = Printout follows. Followed by the OP:MON-CTL output message.

RL = Retry later. System resource shortage.

5. REFERENCES

Input Message(s):

OP:MON-DSP
OP:MON-PID

Output Message(s):

OP:MON-CTL
OP:MON-DSP
OP:MON-PID
**OP:MON-DSP-A**

**Software Release:** 5E14 only  
**Command Group:** SFTUTIL  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that the contents of the dispatch array area of the monitor buffer or the contents of the entire monitor buffer be output to the receive-only printer (ROP) or a file.

The OP:MON-DSP message is used to dump data from the monitor buffer to the ROP or a file. If the specified option is dump first portion (DPF), dump range (DPR), or dump last portion (DPL), then the data is taken from the dispatch array area of the monitor buffer (format 1). If the option is dump all (DPA) then the entire monitor buffer is dumped into the specified file name (format 2).

Note: Excessive ROP may be generated by the response of this message.

2. **FORMAT**

[1] \[\text{OP:MON,DSP,\{AM|SM=a\mid CMP=b-c\},\{DPF=d\mid DPR=e-f\mid DPL=g\},\{ROP|FN="h"\};}\]

[2] \[\text{OP:MON,DSP,\{AM|SM=a\mid CMP=b-c\},DPA,FN="h";}\]

3. **EXPLANATION OF MESSAGE**

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **DSP** = Dispatch area of monitor buffer.
- **a** = Switching module (SM) number.
- **b** = Message switch side (0 or 1).
- **c** = Communications module processor (CMP) number.
- **d** = Number of words to be dumped from the beginning of the dispatch area of the monitor buffer.
- **e** = Start word index for dumping a range of words from the dispatch area of the monitor buffer.
- **f** = End word index for dumping a range of words from the dispatch area of the monitor buffer.
- **g** = Number of words to be dumped from the end of the dispatch area of the monitor buffer.
- **h** = Full pathname to *UNIX®* RTR operating system output file.

4. **SYSTEM RESPONSE**

- **NG** = No good. Error in format.
- **PF** = Printout follows. Followed by the OP:MON-DSP output message.
RL = Retry later. System resource shortage.

Software Release: 5E15 and later
Command Group: SFTUTIL
Application: 5
Type: Input

1. PURPOSE

Requests that the contents of the dispatch array area of the monitor buffer or the contents of the entire monitor buffer be output to the read-only printer (ROP) or a file.

The OP:MON-DSP message is used to dump data from the monitor buffer to the ROP or a file. If the specified option is dump first portion (DPF), dump range (DPR), dump last portion (DPL), or dump used portion (DPU), then the data is taken from the dispatch array area of the monitor buffer (format 1). If the option is dump all (DPA) then the entire monitor buffer is dumped into the specified file name (format 2).

Note: Excessive ROP may be generated by the response of this message.

2. FORMAT

[1] OP:MON,DSP,{AM\textbar SM=a \textbar CMP=b-c},{DPF=d \textbar DPR=e-f \textbar DPL=g \textbar DPU},{ROP \textbar FN="h"};

[2] OP:MON,DSP,{AM\textbar SM=a \textbar CMP=b-c},DPA,FN="h";

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

DSP = Dispatch area of monitor buffer.
a = Switching module (SM) number.
b = Message switch side (0 or 1).
c = Communications module processor (CMP) number.
d = Number of words to be dumped from the beginning of the dispatch area of the monitor buffer.
e = Start word index for dumping a range of words from the dispatch area of the monitor buffer.
f = End word index for dumping a range of words from the dispatch area of the monitor buffer.
g = Number of words to be dumped from the end of the dispatch area of the monitor buffer.
h = Full pathname to UNIX® RTR operating system output file.

4. SYSTEM RESPONSE

NG = No good. Error in format.
PF = Printout follows. Followed by the OP:MON-DSP output message.
RL = Retry later. System resource shortage.

Application: 5
Type: Input

1. PURPOSE

Requests that the count/time data on a specific program ID or all program IDs, or output count/time data on the
operating system be output to either the receive-only printer (ROP) or a file.

2. FORMAT

OP:MON,PID,{AM|SM=a|CMP=b-c},{PRS|PRT} [=d],{ROP|FN=e};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = All program IDs or operating system data (default).
PRS = Counts of process real time usage.
PRT = Counts of system real time usage.
a = Switching module (SM) number.
b = Message switch side (0 or 1).
c = Communications module processor (CMP) number.
d = Specific program ID(0-259 OKP -- 0-649 SM -- 0-149 CMP)
e = Filename (FN) that data is dumped into.

4. SYSTEM RESPONSE

NG = No good. Error in format.
PF = Printout follows. Followed by OP:MON-PID-AM, OP:MON-PID-CMP, or the OP:MON-PID-SM
output message depending upon input options.
RL = Retry later. System resource shortage.

51. OP:N
OP:NAILUP-A
Software Release: 5E14 - 5E16(1)
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests a display of all specified nail-up connections nailed up using RC/V View 7.11 (NAIL-UP AND HAIRPIN SPECIFICATION) for a given SM, unit, facility, or equipment number.

Format 1 requests that nail-up connections on a specific unit, facility, or equipment number be displayed.

Format 2 requests that the number of nail-up connections on a switching module (SM) be displayed.

2. FORMAT

[1] OP:NAILUP,a;

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

QUAN = Display the number of nailup ports only.

a = Unit, facility or equipment number. Valid value(s):
DEN=b-c-d-j;
DFI=b-c-d;
DS1=b-y-z-a1-b1-v-w;
DS1SFAC=b-r-s-t-u-v-w;
IFAC=b-n-o;
ILEN=b-n-m-q;
INEN=b-r-m-p;
NEN=b-r-s-t-u-v-w-x;
SDFI=b-e-f;
SLEN=b-e-l-p;
TEN=b-g-h-i-k;
TUCHBD=b-g-h-i;

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = SDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Remote terminal (RT) number for the DCLU. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = RT number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = IDCU facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = RT line number or PUB43801 channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
x = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- SM DOES NOT EXIST = The message was not accepted because the SM does not exist.
- SM UNEQUIPPED = The message was not accepted because the SM is unequipped.
- UNIT DOES NOT EXIST = The message was not accepted because the trunk unit does not exist or the target equipment is not equipped.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a report of the specified node processor (NP) or attached processor (AP) memory or port locations, and sends the output to a file or to the ROP or both.

WARNING: Due to the potential destructive nature of reading certain input/output (I/O) ports, do not read I/O ports on an ACTIVE node. The use of OP:NPMEM should be avoided when the NP under test is in the isolated segment, and other maintenance activity is occurring in the isolated segment. This interaction of OP:NPMEM with maintenance could have adverse affects on maintenance and the active segment of the common network interface (CNI) ring.

2. FORMAT

OP:NPMEM=[ROP | FILE | FILEROP | RAW3B | RAW80] {,RPCNa=0 | ,LNb=c} {,MADDR | :BPORT | :APADDR}=d {,NBYTES | :NPORTS}=e [:{WTIME=f | UCL | WTIME=f,UCL}];

3. EXPLANATION OF MESSAGE

ROP

= Print the output at the read only printer. This is the default.

FILE

= Place the output into a file.

NOTE: When this argument is specified, the input message doesn't echo on the read only printer.

FILEROP

= Print the output at the read only printer and place the output into a file.

RAW3B

= Place the output into a file.

NOTE: When this argument is specified, the content of the file will have both binary and ASCII data with the byte ordering for the binary portion being like that of a M68000 family of processors.

RAW80

= Place the output into a file.

NOTE: When this argument is specified, the content of the file will have both binary and ASCII data with the byte ordering for the binary portion being like that of an I80 family of processors.

RPCN

= Ring Peripheral Controller Node request. When FILE or FILEROP is the argument to the NPMEM keyword, the file produced will be named with the D.RPCNa_b convention.
RAW3B or RAW80 is the argument to the NPMEM keyword, the file produced will be named with the DR.RPCNa_b convention.

LN = Link node request. When FILE or FILEROP is the argument to the NPMEM keyword, the file produced will be named with the D.LNa_b convention. When RAW3B or RAW80 is the argument to the NPMEM keyword, the file produced will be named with the DR.LNa_b convention.

MADDR = Read NP memory address.

BPORT = Read NP byte port number.

APADDR = Read AP memory address.

NBYTES = Dump memory.

NPORTS = Dump consecutive ports.

WTIME = Waiting time allowed for this command.

UCL = Unconditional request.

WARNING: When this option is specified, there is a risk of causing RING TRANSPORT ERRORS. This option is intended for use only in emergency situations where a node is marked faulty but believed to be otherwise.

a = The ring node (RN) group number for an RPCN. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The ring node (RN) group number for an LN. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = The RN member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = The start address for memory or port to be dumped. For a node processor memory or port request, the start address is specified as a twenty bit address: 16 bits virtual address (bits 0-15) plus a 4 bit segment (bits 16-19) for memory dumps, and a don't care segment for port dumps. For attached processor memory dumps, the start address is specified as a 32-bit physical address when the node is not in the ACTIVE state, and a 32-bit virtual address for ACTIVE nodes.

e = Number of consecutive bytes to dump. The total number of bytes that can be obtained is 63488 for attached processors that are not active. A node in an isolated segment of the ring can only dump a maximum of 432 bytes for the ROP option. If these restrictions are satisfied, a request can obtain from 1 to 1024 bytes for ROP and from 1 to the total memory size available in the node for FILE, FILEROP, RAW3B, or RAW80.

f = Wait time limit for the duration of the data dump specified in minutes. Range is 1-60. When specified wait time expires, this command will be terminated. The default value for the wait time is 3 minutes.

All desired data should be retrieved from the node processor before attempting to read memory back from an inactive attached processor since the read of the attached processor memory can destroy memory addresses X’80000 to X’90000 in the NP.
The memory or port specified is uploaded and the OP:NPMEM output message is generated. The data read will be segmented in 464 bytes or less. Each segment read will be blocked in 464 bytes or less for ROP dumps. Each block will be read in one time interval providing a static view (snapshot) of the block of memory.

Directory "/etc/log/" will be used as the default directory for file placement when the FILE, FILEROP, RAW3B or RAW80 argument is used. Users can direct the output file to any location by creating the file "npmempath" in directory "/no5text/ims/npfile/". The "npmempath" file can then contain the path to the directory where the file is to be placed.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:NPMEM output message.

5. REFERENCES

Output Message(s):

OP : NPMEM

MCC Display Page(s):

1520 (RING NODE STATUS PAGE)
52. OP:O
OP:ODD-AM-SM

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests a report of the office-dependent data (ODD) availability in the administrative module (AM), switching module(s) (SMs), and communication module processor CMP(s). Depending on the information required, one processor or any combination of the three may be requested.

This input message can be used to manually clear or set the ODDWARN MCC processor status lamp(s) on the 116, 1800,x, 1850, and/or 1851 MCC page(s) depending on the current amount of ODD usage.

2. FORMAT

[1] OP:ODD, {AM|SM=a[&&b]|CMP=a[&&b]|AM[,CMP=a[&&b][,SM=a[&&b]]]};

3. EXPLANATION OF MESSAGE

AM = Requests the ODD availability report in the administrative module.
   a = SM or CMP number or the lower limit of the range whose availability report is requested.
   b = Upper limit of the range of SM or CMP number specified whose availability report is requested.

4. SYSTEM RESPONSE

NG = No good. The input request is not valid.
PF = Printout follows. Followed by the OP:ODD output message.

5. REFERENCES

Input Message(s):
   OP:ODDWARN

Output Message(s):
   OP:ODD
   OP:ODDWARN

Other Manual(s):
235-105-220 Corrective Maintenance
OP:ODDWARN

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests a report of office dependent-data (ODD) warning information in the specified processors. Two ODD warning conditions are reported as either normal or abnormal: the status of used ODD and the status of generated key (GK) or hashed relations in overflow after automatic reorganization. A hashed relation is one whose access method is DBACC_HASH. A GK relation is one whose access method is DBACC_GK.

Depending on the information required, one processor or any combination of the administration module (AM), communication module processors (CMPs), or switching modules (SMs) may be requested. At least one processor must be specified. ODD warning information will appear for every operational processor specified.

2. FORMAT

OP:ODDWARN{{[,SM=a[&b]][,CMP=c-d][,AM]}};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number or the lower limit of a range of SM numbers.
b = Upper limit of a range of SM numbers.
c = Message switch side of the communication module (CM) with the desired CMP. (0,1)
d = CMP number or peripheral control number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. May also include:
- INVALID CMP PROCESSOR SPECIFIED = The requested CMP processor was not operational.
- NO VALID PROCESSOR SPECIFIED = No requested processor was operational. At least one requested processor must be operational.

PF = Printout follows. The request was accepted because at least one operational processor was specified. Followed by the OP:ODDWARN output message for each operational processor requested.

235-105-110  System Maintenance Requirements and Tools
235-105-210  Routine Operations and Maintenance
235-105-220  Corrective Maintenance
OP:OFFNORM-CM

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests a list of all off-normal circuits in communication modules (CM). Circuits that are in forced active states or are in service but have hardware checks (HDWCHK) inhibited are considered off-normal.

2. FORMAT

OP:OFFNORM,CM;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the OP:OFFNORM output message.

5. REFERENCES

Output Message(s):

Input Appendix(es):

APP:CM-IM-REASON

Other Manual(s):

235-105-220 Corrective Maintenance
235-105-250 System Recovery Procedures
OP:OFFNORM-IS

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Outputs a report of off-normal inter-SM (switching module) nailups (ISMNAILs) used for packet transport between SMs. "Off-normal" is to be equated with any nailup, which is not IS (in-service), and for which maintenance personnel action could affect the restoration of that ISMNAIIL. The request allows data to be provided for a single SM or a contiguous range of SMs.

2. FORMAT

OP:OFFNORM,ISMNAIL,SM=a[&b];

3. EXPLANATION OF MESSAGE

a = SM number or the lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by the OP:OFFNORM-IS output message.

RL = Retry later. The request cannot be executed immediately because the automatic task administrator (ATA) cannot currently schedule a new task, or an OP:LIST-ISMNAIL or another OP:OFFNORM-IS request is in progress (no more than one task of this type may be executed at any given time); retry later, when system load is reduced.

5. REFERENCES

Input Message(s):

STP:ISMNAIL
OP:LIST-ISMNAIL

Output Message(s):

OP:OFFNORM-IS
1. PURPOSE

Requests a list of all off-normal primary rate interface (PRI) integrated services digital network (ISDN) D-channels. Only the status of D-channels are listed. B-channels are not included in this report. An off-normal condition is in effect when a D-channel for a PRI group is out-of-service (OOS).

2. FORMAT

OP:OFFNORM, PRIGRP;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by the OP:OFFNORM-PRI output message.

RL = Retry later. May also include:
    - FAILED TO CREATE PROCESS
    - TOO MANY PROCESSES ACTIVE

5. REFERENCES

Output Message(s):

OP:OFFNORM-PRI

Other Manual(s):
235-105-110 System Maintenance Requirements and Tools

MCC Display Page(s):

107 (CIRCUIT LIMIT)
OP:OFFNORM-QPHN

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status for all offnormal quad-link packet switch protocol handler links (QPHLNKs) on a host global switching module (HOST GSM). This type of request is useful in determining the overall "health" of QPH operation on a HOST GSM, as part of corrective maintenance activities (or periodic offnormal reports).

2. FORMAT

OP:OFFNORM,QPHNET[,GSM=a|ALL];

3. EXPLANATION OF MESSAGE

ALL = Report status of all offnormal QPHLNKs on all GS Ms in the office with QPHs equipped.

a = GSM number. If no SM number is specified and only one CCS GSM exists in the office, that GSM will be defaulted.

4. SYSTEM RESPONSE

PF = The request has been accepted. An OP:OFFNORM,QPHNET output message will follow.
RL - GSM NOT AVAILABLE = This response indicates that the input GSM is not available, because it is isolated or undergoing an initialization. Retry later.
NG - SM UNEQUIPPED = This response indicates that the input GSM is not an equipped SM.
NG - NOT A GSM = This response indicates that the input GSM is not a provisioned GSM.
NG - NO GSM PROVISIONED = No GSM was specified or ALL option was input, and there are no GSMS provisioned in the office.
NG - GSM MUST BE SPECIFIED = No GSM was specified, and there is more than one GSM provisioned in the office.
RL - CURRENTLY IN PROGRESS = Only one OP:OFFNORM,QPHNET,ALL request can be processed at a time. Retry later.

5. REFERENCES

Output Message(s):

OP:OFFNORM,QPHNET

Other Manual(s):
235-200-116 5ESS Switch Signaling Gateway Common Channel Signaling

MCC Display Page(s):

1540 (GSM CMT STATUS)
OP:OFFNORM-SM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a list of all off-normal circuits in switching modules (SM).

2. FORMAT

OP:OFFNORM, SM=a[&b] [,NOPRINT];

3. EXPLANATION OF MESSAGE

NOPRINT = No print. This option prevents the printing of the OP:OFFNORM-SM output response for those SMs that have no OFFNORM units. Selecting this option also condenses the OP:OFFNORM-SM report for SMs that have master inhibits applied for the hardware error checks. When this option is selected, the report will simply indicate that the SM has master inhibits applied for the hardware error checks without listing all the off-normal circuits in the SM.

Note: If a large amount of records are requested, then some records may not be printed on the receive-only printer (ROP) due to the finite queuing capability.

a = SM number or lower limit for a range of SM numbers.
b = Upper limit for a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
- SM DOES NOT EXIST = The message syntax is valid, but the requested SM is not in the system.
- SM UNEQUIPPED = The message syntax is valid, but the requested SM is unequipped. In case of a range request, all SMs are unequipped.

PF = Printout follows. Followed by the OP:OFFNORM-SM output message.

RL = Retry later. The request cannot be executed now. A lack of system resources has resulted in loss of communication to the requested SM.

5. REFERENCES

Output Message(s):

OP:OFFNORM-SM
OP:OFL

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests a list of all currently off-line administrative module (AM) hardware units. This format provides a list of all off-line units of a particular type.

2. FORMAT

\[ \text{OP:OFL}[:\text{DATA}, \langle a(=b)[,c=d]\rangle]; \]

3. EXPLANATION OF MESSAGE

- \(a\) = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for AM unit names.
- \(b\) = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.
- \(c\) = Subunit name, if 'a' = CU. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual for AM control unit (CU) subunit names.
- \(d\) = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- \(\text{PF}\) = Printout follows. Followed by the OP:OFL output message.
- \(\text{RL}\) = Retry later.
- \(\text{?D}\) = Data field error.

Input Appendix(es):
OP:OFR-CAT

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests the printing of all categories or one category of office record forms.

2. FORMAT

OP:OFR:CAT=a[,OPT=b][,FORMAT=c][,DEVICE=d];

3. EXPLANATION OF MESSAGE

a = Category to be printed.

Valid value(s) for the switch:
ADMIN = Administrative forms.
ALL = All categories, all forms.
APPROC = Applications processor forms.
BRCSFD = Business and residential customer services (BRCS) feature definition forms.
CONFIG = Configuration forms.
DARC = Digit analysis, screening, routing and charging forms.
EQUIP = Equipment forms.
LASS = Local area signaling service forms.
LINE = Line forms.
OSPS = Operator Services Position System forms.
PKT = Packet switching forms.
TRUNK = Trunk forms.

Valid value(s) for wireless centrex:
WCTX = Wireless centrex forms. This is the only category valid for Wireless Centrex offices.

b = Printing option. Valid value(s):
DELAY = Delay printing until the time set by the IN:OFR-PARM input message.

c = Format of office record option. Valid value(s):
RAW = Office record output is in RAW format. Each row of output in a "RAW" formatted office record is an instance of the Recent Change view associated with the form type being processed. Each row contains tab separated values associated with the fields defined for the particular Recent Change view. When using this format the output is machine readable and can be post processed more easily than the default formatting of office records. Office records that are to be raw formatted are scheduled in either of the two following ways: OP:OFR:CAT=XXX,FORMAT=RAW OP:OFR:FORM=XXX,FORMAT=RAW

d = Device/file string of up to 9 characters.
Device | Use
--- | ---
"FILE" | OFR.E(reqid) and OFR.O(reqid) are error and output files respectively in the RCLOG partition.
"FIL_FRMID" | (formid).E and (formid).O are error and output files respectively in the RCLOG partition. These files are created in pairs per formid. The term formid has the same meaning as form type. For example, for form type (or formid) 5050, files 5050.E and 5050.O would be created.
"mt00" | High density tape device, IOP 0 rewind after I/O.
"mt04" | High density tape device, IOP 0 do not rewind after I/O.
"mt08" | Low density tape device, IOP 0 rewind after I/O.
"mt0c" | Low density tape device, IOP 0 do not rewind after I/O.
"mt18" | Low density tape device, IOP 1 rewind after I/O.
"mt1c" | Low density tape device, IOP 1 do not rewind after I/O.
"null" | A dummy port used for error checking
"report" | A file in the RCLOG partition (appends)
"ttyR" | Office records printer
"ttyT" | Traffic printer
"ttyU" | Belt line B
"ttyn" | SLC™96
"ttyj" | Supplemental trunk/line work station, first
"ttyk" | Supplemental trunk/line work station, sixth
"ttym" | Supplemental trunk/line work station, first
"ttym" | Supplemental trunk/line work station, second
"ttyo" | Supplemental trunk/line work station, third
"ttyp" | Recent change and verify/Reserved Service Bureau
"ttyq" | Recent change and verify/Network Administration Center
"ttyr" | Automatic line insulation test/Reserved Service Bureau
"ttys" | Magnetic tape controller
"ttyt" | Magnetic tape controller
"ttyu" | Belt line A
"ttyv" | Local recent change and verify
"ttyw" | Remote recent change and verify
"ttyx" | Master Control Center/ Switching Control Center System
"ttyy" | Master Control Center/ Switching Control Center System
"ttyz" | Master Control Center/ Switching Control Center System

Note: FILE option is used primarily by an Operational Support System (OSS) to request office records and store the output in files.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:OFR-CAT output message.

Note: A request identification number is printed in the OP:OFR-CAT output message. This number is used in the STP:OFR input message to stop the printing of office records.

OP:OFR-FORM-A

Software Release: 5E14 only
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests printing of an office record form.

2. FORMAT

OP:OFR:FORM=a[,b=c[-d]][,OPT=e][,FORMAT=f][,DEVICE=g];

3. EXPLANATION OF MESSAGE

a = Form type. Refer to variable ‘a’ for the form types that can be requested.

b = Key ID associated with the form type used for optional ranging. Refer to variable ‘d’ for additional Key ID.
Note: A key ID is required for form 56151.
Note: A "*" in the key ID field represents a secondary key. To request the form with this key, the other key ID associated with this form is required to be entered.

c = Optional key ID number, or the lower limit of a range of key ID numbers.

d = Optional key ID number, or the upper limit of a range of key ID numbers. Refer to the APP:KEY-ID appendix in the Appendixes section of the Input Messages manual.

e = Printing option. Valid value(s):
DELAY = Delay printing until the time set by the IN:OFR-PARM input message.

f = Format of office record option. Valid value(s):
RAW = Office record output is in RAW format. Each row of output in a "RAW" formatted office record is an instance of the Recent Change view associated with the form type being processed. Each row contains tab separated values associated with the fields defined for the particular Recent Change view. When using this format the output is machine readable and can be post processed more easily than the default formatting of office records.

Office records that are to be raw formatted are scheduled in either of the two following ways:

OP:OFR:CAT=XXX,FORMAT=RAW
OP:OFR:FORM=XXX,FORMAT=RAW

OP:OFR-STATUS

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests a list of all output requests or all output requests of a specific type that are queued internally by the on-line office records capability and/or lists all the internal operating parameters of the on-line office records capability.

2. FORMAT

OP:OFR:STATUS=a[,REQID=b];

3. EXPLANATION OF MESSAGE

a = Request type. Valid value(s):
COMPLETED = List all completed output requests.
PARM = List the internal operating parameters, refer to the OP:OFR-STATUS output message for more details.
PENDING = List all pending output requests.
PROCESSING = List the processing output request.
REQID = List the specified output request.
SCHED = List all internal output requests.

b = Request identification number of print request, as given in the OP:OFR-CAT or OP:OFR-FORM output messages.

Note: Default prints three messages, SCHED, PARM and KEYS.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by one or more OP:OFR-STATUS output messages.

OP:OLHB

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests the report of the outgoing line history block (OLHB) information for local area signaling services (LASS).

2. FORMAT

[1]   OP:OLHB,DN=a;

[2]   OP:OLHB,b[,PTY=c];

3. EXPLANATION OF MESSAGE

a   = Ten-digit directory number (DN) of the line.

b   = Valid value(s):

<table>
<thead>
<tr>
<th>ILEN=d-e-f-g</th>
<th>LCEN=d-u-t-j</th>
<th>LCKEN=d-u-i-r-s</th>
<th>LEN=d-h-k-l-m-n</th>
<th>SLEN=d-o-p-q</th>
</tr>
</thead>
</table>

b   = Party. One of the following for an analog ILEN, LEN, LCEN, or SLEN. Refer to the RC/V view 1.6 for the specified office equipment (OE) number. Valid value(s):

0-9   = Multi-party (4, 5, 8, or 10 party lines).
I   = Individual line (default).
R   = 2 party ring.
T   = 2 party tip.

One of the following for an ISDN LCEN, ILEN, or LCKEN. Refer to the RC/V view 23.1 for the specified OE number. Valid value(s):

0-7   = Multi-point.
I,0   = Point-point (default).

d   = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e   = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f   = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g   = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h   = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

i = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = ISDN line unit (ISLU/ISLU2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- INVALID OFFICE EQUIPMENT NUMBER = This request was denied because an invalid office equipment number was entered.
- MUST ENTER TEN NUMERIC DIGITS = This request was denied because ten numeric digits must be entered.

PF = Printout follows. Followed by the OP:OLHB output message.

RL = Retry later. The request has been denied, probably due to system load.

OP:OMDB

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the message text, message class, and alarm level from an OMDB entry be output for the given key or keys.

2. FORMAT

OP:OMDB:a: KEY b;

3. EXPLANATION OF MESSAGE

a = Copy of output message database to access. Valid value(s):
   ACT = Active OMDB.
   DISK = OMDB disk file.

b = Message key (or list of keys). Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual for a list of valid OMDB keys.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - INVALID KEY = A message key is not within the valid range.
   - INVALID OMDB COPY = DISK or ACT not entered for OMDB copy to access.
   - SYNTAX ERROR = Command is not in the correct format.
   - TOO MANY KEYS = Maximum of 32 keys are allowed per input message.

PF = Printout follows. Followed by the OP:OMDB output message.

MCC Display Page(s):
118 (CNI FRAME AND CCS LINK STATUS)
OP:OVRLD-AM-SM

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests an overload status report. The report is for the administrative module (AM), a switching module (SM), a communications module processor (CMP), a direct link node processor (DLN), or a quad-link packet switch gateway processor (QGP).

2. FORMAT

3. EXPLANATION OF MESSAGE

ALL = Give the status of each module that is currently in overload. If no module is in overload, then no message will be given.

HSM = Give the status of all host SMs in the SM range requested.

LSM = Give the status of all local SMs in the SM range requested.

MATE = Mate CMP.

ORM = Give the status of all optical remote SMs in the SM range requested.

PRIM = Primary CMP.

RSM = Give the status of all remote SMs in the SM range requested.

TRM = Give the status of all two-mile optical remote SMs in the SM range requested.

DRM = Give the status of all distinctive remote SMs in the SM range requested.

a = Switching module (SM) number, or lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = Communication module processor (CMP) number.

d = Message switch side number.

e = QGP number.

4. SYSTEM RESPONSE

OK = Good. Valid value(s):
- NO MODULE OVERLOADED = Message received, but there are no modules in overload, and there will be no printed report.
PF = Printout follows. Followed by the OP:OVRLD output message.

Other Manual(s):
235-190-115  Local and Toll System Features
**OP:PB**

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. **PURPOSE**

Requests the display of the position busy (PB) and not position busy (NPB) status of each of the trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test calls. From this data, the user can direct the destination of the incoming 101 test line call by using the input messages SET:PB and CLR:PB.

2. **FORMAT**

OP:PB;

3. **EXPLANATION OF MESSAGE**

No variables.

4. **SYSTEM RESPONSE**

NA = No acknowledgement. The request has not been acknowledged. It is probable the request has been lost.

PF = Printout follows. The request has been accepted. Followed by the OP:PB output message displaying the position busy status of the TLWSs or CTTUs.

RL = Retry later. The request has been denied due to system overload.

**Software Release:** 5E17(1) and later  
**Command Group:** PCF  
**Application:** 5  
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests the status of a packet data serving node (PDSN) or all PDSNs on a packet control function (PCF).

Format 1 requests the status for a single PDSN on a PCF.

Format 2 requests the status for all PDSNs on a PCF by optionally specifying the PDSN status. If the PDSN status is not specified, all PDSN statuses will be displayed.

**WARNING:** This input message can potentially output many segments of data which could severely affect operations at the technician control center. The STP:PCF input message can be used to terminate the output from this input message.

2. **FORMAT**

[1] \text{OP:PCF,CHNG=a-b-c-d,PDSNIP=e-f-g-h;}

[2] \text{OP:PCF,CHNG=a-b-c-d[,STATE=i];}

3. **EXPLANATION OF MESSAGE**

\begin{itemize}
\item \textbf{a} = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\item \textbf{b} = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\item \textbf{c} = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\item \textbf{d} = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\item \textbf{e} = Internet Protocol address segment (0-255).
\item \textbf{f} = Internet Protocol address segment (0-255).
\item \textbf{g} = Internet Protocol address segment (0-255).
\item \textbf{h} = Internet Protocol address segment (0-255).
\item \textbf{i} = PDSN status. Valid value(s):
\begin{itemize}
\item \textbf{ALL} = The status of PDSN can be any status.
\end{itemize}
\end{itemize}
DEGRADED = The PDSN is in service, but marked degraded.
IS = The PDSN is in service.
OOS = The PDSN is out of service
REMOVED = The PDSN has been degrown in RC/V but still has active sessions.
UNKNOWN = The status of the PDSN is unknown.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP PCF output message.

Output Message(s):

OP:PCF
STP:PCF

Input Appendix(es):

APP:RANGES
OP:PCTF

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a list of all per-call test failures (PCTFs) that have occurred in all switching modules (SMs), a range of SMs, or a particular SM since the last time the periodic list was printed. Requests which do not specify a range of SMs will result in all equipped SMs in the system being reported. Only one OP:PCTF request can be active in the system at any moment; any additional requests will be denied. The OP:PCTF request will not clear the SM based PCTF counts; only the periodic report (REPT:PCTF-SUMMARY) will cause the PCTF counts to be cleared (set to zero).

2. FORMAT

OP:PCTF[,SM=a[&b]];  

3. EXPLANATION OF MESSAGE

a = SM number, or lower limit of a range of SM numbers.
b = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the OP:PCTF output message.
RL = Retry later. The request has been denied, probably due to system load.

5. REFERENCES

Input Message(s):

STP:PCTF

Output Message(s):

OP:PCTF
REPT:PCTF-SUMMARY

Other Manual(s):

235-105-220  Corrective Maintenance
1. PURPOSE

Requests the Operating System for Distributed Switching (OSDS) resource monitoring utility to collect and report usage of OSDS message, process, stack, and timer control blocks. Reports will be generated periodically until the utility is disabled by the STP:PERF input message or after two hours have elapsed.

2. FORMAT

OP:PERF, {AM | CMP=a-b | SM=c}, [TIME=d];

3. EXPLANATION OF MESSAGE

AM = Operational kernel process in the administrative module (AM).
a = Message switch side (0 or 1).
b = Communications module processor (CMP) number.
c = Switching module (SM) number.
d = Interval, in minutes, between reports. (1-15, default 15)

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with a previous request, or with current system or equipment status. May also include:
- CMP NOT EQUIPPED = Requested CMP is not equipped.
- INTERNAL ERROR = An internal error has occurred while processing a CMP request.
- PREV REQ INPROG, ISSUE 'STP:PERF,AM' TO CANCEL = Previous request in progress. OSDS resource monitoring is already enabled in the AM.
- PREV REQ INPROG, ISSUE 'STP:PERF,CMP=#-#' TO CANCEL = Previous request in progress. OSDS resource monitoring is already enabled in the requested CMP.
- PREV REQ INPROG, ISSUE 'STP:PERF,SM=###' TO CANCEL = Previous request in progress. OSDS resource monitoring is already enabled in the requested SM.

PF = Printout follows. Followed by the OP:PERF output messages.

RL = Retry later. The request cannot be initiated now due to unavailable system resources. May also include:
- CMP SOFT SWITCH INPG = A CMP soft switch is in progress.
- CMP UNAVAILABLE = Requested CMP is out of service, initializing, or unavailable.

Input Message(s):

STP : PERF

Output Message(s):

OP : PERF
OP:PERPH-SM-SUM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a summary of peripheral (PERPH) transient errors on switching modules (SMs). Peripheral transient errors are counted by peripheral fault recovery (PFR) but are not normally reported.

Two different types of peripheral transient error summary messages may be requested. The system (SYS) wide SM peripheral error summary message will print the total number of transient peripheral errors which have occurred in the requested SMs.

The system wide SM error summary is printed at 7:00AM, and cleared at 7:00PM, automatically each day. The system wide SM error summary counts can also be cleared by request.

It is possible to request that the system wide peripheral error summary be printed every hour. The hourly printout will be printed every hour from the time at which it was enabled. For example, if the hourly report mechanism is enabled at 18:44 then the first report will be at 19:44. The hourly reports will continue to be printed until the mechanism is disabled.

A more detailed summary of SM transient peripheral errors which lists the transient errors for SMs by unit type (UNIT) can also be requested. The error counts for the UNIT summary message can be cleared (CLR) by request, and are automatically cleared at 7:00 PM each day.

2. FORMAT

OP:PERPH, {SM= a[b], CLR], SUM=[c] | HOURLY= {ON | OFF}};

3. EXPLANATION OF MESSAGE

CLR = Clear unit type error summary information in each specified SM after summary information is printed.
Note: This will not clear out the system wide SM error summary counts.

a = SM number or lower limit of range of SM numbers. Default is all SMs.

b = Upper limit of range of SM numbers.

c = Summary (SUM) type. Valid value(s):
SYS = Request system wide SM transient peripheral error summary
UNIT = Request summary of transient peripheral errors by unit type for each SM indicated (default).

4. SYSTEM RESPONSE

NG = No good. The request has been denied. May also include:
- **ALREADY IN REQUESTED STATE** = The request cannot be honored because the hourly report mechanism is already in the state requested.
- **SM UNEQUIPPED** = The request has been denied. The SM number does not match any equipped SM.

**OK**

= Good. The request has been accepted.

**PF**

= Printout follows. Followed by either the OP:PERPH-SYS-ES (if SUM=SYS) or OP:PERPH-SM-UES (if SUM=UNIT) output message.

**RL**

= Retry later. System resource shortage. May also include:
- **CANNOT CREATE TERMINAL PROCESS** = The request cannot be executed now due to the unavailability of the system resources necessary for creating a terminal process.

235-105-220  *Corrective Maintenance*
OP:PLNT24-A

Software Release: 5E14 - 5E16(2)
Command Group: MEAS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the plant report be printed at a time other than the regularly scheduled time.

WARNING: It is recommended that PART24 not be requested during busy hours because this request could generate up to 2000 lines of data.

2. FORMAT

OP:PLNT24:{a|ALL};

3. EXPLANATION OF MESSAGE

ALL = Print all parts of the 24-hour plant report.

a = Name of report part to be printed. Valid value(s):
  PART1 = Service measurements.
  PART2 = Equipment performance.
  PART3 = Performance measurements.
  PART4 [=x] = Remote switching module (RSM) maintenance service and performance, where 'x' is the RSM number(s) (maximum of five numbers, separated by "."). If 'x' is not specified, all RSMs will be printed.
  PART5 = Trunk error analysis.
  PART6 = Interlata carrier measurements.
  PART7 = Network call denial.
  PART8 = RSM cluster measurements.
  PART9 = Integrated services digital network (ISDN) packet switching office totals.
  PART10 = Operator Services Position System (OSPS) processors counts.
  PART11 = ISDN office totals.
  PART13 = OSPS real-time rating query measures.
  PART14 = OSPS facility administration measures.
  PART15 = OSPS measurements.
  PART16 = OSPS interflow measures.
  PART17 = OSPS line information database (LIDB) measures.
  PART18 = OSPS customer account services (CAS).
  PART19 = Action control point (ACP) for software defined network.
  PART21 = Leased network action point.
  PART22 = OSPS intercept measures.
  PART23 = OSPS customer account services release 3 signaling measures.
  PART24 = Machine detected inter-office irregularity (MDII) trunk group measurements.
  PART25 = ISDN user part (ISUP) office totals.
  PART26 = DS1 measurements.
  PART27 = Static proportionate bidding (PB) measurements.
PART28 = OSPS international credit card validation (ICCV) measures by foreign database.
PART29 = OSPS line applications for consumers (LAC) signaling measures.
PART30 = OSPS originating line number screening (OLNS) measures.
PART36 = Signaling link performance.

4. SYSTEM RESPONSE

NG = No good. May also include:
- DATA NOT AVAILABLE = The request was made during the automatic preparation of the report.
- DATA NOT AVAILABLE AT THIS TIME = Report is being generated and, therefore, manual requests are locked out, or the report has not generated since an initialization.
- DATA NOT COLLECTED = Data for this part was not collected.
- FEATURE NOT AVAILABLE = The feature required to process the request is not present in the switch.

PF = Printout follows. The request has been received and is being processed. If the report is available, it will follow. Otherwise, an error message will follow.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the plant report be printed at a time other than the regularly scheduled time.

WARNING: It is recommended that PART24 not be requested during busy hours because this request could generate up to 2000 lines of data.

2. FORMAT

OP:PLNT24:{a|ALL};

3. EXPLANATION OF MESSAGE

<table>
<thead>
<tr>
<th>ALL</th>
<th>= Print all parts of the 24-hour plant report.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>= Name of report part to be printed. Valid value(s):</td>
</tr>
<tr>
<td>PART1</td>

</table>
PART28 = OSPS international credit card validation (ICCV) measures by foreign database.
PART29 = OSPS line applications for consumers (LAC) signaling measures.
PART30 = OSPS originating line number screening (OLNS) measures.
PART36 = Signaling link performance.
PART37 = ATM quality of service.
PART38 = ATM quality of service for PSU to PSU connection.

4. SYSTEM RESPONSE

NG = No good. May also include:
- DATA NOT AVAILABLE = The request was made during the automatic preparation of the report.
- DATA NOT AVAILABLE AT THIS TIME = Report is being generated and, therefore, manual requests are locked out, or the report has not generated since an initialization.
- DATA NOT COLLECTED = Data for this part was not collected.
- FEATURE NOT AVAILABLE = The feature required to process the request is not present in the switch.

PF = Printout follows. The request has been received and is being processed. If the report is available, it will follow. Otherwise, an error message will follow.

OP:PLNTMO-PT15
OP:PLNTMO-PT16
OP:PM-PP-MCTSI

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests the output of the port processor's (PP's) postmortem reports saved in the specified module controller time slot interchanger (MCTSI). The postmortem report will be locked in memory for 72 hours, or until it is manually released by the RLS:PM-PP-MCTSI input message. When memory is unlocked, the next autonomous packet switching unit protocol handler (PSUPH) or packet interface (PI) initialization will have its postmortem report saved in the PI of the in-service MCTSI.

The PI's postmortem save area in an out-of-service MCTSI will not be updated when it is returned to service. The manual release of a postmortem report from a single MCTSI allows the save areas to hold different reports. Thus, a time stamp will be supplied in the postmortem report to help determine the time sequence of initialization actions.

2. FORMAT

OP:POSTMORT,PP,MCTSI=a-b;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Switching module (SM) number.

b = MCTSI side number (0 or 1).

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the output of the postmortem reports is in progress.

NG = No good. The message was not accepted because the SM is isolated or the MCTSI is out of service.

NO = Feature not available. The requested action failed because the feature required to process the request is not present in the module.

Output Message(s):
**OP:PM-SM**

**Software Release:** 5E14 and later  
**Command Group:** SYSRCVY  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests a copy of the specified postmortems from the specified switching module (SM). The postmortem also prints automatically 5 minutes after a recovery unless requested by this input request or released by the RLS:POSTMORT input request. If no specific postmortem type is requested, then by default the online SPP, EVENT, ESCAL, RCVY, and DCF postmortems are dumped.

Execution of this input request will cause any of the output messages listed under REFERENCES.

### 2. FORMAT

\[
\text{OP:POSTMORT,SM=SMaN[,OFL][,SPP][,EVENT][,ESCAL][,RCVY][,DCF]};
\]

### 3. EXPLANATION OF MESSAGE

- **DCF** = Execute defensive check failure postmortem dump.
- **ESCAL** = Execute escalation count postmortem dump.
- **EVENT** = Execute event history postmortem dump.
- **OFL** = Execute a dump of the offline postmortem. If this option is specified alone, offline SPP, event, and escalation histories will be dumped. When OFL is specified, the RCVY or DCF options are not allowed. Default is to dump the online postmortem.
- **RCVY** = Execute recovery output reports postmortem dump.
- **SPP** = Execute SPP history postmortem dump.
- **a** = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

### 4. SYSTEM RESPONSE

- **NG** = No good. The request was not accepted because an illegal SM number was specified. May also include:
  - **OFL AND DCF OR RCVY NOT ALLOWED** = The combination of options OFL with DCF or RCVY is not a legal combination.
  - **OFFLINE DATA NOT AVAILABLE** = The data which resides on the offline side of the switch module has not been set up by SM offline verification. This data only gets set up after an offline pump with the verification option set. An illegal SM number was specified.

- **PF** = Printout follows.

1. PURPOSE

Requests a list of active protocol monitoring (PM) sessions.

2. FORMAT

OP:PM{,SES=a|ALL}[,PRINT];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = All active protocol monitoring sessions.
PRINT = Print on the receive-only printer (ROP).

Note: If the request is initiated from the MCC or a STLWS, the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

a = The protocol monitoring session (SES) specified in the EXC:PM output message.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized, or was not acceptable.
PF = Printout follows. The request has been accepted and is in progress. Followed by the OP:PM output message(s).
RL = Retry later. The system is busy.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Requests a list of active CCS protocol monitoring (PM) sessions and provides status of the PM processors.

2. FORMAT
OP:PMCCS{,SES=a|ALL}[,PRINT][,VERBOSE];

3. EXPLANATION OF MESSAGE
Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = All active CCS protocol monitoring sessions.
PRINT = Print on the receive-only printer (ROP).
Note: If the request is initiated from the MCC or a STLWS, the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

VERBOSE = Print additional information regarding the status of the processors involved in the PM session.
Lists the SCREENING, RECORDING, ABORTED or OVERLOADED processors for the PM session.

a = The protocol monitoring session (SES) specified in the EXC:PMCCS output message.

4. SYSTEM RESPONSE
NG = No good. The message was not recognized, or was not acceptable.
PF = Printout follows. The request has been accepted and is in progress. Followed by the OP:PMCCS output message(s).
RL = Retry later. The system is busy.

Output Message(s):
   EXC:PMCCS
Other Manual(s):
235-105-110  System Maintenance Requirements and Tools
**OP:PMCR**

Software Release: 5E14 and later  
Command Group: MEAS  
Application: 5,3B  
Type: Input

1. **PURPOSE**

Requests the various plant measurements common reports, detailing system performance statistics. By default, the data collected for the previous hour is reported every hour and the data collected for the previous day is reported at midnight.

2. **FORMAT**

   [1]  OP:PMCR,TYPE=STAT[,HOURLY|,DAILY=a|,NOHOURLY|,NODAILY];  
   [2]  OP:PMCR,TYPE=RET,INTVL=b,FORM=c;  
   [3]  OP:PMCR,TYPE=DEM,FORM=c;

3. **EXPLANATION OF MESSAGE**

Each of the three formats (for STAT, RET, and DEM) has its own distinct purpose.

**DAILY**  = Set the option for daily reports to be output once per day.  
**DEM**  = Demand report. Outputs a report of up-to-the-hour data collected for the next daily report (as determined by the STAT format, default is midnight). Demand reports should not be attempted until at least one hour after a valid scheduled daily report has been generated.  
**HOURLY**  = Set the option for hourly reports to be output every hour. Use only with STAT form.  
**NODAILY**  = Sets the option for daily reports not to be output. Use only with STAT format.  
**NOHOURLY**  = Sets the option for hourly reports not to be output. Use only with STAT format.  
**RET**  = Retained report. Outputs a report of the previous daily or hourly data, depending on the interval entered. Requesting a daily retained report should not be attempted until after a scheduled daily report has been generated. Requesting an hourly retained report should not be attempted until after a scheduled hourly report has been generated.  
**STAT**  = Status report. Indicates whether the hourly and/or daily scheduled reports will be output. This form is used to turn the scheduled reports on or off. This form is also used to enable/disable printing of the daily/hourly reports or to change the hour when the daily report is output.  

   a  = The hour ‘a’, 0-23, where the default is 0 (midnight). Use only with STAT format.  
   b  = Report interval. ‘b’ values are HOURLY or DAILY. Used only with RET format, HOURLY outputs the data from the previous hour; DAILY from the previous day.  
   c  = Report form. ‘c’ values are 1 or 2, where form 1 outputs system and equipment performance and 2 outputs more detailed equipment performance.
4. SYSTEM RESPONSE

**PF** = Printout follows. Followed by the REPT:OP-PMCR output message.

5. REFERENCES

Output Message(s):

- **OP:PMCR-ERROR**
- **REPT:OP-PMCR**
1. PURPOSE

Requests a copy of the postmortem for the digital networking unit - synchronous optical network (DNU-S) common controller (DNUSCC), the integrated digital carrier unit (IDCU), the integrated service line unit common controller (ISLUCC) or the transmission multiplexer (TMUX). The postmortem also prints automatically five minutes after a recovery unless requested sooner by this input message.

2. FORMAT

OP:POSTMORT[,HISTORY],{DNUSCC=a-b-c|IDCU=a-d-e|ISLUCC=a-f-c|TMUX=a-b-g-h};

3. EXPLANATION OF MESSAGE

**HISTORY** = Log the events of the DNUSCC, IDCU, ISLUCC or TMUX postmortem.

a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

**NG** = No good. The message was not accepted because the SM is isolated or the equipment does not exist.

**PF** = Printout follows. The OP:PM-DNUSCC for DNU-S output, OP:PM-IDCU for IDCU output, OP:PM-ISLUCC for ISLUCC output or OP:PM-TMUX for TMUX output message follows.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = SONET terminating equipment facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = OIU number (0-7). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Protection group (PG) number (0-9). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = OC3 number (1). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = STS-1 number (1-3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = Optical carrier level 3 concatenated (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Synchronous transport signal level 3 concatenated (STS3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The input contained an illegal specification.

PF = Printout follows. The request has been accepted and the OP:PTRC output message follows.

RL = Retry later. The request has been denied, probably due to system load.

OP:PTRC-STS FAC

Software Release: 5E14 - 5E15
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

This input message is used to verify that the specified receiving synchronous transport signal (STS) path terminating equipment (PTE) is connected to the intended transmitting STS PTE. This request is used for digital networking unit - synchronous optical network (SONET) (DNU-S).

2. FORMAT

OP:PTRC, STSFAC=a-b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = SONET terminating equipment facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The input contained an illegal specification.

PF = Printout follows. The request has been accepted and the OP:PTRC-STS FAC output message follows.

RL = Retry later. The request has been denied, probably due to system load.

54. OP:Q
OP:QNETSTAT

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests a report of the status of quad-link packet switch (QLPS) pipes (QPIPEs), QLPS communication links (QLNKs), and inter-switching module QLNKs (ISMQLNKs) and, optionally, the supporting communication module (CM) hardware.

Format 1 requests a report of the status of all QPIPEs, QLNKs, and ISMQLNKs meeting specified criteria. If no criteria are specified, the status of all out-of-service (OOS) QPIPEs, QLNKs, and ISMQLNKs for both networks will be reported unless the outage is due to a parent unit (family-of-equipment). Output can be restricted (or expanded) by specifying the QLPS network, source and/or destination endpoints, and state qualifiers. If both source and destination are specified, the report will include the status of QPIPEs at both the source and destination, and QLNKs or ISMQLNKs between them. If either source or destination is specified (but not both), the report will include the status of QPIPEs at the specified endpoint, and QLNKs and/or ISMQLNKs to all other endpoints.

Format 2 requests a report of the status of a specific QPIPE, QLNK, or ISMQLNK and the identity and status of all of it's supporting CM hardware.

2. FORMAT

[1] OP:QNETSTAT[,QLPSNW=a][,SRCSM=b|SRCQGP=c-d][,DESTSM=e][,ALL|OOS|NOFE];

[2] OP:QNETSTAT,{MHQPIPE=f-g-h-i|QGPQPIPE=j-k-h-i|QLNK=f-g-h-i-k-j|ISMQLNK=f-g-h-i-l-m};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Report status of all equipped QPIPEs, QLNKs, and ISMQLNKs.

NOFE = Report status of OOS QPIPEs, QLNKs, and ISMQLNKs that are not OOS family-of-equipment (FE). This is the default option.

SRCSM = Source SM-2000. Restricts status output to MH QPIPEs, QLNKs, and ISMQLNKs associated with the source SM-2000 and, if specified, a destination SM-2000.

SRCQGP = Source QGP. Restricts status output to QPIPEs and QLNKs associated with the source QGP and, if specified, a destination SM-2000.

a = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Message switch (MSGS) side of source QGP. Refer to the APP:RANGES appendix in the...
Appendixes section of the Input Messages manual.

d = Source QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Destination SM-2000 number. Restricts status output to QPIPEs, QLNKs, and ISMQLNKs associated with the destination SM-2000 and, if specified, a source QGP or SM-2000. If used with the SRCSM option, the report will include the status of MH QPIPEs for both SM-2000s and the ISMQLNKs between them. If used with the SRCQGP option, the report will include the MH QPIPEs for the destination SM-2000, the QGP QPIPEs for the source QGP, and the QLNKs between the source QGP and destination SM-2000. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Source SM-2000 number associated with the specified MH QPIPE, QLNK, or ISMQLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Source SM-2000's active module controller time slot interchanger (MCTSI) side. The active MCTSI side is reported for informational purposes as part of the MH QPIPE, QLNK, and ISMQLNK identification in output messages. Regardless of the MCTSI side specified, the current active MCTSI will be indicated in the OP QNETSTAT output message.

h = QLPS network associated with the specified QPIPE, QLNK, or ISMQLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Office network and timing complex (ONTC) side associated with the specified QPIPE, QLNK, or ISMQLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = MSGS side associated with the specified QGP QPIPE or QLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = QGP number associated with the specified QGP QPIPE or QLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Destination SM-2000 number associated with the specified ISMQLNK. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Destination SM-2000's active MCTSI side. Regardless of the MCTSI side specified, the current active MCTSI will be indicated in the OP QNETSTAT output message.

4. SYSTEM RESPONSE

NG = No good. May also include:
- DATA BASE READ FAILURE = A database access to determine whether a specified SM was equipped failed. An assert will fire.
- DESTINATION NOT AN SM2000 = DESTSM is not a SM-2000.
- DYNAMIC DATA READ FAILURE = The dynamic state of a specified unit could not be obtained from the PCD (peripheral configuration database).
- INVALID MSGS SIDE = The MSGS side (as input with the SRCQGP option) is out of range.
- SM UNEQUIPPED = SM is not equipped.
- SOURCE CANNOT BE BOTH QGP AND SM = Both the SRCSM and SRCQGP options were input.
- SOURCE NOT AN SM2000 = SRCSM is not a SM-2000.
UNIT UNEQUIPPED = There are no equipped QLPSs in the office, the specified SRCQGP is not equipped, or the specified QPIPE/QLNK/ISMQLNK is not equipped.

PF = Printout follows. Followed by the OP:QNETSTAT output message.

RL = Retry later. May also include:
- PREVIOUS REQUEST IN PROGRESS = Terminal process already exists for a previous request.

?E = An error occurred while processing the message, but the problem cannot be attributed to a specific field. May also include:
- CANNOT CREATE TERMINAL PROCESS = Attempt to create the terminal process failed. An assert will fire.
- COMMUNICATION ERROR = Deferred maintenance administrator and monitor (DMAM) was unable to communicate with the terminal process.

OP:RCACCESS-A

Software Release: 5E14 only
Command Group: AUTH
Application: 5
Type: Input

1. PURPOSE

Requests verification of permissions for recent change (RC) access from a specified terminal (TTY) associated with the 3B processor or a specified login id (LOGIN) assigned on the administrative services module (ASM).

2. FORMAT

OP:RCACCESS, (LOGIN="a"|TTY="b");

3. EXPLANATION OF MESSAGE

a = Name of a login id assigned on the ASM in the office. Because the login ids may have lower case characters in them it is necessary to surround each id with a pair of quotation marks.

b = Name of a terminal associated with the 3B in the office. Because the terminal names have lower case characters in them it is necessary to surround each name with a pair of quotation marks.

235-118-xxx Recent Change Procedures and References Collection
OP:RCACCESS-B
Software Release: 5E15 and later
Command Group: AUTH
Application: 5
Type: Input

1. PURPOSE
Requests verification of permissions for recent change (RC) access from a specified terminal (TTY) associated with
the 3B processor, a specified login id (LOGIN) assigned on the administrative services module (ASM), an Authority
Management Login (AUTHLOGIN), or a Recent Change Security Group (RCSECGRP).

2. FORMAT
OP:RCACCESS, {LOGIN="a"|TTY="b"|AUTHLOGIN="c"|RCSECGRP="d"};

3. EXPLANATION OF MESSAGE

   a = Name of a login id assigned on the ASM in the office. Because the login ids may have lower
case characters in them it is necessary to surround each id with a pair of quotation marks.

   b = Name of a terminal associated with the 3B in the office. Because the terminal names have lower
case characters in them it is necessary to surround each name with a pair of quotation marks.

   c = Name of a login assigned through Authority Management in the office. Because the login ids may
have lower case characters in them, it is necessary to surround each id with a pair of quotation marks. This parameter is associated with a secured feature. Refer to the
SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

   d = Name of the Recent Change Security Group in the office. Because the RC security group may
have lower case characters in them, it is necessary to surround each group name with a pair of
quotation marks. This parameter is associated with a secured feature. Refer to the
SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

4. SYSTEM RESPONSE

   NG = No good. Invalid terminal or login designation.

   PF = Printout follows. The request has been received. A printout and a response message will follow.

235-105-24x  *Software Release Retrofit*
OP:RCSECGRP

Software Release: 5E15 and later
Command Group: AUTH
Application: 5
Type: Input

1. PURPOSE

If the recent change (RC) access for a specified terminal (TTY) associated with the 3B processor, a specified login id (LOGIN) assigned on the administrative services module (ASM), or an Authority Management Login (AUTHLOGIN), this message requests the Recent Change Security Group (RCSECGRP) that it is assigned to. If a RCSECGRP is specified, this message request a list of TTYs, logins and AUTHLOGINS that are assigned to the RCSECGRP. If LIST is specified, this message requests a list of RCSECGRP's in the office. This message is associated with a secured feature (99-5E-7951). Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

2. FORMAT

OP:RCSECGRP,{LOGIN="a"|TTY="b"|AUTHLOGIN="c"|SECGRP="d"|LIST};

3. EXPLANATION OF MESSAGE

a = Name of a login id assigned on the ASM in the office. Because the login ids may have lower case characters in them it is necessary to surround each id with a pair of quotation marks.

b = Name of a terminal associated with the 3B in the office. Because the terminal names have lower case characters in them it is necessary to surround each name with a pair of quotation marks.

c = Name of a login assigned through Authority Management in the office. Because the login ids may have lower case characters in them, it is necessary to surround each id with a pair of quotation marks.

d = Name of the Recent Change Security Group in the office. Because the RC security group may have lower case characters in them, it is necessary to surround each group name with a pair of quotation marks.

4. SYSTEM RESPONSE

NG = No good. Invalid terminal or login designation.

PF = Printout follows. The request has been received. A printout and a response message will follow.

235-118-25x  Recent Change Reference
OP:RCSTAT-SM
Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests the number of recent changes applied in the administrative module (AM), one or more communication module processors (CMPs), and/or one or more switching modules (SMs) since the previous backup of the office-dependent data (ODD). It also reports the percentage of space used by these recent changes in the AM, CMP, SM, and the redundant log files.

2. FORMAT

OP:RCSTAT, {SM=a[&&b]|CMP=c[&&d]|AM|SM=a[&&b],CMP=c[&&d]|SM=a[&&b],AM|CMP=c[&&d],AM|SM=a[&&b],CMP=c[&&d],AM};

3. EXPLANATION OF MESSAGE

AM = Report the number of recent changes logged in the AM.
a = SM number, or the lower limit of a range of SM numbers.
b = Upper limit of a range of SM numbers.
c = CMP number, or the lower limit of a range of CMP numbers.
d = Upper limit of a range of CMP numbers.

4. SYSTEM RESPONSE

NG = No good. The input message is not valid.
PF = Printout follows. Followed by the OP:RCSTAT output message.

Application: 5
Type: Input

1. PURPOSE

Requests a report on the active recent change (RC) process that is accessing the office-dependent data (ODD) and the terminal (TTY), the clerk ID in the case of batch RC, associated with the process.

2. FORMAT

OP:RCUSER;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. The request was accepted. Followed by the OP:RCUSER output message.

5. REFERENCES

Output Message(s):

OP:RCUSER
1. PURPOSE

Requests a report of a specific remote digital test access (RDTA) session or a summary of all currently active RDTA sessions. The information displayed as a result of this request represents the data that is populated in the RLRDTA_DATA relation which resides in the administrative module (AM).

Information corresponding to one specific RDTA session can be accessed by either providing the session number (returned in the EXC:RDTA output message after the connection was setup) or the port under test (PUT). The session number may also be found by executing the OP:RDTA input message to receive information on all sessions (SES=ALL option).

2. FORMAT

\[ \text{OP:RDTA}, \{a \mid \text{SES}=\{u \mid \text{ALL}\}\}[,\text{CH}=v] \];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

\begin{itemize}
  \item **ALL** = Report information pertaining to all active RDTA sessions.
  \item **SES** = Session.
  \item **a** = Port identification. Valid value(s):
  \begin{itemize}
    \item \text{BST}=b-c
    \item \text{DEN}=d-e-f-g
    \item \text{DN}=h
    \item \text{ILEN}=d-i-j-k
    \item \text{LCEN}=d-l-m-n
    \item \text{LCKEN}=d-l-f1-w-x
    \item \text{MLHG}=o-p
    \item \text{INEN}=d-y-j-k
    \item \text{NEN}=d-y-z-a1-b1-c1-d1-e1
    \item \text{OAPO}=b
    \item \text{OPT}=b-c
    \item \text{PKTDN}=h
    \item \text{RTRS}=q-r
    \item \text{TKGHN}=s-t
  \end{itemize}
  \item \text{b} = Operator Service Center number of the BST. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  \item \text{c} = Relative position number of the BST. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  \item \text{d} = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  \item \text{e} = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  \item \text{f} = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\end{itemize}
g = Digital channel number. If this is a DFI-2, channels 1-24 are associated with T1 A and channels 25-48 are associated with facility T1 B. Otherwise there is only one T1 facility (1-48).

h = The DN associated with the ISDN interface port. This parameter can only be used to identify channels associated with digital subscriber lines (DSLs).

i = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Session number of the RDTA session for which corresponding RDTA information is requested. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Channel type (valid only for DN and LCEN port identification). Valid value(s):
    B1 = Channel B1.
    D = D-channel (default).

w = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

x = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages Manual.

\( y \) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( z \) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( a \) = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( b \) = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( c \) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( d \) = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( e \) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

\( f \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

4. SYSTEM RESPONSE

\( PF \) = Printout follows. The request has been accepted. Followed by an OP:RDTA output message.

\( RL \) = Retry later. Valid value(s):

- FAILED TO CREATE PROCESS = A system error has occurred. Refer to the TECHNICAL ASSISTANCE section of the INTRODUCTION.
- TOO MANY PROCESSES ACTIVE = The request has been denied, probably due to system load.

Type: Input

1. PURPOSE

Requests a report of a specific remote digital test access (RDTA) session or a summary of all currently active RDTA sessions. The information displayed as a result of this request represents the data that is populated in the RLRDTA_DATA relation which resides in the administrative module (AM).

Information corresponding to one specific RDTA session can be accessed by either providing the session number (returned in the EXC:RDTA output message after the connection was setup) or the port under test (PUT). The session number may also be found by executing the OP:RDTA input message to receive information on all sessions (SES=ALL option).

2. FORMAT

OP:RDTA,{a|SES={u|ALL}}[,CH=v];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL
= Report information pertaining to all active RDTA sessions.

SES
= Session.

a
= Port identification. Valid value(s):

BST=b-c
DEN=d-e-f-g
DN=h
ILEN=d-i-j-k
LCEN=d-l-m-n
LCKEN=d-l-f1-w-x
MLHG=o-p
INEN=d-y-j-k
NEN=d-y-z-a1-b1-c1-d1-e1
OAPO=b
OPT=b-c
PKTN=h
RTRS=q-r
TKGMN=s-t
PLTEN=d-g1-h1-l1-j1

b
= Operator Service Center number of the BST. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c
= Relative position number of the BST. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital channel number. If this is a DFI-2, channels 1-24 are associated with T1 A and channels 25-48 are associated with facility T1 B. Otherwise there is only one T1 facility (1-48).

h = The DN associated with the ISDN interface port. This parameter can only be used to identify channels associated with digital subscriber lines (DSLs).

i = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Session number of the RDTA session for which corresponding RDTA information is requested. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Channel type (valid only for DN and LCEN port identification). Valid value(s):

   B1 = Channel B1.
D = D-channel (default).

w = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

x = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

z = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

a1 = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

b1 = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

c1 = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

d1 = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

e1 = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

f1 = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

g1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

h1 = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

i1 = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

j1 = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by an OP:RDTA output message.

RL = Retry later. Valid value(s):
  - FAILED TO CREATE PROCESS = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

**OP:REG**

Software Release: 5E14 and later  
Command Group: SM  
Application: 5  
Type: Input

1. **PURPOSE**

Requests that the contents of the error registers of the specified hardware unit be printed. This is used only for T1 error registers on digital facility interfaces (DFIs).

Format 1 is used to request the contents of registers on a digital facility interface (DFI), a remote digital facility interface (RDFI), or a host digital facility interface (HDFI). Format 2 is used only with a SLC® digital facility interface (SDFI). Format 3 is used only with a remote integrated services line unit (RISLU) digital facility interface (DFIH).

2. **FORMAT**

   [1] \(\text{OP:REG,}\{\text{DFI|RDFI|HDFI}\}=a-b-c;\)

   [2] \(\text{OP:REG, SDFI}=a-d-e;\)

   [3] \(\text{OP:REG, DFIH}=a-f-g;\)

3. **EXPLANATION OF MESSAGE**

   a = Switching module (SM) number.

   b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   d = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. (for SDFI only).

   e = SDFI number (for SDFI only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   f = RISLU DLTU number (for RISLU only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   g = DFIH number (for RISLU only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   NG = No good. The request was not accepted because:
   - An illegal SM number was specified.
   - An illegal DLTU number was specified.
   - An illegal DCLU number was specified.
   - An illegal DFI number was specified.
PF = Printout follows. Followed by the OP:REG output message.

RL = Retry later. Communication lost to the specified SM.

235-105-220 Corrective Maintenance
OP:RELSPACE

Software Release: 5E14 and later  
Command Group: ODD  
Application: 5  
Type: Input

1. PURPOSE

Requests a report of the size of a relation residing on an operational processor or range of processors.

The size of the relation refers to all memory allocated to the relation, including head pages, data pages and intermediate data pages. This message does not report the number of tuples in the relation, but only the amount of memory allocated to the relation at the time of request.

2. FORMAT

OP:RELSPACE,REL=a,PCRNO=b[&c];

3. EXPLANATION OF MESSAGE

a = Relation name. The relation name should be in capital letters and match the relation name dictionary entry exactly as shown in Translations Data Manual or Dynamic Data Manual. The relation name should be enclosed in double quotes.

b = Processor number, or lower limit of a range of processor numbers.

c = Upper limit of a range of processor numbers.

4. SYSTEM RESPONSE

NG = No good. The input request is not valid.

PF = Printout follows. Request was accepted and is followed by the OP:RELSPACE output message.

RL = Retry later. The request was acceptable but the AM terminal process could not be created at this time. This means the switch is probably in trouble. Try the input message when the switch returns to an operable state.

OP:REX-CM-SM
  Software Release: 5E14 and later
  Command Group: MAINT
  Application: 5
  Type: Input

1. PURPOSE

Requests the summary of one or all valid test types of routine exercise (REX) for the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in an SM.

2. FORMAT

  OP:REX[,CM|,SM=a][,b];

3. EXPLANATION OF MESSAGE

  a = SM number.

  b = REX test type whose summary is to be printed (default is to print the summary of all valid test types for the module). Valid value(s):
     DGN = Print the summary of diagnostic tests.
     ELS = Print the summary of electronic loop segregation tests. This is not a valid test type for the CM.
     FAB = Print the summary of fabric exerciser tests of grids. This is not a valid test type for the CM.

  Note: If neither CM nor SM is specified, the hardware test results in the CM and all of the SMs are retrieved.

4. SYSTEM RESPONSE

  NG = No good. The request was not a valid entry.

  PF = Printout follows. Request is valid and output message will follow.

  RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

  1280 [REX STATUS (SM)]
  1290 [REX STATUS (CM)]
OP:REXINH

**Software Release:** 5E14 and later
**Command Group:** MAINT
**Application:** 5,3B
**Type:** Input

1. **PURPOSE**

Requests the status of routine exercises (REX) in a specific module. Applications may add additional hardware units which may be reported by this input message.

Format 1 requests a report of the inhibit status of hardware in the communications module (CM) and all operational switching modules (SMs).

Format 2 requests a list of all the administrative module (AM) hardware units that have REX temporarily inhibited by means of the INH:REX or INH:DMQ input messages. Requests AM and application hardware communities that have REX permanently inhibited by a field in the equipment configuration database (ECD). The specific deferred maintenance queue (DMQ) inhibits may be verified by using the OP:DMQ input message.

Format 3 requests a report of the SM or SMs for which routine exercises are currently inhibited by means of the INH:REX-AM-SM or INH:REX-CM-SM input message. This request shows whether the test types for a module have been inhibited or allowed, and if allowed, if that test is in progress (IP).

Format 4 requests a report of the CM for which routine exercises are currently inhibited by means of the INH:REX-CM-SM input message. This request shows whether the test types for a module have been inhibited or allowed, and if allowed, if that test is IP. By using the UNITS option of the input message requests a report of the units which are currently inhibited for REX in a CM.

Format 5 requests a report of the units which are currently inhibited for REX in the SM.

2. **FORMAT**

   [1] OP:REXINH;
   [3] OP:REXINH,SM=a[&&b];
   [4] OP:REXINH,CM[,UNITS];

3. **EXPLANATION OF MESSAGE**

   **PERM** = Requests a list of permanent REX inhibits.
   
   **a** = SM number or the lower limit of a range of SM numbers.
   
   **b** = Upper limit of a range of SM numbers.

4. **SYSTEM RESPONSE**

   **OK** = Good. Request is valid and accepted.
PF = Printout follows. Formats 1, 3, 4 and 5 are followed by the OP:REXINH-SLB output message. Format 2 is followed by the OP:REXINH output message.

RL = Retry later. Cannot read ECD unit control block (UCB). Unit that the information was requested on is in an abnormal state. The request cannot be executed now.

OP:RT-ALM-ALL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a report of the current off-normal states and alarms for integrated TR008/TR303 remote terminals (RT) in the office, either as a summary or a separate report for each RT. TR008 RTs can be the SLC® 96, Series 5 Feature Package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G.

2. FORMAT

OP:RT, {ALM[,NOPRINT] | ALL};

3. EXPLANATION OF MESSAGE

**ALL** = Print a status message (output message OP:RT-SID) for each integrated TR008/TR303 RT in the office, whether it has active alarms or not.

**ALM** = Print a summary (output message OP:RT-ALARM) of the active alarms for the off-normal RTs in the office.

**NOPRINT** = The NOPRINT option is only valid with OP:RT-ALM. This option inhibits the "NO ACTIVE ALARMS" response when there are no active alarms for the RTs in the office.

4. SYSTEM RESPONSE

**NG** = No good. The request has been denied. The message form is valid, but the request conflicts with current status. May also include:
- **NO RT'S FOUND** = There are no integrated TR008/TR303 RTs in the office data base.

**PF** = Printout follows. The request was accepted and is followed by OP:RT-ALL, OP:RT-SID-SNA or the OP:RT-ALARM output message.

**RL** = Retry later. May also include:
- **CANNOT CREATE TERMINAL PROCESS** = The request cannot be executed now due to unavailable system resources necessary for creating a terminal process.

1660,xxxx (TR303 REMOTE TERMINAL)
**OP:RT-CHAN**

Software Release: 5E14 and later  
Command Group: SM  
Application: 5  
Type: Input

1. **PURPOSE**

Requests that information describing the configuration of the embedded operations channel (EOC) and timeslot management channel (TMC) for the specified remote terminal (RT) be displayed. The output will identify the EOC and TMC channels, the associated terminal endpoint identifier (TEI), and its multi-frame status.

This output is useful in identifying the current configuration of the EOC and TMC.

2. **FORMAT**

```
OP:RT,CHAN,{SID[=a] | IDCURT=b-c-d | DNUSRT=b-e-d};
```

3. **EXPLANATION OF MESSAGE**

- **a** = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Switching module (SM) number.
- **c** = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Local RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied. The message is valid but the request conflicts with current status. May also include:
  - **NO RT's FOUND** = The message format is valid, but there are no integrated RTs in the office database.
  - **UNIT DOES NOT EXIST** = The request has been denied. The message format is valid, but the requested RT does not exist in the database.

- **PF** = Printout follows. Followed by the OP:RT-CHAN output message.

- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

OP:RT-PROV

**Software Release:** 5E14 and later
**Command Group:** TRKLN
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests a status message of the provisionable elements of a remote terminal (RT) terminating on an IDCU or DNUS. The message also reports the current provisioning report inhibit status for the RT and, if any, the preemptable client currently being served by provisioning.

This request should not be used when the PROVISION RT field in RC/V View 18.15 shows N (NO). The 5ESS® switch is then not responsible for RT provisioning and does not maintain the data reported as a result of this request.

2. **FORMAT**

\[ \text{OP:RT,PROV}, \{ \text{SID} = a \mid \text{IDCURT|DNUS} = b-c-d \}; \]

3. **EXPLANATION OF MESSAGE**

\[ \begin{aligned}
\text{a} & \quad = \text{Site identification (SID) number of the RT. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.} \\
\text{b} & \quad = \text{Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.} \\
\text{c} & \quad = \text{Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.} \\
\text{d} & \quad = \text{Local RT (LRT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.}
\end{aligned} \]

4. **SYSTEM RESPONSE**

\[ \begin{aligned}
\text{NG} & \quad = \text{No good. May also include:} \\
& \quad \quad \text{NO TR303 RT found} = \text{The request has been denied. The message is valid, but the specified RT is not a TR303 RT.} \\
& \quad \quad \text{UNIT DOES NOT EXIST} = \text{The request has been denied. The message is valid, but the requested RT does not exist in the database.}
\end{aligned} \]

\[ \begin{aligned}
\text{PF} & \quad = \text{Printout follows. Followed by the OP:RT-PROV output message.}
\end{aligned} \]

\[ \begin{aligned}
\text{RL} & \quad = \text{Retry later. May also include:} \\
& \quad \quad \text{CANNOT CREATE TERMINAL PROCESS} = \text{The request cannot be executed now due to unavailable system resources for creating a terminal process.}
\end{aligned} \]

Application: 5
Type: Input

1. PURPOSE

Requests a report of the current off-normal states and alarms for one or more integrated TR008/TR303 remote terminals (RT) in the office. TR008 RTs can be the SLC® 96, Series 5 Feature Package B, and Enhanced B. TR303 RTs can be the Series 5 feature package 303G.

2. FORMAT

OP:RT, {SID[=a[&&b]] | DCLURT=c-d-e | IDCURT=c-d-e | DNUSRT=c-d-e};

3. EXPLANATION OF MESSAGE

a  = Site identification (SID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Upper range of the SID number when requesting status of more than one RT. When the SID number is not entered, status messages will be output for each integrated TR008/TR303 RT in the office. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Digital carrier line unit (DCLU) or integrated digital carrier unit (IDCU) number or digital networking unit - synchronous optical network (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Local RT (LRT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied. The message form is valid, but the request conflicts with current status. May also include:
    - NO RT'S FOUND = There are no integrated TR008/TR303 RTs in the office database.
    - UNIT DOES NOT EXIST = The requested RT does not exist in the database.

PF  = Printout follows. The request was accepted and is followed by the OP:RT-SID-LRT output message.

RL  = Retry later. May also include:
    - CANNOT CREATE TERMINAL PROCESS = The request cannot be executed now due to unavailable system resources necessary for creating a terminal process.

OP:RTCD

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE
Requests a printout of the global billing switching module (SM) number and the status of the real time call detail (RTCD) office option.

2. FORMAT

OP:RTCD;

3. EXPLANATION OF MESSAGE
No variables.

4. SYSTEM RESPONSE

PF = Printout follows. An OP:RTCD output message will follow in response to the request.

5. REFERENCES
Output Message(s):

OP:RTCD
OP:RTITRC

Software Release: 5E14 and later
Command Group: TRACE
Application: 5
Type: Input

1. PURPOSE

Requests output of a complete routing pattern based on input information. Input may consist of a starting routing index (RTI) (Format 1) or a range of digits plus a switching module (SM) number, a trunk group (TG), and optional member number (Format 2) or a range of digits plus a digit analysis selector (DAS) and SM number (Format 3).

The routing information extracted consists of the RTI, the TG, and the next RTI (NRTI). For each RTI or for each valid digit string, up to ten RTI, TG, and NRTI patterns will be output. The information derived is output to a UNIX® RTR operating system file.

2. FORMAT

[1] OP:RTITRC,RTI=a;
[3] OP:RTITRC,SM=f,DAS=g,START=d,END=e;

3. EXPLANATION OF MESSAGE

a = Starting routing index of routing pattern to be verified.
b = Incoming trunk group number of the trunk whose translations are to be verified.
c = Member of the trunk group whose translations are to be verified. If not specified, the first assigned member from 0 - 9 is used. If there is no member 0 - 9, the input message fails.
d = The lower limit of a range of digits to be used to verify the routing pattern (0-9999999999). These represent the dialed digits in the case of a line call or the incoming digits in the case of a trunk call. This value may consist of one to ten digits.

If the starting digit string is longer than the ending digit string, the ending digit string will be expanded with trailing zeroes up to the length of the starting digit string.
e = The upper limit of a range of digits to be used to verify the routing pattern (0-9999999999). These represent the dialed digits in the case of a line call or the incoming digits in the case of a trunk call. This value may consist of one to ten digits. The upper limit of the range must be equal to or higher than the lower limit. Trailing zeroes are optional.
f = SM number to be used to verify the routing pattern.
g = Digit analysis selector (DAS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
PF

= Printout follows. A message will be sent to the read-only printer (ROP) giving the status of the input message and any output files associated with it. The OP: DIGTRC output will be sent to a UNIX® RTR file. Any errors encountered will be sent to an error log file.

RL

= Retry later. Valid value(s):
   - CANNOT ATTACH AM ODD = The RTITRC process was unable to access the administrative module (AM) office-dependent data (ODD).
   - CANNOT CREATE ERROR FILE = An error log file could not be created under /updtmp. Remove unneeded files from that directory to leave space for a new file.
   - CANNOT CREATE OUTPUT FILE = An output file could not be created under /updtmp. Remove unneeded files from that directory to leave space for a new file.
   - UNABLE TO OPEN LINK TO SMs = The RTITRC process was unable to open a communications link to the SMs in order to access SM ODD.

Input Appendix(es):

APP:RANGES
OP:SL-B

Software Release: 5E16(1) only
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Queries the digital network unit - synchronous optical network (SONET) (DNU-S) for the expected and received signal labels for synchronous transport signal facility (STSFAC). Queries the DNU-S for the expected and received signal labels and virtual tributary (VT) group size for virtual tributary 1.5 (VT1.5) facility (VT1FAC). This command is also used to query the SONET (OIU-NAR) for the expected and received signal labels for synchronous transport signal facility (STS-1) and VT1.5.

2. FORMAT

OP:SL,a;

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Facility identification. Valid value(s):
   STS1=b-i-j-k-f
   STS3C=b-i-j-k-f
   STSFAC=b-c-d-e-f
   VT15=b-i-j-k-f-g-h
   VT1FAC=b-c-d-e-f-g-h

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = OC3 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Message manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or was not acceptable.

PF = Printout follows. The request has been accepted and is in progress. Followed by the OP:SL output message(s).

RL = Retry later. The system is busy.

Input Appendix(es):

APP:RANGES
OP:SLK

**Software Release:** 5E14 and later
**Command Group:** CCS
**Application:** 5,CNI
**Type:** Input

1. PURPOSE

Requests status information for the signaling links (SLKs).

2. FORMAT

```
OP:SLK={ALL|a-b[-c-d]}[:[STATE=e[-f]] [,TYPE=g]] [:[ABNORMAL] [,CODES] [,FIX] [,ROUTING] [,RAW]] [:DATA, DEST=h];
```

3. EXPLANATION OF MESSAGE

- **ABNORMAL**
  Output a detailed report including links abnormal conditions. This is a shortened form of the RAW option. If both options are selected only the RAW option will be honored.

- **ALL**
  Report status of all links.

- **CODES**
  Output a detailed report including the link failure codes. This is a shortened form of the RAW option. CODES is intended to be used by itself, therefore if it appears on the input message line with any other of these options, the other options will be ignored.

- **FIX**
  Output a detailed report including the link configuration data.

- **RAW**
  Output a detailed report of the dynamic link information.

- **ROUTING**
  Output a detailed report including some routing information.

- **a**
  Group number or lower limit of a range of group numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **b**
  Member number or lower limit of a range of member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c**
  Upper limit of group numbers for a range of SLKs.

- **d**
  Upper limit of member numbers for a range of SLKs.

**Note:** By use of the following fields, the link report may be limited to links in the specified major and/or minor state, and/or of a given link type.

- **e**
  Either a major or a minor state name. Valid value(s):
  - **AVL** = Available.
  - **GROW** = Grow state, link also unavailable.
  - **IS** = In service.
  - **MOOS** = Available manual out-of-service.
  - **NOTIS** = Output all links in the major state of available whose minor state is NOT in-service.
  - **OOS** = Available out-of-service.
TEST = Test state, link also unavailable.
UNA = Unavailable.
UNE = Unequipped.

f = Minor state. Valid value(s):
GROW = Unavailable grow.
IS = In-service.
MOOS = Available manual OOS.
OOS = Available OOS.
STBY = Stand by.
TEST = Unavailable test.

g = Type of link. Valid value(s):
A = A links
D7 = Domestic system 7 links
DLN = Direct link node
E = E links
F = F links

h = Destination class. This is the numeric value associated with message class desired. A cross reference can be found in output appendix (APP:MSGCLLS), or with the use of the OP:OUTCLS input message. If the DEST option is not used, the output returns to the input device. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:SLK output message.

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the output of signaling system 7 (SS7) trunk data matching the following specified characteristics:
A the entire office
B a specific origination point code (OPC),
C a specific destination point code (DPC),
D a specific DPC and OPC combination,
E a DPC and a specific, range or all circuit identification codes (CICs), with an optional SM parameter described below,
F an OPC and a specific, range or all CICs, with an optional SM parameter described below,
G a DPC, OPC and a specific, range or all CICs, with an optional SM parameter described below,
H an SS7 trunk group, with an optional SM parameter described below, or
I an SS7 trunk group and a specific or range of all trunk group members, with an optional SM parameter described below.
J the Global Switching Module (GSM) supported in the office,
K a specific DPC for an specific GSM,
L a specific DPC and a specific, range or all CIC, for an specific GSM, with an optional SM parameter,
M a specific, range or all CIC for an specific GSM.
N the Common Network Interface (CNI) supported in the office,
O a specific DPC associated with the CNI,
P a specific DPC and a specific, range, or all CIC, associated with the CNI, with an optional SM parameter,
Q a specific, range or all CIC associated with the CNI,

Output will include the SS7 trunk group numbers, OPC, and DPC for formats [1] through [17]. Output will include the SS7 trunk group number(s), SS7 trunk member number(s), OPC(s), DPC(s), CIC(s) for all other inputs.

Only one OP:SS7 request may be processed by the system at any moment; additional requests will be denied.

WARNING: Requesting this message may cause an enormous amount of data to be printed on the receive-only printer (ROP). The use of any format could cause a degradation in switch service depending upon the number and size of SS7 trunk groups.

The input message, STP:SS7, can be used to halt the printing of this input message should system operation be impacted by this message.

2. FORMAT

[1] OP:SS7,OFFICE;
[2] OP:SS7,DPC=a;
[3] OP:SS7,OPC=b;
3. EXPLANATION OF MESSAGE

ALL = Search for SS7 trunk group members using a range of all possible CICs. (Refer to the APP:RANGES appendix.)

a = Destination point code (DPC) consisting of a nine digit number. Refer to the APP:POINT-CODE appendix. In multi-OPC offices where OPCs are in both ATT/UNITEL and ANSI networks, the OPC is required. In offices with both CNI and PSU, CNI, OPC, or GSM must be specified.

b = Origination point code (OPC) consisting of a nine digit number. Refer to the APP:POINT-CODE appendix. Alias point codes are allowed for CNI.

c = Circuit identification code (CIC) or the lower limit of a range of CICs. Refer to the APP:RANGES appendix.

d = The upper limit of a range of CICs. Refer to the APP:RANGES appendix.

e = SS7 trunk group (TG) number. Refer to the APP:RANGES appendix.

f = SS7 trunk group member number (TKGMN) or the lower limit of a range of SS7 trunk group member numbers. Refer to the APP:RANGES appendix.

g = The upper limit of a range of SS7 trunk group member numbers. Refer to the APP:RANGES appendix.

h = SM number. Search for trunks is restricted to specified SM. This option is allowed only for OPC/DPC/CIC, TG or TKGMN requests.

i = GSM number.
4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and an OP:SS7 output message will follow.

RL = Retry later. Valid value(s):
- FAILED TO CREATE PROCESS = The process that would service the request could not be created, or did not receive the request, probably due to system load.
- REQUEST ALREADY IN PROGRESS = An OP:SS7 request is already running. Only one request is allowed to run at a time.
- TOO MANY PROCESSES ACTIVE = A process to service the request cannot be created because the maximum number of active maintenance processes has been reached.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the output of signaling system 7 (SS7) trunk data matching the following specified characteristics. These include:

- The entire office, includes a summary of the ISUP equippage.
- A specific origination point code (OPC).
- A specific destination point code (DPC).
- A specific DPC and OPC combination.
- A DPC and a specific, range or all circuit identification codes (CICs), with an optional SM parameter.
- An OPC and a specific, range or all CICs, with an optional SM parameter.
- A DPC, OPC and a specific, range or all CICs, with an optional SM parameter.
- An SS7 trunk group, with an optional SM parameter.
- An SS7 trunk group and a specific or range of all trunk group members, with an optional SM parameter.
- The global switching module (GSM) supported in the office.
- A specific DPC for an specific GSM.
- A specific DPC and a specific, range or all CIC, for an specific GSM, with an optional SM parameter.
- A specific, range or all CIC for an specific GSM.
- The common network interface (CNI) supported in the office.
- A specific DPC associated with the CNI.
- A specific DPC and a specific, range, or all CIC, associated with the CNI, with an optional SM parameter.
- A specific, range or all CIC associated with the CNI.
- A summary of the ISUP equippage in the office.

Output will include the SS7 trunk group numbers, OPC, and DPC for formats [1] through [17]. Output will include the SS7 trunk group number(s), SS7 trunk member number(s), OPC(s), DPC(s), CIC(s) for all other inputs, except format [18].

Output for the summary report will include the total number of ISUP trunks equipped, number equipped per platform, and the number of ISUP inter/intra module trunks (IMT).

Only one OP:SS7 request may be processed by the system at any moment; additional requests will be denied.

WARNING: Requesting this message may cause an enormous amount of data to be printed on the ROP. The use of any format could cause a degradation in switch service depending upon the number and size of SS7 trunk groups.

The input message, STP:SS7, can be used to halt the printing of this input message should system operation be impacted by this message.

2. FORMAT
3. EXPLANATION OF MESSAGE

ALL   = Search for SS7 trunk group members using a range of all possible CICs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a    = Destination point code (DPC) consisting of a nine digit number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual. In multi-OPC offices where OPCs are in both ATT/UNITEL and ANSI® networks, the OPC is required. In offices with both CNI and PSU, CNI, OPC, or GSM must be specified.

b    = Origination point code (OPC) consisting of a nine digit number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual. Alias point codes are allowed for CNI.

c    = CIC or the lower limit of a range of CICs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d    = The upper limit of a range of CICs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e  = SS7 trunk group (TG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = SS7 trunk group member number (TKGMN) or the lower limit of a range of SS7 trunk group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = The upper limit of a range of SS7 trunk group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = SM number. Search for trunks is restricted to specified SM. This option is allowed only for OPC/DPC/CIC, TG, or TKGMN requests.

i  = GSM number.

4. SYSTEM RESPONSE

PF  = Printout follows. The request has been accepted and an OP:SS7 output message will follow.

RL  = Retry later. May also include:
   - FAILED TO CREATE PROCESS = The process that would service the request could not be created, or did not receive the request, probably due to system load.
   - REQUEST ALREADY IN PROGRESS = An OP:SS7 request is already running. Only one request is allowed to run at a time.

4. SYSTEM RESPONSE

   NG = No good. May also include:
      - ARGUMENT FOR ENV MISSING = The request has been denied because neither OKP nor SMKP were specified for variable 'b'.
      - AUDIT NOT AVAILABLE IN SPECIFIED ENV = The request has been denied because the specified audit is not available in the requested kernel process.
      - SM TYPE NOT VALID FOR THIS REQUEST = The request has been denied because a switching module (SM) type [remote switching module (RSM), local switching module (LSM), or host switching module (HSM)] was specified for a kernel process environment.
      - UNRECOGNIZED AUDIT ENVIRONMENT = The request is denied because the environment was not recognized.

   PF = Printout follows. The request has been received. Followed by the OP:ST-AUD-ENV output message.

5. REFERENCES

Output Message(s):
OP: ST-AUD-ENV

Other Manual(s):
235-600-400 Audits
OP:ST-AUD-SM-A

Software Release: 5E14 - 5E15
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE
Requests a report of the status of a specific audit, all audits, or all inhibited audits for a particular switching module (SM) or range of SMs.

2. FORMAT
OP:STATUS[=a],AUD[=b],SM=c[&&d][,RSM][,LSM][,HSM][,ORM][,TRM];

3. EXPLANATION OF MESSAGE

HSM = Host switching module. Audit status will be retrieved for HSMs only. The default is any type of SM.

LSM = Local switching module. Audit status will be retrieved for LSMs only. The default is any type of SM.

ORM = Optically remote switching module. Audit status will be retrieved for ORMs only. The default is any type of SM.

RSM = Remote switching module. Audit status will be retrieved for RSMs only.

TRM = Two mile optically remote switching module. Audit status will be retrieved for TRMs only. The default is any type of SM.

a = Status of the audit. Valid value(s):
   ALL = Report the status of all audits is printed.
   INH = Report the status of only the inhibited audits prints. This is the default value.

b = Audit ID for an application audit. The default value is all audits and the routine audit cycle.

c = SM number, or lower limit of a range of SM numbers.

d = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - ALL AUDITS STATUS SPECIFIED WITH SM RANGE = If the 'a' variable is ALL, either a specific audit must be used in the 'b' variable, or a specific SM must be used in the 'c' variable.
   - AUDIT NOT AVAILABLE IN SM TYPE = The request has been denied because the audit specified in the 'b' variable does not exist in the SM type specified or does not exist in any SM type.
   - INVALID SM RANGE/TYPE COMBINATION = The request has been denied because either the range is not in ascending order, or there is not at least one SM of the specified type.
or any type within the range.

**PF**  = Printout follows. Followed by the OP:ST-AUD-SM output message.

**RL**  = Retry later. May also include:

- **MESSAGE BROADCAST INTERNAL ERROR** = The message cannot be sent to the specified SM(s) at the present time due to problems scheduling a job to broadcast the message.

Software Release: 5E16(1) and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests a report of the status of a specific audit, all audits, or all inhibited audits for a particular switching module (SM) or range of SMs.

If an SM type is not specified, the default is any type of SM.

2. FORMAT

OP:STATUS[=a],AUD[=b],SM=c[&d][,RSM][,LSM][,HSM][,ORM][,TRM];

3. EXPLANATION OF MESSAGE

a = Status of the audit. Valid value(s):
   ALL = Report the status of all audits is printed.
   INH = Report the status of only the inhibited audits prints. This is the default value.
   LIST = Lists all audits which can be requested individually.

b = Audit ID for an application audit. Refer to the APP:AUDITS Appendix in the Appendixes section of the Audits manual for valid audit IDs. The default value is all audits and the routine audit cycle.

c = SM number, or lower limit of a range of SM numbers.

d = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - ALL AUDITS STATUS SPECIFIED WITH SM RANGE = If the ‘a’ variable is ALL, either a specific audit must be used in the ‘b’ variable, or a specific SM must be used in the ‘c’ variable.
   - AUDIT NOT AVAILABLE IN SM TYPE = The request has been denied because the audit specified in the ‘b’ variable does not exist in the SM type specified or does not exist in any SM type.
   - INVALID SM RANGE/TYPEx COMBINATION = The request has been denied because either the range is not in ascending order, or there is not at least one SM of the specified type or any type within the range.
   - UNRECOGNIZED AUDIT ENVIRONMENT = The request is denied because the environment was not recognized.

PF = Printout follows. Followed by the OP:ST-AUD-SM output message.

RL = Retry later. May also include:
   - MESSAGE BROADCAST INTERNAL ERROR = The message cannot be sent to the specified SM(s) at the present time due to problems scheduling a job to broadcast the
message.

235-600-400 *Audits*
OP:ST-AUD-SODD

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE
Requests the status of the full or incremental static office-dependent data (SODD) audit.

2. FORMAT
OP:STATUS[=a],AUD=SODD,(FULL|INCR);

3. EXPLANATION OF MESSAGE

a = The type of audit reported. Valid value(s):
   ALL    = Report the status of all routine audits.
   INH    = Report the status of only the inhibited audits. This is the default value.

FULL   = Report the status of the full SODD audit.
INCR   = Report the status of the incremental SODD audit.

4. SYSTEM RESPONSE
PF = Printout follows. Followed by an OP:ST-AUD-ENV output message.

Output Message(s):
   OP:ST-AUD-ENV

Other Manual(s):
235-105-210  Routine Operations and Maintenance Manual
OP:ST-CCSLK

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests the status of one or more common channel signaling (CCS) links. Link set and member are optional. If they are omitted, all link members of all link sets on the specified global switching module (GSM) will be displayed.

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

OP:STATUS,CCSLK[,SET=a[&b]][,MEMBER=c[&d]][,STATE=e][,SM=f];

3. EXPLANATION OF MESSAGE

a = Link set number or lower limit of a range of link sets. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If not specified, all link members are displayed.

b = Upper limit of a link set number range.

c = Link member number or lower limit of a range of link members. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Upper limit of a link member range.

e = State classification to restrict output. If not specified, links having any state are displayed. Valid value(s):
   AVAIL = Available. Link is active, available for traffic.
   UNAV = Unavailable. Link unavailable for traffic.

f = GSM number. CCS GSM number from which the data is desired. If no SM number is specified and only one CCS GSM exists in the office, output will be produced for that GSM. If multiple CCS GSMs exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
   - NO GLOBAL SM = No GSM is provisioned in the office.
   - NEED GSM NUMBER = SM was not specified in the input message, and the office has more than one GSM provisioned.

PF = Printout follows. Followed by the OP:STATUS-CCSLK output message.

RL = Retry later. May also include:
- SM NOT AVAILABLE = Command cannot be processed because the GSM is not accessible.

1533 (CCS LINK SET MEMBER)
OP:ST-DISKUSE

Software Release: 5E14 and later
Command Group: FHADM
Application: 5.3B
Type: Input

1. PURPOSE

Requests the number of blocks contained in all files and directories within each specified directory or filename. This process is repeated for all directories that descend from the specified directories. The block count includes the indirect blocks of the file.

2. FORMAT

OP:STATUS,DISKUSE,FN="a",{TOTAL|EACH}[,OPL=b];

3. EXPLANATION OF MESSAGE

EACH = Print an entry for each file.
TOTAL = Print the total number of blocks in the directory or file.
a = Pathname of the file.
   Note: The default for TOTAL and EACH is to generate an entry for each directory only. One of these variables must be used when a file is specified as variable 'a'.

b = Number of segments to be output (specified in decimal). Default = 10 segments. Each segment has a maximum size of 1000 bytes or 20 lines. This option is not needed when TOTAL is used.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:ST-DISKUSE output message.

Other Manual(s):
235-105-210  Routine Operations and Maintenance
1. PURPOSE

Requests a report of the on/off status of the direct signaling events (DSE) trapping and printing. This function includes the advanced services platform (ASP), automated inward line screening (AILS), billing validation application (BVA) calling card service (CCRD), BVA billing number screening (BNS), customer account services (CAS), CAS common channel signaling 7 (CCS7), interswitch voice messaging (ISVM), international credit card validation (ICCV), inward wide area telecommunications services (INWATS), leased network (LN), line applications for consumers (LAC), line information database (LIDB) BNS, LIDB CCRD features, LIDB OLNS, network call denial (NCD), number services (NS), rating, software defined network (SDN) or Operator Services Position System (OSPS) local number portability (LNP).

DSE traps can be turned on with the SET:DSE input message and turned off with the CLR:DSE input message. Events are reported in the REPT:ACP-APP-SM, REPT:ASP, REPT:DSE, REPT:MS-TRAPPED, REPT:NS or REPT:OSPS-DSE output message.

2. FORMAT

   OP:STATUS,DSE=a;

3. EXPLANATION OF MESSAGE

   a = Name of event trap whose status is to be output. Valid value(s):
      AILSGMG = AILS message received with invalid format reply.
      AILSMRQ = AILS error - misrouted query.
      AILSTOT = AILS query timed out before a reply was received.
      AILSTRF = AILS error - task refused.
      AILSUDV = AILS error - message received with unexpected input data value.
      ASPACGCOMP = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.
      ASPBADRESP = ASP SCP response message received with invalid data.
      ASPNORTEMSG = ASP reject message, a return error, or a play announcement received at the switch from the SCP.
      ASPQRYFAIL = ASP query blocked by network management (NM) ACG, a returned query or conversation received at the switch or a time out received in call processing.
      ASPSNCOMP = ASP SCP response message with a send notification received at the switch.
      ASPTNMSG = ASP termination notification message sent from the switch to the SCP.
      CASDBOV = CAS message received indicating database overload.
      CASDBUN = CAS message returned - database unable to process.
      CAGMSG = CAS message received garbled.
      CASNBKL = CAS message returned because of network blockage.
      CASNCON = CAS message returned because of network congestion.
      CASNRTE = CAS message returned because of no routing data.
      CASTOUT = CAS message returned because of timeout.
      CASUNEQ = CAS message returned because of unequipped destination.
      CASURPY = CAS message received with an unexpected reply.
      CAS7ABM = CAS CCS7 abort message received.

INWOVLD = INWATS returned overload.
INWUNEQ = INWATS returned unequipped.
INWVLIN = INWATS vacant line number.
INWVNXX = INWATS vacant NXX.
LACABM = LAC abort message received.
LACACG = LAC invoke component received.
LACMG = LAC message received with invalid format.
LACMPR = LAC error - message received with missing parameter.
LACMRQ = LAC error - misrouted query.
LACNCG = LAC message returned because of network congestion.
LACNFL = LAC message returned because of network failure.
LACRCR = LAC reject component received.
LACSCG = LAC message returned because of subsystem congestion.
LACSFL = LAC message returned because of subsystem failure.
LACTAN = LAC message returned - no translation data for address of such nature.
LACTOT = LAC query timed out before a reply was received.
LACTRF = LAC error - task refused.
LACTSA = LAC message returned - no translation data for this specific address.
LACUDV = LAC error - message received with unexpected input data value.
LACUPR = LAC error - message received with unexpected parameter.
LACUQD = LAC message returned - unqualified.
LACURY = LAC unexpected reply.
LACUUR = LAC message returned - unequipped user.
LACVCD = LAC error - vacant code.
LIDBCGI = LIDB message with call gapping indicator present.
LIDBGM = LIDB garbled message.
LIDBMGM = LIDB return value missing group or misrouted.
LIDBNAN = LIDB return value no translation for an address of such nature.
LIDBNCG = LIDB return value network congestion.
LIDBNFL = LIDB return value network failure.
LIDBNPG = LIDB return value nonparticipating group.
LIDBNSA = LIDB return value no translation for this specific address.
LIDBREJ = LIDB reject message received.
LIDBSCG = LIDB return value subsystem congestion.
LIDBSFL = LIDB return value subsystem failure.
LIDBTO = LIDB message missed because of timeout.
LIDBUP = LIDB message with unexpected reply.
LIDBURe = LIDB return value unequipped user.
LNBSAS = Call failed due to the query being blocked at the switch.
LNBN = Call failed due to the query being blocked in the common channel signaling (CCS) network.
LNGTCAP = Garbled transaction capabilities application part (TCAP) message received - message can not be parsed.
LNNCASI = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk not providing automatic number identification (ANI) for query.
LNNCF = Call failure due to some reason while the transaction with the network control
point (NCP) is active.

LNNCFI = Call failure due to some reason while the transaction with the NCP is inactive.
LNRR = Call failed due to the conversation with the NCP resulting in a reject response.
LNTIM = Call failed due to the query not being answered in time by the NCP.
LNTIM = Call failed due to the NCP answering with a terminate request.
MSFAILRCD = A "Message Service System (MSS) reject" message or a "return error" message was received at the near/far switch from the far/near switch respectively.
MSFAILSEN = An "MSS reject" message or a "return error" message was sent to the near/far switch from the far/near switch respectively.
MSQRYFAIL = A timeout was received in the MSS. A "return query" message received at the near switch because of network failure or failure to send a query.
NCDAFTA = NCD denied after answer.
NCDBEFA = NCD denied before answer.
NCDBLKD = NCD returned blocked.
NCDCCBLS = NCD code control blocked.
NCDDBOV = NCD database overload.
NCDDENY = NCD deny received.
NCDDSQBL = NCD direct signaling blocked.
NCDDNOXL = NCD returned no translation.
NCDOVLD = NCD returned overload.
NCDUNEQ = NCD returned unequipped.
NSACGCMP = Number services (NS) SCP response message with an ACG component received at the switch.
NSBADRESP = NS SCP response message with invalid data.
NSNONRTEMSG = NS reject message, a return error or a play announcement received at the switch from the SCP.
NSQRYFAIL = NS query blocked by NM ACG, a returned query received at the switch or a time out received in call processing.
NSSLNREMP = NS response message with a send notification received at the switch.
NSTMSTG = NS termination notification message sent from the switch to the SCP.

**OP:ST-GQPHLNK**

**Software Release:** 5E16(2) and later  
**Command Group:** SIP  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests status for general quad-link packet switch protocol handler links (GQPHLNKs) associated with a particular global switching module (GSM).

### 2. FORMAT

\[
\text{OP:STATUS,GQPHLNK,(LINK=a-b-c-d-e-f|QPIPE=a-b-c-d-e|GQPH=a-b-c-d)};
\]

### 3. EXPLANATION OF MESSAGE

- \(a\) = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- \(b\) = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- \(c\) = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- \(d\) = GQPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- \(e\) = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- \(f\) = Non-global switching module (NGSM) number, noting only an NGSM-2000 is a valid input. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### 4. SYSTEM RESPONSE

- \(NG\) = No good. May also include:
  - \(\text{NOT A GSM}\) = This response indicates that the input GSM (part of the LINK, QPIPE or GQPH specification) is not a provisioned GSM.
  - \(\text{SM UNEQUIPPED}\) = This response indicates that the input GSM (part of the LINK, QPIPE or GQPH specification) is not even an equipped SM.
- \(PF\) = The request has been accepted. An OP STATUS GQPHLNK output message will follow.
- \(RL\) = Retry later. May also include:
  - \(\text{RL - GSM NOT AVAILABLE}\) = This response indicates that the input GSM (part of the LINK, QPIPE or GQPH specification) is not available, because it is isolated or undergoing an initialization.

Output Message(s):

OP : ST-GQPHLNK

Input Appendix(es):

APP : RANGES
OP:ST-GQPHPIPE

Software Release: 5E16(2) and later
Command Group: SIP
Application: 5
Type: Input

1. PURPOSE

Requests status for general quad-link packet switch protocol handler (GQPH) QPIPEs on a HOST global switching module (GSM).

2. FORMAT

OP:STATUS,GQPHPIPE,(QPIPE=a-b-c-d-e[,DETAIL]|GQPH=a-b-c-d|GSM=a);

3. EXPLANATION OF MESSAGE

DETAIL = Provides location of parent quad-link packet switch time-multiplex switch link (QTMSLNK) and network link interface (NLI) associated with the specified GQPH QPIPE, in addition to status.

a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = GQPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- NOT A GSM = This response indicates that the input GSM (possibly part of the QPIPE or GQPH specification) is not a provisioned GSM.
- SM UNEQUIPPED = This response indicates that the input GSM (possibly part of the QPIPE or GQPH specification) is not even an equipped SM.

PF = The request has been accepted. Followed by annnnnnnn OP:ST-GQPHPIPE output message.

RL = Retry later. May also include:
- GSM NOT AVAILABLE = This response indicates that the input GSM (possibly part of the QPIPE or GQPH specification) is not available, because it is isolated or undergoing an initialization.

5. REFERENCES
Output Message(s):

OP: ST-GQPHPIPE

Input Appendix(es):

APP: RANGES
1. PURPOSE

Requests status of the CCS message transport (CMT) connectivity between a specified global switching module (GSM) and one/all child non-global switching modules (NGSMs). CMT is the ability to transport CCS messages internally within the switch. Currently, the only permissible NGSM is the GSM itself.

Note: If the output is not restricted to a single NGSM, it may be restricted by state:
- STATE=ACC for status reports of all accessible NGSMs.
- STATE=INACC for status reports of all inaccessible NGSMs.
- STATE=ALL for status reports of all NGSMs.

Only one of these options, NGSM or STATE (if any) is permitted. If the NGSM is specified, output will be produced regardless of state. The NGSM specified must be the GSM itself. If neither the NGSM or STATE option is specified, the default is the GSM itself with INACC state.

2. FORMAT

OP:STATUS,GSMNET,[GSM=a],[NGSM=b|STATE=c];

3. EXPLANATION OF MESSAGE

a = ISLAND GSM number. If no SM number is specified and only one CCS GSM exists in the office, that GSM will be defaulted. Refer to the APP:RANGES appendix in the APPENDIX section of the Input Messages manual.

b = Specific NGSM (if specified, it must be the same as the GSM). Refer to the APP:RANGES appendix in the APPENDIX section of the Input Messages manual.

c = State restriction. Valid value(s):

ACC = only list GSM/NGSM pairs with CMT connectivity.

INACC = only list GSM/NGSM pairs with no CMT connectivity (default).

ALL = list all provisioned GSM/NGSM pairs.

4. SYSTEM RESPONSE

NG = No good. May also include:
- GSM MUST BE SPECIFIED = No GSM was specified, and there is more than one GSM provisioned in the office.
- INVALID NGSM = The NGSM specified to restrict output is not served by the target GSM. That specified NGSM must be the GSM.
- NO GSM PROVISIONED = No GSM was specified, and there are no GSMS provisioned in the office.
office.
- **NO NGSM PROVISIONED** = No NGSM is provisioned for the identified GSM, which should be a transient condition during a growth/degrowth sequence (with STATUS or no option only).
- **NOT A GSM** = This response indicates that the input GSM is not a provisioned GSM.
- **SM # UNEQUIPPED** = This response indicates that the input GSM is not an equipped SM. This error is only valid for the input GSM.

**PF** = Printout follows. The request has been accepted. Followed by the OP:ST-GSMNET output message.

**RL** = Retry later. May also include:
- **GSM NOT AVAILABLE** = This response indicates that the input GSM is not available, because it is isolated or undergoing an initialization.

1540 (GSM CMT STATUS)
OP:ST-GSMNET-B

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status of the CCS message transport (CMT) connectivity between a specified global switching module (GSM) and one/all child non-global switching modules (NGSMs). CMT is the ability to transport CCS messages internally within the switch. For an ISLAND GSM, the only permissible NGSM is the GSM itself.

Note: If the output is not restricted to a single NGSM, it may be restricted by state:
- ACC = Status reports of all accessible NGSMs.
- INACC = Status reports of all inaccessible NGSMs.
- ALL = Status reports of all NGSMs.
- DOWN = Status reports indicating one (of two) provisioned TMH paths is unavailable.

Only one of these options, NGSM or STATE (if any) is permitted. If the NGSM is specified, output will be produced regardless of state; the NGSM specified must be the GSM itself. If neither the NGSM or STATE option is specified, the default is the GSM itself with INACC or DOWN state.

2. FORMAT

OP:STATUS,GSMNET,[GSM=a],[NGSM=b|STATE=c];

3. EXPLANATION OF MESSAGE

a = HOST GSM number. If no SM number is specified and only one CCS GSM exists in the office, that GSM will be defaulted. Refer to the APP:RANGES appendix in the APPENDIX section of the Input Messages manual.

b = Specific NGSM (the default is ALL NGSMs). Refer to the APP:RANGES appendix in the APPENDIX section of the Input Messages manual.

c = State restriction. Valid value(s):
- ACC = only list GSM/NGSM pairs with CMT connectivity.
- INACC = only list GSM/NGSM pairs with no CMT connectivity.
- ALL = list all provisioned GSM/NGSM pairs.
- DOWN = only used to indicate one (of two) provisioned TMH paths is unavailable.

4. SYSTEM RESPONSE

NG = No good. May also include:
- GSM MUST BE SPECIFIED = No GSM was specified, and there is more than one GSM provisioned in the office.
- INVALID NGSM = The NGSM specified to restrict output is not served by the target GSM. That specified NGSM must be the GSM.
- NO GSM PROVISIONED = No GSM was specified, and there are no GSMs provisioned in the office.
- **NO NGSM PROVISIONED** = No NGSM is provisioned for the identified GSM, which should be a transient condition during a growth/degrowth sequence (with STATUS or no option only).

- **NOT A GSM** = This response indicates that the input GSM is not a provisioned HOST or ISLAND GSM.

- **SM # UNEQUIPPED** = This response indicates that the input GSM is not an equipped SM. This error is only valid for the input GSM.

**PF** = Printout follows. The request has been accepted. Followed by the OP:ST-GSMNET output message.

**RL** = Retry later. May also include:

- **GSM NOT AVAILABLE** = This response indicates that the input GSM is not available, because it is isolated or undergoing an initialization.

1540 (GSM CMT STATUS)
OP:ST-ISMNAIL

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Outputs the primary and history states of a single inter-SM (switching module) nailup (ISMNAIL), used for packet transport between two SMs.

2. FORMAT

OP:STATUS, ISMNAIL, DLT=a-b, MATEDLT=c-d;

3. EXPLANATION OF MESSAGE

a = SM number (may be the SM associated with either end of the ISMNAIL). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Data link terminal (DLT) number associated with the source SM.

c = Mate SM number (the other SM associated with the ISMNAIL). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DLT number associated with the mate SM.

4. SYSTEM RESPONSE

NG = No good. May also include:
- SM ## NOT IN THE ISM NETWORK = The request has been denied. Either the source or the destination SM or both have no ISMNAILS associated with it.

PF = Printout follows. The request has been accepted. Followed by the OP:ST-ISMNAIL output message.

RL = Retry later. The request cannot be executed immediately because the automatic task administrator (ATA) cannot currently schedule a new task; retry later, when system load is reduced.

5. REFERENCES

Output Message(s):

OP:ST-ISMNAIL

Input Appendix(es):

APP:RANGES
OP:ST-ISMTS
Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Outputs the inter-SM (switching module) timeslot (ISMTS) usage of inter-SM nailups (ISMNAIL), used for packet transport between two SMs.

Network side timeslot inter-change unit (TSIU) timeslot usage is provided; this corresponds to time multiplexed switch (TMS) timeslot usage in a local switching module (LSM), host switching module (HSM), optically remoted module (ORM), and/or trunk remoted module (TRM), noting the HSM count will include usage due to ISMNAILs terminating on child remote switching modules (RSMs). Also provides peripheral interface data bus (PIDB) timeslot usage, parsed on a packet switch unit (PSU) shelf basis.

2. FORMAT

OP:STATUS,ISMTS,SRCSM=a;

3. EXPLANATION OF MESSAGE

a = Source SM number for which timeslot usage is required.

4. SYSTEM RESPONSE

NG = No good. May also include:
- SM ## NOT IN THE ISM NETWORK = The request has been denied. The source SM designated has no ISMNAIL resources associated with it.
- SM NOT EQUIPPED = The request has been denied. The source SM is not equipped in the office.

PF = Printout follows. The request has been accepted. Followed by the OP:ST-ISMTS output message.

5. REFERENCES

Output Message(s):

OP:ST-ISMTS
OP:ST-ISUP

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a report of the on/off status of the integrated services digital network (ISDN) user part (ISUP) events trapping and printing.

ISUP traps can be turned on with the SET:ISUP input message and turned off with the CLR:ISUP input message. Events are reported in the REPT:ISUP output message.

2. FORMAT

OP:STATUS,ISUP=ATPUUI;

3. EXPLANATION OF MESSAGE

ATPUUI = Access transport parameter (ATP) user-to-user information (UUI).

4. SYSTEM RESPONSE

PF = Printout follows. The request was received and is followed by the OP:ST-ISUP output message.

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests information from internal registers of the link interface (LI) or the specified office network and timing complex (ONT) side.

Note: This message is only valid for communication module model 1 (CM1) hardware.

2. FORMAT

OP:STATUS, LI=a;

3. EXPLANATION OF MESSAGE

a = ONTC side that the LI is on.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of this manual for a list of possible reasons for denying the request.

PF = Printout follows.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

5. REFERENCES

Input Appendix(es):

APP:CM-IM-REASON
OP:ST-LISTDIR

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests the contents of a specific directory or file.

2. FORMAT

OP:STATUS, LISTDIR, FN="a", OPL=b;

3. EXPLANATION OF MESSAGE

a = Pathname of the directory or file.
b = Number of segments to be output, specified in decimal. Default=10 segments; maximum=999. Each segment has a maximum size of 1000 bytes or 20 lines.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:ST-LISTDIR output message.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status of the common channel signaling (CCS) message delivery (MD) network. The status of the intra-global switching module (GSM) MD path is printed.

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

OP: STATUS, MD[, SM=a];

3. EXPLANATION OF MESSAGE

a = GSM number. CCS GSM number from which the data is desired. If no SM number is specified and one/more CCS GSMs exist in the office, the output will be produced for all CCS GSMs in the office.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - SM SPECIFIED MUST BE A GSM = The specified SM is equipped, but is not a GSM.
   - SM x UNEQUIPPED = The specified SM is not equipped, where 'x' is the SM entered in the input message.
   - NO GLOBAL SM = No GSM is provisioned in the office.

RL = Retry later. Valid value is:
   - SM x CURRENTLY UNAVAILABLE = Command cannot be processed because the specific GSM is not accessible.

PF = Printout follows. Followed by the OP:STATUS-MD output message.

235-190-120 Common Channel Signaling Service Features

MCC Display Page(s):
1530 (GLOBAL SM MESSAGE DELIVERY STATUS)
OP:ST-MELNK

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a printout of the maintenance state of the MCTSI-based ethernet links (MELNKs) and MCTSI-based ethernet pipes (MEPIPEs) on a switching module (SM).

2. FORMAT

OP:STATUS,MELNK,SM=a[&b] [,OFFNORM] [,NOFE] [,NOPRINT];

3. EXPLANATION OF MESSAGE

a

= SM number, or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b

= The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

OFFNORM

= Off normal. Reports only equipped MEPIPEs/MELNKs that are not in the active state.

NOFE

= Not family of equipment. Same as OFFNORM except OOSFE (out of service family of equipment) MELNKs are not printed.

NOPRINT

= No print. This option suppresses printing of the OP:ST-MELNK output response when no accessible SMs in an SM range have equipped MELNKs. When used with the OFFNORM or NOFE options, NOPRINT also suppresses printing of the OP:ST-MELNK output response from SMs with no MEPIPEs or MELNKs in an off normal condition.

4. SYSTEM RESPONSE

NG

= No good. Valid qualifiers are:
  - NO SUCH SM = Input command specified an SM that does not exist.
  - SM UNEQ = Input command specified an SM that is unequipped.
  - UNIT UNEQ = Input command specified an SM with no equipped MELNKs.

RL

= Retry later. The request cannot be executed now due to unavailable system resources. Optional additional qualifiers are:
  - SM ISOLATED = Cannot communicate with requested SM.
  - CANNOT CREATE TERMINAL PROCESS = The request cannot be executed now due to the unavailability of the system resources necessary for creating a terminal process.

PF

= Printout follows. An OP:ST-MELNK output message will follow in response to the request.

Output Message(s):

OP:ST-MI
OP:ST-NGSMNET-A
Software Release: 5E14 only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status of the CCS message transport (CMT) connectivity between a specified non-global switching module (NGSM) and one/more of its associated global switching modules (GSM). CMT is the ability to transport CCS messages internally within the switch. Currently, the only permissible NGSM is a GSM itself.

Note: If the output is not restricted to a single GSM, it may be restricted by state:
- STATE=ACC for status reports of all associated accessible GSMs.
- STATE=INACC for status reports of all associated inaccessible GSMs.
- STATE=ALL for status reports of all associated GSMs.

Only one of these options, GSM or STATE (if any) is permitted. If the GSM is specified, output will be produced regardless of state. The GSM specified must be the NGSM itself. If neither the GSM or STATE option is specified, the default is all provisioned GSMs with INACC state.

2. FORMAT

OP:STATUS,NGSMNET,NGSM=a,[GSM=b|STATE=c];

3. EXPLANATION OF MESSAGE

a = NGSM number (a ISLAND GSM can function as a NGSM and currently only this case will be allowed as an input). Refer to the APP:RANGES appendix in the APPENDIX section of the Input Messages manual.

b = Specific ISLAND GSM (only the specified NGSM is allowed). Refer to the APP:RANGES appendix in the APPENDIX section of the Input Messages manual.

c = State restriction. Valid value(s):
  ACC = only list GSM/NGSM pairs with CMT connectivity.
  INACC = only list GSM/NGSM pairs with no CMT connectivity (default).
  ALL = list all GSM/NGSM pairs.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the OP:ST-NGSMNET output message.

RL = Retry later. May also include:
- NGSM NOT AVAILABLE = This response indicates that the input NGSM is not available, because it is isolated or undergoing an initialization.
- INVALID GSM = The GSM specified to restrict output is not provisioned to serve the specified NGSM.
- NOT A NGSM = This response indicates that the input SM number is not a NGSM (such as, on
intra-SM MD link is not provisioned to serve this SM).

- \textbf{SM \# UNEQUIPPED} = This response indicates that the input NGSM is not an equipped SM. This error is only valid for the input NGSM.

OP:ST-PSALNK

Software Release: 5E16(2) and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests the output of the current link status and other information of a single asynchronous transfer mode (ATM) link (PSALNK) or the output of the current status of a group of ATM links.

With the exception of Format 1, output can be limited to those links with a specific ATM link status.

2. FORMAT

[1] OP:STATUS,PSALNK=a-b-c[,d];

[2] OP:STATUS,PSALNK,SM=a[,d];

[4] OP:STATUS,PSALNK,PSU=a-b[,d];

[5] OP:STATUS,PSALNK,PSU=a-b,UNAV,NOPRINT;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. A range of SMs can be specified for Formats 2 and 3. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = PSU number.
c = ATM link number.
d = Find only link(s) or channel(s) whose status is this value. Valid value(s):
OFFNORM = Off normal. Includes OOS links and duplex links with only one channel in service.
OOS = Out-of-service. Links with no members in service.
UNAV = Unavailable. Channel is manually made unavailable by the SET:PSALNK input message.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.
PF = Printout follows. Followed by the OP:STATUS output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE

An ethernet link is defined by the SM, PSU to which it is connected and link number.

Format 1 requests the status of given ethernet link. Format 2 requests the status of all the ethernet links on a given SM and also the range of SMs. If option \(d\) is specified then the output includes all the links with that given status.

2. FORMAT

\[1\] \text{OP:STATUS,PSELNK=a-b-c;}

\[2\] \text{OP:STATUS,PSELNK,SM=a Range...[,d];}

3. EXPLANATION OF MESSAGE

\(a\) = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(b\) = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(c\) = Ethernet link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(d\) = Status of the link which is either OOS or ACT. Valid value(s):

- \(\text{OOS}\) = Out-of-service.
- \(\text{ACT}\) = Active.

4. SYSTEM RESPONSE

\(\text{NG}\) = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

\(\text{PF}\) = Printout follows. Followed by the OP:STATUS output message.

\(\text{RL}\) = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Input Appendix(es):

\text{APP:RANGES}

Output Message(s):

\text{OP:ST-PSELNK}
1. PURPOSE

Requests the output of the current link status and other information of a single packet switch unit (PSU) link (PSLNK); or the output of the current status of a group of PSU links.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be directly entered in the input message line, or can be translated by the switch from the entered PSU equipment number or switching module (SM) number. However, the far end CA cannot be specified by the PSU equipment number.

If only the near end PSU CA(s) is given or can be translated, then the status of all PSU links originating from the given or translated near end PSU CA(s) to all existing far end PSU CA(s) will be reported. Entering the far end PSU CA (optional) will give a more selective and expanded report of a particular PSU link status and other information.

With the exception of Formats 8 through 10, output can be limited to those links with a specific PSU link status.

NOTE: For gateway protocol handlers (PH) the only valid input message format is # 11. Other formats will not yield the expected results.

2. FORMAT

[1] OP:STATUS,PSLNK=a-b[,c];
[2] OP:STATUS,PSLNK,PSUCA=a,FARCA=b[,c];
[3] OP:STATUS,PSLNK,PSU=d-0,FARCA=b[,c];
[4] OP:STATUS,PSLNK,SM=d,FARCA=b[,c];
[5] OP:STATUS,PSLNK,PSUCA=a[,c];
[6] OP:STATUS,PSLNK,PSU=d-0[,c];
[7] OP:STATUS,PSLNK,SM=d[,c];
[8] OP:STATUS,PSLNK,PSU=d-0,UNAV,NOPRINT;
[9] OP:STATUS,PSLNK,PSUCA=a,UNAV,NOPRINT;

3. EXPLANATION OF MESSAGE

NOPRINT = No print. When specified with the UNAV state (variable 'c'), this option suppresses the printing of the response message if no PSU link has any channel in UNAV state.

a = Near PSU community address of the PSU link.
b = Far PSU community address of the PSU link.

c = Find only link(s) or channel(s) whose status is this value.

Note: Since Formats 1 through 4 request the status of one specific link, the status will always be printed regardless of the link state. This means that variable 'c' is ignored for these formats.

Valid value(s):
OFF’NORM = Off normal. Includes OOS links and duplex links with only one channel in service.
OOS = Out-of-service. Links with no members in service.
UNAV = Unavailable. Channel is manually made unavailable by the SET:PSLNK input message.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Printout follows. Followed by the OP:STATUS output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1187.y PSU LINKS STATUS (where y=PSU number)
OP:ST-QPHLNK
Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Requests status for quad-link packet switch protocol handler links (QPHLNKs) associated with a particular global switching module (GSM).

Note: One of the following parameters must be specified to limit the scope of the response:
- LINK = Produces status for an individual QPHLNK.
- QPIPE = Produces status for all QPHLNKs associated with a QPH QPIPE.
- QPH = Produces status for all QPHLNKs associated with a QPH.

2. FORMAT
OP:STATUS,QPHLNK,(LINK=a-b-c-d-e-f|QPIPE=a-b-c-d-e|QPH=a-b-c-d);

3. EXPLANATION OF MESSAGE
a = GSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Quad-link packet switch (QLPS) network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Non-global switching module (NGSM) number, noting only an NGSM-2000 is a valid input. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
OP:STATUS,QPHLNK output message will follow. Valid value(s) are:
- PF = The request has been accepted. An OP:STATUS,QPHLNK output message will follow.
- NG - SM UNEQUIPPED = This response indicates that the input GSM (part of the LINK, QPIPE or QPH specification) is not even an equipped SM.
- NG - NOT A GSM = This response indicates that the input GSM (part of the LINK, QPIPE or QPH specification) is not a provisioned GSM.
- RL - GSM NOT AVAILABLE = This response indicates that the input GSM (part of the LINK, QPIPE or QPH specification) is not available, because it is isolated or undergoing...
an initialization. Retry later.

235-200-116   5ESS Switch Signaling Gateway Common Channel Signaling
OP:ST-QPHPIPE

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status for quad-link packet switch protocol handler (QPH) QPIPEs on a HOST global switching module (GSM).

Note: One of the following parameters must be specified to limit the scope of the response:
- QPIPE = Produces status for an individual QPH QPIPE.
- QPH = Produces status for both QPH QPIPEs on a QPH channel group.
- GSM = Produces status of all equipped QPH QPIPEs on a HOST GSM.

2. FORMAT

OP: STATUS, QPHPIPE, (QPIPE=a-b-c-d-e[, DETAIL] | QPH=a-b-c-d | GSM=a); ;

3. EXPLANATION OF MESSAGE

DETAIL = Provides location of parent quad-link packet switch time-multiplex switch link (QTMSLNK) and network link interface (NLI) associated with the specified QPH QPIPE, in addition to status.

a = GSM number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
b = Packet Switch Unit (PSU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
c = PSU shelf number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
d = QPH channel group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
e = Quad-link Packet Switch (QLPS) network number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = The request has been accepted. An OP: STATUS, QPHPIPE output message will follow.

NG - SM UNEQUIPPED = This response indicates that the input GSM (possibly part of the QPIPE or QPH specification) is not even an equipped SM.

NG - NOT A GSM = This response indicates that the input GSM (possibly part of the QPIPE or QPH specification) is not a provisioned GSM.

RL - GSM NOT AVAILABLE = This response indicates that the input GSM (possibly part of the QPIPE or QPH
specification) is not available, because it is isolated or undergoing an initialization. Retry later.

235-200-116  5ESS Switch Signaling Gateway Common Channel Signaling
1. PURPOSE

Requests the status of one or more near endpoint(s) and service selection for the associated session initiation protocol for telephony protocol handler (SIP-T PH) or the status of one or more association(s) and the associated paths. There are 5 formats that are available to produce status reports depending on the specified characteristics. These include:

- A specific endpoint.
- All endpoints in the office.
- A specific association.
- A specific association including the path status.
- All associations in the office.
- All associations in a specified association Set.

2. FORMAT

1. \[1\] OP:STATUS,SCTP,NEAREPT=a[,DETAIL];
2. \[2\] OP:STATUS,SCTP,NEAREPT,ALL;
3. \[3\] OP:STATUS,SCTP,ASSOC=b[,PATHS];
4. \[4\] OP:STATUS,SCTP,ASSOC,ALL;
5. \[5\] OP:STATUS,SCTP,ASSOCSET=c;

3. EXPLANATION OF MESSAGE

ALL = Get the status for all the endpoints or associations.

DETAIL = Get the status, association set and far endpoint for all the associations assigned to that near endpoint.

PATHS = Get the paths status for the association.

a = Endpoint name. This is a character string (<=20) that is provisioned on RC/V View 33.19 (SCTP NEAR END POINT).

b = Association number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Association set name. This is a character string (<=20) that is provisioned on RC/V View 33.23 (ASSOCIATION SET).
4. SYSTEM RESPONSE

NG = No good. The request has been denied. May also include:
- INVALID NEAR ENDPOINT NAME = Specified endpoint not provisioned on any SM.
- INVALID ASSOCIATION ID = Specified association not provisioned on any SM.
- INVALID ASSOCIATION SET NAME = Specified association set not provisioned on any SM.
- DATABASE ERROR = Database error.
- INTERNAL ERROR = Unknown request type.

PF = Printout follows. Followed by the OP:ST-SCTP output message.

RL = Retry later. May also include:
- AM OVERLOAD = AM in real-time overload. Unable to process request.
- CONFLICTING REQUEST RUNNING = Cannot process request until running OP:ST-SCTP request completes
- FAILED TO CREATE PROCESS = The process that would service the request could not be created, or did not receive the request, probably due to system load.
- SM INACCESSIBLE = SM is not available (for example, isolation, initialization, and so forth).
- SYSTEM ERROR = System error encountered. Please retry later.
- TOO MANY PROCESSES ACTIVE = A process to service the request cannot be created because the maximum number of active maintenance processes has been reached.

235-070-100   Administration and Engineering Guidelines
1. PURPOSE

Requests the output of the print mode, overload status, and initialization summary information for the specified packet interface (PI) of the module controller time slot interchanger (MCTSI) or packet switching unit protocol handler (PSUPH).

If the status of an out-of-service PSUPH or PI is requested, only the information stored in the switching module (SM) will be printed. The unequipped units will report configuration status of "UNEQ" only.

2. FORMAT

OP:STATUS, {PSUPH=a-b-c-d|CHNG=a-b-c-e|MCTSI=a-f,PI};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number.
b = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = PSUPH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Channel group (CHNG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = MCTSI side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because the SM is isolated or the equipment does not exist.
NO = Feature not available. The requested action failed because the feature required to process the request is not present in the module.
PF = Printout follows. The message was accepted and a printout will follow.

of the Input Messages manual.

i = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise there is only one T1 facility.

n = Member number of the multi-line hunt group (MLHG) or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be accessed. For LTSB a member number of 1 will give the status of the lead line and a member number of 2 will give the status of the associate line. If no member number is specified, for 1-DN LTSB, the status of both lines will be given. If no member number is specified, for 2-DN LTSB, the status of the line associated with the DN entered will be given.

o = Line unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Switch. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Level. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Multi-line hunt group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Force management center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

al = Digital carrier line unit. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

b\textsuperscript{1} = Remote terminal (RT). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c\textsuperscript{1} = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\textsuperscript{1} = Trunk unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\textsuperscript{1} = Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\textsuperscript{1} = Channel board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\textsuperscript{1} = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\textsuperscript{1} = Trunk group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\textsuperscript{1} = Trunk member. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\textsuperscript{1} = Primary rate interface group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\textsuperscript{1} = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\textsuperscript{1} = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\textsuperscript{1} = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\textsuperscript{1} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\textsuperscript{1} = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\textsuperscript{1} = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\textsuperscript{1} = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s\textsuperscript{1} = Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t\textsuperscript{1} = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
u1 = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v1 = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w1 = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y1 = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z1 = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a2 = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b2 = Integrated services line unit model 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c2 = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d2 = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e2 = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f2 = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g2 = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by the OP:ST-PORT output message.

RL = Retry later. The request has been denied, probably due to system load.

Output Message(s):

OP:ST-PORT

Input Appendix(es):

APP:RANGES
1. PURPOSE

Requests the output of the current status history for a specified trunk, line, data link, or operator services position system port (OSPSPORT). Output will include trunk, line, data link, or OSPSPORT identification (logical and terminal names), primary status, the time the primary status went into effect, and any pending status(es) associated with the trunk, line, data link, or OSPSPORT.

2. FORMAT

\texttt{OP:STATUS,a[,CH=b];}

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- \texttt{a} = Equipment number or identifier. Valid value(s):

</table>
= Telephone number.

h = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise there is only one T1 facility.

n = Member number of the multi-line hunt group (MLHG) or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be accessed. For LTSB a member number of 1 will give the status of the lead line and a member number of 2 will give the status of the associate line. If no member number is specified, for 1-DN LTSB, the status of both lines will be given. If no member number is specified, for 2-DN LTSB, the status of the line associated with the DN entered will be given.

o = Line unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Switch. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Level. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Multi-line hunt group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
z = Force management center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a1 = Digital carrier line unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b1 = Remote terminal (RT). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c1 = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d1 = Trunk unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e1 = Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f1 = Channel board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g1 = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h1 = Trunk group or Bearer Independent Call Control (BICC) group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i1 = Trunk member or normalized Call Instance Code (CIC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j1 = Primary rate interface group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l1 = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m1 = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n1 = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p1 = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q1 = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r1 = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s1 = Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
t¹ = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u¹ = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v¹ = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w¹ = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x¹ = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y¹ = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z¹ = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a² = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b² = Integrated services line unit model 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c² = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d² = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e² = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f² = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g² = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h² = Peripheral control and timing line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i² = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j² = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k² = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l² = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

\( m^2 \) = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^2 \) = STM-1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o^2 \) = High order virtual container number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p^2 \) = Low order virtual container group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( q^2 \) = Low order virtual container member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF  = Printout follows. The request has been accepted and is followed by the OP:ST-PORT output message.

RL  = Retry later. The request has been denied, probably due to system load.

APP:RANGES
OP:STATUS-PS

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests output of the switching module (SM) packet switch unit (PSU) timeslot usage (PSUTSCOUNT) for nailups. The types of nailups used for packet transport are inter-SM (ISMNAIL), internal protocol (IP) trunk, extended digital subscriber line (EDSL), X.25 access on T1 (XAT) trunk, X.75 trunk, X.75' trunk, remote integrated services line unit (RISLU), and common channel signaling (CCS). In addition to these nailups, the PSU peripheral interface data bus (PIDB) time-slots reserved for the remote digital test access (RDTA) feature are included in the output.

The network side TSIU timeslots and PIDB timeslots used per PSU shelf are included for packet pipes (PKTPIPE) and the PIDB timeslots used per PSU shelf are included for speech handler channel groups (SHCG). Since a packet pipe (which is composed of packet pipe members on a DFI connected to a packet pipe port on a PSU) can be inter-SM, the network side TSIU timeslots for the packet pipe members are included in the PKTPIPE count for the SM that contains the packet pipe member. This SM may or may not have a PSU but the packet pipe members were included as they are connected to a PSU which resides in another SM. The output provides network side timeslot interchange unit (TSIU) timeslot usage. This corresponds to time multiplexed switch (TMS) timeslot usage in a local switching module (LSM), host switching module (HSM), optically remoted module (ORM), and/or two mile remoted module (TRM), noting the HSM count will include usage due to ISM nailups terminating on child remote switching modules (RSMs). The output also provides peripheral interface data bus (PIDB) timeslot usage for each packet switch unit (PSU) shelf. The intra-cluster link (ICL) timeslot usage by ISM nailups for RSMs within the same cluster is also provided.

2. FORMAT

OP:STATUS,PSUTSCOUNT,SM=a[&&b];

3. EXPLANATION OF MESSAGE

a = SM number or the lower limit of a range of SM numbers for which timeslot usage is desired.
b = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The SM has no integrated services digital network (ISDN) nailups associated with it.
PF = Printout follows. The request has been accepted. Followed by the OP:STATUS-PS output message.

OP:TAG

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that a circuit pack return tag is to be printed based on the information taken from the failing diagnostics on the switch. If arguments are specified, then a tag will be printed using information from the last failing diagnostic that matches the specified arguments.

