**NOTE:** This option of this input message can only be used as part of a generic utilities WHEN input message clause.

**g** = Utility variable (UVAR) (0-14) that the value is copied into.

**h** = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘i’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

**i** = Symbol index number of global variable. The symbol index can be determined for this processor by using
the DUMP:UT-SYMID input message.

\(\text{j}\) = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

\(\text{k}\) = Level of indirection (0-3) for the first part of the message. Default is 0.

\(\text{l}\) = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

\(\text{m}\) = Address that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

\(\text{n}\) = Name of a specific register that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message. The following registers can be used:

- If PSUPH is a PHV5, PHV6, PH31, PHA2, or PHE2 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.
- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

\text{NOTE:} This option of this input message can only be used as part of a generic utilities WHEN input message clause.

\(\text{o}\) = Utility variable (0-14) that the value is copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

\(\text{p}\) = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number ‘\(\text{q}\)’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

\(\text{q}\) = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

\(\text{r}\) = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

\(\text{s}\) = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2, SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

\(\text{t}\) = Level of indirection (0-3) for the second part of the message. Default is 0.
= The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

v = Legal operator. Valid value(s):
\[\begin{align*}
\text{and} & = \text{Performs logical "and" of the value in field 2 with the value of field 3.} \\
\text{div} & = \text{Divides the value of field 2 by the value of field 3.} \\
\text{invert} & = \text{Performs a logical binary inversion of the value in field 2.} \\
\text{minus} & = \text{Subtracts the value of field 3 from the value of field 2.} \\
\text{mult} & = \text{Multipies the value of field 3 with the value of field 2.} \\
\text{or} & = \text{Performs logical "or" of the value in field 2 with the value of field 3.} \\
\text{plus} & = \text{Adds the value of field 3 to the value of field 2.} \\
\text{shl} & = \text{Shifts left the value in field 2 by the value of field 3.} \\
\text{shr} & = \text{Shifts right the value in field 2 by the value of field 3.} \\
\text{xor} & = \text{Performs logical "exclusive or" of the value in field 2 with the value of field 3.}
\end{align*}\]

w = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

x = Name of register whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy message. The following registers can be used:
- If PSUPH is a PHV5, PHV6, PH31, PHA2, or PHE2 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.
- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

**NOTE:** This option of this input message can only be used as part of a generic utilities WHEN input message clause.

y = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

z = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number \text{`a^1`} must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

a^1 = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

b^1 = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of the copy input message.

c^1 = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.
\( d^1 \) = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

\( e^1 \) = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

### 4. SYSTEM RESPONSE

1. PURPOSE

Requests that a value be copied into an address, register, variable, or utility variable of the switching module (SM), and can perform any of the following operations:

<table>
<thead>
<tr>
<th>To perform</th>
<th>Use:</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment operation</td>
<td>target(1) = value(2) oper=plus value(3)</td>
</tr>
<tr>
<td>decrement operation</td>
<td>target(1) = value(2) oper=minus value(3)</td>
</tr>
<tr>
<td>multiply operation</td>
<td>target(1) = value(2) oper=mult value(3)</td>
</tr>
<tr>
<td>divide operation</td>
<td>target(1) = value(2) oper=div value(3)</td>
</tr>
<tr>
<td>logical AND operation</td>
<td>target(1) = value(2) oper=and value(3)</td>
</tr>
<tr>
<td>logical OR operation</td>
<td>target(1) = value(2) oper=or value(3)</td>
</tr>
<tr>
<td>logical XOR operation</td>
<td>target(1) = value(2) oper=xor value(3)</td>
</tr>
<tr>
<td>logical shift left operation</td>
<td>target(1) = value(2) oper=shl value(3)</td>
</tr>
<tr>
<td>logical shift right operation</td>
<td>target(1) = value(2) oper=shr value(3)</td>
</tr>
<tr>
<td>invert operation</td>
<td>target(1) = value(2) oper=invert</td>
</tr>
</tbody>
</table>

This message may be used together with any of the other SM generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

COPY:UT:SM=a[,MATE1],{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"|SYMIDX1=f} [,L1=g][,INDIR1=h][,OFF1=i[-i[-i]],EQ [,MATE2][,EA2],[ADDR2=j|REG2=k|UVAR2=l|GVAR2="m"|SYMIDX2=n|VAL2=o] [,L2=p][,INDIR2=q][,OFF2=r[-r[-r]],oper=s][,MATE3 [,EA3],[ADDR3=t|REG3=u|UVAR3=v|GVAR3="w"|SYMIDX3=x|VAL3=y]][,L3=z] [,INDIR3=a1][,OFF3=b1[-b1[-b1]]]{!|;}

3. EXPLANATION OF MESSAGE

Note: Variables 'b' through 'i' are field one of this message, this field is also described as the target field.

Note: Variables 'j' through 't' are field two of this message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

Note: Variables 's' through 'b1' are field three of this message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of this message.
EA2 = The value which is to be copied is the effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE1 = Address, utility variable or symbolic address specified in the first part of the message is in MATE memory (default is active). REG1 and UVAR1 may be used with MATE1 only if a level of indirection is specified.

MATE2 = Address, utility variable or symbolic address specified in the second part of the message is in MATE memory (default is active). REG2 and UVAR2 may be used with MATE2 only if a level of indirection is specified.

MATE3 = Address, register, utility variable or symbolic address specified in the third part of the message is in MATE memory. REG3 and UVAR3 may be used with MATE3 only if a level of indirection is specified.

a = SM number.

b = Address that the value is to be copied into.

c = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is to be copied into.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

d = Utility variable (0-14) that the value is to be copied into.

e = Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'c' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

k = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) that the value is to be copied from. This value can be modified by using one of the
arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

l = Utility variable (0-14) that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

m = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message. If the symbol name is greater than 15 characters the symbol index number 'n' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

n = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this input message.

O = Value to be copied. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

p = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

q = Level of indirection (0-3) for the second part of the message. Default is 0.

r = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

s = Legal operator. Valid value(s):
   and = Performs logical "and" of the value in field 2 with the value of field 3.
   div = Divides the value of field 2 by the value of field 3.
   invert = Performs a logical binary inversion of the value in field 2.
   minus = Subtracts the value of field 3 from the value of field 2.
   mult = Multiplies the value of field 3 with the value of field 2.
   or = Performs logical "or" of the value in field 2 with the value of field 3.
   plus = Adds the value of field 3 to the value of field 2.
   shl = Shifts left the value in field 2 by the value of field 3.
   shr = Shifts right the value in field 2 by the value of field 3.
   xor = Performs logical "exclusive or" of the value in field 2 with the value of field 3.

T = An address whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

u = Name of register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.
Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

\(v\) = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

\(w\) = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'x' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

\(x\) = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

\(y\) = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

\(z\) = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

\(a^1\) = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

\(b^1\) = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Software Release: 5E16(2) and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be copied into an address, register, global variable (specified by name or symbol index), or utility variable of the switching module (SM), and can perform specific operations. These include:

<table>
<thead>
<tr>
<th>To perform:</th>
<th>Use:</th>
</tr>
</thead>
<tbody>
<tr>
<td>increment operation</td>
<td>target(1) = value(2) oper=plus value(3)</td>
</tr>
<tr>
<td>decrement operation</td>
<td>target(1) = value(2) oper=minus value(3)</td>
</tr>
<tr>
<td>multiply operation</td>
<td>target(1) = value(2) oper=mult value(3)</td>
</tr>
<tr>
<td>divide operation</td>
<td>target(1) = value(2) oper=div value(3)</td>
</tr>
<tr>
<td>logical AND operation</td>
<td>target(1) = value(2) oper=and value(3)</td>
</tr>
<tr>
<td>logical OR operation</td>
<td>target(1) = value(2) oper=or value(3)</td>
</tr>
<tr>
<td>logical XOR operation</td>
<td>target(1) = value(2) oper=xor value(3)</td>
</tr>
<tr>
<td>logical shift left operation</td>
<td>target(1) = value(2) oper=shl value(3)</td>
</tr>
<tr>
<td>logical shift right operation</td>
<td>target(1) = value(2) oper=shr value(3)</td>
</tr>
<tr>
<td>invert operation</td>
<td>target(1) = value(2) oper=invert</td>
</tr>
</tbody>
</table>

The microprocessor registers used in this message will vary based on the SM software configuration. If the software configuration is CNFG2KPPC the microprocessor is PowerPC® based. All others configurations are M680x0 based.

This message may be used together with any of the other SM generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

During patch space recovery operation, UT will modify its normal behavior to force non-mate operation to write only the local memory even if both MCTSIss are in service. Therefore, in order to have operations happen on both sides, the user needs to run the command twice, first for the active side, then for the mate side.

2. FORMAT

COPY:UT:SM=a[,MATE1],{ADDR1=b|REG1=c|UVAR1=d|GVAR1="e"|SYMIDX1=f}[,L1=g][,INDIR1=h][,OFF1=i[-i][-i]],EQ[,]MATE2[,EA2],{ADDR2=j|REG2=k|UVAR2=l|GVAR2="m"|SYMIDX2=n|VAL2=o}[,L2=p][,INDIR2=q][,OFF2=r[-r][-r]],[,]MATE3[,]EA3[,ADDR3=t|REG3=u|UVAR3=v|GVAR3="w"|SYMIDX3=x|VAL3=y][,L3=z][,INDIR3=a1][,OFF3=b1[-b1][-b1]][,;]

3. EXPLANATION OF MESSAGE

NOTE 1: Variables 'b' through 'i' are field one of this message, this field is also described as the target field.
**NOTE 2:** Variables 'j' through 'r' are field two of this message, this field is also described as the value(2) field. This field provides the source data for the target. This field can be modified by using one of the arithmetic operators together with the third field of the copy input message.

**NOTE 3:** Variables 's' through 'b' are field three of this message, this field is also described as the value(3) field. This field is used together with the arithmetic operator to modify field two of this message.

EA2 = The value which is to be copied is the effective address of the message instead of the contents of the address for the second part of the input message.

EA3 = The value which is to be copied is the determined effective address of the message instead of the contents of the address for the third part of the input message.

MATE1 = Address, utility variable or symbolic address specified in the first part of the message is in MATE memory (default is active and mate unless it is during patch space recovery operation). REG1 and UVAR1 may be used with MATE1 only if a level of indirection is specified.

MATE2 = Address, utility variable or symbolic address specified in the second part of the message is in MATE memory (default is active and mate unless it is during patch space recovery operation). REG2 and UVAR2 may be used with MATE2 only if a level of indirection is specified.

MATE3 = Address, register, utility variable or symbolic address specified in the third part of the message is in MATE memory (default is active and mate unless it is during patch space recovery operation). REG3 and UVAR3 may be used with MATE3 only if a level of indirection is specified.

*a* = SM number.

*b* = Address that the value is to be copied into.

*c* = Name of a specific register where data is copied to. Valid value(s):

<table>
<thead>
<tr>
<th>SM Software Configuration:</th>
<th>Registers:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNFG2KPPC</td>
<td>CR = Condition register.</td>
</tr>
<tr>
<td></td>
<td>CTR = Count register.</td>
</tr>
<tr>
<td></td>
<td>GPR0 = General purpose register.</td>
</tr>
<tr>
<td></td>
<td>GPR2-GPR31 = General purpose registers.</td>
</tr>
<tr>
<td></td>
<td>LR = Link register.</td>
</tr>
<tr>
<td></td>
<td>MSR = Machine state register.</td>
</tr>
<tr>
<td></td>
<td>PC = Program counter.</td>
</tr>
<tr>
<td></td>
<td>SP = General purpose register (also known as GPR1).</td>
</tr>
<tr>
<td></td>
<td>XER = The external interrupt mask register (integer exception).</td>
</tr>
</tbody>
</table>

| Not CNFG2KPPC            | A0-A5 = Address registers. |
|                         | A6 = The frame pointer (FP). |
|                         | A7 = The stack pointer (SP). |
|                         | D0-D7 = Data registers. |
|                         | PC = Program counter. |
|                         | SR = Status register. |

This option of this input message can only be used as part of a generic utilities WHEN input message clause.

*d* = Utility variable (0-14) that the value is to be copied into.
= Symbolic name of the global variable that the value is copied into. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘e’ must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Length of the value to be used for the target part of the message (0-4). Default is 4 bytes for UVAR1 and REG1 unless REG1 is set to the status register where the default is 2 bytes. Default is 1 byte for ADDR1, GVAR1 and SYMIDX1.

h = Level of indirection (0-3) for the first part of the message. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

j = Address that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of the copy input message.

k = Name of a specific register where data is copied to. Valid value(s):

<table>

</tbody>
</table>

This option of this input message can only be used as part of a generic utilities WHEN input message clause.

l = Utility variable (0-14) that the value is to be copied from. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value) contained in the third field of this message.

m = Symbolic name of the global variable that the value is to be copied from. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. This value can be modified by using one of the arithmetic operators together with any one of the addressing modes (or value)
contained in the third field of this input message. If the symbol name is greater than 15 characters
the symbol index number ‘n’ must be used to enter this input message using symbolic access. The
global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input
message.

\[ n \] = Symbol index number of global variable. The symbol index can be determined for this processor
by using the DUMP:UT-SYMID input message. This value can be modified by using one of the
arithmetic operators together with any one of the addressing modes (or value) contained in the third
field of this input message.

\[ o \] = Value to be copied. This value can be modified by using one of the arithmetic operators together
with any one of the addressing modes (or value) contained in the third field of this message.

\[ p \] = Length of the value to be used in the value(2) part of the message (0-4). Default is 4 bytes for
UVAR2, VAL2, and REG2 unless REG2 is the status register where the default is 2 bytes; 1 byte for
ADDR2, GVAR2 and SYMIDX2. If EA2 is specified, the length is set to 4 bytes.

\[ q \] = Level of indirection (0-3) for the second part of the message. Default is 0.

\[ r \] = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets
greater than 32767 will be treated as negative offsets. One offset can be specified per each level of
indirection. Maximum number of offsets is 3. Default is 0.

\[ s \] = Legal operator. Valid value(s):
- and = Performs logical "and" of the value in field 2 with the value of field 3.
- div = Divides the value of field 2 by the value of field 3.
- invert = Performs a logical binary inversion of the value in field 2.
- minus = Subtracts the value of field 3 from the value of field 2.
- mult = Multiplies the value of field 3 with the value of field 2.
- or = Performs logical "or" of the value in field 2 with the value of field 3.
- plus = Adds the value of field 3 to the value of field 2.
- shl = Shifts left the value in field 2 by the value of field 3.
- shr = Shifts right the value in field 2 by the value of field 3.
- xor = Performs logical "exclusive or" of the value in field 2 with the value of field 3.

\[ t \] = An address whose contents may be used with one of the arithmetic operators to modify the
addressing mode (or value) in the second field of this message.

\[ u \] = Name of a specific register where data is copied to. Valid value(s):

<table>

A7 = The stack pointer (SP).
D0-D7 = Data registers.
PC = Program counter.
SR = Status register.

This option of this input message can only be used as part of a generic utilities WHEN input message clause.

\[ v \] = Utility variable (0-14) whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

\[ w \] = Symbolic name of the global variable whose contents may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this input message. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number \( x \) must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

\[ x \] = Symbol index number of global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

\[ y \] = Value that may be used with one of the arithmetic operators to modify the addressing mode (or value) in the second field of this message.

\[ z \] = Length of the value to be used in the value (3) part of the message (0-4). Default is 4 bytes for UVAR3, VAL3, and REG3 unless REG3 is the status register where the default is 2 bytes; 1 byte for ADDR3, GVAR3 and SYMIDX3. If EA3 is specified, the length is always set to 4 bytes.

\[ a^1 \] = Level of the indirection (0-3) for the third field of copy input message. Default is 0.

\[ b^1 \] = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that data be copied from an administrative module (AM) generic access package (GRASP) in utility variable to virtual addresses in main memory and in registers as an action associated with a breakpoint. Copies data from another GRASP utility variable as an immediate action or as an action triggered by a breakpoint.

Indirect addressing may be specified. The first listed offset is added to the value of the source address and the result is used as a virtual address of a location in main memory. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of source locations. For example, a single offset with value 0 uses the virtual address found in the source for the location to be copied. Format 1 is a required by action to be triggered by a breakpoint. Format 2 is either executed immediately or triggered by a breakpoint.

2. FORMAT

[1] COPY:UVAR=a[,OFF=b][,L=c|,NL=d]{:ADDR=e|:REG=f}[:WORD]!
[2] COPY:UVAR=a[,L=c|,NL=d]:UVAR=g{:WORD}{!|;}

3. EXPLANATION OF MESSAGE

WORD = Indicates that all addresses, offsets, and lengths are to be interpreted in terms of words, including addresses derived in address chains. If this option is omitted, values given are assumed to be in bytes.

a = A GRASP utility variable, in decimal, as the source for the copy. Utility variable values are reset to zero at the end of a debugging session.

b = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is specified. (Used as an action associated with a breakpoint.)

c = The length of the copy in bytes unless the WORD option is specified, in which case, the maximum is 128 bytes or 32 words. The default is 1.

d = The operation should use the locations beginning 'd' lower than the calculated address and ending at the address. The locations are used in ascending order.

e = The destination virtual address for the data in decimal, octal, or hexadecimal notation. (Used as an action associated with a breakpoint.)

f = The register to be written as the destination of the copy. (Used as an action associated with a breakpoint.) Valid value(s):
   AP = Argument pointer.
   ATBBGR = Register used by the ATB miss routine to temporarily store the bi-directional gating register (BGR).
   ATBPSW = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.

UINT3 = Error microinterrupt handler register UINT3.
UINTER = Shadow error register (uint_er) loaded during an error microinterrupt.

g = A GRASP utility variable, in decimal, to be written as the destination copy. Utility variable values are reset to 0 at the end of a debugging session. (Can be used as an immediate action or associated with a breakpoint.)

4. SYSTEM RESPONSE

?I = General syntax error. May also include:
- EXTRA KEYWORD (OFF) = Indirection not allowed except as action of a WHEN.
- INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
- INVALID KEYWORD = Destination of ADDR or REG not valid outside of a WHEN action list.
- RANGE ERROR (UVAR) = Invalid utility variable number was specified.
- RANGE ERROR (L or NL) = Length specified is too long.

IP = In progress. The message has been added to the WHEN action list.

NG = No good. May also include:
- BAD REG NAME = A named register is not a valid destination.

PF = Printout follows. Followed by the COPY:UVAR output message.

RL = Retry later. The system is in an overload condition or completing the previous OP:UMEM input message.

COPY: REG
COPY: UID
COPY: UVAR
21. CPY
CPY:AMATAPE

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests that primary or secondary automatic message accounting (AMA) data records be copied onto tape.

2. FORMAT

CPY:AMATAPE: {PRIM|SEC,SBLK=a,EBLK=b},MT=c [,ST1|,ST2];

3. EXPLANATION OF MESSAGE

PRIM = Write primary data.
SEC = Write secondary data.
ST1 = Used if AMA data goes to the ST1 data stream.
ST2 = Used if AMA data goes to the ST2 data stream.

NOTE: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

a = Sequence number of the first block of secondary data required. This variable is used only if secondary data is being written onto tape. For secondary data, it is not possible to transmit the oldest 51 blocks of secondary data. Therefore, this number may not reflect the actual first block of secondary data transmitted in the case where the first block falls in that range. To determine the oldest secondary block of data, use OP:AMA-MAPS and determine the FSS from the right side of the maps for the WRITE PARTITION listed at the top of the OP:AMA-MAPS output. This block plus the 50 blocks following cannot be accessed. This is necessary since the oldest secondary AMA data could be overwritten by primary AMA data while a secondary session is in progress.

b = Sequence number of the last block of secondary data required. This variable is used only if secondary data is being written onto tape.

c = Tape drive number.

4. SYSTEM RESPONSE

IP = In progress. Tape writing is allowed and the message was successfully sent to start the tape writing session. When tape writing is completed either a REPT:AMATAPE-ERR message or a REPT:AMATAPE-COMP message will be output indicating the outcome of the request.

NG = No good. The teleprocessing option is in effect, a tape session is already in progress, or data transfer sessions have been manually inhibited, or data stream checks have failed.

PF = Printout follows. Invalid internal data was encountered while processing the input message. An audit printout will follow.
RL = Retry later. A message could not be sent to start the tape writing process.

**Other Manual(s):**

- 235-040-100 *OA&M Planning Guide*
- 235-100-125 *System Description*
1. PURPOSE

Requests deletion of selected contents of a logfile and cleans out corrupt entries from the file. If the filename is the only criterion entered, only corrupt entries are deleted. Otherwise, only entries in the logfile that meet all the specified criteria are deleted.

Two formats are given, depending on the form of specifying starting and ending dates and times.

2. FORMAT

[1] `DEL:LOG:LG="a"":[DATE=b[&&c],][KW="f"][ID=g][TYPE=h]];

[2] `DEL:LOG:LG="a"":[DATE=i[&&j],][TIME=d[&&e],][KW="f"][ID=g][TYPE=h]];

3. EXPLANATION OF MESSAGE

a = Name of the logfile. Any valid administrative module (AM) logfile name. For example: ULARP, DAYLOG.

b = Start date as a six-digit format (mmddyy) or ten-digit format (mmddyyhhmm). For example, 100257 = October 2, 1957; 0102571000 = January 2, 1957, at 10:00 a.m.

c = End date as six-digit format (mmddyy) or ten-digit format (mmddyyhhmm). The default is the start date. If supplied, this date must be in the same format (six or ten digits) as the start date.

d = Start time in hours and minutes format (hhmm). For example, 0110 = 1:10 a.m.

e = End time in hours and minutes format (hhmm). For example, 1530 = 3:30 p.m. The default is the start time.

NOTE: When the six-digit date range is used in conjunction with a time range, the log entries will be deleted from start time to end time for each day in the range of start date through end date.

The ten-digit date allows the user to delete log entries from the start time on the start date until the end time on the end date. Specifying the start time (variable 'd') and end time (variable 'e') with the ten-digit date range is invalid.

f = A keyword that appears in all entries that are to be deleted.

g = An optional four-digit decimal number that is used to link an item in a logfile with an entry in another file. The ID is filled in by the process that made the logfile entry: for example, 1234, 0017, 0003.

h = An optional four-digit decimal number that specifies the type of entry on a logfile. This type is filled in by the process that made the logfile entry; for example, 1234, 0945, 0005.

i = Start date, given as a six-digit number in the form mmddyy.
j = End date, given as a six-digit number in the form mmddyy. Default is the start date.

4. SYSTEM RESPONSE

IP = In progress.

NG = No good. May also include:
   - CANNOT ATTACH TO ECD = Could not attach to the equipment configuration database (EDC).

DEL:TAUTH

**Software Release:** 5E14 and later  
**Command Group:** AUTH  
**Application:** 5,3B  
**Type:** Input

1. PURPOSE

Deletes a terminal identity (TERM) from the terminal authority (TAUTH) database.

This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

DEL:TAUTH:TERM=a;

3. EXPLANATION OF MESSAGE

a = Terminal identity in four characters, starting with "tty".

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID TERMINAL IDENTITY = The given terminal identity is either not four characters in length or does not start with "tty".
- NON-EXISTENT TERMINAL IDENTITY = The given terminal identity does not exist in the terminal authority database.
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The terminal authority database is inaccessible.

OK = Good. The terminal identity is deleted from the terminal authority database.

RL = Retry later. May also include:
- AUTHORITY ADMINISTRATION UNDER UPDATE = The terminal authority database is currently being updated.

Output Message(s):

VFY:TAUTH

Other Manual(s):
235-105-210    Routine Operations and Maintenance
DEL:TCGRP

Software Release: 5E14 and later
Command Group: AUTH
Application: 5,3B
Type: Input

1. PURPOSE

This command deletes a command group of profile from the terminal-command group (TCGRP) relation for a given terminal (TERM) identity.

Format 1 disassociates a command group (COMGR) from a TERM, preventing the user from accessing this group of commands from that terminal. Format 2 disassociates a command profile (PROFL) from a TERM, preventing the user from accessing this command profile from that terminal. This input message is used in administering security of the maintenance interface. Refer to the Routine Operations and Maintenance manual for authority administration information.

2. FORMAT

[1] DEL:TCGRP:TERM=a,COMGR=b;

3. EXPLANATION OF MESSAGE

a = Terminal identity in four characters, starting with “tty”.

b = Command group. Valid value(s):

ADMIN = System administrator only activities.
ALARM = Alarm manipulation.
AM = Administrative module maintenance.
AMA = Automatic Message Accounting.
AUDIT = Audits.
AUTH = Command and authority administration.
CCS = Common channel signaling.
CM = Communications module maintenance.
FHADM = File handling and administration.
MAINT = Routine maintenance activities.
MEAS = Measurements.
NMOC = Network management and overload control.
ODD = Office Dependent Data activities.
PASS = Personal password modification.
RCV = Recent Change and Verify activities.
SM = Switching module maintenance.
SPECRCV = Special RCV commands.
SFTMGIT = Software management (update, software release retrofit).
SFTUTIL = Software utilities.
SUPERUSR = Super user authority (bypass terminal authority).
SYSRCVY = System recovery activities.
TRACE = Call trace.
TRKLN = Trunk and line maintenance.
Refer to the APP:COMMAND-GRP appendix in the Appendixes section of the Input Messages manual for more details.

4. SYSTEM RESPONSE

NG = No good. May also include:
- COMMAND GROUP NOT ASSIGNED TO THIS TERMINAL = The given command group was never assigned to this terminal identity.
- INVALID TERMINAL IDENTITY = The given terminal identity is either not four characters in length or does not start with tty.
- TERMINAL IDENTITY DOES NOT EXIST = The given terminal identity does not exist in the terminal authority administration.
- PROFILE NOT ASSIGNED = The given command profile was never assigned to this terminal identity.
- UNABLE TO ACCESS AUTHORITY ADMINISTRATION = The terminal authority database is inaccessible.

OK = Good. The command group or profile is no longer associated with the terminal identity.

RL = Retry later. May also include:
- AUTHORITY ADMINISTRATION UNDER UPDATE = The terminal authority database is currently being updated.

**DGN:AIUCOM**

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that diagnostics be executed on an access interface unit common data and control controller (COMDAC).

2. **FORMAT**

```
DGN:AIUCOM=a-b-c[,PH=d[&e]][,RPT=[f]][,GROW][,RAW][,TLP][,UCL];
```

3. **EXPLANATION OF MESSAGE**

- **GROW** = Allows access to growth equipment.  
- **RAW** = Print data from raw data test failure.  
- **TLP** = Print the ordered pack list.  
- **UCL** = Execute and print all test failures unconditionally rather than stopping after the first test failure.

- **a** = Switching module (SM) number.  
- **b** = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  
- **c** = COMDAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  
- **d** = The number of the phase to be run, or the lower limit of a range of phases.  
- **e** = The upper limit of a range of phases to be run.  
- **f** = The number of times the exercise is to be repeated (1-32676). If 'f' is not specified, the test will be repeated 32,767 times.

4. **SYSTEM RESPONSE**

- **NG** = No good. The message form is valid, but the request conflicts with the current status.  
- **PF** = Printout follows. Followed by the DGN:AIUCOM output message.  
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5
Type: Input

1. PURPOSE

Requests that the bootstrapper board (BTSR) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

DGN:BTSR=a[,RAW][,UCL][,RPT[=b]][,GROW][,PH=c[&d]][,TLP];

3. EXPLANATION OF MESSAGE

 RAW = Print data from raw data test failure.
 TLP = Print the ordered pack list.
 UCL = Unconditionally execute the removal.
 a = Switching module number.
 b = The number of times that the test is to be repeated. If 'b' is not specified, the test will be repeated 32,767 times.
 c = If specified as a single argument, the diagnostic phase to be performed. If specified as a range, the first diagnostic phase of the range of phases to be performed.
 d = The last diagnostic phase of the range of phases starting with 'e' to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF = Printout follows. The request was accepted. Followed by the DGN:BTSR output message.

5. REFERENCES

Output Message(s):

DGN:BTSR
DGN:CDFI

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Diagnoses an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit to determine if it is in working order. If the circuit is in service, it is removed from service and diagnosed. The circuit is left out of service at the end of the diagnostic regardless of the result.

2. FORMAT

DGN:CDFI=a-b-c[,RAW][,UCL][,RPT [=d]][,GROW][,PH=e[&f]][,TPL];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw data from test failure.

TLP = Print the ordered pack list if a diagnostic fails.

UCL = Unconditionally execute and print all test failures. Diagnostic will continue past all non-fatal errors.

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = CDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Repeat (RPT) the test 'd' times. If 'd' is not specified, the test will be repeated 32,767 times.

e = Run phase 'e'.

f = Run phases 'e' through 'f'.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:
- NOT STARTED UNIT IN GROWTH STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST

PF = Printout follows. The DGN:CDFI output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that a control data interface (CDI) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT
DGN:CDI=a-b-c[,RAW][,UCL][,SVG][,RPT[=d]][,GROW][,PH=e[&f]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
SVG = Run diagnostics on the entire service group, including the demand phases.
TLP = Print the ordered pack list.
UCL = Unconditionally execute and print all test failures.
a = Switching module number.
b = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = The number of times the test is to be repeated. If ‘d’ is not specified, the test will be repeated 32,767 times.
e = Diagnostic phase(s) to be performed. If ‘e’ is specified as a single phase, only that phase will be performed. If ‘e’ is specified in a range, ‘e’ will be the first phase in that range to be performed.
f = The last diagnostic phase in the range between and including ‘e’ and ‘f’ to be performed.

4. SYSTEM RESPONSE
NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF = Printout follows. The request was accepted. Followed by the DGN:CDI output message.

5. REFERENCES
Output Message(s):
DGN:CMP

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnosis of a communication module processor (CMP) to determine whether it is in satisfactory working order. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Note 1: If the unit is not OOS, the system will first remove the unit conditionally.

Note 2: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

DGN:CMP=a-b[,,RAW][,GROW][,UCL][,RPT[=c]][,TLP][,PH=d[&e]];

3. EXPLANATION OF MESSAGE

GROW = Run diagnostics on a CMP in the GROW state. If the CMP is GROW, this option must be input to perform the diagnostic.

RAW = Print data from raw data test failure.

RPT = Repeat the diagnostic 'c' times.

TLP = Print the ordered pack list.

UCL = Execute tests unconditionally and print test failures rather than stopping after the first test failure.

a = Message switch side number.

b = CMP number.

c = Number of times the diagnostic is to be repeated (default 32,767). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Phase (PH) number or lower limit of a range of phase numbers.

e = Upper limit of a range of phase numbers.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. The DGN:CMP output message follows.
RL  = Retry later. The request cannot be executed now due to unavailable system resources.

[8] DGN:CU=a , UC=0 [: [ , RPT=c] [ , RAW] [ , UCL] [ , REX] [ , DEX] ] [ , PH=d[&&e] ] [ , TLP] ;
```

3. **EXPLANATION OF MESSAGE**

**CONT**

= Include only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored. Format 5 is currently used by the DMA. If this parameter is not specified, the DMA controller and all channels connected to it are diagnosed.

**DEX**

= Run demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases which require user interaction to be run even if the range of phases specified includes such a phase.

**RAW**

= Print the diagnostic results of every phase. Default equals the first five failures of each failing phase.
REX = Run routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

**NOTE:** It is recommended that the TLP and UCL parameters not be specified together, as it may produce an improper TLP listing.

UCL = Unconditional execution.

**NOTE:** This option does not override forced early terminations.

- **a** = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.
- **c** = Number of times diagnostic is repeated (maximum is 256) (default is 1).

**NOTE:** This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

- **d** = The number of the first phase to be executed.
- **e** = The number of the last phase to be executed.
- **f** = Member number of the DFC or IOP that is to be used as a helper unit. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped.
- **g** = Member number of the link node (LN) or ring peripheral control node (RPCN) to be used as a helper unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. 0 is used for the RPCN.

### 4. SYSTEM RESPONSE

**?D** = General syntax error in the data field, followed by the parameter position. Valid value(s):
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.
- INVALID DATA = Not a valid value for the phase option.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.

**?E** = Input error of undetermined type.

**?I** = General syntax error, followed by the parameter position. May also include:
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- MISSING DATA = Data required for a keyword in the stated parameter block was not found.
- MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified.
- **RANGE ERROR** = Input is out of the valid range.

**PF** = Printout follows. Followed by the DGN:CU output message.

**RL** = Retry later. The system is in an overload condition.

**Command Group:** N/A  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**

Diagnoses the specified dual serial channel/computer interconnect (DCI).

2. **FORMAT**

\[
\text{DGN:DCI}=a\[:\[,\text{RPT}=b\]\[,\text{RAW}\]\[,\text{UCL}\]\[,\text{REX}\]|,\text{DEX}\]\][:\text{DATA}\[,\text{PH}=c[\&\&d]\]\[,\text{TLP}\]]; 
\]

3. **EXPLANATION OF MESSAGE**

- **DEX**
  - Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

- **RAW**
  - Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

- **REX**
  - Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

- **TLP**
  - Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

*NOTE:* The **TLP** and **UCL** parameters should not be used together, as additional test results may adversely affect the **TLP** listing.

- **UCL**
  - Unconditional execution.

*NOTE:* This option does not override forced early terminations.

- **a**
  - Member number. Refer to the **APP:RANGES** appendix in the Appendixes section of the Input Messages manual.

- **b**
  - Number of times diagnostic is repeated. The maximum is 256. The default is one.

*NOTE:* This option does not override early terminations. **UCL** should also be specified if the diagnostic terminates.

- **c**
  - The number of the first phase to be executed.

- **d**
  - The number of the last phase to be executed.

4. **SYSTEM RESPONSE**

- **PF**
  - Printout follows. Followed by the DGN:DCI output message.

- **RL**
  - Retry later. The system is in an overload condition.
= General syntax error, followed by the parameter position and one of the following reasons: 
EXTRA KEYWORD = Duplicate or extraneous keywords were input. 
INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword. 
MISSING DATA = Data required for a keyword in the stated parameter block was not found. 
MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified. 
RANGE ERROR = Input is out of the valid range.

= General syntax error in the data field, followed by the parameter position and one of the following reasons: 
EXTRA KEYWORD = Duplicate or extraneous keywords were input. 
INCONSISTENT KEYWORD = The combination of keywords is not a valid combination. 
INVALID DATA = Not a valid value for the phase option. 
INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.

= Input error of undetermined type.

(COMMON PROCESSOR DISPLAY)
DGN:DCLU

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a $SLC^\circlearrowright$ 96 digital carrier line unit (DCLU) be removed and diagnosed. The circuit will remain out of service (regardless of the diagnostic's result) until a restore (RST) is requested.

The DCLU service groups interface with $SLC^\circlearrowright$ 96 digital facility interface (SDFI) circuits. There are 4 classes of faults associated with DCLU and SDFI circuits and they are written in the order in which they are most likely to occur:

A DCLU faults that are detected with DCLU diagnosis.
B DCLU faults that are only detected by diagnosing an SDFI circuit (any SDFI).
C SDFI faults that are only detected by diagnosis of the DCLU.
D DCLU faults that are only detected by diagnosing a particular SDFI.

In addition, fault recovery is unable to determine if detected problems are associated with bad DCLU or SDFI circuits. Therefore, fault recovery uses an algorithm in determining which circuits (DCLU or SDFI) to diagnose.

2. FORMAT

DGN:DCLU=a-b-c[,RAW][,UCL][,RPT=[=d]][,GROW][,PH=e[&f]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Prints raw test results [all tests passed (ATP)/some tests failed (STF)] for each phase executed.
TLP = Print the ordered suspect pack if a test fails.
UCL = Unconditionally execute and print all test results requested rather than stopping on first failing phase.
a = Switching module (SM) number.
b = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = The number of times the test is to be repeated. If ‘d’ is not specified, the test will be repeated 32,767 times.
e = Diagnostic phase to be performed. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If ‘e’ is specified as a single phase, only that phase will be
performed. If 'e' is specified in a range, 'e' will be the first phase in that range to be performed.

\( e \) = The last diagnostic phase in the range between and including 'e' and 'f' to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:DCLU output message follows when the diagnostic is executed.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP : RANGES

Other Manual(s):
235-105-220 Corrective Maintenance
DGN:DFC

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the specified disk file controller (DFC) be diagnosed.

NOTE: The moving head disk (MHD) cannot be diagnosed if the disk file controller (DFC) is not in service. Therefore, a controller and its associated disk units cannot be diagnosed with one input message.

2. FORMAT

DGN:DFC=a[:[RPT=b][,RAW][,UCL][,REX|,DEX]][[,PH=c[&d]][,CONT][,TLP][,CU=e]];

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit (controller). Units attached to the specified unit will not be included. Default is diagnose DFC variable 'a' only.

DEX = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

REX = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The TLP and UCL parameters should not be used together, as additional test results may adversely affect the TLP listing.

UCL = Unconditional execution.

NOTE: This option does not override forced early terminations.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Number of times diagnostic is repeated. The maximum is 256. The default is one.

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

c = The number of the first phase to be executed.

d = The number of the last phase to be executed.
Member number of the CU helper unit. Refer to the APP:RANGES appendix in the Appendix section of the Input Messages manual. When a helper unit is not required, the specified helper unit is not used. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. The off-line CU is required as a helper unit when demand phase 15 is executed.

**NOTE:** The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

### 4. SYSTEM RESPONSE

?D = General syntax error in the data field, followed by the parameter position. Valid value(s):
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID DATA = Not a valid value for the phase option.
- INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.

?E = Input error of undetermined type.

?I = General syntax error, followed by the parameter position. May also include:
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- MISSING DATA = Data required for a keyword in the stated parameter block was not found.
- RANGE ERROR = Input is out of the valid range.
- MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified.

PF = Printout follows. Followed by the DGN:DFC output message.

RL = Retry later. The system is in an overload condition.

APP: RANGES
DGN:DLI

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Diagnoses a specific dual link interface (DLI) or a range of DLIs in a switching module (SM) on a specified side of the office network and timing complex (ONTC), and determines if in satisfactory working order.

2. FORMAT

DGN:DLI={a|a&&b}-c[,RAW][,UCL][,RPT[=d]][,PH={e|e&&f}][,TLP][,GROW];

3. EXPLANATION OF MESSAGE

GROW = If an SM is in the GROW or special grow (SGROW) equipage state this option must be input for a diagnostic to execute on the DLI.

RAW = Print data from raw data test failure.

TLP = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty circuit packs.

UCL = Unconditionally execute and print all test results rather than stopping on the first failure.

a = Switching module (SM) number that the DLI to be diagnosed is in. This can also be the lower limit for a range of DLIs that are to be diagnosed. (The DLI number and the SM number are identical.)

b = Upper limit of a range of DLIs to be diagnosed. All DLIs in the range must be on the same side of the ONTC.

NOTE: Unequipped SMs will be 'ignored' on a manual request for a range of DLIs. SMs that are in a special grow state will only be included in a range if the GROW option is also used.

c = ONTC side that the DLI is on. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = The number of times the test is to be repeated. If 'd' is not specified, the test will be repeated 32,767 times.

e = Name of the diagnostic phase to be executed. If 'e' is specified as a single phase, only that phase will be executed. If 'f' is specified as a range it will be the first phase in that range to be executed.

f = The last phase of the diagnostic in the range between 'e' and including 'f' to be executed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of reasons for denying the request.

PF = Printout follows.
RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

**Type:** Input

### 1. PURPOSE

Requests that a digital service circuit (DSC) be removed and diagnosed. This circuit will remain out-of-service (OOS), regardless of the diagnostic's result, until a restore (RST) is requested.

A DSC circuit is defined as a universal tone generator (UTG), universal tone detector (UTD), universal conference circuit (UCONF), or transmission test facility common circuit (TTFCOM) circuit. These circuits are part of local digital service units (LDSU) or global digital service units (GDSU). The LDSU contains the UTG and UTD circuits while the GDSU contains the UCONF and TTFCOM circuits. To obtain a cross reference between the DSC number and the actual circuit, refer to the desired MCC page under LDSU or GDSU.

### 2. FORMAT

DGN:DSC=a-b-c-d[,RAW][,UCL][,TLP][,RPT[=e]][,GROW][,PH=f[&g];

### 3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.
- **RAW** = Print raw test results (all tests passed (ATP)/some tests failed (STF)) for each phase executed.
- **TLP** = Print the ordered suspect pack list if a test fails.
- **UCL** = Unconditionally execute and print all test results requested rather than stopping on first failing phase.
- **a** = Switching module (SM) number.
- **b** = Local or global digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = DSC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = The number of times that the test is to be repeated. If ‘e’ is not specified, the test will be repeated 32,767 times.

**NOTE:** The UTD diagnostic has 5 phases (1-5). UTG has 3 phases (1-3), UCONF has 5 phases (1-5), and TTFCOM has 13 phases (1-4, 7-15).

- **f** = Diagnostic phase to be performed, or the lower limit of a range of phases.
- **g** = Upper limit of a range of diagnostic phases to be performed.

### 4. SYSTEM RESPONSE
NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:DSC output message follows when the diagnostic is executed.

DGN:DUIC

**Software Release:** 5E14 and later  
**Command Group:** AM  
**Application:** 5,3B  
**Type:** Input

1. PURPOSE

Diagnoses the specified direct user interface controller (DUIC).

**NOTE:** The input/output processor (IOP) must be in service before the DUIC can be diagnosed.

2. FORMAT

DGN:DUIC=a[:[RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&d]][,TLP][,CONT];

3. EXPLANATION OF MESSAGE

- **CONT** = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.
- **DEX** = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.
- **RAW** = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.
- **REX** = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.
- **TLP** = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

**NOTE:** The TLP and UCL parameters should not be used together, as additional test results may adversely affect the TLP listing.

- **UCL** = Unconditional execution.  
  Note: This option does not override a forced early termination.

- **a** = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **b** = Number of times the diagnostic is repeated. The maximum is 256. The default is one.  
  Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

- **c** = Number of the phase to be executed, or the first number in a range of phases.

- **d** = Specifies the last phase to be executed.
4. SYSTEM RESPONSE

Output Message(s):

DGN: GDXCON

Input Appendix(es):

APP: RANGES
1. PURPOSE

Requests that a gated diode crosspoint grid (GRID) in a line unit concentrator be removed from service and diagnosed. The grid diagnostic does a check of basic power and control access. For a complete test, restore the grid to service and run in-service grid exercises using the TST:GRID input message.

NOTE: Upon completion of this input message, the grid and all lines it serves will remain out of service until a RST:GRID input message is entered.

2. FORMAT

DGN:GRID=a-b-c[,RAW][,UCL][,RPT[=d]][,GROW][,PH=e[&f]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure results for each phase executed.
TLP = Print the ordered suspect pack list if a test fails.
UCL = Unconditionally execute and print all test failures rather than stopping after the first test failure.
a = Switching module (SM) number.
b = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = The number of times the test is to be repeated. Default is 32,767.
Note: Use of the default for variable ‘d’ is not recommended since lines on the grid will remain out of service for a long time and until a RST input message is entered.
e = Number of the diagnostic phase(s) to be performed or the lower limit of a range of diagnostic phases.
f = The upper limit of a range of diagnostic phases.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

Type: Input

1. PURPOSE

Requests that an integrated digital carrier unit (IDCU) service group circuit be diagnosed. Completion of this input message leaves the circuit in the out-of-service state.

NOTE: If the circuit is not initially out of service, the system will first remove the circuit conditionally.

2. FORMAT

DGN:IDCU=a-b-c[,RAW][,UCL][,RPT=[d]][,GROW][,PH=e[&f]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow diagnostic access to growth equipment

RAW = Print raw test failure data.

TLP = Trouble location procedure. Print the ordered pack list.

UCL = Unconditionally execute past all non-fatal errors and print out all test failures.

a = Switching module (SM) number.

b = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = IDCU service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Number of times that the test is to be repeated (RPT), default is 32,767 times.

e = Diagnostic phase (PH) to be executed, or the lower limit of a range of diagnostic phases.

f = The upper limit of a range of diagnostic phases.

4. SYSTEM RESPONSE

PF = Printout follows. The DGN:IDCU output message follows.

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Input Message(s):
DGN:IOP

**Software Release:** 5E14 and later  
**Command Group:** AM  
**Application:** 5,3B  
**Type:** Input

1. PURPOSE

Diagnoses the specified input/output processor (IOP).

**NOTE:** The peripheral controllers (PCs) cannot be diagnosed if the IOP is not in service. Therefore, an IOP and its associated PCs cannot be diagnosed with one input message.

2. FORMAT

3. EXPLANATION OF MESSAGE

- **CONT** = Includes only the specified unit (controller). Units attached to the specified unit will not be included. Defaulted is diagnose IOP a only.

- **DEX** = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

- **RAW** = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

- **REX** = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

- **TLP** = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

**NOTE:** The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

- **UCL** = Unconditional execution.  
  **NOTE:** This option does not override a forced early termination.

- **a** = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **b** = Number of times the diagnostic is to be repeated. The maximum is 256. The default is one.  
  **NOTE:** This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

- **c** = Specifies the first phase to be executed.

- **d** = Specifies the last phase to be executed.
e  = Member number of the CU helper unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a helper unit is not required, the specified helper unit is not used. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. The off-line CU is required as a helper unit when demand phase 15 is executed.

**NOTE:** The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

UCL = Print all test results unconditionally rather than just printing the first failing test.

a = LI side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Number of times the diagnostic is to be repeated (RPT) (default 32,767).

c = The number of the phase (PH) to be executed, or the lower limit in a range of phases.

d = Upper limit in a range of phases.

e = Specifies the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

PF = Printout follows. Followed by the DGN:LI output message.

RL = Retry later. The request cannot be executed now.

DGN:LN

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the specified link nodes (LN) be diagnosed.

Four sequential system actions are performed in response to this input message.

A = The LN is removed from service following the rules for the RMV:LN input message.
B = If the resultant LN major state is outofservice (OOS), growth (GROW), offline (OFL), or unavailable (UNAV), an attempt is made to isolate the LN. For other major states, the diagnostic is aborted by the diagnostic monitor (DIAMON).
C = The specified (or default) diagnostic phases are run.
D = If the LN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), an attempt is made at the conclusion of the diagnostic to include the LN back into the active ring. Otherwise the node is left in its original ring configuration state. The LN remains in the OOS, GROW, OFL, or UNAV state.

Note: The UCL and TLP parameters must not be used together as it may produce an incorrect TLP listing.

2. FORMAT

DGN:LNa=b:[[RPT=c][,RAW][,UCL]][:PH=d[&e][,CU=f][,TLP]];

3. EXPLANATION OF MESSAGE

CU = Helper Control Unit.
PH = This option indicates the phase or phases to be run in the diagnostic.
RAW = Print the diagnostic results of every phase. The default is to print the results of the first five failures of each failing phase.
RPT = This option allows for repetition of the diagnostics c number of times.
TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP generates a list of suspected faulty equipment.
UCL = Execute unconditionally. This option overrides early terminations but does not override a forced early termination.
a = Ring node group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Number of times the diagnostic is to be repeated (default is 1, maximum is 256).  
Note: This option does not override early termination. UCL should also be specified if the diagnostic is arranged to terminate early.

d = Phase number or lower limit of a range of phase numbers to be executed (default, all automatic phases).

e = Upper limit of a range of phase numbers to be executed.

f = (0 or 1) - Off-line CU required as a helper unit when demand phase 34 is specified for a DLN.  
NOTE: The helper CU must be out of service and all tests passed (ATP) before it can be used as a helper.

4. SYSTEM RESPONSE

PF = Printout follows. The DGN:LN output message follows.

DGN:LUCHAN

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a line unit channel (LUCHAN) on a line unit channel board (LUCHBD) be removed and diagnosed to determine if it is in satisfactory working order. The channel will remain out of service (regardless of the diagnostic result) until a restore (RST) is entered.

2. FORMAT

DGN:LUCHAN=a-b-c-d-e[,RAW][,UCL][,RPT[=f]][,GROW][,PH=g[&h]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure results for each phase executed.

TLP = Print the ordered suspect pack list if a test fails.

UCL = Unconditionally execute and print all test failures rather than stopping after the first failure.

a = Switching module (SM) number.

b = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = The number of times the test is to be repeated. If ‘f’ is not specified, the test will be repeated 32,767 times.

g = Diagnostic phase(s) to be performed. If ‘g’ is specified as a single phase, only that phase will be performed. If ‘g’ is specified as a range, ‘g’ will be the first phase in that range to be performed.

h = The last diagnostic phase in the range between and including ‘g’ and ‘h’ to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:LUCHAN output message follows after the
diagnostic is executed.

Output Message(s):

DGN: LUCHBD

Input Appendix(es):

APP: RANGES
DGN: LUCOMC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a line unit common control (LUCOMC) be diagnosed. The circuit will remain out-of-service (OOS) (regardless of the diagnostic's result) until a restore (RST) is requested.

2. FORMAT

DGN: LUCOMC=a-b-c[,RAW][,UCL][,SVG][,RPT=[d]][,GROW][,PH=[e&&f]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test results (all tests passed (ATP)/some tests failed (STF)) for each phase executed.

SVG = Run diagnostics, including the demand phases, on the entire service group.

TLP = Print the ordered suspect pack list if a test fails.

UCL = Unconditionally execute and print all test results requested rather than stopping on first failing phase.

a = Switching module number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

b = Line unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

d = The number of times the test is to be repeated. If 'd' is not specified, the test will be repeated 32,767 times.

e = Diagnostic beginning phase to be performed. If 'e' is specified as a single phase, only that phase will be performed. If 'e' is specified in a range, 'e' will be the first phase in that range to be performed.

There are 5 phases associated with the LU1 line unit diagnostic and 7 phases associated with the LU2 line unit diagnostic. Phase 5 for LU1 and phase 7 for LU2 are demand-only phases. These phases are concerned with verifying the interface from the common controller to peripheral units (GDXACC, HLSC, CHANBD and GRID) for all-seems-well, service request, and power alarms. The phases should normally be run after replacing a defective controller or to verify the interface to the peripheral circuits.

For LU1 when one module controller/time slot interchanger (MCTSI) is OOS, phases 1 and 4 yield CATP; phase 3 yields no tests run (NTR). For LU2 when one MCTSI is OOS, phases 1 and 6 yield conditional all tests passed (CATP); phase 5 yields NTR.
The last diagnostic phase in the range between and including 'e' and 'f' to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:LUCOMC output message follows when the diagnostic is executed.

5. REFERENCES
Output Message(s):
DGN:MAB
Input Appendix(es):

APP : RANGES

Other Manual(s):
235-105-220  Corrective Maintenance
DGN:MCTSI
  Software Release: 5E14 and later
  Command Group: SM
  Application: 5
  Type: Input

1. PURPOSE

Removes and diagnoses a module control/time-slot interchange unit (MCTSI) to determine if it is in satisfactory
working order. The MCTSI will remain out of service (regardless of the result of the diagnostic) until a restore (RST)
is entered.

2. FORMAT

DGN:MCTSI=a-b[,RAW][,UCL][,RPT[=c]][,GROW] [,PH=d[&e]][,RETRO][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure results for each phase executed.

RETRO = Conditionally execute only the diagnostic phase or range of phases which are designated for use
in a retrofit situation. This option and the PH (demand phase) option are redundant and not allowed
on the same input message line. Compatible with all other options.

TLP = Print the ordered suspect pack list if a test fails.

UCL = Unconditionally execute and print all test failures rather than stopping after the first test failures.

a = Switching module (SM) number.

b = Module control unit/side number. Refer to the APP:RANGES appendix in the Appendixes section
of the Input Messages manual.

c = The number of times the test is to be repeated. If ‘c’ is not specified, the test will be repeated
32,767 times.

d = Number of the diagnostic phase(s) to be performed. If ‘d’ is specified as a single phase, only that
phase will be performed. If ‘d’ is specified as a range, ‘d’ will be the first phase in that range to be
performed.

Special demand phases may be requested also. Valid value(s):

Phase 7 = Complete memory tests. Phase 6 (which runs as a part of the MCTSI diagnostic)
does a quick test of memory system. Phase 7 does a more exhaustive test which
takes several minutes to run. This phase should be requested when a MCTSI is
removed from service due to MEM SYSTEM interrupts.

Phase 90 = Tests TN874 board and is for use only in retrofit situations where module
controller time slot interchange unit model 2 (MCTU2) hardware is not involved.
Can be run on demand or by specifying the RETRO option on the input message
line. The circuits on the board are tested and a checksum test over all EPROM is
done using the stored checksum in EPROM. The final test compares the stored
microcode number with that in the active MCTSI side. This test will fail if the
microcode number is the same as that in the active side. For retrofit situations involving MCTU2 hardware a range of phases need to be executed to perform retrofit testing requirements. This diagnostic phase selection should be initially keyed by the RETRO option.

\[ e \] = The last diagnostic phase in the range between and including ‘a’ and ‘e’ to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. The DGN:MCTSI output message follows when the diagnostic is executed. Use the OP:SM-DMQUE input message to determine if the diagnostic request is waiting in the diagnostic control program's queue.

Other Manual(s):

235-105-220 Corrective Maintenance
DGN:MHD

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified moving head disk (MHD).

Note: The disk file controller (DFC) must be in service before the MHD can be diagnosed.

2. FORMAT

DGN:MHD=a[:[,RPT=b][[,RAW][[,UCL][[,REX|,DEX]][,PH=c[&&d]][,TLP][[,CONT]];]

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

DEX = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases which require manual interaction to be run even if the range of phases specified includes such a phase.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

REX = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.
   Note: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

UCL = Unconditional execution.
   Note: This option does not override a forced early termination.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Number of times the diagnostic is repeated. The maximum is 256. The default is one.
   Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

c = Number of the first phase to be executed.

d = Number of the last phase to be executed.

**Type:** Input

1. **PURPOSE**

Diagnoses the specified message switch control unit (MSCU).

Note: This command is not applicable to offices having CM3 vintage communications modules.

2. **FORMAT**

DGN:MSCU=a[,RAW][,UCL][,RPT[=b]][,PH=c[&d]][,TLP][,GROW];

3. **EXPLANATION OF MESSAGE**

- **GROW** = If the unit or one of its subunits is in the GROW or special grow (SGROW) equipage state, this option must be input for a diagnostic to execute on that unit or subunit. If the unit is not in a growth state, the option will have no effect.

- **RAW** = Prints the raw test results for each phase that is executed.

- **TLP** = Execute the trouble location procedure at the conclusion of the diagnostic. This process prints an ordered suspect pack list if a test fails.

- **UCL** = Unconditionally execute and print all test results rather than stopping on the first failing phase.

- **a** = Message switch (MSGS) side.

- **b** = Number of times the diagnostic is executed. If 'b' is not specified, the test will be repeated 32,767 times.

- **c** = Number of diagnostic phase to be executed, or a lower limit of a range of phases.

- **d** = Upper limit of a range of numbers if diagnostic phases.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

- **PF** = Printout follows.

- **RL** = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

Software Release: 5E14 only
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnostics on a message switch (MSGS) to determine if it is in satisfactory working order.

2. FORMAT

DGN:MSGS=a[,RAW][,UCL][,RPT[]=b][PH=c[&d]][,TLP];

3. EXPLANATION OF MESSAGE

RAW = Print data from raw data test failure.
TLP = Print the ordered pack list.
UCL = Execute unconditionally.
a = MSGS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = The number of times the test is to be repeated. If 'b' is not specified, the test will be repeated 32,767 times.
c = Diagnostic phase to be performed or lower limit in a range of phases.
d = Upper limit in a range of phases.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.
PF = Printout follows.
RL = Retry later. The request cannot be executed now.

DGN:MSUCOM

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests that a metallic service unit common (MSUCOM) board be diagnosed to determine whether it is in satisfactory working order.

### 2. FORMAT

```
DGN:MSUCOM=a-b-c[,RAW][,UCL][,SVG][,RPT=[d]][,GROW][,PH=e[&f]][,TLP];
```

### 3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.  
- **RAW** = Print raw test failure data.  
- **SVG** = Run diagnostics on the entire service group, including the demand phases.  
- **TLP** = Print the ordered pack list.  
- **UCL** = Unconditionally execute and print all test failures.  

**a** = Switching module number.  
**b** = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  
**c** = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  
**d** = The number of times the test is to be repeated. If ‘d’ is not specified, the test will be repeated 32,767 times.  
**e** = Number of the diagnostic phases to be performed. If ‘e’ is specified as a single phase, only that phase will be performed. If ‘e’ is specified as a range, ‘e’ will be the first phase in that range to be performed.  
**f** = The last diagnostic phase in the range between and including ‘e’ and ‘f’ to be performed.

### 4. SYSTEM RESPONSE

- **NG** = No good. The request has been denied. The message form is valid, but the request conflicts with current status.  
- **PF** = Printout follows. The request was accepted. Followed by the DGN:MSUCOM output message.

Output Message(s):

DGN: MSUCOM

Input Appendix(es):

APP: RANGES
DGN:MT

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Diagnoses the specified magnetic tape (MT).

Note: The disk file controller (DFC) must be in service before the MT can be diagnosed.

2. FORMAT

DGN:MTa[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][:DATA[,PH=c[&d]][,TLP][,CONT]];

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit controller (CONT). Units attached to the specified unit are not to be included. If the specified unit has no attached units, CONT is ignored.

DEX = Runs demand exercise (DEX) phases in addition to REX and normal (automatic) phases. This option does not allow special DEX phases that require user interaction to run even if the range of phases specified includes such a phase.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

REX = Runs routine exercise (REX) phases in addition to the normal (automatic) phases. This option does not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

Note: The TLP and UCL parameters cannot be used together, because additional test results may adversely affect the TLP listing.

UCL = Unconditional (UCL) execution.

Note: This option does not override a forced early termination.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Number of times the diagnostic is repeated. The maximum is 256. The default is one.

Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

c = Number of the first phase to be executed.

d = Number of the last phase to be executed.
4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DGN:MT output message.

RL = Retry later. The system is in an overload condition.

?I = General syntax error, followed by the parameter position. May also include:
   - EXTRA KEYWORD = Duplicate or extraneous keywords were input.
   - INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
   - MISSING DAT = Data required for a keyword in the stated parameter block was not found.
   - MISSING KEYWORD = A required keyword is missing from the input. Unit to diagnose must be specified.
   - RANGE ERROR = Input is out of the valid range.

?D = General syntax error in the data field, followed by the parameter position. Valid value(s):
   - EXTRA KEYWORD = Duplicate or extraneous keywords were input.
   - INCONSISTENT KEYWORD = The combination of keywords is not a valid combination.
   - INVALID DATA = Not a valid value for the phase option.
   - INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.

?E = Input error of undetermined type.

MCC Display Page(s):

1135/1145 (MSU MA STATUS)
DGN:MTC

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE
Diagnoses the specified magnetic tape controller (MTC).

Note: The input/output processor (IOP) must be in service before the MTC can be diagnosed.

2. FORMAT

DGN:MTC=a[[:[,]RPT=b[[,]RAW][[,]UCL][[,]REX[,DEX]][,PH=c[&d]][,TLP][[,]CONT][,MT=e];

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

DEX = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases which require manual interaction to be run even if the range of phases specified includes such a phase.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

REX = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

Note: It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

UCL = Unconditional execution.

Note: This option does not override a forced early termination.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Number of times the diagnostic is to be repeated. The maximum is 256. The default is one.

Note: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

c = Specifies the number of the first phase to be executed.

d = Specifies the last phase to be executed.
Note: Before phase 5 is executed, a diagnostic test tape with a write ring must be mounted on the specified MT.

\[ e \] = Member number of the magnetic tape device that is to be used as a helper unit (0-255). When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped. Member number of the magnetic tape (MT) device helper unit is required when demand phase 5 is executed.

235-105-220    Corrective Maintenance
DGN:NLI

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests diagnosis of a specific network link interface (NLI) in a switching module (SM) on a specified office network and timing complex (ONTC) side, to determine if it is in satisfactory working order. Completion of this request leaves the unit in the out-of-service (OOS) state.

NOTE: If the unit is not OOS, the system first removes the unit conditionally.

2. FORMAT

DGN:NLI=a-b-c[,RAW][,UCL][,RPT=[d]][,PH={e|e&&f}][,TLP][,GROW];

3. EXPLANATION OF MESSAGE

GROW = Run the diagnostic on an NLI in the GROW state, or in an SM in the special grow (SGRO) state. If the NLI is GROW or the SM is in the SGRO equipage state, this option must be input to perform the diagnostic.

RAW = Print data from raw data test failure.

RPT = Repeat the diagnostic 'd' times.

TLP = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty circuit packs.

UCL = Unconditionally execute and print all test failures rather than printing only the first failure and stopping.

a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = NLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ONTC side number.

d = The number of times the diagnostic is to be repeated. If 'd' is not specified, the test is repeated 32,767 times.

e = Number of the diagnostic phase (PH) to be executed. If 'e' is specified as a single phase, only that phase will be executed. If 'e' is specified as a range it is the first phase in that range to be executed.

f = The last phase of the diagnostic in the range between 'e' and including 'f' to be executed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual.
Messages manual for a list of reasons for denying the request.

DGN:OFI

**Software Release:** 5E16(1) and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that diagnostics be executed on an optical facility interface (OFI). This circuit remains out-of-service (OOS), and the ports are denied service, regardless of the result of the diagnostic, until a restore is requested.

2. **FORMAT**

```
DGN:OFI=a-b-c-d[,PH=e[&f]][,RPT~[=g]][,GROW][,RAW][,TLP][,UCL];
```

3. **EXPLANATION OF MESSAGE**

- **GROW** = Allows access to growth equipment.
- **RAW** = Print data from raw data test failure.
- **TLP** = Print the ordered pack list if a test fails.
- **UCL** = Execute and print all test failures unconditionally rather than stopping after the first test failure.

- **a** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = Start phase of the range of diagnostic phases to be performed.
- **f** = End phase of the range of diagnostic phases to be performed.
- **g** = The number of times the test is to be repeated. The maximum is 32,000 times.

4. **SYSTEM RESPONSE**

- **NG** = No good. The message form is valid, but the request conflicts with the current status.
- **PF** = Printout follows. The DGN:OFI output message follows.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

TLP = Print the ordered suspected pack list if a test fails.

UCL = Print all test results unconditionally rather than just printing the first failing test. This includes executing all dual link interface (DLI) diagnostics if the ONTC common (ONTCCOM) fails.

Note: This may create volumes of ROP output if many failures occur.

a = ONTC side.

b = The number of times the diagnostic is to be repeated (RPT) (default 32,767).

c = Specify the foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request could not be processed.

PF = Printout follows. Followed by the DGN:ONTC output message.

RL = Retry later. The request cannot be executed now.

Command Group: CM
Application: 5
Type: Input

1. PURPOSE
Requests that the specified office network and timing common units (ONTCCOM) be diagnosed. The ONTCCOM is made up of the following entities:

- Message interface (MI).
- Network clock (NC).
- Time multiplexed switch (TMS) excluding the network control and timing links (NCTLNKs).
- Link interface (LI), which exists only in the communication module model 1 (CM1) hardware.

2. FORMAT
DGN:ONTCCOM=a[,RAW][][,UCL][][,RPT[]=b][][,TLP][][,HELPER=c];

3. EXPLANATION OF MESSAGE

RAW  = Print raw test failure data.
TLP  = Print the ordered suspected pack list is a test fails.
UCL  = Print all test results unconditionally rather than just printing the first failing test.
a    = ONTC side.
b    = Number of times the diagnostic is to be executed (RPT) (default 32,767).
c    = Specify the foundation peripheral controller (FPC) side to be used as a 'helper' unit. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE
NG   = No good. The request has been denied. The message syntax is valid, but the request could not be processed.
PF   = Printout follows. Followed by the DGN:ONTCCOM output message.
RL   = Retry later. The request cannot be executed now.

1. PURPOSE

Requests that the specified office network and timing common units (ONTCCOM) be diagnosed. The ONTCCOM is made up of the following entities:
- Message interface (MI).
- Network clock (NC).
- Time multiplexed switch (TMS) excluding the network control and timing links (NCTLNKs).
- Link interface (LI), which exists only in the communication module model 1 (CM1) hardware.

2. FORMAT

DGN:ONTCOM=a[,RAW][,UCL][,RPT=[b]][,TLP][,PH=[c][&&d]][,TMSLNK=[e][&&f]][,GROW][,HELPER=g];

3. EXPLANATION OF MESSAGE

RAW = Print raw test failure data.
TLP = Print the ordered suspected pack list is a test fails.
UCL = Print all test results unconditionally rather than just printing the first failing test.
GROW = Allows access to growth equipment.
a = ONTC side.
b = Number of times the diagnostic is to be executed (RPT) (default 32,767).
c = Diagnostic beginning phase to be performed.
d = Diagnostic ending phase to be performed.
e = TMS link number to start diagnostic from. This option is applicable only in Communication Module model 3 (CM3). Used only with diagnostic phases 20 and 21. If it's the only range limit specified then it's the only TMS link being diagnosed. If neither range limit specified then the whole range of 4-371 is implied.
f = TMS link number to end diagnostic at. This option is applicable only in CM3.
g = Specify the foundation peripheral controller (FPC) side to be used as a 'helper' unit. If this option is not input, the standby FPC will be used. This option is not legal in CM3.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.
PF = Printout follows. Followed by the DGN:ONTCCOM output message.

RL = Retry later. The request cannot be executed now.

DGN:PCTDX

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests that diagnostics be executed on a peripheral control and timing data exchanger (PCTDX)

### 2. FORMAT