2. FORMAT

[1] OP:TAG[,a]
[2] OP:TAG[,ARG1=b[,ARG2=b[,ARG3=b[,ARG4=b]]]]

3. EXPLANATION OF MESSAGE

a = ALL or BLANK; choose one or omit. "ALL" will dump a list of all failing diagnostics that are available for formatting. "BLANK" will format and print a blank circuit pack return tag. If no arguments are specified, the last failing diagnostics will be formatted and the information printed as a circuit pack return tag.

b = Arguments that describe which failing diagnostic is to be used to format the tag. A maximum of four arguments may be used for tag selection. If the arguments specified do not match any of the failing diagnostics stored in the TAGLOG, a list of failing diagnostics that are available for tag selection will be dumped.

4. SYSTEM RESPONSE

NG = No good. The request is denied.
PF = Printout follows. Output message will follow with completion status.

Software Release: 5E14 - 5E15
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests print-out of the threshold counts, operational all tests passed count, and purge count of a trunk circuit, universal tone decoder (UTD), universal tone generator (UTG), or revertive pulsing trunk on he trunk error analysis lists. If a specific machine detected interoffice irregularity (MDII) is specified, only entries related to that MDII are printed.

2. FORMAT

OP:TERACNTS,a[,MDII=d];

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Unit. Valid value(s):
DEN=e-j-k-l
ILEN=e-r-n-o
INEN=e-s-n-o
NEN=e-s-t-x-u-v-y-w
PLTEN=e-z-a1-b1-c1
RVPT=e-p-g-q;
SLEN=e-m-n-o
TEN=e-f-g-h-i
TKGMN=b-c
UTD=e-p-g-q;
UTG=e-p-g-q;
VTRK=e-d1-e1

b = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Member number in trunk group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = MDII type (refer to the REPT:MDII output message for complete enumeration).

e = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

- **i**: Channel circuit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **j**: Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **k**: Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **l**: DFI channel number. A DFI-2 has 48 channels. Channel ranges are:
  - 1-24 = Channels 1-24 of facility T1A.
  - 25-48 = Channels 1-24 of facility T1B.

  Otherwise, only a range of 1-24 is allowed. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **m**: Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **n**: Remote terminal number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **o**: Remote terminal line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **p**: Local digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **q**: Digital service unit board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **r**: IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **s**: Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **t**: Data group (DG). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **u**: Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **v**: Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **w**: Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **x**: SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **y**: Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(a^1\) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(b^1\) = Tributary (T1FAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(c^1\) = Channel (CHAN) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(d^1\) = Virtual Trunk Facility (FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(e^1\) = Virtual Trunk Channel (CHAN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

235-701-120 Air ExtensionSM User Guide
OP:TGC

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests a list of all trunk group controls (TGCs) applied to a particular trunk group, all TGCs of a particular type, or all TGCs in the office.

2. FORMAT

OP:TGC[,TG=a|,CNTL=b];

3. EXPLANATION OF MESSAGE

a = Trunk group identifier. The default is the total office.

b = Control type. Valid value(s):
   CANT = Manual cancel-to control.
   SKIP = Manual skip control.
   CRO = Manual cancel rerouted overflow control.
   RR = Manual reroute control.
   CANF = Manual cancel-from control.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

PF = Printout follows. Followed by the OP:TGC output message.

RL = Retry later. May also include:
   - CONFLICTING REQUEST = A similar request is being processed utilizing necessary resources.
   - RESOURCE SHORTAGE = The necessary resources are not available.

130 (NM EXCEPTION)
OP:TGCNT

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Reports (outputs) the total number of trunks in a trunk group, the number of in-service trunks, the number of out-of-service (OOS) trunks, and an indicator if the counts may be invalid. This message may be used to display the above information for a single specified trunk group, a range of trunk groups, or all trunk groups. In the case of a range or all trunk groups, the above information will be for trunk groups that have OOS trunks. OOS CADN is not counted towards this OOS count.

2. FORMAT

OP:TGCNT[,TG=a[&b]][,PRINT];

3. EXPLANATION OF MESSAGE

PRINT = Print the output from this input message at the ROP in addition to its normal destinations(s). When PRINT is not specified (the default), the output is not printed on the ROP, unless the request comes from Master Control Center (MCC).

a = Trunk group (TG) number or lower limit of a range of TG whose count is desired. Default prints all TGs with an OOS count.

b = Upper limit of a range of TG.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:TGCNT output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

[2] OP:TRAP[,LFORM={Y|N}][,DEST=c];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

LFORM = Long form. Print detailed status information for the trapped messages. Information will be given regarding the trap parameters and associated values that were given in the SET:TRAP input message.

N = No, turn off the option.

RTDSP = Real-time display. Print trapped messages in real-time to the specified output class. The default value is what was specified in the SET:TRAP input message for this field.

Y = Yes, turn on the option.

a = Trap identification number.

c = Destination output class (1-255). The default output class is the class specified in the SET:TRAP input message for this trap ID. Refer to the APP:MSGCLS appendix in the Appendixes section of the Output Messages manual for a cross reference between numeric value (destination class) and ECD destinations.

118 (CNI FRAME AND CCS LINK STATUS)
OP:TRC

Software Release: 5E14 and later
Command Group: TRACE
Application: 5
Type: Input

1. PURPOSE

Requests the printing of all data collected for a traced call. It results in a series of OP:TRC output messages containing hexadecimal dumps of the collected data.

2. FORMAT

OP:TRC:[PID=a-b-c][,STRUCTS=d][,DN=e];

3. EXPLANATION OF MESSAGE

| PID | = Process ID (PID) of the process controlling a traced connection. All messages describing one connection of a call will have the same PID. If no PID is specified, the trace data for all connections related to this call will be printed. The PID can be obtained from a TRC:UTIL output message. |
| a   | = Process number of the PID. |
| b   | = Switching module (SM) number of the PID. |
| c   | = Uniqueness number of the PID. |
| d   | = The data structures to be printed. Valid value(s): |
| ACCS | = Print the data blocks associated with an Operator Services Position System (OSPS) automated calling card service (ACCS) call. These data blocks include the ACCS data block (ACCSDB) and the ACCS query data block (QRYDB). |
| ALCB | = Print the access link control block (ALCB) associated with the packet utility call trace. |
| ALL | = Print all of the trace data for a connection of the call, which includes all of the data structures. This is the default. |
| APB | = Print the associated process blocks (APB). |
| BST | = Print the data blocks associated with an OSPS directory assistance (DA) operator position basic services terminal (BST). The blocks dumped are the call loop data block (LOOPDB), which contains information concerning a DA call at the operator position. The operator position data block (POSDB), which contains the operator status and the supplementary protocol data block (SPB), contains data communications information concerning the integrated services digital network (ISDN) digital subscriber line (DSL) connected to the BST. |
| CHAN | = Print the channel control block (CCB) contents, and its related source channel data block (CHDB), circuit queuing block (CQB), DS0 data block (DS0B), and PIDB time slot block (PTSB) in an OP:TRC-CHAN output message. |
| CKT | = Print circuits used by the traced call. They are represented by a circuit data block common (CDBCOM) and its associated channel circuit data block (RLCHAN) relations. The result is an OP:TRC-CKT output message for each CDBCOM. |
| CLDB | = Print the call leg data blocks (CLDB). |
| COIN | = Print the data block associated with the automated coin service terminal process (COINOT) for an OSPS call. |
| CONFCKT | = Print the data blocks associated with a conference circuit connection. The data |
blocks dumped are the CCBs, the channel data blocks (CHDBs), the CDBCOMs,
the path data blocks (PHDBs), the sink and source time slot data blocks (TSDBs),
and the process control block linkage area (PCBLA) of the conference circuit.

CR
= Print the call record (CR) associated with the originator in an OP:TRC-CR output
message.

CV
= Print the data block associated with a vectored call. This data block contains
information gathered from the call vectoring state (CV_STATE) relation tuple
associated with the vectored call.

DISP
= Print the display data block (DISPDB).

EIS
= Print the external information system (EIS) data blocks when the call at the
position is associated with an EIS. These include: EISCALL, EIS_LNK and
EISLKSEL.

HLSC
= Print the list of high level service circuits for ringing and the per call test, and the
peripheral control (PC) foreground data area PCCCBFG. These will be in an
OP:TRC-HLSC output message.

ISDN
= Print the list of feature data blocks associated with an integrated services digital
network call.

The following data blocks are printed in the OP:TRC-ISDN output message:
D-channel application linkage block (DALB), and the PRI group status data block
(PRISTAT).

The following data blocks are printed in the OP:TRC-ISDN2 output message:
terminal equipment data block (TEDB), terminal endpoint identifier linkage area
(TEILA), business and residential custom services data block (BRCSDB), and
automatic call distribution position data block (ACDPOSDB).

LCNx
= Print the logical channel control block (LCCB) associated with a specific active
logical channel number (LCN) for packet utility call trace. Up to 127 active logical
channel numbers may exist for a packet utility trace. The exact LCN must be
specified. Where ‘x’ is 1 through 127. (LCN0, LCN1, LCN2...LCN127).

MDB
= Print the model data blocks.

NTWK
= Print the network path descriptors, the path data blocks (PHDBs), and the sink
and source time slot data blocks (TSDBs) in an OP:TRC-NTWK output message.

OPT
= Print the data blocks associated with an OSPS toll and assistance (T&A) operator
position, operator position terminal (OPT). The three call loop data blocks
(TALOOPDB) are dumped, which contain information concerning the T&A calls at
the operator position. The T/A operator position data block (TAPOSDB), which
contains the operator status and the supplementary protocol data block (SPB),
contains data communications information concerning the ISDN DSL connected to
the OPT. Also prints the EIS data blocks when the call at the position is associated
with an external information system.

PKL2DATA
= Print the level 2 collected data associated with the packet utility call trace. These
include: D-channel control block (DCCB) and the logical link control block (LLCB).

PKTSUM
= Print the summary information of the packet utility call trace for B- and
D-channels. This includes the local and remote directory numbers, call type, call
connection, destination SM, and destination port or trunk group for each active
LCN. For inter-switch calls, the trunk group number on the destination SM will be
displayed. For intra-SM and inter-SM calls, the port number on the destination SM
will be displayed.

PROC
= Print the process control block linkage area (PCBLA), the port link area
(PORTLA), D-channel process block (DPB), and LTSB data block (DLTSDBDB) [for
line time slot bridging (LTSB) ports only] in an OP:TRC-PROC output message.

SHDN
= Print the data blocks associated with a shared directory number (SHDN) call.
These include the analog data block (ADB), shared call model data block (SCMDB), and logical termination busy/idle status (LTMSTAT).

SRVOT
= Print the call and service related data for OS PS listing services (LS). The block dumped is SRVOT, which is used by originating treatment (OT) and the EIS interface to store data that must be saved through OS DS restarts.

WRLS
= Prints the data associated with a wireless call. It includes the Autoplex® call table (APXCTBL), the Autoplex® feature data block, and the general purpose annex data block(s) (GPAXDB),

e = Directory number. For packet call trace only.

4. SYSTEM RESPONSE

NG
= No good. May also include:
- BAD OPTION = Incompatible options were selected.
- INTERNAL ERROR = An unexpected condition was encountered during processing.
- INVALID DN = An invalid DN was entered.
- NO DATA COLLECTED = The requested data was not collected.
- PID = There is no data for the given process ID.

PF
= Printout follows. May also include:
- EVENT n = The requested trace data (identified by event number ’n’) will be printed out as a series of OP:TRC output messages that all have the given event flag. The data printed reflects the most recent trace data collected.

OP:TRCU

Software Release: 5E14 and later
Command Group: ONTC
Application: 5
Type: Input

1. PURPOSE

Requests a print-out of the Transmission Rate Converter Unit (TRCU) information associated with the specified TRCU path (TRCP) or the TRCU3 control time slot (TCTS) number.

2. FORMAT

OP:TRCU, {TRCP=a-b|TCTS=c}

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.

b = TRCU path value. Refer to the APP:RANGES in the Appendixes section of the Input Messages manual.

c = TCTS value. Refer to the APP:RANGES in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status. Valid values are:
- DB READ ERR = The DB couldn't be read.
- UNEQUIPPED = The SM isn't equipped with the TRCU path.
- NO MATCH = The TCTS wasn't found.
- UNEQ SM = The SM isn't equipped.
- NOT ORM = The SM isn't an ORM/EXM2000.
- INVLD PATH = TRCU path is out of range.

PF = Print-out follows. An OP:TRCU output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

   OP:TRFC15-PT02B

Other Manual(s):
235-070-100  Administration and Engineering Guidelines
OP:TRFC30

Software Release: 5E14 and later
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests the immediate output of the specified section of the 30-minute traffic report.

2. FORMAT

OP:TRFC30,a;

3. EXPLANATION OF MESSAGE

a = Name of the section to be printed. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual for section names. For those sections that indicate identifiers in addition to section names, omitting the identifier on the "OP:TRFC30,a" input message line will cause whatever has been previously allowed to print. The identifier on the input message line will cause the specified record(s) to print (if available).

4. SYSTEM RESPONSE

NG = No good. May also include:
- CONFIGURATION NOT SUPPORTED = The section requested represents a configuration not present in this office.
- DATA NOT AVAILABLE AT THIS TIME = Report is being generated and therefore manual requests are locked out, or report has not generated since an initialization.
- DATA NOT COLLECTED = Data for this section was not collected.
- NOT ALLOWED FOR ROP OUTPUT = This section is not allowed for receive-only printer (ROP).
  The request was to print whatever records were previously allowed - and there were none.

NO = The requested action failed. May also include:
- FEATURE NOT AVAILABLE = The feature required to process the request is not present in the switch.

PF = Printout follows. Followed by the OP:TRFC30-ND output message.

OP:UMBILMAP

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Request output containing the busy/idle status of host umbilical channels

2. FORMAT

OP:UMBILMAP, UMBIL=a-b-c;

3. EXPLANATION OF MESSAGE

   a = Host switching module (HSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   b = Remote switching module (RSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   c = Host umbilical (UMBIL) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

   NG = No good. Valid value(s):
       - DATA BASE READ FAILURE = Failure in reading database for this facility.
       - FACILITY IS NOT AN UMBILICAL FACILITY. = Facility is not an HSM to/from an RSM umbilical facility.
       - UNIT DOES NOT EXIST = Bad unit number.

   PF = Printout follows. The request has been accepted and is being processed. The OP:UMBILMAP output message will follow.

OP:UMEM

**Software Release:** 5E14 and later  
**Command Group:** SFTUTIL  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**

Causes the contents of the administrative module (AM) generic access package (GRASP) trace to be dumped to a file. The trace goes into the DUMPED state with the successful completion of the input message. The output is formatted depending upon the type of trace specified with the INIT:UMEM input message.

2. **FORMAT**

```
OP:UMEM[:UCL][:MCH];
```

3. **EXPLANATION OF MESSAGE**

- **MCH** = Dump trace memory of inactive control unit (CU) using the maintenance channel (MCH). This option should only be used in extreme cases in which the sanity of the off-line CU is in question and it is not desirable to perform a switch to that CU.

- **UCL** = Unconditionally dump trace memory.

4. **SYSTEM RESPONSE**

- **NG** = No good. No trace is defined.

- **PF** = Printout follows. Followed by the OP:UMEM output message.

- **RL** = Retry later or wait for previous OP:UMEM to complete. The system is in an overload condition.

5. **REFERENCES**

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a report on the status of one or all of the generic utilities WHEN (breakpoint) clauses in the communications module processor (CMP).

This message may be used together with any of the other CMP generic utilities input messages. Refer to the References section of this message.

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

OP:UT-CMP=a,{MATE|PRIM},{UTIL|UTILFLAG=b};

3. EXPLANATION OF MESSAGE

MATE = Execute this input message on the standby CMP.
PRIM = Execute this input message on the active CMP.
UTIL = Report the status (active or inhibited) of all WHEN breakpoint clauses in the specified CMP.
a = CMP number.
b = The identification number of a specific WHEN breakpoint clause for which the status is to be reported. Must be a number from 0 to 127.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Software Release: 5E14 and later
Command Group: TRKLN
Application: AEWNC
Type: Input

1. PURPOSE

Requests that maintenance information be collected for an *Air Extension*™ wireless phone. This input message collects the following information:

- Indication of whether the wireless phone is a wireless test set or a subscriber's wireless phone.
- Tenant group wireless phone is assigned to.
- Electronic serial number stored in the wireless network controller (WNC) for the wireless phone.
- Terminal ID stored in the WNC for the wireless phone.
- Port status of the wireless phone's associated W-card line.
- Registration state of the wireless phone.
- Registration area the wireless phone is registered in if applicable.
- Call state of the wireless phone.
- Alert ID assigned to the wireless phone by the WNC if applicable.
- Status of wireless phone's visual message waiting indicator (MWI) as maintained in the WNC.
- Hook status of wireless phone's associated wired phone.
- Service restriction assigned to the wireless phone if any.

2. FORMAT

OP:WCPE,{DN=a | LCKEN=b-c-d-e-f};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = 10 digit wireless directory number (DN).

b = Switching module (SM) in which the wireless phone's W-card line exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Integrated services line unit version 2 (ISLU2) in which the wireless phone's W-card line exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Line group number of wireless phone's W-card line. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Line board number of wireless phone’s W-card line. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Line circuit number of wireless phone’s W-card line. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

RL = Retry Later. The request has been denied, probably due to system load.

PF = Printout follows. The request has been accepted and is followed by an OP WCPE output message.

Requests the immediate or automatic printing of test results from the specified trunk and line work station (TLWS) test position (TP).

2. FORMAT

OP:WSDATA, TP=a[,LOG[,USERDEF]];

3. EXPLANATION OF MESSAGE

LOG = Echo output that normally only goes to the TLWS screen to the ROP. This parameter toggles the log option. If the log option is off, it is toggled on. If the log option is on, it is toggled off.

USERDEF = Requests a display of all the user defined defaults for the test position: CHAN, BLKSZ, FREQ, LEVEL, OPDGTS, TERM, TESTEQ, and T&M NUMBER.

a = TLWS TP number.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

OK = Good.

OP:WSSTAT

Software Release: 5E14 and later
Command Group:
Application: 5
Type: Input

1. PURPOSE

Requests the testing status of one or all trunk and line work station (TLWS) test positions (TP).
The summary shows which TPs are available to be selected by the SET:WSPOS input message.

2. FORMAT

OP:WSSTAT [,TP=a] [,ROP];

3. EXPLANATION OF MESSAGE

ROP = If entered, the results of this input message will go to the ROP and the terminal. Without this optional parameter, the results will only be displayed on the terminal.

a = TLWS TP number. If no TP is requested, then a summary line giving TLWS global parameters is provided. If the TP requested is zero (0), then all TPs are reported.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

PF = Printout follows. Followed by the OP:WSSTAT output message.

61. ORD
ORD:CPI

Software Release: 5E14 and later  
Command Group: SYSRCVY  
Application: 5  
Type: Input  

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that switching modules (SM) be reconfigured or forced by sending administrative module intervention (AMI) messages (CMD) to either a single SM, to a range of SMs, or broadcast to all SMs.

This message allows the selection of four distinct paths from the administrative module (AM) to the SM. Eight paths may be achieved by switching to the mate AM and repeating the ORD:CPI messages.

WARNING: This message should be used only when normal communication with the SM fails. Use variable 'd' options FRC, INH, RESET, and SW with caution.

2. FORMAT

ORD:CPI=a[&&b][-c[-d]],CMD=e[-f],UCL;

3. EXPLANATION OF MESSAGE

UCL = Send the message down all four paths until the SM acknowledges or all paths are tried. This option cannot be entered if a range of 1 to 192 is specified.

a = SM number or lower limit for a range of SMs.

b = Upper limit for a range of SMs.

Note: For a simultaneous broadcast to all SMs, a range of 1 to 192 should be specified. Any other range will result in sending individual messages to specified SMs.

c = Office network and timing complex (ONTC) side 0 or 1 (defaults to active major ONTC).

d = Even (0) or odd (1) NCT link to the SMs (defaults to logical link 0).

e = Type of CPI input message to be sent to the SMs. Valid value(s):

ALW = Allow the sanity timer.
CLR = Clear the force on the specified SMs.
FRC = Force the specified module controller/time slot interchange units (MCTSI) to the active state. This will cause a single process purge if a processor switch is involved.
GRSW = Generic retrofit switch. Force the specified MCTSIs to the active state and cause a full initialization. This input message should only be used as directed during a retrofit.
INH = Inhibit the sanity timer.
RESET = Reset the specified SM. This will result in a full initialization.
SW = Switch the MCTSI to the specified side, then force that side to the active state.

Note: When using the SW option for CMD, a failure will occur if SM
diagnostics are running. Always check the SM status and verify that no diagnostics are running on the SM.

\[ f \] = Side 0 or 1 of the MCTSI (required for FRC, GRSW, and SW input messages).

4. SYSTEM RESPONSE

\[ PF \] = Printout follows. Followed by the ORD:CPI output message.

**Software Release:** 5E14 - 5E15  
**Command Group:** TRKLN  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Establishes or releases a connection between a network digital loop and a specific digital trunk.

2. **FORMAT**

```
ORD:DLOOP,{OPR[=a] | RLS},b;
```

3. **EXPLANATION OF MESSAGE**

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **OPR** = Establishes (operates) a connection.
- **RLS** = Release a connection.

- **a** = The time limit or duration, in seconds, to maintain the connection. The time limit is 3600 seconds in 1 second increments. The default is 30 seconds. (This is only valid when the OPR keyword is specified.)

- **b** = Test parameter. Valid value(s):
  - DEN=c-d-e-f = Test a single digital trunk.
  - NEN=c-g-h-i-j-k-l-m = Test a single digital trunk on a digital network unit - synchronous optical network (SONET) (DNU-S).

- **c** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **d** = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **e** = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **f** = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise, there is only one T1 facility.

- **g** = Digital networking unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **h** = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **i** = SONET terminal equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the ORD:DLOOP output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP:RANGES
ORD:SCSD

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that one of four distribution operations be performed on a scanner and signal distributor (SCSD) distribute point.

Distribute points can be identified by physical location as shown in Format 1 or by logical address as shown in Format 2.

2. FORMAT

[1] ORD:SCSD:UNIT=a,PT=b[-b-b-b-b-b-b-b],OPR=f;

3. EXPLANATION OF MESSAGE

a = Member number of the SCSD unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Physical distribute point number on an SCSD (0-31).

c = Name of the logical SCSD group. Valid value(s):

   ACPALARM
   FANACU0
   FANACU1
   PRSWCU0
   PRSWCU1
   PRSWDFC0
   PRSWDFC1
   PRSWIOP0
   PRSWIOP1
   PRSWMHD0
   PRSWMHD1

d = Duplex point ID (0 or 1).

e = Number of a point within a logical group (0-5).

f = Operation to be done on the distribute point. Valid value(s):

   OPERATE = Set.
   RELEASE = Clear.
   REPEAT = Flash continuously.
   STEP = Flash for eight seconds, which terminates in the cleared state.

4. SYSTEM RESPONSE
NG = No good. SCSD administrator process is not active; no communication with SCSD points is possible.

PF = Printout follows. Followed by the ORD:SCSD output message.

RL = Retry later.

APP:RANGES
62. RCV
1. PURPOSE

Requests a recent change and verify (RC/V) session using the text input option.

The text input option is not menu-driven and does not require a terminal that has cursor control.

The input message consists of the message itself or the message plus one or more message line parameters to be passed to the APPTEXT process. If the parameters are not entered on the message line, they may be entered after the APPTEXT process begins but prior to the first "FORM=" statement. Refer to the Recent Change Procedures 235-118-252 manual for information on performing recent changes on the message line.

A session is composed of one or more text recent change operations. Operations are tasks specified within a session to perform a unit of work (for example: change the data for a particular telephone line).

2. FORMAT

[1] RCV:APPTEXT;

    [,VFYNMVAL|,VFYSCIMG][,DEVICE={STDOUT|ROP|ROP0|FILE|TTYx}],
    [,VERSION=X],
    FORM=...,DATA,FORM=...,END;

3. EXPLANATION OF MESSAGE

DATA = If the user is performing more than one recent change operation on a single line of input to the text interface, ".DATA" must be used after "APPTEXT." In addition, ",DATA" must be used before each subsequent ",FORM=" statement in the single-line input.

DEVICE = Redirect verify output to a device other than the user's terminal. Valid value(s):
FILE = Send verify output to a file in "/rclog". The file will be prefixed with "RCTX", and the user will be given the name of the file at the beginning and end of the APPTEXT session.
ROP/ROP0 = Send verify output to the ROP.
STDOUT = Send verify output to user's terminal. This is the default.
TTYx = Send verify output to any valid tty (such as ttya and ttyv) that exists in "/dev." The user must use the tty name, not tty number.

END = Terminating keyword.

FORM = Recent Change view upon which an operation is to be performed.

VERBOSE = Turn on one-line logging message of recent changes (RCs) on the receive-only printer (ROP) for the current session only. The default is no logging.

The one-line logging message has the following format:
RCV SUCCESS|FAILURE RCV-Form-Name RC-Operation Key(s) TERM-ID=terminal-name

VERSION = Translate APPTEXT input messages from software release X to the current software release. The value of X is an integer that specifies a software release supported for translation of input messages. If the value of X is equal to the software release on the switch, then no translation of input messages will be performed.

VFYEND = Print verify output at the end of the APPTEXT session. This is the default. With this option, the number of verifies per APPTEXT session is limited by the amount of file space in the "rclog" partition.

VFYIMMED = Print verify output immediately after each verify instead of at the end of the session. Verify output must be directed to a device other than the user's terminal.

VFYNMVAL = Print verify output in name-value pair format. Must be redirected to a file.

VFYSCIMG = Print verify output in screen-image format. This is the default.

Valid Option Combinations

* Immediate verify output cannot be directed to the user's terminal or the SCC terminal.

4. SYSTEM RESPONSE

OK = Good. The request has been received. This will be the response when recent changes are not performed on the message line. The user will be put into the APPTEXT session.

PF = Printout follows. A printout will follow on the terminal and on the ROP indicating the end of the APPTEXT session. This will be the response when recent changes are performed on the message line. Sessions initiated from the Master Control Center (MCC) and Switching Control Center (SCC) will get a detailed log printout of session input text. Any requested verify output will be printed to the user's terminal unless the user has redirected the verify output.

RCV:DMTECD-RC

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Invokes the text recent change and verify (RC/V) activity; this format is used to insert, update, or delete records in the equipment configuration database (ECD) using serial text input.

Text RC/V is similar to forms RC/V (trbegin, trend, dbdump, etc.) with the following exceptions: Interactive feedback is on a line basis, not on data fields, and so forth. Errors will be flagged after a message line. All key fields must be entered (no defaults) before any data fields. Assigned default values are not viewable without a secondary operation (refer RCV:DMTECD-VFY). Review/change-insert mode is not supported. A text RC/V session is a single logical message that can be broken into one or more physical lines between keyword units. When the message is broken into multiple lines, a continuation character ("!") must be entered at the end of each line. At the end of continued lines, an acknowledgment is printed, followed by a prompt for more input. Zero or more form operations can be performed per text RC/V session. The session continues until a line is entered without the continuation character. Note, the shell cannot parse an execute character on a line by itself. A text RC/V session is divided into two processing segments: process parameters and process forms. The parameter processing must be first and must be successfully completed before forms processing is allowed. No parameter processing can be done once forms processing has begun. The valid text parameters are shown in this section. The parameter section follows the invocation and ends with the next END or FORM keyword. Note that these keywords cannot be entered on the first line of parameter input. The parameters are verified and errors are generated as needed. If errors are associated with a noncontinued line, the errors are output as a spooler message. Text RC/V recognizes:

ABORTFORM = Aborts a particular form operation.
END = Checks termination status. (Not recognized within a form operation.)
FORM = Begins a form operation.
MSG = Reports an error message when an error occurs during form processing.
SET = This keyword must be used if the field name in the keyword-data-pair (parameter 'f') is part of a structure or list, or contains nonalphanumeric characters.

2. FORMAT

RCV:DMTECD:RC,(DB=|DBF=){a}[|MasKs=|b][|c]||d];
[FORM=e|&g|f,|g][|,END];

3. EXPLANATION OF MESSAGE

DB = The ECD to be processed is not in loadfile format.
DBF = The ECD to be processed is in loadfile format.
a = Name of the data base to be processed. It may be the pathname of a data base file or:
broot = Backup (/broot) full-configuration data base (valid only if backup file system is mounted).
brootdmly = Backup (/broot) minimum-configuration data base (valid only if backup file system
is mounted).

- `incore` = In-core copy.
- `root` = Root copy of full-configuration data base.
- `rootdmly` = Root copy of minimum-configuration data base.

b = Pathname of the directory containing the mask description files. Default = /lla/ecdmasks.

c = JOURNAL/NJOURNAL option. Valid value(s):
- `JOURNAL` = Print all forms from insert, delete, and updates requests to /etc/rcvecd.journal. (Default)
- `NJOURNAL` = Do not print forms from insert, delete, or updates requests to etc/rcvecd.journal.

d = SYSGEN/NSYSGEN option. Valid value(s):
- `SYSGEN` = Enable the system generation mode of operation. This should only be used when executing a dbload or data base evolution because the changes are written into the data base as applied rather than at the end of the transaction block.
- `NSYSGEN` = Disable the system generation mode of operation. Changes are not applied to the data base until the end of the transaction block. (Default)

e = Formtype name of form to be recent changed. Valid names are listed in the Recent Change and Verify User's Guide.

f = Keyword_data_pair-This argument is in the general form of a keyword and an argument, where keyword is usually a form field name, and argument is the data for that field. Valid field names and argument values are listed in the Recent Change and Verify User's Guide. The 'f' argument must be in one of the following formats:
- keyword, ...
- keyword=data, ...
- SET=keyword, ...
- SET=keyword & data, ...
- ABORTFORM, ...

Note: Fatal errors are written to /etc/dmtecd.err.

If errors are associated with a noncontinued line, the errors are output as a spooler message. Text RC/V recognizes:

ABORTFORM = Aborts a particular form operation.
END = Checks termination status. (Not recognized within a form operation.)
FORM = Begins a form operation.
MSG = Reports an error message when an error occurs during form processing.
SET = This keyword must be used if the field name in the keyword-data-pair (parameter 'f') is part of a structure or list, or contains nonalphanumeric characters.

2. FORMAT

RCV:DMTSG:RC,DB="a",MASKS="b",[c],[d];
[FORM="e"&g;f,g],[END];

3. EXPLANATION OF MESSAGE

a = Name of the system generation (SG) data base to be processed. Valid value(s):
broot = Backup (/broot) full-configuration data base (valid only if backup file system is mounted).
brootdmy = Backup (/broot) minimum-configuration data base (valid only if backup file system is mounted).
incore = In-core copy.
root = Root copy of full-configuration data base.
rootdmly = Root copy of minimum-configuration data base.
        = The pathname of a data base file.

b = Pathname of the directory containing the mask description files. Default = /lla/sgmasks.

c = JOURNAL/NJOURNAL option. Valid value(s):
   JOURNAL = Print all forms from insert, delete, and updates requests to /etc/rcvsg.journal.
              (Default)
   NJOURNAL = Do not print forms from insert, delete, or updates requests to /etc/rcvsg.journal.

d = SYSEN/NSYSGEN option. Valid value(s):
   NSYSGEN = Disable the system generation mode operation. Changes are not applied to the
              data base until the end of the transaction check. (Default)
   SYSGEN = Enable the system generation mode of operation. This should only be used when
             executing a dbload or data base evolution because the changes are written into the
             data base as applied rather than at the end of the transaction block.

e = Formtype name of form to be recent changed. Valid names are listed in the Recent Change and
Verify User's Guide.

f = Keyword_data_pair-This argument is in the general form of a keyword and an argument, where
keyword is usually a form field name, and argument is the data for that field. Valid field names and
argument values are listed in the Recent Change and Verify User's Guide. The 'f' argument must be
in one of the following formats:
   keyword, ...
   keyword=data, ...
   SET=keyword, ...
   SET=keyword & data, ...
   ABORTFORM, ...

        g = This argument is shown twice in the format. The first instance is used to indicate the desired
operation to be performed on the associated form-type. The second instance is used to indicate the
actual execution of the desired operation once all data has been entered for the form. Valid
value(s):
   CHG = The form is to be updated in the data base.
   NEW = The form is to be inserted into the data base.
   OUT = The form is to be deleted from the data base.
   XEQ = The form is to be executed. This is the default operation type, but is only valid on
        executable form-types.

Note: Fatal errors are written to /etc/dmtsg.err.

Software Release: 5E14 and later
Command Group: N/A
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the switch access dictionary editor tool (ACCED) be run. In an ACCED session, the following office-dependent database (ODD) error detection and correction operations are available: DESTROY, HASHSIM, OVERWRITE, REORG, REVIEW, and SCAN.

WARNING: Incorrect use of OVERWRITE and DESTROY operations in ACCED can cause serious damage to a system database. ACCED’s OVERWRITE and DESTROY operations should never be used without expert technical assistance.

The DESTROY operation destroys a single data page, a single intermediate date page, or an entire relation. The HASHSIM operation simulates staged hashing to help determine optimal hashing parameters for database reorganization of hashed relations. The OVERWRITE operation overwrites one, two, or four bytes of ODD data. The REORG operation executes a manual reorganization of an ODD relation. The REVIEW operation supports several ways to review disk and memory ODD data. The SCAN operation searches an ODD relation for corruption one tuple at a time. Each ACCED operation has an associated output message that is printed only when output message printing is activated (this is accomplished by typing ‘p’ at any prompt in ACCED).

2. FORMAT

RCV:MENU:ACCED;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been received. The user will now be put into the ACCED session. A completion message will follow when the ACCED session is terminated.

5. REFERENCES

None.
1. PURPOSE

Compares the equipment configuration database (ECD) and the system generation (SG) database. It creates three files for each formtype:

outdir/keycmp/formtype = Contains form keys in three columns, keys found only in the ECD, keys only found in SG, and keys found in both ECD and SG.

outdir/keycomm/formtype = Contains form keys found in both ECD and SG in one column.

outdir/fdiff/formtype = Contains a comparison of all forms that are in both ECD and SG.

In each case "outdir" and "formtype" are replaced by the arguments entered with the keywords OUTDIR and FORM, respectively.

RCV:M-CMPRDB is usually preceded by executing RCV:M-NEWDB.

2. FORMAT

RCV:MENU,COMPAREDB,RCV="a",MASKS="b",DB1="c",NEWDIR1="d",DB2="e",NEWDIR2="f",OUTDIR="g",FORM="h",STDERR="i";

3. EXPLANATION OF MESSAGE

a = Name of the recent change and verify (RC/V) program (rcvecd or rcvsg).

b = Pathname of the directory containing the mask files used by RC/V. Default= /lla/ecdmasks, or /lla/sgmasks.

c = Name of ECD or SG data base for DB1. Valid value(s):
broot = Backup (/broot) full-configuration data base (valid only if backup file system is mounted).
brootdmly = Backup (/broot) minimum-configuration data base (valid only if backup file system is mounted).
incore = In-core copy.
root = Root copy of full-configuration data base.
rootdmly = Root copy of minimum-configuration data base.

Note: Any data base name used in the RCV:M-CREATEECD or RCV:M-CREATESG input message may be used here.

d = Pathname of the directory which contains all the keys for DB1.

e = Pathname of ECD or SG data base for DB2.
f  = Pathname of the directory which contains all the keys for DB2.

g  = Pathname of the output directory where the comparison will be written.

h  = Form type(s) to be compared. Up to 20 may be entered. Valid form types are listed in the Recent Change and Verify User's Guide.

i  = Pathname of the file for redirection of standard error.

4. SYSTEM RESPONSE

PF  = Printout follows. Followed by RCV:MENU output message.

235-600-30x  ECD/SG Data Base
RCV:M-CREATEECD

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a skeleton equipment configuration database (ECD) be generated.

2. FORMAT

RCV:MENU,CREATEECD,DB="a",AUDINST=b[,APHORT=b[,APHUSER=b]]
[,AUDREC=b[,BTIHDEV=b[,BXSLLOC=b[,BXSLRMT=b[,DEVICE=b]
[,LOGDEV=b[,MDCT=b[,RUNA=b[,TSAPINFO=b[,UCB=b[,ULARP=b]
[,WORKHRS=b];

3. EXPLANATION OF MESSAGE

a = Pathname of the database skeleton to be created.

b = Estimated number of records to be contained in the specified set. The correct choice of values
   can reduce disk fragmentation and decrease processor time by eliminating unnecessary growth.
   Note: Message errors are written to /etc/createecd.err.

4. SYSTEM RESPONSE

OK = Good. Requested action initiated and completed.

PF = Printout follows. Followed by RCV:MENU output message.

RCV:M-CREATESG

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Generates a skeleton system generation (SG) database

2. FORMAT

RCV:MENU,CREATESG, DB=\"a\" [,PACK=b] [,PROCESS=b] [,SHARE=b];

3. EXPLANATION OF MESSAGE

a = Pathname of the database skeleton to be created.
b = Estimated number of records to be contained in the specified set. The correct choice of these values can reduce disk fragmentation and decrease processor time by eliminating unnecessary growth of internal access structures.

Note: Message errors are written to /etc/createsg.err.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RCV:MENU output message.

235-600-30x  ECD/SG Data Base
RCV:M-EVOL

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Invokes a specified recent change activity; this format is used to evolve a new database from an old one. The databases are in dump format.

2. FORMAT

RCV:MENU,EVOL,OLD="a",DB="b",ORDER="c",NEW="d";

3. EXPLANATION OF MESSAGE

a = Pathname of the old database in dump/load format. This file was previously created by RCVECD or RCVSG upon insertion of the db_dump form.

b = Pathname of the translation database.

c = Pathname of the file containing the specification of the order of evolution; that is, the order in which new form types should appear in 'd'.

d = Pathname of the file to contain the evolved database in dump/load format. This file will be used as input to RCVECD or RCVSG upon insertion of the db_load form.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RCV:MENU output message.

RCV:M-FDIFF

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Compares two form types. It compares the first form from PFILE1 with the first form from PFILE2, and continues this process for each successive form until reaching the end of the file. If any pair of forms should differ RCV:M-FDIFF prints the two database names, the form type, the form key(s), and the lines that differ.

2. FORMAT

RCV:MENU,FDIFF,MASK="a",PFILE1="b",PFILE2="c"
[,STDOUT="d"][,STDERR="e"];

3. EXPLANATION OF MESSAGE

a = Pathname of the mask file associated with the form type.
b = Pathname of the first printfile. (Usually the output of RCV:M-PRINTFRM which uses the output of RCV:M-KEYCOMM.)
c = Pathname of the second printfile. (Usually the output of RCV:M-PRINTFRM which uses the output of RCV:M-KEYCOMM.)
d = Pathname of the file for redirection of standard output.
e = Pathname of the file for redirection of standard error.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RCV:MENU output message.

Output Message(s):

RCV:MENU
RCV:M-GENBKUP

Software Release: 5E14 and later
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Requests that the automatic generic backup process be started. The process makes copies of disks for backup purposes. The user will be prompted for selection of options for all necessary steps. Available options are: make backup tapes for administrative module (AM) and switching module (SM) text, and AM and SM office dependent data (ODD); make software backup disk for the primary disk pair (moving head disk (MHD) pair 0 and 1 copied to MHD 14 and 15); verify tape (verify that a tape is readable); and identify tape (identify the contents of a tape); and make tape operating procedure (TOP) tape.

It is strongly advised that the user follow the procedure for full office backup described in the Routine Operations and Maintenance manual.

2. FORMAT

RCV:MENU:GENBKUP;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PP = Printout follows. Followed by RCV:MENU-GENBKUP output message.

RCV:M-IREX

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Invokes the installation routine exercise (IREX) user interface tool.

2. FORMAT

RCV:MENU:IREX;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PFF = Printout follows. The request has been received. The user is put into the IREX session. A completion message follows when the session is terminated.

5. REFERENCES

None.
RCV:M-KEYCMP

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Compares of two sorted keyfiles. The comparison consists of three files: keys only in file a, keys only in file b, and keys in file a and file b.

2. FORMAT

RCV:MENU,KEYCMP,KFILE1="a",KFILE2="b",STDOUT="c",STDERR="d";

3. EXPLANATION OF MESSAGE

a = Pathname of the first keyfile.
b = Pathname of the second keyfile.
c = Pathname of the file for redirection of standard output.
d = Pathname of the file for redirection of standard error.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RCV:MENU output message.

RCV : MENU
RCV:M-KEYS

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Creates a sorted list of form keys for all the instances of a given form type found in the equipment configuration database (ECD) and the system generation (SG) database.

2. FORMAT

RCV:MENU, KEYS, RCV="a", [MASKS="b",] DB="c", FORM="d", KFILE="e" [, STDERR="f"];

3. EXPLANATION OF MESSAGE

a = Name of the recent change and verify (RC/V) program (rcvecd or rcvsg).
b = Pathname of the directory containing the mask files used by RC/V. Default=/lla/ecdmasks or /lla/sgmasks.
c = Name of the database to be processed. Valid value(s):
broot = Backup (/broot) full-configuration database (valid only if backup file system is mounted).
brootdmly = Backup (/broot) minimum-configuration database (valid only if backup file system is mounted).
incore = In-core copy.
root = Root copy of full-configuration database.
rootdmly = Root copy of minimum-configuration database.
blank = The pathname of a database file.
Note: Any database name used in the RCV:M-CREATEECD or RCV:M-CREATESG input message may be used here.
d = Form type associated with the desired keys. Valid form types are listed in the Recent Change and Verify User’s Guide.
e = Pathname of the file name to be used for listing the desired keys.
f = Pathname of the file for redirection of standard error.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RCV:MENU output message.

RCV:MENU

Other Manual(s):
235-600-30x  ECD/SG Data Base
RCV:M-LOADF3B

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Invokes a specified recent change activity. This format is used to create a database in loadfile format from a set of database files.

2. FORMAT

RCV:MENU,LOADF3B,DB="a"&b,LF="c"&d[&"e"] [,STDERR="f"];

3. EXPLANATION OF MESSAGE

a = Full root pathname of the equipment configuration database (ECD) (for example, /tmp/dmert.ecd). This is the file from which the loadfile will be generated.
   Note: Any database name used in the RCV:M-CREATEECD input message may be used here.

b = Page size of 'a', specified as the number of bytes, in decimal notation.

c = Pathname of the loadfile, which contains the load image of the database.

d = Virtual address where the loadfile is to be loaded, in decimal notation.

e = Optional argument used to specify the number of bytes (in decimal) to be built into 'c' for growth. All instances of 'e' should be in multiples of the page size 'b'. The default for this argument will be the size of any free space within the current segment.

f = Pathname of the file for redirection of standard error.

4. SYSTEM RESPONSE

OK = Good. Requested action initiated and completed.

PF = Printout follows. Followed by RCV:MENU output message.

RCV:M-COMPAREDB
RCV:M-CREATEECD
RCV:M-CREATESG
RCV:M-EVOL
RCV:M-FDIFF
RCV:M-KEYCMP
RCV:M-NEWDB

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Creates a sorted list of keys for all form types in the equipment configuration database (ECD) and the system generation (SG) database. A sorted key file for each form type is written in d/keys/formtype where "d" is the argument that is entered with the OUTDIR keyword and "formtype" is the name of the form type. This message creates key lists for all data form types, that is all form types listed by klist of recent change and verify (RC/V).

2. FORMAT

RCV:MENU,NEWDB,RCV="a",MASKS="b",DB="c",OUTDIR="d"[,STDERR="e"]; 

3. EXPLANATION OF MESSAGE

a  = Name of the recent change and verify (RC/V) program (rcvecd or rcvsg).
b  = Pathname of the directory containing the mask files used by RC/V. Default= /lla/ecd_masks or /lla/sg_masks.
c  = Name of the database to be processed. Valid value(s):
broot  = Backup (/broot) full-configuration database (valid only if backup file system is mounted).
brootdmly = Backup (/broot) minimum-configuration database (valid only if backup file system is mounted).
inecore = In-core copy.
root    = Root copy of full-configuration database.
rootdmly = Root copy of minimum-configuration database.
  = The pathname of a database file.

Note: Any database name used in the RCV:M-CREATEECD or RCV:M-CREATESG input message may be used here.

d  = Pathname of the output directory where keylist files will be placed. This directory will be created if it does not exist.
e  = Pathname of the file for redirection of standard error.

4. SYSTEM RESPONSE

PF  = Printout follows. Followed by RCV:MENU output message.

RCV:M-PRINTDB

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Creates files of form instances when specified data form type(s) from the equipment configuration database (ECD) and the system generation (SG) database are given. The keyfile for “formtype” is found in d/keys/formtype, and the file of the form instances is created in d/print/formtype, where "d" is the argument that is entered with the OUTDIR keyword and “formtype” is a file name corresponding to the type of form to be printed.

2. FORMAT

RCV:MENU,PRINTDB,RCV="a",[MASKS="b",]DB="c",OUTDIR="d"
[,FORM="e"][,STDERR="f"];

3. EXPLANATION OF MESSAGE

a = Name of the recent change and verify (RC/V) program (rcvecd or rcvsg).
b = Pathname of the directory containing the mask files used by RC/V. Default= /lla/ecdmasks or /lla/sgmasks.
c = Name of the database to be processed. Valid value(s):
   broot = Backup (/broot) full-configuration database (valid only if backup file system is mounted).
   brootdmly = Backup (/broot) minimum-configuration database (valid only if backup file system is mounted).
   incore = In-core copy.
   root = Root copy of full-configuration database.
   rootdmly = Root copy of minimum-configuration database.

   = The pathname of a database file.

   Note: Any database name used in the RCV:M-CREATEECD or RCV:M-CREATESG input message may be used here.

d = Pathname of the output directory.
e = Form type or types that are to be printed. Up to 20 may be entered. Valid form types are listed in the Recent Change and Verify User’s Guide. Default is all data form types listed by klist in RC/V.

f = File for redirection of standard error.

4. SYSTEM RESPONSE

Output Message(s):

RCV:MENU
RCV:M-RCVECD

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Reviews or modifies an equipment configuration database (ECD) through recent change (RC). This message is supported from the maintenance teletypewriter (MTTY) only if both STDIN and STDOUT are redirected. This message is not supported over the Switching Control Center (SCC) link.

2. FORMAT

RCV:MENU,RCVECD[,DB="a"] [,DBF="a"] [,TERM=b] [,MASKS="c"] [,DEFAULTS="d"] [,PRINT="e"] [,ECHO="f"] [,g] [,h] [,i] [,j] [,k] [,l] [,STDIN="m"] [,STDOUT="n"] [,STDERR="o"] ;

3. EXPLANATION OF MESSAGE

DB
= The ECD to be processed is not in loadfile format.

DBF
= The ECD to be processed is in loadfile format.

a
= Name of the database to process. May be the pathname of a database file, or:
broot
= Backup (/broot) full-configuration database (valid only if backup file system is mounted).
brootdmly
= Backup (/broot) minimum-configuration database (valid only if backup file system is mounted).
incore
= In-core copy.
root
= Root copy of full-configuration database.
rootdmly
= Root copy of minimum-configuration database.

Note: Any database name used in the RCV:M-CREATEECD input message may be used here.

b
= Terminal type on which forms are to be displayed. Valid types= VT100, VT52, ADM3A, ADM42, HP2621, GNAT, and DUMB. The default is VT100.

If VT100 is selected, the internal terminal setup options must be correctly initialized. Critical values for On Line Data Integrity System (ODIN) are contained in the fourth grouping, which must be 1010. To check the options, press the setup key, then '5'. To change the options, use the left cursor key to tab to the desired flag, then use '6' to toggle its value. Pressing the setup key returns the terminal to the normal mode of operation.

c
= Pathname of the directory containing the mask description files. The default is /lla/ecdmasks.

d
= Pathname of the directory containing the low level mask default files. The default is /lla/defaults.

e
= Pathname of the file to be used for writing form instances. This option is independent of JOURNAL.

f
= Pathname of the file to which the set of key strokes executed during the course of the RC/V session is sent. This file may be reapplied in a later RC/V session as batch input.
g = HELP/NHELP option. Valid value(s):
HELP = Enable help messages at the bottom of the screen (default).
NHELP = Disables help messages.

h = REVIEW/NREVIEW option. Valid value(s):
REVIEW = Allow only review requests (and disallow insert, delete, and update requests). (default)
NREVIEW = Allow insert, delete, and update requests.

i = JOURNAL/NJOURNAL option. Valid value(s):
JOURNAL = Print all forms from insert, delete, and update requests to /etc/rcvecd.jrn[0,1]. (default)
NJOURNAL = Do not print forms from insert, delete, or update requests to /etc/rcvecd.jrn[0,1].

j = HLMODE/NHLMODE option. Valid value(s):
HLMODE = Enable high level functionality.
NHLMODE = Disables high level functionality (default).

k = SYSGEN/NSYSGEN option. Valid value(s):
SYSGEN = Enable the system generation mode of operation. This should only be used when executing a dbload or database evolution because the changes are written into the database as applied rather than at the end of the transaction block.
NSYSGEN = Disable the system generation mode of operation. Changes are not applied to the database until the end of the transaction block.

l = PRCMSG/NPRCMSG option. Valid value(s):
PRCMSG = Enable ODIN to print processing messages in the upper right-hand corner of the CRT screen. (default)
NPRCMSG = Disable processing messages.

m = Pathname of the file for redirection of standard input.

n = Pathname of the file for redirection of standard output.

o = Pathname of the file for redirection of standard error.
Note: The error file for this input message is /etc/rcvecd.err.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RCV:MENU output message.

MCC Display Page(s):

199 (ECD/RCV)
RCV:M-RCVSG

Software Release: 5E14 and later
Command Group: SPECRCV
Application: 5,3B
Type: Input

1. PURPOSE

Reviews or modifies a system generation (SG) database through recent change (RC). This message is supported from the maintenance teletypewriter (MTTY) only if both STDIN and STDOUT are redirected. This message is not supported over the Switching Control Center (SCC) link.

2. FORMAT

RCV:MENU, RCVSG[, DB="a"] [, TERM=b] [, MASKS="c"] [, PRINT="d"] [, ECHO="e"]
[ , f ] [ , g ] [ , h ] [ , i ] [ , j ] [ , STDIN="k"] [ , STDOUT="l"] [ , STDERR="m"] ;

3. EXPLANATION OF MESSAGE

a = Name of the SG database to be processed. May be the pathname of a database file, or:
broot = Backup (/broot) full-configuration database (valid only if backup is mounted).
brootdmly = Backup (/broot) minimum-configuration database (valid only if backup is mounted).
root = Root copy of full-configuration database.
rootdmly = Root copy of minimum-configuration database.
Note: Any database name used in the RCV:M-CREATESG input message may be used here.

b = Terminal type on which forms are to be displayed. Valid types are VT100, VT52, ADM3A, ADM42, HP2621, GNAT, and DUMB. The default is VT100.

If VT100 is selected, the internal terminal setup options must be correctly initialized. Critical values for On Line Data Integrity System (ODIN) are contained in the fourth grouping, which must be 1010. To check the options, press the setup key, then '5'. To change the options, use the left cursor key to tab to the desired flag, then use '6' to toggle its value. Pressing the setup key returns the terminal to the normal mode of operation.

c = Pathname of the directory containing the mask description files. The default is /lla/sgmasks.

d = Pathname of the file to be used for writing form instances. This option is independent of JOURNAL.

e = Pathname of the file to which the set of key strokes executed during the course of the RC/V session is sent. This file may be reapplied in a later RC/V session as batch input.

f = HELP/NHELP option. Valid value(s):
HELP = Enable help messages at the bottom of the screen (default).
NHELP = Disables help messages.

g = REVIEW/NREVIEW option. Valid value(s):
REVIEW = Allow only review requests (and disallow insert, delete, and update requests)
NREVIEW  = Allow insert, delete, and update requests.

h  = JOURNAL/NJOURNAL option. Valid value(s):
  JOURNAL   = Print all forms from insert, delete, and update requests to /etc/rcvsg.jrnl[0,1] (default).
  NJOURNAL  = Do not print forms from insert, delete, or update requests to /etc/rcvsg.jrnl[0,1].

i  = SYSGEN/NSYSGEN option. Valid value(s):
  SYSGEN    = Enable the system generation mode of operation. This should only be used when executing a dbload or database evolution because the changes are written into the database as applied rather than at the end of the transaction block.
  NSYSGEN   = Disable the system generation mode of operation. Changes are not applied to the database until the end of the transaction block (default).

j  = PRCMSG/NPRCMSG option.
  PRCMSG    = Enables ODIN to print processing messages in the upper right-hand corner of the CRT screen (default).
  NPRCMSG   = Disables processing messages.

k  = Pathname of the file for redirection of standard input.

l  = Pathname of the file for redirection of standard output.

m  = Pathname of the file for redirection of standard error.  
    Note: The error file for this message is /etc/rcvsg.err.

4. SYSTEM RESPONSE

   PF  = Printout follows. Followed by RCV:MENU output message.

63. REKEY
REKEY:SLK

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Requests that a change be made to a new key on an encrypted signaling link (SLK).
This message results in a long key exchange on the specified link the next time the link is resynchronized.

2. FORMAT
REKEY:SLK=a-b;

3. EXPLANATION OF MESSAGE
   a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
   PF = Printout follows.

5. REFERENCES
Output Message(s):
   REKEY:SLK

Input Appendix(es):
   APP:RANGES
64. REPT
REPT:GRC

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that a report of the global recent change (GRC) activity be printed. The NAME field refers to the name of a GRC job. If NAME is not entered, the schedule for all GRC jobs will be displayed. If NAME is entered, a more detailed status of the named job will be reported.

If a named GRC job has been split into sections, the section number MUST be provided using the SECT input message line option. When BATCH is specified, a list of all time-released batch jobs will print. When HISTORY is specified, a history of all input messages executed for all GRC jobs will be printed unless a GRC NAME is specified. When UPDSPEC is specified, a list of the updates defined for all GRC jobs will be printed unless a GRC NAME is specified. When QUERY is specified, the query criteria for all GRC jobs will be printed unless a GRC NAME is specified.

2. FORMAT

REPT:GRC[,NAME=a[,SECT=b]][,DEVICE="c"][,BATCH][,HISTORY][,UPDSPEC][,QUERY];

3. EXPLANATION OF MESSAGE

BATCH = Report the current list of recent change/verify (RC/V) batch jobs scheduled.
HISTORY = Report the history of input messages executed on this GRC name.
QUERY = List the criteria specified for this GRC name.
UPDSPEC = List updates specified for this GRC name.
a = GRC name (up to 10 characters).
b = GRC section number.
c = Destination device or file for the report. The device or file name is input as a character string and must be enclosed with double quotation marks. If the input string is prefixed by a slash (/), the destination will be taken as the name of a file. The length of the file name must not exceed 30 characters. If the device name does not start with a slash (/), it must correspond to an output device defined in a "device" record in the equipment configuration database (ECD). The default destination is the name of the default tty device obtained from the environment variable LCHAN.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by a REPT:GRC output message.
NG = No good. The request was denied. A GRC:ERROR output message will provide the reason for failure.

235-070-100 Administration and Engineering Guidelines
REPT:RCHIST

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests an RC batch history of recent changes (RCs) entered into the RC batch delayed-release clerk files. The RC batch delayed-release clerk files are commonly known as RC batch clerk files.

Format 1 outputs the activity of all RCs in the RC batch clerk files. This report has a one-line synopsis, showing the total RCs per status (pending, demand, complete and error) for each RC batch clerk file in the system. This report is commonly used during a retrofit when the evolved RCs are being reapplied to the new software release's office-dependent data (ODD). The reapplication time is lengthy and this report gives the status on the number successful, failed and demand RCs. Format 2 outputs the RC batch history of the selected RCs in the specified RC batch clerk file. The summary RC batch history report displays the information stored in the RC batch header such as view name, status, operation and key data. The detail RC batch history reports displays the RC batch history summary report and the entire RC in view format. This report is commonly used during a retrofit when the evolved RCs are being reapplied to the new software release ODD. When reported on failed RCs it displays the error messages and the view.

2. FORMAT

[1] REPT:RCHIST,ACTIVITY;

[2] REPT:RCHIST,CLERK=a[,FORMAT={SUMMARY|DETAIL}]
\{,ALL|,b\}[,DEST={c|FILE}][,TIME=d-e];

3. EXPLANATION OF MESSAGE

ALL = Report all RCs. RCs selected could be pending, completed, error, or demand.

DETAIL = For each record selected for the report, format entire RC record.
Note: The defaults for selection parameters are COMPLETE and ERROR. These are set when none of the following selection parameters are specified.

FILE = Writes the report to a file. If the clerk name is RCNEW the file is in /updtmp/HIST.RCNEW. Otherwise the report is in the file /rclog/HIST.<clerk name>.

SUMMARY = For each record selected for the report, format by key only.

a = Clerk name.

b = Valid value(s):
COMPLETE = Report released RCs that were successfully completed.
DEMAND = Report demand RCs.
ERROR = Report released RCs that failed.
PENDING = Report pending RCs.

C = Name of printer to which reports are to be routed. Default is receive-only printer (ROP).

d-e = The range of times between which records are selected. The time fields are specified in month...
(01-12), day (01-31), year (last two digits of calendar year), hour (00-23), and minute (00-59), format, with no separators. Leading zeros must be specified. The first time field must specify a time earlier than the second time field. Thus, choosing 0101000000 as the first time field and 1231992300 as the second time field would select all records and this time (selecting all records) is the default when no time is specified.

4. SYSTEM RESPONSE

PF = Printout follows. The request was accepted. Followed by an REPT:RCHIST output message.

Type: Input

1. PURPOSE

Stops the test in progress and releases the associated testing hardware [such as, global digital services function (GDSF), transmission test facility (TTF) or directly connected test unit (DCTU)] at the indicated trunk and line work station (TLWS) test position (TP).

2. FORMAT

RLS:WSTST,TP=a;

3. EXPLANATION OF MESSAGE

a = TLWS TP number.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

OK = Good. The test was stopped and the hardware released.

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE
Requests that an access interface unit common data and control controller (COMDAC) be removed from service.

WARNING: An unconditional removal of a COMDAC while mate side is out of service will result in a duplex failure of the COMDAC.

2. FORMAT
RMV:AIUCOM=a-b-c[,CAMPON=d][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Executes removal unconditionally.

a = Switching module (SM) number.

b = AIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = COMDAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Camp-on time in minutes (0-20). If CAMPON is not specified, camp-on time defaults to 6 minutes. Maximum time allowed is 20 minutes.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:AIUCOM output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

235-105-110 System Maintenance Requirements and Tools
RMV:BICCCADN

Software Release: 5E16(1) and later
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the removal of a single bearer-independent call control (BICC) block from service and the placing of all the call instance codes (CICs) of the specified block into the circuit administration (CADN) out-of-service (OOS) status.

The request also sends a BICC circuit group blocking (CGB) message to the far end to block the addressed BICC CIC block members at the far end. Any CICs in the BICC CIC block that is being removed from service will be blocked so that no new calls can be originated on them at the far end.

The provisioned CICs required by the BICC protocol for each origination point code (OPC) and destination point code (DPC) are divided into blocks of 128 and are stored on switching module (SM)-2000s that are provisioned as being BICC-capable.

A BICC CIC block may be put into out-of-service for circuit administration (OOS CADN).

No more than three requests can be active at any one time.

If a request is issued for a BICC group and CIC block and if a previous request is still active for the same BICC group and CIC block, the second request will be treated as a duplicate request and will not be honored.

WARNING: Using the UCL option could be service-affecting.

2. FORMAT

RMV:BICCCADN,BGMN=a-b&&c[,CAMPON=d][,BACKOUT][,KILL][,UCL];

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

BACKOUT = The restore functionality will be invoked if the block is not entirely moved into the OOS CADN status. All CICs that had been successfully moved into OOS CADN status will be restored to active status. If the BACKOUT option is not selected, the restore function will not be invoked if the block is not entirely moved into the OOS CADN status, and those CICs that were successfully moved to OOS CADN status will remain OOS CADN. The BACKOUT option cannot be used if either the KILL option or the UCL option is selected.

KILL = Kill all calls.

If any of the CICs still have busy calls on them at the end of the campon interval, these calls will be killed and the entire block will be put into the OOS CADN status.

UCL = Unconditional.

If the user requests that the BICC CIC block be removed unconditionally, then any CICs that have active calls will have their calls killed immediately and the CICs will be put into the OOS CADN status.
If the user does not request the UCL option, and if there are calls active on some of the CICs of the BICC block specified in the input message, these calls will be camped-on using a time specified by the user or by using a default time. As the calls become idle, the corresponding CICs will be put into the CADN status. While camped onto an entire BICC CIC block, no new calls are allowed on the specified BICC CIC block.

If UCL is selected, the user cannot enter a camp-on time, select the KILL option, or select the BACKOUT option.

\[a\] = BICC trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[b\] = CIC for first member of the BICC CIC block.

\[c\] = CIC for last member of the BICC CIC block.

\[d\] = Camp-on time, measured in minutes. If no time is entered, the default camp-on time is 20 minutes. If the camp-on interval expires before all of the CICs become idle, the action to be taken will depend on the user input.

If the user does not request that all calls be killed, then if any CICs are still busy at the end of the camp-on time interval these calls will remain alive.

### 4. SYSTEM RESPONSE

**PF** = Printout follows. The request has been accepted. Followed by the RMV:BICCCADN output message.

**NG** = No good. May also include:
- **BICC NOT AVAILABLE IN OFFICE.** = This office does not support the BICC protocol.
- **DUPLICATE REQUEST.** = This is a duplicate RMV:BICCCADN request for the same BICC CIC block and CIC group, and will not be allowed.
- **HIGH MEMBER NOT LAST IN SAME BLOCK.** = The normalized CIC high member is not exactly 127 greater than the low member.
- **INVALID BG.** = The BICC group entered by the user does not exist.
- **INVALID BGMN.** = The BICC CIC block range is invalid.
- **INVALID BICC BLOCK.** = The BICC CIC block has no members.
- **LOW MEMBER NOT FIRST IN BLOCK.** = The normalized CIC low member is not divisible by 128, or is greater than 65408.
- **NO MEMBERS IN BICC GROUP.** = There are no CIC block members in the BICC group.
- **TOO MANY ACTIVE REQUESTS.** = No more than three active RMV:BICCCADN are allowed at one time.

**RL** = Retry later. May also include:
- **DATABASE ERROR.** Cannot read the trunk group relation.
- **BICCBMOVE IN PROGRESS.** A movement of BICC groups is in progress.

RMV:CCSLK
Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Removes a common channel signaling (CCS) link(s) from service by deactivating, inhibiting, or blocking the link(s).

Note: The BLK option will block the last active link to a point code, whether or not the UCL option is used, because BLK is by default, unconditional.

The INH option cannot be used on the last active link to a point code, even if UCL is used.

Conditional removal requests (either individual or range requests) will be honored only to the extent that at least 50% of the equipped links in the link set remain ACT. The UCL option is required to remove the remaining links to the DACT state.

This input message is applicable only for PSU platform CCS7.

WARNING: Care should be taken when using the blocking (BLK) or the deactivating (DACT) option (variable 'e'); misuse of this option may cause blocking or deactivating of all the links to a point code. Only experienced technicians should attempt to use this option.

2. FORMAT

RMV:CCSLK, SET=a[&&b], MEMBER=c[&&d], STATE=e[, UCL][, SM=f];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally executes removal of a signaling link. Refer to the PURPOSE section for UCL usage.

a = Link set number or lower limit of a range of link set numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. The range of numbers need not start or end with equipped link set numbers.

b = Upper limit of a range of link set numbers.

c = Link member number or lower limit of a range of link member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. Range of numbers need not start or end with equipped link member numbers.

d = Upper limit of a range of link member numbers.

e = Link state. Valid value(s):
BLK = Blocks all traffic from using a link(s).
DACT = Deactivates a link(s).
INH = Except for test and maintenance traffic, inhibits all traffic from the link. The last signaling link may not be inhibited if it would cause common channel signaling to be lost to any DPC.

f = Global switching module (GSM) number. CCS GSM number where the link to be removed is located. If no SM number is specified and only one CCS GSM exists in the office, action will be taken on the specified link on that GSM. If multiple CCS GSMS exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

NG = No good. May also include:
- GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
- NO GLOBAL SM = No GSM is provisioned in the office.
- NEED GSM NUMBER = SM was not specified in the input message, and the office has more than one GSM provisioned.

PF = Printout follows. Followed by the RMV:CCSLK output message.

RL = Retry later. May also include:
- SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.

MCC Display Page(s):

1241, 1251 (MSGS COMMUNITIES)
1240, 1250 (MSGS STATUS for CM3)
RMV:CPE

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests removal from service of the specified customer premises equipment (CPE) integrated services digital network (ISDN) terminal on custom multi-point (MP) and standard interface digital subscriber line (DSL).

CPEs on custom MP and standard interfaces can be removed from service. A CPE is removed from service until it:
- Is manually restored using the RST:CPE input message,
- Re-initializes its layer 2 connection automatically, or
- The DSL to which the CPE is connected loses its layer 2 connection and regains it (either automatically or on demand using the RMV:LINE and RST:LINE input messages).

If the CPE removed from service is a member of modem pool group, the analog port of this member is also removed from service and the status of the analog port is marked "OOS MTCE FE MPOOS AUTO".

During the time that the CPE is out-of-service (OOS), the customer served by the CPE will be without service. Both circuit-switched services and packet-switched services will be unavailable. Customers can regain service at their own initiative by powering down the CPE, waiting some amount of time (which is terminal-dependent), and then powering the CPE back up.

Since only one maintenance activity is allowed on a DSL at a given time, this request could be blocked if another maintenance activity is already active. This is true for both conditional and unconditional removal requests.

2. FORMAT

RMV:CPE,a[,TEI=h][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Remove the CPE from service unconditionally. This will tear down any active calls associated with the CPE before removing the CPE from service. However, even an unconditional request will be rejected if any other maintenance activity is already in progress on the DSL. If UCL is not specified, the CPE will be removed only if no other maintenance activity is in progress on the DSL and the specified CPE is idle.

a = Equipment number or identifier. Valid value(s):

AIUEN=d-o-p-q
DN=r
ILEN=d-i-j-k
INEN=d-s-j-k
LCEN=d-e-f-g
LCKEN=d-e-n-l-m
MLHG=b-c
PKTDN=r

b = Multi-line hunt group (MLHG) number of the subscriber associated with the CPE. This option is valid only if a CPE has associated itself with that MLHG subscriber.
c = Multi-line hunt member number of the subscriber.
d = Switching module (SM) in which the DSL exists.
e = Integrated services line unit (ISLU) or ISLU version 2 (ISLU2) in which the DSL exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Line group controller (LGC) in the ISLU/ISLU2 in which the DSL exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Line card of the ISLU line group controller which the DSL connects to. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Terminal endpoint identifier (TEI) that identifies the particular CPE to be removed. The AIUEN|ILEN|INEN|LCEN|LCKEN/TEI identification can be used to remove any in-service (IS) CPE on a DSL. The AIUEN|ILEN|INEN|LCEN|LCKEN/TEI identification is the only way to remove a CPE that is not associated with a specific subscriber on the DSL (for example, a CPE that is receiving default service). The TEI is dynamically assigned to a CPE when the CPE establishes its layer 2 connection with the network. The trunk and line work station (TLWS) DSL MCC Display Pages or the OP:CPE input message can be used to determine what CPEs currently have layer 2 established on the DSL and what TEI has been assigned to each CPE.
i = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = Line board number of. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Access interface unit (AIU) Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
q = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
r = Circuit directory number (DN) or packet directory number (PKTDN) of the subscriber associated with the CPE. This option is only valid if a CPE exists that has identified itself as being associated with that subscriber. For key-system services, only primary DNs are valid. For non-key-system services, any DN associated with the subscriber can be used.
s = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the
APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The input request was in some way invalid, most likely because a value was out of range. Identify the error with the original request and repeat the request.

PF = Printout follows. The requested action has been accepted and is being processed. An output RMV:CPE message will be printed that identifies the outcome of the request.

**Software Release:** 5E14 and later  
**Command Group:** TRKLN  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests the removal of a data link from service by placing it in the specified out-of-service (OOS) status. If no status is given, a default status (identified below) is assumed. A data link can be identified by its type (AP, DASC, etc.) and group and relative link number or by its equipment number (LCEN, LCKEN, INEN, ILEN, or AIUEN).

If the data link is already OOS, the OOS status will be added to the data link in its proper place in the hierarchy, if possible. Up to four independent OOS conditions can exist simultaneously on a data link. Refer to the APP:PORT-STATUS appendix for a more detailed explanation of statuses that apply to data links. If an external data base (XDB) data link is busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested or a camp-on time limit of 0 is specified. If a camp-on is started, a REPT:CAMPON output message will be generated. The camp-on can then be terminated by a STP:CAMPON input message if desired. If removed unconditionally, the data link is preempted and any communication in progress is torn down. If a data link other than an XDB is busy when the request is made, the conditional request is denied. If an external information system (EIS) data link is busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested or a camp-on time limit of 0 is specified. If a camp-on is started, a REPT:CAMPON output message will be generated. The camp-on can be terminated by a STP:CAMPON input message if desired. Unconditional removal of an EIS data link will preempt any communication and calls in progress will be torn down. Conditional removal of an autoquote (AQ), hotel billing center record terminal (HOBICR), hotel billing center voice terminal (HOBICV), Hotel Billing Information System (HOBIS), or XDB data link, is denied if fewer than 50% of the equipped data links of the same type would remain in service after the removal. Conditional removal of a directory assistance system computer (DASC), management information system (MISLNK), remote alarm section (RAS), or Real-Time Rating System (RTRS) data link, is denied if its mate duplex data link is out of service. Conditional removal of an EIS data link is denied if fewer than N data links of the EIS data link group would remain in service after the removal, where N is the EIS data link group's minimum links. Refer to the recent change View 21.52. Conditional removal of an operator services position system (OSPS) administrative processor (OAP) data link is denied if the data link is in service and logged in. For these cases, a completion report of PORT BUSY is returned in the RMV:DATALINK output message. Conditional removal of an AP data link is not permitted. The RMV:DATALINK output message will have a completion report of CAMPON NOT ALLOWED. An OOS condition on a data link may be deleted using the RST:DATALINK input message.

### 2. FORMAT

```
RMV:DATALINK,a[,CH=b][,c][[:[d][,e][,f][,g][,UCL]];
```

### 3. EXPLANATION OF MESSAGE

**Note:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **UCL** = Unconditional removal. Indicates that the data link should be preempted. All stable communication will be disconnected (traffic release).

- **a** = Valid value(s):

| AIUEN=l-e | HOBIS=h-1 | OAPF=y |
| AP=h-1    | ILEN=l-v-w-x | OAPO=z |
| AQ=h-1    | INEN=l-d1-w-x | RAS=h-1 |
b

Channel identifier [D (default), B1, or B2].

If this option is not specified or if the D-channel is specified, the D-channel and all on-demand service B-channels will be removed from service, but permanent packet B-channels will not be removed. If a B-channel is specified, only that B-channel will be removed from service.

The channel identifier is ignored for Operator Services Position System (OSPS) digital subscriber lines (DSLs) serving basic services terminals (BSTs) and operator position terminals (OPTs). For BST and OPT DSLs, the entire DSL will be removed from service even if only the D-channel or a B-channel is specified in the input request.

c

Valid value(s):

CAMPON=p UCL

Status subfields are always separated by a single comma, even if in-between statuses are omitted (as in OOS,DSBLD).

d

Basic state. Valid value(s):

OOS = Out of service (default)

e

Qualifier (choose one or omit). Valid value(s):

MKBUSY = Make busy. If basic state field 'd' is not specified, it will be defaulted to OOS.
MTCE = Maintenance (default). If basic state field 'd' is not specified, it will be defaulted to OOS.
PPSRV = Pre-post service. If basic state field 'd' is not specified, it will be defaulted to OOS.
TMT = Traffic management (valid only for outgoing trunks). If basic state field 'd' is not specified, it will be defaulted to OOS.

f

Operational restrictions (choose one or omit). Valid value(s):

DSBLD = Disabled (default). If qualifier field 'e' is not specified, it will be defaulted to MTCE.
PLGUP = Plug-up (no effect). If qualifier field 'e' is not specified, it will be defaulted to MTCE.
PX = Power cross. If qualifier field 'e' is not specified, it will be defaulted to MTCE.
RAP = Recorded announcement port. If qualifier field 'e' is not specified, it will be defaulted to MTCE.

Note: If the entire port status is omitted the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

g

Supplementary information (choose one or omit). This field is used to record the reason for removal. Valid value(s):

AML = Automatic maintenance limit
AUDIT = Audit detected problem
CAMA = Central automatic message accounting
CAROT = Centralized automatic reporting on trunks
CDI = Control and data interface
CKT = Circuit
CTTU = Central trunk testing unit
DFI = Digital facility interface
FORPOT = Foreign potential
GRD = Ground fault
GRID = Line unit grid
IAA = Ineffective attempt analysis
ISLU = Integrated services line unit
PCTF = Per-call test failure
PPM = Periodic pulse metering
PSU = Packet switch unit
REX = Routine exercise
RO = Routine other
ROTF = Operational trouble
SCC = Switching control center
SPARED = Line involved in ISLU sparing configuration
TICOM = Treated interface common circuit
TRBL = Unspecified trouble
TRBLORG = Origination trouble
TRKBD = Trunk board
TRKCT = Trunk circuit

h = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = Switching module (SM) number.
m = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = Time limit specified in minutes (0-1438). A camp-on time limit of 0 indicates that no camp-on will be performed if the line is traffic busy.
t = EIS identifier (ID) on which the CPDL terminate. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
u = External data link (member) number relative to the EIS. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
v = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\( w \) = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x \) = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y \) = Force management center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z \) = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^1 \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^1 \) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^1 \) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^1 \) = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^1 \) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^1 \) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^1 \) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\( PF \) = Printout follows. The request has been accepted and will be followed by a RMV:DATALINK output message.

\( RL \) = Retry later. The request has been denied, probably due to system load.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a digital facility interface (DFI) be removed from service.

WARNING: DFI containing packet pipe (PP) or packet pipe member (PPM) can not be removed conditionally. Doing so may result in the DFI being marked as degraded. An unconditional (UCL) remove input message is needed to completely remove DFI with PP or PPM.

For a very compact digital exchange (VCDX) switching module (SM) with common channel signaling (CCS7) access on a packet switching unit (PSU), a DFI can be conditionally removed only if any CCS signaling data links (SDLs) on this DFI are manually removed first, or if the SDL parent CCS links (CCSLKs) are manually deactivated. In addition, an unconditional (UCL) removal of a DFI may impact CCS operations.

2. FORMAT

RMV:DFI=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Execute the removal unconditionally.

a = Switching module number.

b = Digital line/trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by an RMV:DFI output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

RMV:DFIH

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) be removed from service. The system will attempt to move traffic present on the associated facility to other facilities serving the same RISLU. If the facility cannot be made available immediately then a conditional remove request will wait (camp-on) until the facility becomes available or the camp-on period expires.

**WARNING:** An unconditional remove request does not camp-on and will result in the unit dropping stable calls unless traffic can be moved to other facilities.

2. **FORMAT**

RMV:DFIH=a-b-c[,CAMP=d][,UCL];

3. **EXPLANATION OF MESSAGE**

- **UCL** = Execute removal unconditionally.
- **a** = Switching module (SM) number.
- **b** = RISLU digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Allow a maximum of ‘d’ minutes for camp-on time. If CAMP is not specified, camp-on defaults to 3 minutes. Maximum camp-on time is 20 minutes.

4. **SYSTEM RESPONSE**

- **NG** = No good.  
  - CONFLICT WITH UNIT STATE  
  - SM DOES NOT EXIST  
  - SM UNEQUIPPED  
  - UNIT DOES NOT EXIST

- **PF** = Printout follows. Followed by the RMV:DFIH output message.

- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a removal of a specific dual link interface (DLI) and places it in the ‘OOS MAN RMV’ state.

WARNING: Using the unconditional (UCL) option with this message may result in lost calls. If the UCL option is not used, checks will be made to see whether removing the DLI will be service affecting. If the removal will affect service, the request will be denied.

If the UCL option is used, the DLI will be removed whether it affects calls or not.

2. FORMAT

RMV:DLI=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Remove the DLI unconditionally. This option should only be used when the DLI MUST BE removed from service and a conditional removal is denied.

a = Switching module (SM) number that the DLI to be removed is in. (The DLI number and the SM number are the same.)

b = Office network and timing complex (ONTC) side that the DLI is on.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on an digital networking unit - synchronous optical network (DNU-S).

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:DNUSEOC=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Switching module (SM) number.

b = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:DNUSEOC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on an digital networking unit - synchronous optical network (DNU-S).

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:DNUSTMC=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL  =    Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a   =    Switching module (SM) number.

b   =    DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c   =    RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d   =    TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF   =    Printout follows. Followed by the RMV:DNUSTMC output message.

NG   =    No good. The request has been denied. The message is valid but the request conflicts with current status.

RL   =    Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a digital networking unit - synchronous optical network (DNU-S) digital signal level 1 facility (DS1SFAC) be removed from service.

WARNING: An unconditional removal of a DS1SFAC will result in preempting stable calls.

For a very compact digital exchange (VCDX) switching module (SM) with common channel signaling (CCS7) access on a packet switching unit (PSU), a DS1SFAC can be conditionally removed only if any CCS signaling data links (SDLs) on this facility are manually removed first, or if the SDL parent CCS links (CCSLKs) are manually deactivated. In addition, an unconditional (UCL) removal of a DS1SFAC may impact CCS operations.

2. FORMAT

RMV:DS1SFAC=a-b-c-d-e-f-g[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Executes removal unconditionally.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital Networking Unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = SONET Termination Equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

1510 (DNUS STATUS)
RMV:FAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests removal of a remote switching module (RSM) facility (FAC) or a trunk FAC from service.

An RSM FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is an inter-office trunk.

WARNING: FAC containing packet pipe (PP) or packet pipe member (PPM) can not be removed conditionally. Doing so may result in the FAC being marked as degraded. An unconditional (UCL) remove input message is needed to remove FAC with PP or PPM. For a very compact digital exchange (VCDX) switching module (SM) with common channel signaling (CCS7) access on a packet switching unit (PSU), a FAC can be conditionally removed only if any CCS signaling data links (SDLs) on this facility are manually removed first, or if the SDL parent CCS links (CCSLKs) are manually deactivated. In addition, an unconditional (UCL) removal of a FAC may impact CCS operations.

2. FORMAT

RMV:FAC=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Remove the circuit unconditionally. This will disconnect stable calls.

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RSM digital facilities interface (RDFI), inter-RSM communication link digital facilities interface (CDFI), or inter-office trunk digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = FAC number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status.

- NOT STARTED UNIT IN GROWTH STATE = The unit is in a transient state. It is not available at this time.

- SM DOES NOT EXIST = The message syntax is valid, but the SM requested does not exist.

- SM UNEQUIPPED = The message syntax is valid, but the SM is unequipped.
UNIT DOES NOT EXIST = The message syntax is valid, but the unit does not exist.

PF = Printout follows. A RMV:FAC output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an integrated digital carrier unit (IDCU) service group circuit be removed from service.

WARNING: An unconditional removal of an IDCU while the mate side is out-of-service (OOS) will result in a duplex failure of the IDCU.

2. FORMAT

RMV:IDCU=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL  = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a  = Switching module (SM) number.

b  = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = IDCU service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF  = Printout follows. Followed by the RMV:IDCU output message.

NG  = No good. The request has been denied. The message is valid but the request conflicts with current status.

RL  = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an integrated digital carrier unit (IDCU) electrical line interface (ELI) circuit be removed from service unconditionally, by preempting the current user.

WARNING: The use of this input message may cause calls to be dropped on the IDCU facilities associated with the ELI being removed.

2. FORMAT

RMV:IDCUELI=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Switching module (SM) number.

b = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ELI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the RMV:IDCUELI output message.

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on an integrated digital carrier unit (IDCU).

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:IDCUEOC=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Switching module (SM) number.

b = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:EOC output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that an integrated services line unit peripheral interface data bus (ISLUPIDB) pair be removed from service. The removal can be done conditionally or unconditionally. If the removal is conditional, it camps on any traffic on the peripheral interface data bus (PIDB) pair. If the removal is unconditional, it preempts the current user.

WARNING: Stable calls will be affected if the UCL option is used.

2. **FORMAT**

RMV:ISLUPIDB=a-b-c[,CAMP=d][,UCL];

3. **EXPLANATION OF MESSAGE**

- **UCL** = Execute removal unconditionally.
- **a** = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Peripheral interface data bus number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Maximum number of minutes of campon time allowed. If CAMP is not specified, camp on defaults to 6 minutes. Maximum time allowed is 20 minutes. This option is valid only on conditional requests.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
- **PF** = Printout follows. The request was accepted. Followed by the RMV:ISLUPIDB output message.

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Removes an inter-SM (switching module) nailup (ISMNAIL), which is used to support packet transport between two SMs.

WARNING: Use of the unconditional option can be service affecting, that is, stable packet traffic can be disrupted.

2. FORMAT

RMV:ISMNAIL,DLT=a-b,MATEDLT=c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Option to remove ISMNAIL unconditionally, regardless of the effect upon packet transport. The default is to allow the ISMNAIL removal, only if there is an alternate nailup between the same pair of SMs to accept active packet calls.

a = SM number (may be the SM associated with either end of the ISMNAIL).

b = Data link terminal (DLT) number associated with the SM. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Mate SM number (the other SM associated with the ISMNAIL).

d = DLT number associated with the mate SM. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- SM ## NOT IN THE ISM NETWORK = The request has been denied. Either the source or the mate SM or both have no ISMNAILs associated with it.
- SAME SM AND MATESM SPECIFIED = The source and mate SM numbers are the same. This is an invalid condition.

PF = Printout follows. The request has been accepted. Followed by the RMV:ISMNAIL-SD output message.

Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an integrated services test function (ISTF) unit be removed from service.

WARNING: If the RMV input message is used with the ‘UCL’ option, the current customers will be preempted.

2. FORMAT

RMV:ISTF=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Executes the removal unconditionally. This will preempt users in the process of making a call.

a = Switching module (SM) number.

b = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status.
- SM DOES NOT EXIST = The requested SM does not exist in the system.
- SM UNEQUIPPED = The SM specified in the request is unequipped.
- UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by the RMV:ISTF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an inter-working gateway facility (IWGFAC) be removed from service.

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:IWGFAC=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Switch module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Inter-working gateway (IWG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Inter-working gateway facility (IWGFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:IWGFAC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP:RANGES
**RMV:LDSUCOM**

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that a local digital services unit common (LDSUCOM) board be removed from service.

The preempt will be executed only if the office out-of-service limit is not exceeded by this remove request. The office out-of-service limit for LDSUCOMs is 50% of the totally equipped LDSUCOMs.

2. **FORMAT**

RMV:LDSUCOM=a-b-c[,UCL];

3. **EXPLANATION OF MESSAGE**

   **UCL** = Executes the removal of the LDSUCOM board unconditionally unless removing it will result in a loss of call processing.
   
   **a** = Switching module number.
   
   **b** = Local digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   
   **c** = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   **NG** = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
   
   **PF** = Printout follows. Followed by the RMV:LDSUCOM output message.

Input Appendix(es):

APP : RANGES
RMV:LINE

**Software Release:** 5E14 and later
**Command Group:** TRKLN
**Application:** 5
**Type:** Input

### 1. PURPOSE

Requests that a line be removed from service by the addition of a specified out-of-service (OOS) status.

If the line is in service at the time of the request, the OOS status will be added and it will be restricted accordingly. If the line is already OOS, the OOS status will be added to the line in its proper place in the hierarchy, if possible. Up to four independent OOS conditions can exist simultaneously on a line. Refer to the APP:PORT-STATUS appendix for a more detailed explanation of statuses that apply to lines. If the line is traffic busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested or a camp-on time limit of 0 is specified. If a camp-on is started, a REPT:CAMPON output message will be generated. The camp-on can then be terminated by a STP:CAMPON input message, if desired. If removed unconditionally, the line is preempted and all stable calls in progress on the line are torn down. An OOS condition on a line may be deleted using the RST:LINE input message.

### 2. FORMAT

[1] RMV:LINE,(DN=a|PKTDN=a)[-u],[,CH=b],[,CAMPON=c|,UCL]:w,x,y[,z];

[2] RMV:LINE,j 1[,CH=b],[,CAMPON=c|,UCL]:w,x,y[,z];

### 3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **UCL** = Remove the line(s) unconditionally. This action will disconnect stable calls.
- **a** = The directory number of the line.
- **b** = Channel identifier [D (default), B1, or B2]. Used only for digital subscriber lines (DSLs).

If this option is not specified or if the D-channel is specified, the D-channel and all on-demand service B-channels will be removed from service, but permanent packet B-channels will not be removed. If a B-channel is specified, only that B-channel will be removed from service.

The channel identifier is ignored for Operator Services Position System (OSPS) digital subscriber lines (DSLs) serving basic services terminals (BSTs) and operator position terminals (OPTs). For BST and OPT DSLs, the entire DSL will be removed from service even if only the D-channel or a B-channel is specified in the input request.

A modem pool member consists of an analog line and a DSL. They are identified by the same multi-line hunt group member number (MLHG). For Format 4, if the channel is not specified and the MLHG specified is a modem pool group, by default, the analog side is selected for removal. To remove DSL side of the member the channel should be set explicitly to D. Whenever the DSL (multi-point DSL) is removed the corresponding analog line(s) of the modem pool member will also be removed from service with "OOS MTCE FE MPOOS AUTO" status.

- **c** = Camp-on time limit in minutes (0-1438). A camp-on time limit of 0 indicates that no camp-on will be performed if the line is traffic busy.
d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Not required if the switch board equals ALL.

m = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Not required if the switch board equals ALL.

n = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Member number of the multi-line hunt group (MLHG) or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be removed. For LTSB a member number of 1 will remove the lead line and a member number of 2 will remove the associate line. If no member number is specified, for 1-DN LTSB, the lead line and the associate line will both be removed. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be removed.

v = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
section of the Input Messages manual.

Status subfields are always separated by a single comma, even if in-between statuses are omitted (as in OOS, DSBLD).

\[ w \] = Basic state. Valid value(s):

- \textbf{OOS} = Out-of-service (default).

\[ x \] = Qualifier (choose one or omit). Valid value(s):

- \textbf{MKBUSY} = Make busy. If variable \( w \) is not specified, it will be defaulted to OOS.
- \textbf{MTCE} = Maintenance (default). If variable \( w \) is not specified, it will be defaulted to OOS.
- \textbf{PPSRV} = Pre-post service. If variable \( w \) is not specified, it will be defaulted to OOS.
- \textbf{TMT} = Traffic management. If variable \( w \) is not specified, it will be defaulted to OOS.

\[ y \] = Operational restrictions (choose one or omit). Valid value(s):

- \textbf{DSBLD} = Disabled. If variable \( x \) is not specified, it will be defaulted to MTCE (default).
- \textbf{PLGUP} = Plug-up (no effect). If variable \( x \) is not specified, it will be defaulted to MTCE.
- \textbf{PX} = Power cross. If variable \( x \) is not specified, it will be defaulted to MTCE.
- \textbf{RAP} = Recorded announcement port. If variable \( x \) is not specified, it will be defaulted to MTCE.

If the entire port status is omitted the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

\[ z \] = Supplementary information (choose one or omit). This field is used to record the reason for removal. Valid value(s):

- \textbf{AML} = Automatic maintenance limit.
- \textbf{AUDIT} = Audit detected problem.
- \textbf{CAMA} = Central automatic message accounting.
- \textbf{CAROT} = Centralized automatic reporting on trunks.
- \textbf{CDI} = Control and data interface.
- \textbf{CKT} = Circuit.
- \textbf{CTTU} = Central trunk testing unit.
- \textbf{DFI} = Digital facility interface.
- \textbf{FORPOT} = Foreign potential.
- \textbf{GRD} = Ground fault.
- \textbf{GRID} = Line unit grid.
- \textbf{IAA} = Ineffective attempt analysis.
- \textbf{ISLU} = Integrated services line unit.
- \textbf{MPP} = Modem-pool problem.
- \textbf{PCTF} = Per-call test failure.
- \textbf{PPM} = Periodic pulse metering.
- \textbf{PSU} = Packet switch unit.
- \textbf{REX} = Routine exercise.
- \textbf{RO} = Routine other.
ROTFL  = Operational trouble.
SCC    = Switching control center.
SPARED = Line involved in ISLU sparing configuration.
TEST   = In test mode.
TICOM  = Treated interface common circuit.
TRBL   = Unspecified trouble.
TRBLORG= Origination trouble.
TRKBD  = Trunk board.
TRKCT  = Trunk circuit.

a = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = Equipment numbers: Valid value(s):
    AIUEN=d-d^1-e^1-f^1
    ILEN=d-t-h-v
    INEN=d-g^1-h-s
    LCEN=d-e-f-g
    LCKEN=d-e-a^1-b^1-c^1
    LEN=d-i-j-k
    MLHG=n-o
    SLEN=d-q-r-s
    VANA=d-h^1
    VBRI=d-i^1

4. SYSTEM RESPONSE
PF  = Printout follows. The request has been accepted. Followed by the RMV:LINE output message.
RL  = Retry later. The request has been denied, probably due to system load.

Software Release: 5E14 and later
Command Group: CCS
Application: 5,CNI
Type: Input

1. PURPOSE

Requests that the specified link node (LN) be removed from service. The removal is conditional upon having the link facility inactive. To override this condition, refer to the FRMV:LN input request.

If the LN major state is active (ACT) or initialization (INIT), an attempt is made to remove the LN from service. If successful, the LN major state is changed to out-of-service (OOS) and the node itself is placed in the quarantine state. Success depends on the signaling link state being inactive and the associated signaling link being not-in-service.

If the LN major state is other than ACT or INIT, no system action is performed.

When a node is manually removed, it becomes the responsibility of the user to restore the node to service. This is true even if the node had earlier been placed in the OOS state due to automatic system action.

2. FORMAT

RMV:LNa=b;

3. EXPLANATION OF MESSAGE

a  = Ring node (RN) group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Node position in the RN group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Removes a common channel signaling (CCS) intra-global switching module (GSM) message delivery (MD) path internal to the GSM.

The CCS intra-GSM MD path is removed by deactivating the associated protocol handler (PH) channel. Note that there is no nailed-up time slot associated with an intra-GSM MD path. On completion of the request, CCS message delivery of user part messages from the GSM processor is not possible.

Note: This input message is applicable only for PSU platform CCS7.

WARNING: The use of this input message will stop all CCS signaling on the PSU platform in the specified GSM. Use with extreme caution!

2. FORMAT

RMV:MD, SM=a, UCL;

3. EXPLANATION OF MESSAGE

UCL = The unconditional mode is required when removing an intra-GSM MD path.

a = Global switching module (GSM) number.

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID MD PATH = The SM specified is equipped, but not a GSM.
- NO GLOBAL SM = No GSMs are provisioned in the office.
- SM NOT EQUIPPED = SM specified in the input message does not exist in the office.

PF = Printout follows. Followed by the RMV:MD output message.

RL = Retry later. May also include:
- SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.

  1530 (GLOBAL SM MESSAGE DELIVERY STATUS)
RMV:MELNK

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that an MCTSI-based ethernet link (MELNK) be removed from service.

The UCL qualifier is required when removing the real time call detail (RTCD) MELNK if the RTCD office option is on since this action would isolate the global billing switching module (SM) from the billing collector system. For other service types, the UCL option is required to remove the last MELNK.

2. **FORMAT**

RMV:MELNK=a-b-c[,UCL];

3. **EXPLANATION OF MESSAGE**

   **UCL** = Remove unconditionally.
   **a** = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   **b** = MCTSI-based ethernet pipe (MEPIPE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   **c** = MELNK number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   **NG** = No good. May also include:
   - NO SUCH SM = Input command specified an SM that does not exist.
   - SM UNEQ = Input command specified an SM that is unequipped.
   - UNIT UNEQ = Input command specified an SM with no equipped MELNK.

   **RL** = Retry later. The request cannot be executed now due to unavailable system resources. May also include:
   - SM ISOLATED = Cannot communicate with requested SM.

   **PF** = Printout follows. Followed by the RMV:MELNK output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a removal of a specific network link interface (NLI) from service.

Note: Automatic quad-link packet switch (QLPS) network switches may occur if the primary NLI is reconfigured/QLPSs are equipped.

WARNING: Using the unconditional (UCL) option with this message may result in lost calls. If the UCL option is not used, checks are made to see whether removing the NLI is service affecting. If the removal affects service, the request is denied.

If the UCL option is used, the NLI is removed whether it affects calls or not.

2. FORMAT

RMV:NLI=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Remove the NLI unconditionally. This option should only be used when the NLI MUST BE removed from service and a conditional removal is denied.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = NLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ONTC side number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the RMV:NLI output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a removal of a specific network link interface (NLI) from service.

Automatic quad-link packet switch (QLPS) network switches may occur if the primary NLI is reconfigured/QLPSs are equipped.

WARNING: Using the unconditional (UCL) option with this message may result in lost calls. If the UCL option is not used, checks are made to see whether removing the NLI is service affecting. If the removal affects service, the request is denied. If the UCL option is used, the NLI is removed whether it affects calls or not.

2. FORMAT

RMV:NLI=a-b-c[,UCL|,REMAP];

3. EXPLANATION OF MESSAGE

REMAP = Removes the NLI with the remap of timeslots option. This option attempts to preserve inter-SM connections that were using the NLI being removed, by moving those connections to available timeslots on other NLIs. This option is used during the conversion or degrowth procedures for the removing of NLI's in an attempt to save calls. Cannot be used with the UCL option.

UCL = Remove the NLI unconditionally. This option should only be used when the NLI must be removed from service and a conditional removal is denied. Cannot be used with the REMAP option.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = NLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ONTC side number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the RMV:NLI output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an optical carrier - level 3 concatenated (OC3C) facility be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user.

WARNING: Removal of an active OC3C when the mate is standby will generate transient errors on the facilities.

2. FORMAT

RMV:OC3C=a-b-c-d-e[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. If the specified OC3C is the active OC3C, the parameter is required.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = OC3C number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:OC3C output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

RMV:ONTC

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an office network and timing complex (ONTC) be removed from service.

WARNING: Using the unconditional (UCL) option with this message may result in lost calls. If the UCL option is not used, checks will be made to see if removing the ONTC side will be service affecting. If the remove will affect service, the request will be denied.

If the UCL option is used, the ONTC will be removed whether it affects calls or not. It will not, however, allow both sides to be removed (duplex failure).

2. FORMAT

RMV:ONTC=a[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Remove the ONTC unconditionally. Refer to the Purpose section of this message for more details.

a = ONTC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

Output Message(s):

RMV:ONTC
RMV:ONTCCOM

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an office network and timing complex common unit (ONTCCOM) be removed from service and placed in the 'out of service, manual removed' (OOS MAN RMV) state. The dual link interfaces (DLIs) that are currently active below the requested ONTCCOM will be placed in an OOS family of equipment (FE) state. The DLIs currently OOS will stay in the same state.

The ONTCCOM is made up of the following entities:
- Message interface (MI).
- Network clock (NC).
- Time multiplexed switch (TMS) excluding the network control and timing links (NCTLNKs).
- Link interface (LI), which exists only in the communication module model 1 (CM1) hardware.

WARNING: Using the unconditional (UCL) option with this message may result in lost calls. If UCL option is not used, checks will be made to see whether removing the ONTC side will be service affecting. If the remove will affect service, the request would be denied.

If the UCL option is used, the ONTC will be removed whether it affects calls or not. It will not, however, allow both sides to be removed (duplex failure).

2. FORMAT

RMV:ONTCCOM=a[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Remove the ONTCCOM unconditionally. This option should only be used when the DLI must be removed from service and a conditional remove is denied.

a = ONTC common side.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows.
RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

APP:RANGES

MCC Display Page(s):
RMV:OSPSPORT
Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests the removal of an operator services position system (OSPS) port (OSPSPORT) from service by placing it in the specified out-of-service (OOS) status. If no status is given, a default status (identified below) is assumed. An OSPSPORT can be identified by its type [such as autoquote establishment (AQEST) or autoquote mate analog (AQM)] and its associated external identifier parameters or by its equipment number (LCEN, LCKEN, or TEN).

If the OSPSPORT is already OOS, the OOS status will be added to the OSPSPORT in its proper place in the hierarchy, if possible. Up to four independent OOS conditions can exist simultaneously on an OSPSPORT. Refer to APP:PORT-STATUS in the Appendix section of the Output Messages manual for a more detailed explanation of statuses that apply to OSPSPORTs. If an AQEST OSPSPORT or AQM OSPSPORT is busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested or a camp-on time limit of zero is specified. If a camp-on is started, a report REPT:CAMPON output message will be generated. The camp-on can then be terminated by a STP:CAMPON input message, if desired. If removed unconditionally, the OSPSPORT is preempted and any communication in progress is torn down. When an AQM is removed from service, its associated autoquote (AQ) data link is also removed from service. Conditional removal of an AQM is not allowed if fewer than 50% of the equipped AQ data links would remain in service after the removal. If an OSPSPORT other than an AQEST or AQM is busy when the request is made, the request is denied. The corresponding RMV:OSPSPORT output message has a completion report of PORT BUSY. An OOS condition on an OSPSPORT may be deleted using the RST:OSPSPORT input message.

2. FORMAT

RMV:OSPSPORT,a[,CH=b][,CAMPON=v|,UCL][[:d][,e][,f][,g]];

3. EXPLANATION OF MESSAGE

UCL = Remove the unit unconditionally. The OSPSPORT should be preempted. All stable communication will be disconnected (traffic release).

a = Valid value(s):

| AQEST=h     | OPT=k-l |
| AQM=i-j    | TEN=m-r-s-t-u |
| BST=k-l    | XDPF=q |
| LCEN=m-n-o-p | XDPO=k |
| LCKEN=m-n-w-x-y |

b = Channel identifier [D (default), B1, or B2]. Used only for digital subscriber line (DSL) OSPSPORTs. Ignored if the item identified is not a DSL.

If this option is not specified or if the D-channel is specified, the D-channel and all on-demand service B-channels will be removed from service, but permanent packet B-channels will not be removed. If a B-channel is specified, only that B-channel will be removed from service.

The channel identifier is ignored for Operator Services Position System (OSPS) digital subscriber lines (DSLs) serving basic services terminals (BSTs) and operator position terminals (OPTs). For BST and OPT DSLs, the entire DSL will be removed from service even if only the D-channel or a B-channel is specified in the input request.
Status subfields are always separated by a single comma, even if in-between statuses are omitted (as in OOS, DSBLD).

\[ \text{d} \] = Basic state. Valid value(s):
\[ \text{OOS} \] = Out of service (default).

\[ \text{e} \] = Qualifier (choose one or omit). Valid value(s):
\[ \text{MKBUSY} \] = Make busy.
\[ \text{MTCE} \] = Maintenance (default).
\[ \text{PPSRV} \] = Pre-post service.
\[ \text{TMT} \] = Traffic management.

\[ \text{f} \] = Operational restrictions (choose one or omit). Valid value(s):
\[ \text{DSBLD} \] = Disabled (default).
\[ \text{PLGUP} \] = Plug-up (no effect).
\[ \text{PX} \] = Power cross.
\[ \text{RAP} \] = Recorded announcement port.

**NOTE:** If the entire port status is omitted the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

\[ \text{g} \] = Supplementary information (choose one or omit). Records the reason for removal. Valid value(s):
\[ \text{AML} \] = Automatic maintenance limit.
\[ \text{AUDIT} \] = Audit detected problem.
\[ \text{CAROT} \] = Centralized automatic reporting on trunks.
\[ \text{CDI} \] = Control and data interface.
\[ \text{CKT} \] = Circuit.
\[ \text{CTTU} \] = Central trunk testing unit.
\[ \text{DFI} \] = Digital facility interface.
\[ \text{FORPOT} \] = Foreign potential.
\[ \text{GRD} \] = Ground fault.
\[ \text{IAA} \] = Ineffective attempt analysis.
\[ \text{ISLU} \] = Integrated services line unit.
\[ \text{PCTF} \] = Per-call test failure.
\[ \text{PPM} \] = Periodic pulse metering.
\[ \text{PSU} \] = Packet switch unit.
\[ \text{REX} \] = Routine exercise.
\[ \text{RO} \] = Routine other.
\[ \text{ROTF} \] = Operational trouble.
\[ \text{SCC} \] = Switching Control Center.
\[ \text{SPARED} \] = Line involved in ISLU sparing configuration.
\[ \text{TICOM} \] = Treated interface common circuit.
\[ \text{TRBL} \] = Unspecified trouble.
\[ \text{TRBLORG} \] = Origination trouble.
\[ \text{TRKBD} \] = Trunk board.
\[ \text{TRKCT} \] = Trunk circuit.
h = Telephone number.

i = Data link (group) number.

j = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Switching module (SM) number.

n = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Force management center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Trunk unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Channel board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Time limit specified in minutes (0-1438). A camp-on time limit of 0 indicates that no camp-on will be performed if the line is traffic busy.

w = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by the RMV:OSPSPORT output message.

RL = Retry later. The request has been denied, probably due to system load.

WARNING: An unconditional removal of the active PSUCOM while the mate side is out-of-service (OOS), will result in a PSUCOM duplex failure.

2. FORMAT

RMV:PSUCOM=a-b-c[-d][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Execute removal unconditionally.

a = Switching module (SM) number.

b = PSU number.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:PSU output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E14 - 5E15
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a packet switch unit (PSU) common controller (COM) or protocol handler (PH) be removed from service.

WARNING: An unconditional removal of the active PSUCOM while the mate side is out-of-service (OOS), will result in a PSUCOM duplex failure.

An unconditional removal of an active PSUPH while no spare PSUPH is available will result in a loss of service to a channel group. An unconditional remove of an active PSUPH (except for QPHs) with a spare available will result in a hard switch of the PSUPHs resulting in a loss of calls.

Attempts to unconditionally remove a PH serving an MD or MD-ST7 channel group will be denied if no spare PH of the same hardware type exists on the shelf.

Attempts to conditionally or unconditionally remove an ACT PH supporting a QPH channel group will be allowed if a STBY PH of the same hardware type is available on the PSU shelf. If there is not a STBY PH of the same hardware type on the PSU shelf, conditional and unconditional requests to remove a QPH will be allowed if one of the following conditions are true:

- A conditional remove of a QPH will be allowed if all QPIPE(s) provisioned on that QPH channel group have been manually deactivated,
- An unconditional remove of a QPH will be allowed if the system determines that removing this QPH channel group will not cause CCS message transport to any NGSM to be severed (this is always the case if all resident QPIPECs are manually deactivated).

2. FORMAT

RMV:PSU{a}=b-c-d[-e][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Execute removal unconditionally.

a = Circuit name. Valid value(s):
   COM = Common controller.
   PH  = Protocol handler.

b = Switching module (SM) number.

c = PSU number (0).
= This variable has more than one definition.

<table>
<thead>
<tr>
<th>'a'</th>
<th>'d'</th>
</tr>
</thead>
<tbody>
<tr>
<td>COM</td>
<td>Service group number.</td>
</tr>
<tr>
<td>PH</td>
<td>Shelf number.</td>
</tr>
</tbody>
</table>

Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:PSU output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a packet switch unit (PSU) shelf peripheral interface data bus (PIDB) pair be removed from service. The purpose of this input message is to free up the traffic through the PIDB for degrowth purposes. Removal of PIDB 0 relative to the PSU shelf is not allowed. Removal of the PIDB is always unconditional.

WARNING: This input message should only be used while degrowing the PSU PIDB. Use of this input message moves traffic from one PIDB to another PIDB on the same shelf. Before executing this input message, switch maintenance personnel must ensure that remaining PIDBs have sufficient resources to support remaining traffic.

2. FORMAT

RMV:PSUPIDB=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PIDB number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The RMV:PSUPIDB output message will follow.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Output Message(s):

RMV:PSUPIDB
Input Appendix(es):

APP : RANGES
RMV:PSUSHLF

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Request that a packet switch unit (PSU) shelf side be removed from service. The purpose of this command is to support conversion of a PSU shelf from using peripheral interface data bus (PIDB)s to connect to the time slot interchanger unit (TSIU) to using peripheral control and timing (PCT) link for that connection. Removal of PSU shelf side will always always require the unconditional parameter.

WARNING: This command should not be used except while converting a PSU shelf to use PCT links to interconnect to the TSI. Use of this command will cause a service degradation until the shelf conversion is complete. Because of service degradation it is recommended that shelf conversion be done during off-peak hours.

2. FORMAT

RMV:PSUSHLF=a-b-c-d,UCL;

3. EXPLANATION OF MESSAGE

UCL = Execute removal unconditionally.
    a = Switching module (SM) number.
    b = PSU number (0).
    c = PSU shelf side (0-1)
    d = PSU shelf number (0-4)

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF = Printout follows. The request was accepted. Output message RMV PSUSHLF will follow.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Output Message(s):

RMV:PSUSHLF
Input Appendix(es):

APP : RANGES
RMV:QGP

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Request a conditional or unconditional removal of a quad-link packet switch (QLPS) gateway processor (QGP) from service.

Note 1: As part of the QGP reconfiguration, switching of the QLPS may occur.

Unless the degrow option is specified, the removal of the last QGP will be denied.

Note 2: The DEGROW option is not a valid parameter for CM3.

2. FORMAT

RMV:QGP=a-b[,UCL|,DEGROW];

3. EXPLANATION OF MESSAGE

DEGROW = Remove QGP unconditionally. This option should generally be used only for degrowth procedures, because this option will allow the removal of the last QGP if all switching module (SM)-2000s would still have communication link (CLNK) connectivity. The DEGROW option is not valid for CM3.

UCL = Remove QGP unconditionally. This request will not be honored, however, if the number of SM-2000s that do not have QLPS connectivity increases or QLNK connectivity would decrease as a result of the remove.

a = Message switch (MSGS) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the RMV:QGP output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

235-105-220  Corrective Maintenance
235-105-250  System Recovery Procedures

MCC Display Page(s):

1241, 1251 (MSGS COMMUNITIES)
1240, 1250 (MSGS STATUS for CM3)
1380, 1381 (QLPS NETWORK 0/1 STATUS)
1. PURPOSE

Requests a conditional or unconditional removal of a quad-link packet switch (QLPS) from service.

WARNING: The use of this input message with the unconditional option could result in the loss of transient calls. Use with extreme caution! Inappropriate use of this message may also reduce call processing capacity.

Note: The DEGROW option is not a valid parameter for CM3.

2. FORMAT

RMV:QLPS=a-b[,UCL|,DEGROW];

3. EXPLANATION OF MESSAGE

DEGROW = Perform QLPS remove truly unconditionally. Unlike the UCL option, no defensive checks are performed. Thus, this option should only be used to degrow the QLPSs; otherwise, additional switching module-2000s (SM-2000s) may lose QLPS connectivity. The DEGROW option is not valid for CM3.

UCL = Perform QLPS remove unconditionally. This request will not be honored, however, if the outcome will increase the number of SM-2000s that do not have any QLPS or QGP (if equipped) connectivity.

a = Office network and timing complex (ONTC) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the RMV:QLPS output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1380, 1381 (QLPS NETWORK 0/1 STATUS)
RMV:QPHPIPE

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a quad-link packet switch protocol handler (QPH) QPIPE be removed from service unconditionally.

WARNING: The UCL construct is required. SS7 services in the office may be impaired by this action.

2. FORMAT

RMV:QPHPIPE=a-b-c-d-e,UCL;

3. EXPLANATION OF MESSAGE

UCL = Execute removal unconditionally.

a = Global switching module (GSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = QLPS network number (0 or 1, or a range 0&&1 for QPH QPIPEs on both networks). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = The request has been accepted. A RMV:QPHPIPE output message will follow, specifying the results of the request.

NG - SM UNEQUIPPED = This response indicates that the input GSM (part of the QPH QPIPE specification) is not even an equipped SM.

NG - NOT A GSM = This response indicates that the input GSM (part of the QPH QPIPE specification) is not a provisioned GSM.

RL - GSM NOT AVAILABLE = This response indicates that the input GSM (part of the QPH QPIPE specification) is not available, because it is isolated or undergoing an initialization. Retry later.

(COMMON PROCESSOR)
RMV:RPCN

**Software Release:** 5E14 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that the specified ring peripheral controller node (RPCN) be removed from service. The removal is conditional upon having adequate traffic handling capacity.

If the RPCN major state is active (ACT), initialization (INIT), or standby (STBY), an attempt is made to remove the RPCN from service. If successful, the RPCN major state is changed to out-of-service (OOS) and the node itself is placed in the quarantine state. Success depends on remaining traffic handling capacity. If the RPCN major state is other than ACT, INIT, or STBY, no system action is performed. If a node is manually removed from service, it becomes the responsibility of the user to restore the node to service. This is true even if the node had earlier been placed in the OOS state due to automatic system action.

2. **FORMAT**

RMV:RPCTa=0;

3. **EXPLANATION OF MESSAGE**

a  

= Ring node (RN) group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

118 (CNI FREAME AND CCS LINK STATUS)
RMV:RRCLK

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) be removed from service.

If the request is conditional, the system will remove the specified RRCLK side only if the mate RRCLK side is in-service [that is, active (ACT) or standby (STBY)]. If the request is unconditional the specified RRCLK side will be removed from service regardless of the state of the mate RRCLK side.

Removal of an active RRCLK side causes the currently standby side to become active.

WARNING: Unconditional removal of an RRCLK side when the mate RRCLK side is out of service will result in duplex failure of the RISLU.

2. FORMAT

RMV:RRCLK=a-b-c[,UCL][,SCREEN=d];

3. EXPLANATION OF MESSAGE

UCL = Execute removal unconditionally.

a = Switching module (SM) number.

b = RISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RRCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Although this option is syntactically correct, it is set internally for cross checking purposes and values entered here will be ignored.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CONFLICT WITH UNIT STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST
PF = Printout follows. Followed by the RMV:RRCLK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote terminal (RT) embedded operations channel (EOC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for TR303 RTs (that is, Series 5 RTs running feature package 303G) terminating on an integrated digital carrier unit (IDCU) or a digital networking unit - synchronous optical network (DNU-S).

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:RT,EOC=a-b [,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:RT-EOC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote terminal (RT) timeslot management channel (TMC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for TR303 RTs (that is, Series 5 RTs running feature package 303G) terminating on an integrated digital carrier unit (IDCU) or a digital networking unit - synchronous optical network (DNU-S).

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:RT,TMC=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:RT-TMC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a remote terminal (RT) facility (FAC) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on a digital networking unit - synchronous optical network (DNU-S). This is an alternative way to address a remove of a DS1 facility.

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:RTFAC=a-b[, UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.

a = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RT FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:RTFAC output message.

- **Software Release**: 5E14 and later
- **Command Group**: SM
- **Application**: 5
- **Type**: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that a service announcement system (SAS) unit be removed from service.

**WARNING**: If the RMV input message is used with the 'UCL' option, the current customers will be preempted.

2. **FORMAT**

```
RMV:SAS=a-b[,UCL];
```

3. **EXPLANATION OF MESSAGE**

- **UCL** = Executes the removal unconditionally. This will preempt the current users of this SAS.
- **a** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied because it conflicts with current equipment status. May also include:
  - **SM DOES NOT EXIST** = The requested SM does not exist in the system.
  - **SM UNEQUIPPED** = The SM specified in the request is unequipped.
  - **UNIT DOES NOT EXIST** = The requested unit does not exist in the system.
- **PF** = Printout follows. The request has been accepted. Followed by the RMV:SAS output message.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

**Software Release:** 5E16(2) and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the removal of a stream control transmission protocol (SCTP) by endpoint or association.

Format 1 allows for the state change to the near endpoint to **OOS MAN** and its associations to closed state.

Format 2 allows for the state change to the association specified to **CLOSED MAN**.

**WARNING:** Using the **UCL** option could be service-affecting causing the shut down of traffic.

2. FORMAT

[1] RMV:SCTP,ENDPT=a[,UCL];

[2] RMV:SCTP,ASSOC=b[,UCL];

3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**UCL** = Execute the removal unconditionally. All stable calls will be disconnected (traffic release). For packet switching trunks, the UCL option overrides the check for the maintenance limit.

**a** = Endpoint name to be removed from service. This is a character string \(<=20\) that is provisioned on RC/V View 33.19 (SCTP NEAR END POINT).

**b** = Association number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

**NG** = No good. The request has been denied. May also include:
- DATABASE ERROR = Unrecoverable database error has occurred.
- INTERNAL ERROR = Undetermined errors, possibly a software error. This response may be accompanied by an assert.
- INVALID ASSOCIATION ID = The association number entered was not valid.
- INVALID NEAR ENDPOINT NAME = The near endpoint name entered was not valid.

**PF** = Printout follows. The request has been accepted. Followed by the RMV:SCTP output message.
RL = Retry later. May also include:
- AM OVERLOAD = AM is in overload.
- SM INACCESSIBLE = SM is not available (for example, isolation, initialization, and so forth).
- SYSTEM ERROR = The system is probably in overload due to too many requests. The
  OP:JOBSTATUS input message can be used to determine if the RL was because
  the maximum number of jobs are active.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a digital networking unit - synchronous optical network (DNU-S) synchronous transport signal facility (STSFAC) be removed from service.

WARNING: An unconditional removal of an STSFAC will result in preempting stable calls.

For a very compact digital exchange (VCDX) switching module (SM) with common channel signaling (CCS7) access on a packet switching unit (PSU), an STSFAC can be conditionally removed only if any CCS signaling data links (SDLs) on child facilities are manually removed first, or if the SDL parent CCS links (CCSLKs) are manually deactivated. In addition, an unconditional (UCL) removal of an STSFAC may impact CCS operations.

2. FORMAT

RMV:STSFAC=a-b-c-d-e[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Executes removal unconditionally.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital Networking Unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = SONET Termination Equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Synchronous Transport Signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the RMV:STSFAC output message.
Retry later. The request cannot be executed now due to unavailable system resources.

Input Appendix(es):
APP:RANGES
RMV:TEN

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that the analog trunk specified by the trunk equipment number (TEN) be removed from service.

2. FORMAT
RMV:TEN=a-b-c-d-e[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Execute the removal unconditionally.

a = Switching module number.

b = TEN unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = TEN board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the RMV:TEN output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Output Message(s):

RMV:TEN

Input Appendix(es):

APP:RANGES
RMV:TMSFP

Software Release: 5E16(2) and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specified time multiplexed switch (TMS) fabric pair (TMSFP) be removed from service. This command also has the option of removing the TMSFP and all of its child units to the OOS,MAN,RMV state.

WARNING: Using the unconditional (UCL) option with this message may result in lost calls. If the UCL option is not used, checks are made to see whether removing the TMSFP is service affecting. If the removal affects service, the request is denied.

If the UCL option is used, the TMSFP is removed whether it affects calls or not.

2. FORMAT

RMV:TMSFP=a-b[,ALL][,UCL];

3. EXPLANATION OF MESSAGE

ALL = Removes the TMSFP and all its child units (for example, QLPSs, NLIs, DLIs) to the OOS,MAN, RMV state.
UCL = Unconditionally remove the TMSFP.
a = ONTC side that the TMSFP is on.
b = TMS fabric pair number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
PF = Printout follows. A RMV:TMSFP output message will follow in response to the request.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

1220,b TMS LINK SUMMARY (where b=TMSFP number).
RMV:TMUX

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a digital networking unit - synchronous optical network (DNU-S) transmission multiplexer (TMUX) be removed from service.

WARNING: An unconditional removal of a TMUX may result in preempting stable calls.

For a very compact digital exchange (VCDX) switching module (SM) with common channel signaling (CCS7) access on a packet switching unit (PSU), a TMUX can be conditionally removed only if any CCS signaling data links (SDLs) on child facilities are manually removed first, or if the SDL parent CCS links (CCSLKs) are manually deactivated. In addition, an unconditional (UCL) removal of a TMUX may impact CCS operations.

2. FORMAT

RMV:TMUX=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Executes removal unconditionally.
a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.
PF = Printout follows. Followed by the RMV:TMUX output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status. The ability to remove a trunk group is also provided.

Formats 1, 8, and 11 specify a single trunk to be removed, based on access hardware type. Format 1 also allows the option of removing all trunks on a digital facilities interface (DFI) by specifying the facility. Format 11 also allows the option of removing all trunks residing on a digital networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility by specifying the facility.

Formats 1 and 11 may be used to remove packet switch unit (PSU) based CCS7 signaling data link (SDL) ports. The SDL may be removed conditionally if the parent CCS signaling link is in the DACT state. The parent signaling link can be determined by use of the RC/V Views 7.41 or 7.42. No state should be specified since the OOS-MTCE-DSBLD state is the default and only valid state. Finally, the UCL option is available but will cause service interruptions if the SDL is servicing traffic.

Format 2 specifies an integrated digital carrier unit (IDCU) line equipment number (ILEN) to be removed.

Format 3 specifies an X.25 access on T1 (XAT) port to be removed by specifying the multi-line hunt group (MLHG) and member.

Format 4 specifies an XAT port to be removed by specifying a packet directory number (PKTDN).

Format 5 specifies a primary rate interface (PRI) group to be removed. If the type of channel to be removed is not specified, the D-channel(s) of the PRI group will be removed to the specified or default port status. Format 5 allows the option of removing either the D-channel(s) of the PRI group or all the B-channels of the PRI group. This format cannot be used for operator services position system (OSPS) PRIs because they are not assigned PRI group numbers.

Format 6 specifies the PSU equipment number of the trunk to be removed.

Format 7 specifies a SLC® line equipment number (SLEN) to be removed.

Format 9 specifies all members in a trunk group are to be removed.

Format 10 specifies an individual or range of trunks within the same trunk group to be removed.

Format 11 specifies an integrated digital loop carrier (IDLC) networking equipment number (INEN) to be removed.

If the trunk is in service at the time of the request, the OOS status will be added and the trunk will be restricted accordingly. If the trunk is already OOS, the OOS status will be added to the trunk according to the trunk status hierarchy, if possible. Up to four independent OOS conditions can exist simultaneously on a trunk.

If the trunk is traffic-busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested. If camped on, a STP:CAMPON input request can stop the campon (and abort the removal), if desired. If removed unconditionally, the trunk is preempted and all stable calls in progress on the
trunks are torn down.

If the trunk is a packet pipe trunk or a packet pipe member trunk, a conditional remove will be denied (camp-ons are not allowed). Trunks associated with a packet pipe are nailed-up paths that carry CDMA packets that are distributed to any number of speech handler (SH) trunks. There is no way to determine if call traffic is present on these trunks so only an unconditional remove will be allowed. An unconditional removal of a packet pipe trunk or a packet pipe member trunk may impact up to 30 calls.

If the trunk to be removed is a PRI D-channel, the associated B-channels will also be removed from service unless the PRI is equipped with a backup D-channel and that backup D-channel is not already manually out-of-service. If a PRI is equipped with a backup D-channel, both D-channels must be removed from service before the B-channels will be taken out-of-service. This can be accomplished by using either the PRIGRP option on the RMV:TRK input request or by removing the two D-channel trunks with 2 individual RMV:TRK input requests. Except for the PRIGRP option, PRI D-channels can only be removed one at a time. Specifying a range of D-channel trunks or a D-channel trunk group is not allowed. OSPS PRIs cannot have a backup D-channel.

For internal protocol (IP) packet switching (PS) traffic busy trunks, a conditional removal will remove the trunk from service without camping-on and the PS calls will be transferred to other in-service trunks within the same trunk group.

A conditional removal of a PS trunk will camp-on only if it is involved in loopback testing. A conditional removal request for a PS trunk will be denied if the trunk removal would result in exceeding the packet switching maintenance limit (PSML), 25% of the trunk group size. The PSML is rounded off to the nearest whole number and if the trunk group size is less than 4 then the PSML is set to 1. The UCL option will override the PSML check. The PSML check does not apply to XAT ports.

An OOS condition on a trunk may be deleted using the RST:TRK input request.

**WARNING:** Using the UCL option could be service-affecting.

Specifying `RMV:TRK,PRIGRP=RMV:TRK,PRIGRP=CH=D` can affect service on all B-channels assigned to the PRI. At most, 479 B-channels may be assigned to a PRI. If the UCL option is used with either of these two RMV:TRK formats, all calls on the PRI’s B-channels are cleared. While camped onto an entire PRI with either of these two RMV:TRK formats, no new calls are allowed on the PRI.

### 2. FORMAT

1. `RMV:TRK,DEN=a-b-c-d[,FAC=v][,UCL|CAMPON=x][:[a1][,b1][,c1][,d1]];`
2. `RMV:TRK,PRIGRP=k[,CH=w][,UCL|CAMPON=x][:[a1][,b1][,c1]]`
3. `RMV:TRK,s1[,UCL|CAMPON=x][:[a1][,b1][,c1][,d1]];`

### 3. EXPLANATION OF MESSAGE

**Note:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **ALL** = Remove all trunks on the remote terminal from service.
- **CAMPON** = Camp on the trunk for the specified time interval if it is traffic busy.
- **DEN** = Digital equipment number of the digital trunk.
SUM = Generate a summary report.

UCL = Execute the removal unconditionally. All stable calls will be disconnected (traffic release). For packet switching trunks, the UCL option overrides the check for the maintenance limit.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 0 and channels 25-48 are associated with facility T1 1.

If ALL is specified, all channels on the DFI will be removed from service. For DFI-1, this will be channels 1-24. For DFI-2, this will be channels 1-48. The FAC option can be used to specify which set of 24 channels to remove for a DFI-2. Refer to the FAC option (variable 'v') for additional information.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Directory number.

k = PRI group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Number of the trunk group to be removed from service.
   Note: Using this will remove all members of the trunk group specified and could potentially isolate the far-end office.

s = Trunk group number.

t = Trunk member number or lower limit of a range of trunk member numbers.

u = Upper limit of a range of trunk member numbers.

v = Facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   0 = Facility 0 is channels 1 through 24 on a DFI-2. Specifying this will remove channels 1 through 24.
   1 = Facility 1 is channels 25 through 48 on a DFI-2. Specifying this will remove channels 25 through 48.

When used with the DEN identifier, this option specifies the facility to be removed. It is only valid for DFI-2 hardware. The DEN identifier must have the channel set to ALL.

w = Channel. Valid value(s):
   D = Specifying this will cause the D-channel(s) of the PRI group to be removed to the specified or default status. If the PRI has a backup D-channel assigned, it will also be removed.
   B = Specifying this will cause all of the B-channel(s) of the PRI group to be removed to the specified or default status.

When used with the PRIGRP identifier, this option specifies which channels on the PRIGRP are to be removed.

x = Camp-on time limit in minutes (0-20). (Default is 2 minutes for OSPS-PRI trunks, 20 minutes for all others).

Status subfields are always separated by a single comma even if in-between statuses are omitted.

If variables 'a1', 'b1', and 'c1' are omitted, they will default based on trunk type.

<table>
<thead>
<tr>
<th>Trunk Type</th>
<th>Default Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-way incoming</td>

235-190-120  Common Channel Signaling Service Features
235-900-341  National ISDN Basic Rate Interface Specification
1. PURPOSE

Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status. The ability to remove a trunk group is also provided.

If the trunk is in service at the time of the request, the OOS status will be added and the trunk will be restricted accordingly. If the trunk is already OOS, the OOS status will be added to the trunk according to the trunk status hierarchy, if possible. Up to four independent OOS conditions can exist simultaneously on a trunk.

If the trunk is traffic-busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested. If camped on, an STP:CAMPON input request can stop the campon (and abort the removal), if desired. If removed unconditionally, the trunk is preempted and all stable calls in progress on the trunks are torn down.

If the trunk is a packet pipe trunk or a packet pipe member trunk, a conditional remove will be denied (camp-ons are not allowed). Trunks associated with a packet pipe are nailed-up paths that carry CDMA packets that are distributed to any number of speech handler (SH) trunks. There is no way to determine if call traffic is present on these trunks so only an unconditional remove will be allowed. An unconditional removal of a packet pipe trunk or a packet pipe member trunk may impact up to 30 calls.

If the trunk to be removed is a PRI D-channel, the associated B-channels will also be removed from service unless the PRI is equipped with a backup D-channel and that backup D-channel is not already manually out-of-service. If a PRI is equipped with a backup D-channel, both D-channels must be removed from service before the B-channels will be taken out-of-service. This can be accomplished by using either the PRIGRP option on the RMV:TRK input request or by removing the two D-channel trunks with 2 individual RMV:TRK input requests. Except for the PRIGRP option, PRI D-channels can only be removed one at a time. Specifying a range of D-channel trunks or a D-channel trunk group is not allowed. OSPS PRIs cannot have a backup D-channel.

For internal protocol (IP) packet switching (PS) traffic busy trunks, a conditional removal will remove the trunk from service without camping-on and the PS calls will be transferred to other in-service trunks within the same trunk group.

A conditional removal of a PS trunk will camp-on only if it is involved in loopback testing. A conditional removal request for a PS trunk will be denied if the trunk removal would result in exceeding the packet switching maintenance limit (PSML). 25% of the trunk group size. The PSML is rounded off to the nearest whole number and if the trunk group size is less than 4 then the PSML is set to 1. The UCL option will override the PSML check. The PSML check does not apply to XAT ports.

Adding the OOS,MTCE,DSBLD,TRBL status to the trunk will cause in progress block/unblock/reset sending to stop.

While in the OOS,MTCE,DSBLD,TRBL status, additional block/unblock sending can start.

An OOS condition on a trunk may be deleted using the RST:TRK input request.

WARNING: Using the UCL option could be service-affecting.
Specifying RMV:TRK, PRIGRP= or RMV:TRK, PRIGRP=, CH=D can affect service on all B-channels assigned to the PRI. At most, 479 B-channels may be assigned to a PRI. If the UCL option is used with either of these two RMV:TRK formats, all calls on the PRI's B-channels are cleared. While camped onto an entire PRI with either of these two RMV:TRK formats, no new calls are allowed on the PRI.

2. FORMAT

RMV:TRK, a[, UCL|CAMPON=y][[:a^1][,b^1][,c^1][,d^1]][,SUM];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Remove all trunks on the remote terminal from service.

SUM = Generate a summary report.

UCL = Execute the removal unconditionally. All stable calls will be disconnected (traffic release). For packet switching trunks, the UCL option overrides the check for the maintenance limit.

\[a\] = Unit. Valid value(s):

DEN=b-c-d-e[, FAC=w] = The SDL may be removed conditionally if the parent CCS signaling link is in the DACT state. The parent signaling link can be determined by use of the RC/V Views 7.41 or 7.42. No state should be specified since the OOS-MTCE-DSBLD state is the default and only valid state. Finally, the UCL option is available but will cause service interruptions if the SDL is servicing traffic.

ILEN=b-f-g-h
INEN=b-e^1-g-n

\[b\] = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[c\] = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[d\] = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

e = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 0 and channels 25-48 are associated with facility T1 1.

If ALL is specified, all channels on the DFI will be removed from service. For DFI-1, this will be channels 1-24. For DFI-2, this will be channels 1-48. The FAC option can be used to specify which set of 24 channels to remove for a DFI-2. Refer to the FAC option (variable 'w') for additional information.

f = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Directory number.

l = PRI group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Number of the trunk group to be removed from service.

Using this will remove all members of the trunk group specified and could potentially isolate the far-end office.
t = Trunk group or bearer independent call control (BICC) group number.

u = Trunk member or normalized call instance code (CIC), or lower limit of a range of trunk member numbers or normalized CICs.

v = Upper limit of a range of trunk member numbers or normalized CICs.

w = Facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):

0 = Facility 0 is channels 1 through 24 on a DFI-2. Specifying this will remove channels 1 through 24.

1 = Facility 1 is channels 25 through 48 on a DFI-2. Specifying this will remove channels 25 through 48.

When used with the DEN identifier, this option specifies the facility to be removed. It is only valid for DFI-2 hardware. The DEN identifier must have the channel set to ALL.

x = Channel. Valid value(s):

B = Specifying this will cause all of the B-channel(s) of the PRI group to be removed to the specified or default status.

D = Specifying this will cause the D-channel(s) of the PRI group to be removed to the specified or default status. If the PRI has a backup D-channel assigned, it will also be removed.

When used with the PRIGRP identifier, this option specifies which channels on the PRIGRP are to be removed.

y = Camp-on time limit in minutes (0-1438). (Default is 2 minutes for OSPS-PRI trunks, 20 minutes for all others). Camp on the trunk for the specified time interval if it is traffic busy.

Status subfields are always separated by a single comma even if in-between statuses are omitted.

If variables ‘a1’, ‘b1’, and ‘c1’ are omitted, they will default based on trunk type.

<table>
<thead>
<tr>
<th>Trunk Type</th>
<th>Default Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-way incoming</td>
<td>OOS,MTCE,DSBLD</td>
</tr>
<tr>
<td>Two-way</td>
<td>OOS,MTCE,DSBLD</td>
</tr>
<tr>
<td>One-way outgoing</td>
<td>OOS,MTCE,DSBLD</td>
</tr>
<tr>
<td>Announcement</td>
<td>OOS,MTCE,RAP</td>
</tr>
<tr>
<td>XAT</td>
<td>OOS,MTCE,DSBLD</td>
</tr>
</tbody>
</table>

If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

A trunk type of announcement will identify either a recorded announcement facility (RAF) or service announcement system (SAS). Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Message manual to determine valid states for each port type.

a1 = Basic state. Valid value(s):

OOS = Out-of-service (default).

b1 = Qualifier (choose one or omit). Valid value(s):

BLKD = Blocked. If basic state field ‘a1’ is not specified, it will be defaulted to OOS.
CADN = Circuit administration. If basic state field 'a1' is not specified, it will be defaulted to OOS.

If CADN is specified, the operational restriction of DSBLD or LKDO must also be specified.

MTCE = Maintenance. If basic state field 'a1' is not specified, it will be defaulted to OOS.

TMT = Traffic management (valid only for outgoing trunks). If basic state field 'a1' is not specified, it will be defaulted to OOS.

c1 = Operational restrictions (choose one or omit). Valid value(s):

DSBLD = Disabled (not valid for recorded announcement trunks). Implies busy to outgoing calls and seizure toward distant office If qualifier field 'b1' is not specified, it will be defaulted to MTCE.

LKDO = Locked out (valid only for two-way trunks). Implies busy to outgoing calls only. If qualifier field 'b1' is not specified, it will be defaulted to MTCE.

RAP = Recorded announcement port (valid only for recorded announcement or service announcement system trunks). Implies that the particular announcement trunk will not be selected. If qualifier field 'b1' is not specified, it will be defaulted to MTCE.

d1 = Supplementary information (choose one or omit). Valid value(s):

AML = Automatic maintenance limit.
AUDIT = Audit-detected problem.
CAMA = Central automatic message accounting.
CAROT = Centralized automatic reporting on trunks.
CDI = Control and data interface.
CKT = Circuit.
CTTU = Central trunk testing unit.
DFI = Digital facility interface.
FORPOT = Foreign potential.
GRID = Line unit grid.
IAA = Ineffective attempt analysis.
PCTF = Per-call test failure.
PPM = Periodic pulse metering.
PVELBK = Protocol handler voice encoding loopback test failed.
REX = Routine exercise.
RO = Routine/other reasons.
ROTF = Operational test failure.
SCC = Switching control center.
TICOM = Treated interface common circuit.
TRBL = Unspecified trouble.
TRBLORG = Origination trouble.
TRKBD = Trunk board.
TRKCT = Trunk circuit.

e1 = Digital networking unit - SONET number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f1 = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If ALL is specified, all channels on the VT1.5 facility will be removed from service.

j = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If ALL is specified, all members on the PSU channel group will be removed from service.

n = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = PLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If ALL is specified, all channels on that facility will be removed.

t = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
x¹ = STM-1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y¹ = High order virtual container number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z¹ = Low order virtual container group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a² = Low order virtual container member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the RMV:TRK output message.

RL = Retry later. The request has been denied, probably due to system load.

Software Release: 5E16(1) and later
Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the removal of a trunk from service and places it in the specified out-of-service (OOS) status. The ability to remove a trunk group is also provided.

If the trunk is in service at the time of the request, the OOS status will be added and the trunk will be restricted accordingly. If the trunk is already OOS, the OOS status will be added to the trunk according to the trunk status hierarchy, if possible. Up to four independent OOS conditions can exist simultaneously on a trunk.

If the trunk is traffic-busy when the request is made, it will be camped on for up to 20 minutes unless an unconditional removal is requested. If camped on, a STP:CAMPON input request can stop the campon (and abort the removal), if desired. If removed unconditionally, the trunk is preempted and all stable calls in progress on the trunks are torn down.

If the trunk is a packet pipe trunk or a packet pipe member trunk, a conditional remove will be denied (camp-ons are not allowed). Trunks associated with a packet pipe are nailed-up paths that carry CDMA packets that are distributed to any number of speech handler (SH) trunks. There is no way to determine if call traffic is present on these trunks so only an unconditional remove will be allowed. An unconditional removal of a packet pipe trunk or a packet pipe member trunk may impact up to 30 calls.

When PSUEN for the PCF trunk is entered, the entire PCF trunk group will be removed.

If the trunk to be removed is a PRI D-channel, the associated B-channels will also be removed from service unless the PRI is equipped with a backup D-channel and that backup D-channel is not already manually out-of-service. If a PRI is equipped with a backup D-channel, both D-channels must be removed from service before the B-channels will be taken out-of-service. This can be accomplished by using either the PRIGRP option on the RMV:TRK input request or by removing the two D-channel trunks with 2 individual RMV:TRK input requests. Except for the PRIGRP option, PRI D-channels can only be removed one at a time. Specifying a range of D-channel trunks or a D-channel trunk group is not allowed. OSPS PRIIs cannot have a backup D-channel.

For internal protocol (IP) packet switching (PS) traffic busy trunks, a conditional removal will remove the trunk from service without camping-on and the PS calls will be transferred to other in-service trunks within the same trunk group.

A conditional removal of a PS trunk will camp-on only if it is involved in loopback testing. A conditional removal request for a PS trunk will be denied if the trunk removal would result in exceeding the packet switching maintenance limit (PSML). 25% of the trunk group size. The PSML is rounded off to the nearest whole number and if the trunk group size is less than 4 then the PSML is set to 1. The UCL option will override the PSML check. The PSML check does not apply to XAT ports.

Adding the OOS,MTCE,DSBLD,TRBL status to the trunk will cause in progress block/unblock/reset sending to stop.

While in the OOS,MTCE,DSBLD,TRBL status, additional block/unblock sending can start.

An OOS condition on a trunk may be deleted using the RST:TRK input request.
WARNING: Using the UCL option could be service-affecting.

Specifying RMV:TRK,PRIGRP= or RMV:TRK,PRIGRP=,CH=D can affect service on all B-channels assigned to the PRI. At most, 479 B-channels may be assigned to a PRI. If the UCL option is used with either of these two RMV:TRK formats, all calls on the PRI's B-channels are cleared. While camped onto an entire PRI with either of these two RMV:TRK formats, no new calls are allowed on the PRI.

2. FORMAT

RMV:TRK,a[,UCL|CAMPON=y][:[a1][,b1][,c1][,d1]][,SUM];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Remove all trunks on the remote terminal from service.

SUM = Generate a summary report.

UCL = Execute the removal unconditionally. All stable calls will be disconnected (traffic release). For packet switching trunks, the UCL option overrides the check for the maintenance limit.

a = Unit. Valid value(s):

DEN=b-c-d-e[,FAC=w] = The SDL may be removed conditionally if the parent CCS signaling link is in the DACT state. The parent signaling link can be determined by use of the RC/V Views 7.41 or 7.42. No state should be specified since the OOS-MTCE-DSBLD state is the default and only valid state. Finally, the UCL option is available but will cause service interruptions if the SDL is servicing traffic.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

d  = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 0 and channels 25-48 are associated with facility T1 1.

If ALL is specified, all channels on the DFI will be removed from service. For DFI-1, this will be channels 1-24. For DFI-2, this will be channels 1-48. The FAC option can be used to specify which set of 24 channels to remove for a DFI-2. Refer to the FAC option (variable 'w') for additional information.

f  = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i  = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j  = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k  = Directory number.

l  = PRI group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m  = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n  = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o  = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p  = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q  = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r  = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s  = Number of the trunk group to be removed from service.
Using this will remove all members of the trunk group specified and could potentially isolate the far-end office.

**t**  = Trunk group or bearer independent call control (BICC) group number.

**u**  = Trunk member or normalized call instance code (CIC), or lower limit of a range of trunk member numbers or normalized CICs.

**v**  = Upper limit of a range of trunk member numbers or normalized CICs.

**w**  = Facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):

- 0  = Facility 0 is channels 1 through 24 on a DFI-2. Specifying this will remove channels 1 through 24.
- 1  = Facility 1 is channels 25 through 48 on a DFI-2. Specifying this will remove channels 25 through 48.

When used with the DEN identifier, this option specifies the facility to be removed. It is only valid for DFI-2 hardware. The DEN identifier must have the channel set to ALL.

**x**  = Channel. Valid value(s):

- **B**  = Specifying this will cause all of the B-channel(s) of the PRI group to be removed to the specified or default status.
- **D**  = Specifying this will cause the D-channel(s) of the PRI group to be removed to the specified or default status. If the PRI has a backup D-channel assigned, it will also be removed.

When used with the PRIGRP identifier, this option specifies which channels on the PRIGRP are to be removed.

Status subfields are always separated by a single comma even if in-between statuses are omitted.

If variables 'a', 'b', and 'c' are omitted, they will default based on trunk type.

<table>
<thead>
<tr>

Output Message(s):

RMV:UCONF

Input Appendix(es):

APP: RANGES
RMV:UMBIL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a host umbilical (UMBIL) circuit be removed from service either conditionally, by waiting for it to become idle, or unconditionally, by preempting the current user. This message is applicable for host umbilicals terminating on a digital line and trunk unit (DLTU) or on a digital networking unit - synchronous optical network (DNU-S). This is an alternative way to address a remove of a host facility (HFAC) or a DS1 facility.

WARNING: Use of the UCL parameter may cause any calls/communication in progress to be terminated.

2. FORMAT

RMV:UMBIL=a-b-c[,UCL|REMAP];

3. EXPLANATION OF MESSAGE

   UCL        = Unconditionally execute the removal. Any calls/communication in progress using this circuit may be terminated.
   REMAP     = Move calls off of particular time slots with minimal disruption to the talk path during remove of this Umbilical.
   a          = Host Switch Module (HSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   b          = Host Switch Module (RSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   c          = UMBIL number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

   NG         = No good. The request has been denied. The message is valid but the request conflicts with current status.
   PF         = Printout follows. Followed by the RMV:UMBIL output message.
   RL         = Retry later. The request cannot be executed now due to unavailable system resources.

1741,xxx,yyy (HOST UMBILICALS (11 - 20))
RMV:UTD

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a universal tone decoder (UTD) board be removed from service. A preempt will be executed only if
the office out-of-service limit is not exceeded by this remove request. The office out-of-service limit for UTDs is 60%
of the totally equipped UTDs.

2. FORMAT

RMV:UTD=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL  = Executes the removal of the UTD unconditionally, unless removing it will result in a loss of call
processing.

a  = Switching module (SM) number.

b  = Local digital service unit (DSU) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

c  = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

d  = DSU board position number. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied. The message form is valid, but the request conflicts with
current status.

PF  = Printout follows. Followed by the RMV:UTD output message.

RL  = Retry later. The request cannot be executed now due to unavailable system resources.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a digital networking unit - synchronous optical network (DNU-S) virtual tributary level 1 facility (VT1FAC) be removed from service.

WARNING: An unconditional removal of a VT1FAC will result in preempting stable calls.

For a very compact digital exchange (VCDX) switching module (SM) with common channel signaling (CCS7) access on a packet switching unit (PSU), a VT1FAC can be conditionally removed only if any CCS signaling data links (SDLs) on this facility are manually removed first, or if the SDL parent CCS links (CCSLKs) are manually deactivated. In addition, an unconditional (UCL) removal of a VT1FAC may impact CCS operations.

2. FORMAT

RMV:VT1FAC=a-b-c-d-e-f-g[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Executes removal unconditionally.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital Networking Unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = SONET Termination Equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Synchronous Transport Signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
NG = No good. The message form is valid, but the request conflicts with current status.

235-105-110  System Maintenance Requirements and Tools
RST:BICCCADN

Software Release: 5E16(1) and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests the restoration of a single bearer-independent call control (BICC) block to service and the removal of all
the call instance codes (CICs) of the specified block from the circuit administration (CADN) out-of-service (OOS) list
and their restoration to the in-service (IS) state. Only those CIC members that are initially in the OOS CADN state
will be considered as being included in the RST:BICCCADN command, and CICs in any other state will be
considered as being excluded by the input message.

The provisioned CICs required by the BICC protocol for each origination point code (OPC) and destination point
code (DPC) are divided into blocks of 128 and are stored on switching module (SM)-2000(s). that is provisioned as
being BICC-capable. The command sends a BICC circuit group reset (GRS) message to the far end to unblock the
included BICC CICS. Any CICs in the BICC block

2. FORMAT

RST:BICCCADN,BGMN=a-b&&c;

3. EXPLANATION OF MESSAGE

a = BICC trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

b = CIC for first member of the BICC CIC block.

The member range must represent exactly one BICC CIC block (that is, BGMN=7000-0&&127).
The range of a CIC BICC block is 128 (i.e. 0&&127, 128&&255, etc.).

c = CIC for last member of the BICC CIC block.

The member range must represent exactly one BICC CIC block (that is, BGMN=7000-0&&127).
The range of a CIC BICC block is 128 (i.e. 0&&127, 128&&255, etc.).

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and an OP:SS7 output message will follow.

NG = No good. May also include:
 – BAD CIC INPUT = The craft entered a member range that is incorrect.
 – STARTING CIC NOT AT BEGINNING OF BLOCK = The starting CIC is not at the beginning of
    a BICC CIC block.
 – RANGE OF CICS INCORRECT = The ranges of CICs is not an exact BICC CIC block.

235-200-115  CNI Common Channel Signaling
235-200-116  Signaling Gateway Common Channel Signaling
RST:BTSR

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the bootstrapper boards (BTSR) be restored to the active state.

If restoration is conditional, then the diagnostic will be run. All tests must be passed before the units are restored to service. If restoration is unconditional, then no testing is performed.

2. FORMAT

RST:BTSR=a[&&b][,UCL];

3. EXPLANATION OF MESSAGE

UCL = Execute the restoration unconditionally.

a = Switching module (SM) number, or lower limit for a range of SMs.

b = Upper limit for a range of SMs.

4. SYSTEM RESPONSE

PF = Printout follows. An RST:BTSR output message will follow.

5. REFERENCES

Output Message(s):

RST:BTSR
RST:CCSLK

**Software Release:** 5E14 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

1. PURPOSE

Restores service to a common channel signaling (CCS) link(s) by removing the deactivating, inhibiting, or blocking status on that link(s).

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

RST:CCSLK,SET=a[&b],MEMBER=c[&d],STATE=e[,SM=f];

3. EXPLANATION OF MESSAGE

- **a** = Link set number or lower limit of a range of link set numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. The range of numbers need not start or end with equipped link set numbers.

- **b** = Upper limit of a range of link set numbers.

- **c** = Link member number or lower limit of a range of link member numbers. When a range is specified, only equipped numbers in the range will be processed. Range of numbers need not start or end with equipped link member numbers.

- **d** = Upper limit of a range of link member numbers.

- **e** = Link state. Valid value(s):
  - **BLK** = Removes the block status from a link(s).
  - **DACT** = Removes the deactivated status from a link(s).
  - **INH** = Removes the inhibit status from a link(s).

- **f** = Global switching module (GSM) number. CCS GSM number on which the link to be restored terminates. If no SM number is specified and only one CCS GSM exists in the office, the specified link on that CCS GSM will be processed. If multiple CCS GSMs exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

- **NG** = No good. May also include:
  - **GSM MISMATCH** = The specified SM is not a GSM or the SM does not exist.
  - **NO GLOBAL SM** = No GSM is provisioned in the office.
  - **NEED GSM NUMBER** = SM was not specified in the input message, and office has more than one GSM provisioned.
PF = Printout follows. Followed by the RST:CCSLK output message.

RL = Retry later. May also include:
   - SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.

Output Message(s):

RST:CDI

Input Appendix(es):

APP:RANGES
RST:CLNK

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that one or all of the specified communication links (CLNKs) be restored to an available state ('hardware available', 'active' or 'ready for level 2').

2. FORMAT

RST:CLNK{=a-b-c-d|,ALL};

3. EXPLANATION OF MESSAGE

ALL = Restore all communication links that are in an out-of-service fault or manual removed state.

It is not an error to request 'ALL' with no communication links in an out-of-service fault or manual removed state.

a = Switching module (SM) number.

b = Office network and timing complex (ONTC) side (0 or 1).

c = Module message processor (MMP) type. Valid value(s):
   0 = Alpha.
   1 = Beta.

d = Message switch (MSGS) side (0 or 1).

4. SYSTEM RESPONSE

NG = No good. May also include:
   - ALL NOT VALID WITH A SINGLE UNIT = A single CLNK and ALL may not be specified together.
   - UNIT UNEQUIPPED = The specified single CLNK is unequipped.

PF = Printout follows. A printout will follow when the requested action is completed.

MCC Display Page(s):
(CLNK SUMMARY)
RST:CMP

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests a conditional or unconditional restore of a communication module processor (CMP) to the active or standby state.

Note: For conditional restores, if the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

RST:CMP=a-b[,UCL][,STBY];

3. EXPLANATION OF MESSAGE

STBY = Restore the CMP to the standby state rather than the active state (the default).

UCL = Restore the CMP unconditionally. No diagnostics are performed.

Note: For offices having CM3 vintage communications modules, the restore will always be run unconditionally, with or without the UCL parameter.

a = Message switch side number.

b = CMP number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by a RST:CMP output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1241, 1251 (MSGS COMMUNITIES)
1240, 1250 (MSGS STATUS for CM3)
RST:CPE

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that a specified customer premises equipment (CPE) integrated services digital network (ISDN) terminal on custom multi-point (MP) and standard interface digital subscriber line (DSL) be restored to service.

This input message will restore service to a CPE that has previously been removed from service manually with the RMV:CPE input message. If a CPE has been removed from service automatically by the network, this input message will attempt to restore the CPE back to service, but if the CPE is illegally configured on the DSL, then the CPE will stay out-of-service (OOS). If the CPE restored to service is a member of modem pool group, the "OOS FE MPOOS AUTO" status on the analog port of this member is deleted. An alternative method of restoring all CPE on a single DSL is to remove the entire DSL using the RMV:LINE input message and then to restore the line using RST:LINE. However, this will remove all services to all subscribers on the DSL while the DSL is OOS.

2. FORMAT

RST:CPE,a[,TEI=h][,UCL];

3. EXPLANATION OF MESSAGE

a  = Equipment number or identifier. Valid value(s):
   AIUEN=d-o-p-q
   DN=r
   ILEN=d-i-j-k
   INEN=d-s-j-k
   LCEN=d-e-f-g
   LCKEN=d-e-l-m-n
   MLHG=b-c
   PKTDN=r

b  = Multi-line hunt group (MLHG) number of the subscriber associated with the CPE. This option is only valid if a CPE has identified itself as being associated with that MLHG subscriber.

c  = Multi-line hunt member number of the subscriber.

d  = Switching module (SM) in which the DSL exists.

e  = Integrated services line unit (ISLU) or ISLU version 2 (ISLU2) in which the DSL exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Line group controller (LGC) in the ISLU in which the DSL exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = Line card of the ISLU line group controller to which the DSL connects. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = Terminal endpoint identifier (TEI) that identifies the particular CPE to be restored. The ILEN|INEN|LCEN|LCKEN/TEI identification can be used to restore any out-of-service (OOS) CPE
on a DSL It is the only way to restore a CPE that is not associated with a specific subscriber on the DSL (for example, a CPE that is receiving default service). The TEI is dynamically assigned to a CPE when the CPE establishes its layer 2 connection with the network. The trunk and line work station (TLWS) DSL display or the OP:CPE input message can be used to determine what CPEs currently have layer 2 established on the DSL and what TEI has been assigned to each CPE.

\( i \) = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j \) = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k \) = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m \) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n \) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o \) = Access interface unit (AIU) Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p \) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( q \) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( r \) = Circuit directory number (DN) or packet directory number (PKTDN) of the subscriber associated with the CPE. This option is only valid if a CPE exists which has identified itself as being associated with that subscriber. For key-system services, only primary DNs are valid. For non-key-system services, any DN associated with the

\( s \) = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\( NG \) = No good. The input request was in some way invalid, most likely because a value was out of range. Identify the error with the original request and repeat the request.

\( PF \) = Printout follows. The requested action has been accepted and is being processed. A RST:CPE output message will be printed showing the outcome of the request.

160 (TRUNK & LINE MAINT)
RST:CU

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a control unit (CU) be restored to standby status. If restored conditionally, a complete CU diagnostic will be run and must be all tests pass (ATP) before the unit is restored to service. If restored unconditionally, no testing will be performed.

2. FORMAT

RST:CU=a[:UCL[:RAW]][,TLP];

3. EXPLANATION OF MESSAGE

RAW = Print the diagnostic results of every phase. Default is the first five failures of each failing phase.

TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

UCL = Restore unconditionally. (The default is conditional restoration).

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RST:CU output message. If UCL is not specified, a DGN:CU output message is also printed.

MCC Display Page(s):

(COMMON PROCESSOR)
1. PURPOSE

Requests the restoration of a data link to service by deletion of the specified out-of-service (OOS) status. When all OOS statuses have been deleted, the data link will be restored to service.

Up to four independent OOS conditions can exist simultaneously on a data link. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for a more detailed explanation of statuses that apply to data links. A data link can be identified by its type (such as, AP, DASC, and so forth) and group and relative link number or by its equipment number (LCEN, LCKEN, INEN, ILEN, or AIUEN). If the data link is busy when the request is made, it will be camped on for up to 20 minutes. If a camp-on is started, a REPT:CAMPON output message will be generated. The camp-on can then be terminated by a STP:CAMPON input message, if desired.

2. FORMAT

RST:DATALINK,a[,CH=b][[:c][,d][,e][,f]];

3. EXPLANATION OF MESSAGE

a = Valid value(s):

<table>
<thead>
<tr>
<th>Status</th>
<th>Value</th>

</tr>
</tbody>
</table>

b = Channel identifier [D (default), B1, or B2].

If this option is not specified or if the D-channel is specified, an attempt will be made to restore the D-channel and all on-demand service B-channels, but permanent packet B-channels will not be restored. If a B-channel is specified, only that B-channel will be restored to service.

The channel identifier is ignored for Operator Services Position System (OSPS) digital subscriber lines (DSLs) serving basic services terminals (BSTs) and operator position terminals (OPTs). For BST and OPT DSLs, the entire DSL will be restored to service even if only the D-channel or a B-channel is specified in the input request.

Status subfields are always separated by a single comma, even if in-between statuses are omitted (as in OOS,DSBLD).

c = Basic state. Valid value(s):

<table>
<thead>
<tr>
<th>Status</th>
<th>Value</th>
</tr>
</thead>
</table>
| ALL    | If entered, no other status fields need be specified and all existing status information (primary and pending) will be removed for the specified line(s). This will result in the line(s) being placed in service (IS). Care should be exercised when using this option because restoring lines that are OOS, MTCE, FE, or FAF could result in undesired effects (that is, PORTLA audit failures, and so forth).
OOS = Out-of-service (default).

d = Qualifier (choose one or omit). Valid value(s):
BLKD = Blocked. If basic state field 'c' is not specified, it will be defaulted to OOS.
CADN = Circuit administration. If basic state field 'c' is not specified, it will be defaulted to OOS.
CUTOVER = Cutover (pre-cut) inactive state. If basic state field 'c' is not specified, it will be defaulted to OOS.
DSLINIT = DSL initialization. If basic state field 'c' is not specified, it will be defaulted to OOS.
MKBUSY = Make busy. If basic state field 'c' is not specified, it will be defaulted to OOS.
MTCE = Maintenance (default). If basic state field 'c' is not specified, it will be defaulted to OOS.
PPSRV = Pre-post service. If basic state field 'c' is not specified, it will be defaulted to OOS.
TMT = Traffic management (valid only for outgoing trunks). If basic state field 'c' is not specified, it will be defaulted to OOS.

Note: If the entire port status is omitted, the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

e = Operational restrictions (choose one or omit). Valid value(s):
DSBLD = Disabled (default). If qualifier field 'd' is not specified, it will be defaulted to MTCE.
DCHOOS = D-channel is OOS. If qualifier field 'd' is not specified, it will be defaulted to MTCE.
HW = High and wet. If qualifier field 'd' is not specified, it will be defaulted to MTCE.
LVL1ERR = Level 1 protocol error. If qualifier field 'd' is not specified, it will be defaulted to MTCE.
LVL2ERR = Level 2 protocol error. If qualifier field 'd' is not specified, it will be defaulted to MTCE.
LVL3ERR = Level 3 protocol error. If qualifier field 'd' is not specified, it will be defaulted to MTCE.
PLGUP = Plug-up (currently no effect). If qualifier field 'd' is not specified, it will be defaulted to MTCE.
PX = Power cross. If qualifier field 'd' is not specified, it will be defaulted to MTCE.
RAP = Recorded announcement port. If qualifier field 'd' is not specified, it will be defaulted to MTCE.

Note: If the entire port status is omitted, the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

f = Supplementary information (choose one or omit). This field is used to record the reason for removal. Valid value(s):
AML = Automatic maintenance limit.
AQ = Autoquote problem.
AUDIT = Audit detected problem.
CAMa = Central automatic message accounting.
CAROT = Centralized automatic reporting on trunks.
CDI = Control and data interface.
CKT = Circuit.
CTTU = Central trunk testing unit.
DFI = Digital facility interface.
DLNORSP = Init response not received from data link.
DYGSPUS = Dying gasp under study.
FORPOT = Foreign potential.
GRD = Ground fault.
GRID = Line unit grid.
IAA = Ineffective attempt analysis.
ISLU = Integrated services line unit (ISLU).
L2QLTY = Poor level 2 transmission quality.
L2DOWN = Level 2 is inoperable.
LINK1 = The basic rate interface transmission extension (BRITE) link one is down.
LINK2 = The BRITE link two is down.
LINK3 = The BRITE link three is down.
LINK4 = The BRITE link four is down.
LINK5 = The BRITE link five is down.
LINK6 = The BRITE link six is down.
MPOOS = Modern pool line out of service.
MSMTCH = Mismatch.
MTCECH = Maintenance channel.
NR = No response.
NRT = No response while in test mode.
NTDACT = Network termination (NT) is deactivated.
NTOFN = NT off normal.
NTPWR = NT lost power.
OPNOXL3 = OSPS position no level 3 protocol.
PCTF = Per-call test failure.
POSNOB = OSPS position no B-channel.
POSNRSP = OSPS position no response.
PPM = Periodic pulse metering.
PSU = Packet switch unit.
REX = Routine exercise.
RO = Routine other.
ROTF = Operational trouble.
SCC = Switching control center.
SPARED = Line involved in ISLU sparing configuration.
STKSCN = Suspected stuck scan (STKSCN) lead on the line group controller (LGC) or the line card (LC).
SWEQF = Switch equipment failure.
TEST = In test mode.
TEST1 = Testing in progress at the NT or BRITE channel unit (CU) and the BRITE link one is down.
TEST2 = Testing in progress at the NT or BRITE CU and the BRITE link two is down.
TEST3 = Testing in progress at the NT or BRITE CU and the BRITE link three is down.
TEST4 = Testing in progress at the NT or BRITE CU and the BRITE link four is down.
TEST5 = Testing in progress at the NT or BRITE CU and the BRITE link five is down.
TEST6 = Testing in progress at the NT or BRITE CU and the BRITE link six is down.
TICOM = Treated interface common circuit.
TINTF = The T interface is down.
TRBL = Unspecified trouble.
TRBLORG = Origination trouble.
TREQF = Transmission equipment failure.
TRKBD = Trunk board.
TRKCT = Trunk circuit.
UINTF = The ANSI® standard U interface is down.
4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and will be followed by a RST:DATALINK output message.

RL = Retry later. The request has been denied, probably due to system load.

UCL = Restore unconditionally.

a = Switching module number.

b = Directly connected test unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RST:DCTUPORT output message.

5. REFERENCES

Output Message(s):

RST:DCTUPORT

Input Appendix(es):

APP:RANGES
RST:DFC

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a disk file controller (DFC) be restored to service. If restored conditionally, a DFC diagnostic will be run and must be all tests pass (ATP) before the unit will be restored to service. If restored unconditionally, no testing will be performed.

2. FORMAT

\[ \text{RST:DFC}=a\left[ [:UCL]\,|\,[CONT]\,|\,[:RAW]\,|\,[:DATA[,TLP[,CONT[,CU\,b]]]\right] ; \]

3. EXPLANATION OF MESSAGE

CONT = Restores only the DFC. (The default is to restore the DFC, all the SBUSs connected to this DFC and all associated moving head disks (MHDs)).

RAW = Print the diagnostic results of every phase. (The default is to print the first five failures of each failing phase).

TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

UCL = Restore unconditionally. (The default is conditional restoration).

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number of the CU helper unit (0 or 1). When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. This off-line CU is required as a helper unit when demand phase 15 is executed.
Note: The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RST:DFC output message.

RL = Retry later. The system is in an overload condition.

Output Message(s):

RST:DFI

Input Appendix(es):

APP:RANGES
RST:DFIH

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) be restored to the active state.

If the restoration is conditional, diagnostics will be run. All tests must pass before the unit will be restored to the active state. If the restoration is unconditional, no testing will be performed.

2. FORMAT

RST:DFIH=a-b-c[,CAMP=d][,UCL];

3. EXPLANATION OF MESSAGE

CAMP = Camp on.
UCL = Restore unconditionally.
a = Switching module (SM) number.
b = RISLU digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Maximum of minutes allowed for camp on (CAMP) time. If CAMP is not specified, camp on defaults to 3 minutes. Maximum time allowed is 20 minutes.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CONFLICT WITH UNIT STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST

PF = Printout follows. An RST:DFIH output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

RST:DLI

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a specific dual link interface (DLI) or range of DLIs be restored to service.

2. FORMAT

RST:DLI=a[&b]|-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the specific DLI or range of DLIs unconditionally. Diagnostics will not be executed.
     Note: SMs that are not in an operational equipage state will be skipped on a request for a range of DLIs.

a = Switching module (SM) number or the lower limit for a range of SM numbers.

b = Upper limit of a range of SM numbers. All SMs in the range must be on the same side of the ONTC.

c = ONTC side.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes Section of the Input Messages manual for a list of possible reasons for denying the request.

MCC Display Page(s):

1510 (DNUS STATUS)
RST:FAC
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests restoration of a remote switching module (RSM) facility (FAC) or a trunk FAC to service.

An RSM FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is an inter-office trunk.

If the FAC is restored conditionally, the following occurs: If the facility is out of service, the connectivity exercise must succeed before the facility will be returned to service. If facility is in service, it will be removed conditionally, and the connectivity exercise must succeed before the facility will be returned to service.

2. FORMAT

RST:FAC=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the facility unconditionally (without connectivity exercise testing). The facility will not be restored if there is a carrier group alarm on the RDFI or CDFI.

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RSM digital facilities interface (RDFI), inter-RSM communication link digital facilities interface (CDFI), or inter-office trunk digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = FAC number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
- NOT STARTED UNIT IN GROWTH STATE = The unit is in a transient state, it is not available at this time.
- SM DOES NOT EXIST = The message syntax is valid, but the SM requested does not exist.
- SM UNEQUIPPED = The message syntax is valid, but the SM is unequipped.
- UNIT DOES NOT EXIST = The message syntax is valid, but the unit does not exist.

PF = Printout follows. An RST:FAC output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE
Requests that the specified foundation peripheral controller (FPC) be restored to service.
Note: For conditional restores, if the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

RST:FPC=a[,UCL][,STBY];

3. EXPLANATION OF MESSAGE

STBY = Restore the unit to the standby maintenance state.
UCL = Restores the FPC unconditionally. No diagnostics are performed.
Note: For offices having CM3 vintage communications modules, the restore will always be run unconditionally, with or without the UCL parameter.

a = FPC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message is invalid.
PF = Printout follows. Followed by RST:FPC message.
RL = Retry later. The request cannot be executed now.

Software Release: 5E16(2) and later
Command Group: MTCE
Application: 5
Type: Input

1. PURPOSE

Requests that a general quad-link packet switch protocol handler (GQPH) QPIPE be restored to service.

2. FORMAT

RST:GQPHPIPE=a-b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Global switching module (GSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = GQPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Quad-link packet switch (QLPS) network number, which is 0 or 1, or a range 0&1 to restore GQPH QPIPEs on both networks. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - NOT A GSM = This response indicates that the input GSM (part of the GQPH QPIPE specification) is not a provisioned GSM.
   - SM UNEQUIPPED = This response indicates that the input GSM (part of the GQPH QPIPE specification) is not even an equipped SM.

PF = Printout follows. The request has been accepted. Followed by the RST GQPHPIPE output message specifying the results of the request.

RL = Retry later. May also include:
   - GSM NOT AVAILABLE = This response indicates that the input GSM (part of the GQPH QPIPE specification) is not available, because it is isolated or undergoing an initialization.

5. **REFERENCES**

Input Message(s):
RST:HDFI

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a host switching module (HSM) digital facilities interface (HDFI) circuit be restored to service.

2. FORMAT

RST:HDFI=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the circuit unconditionally. If circuit is out of service, it will be returned to service without diagnostic testing. If circuit is in service, it will be removed unconditionally, which will disconnect stable inter-module calls. It will then be returned to service without diagnostic testing.

a = Switching module number.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = HDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Request denied because of a conflict with current status.

1880,x.yy (IDCU REMOTE TERMINAL)
RST:IFAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an integrated digital carrier unit (IDCU) digital signal level one (DS1) facility (IFAC) circuit be restored to service.

WARNING: The use of this input message with the SCREEN option could result in the degradation of an IDCU facility (IFAC), not necessarily the one indicated in the input message. It could affect a totally unrelated IFAC circuit. This option is used strictly by the page pokes on the MCC display terminal.

2. FORMAT

RST:IFAC=a-b-c[,SCREEN=d][,UCL];

3. EXPLANATION OF MESSAGE

SCREEN = Used by MCC display poke to determine the IFACs being displayed on the MCC page.
UCL = Unconditionally execute the restoration.
a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Note: The 5th IFAC on a SLC5 RT must be designated as a protection line (using RC/V) before it is restored. If it is not, calls to the RT may fail.
d = Remote terminal (RT) number.

4. SYSTEM RESPONSE

PF = Printout follows. An RST:IFAC output message will follow.
NG = No good. The request has been denied. The message is valid but the request conflicts with current status.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

188xyy (IDCU REMOTE TERMINAL)
RST:IOP

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that an input/output processor (IOP) be restored to service.

If restored conditionally, an IOP diagnostic will be run and must be all tests pass (ATP) before the unit will be restored to service. If restored unconditionally, no testing will be performed.

2. FORMAT

RST:IOP=a[:UCL][,CONT][,:RAW][:DATA[,TLP][,CONT][,CU b]];

3. EXPLANATION OF MESSAGE

CONT = Restore only the IOP. (The default is to restore the IOP and all associated peripheral controllers (for example, the teletypewriter controller, magnetic tape controller, etc.).)

RAW = Print the diagnostic results of every phase. (The default is to print the first five failures of each failing phase).

TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

UCL = Restore unconditionally. (Default is conditional restoration).

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Specified helper unit, required for some diagnostic phases. An entry in the data field other than a keyword or keyword parameter is the specified helper unit. When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. The off-line CU is required as a helper unit when demand phase 15 is executed.

Note: The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

4. SYSTEM RESPONSE

RST:ISLUHLSC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that an integrated services line unit high level service circuit (ISLUHLSC) be restored to service.

If restored conditionally, the diagnostics will be run. All tests must pass before the unit will be restored to service. If restored unconditionally no tests will be performed.

2. FORMAT

RST:ISLUHLSC=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL   = Restore unconditionally.

a     = Switching module (SM) number.

b     = ISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c     = ISLU service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d     = High level service circuit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG   = No good. The request has been denied. The message is valid but the request conflicts with the current status.

PF   = Printout follows. The RST:ISLUHLSC output message will follow.

RL   = Retry later. The request cannot be executed now due to unavailable system resources.

   170x (ISLU NETWORK)
RST:ISMNAIL

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Restores an inter-SM (switching module) nailup (ISMNAIL), which is used to support packet transport between two SMs.

2. FORMAT

RST:ISMNAIL,DLT=a-b,MATEDLT=c-d[,FRC];

3. EXPLANATION OF MESSAGE

FRC  = Restoration will be attempted regardless of current status of ISMNAIL.
a  = SM number (may be the SM associated with either end of the ISMNAIL).
b  = Data link terminal (DLT) number (1-160) associated with the SM.
c  = Mate SM number (the other SM associated with ISMNAIL).
d  = DLT number (1-160) associated with the mate SM.

4. SYSTEM RESPONSE

NG  = No good. May also include:
   - SM ## NOT IN THE ISM NETWORK = The request has been denied. Either the source or the mate SM or both have no ISMNAILs associated with it.
   - SAME SM AND MATESM SPECIFIED = The source and mate SM numbers are the same. This is an invalid condition.

PF  = Printout follows. The request has been accepted. An RST:ISMNAIL output message follows.

5. REFERENCES

Output Message(s):

RST:ISMNAIL
RST:ISTF
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that an integrated services test function (ISTF) unit be restored to service.

If restored conditionally, the diagnostic will be run. All tests must pass before the unit will be restored to service. If restored unconditionally, no testing will be performed.

2. FORMAT

RST:ISTF=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore unconditionally.

a = Switching module (SM) number.

b = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
   - SM DOES NOT EXIST = The requested SM does not exist in the system.
   - SM UNEQUIPPED = The SM specified in the request is unequipped.
   - UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by an RST:ISTF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

3. EXPLANATION OF MESSAGE
If restored conditionally, the diagnostic will be run. All tests must pass before the unit will be restored to service. If restored unconditionally, no testing is performed.

UCL = Unconditionally restores without diagnosis.
a = Switching module number.
b = Local digital service unit number (0).
c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
PF = Followed by RST:LDSUCOM output message.

5. REFERENCES
Output Message(s):
RST:LDSUCOM

Input Appendix(es):
APP:RANGES
RST:LINE

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that a line be restored to service by deleting the specified out-of-service (OOS) condition. A line may have from one to four OOS statuses. If no other OOS status is pending after the OOS status is deleted, the line is placed back in service and idled. If another OOS status was pending, the line is treated according to the pending OOS status.

2. FORMAT

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

UCL = Restore the line unconditionally. No operational test will be run (default).

a = Telephone number of the line.

b = Channel identifier. Used only for digital subscriber lines (DSLs). Valid value(s):
   B1
   B2
   D (default)

   If this option is not specified or if the D-channel is specified, an attempt will be made to restore the D-channel and all on-demand service B-channels, but permanent packet B-channels will not be restored. If a B-channel is specified, only that B-channel will be restored to service.

   The channel identifier is ignored for Operator Services Position System (OSPS) digital subscriber lines (DSLs) serving basic services terminals (BSTs) and operator position terminals (OPTs). For BST and OPT DSLs, the entire DSL will be restored to service even if only the D-channel or a B-channel is specified in the input request.

   A modem pool member consists of an analog line and a DSL. They are identified by the same multi-line hunt group (MLHG) member number. For format 4, if channel is not specified and the MLHG specified is a modem pool group, by default, the analog side is selected for restoration. To restore DSL side of the member the channel should be set explicitly to D. Whenever the DSL (multi-point DSL) is restored the OOS MTC FE MPOOS AUTO status on corresponding analog line(s) of the modem pool member is deleted.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Switch board number (0, 1 or ALL). If ALL is specified, all lines on the specified grid are restored.

k = Switch number. This variable is not required if the switch board number (variable 'j') equals ALL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Level number. This variable is not required if the switch board number (variable 'j') equals ALL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = RT line number (1-96 or ALL). If ALL is specified, all 96 possible lines on the RT will be restored.

s = Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be restored. For LTSB a member number of 1 will restore the lead line and a member number of 2 will restore the associate line. If no member number is specified for 1-DN LTSB the lead line and the associate line will both be restored. If no member number is specified for 2-DN LTSB the line associated with the DN entered will be restored.

t = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Variables 'w' through 'z' give the line status currently in effect on the line that is to be deleted; therefore, removing that restriction. Status subfields are always separated by a single comma, even if in-between statuses are omitted (as in OOS,DSBLD).
\[ w \] = Basic state (choose one or omit). Valid value(s):
- ALL = If entered, no other status fields need be specified and all existing status information (primary and pending) will be removed for the specified line(s). This will result in the line(s) being placed in-service (IS). Care should be exercised when using this option because restoring lines that are OOS MTCE FE or FAF could result in undesired effects (that is, PORTLA audit failures and so forth).
- OOS = Out-of-service (default).

\[ x \] = Qualifier (choose one or omit). Valid value(s):
- BLKD = Blocked. If variable \( w \) is not specified, it will be defaulted to OOS.
- CADN = Circuit administration. If variable \( w \) is not specified, it will be defaulted to OOS.
- CUTOVER = Pre-cut line. If variable \( w \) is not specified, it will be defaulted to OOS.
- DSLINIT = DSL initialization. If variable \( w \) is not specified, it will be defaulted to OOS.
- MKBUSY = Make busy. If variable \( w \) is not specified, it will be defaulted to OOS.
- MTCE = Maintenance (default). If variable \( w \) is not specified, it will be defaulted to OOS.
- PPSRV = Pre/post service. If variable \( w \) is not specified, it will be defaulted to OOS.
- TMT = Traffic management (valid only for outgoing trunks). If variable \( w \) is not specified, it will be defaulted to OOS.

\[ y \] = Operational restrictions (choose one or omit). Valid value(s):
- DCHOOS = D-channel is out-of-service. If variable \( x \) is not specified, it will be defaulted to MTCE.
- DSBLD = Disabled (default). If variable \( x \) is not specified, it will be defaulted to MTCE.
- HW = High and wet. If variable \( x \) is not specified, it will be defaulted to MTCE.
- LVL1ERR = Level 1 error. If variable \( x \) is not specified, it will be defaulted to MTCE.
- LVL2ERR = Level 2 error. If variable \( x \) is not specified, it will be defaulted to MTCE.
- LVL3ERR = Level 3 error. If variable \( x \) is not specified, it will be defaulted to MTCE.
- PLGUP = Plug-up. If variable \( x \) is not specified, it will be defaulted to MTCE.
- PX = Power cross. If variable \( x \) is not specified, it will be defaulted to MTCE.
- RAP = Recorded announcement port. If variable \( x \) is not specified, it will be defaulted to MTCE.

If the entire port status is omitted the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

\[ z \] = Supplementary information (choose one or omit). Valid value(s):
- AML = Automatic maintenance limit.
- AUDIT = Audit-detected problem.
- CAMA = Central automatic message accounting.
- CAROT = Centralized automatic reporting on trunks.
- CDI = Control and data interface.
- CKT = General circuit.
- CTTU = Central trunk testing unit.
- DFI = Digital facility interface.
- DLNORSP = DAS/C link no response.
- DYGSPUS = Dying gasp message from ANSI®-U DSL.
- FORPOT = Foreign potential.
- GRD = Ground fault.
- GRID = Line unit grid bad.
IAA = Ineffective attempt analysis.
ISLU = Integrated services line unit.
LINK1 = The basic rate interface transmission extension (BRITE) link one is down.
LINK2 = The BRITE link two is down.
LINK3 = The BRITE link three is down.
LINK4 = The BRITE link four is down.
LINK5 = The BRITE link five is down.
LINK6 = The BRITE link six is down.
MPP = Modem-pool problem.
MSMTCH = Mismatch.
MTCECH = Maintenance channel.
NR = No response.
NRT = No response while in test mode.
NTDACT = Network termination (NT) is deactivated.
NTOFN = NT off normal.
NTPWR = NT lost power.
OPNOXL3 = OSPS position no level 3 protocol.
PCTF = Per-call test failure.
POSNOB = OSPS position no B-channel.
POSNRSP = OSPS position no response.
PPM = Periodic pulse metering unit.
PSU = Packet switch unit.
REX = Routine exercise.
RO = Routine/other.
ROTF = Operational trouble (that is, scanner stuck off-hook).
SCC = Removed by Switching Control Center.
SPARED = Line is involved in an ISLU sparing configuration.
STKSCN = Suspected stuck scan (STKSCN) lead on the line group controller (LGC) or the line card (LC).
SWEQF = Switch equipment failure.
TEST = In test mode.
TEST1 = Testing in progress at the NT or BRITE channel unit (CU) and the BRITE link one is down.
TEST2 = Testing in progress at the NT or BRITE CU and the BRITE Link two is down.
TEST3 = Testing in progress at the NT or BRITE CU and the BRITE Link three is down.
TEST4 = Testing in progress at the NT or BRITE CU and the BRITE Link four is down.
TEST5 = Testing in progress at the NT or BRITE CU and the BRITE Link five is down.
TEST6 = Testing in progress at the NT or BRITE CU and the BRITE Link six is down.
TICOM = Treated interface unit common circuit.
TINTF = The T interface is down.
TRBL = Unspecified trouble.
TRBLORG = Origination trouble.
TREQF = Transmission equipment failure.
TRKBD = Trunk board.
TRKCT = Trunk circuit.
UINTF = The ANSI® standard U-interface is down.

\(^a^1\) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(^b^1\) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

\( c^1 \) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^1 \) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^1 \) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^1 \) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^1 \) = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h^1 \) = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^1 \) = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^1 \) = Equipment number: Valid value(s):

\[ ILEN=c-t-u-v \]
\[ LCEN=c-d-e-f \]
\[ LCKEN=c-d-a^1-b^1-c^1 \]
\[ LEN=c-h-i \]
\[ MLHG=m-n \]
\[ SLEN=c-p-q-r \]
\[ AIUEN=c-d^1-e^1-f^1 \]
\[ INEN=c-g^1-u-v \]
\[ VANA=c-h^1 \]
\[ VBRI=c-i^1 \]

4. SYSTEM RESPONSE

\( PF \) = Printout follows. Followed by the RST:LINE output message.

If the line to be restored is controlled by another request or activity, the port will be camped on (refer to the REPT:CAMPON output message). The camp-on can be stopped by using the STP:CAMPON input message, which aborts the line restoration.

\( RL \) = Retry later. Request denied, probably due to system load.

5. REFERENCES

APP: RANGES

Other Manual(s):

235-105-220  Corrective Maintenance
RST:LN

Software Release: 5E14 and later
Command Group: CCS
Application: 5,CNI
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE
SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the specified link node (LN) be restored to service either conditionally or unconditionally.

WARNING: This input message contains time sensitive elements. Maintenance input request administrator (MIRA)
should be checked for LN maintenance activity (OP:DMQ) before using this input message. If there is
any LN maintenance activity (active or queued) it should be allowed to complete before using this input
message.

2. FORMAT

RST:LN\(a=b\)\[\[:\]RAW\[::\]:TLP\]\[\[,\]:UCL\]\;

3. EXPLANATION OF MESSAGE

RAW  = Print the diagnostic results of every phase. The default is to print the results of the first five failures
of each failing phase.

TLP  = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP
generates a list of suspected faulty equipment.

UCL  = Restore the node unconditionally. The default is a conditional restoration.

If the LN major state is not out-of-service (OOS), the restoration is stopped. If the LN major state is
OOS, an attempt is first made to include the LN into the active ring. If the inclusion fails, the
restoration is stopped. If the inclusion succeeds, the LN is restored to service (pumped with
operational code, placed into execution, and its major state changed to active [ACT]).

Note: The UCL parameter should not be used with any other parameter. If it is used with
another parameter then the other parameter will be ignored.

a  = Ring node (RN) group number. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

b  = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

4. SYSTEM RESPONSE

PF  = Printout follows. The system action is different for conditional and unconditional restoration
requests as described in 'UCL'.

1530 (GLOBAL SM MESSAGE DELIVERY STATUS)
RST:MELNK

**Software Release:** 5E14 and later
**Command Group:** SM
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests that a single MCTSI-based ethernet link (MELNK) or all MELNKs on a switching module (SM) be restored to service.

2. **FORMAT**

   
   RST:MELNK\{=a-b-c|,ALL,SM=a\}[,UCL];

3. **EXPLANATION OF MESSAGE**

   **ALL** = Restore all MELNKs that are in an out of service state.

   **UCL** = Restore unconditionally.

   **a** = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   **b** = MCTSI-based ethernet pipe (MEPIPE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   **c** = MELNK number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   **NG** = No good. Valid qualifiers are:
   - NO SUCH SM = Input command specified an SM that does not exist.
   - SM UNEQ = Input command specified an SM that is unequipped
   - UNIT UNEQ = Either "ALL" is specified and the specified SM has no equipped MELNKs, or the specified individual MELNK is not equipped.

   **RL** = Retry later. The request cannot be executed now due to unavailable system resources. Optional additional qualifiers are:
   - SM ISOLATED = Cannot communicate with requested SM.

   **PF** = Printout follows. A RST:MELNK output message will follow in response to the request.

MCC Display Page(s):

1204 (MELNK STATUS)
RST:MHD

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Conditionally or unconditionally restores a moving head disk (MHD) to service. If restored conditionally, an MHD diagnostic is run, and must be all tests pass (ATP) before the unit is restored to service. If restored unconditionally, no testing is performed.

Note: The disk file controller (DFC) must be in service before the MHD can be restored.

WARNING: This message should not be executed when AM or CM REX is executing. If the MHD must be restored, halt any AM or CM REX activity before restoring the MHD.

2. FORMAT

RST:MHD=a [:UCL][,CONT] [:RAW][:DATA[,TLP][,CONT]];

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

UCL = Unconditional restoration. The default is conditional restoration.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**Command Group:** AM  
**Application:** 5,3B  
**Type:** Input

**1. PURPOSE**

Restores the specified magnetic tape (MT) device to service.

**Note:** For MT residing under the disk file controller (DFC), the DFC and small computer system interface (SCSI) bus (SBUS) must be in service before the MT can be restored.

**Note:** For MT residing under the input/output processor (IOP), and magnetic tape controller (MTC) must be in service before the MT can be restored.

**2. FORMAT**

\[
\text{RST:MT}=a[:UCL|:RAW|:DATA][:,TLP];
\]

**3. EXPLANATION OF MESSAGE**

- **RAW**
  = Prints the diagnostic results of every phase. Default is the first five failures of each failing phase. Not available for IOP MT units.
  **Note:** The RAW and UCL parameters cannot be used together, because no testing is performed on an unconditional restore.

- **TLP**
  = Executes the trouble location procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment. Not available for IOP MT units.

- **UCL**
  = Unconditional restore. Default is conditional restore.

- **a**
  = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**4. SYSTEM RESPONSE**

- **PF**
  = Printout follows. Followed by the RST:MT output message.

- **RL**
  = Retry Later. The system is in overload condition.

- **?D**
  = General syntax error in the data field, followed by the parameter position and:
  - **EXTRA KEYWORD** = Duplicate or extraneous keywords were input.
  - **INVALID KEYWORD** = The keyword in the stated parameter position is not a valid keyword.

- **?E**
  = Input error of undetermined type.

- **?I**
  = General syntax error, followed by the parameter position and:
  - **EXTRA KEYWORD** = Duplicate or extraneous keywords were input.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- MISSING KEYWORD = A required keyword is missing from the input.

Note: The input/output processor (IOP) must be in service before the MTC can be restored.

2. FORMAT

RST:MTC=a [:UCL][, CONT] | [:RAW][:DATA[,TLP][,CONT][,MT=b]]

3. EXPLANATION OF MESSAGE

CONT = Restores only the MTC. The default is to restore the MTC and all associated magnetic tape devices.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

UCL = Unconditional restoration. The default is conditional restoration.

Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Specified helper unit, required for some diagnostic phases. An entry in the data field other than a keyword or keyword parameter is the specified helper unit. When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RST:MTC output message.

(COMMON PROCESSOR)
**RST:NCOSC-A**

*Software Release: 5E14 only*
*Command Group: CM*
*Application: 5*
*Type: Input*

1. **PURPOSE**

Restores a network clock 2 oscillator (NCOSC) to service. There are no diagnostics run on the NCOSC unit.

Note: Under normal conditions an oscillator may only be restored to service if it has been powered up for a minimum of one hour for a medium-stability (TN1284/TN1286) oscillator or 16 hours for a high-stability oscillator (TN1283/TN1285).

2. **FORMAT**

RST:NCOSC=a;

3. **EXPLANATION OF MESSAGE**

a = Unit side (0 or 1).

4. **SYSTEM RESPONSE**

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

OK = The request was accepted and completed.

PF = Printout follows. An RST:NCOSC output message will follow in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

MCC Display Page(s):

(NETWORK CLOCK)
RST:NCOSC-B

Software Release: 5E15 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Restores a network clock model 2 (NC2) or model 3 (NC3) oscillator (NCOSC) to service. There are no diagnostics run on the NCOSC unit.

Note: For NC2 it was that under normal conditions an oscillator may only be restored to service if it has been powered up for a minimum of one hour for a medium-stability (TN1284/TN1286) oscillator or 16 hours for a high-stability oscillator (TN1283/TN1285).

For NC3 it's a high-stability oscillator (MMB100) with a warmup time of 1.5 hours. The oscillators will not restore to STBY when the ONTCs are duplex (both in-service), since the ACT/STBY configuration only occurs when the ONTCs are simplex.

2. FORMAT

RST:NCOSC=a[,STATE=STBY];

3. EXPLANATION OF MESSAGE

a = Unit side (0 or 1).

STBY = Restore to a standby state.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

OK = The request was accepted and completed.

PF = Printout follows. An RST:NCOSC output message will follow in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1211 (NETWORK CLOCK)
RST:NCREF-B

Software Release: 5E15 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a network clock reference (NCREF) be restored to service. There are no diagnostics run on NCREF units. External references will be restored to service on both clock sides.

2. FORMAT

RST:NCREF,\{XC=a|b[,TYPE=c][,UCL]\};

3. EXPLANATION OF MESSAGE

XC = Cross-couple reference. This is only legal for NC1 and NC2.
   a = Network clock side.
   b = Network clock reference (NCREF).

<table>
<thead>
<tr>
<th>NC1</th>
<th>NC2 or NC3</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIM Primary reference.</td>
<td>REFn Reference number, n=1-8.</td>
</tr>
<tr>
<td>SEC Secondary reference.</td>
<td></td>
</tr>
</tbody>
</table>

   c = Reference Type. This is only legal for NC3. This is only required if the same reference number is equipped with different reference types. The values are:
   10M = 10 MHz analog clock reference.
   2M = 2.048 MHz analog clock reference.
   CC = 64K Composite clock reference.
   DGTL = Digital clock reference.

   UCL = Applies only to REF1-REF8. Must be used to restore the last active reference.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request conflicts with the current system or equipment status.

PF = Printout follows. The request has been received. Followed by a RST:NCREF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Output Message(s):

RST:OFI
**RST:ONTC**

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

**1. PURPOSE**

Requests a restore of the office network and timing complex (ONTC) to an in service condition. The ONTC complex consists of the ONTC common units (ONTCCOM) and dual link interfaces (DLIs). The ONTCCOM consists of the link interface (LI) (CM1 hardware only), message interface (MI), network clock (NC), and time multiplexed switch (TMS).

Format 1 calls for a conditional restore of the ONTC, with both a helper unit and the desired state of that side (active major or active minor) optionally specified. Format 2 calls for a conditional restore of the subunits of the ONTC that are currently not in service (NIS), with a helper unit optionally specified. Format 3 calls for an unconditional restore of the ONTC, with the desired state of that side (active major or active minor) optionally specified.

**2. FORMAT**

[1] RST:ONTC=a [:HELPER=b][,{MAJOR|MINOR}];

[2] RST:ONTC=a,NIS [:HELPER=b];

[3] RST:ONTC=a,UCL [, {MAJOR|MINOR}];

**3. EXPLANATION OF MESSAGE**

Note: If the MAJOR or MINOR option is not specified, the optimum side of the ONTC will become ACT MAJOR.

The optimum ONTC side is determined by examining the number of switching modules (SMs) isolated from call processing as the first criterion, interconnectivity of SMs for call processing as the second criterion, and call setup capacity as the third criterion.

First the SMs are checked, to determine which side has the most SMs available. If neither side is greater the second criterion is invoked to determine which side has the least SMs isolated from call processing. If both sides are equal the third criterion is invoked. If call setup capacity is the same on both sides no clear cut side has been established as the best; therefore the requested side is made ACT MAJOR. Otherwise, the optimal algorithm shows that the other side is better, and that side is made ACT MAJOR.

NIS = Conditionally restore only the portions of the ONTC complex that are NOT in service. If this option is not used all equipped parts of the ONTC will be restored.

MAJOR = Restore the requested ONTC side to active major.

MINOR = Restore the requested ONTC side to active minor.

UCL = Unconditionally restore the specified ONTC. No diagnostics are performed.

a = ONTC side (0 or 1).

b = Foundation peripheral controller (FPC) side (0 or 1) to be used as a 'helper' unit for the diagnostic.
The FPC is used to control the ONTC during the diagnostic. If this option is not input the standby FPC will be used.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. An RST:ONTC output message will follow.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

5. REFERENCES

Input Message(s):

- RMV:ONTC

Input Appendix(es):
- APP:CM-IM-REASON

Output Message(s):
- DGN:ONTC
- RMV:ONTC
- RST:ONTC
RST:ONTCCOM

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Restores office network and timing complex common (ONTCCOM) units to an in-service condition. All dual link interfaces (DLIs) or network link interfaces (NLIs) that are currently in an out-of-service (OOS) family of equipment (FE) state will also be restored.

Refer to MCC Display Page 12.09 for additional information.

2. FORMAT

RST:ONTCCOM=a[{,UCL~|~:HELPER=b}][c];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally restores the specified ONTCCOM. No diagnostics are performed.

a = ONTC common side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Specifies the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The FPC is used to control the ONTC during the diagnostic. If this option is not input the standby FPC will be used.

This option is not applicable in communication module 3 (CM3) office.

c = ONTC common side restore status.

If the MAJOR or MINOR option is not specified, the optimum side of the ONTCCOM will become ACT MAJOR.

The optimum ONTCCOM side is determined by examining the number of SMs isolated from call processing as the first criterion, interconnectability of SMs for call processing as the second criterion, and call setup capacity as the third criterion. First the SMs are checked, to determine which side has the most SMs available. If neither side is greater the second criterion is invoked to determine which side has the least SMs isolated from call processing. If both sides are equal the third criterion is invoked. If call setup capacity is the same on both sides no clear cut side has been established as the best; therefore the requested side is made ACT MAJOR. Otherwise, the optimal algorithm shows that the other side is better, and that side is made ACT MAJOR.

Valid value(s):

MAJOR = ONTC common side restored becomes active major.

MINOR = ONTC common side restored becomes active minor.

4. SYSTEM RESPONSE
NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. An RST:ONTCCOM output message will follow.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

   (NETWORK CLOCK)
RST:OSPSPORT

1. PURPOSE

Requests the restoration of an operator services position system (OSPS) port (OSPSPORT) to service by deleting the specified out-of-service (OOS) status. When the last OOS status is deleted, the OSPSPORT is restored to service.

Up to four independent OOS conditions can exist simultaneously on an OSPSPORT. Refer to APP:PORT-STATUS in the Appendixes section of the Output Messages manual for a more detailed explanation of statuses that apply to OSPSPORTs. An OSPSPORT can be identified by its type [such as autoquote establishment (AQEST) or autoquote mate analog (AQM)] and its associated external identifier parameters or by its equipment number (LCEN, LCKEN, or TEN). If an AQEST or AQM OSPSPORT is busy when the request is made, it will be camped on for up to 20 minutes. If a camp-on is started, a REPT:CAMPON output message will be generated. The camp-on can then be terminated by a STP:CAMPON input message if desired. If an OSPSPORT other than an AQEST or AQM is busy when the request is made, the request is denied.

2. FORMAT

RST:OSPSPORT,a[,CH=b][,UCL][[:c][,d][,e][,f]];  

3. EXPLANATION OF MESSAGE

a = Port identifier. Valid value(s):

<table>
<thead>
<tr>
<th>AQEST</th>
<th>OPT</th>
</tr>
</thead>
<tbody>
<tr>
<td>g</td>
<td>j-k</td>
</tr>
<tr>
<td>h-i</td>
<td></td>

<td></td>
</tr>
<tr>
<td>l-m-n-o</td>
<td>l-q-r-s-t</td>
</tr>
<tr>
<td>l-m-u-v-w</td>
<td></td>
</tr>
</tbody>
</table>

b = Channel identifier [D (default), B1, or B2]. Used only for digital subscriber line (DSL) OSPSPORTs. Ignored if the item identified is not a DSL.

If this option is not specified or if the D-channel is specified, an attempt will be made to restore the D-channel and all on-demand service B-channels, but permanent packet B-channels will not be restored. If a B-channel is specified, only that B-channel will be restored to service.

The channel identifier is ignored for Operator Services Position System (OSPS) digital subscriber lines (DSLs) serving basic services terminals (BSTs) and operator position terminals (OPTs). For BST and OPT DSLs, the entire DSL will be restored to service even if only the D-channel or a B-channel is specified in the input request.

Port status, which indicates the restriction to be deleted from the OSPSPORT. Status subfields are always separated by a single comma, even if the statuses in-between are omitted (as in OOS, DSBLD).

c = Basic state. Valid value(s):

<table>
<thead>
<tr>
<th>ALL</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If entered, no other status fields need be specified and all existing status information (primary and pending) will be removed for the specified line(s). This will</td>
</tr>
</tbody>
</table>
result in the line(s) being placed in service (IS). Care should be exercised when using this option because restoring lines that are OOS, MTCE, FE, or FAF could result in undesired effects (that is, PORTLA audit failures, and so forth).

OOS
  = Out-of-service (default).

d  = Qualifier (choose one or omit). Valid value(s):
  BLKD  = Blocked.
  CADN  = Circuit administration.
  CUTOVER  = Cutover (pre-cut) inactive state.
  DSLINIT  = DSL initialization.
  MKBUSY  = Make busy.
  MTCE  = Maintenance (default).
  PPSRV  = Pre-post service.
  TMT  = Traffic management.

e  = Operational restriction (choose one or omit). Valid value(s):
  DSBLD  = Disabled (default).
  DCHOOS  = D-channel is out of service.
  HW  = High and wet.
  LVL1ERR  = Level 1 protocol error.
  LVL2ERR  = Level 2 protocol error.
  LVL3ERR  = Level 3 protocol error.
  PLGUP  = Plug-up (currently no affect).
  PX  = Power cross.
  RAP  = Recorded announcement port.
  Note: If the entire port status is omitted, the status will default to OOS, MTCE, and DSBLD. If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

f  = Supplementary information (choose one or omit). This field is used to record the reason for removal. Valid value(s):
  AML  = Automatic maintenance limit.
  AQ  = Autoquote problem.
  AUDIT  = Audit detected problem.
  CAROT  = Centralized automatic reporting on trunks.
  CDI  = Control and data interface.
  CKT  = Circuit.
  CTTU  = Central trunk testing unit.
  DFI  = Digital facility interface.
  DLNORSP  = Directory assistance system computer (DAS/C) link no response.
  DYGSPUS  = Dying gasp under study.
  FORPOT  = Foreign potential.
  GRD  = Ground fault.
  IAA  = Ineffective attempt analysis.
  ISLU  = Integrated services line unit.
  L2DOWN  = Level 2 is inoperable.
  L2QLTY  = Poor level 2 transmission quality.
  LINK1  = The basic rate interface transmission extension (BRITE) link one is down.
LINK2 = The BRITE link two is down.
LINK3 = The BRITE link three is down.
LINK4 = The BRITE link four is down.
LINK5 = The BRITE link five is down.
LINK6 = The BRITE link six is down.
MPOOS = Modern pool line out of service.
MSMTCH = Mismatch.
MTCECH = Maintenance channel.
NR = No response.
NRT = No response while in test mode.
NTDACT = Network termination (NT) is deactivated.
NTOFN = NT off normal.
NTPWR = NT lost power.
OPNOXL3 = OSPS position no level 3 protocol 3.
PCTF = Per-call test failure.
POSNOB = OSPS position no B-channel.
POSNRSP = OSPS position no response.
PPM = Periodic pulse metering.
PSU = Packet switch unit.
REX = Routine exercise.
RO = Routine other.
ROTF = Operational trouble.
SCC = Switching Control Center.
SPARED = Line involved in an integrated services line unit (ISLU) sparing configuration.
STKSCH = Suspected stuck scan (STKSCN) lead on the line group controller (LGC) or the line card (LC).
SWEQF = Switch equipment failure.
TEST = In test mode.
TEST1 = Testing in progress at the NT or BRITE channel unit (CU) and the BRITE link one is down.
TEST2 = Testing in progress at the NT or BRITE CU and the BRITE link two is down.
TEST3 = Testing in progress at the NT or BRITE CU and the BRITE link three is down.
TEST4 = Testing in progress at the NT or BRITE CU and the BRITE link four is down.
TEST5 = Testing in progress at the NT or BRITE CU and the BRITE link five is down.
TEST6 = Testing in progress at the NT or BRITE CU and the BRITE link six is down.
TICOM = Treated interface common circuit.
TINF = The T interface is down.
TRBL = Unspecified trouble.
TRBLORG = Origination trouble.
TREQF = Transmission equipment failure.
TRKBD = Trunk board.
TRKCT = Trunk circuit.
UINTF = The ANSI® Standard U interface is down.

g = Telephone number.

h = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and is followed by a RST:OSPSPORT output message.

RL = Retry later. The request has been denied, most likely due to system load.

MCC Display Page(s):
  1330,y (PDXU)
RST:PERF

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests an unconditional restoration of the OOS common controller for each offline pumpable peripheral after a peripheral offline pump has been performed on one or more switching modules (SMs). The request will duplex the peripheral to an active/stand-by state. This input message can be issued prior to a generic retrofit SM switch to back out of the peripheral offline pump or after the generic retrofit SM switch to commit the peripherals.

2. FORMAT

RST:PERF,SM=a[&b];

3. EXPLANATION OF MESSAGE

a = SM number, or the lower limit of a range of SM numbers.

b = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The request cannot be executed now due to unavailable system resources.

PF = Printout follows. The request was accepted. Output message REPT:RST-PERF follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Output Message(s):

REPT:RST-PERF
RST:PLTLK

Software Release: 5E15 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a PCT (Peripheral Control and Timing) line and trunk unit link (PLTLK) be restored to service. If the PLTLK is restored conditionally, the diagnostic runs and all tests must pass before service is restored to the link. If the PLTLK is restored unconditionally, no testing is performed.

2. FORMAT

RST:PLTLK=a-b-c-d[,UCL][,STBY][,ALL];

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = PLTU (PCT Line and Trunk Unit) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = PCT Facility Interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PCT Facility Interface side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

UCL = Restore unconditionally without diagnostics.

STBY = Restore the unit to the standby state. If the mate PLTLK is active, this option is required.

ALL = All subtending tributaries will be restored.

4. SYSTEM RESPONSE

NG = No good. Valid values are:
- REASON FOR NG = The message form is valid, but the request conflicts with current status.

PF = Printout follows. A RST PLTLK output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resource.

Output Message(s):
   RST:PMU

Input Appendix(es):
   APP:RANGES
RST:PPC

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Restores the specified pump peripheral controller (PPC) to service.

The message switch control unit must be in service before the PPC can be restored.

Note: For conditional restores, if the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

RST:PPC=a[,UCL][,STBY];

3. EXPLANATION OF MESSAGE

STBY = Restores the PPC to the standby state.

UCL = Unconditionally restores. No diagnostics are performed.

Note: For offices having CM3 vintage communications modules, the restore will always be run unconditionally, with or without the UCL parameter.

a = PPC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = The message was invalid.

PF = Followed by an RST:PPC output message.

Output Message(s):

- RST:PSUPIDB

Input Appendix(es):
RST:QGL

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE
Requests an unconditional restore of a quad-link packet switch (QLPS) gateway processor link (QGL).

Note: Automatic QLPS network switches may occur if the QGL restoration improves QLPS connectivity.

2. FORMAT
RST:QGL=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the QGL unconditionally to the active state. Since no diagnostic exists for a QGL, every request to restore a QGL to service is performed unconditionally with or without the UCL option.

a = Message switch (MSGS) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QLPS gateway processor (QGP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = QGL number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

  1380, 1381 (QLPS NETWORK 0/1 STATUS)
RST:QGP

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Request a conditional or unconditional restore of a quad-link packet switch (QLPS) gateway processor (QGP) to the active state. The request restores all the children circuits, QLPS gateway processor links (QGLs).

Note: As part of the QGP reconfiguration, switching of the QLPS may occur.

Note: If the QGP is already in service, this message may be used with the unconditional (UCL) option to restore all related OOS QGLs/QGP QPIPEs.

Note: For conditional restores, if the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

RST:QGP=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the QGP unconditionally. No diagnostics are performed. If the QGP is already in service, restore all related OOS QGLs/QGP QPIPEs to service.

Note: For offices having CM3 vintage communications modules, the restore will always be run unconditionally, with or without the UCL parameter.

a = Message switch (MSGS) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. A RST:QGP output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Input Message(s):

RST:QGL
RST:QLPS

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Request a conditional or unconditional restore of a quad-link packet switch (QLPS) to the standby state.

Note: If the resulting QLPS configuration is not optimal, an automatic reconfiguration (switch) of the QLPS occurs.

2. FORMAT

RST:QLPS=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the QLPS unconditionally. No diagnostics are performed.

a = Office network and timing complex (ONT) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. A RST:QLPS output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Requests that a quad-link packet switch protocol handler (QPH) QPIPE be restored to service.

2. FORMAT

RST:QPHPIPE=a-b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Global switching module (GSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = QPH channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Quad-link packet switch (QLPS) network number, which is 0 or 1, or a range 0&&1 to restore QPH QPIPEs on both networks. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = The request has been accepted. A RST:QPHPIPE output message will follow, specifying the results of the request.

NG - SM UNEQUIPPED = This response indicates that the input GSM (part of the QPH QPIPE specification) is not even an equipped SM.

NG - NOT A GSM = This response indicates that the input GSM (part of the QPH QPIPE specification) is not a provisioned GSM.

RL - GSM NOT AVAILABLE = This response indicates that the input GSM (part of the QPH QPIPE specification) is not available, because it is isolated or undergoing an initialization. Retry later.

235-200-116  5ESS Switch Signaling Gateway Common Channel Signaling
**RST:QTMSLNK**

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests an unconditional restore of a quad-link packet switch (QLPS) time multiplexed switch link (QTMSLNK) to the active state.

Note: Automatic QLPS network switches may occur if the QTMSLNK restoration improves QLPS connectivity.

2. **FORMAT**

```
RST:QTMSLNK=a-b-c[,UCL];
```

3. **EXPLANATION OF MESSAGE**

**UCL** = Restore the QTMSLNK unconditionally to the active state. Since no diagnostic exists for a QTMSLNK, every request to restore a QTMSLNK to service is performed unconditionally with or without the UCL option.

**a** = Office network and timing complex (ONTC) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**b** = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**c** = QTMSLNK number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

**NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

**PF** = Printout follows. A RST:QTMSLNK output message follows.

**RL** = Retry later. The request cannot be executed now due to unavailable system resources.

MCC Display Page(s):
1380,1381 (QLPS NETWORK 0/1 STATUS)
RST:RAF

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Conditionally or unconditionally restores a recorded announcement function (RAF) unit to service. If restored conditionally, the diagnostic will be run. All tests must pass before the unit will be restored to service. If restored unconditionally, no testing is performed.

2. FORMAT

RST:RAF=a-b [,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally restores without diagnostics.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RAF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
- SM DOES NOT EXIST = The requested SM does not exist in the system.
- SM UNEQUIPPED = The SM specified in the request is unequipped.
- UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by an RST:RAF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

RST:RAF

Input Appendix(es):

APP: RANGES
RST:RAU

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Restores a remote switching module (RSM) alarm (RAU) circuit to service.

2. FORMAT

RST:RAU=a [,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally restore the circuit. If circuit is out of service, it is returned to service without diagnostic testing. If circuit is in service, it is removed unconditionally. It is then returned to service without diagnostic testing.

a = Switching module number.

4. SYSTEM RESPONSE

NG = Request denied because of a conflict with current status.

PF = Followed by the RST:RAU output message.

5. REFERENCES

Input Message(s):

RMV:RAU

Output Message(s):

RST:RAU
RST:RCL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a remote communication link (RCL) between inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuits be restored to service.

2. FORMAT

RST:RCL=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the communication link unconditionally without connectivity exercise testing. The link will not be restored if there is a carrier group alarm on the CDFI.

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number, (0-5).

c = CDFI number, (1 - 10).

d = Facility (FAC) number, (0, 1). The FAC number is the T1 facility number on a CDFI.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
     - NOT STARTED UNIT IN GROWTH STATE
     - SM DOES NOT EXIST
     - SM UNEQUIPPED
     - UNIT DOES NOT EXIST

PF = Printout follows. A RST:RCL output message will follow.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

MCC Display Page(s):
RST:RCOSC
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a specified remote clock oscillator (RCOSC) be restored to service. Depending upon the state of the RCLK, the oscillator may be restored as active or standby. This message will also restore the associated remote clock oscillator cross couple (RCOXC).

Note: Under normal conditions an oscillator may only be restored to service if it has been powered up for a minimum of one hour for a medium stability oscillator or 16 hours for a high stability oscillator.

2. FORMAT

RST:RCOSC=a-b [,STBY][,UCL];

3. EXPLANATION OF MESSAGE

STBY = Restore to standby state (default is active).
UCL = Execute unconditionally.
a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = RCOSC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- NOT STARTED UNIT IN GROWTH STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST
PF = Printout follows. A RST:RCOSC output message follows in response to the request.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

MCC Display Page(s):

(COMMON PROCESSOR DISPLAY)
RST:RPCN

Software Release: 5E14 and later  
Command Group: CCS  
Application: 5  
Type: Input

1. PURPOSE

Requests that the specified ring peripheral controller node (RPCN) be restored to service.

The RPCN is first removed from service following the rules for RMV:RPCN input message. The RPCN is next diagnosed following the rules for the DGN:RPCN input message (all automatic phases are executed). The final action depends on the RPCN major state and diagnostic results as follows:

1 = If the RPCN major state is out of service (OOS) and the diagnostic results are all tests passed (ATP) or conditional all tests passed (CATP), an attempt is made to include the RPCN into the active ring. If the inclusion fails, the restoration is stopped. If the inclusion succeeds, and both the ring interface unit (RI) minor state and the node processor (NP) minor state are usable (USBL), the RPCN is restored to service (pumped with operational code, placed into execution, and its major state changed to ACT). Otherwise the restoration is stopped.

2 = If the RPCN major state is OOS but the diagnostic results are no tests run (NTR), abort (ABT), or some tests failed (STF), the restoration is stopped.

3 = If the RPCN major state is not OOS, the restoration is stopped.

2. FORMAT

RST:RPCNa=0[[:RAW[:TLP]]|[,UCL]];

3. EXPLANATION OF MESSAGE

RAW = Print the diagnostic results of every phase. The default is to print the results of the first five failures of each failing phase.

TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP generates a list of suspected faulty equipment.

UCL = Restore the node unconditionally. The default is a conditional restoration.

Note: The UCL parameter should not be used with any other parameter. If it is used with another parameter then the other parameter will be ignored.

a = Ring node (RN) group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows.

The system action is different for conditional and unconditional restoration requests.

118 (CNI FRAME AND CCS LINK STATUS)
RST:RRCLK

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK) be restored to service. If the restoration is conditional diagnostics will be run. All tests must pass before the unit will be restored to service. If the restoration is unconditional no testing is performed.

2. FORMAT

RST:RRCLK=a-b-c[,STBY][,UCL][SCREEN=d];

3. EXPLANATION OF MESSAGE

STBY = Restore the circuit to the standby state. If this state is not specified the circuit will be restored to the active state.

UCL = Restores the RISLU unconditionally without diagnostics.

a = Switching module (SM) number.

b = RISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RRCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Although this option is syntactically correct, it is set internally for cross checking purposes and values entered here will be ignored.

4. SYSTEM RESPONSE

NG = No good.
- CONFLICT WITH UNIT STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST

PF = Printout follows. An RST:RRCLK output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

(COMMON PROCESSOR DISPLAY)
123 (DISK FILE SYSTEM ACCESS)
RST:SCAN

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a scan point board (SCAN) in the metallic service unit be conditionally or unconditionally restored to service.

If restored conditionally, the diagnostic will be run. All tests must pass before the unit will be restored to service. If restored unconditionally, no testing is performed.

2. FORMAT

RST:SCAN=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally restores without diagnosis.

a = Switching module (SM) number.

b = MSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Scan point board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by RST:SCAN output message.

(COMMON PROCESSOR DISPLAY)
RST:SCSDC

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Conditionally or unconditionally restores a scanner and signal distributor controller (SCSDC) to service. If restored conditionally, an SCSDC diagnostic is run and must be all tests pass (ATP) before the unit is restored to service. If restored unconditionally, no testing is performed.

Note: The input/output processor (IOP) must be in service before the SCSDC can be restored.

2. FORMAT

RST:SCSDC=a [:UCL][,CONT] | [:RAW][:DATA[,TLP][,CONT]];

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

TLP = Executes the trouble locating procedure (TLP) to generate a list of suspected faulty equipment.
Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

UCL = Unconditional restoration. The default is conditional restoration.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

235-105-220  Corrective Maintenance
RST:SCTP

Software Release: 5E16(2) and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests the restoration of a stream control transmission protocol (SCTP) by endpoint or association.

Format 1 requests that the state be restored from the specified SCTP near endpoint and that attempts be made to establish all associations on that near endpoint, except for those associations that are individually in the CLOSED state.

Format 2 requests that the specified association be restored.

2. FORMAT

[1] RST:SCTP,ENDPT=a;

[2] RST:SCTP,ASSOC=b;

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Endpoint name to be restored to service. This is a character string (<=20) that is provisioned on RC/V View 33.19 (SCTP NEAR END POINT).

b = Association number to be restored to service. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. May also include:
   - DATABASE ERROR = Unrecoverable database error has occurred.
   - INTERNAL ERROR = Undetermined errors, possibly a software error. This response may be accompanied by an assert.
   - INVALID ASSOCIATION ID = The association number entered was not valid.
   - INVALID NEAR ENDPOINT NAME = The near endpoint name entered was not valid.

PF = Printout follows. The request has been accepted. Followed by the RST:SCTP output message.

RL = Retry later. The request has been denied. May also include:
   - AM OVERLOAD = AM is in overload.
   - SM INACCESSIBLE = SM is not available (for example, Isolation, initialization, and so forth).
   - SYSTEM ERROR = The system is probably in overload due to too many requests. The OP:JOBSTATUS input message can be used to determine if the RL was because the maximum number of jobs are active.

Output Message(s):

RST:SLIM

Input Appendix(es):

APP: RANGES
RST:STS1

Software Release: 5E16(1) and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a synchronous transport signal - level 1 (STS1) be restored to service. Restoring an STS1 without the ALL and UCL options will restore the STS1 circuit and the OOS-FE children (subtending) circuits. When the ALL option is used in conjunction with UCL option, all OOS children (subtending) circuits and the parent STS1 circuit will be restored.

2. FORMAT

RST:STS1=a-b-c-d-e[,UCL][,ALL];

3. EXPLANATION OF MESSAGE

ALL = All subtending facilities will be restored.
UCL = Restores without first conditionally removing the parent STS1. When the UCL option is used in with the All option, the OOS children of the STS1 and the parent STS1 circuit will be restored.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Optical carrier - level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = STS1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.
PF = Printout follows. Followed by the RST:STS1 output message.

1492  OIU STS1 STATUS
RST:STS3C
Software Release: 5E16(2) and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that a synchronous transport signal - level 3 concatenated (STS3C) facility be restored to service. Restoring an STS3C with the UCL option will restore the STS3C facility immediately, from the current state, without first attempting a conditional remove of the STS3C. Restoring an STS3C without the ALL option will restore the STS3C facility and any out-of-service family-of-equipment (OOS-FE) subtending circuit(s). When the ALL option is used, all subtending circuit(s) which are eligible to be restored manually will be restored regardless of their current state(s).

2. FORMAT
RST:STS3C=a-b-c-d-e[,UCL][,ALL];

3. EXPLANATION OF MESSAGE
UCL = Restores without first conditionally removing the STS3C.
ALL = All subtending circuit(s) will be restored.
a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Optical carrier - level 3 concatenated (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = STS3C number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

Application: 5
Type: Input

1. PURPOSE

Restores either conditionally or unconditionally a single analog trunk in a trunk unit specified by a trunk equipment number (TEN) circuit in a trunk unit to service. If restored conditionally, the diagnostic will be run. All tests must pass before the unit will be restored to service. If restored unconditionally, no testing is performed.

2. FORMAT

RST:TEN=a-b-c-d-e[,UCL];

3. EXPLANATION OF MESSAGE

- **UCL** = Unconditionally restores without diagnosis.
- **a** = Switching module number.
- **b** = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Trunk circuit board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Followed by RST:TEN output message.

5. REFERENCES

Output Message(s):

RST:TEN

Input Appendix(es):

APP:RANGES
1. PURPOSE

Requests that a specified time multiplexed switch (TMS) fabric pair (TMSFP) be restored to service. This command also has the option of restoring the TMSFP and all of its children, independent of the child's state (for example, OOS, MAN, RMV).

2. FORMAT

```
RST:TMSFP=a-b[,ALL] [,UCL];
```

3. EXPLANATION OF MESSAGE

- **ALL** = Restores the TMSFP and all its child units (for example, QLPSs, NLIs, DLIs), independent of the child's state (for example, OOS, MAN, RMV, OOS, MAN, FLT).
- **UCL** = Unconditionally restores the TMSFP without diagnostics.
- **a** = ONTC side that the TMSFP is on.
- **b** = TMS fabric pair number.

4. SYSTEM RESPONSE

- **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
- **PF** = Printout follows. A RST:TMSFP output message will follow in response to the request.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

APP : CM-IM-REASON

MCC Display Page(s):
1212    TMS FABRIC PAIR STATUS
1214    QLPS SUMMARY
1220,b   TMS LINK SUMMARY (where b=TMSFP number).
1. PURPOSE

Requests that a specified time multiplexed switch link (TMSLNK) be restored to service. The TMS portion of the
office network and timing circuit common (ONTCCOM) portion, and the DLI, dual link interface, both must be in
service prior to restoring a TMSLNK. No diagnostics exist for TMSLNKS. Therefore, any request that TMSLNKS be
restored is an unconditional request.

2. FORMAT

RST:TMSLNK=a-{b|b&&c},UCL;

3. EXPLANATION OF MESSAGE

UCL = Restore the line unconditionally. Since there is no diagnostic for the TMSLNK, adding the UCL
option has no effect on the message. The option is provided for consistency with other input
messages.

a = ONTC side that the TMSLNK(s) are on.

b = Number of the specific TMS link to be restored, on the lower limit in a range of TMS line numbers.

c = Upper limit is a range of TMS line numbers.

Note: If a TMSLNK that is part of a range request is either unequipped or already in
service, no action will be performed on that link.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not
be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input
Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. A RST:TMSLNK output message will follow in response to the request.

RL = Retry later. The request cannot be executed now because the communication module (CM)
deferred maintenance queue (DMQ) is full.

RST:TMSLNK
RST:TMSLNK-B

Software Release: 5E16(2) and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a specified time multiplexed switch link (TMSLNK) be restored to service. The DLI or NLI associated with the TMSLNK must be in service prior to restoring the TMSLNK. No diagnostics exist for TMSLNKS. Therefore, any request that TMSLNKs be restored is an unconditional request.

2. FORMAT

RST:TMSLNK=a[-b]-c[&d],[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Restore the link unconditionally. Since there is no diagnostic for the TMSLNK, adding the UCL option has no effect on the message. The option is provided for consistency with other input messages.

a = ONTC side that the TMSLNK(s) are on.

b = Time multiplexed switch fabric pair (TMSFP) number. For CM2 offices, this parameter is optional, and when entered, must always be TMS fabric pair 0. For CM3 offices, this parameter is required to identify a TMS link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Number of the specific TMS link to be restored, or the lower limit in a range of TMS link numbers.

d = Upper limit for a range of TMS link numbers.

If a TMSLNK that is part of a range request is either unequipped or already in service, no action will be performed on that link.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the RST:TMSLNK output message.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

235-070-100 Administration and Engineering Guidelines
RST:TRIB

Software Release: 5E15 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a PCT (Peripheral Control and Timing) link tributary (TRIB) is restored to service. If the TRIB is restored conditionally, a conditional remove is done first.

2. FORMAT

RST:TRIB=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE

a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = PLTU (PCT Line and Trunk Unit) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = PCT Facility Interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = PCT Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

UCL = Restore unconditionally.

4. SYSTEM RESPONSE

NG  = No good. Valid values are:
     - REASON FOR NG = The message form is valid, but the request conflicts with current status.

PF  = Printout follows. A RST:TRIB output message follows.

RL  = Retry later. The request cannot be executed now due to unavailable system resource.

MCC Display Page(s):

1430 (PLTU Status page)
1431 (PLTU Tributary Status Page)
1. PURPOSE

Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate interface (PRI) group, all trunks on a digital facility interface (DFI), or all trunks on a digital networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility be returned to service by deleting the specified out-of-service (OOS) condition. If no port status is given, a default port status is assumed.

A trunk may have from one to four OOS statuses. If no other OOS status is pending after the OOS status is deleted, the trunk is placed back in service and idled. If another OOS status was pending, the trunk is treated according to the pending OOS status.

Digital equipment number (DEN) is used for trunk identification. This can be used to restore all trunks on a digital facility interface (DFI) by specifying the facility.

An integrated digital carrier unit (IDCU) line equipment number (ILEN) is used to restore a trunk.

A multi-line hunt group and member number is used to restore a trunk. This is specific to X.25 access on T1 (XAT) ports only.

A packet directory number (PKTDN) is used to restore a trunk. This is also specific to XAT ports.

A PRI group number is used to restore a PRI. If the type of channel to be restored is not specified, the D-channel(s) of the PRI group will be restored. Format 5 allows the option of restoring either the D-channel(s) of the PRI group or all the B-channels of the PRI group. This format cannot be used for operator services position system (OSPS) PRIs because they are not assigned PRI group numbers.

A packet switching unit (PSU) equipment number (PSUEN) is used for trunk identification.

A SLC® line equipment number (SLEN) is used to restore a trunk.

A trunk equipment number (TEN) is used for trunk identification.

A trunk group number is used to restore.

A trunk group member number (TKGMN) is used for trunk identification. It also allows a range of trunks in a group to be specified.

A networking equipment number (NEN) is used for trunk identification. This can be used to restore all trunks on a virtual tributary 1.5 facility by specifying the facility.

An integrated digital loop carrier (IDLC) networking equipment number (INEN) is used to restore a trunk.

If the trunk to be restored is a custom PRI D-channel or OSPS PRI D-channel, up to 23 associated B-channels may also be restored as a result. If the trunk to restored is a standard PRI D-channel, up to 479 B-channels may also be restored as a result.

NOTE: When a packet trunk is restored, a loopback test is executed. This loopback test generates a receiver ready frame at layer 2, which, due to hardware limitations, is erroneously sent to the trunk's far end. To take care of this case, the switch at the far end should follow the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) X75 recommendation which
specifies discarding any invalid frames while in the disconnected state.

2. FORMAT

\[ \text{RST:TRK}, [m^1] [,UCL] [:[w] [,x] [,y] [,z]] [,SUM]; \]

3. EXPLANATION OF MESSAGE

**UCL**
- Restore the trunk(s) unconditionally. For a CCS7 trunks, this option bypasses the default automatic test provisioned for the TG (if any). For a packet switching trunk, this option restores the trunk to service without performing a digital loop back test at the office channel unit (OCU).

**a**
- Trunk group in which all of the members will have the specified status deleted. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**b**
- Trunk group member number, or the lower limit of a range of trunk group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**c**
- Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**d**
- Trunk unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**e**
- Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**f**
- Channel board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**g**
- Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**h**
- Channel (D,B). Valid value(s):
  - **D** = Specifying this causes the D-channel(s) of the PRI group to be restored. If the PRI has a backup D-channel, it is also restored.
  - **B** = Specifying this will cause all of the B-channels of the PRI group to be restored.

When used with the PRIGRP identifier, this option specifies which channels on the PRIGRP are to be restored.

**i**
- Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**j**
- Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**k**
- Channel number. If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Valid value(s):
- **ALL** = If ALL is requested, all channels on the DFI will have the specified OOS status deleted. For DFI-1, this will be channels 1-24. For DFI-2, this will be channels 1-48. The FAC option can be used to specify which set of 24 channels to restore for a DFI-2. Refer to the FAC option.
for additional information.

l = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Directory number (DN).

o = Upper limit of a range of trunk group members.

p = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
   ALL = Delete the specified OOS status for all trunks on the RT.

s = Facility numbers. Valid value(s):
   0 = Restore channels 1 through 24.
   1 = Restore channels 25 through 48.

When used with the DEN identifier, this option specifies the facility to be restored. It is only valid for DFI-2 hardware. The DEN identifier must have the channel set to ALL. Refer to the DEN identifier for additional information.

t = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

If a status is not specified, statuses will be deleted depending on trunk type.

<table>
<thead>
<tr>
<th>One-way incoming trunks</th>
<th>OOS, MTCE, DSBLD</th>
</tr>
</thead>
<tbody>
<tr>
<td>One-way outgoing trunks,</td>
<td>OOS, MTCE, DSBLD and/or</td>
</tr>
<tr>
<td>two-way trunks, and CAMA ONI trunks</td>
<td>OOS, MTCE, LKDO</td>
</tr>
<tr>
<td>Announcement port</td>
<td>OOS, MTCE, RAP</td>
</tr>
<tr>
<td>CCS trunks</td>
<td>OOS, MTCE, DSBLD</td>
</tr>
<tr>
<td>XAT ports</td>
<td>No default.</td>
</tr>
</tbody>
</table>

All other OOS statuses must be removed by explicitly stating the status to be deleted from the trunk. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual to determine valid states for each port type.

For XAT ports, any manual state will be deleted if no state is specified. In addition, the DSLINIT and LVL2ERR states will be deleted, if possible.
Status subfields are always separated by a single comma, even if in-between subfields are omitted (as in OOS,LKDO).

**NOTE:** If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

\[ w \]

- Basic state. Valid value(s):
  - ALL = If entered no other status fields need be specified and all existing status information (primary and pending) will be removed for the specified trunk(s). This will result in the trunk(s) being placed in-service (IS). Care should be exercised when using this option since restoring trunks that are OOS MTCE FE or FAF could result in undesired effects (that is, PORTLA audit failures and so forth).
  - OOS = Out-of-service (default).

\[ x \]

- Qualifier (choose one or omit). Valid value(s):
  - BLKD = Blocked. If basic state field 'w' is not specified, it will be defaulted to OOS.
  - CADN = Circuit administration. If basic state field 'w' is not specified, it will be defaulted to OOS.
  
  **NOTE:** If CADN is specified, the operational restriction of DSBLD or LKDO must also be specified.

- DSLINIT = DSL initialization. If basic state field 'w' is not specified, it will be defaulted to OOS.
- MTCE = Maintenance. If basic state field 'w' is not specified, it will be defaulted to OOS.
- PPSRV = Pre/post service. If basic state field 'w' is not specified, it will be defaulted to OOS.
- TMT = Traffic management (valid only for outgoing trunks). If basic state field 'w' is not specified, it will be defaulted to OOS.

\[ y \]

- Operational restrictions (choose one or omit). Valid value(s):
  - DCHOOS = D-channel is OOS. If qualifier field 'x' is not specified, it will be defaulted to MTCE.
  - DSBLD = Disabled (busies outgoing calls and causes seizure toward far end office). If qualifier field 'x' is not specified, it will be defaulted to MTCE.
  - HW = High and wet. If qualifier field 'x' is not specified, it will be defaulted to MTCE.
  - LKDO = Locked out (busies outgoing calls only). If qualifier field 'x' is not specified, it will be defaulted to MTCE.
  - LVL2ERR = Level 2 protocol error. If qualifier field 'x' is not specified, it will be defaulted to MTCE.
  - LVL3ERR = Level 3 protocol error. If qualifier field 'x' is not specified, it will be defaulted to MTCE.
  - RAP = Announcement port. If qualifier field 'x' is not specified, it will be defaulted to MTCE.

\[ z \]

- Supplementary information (choose one or omit). Valid value(s):
  - AML = Automatic maintenance limit.
  - AUDIT = Audit detected problem.
  - CAMA = Central automatic message accounting.
  - CAROT = Centralized automatic reporting on trunks.
  - CDI = Control and data interface.
  - CRT = Circuit.
  - CTTU = Central trunk testing unit.
  - DFI = Digital facility interface.

TKGMN=a-b[&&o]
NEN=c-b-d-e-f-g-h
INEN=c-b-d-e-f-g-h
VNAR=c-n
VTRK=c-o-p

n = Virtual network announcement resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Request accepted. Followed by an RST:TRK output message.

NOTE: If the trunk to be restored is controlled by another process, the port will be camped on (refer to the REPT:CAMPON output message). The camp-on can be stopped by using the STP:CAMPON input message which aborts the port restoration.

RL = Retry later. Request denied, probably due to system load. The OP:JOBSTATUS input message can be used to determine if the RL was because the maximum number of jobs are active.

5. REFERENCES

Other Manual(s):
235-105-110 System Maintenance Requirements and Tools
235-190-104 ISDN Feature Description
235-200-115 CNI Common Channel Signaling
235-200-116 Signaling Gateway Common Channel Signaling
235-900-341 National ISDN Basic Rate Interface Specification
1. PURPOSE

Requests that a trunk, a range of trunks in a trunk group, an entire trunk group, a primary rate interface (PRI) group, all trunks on a digital facility interface (DFI), all trunks on a digital networking unit - synchronous optical network (SONET) (DNU-S) virtual tributary level 1 facility, or all trunks on a peripheral control and timing line and trunk unit (PLTU) be returned to service by deleting the specified out-of-service (OOS) condition. If no port status is given, a default port status is assumed.

When the PSUEN for the PCF trunk is entered, the entire PCF trunk group will be restored.

A trunk may have from one to four OOS statuses. If no other OOS status is pending after the OOS status is deleted, the trunk is placed back in service and idled. If another OOS status was pending, the trunk is treated according to the pending OOS status.

If the trunk to be restored is an custom PRI D-channel or OSPS PRI D-channel, up to 23 associated B-channels may also be restored as a result. If the trunk to restored is a standard PRI D-channel, up to 479 B-channels may also be restored as a result.

NOTE: When a packet trunk is restored, a loopback test is executed. This loopback test generates a receiver ready frame at layer 2, which, due to hardware limitations, is erroneously sent to the trunk's far end. To take care of this case, the switch at the far end should follow the International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) X75 recommendation which specifies discarding any invalid frames while in the disconnected state.

Restoring a CCS trunk from the OOS,MTCE,DSBLD,TRBL status will cause trunk's status change to OOS,MTCE, CCSINIT,TRBL and reset sending start immediately for the restored trunk.

2. FORMAT

RST:TRK,q 1[,UCL][:[w][,x][,y][,z]][,SUM];

3. EXPLANATION OF MESSAGE

UCL = Restore the trunk(s) unconditionally. For a CCS7 trunks, this option bypasses the default automatic test provisioned for the TG (if any). For a packet switching trunk, this option restores the trunk to service without performing a digital loop back test at the office channel unit (OCU).

a = Trunk group or bearer independent call control (BICC) group in which all of the members will have the specified status deleted. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Trunk group member or normalized call instance code (CIC), or the lower limit of a range of trunk group member numbers or normalized CICs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Trunk unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Channel board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Channel (D,B). Valid value(s):
  D = Specifying this causes the D-channel(s) of the PRI group to be restored. If the PRI has a backup D-channel, it is also restored.
  B = Specifying this will cause all of the B-channels of the PRI group to be restored.

When used with the PRIGRP identifier, this option specifies which channels on the PRIGRP are to be restored.

h = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Channel number. If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
  ALL = If ALL is requested, all channels on the DFI will have the specified OOS status deleted. For DFI-1, this will be channels 1-24. For DFI-2, this will be channels 1-48. The FAC option can be used to specify which set of 24 channels to restore for a DFI-2. Refer to the FAC option for additional information.

l = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Directory number (DN).

o = Upper limit of a range of trunk group members or normalized CICs.

p = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
  ALL = Delete the specified OOS status for all trunks on the RT.
If a status is not specified, statuses will be deleted depending on trunk type.

<table>
<thead>
<tr>
<th>Trunk Type</th>
<th>Default Status</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

All other OOS statuses must be removed by explicitly stating the status to be deleted from the trunk. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual to determine valid states for each port type.

For XAT ports, any manual state will be deleted if no state is specified. In addition, the DSLINIT and LVL2ERR states will be deleted, if possible.

Status subfields are always separated by a single comma, even if in-between subfields are omitted (as in OOS, LKDO).

If a status sub-field is entered without entering the previous sub-field, the default values indicated will be assumed.

- **s** = Facility numbers. Valid value(s):
  - 0 = Restore channels 1 through 24.
  - 1 = Restore channels 25 through 48.

When used with the DEN identifier, this option specifies the facility to be restored. It is only valid for DFI-2 hardware. The DEN identifier must have the channel set to ALL. Refer to the DEN identifier for additional information.

- **t** = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **u** = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **v** = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **w** = Basic state. Valid value(s):
  - **ALL** = If entered no other status fields need be specified and all existing status information (primary and pending) will be removed for the specified trunk(s). This will result in the trunk(s) being placed in-service (IS). Care should be exercised when using this option since restoring trunks that are OOS MTCE FE or FAF could result in undesired effects (that is, PORTLA audit failures and so forth).
  - **OOS** = Out-of-service (default).

- **x** = Qualifier (choose one or omit). Valid value(s):
  - **BLKD** = Blocked. If variable ‘w’ is not specified, it will be defaulted to OOS.
  - **CADN** = Circuit administration. If variable ‘w’ is not specified, it will be defaulted to OOS.

  If CADN is specified, the operational restriction of DSBLD or LKDO must also be specified.
  - **DSLINIT** = DSL initialization. If variable ‘w’ is not specified, it will be defaulted to OOS.
MTCE = Maintenance. If variable 'w' is not specified, it will be defaulted to OOS.
PPSRV = Pre/post service. If variable 'w' is not specified, it will be defaulted to OOS.
TMT = Traffic management (valid only for outgoing trunks). If variable 'w' is not specified, it will be defaulted to OOS.

y = Operational restrictions (choose one or omit). Valid value(s):
DCHOOS = D-channel is OOS. If variable 'x' is not specified, it will be defaulted to MTCE.
DSBLD = Disabled (busies outgoing calls and causes seizure toward far end office). If variable 'x' is not specified, it will be defaulted to MTCE.
HW = High and wet. If variable 'x' is not specified, it will be defaulted to MTCE.
LKDO = Locked out (busies outgoing calls only). If variable 'x' is not specified, it will be defaulted to MTCE.
LVL2ERR = Level 2 protocol error. If variable 'x' is not specified, it will be defaulted to MTCE.
LVL3ERR = Level 3 protocol error. If variable 'x' is not specified, it will be defaulted to MTCE.
RAP = Announcement port. If variable 'x' is not specified, it will be defaulted to MTCE.

z = Supplementary information (choose one or omit). Valid value(s):
AML = Automatic maintenance limit.
AUDIT = Audit detected problem.

TEN=c\text{-}d\text{-}e\text{-}f\text{-}g
TG=a
TKGMN=a\text{-}b[&\&o]
VTRK=c\text{-}r^1\text{-}s^1

r = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = STS level 1 (STS-1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Virtual connection identifier (VCID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
PF  = Printout follows. Request accepted. Followed by the RST:TRK output message.

If the trunk to be restored is controlled by another process, the port will be camped on (refer to the REPT:CAMPON output message). The camp-on can be stopped by using the STP:CAMPON input message that aborts the port restoration.

RL  = Retry later. Request denied, probably due to system load. The OP:JOBSTATUS input message can be used to determine if the RL was because the maximum number of jobs are active.

RST:TTFCOM
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Conditionally or unconditionally restores a transmission test facility common (TTFCOM) board in a global digital service unit (GDSU) to service.

2. FORMAT
RST:TTFCOM=a-b-c-d[,UCL];

3. EXPLANATION OF MESSAGE
If restored conditionally, the diagnostic will be run. All tests must pass before the unit will be restored to service. If restored unconditionally, no testing is performed.

UCL = Unconditionally restores without diagnosis.

a = Switching module (SM) number.

b = GDSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
PF = Printout follows. The request has been received. Followed by an RST:TTFCOM output message.

5. REFERENCES
Output Message(s):

RST:TTFCOM
RST:TTY
Software Release: 5E14 and later
Command Group: SM
Application: 5,3B
Type: Input

1. PURPOSE
Unconditionally restores the specified teletypewriter (TTY) to service.

Note: The input/output processor (IOP) and the teletypewriter controller (TTYC) must be in service before the TTY can be restored.

TTY is a subdevice of TTYC. Restoring a TTY by using RST:TTY a! has the same effect as using RST:TTY a;UCL!

2. FORMAT
RST:TTY=a;

3. EXPLANATION OF MESSAGE
a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

RST:TTYC

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Conditionally or unconditionally restores a teletypewriter controller (TTYC) to service. If restored conditionally, a TTYC diagnostic is run and must be all tests pass (ATP) before the unit is restored to service. If restored unconditionally, no testing is done on the unit to be restored.

Note: The input output processor (IOP) must be in service before the TTYC can be restored.

2. FORMAT

RST:TTYC=a[:UCL][,CONT]=[:RAW][[:DATA][,TLP][,CONT]]

3. EXPLANATION OF MESSAGE

CONT = Restores only the TTYC. The default is to restore the TTYC and all associated teletypewriters.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

Note: The TLP and UCL parameters should not be used together, as no testing is performed on an unconditional restore.

UCL = Unconditional restoration. The default is conditional restoration.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

RST:UMBIL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a host umbilical (UMBIL) circuit be restored to service. This message is applicable for host umbilicals terminating on a digital line and trunk unit (DLTU) or on a digital networking unit - synchronous optical network (DNU-S). This is an alternative way to address a restore of a host facility (HFAC) or a DS1 facility.

WARNING: A restoration of an UMBIL while the UMBIL is out of service may preempt maintenance activity on the UMBIL.

2. FORMAT

RST:UMBIL=a-b-c[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally execute the restore.

a = Host Switch Module (HSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Remote Switch Module (RSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = UMBIL number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. A RST:UMBIL output message will follow.

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

116 (MISCELLANEOUS)
70. SCHED
1. PURPOSE

Schedules the time in which trunk automatic progression testing (APT) is to be run for a given 24-hour period. The starting time and duration of the test are expressed in hours and minutes on a 24-hour clock. These parameters are only in effect for one period of APT testing.

2. FORMAT

SCHED:APT[,TIME=a-b][,DUR=c][,TKGMN=d-e];

3. EXPLANATION OF MESSAGE

a = The hour after midnight when APT is to be started (0-23).
b = The minutes after the hour when APT is to be run (0-59).
c = Duration in hours that APT is to be run (0-8). When duration is not specified, or when specifying a duration of zero (0) hours, APT will not run. However, APT's schedule will be refreshed immediately from the switch database into application memory.
d = The trunk group on which to start the next APT testing.
e = The member number on which to start the next APT testing.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and the parameters have been changed. Followed by a SCHED:APT output message.

RL = Retry later. The request was not accepted because APT is not currently executing.

?D = The request has been constructed incorrectly with errors in the starting time, duration, or trunk ID fields.

5. REFERENCES

Output Message(s):

SCHED:APT

Other Manual(s):
1. PURPOSE

Schedules the day, time, and duration for the full static office-dependent data (SODD) audit. Overlapping entries in the schedule are not allowed, but an entry that starts at the same time that another one ends is permissible.

2. FORMAT

SCHED:AUD=SODD, DAY=a, STARTTIME=b, DURATION=c;

3. EXPLANATION OF MESSAGE

a
= Run the full audit on a specified day. Valid value(s):
  MON = Monday.
  TUE = Tuesday.
  WED = Wednesday.
  THU = Thursday.
  FRI = Friday.
  SAT = Saturday.
  SUN = Sunday.
  ALL = All days.

b
= The hour the full SODD audit is to start in the form HH:MM [hour (0-23), minute (0-59)].

c
= Duration for which the full SODD audit is to run in the form HH:MM [hour (1-24), minute (0-59)]. Duration must be at least one hour. To schedule a continuous audit, STARTTIME should be set to 1-00, DURATION set to 24-00, and DAY set to ALL.

4. SYSTEM RESPONSE

PF
= Printout follows. Valid value is:
  - OP AUD=SODD SCHED MESSAGE FOLLOWS = Followed by an OP:AUD-SODD-SCH output message.

Output Message(s):

OP: AUD-SODD-SCH

Other Manual(s):
235-105-210  Routine Operations and Maintenance
1. PURPOSE

Requests a new automated system backup to be scheduled or requests all previously scheduled backups to be rescheduled. SCHED:BKUP adds backup entries to the system cron table file so that the backups can be automatically executed by the cron daemon process. Refer to OP:BKUP to display the currently scheduled backups and CLR:BKUP to unschedule a backup.

Format 1 is used to schedule an automated system backup to be run weekly or monthly by the cron daemon process.

Format 2 is used to reschedule all previously scheduled backups during a generic retrofit. SCHED:BKUP will delete all current automated system backup jobs from the cron table and reschedule all automated system backup jobs listed in the schedule file managed by the automated system backup processes. This format may also be used to reschedule backups if the system cron table file is corrupt.

This message will not allow a backup to be scheduled within 8 hours of a currently scheduled backup.

The automated system backup process will only execute one backup at a time. Care must be taken when scheduling both weekly and monthly backups. It is possible to schedule a weekly and monthly backup to run at the same time. If this occurs, the automated system backup process will only perform the first backup initiated by the cron process.

2. FORMAT

3. EXPLANATION OF MESSAGE

a = Interval. Valid value(s):
   WEEK = Weekly backup is to be scheduled.
   MONTH = Monthly backup is to be scheduled.

b = Day. If variable 'a' is equal to 'WEEK', then this variable is the day of the week. Valid value(s):
   0 = Sunday.
   1 = Monday.
   2 = Tuesday.
   3 = Wednesday.
   4 = Thursday.
   5 = Friday.
   6 = Saturday.

If variable 'a' is equal to 'MONTH', then this variable is the day of the month (1-31). The number of days in each month should be considered when scheduling a monthly backup. For example, not every month has 31 days. Therefore, a backup scheduled on the 31st day of the month will not run...
every month.

c = Time of day the backup is to begin in hours and minutes (hhmm) between 0000 and 2359. Example, 2200 is 10:00 PM.

Care should be taken when selecting the time that the backup will be run. It is possible for a backup to be skipped if scheduled during the time change into or out of daylight saving time (DST).

d = Backup option file name. This file must reside in the /no5text/bkup/autobkup directory. If a file name is not specified, the default backup option file name, bkup.opts, will be used. This variable must not be specified as a full or relative pathname.

4. SYSTEM RESPONSE

Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Request that the on-switch ECD audit be scheduled for automatic execution.

2. FORMAT

SCHED:ECDAUD:STARTTIME=a-b,{DAY=c,DATE=d};

3. EXPLANATION OF MESSAGE

a = The hour for the ECD audit to start in the form hh [hour (0-23)].
b = The minute for the ECD audit to start in the form mm [minute (0-59)].
c = The day of the week for the ECD audit to be run. Valid value(s):
   MON = Monday.
   TUE = Tuesday.
   WED = Wednesday.
   THU = Thursday.
   FRI = Friday.
   SAT = Saturday.
   SUN = Sunday.

Note: Variables ‘c’ and ‘d’ are mutually exclusive.

d = The day of the month for the ECD audit to be run. Valid value(s) 0-28.

Note: Variables ‘c’ and ‘d’ are mutually exclusive.

235-105-210  Routine Operations and Maintenance Manual
SCHED:FACR

Software Release: 5E14 and later
Command Group: FHADM
Application: 5
Type: Input

1. PURPOSE

Requests that the feature activation counting and reconciliation (FACR) audit be scheduled for execution at a specific date and hour. All scheduled entries will be carried across a calendar year.

2. FORMAT

[1] SCHED:FACR:{OFC|UNOFC},TIME=a-b-c;

3. EXPLANATION OF MESSAGE

OFC = Request for an official run of the FACR audit.

UNOFC = Request for an unofficial run of the FACR audit. The output from the audit is restricted for use by the service provider only.

APPL= = Request to run a FACR special application audit.

a = Month of the requested execution time (1-12).

b = Day of the requested execution time (1-31).

c = Hour of the requested execution time (0-5 or 18-23).

4. SYSTEM RESPONSE

235-100-125  System Description
SCHED:GRC

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that a global recent change (GRC) job be rescheduled. This input message allows the user to change the options specified when the GRC job was scheduled. If the GRC job has been split, SECT must be provided.

RDATE and RTIME should be specified together. If RDATE is provided without RTIME, RTIME defaults to midnight. If RDATE and RTIME are not provided or RTIME is specified without RDATE, the default is the current date and time.

2. FORMAT

SCHED:GRC,NAME=a[,SECT=b],MODE=c[,VERBOSE=d][,MAXERR=e][,RDATE=ff-ff-ff,RTIME=gg-gg];

3. EXPLANATION OF MESSAGE

a = GRC name (up to 10 characters).

b = GRC section number.

c = Mode of job to be rescheduled. Valid value(s):
UPDATE = Update operation.
BACKOUT = Backout operation.

 d = Print one-line logging messages on the receive-only printer (ROP) for each update or backout of a line for this GRC job. Valid value(s):
Y = Enables the verbose option.
N = Disables the verbose option.

e = Allow a maximum of this many errors.

f = Release date in the form month-day-year. (month of the year [01-12], day of the month [01-31], last two digits of year [00-99]).

g = Release time, in the form hour-minute [hour (00-23), minute (00-59)].

4. SYSTEM RESPONSE

PF = Printout follows. A GRC:STATUS output message will follow indicating the beginning of the operation.

NG = No good. The request was denied. A GRC:ERROR output message will provide the reason for the failure.

71. SET
SET:ALINK

Software Release: 5E14 and later  
Command Group: SM  
Application: 5  
Type: Input

1. PURPOSE

Requests that an out-of-service line unit model 2 (LU2) or a line unit model 3 (LU3) A-link (ALINK) be manually set to a specific state. This allows the A-link either to be placed into a deferred maintenance state in which it has no effect on system indicators, or to be returned to the normal maintenance state.

2. FORMAT

SET:ALINK=a-b-c-d-e,{DEFR|RMVD};

3. EXPLANATION OF MESSAGE

DEFR  = Deferred. Place the link into deferred maintenance state.

RMVD  = Removed. Place the link into standard out-of-service maintenance state.

a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Grid board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied. The message syntax is valid, but the request could not be processed. May also include:
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST

PF  = Printout follows. Followed by the SET:ALINK output message.

RL  = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Output Message(s):
SET: ALINK

Input Appendix(es):

APP: RANGES

MCC Display Page(s):

(LINE UNIT CONCENTRATOR)
1. PURPOSE

Requests that the alarm retire mode (ALMMDE) be set to either automatic or manual. Format 1 is for the local office. Format 2 is for remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) sites with the alarm output option. Format 3 is for remote peripheral sites with a remote alarm section (RAS).

2. FORMAT

[1] SET:ALMMDE=a;
[2] SET:ALMMDE=a,RBPSC,SM=b;
[3] SET:ALMMDE=a,RAS,SITE=c;

3. EXPLANATION OF MESSAGE

AUTO = Automatic retire mode. At the local office, audible alarms will retire automatically in eight seconds or when manually retired--whichever occurs first. At an RSM, ORM, TRM, or remote peripheral site, audible alarms will retire automatically in five seconds to five minutes or when manually retired--whichever occurs first.

MAN = Manual retire mode. At the local office, critical and major audibles will sound until manually retired. At a control/display terminal, use the alarm retire function key to retire alarms. At RSM, ORM, TRM, or remote peripheral sites, the critical, major, and minor audibles will sound until manually retired by pressing the alarm retire button on the remote alarm and status panel.

a = New alarm retire mode (AUTO or MAN).

b = Switching module (SM) number of the module containing the MSU and the remote alarm status circuit (ASC). Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c = Remote peripheral site number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request was not accepted and the retire mode remains unchanged or option not available.

PF = Printout follows. Followed by the SET:ALMMDE output message.

RL = Retry later. System is in overload.

SET:AMA-CONFIG

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that an automatic message accounting (AMA) partition be equipped or unequipped for either the ST1 or ST2 data stream.

Note: After this message is entered, make backup tapes to prevent loss of the updated AMA configuration files in the event of a reload from tape.

2. FORMAT

SET:AMA:CONFIG:{ST1|ST2},PART=a,{EQUIP[,NOINIT]|UNEQUIP};

3. EXPLANATION OF MESSAGE

EQUIP = Make the partition accessible to the data stream indicated.
NOINIT = Do not initialize the partition.
ST1 = AMA data to be written to the ST1 data stream.
ST2 = AMA data to be written to the ST2 data stream.
UNEQUIP = Make the partition inaccessible to the data stream indicated.
a = Partition number.

4. SYSTEM RESPONSE

IP = In progress. No errors or inconsistencies were found in the input data.
PF = Printout follows. An error or inconsistency was found in the input data.
RL = Retry later. Either the process could not attach to a protected application segment, or another SET:AMA-CONFIG process is in progress.

5. REFERENCES

Input Message(s):

OP:AMA-CONFIG

Output Message(s):

REPT:AMA-CONFIG
SET:AMA-CONTROL

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that one or two of the automatic message accounting (AMA) control file parameters be set.

2. FORMAT

SET:AMA:CONTROL[:ST1|:ST2],{OFFICEID=a|EXPDATE=b|START=c-d|STOP=e-f
|MT=g|OPTION=h|HOCPSWD=i|BACKUPSWD=j|TAPEID="k"};

3. EXPLANATION OF MESSAGE

ST1 = Send AMA data to the ST1 data stream.
ST2 = Send AMA data to the ST2 data stream.

Note: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

a = Office identification number (six digits).
b = Number of days (1-99) until AMA tape expires.
c = Hour of start time.
d = Minute of start time.
e = Hour of stop time.
f = Minute of stop time.
g = Default tape drive number for the automatic tape writing process.
h = Option. Valid value(s):
    TAPE = Tape option.
    TP = Teleprocessing option.
    AMADNS1 = AMA data networking services phase 1.
i = Host collector (HOC) password (ten digits).
j = Backup HOC password (ten digits).
k = Tape ID (seventeen characters or fewer).

Note: Refer to Local Switching System General Requirements (LSSGR) for rules defining the construction of a tape identifier.

Notice that double quotes must be used to enclose the tape ID variable in the input message. It is
recommended that lower case letters not be used to compose the tape ID variable.

4. SYSTEM RESPONSE

NG = No good. Data stream checks failed.

PF = Printout follows. Request accepted. The option(s) selected are being updated. When the request is completed, the contents of the AMA control file will be output by the REPT:AMA:CONTL output message. If less than 17 characters are supplied, trailing blanks will be used.

RL = Retry later. A tape or teleprocessing session is currently in progress. Try again after the session terminates.

INH:AMA-SESSION
OP:AMA-CONTROLF
OP:AMA-STREAM

Output Message(s):

REPT:AMA-CONT
SET:AMA-STREAM

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that the automatic message accounting (AMA) office stream configuration be set.

2. FORMAT

SET:AMA:STREAM,{ST1|ST2|DUAL};

3. EXPLANATION OF MESSAGE

DUAL  = Send all AMA data to both ST1 and ST2 data streams.
ST1   = Send AMA data to the ST1 data stream.
ST2   = Send AMA data to the ST2 data stream.

4. SYSTEM RESPONSE

NG     = No Good. A value of ST2 is not allowed if AMA data networking services processing is active.
OK     = Good. Data stream indicator was successfully set up.
RL     = Retry later. Process could not attach to a protected application segment, or a disk copy of the
data stream indicator could not be opened or written.
?I     = Invalid data stream value was specified in the input message.

5. REFERENCES

Input Message(s):

OP:AMA-STREAM
SET:ARC

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that an alternate route cancellation (ARC) control at an office be set or modified. The ARC control is initiated or modified for routine or all levels of precedence.

This message is valid only for defense switched network (DSN) switches.

2. FORMAT

SET:ARC,OFFICE=a,TYPE=b,TRAFFIC=c[,RTNANN=d];

3. EXPLANATION OF MESSAGE

a = Office name.

b = Control type to be applied. Valid value(s):
   CANF = Cancel from. Cancel calls that terminate in a given adjacent office but could not complete with the direct route. This control restricts traffic from overflowing to its alternates.
   CANT = Cancel to. Cause traffic to skip its alternate route through the given office. This control forces calls that do not terminate at the given office to skip the direct trunk groups to that office.

c = Precedence level subject to CANF or CANT control. Valid value(s):
   ALL = All levels of precedence, for example, flash override, flash, immediate, priority, and routine.
   RTN = Routine traffic only.

Note: When a precedence call is blocked as a result of ARC control, the announcement treatment is always the blocked precedence announcement.

d = Routine announcement (RTNANN) treatment to be given if blocking occurs for routine (RTN) traffic only (refer to variable 'c'). Valid value(s):
   EANN1 = Emergency announcement 1.
   EANN2 = Emergency announcement 2.
   NCA = No circuit announcement (default).

4. SYSTEM RESPONSE

NG = No good. May also include:
   - INVALID REQUEST = This system is not equipped to handle the request entered.
PF = Printout follows. Followed by the SET:ARC output message.

RL = Retry later. May also include:
   - RESOURCE SHORTAGE = The necessary resources are not available.

3. EXPLANATION OF MESSAGE

**NOTE:** An "*" indicates a default value to be used when the value is not set by the user and is not presently set. All fields are given for each parameter even if a particular field has been previously described.

**AMAMSMENT** = AMA measurement parameter.

- **a** = Directory number.
- **b** = Service profile ID (20 digits maximum).
- **c** = Trunk group ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Private facility ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = Bearer capability. Valid value(s):
  - 56KBPS = 56 kilobits per second.
  - 64KBPS = 64 kilobits per second.
  - AUDIO = 3.1 kHz audio.
  - SPEECH = Speech.
- **f** = Called party ID digits (15 digits maximum).
- **g** = Nature of number for called type. Valid value(s):
  - 950 = 950+ call.
  - CUTTHRU = No address present cut through to carrier.
  - INTL = International number.
  - INTOPR = International number, operator requested.
  - NA = Not applicable.
  - NADOPR = No address present, operator requested.
  - *NAT = National (significant) number.
  - NATOPR = National number, operator requested.
SSNBR = Subscriber number.
SSOPR = Subscriber number, operator requested.
TESTLN = Test line test code.

h = Numbering plan. Valid value(s):
*ISDN = ISDN numbering plan.
NA = Unknown or not applicable.
PRIV = Private numbering plan.

NOTE: Default values ("**") do not apply to the generic address list parameter therefore must be set by the user.

i = Called party station type number (0-99).

j = LATA digits (3 digits maximum).

k = Trigger criteria type. Valid value(s):
2X = nxx.
6X = nxx-xxxx.
CCNP6X = Country code npa-nxx-xxxx.
CUACCESS = Customized access.
FEATACT = Feature activator.
AFR = Automatic flexible routing.
N11 = n11.
NP0X = npa-n.
NP1X = npa-nx.
NP2X = npa-nxx.
NP3X = npa-nxx-x.
NP4X = npa-nxx-xx.
NP5X = npa-nxx-xxx.
NP6X = npa-nxx-xxxx.
NPA = npa.
OCLDPTYBSY = Origination called party busy.
OHIMMED = Off-hook immediate.
OHDELAY = Off-hook delay.
ONOANS = Origination no answer.
SETPRI = Channel setup PRI.
SHRDIO = Shared inter office trunk.
TBUSY = Termination busy.
TNOANS = Termination no answer.
TRMATMPT = Termination attempt.
VERTSC = Vertical service code.

l = Charge number digits (10 digits maximum).

m = Nature of number for charge type. Valid value(s):
APN = Action pointer number.
DNAANI = Called party ANI not included.
DNATANI = Called party ANI; national number.
DSSAN1 = Called party ANI; subscriber number.
NAANI = ANI not available or not provided.
*NATANI = Calling party ANI national number.
SSANI = Calling party ANI; subscriber number.

n = Calling party ID digits (15 digits maximum).

o = Nature of number for calling type. Valid value(s):
  INTL = Unique international number.
  NA = Not applicable or unknown.
  *NAT = Unique national (significant) number.
  NUINTL = Non-unique international number.
  NUNAT = Non-unique national number.
  NUNSSBR = Non-unique subscriber number.
  SSBNBR = Unique subscriber number.
  TESTLN = Test line test code.

**NOTE:** Default values ("*"") do not apply to the generic address list parameter therefore must be set by the user.

p = Presentation restriction indicator. Valid value(s):
  *ALW = Presentation allowed.
  RST = Presentation restricted.
  UNA = Number unavailable.

**NOTE:** Default values ("*"") do not apply to the generic address list parameter therefore must be set by the user.

q = Screening indicator. Valid value(s):
  NETP = Network provided.
  UPNOT = User provided not screened.
  UPPASS = User provided passed screening.

r = Calling party business group ID (range of 0-16777215).

s = Attendant status. Valid value(s):
  ATTEND = Attendant line.
  NOATTEND = No attendant or no indication.

t = Party selector. Valid value(s):
  CGPN = Calling party number.
  RDPN = Redirecting number.

u = Charge party station type number (0-99).

v = Primary carrier ID (4 digits maximum).

w = Primary carrier selection. Valid value(s):
  CALL = Selected carrier identification code presubscribed and input by calling party.
  NCALL = Selected carrier identification code presubscribed and not input by calling party.

RTNOTSUP = Resource type not supported.
SSERVINVK = Supervisor service invoked.
STRCANC = Send to resource canceled.
TASKREF = Task refused.
TMOUT = Timeout.
TMPFAIL = Temporary failure.

\(p^1\)
= Failure cause. Valid value(s):
HIGH = Rate too high.
UNAVAILABLE = Unavailable resource.

\(q^1\)
= Global title address digits (always 10 digits).

\(u^1\)
= Generic name presentation. Valid value(s):
ALW = Presentation allowed.
BLKTGL = Blocking toggle.
INH = Presentation restricted.

\(v^1\)
= Time to wait for a response from the service control point (SCP) (1-10 seconds).

\(w^1\)
= Generic address signal digits (15 digits maximum).

\(x^1\)
= Generic address type of address. Valid value(s):
DIALEDNBR = Dialed number.
DESTNBR = Destination number.
SUPFAILSCR = Supplemental user provided calling address. Failed screening.
SUPNOTSCR = Supplemental user provided calling address. Not screened.
COMPLETNBR = Completion number.

\(y^1\)
= Close cause. Valid value(s):
TERM = Call terminated.
CMPL = Events and reports completed.
UCOMM = Unexpected communication.
ANSW = Called party answered.
CALLFWD = Call forwarded.

\(z^1\)
= Notification indicator. Valid value(s):
NOTIFY = Switch notification message.
REQ = Switch request message.

\(a^2\)
= Busy cause coding standard. Valid value(s):
CCITT = International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) standard.
**NETWK** = Network specific.

b^2 = Busy cause general location. Valid value(s):
- **INTNTWK** = International network.
- **LOCTRL** = Local interface controlled by signaling link.
- **LOCUNKN** = Location unknown.
- **PUBLU** = Public network serving local user.
- **PUBRU** = Public network serving remote user.
- **PVTLU** = Private network serving local user.
- **PVTRU** = Private network serving remote user.
- **TRNTWK** = Transit network.
- **USER** = User.

c^2 = Busy cause value. Valid value(s):
- **ADRINC** = Address incomplete.
- **AUNKPARM** = Parameter non-existent or not implemented - accepted.
- **BCNOAUTH** = Bearer capability not authorized.
- **BCNOIMPL** = Bearer capability not implemented.
- **BCUNAV** = Bearer capability not presently available.
- **CALLABN** = Caller abandon.
- **CALLREJ** = Call rejected.
- **DESTNORTE** = No route to destination.
- **DESTOUT** = Destination out of order.
- **DUNKPARM** = Parameter non-existent or not implemented - discarded.
- **INFODISC** = Access information discarded.
- **INTWK** = Interworking.
- **INVRSP** = Improper caller response.
- **NBRCHG** = Number changed.
- **NOCKT** = No circuit available.
- **NOUSRSP** = No user responding.
- **NRM** = Normal.
- **NRMCLR** = Normal clearing.
- **NSRVOPT** = Service/option not implemented.
- **NTWNORTE** = No route to specified transit network.
- **NTWKOUT** = Reserved for network out of order.
- **PARMINV** = Parameter with invalid coding.
- **PRCLERR** = Protocol error.
- **RDIRCTR** = Redirection counter exceeded.
- **SWCHCONG** = Switching equipment congestion.
- **TMPFAIL** = Temporary failure.
- **RQCHANUNV** = Requested channel not available.
- **RSRC** = Resource unavailable.
- **SRVOPT** = Service/option not available.
- **UNALCNBR** = Unallocated number.
- **UNKMSG** = Msg type non-existent or not implemented.
- **USRALRT** = User alerting, no answer.
- **USRBSY** = User busy.

d^2 = Translation type (range of 0-255).
\[ e \] = AMA measurement start date (month, day, year) in the form mm-dd-yy.

**NOTE:** Year is only the last digit of the year.

\[ f \] = AMA measurement start time (hour, minutes, seconds, tenths of seconds) in the form hh-mm-ss-t.

\[ g \] = AMA measurement connection duration (minutes, seconds, tenths of seconds) in the form mmmmm-ss-t.

\[ h \] = Time guard. Valid value(s):
   - GUARD = Timing guard allowed.
   - NOGUARD = No timing guard.

\[ i \] = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

\[ j \] = Busy type. Valid value(s):
   - OFFRD = Call can be offered.
   - NOTOFFRD = Call cannot be offered.

\[ k \] = Disconnect cause. Valid value(s):
   - FAREND = Far end.

\[ l \] = Dial tone multi-frequency (DTMF) digits detected (4 digits maximum).

### 4. SYSTEM RESPONSE

**NG**

- **EXCEEDED xx DIGIT MAXIMUM** = Too many digits entered. The allowed range for this parameter is 0-xx.
- **EXCEEDED xx DIGIT MAXIMUM FOR SPID** = Too many digits entered for the SPID field for this parameter. The allowed range is 0-xx.
- **INVALID DIGITS** = The entered digits are invalid (0-9, *, and # are allowed).
- **INVALID DN DIGITS** = The entered DN digits are invalid (0-9, *, and # are allowed).
- **OPC IS INVALID** = The entered digits are either invalid (0-9 are allowed), the number of digits entered is incorrect (there must be nine digits), or the point code was not provisioned in the office.
- **xx DIGITS REQUIRED** = This parameter requires xx digits.
- **xx DIGITS REQUIRED FOR DN** = The DN field for this parameter requires xx digits.

**NO**

- **FEATURE NOT AVAILABLE** = The ASP 0.1 feature must be purchased before attempting to set an ASP 0.1 test query parameter.

**OK**

- **Good. The request was accepted.**

**RL**

- **INTERNAL ERROR** = An internal error was encountered and processing could not continue.

3. EXPLANATION OF MESSAGE

Note: An "*" indicates a default value to be used when the value is not set by the user and is not presently set. All fields are given for each parameter even if a particular field has been previously described.

AMAMSMENT = AMA measurement parameter.

a = Directory number.

b = Service profile ID (20 digits maximum).

c = Trunk group ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Private facility ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

- **e** = Bearer capability. Valid value(s):
  - **56KBPS** = 56 kilobits per second.
  - **64KBPS** = 64 kilobits per second.
  - **AUDIO** = 3.1 kHz audio.
  - **SPEECH** = Speech.

- **f** = Called party ID digits (15 digits maximum).

- **g** = Nature of number for called type. Valid value(s):
  - **950** = 950+ call.
  - **CUTTHRU** = No address present cut through to carrier.
  - **INTL** = International number.
  - **INTOPR** = International number, operator requested.
  - **NA** = Not applicable.
  - **NADOPR** = No address present, operator requested.
  - ***NAT** = National (significant) number.
  - **NATOPR** = National number, operator requested.
  - **SSNBR** = Subscriber number.
  - **SSOPR** = Subscriber number, operator requested.
  - **TESTLN** = Test line test code.

- **h** = Numbering plan. Valid value(s):
  - ***ISDN** = ISDN numbering plan.
  - **NA** = Unknown or not applicable.
  - **PRIV** = Private numbering plan.
  
  **Note:** Default values (“**”) do not apply to the generic address list parameter therefore must be set by the user.

- **i** = Called party station type number (0-99).

- **j** = LATA digits (3 digits maximum).

- **k** = Trigger criteria type. Valid value(s):
  - **2X** = nxx.
  - **6X** = nxx-xxxx.
  - **CCNP6X** = Country code npa-nxx-xxxx.
  - **CUACCESS** = Customized access.
  - **FEACT** = Feature activator.
  - **AFR** = Automatic flexible routing.
  - **N11** = n11.
  - **NP0X** = npa-n.
  - **NP1X** = npa-nx.
  - **NP2X** = npa-nxx.
  - **NP3X** = npa-nxx-x.
  - **NP4X** = npa-nxx-xx.
  - **NP5X** = npa-nxx-xxx.
  - **NP6X** = npa-nxx-xxxx.
  - **NPA** = npa.
OCLDPTYBSY = Origination called party busy.
OHIMMED = Off-hook immediate.
OHDELAY = Off-hook delay.
ONOANS = Origination no answer.
SETPRI = Channel setup PRI.
SHRDIO = Shared inter office trunk.
TBUSY = Termination busy.
TNOANS = Termination no answer.
TRMATMPT = Termination attempt.
TRUNKGRP = Trunk group.
VERTSC = Vertical service code.

l = Charge number digits (10 digits maximum).

m = Nature of number for charge type. Valid value(s):
   APN = Action pointer number.
   DNAANI = Called party ANI not included.
   DNATANI = Called party ANI; national number.
   DSSANI = Called party ANI; subscriber number.
   NAANI = ANI not available or not provided.
   *NATANI = Calling party ANI national number.
   SSANI = Calling party ANI; subscriber number.

n = Calling party ID digits (15 digits maximum).
o = Nature of number for calling type. Valid value(s):
   INTL = Unique international number.
   NA = Not applicable or unknown.
   *NAT = Unique national (significant) number.
   NUINTL = Non-unique international number.
   NUNAT = Non-unique national number.
   NUSSNBR = Non-unique subscriber number.
   SSNBR = Unique subscriber number.
   TESTLN = Test line test code.
   Note: Default values (*** ) do not apply to the generic address list parameter therefore must be set by the user.

p = Presentation restriction indicator. Valid value(s):
   *ALW = Presentation allowed.
   RST = Presentation restricted.
   UNA = Number unavailable.
   Note: Default values (*** ) do not apply to the generic address list parameter therefore must be set by the user.

q = Screening indicator. Valid value(s):
   *NETP = Network provided.
   UPNOT = User provided not screened.
   UPPASS = User provided passed screening.
r = Calling party business group ID (range of 0-16777215).

s = Attendant status. Valid value(s):
  ATTEND = Attendant line.
  NOATTEND = No attendant or no indication.

t = Party selector. Valid value(s):
  CGPN = Calling party number.
  RDPN = Redirecting number.

u = Charge party station type number (0-99).

v = Primary carrier ID (4 digits maximum).

w = Primary carrier selection. Valid value(s):
  CALL = Selected carrier identification code presubscribed and input by calling party.
  NCALL = Selected carrier identification code presubscribed and not input by calling party.
  NIND = No indication.
  NKCALL = Selected carrier identification code presubscribed and no indication of whether input by calling party.
  NPRE = Selected carrier identification code not presubscribed and input by calling party.

x = Access code digits (5 digits maximum).

y = Collected address information digits (15 digits maximum).

z = Nature of number for called type. Valid value(s):
  950 = 950+ call.
  CUTTHRU = No address present cut through to carrier.
  INTL = International number.
  INTOPR = International number, operator requested.
  NA = Not applicable.
  NADOPR = No address present, operator requested.
  *NAT = National (significant) number.
  NATOPR = National number, operator requested.
  SSNBR = Subscriber number.
  SSOPR = Subscriber number, operator requested.
  TESTLN = Test line test code.

a = Collected digits (32 digits maximum).

b = Vertical service code digits (10 digits maximum).

c = Traveling class mark digits (2 digits maximum).

d = Original called party ID digits (15 digits maximum).

e = Nature of number for calling type. Valid value(s):
  INTL = Unique international number.
  NA = Not applicable or unknown.
  *NAT = Unique national (significant) number.
NUINTL = Non-unique international number.
NUNAT = Non-unique national number.
NUSSNBR = Non-unique subscriber number.
SSNBR = Unique subscriber number.
TESTLN = Test line test code.

f
  = Redirecting party ID digits (15 digits maximum).

g
  = Original redirecting reason. Valid value(s):
    BSY = User busy.
    NOR = No reply.
    UNC = Unconditional.
    UNK = Unknown or not available.

h
  = Redirecting reason. Valid value(s):
    BSY = User busy.
    NOR = No reply.
    UNC = Unconditional.
    UNK = Unknown or not available.

i
  = Redirection count (value of 0-15 only).

j
  = Year. Valid value(s):
    CURRENT = Current year.
    LAST = Last year.
    NEXT = Next year.

k
  = Month. Valid value(s):
    JAN = January.
    FEB = February.
    MAR = March.
    APR = April.
    MAY = May.
    JUN = June.
    JUL = July.
    AUG = August.
    SEP = September.
    OCT = October.
    NOV = November.
    DEC = December.

l
  = Date (1 - 31).

m
  = Hour (0 - 23).

n
  = Minute. Valid value(s):
    00 = 0 minutes
    15 = 15 minutes
    30 = 30 minutes
45 = 45 minutes

\[a\] = Clear cause. Valid value(s):
ABAN = Abandon.
ABORT = Abort.
CAPFAIL = Capability failure.
CHBUSY = Channels busy.
CLDPTYANS = Called party answered.
FAIL = Failure.
ICRESP = Invalid caller response.
INVCD = Invalid code.
IPTMOUT = IP timeout.
ISDNTO = ISDN timeout.
NORM = Normal.
PROTERR = Protocol error.
RSCAN = Resource canceled.
RSRCNA = Resource not available.
RTNOTSUP = Resource type not supported.
SSERVINVK = Supervisor service invoked.
STRCANC = Send to resource canceled.
TASKREF = Task refused.
TMOUT = Timeout.
TMPFAIL = Temporary failure.

\[b\] = Failure cause. Valid value(s):
HIGH = Rate too high.
UNAVAILABLE = Unavailable resource.

\[c\] = Global title address digits (always 10 digits).

\[d\] = Generic name presentation. Valid value(s):
ALW = Presentation allowed.
BLKTGL = Blocking toggle.
INH = Presentation restricted.

\[e\] = Time to wait for a response from the service control point (SCP) (1-10 seconds).

\[f\] = Generic address signal digits (15 digits maximum).

\[g\] = Generic address type of address. Values are:
DIALEDNBR = Dialed number.
DESTNBR = Destination number.
SUPFAILSCR = Supplemental user provided calling address. Failed screening.
SUPNOTSCR = Supplemental user provided calling address. Not screened.
COMPLETNBR = Completion number.

\[h\] = Close cause. Valid value(s):
TERM = Call terminated.
CMPL = Events and reports completed.
UCOMM = Unexpected communication.
ANSW = Called party answered.
CALLFWD = Call forwarded.

z
= Notification indicator. Valid value(s):
NOTIFY = Switch notification message.
REQ = Switch request message.

a
= Busy cause coding standard. Valid value(s):
CCITT = International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) standard.
NETWK = Network specific.

b
= Busy cause general location. Valid value(s):
INTNTWK = International network.
LOCTRL = Local interface controlled by signaling link.
LOCUNKN = Location unknown.
PUBLU = Public network serving local user.
PUBRU = Public network serving remote user.
PVTLU = Private network serving local user.
PVTTRU = Private network serving remote user.
TRNTWK = Transit network.
USER = User.

c
= Busy cause value. Valid value(s):
ADRINC = Address incomplete.
AUNKPARM = Parameter non-existent or not implemented - accepted.
BCNOAUTH = Bearer capability not authorized.
BCNOIMPL = Bearer capability not implemented.
BCUNAV = Bearer capability not presently available.
CALLABN = Caller abandon.
CALLREJ = Call rejected.
DESTNORTE = No route to destination.
DESTOUT = Destination out of order.
DUNKPARM = Parameter non-existent or not implemented - discarded.
INFODISCD = Access information discarded.
INTWK = Interworking.
INVRSP = Improper caller response.
NBRCHG = Number changed.
NOCKT = No circuit available.
NOUSRSP = No user responding.
NRM = Normal.
NRMCLR = Normal clearing.
NSRVOPT = Service/option not implemented.
NTWKNORTE = No route to specified transit network.
NTWKOUT = Reserved for network out of order.
PARMINV = Parameter with invalid coding.
PRCLERR = Protocol error.
RDIRCTRL = Redirection counter exceeded.
SWCHCONG  = Switching equipment congestion.
TMPFAIL    = Temporary failure.
RQCHANUNV  = Requested channel not available.
RSRC       = Resource unavailable.
SRVOPT     = Service/option not available.
UNALCNBR   = Unallocated number.
UNKMSG     = Msg type non-existent or not implemented.
USRALRT    = User alerting, no answer.
USRBSY     = User busy.

d2        = Translation type (range of 0-255).
e2        = AMA measurement start date (month, day, year) in the form mm-dd-y.