```
DGN:PCTDX=a-b-c[,PH=d[&e]][,RPT[=f]][,GROW][,RAW][,TLP][,UCL];
```

### 3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.
- **PH** = The phase or phases to be run in the diagnostic.
- **RAW** = Print raw test failure data.
- **RPT** = Repeat test option.
- **TLP** = Print the ordered pack list if diagnostic fails.
- **UCL** = Execute and print all test failures unconditionally.

- **a** = Switch Module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = The number of the phase to be run, or the lower limit of a range of phases.
- **e** = The upper limit of a range of phases to be run.
- **f** = The number of times the exercise is to be repeated (1-32766). If 'f' is not specified, the test will be repeated 32,767 times.

### 4. SYSTEM RESPONSE

- **NG** = No good. The request has been denied. The message is valid, but the request conflicts with current status.
- **PF** = Printout follows. Followed by the DGN:PCTDX output message.
- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

DGN: PLTLK

Software Release: 5E15 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Removes and diagnoses a specified PCT (Peripheral Control and Timing) link. The circuit remains OOS (Out-of-Service), and the ports are denied service, regardless of the result of the diagnostic, until a RST (restore) is requested.

2. FORMAT

DGN: PLTLK=a-b-c-d[,PH=e[,&f][][,RPT[=g]][,GROW][,RAW][,TLP][,UCL];

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

b = PLTU (PCT Line and Trunk Unit) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c = PCT Facility Interface number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

d = PCT Facility Interface side number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

e = The number of the phase to be run, or the lower limit of a range of phases. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

f = The upper limit of a range of phases to be run. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

g = The number of times the diagnostic phases are to be repeated (1-32676). If variable ‘g’ is not specified, the phases will be repeated 32,767 times.

GROW = Allows access to growth equipment.

RAW = Print data from raw data test failure.

TLP = Print the ordered pack list.

UCL = Execute and print all test failures unconditionally rather than stopping after the first test failure.

4. SYSTEM RESPONSE

NG = No good. Valid values are:

- REASON FOR NG = The message form is valid, but the request conflicts with current status.
PF  = Printout follows. A DGN PLTLK output message follows.
RL  = Retry later. The request cannot be executed now due to unavailable system resource.

Software Release: 5E14 - 5E15
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a packet switch unit (PSU) common (COM) controller be diagnosed. Completion of this input message leaves the unit in the out-of-service (OOS) state.

NOTE: If the unit is not OOS, the system will first remove the unit conditionally.

2. FORMAT

DGN:PSUCOM=b-c-d[,PH=f[&g]][,RPT=[h]][,SHELF=i][,FSTEST][,GROW][,RAW][,TLP][,UCL];

3. EXPLANATION OF MESSAGE

FSTEST = Allows the factory demand phases 80, 81, 82, 83 to be executed.
- These demand phases are intended for factory use only, and should not be used in a live office with active PHs.
- Factory demand phases 80, 81, 82, 83 will be run not only on the PSUPH specified in the DGN input message, but on all out-of-service PSUPHs.
- FSTEST has no effect on normal PSUPH diagnostic.
- The factory demand phases do not support TLP.
- If factory demand phases are run without the FSTEST option the result is "no test run" (NTR).
- The PERIIA audit must be manually inhibited prior to running these factory demand phases. INH:AUD=PERIIA,SM=x;
- The PSUPH specified can be any out-of-service protocol handler.
- While running factory demand phases 80, 81, 82, 83, restores of PSUCOMs and PSUPH should not be performed.

GROW = Allow access to growth equipment.

RAW = Print data from raw data test failure.

SHELF = Subunit.

TLP = Print the ordered pack list.

UCL = Unconditionally execute and print all test failures rather than stopping after the first test failure.

b = Switching module (SM) number.

c = PSU number.
d = Service group number.

f = Number of the diagnostic phase to be run or the lower limit of a range of phases.

g = Upper limit of a range of phases.

h = Repeat count. Number of times the test is to be repeated. Default (1 - 32,767).

i = The PSUCOM shelf to be diagnosed. If SHELF is not specified, diagnostics will be performed on all shelves. FSTEST option should only be used for the factory system test.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the DGN:PSU output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1. PURPOSE

Requests diagnosis of a quad-link packet switch (QLPS) gateway processor (QGP) to determine whether it is in satisfactory working order. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Note 1: If the unit is not OOS, the system will first remove the unit conditionally.

Note 2: This command is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

DGN:QGP=a-b[,RAW][,RPT=[c]][,UCL][,TLP][,PH=d&&e][,GROW];

3. EXPLANATION OF MESSAGE

GROW = Run diagnostics on a QGP in the GROW state. If the QGP is GROW, this option must be input to perform the diagnostic.

RAW = Print data from raw data test failure.

RPT = Repeat the diagnostic 'c' times.

TLP = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

UCL = Execute diagnostic unconditionally.

a = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Number of times the diagnostic is to be repeated. The default and maximum is 32767 times.

d = Phase (PH) number or lower limit of a range of phase numbers.

e = Upper limit of a range of phase numbers.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

Note: If the unit is not OOS, the system will first remove the unit conditionally.

2. **FORMAT**

DGN:QLPS=a-b[,RAW][,GROW][,UCL][,RPT [=c]][,TLP][,PH=d&&e][,HELPER=f];

3. **EXPLANATION OF MESSAGE**

- **GROW** = Allows access to growth equipment. Run diagnostics on an QLPS in the GROW state. If the QLPS is GROW, this option must be input to perform the diagnostic. Also allows access to QGPs in the GROW state that are connected to the QLPS using QGLs.

- **RAW** = Print data from raw data test failure.

- **RPT** = Repeat the diagnostic 'c' times.

- **TLP** = Executes the trouble location procedure at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

- **UCL** = Execute tests unconditionally and print test failures rather than stopping after the first test failure.

- **a** = Office network timing and control (ONTC) side number.

- **b** = QLPS network number.

- **c** = Number of times the diagnostic is to be repeated. Maximum and default is 32767 times.

- **d** = Phase (PH) number or lower limit of a range of phase numbers.

- **e** = Upper limit of a range of phase numbers.

- **f** = Foundation peripheral controller (FPC) side number to be used as a ‘helper’ unit for the diagnostic. If this option is not input the standby FPC will be used. This option is not applicable for communication module 3 (CM3).

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
PF = Printout follows. The DGN:QLPS output message follows.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1209 (ONTC 0 & 1)
1380/1381 (QLPS NETWORK 0/1 STATUS)
1. PURPOSE

Removes and diagnoses a recorded announcement function (RAF) unit to determine whether it is in satisfactory working order. The unit is left out-of-service (OOS).

2. FORMAT

DGN:RAF=a-b[,RAW][,UCL][,RPT[=c]][,GROWTH][,PH={d|d&d}][,TLP];

3. EXPLANATION OF MESSAGE

GROWTH = Allow access to growth equipment.
RAW = Print raw test failure data.
RPT = Repeat test option.
TLP = Print the ordered pack list.
UCL = Unconditionally execute. DGN will continue past all non-fatal failures.

a = Switching module (SM) number.
b = RAF unit number.
c = The number of times the test is to be repeated. If 'c' is not specified, the test will be repeated 32,767 times.
d = Diagnostic phase to be performed. If 'd' is specified as a single phase, only that phase will be performed. If 'd' is specified as a range, 'd' will be the first phase in that range to be performed.
e = The last diagnostic phase in the range between and including 'd' and 'e' to be performed.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
- SM DOES NOT EXIST = The requested SM does not exist in the system.
- SM UNEQUIPPED = The SM specified in the request is unequipped.
- UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by the DGN:RAF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

Output Message(s):

DGN:RLI
1. PURPOSE
Requests diagnostics of the specified ring peripheral controller node (RPCN). Four sequential system actions are performed in response to this input request.

A = The RPCN is removed from service following the rules for the RMV:RPCN input message.

B = If the resultant RPCN major state is out-of-service (OOS), growth (GROW), offline (OFL), standby (STBY), or unavailable (UNAV), an attempt is made to isolate the RPCN. For other major states, the diagnostic is aborted by the diagnostic monitor (DIAMON).

C = The specified (or default) diagnostic phases are run.

D = If the RPCN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), an attempt is made at the conclusion of the diagnostic to include the RPCN back into the active ring. Otherwise the node is left in its original ring configuration state. The RPCN remains in the OOS, GROW, OFL, STBY, or UNAV state.

2. FORMAT
DGN:RPCNa=0[:RPT=b] [,RAW] [,UCL] [:PH=c[&&d]] [,CU=e] [,TLP];

3. EXPLANATION OF MESSAGE

CU = Helper control unit.

PH = The phase or phases to be run in the diagnostic.

RAW = Print the diagnostic results of every phase. The default is to print the results of the first five failures of each phase.

TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. The TLP generates a list of suspected faulty equipment.

UCL = Execute unconditionally.
Note: This option overrides early terminations but does not override a forced early termination.

a = Ring node group number.

b = Number of times the diagnostic is to be repeated (default is 1).

NOTE: This option does not override early termination. UCL should also be specified if the diagnostic is arranged to terminate early.

c = Phase number or lower limit of a range of phase numbers to be executed.

d = Upper limit of a range of phase numbers.
NOTE: If no phases are specified, all automatic phases are run.

= Off-line control unit (CU) required as a helper unit when demand phase 14 is specified.

NOTE: The helper CU must be out-of-service and all tests passed (ATP) before it can be used as a helper.

4. SYSTEM RESPONSE

**DGN:SCSDC**

**Software Release:** 5E14 and later  
**Command Group:** AM  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**

Diagnoses the specified scanner and signal distributor controller (SCSDC).

Note: The input/output processor (IOP) must be in service before the SCSDC can be diagnosed.

2. **FORMAT**

\[
\text{DGN:SCSDC} = a \{ [RPT=b] [,RAW] [,UCL] [,REX|,DEX] ] : [PH=c|&d] [ ,TLP] [ ,CONT] ;
\]

3. **EXPLANATION OF MESSAGE**

- **CONT** = Diagnoses only the specified controller. Units attached to the specified controller will not be diagnosed.

- **DEX** = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

- **RAW** = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

- **REX** = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

- **TLP** = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

  Note: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

- **UCL** = Unconditional execution.

  Note: This option does not override a forced early termination.

- **a** = Member number.

- **b** = Number of times the diagnostic is repeated. The maximum is 256. The default is one.

  **NOTE:** This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

- **c** = Specifies the first phase to be executed.

- **d** = Specifies the last phase to be executed.

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests that a SLC®96 digital facility interface (SDFI) circuit be removed and diagnosed. The circuit will remain out of service (regardless of the diagnostic's result) until a restore (RST) is requested.

The SDFI interfaces with SLC®96 digital carrier line unit (DCLU) service groups. There are 4 classes of faults associated with SDFI and DCLU circuits and they are written in the order in which they are most likely to occur:

A = SDFI faults that are detected with SDFI diagnosis.
B = SDFI faults that are only detected by diagnosing a DCLU.
C = DCLU faults that are only detected with a SDFI diagnosis (any SDFI).
D = DCLU faults that are only detected by diagnosing a particular SDFI.

Fault recovery is unable to determine if detected problems are associated with bad SDFI or DCLU circuits. Therefore fault recovery uses an algorithm in determining which circuits (SDFI or DCLU) to diagnose.

2. FORMAT

DGN:SDFI=a-b-c[,RAW][,UCL][,RPT=[d]][,GROW][,PH=e[&f]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test results [all tests passed (ATP)/some tests failed (STF)] for each phase executed.
TLP = Print the ordered suspect pack list if a test fails.
UCL = Unconditionally execute and print all test results requested rather than stopping on first failing phase.
a = Switching module (SM) number.
b = Digital carrier line unit (DCLU) number.
c = SDFI number.
d = The number of times the test is to be repeated. If 'd' is not specified, the test will be repeated 32,767 times.
e = Diagnostic phase to be performed. If 'e' is specified as a single phase, only that phase will be performed. If 'e' is specified in a range, 'e' will be the first phase in that range to be performed.

Requests that a test and access circuit (TAC) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT
DGN:TAC=a-b-c[,RAW][,UCL][,RPT [=d]][,GROW][,PH=e[&f]][,TLP];

3. EXPLANATION OF MESSAGE
GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print the ordered pack list.
UCL = Unconditionally execute and print all test failures.
a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = The number of times the test is to be repeated. If 'd' is not specified, the test will be repeated 32,767 times.
e = Diagnostic phase(s) to be performed. If 'e' is specified as a single phase, only that phase will be performed. If 'e' is specified as a range, 'e' will be the first phase in that range to be performed.
f = The last diagnostic phase in the range between and including 'e' and 'f' to be performed.

4. SYSTEM RESPONSE
NG = No good. Input request not valid.
PF = Printout follows. Followed by the DGN:TAC output message.

Type: Input

1. PURPOSE

Requests that a trunk equipment number (TEN) be diagnosed to determine whether it is in satisfactory working order.

2. FORMAT

DGN:TEN=a-b-c-d-e[,RAW][,UCL][,RPT=[f]][,GROW][,PH=g[&h]][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print the ordered pack list.
UCL = Unconditionally execute and print all test failures.

a = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = TEN unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = TEN board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = The number of times the test is to be repeated. If 'f' is not specified, the test will be repeated 32,767 times.

g = Diagnostic phase(s) to be performed. If 'g' is specified as a single phase, only that phase will be performed. If 'g' is specified as a range, 'g' will be the first phase in that range to be performed.

h = The last diagnostic phase in the range between and including 'g' and 'h' to be performed.

4. SYSTEM RESPONSE

NG = No good. Input request not valid.
PF = Printout follows. Followed by the DGN:TEN output message.

Output Message(s):

   DGN: TEN

Input Appendix(es):

   APP: RANGES
1. PURPOSE

Requests that the time multiplex switch (TMS) in the specified office network and timing complex (ONTC) be diagnosed.

2. FORMAT

DGN:TMS=a[,RAW][,UCL][,RPT=b][,PH=c&d][,TLP][,HELPER=e][,GROW];

3. EXPLANATION OF MESSAGE

GROW = Allows access to growth equipment.
RAW  = Print raw test failure data.
TLP  = Print the ordered suspected pack list if a test fails.
UCL  = Print all test results unconditionally rather than just printing the first failing test.
a   = TMS side.
b   = Number of times the diagnostic is to be repeated (RPT) (default 32,767).
c   = The number of the phase (PH) to be executed, or the lower limit in a range of phases.
d   = Upper limit in a range of phases.
e   = The number of the foundation peripheral controller (FPC) side to be used as a ‘helper’ unit for the diagnostic. If this option is not input, the standby FPC will be used.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.
PF = Printout follows. Followed by the DGN:TMS output message.
RL = Retry later. The request cannot be executed now.

**DGN:TMSFP**

**Software Release:** 5E16(2) and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests diagnostics for the time multiplexed switch (TMS) fabric pair (TMSFP) on the specified office network and timing complex (ONTC). Completion of this input message leaves the unit in the out-of-service (OOS) state.

If the unit is not OOS, the system will first remove the unit conditionally.

2. **FORMAT**

   DGN:TMSFP=a-b,[TMSLNK=c[&&d]][,RAW][,UCL][,RPT=[e]][,PH=[f[&&g]]][,TLP][,GROW];

3. **EXPLANATION OF MESSAGE**

   - **GROW** = Allows access to growth equipment.
   - **RAW** = Print raw test failure data.
   - **TLP** = Print the ordered suspected pack list if a test fails.
   - **UCL** = Continue to print all test results unconditionally rather than just printing the first failing test.
   - **a** = ONTC side that the TMSFP is on.
   - **b** = TMS fabric pair number.
   - **c** = TMS link number to start diagnostic from. Used only with diagnostic phases 4 and 5. If it's the only range limit specified then it's the only TMS link to be diagnosed. If neither range limit specified then the whole range of 4-371 is implied.
   - **d** = Ending number of the TMSLNK range to be diagnosed.
   - **e** = The number of times the test is to be repeated (RPT). If 'e' is not specified, the test will be repeated 32,767 times.
   - **f** = The number of the phase (PH) to be executed, or the lower limit in a range of phases.
   - **g** = Upper limit in a range of phases.

4. **SYSTEM RESPONSE**

   - **NG** = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.
   - **PF** = Printout follows. A DGN:TMSFP output message will follow in response to the request.
   - **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5
Type: Input

1. PURPOSE

Requests that diagnostics be executed on a digital networking unit - synchronous optical network (DNU-S) transmission multiplexer (TMUX).

2. FORMAT

DGN:TMUX=a-b-c-d[,PH=e[&f]][,RPT [=g]][,GROW][,RAW][,TLP][,UCL];

3. EXPLANATION OF MESSAGE

GROW = Allows access to growth equipment.
RAW = Print data from raw data test failure.
TLP = Print the ordered pack list if a test fails.
UCL = Execute and print all test failures unconditionally rather than stopping after the first test failure.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

 e = The number of the phase to be run, or the lower limit of a range of phases.
f = The upper limit of a range of phases to be run.
g = The number of times the diagnostic phases are to be repeated (1-32676). If variable ‘g’ is not specified, the phases will be repeated 32,767 times.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.
PFF = Printout follows. The DGN:TMUX output message follows.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

Output Message(s):

DGN: TTFCOM

Input Appendix(es):

APP: RANGES
DGN:TTYC
Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE
Diagnoses the specified teletypewriter controller (TTYC).

Note: The input/output processor (IOP) must be in service before the TTYC can be diagnosed.

2. FORMAT
DGN:TTYC=a[:[,RPT=b][,RAW][,UCL][,REX|,DEX]][,PH=c[&&d]][,TLP][,CONT];

3. EXPLANATION OF MESSAGE

CONT = Includes only the specified unit (controller). Units attached to the specified unit will not be included. If the specified unit has no attached units, CONT is ignored.

DEX = Runs demand exercise phases in addition to routine exercise and normal (automatic) phases. This option will not allow special demand exercise phases that require user interaction to be run even if the range of phases specified includes such a phase.

RAW = Prints the diagnostic results of every phase. The default is the first five failures of each failing phase.

REX = Runs routine exercise phases in addition to the normal (automatic) phases. This option will not allow demand exercise phases to be run even if the range of phases specified includes such a phase.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: The TLP and UCL parameters cannot be used together, as additional test results may adversely affect the TLP listing.

UCL = Unconditional execution.

NOTE: This option does not override a forced early termination.

a = Member number.

b = Number of times the diagnostic is to be repeated. The maximum is 256. The default is one.

NOTE: This option does not override early terminations. UCL should also be specified if the diagnostic terminates.

c = Specifies the first phase to be executed.

d = Specifies the last phase to be executed.
4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DGN:TTCY output message.

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that automatic customer station rearrangement (ACSR) recent change log and error data files be printed.

2. FORMAT

DUMP:ACSR:DATA=a,FILE=b,DEVICE=c;

3. EXPLANATION OF MESSAGE

a = Data file type. Valid value(s):
   LOG = ACSR recent change log file.
   ERR = ACSR recent change error data file.

b = Age of log or error data files in days. Valid value(s):
   1 = Current day's log or error data file.
   2 = Yesterday's log or error data file.
   3 = Log and error data files from two days ago.
   ALL = All log or error data files.

c = Output device name. Valid value(s):
   TERM = Output device is the input terminal.
   ROP = Output device is the receive-only printer (ROP).
   ALL = Output devices are the ROP and the input terminal.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DUMP:ACSR output message.

5. REFERENCES

Output Message(s):

DUMP:ACSR
DUMP:ADDR
Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the contents of a specified range of virtual addresses in the administrative module (AM) main memory be dumped as an action associated with a breakpoint.

The range is specified by two addresses or an address and a length. The length defaults to a value of one. If only one address is given, indirect addressing may be specified. In this case, the first offset listed is added to the contents of the given address and the result is interpreted as a virtual address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value zero uses the virtual address found in the location specified in the DUMP:ADDR input message for the dump location.

2. FORMAT

DUMP:ADDR={a&&b|a}[,OFF=c] [, {L=d|NL=e}] [:WORD]!

3. EXPLANATION OF MESSAGE

WORD = Indicates that all addresses, offsets, and lengths are to be interpreted as words, including addresses derived in address chains. If this option is omitted, they are assumed to be byte values.

a = Virtual address or the lower limit of a range of virtual addresses of the dump in decimal, binary, octal, or hexadecimal notation. Assumed to be a byte address unless the WORD option is used.

b = Upper limit of a range of virtual addresses. Assumed to be a byte address unless the WORD option is used.

c = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is used.

d = The length of the dump, assumed to be in bytes unless the WORD option is used. Maximum 128 bytes or 32 words. Default is one, unless a range is explicitly specified. The actual range of addresses dumped will be rounded out to word address boundaries.

e = Indicator that the operation should use the locations beginning 'e' lower than the calculated address and ending at the address. The locations are used in ascending order. Usage and limitation are the same as for the L option.

4. SYSTEM RESPONSE

IP = In progress. The input message has been added to the WHEN action list.

RL = Retry later. The system is in an overload condition.

Software Release: 5E14 - 5E17(1)
Command Group: N/A
Application: 5
Type: Input

1. PURPOSE

Dumps the entries in the automatic trunk test scheduler (ATTS) schedule database which relate to a specified ATTS test schedule.

2. FORMAT

DUMP:ATDTA [,SCHED=a] [,WEEK=b] [,DAY=c] [,TGID=d];

3. EXPLANATION OF MESSAGE

a = The number of the ATTS test schedule whose test session entries are to be output (1 - 20).
b = The number of the ATTS schedule week for which test session entries are to be selected for dumping (1 - 8).
c = The number of the day in the week for which test session entries are to be selected for dumping (1 - 7, where 1 corresponds to Monday).
d = The number of the trunk group associated with test session entries which are to be selected for dumping (1 - maximum TGs per office).

• If neither variables 'b', 'c', nor 'd' are specified, then all test session entries for the specified ATTS test schedule are dumped.
• If variable 'd' is specified, then only test session entries related to the specified trunk group are dumped, according to the setting of parameters 'b' and 'c'.
• If variable 'b' is specified and variable 'c' is not, then only test session entries related to any day of the given schedule week are dumped.
• If variable 'c' is specified and variable 'b' is not, then only test session entries related to the given day of the schedule week which is currently in effect are dumped.
• If variables 'b' and 'c' are both specified, then only test session entries related to the given day of the given schedule week are dumped.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the DUMP:ATDTA output message.

14.9  ATTS TEST SESSION SCHEDULE DATA
14.10  ATTS TEST SCHEDULE PARAMETER
DUMP:ATDTA-B

**Software Release:** 5E18(1) and later
**Command Group:** N/A
**Application:** 5
**Type:** Input

1. PURPOSE

Dumps the entries in the automatic trunk test scheduler (ATTS) schedule database which relate to a specified ATTS test schedule.

2. FORMAT

DUMP:ATDTA[,SCHED=a][,WEEK=b][,DAY=c][,TGID=d];

3. EXPLANATION OF MESSAGE

- **a** = The number of the ATTS test schedule whose test session entries are to be output (1 - 20).
- **b** = The number of the ATTS schedule week for which test session entries are to be selected for dumping (1 - 8).
- **c** = The number of the day in the week for which test session entries are to be selected for dumping (1 - 7, where 1 corresponds to Monday).
- **d** = The number of the trunk group associated with test session entries which are to be selected for dumping (1 - maximum TGs per office).
  - If neither variables 'b', 'c', nor 'd' are specified, then all test session entries for the specified ATTS test schedule are dumped.
  - If variable 'd' is specified, then only test session entries related to the specified trunk group are dumped, according to the setting of parameters 'b' and 'c'.
  - If variable 'b' is specified and variable 'c' is not, then only test session entries related to any day of the given schedule week are dumped.
  - If variable 'c' is specified and variable 'b' is not, then only test session entries related to the given day of the schedule week which is currently in effect are dumped.
  - If variables 'b' and 'c' are both specified, then only test session entries related to the given day of the given schedule week are dumped.

4. SYSTEM RESPONSE

- **PF** = Printout follows. The request has been accepted. Followed by the DUMP:ATDTA output message.
- **RL** = Retry later. May also include:
  - **DATA NOT DEFINED** = Indicate no ATTS TEST SESSION SCHEDULE DATA defined in form RATSDTA. Prior to define the data in RATSDTA, schedule parameters must be predefined in form ATTS TEST SESSION SCHEDULE PARAMETERS (RATSPRM).

14.9 ATTS TEST SESSION SCHEDULE DATA
14.10 ATTS TEST SCHEDULE PARAMETER
DUMP:ATLOG

**Software Release:** 5E14 and later
**Command Group:** N/A
**Application:** 5
**Type:** Input

1. **PURPOSE**

Retrieves scheduled trunk test data from automatic trunk test scheduler (ATTS) log files. Searching can be limited to: trunk tests defined in a particular schedule, or across all schedules (variable 'a'); trunk tests executed on a particular schedule week, or during any schedule week (variable 'b'); trunk tests executed on a particular schedule day, or during any schedule day (variable 'c'); trunk test data for members of a particular trunk group or for members of all trunk groups (variable 'd'); and/or passed, failed, aborted, non-passing, or all trunk test results (variable 'e').

2. **FORMAT**

DUMP:ATLOG[,SCHED=a][,WEEK=b][,DAY=c][,TGID=d][,STAT=e];

3. **EXPLANATION OF MESSAGE**

- **a** = Schedule number (1 - 20). If this parameter is defaulted, all schedules are searched for test data conforming to the other parameters.
- **b** = Schedule week number (1 - 8).
- **c** = Schedule day number (1 - 7).
- **d** = Trunk group identifier (1 - maximum TGs per office).
- **e** = Status type. Valid value(s):
  - **A** = Print aborted trunk test results only.
  - **F** = Print failed trunk test results only. This is the default value.
  - **FA** = Print failed or aborted (that is, non-passing) trunk test results only.
  - **FU** = Print failed and/or unavailable trunk test results only.
  - **P** = Print passed trunk test results only.
  - **PFA** = Print all trunk test results.

**NOTE:** If STAT is not specified on the command line, the default is to print failed trunk test results only. If there are no failed trunk test results, the following message will be seen "NO TEST RESULTS MATCH INPUT PARAMETERS".

4. **SYSTEM RESPONSE**

ATTS retrieves the requested information from the log files and outputs the formatted test result data in tabular form, if any logged test result data matches the input parameters.
NG = No good. Valid value(s):
    - INSUFFICIENT RESOURCES

PF = Printout follows. The request has been accepted. Followed by the DUMP:ATLOG output message.

Output Message(s):
   DUMP:BKTAPE

   DUMP:BKTAPE
DUMP:CACHE
Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of the offline cache into administrative module (AM) processor main memory. The portions of cache dumped are the ones which map to the kernel and interrupt stacks. The input message will not be accepted if the other control unit (CU) is in the standby state.

The cache (1Kbytes) is placed at virtual address 0x80000 for the interrupt stack portion and at virtual address 0x6a0000 for the kernel stack. In the case of the kernel stack, the address dumped to will not correspond to the actual start of the kernel stack. This offset is necessary to preserve the portions of the kernel stack which are not resident in the cache but which do map to the address range used for the cache kernel stack. Whether a particular stack entry is in cache or main memory is dependent upon whether the hardware is present and enabled, and the state of the ISTK bit in the program status word (PSW) of the running process. The reconstruction of the kernel stack (both cache and main memory) is left to the user.

2. FORMAT

DUMP:CACHE;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. Could not access or reserve the unit control block (UCB) record of the mate CU, or the mate CU was not out of service.

PF = Printout follows. Followed by the DUMP:CACHE output message.

5. REFERENCES

Output Message(s):

DUMP:CACHE
DUMP:F-ALL

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the contents of an ASCII file be dumped.

2. FORMAT

DUMP:FILE, ALL, FN="a" [, OPL=b ];

3. EXPLANATION OF MESSAGE

a = Pathname of the file.

NOTE: Dumps of directories and/or non-ASCII files may produce unpredictable output.

b = Number of segments output, specified in decimal. Default is 10 segments. Maximum number of segments is 999. Each segment has a maximum size of 1000 bytes or 20 lines.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DUMP:F-ALL output message.

(CRAFT FM 01)
DUMP:F-FORMAT

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of a file in the specified format. If no format is given, the dump is printed in octal.

2. FORMAT

DUMP:FILE,FORMAT, FN="a" [,b] [,OPL=c];

3. EXPLANATION OF MESSAGE

   a = Pathname of the file. The pathname is a list of the names of each directory leading to the file, and
      ends with the name of the specific file. Each name begins with a slash, and the entire pathname is
      enclosed in quotation marks. For example, "usr/a1/ssw/test" means that /usr/a1/ssw/ represents the
      list of directory names and /test represents the file name.

   b = Specifies the output format (default is octal). Valid value(s):
      C = Interprets bytes in ASCII notation.
      D = Interprets words in decimal notation.
      O = Interprets words in octal notation.
      X = Interprets words in hexadecimal notation.

   c = Number of segments output, specified in decimal. Refer to the APP:RANGES appendix in the
      Appendixes section of the Input Messages manual. Default is 10 segments. Each segment has a
      maximum size of 1000 bytes or 20 lines.

4. SYSTEM RESPONSE

(CRAFT FM 01)
DUMP:KERN

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the contents of a specified range of virtual addresses in the administrative module (AM) kernel be dumped as an immediate action.

The range is specified by two addresses or an address and a length. The length defaults to a value of 1. If only one address is given, indirect addressing may be specified. In this case, the first offset listed is added to the content of the given address and the result is interpreted as a virtual address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value 0 uses the virtual address found in the location specified in the DUMP:KERN message for the dump location.

2. FORMAT

DUMP:KERN={a&&b|a[,OFF=c][,{L=d|NL=e}];

3. EXPLANATION OF MESSAGE

a = Virtual byte address of the dump or the lower limit of a range of virtual byte addresses, in decimal, octal, or hexadecimal.

b = Upper limit of a range of virtual byte addresses of the dump.

c = A single offset or list of up to 5 offsets. Omission of the keyword implies no indirect addressing.

d = The length of the dump, assumed to be in bytes. The maximum is 128 bytes. The default is 1, unless a range is explicitly specified. The actual range of addresses to be dumped will be rounded out to word address boundaries.

e = Indicator that the operation should use the locations beginning 'e' lower than the calculated address and ending at the address. The locations are used in ascending order. Usage and limitations are the same as for the 'd' option.

4. SYSTEM RESPONSE

IP = In progress. The message has been added to the WHEN action list.

PF = Printout follows.

RL = Retry later. The system is in an overload condition.

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Dumps the contents of a specified single disk block or a range of blocks, in hexadecimal. One disk block contains 512 bytes.

The moving head disk (MHD) does not have to be in the active state for this request to work.

WARNING: Do not input this request at the same time as another request for the same MHD, because errors due to resource limitations may occur.

2. FORMAT

DUMP:MHD=a:BLOCK=b[&c] [,DEST={ROP |"d"}];

3. EXPLANATION OF MESSAGE

DEST = Destination of the output. A maximum of five disk blocks can be directed to the ROP by a single input request. Default is the inputting teletypewriter (TTY).

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Disk block offset from the start of the disk, specified in decimal. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. May be the first block of a range of blocks. Block 0 is the first block of a disk.

c = Last block of a range of blocks. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Pathname of a file to receive the data. There is no limit on the number of disk blocks that can be directed to a file by a single input request.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DUMP:MHD-BLOCK output message.

5. REFERENCES

Output Message(s):

DUMP:MHD-BLOCK

Input Appendix(es):
DUMP:MHD-DEFECT

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

WARNING: Do not input this request at the same time as another DUMP:MHD or VFY:MHD request because errors may occur.

Dumps defect management information for a moving head disk (MHD).

This message is used to read the defect table from an MHD. The tables specify the location of media defects. This information is used by the MHD's controller to map around defective areas on the media.

- This message should only be used for disk drives that support defect management otherwise the input message will abort.
- The MHD does not have to be in the active state to execute this message.

If no options are specified, the combined (COMB) defect tables will be output.

2. FORMAT

DUMP:MHD=a:DEFECT[:FN="b"|{[,COMB][,MFGR]|,ALL}];

3. EXPLANATION OF MESSAGE

a = MHD member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Full pathname that specifies the file to which the MFGR defect table will be written.

For a storage module drive (SMD) MHD, the file will contain the manufacturer's defect table data in a format that can be used in a LOAD:MHD-DEFECT input message.

For a small computer system interface (SCSI) MHD, the contents of the file is purely informational and cannot be used as input to the LOAD:MHD-DEFECT input message.

COMB = Requests the combined defect table.

For an SMD MHD, this table represents the defect list currently being used by the MHD's controller to map around the defects. The COMB defect table can be updated by using the INIT:MHD input message with the NEW option. The update copies the current MFGR defect table to the COMB defect table.

For a SCSI MHD, this table represents the GROWN defect list and contains only those defects added by the user. This list, in conjunction with the PRIMARY defect list, is used by the MHD's controller to map around media defects.
MFGR = Requests the manufacturer's defect table.

For an SMD MHD, this table represents the original defects and defects added by the user. This table is used to update the COMB defect table.

For a SCSI MHD, this table represents the PRIMARY defect list and contains only the original defects. This list in conjunction with the GROWN defect list, is used by the MHD's controller to map around media defects.

ALL = Requests both COMB and MFGR defect tables.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the DUMP:MHD-DEFECT output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

WARNING: Do not input this request at the same time as a VFY:MHD, DUMP:MHD-BLOCK, DUMP:MHD-DEFECT or another DUMP:MHD-VTOC request, because errors may occur.

Formats and prints the contents of a disk pack's volume table of contents (VTOC). The output will only appear on the receive-only printer (ROP). The moving head disk (MHD) does not have to be in the active state for this input message to work.

2. FORMAT

DUMP:MHD=a:VTOC[,SORT={B|P}];

3. EXPLANATION OF MESSAGE

SORT = Specifies the sort algorithm to be used in formatting the output data. Valid value(s):
B = Sort by ascending disk block addresses (default).
P = Sort by ascending logical partition numbers.

Note: Disk packs used in the *UNIX*® RTR operating system must have a VTOC starting at block number zero.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

Type: Input

1. PURPOSE

Dumps the contents of the specified range of virtual addresses in administrative module (AM) main memory in the address space of the process with the specified process identifier. This message cannot be used as an action associated with a breakpoint. The range is specified by two addresses or as one address and a length. The length defaults to a value of 1.

If only one address is given, indirect addressing may be specified. In this case, the first offset listed is added to the value of the given address and the result is interpreted as another address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value 0 uses the virtual address found in the location specified in the DUMP:PID input message for the dump location.

2. FORMAT

DUMP:PID=a,ADDR={b&&c|b\[,OFF=d\][,{L=e|NL=f}]}[:WORD];

3. EXPLANATION OF MESSAGE

WORD = Indicates that all addresses, offsets, and lengths are to be interpreted in terms of words including addresses derived in address chains. If this option is omitted, they are assumed to be byte values.

a = Process ID of the target process.

b = Starting virtual address of the dump in decimal, octal, or hexadecimal notation. Assumed to be a byte address unless the WORD option is used.

c = Ending virtual address of the dump. Assumed to be a byte address unless the WORD option is used.

d = A single offset or list of up to five offsets. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is used.

e = The length of the dump, assumed to be in bytes unless the WORD option is used. Default=1, unless a range is explicitly specified. The actual range of addresses to be dumped will be rounded out to word address boundaries.

f = Used to indicate that the operation should use the locations beginning 'e' lower than the calculated address and ending at the address. The locations are used in ascending order. Usage and limitations are the same as for the L option.

4. SYSTEM RESPONSE

NG = No good. The PID is for a process for which dumps are not permitted.

PF = Printout follows. Followed by the DUMP:PID output message.

RL = Retry later. The system is in an overload condition or completing the previous OP:UMEM or
OP:UMEM:MCH message.

**Type:** Input

### 1. PURPOSE

Dumps the contents of a specified range of physical addresses in main memory.

The range is specified by two addresses or by one address and an optional byte length count. The default length is 4 bytes.

The output will contain formatted fullwords. If the addresses specified did not describe a set of fullwords, the addresses will be rounded out to fullword boundaries. For example, physical memory addresses X'4041-X'405D (in hexadecimal) would be treated as hexadecimal numbers X'4040-X'405F.

This message may be used either as an immediate input message or in the action list of a WHEN.

### 2. FORMAT

\[
\text{DUMP:PMEM} = \{a \& b | a \{, (L=c|NL=d)} \} \{!|;\}
\]

### 3. EXPLANATION OF MESSAGE

- **a** = Starting (if \( L \) is used) or ending (if \( NL \) is used) physical address dump in decimal, octal, or hexadecimal notation. Value will be rounded down to a fullword address.

- **b** = Ending physical address for dump in decimal, octal, or hexadecimal notation. Value will be rounded up to the next fullword boundary.

- **c** = Indicator that the ending address should be calculated by adding the byte length 'c' to the starting address 'a' and then rounding up to the next fullword boundary.

- **d** = Byte length used to calculate the starting address. The byte length 'd' is subtracted from the ending address 'a' and then rounded down to a fullword boundary. The address 'a' is rounded up to the next fullword boundary and is used as the ending address.

### 4. SYSTEM RESPONSE

- **IP** = In progress. The message has been added to the WHEN action list.

- **PF** = Printout follows. Followed by the DUMP:PMEM output message.

- **RL** = Retry later. The system is in an overload condition.

WHEN: UID

Output Message(s):

DUMP: PMEM
DUMP:REG

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of one or more registers, either as an immediate action, or as an action associated with a breakpoint.

This message can also be used to dump an address range in main memory (by specifying a single register and offsets), but only if the message is part of an action list for a WHEN message.

If offsets are specified, the first offset is added to the contents of the specified register and the result is interpreted as a virtual address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value uses the virtual address found in the register for the memory dump location.

Note: Offsets can only be used if the DUMP:REG message is used as an action associated with a breakpoint, since that defines a process address space for memory addressing.

2. FORMAT

DUMP:REG=a[,OFF=b][,{L|NL}=c][:WORD]{!|;}

3. EXPLANATION OF MESSAGE

a = Single register name or a list of registers to be dumped. Valid value(s):
    AP = Argument pointer AP.
    ATBBGR = Register used by the ATB miss routine to temporarily store the bi-directional gating register (BGR).
    ATBPSW = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.
    ATBQ = Register used by the ATB miss routine to temporarily store the ‘q’ register.
    ATBQ = Register used by the ATB miss routine to temporarily store the 'q' register.
    ATBQ = Register used by the ATB miss routine to temporarily store the 'q' register.
    ATBQ = Register used by the ATB miss routine to temporarily store the 'q' register.
    ATBQ = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.
    ATBSAR = Register used by the ATB miss routine to temporarily store the store address register (SAR) contents.
    ATBSAR = Register used by the ATB miss routine to temporarily store the store control register (SCR) contents.
    ATBSDR = Register used by the ATB miss routine to temporarily store the store data register (SDR) content.
    BGR = Bi-directional gating register.
    CAR = Channel address register.
    CDR = Channel data register.
    ERC = Error register (ER) clear.
    FP = Frame pointer FP.
    HG = Reserved register HG.
    HSR = Hardware status register.
    HSRBGC = Bi-directional gating control bits of the hardware status register (HSR).
    IM = Interrupt mask register IM.
    ISC = IS (interrupt source) register clear.
    ISS = Interrupt source (IS) register set.

</table>

**b** = Offset. Omission of the keyword implies no indirect addressing. Offsets are only allowed if one register is specified. Offsets are in bytes unless the WORD option is used.
= The length of the dump, in bytes unless the WORD option is used. The maximum is 128 bytes or
32 words for memory dumps and 4 bytes for register dumps. The default is 1 unless a range is
explicitly specified. The actual range of addresses to be dumped will be rounded out to word
address boundaries.

= Indicator that the operation should use the locations beginning 'c' lower than the calculated
address and ending at the address. The locations are used in ascending order. Usage and
limitations are the same as for the L option.

= Indicates that all addresses, offsets, and lengths are to be interpreted in terms of words, including
addresses derived in address chains. If this option is omitted they are assumed to be byte values.

4. SYSTEM RESPONSE

 IP = In progress. The message has been added to the WHEN action list.

 NG = No good. May also include:

 - BAD REG NAME

 PF = Printout follows. Followed by the DUMP:REG output message.

 RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a dump of the memory contents of the specified address at the given common network interface (CNI) ring node. Currently a maximum length of 468 bytes is allowed for a single dump operation. All addresses are to be provided in hexadecimal. All lengths are to be specified in decimal.

Format 1 dumps the contents of memory at the address range given at the specified CNI ring node.

WARNING: Incorrect use of this input message may interrupt operation of a node on the CNI ring or the whole CNI ring.

Format 2 dumps the contents of memory from the given address for the specified length.

2. FORMAT

[1] DUMP:RUTIL=a-b,AP:ADDR=c-d;

[2] DUMP:RUTIL=a-b,AP:ADDR=c,\{L=e|NL=f\}[:WORD]

3. EXPLANATION OF MESSAGE

ADDR = Address.

AP = Attached processor.

WORD = If specified, 'e' and 'f' are the number of four-byte words to dump, otherwise they are the number of bytes to dump.

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Start address of the dump in hexadecimal.

d = End address of the dump in hexadecimal.

e = Length of the dump in decimal where 'c' is the beginning of the address dump.

f = Length of the dump in decimal where 'c' is the end address of the dump; the start address is calculated by using the end address minus the total number of bytes to dump.

4. SYSTEM RESPONSE
PF = Printout follows. Followed by the DUMP:RUTIL output message.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a dump of the common channel interoffice signaling (CCIS) signaling measurements (SMEAS) from history files.

2. FORMAT

DUMP:SMEAS=a[-a]:HIST=b:{SLK=c-d[&e-f]|NODE=c-d[&e-f]|CHN=g[&h]
|LS=i[j]|CLUSTER=k[l]}[:DEST=m];

3. EXPLANATION OF MESSAGE

a = Measurement identification. Refer to the References section of this message.

b = History file name (as it appears in /no5text/cni/meas). Valid value(s):
C30M = Current 30-minute data file.
CDAY = Current day data file.
CHRIM = Current hour data file.
L15M = Last 15-minute data file.
L30M = Last 30-minute data file.
LDAY = Last day data file.
LHRM = Last hour data file.
LPM = Last period measurement structure.

c = Group number or lower limit of a range of group numbers of signaling links (SLKs) or nodes.

d = Member number or a lower limit of a range of member numbers of SLKs or nodes.

e = Upper limit of a range of group numbers.

f = Upper limit of a range of member numbers.

g = Channel number (CHN) or lower limit of a range of channel numbers.

h = Upper limit of a range of channel numbers.

i = Link set (LS) or lower limit of a range of link set numbers.

j = Upper limit of a range of link set numbers.

k = Cluster or lower limit of a range of clusters.

l = Upper limit of a range of clusters.

m = Destination class. The 'destination number to output device' cross-reference can be found by using the OP:OUTCLS input message.

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of a specified range of virtual addresses in administrative module (AM) main memory in the address space of the process with the specified utility identifier. This message cannot be used as an action associated with a breakpoint.

The range is specified by two addresses or by one address and a length. The length defaults to a value of 1.

If only one address is given, indirect addressing may be specified. In this case, the first offset is added to the value of the given address and the result is interpreted as a virtual address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value 0 uses the virtual address found in the location specified in the DUMP:UID message for the dump location.

2. FORMAT

DUMP:UID=a,ADDR={b&&c|b[,OFF=d][,\{L=e|NL=f\}]}[:WORD];

3. EXPLANATION OF MESSAGE

WORD = Indicates that all addresses, offsets, and lengths are to be interpreted in terms of words including addresses derived in address chains. If this option is omitted they are assumed to be byte values.

a = Utility ID number of the target process.

b = Starting virtual address of the dump in decimal, binary, octal, or hexadecimal notation. Assumed to be a byte address unless the WORD option is used.

c = Ending virtual address of dump. Assumed to be a byte address unless the WORD option is used.

d = Offset. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is used.

e = The length of the dump, in bytes unless the WORD option is used. The maximum is 128 bytes or 32 words. The default is 1, unless a range is explicitly specified. The actual range of addresses to be dumped will be rounded out to word address boundaries.

f = Indicator that the operation should use the locations beginning 'f' lower than the calculated address and ending at the address. The locations are used in ascending order. Usage and limitations are the same as for the 'e' option.

4. SYSTEM RESPONSE

NG = No good. The UID is for a process for which dumps are not permitted.

PF = Printout follows. Followed by the DUMP:UID output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.
?A = Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted. May also include:
  INVALID KEYWORD = Message not allowed in a WHEN action list.

?I = General syntax error. May also include:
  EXTRA KEYWORD (UID) = UID is not valid in a WHEN action list.
  INCONSISTENT DATA (ADDR) = Address range must be in ascending order.
  INPUT ERROR (OFF COUNT) = Too many offsets listed.
  RANGE ERROR (L or NL) = Length specified is too long or zero.
  RANGE ERROR (UID) = Utility ID is out of range.

  OP:UMEM

Output Message(s):

  DUMP:UID
1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.

This message may be used together with any of the other CMP generic utility input messages (refer to the input message listed in the REFERENCE section). If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages. Format 2 requests that a function trace be performed on the specified CMP. This input message can only be used within a (non-timed) WHEN clause.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] DUMP:UT:CMP=a, {MATE|PRIM} [,DIS][,EA][,L=b],
   {ADDR=c|REG=d|REGS|UVAR=e|GVAR="f"|SYMIDX=g} [,INDIR=h]
   [,OFF=i[-i][-i]]{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

MATE = Dump the contents of the standby CMP's memory starting at the final calculated address.

PRIM = Dump the contents of the active CMP's memory starting at the final calculated address.

REGS = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.

a = CMP number.

b = Length in bytes of the dump (1-32767) outside a WHEN breakpoint. Inside a WHEN breakpoint, the limit for output buffer is 2000, although UT will dump around 1200 bytes storing header information in the remaining bytes. Default is 4 bytes for UVAR and REG unless REG is the status register which defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.

c = Absolute address of location to start the dump or the starting point for indirect addressing.

d = Name of a specific register (address registers A0-A7, data registers D0-D7, program counter PC,
or status register SR) whose data is to be dumped. If the data is dumped outside of a WHEN
clause, a dummy set of registers is used.

e = Number of the utility variable UVAR (0-14) whose data is to be dumped.

f = Symbolic name of the global variable or function to be used to determine a starting address. The
name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the
symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this
input message using symbolic access. The global variable's symbol index number can be
determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this
processor by using the DUMP:UT-SYMID input message.

h = The number of levels of indirection to be calculated by generic utilities (range is 0-3) (default is 0).

i = The offsets, in bytes, at each level of indirection (range is 0-65535) (default is 0). However, offsets
greater than 32767 will be treated as negative offsets. One offset can be specified per each level of
indirection. Maximum number of offsets is 3.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.

This message may be used together with any of the other CMP generic utility input messages (see the input message listed in the Reference section).

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

Format 2 requests that a function trace be performed on the specified CMP. This input message can only be used within a (non-timed) WHEN clause.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

   . . .(ADDR=c|REG=d|REGS|UVAR=e|GVAR="f"|SYMIDX=g) . . .
   . . .[,INDIR=h] [,OFF=i[-i][-i]] {!|;}

3. EXPLANATION OF MESSAGE

DIS
   = Dump the data in a disassembled format.

EA
   = Dump the effective address of the specified field instead of the contents.

MATE
   = Dump the contents of the standby CMP's memory starting at the final calculated address.

PRIM
   = Dump the contents of the active CMP's memory starting at the final calculated address.

REGS
   = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.

a
   = CMP number.

b
   = Length in bytes of the dump (1-8064). The full range is only available outside a WHEN breakpoint. Inside a WHEN breakpoint, the limit for output buffer is 2000, although UT will dump around 1500 bytes storing header information in the remaining bytes. Default is 4 bytes for UVAR and REG.
unless REG is the status register which defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.

c = Absolute address of location to start the dump or the starting point for indirect addressing.

d = Name of a specific register whose data is to be dumped.

If switch CM complex is a model 3, valid value(s):
CR = Condition register.
CTR = Count register.
EIMR = External interrupt mask register.
GPR0 = General purpose register.
GPR2-GPR31 = General purpose registers.
LR = Link register.
MSR = Machine state register.
PC = Program counter. (from module processor).
SMIMR = System management interrupt mask register (from module processor).
SP (also known as GPR1) = General purpose register.
XER = Integer exception.

If switch CM complex is model 2 or earlier, valid value(s):
A0-A5 = Address registers.
A6 = The frame pointer FP.
A7 = The stack pointer SP.
D0-D7 = Data registers.
PC = Program counter.
SR = Status register.

If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

e = Number of the utility variable UVAR (0-14) whose data is to be dumped.

f = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters, the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

g = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = The number of levels of indirection to be calculated by generic utilities (0-3, default=0).

i = The offsets, in bytes, at each level of indirection (0-65535, default=0). However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3.

Output Message(s):

DUMP: UT-CMP
REPT: STACK-TRACE

Input Appendix(es):

APP: UT-IM-REASON

Other Manual(s):
235-105-110 System Maintenance Requirements and Tools
DUMP:UT-CMP-C

Software Release: 5E16(1) and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified communications module processor (CMP) be dumped.

This message may be used together with any of the other CMP generic utility input messages (see the input message listed in the Reference section).

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

Format 2 requests that a function trace be performed on the specified CMP. This input message can only be used within a (non-timed) WHEN clause.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] DUMP:UT:CMP=a, (MATE|PRIM), [DIS], [EA], [L=b], . . .
   . . .(ADDR=c|REG=d|REGS|UVAR=e|GVAR="f"|SYMIDX=g), [INDIR=h]. . .
   . . .[,OFF=i][-i][-i]{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.
EA = Dump the effective address of the specified field instead of the contents.
MATE = Dump the contents of the standby CMP's memory starting at the final calculated address.
PRIM = Dump the contents of the active CMP's memory starting at the final calculated address.
REGS = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.

a = CMP number.
b = Length in bytes of the dump (1-8064). The full range is only available outside a WHEN breakpoint. Inside a WHEN breakpoint, the limit for output buffer is 2000, although UT will dump around 1500 bytes storing header information in the remaining bytes. Default is 4 bytes for UVAR and REG.
unless REG is the status register which defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.

c = Absolute address of location to start the dump or the starting point for indirect addressing.

d = Name of a specific register whose data is to be dumped.

If switch CM complex is a model 3, valid value(s):
CR = Condition register.
CTR = Count register.
EIMR = External interrupt mask register (from module processor).
GPR0 = General purpose register.
GPR2–GPR31 = General purpose registers.
LR = Link register.
MSR = Machine state register.
PC = Program counter.
SMIMR = System management interrupt mask register (from module processor).
SP (also known as GPR1) = General purpose register.
XER = Integer exception.

If switch CM complex is model 2 or earlier, valid value(s):
A0–A5 = Address registers.
A6 = The frame pointer (FP).
A7 = Stack pointer (SP).
D0–D7 = Data registers.
PC = Program counter.
SR = Status register.

If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

e = Number of the utility variable UVAR (0-14) whose data is to be dumped.

f = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters, the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = The number of levels of indirection to be calculated by generic utilities (0-3, default=0).

i = The offsets, in bytes, at each level of indirection (0-65535, default=0). However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3.

4. SYSTEM RESPONSE

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified communication module processor message handler (CMPMSG) be dumped.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

DUMP:UT:CMPMSG=a-b[,(DIS|EA)],(ADDR=c|GVAR="d"|SYMIDX=e)
[,]L=f[,]INDIR=g[,]OFF=h[-h][-h];

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

a = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = CMPMSG number.

c = Absolute address of location to start the dump (unless indirection has been specified).

d = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'e' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

e = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

f = Length in bytes of the dump (default is 1). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

 g = The number of levels of indirection to be calculated by generic utilities (default is 0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = The offsets, in bytes, at each level of indirection. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Default is 0.
4. SYSTEM RESPONSE

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified digital networking unit - synchronous optical network (SONET) (DNU-S) common controller (CC) be dumped.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

DUMP:UT-DNUS=a-b[,MATE][,DIS][,EA][,L=c],[ADDR=d|UVAR=e|GVAR="f"|SYMIDX=g][,INDIR=h][,OFF=i[-i][-i]][!|;]

3. EXPLANATION OF MESSAGE

DIS = Dump data in disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

MATE = Dump the contents of the standby DNU-S CC's memory starting at the final calculated address. (Default: dump active memory.)

a = Switching module (SM) number.

b = DNU-S number.

c = Length in bytes of the dump. Maximum length is 248 bytes. Default is 4 bytes for UVAR, 1 byte for ADDR, GVAR and SYMIDX.

d = Absolute address of location to start the dump or the starting point for indirect addressing to the start of the dump.

e = Number of the utility variable (0 - 10) whose contents are to be dumped.

f = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = Number of levels of indirection to be calculated by generic utilities (range 0-3) (default is 0).
The offset, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection (maximum is 3) (default is 0).

4. SYSTEM RESPONSE

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified packet interface (PI) unit be dumped.

Format 2 requests that a function trace be performed in the specified PI unit. This input message can only be used in a WHEN input message clause.

NOTE: Format 2 is only supported on PIs of the PI2 hardware type.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] DUMP:UT:MCTSI=a-b,PI[,DIS][,EA][,L=c],{ADDR=d|UVAR=e|REG=f|REGS|GVAR="g"|SYMIDX=h][,INDIR=h][,OFF=i[-i[-i]]}{!|;}

[2] DUMP:UT:MCTSI=a-b,PI,FTRACE{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump data in disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

a = Switching module (SM) number.

b = Side of the module controller/time-slot interchange (MCTSI).

c = Total length in bytes of the dump. Maximum length is 1000 bytes for PIs of PI1 type. For PIs of PI2 type the maximum length is 32767. Default is 4 bytes for UVAR, 1 byte for ADDR, GVAR and SYMIDX.

d = Absolute address of location to start the dump or the starting point for indirect addressing to the start of the dump.

e = Number of the utility variable UVAR (0-14) whose contents are to be dumped for PIs of PI2 type. For PIs of PI1 type the utility variables are (0-11).

NOTE: The REG and REGS option is only supported on PIs of the PI2 hardware type.

f = Dumps data from a specific register (address registers A1-A7, data registers D0-D7, program counter PC, or status register SR). If the data is dumped outside of a WHEN clause, a dummy set
of registers is used.

\( g \) = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'h' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

\( h \) = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

\( i \) = Number of levels of indirection to be calculated by generic utilities (range is 0-3) (default is 0).

\( j \) = The offset, in bytes, at each level of indirection. (range is 0-65535) (default is 0) (maximum offsets is 3). In the PI1, offsets can range from 0-65535 in the positive direction. In the PI2, offsets can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets.

4. SYSTEM RESPONSE

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified module message processor (MMP) be dumped.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

DUMP:UT:MMP=a-b[{,DIS|,EA}],{ADDR=c|IO=d|GVAR="e"|SYMIDX=f}[,L=g][,INDIR=h][,OFF=i[-i[-i[-i]]]];

3. EXPLANATION OF MESSAGE

**DIS** = Dump the data in a disassembled format.

**EA** = Dump the effective address of the specified field instead of the contents.

**a** = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**b** = MMP number.

**c** = Absolute address of location to start the dump or the starting point for indirect addressing to the start of the dump.

**d** = The number of the I/O port to be dumped.

**e** = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘f’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

**f** = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

**g** = Length in bytes of dump. Maximum length is 192 bytes. Default is 1 byte.

**h** = The number of levels of indirection to be calculated by generic utilities (range is 0-3) (default is 0).

**i** = The offset, in bytes, at each level of indirection. (range is 0-65535) (default is 0) (maximum offsets is 3).
4. SYSTEM RESPONSE

DUMP:UT-MSGS

Software Release: 5E15 and later
Command Group: SFTUTIL
Application: 5
Type: Input

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified message switch (MSGS) be dumped.

NOTE: This command is valid only on MSGS processors of communication Model 3.

2. FORMAT

DUMP:UT-MSGS=a,(AP|IP) [,DIS] [,EA,ADDR=b|GVAR="c"|SYMIDX=d|UVAR=e] [,L=f] [,INDIR=g] [,OFF=h[-h][-h]] ;

3. EXPLANATION OF MESSAGE

AP = Dump the contents of the MSGS application processor's memory starting at the final calculated address.

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

IP = Dump the contents of the MSGS interface processor's memory starting at the final calculated address.

a = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Absolute address of location to start the dump (unless indirection has been specified).

c = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this command using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input command.

d = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input command.

e = Number of the utility variable UVAR (0-10) whose data is to be dumped.

f = Length in bytes of the dump (1 - 192 bytes). Default is 4 bytes for UVAR, 1 byte for ADDR, GVAR, and SYMIDX.

g = The number of levels of indirection to be calculated by generic utilities (0 - 3, default = 0).

h = The offsets, in bytes, at each level of indirection (0 - 65535). Offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

Software Release: 5E16(1) and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one more sequential memory locations in the specified optical facility interface (OFI) be dumped.

This request may be used together with any of the other OFI generic utility input requests (refer to the REFERENCES section).

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input request. Know the effects of the request before using it.

2. FORMAT

DUMP:UT:OFI=a-b-c-d[,DIS][,EA][,L=e],{ADDR=f|UVAR=g|GVAR="h"|SYMIDX=i}... . .[,INDIR=j][,OFF=k[-k][-k]{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Optical Interface Unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Side number.

e = Length in bytes of the dump. The maximum dump length for an OFI is 248. Default is 4 bytes for utility variable (UVAR), 1 byte for ADDR, GVAR and SYMIDX.

f = Absolute address of location to start the dump or the starting point for indirect addressing to the start of the dump.

g = Number of the UVAR (0 - 10) whose contents are to be dumped.

h = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘\\' must be used to enter this
input request using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT:SYMID input request.

\[ i \] = Symbolic index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT:SYMID input request.

\[ j \] = The number of levels of indirection to be calculated by generic utilities (0 - 3, default is 0).

\[ k \] = The offsets, in bytes, at each level of indirection (default is 0). One offset can be specified per each level of indirection. Maximum number of offsets is 3.

Note: Offsets can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets.

4. SYSTEM RESPONSE

235-105-110 System Maintenance Requirements and Tools
DUMP:UT-PSUPH-A

Software Release: 5E14 only
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.

This request may be used together with any of the other PSUPH generic utility input requests (refer to the REFERENCES section). If this request is used together with other generic utility requests, the END:UT-PSUPH input request may be used to signal the end of the series of requests. Format 2 requests that a function trace be performed in the specified PSUPH. This input request can only be used in a (non-timed) WHEN clause.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input request. Know the effects of the request before using it.

2. FORMAT

[1] DUMP:UT:PSUPH=a-b-c-d[,DIS][,EA][,L=e]
    ,{ADDR=f|REG=g|REGS|UVAR=h|GVAR="i"|SYMIDX=j}
    [,INDIR=k][,OFF=l[-l][-l]]{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.
EA = Dump the effective address of the specified field instead of the contents.

NOTE: The REGS and REG options of this input request are only supported in a PSUPH of the PH3/PH4 hardware type (that is, not valid for PH2 hardware type).

REGS = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Unit number (always 0).
c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Length in bytes of the dump. The maximum dump length for a PSUPH of the PH3/PH4 hardware
type is (1-32767). The maximum dump length for a PSUPH of the PH2 hardware type is (1-1000). Default is 4 bytes for utility variable (UVAR) and REG unless REG is the status register which defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.

\*f\* = Absolute address of location to start the dump or the starting point for indirect addressing.

\*g\* = Name of a specific register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) whose data is to be dumped. If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

\*h\* = Number of the UVAR whose data is to be dumped. The range of UVARs in a PSUPH of the PH2 hardware type is (0-10). The range of UVARs in a PSUPH of the PH3/PH4 hardware type is (0-14).

\*i\* = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number \*'j'\* must be used to enter this input request using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input request.

\*j\* = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input request.

\*k\* = The number of levels of indirection to be calculated by generic utilities (0 - 3, default is 0).

\*l\* = The offsets, in bytes, at each level of indirection (default is 0). One offset can be specified per each level of indirection. Maximum number of offsets is 3.

\*NOTE:\* In the PH3/PH4, offsets can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. In the PH2, offsets can range from 0-65535 in the positive direction.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.

This request may be used together with any of the other PSUPH generic utility input requests (refer to the REFERENCES section).

If this request is used together with other generic utility requests, the END:UT-PSUPH input request may be used to signal the end of the series of requests.

Format 2 requests that a function trace be performed in the specified PSUPH. This input request can only be used in a (non-timed) WHEN clause.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input request. Know the effects of the request before using it.

2. FORMAT

[1] DUMP:UT:PSUPH=a-b-c-d[,DIS][,EA][,L=e]...
     ...,{ADDR=f|REG=g|REGS|UVAR=h|GVAR="i"|SYMIDX=j}...
     ...,{INDIR=k}[,,OFF=l[-l][-l]},,,!|;)

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.
Note: The REGS and REG options of this input request are only supported in a PSUPH of the PH[3-4,6,22], PHA, PHV[1-5] hardware type (that is, not valid for PH2 hardware type).

REGS = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Length in bytes of the dump. The maximum dump length for a PSUPH is (1-1000). Default is 4 bytes for utility variable (UVAR) and REG unless REG is the status register which defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.

f = Absolute address of location to start the dump or the starting point for indirect addressing.

g = Name of a specific register whose data is to be dumped. The following registers can be used:
- If PSUPH is a PHV5 hardware type, the registers are general purpose registers GPR0-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the exception register XER.
- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

Note: If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

h = Number of the UVAR whose data is to be dumped. The range of UVARs in a PSUPH of the PH2 hardware type is (0-10). For all other PHs, the range of UVARs is (0-14).

i = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'j' must be used to enter this input request using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input request.

j = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input request.

k = The number of levels of indirection to be calculated by generic utilities (0 - 3, default is 0).

l = The offsets, in bytes, at each level of indirection (default is 0). One offset can be specified per each level of indirection. Maximum number of offsets is 3.

Note: In the PH2, offsets can range from 0-65535 in the positive direction.

In all other PHs, offsets can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets.

4. SYSTEM RESPONSE

1. PURPOSE

Format 1 requests that the contents of one or more sequential memory locations in the specified packet switch unit protocol handler (PSUPH) be dumped.

This request may be used together with any of the other PSUPH generic utility input requests (refer to the REFERENCES section).

If this request is used together with other generic utility requests, the END:UT-PSUPH input request may be used to signal the end of the series of requests.

Format 2 requests that a function trace be performed in the specified PSUPH. This input request can only be used in a (non-timed) WHEN clause. PH2 is not supported but all the other PH hardware types are.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input request. Know the effects of the request before using it.

2. FORMAT

[1] DUMP:UT:PSUPH=a-b-c-d[,DIS][,EA][,L=e]... 
   ...,(ADDR=f|REG=g|REGS|UVAR=h|GVAR="i"|SYMIDX=j)... 
   ...,[,INDIR=k][,OFF=l[-l][-l]]{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

NOTE: The REGS and REG options of this input request are not supported for PH2 but are for all other.

FTRACE = Dump the contents of the processor stacks when the WHEN:UT message is triggered.

REGS = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes.
section of the Input Messages manual.

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Length in bytes of the dump. The maximum dump length for a PSUPH is (1-1000). Default is 4 bytes for utility variable (UVAR) and REG unless REG is the status register that defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.

f = Absolute address of location to start the dump or the starting point for indirect addressing.

g = Name of a specific register whose data is to be dumped. Valid value(s):

<table>
<thead>
<tr>
<th>PSUPH Hardware Type:</th>
<th>Registers:</th>
</tr>
</thead>
<tbody>
<tr>
<td>PHV5, PHV6, PH31, PHA2, or PHE2</td>
<td>GPR0 = General purpose register.</td>
</tr>
<tr>
<td></td>
<td>GPR2-GPR31 = General purpose registers.</td>
</tr>
<tr>
<td></td>
<td>SP = Stack pointer SP (also known as GPR1).</td>
</tr>
<tr>
<td></td>
<td>LR = Link register.</td>

Application: 5
Type: Input

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified quad-link packet switch (QLPS) gateway processor (QGP) be dumped.

2. FORMAT

DUMP:UT-QGP=a-b, {AP|MSGH}, {DIS|EA}, {ADDR=c|GVAR="d"|SYMIDX=e}, {L=f|INDIR=g|OFF=h[-h][-h]};

3. EXPLANATION OF MESSAGE

AP
   = Dump the contents of the QGP application processor's memory starting at the final calculated address.

DIS
   = Dump the data in a disassembled format.

EA
   = Dump the effective address of the specified field instead of the contents.

MSGH
   = Dump the contents of the QGP message handler processor's memory starting at the final calculated address.

a

b
   = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c
   = Absolute address of location to start the dump (unless indirection has been specified).

d
   = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'e' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

e
   = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

f
   = Length in bytes of the dump (1 - 192 bytes, default is 1).

g
   = The number of levels of indirection to be calculated by generic utilities (0 - 3, default is 0).

h
   = The offsets, in bytes, at each level of indirection (0 - 65535). Offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE
Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified quad-link packet switch (QLPS) gateway processor (QGP) be dumped.

NOTE: This input message is valid on processors of the communications module model 1 and 2. It will be accepted but denied on the communications module model 3. Use the DUMP:UT:MSGS AP input message for equivalent functionality on processors of the communications module model 3.

2. FORMAT

DUMP:UT:QGP=a-b, {AP|MSGH}[,DIS][,EA],[ADDR=c|GVAR="d"|SYMIDX=e][,L=f][,INDIR=g][,OFF=h[-h][-h]]

3. EXPLANATION OF MESSAGE

AP = Dump the contents of the QGP application processor's memory starting at the final calculated address.

DIS = Dump the data in a disassembled format.

EA = Dump the effective address of the specified field instead of the contents.

MSGH = Dump the contents of the QGP message handler processor's memory starting at the final calculated address.

a = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Absolute address of location to start the dump (unless indirection has been specified).

d = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'e' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

e = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

f = Length in bytes of the dump (1 - 192 bytes, default is 1).

g = The number of levels of indirection to be calculated by generic utilities (0 - 3, default is 0).

h = The offsets, in bytes, at each level of indirection (0 - 65535). Offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum
number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the contents of one or more sequential memory locations in the specified switching module (SM) be dumped.

This message may be used together with any of the other SM generic utility input messages (refer to the input messages listed in the REFERENCES section). If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages. Format 2 requests that a function trace be performed in the specified SM. This input message can only be used within a (non-timed) WHEN clause.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] DUMP:UT:SM=a[,MATE][][DIS][,EA][,L=b]
    {ADDR=c|REG=d|REGS|UVAR=e|GVAR="f"|SYMIDX=g}
    [,INDIR=h][][OFF=i[-i][-i]}{!|;}

3. EXPLANATION OF MESSAGE

DIS = Dump data in disassembled format.
EA = Dump the effective address of the specified field instead of the contents.
MATE = Dump the contents of the standby SM's memory starting at the final calculated address. Default is active SM memory.
REGS = Dump data from all registers. If the data is dumped outside a WHEN clause, a dummy set of registers is used.
a = SM number.
b = Length in bytes of the dump. Maximum length is 65536 bytes outside a WHEN breakpoint. Inside a WHEN breakpoint, the limit for output buffer is 2000, although UT will dump around 1500 bytes storing header information in the remaining bytes. Default is 4 bytes for UVAR and REG unless REG is the status register which defaults to 2 bytes, 1 byte for ADDR, GVAR and SYMIDX.
c = Absolute address of location to start the dump or the starting point for indirect addressing to the start of the dump.
d = Dumps data from a specific register (address registers A0-A7, data registers D0-D7, program...
counter PC, or status register SR). If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

e = Number of the utility variable UVAR (0-14) whose data is to be dumped.

f = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = The number of levels of indirection to be calculated by generic utilities. The maximum is 3. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection (default is 0) (maximum offsets is 3).

                          | PC = Program counter.     
                          | SR = Status register.     |

If the data is dumped outside of a WHEN clause, a dummy set of registers is used.

e = Number of the utility variable UVAR (0-14) whose data is to be dumped.

f = Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = The number of levels of indirection to be calculated by generic utilities. The maximum is 3. Default is 0.

i = The offsets, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection (default is 0) (maximum offsets is 3).

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Requests that symbolic information be dumped from the common object file format (COFF) file defined by the processor or path identified in the input message. The symbolic information returned will be the processor identified (if used), the path to the symbol file, the symbol index number(s), and the complete symbol name(s).

For Format 1, given a processor and symbol index as information, this input message provides the full name of the global symbol referenced by the index and the path used by that processor. For Format 2, given a processor and symbol name (part or whole) as information, this input message provides the full name of all global symbols which match the given name (up to 40 matches), their index numbers and the path used by that processor. For Format 3, given a path to a COFF file on the administrative module (AM) and a symbol index as information, this input message provides the full name of the global symbol referenced by the index. For Format 4, given a path to a COFF file on the AM and a symbol name (part or whole) as information, this input message provides the full name of all global symbols which match the given name (up to 40 matches) and their index numbers.

2. FORMAT

3. EXPLANATION OF MESSAGE

- **a** = Communications module processor (CMP) number.
- **b** = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = CMP message handler number.
- **d** = Switching module number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = Digital networking unit - synchronous optical network (SONET) (DNU-S) common controller number.
- **f** = Foundation peripheral controller number.
- **g** = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = IDCU loop side interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Integrated services line unit common controller number.

j = Message handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Module message processor number.

l = Side of the module controller/time-slot interchanger (MCTSI).

m = Pump peripheral controller number.

n = Packet switch unit protocol handler (PSUPH) shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = PSUPH slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Quad-link packet switch gateway processor number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = DNU-S transmission multiplexer (TMUX) data group number.

r = TMUX number.

s = Symbol index (SYMIDX) number of global variable.

t = Whole or partial symbol name of the global variable (GVAR) or function to be used for the symbol matching. Must be entered as a string of up to 127 characters, enclosed in double quotation marks. If the symbol name is greater than 127 characters the utsyminfo or 3bidump tools must be used on the UNIX® RTR terminal. Refer to the System Maintenance Requirements and Tools manual for information on the utsyminfo and 3bidump tools.

u = Full path from 'root' to COFF symbol file on the AM.

v = Unit number (always 0).

4. SYSTEM RESPONSE

235-105-110  System Maintenance Requirements and Tools
DUMP:UT-TMUX

**Software Release:** 5E14 and later  
**Command Group:** SFTUTIL  
**Application:** 5  
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that the contents of one or more sequential memory locations in the specified digital networking unit - synchronous optical network (SONET) (DNU-S) transmission multiplexer (TMUX) be dumped.

**WARNING:** The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. **FORMAT**

```
DUMP:UT-TMUX=a-b-c-d[,DIS][,EA][,L=e]{ADDR=f,UVAR=g,GVAR="h",SYMIDX=i}{,INDIR=j}{,OFF=k[-k]}{!|;}
```

3. **EXPLANATION OF MESSAGE**

- **DIS**
  - Dump data in disassembled format.

- **EA**
  - Dump the effective address of the specified field instead of the contents.

- **a**
  - Switching module (SM) number.

- **b**
  - DNU-S number.

- **c**
  - Data group number.

- **d**
  - TMUX number.

- **e**
  - Length in bytes of the dump. Maximum length is 248 bytes. Default is 4 bytes for UVAR, 1 byte for ADDR, GVAR and SYMIDX.

- **f**
  - Absolute address of location to start the dump or the starting point for indirect addressing to the start of the dump.

- **g**
  - Number of the utility variable (0 - 10) whose contents are to be dumped.

- **h**
  - Symbolic name of the global variable or function to be used to determine a starting address. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'i' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

- **i**
  - Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

- **j**
  - Number of levels of indirection to be calculated by generic utilities. (range is 0-3) (default is 0).
k = The offset, in bytes, at each level of indirection. They can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. One offset can be specified per each level of indirection. Maximum number of offsets is 3. Default is 0.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

5. REFERENCES

Input Appendix(es):

APP:UT-IM-REASON

Other Manual(s):
235-105-110 System Maintenance Requirements and Tools
DUMP:UVAR

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Dumps the contents of one or more administrative module (AM) generic access package (GRASP) utility variables either as an immediate message or as an action associated with a breakpoint. Utility variables are used to store data temporarily.

This message can also be used to dump an address range in main memory (by specifying a single utility variable and offsets) but only if the message is part of the action list for a WHEN message. If offsets are specified, the first offset is added to the value of the contents of the utility variable and the result is interpreted as a virtual address. The number of offsets specified defines the length of the chain of virtual addresses to be accessed in this way before accessing the desired range of dump locations. For example, a single offset with value 0 uses the virtual address found in the utility variable for the dump location.

NOTE: Offsets can only be used if the DUMP:UVAR message is used as an action associated with a breakpoint, since that defines a process address space for memory addressing.

2. FORMAT

DUMP:UVAR=a[,OFF=b] [,L=c|NL=d] ][:WORD];

3. EXPLANATION OF MESSAGE

WORD = Indicates that all addresses, offsets, and lengths are to be interpreted as words including addresses derived in address chains. If this option is omitted they are assumed to be byte values.

a = Utility variable(s) (1-50) to be dumped. A maximum of five utility variables may be listed.

b = Offset. Omission of the keyword implies no indirect addressing. Offsets are in bytes unless the WORD option is used.

c = The length of the dump, assumed to be in bytes unless the WORD option is used. The maximum is 128 bytes or 32 words for memory dumps, 4 bytes or 1 word for utility variable dumps. The default is 1 unless a range is explicitly specified. The actual range of addresses to be dumped is rounded out to word address boundaries.

d = Used to indicate that the operation should use the locations beginning 'd' lower than the calculated address and ending at the address. The locations are used in ascending order. Usage and limitations are the same as for the 'c' option.

4. SYSTEM RESPONSE

IP = In progress. The message has been added to the WHEN action list.

PF = Printout follows. Followed by DUMP:UVAR output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.
= General syntax error. May also include:
- EXTRA KEYWORD (OFF) = Indirection not allowed except as action of a WHEN.
- INCONSISTENT DATA (UVAR LIST + OFF) = No indirection permitted with more than one utility variable listed.
- INCONSISTENT KEYWORDS (NL-OFF) = Negative length not allowed without OFF.
- INPUT ERROR (OFF COUNT) = Too many offsets listed.
- INPUT ERROR (UVAR COUNT) = Too many utility variables listed.
- RANGE ERROR (L OR NL) = Length specified too long or zero.
- RANGE ERROR (UVAR) = Invalid utility variable number was specified.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Conditional ELSE input message used with the IF input message will perform any switching module (SM) generic utility input messages following it, provided the IF input message comparison is not true. Refer to the IF:UT-SM input message.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

ELSE:UT:SM=a;

3. EXPLANATION OF MESSAGE

a = SM number.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

28. EX
EX:ALIT

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Requests interactive diagnostics (exercises) of the automatic line insulation test (ALIT) unit. This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the ALIT.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:ALIT. The unit will remain out of service.

2. FORMAT

[1] EX:ALIT=a-b-c-d,START[,GROW];

[2] EX:ALIT=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i],STEP=e[,TLP];

[4] EX:ALIT=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i][,RPT=[f]],PH=j-k[,TLP];

[5] EX:ALIT=a-b-c-d,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure data.

TLP = Print ordered pack list.

UCL = Execute unconditionally.

a = Switching module (SM) number.

b = Metallic service unit number.

c = Service group number.

d = Metallic service unit board number.

e = Number of segments to be executed, beginning from the current point of suspension. With this
format, the RPT option is not allowed.

f = Number of times the exercise is to be repeated. Default=32,767.
g = The number of the phase that has statement ‘i’ and segment ‘h’ (SM units only).
h = The number of the segment that has statement ‘i’ (SM units only).
i = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
j = The number of the phase that has the segment(s) to be executed.
k = The number of the segment or range of segments in phase ‘j’ to be executed.
l = Number of the phase in which suspension of diagnostic execution is desired.
m = Segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:ALIT output message.

1. PURPOSE

Requests that maintenance exercises be performed on the remote switching module (RSM), optical remote switching module (ORM), or two-mile remote switching module (TRM) alarm and status circuit (ASC). This message is used for manual troubleshooting.

Format 1 activates a diagnostic on the ASC.

Format 2 executes a portion of a previously activated diagnostic.

Format 3 resets the diagnostic options and begins executing the previously activated diagnostic from the current point of suspension until a specified number of segments have been run.

Format 4 inverts the state of a previously activated diagnostic, from running to suspended or vice versa.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic, ignoring interim test failures.

To stop this exercise, use the STP:ASC input message. The circuit will remain out of service.

2. FORMAT

[1] EX:ASC=a,START[,GROW];
[2] EX:ASC=a,PH=g-h[&i][,UCL][,RAW][,SYNCH=d-e-f][,RPT[=c]][,TLP];
[3] EX:ASC=a,STEP=b[,UCL][,RAW][,SYNCH=d-e-f][,TLP];
[4] EX:ASC=a;
[5] EX:ASC=a,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print ordered circuit pack list.
UCL = Execute unconditionally.
a = Switching module (SM) number.
b = The number of segments to be executed, beginning from the current point of suspension.
c = The number of times the exercise is to be repeated (1-32767). Default is 32,767.
d = The phase.
e = The segment.
f = The statement number.
g = The phase.
h = The first segment in phase ‘g’ to be executed.
i = The last segment in phase ‘g’ to be executed.
j = The phase.
k = The segment.

4. SYSTEM RESPONSE

NG = No good. Request denied because of a conflict with current status.
PF = Printout follows. Followed by the EX:ASC output message.

**Type:** Input

### 1. PURPOSE

Performs various exercises on the bootstrapper board (BTSR). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the BTSR.

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 suspends a running diagnostic program.

Format 4 allows a previously suspended exercise to continue from the current point of suspension until the completion of the original exercise. If the exercise is required to continue in the same mode as before the suspension, the diagnostic options should be set as before.

Format 5 executes a portion of a previously activated diagnostic program.

Format 6 transfers control from the current point of suspension to a beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

### 2. FORMAT

1.  EX:BTSR=a,START;
2.  EX:BTSR=a[,UCL][,RAW][,SYNCH=d-e-f],STEP=b[,TLP];
3.  EX:BTSR=a;
4.  EX:BTSR=a[,UCL][,RAW][,SYNCH=d-e-f][,RPT[=c]][,TLP];
5.  EX:BTSR=a[,UCL][,RAW][,SYNCH=d-e-f][,RPT[=c]],PH=g-h[,TLP];
6.  EX:BTSR=a,PAUSE=i-j;

### 3. EXPLANATION OF MESSAGE

- **RAW** = Print data from raw data test failure.
- **TLP** = Print the ordered pack replacement list.
- **UCL** = Unconditionally execute the removal.
- **a** = Switching module (SM) number.
- **b** = The number of segments to be executed, beginning from the current point of suspension. Ignore all specified repeat (RPT) options.
- **c** = The number of times the exercise is to be repeated. Default=32,767.
d = Phase of segment 'e' in statement 'f'.

e = Segment of statement 'f'.

f = Statement at the beginning of which a synchronizing pulse will be generated.

g = The phase whose segment(s) will be executed.

h = The segment or range of segments in phase 'g' to be executed.

i = Phase number at which suspension of diagnostic execution is desired.

j = Segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. Followed by the EX:BTSR output message.

5. REFERENCES

Output Message(s):

EX:BTSR
EX:CDFI

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Performs maintenance exercises on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit. This message is used for manual troubleshooting.

Format 1 activates a diagnostic on the CDFI.

Format 2 executes a portion of a previously activated diagnostic.

Format 3 resets the diagnostic options and begins executing the previously activated diagnostic from the current point of suspension until the specified number of segments have been run.

Format 4 inverts the state, from running to suspended or vice versa, of a previously activated diagnostic.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic, ignoring interim test failures.

To stop this exercise, use the STP:CDFI input message. The circuit will remain out of service.

2. FORMAT

[1] EX:CDFI=a-b-c,START[,GROW];

[2] EX:CDFI=a-b-c,PH=i[-j-k][,UCL][,RAW][,SYNCH=f-g-h][,RPT=[=e]][,TLP];

[3] EX:CDFI=a-b-c,STEP=d[,UCL][,RAW][,SYNCH=f-g-h][,TLP];

[4] EX:CDFI=a-b-c;

[5] EX:CDFI=a-b-c,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure data.

TLP = Print ordered circuit pack replacement list.

UCL = Execute unconditionally. Diagnostic will continue past all non-fatal errors.

a = Switching module (SM) number.

b = Digital line and trunk unit (DLTU) number.

c = CDFI number.

d = The number of segments to execute, beginning from the current point of suspension.

e = The repeat count, default is 32767.
= Generate a synchronizing pulse at the beginning of statement 'h' in segment 'g' of phase 'f'. For 'i', 'j', 'k', execute the specified segments of the phase, where:

- **i** = The phase.
- **j** = The first segment in phase 'i' to be executed.
- **k** = The last segment in phase 'i' to be executed.
- **l** = The phase at which to suspend the diagnostic.
- **m** = The segment at which to suspend the diagnostic.

### 4. SYSTEM RESPONSE

- **NG** = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May include one of the following:
  - NOT STARTED UNIT IN GROWTH STATE.
  - SM DOES NOT EXIST.
  - SM UNEQUIPPED.
  - UNIT DOES NOT EXIST.

- **PF** = Printout follows. Followed by the EX:CDFI output message.

- **RL** = Retry later. The request cannot be executed now due to unavailable system resources.

[5] EX:CDI=a-b-c, PAUSE=k-l;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print ordered pack list.
UCL = Execute unconditionally.
a = Switching module (SM) number.
b = Trunk unit number.
c = Service group number.
d = The number of segments to execute, beginning from the current point of suspension.
e = Number of times the exercise is to be repeated. (0-32,767) Default=32,767.
f = The phase that has state ‘h’ and segment ‘g’ (SM units only).
g = The segment that has statement ‘h’ (SM units only).
h = The statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
i = The phase that has the segment(s) to be executed.
j = The segment or range of segments in phase ‘l’ to be executed.
k = Phase at which suspension of diagnostic execution is desired.
l = Segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:CDI output message.

5. REFERENCES

Input Message(s):

STP:CDI

Output Message(s):

EX:CDI
EX:CMP

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests interactive diagnosis of a communication module processor (CMP). This message is used primarily for manual troubleshooting. Completion of this input message leaves the unit in the out-of-service (OOS) state.

Format 1 activates a diagnostic program on the CMP.

Format 2 resets the diagnostics options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts (toggles) the state of a previously activated diagnostic program from "running" to "suspended" or vice versa.

Format 4 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures. It then executes the specified segment or segment range according to the specified options.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

Note 1: If the unit is not OOS, the system will first remove the unit conditionally.

Note 2: To stop any of these exercises, use the STP:CMP input message.

Note 3: This command is not applicable to offices having CM3 vintage communication modules.

2. FORMAT

[1] EX:CMP=a-b,START[,GROW];

[2] EX:CMP=a-b[,UCL][,RAW],STEP=c[,TLP];

[3] EX:CMP=a-b;

[4] EX:CMP=a-b[,UCL][,RAW][,RPT=d],PH=e-f[&g][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Interactively diagnose a CMP in the GROW state. If the CMP is GROW, this option must be input to perform the diagnostic.

RAW = Print raw test failure data.

TLP = Print the ordered pack list.

UCL = Execute tests unconditionally and print test failures rather than stopping after the first test failure.
a = Message switch side number.
b = CMP number.
c = Number of segments to be executed, beginning from the current point of suspension.
d = Number of times the diagnostic segment(s) are to be repeated (1 to 32,767; default 32,767).
e = The number of the phase (PH) that has the segment(s) to be executed.
f = Segment number, or the lower limit of a range of segment numbers, in phase 'e' to be executed.
g = Upper limit of a range of segment numbers in phase 'e' to be executed.
h = The number of the phase at which suspension of diagnostic execution is desired.
i = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the EX:CMP output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

235-700-300 Peripheral Diagnostic Language Reference
EX:CU

Software Release: 5E14 and later
Command Group: AM, CCS
Application: 5,3B
Type: Input

1. PURPOSE

Requests that an administrative module (AM) control unit (CU) be exercised in an interactive diagnostic mode. Refer to the EX:LDPARM, EX:LOOP, EX:PAUSE, EX:STEP, and EX:STOP input messages in the Input Messages manual.

2. FORMAT

EX:CU=a, CH=b[:[:RAW][:[,UCL]]], PH=c[, TLP][,{RPCN32|RPCN00|DFC|IOP}=d];

3. EXPLANATION OF MESSAGE

RAW
  = Print all the diagnostic failures. Default is to print the first five failures.

TLP
  = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

UCL
  = Execute unconditionally.

NOTE: This option does not override forced early terminations.

a
  = Member number.

b
  = Unit type and member number of the subunit beneath the CU. Valid subunit names and member numbers are listed in the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

c
  = Execute the specified phase.

NOTE: The phase will not be executed until subsequent input messages from input messages EX:PAUSE, EX:LOOP, EX:STEP, and EX:LDPARM are input.

d
  = Member number of the disk file controller (DFC), input/output processor (IOP), or ring peripheral controller node (RPCN) to be used as a helper unit. When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or not available, the helper unit dependent tests are skipped.

4. SYSTEM RESPONSE

PF
  = Printout follows. Followed by the EX:CU output message.

RL
  = Retry later. The system is in an overload condition.

?I
  = General syntax error followed by the parameter position. May also include:
    - EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- **INVALID KEYWORD** = The keyword in the stated parameter position is not a valid keyword.
- **MISSING DATA** = Data required for a keyword in the stated parameter block was not found.
- **MISSING KEYWORD** = A required keyword is missing from the input.

**?D**
= General syntax error in the data field, followed by the parameter position. Includes one of the following:
- **EXTRA KEYWORD** = Duplicate or extraneous keywords were input.
- **INVALID KEYWORD** = The keyword in the stated parameter position is not a valid keyword.
- **MISSING DATA** = Data required for the statement keyword was not found on the input line.
- **MISSING KEYWORD** = A required keyword is missing from the input.
- **RANGE ERROR** = Not a valid value for the statement parameter.

**?E**
= Input error of undetermined type.

**Command Group:** N/A  
**Application:** 5,3B  
**Type:** Input

1. **PURPOSE**
Exercises a dual serial channel/computer interconnect (DCI) in an interactive diagnostic mode.

2. **FORMAT**

```
EX:DCI=a[[:RAW]][,UCL]]:DATA,PH=b[,TLP];
```

3. **EXPLANATION OF MESSAGE**

- **RAW**
  = Prints all the diagnostic failures. Default is the first five failures.

- **TLP**
  = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

  **NOTE:** It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

- **UCL**
  = Executes unconditionally.

  **NOTE:** This option does not override forced early terminations.

- **a**
  = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **b**
  = Number of the phase to be executed.

  **NOTE:** The phase will not be executed until subsequent messages from EX:PAUSE, EX:LOOP, EX:STEP, and EX:STOP are input.

4. **SYSTEM RESPONSE**

- **PF**
  = Printout follows. Followed by the EX:DCI output message.

- **RL**
  = Retry later. The system is in an overload condition.

- **?I**
  = General syntax error, followed by the parameter position and one of the following reasons:
  
  EXTRA KEYWORD = Duplicate or extraneous keywords were input.  
  INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.  
  MISSING KEYWORD = A required keyword is missing from the input.

- **?D**
  = General syntax error in the data field, followed by the parameter position and one of the following reasons:
  
  EXTRA KEYWORD = Duplicate or extraneous keywords were input.  
  INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.  
  MISSING DATA = Data required for the statement keyword was not found on the input line.  
  MISSING KEYWORD = A required keyword is missing from the input.
RANGE ERROR = Not a valid value for the statement parameter.

?E = Input error of undetermined type.

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Interactively diagnoses (exercises) a SLC® 96 digital carrier line unit (DCLU). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the DCLU. Format 2 executes a portion of a previously activated diagnostic program. Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program. Format 4 resets the diagnostic’s options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures. To stop this exercise, use the STP:DCLU input message. The unit will remain out of service.

2. FORMAT

[1] `EX:DCLU=a-b-c,START[,GROW];`

[2] `EX:DCLU=a-b-c,PH=d[-e[&&f]][,UCL][,RAW][,SYNCH=g-h-i][,RPT=[j]] [,TLP];`

[3] `EX:DCLU=a-b-c;`

[4] `EX:DCLU(a,b,c),STEP=k[,UCL][,RAW][,SYNCH=(g,h,i)][,TLP];`

[5] `EX:DCLU=a-b-c,PAUSE=l-m;`

3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.
- **RAW** = Print data from raw data test failure.
- **TLP** = Print the ordered pack list.
- **UCL** = Execute unconditionally.
- **a** = Switching module (SM) number.
- **b** = DCLU number.
- **c** = Service group number.
- **d** = The phase that has the segment(s) to be executed.
- **e** = The segment or upper limit of a range of segments in phase ‘d’ to be executed.
- **f** = Lower limit of a range of segments in phase ‘d’ to be executed.
- **g** = The phase that has statement ‘i’ and segment ‘h’ (SM units only).
h = The segment that has statement 'i' (SM units only).
i = The statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
j = Number of times the exercise is to be repeated. Default is 32,767.
k = The number of segments to be executed, beginning from the current point of suspension.
l = The phase at which suspension of diagnostic execution is desired.
m = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. Followed by the EX:DCLU output message.

5. REFERENCES

Output Message(s):

EX:DISTPT
EX:DLI

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the dual link interface (DLI) be exercised in a switching module (SM) on the specified office network and timing complex (ONTC) side in an interactive mode.

Format 1 activates the interactive diagnostic program.

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. The number of segments is given by the STEP parameter.

Format 3 causes a previously activated diagnostic program to suspend immediately, rather than completing the previous input message (valid after a input message of Format 2 or 5).

Format 4 resets the diagnostic options and resumes executing the previously activated diagnostic program from the current point of suspension. This format is used to restart the exercise after suspending it using Format 3.

Format 5 executes the requested phase or phases of a previously activated diagnostic program.

Format 6 transfers control from the current point of suspension to the beginning of the specified phase and segment of a previously activated diagnostic program, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.

NOTE: Use the STP:DLI message to terminate the exercise.

2. FORMAT

[1] EX:DLI=a-b,START[,GROW];
[2] EX:DLI=a-b[,UCL][,RAW],STEP=c[,TLP][,SYNCH=j-k-l];
[3] EX:DLI=a-b;
[4] EX:DLI=a-b[,UCL][,RAW][,RPT=[d]][,TLP];
[5] EX:DLI=a-b[,UCL][,RAW][,RPT=[d]],PH=e-f&g[,TLP];
[6] EX:DLI=a-b,PAUSE=h-i;

3. EXPLANATION OF MESSAGE

GROW = If an SM is in the growth or special growth equipage state, this option must be input for an exercise to be run on that dual link interface (DLI).

RAW = Print the raw test results for each phase executed.

TLP = Execute the trouble location procedure at the conclusion of the exercise. This process prints an ordered suspect pack list if a test fails.

UCL = Unconditionally print all test results rather than just printing the first failing phase.
a = SM number.
b = Office network and timing complex (ONTC) side.
c = Number of segments to be executed, beginning at the current point of suspension.
d = Number of times the test is to be repeated (default is 32,767).
e = Number of the phase to be executed.
f = Lower limit of a range of segment numbers.
g = Upper limit of a range of segments to be executed in the phase.
h = Number of the phase at which suspension of diagnostic execution is desired.
i = Number of the segment of phase at which suspension of diagnostic execution is desired.
j = The number of the phase that has statement 'g' and segment 'f'.
k = The number of the segment that has statement 'g'.
l = The number of the statement at the beginning of which a synchronizing pulse is to be generated.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by one or more DGN:DLI message(s).

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full.

Output Message(s):
ANALY: TLPFILE
DGN: DUIC
EX: DUIC
**EX:EAN**

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Interactively diagnoses (exercises) the equipment access network (EAN). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the EAN.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:EAN. The unit will remain out of service.

2. **FORMAT**

   [1]  \( \text{EX:EAN=a-b,START[,GROW]}; \)

   [2]  \( \text{EX:EAN=a-b[,UCL][,RAW][,SYNCH=h-i-j][,STEP=f[,TLP]];} \)

   [3]  \( \text{EX:EAN=a-b;} \)

   [4]  \( \text{EX:EAN=a-b[,UCL][,RAW][,SYNCH=h-i-j][,RPT=[g]],PH=k-l[,TLP];} \)

   [5]  \( \text{EX:EAN=a-b,PAUSE=m-n;} \)

3. **EXPLANATION OF MESSAGE**

   - **GROW** = Allow access to growth equipment.
   - **RAW** = Print raw test failure data.
   - **TLP** = Print ordered pack list.
   - **UCL** = Execute unconditionally.
   - **a** = Switching module (SM) number.
   - **b** = Directly connected test unit number in the SM.
   - **f** = The number of segments to be executed, beginning from the current point of suspension.
   - **g** = Number of times the test is to be repeated. Default=32,767.
\[ h = \text{The number of the phase that has statement 'j' and segment 'i'.} \]
\[ i = \text{The number of the segment that has statement 'j'.} \]
\[ j = \text{The number of the statement at the beginning of which a synchronizing pulse is to be generated.} \]
\[ k = \text{The number of the phase of the segment(s) to be executed.} \]
\[ l = \text{The number of the segment or range of segments in phase 'k' to be executed.} \]
\[ m = \text{The number of the phase at which suspension of diagnostic execution is desired.} \]
\[ n = \text{The number of the segment number at which suspension of diagnostic execution is desired.} \]

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:EAN output message.

5. REFERENCES

Input Message(s):

STP:EAN

Output Message(s):

EX:EAN
EX:FPC

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the foundation peripheral controller (FPC) be exercised in an interactive mode. This message is used primarily for manual troubleshooting.

Format 1 activates the interactive diagnostic program.

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. The number of segments is given by the STEP parameter.

Format 3 executes the requested phase and segment or range of segments of a previously activated diagnostic program.

Format 4 causes a previously activated diagnostic program to suspend immediately, rather than completing the previous message (valid after using either Format 2 or 3).

Format 5 resets the diagnostic options and resumes executing the previously activated diagnostic program from the current point of suspension. This format is used to restart the exercise after suspending it using Format 4.

Format 6 transfers control from the current point of suspension to the beginning of the specified phase and segment of a previously activated diagnostic program, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.

Note 1: Use the STP:FPC message to terminate the exercise. Also, execute Format 1 first before attempting to use any of the other formats.

Note 2: This command is not applicable to offices having CM3 vintage communication modules.

2. FORMAT

[1] EX:FPC=a,START;

[2] EX:FPC=a[,UCL][,RAW],STEP=b[,TLP];

[3] EX:FPC=a[,UCL][,RAW][,RPT=[c]],PH=d-e[&amp;&amp;f][,TLP];

[4] EX:FPC=a;

[5] EX:FPC=a[,UCL][,RAW][,RPT=[c]][,TLP];

[6] EX:FPC=a,PAUSE=g-h;

3. EXPLANATION OF MESSAGE

RAW = Print raw test failure data.

TLP = Print the ordered suspected pack list if a test fails.

UCL = Print all test results unconditionally rather than just printing the first failing test.
a = FPC side (0 or 1).
b = The number of segments to be executed, beginning from the current point of suspension. Ignore all specified RPT options.
c = Number of times the exercise is to be repeated (default is 32,767). Ignore if the STEP option is specified.
d = The number of the phase to be executed.
e = The number of the segment in phase 'd' to be executed, or the lower limit in a range of segments.
f = Upper limit in a range of segments to be executed in phase 'd'.
g = The phase number at which suspension of the diagnostic execution is desired.
h = The segment of phase 'g' at which suspension of the diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.
PF = Printout follows. Followed by the EX:FPC output message.
RL = Retry later. The request cannot be executed now.

Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Interactively diagnoses the global digital services function (GDSF) circuit. This message is used primarily for manual troubleshooting. Technical support may be required to determine the phases, segments, or statements to be used for this input message. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

Format 1 activates a diagnostic program on the GDSF board. Format 2 executes a portion of a previously activated diagnostic program. Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program. Format 4 resets the diagnostic option and begin executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures. To stop this exercise, use input message STP:GDSF. The unit will remain out of service.

2. FORMAT

[1] EX:GDSF=a-b,START[,GROW];
[2] EX:GDSF=a-b,PH=h-i[,UCL][,RAW][,SYNCH=e-f-g][,RPT[=d]][,TLP];

[4] EX:GDSF=a-b,STEP=c[,UCL][,RAW][,SYNCH=e-f-g][,TLP];
[5] EX:GDSF=a-b,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
UCL = Execute unconditionally. DGN will continue past all non-fatal failures.
a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = GDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = The number of segments to be executed, beginning from the current point of suspension.
d = Number of times the test is to be repeated. (default is 32,767).
e = The number of the phase that has statement ’g’ and segment ’f’ (SM units only).
f = The number of the segment that has statement ’g’ (SM units only).
g = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).

h = The phase of the segment(s) to be executed.

i = The segment or range of segments in phase ‘h’ to be executed.

j = The number of the phase at which suspension of diagnostic execution is desired.

k = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:GDSF output message.

STP:DMQ

Output Message(s):
EX:IDCU
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that an integrated digital carrier unit (IDCU) service group circuit be interactively diagnosed. This message is used primarily for manual troubleshooting. To stop any of these exercises, use the input message STP:IDCU. The unit will remain in the out-of-service (OOS) state.

Format 1 must be entered before entering other format requests.

Format 2 resets the diagnostic options and begins executing a portion of a previously-activated diagnostic program until the specified number of segments have been performed.

Format 3 inverts the state (from "running" to "suspended" or vice-versa) of the previously-activated diagnostic program.

Format 4 executes a portion of the previously-activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously-activated diagnostic program, ignoring interim test failures.

2. FORMAT

[1] EX:IDCU=a-b-c,START[,GROW];
[2] EX:IDCU=a-b-c[,UCL][,RAW][,SYNCH=d-e-f],STEP=g[,TLP];
[3] EX:IDCU=a-b-c;
[4] EX:IDCU=a-b-c[,UCL][,RAW][,SYNCH=d-e-f][,RPT[=h]],PH=i-j[,TLP];
[5] EX:IDCU=a-b-c,PAUSE=k-l;

3. EXPLANATION OF MESSAGE

GROW = Allow diagnostic access to growth equipment.

RAW = Print raw test failure data.

TLP = Trouble location procedure. Print the ordered pack list.

UCL = Unconditionally execute and print all test failures.

a = Switching module number.

b = IDCU number.

c = IDCU service group number.

d = The phase that has segment ‘e’ and statement ‘f’.

e = The segment that has the ‘f’ statement.
f = The statement at the beginning of which a synchronizing pulse is to be generated.
g = The number of segments to execute beginning from the current point of suspension.
h = Number of times the test is to be repeated (RPT). Default is 32,767 times.
i = The number of the phase of the segments to be executed.
j = The segment number or range of segments in phase 'j' to be executed.
k = The phase at which suspension of diagnostic execution is desired.
l = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EX:IDCU output message.
NG = No good. The request has been denied. The message is valid but the request conflicts with current status.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

Application: 5,3B
Type: Input

1. PURPOSE

2. FORMAT

EX:IOP=a[:[RAW][,UCL]],PH=b[,TLP][,CU=c];

3. EXPLANATION OF MESSAGE

RAW = Prints all the diagnostic failures. Default is the first five failures.

TLP = Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

UCL = Executes unconditionally.

NOTE: This option does not override forced early terminations.

a = Member number.

b = Number of the phase to be executed.

NOTE: The phase will not be executed until subsequent messages from the EX:LOOP EX:PAUSE, EX:STEP and EX:STOP input messages are input.

c = Member number of the CU helper unit. When a helper unit is not required, the specified helper unit is not used. When a helper unit is required but the specified unit is inappropriate or unavailable, the helper unit dependent tests are skipped. The off-line CU is required as a helper unit when demand phase 15 is executed.

NOTE: The helper CU must be out-of-service (OOS) and must be diagnosed as all tests pass (ATP) before it is used as a helper unit.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EX:IOP output message.

[4] EX:ISLUCC=a-b-c;

[5] EX:ISLUCC=a-b-c,PAUSE=h-i;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print data from raw data test failure.

TLP = Print the ordered pack list.

UCL = Execute and print all test failures unconditionally rather than stopping after the first test failure.

a = Switching module (SM) number.

b = Integrated services line unit (ISLU) number.

c = Common controller number.
d = The number of the phase (PH) that has the segment(s) to be executed.
e = The segment number or lower limit of a range of segment numbers in phase 'd' to be executed.
f = The upper limit of a range of segment numbers.
g = The number of the segments to be executed, beginning from the current point of suspension.
h = The number of the phase at which suspension of diagnostic execution is desired.
i = The number of the segment at which suspension of diagnostic execution is desired.
j = The number of times the exercise is to be repeated (1-32676). If 'j' is not specified, the exercise will be repeated 32,767 times.
k = The number of the phase that has statement 'm' and segment 'l'.
l = The segment number that has statement 'm'.
m = The statement at the beginning of which a synchronizing pulse is to be generated.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.
PF = Printout follows. Followed by the EX ISLUCC output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

Input Message(s):

STP:ISLUMAN

Output Message(s):

EX:ISLUMAN
EX:ISLURG

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Interactively diagnoses the integrated services line unit ringing generator (ISLURG). This message is used primarily for manual troubleshooting.

Format 1 must be entered before entering other format requests.

Format 1 activates a diagnostic program on the ISLURG.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice-versa) of the previously activated diagnostic program.

Format 4 executes a portion of the previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

NOTE: To stop any of these exercises, use the STP:ISLURG input message. The unit will remain out-of-service (OOS) after the stop input message completes.

2. FORMAT

[1] EX:ISLURG=a-b-c,START[,GROW];

[2] EX:ISLURG=a-b-c[,UCL][,RAW][,SYNCH=d-e-f],STEP=g[,TLP];

[3] EX:ISLURG=a-b-c;

[4] EX:ISLURG=a-b-c[,UCL][,RAW][,SYNCH=d-e-f][,RPT[=g]],PH=h-i[,TLP];

[5] EX:ISLURG=a-b-c,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

GROW = Allow diagnostic access to growth equip.

RAW = Print raw test failure data.

TLP = Print the ordered pack list.

UCL = Execute unconditionally and print all test failures.

a = Switching module (SM) number.

b = ISLU number.

c = ISLU service group.
\(d\) = The number of the phase that has statement 'e' and segment 'f'.
\(e\) = The number of the segment that has the 't' statement.
\(f\) = The number of the statement at the beginning of which a synchronizing pulse is to be generated.
\(g\) = The number of segments to be executed beginning from the current point of suspension.
\(h\) = The number of the phase of the segments to be executed.
\(i\) = The number of the segment or range of segments in phase 'i' to be executed.
\(j\) = The number of the phase at which suspension of diagnostics execution is desired.
\(k\) = The segment number at which suspension of diagnostics execution is desired.

4. SYSTEM RESPONSE

\(PF\) = Printout follows. Followed by the EX:ISLURG output message.
\(NG\) = No good. The request has been denied. The message is valid but the request conflicts with the current status.
\(RL\) = Retry later. The request cannot be executed now due to unavailable system resources.

Output Message(s):

\texttt{EX:ISLURG}
EX:ISTF

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Interactively diagnoses the integrated services test function (ISTF) unit. This message is used primarily for manual troubleshooting. The exercise is only performed once unless the RPT option is specified.

Format 1 activates a diagnostic program on the ISTF unit.

Format 2 executes a portion of a previously activated diagnostic program.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 resets the diagnostic option and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop the exercise, use the "STP:EX,ISTF" form of the STP:ISTF input message. The unit will remain out of service.

2. FORMAT

[1] EX:ISTF=a-b,START[,GROW];
[2] EX:ISTF=a=b,PH=h-i[,UCL][,RAW][,SYNCH=e-f-g][,RPT=[d]][,TLP];
[3] EX:ISTF=a-b;
[4] EX:ISTF=a-b,STEP=c[,UCL][,RAW][,SYNCH=e-f-g][,TLP];
[5] EX:ISTF=a-b,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print the order pack list.
UCL = Execute unconditionally. DGN will continue past all non-fatal failures.
a = Switching module (SM) number.
b = ISTF unit number.
c = The number of segments to be executed, beginning from the current point of suspension.
d = The number of times the test is to be repeated. If ‘d’ is not specified, the test will be repeated...
32,767 times.

e = The number of the phase that has statement 'g' and segment 'f' (SM units only).
f = The number of the segment that has statement 'g' (SM units only).
g = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
h = The number of the phase of the segment(s) to be executed.
i = The segment or range of segments in phase 'h' to be executed.
j = The number of the phase at which suspension of diagnostic execution is desired.
k = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the EX:ISTF output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.
NG = No good. The request has been denied because it conflicts with current equipment status.
- UNIT DOES NOT EXIST = No good. The requested unit does not exist in the system.
- SM DOES NOT EXIST = No good. The requested SM does not exist in the system.
- UNEQUIPPED = No good. The SM specified in the request is unequipped.

Input Message(s):

STP:ISTF

Output Message(s):

EX:ISTF
EX:LDPARM

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests to execute the main store (MAS) diagnostic phase with user-supplied address range, refresh rate, number of failures to be collected, data pattern (phase 95), words per array to copy (phase 96), and refresh parity check time (phase 96). This message can only be used with MAS diagnostic phase 95 or 96.

NOTE: To use this input message, first invoke the interactive diagnostics. For example:

EX:CU=a,MASC b:ph c;

2. FORMAT

EX:LDPARM:CU=a,MASC=b[,SA=h][,EA=i][,REF=j][,FNUM=k][,PAT=l][,WPA=m][,TIME=n];

3. EXPLANATION OF MESSAGE

a = Member number.
b = Member number of the main store controller (MASC) beneath the CU.
c = Executes the specified phase.
h = Starting address for the main store exercise, in hexadecimal notation. Default=0.
i = End address for the MAS exercise, in hexadecimal notation. Default=all equipped memory in controller under test.
j = Memory refresh rate used in the MAS exercise, in decimal notation. Default = 4 ms. Possible values are 2, 4, 6, 8, 10, 12, 14, 16, 32, 36, 40, 44, 48, 52, 56, or 60 ms. Memory devices are guaranteed to work at a refresh rate of 4 ms or less when the memory device case temperature is between 0 degrees C and 85 degrees C.
k = Number of failures for which data is to be collected. Default = 100.
l = 32 bit data pattern used in the MAS exercise (phase 95), in hexadecimal notation. Default=0xffffffff.
m = Number of words per memory array to copy from the on-line CU, in hexadecimal notation (phase 96). Default= all words in each array.
n = Duration of time, in seconds, for which refresh data parity checks should be run to scan for errors in the MASC under test (phase 96). Default=34 seconds for TN14 MASAs, 68 seconds for TN28, TN56, TN2012 MASAs, 136 seconds for TN56 MASAs with either extended main memory (EMM) or very large main memory (VLMM) features, 136 seconds for TN2012 MASAs with EMM feature, or 272 seconds for TN2012 MASAs with VLMM feature.
4. SYSTEM RESPONSE

PF  = Printout follows. Followed by the EX:LDPARM output message.

RL  = Retry later. The system is in an overload condition.

1. PURPOSE

Interactively diagnoses the local digital service function (LDSF) circuit. This message is used primarily for manual troubleshooting.

Format 1 activates a diagnostic program on the LDSF board.

Format 2 executes a portion of a previously activated diagnostic program.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 resets the diagnostic option and begin executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:LDSF. The unit will remain out of service.

2. FORMAT

[1] EX:LDSF=a-b,START[,GROW];

[2] EX:LDSF=a-b,PH=h-i[,UCL][,RAW][,SYNCH=e-f-g][,RPT=[d]][,TLP];

[3] EX:LDSF=a-b;

[4] EX:LDSF=a-b,STEP=c[,UCL][,RAW][,SYNCH=e-f-g][,TLP];

[5] EX:LDSF=a-b,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

**GROW**  
= Allow access to growth equipment.

**RAW**  
= Print raw test failure data.

**UCL**  
= Execute unconditionally. DGN will continue past all non-fatal failures.

**a**  
= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**b**  
= LDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**c**  
= The number of segments to be executed, beginning from the current point of suspension.

**d**  
= Number of times the test is to be repeated. (default is 32,767).

**e**  
= The number of the phase that has statement 'g' and segment 't' (SM units only).
f = The number of the segment that has statement ‘g’ (SM units only).

g = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).

h = The phase of the segment(s) to be executed.

i = The segment or range of segments in phase ‘h’ to be executed.

j = The number of the phase at which suspension of diagnostic execution is desired.

k = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

EX:LI

**Software Release:** 5E14 and later  
**Command Group:**  
**Application:** 5  
**Type:** Input

### 1. PURPOSE

Requests that the link interface (LI) be exercised in an interactive mode. This message is used primarily for manual troubleshooting.

Format 1 activates the interactive diagnostic program.

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. The number of segments is given by the STEP parameter.

Format 3 executes the requested phase and segment or range of segments of a previously activated diagnostic program.

Format 4 causes a previously activated diagnostic program to suspend immediately, rather than completing the previous message (valid after using either Format 2 or 3).

Format 5 resets the diagnostic options and resumes executing the previously activated diagnostic program from the current point of suspension. This format is used to restart the exercise after suspending it using Format 4.

Format 6 transfers control from the current point of suspension to the beginning of the specified phase and segment of a previously activated diagnostic program, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.

**NOTE:** Use the STP:LI message to terminate the exercise. Also, execute Format 1 first before attempting to use any of the other formats.

### 2. FORMAT

1. `EX:LI=a,START[,HELPER=b];`
2. `EX:LI=a[,UCL][,RAW],STEP=c[,TLP];`
3. `EX:LI=a[,UCL][,RAW][,RPT=d][,RPT=f&g][,TLP];`
4. `EX:LI=a;`
5. `EX:LI=a[,UCL][,RAW][,RPT=d][,TLP];`
6. `EX:LI=a,PAUSE=h-i;`

### 3. EXPLANATION OF MESSAGE

- **RAW** = Print raw test failure data.  
- **TLP** = Print the ordered suspected pack list if a test fails.  
- **UCL** = Print all test results unconditionally rather than just printing the first failing test.  
- **a** = LI side.
b = Foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. If this option is not input the standby FPC will be used.

c = The number of segments to be executed, beginning from the current point of suspension. Ignore all specified RPT options.

d = Number of times the exercise is to be repeated (default is 32,767). Ignore if STEP option is specified.

e = The number of the phase to be executed.

f = The number of segment in phase 'e' to be executed, or the lower limit in a range of segments.

g = Upper limit in a range of segments to be executed in phase 'e'.

h = The phase number at which suspension of the diagnostic execution is desired.

i = The segment of phase 'h' at which suspension of the diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

PF = Printout follows. Followed by the EX:LI output message.

RL = Retry later. The request cannot be executed now.

235-105-210 Routine Operations and Maintenance
EX:LN

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests the exercise of a link node (LN) in an interactive diagnostic mode. Refer to the EX:LOOP, EX:PAUSE, EX:STEP and EX:STOP input messages in the Input Messages manual.

Four sequential system actions are performed in response to this input message.

A = The LN is removed from service following the rules for the RMV:LN input message.

B = If the resultant LN major state is out-of-service (OOS), growth (GROW), offline (OFL), or unavailable (UNAV), an attempt is made to isolate the LN. For other major states the diagnostic is aborted by the diagnostic monitor (DIAMON).

C = The specified diagnostic phases are run.

D = If the LN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), then at the conclusion of the diagnostic execution an attempt is made to include the LN back into the active ring. Otherwise the node is left in its original ring configuration state. The LN remains in the OOS, GROW, OFL, or UNAV state.

2. FORMAT

EX:LNa=b:PH=c;

3. EXPLANATION OF MESSAGE

a = Ring node (RN) group number.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Phase number.

NOTE: The phase will not be executed until subsequent messages from the EX:LOOP, EX:PAUSE, EX:STEP and EX:STOP input messages are input.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EX:LN output message.

Type: Input

1. PURPOSE

Interactively diagnoses the line unit high level service circuit (LUHLSC). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the LUHLSC.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use the STP:LUHLSC input message. The unit will remain out-of-service (OOS).

2. FORMAT

[1] EX:LUHLSC=a-b-c-d,START[,GROW];

[2] EX:LUHLSC=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i],STEP=e[,TLP];

[4] EX:LUHLSC=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i][,RPT[=f]],PH=j-k[,TLP];

[5] EX:LUHLSC=a-b-c-d,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure data.

TLP = Print ordered pack list.

UCL = Execute unconditionally.

a = Switching module (SM) number.

b = Line unit number in the SM.

c = Service group number.

d = High level service circuit number.

e = The number of segments to be executed, beginning from the current point of suspension.
f = Number of times the test is to be repeated. Default=32,767.
g = Number of the phase that contains statement 'i' and segment 'h' (SM units only).
h = Number of the segment that contains statement 'i' (SM units only).
i = Number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
j = The number of the phase that has the segment(s) to be executed.
k = The number of the segment or range of segments in phase 'j' to be executed.
l = The number of the phase at which suspension of diagnostic execution is desired.
m = The number of the segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF = Printout follows. The request has been accepted. Followed by the EX:LUHLSC output message.

### 1. PURPOSE

Requests interactive diagnostics (exercises) of the metallic access (MA) board. This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the MA board.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:MA. The unit will remain out of service.

### 2. FORMAT

1. `EX:MA=a-b-c-d,START[,GROW];`
2. `EX:MA=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i],STEP=e[,TLP];`
3. `EX:MA=a-b-c-d;`
4. `EX:MA=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i][,RPT=[f]],PH=j-k[,TLP];`
5. `EX:MA=a-b-c-d,PAUSE=l-m;`

### 3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.
- **RAW** = Print raw test failure data.
- **TLP** = Print ordered pack list.
- **UCL** = Execute unconditionally.
- **a** = Switching module (SM) number.
- **b** = Metallic service unit number.
- **c** = Service group number.
- **d** = Board number.
= The number of segments to be executed, beginning from the current point of suspension.

f = Number of times the exercise is to be repeated. Default=32,767.

= The number of the phase that has statement ‘i’ and segment ‘h’ (SM units only).

= The number of the segment that has statement ‘i’ (SM units only).

= The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).

= The number of the phase of the segment(s) to be executed.

= The number of the segment or range of segments in phase ‘j’ to be executed.

= The number of the phase at which suspension of diagnostic execution is desired.

= The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:MA output message.

EX:MI-A

Software Release: 5E14 only
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the message interface (MI) be exercised in an interactive mode. This message is used primarily for manual troubleshooting.

Format 1 activates the interactive diagnostic program.

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. The number of segments is given by the STEP parameter.

Format 3 executes the requested phase and segment or range of segments of a previously activated diagnostic program.

Format 4 causes a previously activated diagnostic program to suspend immediately, rather than completing the previous message (valid after using either Format 2 or 3).

Format 5 resets the diagnostic options and resumes executing the previously activated diagnostic program from the current point of suspension. This format is used to restart the exercise after suspending it using Format 4.

Format 6 transfers control from the current point of suspension to the beginning of the specified phase and segment of a previously activated diagnostic program, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.

NOTE: Use the STP:MI message to terminate the exercise. Also, execute Format 1 first before attempting to use any of the other formats.

2. FORMAT

[1] EX:MI=a,START[,HELPER=b];
[2] EX:MI=a[,UCL][,RAW],STEP=c[,TLP];
[3] EX:MI=a[,UCL][,RAW][,RPT[=d]],PH=e-f&&g[,TLP];
[4] EX:MI=a;
[5] EX:MI=a[,UCL][,RAW][,RPT[=d]][,TLP];
[6] EX:MI=a,PAUSE=h-i;

3. EXPLANATION OF MESSAGE

RAW = Print raw test failure data.
TLP = Print the ordered suspected pack list if a test fails.
UCL = Print all test results unconditionally rather than just printing the first failing test.
a = MI side.
b = Foundation peripheral controller (FPC) side to be used as a 'helper' unit for the diagnostic. If this option is not input the standby FPC will be used.

c = The number of segments to be executed, beginning from the current point of suspension. Ignore all specified RPT options.

d = Number of times the exercise is to be repeated (default is 32,767). Ignore if STEP option is specified.

e = The number of the phase to be executed.

f = The number of segment in phase 'e' to be executed, or the lower limit in a range of segments.

g = Upper limit in a range of segments to be executed in phase 'e'.

h = The phase number at which suspension of the diagnostic execution is desired.

i = The segment of phase 'h' at which suspension of the diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

PF = Printout follows. Followed by the EX:MI output message.

RL = Retry later. The request cannot be executed now.

EX:MT
```
1. PURPOSE

Requests interactive diagnostics (exercises) of the metallic access test bus (MTB). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the MTB.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:MTB. The unit will remain out of service.

2. FORMAT

[1] EX:MTB=a-b-c-d-n,START[,GROW];
[2] EX:MTB=a-b-c-d-n[,UCL][,RAW][,SYNCH=g-h-i],[STEP=e[,TLP];
[3] EX:MTB=a-b-c-d-n;
[4] EX:MTB=a-b-c-d-n[,UCL][,RAW][,SYNCH=g-h-i],[RPT=[f]],PH=j-k[,TLP];
[5] EX:MTB=a-b-c-d-n,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print ordered pack list.
UCL = Execute unconditionally.
a = Switching module (SM) number.
b = Metallic service unit number.
c = Service group number.
d = Board number.
e = The number of segments to be executed, beginning from the current point of suspension.
f = Number of times the exercise is to be repeated. Default=32,767.
g = The number of the phase that has statement ‘i’ and segment ‘h’ (SM units only).
h = The number of the segment that has statement ‘i’ (SM units only).
i = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
j = The number of the phase of the segment(s) to be executed.
k = The number of the segment or range of segments in phase ‘j’ to be executed.
l = The number of the phase at which suspension of diagnostic execution is desired.
m = The segment number at which suspension of diagnostic execution is desired.
n = MTB number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:MTB output message.

1. PURPOSE

2. FORMAT

EX:MTC=a::[RAW],UCL],PH=b[,TLP][,MT=c];

3. EXPLANATION OF MESSAGE

RAW
= Print all the diagnostic failures. Default is to print the first five failures.

TLP
= Executes the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

NOTE: It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

UCL
= Execute unconditionally.

NOTE: This option does not override forced early terminations.

a
= Member number.

NOTE: The phase will not be executed until subsequent messages from the EX:LOOP, EX:PAUSE, EX:STEP and EX:STOP input messages are input.

b
= Number of the phase to be executed.

NOTE: The phase will not be executed until subsequent messages from the EX:LOOP, EX:PAUSE, EX:STEP and EX:STOP input messages are input.

c
= Member number of the magnetic tape device that is to be used as a helper unit. When a helper unit is not required, the specified helper unit is ignored. When a helper unit is required but the specified helper unit is inappropriate or unavailable, the helper unit dependent tests are skipped.

4. SYSTEM RESPONSE

PF
= Printout follows. Followed by the EX:MTC output message.

1. PURPOSE  
Requests that the network clock (NC) be exercised in an interactive mode. This message is used primarily for manual troubleshooting.  

Format 1 activates the interactive diagnostic program.  

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. The number of segments is given by the STEP parameter.  

Format 3 executes the requested phase and segment or range of segments of a previously activated diagnostic program.  

Format 4 causes a previously activated diagnostic program to suspend immediately, rather than completing the previous message (valid after using either Format 2 or 3).  

Format 5 resets the diagnostic options and resumes executing the previously activated diagnostic program from the current point of suspension. This format is used to restart the exercise after suspending it using Format 4.  

Format 6 transfers control from the current point of suspension to the beginning of the specified phase and segment of a previously activated diagnostic program, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.  

NOTE: Use the STP:NC message to terminate the exercise. Also, execute Format 1 first before attempting to use any of the other formats.  

2. FORMAT  

[1] EX:NC=a,START[,HELPER=b];

[6] EX:NC=a,PAUSE=h-i;  

3. EXPLANATION OF MESSAGE  

RAW  = Print raw test failure data.  
TLP  = Print the ordered suspected pack list if a test fails.  
UCL  = Print all test results unconditionally rather than just printing the first failing test.  
a  = NC side.
b = Foundation peripheral controller (FPC) side (0 or 1) to be used as a 'helper' unit for the diagnostic. If this option is not input the standby FPC will be used.

c = The number of segments to be executed, beginning from the current point of suspension. Ignore all specified RPT options.

d = Number of times the exercise is to be repeated (default is 32,767). Ignore if STEP option is specified.

e = The number of the phase to be executed.

f = The number of segment in phase 'e' to be executed, or the lower limit in a range of segments.

g = Upper limit in a range of segments to be executed in phase 'e'.

h = The phase number at which suspension of the diagnostic execution is desired.

i = The segment of phase 'h' at which suspension of the diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.

PF = Printout follows. Followed by the EX:NC output message.

RL = Retry later. The request cannot be executed now.

Input Appendix(es):

APP:CM-IM-REASON
EX:NLI

**Software Release:** 5E14 and later  
**Command Group:** CM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Requests that the network link interface (NLI) be exercised in a switching module (SM) on the specified office network and timing complex (ONTC) side.

**NOTE:** If the unit is not out-of-service (OOS), the system first removes the unit conditionally.

Format 1 activates a diagnostic program on the NLI.

Format 2 resets the diagnostics options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts (toggles) the state of a previously activated diagnostic program from "running" to "suspended" or vice versa.

Format 4 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures. It then executes the specified segment or segment range according to the specified options.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

**NOTE:** To stop any of these exercises, use the STP:NLI input message.

2. FORMAT

[1] EX:NLI=a-b-c,START[,GROW];  
[2] EX:NLI=a-b-c[,UCL][,RAW],STEP=d[,TLP][,SYNCH=e-f-g];  
[3] EX:NLI=a-b-c;  
[4] EX:NLI=a-b-c[,UCL][,RAW][,RPT[=h]],PH=i-j[&k][,TLP];  
[5] EX:NLI=a-b-c,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

**GROW** = Interactively diagnose an NLI in the GROW state, or in an SM in the special grow (SGRO) state. If the NLI is GROW or the SM is in the SGRO equipage state, this option must be input to perform the diagnostic.

**RAW** = Print the raw test results for each phase executed.

**RPT** = Repeat the diagnostic segment(s) 'h' times.

**TLP** = Execute the trouble location procedure at the conclusion of the exercise. This process prints an ordered suspect pack list if a test fails.

**UCL** = Unconditionally execute all required tests and print all test failures, rather than printing only the
first failure and stopping.

\(a\) = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(b\) = NLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(c\) = ONTC side number.

\(d\) = Number of segments to be executed, beginning at the current point of suspension.

\(e\) = The number of the phase that has statement 'g' and segment 'f'.

\(f\) = The number of the segment that has statement 'g'.

\(g\) = The number of the statement at the beginning of which a synchronizing pulse is to be generated.

\(h\) = Number of times the diagnostic segment(s) are to be repeated (default is 32,767).

\(i\) = Number of the phase (PH) that has the segment(s) to be executed.

\(j\) = Segment number, or the lower limit of a range of segment numbers, in phase 'i' to be executed.

\(k\) = Upper limit in a range of segment numbers in phase 'i' to be executed.

\(l\) = Number of the phase at which suspension of diagnostic execution is desired.

\(m\) = Number of the segment in phase 'l' at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

\(NG\) = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

\(PF\) = Printout follows. Followed by the EX:NLI output message.

\(RL\) = Retry later. The request cannot be executed now due to unavailable system resources.

EX:OTO

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the office-to-office (OTO) program on analog, integrated SLC®, or integrated digital carrier unit (IDCU) lines be exercised to provide pre-cutover verification of cross-connect wiring and line translations during transfer from an existing in-service office to a 5ESS® switch office. Multiple requests can be handled simultaneously, with the limiting factor being the number of test trunks between the offices.

OTO testing should be performed during low traffic periods to minimize false shorts, busy line blocking, and the possibility of message throttling. To further reduce the possibility of loss of test results due to message throttling, it is strongly recommended that the all tests passed (ATP) option not be used. Refer also to the INH:BREVC input message. The ATP option adds 15 seconds between each line tested to prevent loss due to message throttling. If testing analog lines from a crossbar or 5ESS® switch office, the maximum value of the outpulse timing (OT) option is recommended to allow sufficient delay for detection of traffic busy lines. Enhancements to the short test performed on analog lines provide minimal line unit hardware tests of the tip and ring crosspoints and scan detector circuitry. To avoid test path contention during OTO testing of SLC® or IDCU lines, there should be no loop maintenance testing in progress over the existing office SLC® or IDCU system. When exercising a range of directory numbers (DNs), if the first line translates to a SLC® or IDCU line, any analog lines in the range will be reported as UNTESTABLE. Conversely, if the first line translates to an analog line, any SLC® or IDCU lines in the range will be reported UNTESTABLE. Testing of lines served by IDCU is supported only for TR008 interface remote terminals (RTs). All TR303 interface RT lines encountered will be reported as UNTESTABLE. The office code (OC) option is provided to accommodate the testing of SLC® line equipment number (SLEN) and IDCU line equipment number (ILEN) ranges which span multiple office codes. This option must be used if the in-service switch permits access to only one office code for any given local test desk (LTD) test trunk, or if the route index of the 5ESS® switch OTO trunk is assigned prefix digits to correctly format DNs for outpulsing to the existing office. The OC parameter may be assigned the value ALL to test multiple office codes only for those cases where the aforementioned limitations do not exist. This option is valid for SLEN and ILEN specification only. If this parameter is omitted, the OC of the first assigned line in the SLEN or ILEN range will be assumed for the entire range. Lines assigned office codes different from that assumed for the range or specified with the OC option will be reported as OC-NOT-IN-RANGE. Due to the introduction of Local Number Portability - NPA/NXX feature 5ESS® office will support unique and non-unique office codes (NXX). Multiple NPAs can have same office codes. If the office code is non-unique, then the user has to specify 10 digit DNs including Area Code to correctly specify a DN. But if the office code is unique, then 7 digits are sufficient to correctly represent a DN.

2. FORMAT

EX:OTO=a-b[,NPA=a1],k[,OC={p|ALL}][,OT=q][,CT=r][,DT=s][,DEV=t][,ATP][,GLP][,PP=u][,W C=v];

3. EXPLANATION OF MESSAGE

ALL = Exercise all office codes covered by specified route index.

ATP = All tests passed. Print test results for each line that tests ATP. The default will print only lines that fail. This option is not recommended because it produces a large quantity of listings and therefore increases the possibility that results will be lost due to message throttling. This option also adds 15 seconds between each line tested to prevent loss of output due to message throttling.
GLP = Compare the ground/loop start wiring of the line attending elements in the existing office to the 5ESS® switch translations. (This option does not apply to testing of SLC® or IDCU lines).

a = Numerical code for existing office type. Valid value(s):
  1 = Step-by-step.
  2 = Crossbar equipped with non-no-test-trunk (members of multi-line hunt groups cannot be tested).
  3 = ESS™ office.
  12 = Crossbar equipped with no-test-trunk (members of multi-line hunt groups may be tested only if the 5ESS® switch assigns an individual DN to each member).

b = Route index (RTI) of the OTO trunk group. This number is found in the office record of route indexes or may be re-established by the user.

c = Three-digit office code.

d = Local digits of the first or only line in the DN range.

e = Local digits of the last line in the DN range.

f = Switching module (SM) number.

g = Digital carrier line unit (DCLU) number.

h = Remote terminal (RT) number.

i = RT line number of the first or only line in the SLEN range.

j = RT line number of the last line in the SLEN range.

k = Valid value(s):

| DN=c-d[ee] | SLEN=f-g-h-i[41] | ILEN=f-l-m-n[60] | INEN=f-w-x-y[z2] |

l = Integrated digital carrier unit (IDCU) number.

m = RT number.

n = RT line number of the first or only line in the ILEN range.

o = RT line number of the last line in the ILEN range.

p = Desired three-digit office code if the given SLEN or ILEN range spans multiple office codes and limitations discussed in the Purpose section do not exist.

q = Outpulse timing. Additional delay in increments of 200 milliseconds (ms) to allow the existing office to acknowledge receipt of outpulsed digits and verify that the line is idle. OT delay = 800 + (q*200). If no value is specified, a delay of 800 ms will be used. The valid range for q is 0 (default) to 63, inclusive. When testing analog lines from a crossbar or ESS™ office, the maximum value is recommended to allow detection of traffic busy lines.
r = Cut-through timing (CT). Additional delay in increments of 100 milliseconds to allow the existing office to complete its test connection following transition to low sleeve current. CT delay = 2000 + (r*100). If no value is specified, a delay of 2000 ms will be used. The valid range for r is 0 (default) to 63, inclusive.

s = Disconnect timing (DT). Additional guard timing delay in increments of 200 ms to allow release of trunk resources upon disconnect. DT delay = 1500 + (s*200). If no value is specified, a delay of 1500 ms will be used. The valid range for s is 0 (default) to 9, inclusive.

t = The device to which office to office output should be directed. If not specified, output will be directed to the input device. Output is always printed at the receive-only printer (ROP). For a complete list and explanation of valid device names, refer to the ECD/SG manual.

u = Apply printing priority to the corresponding output messages. A printing priority of 0 is the lowest and a printing priority of 6 is the highest. When the PP option is not used, the output priority defaults to 4 (MANUAL).

Note: Raising the priority of the output messages above 4 may impact the printing of other messages which have a lower priority. Specifying a printing priority of 3 (MINOR), 5 (MAJOR), or 6 (CRITICAL) will set the MCC status indicators and cause the alarms to ring. Using a priority below 3 may result in loss of OTO output, especially during heavy ROP traffic periods.

v = This is a "wild card" used for debugging and implementation of site-specific features. Contact technical support for specific values to assign. The default value is used for standard operation.

w = digital network unit (DNU) number.

x = RT number.

y = RT line number of the first or only line in the INEN range.

z = RT line number of the last line in the INEN range.

a1 = Numbering Plan Area or Area Code of the DN.

4. SYSTEM RESPONSE

PF = Printout follows. Valid value(s):

- REQxx The message is accepted and the OTO test program is activated. The request number is automatically assigned by the OTO test program. Test results will follow in the EX:OTO output message.

RL = Retry later. The request was denied; the office-to-office test program is not in an executable state.

1. PURPOSE

To request to pause or suspend the diagnostic execution at a specified statement number within a diagnostic phase.

NOTE: To use this input message, first invoke the interactive diagnostics. For example: EX:a[,b];ph=c;

2. FORMAT

EX:PAUSE:a[,b],ST=e;

3. EXPLANATION OF MESSAGE

a  = Unit type and member number of the unit on which interactive diagnostics was started. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for valid unit names and member numbers.

b  = Unit type and member number of the subunit beneath the unit name. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual for valid subunit names and member numbers.

c  = Executes the specified phase.

e  = Statement number that is the target of the action. This statement is not executed.

4. SYSTEM RESPONSE

PF  = Printout follows. Followed by the EX:PAUSE output message.

RL  = Retry later. The system is in an overload condition.

?I  = General syntax error followed by the parameter position and one of the following:
    - EXTRA KEYWORD = Duplicate or extraneous keywords were input.
    - INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
    - MISSING KEYWORD = A required keyword is missing from the input.

?D  = General syntax error in the data field followed by the parameter position and one of the following reasons:
    - EXTRA KEYWORD = Duplicate or extraneous keywords were input.
    - INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
    - MISSING DATA = Data required for the statement keyword was not found on the input line.
    - MISSING KEYWORD = A required keyword is missing from the input.
    - RANGE ERROR = Not a valid range for the statement parameter.

?E  = Input error of undetermined type.

EX:PMU

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests interactive diagnostics (exercises) of the precision measurement unit (PMU). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the PMU.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use the STP:PMU input message. The unit will remain out of service.

2. FORMAT

[1] EX:PMU=a-b-c,START[,GROW];
[2] EX:PMU=a-b-c[,UCL][,RAW][,SYNCH=h-i-j][,STEP=f[,TLP];
[3] EX:PMU=a-b-c;
[4] EX:PMU=a-b-c[,UCL][,RAW][,SYNCH=h-i-j][,RPT [=g],PH=k-l[,TLP];
[5] EX:PMU=a-b-c,PAUSE=m-n;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print ordered pack list.
UCL = Execute unconditionally.
a = Switching module (SM) number.
b = Directly connected test unit number in the SM.
c = Circuit number.
f = The number of segments to be executed, beginning from the current point of suspension.
g = Number of times the exercise is to be repeated. Default=32,767.
h = The number of the phase that has statement ‘j’ and segment ‘i’ (SM units only).
i = The number of the segment that has statement ‘j’ (SM units only).
j = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
k = The number of the phase of the segment(s) to be executed.
l = The number of the segment or range of segments in phase ‘k’ to be executed.
m = The number of the phase at which suspension of diagnostic execution is desired.
n = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:PMU output message.

5. REFERENCES

Input Message(s):

STP : PMU

Output Message(s):

EX : PMU
EX:PPC

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests that the pump peripheral controller (PPC) be exercised in an interactive mode. This message is used primarily for manual troubleshooting.

Format 1 activates the interactive diagnostic program.

Format 2 begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. The number of segments is given by the STEP parameter.

Format 3 executes the requested phase and segment or range of segments of a previously activated diagnostic program.

Format 4 causes a previously activated diagnostic program to suspend immediately, rather than completing the previous message (valid after using either Format 2 or 3).

Format 5 resets the diagnostic options and resumes executing the previously activated diagnostic program from the current point of suspension. This format is used to restart the exercise after suspending it using Format 4.

Format 6 transfers control from the current point of suspension to the beginning of the specified phase and segment of a previously activated diagnostic program, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.

Note 1: Use the STP:PPC message to terminate the exercise. Also, execute Format 1; first before attempting to use any of the other formats.

Note 2: This command is not applicable to offices having CM3 vintage communication modules.

2. FORMAT

[1] EX:PPC=a,START;
[2] EX:PPC=a[,UCL][,RAW],STEP=b[,TLP];
[3] EX:PPC=a[,UCL][,RAW][,RPT=c],PH=d-e[&f][,TLP];
[4] EX:PPC=a;
[5] EX:PPC=a[,UCL][,RAW][,RPT=c][,TLP];
[6] EX:PPC=a,PAUSE=g-h;

3. EXPLANATION OF MESSAGE

RAW  = Print raw test failure data.
TLP  = Print the ordered suspected pack list if a test fails.
UCL  = Print all test results unconditionally rather than just printing the first failing test.
a = PPC side.
b = The number of segments to be executed, beginning from the current point of suspension. Ignore all specified RPT options.
c = Number of times exercise is to be repeated (default is 32,767). Ignore if STEP option is specified.
d = The number of the phase to be executed.
e = The number of the segment in phase 'd' to be executed, or the lower limit in a range of segments.
f = Upper limit in range of segments to be executed in phase 'd'.
g = The phase number at which suspension of the diagnostic execution is desired.
h = The segment of phase 'g' at which suspension of the diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed.
PF = Printout follows. Followed by the EX:PPC output message.
RL = Retry later. The request cannot be executed now.

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Exercises the protocol (PROTO) circuit to determine whether it is in satisfactory working order. This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the PROTO. Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed. Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program. Format 4 executes a portion of a previously activated diagnostic program. Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures. To stop this exercise, use the STP:PROTO input message. The unit will remain out-of-service (OOS).

2. FORMAT

[1]  EX:PROTO=a-b-c,START[,GROW];
[2]  EX:PROTO=a-b-c[,RAW][,UCL][,SYNCH=f-g-h],STEP=d[,TLP];
[3]  EX:PROTO=a-b-c;

[5]  EX:PROTO=a-b-c,PAUSE=k-l;

3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.
- **RAW** = Print data from raw data test failure.
- **TLP** = Print ordered pack list.
- **UCL** = Execute unconditionally.
- **a** = Switching module (SM) number.
- **b** = Unit number.
- **c** = Service group number.
- **d** = The number of segments to be executed, beginning from the current point of suspension.
- **e** = The number of times the exercise is to be repeated. Default is 32,767.
- **f** = The number of the phase that has statement ‘i’ and segment ‘h’ (SM units only).
- **g** = The number of the segment that has statement ‘i’ (SM units only).
- **h** = The number of the statement at the beginning of which a synchronous pulse is to be generated.
(SM units only).

\[ i \] = The number of the phase of the segment(s) to be executed.

\[ j \] = The segment or range of segments in phase \( 'j' \) to be executed.

\[ k \] = The number of the phase at which suspension of diagnostic execution is desired.

\[ l \] = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

\[ \text{NG} \] = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

\[ \text{PF} \] = Printout follows. The request was accepted. Followed by the EX:PROTO output message.

**EX:PSUCOM-A**

**Software Release:** 5E14 - 5E15  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Exercises (interactively diagnoses) a packet switch unit (PSU) common controller (COM).

Format 1 activates a diagnostic program on the PSU.

Format 2 executes a portion of a previously activated diagnostic program.

Format 3 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 4 inverts (toggles) the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

**NOTE:** To stop any of these exercises, use the STP:PSU input message.

2. **FORMAT**

1. \[EX:PSUCOM=a-b-c[-d],\text{START}[,\text{SUB}=j][,\text{GROW}];\]

2. \[EX:PSUCOM=a-b-c[-d],\text{PH}=e-f[,\text{RPT}=[k]][,\text{SYNCH}=l-m-n]. . .[,\text{RAW}][,\text{TLP}][,\text{UCL}];\]

3. \[EX:PSUCOM=a-b-c[-d],\text{STEP}=g[,\text{SYNCH}=l-m-n][,\text{RAW}][,\text{TLP}][,\text{UCL}];\]

4. \[EX:PSUCOM=a-b-c[-d];\]

5. \[EX:PSUCOM=a-b-c[-d],\text{PAUSE}=h-i;\]

3. **EXPLANATION OF MESSAGE**

- **GROW** = Allow access to growth equipment.
- **RAW** = Print data from raw data test failure.
- **TLP** = Print the ordered pack list.
- **UCL** = Unconditionally execute and print all test failures rather than stopping after the first test failure.
- **a** = Switching module (SM) number.
- **b** = PSU number.
c = Service group number.

d = Protocol handler number.

e = The number phase (PH) that has the segments to be executed.

f = The number segment or range of segments in phase ‘e’ to be executed.

g = The number of segments to be executed, STEP, beginning from the current point of suspension.

h = The number phase at which suspension, PAUSE, of diagnostic execution is desired.

i = The segment number at which suspension of diagnostic execution is desired.

j = The PSUCOM shelf to be diagnosed (0-5). If SUB is not specified, diagnostics will be performed on all shelves.

k = The number of times the exercise is to be repeated. If ‘k’ is not specified, the test will be repeated 32,767 times.

l = The number of the phase that has statement ‘n’ and segment ‘m’.

m = The number of the segment that has statement ‘n’.

n = The number of the statement at the beginning of which a synchronizing pulse is to be generated.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the EX:PSUCOM output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

1380/1381 (QLPS NETWORK 0/1 STATUS)
EX:QLPS-B

Software Release: 5E15 and later
Command Group: CM
Application: 5
Type: Input

1. PURPOSE

Requests interactive diagnosis of a quad-link packet switch (QLPS). This message is used primarily for manual troubleshooting. Completion of this input message leaves the unit in the out-of-service (OOS) state. This command is not applicable in Communication Module 3 (CM3) office.

Note: If the unit is not OOS, the system will first remove the unit conditionally.

Format 1 activates a diagnostic program on the QLPS.

Format 2 resets the diagnostics options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts (toggles) the state of a previously activated diagnostic program from "running" to "suspended" or vice versa.

Format 4 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures. It then executes the specified segment or segment range according to the specified options.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

Note: To stop any of these exercises, use the STP:QLPS input message.

2. FORMAT

[1] EX:QLPS=a-b,START[,GROW][,HELPER=c];

[2] EX:QLPS=a-b,STEP=d[,UCL][,RAW][,TLP];

[3] EX:QLPS=a-b;

[4] EX:QLPS=a-b,PH=e-f&&g[,UCL][,RAW][,TLP][,RPT[=h]];

[5] EX:QLPS=a-b,PAUSE=i-j;

3. EXPLANATION OF MESSAGE

GROW = Interactively diagnose a QLPS in the GROW state. If the QLPS is GROW, this option must be input to perform the diagnostic. Also allows access to QGPs in the GROW state that are connected
to the QLPS using QGLs.

**TLP**
- Print the ordered pack list.

**RAW**
- Print data from raw data test failure.

**UCL**
- Execute tests unconditionally and print test failures rather than stopping after the first test failure.

- Office network timing and control (ONTC) side number.

- QLPS network number.

- Foundation peripheral controller (FPC) side number to be used as a 'helper' unit for the diagnostic. If this option is not input the standby FPC will be used.

- Number of segments to be executed, beginning from the current point of suspension.

- The number of the phase (PH) that has the segment(s) to be executed.

- Segment number, or the lower limit of a range of segment numbers in phase 'e' to be executed.

- Upper limit of a range of segment numbers in phase 'e' to be executed.

- Number of times the diagnostic segment(s) are to be repeated. Maximum and default is 32767 times.

- The number of the phase at which suspension of diagnostic execution is desired.

- The segment number at which suspension of diagnostic execution is desired.

### 4. SYSTEM RESPONSE

**NG**
- No good. The request has been denied. The message syntax is valid but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

**PF**
- Printout follows. Followed by the EX:QLPS output message.

**RL**
- Retry later. The request cannot be executed now due to unavailable system resources.

1380/1381 (QLPS NETWORK 0/1 STATUS)
EX:RAF

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Interactively diagnoses (exercises) the recorded announcement function (RAF) unit. This message is used primarily for manual troubleshooting. Exercise is only performed once unless the RPT option is specified.

Format 1 activates a diagnostic program on the RAF unit.

Format 2 executes a portion of a previously activated diagnostic program.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 resets the diagnostic option and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use the STP:RAF input message. The unit will remain out-of-service (OOS).

2. FORMAT

[1] EX:RAF=a-b,START[,GROWTH];
[2] EX:RAF=a-b,PH=h-i[,UCL][,RAW][,SYNCH=e-f-g][,RPT [=d]][,TLP];
[3] EX:RAF=a-b;
[4] EX:RAF=a-b,STEP=c[,UCL][,RAW][,SYNCH=e-f-g][,TLP];
[5] EX:RAF=a-b,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

GROWTH = Allow access to growth equipment.
RAW = Print raw test failure data.
TLP = Print the order pack list.
UCL = Execute unconditionally. DGN will continue past all non-fatal failures.
a = Switching module (SM) number.
b = RAF unit number.
c = The number of segments to be executed, beginning from the current point of suspension.
d = Number of times the exercise is to be repeated (default is 32,767).
e = The phase that has statement 'g' and segment 'e' (SM units only).
The segment that has statement ‘g’ (SM units only).

The statement at the beginning of which a synchronizing pulse is to be generated (SM units only).

The phase of the segment(s) to be executed.

The segment or range of segments in phase ‘h’ to be executed.

The phase at which suspension of diagnostic execution is desired.

The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
   - SM DOES NOT EXIST = The requested SM does not exist in the system.
   - SM UNEQUIPPED = The SM specified in the request is unequipped.
   - UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by the EX:RAF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

Input Message(s):

STP:RAF

Output Message(s):

EX:RAF
EX:RAU

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Performs maintenance exercises on the remote switching module (RSM) alarm (RAU) circuit. This message is used for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the RAU.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic from the current point of suspension until the specified number of segments have been run.

Format 3 inverts the state of a previously activated diagnostic from running to suspended or vice versa.

Format 4 executes a portion of a previously activated diagnostic.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic, ignoring interim test failures.

To stop this exercise, use the STP:RAU input message. The circuit will remain out of service.

2. FORMAT

```
[1]  EX:RAU=a,START[,GROW];
[2]  EX:RAU=a[,UCL][,RAW][,SYNCH=d-e-f][,STEP=b[,TLP]);
[3]  EX:RAU=a;
[4]  EX:RAU=a[,UCL][,RAW][,SYNCH=d-e-f][,RPT[=c]][,PH=g-h[,TLP]);
[5]  EX:RAU=a,PAUSE=i-j;
```

3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.
- **RAW** = Print raw test failure data.
- **TLP** = Print ordered circuit pack list.
- **UCL** = Execute unconditionally.
- **a** = Switching module (SM) number.
- **b** = The number of segments to be executed, beginning from the current point of suspension.
- **c** = The number of times the exercise is to be repeated. Default is 32,767.
- **d** = Number of phase that has statement 'e' and segment 'f'.
- **e** = Segment in phase 'd' that has statement 'f'.
f = Statement in segment 'e' of phase 'd'; at the beginning of this statement a synchronizing pulse is to be generated.

g = Phase that has the segment(s) to be executed.

h = Number of the segment or range of segments in phase 'g' to be executed.

i = Number of the phase in which suspension of diagnostic execution is desired.

j = Segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. Request denied because of a conflict with current status.

PF = Printout follows. Followed by the EX:RAU output message.

5. REFERENCES

Input Message(s):

STP:RAU

Output Message(s):

EX:RAU
EX:RCDDP

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that an operation be performed or a status read on a remote common data and control (COMDAC) distribute point. This input message is used for manual trouble-shooting.

2. FORMAT

EX:RCDDP=a-b-c,d;

3. EXPLANATION OF MESSAGE

a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Remote access interface unit (RAIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Distribute point number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = The operation to be performed. Valid value(s):
   CLOSE
   OPEN
   STATUS

4. SYSTEM RESPONSE

PF  = Printout follows. The request has been completed. Followed by the EX:RCDDP output message.

EX:RCDDP

Input Appendix(es):

APP: RANGES
EX:RCLK

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. PURPOSE

Requests that maintenance exercises be performed on the remote clock (RCLK). This message will exercise the following circuits:
- Remote clock (RCLK)
- Remote clock cross couple (RCXC)
- Remote clock oscillator (RCOSC)
- Remote clock oscillator cross couple (RCOXC)
- All the equipped remote clock references (RCREFs)

Format 1 activates a diagnostic on the RCLK.

Format 2 executes a portion of a previously activated diagnostic.

Format 3 resets the diagnostic options and begins executing the previously activated diagnostic from the current point of suspension until the specified number of segments have been run.

Format 4 inverts the state, from running to suspended or vice versa, of a previously activated diagnostic.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic, ignoring interim test failures.

**NOTE:** To stop this exercise, use the STP:RCLK input message. The STP:RCLK message will always leave the circuit out-of-service.

2. FORMAT

1. EX:RCLK=a-b,START[,GROW];
2. EX:RCLK=a-b[,UCL][,RAW][,SYNCH=c-d-e][,RPT=[f]],PH=g-h[,TLP];
3. EX:RCLK=a-b[,UCL][,RAW][,SYNCH=c-d-e],STEP=i[,TLP];
4. EX:RCLK=a-b;
5. EX:RCLK=a-b,PAUSE=j-k;

3. EXPLANATION OF MESSAGE

<table>
<thead>
<tr>
<th>GROW</th>
<th>Allow access to growth equipment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Print raw test failure data.</td>
</tr>
<tr>
<td>TLP</td>
<td>Print ordered circuit pack list.</td>
</tr>
<tr>
<td>UCL</td>
<td>Unconditionally execute and print all test failures. Diagnostic will continue past all non-fatal errors.</td>
</tr>
<tr>
<td>a</td>
<td>Switching module (SM) number.</td>
</tr>
</tbody>
</table>
b  = RCLK side.
cde = Generate a synchronizing pulse at the beginning of statement 'c' in segment 'd' of phase 'e'.
f  = Number of times the exercises to be repeated. Default is 32767.
gh = Execute the specified segments of the phase, where:
        g  = The number of the phase.
        h  = Segment or range of segments in phase 'g' to be executed.
i  = Number of segments to execute, beginning from the current point of suspension.
jk = Phase and segment number at which to suspend the diagnostic.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
    - NOT STARTED UNIT IN GROWTH STATE
    - SM DOES NOT EXIST = The SM specified does not exist in the system.
    - SM UNEQUIPPED = The SM specified is unequipped.
    - UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. Followed by the EX:RCLK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Input Message(s):

STP:RLI

Output Message(s):

EX:RLI
EX:RPCN

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Four sequential system actions are performed in response to this input message.

A  The RPCN is removed from service following the rules for the RMV:RPCN input message.
B  If the resultant RPCN major state is out-of-service (OOS), growth (GROW), offline (OFL), or unavailable (UNAV), an attempt is made to isolate the RPCN. For other major states the diagnostic is aborted by the diagnostic monitor (DIAMON).
C  The specified diagnostic phases are run.
D  If the RPCN was in the active ring before the start of the diagnostics and was successfully isolated (in 2 above), then at the conclusion of the diagnostic execution an attempt is made to include the RPCN back into the active ring. Otherwise the node is left in its original ring configuration state. The RPCN remains in the OOS, GROW, OFL, or UNAV state.

2. FORMAT

EX:RPCNa=0:PH={b|b-c}[,d];

3. EXPLANATION OF MESSAGE

a  = Ring node (RN) group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b  = Single phase to be run or first phase of the range of phases to be run.
c  = Last phase of the range of phases to be run.

NOTE: The phase or phases will not be executed until subsequent input messages from the EX:LOOP, EX:PAUSE, EX:STEP, and EX:STOP input messages are input.

d  = Helper unit to be used with this diagnostic request.

4. SYSTEM RESPONSE

PF  = Printout follows.

APP: RANGES
EX:RRCLK

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Exercises a remote integrated services line unit (RISLU) remote clock circuit pack (RRCLK). This message is used primarily for manual troubleshooting.

Format 1; activates the interactive diagnostic on the RRCLK.

Format 2; executes a portion of a previously activated diagnostic.

Format 3; resets the diagnostics options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments (STEP parameter) has been performed.

Format 4; inverts the state of a previously activated diagnostic from running to suspended or vice versa. This message removes all previous options set.

Format 5; transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic, ignoring interim test failures. When the requested phase and segment are reached, the exercise will pause.

**NOTE:** To stop any of these exercises, use the STP:RRCLK input message. The unit will remain out of service (OOS).

2. **FORMAT**

[1] EX:RRCLK=a-b-c,START[,GROW];

[2] EX:RRCLK=a-b-c,PH=i[-j&k][,UCL][,RAW][,RPT [e]][,TLP];

[3] EX:RRCLK=a-b-c,STEP=d[,UCL][,RAW][,TLP];

[4] EX:RRCLK=a-b-c;

[5] EX:RRCLK=a-b-c,PAUSE=l-m;

3. **EXPLANATION OF MESSAGE**

- **GROW** = Allow access to growth equipment.
- **RAW** = Print raw test failure data.
- **TLP** = Print ordered circuit pack list.
- **UCL** = Execute unconditionally. Diagnostic will continue past all nonfatal errors.
- **a** = Switching module (SM) number.
- **b** = RISLU number (0-7).
- **c** = RRCLK side (0 or 1).
d = The number of segments (STEP) to be executed, beginning from the current point of suspension.

e = Number of times the test is to be repeated. If 'e' is not specified then the test repeats 32,767 times.

i = The number of the phase (PH) to be executed.

j = The first segment in phase 'i' to be executed.

k = Upper limit of a range of segments in phase 'i' to be executed.

l = The phase at which to suspend (PAUSE) the diagnostic.

m = The segment at which to suspend the diagnostic.

4. SYSTEM RESPONSE

NG = No good.
   - NG-CONFLICT WITH UNIT STATE
   - NG-SM DOES NOT EXIST
   - NG-SM UNEQUIPPED
   - NG-UNIT DOES NOT EXIST

PF = Printout follows. Followed by the EX:RRCLK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

[4] EX:RVPT=a-b-c-d,STEP=e[,RAW][,UCL][,SYNCH=g-h-i][,TLP];

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw data from test failure.

TLP = Print trouble locating procedure ordered pack list.

UCL = Print all test failures in the specified segment range.

a = Switching module (SM) number.

b = Unit number.

c = Service group number.

d = Board number.
e = The number of segments to be executed, beginning from the current point of suspension.

f = The number of times the exercises is to be repeated (default is 32,767).

g = The number of the phase in which to generate a synch pulse.

h = The number of the segment in which to generate a synch pulse.

i = The number of the statement at the beginning of which a synchronous pulse is to be generated.

j = The number of the phase of the segment(s) to be executed.

k = The number of the segment or first segment of a range in phase ‘j’ to be executed.

l = The last segment of a range in phase ‘j’ to be executed.

m = The phase at which suspension of diagnostic execution is desired.

n = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. Invalid SM number, metallic service unit (MSU) number, or service group number.

PF = Printout follows. The request was accepted. Followed by the EX:RVPT output message.

1. PURPOSE

Requests interactive diagnostics (exercises) of the scan point board (SCAN). This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the scan point board.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use the STP:SCAN input message. The unit will remain out-of-service (OOS).

2. FORMAT

[1] EX:SCAN=a-b-c-d,START[,GROW];

[2] EX:SCAN=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i],STEP=e[,TLP];

[4] EX:SCAN=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i][,RPT[=f]],PH=j-k[,TLP];

[5] EX:SCAN=a-b-c-d,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure data.

TLP = Print ordered pack list.

UCL = Execute unconditionally.

a = Switching module (SM) number.

b = Metallic service unit number (0 or 1).

c = Service group number (0 or 1).

d = Scan point board number (0-31).

e = The number of segments to be executed, beginning from the current point of suspension.
4. SYSTEM RESPONSE

NG  = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF  = Printout follows. The request has been accepted. Followed by the EX:SCAN output message.

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Interactively diagnoses (exercises) a SLC®96 digital facility interface (SDFI). This message is used primarily for manual troubleshooting.

Format 1; starts a diagnostic exercise program on the SDFI.

Format 2; executes a portion of a previously activated diagnostic program.

Format 3; inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4; resets the diagnostic’s options and executes the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 5; transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:SDFI. The unit will remain out of service.

2. **FORMAT**

   [1]  EX:SDFI=a-b-c,START[,GROW];
   [2]  EX:SDFI=a-b-c,PH=d[-e&f][,UCL][,RAW][,SYNCH=g-h-i] [,RPT[=j]][,TLP];
   [3]  EX:SDFI=a-b-c;
   [4]  EX:SDFI=a-b-c,STEP=k[,UCL][,RAW][,SYNCH=g-h-i][,TLP];
   [5]  EX:SDFI=a-b-c,PAUSE=l-m;

3. **EXPLANATION OF MESSAGE**

   **GROW**  = Allow access to growth equipment.
   **RAW**  = Print data from raw data test failure.
   **TLP**  = Print the ordered pack list.
   **UCL**  = Unconditionally execute.
   **a**  = Switching module (SM) number.
   **b**  = DCLU number (0-7).
   **c**  = SDFI number (0-29).
   **d**  = The number of the phase that has the segment(s) to be executed.
e = The segment number or upper limit of a range of segment numbers in phase ‘d’ to be executed.
f = Lower limit of a range of segment numbers in phase ‘d’ to be executed.
g = The phase that has statement ‘i’ and segment ‘h’ (SM units only).
h = The segment that has statement ‘h’ (SM units only).
i = The statement at the beginning of which a synchronizing pulse is to be generated (SM units only).
j = Number of times the exercise is to be repeated. Default is 32,767.
k = The number of segments to be executed, beginning from the current point of suspension.
l = The number of the phase at which suspension of diagnostic execution is desired.
m = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request was accepted. Followed by the EX:SDFI output message.

APP: RANGES
EX:SLIM

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests interactive diagnostics (exercises) of the subscriber line instrument measurement (SLIM) board. This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the SLIM board. This input message must be run before any of the other EX input message formats can be executed.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use the STP:SLIM input message. The unit will remain out-of-service (OOS).

2. FORMAT

[1]   EX:SLIM=a-b-c-d,START[,GROW];

[2]   EX:SLIM=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i],STEP=e[,TLP];

[4]   EX:SLIM=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i][,RPT [=f]],PH=j-k[,TLP];

[5]   EX:SLIM=a-b-c-d,PAUSE=l-m;

3. EXPLANATION OF MESSAGE

GROW = Allow access to growth equipment.

RAW = Print raw test failure data.

TLP = Print ordered pack list.

UCL = Execute unconditionally.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Metallic service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

d = SLIM board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = The number of segments to be executed, beginning from the current point of suspension.

f = Number of times the exercise is to be repeated. The default is 32,767.

g = The number of the phase that has statement from variable 'i' and segment from variable 'h' (SM units only).

h = The number of the segment that has statement from variable 'i' (SM units only).

i = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).

j = The number of the phase of the segment(s) to be executed.

k = The segment or range of segments in phase from variable 'j' to be executed.

l = The phase at which suspension of diagnostic execution is desired.

m = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. An EX:SLIM output message will follow.

Input Appendix(es):

APP:RANGES
EX:STEP

Software Release: 5E14 and later
Command Group: AM, CCS
Application: 5,3B
Type: Input

1. PURPOSE

Requests to step through the diagnostic input messages and suspend at the specified statement number. It is similar to the EX:PAUSE input message, but in the case of a CU diagnostic, it will also print the input message buffer contents being passed to the diagnostic driver.

NOTE: To use this input message, first invoke the interactive diagnostics. For example: EX:a[,b];ph=c;

2. FORMAT

EX:STEP:a[,b],ST=e;

3. EXPLANATION OF MESSAGE

a = Unit type and member number on which interactive diagnostics was started. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for valid unit names and member numbers.

b = Unit type and member number of the subunit, if any. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual for valid subunit names and member numbers.

c = Executes the specified phase.

e = Statement number that is the target of the action. This statement is not executed.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EX:STEP output message.

RL = Retry later. The system is in an overload condition.

?I = General syntax error followed by the parameter position and one of the following reasons:
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- MISSING KEYWORD = A required keyword is missing from the input.

?D = General syntax error in the data field followed by the parameter and one of the following reasons.
- EXTRA KEYWORD = Duplicate or extraneous keywords were input.
- INVALID KEYWORD = The keyword in the stated parameter position is not a valid keyword.
- MISSING DATA = Data required for the statement keyword was not found on the input line.
- RANGE ERROR = Not a valid range for the statement parameter.

?E = Input error of undetermined type.

### 3. EXPLANATION OF MESSAGE

- **GROW** = Allow access to growth equipment.  
- **RAW** = Print raw test failure data.  
- **TLP** = Print ordered pack list.  
- **UCL** = Execute unconditionally.  

**a** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  

**b** = Global digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  

**c** = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  

**d** = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.  

**e** = The number of segments to be executed, beginning from the current point of suspension.
f = Number of times the exercise is to be repeated. Default=32,767.
g = The number of the phase that has statement 'i' and segment 'h'.
h = The number of the segment that has statement 'i'.
i = The number of the statement at the beginning of which a synchronizing pulse is to be generated.
j = The number of the phase of the segment(s) to be executed.
k = The segment or range of segments in phase 'j' to be executed.
l = The phase at which suspension of diagnostic execution is desired.
m = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:TTFCOM output message.

Application: 5,3B
Type: Input

1. PURPOSE

2. FORMAT

EX:TTYC=a:[RAW][,UCL][,PH=b[,TLP][,CONT];

3. EXPLANATION OF MESSAGE

RAW = Print all the diagnostic failures. Default is to print the first five failures.

TLP = Execute the trouble locating procedure (TLP) at the conclusion of the diagnostic. This process generates a list of suspected faulty equipment.

   NOTE: It is not recommended that the TLP and UCL parameters be specified together, as it may produce an improper TLP listing.

UCL = Execute unconditionally.

   NOTE: This option does not override forced early terminations.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Execute the specified phase.

   NOTE: The phase will not be executed until subsequent messages from the EX:LOOP, EX:PAUSE, EX:STEP, and EX:STOP input messages are input.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EX:TTYC output message.

**Software Release:** 5E14 and later  
**Command Group:** SMA  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Interactively diagnoses (exercises) the universal conference circuit (UCONF) board. This message is used primarily for manual troubleshooting.

Format 1 starts a diagnostic exercise program on the universal conference circuit board.

Format 2 resets the diagnostic options and begins executing the previously activated diagnostic program from the current point of suspension until the specified number of segments has been performed.

Format 3 inverts the state (from running to suspended or vice versa) of a previously activated diagnostic program.

Format 4 executes a portion of a previously activated diagnostic program.

Format 5 transfers control from the current point of suspension to the beginning of the specified segment of a previously activated diagnostic program, ignoring interim test failures.

To stop this exercise, use input message STP:UCONF. The unit will remain out-of-service (OOS).

2. **FORMAT**

[1] \[EX:UCONF=a-b-c-d,START[,GROW];\]

[2] \[EX:UCONF=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i],STEP=e[,TLP];\]

[3] \[EX:UCONF=a-b-c-d;\]

[4] \[EX:UCONF=a-b-c-d[,UCL][,RAW][,SYNCH=g-h-i][,RPT=[f]]
[,PH=j-k[,TLP];\]

[5] \[EX:UCONF=a-b-c-d,PAUSE=l-m;\]

3. **EXPLANATION OF MESSAGE**

GROW = Allow access to growth equipment.

RAW = Print raw test failure data.

TLP = Print ordered pack list.

UCL = Execute unconditionally.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Global digital service unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

d = Digital service circuit unit board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = The number of segments to be executed, beginning from the current point of suspension.

f = Number of times the exercise is to be repeated. Default=32,767.

g = The number of the phase that has statement ‘i’ and segment ‘h’ (SM units only).

h = The number of the segment that has statement ‘i’ (SM units only).

i = The number of the statement at the beginning of which a synchronizing pulse is to be generated (SM units only).

j = The phase of the segment(s) to be executed.

k = The segment or range of segments in phase ‘j’ to be executed.

l = The phase at which suspension of diagnostic execution is desired.

m = The segment number at which suspension of diagnostic execution is desired.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. The request has been accepted. Followed by the EX:UCONF output message.

STP:UTG

Output Message(s):

EX:UTG
29. EXC
1. PURPOSE

Requests that automatic line evaluation (ALE) provide performance monitoring error count information and protocol error histories on integrated services digital network (ISDN) protocol channels. ALE can be requested for an individual ISDN protocol channel [such as, digital subscriber line (DSL)], a DSL group, or an entire switching module (SM). However, only one user-requested ALE can be in progress at a time. Line evaluation may be specified to include level 1 and level 2 error counts and protocol error records (PERs). Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

Level 1 applies to U-interface digital subscriber lines (U-DSLs) and retrieves physical layer error counts stored in the integrated services line unit (ISLU or ISLU2) U-card termination or the integrated digital carrier unit (IDCU) TR303 U-card terminations. Some additional error counts are available for ANSI® U-cards; current (CURR) hour, previous (PREV) hour, hour (HOUR), interval (INT), and day (DAY) counts, as well as the history (HIST) for the last eight intervals. U-DSLs equipped with channel units (CUs) make available the current and previous interval counts using the CU option.

Level 1 also applies to basic rate interface transmission extension (BRITE) channel units for interfaces supported by ANSI® U-cards. The CU option must be specified in the input message in order to retrieve or reset the error counts on these channel units. For interfaces that do not support or have no equipped channel units, the CU option will have no effect on the retrieval of data.

INT and DAY counts are accumulations of CURR counts, and are updated hourly. If either the INT or the DAY counters are reset, they will be updated with the contents of the CURR counter at the next hourly interval. Therefore, if a true zero starting point is needed, it is necessary to reset the CURR counter at the same time the INT and/or DAY counters are reset.

Level 1 requests that immediately following the inhibiting (INH:ALE) of ISDN, protocol channels may give an erroneous indication that the level 1 error counts are increasing. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not be inhibited for a period of up to 5 minutes. Level 1 requests that immediately following the allowing (ALW:ALE) of ISDN, protocol channels may give an erroneous indication that the level 1 error counts are not incrementing. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes.

Level 1 requests on embedded operation channels (EOC) or timeslot management channels (TMC) are not supported.

Level 2 applies to all ISDN protocol channels and retrieves frame error information stored in the protocol handler (PH). Any of the level 1 or level 2 counts may be reset to zero by using the RESET or SRESET option. Normally only DSLs with either off-normal level 2 counts, or level 1 counts that have exceeded thresholds, are reported. A full report of all DSLs is available by specifying FULL. The FULL option is always implied for level 1 on IDCU terminations.

PER reporting retrieves the protocol error history for an ISDN protocol channel stored in the SMs. The protocol error histories can also be reset using one of the RESET options. In addition, the FROM, TO, and LAST options can be used to retrieve PER histories for specified time periods and for specified counts. The default request is execution of level 2 and PER reporting.
2. FORMAT

EXC:ALE,a[,CH=y][,z][,LAST=a][,FROM=b1-b11-b11][,TO=e][,LEVEL1][,CU][,LEVEL2][,FULL][,PER][,PRINT];

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

FULL = For level 1 requests, report counts for all specified line terminations, not just the ones that exceeded a threshold. All IDCU terminations have an implied FULL option for level 1 requests. For level 2 requests, lines with insufficient level 2 error information will also be reported.

LEVEL1 = Evaluate level 1 errors in the ISLU and/or IDCU U-DSL physical layer counters.

LEVEL2 = Evaluate level 2 errors in packet handler counters (default).

PRINT = Send the output to the ROP and switching control center (SCC) as well as to the requesting terminal. The default is to send the output only to the requesting terminal.

a = Line identification. Valid value(s):
   AIUEN=d-u-v-w
   BST=b-c
   DEN=d-e-f-g
   DN=h
   DNUSEOC=d-l-v-x
   DNUSTMC=d-l-v-x
   DSLGM=d-q-i-j = The parameters for DSLGM have more latitude than other identifiers. The 4 legal forms in increasing scope are:
      DSLGM=sm-psunum-group-member = An individual DSLGM.
      DSLGM=sm-psunum-group-ALL = All members of a DSLGM group.
      DSLGM=sm-psunum-ALL-ALL = All members of a PSU
      DSLGM=sm-ALL-ALL-ALL = All DSLGM on an SM (same as sm= option).
      DSLGM=ALL-ALL-ALL-ALL = Entire office.

      Any attempt to mix and match the ALL option with the other parameters will result in propagation of the ALL option to the lower order fields. For example:
      DSLGM=8-ALL-ALL-7 is transformed to DSLGM=8-ALL-ALL-ALL before it is acted upon.
      ATMPP=d-q^1-g^2-h^2
      IDCUEOC=d-u-v-x
      IDCUTMC=d-u-v-x
      ILEN=d-u-v-w
      INEN=d-l-v-w
      LCEN=d-k-l-m
      LCKEN=d-l-v-j-k
      MLHG=n-o
      NEN=d-l-m-x-n-o-y-p
      OAP=b
      OPT=b-c
      PKTDN=h
      PLTEN=d-z-a-b-c
PORT=d-p
PSUEN=d-q^1-r^1-s^1-j
RTRS=q-r
SM=c^1{&d^1}
TKGMN=s-t
VBRI=d-d^2
VTRK=d-e^2-f^2

b = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = The DN associated with the port. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. This parameter can only be used to identify channels associated with DSLs.

i = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Channel type (valid for LEVEL2 and PER requests when using LCEN line identification and for DN/MLHG line identification when the line supports packet switching common DN). Valid value(s):
   B1 = Channel B1.
   D  = D-channel.

Note: The request will be rejected when the channel type is specified, the line is provisioned for on-demand packet service, and both B-channels are available to be used by the on-demand packet service. In this case, there is no direct relationship between the on-demand packet service and a B-channel. Using channel type for LEVEL1 requests is invalid.

z = Reset option. PER's are reset without regard to time ranges specified on the input request line.
The counters are not cleared unless the reset or silent reset option is included in the input request.
Valid value(s):
   RESET = Reset error counts and clear PER tables. Before the reset, requested data will be sent to the receive-only printer (ROP).
   SRESET = Silently reset error counts. Reset error counts and clear PER tables, but do not report present values.

a = The maximum number of PERs, per DSLGM, to be included in the report. The PERs retrieved are the last PERS within the specified time period.

b = Start of time period, in the form hours-minutes-seconds.

c = SM number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e\(^1\) = End of time period, in the form hours-minutes-seconds.

f\(^1\) = Count specifier. Valid value(s):
  \begin{itemize}
    \item ALL = All of the above counts.
    \item CURR = Current hour, interval, and day counts (default).
    \item DAY = Current and previous day counts.
    \item DISK = Report data stored in disk file. This command accepts two line identifications:
      \begin{itemize}
        \item 1 = SM line identification.
        \item 2 = Single line identification.
      \end{itemize}
    \item HIST = Recent interval history.
    \item HOUR = Current and previous hourly line card counts.
    \item INT = Current and previous interval counts.
    \item PREV = Previous hour, interval, and day counts.
  \end{itemize}

g\(^1\) = Channel unit(s) for which current and interval counts are sought. If the CU option is not followed by a specific channel unit number (that is, CU only), then counts for all populated channel units will be printed. Due to the amount of time required to collect data for a CU, this option is only allowed for single-port ALE requests.

h\(^1\) = The PKTDN associated with the port. This parameter can only be used to identify channels associated with DSLs.

i\(^1\) = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^1\) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^1\) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^1\) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^1\) = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^1\) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^1\) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\(^1\) = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\(^1\) = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s\(^1\) = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

\( t^1 \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( u^1 \) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( v^1 \) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w^1 \) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x^1 \) = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y^1 \) = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z^1 \) = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^2 \) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^2 \) = Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^2 \) = Channel number (CHAN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^2 \) = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^2 \) = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^2 \) = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^2 \) = ATM LINK unit number.

\( h^2 \) = Virtual connection identifier (VCID). Refer to a PVC on a given PSU ATM link.

4. SYSTEM RESPONSE

\( \text{NG} \) = No good. This request was not recognized, or was not acceptable. May also include:
- ALE FEATURE NOT LOADED = The ALE feature is not loaded in the switch software configuration.
- COMMUNICATION FAILURE = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- PROCESS CREATION FAILURE = A system error has occurred. Refer to the TECHNICAL
ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

PF = Printout follows. The request has been accepted and is followed by the EXC:ALE output message.

RL = Retry later. May also include:
   - ALE ACTIVE = Only one ALE session may be requested at a time. Wait for completion or stop ALE manually.
   - AM IN MIN MODE = The AM is in minimum operation mode.

**1. PURPOSE**

Requests that automatic line evaluation (ALE) provide performance monitoring error count information and protocol error histories on integrated services digital network (ISDN) protocol channels. ALE can be requested for an individual ISDN protocol channel [such as, digital subscriber line (DSL)], a DSL group, or an entire switching module (SM). However, only one user-requested ALE can be in progress at a time. Line evaluation may be specified to include level 1 and level 2 error counts and protocol error records (PERs). Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

Level 1 applies to U-interface digital subscriber lines (U-DSLs) and retrieves physical layer error counts stored in the integrated services line unit (ISLU or ISLU2) U-card termination or the integrated digital carrier unit (IDCU) TR303 U-card terminations. Some additional error counts are available for ANSI® U-cards; current (CURR) hour, previous (PREV) hour, hour (HOUR), interval (INT), and day (DAY) counts, as well as the history (HIST) for the last eight intervals. U-DSLs equipped with channel units (CUs) make available the current and previous interval counts using the CU option.

Level 1 also applies to basic rate interface transmission extension (BRITE) channel units for interfaces supported by ANSI® U-cards. The CU option must be specified in the input message in order to retrieve or reset the error counts on these channel units. For interfaces that do not support or have no equipped channel units, the CU option will have no effect on the retrieval of data.

Level 2 applies to all ISDN protocol channels and retrieves frame error information stored in the protocol handler (PH). Any of the level 1 or level 2 counts may be reset to zero by using the RESET or SRESET option. Normally only DSLs with either off-normal level 2 counts, or level 1 counts that have exceeded thresholds, are reported. A full report of all DSLs is available by specifying FULL. The FULL option is always implied for level 1 on IDCU terminations.

PER reporting retrieves the protocol error history for an ISDN protocol channel stored in the SMs. The protocol error histories can also be reset using one of the RESET options. In addition, the FROM, TO, and LAST options can be used to retrieve PER histories for specified time periods and for specified counts.

The default request is execution of level 2 and PER reporting.
After the introduction of PCF on PHE2 feature, PER should be able to provide the protocol error histories on A10/A11/ETHERNET protocols on PCF PH. There are two kinds of PERs: level 2 and level 7. Level 2 PER retrieves the ethernet protocol error histories stored in the PH. Level 7 retrieves A10/A11 error histories stored in PH. The are two formats listed below: Format 1 is for ISDN ALE, and Format 2 is for PCF ALE.

2. FORMAT

[1] EXC:ALE,a[,CH=y][,z][,LAST=a1][,FROM=b1b1-b1b1-b1b1][,TO=e1e1-e1e1]. . .
. . .[,LEVEL1=[f1]][,CU=[g1]]][,LEVEL2][,FULL][,PER][,PRINT];

[2] EXC:ALE,i2[,z],PER[,LAST=a1][,FROM=b1b1-b1b1-b1b1]. . .
. . .[,TO=e1e1-e1e1-e1e1][,PRINT];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

FULL = For level 1 requests, report counts for all specified line terminations, not just the ones that exceeded a threshold. All IDCU terminations have an implied FULL option for level 1 requests. For level 2 requests, lines with insufficient level 2 error information will also be reported.

LEVEL1 = Evaluate level 1 errors in the ISLU and/or IDCU U-DSL physical layer counters.

LEVEL2 = Evaluate level 2 errors in packet handler counters (default).

PRINT = Send the output to the ROP and switching control center (SCC) as well as to the requesting terminal. The default is to send the output only to the requesting terminal.

a = Line identification. Valid value(s):
AIUEN=d-u1-v1-w1
BST=b-c
DEN=d-e-f-g
DN=h
DNUSEOC=d-l1-v-x
DNUSTMC=d-l1-v-x
DSLGM=d-q1-i-j = The parameters for DSLGM have more latitude than other identifiers. The 4 legal forms in increasing scope are:
DSLGM=sm-psnum-group-member = An individual DSLGM.
DSLGM=sm-psnum-group-ALL = All members of a DSLGM group.
DSLGM=sm-psnum-ALL-ALL = All members of a PSU
DSLGM=sm-ALL-ALL-ALL = All DSLGM on an SM (same as sm= option).
DSLGM=ALL-ALL-ALL-ALL = Entire office.

Any attempt to mix and match the ALL option with the other parameters will result in propagation of the ALL option to the lower order fields. For example:
DSLGM=8-ALL-ALL-7 is transformed to DSLGM=8-ALL-ALL-ALL before it is acted upon.
ATMPP=d-q1-g2-h2
IDCUEOC=d-u-v-x

Copyright ©2003 Lucent Technologies
b = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = The DN associated with the port. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. This parameter can only be used to identify channels associated with DSLs.

i = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Channel type (valid for LEVEL2 and PER requests when using LCEN line identification and for DN/MLHG line identification when the line supports packet switching common DN). Valid value(s):
   B1   = Channel B1.
   D    = D-channel.

**NOTE:** The request will be rejected when the channel type is specified, the line is provisioned for on-demand packet service, and both B-channels are available to be used by the on-demand packet service. In this case, there is no direct relationship between the on-demand packet service and a B-channel. Using channel type for LEVEL1 requests is invalid.

z = Reset option. PER's are reset without regard to time ranges specified on the input request line. The counters are not cleared unless the reset or silent reset option is included in the input request. Valid value(s):
   RESET = Reset error counts and clear PER tables. Before the reset, requested data will be sent to the receive-only printer (ROP).
   SRESET = Silently reset error counts. Reset error counts and clear PER tables, but do not
= The maximum number of PERs, per DSLGM, to be included in the report. The PERs retrieved are the last PERS within the specified time period.

b¹ = Start of time period, in the form hours-minutes-seconds.

c¹ = SM number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = End of time period, in the form hours-minutes-seconds.

f¹ = Count specifier. Valid value(s):
    ALL = All of the above counts.
    CURR = Current hour, interval, and day counts (default).
    DAY = Current and previous day counts.
    DISK = Report data stored in disk file. This command accepts two line identifications. Valid value(s):
    — SM line identification or,
    — Single Line identification.
    HIST = Recent interval history.
    HOUR = Current and previous hourly line card counts.
    INT = Current and previous interval counts.
    PREV = Previous hour, interval, and day counts.

h¹ = Channel unit(s) for which current and interval counts are sought. If the CU option is not followed by a specific channel unit number (that is, CU only), then counts for all populated channel units will be printed. Due to the amount of time required to collect data for a CU, this option is only allowed for single-port ALE requests.

i¹ = The PKTDN associated with the port. This parameter can only be used to identify channels associated with DSLs.

j¹ = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k¹ = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l¹ = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m¹ = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n^1 = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o^1 = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p^1 = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q^1 = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r^1 = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s^1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t^1 = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u^1 = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v^1 = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w^1 = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x^1 = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y^1 = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z^1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a^2 = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b^2 = Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c^2 = Channel (CHAN) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d^2 = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e^2 = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f^2 = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\( g^2 \) = ATM LINK unit number.

\( h^2 \) = Virtual connection identifier (VCID). Refer to a PVC on a given PSU ATM link.

\( i^2 \) = PCF IP address. Valid value is:

\[ \text{PCFIP}=j^2-j^2-j^2-j^2 \]

\( j^2 \) = IP address field. Valid value is 0-255.

\( k^2 \) = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l^2 \) = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m^2 \) = Optical carrier level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^2 \) = Synchronous transport signal level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\( \text{NG} \) = No good. This request was not recognized, or was not acceptable. May also include:
- \( \text{ALE FEATURE NOT LOADED} \) = The ALE feature is not loaded in the switch software configuration.
- \( \text{COMMUNICATION FAILURE} \) = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- \( \text{PROCESS CREATION FAILURE} \) = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

\( \text{PF} \) = Printout follows. The request has been accepted and is followed by the EXC:ALE output message.

\( \text{RL} \) = Retry later. May also include:
- \( \text{ALE ACTIVE} \) = Only one ALE session may be requested at a time. Wait for completion or stop ALE manually.
- \( \text{AM IN MIN MODE} \) = The AM is in minimum operation mode.

235-105-220  Corrective Maintenance
235-600-755  Protocol Error Record Descriptions
EXC:AUD-SODD

**Software Release:** 5E14 and later  
**Command Group:** AUDIT  
**Application:** 5  
**Type:** Input

1. PURPOSE

Format 1 restarts a full or incremental static office-dependent data (SODD) audit that was previously executing but was stopped for some reason, provided that the conditions permit it to be restarted.

Format 2 requests the immediate execution of an entity SODD audit depending on the parameters specified. It is also used to restart a previously-executing processor entity SODD audit that has been stopped for some reason. A processor entity audit can be restarted numerous times with this input message, but there are limitations:

- If, after the processor entity audit has been stopped, the same EXC:AUD-SODD input message that was used to start it is re-entered within 24 hours from when the audit was stopped, the audit will resume from the point at which it left off during its previous execution.
- If, after the processor entity audit has been stopped, the same EXC:AUD-SODD input message that was used to start it is re-entered more than 24 hours from when the audit was stopped, the audit will start from the beginning (that is, with the first relation on the processor.) It will not resume from the point at which it left off.
- If, after the processor entity audit has been stopped, a different EXC:AUD-SODD input message is used to start a new processor entity audit, the one that was previously stopped will be abandoned (that is, it can never be restarted.)

Format 3 requests the immediate execution of an SODD entity audit on the business and residential customer services (BRCS) relations by specifying one modular feature type (MFT) or all MFTs on one specific processor.

2. FORMAT

```
[1] EXC:AUD=SODD, {FULL | INCR};

[2] EXC:AUD=SODD, {TN=a | OE="b" | RELATION="c", {AM | CMP | SM=d} | MLHG=e | MEMB=f | TGN=g | MEMB=h | [TORELEASE="w"]};

```

3. EXPLANATION OF MESSAGE

- **AM** = Administration module (AM). The processor on which the relation, as specified in 'c', is to be audited.
- **CMP** = Communications module processor (CMP). The processor on which the relation, as specified in 'c', is to be audited.
- **FULL** = The full SODD audit is to be restarted. The audit will only be restarted provided there are at least 15 minutes remaining in the audit schedule (refer to the SCHED:AUD-SODD input message).
- **INCR** = The incremental SODD audit is to be restarted. The audit will only be restarted provided there are unaudited log files from the last ODD backup.
a = Telephone number to be audited.

b = Office equipment type and number to be audited.

Office equipment types. Valid value(s):

C = Integrated services line unit with Z card (ISLU-Z) analog line card in the form Cdddi jkk.

D = Digital equipment number (DEN) in the form Ddddjmmnn.

E = Access interface unit (AIU) in the form Edddz^1z^1a^2a^2b^2b^2.

G = IDCU gamma equipment number (GEN) in the form Gdddooppqqqq.

I = ISDN digital (U & T card) integrated services line unit equipment number in the form Idddi jjrr.

K = Analog line circuit equipment number (LCKEN) in the form Ldddm^1m^1n^1o^1p^1p^1.

L = Analog line unit equipment number (LEN) in the form Ldddsstuvw.

N = DNU-S equipment number (NEN) in the form Nddde^1f^1u^1g^1q^1r^1i^1i^1i.

O = Optical interface unit equipment number (OIUEN) in the form Odddh^1s^1t^1u^1q^1r^1i^1i^1i.

P = Logical test port (LTP) equipment number in the form Pdddxxx.

R = Recorded announcement function (RAF) equipment number in the form Rdddyzz.

S = Digital carrier SLC® line unit equipment number (SLEN) in the form Sddda^1ppqq.

T = Analog trunk unit equipment number (TEN) in the form Tdddb^1uc^1d^1.

U = Packet switch unit equipment number (PSUEN) in the form Udddj^1k^1l^1l^1zzz.

Office equipment acronyms. Valid value(s):

CHGRP = Channel group.

CKT = Circuit number.

DCHAN = Digital channel.

DCLU = Digital carrier line unit.

DFI = Digital facility interface.

DG = Data group.

DLTU = Digital line and trunk unit.

DNU-S = Digital networking unit - synchronous optical network (SONET).

DS0 = Digital signal level 0.

IDCU = Integrated digital carrier unit.

ISLU = Integrated services line unit.

LBD = Line board.

LC = Line card.

LC = Line circuit.

LCKT = Line circuit.

LG = Line group.

LGDC = Line group controller.

LP = Line pack.

LU = Line unit.

LVL = Level.

OIU = Optical interface unit.

PSU = Packet switch unit.

RT = Remote terminal.

RU = Receive unit.

SM = Switching module.
STS = Synchronous transport signal.
SW = Switch number.
SWG = Switch group.
TU = Trunk unit.
VT = Virtual tributary.
ZLC = Analog line card.

c = Static relation to be audited, or "ALL" if all relations on a specific processor are to be audited (that is, a processor entity audit). Legal, auditable relation names can be found in the Routine Operations and Maintenance Manual. At most, eight characters are required for a relation name. If more than eight are entered, they are considered significant and matched.

d = Switching module (SM) to be audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The processor on which the relation, as specified in 'c', is to be audited.

e = Multi-line hunt group to be audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Member of multi-line hunt group to be audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Trunk group number to be audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Member of trunk group number to be audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Line group controller (LGC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Analog line card (ZLC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Digital channel (DCHAN) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
r = Line card (LC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Line unit (LU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Concentrator. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Switch group (SWG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Switch (SW) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Level (LVL) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Receive unit (RU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a\textsuperscript{1} = Digital carrier line unit (DCLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b\textsuperscript{1} = Trunk unit (TU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c\textsuperscript{1} = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\textsuperscript{1} = Circuit (CKT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\textsuperscript{1} = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\textsuperscript{1} = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\textsuperscript{1} = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\textsuperscript{1} = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\textsuperscript{1} = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\textsuperscript{1} = Packet switch unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k\textsuperscript{1} = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\textsuperscript{1} = Channel group (CHGRP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\textsuperscript{1} = Integrated services line unit-2 (ISLU-2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\textsuperscript{1} = Line group (LG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\textsuperscript{1} = Line board (LBD) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\textsuperscript{1} = Line circuit (LCKT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\textsuperscript{1} = Virtual tributary 1.5 group (VTGRP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\textsuperscript{1} = Virtual tributary 1.5 member (VTMEM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s\textsuperscript{1} = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t\textsuperscript{1} = Optical carrier - level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u\textsuperscript{1} = SONET terminating equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v\textsuperscript{1} = STS - level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w\textsuperscript{1} = Release to which the office will retrofit. The TORELEASE parameter is used exclusively for the on-switch hardware check audit. Refer to the Switch Software Release Retrofit Procedures manual for valid selections.

x\textsuperscript{1} = Name of MFT to be audited or "ALL" if all MFTs are to be audited. Valid value(s):

ALL = All modular feature types.
AC = LASS Automatic callback.
ACB = Auto-call-back calling.
ACCT = Account code.
ACSR = Automatic customer station rearrangement.
ACTR = Attendant control.
AR = LASS automatic recall.
ARS = Automatic route selection.
ASI = Advanced service interface.
ASPN = Advanced services platform - non-call.
ASPO = Advanced services platform originating.
ASPT = Advanced services platform terminating.
ATH = Authorization code.
BCL = Bulk calling line identification.
CFW = Call forwarding.
COT = Customer originated trace.
CPI = CPN features.
CWT = Call waiting.
DISP = Display features.
DR = Distinctive ringing.
EDS = Electronic dictionary services.
HI = Home intercom single line variety.
ICM = ISDN intercom.
ID = Individualized dialing.
LID = Line identification features.
MDR = Message detail recording.
MDS = Message desk service.
MWY = Multi-way calling.
PFA = Private facility access.
PP = Precedence and preemption.
PUO = Pick up originating.
PUT = Pick up terminating.
RND = Redirecting number delivery.
SC = Speed calling.
SCA = Selective call acceptance.
SCF = Selective call forwarding.
SCR = Selective call rejection.
SDA = Selective distinctive alert.
TGR = Terminal group.
TOD = Time of day.

y = Switching module (SM) being audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The processor on which the relations associated with the MFT, as specified in ‘x’, are being audited.

z = AIU number to be audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a = Line pack (LP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual (AIUEN).

b = Line circuit (LC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual (AIUEN).

4. SYSTEM RESPONSE
OK = The full or incremental SODD audit has been allowed to restart.
PF = Printout follows. May also include:
-OP AUD=SODD MESSAGE FOLLOWS = Followed by an OP:AUD-STATUS or OP:AUD-ERROR output message.

Command Group: TRKLN
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Execute a BICC CIC block reallocation process. This request will redistribute BICC CIC blocks among BICC CIC enabled SM-2000s. Refer to RC/V View 5.70 for additional information.

WARNING: This request can not be run during a retrofit and only one BICCBMOVE request can be run at a time.

Formats 1 is used to distribute BICC CIC blocks to newly defined BICC SMs (destination SM) from previously defined BICC SMs (source SM).

Formats 2 is used to remove BICC CIC blocks from previously defined BICC SMs.

Formats 3 is used to move a single BICC CIC block from its current SM to another SM.

2. FORMAT

[1] EXC:BICCBMOVE,ADDSM,SRC=b[],b][,b][[,CAMP=c]. . .[,KILL=d]][[,UCL]]

[2] EXC:BICCBMOVE,DELSM,SRC=b[],b][,b][[,CAMP=c][[,UCL]]

[3] EXC:BICCBMOVE,MOVE,BGMN=e-f,DEST=b[],b][,b][[,CAMP=c][[,UCL]]

3. EXPLANATION OF MESSAGE

a = Source switching module (SM). Valid value(s):
   SM number = SM number(s). Refer to RC/V View 5.70.
   ALL = All SMs. Refer to RC/V View 5.70.

b = Destination SMs. Valid value(s):
   SM number = SM number(s). Refer to RC/V View 5.70.
   ALL = All SMs. Refer to RC/V View 5.70.

c = Campon time (minutes). This is a definition of how long calls can remain active. This field is used in conjunction with the KILL parameter. If CAMP is not specified, the value found in RC/V View 8.1 will be used.

d = Kill indicator. This parameter is used in conjunction with the CAMP parameter. If KILL is not specified, the value found in RC/V View 8.1 will be used. Valid value(s):
   N = Do not kill calls at the end of campon time.
   Y = Kill calls at the end of campon time.

e = BICC group number. BICC groups must have been defined previously.
= BICC group member range. The member range must represent exactly one BICC CIC block (that is, BGMN=7000-0&&127). The range of a CIC BICC block is 128 (i.e. 0&&127, 128&&255, etc.).

4. SYSTEM RESPONSE

NG = No Good. The request has been denied. May also include:
- INVALID SOURCE SM’S = SRCSM field contains invalid SMs.
- INVALID DESTINATION SM’S = DESTSM field contains invalid SMs.
- FOR ADDSM, DESTINATION SM(S) MUST BE SPECIFIED = EXC:BICCBMOVE,ADDSM must specify destination SMs.
- FOR DELSM, SOURCE SM(S) MUST BE SPECIFIED = EXC:BICCBMOVE,DELSM must specify source SMs.
- INVALID MEMBER RANGE = BGMN field contains an invalid member range.
- MEMBER RANGE MUST BE ONE CIC BLOCK = BGMN member range must represent one BICC CIC block (128 CIC’s).
- BICC GROUP DOES NOT EXIST = BGMN bicc group does not exist.
- BICC GROUP MEMBERS DO NOT EXIST = BGMN member range (BICC CIC block) does not exist.
- ONLY ONE DESTINATION SM CAN BE ENTERED = EXC:BICCBMOVE,MOVE can only specify one destination SM.
- SOURCE SM’S AND DESTINATION SM’S MUST BE UNIQUE = An SM cannot be in both the DESTSM and SRCSM fields.
- SOURCE SM’S MUST BE UNIQUE = An SM cannot appear twice in the SRCSM field.
- DESTINATION SM’S MUST BE UNIQUE = An SM cannot appear twice in the DESTSM field.
- SOURCE SM’S MUST BE DEFINED ON RC/V 5.70 = SMs in the SRCSM field must be previously defined on RC/V View 5.70.
- DESTINATION SM(S) MUST HAVE INH DIST SET TO 'N' ON RC/V 5.70 = SMs in the DESTSM field must have INH DIST set to "N" on RC/V View 5.70.
- DESTINATION SM(S) MUST BE DEFINED ON RC/V 5.70 = SMs in the DESTSM field must be previously defined on RC/V View 5.70.
- FOR DELSM=ALL, AT LEAST 1 SM2K MUST HAVE INH DIST SET TO 'N' ON RC/V 5.70 = DESTSM=ALL must have at least one SM on RC/V View 5.70 has INH DIST set to N.
- NOT ENOUGH ROOM TO MOVE BICC CIC BLOCKS = There is no room for BICC CIC blocks for request.
- FOR ADDSM, BICC CIC BLOCKS CANNOT EXIST ON DESTINATION SM(S) = EXC:BICCBMOVE,ADDSM must have SMs in DESTSM with no BICC CIC blocks.

PF = Printout Follows. The request has been accepted. Followed by the EXC:BICCBMOVE output message.

RL = Retry Later. May also include:
- CIC ALLOCATION PROCESS ALREADY RUNNING = EXC:BICCBMOVE is currently running.
- BICC CIC BLOCKS DO NOT EXIST IN OFFICE = No BICC CIC blocks exist in the office.
- AN SM2K IS UNAVAILABLE = An SM is currently unavailable.

EXC:BICCCQ

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Executes a bearer independent call control (BICC) call instance code (CIC) query (BQ) request. These requests locate and optionally correct inconsistencies between near-end and far-end call processing and maintenance states of BICC CICs.

Inconsistencies are corrected by default, but can be inhibited (refer to variable 'a' for details). If requested, detailed output reports with per-BICC CIC status will be displayed (refer to variable 'd' for details). Concurrent outgoing BQ requests are restricted by specific rules:

When an office-wide BQ request is running, no other BQ request may be active. This includes automatic and demand BQ requests.

Up to four concurrent non-office-wide BQ requests can be active in the office.

BQ requests cannot be run concurrently with the same originating point code (OPC)- destination point code (DPC) assignment. This restriction applies to all OPC-DPC, BICC group (BG) and BICC group member number (BGMN) requests. For example, a BG request will be denied if another BG, OPC-DPC or BGMN request is active for the OPC-DPC provisioned for that requested BG.

Format 1 is used to initiate a BICC CIC query process on every provisioned BICC CIC in the office. The office-wide request always produces shortened output.

Format 2 is used to initiate a BICC CIC query process on every provisioned BICC CIC with the specified OPC-DPC route. Selectable output message report types are SHORT and LONG, with FORM=SHORT being the default.

Format 3 is used to initiate a BICC CIC query process on every member in the specified BG. Selectable output message report types are SHORT and LONG. FORM=SHORT is the BG default.

Format 4 is used to initiate a BICC CIC query process specifying a BGMN. Selectable output message report types are SHORT, LONG and EXPANDED, with FORM=EXPANDED being the default.

Note: For a specific BQ request to be executed, the affected BG(s) must be allowed for BQ operation on the recent change and verify (RC/V) view 5.1.

2. FORMAT

[1] EXC:BICCCQ,OFFICE[,CORRECT=a];
[2] EXC:BICCCQ,OPC=b,DPC=c[,CORRECT=a][,FORM=d];
[3] EXC:BICCCQ,BG=e[,CORRECT=a][,FORM=d];
[4] EXC:BICCCQ,BGMN=e-f[&g][,CORRECT=a][,FORM=d];

3. EXPLANATION OF MESSAGE

a = Indication of whether correction should be taken if status mismatches are detected. Valid values:
ALW = Allow (default).
INH = Inhibit.

b = Originating point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

c = Destination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

d = The output message report type. Valid values:

SHORT = Matched, mismatched and undetermined summary counts are displayed.
LONG = Matched, mismatched and undetermined summary counts are displayed, in addition to all status combinations encountered that mismatch.
EXPANDED = Matched, mismatched and undetermined summary counts are displayed, in addition to all status combinations. This option will print output for each BICC CIC queried regardless of the far-end statuses returned. However, output is limited to ranges spanning 128 CICs or less.

Note: LONG or EXPANDED output is printed only for CICs where a far-end CIC status has been received from the far-end.

e = BICC group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = BICC group member number or lower limit of a range of BICC group member numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Upper limit of a range of BICC group member numbers. If this value exceeds the maximum BICC group member number in the office, it will be adjusted to that maximum. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. May also include:
- BQ INHIBITED FOR THIS BG = BICC CIC query is not allowed for this BICC GROUP. Refer to RC/V view 5.1.
- BQ INVALID FOR BICC SERVICE GRPS = BICC CIC query is not allowed for a BICC GROUP that is defined as a service group.
- DATABASE ERROR = An unrecoverable database error has occurred.
- INVALID BICC GROUP = The target BICC GROUP is not equipped.
- INVALID BG MEMBER NUMBER OR RANGE = The target BICC group member is not equipped, or a range was specified with the same low member and high member, or the range entered conflicts with the FORM option specified.
- INVALID OPC ENTERED = The OPC entered is not a valid opc.
- INVALID DPC ENTERED = The DPC entered is not a valid DPC or the DPC entered is valid but is not paired with the specified OPC.
- INVALID SIGNALING TYPE = The target BICC GROUP is not a BICC CIC GROUP.
- NO BICC CICS ASSIGNED TO OPC/DPC = No BICC CICS are provisioned for the specified OPC-DPC pair.

PF = Printout follows. The request has been accepted. Followed by an EXC:BICCCQ output message.

RL = Retry later. May also include:
- CONFLICTING BQ REQUEST ACTIVE = Another query request associated with the same OPC-DPC pair is already running, or an office-wide query was requested and an office-wide query is already running, or an office-wide query was requested and other types of BQ requests are running.
- FAILED TO CREATE PROCESS = System resources are not available to start the appropriate process needed to execute this input message.
- TOO MANY BQ REQUESTS = There can only be four non-office-wide BQ requests running at the same time.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Allows the user to run the business and residential custom services (BRCS) feature usage audit and remove unused BRCS constructed features from the switch. If executed without parameters, it restores the audit suspended per a user request.

WARNING: Do not run the audit tool during retrofits, as there is a possibility that an installed constructed feature may be removed in error. Do not assign constructed features when run the audit tool is running. The removal of Unused Constructed Features must not occur if any SM is not operational. It is absolutely necessary to wait until all EXC:BRCS requests, currently being in progress, are completed, before retrofit can be started.

2. FORMAT

EXC:BRCS: [AUD=a, FEAT=b[, DELETE=c]];

3. EXPLANATION OF MESSAGE

a = Audit range. Valid value(s):
   ALLF = Audit all features.
   TYPE = Audit selected type of BRCS feature.
   FEAT = Audit one BRCS feature (the DELETE option must be specified).

b = Feature type or name. If variable 'a' equals FEAT, feature name. If variable 'a' equals TYPE, 1-45.
  1 = Reserved.
  2 = Call waiting.
  3 = Call forwarding.
  4 = Terminal group.
  5 = Time of day.