Note: Year is only the last digit of the year.

f2        = AMA measurement start time (hour, minutes, seconds, tenths of seconds) in the form hh-mm-ss-t.
g2        = AMA measurement connection duration (minutes, seconds, tenths of seconds) in the form mmmmm-ss-t.
h2        = Time guard. Valid value(s):
GUARD     = Timing guard allowed.
NOGUARD   = No timing guard.

i2        = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

j2        = Busy type. Valid value(s):
OFFRD     = Call can be offered.
NOTOFFRD  = Call cannot be offered.

k2        = Disconnect cause. Valid value(s):
FAREND    = Far end.

l2        = Dial tone multi-frequency (DTMF) digits detected (4 digits maximum).
m2        = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
n2        = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
o2        = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
p2        = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
q2        = This parameter is associated with a secured or propriety feature. Refer to the
SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\( r^2 \) = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\( s^2 \) = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

\( t^2 \) = Signaling Platform. Valid value(s):
0 = Common Network Interface (CNI) Platform
1 - 192 = Global Switching Module (GSM) Number

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- EXCEEDED \( \times \times \) DIGIT MAXIMUM = Too many digits entered. The allowed range for this parameter is 0-\( \times \times \).
- EXCEEDED \( \times \times \) DIGIT MAXIMUM FOR SPID = Too many digits entered for the SPID field for this parameter. The allowed range is 0-\( \times \times \).
- INVALID DIGITS = The entered digits are invalid (0-9, *, and # are allowed).
- INVALID DN DIGITS = The entered DN digits are invalid (0-9, *, and # are allowed).
- OPC IS INVALID = The entered digits are either invalid (0-9 are allowed), the number of digits entered is incorrect (there must be nine digits), or the point code was not provisioned in the office.
- PLATFORM IS INVALID = The entered signaling platform is invalid (0 or 1 - 192 allowed.)
- \( \times \times \) DIGITS REQUIRED = This parameter requires \( \times \times \) digits.
- \( \times \times \) DIGITS REQUIRED FOR DN = The DN field for this parameter requires \( \times \times \) digits.

NO = The request is not allowed. Valid value(s):
- FEATURE NOT AVAILABLE = The ASP 0.1 feature must be purchased before attempting to set an ASP 0.1 test query parameter. This response can also be received when attempting to set a parameter that is itself restricted by an additional feature purchase.

OK = Good. The request was accepted.

RL = Retry later. Valid value(s):
- INTERNAL ERROR = An internal error was encountered and processing could not continue.

3. EXPLANATION OF MESSAGE

Note: An "*" indicates a default value to be used when the value is not set by the user and is not presently set. All fields are given for each parameter even if a particular field has been previously described.

AMAMSMENT = AMA measurement parameter.

a = Directory number.
b = Service profile ID (20 digits maximum).
c = Trunk group ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Private facility ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

e  = Bearer capability. Valid value(s):
56KBPS  = 56 kilobits per second.
64KBPS  = 64 kilobits per second.
AUDIO   = 3.1 kHz audio.
SPEECH  = Speech.

f  = Called party ID digits (15 digits maximum).

g  = Nature of number for called type. Valid value(s):
950     = 950+ call.
CUTTHRU = No address present cut through to carrier.
INTL    = International number.
INTOPR  = International number, operator requested.
NA      = Not applicable.
NADOPR  = No address present, operator requested.
*NAT    = National (significant) number.
NATOPR  = National number, operator requested.
SSNBR   = Subscriber number.
SSOPR   = Subscriber number, operator requested.
TESTLN  = Test line test code.

h  = Numbering plan. Valid value(s):
*ISDN   = ISDN numbering plan.
NA      = Unknown or not applicable.
PRIV    = Private numbering plan.

Note: Default values ("*") do not apply to the generic address list parameter therefore must be set by the user.

i  = Called party station type number (0-99).

j  = LATA digits (3 digits maximum).

k  = Trigger criteria type. Valid value(s):
2X      = nxx.
6X      = nxx-xxxx.
CCNP6X   = Country code npa-nxx-xxxx.
CUACCESS = Customized access.
FEATACT  = Feature activator.
AFT     = Automatic flexible routing.
N11     = n11.
NP0X    = npa-n.
NP1X    = npa-nx.
NP2X    = npa-nxx.
NP3X    = npa-nxx-x.
NP4X    = npa-nxx-xx.
NP5X    = npa-nxx-xxx.
NP6X    = npa-nxx-xxxx.
NPA     = npa.
OCLDPTYBSY = Origination called party busy.
OHIMMED = Off-hook immediate.
OHDELAY = Off-hook delay.
ONOANS = Origination no answer.
SETPRI = Channel setup PRI.
SHRDIO = Shared inter office trunk.
TBUSY = Termination busy.
TNOANS = Termination no answer.
TRMATMPT = Termination attempt.
TRUNKGRP = Trunk group.
VERTSC = Vertical service code.
ZEROPLUS = Zero plus.
ZEROMINUS = Zero minus.

l = Charge number digits (10 digits maximum).

m = Nature of number for charge type. Valid value(s):
   APN = Action pointer number.
   DNAANI = Called party ANI not included.
   DNATANI = Called party ANI; national number.
   DSSANI = Called party ANI; subscriber number.
   NAANI = ANI not available or not provided.
   *NATANI = Calling party ANI national number.
   SSANI = Calling party ANI; subscriber number.

n = Calling party ID digits (15 digits maximum).

o = Nature of number for calling type. Valid value(s):
   INTL = Unique international number.
   NA = Not applicable or unknown.
   *NAT = Unique national (significant) number.
   NUINTL = Non-unique international number.
   NUNAT = Non-unique national number.
   NUSSNBR = Non-unique subscriber number.
   SSNBR = Unique subscriber number.
   TESTLN = Test line test code.

Note: Default values (**) do not apply to the generic address list parameter therefore
      must be set by the user.

p = Presentation restriction indicator. Valid value(s):
   *ALW = Presentation allowed.
   RST = Presentation restricted.
   UNA = Number unavailable.

Note: Default values (**) do not apply to the generic address list parameter therefore
      must be set by the user.

q = Screening indicator. Valid value(s):
   *NETP = Network provided.
   UPNOT = User provided not screened.
UPPASS = User provided passed screening.

r = Calling party business group ID (range of 0-16777215).

s = Attendant status. Valid value(s):
ATTEND = Attendant line.
NOATTEND = No attendant or no indication.

= Party selector. Valid value(s):
CGPN = Calling party number.
RDPN = Redirecting number.

u = Charge party station type number (0-99).

v = Primary carrier ID (4 digits maximum).

w = Primary carrier selection. Valid value(s):
CALL = Selected carrier identification code presubscribed and input by calling party.
NCALL = Selected carrier identification code presubscribed and not input by calling party.
NIND = No indication.
NKCALL = Selected carrier identification code presubscribed and no indication of whether input by calling party.
NPRE = Selected carrier identification code not presubscribed and input by calling party.

x = Access code digits (5 digits maximum).

y = Collected address information digits (15 digits maximum).

z = Nature of number for called type. Valid value(s):
950 = 950+ call.
CUTTHRU = No address present cut through to carrier.
INTL = International number.
INTOPR = International number, operator requested.
NA = Not applicable.
NADOPR = No address present, operator requested.
*NAT = National (significant) number.
NATOPR = National number, operator requested.
SSNBR = Subscriber number.
SOPR = Subscriber number, operator requested.
TESTLN = Test line test code.

a = Collected digits (32 digits maximum).

b = Vertical service code digits (10 digits maximum).

c = Traveling class mark digits (2 digits maximum).

d = Original called party ID digits (15 digits maximum).

e = Nature of number for calling type. Valid value(s):
INTL = Unique international number.
NA = Not applicable or unknown.
*NAT = Unique national (significant) number.
NUINTL = Non-unique international number.
NUNAT = Non-unique national number.
NUSSNBR = Non-unique subscriber number.
SSNBR = Unique subscriber number.
TESTLN = Test line test code.

f = Redirecting party ID digits (15 digits maximum).

g = Original redirecting reason. Valid value(s):
BSY = User busy.
NOR = No reply.
UNC = Unconditional.
UNK = Unknown or not available.

h = Redirecting reason. Valid value(s):
BSY = User busy.
NOR = No reply.
UNC = Unconditional.
UNK = Unknown or not available.

i = Redirection count (value of 0-15 only).

j = Year. Valid value(s):
CURRENT = Current year.
LAST = Last year.
NEXT = Next year.

k = Month. Valid value(s):
JAN = January.
FEB = February.
MAR = March.
APR = April.
MAY = May.
JUN = June.
JUL = July.
AUG = August.
SEP = September.
OCT = October.
NOV = November.
DEC = December.

l = Date (1 - 31).

m = Hour (0 - 23).

n = Minute. Valid value(s):
00 = 0 minutes
15 = 15 minutes
30 = 30 minutes
45 = 45 minutes

-o1 = Clear cause. Valid value(s):
  ABAN = Abandon.
  ABORT = Abort.
  CAPFAIL = Capability failure.
  CHBUSY = Channels busy.
  CLDPTYANS = Called party answered.
  FAIL = Failure.
  ICRESP = Invalid caller response.
  INVCD = Invalid code.
  IPTMOUT = IP timeout.
  ISDNT0 = ISDN timeout.
  NORM = Normal.
  PROTERR = Protocol error.
  RSCAN = Resource canceled.
  RSRCNA = Resource not available.
  RTNOTSUP = Resource type not supported.
  SSERVINVK = Supervisor service invoked.
  STRCANC = Send to resource canceled.
  TASKREF = Task refused.
  TMOUT = Timeout.
  TMPFAIL = Temporary failure.

-p1 = Failure cause. Valid value(s):
  HIGH = Rate too high.
  UNAVAILABLE = Unavailable resource.

-q1 = Global title address digits (always 10 digits).

-u1 = Generic name presentation. Valid value(s):
  ALW = Presentation allowed.
  BLKTGL = Blocking toggle.
  INH = Presentation restricted.

-v1 = Time to wait for a response from the service control point (SCP) (1-10 seconds).

-w1 = Generic address signal digits (15 digits maximum).

-x1 = Generic address type of address. Values are:
  DIALEDNBR = Dialed number.
  DESTNBR = Destination number.
  SUPFAILSCR = Supplemental user provided calling address. Failed screening.
  SUPNOTSCR = Supplemental user provided calling address. Not screened.
  COMPLETNBR = Completion number.
y\(^1\) = Close cause. Valid value(s):
    TERM = Call terminated.
    CMPL = Events and reports completed.
    UCOMM = Unexpected communication.
    ANSN = Called party answered.
    CALLFWD = Call forwarded.

z\(^1\) = Notification indicator. Valid value(s):
    NOTIFY = Switch notification message.
    REQ = Switch request message.

a\(^2\) = Busy cause coding standard. Valid value(s):
    CCITT = International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) standard.
    NETWK = Network specific.

b\(^2\) = Busy cause general location. Valid value(s):
    INTNTWK = International network.
    LOCTRL = Local interface controlled by signaling link.
    LOCUNKN = Location unknown.
    PUBLU = Public network serving local user.
    PUBRU = Public network serving remote user.
    PVTLU = Private network serving local user.
    PVTRU = Private network serving remote user.
    TRNTWK = Transit network.
    USER = User.

c\(^2\) = Busy cause value. Valid value(s):
    ADRINC = Address incomplete.
    AUNKPARM = Parameter non-existent or not implemented - accepted.
    BCNQAUTH = Bearer capability not authorized.
    BCNOIMPL = Bearer capability not implemented.
    BCUNAV = Bearer capability not presently available.
    CALLABN = Caller abandon.
    CALLREJ = Call rejected.
    DESTNORTE = No route to destination.
    DESTOUT = Destination out of order.
    DUNKPARM = Parameter non-existent or not implemented - discarded.
    INFODISCD = Access information discarded.
    INTWK = Interworking.
    INVRSP = Improper caller response.
    NBRCHG = Number changed.
    NOCKT = No circuit available.
    NOUSRSP = No user responding.
    NRM = Normal.
    NRMCLR = Normal clearing.
    NSRVOPT = Service/option not implemented.
    NTWKNORTE = No route to specified transit network.
    NTWKOUT = Reserved for network out of order.
PARMINV = Parameter with invalid coding.
PRCLERR = Protocol error.
RDICTRX = Redirection counter exceeded.
SWCHCONG = Switching equipment congestion.
TMPFAIL = Temporary failure.
RQCHANUNV = Requested channel not available.
RSRC = Resource unavailable.
SRVOPT = Service/option not available.
UNALCNBR = Unallocated number.
UNKMSG = Msg type non-existent or not implemented.
USRALRT = User alerting, no answer.
USRBAY = User busy.

d\textsuperscript{2} = Translation type (range of 0-255).

e\textsuperscript{2} = AMA measurement start date (month, day, year) in the form mm-dd-y.

Note: Year is only the last digit of the year.

f\textsuperscript{2} = AMA measurement start time (hour, minutes, seconds, tenths of seconds) in the form hh-mm-ss-t.

g\textsuperscript{2} = AMA measurement connection duration (minutes, seconds, tenths of seconds) in the form mmmmm-ss-t.

h\textsuperscript{2} = Time guard. Valid value(s):
GUARD = Timing guard allowed.
NOGUARD = No timing guard.

i\textsuperscript{2} = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendices section of the Input Messages manual.

j\textsuperscript{2} = Busy type. Valid value(s):
OFFRD = Call can be offered.
NOTOFFRD = Call cannot be offered.

k\textsuperscript{2} = Disconnect cause. Valid value(s):
FAREND = Far end.

l\textsuperscript{2} = Dial tone multi-frequency (DTMF) digits detected (4 digits maximum).

m\textsuperscript{2} = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

n\textsuperscript{2} = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

o\textsuperscript{2} = This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.
This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

This parameter is associated with a secured or propriety feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

= Signaling Platform. Valid value(s):
0 = Common Network Interface (CNI) Platform
1 - 192 = Global Switching Module (GSM) Number

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- EXCEEDED xx DIGIT MAXIMUM = Too many digits entered. The allowed range for this parameter is 0-xx.
- EXCEEDED xx DIGIT MAXIMUM FOR SPID = Too many digits entered for the SPID field for this parameter. The allowed range is 0-xx.
- INVALID DIGITS = The entered digits are invalid (0-9, *, and # are allowed).
- INVALID DN DIGITS = The entered DN digits are invalid (0-9, *, and # are allowed).
- OPC IS INVALID = The entered digits are either invalid (0-9 are allowed), the number of digits entered is incorrect (there must be nine digits), or the point code was not provisioned in the office.
- PLATFORM IS INVALID = The entered signaling platform is invalid (0 or 1 - 192 allowed).
- xx DIGITS REQUIRED = This parameter requires xx digits.
- xx DIGITS REQUIRED FOR DN = The DN field for this parameter requires xx digits.

NO = The request is not allowed. Valid value(s):
- FEATURE NOT AVAILABLE = The ASP 0.1 feature must be purchased before attempting to set an ASP 0.1 test query parameter. This response can also be received when attempting to set a parameter that is itself restricted by an additional feature purchase.

OK = Good. The request was accepted.

RL = Retry later. Valid value(s):
- INTERNAL ERROR = An internal error was encountered and processing could not continue.

5. REFERENCES

Input Message(s):
CLR:ASPTQ
OP: ASPTQ
TST: ASPTQ

Output Message(s):
OP: ASPTQ
TST: ASPTQ

Input Appendix(es):
APP: RANGES

Other Manual(s):
235-190-126  Advanced Services Platform
1. PURPOSE

Set the value of a parameter for an advanced services platform (ASP) 0.1 test query message.

Some fields of certain parameters (the digit related parameters with the optional INFO keyword) have default values that are used if the optional field is not set. If the parameter is presently set, the present values of the optional fields are maintained. If the parameter is not presently set, the default values given below are used for the optional fields.

<table>
<thead>
<tr>
<th>Parameter</th>

3. EXPLANATION OF MESSAGE

| AMAMSMENT | = AMA measurement parameter. |
| a | = Directory number. |
| b | = Service profile ID (20 digits maximum). |
| c | = Trunk group ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. |
| d | = Private facility ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. |
| e | = Bearer capability. Valid value(s): |
| 56KBPS | = 56 kilobits per second. |
| 64KBPS | = 64 kilobits per second. |
| AUDIO | = 3.1 kHz audio. |
| SPEECH | = Speech. |
| f | = Called party ID digits (15 digits maximum). |
| g | = Nature of number for called type. Valid value(s): |
| 950 | = 950+ call. |
| CUTTHRU | = No address present cut through to carrier. |
INTL = International number.
INTOPR = International number, operator requested.
NA = Not applicable.
NADOPR = No address present, operator requested.
NAT = National (significant) number (default value).
NATOPR = National number, operator requested.
SSNBR = Subscriber number.
SSOPR = Subscriber number, operator requested.
TESTLN = Test line test code.

\[ \text{h} \] = Numbering plan. Valid value(s):
ISDN = ISDN numbering plan (default value).
NA = Unknown or not applicable.
PRIV = Private numbering plan.

\[ \text{i} \] = Called party station type number (0-99).

\[ \text{j} \] = LATA digits (3 digits maximum).

\[ \text{k} \] = Trigger criteria type. Valid value(s):
2X = nxx.
6X = nxx-xxxx.
CCNP6X = Country code npa-nxx-xxxx.
CUACCESS = Customized access.
FEATACT = Feature activator.
AFR = Automatic flexible routing.
N11 = n11.
NP0X = npa-n.
NP1X = npa-nx.
NP2X = npa-nxx.
NP3X = npa-nxx-x.
NP4X = npa-nxx-xx.
NP5X = npa-nxx-xxx.
NP6X = npa-nxx-xxxx.
NPA = npa.
OCLDPTYBSY = Origination called party busy.
OHIMMED = Off-hook immediate.
OHDELAY = Off-hook delay.
ONOANS = Origination no answer.
SETPRI = Channel setup PRI.
SHRDIO = Shared inter office trunk.
TBUSY = Termination busy.
TNOANS = Termination no answer.
TRMATMPT = Termination attempt.
TRUNKGRP = Trunk group.
VERISC = Vertical service code.
ZEROMINUS = Zero minus.
ZEROPLUS = Zero plus.

\[ \text{l} \] = Charge number digits (10 digits maximum).
m = Nature of number for charge type. Valid value(s):
   APN = Action pointer number.
   DNAANI = Called party ANI not included.
   DNATANI = Called party ANI; national number.
   DSSANI = Called party ANI; subscriber number.
   NAANI = ANI not available or not provided.
   NATANI = Calling party ANI national number (default value).
   SSANI = Calling party ANI; subscriber number.

n = Calling party ID digits (15 digits maximum).

o = Nature of number for calling type. Valid value(s):
   INTL = Unique international number.
   NA = Not applicable or unknown.
   NAT = Unique national (significant) number (default value).
   NUINTL = Non-unique international number.
   NUNAT = Non-unique national number.
   NUSSNBR = Non-unique subscriber number.
   SSNBR = Unique subscriber number.
   TESTLN = Test line test code.

p = Presentation restriction indicator. Valid value(s):
   ALW = Presentation allowed (default value).
   RST = Presentation restricted.
   UNA = Number unavailable.

q = Screening indicator. Valid value(s):
   NETP = Network provided (default value).
   UPNOT = User provided not screened.
   UPPASS = User provided passed screening.

r = Calling party business group ID (range of 0-16777215).

s = Attendant status. Valid value(s):
   ATTEND = Attendant line.
   NOATTEND = No attendant or no indication.

t = Party selector. Valid value(s):
   CGPN = Calling party number.
   RDPN = Redirecting number.

u = Charge party station type number (0-99).

v = Primary carrier ID (4 digits maximum).

w = Primary carrier selection. Valid value(s):
   CALL = Selected carrier identification code presubscribed and input by calling party.
   NCALL = Selected carrier identification code presubscribed and not input by calling party.
NIND  = No indication.
NKCALL  = Selected carrier identification code presubscribed and no indication of whether input by calling party.
NPRE  = Selected carrier identification code not presubscribed and input by calling party.

x  = Access code digits (5 digits maximum).
y  = Collected address information digits (15 digits maximum).
z  = Nature of number for called type. Valid value(s):
   950  = 950+ call.
   CUTTHRU  = No address present cut through to carrier.
   INTL  = International number.
   INTOPR  = International number, operator requested.
   NA  = Not applicable.
   NADOPR  = No address present, operator requested.
   NAT  = National (significant) number (default value).
   NATOPR  = National number, operator requested.
   SSNBR  = Subscriber number.
   SSOPR  = Subscriber number, operator requested.
   TESTLN  = Test line test code.

a\l  = Collected digits (32 digits maximum). (default value)
b\l  = Vertical service code digits (10 digits maximum).
c\l  = Traveling class mark digits (2 digits maximum).
d\l  = Original called party ID digits (15 digits maximum).
e\l  = Nature of number for calling type. Valid value(s):
   INTL  = Unique international number.
   NA  = Not applicable or unknown.
   NAT  = Unique national (significant) number (default value).
   NUINTL  = Non-unique international number.
   NUNAT  = Non-unique national number.
   NUSSNBR  = Non-unique subscriber number.
   SSNBR  = Unique subscriber number.
   TESTLN  = Test line test code.

f\l  = Redirecting party ID digits (15 digits maximum).
g\l  = Original redirecting reason. Valid value(s):
   BSY  = User busy.
   NOR  = No reply.
   UNC  = Unconditional.
   UNK  = Unknown or not available.

h\l  = Redirecting reason. Valid value(s):
   BSY  = User busy.
NOR = No reply.
UNC = Unconditional.
UNK = Unknown or not available.

\( i^1 \) = Redirection count (value of 0-15 only).

\( j^1 \) = Year. Valid value(s):
CURRENT = Current year.
LAST = Last year.
NEXT = Next year.

\( k^1 \) = Month. Valid value(s):
JAN = January.
FEB = February.
MAR = March.
APR = April.
MAY = May.
JUN = June.
JUL = July.
AUG = August.
SEP = September.
OCT = October.
NOV = November.
DEC = December.

\( l^1 \) = Date (1 - 31).

\( m^1 \) = Hour (0 - 23).

\( n^1 \) = Minute. Valid value(s):
00 = 0 minutes
15 = 15 minutes
30 = 30 minutes
45 = 45 minutes

\( o^1 \) = Clear cause. Valid value(s):
ABAN = Abandon.
ABORT = Abort.
CAPFAIL = Capability failure.
CHBUSY = Channels busy.
CLDPTYANS = Called party answered.
FAIL = Failure.
ICRESP = Invalid caller response.
INVCD = Invalid code.
IPTMOUT = IP timeout.
ISDNTO = ISDN timeout.
NORM = Normal.
PROTERR = Protocol error.
RSCAN = Resource canceled.
RSRCNA = Resource not available.
RTNOTSUP = Resource type not supported.
SSERVINVK = Supervisor service invoked.
STRCANC = Send to resource canceled.
TASKREF = Task refused.
TMOUT = Timeout.
TMPFAIL = Temporary failure.

p\textsuperscript{1} = Failure cause. Valid value(s):
HIGH = Rate too high.
UNAVAILABLE = Unavailable resource.

q\textsuperscript{1} = Global title address digits (always 10 digits).

u\textsuperscript{1} = Generic name presentation. Valid value(s):
ALW = Presentation allowed.
BLKTGL = Blocking toggle.
INH = Presentation restricted.

v\textsuperscript{1} = Time to wait for a response from the service control point (SCP) (1-10 seconds).

w\textsuperscript{1} = Generic address signal digits (15 digits maximum).

x\textsuperscript{1} = Generic address type of address. Valid value(s):
DIALEDNBR = Dialed number.
DESTNBR = Destination number.
SUPFAILSCR = Supplemental user provided calling address. Failed screening.
SUPNOTSCR = Supplemental user provided calling address. Not screened.
COMPLETNBR = Completion number.

y\textsuperscript{1} = Close cause. Valid value(s):
TERM = Call terminated.
CMPL = Events and reports completed.
UCOMM = Unexpected communication.
ANSW = Called party answered.
CALLFWD = Call forwarded.

z\textsuperscript{1} = Notification indicator. Valid value(s):
NOTIFY = Switch notification message.
REQ = Switch request message.

a\textsuperscript{2} = Busy cause coding standard. Valid value(s):
CCITT = International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) standard.
NETWK = Network specific.

b\textsuperscript{2} = Busy cause general location. Valid value(s):
INTNTWK = International network.
LOCTRL = Local interface controlled by signaling link.
LOCUNKN = Location unknown.
PUBLU = Public network serving local user.
PUBRU = Public network serving remote user.
PVTLU = Private network serving local user.
PVTTRU = Private network serving remote user.
TRNTWK = Transit network.
USER = User.

= Busy cause value. Valid value(s):
ADRINC = Address incomplete.
AUNKPARM = Parameter non-existent or not implemented - accepted.
BCNOAUTH = Bearer capability not authorized.
BCNOIMPL = Bearer capability not implemented.
BCUNAV = Bearer capability not presently available.
CALLABN = Caller abandon.
CALLREJ = Call rejected.
DESTNORTE = No route to destination.
DESTOUT = Destination out of order.
DUNKPARM = Parameter non-existent or not implemented - discarded.
INFODISCD = Access information discarded.
INTWK = Interworking.
INVRSP = Improper caller response.
NBRCHG = Number changed.
NOCKT = No circuit available.
NOUSRSP = No user responding.
NRM = Normal.
NRMCLR = Normal clearing.
NSRVOPT = Service/option not implemented.
NTWKNorTE = No route to specified transit network.
NTWKOUT = Reserved for network out of order.
PARMINV = Parameter with invalid coding.
PRCLERR = Protocol error.
RDIRCTRX = Redirection counter exceeded.
SWCHCONG = Switching equipment congestion.
TMPFAIL = Temporary failure.
RQCHANUNV = Requested channel not available.
RSRC = Resource unavailable.
SRVOPT = Service/option not available.
UNALCNBR = Unallocated number.
UNKMSG = Msg type non-existent or not implemented.
USRALRT = User alerting, no answer.
USRBSY = User busy.

= Translation type.

= AMA measurement start date (month, day, year) in the form mm-dd-y.

NOTE: Year is only the last digit of the year.
= AMA measurement start time (hour, minutes, seconds, tenths of seconds) in the form hh-mm-ss-t.

= AMA measurement connection duration (minutes, seconds, tenths of seconds) in the form mmmm-ss-t.

= Time guard. Valid value(s):
  GUARD = Timing guard allowed.
  NOGUARD = No timing guard.

= Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

= Busy type. Valid value(s):
  OFFRD = Call can be offered.
  NOTOFFRD = Call cannot be offered.

= Disconnect cause. Valid value(s):
  FAREND = Far end.

= Dial tone multi-frequency (DTMF) digits detected (4 digits maximum).

= Assignment authority.

= Access type.

= LANI 10 digit charge number.

= Nature of number for LANI. Valid value(s):
  APN = Action pointer number.
  INTL = Unique international number.
  NA = Not applicable or unknown.
  NAT = Unique national (significant) number (default value).
  NUINTL = Non-unique international number.
  NUNAT = Non-unique national number.
  NUSSNBR = Non-unique subscriber number.
  SSNBR = Unique subscriber number.
  TESTLN = Test line test code.

= Signaling platform. Valid value(s):
  0 = Common network interface (CNI) platform
  1 - 192 = Global switching module (GSM) number.

= OLI screen value.

4. SYSTEM RESPONSE

NG = No good. May also include:
  - EXCEEDEX xx DIGIT MAXIMUM = Too many digits entered. The allowed range for this
parameter is 0-xx.
- EXCEEDED xx DIGIT MAXIMUM FOR SPID = Too many digits entered for the SPID field for this parameter. The allowed range is 0-xx.
- INVALID DIGITS = The entered digits are invalid (0-9, *, and # are allowed).
- INVALID DN DIGITS = The entered DN digits are invalid (0-9, *, and # are allowed).
- OPC IS INVALID = The entered digits are either invalid (0-9 are allowed), the number of digits entered is incorrect (there must be nine digits), or the point code was not provisioned in the office.
- PLATFORM IS INVALID = The entered signaling platform is invalid (0 or 1 - 192 allowed).
- xx DIGITS REQUIRED = This parameter requires xx digits.
- xx DIGITS REQUIRED FOR DN = The DN field for this parameter requires xx digits.

NO = The request is not allowed. May also include:
- FEATURE NOT AVAILABLE = The ASP 0.1 feature must be purchased before attempting to set an ASP 0.1 test query parameter. This response can also be received when attempting to set a parameter that is itself restricted by an additional feature purchase.

OK = Good. The request was accepted.

RL = Retry later. May also include:
- INTERNAL ERROR = An internal error was encountered and processing could not continue.

Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests to set SODD Audit to run Full, Incremental or sub audit(s) during execution.

2. FORMAT

SET:AUD=SODD,AUDIT=a;

3. EXPLANATION OF MESSAGE

a = Sub audit for the full audit to be set. Valid value(s):
   BOOT  = Boot Critical sub audit.
   BRCES = BRCES sub audit.
   CCS   = CCS sub audit.
   DIGIT = Digit Analysis sub audit.
   EQUIP = Equipment sub audit.
   FULL  = Full audit.
   GLOBAL = Global Parameters sub audit.
   INCR  = Incremental audit.
   ISDN  = ISDN sub audit.
   LINE  = Line sub audit.
   MISC  = Miscellaneous sub audit.
   MLHG  = MLHG sub audit.
   PSMLHG = Packet Switching MLHG sub audit.
   OSPS  = OSPS sub audit.
   TRUNK = Trunk sub audit.
   PSTRUNK = Packet Switching Trunk sub audit.

4. SYSTEM RESPONSE

PF = Printout follows.

- FULL AUDIT IS CURRENTLY RUNNING. ENTER "STP:AUD=SODD,FULL" TO STOP THE AUDIT." The input request is not valid because the SODD Audit is currently running.

Other Manual(s):

235-105-210 *Routine Operations and Maintenance*
SET:BACKOUT

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that uncommitted application recent changes be backed out. These backouts are from the administrative module (AM) and/or one or more switching modules (SMs) or a selected communication module processor (CMP) on a bootstrap (pump) of that processor. This is accomplished by unconditionally pumping the RC memory and inhibiting RC roll-forward.

Normally, when a processor (AM, SM or CMP) undergoes a high-level initialization (selective initialization or full initialization), recently applied recent changes are retained in office-dependent data (ODD). This input message causes recent changes to be backed out from memory on the next high-level initialization and all thereafter until manually cancelled. This procedure may be necessary if it is suspected that a recent change to a processor is linked to a performance problem of that processor. The backout condition will remain in effect through all processor initializations (with the exception of DMERT LVL4 initialization) until manually cleared by a CLR:BACKOUT input message or the related emergency action interface (EAI) parameter (AM bootstraps only). Format 1 requests that uncommitted recent changes in the AM be backed out. Format 2 requests that the same activity be performed on a CMP, and optionally the AM. Format 3 requests backing out uncommitted recent changes on one or more SMs, and other optional processors.

WARNING: Recent changes that have been applied since the last backout will not be included on one or more processors. Permitting backouts of selected processors may introduce inconsistencies between processors which can have adverse effects.

2. FORMAT

[2] SET:BACKOUT:RC,CMP=a, {PRIM|MATE}[,AM];
[3] SET:BACKOUT,RC,SM=b[&c][,LSM][,HSM][,ORM][,TRM][,DRM][,AM][,CMP=a, {PRIM|MATE}];

3. EXPLANATION OF MESSAGE

AM = Apply the backout to the AM.
HSM = Select switching modules of the type host switching module (HSM).
LSM = Select switching modules of the type local switching module (LSM).
MATE = Mate CMP.
ORM = Select modules of the type optically remote switching module (ORM).
PRIM = Primary CMP.
RC = Set the named processor(s) to back out all uncommitted recent changes on subsequent AM bootstraps and/or SM pumps.

RSM = Select switching modules of the type remote switching module (RSM).

SM = Apply the backout to one or more SMs.

TRM = Select modules of the type two mile optically remote switching module (TRM).

DRM = Select modules of the type distinctive remote reliable switching module (DRM).

a = CMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = SM number or lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Upper limit of the range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because:
- The processor type was invalid or missing (AM, SM or CMP).
- An illegal SM number or range was specified.
- An illegal CMP number was specified.

OK = Good. The message was accepted and the action completed.

1850,1851 (CMP INH & RCVRY CNTL)
SET:BKUP

Software Release: 5E15 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Request a file to be created that specifies the options for an automated system backup. This file is referred to as a backup option file and is created in the /no5text/bkup/autobkup directory. Backup option files will remain in existence until manually removed from the /no5text/bkup/autobkup directory. The backup option files are used as input to the automated system backup process after backups are scheduled with SCHED:BKUP.

Format 1 is used to specify the options for a full office backup written at the beginning of tape (BOT).

Format 2 is used to specify the options for a backup appended after an existing tape volume. This format allows volumes to be appended within or after the last session. The entire last session or a subset of volumes within the last session can be overwritten.

Format 3 is used to specify the options for a backup written at the end of tape data (EOD).

Format 4 is used to specify the options for a backup written to a system backup disk (MHD 14 or MHD 15) or base disk pair (MHD 0 and MHD 1) backup partitions.

2. FORMAT

[1] SET:BKUP:BOT:DATA, DEST="a", [FN="f"], [TPSIZE=g];

    .. .SESS=d, VOL=e[-e[-e[...]]], [FN="f"], [TPSIZE=g];

    .. .[, FN="f"], [TPSIZE=g];

3. EXPLANATION OF MESSAGE

a = Destination device. Valid value(s):
   pathname = Tape drive special device file (such as, /dev/mt08). Only valid when used with a backup to tape message format.
   MHD14 = System backup disk MHD 14. Only valid when used with the backup to disk message format.
   MHD15 = System backup disk MHD 15. Only valid when used with the backup to disk message format.
   BKPTN = Base disk pair (MHD 0/MHD 1) backup partitions. Only valid when used with the backup to disk message format.

b = Tape positioning session number (1-9). Used with the tape positioning volume number to specify the location on the tape to append volumes that will be backed up. The existing tape session and
volume numbers can be determined from the DUMP:BKTAPE output message.

The tape positioning session must be set to the number of the last session or the number of the last session minus one. It is invalid to specify any other session number. This ensures that only the last session on a tape can be overwitten with new data.

To append volumes within the last session or create a new session, the tape positioning session number must be set to the number of the last session on the tape.

To overwrite the entire last session, the tape positioning session number must be set to the number of the last session on the tape minus one.

c
= Tape positioning logical volume number. Valid value(s):
  0  = TOP.
  1  = AMTEXT.
  2  = AMODD.
  3  = SMTEXT.
  4  = SMODD1.
  5  = SMODD2.
  6  = SMODD3.
  7  = SMODD4.
  8  = SMODD5.
  9  = SMODD6.

Used with the tape positioning session number to specify the location on the tape to append volumes that will be backed up. Volumes to be backed up will be written onto the tape after the volume identified by the tape positioning session and volume numbers. All existing volumes following the volume identified by the tape positioning session and volume numbers will be overwritten. The existing tape session and volume numbers can be determined from the DUMP:BKTAPE output message.

To append volumes within the last session, the tape positioning volume number must be less than the numbers corresponding to the volumes to be backed up. This is required to keep the volume numbers in ascending order within a session.

It is invalid to append volumes so that a portion of the SMODD volumes are overwritten. To overwrite all of the SMODD volumes in the last session, the tape positioning volume number must be equal to 4.

To create a new session or overwrite all existing volumes in the last session, the tape positioning volume number must be equal to the last volume within the session specified as the tape positioning session ‘b’.

d
= Session number assigned to new volumes written to tape. The first session on a tape must be numbered 1 and increased sequentially thereafter with a maximum value of 9.

To append volumes within the last session on the tape or overwrite all existing volumes in the last session, the session number must be equal to the number of the last session on the tape.

To create a new session on the tape, the session number must be equal to the last session number on the tape plus one.

e
= A dash separated list of identifiers for volumes that will be backed up to tape. Valid value(s): ALL
  = Full office backup includes AMTEXT, AMODD, SMTEXT, SMODD. Logical
volume numbers 1-9.

AMTEXT = Logical volume number 1.
AMODD = Logical volume number 2.
SMTEXT = Logical volume number 3.

Volumes must be written in ascending order within a session and are allowed to be skipped within a session.

f = Name of the backup option file that will be created. This variable must not be specified as a full or relative pathname.

This file will be created in the /no5text/bkup/autobkup directory and will remain in existence until manually removed. An existing backup option file cannot be over written. If a file name is not specified, the default file name, bkup.opts, will be used.

g = Length in meters of the DAT mounted on the specified destination tape drive. Valid lengths are 90, 120, 125 and 150 meters.

A default length of 90 meters will be used if the tape length is not specified.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the SET:BKUP output message.

116 (MISCELLANEOUS)
SET:CGAP-A

Software Release: 5E14 only
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a call gapping (CGAP) code control be set to restrict traffic.

Format 1 introduces or modifies a code control for all calls to a specified destination code, regardless of access prefix.

Format 2 introduces or modifies a code control for all calls to a specified access prefix, regardless of destination code.

Format 3 introduces or modifies a code control for all calls to a specified destination code and access prefix.

Note: For the Autoplex® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

[1] SET:CGAP, CODE=a, DOM={ALL|f}, GAP=c[,ANN=d];
[2] SET:CGAP, PREFIX=b, DOM={ALL|f}, GAP=c[,ANN=d];
[3] SET:CGAP, CODE=a, PREFIX=b, DOM={ALL|f}, GAP=c[,ANN=d];

3. EXPLANATION OF MESSAGE

a = Destination code (often referred to as called number). This string may contain up to 18 digits. (Valid characters 0-9, "+", "; the quotation marks are required where shown). The string is typically of the form NPANXXXXXX where NPA is the area code, NXX is the office code and XXXX is the last four digits of the number. Any of the leftmost subsets, however, can be entered (such as, a code control can be set on the NPA, the first digit of the NPA, the area code followed by two digits of the office code NPANX, and so forth.).

Note: Code controls are usually more effective when set in the offices surrounding the office where the controlled number (NPANXXXXXX) physically resides.

b = The access prefix (0 - 9999). The access prefix only applies to feature group D carriers.

c = Gap interval. Maximum rate at which calls may be released towards the specified destination code.

Note: The gap is randomized by +- 50%, to prevent bursts or pulses of traffic (except for gaps 0 and INF).

Valid value(s):
0 = Apply no control, but collect measurements.
PT1 = 0.10 sec.
PT12 = 0.12 sec.
PT14 = 0.14 sec.
PT16 = 0.16 sec.
PT18 = 0.18 sec.
PT2  = 0.20 sec.
PT25 = 0.25 sec.
PT36 = 0.36 sec.
PT5  = 0.50 sec.
PT6  = 0.60 sec.
PT75 = 0.75 sec.
1   = 1.0  sec.
1PT6 = 1.6  sec.
2   = 2.0  sec.
3   = 3.0  sec.
5   = 5.0  sec.
6   = 6.0  sec.
9   = 9.0  sec.
10  = 10.0 sec.
12  = 12.0 sec.
15  = 15.0 sec.
20  = 20.0 sec.
30  = 30.0 sec.
45  = 45.0 sec.
60  = 60.0 sec.
75  = 75.0 sec.
100 = 100.0 sec.
120 = 120.0 sec.
150 = 150.0 sec.
300 = 300.0 sec.
450 = 450.0 sec.
600 = 600.0 sec.
INF = Infinity, block all calls.

d = Announcement (ANN) treatment if blocking occurs. Valid value(s):
EANN1 = Emergency announcement 1.
EANN2 = Emergency announcement 2.
NCA  = No circuit announcement. Default.
Note: This is different from no announcement.

f = Switching domain list (1 - 99). The switching domain is equivalent to the digit analysis selector (DAS).
ALL  = Apply code control to all domains.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the SET:CGAP output message.
RL  = Retry later. May also include:

109 (OVERLOAD)
130 (NM EXCEPTION)
SET:CLK-5

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the system clock be set to the specified date and time, or that the system time be adjusted by a small amount.

Format 1 sets the system clock to the specified date and time. If a date is not specified, the current date is used. Format 2 increases the system time by up to one hour. Format 3 decreases the system time by up to one hour.

Note: Changing the system clock impacts the scheduling time of some tasks. Depending on the actual time transition and a task's scheduled execution time, setting the system clock backward may delay some tasks, while setting the system clock ahead may cause some tasks to run immediately.

2. FORMAT

[2] SET:CLK,INCREASE=g;
[3] SET:CLK,DECREASE=g;

3. EXPLANATION OF MESSAGE

a = Date, in the form month-day-year.
b = Time, in the form hour-minute-second.
g = Offset from current time, in seconds (0-3600).

4. SYSTEM RESPONSE

NG = No good. Semantic checks on the input values failed, causing the request to be rejected. May also include:
- BAD INPUT DATA = An input value either conflicted with another input value or was out of range.
- INVALID HOUR FOR DST = In offices that honor daylight savings time (DST), the new system time fell in the non-existent hour between 02:00:00 and 02:59:59 on the first Sunday in April.
- NEW TIME EXCEEDS INTERNAL LIMIT = The new system time overflowed the internal time structure.

PF = Printout follows. The request was accepted. Followed by the SET:CLK-5 output message.

RL = Retry later. May also include:
- CANNOT APPLY OFFSET WHILE TIME IS BAD = A request to increase or decrease the
system time by some offset value was denied because the existing system time was invalid.

Input Message(s):

OP : CLK

Output Message(s):

OP : CLK
SET : CLK-5
SET:CONFIRM

Software Release: 5E14 and later
Command Group: ADMIN
Application: 5
Type: Input

1. PURPOSE

Request to set the text and/or display status of a user-definable confirmation prompt. A user-definable confirmation prompt can only be set for page pokes which have existing system-defined default confirmation prompts. A user-definable confirmation prompt can have up to three lines of text.

2. FORMAT

SET:CONFIRM,PAGE=a,POKE=b{[,LINE1|LINE2|LINE3]="c"}[,DISPLAY[=d]]

3. EXPLANATION OF MESSAGE

a = MCC page number. Refer to the E-CONF-POKES appendix in the Appendixes section of the Input Messages manual.

b = Command poke number. Refer to the E-CONF-POKES appendix in the Appendixes section of the Input Messages manual.

c = User-definable text for a line of the confirmation prompt. Only one line may be requested at a time. May be used with or without variable 'd'. Maximum line length is 65 characters.

d = Display status. May be used with or without variable 'c' but, if used must be the last item in the message line. Valid value(s):
  N = If used, no confirmation page will appear and only the system-defined default confirmation prompt will appear.
  Y = If used when the user enters the specified page and poke combination, a confirmation page (that is, a page showing the user-definable text) will be displayed at the requesting terminal, followed by the system-defined default confirmation prompt.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
  - INTERNAL ERROR (CREAT FAIL1) = Failed to create confirmation prompt file /no5text/hm/.enhconf.
  - INTERNAL ERROR (MALLOC FAIL1) = Failed to allocate space in memory. Try repeating the request.
  - INTERNAL ERROR (OPEN FAIL1) = Failed to open confirmation prompt file /no5text/hm/.enhconf.
  - INTERNAL ERROR (READ FAIL1) = Failed to read confirmation prompt file /no5text/hm/.enhconf.
  - INTERNAL ERROR (SEEK FAIL1) = Failed to seek to appropriate position in confirmation prompt file /no5text/hm/.enhconf.
  - INTERNAL ERROR (WRITE FAIL1) = Failed to write to confirmation prompt file
/no5text/hm/.enhconf.
- INVALID PAGE AND POKE COMBINATION = The page and poke combination is not valid, or is a combination which does not have a default confirmation prompt.
- SPECIAL FEATURE NOT AVAILABLE = Secured feature bit is not turned on.
- NO LINE OR DISPLAY INPUT

OK = The input message syntax is correct and the input message has been accepted and will be processed.

235-190-115  Local and Toll System Features
235-105-110  System Maintenance Requirements and Tools
SET:COT

Software Release: 5E14 and later
Command Group: TRACE
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the mode and/or priority of customer-originated traces (COT) be changed. This input message allows
the device for COT messages to be dedicated to tty45 (MODE=DEDICATED), or to be set to what is specified by
the classdef (MODE=NONDEDICATED), and will allow the priority of the messages going to the classdef(160) to be
changed.

Format 1 is used to toggle between DEDICATED and NONDEDICATED mode without changing the priority.

Format 2 is used to change only the priority of the messages to the classdef, but not the mode.

Format 3 is used to change both the mode and priority.

WARNING: Incorrect use of this message could result in COT messages' being lost. If dedicated mode is chosen, there MUST be a dedicated tty45 available. If nondedicated mode is chosen then there must be writable devices listed on the appropriate classdef. No warning message will be printed if either of the above rules is violated, and no warning message will be printed if any COT messages are lost. To determine whether there is an available tty45, look at the equipment configuration database (ECD). Poke 199 from the Master Control Center (MCC) page. Look at the UCB and give a key of TTY45. The information will then be displayed. Verify that the TTY45 is active. To see which devices are on the classdef, look at classdef 160 from the ECD.

DEDICATED mode enables special monitoring of TTY45. In the event that a COT message could not be sent to TTY45, (that is, TTY45 is out-of-service) it will be buffered until TTY45 is restored. This ensures that TTY45 will always get the COT messages. The buffer will hold 300 COT messages. Once 300 COT messages are buffered COT is internally disabled, and will not be re-enabled until the COT buffer is emptied to at least 285. Alarm messages are sent to the ROP when the COT buffer reaches 50% and 100% full. While in DEDICATED mode, each time an attempt is made to send a message to TTY45, the same message is sent to any and all devices specified on the classdef form 160. While in DEDICATED mode TTY45 must be equipped or COT will be internally disabled. Equipped is defined to be ACTIVE, STANDBY, INIT, or OOS. NONDEDICATED mode does not use the special monitoring, and only sends the COT messages to all devices specified on classdef form 160. When using this mode it is the user's responsibility to make sure that the proper devices are entered on classdef form 160. If no devices are specified on that form, then the COT messages will be lost.

Setting up the classdef form applies to both DEDICATED and NONDEDICATED modes, however, DEDICATED mode does not need to specify anything on the classdef form, since the messages will always go to TTY45. When using NONDEDICATED mode, special care needs to be taken when setting up the classdef form. The classdef form will accept any logical device name. That device could be an SCCS link, the ROP, the MCC, any TTY, or even a log file. The logical device name is the same name used as a key for the ECD device form. A typical classdef form for COT might specify that COT messages should go to the SCCS, the ROP, and a COT log file. The COT log file would be defined on the device form in the ECD. Note that the name of the COT log file must not conflict with the COT buffer which is /log/COTbuffer. If a device on the classdef form is OOS, or has reached its message buffer limit, then the message destined for that device is forwarded to the alternate device specified for that device. If no alternate device was specified, then the message for that device is lost. Alternate devices are specified on the device form. In order to achieve a high reliability for NONDEDICATED mode, we strongly recommend defining
alternate devices. Changing the mode is rare event. It should be done when COT is installed in the office. If DEDICATED mode is normally used, changing the mode to NONDEDICATED may be useful during usually long outages of TTY45. DEDICATED mode offers the highest reliability against lost COT messages.

However, the buffer size is limited to 300 COT messages. If there is a prolonged outage of TTY45, the user may choose to temporarily change to NONDEDICATED mode operation. This would keep COT enabled since the COT buffer is not used in NONDEDICATED mode. Note that when the mode is switched to NONDEDICATED, any messages in the COT buffer are forwarded to the classdef form 160, and the buffer cleared. If the buffer was full, and COT was disabled, COT would be re-enabled. Priority is used in conjunction with messages that are sent to the classdef form. If a device specified on the classdef form uses a priority queue, then this priority is used to determine the messages placement in the queue. The priority is set to 4 when COT is installed in the office. If a device does not use a priority queue, but rather uses FIFO, the priority has no effect.

2. FORMAT

[2] SET:COT,PRIORITY=b;

3. EXPLANATION OF MESSAGE

DEDICATED = Allow the sending of COT messages to the dedicated tty45 device (as well as to anything listed on the classdef). This mode is desired because up to 300 COT messages can be buffered if the tty45 temporarily goes down. If this mode is chosen then there must exist a dedicated tty45 device.

NONDEDICATED = Inhibit the sending of COT messages to the dedicated tty45, and send them to what is defined in the classdef. If no dedicated tty45 is available, then this mode must be chosen. If this mode is chosen then there MUST be writable devices listed on the classdef. No warning message will appear if there are no devices on the classdef.

b = Priority of the COT messages. A number from 0 (lowest) to 5. This priority determines how important it is that the COT messages be printed. If many messages are sent to a device, and the priority is not very high for the COT message, it may not be printed.

4. SYSTEM RESPONSE

NA = No acknowledgement. The COT process is too busy to handle the request. No changes have been made. Retry the input message later.

PF = Printout follows. Followed by the OP:COT-STATUS output message showing the status and priority set by this message.

5. REFERENCES

Input Message(s):

   OP:COT-STATUS

Output Message(s):
SET:DCC

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that a destination code cancellation (DCC) control to be set or modified to restrict traffic to a specified destination code. The DCC control is initiated or modified for routine or all levels of precedence.

This input message is used only in the defense switched network (DSN).

2. FORMAT

SET:DCC, CODE=a, GAP=b, TRAFFIC=c [, ANN=d ];

3. EXPLANATION OF MESSAGE

a  = Destination code (up to 15 characters; valid characters 0-9). The digits entered may be on the form of NYXNNXXXXX, where NYX is the area code, NNX is the office code, and XXXX is the line number. However, any of the left-most subsets of NYXNNXXXXX (such as, N, NY, NYX, NYXN, NYXNN, NYXNNX, NYXNNXX) can be entered as the control code.

b  = Gap interval. Valid value(s):
   0    = No control but collect measurements.
   PT1  = 0.10 sec.
   PT12 = 0.12 sec.
   PT14 = 0.14 sec.
   PT16 = 0.16 sec.
   PT18 = 0.18 sec.
   PT25 = 0.25 sec.
   PT36 = 0.36 sec.
   PT5  = 0.50 sec.
   PT6  = 0.6 sec.
   PT75 = 0.75 sec.
   1    = 1.0 sec.
   1PT6 = 1.6 sec.
   2    = 2.0 sec.
   3    = 3.0 sec.
   2    = 2.0 sec.
   5    = 5.0 sec.
   6    = 6.0 sec.
   9    = 9.0 sec.
   10   = 10.0 sec.
   12   = 12.0 sec.
   15   = 15.0 sec.
   20   = 20.0 sec.
   30   = 30.0 sec.
   45   = 45.0 sec.
   60   = 60.0 sec.
   75   = 75.0 sec.
100 = 100.0 sec.
120 = 120.0 sec.
150 = 150.0 sec.
300 = 300.0 sec.
450 = 450.0 sec.
600 = 600.0 sec.
INF = Infinity, all calls blocked.

c = Traffic type subject to the control. Valid value(s):
ALL = All levels of precedence, for example, flash override, flash, immediate, priority, and routine.
RTN = Routine traffic only.

d = Announcement treatment if blocking occurs. Valid value(s):
EANN1 = Emergency announcement 1.
EANN2 = Emergency announcement 2.
NCA = No circuit announcement.
ICA = Isolated code announcement (default).

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the SET:DCC output message.

RL = Retry later. May also include:
- RESOURCE SHORTAGE = The necessary resources are not available.

**SET:DSE**

*Software Release:* 5E14 and later  
*Command Group:* CCS  
*Application:* 5  
*Type:* Input

1. **PURPOSE**

Requests that the trapping and printing of direct signaling events (DSEs) be turned on. These events will be reported in the `REPT:ACP-APP-SM`, `REPT:ASP`, `REPT:DSE`, `REPT:MS-TRAPPED`, `REPT:NS` and `REPT:OSPS-DSE` output messages.

2. **FORMAT**

```
SET:DSE=a[,DUR=b];
```

3. **EXPLANATION OF MESSAGE**

- `a` = Event to be trapped and printed. Valid value(s):
  - `AILSGMG` = Automated inward line screening (AILS) message received with invalid format reply.
  - `AILSMRQ` = AILS error - misrouted query.
  - `AILSTOT` = AILS query timed out before a reply was received.
  - `AILSTRF` = AILS error - task refused.
  - `AILSUVD` = AILS error - message received with unexpected input data value.
  - `ASPCGCOMP` = Advanced services platform (ASP) service control point (SCP) response or unidirectional message with an automatic call gap (ACG) component received at the switch.
  - `ASPBADRESP` = ASP SCP response message received with invalid data.
  - `ASPNORTEMSG` = ASP reject message, a return error, or a play announcement received at the switch from the SCP.
  - `ASPQRYFAIL` = ASP query blocked by network management(NM) ACG, a returned query or conversation received at the switch or a time out received in call processing.
  - `ASPSNCOMP` = ASP SCP response message with a send notification received at the switch.
  - `ASPTNMSG` = ASP termination notification message sent from the switch to the SCP.
  - `CASDBOV` = Customer account services (CAS) message received indicating database overload.
  - `CASDBUN` = CAS message returned - database unable to process.
  - `CASMGSG` = CAS message received garbled.
  - `CASNBLK` = CAS message returned because of network blockage.
  - `CASNCON` = CAS message returned because of network congestion.
  - `CASNRTE` = CAS message returned because of no routing data.
  - `CASTOUT` = CAS message returned because of timeout.
  - `CASUNEQ` = CAS message returned because of unequipped destination.
  - `CASURPY` = CAS message received with an unexpected reply.
  - `CAS7ABM` = CAS common channel signaling 7 (CCS7) abort message received.
  - `CAS7ACG` = CAS CCS7 ACG invoke component received.
  - `CAS7GMR` = CAS CCS7 received with invalid format reply.
  - `CAS7GWE` = CAS CCS7 error - gateway error.
  - `CAS7MRP` = CAS CCS7 error - message received with missing parameter.
  - `CAS7MRQ` = CAS CCS7 error - misrouted query.
  - `CAS7NCG` = CAS CCS7 message returned because of network congestion.
CAS7NFL = CAS CCS7 message returned because of network failure.
CAS7RCR = CAS CCS7 reject component received.
CAS7SCG = CAS CCS7 message returned because of subsystem congestion.
CAS7SFL = CAS CCS7 message returned because of subsystem failure.
CAS7TAN = CAS CCS7 message returned - no translation data for address of such nature.
CAS7TOT = CAS CCS7 query which timed out before reply received.
CAS7TRF = CAS CCS7 error - task refused.
CAS7TSA = CAS CCS7 message returned - no translation data for this specific address.
CAS7UDV = CAS CCS7 error - message received with unexpected input data value.
CAS7UPR = CAS CCS7 error - message received with unexpected parameter.
CAS7UQD = CAS CCS7 message returned - unqualified.
CAS7URY = CAS CCS7 message returned - unequipped user.
CAS7VCD = CAS CCS7 error - vacant code.
CCDDBOV = BVA calling card (CCRD) message received indicating database overload.
CCDDBUN = BVA CCRD message returned- database unable to process.
CCDGMSG = BVA CCRD message received garbled.
CCDDBLK = BVA CCRD message returned because of network blockage.
CCDNCN = BVA CCRD message returned because of network congestion.
CCDNRTE = BVA CCRD message returned because of no routing data.
CCDUNEQ = BVA CCRD message returned because of unequipped destination.
CCDURPY = BVA CCRD message received with an unexpected reply.
ICCVABM = International credit card validation (ICCV) abort message received.
ICCVDBU = ICCV error - message returned - database unavailable.
ICCVEMF = ICCV error in message format.
ICCVGMR = ICCV received with invalid format reply.
ICCVMRQ = ICCV error - misrouted query.
ICCVNCG = ICCV message returned because of network congestion.
ICCVNFL = ICCV message returned because of network failure.
ICCVRCR = ICCV reject component received.
ICCVSCG = ICCV message returned because of subsystem congestion.
ICCVSFL = ICCV message returned because of subsystem failure.
ICCVTAN = ICCV message returned - no translation data for address of such nature.
ICCVTOT = ICCV query which timed out before reply received.
ICCVTSA = ICCV message returned - no translation data for this specific address.
ICCVUDV = ICCV error - message received with unexpected input data value.
ICCVUPR = ICCV error - message received with unexpected parameter.
ICCVUQD = ICCV message returned - unqualified.
ICCVURY = ICCV received with unexpected reply.
ICCVUUR = ICCV message returned - unequipped user.
INWBLKD = Inward wide area telecommunications service (INWATS) returned blocked.
INWBUSY = INWATS all lines busy.
INWCCLBL = INWATS code control blocked.
INWDBOV = INWATS database overload.
INWDBTO = INWATS database timeout.
INWDSBL = INWATS direct signaling blocked.
INWNPA = INWATS nonpurchased numbering plan area (NPA).
INWNOXL = INWATS returned no translation.
INWONPA = INWATS invalid originating numbering plan area (ONPA).
INWOVLD = INWATS returned overload.
INWUNEQ  = INWATS returned unequipped.
INWVLIN  = INWATS vacant line number.
INWVNXX  = INWATS vacant NXX.
LACABM  = Line application for consumers (LAC) abort message received.
LACACG  = LAC invoke component received.
LACGMG  = LAC message received with invalid format.
LACMPR  = LAC error - message received with missing parameter.
LACMRQ  = LAC error - misrouted query.
LACNCG  = LAC message returned because of network congestion.
LACNFL  = LAC message returned because of network failure.
LACCR  = LAC reject component received.
LACSCG  = LAC message returned because of subsystem congestion.
LACSLF  = LAC message returned because of subsystem failure.
LACTAN  = LAC message returned - no translation data for address of such nature.
LACTOT  = LAC query timed out before a reply was received.
LACTRF  = LAC error - task refused.
LACTSA  = LAC message returned - no translation data for this specific address.
LACUDV  = LAC error - message received with unexpected input data value.
LACUPR  = LAC error - message received with unexpected parameter.
LACUQD  = LAC message returned - unqualified.
LACURY  = LAC unexpected reply.
LACUUR  = LAC message returned - unequipped user.
LACVCD  = LAC error - vacant code.
LIDBCGI  = Line information database (LIDB) message with a call gapping indicator present.
LIDBGM  = LIDB garbled message.
LIDBMGM  = LIDB return value missing group or misrouted.
LIDBNAN  = LIDB return value no translation for an address of such nature.
LIDBNCG  = LIDB return value network congestion.
LIDBNFL  = LIDB return value network failure.
LIDBNPG  = LIDB return value nonparticipating group.
LIDBNSA  = LIDB return value no translation for this specific address.
LIDBREJ  = LIDB reject message received.
LIDBSCG  = LIDB return value subsystem congestion.
LIDBSFL  = LIDB return value subsystem failure.
LIDBTO  = LIDB message missed because of timeout.
LIDBUP  = LIDB message with unexpected reply.
LIDBUUR  = LIDB return value unequipped user.
LNBAS  = Call failed due to the query being blocked at the switch.
LNBN  = Call failed due to the query being blocked in the common channel signaling (CCS) network.
LNGTCAP  = Garbled transaction capabilities application part (TCAP) message received - message can not be parsed.
LNNCANI  = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk not providing automatic number identification (ANI) for query.
LNNCFA  = Call failure due to some reason while the transaction with the network control point (NCP) is active.
LNNCFI  = Call failure due to some reason while the transaction with the NCP is inactive.
LNRRER  = Call failed due to the conversation with the NCP resulting in a reject error response.
LNRR  = Call failed due to the conversation with the NCP resulting in a reject response.
LNTIM  = Call failed due to the query not being answered in time by the NCP.

</table>
SDNNCANI = Centralized automatic message accounting (CAMA) call failed due to CAMA trunk’s not providing automatic number identification (ANI) for query.

SDNNCFA = Call failed while the transaction with the network control point (NCP) was active.

SDNNCFI = Call failed while the transaction with the NCP was inactive.

SDNOCANI = CAMA call failed due to CAMA trunk’s not providing ANI through operator number identification (ONI) for query.

SDNRER = Call failed because to the conversation with the NCP resulting in a return error response.

SDNRR = Call failed because to the conversation with the NCP resulting in a reject response.

SDNTIM = Call failed due to the query’s not being answered in time by the NCP.

SDNTRF = Call failed due to the NCP’s answering with a terminate request.

b = Duration (DUR) of DSE trapping and printing in minutes (range is 1-30) (default is 10).

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- SYSTEM TROUBLE = The trap could not be activated due to a problem in the system.
- TRAP ALREADY SET = The requested trap is already activated.

OK = Good. The request was received and the trap was successfully activated. If any direct signaling events occur, the output messages will report them until traps are turned off or expire.

SET:ESA

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests to make a specified enhanced 911 service adjunct (ESA) active. This request can be a simple switch operation or a request to force an ESA active.

2. FORMAT

SET:ESA,ACTIVE=a[,FRC];

3. EXPLANATION OF MESSAGE

FRC = The ESA is to be forced active. Once an ESA is put into the forced active state, the specified ESA will remain active and no manual or automatic switches will be allowed until the force is removed using a CLR:ESA input message using the FRC option.

a = Attached processor ID (APID) of the ESA to be set active.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - FAILED TO SEND MESSAGE = The request has been denied because the message cannot be sent to the communication module processor (CMP) to perform the requested action.
   - FEATURE NOT AVAILABLE = The request has been denied because the dual ESA for E911 (SFID 108) and/or the dual ESA enhancements special feature (SFID 141) have not been purchased.
   - INVALID APID SPECIFIED = The request has been denied because the APID specified is not one of the ESAs defined for this office.
   - NOT AN ESA OFFICE = The request has been denied because the ESAs for the office have not been equipped (E911 OPTION field on RC/V View 8.1 is not ESA).
   - SYSTEM ERROR = An internal system error has occurred while processing the request.

PF = Printout follows. A SET:ESA output message follows.

RL = Retry later. May also include:
   - CMP UNAVAILABLE = The message can not be sent. The communications module processor (CMP) is not available.
   - OTHER REQUEST IN PROGRESS = Another ESA request is currently in progress.

24.7 (DSL APPLICATION PROCESSOR COMMUNICATION DATA)
**SET:FRC-MSCU**

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that the specified side of the message switch control unit (MSCU) be forced active.

**WARNING:** If this message is used, the MSCU side specified will be unconditionally restored to an active forced (ACT FRCD) state and the other side put in the unavailable forced (UNAV FRCD) state. If the forced side is defective, fault recovery will not attempt to recover it. The use of this input message could result in the loss of transient calls if the MSCU forced contains the standby CMP. Use with extreme caution!

2. **FORMAT**

`SET:FRC,MSCU=a;`

3. **EXPLANATION OF MESSAGE**

`a`  
= Side of the MSCU to be forced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

`NG`  
= No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

`PF`  
= Printout follows.

`RL`  
= Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

5. **REFERENCES**

**Input Message(s):**

**Input Appendix(es):**

`APP:CM-IM-REASON`

**Output Message(s):**
SET: FRC-MSCU
SET:FRC-NCOSC-A

Software Release: 5E14 only
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the forced (FRC) condition be set on the specified side of the network clock 2 oscillator (NCOSC) to be used as the timing base for the office. If this message is used, the NCOSC side specified will be restored to an active forced (ACD FRCD) state and the other side put in the unavailable forced (UNAV FRCD) state.

WARNING: If the forced side is defective, fault recovery will not attempt to recover it.

NOTE: A warmup period of 16 hours is required for a high stability oscillator to meet its stated requirements. The warmup period for a medium stability oscillator is one hour. During the warmup period, the oscillator may be forced into service if the operation of the office network and timing complex (ONTC) depends on it. There may be a slight degradation of service during this period.

2. FORMAT

SET:FRC,NCOSC=a;

3. EXPLANATION OF MESSAGE

a = Side of the NCOSC to be forced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

PF = Printout follows. Followed by the SET:FRC-NCOSC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

1. PURPOSE

Requests that the forced (FRC) condition be set on the specified side of the network clock model 2 or 3 oscillator (NCOSC) to be used as the timing base for the office. If this message is used, the NCOSC side specified will be put to an active forced (ACT FRCD) state and the other side put in the unavailable forced (UNAV FRCD) state.

Note: For network clock model 2 (NC2) consider that a warmup period of 16 hours is required for a high stability oscillator to meet its stated requirements. The warmup period for a medium stability oscillator is one hour. For network clock model 3 (NC3) oscillator the warmup period is one and a half hours. During the warmup period, the oscillator may be forced into service if the operation of the office network and timing complex (ONTC) depends on it. This may cause a greater frequency of timing slips in HOLDOVER or FREERUN modes during this period.

2. FORMAT

SET:FRC,NCOSC=a;

3. EXPLANATION OF MESSAGE

a = Side of the NCOSC to be forced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

PF = Printout follows. Followed by the SET:FRC-NCOSC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that the specified side of the office network and timing complex common unit (ONTCCOM) be forced active.

**WARNING:** If this message is used, the ONTCCOM side specified will be restored to an active forced (ACT FRCD) state unconditionally and the other side put in the unavailable forced (UNAV FRCD) state. If the forced side is defective, fault recovery will not attempt to recover it.

2. **FORMAT**

```
SET:FRC,ONTCCOM=a;
```

3. **EXPLANATION OF MESSAGE**

a = Side of the ONTCCOM to be forced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

```
NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.
```

SET:FRC-TRCU3

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

   This request is used to "force" active a particular function pack pair of a transmission rate conversion unit - model III (TRCU3) circuit. There is no force state of a function pair, so this request is accomplished by forcing the mate function pack to look faulty (Done by setting a hardware register). This command is needed to facilitate TRCU3 function pack replacement.

   **WARNING:** If this message is used, the TRCU3 side and path specified will be force into service. If the forced side is defective, fault recovery will not attempt to recover it.

2. **FORMAT**

   SET:FRC,TRCU3=a-b-c,{HOST|REMOTE};

3. **EXPLANATION OF MESSAGE**

   a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   b  = TRCU3 Path (TRCUPATH). This is the TRCUPATH connecting a host and remote TRCU3 circuits.

   c  = Side. This is the side of the CM which the function pack is connected that is desired to be forced active.

   **HOST**  "HOST" refers to the TRCU3 at the host location next which connects to the communications module (CM).

   **REMOTE**  "REMOTE" refers to the TRCU3 at the remote location which is connected to the optically remoted (switching) module (ORM).

4. **SYSTEM RESPONSE**

   **NG**  = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request. Refer to the SET FRC TRCU3 output manual page.

   **PF**  = Printout follows.

   **RL**  = Retry later. The request cannot be executed now.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

To requests that a terminal be set up as a high priority terminal.

This input message is for activating the high priority terminal feature. This feature sets terminal priority to high to improve the response time of output messages. Page pokes and command pokes will not be affected.

**WARNING:** Usage of this input message may impact the processing of messages on other terminals as well as some system generated output messages. Other terminals may see some delays in output response times since higher priority is given to messages processed at the selected high priority terminal.

2. **FORMAT**

SET:HPRI[,DUR=a];

3. **EXPLANATION OF MESSAGE**

a = Time duration in minutes (5 to 360). If none is specified, a default of 360 minutes will be used.

4. **SYSTEM RESPONSE**

PF = Printout follows. The request was accepted. Followed by the SET:HPRI output message.

NG = No good. The input message entered is invalid. May also include:

- SPECIAL FEATURE NOT AVAILABLE = Secured feature bit is not turned on.

Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the input/output processor (IOP) driver (IODRV) print messages.

Note: Using the SET:IODRV input message without the options turns on all severity levels, handler identifiers, and classes, but does not change the setting for saving IOP error messages.

2. FORMAT

SET:IODRV[:[LVL=a[&a[&a]]],[ID=b[&b[&b...]]],[CLASS=c[&c[&c...]]] [,MSGSAVE]];

3. EXPLANATION OF MESSAGE

MSGSAVE = Save all IOP error messages in the logfile IODRVLOG.

a = Severity level. 1-3, where one is the most severe setting and three is the least severe.

b = Handler identifications. Valid value(s):
   ALL = All IDs.
   APH = Application protocol handler.
   APPL1-APPL5 = Reserved for application handlers.
   CIH = End user interface handler.
   DUIH = Direct user interface handler.
   IOP = Input/output processor driver.
   MAINT = Maintenance handler.
   MTH = Magnetic tape handler.
   NPH = Network protocol handler.
   SCSDH = Scanner and signal distributor handler.
   SDLH = Synchronous data link handler.
   SPH = Session protocol handler.
   TPH = Transport protocol handler.

c = 32 classes available, but none are assigned.

4. SYSTEM RESPONSE

NG = No good. Conflict with system status.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the communication module (CM) be isolated from the administrative module (AM). This request configures the message switch control unit (MSCU) so that it operates independent of the AM. The configuration is performed unconditionally. The CM remains isolated until a CLR:ISOL-CM input message is entered, a manual D4 initialization is performed, or isolation is cleared using the application parameter 't' on the EAI page.

This input message is only applicable to offices having CM2-vintage communication modules.

WARNING: While the CM is isolated from the AM, no communication is possible between the AM and SMs or CMPs. Functionality requiring such communication, including common channel signaling (CCS) call processing, and AM-directed maintenance activities will not be available. If an SM's communication link configuration is non-optimal, it may become call processing-isolated when this input message is invoked. This input message should only be used as directed by the System Recovery Manual or by support personnel.

2. FORMAT

SET:ISOL,CM;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by a SET:ISOL-CM output message.

235-105-250 System Recovery Procedures
SET:ISOL-SM

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

1. PURPOSE

Requests that a switching module (SM) or a range of SMs be isolated. This request configures communication link hardware to take down level 2 protocol on any active links. The configuration is performed unconditionally. An isolated SM remains isolated until a CLR:ISOL input message is received.

If the SM is a remote switching module (RSM), then the host digital facility interfaces (HDFIs) carrying control channels at the host switching module (HSM) for this RSM will be disabled. The cluster digital facility interfaces (CDFIs) linking the RSM to other members of a multi-module RSM cluster will also be disabled, unless the NOSEP option is specified.

2. FORMAT

SET:ISOL,SM=a[&b][,NOSEP|QLPS|ALL];

3. EXPLANATION OF MESSAGE

ALL = All. Manually isolate the SM from the control time slot (CTS) network, the quad-link packet switch (QLPS) network (if applicable), and any other members of a multimodule RSM (if applicable). This includes disconnecting all equipped communication links (QLNKs)/QLPS communication links (QLNKs)/inter-switching module QLNKs (ISMQLNKs). This is the default option.

NOSEP = Do not isolate RSMs from other members of multi-module RSM clusters.

QLPS = Quad-link packet switch. Manually isolate this SM from the QLPS network only. This includes disconnecting all equipped QLNKs/ISMQLNKs on the SM-2000.

a = SM number, or lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was invalid.

PF = Printout follows. Followed by a SET:ISOL-SM output message.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the trapping and printing of integrated services digital network (ISDN) user part (ISUP) events be turned on. These events will be reported in the REPT:ISUP output message.

2. FORMAT

SET:ISUP=ATPUUI[,DUR=b];

3. EXPLANATION OF MESSAGE

ATPUUI = Access transport parameter (ATP) user-to-user information (UUI).
a = Event to be trapped and printed.
b = Duration (DUR) of ISUP trapping and printing in minutes (range is 1-30) (default is 10).

4. SYSTEM RESPONSE

NG = No good. May also include:
   - SYSTEM TROUBLE = The trap could not be activated due to a problem in the system.
   - TRAP ALREADY SET = The requested trap is already activated.

OK = Good. The request was received and the trap was successfully activated. If any direct signaling events occur, the REPT:ISUP output message will report them until traps are turned off.

Input Appendix(es):

APP: RANGES
SET:MINMODE-CNI

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the common network interface (CNI) system be placed into min mode. In min mode, automatic fault recovery of the CNI system will be inhibited. No escalation from lower to higher levels of initialization will take place, and common channel signaling (CCS) call processing will be shut off.

The CNI system should be put into min mode only in extreme situations when automatic recovery is unsuccessful. The CNI system will not leave min mode until the CLR:MINMODE,CNI TTY input message is entered, or the switch is booted using 42!N!53 or 42!N!54 emergency action interface (EAI) pokes. When the CNI system is put into min mode, a CNI full initialization (level 4) will be performed.

WARNING: This message is CCS service affecting. All CCS call processing service will be discontinued. CNI min mode will remain in effect through all processor initializations until manually cleared using CLR:MINMODE-CNI input message or 42!N!53, 42!N!54, 54 EAI pokes.

2. FORMAT

SET:MINMODE,CNI,LVL4

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The request was unsuccessful because:
- The office is not equipped with CNI.
- Software level 5 (S5) initialization of CCSINIT failed.
- Some internal error occurred.

PF = Printout follows. The message has been accepted and an output message will follow.

5. REFERENCES

Input Message(s):
CLR:MINMODE-CNI

Output Message(s):
INIT:CNI-LVL
MCC Display Page(s):

(CNI FRAME AND CCS LINK STATUS)
1. PURPOSE

Requests that the selected switching module (SMs) be placed in minimum mode (minmode). This is accomplished by setting the appropriate SM inhibits and executing a high level initialization (SI or FI).

The SM inhibits which are set as a result of this message are minmode, software error checks, hardware error checks, application routine exercises, and application routine audits. In addition, output message brevity control is allowed. Minmode should only be used in extreme emergencies when all other normal recovery procedures have failed. The SM will be placed in a configuration such that all call processing is ignored. This inhibit will remain in effect through all processor initializations (with the exception of EAI input message 54) until manually cleared by the CLR:MINMODE input message or EAI input message ‘n’, which cancels the request.

WARNING: All call processing service will be discontinued.

2. FORMAT

```
SET:MINMODE,SM=a[&b],FI[,PUMP|,NPUMP|,BPUMP][,LSM][,HSM][,RSM][,ORM][,TRM][,DRM];
```

3. EXPLANATION OF MESSAGE

- **BPUMP** = Perform a full SM pump using the backup pump function. This pump uses the control time slots (no special hardware) and may succeed when a normal pump fails; however, it is at least 16 times slower than the normal pump. This option should be used on a pump peripheral controller (PPC) duplex failure of the AM peripheral hardware or failure of the bootstrapper hardware in the SM.

- **HSM** = Select modules of the type host switching module.

- **LSM** = Select modules of the type local switching module.

- **NPUMP** = Perform a full SM pump using the normal pump function.

- **ORM** = Select modules of the type optically remote switching module.

- **PUMP** = Perform a full SM pump at the requested level (FI only). A normal pump (NPUMP) will be used unless a failure occurs, in which case a backup pump (BPUMP) will be selected automatically. This is the recommended option to request a full pump.

- **RSM** = Select modules of the type remote switching module.

- **TRM** = Select modules of the type two mile optically remote switching module.

- **DRM** = Select modules of the type distinctive remote switching module.

- **a** = SM number, or lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the
Appendixes section of the Input Messages manual.

b = Upper limit of the range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = The desired initialization level. Valid value(s):
   FI = Full initialization (clear all stable calls).
   SI = Selective initialization (clear all transient calls).

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the request is in progress.

NG = No good. The message was not accepted because:
   - An illegal SM number or invalid range/type combination was specified.
   - An illegal initialization level was specified.
   - An illegal option was specified (only PUMP, NPUMP, or BPUMP are allowed).

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the specific data for use with the operating system for distributed switching (OSDS) monitor be initialized.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

This message should be used under the guidance of high-level technical support. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Note: An increase in the processor occupancy is directly related to the number of options specified for this message.

2. FORMAT

SET:MON,DATA,(AM|SM=a|CMP=b-c),(PRI=d,|PRG=e,|PRT=f,|PTM=g,|PSG=h,|PST=i,|
PDA=j,|PDM=k,|AD1=l,|AD2=m,|AD3=n,|AD4=o,|AD5=p,|AD6=q,|LA1=r,|LA2=s,|
LA3=t,|TIM=u);

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Communications module processor (CMP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = 0 through 7. OSDS priority level to be monitored.

e = Operational kernel process (OKP), SM, or CMP program ID not process number of the process to be monitored. Valid value(s):
   - 0 through 259 for OKP.
   - 0 through 649 for SM.
   - 0 through 149 for CMP.
   - 65280 (H'FF00) - All program IDs
   - 61440 (H'F000) - All program IDs except program IDs for priority 0 processes

f = Any valid port number from relation FC_PORTTYP.
g = 0 through 65535 (0 means no filtering). Valid value(s):
- Time in milliseconds for filter value for per event snapshot (OKP).
- Time in 125-microsecond intervals for filter value for per event snapshot (SM|CMP).
- Time period in milliseconds for timed data dump (OKP|SM|CMP).

h = Switch maintenance kernel process (SMKP) program ID not process number of the process to be monitored. Valid value(s):
- 0 through 149.
- 65280 (H'FF00) - All program IDs.
- 61440 (H'F000) - All program IDs except program IDs priority 0 processes.

i = 0 through 65535 (0 means no filtering). Time in milliseconds for filter value for per event snapshot for SMKP.

j = Any hexadecimal value (0 - H'FFFFFFFF). Valid value(s):
- Data to be matched if control flag DAT or [SP6 (SM)] from a previous or subsequent SET:MON-WTD input message is turned on.
- Start time for automatic start/stop.

k = Any hexadecimal value (0 - H'FFFFFFFF). Mask value for data match if control flag DAT or [SP6 (SM)] from a previous or subsequent SET:MON-WTD input message is turned on.

l = Any hexadecimal value (0 - H'FFFFFFFF). Address number one of data to be dumped on per event snapshot.

m = Any hexadecimal value (0 - H'FFFFFFFF). Address number two of data to be dumped on per event snapshot.

n = Any hexadecimal value (0 - H'FFFFFFFF). Address number three of data to be dumped on per event snapshot.

o = Any hexadecimal value (0 - H'FFFFFFFF). Address number four of data to be dumped on per event snapshot.

p = Any hexadecimal value (0 - H'FFFFFFFF). Address number five of data to be dumped on per event snapshot.

q = Any hexadecimal value (0 - H'FFFFFFFF). Address number six of data to be dumped on per event snapshot.

r = Any hexadecimal value (0-H'FFFFFFFF). Process control block link area (PCBLA) first offset of data in PCBLA to be dumped on per event snapshot.

s = Any hexadecimal value (0-H'FFFFFFFF). PCBLA second offset of data in PCBLA to be dumped on per event snapshot.

t = Any hexadecimal value (0-H'FFFFFFFF). Process control block link area PCBLA third offset of data in PCBLA to be dumped on per event snapshot.

u = Not used.
4. SYSTEM RESPONSE

NG = No good. Error in format.
PF = Printout follows. Followed by the SET:MON output message.
RL = Retry later. System resource shortage.

SET:MON-FCN

**Software Release:** 5E14 and later  
**Command Group:** SFTUTIL  
**Application:** 5  
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that the special monitor action flags and/or the special monitor function execution flags be set.

**WARNING:** The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

This message should be used under the guidance of high-level technical support.

**Note:** An increase in the processor occupancy is directly related to the number of options specified for this message.

The SET:MON-FCN input message sets flags in the monitor control word OSCFFLAG. These flags are divided into two groups. The first group of flags, F00 through F15, is used to select special functions that may be pre-defined in the monitor code or added to the monitor code using a temporary software update. The associated function names are OSmonf00 through OSmonf15 in all processors. Setting a flag will allow the function to be executed only once. The actual execution of the special function occurs when the monitor is allowed and the "what to do" (WTD) special function control flag (CTL) is set to ON. Refer to the SET:MON-WTD input message. Repetitive execution of the special function requires the function to set its associated flag upon exit.

The second group of flags, F16 through F31, allows the monitor to gather data about operating system for distributed switching (OSDS) message types, collect per event data on OSDS messages from the administrative module (AM), switching module (SM), or communications module processor (CMP), or automatically inhibit the monitor in the event of a real time or resource overload. The automatic inhibit occurs on the transition from the no overload state to minor or major overload state.

2. **FORMAT**

```
SET:MON,FCN,{AM|SM=a|CMP=b-c},d[=e] [,d[=e]...];
```

3. **EXPLANATION OF MESSAGE**

**Note:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **a**  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **b**  = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c**  = Communications module processor (CMP) number. Refer to the APP:RANGES appendix in the
Appendices section of the Input Messages manual.

\[\text{d} \]

Flag (F00-F31). Valid value(s):

- F00-F15: Special monitor function execution flags (AM|SM|CMP).
- F16: Automatic monitor inhibit on real time overload (AM|SM|CMP).
- F17: Automatic monitor inhibit on resource overload (AM|SM|CMP).
- F18: Not assigned (AM|SM|CMP).
- F19: Not assigned (AM|SM|CMP).
- F20: Number of operating system for distributed switching (OSDS) messages sent by the SM or CMP to another processor (SM|CMP). Not assigned (AM).
- F21: Number of OSDS messages received by the SM or CMP from another processor (SM|CMP). Not assigned (AM).
- F22: Snap shot per event message data for the feature execution (FEX) environment (SM). Not assigned (AM|CMP).
- F23: Snap shot real time clock on per event message data (AM|SM|CMP).
- F24: Number of OSDS message type for operational kernel process (OKP) sent to a UNIX® RTR kernel or supervisory process (AM).
- F25: Snap shot per event message data for OKP messages to an RTR kernel or supervisory process (AM). Not assigned (SM/CMP).
- F26: Number of OSDS message type for RTR messages received by OKP (AM). Number of OSDS message type for messages received from another processor (SM|CMP).
- F27: Snap shot per event message data for RTR messages received by OKP (AM). Not assigned (SM|CMP).
- F28: Number of OSDS message type for messages received by OKP or CMP (AM/CMP). Number of OSDS message types for all messages received (SM).
- F29: Snap shot per event message data for SM/CMP messages within the AM (AM). Snap shot per event message data for all messages within that processor (SM|CMP).
- F30: Number of OSDS message type for OKP messages sent to other processors (AM). Number of OSDS message type for all messages sent to other processors from that processor (SM|CMP).
- F31: Snap shot per event message data for OKP messages sent to other processors (AM). Snap shot per event message data for all messages sent by the SM to other processors (SM|CMP).

\[\text{e} \]

Requested state of special function or action. Valid value(s):

- ON: Enables the function (default).
- OFF: Disables the function.

4. SYSTEM RESPONSE

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that data words for the timed data dump feature or special function use be initialized.

The SET:MON-SPEC message is used to initialize addresses for the timed data dump feature or miscellaneous data for any other use of the dispatch array, that is, data needed by a special function. Parameters S00 through S45 correspond to words 0 through 45 of the monitor buffer dispatch array area. This maps to location "OSHAMDSP" in the AM monitor buffer "OShisarray" and "OSHSMDSP" in the SM monitor buffer "SIhistory", and "OSHSMDSP" in the CMP monitor buffer "SIhistory".

Note: This symbolic address is not the start of the monitor buffer. Data values S00 through S45 are full words (4 bytes).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

This message should be used under the guidance of high-level technical support.

Note: An increase in the processor occupancy is directly related to the number of options specified for this message.

2. FORMAT

SET:MON,SPEC,{AM|SM=a|CMP=b-c},d=e...;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Messages switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Communications module processor (CMP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Flag index value (S00-S45).

e = Special data to be set in the monitor buffer in hexadecimal.
4. SYSTEM RESPONSE

NG = No good. Error in format.

PF = Printout follows. Followed by the SET:MON output message.

RL = Retry later. System resource shortage.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the monitor control flags that select "What To Do" actions or "What To Dump" fields be set or cleared.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

This message should be used under the guidance of high-level technical support.

Note: An increase in the processor occupancy is directly related to the number of options specified for this message.

2. FORMAT

SET:MON,WTD,{AM|SM=a|CMP=b-c},{BEG=[d],END=[d],HUF=[d],HIJ=[d],|HHH=[d],HPD=[d],DUF=[d],DIJ=[d],DPD=[d],DPY=[d],DOX=[d],|HMH=[d],|DMH=[d],HSP=[d],|HSX=[d],DSP=[d],|DSX=[d],HMX=[d],|DMX=[d],|DMP=[d],|DSP=[d],|DSX=[d],HMX=[d],|DMX=[d],|DMP=[d],|SP0=[d],|SP1=[d],|SP2=[d],|CLP=[d],|CLT=[d],|CLT=[d]);

3. EXPLANATION OF MESSAGE

AAA = For the AM, SM or CMP, shorthand that includes options ACL, APP, AID and ASA.
ACL = For the AM, SM or CMP, clock time in milliseconds for per event snapshot.
ADM = For the AM, snapshot address data on MSKP process dispatch.
ADO = For the AM, snapshot address data on OKP process dispatch. For the SM or CMP, snapshot address data on SM process dispatch.
ADS = For the AM, snapshot address data on SMKP process dispatch.
AID = For the AM, SM or CMP, snapshot priority, event identifier, and time in event for per event snapshot.
APC = For the SM or CMP, snapshot data from PCBLA on SM process dispatch.
APP = For the AM, SM or CMP, program ID and PCB index for per event snapshot.
ASA = For the AM, SM or CMP, segment start address of other data for per event snapshot.
BEG = For the AM, SM or CMP, when 'd' = ON, sets the monitor to zero the index (OSCINDEX) into the dispatch array area of the monitor buffer. When 'd' = OFF, cause no action.

CTL = For the AM, SM or CMP, activate the special function control word.

DAD = For the AM, SM or CMP, not used.

DAP = For the AM, SM, or CMP, not used.

DAT = For the AM, SM or CMP, filter on address data match/mismatch for per event data snap shot.

DIJ = For the AM, SM or CMP, per event data snap shot on interject.

DMH = In the SM, filter on port number for per event data snap shot. In the AM or CMP, not used.

DMP = In the AM, per event data snap shot on MSKP program point. In the SM or CMP, not used (SM/CMP).

DMX = In the AM, per event data snap shot on MSKP entry/exit. In the SM or CMP, not used.

DOX = For the AM, SM or CMP, turn on no-wrap flag for dispatch array area.

DPD = For the AM, SM or CMP, per event data snap shot on process dispatch.

DPY = For the AM, SM or CMP, per event data snap shot on priority levels.

DSP = In the AM, per event data snap shot on SMKP process dispatch. In the SM or CMP, not used.

DSX = In the AM, per event data snap shot on SMKP entry/exit. In the SM or CMP, not used.

DUF = In the AM, per event data snap shot on OKP/UNIX® RTR operating system entry/exit. In the SM or CMP, per event data snap shot on foreground.

END = For the AM, SM, or CMP, sets clears the stop flag to inhibit the monitor. Same as the input message INH:MON.

HAP = For the AM, SM, or CMP, not used.

HHH = In the AM, shorthand that includes options HUF, HIJ, HPD, HPY, HSP, HSX, and HMX. In the SM or CMP, shorthand that includes options HUF, HIJ, HPD, and HPY.

HIJ = For the AM, SM or CMP, count & time in milliseconds accumulation for interject.

HMH = In the AM, histogram time in milliseconds in OKP, UNIX® RTR operating system, interject, CCrcvcni, OKP Program ID(s), switch maintenance kernel process (SMKP), SMKP program IDs, message switch kernel process (MSKP) event, fault, and interrupt entries. In the SM or CMP, histogram time in milliseconds in foreground, interject, and program ID(s).

HMX = In the AM, count & time in milliseconds accumulation for MSKP entry/exit. In the SM or CMP, not used.

HPD = For the AM, SM, or CMP, count & time in milliseconds accumulation for program IDs AM/SM/CMP).

HPY = For the AM, SM, or CMP, count & time in milliseconds accumulation for priority levels.
HSP = In the AM, count & time in milliseconds accumulation for SMKP program IDs. In the SM or CMP, not used.

HSX = In the AM, count & time in milliseconds accumulation for SMKP entry/exit. In the SM or CMP, not used.

HUF = In the AM, count & time in milliseconds accumulation for operational kernel process (OKP) and UNIX® RTR operating system. In the SM or CMP, count & time in milliseconds accumulation for foreground.

SEG = For the AM, SM or CMP, process dispatch consecutive segment check.

SP0 = For the AM, SM or CMP, not used.

SP1 = For the AM, SM or CMP, not used.

SP2 = For the AM, SM or CMP, not used.

SP3 = For the AM, SM or CMP, automatic start/stop.

SP4 = For the AM, SM or CMP, inhibit monitor on data address match/mismatch.

SP5 = For the SM, inhibit monitor on process control block link area (PCBLA) match/mismatch.

SP6 = For the AM or CMP, reset dispatch array index on data address match/mismatch. For the SM, reset dispatch array index on PCBLA match/mismatch.

SP7 = For the AM or CMP, not used. For the SM, per event data snapshot on PCBLA match.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Communications module processor (CMP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = State of flag. Valid value(s):
    OFF = Clear the flag.
    ON = Set the flag (default).

4. SYSTEM RESPONSE

NG = No good. Error in format.

PF = Printout follows. Followed by the SET:MON output message.

RL = Retry later. System resource shortage.

Software Release: 5E16(1) and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the automatic protection switch (APS) state of an optical carrier - level 3 (OC3) be set to a higher priority state.

If no higher priority state than a forced switch (FS) exists on an OC3, FS away from side 1 of an OC3 will result in a transfer of the working channel from working side 1 to protect side 0. FS away from side 0 of an OC3 will result in a transfer of the working channel from side 0 to side 1. Manual switch (MS) is similar to FS, except MS is a lower priority request than FS. Setting an OC3 to LP switches away from side 0 and locks it from being used until the lockout is cleared.

WARNING: Switching away from an OC3 side will generate transient errors on the facilities.

When an OC3 side is made unavailable by an FS, LP, or RMV, the OC3 is reduced to a simplex configuration. Leaving a side unavailable may adversely impact service, such as loss of calls, if a failure occurs on the active side.

Switch maintenance activities that cause an OC3 to be removed from service will override any transmission configuration established by this command.

2. FORMAT

SET:OC3=a-b-c-d-e,f;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = OC3 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = State. Valid value(s):
MS = Manual switch.
FS = Forced switch.
LP = Lockout of protection.
4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the SET:OC3 output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the automatic protection switch (APS) state of an optical carrier - level 3 concatenated (OC3C) facility be set to a higher priority state.

If no higher priority state than a forced switch (FS) exists on an OC3C, FS away from side 1 of an OC3C will result in a transfer of the working channel from working side 1 to protect side 0. FS away from side 0 of an OC3C will result in a transfer of the working channel from side 0 to side 1.

Manual switch (MS) is similar to FS, except MS is a lower priority request than FS.

Setting an OC3C to LP switches away from side 0 and locks it from being used until the lockout is cleared.

WARNING: Switching away from an OC3C side will generate transient errors on the facilities.

When an OC3C side is made unavailable by an FS, LP, or RMV, the OC3C is reduced to a simplex configuration. Leaving a side unavailable may adversely impact service, such as loss of calls, if a failure occurs on the active side.

Switch maintenance activities that cause an OC3C to be removed from service will override any transmission configuration established by this command.

2. FORMAT

SET:OC3C=a-b-c-d-e,f;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

MCC Display Page(s):
1491 OIU OC3C STATUS
SET:PB

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the position busy (PB) indicator of certain trunk line work stations (TLWSs) or centralized trunk test units (CTTUs) that are assigned to receive incoming 101 test line calls be set. When this indicator is set, incoming calls will not terminate at this TLWS talk and monitor phone.

When the message is entered for a local TLWS, the talk and monitor phone (at the TLWS) will be "made busy" to 101 test line calls. When this message is entered for a remote TLWS or CTTU, incoming 101 test line calls will not be routed to the talk and monitor phone at that location.

Note: The talk and monitor phone may still be used for other types of testing at the trunk and line work station while the PB indicator is set.

2. FORMAT

SET:PB[,ID=a];

3. EXPLANATION OF MESSAGE

a = ID of the TLWS or CTTU to be set to position busy. Valid value(s) 1-33 and:
  l = Local.
  r = Remote.
  c = CTTU.

If no ID is specified, all LOCAL positions are set to busy.

4. SYSTEM RESPONSE

NA = Not available. The request has not been acknowledged. It is probable the request has been lost.

PF = Printout follows. The request has been accepted. Followed by the SET:PB output message verifying the results of the input message.

RL = Retry later. The request has been denied due to system overload.

  14.0 (VERIFY 101 TEST LINE)
SET:PERPH-SM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that the verbose status in a single switching module (SM) or a range of SMs be set.

When the verbose status is SET, peripheral fault recovery (PFR) will output transient peripheral (PERPH) error messages which indicate that no recovery action has occurred (for example ANALYSIS ONLY”). When the verbose status is CLEAR, PFR will only output messages which indicate that a peripheral error has caused recovery actions on a circuit. Output messages may be logged or printed, depending on the message class for each unit type. A REPT [unit] TROUBLE message could appear for any circuit.

2. FORMAT

SET:PERPH,SM=a[&b],VERBOSE ;

3. EXPLANATION OF MESSAGE

a = SM number, or lower limit of range. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Upper limit of range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- NO SM RANGE PROVIDED = Request has been denied, SM(s) must be specified.
- SM DOES NOT EXIST = Request has been denied, SM number does not match any equipped SM.

OK = Good. The input message has been completed.

RL = Retry later. System resource shortage.

Software Release: 5E16(2) and later
Command Group: MAINT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the automatic protection switch (APS) state of a packet switch unit (PSU) asynchronous transfer mode (ATM) link (PSALNK) be set to a higher priority state.

For Format 1, if no higher priority state than forced switch (FS) exists on a channel of a duplex ATM link, setting FS on that channel will result in a ATM link switch switching away from that channel and making that channel unavailable.

Lock out of protection (LP) only applies to the protection channel of a duplex ATM link. Setting an ATM link to LP will result in an ATM link switch switching away from the protection channel and making the protection channel unavailable.

WARNING: When a ATM link channel is made unavailable by the manual FS or LP, the ATM link is reduced to a simplex link. Leaving a channel UNAV may adversely impact service if failure occurs on the other channel, that is signal fail (SF).

2. FORMAT

[1] SET:PSALNK=a-b-c,CH=d,FS;

[2] SET:PSALNK=a-b-c,LP;

3. EXPLANATION OF MESSAGE

FS = Forced switch. Set the specified channel number to FS.

LP = Lock out of protection. Set protection channel to LP.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Channel number of the link. This field is not required if type of operation of LP is entered.

4. SYSTEM RESPONSE
NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status. Refer to the APP:SYS-RESPONSE appendix in the Appendixes section of this Input Messages manual.

PF = Printout follows. Followed by the SET:PSALNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1187.y,x PSU/ATM LINKS STATUS (where y=PSU number and x=SM number)
SET:PSLNK-A

Software Release: 5E14 - 5E15
Command Group: MAINT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the automatic protection switch (APS) state of a packet switch unit (PSU) link (PSLNK) be set to a higher priority state.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA.

If no higher priority state than forced switch (FS) exists on a channel of a duplex PSU link, setting FS (with any input message line in [1] to [3] in the FORMAT section) on that channel will result in a PSU link switch switching away from that channel and making that channel unavailable.

Lock out of protection (LP) only applies to the protection channel of a duplex PSU link. Setting a PSU link to LP (with any input message line in [4] to [6]) will result in a PSU link switch switching away from the protection channel and making the protection channel unavailable.

NOTE: For gateway protocol handlers (PH) the only valid input message formats are #4 and #8. Other formats will not yield the expected results.

WARNING: When a PSU link channel is made unavailable (UNAV) by the manual FS or LP, the PSU link is reduced to a simplex link. Leaving a channel UNAV may adversely impact service if failure occurs on the other channel, that is signal fail (SF).

2. FORMAT

[1] SET:PSLNK=a-b,CH=d,FS;
[2] SET:PSLNK,PSUCA=a,FARCA=b,CH=d,FS;
[3] SET:PSLNK,PSU=c-0,FARCA=b,CH=d,FS;
[5] SET:PSLNK=a-b,LP;
[6] SET:PSLNK,PSUCA=a,FARCA=b,LP;
[7] SET:PSLNK,PSU=c-0,FARCA=b,LP;
[8] SET:PSLNK,PSUCA=a,LP;

3. EXPLANATION OF MESSAGE

a = Near end PSU community address of the PSU link.
b = Far end PSU community address of the PSU link.

Note: The far end CA must be zero if the PSU link is connected to an ATM switch in a point-to-multipoint configuration network.

c = Switching module (SM) number.

d = Channel number of the PSU link.

Note: This field is not required if type of operation of LP is entered.

FS = Forced switch. Set the specified channel number to FS.

LP = Lock out of protection. Set protection channel to LP.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Printout follows. Followed by the SET:PSLNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

PSU LINKS STATUS
1. PURPOSE

Requests that the automatic protection switch (APS) state of a packet switch unit (PSU) link (PSLNK) be set to a higher priority state.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA.

If no higher priority state than forced switch (FS) exists on a channel of a duplex PSU link, setting FS (Formats 1-3) on that channel will result in a PSU link switch switching away from that channel and making that channel unavailable.

Lock out of protection (LP) only applies to the protection channel of a duplex PSU link. Setting a PSU link to LP (Formats 4-6) will result in a PSU link switch switching away from the protection channel and making the protection channel unavailable.

WARNING: When a PSU link channel is made unavailable by the manual FS or LP, the PSU link is reduced to a simplex link. Leaving a channel UNAV may adversely impact service if failure occurs on the other channel, that is signal fail (SF).

2. FORMAT

[1] SET:PSLNK=a-b,CH=e,FS;

[2] SET:PSLNK,PSUCA=a,FARCA=b,CH=e,FS;

[3] SET:PSLNK,PSU=c-d,FARCA=b,CH=e,FS;

[5] SET:PSLNK=a-b,LP;

[6] SET:PSLNK,PSUCA=a,FARCA=b,LP;

[7] SET:PSLNK,PSU=c-d,FARCA=b,LP;

3. EXPLANATION OF MESSAGE

FS = Forced switch. Set the specified channel number to FS.
LP = Lock out of protection. Set protection channel to LP.

a = Near end PSU community address of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Far end PSU community address of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

The far end CA must be zero if the PSU link is connected to an ATM switch in a point-to-multipoint configuration network.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Channel number of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

This field is not required if type of operation of LP is entered.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status. Refer to the APP:SYS-RESPONSE appendix in the Appendixes section of the Input Messages manual.

PF = Printout follows. Followed by the SET:PSLNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1187.y PSU LINKS STATUS (where y=PSU number)
SET:PSUCOM-A
Software Release: 5E14 - 5E15
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the specified side of the Packet Switch Unit (PSUCOM) be forced to the active state.

WARNING: Use of this message may result in a switch of the PSUCOM. If the requested PSUCOM is faulty, fault recovery may cause an SM initialization.

This command forces the requested PSUCOM service group active. The command is only valid if the requested PSU is marked a Critical PSU in Recent Change.

2. FORMAT

SET:PSUCOM=a-b-c,FRC;

3. EXPLANATION OF MESSAGE

a = Switching Module(SM) number.
b = PSUCOM unit number (0).
c = Service group number (0 or 1).
FRC = Forced Active state.

4. SYSTEM RESPONSE

NG = No good. May also include:
  - FORCE NOT ALLOWED ON NON-CRITICAL PSU = The requested PSU is not marked a Critical PSU in Recent Change.

PF = Printout follows. Followed by the SET:PSUCOM output message.

5. REFERENCES

SET:PSUCOM
SET:PUPAGE

Software Release: 5E14 and later
Command Group: NOCHK
Application: 5
Type: Input

1. PURPOSE

Requests that the software update installation page (BWM installation) or program update maintenance page be entered.

2. FORMAT

SET:PUPAGE=HMa;

3. EXPLANATION OF MESSAGE

a = The page to be set. Valid value(s):
  95 = Program update maintenance page.
  96 = BWM installation page.

4. SYSTEM RESPONSE

OK = Good. The message was accepted and the most current status information of the page will be displayed, if any.

5. REFERENCES

None.
1. PURPOSE

Requests that permissions for recent change (RC) access from a specified terminal (TTY) associated with the 3B processor or a specified login id (LOGIN) from the administrative services module (ASM) be set.

2. FORMAT

SET:RCACCESS, {LOGIN="a" | TTY="b"}, ACCESS=c;

3. EXPLANATION OF MESSAGE

- **a** = Name of a login id assigned on the ASM in the office. Because the login ids may have lower case characters in them, it is necessary to surround each id with a pair of quotation marks.

- **b** = Name of a terminal associated with the 3B in the office. Because the terminal names have lower case characters in them, it is necessary to surround each name with a pair of quotation marks. (Refer to Exhibit A).

- **c** = Sets of recent change view access permissions. Numbers entered for the ‘c’ variable must be preceded by B’ (binary), O’ (octal), or H’ (hexadecimal) unless the number is decimal. For decimal values of ‘c’, only the number is needed since decimal is the default. The bits are numbered for reference from right to left. When translated to binary, binary "1" indicates that a representative set of recent change abilities are allowed from LOGIN "a" or TTY "b":

Where ‘x’ is the release-specific version of the document.

235-118-xxx   *Recent Change Procedures and References Collection*
SET:RCACCESS-B
Software Release: 5E15 and later
Command Group: AUTH
Application: 5
Type: Input

1. PURPOSE

Requests that permissions for recent change (RC) access from a specified terminal (TTY) associated with the 3B processor, a specified login id (LOGIN) from the administrative services module (ASM) be set, an Authority Management Login (AUTHLOGIN), or a Recent Change Security Group (RCSECGRP).

2. FORMAT

SET:RCACCESS[,LOGIN="a"][,TTY="b"][,AUTHLOGIN="c"][,RCSECGRP="d"],ACCESS="e";

3. EXPLANATION OF MESSAGE

a = Name of a login id assigned on the ASM in the office. Because the login ids may have lower case characters in them, it is necessary to surround each id with a pair of quotation marks.

b = Name of a terminal associated with the 3B in the office. Because the terminal names have lower case characters in them, it is necessary to surround each name with a pair of quotation marks. (Refer to Exhibit A).

c = Name of a login assigned through Authority Management in the office. Because the login ids may have lower case characters in them, it is necessary to surround each id with a pair of quotation marks. This parameter is associated with a secured feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

d = Name of the Recent Change Security Group in the office. Because the RC security groups may have lower case characters in them, it is necessary to surround each group name with a pair of quotation marks. This parameter is associated with a secured feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

e = A Set of recent change view access permissions. A string containing the classes and views to allow or disallow. A "+" or "-" in the first column of the string will cause the classes or views in the string to be allowed or disallowed. All other permissions that are currently in force are not changed. If no "+" or "-" exists then the permissions are set only for those classes and views in the string and all others are disallowed. Applying a "-" when there were no previous permissions set is an error. If the empty string (i.e. "") is used then all permissions are disallowed and the permission files are removed for the LOGIN(s), TTY(s), and/or AUTHLOGIN(s). RCSECGRP(s) will only have their permissions set to none when "" is specified. Inclusive ranges for classes and views may be given in the string by placing a dash ("-"), between two classes or views. Or a list of classes and/or views may be entered separated by commas (";"). This string is limited to 29 characters.

**SET:RCLK**

Software Release: 5E14 and later  
Command Group: SM  
Application: 5  
Type: Input

1. PURPOSE

Requests that a remote clock (RCLK) circuit be set to a specific mode.

2. FORMAT

```
SET:RCLK=a-b, {NORM|FAST|HOLD};
```

3. EXPLANATION OF MESSAGE

- **FAST** = Set to the fast mode of operation. The clock will stay in this mode until it is manually or automatically reconfigured or until the mode is manually set to NORM or HOLD.
- **HOLD** = Set the mode to hold last known phase lock.
- **NORM** = Set to the normal mode of operation.
- **a** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = RCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG** = No good. May also include:
  - NOT STARTED UNIT IN GROWTH STATE
  - SM DOES NOT EXIST
  - SM UNEQUIPPED
  - UNIT DOES NOT EXIST
- **PF** = Printout follows. Followed by the SET:RCLK output message.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

SET:RCLK
```

Input Appendix(es):

```
APP:RANGES
```
SET:RCSECGRP

Software Release: 5E15 and later
Command Group: AUTH
Application: 5
Type: Input

1. PURPOSE

Requests that a specified terminal (TTY) associated with the 3B processor, a specified login id (LOGIN) the administrative services module (ASM), or an Authority Management Login (AUTHLOGIN), be assigned to a Recent Change Security Group (RCSECGRP). This gives the TTY, LOGIN or AUTHLOGIN the same RC access permissions as those assigned to the group. This input message is associated with a secured feature. Refer to the SECURED/PROPRIETARY FEATURES portion of the INTRODUCTION section of this manual.

2. FORMAT

\[ \text{SET:RCSECGRP="a", [LOGIN="b"] [TTY="c"] [AUTHLOGIN="d"];} \]

3. EXPLANATION OF MESSAGE

- \(a\) = Name of the Recent Change Security Group in the office.
- \(b\) = Name of a login id assigned on the ASM in the office. Because the login ids may have lower case characters in them, it is necessary to surround each id with a pair of quotation marks.
- \(c\) = Name of a terminal associated with the 3B in the office. Because the terminal names have lower case characters in them, it is necessary to surround each name with a pair of quotation marks. (Refer to Exhibit A).
- \(d\) = Name of a login assigned through Authority Management in the office. Because the login ids may have lower case characters in them, it is necessary to surround each id with a pair of quotation marks.

1. PURPOSE

Requests that the manual reroute (RR) trunk group control (TGC) for a single trunk group be set.

Note: For the Autoplex® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

SET:RR,TG=a[,DRPCT=b[,ARPCT=c[,CICR=d[,PRR=e[,PIIT=f[,VIATO=g[-g[-g[-g[-g[-g[-g]]]]]]]]]]],ALG=h,VIARR=i[-i[-i[-i[-i[-i[-i]]]]]]],DL=(ALL|j[,j[,j[,j[,j]]]]],DLTYPE=k;

3. EXPLANATION OF MESSAGE

ALL = Reroute trunk group control for all domains in a trunk group. (This option is only valid if variable 'k'= INC.)

a = Trunk group number.

b = Direct route percentage of traffic to control. Valid value(s):
   0 = No control, but collect measurements (default).
   12PT5 = 12.5%.
   25 = 25%.
   37PT5 = 37.5%.
   50 = 50%.
   62PT5 = 62.5%.
   75 = 75%.
   87PT5 = 87.5%.
   100 = 100%, reroute all direct routed traffic. Default is 0%.

c = Alternate route percentage of traffic to control. Valid value(s):
   0 = No control, but collect measurements (default).
   12PT5 = 12.5%.
   25 = 25%.
   37PT5 = 37.5%.
   50 = 50%.
   62PT5 = 62.5%.
   75 = 75%.
   87PT5 = 87.5%.
   100 = 100%; reroute all alternate routed traffic. Default is 0%.

d = Cancel in-chain return option. Valid value(s):
   N = No (default).
Y = Yes.

e = Previously rerouted option. Reroute calls that have been previously rerouted. Valid value(s):
N = No (default).
Y = Yes.

f = International option. Reroute calls that originated internationally. Valid value(s):
N = No (default).
Y = Yes.

g = Ignore congestion signaling. Allow sprayed reroutes to trunk groups even when congestion signals have been received for those trunk groups. Valid value(s):
N = No (default).
Y = Yes.

h = Hunting algorithm. Valid value(s):
ORD = Ordered.
RGLR = Regular.
SPRY = Spray.

i = An ordered list of one to seven trunk group numbers representing the out-of-chain trunk groups.

j = Switching domain list.

k = Switching domain list type. Valid value(s):
EXC = Exclude (control the domain not in the list).
INC = Include (control the domains in the list). ALL is only valid with INC.

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

PF = Printout follows. Followed by the SET:RR output message.

RL = Retry later. May also include:
- RESOURCE SHORTAGE = The necessary resources are not available.

Software Release: 5E15 - 5E16(1)
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that the manual reroute (RR) trunk group control (TGC) for a single trunk group be set.

Note: For the AUTOPLEX® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

SET:RR,TG=a,DL={ALL|1[,1[,1[1[,1]]]]}],DLTYPE=m[,IRR=n]
[,CODE=b][,CARR=c][,DRPCT=d][,ARPCT=e][,CICR=f][,PRR=g]
[,PIIT=h],VIATO=i[-i[-i[-i[-i[-i[-i]
[,VIARR=k[-k[-k[-k[-k][-k]]]]]],ALG=j,
VIARR=k[-k[-k[-k[-k[-k]]]]]].

3. EXPLANATION OF MESSAGE

ALL = Reroute trunk group control for all domains in a trunk group. (This option is only valid if variable 'm' = INC.)

a = Trunk group number.

b = Destination code (1 to 10 digits). (Valid character set 0-9). The string is typically of the form NPANXXX where NPA is the area code, NXX is the office code and X is the first of the last four digits of the number. Any of the leftmost subsets, however, can be entered (such as, the area code, the area code followed by one digit of the office code NPAN, and so forth.).

Note: The code could be a full destination code or any left-most subset thereof.

c = The feature group D carrier (0 - 9999).

d = Direct route percentage of traffic to control to hard to reach destinations. Valid value(s):
0 = No control, but collect measurements (default).
12PT5 = 12.5%.
25 = 25%.
37PT5 = 37.5%.
50 = 50%.
62PT5 = 62.5%.
75 = 75%.
87PT5 = 87.5%.
100 = 100%, reroute all direct routed traffic.

In addition to the above, any integer between 0 and 100 may also be specified as a direct route percentage.

e = Alternate route percentage of traffic to control. Valid values are the same as for variable 'd'.
f  = Cancel in-chain return option. Valid value(s):
   N  = No (default).
   Y  = Yes.

g  = Previously rerouted option. Reroute calls that have been previously rerouted. Valid value(s):
   N  = No (default).
   Y  = Yes.

h  = International option. Reroute calls that originated internationally. Valid value(s):
   N  = No (default).
   Y  = Yes.

i  = Ignore congestion signaling. Allow sprayed reroutes to trunk groups even when congestion signals have been received for those trunk groups. Valid value(s):
   N  = No (default).
   Y  = Yes.

j  = Hunting algorithm. Valid value(s):
   ORD = Ordered.
   RGLR = Regular.
   SPRY = Spray.

k  = An ordered list of one to seven trunk group numbers representing the out-of-chain trunk groups.

l  = Switching domain list.

m  = Switching domain list type. Valid value(s):
   EXC = Exclude (control the domain not in the list).
   INC = Include (control the domains in the list). ALL is only valid with INC.

n  = Immediate reroute. Valid value(s):
   N  = No (default).
   Y  = Yes.

4.  SYSTEM RESPONSE

NG  = No good. Valid value(s):
   - INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.
   - FEATURE NOT AVAILABLE = Due to one or more of the following reasons:
     - The code specific reroute feature is not available.

PF  = Printout follows. Followed by the SET:RR output message.

RL  = Retry later. Valid value(s):
- RESOURCE SHORTAGE = The necessary resources are not available.

```

3. EXPLANATION OF MESSAGE

- **ALL** = Reroute trunk group control for all domains in a trunk group. (This option is only valid if variable 'o' = INC.)
- **a** = Trunk group number.
- **b** = Destination code (1 to 10 digits). (Valid character set 0-9). The string is typically of the form NPANXXX where NPA is the area code, NXX is the office code and X is the first of the last four digits of the number. Any of the leftmost subsets, however, can be entered (such as, the area code, the area code followed by one digit of the office code NPAN, and so forth.).
  **NOTE:** The code could be a full destination code or any left-most subset thereof.
- **c** = The feature group D carrier (0 - 9999).
- **d** = Direct route percentage of traffic to control to hard-to-reach (HTR) destinations. Valid value(s):
  - 0 = No control, but collect measurements (default).
  - 12PT5 = 12.5%.
  - 25 = 25%.
  - 37PT5 = 37.5%.
  - 50 = 50%.
  - 62PT5 = 62.5%.
  - 75 = 75%.
  - 87PT5 = 87.5%.
  - 100 = 100%, reroute all traffic.

  In addition to the above, any integer between 0 and 100 may also be specified as a route percentage.
- **e** = Alternate route percentage of traffic to control to HTR destinations. Valid values are the same as for variable 'd'.
f = Direct route percentage of non-HTR traffic to control. Valid values are the same as for variable 'd'.

g = Alternate route percentage of non-HTR traffic to control. Valid values are the same as for variable 'd'.

h = Cancel in-chain return option. Valid value(s):
    N = No (default).
    Y = Yes.

i = Previously rerouted option. Reroute calls that have been previously rerouted. Valid value(s):
    N = No (default).
    Y = Yes.

j = International option. Reroute calls that originated internationally. Valid value(s):
    N = No (default).
    Y = Yes.

k = Ignore congestion signaling. Allow sprayed reroutes to trunk groups even when congestion signals have been received for those trunk groups. Valid value(s):
    N = No (default).
    Y = Yes.

l = Hunting algorithm. Valid value(s):
    ORD = Ordered.
    RGLR = Regular.
    SPRY = Spray.

m = An ordered list of one to seven trunk group numbers representing the out-of-chain trunk groups.

n = Switching domain list.

o = Switching domain list type. Valid value(s):
    EXC = Exclude (control the domain not in the list).
    INC = Include (control the domains in the list). ALL is only valid with INC.

p = Immediate reroute. Valid value(s):
    N = No (default).
    Y = Yes.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.
- FEATURE NOT AVAILABLE = Due to one or more of the following reasons:
  - The HTR feature is not available.
  - The code specific reroute feature is not available.
PF = Printout follows. Followed by the SET:RR output message.

RL = Retry later. Valid value(s):
   - RESOURCE SHORTAGE = The necessary resources are not available.

In addition to the above, any integer between 0 and 100 may also be specified as a direct route percentage.

c = Direct route percentage of traffic to control. Valid value(s):
0  = No control, but collect measurements (default).
12PT5 = 12.5%.
25 = 25%.
37PT5 = 37.5%.
50 = 50%.
62PT5 = 62.5%.
75 = 75%.
87PT5 = 87.5%.
100 = 100%, control all direct route traffic.

In addition to the above, any integer between 0 and 100 may also be specified as a direct route percentage.

d = Alternate route percentage of traffic to control. Valid value(s):
0  = No control but collect measurements (default).
12PT5 = 12.5%.
25 = 25%.
37PT5 = 37.5%.
50 = 50%.
62PT5 = 62.5%.
75 = 75%.
87PT5 = 87.5%.
100 = 100% control all alternate route traffic.

In addition to the above, any integer between 0 and 100 may also be specified as an alternate route percentage.

e = Announcement (ANN) treatment if blocking occurs. Valid value(s):
   EANN1 = Emergency announcement 1.
   EANN2 = Emergency announcement 2.
   NCA = No circuit announcement.
   NODISP = No announcement.

Note: Default is NODISP. Control types CANT and CANF require an announcement (EANN1, EANN2, or NCA).

f = Switching domain list.

g = Switching domain list type. Valid value(s):
   EXC = Exclude (control domains not in the list).
   INC = Include (control the domains in the list). ALL is only valid with INC option.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
   INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

PF = Printout follows. Followed by the SET:TGC output message.

RL = Retry later. Valid value(s):
   RESOURCE SHORTAGE = The necessary resources are not available.

5. REFERENCES

Input Message(s):

CLR:TGC
OP:M5
OP:TGC
SET:RR

Output Message(s):

SET:TGC
1. PURPOSE

Requests that a skip, cancel-to, cancel-from, or cancel reroute overflow (CRO) trunk group control (TGC) on a trunk group be set for immediate activation (manual control).

2. FORMAT

`SET:TGC,TG=a,CNTL=b[,DRPCT=c][,ARPCT=d][,ANN=e],DL={ALL|f[-f. . . .[-f[-f]]]},DLTYPE=g;`

3. EXPLANATION OF MESSAGE

- **ALL** = Set trunk group control for all domains on a trunk group. (This option is only valid if variable ‘g’ = INC.)

- **a** = Trunk group number.

- **b** = Control type. Valid value(s):
  - CANF = Manual cancel from control.
  - CANT = Manual cancel-to control.
  - CRO = Manual cancel reroute overflow control.
  - SKIP = Manual skip control.

- **c** = Direct route percentage of traffic to control. Valid value(s):
  - 0 = No control, but collect measurements (default).
  - 12PT5 = 12.5%.
  - 25 = 25%.
  - 37PT5 = 37.5%.
  - 50 = 50%.
  - 62PT5 = 62.5%.
  - 75 = 75%.
  - 87PT5 = 87.5%.
  - 100 = 100%, control all direct route traffic.

In addition to the above, any integer between 0 and 100 may also be specified as a direct route percentage.

- **d** = Alternate route percentage of traffic to control. Valid value(s):
  - 0 = No control but collect measurements (default).
  - 12PT5 = 12.5%.
  - 25 = 25%.
  - 37PT5 = 37.5%.
  - 50 = 50%.
  - 62PT5 = 62.5%.
  - 75 = 75%.
87PT5   = 87.5%.
100     = 100% control all alternate route traffic.

In addition to the above, any integer between 0 and 100 may also be specified as an alternate route
percentage.

e = Announcement (ANN) treatment if blocking occurs. Valid value(s):
EANN1   = Emergency announcement 1.
EANN2   = Emergency announcement 2.
NCA     = No circuit announcement.
NODISP  = No announcement.

Default is NODISP. Control types CANT and CANF require an announcement (EANN1, EANN2, or
NCA).

f = Switching domain list.

Switching domain list type. Valid value(s):
EXC     = Exclude (control domains not in the list).
INC     = Include (control the domains in the list). ALL is only valid with INC option.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - INVALID REQUEST = The request has been denied. This office is not equipped to process the
     request entered.

PF = Printout follows. Followed by the SET:TGC output message.

RL = Retry later. May also include:
   - RESOURCE SHORTAGE = The necessary resources are not available.

235-190-115  Local and Toll System Features
1. PURPOSE

Requests that a skip, cancel-to, cancel-from, or cancel reroute overflow (CRO) trunk group control (TGC) on a trunk group be set for immediate activation (manual control).

**NOTE:** For the AUTOPLEX® application, this message will not have any effect on the application software. It can be entered, but it will not take effect.

2. FORMAT

```plaintext
SET:TGC,TG=a,CNTL=b
[,DRPCT=c][,ARPCT=d][,HTRDPCT=e][,HTRAPCT=f][,ANN=g],DL={ALL|h[-h[-h[-h]]]},DLTYPE=i;
```

3. EXPLANATION OF MESSAGE

- **ALL** = Set trunk group control for all domains on a trunk group. (This option is only valid if variable 'c' = INC.)
- **a** = Trunk group number.
- **b** = Control type. Valid value(s):
  - **CANF** = Manual cancel from control.
  - **CANT** = Manual cancel-to control.
  - **CRO** = Manual cancel reroute overflow control.
  - **SKIP** = Manual skip control.
- **c** = Direct route percentage of traffic to control to non hard-to-reach (HTR) destinations. Valid value(s):
  - 0 = No control (default).
  - 12PT5 = 12.5%.
  - 25 = 25%.
  - 37PT5 = 37.5%.
  - 50 = 50%.
  - 62PT5 = 62.5%.
  - 75 = 75%.
  - 87PT5 = 87.5%.
  - 100 = 100%, control all traffic.

In addition to the above, any integer between 0 and 100 may also be specified as a route percentage.

- **d** = Alternate route percentage of traffic to control to non-HTR destinations. Valid values are the same as variable ‘c’.
- **e** = Direct route percentage of traffic to control to destinations assigned to the HTR list. Valid values
are the same as variable 'c'.

\( f \) = Alternate route percentage of traffic to control to destinations assigned to the HTR list. Valid values are the same as variable 'c'.

\( g \) = Announcement (ANN) treatment if blocking occurs. Valid value(s):

- EANN1 = Emergency announcement 1.
- EANN2 = Emergency announcement 2.
- NCA = No circuit announcement.
- NODISP = No announcement.

**NOTE:** Default is NODISP. Control types CANT and CANF require an announcement (EANN1, EANN2, or NCA).

\( h \) = Switching domain list.

\( i \) = Switching domain list type. Valid value(s):

- EXC = Exclude (control domains not in the list).
- INC = Include (control the domains in the list). ALL is only valid with INC option.

### 4. SYSTEM RESPONSE

\( NG \) = No good. Valid value(s):

- INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.
- FEATURE NOT AVAILABLE = The HTR feature is not available.

\( PF \) = Printout follows. Followed by the SET:TGC output message.

\( RL \) = Retry later. Valid value(s):

- RESOURCE SHORTAGE = The necessary resources are not available.

Output Message(s):

- SET:TGC

Other Manual(s):

235-190-115  *Local and Toll System Features*
SET:TRACE

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the user be allowed to change the contents of the system trace control block, and therefore to change the operational characteristics of trace.

The TRACE process SET:TRACE joins the terminate class associated with TRACE process tdcp.p. This means that the process will be aborted whenever tdcp.p is aborted by its owner which may be either interprocess message switch (IMS) or an application.

Inserts any specified changes into the system trace control block in the administration module (AM). New detail flags are place in both the user-detail-flag structure and the system-detail-flag structure.

The control unit (CU) parameter specifies what TRACE will process. If CU is YES, the AM software will be traced. If CU is NO, it will not trace the AM software. If CU is set to ONLY, the AM software will be traced without tracing the NP software.

The RFMT keyword requests that a new trace format file be read into main memory from disk. This allows a new trace format file to be installed without requiring an interprocess message switch (IMS) level 3 or 4 initialization.

2. FORMAT

1. SET:TRACE=[((IMEAS[-ITRACE-IOPNS]|ALL)-(h'FFF|0))]
   [CU={YES|NO|ONLY}][,RFMT];

2. SET:TRACE=[((IMEAS[-ITRACE-IOPNS]|ALL)-(h'FFF|0))]
   NP={IUN01 1|IUN32 1-IUN32 5-IUN02 2|NONE};

3. SET:TRACE=[((IMEAS[-ITRACE-IOPNS]|ALL)-(h'FFF|0))]
   NP=IUN01 1:SLOT={1|(1,2,5)}[:CU={YES|NO|ONLY}];

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

OK = Good. The request has been received and completed.

5. REFERENCES

Input Message(s):

ALW:TRACE
INH:TRACE
OP:TRACE

Output Message(s):
ALW:TRACE
INH:TRACE
OP:TRACE
REPT:TRACE
SET:TRACE
1. PURPOSE

Requests that a trap be set for CCS7 type messages by entering the specific trap attributes that are to be matched. The trap can be set to start immediately or at a future time.

Traps will be initiated based on the trap attribute information given. A trap identification number is given for each valid SET:TRAP input message entered. This number will allow tracking of the status of the trap entered. Incoming signaling messages meeting the trap criteria given in this input message will be collected at the nodes and sent to the administrative module (AM).

2. FORMAT

SET:TRAP, LNKR=z^1-a^2-z^1-a^2:, DMI=Y, [:ST=r^1]
[, DUR=s^1-t^1] [, MCNT=u^1]
[, RATE=w^1] [, RTDSP=y^1];

3. EXPLANATION OF MESSAGE

DMI = Discard message indicator - 'Y' or 'N'. If 'Y' is given, no other trap attribute parameters can be specified.

NOSAVE = Trapped messages on the disk will not be saved.

RTDSP = Real-time display - 'Y' or 'N'. This indicates whether the trapped messages will be printed in real-time to the default destination (that is, MCRT, ROP, SCCS). The default will be 'N'. If 'Y' is given, the trapped messages will be printed to the default destination as soon as they arrive at the AM.

SAVE = Trapped messages on the disk will be saved.

a = Filename (full pathname using lower case where it applies).
Note: SET:TRAP input messages are to be typed in the file just as they would appear if typed manually on the maintenance terminal (MCRT) (that is, if wrap-around occurs with input messages typed on the MCRT, that input message should be typed in the file with wrap-around occurring). All input messages specified in the file must have a proper terminating character (that is, ";") followed by a newline character. There is a limit of five SET:TRAP input messages that can be included in a file because only five simultaneous traps can be activated at one time.

b = Linkset (1 - 255).

c = System 7 (S7) message type. Valid value(s):
- ALL7 = All System 7 signaling messages.
- DCIS = System 7 direct signaling message.
- ECIS7 = System 7 embedded CIS message.
- MREG7 = System 7 maintenance regular messages.
- MSPEC7 = System 7 maintenance special messages.
- ISDN7 = System 7 integrated services digital messages.
- SCCP = System 7 signaling connection control point.
- SNM7 = System 7 signaling network management messages.

d = Source origination point code (SOPC) (3 bytes).

e = Mask field for SOPC (3 bytes).

f = Origination point code (3 bytes).

g = Mask field for OPC (3 bytes).

h = Destination point code (3 bytes).
i = Mask field for DPC (3 bytes).

j = Calling party translation type (1 byte).

k = Mask for calling party translation type (1 byte).

l = Calling party point code (3 bytes).

m = Mask for calling party point code (3 bytes).

n = Calling party sub-system number (1 byte).

o = Mask for calling party sub-system number (1 byte).

p = Calling party global title (up to 6 bytes).
   Note: This attribute is typically the calling party directory number (DN).

q = Mask for calling party DN (up to 6 bytes).

r = Called party translation type (1 byte).

s = Mask for called party translation type (1 byte).

t = Called party point code (3 bytes).

u = Mask for called party point code (3 bytes).

v = Called party sub-system number (1 byte).

w = Mask for called party sub-system number (1 byte).

x = Called party global title (up to 6 bytes).
   Note: This attribute is typically the called party DN.

y = Mask for called party DN (up to 6 bytes).

z = Domain (3 bits).

a = Mask for domain (3 bits).

b = Destination_A field (10 bits).

c = Mask for Destination_A field (10 bits).

d = Destination_B field (10 bits).

e = Mask for Destination_B field (10 bits).

f = Band number (9 bits).

g = Mask for band number (9 bits).

h = Virtual link number (3 bits).

i = Mask for virtual link number (3 bits).
j¹ = Reason for return field (1 byte).

k¹ = Return code (2 bits).

l¹ = Mask for return code (2 bits).

m¹ = Layer 3 offset (in bytes) beginning at 1 byte before the SIO field byte. This value must be a multiple of 2 bytes.

n¹ = Layer 3 bit pattern (4 bytes).

o¹ = Mask for layer 3 bit pattern (4 bytes).

Note: The offset and bit pattern field can be given multiple times when specifying multiple offsets and bit patterns (that is, e¹-f¹, e¹-f¹, e¹-f¹).

p¹ = Return address (15 bits).

q¹ = Mask for return address (15 bits).

Note: The numbers in () reflect the actual size for the fields. Byte quantities should be specified when values are entered in hexadecimal. Only a maximum of 5 fields can be specified for c - h¹.

r¹ = Starting time of trap (given in network time [24-hour format] example, 3:00 P.M. is given as 1500). The default is immediate activation of the trap.

s¹ = Number of hours in duration of trap (Maximum duration is 168 hours [7 days times 24 hours]).

t¹ = Number of minutes for duration of trap. Default duration is five minutes or ten messages, whichever comes first.

u¹ = Maximum number of messages to be trapped and saved. The default is 100 messages.

Note: If neither DUR nor MCNT is given, default values will be taken from DEF_MSGCNT (10) and DEF_DUR (5) respectively. If MCNT is given and DUR is not given, MAX_DUR (168) will be taken as the value of the DUR field and the given MCNT value will be checked against an upper-bound of MTRP_CNT (1000) to preserve system integrity. If DUR is given and MCNT is not given, MAX_MSGCNT (100) will be taken as the value of the MCNT field and the given DUR value will be checked against an upper-bound of MTRP_DUR (7 days) to preserve system integrity. If both MCNT and DUR are given, they will be checked against the values in MTRP_CNT (1000) and MTRP_DUR (7 days) to preserve system integrity.

v¹ = Message size (that is, maximum number of bytes of a trapped message to be saved). This value must be given in multiples of 4 bytes. If no value is given for message size, the user tunable parameter is MAX_MSGSIZE (272 bytes).

w¹ = Rate of trapping for matching messages to be collected will be 1 out of the given rate value (that is, if 10 is specified, then 1 out of every 10 messages will be collected). The default taken will be a trapping rate of 1 per 100 (1-100).

x¹ = Message class number (0-255). Specifies the output class for output of trap information. The default will be the MCRT, ROP, and SCCS (0-255).
\[ y^1 \quad = \text{Yes or no (Y or N).} \]
\[ z^1 \quad = \text{Group number.} \]
\[ a^2 \quad = \text{Member number.} \]
\[ d^2 \quad = \text{Mode for incoming or outgoing trapping. The default is for incoming. Valid value(s): IN = Incoming message type. OUT = Outgoing message type.} \]

Note: Fields requiring a bit pattern value can be specified in either hexadecimal or decimal value with the exception of the global title fields. Global title fields can only be entered in hexadecimal.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by a SET:TRAP output message.

3. EXPLANATION OF MESSAGE

**DMI**
- Discard message indicator - 'Y' or 'N'. If 'Y' is given, no other trap attribute parameters can be specified.

**NOSAVE**
- Trapped messages on the disk will not be saved.

**RTDSP**
- Real-time display - 'Y' or 'N'. This indicates whether the trapped messages will be printed in real-time to the default destination (that is, MCRT, ROP, SCCS). The default will be 'N'. If 'Y' is given, the trapped messages will be printed to the default destination as soon as they arrive at the AM.

**SAVE**
- Trapped messages on the disk will be saved.

**a**
- Filename (full pathname using lower case where it applies).

Note: SET:TRAP input messages are to be typed in the file just as they would appear if typed manually on the maintenance terminal (MCRT) (that is, if wrap-around occurs with input messages typed on the MCRT, that input message should be typed in the file with wrap-around occurring). All input messages specified in the file must have a proper terminating character (that is, ";") followed by a newline character. There is a limit of five SET:TRAP input messages that can be included in a file because only five simultaneous traps can be activated at one time.

**b**
- Linkset (1 - 255).

**c**
- System 7 (S7) message type. Valid value(s):
  - **ALL7** = All System 7 signaling messages.
  - **BICC7** = System 7 bearer independent call control messages.
  - **MREG7** = System 7 maintenance regular messages.
  - **MSPEC7** = System 7 maintenance special messages.
  - **ISDN7** = System 7 integrated services digital messages.
  - **SCCP** = System 7 signaling connection control point.
  - **SNM7** = System 7 signaling network management messages.