EXC:CCS

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the message transfer part (MTP) route verification test (MRVT) be initiated. The requested test is run, and the report is written to the MTCE message class and/or the standard output. Requests that the signaling connection control port (SCCP) routing verification test (SRVT) be initiated.

2. FORMAT

[1] EXC:CCS,MRVT,DPC=a,OPC=b,[STPS=c],[TRACE]

[2] EXC:CCS,SRVT,TT=a,DIGITS=b,OPC=c,[NTSP=d],[TPC=e],[TRACE]

3. EXPLANATION OF MESSAGE

a = Destination point code (DPC) being tested is a nine digit number. Refer to the APP:POINT-CODE appendix in the Appendices section of the Input Messages manual.

b = Origination point code (OPC) that originates test is a nine digit number. Refer to the APP:POINT-CODE appendix in the Appendices section of the Input Messages manual.

c = Max number of signaling point codes to traverse. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual. TRACE = Include traces of STPs crossed during the test in the output if the test was a success.

d = Actual number of GTTs allowed before reaching final destination. Refer to the APP:RANGES appendix in the Appendices section of the Input Messages manual.

e = Translation point code to which the initiator should address and send an SRVT message is a nine digit number. If not entered, the default is chosen based on provisioned SCCP data associated with the translation type and digits. Refer to the APP:POINT-CODE appendix in the Appendices section of the Input Messages manual for valid point code formats.

4. SYSTEM RESPONSE

PF = Printout follows. Valid value(s):
- PRINTOUT FOLLOWS = The request has been accepted. Followed by the EXC:CCS-MRVT or EXC:CCS-SRVT output message.

NG = No good. Valid value(s):
- INVALID OPC = The OPC is not associated with any GSM local point code.
- INVALID OPC FORMAT = The OPC is not in the correct ANSI®/AT&T format.
- REQUESTED DPC IS SAME AS OPC = The DPC is the same as the OPC.
- INVALID DPC FORMAT = The DPC is not in the correct ANSI®/AT&T format.
- INVALID OPC The OPC is not associated with any GSM local point code.
- INVALID OPC FORMAT = The OPC is not in the correct ANSI/AT&T format.
- INVALID TPC FORMAT = The translation point code is not in the correct format.
- TPC IS SAME AS OPC = The TPC is the same as the OPC.

RL = Retry later. Valid value(s):
- SM NOT AVAILABLE = The designated GSM is not available due to MIN-MODE, ISOLATION, or INITIALIZATION.
- SM NOT AVAILABLE = The designated GSM is not available due to MIN-MODE, ISOLATION, or INITIALIZATION.

16.4 (OMAP ROUTE VERIFICATION TEST TIMER PARAMETERS)
**EXC:CCSCQ-A**

**Software Release:** 5E14 only  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input  

1. **PURPOSE**

Execute a circuit query (CQ) request. These requests locate and optionally correct inconsistencies between near-end and far-end call processing and maintenance states of CCS7 trunks.

Inconsistencies are corrected by default, but can be inhibited by using the CORECT=INH option. If requested, detailed output reports with per-circuit status will be displayed. The FORM=LONG option will print all status combinations where a mismatch is detected between the near-end and far-end offices. The FORM=EXPANDED option will print all status combinations encountered. The FORM=SHORT option produces only summary counts of matched, mismatched and undetermined status combinations detected. Concurrent outgoing CQ requests are restricted by specific rules:

- When an office-wide CQ request is running, no other CQ request may be active. This includes automatic and demand CQ requests.
- Up to 4 concurrent non-office-wide CQ requests can be active in the office.
- CQ requests can not be run concurrently with the same OPC-DPC assignment. This restriction applies to all OPC-DPC, TG, and TKGMN requests. For example, TG request will be denied, if another TG, OPC-DPC, or TKGMN request is active for the OPC-DPC provisioned for that requested TG.

Format 1 is used to initiate a circuit query process on every provisioned CCS trunk in the office. The office-wide request always produces shortened output.

Format 2 is used to initiate a circuit query process on every provisioned CCS trunk with the same OPC-DPC route. Selectable output report types are SHORT and LONG, with FORM=SHORT being the default.

Format 3 is used to initiate a circuit query process on every member in the specified TG (trunk group). Selectable output report types are SHORT, LONG, and EXPANDED. FORM=SHORT is the TG default.

Format 4 is used to initiate a circuit query process specifying a trunk group member number (TKGMN). Selectable output report types are SHORT, LONG and EXPANDED, with FORM=EXPANDED being default.

**NOTE:** For a specific input message to execute, the affected TG must be allowed for CQ operation on the 5.1 RC/V view.

2. **FORMAT**

[1] EXC:CCSCQ,OFFICE[],CORRECT=a;  
[2] EXC:CCSCQ,OPC=b,DPC=c[],FORM=d][,CORRECT=a];  
[3] EXC:CCSCQ,TG=e[,FORM=d][,CORRECT=a];  
[4] EXC:CCSCQ,TKGMN=e-f[,FORM=d][,CORRECT=a];

3. **EXPLANATION OF MESSAGE**
a  Indication of whether correction that should be taken if status mismatches are detected. Valid value(s):
ALW    = Allow (default).
INH    = Inhibit.

b  Origination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

c  Destination point code number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

d  The output report type. Valid value(s):
SHORT  = Matched, mismatched and undetermined summary counts are displayed.
LONG   = Matched, mismatched and undetermined summary counts are displayed, in addition to all statuses combinations encountered that mismatch.
EXPANDED = Matched, mismatched and undetermined summary counts are displayed, in addition to all statuses combinations. This report option will print output for each circuit queried regardless of the far-end statuses returned.

e  = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied. May also include:
- INVALID OPC or DPC = DPC or OPC is in the wrong format or is not provisioned for any trunk group in the office.
- INVALID SIGNALING TYPE = The target trunk group is not a CCS trunk group.
- INVALID TRUNK GROUP = The target trunk group is not provisioned in the office.
- CQ INHIBITED FOR THIS TG = Circuit query is not allowed for this trunk group. Refer to RC/V view 5.1
- INVALID TG MEMBER = The target trunk member is not equipped.
- DATABASE ERROR = An unrecoverable database error has occurred.

PF  = Printout follows. The request has been accepted. Followed by the EXC:CCSCQ output message.

RL  = Retry later. May also include:
- OPC/DPC or TG REQUEST ALREADY RUNNING = An office-wide query request can only execute if no other CQ requests are running.
- CQ REQUEST ACTIVE ON SAME OPC/DPC = Another query request associated with the same OPC-DPC pair is already running.
- OFFICE REQUEST ALREADY RUNNING = Only one office-wide query request can be executed at any time.
- TOO MANY CQ REQUESTS = There can only be four non-office-wide CQ requests running at the same time.
- TOO MANY PROCESSES ACTIVE = The number of processes that can be run by the ATA process has been reached. Use OP:JOBSTATUS to view the current status.
- FAILED TO CREATE PROCESS = System resources are not available to start the appropriate process needed to execute this input message.

5.1 TRUNK GROUP
EXC:CCSXLATE-A

Software Release: 5E14 only
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Initiates the common channel signaling (CCS) translation test (or circuit validation) for a specific CCS7 trunk. Translation testing checks for consistency between near-end office-dependent data (ODD), as well as the following characteristics between near-end (NE) and far-end (FE) offices: double seizure control (DSC), circuit group carrier (CGC), circuit identification name (CIN), and common language location identifier (CLLI).

The following additional fields are displayed for both NE and FE, but not checked for consistency: alarm carrier indicator (ACI), and continuity check indicator (CCI). ACI and CCI consistency is not important to carrying call traffic. Also, DSC is not checked for one-way trunks. The request will not be denied if a call or trunk maintenance activity is in progress on this trunk. Furthermore, it does not impact on any current activity on this trunk.

2. FORMAT

EXC:CCSXLATE, TKGMN=a-b;

3. EXPLANATION OF MESSAGE

a = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. Valid value(s):
- DATABASE ERROR = Required information could not be obtained from the database.
- INVALID SIGNALING TYPE = The trunk group specified is not a CCS trunk group.
- INVALID TRUNK MEMBER = The trunk member is not provisioned.
- INVALID TRUNK GROUP = The trunk group is not provisioned.
- TRANS TEST INHIBITED FOR THIS TG = Trunk translation test requests have been inhibited by using RC/V View 5.1.

PF = Printout follows. The request has been accepted. Followed by the EXC CCSXLATE output message.

RL = Retry later. Valid value(s) are:
- TOO MANY PROCESSES ACTIVE = The number of processes that can be run by the ATA process has been reached. Use OP:JOBSTATUS to view current status.
- FAILED TO CREATE PROCESS = System resources are not available to start the appropriate process needed to execute this input message.
- SM INACCESSIBLE = The target trunk member's SM is either inaccessible or in min-mode.
- TOO MANY TRANSLATION TESTS RUNNING = There can only be 4 trunk translation requests active at the same time. This limit has been reached.
- **AM OVERLOAD** = AM is experiencing an overload situation.

EXC:CO

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5
Type: Input

1. PURPOSE

Transfers lines from one switching system to another switching system (cutover and cutback).

NOTE: The CUTOVER page of the master control center (MCC) lists the pokes that can be used to perform cutovers and cutbacks.

2. FORMAT

EXC:CO:CMD=a;

3. EXPLANATION OF MESSAGE

a = Type of input message. Valid value(s):
ABORT = Aborts a cutover. The abort must be performed while the cutover is still in progress.
CUT = Activates inactive lines.
CUTBK = Deactivates in-service lines.
ENCBK = Enables the cutover program for cutback.
ENCUT = Enables the cutover program for cutover.

4. SYSTEM RESPONSE

IP = In progress. The request is in progress.
NG = No good. The request is denied.
OK = Good. The request is completed.

5. REFERENCES

Output Message(s):
EXC:CO-SM
EXC:CO-STATUS

MCC Display Page(s):
(CUTOVER)
**EXC:DSTT**

- **Software Release:** 5E14 and later
- **Command Group:** CCS
- **Application:** 5
- **Type:** Input

### 1. PURPOSE

Requests that a direct signaling translation test (DSTT) be initiated. A DSTT is used to verify Common Channel Interoffice Signaling System 6 (CCIS6) translation data for CCIS6 messages sent over low speed links (4.8 kilobytes) in the common channel signaling (CCS) network.

DSTT is not applicable to CCIS6 messages embedded in Common Channel Signaling System 7 (CCS7) messages on high speed links (56 kilobytes).

### 2. FORMAT

```
EXC:DSTT,{INWATS=a|NCD=b|FUNC=c|BNS=d|CCRD=b|CAS=b};
```

### 3. EXPLANATION OF MESSAGE

- **a** = Inward wide area telecommunications service (INWATS) number in the form 800NXX.
- **b** = Network call denial (NCD), customer account services (CAS) or calling card (CCRD) number in the form NPANXX or RAO[0/1]XX. For CAS, this is the first six digits of the individual account number.
- **c** = Function number to be tested. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Billed number screening (BNS) in the form NPANXX.

### 4. SYSTEM RESPONSE

- **NG** = No good. May also include:
  - **CNI NOT AVAILABLE** = The 5ESS® switch can not send the test message. The common network interface (CNI) is not operational or is in overload. Check CNI status and wait 10 minutes before requesting another test.
  - **INVALID INPUT DATA** = The data field is invalid.

- **PF** = Printout follows. The request was received, the test is being executed and the EXC:DSTT output message follows.

- **RL** = Retry later. May also include:
  - **TEST IN PROGRESS** = Another CCS test is in progress. Repeat this test after a reply or time-out for the current test is received.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a task be executed as a user process.

WARNING: Incorrect use of this message can cause unpredictable system damage or degradation. It should not be used without expert technical assistance unless it is part of a prescribed procedure.

2. FORMAT

EXC:ENVIR,UPROC,FN="a",ARGS=b[,BKG][,OPL=c];

3. EXPLANATION OF MESSAGE

BKG = Run the process in the background, freeing the terminal for further input messages. The default is foreground execution.

a = Full pathname of the file to be executed.

b = A single argument or a list of up to six arguments for the user process. Any argument containing lowercase letters or special characters must be enclosed in quotation marks.

c = Number of segments to be output; specified in decimal. The default is 10 segments; maximum is 999. Each segment has a maximum size of 1000 bytes or 20 lines.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EXC:ENVIR-UPROC output message.

EXC:FACR

Software Release: 5E14 and later
Command Group: FHADM
Application: 5
Type: Input

1. PURPOSE

Requests that the feature activation counting and reconciliation (FACR) audit be started. If the request occurs
between the hours of 6:00 p.m. and 6:00 a.m. the audit begins immediately. Requests made outside of the 6:00 p.m.
to 6:00 a.m. time frame are scheduled for execution at 6:00 p.m.

2. FORMAT

3. EXPLANATION OF MESSAGE

OFC = Request for an official run of the FACR audit.
UNOFC = Request for an unofficial run of the FACR audit. The output from the audit is restricted for use by
the service provider only.
DETAIL = Request for an detail report for a single network systems engineering practice (NSEP) value.
APPL= = Request to run a FACR special application audit.
a = NSEP value supplied by FACR coordinator.
b = APPLICATION name of special audit to run.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EXC:FACR output message.

Input Message(s):

OP:FACR
STP:FACR

Output Message(s):

EXC:FACR
EXC:GKCCR

**Software Release:** 5E14 and later  
**Command Group:** ODD  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests execution of a generated key collection and compression routine (GKCCR) in the specified processors. The routine will collect any unused generated key tuples and place them on the free lists for the appropriate relation. If the relation can reduce the amount of office-dependent data (ODD) memory allocated to it, the generated key tuples will be compressed into fewer data pages. Either specific processors can be specified or the GKCCR will be executed on every processor.

An EXC:GKCCCR output message will report the status of the GKCCR request unless the GKCCR is aborted using the ABT:GKCCCR input request, in which case an ABT:GKCCCR output message occurs instead.

2. **FORMAT**

EXC:GKCCCR[,SM=a[&&b]][,CMP=c[-{PRIM|MATE}]][,AM];

3. **EXPLANATION OF MESSAGE**

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **MATE** = Mate CMP.  
- **PRIM** = Primary CMP.  
- **a** = Switching module (SM) number or the lower limit of a range of SM numbers.  
- **b** = Upper limit of a range of SM numbers.  
- **c** = Communications module processor (CMP) number.

4. **SYSTEM RESPONSE**

- **NG** = No good. The input request is invalid. May also include:
  - **NO VALID PROCESSOR SPECIFIED** = Specific processor(s) were specified in the input request line, but no requested processor was operational. If specific processors are to be requested, at least one requested processor must be operational.

- **PF** = Printout follows. The request was accepted. EXC:GKCCCR output messages for each specified processor follow. REPT:GKCCCR output messages are produced if, during the execution of the GKCCR, data or system errors are discovered.

- **RL** = Retry later. System resources could not be allocated to process the request.

EXC:LIT

**Software Release:** 5E14 and later  
**Command Group:** TRKLN  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that line insulation testing (LIT) be initiated, altered or verified.

Format 1 initiates a manually requested demand LIT (DLIT) (S) to test a single line or a group of lines.

Format 2 alters the parameters (Q) for the next automatic LIT (ALIT) session.

Format 3 verifies the parameters (V) for the next ALIT session.

2. **FORMAT**

   [1] EXC:LIT:OPT=S[,TYP=a][,RG=b],g 1;
   
   [2] EXC:LIT:OPT=Q[,TYP=a][,RG=b][,TMO=t][,TM=u-v];
   

3. **EXPLANATION OF MESSAGE**

   a  
   = Type of line insulation test to perform. Valid value(s):
     F  = Foreign potential (FEMF) test.
     G  = General. Performs tip and ring-to-ground (TRG), short circuit and ring-to-ground (SRG), and FEMF test.
     S  = SRG test.
     T  = TRG test.

   b  
   = Code denotes threshold resistance that electrical leakage on the line will be compared to. The resistance for each range group depends on the ALIT circuit pack, (TN328, TN329, or TN330) to be used. Depending upon the circuit pack to be used, enter the letter (A - D) that corresponds to the threshold resistance desired for the specific circuit pack to be used (refer to Exhibit A).

<table>
<thead>
<tr>
<th>CODE</th>
<th>TN328</th>
<th>TN329</th>
<th>TN330</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>80K ohms</td>
<td>80K ohms</td>
<td>320K ohms</td>
</tr>
<tr>
<td>B</td>
<td>160K ohms</td>
<td>320K ohms</td>
<td>1.25M ohms</td>
</tr>
<tr>
<td>C</td>
<td>640K ohms</td>
<td>1.25M ohms</td>
<td>2.5M ohms</td>
</tr>
<tr>
<td>D</td>
<td>2.5M ohms</td>
<td>5M ohms</td>
<td>5M ohms</td>
</tr>
</tbody>
</table>

   c  
   = Directory number of the line to be tested.

   d  
   = Member number of the multi-line hunt group (MLHG) or line time slot bridging (LTSB) line. For MLHG the DN specified must be the main DN for the group and the member number specifies which member of the group will be tested. For LTSB a member number of 1 will test the lead line and a member number of 2 will test the associate line. If no member number is specified, for 1-DN LTSB, the lead line will be tested. If no member number is specified, for 2-DN LTSB, the line associated with the DN entered will be tested.

   e  
   = Multi-line hunt group number of the line to be tested. Refer to the APP:RANGES appendix in the
Appendixes section of the Input Messages manual.

f = Multi-line hunt member number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

g = Switching module (SM) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

h = Line unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

i = Grid number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

j = Board number (LU1, LU2, or LU3). Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

k = Switch number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

l = Level number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

m = Digital carrier line unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

n = Remote terminal (RT) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

o = RT line number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

p = Integrated services line unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

q = Line group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

r = Line card number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

s = IDCU number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

t = Maximum duration for the next automatic LIT. Valid value(s):
   0 = Suppresses the next ALIT.
   1-8 = Number of hours that ALIT is to be run (or until all testable lines have been tested).

u = Hours of 24-hour clock time when ALIT will start.

v = Minutes of 24-hour clock time when ALIT will start.

w = Integrated services line unit 2 (ISLU2) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
x = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a¹ = Access interface unit equipment number (AIUEN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b¹ = Access interface unit (AIU) pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = Digital network unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f¹ = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g¹ = Valid value(s):

<table>
<thead>
<tr>
<th>AIUEN=g-a¹-b¹-c¹</th>
<th>LEN=g-h-i-j-k-l</th>
</tr>
</thead>
<tbody>
<tr>
<td>DN=c[-d]</td>

<tr>
<td>LCKEN=g-w-q-x-y</td>
<td></td>
</tr>
</tbody>
</table>

### 4. SYSTEM RESPONSE

- **NG** = No good. The message was not recognized. Valid value(s):
  - DATA OUT OF RANGE = The message was not recognized because the parameter value specified in ALIT request is invalid.
  - INVALID LINE = The message was not recognized because the line identified in DLIT request is invalid.
  - INVALID OPTION SET = The message was not recognized because the option set specified in the request is invalid.

- **PF** = Printout follows. The request has been accepted and is in progress. Followed by the EXC:LIT output message.

- **RL** = Retry later. The request has been denied. Valid value(s):
  - COMMUNICATION FAILURE = The DLIT request has been denied because the request could not be delivered in the system.
  - DEMAND LIT ACTIVE = The DLIT request has been denied because another DLIT session is currently executing.
  - PROCESS CREATION FAILURE = The DLIT request has been denied because a controlling
process could not be created.
- RESOURCE SHORTAGE = The request has been denied because of a resource shortage.
- SYSTEM PROBLEM = The request has been denied because of a system problem such as the administrative module (AM) being in minimum (MIN) mode.

EXC:MRVT-PC

**Software Release:** 5E14 and later
**Command Group:** CCS
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests that the message transfer part (MTP) route verification test (MRVT) be initiated. The requested test is run, and the report is written to the MTCE message class and/or the standard output.

2. **FORMAT**

   EXC:MRVT:PC=a[,STPS=b][,TRACE];

3. **EXPLANATION OF MESSAGE**

   **TRACE**
   
   = Include traces of STPs crossed during the test in the output if the test was a success or partial success. If a failure occurs, and this keyword is present the "trace" will not appear, but some error messages do contain a listing of point codes that is similar to the "trace".

   **a**
   
   = The point code of the terminating node for the test. Must be entered in one of the following formats:

   - dddccceee = ANSI® standard.
   - dddffceee = AT&T standard.

   **NOTE:** Non-local network point codes always use ANSI® standard format.

   **b**
   
   = Value of the parameter N, which is the maximum number of signaling transfer points (STPS) the MRVT is allowed to cross (default 2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual

   **c**
   
   = The cluster identifier.

   **d**
   
   = The network identifier.

   **e**
   
   = The member identifier.

   **f**
   
   = The region identifier.

4. **SYSTEM RESPONSE**

**Software Release:** 5E14 and later
**Command Group:** ODD
**Application:** 5
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests reapplication of customer-originated and/or regular recent changes (RCs) from the disk log. This message is used when the backout of recent changes has been requested manually or when an automatic recovery of the recent changes is aborted.

When an administrative module (AM), switching module (SM), or communication module processor (CMP) is in a roll forward and an RC transaction problem exists, the roll forward aborts. To restart the roll forward, reenter this message. With a possible roll forward occurring on either side 0 or 1 of the message switch, this input message requires the use of a message switch side indicator to determine the CMP side to roll forward.

WARNING: Using the SKIPLOG option with this message may result in database inconsistencies (splits) to the processor specified. If the processor is in RC BACKOUT and manual intervention is required, only the ALL option should be used to clear the RC BACKOUT status. Use of the SKIPLOG option will skip applying logged recent changes which will cause splits. Only use SKIPLOG if you are familiar with its operation and understand its consequences. Otherwise, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

2. FORMAT

EXC:ODDRCVY={CORC|ALL|SKIPLOG}{[,SM=a[&b]][,CMP=c-d][,AM][,SKIPRC];

3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>Reapply both recent changes and customer-originated recent changes.</td>
</tr>
<tr>
<td>CORC</td>
<td>Reapply only customer-originated recent changes.</td>
</tr>
<tr>
<td>SKIPLOG</td>
<td>Does not reapply any changes. Convert RC BACKOUT lamp to off. Caution: This may cause database splits.</td>
</tr>
<tr>
<td>SKIPRC</td>
<td>Skip the current RC which has the problem and restart the RC roll forward on the next RC tuple. Default is to stop the current RC with the problem.</td>
</tr>
</tbody>
</table>

a = SM number or the lower limit of a range of SM numbers.
b = The upper limit of a range of SM numbers.
c = Message switch side of the CM with the desired CMP. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = CMP number or peripheral control number.

4. SYSTEM RESPONSE

NG = No good. The input request is invalid.

PF = Printout follows. The request was accepted. Followed by the EXC:ODDRCVY output message.

RL = Retry later. The input request is blocked by a previous request that is not completed or because the system is not yet stabilized from initialization.

235-105-250  System Recovery
235-105-210  Routine Operations and Maintenance
EXC:OFLBOOT

Software Release: 5E14 and later
Command Group: MAINT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Initiates the off-line boot procedure. This may be used to verify the integrity of boot files and data, or as the prelude for the side switch.

There are some restrictions the user must follow for this input message to execute successfully:

- The primary or secondary disk must be selected manually.
- Input/output processors (IOPs) 0 and 1 cannot both be selected for the off-line side.
- There should be no recent change/verify (RCV) activities running.
- There should be no diagnostic activities running.
- The maintenance teletypewriter (MTTY) and receive-only printer (ROP) port selector switches must be in the AUTO position and the portswitch controller must be powered on.

WARNING: Incorrect use of this input message may interrupt operations of the system, or degrade its performance or availability.

Off-line boot requires a logical split of the system during which one control unit (CU) and all its subunits will not be available. Off-line boot should never be used if CCS6 links are equipped on the CNI ring.

Note that the boot signal generated in the offline side will result in the yellow critical alarm indicator being lit. This is the expected behavior of the indicator in all bootstraps (including the offline boot). The indicator will be cleared automatically within 30 seconds.

2. FORMAT

EXC:OFLBOOT:[,TTY=a][,APARM=b][,INITLVL=c][,IOPx[MAX]][,HDWCHK][,SFTCHK][,ERRINT][,BROOT][,MINCONFIG][,UCL=d][,MONITOR][,RETROFIT][,OOS][,TRACE];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

BROOT = Back up partitions will be used for the off-line side. The default is the primary partitions.
Caution: If a side switch is done and then the OFLBOOT procedure stopped, the system will be running on the backup partitions. A boot will be needed afterward to return to the primary (ROOT) partition.

ERRINT = Error interrupts will be inhibited for the off-line side. The default is allowed.
HDWCHK = Hardware checks will be inhibited for the off-line side. The default is allowed.

IOPx = The IOP will be removed from service in the on-line side and remain on the original off-line side until OFLBOOT is stopped. Side switching does not affect this assignment. The range can be 0 through 7.

If MAX is specified, all devices under this IOP will be equipped and made available to the off-line side except the ROP, MTTY, and Switching Control Center (SCC). The ROP, MTTY, and SCC will be unequipped on the off-line side.

Caution: Even with the SCC unequipped, it may perform a link switch. In this case, all emergency action interface (EAI) capabilities are function.

If MAX is not specified, only peripheral controllers under this IOP will be equipped. Peripheral units under this IOP will not be equipped.

If the default option and the TTY=a option is selected, only TTY=a will be equipped under this IOP in addition to the peripheral controllers.

If OFLBOOT is a prelude to the software release transition procedure, ‘x’ has to be either 0 or 1.

The default is IOPx without MAX.

MINCONFIG = Minimum configuration database will be used for the off-line side. Any subsequent side switch will not be allowed. The default is the full configuration database.

MONITOR = All off-line process recovery messages (PRMs) will be directed to the on-line ROP.

The default case will have only off-line PRMs up to step 4 (KBOOT) directed to the on-line ROP.

OOS = If specified, units selected for the off-line side may be initially OOS. The default requires those units be active (ACT) or standby (STBY).

RETROFIT = Recovery strategy will be modified to accommodate the software release transition. The default is normal recovery strategy. The RETROFIT option should only be used during a manual software release transition scenario. It has a strong impact during the side switch. It allows the side switch to occur even if the switch precheck fails. This can result in a level 3 boot depending on the nature of switch precheck failure. Misuse of this option can cause call processing downtime.

SFTCHK = Software checks will be inhibited for the off-line side. The default is allowed.

TRACE = This option is used by authorized technical personnel only. It is for trouble shooting purposes and generates a significant amount of undocumented trace messages. The default is no trace message generated.

a = The teletypewriter (TTY) option is used as a pseudo ROP on the off-line side. All of the off-line side output directed to the ROP is sent to this TTY. The valid range is 0 to 254. If the selected TTY is a UNIX® system TTY, the output sent to it may be unformatted until someone logs in. The default is no TTY; the off-line ROP output will not be sent to any output device.

Caution: By selecting the TTY option, the IOP associated with it is implicitly assigned to the off-line side.

b = Application parameter for the off-line side. The range is a single alphanumeric character. This is equivalent to the function of poke 42 on the EAI page during normal boot. The default is no APARM.
option set for the off-line side.

\( c \)

\( = \) UNIX® RTR bootstrap initialization level for the off-line side. Valid value(s):
2 \( = \) The initial CU system configuration must be ACT or STBY. The out-of-service (OOS) option will not override this requirement.
3 \( = \) Boot and load new equipment configuration database (ECD).
4 \( = \) Boot and load new ECD and clear the protected application segment (PAS) (default).

Caution: These levels apply to UNIX® RTR initialization. Different applications may or may not support all of them.

\( d \)

\( = \) By selecting the UCL option, some application prechecks will be overridden. The default enforces all prechecks. Application initiated aborts will be ignored. Because the UCL option inhibits system recover actions, it should be used only in a software release transition procedure under technical guidance. Misuse can cause call processing downtime.

\textbf{NOTE:} Using the UCL option requires a password (’d’); to obtain it, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual. The value of ’d’ will change every time the UCL option is entered. Using the UCL option always requires contacting technical assistance.

4. SYSTEM RESPONSE

\( \text{IP} \) \( = \) In progress.

\( \text{NG} \) \( = \) No good.

\( \text{RL} \) \( = \) Retry later. Some activity is running that is incompatible with EXC:OFLBOOT (for example, rcvecd).

EXC:PING-A

**Software Release:** 5E14 - 5E16(1)

**Command Group:** TRKLN

**Application:** 5

**Type:** Input

1. **PURPOSE**

The Packet Internet Grooper (PING) is used to verify a Transmission Control Protocol/Internet Protocol (TCP/IP) connection between the Source Internet Protocol (SRCIP) address and the Internet Protocol Destination (IPDEST) address. PING sends a request message with data to the IPDEST address and expects a reply from IPDEST, returning the data sent in the request.

Note: Only one EXC:PING input message is allowed per SM or CHNG until the EXC:PING processing is complete. The system response will indicate when the EXC:PING is still in progress. The response message is RL - PING IN PROGRESS. To enter a valid EXC:PING, repeat the input message after an EXC:PING output.

2. **FORMAT**

[1] EXC:PING,SM=a[,SRCIP=e-f-g-h][,BYTES=i]...
   ...[,TIMEOUT=j][,REPEAT=k],IPDEST=l-m-n-o;

[2] EXC:PING,CHNG=a-b-c-d[,SRCIP=e-f-g-h][,BYTES=i]...
   ...[,TIMEOUT=j][,REPEAT=k],IPDEST=l-m-n-o;

3. **EXPLANATION OF MESSAGE**

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **a** = SM number.

- **b** = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **c** = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- **d** = Channel group (CHNG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: SRCIP is the address the PING is sent from. Each entry (e-h) is part of the SRCIP address. The default is the SRCIP of the SM or CHNG.

- **e** = SRCIP. The range is 0-255.

- **f** = SRCIP. The range is 0-255.

- **g** = SRCIP. The range is 0-255.

- **h** = SRCIP. The range is 0-255.

- **i** = BYTES to send in PING Message. This is the number of bytes that will be sent to the IPDEST and...
the same number of bytes received from the IPDEST. The range is 1-126. The default is 126.

\[ j \] = TIMEOUT in seconds waiting from a reply from IPDEST. The range is 1-10. The default is 5.

\[ k \] = REPEAT the number of times to send the message to IPDEST. The range is 1-5. The default is 3.

Note: IPEST is the address the PING is sent to. Each entry (l-o) is part of the IPDEST address.

\[ l \] = IPDEST. The range is 0-255.

\[ m \] = IPDEST. The range is 0-255.

\[ n \] = IPDEST. The range is 0-255.

\[ o \] = IPDEST. The range is 0-255.

4. SYSTEM RESPONSE

\[ \text{NG} \] = No good. The message was not accepted because the SM is isolated or the equipment does not exist. May also include:
- NOT VALID FOR PH = The EXC:PING is not valid for this PH. The feature is not equipped on this PH.
- NOT VALID FOR SM = The EXC:PING is not valid for this SM. The feature is not equipped for this SM.
- NOT VALID PROCESSOR = A invalid processor type was requested, other than SM or PH.

\[ \text{PF} \] = Printout follows. The message was accepted and a printout will follow.

\[ \text{RL} \] = Retry later. May also include:
- PING IN PROGRESS = Only one ping input message is allowed to execute on the same SM or PH.
- CREATE PING TP FAILED = Failed to create the PING Terminal Process.
- MESSAGE TO PING TP FAILED = Message sent to the PING Terminal Process Failed.
- TIMEOUT WAITING TO PROCESS PINGDATA = A timeout occurred waiting for the PING DATA message in the PING Terminal Process.
- BAD DEFAULT = An incorrect message was received in the PING Terminal Process.
- SOCKET NOT CREATED = A socket could not be created.
- BIND FAILED = A BIND to the socket could not be completed.
- SOCKOPT FAILED (BLKING) = When setting BLOCKING for this application, a failure occurred.
- SOCKOPT FAILED (TO) = When setting the TIMEOUT for this application, a failure occurred.

Input Message(s):

NA

Output Message(s):

EXC:PING
1. PURPOSE

The packet internet groper (PING) is used to verify a transmission control protocol/internet protocol (TCP/IP) connection between the source internet protocol (SRCIP) address and the internet protocol destination (IPDEST) address. PING sends a request message with data to the IPDEST address and expects a reply from IPDEST, returning the data sent in the request.

Only one EXC:PING input message is allowed per SM, CHNG, or OFI until the EXC:PING processing is complete. The system response will indicate when the EXC:PING is still in progress. The response message is RL - PING IN PROGRESS. To enter a valid EXC:PING, repeat the input message after a EXC:PING output.

2. FORMAT

[1] EXC:PING,SM=a[,SRCIP=e-e-e-e][,BYTES=i][,TIMEOUT=j][,REPEAT=k],IPDEST=l-l-l-l;

[2] EXC:PING,CHNG=a-b-c-d[,SRCIP=e-e-e-e][,BYTES=i][,TIMEOUT=j][,REPEAT=k],IPDEST=l-l-l-l;

[3] EXC:PING,OFI=a-m-n-o[,SRCIP=e-e-e-e|BROADCAST][,BYTES=i][,TIMEOUT=j][,REPEAT=k],IPDEST=l-l-l-l;

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Channel group (CHNG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: SRCIP is the address the PING is sent from. Each entry (variable `e`) is part of the SRCIP address. The default is the SRCIP of the SM or CHNG.

e = SRCIP number. The range is 0-255.

i = Bytes to send in the PING message. This is the number of bytes that will be sent to the IPDEST and the same number of bytes received from the IPDEST. The range is 1-126. The default is 126.
j = Timeout in seconds waiting from a reply from IPDEST. The range is 1-10. The default is 5.
k = Repeat the number of times to send the message to IPDEST. The range is 1-5. The default is 3.

IPDEST is the address the PING is sent to. Each entry (variable ‘i’) is part of the IPDEST address. If the BROADCAST option is used, it is only valid with the OFI identifier. BROADCAST can be used to obtain the IP address of the router associated with the OFI when that IP address is unknown.
l = IPDEST number. The range is 0-255.
m = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because the SM is isolated or the equipment does not exist. May also include:
   - NOT VALID FOR PH = The EXC:PING is not valid for this PH. The feature is not equipped on this PH.
   - NOT VALID FOR OFI = The EXC:PING is not valid for this OFI. The feature is not equipped for this OFI.
   - NOT VALID FOR NON-SELECTED OFI = The OFI side specified is the non-selected side. The selected side needs to be chosen.
   - NOT VALID FOR SM = The EXC:PING is not valid for this SM. The feature is not equipped for this SM.
   - NOT VALID PROCESSOR = A invalid processor type was requested, other than SM or PH.
   - NOT VALID OPTION = The BROADCAST option can only be used with the OFI identifier.
   - OFI IS OOS = The specified OFI is out-of-service.
   - OFI NOT AVAILABLE = The OFI chosen is not available.
   - UNIT DOES NOT EXIST = An invalid OFI was specified.

PF = Printout follows. The message was accepted and a printout will follow.

RL = Retry later. May also include:
   - BAD DEFAULT = An incorrect message was received in the PING terminal process.
   - BIND FAILED = A BIND to the socket could not be completed.
   - CREATE PING TP FAILED = Failed to create the PING terminal process.
   - MESSAGE TO PING TP FAILED = Message sent to the PING terminal process failed.
   - PING IN PROGRESS = Only one ping input message is allowed to execute on the same SM or PH.
   - SOCKET NOT CREATED = A socket could not be created.
   - SOCKOPT FAILED(BLKING) = When setting BLOCKING for this application, a failure occurred.
   - SOCKOPT FAILED(TO) = When setting the TIMEOUT for this application, a failure occurred.
   - TIMEOUT WAITING TO PROCESS PINGDATA = A timeout occurred waiting for the PING DATA message in the PING terminal process.

Other Manual(s):
235-105-110  System Maintenance Requirements and Tools
EXC:PM-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests the monitoring of a particular level 2 or level 3 or level 7 protocol on a given interface terminating on the switch provided the protocol stack to be monitored is supported on the interface.

The monitoring function records frames or packets or messages transmitted or received for the requested recording protocol level. The frames or packets or messages recorded are those surrounding a particular specified event, either a particular frame or packet or message or a particular protocol error record (PER). Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER. Depending on the protocol, the protocol monitoring session will be recorded on either an SM or a PH. The following table indicates which processor records the protocol exchange. The number of sessions which can concurrently record on a given processor are:

- 8 per office.
- 2 per SM and 4 per SM 2000.
- 2 per PH and PH2.
- 3 per PH3 and PH4.
- 2 per PHV1, PHV2, and PHV3.
- 1 per PH4 connected to Frame Relay Bearer Channels (FRBCs).

Note: It is very important for the user to understand that when protocol monitoring is turned on to monitor a Frame Relay Bearer Channel connected to a PH4, it will result in real time performance degradation of the PH4. Therefore, the user is strongly urged to limit the duration of protocol monitoring session on a Frame Relay Bearer Channel to the absolute bare minimum.

PROTOCOL RECORDING PROCESSOR

Up to eighty frames or packets or messages can be saved; the total number saved is dependent on the length of each frame or packet or message.

Format 1 is specified when a recording session is to be terminated upon the occurrence of either any PER or a specific PER found on the monitored channel.

Format 2 is specified when a recording session is to be terminated upon the occurrence of a particular frame or packet or message traveling in the specified direction between switch and customer premises equipment (CPE).

2. FORMAT
3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**PER**
- Terminate the recording session if a valid PER occurs on the channel for the specified trigger protocol. If a protocol error code (PEC) is not specified, then any valid PER for the trigger protocol will terminate the session.

**PRINT**
- Print the output on the receive-only printer (ROP).

Note: If the request is initiated from the Master Control Center (MCC) or a supplemental trunk and line workstation (STLWS), the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

**XLATE**
- Translate the hexadecimal data messages of the recording session into ASCII and store the translated output in a file on the moving head disk (MHD) of the administrative module (AM). Translation capability is a "secured feature". If the feature is not activated, the information will be reported in hex format. Translation is not available for all protocols.

The base translation capability is controlled by "special feature" #32. Enhancements to the base translation capability are built on top of the base translation capability. Currently, the translator has one translation enhancement. The "special feature" #151 enhancement allows translation of the National ISDN (NI) protocol changes. The base translation capability "special feature" #32 supports translation for LAPB, LAPD, LAPF, Q.931 (custom only), X.25, X.75, and RLP protocols. The NI translation capability "special feature" #151 adds translation for Q.931 (National ISDN) protocol, and also to a lesser extent for the X.25 and X.75 (National ISDN changes) protocols.

If the translation of the protocol is not supported, the information will be reported in hex format. The file name will be formatted as atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ASCII translation file (ATF) in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

**a**
- Line identification. Valid value(s):
  - AIUEN=c-1^1-m^1-n^1
  - DEN=c-m-n-o
  - DN=b
  - DNUSEOC=c-f^1-r-t
  - DNUSTMC=c-f^1-r-t

MLHG=h-i
NEN=c-f\textsuperscript{1}-g\textsuperscript{1}-u\textsuperscript{1}-h\textsuperscript{1}-i\textsuperscript{1}-v\textsuperscript{1}-j\textsuperscript{1}
PKTDN=b
PLTEN=c-w\textsuperscript{1}-x\textsuperscript{1}-y\textsuperscript{1}-z\textsuperscript{1}
PORT=c-p
TKGMN=f-g
PSUEN=c-q\textsuperscript{1}-r\textsuperscript{1}-t\textsuperscript{1}-e

b = The directory number.
c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = PH channel member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
p = Logical port number.
q = Integrated digital carrier unit. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

r = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = RT Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Channel to be monitored (applies only to basic rate interfaces). The default channel will be based on the method of line identification and, optionally, the protocol level to be monitored. The channel option will be required when invoked with the DN or multi-line hunt group line identifiers, and these identifiers reflect multiple packet services. In other words, if a channel cannot be determined (such as, a user has a circuit service on the D-channel, a packet service on the D-channel, and a packet service on the B-channel and all services use the same DN), the request will be denied. It will, however, be accepted if the input message included the appropriate channel option.

D = D-channel.

B1 = B1-channel. This option can only be used with permanent packet B-channel (PPB).

B2 = B2-channel. This option can only be used with PPB.

ODPRI = Primary on-demand packet B-channel (valid for single and multiple on-demand B-channel packet switching). This option can only be used with on-demand B-channel services. With on-demand packet services, either B-channel is available for use by the on-demand packet service. There is no direct relationship between the on-demand packet service and a B-channel. The first B-channel used by the on-demand packet service is considered the primary channel.

ODPSEC = Secondary on-demand packet B-channel (valid for multiple on-demand B-channel packet switching only). This option can only be used with on-demand B-channel services. The second B-channel used by the on-demand packet service is considered the secondary channel.

v = Protocol level (PROT). Valid value(s):

LAPD = Monitor the LAPD protocol (default, if determined/requested channel is D).

LAPB = Monitor the LAPB protocol (default, if determined/requested channel is other than D).

LAPF = Monitor the LAPF protocol

Q931 = Monitor the Q.931 protocol.

TMC = Monitor the TMC protocol.

V120 = Monitor the V.120 protocol.

X25 = Monitor the X.25 protocol.
X75  = Monitor the X.75 protocol.
X75P = Monitor the X.75' protocol.
CESHL2 = Monitor the CESHL2 protocol.
CESHL3 = Monitor the CESHL3 protocol.
RLP  = Monitor the RLP protocol.
ISLP = Monitor the ISLP protocol.

w = Protocol's trigger level (TRIGLVL). The default depends on PROT. Valid value(s):

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>TRIGLVL</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAPD</td>
<td>LEVEL2</td>
</tr>
<tr>
<td>LAPF</td>
<td>LEVEL2</td>

</tr>
<tr>
<td>RLP</td>
<td>LEVEL7</td>
</tr>
<tr>
<td>ISLP</td>
<td>LEVEL2</td>
</tr>
</tbody>
</table>

Note: The trigger level/protocol must be terminated on the same processor as the recording protocol.

Note: For CESHL2, CESHL3, ISLP, and RLP protocols there is only one triggering level which is the above indicated default value.

x = Specific PEC to trigger session termination. Refer to the 235-600-755 for details.

Note: This field must be enclosed in double quotation marks.

y = TRIGVAL that terminates the recording session. Valid value(s):

INTR = X.75' or X75 interrupt packet.
INTRCNF = X.75' or X75 interrupt confirmation packet.
RESET = X.75' or X75 reset request packet.
RESETCNF = X.75' or X75 reset confirmation packet.
RESTART = X.75' or X75 restart request packet.
RESTARTCNF = X.75' or X75 restart confirmation packet.
RNR = X.75' or X75 receiver not ready packet.
RR = X.75' or X75 receiver ready packet.

**CESHL2**

DISC = CESHL2 disconnect frame.
DM = CESHL2 disconnect mode frame.
FRMR = CESHL2 S type reject frame.
I = CESHL2 information frame.
RR = CESHL2 receive ready frame.
RNR = CESHL2 receive not ready frame.
REJ = CESHL2 U type reject frame.
SABME = CESHL2 set asynchronous balanced mode extended frame.
UA = CESHL2 unnumbered acknowledgment frame.
UI = CESHL2 unnumbered information frame.
XID = CESHL2 identification frame.

**CESHL3**

BURST DTMF = CESHL3 general burst Dual Tone Multi-Frequency (DTMF) message.
START DTMF = CESHL3 start continuous DTMF message.
STOP DTMF = CESHL3 stop continuous DTMF message.
CLK ADJUST = CESHL3 clock adjust message.
CONNECT = CESHL3 connect message.
JOIN = CESHL3 join message.
REMOVE = CESHL3 remove message.
ACK = CESHL3 acknowledgment message.
NACK = CESHL3 negative acknowledgment message.
DROP = CESHL3 drop message.
REV VOICE = CESHL3 reverse voice traffic message.
REV MIXED = CESHL3 reverse mixed traffic message.
FWD VOICE = CESHL3 forward voice traffic message.
FWD VIXED = CESHL3 forward mixed traffic message.

**RLP**

INV = RLP invalid message.
UNSEG = RLP unsegmented data message.
FIRST SEG = RLP first segmented data message.
SECOND SEG = RLP second segmented data message.
LAST SEG = RLP last segmented data message.
IDLE = RLP idle message.
ISFF = RLP intersegment fill message.
NAK = RLP negative acknowledgment fill message.
SYNC = RLP synchronous message.
ACK = RLP acknowledgment message.
SYNC ACK = RLP synchronous acknowledgment message.

*z* = Direction (DIR) of frame or packet or message to trigger upon. Valid value(s):
RCV = Trigger if the frame or packet or message is received by the switch from the CPE.
   RCV is the default.
XMT = Trigger if the frame or packet or message is transmitted from the switch to the
CPE.

a \= Offset (OFF) of the number of frames to be recorded after detection of the trigger event (default is 0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b \= Duration (DUR) of the recording session in seconds (default is 3600). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c \= Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d \= Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e \= Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f \= Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g \= Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h \= Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i \= Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j \= Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k \= Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l \= Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m \= AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n \= AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p \= Allows the user to optionally specify the type of messages to be recorded when monitoring LAP D protocol on a Frame Relay Bearer Channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received.

Valid value(s):
CTRL \= record only control messages. CTRL is the default value.
DATA \= record only a summary of the transmitted or received user data frame.
ALL \= record both control messages and a summary of the transmitted or received
user data frame.

= Allows the user to optionally specify the type of messages or frames to be recorded when protocol monitoring is on a Speech Handler or an Autoplex® Data Trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol.

Valid value(s):
CTRL = requesting recording of control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
TRAF = requesting recording of UI traffic messages for CESHL3 protocol.
IP = requesting recording of Inter-Processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
RLP = requesting recording of non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.
ALL = requesting recording of all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

= Packet Switching Unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Peripheral Control and Timing (PCT) Line and Trunk Unit number (PLTU). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PCT Facility Interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Channel number (CHAN.) Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or was not acceptable.
PF = Printout follows. The request has been accepted and is in progress. Followed by the EXC:PM output message.
RL = Retry later. The system is busy.

235-190-120 Common Channel Signaling Service Features
235-600-755 Protocol Error Record Descriptions
235-900-341 National ISDN Basic Rate Interface Specification
1. PURPOSE

Requests the monitoring of a particular level 2 or level 3 or level 7 protocol on a given interface terminating on the switch provided the protocol stack to be monitored is supported on the interface.

The monitoring function records frames or packets or messages transmitted or received for the requested recording protocol level. The frames or packets or messages recorded are those surrounding a particular specified event, either a particular frame or packet or message or a particular protocol error record (PER). Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER. Depending on the protocol, the protocol monitoring session will be recorded on either an SM or a PH. The following table indicates which processor records the protocol exchange. The number of sessions which can concurrently record on a given processor are:

- 8 per office.
- 2 per SM and 4 per SM 2000.
- 2 per PH and PH2.
- 3 per PH3 and PH4.
- 2 per PHV1, PHV2, and PHV3.
- 1 per PH4 connected to frame relay bearer channels (FRBCs).

It is very important for the user to understand that when protocol monitoring is turned on to monitor a frame relay bearer channel connected to a PH4, it will result in real time performance degradation of the PH4. Therefore, the user is strongly urged to limit the duration of protocol monitoring session on a frame relay Bearer channel to the absolute bare minimum.

Up to eighty frames or packets or messages can be saved; the total number saved is dependent on the length of each frame or packet or message.

Format 1 is specified when a recording session is to be terminated upon the occurrence of either any PER or a specific PER found on the monitored channel.

Format 2 is specified when a recording session is to be terminated upon the occurrence of a particular frame or packet or message traveling in the specified direction between switch and customer premises equipment (CPE).

2. FORMAT

[1] EXC:PM,a,[,CH=u][,PROT=v][,TRIGLVL=w][,PLANE=p1][,MSGGRP=o1]...PER[="x"][,OFF=a1][,DUR=b1][,PRINT][,XLATE];

[2] EXC:PM,a,[,CH=u][,PROT=v][,TRIGLVL=w][,PLANE=p1][,MSGGRP=o1]...TRIGVAL=y[,DIR=z][,OFF=a1][,DUR=b1][,PRINT][,XLATE];

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.
PER = Terminate the recording session if a valid PER occurs on the channel for the specified trigger protocol. If a protocol error code (PEC) is not specified, then any valid PER for the trigger protocol will terminate the session.

PRINT = Print the output on the ROP. If the request is initiated from the Master Control Center (MCC) or a supplemental trunk and line workstation (STLWS), the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

Xlate = Translate the hexadecimal data messages of the recording session into ASCII and store the translated output in a file on the moving head disk (MHD) of the administrative module (AM). Translation capability is a "secured feature". If the feature is not activated, the information will be reported in hex format. Translation is not available for all protocols.

The base translation capability is controlled by "special feature" #32. Enhancements to the base translation capability are built on top of the base translation capability. Currently, the translator has one translation enhancement. The "special feature" #151 enhancement allows translation of the national ISDN (NI) protocol changes. The base translation capability "special feature" #32 supports translation for LAPB, LAPD, LAPF, Q.931 (custom only), X.25, X.75, and RLP protocols. The NI translation capability "special feature" #151 adds translation for Q.931 (National ISDN) protocol, and also to a lesser extent for the X.25 and X.75 (National ISDN changes) protocols.

If the translation of the protocol is not supported, the information will be reported in hex format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ASCII translation file (ATF) in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

a = Line identification. Valid value(s):
AIUEN=c-l^1-m^1-n^1

PSUEN=c-q^1-r^1-t^1-e
VBRI=c-a^2
VTRK=c-b^2-c^2

b = The directory number.
c  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = PH channel member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i  = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j  = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k  = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l  = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m  = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n  = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o  = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p  = Logical port number.

q  = Integrated digital carrier unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r  = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s  = RT Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t  = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u  = Channel to be monitored (applies only to basic rate interfaces). The default channel will be based on the method of line identification and, optionally, the protocol level to be monitored. The channel
option will be required when invoked with the DN or multi-line hunt group line identifiers, and these identifiers reflect multiple packet services. In other words, if a channel cannot be determined (such as, a user has a circuit service on the D-channel, a packet service on the D-channel, and a packet service on the B-channel and all services use the same DN), the request will be denied. It will, however, be accepted if the input message included the appropriate channel option.

\[ \text{D} = \text{D-channel}. \]
\[ \text{B1} = \text{B1-channel}. \] This option can only be used with permanent packet B-channel (PPB).
\[ \text{B2} = \text{B2-channel}. \] This option can only be used with PPB.
\[ \text{ODPPRI} = \text{Primary on-demand packet B-channel (valid for single and multiple on-demand B-channel packet switching). This option can only be used with on-demand B-channel services. With on-demand packet services, either B-channel is available for use by the on-demand packet service. There is no direct relationship between the on-demand packet service and a B-channel. The first B-channel used by the on-demand packet service is considered the primary channel.} \]
\[ \text{ODPSEC} = \text{Secondary on-demand packet B-channel (valid for multiple on-demand B-channel packet switching only). This option can only be used with on-demand B-channel services. The second B-channel used by the on-demand packet service is considered the secondary channel.} \]

\[ \text{v} = \text{Protocol level (PROT). Valid value(s):} \]
\[ \text{CESHL2} = \text{Monitor the CESHL2 protocol.} \]
\[ \text{CESHL3} = \text{Monitor the CESHL3 protocol.} \]
\[ \text{ISLP} = \text{Monitor the ISLP protocol.} \]
\[ \text{LAPD} = \text{Monitor the LAPD protocol (default, if determined/requested channel is D).} \]
\[ \text{LAPB} = \text{Monitor the LAPB protocol (default, if determined/requested channel is other than D).} \]
\[ \text{LAPF} = \text{Monitor the LAPF protocol} \]
\[ \text{Q931} = \text{Monitor the Q.931 protocol.} \]
\[ \text{RLP} = \text{Monitor the RLP protocol.} \]
\[ \text{TMC} = \text{Monitor the TMC protocol.} \]
\[ \text{V120} = \text{Monitor the V.120 protocol.} \]
\[ \text{X25} = \text{Monitor the X.25 protocol.} \]
\[ \text{X75} = \text{Monitor the X.75 protocol.} \]
\[ \text{X75P} = \text{Monitor the X.75' protocol.} \]

\[ \text{w} = \text{Protocol's trigger level (TRIGLVL). The default depends on PROT. Valid value(s):} \]
\[ \text{PROTOCOL} \quad \text{TRIGLVL} \]
\[ \text{LAPD} \quad \text{LEVEL2} \]
\[ \text{LAPF} \quad \text{LEVEL2} \]
\[ \text{LAPB} \quad \text{LEVEL2} \]
\[ \text{X25} \quad \text{LEVEL3} \]
\[ \text{X75P} \quad \text{LEVEL3} \]
\[ \text{Q931} \quad \text{LEVEL3} \]
\[ \text{X75} \quad \text{LEVEL3} \]
\[ \text{TMC} \quad \text{LEVEL3} \]
\[ \text{V120} \quad \text{LEVEL3} \]
\[ \text{IDLC} \quad \text{LEVEL7} \]
\[ \text{ATS} \quad \text{LEVEL7} \]
\[ \text{CESHL2} \quad \text{LEVEL2} \]
\[ \text{CESHL3} \quad \text{LEVEL3} \]
RLP LEVEL7  
ISLP LEVEL2  

Note: The trigger level/protocol must be terminated on the same processor as the recording protocol.  
Note: For CESHL2, CESHL3, ISLP, and RLP protocols there is only one triggering level which is the above indicated default value.  

\* = Specific PEC to trigger session termination. Refer to the 235-600-755 for details.  
This field must be enclosed in double quotation marks.  

\( y \) = TRIGVAL that terminates the recording session. Valid value(s):

SACK = RLP3 synchronous acknowledgment message.
SEG = RLP3 segmented data message.
FILL = RLP3 fill frame message.

ISLP

UI = ISLP unnumbered information frame.

\(a^1\) = Offset (OFF) of the number of frames to be recorded after detection of the trigger event (default is 0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\(b^1\) = Duration (DUR) of the recording session in seconds (default is 3600). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c\(^1\) = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\(^1\) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\(^1\) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^1\) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^1\) = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^1\) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^1\) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^1\) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^1\) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^1\) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^1\) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^1\) = Allows the user to optionally specify the type of messages to be recorded when monitoring LAP D protocol on a frame relay bearer channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

CTRL = Record only control messages. CTRL is the default value.

DATA = Record only a summary of the transmitted or received user data frame.

ALL = Record both control messages and a summary of the transmitted or received user data frame.

o\(^1\) = Allows the user to optionally specify the type of messages or frames to be recorded when protocol monitoring is on a speech handler or an Autoplex\textsuperscript® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):
CTRL = Requesting recording of control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.

TRAF = Requesting recording of UI traffic messages for CESHL3 protocol.

IP = Requesting recording of inter-processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.

RLP = Requesting recording of non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.

ALL = Requesting recording of all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.

q^1 = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r^1 = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t^1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u^1 = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v^1 = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w^1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x^1 = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y^1 = Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z^1 = Channel number (CHAN.). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a^2 = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b^2 = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c^2 = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
NG = No good. The message was not recognized or was not acceptable.

PF = Printout follows. The request has been accepted and is in progress. Followed by the EXC:PM output message.

RL = Retry later. The system is busy.

### 1. PURPOSE

Requests the monitoring of a particular level 2 or level 3 or level 7 protocol on a given interface terminating on the switch provided the protocol stack to be monitored is supported on the interface.

The monitoring function records frames or packets or messages transmitted or received for the requested recording protocol level. The frames or packets or messages recorded are those surrounding a particular specified event, either a particular frame or packet or message or a particular protocol error record (PER). Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

Depending on the protocol, the protocol monitoring session will be recorded on either an SM or a PH. The following table indicates which processor records the protocol exchange. The number of sessions which can concurrently record on a given processor are:

- — 8 per office.
- — 2 per SM and 4 per SM 2000.
- — 2 per PH and PH2.
- — 3 per PH3 and PH4.
- — 2 per PHV1, PHV2, and PHV3.
- — 1 per PH4 connected to frame relay bearer channels (FRBCs).
- — 3 per PHE2.

It is very important for the user to understand that when protocol monitoring is turned on to monitor a frame relay bearer channel connected to a PH4, it will result in real time performance degradation of the PH4. Therefore, the user is strongly urged to limit the duration of protocol monitoring session on a frame relay Bearer channel to the absolute bare minimum.

Up to eighty frames or packets or messages can be saved; the total number saved is dependent on the length of each frame or packet or message.
Format 1 is specified when a recording session is to be terminated upon the occurrence of either any PER or a specific PER found on the monitored channel.

Format 2 is specified when a recording session is to be terminated upon the occurrence of a particular frame or packet or message traveling in the specified direction between switch and customer premises equipment (CPE).

Format 3 is introduced with the PCF on PHE2 feature. It is specified when a recording session is to be terminated upon the occurrence of a particular frame or packet or message traveling in the specified direction between switch and the mobile station (MS).

Format 4 is specified when a recording session is to be terminated upon the occurrence of either any PER or a specific PER found on the monitored PCF trunk.

3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**PER** = Terminate the recording session if a valid PER occurs on the channel for the specified trigger protocol. If a protocol error code (PEC) is not specified, then any valid PER for the trigger protocol will terminate the session.

**PRINT** = Print the output on the ROP.

If the request is initiated from the Master Control Center (MCC) or a supplemental trunk and line workstation (STLWS), the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

**XLATE** = Translate the hexadecimal data messages of the recording session into ASCII and store the
translated output in a file on the moving head disk (MHD) of the administrative module (AM). Translation capability is a "secured feature". If the feature is not activated, the information will be reported in hex format. Translation is not available for all protocols.

The base translation capability is controlled by "special feature" #32. Enhancements to the base translation capability are built on top of the base translation capability. Currently, the translator has one translation enhancement. The "special feature" #151 enhancement allows translation of the national ISDN (NI) protocol changes. The base translation capability "special feature" #32 supports translation for LAPB, LAPD, LAPF, Q.931 (custom only), X.25, X.75, and RLP protocols. The NI translation capability "special feature" #151 adds translation for Q.931 (national ISDN) protocol, and also to a lesser extent for the X.25 and X.75 (national ISDN changes) protocols.

After the introduction of PCF on PHE2 feature, the translator also allows the translation of A10 and A11 protocols.

If the translation of the protocol is not supported, the information will be reported in hex format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ASCII translation file (ATF) in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

a = Line identification. Valid value(s):

AIUEN=c-11-m1-n1

VTRK=c-b2-c2

b = The directory number.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= PH channel member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Logical port number.

q = Integrated digital carrier unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = RT Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Channel to be monitored (applies only to basic rate interfaces). The default channel will be based on the method of line identification and, optionally, the protocol level to be monitored. The channel option will be required when invoked with the DN or multi-line hunt group line identifiers, and these identifiers reflect multiple packet services. In other words, if a channel cannot be determined (such as, a user has a circuit service on the D-channel, a packet service on the D-channel, and a packet service on the B-channel and all services use the same DN), the request will be denied. It will, however, be accepted if the input message included the appropriate channel option.

D = D-channel.
**B1**  = B1-channel. This option can only be used with permanent packet B-channel (PPB).
**B2**  = B2-channel. This option can only be used with PPB.
**ODPPRI**  = Primary on-demand packet B-channel (valid for single and multiple on-demand B-channel packet switching). This option can only be used with on-demand B-channel services. With on-demand packet services, either B-channel is available for use by the on-demand packet service. There is no direct relationship between the on-demand packet service and a B-channel. The first B-channel used by the on-demand packet service is considered the primary channel.
**ODPSEC**  = Secondary on-demand packet B-channel (valid for multiple on-demand B-channel packet switching only). This option can only be used with on-demand B-channel services. The second B-channel used by the on-demand packet service is considered the secondary channel.

\[v\]  = Protocol level (PROT). Valid value(s):
- CESHL2 = Monitor the CESHL2 protocol.
- CESHL3 = Monitor the CESHL3 protocol.
- ISLP = Monitor the ISLP protocol.
- LAPD = Monitor the LAPD protocol (default, if determined/requested channel is D).
- LAPB = Monitor the LAPB protocol (default, if determined/requested channel is other than D).
- LAPF = Monitor the LAPF protocol
- Q931 = Monitor the Q.931 protocol.
- RLP = Monitors the RLP protocol.
- TMC = Monitor the TMC protocol.
- V120 = Monitor the V.120 protocol.
- X25 = Monitor the X.25 protocol.
- X75 = Monitor the X.75 protocol.
- X75P = Monitor the X.75' protocol.

\[w\]  = Protocol's trigger level (TRIGLVL). The default depends on PROT. Valid value(s):

\( z \) = Direction (DIR) of frame or packet or message to trigger upon. Valid value(s):

- RCV = Trigger if the frame or packet or message is received by the switch from the CPE. RCV is the default.
- XMT = Trigger if the frame or packet or message is transmitted from the switch to the CPE.

\( a \) = Offset (OFF) of the number of frames to be recorded after detection of the trigger event (default is 0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b \) = Duration (DUR) of the recording session in seconds (default is 3600). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c \) = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d \) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e \) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

\( f \) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g \) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h \) = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i \) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j \) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l \) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m \) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n \) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p \) = Allows the user to optionally specify the type of messages to be recorded when monitoring LAP D protocol on a frame relay bearer channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

- **CTRL** = Record only control messages. CTRL is the default value.
- **DATA** = Record only a summary of the transmitted or received user data frame.
- **ALL** = Record both control messages and a summary of the transmitted or received user data frame.

\( o \) = Allows the user to optionally specify the type of messages or frames to be recorded when protocol monitoring is on a speech handler or an AUTOPLEX® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):

- **CTRL** = Requesting recording of control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
- **TRAF** = Requesting recording of UI traffic messages for CESHL3 protocol.
- **IP** = Requesting recording of inter-processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
- **RLP** = Requesting recording of non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.
- **ALL** = Requesting recording of all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and, UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.
- Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Channel number (CHAN.). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- IP address field. Valid value is number between 0-255.
- Protocol (PROT) level for PCF (Format 3 and Format 4). Valid value(s):
  - A10 = Monitor the A10 protocol.
  - A11 = Monitor the A11 protocol.
- Protocol's trigger level (TRIGLVL). The default depends on PROT. Valid value(s):

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>TRIGLVL</th>
</tr>
</thead>
<tbody>
<tr>
<td>A10</td>
<td>LEVEL7</td>
</tr>
<tr>
<td>A11</td>
<td>LEVEL7</td>
</tr>
</tbody>
</table>

- PCF PM TRIGVAL that terminates the recording session. Valid value(s):

<table>
<thead>
<tr>
<th>Protocol(s):</th>
<th>Value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>A10</td>
<td>A10_UNKNOWN = A10 unknown frame type. GRE = A10 GRE frame.</td>
</tr>
<tr>
<td>A11</td>
<td>A11_UNKNOWN = A11 unknown message type.</td>
</tr>
</tbody>
</table>
REGREQ = A11 request message.
REGRPL = A11 reply message.
REGUPD = A11 update message.
REGACK = A11 acknowledge message.

h^2 = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i^2 = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j^2 = Optical carrier level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k^2 = Synchronous transport signal level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or was not acceptable.

PF = Printout follows. The request has been accepted and is in progress. Followed by the EXC:PM output message.

RL = Retry later. The system is busy.

1. PURPOSE

Requests the monitoring of a particular level 2 or level 3 or level 7 protocol on a given interface terminating on the switch provided the protocol stack to be monitored is supported on the interface.

The monitoring function records frames or packets or messages transmitted or received for the requested recording protocol level. The frames or packets or messages recorded are those surrounding a particular specified event, either a particular frame or packet or message or a particular protocol error record (PER). Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

Depending on the protocol, the protocol monitoring session will be recorded on either an SM or a PH. The following table indicates which processor records the protocol exchange. The number of sessions which can concurrently record on a given processor are:

- 8 per office.
- 2 per SM and 4 per SM 2000.
- 2 per PH and PH2.
- 3 per PH3 and PH4.
- 2 per PHV1, PHV2, and PHV3.
- 1 per PH4 connected to frame relay bearer channels (FRBCs).
- 3 per PHE2.

It is very important for the user to understand that when protocol monitoring is turned on to monitor a frame relay bearer channel connected to a PH4, it will result in real time performance degradation of the PH4. Therefore, the user is strongly urged to limit the duration of protocol monitoring session on a frame relay Bearer channel to the absolute bare minimum.

Up to eighty frames or packets or messages can be saved; the total number saved is dependent on the length of each frame or packet or message.

Format 1 is specified when a recording session is to be terminated upon the occurrence of either any PER or a specific PER found on the monitored channel.

Format 2 is specified when a recording session is to be terminated upon the occurrence of a particular frame or packet or message traveling in the specified direction between switch and customer premises equipment (CPE).
Format 3 is introduced with the PCF on PHE2 feature. It is specified when a recording session is to be terminated upon the occurrence of a particular frame or packet or message traveling in the specified direction between switch and the mobile station (MS).

Format 4 is specified when a recording session is to be terminated upon the occurrence of either any PER or a specific PER found on the monitored PCF trunk.

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

PER = Terminate the recording session if a valid PER occurs on the channel for the specified trigger protocol. If a protocol error code (PEC) is not specified, then any valid PER for the trigger protocol will terminate the session.

PRINT = Print the output on the ROP.

If the request is initiated from the Master Control Center (MCC) or a supplemental trunk and line workstation (STLWS), the output is automatically printed on the ROP. Any other device requires this option for printing output on the ROP.

XLATE = Translate the hexadecimal data messages of the recording session into ASCII and store the translated output in a file on the moving head disk (MHD) of the administrative module (AM). Translation capability is a "secured feature". If the feature is not activated, the information will be reported in hex format. Translation is not available for all protocols.

The base translation capability is controlled by "special feature" #32. Enhancements to the base translation capability are built on top of the base translation capability. Currently, the translator has
one translation enhancement. The "special feature" #151 enhancement allows translation of the national ISDN (NI) protocol changes. The base translation capability "special feature" #32 supports translation for LAPB, LAPD, LAPF, Q.931 (custom only), X.25, X.75, and RLP protocols. The NI translation capability "special feature" #151 adds translation for Q.931 (National ISDN) protocol, and also to a lesser extent for the X.25 and X.75 (National ISDN changes) protocols.

After the introduction of PCF on PHE2 feature, the translator also allows the translation of A10 and A11 protocols.

If the translation of the protocol is not supported, the information will be reported in hex format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ASCII translation file (ATF) in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

a = Line identification. Valid value(s):

AIUEN=c-l^1-m^1-n^1

PSUEN=c-q^1-r^1-t^1-e
VBRl=c-a^2
VTRK=c-b^2-c^2

b = The directory number.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = PH channel member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Logical port number.

= Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= RT Line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Channel to be monitored (applies only to basic rate interfaces). The default channel will be based on the method of line identification and, optionally, the protocol level to be monitored. The channel option will be required when invoked with the DN or multi-line hunt group line identifiers, and these identifiers reflect multiple packet services. In other words, if a channel cannot be determined (such as, a user has a circuit service on the D-channel, a packet service on the D-channel, and a packet service on the B-channel and all services use the same DN), the request will be denied. It will, however, be accepted if the input message included the appropriate channel option.

= B1-channel. This option can only be used with permanent packet B-channel (PPB).

= B2-channel. This option can only be used with PPB.

= D-channel.

= Primary on-demand packet B-channel (valid for single and multiple on-demand B-channel packet switching). This option can only be used with on-demand B-channel services. With on-demand packet services, either B-channel is available.
for use by the on-demand packet service. There is no direct relationship between
the on-demand packet service and a B-channel. The first B-channel used by the
on-demand packet service is considered the primary channel.

ODPSEC = Secondary on-demand packet B-channel (valid for multiple on-demand B-channel
packet switching only). This option can only be used with on-demand B-channel
services. The second B-channel used by the on-demand packet service is
considered the secondary channel.

v = Protocol level (PROT). Valid value(s):
   CESHL2 = Monitor the CESHL2 protocol.
   CESHL3 = Monitor the CESHL3 protocol.
   ISLP = Monitor the ISLP protocol.
   LAPD = Monitor the LAPD protocol (default, if determined/requested channel is D).
   LAPB = Monitor the LAPB protocol (default, if determined/requested channel is other than
          D).
   LAPF = Monitor the LAPF protocol
   Q931 = Monitor the Q.931 protocol.
   RLP = Monitors the RLP protocol.
   TMC = Monitor the TMC protocol.
   V120 = Monitor the V.120 protocol.
   X25 = Monitor the X.25 protocol.
   X75 = Monitor the X.75 protocol.
   X75P = Monitor the X.75’ protocol.

w = Protocol’s trigger level (TRIGLVL). The default depends on PROT. Valid value(s):

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>TRIGLVL</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAPD</td>
<td>LEVEL2</td>
</tr>
<tr>
<td>LAPF</td>
<td>LEVEL2</td>
</tr>
<tr>

</tr>
</tbody>
</table>

The trigger level/protocol must be terminated on the same processor as the recording protocol.

For CESHL2, CESHL3, ISLP, and RLP protocols there is only one triggering level which is the
above indicated default value.

x = Specific PEC to trigger session termination. Refer to the 235-600-755 for details.

This field must be enclosed in double quotation marks.

y = TRIGVAL that terminates the recording session. Valid value(s):

**Notes:**
- **z**: Direction (DIR) of frame or packet or message to trigger upon. Valid value(s):
  - RCV: Trigger if the frame or packet or message is received by the switch from the CPE. RCV is the default.
  - XMT: Trigger if the frame or packet or message is transmitted from the switch to the CPE.
- **a**: Offset (OFF) of the number of frames to be recorded after detection of the trigger event (default is 0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b**: Duration (DUR) of the recording session in seconds (default is 3600). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c**: Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d**: Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Allows the user to optionally specify the type of messages to be recorded when monitoring LAP D protocol on a frame relay bearer channel. User can request specifically to monitor either control messages or user data. However, if user data recording is requested, only a summary of the user data frame will be recorded, due to the sheer volume of the user data. The summary of the user data frame will contain the address information and the length of the actual user data frame transmitted or received. Valid value(s):

CTRL = Record only control messages. CTRL is the default value.
DATA = Record only a summary of the transmitted or received user data frame.
ALL = Record both control messages and a summary of the transmitted or received user data frame.

o = Allows the user to optionally specify the type of messages or frames to be recorded when protocol monitoring is on a speech handler or an AUTOPLEX® data trunk. This option can be used with CESHL2 or CESHL3 or RLP protocol. Valid value(s):

CTRL = Requesting recording of control frames (S and I) for CESHL2 protocol. Default value for CESHL2 protocol at level 2 recording.
TRAF = Requesting recording of UI traffic messages for CESHL3 protocol.
IP = Requesting recording of inter-processor messages for CESHL3 protocol. Default value for CESHL3 protocol at level 3 recording.
RLP = Requesting recording of non-idle RLP frames for RLP protocol. Default value for RLP protocol at level 7 recording.
ALL = Requesting recording of all messages for CESHL2 or CESHL3 or RLP protocol. This will result in recording S, I, XID, and, UI frames for CESHL2 protocol, or UI plus IP frames for CESHL3 protocol, or RLP plus idle frames for RLP protocol.
q¹ = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r¹ = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t¹ = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u¹ = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v¹ = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w¹ = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x¹ = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y¹ = Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z¹ = Channel number (CHAN.) Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a² = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b² = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c² = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d² = IP address field. Valid value is number between 0-255.

e² = Protocol (PROT) level for PCF (Format 3 and Format 4). Valid value(s):
  A10 = Monitor the A10 protocol.
  A11 = Monitor the A11 protocol.

f² = Protocol's trigger level (TRIGLVL). The default depends on PROT. Valid value(s):

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>TRIGLVL</th>
</tr>
</thead>
<tbody>
<tr>
<td>A10</td>
<td>LEVEL7</td>
</tr>
<tr>
<td>A11</td>
<td>LEVEL7</td>
</tr>
</tbody>
</table>

g² = PCF PM TRIGVAL that terminates the recording session. Valid value(s):

<table>
<thead>
<tr>
<th>Protocol(s)</th>
<th>Value(s):</th>
</tr>
</thead>
<tbody>
<tr>
<td>A10_EXP</td>
<td>A10_UNKNOWN = A10 unknown frame type.</td>
</tr>
<tr>
<td></td>
<td>GRE = A10 GRE frame.</td>
</tr>
</tbody>
</table>
A11

A11_UNKNOWN = A11 unknown message type.
REGREQ = A11 request message.
REGRPL = A11 reply message.
REGUPD = A11 update message.
REGACK = A11 acknowledge message.

h^2 = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i^2 = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j^2 = Optical carrier level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k^2 = Synchronous transport signal level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or was not acceptable.
PF = Printout follows. The request has been accepted and is in progress. Followed by the EXC:PM output message.
RL = Retry later. The system is busy.

235-600-755 Protocol Error Record Descriptions
1. PURPOSE

Requests that a protocol monitoring session be started for the ISUP or TCAP protocol based on the values of particular parameters within the message.

The monitoring function records messages transmitted or received for the requested protocol. The messages recorded are those surrounding a particular specified ISUP call or TCAP transaction. A request to monitor ISUP calls will cause a protocol monitoring (PM) session to be started on each operational SM. PM will screen messages in the SMs until the first message matching the input criteria is captured. Once the first message is captured on a particular SM, that SM is the recording processor and screening will terminate in the other SMs. The first message captured will be the Initial Address Message (IAM). Recording will terminate when a Release Complete (RLC), Group Reset Acknowledge (GRA), or Unknown Circuit Identification Code (UCIC) message is captured. A request to monitor TCAP transactions will cause a protocol monitoring (PM) session to be started on each operational SM and the DLN (or AM if no DLN is equipped). PM will screen messages in the SMs, DLN or AM until the first message matching the input criteria is captured. Once the first message is captured on a particular processor, that processor is the recording processor and screening will terminate in the other processors. TCAP transactions using the CNI CCS platform will be recorded in the DLN or AM. TCAP transactions using the PSU CCS platform will be recorded in an SM. The TCAP applications supported are: NS800, CNAM, ASP, AINR0D1, ISVM and LASS. The first message captured will be either a Query (QRY) or Unidirectional (UNI) message. Recording will terminate when a Response (RESP) or Abort (ABORT) message is captured. Depending on the protocol, the PM session will be recorded on either an SM, DLN or AM. The following table indicates which processor records the protocol exchange. Only one PM session is allowed concurrently per protocol (ISUP or TCAP). The maximum number of sessions which can concurrently record on a given processor are:

- 2 per office (one ISUP, one TCAP)
- 2 per SM (one ISUP, one TCAP)
- 1 per DLN or AM (TCAP only)

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>RECORDING PROCESSOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISUP</td>
<td>SM</td>
</tr>
<tr>
<td>TCAP</td>
<td>SM, DLN or AM</td>
</tr>
</tbody>
</table>

NOTE: The default option for PM output is translation to a file. If the translation fails, the information will be reported in hexadecimal format. The file name will be formatted atf.xxx where xxx corresponds to the session number of the protocol monitoring session. The protocol translator will store the ASCII translation file (ATF) in a predetermined location. The location is presently /unixa/users/pmtran/atf.xxx. The full path name of the ATF will appear in the ROP output.

WARNINGS: Depending on the call traffic, initiating CCS protocol monitoring may cause an overload condition to occur on the screening or recording processor(s). If an overload condition is detected, PM will be terminated on the overloaded processor(s).

If PM is screening or recording messages in the DLN during a DLN switch, the PM session will be terminated in the DLN. Do not cause a DLN switch during a PM session if the DLN is screening or recording.

Format 1 is specified when a recording session is requested for the ISUP protocol.
Format 2 is specified when a recording session is requested for the TCAP protocol.

2. FORMAT

[1] EXC:PMCCS,ISUP,{CALLED=a|CALLING=b},{DIR=c},{DUR=d},{REPEAT=e},{HEXDUMP};

[2] EXC:PMCCS,TCAP,{CALLED=a|CALLING=b},{CDTT=f|CDSN=g|CGSN=h},{LAYER=i}
   {DIR=c},{DUR=d},{REPEAT=e},{HEXDUMP};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ISUP = Monitor the Integrated Services Digital Network (ISDN) User Part protocol.

TCAP = Monitor the Transaction Capability Application Part protocol.

HEXDUMP = Print the output in hexadecimal format on the receive-only printer (ROP).

a = Called party directory number. Valid values(s): variable length 3-15 digits (no default) This value will be used as the matching criteria for the initial message. For the TCAP protocol, the LAYER parameter identifies the location in the message to match this value.

b = Calling party directory number. Valid values(s): variable length 3-15 digits (no default) This value will be used as the matching criteria for the initial message. For the TCAP protocol, the LAYER parameter identifies the location in the message to match this value. When specifying the CALLING parameter, the LAYER parameter should be set to TCAP. The CALLING party directory number is not available when LAYER is set to SCCP.

c = Direction of the IAM or QRY/UNI message. Valid value(s): RCV, XMT, BOTH (default BOTH) Note: The direction only pertains to the first message matching the input criteria. Once the first message has been captured, subsequent matching messages will be captured in either direction.

d = Duration of the monitoring session in seconds. Valid value(s): For ISUP (1-86400) (default=86400) For TCAP (1-3600) (default=3600)

e = The number of protocol monitoring sessions to be repeated. Valid value(s): 1-10 (default=0)

f = Called party translation type. Valid value(s): 0-255 (no default)

g = Called party subsystem number. Valid value(s): 0-255 (no default) Note: the CDSN parameter is only valid when the DIR parameter is set to RCV or BOTH. Specifying CDSN is not valid when DIR is set to XMT.

h = Calling party subsystem number. Valid value(s): 1-255 (no default)

i = Location in the message to match the TCAP CALLED or CALLING parameter. Valid value(s): SCCP or TCAP (default=SCCP) Note: The location specified as SCCP will match the CALLED party number in the SCCP header (CALLING not available in the SCCP header). The location specified as TCAP will match the CALLED or CALLING party number in the TCAP data portion of the message. The LAYER parameter set to TCAP is valid only when the DIR parameter is set to XMT. That is, matching the CALLED/CALLING parameter in TCAP data is only valid for outbound messages.
4. SYSTEM RESPONSE

NG  = No good. The message was not recognized or was not acceptable.

PF  = Printout follows. The request has been accepted and is in progress. Followed by the EXC:PMCCS output message.

**Software Release:** 5E15 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input  

1. **PURPOSE**

Requests that a protocol monitoring session be started for the ISUP, BICC, or TCAP protocol based on the values of particular parameters within the message.

The monitoring function records messages transmitted or received for the requested protocol. The messages recorded are those surrounding a particular specified ISUP or BICC call or TCAP transaction.

A request to monitor ISUP/BICC calls will cause a protocol monitoring (PM) session to be started on each operational SM. PM will screen messages in the SMs until the first message matching the input criteria is captured. Once the first message is captured on a particular SM, that SM is the recording processor and screening will terminate in the other SMs. The first message captured will be the initial address message (IAM). Recording will terminate when a release complete (RLC), group reset acknowledge (GRA), or unknown circuit identification code (UCIC) message is captured.

A request to monitor TCAP transactions will cause a PM session to be started on each operational SM and the DLN (or AM if no DLN) is equipped. PM will screen messages in the SMs, DLN or AM until the first message matching the input criteria is captured. Once the first message is captured on a particular processor, that processor is the recording processor and screening will terminate in the other processors. TCAP transactions using the CNI CCS platform will be recorded in the DLN or AM. TCAP transactions using the PSU CCS platform will be recorded in an SM. The TCAP applications supported are:

- AINR0D1
- ASP
- CNAM
- ISVM
- LASS
- NS800

The first message captured will be either a query (QRY) or unidirectional (UNI) message. Recording will terminate when a response (RESP) or abort (ABORT) message is captured.

Depending on the protocol, the PM session will be recorded on either an SM, DLN or AM. The following table indicates which processor records the protocol exchange. Only one PM session is allowed concurrently per protocol (ISUP/BICC or TCAP). The maximum number of sessions which can concurrently record on a given processor are:

- 1 per DLN or AM (TCAP only)
- 2 per office (one ISUP/BICC, one TCAP)
- 2 per SM (one ISUP/BICC, one TCAP)

<table>
<thead>
<tr>
<th>PROTOCOL</th>
<th>RECORDING PROCESSOR</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISUP/BICC</td>
<td>SM</td>
</tr>
<tr>
<td>TCAP</td>
<td>SM, DLN or AM</td>
</tr>
</tbody>
</table>

The default option for PM output is translation to a file. If the translation fails, the information will be reported in hexadecimal format. The file name will be formatted `atf.xxx` where `xxx` corresponds to the session number of the protocol monitoring session. The protocol translator will store the ASCII translation file (ATF) in a predetermined location. The location is presently `/unixa/users/pmtran/atf.xxx`. The full path name of the ATF will appear in the ROP output.
Depending on the call traffic, initiating CCS protocol monitoring may cause an overload condition to occur on the screening or recording processor(s). If an overload condition is detected, PM will be terminated on the overloaded processor(s).

If PM is screening or recording messages in the DLN during a DLN switch, the PM session will be terminated in the DLN. Do not cause a DLN switch during a PM session if the DLN is screening or recording.

Format 1 is specified when a recording session is requested for the ISUP or BICC protocol.

Format 2 is specified when a recording session is requested for the TCAP protocol.

2. FORMAT

[1] EXC:PMCCS,ISUP|BICC,{CALLED=a|CALLING=b}[,(DIR=c) . . .,(DUR=d)[,(REPEAT=e)[,(HEXDUMP];

[2] EXC:PMCCS,TCAP,{CALLED=a|CALLING=b}{CDTT=f|CDSN=g|CGSN=h}[(LAYER=i)[,(DIR=c)[,(DUR=d). . .,(REPEAT=e)[,(HEXDUMP];

3. EXPLANATION OF MESSAGE

NOTE: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

BICC = Bearer independent call control protocol.

HEXDUMP = Print the output in hexadecimal format on the receive-only printer (ROP).

ISUP = Monitor the integrated services digital network (ISDN) user part protocol.

TCAP = Monitor the transaction capability application part protocol.

a = Called party directory number. [variable length 3-15 digits (no default)]

This value will be used as the matching criteria for the initial message. For the TCAP protocol, the LAYER parameter identifies the location in the message to match this value.

b = Calling party directory number. [variable length 3-15 digits (no default)]

This value will be used as the matching criteria for the initial message. For the TCAP protocol, the LAYER parameter identifies the location in the message to match this value. When specifying the CALLING parameter, the LAYER parameter should be set to TCAP. The CALLING party directory number is not available when LAYER is set to SCCP.

For ISUP/BICC, the calling party directory number is an optional parameter in the IAM message; hence, if a calling party directory number is specified as the matching criteria, it may not always result in a message trap.

c = Direction of the IAM or QRY/UNI message. Valid value(s):
   BOTH = Default.
   RCV
   XMT
The direction only pertains to the first message matching the input criteria. Once the first message has been captured, subsequent matching messages will be captured in either direction.

d = Duration of the monitoring session in seconds. Valid value(s):
   For ISUP/BICC = 1-86400 (default is 86400)
   For TCAP = 1-3600 (default is 3600)

e = The number of protocol monitoring sessions to be repeated. [1-10 (default is 0)]

f = Called party translation type. [0-255 (no default)]

 g = Called party subsystem number. [0-254 (no default)]

Due to protocol monitoring limitations, when CDSN is set to 0, the DIR parameter must be set to XMT. When CDSN is greater than 0, the DIR parameter must be set to RCV. If the DIR parameter is not specified, it will default to the correct direction based on the CDSN specified.

h = Calling party subsystem number. [1-255 (no default)]

i = Location in the message to match the TCAP CALLED or CALLING parameter. Valid value(s):
   SCCP = Default.
   TCAP

The location specified as SCCP will match the CALLED party number in the SCCP header (CALLING not available in the SCCP header). The location specified as TCAP will match the CALLED or CALLING party number in the TCAP data portion of the message. The LAYER parameter set to TCAP is valid only when the DIR parameter is set to XMT. That is, matching the CALLED/CALLING parameter in TCAP data is only valid for outbound messages.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or was not acceptable.

PF = Printout follows. The request has been accepted and is in progress. Followed by the EXC:PMCCS output message.

EXC:PREV

Software Release: 5E14 and later
Command Group: NOCHK
Application: 5
Type: Input

1. PURPOSE

Requests that the previous input message entered at this terminal be re-executed. The previous message must have been entered correctly at the same terminal for this request to complete successfully.

2. FORMAT

EXC:PREV;

3. EXPLANATION OF MESSAGE

No variables.

For further information, refer to the input message manual page for the previously executed message.

4. SYSTEM RESPONSE

NG = No good. May also include:
- PREVIOUS MESSAGE MUST NOT BE A HELP REQUEST = The previous message was a help request and cannot be re-executed.
- SYNTAX ERROR IN PREVIOUS MESSAGE = The previous message contained a syntax error and cannot be re-executed.

OK = Good. The previous message will be executed.

5. REFERENCES

None.
**EXC:RCDECODE**

**Software Release:** 5E14 and later  
**Command Group:** ODD  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests the execution of the recent change (RC) or customer originated recent change (CORC) log file decoder. This allows the user to read the RC redundant log file, the RC log file, or CORC log file (Format 1), or read the RC error file (Format 2). This can help in determining what database transactions and CORCs were applied to a module or what transactions or CORCs failed during a roll forward of a module.

2. **FORMAT**

   [1] `EXC:RCDECODE, {REDLOG|PARTLOG|CORCLOG}, {AM|SM=a|CMP=b} [,OFFSET=c] [,LENGTH=d], {ROP|TERM|OUTFILE=e};`

   [2] `EXC:RCDECODE, ERRLOG, {AM|SM=a|CMP=f-b} [,OFFSET=c] [,LENGTH=d], {ROP|TERM|OUTFILE=e};`

3. **EXPLANATION OF MESSAGE**

   **NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

   - **ERRLOG** = Read the RC log error file.
   - **PARTLOG** = Read the RC log file.
   - **REDLOG** = Read the RC log redundant file.
   - **CORCLOG** = Read the CORC log file.
   - **ROP** = Print the output of RC decoder on the receive-only printer (ROP).
   - **TERM** = Print the output of RC decoder back to requesting terminal.
   - **a** = SM number.
   - **b** = CMP number.
   - **c** = The start offset in bytes, from the beginning of the logfile, to read the file. Default is zero (beginning of log file).
   - **d** = The length, in bytes, of what is to be read. The default is from the start offset to the end of the file.
   - **e** = Directory and name of file in which output will be placed. All files will be placed in a directory specified or in the directory (/tmp) if no directory is specified. Must be surrounded by quotes (for example, `OUTFILE="/updtmp/filename"`), or just a name of file in which output will be placed (for example, `OUTFILE=filename`). There is a 14-character limit on file names.
   - **f** = CM message switch side for the physical CMP error log file. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
4. SYSTEM RESPONSE

PF
Printout follows. The RC decoder is executed. Printout will follow, either to the terminal or ROP, depending on option.

NG
No good. May also include:
- Bad Input File = Invalid input option. The valid option must be one of the followings - REDLOG, PARTLOG, CORCLOG, or ERRLOG.
- Bad Output File = Invalid output device. The valid output device must be one of the followings - ROP, TERM, or an output file name.
- Cannot open output file = Cannot open the specified output file. Make sure that the output file directory has write permission.
- Cannot open input file = Cannot open the specified input file. This shows that either the processor specified is not equipped or no log file existed for that processor.