**d**
- Origination point code (3 bytes).

**e**
- Mask field for OPC (3 bytes).

**f**
- Destination point code (3 bytes).

**g**
- Mask field for DPC (3 bytes).

**h**
- Calling party translation type (1 byte).

**i**
- Mask for calling party translation type (1 byte).

**j**
- Calling party point code (3 bytes).

**k**
- Mask for calling party point code (3 bytes).
l = Calling party sub-system number (1 byte).

m = Mask for calling party sub-system number (1 byte).

n = Calling party global title (up to 6 bytes).

Note: This attribute is typically the calling party directory number (DN).

o = Mask for calling party DN (up to 6 bytes).

p = Called party translation type (1 byte).

q = Mask for called party translation type (1 byte).

r = Called party point code (3 bytes).

s = Mask for called party point code (3 bytes).

t = Called party sub-system number (1 byte).

u = Mask for called party sub-system number (1 byte).

v = Called party global title (up to 6 bytes).

Note: This attribute is typically the called party DN.

w = Mask for called party DN (up to 6 bytes).

x = Reason for return field (1 byte).

y = Return code (2 bits).

z = Mask for return code (2 bits).

a₁ = Layer 3 offset (in bytes) beginning at 1 byte before the SIO field byte. This value must be a multiple of 2 bytes.

b₁ = Layer 3 bit pattern (4 bytes).

c₁ = Mask for layer 3 bit pattern (4 bytes).

Note: The offset and bit pattern field can be given multiple times when specifying multiple offsets and bit patterns (that is, a₁-b₁,a₁-b₁,).

d₁ = Return address (15 bits).

e₁ = Mask for return address (15 bits).

Note: The numbers in () reflect the actual size for the fields. Byte quantities should be specified when values are entered in hexadecimal. Only a maximum of 5 fields can be specified for c-v.

MCC Display Page(s):
130 (NM EXCEPTION)
SET:WSDGTL

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests setting the trunk and line work station (TLWS) test position (TP) digital testing defaults. The stored defaults are then used when a TST:WSDGTL test is requested and the values are not explicitly set.

2. FORMAT

SET:WSDGTL,TP=a[,TERM=b][,BLKSZ=d][,CHAN=e][,TESTEQ=f][,TRUNK]

3. EXPLANATION OF MESSAGE

CHAN = Channel.
TERM = Termination point.
TESTEQ = Information pertaining to the test equipment being used in the testing.
TRUNK = When present, the SET:WSDGTL defaults are for trunk testing. Otherwise, the testing defaults are for DSL testing (default).

a = TLWS TP number.
b = Termination point for the loopback. Valid value(s):

CUc = Loopback point is a specified basic rate interface transmission extension (BRITE) channel unit (CU). Only valid on U-DSLs. For ANSI U-DSLs, c = 1 through 6. For AMI U-DSLs, c = 1 through 4.

EXT = Loopback is an external connection to the terminal. The digital bit stream is sent out, and it is the terminal's option to send the bits back in the sent format or in an inverted format.

LBK = Loopback test, for a digital trunk, sends the digital bit stream out to the far end office. The far end office sends the bit stream back in the same format. (digital trunks only)

LBKCSU = Loopback test, for a packet-switching digital trunk, sends the digital bit stream out to the channel service unit (CSU). The CSU sends the bit stream back in the same format. Valid for packet switching trunks only.

LBKINV = Loopback test, for a digital trunk, sends the digital bit stream out to the far end office. The far end office sends the bit stream back in the inverted format. (digital trunks only)

LBKOCU = Loopback test, for a packet-switching digital trunk, sends the digital bit stream out to the office channel unit (OCU). The OCU sends the bit stream back in the same format. Valid for speech handler trunks only.

LBKSHT = Loopback test, for a speech handler trunk, sends the digital bit stream in to the speech handler (SH). The SH sends the bit stream back in the same format. Valid for speech handler trunks only.

LT = Loopback point is a physical loopback in the line card. Default value digital subscriber line. (DSL only)

MANSINK = Sets a loopback for a loopback test originated by the far end switch. When the far
end switch sends a digital bit stream, the switch sends the digital bit stream back in the same format. Note: Block size entered is irrelevant when this termination is used. Valid for packet switching trunks only.

MANSRCE = Loopback test, for a packet-switching digital trunk sends the digital bit stream out to the far end switch. The far end switch sends the digital bit stream back in the same format. Note: the far end switch must manually set the loopback prior to running this test. Valid for packet switching trunks only.

NT1 = Loopback point is a physical loopback at the network termination (NT1). Default value for U-DSL. (U-DSL only)

PH = Loopback point is in the protocol handler. (DSL only)

d = Number of bits in the blocks to be sent (1 - 64000, Default: 56000 for DSLs, 64000 for digital trunks).

e = Channel of the DSL (valid for DSLs only) where. Valid value(s):
   ALL = Run the test on all the channels of the DSL.
   B1 = Run the test on the B1-channel.
   B2 = Run the test on the B2-channel.
   D = Run the test on the D-channel.

f = Channel of the DSL for which information pertaining to the test equipment being used in the testing will is. Valid value(s):
   B1 = Display the B1-channel test equipment information.
   B2 = Display the B2-channel test equipment information.
   D = Display the D-channel test equipment information (default).

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

OK = Good. Digital testing defaults set.

MCC Display Page(s):

160 (TRUNK & LINE MAINT)
SET:WSFREQ

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests setting the trunk and line work station (TLWS) test position (TP) frequency and/or level. The stored frequency and level are used when a request for a TST:WSSEND test is performed and no frequency or level are specified or when a TST:WSMEAS test is requested with an associated tone sent simultaneous with the measurement.

This request overwrites the default frequency and level of 1004hz 0db. Use CLR:WSFREQ to reset the test position default frequency and level.

2. FORMAT

SET:WSFREQ,TP=a,FREQ=b,{LVP=c|LVN=d};

3. EXPLANATION OF MESSAGE

FREQ = Frequency in hertz.
LVN = Negative level in decibels.
LVP = Positive level in decibels.
a = TLWS TP number.
b = Frequency in hertz (0-4000). The values 1, 2, and 4 are interpreted as a short-hand encoding of the values 1004, 2804, and 404 Hz respectively.
c = Level in positive tenths of db of the tone (0-30) (for example, +2.4 db is specified as 24).
d = Level in negative tenths of a db of the tone. (for example, -24 db is specified as 240).

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.
OK = Good. Frequency and/or level set.

MCC Display Page(s):

160 (TRUNK & LINE MAINT)
SET:WSOPD

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests to set the digits that are to be used for automatic outpulsing on a trunk associated with the indicated trunk and line work station (TLWS) test position (TP). If a trunk is currently associated with the indicated TP, then the outpulsing will occur with this input message. If no test is occurring, then the digits will be outpulsed whenever a valid test is requested (that is, AC JACK or transmission). A TLWS TP must have already been selected by the seize TP menu input message.

Use the clear outpulse digits menu input message to clear the outpulse digits from the TP memory.

2. FORMAT

SET:WSOPD,TP=a,OPD=b[,FRCD][,MINT=c];

3. EXPLANATION OF MESSAGE

FRCD  = Force outpulsing of digits immediately. This option only has significance for direct inward dialing (DID) and integrated digital carrier unit (IDCU) trunks.

MINT  = Multifarious Intra-Network Trunk.

a  = TLWS TP number.

b  = Digits to be outpulsed for trunk tests (a maximum of 15 digits allowed).

c  = Additional digits for outpulsing over MINT trunks.

4. SYSTEM RESPONSE

Note: If the TLWS talk and monitor (T&M) phone is not busy, it will automatically be brought into the connection.

IP  = Request in progress.

NG  = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

SET:WSPHONE

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the mode of the trunk and line work station (TLWS) talk-and-monitor (T&M) phone connected to the indicated test position (TP) be set.

2. FORMAT

SET:WSPHONE,TP=a[,MODE=b][,DN=c];

3. EXPLANATION OF MESSAGE

DN = Directory number.
a = TLWS TP number.
b = Mode to set the T&M phone. Valid value(s):
MNTR = The user can only listen.
TALK = The user can talk and listen. This is the default value.
TEST = Phone on hold.
OVER = Changes the phone number of a remote talk and monitor connection. The phone associated with this TP using a TLWSR tuple must already have the T&M phone defined as remote. Refer to the SET:WSPOS input message.
c = Directory number to use from this point on when adding a remote talk and monitor (CONN:WSPHONE) phone into the connection.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.
OK = Good.

   160 (TRUNK & LINE MAINT)

RC/V View(s):

   14.3 (TRUNK AND LINE WORK STATION)
1. PURPOSE
Requests a trunk and line work station (TLWS) test position (TP) and testing resources (ID) to associate with the terminal issuing this input message.

2. FORMAT

SET:WSPOS[,TP=a][,ID=b];

3. EXPLANATION OF MESSAGE

a = TLWS TP number. This parameter is optional and, if not provided, a search is made to find the lowest unused TP the number of TP that may be acquired concurrently may be modified using the GLTPMAX system parameter and is also affected by the GLTPMAJOR and GLTPMINOR system parameters in overload conditions.

b = TLWS identifier (ID) number. Associates a set of testing resources with a TP. The testing resources are specified using a TLWSR tuple in the ODD database. This is specified using RC/V View 14.3 TRUNK ANND LINE WORK STATION. Multiple TPs may use the same identifier. This parameter is optional and, if not provided, a search is made to find the lowest TLWSR tuple whose DEVID field matches the device identifier of the input terminal.

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

OK = Good. TP was acquired.

PF = Printout follows. Followed by an OP:WSPOS output message indicating the TP number and the TLWSR tuple number (ID) which were acquired.

RL = Retry later. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

RC/V View(s):

14.3 (TRUNK AND LINE WORK STATION)
72. SND
1. PURPOSE

Allows the user to send on demand a block or unblock message for bearer independent call control (BICC). This input message will provide this capability with the following side effects:

- If block sending is requested, the far-end office will be prohibited from originating calls until an unblocking, initial address message (IAM), reset circuit (RSC) / group reset (GRS) is sent.

- Block/unblock sending is done without any call instance code (CIC) state change. If block sending is requested, there is no state change done that will prohibit outgoing call selection. If unblock sending is requested, there is no state change done that will allow outgoing call selection.

- There is no immediate indication that the far-end office received the block/unblock message and is indeed remotely blocked.

  Machine-detected interoffice irregularities (MDII) generation would imply the message was not received and/or processed in the far-end office.

  BICC CIC query (BQ) could be used to verify that the far-end office is remotely blocked.

- Previously active block/unblock/reset sending requests are terminated when this command is entered.

  Abnormal acknowledgement processing should be expected, if the previously sent request acknowledges.

Format 1 is used to send on demand a(n) (un)block for an entire BICC group.

Format 2 is used to send on demand a(n) (un)block for one BICC group member or a range of members.

2. FORMAT

[1] SND:BICCMSG,BG=a,MSG=d;

[2] SND:BICCMSG,BGMN=a-b[&c],MSG=d;

3. EXPLANATION OF MESSAGE

a  = BICC group number.

b  = BICC group member number. If a range is used, this will be the lower range value.

c  = BICC group member number. This is only used with a range and will be the upper range value.

d  = Message type, either BLOCK or UNBLOCK.

4. SYSTEM RESPONSE
NG  = No good. May also include:
- BG INVALID = BICC group number not equipped.
- BGMN INVALID = BICC group member number not equipped.
- BG HAS NO ASSOCIATED MEMBERS = BICC group is equipped but it has no associated member.

PF  = Printout follows. Followed by the SND:BICCMGS output message.

Software Release: 5E14 and later
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Places a specified ATTS (Automatic Trunk Test Scheduler) test schedule in an operational state to enable the automatic execution of test sessions defined in that schedule. If the specified schedule is in the "SUSPENDED" state at the time this input message is processed, then that schedule will be placed in the state in which it was operating at the time it was interrupted by the prior STP:ATTS input message. If that previous state is the "RUNNING" state, then operation of the test session will resume from the point of interruption.

2. FORMAT

ST:ATTS,SCHED=a;

3. EXPLANATION OF MESSAGE

a = The number of the ATTS test schedule to be started (1 - 20).

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the ST:ATTS output message.

14.9 (ATTS TEST SESSION SCHEDULE DATA)
14.10 (ATTS TEST SCHEDULE PARAMETER)
ST:DBPROXY

Software Release: 5E15 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Perform maintenance actions on the static office-dependent data (ODD) proxy database. The static ODD proxy database is an in sync copy of the static ODD and is located on the administrative services module (ASM). The static ODD proxy database contains several databases. A database exists for each of the processors [administrative module (AM), switching module(s) (SMs), and communication module processor (CMP)], plus a database for the SM's redundant ODD (RODD). Actions performed on the proxy database can be done on individual databases or on the entire set of databases.

The proxy database will be largely transparent to the user in the sense that all initialization, update, and recovery actions will be handled automatically. However, this command allows manual interaction with the proxy database when needed.

2. FORMAT

ST:DBPROXY,ACTION=a[,DB=b[,SM=c][,MAXSIZE=d][,RELNAME=e]];  

3. EXPLANATION OF MESSAGE

<table>

<th>Database. Valid value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>AM</td>
<td>Administrative module.</td>
</tr>
<tr>
<td>CMP</td>
<td>Communications module processor.</td>
</tr>
<tr>
<td>RODD</td>
<td>SM redundant ODD.</td>
</tr>
<tr>
<td>SM</td>
<td>Switching module.</td>
</tr>
</tbody>
</table>

| c       | SM number. This parameter is only valid when variable 'b' is equal to SM. |
| d       | New maximum size value for the specified database, in kilobytes. This parameter is only valid when variable 'a' is equal to RESIZE. |
The current status of the proxy database will be printed if the STATUS action is specified. The status information will indicate if the proxy is available, unavailable, or in some form of recovery. The OFFLINE and ONLINE actions are used to take the proxy database offline and bring it back online. Bringing the proxy offline will block any user access to the proxy and disconnect the proxy from any interaction with the switch. The forwarding of updates from the switch will stop and any proxy recovery actions will be stopped in this case. Bringing the proxy back online will cause the proxy to be resynchronized from the switch ODDs and make it available to user access again. If the proxy was offline for an extended period this could involve a full reload of the databases.

The RELOAD action is used to reload the proxy database for a specific processor from its switch ODD. The RELOADALL action is used to reload the entire proxy database from the switch ODDs. These reload actions can also be used to create a proxy for a specific processor if it does not exist. A processor must be operational to be reloaded or created. The REMOVE action is used to remove the proxy database for a specific processor. The REMOVEALL action is used to remove the entire proxy database. The entire proxy database can only be removed if it is offline. The SIZEREPORT action is used to print the current and maximum space allocated to a specific proxy database. The SIZEREPORTALL action is used to print the current and maximum space allocated to all proxy databases. The RESIZE action changes the maximum space allocated to a specific proxy database. When using the resize action the database must be specified and the new maximum size of the database in Kbytes must be specified in variable ‘d’. Note that the current size of the database may also slightly change when the maximum size is changed with the RESIZE action due to allocation of page tables that are included in the database. The RELCOMPARE action determines if the data in the relation specified in variable ‘e’ is the same in both the switch ODD and the proxy database. A database must be specified with this action and the relation will only be compared on the specified database. The RESTART action restarts the database servers.

Interactions between full office recovery actions and single processor recovery actions are more complicated and will be handled as follows. If a full office recovery action is in progress, no single processor operations are allowed. If the proxy is online, offline (or recovery failed), or removed, then single processor recovery actions will be allowed. Only one single processor recovery action will be allowed at a time. If a single processor recovery is in progress and a full office recovery is requested, the single processor recovery will be stopped and the full office recovery will proceed. A server restart may escalate into a full recovery in this case.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by ST:DBPROXY output message.

   235-105-230 Hardware Change Procedures
1. PURPOSE

Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line. This is accomplished with a non-interfering pump that does not interrupt call processing nor drop any calls. This input message must be executed during the growth procedures for the first peripheral of each type grown in on an SM. The SM is no longer pumped with the peripheral images for peripherals that are unequipped.

2. FORMAT

ST:NIPMP,ODRID=a,SM=b[,UCL];

3. EXPLANATION OF MESSAGE

- **UCL** = Unconditionally pump the image(s) for the specified unit although the images may have previously been loaded.

- **a** = SM peripheral hardware unit. Valid value(s):
  - **DNUS** = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are pumped from AM disk. This includes the DNUSCC and DNUSTMX images and hashsums.
  - **DSP13K** = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.
  - **DSPACELP** = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.
  - **DSPEVRC** = The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.
  - **DSPVSELP** = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.
  - **GDSF** = The global digital services function (GDSF) resident operational software image and hashsum are pumped from AM disk.
  - **IDCU** = The set of three IDCU resident software images and hashsums are pumped from AM disk. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.
  - **ISLU** = The integrated services line unit (ISLU) resident software image and hashsum are pumped from AM disk.
  - **ISLU2** = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are pumped from AM disk.
  - **ISTF** = The integrated services test facility (ISTF) resident operational software image and hashsum are pumped from AM disk. The hardware digital service unit (HDSU) diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.
  - **LDSF** = The logical digital service unit (LDSF) resident operational software image and hashsum are pumped from AM disk. The DSC3 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.
  - **LDSF2** = The local digital service function 2 (LDSF2) resident operational software image
and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**LDSU**
- The LDSU resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**PH2**
- The set of four protocol handler model 2 (PH2) resident software images and hashsums are pumped from AM disk. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

**PH22S**
- The protocol handler model 22 (PH22) common channel signaling resident software image (PH22S) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22S) and hashsums will also be pumped.

**PH3C**
- The set of two PH3 ISDN resident software images and hashsums are pumped from the AM disk. This includes the PH3C and OIOP images and hashsums.

**PH3S**
- The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

**PH4ACC**
- The set of two protocol handler model 4 (PH4) resident access software images and hashsums are pumped from AM disk. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

**PH4GWY**
- The set of two PH4 resident gateway software images and hashsums are pumped from AM disk. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

**PH4IFR**
- The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4W LAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well.

**PH4PP**
- The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well. These images are used for CDMA and TDMA packet pipe applications.

**PHA1**
- The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are pumped from AM disk.

**PHE1**
- The set of two protocol handler (PHE1) with SCSI/Ethernet resident software images and hashsums are pumped from AM disk.

**PHV1**
- The speech handler (PHV1) resident software image (PHV1C) and hashsum are pumped from AM disk.

**PHV3C**
- The set of two speech handler (PHV3) resident software images and hashsums are pumped from the AM disk. This includes the PHV3C and DSP8K images and hashsums.

**PHV4C**
- The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSPEVRC images and hashsums.

**PI**
- The packet interface (PI) resident software image and hashsum are pumped from AM disk.

**PI2**
- The packet interface model 2 (PI2) resident software image and hashsum are pumped from AM disk.

**RAF**
- The recorded announcement function (RAF) resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**SAS**
- The operational and diagnostic service announcement system (SAS) resident
software images and hashsums are pumped from AM disk. This includes the SAS and HSAS images and hashsums.

V4DSPEVRC = The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPACELP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPISLP = The ISLP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Request not initiated due to bad syntax or invalid SM specified.

PF = Printout follows. Request accepted. Followed by the REPT:NIPMP output message.

      - The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.
    - **DSPVSELP**
      - The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.
    - **GDSF**
      - The global digital services function (GDSF) resident operational software image and hashsum are pumped from AM disk.
    - **IDCU**
      - The set of three IDCU resident software images and hashsums are pumped from AM disk. This includes the IDCUCP, IDCULSI, and IDCUDLP images and hashsums.
    - **ISLU**
      - The integrated services line unit (ISLU) resident software image and hashsum are pumped from AM disk.
    - **ISLU2**
      - The integrated services line unit model 2 (ISLU2) resident software image and hashsum are pumped from AM disk.
    - **ISTF**
      - The integrated services test facility (ISTF) resident operational software image and hashsum are pumped from AM disk. The hardware digital service unit (HDSU) diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.
    - **LDSF**
      - The logical digital service unit (LDSF) resident operational software image and hashsum are pumped from AM disk. The DSC3 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.
    - **LDSF2**
      - The local digital service function 2 (LDSF2) resident operational software image
and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**LDSU**  
The LDSU resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**PH2**  
The set of four protocol handler model 2 (PH2) resident software images and hashsums are pumped from AM disk. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

**PH22S**  
The protocol handler model 22 (PH22) common channel signaling resident software image (PH22S) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22S) and hashsums will also be pumped.

**PH22W**  
The PH22 wireless resident software image (PH22W) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22W) and hashsums will also be pumped.

**PH3C**  
The set of two PH3 ISDN resident software images and hashsums are pumped from the AM disk. This includes the PH3C and OIOP images and hashsums.

**PH3S**  
The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

**PH4ACC**  
The set of two protocol handler model 4 (PH4) resident access software images and hashsums are pumped from AM disk. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

**PH4GWY**  
The set of two PH4 resident gateway software images and hashsums are pumped from AM disk. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

**PH4IFR**  
The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well.

**PH4PP**  
The PH4 resident package pipe software IOP image (PH4PPPIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well. These images are used for CDMA and TDMA packet pipe applications.

**PHA1**  
The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are pumped from AM disk.

**PHE1**  
The set of two protocol handler (PHE1) with SCSI/Ethernet resident software images and hashsums are pumped from AM disk.

**PHV1**  
The speech handler (PHV1) resident software image (PHV1C) and hashsum are pumped from AM disk.

**PHV3C**  
The set of two speech handler (PHV3) resident software images and hashsums are pumped from the AM disk. This includes the PHV3C and DSP8K images and hashsums.

**PHV4C**  
The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSP8K images and hashsums.

**PHV5C**  
The set of two speech handler (PHV5) resident software images and hashsums are pumped from the AM disk. This includes the PHV5C and V5DSPCDMA images and hashsums.

**PI**  
The packet interface (PI) resident software image and hashsum are pumped from AM disk.

**PI2**  
The packet interface model 2 (PI2) resident software image and hashsum are
pumped from AM disk.

RAF
= The recorded announcement function (RAF) resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

SAS
= The operational and diagnostic service announcement system (SAS) resident software images and hashsums are pumped from AM disk. This includes the SAS and HSAS images and hashsums.

V4DSPEVRC1
= The set of three EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF +TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

V4DSP13K
= The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPACELP
= The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPISLP
= The ISLP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPVSELP
= The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V5DSPCDMA
= The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are pumped from AM disk, for use with the PHV5 speech handlers.

V5DSPISLP
= The ISLP DSP software image and hashsum are pumped from AM disk, for use with the PHV5 speech handlers.

V5DSPTDMA
= The consolidated TDMA QCELP (which include ACELP and VSELP) image and hashsums are pumped from AM disk, for use with the PHV5 speech handlers.

b
= SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

</table>
hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**LDSF2**
- The local digital service function 2 (LDSF2) resident operational software image and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**LDSU**
- The LDSU resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**OIU24**
- The 24-channel optical interface unit (OIU) resident software image and hashsum are pumped from AM disk.

**PH2**
- The set of four protocol handler model 2 (PH2) resident software images and hashsums are pumped from AM disk. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

**PH22I**
- The protocol handler model 22 (PH22) ISDN-Wireless resident software images (PH22I) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22) and hashsums will also be pumped.

**PH22S**
- The PH22 common channel signaling resident software image (PH22S) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22) and hashsums will also be pumped.

**PH31S**
- The protocol handler 31 for high speed signaling links image and hashsums are pumped from AM disk.

**PH3C**
- The set of two PH3 ISDN resident software images and hashsums are pumped from the AM disk. This includes the PH3C and OIOP images and hashsums.

**PH3S**
- The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

**PH4ACC**
- The set of two protocol handler model 4 (PH4) resident access software images and hashsums are pumped from AM disk. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

**PH4GWY**
- The set of two PH4 resident gateway software images and hashsums are pumped from AM disk. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

**PH4IFR**
- The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well.

**PH4PP**
- The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well. These images are used for CDMA and TDMA packet pipe applications.

**PHA1**
- The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are pumped from AM disk.

**PHA2A**
- The protocol handler for ATM (PHA2) version 2 resident software image and hashsum are pumped from AM disk.

**PHE1**
- The set of two protocol handler with SCSI/ethernet version 1 (PHE1) resident software images and hashsums are pumped from AM disk.

**PHE2E**
- The protocol handler with SCSI/ethernet version 2 (PHE2) resident software images and hashsums are pumped from AM disk.

**PHV1**
- The speech handler (PHV1) resident software image (PHV1C) and hashsum are pumped from AM disk.

**PHV3C**
- The set of two speech handler (PHV3) resident software images and hashsums
are pumped from the AM disk. This includes the PHV3C and DSP8K images and hashsums.

**PHV4C** = The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSP8K images and hashsums.

**PHV5C** = The set of two speech handler (PHV5) resident software images and hashsums are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.

**PI** = The packet interface (PI) resident software image and hashsum are pumped from AM disk.

**PI2** = The packet interface model 2 (PI2) resident software image and hashsum are pumped from AM disk.

**RAF** = The recorded announcement function (RAF) resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

**SAS** = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are pumped from AM disk. This includes the SAS and HSAS images and hashsums.

**V4DSPEVRC1** = The set of three EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF +TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

**V4DSP13K** = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

**V4DSPACELP** = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

**V4DSPISLP** = The ISLP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

**V4DSPVSELP** = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

**V5DSPCDMA** = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are pumped from AM disk, for use with the PHV5 speech handlers.

**V5DSPISLP** = The ISLP DSP software image and hashsum are pumped from AM disk, for use with the PHV5 speech handlers.

b = SM number. Refer to the APP::RANGES appendix in the Appendixes section of the Input Messages manual.

### 4. SYSTEM RESPONSE

**NG** = No good. Request not initiated due to bad syntax or invalid SM specified.

**PF** = Printout follows. Request accepted. Followed by the REPT:NIPMP output message.

### 5. REFERENCES

**Input Message(s):**

**STP:NIPMP**
Output Message(s):

    REPT:NIPMP

Input Appendix(es):

    APP: RANGES
1. PURPOSE

Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line. This is accomplished with a non-interfering pump that does not interrupt call processing nor drop any calls. This input message must be executed during the growth procedures for the first peripheral of each type grown in on an SM. The SM is no longer pumped with the peripheral images for peripherals that are unequipped.

2. FORMAT

ST:NIPMP,ODRID=a,SM=b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally pump the image(s) for the specified unit although the images may have previously been loaded.

a = SM peripheral hardware unit. Valid value(s):

CFCBUF = The configuration control buffer is not valid for this command, however it is listed as an available input because of commonality with CFR:SPRMEM. This buffer is not pumpable and should not be used as input to this command.

DNUS = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are pumped from AM disk. This includes the DNUSCC and DNUSTMX images and hashsums.

DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPACELP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPEVRC = The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

GDSF = The global digital services function (GDSF) resident operational software image and hashsum are pumped from AM disk.

GDSF2 = The global digital services function 2 (GDSF2) resident operational software image and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

IDCU = The set of three IDCU resident software images and hashsums are pumped from AM disk. This includes the IDCUCCP, IDCULSI, and IDCUDLP images and hashsums.

ISLU = The integrated services line unit (ISLU) resident software image and hashsum are pumped from AM disk.

ISLU2 = The integrated services line unit model 2 (ISLU2) resident software image and hashsum are pumped from AM disk.

ISTF = The integrated services test facility (ISTF) resident operational software image and hashsum are pumped from AM disk. The hardware digital service unit (HDSU)
diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

LDSF = The logical digital service unit (LDSF) resident operational software image and hashsum are pumped from AM disk. The DSC3 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

LDSF2 = The local digital service function 2 (LDSF2) resident operational software image and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

LDSU = The LDSU resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

OIU24 = The 24-channel optical interface unit (OIU) resident software image and hashsum are pumped from AM disk.

OIUATM = The asynchronous transfer mode (ATM) OIU resident software image and hashsum are pumped from AM disk.

OIUIMP = The internet protocol (IP) OIU resident software image and hashsum are pumped from AM disk.

PH2 = The set of four protocol handler model 2 (PH2) resident software images and hashsums are pumped from AM disk. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH22I = The protocol handler model 22 (PH22) ISDN-Wireless resident software image (PH22I) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22) and hashsums will also be pumped.

PH22S = The PH22 common channel signaling resident software image (PH22S) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22) and hashsums will also be pumped.

PH31S = The protocol handler 31 for high speed signaling links image and hashsums are pumped from AM disk.

PH3C = The set of two PH3 ISDN resident software images and hashsums are pumped from AM disk. This includes the PH3C and OIOP images and hashsums.

PH3S = The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

PH4ACC = The set of two protocol handler model 4 (PH4) resident access software images and hashsums are pumped from AM disk. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

PH4GWY = The set of two PH4 resident gateway software images and hashsums are pumped from AM disk. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

PH4IFR = The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well.

PH4PP = The PH4 resident package pipe software IOP image (PH4PPIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well. These images are used for CDMA and TDMA packet pipe applications.

PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are pumped from AM disk.

PHA2A = The protocol handler for ATM (PHA2) version 2 resident software image and
hashsums are pumped from AM disk.

PHE1 = The set of two protocol handler (PHE1) with SCSI/ethernet resident software images and hashsums are pumped from AM disk.

PHE2E = The protocol handler (PHE2) with SCSI/ethernet version 2 resident software images and hashsums are pumped from AM disk.

PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are pumped from AM disk.

PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are pumped from the AM disk. This includes the PHV3C and DSP8K images and hashsums.

PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSP8K images and hashsums.

PHV5C = The set of two speech handler (PHV5) resident software images and hashsums are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.

PI = The packet interface (PI) resident software image and hashsum are pumped from AM disk.

PI2 = The packet interface model 2 (PI2) resident software image and hashsum are pumped from AM disk.

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are pumped from AM disk. This includes the SAS and HSAS images and hashsums.

V4DSPEVRC1 = The set of three EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF+TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

V4DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPACELP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPISLP = The ISLP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V5DSPCDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are pumped from AM disk, for use with the PHV5 speech handlers.

V5DSPISLP = The ISLP DSP software image and hashsum are pumped from AM disk, for use with the PHV5 speech handlers.

V5DPSME13 = The consolidated SMV, EVRC and 13K DSP software image and hashsum are pumped from AM disk, for use with the PHV5 speech handlers.

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
NG = No good. Request not initiated due to bad syntax or invalid SM specified.

PF = Printout follows. Request accepted. Followed by the REPT:NIPMP output message.

APP: RANGES
1. PURPOSE

Requests a download into switching module (SM) memory from administrative module (AM) disk of the peripheral image or images that reside in the peripheral unit specified on the input message line. This is accomplished with a non-interfering pump that does not interrupt call processing nor drop any calls. This input message must be executed during the growth procedures for the first peripheral of each type grown in on an SM. The SM is no longer pumped with the peripheral images for peripherals that are unequipped.

2. FORMAT

ST:NIPMP,ODRID=a,SM=b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally pump the image(s) for the specified unit although the images may have previously been loaded.

a = SM peripheral hardware unit. Valid value(s):

CFCBUF = The configuration control buffer is not valid for this input message, however it is listed as an available input because of commonality with CFR:SPRMEM. This buffer is not pumpable and should not be used as input to this input message.

CSCPSAS = The operational and diagnostic common service circuit platform (CSCP) service announcement system (SAS) resident software images and hashsums are pumped from AM disk. This includes the CSCPSAS and CSCPDG images and hashsums.

DNUS = The set of two digital network unit - synchronous optical network (SONET) (DNU-S) resident software images and hashsums are pumped from AM disk. This includes the DNUSCC and DNUSTMX images and hashsums.

DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPACELP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPEVRC = The EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV3 speech handlers.

GDSF = The global digital services function (GDSF) resident operational software image and hashsum are pumped from AM disk.

GDSF2 = The global digital services function 2 (GDSF2) resident operational software image and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are allocated in conjunction with this request if not already allocated.

IDCU = The set of three IDCU resident software images and hashsums are pumped from AM disk. This includes the IDCUCCP, IDCULSI, and IDCU2DLP images and hashsums.

ISLU = The integrated services line unit (ISLU) resident software image and hashsum are pumped from AM disk.

ISLU2 = The integrated services line unit model 2 (ISLU2) resident software image and
hashsum are pumped from AM disk.

ISTF
- The integrated services test facility (ISTF) resident operational software image and hashsum are pumped from AM disk. The hardware digital service unit (HDSU) diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

LDSF
- The logical digital service unit (LDSF) resident operational software image and hashsum are pumped from AM disk. The DSC3 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

LDSF2
- The local digital service function 2 (LDSF2) resident operational software image and hashsum are pumped from AM disk. The DSC4 diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

LDSU
- The LDSU resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

OIU24
- The 24-channel optical interface unit (OIU) resident software image and hashsum are pumped from AM disk.

OIUATM
- The asynchronous transfer mode (ATM) OIU resident software image and hashsum are pumped from AM disk.

OIUIP
- The internet protocol (IP) OIU resident software image and hashsum are pumped from AM disk.

PH2
- The set of four protocol handler model 2 (PH2) resident software images and hashsums are pumped from AM disk. This includes the PH2A, PH2G, DDMA, and ODMA images and hashsums.

PH22I
- The protocol handler model 22 (PH22) ISDN-Wireless resident software image (PH22I) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22) and hashsums will also be pumped.

PH22S
- The PH22 common channel signaling resident software image (PH22S) and hashsums are pumped from the AM disk. If not already loaded, the PH22 IOP image (IP22) and hashsums will also be pumped.

PH31S
- The protocol handler 31 for high speed signaling links image and hashsums are pumped from AM disk.

PH3C
- The set of two PH3 ISDN resident software images and hashsums are pumped from the AM disk. This includes the PH3C and OIOP images and hashsums.

PH3S
- The set of two protocol handler model 3 (PH3) common channel signaling (CCS) resident software images and hashsums are pumped from the AM disk. This includes the PH3S and IP3S images and hashsums.

PH4ACC
- The set of two protocol handler model 4 (PH4) resident access software images and hashsums are pumped from AM disk. This includes the PH4ACCAP and the PH4ISDNIP images and hashsums.

PH4GWY
- The set of two PH4 resident gateway software images and hashsums are pumped from AM disk. This includes the PH4GWYAP and the PH4ISDNIP images and hashsums.

PH4IFR
- The PH4 resident ISDN frame relay software IOP image (PH4IFRIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well.

PH4PP
- The PH4 resident package pipe software IOP image (PH4PPPIP) and hashsum regions are pumped from AM disk. If not already loaded, the PH4WLAP and the PH4ISDNIP (needed for diagnostics) images and hashsums will be pumped from AM disk as well. These images are used for CDMA and TDMA packet pipe applications.
PHA1 = The protocol handler for ATM (PHA1) resident software image (PHA1A) and hashsum are pumped from AM disk.
PHA2A = The protocol handler for ATM (PHA2) version 2 resident software image and hashsum are pumped from AM disk.
PHE1 = The set of two protocol handler (PHE1) with SCSI/ethernet resident software images and hashsums are pumped from AM disk.
PHE2E = The protocol handler (PHE2) with SCSI/ethernet version 2 resident software images and hashsums are pumped from AM disk.
PHV1 = The speech handler (PHV1) resident software image (PHV1C) and hashsum are pumped from AM disk.
PHV3C = The set of two speech handler (PHV3) resident software images and hashsums are pumped from the AM disk. This includes the PHV3C and DSP8K images and hashsums.
PHV4C = The set of two speech handler (PHV4) resident software images and hashsums are pumped from the AM disk. This includes the PHV4C and V4DSP8K images and hashsums.
PHV5C = The set of two speech handler (PHV5) resident software images and hashsums are allocated. This includes the PHV5C and V5DSPCDMA images and hashsums.
PHV6C = The set of two speech handler (PHV6) resident software images and hashsums are allocated. This includes the PHV6C and V6DSPCDMA images and hashsums.
PI = The packet interface (PI) resident software image and hashsum are pumped from AM disk.
PI2 = The packet interface model 2 (PI2) resident software image and hashsum are pumped from AM disk.
PSU2E = The set of CF3/PF3 resident firmware and hardware images and their corresponding hashsums that are pumped from the AM disk. This set is composed of 2 PF3 and 2 CF3 images as shown:

<table>
<thead>
<tr>
<th>Image Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CF3FW</td>
<td>CF3 Firmware image</td>
</tr>
<tr>
<td>CF3HW</td>
<td>CF3 Hardware image</td>
</tr>
<tr>
<td>PF3FW</td>
<td>PF3 Firmware image</td>
</tr>
<tr>
<td>PF3HW</td>
<td>PF3 Hardware image</td>
</tr>
</tbody>
</table>

RAF = The recorded announcement function (RAF) resident operational software image and hashsum are pumped from AM disk. The HDSU diagnostic software image and hashsum are pumped from AM disk in conjunction with this request if not already pumped.

SAS = The operational and diagnostic service announcement system (SAS) resident software images and hashsums are pumped from AM disk. This includes the SAS and HSAS images and hashsums.

V4DSPEVRC1 = The set of three EVRC DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers. This includes the V4DSPEVRC(FDTMF +TTY/TDD), V4DSPEVRC2(EC+TTY/TDD) and V4DSPEVRC3(EC+FDTMF) images and hashsums.

V4DSP13K = The 13K DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPACELP = The ACELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPISLP = The ISLP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V4DSPVSELP = The VSELP DSP software image and hashsum are pumped from the AM disk, for use with the PHV4 speech handlers.

V5DSPCDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are pumped from AM disk, for use with
the PHV5 speech handlers.

V5DSPISLP = The ISLP DSP software image and hashsum are pumped from AM disk, for use with the PHV5 speech handlers.

V5DSPSMV = The consolidated SMV, EVRC and 13K DSP software image and hashsum are pumped from AM disk, for use with the PHV5 speech handlers.

V6DSPCDMA = The consolidated CDMA QCELP (which include QCELP 13K and all EVRC algorithm variations) image and hashsums are pumped from AM disk, for use with the PHV6 speech handlers.

V6DSPSMV = The consolidated SMV, EVRC and 13K DSP software image and hashsum are pumped from AM disk, for use with the PHV6 speech handlers.

\[ b \] = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Request not initiated due to bad syntax or invalid SM specified.

PF = Printout follows. Request accepted. Followed by the REPT:NIPMP output message.

Input Message(s):

STP:NIPMP

Output Message(s):

REPT:NIPMP

Input Appendix(es):

APP:RANGES
1. PURPOSE

Increases the size of physical memory allocated to the protected non-redundant database. Only one switching module (SM) office-dependent data (ODD) growth at a time is allowed: non-redundant (ST:NRODDGRW), redundant (ST:RODDGRW), unprotected (ST:UODDGRW), or the bitmap salvage technique (ST:ODDBST).

2. FORMAT

ST:NRODDGRW,SM=a,KBYTES=b;

3. EXPLANATION OF MESSAGE

a = SM number.

b = Amount of growth space to be added, in kilobytes. The number input must be a multiple of 16 (for example 16, 32, 48, ... 2048) not to exceed 2048; otherwise the growth will not start. Growing and ODD greater than 2048 kilobytes may be done by repeating the ST:NRODDGRW input message.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with system or equipment status.
Valid value(s):
- GROWTH SIZE NOT A MULTIPLE OF 16 = The input number of kilobytes must be a multiple of 16.
- SM NOT OPERATIONAL OR IN SPECIAL GROWTH MODE = The SM specified must be operational or in the special growth mode.

PF = Printout follows. Followed by ST:NRODDGRW output message.

RL = Retry later. Request cannot be executed now. Valid value(s):
- ANOTHER ODD GROWTH OR ODDBST EXECUTING = Retry after current ODD growth or ODDBST completes.
- ODD BACKUP CURRENTLY IN PROGRESS = Retry after the ODD backup process completes.
- RECOVERING FROM PREVIOUS ODDBST OR ODD GROWTH = The recovery of a previous ODD growth or ODDBST is currently in progress.

ST:NRODDGRW-B

**Software Release:** 5E16(2) and later
**Command Group:** ODD
**Application:** 5
**Type:** Input

1. **PURPOSE**

Increases the size of physical memory allocated to the protected non-redundant database. Only one office-dependent data (ODD) growth at a time is allowed: non-redundant (ST:NRODDGRW), redundant (ST:RODDGRW), unprotected (ST:UODDGRW), or the bitmap salvage technique (ST:ODDBST).

2. **FORMAT**

```
ST:NRODDGRW,{SM=a|CMP=a},KBYTES=b;
```  

3. **EXPLANATION OF MESSAGE**

- **a** = Switching module (SM) or communications module processor (CMP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.
- **b** = Amount of growth space to be added, in kilobytes. The number input must be a multiple of 16 (for example 16, 32, 48, ... 2048) not to exceed 2048; otherwise the growth will not start. Growing and ODD greater than 2048 kilobytes may be done by repeating the ST:NRODDGRW input message.

4. **SYSTEM RESPONSE**

- **NG** = No good. The message syntax is valid, but the request conflicts with system or equipment status. May also include:
  - GROWTH SIZE NOT A MULTIPLE OF 16 = The input number of kilobytes must be a multiple of 16.
  - SM NOT OPERATIONAL OR IN SPECIAL GROWTH MODE = The SM specified must be operational or in the special growth mode.
  - MATE CMP MUST BE OOS BEFORE EXECUTING NRODD GROWTH = The mate CMP must be out of service (OOS) before executing the CMP non-redundant ODD (NRODD) growth command.

- **PF** = Printout follows. Followed by the ST:NRODDGRW output message.

- **RL** = Retry later. Request cannot be executed now. May also include:
  - ANOTHER ODD GROWTH OR ODDBST EXECUTING = Retry after current ODD growth or ODDBST completes.
  - ODD BACKUP CURRENTLY IN PROGRESS = Retry after the ODD backup process completes.
  - RECOVERING FROM PREVIOUS ODDBST OR ODD GROWTH = The recovery of a previous ODD growth or ODDBST is currently in progress.

Other Manual(s):
235-105-220  Corrective Maintenance
ST:ODDBST

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Performs the blockid conversion for the redundant office-dependent data (RODD). The RODD bitmap may need to be converted for future RODD and/or non-redundant office dependent data (NRODD) growth to be performed.

The process invoked by this ST:ODDBST input message is the bitmap salvage technique (BST). The BST will relocate the portion of the RODD bitmap being used (last half of the RODD bitmap) to the beginning of the RODD bitmap. Also, the RODD relation's blockids will be converted to point to the first half of the RODD bitmap. NRODD growth or RODD growth will output a message indicating when it is necessary to run the BST.

2. FORMAT

ST:ODDBST, SM=a[&&b];

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = SM number that specifies the last number in a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Input request not valid.

PF = Printout follows. Request accepted. Followed by the ST:ODDBST output message.

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests that a new copy of office-dependent data (ODD) be created for a switching module (SM) that is being added to the switch.

2. FORMAT

ST:ODDCREAT,SM=a[,UODDSZ=b][,NRODDSZ=c];

3. EXPLANATION OF MESSAGE

a = SM number.

b = Requested size of unprotected ODD in kilobytes. Must be on an 16k boundary (that is, must be a multiple of 16). If a value of zero is entered for both the uoddsz and the nroddsz fields, the default size of the unprotected and nonredundant ODDs will be calculated and printed out with the oddcreat output message.

c = Requested size of nonredundant ODD in kilobytes. Must be on an 16k boundary (that is, must be a multiple of 16). If a value of zero is entered for both the uoddsz and the nroddsz fields, the default size of the unprotected and nonredundant ODDs will be calculated and printed out with the oddcreat output message.

4. SYSTEM RESPONSE

NG = No good. Input request was not valid.

PF = Printout follows. Request accepted. Followed by an ST:ODDCREAT-SM output message.

Input Appendix(es):

APP: RANGES
ST:ODDDUPD

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Requests initiative of an update of all multi-module remote switching module (MMRSM) site common office dependent data (ODD) in all RSMs which are members of the MMRSM site. The function of this message is to move the association of a remote switching module (RSM) from one MMRSM site to another MMRSM site.

Note: This input message is only used in conjunction with the RSM association/disassociation procedure which is part of MMRSM growth/degrowth. This function can take several minutes to complete.

2. FORMAT

ST:ODDDUPD, FROM=a-b, TO=c-d;

3. EXPLANATION OF MESSAGE

a = MMRSM site number (1-174) from which the RSM is to be moved.
b = Remote member (1-4) in MMRSM site 'a' of RSM to be moved.
c = MMRSM site number (1-174) to which the RSM is to be joined.
d = Remote member (1-4) in MMRSM site 'c' to which RSM is to be assigned.

4. SYSTEM RESPONSE

NG = No good. The input request is not valid.
PF = Printout follows. Followed by the ST:ODDDUPD-MMRSM output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

Other Manual(s):
Where ‘x’ is the release-specific version of the document.
235-105-24x Software Release Retrofit
MCC Display Page(s):

1851 (CMP INH AND RCVRY CNTL)
ST:OPUMP-SM
Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5
Type: Input

1. PURPOSE

Requests a download of the off-line module controller/time slot interchange (MCTSI) memory for each specified
switching module (SM) from the active or off-line administrative module (AM) disk, with or without an off-line
verification. For successful execution, this input message requires that the active MCTSI of each specified SM be
forced and the off-line MCTSI be forced unavailable.

Format 1 shows the method used to off-line pump the SM and optionally off-line pump the SM peripherals. All
duplex peripherals within an SM are downloaded when the PERF and VFY options are specified. For successful
execution of the peripheral download, all of the affected peripherals must be in an active/standby state. The
peripheral side that is opposite the SM side is the one that will be removed from service and pumped. The PERF
option is ignored on those SMs without duplex peripherals. This format requires the disk (ACTDISK, OFLDISK),
verify (VFY) and PERF options to be set to perform an off-line pump of the SM and its peripherals. The off-line
pump of multiple SMs is normally performed using a broadcast mechanism, reducing the amount of time it takes to
off-line pump multiple SMs. Offline pump does not use the broadcast mechanism for RSMs or when the NBCST
option is used.

Format 2 shows the method used to off-line pump the SM peripherals only. This format is used when a peripheral
failed to off-line pump and the SM has been successfully downloaded and verified. Requests for a download of just
the peripherals can only be performed after an off-line download of the SM with a successful completion of off-line
verification. The disk and verification parameters are omitted in this format.

2. FORMAT

[1] ST:OPUMP,SM=a[&&b],{ACTDISK|OFLDISK},{VFY|NVFY},{PERF|NPERF}

[2] ST:OPUMP,SM=a[&&b],PERF;

3. EXPLANATION OF MESSAGE

ACTDISK = Off-line pump is to be from the existing software release.
HSM = Offline pump HSMs within the range indicated.
LSM = Offline pump LSMs within the range indicated.
NBCST = Do not broadcast the off-line pump. If this option is chosen, the SMs will be off-line pumped one at
time rather than like SMs (such as, LOADED) being pumped in parallel.
NPERF = Do not perform off-line pump on all duplex peripherals.
NVFY = Do not execute off-line verification.
OFLDISK = Off-line pump is to be from the new software release.
ORM = Offline pump ORMs within the range indicated.
PERF = Perform off-line pump on all duplex peripherals.
RSM = Offline pump RSMs within the range indicated.

TRM = Offline pump TRMs within the range indicated.

VFY = Execute off-line verification.

a = SM number, or the lower limit for a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Upper limit of the range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Process not initiated due to bad syntax or invalid SM specified.

PF = Printout follows. Message received. Followed by the REPT:SM-HASHSUM or REPT:SM-OFFLINE output message.

5. REFERENCES

Input Message(s):
STP:OPUMP-SM

Output Message(s):
REPT:SM-HASHSUM
REPT:SM-OFFLINE

Input Appendix(es):
APP:RANGES
ST:OVERLAY

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the termination or initialization of the recent change kernel process (RCKP). If RCKP is terminated, its freed memory space can be automatically overlaid with the DBdiskrc process of the PRE-release recent change reapplication (RCR) process (only during retrofit) or manually requested to be overlaid with the RCKP version on disk.

During retrofit, memory is needed to allow the entire PRERCR process to reapply all recent changes (RCs) and customer-oriented recent changes (CORCs) before the initialization on the new software release. When DBdiskrc is initialized, recent changes are inhibited. When RCKP is initialized, communication with RCKP is allowed. To perform RCs, RCs must be allowed (using the ALW:RC input message). The RCKP option is used during retrofit to terminate PRERCR’s execution and to allow emergency RCs after PRERCR has been manually stopped (EXC:RCR input message).

WARNING: THIS MESSAGE SHOULD ONLY BE USED for retrofit and inside the message switch (MSGS) file of a software update package for a large field update of RCKP. Before this message can be used, all software updates for RCKP and operational kernel process (OKP) must be made permanent (if official) or backed out (if temporary), and RCs must be inhibited.

2. FORMAT

ST:OVERLAY,PROD=a;

3. EXPLANATION OF MESSAGE

a
  = The product that is to be copied from disk to overlay RCKP:
  NONE       = RCKP is terminated only. No product is to be initialized.
  RCKP       = RCKP process. If RCs are needed, this option initializes RCKP. If RCKP has not been terminated, this option will terminate RCKP first. If emergency RCs are needed while PRERCR is running, this option should be used after PRERCR manually stopped.
  RCR        = DBdiskrc kernel process of PRERCR. RCKP is terminated automatically.

By using this option when large field updates are needed, file replacement of RCKP occurs.

4. SYSTEM RESPONSE

IP       = In progress. RCKP is about to be recreated.
NG
  = No good. May also include:
  - NON_RETROFIT = RCR only used during retrofit.
  - RCKP NOT RUNNING = Should use EXC:RCR,START to start PRERCR.
− RCR ALREADY RUNNING = Should use EXC:RCR,STOP to stop PRERCR first followed by
ST:OVERLAY,PROD=RCKP if RCKP to be initialized.

PF = Printout follows. Followed by the ST:OVERLAY output message.

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Allocates physical memory to the redundant portion of office dependent data (RODD) for the purpose of growth, provided that there is physical memory available.

WARNING: If an ST:RODDGRW input message is entered before the previous one has completed, the second one will not be honored. Only one growth at a time is possible.

Check the available switching module (SM) memory before inputting this message, and check diagnostics.

2. FORMAT

ST:RODDGRW:KBYTES=a;

3. EXPLANATION OF MESSAGE

a = The amount of growth space to be added, in kilobytes. This number must be a multiple of 16 (such as, 16, 32, 48, ... 2048) not to exceed 2048; otherwise the growth will be aborted. Growing and ODD greater than 2048 kilobytes may be done by repeating the ST:RODDGRW input message.

4. SYSTEM RESPONSE

NG = No good. Input request not valid.
FF = Printout follows. Request accepted. Followed by an ST:RODDGRW output message.
RL = Retry later. Request cannot be executed now.

5. REFERENCES

Output Message(s):

235-105-220 Corrective Maintenance
ST:UODDGRW-SM

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests an increase in the size of physical memory allocated to the unprotected (dynamic) office-dependent data (ODD).

WARNING: The size increase of the unprotected ODD is at the expense of the non-redundant ODD.

No reversal of this growth is possible. Only one SM ODD growth (unprotected - ST:UODDGRW, non-redundant - ST:NRODDGRW, or redundant - ST:RODDGRW) or bitmap salvage technique (BST) - ST:ODDBST at a time is possible. If an ST:UODDGRW input message is entered before the previous unprotected, non-redundant, redundant, or BST has completed, it will cause service affecting conditions to occur on the processor being grown.

2. FORMAT

ST:UODDGRW, SM=a; KBYTES=b;

3. EXPLANATION OF MESSAGE

a  = Switching module (SM) number.

b  = Amount of growth space to be added, in kilobytes. The number input must be a multiple of 16 (for example 16, 32, 48, ... 2048); otherwise the growth will be aborted. Growing and ODD greater than 2048 kilobytes may be done by repeating the ST:UODDGRW input message. Since unprotected ODD growth acquires space from the non-redundant ODD, the amount of growth space specified must leave available space in the non-redundant ODD for recent changes. The percent of non-redundant ODD space required to be free after an unprotected ODD growth is given by the SM global parameter DBmavsodd. The OP:ODD input message generates a report on ODD space utilization.

4. SYSTEM RESPONSE

NG  = No good. The message syntax is valid, but the request conflicts with system or equipment status. Valid value(s):
   - SM NOT OPERATIONAL OR IN SPECIAL GROWTH MODE = The message syntax is valid, but the request conflicts with system or equipment status. The SM specified must be operational or in the special growth mode.
   - UODD GROWTH SIZE NOT A MULTIPLE OF 16 = The message syntax is valid, but the request conflicts with system or equipment status. The input number of kilobytes must be a multiple of 16.

PF  = Printout follows. Followed by an ST:UODDGRW output message.
RL

= Retry later. Request cannot be executed now. Valid value(s):
- ANOTHER ODD GROWTH OR ODDBST EXECUTING = Retry later. Request cannot be executed now. Retry after the current ODD growth or ODDBST completes.
- ODD BACKUP CURRENTLY IN PROGRESS = Retry later. Request cannot be executed now. Retry after the ODD backup process finishes.
- RECOVERING FROM PREVIOUS ODDBST OR ODD GROWTH = Retry later. Request cannot be executed now because a recovery of a previous ODD growth or ODDBST is currently in progress.

2. FORMAT

STOP:EXC, ANY, {PID=a|FN="b"}, UCL;

3. EXPLANATION OF MESSAGE

a = ID number of the process to be terminated.

Note: If a nonexistent process ID is used, the system prints a STOPPED message followed by the UNIX® RTR 'pkill' message.

b = Pathname of the file.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the STOP:EXC-ANY output message.

STOP:EXC-USER

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a user process specified either by ID number or by pathname be stopped.

WARNING: Use of this input message to stop a monitored process will prevent it from being restarted automatically. The INIT:ULARP input message can be used to restart ULARP and processes monitored by ULARP.

2. FORMAT

STOP:EXC,USER,{PID=a|FN="b"}[,SIG=c];

3. EXPLANATION OF MESSAGE

a = ID number of the process to be terminated.
b = Pathname of the process to be terminated. Pathname of the file.
c = Signals (default is 15 if PID is used and 9 if FN is used). Valid value(s):
   1 = Hang up.
   2 = Interrupt.
   3 = Quit.
   4 = Illegal instruction
      = not reset when caught.
   5 = Trace trap
      = not reset when caught.
   6 = IOT instruction.
   7 = EMT instruction.
   8 = Floating point exception.
   9 = Kill
      = cannot be caught or ignored.
  10 = Bus error.
  11 = Segmentation violation.
  12 = Bad argument to system call.
  13 = Write on a pipe with no one to read it.
  14 = Alarm clock.
  15 = Software termination signal.

4. SYSTEM RESPONSE
Printout follows. Followed by the STOP:E-USER output message.

01 (CRAFT FM)
STOP:GEN

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the administrative module (AM) system-update message in progress be stopped. This is used to terminate the process associated with a previous UPD:GEN input message.

2. FORMAT

STOP:GEN[:UCL]; or STP:GEN[:UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditional execution. If the process cannot be terminated using termination or kill signals, it will be terminated by a more extreme method. In this case, some system resources in use by the process may not be released automatically.

4. SYSTEM RESPONSE

NG = No good. Process not initiated.
PF = Printout follows. Followed by STOP:GEN output message.

STOP:TRAP

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that a trap be stopped or removed from the internal database. Also, disk space can be initialized or set to not overwrite upon wrap-around of the circular buffer space.

2. FORMAT

\[1\] STOP:TRAP:{ID|RMTID}={a[-a[-a[-a[-a]]} | ALL};
\[2\] STOP:TRAP:{INIT|OVRWT}={Y|N};

3. EXPLANATION OF MESSAGE

ALL = Stop or remove all traps.

ID = ID of traps be stopped. Note that these traps cannot be activated by an ALW:TRAP input message. Status or results of these stopped traps can be obtained by entering the OP:TRAP input message.

INIT = Initialize of disk space. This allows for the entire disk space to be freed. If "Y" is given, all trapped messages that have been collected will be discarded. All active traps will be inhibited and information collected prior to a disk initialization will be discarded. All completed, aborted, or terminated traps will be removed from the internal database. No system action will be taken if "N" is specified.

N = No. Do not perform the indicated operation.

OVRWT = Overwrite disk. This allows for the contents of the disk to be overwritten if necessary. If "Y" is given, all ensuing trapped messages collected may be overwritten. Disk overwrite will remain active unless otherwise specified by this input message. If "N" is given, all ensuing trapped messages on the disk will not be overwritten.

RMTID = Remove trap ID. Traps will be permanently removed from the internal database for the specified identification numbers or ALL. Active or inhibited traps that are to be removed must have been stopped with a STOP:TRAP input message prior to being removed. No trap status or results can be obtained once these traps have been deleted from the database.

Y = Yes. Perform the indicated operation.

a = Trap identification number. There can be a maximum of five.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by a STOP:TRAP output message.

**Software Release:** 5E14 and later  
**Command Group:** TRKLN  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that the current automatic line evaluation (ALE) session be stopped. The administrative module (AM) terminal process will attempt to stop the switching module (SM) currently running ALE. A maximum time of 5 minutes may elapse before ALE terminates.

This request may be used to stop an automatically invoked ALE session or one of the manually invoked ale operations, that is, ALW, EXC, INH, or OP input verbs. The default operation is to stop the automatically invoked ALE or the demand EXC:ALE sessions.

2. **FORMAT**

```
STP:ALE[,ALW|,EXC|,INH|,OP];
```

3. **EXPLANATION OF MESSAGE**

- **ALW** = Stop the session invoked using the ALW:ALE input request.
- **EXC** = Stop the automatically invoked ALE session of the session invoked using the EXC:ALE input request.
- **INH** = Stop the session invoked using the INH:ALE input request.
- **OP** = Stop the session invoked using the OP:ALE input request.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request was not recognized, or was not acceptable. May also include:
  - **ALE FEATURE NOT LOADED** = The ALE feature is not loaded in the switch software configuration.
  - **COMMUNICATION FAILURE** = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
  - **PROCESS CREATION FAILURE** = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

- **PF** = Printout follows. The request has been accepted. Followed by the STP:ALE-COMPL output message.

- **RL** = Retry later.
  - **ALE ACTIVE** = Only one ALE session may be requested at a time. Wait for completion or stop the session manually.
  - **AM IN MIN MODE** = The AM is in minimum operation mode.

Other Manual(s):
1. PURPOSE

Disables the automatic execution of test sessions defined in a specified ATTS (Automatic Trunk Test Scheduler) test schedule.

When a schedule is stopped unconditionally, it will always be placed in the "STOPPED" state. If the specified schedule is in the "RUNNING" state at the time this input message is processed, then the test session currently executing will be terminated upon completion of the test call in progress. When a schedule is stopped conditionally, it will be placed in either the "STOPPED" or "SUSPENDED" state. If the specified schedule is in the "RUNNING" state at the time this input message is processed, then the schedule will be placed in the "SUSPENDED" state and the test session currently executing will be interrupted upon completion of the test call in progress. If the specified schedule is in the "PAUSING" state at the time this input message is processed, then the schedule will also be placed in the "SUSPENDED" state even though no testing is being performed. Otherwise, the schedule will be placed in the "STOPPED" state. When a schedule is in the "SUSPENDED" state, the operation of the previously-interrupted test session will be resumed upon processing of a ST:ATTS input message. Without manual action to resume the session's operation, the schedule will remain in the "SUSPENDED" state until the scheduled stopping time of the interrupted session arrives, at which time the session will terminate and the schedule will automatically be placed in the "STOPPED" state.

2. FORMAT

STP:ATTS,SCHED=a[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditionally place the specified schedule in the STOPPED state.

a = The number of the ATTS test schedule to be stopped (1 - 20).

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the ST:ATTS output message.

4. **SYSTEM RESPONSE**

   **NG** = No good. May also include:

   - **INVALID SM RANGE/TYP**E COMBINATION = The request has been denied because either the range is not in ascending order, or there is not at least one SM of the specified type (or any type) within the range.

   **PF** = Printout follows. The request has been received. The audit output message STP:AUD-SM will follow indicating which audit was stopped.

   **RL** = Retry later. May also include:

   - **MESSAGE BROADCAST INTERNAL ERROR** = The message cannot be sent to the specified SM(s) at the present time due to problems scheduling a job to broadcast the message.

5. **REFERENCES**
Input Message(s):
INH: AUD-SM

Output Message(s):
STP: AUD-SM

Input Appendix(es):
APP: RANGES
STP:AUD-SODD
Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE
Requests the termination of an executing static office-dependent data (SODD) audit as indicated with the parameter list. If no parameters are specified, all executing SODD audits are terminated. A stopped full, incremental, or processor entity audit can be restarted at the point of termination, but the other entity audits can only be re-run in their entirety.

2. FORMAT

[1] STP:AUD=SODD[,FULL|,INCR|,TN=a|,OE="b"|,RELATION="c", 
   {AM|SM=d|CMP}|,MLHG=e,MEMB=f|,TGN=g[,MEMB=h]];

[2] STP:AUD=SODD[,BRCS,MFT=i,{AM|SM=j|CMP}];

3. EXPLANATION OF MESSAGE

AM = Administration module. The processor on which the relation, as specified in 'c' or 'i', is being audited.

CMP = Communications module processor (CMP). The processor on which the relation, as specified in 'c' or 'i', is being audited.

FULL = The full SODD audit is to be stopped.

INCR = The incremental SODD audit is to be stopped.

a = Telephone number being audited.

b = Office equipment type and number being audited.

c = Relation being audited, or "ALL" if all relations on a specific processor are being audited (that is, processor entity audit).

d = Switching module (SM) being audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The processor on which the relation, as specified in 'c', is being audited.

e = Multi-line hunt group being audited.

f = Member of multi-line hunt group being audited.

g = Trunk group number being audited.

h = Member of trunk group number being audited.

i = Name of modular feature type (MFT) or ALL.

j = Switching module (SM) being audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The processor on which the relations associated with the
MFT, as specified in '1', are being audited.

4. SYSTEM RESPONSE

\[ PF \] = Printout follows. Valid value is:
- \[ OP \, AUD=SODD \, MESSAGE \, FOLLOWED = \] Followed by an \[ OP:AUD-STATUS \] or \[ OP:AUD-ERROR \] output message.

STP:AUTOBKUP

Software Release: 5E15 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that an automated system backup currently in progress be stopped.

The STP:AUTOBKUP input message is used to gracefully stop an automated system backup that is currently in progress.

If an automated system backup is not currently in progress, STP:AUTOBKUP outputs a message indicating that an automated system backup is not currently in progress.

The automated system backup process (autobkup) executes various input messages in order to perform the backup. If STP:AUTOBKUP is executed while autobkup is executing an input message, the autobkup process will attempt to terminate some of the input messages in order to fully stop the backup. Other input messages will be allowed to continue to completion either because the termination of these input messages may leave the system in an undesirable state, or because the input messages will terminate on their own in a short time.

Automated system backup will attempt to terminate the following input messages.

AUD:FSBLK
AUD:FSLINK
AUD:NIDATA
AUD:NMDATA
CMPR:MHD
COPY:BKDISK

Automated system backup will not attempt to terminate the following input messages.

```

3. **EXPLANATION OF MESSAGE**

No variables.

4. **SYSTEM RESPONSE**

- **PF** = Printout follows. The request has been accepted.
- **RL** = Retry Later. The request has been denied. Valid value(s):
  - CIC ALLOCATION PROCESS NOT RUNNING

5. **REFERENCES**

None.
STP:BICCCQ

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the active bearer independent call control (BICC) call instance code (CIC) query be stopped. Both demand BICC CIC queries, initiated by an EXC:BICCCQ input message, and periodic automatic queries administered by recent change and verify (RC/V) view 8.15 can be stopped using this input message.

Format 1 is used to stop an office-wide BICC CIC query, either automatically scheduled or manually requested. The optional PRINT parameter specifies whether or not the accumulated results of the query being stopped will be printed. Format 2 is used to stop the active BICC CIC query for the specified originating point code (OPC) and destination point code (DPC). The printing of accumulated output is optional as described above. Format 3 is used to stop the active demand BICC CIC query for the specified BICC group. The printing of accumulated output is optional as described above. Format 4 is used to stop the active BICC CIC query for the specified BICC group member number or BICC group member number range. The printing of accumulated output is optional as described above.

2. FORMAT

[1] STP:BICCCQ,OFFICE[,PRINT];
[2] STP:BICCCQ,OPC=a,DPC=b[,PRINT];
[3] STP:BICCCQ,BG=c[,PRINT];
[4] STP:BICCCQ,BGMN=c-d[&e][,PRINT];

3. EXPLANATION OF MESSAGE

a = Originating point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

b = Destination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

c = BICC group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = BICC group member number or the lower limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = The upper limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

PRINT = Option to print the accumulated results of the BICC CIC query when it is stopped.

4. SYSTEM RESPONSE

NG = No good. May also include:
NO SUCH BQ REQUEST EXISTS

PF = Printout follows. The request has been accepted and the query has been stopped. Followed by a STP:BICCCQ output message.

Input Appendix(es):
1. PURPOSE

Requests that all port camp-on activity be stopped. If a busy port (trunk or line) is being camped on to remove it from service or restore it to service, this message forces the camp-on activity to timeout immediately.

2. FORMAT

STP:CAMP, {DN=a|TRK=b-c};

3. EXPLANATION OF MESSAGE

a = Directory number.

b = Trunk group number.

c = Member number of the trunk group.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized. Repeat the request.

PF = Printout follows. The request has been accepted and the specified camp-on will be removed if possible. Followed by the STP:CAMPON output message.

RL = Retry later. The request cannot be executed now because the system is busy.

5. REFERENCES

Output Message(s):

STP:CAMPON
STP:CAMPON-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that all camp-on activity on a trunk, line, data link, or operator services position system port (OSPSPORT) caused by a RMV:TRK, RMV:LINE, RMV:DATALINK, RMV:OSPSPORT, RST:TRK, RST:LINE, RST:DATALINK, or RST:OSPSPORT input message be stopped.

If a traffic busy trunk, line, data link, or OSPSPORT is being camped on from one of the above requests, this message forces the camp-on activity to time-out immediately, causing the RMV or RST to terminate without removing or restoring the trunk, line, data link, or OSPSPORT. The status of the trunk, line, data link, or OSPSPORT will be unchanged.

If a directory number (DN) or a line card equipment number (LCEN) or a line circuit equipment number (LCKEN) or an integrated digital carrier unit (IDCU) line equipment number (ILEN) or an integrated digital loop carrier (IDLC) networking equipment number (INEN) is specified and a channel is not specified, and the line, data link, or OSPSPORT is a digital subscriber line (DSL), then the entire DSL (D and both B-channels) will be affected. If the D-channel is specified, then the entire DSL is affected. If a B-channel is specified, then only that channel is affected.

If the line being camped on is a 1-DN line time-slot bridging (LTSB) line and a DN with no member number is entered, the camp-ons will be stopped on both lines in the bridged group. If the line being camped on is a LTSB line and a DN with a member number of '1' or '2' is entered, camp-ons will be stopped on the line associated with the member number entered (only the one line will be affected).

If the line being camped on is a common DN dual permanent packet B-channel (PPB) DSL and no channel number is entered, the camp-ons will be stopped on both channels of the DSL. If the DN being camped on is a dual PPB DSL and a channel number of 'B1' or 'B2' is entered, camp-ons will be stopped on the channel associated with the channel number entered (only the one channel will be affected).

2. FORMAT

STP:CAMPON,a[,CH=b];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

\[ a \] = Equipment number or identifier. Valid value(s):

\begin{align*}
\text{AIUEN} & = \text{f-v}^{1}\text{w}_{1}\text{x}^{1} \\
\text{DEN} & = \text{g-h-1} \\
\text{ILEN} & = \text{f-g}^{1}\text{i}_{1}^{1}\text{l}_{1}^{1} \\
\text{LCEN} & = \text{f-j-k-o}^{1}\text{p}^{1} \\
\text{LEN} & = \text{f-j-m-n-o-p} \\
\text{PKTDN} & = \text{f-s+t-u} \\
\text{XDB} & = \text{d-e} \\
\end{align*}

\[ b \] = Channel identifier. (D, B1, or B2.) Used only for DSL lines, data links, and OSPSPORTs.

\[ c \] = Telephone number.
d = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Channel number. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise, there is only one T1 facility. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
v = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a1 = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d1 = Member number of the multi-line hunt group (MLHG) or LTSB line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be accessed. For LTSB a member number of ‘1’ will stop the camp-on of the lead line and a member number of ‘2’ will stop the camp-on of the associate line.

e1 = EIS identifier on which the (CPDL) terminates. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f1 = External data link (member) number relative to the EIS. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g1 = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h1 = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i1 = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k1 = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l1 = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m1 = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n1 = Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o1 = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the STP:CAMPON output message.

RL = Retry later. The request has been denied, probably due to system load.

b = Channel identifier. (D, B1, or B2.) Used only for DSL lines, data links, and OSPSPORTs.

c = Telephone number.

d = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Channel number. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise, there is only one T1 facility. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
u = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a¹ = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = Member number of the multi-line hunt group (MLHG) or LTSB line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be accessed. For LTSB a member number of ‘1’ will stop the camp-on of the lead line and a member number of ‘2’ will stop the camp-on of the associate line.

e¹ = EIS identifier on which the (CPDL) terminates. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f¹ = External data link (member) number relative to the EIS. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g¹ = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h¹ = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i¹ = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k¹ = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l¹ = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m¹ = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n¹ = Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
a^1 = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p^1 = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q^1 = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r^1 = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s^1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t^1 = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u^1 = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v^1 = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w^1 = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x^1 = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y^1 = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z^1 = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a^2 = Peripheral control and timing line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b^2 = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c^2 = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d^2 = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e^2 = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f^2 = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g^2 = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h^2 = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i^2 = Virtual network announcement resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j^2 = Virtual network conference resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k^2 = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l^2 = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m^2 = STM-1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n^2 = High order virtual container number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o^2 = Low order virtual container group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p^2 = Low order virtual container member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the STP:CAMPON output message.

RL = Retry later. The request has been denied, probably due to system load.

RST:LINE
RST:OSPSPORT
RST:TRK

Output Message(s):

REPT:CAMPON
STP:CAMPON
Input Appendix(es):

APP : RANGES
STP:CAMPON-C

**Software Release:** 5E16(1) and later

**Command Group:** TRKLN

**Application:** 5

**Type:** Input

1. **PURPOSE**

Requests that all camp-on activity on a trunk, line, data link, or operator services position system port (OSPSPORT) caused by a RMV:TRK, RMV:LINE, RMV:DATALINK, RMV:OSPSPORT, RST:TRK, RST:LINE, RST:DATALINK, or RST:OSPSPORT input message be stopped.

If a traffic busy trunk, line, data link, or OSPSPORT is being camped on from one of the above requests, this message forces the camp-on activity to time-out immediately, causing the RMV or RST to terminate without removing or restoring the trunk, line, data link, or OSPSPORT. The status of the trunk, line, data link, or OSPSPORT will be unchanged.

If a directory number (DN) or a line card equipment number (LCEN) or a line circuit equipment number (LCKEN) or an integrated digital carrier unit (IDCU) line equipment number (ILEN) or an integrated digital loop carrier (IDLC) networking equipment number (INEN) is specified and a channel is not specified, and the line, data link, or OSPSPORT is a digital subscriber line (DSL), then the entire DSL (D and both B-channels) will be affected. If the D-channel is specified, then the entire DSL is affected. If a B-channel is specified, then only that channel is affected.

If the line being camped on is a 1-DN line time-slot bridging (LTSB) line and a DN with no member number is entered, the camp-ons will be stopped on both lines in the bridged group. If the line being camped on is a LTSB line and a DN with a member number of ‘1’ or ‘2’ is entered, camp-ons will be stopped on the line associated with the member number entered (only the one line will be affected).

If the line being camped on is a common DN dual permanent packet B-channel (PPB) DSL and no channel number is entered, the camp-ons will be stopped on both channels of the DSL. If the DN being camped on is a dual PPB DSL and a channel number of ‘B1’ or ‘B2’ is entered, camp-ons will be stopped on the channel associated with the channel number entered (only the one channel will be affected).

2. **FORMAT**

```
STP:CAMPON,a[,CH=b];
```

3. **EXPLANATION OF MESSAGE**

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

\( a \) = Equipment number or identifier. Valid value(s):

- AIUEN=\( f-v^1-w^1-x^1 \)

\textbf{b} = Channel identifier. Valid value(s):

B1
B2
D

Used only for DSL lines, data links, and OSPSPORTs.

\textbf{c} = Telephone number.

\textbf{d} = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{e} = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{f} = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{g} = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{h} = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{i} = Channel number. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise, there is only one T1 facility. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{j} = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{k} = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\textbf{l} = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(a^1\) = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(d^1\) = Member number of the multi-line hunt group (MLHG) or LTSB line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be accessed. For LTSB a member number of ‘1’ will stop the camp-on of the lead line and a member number of ‘2’ will stop the camp-on of the associate line.

\(e^1\) = EIS identifier on which the (CPDL) terminates. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(f^1\) = External data link (member) number relative to the EIS. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g^1 = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h^1 = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i^1 = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j^1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k^1 = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l^1 = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m^1 = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n^1 = Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o^1 = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p^1 = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q^1 = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r^1 = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s^1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t^1 = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u^1 = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v^1 = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w^1 = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x^1 = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y^1 = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
z = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a = Peripheral control and timing line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = STS level 1 (STS-1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Virtual connection identifier (VCID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the STP:CAMPON output message.

RL = Retry later. The request has been denied, probably due to system load.

Input Appendix(es):

APP : RANGES
STP:CCS-ROUTE

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the reporting of accessibility status of the destination point codes (DPC), clusters and/or networks in the global switching module (GSM) by the OP:CCS-ROUTE message be stopped.

2. FORMAT

STP:CCS,ROUTE[,SM=a];

3. EXPLANATION OF MESSAGE

a = GSM number. CCS global SM number in which the request is to be stopped. No 'SM=' field on the command line implies request is for all GSMS in office.

4. SYSTEM RESPONSE

PF = Printout follows. Request accepted. May also include:
   - MSG SENT TO SOME GSMS = Not all global SMs were available. Printout follows for the ones the message has been sent to.

NG = No good. The message form is valid, but the message has been denied. Additional information is printed out to explain why the message was denied. May also include:
   - GSM/PROTOCOL MISMATCH = GSM entered by craft does not match protocol.
   - NO GLOBAL SM in the office = There are no Global SM in the office.

RL = Retry later. May also include:
   - SM NOT AVAILABLE = Request cannot be processed because the specified GSM is not accessible.
   - GSM(S) UNAVAILABLE = Request cannot be processed for all GSMS because one or more GSMS may not be accessible.
   - NO GSMS AVAILABLE = Request cannot be processed because none of the GSMS in the office is accessible.

235-200-115  CNI Common Channel Signaling
235-200-116  Signaling Gateway Common Channel Signaling
STP:CCSCQ

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the active circuit query request be stopped. Both demand circuit queries, initiated by an EXC:CCSCQ request, and periodic automatic queries administered by RC/V View 8.15 can be stopped by this input message.

Format 1 is used to stop an office-wide circuit query, either automatically scheduled or manually requested. The optional print parameter specifies whether or not the accumulated results of the input message being stopped will be printed. Format 2 is used to stop the active circuit query for the specified OPC/DPC. The printing of accumulated output is optional as described above. Format 3 is used to stop the active demand circuit query for the specified trunk group. The printing of accumulated output is optional as described above. Circuit queries for individual trunk group members can not be stopped (processing is quick and output is limited).

2. FORMAT

[1] STP:CCSCQ,OFFICE[,PRINT];
[2] STP:CCSCQ,OPC=a,DPC=b[,PRINT];
[3] STP:CCSCQ,TG=c[,PRINT];

3. EXPLANATION OF MESSAGE

a = Origination point code number. Refer to the APP:POINT-CODE appendix.

b = Destination point code number. Refer to the APP:POINT-CODE appendix.

c = Trunk group number. Refer to the APP:RANGES appendix.

PRINT = Option to print the accumulated results of the circuit query when it was stopped.

4. SYSTEM RESPONSE

NG = No good. May also include:

NO SUCH CQ REQUEST EXISTS

PF = Printout follows. The request has been accepted and the query has been stopped. Followed by the STP:CCSCQ output message.

235-105-220   Corrective Maintenance
235-105-250   System Recovery Procedures
STP:CMPR-MHD

Software Release: 5E14 and later
Command Group: FHADM
Application: 5.3B
Type: Input

1. PURPOSE

Stops any CMPR:MHD input messages that are currently executing.

2. FORMAT

STP:CMPR:MHD;

3. EXPLANATION OF MESSAGE

None.

4. SYSTEM RESPONSE

NG = No good. No CMPR:MHD input message currently executing.
OK = Request accepted.

5. REFERENCES

Input Message(s):

CMPR:MHD

Output Message(s):

CMPR:MHD
1. PURPOSE
Stops any COPY:DIFF:SRC input messages that are currently executing.

2. FORMAT
STP: COPY: DIFF;

3. EXPLANATION OF MESSAGE
None.

4. SYSTEM RESPONSE
NG  = No good. No COPY:DIFF-SRC-MHD input message currently executing.
OK  = Request accepted.

5. REFERENCES
Input Message(s):
COPY:DIFF-SRC-MHD

Output Message(s):
COPY:DIFF-SRC-MHD
1. PURPOSE
Requests that the reporting of information related to calls pegging the default cell group (DCG) be stopped. The DCG is the zero cell group.

2. FORMAT
STP:DCGRPT;

3. EXPLANATION OF MESSAGE
No variables.

4. SYSTEM RESPONSE
NG = No good. May also include:
   - NOT ALLOWED - DIV OF REV OPTION OFF = The request has been denied because division of revenue option must be on.

OK = Good. The request has been accepted. All subsequent occurrences of calls pegging the default cell group will not print the information report (REPT:DCGRPT).

5. REFERENCES
Input Message(s):
   ALW:DCGRPT

Output Message(s):
   REPT:DCGRPT

Other Manual(s):
235-070-100 Administration and Engineering Guidelines
TG-5 Translation Guide
STP:DCLU

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on a specified SLC®96 digital carrier line unit (DCLU) stop.

2. FORMAT

STP: [a,]DCLU=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is the action currently executing on the DCLU). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF  = Printout follows. The request was accepted. Followed by the STP:DCLU output message.

5. REFERENCES

Input Message(s):

   RST:DCLU

Output Message(s):
   STP:DCLU
Input Appendix(es):

APP : RANGES
STP:DCTUCOM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on the directly connected test unit common board (DCTUCOM) at the specified location be stopped.

2. FORMAT

STP: [a,]DCTUCOM=b-c;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is the action currently executing on the DCTUCOM). Valid value(s):
   DGN = Diagnose.
   EX = Execute.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the STP:DCTUCOM output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP : RANGES
STP:DCTUPORT

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on the directly connected test unit port (DCTUPORT) at the specified location be stopped.

2. FORMAT

STP: [a,] DCTUPORT=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is the action currently executing on the DCTUPORT). Valid value(s):
   DGN = Diagnose.
   EX = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the STP:DCTUPORT output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Input Appendix(es):

APP: RANGES
1. PURPOSE

Requests that actions on the digital facility interface (DFI) at the specified location be stopped.

2. FORMAT

   STP:[a,,DFI=b-c-d;

3. EXPLANATION OF MESSAGE

   a  = Action to be stopped (default is the action currently executing on the DFI). Valid value(s):
       DGN  = Diagnose.
       EX   = Exercise.
       RMV  = Remove.
       RST  = Restore.

   b  = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the
       Input Messages manual.

   c  = Digital line/trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of
       the Input Messages manual.

   d  = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
       Messages manual.

4. SYSTEM RESPONSE

   NG  = No good. The request has been denied because of a conflict with current status.

   PF  = Printout follows. Followed by the STP:DFI output message.

Output Message(s):

   STP:DFI

Input Appendix(es):
STP:DFIH

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that maintenance actions on a remote integrated services line unit (RISLU) host/remote digital facility interface circuit pair (DFIH) be stopped.

2. FORMAT

STP: [a,]DFIH=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action to be stopped. Valid value(s):
DGN = Diagnose.
EX = Exercise.
RMV = Remove.
RST = Restore.
Note: The default is the action currently executing on the DFIH.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RISLU digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CONFLICT WITH UNIT STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST

PF = Printout follows. Followed by the STP:DFIH output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Input Appendix(es):
APP:RANGES
STP:DFTAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that currently running actions on the distributing frame test access circuit (DFTAC) be stopped.

2. FORMAT

STP:[e,]DFTAC=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = The action to be stopped. Valid value(s):
   DGN = Diagnose.
   EX = Exercise.
   RMV = Remove.
   RST = Restore.

4. SYSTEM RESPONSE

NG = No good. Invalid SM number, MSU number, or service group number.

PF = Printout follows. Followed by the STP:DFTAC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources (such as, SM not linked).

k = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Message switch side number.

n = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Side of the ONTC that the unit is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

\( t \) = High level service circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

\( u \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( v \) = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w \) = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x \) = Access network board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y \) = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z \) = MMP logical identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^1 \) = Metallic access test bus number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^1 \) = Shelf number.

\( c^1 \) = Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^1 \) = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^1 \) = RISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^1 \) = STSX-1 facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\( IP \) = In progress. The stop has been initiated. A completion message will be printed for the original request if the stop completes successfully.

For CMP messages, if no completion message is printed, determine the current status of the original request using the OP:DMQ-CM-SM input message, and consider using the appropriate abort message as a final resort if the original request is still present.

\( NG \) = No good. The request has been denied because of a conflict with current status. May also include:
-\( \text{CONFLICT WITH UNIT STATE} \)
-\( \text{SM DOES NOT EXIST = The requested SM does not exist in the system.} \)
-\( \text{SM UNEQUIPPED = The SM specified in the request is unequipped.} \)
-\( \text{NOT STARTED UNIT IN GROWTH STATE} \)
- **UNIT DOES NOT EXIST** = The requested unit does not exist in the system.

For CMP messages, refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

**OK** = Good. The action will be stopped.

**PF** = Printout follows. Followed by the corresponding output message.

**RL** = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that actions on the distribute point board (DIST) at the specified location be stopped.

2. FORMAT
STP: [a,] DIST=b-c-d-e;

3. EXPLANATION OF MESSAGE
   a = Action to be stopped (default is the action currently executing on the distribute point board). Valid value(s):
      DGN = Diagnose.
      EX  = Exercise.
      RMV = Remove.
      RST = Restore.
   b = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   c = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   d = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   e = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
   NG = No good. The request has been denied because of a conflict with current status.
   PF = Printout follows. Followed by the STP:DIST output message.

   RMV:DIST
   RST:DIST

Output Message(s):
STP: DIST

Input Appendix(es):

APP: RANGES
**STP:DLI**

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that an action on a specific dual link interface (DLI) or range of DLIs in the specified office network and timing complex (ONTC) be stopped.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a sane state. An abort action is immediate and the state of the hardware is not guaranteed.

2. **FORMAT**

`STP: [a,] DLI=b[&c]-d;`

3. **EXPLANATION OF MESSAGE**

   a = Action being stopped (default is any action currently waiting or executing on the DLI). Valid value(s):
   - `DGN` = Diagnose.
   - `EX` = Exercise.
   - `RST` = Restore.

   Note: A remove or unconditional restore cannot be stopped once it is accepted.

   b = Switching module (SM) number, or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   c = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   d = ONTC side that the DLI is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   **IP** = In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.

   **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

5. **REFERENCES**

Input Message(s):
DGN: DLI
EX: DLI
OP: DMQ
RST: DLI

Output Message(s):

DGN: DLI
EX: DLI
OP: DMQ-CM
RST: DLI

Input Appendix(es):

APP: CM–IM–REASON
APP: RANGES
1. PURPOSE

Requests that the specified switching module (SM) have all deferred maintenance queue (DMQ) requests stopped.

This command will send a stop request to all processes either running or waiting that are under the control of the maintenance request administrator (MRA).

2. FORMAT

STP:DMQ,SM=a;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid but the request conflicts with current status.

PF = Printout follows. The request was accepted. The STP:DMQ output message will follow when the request has completed.

RL = Retry later. The request cannot be executed because system resources are unavailable.

APP:RANGES

Output Message(s):

STP:DMQ
STP:DMQ

Software Release: 5E14 and later  
Command Group: MAINT  
Application: 5,3B  
Type: Input

1. PURPOSE

Requests that the specified administrative module (AM) maintenance request be stopped. The request is identified by the unit name and number and optionally the subunit name and number.

Any request handled by the maintenance input request administrator (MIRA) (restore, remove, diagnose) can be stopped by using this input message.

2. FORMAT

STP:DMQ: [a=b[,c=d]] [,ACTIVE|,WAITING];

3. EXPLANATION OF MESSAGE

ACTIVE  = Stop only active maintenance requests.

WAITING = Stop only waiting maintenance requests.

Note: If neither ACTIVE nor WAITING is specified, then both requests will be stopped.

a  = Unit name. AM unit names are listed in the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

b  = Unit number. Refer to the APP:MEM-NUM-UNIT input appendix in Appendixes section of the Input Messages manual.

c  = Subunit name, if 'a'='CU'. AM subunit names are listed in the APP:MEM-NUM-CU input appendix in the Appendixes section of the Input Messages manual.

d  = Subunit Number. Refer to the APP:MEM-NUM-CU input appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

OK  = Good. Request accepted.

PF  = Printout follows. Followed by the STP:DMQ output message.

f¹ = STSX-1 facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress. The stop has been initiated. A completion message will be printed for the original request if the stop completes successfully.

For CMP messages, if no completion message is printed, determine the current status of the original request using the OP:DMQ-CM-SM input message, and consider using the appropriate abort message as a final resort if the original request is still present.

NG = No good. The request has been denied because of a conflict with current status. May also include:
- CONFLICT WITH UNIT STATE
- SM DOES NOT EXIST = The requested SM does not exist in the system.
- SM UNEQUIPPED = The SM specified in the request is unequipped.
- NOT STARTED UNIT IN GROWTH STATE
- UNIT DOES NOT EXIST = The requested unit does not exist in the system.

For CMP messages, refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

OK = Good. The action will be stopped.

PF = Printout follows. Followed by the corresponding output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

**Software Release:** 5E14 and later
**Command Group:** SFTMGT
**Application:** 5,3B
**Type:** Input

1. **PURPOSE**

Requests that any process be stopped. The process can be killed either by specifying the ID number or the pathname.

2. **FORMAT**

```
STP:EXC,ANY,{PID=a|FN="b"},UCL;
```

3. **EXPLANATION OF MESSAGE**

- **a** = ID number of the process to be terminated.
  - **Note:** If a nonexistent process ID is used, the system prints a COMPLETED message.

- **b** = Pathname of the file.

4. **SYSTEM RESPONSE**

**PF** = Printout follows. Followed by an STP:EXC-ANY output message.

5. **REFERENCES**

**Input Message(s):**

**MCC Display Page(s):**

```
01 (CRAFT FM)
```
STP:EXC-UPD

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5
Type: Input

1. PURPOSE
Stops current execution of the software update (SU) installation process. This input message may be used to stop an SU installation that was started using the Master Control Center (MCC) 1960 page or the MCC 1940 page.

2. FORMAT
STP:EXC:UPD;

3. EXPLANATION OF MESSAGE
No variables.

4. SYSTEM RESPONSE
OK = The message was accepted and the action completed.

Command Group: SFTMGT  
Application: 5,3B  
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that a user process specified either by ID number or by pathname be stopped.

**WARNING:** Use of this input message to stop a monitored process will prevent it from being restarted automatically. The INIT:ULARP input message can be used to restart ULARP and processes monitored by ULARP.

2. **FORMAT**

```
STP:EXC,USER,{PID=a|FN="b"}[,SIG=c];
```

3. **EXPLANATION OF MESSAGE**

- **a** = ID number of the process to be terminated.
- **b** = Pathname of the process to be terminated.
- **c** = Signals (default is 15 if PID is used and 9 if FN is used). Valid value(s):
  1. Hang up.
  2. Interrupt.
  3. Quit.
  4. Illegal instruction
     or
     = not reset when caught.
  5. Trace trap
     or
     = not reset when caught.
  6. IOT instruction.
  7. EMT instruction.
  8. Floating point exception.
  9. Kill
     or
     = cannot be caught or ignored.
  11. Segmentation violation.
  12. Bad argument to system call.
  13. Write on a pipe with no one to read it.
  15. Software termination signal.

01 (CRAFT FM)
STP:FAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that maintenance actions be stopped on a remote switching module (RSM) facility (FAC) or a trunk FAC.

An RSM FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. A trunk FAC is an inter-office trunk.

2. FORMAT

STP: [a,]FAC=b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is the action currently executing on the FAC). Valid value(s):
   RMV = Remove.
   RST = Restore.
   TST = Test.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = RSM digital facilities interface (RDFI), inter-RSM communication link digital facilities interface (CDFI), or inter-office trunk digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Facility (FAC) number. The FAC number is the T1 facility number on a RDFI, CDFI, or DFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
   - NOT STARTED UNIT IN GROWTH STATE
   - SM DOES NOT EXIST
   - SM UNEQUIPPED
   - UNIT DOES NOT EXIST

PF = Printout follows. Followed by the STP:FAC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

235-105-220 Corrective Maintenance
STP:FACR
Software Release: 5E14 and later
Command Group: FHADM
Application: 5
Type: Input

1. PURPOSE
Requests that a running feature activation counting and reconciliation (FACR) audit be terminated.

2. FORMAT
STP:FACR:[SUSPEND],[APPL=a];

3. EXPLANATION OF MESSAGE
SUSPEND = Request for a currently running FACR audit to be suspended and rescheduled for the next day.
APPL = Request refers to a FACR special application audit.
a = APPLICATION name of special audit to stop/suspend.

4. SYSTEM RESPONSE
PF = Printout follows. Followed by the STP:FACR output message.

5. REFERENCES
Output Message(s):

Other Manual(s):
235-040-100 OA&M Planning Guide
235-100-125 System Description
STP:FPC

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that actions on the specified foundation peripheral controller (FPC) be stopped.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a 'clean' point of termination (that is, the end of a phase), and will attempt to leave the hardware in a sane state. An abort action is immediate and the state of the hardware is not guaranteed.

2. **FORMAT**

STP:a,FPC=b;

3. **EXPLANATION OF MESSAGE**

<table>
<thead>
<tr>
<th>a</th>
<th>= Action to be stopped (default is any action currently waiting or executing on the FPC). Valid value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>DGN</td>
<td>= Diagnose. (Not valid for CM3)</td>
</tr>
<tr>
<td>EX</td>
<td>= Exercise. (Not valid for CM3)</td>
</tr>
<tr>
<td>RST</td>
<td>= Restore.</td>
</tr>
</tbody>
</table>

b = FPC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

IP = In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

5. **REFERENCES**

Input Message(s):

STP:IDCUTMC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that actions on a remote terminal (RT) timeslot Management channel (TMC) circuit be stopped. This message is applicable for TR303 RTs (such as, AT&T Series 5 RTs running Feature Package 303G) terminating on an integrated digital carrier unit (IDCU).

2. FORMAT

STP:[a,]IDCUTMC=b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (the default action is the action currently executing on the TMC). Valid values are:
RMV = Remove.
RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the STP:IDCUTMC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE
Requests that actions on the local digital service function (LDSF) circuit be stopped.

2. FORMAT
STP: [a,] LDSF=b-c;

3. EXPLANATION OF MESSAGE
   a = Action to be stopped (default is the action currently executing on the LDSF). Valid value(s):
       DGN = Diagnose.
       EX = Exercise.
       RMV = Remove.
       RST = Restore.
   
   b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
   
   c = LDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
   NG = No good. The request has been denied because of a conflict with current status.
   PF = Printout follows. Followed by the STP:LDSF output message.

APP : RANGES
STP:LI
Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a diagnostic or exercise on the link interface (LI) on the specified office network and timing complex (ONTC) be stopped.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a valid state. An abort action is immediate and the state of the hardware is not guaranteed.

Note: This message is only valid for offices with communication module model 1 (CM1) hardware.

2. FORMAT

STP: [a,]LI=b;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is any action currently waiting or executing on the LI). Valid value(s):
   DGN = Diagnose.
   EX = Exercise.

b = Side of ONTC that the LI is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

Input Appendix(es):

APP: CM—IM—REASON
APP: RANGES
STP:LIB

Software Release: 5E14 and later
Command Group: ADMIN
Application: 5
Type: Input

1. PURPOSE
Requests that the previously started library program be stopped in the administrative module (AM) and/or switching modules (SMs) specified. If no AM or SM(s) is specified, the AM and all SMs currently running under the specified team will receive the message.

2. FORMAT

```
STP:LIB:TEAM=a[,AM][{,SM=b[-b][-b][-b][-b]|c&&d}];
```

3. EXPLANATION OF MESSAGE

| AM | Send the message to the library program running in the AM under this team. |
| a  | The team number (1-15) to which this message applies. This number is specified in the LOAD:LIB message, and is used so that more than one person may test at the same time, using different team numbers. |
| b  | SM(s) to which this message should be directed. The team specified must have a library program running in the SM(s) listed. There can be up to 5 SM numbers listed. A range could be used instead, as indicated. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. |
| c  | Lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. |
| d  | Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. |

Note: If neither the AM nor any SMs are specified, the STP:LIB message is sent to the AM and all SMs with clients loaded under the same team as that specified.

4. SYSTEM RESPONSE

| NG | No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages. |
| PF | Printout follows. Message has been sent to the SMs/AM or team specified. |

4. SYSTEM RESPONSE

\texttt{IP} = In progress. The stop has been initiated. A completion message will be printed for the original request if the stop completes successfully. If no completion message is printed, determine the current status of the original request using the OP:DMQ-CM-SM input message. Consider using the abort (ABT) message, ABT:MSGS, as a final resort, if the original request is still present.

\texttt{NG} = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

APP: RANGES
1. PURPOSE

Requests that a diagnostic or exercise on the network clock (NC) on the specified office network and timing complex (ONTC) be stopped.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a sane state. An abort action is immediate and the state of the hardware is not guaranteed.

2. FORMAT

STP:[a,]NC=b;

3. EXPLANATION OF MESSAGE

a

= Action to be stopped (default is any action currently waiting or executing on the NC). Valid value(s):

DGN = Diagnose.
EX = Exercise.

b

= Side of ONTC that the NC is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP

= In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.

NG

= No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that offline pump requests for the specified switching modules (SMs) including peripheral offline pumps be cancelled.

If an offline pump has been started using the ST:OPUMP message or automatically in the retrofit procedure, this input message aborts the request for the specified SM(s).

If an offline pump has been performed, but some of the duplexed peripheral units failed to offline pump, this message can be used to stop a re-pump of a duplexed peripheral unit.

WARNING: This message is used to abort the offline pump of an SM or duplexed peripheral units.

2. FORMAT

STP:OPUMP, SM=a[&&b][,LSM][,HSM][,RSM];

3. EXPLANATION OF MESSAGE

HSM = Stop offline pump of the HSMs within the indicated range.
LSM = Stop offline pump of the LSMs within the indicated range.
RSM = Stop offline pump of the RSMs within the indicated range.
a = SM number, or the lower limit of a range of SMs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Upper limit of the range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Process not initiated due to bad syntax or invalid SM specified.
OK = Message good. Valid value(s):
   - PUMPING SMS WILL REPORT = Printout will follow from only those SMs specified that were in a pumping state.

5. REFERENCES

Input Message(s):

3. **EXPLANATION OF MESSAGE**

   a  =  Switch Module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   b  =  Peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   c  =  Peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   NG  =  No good. The request has been denied. The message form is valid, but the request conflicts with the current status.

   PF  =  Printout follows. Followed by the STP:PCTDX output message.

   RL  =  Retry later. The request cannot be executed now due to unavailable system resources.

5. **REFERENCES**

235-105-220  Corrective Maintenance

MCC Display Page(s):

1330.y (PDXU)
STP:PCTF

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

To request a graceful stop of the currently printing per call test failure (PCTF) summary. PCTF summary lists are printed when an OP:PCTF input message is processed and automatically on a periodic basis. The STP:PCTF request will only stop a manually initiated PCTF summary; automatically initiated summaries are not affected.

2. FORMAT

STP:PCTF;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the STP:PCTF output message.

RL = Retry later. The request has been denied, most probably due to system load.

5. REFERENCES

Input Message(s):

Output Message(s):

OP:PCTF
STP:PCTF

Other Manual(s):
235-105-220 Corrective Maintenance
1. PURPOSE

Requests the Operating System for Distributed Switching (OSDS) resource monitoring utility to stop collecting and reporting usage of OSDS message, process, stack, and timer control blocks.

2. FORMAT

STP:PERF,{AM|CMP=a-b|SM=c};

3. EXPLANATION OF MESSAGE

AM = Operational kernel process in the administrative module (AM).

a = Message switch side. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual.

b = Communications module processor (CMP) number. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
- CMP NOT EQUIPPED = Requested CMP is not equipped.
- INTERNAL ERROR = An internal error has occurred while processing a CMP request.

OK = Request was successful. OSDS resource monitoring in the requested destination will be halted. May also include:
- JOB ALREADY INACTIVE = OSDS resource monitoring was already disabled.

RL = Retry later. The request cannot be initiated now because:
- CMP SOFT SWITCH INPG = A CMP soft switch is in progress.
- CMP UNAVAILABLE = Requested CMP is out of service, initializing, or unavailable.

APP : RANGES
STP:PLTLK

**Software Release:** 5E15 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Stops the currently executing action on a PCT (Peripheral Control and Timing) line and trunk unit link.

2. **FORMAT**

```
STP: [a,]PLTLK=b-c-d-e;
```

3. **EXPLANATION OF MESSAGE**

- **a** = Action to be stopped (default is the action currently executing on the PCT link). Valid value(s):  
  - DGN = Diagnose.  
  - RMV = Remove.  
  - RST = Restore.

- **b** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c** = PLTU (PCT Line and Trunk Unit) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **d** = PCT Facility Interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **e** = PCT Facility Interface side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **UCL** = Remove unconditionally.

4. **SYSTEM RESPONSE**

- **NG** = No good. Valid values are:  
  - REASON FOR NG = The message form is valid, but the request conflicts with current status.

- **PF** = Printout follows. A STP PLTLK output message follows.

- **RL** = Retry later. The request cannot be executed now due to unavailable system resource.

1430 (PLTU Status page)
1. PURPOSE

Requests that a specific integrated services digital network (ISDN) channel protocol monitoring (PM) session or all protocol monitoring sessions be stopped. If XLATE is requested, the American standard code for information interchange (ASCII) translation of the hexadecimal data currently collected for the specified session(s) will be sent to the ASCII translation file (ATF) atf.xxx. If DUMP is requested for a PM session that was initiated with the XLATE input message, the ASCII translation of the hexadecimal data currently collected for the specified session(s) will be sent to the ATF. Otherwise, if DUMP is requested, the hexadecimal data currently collected for the specified session(s) will be displayed.

2. FORMAT

STP:PM{,SES=a|ALL}{,DUMP}{,PRINT}{,XLATE};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Stop all protocol monitoring sessions.

DUMP = Dump the recorded data before the session is terminated. If the PM session was initiated with the XLATE option, dumping the data will have the same result as issuing the STP:PM input message with the XLATE option. Otherwise, the hexadecimal data will be displayed.

PRINT = Print the EXC PM STOPPED output on the receive-only printer (ROP).

NOTE: If the request is initiated from the Master Control Center (MCC) or a supplemental trunk and line workstation (STLWS), the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

NOTE: If the output from this PM session is being translated because the session was initiated with the XLATE option, or because the STP:PM input message was given with the XLATE option, the PRINT option will have no impact. Translated data will never go to the ROP.

XLATE = Translate the hexadecimal data messages of the recording session into ASCII and store the translated output in a file on the moving head disk (MHD) of the administrative module (AM). Translation capability is a "secured feature". If the feature is not activated, the information will be reported in hex format. Translation is not available for all protocols. Translation is supported for LapB, LapD, Q.931 (Custom only), X.25, and X.75. Protocols. If the translation of the protocol is not supported, the information will be reported in hex format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ATF in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

NOTE: If the data collection phase of the session has terminated prior to the execution of the STP:PM input message, translation is no longer an option.

NOTE: Translated data will never go to the ROP.
a = The protocol monitoring session (SES) specified in the EXC PM STARTED output message.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized, or was not acceptable.

PF = Printout follows. The request has been accepted and is in progress. Followed by the STP:PM output message.

RL = Retry later. The system is busy.

Application: 5
Type: Input

1. PURPOSE

Requests that a specific integrated services digital network (ISDN) channel protocol monitoring (PM) session or all protocol monitoring sessions be stopped. After the introduction of PCF on PHE2 feature, it is also used to stop a PCF PM session. If SES=ALL is specified, all the PM sessions will be stopped. If XLATE is requested, the American standard code for information interchange (ASCII) translation of the hexadecimal data currently collected for the specified session(s) will be sent to the ASCII translation file (ATF) atf.xxx. If DUMP is requested for a PM session that was initiated with the XLATE input message, the ASCII translation of the hexadecimal data currently collected for the specified session(s) will be sent to the ATF. Otherwise, if DUMP is requested, the hexadecimal data currently collected for the specified session(s) will be displayed.

2. FORMAT

STP:PM{,SES=a|ALL}{,DUMP}{,PRINT}{,XLATE};

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Stop all protocol monitoring sessions.

DUMP = Dump the recorded data before the session is terminated. If the PM session was initiated with the XLATE option, dumping the data will have the same result as issuing the STP:PM input message with the XLATE option. Otherwise, the hexadecimal data will be displayed.

PRINT = Print the EXC PM STOPPED output on the ROP.

If the request is initiated from the Master Control Center (MCC) or a supplemental trunk and line workstation (STLWS), the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

If the output from this PM session is being translated because the session was initiated with the XLATE option, or because the STP:PM input message was given with the XLATE option, the PRINT option will have no impact. Translated data will never go to the ROP.

XLATE = Translate the hexadecimal data messages of the recording session into ASCII and store the translated output in a file on the moving head disk (MHD) of the administrative module (AM). Translation capability is a "secured feature". If the feature is not activated, the information will be reported in hex format. Translation is not available for all protocols. Translation is supported for LAPB, LAPD, Q.931 (Custom only), X.25, X.75, and RLP protocols. If the translation of the protocol is not supported, the information will be reported in hex format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ATF in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

If the data collection phase of the session has terminated prior to the execution of the STP:PM input message, translation is no longer an option.

Translated data will never go to the ROP.
= The protocol monitoring session (SES) specified in the EXC PM STARTED output message.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized, or was not acceptable.

PF = Printout follows. The request has been accepted and is in progress. Followed by the STP:PM output message.

RL = Retry later. The system is busy.

235-190-104 ISDN Feature Descriptions
235-190-130 Local Area Signaling Services
235-900-341 National ISDN Basic Rate Interface Specification
1. PURPOSE

Requests that a specific CCS protocol monitoring (PM) session or all CCS protocol monitoring sessions be stopped. If DISCARD is specified, any data collected for the session(s) will be discarded (i.e. not reported). If the data is to be reported, the default format of the data will be the format that was specified on the initiating EXC:PMCCS command for that session. That is, if the EXC:PMCCS command initiating this session defaulted to XLATE, then the STP:PMCCS output will also be translated as a default. Similarly, if the EXC:PMCCS command initiating this session was specified to provide a HEXDUMP, then the STP:PMCCS output will also provide a HEXDUMP as a default. Two options are provided to override the STP:PMCCS default output format. Specifying XLATE on the STP:PMCCS will provide translation of the hexadecimal data in an ASCII translation file (ATF) atf.xxx. If HEXDUMP is requested for the STP:PMCCS command, the hexadecimal data currently collected for the specified session(s) will be displayed on the receive-only printer (ROP).

Note: The STP:PMCCS command stops all subsequent sessions related to the session specified. That is, if the STP:PMCCS command is issued to stop a session that was initiated with the REPEAT option, the session will not REPEAT.

2. FORMAT

\texttt{STP:PMCCS\{,SES=a|ALL\}[,XLATE|HEXDUMP|DISCARD];}

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format. The default behavior for the STP:PMCCS command is to display the data as was requested in the EXC:PMCCS command which initiated the request.

\texttt{ALL} = Stop all CCS protocol monitoring sessions.

\texttt{XLATE} = Translate the hexadecimal data messages of the recording session into ASCII and store the translated output in a file on the moving head disk (MHD) of the administrative module (AM). Overrides EXC:PMCCS specification. If the translation of the protocol is not supported, the information will be reported in hexadecimal format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ATF in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

\texttt{HEXDUMP} = Report the data in hexadecimal format on the ROP. Overrides EXC:PMCCS specification.

\texttt{DISCARD} = Do not report any data collected. This option can be used to stop sessions that are in a TRANSIENT STATE.

\texttt{a} = The CCS protocol monitoring session (SES) specified in the EXC PMCCS STARTED output message.

4. SYSTEM RESPONSE
NG  = No good. The message was not recognized, or was not acceptable.
PF  = Printout follows. The request has been accepted and is in progress. Followed by the STP:PMCCS output message.
RL  = Retry later. The system is busy.

Input Appendix(es):

APP : RANGES
1. PURPOSE

Requests that actions on the specified pump peripheral controller (PPC) be stopped.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a sane state. An abort action is immediate and the state of the hardware is not guaranteed.

2. FORMAT

\texttt{STP:a,PPC=b;}

3. EXPLANATION OF MESSAGE

\begin{itemize}
\item \texttt{a} = Action to be stopped (default is any action currently waiting or executing on the PPC). Valid value(s):
\begin{itemize}
\item \texttt{DGN} = Diagnose. (Not valid for CM3)
\item \texttt{EX} = Exercise. (Not valid for CM3)
\item \texttt{RST} = Restore.
\end{itemize}
\item \texttt{b} = PPC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\end{itemize}

4. SYSTEM RESPONSE

\begin{itemize}
\item \texttt{IP} = In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.
\item \texttt{NG} = No good. The request has been denied. The message syntax is invalid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
\end{itemize}

STP: PSUP IDB

Input Appendix(es):

APP: RANGES
**STP:QGP**

Software Release: 5E14 and later  
Command Group: CM  
Application: 5  
Type: Input  

1. **PURPOSE**

Requests that actions on a quad-link packet switch (QLPS) gateway processor (QGP) be stopped (STP).

2. **FORMAT**

\[ \text{STP:}[a,]QGP=b-c; \]

3. **EXPLANATION OF MESSAGE**

- **a** = Action to be stopped. This input message will stop all requests with the specified action either waiting or executing for the QGP; if no action is given, all requests for the QGP are stopped. Valid value(s):  
  - DGN = Diagnose. (Not valid for CM3)  
  - EX = Exercise. (Not valid for CM3)  
  - RST = Restore.  
  - blank = Any or all the above actions currently waiting or executing on the QGP.

- **b** = Message switch (MSGS) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c** = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

- **PF** = Printout follows. Followed by the STP:QGP output message.

5. **REFERENCES**

Input Message(s):

- EX:QGP  
- OP:DMQ-CM-SM  
- RST:QGP

Output Message(s):

- DGN:QGP
STP:QLPS

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on a quad-link packet switch (QLPS) be stopped (STP).

2. FORMAT

STP: [a,]QLPS=b-c;

3. EXPLANATION OF MESSAGE

a = Action to be stopped. This input message will stop all requests with the specified action either waiting or executing for the QLPS; if no action is given, all requests for the QLPS are stopped. Valid value(s):
   DGN = Diagnose.
   EX = Exercise.
   RST = Restore.
   blank = Any or all of the above actions currently waiting or executing on the QLPS.

b = Office network and timing complex (ONTC) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Output Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the STP:QLPS output message.

5. REFERENCES

Input Message(s):

Output Message(s):
   DGN:QLPS
EX: QLPS
OP: DMQ-CM
RST: QLPS
STP: QLPS

Input Appendix(es):

APP: CM-IM-REASON
APP: RANGES
1. PURPOSE

Requests that the specified actions on the recorded announcement function (RAF) unit be stopped.

2. FORMAT

STP: [a,] RAF=b-c;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is the action currently executing on the RAF). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number.

c = RAF unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
   - SM DOES NOT EXIST = The requested SM does not exist in the system.
   - SM UNEQUIPPED = The SM specified in the request is unequipped.
   - UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by an STP: RAF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

Software Release Retrofit
STP:RCL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that maintenance actions on an inter-remote switching module (RSM) communication link (RCL) be stopped.

2. FORMAT

STP: [a,] RCL = b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action being stopped (default is the action currently executing on the RCL). Valid value(s):
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Inter-RSM communication link digital facilities interface (CDFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Facility (FAC) number. The FAC number is the T1 facility number on a CDFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
   - NOT STARTED UNIT IN GROWTH STATE
   - SM DOES NOT EXIST
   - SM UNEQUIPPED
   - UNIT DOES NOT EXIST

PF = Printout follows. Followed by the STP:RCL output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

**1. PURPOSE**

Requests that a given active remote digital test access (RDTA) session be stopped.

The active RDTA session will be terminated based on the session number returned in the EXC RDTA output message after the connection was setup. The session number must either be known by the user attempting maintenance or it can be found by exercising the OP:RDTA input message to receive information on all sessions (SES=ALL option). This session number input verifies the user's knowledge of the session's status to the switch when changes are made affecting the session.

**2. FORMAT**

```
STP:RDTA,SES=a;
```

**3. EXPLANATION OF MESSAGE**

- **a** = Session number of the active RDTA connection to be stopped.

**4. SYSTEM RESPONSE**

- **PF** = Printout follows. The request has been accepted. Followed by the STP:RDTA output message.
- **RL** = Retry later. May also include:
  - **FAILED TO CREATE PROCESS** = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
  - **TOO MANY PROCESSES ACTIVE** = The request has been denied, probably due to system load.

**5. REFERENCES**

STP:REX-CM-SM
Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE
Requests that either one or all valid test types of routine exercise (REX) of the hardware be stopped in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs.

2. FORMAT
STP:REX[,CM|,SM=a[&b]][,c];

3. EXPLANATION OF MESSAGE
a = Number of the SM or lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = REX test type to be stopped (default is to stop all valid test types). Valid value(s):
  DGN = Stop diagnostic exercise
  ELS = Stop electronic loop segregation tests. This is not a valid test type for the CM.
  FAB = Stop fabric exerciser tests of grids. This is not a valid test type for the CM.

NOTE: If neither CM nor SM is specified, the default is to stop exercise hardware in the CM and all SMs.

4. SYSTEM RESPONSE
NG = No good. The request was not a valid entry.
PF = Printout follows. Request is valid and output message will follow.
RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

h = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Virtual tributary 1.5 group (VTGRP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Digital signal level 0 (DS0) number or ALL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Primary rate interface (PRI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Line group number or ALL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
a¹ = SONET terminating equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b¹ = Virtual tributary 1.5 member (VTMEM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = Peripheral control and timing line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f¹ = Channel number or ALL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g¹ = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h¹ = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i¹ = Link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j¹ = Virtual connection identifier (VCID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k¹ = Office interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l¹ = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m¹ = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n¹ = STS level 1 (STS-1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NA = Not available. May also include:
- FEATURE NOT LOADED = The special feature is not turned on.

PF = Printout follows. The request has been accepted and the STP:RST output message follows.

RST: TRK
OP: JOBSTATUS

Input Appendix(es):

APP: RANGES
STP:RTFAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on a remote terminal (RT) facility (FAC) circuit be stopped. This message is applicable for TR303 RTs (that is, AT&T Series 5 RTs running Feature Package 303G) terminating on a digital networking unit - synchronous optical network (DNU-S). This is an alternative way to address a DS1SFAC facility.

2. FORMAT

STP: [a,] RTFAC=b-c;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (the default action is the action currently executing on the RT FAC). Valid values are:
   RMV = Remove.
   RST = Restore.

b = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RT FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the STP:RTFAC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1512.x.yy (DNUS STS DS1 APPLICATION)
1660.xxxx (TR303 REMOTE TERMINAL)
1. PURPOSE
Requests that currently running actions be stopped gracefully on the revertive pulsing transceiver (RVPT) at the specified location.

2. FORMAT

STP: [e, ]RVPT=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
b = Unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
c = Service group. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
d = Circuit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
e = The action to be stopped. Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.
   RMV = Remove.
   RST = Restore.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF = Printout follows. Followed by the STP: RVPT output message.
RL = Repeat later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Terminates an observation scope for all selected blocking, reset, unblocking, continuity, circuit query, and circuit validation CCSMTCE messages.

It turns off all selected blocking, reset, unblocking, continuity, circuit query, and circuit validation messages for trunks assigned to the specified origination point code (OPC), destination point code (DPC), and optional circuit identification code (CIC).

This input message has no affect if the ALW:S7RPT input message has not been entered.

2. FORMAT

STP:S7RPT,OPC=a,DPC=b[,CIC=c];

3. EXPLANATION OF MESSAGE

a = OPC identification.
b = DPC identification.
c = CIC identification.

4. SYSTEM RESPONSE

NG = No good. May also include:
- FEATURE NOT AVAILABLE = The input message cannot be used in this office. The office should be upgraded.
- S7RPT NOT ALLOWED = The ALW:S7RPT input message must be issued for STP:S7RPT input message to have any affect.
- HARDWARE NOT OPERATIONAL = The office does not have SS7 trunks.
- PARAMETER COMBINATION ERROR = The input message parameter combination is wrong.
- OBSERVATION SCOPE NOT ACTIVE = No observation scopes are active.

PF = Printout follows. Followed by the EXC:S7RPT output message.

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that a diagnostic or exercise on the time-multiplexed switch (TMS) on the specified office network and timing complex (ONTC) be stopped.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a 'clean' point of termination (such as, the end of a phase), and will attempt to leave the hardware in a sane state. An about action is immediate and the state of the hardware is not guaranteed.

2. FORMAT

STP: [a,] TMS=b;

3. EXPLANATION OF MESSAGE

a

= Action to be stopped (default is any action currently waiting or executing on the TMS). Valid value(s):
   DGN = Diagnose.
   EX  = Exercise.

b

= Side of ONTC that the TMS is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP

= In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.

NG

= No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

5. REFERENCES

Input Message(s):

   EX:TMS
   OP:DMQ

Output Message(s):
   DGN:TMS
   EX:TMS
   OP:DMQ-CM
Input Appendix(es):

APP: CM-IM-REASON
APP: RANGES
1. PURPOSE

Stops a diagnostic, remove, or restore, on the time multiplexed switch (TMS) fabric pair (TMSFP) for the specified office network and timing complex (ONTC). This command also has the option of stopping any running or pending child requests of the parent TMSFP.

Stop is differentiated from abort by the action of the request. A stop action is not immediate, but waits for a graceful point of termination (for example, the end of a phase), and will attempt to leave the hardware in a sane state. An abort action is immediate and the state of the hardware is not guaranteed.

2. FORMAT

\[ \text{STP:} [a,] \text{TMSFP=}b-c[,\text{ALL}]; \]

3. EXPLANATION OF MESSAGE

- **ALL** = Stop the TSMFP request and/or any child (for example, QLPS, NLI, DLI) requests that may exist on the deferred maintenance queues (DMQ).
- **a** = Action to be stopped. The default is any action currently waiting or executing on the TMSFP. Valid value(s):
  - **DGN** = Diagnose.
  - **RMV** = Remove.
  - **RST** = Restore.
- **b** = ONTC side that the TMSFP is on.
- **c** = TMS fabric pair number.

4. SYSTEM RESPONSE

- **IP** = In progress. The stop has been initiated. A completion message will be printed for the original request when the stop has completed.
- **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE

Requests that maintenance actions be stopped on a digital networking unit - synchronous optical network (DNU-S) transmission multiplexer (TMUX).

2. FORMAT

STP:\[a,] TMUX=b-c-d-e;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (default is the action currently executing on the TMUX). Valid value(s):
   DGN = Diagnose.
   RMV = Remove.
   RST = Restore.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. Followed by the STP:TMUX output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

1. PURPOSE

Stops pending or currently running test(s) of a integrated service digital network (ISDN) digital subscriber line (DSL). The test to be stopped was previously requested by the TST:DSL input message or from the trunk and line work station (TLWS). This message stops all tests on the DSL specified.

Unless otherwise stated: all references to integrated services line unit (ISLU), include all configurations of the ISLU and the integrated services line unit, version 2 (ISLU2). This includes both the remote integrated services line unit (RISLU) and remote integrated services line unit version 2 (RISLU2). All references to access interface unit (AIU), include the remote access interface unit (RAIU). Reference to line unit (LU) includes all supported ISDN compatible LUs.

For integrated digital carrier unit (IDCU) or digital network unit - synchronous optical network (SONET) (DNU-S) remote digital terminal (RDT) DSLs, a corrupt cyclic redundancy check (CRC) test cannot be stopped (see the TST:DSL input message).

In general, the DSL test to be stopped is identified using the office equipment number (OEN) or an associated subscriber directory number (DN).

Format 1 stops ALL test requests in the system.

Format 2 stops test requests on any LU DSL using the subscriber DN.

Format 3 stops test requests on ISLU DSLs using the line card equipment number (LCEN).

Format 4 stops test requests on ISLU2 DSLs using the line circuit equipment number (LCKEN).

Format 5 stops test requests on AIU DSLs using the AIU equipment number (AIUEN).

Format 6 stops test requests on IDCU, DSLs using the IDCU line equipment number (ILEN).

Format 7 stops test requests on DNU-S, DSLs using the integrated digital loop carrier (IDLC) networking line equipment number (INEN).

2. FORMAT

[1] STP:TST:DSL;
[7] STP:TST:DSL,INEN=b-f-g-k;
3. EXPLANATION OF MESSAGE

a = subscriber directory number.

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ISDN line unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Remote digital terminal number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Line board/pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RDT channel unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. A TST:DSL output message will follow when the test has been stopped.

5. REFERENCES

Input Message(s):

OP:CONV
TST:DSL

Output Message(s):

TST:DSL

Input Appendix(es):

APP:RANGES
STP:TST-ELS

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that a currently-running (manually-requested) electronic loop segregation (ELS) test be stopped. The test to be stopped has been previously requested by the TST:LINE-ELS input message.

Only one manually-requested ELS test per switching module (SM) is allowed. Therefore, any test of the line identifier type specified (DN, MLHG, and so forth) running in the SM will be stopped. Formats 1 through 6 are used to request that an ELS test related to an individual line of the type indicated be stopped. Format 7 is used to request that all ELS tests related to the specified SM be stopped.

2. FORMAT

[1] STP:TST,ELS,DN=a[-n];
[3] STP:TST,ELS,LEN=d-e-f-g[-h][-i]];
[4] STP:TST,ELS,LCEN=d-k-l-m;
[6] STP:TST,ELS,LCKEN=d-o-p-q[-r];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Directory number (DN) of the line being tested. The directory number will include NPA for non-unique NXX DN.

b = Hunt group number of the line being tested (or any line in the same SM as the line being tested). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Line unit number of the line being tested (or any line in the same SM as the line being tested). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Grid pack number (LU1, LU2, or LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If ALL is specified for variable ‘g’ then variable ‘h’ and ‘i’ should be omitted.

h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If ALL is specified for variable ‘h’ then variable ‘i’ should be omitted.

i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If ALL is specified for variable ‘i’ then the 4 lines on the specified switch will be stopped.

k = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified should be the main DN for the group and the member number should indicate a specific member in the group. For LTSB a member number of 1 indicates the lead line and a member number of 2 indicates the associate line. If no member is specified, for 1-DN LTSB, the lead line will be stopped. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be stopped.

o = Integrated services line unit-2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If ALL is specified for variable ‘q’ then variable ‘r’ should be omitted.

r = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If ALL is specified for variable ‘r’ then all the lines on the line board will be stopped.

s = Access interface unit (AIU) equipment number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
t = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid but the request conflicts with current status.

PF = Printout follows. The request has been received. Followed by the STP:TST-ELS output message.

5. REFERENCES

235-105-220  Corrective Maintenance
1. PURPOSE
Requests that a modem pool (MP) test started by the TST:MP input message be stopped.
The test will be stopped immediately.

2. FORMAT

[1]  STP:TST:MP,MPM=a-b;

3. EXPLANATION OF MESSAGE
An MPG is a multi-line hunt group (MLHG). An MLHG can be identified by both its number and its directory number (DN). An MPM is identified by the group number and member number.

a  = Modem pool group (MPG) number involved in this test.
b  = Modem pool member (MPM) number of first MPM involved in this test.
c  = Directory number (DN) of multi-line hunt group (MLHG) for this test.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied.
PF  = Printout follows. The request has been accepted and the test will be stopped. Followed by the STP:TST-MP output message.
RL  = Retry later. The request cannot be accepted now because of system load.

STP:TST-PATH-A

Software Release: 5E15 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Stops pending or currently running test(s) of a digital loop-back (LPBK) test on inter-working gateway (IWG) or the end to end test call. The test to be stopped was previously requested by the TST:PATH input message.

Format 1 stops ALL test requests in the system or on any SM. The SM parameter can only be used to stop tests which had requested with the IWG parameter on the original test path request.

Format 2 stops test requests for IWG test call. If user specified any path equipment number (PEN) identifiers in test path request, then the same identifiers can be specified here to stop the test.

Format 3 stops test requests for bearer independent connection control (BICC) test call. If user specified any IWG, PEN or overload control 3 (OC3) identifiers in test path request, then the same identifiers can be specified to stop the test.

2. FORMAT

[1] STP:TST,PATH[,SM=a];

[2] STP:TST,PATH,IWG=a-b[,PEN=c[-d[-e]]];

[3] STP:TST,PATH,{BG=h|BGMN=h-i},OPDN=g[,IWG=a-b][,PEN=c[-d[-e]]][,OC3=f];

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Inter-working gateway (IWG) unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Relative link number (0-4). Each relative link (rlink) is a coaxial cable connected to a synchronous transport signal number 1 (STS-1e) card in the IWG. Each rlink is equivalent to an host facility on the IWG (also equivalent to IWGFAC#-1).

d = Relative tributary number (0-27). Each rlink has 28 relative tributary numbers (rtrib). The rtrib is a logical entity on the rlink, which is equivalent to a DS1 in the DNUS. Each rtrib is a physical device chip inside of IWG which capable of handling 24 channels.

e = Digital signal 0 (DS0) value (0-24). DS0 is logical channels inside the rtrib. The total logical DS0 channels (total rtrib * total DS0) on a rlink is equivalent to the total time slots (TS) on 5E.

f = Optical carrier 3 (OC3) link number (0-1).

g = Out pulse digits.
h = BICC group number.
i = BICC group member or normalized circuit identification code (CIC).

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the TST:PATH output message.

**Type:** Input

### 1. PURPOSE

Stops currently executing or pending test(s) initiated by a previously received TST:PATH input message. For descriptions of the various TST:PATH test types, see the TST:PATH input message manual page.

Format 1 stops ALL test requests in the system.

Format 2 stops the test request identified by the specified REQNO. The REQNO is assigned to the test request when the input message acknowledgment ("PF") is provided.

Format 3 stops all test requests which were requested for the specified switching module (SM) using either the optical interface unit (OIU) or the optical interface unit protection group (OIUPG) parameter in the original test request.

Format 4 stops test requests for packet test calls looped back internally in the packet OIU protection group.

Format 5 stops test requests for packet test calls connecting over the packet network to a test line in the far office.

Format 6 stops test requests for ATM packet pipe trunk test calls. The ability to stop all tests running on a specific ATM link is also provided.

Format 7 stops test requests for signaling ATM adaption layer (SAAL) high speed link (HSL) test calls.

If an identifier is specified in a STP:TST-PATH input message, generally that same identifier must have also been specified in the original TST:PATH request for it to be stopped by a stop request. By omitting an optional identifier in the STP:TST-PATH input message, no consideration is given to the use of that identifier in the original TST:PATH request in deciding whether or not to stop a running test.

3. EXPLANATION OF MESSAGE

a = Request number to be stopped, or the lower limit of a range of request numbers to be stopped (0-254).
b = Upper limit of a range of request numbers to be stopped (0-254).
c = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = OIUPG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Peripheral control and timing (PCT) link number, relative to the OIU (0-2).
g = PCT time slot (PCTTS) number (0-767).
h = Packet group (PKTG) number (7000-7999).
i = Packet group member number (PKTGMN) (0-65535).
j = Outpulsed directory number (OPDN) of the appropriate test line type at far-end office.
k = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = ATM link unit number (1-10).
m = Virtual connection identifier (VCID) number (0-1023). VCID is a virtual connection identifier that identifies a PVC on a given PSU ATM link. If "ALL" is specified instead of a specific VCID number, all test requests which are currently running or pending on each VCID of the matching SM-PSU-LINKs specified in TST:PATH input message will be stopped.
n = Trunk group number.
o = Trunk member number or the lower end of a range of trunk member numbers.
p = Upper end of a range of trunk member numbers.
q = Number of times to repeat (RPT) the test being run (1-32).
r = Duration (DUR) of the test to be run, in seconds.
s = Camp-on time for the test being run (10-3600).
t = PSU shelf number (0-5).
u = PSU channel number (0-15).
v = PSU channel member number (0-127).

4. SYSTEM RESPONSE

PF = Printout follows. Followed by one or more TST:PATH output messages for stopped tests, or a STP:TST-PATH output message indicating the outcome of the request.

STP:UMBIL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that actions on a host umbilical (UMBIL) circuit be stopped. This message is applicable for host umbilicals terminating on a digital line and trunk unit (DLTU) or on a digital networking unit - synchronous optical network (DNU-S). This is an alternative way to address a remove of a host facility (HFAC) or a DS1 facility.

2. FORMAT

STP:[a,]UMBIL=b-c-d;

3. EXPLANATION OF MESSAGE

a = Action to be stopped (the default action is the action currently executing on the UMBIL). Valid values are:
   RMV = Remove.
   RST = Restore.

b = Host Switch Module (HSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Remote Switch Module (RSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = UMBIL number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the STP:UMBIL output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1320.y.x (AIU SUMMARY)
1. PURPOSE

Requests that the active/standby state of the administrative service module (ASM) be switched (interchanged) when high availability ASM (HA-ASM) exists in an office.

On a conditional request, the input request is only performed if the ASMs are in an active/standby configuration and no conflicting operations are in progress.

For the unconditional request, the input request is performed if the ASMs are in an active/standby configuration. If a conflicting operation is in progress, the UCL option will over-ride the operation.

The command is rejected if the mate ASM is in an out of service state.

The SW ASM output command will indicate if the request was started or blocked. Once the switch over is started, ASM state changes are reported using the REPT:ASM input message.

2. FORMAT

SW:ASM[,UCL];

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good.

RL = Retry later.

PF = Printout follows. The command has been accepted. Followed by the SW:ASM output message indicating if the request can be started.

5. REFERENCES

Output Message(s):

REPT:ASM
SW:ASM

Other Manual(s):
235-200-145 ASM User's Guide
SW:CLOCK

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the mate network clock node be switched to the master network clock node.

If the STATUS data field is not used, the mate clock node will become the master clock node and will broadcast the change to all member nodes in the CCS network. This message can only be entered at the mate clock node. The status of the clock information can be verified by including the STATUS data field. The status information is the master/mate clock node point codes or a message if the data is not assigned. If the point codes are displayed and the master has been determined, it will be determined with an asterisk (**).

2. FORMAT

SW:CLOCK[:STATUS];

3. EXPLANATION OF MESSAGE

STATUS = Verify the status of clock information. The status information is the master/mate clock node point codes or a message if the data is not assigned. If the point codes are displayed and the master has been determined, it will be marked with an asterisk (**).

Note: Default will switch the network clock node to the master network clock node.

4. SYSTEM RESPONSE

MASTER/MATE POINT CODES: UNASSIGNED = If the master and mate clock nodes are not assigned, the following message will be output.

NETWORK CLOCK DATA DOES NOT EXIST = If the STATUS data field is not used, certain checks of the current status of the office are made. For the switch to be performed, neither the master nor mate point codes can equal "000000000". This condition would occur if the "clkdata" disk file does not exist or if it contains all zeroes for the point codes. If this condition is detected, the following message will be output.

CLOCK MESSAGES ARE NOT ENABLED = Additionally, for the switch to be performed, IMS messages must be allowed to be transmitted. They are not allowed if the office has not successfully completed an initialization of level 1 or higher. If this condition is detected, the following message will be output.

CURRENT NODE MUST BE THE MATE CLOCK = The last remaining check to be made is that the office is the mate clock. If the office is not currently the mate clock, the following message will be output.

**SW:CMP**

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests activation of the standby of the communication module processor (CMP). The CMPs must be active standby to allow a switch.

This input message also stimulates the communication link normalization program (CLNORM) to analyze the resulting CMP and foundation peripheral controller (FPC) configuration and, under certain circumstances, modify it.

CLNORM modifies the configuration under the following circumstances. When message switch (MSGS) sides have an unequal number of communication links, CLNORM will attempt to keep the active CMP and active FPC configured to the MSGS side that carries the largest number of communication links. This is to reduce an administrative module (AM) performance degradation condition known as "message hairpinning". To ensure that CLNORM does not switch CMPs and FPCs back to the previous configuration, all MSGS hardware should be in service and communication links normalized before this input message is entered.

When MSGS sides have an equal number of communication links (the normal case), CLNORM will attempt to keep the active CMP and the active FPC on opposite MSGS sides. CLNORM keeps these units on separate sides so as to more evenly distribute message traffic between MSGS sides. In this case, issuing the SW:CMP input message will internally produce a switch of the FPC. Likewise, a switch of the FPC will indirectly produce a switch of the CMP.

During periods of repair or installation, this activity by CLNORM is inhibited by entering the INH:CLNORM,FPC and/or the INH:CLNORM,CMP input message.

**WARNING:** The use of this input message with the unconditional option could result in the loss of transient calls. Use with extreme caution!

2. **FORMAT**

```
SW:CMP=a-b[,UCL];
```

3. **EXPLANATION OF MESSAGE**

**UCL** = Switch the CMP unconditionally without performing a memory update.

**a** = Message switch side number.

**b** = CMP number.

4. **SYSTEM RESPONSE**

**NG** = No good. The request has been denied. The message syntax was valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
PF = Printout follows. The output message SW:CMP follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5
Type: Input

1. PURPOSE

Requests that a module controller/time slot interchange (MCTSI) be switched from standby to active.

To allow a switch, the configuration of the module controller/time slot interchanges (MCTSIs) must be active-standby; the message does not work for other configurations (such as unavailable and out-of-service).

2. FORMAT

SW: MCTSI=a;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the SW:MCTSI output message.

5. REFERENCES

Output Message(s):

SW: MCTSI

Input Appendix(es):

APP: RANGES
SW:MHD
Software Release: 5E14 and later
Command Group: AM
Application: 5
Type: Input

1. PURPOSE

Requests a software switch of the logical names of the moving head disks (MHDs). This message allows any two MHDs in the office to swap identity for the purpose of file access. This allows disk memory to be remotely configured should a disk fail in an unstaffed office.

For example, if MHD 1; had a failure and the office had a spare MHD connected into the system as MHD 15, the two could swap identity with by entering:

SW:MHD=1:MHD=15;

After this message completes, MHD 15 will act as if it were MHD 1; for the purpose of file access. When MHD 15 is restored to service, it will get a copy of MHD 0 files, and MHD 0 and MHD 15 will be the primary duplex MHD pair.

Any time a primary MHD needs to be swapped, the ideal choice would be to swap it with the warm spare on the same disk file controller (DFC). For example, the superior swap choice for MHD 0 would be MHD 14, and the choice for MHD 1; would be MHD 15. This would prevent both primary disks from depending on the same DFC. If there are no warm spares available for swapping, then another MHD can be selected.

The system can continue to operate for an indefinite time with a reconfiguration in effect. Because the reconfiguration consists of equipment configuration data base (ECD) changes, care should be taken so that an incore activate does not copy the changes to disk. However, because the reconfiguration is incore only, a level 53 or higher boot will restore the original MHD configuration.

If both MHD 0 and MHD 1; have been swapped, the system will most likely NOT recover from a level* or higher boot. You should avoid this configuration, if possible.

Format 1 is used to swap an MHD with either a specified MHD or a system-selected MHD. (If both MHDs are specified, then they both must be out-of-service (OOS)).

Format 2 is used to restore either a specified MHD or all MHDs to their standard configuration.

2. FORMAT

[1] SW:MHD=a:[MHD=b|REPLACE];
[2] SW:MHD=[c|ALL]:STANDARD;

3. EXPLANATION OF MESSAGE

ALL = Restore all MHDs in the office.
REPLACE = System selected MHD to be substituted.
a = Number of the MHD to be replaced, typically the faulty OOS device. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Number of the MHD to be substituted. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Number of the MHD to have its configuration restored. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CAN'T SWITCH MHD WITH ITSELF = MHD 'a' cannot be the same value as MHD 'b'.

PF = Printout follows. The message was accepted. Followed by one or more REPT:SW-MHD output messages. If either MHD is marked essential, then degrowth and growth messages will also follow.

RL = Retry later. May also include:
- PREVIOUS 'SW:MHD' COMMAND IN PROGRESS = The message was accepted, and one or more REPT:SW-MHD output.
- PREVIOUS COMMAND IN PROGRESS = System is unable to honor an additional request at this time.

Where 'x' is the release-specific version of the document.

APP:RANGES
SW:NCOSC-A

Software Release: 5E14 only
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the network clock 2 oscillator (NCOSC) used to provide the time base signal be switched to the specified network clock side from the one currently in use to the other oscillator.

For example, network clock side 0 is using NCOSC 1 for its time-base signal. The input message SW:NCOSC=0 will make NCOSC 0 the active oscillator for side 0.

2. FORMAT

SW:NCOSC=a;

3. EXPLANATION OF MESSAGE

a = Network clock unit side for which the switch of active oscillator unit is requested. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.
OK = Good. The request was accepted and completed.
PF = Printout follows. Followed by the SW:NCOSC output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

Output Message(s):
REPT:NC
SW:NCOSC

Input Appendix(es):
APP:RANGES

MCC Display Page(s):
1. PURPOSE

Switches the active network clock oscillator (NCOSC) to the specified side. Valid for network clock (NC) model 2 or 3.

For NC model 2: The command may be applied when both oscillators are active.

For NC model 3: The command will only be accepted when the oscillators are in an ACTIVE/STANDBY configuration. This configuration only exists when the ONTCs are simplex, since when the ONTCs are duplexed, each ONTC side uses its respective near oscillator and the oscillator states are ACTIVE/ACTIVE. When the ONTCs are simplex and neither oscillator is out of service, the ONTC will use the ACTIVE oscillator and the other one will be in the STANDBY state. This command can be used to switch the ACTIVE/STANDBY configuration by specifying the STANDBY oscillator in the command.

2. FORMAT

SW:NCOSC=a;

3. EXPLANATION OF MESSAGE

a = Network clock unit side for which the switch of active oscillator unit is requested. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status.

OK = Good. The request was accepted and completed.

PF = Printout follows. Followed by the SW:NCOSC output message.

SW:OFLBOOT

Software Release: 5E14 and later
Command Group: MAINT
Application: 5,3B
Type: Input

1. PURPOSE

To perform a call processing side switch. This input message may be used only after a `REPT OFLBOOT BOOT COMPLETED` message has been received.

This input message may be used to switch call processing to the other side. After the switch, call processing is handled by the new on-line side, and the previous on-line side becomes the off-line side. The system remains split. A `STOP:OFLBOOT` is needed to return to duplex configuration. There are some restrictions the user must follow for this input message to execute successfully:

- There should be no diagnostic activities running.
- The maintenance teletypewriter (MTTY) and receive-only printer (ROP) port selector switches must be in the AUTO position and the portswitch controller must be powered on.

2. FORMAT

`SW:OFLBOOT: [, UCL];`

3. EXPLANATION OF MESSAGE

`UCL` = If specified, some application precheck results will be overridden. The UNIX® RTR precheck results will not be overridden. The default is enforce all precheck results.

4. SYSTEM RESPONSE

`IP` = In progress.
`?A` = Action field error.
`?E` = Error exists in the message.
`?I` = Identification field error.

1187,y,x PSU/ATM LINKS STATUS (where y=PSU number and x=SM number)
1. PURPOSE

Request that the active/standby states of the packet switch unit (PSU) link (PSLNK) channels be switched.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA. NOTE: For gateway protocol handlers (PH) the only valid input message format is #4. Other formats will not yield the expected results.

2. FORMAT

[1] SW:PSLNK=a-b;

[2] SW:PSLNK,PSUCA=a,FARCA=b;

[3] SW:PSLNK,PSU=c-0,FARCA=b;

[4] SW:PSLNK,PSUCA=a;

3. EXPLANATION OF MESSAGE

a = Near PSU community address of the PSU link.

b = Far PSU community address of the PSU link.

Note: The far end CA must be zero if the PSU link is connected to an asynchronous transfer mode (ATM) switch in a point-to-multipoint configuration network.

c = Switching module (SM) number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equippage or status.

PF = Printout follows. Followed by the SW:PSLNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

SW: PSLNK

MCC Display Page(s):

PSU LINKS STATUS
1. PURPOSE

Request that the active/standby states of the packet switch unit (PSU) link (PSLNK) channels be switched.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA.

2. FORMAT

[1] SW:PSLNK=a-b;

[2] SW:PSLNK,PSUCA=a,FARCA=b;

[3] SW:PSLNK,PSU=c-d,FARCA=b;

3. EXPLANATION OF MESSAGE

a = Near PSU community address of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Far PSU community address of the PSU link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

NOTE: The far end CA must be zero if the PSU link is connected to an asynchronous transfer mode (ATM) switch in a point-to-multipoint configuration network.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equippage or status. Refer to the APP:SYS-RESPONSE appendix in the Appendixes section of this Input Messages manual.

PF = Printout follows. Followed by the SW:PSLNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP: RANGES

MCC Display Page(s):
118x (PSU SHELF)
SW:QLPS

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests activation of a standby quad-link packet switch (QLPS) processor.

WARNING: The use of this input message with the unconditional option could result in the loss of transient calls/reduction in call processing capacity. Use with extreme caution!

2. FORMAT

SW:QLPS=a-b[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Switch QLPS network unconditionally. Although this option cannot override the primary criteria not to increase the number of switching module-2000s (SM-2000s) which are isolated from both QLPS networks or all QGPs (if equipped), it is possible to reduce messaging capacity or enter overload, which would impact call processing.

a = Office network and timing complex (ONTC) side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Note that this argument is required only to be consistent with other QLPS requests; irrespective of the 0 or 1 entry, an attempt will be made to switch QLPSs in the network designated by field 'b'.

b = QLPS network number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax was valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Command Group: SM  
Application: 5  
Type: Input

1. PURPOSE

Requests that activity of the remote switching module (RSM) remote link interface (RLI) circuit be switched. This message is honored only if the RLI controllers are in an active/standby configuration.

2. FORMAT

SW:RLI=a-b;

3. EXPLANATION OF MESSAGE

a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The standby controller is made active regardless of this variable.

4. SYSTEM RESPONSE

NG = No good. Request denied because of a conflict with current status.

PF = Printout follows. Followed by the SW:RLI output message.

5. REFERENCES

Output Message(s):

SW:RLI

Input Appendix(es):

APP:RANGES
1. PURPOSE

Requests that the active/standby states of the remote integrated services line unit (RISLU) remote clock circuit packs (RRCLKs) be switched (interchanged).

Note: Both RRCLK packs must be in service before this message will be honored.

2. FORMAT

```plaintext
SW:RRCLK=a-b[,SCREEN=c];
```

3. EXPLANATION OF MESSAGE

- `a` = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- `b` = RISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- `c` = Although this option is syntactically correct, it is set internally for cross checking purposes and values entered here will be ignored.

4. SYSTEM RESPONSE

- `NG` = No good. May also include:
  - CONFLICT WITH UNIT STATE
  - SM DOES NOT EXIST
  - SM UNEQUIPPED
  - UNIT DOES NOT EXIST
- `PF` = Printout follows. Followed by the SW:RRCLK output message.
- `RL` = Retry later. The request cannot be executed now due to unavailable system resources.

77. TELL
TELL:LIB

**Software Release:** 5E14 and later  
**Command Group:** ADMIN  
**Application:** 5  
**Type:** Input

1. PURPOSE

Provides the data string entered to the specified library program(s). No modification is made to the message. The library program is responsible for accepting the message from the library client supervisor, and acting on it as desired.

2. FORMAT

```
TELL:LIB:TEAM=a[,AM]{,SM=b[-b][-b][-b][-b]|,SM=c&&d},DATA=e;
```

3. EXPLANATION OF MESSAGE

- **AM** = Send the data to the library program running in the administrative module (AM) under this team.
- **a** = The team number (1-15) to which this input message applies. This number is specified in the LOAD:LIB input message, and is used so that more than one person may test at the same time, using different team numbers.
- **b** = Switching module (SM) number(s) to which the data is to be sent. A range could be used instead, as indicated.
- **c** = Lower limit of a range of SM numbers.
- **d** = Upper limit of a range of SM numbers.

**Note:** If neither the AM or any SMs are specified, the TELL:LIB message is sent to the AM and all SMs with clients loaded under the same team as that specified.

- **e** = The string of data to be passed to the client program.

4. SYSTEM RESPONSE

- **NG** = No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages.
- **PF** = Printout follows. Message has been sent to the SMs/AM or TEAM specified.

TRC:CLID

Software Release: 5E14 and later
Command Group: TRACE
Application: 5
Type: Input

1. PURPOSE

Requests that a directory number (DN) be added to or deleted from the calling line identification (CLID) list.

Note: The CLID list contains directory numbers outside the office. When a call is made to a listed DN, the originating DN will be identified.

2. FORMAT

TRC:CLID:{ADD|DEL},DN=a;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym Section of the Input Messages manual for the full expansion of any acronyms shown in the format.

a = Directory number to be added to or deleted from the CLID list.

4. SYSTEM RESPONSE

NG = No good. May also include:
- DUPLICATE DN = The number being added is already on the CLID list.
- INCORRECT STATE, USE ADD OR DEL = ADD enters the DN on the CLID list. DEL deletes the DN from the CLID list.
- LIST EMPTY = The CLID list does not contain any DNs.
- LIST FULL = CLID list is full. Remove one of the numbers on the CLID list to add a new DN.
- REENTER DN WITH NPA = The Office Code (NXX), is in multiple Numbering Plan Areas (NPA).
  Reenter the DN with an NPA.
- UNKNOWN DN = The number being deleted is not on the CLID list.

OK = Good. The request has been accepted and completed.

Output Message(s):

TRC:IPCT-EVENT
TRC:IPCT-FAILED
Other Manual(s):
235-105-210  Routine Operations and Maintenance
235-190-102  Business and Residence Non-Modular Features
1. PURPOSE

Requests an in-progress call trace (IPCT) by using either the directory number (DN), the multiline hunt group and member number (MLHG), the trunk group and member number (TKGMN), or the process ID (PID) of the party to be traced.

For shared DN, only the primary DN will be traced. For MLHG, only the primary MLHG member will be traced. If DN corresponds to a line time slot bridging (LTSB) port, the call controller will be traced. For non-end trace (END=n), IPCT will only trace the call up to the intermodule trunk (IMT) if the call goes through an IMT.

IPCT does not apply to Direct Inward Dialing (DID) trunks because the trunk group and member number of DID trunks map to a group of ports, not to an individual port.

2. FORMAT

[1] TRC:IPCT:{DN=a|MLHG=b-c|TKGMN=d-e}[,HARDHOLD][,END=f];

[2] TRC:IPCT:PID=g-h-i[,END=f];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym Section of the Input Messages manual for the full expansion of any acronyms shown in the format.

HARDHOLD = Call trace option for hardhold call. Default is for non-hardhold call trace.

a = DN of the line to be traced.

b = Group number of the multi-line hunt group of the line to be traced.

c = Member number of the multi-line hunt group of the line to be traced.

d = Trunk group of the trunk to be traced.

e = Member number of the trunk to be traced.

f = End trace flag. Valid value(s):
   y = End trace through IMT (default).
   n = Non-end trace.

g = Process number of the PID.

h = Switching module (SM) number of the PID.

i = Uniqueness number of the PID.

4. SYSTEM RESPONSE
PF = Printout follows. Followed by the TRC:IPCT output message.
- EVENT n = The trace request (identified by the event number 'n') has been accepted, and the specified line will be traced.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Integrated services line number (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Process number of the PID.

k = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Remote terminal (RT) number or IDCU DS1 serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = ID number of call on DN or MLHG (0-31). When ‘ALL’ is specified, all calls for this DN or MLHG are listed in chronological order. This option can only be used on DNs or MLHGs on standard, non-electronic key telephone set (EKTS) DSLs.

o = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Channel identifier. Valid value(s):
   B1
   B2
   D (default)

s = RAF or SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\( t \) = Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( u \) = OPT operator call loop number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Defaults to active loop. Enter a zero to trace the active loop. This option can only be used with an OPT.

\( v \) = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w \) = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x \) = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y \) = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z \) = DDS path identifier: 1 or 2, default to 0. For use with dual path DDS only.

\( a^1 \) = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^1 \) = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^1 \) = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^1 \) = Port name (key of PORTLA). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^1 \) = Digital networking unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^1 \) = Circuit name (key of CDBCOM). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^1 \) = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h^1 \) = Key of source time slot data block (TSDB) to be traced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^1 \) = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^1 \) = Virtual Tributary Member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k^1 \) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l^1 \) = Uniqueness number of the PID.
4. SYSTEM RESPONSE

NG = No good. Includes one of the following:
- BAD CHANNEL = A channel type was specified on an analog line or a trunk.
- BAD OPTION = Incompatible options were selected.
- BAD SA/ID = A bad sub-address or ID number was specified.
- CIRCUIT DESCRIPTOR = A bad universal tone decoder (UTD), universal tone generator (UTG),
  LUCHAN, or CKT input was specified.
- IDLE SA/ID = The traced sub-address or ID was idle.
- INTERNAL ERROR = Undetermined errors, possibly a software bug. Retry the request at a later
time. This response may be accompanied by an assert.
- NOT PRIMARY DN/MLHG = The traced DN or MLHG is not primary on any terminal. Either input
  the primary DN/MLHG of the terminal you wish to trace or specify an SA number for
  this DN/MLHG.
- NOT PACKET = The PKT option was requested on a non-packet call.
- PORT DESCRIPTOR = A bad DN, LEN, LCEN, SLEN, MLHG, TKGMN, TEN, DEN, or PORT
  description was specified.
- REENTER DN WITH NPA = The office code (NXX), is in multiple numbering plan areas (NPA).
  Reenter the DN with an NPA.
- SA/ID NOT ALLOWED = A sub-address or ID number was specified on a line that does not use
  them.
- SM NOT OPERATIONAL = The SM where the trace should begin is not operational.
- TRACE NOT SUPPORTED ON SPECIFIED PORT = Traced port not supported.
- UNKNOWN INPUT = Input was not recognized.

OK = Okay. Includes the following:
- SEE STATUS PAGE = All sub-addresses or IDs for the DN or MLHG have been traced. The
  results are displayed on the TRACEABLE CALL STATUS MCC Display Page.

PF = Printout follows. Includes the following:
- EVENT n = The trace event (identified by the number 'n') has been accepted and is being
  processed. One or more TRC:UTIL output messages will follow.

RL = Retry later. Includes one of the following:
- MSG = Unable to send the message that starts the trace.
- TIMER = Unable to set a timer.
- TRACE IN PROGRESS = A trace is currently in progress.

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

HARDHOLD = Call trace request option for hardhold call. Default is non-hardhold utility call trace. Hardhold is an analog only feature.

PKT = Packet utility call trace request. Default is non-packet utility call trace.
a = DN of the line to be traced. If DN corresponds to a line time slot bridging (LTSB) port, call controller will be traced.

b = Trunk or MLHG group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Trunk or MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Integrated services line number (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Process number of the PID.

k = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Remote terminal (RT) number or IDCU DS1 serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = ID number of call on DN or MLHG (0-31). When 'ALL' is specified, all calls for this DN or MLHG are listed in chronological order. This option can only be used on DNs or MLHGs on standard, non-electronic key telephone set (EKTS) DSLs.

o = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Channel identifier. Valid value(s):

B1
B2
D (default)

s = RAF or SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = OPT operator call loop number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Defaults to active loop. Enter a zero to trace the active loop. This option can only be used with an OPT.

v = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = DDS path identifier: 1 or 2, default to 0. For use with dual path DDS only.

a = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Port name (key of PORTLA). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital networking unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Circuit name (key of CDBCOM). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Key of source time slot data block (TSDB) to be traced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Virtual Tributary Member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

\[ k^1 \] = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ l^1 \] = Uniqueness number of the PID.

\[ m^1 \] = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ n^1 \] = Channel circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ o^1 \] = SA number of DN or MLHG. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When 'ALL' is specified, all busy SAs of this DN or MLHG are listed. This option can only be used with a DN or MLHG that uses sub-addresses.

\[ p^1 \] = Operator service center (OSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ q^1 \] = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ r^1 \] = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ s^1 \] = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ t^1 \] = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ u^1 \] = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ v^1 \] = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ w^1 \] = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ x^1 \] = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ y^1 \] = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ z^1 \] = Remote digital terminal (RDT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ a^2 \] = Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ b^2 \] = Signaling terminal équipement (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c\(^2\) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\(^2\) = PCT line and trunk (virtual) unit number (PLTU). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\(^2\) = PCT facility interface number (PCTFI). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^2\) = The PCT tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^2\) = Bearer Independant Call Control (BICC) origination point code (OPC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^2\) = BICC destination point code (DPC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^2\) = BICC raw call instance code (RCIC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Includes one of the following:
- BAD CHANNEL = A channel type was specified on an analog line or a trunk.
- BAD OPTION = Incompatible options were selected.
- BAD SA/ID = A bad sub-address or ID number was specified.
- CIRCUIT DESCRIPTOR = A bad universal tone decoder (UTD), universal tone generator (UTG), LUCHAN, or CKT input was specified.
- IDLE SA/ID = The traced sub-address or ID was idle.
- INTERNAL ERROR = Undetermined errors, possibly a software bug. Retry the request at a later time. This response may be accompanied by an assert.
- NOT PRIMARY DN/MLHG = The traced DN or MLHG is not primary on any terminal. Either input the primary DN/MLHG of the terminal you wish to trace or specify an SA number for this DN/MLHG.
- NOT PACKET = The PKT option was requested on a non-packet call.
- PORT DESCRIPTOR = A bad DN, LEN, LCEN, SLEN, MLHG, TKGMN, TEN, DEN, or PORT description was specified.
- REENTER DN WITH NPA = The office code (NXX), is in multiple numbering plan areas (NPA). Reenter the DN with an NPA.
- SA/ID NOT ALLOWED = A sub-address or ID number was specified on a line that does not use them.
- SM NOT OPERATIONAL = The SM where the trace should begin is not operational.
- TRACE NOT SUPPORTED ON SPECIFIED PORT = Traced port not supported.
- UNKNOWN INPUT = Input was not recognized.

OK = Okay. Includes the following:
- SEE STATUS PAGE = All sub-addresses or IDs for the DN or MLHG have been traced. The results are displayed on the TRACEABLE CALL STATUS MCC Display Page.
PF = Printout follows. Includes the following:
- EVENT n = The trace event (identified by the number 'n') has been accepted and is being processed. One or more TRC:UTIL output messages will follow.

RL = Retry later. Includes one of the following:
- MSG = Unable to send the message that starts the trace.
- TIMER = Unable to set a timer.
- TRACE IN PROGRESS = A trace is currently in progress.

m²  = STS level 1 (STS-1). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n²  = Optical carrier - level 3 (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
section of the Input Messages manual.

\[a^2\] = Synchronous transport signal - level 3 (STS3C) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\[p^2\] = User datagram protocol (UDP) source port.

\[q^2\] = Session initiation protocol (SIP) global SM (GSM) index.

\[r^2\] = Processor group (PG).

\[s^2\] = SIP call processing SM number.

\[t^2\] = SIP map index (map IDX).

\[u^2\] = SIP process number.

4. SYSTEM RESPONSE

\[NG\] = No good. May also include:
- BAD CHANNEL = A channel type was specified on an analog line or a trunk.
- BAD OPTION = Incompatible options were selected.
- BAD SA/ID = A bad sub-address or ID number was specified.
- CIRCUIT DESCRIPTOR = A bad universal tone decoder (UTD), universal tone generator (UTG), LUCHAN, or CKT input was specified.
- IDLE SA/ID = The traced sub-address or ID was idle.
- INTERNAL ERROR = Undetermined errors, possibly a software bug. Retry the request at a later time. This response may be accompanied by an assert.
- NOT PRIMARY DN/MLHG = The traced DN or MLHG is not primary on any terminal. Either input the primary DN/MLHG of the terminal you wish to trace or specify an SA number for this DN/MLHG.
- NOT PACKET = The PKT option was requested on a non-packet call.
- PORT DESCRIPTOR = A bad DN, LEN, LCEN, SLEN, MLHG, TKGMN, TEN, DEN, or PORT description was specified.
- REENTER DN WITH NPA = The office code (NXX), is in multiple numbering plan areas (NPA). Reenter the DN with an NPA.
- SA/ID NOT ALLOWED = A sub-address or ID number was specified on a line that does not use them.
- SM NOT OPERATIONAL = The SM where the trace should begin is not operational.
- TRACE NOT SUPPORTED ON SPECIFIED PORT = Traced port not supported.
- UNKNOWN INPUT = Input was not recognized.

\[OK\] = Okay. May also include:
- SEE STATUS PAGE = All sub-addresses or IDs for the DN or MLHG have been traced. The results are displayed on the TRACEABLE CALL STATUS MCC Display Page.

\[PF\] = Printout follows. May also include:
- EVENT n = The trace event (identified by the number 'n') has been accepted and is being processed. One or more TRC:UTIL output messages will follow.

\[RL\] = Retry later. May also include:
- MSG = Unable to send the message that starts the trace.
- TIMER = Unable to set a timer.
- TRACE IN PROGRESS = A trace is currently in progress.

3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**HARDHOLD** = Call trace request option for hardhold call. Default is non-hardhold utility call trace. Hardhold is an analog only feature.

**PKT** = Packet utility call trace request. Default is non-packet utility call trace.

a = DN of the line to be traced. If DN corresponds to a line time slot bridging (LTSB) port, call controller will be traced.

b = Trunk or MLHG group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Trunk or MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Integrated services line number (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Process number of the PID.

k = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Remote terminal (RT) number or IDCU DS1 serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = ID number of call on DN or MLHG (0-31). When 'ALL' is specified, all calls for this DN or MLHG are listed in chronological order. This option can only be used on DNs or MLHGs on standard, non-electronic key telephone set (EKTS) DSLs.

o = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Channel identifier. Valid value(s):

- B1
- B2
- D (default)

s = RAF or SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = OPT operator call loop number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Defaults to active loop. Enter a zero to trace the active loop. This option can only be used with an OPT.

v = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = DDS path identifier: 1 or 2, default to 0. For use with dual path DDS only.

a¹ = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b¹ = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d\(^1\) = Port name (key of PORTLA). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^1\) = Circuit name (key of CDBCOM). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^1\) = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^1\) = Key of source time slot data block (TSDB) to be traced. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^1\) = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^1\) = Virtual Tributary Member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^1\) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^1\) = Uniqueness number of the PID.

m\(^1\) = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^1\) = Channel circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^1\) = SA number of DN or MLHG. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When ‘ALL’ is specified, all busy SAs of this DN or MLHG are listed. This option can only be used with a DN or MLHG that uses sub-addresses.

p\(^1\) = Operator service center (OSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\(^1\) = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\(^1\) = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s\(^1\) = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t\(^1\) = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u\(^1\) = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v\(^1\) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\( w^1 \) = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x^1 \) = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y^1 \) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z^1 \) = Remote digital terminal (RDT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^2 \) = Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^2 \) = SONET terminal equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^2 \) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^2 \) = PCT line and trunk (virtual) unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^2 \) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^2 \) = The PCT tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^2 \) = Bearer independent call control (BICC) origination point code (OPC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h^2 \) = BICC destination point code (DPC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^2 \) = BICC raw call instance code (RCIC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^2 \) = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k^2 \) = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l^2 \) = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m^2 \) = STS level 1 (STS-1). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^2 \) = Optical carrier - level 3 (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o^2 \) = Synchronous transport signal - level 3 (STS3C) number. Refer to the APP:RANGES appendix in
the Appendixes section of the Input Messages manual.

\[ p^2 \]

- User datagram protocol (UDP) source port.

### 4. SYSTEM RESPONSE

**NG**

- **No good.** May also include:
  - **BAD CHANNEL** = A channel type was specified on an analog line or a trunk.
  - **BAD OPTION** = Incompatible options were selected.
  - **BAD SA/ID** = A bad sub-address or ID number was specified.
  - **CIRCUIT DESCRIPTOR** = A bad universal tone decoder (UTD), universal tone generator (UTG),
    LUCHAN, or CKT input was specified.
  - **IDLE SA/ID** = The traced sub-address or ID was idle.
  - **INTERNAL ERROR** = Undetermined errors, possibly a software bug. Retry the request at a later
    time. This response may be accompanied by an assert.
  - **NOT PRIMARY DN/MLHG** = The traced DN or MLHG is not primary on any terminal. Either input
    the primary DN/MLHG of the terminal you wish to trace or specify an SA number for
    this DN/MLHG.
  - **NOT PACKET** = The PKT option was requested on a non-packet call.
  - **PORT DESCRIPTOR** = A bad DN, LEN, LCEN, SLEN, MLHG, TKGMN, TEN, DEN, or PORT
    description was specified.
  - **REENTER DN WITH NPA** = The office code (NXX), is in multiple numbering plan areas (NPA).
    Reenter the DN with an NPA.
  - **SA/ID NOT ALLOWED** = A sub-address or ID number was specified on a line that does not use
    them.
  - **SM NOT OPERATIONAL** = The SM where the trace should begin is not operational.
  - **TRACE NOT SUPPORTED ON SPECIFIED PORT** = Traced port not supported.
  - **UNKNOWN INPUT** = Input was not recognized.

**OK**

- **Okay.** May also include:
  - **SEE STATUS PAGE** = All sub-addresses or IDs for the DN or MLHG have been traced. The
    results are displayed on the TRACEABLE CALL STATUS MCC Display Page.

**PF**

- **Printout follows.** May also include:
  - **EVENT n** = The trace event (identified by the number ’n’) has been accepted and is being
    processed. One or more TRC:UTIL output messages will follow.

**RL**

- **Retry later.** May also include:
  - **MSG** = Unable to send the message that starts the trace.
  - **TIMER** = Unable to set a timer.
  - **TRACE IN PROGRESS** = A trace is currently in progress.

  = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Remote digital terminal (RDT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

SONET terminal equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

PCT line and trunk (virtual) unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

The PCT tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Bearer independent call control (BICC) origination point code (OPC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

BICC destination point code (DPC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

BICC raw call instance code (RCIC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

STS level 1 (STS-1). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Optical carrier - level 3 (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

\( a^2 \) = Synchronous transport signal - level 3 (STS3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p^2 \) = User datagram protocol (UDP) source port.

\( q^2 \) = Session initiation protocol (SIP) global SM (GSM) index.

\( r^2 \) = Processor group (PG).

\( s^2 \) = SIP call processing SM number.

\( t^2 \) = SIP map index (map IDX).

\( u^2 \) = SIP process number.

4. SYSTEM RESPONSE

NG = No good. May also include:
- BAD CHANNEL = A channel type was specified on an analog line or a trunk.
- BAD OPTION = Incompatible options were selected.
- BAD SA/ID = A bad sub-address or ID number was specified.
- CIRCUIT DESCRIPTOR = A bad universal tone decoder (UTD), universal tone generator (UTG), LUCHAN, or CKT input was specified.
- IDLE SA/ID = The traced sub-address or ID was idle.
- INTERNAL ERROR = Undetermined errors, possibly a software bug. Retry the request at a later time. This response may be accompanied by an assert.
- NOT PRIMARY DN/MLHG = The traced DN or MLHG is not primary on any terminal. Either input the primary DN/MLHG of the terminal you wish to trace or specify an SA number for this DN/MLHG.
- NOT PACKET = The PKT option was requested on a non-packet call.
- PORT DESCRIPTOR = A bad DN, LEN, LCEN, SLEN, MLHG, TKGMN, TEN, DEN, or PORT description was specified.
- REENTER DN WITH NPA = The office code (NXX), is in multiple numbering plan areas (NPA). Reenter the DN with an NPA.
- SA/ID NOT ALLOWED = A sub-address or ID number was specified on a line that does not use them.
- SM NOT OPERATIONAL = The SM where the trace should begin is not operational.
- TRACE NOT SUPPORTED ON SPECIFIED PORT = Traced port not supported.
- UNKNOWN INPUT = Input was not recognized.

OK = Okay. May also include:
- SEE STATUS PAGE = All sub-addresses or IDs for the DN or MLHG have been traced. The results are displayed on the TRACEABLE CALL STATUS MCC Display Page.

PF = Printout follows. May also include:
- EVENT n = The trace event (identified by the number ‘n’) has been accepted and is being processed. One or more TRC:UTIL output messages will follow.

RL = Retry later. May also include:
- **MSG** = Unable to send the message that starts the trace.
- **TIMER** = Unable to set a timer.
- **TRACE IN PROGRESS** = A trace is currently in progress.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Requests testing of the integrity of the common channel signaling (CCS) network and data consistency between the network control point (NCP) and the 5ESS® switch. In this case the switch is functioning as an action control point (ACP) for the software defined network (SDN) and leased network (LN) using the International Telecommunication Union - Telecommunication, Standardization Sector (ITU-TS) (formerly CCITT) standard transaction capability application part (TCAP) protocol.

2. FORMAT
TST:ACPNUM=a,APP=b,ANI=c[,DATARATE=d][,SID=e][,SGD=f];

3. EXPLANATION OF MESSAGE
a = LN number to be tested. This number must be a string of seven or ten digits, and must fit the template NXXXXXX or NPANXXXXXX.

b = Feature application type. Valid value(s):
  LN = Leased network.
  SDN = Software defined network.

c = Ten-digit automatic number identification (ANI) of the calling party, which must have the format NPANXXXXXX.

d = Data rate used for integrated services digital network (ISDN) primary rate interface (ISDN-PRI) data call. Valid value(s):
  VOICE = Voice (default).
  64KC = 64 KPS clear.
  64KR = 64 KPS restricted.
  56KC = 56 KPS.

e = Station identification (SID) for an ISDN-PRI call. This number must have the format NPANXXXXXX.

f = Station group designator (SGD), (0-8).

4. SYSTEM RESPONSE
NG = No good. May also include:
  - CNI NOT OPERATIONAL = The test message cannot be sent. The common network interface (CNI) is not operational or is overloaded. Check CNI status and wait at least 10 minutes before requesting another test.
  - FAILED TO SEND TCAP MESSAGE = Unable to format query and send message out to the network.
  - INVALID INPUT FIELD = There is either an invalid character for variables 'a' or 'b' or an
incorrect number of digits. You must input digits at variables 'a' and 'b'.

**PF** = Printout follows. The request has been received. Followed by a TST:ACPNUM output message.

**RL** = Retry later. May also include:
- **TEST IN PROGRESS** = A common channel signaling (CCS) test is currently in progress.

Output Message(s):

TST:ACPNUM

Other Manual(s):
235-070-100  *Administration and Engineering Guidelines*
TST:AILS-OLS

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an automated inward line screening (AILS) originating line screening (OLS) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent from a call serving Operator Service Position System (OSPS) to a normal serving site OSPS to gather AILS OLS data.

2. FORMAT

TST:AILS OLS,CLG=a,SV=b,DPC=c;

3. EXPLANATION OF MESSAGE

a = Calling number. This is a 10-digit North American number plan (NANP) number.

b = AILS software version number. The AILS software version number is used to indicate the current software level for the AILS feature. The AILS software version number is a number from 1 to 99.

c = Destination point code. The destination point code is the point code of the normal serving site OSPS that will receive this AILS OLS test query. The destination point code is a 9-digit number.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CNI NOT AVAILABLE = The test query cannot be sent to the CAS/NCP database because the common network interface (CNI) or CCS7 links are not available.
- INVALID CALLING NUMBER = The calling number must be a 10-digit NANP number.

PF = Printout follows. The request has been received. Output message TST:AILS-OLS will follow.

RL = Retry later. May also include:
- INTERNAL ERROR = There was a problem reading the RLDS_APP relation. Refer to RC/V View 8.17 for the subsystem number.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.

8.17 (DIRECT SIGNALING APPLICATIONS)
TST:AILS-TCS

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an automated inward line screening (AILS) terminating code screening (TCS) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent from a call serving Operator Service Position System (OSPS) to a normal serving site OSPS to gather AILS TCS data.

2. FORMAT

TST:AILS TCS,CLG=a[,CLD|,ICLD]=b[,SSCNUM=c],SV=d,DPC=e;

3. EXPLANATION OF MESSAGE

a = Calling number. This is a 10-digit North American number plan (NANP) number.

b = Called number.

Prefix | Explanation
--- | ---
CLD= | This is a 10-digit directory number for a NANP called number.
ICLD= | This is a 1- to 3-digit international country code.

c = Special services code (SSC) number. This is a 7-digit number (SSC-WXYZ) used for 800 access calls. If this entry is omitted, a default value of 0 (no SSC-WXYZ number) will be used.

d = AILS software version number. The AILS software version number is used to indicate the current software level for the AILS feature. The AILS software version number is a number from 1 to 99.

e = Destination point code. The destination point code is the point code of the normal serving site OSPS that will receive this AILS TCS test query. The destination point code is a 9-digit number.

4. SYSTEM RESPONSE

NG = No good. Includes one of the following:
- CNI NOT AVAILABLE = The test query cannot be sent to the CAS/NCP database because the common network interface (CNI) or CCS7 links are not available.
- INVALID CALLING NUMBER = The calling number must be a 10-digit NANP number.
- INVALID CALLED NUMBER = The called number must be a 10-digit NANP number or a 1 to 3 digit international country code.
- INVALID SSC-WXYZ NUMBER = The SSC number must be a 7-digit number.

PF = Printout follows. The request has been received. The TST:AILS-TCS output message will follow.

RL = Retry later. Includes one of the following:
- INTERNAL ERROR = There was a problem reading the RLDS_APP relation. Refer to RC/V View 8.17 for the subsystem number.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.

8.17 (DIRECT SIGNALING APPLICATIONS)
TST:ALM

Software Release: 5E14 and later
Command Group: ALARM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the audible and visual alarm reporting mechanism be tested. This request does not test that a specific fault will actually cause an alarm. This will only verify that the audible and visual alarm devices are in working order.

WARNING: Before starting this test, it is recommended that the user make sure all existing active alarms have been retired. Also note that when retiring the alarm generated by this input message, any other alarms that may have been activated during this testing will also be retired. Check the ROP and daylog for any real alarms that may have occurred during the test.

2. FORMAT

TST:ALM, LVL={CR|MJ|MN};

3. EXPLANATION OF MESSAGE

CR = Critical alarm level.
MJ = Major alarm level.
MN = Minor alarm level.

4. SYSTEM RESPONSE

PF = Followed by the TST:ALM output message.

Input Message(s):

CLR:ALARMS
CLR:LAMPS

Output Message(s):

TST:ALM
TST:ASP-A

Software Release: 5E14 only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an R0 advanced services platform (ASP) test query verifying integrity be sent to the external service control point (SCP) database. This will be sent using the service switching point (SSP) of the network and the contents of the routing information returned from the SCP.

2. FORMAT

TST:ASP[,TESTDN=a],ANI=b,SKEY=c,LATA=d[,CID=e][,CARSEL=f][,NON=g][,CICEI=h][,OPC=i];

3. EXPLANATION OF MESSAGE

a = The dialed ASP number. If called party (DIALED_NUM) is the service key then this field must be 10 digits, otherwise it can be any number of digits.

b = Automatic number identification (ANI) of the calling party. If calling ANI is the service key then this field must be 10 digits, otherwise it can be any number of digits.

c = The service key field. Valid value(s):
   ANI = Automatic number identification.
   DIALED_NUM = Dialed number or testdn.

d = Three-digit absolute local access and transport area (LATA) number (100-999).

e = A 3-digit or 4-digit feature group D (FGD) carrier identification which is either the "XXX" or "XXXX" digits contained in either the "10XXX" or "101XXXX" digits in sequence dialed by the caller or carrier code assigned to the caller as presubscribed inter-exchange carrier (PIC) information.

f = Carrier selection. Indicates whether digits (carrier identification) information dialed, is equal to the caller's presubscribed carrier information, or indicates the lack of this information. Valid value(s):
   CALLER = No presubscribed carrier input by caller.
   PIC = Presubscribed carrier not input by caller.
   PICIND = Presubscribed carrier origination unknown.
   PICMTCH = Presubscribed carrier input by caller.
   UNKN = Unknown.

g = Nature of number. Specifies the format of the address digits for subscribed triggers using the ASP dialing plan. Valid value(s):
   IECOPR = Inter exchange carrier operator.
   INTER = International.
   INTOPR = International operator.
   LECOPR = Local exchange carrier operator.
   NAP = Not applicable.
   NAT = National.
   NETWK = Network specific.
h = CIC expansion indicator (Y or N). Indicates whether the CIC expansion parameter should be sent in the test query. If not specified the value is taken from the Glcapic office parameter.

i = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual. Note: this option is mandatory in a multi-platform office.

4. SYSTEM RESPONSE

NG
- No good. Valid value(s):
  - CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
  - CNI NOT AVAILABLE = The test message can not be sent because the common network interface (CNI) is not operational or is overloaded. Check CNI status and wait at least 10 seconds before requesting another test.
  - FAILED TO SEND TCAP MESSAGE = Unable to format query and send message out to network
  - GSM/PROTOCOL MISMATCH = The GSM and the protocol do not match, missing or incorrect data.
  - INVALID INPUT IN FIELD = There is either an invalid character in the numeric variables 'a', 'b', 'c', or 'd' or an incorrect number of digits.
  - MISSING INPUT FOR FIELD = There is a missing field for variables 'e', 'f' or 'g'.
  - MUST ENTER OPC = The origination point code must be specified as part of the input message line because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
  - NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
  - NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
  - OPC IS INVALID = The entered digits are either invalid, the number of digits entered is incorrect, or the point code was not provisioned in the office.
  - OPC IS NOT AVAILABLE = Could not get the point code. There was missing or incorrect data.

NO
- The feature is not allowed. Valid value(s):
  - CARRIER ID FIELD NOT ALLOWED = Carrier ID enhancement not authorized in this office. Do not include this field.
  - CARRIER SELECTION FIELD NOT ALLOWED = Carrier selection enhancement not authorized in this office. Do not include this field.
  - FEATURE NOT AVAILABLE = ASP must be purchased before attempting to send a test query.
  - NATURE OF NUMBER FIELD NOT ALLOWED = Nature of number enhancement not authorized in the office. Do not include this field.

PF
= Printout follows. The request has been received. Followed by a TST:ASP output message.

RL
= Retry later. Valid value(s):
  - OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.
  - TEST IN PROGRESS = A test query is currently in progress.

3. EXPLANATION OF MESSAGE

a = The dialed ASP number. If called party (DIALED_NUM) is the service key then this field must be 10 digits, otherwise it can be any number of digits.

b = Automatic number identification (ANI) of the calling party. If calling ANI is the service key then this field must be 10 digits, otherwise it can be any number of digits.

c = The service key field. Valid value(s):
   ANI = Automatic number identification.
   DIALED_NUM = Dialed number or testdn.

d = Three-digit absolute local access and transport area (LATA) number (100-999).

e = A 3-digit or 4-digit feature group D (FGD) carrier identification which is either the "XXX" or "XXXX" digits contained in either the "10XXX" or "101XXXX" digits in sequence dialed by the caller or carrier code assigned to the caller as presubscribed inter-exchange carrier (PIC) information.

f = Carrier selection. Indicates whether digits (carrier identification) information dialed, is equal to the caller's presubscribed carrier information, or indicates the lack of this information. Valid value(s):
   CALLER = No presubscribed carrier input by caller.
   PIC = Presubscribed carrier not input by caller.
   PICIND = Presubscribed carrier origination unknown.
   PICMTCH = Presubscribed carrier input by caller.
   UNKN = Unknown.

g = Nature of number. Specifies the format of the address digits for subscribed triggers using the ASP dialing plan. Valid value(s):
   IECOPR = Inter exchange carrier operator.
   INTER = International.
   INTOPR = International operator.
   LECOPR = Local exchange carrier operator.
   NAP = Not applicable.
   NAT = National.
   NETWK = Network specific.
h = CIC expansion indicator (Y or N). Indicates whether the CIC expansion parameter should be sent in the test query. If not specified the value is taken from the Gltcapic office parameter.

i = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual. Note: this option is mandatory in a multi-platform office.

j = Signaling Platform. Valid value(s):
   0 = Common Network Interface (CNI) Platform
   1 - 192 = Global Switching Module (GSM) Number

Note: this option is mandatory in a multi-platform office.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
   - CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
   - CNI NOT AVAILABLE = The test message can not be sent because the common network interface (CNI) is not operational or is overloaded. Check CNI status and wait at least 10 seconds before requesting another test.
   - FAILED TO SEND TCAP MESSAGE = Unable to format query and send message out to network
   - GSM/PROTOCOL MISMATCH = The GSM and the protocol do not match, missing or incorrect data.
   - INVALID INPUT IN FIELD = There is either an invalid character in the numeric variables 'a', 'b', 'c', or 'd' or an incorrect number of digits.
   - MISSING INPUT FOR FIELD = There is a missing field for variables 'a', 'f' or 'g'.
   - MUST ENTER OPC = The origination point code must be specified as part of the input message line because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
   - MUST ENTER PLATFORM = The signaling platform must be specified as part of the input message line because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
   - NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
   - NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
   - OPC IS INVALID = The entered digits are either invalid, the number of digits entered is incorrect, or the point code was not provisioned in the office.
   - OPC IS NOT AVAILABLE = Could not get the point code. There was missing or incorrect data.
   - OPC NOT ON PLATFORM = Could not find the point code on the platform entered.
   - PLATFORM IS INVALID = The entered signaling platform is either invalid or the platform entered is not provisioned in the office.

NO = The feature is not allowed. Valid value(s):
   - CARRIER ID FIELD NOT ALLOWED = Carrier ID enhancement not authorized in this office. Do not include this field.
   - CARRIER SELECTION FIELD NOT ALLOWED = Carrier selection enhancement not authorized in this office. Do not include this field.
FEATURE NOT AVAILABLE = ASP must be purchased before attempting to send a test query.
NATURE OF NUMBER FIELD NOT ALLOWED = Nature of number enhancement not authorized in the office. Do not include this field.

PF = Printout follows. The request has been received. Followed by a TST:ASP output message.

RL = Retry later. Valid value(s):
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.
- TEST IN PROGRESS = A test query is currently in progress.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests sending an advanced services platform (ASP) 0.1 test message to the service control point (SCP). If a response to format one is received from the SCP, the output is divided into two parts for display purposes [routing and automatic message accounting (AMA) billing]. The portion (routing or billing) of the response to display may be specified.

Format two is only for number portability. The only message type valid for this format is NPINFOANAL (information analyzed for number portability). It is used to verify whether a called party (CLDPTY) directory number (DN) is ported and the response to format two will display its location routing number if ported or, if not ported, will say it’s not ported and echo back the specified CLDPTY.

WARNING: Using format two of this input message will effectively do a clear of any information analyzed (INFOANAL) parameter settings previously set using the SET:ASPTQ input message except for TRANTYPE, OPC, and TIMER. Using format two of this message will set number portability default values for the bearer capability and trigger type parameters and will set the called party ID, user ID directory number, and global title address parameters based on the called party value (CLDPTY=c) on the command line. If TRANTYPE is included on the command line, the command line value for TRANTYPE will over write any previous setting of TRANTYPE using the SET:ASPTQ input message. Use OP:ASPTQ,MSGTYPE=INFOANAL before using this command to see what currently set values may be lost by executing this command. Use OP:ASPTQ,MSGTYPE=INFOANAL after using this command to see what parameters were used in the query.

2. FORMAT

[1] TST:ASPTQ,MSGTYPE=a[,MSGPART=b];

[2] TST:ASPTQ,MSGTYPE=NPINFOANAL,CLDPTY=c[,TRANTYPE=d][,OPC=e];

3. EXPLANATION OF MESSAGE

a = The type of message to send to the SCP. Valid value(s):

CLOSE = Close. The CLOSE message type is used to close the transaction with the SCP, and is typically used after sending the final notification message or in place of a request message to indicate caller abandon or an abnormal situation.

INFOANAL = Information analyzed.

INFOCOLL = Information collected.

NTWKBSY = Network Busy. It is a request for the SCP to respond with further routing information. It can be sent as an event detection point request (EDP-R) message as a result of event detection when the SCP requests an NEL that specifies a busy event (the transaction remains open with the SCP).
OANSWER = Originating answer. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

Note: Multiple notification messages may be requested by the user (for example, OTERMSZD followed by OANSWER).

OCLDPTYBSY = Originating called party busy. It is a request for the SCP to respond with further routing informations. It can be sent either as a trigger detection point request (TDP-R) message resulting due to trigger events detection (which opens a transaction with SCP) or event detection point request (EDP-R) message as a result of event detection when the SCP requests an NEL that specifies a busy event (the transaction remains open with the SCP).

ODISCONNECT = Originating disconnect. This is a request for the SCP to respond with further routing information. It would be sent as an EDP-R message as a result of event detection when the SCP requests an NEL that specifies an originating disconnect. The transaction with the SCP remains open.

ODTMFENTRD = Originating DTMF (Dial Tone Multi-Frequency) entered. This is a request for the SCP to respond with further routing information. It would be sent as an EDP-R message as a result of event detection when the SCP requests an NEL that specifies an originating DTMF entered event. The transaction with the SCP remains open.

ONOANSWER = Originating no answer. It is a request for the SCP to respond with further routing informations. It can be sent either as a TDP-R message resulting due to trigger events detection (which opens a transaction with SCP) or EDP-R message as a result of event detection when the SCP requests an NEL that specifies a no answer (the transaction remains open with the SCP).

ORIGAT = Origination attempt.

OTERMSZD = Originating termination seized. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

RESCLR = Resource clear.

TANSWER = Terminating answer. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

TBUSY = Terminating busy. It is a request for the SCP to respond with further routing information. It can be sent either as a TDP-R message resulting due to trigger events detection (which opens a transaction with SCP) or EDP-R message as a result of event detection when the SCP requests a NEL that specifies a busy event (the transaction remains open with the SCP).

TERMAT = Termination attempt.

TNOANSWER = Terminating no answer. It is a request for the SCP to respond with further routing information. It can be sent either as a TDP-R message resulting due to trigger
events detection (which opens a transaction with SCP) or EDP-R message as a result of event detection when the SCP requests a NEL that specifies a terminating no answer (the transaction remains open with the SCP).

TRMRSCAVL = Terminating resource available. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

b = The portion of the response message to display. The default is both. The routing portion of the message is always displayed when a SEND TO RESOURCE message is received. This allows information concerning possible subsequent actions to be displayed (that is, number of digits to collect). Valid value(s):

AMA = AMA billing part of the response message.
RTE = Routing part of the response message.
BOTH = Both the AMA billing and routing part of the response message.

c = Called party ID digits (10 digit DN required).

d = Translation type (range of 0-255).

e = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Includes the following:
- CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
- CLDPTY IS MANDATORY - INCLUDE CLDPTY = The called party ID parameter is mandatory for the requested message. Include the parameter on the command line of the TST:ASPTQ input message.
- CLEAR CAUSE IS MANDATORY, SET CLEAR CAUSE = The clear cause parameter is mandatory for the requested message. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- CONVERSATION NOT IN PROGRESS = A transaction is not open. The resource clear message is only allowed in response to receiving a send to resource conversation message.
- GSM/PROTOCOL MISMATCH = The global switch module (GSM) and the protocol do not match, missing or incorrect data.
- INVALID PARAMETER USED = One or more of the options for format two (message type of NPIFONANAL) were used with format one (a message type other than NPIFONANAL).
- NEXT EVENT LIST NOT IN PROGRESS = A next event list is not in progress. The close, originating answer, Network Busy, and originating termination seized messages are only allowed in response to receiving either an analyze route or forward call conversation message which contains a next event list component.
- NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMS.
- NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
- OPC IS INVALID = The entered digits are either invalid (0-9 are allowed), the number of digits
entered is incorrect (there must be nine digits), or the point code was not provisioned in the office.

- **OPC IS NOT AVAILABLE** = Couldn’t get the point code, missing or incorrect data.
- **OPC IS MANDATORY** = The origination point code parameter is mandatory for the requested message. The origination point code parameter has not been included or cannot be determined because the office has multiple GSMS or is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms. Set the parameter with the SET:ASPTQ input message before requesting the test again or include the parameter on the TST:ASPTQ input message for number portability.

- **USERID AND BEARCAP ARE MANDATORY** = The user ID and bearer capability parameters are mandatory for the requested message. The bearer capability parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.

- **USERID AND BEARCAP ARE MANDATORY** = The user ID and bearer capability parameters are mandatory for the requested message. The user ID parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.

- **USERID, BEARCAP, AND GLOBTITLE ARE MANDATORY** = The user ID, bearer capability, and the global title address parameters are mandatory for the requested message. The bearer capability parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.

- **USERID, BEARCAP, AND GLOBTITLE ARE MANDATORY** = The user ID, bearer capability, and the global title address parameters are mandatory for the requested message. The global title address parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.

- **USERID, BEARCAP, AND GLOBTITLE ARE MANDATORY** = The user ID, bearer capability, and the global title address parameters are mandatory for the requested message. The user ID parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.

- **USERID, BEARCAP, GLOBTITLE, AND OPC ARE MANDATORY** = The origination point code parameter is mandatory for the requested message. The origination point code parameter has not been set or cannot be determined because the office has multiple GSMS or is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms. Set the parameter with the SET:ASPTQ input message before requesting the test again.

- **NO** = The request is not allowed. Valid value(s):
  - **FEATURE NOT AVAILABLE** = The feature associated with the requested functionality must be purchased before attempting to send the particular test query. All ASP 0.1 test queries require that the ASP 0.1 feature must be purchased. In addition, the number portability test query (format two) requires the purchase of the Number Portability - Test Query for LRN feature.

- **OK** = Good. The request was accepted.

- **PF** = Printout follows. Followed by an TST:ASPTQ-AMA, TST:ASPTQ-FAIL, and/or TST:ASPTQ output message.

- **RL** = Retry later. Valid value(s):
  - **FAILED TO SEND TCAP MESSAGE** = Unable to send a message. Retry the test later.
  - **OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH** = SS7 PSU signaling links are
congested.
- SM IS NOT AVAILABLE = A switching module is not available (not operational or overloaded).
  Request the test again after the SMs become available.
- TEST IN PROGRESS = Another test query is currently in progress. Wait for that test query
  transaction to complete before requesting another test.

235-190-126  Advanced Services Platform Release 0.1B
1. PURPOSE

Requests sending an advanced services platform (ASP) 0.1 test message to the service control point (SCP). If a response to format one is received from the SCP, the output is divided into two parts for display purposes [routing and automatic message accounting (AMA) billing]. The portion (routing or billing) of the response to display may be specified.

Format two is only for number portability. The only message type valid for this format is NPINFOANAL (information analyzed for number portability). It is used to verify whether a called party (CLDPTY) directory number (DN) is ported and the response to format two will display its location routing number if ported or, if not ported, will say it's not ported and echo back the specified CLDPTY.

WARNING: Using format two of this input message will effectively do a clear of any information analyzed (INFOANAL) parameter settings previously set using the SET:ASPTQ input message except for TRANTYPE, OPC, and TIMER. Using format two of this message will set number portability default values for the bearer capability and trigger type parameters and will set the called party ID, user ID directory number, and global title address parameters based on the called party value (CLDPTY=c) on the command line. If TRANTYPE is included on the command line, the command line value for TRANTYPE will overwrite any previous setting of TRANTYPE using the SET:ASPTQ input message. Use OP:ASPTQ,MSGTYPE=INFOANAL before using this command to see what currently set values may be lost by executing this command. Use OP:ASPTQ,MSGTYPE=INFOANAL after using this command to see what parameters were used in the query.

2. FORMAT

[1] TST:ASPTQ,MSGTYPE=a[,MSGPART=b];

[2] TST:ASPTQ,MSGTYPE=NPINFOANAL,CLDPTY=c[,TRANTYPE=d][,OPC=e][,PLATFORM=f];

3. EXPLANATION OF MESSAGE

a = The type of message to send to the SCP. Valid value(s):
   CLOSE = Close. The CLOSE message type is used to close the transaction with the SCP, and is typically used after sending the final notification message or in place of a request message to indicate caller abandon or an abnormal situation.
   INFOANAL = Information analyzed.
   INFOCOLL = Information collected.
   NTWKBSY = Network Busy. It is a request for the SCP to respond with further routing information. It can be sent as an event detection point request (EDP-R) message as a result of event detection when the SCP requests an NEL that specifies a busy event (the transaction remains open with the SCP).
   OANSWER = Originating answer. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.
Note: Multiple notification messages may be requested by the user (for example, _OTERMSZD_ followed by _OANSWER_).

_**OCLDPTYBSY** _= Originating called party busy. It is a request for the SCP to respond with further routing informations. It can be sent either as a trigger detection point request (TDP-R) message resulting due to trigger events detection (which opens a transaction with SCP) or event detection point request (EDP-R) message as a result of event detection when the SCP requests an NEL that specifies a busy event (the transaction remains open with the SCP).

_**ODISCONNECT** _= Originating disconnect. This is a request for the SCP to respond with further routing information. It would be sent as an EDP-R message as a result of event detection when the SCP requests an NEL that specifies an originating disconnect. The transaction with the SCP remains open.

_**ODTMFENTRD** _= Originating DTMF (Dial Tone Multi-Frequency) entered. This is a request for the SCP to respond with further routing information. It would be sent as an EDP-R message as a result of event detection when the SCP requests an NEL that specifies an originating DTMF entered event. The transaction with the SCP remains open.

_**ONOANSWER** _= Originating no answer. It is a request for the SCP to respond with further routing informations. It can be sent either as a TDP-R message resulting due to trigger events detection (which opens a transaction with SCP) or EDP-R message as a result of event detection when the SCP requests an NEL that specifies a no answer (the transaction remains open with the SCP).

_**ORIGAT** _= Origination attempt.

_**OTERMSZD** _= Originating termination seized. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

_**RESCLR** _= Resource clear.

_**TANSWER** _= Terminating answer. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

_**TBUSY** _= Terminating busy. It is a request for the SCP to respond with further routing information. It can be sent either as a TDP-R message resulting due to trigger events detection (which opens a transaction with SCP) or EDP-R message as a result of event detection when the SCP requests a NEL that specifies a busy event (the transaction remains open with the SCP).

_**TERMAT** _= Termination attempt.

_**TNOANSWER** _= Terminating no answer. It is a request for the SCP to respond with further routing information. It can be sent either as a TDP-R message resulting due to trigger events detection (which opens a transaction with SCP) or EDP-R message as a result of event detection when the SCP requests a NEL that specifies a terminating no answer (the transaction remains open with the SCP).

_**TRMRSRCAVL** _= Terminating resource available. It is a notification used to notify the SCP of call processing progress. The SCP is not expected to respond to notification messages, and the transaction with the SCP remains open.

_**b**_ = The portion of the response message to display. The default is both. The routing portion of the message is always displayed when a SEND TO RESOURCE message is received. This allows information concerning possible subsequent actions to be displayed (that is, number of digits to collect). Valid value(s):

_**AMA** _= AMA billing part of the response message.
RTE = Routing part of the response message.

BOTH = Both the AMA billing and routing part of the response message.

c = Called party ID digits (10 digit DN required).

d = Translation type (range of 0-255).

e = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

f = Signaling Platform. Valid value(s):

0 = Common Network Interface (CNI) Platform
1 - 192 = Global Switching Module (GSM) Number

Note: this option is mandatory in a multi-platform office.

4. SYSTEM RESPONSE

NG = No good. May also include:

- CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
- CLDPTY IS MANDATORY - INCLUDE CLDPTY = The called party ID parameter is mandatory for the requested message. Include the parameter on the command line of the TST:ASPTQ input message.
- CLEAR CAUSE IS MANDATORY, SET CLEAR CAUSE = The clear cause parameter is mandatory for the requested message. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- CONVERSATION NOT IN PROGRESS = A transaction is not open. The resource clear message is only allowed in response to receiving a send to resource conversation message.
- GSM/PROTOCOL MISMATCH = The global switch module (GSM) and the protocol do not match, missing or incorrect data.
- INVALID PARAMETER USED = One or more of the options for format two (message type of NPINFOANAL) were used with format one (a message type other than NPINFOANAL).
- NEXT EVENT LIST NOT IN PROGRESS = A next event list is not in progress. The close, originating answer, Network Busy, and originating termination seized messages are only allowed in response to receiving either an analyze route or forward call conversation message which contains a next event list component.
- NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
- NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
- OPC IS INVALID = The entered digits are either invalid (0-9 are allowed), the number of digits entered is incorrect (there must be nine digits), or the point code was not provisioned in the office.
- OPC IS NOT AVAILABLE = Couldn’t get the point code, missing or incorrect data.
- OPC IS MANDATORY - INCLUDE OR SET OPC = The origination point code parameter is mandatory for the requested message. The origination point code parameter has not been included or cannot be determined because the office has multiple GSMs or is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms. Set the parameter with the SET:ASPTQ input message before...
requesting the test again or include the parameter on the TST:ASPTQ input message for number portability.
- OPC NOT ON PLATFORM = Could not find the point code on the platform entered.
- PLATFORM IS INVALID = The entered signaling platform is either invalid or the platform entered is not provisioned in the office.
- PLATFORM IS MANDATORY – INCLUDE OR SET PLATFORM = The signaling platform is mandatory for the requested message. The signaling platform has not been included or cannot be determined because the office has multiple global switch modules (GSMs) or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms. Set the parameter with the SET:ASPTQ input message before requesting the test again or include the parameter on the TST:ASPTQ input message for number portability.
- USERID AND BEARCAP ARE MANDATORY – SET BEARCAP = The user ID and bearer capability parameters are mandatory for the requested message. The bearer capability parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- USERID AND BEARCAP ARE MANDATORY – SET USERID = The user ID and bearer capability parameters are mandatory for the requested message. The user ID parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- USERID, BEARCAP, AND GLOBTITLE ARE MANDATORY – SET BEARCAP = The user ID, bearer capability, and the global title address parameters are mandatory for the requested message. The bearer capability parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- USERID, BEARCAP, AND GLOBTITLE ARE MANDATORY – SET GLOBTITLE = The user ID, bearer capability, and the global title address parameters are mandatory for the requested message. The global title address parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- USERID, BEARCAP, AND GLOBTITLE ARE MANDATORY – SET USERID = The user ID, bearer capability, and the global title address parameters are mandatory for the requested message. The user ID parameter has not been set. Set the parameter with the SET:ASPTQ input message before requesting the test again.
- USERID, BEARCAP, GLOBTITLE, AND OPC ARE MANDATORY – SET OPC = The origination point code parameter is mandatory for the requested message. The origination point code parameter has not been set or cannot be determined because the office has multiple GSMs or is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms. Set the parameter with the SET:ASPTQ input message before requesting the test again.

NO = The request is not allowed. Valid value(s):
- FEATURE NOT AVAILABLE = The feature associated with the requested functionality must be purchased before attempting to send the particular test query. All ASP 0.1 test queries require that the ASP 0.1 feature must be purchased. In addition, the number portability test query (format two) requires the purchase of the Number Portability - Test Query for LRN feature.

OK = Good. The request was accepted.

PF = Printout follows. Followed by an TST:ASPTQ-AMA, TST:ASPTQ-FAIL, and/or TST:ASPTQ output message.

RL = Retry later. May also include:
- FAILED TO SEND TCAP MESSAGE = Unable to send a message. Retry the test later.
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.
- SM IS NOT AVAILABLE = A switching module is not available (not operational or overloaded). Request the test again after the SMs become available.
- TEST IN PROGRESS = Another test query is currently in progress. Wait for that test query transaction to complete before requesting another test.

235-190-126 Advanced Services Platform Release 0.1B
TST:AT1

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an ANSI® transaction capabilities application part (TCAP) Type I test query be sent to a billing validation database to verify its operation.

2. FORMAT

TST:AT1,CCRD=a-b-c,{CLG|ICLG}=d,TTYP=e[,CICEXP][,{CLD|ICLD}=f];

3. EXPLANATION OF MESSAGE

CICEXP = Carrier identification code (CIC) expansion indicator - presence of this keyword indicates that the CIC sent by the database in the response message should be in the 4-digit format. Absence of the keyword indicates that the CIC should contain 3 digits. Note that currently the CIC is not used by Operator Services Position System (OSPS); therefore, there is no CIC in the test output message TST:AT1.

a = Issuer identification number of the telecommunications calling card (89C) or commercial credit card (CCC) number to be queried. This field will be 2 to 7 digits in length (enter the full card number).

b = Individual account number of the 89C or CCC card to be queried. This includes a check number, if required. This field will be a maximum of 15 digits; however, this field together with the issuer identification number will be 7 to 19 digits in length.

c = The 4-digit personal identification number (PIN) of the credit card to be queried.

d = The calling number, also known as the automatic number identification (ANI), or the back number.

e = Translation type. The translation type is used in the TCAP query to indicate to the signaling transfer point (STP) which translation tables should be used to obtain routing information for the query. The translation type is a number from 0 to 255.

f = The called number.

<table>

4. SYSTEM RESPONSE
NG

- No good. Includes one of the following:
  - CNI NOT AVAILABLE = The query request cannot be sent to the billing validation data base because the common network interface (CNI) is not available.
  - FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
  - INCOMPATIBLE ICLG AND CLD NUMBERS = The international calling number is incompatible with a NANP called number of 4110000000. Specify the NANP called number as NPA-555-1212.
  - INTERNAL ERROR = There is an internal error with the query format.
  - INVALID CARD NUMBER = The input card number must be at least 7 digits, and at most 19 digits in length. The card number is composed of the issuer identification number and the individual account number (including the check number).
  - INVALID CLD NUMBER = The called number is invalid. The NANP called number must be a 10-digit directory number.
  - INVALID CLG NUMBER = The calling number is invalid. The NANP calling number must be a 10-digit directory number.
  - INVALID ISSUER ID NUMBER = The issuer identification number must be at least 2 digits, and at most 7 digits in length.
  - INVALID PIN = The PIN must be 4 digits in length.
  - INVALID TRANSLATION TYPE = The translation type must be a number from 0 to 255.

PF

- Printout follows. The request has been received. Output message TST:AT1 follows.

RL

- Retry later. Includes the following:
  - TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.

TST:NCD
TST:RATE
1. PURPOSE

Requests that a billed number screening (BNS) query be sent to the billing validation application (BVA), the line information database (LIDB), or the LIDB alternate destination (LALT) to verify its operation.

2. FORMAT

[1] TST:BNS=a[-BVA];

[2] TST:BNS=a-LIDB[,{CLG|ICLG}=b] [,{CLD|ICLD}=c,CICEXP];

3. EXPLANATION OF MESSAGE

CICEXP  = Carrier identification code (CIC) expansion indicator - presence of this keyword indicates that the CIC sent by LIDB in the response message should be in the 4-digit format. Absence of the keyword indicates that the CIC should contain 3 digits. Note that currently the CIC could be sent by LIDB but it is not used by Operator Services Position System (OSPS) therefore there is no CIC in the test output message TST:LIDB-BNS.

a  = 10-digit billing number to be queried in the form NPANXXXXXX.

b  = Calling number, also known as the automatic number identification (ANI), or the back number.

c  = Called number.

d  = Originating line screening (OLS) code. Valid range is 1 - 999. If this entry is omitted, a default value of 0 (no OLS) is used.

e  = Originating station type (OST). Valid value(s):
   ACQS  = Other ACQS station.
   ACQSHOTL = Automatic charge quotation service (ACQS) hotel station.
   CNPRE = Pre-paid coin station.
   CNPST = Post-paid coin station.
   NAHOTL = Non-ACQS hotel.
   NCNPUB = Non-coin public station.
   OTHER = Other station.
UNKN = Unknown station.

f = Call type (CT). This is the type of call, collect, bill to third, or none. Valid value(s):
COLLECT = Collect.
NONE = No call type (default).
PAID = Sent-paid.
THIRD = Bill to third.

4. SYSTEM RESPONSE

NG = No good. Includes one of the following:
- CICEXP ALLOWED ONLY FOR LIDB AND LALT = The carrier identification code expansion indicator may only be used if LIDB translation capabilities application part (TCAP) interface is the protocol used to access the database.
- CLD/ICLD NOT ALLOWED FOR BVA = The called number may not be specified if the database is specified as BVA.
- CLG/ICLG NOT ALLOWED FOR BVA = The calling number may not be specified if the database is specified as BVA.
- CNI NOT AVAILABLE = The query test cannot be sent to the BVA, LIDB, or LALT database because the common network interface (CNI) is not available.
- CT ALLOWED ONLY FOR LALT = The call type may only be specified if the database is specified as LALT.
- FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- INCOMPATIBLE ICLG AND CLD NUMBERS = The international calling number is incompatible with a NANP called number of 4110000000 or 411. Specify the NANP called number as NPA-555-1212.
- INTERNAL ERROR = There is an internal error with the LIDB query format.
- INVALID CLD NUMBER = The called number is invalid. The NANP called number must be a 10-digit directory number.
- INVALID CLG NUMBER = The calling number is invalid. The NANP calling number must be a 10-digit directory number.
- INVALID INPUT = The billing number must be ten digits.
- OLS ALLOWED ONLY FOR LALT = The OLS may only be specified if the database is specified as LALT.
- OLS RANGE IS 1 - 999 = The valid range for the OLS is 1 to 999, inclusive.
- OST ALLOWED ONLY FOR LALT = The OST may only be specified if the database is specified as LALT.

PF = Printout follows. The request has been received. If BVA was specified, output message TST:BNS follows. If LIDB or LALT was specified, output message TST:LIDB-BNS follows.

RL = Retry later. Includes one of the following:
- CNI/DLN PROBLEM = The test message cannot be sent - CNI is in overload or no active direct link node (DLN) is available.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.
- TOO MANY QUERIES RUNNING = No BNS query IDs are available.

**Software Release:** 5E14 and later
**Command Group:** SM
**Application:** 5
**Type:** Input

1. **PURPOSE**

Invokes the bootstrapper board (BTSR) resident diagnostic.

2. **FORMAT**

TST:BTSR=a;

3. **EXPLANATION OF MESSAGE**

a = Switching module (SM) number

4. **SYSTEM RESPONSE**

**NG** = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

**PF** = Printout follows. The request was accepted. Followed by a TST:BTSR output message.

5. **REFERENCES**

Output Message(s):

TST:BTSR
1. PURPOSE

Requests that a customer account services (CAS) query be sent to the CAS/network control point (NCP) data base to verify its operation.

2. FORMAT

TST:CAS=a[-b];

3. EXPLANATION OF MESSAGE

a = The 14-digit CAS account number to be queried (consists of a 10-digit individual account number plus a 4-digit personal identification number (PIN)).

b = The called number. For a domestic call this is a 10-digit directory number. For an international call this is a 1- to 3-digit international country code. For queries with no called number, this is 0. If this entry is omitted, a default value of 0 (no called number) will be used. Note that 411 and other N11 numbers must be entered as N110000000 in order to distinguish the N11 number from a 3-digit international country code.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CALLED NUMBER = The called number must be a 10-digit domestic number, a 1- to 3-digit international country code, or 0.
- CARD NUMBER = The input CAS card number must be 14 digits.
- CNI NOT AVAILABLE = The query test cannot be sent to the CAS/NCP data base because the common network interface (CNI) is not available.
- FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- INVALID INPUT = The query could not be formatted with the data input.

PF = Printout follows. The request has been received. Output message TST CAS will follow.

RL = Retry later. May also include:
- CNI/DLN PROBLEM = The test message cannot be sent- CNI is in overload or no active direct link node (DLN) is available.
- INTERNAL ERROR = An invalid CAS query identifier (QID) was obtained.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.
- TOO MANY QUERIES RUNNING = No CAS query IDs are available.

5. REFERENCES

Input Message(s):
Output Message(s):
TST:CAS7

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that a customer account services (CAS) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the CAS/network control point (NCP) or gateway/NCP data base to verify its operation.

2. FORMAT

TST:CAS7=a-b-c,TTYP=d[{,CLD|ICLD}=e][,{CLG|ICLG}=g][,SDC=h][,CTYP=i];

3. EXPLANATION OF MESSAGE

a = Issuer identification number of the telecommunications calling card (89C) or commercial credit card (CCC) number to be queried. This field will be 2-7 digits in length (enter the full card number).

b = Individual account number of the 89C or CCC card to be queried. This includes a check number, if required. This field will be a maximum of 15 digits; however, this field together with the issuer identification number will be 7-19 digits in length.

c = Personal identification number (PIN). The PIN can be a maximum of 13 digits. If no PIN exists for the card, enter 0.

d = Translation type. The translation type is used in the TCAP query to indicate to the signaling transfer point (STP) which translation tables should be used to obtain routing information for the query. The translation type is a number from 0 to 255.

e = Called number. For international numbers, use the ICLD= label with a 1- to 15-digit international number. For North American numbering plan (NANP) numbers use the CLD= label with a 10-digit phone number. For queries with no called number, this is 0. If this entry is omitted, a default value of 0 (no called number) will be used. Note that 411 and other N11 numbers must be entered as N110000000. Note also that customer-initiated card calls to 411 contain LOCAL NPA-555-1212 as the called number in the card query to the NCP. Test queries need LOCAL NPA-555-1212 explicitly specified. A called number may not be entered if a speed dial code (SDC) is also entered.

f = CAS service specifier. The CAS service specifier is used in the CCS7 TCAP query to indicate the type of query associated with the call. Valid value(s):
   IVI = For inward queries.
   NORMAL = For other queries (standard card validation).
   RQV = For rate quote queries.
   SDAP = For speed dial auto provisioning (SDAP) queries.
   Note If this field is omitted, the default value NORMAL will be used.

= Calling number. This is either a 10-digit NANP number, a 1-to 3-digit international country code, or a 7-digit DIOR number. If this entry is omitted, no calling number will be used. For international numbers, use the ICLG= label with a 4- to 15-digit international number. For NANP numbers use the CLG= label with a 10-digit phone number.
= Speed dial code. This is a one to three digit number that may not begin with 0. A speed dial code may not be entered if a called (CLD) number is also entered.

= Card type. This is required if the sum of the lengths of the issuer identification number, individual account number, and PIN is 14. The card type is prohibited if the entered card number length is not 14. Valid value(s):

| CIID       | Carrier issuer identifier card. |
| INIT       | AT&T 14 digit True Choice™ calling card, initial call. |
| SEQ        | AT&T 14 digit True Choice™ calling card, sequence call. |

4. SYSTEM RESPONSE

= No good. May also include:

- CNI NOT AVAILABLE = The test query cannot be sent to the CAS/NCP database because the common network interface (CNI) or CCS7 links are not available.
- CTYP ONLY ACCEPTED WITH 14 DIGIT CARD NUMBER = A card type value can only be entered when the sum of the lengths of the issuer identification number, individual account number, and PIN is 14 digits.
- CTYP REQUIRED WITH 14 DIGIT CARD NUMBER = When the sum of the lengths of the issuer identification number, individual account number, and PIN is 14 digits, a card type value must be entered.
- FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- INVALID CLD NUMBER = The called number must be a 10-digit NANP number.
- INVALID ICLD NUMBER = The international called number must be a 4- to 15-digit international number.
- INVALID CALLING NUMBER = The calling number must be a 10-digit NANP number, a 1- to 3-digit international country code, or 0.
- INVALID CARD NUMBER = The input card number must be at least 7 digits, and at most 19 digits in length. The card number is composed of the issuer identification number and the individual account number (including the check number).

If a 14-digit card number is entered and the card type is either INIT or SEQ, then the first and fourth digits must be 2 or higher.

- INVALID ISSUER ID NUMBER = The issuer identification number must be at least 2 digits, and at most 7 digits in length.
- INVALID PIN OR EXPIRATION DATE = The PIN or EXPIRATION DATE must be at most 13 digits in length.
- INVALID SERVICE SPECIFIER = Invalid specifier. May also include:
  - 6 = For rate quote query.
  - IVI = For inward query.
  - NORMAL = For standard card validation.
  - SDAP = For SDAP query.

- INVALID SPEED CODE = The speed dial code must be from one to three digits and may not begin with 0.
- INVALID TRANSLATION TYPE = The translation type must be a number from 0 to 255.
- SDC NOT ALLOWED WITH CLD = A speed dial code may not be entered if a called number is also entered.
PF = Printout follows. The request has been received. Output message TST:CAS7 will follow.

RL = Retry later. May also include:
- INTERNAL ERROR = There was a problem reading the RLDS_APP relation (Recent Change/Verify View 8.17), to obtain the subsystem number.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.

8.17 (DIRECT SIGNALING APPLICATIONS)
1. PURPOSE

Requests that a calling card (CCRD) query be sent using the billing validation application (BVA) interface, the line information database (LIDB) transaction capability application part (TCAP) interface, or to the LIDB alternate destination (LALT) using the LIDB TCAP interface to verify its operation.

2. FORMAT

[1] TST:CCRD=a[-BVA];

[2] TST:CCRD=a-LIDB, {CLG|ICLG}=b, {CLD|ICLD}=c[,CICEXP];

[3] TST:CCRD=a-LALT, {CLG|ICLG}=b, {CLD|ICLD}=c[,OLS=d][,OST=e][,CICEXP];

3. EXPLANATION OF MESSAGE

CICEXP = Carrier identification code (CIC) expansion indicator - presence of this keyword indicates that the CIC sent by LIDB in the response message should be in the 4-digit format. Absence of the keyword indicates that the CIC should contain 3 digits.

Note: Currently the CIC could be sent by LIDB but it is not used by Operator Services Position System (OSPS) therefore there is no CIC in the test output message TST:LIDB-CCRD.

a = Fourteen-digit calling card number to be queried, in the form NPANXXXXXXYYYY or RAO[0/1]XXXXXXYYYY.

b = The calling number, also known as the automatic number identification (ANI), or the back number.

c = The called number.

<table>

4. SYSTEM RESPONSE

NG = No good. Includes one of the following:
- CICEXP ALLOWED ONLY FOR LIDB AND LALT = The carrier identification code expansion indicator (CICEXP) may only be used if LIDB TCAP interface is the protocol used to access the database.
- CLD/ICLD ALLOWED ONLY FOR LIDB AND LALT = The called number may only be specified if LIDB TCAP interface is the protocol used to access the database.
- CLG/ICLG ALLOWED ONLY FOR LIDB AND LALT = The calling number may only be specified if LIDB TCAP interface is the protocol used to access the database.
- CNI NOT AVAILABLE = The query request cannot be sent to the BVA, LIDB, or LALT database because the common network interface (CNI) is not available.
- FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- INCOMPATIBLE ICLG AND CLD NUMBERS = The international calling number is incompatible with a NANP called number of 4110000000. Specify the NANP called number as NPA-555-1212.
- INTERNAL ERROR = There is an internal error with the LIDB query format.
- INVALID CLD NUMBER = The called number is invalid. The NANP called number must be a 10-digit directory number.
- INVALID CLG/ICLG NUMBER = The calling number is invalid. The calling number must be specified if LIDB TCAP interface is the protocol used to access the database, and a NANP calling number must be a 10-digit directory number.
- INVALID INPUT = The calling card number must be fourteen digits.
- OLS ALLOWED ONLY FOR LALT = The OLS may only be specified if the database is specified as LALT.
- OLS RANGE IS 1 - 999 = The valid range for OLS is 1 to 999, inclusive.
- OST ALLOWED ONLY FOR LALT = The OST may only be specified if the database is specified as LALT.

PF = Printout follows. The request has been received. If BVA was specified, output message TST:CCRD follows. If LIDB or LALT was specified, output message TST:LIDB-CCRD follows.

RL = Retry later. Includes one of the following:
- CNI/DLN PROBLEM = The test message cannot be sent. CNI is in overload or no active direct link node (DLN) is available.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.
- TOO MANY QUERIES RUNNING = No calling card query IDs are available.

Type: Input

1. PURPOSE

Requests that a report is issued indicating whether Generic Retrofit Selective Initialization may proceed with minimal impact on CCS capability.

2. FORMAT

TST:CCS,GSMCFG[,OPT=a];

3. EXPLANATION OF MESSAGE

a  = Command line option string passed to the unix command: /prc/supr/gsmcnfg. If no option string is specified, a summary of possible command line options are printed on the ROP and displayed on the terminal.

4. SYSTEM RESPONSE

NG  = No good. May also include:
   - NO GLOBAL SM  = No GSM is provisioned in the office.
   - GSM MISMATCH  = The specified SM does not exist or is not a GSM.

RL  = Retry later. May also include:
   - DATA BEING UPDATED = The input message cannot be processed because the relations that contain the status of linksets, DPCs, clusters, networks, PHs, etc. are being updated either by a traffic diversion terminal process or by audits.
   - MSG NOT SENT TO CLIENT PROC = The input message cannot be processed because the signaling traffic route and management (STRM) system process failed to create the terminal process.

PF  = Printout Follows. Followed by the TST:CCS,GSMCFG output message.

*Command Group:* CCS  
*Application:* 5  
*Type:* Input

1. **PURPOSE**

Schedules a link test to be run on a signaling link. The link tests are conducted to ensure that message traffic can travel across the signaling links.

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. **FORMAT**

   TST:CCSLK,SET=a[&&b],MEMBER=c[&&d][,SM=e];

3. **EXPLANATION OF MESSAGE**

   a  = Link set number or lower limit of a range of link set numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. The range of numbers need not start or end with equipped link set numbers.

   b  = Upper limit of a range of link set numbers.

   c  = Link member number or lower limit of a range of link member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. Range of numbers need not start or end with equipped link member numbers.

   d  = Upper limit of a range of link member numbers.

   e  = Global switching module (GSM) number. Common channel signaling (CCS) GSM number where the link to be tested is located. If no SM number is specified and only one CCS GSM exists in the office, the specified link on that GSM will be tested. If multiple CCS GSms exist in the office, the SM must be specified.

4. **SYSTEM RESPONSE**

   NG = No good. May also include:
   - GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
   - NO GLOBAL SM = No GSM is provisioned in the office.
   - NEED GSM NUMBER = SM was not specified in the input message, and office has more than one GSM provisioned.

   PF = Printout follows. Followed by the TST:CCSLK output message.

   RL = Retry later. May also include:
   - SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.

TST:DLNHB

Software Release: 5E14 and later
Command Group: CCS
Application: 5,CNI
Type: Input

1. PURPOSE

Requests a manual direct link node (DLN) "heartbeat test" execution for a specific switching module (SM). The DLN heartbeat test checks each SM for its ability to communicate with the DLN. This input message allows the user to test a particular SM to insure that it can process messages from the DLN. If problems exist the REPT:DLN output message generated will help in the solution.

2. FORMAT

TST:DLNHB,SM=a;

3. EXPLANATION OF MESSAGE

a = SM number.

4. SYSTEM RESPONSE

NG = No good. May also include:
- DLNS ARE NOT EQUIPPED = This test can only be run on common network interface (CNI) rings equipped with DLNs. This ring does not have DLNs.
- SM NOT AVAILABLE = The SM chosen is either not equipped or cannot process messages at this time.

PF = Printout follows. The REPT:DLN and REPT:TST-DLN request has been received and test is being executed.

RL = Retry later. May also include:
- AM INIT IN PROGRESS = The administrative module (AM) is currently in an initialization state. This test cannot be run at this time.
- CNI NOT AVAILABLE = The CNI ring is not available at this time.
- DLN NOT AVAILABLE = The DLNs are not in active/standby state.
- DLN SWITCH IN PROGRESS = The DLNs are switching states. Communications to the DLN is not possible at this time.
- RING IS IN SILENCE STATE = Communication both to and from the node is not available at this time.
- TST DLNHB CURRENTLY INPROG = A previous test is currently in progress. Only one test at a time is allowed.

TST:DSL

**Software Release:** 5E14 and later
**Command Group:** TRKLN
**Application:** 5
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

To test the specified integrated service digital network (ISDN) basic rate interface (BRI) using digital, analog or metallic techniques (digital subscriber line (DSL) and BRI are used interchangeably in this message).

**WARNING:** Mismatch tests and loop-back tests deny customer service on associated DSL channels for the duration of the request. In general, tests that include the D-channel (explicitly or implicitly) block all call processing on the DSL.

Specifically, the test type parameter is used to request digital loop-back (LPBK) testing, corrupt cyclic redundancy check (CRC) testing or hardware mismatch testing. Testing of DSLs is supported in all configurations of the access interface unit (AIU), integrated services line unit (ISLU), integrated services line unit, version 2 (ISLU2), integrated digital carrier unit (IDCU), and digital network unit - synchronous optical network (SONET) (DNU-S). In addition, testing DSLs of both custom and standard (layer 3) interface types is supported.

The types of DSL (layer 1) interfaces supported are the T-interface (T) and the U-interface (U). The U-interface DSLs (U-DSLs), are supported by alternate mark inversion (AMI) and 2 binary 1 quaternary (2B1Q) technologies. The 2B1Q version supports the standard defined by the ANSI®. For the remainder of this message, the term ANSI® refers to the 2B1Q version.

The IDCU and DNU-S connect a remote digital terminal (RDT) using the TR-303 interface. The RDT equivalent of the ISLU line card (LC) is called a channel unit (CU). Any type of LC, line circuit (LCKT) or RDT CU are collectively referred to as the line termination (LT) throughout this message.

Unless otherwise stated: all references to ISLU include all configurations of the ISLU and the ISLU2. This includes both the remote integrated services line unit (RISLU) and remote integrated services line unit version 2 (RISLU2). All references to AIU include the remote access interface unit (RAIU). Reference to line unit (LU) includes all supported ISDN compatible LUs.

Any TST:DSL request may be stopped using the STP:TST-DSL input message (with the exception of IDCU or DNU-S CRC test which must execute until completion, as per specification).

The following message formats indicate the parameters that apply to specific test types as used for ISLU, AIU, IDCU and DNU-S applications. In general, the DSL to be tested is identified using the office equipment number (OEN) or an associated subscriber directory number (DN).

Formats 1 through 4 are for DSL tests on any LU using the subscriber DN.

Format 5 is for ISLU DSL testing using the subscriber DN.

Formats 6 through 10 are for ISLU DSLs using the line card equipment number (LCEN).

Formats 11 through 14 are for IDCU DSLs using the IDCU line equipment number (ILEN).

Formats 15 through 19 are for ISLU2 DSLs using the line circuit equipment number (LCKEN).
Formats 20 through 23 are for DNU-S DSLs using the integrated digital loop carrier (IDLC) networking line equipment number (INEN).

Formats 24 through 27 are for AIU DSLs using the AIU equipment number (AIUEN).

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

AUTO

= Perform LPBK testing on the specified or defaulted DSL channels, automatically (AUTO) selecting the test type in accordance with the basic/logical configuration of each channel tested (AUTO is the default test type). Using AUTO test type selection, packet switch (PS) testing is selected for the D-channel and/or any permanent packet B-channel (PPB); otherwise, circuit switched (CS) testing is selected.

If all ISLU ANSI® DSL channels are under CS or PS test, the LPBK point is beyond the LT and layer 1 is found to be down beyond that point, a mismatch test is automatically invoked. In such cases, a "job status" of the form

CRC

= Perform a corrupt performance monitoring (PM) CRC test on the specified ANSI® U-DSL, between the LT and the network termination 1 (NT1). The corrupt CRC test verifies that the PM counters at the LT and CUs can detect and maintain a record of block errors (BE). In addition, if the reporting of PM alerts has been turned on and the associated alerts have not fired for the current period, a PM alert (refer to the REPT:ALE-LEVEL1 output message) is triggered if the CRC test duration (DUR) is long enough to cause a LT PM count threshold to be reached (refer to RC/V View 22.15).

The CRC test can be used to output the PM counts at the LT and optionally the CUs (for verbose requests) by specifying a test duration of zero (refer to the DUR parameter). In this case, no CRC corruption is done.

The CRC test introduces "corrupted" CRC once every superframe of the layer 1 protocol. One BE is generated for each superframe that transmitted downstream (that is, LT toward the NT1) and then back upstream (that is, NT1 toward the LT). For ISLU and AIU DSLs, both the upstream and downstream directions on the U-DSL are tested at the same time. For IDCU DSLs, the direction of testing must be specified (refer to variable 'l'). Test results in the form of PM counts are output for the LT and optionally for each equipped CU if the verbose (V) parameter is specified.
The IDCU and DNU-S CRC test differs from other LUs as required by the RDT standard. For IDCU and DNU-S DSLs, ANSI® CUs cannot be detected by the switch; therefore, PM counts are generated for only the LT. The CRC test for IDCU and DNU-S must run to completion; once started, it cannot be stopped (refer to the STP:TST-DSL input message). The IDCU and DNU-S CRC maximum test duration is 255 seconds (4 minutes, 15 seconds).

The LT current hour PM counts are marked corrupt as a result of CRC testing to indicate that the entire U-DSL (NT1 to LT) cannot be monitored for BEs during or after the CRC test (that is, while the corrupt condition persists). The PM counters are left as they were at the end of the test. This allows a re-read of the PM counts if necessary. The EXC:ALE input message can be used to clear the PM counts if desired; however, the corrupt condition persists until the next PM interval. There is no way to mark the CU PM counts as corrupt.

The CRC test is non-invasive with regards to DSL (2B+D) channel operations and does not cause a loss of customer service.

CS

Perform a CS digital LPBK test on the specified or defaulted DSL channel(s). This test is useful for evaluating the quality of DSL channels supporting circuit-switched data (CSD) or circuit-switched voice (CSV) types of services. This test requires the use of a integrated services test function (ISTF) or global digital services function (GDSF) as the digital test source. One test equipment transmit/receive channel (maximum of 3 per ISTF and 16 per GDSF) must be allocated for each CS DSL channel to be tested. The data rate of the digital bit stream may be specified using the RATE parameter.

The CS test activates the specified (or default) LPBK termination, establishes a digital path between the test equipment channel and the associated DSL channel, and transmits a pseudo random bit stream to be returned at the location of LPBK termination. The incoming bit stream (returning from the LPBK) is checked by the test equipment to derive the bit error rate (BER) and the errored blocks (ERBLK) for output. The success or failure of testing is based on the acceptable bit error rate (ABER), which may be specified on input.

The test equipment is accessed using trunk routing techniques. All associated growth procedures, which include the assignment of logical test ports (LTP), must be completed before the test equipment can be accessed. The number of LTPs that serve a switching module (SM) must always be equal to the number of ISTF and GDSF circuits in that SM. If test equipment circuits are out-of-service (OOS) a like number of LTPs must be OOS. If an imbalance exists, the test equipment is chronically unavailable.

MSMTCH

Perform a mismatch test on the specified ISLU U-DSL to test compatibility between the LT and the first metallic termination (CU or NT1) connected to the LT. The mismatch test is not supported for AIU, IDCU and DNU-S DSLs. All customer service is blocked during mismatch testing.

After verifying database integrity, the mismatch test makes current measurements to determine the resistance at the LT, as connected to the first metallic termination (NT1 or CU), to detect the following abnormal conditions:
- Loop resistance that is too high or low between tip and ring.
- Loop resistance that is too low between tip and ground or ring and ground.
- For AMI U-DSLs, tip and ring reversal at the NT1 (that is, when no CUs are present).

For ISLU ANSI® U-DSLs, the mismatch test marks the LT current hour PM counts as corrupt to indicate that the entire U-DSL (from NT1 to LT) cannot be monitored for BEs during or after the mismatch test (that is, while the corrupt condition persists). There is no way to mark the CU PM counts as corrupt.
OSPS = Perform a voice continuity test on an Operator Services Position Systems (OSPS) DSL supporting directory assistance (DA) or toll assistance (TA) operators. The transmission test function (TTF) or GDSF is used as the analog test source. This test can only be performed on the B1-channel using an external analog termination provided by customer premise equipment (CPE) such as the basic services terminal (BST) or video display terminal (VDT). The termination is provided when the CPE headset is unplugged. The OSPS test duration is fixed at 10 seconds. The OSPS DSL must be OOS before it can be tested (refer to the RMV:LINE message).

PS = Perform a PS digital LPBK test on the specified or defaulted DSL channel(s). This test is used to evaluate the quality of DSL channels supporting permanent packet D-channel (PPD), PPB, or on-demand packet (ODP) types of services. This test uses the logical protocol handler (PH) channel(s) assigned to serve the associated DSL channel(s) to source layer 2 test packets. The transmission rate of test packets is approximately 1 packet per second.

The test activates the specified (or default) LPBK termination, establishes a virtual digital path between the PH channel and the associated DSL channel, and transmits test packets (containing a pseudo random number) to be returned at the location of LPBK termination. The incoming packets are checked by the PH to derive the percentage of successfully transmitted packets (PKTRATE) for output.

The testing status is ATP if 98% to 100% of the transmitted packets are received error-free. A failed status indicates less than 98% of the transmitted packets were received error-free.

Generally, a logical PH channel is always dedicated to serve a D-channel or PPB-channel. One exception is the pseudo BRI D-channel, which has no active PH channel assigned and therefore cannot be tested. For ODP B-channels, up to two logical PH channels may be assigned to serve a single user. In this case, an available PH channel is chosen by software for testing (not user selectable). On DSL channels that support ODP service, both CS and PS tests can be performed (refer to the MODE=USER parameter).

If PS DSL channels are assigned to different logical PHs, the testing of all channels may continue simultaneously; however, if those PH channels are mixed on the same logical PH, the PS tests are done sequentially. This results in an elapsed test time approximately three times the test duration when testing all DSL channels. If the test duration is over 60 seconds, an output message is generated indicating a retest is in progress for each DSL channel encountering a busy PH. Sequential testing is required, as only one PS digital test can be performed per PH (this limit has always existed). The effects may also be observed when testing two different DSLs, both having a PS channel assigned to the same logical PH (which may support 128 channels). The test results indicate a PH resource shortage for the later of the two tests.

A physical PH is logically assigned to serve specific DSL channels. This logical assignment can change automatically during testing. This means that the PH test source can be different when the test completes. A PS test procedure is not preserved in the event of a PH soft or hard switch. If detected, the PH switch terminates testing on the associated channel(s). If a PH switch goes undetected, a time-out for test results occurs. The assigned physical PH is checked on a periodic basis; however, during that period the test duration may elapse or the defective PH can be switched.

ROP = Direct all output to the receive-only printer (ROP).

The ROP parameter frees the invoking terminal (such as, TLWS, MCC) for subsequent work while test results are logged only on the ROP device. This is useful when performing long duration tests in modes that produce multiple output messages.
This parameter provides for the output of testing information which would otherwise not be made available. For CRC test requests, test results for all populated CUs are output. For SECT mode LPBK requests, all intermediate failures are output.

- Generate output in a verbose manner.

a = Directory number that specifies a user of the DSL.

b = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ISDN line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Remote digital terminal number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Line board/pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RDT channel unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = IDCU or DNU-S CRC test direction. The IDCU and DNU-S CRC test is run in one direction at a time, which is specified as a value to the CRC parameter. The test direction values are not used by other LUs, as the test is always runs in both directions. If the duration specified is zero the test direction values are ignored. Valid value(s):

- **UP**
  - Perform a CRC test using the upstream registers of the LT on the U-DSL, reporting only upstream PM results on output.

- **DWN**
  - Perform a CRC test using the downstream registers of the LT on the U-DSL, reporting only downstream PM results on output.

DEFAULT: If a direction is not specified and the duration specified is greater than 0, the CRC parameter defaults to DWN.

m = DSL channel(s) tested.

This parameter specifies the DSL channel(s) to be tested. The entry of a particular value does not imply that call processing continues for untested DSL channels; if hardware limitations require the
control of other DSL channels, they are also blocked for testing. If ALL DSL channels are to be tested and the request is inappropriate for one or more channels, testing may continue, requiring fewer DSL channels to be blocked for testing. Output messages are generated for all channels requested for testing. Valid value(s):

B      = Test using any idle B-channel. If both B-channels are busy, camp-on both channels, using the channel that becomes free first. The UCL=PRMT parameter is not allowed when any B-channel is specified.

B1     = Test on the B1-channel.

B2     = Test on the B2-channel.

D      = Test on the D-channel. The D-channel provides in-band signaling required to support CS B-channels; therefore, when the D-channel is tested, the test procedure also controls any CS B-channels. However, PPB-channels may be free (that is, hardware permitting), as signaling is done in-band.

BB     = Test on both B-channels.

ALL    = Test on all assigned DSL channels.

DEFAULT: Except for CS testing, the CH parameter defaults to ALL. For CS testing, the default is BB.

n      = Terminal endpoint identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

The TEI can be used to identify specific CPE for the purpose of performing a CPE LPBK or identifying a specific subscriber for USER mode testing. The DN or OEN must be used in conjunction with a TEI to properly identify the associated SM and LT. Use the OP:CPE input message to obtain active TEI.

A TEI must be specified to do a CPE LPBK when the CPE is not bound to a specific user. In this case, the OEN or an unbound DN must be used to identify the LT. If a DN is used, the service order profile (SOP) associated with that user is implied to be bound to the CPE assigned the TEI. This allows the LPBK testing of an unbound users ODP service using any unbound CPE. If a bound DN is used, the TEI is ignored on input and the TEI associated with the users CPE is always output.

To perform USER mode testing, a unique SOP must always be identified. The SOP can be identified using a DN, or the OEN with the TEI assigned to a bound CPE.

o      = Camp-on (CAMP) time (15-3600, default 300).

The test camps-on for the time specified (in seconds), waiting for the required resources to become available, at which time testing may proceed. If the resources do not become available in the specified time, the test is aborted. No camp-on occurs if UCL=PRMT is specified.

p      = Remote terminal digital signal level 1 (DS1) (RTDS1=1-28).

The RTDS1 specifies the DS1 carrier transmission path between the IDCU and the RDT that is used during digital testing. If the specified RTDS1 is unavailable, the test is aborted. The RTDS1 is only selectable when performing CS or ODP tests on CS channels. The RTDS1 is permanently assigned for D-channels and PPB-channels. The protected (that is, spare) DS1 cannot be specified for testing. The specified RTDS1 can be lost if the digital path must be reestablished for retest or multi-section tests (refer to the MODE parameter).

q      = Termination.
For digital LPBK testing, the termination is the point at which the test data is returned to the test equipment for evaluation. A LPBK termination may be provided using the built in capabilities of transmission equipment dedicated to serve the DSL or by breaking the LOOP|PATH manually, applying suitable test equipment and specifying TERM=EXT.

A LPBK termination may be placed at various locations within the digital path or loop to facilitate the sectionalization of transmission problems. The failure of a digital LPBK test implicates the transmission media as well as the transmission equipment providing the LPBK termination. Alternatively, the success of a LPBK test does not absolve the transmission equipment providing that LPBK from failure, as the fault may lie within that unit beyond the associated LPBK circuitry. In addition, particular transmission equipment may perform its primary function flawlessly; however, the LPBK function within that unit can be faulty or simply unimplemented.

The customer is denied service during testing. The extent of service blockage depends on the channels under test and the LPBK chosen. Any attempt to test the D-channel blocks all CSV/CSD/ODP calls, as the D-channel is used for all call setup procedures. The customer impact may be reduced by requesting interruptible tests (refer to the INT parameter). Valid value(s):

- **CPE**
  - The LPBK termination is provided within the CPE connected to the DSL.
  - Specifically, the selected ISDN telephone or data module CPE provides the LPBK termination(s) for digital testing. For U-DSLs, the use of this termination allows evaluation of the subscribers on premise wiring/equipment. If an NT1 LPBK test passes and a CPE LPBK fails, the fault must lie beyond the LPBK termination within the NT1. For T-DSLs the fault would lie beyond the LT LPBK termination.

  - The CPE may also be specified using a bound DN, or the OEN with an assigned TEI. This implies binding between the SOP of the DN and the selected CPE. The CPE can provide a LPBK on one or both B-channels. The CPE cannot provide a LPBK on the D-channel.

  - Only CPEs that support the maintenance information message (MIM) protocol, as described in the Basic Rate Interface Specification manual, can activate this LPBK termination. CPE vendors other than Lucent Technologies are not required to support this LPBK termination. The standard interface CPE does not support MIM or provide LPBK capability. Attempts to LPBK incompatible CPEs can result in failures to establish or remove LPBK terminations.

  - It should be noted, that the CPE using feature package one (FP1) firmware does not support CPE LPBKs, while the CPE FP firmware and later fully supports the LPBK. Examples of compatible CPE include the AT&T 6508, 7505, 7506, 7507 and 8503 telephones and the 7500 data module.

- **CUx**
  - The LPBK termination is provided within the specified DSL CU. The CU LPBK terminations are only supported on ISLU and AIU DSLs (CUs are not detected and associated LPBKs are not attempted, on DSLs supported by other LUs). The three types of CUs supported are the AMI, TBRITE AMI and the ANSI® CUs.

  - The AMI U-DSL supports up to four CUs (x=1-4). The presence of AMI CUs cannot be determined by the switch; therefore, a LPBK request is performed as if every AMI DSL had CUs. If CUs are not populated, LPBK testing always fails indicating a “FAULT IN LOOP|PATH”, as the test data is not returned to the test equipment.

  - The ANSI® U-DSL supports up to six channel units (x=1-6) and can respond to queries from the switch; therefore, the number of populated CUs is determined prior to testing and only those present are tested.
ANSI® CUs support the LPBK of individual B-channels or all DSL channels simultaneously. For AMI CUs, individual B-channel LPBKs are not possible and the D-channel LPBK is not supported for ANSI® or AMI; therefore, to perform associated requests, ownership of all DSL channels is obtained and all DSL channels are placed in LPBK. This method denies service to all users during the CU test. Only the ANSI® CU supports concurrent B-channel LPBKs using the CH=BB value. However, because all DSL channels are unlooped with one request, only one test procedure may LPBK a given CU at a time. The TBRITE AMI CU differs from the AMI CU in that the NT1 is built into the CU. The TBRITE AMI unit provides both CU and NT1 LPBK capability.

EXT
= A test may be performed without a LPBK termination for the purpose of applying a termination "manually" (by the user) external (EXT) to the switch. If a LPBK termination is not "manually" applied, the test fails because test data is not returned to the test equipment. An EXT LPBK can be provided by suitable test equipment connected along the loop or by setting compatible CPE in LPBK mode.

The DSL port to be tested should be manually taken OOS prior to testing (For example, refer to the RMV:LINE and RMV:DATALINK input messages), as the LPBK must be applied prior to invoking the test. This eliminates the possibility of producing protocol errors and associated records when looping back PS channels.

LT | LC
= The LPBK termination is provided within the ISLU LC, the AIU LCXK or the IDCU or DNUS RDT CU. The three LT types supported are T-DSLs, ANSI® U-DSLs, and AMI U-DSLs. The T-DSL LT attaches directly to the (T-interface) CPE. The U-DSL LT uses an (on premise) NT1 to provide a T-interface for the CPE and may possibly employ CUs to extend the U-interface.

The LT supports the LPBK of individual DSL channels or all DSL channels simultaneously and DSL channels may be selectively unlooped. This allows concurrent test procedures to set and remove LPBKs independently. Requests to LPBK the LT on the D-channel result in blocking calls on CS B-channels.

NT1
= The LPBK termination is provided within the NT1. The NT1 termination is supported on ANSI® and AMI U-DSLs. The NT1 termination does not exist for T-DSLs. The NT1 functionality may be incorporated in other equipment (such as, the T-BRITE CU and the 6508 CPE), however, the actual implementation should be transparent.

Both the ANSI® and AMI NT1 support the LPBK of individual B-channels or all DSL channels simultaneously. Only the ANSI® NT1 allows concurrent B-channel LPBKs using the CH=BB value. Since the D-channel and AMI CH=BB LPBKs are not supported, ownership of all DSL channels is obtained and all DSL channels are placed in LPBK to support these requests. This method denies service to all users during the NT1 test. Also, because all DSL channels are unlooped with one request, only one test procedure may LPBK a given NT1 at a time.

PH
= The LPBK termination is provided on the PH channel that supports the associated DSL channel. The type of PH hardware (such as, PH2 or PH3) is transparent to the LPBK request.

This LPBK provides the ability to diagnose the PH channel (that is, the test equipment) serving a particular DSL channel. An ODP user can be served by two PH channels. In this case, a free PH channel is automatically selected to provide the LPBK termination (the PH channel that provides the LPBK is not user selectable). A PH LPBK may be performed on one or all DSL channels simultaneously; however, only one PH LPBK test may be performed per PH (refer
to the PS test type for limitations). Requesting a PH LPBK test of the D-channel, always blocks call processing on CS B-channels.

DEFAULT: The LT is the default for T-DSLs and the NT1 is the default for U-DSLs.

r = Customer interrupt (INT) allowed.

This is the type of customer service request allowed to interrupt the testing procedure. This parameter allows the user to minimize the customer impact associated with performing a LPBK test. Because all LPBK tests block customer service on one or more DSL channels, the INT parameter should be considered whenever performing routine or preventive maintenance during periods of high or moderate customer usage. When a test is aborted, test results up to that point and the elapsed test time are delivered to the user. The INT parameter only applies to LPBK tests, as other test types are of either a fixed, short duration or are non-invasive with respect to the customer. To assure the collection of a minimum test data set, a minimum test duration may be specified (refer to the MDUR parameter).

In all cases, only customer CSV or CSD requests to originate calls on or terminate calls to the DSL under test can cause the test procedure to be aborted. That is, only customer service requests that require the use of a CS DSL channel that is under test, cause the test to be aborted. Test procedures on permanent packet DSL channels cannot be aborted for incoming packets.

Whenever the D-channel is looped back, the CPEs are effectively cut-off from the switch and customer originations from the CPE cannot be detected by the switch. The D-channel can be placed in LPBK even if that channel is not tested. For example, a request to test one or more B-channels using an AMI CU termination requires the LPBK of ALL DSL channels (refer to the TERM=CU parameter). Valid value(s):

- BOTH = Call originations from or terminations to the DSL under test cause the test procedure to be aborted.
- ORIG = Call originations from the DSL under test cause the test procedure to be aborted.
- TERM = Call terminations to the DSL under test cause the test procedure to be aborted.

DEFAULT: By default, the customer is denied service on the DSL channel(s) required for testing, for the full test duration.

s = Duration (DUR) of test (0-3600, default 20).

The duration is the length of time (in seconds) that the test source (such as, ISTF, GDSF or PH) sends test data. In general, the test duration does not include the setup time, camp-on time, or idling time associated with any test request. The elapsed time taken for the test request to complete can be significantly greater than the actual test duration (refer to the MODE parameter).

LPBK testing for CS, PS, and AUTO tests accepts durations of 1 to 3600 seconds, since a value of zero is meaningless.

The CRC test accepts a duration of zero to request a read only of PM counts (no CRC corruption is done). This is useful for obtaining the current PM counts or obtaining the counts associated with a CRC test that has just finished.

The IDCU CRC maximum test duration is 255 seconds (4 minutes, 15 seconds)

For ISLU and AIU CRC testing, the test duration that is output is greater than the requested
duration. This is due to internal delays associated with starting and stopping the accumulation of CRC results. The actual time the test runs is printed on output.

\[ t \] = Minimum test duration (MDUR) (1-3600).

The test procedure is not aborted for customer service requests (refer to the INT parameter) until the minimum test duration, in seconds, has elapsed. Use of this parameter assures the collection of test data for at least the MDUR specified. That is, the customer is denied service on the associated channel(s) until MDUR elapses.

If MDUR is specified in the absence of the INT parameter, the test request is implied to be interruptible when the MDUR has elapsed. For requests that require control of the D-channel, testing is interruptible for only terminations when the MDUR elapses. In all other cases, testing is interruptible for both originations and terminations.

\[ u \] = Data rate.

This is rate of the digital bit stream to be sourced by the ISTF|GDSF during CS LPBK testing. The configuration of SM umbilicals must be consistent with the data rate chosen. The test equipment may be located in any SM; therefore, the test port and the port under test can be located in the same or different SMs (which may be connected by an umbilical). Valid value(s):

- AUTO = Automatically select the effective data rate (default).
- 64CLR = 64000 bits/sec clear channel (that is, zero-octet allowed).
- 64RES = 64000 bits/sec restricted (that is, zero-octet suppressed).
- 56KPS = 56000 bits/sec.

DEFAULT: By default, the effective data rate is determined by automatically attempting to synchronize for 6 seconds at each valid data rate. AUTO data rate selection is complete and testing begins when synchronization is first achieved, trying first at 64CLR, then 64RES and then at 56KPS. If synchronization cannot be achieved, testing will fail indicating "FAULT IN LOOP OR PATH" at the 56KPS data rate.

In general, SM umbilicals capable of supporting the 64CLR data rate support all other data rates; however, a lower data rate umbilical is incompatible with digital testing performed at a higher data rate. In the later case, digital testing fails consistently with "FAULT IN LOOP OR PATH". An ISTF|GDSF should never be configured in a SM that is connected via 56KPS|64RES umbilical. This would effectively restrict LPBK testing in ALL SMs to that data rate. It makes no difference if there is other test equipment available, as the lower rate equipment is selected randomly. It also makes no difference if there is a second 64CLR umbilical added, as the wrong umbilical is assigned randomly.

The data rate must also be matched with the facility being tested. If a customer complaint is associated with a service that is subscribed at 64CLR, that data rate must be explicitly provided in the test request (by default, the effective data rate is used and the associated problem may not be seen at that rate). In addition, if digital testing is performed as part of preventive maintenance, the 64CLR data rate must be specified to evaluate DSLs at the highest rate possible.

\[ v \] = Block-size (BLKSZ) (1-64000).

For CS LPBK testing, the digital-bit-stream is partitioned into segments called blocks, specified using the BLKSZ parameter. The BLKSZ is the number of bits in each block. The BLKSZ is used by the ISTF|GDSF to calculate the total ERBLK for output. The ERBLK result characterizes the accumulation of bit-errors. Varying the BLKSZ allows the distribution of errors over time to be better understood. If BLKSZ is not specified, the default is chosen based on the data rate used. Valid
default value(s):
56000 = For RATE=56KPS
64000 = For RATE=64RES or RATE=64CLR

w = Acceptable bit error rate (0-9, default 6).

The ABER is used by the ISTF/GDSF to determine when a CS LPBK test request is all test pass (ATP), passes degraded (DGR), or fails (FAILED). The ABER does not modify the pass/fail criteria for PS LPBK tests.

The ABER defines the failing BER as a negative power of ten. That is, an ABER of 6 defines the failing BER as 1 or more bits in error, for every 1,000,000 bits transmitted.

x = Mode of testing. The mode parameter provides a mechanism through which additional attributes may be attached to a specific test request. Valid value(s):

SNGL = In single section mode, the test request is stopped after performing one test as specified and generating the associated result output. This is the default mode of testing.

SECT = The sectionalization mode of testing is used to automatically isolate the operative/faulty portion of a DSLs digital path or transmission loop. This is accomplished by dividing the path and loop into a finite number of testable sections that are delineated by the available LPBK terminations. The maximum number of test sections possible is 10 for ANSI® U-DSLs, 8 for AMI U-DSLs and 3 for T-DSLs.

Testing begins with the section of the LOOP|PATH that ends at the LPBK termination selected. If that test produces a passing result, SECT mode testing is complete; however, in the event of failure, testing automatically continues with the next testable section, by changing the LPBK termination. The ABER parameter can be used to change the criteria for ending sectionalization testing. The selection of subsequent test sections effectively shortens the LOOP|PATH and causes diagnosis to approach the test source itself (such as, PH). The testing procedure continues in this manner, until a passing result is obtained or all possible sections (that is, terminations) have been exhausted.

Whether the SECT mode test terminates successfully or with failure, output messages always indicate the section of the LOOP|PATH affected by displaying the current LPBK termination. SECT mode testing can proceed to the next section for failures that are not transmission oriented (such as, layer 1 down beyond the LT results in the test proceeding at the LT).

The default output procedure generates only one result message for each DSL channel tested. This is a concise output strategy; however, all failures encountered at other test sections are not output unless the V parameter is specified.

SEQ = The sequence (SEQ) test mode performs a series of digital LPBK tests that begin at the LPBK termination specified and continue until all possible terminations between that point and the test source have been used. Results are unconditionally generated subsequent to performing each test. This test verifies the LPBK functionality within each associated unit. That is, the equipment may perform its primary function flawlessly; however, the LPBK function within that unit can be faulty.

USER = The scope of testing is limited to the DSL channel(s) supporting USER subscribed communication service(s) associated with a specific DN. DSL channel(s) associated with a users PPD, ODP, PPB, CSV or CSD service(s) are
considered for testing (for DSL channels on which service is not assigned, testing is not performed). This mode of testing verifies office-dependent data (ODD) as well as the subscribed service.

The DSL user must be identified by subscriber DN. Either the DN is given directly, or it is derived from the OEN and a TEI that is assigned to a bound CPE. Only the communication services assigned to that DN are tested.

The actual test performed is always a PS or CS digital LPBK test. The PS test is used to evaluate PPD, PPB or ODP services. The CS test is used to evaluate CSV or CSD services. If the test type is not specified (that is, AUTO), it is selected based upon the service(s) that can be connected to each DSL channel tested. The scope of testing can be limited to specific services by specifying the associated test type (such as, CS). The scope of testing may be further limited by specifying a specific DSL channel (such as, CH=B1).

Various combinations of DSL services cannot be tested simultaneously; therefore, testing may be performed in two sections. For example, if ODP and CSV service are subscribed to the same DN, a CS B1-channel must undergo CS and PS testing. In this case, the PS test is performed in the first section and the test type is changed to CS for the second section.

The reason for testing specific DSL channel(s) can be derived from output. If a PS test is performed on the D-channel or a B-channel, the subscribed service is respectively, PPD or PPB. If an ODP switched (ODPS) test is performed, ODP service is subscribed. If a CS test is performed, the user typically subscribes to CSV and/or CSD services.

In general, all modes of testing are subject to a two-try retest in the event that specific testing resources are unavailable. For example, subsequent to obtaining control of associated DSL channels, test equipment may be unavailable. Rather than aborting the test request on all channels, testing continues on DSL channels having test equipment. After testing completes on those channels, the channel(s) that experienced a resource problem are tried again. If the test equipment has become available, the test proceeds to completion and test results for all channels are output. This results in extending the elapsed test time up to three times the test duration for the affected test section. If the test duration is greater than one minute, an intermediate status message is output to inform the user that a retest is in progress on the indicated channel(s).

When a retest or a new test section is performed, the test equipment and associated digital path(s) from the previous test are not reserved. That is, for each test section, control of the test equipment is regained and the digital path is reestablished. This can result in unexpected failures, when the test equipment or a digital path component (such as, RTDS1) becomes unavailable. For each CS test section, a different ISTF/GDSF channel or an ISTF/GDSF in a different SM may be used (refer to the RATE parameter). For each ODPS test section, a different PH channel may be used (that is, if the user is served by two PH channels).

Perform requested action unconditionally. This parameter specifies an unconditional action that should be performed as part of the test request. Use of this parameter terminates active customer calls.

Valid value(s):

PRMT

= In general, if any of the DSL channels or resources required for testing are busy, the associated call or maintenance procedure is prematurely terminated. The only exceptions are those procedures that execute with a high priority. In those cases, a
PRMT request fails indicating the "port is still busy". Camp-on does not occur for PRMT requests.

The PRMT request is denied in specific cases. Attempts to test any B-channel are not permitted with the PRMT parameter, as the switch does not arbitrate which of possibly two B-channel procedures to terminate. Prior to testing DSLs supporting a OSPS facility, application processor (AP) or data link (DL), the resident procedure supporting operations must be disabled. This is accomplished by placing the DSL in an OOS state. The PRMT parameter cannot be used to terminate that procedure.

NTM = NT1 or CU "test mode" indications should be ignored ("test mode" indicates the CPE has control of the NT1 or CU LPBKs). Any test results obtained in "test mode" may be corrupt; however, this may be useful when the "test mode" indication is believed to be in error (refer to the EQCU=TESTx parameter in the TST:DSL output message).

4. SYSTEM RESPONSE

PF = Printout follows. If the test request is incomplete or invalid, a single TST:DSL output message is generated indicating the failure.

If the test request is complete, the test procedure attempts to seize control of all DSL resources required for testing. If UCL=PRMT was specified and all required DSL resources cannot be obtained immediately, the output message indicates the "port is still busy". The same output message is generated, when the camp-on period elapses.

After obtaining DSL resource ownership the test procedure outputs a "testing begins" message. The test procedure then attempts to obtain the necessary test equipment and complete the test request.

The number of TST:DSL output messages generated varies in accordance with the number of DSL channels tested and the MODE of testing selected. In general, an output message is generated for each DSL channel tested; however, if the same failure occurs on all channels tested, one output message may be output for all channels. Primarily, the test duration determines the elapsed time between output messages for multi-section tests. A unique request number is given to each test procedure and is given in the resulting output messages. When a TST:DSL request is complete, an end-of-transmission (EOT) flag appears on output.

RL = Retry later. The request has been denied due to unavailable system resources.

TST:E911

Software Release: 5E14 and later  
Command Group: CCS 
Application: 5 
Type: Input 

1. PURPOSE

Requests that an enhanced 911 (E911) test query be sent to the enhanced 911 service adjunct (ESA) to retrieve an emergency service number (ESN).

2. FORMAT

TST:E911=a[,VERBOSE][,{ALT|SITE=b}];

3. EXPLANATION OF MESSAGE

ALT = The alternate ESA (listed in RC/V View 8.1 field “SEC E911 APID”) is queried.  

Note: The ALT and SITE optional parameters can not both be specified on the same input message. The ALT optional parameter will result in a error message if the DUAL ESA feature is not licensed, enabled or if the alternate site has not been specified in the RC/V View.

VERBOSE = The routing information associated with the retrieved ESN is also requested.

a = Ten-digit billing number or calling party number to be queried.

b = The site ID of an alternate ESA to be queried. If this option is not specified (which is the common situation), the site ID is obtained from the GLE911APID or GLE911SEC office parameter. If the dual ESA enhancements feature is not enabled, GLE911APID is used. If the dual ESA enhancements feature is enabled, the current active ESA APID, which may be either GLE911APID or GL911SEC, is used.

Note: The ALT and SITE optional parameters can not both be specified on the same input message.

4. SYSTEM RESPONSE

NG = No good. May also include:

- DUAL ESA FEATURE NOT ALLOWED = The test message can not be sent. Dual ESA is a licensed feature, that must be purchased before it can be used. Please contact your Account Representative for information on purchasing and then authorizing the dual ESA feature.
- DUAL ESA NOT CONFIGURED = The test message can not be sent. The alternate (secondary) ESA site ID must be entered in RC/V View 24.7.
- E911 FEATURE NOT ALLOWED = The test message can not be sent. E911 is a licensed feature, that must be purchased before it can be used. Please contact your Account Representative for information on purchasing and then authorizing the dual ESA feature.
- ESA NOT CONFIGURED = The test message can not be sent. The E911 office option
GLE911OP does not support an ESA.

- FAILED TO SEND QUERY MESSAGE = The attempt to send the query message to the CMP failed.
- INVALID INPUT IN FIELD 'a' = There is either an invalid character in variable 'a', or an incorrect number of digits was input. There must be 10 digits input at 'a'.
- INVALID INPUT IN FIELD 'b' = There is either an invalid character in variable 'b', or the entry is out of the range (1-255).
- SITE ID DOES NOT EXIST = The SITE ID input in variable 'b' does not exist.
- SYSTEM ERROR = An internal system error has occurred.

PF = Printout follows. Followed by a TST:E911 output message.

RL = Retry later. May also include:
- CMP UNAVAILABLE = The test message can not be sent. The communications module processor (CMP) is available.
- OTHER REQUEST IN PROGRESS = An E911 test query or an ESA request is currently in progress.

TST:FAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests a test (connectivity exercise) of the connection of a remote switching module (RSM) facility (FAC).

A FAC can be a host-remote facility between a host switching module (HSM) and an RSM, or a remote facility between two RSMs. The test does not interfere with stable calls, and may be run on an in-service or out of service (OOS) facility. The request is not honored if a carrier group alarm is present on the RDFI or CDFI.

2. FORMAT

TST:FAC=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RSM digital facilities interface (RDFI) or inter-RSM communication link digital facilities interface (CDFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = FAC number. The FAC number is the T1 facility number on a RDFI or CDFI. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
   - NOT STARTED UNIT IN GROWTH STATE
   - SM DOES NOT EXIST
   - SM UNEQUIPPED
   - UNIT DOES NOT EXIST

PF = Printout follows. A TST:FAC output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

1. PURPOSE

Requests that a global recent change (GRC) test update job be run to verify that the correct updates will be applied. If the updates are not desired at this time, then when the GRC test update job is completed, backout the updates using the SCHED:GRC input message. After the backout is completed, then reschedule the GRC update job for its original time and date using the SCHED:GRC input message.

2. FORMAT

[1] TST:GRC,NAME=a[,SECT=b],TN=c[-d];
[2] TST:GRC,NAME=a[,SECT=b],MLHG=e[-f][,MEMB=g[-h]];

3. EXPLANATION OF MESSAGE

a = GRC name (up to 10 characters).
b = GRC section number.
c = First telephone number (TN) in the range of lines to be tested.
d = Last TN in range of lines to be tested.
e = First multi-line hunt group (MLHG) number in range to be tested.
f = Last MLHG in range to be tested.
g = First MLHG member number to be tested.
h = Last MLHG member number to be tested.

4. SYSTEM RESPONSE

NG = No good. The request was denied. A GRC:ERROR output message will provide the reason for the failure.
PF = Printout follows. A GRC:STATUS output message will follow indicating the beginning of the operation.

TST:GRID

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests the fabric exerciser to be run on a line unit grid.

2. FORMAT
TST:GRID=a-b-c[,]UCL[,]RAW[,]AUD[,]PH={d[,]e}[,]TLP;

3. EXPLANATION OF MESSAGE

AUD = Audit the state of the crosspoints. Crosspoints that disagree with the software status will be printed and corrected.

RAW = Report the internal software benchmark number in the event of a failure.

TLP = Report a trouble location procedure (TLP) suspect circuit pack list if there is a failure.

UCL = Execute all tests in the phase(s) requested unconditionally.

a = Switching module (SM) number.

b = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Number of the phase to be run, or the lower limit of a range of phases.

e = Upper limit of a range of phases to be run.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid but the request conflicts with current status.

PF = Printout follows. The request has been received. The TST:GRID output message will follow.

Output Message(s):
TST: GRIDBD

Output Appendix(es):
APP: RANGES
TST:GSMNET

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status of the CCS message transport (CMT) connectivity between a specified global switching module (GSM) and one/all child non-global switching modules (NGSMs). CMT is the ability to transport CCS messages internally within the switch.

2. FORMAT

TST:GSMNET,[GSM=a],[NGSM=b];

3. EXPLANATION OF MESSAGE

<table>
<thead>
<tr>
<th>a</th>
<th>= GSM number. If no SM number is specified and only one CCS GSM exists in the office, that GSM will be defaulted. If multiple GSMs exist, then the GSM must be specified. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>= Specific NGSM (the default is ALL NGSMs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.</td>

</tbody>
</table>

4. SYSTEM RESPONSE

| PF  | = The request has been accepted. Followed by the TST:GSMNET output messages.                                                                                                                             |
| NG  | = No good. May also include:                                                                                                           |
|     | - SM # UNEQUIPPED = This response indicates that the input GSM is not an equipped SM. This error is only valid for the input GSM.                                                                                     |
|     | - NOT A GSM = This response indicates that the input GSM is not provisioned as a HOST or ISLAND GSM.                                                                                                        |
|     | - NO GSM PROVISIONED = This response indicates that no GSM was specified, and there are no GSMs provisioned in the office.                                                                               |
|     | - GSM MUST BE SPECIFIED = This response indicates that no GSM was specified, and there is more than one GSM provisioned in the office.                                                             |
|     | - NO NGSM PROVISIONED = This response indicates that no NGSM is provisioned for the identified GSM, which should be a transient condition during a growth/degrowth sequence. |
|     | - INVALID NGSM = This response indicates that the NGSM specified to restrict output is not served by the input GSM.                                                                                  |
|     | - TST GSMNET IN PROGRESS = This response indicates that another TST:GSMNET request is underway and this request will not be processed.                                                            |

5. REFERENCES

Output Message(s):
TST:ICCV

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an international credit card validation (ICCV) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to a foreign database to verify its operation.

2. FORMAT

TST:ICCV=a-b-c,TTYP=d,OPCD=e[{CLD|ICLD}=f];

3. EXPLANATION OF MESSAGE

a  = Issuer identification number of the telecommunications calling card (89C) number to be queried. This field will be 2-7 digits in length (enter the full card number).

b  = Individual account number of the 89C calling card number to be queried. This includes a check number, if required. This field will be a maximum of 15 digits; however, this field together with the issuer identification number will be 7-19 digits in length.

c  = Personal identification number (PIN). The PIN can be a maximum of 13 digits. If no PIN exists for the card, enter 0.

d  = Translation type. The translation type is used in the TCAP query and indicates to the signaling transfer point (STP) which translation tables should be used to obtain routing information for the query. The translation type is a number from 0 to 255.

e  = Operation code. The operation code specifies which International credit card validation (ICCV) features are active in the switch. Each bit of the 8-bit operation code indicates whether the corresponding ICCV feature is applicable or not in the switch. The bits in order from low to high and their associated features are:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Bit Value</th>
<th>Bit Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic Validation</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>CDM</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>CDBS</td>
<td>4</td>
<td>2</td>
</tr>
<tr>
<td>Call Gapping</td>
<td>8</td>
<td>3</td>
</tr>
<tr>
<td>Geographic Restriction</td>
<td>16</td>
<td>4</td>
</tr>
<tr>
<td>Partial Purchase Limit</td>
<td>32</td>
<td>5</td>
</tr>
<tr>
<td>Full Purchase Limit</td>
<td>64</td>
<td>6</td>
</tr>
<tr>
<td>NOT USED</td>
<td>128</td>
<td>7</td>
</tr>
</tbody>
</table>

The operation code is the sum of the bit values of all applicable ICCV features. For example, if Basic Validation, CDBS, and Geographic Restrictions are applicable, the operation code will have a value of 21, which is the sum of 1, 4, and 16. The valid range is 1-95 because partial purchase limit is not supported. For inward calls, only values 1, 5, 17 and 21 are allowed.

f  = The called number (maximum 15 digits with no prefix). This is either a 10-digit North American numbering plan (NANP) number (that is, NPANXXXXXXX) which will be specified by the tag CLD, a 7- to 15-digit international number will be specified by the tag ICLD (such as, CCXXX...XXX) or 0 indicating no called number. If this entry is omitted, a default value of 0 (no called number) will be used. Note that N11 numbers (such as, 411, 611,911) must be entered as N110000000 in order to distinguish the N11 number from a 3-digit international country code. Note also that
customer-initiated card calls to 411 contain the NPA-555-1212 (with calling number's NPA) as the called number in the query to PTT database. Test queries need NPA-555-1212 explicitly specified if the calling number NPA is known.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- CNI NOT AVAILABLE = The test query cannot be sent to the CAS/NCP data base because the common network interface (CNI) or CCS7 links are not available.
- INVALID CARD NUMBER = The input card number must be at least 7 digits, and at most 19 digits in length. The card number is composed of the issuer identification number and the individual account number (including the check number).
- INVALID FORMAT FOR DOMESTIC NUMBER. PLEASE USE NPANXX..XXX = The format for a domestic number must be NPANXX..XXX.
- INVALID FORMAT FOR INTERNATIONAL NUMBER. PLEASE USE CCXXX..XXX = The format for an international number must be CCXXX..XXX without the prefix 01.
- INVALID ISSUER ID NUMBER = The issuer identification number must be at least 2 digits, and at most 7 digits in length. In addition, the first two digits of the card number must be "89".
- INVALID OPERATION CODE = The operation code must be in the range of 1 to 95.
- INVALID PIN = The PIN must be at most 13 digits in length.
- INVALID TRANSLATION TYPE = The translation type must be a number from 0 to 255.

PF = Printout follows. The request has been received. Output message TST ICCV will follow.

RL = Retry later. Valid value(s):
- INTERNAL ERROR = There was a problem reading the RLDS_APP relation (recent change view 8.17 - direct signaling applications), to obtain a subsystem number.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.

8.17 (DIRECT SIGNALING APPLICATIONS)
TST:INWATS

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an inward wide area telecommunications service (INWATS) direct signaling query be sent to the INWATS database to verify its operation. This input message does not support NS800 calls. For NS800 test queries, use the TST:NS800 message.

2. FORMAT

TST:INWATS=a,ONPA=b;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = INWATS number to be tested. This number must be a string of ten digits which must start with 800, such as 8007654321.

b = Three-digit area code indicating where 800 number is originated.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CNI NOT AVAILABLE = The test message cannot be sent. The common network interface (CNI) is not operational or is in overload. Check CNI status and wait 10 minutes before requesting another test.
- INVALID INPUT FIELD a = There is either an invalid character in field 'a', or an incorrect number of digits. There must be 10 digits input in field 'a'.
- NO REPLY INDEX AVAILABLE = Switch could not send test message because a reply index was not available.
- REPLY RELATION PROBLEM = Switch could not send test message. A reply index was available, but the relation could not be updated.

PF = Printout follows. The request has been received. Followed by the TST:INWATS output message.

RL = Retry later. May also include:
- TEST IN PROGRESS = A common channel signaling (CCS) test is currently in progress.

5. REFERENCES

Input Message(s):

EXC:DSTT

TST:NS800
Output Message(s):

EXC:DSTT
TST:INNATS
TST:NCD
1. PURPOSE

Requests that a line applications for consumers (LAC) Common Channel Signaling System 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the number 2 LAC (2LAC)/network control point (NCP) to verify its operation.

2. FORMAT

TST:LAC={BLG=a|BNS=a|CCRD=a-b},SW=c[,TTYP=d]
[,{CLD|ICLD}=e]
[,{CLG|ICLG}=f]
[,STD=g]
[,XCAP=h]
[,XMODE=i]
[,XRATE=j]
[,OLI=k]
[,OLDB=l]
[,OST=m]
[,CTYP=n]
[,CSI=o]
[,RSP=p]
[,NAI=q]
[,LIDB=r]
[,CICEXP=s]

3. EXPLANATION OF MESSAGE

a = Billing number. For sent-paid queries, use the BLG= keyword with a phone number as the billing number. For billed number screening (BNS) queries, use the BNS= keyword with a phone number. For card queries (CCRD), use the CCRD= keyword with a 10-digit calling card account number.

b = Personal identification number (PIN). This is included for card queries only.

c = Switch type. This input request can emulate queries that would normally originate from several switch types. Valid value(s):

4ESS = 4ESS™ switch.

5ETOLL = 5ESS® toll switch.

OSPS = Operator services position system (OSPS) switch.

d = Translation type. This is a number from 0 to 255 which is used by number 2 signal transfer point (2STP) routing tables to determine the destination of the query.

e = Called number. For international numbers, use the ICLD= label with a 4- to 15-digit international number. For North American numbering plan (NANP) numbers use the CLD= label with a 10-digit phone number.

f = Calling number. For international numbers, use the ICLG= label with a 4- to 15-digit international number. For NANP numbers use the CLG= label with a 10-digit phone number.

g = Coding standard. If no value is entered for coding standard, but a data is entered for one or more of transfer capability, transfer mode, or transfer rate, then ITU-TS will be sent in the query. If no values are supplied for any of these fields, then this field will not be sent in the query. Valid value(s):

CCITT = International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) standard.

INTL = Reserved for other international standards.

NATL = National standard.
h = Transfer capability. If no value is entered for transfer capability, but a data is entered for one or more of coding standard, transfer mode, or transfer rate, then SPEECH will be sent in the query. If no values are supplied for any of these fields, then this field will not be sent in the query. Valid value(s):

- 3K = 3.1 kHz audio.
- 7K = 7 kHz audio.
- 15K = 15 kHz audio.
- DIG = Unrestricted digital information.
- RDIG = Restricted digital information.
- SPEECH = Speech.
- VIDEO = Video.

i = Transfer mode that was input. If no value is entered for transfer mode, but a data is entered for one or more of coding standard, transfer capability, or transfer rate, then CIRCUIT will be sent in the query. If no values are supplied for any of these fields, then this field will not be sent in the query.

- CIRCUIT = Circuit mode.
- PACKET = Packet mode.

j = Transfer rate. If no value is entered for transfer rate, but a data is entered for one or more of coding standard, transfer capability, or transfer mode, then CHSIZE will be sent in the query. If no values are supplied for any of these fields, then this field will not be sent in the query. Valid value(s):

- 64K = 64 Kbit/second.
- 384K = 384 Kbit/second.
- 1500K = 1536 Kbit/second.
- 1900K = 1920 Kbit/second.
- CHSIZE = Transfer rate dictated by the size of the channel.

k = Originating line information (OLI) or automatic number identification (ANI) information digits (II). For OLI data use the OLI= keyword. For II data use the II= keyword. This field is only permitted for CCRD and BNS queries. Valid value(s):

- 800CALL = Translated 800 call.
- AIOD = Automatic input/output dialing (AIOD) listed directory number sent.
- ANIFAIL = ANI failure.
- COIN = Coin line.
- NONCOIN = Identified line (coin or noncoin).
- COINLESS = Coinless, hospital, or inmate call.
- HOTEL = Hotel without room identification.
- IDLINE = Identified line with no special treatment.
- RESTR = Interlata restricted.
- ONI = Operator number identified (multiparty).
- OPER = Operator handled.
- OUTWATS = Outbound wide area transport (OUTWATS) line.
- RCOINLESS = Interlata restricted coinless line.
- RHOTEL = Interlata restricted hotel line.
- TEST = Test call.
- VPN = Virtual private network line.

l = Originating line screening (OLS) information. This is a number from 0 to 999. This field is only
permitted for CCRD and BNS queries.

m = Originating station type (OST). This field is only permitted for CCRD and BNS queries. Valid value(s):
ACQS = Automatic charge quotation system (ACQS) phone.
ACQSHOTL = ACQS hotel phone.
NAHOTL = Non-ACQS hotel phone.
NCNPUB = Non-coin public phone.
CNPST = Post-pay coin phone.
CNPRE = Pre-pay coin phone.
UNKN = Unknown station type.

n = Call type. This field is required for BNS queries, and is not permitted for CCRD or sent-paid queries. Valid value(s):
COLLECT = BNS collect call.
PAID = BNS sent paid call.
THIRD = BNS bill to third number call.

o = Carrier selection information (CSI). If no CSI value is entered, "UNKNOWN" will be used. Valid value(s):
INPUT = Selected carrier presubscribed and input by calling party.
NOIND = Selected carrier presubscribed and no indication of input by calling party.
NOTINPUT = Selected carrier presubscribed and no input by calling party.
NOTPRE = Selected carrier not presubscribed and input by calling party.
UNKNOWN = No indication.

p = 'Response required' indicator. A value of "YES" indicates that the 2LAC/NCP must always return a reply in response to the test query. A value of "NO" indicates that the 2LAC/NCP must only return a reply for deny and error cases. If no value is entered, a default value of "YES" will be used.

q = 'Network access interrupt (NAI)' indicator. A value of "YES" indicates that the 2LAC/NCP should apply NAI processing to the query. A value of "NO" indicates that NAI processing should not be applied. If no value was input, a default value of "YES" will be used. A value of "NO" is only permitted for CCRD and BNS queries.

r = Line information database (LIDB) indicator. A value of YES indicates that the 2LAC/NCP should forward the calling card or BNS information contained within the query to a LIDB for processing. A value of NO indicates that the query should not be forwarded to a LIDB. If no input was given for CCRD or BNS queries, YES will used. For sent-paid queries, this field must be NO.

s = Carrier expansion indicator. The CICEXP keyword indicates that the switch can accept expanded carrier information. This keyword is only permitted with CCRD or BNS queries.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CICEXP NOT ALLOWED = The carrier expansion indicator is only permitted with CCRD OR BNS queries.
- CLD OR ICLD NUMBER REQUIRED = For sent-paid calls, a NANP or international called number is required.
- **CNI NOT AVAILABLE** = The test query cannot be sent to the 2LAC/NCP database because the common network interface (CNI) or CCS7 links are not available.
- **CTYP NOT ALLOWED** = The call type parameter is not allowed with CCRD or sent-paid queries.
- **CTYP REQUIRED WITH BNS** = The call type parameter is required with BNS queries.
- **FEATURE NOT AVAILABLE** = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- **INVALID BILLING NUMBER** = The billing number must be entered with either the BLG, CCRD, or BNS keywords.
- **INVALID BLG NUMBER** = The billing number must be a 10-digit NANP number.
- **INVALID BNS NUMBER** = The billed number screening number must be a 10-digit NANP number.
- **INVALID CLD NUMBER** = The called number must be a 10-digit NANP number.
- **INVALID CLG NUMBER** = The calling number must be a 10-digit NANP number.
- **INVALID CCRD NUMBER** = The calling card number must be a 10-digit number.
- **INVALID ICLD NUMBER** = The international called number must be a 4- to 15-digit international number.
- **INVALID ICLG NUMBER** = The international calling number must be a 4- to 15-digit international number.
- **INVALID PIN** = The calling card PIN must be a 4-digit number.
- **INVALID TRANSLATION TYPE** = The translation type must be a number between 0 and 255.
- **LIDB MUST BE NO** = The 'LIDB requested' indicator cannot be "YES" for sent-paid queries. Either enter LIDB=NO, or omit the parameter entirely and use the default.
- **NAI MAY BE NO ONLY WITH CCRD OR BNS** = The 'NAI indicator' must be "YES" for sent-paid queries.
- **OLS OUT OF RANGE** = The OLS must be a number within the range of 0 to 999 (inclusive).
- **OLS NOT ALLOWED** = The OLS parameter is not allowed with sent-paid queries.
- **OST ONLY ALLOWED WITH CCRD OR BNS** = The originating station type parameter is not allowed with sent-paid queries.

**PF**
= Printout follows. The request has been received. Followed by the TST:LAC output message.

**RL**
= Retry later. May also include:
- **INTERNAL ERROR** = There was a problem reading the RLDS_APP relation (Recent Change View 8.17), to obtain the subsystem number.
- **TEST IN PROGRESS** = Another common channel signaling (CCS) test is in progress.

RC/V View(s):

8.17 (DIRECT SIGNALING APPLICATIONS)
1. PURPOSE

Requests that a specified path be exercised through the line unit path exerciser (LUPEX). The path consists of a line equipment number (LEN), A-link, B-link, and a high level service circuit (HLSC). LUPEX exercises line unit (LU) types LU1, LU2 and LU3.

LUPEX will only run on a path where the A-link and B-link are both in service and idle, or both out of service. LUPEX will only run on lines in the pre-cutover state if the line is marked as a test line. LUPEX will not run on busy lines or lines that are marked in the office-dependent data (ODD) as incompatible equipment, private branch exchange (PBX), or SLC® PBX.

WARNING: While LUPEX is running, the customer whose LEN is seized will be denied service. None of the equipment specified by the input message will be available during the testing. This message should not be executed using HLSCs known to fail diagnostics as it could cause erroneous results. Also, the execution of this input message using the RAW and UCL options with the maximum RPT value may generate in excess of 1000 receive-only printer messages if many failures occur. This may delay more critical output messages.

2. FORMAT

TST:LEN=a-b-c-d-e-f,ALINK=g,BLINK=h-i,HLSC=j-k[,RPT [=l]][,PH=m[&n]][,RAW][,UCL];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

RAW = Produce an output message for every phase failure.
RPT = Repeat.
UCL = Execute all requested phases unconditionally without terminating on the first error before continuing with the next repeat iteration.

a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Grid board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

\( e \) = Grid board switch number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\( f \) = Grid board switch level number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\( g \) = Grid board A-link number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\( h \) = B-link service group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\( i \) = Grid board B-link number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

Note: A B-link is equivalent to a channel.

\( j \) = HLSC service group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\( k \) = HLSC number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

\( l \) = Number of times the exercise is to be repeated (1-100, default is 1).

\( m \) = Phase number or lower limit for range of phase numbers (1-100, default is 1 through 9). Phases will be executed sequentially.

Note: When a phase range starting above phase 3 is requested, phases 1, 2, and 3 will also run as low-level tests. They will not, however, be reported. Also, phases 94 through 99 establish and hold the path for up to 15 minutes maximum and can not use the repeat option.

<table>

Other Manual(s):
235-105-220 Corrective Maintenance
**TST:LINE-ELS**

**Software Release:** 5E14 and later  
**Command Group:** TRKLN  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests electronic loop segregation (ELS) to be run on the specified line or hardware group of lines.

Due to the introduction of Local Number Portability - NPA/NXX feature 5ESS® office will support unique and non-unique office codes (NXX). Multiple NPAs can have same office codes. If the office code is non-unique, then the user has to specify 10 digit DNs including Area Code to correctly specify a DN. But if the office code is unique, then 7 digits are sufficient to correctly represent a DN.

The four formats all run the same tests. Format 1 specifies that the test be run on one line identified by the directory number (DN). Format 2 specifies that the test be run on one member of a multi-line hunt group (MLHG). Format 3 specifies that the test be run on a line or group of lines in a line unit model 1, 2, or 3. Format 4 specifies that the test be run on a line or group of lines in an integrated services line unit (ISLU) or a remote ISLU (RISLU). Format 5 specifies that the test be run on a line or group of lines in an integrated services line unit model 2 (ISLU2) or a remote ISLU2 (RISLU). Format 6 specifies that the test be run on a line or group of lines in an access interface unit (AIU).

2. **FORMAT**

   1. TST:LINE,ELS,DN=a[-n];  
   2. TST:LINE,ELS,MLHG=b-c;  
   3. TST:LINE,ELS,LEN=d-e-f-g[-h][-i]];  
   4. TST:LINE,ELS,LCEN=d-k-l-m;  
   5. TST:LINE,ELS,LCKEN=d-o-l-p[-q];  
   6. TST:LINE,ELS,AIUEN=d-r-s-t;

3. **EXPLANATION OF MESSAGE**

   **DN**  
   = Directory number.

   **LCEN**  
   = Integrated services (line unit) equipment number.

   **LCKEN**  
   = Line circuit equipment number.

   **LEN**  
   = Line equipment number.

   **MLHG**  
   = Multi-line hunt group and member identifier. Multi-line hunt group and member numbers of lines which reside on integrated SLC® remote terminals should not be used.

   **AIUEN**  
   = Access interface unit equipment number.

   **a**  
   = Directory number of the line to be tested. Include NPA for non-unique office code DNs, and NPA not required for unique office code DNs. Directory numbers of lines which reside on integrated SLC® remote terminals should not be used.
b = Hunt group number.
c = Member number.
d = Switching module (SM) number.
e = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Grid pack number (LU1, LU2, LU3). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
  ALL = If ALL is specified for variable 'g', all 64 lines in the grid will be tested and variables 'h' and 'i' should be omitted.
h = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
  ALL = If ALL is specified for variable 'h', all 32 lines on the grid board will be tested and variable 'i' should be omitted.
i = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
  ALL = If ALL is specified for variable 'i', the four lines on the specified switch will be tested.
k = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
  ALL = If ALL is specified for variable 'm', all 31 lines in the line group will be tested.
n = Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified should be the main DN for the group and the member number specifies which member of the group will be tested. For LTSB a member number of 1 will test the lead line and a member number of 2 will test the associate line. If no member number is specified, for 1-DN LTSB, the lead line will be tested. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be tested.
o = Integrated services line unit-2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  ALL = If ALL is specified for variable 'p', all lines on the line group will be tested and variable 'q' should be omitted.
q  = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
    ALL       = If ALL is specified for variable 'q', all lines on the line board will be tested.

r  = Access interface unit equipment number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s  = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t  = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Valid value(s):
    ALL       = If ALL is specified for variable 't', all lines in the pack will be tested.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied. The message form is valid but the request conflicts with current status.

PF  = Printout follows. The request has been received. Output message TST:LINE-ELS will follow.

5. REFERENCES

Input Message(s):

    STP:TST-ELS

Output Message(s):

    TST:LINE-ELS
TST:LNP

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that an Operator Services Position System (OSPS) local number portability (LNP) common channel signaling system 7 (CCS7) transaction capabilities application part (TCAP) test query be sent to the LNP/network control point (NCP) data base to verify its operation.

2. FORMAT

TST:LNP, TTYP=d[, BLG=a][, CLD=b][, CLG=c];

3. EXPLANATION OF MESSAGE

The test query should contain any combination of BLG and/or CLD and/or CLG number(s) as long as at least one of the three numbers is specified.

- a = Billing number. This is a 10-digit North American numbering plan (NANP) number.
- b = Called number. This is a 10-digit North American numbering plan (NANP) number.
- c = Calling number. This is a 10-digit North American numbering plan (NANP) number.
- d = Translation type. The translation type is used in the TCAP query to indicate to the signaling transfer point (STP) which translation tables should be used to obtain routing information for the query. The translation type is a number from 0 to 255.

4. SYSTEM RESPONSE

NG = No good. May also include:
- CNI NOT AVAILABLE = The test query cannot be sent to the LNP/NCP database because the common network interface (CNI) or CCS7 links are not available.
- FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- INVALID BILLING NUMBER (10 DIGITS ONLY) = The billing number must be a 10-digit NANP number.
- INVALID CALLED NUMBER (10 DIGITS ONLY) = The called number must be a 10-digit NANP number.
- INVALID CALLING NUMBER (10 DIGITS ONLY) = The calling number must be a 10-digit NANP number.
- INVALID TRANSLATION TYPE = The translation type must be a number from 0 to 255.
- NO NUMBER IN QUERY = At least one 10 digit NANP number must be specified in the test query.

PF = Printout follows. The request has been received. Output message TST:LNP will follow.

RL = Retry later. May also include:
- INTERNAL ERROR = There was a problem reading the RLDS_APP relation (Recent
Change/Verify View 8.17), to obtain the subsystem number.

- **TEST IN PROGRESS** = Another common channel signaling (CCS) test is in progress.

8.17 (DIRECT SIGNALING APPLICATIONS)
TST:MAPTQ-A

Software Release: 5E16(2) only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that a global system for mobile communications (GSM) mobile application part (MAP) test query message be sent to the home location register (HLR).

2. FORMAT

TST:MAPTQ,MSISDN=a,GSM=b[,NBRPLN=c][,NFORWD=d]...
...[,INTTYPE=e][,FORWDREASON=f][,GLOBTITLE=g]...
...[,TRANTYPE=h];

3. EXPLANATION OF MESSAGE

a = Mobile station international ISDN (MSISDN) number consisting of 10-11 digits. Each digit is in the range of 0-9.

b = Global switching module number (range of 1-192).

c = MSISDN numbering plan. Valid value(s):

E164 = ISDN/telephony numbering plan [International Telecommunication Union - Telecommunication Standardization Sector (ITU-TS) (formerly CCITT) Recommendation E.164].

E212 = Land mobile numbering plan [ITU-TS (formerly CCITT) Recommendation E.212].

F69 = Telex numbering plan [ITU-TS (formerly CCITT) Recommendation F.69].

NATIONAL = National numbering plan.

PRIVATE = Private numbering plan.

UNKNOWN = Unknown.

X121 = Data numbering plan [ITU-TS (formerly CCITT) Recommendation X.121].

d = Number of forwardings (range of 1-5).

e = Interrogation type. Valid value(s):

BASICCALL = Basic call.

FORWARDING = Forwarded call.

f = Forwarding reason. Valid value(s):

BUSY = The mobile subscriber is busy.

NOREPLY = There is no reply from the mobile subscriber.

NOTREACHABLE = The mobile subscriber is not reachable.

g = Global title consisting of 10-11 digits. Each digit is in the range of 0-9.

h = Translation type (range of 0-255).
4. SYSTEM RESPONSE

NG = No good. May also include:
- CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
- FAILED TO READ RLDS_APP = Failed to read the relation RLDS_APP using the GSM MAP application as the key. Refer to RC/V View 8.17 (DIRECT SIGNALLING APPLICATION).
- FAILED TO READ RLGTS_ADDR = Failed to read the RLGTS_ADDR relation.
- GLOBAL SM IS INVALID = The entered global switching module is either invalid or is not provisioned in the office.
- GSM MAP NOT AVAILABLE = The GSM MAP functionality has not been provisioned. Refer to RC/V Views 8.15 (CCS OFFICE PARAMETERS), 8.17, and 8.42 (CCS TCAP APPLICATION).
- INVALID DATA IN RLGTS_ADDR = There is invalid data in the rlGTS_ADDR tuple. Refer to RC/V View 8.15.
- INVALID GLOBTITLE DIGITS = There is an unrecognized digit in the global title. The valid range of a digit is 0-9.
- INVALID GLOBTITLE NUMBER OF DIGITS = The number of digits in the GLOBTITLE parameter is out of range. Enter 10-11 digits.
- INVALID MSISDN DIGITS = There is an unrecognized digit in the MSISDN parameter. The valid range of a digit is 0-9.
- INVALID MSISDN NUMBER OF DIGITS = The number of digits in the MSISDN parameter is out of range. Enter 10-11 digits.
- NO GLOBAL SM IN OFFICE = There is no global switching module in this office.

NO = The request is not allowed. May also include:
- FEATURE NOT AVAILABLE = The feature associated with the requested functionality must be purchased before attempting to send the particular test query. All GSM MAP test queries require that the GSM MAP feature must be purchased.

OK = Good. The request was accepted.

PF = Printout follows. Followed by a TST:MAPTQ or TST:MAPTQ-FAIL output message.

RL = Retry later. May also include:
- FAILED TO SEND GSM MAP MESSAGE = The GSM MAP test query message could not be sent to the HLR.
- INTERNAL ERROR = Encoding of the GSM MAP test query failed.
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.
- TEST IN PROGRESS = Another GSM MAP test query is currently in progress. Wait for that test query transaction to complete before requesting another test.

RC/V View(s):
8.15 CCS OFFICE PARAMETERS
8.17 DIRECT SIGNALLING APPLICATION
8.42 CCS TCAP APPLICATION
TST:MP

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a test of a modem pool (MP).

Format 1 tests one or two modem pool members (MPMs). Format 2 tests an entire modem pool group (MPG) by specifying the multi-line hunt group number of the MPG or a range of MPMs within an MPG. Format 3 tests an entire MPG by specifying the modem pool access directory number (DN) of the MPG (that is, a DN that an analog user would dial to reach an X.25 terminating packet-service through the modem pool).

2. FORMAT

[1] TST:MP, MPM=a-b[,MPMB=a-f][,TYPE=d];

[2] TST:MP, MPG=a[-b&c][,TYPE=d];

[3] TST:MP, DN=e[,TYPE=d];

3. EXPLANATION OF MESSAGE

An MPG is a multi-line hunt group (MLHG). An MLHG is identified by both its group number and MLHG listed DN. An MPM is identified by the group number and member number. A modem pool test is run between two MPMs at a time. If the input message specifies a single MPM to be tested, the switch will select another MPM from the same MPG to test the first one against, and the selected member will be idle in-service-manual or in-service-auto (IS MAN/IS AUTO). If there is a member that is in-service-forced (IS FRCD), then that member will not be selected for this type of testing.

Note: To isolate a problem there must be three in-service (IS) idle modem pool members in the group. However, if the test is run with two idle members TST:MP will attempt to find a third idle IS member. If a third idle member is not found the user will be informed that no idle members were found to test.

If two MPMs are specified on the message line in Format 1, they must be members of the same MPG.

If the DN (Format 3) or just the MLHG number (Format 2) of the MPG is given, then all members of the group will be tested. In this case, the switch will select pairs of in-service and idle MPMs, run the test between those two, and report any failures.

If the input message specifies a range of MPMs (Format 2) to be tested, the test is performed on all the valid idle members in the range. If holes in the range exist, then the test would skip to the next available member in the range. If the specified upper boundary in the range is greater than the highest member number, tests would be performed on all valid idle members in the group greater than the lower boundary.

An out-of-service (OOS) MPM can be tested only if the analog side of that MPM is OOS MTCE DSBLD MAN before the test is run. While the MPM is being tested, the status will be IS FRCD UTEST AUTO. The status will be returned to OOS MTCE DSBLD MAN after the test is completed. Only Format 1 will allow the testing of an OOS MPM.

a = MLHG number of the MPG to be tested.

b = Member number of the MPM to be tested or lower limit of range of MPMs to be tested.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied.

PF  = Printout follows. The request has been accepted and the test will be run. Followed by the TST:MP output message.

RL  = Retry later. The request cannot be run now because of system load.

1. PURPOSE

Requests testing of the integrity of the common channel signaling (CCS) network and data consistency between the service control point (SCP) and the switch.

2. FORMAT

TST:NS800=a,ANI=b,LATA=c[,OST=d][,CICEI=e][,OPC=f];

3. EXPLANATION OF MESSAGE

a = Number to be tested. This number must be a string of ten digits.

b = Ten-digit automatic number identification (ANI) of the calling party which must have the format NPANXXXXXX.

c = Three digit absolute local access transport area (LATA) number (100-999).

d = Originating station type. Valid value(s):
   AIOD = Auto identified outward dialing - listed directory number (DN) sent.
   ANIF = Automatic number identification (ANI) failure.
   CNLES = Coinless, hospital, inmate, and so forth.
   COIN = Coin call.
   HOTEL = Hotel without room identification.
   ILCNL = InterLATA restricted- coinless line, and so forth.
   ILHT = InterLATA restricted- hotel line.
   ILRST = InterLATA restricted.
   LINE = Identified line- no special treatment.
   NLINE = Identified line, (coin or noncoin).
   ONI = Operator number identification (multiparty).
   TEST = Test call.

e = CIC expansion indicator (Y or N). Indicates whether the CIC expansion parameter should be sent in the test query. If not specified the default value is taken from the Gltcapi office parameter.

f = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual. Note: this option is mandatory in a multi-platform office.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
   - CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
   - CNI NOT AVAILABLE = The test message cannot be sent. The common network interface (CNI) is not operational or is overloaded. Check CNI status and wait at least 10
minutes before requesting another test.
- FAILED TO SENT TCAP MESSAGE = Unable to format query and sent message out to the network.
- GSM/PROTOCOL MISMATCH = The GSM and the protocol do not match, missing or incorrect data.
- INVALID INPUT IN FIELD = There is either an invalid character in variable 'a', 'b', 'c' or an incorrect number of digits. There must be digits input in variable 'a', 'b', 'c'.
- MUST ENTER OPC = The origination point code must be specified as part of the input message because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
- NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
- NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
- OPC IS INVALID = The entered digits are either invalid, the number of digits entered is incorrect, or the point code was not provisioned in the office.
- OPC IS NOT AVAILABLE = Could not get the point code. There was missing or incorrect data.

PF = Printout follows. The request has been received. Followed by the TST:NS800 output message.
RL = Retry later. Valid value(s):
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.
- TEST IN PROGRESS = A common channel signaling (CCS) test is currently in progress.

a = Number to be tested. This number must be a string of ten digits.

b = Ten-digit automatic number identification (ANI) of the calling party which must have the format NPANXXXXXX.

c = Three digit absolute local access transport area (LATA) number (100-999).

d = Originating station type. Valid value(s):
   - AIOD = Auto identified outward dialing - listed directory number (DN) sent.
   - ANIF = Automatic number identification (ANI) failure.
   - CNLES = Coinless, hospital, inmate, and so forth.
   - COIN = Coin call.
   - HOTEL = Hotel without room identification.
   - ILCNL = InterLATA restricted- coinless line, and so forth.
   - ILHT = InterLATA restricted- hotel line.
   - ILRST = InterLATA restricted.
   - LINE = Identified line- no special treatment.
   - NLINE = Identified line, (coin or noncoin).
   - ONI = Operator number identification (multiparty).
   - TEST = Test call.

e = CIC expansion indicator (Y or N). Indicates whether the CIC expansion parameter should be sent in the test query. If not specified the default value is taken from the Gltcapi office parameter.

f = Origination point code consisting of a nine digit character string. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual. Note: this option is mandatory in a multi-platform office.

= Signaling Platform. Valid value(s):
   - 0 = Common Network Interface (CNI) Platform
   - 1 - 192 = Global Switching Module (GSM) Number

Note: this option is mandatory in a multi-platform office.
4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- CCS MESSAGE TRANSPORT PATH UNAVAILABLE = SS7 PSU signaling links are not available.
- CNI NOT AVAILABLE = The test message cannot be sent. The common network interface (CNI) is not operational or is overloaded. Check CNI status and wait at least 10 minutes before requesting another test.
- FAILED TO SENT TCAP MESSAGE = Unable to format query and sent message out to the network.
- GSM/PROTOCOL MISMATCH = The GSM and the protocol do not match, missing or incorrect data.
- INVALID INPUT IN FIELD = There is either an invalid character in variable 'a', 'b', 'c' or an incorrect number of digits. There must be digits input in variable 'a', 'b', 'c'.
- MUST ENTER OPC = The origination point code must be specified as part of the input message because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
- MUST ENTER PLATFORM = The signaling platform must be specified as part of the input message because either there are multiple global switch modules (GSM) in the office or the office is equipped with both common network interface (CNI) and packet switch unit (PSU) platforms.
- NO GLOBAL SM IN OFFICE = The office is not equipped with any GSMs.
- NO SS7 IN OFFICE = The office is not equipped with signaling system 7 (SS7) platform.
- OPC IS INVALID = The entered digits are either invalid, the number of digits entered is incorrect, or the point code was not provisioned in the office.
- OPC IS NOT AVAILABLE = Could not get the point code. There was missing or incorrect data.
- OPC NOT ON PLATFORM = Could not find the point code on the platform entered.
- PLATFORM IS INVALID = The entered signaling platform is either invalid or the platform entered is not provisioned in the office.

PF = Printout follows. The request has been received. Followed by the TST:NS800 output message.

RL = Retry later. Valid value(s):
- OVERLOAD CONDITION IN CCS MESSAGE TRANSPORT PATH = SS7 PSU signaling links are congested.
- TEST IN PROGRESS = A common channel signaling (CCS) test is currently in progress.

Output Message(s):

TST:NS800

Other Manual(s):
235-200-115  CNI Common Channel Signaling
235-200-116  Signaling Gateway Common Channel Signaling
TST:OLNS

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that a originating line number screening (OLNS) query be sent to the line information database (LIDB) to verify its operation.

2. FORMAT

TST:OLNS=a

3. EXPLANATION OF MESSAGE

a = 10-digit calling number to be queried in the form NPANXXXXXX.

4. SYSTEM RESPONSE

NG = No good. Includes one of the following:
- REASON FOR NG = Explanation of reason.
- INVALID CLG NUMBER = The calling number is invalid. The NANP calling number must be a 10-digit number.
- CNI NOT AVAILABLE = The query test cannot be sent to the LIDB database because the common network interface (CNI) is not available.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.
- INTERNAL ERROR = There is an internal error with the LIDB query format.

PF = Printout follows. The request has been received. The output message TST:OLNS follows.

RL = Retry later. Includes one of the following:
- CNI/DLN PROBLEM = The test message cannot be sent - CNI is in overload or no active direct link node (DLN) is available.
- TEST IN PROGRESS = Another common channel signaling (CCS) test is in progress.
- TOO MANY QUERIES RUNNING = No OLNS query IDs are available.

Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the Hotel Billing Information System (HOBIS) or hotel billing information center (HOBIC) printer be tested by printing a text string (THE QUICK BROWN FOX JUMPED OVER THE LAZY DOGS.$#: /-'0123456789,"). The message accepts as input either the external Operator Services Position System (OSPS) equipment ID or the internal integrated services line unit (ISLU) line card ID.

This input message can also be used to test an autoquote establishment modem and printer by sending a text string (same as above), or by sending a series of "ENQ" characters, or by raising the carrier at the autoquote digital subscriber line (DSL) modem.

2. FORMAT

TST:OSPS,\{HOBIS=a-b|HOBICR=c-d|HOBICV=c-e|LCEN=f-g-h-i
|AQEST=j[,AQ=k-l],m\};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Hotel Billing Information System (HOBIS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Relative digital subscriber line (DSL) number assigned to a HOBIS data link DSL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Hotel billing information center (HOBIC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Relative DSL number assigned to a HOBICR (HOBIC record TTY) data link DSL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative DSL number assigned to a HOBICV (HOBIC voice-quote TTY) data link DSL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Line card ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Directory (telephone) number of AQEST.
k = AQ group ID (1).

l = AQ relative DSL number (0-15).

m = Test type for AQEST. Valid value(s):
   CARRIER = Raise the carrier from local modem (connected at the Autoquote DSL) for 90 seconds on the hotel-leased line.
   ENQACK = Send a series of ENQ characters to AQEST for 5 seconds at 500-millisecond intervals.
   PRINT = Print the text string on AQEST printer.

4. SYSTEM RESPONSE

   IP = In progress. A message to the HOBIS/HOBIC service process has been sent.

   NG = No good. May also include:
       - LCEN UNKN = The given HOBIS/HOBIC LCEN is invalid.

   RL = Retry later. The request has been denied, probably due to system load.

TST:PATH-A

Software Release: 5E15 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Format 1 is for requesting the automatic digital 64Kbps pseudo random bit error rate (BER) loopback test call on inter-working gateway (IWG) paths. The users enter the external identifiers required to adequately identify the SM and IWG minimumly to be used for testing. The path equipment number (PEN) are optional identifiers for requesting specific test path. In addition, the user must specify the IWG as the loopback (LPBK) termination point.

Format 2 is for requesting end to end test calls (also referred to as the 108 or BICC test call) of ATM packet network switched virtual connections (SVC) connections. The users are required to specify the BICC identifier and out pulse digits (OPDN). The LPBK termination is default to test line (TL) for BICC test call.

This test requires the use of a integrated services test function (ISTF) or global digital services function (GDSF) as the digital test source. One test equipment transmit/receive channel (maximum of 3 per ISTF and 16 per GDSF) must be allocated for each path to be tested. The data rate of the digital bit stream may be specified using the RATE parameter.

The test activates the specified (or default) LPBK termination, establishes a digital path between the test equipment channel and the associated IWG and SVC path, and transmits a pseudo random bit stream to be returned at the location of LPBK termination. The incoming bit stream (returning from the LPBK) is checked by the test equipment to derive the bit error rate (BER) and the errored blocks (ERBLK) for output. The success or failure of testing is based on the acceptable bit error rate (ABER), which is default to 6 - the failing BER of 1 or more bits in error, for every 1,000,000 bits transmitted.

Any TST:PATH request may be stopped using the STP:TST-PATH input message.

2. FORMAT

[1] TST:PATH:IWG=a-b[,PEN=c[-d[-e]]][,TERM=f][,TYPE=g]. . .[,DUR=h][,RATE=i][,RPT=j][,BLKSZ=k][,ROP];

[2] TST:PATH:{BG=n|BGMN=n-o},OPDN=m. . .[,IWG=a-b[,PEN=c[-d[-e]]][,OC3=p][,TYPE=g][,DUR=h]. . .[,RATE=i][,RPT=j][,BLKSZ=k][,ROP];

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ROP = The ROP parameter frees the invoking terminal (such as, TLWS, MCC) for subsequent work while test results are logged only on the ROP device. This is useful when performing long duration tests in modes that produce multiple output messages.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Inter-working gateway (IWG) unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Relative link number (0-4).

Each relative link (rlink) is a coaxial cable connected to a synchronous transport signal number 1 (STS-1e) card in the IWG. Each rlink is equivalent to a host facility on the IWG (also equivalent to IWGFAC#-1).

d = Relative tributary number (0-27).

Each rlink has 28 relative tributary numbers (rtrib). The rtrib is a logical entity on the rlink, which is equivalent to a DS1 in the DNUS. Each rtrib is a physical device chip inside of IWG which capable of handling 24 channels.

e = Digital signal 0 (DS0) value (0-23).

DS0 is logical channels inside the rtrib. The total logical DS0 channels (total rtrib * total DS0) on a rlink is equivalent to the total time slots (TS) on 5E.

f = Termination.

For digital LPBK testing, the termination is the point at which the test data is returned to the test equipment for evaluation. A LPBK termination may be provided using the built in capabilities of transmission equipment.

For Format 1 Only:

IWG = Inter-working gateway. The termination loopback is provided within the IWG connected to the SM.

DEFAULT: IWG

For Format 2 Only:

TL = Test Line. The termination loopback is provided at the test line on the terminating switch.

DEFAULT: TL

g = The type of test to be executed. Valid value(s):

BER = Non-inverted loopback. All bits are returned in the same order as sent.
BERINV = Inverted loopback. All bits are returned as a mirror image of the order sent.

For Format 1 : only BER is allowed. DEFAULT: BER

h = Duration (DUR) of test (1-3600, default 20).

The duration is the length of time (in seconds) that the test source sends test data. In general, the test duration does not include the setup time, or idling time associated with any test request. The elapsed time taken for the test request to complete can be significantly greater than the actual test duration.

i = Data rate.
This is rate of the digital bit stream to be sourced by the ISTF|GDSF during LPBK testing. Valid value(s):

- **64CLR** = 64000 bits/sec clear channel (that is, zero-octet allowed). Default.
- **64RES** = 64000 bits/sec restricted (that is, zero-octet suppressed).
- **56KPS** = 56000 bits/sec.

\[ j \] = Number of times to repeat the test (default 1).

The current valid repeat test is once. The repeat capability will be implemented in later generic.

\[ k \] = Block-size (BLKSZ) (1-64000).

For LPBK testing, the digital-bit-stream is partitioned into segments called blocks, specified using the BLKSZ parameter. The BLKSZ is the number of bits in each block. The BLKSZ is used by the ISTF|GDSF to calculate the total ERBLK for output. The ERBLK result characterizes the accumulation of bit-errors. Varying the BLKSZ allows the distribution of errors over time to be better understood.

For Format 1 Only: If BLKSZ is not specified, the default is chosen based on the data rate used.

Valid value(s):

- **56000** = For RATE=56KPS.
- **64000** = For RATE=64RES or RATE=64CLR.

For Format 2 Only: LPBK testing across ATM network, the BLKSZ is the block of multiple ATM cells.

If BLKSZ is not specified, the default is 384 (48 bytes per ATM cell * 8 cells per block).

\[ m \] = Digits to be outpulsed for the specified test.

\[ n \] = BICC group number (7000-7999).

\[ o \] = BICC group member, normalized CIC (0-65535).

\[ p \] = Optical carrier 3 (OC3) link (0-1).

### 4. SYSTEM RESPONSE

\[ PF \] = Printout follows. A unique request number is given to each test path requested and is output as "PF - REQNO=x".

If the test request is incomplete or invalid, a single TST:PATH output message is generated indicating the failure.

If the test request is completed, the test procedure attempts to seize control of all resources required for testing.

The number of TST:PATH output messages generated varies in accordance with the number of tests. In general, an output message is generated for each path tested; however, if the same failure occurs on all path tested, one output message may be output for all path. Primarily, the test duration determines the elapsed time between output messages for multi-section tests. When a TST:PATH
request is complete, an end-of-transmission (EOT) flag appears on output.

RL = Retry later. The request has been denied due to unavailable system resources.

Input Message(s):

STP: TST–PATH
OP: BICC
OP: JOBSTATUS

Output Message(s):

TST: PATH
OP: BICC
OP: JOBSTATUS

Input Appendix(es):

APP: RANGES
1. PURPOSE

The TST:PATH input message is used by office personnel to perform test calls on voice, data, or control paths involving system components. TST:PATH test calls are not associated with a specific trunk or line. There are multiple formats of the TST:PATH input messages that can be performed on an optical interface unit (OIU) serving both ATM and IP connections, as well as PSU PH’s. These input messages provide functionality for supporting both loopback and end-to-end type testing. Any TST:PATH request may be stopped using the STP:TST-PATH input message.

Format 1 is for requesting the ATM packet pipe trunk test. In this format, the trunk can be identified by trunk group number and trunk member number or by SM number, packet switch unit (PSU) number, ATM link number and virtual connection identifier (VCID) number. Also, this command provides two mechanisms to run repeating test on ATM packet pipe trunk. One is "RPT", another is the parameter of "DUR".

This test is created for PHA2 which allows ATM permanent virtual circuits (PVCs) to be terminated on digital cellular switch (DCS) to transport cell site to PSU bearer traffic over ATM. Those ATMPPs are represented as trunk group and trunk members similar to frame relay protocol handler (FRPH) PPs.

This test provides an ability to detect the configuration for both the cell site and DCS. For the duplex channel mode, the STBY channel will be marked with a "*".

This test can be run on both the IS ATMPP trunk and OOS ATMPP trunks. (Note: When ATMPP trunk is in OOS state, only "OOS-MTCE-DSBLD and OOS-CADN-DSBLD" are allowed to run test). When execute an ATM loop back test while ATMPP trunk is OOS, this test is used to allow verification of PVC provisioning in the ATM network prior to making the ATMPP trunk operational.

Format 2 is for requesting the ATM OA&M loop back test on signaling ATM adaptation layer-high speed link (SAAL HSL). The SAAL HSL is also known as PSU PIPE, and appears on RC/V View 22.25 (PACKET SWITCH UNIT PIPE). It carries the ATM traffic containing SS7 signaling for all the ISUP/BICC trunks in the whole office. The SAAL HSL connects two CCS nodes, and can be identified by PSU equipment number (PSUEN).

This test provides a mechanism to detect the availability of the ATM layer functions of HSL. The user can initiate a test from one CCS node, for example, 5ESS. This CCS node sends out OA&M cell to the far end CCS node and gets loop back cell back, the result will be looked as successful completion.

This test can only be run on IS SAAL-HSL, and access is denied when the user attempts to run the OA&M loop-back on the OOS SAAL HSL.

The DELAY test call be used to identify the round-trip transmission delay associated with an OIU-IP bearer path connection to a far-end office, as well as to measure some basic transmission characteristics of the looped back path.

Format 3 is used for requesting the DELAY loop-back test call for OIU-IP test paths. For loop-back related test there is no signaling required outside of the office. The TST:PATH input message to supports the addition of OIUPG and PCTTS input parameters.

This test will exercise the majority of the OIU-IP hardware functionality, including (outgoing) the conversion of a TDM channel into IP packets and (incoming) the conversion of IP packets into a TDM channel. The final step of inserting outgoing packets onto the outgoing OC3C link is skipped for the OIU-IP loop-back test call, and instead of leaving
the OIP-IP test path, these packets are instead processed as if they had just been received over the incoming OC3C link packet stream.

Format 4 is used for requesting a DELAY test calls over an OIU-IP bearer network path to a far end office. For end to end loop testing a test signal is supported to the far-end office much like standard OIU-IP calls (for example, BICC, and so forth).

Format 5 is used for requesting an outgoing test call over an OIU-IP bearer network using the 105 voice quality test type. The MEAS options allows office personnel to enter the specific 105 measurement to run. If only a packet group (PKTG) is specified, the system will select the appropriate call resources associated with that group. Selecting the PKTGMN keyword gives office personnel the ability to select a specific call identification code (CIC) within the packet group for BICC signaling.

Format 6 will run a SCTP heartbeat (SCTPHB) test to evaluate the SCTP association path.

This test validates the integrity of SCTP association path. The user can request to test one specific association or the whole association set (by input ASSOCSET or PTKTG). The input message also provides testing of an active path (default), a specific path (DIP) or all paths (ALL) of the associations(s). This test path does not need a bearer path through the packet network. The serving SIP-T PH performs the role of the test equipment and interfaces with the SCTP layer manager to execute the requested test.

  . . .[,DIP=y|ALL][,RPT=z][,ROP];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ATMENH = ATMPP enhanced loop-back test. Used to request the exact configuration of cell sites corresponding to the DCS side, which are represented as trunk group and trunk member.
ATMLBK = Standard ATMPP loopback request.

ROP = The ROP parameter frees the invoking terminal (such as, TLWS, MCC) for subsequent work while test results are logged only on the ROP device. This is useful when performing long duration tests in modes that produce multiple output messages.

a = Switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switch unit (PSU). Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c = ATM link unit number (1-10).

d = VCID number (0-1023) or ALL. When ALL is specified, then all of the VCIDs on the link will be tested.

e = Trunk group (TG) number.

f = Trunk group member (TKGMN) number or lower limit of range of trunk group member numbers.

g = Upper limit of range of trunk group member numbers.

h = The duration or length of time the test source sends test data. The range of the duration is 6-3600, default value is 5. The test duration does not include the setup or idling time associated with the test. The elapsed time for the test request to complete can be significantly greater than the actual test duration.

i = Camp-on (CAMP) time (10-3600). Test camps-on the requested test for the time specified (in seconds), wait for the required resources to become available. Once the resources become available the test proceeds. If the resources do not become available in the specified time, the test is aborted.

j = Number of times to repeat the test. For Format 1, the range is from 1 to 126. For all other formats, the range is from 1 to 32. The default is 1.

k = PSU shelf number (0-4).

l = PSU channel number (0-15).

m = PSU channel member number (0-127).

n = The DELAY test timeout threshold in milliseconds. The accuracy of the measurement in the GDSF is only to within about 10 milliseconds, which is sufficient to measure the impact of the end-to-end network delay on the perceived quality of a voice call. The DELAY test will compare the round-trip transmission delay against this value to determine the results of the test. If the round-trip delay is equal or less than the specified delay timeout, the result will indicate the delay threshold was not exceeded.

o = Packet group (PKTG) number over which to set up the test call (7000-7999).

p = Packet group member number (PKTGMN). Only valid for BICC packet groups, and is the normalized call identification code (CIC) to use for the test call (0-65535).
\( q \) = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( r \) = Optical interface unit protection group (OIUPG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( s \) = Digits to be outpulsed for the specified test. This represents the test lines DN in the far-end office to be outpulsed by the near-end office during the establishment of the loop-back test between the far and near-end offices. The digits outpulsed should be the digits necessary to connect to the appropriate incoming test line in the far-end office for the outgoing test type specified. This represents the exact digit sequence that will be sent to the far-end office, without any routing or steering digits being added.

\( t \) = Peripheral control and timing (PCT) link number, relative to the OIU (0-2).

\( u \) = PCT time slot (PCTTS) number (0-767).

\( v \) = The type of 105 measurement to perform on the path under test. It represents the measurements for a two-way balance, loss, and noise 105 transmission test. This option allows the user to specify the measurement type to perform on the path under test between the far-end to near-end and near-end to far-end offices.

<table>
<thead>

</tbody>
</table>

\( w \) = Association set parameter. It is a request to test the whole association set which could have up to 64 associations. Since one association set corresponds to one packet group, ASSOCSET could be found using PKTG on RC/V View 5.71 (PACKET GROUP DEFINITION). Designating ALL
causes the heart beat test to be executed for all paths of the association(s).

\(x\) = Association. It is a request to run a test on a single association. Refer to RC/V View 33.23 (ASSOCIATION SET) to find the associations under the specified set. Refer to RC/V View 33.22 (SCTP ASSOCIATION) to find the association information.

\(y\) = Destination internet protocol address, in the form \(xxx.xxx.xxx.xxx\). It is a request to the SCTP HB test on the specific path in one association. It is not applicable for PKTG and ASSOCSET parameter. Once the association is known, the user can access RC/V View 33.22 to identify the DIP1 and DIP2 values (there are two DIPs associated with one association).

\(z\) = Repeat test. Used to perform successive SCTPHB test on the target. Currently it's only supported when ASSOCIATION is identified. It is not used with the ASSOCSET and PKTG parameters.

4. SYSTEM RESPONSE

\(PF\) = Printout follows. A unique request number is given to each test path requested and is output as "PF - REQNO=x".

If the test request is incomplete or invalid, a single TST:PATH output message is generated indicating the failure.

If the test request is completed, the test procedure attempts to seize control of all resources required for testing.

The number of TST:PATH output messages generated varies in accordance with the number of tests. In general, an output message is generated for each path tested; however, if the same failure occurs on all path tested, one output message may be output for all path. Primarily, the test duration determines the elapsed time between output messages for multi-section tests. When a TST:PATH request is complete, an end-of-transmission (EOT) flag appears on output.

\(RL\) = Retry later. The request has been denied due to unavailable system resources.

**TST:PSALNK**

**Software Release:** 5E17(1) and later  
**Command Group:** MAINT  
**Application:** 5  
**Type:** Input

**1. PURPOSE**

Requests an asynchronous transfer mode (ATM) level loop back test between two end points of a virtual path in a point-to-multipoint ATM network. This command is only available when the PSU link uses a PHA2(s).

A virtual path (VPATH) is uniquely identified by the CAs of two PSUs within the point-to-multipoint ATM network, that the VPATH connects. The near end PSU link is entered in the input message line. However, the VPATH's far end PSU CA must be entered as a PSU CA. If the far end PSU CA is not entered then a loopback test will be executed to every other possible PSU CA in the network. If the far end PSU CA is entered as 0, then a loopback test will be executed to every other possible PSU CA in the DCS.

When requesting an inter-network loopback test the far subnetwork number is needed.

There are two options of the loop back test. The default loop back test is the standard test as described in the GR-1248 ATM specification. This test is useful for checking provisioning between ATM end points through an ATM center-stage switch. This test verifies that the far end point received the loop back cell, and returned the cell within the proper time interval. This test will not detect the case where the far end point that returned the ATM loop back cell was not the end point specified by the input message. This could happen if there is a misprovisioned ATM center-stage switch that connects to an ATM end point that can return the loop back cell.

The second option is the "Enhanced" test, which is invoked using the "ENH" parameter. The enhancement option is a non-standard, loop back test that explicitly verifies the virtual path between Lucent Technology PHAs. This test uses the information available at the far end point to overwrite part of the ATM loop back cell "Source ID" field before sending back the cell. The originating end point validates the received "Source ID", and outputs the far end point's PSU CA as well as the far network and VPI/VCI on which the loop back cell was received. This test can only be properly used between PSU CA end points.

**2. FORMAT**