Requests that all recent changes (RCs) previously entered into the delayed release clerk file(s) be released.

2. FORMAT
EXC:RCRLS,{CLERK=a[,VERBOSE] | ODDEVOL[,CONCURRENT],NONCON|, SKIPERR});

3. EXPLANATION OF MESSAGE
CONCURRENT = Divide the evolved RC file into multiple release clerk files and proceed on all files simultaneously.
NONCON = Release RCs in single stream (non-concurrent).
ODDEVOL = Release the evolved RC file.
SKIPERR = Skip over the failed RCs. Use this option ONLY if the releasing of the evolved RC file was stopped because a BKUP:ODD was necessary and it was necessary to reduce the retrofit time interval. The user must release this file again during the "END STAGE" in the "RC reapplication cleanup phase". Directions for this are given in Software Release Retrofit manual.
VERBOSE = Turn on one-line logging message of recent changes (RCs) on the receive-only printer (ROP) for the current session only. The default is no logging.

The one-line logging message has the following format:
RC BATCH SUCCESS|ERROR RC/V-Form-Name RC-Operation Key(s)
TERM-ID=terminal-name CLERK=clerk-name

a = Clerk name entered on the request. Maximum length is eight ASCII characters. (Do not use blanks or special characters.)

4. SYSTEM RESPONSE
PF = Printout follows. The request was accepted. Followed by the EXC:RCRLS output message.

235-105-24x  Software Release Retrofit Procedures
EXC:RCRMV

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Removes selected recent changes previously entered into the delayed release clerk file.

2. FORMAT

EXC:RCRMV,CLERK=a[,ALL][,PENDING][,COMPLETE][,ERROR][,DEMAND][,TIME=b-b];

3. EXPLANATION OF MESSAGE

NOTE: The defaults for selection parameters are COMPLETE and ERROR. These are set when none of the following selection parameters are specified.

ALL = Remove all recent changes. Recent changes selected could be pending, completed, error, or demand.

COMPLETE = Remove released recent changes that were successfully completed.

DEMAND = Remove demand recent changes.

ERROR = Remove recent changes released with error.

PENDING = Remove pending recent changes.

a = Clerkname entered on request.

b = The range of times between which records are selected. The time fields are specified in month, day, year, hour, and minute, format with no separators. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Leading zeros must be specified. The first time field must specify a time earlier than the second time field. Thus, choosing 0101000000 as the first time field and 1231992300 as the second time field would select all records and this range of time (selecting all records) is the default when no time is specified.

4. SYSTEM RESPONSE

PF = Printout follows. The request was accepted. Followed by the EXC:RCRMV output message.

Input Appendix(es):
APP: RANGES
1. PURPOSE

Requests that a remote digital test access (RDTA) connection be set up between the port to be tested and the output facility where the protocol analysis equipment is located. The port under test (PUT) may be a channel on an integrated services digital network (ISDN) basic rate interface (BRI), a channel on an ISDN primary rate interface (PRI), or a trunk using the ISDN protocols such as: IP, XAT, X.75, X.75', and CCS7 ISUP. The two types of output facilities (connections to analysis equipment) are the PRI and pseudo BRI ports. A pseudo BRI is a digital subscriber line (DSL) in which none of its channels are connected to the protocol handler (PH). There are basically two types of RDTA connections that can be set up:

Monitor = This type allows a copy of the receive and transmit data passing over the circuit being tested to be received by the protocol analysis equipment. This is a “hitless” (non-interfering) type of connection. This type of connection includes only the monitor (MON) connection mode.

Interactive = This type allows exchange of data between the PUT and the protocol analysis equipment. This type of connection includes the direct test access connection (DTAC) and all splits such as duplex split (SPLIT), simplex split PH side (SPLITPH), and simplex split PUT side (SPLITPUT).

An RDTA session will be assigned a session number and a duration timer DUR (default is 1 day). At any time during the duration interval, the user may reset the timer by typing a UPD:RDTA message for that active RDTA session. If a session is set up for a period longer than 24-hours, a UPD:RDTA reminder message will print every 24 hours to indicate that the RDTA session is active. Thirty minutes before the termination interval specified on the EXC:RDTA input message, a UPD:RDTA warning message will print to indicate that the RDTA session will be terminated in 30 minutes. The user may keep the active RDTA session alive by responding with a UPD:RDTA input message.

Restrictions apply to certain mode and port type combinations. No split or DTAC may be requested on a BRI port; only a MON may be performed on a BRI. Furthermore, a SPLITPH may not be performed on a circuit-switched trunk; it may only be performed on PRI and packet D-channel connections.

The UCL option is required for all requests to SPLIT, SPLITPH, or SPLITPUT a PRI D-channel. The UCL option is on the PRI B-channels associated with the D-channel. A PRI provisioned with D-channel Backup (DCBU) has two D-channels. An EXC:RDTA session can be requested for one of the two D-channels only. Requesting an EXC:RDTA session on the mate D-channel causes the other EXC:RDTA session to terminate. Before invoking an EXC:RDTA session on the selected D-channel on a PRI with DCBU, the selected D-channel should be in-service (IS) or out-of-service (OOS) blocked for automatic reasons (OOS-BLKD-AUTO), and the mate D-channel must be manually removed. The manual removal of the mate D-channel ensures that the D-channel that the SPLIT, SPLITPH, or SPLITPUT connection is requested for ends up being the D-channel that supports the exchange of protocol traffic.

An RDTA monitor connection may be converted to an interactive split connection. The input data request to split a monitor must match that of the monitor connection to assure the integrity of the request. The option is provided so the user may omit the output facility directory numbers (DN), incoming DN (INDN) and outgoing DN (OUTDN), when inputing format 1. In this case, the appropriate DN(s) will be retained in accordance with the requested split. When the conversion is made the duration timer will be reset but all other information will stay intact, including the session number.

Format 1 is used to set up a new RDTA session or to convert a monitor connection to a split connection. INDN and OUTDN may be omitted when converting a monitor to a split; however, if either is entered, the entries must match.
that of the existing monitor. INDN and OUTDN are required to begin a MON or SPLIT. INDN is required to start the
DTAC and SPLITPUT connections and OUTDN is required to start the SPLITPH connection.

Format 2 must be used after a format one request when successfully monitoring a BRI D-channel on output facilities
located on a different switch from the RDTA session itself. It must be sent to the switch where the output facility
DN(s) are located and must be executed (when doing remote access) in order to obtain the data being monitored.
The function of this format is to select the quarter section of a 64 kb time-slot for placement onto the pseudo BRI
D-channel output facility. The quarter time-slot input to this format for a particular session is given in the EXC:RDTA
output message or may be found by using the OP:RDTA input message. For a BRI D-channel, if the output facility is
on the same switch as the BRI under test, the quarter time-slot on the output facility will be set up correctly.

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms
shown in the format.

UCL = Set up split connection unconditionally. The UCL option applies to connection modes SPLIT,
SPLITPH, and SPLITPUT. It will be ignored for all other connection modes. If the PUT is a PRI
D-channel or packet trunk all active calls will be torn down prior to setting up the split connection.
The UCL option is required to set up a split connection on a circuit switch PUT. The UCL option is
also required to set up a split connection on a PRI D-channel.

a = Port identification. Valid value(s): AIUEN=d-l-d* (s1-e*) (s1
BST=b-c
DEN=d-e-f-g
DN=h
ILEN=d-i-j-k

b = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section
of the Input Messages manual.

c = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section
of the Input Messages manual.

e = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

f = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital channel number. If this is a DFI-2, channels 1-24 are associated with T1 A and channels 25-48 are associated with facility T1 B.

h = The DN associated with the ISDN interface port. This parameter can only be used to identify channels associated with DSLs.

i = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Integrated services line unit (ISLU) or access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Channel type (not valid for DEN and TKGMN port identification). Valid value(s):
   B1 = B1-Channel.
   D  = D-Channel (default).

v = Digit analysis selector (DAS) (routing domain) to be used to specify the correct set of digit analysis tables to translate INDN and OUTDN. This parameter will override the office’s default DAS for RDTA. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
manual.

\(w\) = DN of the output facility where the protocol analyzer accesses the test data sent over the PUT to the switch. This direction is known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections, except the SPLITPH connection.

\(x\) = DN number of the output facility where the protocol analyzer accesses the test data sent from the switch to the PUT. This direction is known as outgoing. Data sent from the analysis equipment for interaction with the switch will originate from OUTDN for the SPLIT and SPLITPH connections.

\(y\) = Connection mode of the RDTA session. Valid value(s):

- **DTAC** = Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The port under test (PUT) is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.

- **MON** = Monitor. This is a receive-only connection on a busy circuit. A copy of the receive and transmit data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

- **SPLIT** = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

- **SPLITPH** = Simplex split protocol handler (PH) side. This is an interactive connection on an ISDN channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

- **SPLITPUT** = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

\(z\) = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.

\(a^1\) = The maximum duration of the RDTA session. The duration timer default is 1 day.

\(b^1\) = The billing directory number that will be passed through the network when routing to the output facilities located in another LATA.

\(c^1\) = The customer identification will identify a leased network customer. Specifying a CUSTID of nonzero value will cause automatic route selection (ARS) routing to be invoked for the leased network. The CUSTID parameter should only be specified when the INDN and/or OUTDN directory numbers will route to output facilities located on a different switch from the RDTA session itself. The CUSTID is required when routing over CCS7 ISUP IMTs (intermachine trunks).

\(d^1\) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.
e\textsuperscript{1} = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

f\textsuperscript{1} = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

g\textsuperscript{1} = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

h\textsuperscript{1} = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

i\textsuperscript{1} = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

j\textsuperscript{1} = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

k\textsuperscript{1} = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

l\textsuperscript{1} = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

m\textsuperscript{1} = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the EXC:RDTA output message.

RL = Retry later. Valid value(s):
   - FAILED TO CREATE PROCESS = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
   - TOO MANY PROCESSES ACTIVE = The request has been denied, probably due to system load.

1. PURPOSE

Requests that a remote digital test access (RDTA) connection be set up between the port to be tested and the output facility where the protocol analysis equipment is located. The port under test (PUT) may be a channel on an integrated services digital network (ISDN) basic rate interface (BRI), a channel on an ISDN primary rate interface (PRI), or a trunk using the ISDN protocols such as: IP, XAT, X.75, X.75', and CCS7 ISUP. The two types of output facilities (connections to analysis equipment) are the PRI and pseudo BRI ports. A pseudo BRI is a digital subscriber line (DSL) in which none of its channels are connected to the protocol handler (PH). There are basically two types of RDTA connections that can be set up:

Monitor = This type allows a copy of the receive and transmit data passing over the circuit being tested to be received by the protocol analysis equipment. This is a “hitless” (non-interfering) type of connection. This type of connection includes only the monitor (MON) connection mode.

Interactive = This type allows exchange of data between the PUT and the protocol analysis equipment. This type of connection includes the direct test access connection (DTAC) and all splits such as duplex split (SPLIT), simplex split PH side (SPLITPH), and simplex split PUT side (SPLITPUT).

An RDTA session will be assigned a session number and a duration timer DUR (default is 1 day). At any time during the duration interval, the user may reset the timer by typing a UPD:RDTA message for that active RDTA session. If a session is set up for a period longer than 24-hours, a UPD:RDTA reminder message will print every 24 hours to indicate that the RDTA session is active. Thirty minutes before the termination interval specified on the EXC:RDTA input message, a UPD:RDTA warning message will print to indicate that the RDTA session will be terminated in 30 minutes. The user may keep the active RDTA session alive by responding with a UPD:RDTA input message.

Restrictions apply to certain mode and port type combinations. No split or DTAC may be requested on a BRI port; only a MON may be performed on a BRI. Furthermore, a SPLITPH may not be performed on a circuit-switched trunk; it may only be performed on PRI and packet D-channel connections.

The UCL option is required for all requests to SPLIT, SPLITPH, or SPLITPUT a PRI D-channel. The UCL option is on the PRI B-channels associated with the D-channel. A PRI provisioned with D-channel Backup (DCBU) has two D-channels. An EXC:RDTA session can be requested for one of the two D-channels only. Requesting an EXC:RDTA session on the mate D-channel causes the other EXC:RDTA session to terminate. Before invoking an EXC:RDTA session on the selected D-channel on a PRI with DCBU, the selected D-channel should be in-service (IS) or out-of-service (OOS) blocked for automatic reasons (OOS-BLK-D-AUTO), and the mate D-channel must be manually removed (OOS-MTCE-DSBLD). The manual removal of the mate D-channel ensures that the D-channel that the SPLIT, SPLITPH, or SPLITPUT connection is requested for ends up being the D-channel that supports the exchange of protocol traffic.

An RDTA monitor connection may be converted to an interactive split connection. The input data request to split a monitor must match that of the monitor connection to assure the integrity of the request. The option is provided so the user may omit the output facility directory numbers (DN), incoming DN (INDN) and outgoing DN (OUTDN), when inputting format 1. In this case, the appropriate DN(s) will be retained in accordance with the requested split. When the conversion is made the duration timer will be reset but all other information will stay intact, including the session number.

Format 1 is used to set up a new RDTA session or to convert a monitor connection to a split connection. INDN and OUTDN may be omitted when converting a monitor to a split; however, if either is entered, the entries must match that of the existing monitor. INDN and OUTDN are required to begin a MON or SPLIT. INDN is required to start the
DTAC and SPLITPUT connections and OUTDN is required to start the SPLITPH connection.

Format 2 must be used after a format one request when successfully monitoring a BRI D-channel on output facilities located on a different switch from the RDTA session itself. It must be sent to the switch where the output facility DN(s) are located and must be executed (when doing remote access) in order to obtain the data being monitored. The function of this format is to select the quarter section of a 64 kb time-slot for placement onto the pseudo BRI D-channel output facility. The quarter time-slot input to this format for a particular session is given in the EXC:RDTA output message or may be found by using the OP:RDTA input message. For a BRI D-channel, if the output facility is on the same switch as the BRI under test, the quarter time-slot on the output facility will be set up correctly.

b = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital channel number. If this is a DFI-2, channels 1-24 are associated with T1 A and channels 25-48 are associated with facility T1 B.

h = The DN associated with the ISDN interface port. This parameter can only be used to identify channels associated with DSLs.

i = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Integrated services line unit (ISLU) or access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Channel type (not valid for DEN and TKGMN port identification). Valid value(s):

   B1 = B1-Channel.
   D  = D-Channel (default).

v = Digit analysis selector (DAS) (routing domain) to be used to specify the correct set of digit analysis tables to translate INDN and OUTDN. This parameter will override the office's default DAS for RDTA. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = DN of the output facility where the protocol analyzer accesses the test data sent over the PUT to the switch. This direction is known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections, except the SPLITPH connection.

x = DN number of the output facility where the protocol analyzer accesses the test data sent from the switch to the PUT. This direction is known as outgoing. Data sent from the analysis equipment for interaction with the switch will originate from OUTDN for the SPLIT and SPLITPH connections.

y = Connection mode of the RDTA session. Valid value(s):

   DTAC = Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The port under test (PUT) is seized and directly connected to an outgoing port terminating at the protocol analysis equipment.

   MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the receive and transmit data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.

   SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.

   SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection on a ISDN channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating to the protocol analysis equipment.

   SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

z = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility
pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI
D-channel data, the PUT data, to the PH.

a¹ = The maximum duration of the RDTA session. The duration timer default is 1 day.

b¹ = The billing directory number that will be passed through the network when routing to the output
facilities located in another LATA.

c¹ = The customer identification will identify a leased network customer. Specifying a CUSTID of
nonzero value will cause automatic route selection (ARS) routing to be invoked for the leased
network. The CUSTID parameter should only be specified when the INDN and/or OUTDN directory
numbers will route to output facilities located on a different switch from the RDTA session itself. The
CUSTID is required when routing over CCS7 ISUP IMTs (intermachine trunks).

d¹ = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages Manual.

e¹ = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages Manual.

f¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the

g¹ = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the
Input Messages Manual.

h¹ = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the
Appendixes section of the Input Messages Manual.

i¹ = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the
Appendixes section of the Input Messages Manual.

j¹ = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages Manual.

k¹ = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages Manual.

l¹ = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages Manual.

m¹ = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages Manual.

n¹ = Peripheral Control and Timing (PCT) Line and Trunk Unit (PLTU) number. Refer to the

o¹ = PCT Facility Interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages Manual.

p¹ = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages Manual.

q¹ = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages Manual.
4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the EXC:RDTA output message.

RL = Retry later. May also include:
- FAILED TO CREATE PROCESS = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- TOO MANY PROCESSES ACTIVE = The request has been denied, probably due to system load.

235-900-341 National ISDN Basic Rate Interface Specification
1. PURPOSE

Requests that a remote digital test access (RDTA) connection be set up between the port to be tested and the output facility where the protocol analysis equipment is located. The port under test (PUT) may be a channel on an integrated services digital network (ISDN) basic rate interface (BRI), a channel on an ISDN primary rate interface (PRI), or a trunk using the ISDN protocols such as: IP, XAT, X.75, X.75', and CCS7 ISUP. The two types of output facilities (connections to analysis equipment) are the PRI and pseudo BRI ports. A pseudo BRI is a digital subscriber line (DSL) in which none of its channels are connected to the protocol handler (PH). There are basically two types of RDTA connections that can be set up:

Interactive = This type allows exchange of data between the PUT and the protocol analysis equipment. This type of connection includes the direct test access connection (DTAC) and all splits such as duplex split (SPLIT), simplex split PH side (SPLITPH), and simplex split PUT side (SPLITPUT).

Monitor = This type allows a copy of the receive and transmit data passing over the circuit being tested to be received by the protocol analysis equipment. This is a "hitless" (non-interfering) type of connection. This type of connection includes only the monitor (MON) connection mode.

An RDTA session will be assigned a session number and a duration timer DUR (default is 1 day). At any time during the duration interval, the user may reset the timer by typing a UPD:RDTA message for that active RDTA session. If a session is set up for a period longer than 24-hours, a UPD:RDTA reminder message will print every 24 hours to indicate that the RDTA session is active. Thirty minutes before the termination interval specified on the EXC:RDTA input message, a UPD:RDTA warning message will print to indicate that the RDTA session will be terminated in 30 minutes. The user may keep the active RDTA session alive by responding with a UPD:RDTA input message.

Restrictions apply to certain mode and port type combinations. No split or DTAC may be requested on a BRI port; only a MON may be performed on a BRI. Furthermore, a SPLITPH may not be performed on a circuit-switched trunk; it may only be performed on PRI and packet D-channel connections.

The UCL option is required for all requests to SPLIT, SPLITPH, or SPLITPUT a PRI D-channel. The UCL option is on the PRI B-channels associated with the D-channel. A PRI provisioned with D-channel Backup (DCBU) has two D-channels. An EXC:RDTA session can be requested for one of the two D-channels only. Requesting an EXC:RDTA session on the mate D-channel causes the other EXC:RDTA session to terminate. Before invoking an EXC:RDTA session on the selected D-channel on a PRI with DCBU, the selected D-channel should be in-service (IS) or out-of-service (OOS) blocked for automatic reasons (OOS-BLK-D-AUTO), and the mate D-channel must be manually removed (OOS-MTCE-DSBLD). The manual removal of the mate D-channel ensures that the D-channel that the SPLIT, SPLITPH, or SPLITPUT connection is requested for ends up being the D-channel that supports the exchange of protocol traffic.

An RDTA monitor connection may be converted to an interactive split connection. The input data request to split a monitor must match that of the monitor connection to assure the integrity of the request. The option is provided so the user may omit the output facility directory numbers (DN), incoming DN (INDN) and outgoing DN (OUTDN), when inputing format 1. In this case, the appropriate DN(s) will be retained in accordance with the requested split. When the conversion is made the duration timer will be reset but all other information will stay intact, including the session number.

Format 1 is used to set up a new RDTA session or to convert a monitor connection to a split connection. INDN and OUTDN may be omitted when converting a monitor to a split; however, if either is entered, the entries must match that of the existing monitor. INDN and OUTDN are required to begin a MON or SPLIT. INDN is required to start the...
DTAC and SPLITPUT connections and OUTDN is required to start the SPLITPH connection.

Format 2 must be used after a format one request when successfully monitoring a BRI D-channel on output facilities located on a different switch from the RDTA session itself. It must be sent to the switch where the output facility DN(s) are located and must be executed (when doing remote access) in order to obtain the data being monitored. The function of this format is to select the quarter section of a 64 kb time-slot for placement onto the pseudo BRI D-channel output facility. The quarter time-slot input to this format for a particular session is given in the EXC:RDTA output message or may be found by using the OP:RDTA input message. For a BRI D-channel, if the output facility is on the same switch as the BRI under test, the quarter time-slot on the output facility will be set up correctly.

2. FORMAT

[1] EXC:RDTA,a[,CH=u][,DAS=v][,INDN=w][,OUTDN=x],MODE=y[,UCL]
   [,DUR=a][,BDN=b][,CUSTID=c];

[2] EXC:RDTA,INDN=w,OUTDN=x,QTS=z;

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

UCL = Set up split connection unconditionally. The UCL option applies to connection modes SPLIT, SPLITPH, and SPLITPUT. It will be ignored for all other connection modes. If the PUT is a PRI D-channel or packet trunk all active calls will be torn down prior to setting up the split connection. The UCL option is required to set up a split connection on a circuit switch PUT. The UCL option is also required to set up a split connection on a PRI D-channel.

a = Port identification. Valid value(s):
   AIUEN=d-l-d1-e1
   BST=b-c
   DEN=d-e-f-g
   DN=h
   ILEN=d-i-j-k
   INEN=d-f1-j-k
   LCEN=d-l-m-n
   LCKEN=d-l-m1-d1-e1
   MLHG=o-p
   NEN=d-f1-g1-h1-i1-j1-k1-l1
   OAPO=b
   OPT=b-c
   PKTDN=h
PLTEN=d-n^1-o^1-p^1-q^1
RTRS=q-r
TKGMN=s-t
OIUEN=d-r^1-s^1-h^1-i^1-j^1-k^1-l^1

b = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital channel number. If this is a DFI-2, channels 1-24 are associated with T1 A and channels 25-48 are associated with facility T1 B.

h = The DN associated with the ISDN interface port. This parameter can only be used to identify channels associated with DSLs.

i = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Integrated services line unit (ISLU) or access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Data link relative group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Data link relative member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Channel type (not valid for DEN and TKGMN port identification). Valid value(s):
   B1 = B1-Channel.
   D  = D-Channel (default).

v = Digit analysis selector (DAS) (routing domain) to be used to specify the correct set of digit analysis tables to translate INDN and OUTDN. This parameter will override the office’s default DAS for RDTA. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = DN of the output facility where the protocol analyzer accesses the test data sent over the PUT to the switch. This direction is known as incoming. Data sent from the analysis equipment for interaction with the PUT will therefore originate from INDN for all interactive mode connections, except the SPLITPH connection.

x = DN number of the output facility where the protocol analyzer accesses the test data sent from the switch to the PUT. This direction is known as outgoing. Data sent from the analysis equipment for interaction with the switch will originate from OUTDN for the SPLIT and SPLITPH connections.

y = Connection mode of the RDTA session. Valid value(s):
   DTAC = Direct test access connection (DTAC). This is an interactive connection on a port that does not have a path set up on it. The port under test (PUT) is seized and directly connected to a outgoing port terminating at the protocol analysis equipment.
   MON = Monitor. This is a receive-only connection on a busy circuit. A copy of the receive and transmit data being passed over the PUT is transmitted to two individual outgoing ports that terminate at the protocol analysis equipment.
   SPLIT = Duplex split. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and each half is connected to an outgoing port terminated at the protocol analysis equipment. This allows interactive testing of both sides of the original path.
   SPLITPH = Simplex split protocol handler (PH) side. This is an interactive connection on a ISDN channel nailed-up to a PH. The existing path on the ISDN channel is torn down and the PH associated with the channel being tested is directly connected to an outgoing port terminating at the protocol analysis equipment.
   SPLITPUT = Simplex split PUT side. This is an interactive connection on a busy circuit. The existing path on the PUT is broken and the PUT is directly connected to an outgoing port terminating to the protocol analysis equipment.

z = The quarter time-slot (QTS) (16 kb/s section) of a 64 kb/s unrestricted channel. This output facility pseudo BRI D-channel quarter time-slot corresponds to the quarter time-slot carrying the BRI D-channel data, the PUT data, to the PH.
a^1 = The maximum duration of the RDTA session. The duration timer default is 1 day.

b^1 = The billing directory number that will be passed through the network when routing to the output facilities located in another LATA.

c^1 = The customer identification will identify a leased network customer. Specifying a CUSTID of nonzero value will cause automatic route selection (ARS) routing to be invoked for the leased network. The CUSTID parameter should only be specified when the INDN and/or OUTDN directory numbers will route to output facilities located on a different switch from the RDTA session itself. The CUSTID is required when routing over CCS7 ISUP IMTs (intermachine trunks).

d^1 = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

e^1 = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

f^1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

g^1 = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

h^1 = SONET termination equipment (STE) facility number. For OIU-NAR, it is OC-3. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

i^1 = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

j^1 = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

k^1 = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

l^1 = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

m^1 = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

n^1 = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

o^1 = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

p^1 = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

q^1 = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

r^1 = Optical Interface Unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.
s^1 = Protection Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages Manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the EXC:RDTA output message.

RL = Retry later. May also include:
   - FAILED TO CREATE PROCESS = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
   - TOO MANY PROCESSES ACTIVE = The request has been denied, probably due to system load.

235-190-104 ISDN Feature Description
235-900-341 National ISDN Basic Rate Interface Specification
EXC:REMACS
Software Release: 5E14 and later
Command Group: AUDIT
Application: 5,CNI
Type: Input

1. PURPOSE
Requests that control operations be performed on the remote access subsystem (REMACS) data audit, or requests the status of that subsystem.

2. FORMAT
EXC:REMACS: {INH | ALW | STATUS | CYCLE=a | FREQ=b};

3. EXPLANATION OF MESSAGE

ALW = Allow the running of the REMACS data audit. This is the default state of the REMACS data audit.

INH = Inhibit the running of the REMACS data audit and abort any previous requested cycle(s) that may be running. This inhibit will remain in effect as long as common network interface (CNI) does not perform a level 4 initialization. Once this occurs the inhibit will have to be entered again.

STATUS = Display the current status of the REMACS data audit; if the audit is running or is cycling, the current frequency of invocation is also displayed. If the audit is cycling the current cycle count will be displayed.

a = Number of cycles to be run. The audit must already be inhibited and currently not cycling for this input message to be honored by REMACS.

b = Frequency of invocation. Each time REMACS is invoked, REMACS runs the data audit on a portion of REMACS data; this input message modifies the frequency of data audit invocation each time REMACS itself is invoked. For example if REMACS is invoked every 200 milliseconds and the data audit frequency of invocation is 3, then the data audit will be run once every 600 milliseconds. The data audit frequency of invocation is initially set to 1 (data audit invoked each time REMACS itself is invoked).

4. SYSTEM RESPONSE
PF = Printout follows. Followed by the EXC:REMACS output message.

235-600-400 Audits
EXC:REORG

Software Release: 5E14 and later
Command Group: ODD
Application: 5
Type: Input

1. PURPOSE

Runs the reorganization of the database relations immediately. This does not change the automatic run time set by the SET:REORG input message.

NOTE: If this message is requested while automatic relation reorganization has been manually inhibited with the INH:REORG input message, reorganization of data base relations will not be done. Automatic relation reorganization can be allowed with the ALW:REORG input message.

2. FORMAT

EXC:REORG;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the REPT:REORG output message.

5. REFERENCES

EXC:REX-CM-SM

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests routine exercises (REX) of the hardware in the communication module (CM) and all switching modules (SMs) or in the CM or in a range of SMs be executed. The demand mode or the verbose mode can be specified.

Format 1 describes the SM message syntax, and Format 2 describes the CM message syntax.

WARNING: This message may result in severe traffic interruption if the DEMAND option is used.

2. FORMAT

\[1\] EXC:REX,SM=a[&b][,c][,RPT=d][,VERBOSE][,DEMAND];

\[2\] EXC:REX,CM,e[,VERBOSE];

3. EXPLANATION OF MESSAGE

DEMAND = Start the REX in the demand mode. Default is the non-demand mode. Do not use the DEMAND option if the SM is cut-over and taking live traffic, as this results in severe traffic interruption. The DEMAND option is specified only when the SM is in the pre-cut state (that is, not in operation and taking no live traffic.) This mode is provided to test the circuits that are not tested in normal mode because, when they are taken out of service for test, the subtending trunks are also taken out of service. The demand-only phases of the circuit diagnostics are also run during this mode.

VERBOSE = Print each unit completion message on the receive-only printer (ROP) and on the terminal that requested it. (Default is not to print the completion message for each unit, but still print failures for each unit on the ROP.)

a = Number of the SM on which REX is to start running, or the lower limit of a range of SM numbers.

b = Upper limit on a range of SM numbers.

c = REX test type to be executed (default is to execute all three test types). Valid value(s):

DGN = Execute the summary of diagnostic tests.
ELS = Execute the summary of electronic loop segregation tests.
FAB = Execute the summary of fabric exerciser tests of grids.

\[d\] = Repeat times when installation mode is on (default is 1). Valid value(s):

0 = Repeat forever.
1-7 = Repeat number.

e = REX test type to be executed. Valid value(s):

DGN = Execute the summary of diagnostic tests.
SWITCH = Switch the CM hardware states only.

**NOTE:** If neither CM nor SM is specified, the hardware will be tested in the CM and all of the operational SMs.

### 4. SYSTEM RESPONSE

NG = No good. The request was not a valid entry.

PF = Printout follows. Request is valid and is followed by the EXC:REX output message. However, dependent on equipment and traffic loads, REX may not start for 2-10 minutes, at which time it will print its start message. Refer to the EXC:REX output message. Any status input messages relating to REX will not indicate REX starting until this time.

RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

**Command Group:** CCS  
**Application:** 5,CNI  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Provides the ability to exercise operations in the stand-by ring (ring1) on demand. Allows for the possible detection of ring one problems prior to it affecting the performance of the transport system.

**WARNING:** Use of the UCL option, which permits the ring 1 audit to run on a ring with an isolated segment, could affect ring operation due to the increased message load, and should be used ONLY when instructed by support personnel.

2. FORMAT

EXC:RG1AUD[:[RATE=a][,DUR=b][,APAT=c|UPAT=d][:UCL]]

3. EXPLANATION OF MESSAGE

- **UCL** = Unconditional request. Will enable the execution of the ring 1 audit even if node isolation exists.
- **a** = Declares rate at which ring 1 messages will be transmitted. Valid value(s):
  - LOW (Default)
  - MED
  - HIGH
- **b** = Declares the duration in minutes the ring 1 audit will execute. Range is 1 - 480. Default value is 10.
- **c** = Declares the test pattern to be repeated in the ring 1 audit message. Valid value(s):
  - AUD1 (Default)
  - AUD2
  - AUD3
- **d** = Declares a user-defined test pattern to be repeated in the ring 1 audit message. For example: H'1234ABCD This parameter is of type long.

4. SYSTEM RESPONSE

**PF** = Printout follows. Followed by the EXC:RG1AUD output message. The REPT RG1AUD output message will be the output at the end of the duration (1 - 480 minutes) of the audit if the audit is successful. Refer to the EXC:RG1AUD output message for additional information.
5. REFERENCES

IM/OM References:

None.
EXC:RT-PROV

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests the provisioning of a TR303 remote terminal (RT) on an Integrated Digital Carrier Unit (IDCU) or Digital Network Unit SONET (DNU-S).

2. FORMAT

[1] EXC:RT,PROV,LIN{E=(I|IEN)=(c-d-e-f);

[2] EXC:RT,PROV,AL|GNOFAC|DS1FAC),
   {SID=b|{IDCURT|DNUSRT}=c-d-e-f;

3. EXPLANATION OF MESSAGE

a = Type of provisioning request. Valid Value(s):
LINE = Provision an analog or digital line. IDCU or DNU-S line equipment number
   (ILEN/INEN) must accompany this request type.
ALL = Provision all data on an RT.
GLOBAL = Provision global data on an RT.
IFAC = Provision an IDCURT digital signal level 1 (DS1) facility.
DS1SFAC = Provision a DNUSRT digital signal level 1 (DS1) facility.

b = Site identification (SID) number of the RT. Refer to the APP:RANGES appendix in the Appendixes
   section of the Input Messages manual.

c = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section
   of the Input Messages manual.

d = unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
   Messages manual.

e = Local RT (LRT) number. Refer to the APP:RANGES appendix in the Appendixes section of the
   Input Messages manual.

f = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
   Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the EXC:RT-PROV output message.

NG = No good. May also include:
   - NO TR303 RT FOUND = The request has been denied. The message is valid, but the specified
      RT is not a TR303 RT.
   - UNIT DOES NOT EXIST = The request has been denied. The message is valid, but the
      requested RT does not exist in the database.
= Retry later. May also include:
- CANNOT CREATE TERMINAL PROCESS = The request cannot be executed now due to unavailable system resources for creating a terminal process.

1. PURPOSE

2. FORMAT

EXC:RTRACK[,a];

3. EXPLANATION OF MESSAGE

a = The ring peripheral controller node (RPCN) or link node (LN) to be isolated. Valid value(s):
   - RPCNd=0
   - LNx=c

b = A ring node group number with explicit leading zero for group numbers less than 10. Refer to the
   APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = The node’s position in the ring node group. Refer to the APP:RANGES appendix in the
   Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

IP = In progress.
NG = No good. The request was not accepted; reason will follow.
PF = Printout follows. Followed by the EXC:RTRACK output message. If accepted, ring tracker begins
     iteratively isolating one node at a time until a stable ring configuration is found. If a node was
     specified with the input message, Ring Tracker begins isolation with that node.
     Once the ring tracker mode is entered, a REPT:RING-CFR output message is output once every 15
     minutes for as long as ring tracker is active.
RL = Retry later.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Activates an observation scope for all selected blocking, reset, unblocking, continuity, circuit query, and circuit validation CCSMTCE messages.

All selected blocking, reset, unblocking, continuity, circuit query, and circuit validation messages for trunks assigned to the specified origination point code (OPC), destination point code (DPC), and optional circuit identification code (CIC) would be reported. This input message has no affect if the ALW:S7RPT input message has not been entered. It is used with SET:S7RPT to start viewing CCSMTCE messages. Requesting this message may cause large amounts of data to be printed on the ROP. By request, the output message generated by this input message can be saved in a daily log file.

WARNING: Should system operation be impacted by this message:

- The input message STP:S7RPT, can be used to halt observation on a specific scope.
- The input message SET:S7RPT, can be used to halt observation on a specific type.
- The input message INH:S7RPT, can be used to halt observation on all scopes and turn off the ALW:S7RPT input message.

2. FORMAT

EXC:S7RPT,OPC=a,DPC=b[,CIC=c];

3. EXPLANATION OF MESSAGE

a = Origination point code (OPC).
b = Destination point code (DPC).
c = Circuit identification code (CIC).

4. SYSTEM RESPONSE

NG = No good. May also include:
- FEATURE NOT AVAILABLE = The input message cannot be used in this office. The office should be upgraded.
- S7RPT NOT ALLOWED = The ALW:S7RPT input message must be issued for SET:S7RPT input message to have any affect.
- HARDWARE NOT OPERATIONAL = The office does not have SS7 trunks.
- PARAMETER COMBINATION ERROR = The input message parameter combination is wrong.
- **OBSERVATION SCOPE CONFLICT** = Entered different scope than the active one.
- **OBSERVATION SCOPE LIMIT REACHED** = Two OPC,DPC or OPC,DPC,CIC observation scopes are already active.

**PF** = Printout follows. Followed by the EXC:S7RPT Output Messages message.

**Command Group:** CCS  
**Application:** 5  
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Execute a demand cross check (S7XCHK) request. These requests locate and optionally correct inconsistencies between AMPCI7GR/GMPCI7GR and PC7GR.

Inconsistencies are only reported by default, but can be corrected by using the CORRECT=Y option.

**WARNING:** When CNI-PSU Conversion is running, no S7XCHK request can be run.

Only one S7XCHK request can be run at a time.

Format 1 is used to initiate a cross check process on every provisioned SM in the office.

Format 2 is used to initiate a cross check process on a specified SM or range of SMs.

2. **FORMAT**

[1] EXC:S7XCHK,OFFICE[,TYPE=a][,CORRECT=d];

[2] EXC:S7XCHK,SM=b[&c][TYPE=a][,CORRECT=d];

3. **EXPLANATION OF MESSAGE**

a  
= Type of cross check requested. Valid value(s):
PC7GR  = PC7GR cross check.

b  
= Switching module.

c  
= Optional end of range of switching modules.

d  
= Correction status indicator. Valid value(s):
N  = Only report inconsistent tuples.
Y  = Correct inconsistent tuples.

4. **SYSTEM RESPONSE**

NG  
= No good. The request has been denied. May also include:
- CNI2PSU CONVERSION IN PROGRESS = Conversion is in progress, therefore no cross checks can be requested.
- SM DOES NOT EXIST = The switching module requested does not exist in the office.
PF = Printout follows. The request has been accepted. Followed by the EXC:S7XCHK output message.

RL = Retry later. May also include:
- PCI7GR CROSS CHECK IN PROGRESS = A cross check request can only execute if no other S7XCHK requests are running.

235-200-116  Signaling Gateway Common Channel Signaling
EXC:SCHED

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that a routine exercise (REX) and/or automatic line insulation test (ALIT) schedule be generated based on the equipment present. Optionally updates recent change and verify (RC/V) views 8.1 and 8.3.

2. FORMAT

[1] EXC:SCHED:REX[,RDAYS=a[-a...]][,RSTART=bbbb][,RDUR=c][,UPD];
[3] EXC:SCHED:ALL[,RDAYS=a[-a...]][,RSTART=bbbb][,RDUR=c][,AEND=dddd][,ADUR=e][,UPD];

3. EXPLANATION OF MESSAGE

ALL = Generate both REX and ALIT schedules.
UPD = Update the office-dependent data (ODD) relating to REX and/or ALIT, using RC/V views 8.1 (OFFICE PARAMETERS (MISCELLANEOUS)) and 8.3 (ROUTINE EXERCISE SCHEDULE). Make sure that RC/V is not inhibited. Otherwise, no update action will be taken. If ODD update completed successfully, multiple 'REPT:RCV APPTEXT COMPLETED...' messages will be displayed on the terminal screen.
a = Days in which REX is allowed to be scheduled. Legal values range from 1 (Monday) through 7 (Sunday). Thus, RDAYS=1-3-5 would restrict REX to run only on Monday, Wednesday and Friday. RDAYS=1-2-3-4-5 would indicate that REX should run on weekdays only. Default is to schedule REX for all seven days of the week (same as RDAYS=1-2-3-4-5-6-7).
b = REX start time given in 24-hour format (for example, 0130 = 1:30 AM). Default is REX starts at midnight.
c = Number of hours (integer values only) that REX is to be run daily (default is 6). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = ALIT end time given in 24-hour format (for example, 0130 = 1:30 AM). Default is ALIT ends at midnight.
e = Number of hours (integer values only) that ALIT is to run daily. (Default=5 or the time required to test all lines, whichever is shorter.)

4. SYSTEM RESPONSE

PF = Printout follows. The request was accepted. Followed by the REPT:SCHED output message.
NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

EXC:SODD-RED-OP

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Displays the relation currently being audited by the redundant static office dependent data (SODD) audit (invoked by EXC:SODD,RED). The message returned is: “EXC SODD RED IN PROGRESS REL <relation name>“. Relations are audited in the order determined by the relation ID which is a numeric identifier.

2. FORMAT

EXC:SODD:RED:OP;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

PF = Printout follows.

RL = Retry later. The request cannot be accepted now. Cannot signal the audit when it is not currently running.

Refer to the User Guidelines section of the Input Messages manual for additional system responses.

5. REFERENCES

Input Message(s):

EXC:SODD-RED
EXC:SODD-STP
1. PURPOSE

Requests an audit of the redundant (RED) relations to check for split translations in the static office-dependent data (SODD). Redundant relations are relations that are supposed to be exactly the same in more than one processor, the set of processors being determined by the relation distribution type. These relations include most of the routing, charging and digit analysis translations.

The redundant static data audit checks redundant relations, which have the distribution type of LR, FR, LRFR, or LPFR. This audit detects any corrupt tuples (tuples with the same key with different contents), extra tuples and missing tuples. All detected errors are printed to the output file. The following is a description of the distribution types:

- Logical redundant (LR) = Redundant relations that should be the same in the communications module processor (CMP) and the administrative module (AM).
- Fixed redundant (FR) = Redundant relations that should be the same in all the switching modules (SMs).
- Logical redundant fixed redundant (LRFR) = Redundant relations that should be the same in the CMP, the AM, and all the SMs.
- Logical processor fixed redundant (LPFR) = Relations that should be the same in either the CMP or AM, depending on the application, and all the SMs.

The audit works by calculating the checksum of the relation for each of the processors the relation is on. It groups the processors according to their checksums for the relation. All processors returning the same checksum are grouped together. If the relation checksum for each of the processors is the same, the relation is assumed to be free of errors. Otherwise, the master processor is taken from the group with the largest number of processors. The remaining groups are the "suspect" groups. Note that a master processor and a suspect processor are determined for each relation.

A processor from the first suspect group is chosen to compare with the master processor. The audit does a checksum on all of the tuples for the relation on the master processor and on all the tuples for the relation on the suspect processor. Identical checksums are removed and the remaining tuples from the master processor are compared to the remaining tuples from the suspect processor to determine which tuples are missing, extra or corrupt. This is then repeated for each of the suspect groups.

If the START and REL keywords are omitted from the input message line then all of the static redundant ODD relations are audited. If the REL keyword is used, then just the relation specified will be audited. If the START keyword is used, the audit will start with the specified relation and then audit all relations after this relation. The relations are ordered by ascending relation identifier.

The EXC:SODD-STOP and EXC:SODD-RED-OP input messages may be used to stop the audit prematurely or to check the status of the audit, respectively.

The audit's output file contains a listing of all errors found. Each error message contains an error number, the type of error, the relation name, a list of processors where the error occurs, and the tuple in error. For corrupt tuples, both the corrupt tuple and the correct version of the tuple are printed. In addition to tuple listings, the error file contains a
list of any other errors encountered during the audit. These errors may include loss of communication with a processor, DB primitive failures, or resource problems.

2. FORMAT

EXC:SODD:RED[,REL=a] [,START=b],OUTFILE=c;

3. EXPLANATION OF MESSAGE

RED = Verify redundant relations across all the processors.

a = Relation to be audited. Only one redundant relation is requested to be audited. If the relation name has an underscore, the name must be placed in quotation marks. If REL is specified, any START argument will be ignored. The default is to audit all redundant relations.

Logical redundant (LR) relations:

Copyright ©2003 Lucent Technologies
If specified, 'b' is a relation name that will be used as a starting point for the audit. The ordering of the relations is by ascending relation identifier, an integer assigned to relations. By default, the audit starts at the first relation.

This argument specifies where the output from the SODD audit will be placed (such as, OUTFILE="test1"). All files will be placed in the "/rclog" directory. Outfile name may be up to 14 characters long and may not contain a slash (/). Use upper case letters or enclose the outfile name in quotes.

Output files can be printed with the following message: DUMP:FILE,ALL,FN="/rclog/test1";

files can be removed from the "/rclog" directory with the following message: CLR:FILESYS,FILE,FN="/rclog/test1";

4. SYSTEM RESPONSE

NG
= No good. Valid value(s):
- CANNOT OPEN OUTPUT FILE = The outfile cannot be opened in the directory (/rclog). Check the outfile name and retry the message.
- INVALID OUTFILE NAME = The outfile name may not contain a slash (/). Check the outfile name and retry the message.

PF
= Printout follows. The request was received and followed by the EXC:SODD-RED output message.

RL
= Retry later. Request cannot be accepted now. Cannot start the audit while one is already in progress or cannot signal audit when it is not currently running. Standard system responses also apply.

235-600-10x Translations Data
**EXC:SODD-STP**

**Software Release:** 5E14 and later  
**Command Group:** AUDIT  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that the current static data audit be stopped. Static data audits check for split translations in the static office-dependent data (SODD).

This message will set a stop flag that is global to the static data audits. The static data audits periodically check this flag and terminate if it is set.

2. **FORMAT**

```plaintext
EXC:SODD:STP;
```

3. **EXPLANATION OF MESSAGE**

No variables.

4. **SYSTEM RESPONSE**

- **NG** = No good. The request has been denied. Check the format and retry the message.
- **PF** = Printout follows. The request was received and followed by the EXC:SODD-STP output message. After the audit completes, the output can be found in the output file specified in directory (/rclog).
- **RL** = Retry later. No static data audit running at this time.

5. **REFERENCES**

**Input Message(s):**

- EXC:SODD-BRCS  
- EXC:SODD-ISDN  
- EXC:SODD-LINE  
- EXC:SODD-MLHG  
- EXC:SODD-PSMHG

**Output Message(s):**

- EXC:SODD-STP
EXC:SRVT

**Software Release:** 5E14 and later  
**Command Group:** CCS  
**Application:** 5,CNI  
**Type:** Input

1. PURPOSE

Requests that the signaling connection control port (SCCP) routing verification test (SRVT) be initiated.

2. FORMAT

```
EXC:SRVT:TYPE=a,DIGITS=b[,TPC=c][,NTSP=d][,TRACE];
```

3. EXPLANATION OF MESSAGE

- **TRACE**
  - If this keyword is present, a list of TSPs crossed during the test will be included in the output. If this keyword is not present, a list of TSPs crossed will be included only when an error occurs and one or more TSPs had been crossed when the error occurred. No TRACE word will appear if not requested.
  
  - **a**
    - The translation type. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  
  - **b**
    - The digits in the global title, 19 digit maximum (such as, an 800 number).
  
  - **c**
    - The translation point code (TPC) to which the initiator should address and send an SRVT message. If not included, the default is chosen by common network interface (CNI) based on the translation type. CNI will send more than one SRVT message if more than one unique TPC is returned.
    
    Must be entered in one of the following formats:
    
    - `eeefffggg` = ANSI® standard.  
    - `eeehhfggg` = AT&T standard.
    
    Note: Non-local network point codes always use ANSI® standard format.
  
  - **d**
    - The maximum number of translation signaling points (TSPs) allowed to be crossed (default 1). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
  
  - **e**
    - The network identifier.
  
  - **f**
    - The cluster identifier.
  
  - **g**
    - The member identifier.
  
  - **h**
    - The region identifier.

4. SYSTEM RESPONSE

- **PF**
  - Printout follows. Followed by the EXC:SRVT output message.

Other Manual(s):
235-190-120 Common Channel Signaling Service Features
EXC:UCL

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the user shell accept an input message that it previously rejected because it was not represented in
the input message catalog database.

When operating in the full capability mode, the user shell will reject any input message that is not represented in the
input message (IM) catalog database, with an error acknowledgement. Consequently, a missing or erroneous entry
in the IM catalog will cause the user shell to reject the associated input message, even if it is typed correctly. If this
should occur, the user can force the user shell to accept the message and attempt to execute it by entering the
EXC:UCL input message immediately following the error acknowledgement. This input message affects only the
message immediately preceding the rejected input message. It will not cause the user shell to re-execute a
successful message or a message with a syntax error, and it has no effect on any subsequent message. If it is used
to force the user shell to execute an invalid input message, the invalid message will be rejected by the program that
processes it.

This input message may be used only when the shell is operating in the full capability mode. It will be rejected if the
shell is operating in the partial capability mode or limp mode.

2. FORMAT

EXC:UCL;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The input message has been rejected because:
- 'EXC:UCL' INVALID IN PART MODE
- CFTSHL CANNOT EXECUTE 'EXC:UCL' ITSELF
- PREVIOUS COMMAND HAD A SYNTAX ERROR
- NO PREVIOUS COMMAND AVAILABLE

OK = Good. Followed by the input message to be executed, its acknowledgement, and any resulting
output messages. Refer to the manual page for the previously-executed input message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) be executed.

Format 2 requests that a transfer of execution to an absolute address in the specified CMP be executed. This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the References section). If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] EXC:UT:CMP=a,{MATE|PRIM},CALL,{FUNC="b"|SYMIDX=c}[,ARG=d,PARM=e[-e...]}{!|;}

3. EXPLANATION OF MESSAGE

MATE = Execute this input message on the standby CMP.
PRIM = Execute this input message on the active CMP.
a = CMP number.
b = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'c' must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.
c = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
d = Number of parameters being passed to function. Must be a number from 0 to 10.
e = The parameters to be passed (maximum of 10). They must be 2 bytes apiece. If more than one parameter is to be entered, they should be entered as a list (separated by a dash). If the parameters are addresses, the high byte must be input before the low byte.
f = Transfer processor to this absolute address. This is only valid in WHEN breakpoint clauses.
4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

### 1. PURPOSE

Format 1 requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) be executed.

Note: This format shows the format of the function call to be used when the switch CM complex is a Model 2 or earlier.

Format 2 requests that an unconditional call to a function using parameters in the specified communication module processor (CMP) be executed.

Note: This format shows the format of the function call to be used when the switch CM complex is a Model 3.

Format 3 requests that a transfer of execution to an absolute address in the specified CMP be executed.

This message may be used together with any of the other CMP generic utility input messages (see the input messages listed in the References section).

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

**WARNING:** The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

### 2. FORMAT

1. EXC:UT-CMP=a, {MATE|PRIM}, CALL, {FUNC="b" | SYMIDX=c } [, ARG=d, PARM=e [-e...]] {!|;}
3. EXC:UT-CMP=a, {MATE|PRIM}, GOTO, ADDR=g {!|;}

### 3. EXPLANATION OF MESSAGE

- **MATE** = Execute this input message on the standby CMP.
- **PRIM** = Execute this input message on the active CMP.
- **a** = CMP number.
b = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number \( c \) must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

c = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

d = The number of shorts being passed in PARM list 'f' to the called functions stack (0 to 10).

e = Stack parameter information to be presented to called function. The stack information to be passed (maximum of 10); must be 2 bytes each. If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). This information will be packed together to form up to 20 bytes of data which is installed in the same order given by this input message.

- If switch CM complex is Model 2 or earlier, the compiler rules state that all parameters passed to a function are presented on the stack.

- If switch CM complex is a Model 3, the compiler rules state that the first 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one "C code" parameter per each register loaded sequentially. These first 8 parameters are passed using field(s) 'f' of this message. Stack parameter will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

f First 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one "C code" parameter per each register loaded sequentially. If the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed, the fields 'd' and 'e' must be used to pass the information.

1 If switch CM complex is Model 2 or earlier, the R[1-8] fields are set to zero and not used.

2 If switch CM complex is a Model 3, the compiler rules state that the first 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one "C code" parameter per each register loaded sequentially. Stack parameter fields 'd' and 'e' will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

g = Transfer processor to this absolute address. This is only valid in WHEN breakpoint, matching WHEN (switch CM complex Model 3 only), address access WHEN (switch CM complex Model 3 only), and data access WHEN (switch CM complex Model 3 only) clauses.

h = Size of the function return value. Needed only when the function returns a structure. Maximum supported return size structure is 100 bytes. Default to zero.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that an unconditional call to a function using parameters in the specified foundation peripheral controller (FPC) be executed.

**WARNING:** The user is responsible that result from the use of this input message. Know the effects of the message before using it. This message can access and affect any function in the foundation peripheral controller.

2. **FORMAT**

```
EXC:UT:FPC=a,CALL,(FUNC="b"|SYMIDX=c)[,ARG=d],PARM=e[-e...-e];
```

3. **EXPLANATION OF MESSAGE**

- **a** = FPC number.
- **b** = Function name to be called. Must be entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘c’ must be used to enter this input message using symbolic access. The functions symbol index number can be determined by using the DUMP:UT-SYMID input message.
- **c** = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
- **d** = Number of parameters being passed to function. (0 - 10, default is 0).
- **e** = The parameters to be passed (maximum of 10). They must be 2 bytes a piece. If more than one parameter is to be entered, they must be entered as a list. If the parameters are addresses, then the high byte must be input before the low byte.

4. **SYSTEM RESPONSE**

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that an unconditional call to a function using parameters in the specified message handler (MH) unit be executed. This format shows the format of the function call to be used when the MH is a MH32 or MHEIB type.

Format 2 requests that an unconditional call to a function using parameters in the specified MH unit be executed. This format shows the format of the function call to be used when the MH is a MHPPC type.

The MH image and hardware type can be determined for this processor by using the DUMP:UT-SYMID input message.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

   ...[,ARG=e,PARM=f[-f...]]{!|;}

   ...[,RP1=g[,RP2=g[,RP3=g[,RP4=g[,RP5=g[,RP6=g]...]
   ...[,RP7=g[,RP8=g[,ARG=e,PARM=f[-f...]][,RTNSZ=h}{!|;}

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = MH unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘d’ must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = The number of shorts being passed in PARM list ‘f’ to the called functions stack (0 to 10) (default is 0).
f = Stack parameter information to be presented to called function. The stack information to be passed (maximum of 10); must be 2 bytes each. If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). This information will be packed together to form up to 20 bytes of data which is installed in the same order given by this input message.
- If MH unit is a MH32 or a MHEIB, the compiler rules state that all parameters passed to a function are presented on the stack.
- If MH unit is a MHPPC, the compiler rules state that the first 8 parameters are passed in registers, one "C code" parameter per each register loaded sequentially. Each parameter is 1 to 4 bytes in length.

These first 8 parameters are passed using field(s) ‘g’ of this message. Stack parameter will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

g = First 8 parameters are passed in registers, one "C code" parameter per each register loaded sequentially. Each parameter is 1 to 4 bytes in length.

If the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed, the fields ‘e’ and ‘f’ must be used to pass the information.
- If MH unit is a MH32 or MHEIB, the RP[1-8] fields are set to zero and not used.
- If MH unit is a MHPPC, the compiler rules state that the first 8 parameters are passed in registers, one "C code" parameter per each register loaded sequentially. Each parameter is 1 to 4 bytes in length.

Stack parameter fields ‘e’ and ‘f’ will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

h = Size of the function return value. Needed only when the function returns a structure. Maximum supported return size structure is 100 bytes. Default to zero.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that an unconditional call to a function using parameters in the specified peripheral interface (PI) unit be executed.

Format 2 requests that a transfer of execution to an absolute address in the specified PI be executed.

WARNING: The user is responsible for any effects on system operation that result from the use of this input request. Know the effects of the request before using it.

2. FORMAT

[1] EXC:UT:MCTSI=a-b,PI,CALL,{FUNC="c"|SYMIDX=d}
     [,ARG=e,PARM=f[-f...]]{!|;}

[2] EXC:UT:MCTSI=a-b,PI,GOTO,ADDR=g{!|;}

3. EXPLANATION OF MESSAGE

Note: The GOTO option of this input request is only supported in PIs of PI2 hardware type.

a = Switching module (SM) number.

b = Side of the module controller/time-slot interchange (MCTSI).

c = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input request using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input request.

d = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input request.

e = Number of parameters being passed to function.

f = The parameters to be passed (maximum of 10). They must be 2 bytes a piece. If more than one parameter is to be entered, they must be entered as a list. If the parameters are 2 bytes, the low byte must be input before the high byte. Pointers must be entered in the following format: offset-segment register (example: 0x5d5fa ==> 0xfa5d50 where 0xfa is the offset and 0x5d50 is the value of the segment register. This swabbing is only true in PIs of PI1 type.

g = Transfer processor to this absolute address (ADDR). This is only valid in WHEN breakpoint clauses. This is only valid in PIs of PI2 type.
4. SYSTEM RESPONSE

Software Release: 5E15 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an unconditional call to a function using parameters in the specified message switch (MSGS) be executed.

NOTE: This command is valid only on MSGS processors of communication Model 3.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

3. EXPLANATION OF MESSAGE

AP = Execute this command on the MSGS application processor.

IP = Execute this command on the MSGS interface processor.

a = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'c' must be used to enter this command using symbolic access. The function’s symbol index number can be determined by using the DUMP:UT-SYMID input command.

c = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input command.

d = First 8 parameters (Note: each parameter is 1 to 4 bytes long) are passed in registers, one parameter per each register loaded sequentially.

Structures (of any size) passed as parameters require the user to build a copy of the structure somewhere else in memory, and then give that memory address in the parameter list.

If the number of parameters passed to the called function exceeds eight, the fields 'e' and 'f' must also be used to pass the additional information.

e = The number of shorts being passed in PARM list 'f' to the called functions stack (0 to 10).

f = Stack parameter information to be presented to called function. Each parameter is represented as a "long", but must be entered as two "shorts" separated by a dash. For example:
char(aa) = h'0-h'aa
short(bbcc) = h'0-h'bbcc
long(ddeeffaa) = h'ddee-h'ffaa

If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). The maximum number of supported stack parameters is 5.

\( g \) = Size of the function return value. Needed only when the function returns a structure. Maximum supported return size structure is 100 bytes, default is zero.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that an unconditional call to a function using parameters in the specified optical facility interface (OFI) be executed.

This message may be used together with any of the other OFI generic utility input messages. Refer to the input messages listed in the REFERENCES section of this message description.

**WARNING:** The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. **FORMAT**

```
EXC:UT:OFI=a-b-c-d,CALL,{FUNC="e"|SYMIDX=f}[,...ARG=g,PARM=h[-h...]}{!|;}
```

3. **EXPLANATION OF MESSAGE**

- **a** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = Side number.
- **e** = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'f' must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.
- **f** = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
- **g** = Number of parameters being passed to function (0 to 10, default is 0).
- **h** = Stack parameter information to be presented to called function. The stack information to be passed (maximum of 10) must be 2 bytes each. If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). This information will be packed together to form up to 20 bytes of data which is installed in the same order given by this command.

4. **SYSTEM RESPONSE**
Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Software Release: 5E15 and later
Command Group: N/A
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that an unconditional call to a function using parameters in the specified office network and timing complex processor (ONTC) be executed.

NOTE: This command is valid only on ONTC processors of communication Model 3.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

EXC:UT:ONTC=a, {AP|IP}, CALL, {FUNC="b"|SYMIDX=c}[,RP1=d][,RP2=d][,RP3=d][,RP4=d][,RP5=d][,RP6=d][,RP7=d][,RP8=d][,ARG=e, PARM=f[-f...]][,RTNSZ=g];

3. EXPLANATION OF MESSAGE

AP = Execute this command on the ONTC application processor.

IP = Execute this command on the ONTC interface processor.

a = ONTC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'c' must be used to enter this command using symbolic access. The function’s symbol index number can be determined by using the DUMP:UT-SYMID input command.

c = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input command.

d = First 8 parameters (Note: each parameter is 1 to 4 bytes long) are passed in registers, one parameter per each register loaded sequentially.

Structures (of any size) passed as parameters require the user to build a copy of the structure somewhere else in memory, and then give that memory address in the parameter list.

If the number of parameters passed to the called function exceeds eight, the fields 'e' and 'f' must also be used to pass the additional information.

e = The number of shorts being passed in PARM list 'f' to the called functions stack (0 to 10).

f = Stack parameter information to be presented to called function. Each parameter is represented as a "long", but must be entered as two "shorts" separated by a dash. For example:
char(aa) = h'0-h'aa
short(bbcc) = h'0-h'bbcc
long(ddeeffaa) = h'ddee-h'ffaa

If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). The maximum number of supported stack parameters is 5.

g = Size of the function return value. Needed only when the function returns a structure. Maximum supported return size structure is 100 bytes, defaults to zero.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Format 1 requests that an unconditional call to a function using parameters in the specified packet switch unit protocol handler (PSUPH) be executed.

Format 2 requests that a transfer of execution to an absolute address in the specified PSUPH be executed. This message may be used together with any of the other PSUPH generic utility input messages (refer to the input messages listed in the REFERENCES section). If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] EXC:UT:PSUPH=a-b-c-d,CALL,{FUNC="e" | SYMIDX=f} [,ARG=g,PARM=h[-h...]]{!|;}

3. EXPLANATION OF MESSAGE

a  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Unit number (always 0).

c  = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'f' must be used to enter this input message using symbolic access. The function’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

f  = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g  = Number of parameters being passed to function. Must be a number from 0 to 10.

h  = The parameters (PARM) to be passed (maximum of 10). They must be 2 bytes apiece. If more than one parameter is to be entered, they must be entered as a list.
If the PSUPH is a PH2 and the parameters are 4 bytes, the low byte must be input before the high byte. Pointers must be entered in the following format: offset-segment register (example: 0x5d5fa => 0xfa5d50 where 0xfa is the offset and 0x5d50 is the value of the segment register).

If the PSUPH is a PH3 and the parameters are 4 bytes, the high byte must be input before the low byte. Pointers must be entered in the following format: (example: 0x7c5d5fa => 0x7c5d5fa).

Note: The GOTO option and its required address are only supported in a PSUPH of the PH3/PH4 and later hardware types (for example, not in a PH2 hardware type).

\[i\] = Transfer processor to this absolute address (ADDR). This is only valid in WHEN breakpoint clauses.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘f’ must be used to enter this input message using symbolic access. The function’s symbol index number can be determined by using the DUMP:UT-SYMID input message.
f = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Number of parameters being passed to function. Must be a number from 0 to 10.

h = Stack parameter information to be presented to called function. The stack information to be passed (maximum of 10) must be 2 bytes each. If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). This information will be packed together to form up to 20 bytes of data which is installed in the same order given by this command.

- If the PSUPH is a PH[2-4,6,22], PHA, PHV[1-4] hardware type, the compiler rules state that all parameters passed to a function are presented on the stack.

  If the PSUPH is a PH2 hardware type and the parameters are 4 bytes, the low two bytes must occur before the high two bytes. Pointers must be entered in the following format: offset-segment register (example: 0x5d5fa == 0xfa5d50 where 0xfa is the offset and 0x5d50 is the value of the segment register).

  Otherwise, if the parameters are 4 bytes, the high byte must be input before the low byte. Pointers must be entered in the following format: (example: 0x7c5d5fa).

  - If the PSUPH is a PHV5 hardware type, the compiler rules state that the first 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one "C code" parameter per each register loaded sequentially. These first 8 parameters are passed using field(s) 'i' of this message. Stack parameters will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

i = First 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one "C code" parameter per each register loaded sequentially. If the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed, the fields 'g' and 'h' must be used to pass the information.

- If the PSUPH is a PH[2-4,6,22], PHA, PHV[1-4] hardware type, the RP[1-8] fields are set to zero and not used.

- If the PSUPH is a PHV5, the compiler rules state that the first 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one "C code" parameter per each register loaded sequentially. Stack parameter fields 'g' and 'h' will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

j = Size of the function return value. Needed only when the function returns a structure. Maximum supported return size structure is 100 bytes. Default to zero.

k = Transfer processor to this absolute address (ADDR). This is only valid in WHEN breakpoint clauses.

Note: The GOTO option and its required address are not supported on a PSUPH of the PH2 hardware types.

4. SYSTEM RESPONSE
Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

[3] EXC:UT:PSUPH=a-b-c-d,GOTO,ADDR=k{!|;}

3. **EXPLANATION OF MESSAGE**

**GOTO**

- This option and its required address are not supported on a PSUPH of the PH2 hardware types.

a

- Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b

- Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c

- Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘f’ must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

f = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g = Number of parameters being passed to function. Must be a number from 0 to 10.

h = Stack parameter information to be presented to called function. The stack information to be passed (maximum of 10) must be 2 bytes each. If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). This information will be packed together to form up to 20 bytes of data which is installed in the same order given by this command.

<table>
<thead>
<tr>
<th>PH</th>
<th>PHA</th>
<th>PHV</th>
</tr>
</thead>
<tbody>
<tr>
<td>[2-4,6,22]</td>
<td>[1-4]</td>
<td></td>
</tr>
</tbody>
</table>

If the PSUPH is a PH[2-4,6,22], PHA, PHV[1-4] hardware type, the compiler rules state that all parameters passed to a function are presented on the stack.

If the PSUPH is a PH2 hardware type and the parameters are 4 bytes, the low two bytes must occur before the high two bytes. Pointers must be entered in the following format: offset-segment register (example: 0x5d5fa ==> 0xfa5d50 where 0xfa is the offset and 0x5d50 is the value of the segment register).

Otherwise, if the parameters are 4 bytes, the high byte must be input before the low byte. Pointers must be entered in the following format: (example: 0x7c5d5fa).

- If the PSUPH is a PHV5, PHV6, PH31, PHA2, or PHE2 hardware type, the first 8 parameters are passed in registers, one “C code” parameter per each register loaded sequentially. Each parameter is 1 to 4 bytes in length.

These first 8 parameters are passed using variable(s) ‘i’ of this message. Stack parameters will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

i = First 8 parameters (Note: each parameter is 1 to 4 bytes in length) are passed in registers, one “C code” parameter per each register loaded sequentially. If the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed, the variables ‘g’ and ‘h’ must be used to pass the information.

- If the PSUPH is a PH[2-4,6,22], PHA, PHV[1-4] hardware type, the RP[1-8] variables are set to zero and not used.

- If the PSUPH is a PHV5, PHV6, PH31, PHA2, or PHE2 the compiler rules state that the first 8 parameters are passed in registers, one “C code” parameter per each register loaded sequentially. Each parameter is 1 to 4 bytes in length.

Stack parameter variables ‘g’ and ‘h’ will only be used when the number of parameters passed to the called function exceeds eight or a structure of greater than eight bytes is to be passed to the function.

j = Size of the function return value. Needed only when the function returns a structure. Maximum supported return size structure is 100 bytes. Default to zero.
k = Transfer processor to this absolute address (ADDR). This is only valid in WHEN breakpoint clauses.

Format 1 requests that an unconditional call to a function using parameters in the specified switching module (SM) be executed.

Format 2 requests that a transfer of execution to an absolute address in the specified SM be executed. This message may be used together with any of the other SM generic utility input messages (refer to the input messages listed in the REFERENCES section). If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

[1] EXC:UT:SM=a,CALL,{FUNC="b"|SYMIDX=c},{ARG=d,PARM=[-e...]}{!|;}

3. EXPLANATION OF MESSAGE

a = SM number.

b = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'c' must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

c = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

d = Number of parameters being passed to function (range is 0-10) (default is 0).

e = The parameters to be passed (maximum of 10). They must be 2 bytes a piece. If more than one parameter is to be entered, they must be entered as a list. If the parameters are addresses, then the high byte must be input before the low byte.

f = Transfer the processor to this absolute address. This is only valid in WHEN breakpoint or match WHEN clauses.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

3. EXPLANATION OF MESSAGE

a = SM number.

b = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'c' must be used to enter this input message using symbolic access. The function's symbol index number can be determined by using the DUMP:UT-SYMID input message.

c = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
\( \text{d} \) = The number of shorts being passed in PARM variable ‘\( \text{e} \)’ to the called functions stack (0 to 10). Default is 0.

\( \text{e} \) = Stack parameter information to be presented to called function. The stack information to be passed (maximum of 10); must be 2 bytes each. If more than one parameter is to be entered, the parameters should be entered as a list (separated by a dash). This information will be packed together to form up to 20 bytes of data which is installed in the same order given by this input message.

<table>
<thead>
<tr>

**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

### 1. PURPOSE

Requests that an unconditional call be made to a function using parameters in the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).

**WARNING:** The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

### 2. FORMAT

```
EXC:UT:TMUX=a-b-c-d,CALL,{FUNC="e"|SYMIDX=f}
[,ARG=g,PARM=h[-h]...[-h]}{!|;}
```

### 3. EXPLANATION OF MESSAGE

- **a** = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **b** = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **d** = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **e** = Function name to be called. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘f’ must be used to enter this input message using symbolic access. The function’s symbol index number can be determined by using the DUMP:UT-SYMID input message.
- **f** = Symbol index number of function. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
- **g** = Number of parameters being passed to function (range is 0-10) (default is 0).
- **h** = The parameters to be passed (maximum of 10). They must be 2 bytes apiece. If more than one parameter is to be entered, they must be entered as a list separated by a dash.

### 4. SYSTEM RESPONSE

FRMV:LN

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5,CNI
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests forced removal of the specified node from service, regardless of the state of the link, mate, or other nodes.

An attempt is made to remove the node from service, provided that the node is not the ring peripheral controller (RPC), the major state is active (ACT), the node is in the active ring segment, and the interprocess message switch (IMS) subsystem is not initializing at a level higher than 1A. If successful, the link node (LN) major state is changed to out-of-service (OOS), and the node itself is placed in the quarantine state. When a node is manually removed, it becomes the responsibility of the user to restore the node to service. This input message does not use the maintenance input request administrator (MIRA) queue, so the OP:DMQ and STOP:DMQ input messages do not apply to it and it may be executed ahead of previously entered input messages in the MIRA queue.

WARNING: This input message can cause signaling point isolation - isolating the office and interrupting common channel signaling (CCS) message processing, by removing the last LN of a set. Use it only when it is necessary to override the safety checks of the RMV:LN input message.

2. FORMAT

FRMV:LNa=b;

3. EXPLANATION OF MESSAGE

a = A ring node (RN) group number with explicit leading zero for group numbers less than 10. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The node’s position in the RN group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the FRMV:LN output message.

31. GRC
GRC:CANCEL

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that a global recent change (GRC) job that is waiting in the queue be canceled. This allows the user to un-schedule a GRC job. If the GRC job has been split, SECT must be provided.

Note: Use the CLR:GRC message since it will replace this message.

2. FORMAT

GRC:CANCEL, NAME=a[, SECT=b];

3. EXPLANATION OF MESSAGE

a = GRC name (up to 10 characters).

b = GRC section number.

4. SYSTEM RESPONSE

NG = No good. The request was denied. The GRC:ERROR output message provides the reason for the failure.

PF = Printout follows. Followed by the GRC:STATUS output message indicating the beginning of the operation.

GRC:CONTINUE

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE

Requests that a global recent change (GRC) operation that is halted be restarted. This input message restarts the GRC process that was halted using the STP:GRC input message. The REPT:GRC input message can be used to determine which job was halted.

Note: Use the EXC:GRC input message since it will replace this input message.

2. FORMAT

GRC:CONTINUE;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

NG = No good. The request was denied. The GRC:ERROR output message provides the reason for the failure.

PF = Printout follows. Followed by the GRC:STATUS output message indicating the beginning of the operation.

**GRC:HALT**

Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

### 1. PURPOSE

Requests that the execution of the current global recent change (GRC) job be suspended. This input message stops the processing GRC job gracefully. The EXC:GRC input message continues job execution.

Note: Use the STP:GRC message since it will replace this message.

### 2. FORMAT

GRC:HALT;

### 3. EXPLANATION OF MESSAGE

No variables.

### 4. SYSTEM RESPONSE

NG = No good. The request was denied. The GRC:ERROR output message provides the reason for the failure.

PF = Printout follows. Followed by the GRC:STATUS output message indicating that the job was successfully halted.

### 5. REFERENCES

GRC:PASSWORD
Software Release: 5E14 and later
Command Group: AUTH
Application: 5
Type: Input

1. PURPOSE
Requests that the global recent change (GRC) password for the given clerk identifier be updated or deleted.

Note: Use the EXC:GRCPASSWORD message since it will replace this message.

2. FORMAT
GRC:PASSWORD,CLERKID=a,{PASSWD=b|DELETE};

3. EXPLANATION OF MESSAGE
DELETE = Delete the password.
a = Clerk identifier assigned to GRC clerk.
b = New password for GRC clerk.

4. SYSTEM RESPONSE
NG = No good. The request was denied. The GRC:ERROR output message provides the reason for the failure.
OK = Good. The input message has been accepted indicating that the action will be taken.

5. REFERENCES
Input Message(s):

235-118-251 Recent Change Procedures
235-118-25x Recent Change Reference
235-070-100 Administration and Engineering Guidelines
1. PURPOSE

Requests that a report of the global recent change (GRC) activity be printed. The NAME field refers to the name of a GRC job. If NAME is not entered, the schedule for all GRC jobs will be displayed. If NAME is entered, a more detailed status of the named job will be reported.

If a named GRC job has been split into sections, the section number MUST be provided using the SECT input message line option.

When BATCH is specified, a list of all time-released batch jobs will print. When HISTORY is specified, a history of all input messages executed for all GRC jobs will be printed unless a GRC NAME is specified. When UPDSPEC is specified, a list of the updates defined for all GRC jobs will be printed unless a GRC NAME is specified. When QUERY is specified, the query criteria for all GRC jobs will be printed unless a GRC NAME is specified.

Note: Use the REPT:GRC message since it will replace this message.

2. FORMAT

```
GRC:REPORT[,NAME=a[,SECT=b]][,DEVICE="c"][,BATCH][,HISTORY][,UPDSPEC][,QUERY];
```

3. EXPLANATION OF MESSAGE

- **BATCH** = Report the current list of recent change/verify (RC/V) batch jobs scheduled.
- **HISTORY** = Report the history of input messages executed on this GRC name.
- **QUERY** = List the criteria specified for this GRC name.
- **UPDSPEC** = List updates specified for this GRC name.

- **a** = GRC name (up to 10 characters).
- **b** = GRC section number.
- **c** = Destination device or file for the report. The device or file name is input as a character string and must be enclosed with double quotation marks. If the input string is prefixed by a slash (/), the destination will be taken as the name of a file. The length of the file name must not exceed 30 characters. If the device name does not start with a slash (/), it must correspond to an output device defined in a “device” record in the equipment configuration database (ECD). The default destination is the name of the default tty device obtained from the environment variable LCHAN.

4. SYSTEM RESPONSE

- **NG** = No good. The request was denied. The GRC:ERROR output message provides the reason for
failure.

= Printout follows. Followed by the REPT:GRC output message.

GRC:RESCHED
Software Release: 5E14 and later
Command Group: RCV
Application: 5
Type: Input

1. PURPOSE
Requests that a global recent change (GRC) job be rescheduled. This input message allows the user to change the options specified when the GRC job was scheduled. If the GRC job has been split, SECT must be provided.

RDATE and RTIME should be specified together. If RDATE is provided without RTIME, RTIME defaults to midnight. If RDATE and RTIME are not provided or RTIME is specified without RDATE, the default is the current date and time.

Note: Use the SCHED:GRC message since it will replace this message.

2. FORMAT
GRC:RESCHED,NAME=a[,SECT=b],MODE=c[,VERBOSE=d][,MAXERR=e][,RDATE=ff-ff-ff,RTIME=gg-gg];

3. EXPLANATION OF MESSAGE

a = GRC name (up to 10 characters).
b = GRC section number.
c = Mode of job to be rescheduled. Valid value(s):
   BACKOUT = Backout operation.
   UPDATE = Update operation.
d = Print one-line logging messages on the receive-only printer (ROP) for each update or backout of a line for this GRC job. Valid value(s):
   N = Disables the verbose option.
   Y = Enables the verbose option.
e = Allow a maximum of this many errors.
f = Release date, in the form month-day-year.
g = Release time, in the form hour-minute.

4. SYSTEM RESPONSE

NG = No good. The request was denied. The GRC:ERROR output message provides the reason for the failure.
PF = Printout follows. Followed by the GRC:STATUS output message indicating the beginning of the
operation.

32. IF
IF:UT-CMP-A

Software Release: 5E14 only
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory. The two items being compared must be the same byte size and on the same processor. This message may be used together with an ELSE:UT-CMP input message.

If the comparison is true, any input messages after the IF input message are performed. If the comparison is false, any input messages after the ELSE input message are performed.

Note: The comparison is based on signed arithmetic.

IF statements can be nested. The IF:UT-CMP-ENDIF input message is used to signify the end of each IF clause.

This message may be used together with any of the other CMP generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

IF:UT-CMP=a, {MATE|PRIM}[,EA1], {ADDR1=b|GVAR1="c"|SYMIDX1=d|REG1=e|UVAR1=f|VAL1=g}[,L1=h][,INDIR1=i][,OFF1=j[-j][-j]][,MSK1=k],l[,EA2], {ADDR2=m|GVAR2="n"|SYMIDX2=o|REG2=p|UVAR2=q|VAL2=r}[,L2=s][,INDIR2=t][,OFF2=u[-u][-u]][,MSK2=v]!|;}

3. EXPLANATION OF MESSAGE

EA1 = The first part of the comparison will use the determined effective address of the specified field instead of the contents of the specified field.

EA2 = The second part of the comparison will use the determined effective address of the specified field instead of the contents of the specified field.

MATE = Execute this input message on the standby CMP.

PRIM = Execute this input message on the active CMP.

a = CMP number.

b = Address for the first part of the comparison.
c = Symbolic name of the global variable for the first part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d = Symbol index number of the global variable or function for the first part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = Register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) for the first part of the comparison.

f = Utility variable for the first part of the comparison.

g = Constant value for the first part of the comparison.

h = Length of the value (in bytes) to be used for the first part of the comparison. Default is 4 bytes for utility variable (UVAR) and register (REG) unless REG is the status register which defaults to 2 bytes, and 1 byte for absolute address (ADDR), global variable (GVAR) and symbol index (SYMIDX). Maximum length in bytes is 4.

i = Level of indirection for the first part of the comparison (maximum of 3, default is 0).

j = The offsets, in bytes, at each level of indirection for the first part of the comparison can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. The default is zero.

k = Value of the mask to be "anded" with the final value for the first part of the comparison.

l = Conditionals used for the comparison (default is EQ). Valid value(s):
EQ = Equal to.
GE = Greater than or equal to.
GT = Greater than.
LE = Less than or equal to.
LT = Less than.
NE = Not equal to.

m = Address for the second part of the comparison.

n = Symbolic name of the global variable for the second part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'o' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

o = Symbol index number of the global variable or function for the second part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

p = Register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) for the second part of the comparison.

q = Utility variable for the second part of the comparison.
r = Constant value for the second part of the comparison.

s = Length of the value to be used for the second part of the comparison. Default is 4 bytes for UVAR and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR and SYMIDX. The maximum length in bytes is 4.

t = Level of indirection for the second part of the comparison (maximum of 3, default is 0).

u = The offsets, in bytes, at each level of indirection for the second part of the comparison can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. The default is zero.

v = Value of the mask to be "anded" with the final value for the second part of the comparison.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a constant or variable in a communication module processor's (CMP) memory be compared against another constant or variable in the CMP memory. The items being compared must be on the same processor. This message may be used together with an ELSE:UT-CMP input message.

If the comparison is true, any input messages after the IF input message are performed. If the comparison is false, any input messages after the ELSE input message are performed.

Note: The comparison is based on signed arithmetic. Internally UT always does a signed 4 byte comparison. For lengths less than 4 bytes, each value will be sign extended then “anded” with the mask prior to the completion of the comparison (e.g. a val2=h`80,l2=1 causes 4 byte comparison with h`ffffff80 while a val2=h`80,l2=2 causes a 4 byte comparision with h`00000080).

IF statements can be nested. The IF:UT-CMP-ENDIF input message is used to signify the end of each IF clause.

This message may be used together with any of the other CMP generic utility input messages (see the input messages listed in the References section).

If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

IF:UT:CMP=a,{MATE|PRIM}[,EA1],{ADDR1=b|GVAR1="c"|SYMIDX1=d|REG1=e|UVAR1="f"|VAL1=g}[,L1=h][,INDIR1=i][,OFF1=j[-j][-j][-j]][,MSK1=k],l[,EA2],{ADDR2=m|GVAR2="n"|SYMIDX2=o|REG2=p|UVAR2=q|VAL2=r}[,L2=s][,INDIR2=t][,OFF2=u[-u][-u][-u]][,MSK2=v]{!|;}

3. EXPLANATION OF MESSAGE

EA1 = The first part of the comparison will use the determined effective address of the specified field instead of the contents of the specified field.

EA2 = The second part of the comparison will use the determined effective address of the specified field instead of the contents of the specified field.

MATE = Execute this input message on the standby CMP.

PRIM = Execute this input message on the active CMP.
a = CMP number.

b = Address for the first part of the comparison.

c = Symbolic name of the global variable for the first part of the comparison. The name is entered as
a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater
than 15 characters the symbol index number ‘d’ must be used to enter this input message using
symbolic access. The global variable’s symbol index number can be determined by using the
DUMP:UT-SYMID input message.

d = Symbol index number of the global variable or function for the first part of the comparison. The
symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = Register for the first part of the comparison. The following registers can be used:
- If switch CM complex is a Model 3, the registers are general purpose registers
  GPR0, GPR2-GPR31, SP [which is GPR1], the link register LR, program counter
  PC, count register CTR, condition register CR, machine state register MSR, integer
  exception XER, external interrupt mask register EIMR (from module processor), and
  the system management interrupt mask register SMIMR (from module processor).
- If switch CM complex is Model 2 or earlier, the registers are address registers
  A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data
  registers D0-D7, program counter PC, or status register SR.

Note: This option of this input message can only be used as part of a generic utilities
WHEN input message clause.

f = Utility variable for the first part of the comparison.

g = Constant value for the first part of the comparison.

h = Length of the value (in bytes) to be used for the first part of the comparison. Default is 4 bytes for
utility variable (UVAR), constant value (VAL) and register (REG) unless REG is the status register
which defaults to 2 bytes, and 1 byte for absolute address (ADDR), global variable (GVAR) and
symbol index (SYMIDX). Maximum length in bytes is 4. It is suggested that the length and mask
values being compared be of the same byte size on each side of the comparison.

i = Level of indirection for the first part of the comparison (maximum of 3, default is 0).

j = The offsets, in bytes, at each level of indirection for the first part of the comparison can range
from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. The default
is zero.

k = Value of the mask to be "anded" with the final value for the first part of the comparison. Mask
operations are always performed with a mask of 0xffffffff unless another mask value is provided.

l = Conditionals used for the comparison (default is EQ). Valid values are:

  EQ   = Equal to.
  GE   = Greater than or equal to.
  GT   = Greater than.
  LE   = Less than or equal to.
LT = Less than.
NE = Not equal to.

m = Address for the second part of the comparison.
n = Symbolic name of the global variable for the second part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘o’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.
o = Symbol index number of the global variable or function for the second part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
p = Register for the second part of the comparison. The following registers can be used:
- If switch CM complex is a Model 3, the registers are general purpose registers GPR0, GPR2-GPR31, SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, integer exception XER, external interrupt mask register EIMR (from module processor), and the system management interrupt mask register SMIMR (from module processor).
- If switch CM complex is Model 2 or earlier, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, or status register SR.

Note: This option of this input message can only be used as part of a generic utilities WHEN input message clause.

q = Utility variable for the second part of the comparison.
r = Constant value for the second part of the comparison.
s = Length of the value to be used for the second part of the comparison. Default is 4 bytes for UVAR, VAL and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR and SYMIDX. The maximum length in bytes is 4. It is suggested that the length and mask values being compared be of the same byte size on each side of the comparison.

t = Level of indirection for the second part of the comparison (maximum of 3, default is 0).
u = The offsets, in bytes, at each level of indirection for the second part of the comparison can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. The default is zero.
v = Value of the mask to be "anded" with the final value for the second part of the comparison. Mask operations are always performed with a mask of 0xffffffff unless another mask value is provided.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Address for the first part of the comparison.

f = Symbolic name of the global variable for the first part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘g’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of the global variable or function for the first part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

h = Register for the first part of the comparison. The following registers can be used:

- If PSUPH is a PHV5 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.

- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

i = Utility variable (UVAR) for the first part of the comparison. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Constant value for the first part of the comparison.

k = Length of the value (in bytes) to be used for the first part of the comparison. Default is 4 bytes for UVAR and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR and SYMIDX. Maximum length in bytes is 4.

l = Level of indirection for the first part of the comparison (maximum of 3, default is 0).

m = The offsets, in bytes, at each level of indirection for the first part of the comparison can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. The default is zero.

n = Value of the mask to be "anded" with the final value for the first part of the comparison.

o = Conditionals used for the comparison (default is EQ). Valid value(s):

EQ = Equal to.
GE = Greater than or equal to.
GT = Greater than.
LE = Less than or equal to.
LT = Less than.
NE = Not equal to.
p = Address for the second part of the comparison.

q = Symbolic name of the global variable for the second part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number "r" must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

r = Symbol index number of the global variable or function for the second part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

s = Register for the second part of the comparison. The following registers can be used:
- If PSUPH is a PHV5 hardware type, the registers are general purpose registers GPR0, GPR2-GPR31, the stack pointer SP [which is GPR1], the link register LR, program counter PC, count register CTR, condition register CR, machine state register MSR, and the integer exception register XER.
- If PSUPH is a PH[3-4,6,22], PHA, PHV[1-4] hardware type, the registers are address registers A0-A5, A6 [which is the frame pointer FP], A7 [which is the stack pointer SP], data registers D0-D7, program counter PC, and status register SR.

t = Utility variable for the second part of the comparison. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Constant value for the second part of the comparison.

v = Length of the value to be used for the second part of the comparison. Default is 4 bytes for UVAR and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR and SYMIDX. The maximum length in bytes is 4.

w = Level of indirection for the second part of the comparison (maximum of 3, default is 0).

x = The offsets, in bytes, at each level of indirection for the second part of the comparison can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets. The default is zero.

y = Value of the mask to be "anded" with the final value for the second part of the comparison.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a constant or variable in a packet switch unit protocol handler's (PSUPH) memory be compared against another constant or variable in the PSUPH memory. The items being compared must be on the same processor. This message may be used together with an ELSE:UT-PSUPH input message.

If the comparison is true, any input messages after the IF input message are performed. If the comparison is false, any input messages after the ELSE input message are performed.

The comparison is based on signed arithmetic. Internally UT always does a signed 4 byte comparison. For lengths less than 4 bytes, each value will be sign extended then "anded" with the mask prior to the completion of the comparison (such as, a val2=h`80,l2=1 causes 4 byte comparison with h`ffffff80 while a val2=h`80,l2=2 causes a 4 byte comparison with h`00000080).

IF statements can be nested. The IF:UT-PSUPH-END input message is used to signify the end of each IF clause.

This input message is not supported on PSUPHs of the PH2 hardware type and is supported on all other.

This message may be used together with any of the other PSUPH generic utility input messages (refer to the input messages listed in the References section).

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

3. EXPLANATION OF MESSAGE

EA1 = The first part of the comparison will use the determined effective address of the specified field instead of the contents of the specified field.

EA2 = The second part of the comparison will use the determined effective address of the specified field instead of the contents of the specified field.

MATE1 = The specified field used for the first part of the comparison is from the mate memory. The default is active memory.

MATE2 = The specified field used for the second part of the comparison is from the mate memory. The
default is active memory.

a = SM number.

b = Address for the first part of the comparison.

c = Symbolic name of the global variable for the first part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d = Symbol index number of the global variable or function for the first part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = Register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) for the first part of the comparison.

f = Utility variable for the first part of the comparison. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Constant value for the first part of the comparison.

h = Length of the value (in bytes) to be used for the first part of the comparison. Default is 4 bytes for UVAR, VAL and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR and SYMIDX. Maximum length in bytes is 4. It is suggested that the length and mask values being compared be of the same byte size on each side of the comparison.

i = Level of indirection for the first part of the comparison (maximum of 3, default is 0).

j = The offset, in bytes, at each level of indirection for the first part of the comparison can range from 0-65535 (default is 0). However, offsets greater than 32767 will be treated as negative offsets.

k = Contents of the mask to be "anded" with the final value for the first part of the comparison. Mask operations are always performed with a mask of 0xffffffff unless another mask value is provided.

l = Conditionals used for the comparison (default is EQ). Valid value(s):

- **EQ** = Equal to.
- **GE** = Greater than or equal to.
- **GT** = Greater than.
- **LE** = Less than or equal to.
- **LT** = Less than.
- **NE** = Not equal to.

m = Address for the second part of the comparison.

n = Symbolic name of the global variable for the second part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'o' must be used to enter this input message.
using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

Symbol index number of the global variable or function for the second part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

Register (address registers A0-A7, data registers D0-D7, program counter PC, or status register SR) for the second part of the comparison.

Utility variable for the second part of the comparison. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Constant value for the second part of the comparison.

Length of the value to be used for the second part of the comparison. Default is 4 bytes for UVAR, VAL and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR and SYMIDX. Maximum length in bytes is 4. It is suggested that the length and mask values being compared be of the same byte size on each side of the comparison.

Level of indirection for the second part of the comparison (maximum of 3, default is 0).

The offset, in bytes, at each level of indirection for the second part of the comparison can range from 0-65535. However, offsets greater than 32767 will be treated as negative offsets.

Contents of the mask to be "anded" with the final value for the second part of the comparison. Mask operations are always performed with a mask of 0xffffffff unless another mask value is provided.

| Not CNFG2KPPC             | A0-A5 = Address registers. |
|                           | A6 = The frame pointer (FP). |
|                           | A7 = The stack pointer (SP). |
|                           | D0-D7 = Data registers. |
|                           | PC = Program counter. |
|                           | SR = Status register. |

This option can only be used as part of a generic utilities WHEN input message clause.
f = Utility variable for the first part of the comparison. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Constant value for the first part of the comparison.
h = Length of the value (in bytes) to be used for the first part of the comparison. Default is 4 bytes for UVAR, VAL and REG unless REG is the status register which defaults to 2 bytes, and 1 byte for ADDR, GVAR, and SYMIDX. Maximum length in bytes is 4. It is suggested that the length and mask values being compared be of the same byte size on each side of the comparison.
i = Level of indirection for the first part of the comparison (maximum of 3, default is 0).
j = The offset, in bytes, at each level of indirection for the first part of the comparison can range from 0-65535 (default is 0). However, offsets greater than 32767 will be treated as negative offsets.
k = Contents of the mask to be ‘anded’ with the final value for the first part of the comparison. Mask operations are always performed with a mask of 0xffffffff unless another mask value is provided.
l = Conditionals used for the comparison (default is EQ). Valid value(s):
  EQ = Equal to.
  GE = Greater than or equal to.
  GT = Greater than.
  LE = Less than or equal to.
  LT = Less than.
  NE = Not equal to.

m = Address for the second part of the comparison.

n = Symbolic name of the global variable for the second part of the comparison. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'o' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

o = Symbol index number of the global variable or function for the second part of the comparison. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

p = Register for the second part of the comparison. Valid value(s):

33. IN
IN:DTIME

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Overrides the administrative module (AM) default generic access package (GRASP) dynamic real-time limit with a specified limit until the specified clock time or the end of the debugging session, whichever occurs first.

2. FORMAT

IN:DTIME=a:UNTIL=b;

3. EXPLANATION OF MESSAGE

  a  = Real time allowed to GRASP, specified in decimal (1-100).

  b  = Clock time when override will expire; specified as a 24-hour clock time (for example, 1535 equals 3:35 p.m.).

4. SYSTEM RESPONSE

  OK  = Good. The request was received and has been processed.

  RL  = Retry later. The system is in an overload condition or completing the previous OP:UMEM message.

  ?A  = Action field or command code contains an error. It may mean that the command code was incorrectly typed or that a field delimiter was omitted. Includes the following:
        - INVALID KEYWORD = Not a valid action in a WHEN action list.

  ?I  = General syntax error, or one of the following errors:
        - RANGE ERROR (DTIME) = Dynamic time value is out of range.
        - RANGE ERROR (UNTIL) = Invalid 24-hour clock time is specified.

Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Appends one line of user-supplied text at a specified location in a regular ASCII file. Directory and special device files cannot be edited.

Note: All file editing should proceed from the highest numbered line towards the lowest numbered line; otherwise, multiple edits could cause errors.

WARNING: Insertion of incorrect data may make the file unusable.

2. FORMAT

IN:FILE,APND,FN="a",LINE=b!
"c";

3. EXPLANATION OF MESSAGE

a = Full pathname that specifies the file. Upon successful completion of the edit, a file called a.bk, where 'a' is the file name entered, will contain the data in file 'a' prior to the edit. Should the edit be unsuccessful, the a.bk file will either contain the same data as the original file, or it will not exist.

b = Number of the line at which the input is to be appended. If the line number specified is larger or smaller than the number of lines in the file, the new line will be appended at the end of the file. Entering zero as the line number will insert the line of text before the first line of the file. If the file does not exist, entering zero in the line number will create the file.

c = User-supplied text. Entered on a separate line after entering the continuation character and receiving the acknowledgement 'IP'. The maximum length is 511 characters.

The text must be enclosed in quotation marks, otherwise data may be lost and misleading error messages printed.

4. SYSTEM RESPONSE

IP = In progress. The request was received and has been initiated.
PF = Printout follows. Followed by the IN:F-APND output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Deletes one or more lines from a regular ASCII file. Directory files and special device files cannot be edited.

Note: All file editing should proceed from the highest numbered line towards the lowest numbered line; otherwise multiple edits could cause errors.

WARNING: All existing data in the targeted lines of the file will be destroyed.

2. FORMAT

IN:FILE,DEL,FN="a",LINE=b[&c];

3. EXPLANATION OF MESSAGE

a = Full pathname of the file. Upon successful completion of the edit, a file called 'a.bk', where 'a' is the filename entered, will contain the data in file 'a' prior to the edit. Should the edit be unsuccessful, the 'a.bk' file will either contain the same data as the original file, or it will not exist.

b = Number of the first (or only) line to be deleted. If the line number specified is larger than the number of lines in the file, the last line of the file is assumed.

c = Last line number of a range of lines to be deleted. If the line number specified is out of the range, the last line of the file is assumed.

4. SYSTEM RESPONSE

Software Release: 5E14 and later
Command Group: SFTMGT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the administrative module (AM) be put in the remote-file-receive mode. This message should be entered immediately before ordering delivery of software update files from the Software Change Administration and Notification System (SCANS-2), so that the transaction ID displayed in the IN REMOTE output message can be supplied in the order to SCANS-2. Software updates must begin to arrive at the administrative module within 24 hours. Response messages are printed when they are initially received or when this time limit is reached.

2. FORMAT

IN:REMOTE,START[,BSDIR="a"][,BLOCKS=b][,VLEV=c];

3. EXPLANATION OF MESSAGE

a = Full pathname of the base directory into which the received files are stored. Default= /etc/bwm.
b = Number of blocks. The base directory is checked to ensure that at least 'b' blocks of space are available. Default= 100.
c = Verbose level (0-546048). The only value of 'c' that has any effect is 1, which prints the version number of the file receive process. Default= 0.

4. SYSTEM RESPONSE

PF = Printout follows. The message has been successfully invoked. Followed by the IN:REMOTE-INIT output message.

RL = Retry later. Valid value(s):
- BAD MEMORY ALLOCATION = Request cannot be executed due to insufficient memory.

Application: 5
Type: Input

1. PURPOSE

Requests that the remote file transfer system be started, stopped or status be reported. The remote file transfer system resides in the administrative module (AM). When this system is running, files may be transferred between it and a special support computer. This system may be used to recover files that have been lost or corrupted.

2. FORMAT

IN:XFER:{START|STOP|REPT};

3. EXPLANATION OF MESSAGE

START = Start the remote file transfer system. Once started, the system is active for one transaction, 24 hours, or until stopped, whichever occurs first.

STOP = Stop the remote file transfer system.

REPT = Report on the state of the remote file transfer system.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- NOT ACTIVATED = System is not running.
- PREVIOUS PASSWORD HAS EXPIRED = System was previously started but the 24-hour time limit expired without an attempt to use it.

OK = Good. System has been stopped. Valid value(s):
- PASSWD = a = System has been started. Report the password 'a' to the support person who requested this input message be entered.
- PASSWD = b, EXPIRES c = System is running. Report the password 'b' and the expiration time 'c' to the support person who requested this input message be entered.

PF = Printout follows. Followed by the IN:XFER output message.

OP:STAT

Output Message(s):

OP:STAT
INH:ALE-A

Software Release: 5E14 - 5E15
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests inhibition of the options utilized for the operation of the automatic line evaluation (ALE) system and protocol error record (PER) reporting and generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

The parameters are grouped into three classes.
A = Automatic ALE session output controls

The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session.

The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

B = Switching module (SM) controls

The SM parameters control the behavior of the level 1 performance monitoring and PER generation.

If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL.

All automatically generated reports are inhibited immediately. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not be inhibited for a period of up to 5 minutes.

If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

C = Line/trunk controls

Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks.

The level 1 control parameters for U-interface DSLs are manipulated using the RC/V Views 8.1 and 22.15 for performance monitoring group definitions.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

Format 1 is used to inhibit the automatic session controls. Format 2 is used to inhibit the SM control parameters. Format 3 is used to inhibit the PER generation for a ISDN protocol channel.
For example, the input message

INH:ALE,LEVEL2,PER=REPT,PRINT

will inhibit the LEVEL2, PER=REPT, and PRINT controls prohibiting the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message requests that the results from the automatic session not be printed on the receive-only printer (ROP).

For example, the input message

INH:ALE,PER=GEN,SM=7

will inhibit the PER generation control that enables the collection of PERs on SM 7.

The input message

INH:ALE,PER=GEN,DN=2204000

will inhibit the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000.

2. FORMAT

[1] INH:ALE[,LEVEL2][,PRINT][,PER=REPT];
[2] INH:ALE,SM=a[&&b][,LEVEL1][,PER=GEN];
[3] INH:ALE,c[,CH=a1],PER=GEN;

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

LEVEL1 = Inhibit level 1 performance monitoring for the indicated SM. The default is level 1 allowed.

LEVEL2 = Inhibit level 2 error counts. These counters exist in the protocol handler (PH). Inhibiting level 2 automatic ALE will prevent packet error counts and automatically reset the counters. The default is level 2 allowed.

PER=GEN = Inhibit PER generation for the indicated SM or channel. The default is that PER generation is allowed for the indicated SM or channel.

PER=REPT = Inhibit PER reporting for the automatically requested ALE sessions. The default is that PER reporting is allowed. Set the specified protocol error record (PER) parameters.

PRINT = Send output to the ROP. All other output will be sent to the message class PRFMMON. The default is ROP output allowed.

a = SM number, or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

section of the Input Messages manual.

n = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a¹ = Channel type to be inhibited (valid only for LCEN and LCKEN line identifications). Valid value(s):
     B1 = Channel B1.
     D = D-channel (default).

b¹ = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Channel number (CHAN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

**NG**

= No good. This message was not recognized, or was not acceptable. May also include:
- **ALE FEATURE NOT LOADED** = The ALE feature is not loaded in the switch software configuration.
- **COMMUNICATION FAILURE** = A system error has occurred.
- **INVALID INPUT** = Parameter to inhibit does not match entity to inhibit. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- **PROCESS CREATION FAILURE** = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

**OK**

= Good. Requested parameter has been allowed.

**PF**

= Printout follows. Requested parameter inhibit has been initiated and an INH:ALE message will follow.

**RL**

= Retry later. May also include:
- **AM IN MIN MODE** = The AM is in minimum operation mode.
- **REQUEST ALREADY IN PROGRESS** = An ALE allow request is already running. Only one inhibit request is permitted at a time.

235-600-755  Protocol Error Record Descriptions

RC/V View(s):
8.1  OFFICE PARAMETERS (MISCELLANEOUS)
22.15  PERFORMANCE MONITORING THRESHOLD GROUP
1. PURPOSE

Requests inhibition of the options utilized for the operation of the automatic line evaluation (ALE) system and protocol error record (PER) reporting and generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER.

The parameters are grouped into three classes.

<table>
<thead>
<tr>
<th>Class</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic ALE session output controls</td>
<td>The parameters LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session. The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.</td>
</tr>
<tr>
<td>Switching module (SM) controls</td>
<td>The SM parameters control the behavior of the level 1 performance monitoring and PER generation. If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for any U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL. All automatically generated reports are inhibited immediately. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not be inhibited for a period of up to 5 minutes. If the PER generation parameter is inhibited, then no PERs will be recorded for any integrated services digital network (ISDN) protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel. After the introduction of PCF on PHE2 feature, the PER generation parameter applies to the PCF PH as well.</td>
</tr>
</tbody>
</table>
| Line/trunk controls | Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks. After the introduction of PCF on PHE2 feature, the PER generation parameter applies to the PCF PH as well. The level 1 control parameters for U-interface DSLs are manipulated using the RC/V...
Views 8.1 and 22.15 for performance monitoring group definitions.

If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel.

| INH:ALE, LEVEL2, PER=REPT, PRINT | Will inhibit the LEVEL2, PER=REPT, and PRINT controls prohibiting the execution of the LEVEL2 and PER jobs for automatically initiated ALE sessions. In addition, this message requests that the results from the automatic session not be printed on the ROP. |
| INH:ALE, PER=GEN, SM=7 | Will inhibit the PER generation control that enables the collection of PERs on SM 7, for both ISDN channels and PCF PH. |
| INH:ALE, PER=GEN, DN=2204000 | Will inhibit the PER generation control that enables the collection of PERs for the D-channel associated with the DSL for DN 2204000. |
| INH:ALE, PER=GEN, PCFIP=193.192.193.193 | Will inhibit the PER generation control that enables the collection of PERs for the PCF PH associated with the IP address 193.192.193.193. |

2. FORMAT

[1] INH:ALE{[,LEVEL2][,PRINT][,PER=REPT]};

[2] INH:ALE, SM=a{&&b}{[,LEVEL1][,PER=GEN]};

[3] INH:ALE, c{[,CH=a^1],PER=GEN};

[4] INH:ALE, PCFIP=y^1-y^1-y^1-y^1,PER=GEN;

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

LEVEL1 = Inhibit level 1 performance monitoring for the indicated SM. The default is level 1 allowed.

LEVEL2 = Inhibit level 2 error counts. These counters exist in the protocol handler (PH). Inhibiting level 2 automatic ALE will prevent packet error counts and automatically reset the counters. The default is level 2 allowed.

PER=GEN = Inhibit PER generation for the indicated SM or channel. The default is that PER generation is allowed for the indicated SM or channel.

PER=REPT = Inhibit PER reporting for the automatically requested ALE sessions. The default is that PER reporting is allowed. Set the specified protocol error record (PER) parameters.

PRINT = Send output to the ROP. All other output will be sent to the message class PRFMMON. The default is ROP output allowed.

a = SM number, or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Line identification. Valid value(s):

AIUEN=f^1-m^1-n^1-o^1
d = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Digital facility interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = The directory number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. This parameter can only be used to identify channels associated with DSLs.

k = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Integrated services line unit number. Refer to the APP:RANGES appendix in the Appendixes
section of the Input Messages manual.

n = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Multi-line hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Integrated digital carrier unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a1 = Channel type to be inhibited (valid only for LCEN and LCKEN line identifications). Valid value(s):
   B1 = Channel B1.
   D = D-channel (default).

b1 = Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c1 = PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d1 = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e\(^1\) = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^1\) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^1\) = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^1\) = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^1\) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^1\) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^1\) = Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^1\) = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^1\) = AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^1\) = AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^1\) = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\(^1\) = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\(^1\) = Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s\(^1\) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t\(^1\) = Tributary number (T1FAC). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u\(^1\) = Channel number (CHAN). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v\(^1\) = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w\(^1\) = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

IP address field. Valid value is 0-255.

Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Optical carrier level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Synchronous transport signal level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. This message was not recognized, or was not acceptable. May also include:
- ALE FEATURE NOT LOADED = The ALE feature is not loaded in the switch software configuration.
- COMMUNICATION FAILURE = A system error has occurred.
- INVALID INPUT = Parameter to inhibit does not match entity to inhibit. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.
- PROCESS CREATION FAILURE = A system error has occurred. Refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

OK = Good. Requested parameter has been allowed.

PF = Printout follows. Requested parameter inhibit has been initiated and an INH:ALE message will follow.

RL = Retry later. May also include:
- AM IN MIN MODE = The AM is in minimum operation mode.
- REQUEST ALREADY IN PROGRESS = An ALE allow request is already running. Only one inhibit request is permitted at a time.

Output Message(s):
INH:ALM

Software Release: 5E14 and later
Command Group: ALARM
Application: 5
Type: Input

1. PURPOSE

Requests that alarm reporting on a scan point be inhibited, according to type. Formats 1 and 2 are for alarms assigned to input/output processor (IOP) scan points. Format 3 is for those assigned to remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) metallic service unit (MSU) scan points and is available only in a multimodule RSM, ORM or TRM that has the alarm input option. Format 4 is for alarms assigned to remote alarm section (RAS) scan points. Format 5 is for alarms assigned to expansion access interface unit (EAIU) scan points.

2. FORMAT

[1] INH:ALM, {BPSC=a|MFFUSE=b|MISC=c};
[3] INH:ALM, RBPSC=d, SM=e;
[4] INH:ALM, RAS, SCPT=f, SITE=g;
[5] INH:ALM, EAIU=e-h, SCPT=f;

3. EXPLANATION OF MESSAGE

ESM = External sanity monitor.

SCPT = Scan point.

a = Building/power scan point (BPSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Miscellaneous frame fuse (MFFUSE) unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Miscellaneous (MISC) IOP scan point number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Remote building/power scan point (RBPSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Switching module (SM) number.

f = Scan point number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Remote peripheral site number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = EAIU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
4. SYSTEM RESPONSE

NG = No good. Invalid scan point, SM, or site number; or option not available.

PF = Printout follows. Followed by the INH:ALM output message.

RL = Retry later. Unable to process request or unable to communicate with SM.

INH:AMA-AUTOST
Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE
Requests that automatic message accounting (AMA) automatic tape writing sessions be inhibited.

2. FORMAT
INH:AMA:AUTOST[,ST1|,ST2];

3. EXPLANATION OF MESSAGE

ST1 = Used if AMA data goes to the ST1 data stream.
ST2 = Used if AMA data goes to the ST2 data stream.
Note: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

IP = In progress. Request accepted and in progress. The AMA monitor process has been called to manually block automatic AMA tape writing sessions. When the request is complete, the contents of the AMA control file will be output.
NG = No good. Data stream checks failed.
RL = Retry later. A message could not be sent to the AMA monitor process.

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Format 1 requests that the printing of automatic message accounting (AMA) records be inhibited for a matching active trace directory number (DN) (that is, DN and PS option are equal).

Format 2 requests that the printing of AMA records be inhibited for all existing trace DN(s).

Format 3 requests that the printing of AMA records no longer go to the AMTRCLOG log file. This applies to all existing trace DN(s).

2. FORMAT

[1] INH:AMATRC:DN=a[,PS];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = Inhibit tracing on all DN(s) previously entered for tracing.
FILE = Requests that AMATRC output no longer be placed in the AMATRC Log File.
a = A seven- or ten-digit directory number.

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID DIGIT ENTERED = Only digits, no alpha or special characters are accepted.
- NO EXISTING DN ENTRIES = There are currently no existing DNs for which an AMATRC is currently being performed.
- NO MATCH FOUND = DN entered did not match any existing DN for which an AMATRC is currently being performed. OP:AMATRC will show all existing DN(s).
- SEVEN OR TEN DIGITS REQUIRED = Either seven or ten digits are required to perform the trace.

OK = Good. The request has been received.

235-190-300  Billing Features and Specifications
INH: AUD-CMP

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Requests that the automatic execution of an audit or the routine execution of the audit cycle be inhibited in one communication module processor (CMP).

The inhibition of the audit cycle is phase protected. Once the audit cycle has been inhibited, it will remain inhibited even through system phases. An individual audit inhibit is not phase protected and can only be set after the processor is cycling normally. A high level initialization will have the effect of allowing a previously inhibited audit to run.

2. FORMAT

INH: AUD[a], CMP=b;

3. EXPLANATION OF MESSAGE

a = Item to be audited. Valid value(s):
   Audit ID
   CYCLE = Inhibit the routine execution of the audit cycle. (Default)

b = CMP number (such as, 0).

4. SYSTEM RESPONSE

NG = No good. May also include:
   - AUDIT NOT AVAILABLE IN CMP = The request has been denied because the audit specified in the 'a' variable does not exist in the CMP.
   - INVALID CMP = No good. The specified CMP does not exist.

OK = Good. The request has been received and completed. Audit or cycle has been inhibited.

5. REFERENCES

Input Message(s):

Other Manual(s):
   235-600-400 Audits
INH:AUD-ENV

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5
Type: Input

1. PURPOSE

Inhibits the automatic execution of a kernel process environment (OKP or SMKP) audit or the routine execution of the cycle in the administrative module (AM). The inhibit for the audit cycle is phase-protected. That is, once the audit cycle has been inhibited, it will remain inhibited even through system phases. An individual audit inhibit is not phase-protected and can only be set after the processor is up. A phase will have the effect of allowing previously inhibited audits to run.

2. FORMAT

INH:AUD[=a],ENV=b;

3. EXPLANATION OF MESSAGE

a
  = Audit ID for an application audit.
  CYCLE = Routine audit cycle. This is the default.

b
  = The kernel process. Valid value(s):
  OKP = Operational kernel process.
  SMKP = Switch maintenance kernel process.

4. SYSTEM RESPONSE

NG
  = No good. May also include:
  - ARGUMENT FOR ENV MISSING = The request has been denied because neither OKP nor SMKP were specified for variable "b".
  - AUDIT NOT AVAILABLE IN SPECIFIED ENV = The request has been denied because the specified audit is not available in the requested kernel process.
  - SM TYPE NOT VALID FOR THIS REQUEST = The request has been denied because an SM type (RSM, LSM, or HSM) was specified for a kernel process environment.

OK
  = The request has been received and completed; audit or audit cycle has been inhibited.

Inhibits the automatic execution of an audit or the routine execution of the audit cycle in the switching module (SM) or range of SMs. The inhibit for the audit cycle is phase-protected. That is, once the audit cycle has been inhibited, it will remain inhibited even through system phases. An individual audit inhibit is not phase-protected and can only be set after the processor is up. A phase will have the effect of allowing a previously-inhibited audit to run.

2. FORMAT

INH:AUD[=a],SM=b[&c][,RSM][,LSM][,HSM][,ORM][,TRM];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Audit(s) to be inhibited. The default is CYCLE. Valid value(s):
   Audit ID
   CYCLE = Inhibit the routine execution of the audit cycle.

b = SM number or lower limit of a range of SM numbers.

c = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good.
- AUDIT NOT AVAILABLE IN SM TYPE = The request has been denied because the audit specified in the ‘a’ variable does not exist in the SM type specified, or does not exist in any SM type.
- INVALID SM RANGE/TYPEx COMBINATION = The request has been denied because either the range is not in ascending order, or there is not at least one SM of the specified type (or any type) within the range.

OK = Good. The request has been received and completed. Audit or cycle has been inhibited.

RL = Retry later. May also include:
- MESSAGE BROADCAST INTERNAL ERROR = The message cannot be sent to the specified SM(s) at the present time due to problems in scheduling a job to broadcast the message.

5. REFERENCES
Input Message(s):
  ALM : AUD

Other Manual(s):
235-600-400  Audits
1. PURPOSE

Requests that the execution of either the full or incremental static office-dependent data (SODD) audit be inhibited. If the audit is currently running when this message is accepted, it is stopped. In addition, if the incremental audit is inhibited, all unaudited tuples are removed so that when the audit is eventually allowed, it does not produce invalid output caused by outdated tuples.

2. FORMAT

INH:AUD=SODD, {FULL | INCR};

3. EXPLANATION OF MESSAGE

FULL = The full SODD audit is to be inhibited.

INCR = The incremental SODD audit is to be inhibited.

4. SYSTEM RESPONSE

OK = The request has been received and completed; the SODD audit has been inhibited.

Other Manual(s):

235-105-210 Routine Operations and Maintenance
INH:AUD

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the routine execution of one or more audits that are controlled by the system integrity monitor (SIM) be inhibited. Entering the INH:AUD input message sets one or more audit inhibits to the manually inhibited state. This state can be removed only by entering an ALW:AUD input message. Every audit inhibit is removed by a phase 3 bootstrap.

Separate inhibit states are provided for:

- All audits. Entering the INH:AUD input message with the ALL option turns off routine audit scheduling completely, but has no effect on the inhibit states of individual audits.

- Each audit identified by audit name and member number. When an audit is inhibited it is not scheduled to run routinely. However, if it is permitted to run manually, it may be run by entering an AUD input message.

- One instance of an audit may be inhibited while other instances are allowed to run routinely.

Audit inhibit states may be displayed by entering the OP:AUD input message. The REPT:AUDSTAT output message periodically reports which audits are inhibited.

WARNING: Inhibiting audits may result in degradation of associated operating system resources.

2. FORMAT

INH:AUD,{ALL|a=[b]|a=c,INS=d};

3. EXPLANATION OF MESSAGE

ALL = Specifies all audits controlled by the SIM. Sets a master inhibit state which is independent of the inhibit states for individual audits.

a = Audit name. Central process or administrative module audit names can be found in the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual.

Note: If ‘a’ is specified without ‘b’, all members of the audit will be inhibited.

b = Member number. May be specified as a single number or a list of numbers. Member numbers can be found in the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual.

c = Single member number. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual.
d = Instance name.

4. SYSTEM RESPONSE
Refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual.

INH:AUTOBKUP

Software Release: 5E15 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that all future automated system backup attempts be inhibited.

Format 1 is used to inhibit all future automated system backup attempts from executing until backups are once again allowed using the ALW:AUTOBKUP input message. If an automated system backup is currently in progress when INH:AUTOBKUP is executed, the backup will be allowed to continue, it will not be stopped. A message will be output indicating that an automated system backup is currently in progress. All future automated system backup attempts will be inhibited.

Format 2 is used to output a message indicating if automated system backups are currently inhibited or allowed. The inhibit status of automated system backups will not change. If automated system backups are allowed at the time INH:AUTOBKUP:STAT is executed, backups will remain allowed.

2. FORMAT

[1] INH:AUTOBKUP;

3. EXPLANATION OF MESSAGE

No Variables.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the INH:AUTOBKUP output message.

INH:BREVC

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that automatic output message brevity control (BREVC) by output message class (MSGCLS) or processor be inhibited. The administrative module (AM), communication module processor (CMP) and all the switching modules (SMs) normally restrict the generation of output messages through automatic brevity controls. Under unusual circumstances, it may be desirable to allow certain output messages to route to the receive-only printer (ROP) or log file which otherwise would be suppressed. Brevity control restricts and prints application TTY output message by message class and priority to reduce the quantity of messages printed on the ROP. Inhibiting brevity control means that all messages generated by the switch will appear on the ROP.

The brevity status for each MSGCLS can be printed out using the OP:BREVC input message. The status for each system can be printed out using OP:SYSSTAT input message.

If a MSGCLS is selected, brevity control will be inhibited on all processors for that MSGCLS. If a processor is selected, brevity control will be inhibited on all output messages for that processor.

This inhibit is automatically cleared on high-level AM initializations. In addition, brevity control in the AM will be reallowed automatically if a shortage of message buffers is detected.

WARNING: Indiscriminate use of this inhibit may cause increased communication link traffic which can degrade call processing performance and capacity.

2. FORMAT

INH:BREVC, {MSGCLS=a | CMP=b | AM | SM=c (& &d) | LSM | HSM | RSM | ORM | TRM};

3. EXPLANATION OF MESSAGE

a = Message class mnemonic. The message class for a particular message can be found on the corresponding output message manual page. A list of all valid MSGCLS codes are printed using the OP:LPS input message.

b = CMP number.

c = SM number or lower limit of a range of SM numbers to be inhibited.

d = Upper limit of a range of SM numbers to be inhibited.

4. SYSTEM RESPONSE

NG = No good. An illegal SM number or range was specified. An illegal CMP number was specified.

OK = Good. The request was accepted and executed.

5. REFERENCES

Input Message(s):

INH:RCLOG
INH:DEBUG

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that debugging messages be inhibited from being printed for a given feature. Inhibiting debugging messages on a switching module (SM) prohibits additional ASSERT, PTRACE, and REPT:METALLIC output messages from being printed during error handling.

Using METALLMSG will inhibit METRESBLK, METSWBLK, and METHWFAIL.

Format 1 is for ALE, CCS7MTCE, DIGITAL, METALLIC, METPTRACE, METALLMSG, METRESBLK, METSWBLK, METHWFAIL, METSUCCESS, and MLT SM only cases.

Format 2 is for CCS7MTCE and MLT AM only cases.

Format 3 is for MLT AM and SM cases.

2. FORMAT

[1] INH:DEBUG,a,SM[=b[&c]];  
[2] INH:DEBUG,a,AM;  
[3] INH:DEBUG,a;

3. EXPLANATION OF MESSAGE

a  = Feature with additional debugging messages. Valid value(s):
ALE  = Automatic line evaluation.
CCS7MTCE  = Common channel signal maintenance activity.
DIGITAL  = Digital testing of lines (TST:DSL) and trunks (TST:TRK).
METALLIC  = Metallic path setup ASSERT and PTRACE messages with low-level unformatted information, not intended for general customer use.
METPTRACE  = Metallic related PTRACE messages.
METALLMSG  = Metallic path setup blockage and failure.
METRESBLK  = Metallic path setup resource blockage.
METSWBLK  = Metallic path setup software blockage.
METHWFAIL  = Metallic path setup hardware failure.
METSUCCESS  = Metallic path setup completed successfully.
MLT  = Mechanized loop test.
TSTPATH  = Test path application (TST:PATH).

b  = SM number or the lower limit of a range of SM numbers (defaults to all equipped SMs). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = The upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
4. SYSTEM RESPONSE

NG  = No good. The message was not recognized or acceptable.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Request that the specified source of automatic maintenance requests be inhibited. Any process that sends a restore, remove, or diagnose request to the administrative module (AM) maintenance input request administrator can be prevented from doing so for the amount of time specified. A reminder that a specific inhibit is in effect is output at the specified intervals.

WARNING: Inhibiting automatic maintenance requests may result in hardware units remaining out-of-service (OOS) longer than necessary.

Note: The automatic maintenance requests will remain inhibited until the appropriate ALW:DMQ input message is issued.

2. FORMAT

INH:DMQ:SRC=a[,TINH=b][,AINH=c];

3. EXPLANATION OF MESSAGE

a = Three-character source name. Valid value(s):
   ADP = Automatic diagnostic process.
   ALL = Inhibits all automatic maintenance requests by changing the inhibited sources to ALL.
   ARR = Automatic ring recovery.
   REX = Routine exerciser.

Application processes may specify other sources of diagnostic requests.

b = The amount of time, in minutes, that the requests will be inhibited. The default is infinity. Specifying zero is the same as defaulting.

c = Alarm interval, in minutes. Each time this period elapses, a REPT:DMQ output message will be printed, indicating the inhibit that is in effect. The default is five minutes.

4. SYSTEM RESPONSE

OK = Good. Request accepted.

PF = Printout follows. Followed by OP:DMQ or the REPT:DMQ output message.

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Request that the logging and processing of error interrupts attached to the administrative module (AM) unit specified in the identification field be inhibited. If a unit name is not specified, then error interrupts for all AM units are inhibited.

WARNING: Inhibiting error interrupts can prevent the system from recovering automatically from hardware faults.

2. FORMAT

INH:ERRINT[:{a=b[,c=d]}];

3. EXPLANATION OF MESSAGE

a = Unit name. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for AM unit names.

   Note: Inhibiting a control unit (CU) in an active/standby duplex configuration inhibits both CUs since they must be kept in identical states.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

c = Subunit name. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual for AM CU subunit names.

d = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Indicates that the unit name and number specified was found in the database but is unequipped.

PF = Printout follows. Followed by the INH:ERRINT output message.

### 1. PURPOSE

Deactivates all active external performance monitoring (PM) sessions and inhibits the initiation of future external PM sessions over one or more packet switch unit (PSU) asynchronous transfer mode (ATM) links (PSALNK).

A PSALNK provides the ability to interconnect the local PSU with multiple other PSUs in the ATM network, as designated by their community address and subnetwork identifiers. Each of these PSU-to-PSU connections can be monitored internally for performance-impacting metrics in accordance to the GR-1248 ATM standard and included in the relevant switch measurement reports for output. Similarly, the far endpoint of each PSU-to-PSU connection can request that the identical virtual circuit be monitored.

The purpose of this input message is to prevent these external requests for PM activity by far endpoints from being fulfilled by the host switch. It has the added effect of deactivating any currently active external PM sessions (except for shared flows as explained below). Each PM session (either internally or externally initiated) consumes a set amount of finite resources on each end of the target virtual circuit. Once these resources have been exhausted, additional PM requests will be denied. The corresponding ALW:EXTPM input message provides a means of enabling external PM activity.

Any single ATM virtual circuit may be tracked for performance activity by both the local host and the remote endpoint simultaneously. Such a PM session has both internal and external properties. When both endpoints have identical connection types [for example, both are virtual path connections (VPC) or both are virtual channel connections (VCC)], this PM session is referred to as a shared flow. One side of a shared flow (internal or external) cannot be disabled without affecting the entire session. For this reason, the INH:EXTPM input message deactivates all currently active external PM sessions except for those containing shared flows. To deactivate a shared flow, the internal PM session must be inhibited with the INH:PM input message. The INH:PM input message will also deactivate the external portion of a shared flow if external PM was previously inhibited.

If the PSALNK option is included, only the specified PSALNK will be affected by the input message. Otherwise, all PSALNKs in the office will be affected by the input message.

PM is only supported over a virtual circuit terminated locally by a PSALNK hosted on a protocol handler for ATM version 2 (PHA2).

### 2. FORMAT

\[ \text{INH:EXTPM}[, \text{PSALNK}=a-b-c] ; \]

### 3. EXPLANATION OF MESSAGE

- **a** = Switching module (SM) number of the target PSALNK.
- **b** = PSU number of the target PSALNK.
- **c** = Link number of the target PSALNK.

### 4. SYSTEM RESPONSE

\[ \text{PF} \] = Printout follows. Followed by one or more INH:EXTPM output messages.
NG = No good. May also include:
- NO PHA2 PSALNK EQUIPPED = The request has been denied. The message is valid but no PSALNKs within the scope of the input message were detected in the current equipage.
- PSALNK UNEQUIPPED = The request has been denied. The message is valid but the specified PSALNK was not detected in the current equipage.
- MUST BE A PHA2 PSALNK = The request has been denied. The message is valid but the specified PSALNK is not hosted by a PHA2.
- AM TIMER NOT STARTED = The request has been denied. The message is valid but a shortage of system resources has prevented any action from being taken.
- DATABASE ERROR = The request has been denied. The message is valid but an internal database error has prevented any action from being taken.
- INTERNAL CORRUPTION = The request has been denied. The message is valid but an internal data corruption error has prevented any action from being taken.

RL = Retry later. May also include:
- PREVIOUS REQUEST IN PROGRESS The request has been denied. The message is valid but the previous request must complete before a new request can be made.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Inhibits maintenance interrupts on an inter-remote switching module (RSM) communication link digital facilities interface (CDFI) circuit. Interrupts may be re-enabled with the ALW:HDWCHK-CDFI input message.

WARNING: Inhibiting hardware checks can prevent the system from recovering automatically from hardware faults in this unit.

2. FORMAT

INH:HDWCHK,CDFI=a-b-c;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = CDFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with current system or equipment status. May also include:

- NOT STARTED UNIT IN GROWTH STATE
- SM DOES NOT EXIST
- SM UNEQUIPPED
- UNIT DOES NOT EXIST

PF = Printout follows. Followed by the INH:HDWCHK-CDFI output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

**Command Group:** CM  
**Application:** 5  
**Type:** Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Inhibits level 2 and level 3 hardware checks (errors) on one or all of the specified communication links (CLNKs). Refer to the Corrective Maintenance manual for an explanation of level 2 and level 3 errors.

**WARNING:** Inhibiting hardware checks can prevent the system from recovering automatically from hardware faults in this unit.

2. **FORMAT**

```
INH:HDWCHK,CLNK{=a-b-c-d|,ALL};
```

3. **EXPLANATION OF MESSAGE**

- **ALL** = Inhibit errors on all communication links (CLNKs).
- **a** = Switching module (SM) number.
- **b** = Office network and timing complex (ONTC) side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Module message processor (MMP) type. Valid value(s):
  - 0 = Alpha.
  - 1 = Beta.
- **d** = Message switch ( MSGS) side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

- **NG** = No good. May also include:
  - ALL NOT VALID WITH A SINGLE UNIT = A single CLNK and ALL may not be specified together.
  - UNIT UNEQUIPPED = The specified single CLNK is unequipped.

- **PF** = Printout follows. A printout will follow when the requested action is completed.

INH:HDW-CM

Software Release: 5E14 and later
Command Group: CM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Inhibits all hardware error checks on all communication module (CM) units. This includes the message switch control unit (MSCU) (for communication module model 2; hardware only), foundation peripheral controller (FPC), pump peripheral controller (PPC), module message processor (MMP), office network and timing complex (ONTC), and communication links (CLNKs).

WARNING: Inhibiting hardware checks can prevent the system from recovering automatically from hardware faults in these units.

2. FORMAT

INH:HDWCHK,CM;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

IP = In progress. The phrase 'PENDING EXIT FROM MANUAL CM ISOLATION' indicates that the request cannot be executed now because the communication module (CM) is isolated from the administrative module (AM) using a manual request. The request will be acted upon once AM communication with the CM is re-established.

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. The request has been accepted and an INH:HDW-CM output message will follow.

RL = Retry later. The request cannot be executed now because the communication module (CM) deferred maintenance queue (DMQ) is full; try again later.

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that hardware checks be inhibited on an integrated services line unit common data (ISLUCD).

2. FORMAT
INH:HDWCHK,ISLUCD=a-b-c;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.

b = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with the current status.

PF = Printout follows. Followed by the INH:HDW-ISLUCD output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

170xy (ISLU LINE GROUP)
INH:HDW-ISLUHLSC
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Inhibits ring trip interrupts in an integrated services line unit (ISLU) high level service circuit (HLSC).

2. FORMAT

INH:HDWCHK,ISLUHLSC=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.
b = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = HLSC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.
PF = Printout follows. Followed by the INH:HDW-ISLUHLSC output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP:RANGES
INH:HDW-ISLUMAN

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Inhibits interrupts in an integrated services line unit (ISLU) metallic access network (MAN).

2. FORMAT
INH:HDWCHK,ISLUMAN=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module number.

b = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = MAN number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the INH:HDW-ISLUMAN output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

INH:HDW-ISLURG

Input Appendix(es):

APP:RANGES
INH:HDW-ISTF

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Inhibits hardware checks in an integrated services test function (ISTF) unit. The module software inhibits the indicated error source. The system first requires an ALW message to allow the error source before inhibiting.

2. FORMAT

INH:HDWCHK,ISTF=a-b;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.
b = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied because it conflicts with current equipment status. May also include:
   - SM DOES NOT EXIST = The requested SM does not exist in the system.
   - SM UNEQUIPPED = The SM specified in the request is unequipped.
   - UNIT DOES NOT EXIST = The requested unit does not exist in the system.

PF = Printout follows. The request has been accepted. Followed by the INH:HDW-ISTF output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources. The message may be entered again later.

APP:RANGES
INH:HDW-MCTSI-A

Software Release: 5E14 only
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a hardware check (HDWCHK) be inhibited in a module controller/time-slot interchange unit (MCTSI).
The system requires an ALW:HDW-MCTSI input message to allow the HDWCHK.

WARNING: Inhibiting ALL disables all hardware error detection circuitry, puts the processor into a slow state, and
disables the cache memory. This will result in degraded switching module (SM) performance. Inhibiting
ALL has no performance impact on SMs with the MCTU3 (module controller/time slot interchange unit 3)
or SM-2000s.

2. FORMAT

INH:HDWCHK,MCTSI=a-b,c;

3. EXPLANATION OF MESSAGE

a = SM/SM-2000 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
   Messages manual.

b = Module controller number. Refer to the APP:RANGES appendix in the Appendixes section of the
   Input Messages manual.

c = Keyword that specifies inhibit bit names. Valid value(s):
   Note: If the keyword is invalid for the specified SM/SM-2000, the request will be denied
   with the message STOPPED REQUEST NOT ALLOWED.
   ALL = All module controller maintenance errors. Refer to the service degradation
   warning.
   AFFCI = Active flip-flop cleared interrupt. Valid for SMs with the MCTU3 and in SM-2000s.
   ARPV = Arbitration protocol violation error. Valid for SM-2000 only.
   CACHE = Cache errors. Inhibiting CACHE on SM-2000s with cache inhibits the interrupts
   source while on non-SM-2000s with caches it disables the cache area as well,
   which slows down the operation of the processor. This option is only valid for SMs
   with the module controller/time slot interchange unit 2 (MCTU2), the extended
   memory addressing (EMA) 20 or SM-2000s equipped with a CORE60 processor
   pack.
   CADPR = Memory address mismatch error. Valid for SM-2000 only.
   CBERR = Correctable bit error. Inhibiting this error will degrade processor performance.
   Inhibiting this error has no performance impact on SM-2000 or MCTU3.
   CI0IN = Control interface 0 interrupt.
   CI1IN = Control interface 1 interrupt.
   CPINT = Enhanced central processor intervention interrupt.
DCODE = Decode error. Valid for SM-2000 only.
DLOPE = Dual link interface (DLI) 0 parity error. Not valid for SM-2000.
DL0I = Data link 0 interrupt. Not valid for SM-2000.
DL1I = Data link 1 interrupt. Not valid for SM-2000.
IA0 = DLI0 illegal access error. Not valid for SM-2000.
IA1 = DLI 1 illegal access error. Not valid for SM-2000.
LPVER = Bus lock violation. Valid for SM-2000 only.
MADPE = Address parity error.
MCINT = Resets in the mate controller.
MH0IN = Message handler 0 interrupt. Valid for SM-2000 only.
MH1IN = Message handler 1 interrupt. Valid for SM-2000 only.
MH2IN = Message handler 2 interrupt. Valid for SM-2000 only.
MIOIO = I/O invalid operation error.
MIOLE = I/O timer lock error.
MIOTO = I/O timer time out error.
MIOUE = I/O unlock error.
MPRIN = Maintenance interrupts in the mate MCTSI.
MRDYT = Ready time out.
MRSPERR = Multiple response error. Valid for MCTU2 and SM-2000 only.
MRWPE = Read or write parity error.
MWPER = Write protect error. For SM-2000, inhibiting this error will not inhibit all write protect errors because they are not all inhibitable.
NCBERR = Non-correctable bit error. Valid for SM-2000 only.
PIINT = Packet interface (PI) interrupt.
PUMPHW = Pump hardware errors. Valid for MCTU2, MCTU3, and SM-2000 only.
REFE = Dynamic RAM refresh fail error. Valid for SM-2000 only.
SSYNC = Scanned I/O sync error. Valid for SM-2000 only.
TSIIN = Time-slot interchange (TSI) interrupt. For SM-2000, this will also inhibit interrupts from network link interfaces (NLIs).
TSI4IN = TSI model four interrupt. Inhibiting this bit will not affect the inhibits for NLIs. Use this if you want to inhibit only TSI interrupts. Valid for SM-2000 only.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the INH:HDW-MCTSI output message.
RL = Retry later. The message cannot be processed, so try the message again later. This response will be output if the AM cannot communicate with the requested SM/SM-2000.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a hardware check be inhibited in a module controller/time-slot interchange unit (MCTSI).

WARNING: Inhibiting ALL disables all hardware error detection circuitry, puts the processor into a slow state, and disables the cache memory. This will result in degraded switching module (SM) performance. Inhibiting ALL has no performance impact on SMs with the module controller/time slot interchange unit 3 (MCTU3) or SM-2000s.

2. FORMAT

INH:HDWCHK,MCTSI=a-b,c;

3. EXPLANATION OF MESSAGE

b = Module controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Keyword that specifies inhibit bit names.

If the keyword is invalid for the specified SM/SM-2000, the request will be denied with the message STOPPED REQUEST NOT ALLOWED.

Valid value(s):

ALL = All module controller maintenance errors. Refer to the service degradation warning.

AFFCI = Active flip-flop cleared interrupt. Valid for SMs with the MCTU3 and in SM-2000s.

ARPV = Arbitration protocol violation error. Valid for SM-2000 only.

CACHE = Cache errors. Inhibiting CACHE on SM-2000s with cache inhibits the interrupts source while on non-SM-2000s with caches it disables the cache area as well, which slows down the operation of the processor. This option is only valid for SMs with the module controller/time slot interchange unit 2 (MCTU2), the extended memory addressing (EMA) 20 or SM-2000s equipped with a CORE60 or CORE700 processor pack.

CADPR = Memory address mismatch error. Valid for SM-2000 only.

CBERR = Correctable bit error. Inhibiting this error will degrade processor performance. Inhibiting this error has no performance impact on SM-2000 or MCTU3.

CI0IN and CI00IN = Control interface (CI) 0 interrupt.

CI1IN and CI01IN = CI 1 interrupt.
CI2IN and CI02IN = CI 2 interrupt. Valid for SM-2000 only.
CI3IN and CI03IN = CI 3 interrupt. Valid for SM-2000 only.
CIxyN = CI interrupt in an electrical extended control and data unit (XCDU) or optical extended control and data unit (OXU) shelf where “x” is the XCDU/OXU number and "y" is the CI number. x is 0 for local CIs and 1 - 8 for XCDU/OXU, y is the CI number which is 0 - 3 for local and 0 - 2 for XCDU/OXU Valid for SM-2000 only.
CPINT = Enhanced central processor intervention interrupt.
DCODE = Decode error. Valid for SM-2000 with CORE60 only.
DL0PE = Dual link interface (DLI) 0 parity error. Not valid for SM-2000.
DLIOI = Data link 0 interrupt. Not valid for SM-2000.
DLI1I = Data link 1 interrupt. Not valid for SM-2000.
IAC0 = DLI0 illegal access error. Not valid for SM-2000.
IAC1 = DLI 1 illegal access error.
LOSUI = Update interface loss of synchronization. Valid for SM-2000 with CORE700 only.
LPVER = Bus lock violation. Valid for SM-2000 with CORE60 only.
MADPE = Address parity error.
MCINT = Resets in the mate controller.
MH0IN = Message handler 0 interrupt. Valid for SM-2000 only.
MH1IN = Message handler 1 interrupt. Valid for SM-2000 only.
MH2IN = Message handler 2 interrupt. Valid for SM-2000 only.
MIOIO = I/O invalid operation error.
MIOLE = I/O timer lock error.
MIOTO = I/O timer time out error.
MIOUE = I/O unlock error.
MPRIN = Maintenance interrupts in the mate MCTSI.
MRDVT = Ready time out.
MRSPERR = Multiple response error. Valid for MCTU2 and SM-2000 only.
MRWPE = Read or write parity error.
MWPER = Write protect error. For SM-2000, inhibiting this error will not inhibit all write protect errors because they are not all inhibitable.
NCBERR = Non-correctable bit error. Valid for SM-2000 only.
OXUxIN = OXU interrupts where “x” is the OXU number (1 - 8). Valid for SM-2000 only.
PIINT = Packet interface (PI) interrupt.
PUMPHW = Pump hardware errors. Valid for MCTU2, MCTU3, and SM-2000 only.
REFE = Dynamic RAM refresh fail error. Valid for SM-2000 only.
SSYNC = Scanned I/O sync error. Valid for SM-2000 with CORE60 only.
TSIIN = Time-slot interchange (TSI) interrupt. For SM-2000, this will also inhibit interrupts from network link interfaces (NLIs).
TSI4IN = TSI model four interrupt. Inhibiting this bit will not affect the inhibits for NLIs. Use this if you want to inhibit only TSI interrupts. Valid for SM-2000 only.
XCDU\text{\textregistered}xIN = XCDU interrupt where x is the XCDU number. Inhibiting this interrupt will result in inhibiting all interrupts for the requested XCDU including the interrupts from the CIs and DIs in that XCDU. Valid for SM-2000 only.

XLCKM = Electrical control and data control links (XCDCL) or optical control and data control links (OCDCL) loss of clock interrupt.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the INH:HDW-MCTSI output message.

RL = Retry later. The message cannot be processed, so try the message again later. This response will be output if the AM cannot communicate with the requested SM/SM-2000.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Inhibits hardware error checks from being performed on the specified remote clock reference (RCREF).

WARNING: Inhibiting hardware checks can prevent the system from recovering automatically from hardware faults in this unit.

2. FORMAT

INH:HDWCHK,RCREF=a-b;

3. EXPLANATION OF MESSAGE

\[ a \]
= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ b \]
= Equipped reference number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\[ NG \]
= No good. The request has been denied because it conflicts with current equipment status. May also include:
  - NG UNIT DOES NOT EXIST = The requested unit does not exist in the system.
  - NOT STARTED UNIT IN GROWTH STATE
  - SM DOES NOT EXIST = The requested SM does not exist in the system.
  - SM UNEQUIPPED = The SM specified is unequipped.

\[ PF \]
= Printout follows. Followed by the INH:HDW-RCREF output message.

\[ RL \]
= Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that all hardware error checks be inhibited in one or more switching modules (SMs). This message has the effect of inhibiting all module controller/time slot interchange unit (MCTSI) interrupts, resets, maintenance service requests, and peripheral fault recovery actions for the selected SMs.

This inhibit will remain in effect through all processor initializations [except emergency action interface (EAI) input message 54] until manually allowed.

WARNING: Inhibiting hardware checks disables all hardware error detection circuitry, puts the processor in a slow state and disables the cache memory. This will result in degraded SM performance and will prevent the system from recovering automatically from its hardware faults.

The performance reduction is associated with degraded modes of the MCTSI; these are described in more detail under the INH:HDW-MCTSI message. ALW:HDW-MCTSI may be used to remove the performance effects (and allow certain errors) while keeping the overall SM hardware checks inhibited. The degree of performance reduction and its impact will vary with the SM type, equipage and load.

2. FORMAT

INH:HDWCHK,SM=a[&b][,LSM][,HSM][,RSM][,ORM][,TRM];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number, or lower limit of a range of SMs.

b = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the request is in progress. The state of the hardware checks can be determined by examining Master Control Center (MCC) page INH & RCVY CNTL.

NG = No good. The message was not accepted because an illegal SM number or range was specified.

- INH:HDWCHK
- OP:ERRCHK
**INH:HIST**

**Software Release:** 5E14 and later  
**Command Group:** NOCHK  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Inhibits history recording for the terminal upon which it is entered. Subsequent input messages entered at the terminal will not be stored for recall. INH:HIST does not clear the input message history buffer.

Input messages that were previously stored in the input message history buffer will still be available for recall and edit, until a CLR:HIST is entered or the terminal is reinitialized.

INH:HIST can be used to prevent the storage of sensitive input messages. This gives insurance that such messages will not be recalled and entered into the system unintentionally. When the input messages being entered become non-sensitive, ALW:HIST can be entered to re-enable history recording.

2. **FORMAT**

INH:HIST

3. **EXPLANATION OF MESSAGE**

No variables.

4. **SYSTEM RESPONSE**

**OK**  
= OK. Input message was accepted and has been applied.

5. **REFERENCES**

INH:MDII-A

Software Release: 5E14 - 5E15
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of a specific machine-detected interoffice irregularity (MDII) be suppressed. If the suppressed MDII occurs on the trunk group, no REPT:MDII output message will be generated.

2. FORMAT

INH:MDII=a,TG=b;

3. EXPLANATION OF MESSAGE

a = The MDII suppressed on a trunk group. Valid value(s):
   2SPDT = Partial dial timeout in the second stage of a traditional 2-stage international outbound call.
   2SPST = Permanent signal timeout in the second stage of a traditional 2-stage international outbound call.
   2SVCA = Vacant code in the second stage of a traditional 2-stage international outbound call.
   ABF  = Abandon failure.
   ACK  = No acknowledgment wink.
   ANF  = Failure to receive automatic number identification (ANI) digits on incoming LATA trunk.
   ANF2 = ANI collected by an operator following a failure to receive ANI digits on an incoming centralized automatic message accounting (CAMA) trunk.
   ANI  = Time-out waiting for far off-hook from Traffic Service Position System (TSPS) before sending ANI digits.
   AST  = Position acknowledge seizure signal time-out.
   ATO  = Time-out waiting for address complete signal.
   BAF  = Blocking acknowledgment failure.
   BLFCA= Blocking a fully coded addressed international outbound call routed to a non-CCS trunk.
   CAF  = Circuit reset acknowledgment failure.
   CAI  = Address incomplete received.
   CII  = Initial address message (IAM) irregularity (incoming).
   CKF  = Continuity check failure (incoming).
   COF  = Confusion received (outgoing).
   CQR  = Circuit query message (CQM) timed out while waiting for a circuit query reply (CQR) message.
   CRA  = Circuit reservation message (CRM) timer timed out while waiting for a circuit reservation acknowledgment (CRA) message.
   CRR  = Reset received (incoming).
   CTO  = Continuity timeout (incoming).
   CVN  = Vacant national number received (outgoing).
   DDF  = Delay dial, steady off-hook.
   DSN  = Delay dial, steady on-hook.

Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of a specific machine-detected interoffice irregularity (MDII) be suppressed. If the suppressed MDII occurs on the trunk group, no REPT:MDII output message will be generated.

2. FORMAT

INH:MDII=a,TG=b;

3. EXPLANATION OF MESSAGE

a  = The MDII suppressed on a trunk group. Valid value(s):
    2SPDT  = Partial dial timeout in the second stage of a traditional 2-stage international outbound call.
    2SPST  = Permanent signal timeout in the second stage of a traditional 2-stage international outbound call.
    2SVCA  = Vacant code in the second stage of a traditional 2-stage international outbound call.
    ABF    = Abandon failure.
    ACK    = No acknowledgment wink.
    ANF    = Failure to receive automatic number identification (ANI) digits on incoming LATA trunk.
    ANF2   = ANI collected by an operator following a failure to receive ANI digits on an incoming centralized automatic message accounting (CAMA) trunk.
    ANI    = Time-out waiting for far off-hook from Traffic Service Position System (TSPS) before sending ANI digits.
    APMTO  = Application transport message time out.
    AST    = Position acknowledge seizure signal time-out.
    ATO    = Time-out waiting for address complete signal.
    BAF    = Blocking acknowledgment failure.
    BLFCA  = Blocking a fully coded addressed international outbound call routed to a non-CCS trunk.
    CAF    = Circuit reset acknowledgment failure.
    CAI    = Address incomplete received.
    CHRTO  = Connection Hold Release Request Timeout at the Originating Switch.
    CII    = Initial address message (IAM) irregularity (incoming).
    CKF    = Continuity check failure (incoming).
    C0F    = Confusion received (outgoing).
    CQR    = Circuit query message (CQM) timed out while waiting for a circuit query reply (CQR) message.
    CRA    = Circuit reservation message (CRM) timer timed out while waiting for a circuit reservation acknowledgment (CRA) message.
    CRR    = Reset received (incoming).
    CTO    = Continuity timeout (incoming).
    CVN    = Vacant national number received (outgoing).
    DDF    = Delay dial, steady off-hook.

235-200-116  Signaling Gateway Common Channel Signaling
INH:MISMATCH

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that line card/network termination (NT) mismatch detection be inhibited on integrated services digital network (ISDN) lines equipped with U-cards. To be certain of the results of this message, the following three conditions should be noted.

First, INH:MISMATCH,REPT will only inhibit the printout on the receive-only printer (ROP) of the lines that have mismatches. INH:MISMATCH,REPT does not disable mismatch detection. Second, INH:MISMATCH without the report (REPT) option will inhibit mismatch detection but will leave reporting enabled if the INH:MISMATCH,REPT message isn't also entered. If mismatch detection is inhibited without inhibiting mismatch report, no output will be printed on the ROP, but printout on the ROP will automatically resume if the ALW:MISMATCH message is entered at a later time. Third, to inhibit the NT mismatch detection and the NT mismatch report for the entire office, set the office parameters to N, using Recent Change/Verify (RC/V) OFFICE PARAMETERS view 8.1 (OFFICE PARAMETERS).

NOTE: Inhibiting mismatch detection will prevent the OOS BLKD - DYGSPUS AUTO port status from being automatically updated to either the OOS BLKD - NTPWR AUTO or OOS BLKD - UINTF AUTO status. Refer to the APP:PORT-STATUS appendix in the Appendixes section of the Output Messages manual for more information on the OOS BLKD - DYGSPUS AUTO status.

2. FORMAT

INH:MISMATCH[,REPT][,SM=a[&&b]];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

REPT = Inhibit the reporting on the ROP of the lines found to have mismatches.

a = SM number or the lower limit of a range of SM numbers.

b = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

PF = Printout follows. Followed by the INH:MISMATCH output message.

8.1 (OFFICE PARAMETERS)
INH:MON

**Software Release:** 5E14 and later  
**Command Group:** SFTUTIL  
**Application:** 5  
**Type:** Input

### 1. PURPOSE
Requests that the operating system for distributed switching (OSDS) monitor actions be inhibited.

The INH:MON messages deactivates the OSDS monitor by setting the monitor control word to zero. This is the first word of the OShisarray monitor buffer in the administrative module (AM) or the SIhistory monitor buffer in the switching module (SM) or the communications module processor (CMP).

### 2. FORMAT

```
INH:MON, {AM | SM=a | CMP=b-c};
```

### 3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

- **a** = Switching module (SM) number.
- **b** = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
- **c** = Communications module processor (CMP) number.

### 4. SYSTEM RESPONSE

- **NG** = No good. Error in format.
- **PF** = Printout follows. Followed by the INH:MON output message.
- **RL** = Retry later. System resource shortage.

INH:NMOUT-A

Software Release: 5E14 - 5E16(1)
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE
Requests that the printing of output messages stimulated by the remote network management center (RNMC) be inhibited.

2. FORMAT
INH:NMOUT[,TYPE=a];

3. EXPLANATION OF MESSAGE

\[ a \] = Message type. Valid value(s):
- CGAP = Call gapping code controls messages.
- DOC = Dynamic overload controls messages.
- SILC = Selective incoming load controls messages.
- SSTR = Service selective trunk reservation controls messages.
- TGC = Manual trunk group controls messages.
- TR = Trunk reservation controls messages.

The default is to inhibit all output messages resulting from RNMC actions.

4. SYSTEM RESPONSE

\[ \text{NG} \] = No good. May also include:
- INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.
- INVALID TYPE = The request has been denied. An invalid message type was entered.

\[ \text{OK} \] = Good. The inhibit was successful.

Software Release: 5E16(2) and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of output messages stimulated by the remote network management center (RNMC) be inhibited.

NOTE: Total office clear output messages stimulated by the RNMC will not be inhibited.

2. FORMAT

INH:NMOUT[,TYPE=a];

3. EXPLANATION OF MESSAGE

a = Message type. Valid value(s):
   CGAP = Call gapping code controls messages.
   DOC  = Dynamic overload controls messages.
   SILC = Selective incoming load controls messages.
   SSTR = Service selective trunk reservation controls messages.
   TGC  = Manual trunk group controls messages.
   TR   = Trunk reservation controls messages.
   HTR  = Hard-to-reach controls messages.

The default is to inhibit all output messages resulting from RNMC actions.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. May also include:
   - INVALID REQUEST = This office is not equipped to process the request entered.
   - INVALID TYPE = An invalid message type was entered.
   - FEATURE NOT AVAILABLE = The HTR feature is not available.

OK = Good. The inhibit was successful.

INH:PCTF

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE
Requests that the per-call test failure (PCTF) verbose mode be inhibited. Inhibiting the PCTF verbose mode on a switching module (SM) causes only the first and tenth occurrence of a PCTF type on a line to be reported daily. When the PCTF verbose mode is not inhibited (allowed), every PCTF occurrence will be reported in an individual REPT:PCTF report.

2. FORMAT
INH:PCTF,VERBOSE[,SM=a[&b]];

3. EXPLANATION OF MESSAGE
a = SM number or the lower limit of a range of SM numbers (default is all equipped SMs).
b = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE
NG = No good. The message was not recognized or acceptable.
PF = Printout follows. Followed by the INH:PCTF output message.

INH:PLNT24-A

Software Release: 5E14 - 5E16(2)
Command Group: MEAS
Application: 5
Type: Input

1. PURPOSE

Requests that the regularly scheduled 24-hour plant report be inhibited from printing to the ROP. The specified part(s) will not be printed until allowed by the ALW:PLNT24 input message.

2. FORMAT

INH:PLNT24:(a|ALL);

3. EXPLANATION OF MESSAGE

ALL = Inhibit all parts of the 24-hour plant report.

a = Name of report part to be inhibited. Valid value(s):
   PART1 = Service measurements.
   PART2 = Equipment performance.
   PART3 = Performance measurements.
   PART4 = Remote switching module (RSM) maintenance service and performance.
   PART5 = Trunk error analysis.
   PART6 = Interlata carrier measurements.
   PART7 = Network call denial.
   PART8 = RSM cluster measurements.
   PART9 = Integrated services digital network (ISDN) packet switching office totals.
   PART10 = Operator Services Position System (OSPS) processors counts.
   PART11 = ISDN office totals.
   PART13 = OSPS real-time rating query measures.
   PART14 = OSPS facility administration measures.
   PART15 = OSPS measurements.
   PART16 = OSPS interflow measures.
   PART17 = OSPS line information database (LIDB) measures.
   PART18 = OSPS customer account services (CAS).
   PART19 = Action control point (ACP) for software defined network.
   PART21 = Leased network action point
   PART22 = OSPS intercept measures.
   PART23 = OSPS customer account services release 3 signaling measures.
   PART24 = Machine detected inter-office irregularity (MDII) trunk group measurements.
   PART25 = ISDN user part (ISUP) office totals.
   PART26 = DS1 measurements.
   PART27 = Static proportionate bidding (PB) measurements.
   PART28 = OSPS international credit card validation (ICCV) measures by foreign database.
   PART29 = OSPS line applications for consumers (LAC) signaling measures.
   PART30 = OSPS originating line number screening (OLNS) measures.
   PART36 = Signaling link performance.
4. SYSTEM RESPONSE

NG = No good. May also include:
(b) = The request was made during the automatic preparation of the report. The message OP:PLNT24-NOT will follow.
  - DATA NOT AVAILABLE AT THIS TIME = Report is being generated and, therefore, manual requests are locked out, or the report has not generated since an initialization.

OK = Good. The part(s) was/were inhibited.

INH:PSLT

Software Release: 5E14 and later
Command Group: CCS
Application: 5,CNI
Type: Input

1. PURPOSE

Requests that the inhibit for the periodic signaling link test (PSLT) be set, reset or reported. When the inhibit is 'ON' for any particular link, periodic signaling link tests for that link are not done. When the inhibit is 'OFF' periodic tests are run.

2. FORMAT

INH:PSLT={ALL|a-b}:c;

3. EXPLANATION OF MESSAGE

ALL = All links.

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Request type. Valid value(s):
OFF = The PSLT is allowed.
ON = The PSLT is inhibited.
STATUS = Reports the status of the links.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the INH:PSLT output message. For either the 'ON' or 'OFF' request the PSLT inhibit is conditioned according to the input request. When the 'STATUS' option is specified the system will output a report for the requested link(s).

3. **EXPLANATION OF MESSAGE**

- \( a \) = Scan point number in bldg/misc group. as displayed on the master control center (MCC) remote alarms page. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

- \( b \) = Switching module (SM) number (must be module type that has remote alarm process active).

4. **SYSTEM RESPONSE**

- **NG** = No good. The request is invalid.

- **PF** = Printout follows. The request is being processed. Followed by the INH:RBPSC-SM output message.

- **RL** = Retry later. The system is unable to process the request at this time.

INH:REX-AM-SM  
Software Release: 5E14 and later  
Command Group: MAINT  
Application: 5  
Type: Input  

1. PURPOSE  
Inhibits either one or all three test types of routine exercise of the hardware in the administrative module (AM) and  
switching modules (SMs). Routine exercises may be inhibited in the administrative module or in one switching  
module or in the AM and all SMs.  
This action is effective for only one routine exercise session. If the tests are in progress when this message is  
received, the tests are not stopped, but inhibit action is taken for the next session.  

2. FORMAT  
INH:REX[,{AM|,SM=a}][,b];  

3. EXPLANATION OF MESSAGE  
AM = Inhibits hardware exercise tests in the AM.  
a = The number of the switching module to be inhibited. Refer to the APP:RANGES appendix in the  
Appendixes section of the Input Messages manual.  
Note: If neither AM nor SM is specified, exercising of hardware in the AM and all the SMs  
is inhibited.  
b = Routine exercise test type to be inhibited (default is to inhibit all three test types). Valid value(s):  
DGN = Inhibit diagnostic exercises.  
ELS = Inhibit electronic loop segregation (ELS) exercises.  
FAB = Inhibit fabric exercise tests of grids.  

4. SYSTEM RESPONSE  
NG = No good. Wrong test type.  
OK = Good. Request is valid and accepted.  
RL = Retry later. System is in min-mode.  
Note: The results of this message can be verified by using the OP:REXINH input  
message.  
?I = General syntax error or invalid processor ID.  

5. REFERENCES  
Input Message(s):
INH:REX-CM-SM

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Inhibits either one or all valid test types for routine exercise (REX) of the hardware in the communication module (CM) and in all switching modules (SMs) or in the CM or in a range of SMs.

2. FORMAT

INH:REX[{,CM|,SM=a[&b]}][,c];

3. EXPLANATION OF MESSAGE

a = Number of the SM for which REX is to be inhibited or lower limit of a range of module numbers.
b = Upper limit of a range of SMs requested to be inhibited.
c = Routine exercise test type to be inhibited (default is to inhibit all three test types). Valid value(s):
   DGN = Inhibit diagnostic exercise.
   ELS = Inhibit electronic loop segregation tests. This is not a valid test type for the CM.
   FAB = Inhibit fabric exerciser tests of grids. This is not a valid test type for the CM.

Note: If neither CM nor SM is specified, the default is to inhibit all test types for the CM and all SMs.

4. SYSTEM RESPONSE

NG = No good. The request was not a valid entry.
OK = Good. Request is valid and accepted.
RL = Retry later. SM is in an abnormal state. The request cannot be executed now.

1290 REX STATUS (CM)
INH:REX

Software Release: 5E14 and later
Command Group: MAINT
Application: 5,3B
Type: Input

1. PURPOSE

Requests that routine exercises (REX) be inhibited for one or more hardware communities by setting the REX temporary inhibit(s). A hardware community consists of a major device controller and its associated subdevices. If a hardware community has REX permanently inhibited, its REX temporary inhibit is not available.

Note: All routine exercises may be inhibited by using the INH:DMQ input message. The rex_inh flag will remain set until released with an ALW:DMQ or ALW:REX input message.

2. FORMAT

INH:REX [,a[=b]|ALL] ;

3. EXPLANATION OF MESSAGE

ALL = Set the temporary REX inhibits for all major community controllers that are not permanently inhibited from REX.

a = Unit name of a major community controller. Applications may add additional major controllers which may be inhibited by this message. Valid value(s):
   CU = Control unit.
   DCI = Dual serial channel/computer interconnect.
   IOP = Input/output processor.

If not specified, then routine exercises will be inhibited for all AM controllers.

b = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual. If not specified, then all controllers with the specified unit name are inhibited.

4. SYSTEM RESPONSE

NG = No good. Routine exercises are permanently inhibited for the unit specified or for all the units specified.

OK = Good. Routine exercises are temporarily inhibited for the unit specified or for at least one of the unit is specified.

PF = Printout follows. Followed by the INH:REX output message.

RL = Retry later. The database manager or a database record could not be opened. Try again at a later time. If this persists, refer to the TECHNICAL ASSISTANCE portion of the INTRODUCTION section of the Input Messages manual.

?D = Data field error.

INH:RT-FAC

Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that protection (PROT) line switch requests to be performed on the specified remote terminal (RT) digital signal level one (DS1) facility (FAC) circuit be inhibited or requests that a DS1 currently on protection be taken off of protection.

Requests that a DS1, that is being protected, be inhibited from being released or coming off of protection. This message is applicable for RTs terminating on an integrated digital carrier unit (IDCU) or a digital carrier line unit (DCLU).

WARNING: If a DS1 is already on protection when the inhibit PROT input message is used, any calls on that DS1 will be dropped.

If a DS1 is on protection and RELEASE is inhibited, then a higher priority DS1 cannot go on protection until the RELEASE is allowed on the original DS1.

2. FORMAT

INH:RT,FAC=a-b,{PROT|RELEASE};

3. EXPLANATION OF MESSAGE

PROT = Inhibit switching from the specified DS1 FAC to the protection line (for use with the DCLU or the IDCU). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

RELEASE = Inhibit the release of a DS1 from protection (for use with the IDCU only).

a = Site identification number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DS1 FAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current status.

PF = Printout follows. Followed by the INH:RT-FAC output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

   1660,xxxx (TR303 REMOTE TERMINAL)
INH:RTMTBOVR

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that metallic setup failure override be inhibited when the metallic test bus (MTB) is found to be open between the test bus control unit (TBCU) and the remote terminal (RT). If the MTB is really open and override is inhibited, metallic setup will fail. The system default is to allow metallic setup failure override.

This message will set an override flag in a switching module (SM) to the inhibit state. The flag can be set in one SM or in all SMs. If individual SMs are set differently, be aware that if the modular metallic service unit (MMSU) and RT are in different SMs a remote read of the flag stored in the RT SM is done from the MMSU SM. If the remote read fails, the default of the override flag will be that stored in the MMSU SM.

2. FORMAT

INH:RTMTBOVR[,SM=a[&b]];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number, or the lower limit of a range of SM numbers.

b = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

PF = Printout follows. The request has been accepted and is followed by the INH:RTMTBOVR output message.

ALW:RTMTBPRT
INH:RTMTBOVR
INH:RTMTBPRT
INH:RTMTBPRT

Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests that the printing of the REPTRMTBSID message be inhibited when the metallic test bus (MTB) fails the closed diode protocol test during metallic setup to a remote terminal (RT).

The system default is to allow the printing of this message. By inhibiting the printing of this message, the ability to see the cause of metallic setup failure will be lost. If, however, metallic setup override is allowed with the message ALW:RTMTBOVR, then it might be desirable not to have the message print. Consider carefully what configuration is desired in the office.

This message will set a print flag in a switching module (SM) or in all SMs. If individual SMs are set differently, be aware that if the modular metallic service unit (MMSU) and RT are in different SMs a remote read of the flag stored in the RT SM is done from the MMSU SM. If the remote read fails, the default of the print flag will be that stored in the MMSU SM.

2. FORMAT

INH:RTMTBPRT[,SM=a[&b]];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number, or the lower limit of a range of SM numbers.

b = The upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized or acceptable.

1. PURPOSE

Requests that the reporting of information related to switch cutoff calls be inhibited.

2. FORMAT

INH:SCORPT;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

OK = Good. The request has been received. No subsequent occurrences of switch cutoff calls will print the information report (REPT:SWITCH-CC).

5. REFERENCES

Input Message(s):

ALW:SCORPT

Output Message(s):

REPT:SWITCH-CC
INH:SCSD

Software Release: 5E14 and later
Command Group: AM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that reporting of transitions of a scanner and signal distributor (SCSD) scan point be inhibited. Scan points can be identified by physical location (as in Format 1) or by logical address (as in Format 2).

2. FORMAT

[1] INH:SCSD:UNIT=a,PT=b[-b-b-b-b-b-b-b];

3. EXPLANATION OF MESSAGE

a = Member number of the SCSD unit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Physical scan point number on an SCSD. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Name of the logical SCSD group. Valid value(s):
   FANACU0
   FANACU1
   PDF0
   PRSWCU0
   PRSWCU1
   PRSWIOP0
   PRSWIOP1
   PRSWDFC0
   PRSWDFC1
   PRSWMHD0
   PRSWMHD1
   PTSWMCR
   PTSWROP

d = Duplex point ID. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Number of a point within a logical group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. SCSD administrator process is not active; no communication with SCSD points is possible.
PF = Printout follows. Followed by the INH:SCSD output message.

RL = Retry later.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that all software error checks be inhibited in one or more switching modules (SMs), or a specified communication module processor (CMP). This inhibit prevents automatic recovery escalation.

This inhibit will remain in effect through all processor initializations (with the exception of emergency action interface (EAI) input message 54) until manually allowed.

WARNING: Inhibiting software checks can prevent the system from recovering automatically from software faults in this unit.

2. FORMAT

INH:SFTCHK,{CMP=a|SM=b[&c][,LSM][,HSM][,RSM][,ORM][,TRM]};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = CMP number.

b = SM number, or lower limit of a range of SM numbers.
c = Upper limit of the range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because an illegal SM number or range was specified. The message was not accepted because an illegal CMP number was specified.

OK = Good. The message was accepted and the action completed.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests that the status of the alarm inhibit flag of a signaling link (SLK) be set, reset, or listed. The alarm inhibit flag is conditioned in accordance with the input request for the specified SLK or the current status of the flag is reported.

2. FORMAT

INH:SLK=a-b:c;

3. EXPLANATION OF MESSAGE

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Request type. Valid value(s):
OFF = The alarm inhibit is turned off. This allows all messages associated with a signaling link to be print.
ON = The alarm inhibit is turned on. This will allow only non-alarm messages to print for a signaling link.
STATUS = Requests the status of the alarm inhibit flag for the corresponding signaling link.

235-070-100  Administration and Engineering Guidelines
INH:TRFC30

Software Release: 5E14 and later
Command Group: MEAS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the inhibition of the collection or outputting of the specified section of the 30-minute traffic report.

WARNING: If no section is specified, all sections will be inhibited.

2. FORMAT

INH:TRFC30, {CLCT|TRFCH|ROP} [:a|:ALL];

3. EXPLANATION OF MESSAGE

ALL = Inhibit all sections, regardless of whether they need IDs (default).

CLCT = Inhibit collection of specified section(s). Inhibiting collection of sections will automatically cause those sections to be inhibited for printing.

ROP = Inhibit output of specified section(s) to the receive-only printer.

TRFCH = Inhibit output of specified section(s) to the traffic channel.

a = Section that is to be inhibited. Refer to the APP:TRFC-SECTION appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
- CONFIGURATION NOT SUPPORTED. The section requested represents a configuration not present in this office.
- FEATURE NOT AVAILABLE The requested action failed; the feature required to process the request is not present in the switch.
- INCOMPLETE UNIT ID The identifiers entered incompletely specified a unit.
- NOT ALLOWED The inhibit request was for some unit or count not currently allowed but the section is still allowed.
- SECTION NOT INHIBITABLE FOR COLLECTION The section cannot be inhibited for data collection.
- SECTION NOT INHIBITABLE FOR PRINT The section cannot be inhibited for ROP/traffic channel.
- UNIT(S) NOT EXPLICITLY ALLOWED The previous input was "ALW:TRFC30,ROP,b", where "b" was the section name or ALL. Therefore, specific records cannot be inhibited. The section is allowed.
OK = Good. The section(s) were inhibited; however, section(s) that cannot be inhibited for collection remain allowed when an INH:TRFC30,CLCT,ALL is requested. If the request is to inhibit an individual section for collection and the section or identifiers are already inhibited, OK will be output. To determine which sections or identifiers remain allowed for collection use the OP:MEASTAT,CLCT input message.

PF = Printout follows. Followed by the INH:TRFC30 output message detailing which groups are inhibited or are invalid prints.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a specific generic utility WHEN clause in the switching module (SM), or all such active clauses, be inhibited.

This message may be used together with any of the other SM generic utility input messages. Refer to the References section of this message. If this message is used together with any of the other generic utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

INH:UT:SM=a[&b],{UTIL|UTILFLAG=c};

3. EXPLANATION OF MESSAGE

UTIL = Execute this input message on all of the WHEN clauses in the specified SM(s).

a = SM number or the lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = The identification number of a specific WHEN clause which is to be inhibited. Must be a number from 0 to 127.

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Disables (but leaves defined) all administrative module (AM) generic access package (GRASP) breakpoints. Inhibits the associated actions normally executed when the breakpoint conditions occur.

2. FORMAT

INH:UTIL;

3. EXPLANATION OF MESSAGE

No variables.

4. SYSTEM RESPONSE

IP = In progress. The request has been added to the WHEN action list.
NG = No good. No GRASP breakpoints are currently defined.
PF = Printout follows. Followed by the INH:UTIL output message.
RL = Retry later. The system is in an overload condition or completing the previous OP:UMEM request.

Output Message(s):

INH:UTIL
OP:UTIL
1. PURPOSE

Disables (but leaves defined) a specific central processor (CP) generic access package (GRASP) breakpoint. Inhibits the associated actions that normally are executed when the breakpoint condition occurs.

Within a WHEN action list, the identifier ME can be used to refer to the breakpoint being defined, since the breakpoint number has not yet been assigned.

2. FORMAT

INH:UTILFLAG={a|ME};

3. EXPLANATION OF MESSAGE

ME = Used within a WHEN action list to refer to the breakpoint being defined.

a = Numeric identifier (one or more decimal digits) of the breakpoint to be disabled.

4. SYSTEM RESPONSE

IP = In progress. The message has been added to the WHEN action list.

NG = No good. Identifier does not correspond to a currently defined breakpoint.

PF = Printout follows. Followed by INH:UTILFLAG output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

INIT:AM-SPP-A

Software Release: 5E14 only
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests an administrative module (AM) single process purge (SPP) initialization of a named application process running under either operational kernel process (OKP) or switch maintenance kernel process (SMKP). The named process ID (PID) may be either a system process or terminal process. Refer to the APP:PID-AM-OKP appendix for a list of the system process PIDs for OKP. Refer to the APP:PID-AM-SMKP appendix for a list of the system process PIDs for SMKP.

WARNING: This message will purge the requested process. Any activity currently in progress will be killed. This may result in other asserts or audits as the system cleans up.

2. FORMAT

INIT:AM,a,SPP,PID=b[-c];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Identity of the selected UNIX® RTR application process (DAP). Valid value(s):
   OKP = Operational kernel process.
   SMKP = Switch maintenance kernel process.

b = Number of the process to be purged. The process may be either a system process or a terminal process. If the PID refers to a terminal process, a uniqueness number must be included.

c = Uniqueness number of the specified terminal process PID (used only for a terminal process).

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because valid values are:
   - INVALID PID = An illegal value for PID was specified.
   - PID NOT ACTIVE = The specified PID is no longer associated with an active process.

PF = Printout follows. The initialization request was accepted and is followed by the INIT:AM-LVL output messages.

Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a single process purge (SPP) of a named process in a selected communication module processor (CMP). The named process ID (PID) may be either a system process or terminal process. Refer to the APP:PID-CMP appendix in the Appendixes section of the Input Messages manual for a list of the CMP system process PIDs.

WARNING: This message will purge the requested process. Any activity currently in progress will be killed. This may result in other asserts or audits as the system cleans up.

2. FORMAT

INIT:CMP=a,b,SPP,PID=c[-d];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = CMP number.
b = Processor affected. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.
c = PID to be purged. The process may be either a system process or a terminal process. If the PID refers to a terminal process, a uniqueness number must be included.
d = Uniqueness number of the specified terminal process PID (used only for a terminal process).

4. SYSTEM RESPONSE

NG = No good. The message was not accepted because:
- An illegal CMP number was specified.
- An illegal initialization level or PID was specified.
PF = Printout follows. Followed by the INIT:CMP-LVL output message.

235-600-400  Audits
INIT:CMP

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the selected communication module processors (CMPs) be initialized at the specified level. The initialization level may be a selective initialization (SI), full initialization (FI), or purging initialization (PGI). In addition, a full pump of the CMP may be specified with the FI.

If an initialization is requested on a CMP that is isolated from the administrative module (AM), the initialization request will be queued until communication is restored. Initialization requests for the mate CMP may be queued behind primary CMP or switching module (SM) initialization requests, in which case, the state of the CMP will change to "INIT PEND", indicating there is an initialization pending. Pending initialization requests may be canceled by selecting the NOINIT level as shown below.

WARNING: All service in this unit will be lost for the duration of the initialization.

2. FORMAT

INIT:CMP=a,b,c[,PUMP];

3. EXPLANATION OF MESSAGE

PUMP = Perform a full CMP pump at the requested level (FI).

a = CMP number.

b = Processor to be initialized. Valid value(s):
   MATE = Mate CMP.
   PRIM = Primary CMP.

c = Initialization level. Valid value(s):
   FI = Full initialization (clear all stable calls).
   NOINIT = No initialization (cancel a pending SI, FI, PGI request).
   PGI = Purging initialization.
   SI = Selective initialization (clear all transient calls).

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the request is in progress. Valid value(s):
   - PREVIOUS INIT CANCELLED = As part of accepting this request a previous initialization request was cancelled.

NG = No good. The message was not accepted for one of the following reasons:
- CMP IS OOS, TRY RST:CMP = CMP must be restored rather than initialized.
- INIT INPROGRESS/COMPLETED = Initialization could not be cancelled because it had already started or completed (NOINIT only).
- INTERNAL ERROR = Request count not be handled due to system software problems.
- INVALID CMP PAIR/MEMBER = Illegal CMP pair/member was specified.
- INVALID INIT/PUMP TYPE = Illegal initialization level or pump option was specified.

OK = Good. The message was accepted and the action completed (NOINIT only).

1850/1851 (CMP INH & RCVRY CNTL)
**INIT:CNI**

**Software Release:** 5E14 and later  
**Command Group:** SYSRCVY  
**Application:** 5  
**Type:** Input

**WARNING:** INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests a common network interface (CNI) initialization at a specified level. The selected level may be level 0 (audit level) or 1, 2, 3, or 4, which result in an initialization of the CNI system.

**WARNING:** This message could halt all common channel signaling (CCS) call processing. All service based on the CNI could be lost for the duration of the initialization.

2. **FORMAT**

```
INIT:CNI,{LVL0|LVL1|LVL2|LVL3|LVL4|DLNTBL};
```

3. **EXPLANATION OF MESSAGE**

- **DLNTBL**  
  Direct link node table. Initialize direct memory access (DMA) tables required during DLN growth. This option is only used during CNI growth.

- **LVL0**  
  Perform an audit-level CNI and interprocess message switch (IMS) initialization. The CNI level 0 initialization requests a series of CNI-related data audits to be run by an audit manager residing in the system integrity monitor (SIM). If an excessive amount of non-correctable critical errors occur, the level 0 initialization is advanced to a level 1 initialization. Included with the CNI audits, an IMS level 0 audit is performed.

- **LVL1**  
  Perform a recovery-level CNI initialization. The CNI level 1 initialization resets and restarts all CNI administrative module (AM) resident software. No processes are recreated or reloaded from disk and the CNI ring is not re-pumped. The CNI system is briefly unavailable to carry CCS traffic.

- **LVL2**  
  Perform a boot-level CNI initialization. All AM resident processes parented by CNI and IMS will be killed and recreated. Data that was previously loaded into the CNI protected application segment (PAS) area (during a previous initialization) will not be reloaded during the level 2 initialization and the remote access subsystem (REMACS) will not pump the nodes with CNI routing data.

- **LVL3**  
  In addition to performing a LVL2, data in shared libraries and the CNI PAS area reload and reinitialize from disk. The CNI REMACS downloads routing data to all nodes on the CNI ring.

- **LVL4**  
  In addition to performing a LVL3, download all CNI-related text and data to the CNI ring nodes.

4. **SYSTEM RESPONSE**

- **NG**  
  No good. Request was unsuccessful because:
  - The CNI system is already initializing. Try higher level.
  - The CNI system is in an automatically non-recoverable state. Perform a LVL3 or LVL4.
  - The initialization of the CNI system failed.
- An internal error occurred.
- The office is not equipped with CNI.

OK  = Good. Request has been accepted.
PF  = Printout follows. Initialization request has been accepted and is followed by the INIT:CNI-LVL output message.
RL  = Retry later because:
    - The CNI system is not in a stable state.
    - The system is unable to service the request. (This will happen if the office is not equipped with the CNI ring, and LVL0 or LVL1 level is run.)

4. **SYSTEM RESPONSE**

**IP** = In progress. The message was accepted and the request is in progress.

**NA** = No acknowledgement. The DLN did not respond to the initialization request.
NG = No good. The message was not recognized, or was not acceptable. Valid value(s):
- DLN NOT EQUIPPED = The request was denied. DLN is not equipped in this office.
- INVALID PROCESS ID = The request was denied. The specified PID is invalid or the process
does not exist.
- NODE IS NOT A DLN = The specified ring node is not a DLN.

RL = Retry later. Valid value(s):
- CNI NOT AVAILABLE = The common network interface (CNI) was out of service or in
  initialization.
- DLN INIT IN PROGRESS = A DLN initialization was already in progress.

Application: 5,CNI
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests an initialization of the selected direct link node (DLN) at the specified level. The initialization level may be a start-scan operation, office dependent data (ODD) pump, or software restart.

WARNING: This message will initialize the selected unit. All service in this unit will be lost for the duration of the initialization.

2. FORMAT

INIT:DLN=a-b,c;

3. EXPLANATION OF MESSAGE

a = Ring node group number of selected DLN. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Ring node member number of selected DLN (default 2). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = The desired initialization level. Valid value(s):
   PUMP = Pump the ODD data to the DLN.
   RESTART = Restart the operating system and all software processes of the DLN node processor and attached processor.
   SCAN = Initialize the direct memory access (DMA) scanning process in the active DLN.

4. SYSTEM RESPONSE

NA = No acknowledgement. The DLN did not respond to the start scan operation (SCAN only).

NG = No good. The message was not recognized, or was not acceptable. Valid value(s):
   - DLN IS NOT ACTIVE = SCAN was requested for a DLN that is not in the active state.
   - DLN NOT EQUIPPED = DLN is not equipped in this office.
   - NODE IS NOT A DLN = The specified ring node address is not a DLN.

OK = Good. The message was accepted and the action completed (SCAN only).

PF = Printout follows. Followed by the REPT:RINGMON output message.

RL = Retry later. Valid value(s):
   - CNI NOT AVAILABLE = The common network interface (CNI) was out of service or in
initialization.
- DLN INIT IN PROGRESS = A DLN initialization was already in progress.
- RING IS IN SILENCE STATE = Communication both to and from the node is not available at this time.

Application: 5
Type: Input

1. PURPOSE

Requests a single process purge (SPP) and reinitialization of a terminal process in a switching module (SM) that
controls the named Operator Services Position System (OSPS) digital subscriber line (DSL).

2. FORMAT

INIT:DSL, {BST=a-b|DASC=c-d|EIS=x-y|RAS=e-f|OAPO=g|
OAPF=h|XDPO=i|XDPF=j|OPT=k-l|RTRS=m-n|
HOBIS=o-p|HOBICV=q-r|HOBICR=q-s|AQ=t-u|MISLNK=v-w};

3. EXPLANATION OF MESSAGE

a  = Operator service center (OSC) number associated with an OSPS basic services terminal (BST). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b  = BST relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c  = Directory assistance services computer (DASC) host number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d  = Relative DSL number assigned to a DASC data link DSL.
e  = Remote integrated services line unit (RISLU) site number associated with OSPS remote alarm section (RAS). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f  = Relative data link DSL number assigned to an alarm conversion circuit (ACC) in the RAS.
g  = OSC number that identifies an OSPS administrative processor associated with the OSC (OAPO). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h  = Force management center (FMC) number that identifies an OSPS administrative processor associated with the FMC (OAPF). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i  = OSC number that identifies an OSPS external data port associated with the OSC (XDPO). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j  = FMC number that identifies an OSPS external data port associated with the FMC (XDPF). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
k  = Operator service center (OSC) number associated with an OSPS operator position terminal (OPT). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l  = OPT relative position number.
m = Real-time rating system (RTRS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Relative DSL number assigned to a RTRS data link DSL.

o = Hotel billing information system (HOBIS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Relative DSL number assigned to a HOBIS data link DSL.

q = Hotel billing information center (HOBIC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Relative DSL number assigned to a HOBICV (HOBIC voice-quote terminal) data link DSL.

s = Relative DSL number assigned to a HOBICR (HOBIC record terminal) data link DSL.

t = Autoquote DSL modem pool number.

u = Relative DSL number assigned to an autoquote data link DSL.

v = Commercial automatic call distributor management information system/computer data link (MISLNK) host number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Relative DSL number assigned to a MISLNK data link DSL.

x = External information system (EIS) ID.

y = External data link (member) number relative to the EIS.