```
TST:PSALNK=a-b-c[,FARSN=d][,FARCA=e][,VP][,VC][,TRACE][,ENH];
```

**3. EXPLANATION OF MESSAGE**

- **ENH** = Enhancement option for more rigorous verification of the "Source ID" field in the ATM loop back cell. With this option, the far end ATM and the virtual path taken by the responding loop back cell are explicitly verified. Refer to the PURPOSE section for more complete explanation. This test is only to be used between PSU CA end points.

- **VC** = Virtual channel option specifies that a virtual channel test be executed.

- **VP** = Virtual path option specifies that a virtual path test be executed.

- **TRACE** = Trace option specifies that a trace of the far endpoints routing data be executed.

- **a** = Switching module (SM) number.

- **b** = PSU number.

- **c** = PSU link number.
d = Far subnetwork number.

e = Far end PSU community address of a virtual path.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Printout follows. Followed by the TST:PSALNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

TST:PSALNK

Input Appendix(es):

APP: RANGES
TST:PSLNK-A

Software Release: 5E14-5E15
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests an asynchronous transfer mode (ATM) level loop back test between two end points of a packet switch unit (PSU) link (PSLNK) in a point-to-point network configuration (Formats 1 through 3) or between two end points of a virtual path in a point-to-multipoint ATM network (Formats 4 through 6). Each end point is uniquely addressed with a non-zero PSU community address (CA) within that network.

A PSU link is uniquely identified by the CAs of two PSUs within the point-to-point network, that this PSU link connects. Similarly, a virtual path (VPATH) is uniquely identified by the CAs of two PSUs within the point-to-multipoint ATM network, that this VPATH connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the PSU link's or VPATH's far end PSU CA can not be specified by the PSU equipment number and must always be entered as PSU CA. For gateway PHAs the far subnetwork number is needed to do the loopback test. The test cannot be started from a gateway PHA.

There are two options of the loop back test. The default loop back test is the standard test as described in the GR-1248 ATM specification. This test is useful for checking provisioning between ATM end points through an ATM center-stage switch. This test verifies that the far end point received the loop back cell, and returned the cell within proper time interval. This test will not detect the case where the far end point that returned the ATM loop back cell was not the end point specified by the input command. This could happen if there is a misprovisioned ATM center-stage switch that connects to an ATM end point that can return the loop back cell.

The second option is the "Enhanced" test, which is invoked using the "ENH" parameter. The enhancement option is a non-standard, Lucent-only loop back test that explicitly verifies the virtual path between Lucent PHAs. This test uses the information available at the far end point to overwrite part of the ATM loop back cell "tag" field before sending back the cell. The originating end point validates the received "tag", and outputs the far end point's PSU CA as well as the VPI on which the loop back cell was received. This test can only be properly used between Lucent PSU CA end points.

Output Message(s):

TST: PSLNK
TST:PSLNK-C

Software Release: 5E17(1) and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests an asynchronous transfer mode (ATM) level loop back test between two endpoints of a packet switch unit (PSU) link (PSLNK) in a point-to-point network configuration (Formats 1 through 3) or between two end points of a virtual path in a point-to-multipoint ATM network (Formats 4 through 6). Each endpoint is uniquely addressed with a non-zero PSU community address (CA) within that network.

A PSU link is uniquely identified by the CAs of two PSUs within the point-to-point network, that this PSU link connects. Similarly, a virtual path (VPATH) is uniquely identified by the CAs of two PSUs within the point-to-multipoint ATM network, that this VPATH connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the PSU link's or VPATH's far end PSU CA can not be specified by the PSU equipment number and must always be entered as PSU CA. When requesting an inter-network loop back test, the far subnetwork number is needed. The test cannot be started from a gateway PHA.

There are two options of the loop back test. The default loop back test is the standard test as described in the GR-1248 ATM specification. This test is useful for checking provisioning between ATM endpoints through an ATM center-stage switch. This test verifies that the far endpoint received the loop back cell, and returned the cell within the proper time interval. This test will not detect the case where the far endpoint that returned the ATM loop back cell was not the endpoint specified by the input message. This could happen if there is a misprovisioned ATM center-stage switch that connects to an ATM end point that can return the loop back cell.

The second option is the "enhanced" test, which is invoked using the "ENH" parameter. The enhancement option is a non-standard, loop back test that explicitly verifies the virtual path between Lucent Technology PHAs. This test uses the information available at the far endpoint to overwrite part of the ATM loop back cell "tag" or "Source ID" field before sending back the cell. The originating endpoint validates the received "tag" or "Source ID" and outputs the far endpoint's PSU CA as well as the far network and VPI/VCI on which the loop back cell was received. This test can only be properly used between PSU CA endpoints.

The delay option can be used to measure the roundtrip time that the ATM loopback cell takes to go between PSU CA endpoints. This time includes the PHA scheduling and processing time as well as the ATM delay time. Note: For each PHA1 endpoint the approximate processing and scheduling time is 3-5 ms. The delay time will be output when the test successfully completes.

The trace option can be used to trace the PSU routing that is used by each PSU CA endpoint. When originating or responding to the original ATM loopback cell, the near PSU will use its own routing data to determine the correct PVC to use. The source and destination PVC types will be output when the test successfully completes.

2. FORMAT

TST:RATE

**Software Release:** 5E14 and later

**Command Group:** CCS

**Application:** 5

**Type:** Input

1. **PURPOSE**

Requests that a rate query be sent to the real time rating system (RTRS) database to verify its operation.

It should be noted that optional fields specified in this message which are not valid for that query type will be ignored. The query request will be processed as if they were not entered.

2. **FORMAT**

TST:RATE=a-b-c-d-e-f-g-h-i[,PTP][,CTYP=j][,ACI][,STYP=k][,DUR=l][,CCL=m][,CCR=n][,CU104][,CMCD=o][,CP104][,BAL=p][,MQD=q][,CRS=r][,API=s][,SC=t][,AO=u][,FNE=v][,SASI=w][,PCCS=x][,FMS][,SRCHTYP1=y-z][,SRCHTYP2=a'-b'][,DATYPE=c'][,PAYCOMP=d'];

3. **EXPLANATION OF MESSAGE**

- **ACI** = Automated call indicator. Absence of this indicates that the call was operator-handled.
- **CP104** = Comparison card 10+4 indicator. Indicates that the comparison card was a 10+4 card. Absence of this implies some other kind of calling card.
- **CU104** = Customer card 10+4 indicator. Indicates that the customer calling card was a 10+4 card. Absence of this implies some other kind of calling card.
- **FMS** = Flat and measured services indicator. Specifies that both flat and measured services rates are requested in the rating reply.
- **PTP** = Person-to-person indicator. Absence of this indicates that the call was station-to-station.
- **a** = The originating ten digit directory number.
- **b** = The terminating directory number. For a U.S. number, this is a ten digit directory number. For an international number, this is the country code followed by the national number.
- **c** = The carrier ID. For an interexchange carrier, this is the four-digit carrier code. For a non-interexchange carrier, use 16383 for the carrier code.
- **d** = Number of days that have elapsed between the start of the current year and the day the call started.
- **e** = Hour of the start time of the call (0 to 23).
- **f** = Minutes of the start time of the call (0 to 59).
- **g** = Seconds of the start time of the call (0 to 59).
- **h** = The query type. Valid value(s):
  - **EC** = End-of-call query.
  - **IC** = Initial coin query.
IN = Interim query.
PLI = Purchase limits initial query.
PLS = Purchase limits subsequent query.
RQ = Rate quote query.

i = The billing class. Valid value(s):
ASP = Automatic charge quotation service (ACQS) sent-paid.
CCB = Calling card billing.
COB = Collect billing.
CSP = Coin sent paid.
NSP = Non-coin/non-ACQS sent paid.
TNB = Third number billing.

j = Call type. Valid value(s):
0M = Zero minus.
0P = Zero plus (default).
1P = One plus.

k = Special type (STYP). Defaults to no special type. Valid value(s):
BLV = Busy line verification.
CC = Call completion.
CCTC = Call completion with time and charge.
DAC = Directory assistance call.
NCN = Non-coin notify.
TAC = Time & charge call.

l = Duration (DUR) of the call in seconds. This is required if the query type is EC, IN or PLS.

m = Country code length (CCL). This is required if the terminating directory number is an international number.

n = Customer credit card (CCRD). This is an optional field for a calling card rate quote, T&C, or purchase limits initial or subsequent query. This is the vendor/issuer ID digits (first 2-7 digits of calling card). If the calling customer's card is a LEC(10+4) card, only 6 digits of the card should be entered. The card will be accepted even if 6 digits are not entered, but the rating results will be incorrect. Otherwise, the number of digits in the vendor/issuer ID should match their corresponding entries in the card recognition tables RC/V View 27.55.

o = Comparison credit card (CMCD). This is an optional field for rate quote differentiation of card service charges queries. This is the vendor/issuer ID digits (first 2-7 digits of comparison card). If the comparison card is a LEC(10+4) card, only 6 digits of the card should be entered. The card will be accepted even if 6 digits are not entered, but the rating results will be incorrect. Otherwise, the number of digits in the vendor/issuer ID should match their corresponding entries in the card recognition tables. If this field is specified, the CCRD field above must also be included in the input message.

p = Purchase limits balance (BAL) in pennies. This field is required if this is an initial purchase limits query request. The range of values is from 0 to 999999 (0-$9999.99).

q = Method of ACQS quote delivery. This is required if the billing class is ASP, the query type is EC or
RQ and the ACQS rate distinction secure feature bit is active. Valid value(s):

- **FAX** = FAX quote.
- **NWA** = Network autoquote.
- **PLA** = Private line autoquote.
- **VCQ** = Voice quote.

- **r** = Card rate specifier (CRS). This is an optional field used to obtain rate quotes for calls billed to special cards. This field should only be entered if the billing class is “Calling card billing”. The absence of this field should be interpreted as card rate = 0 (standard card rates).

- **s** = Access provider identifier (API). This is an optional field used to identify the source carrier for certain types of incoming feature group D (FGD) calls. It must be a valid carrier identification code (CIC). The API is four digits in length (0 to 9999).

- **t** = Service code (SC). This is an optional field used to obtain rate quotes for a specific set of incoming FGD calls requiring access to operator service position system (OSPS) toll and assistance (T&A) features. It is used to identify specific services or billing arrangements based on the back number. The SC is four digits in length (0 to 9999).

- **u** = Automation offering (AO). This is an optional field used to identify the level of automation (type of treatment) associated with a given OSPS 0/00-originated call. Valid value(s):
  - **APS** = Automated position system handled.
  - **NA** = Not applicable (not used by call processing at this time).
  - **OPER** = Operator handled.
  - **SWITCH** = Switch (not used by call processing at this time).

- **v** = Forward number entry (FNE). This is an optional field used to identify who entered the forward number associated with a given OSPS 0/00-originated call. Valid value(s):
  - **CUST** = Customer entered the forward number at the APS.
  - **NA** = Not applicable (not used by call processing at this time).
  - **OPER** = Operator entered the forward number.
  - **SWITCH** = Switch (not used by call processing at this time).

- **w** = Special access service identifier (SASI). This is an optional field used to identify the special access service identifier associated with a special access call handling call. The range of values is from 1 to 10.

- **x** = Prior call completion status (PCCS). This is an optional field used to identify the prior call completion status associated with a special access call handling call. Valid value(s):
  - **NEG** = Negative prior call completion status.
  - **POS** = Positive prior call completion status.

- **y** = Directory Assistance Search Type 1 (SRCHTYP1). This is an optional field used to identify the first search type value of a directory assistance call. The range of values is from 1 to 999.

- **z** = Number of searches for directory assistance search type 1 (SRCHTYP1). This is an optional field (used in conjunction with field y) used to identify the number of searches for directory assistance search type 1 of a directory assistance call. The range of values is from 1 to 999.

- **a** = Directory assistance search type 2 (SRCHTYP2). This is an optional field used to identify the second search type value of a directory assistance call. The range of values is from 1 to 999.
b
\(^1\) = Number of searches for directory assistance search type 2 (SRCHTYP2). This is an optional field (used in conjunction with field a') used to identify the number of searches for directory assistance search type 2 of a directory assistance call. The range of values is from 1 to 999.

c' = Directory assistance type indicator (DATYPE). This is an optional field used to identify the directory assistance type for a directory assistance call. The range of values is from 1 to 20.

d' = AMA - Record ANI II Digits payphone compensable parameter. This is an optional field used to identify if the Payphone Compensable Eligibility module should be appended. With the value of 0, the module is appended and the call is not payphone compensable. With the value of 1, the module is appended and the call is payphone compensable.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- AUTOMATION OFFERING REQUIRES THE CALL TYPE FIELD TO BE ZERO MINUS (0M) = The automated service access prompting (ASAP) module is appended when the automation offering field is populated. This module requires the call type field to be populated with zero minus (0M).
- AUTOMATION OFFERING REQUIRES THE FORWARD NUMBER ENTRY FIELD TO BE POPULATED
  = The ASAP module is appended when the automation offering field is populated. This module requires both the automation offering field and the forward number entry field to be populated.
- COMPARISON CARD VENDOR/ISSUER ID INVALID = The number of calling card digits specified for a comparison card is not 2 through 7 digits in the CMCD input field.
- CRS PERMITTED ONLY WITH CARD BILLING CLASS = The card rate specifier expects a billing class of calling card.
- CUSTOMER VENDOR/ISSUER ID INVALID = The number of calling card digits specified for a calling customer is not 2 through 7 digits in the CCRD input field.
- CUSTOMER VENDOR/ISSUER ID MISSING = A comparison card vendor/issuer ID has been specified without indicating a customer vendor/issuer ID in the input message.
- DURATION EXCEEDED = The DUR field for EC and IN query types cannot exceed a value of 12 hours in seconds.
- DURATION MISSING = DUR is required for query type of IN, EC, or PLS. This response is also printed if a duration of zero is specified.
- FEATURE NOT AVAILABLE = The requested action failed. The feature required to process the request is not present in the switch or the given module.
- FLAT AND MEASURED SERVICES (FMS) AND CALLING CARDS (CCRD) ARE MUTUALLY EXCLUSIVE
  = The requested action failed. The flat and measured services (FMS) feature does not work with calling cards.
- FLAT AND MEASURED SERVICES (FMS) REQUIRES THE CALL TYPE FIELD TO BE ONE PLUS (1P)
  = The requested action failed. The flat and measured services (FMS) feature only works when prefix is 1+.
- FLAT AND MEASURED SERVICES (FMS) REQUIRES THE BILL CLASS FIELD TO BE OTHER SPECIAL (NSP)
  = The requested action failed. The flat and measured services (FMS) feature only works when the billing class is non-coin/non-ACQS sent paid.
- FLAT AND MEASURED SERVICES (FMS) REQUIRES THE SPECIAL TYPE FIELD TO BE
NO SPECIAL TYPE
- The requested action failed. The flat and measured services (FMS) feature only works when there is no special type.

FORWARD NUMBER ENTRY REQUIRES THE AUTOMATION OFFERING FIELD TO BE POPULATED
- The ASAP module is appended when the automation offering field is populated. This module requires both the automation offering field and the forward number entry field to be populated. Since the forward number entry field is populated and the automation offering field is not, the query cannot be processed with this lack of information.

METHOD OF QUOTE DELIVERY INVALID
- The MQD field must not be entered if the billing class is not ASP and the ACQS rate distinction secure feature bit is not active.

METHOD OF QUOTE DELIVERY MISSING
- The MQD field must be entered for a billing class of ASP when the ACQS rate distinction secure feature bit is active.

NUMBER OF SEARCHES FOR SEARCH TYPE 1 MISSING
- The number of searches for directory assistance search type 1 must be entered if a value for the first directory assistance search type has been entered.

NUMBER OF SEARCHES FOR SEARCH TYPE 2 MISSING
- The number of searches for directory assistance search type 2 must be entered if a value for the second directory assistance search type has been entered.

ORIGINATING DN
- The originating directory number must be ten digits.

PRIOR CALL COMPLETION STATUS MISSING
- The PCCS field must be entered if a value for the SASI field has been entered.

PURCHASE LIMITS BALANCE OUT OF RANGE
- The BAL field for a PLI query cannot exceed a value of $9999.99 in pennies. This response is also printed if the BAL field is not specified for a PLI rating test query.

PURCHASE LIMITS DURATION EXCEEDED
- The DUR field for a subsequent PLS query cannot exceed a value of 48 hours in seconds.

QUERY TYPE/BILLING CLASS INVALID
- The billing class of ASP requires a query type of EC or RQ when the ACQS rate distinction secure feature bit is active.

SEARCH TYPE 1 MISSING
- The value of the first directory assistance search type must be entered if a value has been entered for the number of searches for directory assistance search type 1.

SEARCH TYPE 2 MISSING
- The value of the second directory assistance search type must be entered if a value has been entered for the number of searches for directory assistance search type 2.

SPECIAL ACCESS SERVICE IDENTIFIER MISSING
- The SASI field must be entered if a value for the PCCS field has been entered.

TERMINATING DN
- The terminating directory number must be either a ten digit U.S. number or a country code and national number with the length of the country code specified using the keyword CCL.

UNABLE TO SEND QUERY
- The query could not be sent to the RTRS database.

PF
- Printout follows. The request has been received. Followed by the TST:RATE output message.

RL
- Retry later. Valid value(s):
  - TEST IN PROGRESS = Another RTRS test is in progress.
  - TOO MANY QUERIES RUNNING = No RATE query IDs are available.

27.55 (OSPS TELEPHONE CREDIT CARD IDENTIFICATION)
TST:TRK-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests automatic operational or transmission tests on individual trunks, a range of trunks in a trunk group, or an entire trunk group. In addition, X.25 access on T1 (XAT) ports and Packet Handler Voice (PHV) speech handler trunks can be tested using this message, with corresponding additional identifiers.

Note: For Cell site and IVT APX trunks, the ECP must be notified before a test can be run.

For the APX trunks only, the trunk status will be changed to OOS before the trunk is tested and the trunk will be restored to its original status when the test is complete. For all others, when the tests are completed, the trunk will be restored to the state that it was in before being tested.

This message cannot be used to run explicit hardware tests. Refer to the DGN:TEN and DGN:DFI input messages for hardware tests of analog and digital trunks, respectively.

Format 1 (TKGMN) allows for a single trunk or a range of trunks in a trunk group to be tested.

Format 2 (TEN) tests a single analog trunk.

Format 3 (DEN) tests a single digital trunk.

Format 4 network equipment number (NEN) tests a single trunk on a digital network unit - synchronous optical network (SONET) (DNU-S).

Format 5 (TG) tests a trunk group.

Format 6 (MLHG) tests a trunk that has multi-line hunt group and member associated with it. Currently this includes XAT ports.

Format 7 (PKTDN) tests a trunk that has a packet directory number associated with it. Currently this includes XAT ports.

Format 8 (SLEN) tests a SLc® line equipment number.

Format 9 (ILEN) tests an integrated digital carrier unit line equipment number.

Format 10 (PSUEN) test a single protocol handler channel. Currently this includes speech handler trunks on PHV ports.

Format 11 (INEN) tests a single digital trunk.

[2] TST:TRK,TEN=d-e-f-g-h[,PRINT][,RPT=n][,TYPE=o][,OPDN=p];
[3] TST:TRK,DEN=d-j-k-l[,PRINT][,RPT=n][,TYPE=o][,OPDN=p][,DUR=q]
3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

PRINT = Print the output generated from this request on the receive-only printer (ROP). By default, if the request is entered from the Master Control Center (MCC) it prints on the ROP or if the request is entered from a terminal (TTY) other than the MCC the output will then only print on that TTY.

RPT = Repeat the test.

a = Trunk group number.

b = Trunk member number or lower limit of range of trunk group member numbers.

c = Upper limit of range of trunk group member numbers.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Channel number. If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Trunk group number. Each member of the group will be tested, and output will be reported for each trunk.

n = Number of times to run test. (1-32, default 1). If a value greater than 32 is specified, only 32 tests will be run. The output will be in a form that summarizes the results of all tests run.

o = The type of test to be executed.
Transmission tests (refer to variable ‘z’).

If no test type is specified, the office-defined default operational test type for the trunk group, if one exists, will be run.

The default test for packet switching trunks and XAT ports is an LBKOCU operational test, with a loopback (LBK) termination point at the office channel unit (OCU) interswitch transmission equipment.

Note that the only valid test types for packet switching trunks and XAT ports are LBKOCU and LBKCSU, a LBK termination point at the channel service unit (CSU) interswitch transmission equipment. Requests for any other test type on a packet switching trunk or an XAT port will be rejected.

Operational tests. Valid value(s):
103 = Signal-supervisory test line.
CTX2 = Phase II Centrex test type.
CTX3 = Phase III Centrex test type.
NSYNC = Non-synchronous test line.
PERM = Permanent busy test line.
SYNC = Synchronous test line.
SXS = Step-by-step test type.

p = Digits to be outpulsed for the specified test. If they are not specified, the office-defined default digits for the test type will be used. Note that outpulsing is not applicable during the testing of packet switching trunks. If optional digits are specified, they will be ignored.

q = Duration of digital tests, in seconds (1-3600). Default = 2 seconds (operational test only).

r = Number of consecutive binary digits that are contained in a block (1-64000). Consecutive blocks are transmitted during the test and the number of error-free blocks received from the far end is printed when the test ends.

s = MLHG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

\( u \) = Directory number (DN).

\( w \) = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x \) = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y \) = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z \) = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^1 \) = Digital network unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^1 \) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^1 \) = SONET terminal equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^1 \) = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the InputMessages manual.

\( e^1 \) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^1 \) = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^1 \) = Digital Signal Level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h^1 \) = PSU community number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^1 \) = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^1 \) = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

Note 1: The standard 105 test includes: 105L, 105RN, 105N, and 105NT.
Note 2: The 105RL (return loss) test includes: 105ERL, 105SRL, and 105SHI.
Note 4: The 105ALL test includes the following 105 test line tests: 105L, 105RN, 105N, 105L4, 105L10, 105L28, and 105NT.
Note 5: 102LB test executes 1004 Hz at 0dB transmission and C-message noise filter used in measurement for noise. This test was designed for APX BSSAPS2 and IVT trunks.

Exhibit B -- TYPES OF DIGITAL TESTS
PF = Printout follows. The request has been accepted, and will be followed by a TST:TRK output message.

RL = Retry later. The request has been denied due to the system load. The OP:JOBSTATUS input message can be used to determine if the RL was issued because the maximum number of jobs are active.

1. PURPOSE

Requests automatic operational or transmission tests on individual trunks, a range of trunks in a trunk group, or an entire trunk group. In addition, X.25 access on T1 (XAT) ports and packet handler voice (PHV) speech handler trunks can be tested using this message, with corresponding additional identifiers.

Note: For Cell site and IVT APX trunks, the ECP must be notified before a test can be run.

For the APX trunks only, the trunk status will be changed to OOS before the trunk is tested and the trunk will be restored to its original status when the test is complete. For all others, when the tests are completed, the trunk will be restored to the state that it was in before being tested.

This message cannot be used to run explicit hardware tests. Refer to the DGN:TEN and DGN:DFI input messages for hardware tests of analog and digital trunks, respectively.

Format 1 (TKGMN) allows for a single trunk or a range of trunks in a trunk group to be tested.

Format 2 (TEN) tests a single analog trunk.

Format 3 (DEN) tests a single digital trunk.

Format 4 network equipment number (NEN) tests a single trunk on a digital network unit - synchronous optical network (SONET) (DNU-S).

Format 5 (TG) tests a trunk group.

Format 6 (MLHG) tests a trunk that has multi-line hunt group and member associated with it. Currently this includes XAT ports.

Format 7 (PKTDN) tests a trunk that has a packet directory number associated with it. Currently this includes XAT ports.

Format 8 (PLTEN) tests a trunk that has a peripheral control and timing (PCT) line and trunk equipment number associated with it.

Format 9 (SLEN) tests a SLC® line equipment number.

Format 10 (ILEN) tests an integrated digital carrier unit line equipment number.

Format 11 (PSUEN) test a single protocol handler channel. Currently this includes speech handler trunks on PHV ports.

Format 12 (INEN) tests a single digital trunk.

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

PRINT = Print the output generated from this request on the ROP. By default, if the request is entered from the Master Control Center (MCC) it prints on the ROP or if the request is entered from a terminal (TTY) other than the MCC the output will then only print on that TTY.

RPT = Repeat the test.

a = Trunk group number.

b = Trunk member number or lower limit of range of trunk group member numbers.

c = Upper limit of range of trunk group member numbers.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Channel number. If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Trunk group number. Each member of the group will be tested, and output will be reported for each trunk.

n = Number of times to run test. (1-32, default 1).

If a value greater than 32 is specified, only 32 tests will be run. The output will be in a form that summarizes the results of all tests run.

o = The type of test to be executed.

Transmission tests (refer to Exhibit A).

If no test type is specified, the office-defined default operational test type for the trunk group, if one exists, will be run.

The default test for packet switching trunks and XAT ports is an LBKOCU operational test, with a loopback (LBK) termination point at the office channel unit (OCU) interswitch transmission equipment.

Note that the only valid test types for packet switching trunks and XAT ports are LBKOCU and LBKCSU, a LBK termination point at the channel service unit (CSU) interswitch transmission equipment. Requests for any other test type on a packet switching trunk or an XAT port will be rejected.

Operational tests. Valid value(s):

103 = Signal-supervisory test line.
CTX2 = Phase II Centrex test type.
CTX3 = Phase III Centrex test type.
NSYNC = Non-synchronous test line.
PERM = Permanent busy test line.
SYNC = Synchronous test line.
SXS = Step-by-step test type.

p = Digits to be outpulsed for the specified test. If they are not specified, the office-defined default digits for the test type will be used. Note that outpulsing is not applicable during the testing of packet switching trunks. If optional digits are specified, they will be ignored.

q = Duration of digital tests, in seconds (1-3600). Default = 2 seconds (operational test only).

r = Number of consecutive binary digits that are contained in a block (1-64000). Consecutive blocks are transmitted during the test and the number of error-free blocks received from the far end is printed when the test ends.

s = MLHG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

235-190-120  Common Channel Signaling Service Features
235-900-113  Product Specification

RC/V View(s):

5.1 (TRUNK GROUP)
14.1 (AUTO TRUNK TEST)
TST:TRK-C

Software Release: 5E16(1) and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests automatic operational or transmission tests on individual trunks, a range of trunks in a trunk group, or an entire trunk group. In addition, X.25 access on T1 (XAT) ports and packet handler voice (PHV) speech handler trunks can be tested using this message, with corresponding additional identifiers.

Note: For Cell site and IVT APX trunks, the ECP must be notified before a test can be run.

For the APX trunks only, the trunk status will be changed to OOS before the trunk is tested and the trunk will be restored to its original status when the test is complete. For all others, when the tests are completed, the trunk will be restored to the state that it was in before being tested.

This message cannot be used to run explicit hardware tests. Refer to the DGN:TEN and DGN:DFI input messages for hardware tests of analog and digital trunks, respectively.

Format 1 (TKGMN) allows for a single trunk or a range of trunks in a trunk group to be tested.
Format 2 (TEN) tests a single analog trunk.
Format 3 (DEN) tests a single digital trunk.
Format 4 network equipment number (NEN) tests a single trunk on a digital network unit - synchronous optical network (SONET) (DNU-S).
Format 5 tests a trunk group.
Format 6 tests a trunk that has multi-line hunt group and member associated with it. Currently this includes XAT ports.
Format 7 tests a trunk that has a packet directory number associated with it. Currently this includes XAT ports.
Format 8 tests a trunk that has a peripheral control and timing (PCT) line and trunk equipment number associated with it.
Format 9 tests a SLC® line equipment number.
Format 10 tests an integrated digital carrier unit line equipment number.
Format 11 tests a single protocol handler channel. Currently this includes speech handler trunks on PHV ports.
Format 12 tests a single digital trunk.
Format 13 tests a virtual packet trunk.
Format 14 tests an optical interface unit equipment number.

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

PRINT = Print the output generated from this request on the ROP. By default, if the request is entered from the Master Control Center (MCC) it prints on the ROP or if the request is entered from a terminal (TTY) other than the MCC the output will then only print on that TTY.

RPT = Repeat the test.

a = Trunk group number.

b = Trunk member number or lower limit of range of trunk group member numbers.

c = Upper limit of range of trunk group member numbers.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Channel number. If this is a DFI-1, there is only one facility, channels 1-24. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Trunk group number. Each member of the group will be tested, and output will be reported for each trunk.

n = Number of times to run test. (1-32, default 1).

If a value greater than 32 is specified, only 32 tests will be run. The output will be in a form that summarizes the results of all tests run.

o = The type of test to be executed.

Transmission tests. Refer to the APP:TRANS-TESTS appendix in the Appendixes section of the Input Messages manual.

If no test type is specified, the office-defined default operational test type for the trunk group, if one exists, will be run.

The default test for packet switching trunks and XAT ports is an LBKOCU operational test, with a loopback (LBK) termination point at the office channel unit (OCU) interswitch transmission equipment.

Note that the only valid test types for packet switching trunks and XAT ports are LBKOCU and LBKCSU, a LBK termination point at the channel service unit (CSU) interswitch transmission equipment. Requests for any other test type on a packet switching trunk or an XAT port will be rejected.

Operational tests. Valid value(s):

103 = Signal-supervisory test line.
CTX2 = Phase II Centrex test type.
CTX3 = Phase III Centrex test type.
NSYNC = Non-synchronous test line.
PERM = Permanent busy test line.
SYNC = Synchronous test line.
SXS = Step-by-step test type.
p = Digits to be outpulsed for the specified test. If they are not specified, the office-defined default digits for the test type will be used. Note that outpulsing is not applicable during the testing of packet switching trunks. If optional digits are specified, they will be ignored.

q = Duration of digital tests, in seconds (1-3600). Default = 2 seconds (operational test only).

r = Number of consecutive binary digits that are contained in a block (1-64000). Consecutive blocks are transmitted during the test and the number of error-free blocks received from the far end is printed when the test ends.

s = MLHG number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Directory number (DN).

w = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a¹ = Digital network unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b¹ = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = SONET terminal equipment (STE) facility number.

d¹ = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f¹ = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g¹ = Digital Signal Level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h¹ = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i¹ = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\( j \) = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k \) = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l \) = PCT line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m \) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n \) = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o \) = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p \) = Virtual trunk facility number.

\( q \) = Virtual trunk channel number.

\( r \) = Camp-on (CAMP) time (15-3600). The test camps-on for the time specified (in seconds), waiting for the required resources to become available, at which time testing may proceed. If the resources do not become available in the specified time, the test is aborted.

\( s \) = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( t \) = Protection group (PG) number.

\( u \) = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### 4. SYSTEM RESPONSE

**PF**

= Printout follows. The request has been accepted, and will be followed by a TST:TRK output message.

**RL**

= Retry later. The request has been denied due to the system load. The OP:JOBSTATUS input message can be used to determine if the RL was issued because the maximum number of jobs are active.

### 5. REFERENCES

RC/V View(s):
5.1   TRUNK GROUP
14.1   AUTO TRUNK TEST
TST:UMBIL

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a test (connectivity exercise) of the connection of a host umbilical (UMBIL).

A UMBIL is a host umbilical between a host switching module (HSM) and an RSM. The test does not interfere with stable calls.

2. FORMAT

TST:UMBIL=a-b-c;

3. EXPLANATION OF MESSAGE

a  = Host switching module (HSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Remote switching module (RSM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Host umbilical (UMBIL) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The message syntax is valid, but the request conflicts with current system or equipment status.

PF = Printout follows. A TST:UMBIL output message follows in response to the request.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

TST:VFL

**Software Release:** 5E14 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

1. PURPOSE

Requests an automatic voice frequency link (VFL) test for a specified common channel signaling (CCS) link.

Each 2.4 or 4.8 kbps CCS link consists of a pair of VFLs; one active and the other standby. When a VFL test is requested for a CCS link, the test will always be run for the standby VFL. The CCS link to test is specified by its group number and member number.

2. FORMAT

TST:VFL,GRP=a,MEM=b;

3. EXPLANATION OF MESSAGE

- **a** = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

- **NG** = No good. The request was unsuccessful because:
  - Invalid group number was specified.
  - Invalid member number was specified.
  - Link is not 2.4 or 4.8 kbps.
  - Link is unequipped.
  - Link is manual out-of-service.

- **PF** = Printout follows. The request has been accepted and an output message will follow.

TST:WLINE

Software Release: 5E14 and later
Command Group: TRKLN
Application: AEWNC
Type: Input

1. PURPOSE

Requests that the continuity of analog lines terminated on the W-card of WNC be tested and printed out.

2. FORMAT

TST:WLINE[,DN=a|,LCKEN=b-c-d-e-f|,ALL]

3. EXPLANATION OF MESSAGE

a = The DN number of the analog line being tested.
b = Switching module (SM) number.
c = Integrated services line unit (ISLU2) number.
d = Line group number.
e = Line card number.
f = Circuit number.

4. SYSTEM RESPONSE

RL = Retry later. May also include:
    - PREVIOUS TEST STILL RUNING

PF = Printout follows. The request has been accepted and is followed by an TST:WLINE output message.

**TST:WSAUTO**

*Software Release:* 5E14 and later  
*Command Group:* TRKLN  
*Application:* 5  
*Type:* Input

### 1. PURPOSE

Requests trunk and line work station (TLWS) automatic tests. The line or trunk to be tested must have been seized using the CONN:WSLINE, CONN:WSTRK, or CONN:WSIC input messages.

**Note:** This input message is the message interface between the line/trunk testing software and the TLWS numeric menu options (refer to MCC display page 160). Except for a request to remove a port from service (RST) or perform an utility call trace (UCT) the port being tested at the TLWS test position is released prior to performing the requested test. The test results from this input message are displayed only on the receive-only printer (ROP) Direct entry of this input message is not recommended. Instead, use the TLWS menu options or one of the following input messages: DGN:AIULC, DGN:TEN, DGN:ISLULC, DGN:ISLULCKT, EXC:LIT, EXC:ALE, RMV:LINE, RMV:TRK, RST:LINE, RST:TRK, TRC:UTIL, TST:DSL, or TST:TRK.

Format 1 runs the line insulation test (LIT) and diagnostics.

Format 2 is used to remove or restore the port to service. A remove from service request does not release the port from the test position.

Format 3 performs tests on digital subscriber lines (DSL).

Format 4 runs an automatic test call on a trunk.

Format 5 generates an automatic line evaluation report.

Format 6 generates an UCT on the port seized or camped on at the test position. The call trace is performed without releasing the port from the test position.

### 2. FORMAT

1. \( \text{TST:WSAUTO, TP=a, \{LIT|DGN\};} \)
2. \( \text{TST:WSAUTO, TP=a, \{RMV|RST\}[e][,UCL];} \)
3. \( \text{TST:WSAUTO, TP=a, TSTDSL[,CHAN=e|ALL][,TERM=f][,TEST=k[-o]} \)
\( [,DUR=g][,BLKSZ=h][,MODE=i][,ABER=j][,PS][,UCL][]\);
4. \( \text{TST:WSAUTO, TP=a, TSTTRK[,TYPE=c][,OPD=d][,DUR=g][,BLKSZ=h][];} \)
5. \( \text{TST:WSAUTO, TP=a, ALE=l,m[,n];} \)
6. \( \text{TST:WSAUTO, TP=a, UCT;} \)

### 3. EXPLANATION OF MESSAGE

**Note:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.
ALL = Run the test on all the channels of the DSL.

PS = Run a loop-back test on a packet switched channel, or on a channel used to support on-demand packet switching using the assigned PH. The CHAN parameter is mandatory for this test to be executed.

UCL = When used with RST, restore the selected trunk or line unconditionally; do not run diagnostic tests.

When used with TSTDSL on a selected ANS® U-DSL, execute the test unconditionally and do not interrupt when the NT1 goes into test mode.

V = Output all intermediate test results (that is, output is verbose). This option is useful when performing CRC or fault sectionalization tests.

a = TLWS test position (TP) number.

c = Type of automatic trunk test to be run (transmission and operation tests are available as listed below). If no test is specified, the office-defined default operational test type for the trunk group is run, if one exists.

Transmission tests (also, refer to Exhibit A of the TST:TRK message). Valid value(s):

</thead>
<tbody>
<tr>
<td>CTX2</td>
<td>Phase II Centrex test type.</td>
</tr>
<tr>
<td>CTX3</td>
<td>Phase III Centrex test type.</td>
</tr>
</tbody>
</table>
d  = Digits to be outpulsed, which may be specified when the test type is specified. If not specified, the office-defined default digits for the test type are used.

e  = Channel (CHAN) of the DSL. Valid value(s):
   B1  = Run the test on the B1-channel.
   B2  = Run the test on the B2-channel.
   D   = Run the test on the D-channel.

f  = Termination (TERM) point of the automatic digital subscriber line (DSL) test. Valid value(s):
   CUn = Loopback at a specified BRITE CU. This loopback is valid only for U-DSLs. For ANSI® U-DSLs, \( n \) = 1 through 6. For AMI U-DSLs, \( n \) = 1 through 4.
   EXT = Loopback at an external connection to the far-end office. The digital bit stream is sent out and it is the far-end offices' option to send the bits back in the sent format or in an inverted format.
   LT  = Loopback at the line termination. Default value for DSL (DSL only).
   NT1 = Loopback at the network termination (NT1). Default value for U-DSL (U-DSL only).
   PH  = Loopback in the protocol handler (DSL only).

g  = Number of seconds that the automatic digital test will be run. For trunk tests, the duration ranges from 1 - 3600 and defaults to 2 seconds. For DSL tests, the duration ranges from 0 - 3600 and defaults to 20 seconds. If the test duration is 0 and TEST=CRC, only LT reads will be performed and delivered on output. Attempting to run loopback tests for zero duration will result in the test running for 1 second.

h  = Number of bits in the blocks to be sent (1 - 64000; default is 56000 for DSLs, 64000 for digital trunks).

i  = Mode of TSTDSL test. Valid value(s):
   SECT = Fault sectionalization test. This option requests loopback tests to sectionalize the fault beginning with the TERM specified below. The sectionalization mode of testing is used to automatically isolate the operative/faulty portion of a DSLs digital path or transmission loop. This is accomplished by dividing the path and loop into a finite number of testable sections that are delineated by the available LPBK terminations. The maximum number of test sections possible is 10 for ANSI® U-DSLs, 8 for AMI U-DSLs and 3 for T-DSLs.
   SEQ  = Digital loopback test in sequential mode. This will result in a loopback test's being performed at the specified loopback point and at every loopback point in toward the switch.

j  = Acceptable bit error rate (0 - 9, default 6) for circuit switched loopbacks. The value 1 - 9 is an absolute value of the exponent of the error rate accepted \((10^{-1} - 10^{-9})\). One presents a less stringent error rate specification. Nine represents the most strict error rate. If ABER=0 (valid only with the SECT option) each termination will be tested regardless of the error rate detected.
Test type of TSTDSL. Valid value(s):
- **CRC** = Corrupt cyclic redundancy check (CRC) test. This test causes CRC errors which will increment the level 1 error counts. This test is valid only on ANSI® U-DSL.
- **MSMTCH** = Manual line termination (LT)/network termination (NT) mismatch test. This test detects layer 1 mismatch between the type of U-card and NT or the first BRITE CU. This test is valid only on U-DSL.

Automatic line evaluation (ALE) session type. Valid value(s):
- **ALL** = All of the below (default).
- **LEVEL1** = Applies to U-DSL layer 1 error counts. For ANSI® U-cards, the counts are upstream and downstream block errors (BE), errored seconds (ES) and severe errored seconds (SES). For AMI U-cards, the count is upstream errored seconds.
- **LEVEL2** = Applies to all integrated services digital network (ISDN) protocol channel frame error information.
- **PER** = Applies to the protocol error history for an ISDN protocol channel.

ALE report/reset option. Valid value(s):
- **REPT** = Retrieve and report the error counts (default).
- **RESET** = Reset the error counts and clear the PER tables. The current values of the error counts will be output before being cleared.
- **SRESET** = Silently reset the error counts. Operates exactly like the RESET option except that current values will not be output.

Set of level 1 error counts. This option is valid only on ANSI® U-DSL. Valid value(s):
- **ALL** = All of above counts.
- **CU** = When the CU option is not followed by a specific channel unit number (that is, CU only), then counts for all populated channel units will be printed. Due to the potential time required to collect data for a CU, this option is only allowed for single port ALE requests.
- **CUn** = Current and previous interval counts stored on a specified BRITE CU (‘n’ is 1 through 6).
- **CURR** = Current hour, interval, and day counts (default).
- **DAY** = Current and previous day counts (except BE).
- **HIST** = Recent interval history (ES only).
- **HOUR** = Current and previous hour counts.
- **INT** = Current and previous interval counts.
- **LCCU** = Current and previous hour counts, and current and previous interval counts on all BRITE CUs.
- **PREV** = Previous hour, interval, and day counts.

If ‘k’ = CRC, test direction.

The IDCU CRC test is run in one direction at a time and this direction may be a specified value to the CRC parameter. Valid value(s):
- **DWN** = Perform a CRC test using the downstream registers of the LT on the U-DSL, reporting only downstream PM results on output.
- **UP** = Perform a CRC test using the upstream registers of the LT on the U-DSL, reporting only upstream PM results on output.
The test direction values are not used by RISLU/ISLU DSLs, as these DSLs always run the CRC test in both directions.

4. SYSTEM RESPONSE

NG  = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

OK  = Good. The remove of the port from service was performed.

PF  = Printout follows.

14.1 (AUTO TRUNK TEST)
TST:WSCPE

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a test of customer premises equipment (CPE) connected to a digital subscriber line (DSL) at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line input message. A TP must be selected before requesting the test. Refer to the SET:WSPOS input message.

Note: This input message is the message interface between the line/trunk testing software and the TLWS numeric menu options (refer to the MCC Display Page 160). The test results from this input message are displayed on a TLWS screen and are not printed on the ROP. Direct input of this message is not allowed. Instead, use the TST:DSL input message for testing.

The RMV and RST tests can be run on custom multi-point (MP) and standard interface CPEs. (However, FIP CPE on custom MP interface must be able to respond to a MIM end-point service message which notifies the CPE of a service state change).

2. FORMAT

[1] TST:WSCPE,TP=a,TEST={CPE|PRINT|REFRESH|USPID};
[2] TST:WSCPE,TP=a,TEST={RMV|RST},CPE=b;
[3] TST:WSCPE,TP=a,TEST=LPBK,CPE=b,BLKSZ=c,CHAN=d[,PS];

3. EXPLANATION OF MESSAGE

PS = Indicates a loopback test to be run a packet switched channel.

TEST = Type of test request. Valid value(s):
CPE = Display the CPE information on the TLWS screen.
LPBK = Interactive digital test with a loopback established at the CPE (valid only for CPE that support testing).
PRINT = Print the CPE information, along with information about CPE provisioned for service on the DSL, but not currently connected.
REFRESH = Refresh the TLWS screen display.
RMV = Remove a CPE from service.
RST = Restore a CPE to service.
USPID = Display the user service profile identifier (USPID) on the TLWS screen.

WSCPE = Work station customer premises equipment (CPE).
a = TLWS TP number.
b = The CPE number as displayed on the TLWS screen.
c = Number of bits in the blocks (block size, BLKSZ) to be sent.
Channel of the DSL (B1, B2, or ANY). ‘ANY’ causes the first valid B-channel available to be used for the test.

4. SYSTEM RESPONSE

Hardware and resource errors that occur after a TLWS message has been accepted are displayed on the TLWS menu screen.

IP = In progress.

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses. If this message is attempted as direct input, the error response "DIRECT INPUT NOT ALLOWED, USE TST:DSL" will be displayed.

RL = Retry later.

MCC Display Page(s):

160 (TRUNK & LINE MAINT)
TST:WSDGTL

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests digital testing on the port seized at the trunk and line work station (TLWS) test position (TP).

2. FORMAT

TST:WSDGTL,TP=a[,TERM=b][,BLKSZ=d][,CHAN=e][,TESTEQ=f][,PS][,USERDEF][,UCL];

3. EXPLANATION OF MESSAGE

CHAN = Channel.

PS = Run a packet type test. This parameter is not necessary when running tests on channels with permanent circuit or packet service, because the test type can be determined internally according to the channel provisioning. However, this parameter must be specified to run a packet test on on-demand packet (ODP) channels (default test type for ODP channels is circuit).

TERM = Termination point.

TESTEQ = Information pertaining to the test equipment being used in the testing.

UCL = Do not interrupt the test when the NT1 goes to test mode. This option applies only on ANSI U-DSL.

USERDEF = Run the digital test using the user-defined defaults. If no defaults have been previously set for the test position, the system defaults are used.

a = TLWS TP number.

b = Termination point for the loopback. Valid value(s):

CUc = Loopback point is a specified basic rate interface transmission extension (BRITE) channel unit (CU). Only valid on U-DSLs. For ANSI U-DSLs, c = 1 through 6. For AMI U-DSLs, c = 1 through 4.

EXT = Loopback is an external connection to the terminal. The digital bit stream is sent out, and it is the terminal’s option to send the bits back in the sent format or in an inverted format.

LBK = Loopback test, for a digital trunk, sends the digital bit stream out to the far end office. The far end office sends the bit stream back in the same format. (digital trunks only)

LBKCSU = Loopback test, for a packet-switching digital trunk, sends the digital bit stream out to the channel service unit (CSU). The CSU sends the bit stream back in the same format. Valid for packet switching trunks only.

LBKINV = Loopback test, for a digital trunk, sends the digital bit stream out to the far end office. The far end office sends the bit stream back in the inverted format. (digital trunks only)

LBKOCU = Loopback test, for a packet-switching digital trunk, sends the digital bit stream out to the office channel unit (OCU). The OCU sends the bit stream back in the same
format. Valid for packet switching trunks only.

**LBKSHT**

= Loopback test, for a speech handler trunk, sends the digital bit stream in to the speech handler (SH). The SH sends the bit stream back in the same format. Valid for speech handler trunks only.

**LT**

= Loopback point is a physical loopback in the line card. Default value for the digital subscriber line (DSL). (DSL only)

**MANSINK**

= Sets a loopback for a loopback test originated by the far end switch. When the far end switch sends a digital bit stream, the 5ESS® switch sends the digital bit stream back in the same format. Note: Block size entered is irrelevant when this termination is used. Valid for packet switching trunks only.

**MANSRCE**

= Loopback test, for a packet-switching digital trunk sends the digital bit stream out to the far end switch. The far end switch sends the digital bit stream back in the same format. Note: the far end switch must manually set the loopback prior to running this test. Valid for packet switching trunks only.

**NT1**

= Loopback point is a physical loopback at the network termination (NT1). Default value for U-DSL. (U-DSL only)

**PH**

= Loopback point is in the protocol handler. (DSL only)

**d**

= Number of bits in the blocks to be sent (1 - 64000, Default: 56000).

**e**

= Channel of the DSL (valid for DSLs only). Valid value(s):

- **ALL**
  = Run the test on all the channels of the DSL.
- **B1**
  = Run the test on the B1-channel.
- **B2**
  = Run the test on the B2-channel.
- **D**
  = Run the test on the D-channel.

**f**

= Channel of the DSL for which information pertaining to the test equipment being used in the testing is displayed. Valid value(s):

- (default).
- **B1**
  = Display the B1-channel test equipment information.
- **B2**
  = Display the B2-channel test equipment information.
- **D**
  = Display the D-channel test equipment information.

### 4. SYSTEM RESPONSE

**IP**

= In progress.

**NG**

= No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

**RL**

= Retry later. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

160 (TRUNK & LINE MAINT)
1. PURPOSE

Requests to measure signal characteristics in a transmission test on the line or trunk that was seized at the trunk and line work station (TLWS) test position (TP).

Note: If the TLWS talk and monitor (T&M) phone is not busy, it is automatically brought into the connection. During measurements the phone is in the MONITOR mode.

2. FORMAT

TST:WSMEAS,TP=a[,TEST=b][,ST];

3. EXPLANATION OF MESSAGE

ST
- Send tone simultaneous with the measurement. Sending a simultaneous tone is only allowed for the following measurement types: BBAND, L1, L2, L4, NOISE, and NWT. The tone is sent over the port at the frequency and level stored for the test position using the SET:WSFREQ input message.

a
- TLWS TP number.

b
- Type of measurement. Valid value(s):
  - BBAND = Broadband level.
  - ERL = Echo-return loss.
  - L4 = Level at 404 Hz.
  - L1 = Level at 1004 Hz.
  - L2 = Level at 2804 Hz.
  - MEASURE = Composite measure at BBAND, 404 Hz, 1004 Hz and 2804 Hz with the results being the largest measurement response. This is the default test.
  - NOISE = Far-to-near noise level.
  - NWT = Far-to-near level at 1004 Hz, -16 db.
  - SRL = Singing return loss.
  - SRLHI = Singing return loss, high.

4. SYSTEM RESPONSE

IP
- In progress.

NG
- No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

5. REFERENCES

Input Message(s):
TST:WSMET

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests testing the metallic characteristics of the line or trunk attached to a trunk and line work station (TLWS) test position (TP).

Note: If the TLWS talk & monitor (T&M) phone is not busy, it is automatically brought into the connection. During metallic measurements the phone is in the ON HOLD state, so as not to interfere with the measurements.

2. FORMAT

TST:WSMET, TP=a[,TEST=b;][][,testeq=c;][][offtest=d;]

3. EXPLANATION OF MESSAGE

a = TLWS TP number.

b = Type of metallic measurement test. Valid value(s):
ALL = Perform voltage, resistance, and capacitance tests.
C = Perform capacitance test.
CC = Perform collect coin test (DCTU on coin only).
DC = Perform detect coin test (DCTU on coin only).
DIST = Perform distance to open test (line only).
HT = Perform home totalizer test (DCTU on coin only).
OFKT = Perform SLIM Off-hook test (SLIM on analog line only).
PGTC = Add the pair gain test controller into the metallic connection for testing universal-SLC® (U-SLC) ports (DCTU only).
R = Perform resistance test.
RC = Perform return coin test (DCTU on coin only).
RINGER = Perform ringer count test (DCTU on line only).
SHORT = Perform monitor for short test.
V = Perform voltage test.

c = Type of metallic test equipment. Valid value(s):
DCTU = Directly connected test unit.
SLIM = Subscriber line and measurement.

d = Type of SLIM off-hook test. Valid value(s):
DIALPULSE = Perform dial speed abd pulse test.
FLASH = Perform duration test hook flash.
KEYTONE = Perform keytone test.
LOOPRES = Perform offhook loop resistance test.
RING = Perform ring line test (default).
4. SYSTEM RESPONSE

IP = In progress.

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages Manual for an explanation of TLWS error responses.

160 (TRUNK & LINE MAINT)
**1. PURPOSE**

Requests MONITOR access to either a busy or idle port at the trunk and line work station (TLWS) test position (TP), depending on the mode option chosen in the input message.

The TLWS talk & monitor (T&M) phone must be available for use with this connection. It is in the MONITOR state for the connection.

**2. FORMAT**

TST:WSMNTR,TP=a[,MODE=b];

**3. EXPLANATION OF MESSAGE**

a = TLWS TP number.

b = Mode for the MONITOR function. Valid value(s):

- **BUSY** = The user can monitor audio only on a busy line/trunk.
- **IDLE** = The user can monitor audio on either a busy or idle line/trunk. In addition to monitoring, this mode will display the dialed digits and signals/tones sent or received by the switch.

**4. SYSTEM RESPONSE**

- **IP** = In progress.

14.3 (TRUNK AND LINE WORK STATION)
TST:WSSEND

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that a tone be sent over, or a termination be applied to, the port currently seized at the trunk and line station (TLWS) test position (TP).

Note: If the TLWS talk and monitor (T&M) phone is not busy, it is automatically brought into the connection. During sending of tone, it is in the MONITOR mode.

2. FORMAT

[1] TST:WSSEND,TP=a,SEND[,FREQ=b][,LVP=c|,LVN=d];

[2] TST:WSSEND,TP=a[,TEST=e];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = TLWS TP number.

b = Frequency in hertz (0 - 4000). If not specified, the user defined value set with the SET:WSFREQ input request will be used.

c = Level in positive tenths of db of the tone (0-30) (for example, +2.4 dbm is specified as 24). If not specified, the user defined value set with the SET:WSFREQ input request is used.

d = Level in negative tenths of a db of the tone (0 - 480) (for example, -24 dbm is specified as 240). If not specified, the user defined value set with the SET:WSFREQ input request is used.

e = Test to be run.

OPEN = Open termination: applies only to analog trunks; supervision is not monitored.
QUIET = Quiet termination: applies to both lines and trunks; supervision is monitored during the quiet interval.
SEND = Send tone at frequency and level stored for the TLWS TP. The SET:WSFREQ input request is used to store the frequency and level. This is the default test.

4. SYSTEM RESPONSE

IP = In progress.

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

160 (TRUNK & LINE MAINT)
1. PURPOSE

Requests that supervision characteristics of the line or trunk be tested at the trunk and line work station (TLWS) test position (TP) number that was seized using a TLWS seize line, trunk, or incoming call input message. A TP must be selected before requesting the test. Refer to the SET:WSPOS input message.

Format 1 is used to initiate a specific supervision test on a line or trunk [except for recorded announcement function (RAF) or service announcement system (SAS)]. Format 2 is used to play a single phrase or all phrases on a recorded announcement port. Format 2 can also be used to play a range of phrases (playing a range of phrases applies only to a SAS). Format 3 is used to play a complete announcement or execute a dial-through announcement test on a RAF or SAS port.

2. FORMAT

[1] TST:WSSUPV,TP=a,TEST=b;
[2] TST:WSSUPV,TP=a,TEST=PHRASE,PHRASE=c[&h][,TIME=i];
[3] TST:WSSUPV,TP=a,TEST={ANN|DTA},APPL=d,HANN=e,TANN=f,INFL=g,ANNCSET=j[,TIME=i];

3. EXPLANATION OF MESSAGE

ANN = Play an announcement [digital service unit 2 - recorded announcement function (DSU2-RAF) or SAS port only].

DTA = Dial-through announcement test (DSU2-RAF or SAS port only).

PHRASE = Play phrase(s) (DSU2-RAF or SAS port only).

a = TLWS TP number.

b = Test options. Valid value(s):

CCOR = Coin collect and operator released signal test (incoming operator trunk only).
CNCL = Coin collect signal test (incoming operator trunk only).
CNDT = Coin detect (line only).
CNRT = Coin return signal test (incoming operator trunk only).
DSEC = Disable echo canceler (trunk only).
ENECL = Enable echo canceler (trunk only).
HMTO = Home totalizer (line only).
MSMTCH = Network termination 1 (NT1) mismatch test (U-card only).
OFF = Trunk off-hook (trunk only).
ON = Trunk on-hook (non-common channel signaling [CCS] trunk only). For CCS7 trunks a release (REL) message is sent to the far end.
OPAT = Operator attached signal test (incoming operator trunk only).
OPRL = Operator released signal test (incoming operator trunk only).
PPTONE = Defense switch network (DSN) preemption tone (DSN office only).
QWINK = Quick wink test (trunk only).
RING = Ring line (line only).
RNGBK = Ringback test (trunk only).
ROH = Receiver off-hook (line only).
SHLB = Set up a loopback at the speech handler [speech handler trunk (SHT) only].
SHUNLB = Tear down a loopback at the speech handler (SHT only).
WINK = Wink test (trunk only).

c = Phrase number (0-65535) for RAF, 0 plays all phrases. For SAS this is the low range (0-65530).

d = Announcement application (APPL). Valid value(s):
   2LVL = LASS 2-level activation.
   ACSR = Automatic customer station rearrangement.
   L2 = Non-English Language 2 for OSPS.
   L3 = Non-English Language 3 for OSPS.
   L4 = Non-English Language 4 for OSPS.
   L5 = Non-English Language 5 for OSPS.
   L6 = Non-English Language 6 for OSPS.
   L7 = Non-English Language 7 for OSPS.
   LASS = LASS screen list editing.
   OSPSDA = Operator Services Position System (OSPS) directory assistance.
   OSPSTA = OSPS toll and assistance.
   PVN = Private virtual network custom announcements.
   RAS = Remote access service.

  e = Header announcement (HANN) ID (0-65535).
  f = Trailer announcement (TANN) ID (0-65535).
  g = Inflection (INFL) ID (0-255).
  h = Phrase number high range (SAS only) (1-65530).
  i = Time to wait for announcement or phrase playback (SAS only) (15-60) minutes.
  j = Alternate Announcement Set (ANNCSET) ID (0-1022).

4. SYSTEM RESPONSE

NG = No good. Refer to the APP:TLWS appendix in the Appendixes section of the Output Messages manual for an explanation of TLWS error responses.

OK = Good.

80. UPD
UPD: APPLY-BYTER-A

Software Release: 5E14 - 5E15
Command Group: SFTMGT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests application of a byte replacement update associated with a software update. BYTER writes into sequential memory locations in processes.

Format 1 is used for administrative module (AM) updates only.

Format 2 is used for switching module (SM), communications module processor (CMP) or peripheral updates.

Format 3 is used for updates that require the existence of the pathlist file to determine where the update is to be applied.

WARNING: This message overwrites data in the memory of the switch. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. FORMAT

[1] UPD: APPLY: BYTER, UPNM="a", FN="b", TARGET=AM, ADDR=d, DATA=e, ...
...
OLDDATA=f[, UCL][, WTIME="h"];

[2] UPD: APPLY: BYTER, UPNM="a", FN="b", TARGET=c, PACKINFO="g", ...
...
[, UCL][, DF="j"];

[3] UPD: APPLY: BYTER, UPNM="a", FN="b", TARGET="AMPATH", PACKINFO="g". ...
...
DF="j", [UCL];

3. EXPLANATION OF MESSAGE

UCL = Do not enforce order on the software update name 'a'.

a = Software update. This can be specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update. Double quotes (" ") are required.

b = The name of the file to be changed, specified by the pathname 'b'. Refer to the Routine Operations and Maintenance manual for definitions of file and pathname.

c = The processor to receive the update. Valid value(s):
AMPATH = Office specific update in the AM.
CMP = Communication module processor.
DDMA = Diagnostic direct memory access
DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
DNUSTMX = Transmission multiplexer.
DSC3 = Digital service circuit - model 3.
DSP13K = 8K digital signal processor for CDMA protocol handler for voice.
DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
DSPEVRC = EVRC digital signal processor for CDMA protocol handler for voice.
GDSF = Global digital services function - model 3.
HDSU = Hardware digital service unit.
HSAS = Service announcement system diagnostic image.
IDCUCCP = Integrated digital carrier unit (IDCU) common control processor.
IDCUDLP = IDCU data link processor.
IDCULSI = IDCU loop side interface.
IP3S = Protocol handler 3 CCS OIP image.
IP4F = Frame relay protocol handler version 4 I/O processor.
IP4I = PH4I operational input/output processor.
IP4IF = ISDN Frame Relay protocol handler version 4 I/O processor.
ISLU = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
LDSU = Local digital service unit.
LDSF = Local digital services function - model 3.
MSGH = Message handler.
ODMA = Operational direct memory access.
O1OP = Operational input/output processor.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH3C = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S = PH3 CCS AP image.
PH4A = Protocol handler 4 (PH4) access image.
PH4G = PH4 gateway image.
PH4I = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A = Protocol handler for ATM (asynchronous transfer mode).
PI = Packet interface.
PI2 = Packet interface unit 2.
PHV1C = Protocol handler for voice for CDMA (code division multiple access).
PHV3C = Protocol handler for voice version 3 for CDMA application.
PHV4C = Protocol handler for voice version 4 for CDMA application.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
SMPMH = Switching module processor message handler (MH) operational image.
SMPMHLB = Switching module processor MH little boot image.
V3DACP = ACELP digital signal processor, for TDMA protocol handler for voice.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DEVR1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4DEVR2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4DEVR3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.
d = The starting address (in decimal) of the overwrite, which must be on a word boundary.

e = The overwrite that will be placed at starting address 'd'. Each overwrite must be four bytes long. A list of up to 32 overwrites may be entered. The order they are entered is the order in which they will be written into the file, 'b'.

f = Expected contents of the locations to be overwritten. Old contents must be given for every overwrite entered. The order they are entered will be the order they are compared to the contents in the file 'b', starting at address 'd'.

g = Name of the PACKINFO file. Double quotes (" ") are required.

h = The number of seconds ("wait time", WTIME), for the automatic backout wait (0-3600 seconds, default: 300). This parameter is only applicable when 'b' is non-killable.

j = The path name of the dependent file to be changed. Refer to the Routine Operations and Maintenance manual for definitions of file and path name. Double quotes (" ") are required.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the UPD:APPLY output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests application of a byte replacement update associated with a software update. BYTER writes into sequential memory locations in processes.

Format 1 is used for administrative module (AM) updates only. Format 2 is used for switching module (SM), communications module processor (CMP) or peripheral updates. Format 3 is used for updates that require the existence of the pathlist file to determine where the update is to be applied.

WARNING: This message overwrites data in the memory of the switch. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. FORMAT

   . . .OLDDATA=f[,UCL][,WTIME="h"];

   . . .[,UCL][,DF="j"];

   . . .DF="j"[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Do not enforce order on the software update name 'a'.

a = Software update. This can be specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update. Double quotes (" ") are required.

b = The name of the file to be changed, specified by the pathname 'b'. Refer to the Routine Operations and Maintenance manual for definitions of file and pathname.

c = The processor to receive the update. Valid value(s):
   AMPATH = Office specific update in the AM.
   CMP = Communication module processor.
   DDMA = Diagnostic direct memory access
   DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
   DNUSTMX = Transmission multiplexer.

Software Release: 5E14 - 5E15
Command Group: SFTMGT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests application of a file replacement update associated with a software update. FILER replaces an old file with a new one. The new file retains the old file's characteristics (mode, owner, and so forth).

Format 1 is to be used for administrative module (AM) updates only.
Format 2 is to be used for switching module (SM), communications module processor (CMP) or peripheral updates.
Format 4 is to be used for updates that need the existence of the pathlist file to determine where the update will be applied.

WARNING: This message overwrites data in system files. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. FORMAT

[2] UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=c,UF="d",DF="e" [,UCL];
[3] UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=g,UF="e",DF="f" [,UCL];

3. EXPLANATION OF MESSAGE

NREL = Forces a file replacement of 'b' by 'd' when the file types are different in their magic numbers or when one is in common object file format and the other is not.

UCL = Do not enforce order on the software update name 'a'.

a = Software update. These can be specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update. Double quotes (""") are required.

b = Pathname of the file to be replaced. Refer to the Routine Operations and Maintenance manual for definitions of pathname and file. If the file does not exist it will be created.

c = The processor to receive the update. Valid value(s):
AMPATH = Office specific update in the AM.
CMP = Communication module processor.
DDMA = Diagnostic direct memory access
DNUSCC  = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
DNUSTMX = Transmission multiplexer.
DSC3     = Digital service circuit - model 3.
DSP13K   = 8K digital signal processor for CDMA protocol handler for voice.
DSP8K    = 8K digital signal processor for CDMA protocol handler for voice.
DSP EVRC = EVRC digital signal processor for CDMA protocol handler for voice.
GDSF     = Global digital services function - model 3.
HDSU     = Hardware digital service unit.
HSAS     = Service announcement system diagnostic image.
IDCU CCP = Integrated digital carrier unit (IDCU) common control processor.
IDCU DLP = IDCU data link processor.
IDCU ISI = IDCU loop side interface.
IP3S     = Protocol handler 3 CCS OIP image.
IP4F     = Frame relay protocol handler version 4 I/O processor.
IP4I     = PH4I operational input/output processor.
IP4IF    = ISDN Frame Relay protocol handler version 4 I/O processor.
ISLU     = Integrated services line unit.
ISLU 2   = Integrated services line unit 2.
ISTF     = Integrated services test function.
LDSU     = Local digital service unit.
LDSF     = Local digital services function - model 3.
MSGH     = Message handler.
ODMA     = Operational direct memory access.
O10P     = Operational input/output processor.
PH2A     = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G     = PH2 with GATEWAY application processor image.
PH3C     = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S     = PH3 CCS AP image.
PH4A     = Protocol handler 4 (PH4) access image.
PH4G     = PH4 gateway image.
PH4I     = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A    = Protocol handler for ATM (asynchronous transfer mode).
P1        = Packet interface.
P12       = Packet interface unit 2.
PHV1C    = Protocol handler for voice for CDMA (code division multiple access).
PHV3C    = Protocol handler for voice version 3 for CDMA application.
PHV4C    = Protocol handler for voice version 4 for CDMA application.
RAF      = Recorded announcement function.
SAS      = Service announcement system operational image.
SM       = Switching module.
SMP MH   = Switching module processor message handler (MH) operational image.
SMP MH LB = Switching module processor MH little boot image.
V3 DACP  = ACELP digital signal processor, for TDMA protocol handler for voice.
V4D13K   = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K    = 8K DSP, for CDMA protocol handler for voice version 4.
V4 DACP  = ACELP DSP, for TDMA protocol handler for voice version 4.
V4 DEVR 1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4 DEVR 2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4 DEVR 3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

d = Name of the source file in the software update package.
e = Pathname of the dependent file to be replaced. Refer to the Operations and Routine Maintenance manual for definitions of pathname and file. If the file does not exist it will be created.

4. SYSTEM RESPONSE

1950 PROGRAM UPDATE MAINTENANCE
1960 INSTALL BWM
**UPD: APPLY-FILER-B**

**Software Release:** 5E16(1) only  
**Command Group:** SFTMGT  
**Application:** 5,3B  
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests application of a file replacement update associated with a software update. FILER replaces an old file with a new one. The new file retains the old file's characteristics (mode, owner, and so forth).

Format 1 is to be used for administrative module (AM) updates only.  
Format 2 is to be used for switching module (SM), communications module processor (CMP) or peripheral updates.  
Format 4 is to be used for updates that need the existence of the pathlist file to determine where the update will be applied.

**WARNING:** This message overwrites data in system files. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. **FORMAT**

1. \[1\] `UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=AM,UF="d",[NREL],[UCL];`

2. \[2\] `UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=c,UF="d",UF="e",[UCL];`

3. \[3\] `UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=g,UF="e",DF="f",[UCL];`

4. \[4\] `UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=AMPATH,UF="d",[NREL]. . .[UCL];`

3. **EXPLANATION OF MESSAGE**

- **NREL** = Forces a file replacement of 'b' by 'd' when the file types are different in their magic numbers or when one is in common object file format and the other is not.

- **UCL** = Do not enforce order on the software update name 'a'.

- **a** = Software update. These can be specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update. Double quotes (" ") are required.

- **b** = Pathname of the file to be replaced. Refer to the Routine Operations and Maintenance manual for definitions of pathname and file. If the file does not exist it will be created.

Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests application of a file replacement update associated with a software update. FILER replaces an old file with a new one. The new file retains the old file's characteristics (mode, owner, and so forth).

Format 1 is to be used for administrative module (AM) updates only.

Format 2 is to be used for switching module (SM), communications module processor (CMP) or peripheral updates.

Format 4 is to be used for updates that need the existence of the pathlist file to determine where the update will be applied.

WARNING: This message overwrites data in system files. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. FORMAT

[1] UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=AM,UF="d" [,NREL][,UCL];

[2] UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=c,UF="d",DF="e" [,UCL];

[3] UPD:APPLY:FILER,UPNM="a",FN="b",TARGET=g,UF="e",DF="f" [,UCL];

3. EXPLANATION OF MESSAGE

NREL = Forces a file replacement of 'b' by 'd' when the file types are different in their magic numbers or when one is in common object file format and the other is not.

UCL = Do not enforce order on the software update name 'a'.

a = Software update. These can be specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BW, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update. Double quotes (" ") are required.

b = Pathname of the file to be replaced. Refer to the Routine Operations and Maintenance manual for definitions of pathname and file. If the file does not exist it will be created.
The processor to receive the update. Valid value(s):

- **AMPATH** = Office specific update in the AM.
- **CMP** = Communication module processor.
- **DDMA** = Diagnostic direct memory access.
- **DNUSCC** = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
- **DNUSTMX** = Transmission multiplexer.
- **DSC3** = Digital service circuit - model 3.
- **DSP13K** = 8K digital signal processor (DSP) for code division multiple access (CDMA) protocol handler for voice.
- **DSP8K** = 8K digital signal processor for CDMA protocol handler for voice.
- **DSPEVRC** = EVRC digital signal processor for CDMA protocol handler for voice.
- **GDSF** = Global digital services function - model 3.
- **HDSU** = Hardware digital service unit.
- **HSAS** = Service announcement system diagnostic image.
- **IDCUCCP** = Integrated digital carrier unit (IDCU) common control processor.
- **IDCUDLP** = IDCU data link processor.
- **IDCULSI** = IDCU loop side interface.
- **IP22** = PH22 common input/output processor (IOP) image.
- **IP3S** = PH3 CCS IOP image.
- **IP4F** = Frame relay PH4 IOP image.
- **IP4I** = ISDN PH4 IOP image.
- **IP4IF** = ISDN frame relay PH4 IOP image.
- **ISLU** = Integrated services line unit.
- **ISLU2** = Integrated services line unit 2.
- **ISTF** = Integrated services test function.
- **LDSU** = Local digital service unit.
- **LDSF** = Local digital services function - model 3.
- **MSGH** = Message handler.
- **ODMA** = Operational direct memory access.
- **OIOP** = Operational input/output processor.
- **OIU24** = Optical interface unit (OIU) - 24 channels.
- **OIUIP** = Optical interface unit - internet protocol (IP).
- **PH2A** = Protocol handler 2 (PH2) with ACCESS application processor (AP) image.
- **PH2G** = PH2 with GATEWAY AP image.
- **PH22I** = PH22 wireless ISDN AP image.
- **PH22S** = PH22 signaling AP image.
- **PH3C** = PH3 with COMMON AP image.
- **PH3S** = PH3 CCS AP image.
- **PH4A** = PH4 access AP image.
- **PH4G** = PH4 gateway AP image.
- **PH4I** = PH4 with ISDN AP image.
- **PHA1A** = Protocol handler for asynchronous transfer mode (ATM) AP image.
- **PHA2A** = Protocol handler for ATM model 2 AP image.
- **PHE2E** = Protocol handler for ethernet.
- **PI** = Packet interface.
- **PI2** = Packet interface unit 2.
- **PHV1C** = Protocol handler for voice version 1 (PHV1) for CDMA AP image.
- **PHV2C** = PHV2 for CDMA application AP image.
- **PHV3C** = PHV3 for CDMA application AP image.
- **PHV4C** = PHV4 for CDMA application AP image.
PHV5C = PHV5 for CDMA application AP image.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
SMPMH = Switching module processor message handler (MH) operational image.
SMPMHLB = Switching module processor MH little boot image.
V3DACP = ACELP DSP for TDMA PHV3.
V4D13K = 13K DSP, for CDMA for PHV4.
V4D8K = 8K DSP, for CDMA for PHV4.
V4DACP = ACELP DSP, for TDMA for PHV4.
V4DEVR1 = EVRC1 DSP, for CDMA for PHV4.
V4DEVR2 = EVRC2 DSP, for CDMA for PHV4.
V4DEVR3 = EVRC3 DSP, for CDMA for PHV4.
V4DVSP = VSELP DSP, for TDMA for PHV4.
V4DISL = ISLP DSP, for IS41 TDMA PHV4 data circuit.
V5D13K = 13K DSP, for CDMA for PHV5.
V5D8K = 8K DSP, for CDMA for PHV5.
V5DACP = ACELP DSP, for TDMA for PHV5.
V5DEVR1 = EVRC1 DSP, for CDMA for PHV5.
V5DEVR2 = EVRC2 DSP, for CDMA for PHV5.
V5DEVR3 = EVRC3 DSP, for CDMA for PHV5.
V5DVSP = VSELP DSP, for TDMA PHV5.
V5DISL = ISLP DSP, for IS41 TDMA PHV5 data circuit.

d = Name of the source file in the software update package.
e = Pathname of the dependent file to be replaced. Refer to the Operations and Routine Maintenance manual for definitions of pathname and file. If the file does not exist it will be created.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests application of a function replacement update associated with a software update.

Format 1 is to be used for AM updates only.

Format 2 is to be used for SM, CMP or peripheral updates.

Format 3 is to be used for updates that need the existence of the pathlist file to determine where the update will be applied.

WARNING: This message overwrites data in system files and in the memory of the switch. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. FORMAT

     \{,UCL\}[,WTIME="h"];

     \{,DF="g"\}[,UCL];

     \{,DF="g"\}[,UCL];

3. EXPLANATION OF MESSAGE

UCL = Do not enforce order on the BWM name 'a'.

a = Software update. These can be specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy are the last two digits of the year, and nnnn is the sequence number identifying the software update. Double quotes (" ") are required.

b = Pathname of the file to be modified. Refer to the Operations and Routine Maintenance manual for definitions of pathname, directory and files.

c = The processor to receive the update. Valid value(s):

AMPATH = Office specific update in the AM.
CMP = Communication module processor.
DDMA = Diagnostic direct memory access
DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common
control.

DNUSTMX = Transmission multiplexer.
DSC3 = Digital service circuit - model 3.
DSP13K = 8K digital signal processor (DSP) for code division multiple access (CDMA) protocol handler for voice.

DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
DSPVRC = EVC digital signal processor for CDMA protocol handler for voice.
GDSF = Global digital services function - model 3.
HDSU = Hardware digital service unit.
HSAS = Service announcement system diagnostic image.

IDCUCCP = Integrated digital carrier unit (IDCU) common control processor.
IDCUDLP = IDCU data link processor.
IDCULSI = IDCU loop side interface.

IP22 = PH22 common input/output processor (IOP) image.
IP3S = PH3 CCS IOP image.
IP4F = Frame relay PH4 IOP image.
IP4I = ISDN PH4 IOP image.
IP4IF = ISDN frame relay PH4 IOP image.
ISLU = Integrated services line unit.

ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.

LDSU = Local digital service unit.

LDSF = Local digital services function - model 3.

MH32 = Switching module processor message handler 32 (MH32) image.
MHEIB = Switching module processor message handler EIB (MHEIB) image.

MLB = Switching module processor MH little boot image.
MHPPC = Switching module processor message handler PowerPC® (MHPPC) image.

MHPPCLB = Switching module processor MHPPC little boot image.

MSGH = Message handler.

ODMA = Operational direct memory access.

OIOP = Operational input/output processor.

OIU24 = Optical interface unit (OIU) - 24 channels.
OIUIP = Optical interface unit - internet protocol (IP).

PH2A = Protocol handler 2 (PH2) ACCESS application processor (AP) image.
PH2G = PH2 GATEWAY AP image.

PH22I = PH22 wireless ISDN AP image.
PH22S = PH22 signaling AP image.

PH3C = PH3 COMMON AP image.

PH3S = PH3 CCS AP image.

PH4A = PH4 access AP image.

PH4G = PH4 gateway AP image.

PH4I = PH4 ISDN AP image.

PHA1A = Protocol handler for asynchronous transfer mode (ATM) AP image.

PHA2A = Protocol handler for ATM model 2 AP image.

PHE2E = Protocol handler for ethernet.

PI = Packet interface.

P12 = Packet interface unit 2.

PHV1C = Protocol handler for voice version 1 (PHV1) for CDMA AP image.

PHV2C = PHV2 for CDMA application AP image.

PHV3C = PHV3 for CDMA application AP image.

PHV4C = PHV4 for CDMA application AP image.
PHVS = PHV5 for CDMA application AP image.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
V3DACP = ACELP DSP for TDMA PHV3.
V4D13K = 13K DSP, for CDMA for PHV4.
V4D8K = 8K DSP, for CDMA for PHV4.
V4DACP = ACELP DSP, for TDMA for PHV4.
V4DEVR1 = EVRC1 DSP, for CDMA for PHV4.
V4DEVR2 = EVRC2 DSP, for CDMA for PHV4.
V4DEVR3 = EVRC3 DSP, for CDMA for PHV4.
V4DVSP = VSELP DSP, for TDMA for PHV4.
V4DISL = ISLP DSP, for IS41 TDMA PHV4 data circuit.
V5D13K = 13K DSP, for CDMA for PHV5.
V5D8K = 8K DSP, for CDMA for PHV5.
V5DACP = ACELP DSP, for TDMA for PHV5.
V5DEVR1 = EVRC1 DSP, for CDMA for PHV5.
V5DEVR2 = EVRC2 DSP, for CDMA for PHV5.
V5DEVR3 = EVRC3 DSP, for CDMA for PHV5.
V5DVSP = VSELP DSP, for TDMA PHV5.
V5DISL = ISLP DSP, for IS41 TDMA PHV5 data circuit.

d = Name of the PACKINFO file.
e = Pathname(s) of one or more update files. May be the name of a single .m file, or a list of .m files. Refer to the Operations and Routine Maintenance manual for instructions on entering a list of file names.
f = Name of the file containing list of .m files for this update.
g = Pathname of the dependent file to be modified. Refer to the Operations and Routine Maintenance manual for definitions of pathname, directory, and files.
h = The number of seconds ("wait time", WTIME), for the automatic backout wait (0-3600 seconds, default: 300). This parameter is only applicable when 'b' is non-killable.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests update to the software update database (Cud) after the successful execution of the first input message preceding the first UPD:APPLY message in the APPLY section of the MSGS file in a software update (SU).

This input message is not part of the MSGS file and is automatically executed during the Software Update process. If there is no input message preceding the first UPD:APPLY line in the MSGS file, this input message will not be executed.

WARNING: This message overwrites data in system files and is automatically executed, if needed, when 9310 or 9410 is poked from the 1960 page or 9800 is poked from the 1940 page. It should not be used without expert technical assistance unless it is part of a prescribed software update procedure.

2. FORMAT

UPD:APPLY:UNIXCMD,UPNM="a";

3. EXPLANATION OF MESSAGE

a = Software update: specified as BMWyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BMW, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update ("" is required).

4. SYSTEM RESPONSE

PF = Printout follows. Followed by a UPD:APPLY output message.

- 1960 (INSTALL BWM)
UPD:AUTO
Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5.3B
Type: Input

1. PURPOSE
Requests that the status of software update (SU) process automation be determined and/or changed. This input message may be used to inhibit, allow, stop, resume, cancel or request the current status of SU process automation.

2. FORMAT
UPD:AUTO:a[,REASON=b];

3. EXPLANATION OF MESSAGE
a = Request type. Valid value(s):
ALW = Allow SU process automation. This allows an SU to be scheduled for automatic installation.
CANCEL = Cancels the scheduled automatic installation for the SU that is currently scheduled for automatic installation. May also be used to cancel an SU that has stopped its automatic installation.
INH = Inhibit SU process automation. This prevents an SU from being scheduled for automatic installation.
RESUME = Resume a previously stopped or aborted automated SU installation.

Note: This should NEVER appear in an SU MSGS file, and it should only be used by the office personnel to resume an automated SU installation that was previously stopped or aborted.

STATUS = Show the current status of SU process automation. If it is inhibited this option shows why it is inhibited by displaying the contents of the reason field.
STOP = Stop the automated SU installation that is currently in progress.

Note: This causes an office alarm to fire (MAJOR or MINOR alarm, as set in the SU automation office profile).

b = Reason that the office is inhibiting SU process automation (maximum length = 50 characters).

4. SYSTEM RESPONSE
NG = No good. The software update process automation feature is not available.
PF = Printout follows. The request has been accepted. Followed by a UPD:AUTO output message.

1950 (PROGRAM UPDATE MAINTENANCE)
1960 (INSTALL BWM)
UPD:AUTOPROFILE

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the software update (SU) process automation office profile be changed according to the arguments and values specified in the input message. This SU process automation office profile is used when an SU is scheduled to be automatically installed. The values contained in the office profile are used as defaults when an SU is scheduled in the case where other information is not given.

For example, if an SU is scheduled for automatic installation and no installation state is specified, then the installation state defaults to what is listed in the office profile (‘a’ in this case).

Note: The valid values allowed for each argument are listed with the description of each argument.

2. FORMAT

UPD:AUTOPROFILE: ({ [INSTATE="a"], [SOAKTM=b], [ALARMLVL="c"], [CSCANS="d"],
[WARNTM=e], [PROCINIT=f], [CLRBMW="g"], [SUNOFF=h-i], [MONOFF=h-i],
[TUEOFF=h-i], [WEDOFF=h-i], [THUOFF=h-i], [FRIOFF=h-i], [SATOFF=h-i],
[HCON=j], [HCOFF=k], [HCINFO=l] });

3. EXPLANATION OF MESSAGE

a = The install state. Valid value(s):
  OFC
  SOAK
  VFY

b = The length of soak time desired for an SU that is automatically installed in the form HHMM.
  HH = Hours.
  MM = Minutes.

c = The alarm level that should go off when an automated SU installation halts for any reason (MAJOR or MINOR). This also controls the level of alarm that fires for the advance warning message.

d = State indicating whether or not SU process automation update office profile input messages may be issued over the CSCANS interface (Y or N).

e = The time interval before SU automation starts that a warning message is desired in the form HHMM.
  HH = Hours.
  MM = Minutes.

For example, if set to 0030 then a warning message prints out and an office alarm goes off 30 minutes before a scheduled SU begins automatic installation.
f = The number of hours since any processor initialization took place for AM, SM, CMP in the form HH.
   HH = Hours.

g = State indicating whether or not SU process automation should remove the SU after it has completed the make official stage (Y or N).

h = The beginning of the time interval that SU automation is not allowed, for the given day in the form HHMM (from 0000 to 2359).

i = The end of the time interval that SU automation is not allowed, for the given day in the form HHMM (from 0000 to 2359).

j = A number indicating the health check condition that should be turned ON. Valid value(s) shown in Exhibit A.

k = A number indicating the health check condition that should be turned OFF. Valid value(s) shown in Exhibit A.

l = A number indicating the health check condition for which a more detailed explanation is desired. Valid value(s) shown in Exhibit A.

1960 (INSTALL BWM)
UPD:AUTOSCHED

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the named software update (SU) be scheduled for automatic installation (UPNM option) or requests
the status of the currently scheduled SU (STATUS option). It is important to note that if values are given for DATE,
time, and/or STATE, then these values are used only for the SU currently being scheduled and these values will
override the default values stored in the office profile. If no values are given, then the default values are used from
the office profile.

2. FORMAT

UPD:AUTOSCHED:STATUS [,UPNM="a"] [,DATE=b] [,TIME=c] [,STATE="d"]

3. EXPLANATION OF MESSAGE

STATUS = Show the status of the SU currently scheduled for automatic installation, if any.

a = The 10 character software update name.

b = The date to automatically install the SU in the form MMDDYY.
   DD = Day.
   MM = Month.
   YY = Year.

c = The time to automatically install the SU in the form HHMM.
   HH = Hour.
   MM = Minute.

d = The install state to automatically install the SU. Valid value(s):
   OFC
   SOAK
   VFY

4. SYSTEM RESPONSE

NG = No good. The software update process automation feature is not available.

PF = Printout follows. The request has been accepted. Followed by a UPD:AUTOSCHED output
message.

UPD:BKOUT

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that software updates be backed out. Software updates can be backed out only in the reverse order in which they were applied.

2. FORMAT

UPD:BKOUT: {UPNM="a" | ALL} [,OFC];

3. EXPLANATION OF MESSAGE

ALL = Remove all temporary software updates active in the system.
OFC = Backout software update 'a' even though it is official.
a = Software update: specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year, and nnnn is the sequence number identifying the software update (" " is required).

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by one or more UPD:BKOUT output messages.

**UPD:BLDBOOT**

**Software Release:** 5E14 and later  
**Command Group:** SFTMGT  
**Application:** 5,3B  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that the administrative module (AM) minimum-configuration or full-configuration boot image be updated. This message replaces UPD:APPDMRT and UPD:DMRT input messages only.

**WARNING:** All existing data in the targeted boot image will be destroyed.

2. **FORMAT**

UPD:BLDBOOT [, BOOTIMAGE="a"] [, SGDB="b"] [, SGGEN="c"] [, SHADOW="d"];

3. **EXPLANATION OF MESSAGE**

   a = Name of boot images to be generated. The default ("/dmert") rebuilds the minimum-configuration boot image. To rebuild the full-configuration boot image, use "/appdmert" (" " is required).

   b = Name of the system generation (SG) data base to be used in building the boot image. The default data base for the minimum-configuration boot image is /data base/dmert.sg. The default data base for the full-configuration boot image is /data base/appdmert.sg (" " is required).

   c = Pathname of the process to be executed to build the boot image. Refer to the Routine Operations and Maintenance manual for definitions of file and pathname. The default process pathname is /bin/isgen (" " is required).

   d = Pathname of a file (shadow file) used in building the boot image. The file must consist entirely of adequate contiguous space and is essential to safe updating of the boot image. The default shadow file is /..dmert (" " is required).

4. **SYSTEM RESPONSE**

**PF** = Printout follows. The request has been accepted. Followed by a UPD:BLDBOOT output message.

1950 (PROGRAM UPDATE MAINTENANCE)
1960 (INSTALL BWM)
UPD:BLOCK

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that an official software update be blocked or inhibited from being backed out. This message blocks the software update message from being backed out and any other software updates below the one specified.

The UPD:BLOCK message should only be used when a software update name is specified. If it is necessary to block all software updates that have been made official, the UPD:BLOCK message should be used with the last software update that has been made official. This would block the last official software update and all previous official software updates.

2. FORMAT

UPD:BLOCK:UPNM="a";

3. EXPLANATION OF MESSAGE

a = Software update: specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update (" " is required).

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by one or more UPD:BKOUT output messages.

235-105-210  Routine Operations and Maintenance

MCC Display Page(s):
1950 (PROGRAM UPDATE MAINTENANCE)
1960 (INSTALL BWM)
UPD:BOLO

Software Release: 5E14 and later
Command Group: SFTMG
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the last official software update be backed out. No more than three official software updates are permitted to be backed out. The three software update names are listed on MCC Display Page 1950 next to indicators showing the back-out level of each software update. The "LAST OFC" software update was most recently applied and made official. The "2nd FROM TOP" software update was made official before the "LAST OFC" software update. The "3rd FROM TOP" software update was applied and made official before both the "2nd FROM TOP" software update and the "LAST OFC" software update.

As a new software update is made official, it becomes the "LAST OFC" software update, and the previous "LAST OFC" and "2nd FROM TOP" software updates are moved down to be the "2nd FROM TOP" and "3rd FROM TOP" software updates, respectively. The previous "3rd FROM TOP" software update can no longer be backed out, and is therefore removed from the list of software updates permitted to be backed out.

Executing this input message (UPD:BOLO) in effect requests the back-out of the "LAST OFC" software update. Upon successful completion, the back-out removes the "LAST OFC" software update from the list of software updates permitted to be backed out and moves the "2nd FROM TOP" and "3rd FROM TOP" software updates up to be the new "LAST OFC" and "2nd FROM TOP" software updates, respectively. After an official back-out there is no "3rd FROM TOP" software update because one of the three software updates which could be backed out has been backed out. A software update name is added to the back-out list only when that software update is made official on the switch.

2. FORMAT

UPD:BOLO[:UCL];

3. EXPLANATION OF MESSAGE

UCL = Override the existence of the file odd.bwm, which would otherwise cause the UPD:BOLO input message to abort. The odd.bwm file contains ODD related changes associated with the software update.

4. SYSTEM RESPONSE

OK = Good. The request has been accepted. Followed by one or more UPD:BKOUT output messages and one UPD:BOLO output message.

1960 (INSTALL BWM)
UPD:CCS-CUTOVER

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Used during the common network interface (CNI) to host global switching module (GSM) conversion procedure to copy and initialize integrated services user part (ISUP) trunk member data in the host GSM processor. The data is obtained from static data relations in the CMP processor and copied to the host GSM processor. Any ISUP trunk which is currently defined as using the CNI platform will be populated into the GSM platform relations to be used for distributing the incoming ISUP messages to the trunk SMs.

WARNING: This command uses the database manager to update internal switch cross processor static data. The command is allowed to execute only when the RC/V View 8.15 (CCS OFFICE PARAMETERS) field CUTOVER is set to the value PRECUT. Additionally, the host GSM processor is defined on the RC/V View 8.15 field HOST PLAT 2. There may also be many relation tuples requiring an update, and thus the command may take a significant amount of time to complete. The command will make a status report once every minute until it has completed.

2. FORMAT

UPD:CCS,CUTOVER[,BKOUT];

3. EXPLANATION OF MESSAGE

BKOUT = Used to undo a previous invocation of the command. Only the previously inserted ISUP trunk data resulting from the running the UPD:CCS-CUTOVER input message is deleted from the host GSM processor.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the UPD:CCS-CUTOVER output message.

NG = No good. May also include:

- OFFICE NOT IN CUTOVER MODE = The update cannot be performed because the office is not in the correct state. RC/V View 8.15 field “CUTOVER MODE” must be set to the values PRECUT or POSTCUT for this input message to succeed.

- HOST PLAT 2 IS NOT A VALID GSM = The update cannot be performed because the GSM number specified on RC/V View 8.15 field “HOST PLAT 2” is not currently defined as a valid host GSM or does not exist. This indicates a problem with the internal data.

- CNI PRIMARY OPC NOT POPULATED ON HOST GSM = The update cannot be performed because the primary OPC of the CNI is not currently defined as the primary or alias OPC of the host GSM.
RL = Retry later. May also include:
- GSM NOT AVAILABLE = The GSM is not currently available, due to initialization or isolation.
- PREVIOUS REQUEST IN PROGRESS = A previous UPD:CCS request is being serviced.
- SYSTEM BUSY = A system resource error was encountered that prohibits the input message from running. OSDS on the AM processor failed to transmit a message to the CMP processor.

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Used during the common network interface (CNI) platform to host global switching module (GSM) platform conversion procedure to update internal integrated services user part (ISUP) trunk group/member and transaction capability application part (TCAP) application relational data for the "psu_mod" attribute. The psu_mod attribute indicates the target platform that is to be used to transport the SS7 message when the office is not in the platform conversion mode.

The input message is used towards the end of the conversion procedure to update this internal data to indicate the new signaling platform is the host GSM instead of the CNI. It may also be used during the backout of the conversion to indicate that the CNI platform is to return as the desired platform.

WARNING: This input message uses the database manager to update internal switch cross processor static data. The command is allowed to execute only when the RC/V View 8.15 (CCS OFFICE PARAMETERS) field CUTOVER is set to the value POSTCUT. There may also be many relation tuples requiring an update and the input message may take a significant amount of time to complete. The input message will make a status report once every minute until it has completed.

2. FORMAT

UPD:CCS,PSUMOD,OLD=a,NEW=b;

3. EXPLANATION OF MESSAGE

\[ a \]
= The platform number that is being switched from. When converting from the CNI platform to the host GSM platform, this parameter represents the CNI. If the platform conversion is being backed out, this parameter represents the host GSM. Valid value(s):
\[ 0 \] = CNI platform.
\[ 1-192 \] = GSM number.

\[ b \]
= The platform number that is being switched to. When converting from the CNI platform to the host GSM platform, this parameter represents the host GSM. If the platform conversion is being backed out, this parameter represents the CNI. Valid value(s):
\[ 0 \] = CNI platform.
\[ 1-192 \] = GSM number.

4. SYSTEM RESPONSE

PF
= Printout follows. The request has been accepted. Followed by the UPD:CCS-PSUMOD output message.

NG
= No good. May also include:
- OFFICE NOT IN POST CUTOVER MODE = The update cannot be performed because the office is not in the correct state. RC/V View 8.15 field "CUTOVER MODE" must be set to the value POSTCUT for this input message to succeed.
- CNI PRIMARY OPC NOT POPULATED ON HOST GSM = The update cannot be performed because the GSM number specified on RC/V View 8.15 field "HOST PLAT 2" is not currently defined as the valid host GSM.
- HOST PLAT 2 IS NOT A VALID GSM = The update cannot be performed because the GSM number specified on RC/V View 8.15 field "HOST PLAT 2" is not currently defined as a valid host GSM or does not exist. This indicates a problem with the internal data.
- GSM DOES NOT MATCH HOST PLAT 2 = The update cannot be performed because the GSM number specified in either the "NEW" or "OLD" field does not match RC/V View 8.15 field "HOST PLAT 2".
- OLD OR NEW PARAMETER MUST BE THE CNI = The update cannot be performed because one of the input parameters must be the CNI, represented as the value 0.

RL = Retry later. May also include:
- GSM NOT AVAILABLE = The GSM is not currently available, due to initialization or isolation.
- PREVIOUS REQUEST IN PROGRESS = A previous UPD:CCS request is being serviced.
- SYSTEM BUSY = A system resource error was encountered which prohibits the command from running. OSDS on the AM processor failed to transmit a message to the CMP processor.

  1950 (PROGRAM UPDATE MAINTENANCE)
  1960 (INSTALL BWM)
1. PURPOSE

To enable switching module (SM) or communication module processor (CMP) incore memory to be dumped to a file.

Format 1 is to be used to dump CMP memory to a file.

Format 2 is to be used to dump SM memory to a file.

Format 3 is to be used to dump SM memory to a file using a peripheral image address. This input message may be useful for problem resolution that involves examination of core memory. For example, if a range of memory in a certain SM is suspect, then this range of memory can be dumped to a file. Then the same range of memory in another SM of the same configuration can be dumped to a second file. Then *UNIX*® utilities can be used to compare to two files. Format 1 is for the CMP only. This input message requires that the primary or mate processor be specified since the primary and mate processors of the CMP function independently and they may or may not have the same core memory contents.

Format 2 is for the SM only and it does not support the primary or mate options because the mate module controller/time slot interchange (MCTSI) is continually updated [when in standby (STDBY) mode] with the contents of the active MCTSI. With the 'PADDR' option the user is requesting to dump a physical address in an SM. When the 'VADDR' option is given, the user is requesting a virtual address which will be internally mapped to the corresponding physical address in the requested SM.

Format 3 is for the SM only and does not support the mate option. This format is useful when the user wishes to dump SM memory based on a peripheral image address. This will get internally mapped to the corresponding physical address in the requested SM. The file that is created is a data file and can not be examined with tools or editors that expect American standard code for information interchange (ASCII) text input.

**WARNING:** The amount of data that can be dumped is not restricted. The size of the output file will be the number of bytes that are specified after the L option. Thus all output files should only be placed in file systems that are designed to hold temporary files. Creating files in other file systems may interfere with other routine activities.

2. FORMAT

[1] **UPD:DUMPCORE:DATA,CMP=a,{PRIM|MATE}[,TARGET=c],ADDR=d...L=e,OUTFILE=f**;

[3] **UPD:DUMPCORE:DATA,SM=b,PERF=c,PADDR=d,L=e,OUTFILE=f**;

3. EXPLANATION OF MESSAGE

- **a** = CMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Targets. Valid value(s):

APP : RANGES
UPD:EXPAND

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the software update expansion process that takes place automatically during the download of a compressed software update (SU) be manually stopped (STOP), or requests that any compressed files in the software update specified (UPNM=a) be expanded to their original size so that software update application may begin immediately.

Note: the manual expansion is needed only if expansion was previously inhibited (through use of the STOP option), or if the expansion for the SU was previously aborted.

2. FORMAT

UPD:EXPAND: (UPNM="a" | STOP);

3. EXPLANATION OF MESSAGE

a = The software update name. All files in the software update package specified will be expanded to the original file size so that software update application may follow.

4. SYSTEM RESPONSE

OK = Good. The request has been accepted. Followed by a UPD:EXPAND output message.

1960 (INSTALL BWM)
UPD:FLASH-DFC

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Requests a download of a pumpcode file into a small computer system interface (SCSI) device file controller's (DFC) non-volatile FLASH memory.

The input message can be used to request a download in three different ways.

- Request the DFC driver automatically perform a download using a disk file constructed from fields in the DFC UCB record.
- Request the DFC driver automatically perform a download using a disk file constructed from version information stored in HA memory.
- Request that a user specified file be downloaded.

The input message can also be used to check the integrity of a pumpcode file that is stored as a disk file.

Note: When the downloading is to be done automatically by the DFC driver; the driver will use the information stored in the DFC's UCB record to build the pumpcode file name. The file specified in the UCB record must exist in the directory /dfc, and the file name derived from the UCB record has the format 'xyz', where 'x' is the 4-alphanumeric characters packcode value (that is, u580) stored in the packcode field of the UCB, 'y' is the 1-digit value stored in the version field of the specified DFC's UCB, and 'z' is the 1-digit value stored in the issue field of the UCB. An example of a typical pumpcode file name is u58090; the pumpcode version implied by this filename is 9, the pumpcode issue is 0, and the packcode number is u580.

2. FORMAT

[1] UPD:FLASH;DFC a;

[2] UPD:FLASH;DFC a:DATA,FN= "b",[CHECKSUM];

3. EXPLANATION OF MESSAGE

CHECKSUM = When this option is used, the integrity of the pumpcode contained in the specified file will be verified; no pumpcode downloading will occur.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Full pathname that specifies the pumpcode file to be downloaded into SCSI DFC or to be checked for the integrity of its data.

4. SYSTEM RESPONSE
PF = Printout follows. Followed by a UPD:FLASH-DFC output message.

   DISK FILE SYSTEM ACCESS
**UPD:FLASH**

- **Software Release:** 5E14 and later
- **Command Group:** N/A
- **Application:** 5,3B
- **Type:** Input

### 1. PURPOSE

Requests an update of flash random access memory (RAM) on a specified peripheral controller (PC). Flash is a device designed to be programmed in a system with a standard 5V or 12V supply required for write or erase operations.

### 2. FORMAT

`UPD:FLASH:a=b;`

### 3. EXPLANATION OF MESSAGE

- **a** = Member name. Valid value(s):
  - HSDC
  - MTTYC
  - SCSDC
  - SDLIC
  - TTYC

- **b** = Member number (0-255).

### 4. SYSTEM RESPONSE

- **?E** = Invalid verb (system expecting UPD), missing or invalid keyword or data.
- **?I** = Invalid data, missing data, or extra keyword in the first, second, or third parameter or data blocks.
- **NG** = No good. Cannot enable messages, access equipment configuration database (ECD), or PC is in a wrong state to process the input message. PC must be in the out-of-service (OOS) state, and its peripheral interface controller (IOP) must be in the active (ACT) state.
- **PF** = Printout follows. Followed by a UPD-FLASH output message.

### 5. REFERENCES

Output Message(s):

`UPD:FLASH`
1. PURPOSE

Requests that function information from a process file’s symbol table be displayed for one to twenty five address or function entries.

The output contains the name of the file in which the function resides, the name of the function, its transfer vector address and the virtual address and size of the function. If a function does not contain a transfer vector, the transfer vector field in the output is zero. If a process file has been updated by a function replacement, new addresses for the updated functions will be printed.

Format 1 converts symbolic function names to physical addresses.

Format 2 converts physical addresses to symbolic function names.

Format 3 generates a symbolic function trace based on the stack trace addresses logged from a system integrity event.

Please note that the stack trace addresses are retrieved from the daylog file and as a result a small delay may precede the output.

2. FORMAT

[1] UPD:FTRC:{FN="a"|SM="b"},FCN="c" ["-c"]...,TMP=d;

[2] UPD:FTRC:{FN="a"|SM="b"},ADDR=h'e[-h'e]...,TMP=d;

[3] UPD:FTRC:{SM="b"|ENV="f"},EVENT=g,TMP=d;

3. EXPLANATION OF MESSAGE

a = Full path name of the object file, enclosed in double quotes. An SM filename may not be used as a valid value for this variable. This variable can not be specified if either the 'SM' or 'ENV' parameter is specified.

b = Number of the switching module (SM) if applicable. This variable can not be specified if either the 'FN' or 'ENV' parameter is specified.

c = Name of functions within the object file. A maximum of 25 function names can be specified but must be enclosed in double quotes.

d = If 'd' = 'y', indicates that the object file to be used for the conversion has a temporary SU applied to it. This option is supported only for the SM and OKP object files. If 'y' is not specified, 'd' = 'n' is implied.

e = Physical address within a function's text space in the object file. Can specify a maximum of 25 hexadecimal addresses.

f = Environment that the system integrity event occurred in, enclosed in double quotes. The environment should be exactly the same as the ENV field in the system integrity output report. Either
upper or lower case letters can be used. Not specified if the \textit{SM} parameter is specified. The \textit{ENV} parameter should not be used for \textit{OSDSM} type system integrity events because the \textit{OSDSM} type system integrity event requires the use of the \textit{SM} parameter.

\[ g \] = System integrity event number.

\section*{4. SYSTEM RESPONSE}

\[ PF \] = Printout follows. Followed by the UPD:FTRC output message.

UPD:G-APPLPROC

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests execution of the application process, APPLPROC, (/prc/supr/applproc) during a retrofit or update. The application process will invoke specific input messages and retrofit tools defined for APPLPROC through the argument specified.

2. FORMAT

UPD:GEN:APPLPROC[,ARG="a"];

3. EXPLANATION OF MESSAGE

a = An argument string that is to be passed to the application process.

4. SYSTEM RESPONSE

NG = No good. Process not initiated.
PF = Printout follows. Followed by UPD:GEN-APPL output message.

5. REFERENCES

235-105-34x  Software Release Update
UPD:G-BACKOUT

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the administrative module (AM) be prepared for booting from the old software release if it is necessary to back out of the new software release. This message performs an AM off-line boot by default unless no AM off-line boot is requested.

2. FORMAT

UPD:GEN:BACKOUT[,NOFLBOOT][:UCL];

3. EXPLANATION OF MESSAGE

NOFLBOOT = Do not execute an AM off-line boot.

UCL = Execute unconditionally; context checks are ignored.

4. SYSTEM RESPONSE

NG = No good. Process not initiated.

PF = Printout follows. Followed by UPD:GEN-BACKOUT output message.

116 (MISCELLANEOUS)
UPD:G-ENTER

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the new software release data be entered into the administrative module. This message is the first step of the system update procedure used to introduce a new software release into the system. Up to three different sequences of load disk from tape (LDFT) formatted tapes can be used to update a disk pair. Different disk layouts on each sequence of tapes will be accepted only for the offline disk method and only if the partition affected by the different disk layout was not updated in a previous sequence.

WARNING: During partial updates, the volume table of contents (VTOC) structure for all partitions that are not updated must be identical to the disk VTOC on all tape sequences. If they are not identical, then the starting location of some of the partitions will not match their actual starting location on the disk.

2. FORMAT

UPD:GEN:ENTER[:UCL],{BKPRT|OFLDISK[=a][,NOBKUPD]},SRC="b",{DEST="c"|DEST="c"[-"c"]...}[,SEQOPT=d|,SEQOPT=d[-d...];

3. EXPLANATION OF MESSAGE

BKPRT = Backup partition method specification. This method requires that the disk layout in the new software release must be the same (such as, the VTOC partition in the new software release must be identical to the VTOC in the old software release) and all the disk partitions to be updated must have a corresponding backup partition (such as, like root/broot). The set of unused backup partitions will be updated (such as, if root is being used, broot will be updated).

NOBKUPD = Do not update backup partitions during off-line disk update procedures.

OFLDISK = Off-line disk method specification. This method requires that each disk pair to be updated must be duplex (such as, both disks active). One of the disks will be removed from service and the new software release data will be copied to this disk. The disk will also be marked off-line.

UCL = Execute unconditionally. If this option is not specified, the system update log file must be empty or removed. (The log file is in "/etc/log/suprlog". Refer to OP:G-READLOG).

a = Unit number of the disk file controller (DFC). Used to determine which moving head disk (MHD) unit(s) will be taken off-line (for the off-line disk method). If omitted, DFC 1 will be selected.

b = Special device file name that specifies the input magnetic tape. The name of the tape unit is of the form /dev/mtnn or mt?, where nn is a two-digit hexadecimal number and ? is the MTC controller number.

c = Special device file name that specifies the volume table of contents (VTOC) for the disk to be updated. Up to ten destinations may be specified. The file name (full pathname) cannot be greater than 40 characters long. Refer to the ECD/SG manual.
d   = Tape sequence options that are to be used for each destination that was specified. Valid value(s):
    DBL    = update a disk using a double sequence of tapes
    SGL    = update a disk using a single sequence of tapes
    TPL    = update a disk using a triple sequence of tapes

If a sequence option is not specified at all (the SEQOPT keyword is not used on the input message line), the default values are used (double sequence for the bootdisk, single sequence for non-bootdisks). If default tape sequence options are not desired for all destinations, then all the tape sequence options must be specified (even the tape sequences using default values). If tape sequence options are specified, the number of specified tape sequence options must equal the number of specified destinations. The maximum number of tape sequence options allowed on the enter input message line is ten.

4. SYSTEM RESPONSE

NG   = No good. Process not initiated.
PF   = Printout follows. Followed by UPD:G-ENTER output message.

UPD:G-PROCEED
Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE
Requests that the administrative module (AM) be prepared for booting from the new software release. This message performs an AM off-line boot by default unless no AM off-line boot is requested.

Note: This message must be executed after the UPD:G-ENTER input message.

2. FORMAT
UPD:GEN:PROCEED[,NOFLBOOT][:UCL];

3. EXPLANATION OF MESSAGE

NOFLBOOT = Do not execute an AM off-line boot.

UCL = Execute unconditionally; ignore context checks. If this option is specified, it will be ignored unless the previous step (entering UPD:G-ENTER) was not completed successfully.

4. SYSTEM RESPONSE

NG = No good. Process not initiated.

PF = Printout follows. Followed by UPD:GEN-PROCEED output message.

- 116 (MISCELLANEOUS)
- 124 (RETROFIT)
UPD:G-RESTORE

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the old software release be restored by removing the new software release from the administrative module (AM).

This message should be started after the UPD:G-ENTER and UPD:G-PROCEED messages have completed successfully. If either message did not complete successfully, then the unconditional option should be used. Using this message without the UCL option will produce an error even after a successful PROCEED. Only unconditional restores are valid. If the new software release was introduced using the backup partition method (UPD:G-ENTER), the disk to be updated and its mate must be active, even if only one of them was updated. For example, if moving head disk 0 (MHD0) was updated, then moving head disk 1 (MHD1) should be restored before this message is executed.

2. FORMAT

UPD:GEN:RESTORE[:UCL];

3. EXPLANATION OF MESSAGE

UCL = Execute unconditionally; ignore context checks. If this option is specified, it will be ignored if the previous step (entering UPD:G-PROCEED) was completed successfully.

4. SYSTEM RESPONSE

NG = No good. Process not initiated.

PF = Printout follows. Followed by UPD:GEN-RESTORE output message.

UPD:G-SMBKOUT
Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5
Type: Input

1. PURPOSE
Requests that switching modules (SMs) be switched from module controller/time-slot interchange (MCTSI) side 1 to side 0 and perform an SM retrofit initialization during a retrofit or software release update.

2. FORMAT
UPD:GEN:SMBKOUT, SM=a[&b][,,LSM][,,HSM][,,RSM][,,ORM][,,TRM]:UCL;

3. EXPLANATION OF MESSAGE
HSM = Select modules of the type host switching module.
LSM = Select modules of the type local switching module.
ORM = Select modules of the type optical remote switching module.
RSM = Select modules of the type remote switching module.
TRM = Select modules of the type two-mile optical remote switching module.
UCL = Execute unconditionally; checks for existence of the APPLHOOK log file created by the UPD:G-BEGIN input message, the retrofit indicator on the Master Control Center (MCC) page 116, and that MCTSI side 0 is offline pumped are ignored.

a = SM number or lower limit of a range of SM numbers.
b = Upper limit of the range of SM numbers to be inhibited.

4. SYSTEM RESPONSE
NG = No good. Process not initiated.
OK = Good.

Software Release: 5E14 - 5E15
Command Group: FHADM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

To verify the integrity of the disk and core images for hash sum protected products.

Format 1 is used to perform hash sum checking on ALL of the hashsum protected products, a specific switching module (SM), or a specific target [such as, SM, integrated services line unit (ISLU), and so forth].

Format 2 is used to perform hash sum checking on a specific text file and it's associated hash sum file.

Format 3 is used to perform hash sum checking on a specific communications module processor (CMP).

This check is scheduled by cron to run daily on all text [not office-dependent data (ODD) products in the switch that have associated hash sum files. There are two major checks that are done. First the disk image is verified by calculating the hash sums over the entire image and comparing them with the sums stored in the associated hash sum files. The second check is to compare (not calculate) the disk hash sums with the core hash sums. These two checks, coupled with the routine incore hash sum checking, provide a comprehensive audit to guarantee integrity of the hash sum protected products.

This input message is provided so that hash sum checking can be invoked manually. There are several different options that are provided to narrow the focus of the check to a specific SM or CMP, a specific target (such as, ISLU), a particular configuration, or a particular file.

During routine (scheduled from cron) hash sum verification, the only messages that are seen are the beginning message, and the completion message. However, if an error is found, additional messages will provide information on the error(s) that were found. The hash sum check is more verbose if it is being run in response to the input message. In this case it will report when it is beginning the disk hash sum check for each specified target.

Regardless of how the audit is requested (manually or routinely), disk hash sum errors are reported with a ROP message, a major alarm, and the switching module processor (SMP)/ CMP FILE indicator on MCC Display Page 116 will read HASHERR.

When this input message is run with only the ALL option and it does not find any errors, it will reset MCC Display Page 116 to normal.

WARNING: In the event that hash sum mismatches are found, corrective action should be taken immediately to prevent potential service impacting problems. Detailed procedures for correcting hash sum error problems are given in the Corrective Maintenance Manual. However, these should only be performed by trained and qualified personnel.

2. FORMAT

[1] UPD:HSCHK:(SM=b|TARGET=c|ALL) [,OUTFILE=f|REPT] [,DISK|CORE];

[2] UPD:HSCHK:FN=d,DF=e,TARGET=c [,OUTFILE=f];

[3] UPD:HSCHK:CMP=a, {PRIM|MATE} [,OUTFILE=f] [,DISK|CORE];
3. EXPLANATION OF MESSAGE

ALL = Run the audit on all of the above targets,

CORE = If the CORE option is specified, then only incore hash sum checking is performed. The default is to do both disk and core hash sum checking.

DISK = If the DISK option is specified, then only disk hash sum checking is performed. The default is to do both disk and core hash sum checking.

REPT = The REPT option allows a user to request a summary report of any incore hash sum mismatches that occurred from a previous run of the audit. If the REPT option is specified, then no hash sum checking is performed. The only action that is performed is to look at the SM(s)/CMP(s) that mismatched and report the targets where errors were found. This is especially useful to quickly determine which targets encountered problems in a given SM. For example, if SM 3 is showing a D/C HASH status (on MCC Display Page 1800 or MCC Display pages 141-144), the hash sum mismatch could of occurred in the SM text file (IM.out) or in any of the peripherals that are supported in that configuration (such as, LDSU, RAF, and so forth). The REPT option will report all of the targets that had hash sum mismatches.

a = CMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Valid value(s):

- CMP
- DDMA

The FN option is provided to allow hash sum checking on files that are not supported in the list of targets above. If the FN option is specified, then the DF must also be provided to indicate the hash sum file. The intent of this option is to allow for DISK hash sum verification on files that reside in temporary locations. If the FN option is used, no incore hash sum checking is done. The full path name to the file is required.

Hash sum file associated with the argument to the FN parameter. The DF option is required when the FN option is used. The full path name to the file is required.

Full path name to the output file. When this option is specified, then the output of the audit is sent to the specified file rather than the ROP and the originating terminal. This allows for more verbose output from the audit since the amount of output to the ROP is restricted. The OUTFILE option provides additional information to assist technical support in the resolution of hashsum mismatch problems. All output files should only be placed in file systems that are designed to hold temporary files. Creating files in other file systems may interfere with routine activities in the switch. These files should be removed when they are no longer needed.

### 4. SYSTEM RESPONSE

1. PURPOSE

To verify the integrity of the disk and core images for hash sum protected products.

Format 1 is used to perform hash sum checking on ALL of the hashsum protected products, a specific switching module (SM), or a specific target [such as, SM, integrated services line unit (ISLU), and so forth].

Format 2 is used to perform hash sum checking on a specific text file and its associated hash sum file.

Format 3 is used to perform hash sum checking on a specific communications module processor (CMP).

This check is scheduled by cron to run daily on all text [not office-dependent data (ODD) products in the switch that have associated hash sum files. There are two major checks that are done. First the disk image is verified by calculating the hash sums over the entire image and comparing them with the sums stored in the associated hash sum files. The second check is to compare (not calculate) the disk hash sums with the core hash sums. These two checks, coupled with the routine incore hash sum checking, provide a comprehensive audit to guarantee integrity of the hash sum protected products.

This input message is provided so that hash sum checking can be invoked manually. There are several different options that are provided to narrow the focus of the check to a specific SM or CMP, a specific target (such as, ISLU), a particular configuration, or a particular file.

During routine (scheduled from cron) hash sum verification, the only messages that are seen are the beginning message, and the completion message. However, if an error is found, additional messages will provide information on the error(s) that were found. The hash sum check is more verbose if it is being run in response to the input message. In this case it will report when it is beginning the disk hash sum check for each specified target.

Regardless of how the audit is requested (manually or routinely), disk hash sum errors are reported with a ROP message, a major alarm, and the switching module processor (SMP)/ CMP FILE indicator on MCC Display Page 116 will read HASHERR.

When this input message is run with only the ALL option and it does not find any errors, it will reset MCC Display Page 116 to normal.

WARNING: In the event that hash sum mismatches are found, corrective action should be taken immediately to prevent potential service impacting problems. Detailed procedures for correcting hash sum error problems are given in the Corrective Maintenance Manual. However, these should only be performed by trained and qualified personnel.

2. FORMAT

[1] UPD:HSCHK:(SM=b|TARGET=c|ALL),OUTFILE=f,REPT],[DISK|CORE];

**UPD:IMCAT**

**Software Release:** 5E14 and later  
**Command Group:** SFTMGT  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Invalidates memory segments for the input message catalog (imcatlg), causing the catalog to be read from disk. This message is used during a software update of the input message catalog.

After invalidating the memory segments, this message increments the input message catalog version number shared between processes accessing imcatlg (the shell and HMMcc). When the version number changes, usually during a software update, these processes clear the old catalog from their segment space and read the updated catalog from disk.

2. **FORMAT**

    UPD:IMCAT;

3. **EXPLANATION OF MESSAGE**

No variables.

4. **SYSTEM RESPONSE**

**NG**  
= No good. The input request is invalid. May also include:

- FILE INACCESSIBLE = Failed to open the input message catalog (/no5text/hm/imcatlg). Verify /no5text/hm/imcatlg exists and is readable before executing UPD:IMCAT again.

- SEGCODE CANNOT BE DETERMINED = Failed to get a segment name for one of the input message catalog segments. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

- SEGMENT NAME CANNOT BE CLEARED = Failed to invalidate ("unname") one of the input message catalog segments. Restore original input message catalog before executing UPD:IMCAT again. (Refer to the UPD:BKOUT output message if imcatlg update occurred during a software update). If necessary, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

**OK**  
= Good. Request was accepted. Segments are marked invalid.

5. **REFERENCES**

Input Message(s):

    UPD:BKOUT
**UPD:INITPW**

**Software Release:** 5E14 and later  
**Command Group:** SFTMGT  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**

Requests that the password, the number of login attempts and/or the key, which are used by the Customer Service Computer Access Network System (CSCANS) interface, be initialized. Note that one, two or all three of these arguments may be specified for a given invocation of this input message, with the exception that if a new key is specified, then a new password must also be specified.

This input message should be used initially to setup the password and key used by the CSCANS interface. It should also be used to reinitialize the password and key after the CSCANS interface port has been locked out of service due to too many failed login attempts.

This input message may also be used to initialize the number of failed login attempts allowed and to initialize the key used to decode the password.

2. **FORMAT**