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the request is in progress.

NG = No good. Valid value(s):
- OSPS DSL is not equipped in the office.
- OSPS DSL does not have an active terminal process in control of it.
- The SM specified is unavailable at this time.

RL = Retry later. There is a purge in progress.

**Type:** Input

1. PURPOSE

Requests initialization of performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), an integrated digital carrier unit (IDCU), or a digital networking unit - synchronous optical network (SONET) (DNU-S). The affected facilities’ 15 MIN interval and DAY PM counts (history intervals and previous day counts also if all option is used) are marked corrupt as a result of this initialization.

Format 1 is used to initialize performance monitoring counts for a facility terminated on a DFI or a DFI-2.

Format 2 is used to initialize performance monitoring counts for all facilities terminated on a DFI-2.

Format 3 is used to initialize performance monitoring counts for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 4 is used to initialize performance monitoring counts for all facilities terminated on an IDCU.

Format 5 is used to initialize performance monitoring counts on the specified IDCU facility (IFAC).

Format 6 is used to initialize performance monitoring counts for all facilities terminated on an IDCU-supported or DNU-S supported TR303 remote terminal (RT).

Format 7 is used to initialize current or all performance monitoring counts for all section terminating equipment (STE) facilities on a DNU-S. The PM counts associated with any subtending virtual tributary 1.5 (VT1.5) or digital signal level-1 (DS1) facilities are not initialized.

Format 8 is used to initialize current or all performance monitoring counts on a specified DNU-S STE facility. The PM counts associated with any subtending VT1.5 or DS1 facilities are not initialized.

Format 9 is used to initialize current or all performance monitoring counts on either all VT1.5s or all DS1s terminated on a DNU-S synchronous transport signal-1 (STS-1) facility. With the VT1 option, the PM counts can be initialized on all 28 VT1.5 facilities carried on an STS-1 facility. With the VT1 option, the PM counts associated with each subtending DS1 facility are not initialized. With the DS1 option, the PM counts can be initialized on all 28 DS1 facilities carried on an STS-1 facility.

Format 10 is used to initialize performance monitoring counts on a DNU-S VT1.5 facility. The PM counts associated with the subtending DS1 facility are not initialized.

Format 11 is used to initialize performance monitoring counts on a DNU-S DS1 facility.

2. FORMAT

[1] INIT:FAC,DFAC=a-b-c-d;

[2] INIT:FAC,DFI=a-b-c;

[3] INIT:FAC,DLTU=a-b;

[4] INIT:FAC,IDCU=a-e[, (ALL|CURR)][, {NE|BOTH}];

[5] INIT:FAC,IFAC=a-e-f[, (ALL|CURR)][, {NE|FE|BOTH}];
3. EXPLANATION OF MESSAGE

ALL = Initialize all 15-minute and day PM counts, including current, previous and history counts.

BOTH = Initialize counts at both ends of the facility. If the requested facility has only NE and the BOTH option used, then the request is processed for the NE.

CURR = Initialize all current 15-minute interval and current day PM counts (default).

FE = Initialize counts at the far end of facility only.

NE = Initialize PM counts at the switch end of facility only.

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = IFAC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = TR303 RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = STE facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

1  = VT1.5 facility group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m  = VT1.5 facility member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The input contained an illegal specification.

PF  = Printout follows. The request has been accepted and is followed by the INIT:FAC output message.

RL  = Retry later. The request has been denied, probably due to system load.

8.1 [OFFICE PARAMETERS (MISCELLANEOUS)]
20.23 (IDCU FACILITY EQUIPMENT)
20.25 (DNU-S PERFORMANCE MONITORING THRESHOLD GROUP)
22.15 (PERFORMANCE MONITORING)
1. PURPOSE

Requests initialization of performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), an integrated digital carrier unit (IDCU), a digital networking unit - synchronous optical network (SONET) (DNU-S), or an optical interface unit (OIU). The affected facilities’ 15 MIN interval and DAY PM counts (history intervals and previous day counts also if all option is used) are marked corrupt as a result of this initialization.

Format 1 is used to initialize performance monitoring counts for a facility terminated on a DFI or a DFI-2.

Format 2 is used to initialize performance monitoring counts for all facilities terminated on a DFI-2.

Format 3 is used to initialize performance monitoring counts for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 4 is used to initialize performance monitoring counts for all facilities terminated on an IDCU.

Format 5 is used to initialize performance monitoring counts on the specified IDCU facility (IFAC).

Format 6 is used to initialize performance monitoring counts for all facilities terminated on an IDCU-supported or DNU-S supported TR303 remote terminal (RT).

Format 7 is used to initialize current or all performance monitoring counts for all SONET terminating equipment (STE) facilities on a DNU-S. The PM counts associated with any subtending virtual tributary 1.5 (VT1.5) or digital signal level-1 (DS1) facilities are not initialized.

Format 8 is used to initialize current or all performance monitoring counts on a specified DNU-S STE facility. The PM counts associated with any subtending VT1.5 or DS1 facilities are not initialized.

Format 9 is used to initialize current or all performance monitoring counts on either all VT1.5s or all DS1s terminated on a DNU-S synchronous transport signal - level 1 (STS-1) facility. With the VT1 option, the PM counts can be initialized on all 28 VT1.5 facilities carried on an STS-1 facility. With the VT1 option, the PM counts associated with each subtending DS1 facility are not initialized. With the DS1 option, the PM counts can be initialized on all 28 DS1 facilities carried on an STS-1 facility.

Format 10 is used to initialize performance monitoring counts on a DNU-S VT1.5 facility. The PM counts associated with the subtending DS1 facility are not initialized.

Format 11 is used to initialize performance monitoring counts on a DNU-S DS1 facility.

Format 12 is used to initialize performance monitoring counts on an OIU facility. If subt option is used, PM counts associated with all subtending facilities under this OIU will also be initialized.

Format 13 is used to initialize performance monitoring counts on a optical carrier - level 3 (OC3 or OC3C) facility under OIU. If subt option is used, PM counts associated with all subtending facilities under this OC3 will also be initialized.

Format 14 is used to initialize performance monitoring counts on a optical carrier - level 4 (STS1 or STS3C) facility under OIU. If subt option is used, PM counts associated with all subtending facilities under this facility will also be initialized.
Format 15 is used to initialize performance monitoring counts on a VT1.5 facility under OIU. If subl option is used, PM counts associated with all subtending facilities under this VT1.5 will also be initialized.

Format 16 is used to initialize performance monitoring counts on a DS1 facility under OIU.

Format 17 is used to initialize performance monitoring counts on all protocol layers associated with an OIU PPP link (PPPLK).

8.1  OFFICE PARAMETERS (MISCELLANEOUS)
20.23  IDCU FACILITY EQUIPMENT
20.25  DNU-S PERFORMANCE MONITORING THRESHOLD GROUP
22.15  PERFORMANCE MONITORING
1. PURPOSE

Requests initialization of performance monitoring (PM) data for facilities terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), an integrated digital carrier unit (IDCU), a digital networking unit - synchronous optical network (SONET) (DNU-S), or an optical interface unit (OIU). The affected facilities’ 15 MIN interval and DAY PM counts (history intervals and previous day counts also if all option is used) are marked corrupt as a result of this initialization.

This command can also be used to initializes performance monitoring (PM) data for a session initiation protocol (SIP) protocol handler (PH) (other PHs are not allowed). The affected 15 MIN interval and DAY PM counts are marked corrupt as a result of this initialization.

Format 1 is used to initialize performance monitoring counts for a facility terminated on a DFI or a DFI-2.

Format 2 is used to initialize performance monitoring counts for all facilities terminated on a DFI-2.

Format 3 is used to initialize performance monitoring counts for all facilities terminated on a digital line and trunk unit (DLTU) model 2 (DLTU2).

Format 4 is used to initialize performance monitoring counts for all facilities terminated on an IDCU.

Format 5 is used to initialize performance monitoring counts on the specified IDCU facility (IFAC).

Format 6 is used to initialize performance monitoring counts for all facilities terminated on an IDCU-supported or DNU-S supported TR303 remote terminal (RT).

Format 7 is used to initialize current or all performance monitoring counts for all SONET terminating equipment (STE) facilities on a DNU-S. The PM counts associated with any subtending virtual tributary 1.5 (VT1.5) or digital signal level-1 (DS1) facilities are not initialized.

Format 8 is used to initialize current or all performance monitoring counts on a specified DNU-S STE facility. The PM counts associated with any subtending VT1.5 or DS1 facilities are not initialized.

Format 9 is used to initialize current or all performance monitoring counts on either all VT1.5s or all DS1s terminated on a DNU-S synchronous transport signal - level 1 (STS-1) facility. With the VT1 option, the PM counts can be initialized on all 28 VT1.5 facilities carried on an STS-1 facility. With the VT1 option, the PM counts associated with each subtending DS1 facility are not initialized. With the DS1 option, the PM counts can be initialized on all 28 DS1 facilities carried on an STS-1 facility.

Format 10 is used to initialize performance monitoring counts on a DNU-S VT1.5 facility. The PM counts associated with the subtending DS1 facility are not initialized.

Format 11 is used to initialize performance monitoring counts on a DNU-S DS1 facility.

Format 12 is used to initialize performance monitoring counts on an OIU facility. If subt option is used, PM counts associated with all subtending facilities under this OIU will also be initialized.

Format 13 is used to initialize performance monitoring counts on a optical carrier - level 3 (OC3 or OC3C) facility under OIU. If subt option is used, PM counts associated with all subtending facilities under this OC3 will also be initialized.
Format 14 is used to initialize performance monitoring counts on a optical carrier - level 4 (STS1 or STS3C) facility under OIU. If subt option is used, PM counts associated with all subtending facilities under this facility will also be initialized.

Format 15 is used to initialize performance monitoring counts on a VT1.5 facility under OIU. If subt option is used, PM counts associated with all subtending facilities under this VT1.5 will also be initialized.

Format 16 is used to initialize performance monitoring counts on a DS1 facility under OIU.

Format 17 is used to initialize performance monitoring counts on all protocol layers associated with an OIU PPP link (PPPLK).

Format 18 is used to initialize performance monitoring counts on the extended access interface unit (EAIU) timeslot group (TSGRP).

Format 19 is used to initialize performance monitoring counts on all protocol layers associated with an SIP PH (other PHs are not allowed).

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests forced removal from service and restart of the specified node, regardless of the state of the link and other nodes. Restart consists of initializing the software in the node without pumping it from the administrative module (AM). A successful restart returns the node to service.

An attempt is made to remove the node from service and restart it, provided that the node is not the ring peripheral controller (RPC), the node major state is active (ACT), the node is in the active ring segment, the interprocess message switch (IMS) subsystem is not initializing at a level higher than 1A, and the software in the node is designed to be restartable. The removal changes the major state to out-of-service (OOS). The restart changes the major state to initialization (INIT) only if the node has an attached processor. If successful, the restart changes the major state to ACT. If the restart fails, the major state is changed to OOS and the user becomes responsible for restoring the node to service. This input message does not use the maintenance input request administrator (MIRA) queue, so the OP:DMQ and STOP:DMQ input messages do not apply to it and it may be executed ahead of previously entered input messages in the MIRA queue.

WARNING: This input message can cause signaling point isolation; isolating the office and interrupting common channel signaling (CCS) message processing, by removing the last link node (LN) of a set.

2. FORMAT

INIT:LN a=b;

3. EXPLANATION OF MESSAGE

a = A ring node (RN) group number with explicit leading zero for group numbers less than 10. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The node’s position in the RN group. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Formats all or specific disk tracks of the disk pack with initialized sectors.

Note: New disk packs have no sectors and must be formatted before being used.

For SMD MHDs, disk tracks are formatted a section at a time under the control of the format input message. 

For SCSI MHDs, the entire disk is formatted by the SCSI drive's embedded controller.

It may take up to 30 minutes to format a complete disk pack.

WARNING: Any existing data on the targeted disk tracks will be destroyed.

2. FORMAT

INIT:MHD=a[:VFY][,TRACK b[&c]|,NEW];

3. EXPLANATION OF MESSAGE

Note: Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual for information on ranges for the following variables.

NEW = For SMD MHD, build defect management maps using the manufacturer's defect table. The result is a new working (COMBINED) defect map.

The NEW option must be used if a new disk pack is being formatted and defect management is supported for the drive size.

For SCSI MHDs, this option is not valid since the PRIMARY manufacturer's defect table cannot be altered. New defects can only be added to the GROWING defect table.

VFY = This option will invoke the verify procedure.

For SMD MHDs, the verify procedure is performed immediately after each section of the disk is formatted.

For SCSI MHDs, the entire disk is formatted, then the verify procedure is performed.

Note: A VFY MHD output message will not result if this option is selected.

a = Member number.

b = For SMD MHDs, specifies the track number to be formatted (and verified). The track number may be a single track number or the first track number in the range. Track numbers are given in decimal
For SCSI MHDs, this option is not valid because specific tracks cannot be formatted.

c = For SMD MHDs, specifies the last track number of a range to be formatted (and verified).

For SCSI MHDs, this option is not valid because specific tracks cannot be formatted.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the INIT:MHD output message.

123 (DISK FILE SYSTEM ACCESS)
123 (DISK FILE SYSTEM ACCESS)
INIT:REG

**Software Release:** 5E14 and later  
**Command Group:** SM  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests that the contents of the error registers of the specified hardware unit be initialized. This is used only for T1 error registers on digital facility interfaces (DFIs).

Format 1 is used to initialize the registers on a DFI, a remote digital facility interface (RDFI), or a host digital facility interface (HDFI). Format 2 is used only with a **SLC®** digital facility interface (SDFI). Format 3 is used only with a remote integrated services line unit (RISLU) digital facility interface (DFIH).

2. **FORMAT**

   [1] INIT:REG,(DFI|RDFI|HDFI)=a-b-c;  
   [2] INIT:REG,SDFI=a-d-e;  
   [3] INIT:REG,DFIH=a-f-g;

3. **EXPLANATION OF MESSAGE**

   a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   b = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   c = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   d = Digital carrier line unit (DCLU) number (for SDFI only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   e = SDFI number (for SDFI only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   f = RISLU DLTU number (for RISLU only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

   g = DFIH number (for RISLU only). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. **SYSTEM RESPONSE**

   NG = No good. The request was not accepted because:

   - An illegal SM number was specified.
   - An illegal DLTU number was specified.
   - An illegal DCLU number was specified.
   - An illegal DFI number was specified.
PF = Printout follows. Followed by the INIT:REG output message.
RL = Retry later. Communication lost to the specified SM.

Software Release: 5E15 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Request reset of signaling converter unit equipped on facility terminated on a digital facility interface (DFI), DFI model 2 (DFI-2), or a digital networking unit - synchronous optical network (SONET) (DNU-S) (VT1.5 facility or DS1 facility) to perform its initialization.

2. FORMAT

INIT:SC,a;

3. EXPLANATION OF MESSAGE

a = Unit. Valid value(s):
   FAC=b-c-d-e
   VT1FAC=b-f-g-h-i-j-k
   DS1SFAC=b-f-g-h-i-j-k

b = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = STE facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = STS facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = VT1.5 facility group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = VT1.5 facility member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
4. SYSTEM RESPONSE

NG = No good. The input contained an illegal specification.
PF = Printout follows. Followed by the INIT:SC output message.
RL = Retry later. The request has been denied, probably due to system load.

INIT:SCCP

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests an initialization of named table(s) in the selected common channel signaling (CCS) global switching module (GSM). If the option LEVEL is not given, then all SCCP tables will be initialized.

WARNING: All initializations will affect SCCP functionality to some degree. Some may be service affecting.

2. FORMAT

INIT:SCCP,SM=a[,LEVEL=b];

3. EXPLANATION OF MESSAGE

a = CCS GSM number.

b = The level of initialization. Valid value(s):

GTTFIXED = Global title translation (GTT) fixed digit table.
GTTINFO = GTT information table.
GTTINIT = All GTT tables (GTTINFO, GTTFIXED, GTTTBL, and GTTTTRAN).
GTTBL = GTT table.
GTTTRAN = GTT area table.
GTTTT = GTT type table.
SCMGINIT = All SCCP NM tables (static and dynamic).
SCMGSTAT = SCCP NM static table.

4. SYSTEM RESPONSE

PF = Printout follows. An INIT:SCCP output message follows in response to the request.

NG = No good. Valid supplemental reasons are:

SCCP NOT LOADED ON SM = The specified SM is unequipped or does not have an SCCP platform provisioned.
SCCP NOT OPERATIONAL ON SM = SCCP is in the process of being provisioned on the specified SM (growth state).

RL = Retry later. The only valid reason is:

SM NOT AVAILABLE = Command can not be processed because the specified SM is not accessible.
5. REFERENCES

Output Message(s):

INIT:SCCP
INIT:SM-A

Software Release: 5E14 - 5E16(1)
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests initialization of the selected switching modules (SMs) at the specified level. The initialization level may be a selective initialization (SI), a full initialization (FI), or a power-up (PWRUP) initialization as specified. In addition, a full pump of the SM may be specified for a full or selective initialization. Three types of pumps are possible: The normal (fast) pump, broadcast pump which pumps text images of like SMs simultaneously to reduce total pump time, and a backup pump which does not use special hardware but performs much slower.

If a single SM initialization is requested, that SM will be initialized immediately. If a range of SMs have an initialization requested, the in-service SMs will be initialized in numerical order, by SM type. All host SMs (HSMs) initialize first (numerically), all non-remote SMs (RSMs) [local SMs (LSMs), optically remoted SM (ORMs), distinctive remote SMs (DRMs) and two-mile ORM (TRMs)] are initialized next (numerically, regardless to SM type), and RSMs are initialized last (numerically). SMs in special growth will be initialized after all in-service SMs, and are initialized in numerical order. For broadcast pump and power-up initialization, RSMs are initialized in numerical order after all other SMs, which are initialized immediately. In addition to SM types, the user can also specify configuration types. For example, if HSM and LOADED are specified, then only an SM that is both HSM type and LOADED configuration will be initialized. Further, if HSM, LSM, BASIC, and LOADED are specified, then any SM that is either HSM or LSM type, and is either BASIC or LOADED configuration will be initialized. Multiple ranges of SMs (up to 10) can also be specified. For example, 3&6-9-12-16&25 means that SMs 3 to 6, 9, 12, and 16 to 25 will be initialized provided they match the necessary criteria. If an SM cannot be successfully initialized, (such as, loss of communication), the initialization sequence will pause until the problem is cleared, or the initialization request is cancelled (Format 4). Manual SM initialization requests will attempt to clear any isolation conditions prior to the initialization. Pending initialization requests may be canceled by selecting the NOINIT level as shown below.

WARNING: All service in this unit will be lost for the duration of the initialization. A request for a pump may cause a loss of calls during the pump.

2. FORMAT

[1] INIT:SM=a[&b][-]...,FI[,BCST|,PUMP|,NPUMP|,BPUMP][,LSM][,HSM][,RSM][,ORM][,TRM][,DRM][,c][,d][,e][,f][,g];

[2] INIT:SM=a[&b][-]...,SI[,PUMP|,NPUMP|,BPUMP][,LSM][,HSM][,RSM][,ORM][,TRM][,DRM][,c][,d][,e][,f][,g];

[3] INIT:SM=a[&b][-]...,PWRUP[,LSM][,HSM][,RSM][,ORM][,TRM][,DRM][,c][,d][,e][,f][,g];

[4] INIT:SM=a[&b][-]...,NOINIT[,LSM][,HSM][,RSM][,ORM][,TRM][,DRM][,c][,d][,e][,f][,g];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.
BCST = Perform a full SM pump with the initialization. A broadcast pump will be used. If this fails, no attempt is made to revert to any other type of pump. This is the recommended option to request a full pump of multiple SMs.

BPUMP = Perform a full SM pump using the backup pump function. This pump uses the control time slots (no special hardware) and may succeed when a normal pump fails; however, it is at least 16 times slower than the normal pump. This option should be used for a pump peripheral controller (PPC) duplex failure in the communication module (CM) or failure of the bootstrapper (BTSR) hardware in the SM.

FI = Full initialization. Clear all calls.

NOINIT = No initialization. Cancel a previous initialization request.

NPUMP = Perform a full SM pump using the normal pump function. Only NPUMP will be used. No attempt will be made to switch to BPUMP if any errors are encountered.

PUMP = Perform a full SM pump with the initialization. A normal pump (NPUMP) will be used unless a failure occurs, in which case a backup pump (BPUMP) will be selected automatically. This is the recommended option to request a full pump of a single SM.

PWRUP = Power-up initialization. This is the same as the FI option plus clearing all of processor memory. It simulates a power-up of the SM. As in an actual power-up, RSMs will request a full SM pump (PUMP), and non-RSMs will request a broadcast pump (BCST).

SI = Selective initialization. Clear all transient calls; save stable calls.

a = SM number, or a lower limit of a range of SM numbers.

b = Upper limit of a range of SM numbers.

c = SM basic configuration. Valid value(s):
   BASIC
   CNFG000

d = SM standard configuration. Valid value(s):
   CNFG001
   STANDARD

e = SM loaded configuration. Valid value(s):
   CNFG002
   LOADED

f = SM signaling configuration. Valid value(s):
   CNFG003
   SIGNALING

g = SM-2000 configuration. Valid value(s):
   CNFG2K00
   SM2000
4. SYSTEM RESPONSE

**IP**
- In progress. The message was accepted and the request is in progress.

**NG**
- No good. Valid value(s):
  - GENERIC UTILITIES ACTIVITY PROHIBIT ACTION = Generic utilities breakpoints in the SM must be cleared before the request can be accepted.
  - ILLEGAL LEVEL/PUMP COMBINATION = Illegal pump option was specified.
  - INTERNAL ERROR = Request could not be handled due to system software problems.
  - INVALID SM RANGE/TYPE COMBINATION = Request did not include an SM of the specified type.
  - NO INIT LEVEL SPECIFIED
  - ODD GROWTH IN PROGRESS = Office-dependent data (ODD) growth activity must be completed before request can be accepted.

**OK**
- Good. The message was accepted and the action completed (NOINIT only).

3. EXPLANATION OF MESSAGE

**NOTE:** Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

**BCST**

= Perform a full SM pump with the initialization. A broadcast pump will be used. If this fails, no attempt is made to revert to any other type of pump. This is the recommended option to request a full pump of multiple SMs.

**BPUMP**

= Perform a full SM pump using the backup pump function. This pump uses the control time slots (no special hardware) and may succeed when a normal pump fails; however, it is at least 16 times slower than the normal pump. This option should be used for a pump peripheral controller (PPC) duplex failure in the communication module (CM) or failure of the bootstrapper (BTSR) hardware in the SM.

**FI**

= Full initialization. Clear all calls.

**NOINIT**

= No initialization. Cancel a previous initialization request.

**NPUMP**

= Perform a full SM pump using the normal pump function. Only NPUMP will be used. No attempt will be made to switch to BPUMP if any errors are encountered.

**PUMP**

= Perform a full SM pump with the initialization. A normal pump (NPUMP) will be used unless a failure occurs, in which case a backup pump (BPUMP) will be selected automatically. This is the recommended option to request a full pump of a single SM.

**PWRUP**

= Power-up initialization. This is the same as the FI option plus clearing all of processor memory. It simulates a power-up of the SM. As in an actual power-up, RSMs will request a full SM pump (PUMP), and non-RSMs will request a broadcast pump (BCST).

**SI**

= Selective initialization. Clear all transient calls; save stable calls.

**a**

= SM number, or a lower limit of a range of SM numbers.

**b**

= Upper limit of a range of SM numbers.

**c**

= SM basic configuration. Valid value(s):

- **BASIC**
- **CNFG000**

**d**

= SM standard configuration. Valid value(s):

- **CNFG001**
- **STANDARD**
e  = SM loaded configuration. Valid value(s):
    CNFG002
    LOADED

f  = SM signaling configuration. Valid value(s):
    CNFG003
    SIGNALING

g  = SM-2000 configuration. Valid value(s):
    CNFG2K00
    SM2000

h  = PowerPC® SM-2000 configuration. Valid value(s):
    CNFG2KPPC
    SM2KPPC

4. SYSTEM RESPONSE

   IP   = In progress. The message was accepted and the request is in progress.

   NG   = No good. May also include:
          - GENERIC UTILITIES ACTIVITY PROHIBIT ACTION = Generic utilities breakpoints in the
            SM must be cleared before the request can be accepted.
          - ILLEGAL LEVEL/PUMP COMBINATION = Illegal pump option was specified.
          - INTERNAL ERROR = Request could not be handled due to system software problems.
          - INVALID SM RANGE/TYPÉ COMBINATION = Request did not include an SM of the specified
            type.
          - NO INIT LEVEL SPECIFIED
          - ODD GROWTH IN PROGRESS = Office-dependent data (ODD) growth activity must be completed
            before request can be accepted.

   OK   = Good. The message was accepted and the action completed (NOINIT only).

Software Release: 5E14 and later
Command Group: SYSRCVY
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a single process purge (SPP) of a named process in a selected switching module (SM). The named process ID (PID) may be either a system process or terminal process. Refer to the APP:PID-SM appendix for a list of the switching module system process PIDs.

WARNING: This message will purge the requested process. Any activity associated with this process currently in progress will be killed. This may result in other asserts or audits as the system cleans up.

2. FORMAT

INIT:SM=a,SPP,PID=b[-c];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number.
b = Process number to be purged. The process may be either a system process or a terminal process. If the PID refers to a terminal process, a uniqueness number must be included.
c = Uniqueness number of the specified terminal process PID (used only for a terminal process).

4. SYSTEM RESPONSE

IP = In progress. The message was accepted and the request is in progress.
NG = No good. The message was not accepted because:
- INVALID PID = An illegal value was specified for PID.
- PID NOT ACTIVE = The specified PID is no longer associated with an active process.
- SM 'a' is not equipped = The SM specified ('a') does not exist.

INIT:UC

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that the administration module generic access package (GRASP) be informed that a working utility circuit has been installed so that GRASP will again accept trace and hardware breakpoint definitions, reset the utility circuit if an error occurred, or end the GRASP session.

2. FORMAT

INIT:UC[,END][,UCL];

3. EXPLANATION OF MESSAGE

END = End the GRASP session and cause GRASP to die if no traces or breakpoints are set. Using END with UCL will cause GRASP to die even if traces or breakpoints are set.

UCL = Perform the initialization unconditionally, even if no error has been detected.

4. SYSTEM RESPONSE

Refer to the APP:SYS-RESPONSE appendix for an explanation of general system responses.

NG = No good. Valid value(s):
- STATE ERROR = The circuit is already initialized, or a trace or breakpoint is defined when trying to end GRASP.
- UC IS FUNCTIONAL = No failure has been detected.
- UC WOULD NOT INITIALIZE = The circuit still would not respond. Hardware breakpoint and trace definitions will continue to be rejected.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

?A = Action field or command code contains an error. Valid value(s):
- INVALID KEYWORD = Not a valid action in a WHEN action list.

5. REFERENCES

Input Message(s):

INIT:UMEM

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Specifies the definition of an administrative module (AM) generic access package (GRASP) trace to be set up. The trace enters the NEW state with the successful completion of the input message.

The AM must be equipped with a UN615 utility circuit pack in at least the active control unit (CU) to use this feature. The UN615 installs in slot 60-118. The equipment configuration database (ECD) entry for the UN615 should also be updated when the pack is installed. The form is "ucb". The key is "CU", "0" or "1" (depending on which CU), "UC", "0". Field 21 ("major_status") should be "OOS" and field 27 ("mv") should be "0x2".

2. FORMAT

INIT:UMEM[(,UID=a|PID=b)],[,ADDR={c&&d|c[,L=e|NL=f]}[,STORE=g][,STKADD=h[,STKSZ=i]][,STOP=FULL][[,COND=j][,j][,j]][:WORD];

3. EXPLANATION OF MESSAGE

FULL = The transfer trace will stop collecting data and will enter the STOPPED state when the memory is filled with data. Without this option, the trace will continue to collect data, overwriting the oldest data, until stopped by an INH:UMEM input message.

WORD = Interpact all addresses and lengths in terms of words. If this option is omitted, they are assumed to be byte values.

a = Utility ID number of the target process.

b = Process ID number of the target process.

c = Starting byte address of the range to which tracing will be restricted. The ADDR keyword cannot be used when STORE=FUNCTION. Ending byte address of the range if NL option is used.

If STORE=FUNCTION or STORE=DATAFUNC is specified with an address range then the form of the range is restricted. The restriction is that the left most hex digits of the starting and ending addresses must be equal. All of the other hex digits in the starting address must be "0"s and all of the other hex digits in the ending address must be "F"s. Examples of valid ranges: 0x123000 - 0x123FFF, 0x10000 - 0x1FFFF.

d = Ending byte address of the range to which tracing will be restricted. When specifying UID, TRANSFER, DATA, or TRANDATA traces, the address range can be arbitrary. When specifying FUNCTION, FUNCPAR, or DATAFUNC traces, however, the starting and ending addresses must be of a form where the leftmost hex digits of both are equal, and the rightmost digits of the starting address are all "0" and the rightmost digits of the ending address are "F". For example, 0x123000 - 0x123FFF or 0x10000 - 0x1FFFF.

e = Length of the range of addresses to which tracing will be restricted. The default is four bytes unless a range is explicitly stated.
**f**  = Length of the range of addresses to which tracing will be restricted where the starting address is calculated as ADDR -f + 1.

**g**  = Information to be stored. Valid value(s):
- **DATA** = Data accesses for the specified address or range of addresses will be stored.
- **DATAFUNC** = Both information for data history traces over a specified address range and function calls with parameters passed are stored. As with **FUNCPAR**, a stack start address and a stack size may be specified.
- **FUNCPAR** = Function calls and parameters passed for the function will be stored. A stack start address and a stack size may also be specified with this trace type. The ADDR keyword cannot be used when **STORE=FUNCPAR**.
- **FUNCTION** = Both function call and return instructions will be stored with the address of the instruction and the address branched to.
- **TRANDATA** = Information for both data history trace and transfer trace will be stored.
- **TRANSFER** = Both changes in utility IDs and branches will be stored. This is the default if the **STORE** option is not specified.
- **UID** = Store only changes in utility IDs will be stored. This gives a longer history but less detail.

**h**  = The stack start address for the process being traced. This is an optional input that can only be specified if **STORE=FUNCPAR** or **STORE=DATAFUNC**. The default **STKADD** is H'6A0000.

Be aware that each sub-process within the processes of OKP, SMKP and RCKP has its own private stack.

**i**  = The size of the user stack specified with the stack start address. The default **STKSIZ** is H'10000. If a stack address and stack size are specified, they must specify an address range as described in the previous section. For example, the default stack address is 0x6A0000 and stack size is 0x1000. This specifies an address range of 0x6A0000 through 0x6A0FFF. A function with parameters trace uses two triggers.

**j**  = Match condition to inhibit a running trace. GRASP cannot trace across an initialization, nor control the dual access utility circuit in an off-line control unit (CU). Valid value(s):
- **E**  = To match on external input using the AM backplane.
- **M**  = To match on a maintenance reset function (MRF).
- **S**  = To match on a stop-and-switch.

### 4. SYSTEM RESPONSE

**NG**  = No good. Valid value(s):
- **STATE ERROR** = A trace is already defined.
- **UC ERR** = The utility circuit is unavailable.

**PF**  = Printout follows. Followed by the **INIT:UMEM** output message.

**RL**  = Retry later or wait for previous **OP:UMEM** to complete. The system is in an overload condition.

INH: UMEM
INIT: UMEM
OP: UTIL
36. LNUPD
LNUPD:LN

Software Release: 5E14 and later
Command Group: CCS
Application: CNI
Type: Input

1. PURPOSE

Initiates the updating of the software of all SS7 nodes or a single SS7 node.

2. FORMAT

LNUPD:LN={a-b | ALL}:[DEST=c];

3. EXPLANATION OF MESSAGE

a = The group number of the link node. The valid range is 00 to 63.
b = The member number of the link node. The valid range is 1 to 15.
c = The specified destination output class. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Followed by the LNUPD LN or the REPT LNUPD LN output messages.
RL = Request cannot be executed now due to unavailable system resources.
?D = Data Field contains an error.

This input message results in the updating of the software of a single or all SS7 nodes(s).

5. REFERENCES

Input Appendix(es):

APP : RANGES
37. LOAD
LOAD:ADDR

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Requests that a virtual address be loaded with specified data as an action associated with a breakpoint.

2. FORMAT

LOAD:ADDR=a[,OFF=b][,L=c][:WORD]:DATA,D=d;

3. EXPLANATION OF MESSAGE

WORD = Indication that addresses and lengths are to be interpreted in terms of words. If this option is omitted, addresses and lengths are assumed to be byte values.

a = The starting virtual address for the data in octal, hexadecimal, or decimal notation. Assumed to be a byte address unless the WORD option is used.

The address must be in a segment which is not write-protected. Note that text segments are usually write-protected.

b = Single offset or list of up to five offsets. Omission of the keywords implies no indirect addressing. Offsets are bytes unless the WORD option is used.

c = The length of the load, assumed to be bytes unless the WORD option is used. The default for an omitted or zero length is 1. The specified length must agree with the data as explained below.

d = One or more numbers representing data to be loaded. If more than one number is given, all but the last are assumed to represent four bytes of data. The last or only number is taken to represent the number of bytes of data (up to four) needed to make the data list correspond to the length ‘c’.

4. SYSTEM RESPONSE

IP = In progress. The message has been added to the WHEN action list.

RL = Retry later. The system is in an overload condition.

?I = Syntax error. Valid value(s):
- INCONSISTENT DATA (L + D) = Length and amount of data specified do not agree.
- MISSING KEYWORD = Utility identification (UID) or process identification (PID) is required except in a WHEN action list.
- RANGE ERROR (L) = Length too long.

5. REFERENCES

Input Message(s):
Output Message(s):

LOAD: ADDR
LOAD: PMEM
LOAD: REG
LOAD: UVAR
LOAD:DFC-PUMP

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Download the pumpcode to the small computer system interface (SCSI) disk file controller (DFC). The control of SCSI host adaptor (HA) DFC will be transferred from firmware to pumpcode after the pumpcode is successfully downloaded. The input message can also be used to request the administrative module (AM) disk driver to automatically perform the whole pump procedure.

2. FORMAT

[1] LOAD:DFC a;PUMP [:FN "b" [,CHECKSUM]]!

3. EXPLANATION OF MESSAGE

CHECKSUM = When this option is used, the integrity of the pumpcode contained in the specified file will be verified; no pumpcode downloading will occur.

FU
This option is normally used in a software update messages file. It says that if the DFC does not exist or if the DFC is not a UN373 or if the DFC is not active, this will successfully complete without doing anything to the DFC. This is done to minimize human intervention while making a change to a DFC pumpfile.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Full pathname that specifies the file containing pumpcode to be downloaded into SCSI HA DFC or to be checked for the integrity of its data. The specified file name will be ignored when the downloading is to be done automatically by the AM disk driver since the driver will use the information stored in the DFC’s unit control block (UCB) record to build the pumpcode file name. The file specified in the UCB record must exist in the directory /dfc, and the file name derived from the UCB record has the format xyz, where x is the 4-alphanumeric characters packcode value (that is, u214) stored in the packcode field of the UCB, y is the 2-digit value stored in the issue field of the UCB, and y is the 2-digit value stored in the version field of the specified DFC’s UCB. An example of a typical pumpcode file name is u21471; the pumpcode version implied by this filename is 7, the pumpcode issue is 1, and the packcode number is u214.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the LOAD:DFC-RAM output message.

LOAD:DFC-RAM

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Load a specified pumpcode file into the SCSI disk file controller's (DFC's) random access memory (RAM) area. The message can also be used to verify the integrity of a pump file.

2. FORMAT

LOAD:DFC=a:RAM:FN="b",CHECKSUM;

3. EXPLANATION OF MESSAGE

CHECKSUM = When this option is used the integrity of the pumpcode contained in the specified file will be verified; no downloading will occur.

a = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Full pathname that specifies the file containing pumpcode to be downloaded into SCSI DFC's RAM.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the LOAD:DFC output message.

5. REFERENCES

Output Message(s):
LOAD:DFC-RAM

Input Appendix(es):
APP: RANGES

MCC Display Page(s):
(DISK FILE SYSTEM ACCESS)
LOAD:LIB

Software Release: 5E14 and later
Command Group: ADMIN
Application: 5
Type: Input

1. PURPOSE

Requests that the existence of the specified library program be verified and loads the scratch memory area of the listed switching modules (SMs) with the library program. This input message will not complete if a program is running in an affected SM, or if the specified SM is currently loaded or running under another team’s control. In the administrative module (AM), it will not complete if the specified team has a program already running.

2. FORMAT

LOAD:LIB:TEAM=a[,AM]|{,SM=c|,SM=d&|e}],PROG=b;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = The team number to which this input message applies. This number is used so that more than one person may test at the same time, using different team numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The name of the library program desired. The program must exist on the disk in two or three forms. There must be a progname.info file which contains the generic compatibility, a progname.im if it is to be used in the SM, and a progname.cp if it is to be used in the AM.

c = A list of SM numbers to which this message should be directed. The team specified must have a library program running in the SM(s) listed. A range could be used instead, as indicated.

d = Lower limit of a range of SM numbers.

e = Upper limit of a range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. Either the team number or SM number(s) is illegal. SMs that have not initialized cannot be sent messages.

PF = Printout follows. Message has been sent to the SMs/AM or team specified.

5. REFERENCES

Output Message(s):

LOAD:LIB

Input Appendix(es):
LOAD:MHD-FIRMWARE
Software Release: 5E14 and later
Command Group: FHADM
Application: 3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that the executable microcode and/or control information be loaded into the control memory of a small computer system interface (SCSI) moving head disk (MHD). The downloaded code will be effective after successful completion of this message.

WARNING: This input message will format the MHD. All existing data on the disk drive will be destroyed.

2. FORMAT

LOAD:MHD=a:FIRMWARE,FN="b";

3. EXPLANATION OF MESSAGE

a = MHD member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Full pathname of the firmware data specification file.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the LOAD:MHD-FIRMWARE output message.

5. REFERENCES

Output Message(s):

LOAD:MHD-FIRMWARE

Input Appendix(es):

APP:RANGES
LOAD:MHD

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Loads new defect location data on to a moving head disk (MHD). The data is used to map around defective areas on the disk media.

For an SMD MHD, the defect specification file data replaces the "Manufacturer's" defect table (MFGR).

For an SCSI MHD, the defect specification file data is added to the "Combined" defect table (COMB).

Note: For SCSI disks, after new defect blocks are loaded, all the previous information about the bad blocks (defects) become invalid. For example, bad logical block number 3 is not physically the same block after being loaded. It is now a good block number 3. Therefore, only new defect(s) detected since the previous LOAD:MHD message should be included in the specification file used for loading new defects into the "Combined" defect table.

WARNING: Incorrect use of this message can degrade system performance and result in disk data mutilation. This message should not be used without expert technical assistance.

2. FORMAT

LOAD:MHD=a:DEFECT:DATA,FN="b";

3. EXPLANATION OF MESSAGE

a = MHD member number.

b = Full pathname of the defect specification file.

- For SMD disks, the file contains one line for each defect. The format of each line is as follows:

```
CYL     HEAD     SECTOR
___     ____     ______
|       |         |___ Sector Number (decimal)
|       |         |_____________ Head Number (decimal)
|_____________________ Cylinder Number (decimal)
```

The entries must be created in increasing cylinder number order, and in increasing head number order when on the same cylinder. The sector number is optional.

- For SCSI disks, the file contains one line for each disk block number to be reassigned. The entries must be created in increasing block order number. All the
specified block numbers will be re-assigned by the disk-drive's embedded controller.

- An empty (zero length) specification file results in an empty defect table being written to the disk.

4. SYSTEM RESPONSE

PE  = Printout follows. Followed by the LOAD:MHD-DEFECT output message.

5. REFERENCES

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Loads an administrative module (AM) physical byte address with specified data as an immediate operation or as a generic access package (GRASS) breakpoint action.

WARNING: This message overwrites data in the memory of the AM. It should not be used without expert technical assistance.

2. FORMAT

LOAD:PMEM=a[,L=b][:WORD]:DATA,D=c{!;} 

3. EXPLANATION OF MESSAGE

- **WORD** = Indication that addresses and lengths are to be interpreted in terms of words. If this option is omitted, addresses and lengths are assumed to be byte values.
- **a** = Starting physical byte address of the location in main memory where the load is to be done.
- **b** = The length of the load, assumed to be bytes unless the WORD option is used. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The length must be a multiple of 4 and must agree with the amount of data.
- **c** = One or more numbers representing data to be loaded. If more than one number is given, each is assumed to represent four bytes of data.

4. SYSTEM RESPONSE

- **IP** = In progress. The message has been added to the WHEN action list.
- **PF** = Printout follows. Followed by the LOAD:PMEM output message.
- **RL** = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.
- **?I** = Syntax error. Valid value(s):
  - **INCONSISTENT DATA (L + D)** Length and amount of data specified do not agree.
  - **RANGE ERROR (L)** Length too long.

Type: Input

1. PURPOSE

Loads an administrative module (AM) register with specified data as a breakpoint action.

2. FORMAT

LOAD:REG=a[,OFF=b][,L=c][:WORD]:DATA,D=d;

3. EXPLANATION OF MESSAGE

WORD = Indicates that lengths are to be interpreted in terms of words. If this option is omitted, lengths are assumed to be byte values.

a = The name of the register to be written. Valid value(s):
   AP = Argument pointer.
   ATBBGR = Register used by the ATB miss routine to temporarily store the bi-directional gating register (BGR).
   ATBPSW = Register used by the ATB miss routine to temporarily store the program status word (PSW) register.
   ATBQ = Register used by the ATB miss routine to temporarily store the 'q' register.
   ATBSAR = Register used by the address translation buffer (ATB) miss routine to temporarily store the store address register (SAR) contents.
   ATBSRCR = Register used by the ATB miss routine to temporarily store the store control register (SCR) contents.
   ATBSDR = Register used by the ATB miss routing to temporarily store the store data register (SDR) content.
   BGR = Bi-directional gating register.
   CAR = Channel address register.
   CDR = Channel data register.
   ERC = Error register (ER) clear.
   FP = Frame pointer.
   HG = Reserved register HG.
   HSR = Hardware status register.
   HSRBG = Bi-directional gating control bits of the hardware status register (HSR).
   IM = Interrupt mask register IM.
   ISC = IS (interrupt source) register clear.
   ISS = Interrupt source (IS) register set.
   PA = Program address register.
   PPR = Pulse point register.
   PSW = Program status word.
   R0 = General register R0.
   R1 = General register R1.
   R2 = General register R2.
   R3 = General register R3.
   R4 = General register R4.
   R5 = General register R5.
R7 = General register R7.
R8 = General register R8.
R9 = General register R9.
R10 = General register R10.
R11 = General register R11.
RNULL = Null register.
RTC = Real time clock.
SBR0 = Segment base register SBR0.
SBR1 = Segment base register SBR1.
SBR2 = Segment base register SBR2.
SBR3 = Segment base register SBR3.
SBR4 = Segment base register SBR4.
SBR5 = Segment base register SBR5.
SBR6 = Segment base register SBR6.
SBR7 = Segment base register SBR7.
SCRATCH0 = JE group temp subgroup scratch register SCRATCH0.
SCRATCH1 = JE group temp subgroup scratch register SCRATCH1.
SDR = Store data register.
SP = Stack pointer.
SSRC = System status register (SSR) clear.
SSRS = SSR set.
SYSBASE = Beginning address of UNIX® RTR Operating System tab.
T0 = JE group temp subgroup scratch register T0.
T1 = JE group temp subgroup scratch register T1.
T2 = JE group temp subgroup scratch register T2.
T3 = JE group temp subgroup scratch register T3.
T4 = JE group temp subgroup scratch register T4.
T5 = JE group temp subgroup scratch register T5.
T6 = JE group temp subgroup scratch register T6.
T7 = JE group temp subgroup scratch register T7.
TIMERS = Timing circuit.
TOPIS = Interrupt stack pointer.
UINT0 = Error microinterrupt hander register UINT0.
UINT1 = Error microinterrupt hander register UINT1.
UINT2 = Error microinterrupt hander register UINT2.
UINT3 = Error microinterrupt hander register UINT3.
UINTER = Shadow error register (uint_er) loaded during an error microinterrupt.

b = Single offset or a list of up to five offsets. Omission of the keywords implies no indirect addressing. Offsets are bytes unless the WORD option is used.

c = The length of the load, assumed to be bytes unless the WORD option is used. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The default for an omitted or zero length is 4. The specified length must agree with the data as explained below.

d = The data to be loaded. It is taken to represent the number of bytes of data (up to 4) needed to make the data list correspond to the length 'c'.

4. SYSTEM RESPONSE
IP  = In progress. The message has been added to the WHEN action list.

NG  = No good. Valid value(s):
     - BAD REG NAME

PF  = Printout follows. Followed by the LOAD:REG output message.

RL  = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

?I  = Syntax error. Valid value(s):
     - INCONSISTENT DATA (L + D) = Length and amount of data specified do not agree.
     - RANGE ERROR (L) = Length too long.

LOAD:RUTIL

Software Release: 5E12 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests a load of the contents of the specified address at the given common network interface (CNI) ring node with the given data.

Currently the maximum data size allowed for loading is 128 bytes or 32 four-byte words. There must be a one-to-one correspondence between the length of the data to be written and the data provided in 'e'. If there are three bytes of data to be written, there must be three data entries. Similarly if there are five words to be written, there must be five data entries specified.

WARNING: Incorrect use of this input message may interrupt operation of a node on the ring or the whole ring.

2. FORMAT

LOAD:RUTIL=a-b,AP:ADDR=c,{L|NL}=d[:WORD]:D=e-...;

3. EXPLANATION OF MESSAGE

WORD = Length of the load in bytes; if WORD is specified, then 'd' is the number of four-byte words to load.

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Start address of the load in hexadecimal.

d = Length of the load in bytes; if WORD is specified, then 'd' is the number of four-byte words to load. If L is given, then 'c' is taken to be the beginning address to dump. If NL is given, then 'c' is the end address of the dump; the start address is calculated by end address minus total number of bytes to dump.

e = One or more data items to be loaded in hexadecimal; a dash separated list may be specified.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the LOAD:RUTIL output message.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value(s) be loaded into the memory of the specified communication module processor (CMP).

This message may be used together with any of the other CMP generic utility input messages. Refer to the References section of this message. If this message is used together with other generic utility messages, the END:UT-CMP input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

LOAD:UT:CMP=a,(MATE|PRIM),(ADDR=b|GVAR="c"|SYMIDX=d)[,L=e] [,SIZE=f] [,VAL=g[-g...]{!|;}

3. EXPLANATION OF MESSAGE

MATE            = Execute this input message on the standby CMP.  
PRIM            = Execute this input message on the active CMP.  
a               = CMP number.  
b               = Address to be loaded.  
c               = The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘d’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.  
d               = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.  
e               = Total length in bytes of all values to be loaded. Default is 1, maximum is 80. Length divided by size must be a whole number from 1-20.  
f               = Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.  
g               = Values to be loaded (maximum of 20 listed values).

4. SYSTEM RESPONSE

3. EXPLANATION OF MESSAGE
MATE = Execute this input message on the standby DNU-S. The default is the active DNU-S.

a = Switching module (SM) number.

b = DNU-S number.

c = Physical Address of the location to start the LOAD.

d = The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘e’ must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

e = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

f = Total length in bytes of all values to be loaded (1 - 8, default is 1). Length divided by size (variable 'g') must be a whole number.

h = Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.

4. SYSTEM RESPONSE
Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be loaded into the memory of the specified foundation peripheral controller (FPC).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

LOAD:UT;FPC=a, {ADDR=b | I0=c | GVAR="d" | SYMIDX=e }, L=f, SIZE=g, VAL=h[-h...-h];

3. EXPLANATION OF MESSAGE

a = FPC number.
b = Starting address to be loaded in memory.
c = The number of the I/O port to be loaded.
d = The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'e' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.
e = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
f = Total length in bytes of all values to be loaded. Default is 1, maximum is 80. Length divided by size must be a whole number from 1-20.
g = Size, in bytes, of each value to be loaded. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When loading I/O port, the size must be 1.
h = Values to be loaded (maximum of 20 listed values).

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

**Application**: 5  
**Type**: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU).

**WARNING**: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. **FORMAT**

```
LOAD:UT-IDCU=a-b[,MATE],{ADDR=c|GVAR="d"|SYMIDX=e}[,L=f][,SIZE=g][,VAL=h[-h]...[-h]];
```

3. **EXPLANATION OF MESSAGE**

- **MATE**
  - Execute this input message on the standby IDCU. The default is the active IDCU.

- **a**
  - Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

- **b**
  - IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

- **c**
  - Address to be loaded. The address range from h'30000332 to h'300003ff is the unified control interface (UCI) register area.

- **d**
  - The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'e' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

- **e**
  - Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

- **f**
  - Total length in bytes of all values to be loaded (default is 1). Length divided by size (variable 'g') must be a whole number.  
  **Note**: The dumping and loading of the UCI register area cannot overlap with the remainder of the IDCU address range (refer to variable 'c').

- **g**
  - Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.

- **h**
  - Values to be loaded (maximum of 8 listed values).
4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be loaded into the memory of the specified integrated digital carrier unit (IDCU) loop side interface (LSI).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

LOAD:UT-IDCULSI=a-b-c[,MATE],{ADDR=d|GVAR="e"|SYMIDX=f}{,i=g}[,SIZE=h],{VAL=i[-i]...[-i]}{!|;}

3. EXPLANATION OF MESSAGE

MATE

= Execute this input message on the standby LSI. The default is to use the active LSI.

a

= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

b

= IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

c

= LSI number. Refer to the APP:RANGES appendix in the Appendixes section of the Output Messages manual.

d

= Address to be loaded. The address range from 0x4400 to 0x44ff is the unified control interface (UCI) register area.

e

= The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘i’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

f

Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

g

= Total length in bytes of all values to be loaded (1 - 8, default is 1). Length divided by size (variable ‘h’) must be a whole number.

Note: The dumping and loading of the UCI register area cannot overlap with the remainder of the IDCU loop side interface (LSI) address range (refer to variable ‘d’).
\[ h = \text{Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.} \]

\[ i = \text{Values to be loaded (maximum of 8 listed values).} \]

### 4. SYSTEM RESPONSE

### 1. PURPOSE

Requests that a value(s) be loaded into the memory of the specified optical facility interface (OFI).

This message may be used together with any of the other OFI generic utility input messages. Refer to the input messages listed in the REFERENCES section.

**WARNING:** The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

### 2. FORMAT

LOAD:UT-OFI=a-b-c-d, {ADDR=e,GVAR="f", SYMIDX=g}, [L=h]. . .  
. . . [, SIZE=i] [, VAL=j[-j...]{!|;}

### 3. EXPLANATION OF MESSAGE

**a**  
= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**b**  
= Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**c**  
= Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

**d**  
= Side number.

**e**  
= Address to be loaded.

**f**  
= The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘g’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

**g**  
= Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

**h**  
= Total length (L) in bytes of all values to be loaded. Default is 1, maximum is 8. Length divided by size must be a whole number.

**i**  
= Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.

**j**  
= Values to be loaded (maximum of 8 listed values).
4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be loaded into the memory of the specified pump peripheral controller (PPC).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

LOAD:UT:PPC=a,{ADDR=b|I0=c|GVAR="d"|SYMIDX=e}[,L=f][,SIZE=g][,VAL=h[-h...-h]];

3. EXPLANATION OF MESSAGE

a = PPC number.
b = Starting address to be loaded.
c = The number of the input/output (I/O) port to be loaded.
d = The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number \( e \) must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.
e = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
f = Total length in bytes of all values to be loaded. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Length divided by size should be a whole number from 1-20.
g = Size (number of bytes) of each value to be loaded. Maximum is 4.
h = Values to be loaded (maximum of 20 listed values).

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Requests that a value(s) be loaded into the memory of the specified packet switch unit protocol handler (PSUPH).

Note: This input message is only supported on PSUPHs of the PH3/PH4 and later hardware types (that is, not PH2 hardware types).

This message may be used together with any of the other PSUPH generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other generic utility messages, the END:UT-PSUPH input message may be used to signal the end of the series of messages.

WARNING: The user takes responsibility for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

LOAD:UT:PSUPH=a-b-c-d,{ADDR=e|GVAR="f"|SYMIDX=g}[,,L=h]
[,SIZE=i][,VAL=\{-j\}][!|;]

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number (always 0).

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Address (ADDR) to be loaded.

f = The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'g' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this
processor by using the DUMP:UT-SYMID input message.

\[ h = \text{Total length (L) in bytes of all values to be loaded. Default is 1, maximum is 80. Length divided by size must be a whole number from 1-20.} \]

\[ i = \text{Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.} \]

\[ j = \text{Values to be loaded (maximum of 20 listed values).} \]

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value(s) be loaded into the memory of the specified switching module (SM).

This message may be used together with any of the other SM generic utility input messages (refer to the input messages listed in the REFERENCES section).

If this message is used together with other utility messages, the END:UT-SM input message may be used to signal the end of the series of messages.

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

During patch space recovery operation, UT will modify its normal behavior to force non-mate operations to write only the local memory even if both MCTSI's are in service. Therefore, in order to have operations happen on both sides, the user needs to run the command twice, first for the active side, then for the mate side.

2. FORMAT

LOAD:UT:SM=a[,MATE],{ADDR=b|GVAR="c"|SYMIDX=d}[,L=e][,SIZE=f]. . .
. . .[,VAL=g[-g]...[-g]}{!|;}

3. EXPLANATION OF MESSAGE

MATE = Execute this input message on the mate SM's memory. Default is the active SM's memory and mate memory unless it is during patch space recovery operation.

a = SM number.

b = Address to be loaded.

c = The symbol name of the global variable to be loaded. The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number 'd' must be used to enter this input message using symbolic access. The global variable's symbol index number can be determined by using the DUMP:UT-SYMID input message.

d = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.

e = Total length in bytes of all values to be loaded. Default is 1, maximum is 80. Length divided by size should be a whole number from 1-20.

f = Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.
g = Values to be loaded (maximum of 20 listed values).

4. SYSTEM RESPONSE

Refer to the APP:UT-IM-REASON appendix in the Appendixes section of the Input Messages manual.

5. REFERENCES

LOAD:UT-TMUX

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests that a value be loaded into the memory of the specified digital networking unit - SONET (DNU-S) transmission multiplexer (TMUX).

WARNING: The user is responsible for any effects on system operation that result from the use of this input message. Know the effects of the message before using it.

2. FORMAT

LOAD:UT-TMUX=a-b-c-d,[ADDR=e|GVAR="f"|SYMIDX=g][,L=h][,SIZE=i][,VAL=j[-j]...[-j]]{!|;}

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.
b = DNU-S number.
c = Data group number.
d = TMUX number.
e = Physical Address of the location to start the LOAD.
f = The name is entered as a string of up to 15 characters, enclosed in double quotation marks. If the symbol name is greater than 15 characters the symbol index number ‘g’ must be used to enter this input message using symbolic access. The global variable’s symbol index number can be determined by using the DUMP:UT-SYMID input message.

g = Symbol index number of this global variable. The symbol index can be determined for this processor by using the DUMP:UT-SYMID input message.
h = Total length in bytes of all values to be loaded (1 - 8, default is 1). Length divided by size (variable ‘i’) must be a whole number.
i = Size (number of bytes) of each value to be loaded. Default is 1, maximum is 4.
j = Values to be loaded (maximum of 8 listed values).

4. SYSTEM RESPONSE

235-105-110  System Maintenance Requirements and Tools
LOAD:UVAR

Software Release: 5E14 and later
Command Group: SFTUTIL
Application: 5,3B
Type: Input

1. PURPOSE

Loads administrative module (AM) generic access package (GRASP) utility variable with specified data as an immediate operation or as an action associated with a breakpoint.

2. FORMAT

LOAD:UVAR=a[,L=b][:WORD],D=c;

3. EXPLANATION OF MESSAGE

WORD = Indication that addresses and lengths are to be interpreted in terms of words. If this option is omitted, addresses and lengths are assumed to be byte values.

a = Specifies a GRASP utility variable in decimal. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. Utility variable values are reset to 0 at the end of every debugging session.

b = The length of the load, assumed to be bytes unless the WORD option is used. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The default for an omitted or zero length is 4. The specified length must agree with the data as explained below.

c = The data to be loaded. It is taken to represent the number of bytes of data (up to 4) needed to make the data list correspond to the length 'b'.

4. SYSTEM RESPONSE

IP = In progress. The message has been added to the WHEN action list.

PF = Printout follows. Followed by a LOAD:UVAR output message.

RL = Retry later. The system is in an overload condition or completing a previous OP:UMEM message.

?I = Syntax error. Valid value(s):
- INCONSISTENT DATA (L + D) = Length and amount of data specified do not agree.
- RANGE ERROR (L) = Length too long.
- RANGE ERROR (UVAR) = Invalid utility variable was specified.

Input Appendix(es):

APP: RANGES
38. MON
MON:SLK

Software Release: 5E14 and later
Command Group: CCS
Application: 5, CNI
Type: Input

1. PURPOSE

Requests that the link monitor be turned on or off. This message may also be used to determine the status of the monitor for the specified link(s). When the monitor is on, events associated with signaling links will trigger reports that are not normally output. Turning the monitor off inhibits new events from generating output. Event masks are available for each link. The event mask is used to describe the link related stimuli for which output is desired. There is also a system wide mask. Events can be monitored either on a single link or on all links.

Format 1 starts the link monitor. Either a single link (per link based messages) or a single node (per node based messages) or "ALL" links or nodes may be specified.

Format 2 stops the link monitor for the specified link or node or "ALL" links or nodes.

Format 3 is a request for the status of either a specific link or node or the system wide, "ALL", mask.

2. FORMAT

[1] MON:SLK=[a-b]:ON[c];

3. EXPLANATION OF MESSAGE

a = Group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Events mask. A default value of X'cde7f, everything except TFXs, will be used if no value is specified with the request. Event masks for more specific needs may be formed by "OR-ing" values. Valid value(s):

X'00001 = Ring node events.
X'00002 = CCS6 link failure events.
X'00004 = CCS7 link failure events.
X'00008 = CCS6 link restoration events.
X'00010 = CCS7 link restoration events.
X'00020 = CCS6 network messages (except TFx).
X'00040 = CCS7 network messages (except TFx).
X'00080 = CCS6 TFx events.
X'0100 = CCS7 TFx events.
X'0200 = Self loop link detection.
X'0400 = Manual out-of-service events.
X'0800 = Test and audit events.
X'08000 = DLN user response events.
X'10000  = Internal link state changes.
X'20000  = LSSU link OOS reports.
X'40000  = Changeover events.
X'80000  = Change back events.

As a result of the message the link monitor function as requested is set. OFF turns the monitor off, STATUS will report whether the monitor is currently ON or OFF, and ON will turn on the monitor. When monitors are turned on, administrative module (AM) stimuli for links or nodes, and/or internal state changes will be reported. This may cause large amounts of output, therefore some caution should be exercised when requesting this feature.

Refer to the "Link Monitor Masks With Their Events" exhibit in the APP:CNI appendix in the Appendixes section of the Output Messages manual for which stimuli are associated with the above mask values.

4. SYSTEM RESPONSE

PF  = Printout follows.

MON:TRUNK
Software Release: 5E14 and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE
Requests the specified trunk group marked with stop-go signaling be monitored. The members of the trunk group become candidates for being held off-hook and out of service when a stop-go signaling failure occurs. The connection between the switch and the far-end office is held off-hook for the user to determine the nature of the failure in the far-end office.

2. FORMAT
MON:TRUNK:TG=a;

3. EXPLANATION OF MESSAGE

a = Trunk group number.

4. SYSTEM RESPONSE
PF = Printout follows. Request accepted. Followed by the MON:TRUNK output message.

OP:ABD

Software Release: 5E14 and later
Command Group: N/A
Application: 5,3B
Type: Input

1. PURPOSE

Provides a list of all available alternate boot disk units on the switch. Information within the list will identify whether or not the unit may be used as a boot disk and if so, the date when the unit was last updated. An optional format allows the craft to obtain this information for a specific unit.

Note: Only data from the primary partitions is used to determine if a unit is a valid boot disk. No checking is done on the backup partitions.

2. FORMAT

OP:ABD[a]!

3. EXPLANATION OF MESSAGE

a = Unit number Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual for additional information.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:ABD output message.

5. REFERENCES

Output Message(s):

OP:ABD

Input Appendix(es):

APP:MEM-NUM-UNIT
1. PURPOSE

Lists a history over the immediate previous two hours of attempts per circuit per hour (ACH) and connections per circuit per hour (CCH) taken every 5 minutes for a given trunk group displayed in the TRUNK block of the defense switched network (DSN) network management (NM) exception page. This teletypewriter (TTY) message is valid only for DSN switches.

2. FORMAT

OP:ACCH,TG=a;

3. EXPLANATION OF MESSAGE

a = Trunk group name.

4. SYSTEM RESPONSE

NG = No good. May also include:
    - TG UNASSIGNED = The trunk group is not on the schedule or any display box.

  PF = Printout follows. Followed by the OP:ACCH output message.

  RL = Retry later. May also include:
    - NO DATA = No ACH/CCH data is yet collected for this trunk group.

**Software Release:** 5E14 and later  
**Command Group:** NMOC  
**Application:** 5  
**Type:** Input

*WARNING:* INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. **PURPOSE**

Requests a list of up to 64 automatic call gapping (ACG) controls for the specified application, starting at the given control identifier. If the control identifier is not given, the default control identifier zero will be used as the starting point of the output controls.

*WARNING:* Requesting this message may cause a large amount of data to be printed on the receive-only printer (ROP) and it may degrade other call processing events. This message should not be used during high traffic time.

2. **FORMAT**

```
OP:ACG,a[,CID=b][,GSM=c];
```

3. **EXPLANATION OF MESSAGE**

- **a** = Application type. Valid value(s):
  - **ASP** = Advanced services platform (ASP) release 0.1 application.
  - **NS800** = Number services (NS) 800 application.

- **b** = Control identifier. Range is 0 to 511, depending on available feature set. The default is zero.

- **c** = Processor from which to access the ACG list. Valid value(s) 1 to 192 for a GSM, or 0 to signify the AM/DLN. The default is the AM/DLN, or the GSM of a VCDX office.

4. **SYSTEM RESPONSE**

- **NG** = No Good. May also include:
  - **INVALID GSM** = The input message requested an SM that is not a GSM and has no ACG list.
  - **NO GSM** = For a VCDX office, a GSM could not be found.

- **PF** = Printout follows. Followed by an OP:ACG output message.

- **RL** = Retry later. May also include:
  - **RESOURCE SHORTAGE** = The request could not be accepted because the necessary resources are not available.

5. **REFERENCES**

OP:ACSR

**Software Release:** 5E14 and later
**Command Group:** RCV
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests that the status of one or all automatic customer station rearrangement (ACSR) requests in the ACSR queue be printed.

2. **FORMAT**

OP:ACSR, {PDN=a, ALL};

3. **EXPLANATION OF MESSAGE**

- **ALL** = Print the status of all ACSR requests.
- **a** = Primary directory number (PDN). The PDN value may be a 7 or 10 digit directory number (DN). If the NXX exists in more than one area code (such as, NPA), a 10 digit DN must be entered.

4. **SYSTEM RESPONSE**

PF = Printout follows. An OP:ACSR output message will follow.

Software Release: 5E15 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests translation information for an AUTOPLEX® mobile phone service (AMPS) facility, from AMPS facility identifier to its external facility circuit identifier and vice-versa.

For AMPS facility identifier to external facility circuit translation, the output will be the external facility circuit identifier.

For external facility circuit to AMPS facility identifier translation, the output will be the AMPS facility identifier.

2. FORMAT

OP:AFAC,a;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

a = Facility type. Valid value(s):
   AFACID=b = AMPS facility identifier.
   DS1=c-m-n-o-p-k-l = OIU facility circuit.
   DS1SFAC=c-g-h-i-j-k-l = DNUS facility circuit.
   FAC=c-d-e-f = DLTU facility circuit.

b = AMPS facility identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = FAC number. The FAC number is the T1 facility number on a DFI (0-1).

g = Digital networking unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the
Appendixes section of the Input Messages manual.

\[ k \] = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ l \] = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ m \] = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ n \] = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ o \] = OC3 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ p \] = STS1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\[ \text{NG} \] = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

\[ \text{PF} \] = Printout follows. Followed by the OP:AFAC output message.

\[ \text{RL} \] = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES

Output Message(s):

\[ \text{OP:AFAC} \]
1. PURPOSE

Requests the status of automatic line evaluation (ALE) system control parameters and resource usage.

The control parameters are grouped into three classes.

Automatic ALE Session Output Controls The parameters LEVEL1, LEVEL2, PRINT, and PER=REPT allow the controls used for generating output information for the automatically requested ALE sessions. These options determine which counts are to be used for the session and where the output is to be directed. These controls have no bearing on the output of information due to a manually requested ALE session. The default values for these options are restored on an administrative module (AM) full initialization. No other type of initialization will change the requested settings.

Switching Module (SM) Controls The SM parameters control the behavior of the level 1 performance monitoring and protocol error record (PER) generation. Refer to the Protocol Error Record Descriptions manual for additional information about a specific PER. If the level 1 parameter is inhibited, then level 1 performance monitoring is not active for all the U-interface digital subscriber lines (DSLs) on the SM. If allowed, then level 1 performance monitoring status for a U-interface DSL is determined by the level 1 performance monitoring group assigned to the DSL. Status requests that immediately follow the inhibiting (INH:ALE) of integrated services digital network (ISDN) protocol channels may give an erroneous indication that level 1 performance monitoring has been inhibited. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check (CRC) block errors (BE), may not be inhibited for a period of up to 5 minutes. Status requests that immediately follow the allowing (ALW:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring is operational. The actual counting of level 1 errored seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes. If the PER generation parameter is inhibited, then no PERs will be recorded for any ISDN protocol channels on the SM. If the parameter is allowed, then the PER generation parameter for the individual ISDN protocol channel determines if PERs are recorded for that channel.

Line/Trunk Controls Line/trunk ALE controls consist of a set of level 1 parameters and the PER generation parameter. The level 1 parameters only apply to U-interface DSLs. The PER generation parameter applies to all ISDN protocol channels whether supported on lines or trunks. The level 1 control parameters consist of an overall level 1 inhibit, hourly alert generation, daily alert generation, interval report generation, and daily report generation. If the overall level 1 inhibit is active, then all level 1 performance monitoring activities for the U-interface are disabled. If the hourly alert generation inhibit is active, then the reporting of hourly alerts to the ROP will be suppressed for the interface. If the daily alert generation inhibit is active, then the reporting of daily alerts to the ROP will be suppressed for the interface. If the interval report generation inhibit is active, then the interface will not contribute to the interval report. If the daily report generation inhibit is active, then the interface will not contribute to the daily report. One or more of the level 1 controls may be active. This information is applicable to U-interface DSLs. Status requests that immediately follow the inhibiting (INH:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring has been inhibited. The actual counting of level 1 errored seconds, severely errored seconds, and CRC BEs, may not be inhibited for a period of up to 5 minutes. Status requests that immediately follow the allowing (ALW:ALE) of ISDN protocol channels may give an erroneous indication that level 1 performance monitoring is operational. The actual counting of level 1 errored seconds, severely errored seconds, and CRC BEs, may not be inhibited for a period of up to 5 minutes.
seconds, severely errored seconds, and cyclic redundancy check block errors, may not resume for a period of up to 5 minutes. If the PER generation inhibit is active, then no PERs will be recorded for the ISDN protocol channel. In addition to the INH:ALE input message, PER generation may be inhibited as a result of digital loopback testing (TST:DSL), routine exerciser (REX), or mechanized loop testing (MLT). This inhibit condition will exist for the duration of the test being performed for the line/trunk. After completion of the test, the PER inhibit condition will remain for a period of 3 to 6 minutes. After this period has expired, the inhibit condition will be cleared if the status prior to the invocation of the test was "allowed". If the previous status was not "allowed", then the line/trunk will remain inhibited. Use the ALW:ALE input message to clear the inhibit condition prior to the expiration of the 3 to 6 minute period.

Format 1 is used to request the status of the automatic ALE session output controls.

Format 2 is used to request the status of switching module (SM) parameters for a range of SMs.

Format 3 is used to request the status of the level 1 and PER generation controls for a single interface or ISDN protocol channel.

Format 4 will examine the status of every ISDN interface for the indicated SMs reporting those interfaces and ISDN protocol channels that have one or more of the six inhibits active.

Format 5 will report the capacity of the PER logging buffer resident in the SM physical memory. In addition, the current indication status of the PER logging buffer will be reported.

2. FORMAT

[1] OP:ALE[,PRINT];

[2] OP:ALE,SM=a[&&b][,PRINT];

[3] OP:ALE,c[,CH=a][,PRINT];

[4] OP:ALE,SM=a[&&b],CHAN[,PRINT];

[5] OP:ALE,SM=a[&&b],PER=CAP[,PRINT];

3. EXPLANATION OF MESSAGE

Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

CHAN = Print a list of all inhibited channels for that SM(s).

PRINT = Direct the output to the ROP in addition to the requesting terminal.

a = SM number or the lower limit of a range of SM numbers.

b = The upper limit of a range of SM numbers.

c = Line identification. Valid value(s):
   AIUEN=f-n^1-o^1-p^1
   BST=d-e
   DEN=f-g-h-i
   DN=j
   DNUSEOC=f-e^1-x-y
   DNUSTMC=f-e^1-x-y
d = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = The DN or PKTDN associated with the port. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. This parameter can only be used to identify channels associated with DSLs.

k = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group (MLHG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a^1 = Channel type (valid only for LCEN and LCKEN line identification). Valid value(s):
    B1 = Channel B1.
    D = D-channel (default).

b^1 = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c^1 = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d^1 = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e^1 = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f^1 = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Tributary (T1FAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Channel (CHAN) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
1. Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized, or was not acceptable. May also include:
- ALE FEATURE NOT LOADED = The ALE feature is not loaded in the switch software configuration.
- COMMUNICATION FAILURE = A system error has occurred.
- INVALID INPUT = Parameter to allow does not match entity to allow.
- INVALID SM = SM number is invalid.
- PROCESS CREATION FAILURE = A system error has occurred.

PF = Printout follows. The request has been accepted and the OP:ALE message follows.

RL = Retry later. May also include:
- AM IN MIN MODE = The AM is in minimum operation mode.
- REQUEST ALREADY IN PROGRESS = An ALE status request is already running. Only one status request is allowed at a time.

d = Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
e = Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
g = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = Digital channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
j = The DN or PKTDN associated with the port. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. This parameter can only be used to identify channels associated with DSLs.
k = Protocol handler (PH) channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
l = PH channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Multi-line hunt group (MLHG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = MLHG member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Trunk group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Primary/protection identifier. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a¹ = Channel type (valid only for LCEN and LCKEN line identification). Valid value(s):
    B1 = Channel B1.
    D = D-channel (default).

b¹ = Integrated service line unit 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f
= Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g
= Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h
= Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i
= Digital signal level 0 (DS0) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j
= Packet switching unit (PSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k
= PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l
= PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m
= Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n
= Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o
= AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p
= AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q
= SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r
= Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s
= Peripheral control and timing (PCT) line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t
= PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u
= Tributary (T1FAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v
= Channel (CHAN) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w
= Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x
= Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

$y^1$ = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

$z^1$ = IP address field. Valid value is 0-255.

$a^2$ = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

$b^2$ = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

$c^2$ = Optical carrier level 3 (OC3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

$d^2$ = Synchronous transport signal level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The message was not recognized, or was not acceptable. May also include:
- ALE FEATURE NOT LOADED = The ALE feature is not loaded in the switch software configuration.
- COMMUNICATION FAILURE = A system error has occurred.
- INVALID INPUT = Parameter to allow does not match entity to allow.
- INVALID SM = SM number is invalid.
- PROCESS CREATION FAILURE = A system error has occurred.

PF = Printout follows. The request has been accepted and the OP:ALE message follows.

RL = Retry later. May also include:
- AM IN MIN MODE = The AM is in minimum operation mode.
- REQUEST ALREADY IN PROGRESS = An ALE status request is already running. Only one status request is allowed at a time.

APP: RANGES

Other Manual(s):
235-105-110  System Maintenance Requirements and Tools
235-600-755  Protocol Error Record Descriptions
1. PURPOSE

Requests alarm summary of either off-normal or all alarm scan points.

Format 1 is for requesting remote switching module (RSM), optical remote module (ORM), or two-mile remote module (TRM) metallic service unit (MSU) building/power alarm scan points. This message is available only in an RSM, ORM, or TRM that has the alarm input option. Format 2 is for requesting remote integrated services line unit (RISLU) or expansion access interface unit (EAIU) alarm scan points, either for a single remote peripheral or all remote peripherals at a specified site. When requested for a single remote peripheral, normal and off-normal states are output. When requested for a site, only off-normal states are output unless ALL is specified. Format 3 is for requesting remote alarm section (RAS) scan points. Format 4 requests that all active alarms in the office be printed. Alarms included are:
- Administrative module (AM) fan alarms.
- Local office building/power and miscellaneous alarms.
- Common network interface (CNI) alarms.
- Communication module (CM) fan and fan fuse alarms.
- Miscellaneous frame fan and fuse alarms.
- External sanity monitor (ESM) alarms.
- CM power alarms.
- Carrier group alarms.
- Fan and fan/peripheral fuse alarms for all operational switching modules (SMs).
- Building/power alarms for remoted SMs.
- Remote peripheral building/miscellaneous alarms.
- Expansion access interface unit (EAIU) fan and fuse alarms.
- Remote integrated services line unit (RISLU) fan, fuse, power, and battery alarms.
- Multiplex access interface unit (XAIU) fan and fuse alarms.
- Metallic service unit (MSU) alarms.
- Integrated TR008/TR303 remote terminal (RT) alarms.

(TR008 RTs can be the SLC® 96, Series 5 Feature Package B, and Enhanced B. TR303 TRs can be the Series 5 feature package 303G.)

Note: In the case of MSU alarms, the status of all MSU scan points will be reported regardless of whether they are active or inactive.

Format 5 is for requesting XAIU alarm scan points. Normal and off-normal states are output.

WARNING: Format 4 of this message is resource and receive-only printer (ROP) intensive and should be run only during off hours. Also, if Format 4 of this message is being used at the Switch Control Center (SCC), only one office should be interrogated for office alarm status (OP:ALM-ALL) at a time because the potential exists for overwriting data at the SCC.

2. FORMAT
3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

ALL = When used with formats one through three, report on all scan points including ones that are in the normal state in the specified SM or at the specified site. When used with Format 4, report all active alarms in the office.

RBPSC = Remote building/power scan point.

RP = Remote peripheral.

XAIU = Multiplex access interface unit.

a = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Remote peripheral site number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = EAIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = XAIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. Invalid SM, site number, or option not available. The request could also be denied due to a system problem which would include one of the following:
- INTERNAL ERROR (OPEN FAIL1) /etc/HMBLDALMS = The request cannot be completed because the file /etc/HMBLDALMS cannot be opened for reading. There is either a system problem preventing it being opened or it is missing.
- INTERNAL ERROR (READ FAIL1) /etc/HMBLDALMS = The request cannot be completed because the file /etc/HMBLDALMS cannot be read. There is a system problem preventing it being read.

PF = Printout follows. An OP:ALM-ALL, OP:ALM-RBPSC, OP:ALM-RAS, OP:ALM-RP or
OP:ALM-RISLUSC output message will follow in response to the request.

RL = Retry later. For Formats 1, 2, 3, and 5, unable to process request or unable to communicate with SM. For Format 4, the request is being denied due to unavailable resources necessary for completing the request. Includes the following:
- **ALREADY IN PROGRESS** = A previous OP:ALM request is still in progress.
- **CGA SUMMARY IN PROGRESS** = A previous OP:CGA request is still in progress.
- **CM IS ISOLATED** = The CM is currently isolated.
- **CM SIDES HAVE INCONSISTENT VINTAGES** = The CM sides are in a transient state and not the same vintage (one side is a CM model 1 and the other side is a CM model 2).
- **RT ALARM SUMMARY IN PROGRESS** = A previous OP:RT-ALM-ALL request is still in progress.

Output Message(s):

REPT:AMA-CONT
OP:AMA-DISK

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests current automatic message accounting (AMA) disk space occupancy data. The output displays a truncated percentage of disk space occupied by primary AMA records. In addition, the output also displays the number of primary AMA blocks in use on disk. Because the percentage is truncated, if 0% is displayed, there may still be a small amount of primary data left on disk.

If the alarm levels have been changed in RC/V View 8.1, then there is a possibility that the alarm status has changed. The use of this input message permits the output of the appropriate upgrade and/or downgrade alarm messages along with the appropriate alarm.

During software transitions when the retrofit site file exists, this message only works once the disks are accessed during the session and immediately after a tape or teleprocessing session on the offline side. Once the disks are accessed, it reflects the percent and blocks on disk as they are known to the AMA disk reader (reflecting any data marked as secondary as the session progresses). Prior to such sessions, it gives invalid output and does not reflect the percentage or number of blocks on either the online or offline sides. When the retrofit site file does not exist, the input message works on the online side at all times before, during and after tape or teleprocessing sessions.

2. FORMAT

OP:AMA:DISK[, {ST1|ST2}];

3. EXPLANATION OF MESSAGE

ST1 = Used if AMA data goes to the ST1 data stream.
ST2 = Used if AMA data goes to the ST2 data stream.

Note: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2. However, for a dual stream office, the stream must be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

NG = No good. Data stream checks failed.
PF = Printout follows. Followed by REPT:AMA-DISK-SUM output message.
RL = Retry later. Status cannot be obtained.

Where 'x' is the release-specific version of the specified manual.
OP:AMA-SEQ

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Indicate which disk blocks correspond to a given block sequence number, and the automatic message accounting (AMA) partitions on which they are located. The contents of these block sequence numbers are dumped to the receive-only printer (ROP) in hexadecimal. One block sequence number contains 1536 bytes and is made up of three disk blocks.

2. FORMAT

OP:AMA:SEQ,BLK=a[,ST1|ST2];

3. EXPLANATION OF MESSAGE

SEQ = Output disk blocks corresponding to the given block sequence number.
ST1 = Used if AMA data goes to the ST1 data stream.
ST2 = Used if AMA data goes to the ST2 data stream.
a = Block sequence number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

Note: If the block sequence numbers on the partition consists of the contiguous range [1-27,84-111], then the block sequence numbers are addressed as a continuous sequence [1-55].

4. SYSTEM RESPONSE

OP:AMA-SESSION

Software Release: 5E14 and later
Command Group: AMA
Application: 5
Type: Input

1. PURPOSE

Requests a report of the current or most recent automatic message accounting (AMA) tape or teleprocessing session.

2. FORMAT

OP:AMA:SESSION[,ST1|,ST2];

3. EXPLANATION OF MESSAGE

ST1 = AMA data goes to the ST1 data stream.
ST2 = AMA data goes to the ST2 data stream.

Note: For a single data stream office, the stream does not have to be specified as either an ST1 or ST2.

4. SYSTEM RESPONSE

NG = No good. Data stream checks failed or AMA data networking services processing is active.

PF = Printout follows. If any invalid data was encountered while processing the input message, an REPT:AMA-CONT output message will follow. Also following this printout is the REPT:AMA-TELE-SE output message if the AMA teleprocessing option is in effect or a REPT:AMA-TAPE-SES output message if the tape option is in effect. If there was no previous tape session, then the month field for START TIME, FIRST BLOCK and LAST BLOCK in this output will be printed as ??? indicating no valid month is applicable in that situation. Similarly, if there was no previous teleprocessing session, then the month field for START TIME and STOP TIME in the output will be printed as ???.

RL = Retry later. Message could not be sent to the appropriate process.

2. FORMAT
OP:ANITBL, SM=a[&b];

3. EXPLANATION OF MESSAGE
a = Individual Switching Module (SM) number or lower limit for a range of SM number.
b = Upper limit for a range of SM number.

4. SYSTEM RESPONSE
NG = No good.
PF = Printout follows.
RL = Retry later. One possible condition is that another OP:ANITBL job is in progress. Only one job is allowed at a time.

5. REFERENCES
Output Message(s):
OP:ANITBL
OP:APSSTAT

Software Release: 5E16(1) and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests automatic protection switching (APS) status of optical carrier - level 3 (OC3) or optical carrier - level 3 concatenated (OC3C) circuits for optical interface units (OIs) in a switching module (SM) or a range of SMs. If the ALL option is not specified, the request is for circuits with off-normal APS state only.

2. FORMAT

OP:APSSTAT,SM=a[&b],[,ALL];

3. EXPLANATION OF MESSAGE

ALL = Applies to all OC3(C) circuits with normal and off-normal APS states in the specified SM or a range of SMs.

a = SM number or lower end of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = High end of range of SM numbers.

4. SYSTEM RESPONSE

NG = No good. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the OP:APSSTAT output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

   REPT:APT-STOP
   REPT:APT-SUSPEND
OP:ARC

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE
Lists all alternate route cancellation (ARC) controls in the office. This includes the following information for each control:

- Office name.
- Type of control initiated.
- Type of traffic subject to the control.
- Announcement treatment if blocking occurs.

This message is valid only for defense switched network (DSN) switches.

2. FORMAT
OP:ARC;

3. EXPLANATION OF MESSAGE
No variables.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by the OP:ARC output message.

RL = Retry later. May also include:
- CONFLICTING REQUEST = A similar request is being processed utilizing necessary resources.
- RESOURCE SHORTAGE = The necessary resources are not available.

TST:ASPTQ

Output Message(s):

OP:ASPTQ
OP:ATMALM-A

Software Release: 5E14 - 5E15
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests the output of the virtual path(s) (VPATHs), starting from a given near end community address (CA), that are in the asynchronous transfer mode (ATM) alarm state.

An alarmed virtual path can be in the alarm indication signal (AIS) or remote defect indication (RDI) state. By choice, the output can list the alarmed virtual path(s) in terms of far end PSU CAs that this near end PSU CA has connection to; or in terms of virtual path identifier (VPI) number(s) that uniquely identify the virtual paths between this near end packet switch unit (PSU) CA to all other far end PSU CAs. There are two virtual paths, one high priority and one low priority, that connect two PSU CAs. The high priority VPI number is equal to the far end PSU CA multiplied by 2; and the low priority VPI number is one more than the high priority VPI number. NOTE: For gateway protocol handlers (PH) the only valid input message format is #3. Other formats will not yield the expected results.

2. FORMAT

[1] OP:ATMALM,PSUCA=a[,FARCA=b],d[,e];
[2] OP:ATMALM,PSU=c-0[,FARCA=b],d[,e];
[3] OP:ATMALM,PSUCA=a;

3. EXPLANATION OF MESSAGE

a = Near PSU community address of the PSU link or the virtual path(s).
b = Far PSU community address of the PSU link.

Note: This field (a non-zero value) is required for network configured as point to point. It is optional (a zero value if entered) for multipoint ATM network.

c = Switching module (SM) number.
d = Indication to list alarmed virtual path(s) either in far end PSU CA(s) or VPI number(s). Valid value(s):

CA = Community address.
VPI = Virtual path identifier.

Note: If this field is not specified, then all virtual paths in AIS and/or RDI are reported.

e = Indication to find virtual paths whose status matches this value. Valid value(s):

AIS = Alarm indication signal.
RDI = Remote defect indication.

Note: If this field is not specified, then all virtual paths in AIS and/or RDI are reported.
4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Printout follows. Followed by the OP:ATMALM output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

where y=PSU number
**OP:ATMALM-C**

**Software Release**: 5E17(1) and later  
**Command Group**: MAINT  
**Application**: 5  
**Type**: Input

1. **PURPOSE**

Requests the output of the virtual path(s), starting from a given near end community address (CA), that are in the asynchronous transfer mode (ATM) alarm state.

An alarmed virtual path can be in the alarm indication signal (AIS) or remote defect indication (RDI) state. By choice, the output can list the alarmed virtual path(s) in terms of far end PSU CAs that this near end PSU CA has connection to, or in terms of virtual path identifier (VPI) or VPI and virtual channel identifier (VCI) number(s) that uniquely identify the virtual paths between this near end packet switch unit (PSU) CA to all other far end PSU CAs.

There can be two virtual path connections, one high priority and one low priority, that connect two PSU CAs. The high priority VPI number is equal to the far end PSU CA multiplied by 2, and the low priority VPI number is one more than the high priority VPI number.

There can be two virtual channel connections, one high priority and one low priority, that connect two PSU CAs. The high and low priority VPI numbers are provisioned and the VCI is equal to the far end PSU CA plus 64.

For internetwork connections the far subnetwork must be entered. There is however only a high priority virtual path or virtual channel connection.

2. **FORMAT**

   [1] \[ \text{OP:ATMALM,PSUCA=a[,FARSN=b][,FARCA=c],d[,e];} \]

   [2] \[ \text{OP:ATMALM,PSU=f-g[,FARSN=b][,FARCA=c],d[,e];} \]

   [3] \[ \text{OP:ATMALM,PSALNK=f-g-h[,FARSN=b],d[,e];} \]

3. **EXPLANATION OF MESSAGE**

   a  = Near PSU community address of the PSU link or the virtual path(s).

   b  = Far subnetwork number.

   c  = Far PSU community address of the PSU link.

   This field (a non-zero value) is required for network configured as point to point. It is optional (a zero value if entered) for multipoint ATM network.

   d  = Indication to list alarmed virtual path(s) either in far end PSU CA(s) or VPI number(s). Valid value(s):

      CA = Community address.
      VPI = Virtual path identifier.

   e  = Indication to find virtual paths whose status matches this value. Valid value(s):
AIS = Alarm indication signal.
RDI = Remote defect indication.
L2QUAL = L2 quality information.

If this field is not specified, then all virtual paths in AIS and/or RDI are reported.

f = Switching module (SM) number.
g = PSU number.
h = ATM link number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Printout follows. Followed by the OP:ATMALM output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

Type: Input

1. PURPOSE

Requests either the generation of a detailed error report of the errors found by a previously-executed full, incremental or entity static office-dependent data (SODD) audit, a detailed summary report of errors detected by one of the forementioned audits, or just a summary of the number of errors found by one of the forementioned audits.