```
UPD:INITPW:{PASSWD=a[,KEY=c][,ATTEMPTS=b]|ATTEMPTS=b};
```

3. **EXPLANATION OF MESSAGE**

- **a** = The new password to be used, with a minimum of six characters. It should consist of at least two alphabetic characters and at least one numeric or special character.

- **b** = The number of failed successive login attempts allowed through the CSCANS interface before the port is locked out of service. If not specified, default is 3.

- **c** = The new key to be used, consisting of exactly two characters.

4. **SYSTEM RESPONSE**

```
PF
```

= Printout follows. The request has been accepted. Followed by a UPD:INITPW output message.

5. **REFERENCES**

2. FORMAT

[1] UPD:INSTL:a[,SU="c"];
[2] UPD:INSTL,b[,SU="c"][,NXT[,UCL]];

3. EXPLANATION OF MESSAGE

NXT = Next command.

UCL = Unconditional. This should only be used for those MSGS file commands that allow the UCL option. Valid only with NXT.

a = Begin state.

SET = Identify the SU to be installed.
START = Starts the installation of a SU.

b = Continue state.

BKOUT = Return (unistall) the SU, prior to being made OFFICIAL, back to the VERIFY COMPLETED stage. This will remove any newly created disk files.
DEACT = Return the SU back to the PREPARE completed stage from either the ACTIVATE or SOAK stage in reverse installation order. This will unistall the updates without removing any files.
THRU=d = Install the SU through to the specified stage.
VERFY = Starts the VERIFY stage of the SU installation process.

c = SU name.

d = End stage. Valid value(s):
PREP = Prepare stage.
ACTV = Activate stage.
SOAK = Soak stage.
MKOF = Make official stage.

4. SYSTEM RESPONSE

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the message class or the alarm level for either one or a list of message keys in the output message database (OMDB) disk file be updated. Successful updates are logged so that they can be reapplied after a field update.

2. FORMAT

UPD:OMDB:KEY=a:{MSGCLS=b|ALARM=c};

3. EXPLANATION OF MESSAGE

a = OMDB key (or list of keys). Refer to the APP:OMDB-X-REF appendix in the Appendixes section of the Output Messages manual for a list of valid OMDB keys.

b = Numeric value for message class in range 0 to 225.

c = Valid value(s):

ACT = Automatically generated report. It may require some action to be taken.
CRIT = Critical alarm. Immediate action required.
INFO = Automatically generated report.
MAJ = Major alarm. Immediate action required.
MAN = Manually requested report.
MIN = Minor alarm. Action required.
VAR = Variable alarm supplied by client process. If the client process does not specify it, the alarm is defaulted to "INFO."

4. SYSTEM RESPONSE

IP = In progress. Followed by UPD:OMDB output message.

NG = No good. May also include:

- INVALID ALARM = Alarm is not one of the seven valid alarm levels.
- INVALID KEY = A message key is not within the valid range.
- INVALID MSGCLS = Message class is not within the valid range.
- SYNTAX ERROR = Message is not in the correct format.
- TOO MANY KEYS = Maximum of 32 keys are allowed per message.

UPD:PATCH

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that program update compact switch processor's patch space.

The patch space compaction is normally used when the target's, SM, SM-2000 or CMP, patch space become insufficient and failed the program update process. The patch space compaction operation will try to increase the size of target's patch space and make successful program update process.

Note: If there is any need to back out patch space compaction after it has been made official, back-out-last-official (BOLO) process can be used for backout. For BOLO procedure check BOLO reference.

The target's patch space may become so fragmented or insufficient that even this operation can not generate large enough patch space for a successful program update process.

2. FORMAT

UPD:PATCH:TARGET=a,ACTION=b;

3. EXPLANATION OF MESSAGE

a = Type of processor to be compact patch space. Valid value(s):
  SM = Switching module.
  CMP = Communication module processor.

b = Type of patch space compaction action. Valid value(s):
  APPLY = Execute patch space compaction and apply on requested target.
  OFC = Make official for the applied target.
  BKOUT = Back out previously requested applied target.

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because the wrong TARGET or ACTION has been entered.

PF = Printout follows. The request has been accepted. Followed by a UPD:PATCH output message.

INPROG = In progress. The message was accepted and the action is in progress.

CMPL, (action) = Complete (action)'s process. May also include:
  APPLY
  OFC
  BKOUT

UPD:PMPPERF-A

Software Release: 5E14 - 5E15
Command Group: SFTMGT
Application: 5
Type: Input

1. PURPOSE

Requests that inconsistent pumpable switching module (SM) peripherals be removed and restored.

The target peripheral(s) can be specified in two ways. A single target can be specified explicitly with the TARGET option (Format 1). All targets affected by a given software update may be removed and restored with the UPNM option (Format 2). The SM resident image for the target(s) must be consistent, otherwise UPD:PMPPERF will abort. UPD:PMPPERF can be thought of as a way to recover from type 7 inconsistencies. All the affected hardware should be in service prior to entering this message.

For protocol handlers (PH), each packet switch unit shelf must be equipped with at least one standby spare PH of each affected hardware type. If affected hardware is out-of-service, UPD:PMPPERF may abort unless the UCL option is given (with the TARGET option only). Refer to the UPD:PMPPERF output manual page for more information.

2. FORMAT

[1] UPD:PMPPERF:TARGET=a[,UCL];
[2] UPD:PMPPERF:UPNM="b",[OFC];

3. EXPLANATION OF MESSAGE

OFC = Only those targets that require remove/restore after the UPD:OFC input message (ISLU, IDCUCCP, IDCUDLP, IDCULSI, DNUSCC, and DNUSTMX) will be chosen from the MSGS file. This option is appropriate only after the UPD:OFC input message has completed since only those targets will need to be removed/restored. This option has nothing to do with which image (temporary versus official) is pumped to the peripherals.

UCL = Remove and restore the target peripherals unconditionally.

Default is conditional removal. The restoration is always unconditional.

a = Pumpable SM peripheral type. Valid value(s):
CM3 = Communication module 3
DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
DNUSTMX = Transmission multiplexer.
DSC3 = Digital service circuit - model 3.
DSP13K = 8K digital signal processor for CDMA protocol handler for voice.
DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
DSPEVRC = EVRC digital signal processor for CDMA protocol handler for voice.
GDSF = Global digital services function - model 3.
HDSU = Hardware digital service unit.
HSAS = Service announcement system diagnostic image.
IDCUCCP = Integrated digital carrier unit (IDCU) common control processor.
IDCUDLP = IDCU data link processor.
IDCULSI = IDCU loop side interface.
IP22S = PH22 OIP image.
IP22W = PH22 wireless OIP image.
IP3S = Protocol handler 3 CCS OIP image.
IP4F = Frame relay protocol handler version 4 I/O processor.
IP4I = PH4I operational input/output processor.
IP4IF = ISDN Frame Relay protocol handler version 4 I/O processor.
ISLU = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
LDSU = Local digital service unit.
LDSF = Local digital services function - model 3.
MSGH = Message handler.
ODMA = Operational direct memory access.
O1OP = Operational input/output processor.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH22S = PH22 AP image.
PH22W = PH22 wireless AP image.
PH3C = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S = PH3 CCS AP image.
PH4A = Protocol handler 4 (PH4) access image.
PH4G = PH4 gateway image.
PH4I = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A = Protocol handler for ATM (asynchronous transfer mode).
PI = Packet interface.
PI2 = Packet interface unit 2.
PHV1C = Protocol handler for voice for CDMA (code division multiple access).
PHV3C = Protocol handler for voice version 3 for CDMA application.
PHV4C = Protocol handler for voice version 4 for CDMA application.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
SMPMH = Switching module processor message handler (MH) operational image.
SMPMHLB = Switching module processor MH little boot image.
V3DACP = ACELP digital signal processor, for TDMA protocol handler for voice.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DEV1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4DEV2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4DEV3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

b = Use the MSGS file in the specified software update package to determine the list of targets. The software update package must exist either under the /etc/bwm directory, or be a software update number listed as official on the 1950 page.

4. SYSTEM RESPONSE
PF = Printout follows. The request has been accepted. This is followed by one or more UPD:PMPPERF output messages.

Other Manual(s):
235-105-210 Routine Operations and Maintenance
UPD:RCVRY-A

Software Release: 5E14 - 5E15
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests a program update roll backward or roll forward operation.

The roll forward operation is normally used when it is reasonably certain that the update operation in question did not cause the inconsistency (such as an installed update causing a processor boot). This may result in updates having to be reapplied. The roll backward operation will attempt to remove the update inconsistency by removing temporary updates until consistency is restored.

2. FORMAT

UPD:RCVRY:{BKWD|FRWD}{,ALL|,TARGET=a};

3. EXPLANATION OF MESSAGE

ALL = Recover all processors.

BKWD = Perform backward synchronization; that is, recover from an update inconsistency by removing the appropriate temporary update(s) from the affected processor(s) and file(s).

FRWD = Perform forward synchronization; that is, recover from an update inconsistency by reinstalling the appropriate temporary update(s) in the affected processor(s) and file(s).

a = Type of processor to be recovered. Valid value(s):
    AM = Administrative module.
    CMP = Communication module processor.
    DDMA = Diagnostic direct memory access.
    DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
    DNUSTMX = Transmission multiplexer.
    DSC3 = Digital service circuit - model 3.
    DSP13K = 8K digital signal processor for CDMA protocol handler for voice.
    DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
    DSPEVRC = EVRC digital signal processor for CDMA protocol handler for voice.
    GDSF = Global digital services function - model 3.
    HDSU = Hardware digital service unit.
    HSAS = Service announcement system diagnostic image.
    IDCUCP = Integrated digital carrier unit (IDCU) common control processor.
    IDCUDLP = IDCU data link processor.
    IDCULSI = IDCU loop side interface.
    IP3S = Protocol handler 3 CCS OIP image.
    IP4F = Frame relay protocol handler version 4 I/O processor.
    IP4I = PH4I operational input/output processor.
    IP4IF = ISDN Frame Relay protocol handler version 4 I/O processor.
    ISLU = Integrated services line unit.
    ISLU2 = Integrated services line unit 2.
    ISTF = Integrated services test function.
LDSU = Local digital service unit.
LDSF = Local digital services function - model 3.
MSGH = Message handler.
ODMA = Operational direct memory access.
O1OP = Operational input/output processor.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH3C = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S = PH3 CCS AP image.
PH4A = Protocol handler 4 (PH4) access image.
PH4G = PH4 gateway image.
PH4I = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A = Protocol handler for ATM (asynchronous transfer mode).
PI = Packet interface.
PI2 = Packet interface unit 2.
PHV1C = Protocol handler for voice for CDMA (code division multiple access).
PHV3C = Protocol handler for voice version 3 for CDMA application.
PHV4C = Protocol handler for voice version 4 for CDMA application.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
SMPMH = Switching module processor message handler (MH) operational image.
SMPMHLB = Switching module processor MH little boot image.
V3DACP = ACELP digital signal processor, for TDMA protocol handler for voice.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DEVR1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4DEVR2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4DEVR3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the UPD:RCVRY output message.

1. PURPOSE

Requests a program update roll backward or roll forward operation.

The roll forward operation is normally used when it is reasonably certain that the update operation in question did not cause the inconsistency (such as an installed update causing a processor boot). This may result in updates having to be reapplied. The roll backward operation will attempt to remove the update inconsistency by removing temporary updates until consistency is restored.

2. FORMAT

UPD:RCVRY:{BKWD|FRWD}{,ALL|,TARGET=a};

3. EXPLANATION OF MESSAGE

**ALL**

= Recover all processors.

**BKWD**

= Perform backward synchronization; that is, recover from an update inconsistency by removing the appropriate temporary update(s) from the affected processor(s) and file(s).

**FRWD**

= Perform forward synchronization; that is, recover from an update inconsistency by reinstalling the appropriate temporary update(s) in the affected processor(s) and files(s).

**a**

= Type of processor to be recovered. Valid value(s):

- **AM** = Administrative module.
- **CMP** = Communication module processor.
- **DDMA** = Diagnostic direct memory access.
- **DNUSCC** = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
- **DNUSTMX** = Transmission multiplexer.
- **DSC3** = Digital service circuit - model 3.
- **DSP13K** = 8K digital signal processor (DSP) for code division multiple access (CDMA) protocol handler for voice.
- **DSP8K** = 8K digital signal processor for CDMA protocol handler for voice.
- **DSPEVRC** = EVRC digital signal processor for CDMA protocol handler for voice.
- **GDSF** = Global digital services function - model 3.
- **HDSU** = Hardware digital service unit.
- **HSAS** = Service announcement system diagnostic image.
- **IDCUCCP** = Integrated digital carrier unit (IDCU) common control processor.
- **IDCUDLP** = IDCU data link processor.
- **IDCULSI** = IDCU loop side interface.
- **IP22** = PH22 common input/output processor (IOP) image.
- **IP3S** = PH3 CCS IOP image.
- **IP4F** = Frame relay PH4 IOP image.
- **IP4I** = ISDN PH4 IOP image.
- **IP4IF** = ISDN frame relay PH4 IOP image.
- **ISLU** = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
LDSU = Local digital service unit.
LDSF = Local digital services function - model 3.
MH32 = Switching module processor message handler 32 (MH32) operational image.
MHEIB = Switching module processor message handler EIB (MHEIB) operational image.
MHLB = Switching module processor MH little boot image.
MHPPC = Switching module processor message handler power PC (MHPPC) operational image.
MHPPCLB = Switching module processor MHPPC little boot image.
MSGH = Message handler.
ODMA = Operational direct memory access.
OIOP = Operational input/output processor.
OIU24 = Optical interface unit - 24 channels.
PH2A = Protocol handler 2 (PH2) ACCESS application processor (AP) image.
PH2G = PH2 GATEWAY AP image.
PH22I = PH22 wireless ISDN AP image.
PH22S = PH22 signaling AP image.
PH3C = PH3 COMMON AP image.
PH3S = PH3 CCS AP image.
PH4A = PH4 access AP image.
PH4G = PH4 gateway AP image.
PH4I = PH4 ISDN AP image.
PHA1A = Protocol handler for asynchronous transfer mode (ATM) AP image.
PHA2A = Protocol handler for ATM model 2 AP image.
PH2E2E = Protocol handler for ethernet.
PI = Packet interface.
PI2 = Packet interface unit 2.
PHV1C = Protocol handler for voice version 1 (PHV1) for CDMA AP image.
PHV2C = PHV2 for CDMA application AP image.
PHV3C = PHV3 for CDMA application AP image.
PHV4C = PHV4 for CDMA application AP image.
PHV5C = PHV5 for CDMA application AP image.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
V3DACP = ACELP DSP for TDMA PHV3.
V4D13K = 13K DSP, for CDMA for PHV4.
V4D8K = 8K DSP, for CDMA for PHV4.
V4DACP = ACELP DSP, for TDMA for PHV4.
V4DEVR1 = EVRC1 DSP, for CDMA for PHV4.
V4DEVR2 = EVRC2 DSP, for CDMA for PHV4.
V4DEVR3 = EVRC3 DSP, for CDMA for PHV4.
V4DVSP = VSELP DSP, for TDMA for PHV4.
V4DISL = ISLP DSP, for IS41 TDMA PHV4 data circuit.
V5D13K = 13K DSP, for CDMA for PHV5.
V5D8K = 8K DSP, for CDMA for PHV5.
V5DACP = ACELP DSP, for TDMA for PHV5.
V5DEVR1 = EVRC1 DSP, for CDMA for PHV5.
V5DEVR2 = EVRC2 DSP, for CDMA for PHV5.
V5DEVR3 = EVRC3 DSP, for CDMA for PHV5.
V5DVSP = VSELP DSP, for TDMA PHV5.
V5DISL = ISLP DSP, for IS41 TDMA PHV5 data circuit.

4. SYSTEM RESPONSE

1960 INSTALL BWM
UPD:RDTA

- **Software Release**: 5E14 and later
- **Command Group**: TRKLN
- **Application**: 5
- **Type**: Input

1. **PURPOSE**

To update the timer value for a given active remote digital test access (RDTA) session and to change the duration period.

This input message will cause the duration timer to be reinitialized, allowing the active RDTA session to continue for another duration interval. The duration interval can also be changed by including the optional parameter DUR. The timer may be reset for any session at any time during the session.

Thirty minutes before the termination interval specified on the EXC:RDTA input message, a warning UPD:RDTA output message will print to indicate that the RDTA session will be terminated in 30 minutes. The user may keep the active RDTA session alive by inputting this message within 30 minutes.

The active RDTA session will be updated based on the session number returned in the EXC:RDTA output message after the connection was setup. The session number must either be known by the user attempting maintenance or it can be found by exercising the OP:RDTA input message to receive information on all sessions (SES=ALL option). This session number input verifies the user's knowledge of the session's status to the switch when changes are made affecting the session.

2. **FORMAT**

   UPD:RDTA, SES=a[, DUR=b];

3. **EXPLANATION OF MESSAGE**

   a = Session number of the active RDTA session for which the duration timer is to be reinitialized.

   b = The maximum duration for the RDTA session. The valid values are 1 to 7 (days) or 0 (infinite). If no new period (DUR) is specified on the input message, the session will be prolonged by the original period from the time the input message is executed.

4. **SYSTEM RESPONSE**

   PF = Printout follows. The request has been accepted. Followed by a UPD:RDTA output message.

UPD:REBOOT

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the software update database be updated to reflect the backing out of any temporary administrative module (AM) updates active at the time of the reboot.

The software update processes will be informed automatically as part of a normal boot that a system reboot has occurred. Whenever a level 2 (or higher) reboot occurs, all temporary updates are, by definition, backed out.

2. FORMAT

UPD:REBOOT;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by one or more UPD:REBOOT output message(s).

RL = Retry later. Another UPD input message is active.

1960 (INSTALL BWM)
**UPD:REDUCE**

**Software Release:** 5E14 and later  
**Command Group:** SFTMGT  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**

Requests smaller, more concise software update database entries after all updates on the administrative module (AM) have been made official. The smaller entries are placed in a backup update database (/etc/Bud). The existing software update database (/etc/Cud) file is reduced so that the update entries for those SUs that can still be backed out normally or through an official backout (UPD:BOLO) are kept in the main database (/etc/Cud), while all other entries are saved in a more concise format in the backup update database.

2. **FORMAT**

UPD:REDUCE[:PTLD];

3. **EXPLANATION OF MESSAGE**

**PTLD**  
- This option will reset the software update sequence number to zero.

4. **SYSTEM RESPONSE**

**PF**  
- Printout follows. Followed by UPD:REDUCE output message.

**RL**  
- Retry later. Another UPD input message is active.

UPD:RESET-3B

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that if an operation to an administrative module (AM) field update fails, that update's status may be "reset" to a previously "accepted" state.

2. FORMAT

UPD:RESET[,VLEV=a];

3. EXPLANATION OF MESSAGE

a = The flag, 'a', requests additional output form a Field Update process. Verbose flags may be set for UPD and ucm. The flags must be entered in the order the processes are listed. To turn on the verbose output for ucm, UPD's flag must be used or set to zero.

4. SYSTEM RESPONSE

FIELD UPDATE PAGE
UPD:RESET

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the soak timer duration (TM) of the software update (SU) that is currently soaking be updated, or that the soak timer for the SU that is currently soaking be stopped (ABORT), or that the line number (LINE) to be executed next for the SU loaded on the Master Control Center (MCC) 1960 page be changed.

2. FORMAT

UPD:RESET: [LINE=a|TM=b-c|ABORT];

3. EXPLANATION OF MESSAGE

ABORT = Stop the soak timer.

a = Reset execution to a specified line number displayed on the "1960" program update installation page (MSGS file). Line number is a 3-digit number. The default is 1 (first line of the MSGS file).

b = Number of hours in the software update soak interval (0-99).

c = Number of minutes in the software update soak interval (0-59).

4. SYSTEM RESPONSE

OK = Good. The message was accepted and the action completed.

**UPD:SET**

**Software Release:** 5E14 and later  
**Command Group:** SFTMG  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests the setting of the SU (Software Update), the SOAK timer and the completed stage where the installation execution is to stop.

Format 1 is used for setting the SU name that will identify the package to be scheduled for installation by the automation process. Note: To be used with UPD:INSTL:START; typically used internal to SU automation. Format 2 is used for stopping the SU installation process when either the SOAK stage or the PREPARE stage has completed. Format 3 is used to pre-set the SOAK time interval for SU installation. to pre-set the SOAK time interval for SU installation”

WARNING: Not to be confused with UPD:SKTMR:DEFLT; Typically used internal to SU automation; To be used with UPD:INSTL:START

2. **FORMAT**

   [1] UPD:SET:SU="a";

3. **EXPLANATION OF MESSAGE**

   a  = SU name (maximum of 10 characters).

   b  = Stage. Valid value(s):
       AFTSK  = After the soak stage.
       AFTPR  = After the prepare stage.

   c  = Timer duration. In the form, **HH:MM** Total duration can not exceed 72 hours.
       HH  = Number of hours that the soak timer duration should be set for.
       MM  = Number of minutes that the soak timer duration should be set for.

4. **SYSTEM RESPONSE**

   NG  = No good.
   PFf = Print follows.

Application: 5
Type: Input

1. PURPOSE
Requests that the SOAK timer either have its default time changed, timer restarted, timer report printed or timer canceled.

2. FORMAT
UPD:SKTMR:a;

3. EXPLANATION OF MESSAGE
a = Soak timer action. Valid value(s):
   ABORT = Cancel the soak timer. The soak timer must be restarted and allowed to complete before an SU can be made official.
   DEFLT=b = Change the default time used by the soak timer. Changing the default timer will have no effect on a running soak timer.
   PRINT = Print the soak timer report to the ROP.
   RESET=b = Restart the soak timer with a given duration. This will not affect the default time.

b = Duration in the form "HH:MM". Total duration is not to exceed 72 hours.
   HH = Number of hours.
   MM = Number of minutes.

4. SYSTEM RESPONSE
NG = No good.
PF = Print follows.

235-105-210 Routine Operations and Maintenance

MCC Display Page(s):
   SU INSTALLATION
UPD:SSD

Software Release: 5E14 and later
Command Group: TRKLN
Application: AEWNC
Type: Input

1. PURPOSE

Requests that the shared secret data (SSD) associated with an Air Extension\textsuperscript{SM} wireless subscriber be updated. The SSD is subscriber specific data that is stored in both the wireless network controller (WNC) and every subscriber's wireless phone. This data is used for authentication, to prevent access by unauthorized subscribers, and for voice encryption, that provides call security.

This message may also be executed as part of the routine maintenance performed for an Air Extension\textsuperscript{SM} system to ensure maximum system security.

Caution: It may be useful to execute the OP:WCPE input message for the wireless subscriber before executing the UPD:SSD input message. Output from the OP:WCPE message may be needed later to help determine the results of an SSD update. Refer to the complete SSD update procedure in the Air Extension\textsuperscript{SM} Reference Guide.

2. FORMAT

UPD:SSD,DN=a;

3. EXPLANATION OF MESSAGE

\(a\)

= 10 digit wireless directory number (DN).

4. SYSTEM RESPONSE

\(RL\)

= Retry later. The request has been denied, probably due to system load.

\(PF\)

= Printout follows. The request has been accepted and is followed by an UPD:SSD output message.

**UPD:UP DDSPLY**

**Software Release:** 5E14 and later  
**Command Group:** N/A  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests information about updates to the system through software update procedures.

Format 1 requests update information relating to a specific software update name.

Format 2 requests update information about all official (OFC) or temporary (TMP) updates.

Format 3 requests information on all (ALL) software updates in the software update database. The BACKLOG option retrieves concise software update database entries of all updates stored in /etc/Bud, the backup update database. Refer to the UPD:DISPLAY output message.

### 2. FORMAT

1. UPD:UP DDSPLY:BWM[=b];

2. UPD:UP DDSPLY:a[,V];

3. UPD:UP DDSPLY:ALL[,BACKLOG|,SUM|,V];

### 3. EXPLANATION OF MESSAGE

- **a** = Update type. Valid value(s):
  - OFC = Official update.
  - TMP = Temporary update.

- **b** = Software update name specified as BWMyy-nnnn, TMPyy-nnnnn (temporary) or CFTyy-nnnn where BWM, TMP and CFT identify the category of software update, yy is the last two digits of the year issued, and nnnn is the sequence number identifying the software update.

### 4. SYSTEM RESPONSE

**OK** = Good. The request has been accepted and a UPD:DISPLAY output message will follow.

### 5. REFERENCES

Other Manual(s):
235-105-210  Routine Operations and Maintenance

MCC Display Page(s):

1950 (PROGRAM UPDATE MAINTENANCE)
UPD:VERSION

Software Release: 5E14 and later
Command Group: MAINT
Application: 5,3B
Type: Input

1. PURPOSE

Requests update of the text version and/or software update level of the file system partitions. This information can be used to identify the partitions' text version and software update level should they become detached from the equipment configuration database (ECD). Normally, this message is only entered by the software update updating procedure.

Format 1 is used to apply (advance) the version.

Format 2 is used to backout a version.

2. FORMAT

[1] UPD:VERSION, APPLY="a", [UCL];
[2] UPD:VERSION, BKOUT="b", [UCL];

3. EXPLANATION OF MESSAGE

UCL = Unconditional. This option is provided so the message is accepted if the software update procedure is executed with the UCL append option. It has no effect.

a = A quoted string indicating the new text version and software update level, with the format "ccc(d)ee.ff gghh-iiii" where:
ccc = The software release (such as '5e2').
d = The issue (such as '1').
ee = The release (such as '03').
ff = The point (such as '04').
ggg = The type (such as, 'BWM', 'CFT' or 'TMP').
hh = The year (such as '85').
iiii = The sequence number (such as '0123').

For example: "5e2(1)03.04 BWM85-0123"

To be consistent with system documentation, the release, point and year are padded with a leading zero, if need be, to obtain two digits. Likewise, the sequence number is padded with leading zeros to obtain four digits.

b = A quoted string indicating the previous text version and software update level. Refer to the version string format defined in variable 'a'.

4. SYSTEM RESPONSE

NG = No good. May also include:
   x = software release, issue, release point, type, year or sequence number. This item was not present in the version string. Correct and re-enter message.
OK = Good. Command accepted, no output message will follow.

PF = Printout follows. Command accepted, and a UPD:VERSION output message will follow.

5. REFERENCES

Input Message(s):

   OP:VERSION

Output Message(s):

   OP:VERSION
   UPD:VERSION
UPD:VFY

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that software updates which are updates in the field update directory be updated. An update may be verified any number of times. Update filenames may also be displayed from this message.

2. FORMAT

UPD:VFY:{BWM="a"[-"a"[-"a"...]]|ALL}|,BSDIR="b"|,LIST};

3. EXPLANATION OF MESSAGE

ALL = Verify all software updates in the base directory that match the software update format in variable 'a'.

LIST = List all filenames received for the specified BWM(s).

a = Software update name. A list of 1 to 10 BWM names may be given, specified as BWMyy-nnnn, TMPyy-nnnn (temporary), or CFTyy-nnnn where BWM, TMP, and CFT identify the category of software update, yy is the last two digits of the year, and nnnn is the sequence number identifying the software update. Refer to the Routine Operations and Maintenance manual for instructions on entering a list of names (" " is required).

b = Base directory name. Refer to the Routine Operations and Maintenance manual for definitions of directory, pathname, and file. The default is /etc/bwm.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by a UPD:VFY output message.

1960 (INSTALL BWMM)
UPD:VFYCON-A

Software Release: 5E14 - 5E15
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests verification of update consistency and a summary of all update inconsistencies that exist in the system.

2. FORMAT

UPD:VFYCON:{ALL|TARGET=a};

3. EXPLANATION OF MESSAGE

ALL = Verify update consistency of all processor images.

a = The processor image whose consistency is to be verified. Valid value(s):

AMPATH = Office specific update in the AM.
CMP = Communication module processor.
DDMA = Diagnostic direct memory access
DNUSCC = Digital networking unit - synchronous optical network (SONET) (DNU-S) common control.
DNUSTMX = Transmission multiplexer.
DSC3 = Digital service circuit - model 3.
DSP13K = 8K digital signal processor for CDMA protocol handler for voice.
DSP8K = 8K digital signal processor for CDMA protocol handler for voice.
DSPEVRC = EVRC digital signal processor for CDMA protocol handler for voice.
GDSF = Global digital services function - model 3.
HDSU = Hardware digital service unit.
HSAS = Service announcement system diagnostic image.
IDCUCCP = Integrated digital carrier unit (IDCU) common control processor.
IDCUDLP = IDCU data link processor.
IDCULSI = IDCU loop side interface.
IP3S = Protocol handler 3 CCS OIP image.
IP4F = Frame relay protocol handler version 4 I/O processor.
IP4I = PH4I operational input/output processor.
IP4IF = ISDN Frame Relay protocol handler version 4 I/O processor.
ISLU = Integrated services line unit.
ISLU2 = Integrated services line unit 2.
ISTF = Integrated services test function.
LDSU = Local digital service unit.
LDSF = Local digital services function - model 3.
MSGH = Message handler.
ODMA = Operational direct memory access.
O1OP = Operational input/output processor.
PH2A = Protocol handler 2 (PH2) with ACCESS application processor image.
PH2G = PH2 with GATEWAY application processor image.
PH3C = Protocol handler 3 (PH3) with COMMON application processor image.
PH3S = PH3 CCS AP image.
PH4A = Protocol handler 4 (PH4) access image.
PH4G = PH4 gateway image.
PH4I = PH4 with integrated services digital network (ISDN) application processor image.
PHA1A = Protocol handler for ATM (asynchronous transfer mode).
PI = Packet interface.
PI2 = Packet interface unit 2.
PHV1C = Protocol handler for voice for CDMA (code division multiple access).
PHV3C = Protocol handler for voice version 3 for CDMA application.
PHV4C = Protocol handler for voice version 4 for CDMA application.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
SMPMH = Switching module processor message handler (MH) operational image.
SMPMHLB = Switching module processor MH little boot image.
V3DACP = ACELP digital signal processor, for TDMA protocol handler for voice.
V4D13K = 13K DSP, for CDMA protocol handler for voice version 4.
V4D8K = 8K DSP, for CDMA protocol handler for voice version 4.
V4DACP = ACELP DSP, for TDMA protocol handler for voice version 4.
V4DEVR1 = EVRC1 DSP, for CDMA protocol handler for voice version 4.
V4DEVR2 = EVRC2 DSP, for CDMA protocol handler for voice version 4.
V4DEVR3 = EVRC3 DSP, for CDMA protocol handler for voice version 4.
V4DVSP = VSELP DSP, for TDMA protocol handler for voice version 4.
V4DISL = ISLP DSP, for IS41 TDMA protocol handler for data circuit.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the UPD:VFYCON output message.

   IDCUCCP = Integrated digital carrier unit (IDCU) common control processor.
   IDCUDLP = IDCU data link processor.
   IDCULSI = IDCU loop side interface.
   IP22 = PH22 common input/output processor (IOP) image.
   IP3S = PH3 CCS IOP image.
   IP4F = Frame relay PH4 IOP image.
   IP4I = ISDN PH4 IOP image.
   IP4IF = ISDN frame relay PH4 IOP image.
   ISLU = Integrated services line unit.
   ISLU2 = Integrated services line unit 2.
   ISTF = Integrated services test function.
   LDSU = Local digital service unit.
   LDSF = Local digital services function - model 3.
   MH32 = Switching module processor message handler 32 (MH32) operational image.
   MHEIB = Switching module processor message handler EIB (MHEIB) operational image.
   MHLB = Switching module processor MH little boot image.
   MHPPC = Switching module processor message handler power PC (MHEPPC) operational image.
   MHPPCLB = Switching module processor MHPPC little boot image.
MSGH = Message handler.
ODMA = Operational direct memory access.
O1OP = Operational input/output processor.
O1U24 = Optical interface unit - 24 channels.
PH2A = Protocol handler 2 (PH2) ACCESS application processor (AP) image.
PH2G = PH2 GATEWAY AP image.
PH22I = PH22 wireless ISDN AP image.
PH22S = PH22 signaling AP image.
PH3C = PH3 COMMON AP image.
PH3S = PH3 CCS AP image.
PH4A = PH4 access AP image.
PH4G = PH4 gateway AP image.
PH4I = PH4 ISDN AP image.
PHA1A = Protocol handler for asynchronous transfer mode (ATM) AP image.
PHA2A = Protocol handler for ATM model 2 AP image.
PHE2E = Protocol handler for ethernet.
P1 = Packet interface.
P12 = Packet interface unit 2.
PHV1C = Protocol handler for voice version 1 (PHV1) for CDMA AP image.
PHV2C = PHV2 for CDMA application AP image.
PHV3C = PHV3 for CDMA application AP image.
PHV4C = PHV4 for CDMA application AP image.
PHV5C = PHV5 for CDMA application AP image.
RAF = Recorded announcement function.
SAS = Service announcement system operational image.
SM = Switching module.
V3DACP = ACELP DSP for TDMA PHV3.
V4D13K = 13K DSP, for CDMA for PHV4.
V4D8K = 8K DSP, for CDMA for PHV4.
V4DACP = ACELP DSP, for TDMA for PHV4.
V4DEVR1 = EVRC1 DSP, for CDMA for PHV4.
V4DEVR2 = EVRC2 DSP, for CDMA for PHV4.
V4DEVR3 = EVRC3 DSP, for CDMA for PHV4.
V4DVSP = VSELP DSP, for TDMA for PHV4.
V4DISL = ISLP DSP, for IS41 TDMA PHV4 data circuit.
V5D13K = 13K DSP, for CDMA for PHV5.
V5D8K = 8K DSP, for CDMA for PHV5.
V5DACP = ACELP DSP, for TDMA for PHV5.
V5DEVR1 = EVRC1 DSP, for CDMA for PHV5.

81. VFY
VFY:AMATAPE

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE
Requests that a particular tape drive be set to the automatic message accounting (AMA) function and that the tape on that tape drive be verified.

2. FORMAT
VFY:AMATAPE:MT=a[,ST1|,ST2];

3. EXPLANATION OF MESSAGE

| ST1  | Send AMA data to the ST1 data stream. |
| ST2  | Send AMA data to the ST2 data stream. |

Note: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

a = Tape drive number.

4. SYSTEM RESPONSE

| IP   | In progress. Followed by a REPT:AMATAPE-VER output message if the tape option is in effect and there is no tape session in progress. |
| NG   | No good. A tape writing or verification session is in progress or the teleprocessing option is in effect, or AMA sessions have been manually inhibited, or data stream checks failed. |
| PF   | Printout follows. Invalid data was encountered while processing the input message. In this case, an audit printout will follow. |
| RL   | Retry later. A message could not be sent to the AMA monitor process. |
| ?I   | The tape drive number specified on the input message was invalid. |

VFY:PAUTH
VFY:PCGRP
VFY:TAUTH
VFY:TCGRP
1. PURPOSE
Requests that all lines assigned to a specific call pickup group (CPUG) number or lines having a form of directed call pickup be queried and reported.

2. FORMAT

```
VFY:CPU[,TN=a[-b]|,MLHG=c[&d]-e[&f]][,CPUG=g[-g][-g][-g][-g][,TYPE=h][,DEVICE=j];
```

3. EXPLANATION OF MESSAGE

- **a** = Telephone number (TN) or the lower limit of a range of TNs.
- **b** = Upper limit of a range of TNs. If entered CPUG is also required.
- **c** = Multi-line hunt group (MLHG) number or the lower limit of a range of MLHG numbers (1-2000).
- **d** = Upper limit of a range of MLHG numbers.
- **e** = MLHG terminal member number or the lower limit of a range of MLHG member numbers (1-2015).
- **f** = Upper limit of a range of MLHG members.
- **g** = Call pickup group (CPUG) number (2-65535).
- **h** = Type of call pickup. Valid value(s):
  - **O** = Originating.
  - **T** = Terminating.
  - **B** = Both originating and terminating.
  - **D** = Directed.

- **j** = Destination device or file for the report. The device or file name is input as a character string and must be enclosed with double quote characters. If the input string is prefixed by a slash (/), the destination will be taken as the name of a file. The length of the file name should not exceed thirty (30) characters.

The default destination for single CPUGs or single line is the name of the default tty device obtained from the environment variable LCHAN. The default destination for multiple CPUGs is the FILE vfycpu. Files are stored in the directory (/rclog).

4. SYSTEM RESPONSE

- **NG** = No good. An invalid argument in the input message was given or the default output device could not be determined.
PF = Printout follows. The request was received and the VFY:CPU output will follow.

RL = Retry later. The VFY:CPU process was not able to allocate temporary file resources.

Software Release: 5E15 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that all lines assigned to a specific call pickup group (CPUG) number or lines having a form of directed call pickup be queried and reported.

2. FORMAT

VFY:CPU[,TN=a[-b],MLHG=c[&d]-e[&f]][,CPUG=g[-g][-g][-g][-g]][,TYPE=h][,DEVICE=j][,NTFY=k];

3. EXPLANATION OF MESSAGE

a = Telephone number (TN) or the lower limit of a range of TNs.
b = Upper limit of a range of TNs. If entered CPUG is also required.
c = Multi-line hunt group (MLHG) number or the lower limit of a range of MLHG numbers (1-2000).
d = Upper limit of a range of MLHG numbers.
e = MLHG terminal member number or the lower limit of a range of MLHG member numbers (1-2015).
f = Upper limit of a range of MLHG members.
g = Call pickup group (CPUG) number (2-65535).
h = Type of call pickup. Valid value(s):
   B = Both originating and terminating.
   D = Directed.
   O = Originating.
   T = Terminating.

j = Destination device or file for the report. The device or file name is input as a character string and must be enclosed with double quote characters. If the input string is prefixed by a slash (/), the destination will be taken as the name of a file. The length of the file name should not exceed 30 characters.

The default destination for single CPUGs or single line is the name of the default tty device obtained from the environment variable LCHAN. The default destination for multiple CPUGs is the FILE vfycpu. Files are stored in the directory (/rclog).

k = Visual notification for originating call pickup. Valid value(s):
   N = No, the visual notification is not provided.
   Y = Yes, the visual notification is provided.
4. SYSTEM RESPONSE

NG = No good. An invalid argument in the input message was given or the default output device could not be determined.

PF = Printout follows. The request was received. Followed by the VFY:CPU output message.

RL = Retry later. The VFY:CPU process was not able to allocate temporary file resources.

5. REFERENCES

Output Message(s):

VFY:CPU

Other Manual(s):
235-190-103 Business and Residence Feature Description
1. PURPOSE

Requests that the contents of files that are essential to the booting of the administrative module (AM) be verified.

Format 1 is used to verify a single file or a list of files.

Format 2 is used to verify all essential files within a database partition.

2. FORMAT

[1]  VFY:FILE: ({FN="a b" | FLIST="c" [, DELTA]} [, MP="d" [, OLMP="e" ] [, DN=f, OFLPN=g ] ] [, GEN|, PRINT]);

3. EXPLANATION OF MESSAGE

a = A string containing the full path to the essential file

b = A string of 1 to 3 characters that indicates the type of checking to be performed. The first letter must be 'i', 'g', or 'n'. The letter 'i' or 'g' indicates that the cyclic redundancy check (CRC) information is stored internally or globally. The letter 'n' that CRC information is not to be checked. If CRC information is not to be checked, then at least one additional character must appear in the string.

The first letter may be followed by the letter 'X'. If 'X' appears, then the file is checked for execution permission by the owner.

The last letter (either second or third), if specified, indicates that the file type to be checked. Valid value(s):

- = Regular.
1 = Contiguous.
2 = Multi-extent.
B = Block special.
C = Character special.
I = IOP special.
R = Record special.
D = Director.
P = Pipe.

The checks for executable by owner and file type are optional as long as CRC checking is specified. If CRC checking is inhibited, then at least one of the optional checks must be specified.

c = The full pathname of a specification file containing entries in the format of variables 'a' and 'b'.

d = The full pathname of the directory where the database partition is mounted or where the off-line
partition is to be mounted; default is "/".

e
= The corresponding on-line mount point of the file system containing the files being verified. For a non-root file system, if the file names stored in /.crcvalues were stored relative to "/" (for example, no MP option was used when the CRC was generated and stored), then the on-line mount point (OLMP) option must be used when verifying the contents of a copy of this file which resides on an off-line partition.

f
= The number of the off-line disk which contains the files to be verified. Legal values are 0 to 31. The default is to use the on-line disks.

g
= The number of the off-line disk partition to be verified. Legal values are 0 to 63. The default is to use on-line disk partitions.

h
= A two-character string indicating the pack name of the SG database partition to be verified. This value is the same as the pack_name field in the fs record for the database partition. Default is "rt."

i
= The pack number which corresponds to the pack_number field in the fs record for the database partition being verified. Legal values are 0 to 32767; default is 0.

j
= The SG database partition number of the SG database partition corresponding to the par_number in the partition's fs record. Legal values are 0 to 63; default is 5.

The DELTA keyword provides the following service: If VFY:FILE is using the FLIST keyword and finds a file name in the specification file with the checking option "g," but that file is not found in the global crcvalue file, then VFY:FILE will generate an entry for that file in the global crcvalue file.

The GEN keyword will cause VFY:FILE to generate and store CRC information for the file or list of files provided. GEN and DELTA make the assumption that the contents of each the files is correct before VFY:FILE is run and should be used only with extreme caution. The PRINT option causes VFY:FILE to print the CRC information which it calculates for each essential file specified. No actual verification of the CRC information takes place. The PRINT and GEN options may not be used together. The option to inhibit CRC checking should not be used unless checking CRC information for the specified file is not appropriate. Do not view this option as a fast way to verify essential files.

4. SYSTEM RESPONSE

PF
= Printout follows. Followed by a VFY:FILE output message.

5. REFERENCES

Input Message(s):

VFY:FILE

Other Manual(s):
235-105-250 System Recovery
235-600-305 ECD/SG
VFY:MHD

**Software Release:** 5E14 and later  
**Command Group:** AM  
**Application:** 5,3B  
**Type:** Input  

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Reads all or specific disk tracks/blocks and verifies the header and error-correction code of each sector of the tracks/blocks read. The error-correction code is read to verify the correctability of the data in each sector.

For storage module drive (SMD) disk drives, the header contains the cylinder, track, and sector identification numbers, and should match the SMD disk file controller (DFC) internal head position data. For small computer system interface (SCSI) disk drives, the error-correction code is read to verify the correctability of the data in each disk block. The moving head disk (MHD) does not have to be in the active state for this input message to work.

Note: It may take several minutes to verify a complete disk. For SMD DFC, this request may fail to complete if it is input while another MHD related request is active on the same DFC. If this happens, repeat the request after the other input message completes. For SCSI DFC, a maximum of two "verify" requests are possible for different MHDs on the same DFC.

**WARNING:** This message should not be executed when either the AM or CM REX are running. Executing this message at those times can result in call processing problems.

2. **FORMAT**

    [1] VFY:MHD=a [,TRACK=b[&c]];  
    [2] VFY:MHD=a [,BLOCK=b[&c]];  

3. **EXPLANATION OF MESSAGE**

    a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  
    b = There are two different formats depending on the type of MHD (SMD or SCSI). Valid value(s):  
        - Track(s) of the SMD MHD to be verified, in decimal notation. May be the first track of a range (0-17604).  
        - Block(s) of the SCSI MHD to be verified, in decimal notation. May be the first block of a range (0-2147483646).  
    c = The last track/block of a range of tracks (0-17064 or 0-2147483646).

4. **SYSTEM RESPONSE**

    PF = Printout follows. Followed by VFY:MHD output message.

123 (DISK FILE SYSTEM ACCESS)
VFY:MLHG

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests a report to verify all the members of a multi-line hunt group (MLHG). The report quickly provides information on all members of a particular MLHG. The message is useful for trouble shooting MLHG data.

2. FORMAT

VFY:MLHG, GROUP=a [,DEVICE="b"] [,REPORT=c];

3. EXPLANATION OF MESSAGE

a = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Destination device or file for the report. The device or file name is input as a character string and must be inclosed with double quotation marks. If the input string is prefixed by a slash (/), the destination will be taken as the name of a file. The length of the file name must not exceed thirty (30) characters. The default destination is the name of the default tty device obtained from the environment variable LCHAN.

c = Type of report. Valid value(s):
    G = Report group.
    M = Report member.
    B = Report both group and member.

4. SYSTEM RESPONSE

NG = No good. An invalid argument in the input message was given or the default output device could not be determined.

PF = Printout follows. Followed by the report on the specified destination device/file.

RL = Retry later. The VFY:MLHG process was not able to allocate temporary file resources.

5. REFERENCES

None
1. PURPOSE

Requests verification of office routing translations, used in call processing, from the originating line or trunk to the terminating line or trunk.

This input message supports routing for voice calls. This includes intra- and inter-office calls. This input message examines routing of voice calls including automatic route selection (ARS) voice calls. For Format 1, this message supports verification of switch number portability (NP) routing information and recognition of LRNs in routing tables. This format also supports verification of provisioned routing information for long distance platform (LDP).

For Format 2, this message supports routing for circuit-switched data (CSD), except for certain features like automatic route selection (ARS). This includes intra- and inter-office CSD calls. This input message also supports verification of switch number portability (NP) routing information and recognition of LRNs in routing tables. This format also supports verification of provisioned routing information for long distance platform (LDP), with the ability to verify wideband data rates for LDP calls.

For Format 3, this input supports routing for packet-switched data (PSD) calls. This includes intra- and inter-office PSD calls.

2. FORMAT

[1] VFY:OFC,[CSV],{DN=a|TG=b[-c]|MLHG=d-e|PORI=f-g}[,DIG=h]

3. EXPLANATION OF MESSAGE

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Directory number (DN) of the line whose translations are to be verified.</td>
</tr>
<tr>
<td>b</td>
<td>Trunk group number of the trunk whose translations are to be verified. This field may be used to enter a Bearer Independent Call Control (BICC) Trunk group. If a Service Trunk group is entered, an error will be returned.</td>
</tr>
<tr>
<td>c</td>
<td>Optional member number of the trunk group whose translations are to be verified. If not specified, the first assigned member is used. The member value cannot be entered if the trunk group specified is a BICC trunk group. The base CIC is used to process all BICC requests.</td>
</tr>
<tr>
<td>d</td>
<td>Group number of the multi-line hunt group line whose translations are to be verified.</td>
</tr>
<tr>
<td>e</td>
<td>Member number of the multi-line hunt group line whose translations are to be verified.</td>
</tr>
</tbody>
</table>
f = Module number (key to RLPORTLA) of the port whose translations are to be verified.

g = Port name (key to RLPORTLA) of the port whose translations are to be verified.

h = Optional address digits of call to be verified. This field should contain the LRN when PORTEDDN is also entered. Must be specified unless the call is from a manual or direct connect line, trunk or unless a packet switch number (PSN) is input for Packet. The special characters "#" and "*" may be included along with numeric digits by surrounding the entire field with double quotation marks. If no special characters are entered, then the quotation marks are optional.

It is a general rule-of-thumb that whenever there is timing in a digit sequence that the customer can end by dialing a #, then that # must be included in the input digit string. This is normally the case with ambiguous or conflict sequences.

For example, in the case of using an IDP and dialing an escape to POTS dial code followed by ODP dial code (which starts with a # sign) and possibly more digits, a # sign needs to be inserted in the digit string between the escape to POTS code and the dial code. The customer dialing the following sequence 9 (action DPOTSA defined in IDP), #8 (ARSUSE code defined in ODP) and 5610000 (a DN) would enter this digit string in the input message as dig="9##85610000".

This is because this input message works off the digit string and cannot do critical interdigit timing as is done when the digits are being collected from a user. Entering the digit string above as "9#85610000" would result in the # being read as end of critical interdigit timing and the ODP would be left to incorrectly interpret the digits 85610000.

For LDP calls, the value of this field depends on the CALLTYPE input field (variable q). Please refer the tables under the explanation of CALLTYPE input field for valid values.

i = Optional Registered Private Operating Agency, a four-digit Data Network Interexchange Carrier (DNIC) used with packet routing.

j = Optional Interexchange Carrier Preselect Indication, a four-digit DNIC used with packet routing.

k = Optional Packet Switch Number, a number between 1 and 255, inclusive, used in Internal Protocol Packet routing as the destination of the call.

l = Optional ten digit Location Routing Number.

m = Ported DN, generic address parameter (SS7 ISUP). Variable h contains the LRN. This overrides the LNP query. No LNP query will be done when LRN is entered.

n = Optional automatic number identification (ANI). ANI is a required field for LDP LATA trunks.

Valid value(s):
10 digit NPA-NXX-XXXX
3 digit NPA
NULL = The NULL value shall be valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS.

o = Optional ANI information digits (II) for a MF trunk. Valid value(s):
00 = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = Automatic input/output dialing (AIOD) listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = Outbound wide area transport (OUTWATS) line.
68 = Interlata restricted hotel line.
78 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

The default value for this field is 00.

p
= Optional originating line information (OLI) for a CCS7 trunk. Valid value(s):
    IDLINE = Identified line with no special treatment.
    01 = Operator number identified (multiparty).
    02 = ANI failure.
    06 = Hotel without room identification.
    07 = Coinless, hospital, or inmate call.
    08 = Interlata restricted.
    10 = Test call.
    20 = Automatic input/output dialing (AIOD) listed directory number sent.
    23 = Identified line (coin or noncoin).
    24 = Translated 800 call.
    27 = Coin line.
    34 = Operator handled.
    52 = Outbound wide area transport (OUTWATS) line.
    68 = Interlata restricted hotel line.
    78 = Interlata restricted coinless line.
    93 = Virtual private network line.
    NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

The default value for this field is IDLINE.

q
= Optional calltype prefix of the dialed number. This also corresponds to the nature of number value for CCS7 signaling. Valid value(s):
    1P = World zone 1, non-operator.
    0P = World zone 1, zero plus.
    011 = International, non-operator.
    01P = International 01 plus (dialed as 01+CC+NN).
    01M = International 01 minus.
    DOM = Domestic (United States).
    FGB = FGB (950-xxxx) calls from transition EAEO/AT.
    FGBPS = FGB (950-xxxx) calls from public station during and after the transition.
    FGDCT = Feature group D cutthrough calls.
The default value for this field is DOM.

If calltype is 011, 01P, 1P or 0P only the national number digits have to be entered on the DIG field on input. No prefixes should be present on the DIG= field. The software will add appropriate prefixes based on CALLTYPE. The software will also add the country code from input command for international calls.

If CALLTYPE is 01M, DIG= and CC= should not be entered on input. Software will analyze this as an international operator call based on CALLTYPE.

If CALLTYPE is DOM, user has to enter the actual digit string to be analyzed along with necessary prefixes. For example, if the user wants a DOMESTIC operator call, the digit string must have a 0 prefix on the DIG= field.

Table 1: Mapping of CALLTYPE to CCS7 Nature of Address/Switch Prefixing

The following table describes relationship between certain input parameter combinations and how the switch processes them for ISUP signaling.

Fields CALLTYPE, DIG, CC, TNS are VFY:OFC input fields.

CCS7 nature of address is the nature of address assigned to the call based on these inputs.

Switch prefix is the prefix that the switch adds to the called party number based on these inputs.

<table>

</table>

\r = Optional carrier identification code (CIC). CIC can be 3 digit(0-999) or 4 digit(0-9999).

\s = Optional circuit code for transit network selector (TNS). Valid values are in the range 0-15. For incoming MINT trunk, any value specified for TNS is ignored.

\t = Optional carrier code for transit network selector (TNS). Valid carrier code can be 3 digit(0-999) or 4 digit(0-9999). For incoming MINT trunk, any value specified for TNS is ignored.

\u = Optional 3 digit(0-999) country code for the called number.

\v = Optional terminating network selection code (TNSC), relevant only for specified MINT trunks. Valid values are in the range 0-999. Default value is 1.

\w = Narrowband data rate for CSD calls. Valid value(s):

56 = 56-kbps, unrestricted digital information, circuit-mode, rate adapted from 56-kbps.
64 = 64-kbps, unrestricted digital information, circuit-mode.
R64 = 64-kbps, restricted digital information, circuit-mode, rate adapted from 56-kbps.

\x = Wideband data rate for CSD calls. Valid value(s):

384 = 384 kbps.
384_1536 = 384 or 1536 kbps.
1536 = 1536 kbps.

\y = Wideband data rate channel for CSD calls. Wideband channel specifies the number of DS0s requested for the call. The number of DS0s is the information transfer rate multiplier value. This field will always be included for “multi-rate” calls. Valid values for this field are between 2 and 24.

NONPORTED = Presence of this key indicates that dig= value is known to be nonported.

PRESUBSC = Optional keyword to indicate if the calling party is presubscribed to the carrier associated with this call.

SAT = Optional keyword to indicate if the call has been routed via satellite. For SS7, SAT keyword is valid for all trunks. For MF, SAT keyword can only be used for MINT trunks.
4. SYSTEM RESPONSE

NG

= No good. May also include:
- ANI PARAMETER MUST BE 3 or 10 DIGITS OR ENTERED AS NULL
- ANI PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- ANI PARAMETER MUST BE NULL or DIGITS
- ANI PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- CALLTYPE IS NOT FGB/FGBPS, ANI, OLI OR II CANNOT BE ENTERED
- CALLTYPE PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- CALLTYPE PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- CALLTYPE PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- CALLTYPE SHOULD BE FGB/FGBPS FOR DIG=950-XXXX
- CANNOT SPECIFY LRN DIGITS WITHOUT A DIG PARAMETER
- CANNOT SPECIFY PORTEDDN OR NONPORTED WITHOUT A DIG PARAMETER
- CC PARAMETER CANNOT BE ENTERED WHEN CALLTYPE=01M
- CC PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- CC PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- CC PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- CIC PARAMETER CANNOT BE ENTERED WITH DN OR MLHG

- II PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- II PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- LRN PARAMETER NOT SUPPORTED - TEST QUERY FOR LRN FEATURE NOT PURCHASED
- LRN PARAMETER MUST BE 10 DIGITS
- NON-NUMBER DIGIT = Address digits contain characters other than 0-9, #, and *. These two
  special characters should be in quoted strings.
- NONPORTED KEYWORD NOT SUPPORTED - NP VERIFY OFFICE FOR LRNS NOT
  PURCHASED
- NULL ANI VALUE CAN ONLY BE USED FOR FGB CALLS = ANI=NULL, OLI/II=NULL can be
  entered only when CALLTYPE=FGB/FGBPS.
- OLI PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- OLI PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- OLI PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- ONLY SS7 TRUNK ORIGINATIONS CAN SPECIFY PORTEDDN PARAMETER
- PORTEDDN PARAMETER NOT SUPPORTED - NP VERIFY OFFICE FOR LRNS NOT
  PURCHASED
- PORTEDDN PARAMETER MUST BE 10 DIGITS
- PRESUBSC PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- PRESUBSC PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- PRESUBSC PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- PSN CANNOT BE ENTERED WITH RPOA OR ICPI
- RPOA/ICPI MUST BE FOUR DIGIT BCD
- SAT PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- SAT PARAMETER NOT SUPPORTED - BASIC LDP IS NOT ACTIVE
- SAT PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- SYSTEM ERROR = No terminal process could be created in the administrative module (AM). This is probably a temporary condition. If this happens repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- TG CANNOT BE ENTERED WITH DN OR MLHG = The only valid origination combinations for packet (PKT) are DN, MLHG, DN and MLHG, or TG.
- TNS PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- TNS PARAMETER MUST BE DIGITS = The circuit code and carrier ID in TNS parameter must contain digits only.
- TNS PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- TNS PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- TNSC PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- TNSC PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- WBCHANNEL PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- WBCHANNEL PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- WBRATE PARAMETER CANNOT BE ENTERED WITH DN OR MLHG
- WBRATE PARAMETER NOT SUPPORTED - BASIC LDP FEATURE IS NOT ACTIVE
- WBRATE PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE
- WBRATE PARAMETER NOT SUPPORTED - VERIFY OFFICE FOR LDP IS NOT ACTIVE

PF = Printout follows. Followed by the appropriate output message. May also include:
- EVENT n = Request (identified by the number n) has been accepted and is being processed. The VFY:OFC output message may contain multiple segments. Each segment will contain this event number.

RL = Retry later. May also include:
- NO STACK SPACE = No stack space is available in the AM. This is probably a temporary condition. If this happens repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- NO SYSTEM RESOURCE = No process control blocks (PCBs) in the AM are available. This is probably a temporary condition. If this happens repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- UNABLE TO SEND MSG = The AM is unable to send messages. This is probably a temporary condition. If this happens repeatedly, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- VERIFY IN PROGRESS = Another office verification is currently in progress. Only one verification can be done at a time.

Application: 5
Type: Input

1. PURPOSE

Requests verification of office routing translations, used in call processing, from the originating line or trunk to the terminating line or trunk.

This input message supports routing for voice calls. This includes intra- and inter-office calls. This input message examines routing of voice calls including automatic route selection (ARS) voice calls.

For Format 1, this message supports verification of switch number portability (NP) routing information and recognition of LRNs in routing tables. This format also supports verification of provisioned routing information for long distance platform (LDP).

For Format 2, this message supports routing for circuit-switched data (CSD), except for certain features like automatic route selection (ARS). This includes intra- and inter-office CSD calls. This input message also supports verification of switch number portability (NP) routing information and recognition of LRNs in routing tables. This format also supports verification of provisioned routing information for long distance platform (LDP), with the ability to verify wideband data rates for LDP calls.

For Format 3, this input supports routing for packet-switched data (PSD) calls. This includes intra- and inter-office PSD calls.

________________________________________________________

3. EXPLANATION OF MESSAGE

NONPORTED = Presence of this key indicates that dig= value is known to be nonported.

PRESUBSC = Optional keyword to indicate if the calling party is presubscribed to the carrier associated with this call.

SAT = Optional keyword to indicate if the call has been routed using satellite. For SS7, SAT keyword is valid for all trunks. For MF, SAT keyword can only be used for MINT trunks.
= Directory number (DN) of the line whose translations are to be verified.

b = Trunk group number of the trunk whose translations are to be verified. This field may be used to enter a bearer independent call control (BICC) trunk group. If a service trunk group is entered, an error will be returned.

c = Optional member number of the trunk group whose translations are to be verified. If not specified, the first assigned member is used. The member value cannot be entered if the trunk group specified is a BICC trunk group. The base CIC is used to process all BICC requests.

d = Group number of the multi-line hunt group line whose translations are to be verified.

e = Member number of the multi-line hunt group line whose translations are to be verified.

f = Module number (key to RLPORTLA) of the port whose translations are to be verified.

g = Port name (key to RLPORTLA) of the port whose translations are to be verified.

h = Optional address digits of call to be verified. This field should contain the LRN when PORTEDDN is also entered. Must be specified unless the call is from a manual or direct connect line, trunk or unless a packet switch number (PSN) is input for packet. The special characters "#" and "**" may be included along with numeric digits by surrounding the entire field with double quotation marks. If no special characters are entered, then the quotation marks are optional.

It is a general rule-of-thumb that whenever there is timing in a digit sequence that the customer can end by dialing a #, then that # must be included in the input digit string. This is normally the case with ambiguous or conflict sequences.

For example, in the case of using an IDP and dialing an escape to POTS dial code followed by ODP dial code (which starts with a # sign) and possibly more digits, a # sign needs to be inserted in the digit string between the escape to POTS code and the dial code. The customer dialing the following sequence 9 (action DPOTSA defined in IDP), #8 (ARSUSE code defined in ODP) and 5610000 (a DN) would enter this digit string in the input message as dig="9##85610000".

This is because this input message works off the digit string and cannot do critical interdigit timing as is done when the digits are being collected from a user. Entering the digit string above as "9#85610000" would result in the # being read as end of critical interdigit timing and the ODP would be left to incorrectly interpret the digits 85610000.

For LDP calls, the value of this field depends on the CALLTYPE input field (variable ‘o’). Please refer the tables under the explanation of CALLTYPE input field for valid values.

i = Optional ten digit location routing number.

j = Ported DN, generic address parameter (SS7 ISUP). Variable ‘h’ contains the LRN. This overrides the LNP query. No LNP query will be done when LRN is entered.

k = Optional automatic number identification (ANI). ANI is a required field for LDP LATA trunks. Valid value(s):

10 digit NPA-NXX-XXXX
3 digit NPA
NULL

The NULL value shall be valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS.
l
= Optional ANI information digits (II) for a MF trunk. Valid value(s):
00 = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = Automatic input/output dialing (AIOD) listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = Outbound wide area transport (OUTWATS) line.
68 = Interlata restricted hotel line.
78 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

The default value for this field is 00.

m
= Optional originating line information (OLI) for a CCS7 trunk. Valid value(s):
IDLINE = Identified line with no special treatment.
01 = Operator number identified (multiparty).
02 = ANI failure.
06 = Hotel without room identification.
07 = Coinless, hospital, or inmate call.
08 = Interlata restricted.
10 = Test call.
20 = Automatic input/output dialing (AIOD) listed directory number sent.
23 = Identified line (coin or noncoin).
24 = Translated 800 call.
27 = Coin line.
34 = Operator handled.
52 = Outbound wide area transport (OUTWATS) line.
68 = Interlata restricted hotel line.
78 = Interlata restricted coinless line.
93 = Virtual private network line.
NULL = NULL input, valid only when DIG=950-XXXX for CALLTYPE=FGB or FGBPS calls.

The default value for this field is IDLINE.

n
= Optional calltype prefix of the dialed number. This also corresponds to the nature of number value
for CCS7 signaling except for APN. If APN, it corresponds to either the nature of number value for
CCS7 signaling or to the called party number information element type of number and numbering
plan identification values for Q.931 signaling. Valid value(s):
1P = World zone 1, non-operator.
0P = World zone 1, zero plus.
011 = International, non-operator.
01P = International 01 plus (dialed as 01+CC+NN).
01M = International 01 minus.
DOM = Domestic (United States).
FGB = FGB (950-xxxx) calls from transition EAO/AT.
FGBPS = FGB (950-xxxx) calls from public station during and after the transition.
FGDCT = Feature group D cutthrough calls.
APN = Action point numbers.

The default value for this field is DOM.

If calltype is 011, 01P, 1P or 0P only the national number digits have to be entered on the DIG field on input. No prefixes should be present on the DIG= field. The software will add appropriate prefixes based on CALLTYPE. The software will also add the country code from input command for international calls.

If CALLTYPE is 01M, DIG= and CC= should not be entered on input. Software will analyze this as an international operator call based on CALLTYPE.

If CALLTYPE is DOM, user has to enter the actual digit string to be analyzed along with necessary prefixes. For example, if the user wants a DOMESTIC operator call, the digit string must have a 0 prefix on the DIG= field.

If CALLTYPE is APN, user has to enter the private digit string to be analyzed. This value only applies on an edge switch for CCS7 TTOLL and IC trunks and for Service Node EDSL trunks. The following tables do not apply when CALLTYPE is APN.

### Mapping of CALLTYPE to CCS7 Nature of Address/Switch Prefixing

This table describes relationship between certain input parameter combinations and how the switch processes them for ISUP signaling.

Fields CALLTYPE, DIG, CC, TNS are VFY:OFC input fields.

CCS7 nature of address is the nature of address assigned to the call based on these inputs.

Switch prefix is the prefix that the switch adds to the called party number based on these inputs.

<table>

Mapping of CALLTYPE to switch prefix for MF signaling

This table describes relationship between certain input parameter combinations and how the switch processes them for MF signaling.

Fields CALLTYPE, DIG, CC, CIC are VFY:OFC input fields.

Switch prefix is the prefix that the switch adds to the called party number based on these inputs.

</tbody>
</table>

- **o**: Optional carrier identification code (CIC). CIC can be 3 digit (0-999) or 4 digit (0-9999).
- **p**: Optional circuit code for transit network selector (TNS). Valid values are in the range 0-15. For incoming MINT trunk, any value specified for TNS is ignored.
- **q**: Optional carrier code for transit network selector (TNS). Valid carrier code can be 3 digit (0-999) or 4 digit (0-9999). For incoming MINT trunk, any value specified for TNS is ignored.
- **r**: Optional 3 digit (0-999) country code for the called number.
- **s**: Optional terminating network selection code (TNSC), relevant only for specified MINT trunks. Valid values are in the range 0-999. Default value is 1.
- **t**: Narrowband data rate for CSD calls. Valid value(s):
  - 56 = 56-kbps, unrestricted digital information, circuit-mode, rate adapted from 56-kbps.
  - 64 = 64-kbps, unrestricted digital information, circuit-mode.
  - R64 = 64-kbps, restricted digital information, circuit-mode, rate adapted from 56-kbps.
- **u**: Wideband data rate for CSD calls. Valid value(s):
  - 384 = 384 kbps.
  - 384_1536 = 384 or 1536 kbps.
  - 1536 = 1536 kbps.
- **v**: Wideband data rate channel for CSD calls. Wideband channel specifies the number of DS0s requested for the call. The number of DS0s is the information transfer rate multiplier value. This field will always be included for "multi-rate" calls. Valid values for this field are between 2 and 24.
- **w**: Optional registered private operating agency, a four-digit data network interexchange carrier (DNIC) used with packet routing.
x = Optional interexchange carrier preselect indication, a four-digit DNIC used with packet routing.

y = Optional packet switch number, a number between 1 and 255, inclusive, used in internal protocol packet routing as the destination of the call.

4. SYSTEM RESPONSE

NG = No good. May also include:

1. PURPOSE

Format 1 verifies a person identity and the person's last login date and time. If the optional identity (IDENT) parameter is not specified, the whole person authority database (PAUTH) is printed showing all person identities and last login times.

Format 2 verifies person identities with the following characteristics:

Those that surpass a particular number of days since last logging in.

Those that surpass a particular number of days for a single login session.

Those that have never logged in.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

[1] VFY:PAUTH[:IDENT="a"];

3. EXPLANATION OF MESSAGE

a = Identity of the person to whom the associated date and time applies, in one to eight letters and/or digits.

b = Number of days considered dormant, an integer from 1 to 99999 inclusive.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- NO DORMANT USERS PRESENT = There are no dormant person identities falling within the specified number of days.
- NON-EXISTENT PERSON IDENTITY = The given person identity does not exist in the person authority database.
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The person authority database is inaccessible.

PF = Printout follows. Followed by VFY:PAUTH output message.

VFY:RDTA-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests verification of an active remote digital test access (RDTA) session for a specific port under test (PUT). This request will verify that the ports involved in an RDTA session are connected as intended. The PUT is always used on the input request to identify the session for verification.

The verification begins by accessing the switching module (SM), where the PUT on the input request resides, to determine the actual physical connection. That information is then compared with the session data in the administrative module (AM) for consistency. If there is consistency, a VFY:RDTA success output message is sent in response to the input request to describe the connection. Otherwise, a VFY:RDTA failure message is sent describing the inconsistency or reason for failure. An OP:RDTA input message may be executed to determine a port name for possible verification or to access additional information on a particular RDTA session.

2. FORMAT

VFY:RDTA,a[,CH=u];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Port identification. Valid value(s):

b = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module number.
e  = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = Digital channel number. If this is a DFI-2, channels 1-24 are associated with T1-A and channels 25-48 are associated with facility T1-B.

h  = The DN. This parameter can only be used to identify channels associated with DSLs.

i  = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j  = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k  = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l  = Integrated services line unit (ISLU) or access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m  = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n  = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o  = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p  = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q  = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r  = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s  = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t  = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u  = Channel type (not valid for DEN and TKGMN port identification). Valid value(s):
      B1  = Channel B1.
      D   = D-channel (default).

v  = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
w = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

x = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

y = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

z = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

a¹ = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

b¹ = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

c¹ = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

d¹ = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

e¹ = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by VFY:RDTA output message.

RL = Retry later. Valid value(s):
   - FAILED TO CREATE PROCESS = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
   - TOO MANY PROCESSES ACTIVE = The request has been denied, probably due to system load.

Software Release: 5E15 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests verification of an active remote digital test access (RDTA) session for a specific port under test (PUT). This request will verify that the ports involved in an RDTA session are connected as intended. The PUT is always used on the input request to identify the session for verification.

The verification begins by accessing the switching module (SM), where the PUT on the input request resides, to determine the actual physical connection. That information is then compared with the session data in the administrative module (AM) for consistency. If there is consistency, a VFY:RDTA success output message is sent in response to the input request to describe the connection. Otherwise, a VFY:RDTA failure message is sent describing the inconsistency or reason for failure. An OP:RDTA input message may be executed to determine a port name for possible verification or to access additional information on a particular RDTA session.

2. FORMAT

VFY:RDTA,a[,CH=u];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Port identification. Valid value(s):

VFY:TAPE

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests verification of the readability of information on administrative module (AM) tapes and the consistency of corresponding hash sums.

System tapes are formatted as a series of headers, each followed by a number of data blocks (or records). A header contains information concerning the number of data blocks which follow it and the size of the blocks. The last header on the tape has no associated data records and is called the trailer header. Each header also contains a hash sum for the header itself and a hash sum for the total of all its corresponding records. Tape verification will check the header and data hash sums and make sure that all information is readable. On a digital audio tape (DAT), a single session or a single volume can be verified. A DAT may be formatted as a multi-volume tape; that is, it may contain headers and data blocks for more than one logical volume. One of these logical volumes or several logical volumes grouped together form a session, and several sessions may be found on a DAT.

2. FORMAT

VFY:TAPE,TD="a"[:RETRY=b][,SESS=c[,VOL=d]][,VERBOSE];

3. EXPLANATION OF MESSAGE

a = Special device file name of the tape drive where system tape to be verified is loaded. Refer to the ECD/SG manual.

b = Number of times to retry after tape read errors (default two). If a read attempt is unsuccessful, the tape will backspace and try to read again until either the attempt is successful or the retry count is exceeded.

c = Number of the session that is to be verified. This option is only valid for a multi-volume DAT. The range of session numbers is 1-9.

d = Number of the volume that is to be verified. This option is only valid for a multi-volume DAT. The range of volume numbers is 0-9.

If verbose option is specified, a line of output is produced for each header hash sum successfully read, and for each header or data record successfully read but required retries.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by VFY:TAPE output message.

82. WHEN
WHEN:COND

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Starts a list of administrative module (AM) generic access package (GRASP) input messages that are to be performed when an external event breakpoint condition exists. The list of input messages is called and action list.

2. FORMAT

WHEN:COND=E;

3. EXPLANATION OF MESSAGE

An external event condition exists when the external event backplane signal becomes active.

Commands following a WHEN:COND input message are restricted to the following list. A maximum of five input messages is allowed in the action lists.

- ALW:{UTIL|UTILFLAG|UMEM}
- INH:{UTIL|UTILFLAG|UMEM}
- DUMP:{ADDR|PMEM|REG|UVAR}
- COPY: all forms of the input message, except process identification (PID) or PID source.
- LOAD: all forms of the input message.

Note: Refer to the message descriptions for the details of how the input messages are used within the WHEN input message.

The action list is terminated with the END:WHEN! input message.

E = Action list performed when an external event occurs.

4. SYSTEM RESPONSE

IP = In progress. Breakpoint condition is understood. The associated action list is expected to follow.

NG = No good. May also include:
- TOO MANY BREAKPOINTS = Only 20 breakpoints are permitted at one time.
- UCERR = The utility circuit is unavailable.

RL = Retry later. The system is in an overload condition or completing the previous OP:UMEM message.

Application: 5,3B
Type: Input

1. PURPOSE

Requests that a list of administrative module (AM) generic access package (GRASP) messages be executed when a specified breakpoint condition exists. The list of messages is called an action list.

Two types of breakpoint conditions are recognized: instruction-execution conditions and data-access conditions.

Format 1 is used when instruction-execution breakpoints are required.

Format 2 is used when data-access breakpoints are required.

Instruction execution is detected by specifying a virtual address within a process. When the instruction at that address is executed, the action list is executed. The first byte of the instruction opcode expected to be found at that address must be specified in the message. The breakpoint definition is rejected if this opcode does not agree with the opcode found at the virtual address.

Data access is indicated by specifying both the virtual address within the process and the type of access to be detected: read, write, and read/write.

A data access breakpoint will fire if the location specified is addressed with the correct access type. A data access breakpoint over a range of data locations will fire if any location in the range is addressed with the correct access tape.

Messages following the WHEN message are restricted to the following list. A maximum of five messages are allowed in action lists.

- ALW: {UTIL|UTILFLAG|UMEM}
- COPY: All forms of the message except process ID (PID) or utility ID (UID) source.
- DUMP: {ADDR|PMEM|REG|UVAR}
- INH: {UTIL|UTILFLAG|UMEM}
- LOAD: All forms of the message.

Note: Refer to the message description for the details of how the messages are used within the WHEN message.

The action list is terminated with the END:WHEN input message.

2. FORMAT

[1] WHEN:PID=a,ADDR=b,OPC=e:EXC[,WORD]!
[2] WHEN:PID=a,ADDR={b[&c][,L=d]}:(R|W|RW)[,WORD]!

3. EXPLANATION OF MESSAGE

EXC = Execute the action list when the breakpoint address is executed.
**R** = Trigger the action list when a read operation occurs on any part of the full memory word containing the specified byte address(es).

**RW** = Trigger the action list when either the R or the W condition is met.

**W** = Trigger the action list when a write operation occurs on any part of the full memory word containing the specified byte address(es).

**WORD** = Interpret the address and length fields as words. If this option is omitted, they are assumed to be byte values.

**a** = Process ID (PID) of the target process.

**b** = Virtual byte address for the breakpoint, or the beginning address of a range of addresses, in decimal, octal, or hexadecimal notation.

**c** = End address for a range of addresses.

**d** = Length of a range of addresses in bytes.

**e** = One-byte opcode expected to be found at the breakpoint address. The value is checked for software implemented breakpoints only.

### 4. SYSTEM RESPONSE

**IP** = In progress. Breakpoint condition is understood. The associated action list is expected to follow.

**NG** = No good. May also include:
- **BAD PID** = The process ID is for a process for which dumps are not permitted.
- **TOO MANY BREAKPOINTS** = Only 20 breakpoints are permitted at one time.
- **UCERR** = The utility circuit is unavailable.

**RL** = Retry later. The system is in an overload condition or completing the previous OP:UMEM message.

**?A** = Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted. May also include:
- **INVALID KEY WORD** = The message is not allowed in a WHEN action list. The END:WHEN input message is expected after the fifth action.

**?I** = General syntax error or:
- **RANGE ERROR (PID)** = Process ID is out of range.
- **RANGE ERROR (OPC)** = One byte opcode is expected.
- **INCONSISTENT DATA (ADDR)** = Address range must be in ascending order.

### 5. REFERENCES

Input Message(s):

ALW:UMEM
WHEN:RUTIL

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a set of the given break point at the specified common network interface (CNI) ring node with the action-list provided.

The results of this operation are displayed. On a successful break point setup, the break point is automatically inhibited (disabled). The user must use the ALW:RUTIL or ALW:RUTILFLAG input request to enable this break point. In a given node, the maximum number of outstanding <action-list> items allowed is 25. The user is prompted for <action-list> items. Nested WHEN:RUTIL input requests are not allowed. Valid action-list input requests are:

ALW:RUTIL
ALW:RUTILFLAG
INH:RUTIL
INH:RUTILFLAG

The remaining input options are valid only within a WHEN action-list:

DUMP:ADDR
DUMP:REG
LOAD:BYTE
LOAD:REG
LOAD:SHORT
LOAD:WORD

The action-list is entered at the WHEN prompt after the WHEN input request is entered. The action-list is terminated by the END:WHEN input request.

WARNING: Incorrect use of this request may interrupt operation of a node on the CNI ring or the whole CNI ring.

2. FORMAT

  . . .END:WHEN;

3. EXPLANATION OF MESSAGE
AP = Attached processor.

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Address of the break point in hexadecimal. This must be the address of the first byte of a target processor instruction.

d = Opcode of text where break point is placed in hexadecimal.

e = Address to begin dump in hexadecimal.

f = Number of bytes to dump in decimal.

g = Name of the register to dump or load. Valid value(s):

<table>
<thead>
<tr>
<th>68000 and 68030 CPU's</th>
<th>68030 CPU only:</th>
</tr>
</thead>
<tbody>
<tr>
<td>A0, A1, A2, A3</td>
<td>DFC, MMUSR, MSR,</td>
</tr>
<tr>
<td>A4, A5, A6, A7</td>
<td>SFC, SRPH, SRPL,</td>
</tr>
<tr>
<td>D0, D1, D2, D3</td>
<td>TC, TT0, TT1,</td>
</tr>
<tr>
<td>D4, D5, D6, D7</td>
<td>VBR, VOFSET</td>
</tr>
<tr>
<td>ISP, SR, PC, TRADR,</td>
<td>CAAR, CACR, CCR, CRPH,</td>
</tr>
<tr>
<td>USP</td>
<td>CRPL</td>
</tr>
</tbody>
</table>

h = Address to load data in hexadecimal.

i = Data value to load in hexadecimal. The data provided must be a byte value.

j = Data value to load in hexadecimal. (a maximum of four bytes)

k = Address to load data in hexadecimal. The address provided is expected to be an even address.

l = Data value to load in hexadecimal. The data provided is expected to be a two-byte value.

m = Address to load data in hexadecimal. The address provided is expected to be on a four-byte boundary.

n = Data value to load in hexadecimal. The data provided is expected to be a four-byte value.

O = Specific break point to be allowed.

p = Maximum number of hits to be allowed for that break point. (If not specified MHIT is set to 10.)

4. SYSTEM RESPONSE

PF = Printout follows. Followed by WHEN:RUTIL output requests.

Application: 5,3B
Type: Input

1. PURPOSE

Requests that a list of administrative module (AM) generic access package (GRASP) messages that are to be performed when a specified breakpoint condition exists be triggered.

The list of messages is called an action list. Two types of breakpoint conditions are recognized: instruction execution conditions and data access conditions. Format 1 is used when instruction-execution breakpoints are required. Format 2 is used when data-access breakpoints are required. Instruction execution is detected by specifying a virtual address within a process. When the instruction at that address is executed, the action list is executed. The first byte of the instruction opcode expected to be found at that address must be specified in the message. The breakpoint definition is rejected if this opcode does not agree with the opcode found at the virtual address. Data access is indicated by specifying both the virtual address within a process and the type of access to be detected: read, write, or read-write. A data access breakpoint will fire if the location specified is addressed with the correct access type. A data access breakpoint over a range of data locations will fire if any location in the range is addressed with the correct access type. Messages following the WHEN message are restricted to the following list. A maximum of five messages is allowed in action lists.

ALW: {UTIL|UTILFLAG|UMEM}
COPY: = All forms of the message, except PID or UID source.
DUMP: {ADDR|PMEM|REG|UVAR}
INH: {UTIL|UTILFLAG|UMEM}
LOAD: = All forms of the message.

Note: Refer to the message descriptions for the details of how the messages are used within the WHEN message.

The action list is terminated with the END: WHEN message.

2. FORMAT

[1] WHEN: UID=a, ADDR=b, OPC=e: EXC [, WORD];
[2] WHEN: UID=a, ADDR={b[ && c][,L=d] } : ( R | W | RW) [, WORD];

3. EXPLANATION OF MESSAGE

EXC = Trigger the action list when the breakpoint address is executed.
R = Trigger the action list when a read operation occurs on any part of the full memory word containing the specified byte address(es).
RW = Trigger the action list when either the R or the W condition is met.
W = Trigger the action list when a write operation occurs on any part of the full memory word containing the specified byte address(es).
WORD = Interpret address and length fields as words. If this option is omitted, they are assumed to be byte values.

a = Utility ID (UID) number of target process.

b = Virtual byte address for the breakpoint or first address in a range of addresses. Specified in decimal, octal, or hexadecimal notation.

c = End address for a range of addresses.

d = Length of a range of addresses in bytes.

e = One byte opcode expected to be found at the breakpoint address. The value is only checked for software implemented breakpoints.

4. SYSTEM RESPONSE

IP = In progress. Breakpoint condition is understood. The associated action list is expected to follow.

NG = No good. May also include:
- BAD UID = The UID is for a process for which dumps are not permitted.
- TOO MANY BREAKPOINTS = Only 20 breakpoints are permitted at one time.
- UCERR = The utility circuit is unavailable.

RL = Retry later. The system is in an overload condition or completing the previous OP:UMEM or message.

?A = Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted. May also include:
- INVALID KEYWORD = The message is not allowed in a WHEN action list. END:WHEN expected after fifth action.

?I = General syntax error or:
- INCONSISTENT DATA (ADDR) = Address range must be in ascending order.
- RANGE ERROR (OPC) = One byte opcode is expected.
- RANGE ERROR (UID) = Utility ID is out of range.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).

Format 2 requests that a temporary generic utility WHEN breakpoint be defined using the symbolic address of an application program in the specified CMP. Format 3 requests that a generic utility timed WHEN be defined in the specified CMP. All formats give the user the ability to sequence through a defined list of generic utility input messages at a given point in the application code (breakpoint), or at an approximate time interval (timed). This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the REFERENCES section). If this message is used together with other generic utility input messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

Note: Generic utility WHEN input messages may be removed from processors by various software maintenance/recovery activities (that is, pumps, initializations, audits, and so forth).

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] WHEN:UT:CMP=a,[MATE|PRIM],ADDR=b,OPC=f [,HIT=h][,FOREVER][,NOPRINT][,UTILFLAG=i]{!|;}
[2] WHEN:UT:CMP=a,[MATE|PRIM],[FUNC=c|SYMIDX=d] [,OFF=e,OPC=f][,HIT=h][,FOREVER][,NOPRINT][,UTILFLAG=i]{!|;}
[3] WHEN:UT:CMP=a,[MATE|PRIM],TIME=g [,HIT=h][,FOREVER][,NOPRINT][,UTILFLAG=i]{!|;}

3. EXPLANATION OF MESSAGE

FOREVER = Allow the WHEN to be hit an unlimited number of times. If neither HIT=h nor FOREVER is specified, the hit count 'h' defaults to 1.
MATE = Execute this input message in the standby CMP.
NOPRINT = Suppress the WHEN:UT-CMP output message.
PRIM = Execute this input message in the active CMP.
a = CMP number.
b = Absolute address at which to set the breakpoint.
c = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = Offset to be added to the function address in bytes (0 - 65535).

f = Two bytes of opcode that is expected at address 'b' or within function 'c' or 'd' at offset 'e'.

g = Time interval, in milliseconds, at which the timer expires (1 - 4,294,967,295).

h = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=h nor FOREVER is specified, the hit count 'h' (1 - 32,767, default is 1).

i = User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will automatically assign the next available WHEN ID number and no error message will be printed.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified communications module processor (CMP).

Format 2 requests that a temporary generic utility WHEN breakpoint be defined using the symbolic address of an application program in the specified CMP. Format 3 requests that a generic utility timed WHEN be defined in the specified CMP. Format 4 defines a matching WHEN input message. The matching WHEN input message is only supported on CM Model 3 CMPs. Format 5 defines an instruction access address WHEN input message. The instruction access address WHEN input message is only supported on CM Model 3 CMPs. Format 6 defines a data address access WHEN input message. The data address access WHEN input message is only supported on CM Model 3 CMPs. All formats give the user the ability to sequence through a defined list of generic utility input messages at a given point in the application code (breakpoint formats 1 & 2), or at an approximate time interval (timed format 3), when a complete match is made on the E-Bus (matching format 4), the microprocessor fetches the specified instruction (instruction address format 5), or microprocessor detects the specified access on the data address (data access format 6). This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the REFERENCES section). If this message is used together with other generic utility input messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

Note: Generic utility WHEN input messages may be removed from processors by various software maintenance/recovery activities (that is, pumps, initializations, audits, and so forth).

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] WHEN:UT:CMP=a,{MATE|PRIM},ADDR=b,OPC=f

WHEN:UT:_CMP=a, (MATE|PRIM), DABR=s
[, HIT=h] [, FOREVER] [, NOPRINT] [, UTILFLAG=i]{!|;}

3. EXPLANATION OF MESSAGE

FOREVER
  = Allow the WHEN to be hit an unlimited number of times. If neither HIT=h nor FOREVER is specified, the hit count ‘h’ defaults to 1.

MATE
  = Execute this input message in the standby CMP.

NOPRINT
  = Suppress the WHEN:UT-CMP output message.

PRIM
  = Execute this input message in the active CMP.

a
  = CMP number.

b
  = Absolute address at which to set the breakpoint.

c
  = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘d’ must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d
  = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e
  = Offset to be added to the function address in bytes (0 - 65535).

f
  = Two bytes of opcode that is expected at address ‘b’ or within function ‘c’ or ‘d’ at offset ‘e’.
 Opcode that is expected at address ‘b’ or within function ‘c’ or ‘d’ at offset ‘e’. The following opcode size rules must be used:
  - If switch CM complex is Model 2 or earlier, the opcode must be a two byte opcode.
  - If switch CM complex is Model 3, the opcode must be a four byte opcode.

g
  = Time interval, in milliseconds, at which the timer expires (1 - 4,294,967,295).

h
  = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=h nor FOREVER is specified, the hit count ‘h’ (1 - 32,767, default = 1).

i
  = User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will automatically assign the next available WHEN ID number and no error message will be printed.

j
  = Address that is to be compared on every bus cycle with the address actually on the bus. This value is used with the address mask ‘k’ to provide an address range for the comparison. The three lower address bits cannot be a range.

k
  = Mask value for the address field ‘j’. A “1” bit is a don’t care indication for that bit. A “0” bit indicates that the address comparison between the bus and the contents of the address field ‘j’ must match for that bit.

note: The last three bits are always 0.
l = Data low that is to be compared on every bus cycle with the data actually on the bus. This value is used with the data mask 'm' to provide a range of data values for the comparison.

m = Mask value for the data low field 'l'. A "1" bit is a don't care indication for that bit. A "0" bit indicates that the data comparison between the bus and the contents of the data field 'l' must match for that bit.

Note: The Data low is the bits 0-31 of a 64 bit data bus. Data sizes less than 32 bits must be specified in the correct byte lane for the matcher to function correctly.

n = Data high that is to be compared on every bus cycle with the data actually on the bus. This value is used with the data high mask 'o' to provide a range of data values for the comparison.

o = Mask value for the data field 'n'. A "1" bit is a don't care indication for that bit. A "0" bit indicates that the data comparison between the bus and the contents of the data field 'n' must match for that bit.

Note: The Data high are bits 32-63 of a 64 bit data bus. Data sizes less than 32 bits must be specified in the correct byte lane for the matcher to function correctly.

p = Type of bus operation that is to be compared on every bus cycle with the type of operation actually being performed on the bus. This value is used with the operation mask 'q' to provide a range of operations for the comparison.

Note: To set the WHEN for a basic read or write operation the OMSK field 'q' can be set to OMSK=hhffffff7x, where x is the invert of the size of the operation (that is h'c = byte, h'a = short, h'6 = long word, h'e = double long word, and h'b = burst or 256 bit). The OPER field would need to be set to OPER=hh'0000000x for a read and OPER=hh'0000000x for a write and 'x' would match the size indicated in the invert of the OMSK field (that is h'3 = byte, h'5 = short, h'9 = long word, h'1 = double long word, and h'4 = burst). Refer to the global header regs/RGa74mat.h for further information.

q = Mask value for the operation field 'p'. A "1" bit is a don't care indication for that bit. A "0" bit indicates that the comparison between the operation being performed on the bus and the contents of the operation field 'p' must match for that bit.

r = The address of the instruction access to be trapped on.

Note: This value is passed directly to the instruction address breakpoint register. It contains the instruction address to be compared against bits 0-29, breakpoint enable bit (UT ALLOW forces this to active) bit 30, and the translation enable bit 31. Refer to the global header regs/RG750mis.h for further information.

s = The address and the type of data access to be trapped on. The lowest 3 bits are zero regardless of the value provided.

Note: This value is passed directly to the data address breakpoint register. It contains the data address to be compared against bits 0-28, the translation enable bit 29, the data write enable bit 30, and the data read enable bit 31. To set the WHEN for a basic read operation the value should be h'xxxxxxy where x is the address to match, and y = h'x101 (x being the last of the address, translation is enabled, data
write turned off, and data read turned on). For a write operation the address needs
to be defined and \( y = h'x110 \) can used. Refer to the global header
regs/RG750mis.h for further information.

1. PURPOSE

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).

Format 2 requests that a temporary generic utility WHEN breakpoint be defined using the symbolic address of an application program in the specified PSUPH. Format 3 requests that a generic utility timed WHEN be defined in the specified PSUPH. All formats give the user the ability to sequence through a defined list of generic utility input messages at a given point in the application code (breakpoint), or at an approximate time interval (timed).

Note: This input message is only supported on PSUPHs of the PH3/PH4 and later hardware types (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

Note: Generic utility WHEN input messages may be removed from processors by various software maintenance recovery activities (that is, pumps, initializations, audits, and so forth).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] WHEN:UT:PSUPH=a-b-c-d,ADDR=e,OPC=i
   [,HIT=k][,FOREVER][,NOPRINT][,UTILFLAG=l]{!|;}

[2] WHEN:UT:PSUPH=a-b-c-d,{FUNC=f|SYMIDX=g}
   [,OFF=h,OPC=i][,HIT=k][,FOREVER][,NOPRINT][,UTILFLAG=l]{!|;}

   [,HIT=k][,FOREVER][,NOPRINT][,UTILFLAG=l]{!|;}

3. EXPLANATION OF MESSAGE

FOREVER = Allow the WHEN to be activated an unlimited number of times. If neither HIT=k nor FOREVER is specified, the hit count 'k' defaults to 1.

NOPRINT = Suppress the WHEN:UT-PSUPH output message.
= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Absolute address at which to set the breakpoint.

f = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = Offset to be added to the function address in bytes (0 - 65535).

i = Two bytes of opcode that is expected at address 'e' or within function 'f' or 'g' at offset 'h'.

j = Time interval, in milliseconds, at which the timer expires (1 - 4,294,967,295).

k = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=i nor FOREVER is specified, the hit count 'l' (1 - 32,767, default is 1).

l = User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will automatically assign the next available WHEN ID number and no error message will be printed.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Format 1 requests that a temporary generic utility WHEN breakpoint be defined using an address of an application program in the specified packet switch unit protocol handler (PSUPH).

Format 2 requests that a temporary generic utility WHEN breakpoint be defined using the symbolic address of an application program in the specified PSUPH. Format 3 requests that a generic utility timed WHEN be defined in the specified PSUPH. Format 4 requests that a generic utility instruction access address WHEN be defined in the specified PSUPH. The instruction access address WHEN input message is only supported in a PSUPH of the PHV5 hardware type. Format 5 requests that a generic utility data address access WHEN be defined in the specified PSUPH. The data address access WHEN input message is only supported in a PSUPH of the PHV5 hardware type. All formats give the user the ability to sequence through a defined list of generic utility input messages at a given point in the application code (breakpoint formats 1 & 2), or at an approximate time interval (timed format 3), the microprocessor fetches the specified instruction (instruction address format 4), or microprocessor detects the specified access on the data address (data access format 5).

Note: This input message is not supported on PSUPHs of the PH2 hardware type.

This message may be used together with any of the other PSUPH generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

Note: Generic utility WHEN input messages may be removed from processors by various software maintenance recovery activities (that is, pumps, initializations, audits, and so forth).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] WHEN:UT:PSUPH=a-b-c-d,ADDR=e,OPC=i [,HIT=k][,FOREVER][,NOPRINT][,UTILFLAG=l]{{|};

[2] WHEN:UT:PSUPH=a-b-c-d,{FUNC=f|SYMIDX=g} [,OFF=h,OPC=i][,HIT=k][,FOREVER][,NOPRINT][,UTILFLAG=l]{{|};

[4] WHEN:UT:PSUPH=a-b-c-d,IABR=m [,HIT=k][,FOREVER][,NOPRINT][,UTILFLAG=l]{{|};
3. EXPLANATION OF MESSAGE

FOREVER = Allow the WHEN to be activated an unlimited number of times. If neither HIT=k nor FOREVER is specified, the hit count 'k' defaults to 1.

NOPRINT = Suppress the WHEN:UT-PSUPH output message.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Absolute address at which to set the breakpoint.

f = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = Offset to be added to the function address in bytes (0 - 65535).

i = Opcode that is expected at address 'e' or within function 'f' or 'g' at offset 'h'. The following opcode size rules must be used:
   - If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the opcode must be a two byte opcode.
   - If PSUPH is a PHV5 hardware type, the opcode must be a four byte opcode.

j = Time interval, in milliseconds, at which the timer expires (1 - 4,294,967,295).

k = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=i nor FOREVER is specified, the hit count 'i' (default is 1).

l = User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will automatically assign the next available WHEN ID number and no error message will be printed.

m = The address of the instruction access to be trapped on.

Note: This value is passed directly to the instruction address breakpoint register. It contains the instruction address to be compared against bits 0-29, breakpoint enable bit (UT ALLOW forces this to active) bit 30, and the translation enable bit.
31. Refer to the global header regs/RGppcmis.h for further information.

\[ n \]

= The address and the type of data access to be trapped on. The lowest 3 bits are zero regardless of the value provided.

Note: This value is passed directly to the data address breakpoint register. It contains the data address to be compared against bits 0-28, the translation enable bit 29, the data write enable bit 30, and the data read enable bit 31. To set the WHEN for a basic read operation the value should be h'xxxxxy where x is the address to match, and y = h'w101 (w being the last of the address i.e bit 28, translation is enabled, data write turned off, and data read turned on). For a write operation the address needs to be defined and y = h'w110 can be used. Refer to the global header regs/RGppcmis.h for further information.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

3.  EXPLANATION OF MESSAGE

FOREVER  = Allow the WHEN to be activated an unlimited number of times. If neither HIT=k nor FOREVER is specified, the hit count 'k' defaults to 1.

NOPRINT  = Suppress the WHEN:UT-PSUPH output message.

a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Absolute address at which to set the breakpoint.

f  = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g  = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h  = Offset to be added to the function address in bytes (0 - 65535).

i  = Opcode that is expected at address 'e' or within function 'f' or 'g' at offset 'h'. The following opcode size rules must be used:
     — If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the opcode must be a two byte opcode.
     — If PSUPH is a PHV5, PHV6, PH31, PHA2, or PHE2 hardware type, the opcode must be a four byte opcode.

j  = Time interval, in milliseconds, at which the timer expires (1 - 4,294,967,295).

k  = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=i nor FOREVER is specified, the hit count 'i' (default is 1).
1. User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will automatically assign the next available WHEN ID number and no error message will be printed.

m. The address of the instruction access to be trapped on.

This value is passed directly to the instruction address breakpoint register. It contains the instruction address to be compared against bits 0-29, breakpoint enable bit (UT ALLOW forces this to active) bit 30, and the translation enable bit 31. Refer to the global header regs/RGppcmis.h for further information.

n. The address and the type of data access to be trapped on. The lowest 3 bits are zero regardless of the value provided.

This value is passed directly to the data address breakpoint register. It contains the data address to be compared against bits 0-28, the translation enable bit 29, the data write enable bit 30, and the data read enable bit 31. To set the WHEN for a basic read operation the value should be h'xxxxxxxy where x is the address to match, and y = h'w101 (w being the last of the address such as, bit 28, translation is enabled, data write turned off, and data read turned on). For a write operation the address needs to be defined and y = h'w110 can be used. Refer to the global header regs/RGppcmis.h for further information.

4. SYSTEM RESPONSE

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that a temporary generic utility breakpoint be defined using and address of an application program in the specified switching module (SM/SM-2000).

Format 2 requests that a temporary generic utility WHEN breakpoint be defined using the symbolic address of an application program in the specified SM/SM-2000.

Format 3 requests that a generic utility timed WHEN be defined in the specified SM/SM-2000.

Format 4 defines a matching WHEN input message. The matching WHEN input message is only supported on SM-2000s.

All formats give the user the ability to sequence through a defined list of generic utility input messages at a given point in the application code (breakpoint), at an approximate time interval (timed), or when a complete match is made on the bus service node (matching).

This message may be used together with any of the other SM/SM-2000 generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other generic utility input messages, the END:UT-SM input message may be used to signal the end of the series of messages.

Generic utility WHEN input messages may be removed from processors by various software maintenance/recovery activities (that is, pumps, initializations, audits, and so forth).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

   . . .[,NOPRINT][,UTILFLAG=i]{!|;}

   . . .[,HIT=h][,FOREVER][,NOPRINT][,UTILFLAG=i]{!|;}

   . . .[,UTILFLAG=i]{!|;}

   . . .[,OPER=n][,OMSK=o][,HIT=h][,FOREVER][,NOPRINT]. . .
   . . .[,UTILFLAG=i]{!|;}
3. EXPLANATION OF MESSAGE

FOREVER  = Allow the WHEN to be hit an unlimited number of times. If neither HIT=h nor FOREVER is specified, the hit count 'h' defaults to one.

NOPRINT  = Suppress the WHEN:UT-OUT message.

a  = SM/SM-2000 number.

b  = Absolute address at which to set the breakpoint.

c  = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d  = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e  = Offset to be added to the function address. The offsets, in bytes, can range from 0-65535.

f  = Two bytes of opcode that is expected at address 'b' or within function 'c' or 'd' at offset 'e'.

g  = Time interval, in milliseconds, at which the timer expires (Upper limit of 4,294,967,295 milliseconds).

h  = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=h nor FOREVER is specified, the hit count 'h' defaults to one (upper limit of 32767).

i  = User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will automatically assign the next available WHEN ID number and no error message will be printed.

j  = Address that is to be compared on every bus cycle with the address actually on the bus. This value is used with the address mask 'k' to provide an address range for the comparison.

k  = Mask value for the address field 'j'. A "1" bit is a don't care indication for that bit. A "0" bit indicates that the address comparison between the bus and the contents of the address field 'j' must match for that bit.

l  = Data that is to be compared on every bus cycle with the data actually on the bus. This value is used with the data mask 'm' to provide a range of data values for the comparison.

m  = Mask value for the data field 'l'. A "1" bit is a don't care indication for that bit. A "0" bit indicates that the data comparison between the bus and the contents of the data field 'l' must match for that bit.

n  = Type of bus operation that is to be compared on every bus cycle with the type of operation actually being performed on the bus. This value is used with the operation mask 'o' to provide a range of operations for the comparison.

To set the WHEN for a basic read or write operation the OMSK field 'o' can be set to
OSMK=h'00x03000, where x is the size of the operation (that is 0 = long word, 1 = byte, 2 = short, and 3 = quad long word). The OPER field would need to be set to OPER=h'00x02000 for a write and OPER=h'00x01000 for a read and ‘x’ would match the size indicated in the OMSK field.

Another example is a mask that looks at the size of the operation, the type of operation (read/write) and ignores MCTSI side switches. Use a mask of 'omsk=h'ffcfcffd'. Refer to the global header smim/SMmp_mthop.h for further information.

- Mask value for the operation field ‘n’. A "1" bit is a don't care indication for that bit. A "0" bit indicates that the comparison between the operation being performed on the bus and the contents of the operation field ‘n’ must match for that bit.

4. SYSTEM RESPONSE

Refer to APP:UT-IM-REASON appendix in the Appendixes section of the Output Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that a temporary generic utility breakpoint be defined using and address of an application program in the specified switching module (SM/SM-2000).

Format 2 requests that a temporary generic utility WHEN breakpoint be defined using the symbolic address of an application program in the specified SM/SM-2000.

Format 3 requests that a generic utility timed WHEN be defined in the specified SM/SM-2000.

Format 4 defines a matching WHEN input message. The matching WHEN input message is only supported on SM-2000s.

Format 5 defines an instruction access address WHEN input message. The instruction access address WHEN input message is only supported on SMs with a software configuration of CNFG2KPPC.

Format 6 defines a data address access WHEN input message. The data address access WHEN input message is only supported on SMs with a software configuration of CNFG2KPPC.

All formats give the user the ability to sequence through a defined list of generic utility input messages at a given point in the application code (breakpoint Formats 1 and 2), at an approximate time interval (timed Format 3), when a complete match is made on the bus service node (matching Format 4), when the microprocessor fetches the specified instruction (instruction address format 5), or when the microprocessor detects the specified access on the data address (data access Format 6).

This message may be used together with any of the other SM/SM-2000 generic utility input messages (refer to the REFERENCES section).

If this message is used together with other generic utility input messages, the END:UT-SM input message may be used to signal the end of the series of messages.

Generic utility WHEN input messages may be removed from processors by various software maintenance/recovery activities (that is, pumps, initializations, audits, and so forth). During patch recovery operation, a switch command will delete all the when breakpoints and these breakpoints will have to be replanted if needed.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] WHEN:UT:SM=a,ADDR=b,OPC=f[,HIT=h][,FOREVER][,NOPRINT][,UTILFLAG=i]{!|;}

. . .[,HIT=h][,FOREVER][,NOPRINT][,UTILFLAG=i]{!|;}
3. EXPLANATION OF MESSAGE

FOREVER = Allow the WHEN to be hit an unlimited number of times. If neither HIT=h nor FOREVER is specified, the hit count 'h' defaults to one.

NOPRINT = Suppress the WHEN:UT-SM output message.

a = SM/SM-2000 number.

b = Absolute address at which to set the breakpoint.

c = Symbolic name of the function. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input message using symbolics. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = Offset to be added to the function address. The offsets, in bytes, can range from 0-65535.

f = Opcode that is expected at address 'b' or within function 'c' or 'd' at offset 'e'. Valid value(s):

<table>
<thead>
<tr>
<th>If the SM Software Configuration is:</th>
<th>Then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not CNFG2KPPC</td>
<td>The opcode must be a two byte opcode.</td>
</tr>
<tr>
<td>CNFG2KPPC</td>
<td>The opcode must be a four byte opcode.</td>
</tr>
</tbody>
</table>

g = Time interval, in milliseconds, at which the timer expires (Upper limit of 4,294,967,295 milliseconds).

h = Number of times the WHEN may be activated before being automatically inhibited. If neither HIT=h nor FOREVER is specified, the hit count 'h' defaults to one (upper limit of 32767).

i = User-specified ID of the WHEN input message if it is unique within the system. If the WHEN ID number is not contained within the numeric range of 0 through 127 and there are fewer than 45 total WHEN input messages in the system, or if the WHEN input message is not unique, the system will
automatically assign the next available WHEN ID number and no error message will be printed.

### j
- Address that is to be compared on every bus cycle with the address actually on the bus. This value is used with the address mask ‘k’ to provide an address range for the comparison.

### k
- Mask value for the address field ‘j’. A “1” bit is a don’t care indication for that bit. A “0” bit indicates that the address comparison between the bus and the contents of the address field ‘j’ must match for that bit.

### l
- Data that is to be compared on every bus cycle with the data actually on the bus. This value is used with the data mask ‘m’ to provide a range of data values for the comparison.

### m
- Mask value for the data field ‘l’. A “1” bit is a don’t care indication for that bit. A “0” bit indicates that the data comparison between the bus and the contents of the data field ‘l’ must match for that bit.

### n
- Type of bus operation that is to be compared on every bus cycle with the type of operation actually being performed on the bus. This value is used with the operation mask ‘o’ to provide a range of operations for the comparison.

To set the WHEN for a basic read or write operation the OMSK field ‘o’ can be set to OMSK=h’00x03000, where x is the size of the operation (that is 0 = long word, 1 = byte, 2 = short, and 3 = quad long word). The OPER field would need to be set to OPER=h’00x02000 for a write and OPER=h’00x01000 for a read and ‘x’ would match the size indicated in the OMSK field. Another example is a mask that looks at the size of the operation, the type of operation (read/write) and ignores MCTSI side switches. Use a mask of ‘omsk=h’ffe000fffd’. Refer to the global header smim/SMmp_mthop.h for further information.

### o
- Mask value for the operation field ‘n’. A “1” bit is a don’t care indication for that bit. A “0” bit indicates that the comparison between the operation being performed on the bus and the contents of the operation field ‘n’ must match for that bit.

### p
- The address of the instruction access to be trapped on.

This value is passed directly to the instruction address breakpoint register. It contains the instruction address to be compared against bits 0-29, breakpoint enable bit (UT ALLOW forces this to active) bit 30, and the translation enable bit 31. Refer to the global header regs/RG750mis.h for further information.

### q
- The address and the type of data access to be trapped on. The lowest 3 bits are zero regardless of the value provided.

This value is passed directly to the data address breakpoint register. It contains the data address to be compared against bits 0-28, the translation enable bit 29, the data write enable bit 30, and the data read enable bit 31. To set the WHEN for a basic read operation the value should be h’xxxxxy where ‘x’ is the address to match, and y = h’x101 (‘x’ being the last of the address, translation is enabled, data write turned off, and data read turned on). For a write operation the address needs to be defined and y = h’x110 can used. Refer to the global header regs/RG750mis.h for further information.

### 4. SYSTEM RESPONSE

Refer to APP:UT-IM-REASON appendix in the Appendixes section of the Output Messages manual.

Application: 5
Type: Input

1. PURPOSE

Requests that billing data be collected from the switching modules (SMs) and the billing data in the administrative module be written to disk prior to generic retrofit.

The output of this input message is delayed until all of the daily SM billing data has been written to disk (10 - 15 seconds for every 10 equipped SMs in the office, depending on the amount of daily billing to be collected). This input message should not be used if the SMs are in isolation. Check the 141 MCC page to make sure no SM is listed as isolated before proceeding. If an SM is isolated, the CLR:ISOL-SM input message can be used to take it out of isolation. Since writes to disk are not possible when a write request is in progress, the disk writer is in initialization, or the disks are full. This input message should not be used under those circumstances. To determine if a write request is in progress, use the OP:AMA-STATUS input message to determine if one of the shared data segment (SDS) subsegments is nearly full and therefore about to be written to disk. The disk writer is in initialization if a boot is in progress or a version of the INIT:AM-FPI input message has just been invoked. To determine if the disks are 100% full, use the OP:AMA-DISK input message.

2. FORMAT

WRT:AMADATA;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NA = No acknowledgement. Automatic message accounting (AMA) option may be incorrect. If the AMA option is correct retry input message.

PF = Printout follows. Followed by a WRT:AMA-DATA output message.