If a detailed error report is to be generated, a file name to where the output is to be written must be specified with the optional OUTFILE keyword. This file will then be located under the /rclog/SODD/reports directory. If a detailed summary report is to be generated, both the SUMMARY and OUTFILE keywords must be specified. The detailed summary will then be located under the /rclog/SODD/reports directory. If just a summary of the error count is to be generated, the SUMMARY keyword must be specified (without the OUTFILE keyword). This sends the output to the receive-only printer (ROP).

2. FORMAT

[1] OP:AUD=SODD,ERRLOG,([TN=a | OE="b" | RELATION='c',{AM|SM=d|CMP} | MLHG=e[,MEMB=f] | TGN=g[,MEMB=h}] [,ALL=i][,BREVITY=[j]][,EXPAND=[k]] [,OUTFILE=l | SUMMARY],OUTFILE=l,SUMMARY);

[2] OP:AUD=SODD,ERRLOG,FULL,DAY=m[,WEEK=n][,CYCLE={PREV|CUR}][,ALL=i][,BREVITY=[j]][,EXPAND=[k]] [,OUTFILE=l | SUMMARY],OUTFILE=l,SUMMARY);

[3] OP:AUD=SODD,ERRLOG,INCR,|AM|SM=o|CMP|RED|ALLPRC|DAY=p) [,CYCLE={PREV|CUR}][,ALL=i][,BREVITY=[j]][,EXPAND=[k]] [,OUTFILE=l | SUMMARY],OUTFILE=l,SUMMARY);

[4] OP:AUD=SODD,ERRLOG,BRCS,MFT=q, (AM|SM=r|CMP) > ,ALL=i][,BREVITY=[j]][,EXPAND=[k]>&#93; > [,OUTFILE=l | SUMMARY],OUTFILE=l,SUMMARY);

3. EXPLANATION OF MESSAGE

AM = Administration module (AM). The processor on which the relation, as specified in 'c' or 'q', was audited.

CMP = Communications module processor (CMP). The processor on which the relation, as specified in 'c' or 'q', was audited.

CYCLE = Audit cycle for the full audit. Valid value(s):
CUR = Current (default).
PREV = Previous.

ALL = Indicates whether all warnings will be printed. If ALL=N, then only warnings that are not specified in the "prl_to_ignore" file will be printed. This file is explained in the Routine Operations and Maintenance manual. If this keyword is not specified or is specified without a value, the default is to
print all warnings.

**BREVITY**
- Indicates whether brevity control should be used when printing the contents of the audit error log(s). If this keyword is not specified or is specified without a value, the default is to print only the first ten instances where a particular check in the SODD audit is violated followed by a statement indicating how many additional instances were in error. This keyword is ignored if specified in conjunction with the SUMMARY keyword.

**EXPAND**
- Indicates whether to expand population rule language (PRL) symbols in the error report. If this keyword is not specified or is specified without a value, the default is to expand some of the PRL symbols (not all symbols can be expanded) into their English equivalent. This keyword is ignored if specified in conjunction with the SUMMARY keyword.

**DAY**
- Indicates the day(s) within the full audit cycle on which to report or the day within the incremental audit cycle on which to report.

**WEEK**
- Indicates the week(s) within the full audit cycle on which to report. The WEEK is not a calendar week but rather a week in the full audit cycle (that is, if the cycle started on Wednesday and the following Tuesday's errors are to be printed, **WEEK=1** would be specified and not **WEEK=2**.) Various **DAY/WEEK** combinations include:
  - **DAY= [m], WEEK= [n]** = print the errors found on the specified day during the specified week of the full audit cycle.
  - **DAY= ALL, WEEK= [n]** = print the errors found on all days during the specified week of the full audit cycle.
  - **DAY= [m], WEEK= ALL** = print the errors found on the specified day during the entire full audit cycle.
  - **DAY= ALL, WEEK= ALL** = print the errors found during the entire full audit cycle.
  - **DAY= [m] (no WEEK specified)** = print the errors found on the specified day for the most recent week of the full audit cycle.
  - **DAY= ALL (no WEEK specified)** = print the errors found on all of the most recent days for the most recent week of the full audit cycle.

**RED**
- For incremental audits, redundant (RED) indicates that a report will be generated based on the last iteration of the incremental audit on the transactions in the redundant log file.

**ALLPRC**
- For incremental audits, all processors (ALLPRC) indicates that a report will be generated for all the switching modules, administration modules and communications module processors in the office.

**SUMMARY**
- If specified without the OUTFILE keyword, only the count of errors found by the specified audit will be generated and printed to the ROP. If specified with the OUTFILE keyword, a detailed summary will be generated and written to the specified file under the /rclog/SODD/reports directory.

**a**
- Telephone number that was audited.

**b**
- Office equipment type and number that was audited.

**c**
- Relation that was audited, or "ALL" if all relations on a specific processor were audited.

**d**
- Switching module that was audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The processor on which the relation, as specified in 'c', was audited.

**e**
- Multi-line hunt group that was audited.
= Member of multi-line hunt group that was audited.

g = Trunk group number that was audited.

h = Member of trunk group number that was audited.

i = Output of warnings. Valid value(s):
   N = Print only warnings that are not specified in the "prl_to_ignore" file.
   Y = Print all warnings (default).

j = Brevity control for the printing of the audit error log(s). Valid value(s):
   N = Do not use brevity control.
   Y = Use brevity control (default).

k = Expand PRL symbols into their English equivalent in the error report. Valid value(s):
   N = Do not expand the PRL symbols into English.
   Y = Expand the PRL symbols into English (default).

l = A file with this name is created under /rclog/SODD/reports and the output is stored there. If a file
   with this name already exists, it is overwritten. Double quotes "' should be used around variable 'l'
   to preserve lower-case letters.

m = Report on a specific day or days within the full audit. Valid value(s):
   MON = Monday.
   TUE = Tuesday.
   WED = Wednesday.
   THU = Thursday.
   FRI = Friday.
   SAT = Saturday.
   SUN = Sunday.
   ALL = All days.

n = A single digit number indicating the number of weeks within the full audit cycle. Valid value(s):
   ALL = All weeks.

o = Switching module that was audited. Refer to the APP:RANGES appendix in the Appendixes
   section of the Input Messages manual. Specific processor on which the incremental audit took
   place.

p = Report on a specific day within the incremental audit. The day is when the audit began execution
   and not when it finished. Valid value(s):
   MON = Monday.
   TUE = Tuesday.
   WED = Wednesday.
   THU = Thursday.
   FRI = Friday.
   SAT = Saturday.
   SUN = Sunday.
q = Name of modular feature type (MFT) or ALL.

q = Switching module that was audited. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. The processor on which the relations associated with the MFT, as specified in 'q', were audited.

4. SYSTEM RESPONSE

PF = Printout follows. Followed by an OP:AUD-ERRLOG output message.

Other Manual(s):
235-105-210 Routine Operations and Maintenance
OP:AUD

Software Release: 5E14 and later
Command Group: AUDIT
Application: 5,3B
Type: Input

1. PURPOSE

Reports the status of one or more audits controlled by the system integrity monitor (SIM). The report may be requested for:

- All audit control records.
- All members associated with a specific audit.
- Selected members associated with a specific audit.

2. FORMAT

OP:AUD: {ALL|RUN|a [=b] |a=c, INS="d"};

3. EXPLANATION OF MESSAGE

ALL = Specifies all audits controlled by SIM.
RUN = Restricts the report to include only information for running audits.
a = Audit name. Administrative module (AM) audit names are listed in the APP:AUD appendix in the Appendixes section of the Input Messages manual.

If 'a' is specified without 'b', all members of the audit will be reported.

b = Member number. For a list of member numbers, refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual. May be specified as a single number or a list of numbers.

c = Single member number. Refer to the APP:MEM-NUM-AUD appendix in the Appendixes section of the Input Messages manual.

d = Instance name.

4. SYSTEM RESPONSE

Refer to the APP:AUD appendix in the Appendixes section of the Input Messages manual.

Application: 5
Type: Input

WARNING: INAPPROPRIATE USE OF THIS MESSAGE MAY INTERRUPT OR DEGRADE SERVICE. READ PURPOSE CAREFULLY.

1. PURPOSE

Requests the output of bearer independant call control (BICC) data matching the following specified characteristics:
A the entire office
B a specific OPC and DPC combination,
C a OPC, DPC and a specific, range or all CICs, with an optional SM parameter described below,
D an BICC group, with an optional SM parameter described below, or
E an BICC group and a specific or range of BICC group members, with an optional SM parameter described below.
F an BICC trunk group, with an optional SM parameter described below, or
G an BICC trunk group and a specific or range of trunk group members, with an optional SM parameter described below.

Output formats [1] will include the BICC group numbers, OPC, and DPC, Signalling platform indicator, Base CIC and Total number of CIC blocks assigned to the Group. Output formats [2] through [7] will include the BICC group number(s), Member Range, CIC block SM number and the First CIC for the CIC block.

Only one OP:BICC request may be processed by the system at any moment; additional requests will be denied.

WARNING: Requesting this message may cause an enormous amount of data to be printed on the receive-only printer (ROP). The use of any format could cause a degradation in switch service depending upon the number and size of BICC groups.

The input message, STP:BICC, can be used to halt the printing of this input message should system operation be impacted by this message.

2. FORMAT

[1] OP:BICC,OFFICE;
[2] OP:BICC,OPC=a,DPC=b;
[3] OP:BICC,OPC=a,DPC=b,CIC{=c[&&d]|,ALL}[,SM=k];
[4] OP:BICC,BG=e[,SM=k];
[5] OP:BICC,BGMN=e-f[&&g][,SM=k];
[6] OP:BICC,TG=h[,SM=k];
[7] OP:BICC,TKGMN=h-i[&&j][,SM=k];

3. EXPLANATION OF MESSAGE

ALL = Search for BICC group members using a range of all possible CICs.
a = Origination point code (OPC) consisting of a nine digit number. Refer to the APP:POINT-CODE appendix.
b = Destination point code (DPC) consisting of a nine digit number. Refer to the APP:POINT-CODE appendix.
c = BICC Call Instance code (CIC) or the lower limit of a range of CICs. BICC CICs can range from 0 - 4294967294.
d = The upper limit of a range of BICC CICs.
e = BICC group (BG) number.
f = BICC group member number (BGMN) or the lower limit of a range of BICC group member numbers.
g = The upper limit of a range of BICC group member numbers.
h = BICC trunk group (TG) number.
i = BICC trunk group member number (TKGMN) or the lower limit of a range of BICC trunk group member numbers.
j = The upper limit of a range of BICC trunk group member numbers.
k = SM number. Search for trunks is restricted to specified SM. This option is allowed only for OPC/DPC/CIC, BG, BGMN, TG or TKGMN requests.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and an OP:BICC output message will follow.
RL = Retry later. Valid value(s):
   - FAILED TO CREATE PROCESS = The process that would service the request could not be created, or did not receive the request, probably due to system load.
   - REQUEST ALREADY IN PROGRESS = An OP:BICC request is already running. Only one request is allowed to run at a time.
   - TOO MANY PROCESSES ACTIVE = A process to service the request cannot be created because the maximum number of active maintenance processes has been reached.

5. REFERENCES

   STP:BICC
Input Appendix(es):

APP:POINT-CODE
OP:BICCBLK
Software Release: 5E16(1) and later
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE
Requests the output of bearer-independent call control (BICC) call instance code (CIC) block for the following information:
- Number of idle CICs,
- Number of busy CICs,
- Number of in-service CICs,
- Number of out-of-service (OOS) circuit administration (CADN),
- Number of blocked CICs,
- Number of ressetting CICs,
- Number of CICs in the AUDIT state.

2. FORMAT
OP:BICCBLK,BGMN=a-b&&c;

3. EXPLANATION OF MESSAGE
a = SS7 BICC group number. Refer to APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = The lower limit of a range of SS7 BICC group member numbers. The member range must represent exactly one BICC CIC block (that is, BGMN=7000-0&&127). The range of a CIC BICC block is 128 (i.e. 0&&127, 128&&255, etc.).
c = The upper limit of a range of SS7 BICC group member numbers. The member range must represent exactly one BICC CIC block (that is, BGMN=7000-0&&127). The range of a CIC BICC block is 128 (i.e. 0&&127, 128&&255, etc.).

4. SYSTEM RESPONSE
PF = Printout follows. The request has been accepted and an OP:SS7 output message will follow.
NG = No good. May also include:
  - BAD CIC INPUT = The craft entered a member range that is incorrect.
  - STARTING CIC NOT AT BEGINNING OF BLOCK = The starting CIC is not at the beginning of a BICC CIC block.
  - RANGE OF CICS INCORRECT = The ranges of CICs is not an exact BICC CIC block.

Command Group: CCS
Application: 5,CNI
Type: Input

1. PURPOSE

Requests a formatted display of the routing data in the cluster, member, and load share tables of the common network and for the signaling connection control part (SCCP) subsystem bit map. This is very useful in testing and monitoring the common channel signaling (CCS) traffic management code that updates these tables.

This input message provides a means for printing a formatted display of the routing data in the cluster, member and load share tables, and the timer status for the message transfer part (MTP) signaling point restart procedure.

2. FORMAT

[1] OP:C7NET:PCLU=n-b-o[,DEST=d];

[8] OP:C7NET:PRN=n[,DEST=d];
[9] OP:C7NET:PIDX=n-o-p[,DEST=d];
[10] OP:C7NET:r=s[,DEST=d];
[12] OP:C7NET:PFL=a-f[,DEST=d];
[13] OP:C7NET:PFRNG=a-h-j[,DEST=d];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

PCLU = This message prints data about a cluster. If the cluster routing type is populated (POPCLU), then any exceptional or static members are also printed.

PFRNG = Print a range of integers, each representing marked free elements for the particular table.

PIDX = Print the indexing information in the nonlocal paging tables for a particular nonlocal point code.
PIDXMEM = Print the member level routing data indicated by index.
PLS = Print link set information about the ring node addresses (RNAs) that are actively being used for routing per link set, all equipped link sets and the current link set relations.
PMEM = Given the network identifier, cluster and member number, will print member data.
PREG = Print all cluster level data and any abnormal member level data in this region.
PRN = Print the cluster and member routing data for a particular network identifier.
SSINFO = Print data about the given local subsystem.
STATES = This option will give the status of subsystems for a given point code.

a = Table name (either pa=>cNpage_access, mp=>cNmempages or mem=>cNn1_mem).
b = Valid value(s):
Region
Cluster
Note: The region value is optional and will not be used if the ANSI® point code format is being used.

c = The cluster when the ANSI® point code format is being used.
d = For all formats the DEST parameter is optional. When using this parameter the printing destination (variable 'd') must be supplied. The default is the receive-only printer (ROP).
e = Valid value(s):
ABNORMAL = This option will print the status of common channel signaling system 7 (CCS7) signaling routes that have members that are unavailable, restricted, congested, or subsystems that are prohibited.
DEBUGOFF = This option turns off the SCCP debug flag.
DEBUGON = This option turns on the SCCP debug flag.
Caution: This input message may clutter the ROP with messages. Use under the direction of your customer support group.

f = Length of elements.
g = Linkset.
h = Starting index.
i = Region.

j = Ending index.

k = Region of cluster number.

Note: The region value is optional and will not be used if the ANSI® point code format is being used.

l = The cluster or member. If the ANSI® point code format is being used the cluster value must be supplied here, otherwise the member value must be here.

m = This will be the member value only when the ANSI® standard point code format is being used.

n = The network identifier.

o = Valid value(s):
   Member
   Cluster
   Note: The member value is optional and will be used here if the ANSI® point code format is being used.

p = The member when the ANSI® point code format is not being used.

q = Subsystem number.

r = Valid value(s):
   PIDXNM = Print the nonlocal routing data indicated by index.
   PIDXPA = Print the entry in the cNpage_access table indicated by index.

s = Index number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Index number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request could not be completed. May also include:
   - INVALID KEYWORD FOR C7NET
   - INVALID LINKSET NUMBER
   - INVALID SUBSYSTEM NUMBER
   - MISSING THE MEMBER FOR C7NET
   - MISSING THE SUBSYSTEM NUMBER FOR C7NET
   - NETWORK IDENTIFIER OUT OF RANGE

OP:CCS-ACDPC

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests the linkset or combined linkset servicing each accessible destination point code (DPC) for the common channel signaling (CCS) global switching module (GSM).

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

OP:CCS,ACDPC[,SM=a];

3. EXPLANATION OF MESSAGE

a = GSM number. CCS GSM number from which the data is desired. If no SM number is specified and only one CCS GSM exists in the office, output will be produced for that GSM. If multiple CCS GSMs exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

NG = No good. May also include:
- GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
- NO GLOBAL SM = No GSM is provisioned in the office.
- NEED GSM NUMBER = GSM was not specified in the input message, and the office has more than one GSM provisioned.
- SYSTEM BUSY = Resources unavailable to process request.

PF = Printout follows. Followed by the OP:CCS-ACDPC output message.

RL = Retry later. May also include:
- SM NOT AVAILABLE = Command cannot be processed because the GSM is not accessible.

OP:CCS-CLS
Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Requests status information of all members of one or more combined link sets (CLSs) on a given common channel signaling (CCS) global switching module (GSM).

Note: This input message is applicable only for PSU platform CCS7.

2. FORMAT

OP:CCS,CLS[,SET=a[&b]][,SM=c];

3. EXPLANATION OF MESSAGE

   a = Combined link set (CLS) number or lower limit of a range of CLS numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. Range of numbers need not start or end with equipped CLS numbers. The default is all combined link sets.

   b = Upper limit of a range of CLS numbers.

   c = Global switching module (GSM) number. CCS GSM number from which the data is desired. If no SM number is specified and only one CCS GSM exists in the office, output will be produced for that GSM. If multiple CCS GSMs exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

   NG = No good. May also include:

1532 (CCS LINK SET SUMMARY)
1533 (CCS LINK SET MEMBER)
OP:CCS-DPC
Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests status information for one or more destination point codes (DPC) associated with a given common channel signaling (CCS) global switching module (GSM).

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

OP:CCS,DPC[,DPCID=a[&b]][,STATUS=c][,SM=d];

3. EXPLANATION OF MESSAGE

a = DPC or lower limit of a range of DPCs. When a range is specified, only equipped numbers in the range will be processed. If the DPC is not specified, a report will be generated for all DPCs.

Note: DPC number must be entered as a 9 digit number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual for interpretation.

b = Upper limit of a range of DPCs.

c = Status. Valid value(s):
ACC = Display only accessible DPCs.
INACC = Display only inaccessible DPCs.

If the status is not specified, both accessible and inaccessible DPCs will be displayed.

d = GSM number. CCS global SM number from which the data is desired. If no SM number is specified and only one CCS GSM exists in the office, output will be produced for that GSM. If multiple CCS GSMS exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

NG = No good. NG acknowledgements are used when the syntax of a message is valid, but the message has been denied. Additional information is printed out to explain why the message was denied. May also include:
- NO GLOBAL SM = No GSM is provisioned in the office.
- GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
- NO DPCS IN THE REQ RANGE = No DPCs in the requested range.
- NEED GSM NUMBER = SM was not specified in the input message, and the office has more than one GSM provisioned.
- SYSTEM BUSY = Resources unavailable to process request.
= Retry later. May also include:
- DATA BEING UPDATED = The input message cannot be processed because the relations that contain the status of DPCs are being updated either by traffic diversion terminal process or by audits.
- MSG NOT SENT TO CLIENT PROC. = The input message cannot be processed because the signaling traffic route and management (STRM) system process failed to create the terminal process.
- SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.

= Printout follows. An OP:CCS-DPC output message follows in response to the request.

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Generates the report of the combined link set of which a given link set is a member.

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT
OP:CCS,LSCLS[,LS=a[&b]][,SM=c];

3. EXPLANATION OF MESSAGE

a = Link set (LS) number or lower limit of a range of LS numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. When a range is specified, only equipped numbers in the range will be processed. Range of numbers need not start or end with equipped LS numbers. The default is all of the link sets.

b = Upper limit of a range of equipped LS numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Global switching module (GSM) number. CCS GSM number from which the data is desired. If no SM number is specified and only one CCS GSM exists in the office, output will be produced for that GSM. If multiple CCS GSMs exist in the office, the SM must be specified.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
   - NO GLOBAL SM = No GSM is provided in the office.
   - NEED GSM NUMBER = GSM was not specified in the input message, and the office has more than one GSM provisioned.

PF = Printout follows. Followed by the OP:CCS-LSCLS output message.

RL = Retry later. May also include:
   - SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.

5. REFERENCES
Output Message(s):
OP:CCS-MON

Software Release: 5E16(1) and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests the monitoring action to be turned on, turned off, or the status of links and/or members and/or Flow Control Management (FCM) and/or Traffic Flow Management (TFM) for specified monitoring masks (or a combination thereof).

2. FORMAT

[1] OP:CCS,MON,REQTYPE={ON|OFF|STATUS}[,GSM=a] [,LS=b] [,MEMBER=c] [,MASK=d];

3. EXPLANATION OF MESSAGE

FCM = Monitoring issued for FCM.
TFM = Monitoring issued for TFM.
a = Specific common channel signaling (CCS) global switching module (GSM) number. If this parameter is not specified, then request is applied to all GSM(s), all linksets and all members on the GSM(s).
b = Report for specified signaling linkset. If this parameter is not specified, then request is applied to all linkset(s) and all members of these linksets. The parameter MEMBER will be ignored in this case.
c = Link member number. If this parameter is not specified, then request is applied to all link members of the given linkset. Refer to the APP:RANGES appendix.
d = Event mask. A default value of h'c0554, will be used if no value is specified with the request. Event masks for more specific needs may be formed by "OR-ing" values. Valid value(s):
  h'00004 = CCS7 link failure events.
  h'00010 = CCS7 Link restoration events.
  h'00040 = CCS7 network messages(except TFx).
  h'00100 = CCS7 TFx events.
  h'00400 = Manual out-of-service events.
  h'40000 = Changeover events
  h'80000 = Changeback events

Note: If brevity control is on, some of the reports might be lost. Brevity control can be inhibited to report all events on the ROP.

4. SYSTEM RESPONSE

NG = No good. May also include:
- INVALID/NONPROVISIONED LINKSET = This linkset not provisioned on the specified GSM.
- INVALID/NONPROVISIONED MEMBER = This member not provisioned in the specified LS.
- INVALID MASK REQUESTED = Refer to APP:PSU-SIG-MON appendix in the Appendixes section of the Output Messages manual for the list of valid masks for monitoring purposes.
- SM NOT EQUIPPED = The specified GSM is not equipped.

OK = The input message has been accepted. May also include:
- REQUEST ACCEPTED = The request has been accepted.

PF = Printout follows. The request has been accepted and an REPT:CCS-MON output message will follow.

RL = Retry later. May also include:
- SM NOT AVAILABLE = The specified GSM is not accessible.

**Software Release:** 5E15 and later  
**Command Group:** CCS  
**Application:** 5  
**Type:** Input

1. **PURPOSE**

Requests information about originating point codes that are provisioned:
- in the office.
- only as primary point codes (PC).
- with a specific PC.
- in the office for common network interface (CNI), with an optional PRIMARY parameter described below.
- in the office for a specific global switching module (GSM), with an optional PRIMARY parameter described below.
- in the office for all GSMs, with an optional PRIMARY parameter described below.

2. **FORMAT**

\[
\text{OP:CCS,OPC,} [\text{CNI}|\text{GSM}={\text{b} | \text{ALL}}]|\text{PC}=a\];
\]

3. **EXPLANATION OF MESSAGE**

**PRIMARY**
- Print only the primary point codes provisioned in the office.

**a**
- Specific point code (ANSI or AT&T format). Refer to the APP:POINT-CODE appendix in the Appendixes section of the Output Messages manual for interpretation.

**b**
- Common channel signaling (CCS) global switching module (GSM) number or ALL to print all GSMs provisioned in the office.

4. **SYSTEM RESPONSE**

**PF**
- Printout follows. The request has been accepted and an OP:CCS-OPC output message will follow.

**NG**
- No good. The syntax of a message is valid, but the message has been denied. May also include:
  - INVALID GSM SPECIFIED = Invalid GSM number specified by the craft.
  - INVALID PC SPECIFIED = Invalid point code specified by the craft.
  - NO CNI IN THE OFFICE = No CNI signaling platform in the office.
  - NO GSM IN THE OFFICE = No GSM is provisioned in the office.
  - NO SS7 SIGNALING AVAILABLE = No SS7 signaling is available in the office.

Common Channel Signaling Service Features
OP:CCS-ROUTE

Software Release: 5E15 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests the routing status for:

- one network, a range of networks, or ALL networks be reported based on the network route set. No ‘SM=’ field on the command line implies request for ALL GSMs.

- one cluster, a range of clusters, or ALL clusters be reported based on the cluster route set. No ‘SM=’ field on the command line implies request for ALL GSMs.

- one destination point code (DPC), a range of DPCs, or ALL DPCs be reported based on the member route set. No ‘SM=’ field on the command line implies request for ALL GSMs.

- one destination point code. If a member, cluster, or network route set is provisioned it's information shall be reported. If no member, cluster, or network route set is provisioned an error condition shall be reported.

- those route sets with restricted, prohibited, inaccessible and/or congested routes be reported. No ‘SM=’ field on the command line implies request for ALL GSMs.

- reports ALL networks, ALL clusters, ALL DPCs. No ‘SM=’ field on the command line implies request for ALL GSMs.

If no member, cluster, or network route set is provisioned an error condition shall be reported.

2. FORMAT

[1] OP:CCS,ROUTE,NETWORK,[NETID=a[&b]][,SM=h];
[2] OP:CCS,ROUTE,CLUSTER,[CLUID=c[&d]][,XLIST]{,SM=h};
[3] OP:CCS,ROUTE,DPC,[DPCVAL=e[&f]]{,SM=h};
[4] OP:CCS,ROUTE,DPCID=g[,SM=h];
[5] OP:CCS,ROUTE,ABNORMAL[,SM=h];
[5] OP:CCS,ROUTE,ALLRTE[,SM=h];

3. EXPLANATION OF MESSAGE

ALL = Report for all networks, clusters, or DPCs.

XLIST = Dynamic x-lists within the cluster route set.

a = Network number or the lower limit of a range of networks. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = The upper limit of a range of networks. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Cluster number or the lower limit of a range of clusters (ANSI or AT&T format). Refer to the APP:RANGES appendix in the Appendixes TRUNK & LINE MAINT section of the Input Messages manual.
d = The upper limit of a range of clusters (ANSI or AT&T format). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Destination point code (DPC) number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual.

f = The upper limit of a range of DPCs. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = A single DPC number.

h = Specific common channel signalling (CCS) global switching module (GSM) number from which the data is desired.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted. Followed by the OP:CCS-ROUTE output message. May also include:
   - MSG SENT TO SOME GSMS = Printout follows for GSMs the message has been sent to. The message could not be sent to all GSMs. Followed by the OP:CCS-ROUTE output message.

NG = No good. May also include:
   - NO GLOBAL SM = No GSM is provisioned in the office.
   - GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
   - SYSTEM BUSY = Resources unavailable to process request.

RL = Retry later. May also include:
   - SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.
   - GSM(S) UNAVAILABLE = Command cannot be processed fully because some GSMs are not accessible.
   - NO GSMS AVAILABLE = Command cannot be processed because the GSMS are not accessible.

APP:RANGES
Other Manual(s):
235-200-115  CNI Common Channel Signaling
235-200-116  Signaling Gateway Common Channel Signaling
1. PURPOSE

Requests status information for one or more signaling connection control part (SCCP) subsystem(s) at one or more destination point codes (DPCs).

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

```
OP:CCS,SCMG,SM=a[,DPCID=b[&c]][,SSN=d[&e]][,STATUS=f][,COUNT=g];
```

3. EXPLANATION OF MESSAGE

- **a**
  - Global switching module (GSM) number. CCS GSM number from which the data is desired.

- **b**
  - DPC or lower limit of a range of DPCs on which the subsystem(s) in question reside. When a range is specified, only equipped numbers in the range will be processed. If the DPC is not specified, a report will be generated for all DPCs.

  Note: The value must be entered as a 9 digit number. Refer to the APP:POINT-CODE appendix in the Appendixes section of the Input Messages manual for interpretation.

- **c**
  - Upper limit of a range of DPCs.

- **d**
  - SCCP subsystem number or lower range of subsystem numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If the subsystem number is not entered, a report will be generated for all subsystem numbers.

- **e**
  - Upper limit of a range of SCCP subsystem numbers.

- **f**
  - Subsystem status. Valid value(s):
    - ALW = Display only allowed subsystems.
    - PROH = Display only prohibited subsystems.

  If the status is not specified, both allowed and prohibited subsystems will be displayed.

- **g**
  - The maximum number of DPCs for which output is to be generated. The allowed range is 1 to 2048, with a default of 10.

4. SYSTEM RESPONSE

- **NG**
  - No good. NG acknowledgements are used when the syntax of a message is valid, but the message has been denied. Additional information is printed out to explain why the message was
denied. May also include:
- SCCP NOT RUNNING ON SM = SCCP is not running on the specified SM.
- SM SPECIFIED NOT GSM = The SM specified is not a GSM or SM does not exist.
- DPC OUT OF RANGE = DPCID specified is outside the range of valid values.
- INVALID DPC = DPCID specified is not provisioned.

PF
Printout follows. Followed by the OP:CCS-SCMG output message.

RL
Retry later. May also include:
- SM NOT AVAILABLE = Command cannot be processed because the GSM is not accessible.

235-190-120 Common Channel Signaling Service Features
OP:CCS-SLS

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE

Requests a display of the normal and current signaling link selection (SLS) distributions for all links currently
carrying traffic to the specified destination point code (DPC) or a display of the normal and current SLS distribution
of a link for a specific linkset (LS) or combined linkset (CLS) specified.

Note: This input message is applicable only for packet switching unit (PSU) platform CCS7.

2. FORMAT

OP:CCS,SLS[,SM=a]{,DPCID=b | SET=c};

3. EXPLANATION OF MESSAGE

a = Global switching module (GSM) number. CCS GSM number from which the data is desired. If no
SM number is specified and only one CCS GSM exists in the office, output will be produced for that
GSM. If multiple CCS GSMS exist in the office, the SM must be specified.

b = Specified DPC.

Note: The value must be entered as a 9 digit number. Refer to the APP:POINT-CODE
appendix in the Appendixes section of the Input Messages manual for
interpretation.

c = Specific LS or CLS number. Refer to the APP:RANGES appendix in the Appendixes section of
the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. May also include:
- GSM MISMATCH = The specified SM is not a GSM or the SM does not exist.
- NO GLOBAL SM = No GSM is provisioned in the office.
- NEED GSM NUMBER = SM was not specified in the input message, and the office has more than
  one GSM provisioned.
- SYSTEM BUSY = Resources unavailable to process request.

PF = Printout follows. Followed by the OP:CCS-SLS output message.

RL = Retry later. May also include:
- SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not
  accessible.

235-190-120  Common Channel Signaling Service Features

MCC Display Page(s):

1532 (CCS LINK SET SUMMARY)
1533 (CCS LINK SET MEMBER)
OP:CCS-TPC

**Software Release:** 5E14 and later
**Command Group:** CCS
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests the translation point code (TPC) for a single or range of translation types to be displayed.

Note: This input message is applicable only for the packet switching unit (PSU) platform CCS7.

2. **FORMAT**

```
OP:CCS,TPC,TYPE={a[&b]} [,SM=c];
```  

3. **EXPLANATION OF MESSAGE**

- **a** = A single translation type or lower limit of a range of translation types. The translation type has a range of 1-256. A single translation type or lower limit of a range of translation types is required.
- **b** = The upper limit of a range of translation types.
- **c** = The common channel signaling (CCS) global SM (GSM) number that the request is to be routed. This is an optional field if there is only one GSM in the office. It is a required field if there is more than one GSM in the office.

4. **SYSTEM RESPONSE**

- **NG** = No good. The syntax of a message is valid, but the message has been denied. Additional information is printed out to explain why the message was denied. May also include:
  - MULTIPLE SM's - SINGLE SM PARAMETER REQUIRED = There is more than one GSM provisioned in the office.
  - NO GSM WITH C7NATL IN THE OFFICE = There are no GSM with CCS provisioned in the office.

- **RL** = Retry later. May also include:
  - SM NOT AVAILABLE = Command cannot be processed because the specified GSM is not accessible.
  - SCCP NOT AVAILABLE ON GSM = SCCP is not running on this SM.
  - SYSTEM BUSY = Resources unavailable to process request.

- **PF** = Printout follows. The request has been accepted and is followed by an OP:CCS,TPC output message.

5. **REFERENCES**

Output Message(s):
OP:CCSCQ

Software Release: 5E14 and later
Command Group: CCS
Application: 5
Type: Input

1. PURPOSE
Determines whether the common channel signaling (CCS) automatic circuit query for CCS7 trunks is inhibited or allowed for the entire office, and the circuit query start time.

2. FORMAT
OP:CCSCQ;

3. EXPLANATION OF MESSAGE
No variables.

4. SYSTEM RESPONSE
PP = Printout follows. The request has been accepted, and will be followed by an OP CCSCQ output message.

5. REFERENCES

Input Message(s):

Other Manual(s):
235-190-120 Common Channel Signaling Service Features
OP:CFGSTAT-AM-A
Software Release: 5E14 - 5E16(1)
Command Group: MAINT
Application: 5,3B
Type: Input

1. PURPOSE
Requests output of configuration status information for administrative module (AM) hardware units. This request may optionally be constructed to output the status of a single unit, a list of units with a specified name and maintenance state, a list of all units with a particular maintenance state, or a list of all sub-devices of a specified complex.

2. FORMAT
OP:CFGSTAT[:a][,{b[=c][,d=e]}];

3. EXPLANATION OF MESSAGE

a = One of the following maintenance state definitions:
ACT = Active.
GROW = Being grown.
INIT = Initializing.
OFL = Off-line.
OOS = Out-of-service.
STBY = Standby.
UNAV = Unavailable.
UNEQIP = Unequipped.
If specified, then only units in that maintenance state specified will be listed.

b = Unit name. AM unit names are listed in the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

c = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

d = Subunit name if b=CU. AM control unit (CU) subunit names are listed in the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

e = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE
PF = Printout follows. Followed by OP:CFGSTAT output message.

RL = Retry later.

Application: 5,3B
Type: Input

1. PURPOSE

Requests output of configuration status information for administrative module (AM) hardware units. This request may optionally be constructed to output the status of a single unit, a list of units with a specified name and maintenance state, a list of all units with a particular maintenance state, or a list of all sub-devices of a specified complex.

2. FORMAT

OP:CFGSTAT[:a][,{b[=c][,d=e]}][:f=g];

3. EXPLANATION OF MESSAGE

a = Maintenance state. Valid value(s):
   ACT = Active.
   GROW = Being grown.
   INIT = Initializing.
   OFL  = Off-line.
   OOS  = Out-of-service.
   STBY = Standby.
   UNAV = Unavailable.
   UNEQIP = Unequipped.

   If specified, then only units in the maintenance state specified will be listed.

b = Unit name. AM unit names are listed in the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

c = Unit number. Refer to the APP:MEM-NUM-UNIT appendix in the Appendixes section of the Input Messages manual.

d = Subunit name if variable 'b' equals "CU". AM control unit (CU) subunit names are listed in the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

e = Subunit number. Refer to the APP:MEM-NUM-CU appendix in the Appendixes section of the Input Messages manual.

f = Device name.
   VTTY = Virtual teletypewriter (TTY).
   VTTYC = Virtual TTY controller.
   VIOP = Virtual input/output processor (IOP).

g = Device number. Valid value(s):

<table>
<thead>
<tr>
<th>'f'</th>
<th>then 'g' =</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTTY</td>
<td>0-255</td>
</tr>
<tr>
<td>VTTYC</td>
<td>0-15</td>
</tr>
</tbody>
</table>
4. SYSTEM RESPONSE

PF = Printout follows. Followed by OP:CFGSTAT output message.

RL = Retry later.

OP:CFGSTAT-CM-A

Software Release: 5E14 only
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests a printout of the configuration status of the specified communications module (CM) unit. Configuration requests of QPIPEs, QLNKs, and ISMQLNKs associated with the quad link packet switch (QLPS) in a network are available using the OP:QNETSTAT input message.

Format 1 requests the configuration status of the specified CM unit, regardless of its current maintenance state. Format 2 requests the configuration status of the specified CM units, excluding units in growth (NOGRO) and/or OOS family-of-equipment (NOFE) state. Format 3 requests the configuration status of all CM units that are in the specified maintenance state. Format 4 requests the configuration status of all unavailable CM units. If the NOGRO option is specified, units in the growth state are not included. Format 5 requests the configuration status of all CM units or all out-of-service (OOS) CM units, excluding units in growth (NOGRO) and/or OOS family-of-equipment (NOFE) state.

2. FORMAT

[1]  OP:CFGSTAT, {MSGS=a|MSCU=a|CMP=a-b|MMP=a-b|FPC=a|PPC=a|QGP=a-j|QGL=a-j-b

|NCREF,XC=c|NCREF,PRIM=c|NCREF,SEC=c|NCREF,REFn=c|NCOSC=c|OSCXC=c
|CLNK=d-c-f-a|DLI=d[&&e]};

[2]  OP:CFGSTAT, {MSGS=a|ONTC=c|DLI=d[&e]-c|NLI=d-i-c
|TMSLNK=c-g[&h]}, {NOFE|NOGRO};

[4]  OP:CFGSTAT, CM, UNAV[, NOGRO];

[5]  OP:CFGSTAT, CM[, ALL|OOS], {NOGRO|NOFE};

3. EXPLANATION OF MESSAGE

ACT  = Report on units that are in an active state.
ALL  = Report status of CM/QLPSNW units of all states.
CLNK = Communication link.
CMP  = Communication module processor.
FPC  = Foundation peripheral controller.
FRC  = Report on unit that are in a forced active state.
MMP  = Module message processor.
MSCU = Message switch control unit.
MSGS = Message switch.
NCOSC = Network clock oscillator.
NCREF, PRIM = Network clock primary reference. The office is equipped with network clock 1 (NC1).
NCREF, REFn = Network clock reference number ‘n’, where n = 1-8. The office is equipped with network clock 2 (NC2).
NCREF, SEC = Network clock secondary reference. The office is equipped with network clock 1 (NC1).
NCREF, XC = Network clock cross-couple reference.
NLI = Network link interface. Valid for SM-2000 only.
NOFE = Report on units that are not OOS family of equipment. When specified, this option prevents the listing of circuits that are OOS family-of-equipment (FE).
NOGRO = Report on units that are no growth. When specified, this option prevents the listing of circuits in growth states.
ONTC = Office network and timing complex.
ONTCCOM = Office network and timing complex (ONTC) common controller.
OOS = Report on units that are in an out-of-service state.
OSCXC = Oscillator cross-couple.
PPC = Pump peripheral controller.
PWRALM = Report on units that are in a power alarm state.
PWROFF = Report on units that are in a power off state.
QGL = Quad-link gateway link.
QGP = Quad-link gateway processor.
QLPS = Quad-link packet switch.
QTMSLNK = Quad-link packet switch (QLPS) time multiplexed switch link.
STBY = Report on units that are in a standby state.
TMSLNK = Time multiplexed switch link.
UNAV = Report on units that are in a forced unavailable state.

a = MSGS side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c  = ONTC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = MMP unit number associated with the specified CLNK. Valid value(s):
   0  = MMP that handles the even control time slot associated with the SM/SM-2000.
   1  = MMP that handles the odd control time slot associated with the SM/SM-2000.

g  = Time multiplexed switch (TMS) link number, or lower limit of a range of link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = Upper limit of a range of TMS link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i  = NLI number.

j  = QGP number.

k  = QLPS number.

l  = Source SM/SM-2000 number. Default is report status of all units associated with all end points. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m  = Destination SM/SM-2000 number. Default is report status of QLNKs and ISMQLNKs to all other end points from specified source end point. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The message syntax is valid, but the request conflicts with the current system or equipment status. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF  = Printout follows. An OP:CFGSTAT-CM output message follows in response to the request.

RL  = Retry later. The request cannot be executed now due to unavailable system resources.

3. EXPLANATION OF MESSAGE

ACT = Report on units that are in an active state.
ALL = Report status of CM/QLPSNW units of all states.
CLNK = Communication link.
CMP = Communication module processor.
FPC = Foundation peripheral controller.
FRC = Report on unit that are in a forced active state.
MMP = Module message processor.
MSCU = Message switch control unit.
MSGS = Message switch.
NC = Network clock model 3 (NC3).
NCOSC = Network clock oscillator.
NCREF, PRIM = Network clock primary reference. The office is equipped with network clock 1 (NC1).
NCREF, REF^n = Network clock reference number 'n', where n = 1-8. The office is equipped with network clock 2 (NC2) or network clock 3 (NC3).
NCREF, SEC = Network clock secondary reference. The office is equipped with network clock 1 (NC1).
NCREF, XC = Network clock cross-couple reference. Not valid for network clock 3 (NC3).
NLI = Network link interface. Valid for SM-2000 only.
NOFE = Report on units that are not OOS family of equipment. When specified, this option prevents the listing of circuits that are OOS family-of-equipment (FE).
NOGRO = Report on units that are no growth. When specified, this option prevents the listing of circuits in growth states.
ONTC = Office network and timing complex.
ONTCCOM = Office network and timing complex (ONTC) common controller.
OOS = Report on units that are in an out-of-service state.
OSCXC = Oscillator cross-couple. Not valid for network clock 3 (NC3).
PPC = Pump peripheral controller.
PWRALM = Report on units that are in a power alarm state.
PWROFF = Report on units that are in a power off state.
QGL = Quad-link gateway link.
QGP = Quad-link gateway processor.
QLPS = Quad-link packet switch.
QTMSLNK = Quad-link packet switch (QLPS) time multiplexed switch link.
STBY = Report on units that are in a standby state.
TMSLNK = Time multiplexed switch link.
UNAV = Report on units that are in a forced unavailable state.
a = MSGS side. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

b = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = ONTC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = MMP unit number associated with the specified CLNK. Valid value(s):
   0 = MMP that handles the even control time slot associated with the SM/SM-2000.
   1 = MMP that handles the odd control time slot associated with the SM/SM-2000.

g = Time multiplexed switch (TMS) link number, or lower limit of a range of link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = Upper limit of a range of TMS link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = NLI number.

j = QGP number.

k = QLPS number.

l = Source SM/SM-2000 number. Default is report status of all units associated with all end points. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Destination SM/SM-2000 number. Default is report status of QLNKs and ISMQLNKs to all other end points from specified source end point. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Reference type. This is only legal for NC3. This is only required if the same reference number is equipped with different reference types. The values are:
   10M = 10 MHz analog clock reference.
   2M = 2.048 MHz analog clock reference.
   CC = 64 KHz Composite clock Reference.
   DGTL = Digital clock reference.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request conflicts with the current system or equipment status. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. An OP:CFGSTAT-CM output message follows in response to the request.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

</table>
STBY = Report on units that are in a standby state.
TMSFP = Time multiplexed switch fabric pair number. This option is not valid for CM2 offices.
TMSLNK = Time multiplexed switch link.
UNAV = Report on units that are in a forced unavailable state.
a = MSGS side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = ONTC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f = MMP unit number associated with the specified CLNK. Valid value(s):
   0 = MMP that handles the even control time slot associated with the SM/SM-2000.
   1 = MMP that handles the odd control time slot associated with the SM/SM-2000.
g = Time multiplexed switch (TMS) link number, or lower limit of a range of link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
h = Upper limit of a range of TMS link numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
i = NLI number, or lower limit of a range of NLI numbers.
j = QGP number.
k = QLPS number.
l = Source SM/SM-2000 number. Default is report status of all units associated with all end points. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
m = Destination SM/SM-2000 number. Default is report status of QLNKs and ISMQLNKs to all other end points from specified source end point. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Reference type. This is only legal for NC3. This is only required if the same reference number is equipped with different reference types. Valid value(s):
   10M = 10 MHz analog clock reference.
   2M = 2.048 MHz analog clock reference.
   CC = 64 KHz Composite clock Reference.
   DGTL = Digital clock reference.
o = Time multiplexed switch fabric pair (TMSFP) number. For CM2 offices, when used with the
TMSLNK option, this parameter is optional, and when entered, must always be TMS fabric pair 0. For CM3 offices, when used with the TMSLNK option, this parameter is required to identify a TMS link. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ p \]

= Upper limit of a range of NLI numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG

= No good. The message syntax is valid, but the request conflicts with the current system or equipment status. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Input Messages manual for a list of possible reasons for denying the request.

PF

= Printout follows. An OP:CFGSTAT-CM output message follows in response to the request.

RL

= Retry later. The request cannot be executed now due to unavailable system resources.

1900,X SMX CLNKs
OP:CFGSTAT-SM

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests the current configuration status (CFGSTAT) of switching module (SM) circuits. The OP:CFGSTAT-SM output message will be printed, and will list the SMs that are in the specified state.

Note: If the hardware status is required for the module controller/timeslot interchange (MCTSI), use the OP:OFFNORM input message.

2. FORMAT

OP:CFGSTAT,SM=a[&b],c[,NOFE|NOPRINT];

3. EXPLANATION OF MESSAGE

NOFE = Not family of equipment. When specified with the OOS state (variable 'c'), this option prevents the listing of circuits that are OOS family of equipment (FE).

NOPRINT = No print. When specified with the OOS state (variable 'c'), this option prevents the printing of the OOS report headers for those SMs that have no OOS units.

a = SM number, or the lower limit of a range of SM numbers.

b = The upper limit of a range of SM numbers.

c = Current state:
   ACT = List all active circuits in the SM.
   ALINKS = List all out-of-service A-links in the SM.
   ALL = List status of all circuits in the SM.
   GROWTH = List all circuits in growth state in the SM(s).
   OOS = List all out-of-service circuits in the SM(s).
   STBY = List all standby circuits in the SM(s).
   SPARE = List all integrated services line unit (ISLU) active spare line cards and corresponding faulty line cards.

Note 1: The range option is available only for GROWTH, STBY and OOS states.
Note 2: If a large amount of records is requested, then some records may not be printed on the receive-only printer (ROP) due to the finite queuing capability.

4. SYSTEM RESPONSE

NG = No good. May also include:
   - SM DOES NOT EXIST = The message syntax is valid, but the requested SM is not in the system.
   - SM UNEQUIPPED = The message syntax is valid, but the requested SM is unequipped.
UNIT DOES NOT EXIST = The message syntax is valid, but the requested unit is not in the system.

PF = Printout follows. An OP:CFGSTAT-SM output message will follow in response to the request.

RL = Retry later. The request cannot be executed now. A lack of system resources has resulted in loss of communication to the requested SM.

Application: 5
Type: Input

1. PURPOSE

Requests that the active carrier group alarms from integrated carrier facilities terminating on digital facility interfaces (DFIs), integrated digital carrier units (IDCUs), remote integrated services line units (RISLUs), non-integrated carrier facilities monitored by metallic service unit (MSU) scan points, and digital networking unit-synchronous optical network (SONET)(DNU-S) be printed. An optional parameter allows for an OP:CGA request for a selected SM or a range of SMs, or for a selected electrical carrier level 1 SONET termination equipment (EC1STE) interface.

2. FORMAT

OP:CGA[,SM=a[&b]|EC1STE=c-d-e-f];

3. EXPLANATION OF MESSAGE

a  = Switching module (SM) number or the lower limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = Upper limit of a range of SM numbers. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = DNU-S number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG  = No good. The request has been denied.

PF  = Printout follows. The request has been accepted. The OP:CGA output message follows containing the list.

RL  = Retry later. The request cannot be executed now because the system is busy. Valid value(s):

- OP ALM ALL CURRENTLY IN PROGRESS = The OP:ALM input message with the ALL option is currently running, making resources unavailable for OP:CGA.

- OP CGA CURRENTLY IN PROGRESS = A previous OP:CGA input message is currently running, making resources unavailable for this OP:CGA input message.

**OP:CHANMAP-A**

**Software Release:** 5E14 - 5E16(1)
**Command Group:** TRACE
**Application:** 5
**Type:** Input

1. **PURPOSE**

Request output containing the busy/idle status of T1 facility channels, and how they are populated with circuit switched voice (CSV) and circuit switched data (CSD) (DS0 and/or wideband) calls. This is provided as a front-end for the utility call trace (UCT) mechanism. OP:CHANMAP can be used to determine which channel is of interest, then the UCT mechanism can be used to find information about the complete path through the network.

Conversely, the UCT mechanism can be used on a channel of a wideband call to determine originating and terminating facilities. Then OP:CHANMAP can be used on each facility to determine other channels that are used by the same wideband call. This enables the user to avoid doing a utility call trace for each channel of a wideband call.

2. **FORMAT**

[1] OP:CHANMAP,DFAC=a-b-c-d;

[2] OP:CHANMAP,DS1SFAC=a-e-f-h-g-i-j;

3. **EXPLANATION OF MESSAGE**

a = Switching module (SM) number.
b = Digital line and trunk unit (DLTU) number.
c = Digital facility interface (DFI) number.
d = Facility (FAC) number.
e = Digital networking unit (DNU) - synchronous optical network (SONET) (DNU-S) number.
f = Data group number.
g = Synchronous transport signal (STS) number.
h = SONET termination equipment (STE) facility number.
i = Virtual tributary group (VTG) number.
j = Virtual tributary member (VTM) number.

4. **SYSTEM RESPONSE**

NG = No good. Valid value(s):
   - REASON FOR NG = One or more arguments are not within legal range.

PF = Printout follows. Valid value(s):
   - EVENT n = The request has been accepted and is being processed. One or more OP:CHANMAP output messages will follow.

OP:CONV-A

Software Release: 5E14 only
Command Group: TRKLN
Application: 5
Type: Input

1. PURPOSE

Requests a conversion (translation) for a particular trunk, line, data link, or Operator Services Position System port (OSPSPORT). This message is used to obtain information about a trunk, line, data link, or OSPSPORT.

These units can be specified using either the terminal or logical identifier most suitable. The information can consist of any combination of the following:
- Equipment number.
- Directory number (DN).
- Trunk group and member number (TKGMN).
- Multi-line hunt group and member number (MLHG).
- Digital subscriber line (DSL).
- DSL group and member number (DSLGM).
- DSL-channel (CH).
- Logical port (PORT).
- Primary rate interface group (PRIGRP).
- IDCU Extended operations channel (IDCUEOC).
- IDCU Time-slot management channel (IDCUTMC) and the physical location.
- DNU-S Extended operations channel (DNUSEOC).
- DNU-S Time-slot management channel (DNUSTMC) and the physical location.
- Logical test port number (LTP).
- Scan point number (SPN).

The physical location is the actual location (aisle, bay, and so forth) of the trunk, line, data link, or OSPSPORT within the building. Since SLENs, INENs, and ILENs are not physically located in the office, no physical location information is available for SLENs, INENs, and ILENs.

For shared DNs (SHDN), the DN or MLHG specified must be a primary DN or MLHG, or the request is rejected.

Format 1 applies to all DSL lines, data links, and OSPSPORTs for which channel type is an option.

Format 2 applies to DNUSEOC, IDCUEOC, LEN, LTP, NEN, PRIGRP, PSUEN, recorded announcement frame (RAF), service announcement system (SAS), SLEN, SPN, TEN, TKGMN, DNUSTMC, and IDCUTMC. which do not allow channel type as an option.

2. FORMAT

[1] OP:CONV,a[,CH=y1];
[2] OP:CONV,b;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Equipment number or identifier. Valid value(s):
<table>
<thead>
<tr>
<th>b</th>

v\(^1\) = Circuit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

w\(^1\) = Trunk group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

x\(^1\) = Trunk member number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

y\(^1\) = Channel identifier; D (default), B1, or B2. If the default or the D-channel is specified, the entire DSL is identified. If a channel other than the D-channel is specified, only that channel is identified.

z\(^1\) = Digital signal level 0 (DS0). Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

a\(^2\) = Line board number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

b\(^2\) = Line circuit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

c\(^2\) = PSU unit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

d\(^2\) = PSU shelf number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

e\(^2\) = PSU channel group number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^2\) = PSU channel group member number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^2\) = Line group controller number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^2\) = Integrated services line unit (ISLU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^2\) = Integrated services line unit model 2 (ISLU2) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^2\) = Access interface unit (AIU) number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^2\) = AIU pack number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^2\) = AIU circuit number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^2\) = IDCUTMC ID number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^2\) = DNUSEOC ID number. Refer to the APP: RANGES appendix in the Appendixes section of the Input Messages manual.
= DNUSTMC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ p^2 \] = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ q^2 \] = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\[ PF \] = Printout follows. The request has been accepted and the OP:CONV output message follows.

\[ RL \] = Retry later. The request has been denied, probably due to system load. The input message OP:JOBSTATUS can be used to determine if the RL was because the maximum number of request jobs are active.

**Software Release:** 5E15 only
**Command Group:** TRKLN
**Application:** 5
**Type:** Input

1. **PURPOSE**

Requests a conversion (translation) for a particular trunk, line, data link, or operator services position system port (OSPSPORT). This message is used to obtain information about a trunk, line, data link, or OSPSPORT.

These units can be specified using either the terminal or logical identifier most suitable. The information can consist of any combination of the following:
- Equipment number.
- Directory number (DN).
- Trunk group and member number (TKGMN).
- Multi-line hunt group and member number (MLHG).
- Digital subscriber line (DSL).
- DSL group and member number (DSLGM).
- DSL-channel (CH).
- Logical port (PORT).
- Primary rate interface group (PRIGRP).
- IDCU extended operations channel (IDCUEOC).
- IDCU time-slot management channel (IDCUTMC) and the physical location.
- DNU-S extended operations channel (DNUSEOC).
- DNU-S time-slot management channel (DNUSTMC) and the physical location.
- Logical test port number (LTP).
- Scan point number (SPN).
- Optical Interface unit (OIU).

The physical location is the actual location (aisle, bay, and so forth) of the trunk, line, data link, or OSPSPORT within the building. PLTENs have 2 physical locations, one for the active side and one for the standby side. Since SLENs, INENs, and ILENs are not physically located in the office, no physical location information is available for SLENs, INENs, and ILENs.

For shared DNs (SHDN), the DN or MLHG specified must be a primary DN or MLHG, or the request is rejected.

Format 1 applies to all DSL lines, data links, and OSPSPORTs for which channel type is an option.

Format 2 applies to DNUSEOC, IDCUEOC, line equipment number (LEN), LTP, network equipment number (NEN), PRIGRP, packet switching unit equipment number (PSUEN), PLTEN, recorded announcement frame (RAF), service announcement system (SAS), SLEN, SPN, TEN, TKGMN, DNUSTMC, OIU and IDCUTMC, which do not allow channel type as an option.

2. **FORMAT**

### c

= Data link (group) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### d

= Relative link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### e

= Telephone number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### f

= Operator service center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### g

= Relative position number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### h

= Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### i

= Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### j

= Digital facility interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

### k

= Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual. If this is a DFI-2, channels 1-24 are associated with facility T1 A and channels 25-48 are associated with facility T1 B. Otherwise, there is only one facility.
= Member number of the MLHG or line time slot bridging (LTSB) line. For MLHG the DN specified should be the main DN for the group and the member number specifies which member of the group is converted. For LTSB a member number of '1' converts the lead line, and a member number of '2' converts the associate line. If no member number is specified for 1-DN LTSB, both lines are converted. If no member number is specified for 2-DN LTSB, the line associated with the DN entered is converted.

m = PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = EIS identifier (ID) on which the CPDL terminates. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = External data link (member) number relative to the EIS. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = IDCU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Remote terminal (RT) number or IDCU digital signal level 1 (DS1) serving PUB43801 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = RT line number or PUB43801 channel. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = Logical port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Logical port type. Valid value(s):

<table>

y = Multi-line hunt group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = Hunt group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a = Force management center number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
b¹ = IDCUEOC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c¹ = Grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d¹ = Switch board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e¹ = Switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f¹ = Level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g¹ = Logical test port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h¹ = Digital networking unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i¹ = Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j¹ = Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k¹ = Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l¹ = PRI group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m¹ = DSU2-RAF or SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n¹ = Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o¹ = Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p¹ = Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q¹ = Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r¹ = Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s¹ = Scan point number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t¹ = Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input
Messages manual.

u

= Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v

= Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w

= Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x

= Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y

= Channel identifier; D (default), B1, or B2. If the default or the D-channel is specified, the entire DSL is identified. If a channel other than the D-channel is specified, only that channel is identified.

z

= Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a

= Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b

= Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c

= PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d

= PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e

= PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f

= PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g

= Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h

= Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i

= Integrated services line unit model 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j

= Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k

= AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l

= AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\( m^2 \) = IDCUTMC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^2 \) = DNUSEOC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o^2 \) = DNUSTMC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p^2 \) = SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( q^2 \) = Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( r^2 \) = PLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( s^2 \) = PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( t^2 \) = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( u^2 \) = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( v^2 \) = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w^2 \) = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x^2 \) = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y^2 \) = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z^2 \) = Virtual network announcement resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^3 \) = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^3 \) = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c^3 \) = STM-1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^3 \) = High order virtual container number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^3 \) = Low order virtual container group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
f₃ = Low order virtual container member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

1. PURPOSE

Requests a conversion (translation) for a particular trunk, line, data link, or operator services position system port (OSPSPORT). This message is used to obtain information about a trunk, line, data link, or OSPSPORT.

These units can be specified using either the terminal or logical identifier most suitable. The information can consist of any combination of:
- Equipment number.
- Directory number (DN).
- Trunk group and member number (TKGMN).
- Multi-line hunt group (MLHG) and member number.
- Digital subscriber line (DSL).
- DSL group and member number (DSLGM).
- DSL-channel (CH).
- Logical port (PORT).
- Primary rate interface group (PRIGRP).
- IDCU extended operations channel (IDCUEOC).
- IDCU time-slot management channel (IDCUTMC) and the physical location.
- DNUS extended operations channel (DNUSEOC).
- DNU-S time-slot management channel (DNUSTMC) and the physical location.
- Logical test port (LTP) number.
- Scan point number (SPN).
- Optical interface unit (OIU).

The physical location is the actual location (aisle, bay, and so forth) of the trunk, line, data link, or OSPSPORT within the building. PLTENs have 2 physical locations, one for the active side and one for the standby side. Since SLENs, INENs, and ILENs are not physically located in the office, no physical location information is available for SLENs, INENs, and ILENs.

For shared DNs (SHDN), the DN or MLHG specified must be a primary DN or MLHG, or the request is rejected.

Format 1 applies to all DSL lines, data links, and OSPSPORTs for which channel type is an option.

Format 2 applies to ATM packet pipe equipment number (ATMPP), DNUSEOC, IDCUEOC, line equipment number (LEN), LTP, network equipment number (NEN), PRIGRP, packet switching unit equipment number (PSUEN), PLTEN, recorded announcement frame (RAF), service announcement system (SAS), SLEN, SPN, TEN, TKGMN, DNUSTMC, OIUSECN and IDCUTMC which do not allow channel type as an option.

APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i
= Data group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j
= Synchronous transport signal (STS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k
= Virtual tributary group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l
= PRI group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m
= DSU2-RAF or SAS unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n
= Announcement port number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o
= Digital carrier line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p
= Unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q
= Service group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r
= Board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s
= Scan point number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t
= Trunk unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u
= Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v
= Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w
= Trunk group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x
= Trunk member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y
= Channel identifier; D (default), B1, or B2. If the default or the D-channel is specified, the entire DSL is identified. If a channel other than the D-channel is specified, only that channel is identified.

z
= Digital signal level 0 (DS0). Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU channel group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PSU channel group member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Integrated services line unit (ISLU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Integrated services line unit model 2 (ISLU2) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= IDCUTMC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= DNUSEOC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= DNUSTMC ID number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= SONET termination equipment (STE) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= Virtual tributary member number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

= PCT facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
t² = Tributary number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u² = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v² = Virtual analog line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w² = Virtual BRI line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x² = Virtual trunk facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y² = Virtual trunk channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z² = OIU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a³ = Protection group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b³ = OC-3 STE number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c³ = STS level 1 (STS-1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f³ = Link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g³ = Virtual connection identifier (VCID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF = Printout follows. The request has been accepted and the OP:CONV output message follows.

RL = Retry later. The request has been denied, probably due to system load. The input message OP:JOBSTATUS can be used to determine if the RL was because the maximum number of request jobs are active.

5. REFERENCES

\( b \) = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( c \) = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d \) = Line unit grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e \) = Grid board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f \) = Line unit A-link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g \) = Grid board switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h \) = UTD number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i \) = Grid board switch level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j \) = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k \) = Service group (SG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l \) = MSU board slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m \) = Trunk equipment number (TEN) board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Trunk unit (TU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = DCTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Remote integrated service line unit (RISLU) DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Integrated digital circuit unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a1 = Remote switching module (RSM) DFIH number, inter-RSM CDFI number, or inter-office trunk DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b1 = FAC number. The FAC number is the T1 facility number on a remote DFI (RDFI), CDFI, or DFI (0-1).

c1 = Local digital service unit (LDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d1 = Electrical line interface (ELI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e1 = PIDB or direct DPIDB pair number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f1 = Integrated facility (IFAC) number. Refer to the APP:RANGES appendix in the Appendixes section
of the Input Messages manual.

\( g^1 \) = ISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h^1 \) = High-level service circuit (HLSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^1 \) = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^1 \) = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k^1 \) = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l^1 \) = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m^1 \) = PIDB pair number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^1 \) = Access network board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o^1 \) = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p^1 \) = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( q^1 \) = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( r^1 \) = Metallic access board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( s^1 \) = MAB board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( t^1 \) = MCTSI unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( u^1 \) = MTIB number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( v^1 \) = PMU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w^1 \) = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x^1 \) = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
y\(^1\) = Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z\(^1\) = RAF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a\(^2\) = RCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b\(^2\) = RCOSC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c\(^2\) = RCOXC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\(^2\) = RCREF to be stored. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\(^2\) = RCXC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^2\) = RLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^2\) = RVPT circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^2\) = SLC\textsuperscript{®} 96 digital facility interface (SDFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^2\) = Global digital service unit (GDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^2\) = TTFCOM board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^2\) = Digital service unit (DSU) board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^2\) = LDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^2\) = SAS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^2\) = Digital Networking Unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^2\) = Data Group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^2\) = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\(^2\) = SFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
\[r^2\] = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[s^2\] = SONET Termination Equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[t^2\] = Synchronous Transport Signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[u^2\] = VT1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[v^2\] = Distribute board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[w^2\] = Scan point board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[x^2\] = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[y^2\] = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[z^2\] = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[a^3\] = GDSF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[b^3\] = Subscriber line instrument measuring (SLIM) unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[c^3\] = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[d^3\] = Common data and control controller (COMDAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[e^3\] = Line pack (LP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[f^3\] = Ring generator (RG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[g^3\] = Timeslot group (TSGRP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[h^3\] = Site identification (SID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[i^3\] = Remote Terminal (RT) Facility (FAC) circuit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[j^3\] = Metallic access test bus number. Refer to the APP:RANGES appendix in the Appendixes section
of the Input Messages manual.

k\(^3\) = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^3\) = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^3\) = RSM Number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^3\) = Host umbilical(UMBIL) Number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^3\) = peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^3\) = peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the OP:CONV-EXT output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Line unit grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Grid board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Line unit A-link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

G = Grid board switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = UTD number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Grid board switch level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Service group (SG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = MSU board slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Trunk equipment number (TEN) board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
n = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Trunk unit (TU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = DCTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Remote integrated service line unit (RISLU) DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Integrated digital circuit unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[a\] = Remote switching module (RSM) DFIH number, inter-RSM CDFI number, or inter-office trunk DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[b\] = FAC number. The FAC number is the T1 facility number on a remote DFI (RDFI), CDFI, or DFI (0-1).

\[c\] = Local digital service unit (LDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[d\] = Electrical line interface (ELI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[e\] = PIDB or direct DPIDB pair number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
= Integrated facility (IFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = ISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = High-level service circuit (HLSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = PIDB pair number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Metallic access board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = MAB board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = MCTSI unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = MTIB number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = PMU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
y\(^1\) = Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z\(^1\) = RAF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a\(^2\) = RCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b\(^2\) = RCOSC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c\(^2\) = RCOXC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\(^2\) = RCREF to be stored. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\(^2\) = RCXC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\(^2\) = RLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\(^2\) = RVPT circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\(^2\) = SLC\(^\circledR\) 96 digital facility interface (SDFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\(^2\) = Global digital service unit (GDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\(^2\) = TTFCOM board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\(^2\) = Digital service unit (DSU) board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\(^2\) = LDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\(^2\) = SAS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\(^2\) = Digital Networking Unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\(^2\) = Data Group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\(^2\) = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\(^2\) = SFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

r² = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s² = SONET Termination Equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t² = Synchronous Transport Signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u² = VT1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v² = Distribute board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w² = Scan point board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x² = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y² = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z² = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a³ = GDSF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b³ = Subscriber line instrument measuring (SLIM) unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c³ = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d³ = Common data and control controller (COMDAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e³ = Line pack (LP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f³ = Ring generator (RG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g³ = Timeslot group (TSGRP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h³ = Site identification (SID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j³ = Metallic access test bus number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k³ = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l³ = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m³ = RSM Number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n³ = Host umbilical(UMBIL) Number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o³ = peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p³ = peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q³ = Virtual network conference resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r³ = Peripheral Line and Trunk Unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s³ = Peripheral Control Facility Interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t³ = Peripheral Control Facility Interface (PCTFI) Link Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u³ = Peripheral Control Facility Interface Link Tributary (TRIB) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v³ = Inter-Working Gateway (IWG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w³ = Inter-Working Gateway Link Interface (IWGLI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x³ = Inter-Working Gateway Facility (IWGFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.

PF = Printout follows. Followed by the OP:CONV-EXT output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.
5. REFERENCES

Output Message(s):

OP : CONV–EXT

Input Appendix(es):

APP : RANGES
OP:CONV-EXT-C

**Software Release:** 5E16(1) and later
**Command Group:** SM
**Application:** 5
**Type:** Input

### 1. PURPOSE

Requests that translation information for a particular circuit, from its external identifier to its internal circuit name, be output.

The translation from external identifier to internal circuit name supports only the switching module (SM) circuits. Dual link interface (DLI)/network link interfaces (NLIs) are considered part of the communication module (CM), and are not supported. Remote link interfaces (RLIs) are supported because they are SM circuits.

For external to internal translation, the output is the circuit's internal circuit name in hexadecimal format.

### 2. FORMAT

```
OP:CONV,EXT,a-[,NETINTF=a];
```

### 3. EXPLANATION OF MESSAGE

**Note:** Refer to the Acronym section of the Output Messages manual for the full expansion of acronyms shown in the format.

b = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
d = Line unit grid number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Grid board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = Line unit A-link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = Grid board switch number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h = UTD number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i = Grid board switch level number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j = Metallic service unit (MSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k = Service group (SG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l = MSU board slot number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m = Trunk equipment number (TEN) board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n = Digital line and trunk unit (DLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o = Digital facilities interface (DFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Trunk unit (TU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = DCLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = DCTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = Circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = TEN circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = Remote integrated service line unit (RISLU) DLTU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = DFIH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

\( w \) = TMC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x \) = Integrated digital circuit unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y \) = RT number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( z \) = EOC number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( a^1 \) = Remote switching module (RSM) DFIH number, inter-RSM CDFI number, or inter-office trunk DFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( b^1 \) = FAC number. The FAC number is the T1 facility number on a remote DFI (RDFI), CDFI, or DFI (0-1).

\( c^1 \) = Local digital service unit (LDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( d^1 \) = Electrical line interface (ELI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( e^1 \) = PIDB or direct DPIDB pair number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( f^1 \) = Integrated facility (IFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( g^1 \) = ISLU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( h^1 \) = High-level service circuit (HLSC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^1 \) = Common controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^1 \) = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k^1 \) = Line group controller number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l^1 \) = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m^1 \) = PIDB pair number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^1 \) = Access network board. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
o = ISTF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p = Channel board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q = Channel number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r = Metallic access board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

s = MAB board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t = MCTSI unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u = MTIB number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v = PMU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y = Protocol handler number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z = RAF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a = RCLK side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = RCOSC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = RCOXC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = RCREF to be stored. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = RCXC side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f = RLI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g = RVPT circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
Messages manual.

\( h^2 \) = SLC\(^\text{®} \) 96 digital facility interface (SDFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( i^2 \) = Global digital service unit (GDSU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( j^2 \) = TTFCOM board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( k^2 \) = Digital service unit (DSU) board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( l^2 \) = LDSF number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( m^2 \) = SAS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( n^2 \) = Digital Networking Unit - SONET (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( o^2 \) = Data group (DG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( p^2 \) = Common data number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( q^2 \) = SFI number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( r^2 \) = TMUX number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( s^2 \) = SONET termination equipment (STE) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( t^2 \) = Synchronous transport signal (STS) facility number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( u^2 \) = VT1 number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( v^2 \) = Distribute board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( w^2 \) = Scan point board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( x^2 \) = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\( y^2 \) = Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
z\textsuperscript{3} = Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a\textsuperscript{3} = GDSF unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b\textsuperscript{3} = Subscriber line instrument measuring (SLIM) unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c\textsuperscript{3} = Access interface unit (AIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d\textsuperscript{3} = Common data and control controller (COMDAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e\textsuperscript{3} = Line pack (LP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f\textsuperscript{3} = Ring generator (RG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g\textsuperscript{3} = Timeslot group (TSGRP) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h\textsuperscript{3} = Site identification (SID) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i\textsuperscript{3} = Remote terminal (RT) facility (FAC) circuit. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

j\textsuperscript{3} = Metallic access test bus number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

k\textsuperscript{3} = Virtual tributary group (VTG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

l\textsuperscript{3} = Virtual tributary member (VTM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

m\textsuperscript{3} = RSM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

n\textsuperscript{3} = Host umbilical (UMBIL) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

o\textsuperscript{3} = Peripheral control and timing data exchanger unit (PDXU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

p\textsuperscript{3} = Peripheral control and timing data exchanger (PCTDX) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

q\textsuperscript{3} = Virtual network conference resource number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

r\textsuperscript{3} = Peripheral line and trunk unit (PLTU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
s³ = Peripheral control facility interface (PCTFI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

t³ = Peripheral control facility interface (PCTFI) link side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

u³ = Peripheral control facility interface link tributary (TRIB) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

v³ = Inter-working gateway (IWG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

w³ = Inter-working gateway link interface (IWGLI) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

x³ = Inter-working gateway facility (IWGFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

y³ = Inter-working unit (IWU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

z³ = Inter-working unit facility (IWUFAC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

a⁴ = Network interface number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b⁴ = Packet access gateway (PAG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c⁴ = Optical interface unit (OIU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d⁴ = Protection group (PG) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e⁴ = Side number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f⁴ = Optical carrier - level 3 (OC-3) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g⁴ = Synchronous transport signal - level 1 (STS1) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h⁴ = Optical carrier - level 3 concatenated (OC3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

i⁴ = Synchronous transport signal - level 3 concatenated (STS3C) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

---

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message form is valid, but the request conflicts with
current status.

PF = Printout follows. Followed by the OP:CONV-EXT output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

APP:RANGES
OP:CONV-INT
Software Release: 5E14 and later
Command Group: SM
Application: 5
Type: Input

1. PURPOSE
Requests that translation information for a particular circuit, from its internal identifier to its external identifier.
For internal to external translation, the output will be the circuit’s external identifier; if applicable, additional information such as subtending unit will follow.

2. FORMAT
OP:CONV, INT, {CKT|ALINK|LEN}=a-b;

3. EXPLANATION OF MESSAGE
a = Switching module (SM) number.
b = Internal identifier of line unit A-link (ALINK), line equipment number (LEN) or any SM circuit.

4. SYSTEM RESPONSE
NG = No good. The request has been denied. The message form is valid, but the request conflicts with current status.
PF = Printout follows. Followed by the OP:CONV-INT output message.
RL = Retry later. The request cannot be executed now due to unavailable system resources.

5. REFERENCES
Output Message(s):
   OP:CONV-INT
OP:CONV-PHA-A

Software Release: 5E14 - 5E15
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Convert from a given protocol handler (PH) for asynchronous transfer mode (ATM) (PHA) to the associated packet switch unit (PSU) link and channel that it services.

2. FORMAT

OP:CONV,PHA=a-b-c-d;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b = PSU number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Shelf number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = PH number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Followed by an OP:CONV-PHA output message.

### 5. REFERENCES
Input Message(s):

  OP : CONV-PSELNK

Output Message(s):

  OP : CONV-PSELNK
1. PURPOSE

Convert from a given packet switch unit (PSU) link (PSLNK) to the associated protocol handlers (PHs) for asynchronous transfer mode (ATM) (PHAs) that service the individual channels of the PSU link.

A PSU link is uniquely identified by the community addresses (CAs) of two PSUs that this PSU link connects. The near end PSU CA can be entered directly in the input message line or can be translated by the switch from the entered PSU equipment number. However, the far end CA can not be specified by the PSU equipment number and must always be entered as PSU CA.

NOTE: For gateway protocol handlers (PH) the only valid input message format is #4. Other formats will not yield the expected results.

2. FORMAT

[1] OP:CONV,PSLNK=a-b;
[2] OP:CONV,PSLNK,PSUCA=a,FARCA=b;
[3] OP:CONV,PSLNK,PSU=c-0,FARCA=b;

3. EXPLANATION OF MESSAGE

a = Near PSU community address of the PSU link.

b = Far PSU community address of the PSU link.

Note: The far end CA must be zero if the PSU link is connected to an ATM switch in a point-to-multipoint configuration network.

c = Switching module (SM) number.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message is valid but the request conflicts with current equipage or status.

PF = Printout follows. Followed by an OP:CONV-PSLNK output message.

RL = Retry later. The request cannot be executed now due to unavailable system resources.

PF = Printout follows, followed by the OP:COT-STATUS output message.

5. REFERENCES

Input Message(s):

SET:COT

Output Message(s):

OP:COT-STATUS
1. PURPOSE

Requests that information describing the configuration of the specified digital subscriber line (DSL) be displayed. The output will contain the type of DSL (singlepoint versus multipoint), the status of the DSLs D and B-channels, and whether default service is available on the DSL. It will also identify what customer premises equipment (CPE) integrated services digital network (ISDN) terminals are connected to the DSL, give the terminal endpoint identifier (TEI) of each CPE, identify the type of CPE (when known), identify the protocol that each CPE supports (when known), identify the users service profile identifier (USPID) associated with the CPE (when known), and identify the primary directory number (DN)/multi-line hunt group (MLHG) associated with the CPE (when known).

This output is useful in identifying the current configuration of the DSL and in providing the current CPE’s TEI identification (which can change over time depending on the actions taken by the network and subscribers on the DSL). The TEI information may be needed during manually-requested removals (RMV:CPE) and restorations (RST:CPE) of terminals connected to the DSL.

The information provided by this message is similar in content to the information displayed on the trunk and line work station (TLWS) DSL graphic display page.

2. FORMAT

OP:CPE,a;

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = Equipment number or identifier. Valid value(s):
   AIUEN=d-n-o-p
   DN=q
   ILEN=d-h-i-j
   INEN=d-r-i-j
   LCEN=d-e-f-g
   LCKEN=d-e-k-l-m
   MLHG=b-c
   PKTDN=q

b = MLHG number of a subscriber associated with the DSL. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c = Multi-line hunt member number of the subscriber. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d = Switching module (SM) in which the digital subscriber line (DSL) exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e = Integrated services line unit (ISLU) or ISLU version 2 (ISLU2) in which the DSL exists. Refer to
the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ f \]
= Line group controller (LGC) in the ISLU in which the DSL exists. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ g \]
= Line card of the ISLU line group controller which the DSL connects to. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ h \]
= Integrated digital carrier unit (IDCU) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ i \]
= Remote terminal (RT) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ j \]
= RT line number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ k \]
= Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ l \]
= Line board number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ m \]
= Line circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ n \]
= Access interface unit (AIU) Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ o \]
= AIU pack number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ p \]
= AIU circuit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

\[ q \]
= Circuit directory number (DN) or packet directory number (PKTDN) of any subscriber associated with the DSL. For key-system service DNs, only primary DNs are valid.

\[ r \]
= Digital network unit - synchronous optical network (SONET) (DNU-S) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

\[ NG \]
= No good. The input request was in some way invalid, most likely because a value was out of range. Identify the error with the original request and repeat the request.

\[ PF \]
= Printout follows. The requested action has been accepted and is being processed. An OP:CPE output message will be printed that identifies the outcome of the request, providing the DSL and CPE information when successful.

160 (TRUNK & LINE MAINT)
42. OP:D
OP:DATALINK

Software Release: 5E14 and later  
Command Group: TRKLN  
Application: 5  
Type: Input

1. PURPOSE

Requests the output of the current usage of an Operator Position System (OSPS) External Information System (EIS) data link or data link group. Output will include switching module state, switching module identification, EIS identification, link number, approximate usage as a percentage of link capacity, recent overload count, and the data link state associated with a single data link or a data link group. A data link group is defined as a set of two or more data links, up to a maximum of sixteen, connecting a vendor’s EIS to a switching module (SM).

Note: If a data link is in service and the approximate usage is displayed as zero, then link capacity as calculated is less than one percent.

2. FORMAT

[1] OP:DATALINK, {EIS=b-c | LCEN=d-e-f-g | SM=d} [,DCH];

[2] OP:DATALINK, EIS=b, SM=d [,DCH];

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

DCH  = D-channel identifier.

b  = EIS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = External data link (member) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = SM number.

e  = Line unit number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = Line group number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = Line card number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

PF  = Printout follows. The request has been accepted and is followed by the OP:DATALINK output message.
RL = Retry later. The request has been denied probably due to system load.

5. REFERENCES
Input Message(s):
  OP : MT–INFO

Output Message(s):
  OP : DFC–INFO

Input Appendix(es):
  APP : RANGES
OP:DFCELOG

Software Release: 5E14 and later
Command Group: FHADM
Application: 5,3B
Type: Input

1. PURPOSE

Requests that enhanced information report (EIR) entries of the disk driver logfile be printed and formatted. Refer to the REPT:DFCE and REPT:DFCI output messages for EIR report. If no options are specified, all EIR entries of type 2 are formatted and printed. Otherwise, the EIR entries in the logfile that meet all the selection criteria are printed.

The DATE, TIME, ID, and TYPE options are matched with information contained in the user control string (UCS) which the spooler adds as a prefix to each message before storing it in the logfile. The UCS is not part of the OP:DFCELOG output. If the DATE option is specified in a long format (ten digits), the TIME option is illegal. If the DATE option is specified in a short format (six digits), and the TIME option is given, an intersection between the DATE and TIME options is taken. If the TYPE option is not specified, the OP:DFCELOG message searches for type 2222 in the UCS string. The keyword (KW) option matches on information contained in the text of the EIR message. The unit number in the moving head disk (MHD) option is mapped into the MHD ID plug ID switch number contained in the text of the EIR message. The CCODE option is matched with the completion code contained in the text of the EIR message.

2. FORMAT

OP:DFCELOG;DATA[,MHD=a[,CCODE=b]][,DATE=c&&d][,TIME=e&&f][,KW="g"][,ID=h][,TYPE=i][,LIMIT=j][,CLASS=k,DEVICE="l"];

3. EXPLANATION OF MESSAGE

a = MHD number.
b = Completion code (in hex); for example, h'00ff.'
c = Start date in month, day, and year format (mmddyy); for example, 090188 equals September 1, 1988; or in month, day, year, hour, and minute format (mmddyyhhmm); for example, 0901881030 equals September 1, 1988, at 10:30 a.m. The size of the small computer system interface (SCSI) EIR completion code is two hex digits. Therefore, only the two least significant digits are meaningful.
d = End date (mmddyy) or (mmddyyhhmm); for example, 090188 equals September 1, 1988 or 0901881030 equals September 1, 1988, at 10:30 a.m. Default is the start date. If given, this parameter must be in the same format (six or ten digits) as the start date.
e = Start time in hours and minutes (hhmm); for example, 0110 equals 1:10 a.m. Default date is current date.
f = End time in hours and minutes (hhmm); for example, 1530 equals 3:30 p.m. Default is start time. Default date is the current date.
g = A keyword that appears in all EIR entries that are to be reported (up to 39 characters).
h = An optional 4-digit decimal numeral which is used to link an item in a logfile with an entry in another file. The ID is filled in by the process which made the logfile entry; for example, 1234.
i = An optional 4-digit decimal numeral which specifies the type of entry on a logfile. The type is filled
in by the process which made the logfile entry; for example, 1234. Default is 2222.

\[ j \] = Specifies the maximum number of output entries. Default is 200. Will report output complete if limit is reached.

\[ k \] = Location on which output should be routed. Valid value(s):
  - \[ R \] = Receive-only printer (ROP).
  - \[ T \] = Terminal and ROP.

Default is R.

\[ l \] = A specific device that output should be routed to (up to nine characters). This device cannot be a logfile.

4. SYSTEM RESPONSE

\[ IP \] = In progress.

OP:DIGTRC

Software Release: 5E14 and later
Command Group: TRACE
Application: 5
Type: Input

1. PURPOSE

Requests consolidated routing information based on requested digit analysis selector (DAS). The routing information consists of destination index and route index. A list of translated digit patterns along with the routing information will be placed into a UNIX® RTR operating system file on the administrative module (AM) under the /updtmp directory. The routing information is written to a file called "xxxxxx.results", the "xxxxxx" being a unique number for every execution of the message. The resulting file will be limited to 1000 line entries. Any failures encountered while processing will be indicated on the receive-only printer (ROP) and an error file, "xxxxxx.err", also under "/updtmp".

2. FORMAT

OP:DIGTRC,SM=a,DAS=b,START=c,END=d;

3. EXPLANATION OF MESSAGE

a = Switching module (SM) number.
b = Digit analysis selector (DAS) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
c = Starting range of digit strings (0 - 999999999).
d = Ending range of digit strings (0 - 999999999).

4. SYSTEM RESPONSE

PF = Printout follows. The information will be in an output file.
NG = No good. The request was not accepted because:
- An illegal SM number was specified.
- An illegal DAS number was specified.
- An illegal START number was specified.
- An illegal END number was specified.

Other Manual(s):
235-105-220  Corrective Maintenance
OP:DMQ-CM-SM

Software Release: 5E14 and later
Command Group: MAINT
Application: 5
Type: Input

1. PURPOSE

Requests the status of all active and waiting requests in the deferred maintenance queues (DMQ). Either the communication module (CM) DMQ or the DMQ for one or more switching modules (SM) can be requested.

2. FORMAT

OP:DMQ, {CM|SM=a[&b][,all]};

3. EXPLANATION OF MESSAGE

Note: Refer to the Acronym section of the Input Messages manual for the full expansion of acronyms shown in the format.

a = SM number (or lower limit for a range of SMs) where the desired DMQ resides.
b = Upper limit for a range of SM numbers.
ALL = All available data. This type request can produce large output reports and therefore it's use should be kept to a minimum.

4. SYSTEM RESPONSE

NG = No good. The message syntax is valid, but the request could not be processed.
PF = Printout follows. Followed by OP:DMQ-CM or the OP:DMQ-SM output message.
RL = Retry later. May also include:
- SM ISOLATED = The request could not be processed because the SM is currently isolated.

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests that all dynamic overload controls (DOCs) specified for the office be listed, or lists the control for a single trunk group.

2. FORMAT

OP:DOC[, TG=a];

3. EXPLANATION OF MESSAGE

   a = Trunk group number.

4. SYSTEM RESPONSE

   NG = No good. May also include:
   - INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.

   PF = Printout follows. Followed by the OP:DOC output message.

   RL = Retry later. May also include:
   - CONFLICTING REQUEST = A similar request is being processed utilizing necessary resources.
   - RESOURCE SHORTAGE = The necessary resources are not available.

130 (NM EXCEPTION)
OP:DSNM5

Software Release: 5E14 and later
Command Group: NMOC
Application: 5
Type: Input

1. PURPOSE

Requests a list of a package (PKG) from the five-minute (M5) surveillance data set of packages. This message is valid only for defense switched network (DSN) switches.

2. FORMAT

OP:DSNM5,PKG=a[,TG=b];

3. EXPLANATION OF MESSAGE

a = Package name. Valid value(s):
   ARC = Alternate route cancellation control.
   CLCT = Network management control counts.
   CLDIR = Call direction.
   DCC = Destination code cancellation control.
   DLYR = Delayed readiness.
   IMA = Additional ineffective machine attempts.
   OVRLD = Overload or congestion control.
   RRC = Manual reroute trunk group controls.
   SVC = Critical service circuits.
   TGFLAG = Trunk group flags.
   TGMEAS = Basic trunk group measurements.

b = Trunk group number. This trunk group number must be on the network management (NM) schedule. If it is not, use the ASGN:DPSCH input message to put the trunk group on the NM schedule. This parameter is only specified with the TGMEAS package. The default is all trunk groups on the NM schedule.

4. SYSTEM RESPONSE

NG = No good. Valid value(s):
   - INVALID REQUEST = The request has been denied. This office is not equipped to process the request entered.
   - PACKAGE UNASSIGNED = The request has been denied. The data for the package requested is not currently being collected. Use the SET:DSNM5 input message to add the package to the package list.

PF = Printout follows.

RL = Retry later. Valid value(s):
   - CONFLICTING REQUEST = A similar request is being processed utilizing necessary resources.
   - TG UNASSIGNED = The request has been denied. The trunk group requested is not on the NM schedule so it is not included in the measurement collection. Use the
ASGN:DPSCH input message to add the trunk group to the NM schedule, wait for the next five-minute collection period, and re-enter the request.

Software Release: 5E14 only
Command Group: SM
Application: 5
Type: Input

1. PURPOSE

Requests a printout of all communication module (CM) units and switching modules (SMs) that are in the growth (GROW) or special growth (SGRO) equipage states, or the equipage state of an individual unit.

The units that equipage information can be requested on are the module message processor (MMP), the MMP growth board (MMPGBRD), the MMP synchronous data link controller (MMPSDLC), the time multiplexed switch (TMS) link (TMSLNK), the quad-link packet switch (QLPS), the quad-link packet switch gateway processor (QGP), the RSM communications links (CLNKs) through its host SM (HSM), the SM, or the communications module processor (CMP).

**NOTE 1:** The MMPGBRD only exists in CM model 1 (CM1) hardware. This message does not provide status on any SM peripheral units, or on any units within the SM.

**NOTE 2:** The RSMCL input parameter is not applicable to offices having CM3 vintage communications modules.

2. FORMAT

OP:EQSTAT, {MMP=a-b|MMPGBRD=a-b|MMPSDLC=a-b-c|TMSLNK=d-e ~|QGP=a-g|QLPS=d-h|RSMCL,HSM=f|SM=f|CMP=a-i|GROWTH};

3. EXPLANATION OF MESSAGE

GROWTH  = Print all CM units and SMs in the GROW or SGRO equipage states.

a  = Message switch side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

b  = MMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

c  = Synchronous data link controller (SDLC) number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

d  = Office network and timing complex (ONTC) side. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

e  = TMS link number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

f  = SM number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

g  = QGP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

h  = QLPS number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.
1 = CMP number. Refer to the APP:RANGES appendix in the Appendixes section of the Input Messages manual.

4. SYSTEM RESPONSE

NG = No good. The request has been denied. The message syntax is valid, but the request could not be processed. Refer to the APP:CM-IM-REASON appendix in the Appendixes section of the Output Messages manual for a list of possible reasons for denying the request.

PF = Printout follows. Followed by the OP:EQSTAT-CM or OP:EQSTAT-RSMCL output message.
